annual exhibits of trade ; for the Depnrtment is offcially advised, as late as 1853, that, in respect of valnes, the amounts stated in the Balanzas are fully one fourth less than the real market value both of imports and exports. However this may be, the atatements and tablea given are all which are accessible; none other being published or prepared; and for all useful purposes, they will serve the statistician ea well ae if the greateat accuracy had been attained.
The commerce of Cuba with foreign nations for ths year 1854, is fully set forth in the annexed statements, taken from the "Balanzas Generales" for that year. It is followed by two other tables, made up from the Balanzas, designed to illustrate the commercial movements of Cuba during a periol of $\mathbf{t w e n t y}$-nine years, from 1826 to 1854, both inclusive; while a third table exhibits a comparative view of the foreign commerce of Cuba and Porto Rico, with the duties received, and the number of vessels entered and cleared, during a period of seven years, from 1848 to 1854.

Commrroz of Cuba witif fogeion Nationg from 1926 to 1840, [Made up frox the "Balantab Genebales."]

General Port Reguiations. 1. Ships leaving with a full argo of molasses are free of tonnage dutien.
2. Shlps arriving in balisat, and leaving in the mame atate, pay do tonnuge duty; but If they should take return cargoen of the frulta, or other articies of the Island (entire cargoen of molasses only excepted), they pay the regular duty.
8. Bhips arriving ta dlatrese for water, or other neccsasariea, are free from tennage duty; lut when they diseharge the whole or part of their cargo (natesa every part ta agaln taken In , and no more), or load with produce, forelgn or native (molassea excepted), they are sabjected to the entire tonnuge duty.
4. Veasele, forelgn or natlonal, which have left a port of the laland, having pald the proper tonnage duty, and which enter any port of the latand to repalr damages they may lave sualalned at sea, by reason of storm or other casualty, are exempt from further tonnage duty.
5. Vessela entering the ports of the leiand with mineral coni, in equal or greater quastity than the number of tons per their regiater, pay only 50 centa par ton for tonnage duty, even If they bring other merchandine besides. They are also exempt from all other local charges (excepting captain of the port's fees), such an ponton and health dnes, cuatom-honse visits, entry and clearnnce feea, wharfage, atage-hire, etc. Such as bring coal, solely, in less quantity than their tonnage
measure, pay 50 centa per ton upon the portion occupled by coal; and the difference between this portion sad the number of tona that the vesect may prove to have, by Spenish measarement, will be aubjected to the payment of the full tonuage duty ; but theso vessels are allowed the exemptlon from atl other charges except captala of the port'a fces.

Versels having on board, besidea coal in less quantliy than thelr measurement, other cargo, are in the bame case respecting the tonnage dues, but are subject to the ponton, health viatts, regiatering and other ukual dues. Mall steamers, recognized as such, are permitted to bring and earry 3 tona of cargo vithout paying tonnage dues. If the cargo discharged exceeda 3 tons, they pay duty on such excess over and above the 3 tons. Vessele golng from one pert to enother of the Island, carry a sea-letter of Introduction to the enstom-house of the other port, stating that the regular charges have been paid. Thla tetter coata \&4. By order of November 4,1864 , atl vessela having to perform quarantine must go either to 1Lavana or to 8 t . Jago de Cuba fur that purpose. Quarantine fee, 制 per day. Besldes the faregoing general regulations, which are in foree at all the porte of the jaland, there are others of a more local character, appllcablo to some, and not to others, These retate more eapectally to tonnage and port dutles, and other charges.

Mode of Collecting Duties. The collection of the duties is made in a very simple manner. The friand of Cuba is divided Into customs intendencies, of which IInvana ls the principal. The Intendency is organized Into seven branches, vlz. : the Intendant, the superior counsel of the hacienda, the tribunal of accounts, the accountent-general, the treasurer-general, the administration of the customs, and the administration of the internal revenue. The administration of the customs is comprised of the adminiatrator or collecter, the accountant, and the treasurer. When a vessel arrives at the IIavana, she ls first boarded by the health officer, after whom comes the revenue officer and the sinuggling-preventivo service. A cony of the cuatom-housa regulations, in Spaniel, French, and English, is handed to the captain, and a manalfest required of him of all the particulars of his vessel and carge. Every article on beard the vessel, omitted in the manifest, is subject to contlacation. Within fortyeight heurs nfter the entry of the veasel, every consignee must deliver detniled statements of the articles coming to him, with their quantities, weights, and masures, all reduced to the legal stundard.
Ail the documents and papers relating to a vessel, are stitched together in a book, with the signatures and seals of all the government officers, through whose hands the - irral documents pass. A copy of this
book is made for the use of the inspectors and appraisers; the lutter function beling restrained within very narrow limits, by a printed tariff of all articles of inport, whth a valuation to each, which valuation, in n great degree, defines the dutles of the ad valorem character. As fast as the insjection and appraisement take place, the consignee is permitted to remove the goods, by procuring the signnture of some responsible person to the words lnscribed in the book, "I make myself nnswerable for the duties." The inspection and appralsement being concluded, the book is returned to the accountant's office, where the liquidation of the duties is forthwith made. The payment is then proceciled with. These payments ure mostly cash; that is to say, on some articles, whatever may be the amount, cash is required; upon other articles, the duties are eash under $\$ 1,000$.

If the amount is greater, a credit of one fourth ls given for sixty days, and one fourth payable at the end of each succeeding month-making tive montha' credit in sll. The security for this credit consists simply in the promissory note of the consignee, without indorsement, with the power, in case of a fuilure. to convert every other note of the same lndividual into a cash debt; the individual to be forever after inca. pacitated to enter goods, except for cash.

This syetem has been ln force many years, and un-

## CUM

der it no loss whatever has been sustained by the government.

Formerly, the same credits required the endorsement of a holder of real eatate; but this was nbandoned on account of its Insecurity.-Macorecion's Statistic's; U. S. Com. Dhg. For further Information, refer to A m. Quar. Rev., vli. xi., 230 ; Ilunt's Mag., vi., vii., xvii.-xxi., 519 ; North. Am. Rev., xxix.: De Bow's Rer., vill., p. 318, ix., 164; Ch. Kramr., Fi., 259 , xxili., 82 ; Frasen's Mfag., xil. ; Littelle's Living Age, xxii. ; Foreign Quar., iii., p. 400 ; BlackWOOD, xl. ; Southern Quarterly, iv., xxl.

Cubebs (Germsn Kubeben; French, Cubebes; Italian, Cubebi; Spanigh, Cubebas ; Russian, Kubebii; Latin, Piper Cubeba; Arsb, Kebäbeh; Javsnese, Kıtmundis; Ilindostsn, Cubab-chinie), the produca of a vine or climber extensively grown in Jsva. It is s small dried fruit, like a pepper-corn, but aomewhat longer. Cubebs have a hot, pungent, aromatic, slightly bitter tnste; and a fragrant, agreeable odor. They should be chosen large, fresh, sound, and tho heaviest that can be procured.

Cubit. This was a moasure of the anclents, and is the first messure we read of; the ark of Noah was made and measured by cubits.-IIoliden. The Hebrew ancred cubit was two English feet, and the great cabit eleven English feet. Originally it was the distance from the elbow, bending inwards to the extremlty of the middle finger.-Camet.

Cucumber, a tropical plant, of which there are many varieties, largely cultivated in hot-houses in England.

Cucumber-tree. Magnolia aruminata. In all parts of the United States where this tree is found, it is known only by the name of cucumber-free. It is a beautiful vegetable, equal in height and diameter to the big laurel. The most northern point at which this tree grows, is near the falls of Ningara, In lutitude $43^{\circ}$. It abounds slong the whole tract of the Alleghanies, to their termination, in Georgis, over a distance of $\mathbf{9 0 0}$ miles. It ls slso found on the Cumberland Mountains. The situations peculiarly adajtel to its growth sre the declivities of mountains, narrow valleys, and the banks of torrents, where the air is constantly moist, and where the soll ls deep and fertile. At the distance of forty or fifty miles from the mountains, either wsy, this tree is met with only accidentally upon the steep bsnks of rivers, where the atmosphere is constantly refrestied by the evaporation from their aurface. We may conclude, then, that this tree is a stranger to all parts north of the river Ifulson, and to all the Atlantic parts of the United Stater, to the listance of 100,150 and 200 miles from the sea; the nature of the soil, and the extreme heat of the climate in summer, beling itterly uncongenlal to lts growth. It is also rare In the parts of Kentucky and West Tennessee which are most remote from the mountains, where the face of the country is less uneven. The cucumber-tree sometimes exceeds 80 feet in helght, with a diameter of 3 er 4 feet. The trunk la jerfectly atrajght, of a uniform size, sud often destitute of branches for two thirds of its length. The summit is ample and regularly shapel, and the tree is one of the finest in the American furests. The leaves are 6 or 7 Inches long, and three or foct inches broad, upon old trees; upon sajplings growing in molst jlaces, they are sometimea twlce aa large.
On old stocks the bark of this tree in grayinh, and deeply furrowed. Tho perfect wood ls soft, and of a yellowinh brown. It ls fine-grained, and susceptible of a brilliant pollish.

Being a rare tree, It Is only aceldentally employed in the arts. Sawn into boards, It aerves in joinery for the Interior of wooden houses, and for its size and llghtness, it is selected for large canoen. Most of the inhabitanta of the country loriering on the Alleghanien, gather the cones of this tree about midsummer,

When they are half ripe, and ateep them in whisky; a glass or two of this liquor, which is extremely bitter, they habitually take in the morning, as a preseriative against autumansl fovers.- Brownx's Sylva

## A mericana.

Cudbear, a purple or violet-colored powder, used in dyelng violet, purple, and crimson, prepsred from a species of lichen (Lichen tartaretus Lin.), or crustaceous moss, growing commonly on limestone roeks in Sweden; Scotland, the north of England, etc. A bout 130 ns of this lichen are annually exported from Sweden. It commonly sells in the port of london for about 20l. per ton ; but to prepare it for uee it must lie washed and dried; snd by these operations the welght is commonly diminished a half, and the price, in effect, doubled. Though posseasing great heauty and lustre at first, the colors obtained from cudbear are so very fugaceous, that they ought never to be employed but in aid of some more permanent dye, to which they may give body and vivacity. In this country it is chiefly used to give strength and bri]liancy to the blues dyed with indigo, and to produce a saving in that article; it is also used as a ground for mailer reds, which commonly incline too much to yellow, and are made rosy by this addition. The name cudbear was given to this powder by Dr. Cuthbert Gordon, who, having obtained a patent for the preparation, chose in this way to connect it with his own naine.-Banciort, Philosophy of Colors.

Culeus, in Roman Antiquity, the largest measure of capacity for thlngs liquid, containing twenty amphore or 40 urnie ; equivalent to 115 gallons, 1.6 pints Englisb. Culous also denoted a sack or bag. Parricides were punished at Romo by belng thrown into the Tiher in a sack, along with a cock, an upe, and a viper.

Culm (Wessh culm), n rariety of coal. It is difticult of ignition, but burns for a long time, without thane or smoke, but emitting $n$ disagreeuble smell. It dues not cake, and it leaves but few ashes. Culm is the bitumen oxygenatum of Linnous, and the glanz kohle of Werner. It is otherwise known as anthracite. -See Coal.
Culna, in llindostan, a town in the Iritish dis. trict of Burdwan, presidency of Bengal, on the right bank of the river Hooghly, on the route from Cutwa to the town of Hooghly, 26 miles east of the city of Burdwan. It is the jort of the district, snd has long been noted for its trade in rice, grain, silk, snd cotton. Of late years the trafle of the place bas greatly increased, in consequence of its leing found a convenient station for stemmers plying between Caleuta and the upper provinces. The lazaar rensists of 1000 shops, and the population of tho town has been stated at 60,000 . Jat. $23^{\circ} 14^{\prime}$; long. $88^{\circ} 20^{\prime}$.

Culpee, a town of Ilengal, district if Ilooghly, on the enstern bank of the river llooghly. It stands 33 miles lelow Culcutta, st the mouth of a rreek that gives slolter to louts from the impetuosity of the thile, which runs there $w^{t}{ }^{t} \mathrm{~J}_{1}$ great violence. Ojposite the town is the place of anchorage for large ships which can not get higher up the river. The shores here are a bed of mud, and the banks of tha river aro covered with thick jungle. Culpee js considered extremely unheulthy, on account of tho swamps and woods hy which it is surrounded. Fi. long. $8 \mathrm{x}^{\circ} 1 \mathrm{~s}^{\prime}$; N. lat. $22^{6} 6$.

Cumberland river, a large river of Krntmes and Tennessee, which tlows through Kcatucky mil fulls into the Ghio. lts entire length is ahont 600 miles, and navigable for harge steambonts to Nushville, 203 milex, and for boats of 15 tons, 300 miles. large quantities of cotton, corn, and tobaceo, are transjorted by flat-boats and stemmbonts from numerrous countles on this river, to New Orleans.

native of Egypt, but extensively cultivated in Sicily and Malta. They have a strong, peculiar, hoavy odor, and a warm, bitterish, disagreoable taste. They are long and slender.
Cumnock, or Old Cumnook, a village of Ayrshire, In Scotlund, on the Lugar Water, 12 miles east of Ayr. It is noted for the manufacture of enuff-boxes, similar to those of Laurencekirk, the peculiarity of which la the "invisible wooden hinge." See artcle Snuff-boxes.
Cupel, a shallow earthen vessel, somowhat of a cup shape, generally made of bone earth. It is used in the assays of the precious metuls, which are fused upon a capel with lead. Cupellation meane the refining of gold or silver npon a cupel.

Cupellation is a mode of analyzing gold, silver, palladiam, and platinum, by adding to small portions of alloys, containing thesa motale, a bit of lead, fasing the mixture in a little cup of bone earth called a cupel, then ly the joint action of heat and alr, oxydizing the
copper, tin, etc., preaent in the precious matals. The oxyds thus produced are dissolved and carried down into the porous cupel in a liquid atate, ty the vitrified oxyd of load. See Assay, Gold, and Silver.

Curacoa. This island is situated in the Caribbean Sea, near the coast of Venezuela, and is about 42 miles long, and from 10 to 15 miles broad. The chief staples are tobacco, sugar, indigo, and maize. There are numerous harbors, but that of Santa Anna is considered the best and aafest. The principal merchandise exchanged in the consting-trade of Curaço consists of hider, goat-akins, dye-woods, corn, cochineal, sugar, indigo, and hats. The chief artclele of internal trado is salt, this being the only article manufactured for axport. The following table exhibits, in one view, the general commerce of the lsland with the United States during three years, ending with 1853. It will be seen that the export trade to the United States ia yearly increasing, and that in 1853 the increase over 1851 is nearly 100 per cent.

Tabllan Statemant of Shipments from the Ibland of Curacoa to the United States durino the three Yeara ending June 30th, 185s. [Made vp from Congular Jetunis to tur Dri'artment or Btath Washington.]

Curacoa, a liqueur which derives its name from the island of Curagoa. It is propured in great porfection by the Dutel. It derives ita flavor from Seville orauge peel, with a mall quantity of cinnamon and mace.
Curmi ( $\operatorname{soc}_{\mathrm{c}}^{\mathrm{p}} \mathrm{ti}$ ), in Antiquity, a sort of malt liquor or ala, made of barley, and which, according to Dioscurides, was used ly maty nations insteal of wine. That writer also relates tiat in the western part of lheria, und in Iritain, a sinnilar beverago was in his time prepared from whent.
Currants (lir. Raisins de Corinthe; Ger. Koriuthen; It. Ure pmase di Corinto; Lat. Passule Corinthi"cer: Rus, Korinka, Opoed; Sp. Pasns de Corinto), a small spreies of grape, largely ciltivated in Zante, Cephatonia, and Ithica, of which isiands thoy form the etaple jroduce 1 mid in the Moran, in the vicinity of Patras. The plant la delicate ; and as 6 or 7 years must elapac, after a plantation has been formed, before it legins to produce, its cultivation requires a considerable ontlay of capitui. The crop is particulariy liablo to injury from rains in harvest, and is altogether of a very precarioua description. After lieing dried in the aun, the currants are exported packed la large butts. They are in extensive demand

In Europe and the United States, and, when mixed with ilour and suet, make a dish that is peculiarly acceptuble to the lower classes.
Current (Lat. eurrens, from curro, to run, to flow), literally signillos running, flowing, passing. Hence, passing from person to person, or from hanil to hund; circulating, as current opinions, carront coin. In comy ree it is appliad in manalagous sense to the price of any commodity: as carrent value-that is, the ordinary or present value. As applied to time, it is equivalent to now prosent or passing: as the current month or year. It is applied chiefly to the progronsive movement of fluidis, especially of air, electrieity, and water.
Currents in the ocean arise from various causog, either occasioual or constant. They may be cocasioned by an external impulsion, for exanple, a galo of wind; from a diffurence in the temperature of different parts of the sea; from the inequality of evaporathon, the melting of the puiarice, or in short any cause tending to listurb tho hydrostatic equilibriun. It ls dificalt in many cases to trace their causes, or to give may satisfactory theory of their existence; but on account of their huportance to navigation they have been observed, espgeially of late years, with
great care. Among those which have a permanent or general character, there are two which are very remarkable. The first is that of the troplcal waters westward round the globe, and the second that which constantly flows from each pole toward the equator. The troplcal or westerly current is chiefly confined within the zone, extending to about $30^{\circ}$ on each side of the equator, and its velocity is eatimated by Humboldt at abont 9 or 10 miles a day. In the Atlantle it separates into two branches, one of whlch forms tha Gulf Stream; and the other flows along the coast of Brazil, and passes through the Straits of Magellan. The Gulf Stream flows northward through the milddle of the Atlantic, till It reaches the Cape Verd Islands; It then passes through the Caribbean Sea, between Cuba and the peninsula of Yucatan, sweeps round the Gulf of Moxico, and rushes out by the Bahama Channel; then, spreading out to a greater breadth, it continues Itg course along the shores of the United States to Newfoundland, where it is deflected eastward by a current setting in from Baffin's Bay; and, paasing the Azores and Canary Islands, returns in a great measure into Itself. Its breadth is 51 leagues in the Ihahama Channel, and velocity from 3 to 5 miles an hour. (Dluarar's Geography, p. 186.) The polar currents flow constantly from the poles toward the equator, though it is evident that their sources must he supplied by currents in a contrary direction. Their existence is proved by the great masses of ice which are carried every year from the polar seas to tropical latitudes. Oceanic currents, by carrying with them tho temperature of the regions whence they flow, contribute In no small degreo to modify the tomperature of the atmosphere, and give a character to the climate of the countries to which they are contiguous. On the parallel of New York, IIumboldt found the temperature of the Gulf Stream $72^{\circ}$ of Fahrenheit, while out of the current, the heat of the ocean at the surface was only $63^{\circ}$. The current which flows alongt the eastern coast of Africa, and doubles the Caje of Good llope in a streum 130 miles broad, is from $7^{\circ}$ to $8^{\circ}$ warmer than tho contlguous sea. See Gulf Stream.

Currents of water, like currents of air, meeting from various directions, creato gyrations, which in some parts of the sea, as on the coast of Norway, assume the appearance of whirlpools, as though the water were drawn into a chasm below. The celobrated Maeletrom is caused by such a conflict of tidal or other streams. Admiral Beechey, IR.N., has given diagrame Illustrative of many "rotatory strenms in the English Channel, a number of which occur between the outer extremitles of the Channel ie nnd the stream of the oceanic or parent wave." "They are clearly to be accounted for," mays he, "by the streams acting obiliquely upon each other." It is not necessary to associate with oceanic currents the iden that they must of necessity, as on land, run from a higher to a lower level. So far from this lieing the case, some currents of the sea actually ruin up hill, while others run on a level. The Gulf Stream is of this class. The currents which run from the Atlantic into the Mediterranean, and from the Indian Ocean Into the Iled Sea, are the reverse of this. Here the bottom of tha current is probatily a unter level, and the top an helined plane, running down hill. Take the led Sea current us an illustration. That Senlles, for the nost part, within a rainless and riverlesa district. It may be compared to a long and narrow trough. Ileing in a rainless district the evaporation from it in Immense; none of the water thus taken up is returned to it elther by rivers or rains. It in about 1,000 miles long; It Iles nearly north and south, and extends from latitude $13^{\circ}$ to the parallel of $30^{\circ}$ north.

Mediterramean Currents.-With regard to an under current from the Mediterranean, we may remark that there ls a current alwayn setting in at tho aurfaco
from the Atlantic, and that thls is a salt-water current, which carries an lmmense amount of salt into that sea. We know, moreover, that that sos is not salting up; wo might infer the exlatence of an undercurrent, through which this salt finds lts way out into the broad ocean again.

The Currents of the Indian Ocean.-By enrefully exnmining the physlcal festures of this sea, and studying its conditlons, we are led to look for warm currents flat have their genesis in this ocean, and that carry from it volumes of overheated water, probably exceeding in quantity mnny times that which is dischnrged by the Gulf Stream from lts fountains. The Atlantic Ocean la open at the north, but tropical countries bound the Indian Ocean in that directlon. The waters of this ocean are hottor than those of the Caribhean Sen, and the ovaporating force there is much grenter. That it ls greater, wo mlght, without observatlon, infer from the fact of a higher temperature and a greator amount of precipitation on the neighboring shores. These two facts, taken together, tend, it would seem, to show that largo currents of warm water havo their genesis in the Indian Ocean. One of them is the well-known Mozamblque current, called at the Cnpe of Good Hope the Lagullas current. Ancther of these currents makes its escape through the Straits of Malacca, and, being joined by other warm streams from the Java and Chins Seas, flows out luto the l'aclfic, like another Gulf Stream, between the Philippines and the shores of Asia, Thence it ittempts the grest circle route for the Aloutlan Islands, tempering elimates, and losing Itself in the sea on its routo toward the north-west coast of America. Between the physlenl features of this current and the Gulf Stream of the Atlantic, there are several points of resemblance. Somatra unil Malacen correspond to Florida and Cuba; Borneo to the Bahamas, with the Old Provldence Channel to the south, and the Florida Pass to the west. The coasts ef China answer to those of the United States, the Philipuines to the Bermudas, tho Japan Islands te Nowfoundland. As with the Gulf Stream, so also here with this China Current, there ls a counter current of celd water between It and the ahore. The climates of the Aslatle coast correspond with those of America along the Atluntic, and those of Columbia, Wishington, and Vancouver are duplleates of those of Western Europe and the IIritish Islands; the cllmute of Californla (State) resembling that of Spaln; the sandy plains and ralnless regluns of Lower California reminding one of Africa, with its deserts between the same parallela, etc. Moreover, the North Pacific, like the North Atlantic, is enveloned, where these warm waters go, with mists and fogs, and streuked with lightning. The Aleuthan Islands are almost ns renowned for fogs and mists as are the Grand llanks of Newfountlind. A surface current flows north through IJehring's Straits into the Arctic Sea; but In the Atlantic the current is from, not Into the Arctle Sea: it flows south on the surface, north below; Behring's Stralts being too shallow to nitult of mighty unider currents, or to jermit the introductlon from the polar basin of any large leobergs into the Paclfic.

The ('urrevts of the I'acific.--The contrast has been drawn between the China or "Gulf Stromu" of the North I'aelfic, and the Gulf Strean of tho North Atlantic. The course of the China Stream has never been matlafactorily traced out. There ls aleng the eonst of Californla and Mexico, a southwardly movement of watera, an there is along the west conat of Africa toward the Cape do Verd Islands. In the open apace weat of thil, nouthwardly set nlong the Africun conat, there is the famous Sargasso Sen, which is the general receptacle of the drift-wood and seaweed of the Atlantle. So, in like manner, to the weat from Calfforilia of this other southwardly set, lics the

pool into which the drift-wood and sea-weed of the North Pacifle are generally gathered, but in small quantitica. The natives of the Aleutian Islands, where no trees grow, depend upon tiee drift-wood cast ashore there for all the timber used in the construction of their bosts, fishing-tackle, and household gear. Among this timber, the camphor-tree, and other woods of China and Japan, are said to he often recognized. In this fact we have additional evidence touching this China Stream, as to which, but little, at hest, is known. "The Jspanese," says Lieutenant Bent, in a paper read before the American Geograpincal Society, January, 1856, "are well aware of its existence, and have given it the name of ' KnroSiwe,' or Black Stresm, which is undoubtediy derived from the deep blue color of its water, when compared with that of the adjacent ecean." From this we may infor that the blue watere of this China Stream also contain mere suit than the neighboring waters of the ses.

The Cold Current of Okotsk.-Inshore of, but counter to the China Current, along the eastern siores of Asia, is found a streak or layer, or current of cold water answering to that between the Gulf Stream and the American coast. This eurrent, like its fellow in the Atlantic, is not strong enough at all times sensibly to affect the course of navigation; but, like that in the Atlantic, it is the nursery of most valuable fisheries. The fisheries of Japan are quite as estensive as those of Newfeundland, and the people of each country are indebted for their valuable suppiles of excellent fish to the cold waters rhich the carrents of the sen bring down to their shor s.

IIumboldt's Current.-The curcents of the Pacific sre but little understood. Among those abont which most is thought to be known, is the Ilumboidt Current of Peru, which the great and good man whese name it hears, was the first to discover. This current is feit as far as the equator, mitigating the rainiess climate of Peru ss it gees, and making it deligitful. The Andes, with their snew-caps, on one side of the narrow Pacific slopes of this inter-tropical republic, and the current from the Antarctio regions on the other, make its climate one of the most remarkable in the world; for, thougin torrid as to latitude, it is such as to temperuture that cloth clothes are seldom feit as oppressive during any time of the year, ospeelaily after nigintfall.
Currents of the Atlontic.-The principal currents of the Atiantic wili be described in the article on the Guif Strcam. Ilesides these, ita offsets are the Equatorinl Current and tise St. Roque or Brazil Current. Their fountain-head is the same. It is in the warm waters about the equator, between Africa and America. The former, receiving the Anuazon and tise Oronoco as tributaries by the way, flows into the Caribiean Ses, and incomes, with the waters in which the vapors of the trade-winds leave their salts, the feeder of the Guif Stream. The IBrazil Current, coming from the samo fountain, is suiposed to be divided by Cape St. Reque, one brancil going to the south under this name, the other to the westward. This iast has been a great bughenr to navigatora, prineipaliy on account of the difficulties whieh n few duil vessels failing to leeward of St. Roque inve fomm in beating upagainst it. It was and to have cnused the loss of some liugliain transports in the last century, whieh feli to loeward of the Cape on a voyage to the other hemiaphero; and navigutora, accordingly, were aivined to shun it as a danger. This current has been an olject of special investigation during iny researeiten connected with the Wind and Current Charta, and the result has satisfled me that it is neither a dangerous nor a constant current, not withstanding elder writers. Iiursturgh, in his East India Directory, eantions navLgutors aguinst it ; nnd Keith Joinston, in hia grand phyaical Atias, pulisised in IR48, tims sioaks of it :
"This current greatly Impedes the progress of those vessels which cross the equator west of $23^{\circ}$ west longitnde, impelling them beyond Cape St. Roque, when they are drawn toward the northern cosst of Brazil, and can not regain their course till after weeks or months of delay snd exertion." So far from this being the case, my resuarches abandantly prove that vessels which cross the equator five hundred miles to the west of longitude $23^{\circ}$ have no difficulty on account of this current in clearing that Cape. I receive almost daily the abstract logs of veasels that cross the equator west of $30^{\circ}$ west, and in three days from that crossing they are generally clear of that Cape. A few of them repert the current in their favor; most of them experience no current at all ; but, now and then, some do find a current aetting to the northward and the west ward, and operating sgainst them at the rate of twenty miles a day. The inter-tropical regions of the Atlantic, like those of the other oceans, abound with confileting currents, which ne researches yet have enabled the mariner to unravel so that he may at all times know where they are and tell how they run, in order that he may be certain of their help when favorable, or sure of avoiding them if adverse.

Under Currents.-Lieutensnt J. C. Waish, in the U. S. scheener Tuney, and Lieutenant S. P. Lee, in the U. S. brig Dolphin, both, while they were carrying on a system of ebservations in cennection with the Wind and Current Cinarts, had their attention directed to the subject of submsrine currents. They made some interesting experiments upon the subject. A block of wood was loaded to sinking, and, by means of a fishing-line or a bit of twine, let down to the depth of one hundred or five hundred fathoms, at the will of the experimenter. A amall barrel as a float, just sufficient to keep the block from sinking further, was then tied to the line, and the whele let go from the beat. To use their own expressions, "It was wonderful, indeed, to see this barrega meve eff, agrainst wind, and sea, and surface current, at the rate of over one knot an hour, as was generally the ense, and en one occasion as much as 19 knots. The men in the boat could not repress exclamations of surprise, for it really appeared as if aome monster of the deep had hold of the weight below, and was walking eff with it." Both officers and men were amazed at the sight. The experiments in deep-see soundings have also thrown much ligit upon the subject of under currents. There is reason to believe that they oxist in all, or almest all parts of the deep sea, for never in any instance yet has the deep-sea line ceased to run out, even after the plummet had reached the bottom. If the iine be held fast in the boat, it invariably parts, showing, when two or three milos of it are out, that the under currents are sweeping against the bigit of it with what seamen call a swigging force, that no counding twine has yet proved strong ennugh to withstand. Lileutenant J. P. Parker, of the United States' frigate Congress, attenpted, in 1852, a deci-sen sounding off the ceast of South America. He was engaged with the experiment eight or nine hours, during winch time a line nearly ten miles long was juili out. Night ceming on, ho had to part the line (which he did simply ly attempting to haul it in) and return on bourd. Examinution proved that the ocean there, instend of being over ten miles in deptil was not over tiree, and tinat the line was awept out by the forco of one or more under currents.Mavny's Physical Geography.

Currency. (lat. curro, 1 run.) In Political Economy, a term sonctimes used to express the colluctive amount of the meney, and of the bills, checks, and other subatitutos for money, employed in selling or buying, or in the distribution of the commodities and services among the different ranks and orders ef the community.-See Articles Banks, Consage, Cuedit, and Goid.

Currencies in United Etates. The Treasury Department of the United States issued, on the 19th of September, 1851, the following Instructions to cellectore and officers of the customs: "In view of the embarrasments existing at some of the princlpal ports, and the want of aniformity in the practice of assessing datiee upon merchandise invoiced in depreciated foreign currencles, it is deemed propor to estallish some uniform regulatlons on the sulject, for the future government of officers of the customs. The law requires invoices of all imported merchandise aubject to an ad valorem duty to be made out in the currency of the country or place where the importation is made. The batis of value upon whlch the duties are to be assessed is the true market value in the priacipal markets of the country at the period of exportation to the United States, exhibited in such foreign currency at its intrinsic value, and converted into money of the United States according to the rates of value at which sald currency may have been determined agreeably to law. Congress has fixed the value of some of the foreign curreacies at specific rates; but where the invoice cost of goxis, wares, or merchandise is exhlbited in a depreciated currency issued and circulated under the authority of aay foreign government, the I'resident of the Únited States is duly authorized by luw to cause to he established 'fit and proper regulations' for estinuating the duties on any such goods, wares, and merchandise. In all cases, therefore, where the forcign currency is depreciated, its value in money of the United States is to be ascertained in the mode preseribed by the circular instructions issued by the Department, by direction of the President, under the dates of the 14 th of May and the 16th of August, 1831, and the 16th of Oetober, 1832. Although the consular certificate, required by said instruetions, of the value in United States' money of any foreign depreciated currency is ordinarily to be received and taken as evidence of sueh value, yet it is not to te deemed conclusive in cases where facts or circumstances may exist, producing a rational belief that manifest errer attaches to such certificute. Where Congress has fixed the value In American money of any foreign curreney, it is to be understood that the value is to attach in all cases in estimating that duty; and, should any of the said currencles become depreclated, either by the issuc of government paper money or otherwise, the collectors neverthelens will make no alteration in the value in eatimating duties, without the previous authority of the Department, whleh authority will be promptly given in all cases, so soon as the pact of such depreciation is authentlcally brought to his knowledge. Such informatlon has been received as regards the Austrian thorin, whlch, until further instructions on the subject, the colleetors will consider as deprecisted enrreney, and levy the duty accordingly on invoices stated in it. The forelgn curreneles alluded to above, the value of which is fixed by various acts of Congress, are noted at foot, for your information and government.
"It frequently happens thit lnvoiees statod In the carrency of the country of shipment have expressed on the face of them, in the curroney of another eonntry, the amount for which bills of cxehunge may have been drawn in payment of the goode, or for other causes. In eases where beth currencies have a specie basis, any difference which may exist between the two amounts thus exhlbited is presimed to arise from the interest on the aight of the bill, or a regular difference of exchange between the two points; and where the currency of the country of shipment is depreciuted, a similar difference may exist between the apecie value of the foreign currency thus expressed on the face of the involee, and the consular certified specle value of the local depreeinted currency in which the Involee is atated. As the law providea that the dutles shall be eatimated on the apecie value of the
currency of the country whence the shlpment is made, that mode, as a general rule, will therefore be adopted; yet where the difference betweea the value of two currencies, expressed apon the face of the invoice, is so great as to excite a well-founded helief that either deception or error exists, the appraisers are required to investigate the facts, and if they ascertain that there has been error, either in the consular certifieate in giving the specle value of a depreciated currrency, or that otherwise the true specie value ln currency of the United States has not been correctly set forth, it will become their duty to correct said error by advancing the cost or value given in the invoice or on the entry, either in the price of the goods or the estimatod specie value of the depreciated currency."
Curriole (Lat. curriculum, a chariot), a carriage with two wheels, drawn by two horses alirenst, sad supported ly a pole connected with a bar across the horses' bueks.
Currying of Leather (Corroyer, French; Zu richten, German) is the art of dressing okins after they are tanned, for the purposes of the shoemaker, coach, and hurnessmaker, ete., or of giving them the necessary smoothness, lustre, color, and supplencss. The currier's shop has no resemblance to the tanacr's premises, having a quite different set of tools and manipulutions. Every kind of tanaed leather net intended for soles or such coarse purposes, is generally curried before belng delivered to the workmen whe fashion it, sueh as shoemakere, couchmakers, suddlers, etc. The chief operations of the currier are four: 1. Dipping the leather, which consists in moistening it with water, and beuting it with the mace, or a mallet, upon the hurdle. Ile next applies the cleasiers, both blunt and sharp, as well as the head-knife, to remeve or thin down all inequalities. After the leather is shaved, it is thrown once more iato water, and well scoured hy rublulug the graln eide with punice-stone, or a piece of elaty grit, whereby it purts with the bloem, a whitlish matter, derived from the ouk lark in the tan-pit. 2. Applying the pommel to glve the leather a granular appearance, and correspondeut flexibility. The leather is first folded with its graln side in contact, and rubbed strongly with the pommel, then rublicd simply upon its grain adde; whereby it becomes extrenely fiexible. 3. Seraping the leather. This makes it of uniform thiekness. The werkman holds the tool nearly perpendicular upen the leather, and forcitly scrapes the thick places with both his hands. 4. Dressing it ly the round-kuife. For this purpose he stretches the leather npon the wooden eylinder, lays hold of the pendent under edge, with the pincers attached to his girdle, and then with both hands upplies the edge of the knife to the surfuce of the leather, sluntingly from above downward, and thus pares off the cosrser fleshy parts of the skin. This operstion requirea great experience and dexterity; and when well performed, improves greatly the liok of the leather.

The hide or skin, being rendered flexitle and uniform, is conveyed to the shed or drying-house, where the greasy substances are applied, whilh is called dubbing (daublng) or stuffing. The all used for this purpose is prepared by boiling sheepwkini or doeskins in col oil. This application of grease is often made before the graining-boarl or prommel is employed. Hefarn waxiug, the leather is commonly colored by rubling it with a bruel dipped into a composition of oll and lampblack on the flesh side, till it he thoroughly hath; it Is then black-sized with a bruah or aponge, dried, tullowed with the proper eloth, and slleked upon the thesh with a broad, amooth lump of glass ; sized oguln with a sponge ; and when dry, again curried as ahove described. Currying leather on the hair or graln side, termed black on the grain, is the aame in the first eperation with that dressed on the flesh, till it is scoared.

Then th selution been rul urine is to make now stuf is, ruble on the g slicked w kles, and raised wi ling it to thorough ways. II nearly as grain.

Then the first black ls applied to lt while wet, by a solution of copperas put upn the grain, after this has been rubbed with a stone; a brush dipped in atale urine is next rubbed on, then an iron slicker is used to make the grain come out os fine as possible. It is now stuffed with oil. When dry, it is seasoned; that is, rublued over with a brush dipped in copperss-water, on the grain, till it be perfectly black. It is next slicked with a good grit-stone, to take out the wrinkles, and smooth the coarse grain. The grain is finally raised with the pommel or graining-board, by applying it to the leather in different directions. When thoroughly dry, it is grained again In two or three ways. Hides intended for covering coaches are shaved nearly ss thin as ahoe hides, and blacked upon the grain.

Curtains. Window-curtains are now made in great variety, both of materials and manufactare, the principal difference being $n s$ to the former, which conaist chiefly of 3-silk, wool, and cotton. Silk is employed in damasks and tabarets, mixed with wool, the former being a flowery pattern of silk on a woolen foundation, whilst the latter is a satin stripe arranged in the same way as regards the composing materials. A species of terry-velvet is also now used in which the two $m$ terials are blended, and which makes a rich and elegnnt curtair, this is made slso in wool without silk, and then called repp. When wool is used by itself, it then forms a broad-cloth suiteu to dining-rooms, or a damask, which is not so beantiful to the eye as the silk damesk, but still sufficiently so for common purposes, or else a morfen, either plain or watered, or a chatli, which is a thin trill material, printed with chintz patterns. Cotton is made into a plain article, without any thing but a mere weh and woof, which, when printed and glazed, is ealled chintz.

Customs are duties chnrged upon commoditles on their boing lmported into or exported from a country. They were collected upon merchandise in England, under Ethelred II., in 979. The king's claim to them hy grant of Parliament was established 3 Edward I., 1274. [This is questionslsle.] The customs were farmed to Mr. Thomas Stnith, for $£ 20,000$ for several years, in the reign of Elizabeth.-STowe. They were farmed by Charles II. for $£ 390,000$ in the year 1666. -Dayenant. The dutios collected in England were

The customs in Ireland were, in the year 1224, viz. on every snck of wool, 3d.; on every last of hides, 6d. ; and 2d. on every bnrrel of wine.-Annals of Dublin. Custom-houss oflcers, and oflicers of excise, were disqualified from voting for the election of nembers of Parliament, by statute 22 George III., 1782.

Customs duties seem to have existed in overy commereial country. The Athenians laid a tax of a fifth on the corn and other merchandise imported from foreign countrics, and also on several of the commodities exported from Attica. The portoria, or customs payabie on the commodities imported into, and exported from, the different porth in the Roman empire, formed a very ancient and important part of the public revenue. The rates at which they were charged were fluctuatiug and various, and little ta now known respecting them. Cicaro inform sus, thast the dutios on cern exported from the "orts of Sicily were, in his time, 5 per cent. Under the Imperial governinent, the anount of the portoria depended an much on the caprice of the prince as on the real exigences of the state. Though sometimes diminished, they were never entirely remttted, and were much more frequently $\ln$ creased. Under the Byzantine emperore, they were as high ns $12 \frac{1}{8}$ per cent.

Custome dutios exlated in England previous to the Conquest. They appear to have derived thelr name from having been immemorially or customarily charged on certain articles when conveyed across the principal ferries, bridges, etc., within the kingdom, and on these and other articles of native and foreign produce, When exported from or imported Int the kingdom. In 1206 the entire cuatoms revenue of England, including that derived from toils and fairs, amounted to only £4,958 73. $3 \frac{1}{2} \mathrm{~d}$. 1 It is not, therefore, troe, as has sometimea been stated, that the king's first claim to the customa was established In the reign of Edward I. But that able and politic prince, by rendering the levy of the old duties more effectual, and procuring the sanction of Parliament to the imposition of new duties, was the first who msde the customs revenue of any material importance. The dutiea were at first principally lald on wool, woolfels (shoepskins), and leather when exported. There were also extreordinary duties paid by aliens, which were denominated parva custuma, to distinguish them from the former, or magna custuma. The duties of tonnage and poundage, of which mention is so frequently msde in English history, were customs duties; the first being paid on wine by the tun, and the latter being an ad valoram duty of so mnch a pound on all other merchandise. When these duties were granted to the crown, they were denominated subsidies; and as the duty of poundage had continued for a lengthened period at the rate of 1 s . a pound, or 5 per cent., a subsidy came, in the language of the customs, to denote an ad ralorem duty of 5 per cent. The new subsidy granted in the reign of William III. was an addition of 5 per cent. to the daties on most imported commodities.-Treatise on Taxation, by J. R. McCulloch, 2 d ed., p. 834.

The various customs duties were collected, for the first time, in a hook of rates published in the reign of Charles I. ; a new book of rates being again poblished in the reign of George I. But, exclusive of the duties entered in these two books, many more had heen imposed at different timea; so that the accumulation of the duties, and the complicated regulations to which they gave rise, were productive of the greatest embarrassment. The evll was increased by the careless manner in which new duties were added to the old, a par centage being sometimea added to the original tax; while at other times the commodity was estimated by a new standard of hulk, weight, number, or value, and charged with an sdditional impost, without any reference to the duties formerly Imposed. The confusion arising from these sources was still further angmented by the epecial appropriation of each of the duties, and the consequent necessity of a separate calculation for ench. The intricacy and confusion inseparable from auch a state of things proved a serious injury to commerce, and led to many frauds and nbuses.
Customs duties, like all duties on particular commodities, though advanced in the first instance by the merchant, are ultimately paid by thoae by whom they sre consumed. When a government laya a duty on the foreign commodlties which enter its ports, the daty falls entirely on such of its own subjects as purchase these commodities; for the foreigners would cease supplying its market with them, if they did not get the full price of the commodities, exclusive of the tax; and, for the same reason, when a government lays a duty on the commolities which its suhjects are about tu export, the duty does not fall on them, but on the foreigners by whom they are bought. If, therefore, it were posaible for a country to ralae a sufficient reveune by laying duties on exported commodities, euch revenue would be wholly derived from others, and it would be totally relieved from the hurden of taxation, except in so far as duties nilght be imposed by foreigners on the goods it impoits from them. Care, however, must be taken, in imposing dutios on exportation, nct
to lay thom on commodities that may be produced at the same, or nearly the asme, cost by foreigners; for the effect of the duty would then le to make the market be supplied ly others, and to put an entire atop to their exportation. Hut in the event of a country posseaslag any decided natural or acquired advantage in the production of any sort of commodities, a duty on their exportation would seem to le the most unexceptionable of all taxes. If the Chinese chose to act on this principle, and had the power, they might derive a considerable reveaue frem a duty on exported teas, Which would fall entirely on the linglish and other foreigners who buy them. The coal and tin, and perhaps, aleo, some of the manufactured gooda produced in this country, seem to be in this predicament. The revenue derived from the customs duties in 1590 , in the reign of Elizabeth, amounted to no more than $£ 50,000$. In 1618, it had increased to $£ 148,075$; of which no loss than $£ 109,572$ were collected in london. In 1660, at the Restoration, the customs produced £421,582; and at the Revolution, in 1688 , they produced £f81,987. During the reigns of William $1 I I$. and Anne, the customs revenue was considerably augmented, the nett paymente into the exchequer in 1712, being 21,315,423. During the war terminated by the peace of Paris in 1763, the nett produce of the customs revenue of Great $1 \mathrm{Br}^{*}$ smounted to nearly $£ 2,000$,000 . In $1 \mathbf{1 7 9 2}$, it am, ated to $\mathbf{£ 4 , 4 0 7 , 0 0 0 \text { . In } 1 8 1 5 , ~}$ at the close of the war, it amounted to $£ 11,360,000$. See Great Britain. See Tariff, United States.

Consular officers are instructed that the following valuea have been established by the laws of the United States for certain foreign currencies, viz.: dollars of Mexico, Peru, Chili, and Central America, $\$ 1$; dollar, specie, of Denmark, $\$ 105$; dollar, rix, or thaler, of Prussia, and the Northorn States of Germany, 69 cts. ; dollar, rix, of Bremen, 784 cts. ; dollar, specie, of Sweden and Norway, \$1 0t; ducat of Nsples, 80 cts.; franc of France and Belgium, 18 6-10 cts. ; florin of Netherlands, 40 cts. ; florin of Austria, $48 \frac{1}{8}$ cts. ; florin of Southern States of Germany, 40 cts. ; guilder of Netherlands, 40 cts. ; lira of the Lombardo Venetian Kingdom, 16 cents; lira of Tuscad:- 16 cents; lira of Sardinia, 18 6-10cts.; livre tournolse of France, $18 \frac{1}{3}$ cts. ; livre of Leghorn, 16 cts.; mifrea of Portugal, $\$ 112$; milrea of Azorea, 83 z cts. ; mare banco of Ilamburg, 35 cta. ; ounce of Sicily, . 240 ; pound sterling of Grest Britain, 4484 ; pound sterling of British provipces of Nova Scotia, Now Brunswick, Newfouulland, and Canada, 84; pagoda of India, 184 ; real vellon of Spuin, 5 ets.; renl plate of Spain, 10 cts.; ruhle, silver, of Russin, 75 cts.; rupee, company, $44 \frac{1}{1}$ cts.; rupee of British India, $44 \frac{1}{1}$ ets. ; tael of China, 4148.

Invoices of merchandise made out in the depreciated currencies of Austria, Chile, Bolivia, Peru, Porto Rico, and Nova Scotia, with certificates of United States' consuls annexed, will he received by the collectors of the Inited States.

The repreciated pound sterling of Nova Scotia will be taken, in computation at the custom-house of dutles, In the case of involces of merchandise from that province made out in that depreciated currency, at \&3 84, as compared with the silver curreucy of the United States, provided such depreciathon, at thd date of exportation, is certified by the United States' consul at the port of shlpument.

The value of the Austrian silver florin is fixed by the laws of the United States, and the Austrian paper florin is usually depreciated in comparison with it. Assuming it to be, for example, depreciated 38 per cent., the computation will be made ly collectors liy proportion, to $w$ ue $138: 100$, so ts the muount of paper florius stated in the involee to the value in silver tlorins. Of course the consular certificate, showing tho rate of depreciatlon, must le produced in such caees. $\rightarrow$ See contra, AuT, Hib. 185\%.

cents, United States' currency, and no consular certificate will be requ* 3d, unless the currency should be depreciated. All former acts anthorizing the currency of foreign gold or silver coins, and declaring the same a legal tender in payment of debts, are hereby repealed; but it shall be the duty of the director of the mint to cause assays to be made, from time to time, of such foreign coias as may be known to our commerce, to determine their sverage weight, fineness, and value, and to embrace in his annual report a statement of the results therefor.
The certlficate of the United States' consul, showing the value of the currency of the conntry from which the merchandise is imported, and in which the invoice is made out, in United States' or Spanish silver dollars, must be required in every case in which the value of such forelgn currency is not fixed by the laws of the United States. And in case the foreign currency in which the invoiee is made out, whether its value is fixed ly the laws of the United States or not, is deprecinted, the certificate of the United States' consul, stating the rate of depreciation, must be produced on the entry, and the officers of the customs are governed by such certificate in computing the foreign market valae of the merchandiae.
Customs Duties consist for the most part of taxes levied upon goods, and produce brought for consumption frem foreign countries; such duties are sometimes collected upon exports made to forelgn countries, and upon goods and produce passing from one port to another in the same country.

The carliest statute passed in England, whereby tha crown was authorized to levy customs duties, was the 8 d of Edward I. The mode long employed in the collection of these duties, was to affix a certain rate or ralue upon each kind or article of merchandise, and to grant what was called a subsidy upon these rates. This sabsidy was generally 1 shilling of duty for every 20 shitlings of value assigned in the book of rates. The early sets which grant these dutios speak of them as subaldies of tonnage and poundage. The worl tonnage was applied to a specitic duty clarged on the exportation of each ton of beer; and the w'sri poundage was applied to other articles valued as already explained.
The first " hook of ratos agreed njon by the House of Commens" is believed to he that compiled by a committee in 1642, during the reign of Charles I., ind pullished under the anthority of the House by Lawrence Hlacklock. The next hook of rates of which wo have any record, was published by order of the IIouso of Commons, In 1660, the year of the restoration of Charles II.-Nut. Cyclu. See Hunr's M. M., v. 145 (J. llowhing), vi. 9 (C. Raguet), ix. 448 (C. C. Wimtlaksey), iv. (G. Tucken), xiv, 456 (by C. C. Jewftr). See also Encyc. Am., Art. Tares.
Custom-house, an othce established by law in maritime cities or scaports, for the receipt and managenent of the customs and duties imposed on goods imported or experted.
Cuatoms of Merchants. The law merehant is a pecultar system which prevailed throughont the whole of the Anglo-Saxon times; it was especinlly recognized in the time of Edwarl III.; *hen the staple wss ordained, a mayor was to bo chosen in each town, skilled in the law morchant to do right to every man according to that law. The modern law merchant is composed of threo distinct elements, viz., the customs of merehunts, the orilnunces of foreign statos, and the statute law-as art precedes srience, so customs precede law. long aro these customs practiced before they are committerl to writing. llut though not written or declared by the legialative power, they aequire all the authority of law, and are gradually engrafted upon the comnen law of the country. The customs of merchants are part of the law. Judicial determinations settle what is the custoin of merchants, and they becomo tho lex mercatoria as to the different
questlons. In ordor that a custom he binding, it must be either the usage of the whole mercantile world, or of a particular trade universally known as such. A usage of a particular place, or of a particular class of persons, would not be binding on other persons unless these were acquainted with those usages und adopted them. In all coses, however, no castom can be aet against an express statute law. Among the most important customs among merchants are the establishment of boards of trade, the settlement of disputes by arbitrations, and the binding force of the decision of a referee. See Levi's Manual of Mercantile Law.

Cutlass, a short sword used by seamen. The art of fencing with it is i:ferent from that with the small sword or broad aword. A guard over the hand is an advantage. It is, if well anderstood, a very effectual weapon In close contest ; on account of its shortness, it can be handled enoily, and yet it is long enough to irotect a akillful swordsman.

Cutlery (Fr. coutellerie; Lat. culter, a knife), generally speaking, includes all cutting tools made of steel. Various countrios and cities have at different periods excelled in the manufacture of some particular article, as Damascus for a besutiful sword blade, which has hitherto baflled all attempts at imitation. If this blade is mado, ns is commonly supposed, by welding together extremely fine wires of iren, steel, and gold, laid altomately on each other, the dexterity required is such as must astonish the most active and experienced worknen of other countries. The peculiar wave, usually called the water, so universally admired, is eflected by the application of a weak acid to the poliehed surface of iron und steel. At Damascus, sulphate of alumine is used; but any dilute acid seems to answer the purpose. The cutlery of England is deservedly held in high estimation in every part of the civilized world. The finer articles, as razors, penknives, scissors, and surgical instruments, are made of cast ateel, that is, steel purified and equalized by fusion. Dexterity snd nice attention on the part of the workman to a varicty of circumstances, as the quality of the steel, nature of the fuel, necurucy in the process of lardening and tempering, and many other minor considerations, arg essential to the production of a good cutting instrument. For table-knives, and all cutlery of that description, shear-steel is generally used; the tang and shoulder of the table knife and fork are iron, united to the blade by welding. The celebrated Indian steel called wootz is not used in ths manufacture of British cutlery.

The principal seat of the cutlery trade of England is at Sheffield, where nll kinds of table cutlery, razors, peuknives, scissors, aurgeons' lnatruments, and every variety of cutting iastruments, are manufactured. There are also some small manufactures of similar articles in London; but much the greater proportion of the cutlery sold as London-made, is actunlly manufactured in Sheffild, tilthough bearing the name of London manufucturers. Sheffield cutlery has deservedly ohtained a high degree of reputation in almost every part of the eivilized world ; and it is of the greatest inportance to the commercial interests of the country that this high character should be maintained. But here it must not he omitted to be mentioned, that there is also an extensive manufacture of an inferior description of cutlery, principally censisting of table knives and forks, scissors, and pocket-knives, which are professedly made for export to the lese civilized portions of the ghobe, but also retailed in large quantities in this country. It is manufactured by casting from a species of pig-iron. This iron is, from the superabundance of its carbon, highly susceptible of liquidity, and readlly easts into the required form. In this state the cast-iron cutlery is extrumely liard, nud as brittle as glass; but it is reduced from this hardnces by decomposition-being suljected to a strong and long-continued liro in close vessels, in contact with
iron ore, oxyd of iron, or any auhatance containing oxygen, with which the superabundant carbon combines, and flics off in the state of carbonic acid gas. This cast-iron cutlery is, when finished, not always distinguishable in appearance from that made at the forge, and can, of course, be afforded at a much lower price. This very fusible iron may be applied to many purposes. It le hardly necessary to add, that it is quite unfit for any description of edge instrnment.

These observations apply generally to every deacription of knife nsed in eurgery; but the nature of each particular operation should not be considered, in judging of the requisite degree of strength or delleacy of edge. Next in importance to the knives are the saws used in surgery. All of these mist be of the best apring temper, which, for the cast-steel blads, is about $570^{\circ}$ of Fshrenheit, and for one of Indian steel $600^{\circ}$, or quite the boiling point of mercury. Of another class of instruments, namely, those denominated blunt, It will he sufficient to observe, that what is known by the name of shear-steel is best adapted for the purpose. Case-hariened iron hae been most improperly used, this hardening being very enperficial. It is, in fact, converting the surface only into steel, by heating it to redness, in a close vessel, in contact with animal charcoal, such as charred bone, leather, or horn, snd quenching it when red-hat in a cold fluid. Iron thus treated, will take a beautiful polish; but, excopt for ornamental purposes, it ought never to be employed. Some imstruments are necessarily made of goid or silyer; us catheters, and other tubes and probes. When for these ductility is required, the metals should be unalloyed; the extra expense of which, will be more than compensated by the convenience of giving to the instruments, in all cases, the desired curve nud form.
The handles of instruments, together with all ornamental parts, must in a graat measure depend on the taste and choice of the purchaser. It would be well, however, to svoid such materials sa are known to produce chemical sction when in contact with polished steel. I yory, muther-of-peari, and eiony are much nsed; but the fine walnut-tree, such as the londen gunmakers employ, is perbaps of all the woods the best for the purpose. Sandal-wood answers very well, although it by no means deaerves all the credit which has been given to it as a preservative of steel from rust. The instrument-maker whe wishes to axcel will do well to avail himself of every opportanity of witnessing the operative part of surgery ; that he may observe how far the instrument is mechanicaliy and physically adapted to its purpose, and, if necessary, be the better able to make the requisite alteration.-E. B.

The vaius of hardwares and cutlery exported from Great liritain in 1855, was $£ 2,960,391$. In the New England States the manufacture of cutlery is rapidly increaking. In Massachusetts about $\$ 400,000$ is invested in this branch, with an annual product of about 8500,000 .

Quietly, but rapidly, we are day by day gaining on the old world, and the time is not far distant when it will be discovered that the majority of our manufactures are actualiy superior to those of Europe. As an lllustration of this, we will venture to assert that there are very few persons, not concerned in the business, who are aware of the degree of excelience which the manufacture of cutlery has attained in the United States, or that, if it were generaliy known and encouragel, we should in all probability be entirely selfdependent as regards its production. On this suljeect, Fleischmann, whose work on the "Branches of Industry in the United States" has contributed more than any outher book to enighten Germany as to our country, remarks as follows:
"The manufacturers of cutiery in the United States have far aurpassed those of the old world in the manufacture of tools, and that not merely In the excellence of the metal used, but eapeciaily in the practical utiiity
of their patterns, and In the remarkable degree of finish of tbelr work."

It is a somewhat remarkahle fact that American hardware is overy year developing in its shapes a practical economy of material and a straight-forward adaptation to the end in view which are unknown to the greater part of Europe. The American lalorer or mechanic, it is well known, even where not gifted with a greater degree of physical ability, will stili, sa a ruie, turn ont more work in a day than a foreigner under the same circumstances. With euch men, who go directly at thair work and stick to it, there is no play and no trifling with labor. A result of this is shown in the fact that the American ax, which, in its well. known form, is entirely a native American pattern, is far more practically useful than the misersble European ax which it hes supplanted. And not in axes alone, but in many other implements there has been a marked progreas, and a gradual, though unnoticed, communication of practical patterns to English manufactories. In our factories, which are themselves very generaliy proofs of the same principle of economy and of keeping directly at the object proposed, there is sctually more of the first quality English steei used, than in England itself. Of Hoop L, the best quality of Eaglish steel, thare is annually ten times as much used as in England, though that country manufactures about fifty times as much cutlery as we do.
Could our American mechanics receive the credit so justly their due, for the improvements which they have gradually introduced into the shape of carpenters' tools, and couid the world be made aware of the degree to which of late years the Engiish trade has been indebted to them for these improvements, we will venture to atate that there are few who would not be amazed. The European-especially the continentaisuffers in this respect under a tyranny of "old customs," which no Yankee mechanic would beiieve. If we look through Paris, if we examine the patternplatas published, we are amazed at the luxuriance of beautiful and practical forms annually produced, which glitter in shop windows, or are displayed at exhibitions. But go into the country, and we find tha same clumsy, unpructical old Impiements which were used three centuries ago. The seed falls on stony ground.

At the present lay, American cutlery is extensivelyimitated in Germany, even to the marks and names of our manufacturers. This is also dons by English goods, but the complimentary fraud has been of late yeara greatly on the increase as regards our own. We will not assert that there is net, especially in lingland, a vast amount of inventiveness, nor that a corresponding degree of improvements has not been made. llut a practical invention is less likely to die in the birth in America, and we conndently assert, without fear of refutation, that if any one wiil etudy the history of cutlary patterns adepted for the last 50 years, including all the aliied branches of manufacture, he will find that by far the greater proportion of practical improvements have been of American origin.-llust's Merchants' Magazine.

Cutter. A vessel with one mast and a bowsprit, of considorable lreadth in proportion to lier length. The distinction between a cutter and other vessels of one mast, which are called sloops, is, that in the cutter the jib has no stay to aupport it.

Cutters, Revenue. These vessels are usually about 100 or 150 tons, built as fast sailers, to aid the revenue officers. The captains and lieutenants of revenue cutters of the United States, are appointed by the Prealdent. Thair reports are made to the Treasury Department ; the veasels oubject to the diraction of the coilector of the port. Their officers and seamen are piaced upon the navy pension list, when disabled. Congress has recentiy authorized the construction or purchase of ateam revenue cuttera, which will furnish muterlai aid to the government officers in extraordinary casce.

A werk containing definitlons or accounts of the principal suhjects in one or all departmenta of learaing, art, or aclence. Ita arrangement may be either according to divisiens into the varions aciences, etc., or the subjects may be arranged and treated in alphsbetical order. The Encyclopedie Frangaise, or Dictionnaire Encyclopedlique, and the Eincyolopredia Britannica, have been the most celebrated works of this species; but the earlieat appears to be the Lexicon Technicum of IIarris, published in 1706. The great French work, the Eincyclopedie Methodique, consists, not of ene, but of a series of encyclepedias or dictionaries.

Cypress, a forest tree, of which there are many varieties, the specles denominated the overgreen cypress (Cupressus sempervirens) and the white cedar (Cupressus Thyoides) being the most celebrated. The cypress is indigenoue to the southern parts of Europe, to several parts of Asla, and to America. It grows to s great size, and is a mast valuable species of timber. It is never attacked by worms; and exceeds all other trees, even the cedar, in durability. Hence the Athenians, when desirous to preserve the remains of their heroes and other groat men, had them inclosed in cypress coffins; and hence, also, the external covering of the Egyptian mummies is made of the same enduriag material. Tho cypress is anld to live to a great age; and this circumstance, combined with its thlek, dark, green foliage, has made it be regarded as the emblem of death and the grave. In his Geography and Mistory of the Western States, Mr. Timothy Flint has given the following account of the cypress-trees found in the southern parts of the valley of the Missisaippl: "These noble trees rear their atruight columns from a large cone-shaped buttress, whose circumference at the ground is nerhaps 3 times that of the regular shaft of the tree. This cone rises from 6 te 10 feet, with a regular and sharp taper, and from the apex of the cuisa towers the perpeadicular column, with little taper after it has left the cone, from 60 to 80 feet, clear shaft. Very near the top it begins to throw out multitudes of horizental lirunches, which interlace with those of the adjoining trees, and, when bare of loaves, have an alr of desolation and death, more easily felt than described. In the season of vegetation the leaves are short, tine, and of a verdure so deep as almost to seem brown, giving an indescribnble air of funereal 80 lemnity to this singulur tree. A cyprese forest, when viewed from the adjacent hills, with its numberless interlaced arms covered with this dark-brown foliage, has the aspect of a seuffolding of verdure in the air. It grows, toc, in deep and eickly ewampa, the haunts of fover, musquitoes, meccasin enakes, alligators, and all loathsome and ferocious animale, that congregate far from the abodes of man, and seem to make common cause with nature against him. The cypress loves the deepest, must gloomy, inaccessible swamps; and eouth of $33^{\circ}$ is generally found coverec with sable festoons of long mose, hanging, like shrouds of mourning wreaths, almost to the ground. It eeems to dourish best when water covers its roots for half the year. Unpromising as are the places and circumstances of its growth, no tree of the country where it Is found is so extensively usiful. It is free from knote, it is easily wrought, nud makes excellent planks, shingles, and timber of all sorts. It is very durable, and incomparably the most valuable tree in the southent country of thls valley." Of whatever materiuls the luilding is constracted, the roof is unlversally eovered with cypress shingles, which, if made of trees felled in the winter, last forty years. Cypress bourds are preferred to those of pline for the laside of brick houses, and for window-sashes, and the panels of doors exposed to the weather ; cabinet-makers also choose it
proper for the masta and sides of vessels, and wherever it grews it is chosen for canees, whlch are fashioned frem a single trunk, and are often 30 feet long and 5 feet wide, light, solid, and more durable than those of any other tree. It makes the best pipes to cenvey water under the ground; especially the black variety, which is mcie resinous and solid.-Browne's Trees of America.

Cyprus (Kybris), an 1sland in the N. E. cerner of the Levant, lylng at about equal distances from the shores of Cilicia and Phonicia. Its extreme length from the promontory of Dinaretum to that of Acamas is about 140 miles; its extreme breadth, from the premontory of Cronmyon to that of Curias, about 70 miles. The area is roughly eatimated at about 4,500 English equare miles. The greater part of the island is occupied by the central ridge and spurs of the Stavro-Vuno and Santo Croce mountaine (the nncient Olympus). The loftiest peaks of this range attain a height of from 8,000 to 10,000 feet above the sea. The nerthern slopes are rocky and bare, but on the side of the south they are well wooded and highly picturesque, and inclose, in various parts of their course, valleys of unrivaled fertility. Considerable part of the wealth of ancient Cyprus arose from its copper mines, the most important of which were those of Tamasus in the centre of the island, Soll on the nerth coast, and Amathus and Cyrium on the south coast. In these mines gold and silver were also found. The precioue stones of Cyprue were also highly valuad. The chtef of these were the enuerald, agate, maluchite, jasper, opal, and the minerals asbestoe and rock crystal.

The first eettlers in Cyprus appear to have been of Phoenician origin. Under Augustus it became an imperial province, and was governed by a preconsul, with n staff of inferior officers. Befure the close of the 1st century of the Christian ern, the Jewish population of the islund bad greatly increased, and in the reign of IIadrian, is said to have risen in rebellion, and slain 200,000 of the other inhabitants. In the 7th century, Cyprus fell into the hands of the Saracens; and in the 0th, it owned the supremacy of the "good" Haroun Al Raschid. At the close of the 12 th century, it was conquered by Richard Coour de Lion, who made it over first to the Kinghts of the Temple, and ultimately to Guy of Lusignan, titular king of Jeruaalem. For three centuries the laland remained in the fumily of Lusignan, till, in 1473, it became an appendage of the Venetiun repullic. Cyprus was retained by the Venetians till in 1571 it was overrun by an army of Turkish invaders, who stormed Lefkosia and Finmagosta, and made a general massacre of the inhabitants. Since that date the islund has remained in possession of the Turks, and now forms a pashalic in the Eyalet of Djizairs. Under the Turkish rule the material prosperity of Cyprus has greatly declined. In the times of the Venetiun supremacy, the island muintained a populution of $1,000,000$; its present population is only about 150,000, of whom the great minjority are Greeks. Many parts of the island, formerly heulthy and fertile, aro now, from nalaria and other cuases, barren and uninhubitable. Its trade was at one time valuable and important ; now the value of its annual imports docs not exceed $£ 26,000$; of its exprorts, about $£ 60$, 000. Besides corn, of which it produces about 120,000 quarters nnuually, Cyprus yiedds in considerablo quantities cotton, wine, varlous kinds of fruit, opium, und madder; while the mountain districts furnish ollves, nines, and many species of valuable timber. Cia tho island ure found great quantities of tho $F \cdot r$ rula greca, which the Cypriote upplies to a great variety of domsatio purposes. This is the plant whose uses are feigned by the poets to have been taught to mortals of old by l'rometheus.

Daooa, the capital of an extenslve and rich district in the eastern quarter of the province of Bengal, a large city, and for 80 yenra the capltal of Bengal, of which it is still the third city in point of extent and population. It is situated beyond the principal stream of the Ganges, on the northern bank of a very large branch of that river, called the Boor Gungn, or old Ganges, at the distance of a hundred miles from the mouth of the Ganges. Its position is admirably well adapted for Inland trade, as the river which flows past It communicates with all the other Inland navigations by a direct course. The present town covers a great deal of ground, extending four miles along the bank of the river, though it is not of proportional hreadth. The houses of the wealthy are built of brick, hut there are many thatched houses, with very narrow and crooked atreets; the bazaars are only tiled or thatched; and as every vacant spot is covered with trees, the town looks from a distance like agrove. Owing to the effects of British competition, the manufactures of Dacca are at this time scarcely deserving of notice; hut here were formerly manufactured the most beantiful muslins, which were exported to all quarters of the world, and which had long been famed for their delicacy and beuuty. The spinning of the thread was carried on with wonderful nicety. The operation was performed with the fiagers on $n$ fine steel spindle liy young women, who could only work during the early part of the morning while the dew was on the ground : for such was the extreme tenuity of the fibre that it would not bear manipulation after the sun had risen. Such was the skill of the darners that they could remove an entire thread from a piece of muslin, and replace it by one of a finer texture. From their wonderful fineness these muslins were called Abrawan, or "flowing water," and Shabnam, "evening dew."E. 1 .

Daguerreotype. The name given to $n$ process invented by M. Daguerre of Paris, in 1839 , by which perfect fac-similes of objects are transferred upon thin copper plates with plated silver. The images are proluced by the action of light upon the iodine, through the focus of the camera obscura. An apparatus somewhat kladred in design, was in contemplation about the same time ber M. Niepcé, and nbout five years previously hy Heary Fox Talbot of Iondon; the original ldea, however, is traceable as far back as the days of Roger Hacon. By meana of the Talbotype, a recent improvement upon the above process, pictures in colors are produced both on paper and plates. So important a discovery in the fine nrts was the daguerreotype deemed by the Freneh government, tiat it awarded to its inventor a life pension of 6000 francs.-IIaynn. See Silmman's Jommel of Science, xxxvii., p. 6! ; xl., p. 137 ; xliii., p. 185 ; Forrign (Quarterly Rev., xxiii., p. 218; Westminster Rev., xxxlv., p. 434.

In 1802 Mr. Thomas Wedgewood and Sir llumphrey Davy succeeded in forming pictures of oljects laid on paper prepared with nitrate of silver, and in taking profiles (silhouettes) by menas of shalews. They proposed to obtain similar effect, ly means of the camera obscura, but their paper was not sufficiently sensitive. The effectual bar to thelr proceedloge was, however, this: that they could discover no means of firing the shadones which they hal olbtsined, or preventlog the whole surface of the pnper from leing gradually blackened by exposure to light.

In 1814 J . Nicerilohe Niepce, a retlred proprictor at Chalons sur Saine, entered into a similar inguiry, but by methods quite different. He employed the solar effect upon resinous lodies, and some, at least, of his pictures wero executed upon plates of pewter or
of rotted allver. The;- were mostly coples of engrav. Ings, and the light parts norresponded to the lights of the originals. He, however, at length succeeded in fixing impressions of views in the enmera obscura, though in an imperfect manner, and after very long exposire. The pietures thus ohtained hal this in common with more perfect precessen, that the luminous impression was first brought into view by a chemlcal process subsequent to exposure In the camera. In 1825 Nicephoro Nicpee becnmo azsociated with Daguerre, who had previously heen engaged in the same research; they agreed to communicate the reatles of their eeveral experiments. The result, as is wail known, was the invention of the Daguehreotype, not improperly called after Daguerre, who scems really to have worked it out almost entirely for himself after the death of Niepce in 1833; while so patient nad determined wns Daguerre in keeping his secret till breught to perfection, that he did not even show his results nntil early in 1839, when tho numerous specimens lie had to exhibit rivaled in delicacy any thing that the art has siace produced.-Ency. Brit. Pre. Dissertation, by Fonnes.

Dahlia. This benutiful flower was imported from China, of whlch it is a nutive, early In the present century, nnd amateurs in flowers have annually laid out hundreds of potuds in Englani, and thousands of francs in France, in the purchase of it. The Swedigh lotanist, Professor Dahl, first cultivated and made it known. It soon nttracted notlee in England, where, from the leanty of its form and variety of color, it becament once an especial favorite. In 1815, thout 2 months after the battle of Waterloo, it was introluced into France, and the celelrated florist, Andre Thonine, suggested various practical improvements in its manngement. The botanist, Georgi, land shartly before this introduced it at St. Petersburg ; and bence it is, that to this day the dahlia is known throughout Germany under the name of Genrgina.-Hayon.

Dairy. Milk, either in its natural state, or in the form of butter and cheese, is nn nrticle of dict so wholesome and so palatable, that the health and comfort of peopie, especially such of them as dwell in cities, lepend much upon their having a pure and plentiful supply of it at all seasons. Dainy Mavagsment, which includes every thing about the production and treatment of milk, is consequently a very important branch of busbunilry, and one in which every body fecls interested. The physical conditions of the different countries of the worlid have determined in each case the particulnr milk-y-lelding animal most suitable to be there used for dalry purposes. Tho Laplander obtains his supplies of milk from his reindeer, the roving Tartar from his mares, and the Bedouin of the desert from his camels. In the tempersto regions of the earth many pastoral tribes subsist mainly upon the milk of their sheep. In some rocky regions the goat is invaluable for this purpose ; and the buffalo is equally so amid the swamps and jungles of tropical climates. The milking of ewes was onee a common practice in Great Britaln; luut it has falten into disuse hecause of its hurtful effects upon the flock. A few milch nases nnd gonts nre kept for the benefit of infants or invalids; but with these exceptions the cow is the only naimal now used for dairy parposes in this country and Europe.

Butter is inade either from cream only, or'by chuming the whole milk and cream together. The best butter is obsained from the cream which rises during the first 12 hours after milking, nud the next best by churning the whole mik. In the former case the new milk, after being earefully strained, is poured into

shallow vessels of glazed sarthenware, glass, tinned iron, wood, lead, or zine, of which the 8 firet-named sorts are the best. The wooden vessels are objectionable from the difficulty of cleaning them thoroughly; and the last two from the noxious sait which ia prodnced by the sction of the seid of the milk on the metal. When it is intended to extract as nearly the wholo of the butter from the milk as is practicable, the 18t skimuing takes place at the end of 24 hours, and is foilowed up by oae or more akimmings at further intervals. The cream is stored in jars, which should be kept in a piace separste from the milk-room, thut the milk in the coolers may not be prematurely acidulaterl by the proximity of the sour crean. The latter is either stirrad repestediy, or poured from one vessel to nather, to prevent the formation of a tough coat apon it before enough is accumulated for churning. In iarge dairies it is usual to churn daily. Three days is as iong as the oream can ordinarily be kept with safety to the quality of the butter. When a cow has recentiy esived, her milk is comparatively rich in butter and poor in curd ${ }^{\mid}$but soon the relative proportions of these constituents change places, the cream diminishing and the milk becoming thicker. A very sensibis change in the quality also usually takes place when a cow again becomes pregnant. In not a few cases the cream is so affected by this circumstance, that double or treble the length of time is required to chura it thst sufficed before, and the butter is at the same time of inferior quality. If cows are flurried and heated, either by gadding in the pasture, or by being overdriven in bringing them home for milking, their miik becomes peculiarly itable to corrupt, the yield of butter is sensibly lessened, and its quality is impaired. The success of the process of churning depends much on the temperature of the cream being nicely regulated, A mean temperature of $60^{\circ}$ Fahrenheit seems to be the best. Ths temperature of the cresm usualiy nises about $10^{\circ}$ during the process of churning. About $55^{\circ}$ is therefore the desirabie starting-point. Advantage is derived from rinsing the churn with cold water in summer and with warm water in winter. The addition to the cream of small quantities of cold or hot water, as the cass requires, is also found heveficial. Box or barrel charms are preforred when the crosm oniy is churned, the formor being best adapted for smail dairies, and the latter for large ones.-E. B. See Butter and Cheese.

Damaged Groods, in the language of the customs, afe goods, subject to duties, that have received some injury either in the voyage home or in the bonded warehouses.
Damar, a kind of indurated pitch or turpentine, oxnding spontaneously from various trees indigenous to most of the Indian islands. Different trees produce different species of resin, which are designated according to their color and consistence. "One is eslied Damar-butu in Malsy, or Damar-selo in Javanese, which means hard or stoney rosin; and another in common use, Damer-Puteh, or white rosin, which is softer. The trees which produce the damar yield it in amazing quantity, and generaily without the necesaity of making incisions. It exudes through the bark; and is citier found adisering to the trunk or branches in large iumps, or in masses on the ground under the trees. As theso often grow near the seaside, or on tise banks of rivers, the damar is frequently tionted away, and collected in distant places as drift. It is exported in large quantities to Bengal and China; cond is used for ail the purposea to which we apply pitch, hut principaily in paying the bottoms of ships. By a previous arrangemert, almost any quantity may be procured at Bomeo, at the low rate of $\frac{1}{8}$ doliar per pieul."-CanwFokb, East. Archip., v. i., p. 455, v. iii., p. 420.
Damasous. This city was in being in the time of Abraham.-Gen. xiv. It is, consequently, one of the most ancient in the world. From the Assyrians,

Damascus passed to the Persians, and from them to the Greeke nnder Alezander; and afterward to the Romans, about 70 n.c. It was taken by the Saracens A.s. 683 ; by the Turks in 1006 ; and was dastroyed hy Tameriane in 1400. It was in a journey to this place that the epostie Panl was miraculously converted to the Christian faith, and here he began to presch the gospel, abont A.D. 50 . Damsscus is now the eapital of a Turkish pachalic.-Haydn. Damascus is the scat of an extensivs trade both with India and with Europs. The productions of India, consisting ehiofly of spices, cotton manufactures, coarse and fine muslins, and gold stuffs, are in great demand, and bring high prices. They are lirought frem India by the Perslan Gnlf, Bassora, Bagdad, snd Aleppo. The manufactaree of England are much suught sfter, and hell in very high esteem, particulariy light woolen elothe of gay colors, printed cottons and chintzee, and silk snd cotton shawls made in imitation of those of Cashmere; also nsedles, pins, knives, sciasors, and flne hardware, as well as chins and earthenware, whether English or Indian. These goods being generally imported through Saida, Beirût, and Tripoli, ars sold at very high prices. Iron, lead, tin, cochineal, sugar, and other European articies, are also imported through the same channel. Wearing apparel for fashionable persons of both sexes at Danaseus, and clothes that have been worn, are brought from Constantinople; and being distributed all over the country, are frequently the means of spreading the contagion of the plague. Among the various manufaetures to be found in the bazaars are superb caparisons for horsee, of which the Turks, as well as all the other eastern natims, are extremely fond. These are inade in European Tarkey ; and a number of fine bridies, martingsles, and silver and ombossed breast-pleces, come also from Persia. The firearms are chiefly of French and Germsn manufacture, being prepared in sn ornsmental style expressly for this markst. The sabre blades are almost all of the old Persian or Damascus manufacture. The nrt of making them, however, is no longer known or practiced in this city; so that they grow daily more valuabie, as no modern sword enn compare with them in temper and quality. The silk seen in the bazsars of Damascus is principally of Chiness and Indian manufacture; the furs come from Russia, Georgia, Circassia, and Armenia; the velvet from Italy; copper from Asia Minor; the manufactures of Britain through Smyrna; and various other articies of an inferior kind from Germany and France. There sre fow msnufnctures in Damascus; and theso consist chiefly of siik atuffs, plain, colored, and embroidered with gold ; fabries of plain cotton, and cotton and silk mixed, all for home consumption, and mostly of broad, striped, or wavy patterns, for the caftans of the Turkish dress.

Commerce, as in all other places in the East, is carried on by means of caravans, of which the principal is that which goes with the annual pilgrimage $t_{0}$ Mecca. It is conducted by the pasi s , who receives the standard of the I'rophet from the governor of the castla, and gives a solemn pledge for its restoration. This expedition unites commereial with reiigious objects. A caravan accompanied by a numerous train of armed men goes thrice a yenr to Bagdad, tho journey occupying 30 days; that to Aleppo travels twice or thrics a month. Besides theso, many other caravans go to different ports of Syrin, Damascus being a grent rendezvous and emporium of trade. Provisions and fruits of all kinds are abundant; also ice and snow, which may always be obtained from the noighboring mountains. Damaseus is genorally regarded as the oldest city in the world, its history remounting beyond the time of Abraham, whose atoward Eliezer was a native of this place. A grent era in its history is Jts conquest by the Sarecens.-E. B. See Am. I Whig Rev., vol. viii.

Damasous Blades are awonds or cimeters, proseating upon their surface a variegated appearance of watering, as white, silvery, or black velns, in fine lines, or fillets $]$ fibrous, crossed, interlaced, or paral. lel, ete. They are brought from the East, belng fabricated chiefly at Damacas, whence their name. Their excellent quailty has become proverbial ; for which reason these blades are much sought after br- anilitary men, and are high-priced. The oriental processes have never been satisfactorily described; but of late yeara methods have been devised in Europe to imitate the fabric very well.

Damask (from Damascus, whence first brought), a variegated textlle fabric of ailk, richly omamented with raised patterns representing flowers, fruits, etc., woven in the loons. It is also fabricated in woolen stuff. Woolen damasks and moreens are sold in England at 9d, to 1s. 6d. per yard.

Damask likewise denotes a kind of wrought linen, used chiefly for table-cloths and napkins, and so called because its patterns reaemble those of real damank. It was first made in Flanders, but it is now wrought extensively in Britain, partlcularly at Dunfermline in Scotland, and also at Lisburn and Ardoyne in Ireinnd. An inferiur description has latterly been made of cotton. See Linen,

Irish Itamask.-As early $s$ the beginning of the last century, the manufacture of linen damanke was introduced into Ireland from Germany ; and there still exist specimens woven in Ireland 130 years ago. The manufacture has gone on incressing In excellence, and it is now considered that the bigh-ciass Irish damaske equal any from any other country. Almost all are used in Great Ibritaln, and the better kinds are so costly that none bat the wealthy can purchase them. Hand-loom weaving in invariably adoptod for the best damssks; but the power-loom is now beginning to be employed for the cheaper damasks and diapera; and it is hoped that this will create a forelgn market fur then. The Jacquard loom is extensively used for the richer damasks, for which its wonderful action eapecially adapts lt. What a Jacquard loom is, a long and wearisome description wouid scarcely make intelligible; what it appears like, the thousands who watched the working of the several Jucquard loome at the great exhibition may perhsps remember; what it does is exemplified by specimens of pattern, or damask, or figure weaving, for which it is especialisy adapted. In designing table-cloths, table napkins, and d'oyleys, for roysl personsges, city companies, rlub houses, and regimental messes, the damask manufacturers of Ireland sometimes display considerable taste; and this taste afterward reflects seme of its light npon the cheaper and ordinary commercial products. It is yed a diaputed point among persons artistically inclined, what kind of ornamentation is best fitted for colorless damssks ; human forms and features are seldom damasked satisfactorily, and buildings are very tame affairs when so depicted; at preseut, heraldic emblems seem to take the lead.

Damask is also applied to a very fine steel, prepared in some parts of the Levant, but particularly in former times at Damascus, whence its name. It is used for sword and cutlass blades, and is very finely tempered.

Damaskeening, or Damasking, the art of nrnamenting iron or stecl, by making incisions on its surface, and flling them up with some other metal, genernlly gold or silver. It is chicfly used for enriching sword blades, garde, locks of pistole, etc. There are two ways of damasking; the one, which is the finest, is when the metal is cut deep with proper instrumenta, and inlaid with gold and ellver wire; the other is superficial ouly. This art is of great antiqnity, and its lavention is attributed by IIerodutus (1. 25) to Glaucus of Chios, who lived s.c. 490 . It would appear to lave flourished at some period in Danascus, whence the name is generaliy derived.-E. B.

Damansin. A species of woven damask with gold and ailver flowers.

Dampier, William, an Eagliah navigator, was born at East Coker, Somersetshire, about 1652. IIaving early become an orphan, he was removed from the Latin achool, and placed with the maeter of a shlp at Weymouth. In this ship he made a voysge to Newfoundland; but, disgusted at the cold of that northern climate, on his return he engaged himself as a common sallor in a voyage to the Fast Indies. He next served in the Dutch war under Sir Edward Sprague, and was presont at two engagements; but the declining state of his health induced him to come on ehore, and remove to the country, where he remained some time. In the year following he became an under-manager of a Jamalca eatate; but only continued a short time in this situstion. He afterward engaged in the coasting-trade, and thus acquired an sccurate knowledge of all the ports and bays of that island. Having entered on board a veesel bound for the bay of Campeachy, and returning a eecond time to the same coast, he remained with the logwood-eutters, and engaged himself as a common workman. During him stay in that country he collected the materials for the minute and interesting account which he has given of the laborious life of these people, ss well as of the geographical deacription and the natural history of the country. It appears that he was preparing in 1703 for another voyage. It is mentioned in Woodes Rogers' Voyage Round the World, that Dampier had the command of a shlp in the South Seas alout the year 170 , and along with Captain Stradllog, whose vessel foundered at sea. Dampler accompanied Woodes liogers in his voyage round the worid in the years $1708,1709,1710$, and 1711, but only in the capacity of pilot, which is supposed to be a circumsta-ce due to some remissness in his conduct. During this expeditlon Gunyaquil was taken, and Dampier had the command of the artillery. Nothing further is known of the life of Dampier; and we are equally ignorant of tl: place and time of his death.-E. IB. See Retrospective Review, vol, ix., p. 73, for an account of the voyages of Dampier.

Dantzio (in German, Danzig), the principal port and commercial city of Prussia proper, and capital of a cognominal government, lies on the left bank of the Vistula, about 4 miles frcm its mouth. N. lat. $54^{\circ}$ $20^{\prime}$; E. long. $18^{\circ} 38^{\prime}$. Population in 1849 , including military, 63,917; of whom 2,369 were Jews, 13,339 Catholics, and 47,723 Protestants. Kamparta, bastions, and wet ditches, which have been vastly strengthened since the war, and gigantic works for isying the country under water, have done what fortifications can to make Dantzic impregnable. The road or bay of Dantzic is covered on the west side by a long, narrow, low, asandy tongue of land, extending from Reserhoft Point (on which is a light-house), in lat. $54^{\circ} 501^{\prime}$; long. $8^{\circ} 23^{\prime} 15^{\prime \prime}$, upward of 20 miles in an E. by S. direction, having the small town of Heela or IIcel, near its terminntion. A light-house, elevated 123 feet (English) above the level of the sea, has been erected within about $\frac{1}{2}$ mile of the extremity of this point. The flashes of the light, which is a revelving one, succeed ench other every $\frac{1}{\frac{1}{2}}$ minute. Dantzic lies about S. $\frac{1}{2}$ W. from the Heel ; its port being distint about four leagues. There is good anchorage in the reads for ships of any burden ; but they are exposed, except immediately under the Heel, to the north snd northeasteriy winds. There are harbor-lights at the et. trance to the port. All ships entering the Vistula must heave-to about a mile off the port, and take a pllot on losard ; and pifots must always be ompleyed ia moving ships in the harbor, or in going up and dewn the river. The usual depth of water at the mouth of the river lo from 12 to 13 fect (English); in the harbor, from 13 to 14 fect deep; at the confluence of the Motlau with the Vistula, from 9 to $9+$ feet; and in
town, fri both eld eastern s granite, of atone

town, from 8 to 9 feet. Molem have been erected on both sides tha ontranca to the harior; that on the eastern side, which is most exposed, is constructed of granite, but le not yet completed; the other is partly of stone and partly of timber.

Trade.-Next to Petersburg, Dantaic is the most important commercial city ln the north of Europe. It owes its diatinction In this respect to its situation; the Vistula, with its important tributarles the Bug, Narew, etc., giving it the command of a great internal navigation, and rendering it the evarepie where the surplus products of West Prussia, Poland as far as Hungary, and part of Lithuania, are exchanged for those imported from the foreigner. The exports of wheat from Dantzic are greater than from any other port, Odessa excepted. There are four sorts of wheat distinguished here; viz., white, high-mired, mired, and red, nccording as the white or red predominatcs. The quality of Dantaic wheat is for the most part excellent ; for, though anall in the berry, and not so heavy as many other sorts, it is remarkably thin-skinned, and yields the finest flour. The white Polish what exported here is the best in the Baltic. Hye is ulso vary suparior, belng both clean and heavy; the exports of bariey and oats are comparatively inconsiderable, sud the qualities but indifferent. Very fine white peas are exported. Next to grain, timber is the most inportant article of export from Dantzic, but latterly the supply has been diminishing, and tho quality is said not to be so good as formerly,-Meek. The principal supply of fir timber, masts, etc., is brought by the river Narew, which, with its 1 tanches, rise in old Prussia and Lithuania, and falls into the Bug near the confluence of the latter with the Vistula. Oak planks, ataves, etc., are brought down from the higher parts of the Vistula, and the tributary streams of Dunajetz, Wieprez, etc. Salted pork, weed ashes, linseed and rapeseed, mato, bones, zinc, apruce beor, feathers, etc., are also exported.
Imports.-These consist paincipally of iron and ateol, herrings, wine, sugar, coffee, cotton and cotton yarns, spices, salt, coal, tolacco, dyewoods, spirits, rice, etc.; but their value is seldom more than hulf that of the exports.

Soney.-Accounts used formerly to be wholly kept in guldens, guilders, 0 : florins of 30 groschen. The rixdollar $=3$ florins $=90$ groschen $=270$ schillings $=$ 1,620 pfennings. The florin or guilder $=9$ d, sterling, and the rixdoliar $=2 \mathrm{~s}$. 3d. A new system was, however, introduced into all parts of the Prussinn dominions, conformably to the decrecs of the 30 th of September, 1821, and of the 22d of June, 1823. The Cologne mark (containing 3,609 English grains) is the weight at present used in the Prussian mint in weighing the precious metals. Tho fineness of the coins is not determined, as previonsly, by carats or loths, but the mark is divided for this purpose into 288 gruins. Accounts are now kept in the public offices in thalers or dollars (R.), silver groschen, and pfennings; 1 dol. $=30$ sil, $\mathrm{gr} .=12 \mathrm{pf}$. The only silver moncys now coined are dollars and $t$ dullar picces; but emaller ceins are in circulation, of former coinages. The Prussian silver coins have $f$ of alloy; and as the
mark is coined into 14 dollars, each should contain 257-68 Fuglish grains pure ailver, and be worth about 2s. 11dd. sterling; but the nsaays do not always strictiy colncide with the mint valuation. The gold coins are Frederic d'ors, double, single, and half pleces. The mark of 288 grains, having 260 grains of fine gold, is coined in 35 Fred. d'ors. The Fred. d'or is worth from 5 dol. 18 sil. gr. to 5 dol. 22 sil. gr., accorllng to the demand.

$=1$
In wine measure, which is less than lieer measure, the shm $=39 \mathrm{~g}$ Eng. gallons. The pipe $=2$ ahms.

The last of corn $=54$ malters $=60$ scheffels $=240$ viertels $=960$ metzen; and welghs 4,680 lbs. Dantzie weight in rye. The scheffel $=547$ of a hectolitre= $1 \cdot 552$ Winchester hushels. Hence the last of 60 schoffels $=11$ quarters 3 bushels; the last of $55 \frac{1}{8}$ scheffels $=$ 10 quarters 7 bushels.

The Dantzic foot $=11 \cdot 3$ Eng. Inches, or 100 Dantzic feet $=94 \cdot 16$ Eng, feet. The ell is 2 feet Dantzic measure. The Rhineland or l'rusalan foot $=3138$ French metres, or 12.356 Eng. inches; hence 100 Prussian= 102.8 English feet. Tho Prussian or Berlin ell has 251 Prussian inches $=26.256$ Eng. ditto. 100 Berlin ellis= $72 \cdot 93$ Eng. yards; and $137 \cdot 142$ Berlin ells $=100$
 graphical milos.
Oak planks, deals, and pipe staves are sold by the shock of 60 pieces; wheat, rye, etc., are sold by the last of $56 \frac{1}{2}$ scheffels.-Kelly's Cambist; Ne.kenbrecher, Manual Universel.

Corn Trade of Dantzic.-Grain is almost whelly brought to Dantzic by water, in flat-bottomed boats suited to the navigation of the Vistula, Bug, etc. The English consul estimated the expense of the conveyance of wheat and rye, including the duty at 'Thorn and the charges of turning on the river, till put into the granary, as follows:

Por Imp. quarter.
From the upper provinces on the Bug, a dis-
taneo of froth 700 to 500 mfles................
From the propinces of Cracow, Sendomir, and

From Warsaw and its uelghborhood, about 240
miles..........................................
From Whaclaweek and its nelghborhood, about
140 Oranden .................................
no daty at Thorn, and when not turnod on
the river.................................... 010 " 00
Tho Bug has many windings, and its navigation, which is tedious and uncertuin, can only he attempted in the spring, when the water is bigh. It is the sane, though in a less degree, with somo of the rivers that fall into the Vistula hefore it reaches Warsaw ; and toward Cracow tho Vistula itself is frequently unnavigalile, especially in lry seasons, except in spring, and after the midsmmer rains, when the snow melts on the Carpathian mountains. The navigation of the I'olish rivers in some seasons is more than usually bad. The corn from the upper provinces does not reach Dantzic till from 2 to 4 monthe Inter than usual, and is burdened with a very heavy additional expense. In fact, the supplies of grain at Dantzic depend quite as much on the abundance of water in the rivers, or on their easy navigation in summer, as on the good-
ness of the harvests. "There are," says Mr. Jacob, "two modes of conveying wheat to Dantzle by the Vlstula. That which grows near the lower parts of the iver, comprehending Polish Russin, and part of the pros lnce of Plock, and of Masovla, In the kingdom of Poland, which is generally of an inferior quallty, is conveyed in covered boats, with shlfting-boards that protect the eargo from the rain, but nat from pllfering. These vessels are long, and draw about 15 lnches water, to. ' bring about 150 quarters of wheat. They are not, however, so well calculated for the upper parts of the river. From Cracow, where the Vistula tirst becomes navigable, to below the junetion of the Ilag with that stream, the whent is mostly conveyed to Dantzic in open flata. These are constructed on the banks, in scasons of leisure, on spots far from the ordinary reach of the water, but which, when the rains of autumn, or the melted snow of the Carpathian mountains in the epring, fill and overflow the river, are casily iloated. Burges of this description are alout 75 fest long, and 20 broud, with a depth of $2 \frac{1}{2}$ feet. They are mude of Ir, rudely put together, fastened with wooken treenails, the coraers dovetailed und secured with sllght iron clnmps-the only iron empleyed in their construction.
" A large tree, the length of the vessel, runs along the bottom, to which the timhers are secured. This roughly-cut keelson rises 9 or 10 inches from the floor, and hurdles are laid on it, which extend to the sides. They are covered with mits mnde of rye straw, and serve the purpose of cionnage ; lenving below in spa e in which the water that lenks through the sides and bottom is recelved. The bulk is kept from the sides and ends of the barge by a slmilar plan. The water which these ill-constructed and imperfectly-calked vessels receive, is dipped out nt the end anl sides of the bulk of wheat. Vessels of this description draw from 10 to 12 inches water, and yet they frequently get aground in descending the river. The eargoes usually consist of from 180 to 200 quarters of whent. The wheat is thrown on the mats, piled as high as the gnnwale, and left uneovered, exprsed to nll the inclemencies of the wenther, ned to the pilfering of the erew. During the passafre, the large is carried along hy the force of the stream, onrs being inerely used it the heal and stern, to steer clear of the sand-1anks, which are numerous and shlfting, and to "rect the vessel in passing under the several bridges. These vessels are conducted by 6 or 7 men. A small boat precedes, with a man in it, who is employed somoding, in order to avoid the klifting shonls. This mode of navigating is necessarily very slow; and during the progress of it, whieh lasts geveral weeks, and even months, the ruin, if any full, soon canses the whent to grow, and the vessel nssumes the appearance of a floating mealow. The shooting of the firres soon forms a thick mat, and prevents the rain from penetrating more than an lnch or two. The mais bulk is protected by this kind oi cosering. and, when that is thrown aside, is found in tolerable condition. The vessels are broken up at lontzic, and usually sell for about of their original eost. The mea who conduct them retarn on foot. When the carigo nrrives at Dantzic or lilbing, all hut the grown surface is tirown on tho land, epread abrond, expered to the ana, and frequently tarmed over, till any alight moisture it may have imhibed is dried. If a shower of rain falls, as well as daring the night, the heapis of whent on the shore are thrown together in the form of a stecp roof of a house, that the rain may rom off, and are covered with a inen cloth. It is thas fregnemely a long time after the whent las reached Inatzic, before it is fit to be placed lin the warehouses.

The warchouses (speichers) are very well adupte: for storing corn. They conslat generally of 7 stories, 3 of which are th the roof. The floors are alout 9 feet asunder. Each of them is divlded by perpendicular
partitions, the whole length, about 4 feet high, by which different parcels are kept distinct from each other. Thus the floors have two divisiona, each of them eapable of storing from 150 to 200 quarters of whent, and leaving aufficlent space for turning and screening it. There are abundance of windows on each floor, which are always thrown open in dry weather to ventilais the corn. It is usaally turned over three times a werk. The men who perform the operation throw it with thelr shovels as high as they ean, and thus the gralns are separated from each other, nnd exposed to the drying influence of the air. The whole of the corn warehouses now left (for many were burnt during the aiege of 1814) are capuble of storing 500,000 quarters of wheat, supposing the quarters to he large enongh to fill each of the 2 divisions of the floors with a separate henp; but as of late years it has come down from Poland in amaller parcels than formerly, and of more various qualities, which must of necessity be kept distinet, the present stock of alont 280,000 quarters is found to occupy nearly the whole of these warehonses which are in repair, or are ndvantageonsly situated for loading the ships. Ships nre loaded by gangs of porters, with great despatch, who will complete a cargo of 500 quarters in about 3 or 4 hours."-First Neport.

Banking Establishments.-There is none such here, excepting a branch of the Royal or Govornment bank of Berlln. This was founded partly in the view of receiving deposits of money under litigation in the courts of the province; moneys the property of minors and cbaritablo lnstitutions, the former until disposable or placed on good security ; and moneys belonging to individuals not merchants, and at times, also, those of the latter. Interest la pald on such deposits as follows, viz. : 3 per cent. on sums belonging to minors; $2 \frac{1}{2}$ per cent. on sums belonging to eharitable institations, churches, and sums depositad by the courts of justice, and 2 per cent. on all other deposits.

The principal is demandable at pleasure, unless otherwise stipnlated. The bank makes advances on gruin nnd some other kinds of goods at 5 per ceent. interest; (1)* counta bills with 3 signatures, not huving more than 2 months to run, at 6 per cent., and sometimes, when money is plenty, at a lower rate. It also makes advances at 4 per cent. on deposits of Frell. d'ors sad certnin forejgn moneys ; and it occasionally buys bills for account of, and sells bills cn, the Berlin Jiank. It does not issue notes. The annount of its eapital is net thxed; liut government guaranties its transactions. It is relleved from the payment of postage on muney, and it is not required to l.se the кtmmps fixed by law, on bills for its deproitt transactions, but only those of 10 s . gr. (about 11 fle ) ; while individuals must fise stamps for such lifls of $5 \mathrm{~s} . \mathrm{gr}$. for every 400 r . of not longer date than 3 months, and for every 200 r . of longer date. On negotiable bills, however, the lank must use the stmmps Axed liy law, say of $5 \mathrm{~s} . \mathrm{gr}$. (about 5 ghd.) for sums of 50 ilol. to J00 dol., and at the same rate for every ndditional sum between 100 dol. and 400 dol. Itills from and e 7 forelgn places, negotiated at Dantale, are not sulject to the stanuj dity. The atficirs of the bank are not made public. Heing a government concern, there nro no dividends. It is not anpposed to be very profitable, at lenst in the present circumserthed state of trade, although enjoying the advantages of exemption from postape of moneys, and paying less atamp luty. It is true, however, that the direct advantage of the lower stamp duty is enfoyed ly the horrower.

C'redit, Brokerage, atr.-Very few goorls are conslgned frem aliroad for sale, for such ronslgmoents rarely turn to good account. Imports are seldom nohd for cash, but generally at 1,2 , and 3 months' credit, or longer. The dikcount nllowed for cash payments, when sold on thme, is usually 6 jer eent., but it varics according as money is plentlful or otherwise. Any

person, being a burgher of the town (which any one of good character may becoms), may transact business as a commisaion merchant or factor; but brokers mast be chosen by the elders of the corporations of merchants, approved hy the regency of the province, and sworn in by the magistracy of the town.

Danube (Germin, Donar ; anc. Danubius and Ister), an important river, and, next to the Volga, the largest in Europe, originates in the Berge, a mountain torrat which riees in the E. decllvity of the Schwarzwald, in Baden, at an elovation of 2,850 feet above the level of the ees. The atream, when jolned by the Brigach, and by whe waters of a spring from the castle garden of Donaueschingen, takes the mams of the Donau. It flows first generally E. N. E., through an slphe country to Ulm, thence E. N. E. and S. E., to Passau, it traverses the plain of Bavaria. From Passau to Vienna, E. S. E.., it intersects a hilly region, and the remainder of Its course, E. S. E. to Waitzén, S. to Buze, and E. to the Black Sea, ls through a country generally flat, except at the defile of the " iron gate," E. of Orsova. Length (direct), 1,000 miles ; or, including windings, 1,725 miles. It drains a surface of about 250,000 square miles; ita average full is 18 lnehes per mila, but bulow Pesth it ls only 3 inches; at Ulm it is $1,4 v$, at Regensburg 1,000 , at Passau 800 , at Vienna 450 , and at Pesth 300 feet above the Jevel of the sea. Its breadthat Ulm ia 108 feet, and in its lower course 6,000 feet। dapth at Ulm, 6 fest ; at Passau, 16 feet ; and lower down, a veruge 20 feet. It paeses Sigmaringen and Uhm in W ürtemberg, Dillingen, Ilochatadt, Donaawörtl, Ingolstadt, Regensburg, and Passau, in Bavaria; Linz, Diernstein, Korneuborg, and Viedns, in Austria; Preaburg, Komorn, Gran, Waitzen, Buda, Pesth, Peterwardein, and Carlowitz, in Hungary ; Belgrale, Semendria, and Orsova, in Servia; Widin, Nieopoli, Ratschak, Silistria, and Hirschova, in Hulgaria; Giargevo and Brahilov in Wallachis. The chief afluents of the Danube are, on the right, the Iller, Lech, Isar, Inn, Ens, Raab, Drave, Save, Morava, Timok, 1sker, Vid, and Jantra; and on the left, the Altmühl, Nab, Regen, Mareh, Waag, Gran, Theiss, Temes, Chyl, Aluta, Jalomnitza, Serath, and Prath. Near its month In the Black Soa, it separates into several branches, the southernmost of which, culled the branch of St. George, forms, ly the treaty of Adrianople, the boundary between the Ottoman empire and lussia. It communicates by canals with the Elbe, by means of the Moldan, and with the Rhine by the Altmahl. It is navigable for vessels of 100 tons from Uim. Stean packets ware eatablished on the Dunube in 1830 , and there are 10 steunt vessels employed between Presburg, Pesth, and Constantinople, and 2 betweou Regensburg and Linz.--See Filusich's Mag., xxil., 560, 684; Qusn's Steam Voyage down the Danube.
The ports of Llaila nad Galatz are appointed as ports on the Danule for the connmerce of neutral powers, both as regards exportation and importation. The vessels of neutral powers coming from the Black Sua can return freely into thut sea ufter having received their cargoes in the ports ubove mentioned, on condition always that they abstain, before entering the Black Sea, from touching at uny port on the Danube. Conseyuently these vessels, hefore quitting the ports of Braila and Gulatz, mast present their documents to the Russian consular agent, who will furnish them gratis with a certificate bhowing the destimation of tha ship, and hearing the formal declaration, that if hofore entoring the sea they alauld disembark rorn or provisions upon any point of the right bank of the Danube, they will, by this contravention, jucur sequestration. Neutral vessels which wish to ascend the banume in order to procesd at once into the Austrian States, und which earry down cargoes lestined e'ther for lirila or Galatz, or for exportation liy tho Black Sea, will he llable to the same formallty of a Rascian certillcate ladicating thair destination, and
prohihiting them, under similar penaltios, from entering into any traffic on the ight hank of the Danube. Neutral vessels wiehing to descend the Dannbe will not meet with any hinderarce, provided that on thelr passage by Orsova they furnish thamselves at the Russian consulate with a certificate, stating that they belong, bonâ fide, to a neutral power, and that their cargo is not destined for one of the Turkish ports of the Danube.-P. J. of T. 1856.

Dardanelles (Straits of the), form the communication between the Sea of Marmora and the Archipelago. This channsl, through which there flows a constant current out of the Sea of Mar irs into the Archipelago, is upward of 50 miles long, and varies in breadth from 1 mils toward its western, to 10 mlles at ite enstern extremity. It derives its name from two aucicat fortresses on either side of the river, of which ons is built on the site of the ancient Sestos, and the other on ths site of the anclent Abydos. About 20 miles to the west of these are two modern fortressen called the New Csstles, and between the old and the new forts are military works of various descriptions. The total number of guns mounted on these fortresses is 689 , some of which discharge atone shot, and require a charge of more than 3 cwts . of powder. It derived ite ancient name of the Hellespont from the tradition of Phryxus and Helle, and is celebrated in sncient times for the bridge of boate built over it by Xerxes. It is memorable also as the scene of the death of Le-ander.-E. $\mathbf{B}$.

Tlie gallant exploit of forcing the passage of the Dardanellas was achioved by the British squadron undar Admiral Sir John Duckworth, Folb. 19th, 1807 ; but the acimiral was obliged to repass them, which he did with great lose, and immense damage to the fleat, March 2, following; the castles of Sestos and Abydos hurling down rocka of stone, each of many tong' weight, upon the decks of the British ships.-Maydn. So long as the shores of the Black Sea were exclusively pussessed by Turkey; tnat sen might with propriety be considered a mare clausum; and there seems no reason to question the right of the Ottoman Porte to exclude other nationn from navigating the pasaage whicb connects it with the Mediterranean, both ahores of this passage being at the same time portions of the Turkish territory; but since the territorial acquisitions made ly Rassia, and the commercial establishments formed by her on the shores of the Euxint, both that empire and the other maritims powers have hecons entitled to purticipate in the commerce of the Black Sea, and cousequently to the free navigation of the Dardanelles and the Bosphorus. This right was expressly recognized liy the 7 th article of the treaty of Adriunople, coacluded in 1829 between Russia and the Porte, both ns to Russian vessels and those of othor European States in unity with Turkey. The th artlele of the treaty of 1830 , between the Unlted States and the Ottoman Porte, provides that merchant vessels of the United States, in like manner as vessels of the most fuvored mutions, shall have liberty to pass the cumal of the lmperial lesidence, and go and come in the Bhack Sen, elther laden or in hallast; and they may ho laden with the problice, manufactures and elfects of the Ottoman empire, except such as are prohibited, as well ns of their own country.-Winaton's International Lam, 1. 241.
Daric. A lersian gold coin (so called by the Grocks, from Darias, the naine of several lersian worereigns), having upon the obverse an archer, owned und kncelling upon one knee, and on the revurse a quadrata incusa, or deep cleft. The weight of the daric ls about 1110 grains .

Darien (Isthmas of'). "The Iathmus of Darlen, or, as it is more commonly styled, the lethmus of Panama, conncets Nurth and Suuth Amerlca, and is prinelpally comprised in the republic of Granada. On the northern side is the Caribbenn Sea and the Gulf
of Darien ; on the eouth tha Gulf of Panama. In length the isthmus proper is ahout 200 miles, with an average breadth of 40 milea; but in long. $79^{\circ}$ it narrows dewn to leas than 30 milea. At this point it ls proposed to establiah the ahip canal. The country is undulating, with chalns of small mountains, hut very fertlle and wall simbered. The expense of a commodleus ship cunal, aay 30 miles long and 200 feet wlde, would not be less than $\$ 50,000,000$. When it is considered that one half the world's commerce would in all probability pass through thls canal, the expense is triffing. All the India and China trado, instesd of doubling Cape Hora, would find pasasge through the canal. It should be free to all nations who asslst In the constriction by monay or credit."
An appropriatlon was embraced in the navnl approprintion bill of 180 d , giving a aum not to exceed $\% 25$,000 , to be paid to officere selected by the Secretaries of War and Navy " for the purpose of making explorations and verification of the surveye already made of a ship C.. al near the 1atbmus of Darien. to connect the waters of the Pacific and the Atlantic by the Atrato and Truando rivers."
Dates (German, Datteln; French, Dattes; Italisn Datteri; Spanish, Datiles), the fruit of the palm-tree (Phenix dactylifera Lin.;', This tree is abundant in Egypt, Barbary, Arahia, Persin, and the adjacent countries, particularly on the confines of the desert, and wherever there ls sufficient molsture. It is a tall, majentic trec; and repeated references are made :o it in the sacred writhgs (Ecclus. siv. 14), and in the Koran. Mohammed, in one of his asyings, beautifully compares the upright and generous man to the pnlm-tres: "He stands erect before his Lord; In lifs every action he follows the impulag receivel from above, and his whole iife is devoted to the welfare of his fellow-crentures." But the vencration in which the pilm-tree is held in the East in to be ascribed more to its utility than to its beauty. Dates furm the princlpal part of the suL. isteuce of the Inhahitants of muny parts of Arahia sul liarbary, and they are held in the highest estimation wherever they are met with. "They ure," nays Ihurck hards, " hy fur the mont easential article of fool for the lower classes of Mellina; thelr harvest is expected with as much anxiety, and attiended with as much general rejoichng, as the ; intage in the south of kirope; nua if the crop fuils, which often happens, us those trees are seldom known to produce abundantly for 3 or 4 successlve years, or is caten up ly the locust, universal gloom overypreads the population, as if a famine were ayprehended."-Truerls in Atrabia, vol. |v., p. 21\%.
There is an endless variety of dates. Generally. however, they may be deseribed as leing somewhat in the simpe of an acom, bat usoally larger, emnslisting of a thlek, fleshy sulistance, including and freely separnting from an obloug stome or kernal, having a furrow on the one sille. Their taste is agreeably sweet, accompanted with a alight astringency. 'The new fruit la culled ty the Arabs rueb. When the dates are allowed to remain on the erree till they are quite ripe, and have becone soft and of a high rell color, they are formed into a hard, solld puate or cake, called adjume. 'This is formed by pressing the ripe dates forrihly luto large lowkets, each romtuining nhout 2 cwt "In this state," says Burckharit, " the Bedouins export the atljone; in the market it is cut ont of the hasket, nad sold by the penid. It furms part of the dally fool of all chasses of people; in travelhige it la dissoived in water, nud $t^{\prime}$ 's aflibrda n weet and rafrowhing drink. Daring the munson, the shipa from the l'ersian tiulf liring aijene from husserah to Djadda, for sulte, in small baskets, welghing aloup 10 pumals each; this kind is preferred to every other. Ships hound from Arabia to India take with them a conalderable cumatity of nifoue, which is readily dispored of among the Molmmmedans of llindestan."-7ravels in Arabin, vol. i., p. 57.

The Arabians and Egyptiana use the loaves of the trees In the preparatien of bage and baskets, the boughs, tha outer and Inner bark of the trunk, and the flezhy substance at the root of the leaves, where thay spring from the trunk, bave all their respective uses; and besides this, the kernela of the frult, notwithstanding their hardness, aro used as food for cnttle; they are sosked for 2 dxys in wator, when they become eoftened, and are given to camels, cowa, and sheep, instead of barley; they are aaid to be much more nutritive than that gralu. There are ahops at Medina in which nothing else is sold but data kernela; and the beggars are contlnuslly em?'nyed in all the main streets in picking up thoee that are thrown away.-Burckhardt, vol. 11., p. 212. All the refinements of Arablan cookery are exhausted in the preparntion of dates; and the Arabs say thnt a gcod housewife will dally supply her lord fer a month with a dlah of datea differently dressed. Palm-trees are ralsed by shoota ; and Dr. Shaw mentiona that they arrive at their vigor in about 30 years, and continue so 70 yeare afterward, bearing yearly 15 or 20 clustere of dates, each of them weighling 15 or 20 pounds; after this period they begin to decline. Trarels in the Levant, p. 142, 4to ed.

The best dates Imported are sald to come from Tunix, hut they are most commonly brought from Sinyrna and Alexandria. They should be ct osen large, softish, not muen wriakled, of a reddish yellow color on the outside, with a whitisa membrane betwlxt the flesh and the atone. Thoss that are dry and hard are of little value.

The date-tree is indigenous to Syria, Arabia, and the lower parts of Persia, Egypt, and northern Africa, whence it was introduced Into the south of Europe; nud it is also more or less cultivated in IIritish India, Sonth Airica, and in some parts of Amerlea. Though belonging to the extensive family of palms, which abound and flourish in most tropical regions, it attains perfection only In comparatively high lutitules, and doubtless would he alapted to the eoll and elimate of the more arid regions of Callfurnia and of our southem states.
The date is a lofty tree, growing to a height of 60 feet, with a rugged trunk, crowned with leaves 6 or 8 feet long, with pinne 3 feet long, and a little more than an inch liroall. The flowers of both sexea, which grow on ме parate tri:s, come out in very long bunches, from the trunk, leetween the leaves, and are covered with a spathin, which opens and withers. Those of the male tree have 6 short stanens, with narrow, fourcornered anthers, filled with pollen. The femule flowera have a roundixh germ, which afterwarel liecones an aval berry, with a thiek pulp, faelosing a hard, oblong stone. 'This berry is the frult known as the date of commerce, upon which a considerable portion of the people of Eigypt, Arabia, and Persla, almost entirely subslat. A single tree will produce from 100 to 300 pounds of thls truit in the season. They come lito hearing at from 6 to 10 years of age, and nre fruitful for upward of 950 years.
The extensive impurtance of the date-tree, in the countries whare it oceurs, is parhaps one if the most rariona walijects to which n traveler ean cireat blas attention. Independent of the use of the fruit as ford, the inhmintants make a conserve of It with sugar, and even grimel the hurd stones, to fred to their camels, In lharbury they form handsame heals of these stumes. From the leaves they make couches, hakents, hags, mats, hroushes, and ty-t rups ; the trunk is oplit, and employed in "recting small huildings, also fur frowes to sardens; and the stams of the leaves are used for making cages for their psultry. The threads of the web-like Integument nt the hine of the leaves are twisted linto ropes, which are employed In righing small vessels. The nmylaceous central part of the trmak is also good to pat, nad the buls are extemod a delicate vegetible; nid even the young shouts are eail

to resemble asparagas. The sap, which is sweetish when first collected, and may be drunk as a mild beverage, is distllled into a kind of apirit, known ifr eastern countries by the name of "srrack." It ts obtained by cutting off the head of the tree, and scooping out a hollow in the top of the stem, where, in ascending, it lodges. 8 or 4 quarts may be obtained daily from a single palm, for 10 or 15 days.-U. S. Patent Office Report, 1855 , p. 56.

Davita, beams of wood or iron, with shenves or blocks at their ends, projecting over a vessel's side or stern, to hoint in the borats.

Days of Grace. These vary in almost all mercantlie towns and countries, but the tendency of modern legislatien is to abolish them altogether. France, Relglum, Lombardy, Tuscany, the Two Sicilies, and other States whers the French code has been introduced, there are no days of brace. So threnghout the German States they are altogether done away. In Great Britaln, nad Ireland, and the United States of America, there are 3 dnys; in Denmark there are 8 days; in Sweden, 6 days; in Russia, 3 days for bilis at slight, 10 dnys for bills at a fixed time; in the Canton of Berne, Switzerland, 6 days; in Spaln and Portagal, none; and in the Netherlands, none.

The law merchant respects the rellgion of different peoples. A Jew would not be bound to ph. bill on a day eacred to him. So if the first day of grace should be on Saturday, and Monday Christmas-day, and the maker a Jew, the note would be pryable on liriday. The word month means generally a calendar month. A note duted on the 30 th of August would end with the corresponding day of the month. In calculating the day when the bill falls due, the day of the date is always excluded; so a biil drawn on the 1st of January at 10 days after date would become due on the 11th, and not on the 10th.-Manual of Mercantile Law, by Leose Levi. In New York and other States statutes have been adopted by the Legislature, providing that when a biii falls due on a public holiday (Christmas, 4th of July, 'Thankspiving Day, New-Year's Day, and, in New Orleans, Janusry 8th, for instance) the bill shall be payable the day preceding.

Dead-lights, ports or shutters to close in the cabin-windows of a ship in bad weather.

Dead-reckcning, in Navigation, the eatimation that is made of the place where a ship is situnted, without having recourse to observation of the celestial bodies. It is made ly observing the distunce she has run by the log, and the course on which she has been steered, making allowance for drift, lee-way, etc.

Dead Bea or Lake Asphaitites (Arubian, Bahr-el-Lout, "Sen of Lot"), a lake of Palestine, celebrated in Scripture as the site of Sollom nnd Gomorrah, hetween lat. $31^{\circ} 5^{\prime}$ and $31^{\circ} 52^{\prime}$ N., and long. $35^{\circ}$ $26^{\prime}$ and $35^{\circ} 43^{\prime}$ E., its N. extremity nearly 20 milea E. Jerusalem. Mean length N. to $S$. about 15 miles; average brealth from 10 to 12 miles; hut its size varies greatly in different sensons and years.-Romnsos. It is inclused in a valley; bounded by bare limestone mountains, and according to recent researches, its depth is about 350 fathoms, and its surface 1,312 feet below that of the Mediterranean Sea; it being thus by far the deepest known fissure on the earth's surface. 'The river Jordan enters it on its north side. Its waters are thoroughly imparegnated with sult ; mul it has not leen proved that any animal exists in this son. $A$ moutain of rock salt on its S. W. side, called Hajr Usdum, "Stone of Sodom," preserves the nume of that eity, ruined with others, as descrilied in Genesis xix., $24-2 x$; and traces of towns or buililings are reported, on douhtful authority, to have been geen at certain thmes in its bed. Asphultum was thrown to the surface at its southern extremity in large qiantities after the murthquakes of 18i4 anil 18:17. Messra. Robiason and Smith have found the "A selepices gigantec," growligg at Engedi, on ita western coast, the fruits of which
(the famed "apples of Sodom") though Inviting in appearance, crumble in the hand into powder.-See $N$. A. Rev., l., p. 203 (by B. B. Edwards) ; Bib. Sac., v. 897, vii. (by Dr. Robinson); Silesman's Jour., xlviil viii., 817 ; North Brit. Rev., il., p. 201 ; Living Age, xxili. (same article) ; so Lit. Mess., xiv. (M. F. Maury); Methodist Quar. ' In undertaking to explore the phyrical geography of the sea, I have found myeelf standing side by side with the geolegist on the land, and with him, far away from the sea-shore, engaged in considering some of the phenomena which the inland basins of the earth-those immense indentations on its surface that have no sea-drainage-present for contemplation and study. Among the most interesting of these is that of the Dead Sea. Lieutenant Lyrach, of the United States' Navy, has run a level from that sea to the Mediterranean, and finds the former to be about 1,800 feet bclow the general sea-level of the earth. In seeking to account for this great difference of water-level, the geologist exsmines the neighboring region, and calls to his aid the forces of elevation and depression which are supposed to have resided in the nelghborhood; he then points to them as the agents which did the work. Truly; they are mighty agents, and they have diversified the surface of the earth with the inost cowering monuments of their power. But is it necessary to suppose that they reaided in the vicinity of this region? May they not have come from the sea, and heen, if not in this case, at least in the case of other inland basins, as far removed as the other hemisphere? This is a question which I do not pretend to answer definitely. But the inquiry as to the geological agency of the winds in such cases is a question which my investigations have suggested. It has its sent in the sen, and therefore I propound it as one whlch, in accounting for the formation of this or that inland basin, is worthy, at lenst, of consideration.
"Is there any ovidence that the annual amount of precipitation upon the water-shed of the Dead Sea, at some former period, was greater than the annual amount of evaporation from it now is? If yea, from what part of the sen did the vapor that supplied the excess of chat precipitation come, and what has cut off that supply'? The mere elevation of the rim and deprestion of the lake basin would not cut it off. If we establish the fact that the Dead Sea at a former period did send a river to the ocean, we carry along with this fact the admission that when that sea overtiowed into that river, then the water that $\mathrm{fe}^{\text {² }}$ from the clouds over the Jead Sea basin was more than the winds could convert into vapor and carry away again; the river carried off the excess to the ocean whence it came.
"In the busin of the Dead Sen, in the basin of the Caspian, of the Sea of Aral, and in the other inland basins of Asia, we are entitled to infer that the precipitation and evaporation are at this time exactly equal. Were it not so, the level of these seas would be rising or sinking. If the precipitation were in excess, these sens would he gradnally becoming fuller; and if the evaporation were in excess, they would be gradually irying up; but observation does not show, nor history teli us, that either is the casc. As far as we know, the lovel of these seas is as permment as that of the occan, and it is ditlleult to realize the ex; itence of subterranean channels between them and the preat ocomn. Were there such a channel, tho Dead Sea being the lower, it would be the recipient of oc:an waters, and wo can not conceive how it should be sueh a reriphent without ultimitely rising to tho level of its. feeder. It may be that the question suggested by my researches has no bearing upon the Dead Sen; that local elevations and aubsidences alone were concerned in placing the lovel of its waters where it is. lut is it pro'nable that, thronghout ull the geolegical periods, tiuring ofi the changes that havo tuken place in tb
distribution of land and water sinface over the earth, the winds, which in the general channela of circulation pass over the Dead Sea, have alone been unchanged? Throughout all ages, periods, and formations, is it probable that the winds have brought na juat as much moistare to that nea as they now bring, and have just taken ap as mach water from it as they now carry off? Obviously and clearly not. The salt-beds, the watermarks, the geologlcal formations, and other facts traced by Nuture's own hand upon the tablets of the rock, all indicate plainly enough that not only the Dead Sea, hut the Caspian also, had upon them, in former periode, more abundant rains than they now have. Where did the vapor for those ralna come from ? and what has stopped the auppiy? Snarely not the elevation or depresaion of the Dead Sea basin." Mavry's Phys. Geog. of the Sea, p. 222.
Dead-water. The water that cleses in with a ship's stern.

Deale, or Deal-boarde (German, Dielen ; Dutch, Deelen; Danish, Daeler; Swiss, Tiljor; French, Planches minces; Italian, Tavole, Piane; Rusaian, Dorshi; Polish, Tarcire), a thln kind of fir planks, much used in carpentry. They are formed by aswing the trunk of a tree into longitudlnal divisions, of greater or leas thickness, according to the purposes they are intended to werve. They are Imported from Mantzic, Petersburg, Narva, and many other ports in the Baitic, and from North America; but those from Christiana, the capitai of Norway, are the best, and loring the highest price. They are diatinguishable from thone produced in the contiguons provinces of Norway; their superlority has been sald to depend principaliy on thelr helug more perfectly sawed; but it really depends on the greater eare with whleh the sap-wood and other defective jortiona of the timber are cut away, and on the quality of the timber. A Russian standard deal is 12 feet long, 11 inches wide, and $1 t$ inch thick; 400 feet of 1 lach plank make a load. A Christians standari leal is 11 feet long, 9 inches wide, and it inch thlek. There is another standard of Norway deals at Dram, 10 feet long, 9 inches wide, and $1 \$$ inch thick.

Debenture, a tern used at the custom-honse to Ngnify the rerificase subseribed by the custonss officers, and given to the exporter of goods on which a drawback is allowed, bearing that the exporter has complied with the required regulations, and that be ls entitied to such drawback.

Debt, in law, la a apecies of contract, whereby a chose in action, or right to a certain sum of money, is mutnaliy ner, dired and loat; usanliy divided intn debta of record, delits by apechal contract, and delits by aimpie contract. A delte of recond in a sum which appeara
${ }^{3}$ e due ly the evidence of a court of record; auch as
hit on judgment or recognizance. Debt by speclalty aere a aum la acknowiedged to be due, or becomes s, by instrument under aeal ; such us a covenant, oond, itc. Woth these species of delits, boing contracted by a mun for himself and hila heirs, at mach on hi lands and tenemenin, and bind them in the hands of his heir or devlsee. Bebt by almple contract is either thy paroie or lyy written ohiggation unseaied; within which ciass fall billm of exclange and promissory notea. bebt in also a persomai action of contract, in which the plalntiff seek the recovory of debt; ; i. e, a liquidated or certain sum of money alieged to be due to him.

Debt, Imprianoment for. See llust's M. Mag., Iv.

Decade (Latln, decaf, from Greek deka, ten). A worll used hy some old writers in a general nense for the number ten, or an enumerntion by tens ; but mure pecullarly appropriated to the number of books into which the hlatory of the lioman empire iny Llvy is dividied, ench division consisting of ten trooks or decades.

It was siso the name given to the space of 10 days; rhich in the French republican caiendar was subeti. tuted-for the ordinary' week. The 10 th , or last day, was termed decadi. Thus, except in bissextile years. the whole number of decades was 361: the days of the half decades, falling at the close of the year, were at one time called aansculottides, and afterward complementary; and dedicated respectively to Virtue, Genius, Labor, Opinion, and Recompenco.

Deoimal Coinage, a oyatem of monetary calculation adzancing to infinlty from a fixed atandard of value, and performing its multiplications by any increasing progression of tens, and its divisions by a decreasing progression which is aiso decimal.

This system, whose superiority to all others now in use is universally acknowledged, was first organized and established by the Constituent Assembly of France in 1790 . It forma a part of that vast decimal metrical system of weights and measurea, which, since the close of the last centary, has obtained in France, and is slowly spreading thence into the other conotries of Euroje and America. The subject was so widely and keenly agitated throughout Great Britain in the opening monthe of 1853, that the llouse of Commons appointed a committee to inveatigate the whele matter. The report of this committee wae laid hefore the liouse on the 1st of August of that year. This document was introdneed with a atrong recommendation of the decimal system of coinuge, and proposed that the basis of that systein when introduced should be tice present pound aterling. By the retention of the jound, the decimal system might he introduced with the least possible change. Its 10th part already exists in the shape of the florin or two-shilling piece, while an aiteration of 4 per cent. in the value of the prosent fartiing wili serve to convert that coin into the lowest step of the decimal ncale, which it is necessury to represent ly means of an aetual coin, viz., the one-thourandith part of a pound. To this lowest deromination it was jroposed by the committee to give the iame of $m i l$, in order to mark its reiation to the unlt of value. 'The addition of a coin to be calied a cent, of the vaine of 10 mila , and equal to the 100 th part of a pound, or the 10tih part of the florin, would serve to complete the list of coios necessary to represent the moners of account, which would accordin-ly be pounde, tlorins, cents, and mila. As to the coins ly means of which the decinal system will be deveioped, it Is proposed that some of those now in use be retaned, and that new coins l.e substitnted for others of tiem. The coins thus retainel would be the present sovereign ( 1600 mils). the haif-sovereign ( 500 mils), Horin ( 100 miis), and shilling ( 50 milis, or 5 cents). The present sixpence, under tho denomination of 25 miis, might be retained; and the erown-piece, or a plece of 250 mits, of withel few are in circuiation, need not be witidrawn. On the other inand, it would he desiralice to withdraw the half-crown, and the threepenny and fourpenny pieces, which ore inennsistent with the decinal scale. In the United States the decimai system ins been introducedi into the colnage with great acivantage ; and an effort is now heing mude to introduce it into weights and measures, which it is hoped wiil succeed in a few years.

Decimal Fractions, are fractions which have for titeir denominator $10,100,1000$, ete., or in general some powor of 10 . Thie use of dechas fractions is mereiy an extenalon of the ordinary acale of aritimetleal notatlon. Setting out from the unit's placo, the Ist figure to the left (in the expression of uny whole number) Genotea so many telns, the ed to the teft so many hundreds, the 31 no many thousands, and no on; so that in tho number 765, for example, each unit of the 6 in the loth part of eacil unit of the 7 , and esch anlt of the 6 a loth of each unit of the 6. In tike manner, lin the exprension of a decimal fraction, setting ont from the unit's place, the 1st figure to the right expresses so many loth parts, the ed to the righit so

old stan
many 100th parta, the 8 d so many 1000ths, and so on ; so that each figure, 38 before, expresses parts, which are eaci 10 "tiales smailer than those expressed by the figure mmediately zreceding. By expressing fractions in this manner, the operations of addition, oubtraction, multiplication, and division, are exactly the same as in integer numbers. In order to distinguish the integral from the fractional part of a numerical exprassion, a point or comma ls placed between them. Various marks have been used for this purpose at different times; but the point is now mast commonly employed, and, nccording to the practice of Sir Isase Newton, it should always be placed near the top of the figure, thus $2 \cdot 46$, which prevents it from beiog confounded with the ordinary marks of punctuation, Decimal fructions appear to have been introduced by Regiomontanus, about the year 1464 ; but Stevinus was the first who wrote an express treatise on the aubject in his Pratique d' A rithnetique, published $\ln 1582$. They are now universally employed in all arithmotical calculations ; and it is much to be regretted that a decinual division of weights, messures. money, etc., has not been adopted in nll civilized countries, by which the reduction of fractional parts from one scalo to another would be obviated, and all the applications of arithmetic to the ordinary purposes of life greatly simplified. A suldivision of weights and measures on this priaciple was adopted in France at the time of the levelution, but has not been imitated by other countries.

DecimaI Weights and Measures. I. Introduction of the Decimal System.-The introduction of the decimal system is so important to all nations, and the advantages so apparent, that any discussion on the subject will be of interest. The faclity of transacting avery business, and the snving of liabor, would be much increased by having a general and convenjent system of weighte and measures. The good result of the introduction of the declunal system into our coinage is so universally admitted, that efforts ahould be made to carry the system out in all our standards. The importance of the clause in the Magna Charta, and expressod in an old linglish law of older date, is not folly felt, that there shall be only one meastre and one ueight throughout the land. This has never been realized eitler in England or tais country; though many efforts have been made to introduce a common syatem. Commercial intercourse would be facilitated, and many of the embarrusamenta and delays woukd be obviated, could a system be made universal in all maritime countries. There is no bar to the introduction of such a system; for whatever difference there may be in the systems adopted or in tho notation used, yet they nre ail founded on the Arnbian numbers. All huve the same numerical system for a foumdation, though the superstructures nre vaulud. It would be scarcely practicable to introduce into the whole world a general system at once; but it is practiculie for the principal marltimo nations, who are so mueh Interested, te have a congress, and unite upori some completo system that would take the place of the many diajointed and empirical ones now in uso. 'Ihes rest of the world would follow in thene, from the fact that convenience and advantage are more than equal to custom. However, the principal end would be attained in $n$ short time-rommercial intercourss would be carriod on smong nations with one stanlard ; having, if ne ssaary, the motation admitted into eaph country affected by the language, but yet to be equivalent in values. It is a very interesting questlon what shall be the standuriy and one where rival claims can be brouglit forwarl, each standard of measure, of welight, and of colnage having some advantages; and it may he ditlicult to decide what are the hest. It seoms, however, to he ulmitted that the decimal division is the only perfoct one. It lreing atated as a general principle, that for convenlence a standard varying but littlo from some old standard, shoukl, if possible, be used.
II. The Natural Standard or Unit for the Base of the System. - In respect to coinage, our standard ci a dollar for a unit seems to answer every purpose, and is the most convenient of any in use in the world. So it will, perl.-ns, be sufficient to examine with respect to weights and nieasures. The standard or unit for measurement that would seem to be given bv nature, is the circumference of the earth taken at a givon latitude. We have there an unvarying base, and one alwaya practicable to measure. For convenience, we would naturally take a part of this circle, using any natural division. This is given to uat ance by the rotation of the earth on Its axis, and the arc a fixed star traverses in a given time, and then dlviding by a decimal division this time of rotation, gives a atandard of convenient length. Having to call in the aid of astronomy to determine this distance, the notation used in that science, of degrees and minutes, ctc., was naturally adopted. It was found that one degree, or 360th part of the earth's circumference divided into 60 parts, was abont equal to a nile of the old empirical aystem. A very amall change will be therefore necessary, taking this mile as a unit. From this unit a table is constructed that will give the most convenient medsures, with the least possible change from the old syatem, and one that could be adopted at least by the United States and Great Britain with ndvantage:
III. 1. General Table of New Lineal Measure proposed 10 tentbs

10 tnehos or 100 tenthe $=1$ inch.
6 fect or or in tenthes, $=1$ foot.
1000 fathoms or 6 inc $=1$ fithom.
$\begin{aligned} A_{0} \text { mithoms or } 6060 \text { feet } & =1 \text { mtle. } \\ & =1 \text { degre }\end{aligned}$
the merldan. thermomer trien generally used in France and other coun ries, having ite zero at the freezing point-the only invarlable point of temperature in nature-and its 100th degree determined by the temperature of boiling water, when the barometer stands at $24 \frac{1}{2}$ inches of the new lineal measure proposed to the adopted in preference to Fahrenheit's scalo. The barometer to be marked In inches and l0ths of the new measure. The new standard of lineal measure to he the fathom of 6 feet marked on a rod of lorass or other metal, and made equal to 6 fect 0.91548 lnch of our present measure at the temperature of $62 \cdot 6$ degrees of Fahrenhelt, or 17 degrees of the centlgrade thermometer. 'Thls proportion will make the proposed mile equal to $1012 \cdot 715$ fathoms of our present measure, being the meen length of the minute of a degree of terreatrlal meridian, according to Mr. Airy's treatise on the figure of the earth.-Kincy, Metro. Slould more extensive surveys of meridianal areas, since made or in progress, lead to a more accurate value of the said minute, it is proposed that the necessary correction shall be effected, not by changing the standard rod, but by altering the legal teinpernture to a higher or lower point than 17 degrees cehtigrado.

For mensuring worke of architecture and engineering, the foot and Its dechmal aubdivislons will he used, and ineasurements by 10 feet and 100 feet, and not by the yurd or rol.
2. For Land Measure.-The fathom to be the unit, and 1uth and 100th for fractions, and all equare-work to be so meusured:

1000 square fatbems $=1$ aere.
1000 acres $=1$ mile
3. For Sofid Measure.-The foot to he the unit: 1000 cuble inches $=1$ foot.
Liquids to be measured by solid measurements :
$\begin{array}{ll}10 \text { cuhle Inehes } & =1 \text { plat } \\ 100 \text { cuble Inehes } & =1 \text { galion. }\end{array}$
100 eubte gallons or 10 cuhte feet $=1$ barrol.
4. Measmes of IVeight Priposed.

10 tenths $\Rightarrow 1$ ounce
10 ounces $=1$ pound.
1 100) pounds $=1$ hundreil-weigits, 1 1000 pounds $=1$ theusand-welght, govo pouads

And 1 pound be the welght of 1-60th of a cuble foot of water at 17 degreea centigrade, and the barometer atanding at $24 \frac{1}{2}$ lnchea of the new lineal meaure. By this arrangement, 100 pounds will be equal to about 108 pounds of the preaent avolrdupois weight. All the weights for coins, bullion, apotheoariea' weighta, etc., be regulated by thia system, and all customs and dutlea collected by these tables. Thls wóvld aoon introduce the system withont any compulsory messures.
IV. Some of the Adrantages of the New System of Mfeasures and Weights.-The mile proposed is the nautical or geographical mile, and used exclusively for the purposes of navigation by all the maritime nations, and inserted in all the acales of charts and maps of the world, is the only universal measure now recognized. Also the weights, as well as the measures, are decimal parts of the unlt, as far as can be, without a total change of our present aystema. The French metrical aystem has proved a failnre practically. Theuretically it is perfect ; taking the degree for a unit, and using the decimal divislens throughout. But our whole notation in astronomy and navigation is founded upon the division of the degree into 60 parts, and we can not have a complete change untll we manufacture our clocks and watchea so as to mark thtue by decimal divisions, and change our hours and minutes into corresponding 10 ths and 100 ths; in facs, abandon entirely our present system. This is too great a change ever to be practlcable, especially where so many different people have to conform. The ayatem that has been proposed, only introduces the decimal divisions into the atandards already adopted, and is not only practicable, but the change can readily be made, as in the case of our coinage. It will be sufficient to convince the most akeptical of the necessity of a change, to make an examinution of the tablea of weights, measurea and coins in the world. And as no better time to correct an evil can be had than the present, it is hoped that our government will lead the way $\ln$ so useful a change. The British government have alrealy taken measures to have an examination and researches made for this object, as muy be seen from the following:
"Sir John Wrottesley brought the decimal system of coinage, weighta, etc., before Parliament, February 25 th, 1824 , but it was not till May, 1838, that a conlmission of inquiry was appointed at the inatance of the then Chancellor of the Exchequer, Mr. Spring Rlee, since Lord Monteagle; and in June 20, 1643, another commission was upwointed; they both consisted of eninent scientilio men, and both reported atrongly in fuvor of the change. A committee of the llouse of Commons reported to the same effect, August 1st, 1853. Mr. Gludstone, however, whils admitting the advantages of this asstem, thought its introduction premature. In June, 1854, an associatlon was formed for the purpose of oltaining the udoption of the syistem. In July, $180^{\circ}$, the cominissloners for inquiry were again appointed." See Weights and Measures. See Bankers' Jfagazine, N. Y., 1856 ; Bunkers' Register, N. Y., 1857.

Declination of the Needle. Professor Christopher Hansteen, of Christiana, in Norway, Is the persen who has given, probably, the grentest limpuise, in recent times, to the elforts to methodize the facts anil laws of the earth's magnetism. M. llansteen was born September 26, 1783, and is I'rofessor of Astronony in the University of Christlana, and Hirector of the Observatory. Hia dissertation, entitled Jaymatismus der Firdo, published in 1819, whith recoived a prize from the Royal Danlsh Acadomy, recapltolated all the authenticated facts obtained by voyagers and others, from the eurliest times. It will he recollevted that llalley had represented the nagnutic variation at different parts of the globe lig llnes traced on Mercator'a chart, and passing through all the places where the variation (or declination) of the needlo from the
true north was equal ; and being well aware of tha progresaive (or secular) changea in the course of these lines, he prepored the hypotheais of 2 palrs of magnetio poles interior to the globe, of which 1 pair rovolve. slowly.

Profesaor Hansteen alao conatrueted charts of the lines of equal dip. In certain positiona between the tropics the dip la nothing, or the freel $y$-auspended mag. netle needle remains horizontal. The line connecting these placea ls called the magnetic equator lt is an undulating line, inclined somewhere near $12^{\circ}$ or $13^{\circ}$ to the terreatrial equator, and cuttling it in 2 points, not exactly oppoaite, bint in about $3^{\circ} 20^{\prime}$ and $174^{\circ} 80^{\prime}$ of E. long. from Paris, according to Admiral Duperrey's observations in 1825. The position of these nodes is, however, variable. The north end of the needle (as in well known) dips more and more in the northern hemisphere, until in a certaln place it becomea vertical, when therefore the horlzontal componont of the magnetic force la nothing, and the commen compasa lases altogether lts diractive power. Similar phenomena occur in the aouthern hemisphere. Lines of dip of $10^{\circ}, 20^{\circ}$, etc., may be drawn, and where the dip is $90^{\circ}$ there is a true magnatle pole. The best observations serve to show that there is but one such true pole in each hemisphere.-E. B. Preliminary Dissertation, by J. D. Fonnes, F.R.S.

Deed is a written contract, sealed and delivered. It inust be written before the aealing and delivery, otherwise it is no deed; and, after it is once formally exccuted by tho parties, nothing can be added or interlined; and therefore, if a deed be sealed and deliv. ered, with a blank left for the sum, which the obligee delivers up after sealing and delivery, this will make the deed void. A dced must be made by parties capalile of contracting, and upon a good consideration, and the subject-matter must be legally and formaliy set out. The formal parta of a deed are the premises containing the number, names, additlons, and titles of the parties, the covenants, which are clauses of agreement contained in the deed, whereby the contracting parties stlpulate for the truth of certain facts, or hind themselvea to the performance of some specific acts; the conclusion, which mentions the execution and date of the deed, or the thme of ite being given or exccuted, either expreasly, or with reference to bone day and year hefore-mentioned. Every deed must he founded upon good and sufficient consideration, not upon an ustirious contract, nor upon fraud, collusion, either to docelve bona fide purchasers, or just and lawful creditors; any of which conslderations will vacate the deed, and sulject the parties to forfeiture, and in some cases to imprisonment. A deed, also, without any consideration, ls void. A deed must be executed by the party himself, or by another for him in his presence, or with hls direction; or, in his absence, by un agent authorized so to do by another deod, alse under seal; and In every such case, the deed must ise made and executed in the name of the principal. A deed takes effect only from the day of delivery; and therefore, if it have no date, or a date impossible, the delivery wifi, in all cases, ascertain the date of it ; and if nnother party seal the deed, yet, if the party deliver it himself, he thereby adopts the soaling and slgning, und by such delivery makes them beth his own. The delivery of a doed may ho alleged at any time after the date; bot unless it be sealed and regularly delivered, it is no deed. Another requisite of a deed is, that is loe properly witnessed or atteated. The attestation in, however, necessary rathor for preserving the evlijenco than as intrinsically essential to the validity of the instrument. There are four principles uinpted by the courts of law for the exposition of deede, vla.: 1 . That they bo beneficial to the grantec, or person in whose favor they are intended to operate. 2. That where the words may be employed to some intent, they shall not be void. 3 . That the words be con-

## DEL

strued according to the meaning of the parties, and the Intent of the parties be carried into effect, provided such intent can possibly atand on a law. 4. That they are to be expounded consonantly to the rules of law, and reasonably, without injury to the grantor, and to the greatest advantage of the grantee.-F. A.

Degree of Latitude is the space or distance, on the meridian, through which an observer must move to vary his latitude by 1 degree, or to Increase or diminish the distance of a star from the zenith by 1 degree ; and which, on the supposition of the perfect sphericity of the earth, ls the 360th part of the meridian. The length of $a$ degree of a meridian, or other great circle on the surface of the earth, is variously determined by different observers, and the methods made use of are various; and, therefore, without entering into the history of all attempts of this kind, we shall present our readers with the following
tanleg of tife difpragnt Lengtua of a Degaga, as measuegn in various Pahts or tile eanti, chis tina of its measuagenent, the latitude of its midder point, btc

Degree of Longitude is the spaco between 2 meridians that make an angle of $1^{\circ}$ with euch other at the poles, the quantity or length of which is variuble according to the latitude. The following table expresses the length of a degree of longitude in different latitudes, supposing the earth to possess a perfect sphericity :

| Lat. | Miles. | Lat. 1 | Miles. | Lat. | Mile ${ }^{\text {a }}$ | Lat. | Smles. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

A degree of the meridian on the surface of the globe has been variously determined by different observers. M. l'icart measured a degree In the latituds of $49^{\circ} 21^{\prime}$, and found it equal to 57,060 French tolses. But the French nuthematicians who examined Pleart's operations, found that the degree in that latitude is 57,183 toises. Mr. Norwood measured the distanco hetween London and York, and found it 905,751 English feet, and finding the differonco of latitudes $\mathbf{2}^{\circ} \mathbf{2 8}^{\prime}$, determined
the quantity of 1 degree to be 867,196 English feet, or 69 English miles and 288 yards. Msupertuis measured a degree in Lapland, in the latitude of $66^{\circ} 20^{\circ}$, and found it 57,438 toises. A degree was measured at the equator by other French mathematlelans, and found to contain $56,767 \cdot 8$ toises. From these measurements it appears that the earth is not a sphere, but an ollate spherold.-E. B.

Delaware, one of the middle United States, next to Rhode Island the smallest in the Union, and in population the least, is bounded north by Pennsylvania, east by Delaware River and Bay, south and west by Maryland. It Is between $38^{\circ} 27^{\prime}$ and $39^{\circ} 50^{\circ} \mathrm{N}$. lat., and bet ween $75^{\circ} 04^{\prime} 42^{\prime \prime}$ and $75^{\circ} 56^{\prime} \mathrm{W}$. long., and between $1^{\circ} 13^{\prime}$ and $1^{\circ} 57^{\prime} \mathrm{E}$. long. from W. It is 92 miles long and 23 broad, and contalns 2,120 aquare miles, or $1,356,800$ acres. The population in 1790 wan 59,094 ; in 1800, 64,272; in 1810, 72,674 ; $\ln 1820,72,-$ 749 ; in 1830, 70,739 ; la 1840, 78,085 ; in 1850,91, 532.

Early History,-That Delaware Bay was already known to the Spaniards a long time before Hudson, there is no doubt. But the question is what they called it. Benson, in his memeir on the names of the State of New York, says that they called it The Bay of all Saints. Ilo does not give his authority. In the most ancient Spanish deacription of the east coast which wo have (that of Oviedo), this "Bay of all Saints" is not mentioned all. But Oviedo mentions a Bahia de $S$. Christoval on the east coast, and says that it stands under $39^{\circ} \mathrm{N}$. lat. This is nearly exactly the latitude of Deloware Bay, which therefore probably is designated by him under that name. If it is true that tho Spanish Cabo de las Arenas is our Cape Henlopen, then that large bay which the Spanish maps invariably paint immediately to the north of this cape, must be Delaware Bay. The figure which they give to this bay, as well as to the river which they make run into it, corresponds with the configurstion of our bay and river. Often we find on the maps the name given by Oviedo-that of Bahia de S. Christocal or Chripstoval (St. Christopherus Bay), written to it. So for instance on a Spanish map of 1580, so on a French map nude after a Spanish original of 1587 ; but sometimes other names appear here; for instanco, that of Bahia de la Buelta (Repulse Bay), or that of Rio de S. Antonio, probably only because the map-makera confounded all those names in a mest irregulur way. Aa to the Spanish navigator who brought home the sketch of our bay, and guve it the name of St. Christopherus Bay, there la yet some doubt.

The first navigator whom we can provo to have been at the entrance of the bay, is IIenry IIudson, when (1609) he sailed along the coast from Chesapeake Bay toward the north. Ile looked into the bay, found it full of shoals, did not explore it, gave to it no name, and "suspected, from the carrents which came out from it, that there was a river leading into it." It ls pretty generally said that Lord Delaware, when (in the year 1610 ) ho sailed to Chesapenke Bay, was thrown ont of his way and tonehed at this bay, and that it was therefore called by him, or by his companlons, and tho first English settlers in VIrginia, Delaware Bay. This was not only the first English, but upon the whole the flrst nume under which the bay became more generally known ln Furope. We see it for the frst time mentioned and written in the letter of Cuptain Argall, of tho year 1612, in Purchas' Pilgrlms. The old Virginian writers spelled or corrupted the name in very different ways. Sometimes they write " My Lord Delaware's Bay," sometlmes Delavar Bay, and sometimes Delawore Bay. Later French mapmakers (for instance Bellin) made of this Ray Delanare or Layar. The first mop on which we find this name, is a little map of the greater part of the east coast by Captaln Smith, of the year 1624. Fot the first time, pretty well drawn, the bay is to be found on the first map of Maryland, of the year 1635.

## DEL

After Hudson and Lord Delaware, Dntch akippers and navigators were the first who entered this bay. The Datch Captaln Hendricksén salled (1618) np into the bay and river as far as Schuylkill river. Captain Cornelios May entered the bay 1623, explored 1t, sailed up in the river ss high at least as the present site of the city of Philadelphia, and built there a fort called "Fort Nassau." The hay was from him called "New Port May." The river was called by the Dutch Zuydt rivier (the South river), with respect to the second great river of the New Netherlands to the north (Hudson's river). It is not evident, hat it is probablo that the Dutch commenced at once after ILudaon'e discovery to deaignate the river under that name. The first book In which the name Znydt rivier is mentioned and printed is the "New World" of Lait, 1624. From the river also the bay was generaliy called Zuydt Buy, the Nouth lay, and this uame becane among bu Dietch es common thet the otiner name, New Port siuy, was soon forgotten. Another Dutch nume for the bay was that of Godyn's Bry, from the well-known Amsterdam merchant, Samu:l Godyn, who purchased from the Indians Cape May, and a sract of cnns ${ }^{+} r y$ from this cape along the shores of tou bay. Other Dutch names of this river sornetimes used were siossar rivier, Prince Hendrick's ririer, an : Charles rivier. Tuis latter name was in uae as well among the English as among the Duteh. We find in an English document of the year 1648 , the name Delavare or Charles river. And so we find on the Italian map by lucini, taken from a Dutch original In abont tho year 1631, the name Rio Carlo. We do not know in honor of which Charles the river was so called. The English clalmed the bay and river in consequence of Cabot's and Delaware's discovery, and from different other reasons. The Dutch claimed it from IIudson's discovery, and took possession of it ahout 1623 , through Captain May. In the year 1629 they built another fort there, called Swanandael, and 1633 the gre:t navlgator, David Pletersz de Vries, entered the hay and river, explored it, and msde there also a temporary little settlement, Fort Upland.

But all these Dutch settlements disappeared again, and were partly deatroyed by the Indians, and the river and bay were without any hnbitation from 1633 to 1638 , when at last the Swedes entered it under Peter Minult, Minuct, or Menewe. They chaged the who'e geography of the bay and river. Tho river was under them called The New Streileland Straam, and the bay Vew Swedeland Bay, and the Swedes erected also new forts and gave Swedish names to the old Dutch forts, which they partly rebuilt. The greater number of the Ewedish and Dutch setllements on Delaware river and bay were made on the western shore, and thls first Dutch and Swedish population formed from the beginuing a peculiarly situated commnuity. What since 1638 was called New swedeliond, comprised principally the teritory of the present State of Delaware. The Swedos remained 17 years in possession of the river and hay, and one of their engineers, Linilstrom, who accompan: $n$ d the Swedish governor lisiug, in the , aar 1054 , made a minute exploration and the first special map of the whole. In the following year, 1955, however, the Dutch governor of tho New Netherlands, Stuyvesandt, appeared with sorae men of war in the bay, and snidued the whole little New Sweden to the Dutch. They reintroducad the oll and some new Dutch names, but retainerl possesaion only for 9 years. When the English (1664) conquered this land from the Dutch, it was, until 1681, attached to the great province of New York. But durink; the aame time the founders of Maryland considered it to be comprised under this namo and to be a part of their colony of $\mathbf{3} / a: y-$ hand. Ic this period were formed the 3 oountles of which the State still today consists, and the whole tract was usually called the thrce lover counties on th. Deliguare. In tho year 1681 William Penn bought these 3 coun-
ties from the Dake of York, and they made now a part of Pennsylvania, under the naual name of The Territories of Pennsylvania, or the Three Lonver Counties. They remained in connection with Pennsylvania until 1776, when these territories separated from Pennsylvania and declared themselves independent, under the name of the State of DelowardinJ. G. Koisl.

A somewhat elevated table-land passes through a portion of the State from north to south, dividing; the waters which fall into Chesapeake Bay from those which flow into Delaware Bay. This table-land contalns a chain of swampe in the western part of this State, from which lts princlpal streama originate. The soil in the north ls a strong clay: Along Delaware River, and for about 10 milea weat of it, the soil is generally a rich clay, well adapted to agriculture; but between this and the swamps the soil is light and sandy. Proceeding toward the eonth, the soil hocomes more sandy, and in Sussex county sand greatly predominates. Krolinu, or poicelalu clay, is fond in the nor hern $f$ - tion, bog-iren ore in the southern, and shell marl throughout the State. Thero were in $18: 0$, 580,862 acres of land improved, and 375,282 of unimpreved in farms. Cash valuc of farms, $\$ 18,830,031$; aud the value of implements and machinery, $\$ 510,279$.
Live Stock, ctc.--IIorses, 13,852 ; asses and mules, 791 ; milch cows, 19,24d; working oxen, 9,797 ; other cattle, 24,166 ; sheep, 27,503 ; swino, 56,261 ; value of live stock, $\% 1, \mathrm{~b} 19,281$; of daughtered animals, $\% 373$,665.

Agricultural Produr 's, etc.- Wheat, 482,511 bushels; rye, 8,066 ; ${ }^{\text {rydiar corn, }} 8.145,542$; oats, 604,018; surey, 56 ; buckwheat, 8,615 ; peas and beans, 4,120 ; petatoes, 240,542 ; eweet potatoes, 65,443 ; value of producta of the orchard, 846,574 ; produce of market gardens, 212,714 ; pounds of butter made, $1,055,308$; of cheese, 3,187 ; molasses, 50 gallons; beeswax and ioney, 41,248 pounds ; wool, pounds produced, 57 ,768 ; flax, 11,174; hops, 848 ; luy, tons of, 80,159 ; clover-sced, 2,525 hushels ; other grass seeds, 1,403 ; flax-seed, 904 bubiels; and were made 145 gallom of wine; value of home made mannfactures, $\$ 38,121$.

Manufactures, etc.- There were in the State in 18i0, 12 cotton factories, with a capital invested of ${ }^{\mathbf{w}} \mathbf{5 8 5}$,100, cmploying 413 males and 425 fomales, producing $5,205,000$ yards of sheeting, etc., valued at $\$ 538,439$; 5 woolen factories, with a capital Invested of $\$ 1 / 6,500$, employing 113 males and 80 females, munufacturing 157,000 yarils of cloth, valued at $\$ 244,510 ; 13$ estal)lishments making pig-iron, with a capital of 8373,500 , employing 250 persons, and making 8,630 tons of castings, ete., valucd at $\$ 206,462 ; 2$ estebliaments, with a capital invested of $\$ 15,000$, employing 60 peraons, mannfacturing 550 tuns of wrought iron, valued at 855,000; 70 tlouring-mills, 83 saw. milis, 16 tann ${ }^{\text {a }}$-s, with a capital of $\$ 99,350$, employing 108 persons; value of products, 9163,$742 ; 8$ printing-ofices, issuing 2 semi-weekly, and 8 reekly nowspapers. Capital invested in manufactures, $₫ 2,978,945$; value $\boldsymbol{t}^{4}$ manufactured aiticlen, $4,64,2,206$.
'The principal jort is Wilmingtur. a port of entry, and the primipal commercial town of the State, situated hetwee Brandywine and Christiana Creeks, 1 mile abeve their junction. On llrandywine Creek are sound of the fincst flouring-milly in the Unitel stases, to which vesaels drawing 8 feet wator can come. Christiana Creek is navigable for vessels drawing 14 feat of wator, and gives to Wilmington considerabin commerce. The tonnage of the port in 1856, was 13,Gi5 tons. The foreign :rale of Dillaware is evected chiefly through Maltimon; New York, and Philadelphia, esracially the last; tl :at its direct foreign commerc. is very inconsiderable. Darirg 1850, 16 vessols were built, of an aggregate burden of $1,8.18$ tons, viz., 12 schooners, 3 sloyps, and 1 steamer. The Chesapeake and Deleware Canal connects theso ifro bays.

Formon Commetog of fele 8tath of Delawarll yrom Ootober 1, 1820, to July 1, 1850.

* Niae months to June 30, sad the fiseal year beglas July 1 ,

Dedaware Bay, at the month of the Delaware Bt.er, is a lnrge arm of the sea, 75 miles long, 20 miles wile between Gape May on the north, and Cape Menlopen on the south, and 31 miles wide in the middle. The bavigation is difficult and dangerous, being interrapted by many shoals. Its low and sandy shores were without harbors until the construction of the Delaware Breakrater within Cape IIenlopen.
Delaware Breakwater. This breakwater is situated at the entranco into Deluware Bay, near Cape IIenlopen. The anchorage ground, or roadstead, is formed by a cove in the southern shore, directly west of the pltch of the cape, and the seawarl end of an extensive shoal called The Shears. The entrance from the ocean is 1,950 fcet in wilth, and is accessible during all winds from the sca. The depth of water is fiom 24 to 80 feet deep, at low tide, throughont the harber. There are two lykes, one of 1,500 feet, and the other of 6,000 feet, giving a secure harbor of seven tenths :a, q square mile. The olijects of this artificlal harbor are to protect vessets from winds from east to noth-west, by way of north, and ngainat the flonting leo of the bay.

Dela soare River, a river of the United Statea, which rises on the west alde of the Catskill Mountain', State of New York, and after separating Penusylvanla from New York nud New Jersey, talls intes the Delaware Bay 5 miles below Newenstle. It is formed by the taion oi two streams. The Mohawk, or westem and main branch, rises from a amall lake in Jatitude $42^{\circ} 45^{\prime} \mathrm{N}$.. at in nlevation of 1886 feet above the sen, and fows south-west for uearly 50 miles, when it turas auddenly to the routh-enst, flowing in that direction for 5 miles to the Pennsylvania boundary linn in latituder $42^{\circ}$ N. Eight miles below this spot it is jolned by the Popacton branch, whleh has a previoud sonth-west course of about $\tilde{0} 0$ milea. After the union of these two otreams, the river pursues a winding south-
east course hetween New York and I'eunsylvania for 60 miles to the north-west corner of New Jersey, where it receives the Neversink River. It then turns sontli-vest, along the loase of the Kittaning range, for 35 miles, in passing through which it forms what is called the "Water Gap," a great matural curiosity. The banks here rise precipitously from the wnter's edge to the height of 1,600 teet, overhung by immense masses of rock, and at the south-enst entrance loaving acarcely room for a rosd. The passage, however, widens toward the north-west. Its entire length is abont 2 miles. From this point it pursues a southenst and then a south-west course to Easton, where it receives the Lehigh, a large trihutary, from the west. A little below thi the river passes through Sonth Mountain, and hrs a south-east course to Trenton, 60 miles helow East on ; having in that distance 25 rapids, with a totnl fall of 165 feet. These falls sre nnvigable at high water. The river below Trenton turns to the sonth-west until near the bay, which it enters in a south-enst direction, aftet an entire course of 309 miles. It is navignble for vessela ef the largest class to Philadelphia, 10 miles, and ior sloops 85 miles further, to Trenton. Above the fulls at 'Trenton it is navigable for boats of 8 or 9 tons for 100 miles. The Delaware Is egnnected with the Hudson Kiver and tho bays of New York by the Delaware and Itudson Canal, the Morris Canal, and the Delaware and Raritnn Canal.

Del Credere Counmission. All agents who aell soods fur thoir princlpals, and guaranty the price, are suid ubroad to act under a del credere commission. In the United States, this phrase is seldom need, nor is stsh graranty usually given, except by commisslon merch. ats, And where such guaranty is given, the factor ls still but a surety; so fur that his employers must firat huve recourse to the prineppl telitor. But his promise is not "a promise to pay the debt of another," within the atatute of frauds. Nor does he
guarsnty the safe arrival of the money received by him in payment of the goods, and transmitted to bis employer, but must use proper caution In sending lt. If he take a note from the purchaser, thls note is bls employer's ; and If he take depreclated or bad paper, he must make it good.-Parsons on Mercantile Lae, ch. X., p. 159.

In mercantlle law, a term derlved from the Itallan (credere, to trust), which denotes a commlsslon granted by a merchant to a factor to dispose of goods; the factor, for the consideration of an additlonal perceatage, agreelng to guaranty the solvency of the purchaser.

Delft or Dolf (German, Fayence, Unachtes Porzellun; Duteh, Delfa porcelyn; French, Faienbe), a coarse specles of porcoluin, originally manufuctured at Delft, whence its name. It la a kind of pettery of haked earth, covered with an enamel of white glazing, which gives it the appearance and neatness of porcelain. Some kinds of this enameled pottery differ from others, either in their austaining sudden heat without breaking, or in the beanty and regularity of their forms, enamel, and the painting with which they are ornamented. In geaeral, the fine and beautifullyensmeled potteries, which approach the nearest to porcelain in external appearance, are, at the same time, those which least reslst a brisk fire; while those which sustain s sudden heat are coarse, and resembio common pottery,

Demand and Bupply are terms used in political economy to express the relutions between consumption and production-between the demand of purchasers and the supply of commodities by those who have them to sell. The relations between the demand for an article and its supply, determine its price or exchangeable value: the relntlons between the demand for labor and its supply, determine the anmount of wages to be earned by the laborer. For causes explained elsewhere, the price of an article will rarely vary, for any length of time, very much above or below its cost of production; nor will the wages of labor, fur any leagth of time, much exceed or fall below the amount necessary to maintain laborers and their families in such comforts as their lubits of life have accustomed them to believe necessary for their subsistence; but bearing In mind that, in the prices of commodities and labor, there is a certain print, determined by canses independent of demand or supply; above or below which prices can nut materially vary for any consideratile time: all variations of price, if the medium in which they are calculated remsin unchanged, may be referred to the proportion which exists between the demand for commoditles und the supply of them-between the quantities which purchasers are willing and able to buy, and the quantities which producers are able and willing to sell.
'lo have any influence upon prices, a demand must be accompanied by the means of purchasing. A demand ls not simply a wunt-a desire to otitain and enjoy the products of other men's labor; for if this were its meaning, there would never be the least proportion between demand and supply : all men wouhl always want every thing, and production coull not keep pace with consumption. But an "effective domand," as it is termed by Adam Smith, exists wherever one man is anxious to exchange the products of his lator for that of other men. It is, therefore, of an effective demand only that politieal economists are epeaking when they exanine the circumstances of denand and supply lin connection with prices.
But although a demand, without the means of purchase, can not uffect prices, the universal desire of mankind to possess articles of comfort and luxury suggests other important considerations. As this desire is natural to man, and too often is so strong as to tempt him even to cominit erime, it obvionsly needs no encouragement; men will always gratify it whenever they have the means, and these means consist in
the products of thelr own labor. Hence all that is required to convert thls desice of nequisition inte an effective demand is umple employment for ladustry. Increase the production of all commedities and an Increased consumption of them ls the certaln result; for mea, having larger products of their own latior to offer In exchange for the products of other men's labor, are onabled to purchase what they are always eager to acquire. Production, therefore, is the great object to be secured, not only as furnishing a supply of commodities necessary anil usoful to mankind, but also as creating an effectivo demand for them. When trade Is depressed by u languld demani, It is commonly said that increased consumption is all that is requiral to restore its prosperity. But how is thas consumption to be caused? The desire to consume is invariathe, and thus any falling off in consumption must be attributed to a diminished production in some departments of Inilustry wulch canses an Inability to consume. When production is restorel, nu effective demand for all articles will immediately follow; but until the productlve energies of the consumers are in a state of activily, it ds In valn to expect from them an increased demand.

These considerations lead us to the coaclusion that a universal glat of all commodities is impossible. The supply of particular commodities may easily exceed the demand for them, and very often does exceed it; but as the constant desire to oltanin commodities needs nothing but the power of offering other commodities in exchunge, to become an effective demand, it is evident that a unlversul increase of production is necessarily accompanied by a proportienate increase of consumption. Men are stimulated by no love of production for its own sake, but they produce in order to consume directly, or because, by exchanging their produce with others, they are uble to enjoy the various comforts and luxuries which they are all desirous of obtaining. Active proluction, therefore, in all departments of industry, causes a general and effective demand for commorlities, which will continue to be equal to the supply unless it be checked by war, by restrictions upon commerce, or by iti!er circunstances which prevent a free interchange of commoditiea.

A country is in the highest prosperity when there is an active und steady demand for commodities and lithor, and a sufficient supply of them. Any disturbance of the proportion between one and the other is injurious to the community; and the injury is greater or less according to the extent and duration of such disturbsnce. When the proportion is well adjusted, the whole community derive benefit from the circumstance, both ns prolucers und consumets; whea it is disturbed, they are injured in both cupacities.

Ilaving descritied, thus generally, the nsture and causes of demand, and its intimate connection with sopply, it becomes necessary to examine the influence
demand and supply upon one another, snd upon production, consumption, prices, and profits. This intluence varies uccording to the circumstances of the market, and the nature of the commodities to which its law may the applied. These may be lest understood ing considering, 1nt, the effects of a demand exceeding the supply; anl 2 dly , of a supply exceeding the demand.

1. The firnt effect of a demand excueding the sopply of a commolity, is to raise its price. As more persons want to buy the commodity than the producers ure uble or willing to supuly, they can not all ohtain what they desire; but must slare the supply betwoen them in some manner. But their wunts uro very much rogulated ly the cost of gratifying them. One man weald purchase un article for $n$ dollur for which he ray be unwilling or unable to pay iwo ; while others, rather than forego the purchase, will consent to pay that amount Those who have commodities to sell, finding that they havo more cuatumers than they ean

satisfy, inmediately Infer that they are selling them too cheaply, and that they could dispose of ail their stock at a higher price. The price is accordingly ralsed, when the sale beesmes limited to those who are nut restrained from buying by the incrensed price. In principle, though not in outward form, the market is in the nature of an auction. The sellers endeavor to obtain the highest price for their goods; the price risea with the eagemess of those who wish to buy, and the highest bidders only secure the prizes. In the market, however, the competition of the buyers is not perceptible among thamselves, except through the prices demanded. Their competition determines the prices, but the sellers judge of its extent, and regulate their demande so as to obtain the greatest possible advantage from it.
Some commodities are positively necesasary for the enpport of the people, of whieh the supply may full vary short of the demand and be lneapable of increase. This is the case when there is a ball harvest in a country wisich is excluded from a foreign supply by war or hy fiscal restrictions. IIsre the price rises in proportion to the deficiency of the crops. The competition for food is universal. Some, indeed, may be driven to the consumption of inferior articles of food, and ethers to a diminished consumption; but all must eat. The number of consumers is not diminished, while the supply is reduced 1 and the price must, therefore, rise and continue high untll a fresh supply can be obtained. In a siege tine compaticion is still greater. The prices of provisions become enormous; the rich alone can buy; the poor must starve or plunder.
A similar effect is produced if the smpply, without being leficient, be contined to the possession of a sinall number of persons, who ilmit it to the consumers in order to secure higher prices. However nbundint corn might be in a besiaged town, if ons man were exciasiveiy nuthorized by law to ssil it, it might rise to a famine price, unless the people broke into the granaries, or tho government interfered with the monopoly. Less in degree, but simiinr in principle, is the effect upon prices of every iimitution of the market by fiscal restrictions. When nny sellers are excluded, the others aro enabled to raise their prices.
These are cases in which the supply can not be incressed to meet the demand, or in winich the supply is monepolizsd. But the greater number of commodities may be increased in quantity, and the supply of them is not artificially limited. The price of thens alse rises when the demand exceeds the supply: but the ir reseed price raises the profit of the producer, and attracts the competition of others in the market. Fresh capital and lator are nppiied to the production of the profitable articie, untli the supply is aecommodated to the demnnd, or exceeds it. The prices gradusily fall, and nt lengti the profits are reduced to the ama ievel as the profits in other undertakings, or even lower. The encouragement to further jroduction is thus witbdrawn, and prices are aijusted so as to secure to the producer the ordinary rato of protits, and no more.
llut nometimes the demund for in commodity is diminished, if the supply fall short of it for any consideralie time. Thers are various articles usefui and agrecabie to mankind, but not ogsentini to their existence, which they are eager to enjoy as far as titey cam, but fur which they are nit prepared to make grent sacritices. When tite price of an articie of this description is raised by a deficient supply, continuing for some leugth of time, it is piaced beyond tho reach of many persons who learn to regnrd it with Indifference. They woulu huy it if it were cheap; but as it is dear, they go without it, or are satisfied with a suhatitute. In this menner the number of consumers is diminished. Others again, who will not be deprived of an accustomed luxury, enjoy it more sparingly, and consumo it
in lesa quantities. But so long an the supply io not increased, the price will continus high, bseause the consumers who atill purchase the articie, not withstanding ite price, keep up an effective demand equal to the whole supply; while there is still a dormant demand, only a waiting a reduction of price to become effective.

For the same reasons, a demand for articies ia diminished when their price is artificially raised by taxation. The demand is gradually confined to a emaller number of persons, and many consume more aparingly.

In these various ways demand and supply become adjusted through the medium of price, whenevar the one exceeds the other. This is the result of natural laws, the operation of which is of the highest value to mankind. If the supply be incapable of incresse, it economises consumption; if the supply can be increased, it encourages production. In either case, it la of great benefit to the consumer. To revert, for a moment, to the exnmple of a bad harveat, in a country sxcluded from all foreign supply. Suppose that prices did not rise, but remained precisely the same as if the harvest hed been abundant, what would be the consequence? The whole population would consume as much bread as usual, and use flour In every way that luxury points out, unconscious of nny scarcity. Farmers might even feed their cattle with wheat. By reason of this Iniprovidence, tho whole of the corn would be consumed befors the next harvest, and the horrors of famine would burst, without any warning, upon a people living as if they wers in the midat of plenty. This evil is prevented by a rise of prices, which is a symptom of scarcity, just as pain is a aymptom of disease. By timely precaution the danger is averted. A high price renders providence and economy compulsory, and thns limits coneamption. The supply, therefore, instead of being sxhausted before the next harvest, is sprend over the whole year. In the case of food, it is true that such economy is painfill and presses henvily upon the poor: but this evil is a mercy compared with famine. If no privation had been endured before ocarcity became aisming, none but rich men could buy a ioaf: for every one who had a loaf to sell, would be risking his own life if he sold it.

These observations are also applieable in some mensuro to cases in which prices are raised by the supply being confined to one or to a few persons, who have contrived to buy up the whole or nearly the whole of any commodity. But such exclusive possession (sometimes improperly called a monopoly) can not exist, for eny length of time, in articles of which the suppiy is enpable of increase. The extreme case has been put of a besieged town, in which the whole suppiy of corn was monopolized by one man. Under those circumstances of course lie would demand a high price; but unless his exclusivo supply were upheld by law, it does not follow that the inhabitants would suffer on that account. A most provident consumption of food is nbsolutely necessary for the defense of a town, and no orgonization conid distribnte provisions accoriing to the wants of the people so well as a system of purchase restrcined hy a high price. It must also the recollected that, without any such exelusive possession, the fuct of the siege alone must raise prices by cutting off fresls supplies. If the siege continte, provisions are more likely to hast ont by the inatrumentaiity of prices than by any other means. At the same tinie the soic possessor of the corn would be restrained from keeplng back the supply beyond the actual necessity of the oceasion by many considerations. He would know that if a popular tumult arosa -if the tow $n$ were rolieved, the siege raised, a capituIntion agreed to, or the pinco suddenly carried by assanlt-the value of his exclusive property would be destroyed. Ifis own interest, therefore, is coincident with that of the people. It is better for both tiat the

## DEM

supply should be meted out with parsimony ; it is dangerous to both that it should be immoderately atinted.
In clrcumstances leas peculiar than these, very little ovil can arise from nn exclusive possomion of any commodity not protected diractly or indirectly by law. If the supply be capable of increase, and the demand lee sufficient to enaine the owner to aecure a high price, for reasons already explained, the market would rapidly be aupplied from other quarters. If the supply can not be increased, that fact alone wonld ralse the price: and it is probnble that the supply would not have been se grent without the extraordinary activity of the capitaliet who had been able to esenre for hls country the whele accessinle supply to he collected trom the markets of the world.

A monopoly, properly so called, is of a totally different character: for, however abundant the supply of an article may be, it may, neverthelese, be inaccessible to the consumer.

When prices are high by reason of the demand exceeding the supply, it is by no means necessary that the profits of those who sell the dear commodities should always be greater than the profits in other branches of trade. It must always be recolleeted, that where searcity is the cause of the high price, the sell. ors who demand it have the less to sell. Where scarcity is net the cause, hut the demand is great because the supply, notwithstanding the exertions of producers, can not keep puce with it, the profits are undoubtedly greater than usual, until the supply has been incrensed.
II. It is now time to consider the effects of a surfis exceeding the demand, and this division of the lng iry will require less elucidation, as the effects of such a condition of the market may be atated to be the veryreverse of those which we have just been examining. When there is more of a commodity than people are prepared to buy, its price must fall. Its cellers must offer it for sale at the price at which ther can indace people to purchase. All is now in favor of consumers. They are no longer bidding against each other: but the sellers are competing among themselves to get rid of their goods. The price falls generally in proportion to the excess of the quantity, but this result is very much qualified by the nature of the article. If there be an excess of supply in perishable goods, there is nething to prevant the natural fall of prices. When fish is unusually abundant, it must be cheap, or a great part of it will he destroyed: it must be enten at ence, or not at all; and to induce people to eat it, it must be offered to them at a low price. But with artieles which may lie held back, in expectation of higher prices, their value may be partially sustained. Production may be reduced, and the atock gradually brought into the market, until the supply has been equalized with the demand; and wherever the article is such as to admit of voluntary increase or diminution, the patural result of an excessive supply is to reduce production, until the balance of suppiy and demand hus been restored. This mutual adjustment is In perpetual operation, and is ordlnarily effected with such precision, that it nuy be said, without exaggeration, that a large city is supplied exnctly with every thing its inhalitants requlre-even down to an egg or a pint of milk. There is always enough of every thing, and rurely too much.

Whenever there is an excessive production of any commodity, it is an evil almost as grent ns searcity. It is true that the consumer derives benefit from it, ont the producing elasses are most injurioukly affected. In order to raise the value of the produce of their lator, they must cease to produce, or must protuce in less quantities. The workmen are thus either deprived of employment altogether for a time, or are employed for a portion of their tine only, at relluced wages; while their employers are dispoeing of their goods at low prices, which scarcely rejay the outlay of their capltal.

Nor does the penalty of over-productlon fall exclusivaly apon these engaged in the trade in whieh supply has exceeded the demand. Thelr distresses exteni to ether elasees. It has been shown already that it is to productlon we must look as the cause of sastained consamption, and thus the prasanre apon any considerable branch of productive industry must be sensilily felt by those who have the produce of thelr own lator to sell. Production has falled, and consumption must therefore be diminished.

The ruinous consequences of gluts, in particular staples of trude and manufacture, are too well known, especially in this country, to require any further illustration; but their eauses are not always agreed upon. Such gluts are often attributed to the facility with which manufactures are produced by machinery; but we have ghown that over-production $\ln$ all branches of industry is impossithle; and if that be true, it is evident that when partial gluta are produced by the aid of muchinery, that powerful agent must have been misappliel. It is not contended that nothlng esen be produced in too great abundance. Whether machinery be used or not, production mast : governed liy the same laws of demand and supply. those thitus only must, be produced for which there ls a demund, and they must not be produced in greater abundance than the demand warrants. But the more generally nachinery is used, the more abundant will be the produets which men will have to exchange with each other, and therefore the hetter will be the market. It follows that machinery can only cause a glut when applied excessively to partlcular objects, precisely in the same manner as an excessive quantity of labor would cause one if applled where it was not needed by the demands of commerce.

The supply of markets is a very apeculative business, and is often conducted with more zeal than discretion. When a particular trade is supposed to be more prosperous than others, capitalists rush into it in order to secure hlgh protits; and in this country the abundance of capital, the perfection of our machinery, and the skill of our werkmen, enable them to produce with extraordinary faeility. Over-production in that particular trade is the consequence, and all enguged in it suffer from the depreclation in the value of their goods ; but if, instead of rushing into the favorite trade, they had distributed their enterprises more widely, their own interent and that of the community would have been promoted. When a ship is wrecked, if all the crew precipitate themselves into one boat, they awamp it; but if they wait till all the houts are lowered, anil apportion their numbers to the size of ench, they may nll reach the shere in safety. And so It is in trade : one trade may easily be glutted, while there is room in other trales for all the capital and industry that neel employment.

In proportion to tho extent of the mark and the variety and abundance of commodities he exchanged, will be the facility of disposing of the products of capital and labor; and this conaideration peints out as the most probsble antidete to gluts, a universal freedem of commerce. When the free interchange of commodlties is restricted, not only is a glut caused more easily, but its causes are mere uncertain, and depeailent upon unforesecn events. With the whole world for n market, the operation of the laws of demand and supply would be more equable, nal the univeranlity of the ohjects of exchange would make glats of rare occurrence. The market would still le liable to disturbance by bad harvests, by errors in the monetary syatem, !y shocks to public credit, and 15 war; butupart from these caunes of derangement, demand and aupply would be adjusted, and the productive energles of all nations called into full activity.Botin's C'yclo. Po!. Eeon. ; Adam Smiti, llealh h f Nations, hook 1.; M'Cvlsoon, Principles of Politictl Economy, part i., ch. 7, and part ii., ch. 1, 2; Male

thut, Principles of: Political Ecomomy; Ricardo, ch. 30; Mils, bissays on Uneettled Queations of Political Liconomy, Fosay il.

Demurrage, in commercial navigation, is an allowance made to the master or owners of a ship by the freighter, for detaining her in port longer than the period agreed upon for her adiling. It in usually otipulated ia charter-parties and bllis of lading, that a certain number of days, called running or working days, shail be allowed for receiving or discharging the carge, and that the freighter may detain the vesael for a further apecifial time, or as long aa he pleases, on puyment of so much per diem for such over-time. When the contract of affrelightment expressly stipnlates that so many daya shall he allowed for diseharging or recelving the cargo, and so many more for overtime, such limitation ia Interpreted as an exprese stipulation on the part of the frelghter, that the veasel shall in no event le detained longer, and that if detuined he whil be liable for demurrage. Thia holda aven In casea where the delay la not occastoned by any fault on the freighter's part, luut is inevitable. If, for example, a ship be detuinel, owing to the crowded state of the port, for a longer thme than is allowed by the contract, demurrage is due; and it is no defense to as actlon for demurrage, thut it arose from port regubations, or even from the unlawful acts of the Customhouse officers. Demurrage is not, however, claimable for a delay occasioned by the hostlie detention of the ship, or the hostile oceupation of the intended port; norls it daimable for any delay wilfolly occasioned hy the master, or ewners, or crew of the vessel. The clain for demurrage ceases as soen as the ship is leared out and ready for suiling, though ahe should le detained ly adverse wimls, or tempestuous weather. -Curty's Gommercial Law.
Professor Parsons in his admiruble work on Mercantile Law [Boston, 1856], says:
"As time has lecomo of the utmost lmportance in commercial tranactions, both parties to thiz contract whould be punctual, and cause no unnecessary delny; and for such delay, the party injured would have his remedy ngainst the party in fault. The charter-party usually provides for so many 'lay-days,' ond for so much 'demurrage.' Lay-days, or working-days, are so many days which the eharterer is allowed for loading, or for unloading the vessel. These lay-days are counted from the arrival of the ship at the dock, wharf, or other place of discharge, und not from her arrival at the port of destunation, unless etherwiso agreed on by the parties. In the absence of any custom or bargain to the contrary, Sundays are eomputed in the calculation of laydays at the port of discharge; but if the contract specifies "working lay-days," Sundays and helidays are excluled. If more time than the agreed Iay-days is occupied, it must be pahd for; and 'demurrage' means what is thus paid. Usually the charterer agrees to pay sis much deniurrage a day. If ho egrees only to pay lenturrage, without specifying the oum, or if so many working days are agreed on, and nothing mare is said, it would, generally, at least, he consilered that the number of lay-days determined what was a reasonable and proper delay, and that for whatsoever was more than this, the party in fault must pay a reasonable indemnity. If, nfter the lay-days ailawed for unloading, have commenced, and, of course, after a safe arrival, but before the cargo is unhaden, ship and cargo, or enrgo alone, Is lost, without the Guit of the ship, of the owner, or of the master, the freight or charter-money is due, because that was earned lyy the arrival.
"If time be occupied in the repairs of the ship, which are made necessary, without the fanit of the owner or muster, or of the slip itself, that is, if they do not urise from the original unsenworthiness, the charterer pays during this time. Many enses liave atisen where the ship was ilelayed ly different causes,
and the question occurred, which party whould pay for the time thus lost. On tha whole, we should say, that no delay arising from the elements, as from lee, or tide, or tempent, or from any act of government, or from any disabllity of the consignee, which could not be imputed to his own act, or to his own wrongful neglect, would give rise to a claim on the charterer for denurrage.
"Demurrage eeems essentialiy due only for the fuult or voluntary act of the charterer; but if he hirea at so nueh on tlme, that ls, hy the day, week, or month ; then, If the vensel be delayed by seiaure, entbarge, or eapture, and the impediment is removed end the ship completes her voyage, the charterer pays for the whole time. If she le condemned, or otherwise lost, this terminates the voyage and the contract.
"The contract may be disaolved by the parties, by united consent, or againat their consent, by ony circumatances which make the fulfillment of the contract lilegel ; as, for example, by declaration of war on the part of the country to which the ship belonga, againat that to which she was to go. So eithar an embargo, or an act of non-intercourse, or a blockade of the port to which the ship was going, may either annul or suspend the contract of charter-party. And we should say they would be held to suspend only, if they were temporary in their terms, and did not require a delay, which would be destructive to the purposes of the voyago.
" In reference to all these points, it is to be understood, that if the parties know the circumstance, which they make their bargain, and provide for it , any bargaln they choose to make in relatlon to tt would be enforced, unless it required one or the other of the parties to do something prohibited by the law of nations, or of the country in which the parties resided, and to whose tribunals they must resort.-Parsons' Mercantile Law, p. 862-367. See Kent's Com., 111., pp. 26i, 265.

Denarlus, in Roman Antiquity the chief silver coin, among the Romuns, worth in aterling money, about $74 d$, or about 15 cents. It was originaliy of 62 graine weight; and was considered equivalent to the Attio trachma, which, however, weighed 67 grains. It was originally one-seventh, but afterward fell to one-eighth ounce. (See Arbuthnot on Coins.) There was also a golden denarius, of which there is a specimen in the British Museum weighing 60 grains, beaides others of less welght. As a weight, it was equal to the seventh part of a Roman ounce. Denarius was also used as of the value of an Engliah penny.
Denier, a amall krench coin-copper coln, of which there were 12 to a sol.

Denmark, a kingdom in the north of Enrope, small in extent and scunty in population, but known in histery from en early period of the Christian era. There is no authentic account of the origin of the name of Denmark, nor of the quarter from which the ceuntry received its early inhabitants. From the similarity of the Danish and German languages, us well as from the general course of migration in early ages, it seems probable that Denmark was peopled by immigrants from the south-irom Ilolstein, Ilanover, and Saxeny. There are no means of ascertaining whether natives of Denmark formed part of the formidable hordes which passed tis lioman frontiers in the fifth and sixth centurius; but the attacks on this empire were probaly made by tribes less remete, the expeditions of the Dancs being in general maritime. For such expeditions they wore remarkable as early as the eighth and ninth centarien, as was proved by their repeated iavasions of England, their occasional descents on Scotland, and their conquest, followed by permenent oceupation, of Normandy. To cross a sea of three or four hundred milles in breadth was a bold undertaking for men unacqualnted with the use of the compuss; but the number of islands in Denmark early aceuatomed the in-
habitants to navigntion, and gave them a practical dexterity In It, similar to that acqulred hy the Dutch from their vicinity to arma of the sea, and to the mouths of grest rivers. Both countries proved the advantage of a maritime positlon, for in those days nelther France nor England were capable of sending forth a naval armament.

Denmark is a portion of the great European plain, and may be described as almost uniformly level, with partial Inequalities of surfsce, particularly in Schleswig and IIolstein, and the Islunds of Funen and Zealand. The kingdom conslats of two great divialons, the one a long peninsula, extending from the Elbe to the Scaggerrack, and the other a clister of ialands separating the Cattegat from the Fast Sea. The western conats of the peninsula are a contlnuous level of marah-land; the Interior is dry and sandy; and the Islanda partake of the same characteristics. The soll of the low-land is generally fertile, priducing the linest pasture, and excellent corn crops. The cllmate is milder thrn the northern situation of the country would indicate; but the sky is very' equently olscured with vapors and moist fogs, in "1 , suiamer lasis only from June to the midale os cugust. The climate, however, la not unwholzaome. The mass of the populatlon consists of Danea, who occupy the IAlands, North Jutland, sull the northern part of Schleswig. Germans occupy the southern part of Schleswig, Holstein, and Lauenburg: Frisons nnd Angles live on the islands and other parts of the W. coasts. Agriculture and fisheries are their principal occupations. From 1660 till 1848 the kinglom was an Abselute Monarchy; but in the latter year a constitution was granted by the king; and the legisintive power la now vested in two parliamentary bodies, the Volksthing and Iandesthing, both consisting of elective members; the former resembling the House of Representatives, and the Inticr the Senate, of the Congreas of the United Stated of North America, rather than the Iords and Commons of Great liritain. Denmark is a amall and poor country, and her nivhi and millitary power correaponds with her amall reaources. She possesses In Furope the Firoe Iglands, and the large, voleanic, and poor island of Icelund, with a portion of West Greenland.

Lubec and Dantzic.-The chief mercantile intercourse of Denmark in the fourteenth centiry was with Lubee and the north-west of Germany. To the Bultis L-pbec was nearly what Venice was to the Mediterranean, the earliest commercial town of consequence. There was also some traffic from Den iark to the mouths of the Vistul. ; the name of Dantaic or Danavik (Danish town or pori) hulieating that a I banish colony, aware of the adivantugen of the sltuation, bad entabilished l elf there. The more remote provinces of Courland and Eathonia were also objects of ambition to the Danes; but they did not ind it practioable to keep settlements there. Itolstein was mere within their control, nad much more advantageous, from tha comparative clvilization of its inhahitants.
Hinnse Tourns.-During the fourteenth century, the assnciation of the IIanse 'Towns hat aequired considerable atrength, and assarted atrenuonsly the fredem of commerce in the north of Vurope, Lenmark conimanding the great entrance into the llatic by the Sound, was the power most Interested In Inying mer. thant vessels uniler $n$ toll of regular contribition ; and the result was repented contentiona, followed at times by ofen war, between the Dimish govermment and this powerfal ronfederacy.
Shipurrecked l'essels.-The rule linhits of the uge were atrongly inorked by the diffoulty whild the lanlsh government found in putting a stopito the pructice of plundering merchantmen shij:wrecked on the coant. Veasela proceeding to and from the lialtic necessarily approached! the coant of Juthand, partleularly In an age when the lgnorance of mariners led to their consider-
ing the vicinlty of the land in the light of a protection. Slipwrecks were constantly of frequent occurrence there, and were generally turned to the profit of the nobility, who were proprietors of the maritime districts. We may here remark, that the nobles claimed not only the soll, hat even the persons of the peasantry ; for the principle of personal bondsge was until lately maintained in Denmark. The practice was to collect in the vicinity of a wreck auch a number of the inimbitants, us to prevent the master or mariners from opposing the seizure of the merchandlae. Even hishops residing on the coast, though humane in their treatment of the crews, did not acrople to ald in taking forcible possession of the csrgo; so crude were in those days the notions of justice toward merchanis. It is a remarkable fact, that a law passed by the king about the year 1521 for the prevention of these practices was abrogated and publicly burned at the instance of the barons and clergy a few yeurs after, when a new bovcre: $\cdots$ had rucceeded to the crown.

Soun 1 Dues.-In 1.190 the reigning king of Denmark made a commercial treaty with. Henry VII. of England, by whlch the English engaged to pny the Sound dues on all vessels entering or returalng from the Baltle; and in return they were allowed to have mercantile consuls in the chief ecaports of Dennark and Norway. By thle time the extension of trade had given rise in Denmark, as ia England, to a middle class, among whom tho eovereign found in each country the menns of balancing the political welght of the nobility; hence a grant was made by the kings of Denmark of various privilegrs to traders, and relief from a number of local imposts on the transit of c.erchandise. See Danish Sound Dues.
The Armed Neutrality._One of the principal political questions between England and Denmark occurred In the year 1780, in the midst of a war between Encland, France, Spaln, and the North American colonies. During that arduons contest, England, superior at sea, had no difficulty in obtaling, by her own merchantmen, a supply of hemp, cordage, and other naval stores, from the lhaltic, while France nud Spain trusted to receiving such supplies by neutral vessels. But the British government denied the right of neutrals to carry warlike stores; nnd the northern powers, headed by the ambitions Catherine of Russia, entered into a compact, called tho Arned Neutrality, br which, without resorting to actual hostility, they sought to over. swe England, and to continue the questionable traflic. llsppily no bloodshed followed thla diplomatic menace, and the question fell to t'le ground in 1782, on the negotiation for a general peace.
The king of Denmark, subject all alor.g to imbecility, becume after 1784 quite Incapalilo of governing. 111 s sen, the crown prince, was therefore appointed regent, and soon passed several judicions enactments. The peat as living on the crown lands were gradually emanelpated-an example followed by a number of the aobility on their respective estates. In tha abolition oi the Afrienn slave-trade Ienmark had tho honor of taking the lend nomong tho governments of burope. The crown prince, guided by the ecunsels of Cour: Bemstorff, son of the ninister already mentioned, long remained nout onl in the polltical convalsions engendered by the French Revolution. He continued to adhere steadfnstly to this plan natil in 1801 tho Emperor J'anl of Russia having, as in the case of the armed nentrallty, formed a compact of the northern powers hostile to Eagland, a llritish fleet was sent lito the lbalte under the orders of Sir lIyde Parker, with Lord Nelson as bis aceond in command.
It was this fleet which thught the Danes that their capital was not impregnable, and that the long line of men-uf-wor moored in front of the harbor was nin insufficient defense agalnst surh enterprising opponents. The attack took place on the ed of $\Lambda_{p}$ ril, 1801; nad the resistance of the banes was s!i irited, hat fruitless. The loss of the linglish in killeil and wounded exceeded 1000 men , but that of their oppouents was murh greater, amd most of their shipping was destroyed. llapplly little injary was done to the capital. A cosartion of hostilities took place forthwith, and was tollowed lyy a treaty of peace. The death of tho Emperor Paul, which occurred anon afterwarl, dissolved tho compact between the northerm courts.
llat ne treaty of peace could be regnaded as permanent during the ascemaney of lomuparte. After dofeating tlrst Anstria, and then Drussia, that extraordinary man fomme mene to obtaln the condidenco of the Bimperor Alexander of Russia, and in the antmon of 18if threatened to mako Denmark take part in the war against bughand. Although the lanlah government discoverel no intention to vlolate lis nentrality, the English ministers, eager to please the publie by methg on a system of vigor, despatehed to the lhatle hoth it fleet and nin army, in order to compel the sumtomber of the Danlsh navy $\quad$ upon conditlon of lts heling restored
at a peace. To such a donand the crown prince gave an immodinte negatlve, declaring that he was hoth able and willing to maintaln his neutrality, and that his flect could not be given up on any auch condition. On this the Engligh army landed near Copenhagen; lnid siege to that city; and soon obliged the government to purchase Its safety by surrendering the whole of its naval force.
this act, the most questionable in point of justice of nny conmitted by the liritlsh government during the war, can hardly be defended on the score of pollcy. The battle of Trafalgar had ere this been fought; and after that great vlctory ber superiority at sea was 80 decisive as to evempt her from the necessity of offending forcign powers by adoptling extreme measurea. The resentment felt on that nccasion by the Emperor of Russia was ao grent as to deprive England during four arduous years of the benefit of his alliance; and the reizure of the Danish fleet so exasperated the crown prince and the nation at large, that they forthwith declured wa against England, throwing themselves completely into the arms of France.
The hoatilities between England and Denmark were carried on by aca, partly at the entrunce of the Baltic, and partly on the const of Norwny. These consiated of a scrios of actions between slngle vessels or small detachments, in which the Dancs fonght alwnys with spirit, and not infrequently with success. In regard to trade, both nations suffered eoverely; the Britiah merchantmen in the Baltic being much annoyed by Danish crulsers, while the sorelgn trade of Denmark wns in a manner suspended by kingland's naval superiority.

Population.-The increase nnd distribution of the population of Denmark will appear from the following table:

|  | 1769. | 1884-35. | 1 125. |
| :---: | :---: | :---: | :---: |
| Denmark Proper.... | 811,288 | 1,228, $\overline{9} 97$ | 1,8511,827 |
| Schleswig. . . . . . . . . | 240,104 | 887,878 | 382,900 |
| Molstetn. | 258,968 | 435,596 | 479,364 |
| I suenbury. |  | , | 413,486 |

The population of Denmark Proper, 1st Febriary, 1850, was as follows:

|  | Cowns. | Rural Dista, | Total. |
| :---: | :---: | :---: | :---: |
| Zeiblant and Moent | 1710,892 | 895.168 | 508,480 |
| liornisolm. | 0,451 | 14,176 | 27,927 |
| Fonen, ete........ | 81,824 | 153.40. | 184,018 |
| Lamathi and Falster. | 11,164 | 67,443 | 79,017 |
| North Jutlami. | 138,284 | 530,291 | 604,525 |
| Total. | 2010,165 | 1,117,182 | 1,407,747 |

The population of the principal towns of Denmark l'roper (lsi February, inaio) was as follows, viz.; Copenhagen, 149,600; Olensee, 11,100; Helsingor, 8,100; Aarhuus, 7,800; Aalborg, 7,7100; Randere, 7,400; Tlorsens, 5,800 ; Rönne, 4,700 ; Svendborg, 1,500 ; Fredericin, 4,300 ; Viborg, 4,000 ; Shagelse, 4,000 ; and Roeakilde, $3,80 \mathrm{c}$. In the dueliy of Schleawlot, the principal towns with their populations on 1st Fehruary, 18.10, was as follows, viz.: Filenshorg, 12,561; Sehleswig, 11,204; IIndersleve, 6,165; Eekerns, firde, 4,058; and Apenride, 4,021 . In that of Holstein us follows, vlz: Altoma, 28,095 ; Kiel, 12,844; Rendshurg, 10,009 ; and Gliackstadt, $5,939$.
The prinelpal ports are Copenhagen and Elsinore. Copenhagen, capital of Demmark, situated on the enat coast of the paland of Zealand, in the chaonel of the Baltic called the Somm, in lat. $65^{\circ} 41^{\prime}$ N., lomg. $12^{\circ} 85^{\prime}$ $16^{\prime \prime}$ Fe. The water in the channel la from 25 to 35 fect deep; but it is narrow, and the navigation difficult. Vessels not intending to come linto the harhor bring up in the roads, at from one quarter to one half a mille from where, in ubout 25 feet water. In the harhor, within the boom, the water la from 17 to 18 feet deep, and veasels momal alongside of the quay. The ancharage in the roads la good and safe.

Bilshore, or Eisineur (Dnulsh Helsingör), a seaport town of Denmark l'rojer, on the enst coast of the isl-
and of Soeland. It stands at the narrowest part of the Sound, opposite the Swedish town of Italsingborg, from which It. is three miles diatanto. All marchant vessels are obliged, under certain reservations depending on the weather, to salute the castie by lowering their top-sails in passing. In the vioinity is Marlenlyst (Mary's. delight), till lately a royal chateau, now the property of the corporation, and lot to a private family. The towns of Altona and Wansbeck are included pnder the head of fureign commerce, as standing witho: . the toll-ragulations of the kingdom.
The navigation from the north of Germany to Denmark, around the northern point of Jutiand, being always tedious, and ametimes dangerous, gave rise to the didea of uniting the two seas by means of a canal, communicating with the river Eyder. The work wad commenced in 1777, and finished in the course of seven years, at a great expense. This is the Canal of Kiel, which begins near the town of that name, on the side of the Baltic, and extends enatward s.bout twenty-three miles, when it comes in connection with the Eyder. This canal is nearly 100 feet wide at the ourface, and 54 at the bottom; It has six locks, and Ita least septh of. water ie 10 feet; it admits vessels of 120 tons brirden; and of such small shipping no less than fru:a 2,000 to 3,000 pass in a year. Of no less importance is the Stecknity Canal, which, along with the railway between Altons, Glackstadt, and Kiel, scrves to promote the commerce of the duchies. There are also railways from Copenhagen to Elsinore, and from Copenhagen to hoeskilde; and one has been recently opened from Tonning to Klensburg, with a branch to Kendsburg. Tonning is the port on the east coast, and the iength of navigation from there to the Baltic is about 105 miles.

The passage to the Baltio by the Sound continues to be followed by English, Dutch, and other vessels of heavy burden, as well as by Swedes and Norwegians, on account of the vicinlty of their reapective countries to the Sound; but cossting vessels and other traders from Oidenburg, Hamburg, the mouth of the Elibe, as well as from Tonning and the ports of Sctuleswis, and still more small Dunish bariss belonging to the islands, find it a great convenience to traverse the Canal of Kiel. The hazard on the north cosst of Jutland ariaes from exteneive sand-banks and a number of currents.-F:. $\mathbf{B}$.

The customs regulations of Denmark did not asanme any tixed or permanent character untll toward the close of the last century. No regular system of commercial policy was pursued; and the regulations which, from the to time, ware enforced, were issuod more with the immediate vien of recruiting the treasury of the crown, than with any regard to the encouragement of the industrial or commercial enterprise of the country. HLyh and prohibitory duties were imposed; exclusive privileges were granted by the crowa to such companiea as were either rich or favored enough to secure them; competition, so essential to success in every purnult, was prevented; and the induatrini energles of the nation, the only true buais of indlvidual as well as of nutional wealth, were cruained by tho monopoliziug spirit and grasping cupldity of thene privileged asaociations. They enjoyed the exclusive right of trading, even with the colonista; of supplying their wants; taking In exchunge their surplus productions at auch valuations and pricee as they thought proper to fix and were wilifing to puy. Alout the period already reforred to, a better nysteun was gradually introduced. Many of the reairictiona which had hitherto contrihuted to fetter and depress tho foreign ticule of Demmark were taken off; a new tariff was adopted $;$ and the whole aystem of regalations was consolidated into the "ordinance 31, Christlan VII., dated the 1at of Feliruary, 1797, relating to the customs;" which, wlth the various enastmente aince adopted, conatitutes the baais of the present commercial policy of Denmark.

Under these regulntions, a distinction is drawn le-
tween privileged and unprivileged pations. The former are those, with which, by treaty, convention, or other. wise, a reciprocity and equality of commerce and navigation have bsen established--buch treaty, convention, etc., preserihing the terms on which reclprocity is granted; the latter are subject to extra duties, smounting to as high as. 50 per cent. above the rates fixed in the general tariff. "To the former clase the United States belong, the treaty by whilch entire reciprocity and equality of commerce and navigation are guarantied, dating as far back as April, 1826. The following abotract embraces the principal stipulations of this treaty, so far as lt relates to commerce and navigation:

No particular favors in respect of commerce or navlgation to be granted to other nations, which shall not become common to the other party, on like or equivalent terms. Commerce and navigation between the two countries to rest on the liboral basis of perfect equality and reciprocity; and the citizens and subjects of each to enjoy all rights, privilegea, and exemptions, in the territories of the other, which native citizens or subjects do or shall enjoy; Icelund, the Faroe islands, and Greeuland, and the places, situated beyond the Cape of Good Hope, and the direct trade between Denmark and the Danish West India colonies, being excepted from the operation of the treaty. Duties to be alike on all manufactures or merchandise of any country that can be lawfully imported into either country, whether such importation he made in the vessels of one nation or the other. Similar equality to exist in respect to exportations or re-exportations from either country, and in the vessels of either. The produce and manufactures of each country, when imported into either, to bs subject to no other or highar duties than similar produce or manufactured of any other country; and this equality to extend to exports from either country to the ports of the other. Article 5th stipu3stes that neither the veseels of the Unlted Statee nor their cargoes shall, when they pass the Sound or the Belts, pay higher or other duties than those which are cr may be paid by the most fayored nation.

Weat India Colomies.-In the intercourse between the United States and the Danish West India colonies, it is agreed that whatever can be lawfully imported into or exported from the anid colonies, in vessels of one party, from or to the porte of the United States, or from or to the ports of any other foreign country, may, in like manner, and with the same duties and charges applicalie to vessel and cargo, be imported into or exported from the ssid colonies in vessels of the other party. The treaty to continue in force ten years, with the usual stijulation for twelve months' notice if either party should desire to terminste it after that period.
The general forcign navigation of Denmark, in 1844, employed 33,845 vessels, mensuring $1,266,417$ tons, and, as appears from official returns, floating 765,475 tona of merchandise.

It may be interesting to inquire to what extent the national thag of Demank participated in this gensral movement. The total number of vessels whieh entered and deared on foreign voyages in 1814 was 83,815 , with a tonnage of $1,266,417$ tons, and couveying 765,475 tone of freight. Of these vessela, thero wero under the Danial hag 22,275, with a tomage of 717,*91 tons, und win eying 459,079 tons of freigit. Thus, Denmark had,
1st. In the number of vessola. . . . . . . . . . . . . 68.8 per cont. 2d. In the tonnage
$68.7^{80.8}$ jer cent
84. In the cargoes. . . . . . . . . . . . . . . . . . . . . . . . . 60

Leaving for all other uatlons,
1mt. In the number of vensels. ............... 84.2 per cent. 2d. In the tonnage. . . . . . . . . . . . . . . . . . . . . . . 47.8 80. In the cargoen $\qquad$ $4{ }^{47.8}$
The aggregate tonnage of vessels eniployed in the trade letwern the United States and Deumark in 1814, was 3,458 tons. In 185.1, it had decrensed to 2,608; in 1856, it wиs 2,013.

From ofloial returns of the foreign trade of Denmark, it appears that in 1847 the imports and export: naited amonnted to $\$ 46,500,000$; a sum nearly equally divided bésreen Denmark Proper and its dependencies. In estimating the true relative value of this commerrial movement, we must bear in mind thet ihe $\mathrm{F}_{\mathrm{y}} \because$ a proper contains a population of $1,350,000$ inh $h^{\text {i- }}$ ts, and comprises an area of 683 Danish euperfic'? s. 'ee ; while the duchies contain a population of 842,000 souls, apread over an aros of only 818 Danish miles. The Dsaish miles are given as found in the authoritice from which thess facts are condensed, and because they will suffice for the purpose of comparloon. Denmark and dependencies in Europe contain an area of $1,031,075$ geographical miles, and a population of 2,296,587, exclusive of Greenland, Ice!and, and the Faroe islands. Thue, the latter, with a territory less than ons half, and a population more than one third less, contributes more than its proportionate share to the general commerce of the country. The importance which Denmark attaches to the oovereignty of the duchies is thus accounted for. They are not only the granaries from which her cereal supplies are ohtained, but they also constitute the commercial conduits through which her principal products-live cattle, hotses, etc.-pass to a market. The loss of the driutes would, besides, inflict an irreparable injury apon Denmark, hy cutting off the enormous revenue which she has so long derived from the Sound dues; as, in the event of a aeparation, the Schleswig-Holetein Canal would soon become the principal route to the Baltic.
The description nnd quantities of merchandise which constitute the chief basia of the exchangce hetween Denmark and foreign countries, for any one year of average commerciai activity, will furnish the most accurate standard by which to judge of the present or prospective importance of the trade between that kingdom snd the United States. Dati from which to calculate, even approximately, the value of importations, are not at hand. A valustion baeed upon such data as are possessed may, however, be attempted. We find that the duties levied on importations for the year 1847 reached as bigh as $\$ 2,685,654$, or, in round aumbers, $82,500,000$. Allowing 12 per cent. on the imports as the amount of unties, we have as their value for that year over $\$ 20,000,000$. The value of the exports, as regiztered in the Danish custom-houses, ia more accesslble, and will be found uuder lta proper hesd in the foliowing talies.
Of the $2,685,604$ which is found under the column of duties on imports, the portion reccived in the cus-tom-houses of Denmark Proper, amounted to $\$ 1,806$,246, and that which was levied in the duchies reached 8879,408 . While this latter sum is less than 50 per cent. of that roceived in Denmark l'roper, we must not infer that importation into the duchios was in the same proportion. On the contrary, the tatile which follows will show that, in general, they import morein eome cases 100 per cent. more-man the kIngdon proper. The disproportion in the amount of duties results from the operation of ilfferent tariffis; that of Denmark Proper being much isigher than the tariff applicable to the Duchies of Schleswig and 11olstein. Altona, in the Duchy of IIolsteln, the most important commercial city in Denmark next to Copenhagen, is a free port; and all goode may be landed and stored without any other charges thin port dues.

It appears that the United States supplied Denmark in 1847 with all the rice imported into thnt country, and a large share of the raw cotton, epirita of turpentine, fish-oil, grains, ste, Wines und spirite are chiefly imported from France, either direct or hy way of IInmhurg, and cottons almost exclusivaly from Englata, but in 1855-6, the exportation of tohacco, grain, flour, olis, and turpentine, had ceased.

The tollowing table exhibits the value of exports from Denmark and the duchies to all foreign countries during the years designsted. The values are given in franca, each equal to $18 \cdot 6$ cents.

The following suggestion is found in a commercial report recently lasued under the direction of the French government, which mar be found useful to others besides the French merchants engaged in the trade with the countries of northern Europe:
"In the northern nations, expecially Denmark, Sweden, and Norway, there is an active demand for a beverage extensively used in those countries, which our merchants engaged in supplying them with ligmeurs, might advantageously imitate. It la a mixture knnwn among the northern people as gamriel Fransk viin (old French wine), and composed of white wine, rum, syrup, sind rpices. This kind of negus is highly esteemed by a people who have no relish for liquors, unless they are highly nweetened."

In 1850 there was pulilished, by order of the Disnish government, a atatistical report of the co-t merce and navigation of Demmark Proper for the year 1848. From this publication, It appears that though Denmark was involved in difficultles with the Germanic Confederation during the year 1848, the gencral commerce of the kingdom suffered no sensible diminution. This was mainly owing to the geographicul position, as well as to the military marine of Denmark, by means of which she was enabled to blociande most of the German ports, and thus give free scope to her own merchant flas. Cnt off from the Gerinsn markets, from which she nsually draws her supplies of articles of first neeessity for her manufactures, she sought for new channels through which to supply her wants; and at once found England aiready waiting to avail herself of the difticulties in whith she was embroiled. Hence, the principsl foreign trade of Dinmark during this year, was csrried on with England.

The number ol' vessel- employed in the foreign trade of Denmark in 1848 whe as fillows:
Entered....... Ve is 7,1018 Torirage.. .......... 888,747

The tonnage of merchandise was $4: 0,240$ tons.
From North and South Aheaies there entered, durIng the same year, 61 vervela of $\{2,8 \div 0$ tons; while there cleared 67 veasels of 15,868 tony, of which there were 18 vesseis of 3,736 tons under a foreign flag.
The value of the imports end exports from e! countries, in 1848, as compared with 1847, was as follows: 1848,-Imporis.

Of the above figures, the trade of Copenhagen alone abosorlied:

See Commercial Relations if the U. S., 1857.

The following table exhlbits the trade between tho United States and Denmsrk during the yesr 1848 Navioation amp Commence.
Entered the United 8tatel from Denmark......... 1,494 tons, Cleared from the United States for Deamark.... 8,488 Imports from Denmark. .................................. 819,817 Exports to Denmark. ...................................... 181,918
Of the general exports from Denmark during 1848 , England received 50 per cent, ; and of grains, as high as 65 per cent.; whiie in 1847 the proportion exported to Great Britain was only 36 per cent. of the whole. The exports to the United States were,

The chlef lmports into Copenhsgen from foreign countrice in 1851, were iron, coal, cablnetmakers' and other wood, fire-wood, and heavy merchandise. Fram the United States and Culbs there entered 15 vessels, of 3,158 tons' measurement, and with 2,884 tons of merchandise; and from the Denish West Indies, 34 vessels, of 8,670 tons' measurement, ond with 8,632 tons' merchandise. The imports of sugar were as follows:
From Danish West Indes $\qquad$ . kilogrammes, $3,500,000$
Total. $\qquad$ ${ }^{4}$ 2. $750,(0)$ 650,000 10,500,000

Imports of coffee were from Brszil, Isyti, an: European entrepots, $5,250,000$ kilogrammes ; of which there ware exported frem Copenhagen 500,000 kilogrammes, leaving $\mathbf{4 , 7 5 0 , 0 0 0}$ kilogrammes for consumption.

The vaiue of the foreign commerce of Denmark for 1853 and 1854 is exhibited in the subjoined tuhle:
Commerce of Denmark ant the Dttenibs of Gembewia and holstein fon tile Ygase 1868 ann $1 \times \%$.

The Danish merchants no longer import tobacco from the countries of its production. In 1848 there were $2,032,3^{5}, 7 \mathrm{kilogrammes}$ imported, at a value of about $46^{\circ}, 46020$, principally from Holland, IJremen, and llami,urg, where alect cargoes can at all times be purchased. These markets are supplied chiefly from the United States. From Cuba Denmark imports annuaily about 12,250 kilogrammes-say $27,000 \mathrm{lha}$ of segara. There are no reatrictions of any kind on the sale of tobacco in Denmark; and under the molorate daty [ieaf or unmanufactured, 898 cents per $110 \frac{1}{f}$ lbas. manufactured, 815 per $110 t$ libs.], direct importations from the United States could not fall to le profitable.

In the article of cigars, at least, there is no reason why the Jnited States could not successfully compete with Cuba. The quantities of tobacco exported direct from the United States to Denmark during the four years specified, were as follows:

So long, however, as any duty is imposed in Denmark higher than that levied or similnr merchandise in Hambnrg and the other Hansostic towns, viz., from to to 1 per cent., they will continue, more especialiy Hamburg, to be the entrepots from which Denmark will have to draw her supplles of such colonial produce as her own islands in tho West Indies can not furnish. Cereal produce constltutes the leading staple of Danlsh exports, and forms the chief basis of her exchanges with foreign countrics. Indeed, Denmark may be considered an exclusively agricultural and maritime country. Such, at least, is the predomluant fcature of her national character. In 1851 tho entire exporis of the kingdom ainounted to upward of $\$ 7,500,000$. Of this sum, cereala appropriated $\$ 4,500$,000 . The comaterce of the kingde $n$ and the duchies for the year 1852 , imports and exports, reached the sum of $842,450,81090$; end the proportion of cereals In the export trade was aloout equal to that of the preceding year. During the nast 10 or 12 years, however, manufuctures have made considerable progress In tho kingdom and the duchies ; and, were the obstaclen removed, with whici this branch of national industry'
has to contend, the most oppresslve of which are royal and privileged monopolies, and heavy consumption dutles, that progress would be atill more ancouraging, and its influence more perceptibly felt in the angmented wealth and Increased commerclal prosperity of Denmark. The following brief aummary of the prese ent state of manufuctures in this kIngdom is condensed from recent Danish official publicatlons, and is given for the purpose of showing the extent to which Denmark must rely on the workshops of other natlons for the necessary supplies for her $2,800,000$ subjects.

Woolens. -The woolen manufactures of Denmark are coarse, and of a very Inferior quality. The chicf factories are those of Neumunster, In the duchy of Holstein. The proportien which these manufactures bear to the quantity annually consumed in the kingdom may be seen from the following statement :

Forelgn woolens conaumed. ..... 050.960 lbs . $145,000 \mathrm{lbs}$. Neumuoster woolens consainei 86,700 " 88,000 o
Besidea these woolen cloths, Denmark consumes large quantities of other manufactures of wool, particularly such as are auitable for women's apparel. These are all important. During the 2 years abore-named, thla class of Imports resched as high as $320,000 \mathrm{lbs}$. each year, ylelding a revenue to the government of nearly $\$ 10,000$.

Cottons,-The manufacture of cottona was introduced into Denmark about 40 years back, but its progress was slow and inconsiderable until within the past 10 years. At Copenhagen there were manufactured from 1835 to 1840 about 800,000 Danish ells (about $2 \cdot 26$ feet each) per annum from cotton $t$ wists supplied from English markets. Since 1840, the custom-house declarations Indicate a large augmentation in the quantity of spun cotton (twist) imported. In 1844 It reached as high as 911,000 Danish livres. The Danish live is a fraction over $1 \mathbf{~ d b}$. avoirdupols. The inunufacture of printed cottons has been attempted, but the experiment has but indifferently succeeded; indeed, its present continuance is.owing to high protective duties. The chief cotton manufacturea mas, therefore, be said to consist of old-fashioned, lieavy', coarse pleces, brought through the loom by a procesa at once elow and expensive. There is but one factory in the kingdom-that at Nyhavn-where modern improvementa are introduced. The success which has so far attended the operations at this factory may eventually create an extcuslve demand in Deninark for American cotton.

How far these factories fall short of the demands for home consumption may be gathered from the following figures:
Cotton Clathe baportto inyo Demmage raoren, faom

These importations were destined for the kingdour proper. The quantities imported for consumption In the duchies can not be ascertained; but their relative consumption of such manufactures considerably exceeds that of the kingdom proper.

Paper.-At Strandmollen and Silkberg there are several flourishing paper-mille; but the prices rule so high, that, despite the protective duties, paper figures largely in the inuports from fureign countries. In Is 50 there were lmported 217,563 kilogrammes, valued at \$58,139 88.

Sugar.-Sugar refineries have reached a high stato of prosperity In Denmark. Of upward of $12,000,000$ libe. of refined augar consumed in the klugdom, or exported, but little is imported from furelgn countries. Raw augars, however, constitute an important item in the importations of the country ; indeed, it is known, that if we except England, there in more augar consumed in Deminark, in proportion to its popinlation, than in any other country in the world. In 1850 raw
angar imported reached 18,186,283 kilogrammes, valned at $\$ 1,615,93165$. Of this, there were Imported direct from the United States only 77,258 lbs., valued at 88,192.
Purcelain.-There is a factory at Copenhagen, under government monopoly, for menufacturen of this description. It contributes but little, however, elther to the revenues of tho country or the wants of the people. The manufactures are of beautiful fabrication sad brilllant colore, but they sre not cousldered durable. Notwlthatanding a hlgh protective duty, the marketa of Denmark are anpplied with manufacturea of porceIain from France. In 1850 there were about $40,000 \mathrm{lhs}$. Imported.

Distilleries.-Thls is the moet flourialing branch of manufactures, both in the kingdom and In the duchies. Nearly all the spirits produced in theae establlshinents gre from grain. The excise duty, or impust, derived from the distillerles, forms a large itom In the reven"e of Dennark. In 185C they produced $21,262,678$ Danish cans (over 1 quart each) of spirituous liquors. During the sama year, 2,492 gallons of spirits from molassea were imported direct from the United States, at a value in the home market of $\$ 1,009$.

Brezeries.-The number In Denmark is not known, officlally; but they can not add much to the internal wealth of the kIngdom, as their annual consumption of malt does not exceed 700,000 lbs. In 1850 there were imported direct f:mm the United Statea 14,617 lbs. of hops, valued at $\mathbf{8} 85$.
Class-noorks,-There ari ', establishments in the kingdom, 4 in Schleswlg, and $1 \ln$ IIolstein. They are chiefly devoted to the manufacture of bottles, of which they produce, amnally, upwurd of $3,000,000$.

Ship-builiing.-The princlpal ship-yards in the king. dom are at Copenhsgen and Elsinore, and are chiety used in the repair of vessels. At Apenrado, a capaclous port opening Into the Little Belt, vessela of ths largest class are built. In $18 \pm 612$ vessels, and in 1847, 15 were built at this place. In the former year, 30 large class vessils, belonging to thla port, entered the harbors of Rio de Janeiro and Muntevideo.

Housuleries,-Prior to the separatlon of Norway, Denmark drew all her aupplies of Iron from that country. Since that event, the efforts to obtain sufficient supplies, even for maritime purpeses, have not been crowned with success. The geological formation of the country is not auch as to furnish mineruls ; hence, wi.h the exception of buidding materials, but little is left for the niner to develop. There are, however, founderles at Garlshytte, near Rendsburg, which employ upward of 250 hunds, and produce, annually, 200,000 lbs. of lron; one at Copenhagen, of abont equal annual produce, from which considerable quantities of anchors, chains, etc., sre obtained; and sevoral others, distributed throughout the duchies, at Altona, Kiel, Flenshurg, and Ottensen. Near Elainere there is a foundery for the manufacture of fire-arms, which produces, annuslly, about 2,000 muskets. Bewdes the manufacturing establiahmenta above enomerated, there arv in the kingdum 200 tan-yards, and 60 tan-milla, yielding annually, the latter $2,500,000 \mathrm{lbs}$. of ground tan, and the former $8,080,000$ tanned hides. In addition to these, there are 88 currying establishments, in which 164,000 lhs. of skins are annuuily prepured for hosiery and other uses. At Altona 600,000 Ibs. of candles are manufactured each yeur; 100,000 lbs, of refined wax are annually produced in the kingdom and duchies ; soap, oila, chemicals, gunpowder, etc., but the manufacture of these last-asmed articles is so inconsiderable as scarcely to affect importations from forelgn countries.

The only manufactures in Demmark which yield a supply equal, or nearly equal, to the home consumptlon, are those of refined sugars and tobacco. The furmer in fully adequate to meat the demands of the home market ; and the latter, augmented to some ex-
tent $b$ equally these counts produc 487 lbs gen 4: produc 000 seg factorie Hulstel supply. obtains why' he ond han porting It ri how mu for the has bee and oth duty on she is $n$ industry derived, from the Coxpara
tent by imports from the United States and Cuba, squally so. The quantitles annually lmportsd from these countries have already been glven. Altona counts 28 tobacce factories, omploying 488 hands, and producing, annually, $1,062,068 \mathrm{lba}$. of tobacco, 106 ,487 lbs of annff, and 12,000,000 segars. At Copenhagen 425 workmen are omployed, and the annual produce reaches $1,000,000 \mathrm{lbs}$. of tobacco, and 10,000 ,000 segars. Besldes these, thers are other tobacco fuctories, at Flen burg In Schleswig, and Kiel in Holstaln, which contributa largely toward the matlonal sapply. It has been already shown whence Denmark obtains har supplles of unmanufactured tobaeco, and why her manafacturers are forced to purchase it at second hand in the nelghboring entrepots, Instead of Importing direct from the countries of production.

It vill be easily seen, from the preceding summary, how much Denmark etill deperds on forelgn countries for the supply of her most esacitial wants. Since she has been induced to profit by the example of Englnnd, and other nelghboring countries, in abolishing the daty on raw cotton, her spindles have maltiplied, and she is now learning to depend on her own capital end industry for the apun cottons which ahe has haretofore derived, and whlch, to a great extent, she still derives, from the English spinning-fuctories. A aimilar modi-
ficatlon in her tariff in respect to nnmanufactured tobacco, and other raw material not grown on her eoil, wonld tond not only to augment the importations of such prodace from the producing ceuntries, hut would eminently contribute to attract investments of her own capitallsts, multiply her manufactured productlons, and enable her to become an experter of the same dascriptions of merchandise which hnve so long been an annual draln upon the wealth of the kingdom, and a heavy drawbuck upon the industry of ths people. A more sppesite illuatration of this trith can not be found then that which the general returns of trade, for any one year, will furnish. Her average annual imports are about $\$ 15,000,000$ in value, a large portion of which sum is absorbed by manufactured articles, or articles half-manufactured, such as col.'_n twists, etc. ; while her annual exports scarcaly cover half that sum (say $\boldsymbol{\oplus} 7,000,000$ ), two thirda of which are derivad from cereals and other agricultural producs. Untll the manufacturing Induatry of Denmark recelvea grester encuuragement from the government, the heavy disproportion between Imports and exports which the above figures exhibit, or, in other words, the rulnous balance of trade against Denmark, in her commercial relatlons with forelgn countries, must contlnue to exist.-Com. Danish West India Colonies.-. Prior to the year 1833, the trade between the United Statea and St. Croix was not regulated by any law or act of the Danish government. The inhabitants were at first allowed, by the local authorities, a llmited quentity of sugar or melasses from thelr estates, to exchange for provisions. Afterward they ware permitted to purchase one hulf of their supples in this way; and, finally, the privilege was extended so as to ennble them to purchase from forelgners all they needel for the supplies of their plintatlons. St. Themas was at the same tlme epened as a free port for the trade of all countries, snd, in consequence, became the emporium of an exlensive commerce. The datles ujon inports and exports are moderate, not exceeding $1 t$ per cent. nd valorem; and port charges do not exceed 19 cents per ton. This does not npply to veasels from European ports, which pay 45 cents per ton. The distinction is, grobably, made to encourage the introduction of provisions, rather than the funcy artleles and liquors introduced from Europe. At St. Croix, however, vessels employed In the forelgn trade, even if they do not take a pilot on board, are compelied to pay half-pilotage. Tha full charge is \$1 jer foot of the veasel's draught, in and out. In $18: 12 \mathrm{~min}$ ordinance of the King of Denmark, duted nt Copenhagen, prescribed reguiations far forelgn navlgation and commerce with St. Crolx. This was saperseded by an ordlnance of June 30th, 1850, publlshed at St. Croix 15th of Aughist of the same year, and which la now in force.
Section I providen that all vessela, native or forelgn, both from nistional and forelgn ports, may 'rade to St. Crotr, and there diseliarge and load at the two ports of entry, Chrietisnated and Frederieksted. Section 2. Vessela belonging to the Daniah Weat India Ialanda, trading between Dummark and
the colontes, ahall enjoy, in future, the aame rights and privlleges as veasels beionging to the mother country. Section 0 . Every vessel la to pay tonnage ducs according to Its tonnage, both on entering and lcaving, at the folloming rates: If the veseel discharge or load to the emount of one half its tonnage, and above, per eommareial last 30 cents; if it discharge or load from one querter to one balf of its tonnage, per commer. clal laat 20 centa; if it dtacharge or load lean than ons quarter of tha tonnage, per oommercial last 10 cents. All vessels not diseharging or loading are exempt from tonnage dnea, aa well as vessela belonging to the Danlab Weat India Ielands, when trading between St. Crolx and the ather two tslends.

If tonnage dues are paid at one of the custom-houses of this island, or at St. Thomas, additional tonnage dues are to be puid only in case the vessel should again discharge or load, during the aamo voyage, gooda to such an amount that, together with the previous amount discharged or loaded, it shall reach a quantity on which a higher tonnage due is fixed. At Christiansted, vessels are further to pay one half the ameunt of tonuage dues, at the above rate, for keepling the larhor, with wharves and other appurtenauces, in repair. The 5th section provldes that, within 24 hours after the veasel has bcen lironglit to anchor, the whole cargo, whether intended to be discharged or not, shall bo entered ut the custom-homae, specitied, and in writing. If the whole carge is nnt to he discharged, the remainder shall, on the vessel's clearing out, be entered for export in the same manner. For dutlea on imports and exports, articlea free of duty, and regulations relative to the trile of St. Croix, reference is made to the tariff, in its proper place. (lurt II.) For the deacrip)tions of merchuadise entering into the trude between the United States and the Danish Weat India Iolands, seo Consular Returns, "St. Crolx, 1/hh June, 185t,", Part III. The vessels of the United States arriving
at Frederickated，St．Croix，from July the 1st to Do－ cember 31st，1853，were 8 lJrigs， 3 barkn， 2 schooners． The aggregato value of their in ward cargoes was \＄49，－ 902，and that of the outwand cargoes， 922,452 ．There arrived daring the same period at Christiansted， 7 brigs and $\Sigma$ schooners under the Ameriran flag．Value of cargoes not stated．

The Sound Dues．－Connected with the commercial relations which exist between the United States and Denmark，is the question of Sound dues，to which sub－ ject the Sth article of the treaty of 1821 relates．＇Tl is has long $b$＋a vexata $q$ vistio between the two ge rasi
 discuasion ；and is fully iaid before Cu aress in a cop musication from the Department of State，unde ${ }^{\text {d }}$ ： of May 30，1854．（Executive Docnment No 108， Honas of Representatives， 3 sd Congress，1st session．）

In 1848，the Daniah Minister of Forelign Affairs ad－ mitted to our representative near the court of Den－ mark＂that the principle upon which those daes are collected can not be defended；＂yet，tho final set－ tlement of the question has lieen put off，from time to time，under various pretexts，ulthough the govern－ ment of Denmark has been more than once officially notilied that＂the United States have thus long sub－ mitted to the exartion from deference and respeet for Dennark；but it can not．be expected，great as is our regard for that ancient unu sespectable power，that we shall kubuit to it much longer．＂
The 10th articie of the treaty of 182 h stipulates as follows：＂The present convention swall be in force for ten years from the date hereof；and further，until the end of one year after elther of the contracting frarties shall have given notsee to the other of its in－ tention to terminate the same ；each of the contracting parties reserving to itself the rifitt of giving such no－ tice to the other，at the end of the said term of ten years ；and it is heroby agreed between them，that，on the expiration of one year after such notice shall have been received by either，from the other party，this con－ vention，and all the provisions thercof，shall altogether cease and determine．＂

The notlee required by the foregoing article has heen given by the government of the United States， and it is believed that no new treaty will be cniered into with the government of Denmark，without a spe－ cial article stlpulating that vessels of the Uialted Staters， in pasaing and reprassing the Sound and ths Belta， shall he forever iximpt from the pey：ent of any duties，either upon thel；tonnuge or it $z$ cargoen． By virthe of a resolution of the Senate，in execative session，March 3，1855，Mr．${ }^{\text {＂Hedinge：was instructed }}$ by the President of the United States to communicate， and on the 14th April，1855，did communicate，to the Minister of Forcign Affairs，of Denmark，notice of the desire of the goverument of the United States to ter－ minate the treaty of 1826 ，in accordance with the 10 th article of the arme，and that at the expiration of $z_{2}$ months from the date of asid notice，anid treaty＂shsll cease and determine．＂In the communication to Eon－ gress from the Department of State，alrendy referred to，the histery of the Sound dues is thus given：
＂The date of the origin of the Sound tolls has nuver leen，ao far ad la known to thin government，authentic－ ally ascertained．They are jreaumed to be the relles of exactions by the Norman pirates of the dark ngem． Aa civilization advanced，they were enforced apoa the plea of protecting the lucrative lierring－tiahery at Schenen．The coasts of the three straits（\＄kaggerack， Cattegat，and the Sound）were owned by Denmark
until 1658 （with the exception of 30 yearc in the 14th century），when，by the treaty of peace of Rothschild， the east coast of the Great Belt，lincluding the fortifl－ cations of IIelsinburg，was transferred to Sweden，and is still owned by har．The right of aoverelguty upon which Demnark presumed，in consequence of her own－ ership on either side of this connecting link of ocean water，neressarily ceased after this occurrence，even if it had been before，In the slightest degree，in conform－ ity with national law．But，nevertheless，sh + persisted at Cronberg，the key to the Sound，in extottling large sums from every boticm that passed．l＇revions to the tresty wit is Sweden in the 14th century，the collec－ tion of the Sound tolls was resolutely and successfully resiate，？by the Hansentic League．Then，as now， they came in direct contlict with the interests of ali the eitien up．the Bultic；and that powerful confede－ racy，at that tuso in the meridian of its greatness，ok taln．re fage for its sidipa and car coes througis ther of the year lions，Denmor－i，perceivinis Haz sents League held her authority over the miter co．itempt，deemed it judicious to invite to engage in the trade of the Baltic；and caveutio：：v entered into with England，and sub－ sequ－ntly $w$－fin＂，lland，by which their vessels were pernitted to $u s$ s．rough the Sound by the payment of mere nominal toile．In 1515 ，it appeara that the latter country paid no tolls whatever，but stipalated to give a small sum instead thereof．This was，as in－ tended，a blow at the Hansestic cities；and in their rame Lubec demanded the imniediate exclusion of the Dutch from the Baltic－a demand，however，that was not complled with．In 1544 a treaty of conmerce was concluded between Christian III of Denmark and Charles V．，Regent of the Netherlands，by which the subjects of the high contracting parties were permitted to trade with each other，by paying the sound dues which had been levied＇slnce days of old．＇The Datch ut this period wero a great navigating and com－ mercial people，and the stipulations which they en－ tered into imparted dignity to the jurisdiction claimed hy the Danes over the Sound．The influence of the Ilanse towns began to declino about the beginning of the 15 th century，but they exercised a aupremacy over the North and Baltic seas until the middle of the 1Eth．From their unconsing quarrels with Denamark， relative to the Sound tolle，recourse was liad to nego－ thation；and，in 1560，＇the King of Denmark and his subjects on the one part，and the right honorable lian－ seatic cities and the inerchants thereof on the other part，＇concluded the treaty of the Odensee．In 1663， Denmark was involved in a war with Sweden，and she made this circomstance a pretext to increase the Sound toils against the Hanse towre，notwithatanding her covenant to the contrary threa years before，which was still in force；but the Hanse towns，in their declining power，were compelled to submit to this violation of her obligation．In 1570 a treaky was contracted is－ tween Dennark snd Sweden，at Stettin，by which it was agreed that the latter nation should be exeupted from the Sunnd dues；but this was evaded frem time to time by Denmark，in levying the toll upon the wines intended for Queen Christinas＇s own private use， and by the prohitition of ammanitien when Sweden was in absolute waut of it for prosecutiag the thirty years＇war．At length Demmark becane mo intolerant as to search Swedish Fessens，unnecessurily detain them，and，in some instances，convey thent to Copert－ hagen．Tho Netherlands experienced but little tetter treatment．The Stadtholder complained，and he was put off with promisea．In 1640，the year after the dis－ solution of the Haneeatic I．eagne，the United Nether－ lands，which had sceured their independence，formed a cmpact with Sweilen for the malntenance of their respective rights ；and in 1615 a new truaty was con－ cluded between Denmark ard Sweden，and on the same day（August 13）one hetween Denuark and the

Mei. arlands. In the negotiations which soncluded thent, the I utch and Swediah plenipotentiarles demanded fres navigation through the Sound for all nations. The Danish plenipotentiaries contended that the Sound was a 'Daniah cunal,' and that the tolls collected were of a simila character to those exactol at the mouths of certain ivers In Germany and Holland. France, acting as ivedator, held the queption under consideration, to
lecided at a mor, convenient period; and, subsegris if she sustained the interests of Denmark, for wha: ahe was rewariled by the bestowal of the iane wiv intages to ber flec us had been bestowed upon the vitherlands, and wituout any limit as to duration. in: 1654 Gres ${ }^{\text {' }}$ Irltain concluded a treaty with Donmar'., .loh was .enewed in 1670, by whicall the adva: gee were to be enjoyell by her whin I d beer conforied upon the Nethorlands. Pre vious to 1320 (from 1647), Denmarb fixed this (oll, us ber treaties with other countries, in conformity to the ierms granted to the Netherlands; but after that time she pluced them upon the footing of 'the inost favored nations.' Sweden, in consideration of the restoration of her provinces which had been conquered by Demiork, stipulated to pay, in future, by the tresty of Frederieksburg of June 3, 1720, the same rate of Sound dues that were collected upen the ships and cargoes of the moat favored nations, reserving to herself the right to establish a commissary nt Fisinore, to prevent impositions upon her navigation and commerce. These conditions and obligations (although several treaties have beon male between the two nations gince) continue to be observed. During the 18th century, Sweden having been quieted, the Bound tolls seems to have been submitted to by other powers and states without epposition. Denmark concluded aevesal aew treaties, but none of them contained provisions prohibitory of "'e exaction of the dues demanded at Elsinore.
"This was the condition in whieh Denmark was found when the Congress of Vienna assembled. It was quite naturally expected, at that time, that the Danisil Sound tolls would pregent a legitimate subject for the deliborations of that body, and that, in the settiement of the nffalrs of Europe, they would be entirely abrogated. But lirederic VI. of Denmark was present at Vienna, and the object of compassion with the representatives of the sovereign most interested, on account of the bombardment of Copenhagen and the destruction of his fleet a few years before; und out of tenderuess to him, as it is reusonable to suppose, this question was permitted to remain in statu quo. Vague intinations, it is stated, have occasionally been given at Copeohagen, that the Sound tolls were guarantied to Denmark by the Congress of Vieuna, as an indemnity for the surronder of Norway to Sweden. Admitting the trath of this, and that overy European government was irrevocably bound by such proceedings, the United States were not a party to it in any way, nud no obligation is imposed upon them to respert the arrangement. Nothing has been more remote from the purpose of our government, from the day on which it was ushered into existence, than that of surrendering to any power its right of using the ocean a\& the highway of commerce. This right it cluims, und whil use all proper means to sucure to itself the full onjoyment of it in every quarter of the giobe.
"The fact is nutorious, that the Sound duos affect us more sensibly than any Juropean nation. Under their operation, (ireat Britain lias a decided advantage over us, as concors: our chlof staple. Ruw cotton, according to the most relialie statements before the Department, is charged with about three per cent. ad valurem in its transit through the Sound; whilo cutton twist, of which Great Britain ships from $30,000,000$ to $60,0(0), 000 \mathrm{lbs}$. to purts of tho llaitice, pays only one per cent. ad valoren! If we quietly submit to such a
tax upon the raw material of our helds, Great Britaln, as a matter of profit, cun well afford to consent to the comparatively inoderate one upon the article manufactured from it, because she can not fail to percoive that, were the dues abolished, we should as certuinly guin markets for the raw product, as she should lose them for the fanufactures of her spinnerigs. For the five $\boldsymbol{y}^{\circ}$ fars ter rlanaing the 31st, Necemiler, 1848, 264 American res."is entered the Batic, upon the tonnage and eargoss of which the Sound toll3 amounted to 570,473 Danish bank rixdollara. Sinee then, no tabular statements have been recelved ; our vesaels passing Elsinore, nor the sums an usily paid. Tho Sound toll levied upon our chief products, which find a market in the countries lordt ing upon the Baltic and beyond them, according to the most reliable information on the subject, is as follows:

"Consequently a cargo of 2,000 bules of cotton pays a tax o: about $\$ 1,720$; a curgo of 800 hhds . of tobacco, $\$ 1,400$; a cargo of 1,000 tiorces of rice, $\$ 700$. In addition to the toll on tonnage, tho cost of pilotage for a ship drawing 18 feet of water, from Dragon to Elsinore, varies, according to the season of the yesr, from $\$ 20$ to $\$ 30.1$

The following statement exkibits the number of Ameriean vessels that passed the Sound at Elainore, to and from the Baltle Sea, from 1837 to 1843, inclugive:

Statemeyt oy the Numoer of Vegeele of all Nationa that pabseo the Sound at Elesinobe, to and yhon tile Baltio Sea, from is8s to 1348 , ineldive.

The official reports relative to the navigation of the Sound, in possessiou of the Department of State, do not come down to a later pierion than 1853. The annual returns of the forelgin enmmerce of the lifanse towns for 18.4, compared with the two preceding years, are, however, at hand; and from theso it appoars that the number of lianse vessels which passed tie Sound was as follows:

The late war, of which tho Maltle was one of the chief theatres, will explain the diminution in 1834.
in the years apecifled, was as follows:

Total, 471,854 franes, equal to $\$ 59,55780$ an annunal average of 78500 frances, or $\$ 14,02821$.
If we are correctly lnformed as to the assessment and the bases on which Denmark proposes to raise her revenues under the scheme of capitalization, it would seem quite evilent that ohe has at least tuken care of "her own Interests" as Implicated in thls question; and our government, in rejectlng the compromise thus tendered, accompanied as it was with the entanglements of the "bulance of power In Europe," under whore shield Denmark wishea to place these exactions, pursuod the true pollicy of the country by avoiding any such "dangerous enmplicity;" at Mr. Marcy terins it. The offer of the United States to ehare liberally in compensating Denmark for her expenditures at Elssinore in tho intereats of commerce ought, as it seems to us, to satisfy any reasonable demand which she can urge upon our own country or the countries of Europe; and, if all combine to pay a "fair equivalent" for the advantages derived by their commerce from the out. laye of Denmark, it sitould be accopted by her without further delay or protest, and, inatead of making the intiquity of her exaction tine plea for its continuance, rhould rathers acknowledge tho equity of those governments whleh are willing to meet all her just claims in the future without aeeking any indemnity for the past.
The folluwing table exhiblts the number of vessels of all natlona thut have passed the Danish Sound during the years 1854-55:

| Nation. | $\begin{aligned} & \text { Prom the } \\ & \text { Narth } \\ & \text { Sea. } \end{aligned}$ | rom the Bultic. | Total. $1886 .$ | Total. 1ass. | $\begin{gathered} \text { lacr'se. } \\ \text { 188s. } \end{gathered}$ | $\begin{aligned} & \text { Decer'm. } \\ & 1885 . \end{aligned}$ |

Regulations observed on passing through the Sound into the Balic.-If the vessel be laden with cotton for Rnssia, the eaptaln must ie provided with a certlicate, properly atteated by the Danish consul at the port of departure, verifying that the eotton does not come from Egypt or the Levant. Every vessel not thus protected will be aubject to quarantine, and may have Ler entire eargo put ashoro.
Every eaptain must be able to show legal ovidence of the nationality of his vessel; must be provided with a munifest and a clesranee from the custon-house offcers at hls last port. Should the vesael come from France, Iloiland, Belgium, Portugal, or liamburg, the captain must exhibit his pansport. If from Ilolland or Belginm, destined for Prussis, the certifiente of the Prussian consul at the port of departure will suffice.
If the vessel eomen from the United States, laden with cotton, the euptain must be provided rith a manffest of his esrgo, custom-honse elearance, register of nutionality, and the certificate of the Danish consul attesting that the cotton was actually grown in the Cinited States; or If it eome from Irazil or any other country, thet it was first landed at a port in the Uaited States, and not transhipped from a foreign vessel.
If the veasel comes from Cuba, the captain must be provided with a register attesting the nationality of his vessel, a manifest, passport, and custom-house receipt; and it would be advisable for him to have, also, a bill of health, attested by tho Danish consul at the port of departure.
The papers and certifieates referred to in the preceding remarks must be in duplicate ; and, when the ressel is destived for Russia, sho'td there be any interlinestions, or marginal notes, or adilenda, the captain's signature must be affixed to each, so as to give it autheoticity:-Com. Rel. U. S.

Since the preceding article was in type, a convention was held in referenee to thefunding of the Sound dues on the part of the several governments interosted. For the results of these deliberations, the reader is referred to srtlele entitled "Sound Dues."
Deposit. This term is applien to the sum of money which a man might deposit with the sheriff after he was arrested, instead of putting in speeial bail. The amount of the deposit was the sum sworn to on the back of the writ. (Blacketone's Comm.) Deposit is also used for any sum of money which a man puts in the hands of another as a kind of seeurity for the fullilioent of come agreenment, or as a part payment in advsnee. The Romsa word, depositum, slgnified any thing which a man put in the hainds of another to keep till it was asked back, without any thing being given to the depositarius for his trouble. The depositor was called deponens or depositor. The depositary was bound to take eare of the thing, and to make good any damage that happened to it through fraudulent dosign (dolus) or gross aegleet (lath crilpa). The depositor could recover the thing by action; but the depositary was entitled to satiafaction for any loss that he sustained in the matter of the deposit by any default (culpa) on the part of the depositor. The depositary eculd muke no use of the deposit, exeept with the permission of the depositor, elther given in express words, or arising from Implication. If a man refueed to return a deposit, and was condemned in an aetion of
deposit (actio depositi), infumy (infamia) was a consequence of the condemnation.-DiG.; 16, tit. 8; Ju venal, Sat. xili., 60.

Depot (Fr.), is used to designate a place where all sorts of military stores and provisions are kept, or where recrulta are recelved and trained. It is alao applied to that portlon of a regiment which remaina at home when the rest is ordered upon forelgn service. And is used generally to denote any place intended as a place of doposit for merchandise; as the terminus of a rallroad. The term station is more proper for places Intended merely for passenger accommodation.
Depression of the Eorizon, or Dip of the Horizon, in Nautleal Astronomy, denotes tho depression or dipping of the visible horizon before the true horizontal plane, and which arises from the elreumstance that the eye of the observer is not placed on the same level with the surface of the sea, but at some distance abovo it. Hence in observing the altitude of the sun or a atar above the horizon with the eextant, the altitude appears greater then 't really' is. let $a=$ the radius of the earth, and $x=$ the height of the eye above the horizon; then the cosine of the angle of depression $\frac{a}{a+x}$. At the height of 10 feot this amounts to about three minutes of a degree.

Derrick, in nautical language, used in a variety of meanings, but chiefly for a tackle used at the outer quarters of a mizzen-yurd, consisting of a double and single block eonneeted by a fall.
Desert (Lat. desertum, partielple of desero, to desert, to leave), a lerge traet of barren conntry; a waste,-E. 13. A term generally used to designate an uninhablted place or solitude; In which sense, as has been judiciously remarked, it is equally applicable to the fertile plains watered by the Maranon, and the sandy wastes of Lybla, but applied more partleularly to tho vast sandy nnd stony plains of Afriea and Asla. In every region of the globe plains are to be found of grester or less extent, whieh, though marked by atrong features of resemblanee in their grand outlines, exhibit with the different latitudes in which they are plaeed a corresponding variety of eharacter, and aecordingly the distinguishing peeuliarities of each aro known by different appellations. Thus we have the steppes of Europe, the deserts of Asia and Afriea, the savannahs of tho Mississipni and Missenri, and the pampas and llanos of Sonth Ameriea.

The most striking feuture of Africa consists of Its immense deserts, which have in all ages presented to the speeulations of the geographer objects highiy worthy of attention. Of these the ehlef is the Sahara, or the Desert, so called by way of eminence. This prodiglous zone of sand stretehes, with few interruntions, from the shores of the Atlantic to the confines of Egypt, and comprehunds in its length and breadth a supertieies of aiout $2,200,000$ square miles. The sand raised by tho burning wind ealled the simoom is frequently in a state of motion, and as it sweeps along in its career $0^{c}$ desolation bears a strong resemblance to the waves of a tempestuous sen. Thls lmmense expanse, however, is by no means a uniform suyface of loose sand. In many parts the dreary wastes is broken by low hills of naked sand-stone, or by tracts of arid
clay, and occasionally it is enlivened by verdant islea or oases, which serve as resting-jlacen for the caravans that traverse these dismal regions. But for theae oases, Indeed, the Bahara would be wholly impasabile. It presents, saya Malte Brun, no traces of a beaten path, and the caravans that traverse it, directing their way by the polar atar, deseribe a tortuous road in order to proft by the oases, which are represented as brilliant with vegetation, but which probably owe a great part of their reputation to the contrast they form wlth the absolnte barrenness of the desert.

The great deserts of Africa are only separated from those of Asia by the valley of the river Nile, and the Bed Sea. But upon this subject we can not refrain from transferring to onr collunns the remarks of Dr. Tralll, who has sketched with a masterly hand the grand outlines of the Asiatic deserts. "Soon after quitting the Nile, the traveler by the route of Suez encounters sand, which is continued into the centre of Arabla, where it forms the desert of Nedsjed, oxtendIng to the valley of the Euplirates. The sandy zona then inclinea northward, enters Peraia, and forms the saline deserta of Adjemi, Kerman, and Mekran; it is turned north-east by the valiey of the Indus, pesses through Caubul and Little Bukharia, till it joins the vast deserts of Cobi and Shamoo, which occupy so large a portion of Central Asia between the Altaian and Mustag chains, and reach to the confines of China. The sandy zone, thus traced throughout the breadth of the ancient continent from western Africa to the $120^{\circ}$ of east longitudo, has been computed to cover an area of $6,500,000$ square miles ; but the Ariatic portion of this tract includes many chains of mountains and fertile valleys. It is characterizod by the occurrence of arid wastes of sand or clay, sometimes with saline incrustations on the surface, and is remarkably deficient in considerable rlvers: except the Nile, the Euphrater, the Indus, and the Oxus, there are no large rivers in a region which embraces almost a fourth part of both Africa and Asia. This portion of Central Asin forms a series of elevated plains, 6,000 miles in length from east to west. Some of these plains, ssy, limmboldt, are covered with herbage; others produce only evergreen saliferous plants, with fleshy and jointed stems; but a great number gitter from afar with a saline efflorescence that cryatallizes in the semblance of lichens, and covers the clayey soil with scattered patches like new-fallen now." Under the head Minaor will be found some account of the so-called singular optical illusion 80 often seen in the desert.
In Scripture, the term desert beurs a wholly different interpretation from that usually attached to it in profane writings. It has been fully shown by lleiand (Paleat. 1. i. p. 375) that the Hebrew -270 (midbur), the $\ell \rho \eta \mu \mathrm{o}$ of the Greeks, and the desertum or solitudo of the Latins, bear no analogy to each other; the tirat being appropriated almost exclusively to those thiniypeopled districts of the IJoly Land which yielded pasturage for cattle, and were remarkable at onco for their beauty and the luxuriance of their vergetation.
"The arid plains and deserts, as well as high mountain ranges, have, it may weli be supposed, an influeace upon the movements of the great aerial ocean, an shoals and other obstructions have upon the channels of circulation in the ses. The deserts of Asia, for instance, produce a disturbance upon the grand system of atmospherical circulation, which, in summer and autumn, is felt in Europe, in Liberia, and away out upon the Indian Ocean, as far to the south as the equinoctial line. There is an indraught from all these regions towad these deecrts. These indraughta are known as monsoons at sea; on the land, as the prevailing winds of the seamon.
"We perccive how a desert land spreads its intluonce through the distance upon the winds. The first effects of heating up the plains are necessarily felt by the air nearest at hand, and by that further off at a

Jater poried, no that the sonth-west monsoon influence is in this part of the ocean propagated from the iand out upon the aea at the rate before atated. Of course, the vaat plaina of Asis are not brought up to monsoon heat per saltem, or in a day. They require time both to be heated up to this point and to be cooled down again. The monscon season may be always known by referring to the causes which produce these wind. Thus, by rocollecting where the thirsty and overheated plains are which cause thu moneoons, we know at ance that these winda are rushing with greatest force toward these plains at the time that it is the hottest season of the year upon them. The influences of these heated plains upon the winda at aea la felt for a thousand milen or more. Thus, though the deeert of Cobi and the sunburned plains of Asia are, for the most part, north of tatitude $30^{\circ}$, their influence in making monsoons is felt south of the equator. So, too, with the great desert of Sahara and the African monsoons of the Atlantic; also, with the Salt Lake country and the Mexican monsoons on one side, and those of Central America in the Pacific on the other. The influences of the deserts of Arabin upon the winds is felt in Austria and other parts of Furope, as the observations of Firici, Lamont, and others show."-Mavry'a Physical Geog. of the Sea.
Desertion by a Beaman. "Desertion from the ship without just cause, and animo nors revertendi, or the justifluble discharge of a seaman by the master for bad conduct, will work a forfeiture of the wages previously earned; and this ia a rule of justice and of jolicy which generally pervades the ordinances of the maritime natious. By the English statute iaw, and by the act of Congresa, deaertion is acoompanied with a forfeiture of all the wages that are due, and an absence of forty-eight hours without leave, is made conclusive evidence of desertion; and whatever nnjustitiahie conduct will warrant the act of the master in discharging a seaman during the voyage, will equally deprive the seaman of his wages. But the farfeiture is asved if the seaman repents, makes compensatica or offer of amenda, and is restored to his duty. l'oblic policy and private justice here move together, and the maritime ordinancea unite in this conclusion. The mater has power to remit a forfeiture, and the penaity of forfeiture is not applied to slight fauits, either of meglect or dirobedience. Thore muat be either an habitual negiect, or disobedience, or drunkenness, or else a single act of gross dishonesty, or soune other act of a heinous and nggravated nature, to justify the dis. charging a seaman in a foreign port, or the forfeiture of wages; nor will the admiralty courta, except in cases of great atrocity, visit the offenses of a seaman with the cuntulated load of forf .ure of wages and compenation in damages. They on $p p^{p^{2}}$ the forfeiture of the wages antecedently earnel, and in the application of the forfeiture, the advanced wages are made a charge on the forfeited wages, but the hospital money is apportioned ratably on the wages for the whole voyage. In these regulations the moderation of the courts, and the solicitude which the peculiar condition and character of seamen excite, are equally manifest. So, if the seaman quits the ship involuntarily, or is driven ashore from necessity, from want of provisions, or by reason of cruel usage and for personal asfety, the wages are not forfeited, and he will be entitled to receive them in full to the prosperaus termination of the vayage. On the other hand, it is the duty of the seamen to abide by the vessel an long as reasonable hoje remains; and if they desert the ship under circumstances of danger or distress from the perils of the sea, when their presence and exertions might have prevented damage, or restored the ship to safety, they forfeit their wages, and are answerable in dumages. And even when a seaman might well have been discharged in the course of the voyage for gross mishehavior, if the master refuses to discharge him, and

lesves him in imprisonment abrosd, he will, in that case, be entitled to his wages untli his return to the United Statew after deducting from the claim his time of impriconment."-Kent's Commentaries, Lect. xlvi. There are, however, at times, oxtenuating circnmstances, which will in part authoriae a alior to leave his ship in a foreign port. This subject is discussed with clearness In the work above-mentioned. Jndge Story hoids that the voyage of a shlp is ended when she arrives at her port of destinstion, and is asfely moored, though her cargo be not delivered; and desertion afterward does not forfelt the wages entire, but a partial forfelture only as compensation for breach of duty,-Ibid. See Digctiaran of Seamex.
Dealgn (Fr. desscin, from Lat. designo), a scheme or pian; purpose, intention; a representation of a thlag by an outline or aketch, etc. Design, in the manufactories, expresses the figures with which the workman enriches hin stuff or ailk, and which he copies after some pattern. Design In lainting, is t.' + first ldea of a large work, drawn roughly, to be afterward carefully executed and finished.
Design, Schools of, are establishments for instructing pupilis in the art of drawing. In some the Inetraction is contined to what is aubservient to the fine arts, but in others, especially in the very admirable establishment at Edinburg, under the Board of Trusteen of Arts and Manufactures, not only ls attention paid to the inetruction of the painter and the eculptor, but design is taught, to perfect the mechanic In the principlea of his art, wherever ornamental pattern is required. Such rehools have been long opened In France and rarious parts of Germany, from which important beneft has lieen conferred on the manufactuting Indastry of those countries. The Edinbarg School of Design appear to have been the first eatablished in Hritain for the express improvement of manufacturing industry. It ls most ably conducted, and has found its pupils in demund for the chief seats of Engiish manufactaring art. In England, besides the establishment at Somerset Ifosse, London, there is a brunch school of design in Spitalfields that is well nttended. Simijar schools are now established in Birmingham, Manchester, Coventry, Nottingham, Leeds, York, IIuddersfieli, Sheffiejd, Norwich, Stokeion-Trent, Newcastleon.Tyne, Haniey, Glaggow, and Puisley. Several have been established in the cities of New York and Bostou, and other portions of the United States, and their atility is ciearly demonstrated.-linasde's Enc.
De-allvering Lead. Nearly all lead ore contains a little silver ; and Mr. Pattinson of Newcastle, Engiand, has devised an ingenious and beautiful mode of separating it. His discovery has renderad many head mines workable which must otherwlse have been abaadoned. The chief ore whence lead is extracted is gaiena, a sulphuret of the metal, containing on an areraje ahout 80 per cent. of lead and a minuto portion of silver; and this siliver treasure often determines the working or non-working of the mine. Until recently, 20 ounces of siiver to a ton of lend were the least that would pay for the expense of separating; but Mr. Pattiason has enabied the lead amelter to realize a profit from so amall a ratio as 8 or 4 ounces to the ton. The lead-smelting at the Allenisead mines, and at the Waniock lead hilla in Dumfriesshire, aro both founded on Pattinson's process.
This process is not only scientific in the principle on which it is based, but it is really beautlful to witness. After the oro has been sinelted, and the lead run off into the form of blocks or "pigs," these pige are elowly re-melted in large cast-iron open vessels. The molten lead, while gradually cooling, is atirred uninterruptediy with an iron rod, and cryatals of lead gradually form. These crystula, being denser and heavier than the rest uf the lead, fall to the hottom, and are thence removod by the ald of a colander or perforated ladle. Now these crystals contain less siliver than an equal woight
of the uncrystallized lead; end here we begin at once to see the rationale of the procese: since none of the silver is actualiy gone, that which has left the erystala has tended to enrich the remaining portion of the lead. Again are the crystais melted, to get more and more silver ont of them; again is the richer lead meited, to increase its richness at the expense of the newly-formed crystals ; and thus do the double processes advance antil almost every atom of silver is obtsined from the lead. But this requires another kiud of operation. The very rich lead is brought to an intense heat in a pectuliar furnace, and a blast of air is driven upon it ; the lead combines with the oxygen of the air to form litharge, while the eilver sinks to the bottom in a pure atate, forming a slab of delicate sllver. A very beautiful appearance presents ittelf during the process ; the molten allver absorbs much oxygen, which escapes again as the metal solidifies; bursting through the gradually hardening surface of the mass, the bubbles of gas force along with them portions of the fluid metal from below. It really afforda a very close representation of a volcano; for the same chemical lawe are In operation in both cases. This escape of oxygen leaves the surface covered with beautiful and fantastical concretions of pure and brilliant allver-silivery mountains and valleys, furmed by a process bearing much analogy with that by which our earth mountains were probably formed. In the recent London Exhibition there was a cake of silver weighing no less than 8000 ounces, obtained from lead in Mr. Beaumont's minea in Northumberiand.-Novelties and Inventions.

Detroit, a clty and port of eatry of the United States, capital of the county of Wayne, Milchigan, eituited on the west bank of the Detroit Strait or River, which connecte Lakes Huron, St. Clair, and Erie. Lat. $42^{\circ} 2^{\prime} \mathrm{N}$. , long. $83^{\circ} 2^{\prime} \mathrm{W}$. The city extends along the river for more than a mile and a half, ita central point being 7 miles from Lake St. Ciair, and 18 from Lake Erie. The river is here ahout five eighthe of a mile In width; and Its depth varics from 12 to 48 fect. The descont from Lake St. Clair to Lake Erie is about 6 feet, or 3 inches per milio; and the velocity of the current at the deepest part, opposite the city, is $2 \frac{1}{8}$ miles per hour. Its shores on both sides are hlghly cuitivated; and from lts outiet into Lake Erie to its origin at Lako Huron reseinble a continuous village, with fine farms, pleasant villas, groves, gardens, and excellent roads. The town is well and reguiarly buadt, extending in the form of a rectangle for about 1200 feet from the river, nnd afterward terminating In a triangle. Some of the principal streets are 200 , others 120 , and others 60 feet wide. These generally cross each other at right angles. The housea are mostly of wood, but many of them are of brick. The princlpal of the public buildings are-the old Stata House, the United States' Buildinge (of poliahed limestono), the Stato buildings for the supreme court, public offices, county court-house, county jail, city-hall, and inarkot, the new Catholic cathedral, and the cathedral of St. Anne. Detroit is well supplicd with water from tho river, by means of hydraulic machinery in the upper part of the town. Shlp and boat building is a large and important branch of business ; and there are geverah large stean suw-mills, iron founderies, etc. Detroit has a very extensive trado, for which it enjoys many advantages. The harbor is capacious and secure. It is connected by the Michigan Central Railroad with Chicago vià New Buffalo and Michigan City, a distance of 258 miles, and by the Pontiac with the town of that name, 20 miles distant. The Great Western Railrond, constructed through Cantudn, bringa it into direct communication with the New York and other eastern routes. The population in 1801 was only 770 , and in 1830,2222 ; in 1840 it amounted to 9193 , and 1850 to 21,000 , while in the summer of 1853 It was 34,400 . This, however, includes only thoss within the corporate limits, beyond which there is a num rous popula-
tion, whose entire occupation and interests aro in tho city.

Dials. Invented by Anaximnnder, 550 n. c.Pliny. The first dial of the sun seen at Rome, was placed on the temple of Quirinus by L. Papirius Cursor when time was divided into hours, 293 n. c.-Blair. In the times of the emperors, alnost every palace and publle building bad a aun-dial. They were first set up in charches in A. D. 613.-Tenglet.

Diamond (Ger. Du. Da. nnd Fr. Diamant; Sw. Demant, Diamante; It. Sp. and Port. Diamante; Rus. Almas; Pol. Dyamant; Lat. Adamas; 1lind. Hira), a precious atone which bus heen known from the remotest: agea. lling hus descrilbed it (Ifist. Nat.. lib. 37, 84); but his account is, in many respects, innecurate. It is found in different parts of India, and in Borneo; it is also found in lirazil, on which, indeed, Europe may be said to be at present entirely dependent for supplies of dinmends. Ilitherto, however, it has not been met with anywhere except within the tropics. It is the most beautiful and mest valuable of precious atones. Its mast common colors are white and gray, of various shades. It oceurs also red, blue, brown. yellow, and green. The colors are commonly pale. It is always crystallized, but ametimes so imperfectly that it might pass for amoryhons. It is the hardest body in nature. External, lustre from splendid to glimmering: internal, always pplendid. It is lirittle; its eprecitic gravity is 35.5 . When rubbed it tecomes positively electric, even befere it has been cut by the lapidary, which is ot the case with any other gem.Tromsos's Chemistry.
Diamonds were first bronght to Europe from the Fast whero the mine of Sumbulpour was the first known; and where the mines of dioleonda were discovered 1584. This district may he termed the realm of diamonds. The mines of lirazil were diseovered in 1i2s. From these last a linmond, weighing lima carats, or 14 ounces, was sent to t..e court of lortughl, and was valued liy M. Homeo de lisle at the extravagant sum of 224,000,000 reals; ty others it was valued at $36,000,000$. Its valuo was next stated to be $3,500,0,1001$; bat its trie value is $\mathcal{f ( N ) , O ( N ) \text { . The dianond ralled }}$ the " mountain of llhht," which belonged the the king of Cuubul, was the most superb geme ever seen. It was of the linest water, and the size of an rgg, and war nlso valued at $3,5(0)$, ,thk). The great diamond of the emperor of Russin weighs 193 carate, or $10 \%$. 12 dwt. 4 gr., troy. The empress Catharine 1I. offered for it s104,166, liesides an annuity for life to the owner, of flot1, which was rufusel ; hut it was e!terwarl sold to Catharine's favorite, connt Orloff, for the irst menstioned sum, whithot the annuity, anll was ty himp presented to the empress on her birth-lay, 1i:-2. It is now in thr sceptre of Russia. The, litt diamond weighed 136 carats, and, after cuting, 106 carats. It
 Haydn.

Accorling to Mr. Milhurn (Orient. Com.), the colur should be perfectly erystalline, resembling a drop of clear epring water, in the nidhlie of which you will perceive a atrong light playing with a great deal of epirit. If the coat be amooth and liright, with a little tincture of green in it, it is not the worse. and widlum proves had; lat if there lie a mixture of yollow with tho green, then loware of it-it is a soft greasy atone, and will prove lad.
Trst of lhiammis. Cutting, etci--Tonsertaln whether any apiectinen is a true diamend or not, a tine file may the used; and if the surface of the stone the the Jeast aliraded or serateshed by ha aetion, it is not a diamonis. The difference will alse appear upon close examination without this instrument : the rays of light patily pass through other gems, but in the dhamond they are refracted to the surface, which oecasions ity waperior lirillaney. If the specimen under examinution bo very mlinte, it may lis placed hetween two hulf.
erowns, or other flat metallic surfaces, and pressed with the thumb and finger: if a diamond, it will not be injured; but if otherwise, it will bresk and fall to powder. On account of the extreme hardness of the diamond, the art of cutting and polishing it was for a long time unknown in Europe. But, in 1456, a young man of the name of Louls Berghen, $n$ native of Bruges, is sald to havo constructed a polishing wheel for the purpose, which was fed with diamond powder instead of corundrm, which the Chinese and IIindoos had been long acenstomed to employ. Berghen was lell to this diseovery by observing the action produced by rubbing two rough diamonds toget her. Diamonds are eut ints brillinnts and rose diamonds; the former being, for the most part, made out of the octihedral rrystals, and the Intter from the spheroidal varieties.-Joy ce's Practical Mineralogy; Ress' Cyrlopardia, etc.

Commercial Value of Jiamonds.-In the great or wholesale trade there is but little fluctuation in the price of those diumonds which may be terined stones in goneral demant. I will begin with lirilliants from one Grain to $2 \frac{1}{2}$ grains each. Such brilliants double eut, and what may he termed fine, are worth from 5 to $x$ s per earat. Needy sellers may take 10 per cent. less for eash; but this is the general averago price for a lot of 10,20 , or 50 carats of well-made stones, if the quality the gord. Brilliants, from two grains to three, may he bought in lots at from $\pm 7 \mathrm{7s}$. to $£ 8$ per carat. It is to be understoon, that diamonds in a lot are never all ipuite free from faults; hence there may arise a difference of 10 per cent. in the price. Stones of 3 grains, if fine anl perfect, are always in demand at $\mathrm{N} x$ to f ! per carat. Hrilliants from is grains to 4, if very fino and well proportioned, are worth from is to ed fer earat. Those of $n$ earat euch, if very tine anll wel] selected, are worth f9 to $£ 10$. Three years ago 1 of ferell it 2 each for 8 , and conld not obtain theu. Hrilliants from it grains to 6 , if pure, are worth, from $\pm 18$ to $\boldsymbol{E 1 4}$; if perfectly tine, anil of the full weight of 0 graths, they are wort li from 517 to $5^{\prime} 18$ each. 1 have for such pahl e\%o. Ilrilliants of e carats each, are worth from fert to tu30. Stones of this weight, is well pros portionell, are considered of a tine size, nud well walcalated for pins, or the centre of elusters ; indeed, well jroportioned diamonde, from 6 grains to 2 carats earh, are alwuys in demand, and are retailed at from $\mathbf{f} \%$ to e:tis earli, meoriling to their degree of perfection, or as the retailer may think tit to charge them. For larillinnts of 1 carats, if fine and well formed, from $£ 70$ to f(x) may te ohtaised. Stones of this size, and larger, are nore llatile to capricious floctuations of price than the smaller ones hefore named, being chiefly required for the centre stone of salahle necklares. Irilliants of 4 carats, le tine, are worth from d'lou to flio. I have sold stones, single cut, a little off color, of this weight, at k0 guincus. I passessecl one of 17 grains, jerfectly white, having a surface largo as that of a 7 carat stone ought to he; it was, conseguently, very thin, hat beinge much in refpest, on aceount of its great apread or surface, it was soll for $£ 160$. Irrilliants of $\bar{j}$ carats are nut frequently met with in general trule, and are valnable in price : as the doalors exact mese if they kuow that such stones are wanted than they would in the regular conre of tmainess. The prlces may he satid to vary from fle to $£ 200$.

Brillhats of f carata, as before ntated, are not common: they are suitable for centre atones of expenive recklaces anl ainglo atone rings. If jerfeet and well shaped, they sell for $\mathcal{L} 230$ to fe500, ir more. Fur emio mating the valus of peculitarly tine dianomis there is no itxed stundart. Jough diamouls, selected as fite, and well formell for cutthig, may be estimated as follown: Sifare the wejght of the stone, multiply the promint by 2 , and the result will the the value in jumuls aterling. Hrillianta, if sine, may be eatimated by squaring the weight in carats, and multilyang the prom duct ly $K_{\text {, }}$ which will give the emount in poumels stere

ling. As a very large property, both In Great Britain and in other countries of Europo, is vestell in diamonds, it may be intereetlag to be informed, that not only the price of these $g$ ms has for several years boen, upon the whole, gradually rising, but that it is likely to continue on the advance. At the present timo, indeed, and for the hast few yoars, there has been a dull sale of diamonds in England, nor did the coronation occasion a demand worth notice; but on the Continent the trade has been steady, and rough diamonds have been constantly rising in price. 'That this advonce will be progressive may be assunued from the fact, that the best dismond ground now known, the Serro do Frlo in Briw zil, has assuredly passed the zenith of its prosperity. I went over the greater part of what is yet reserved, and still remains to bo worked, and I conceive that there would be no difficulty in calculating the length of time in which the present number of working may reduco it to a atate of exhaustion, llike that of the farfamed Golconda. The average annual produce of filture years may be cetlmated by the amount obtninel from that portion which has been alrendy worked. Brazil may be said to furnish Europe with 25,000 or 30,003 carats per annum of rough diamonds, which, if reduced to brilllants, may make an influx into the market of 8000 or 9000 carats annually.-Mawe's Treatise on Diamonds, 21 ed. pp. 9-14, and p. 60.

The rule stated by Mr. Mawe, and alopted by the jewelers, for estimating the value of diamonds (multiply the square of the weight in carats ly 2 , and the product is the value in pounds sterling), ean only hold in the case of those that are of a small size, or do not weigh more than 20 carats. The value of the largest dianonuls, which are exceedingly rara (non nisi regibus et ïs odmodum parcis cognitus, Pliny), can, it is clear, depond upon nothing but the competition of the purchasers. The diamoni belonging to the emperor of Brazil is the largest in the world. It is still uncut, and weighs 1680 carats; so that, according to the jowelers' rule, it must bo worth the cnormous sum of $£^{5 j}, 644,800$ ! It may, however, be doubted whether his imperial majesty would have any disinclination to part with it for the odil sum of $\mathbf{E} 644,800$. The famons diamend belonging to the emperor of liussia, which the jewelers tell us is worth $\dot{x} 4,804,000$ did not cost $£ 150,000$.

Diamonds are not used exclusively as articlos of omsment or luxury. They are frequently employed with'grent advantago in the arts. "Ilad, discolored damouds," buys Mr. Mawe, "are sold to break into phwder, and may be suld to lave more extensive anle than brilliants, with all their captlvating heauty. In many uperations of art they are indlapensable; the fine canco and intaglio owe their perfection to the diamond, with which atone they can be engraved. The heauty of the onyx would yet remain dommat, bad not the unrivaled power of the diamond been called forth to the artiat's assistanco. 'I'he carnellan, the agate, or caingrorm, can not be engraved by any other kubstance. Eivery crest or letter cut opon hard atone Is indelited to the diamoul. This is not all; for without it hlocks of crysi.: could net be cut into slices for spectacles, agate for snútubones, etc." The carat graln meed in weighing diamonds is dlilerent from the troy grain, 5 diamond grains heing only equal to 4 troy grains. See I'retminster Rer., xxi., p. 297 ; llunv's Nagazine, xv., p. 600, Fiazki, xv. (by Cahlasles); Bankera' Magazine, N. Y., vol. Y., 270, :169.
Diaper. (Ger. Irell; Iu. Irrl; Fir. Iingeouterd; It. Tela 'essuta r opere; Sp. Ifanteles alemoniscus; Rus. Salfetotsschnar), a sort of the flowered linen, commonly used for table-clotha, mapkins, etc., braught to the highest perfection in the manufactories is the north of Ircland, in Germany, and Scotland. It sometmes rosendblas an inferior kind of damask. It is said to have been originally mannfactured at Ypres, in Flandera; whence the term d'Ypres, corrupted into dlaper.

Dice (Ger. Würfel; Du. Taarlingen; Fr. Des (d jouer); It. Dadi; Sp. Dados; Rus. Kostı), cubical pleces of bone or ivory, marked with dots on each of their sides from i to 6, according to the number of the face. They are nsed in various games of chance, by being thrown from a box.
Dicker (probably from deкa, ten), in our old writers, is used to denote the number or quantity of ten, particularly ten hides or skins, of which twenty made a last; and is sometimes applied to other thinga, as a dicker of gloves or ten pairs, a dicker of iron or ten bars, etc.

Dictionary, in its original acceptation, is the arranging of all the words of a language sccording to the order of the alphabet, and annexing a definition or explanation to each word. When arts and sciences began to bo improved and extended, the multiplicity of technical terms rendered it necessary to compile dletionarios, either of science in general, or of particular sciences, according to the views of the compiler. Hence dictionaries may be said to be of two sorts, of world, and of facts or things; in the former sense, the term dictionary belng equivalent to lexicon, in tho latter, to encyclopedia. A standard dictlonary of the Chincse language containing about 40,000 charocters, most of them hleroglyphic, or rude representations, somowhat like our signs of the zodiac, was perfected by Pa-out-she, who lived about 1100 B. c.-Morrison. Cyclopaedins were compiled in the fifteenth and sixtcenth centuries. The first dictionary of celobrity, perhaps the first, is by Ambrose Calepini, a Venetian friar, in Latin; be wrote oue in eight languages, ahout A. D. 1500.-Niceron. The Lexicon Heptaglotton was published by Edmund Castell, in 1659. Bayle's dictionary was published in 1696, "the first work of the kind in which 8 man may learn to think."- Voltaire. Chambers' Cyclopadia, the first dictionary of the circle of the arts, sciences, etc., was published in 1728. 'The great dictionary of tho English lunguage, by Samuel Jelinson, appeared in 1755. Francls Grose's Dlctionary of the Vulgar Tongue, was compiled in 1768; and from this period numerous dictionaries have been added to our atore of literature. Noal Webster's great American Dictionary of the English language, in two quarto volumes, was first published at New llaven in 1828 . It was repriuted in London in 1832. Numerous abridgments and new editions of the whole work have since been published in London and New York.-I/aydn.

Die (lir. de), in coinago, is the Instrumont by which tho impressions are given upon the various denominations of coin. The following is an outline of the die manufacture: The engraver selects a forged plug of the best cast steel of proper dimensions for his intended work; and having carefuily annenled it, and turned ita surfaces nonooth in the lathe, proceeds to engravo upon it the intoniled device for the coin. When this is perfect the letters ure put in, and the circularity and size duly allosted; it is then hariened, and is termed a matrix. Another plug of soft atcel is now selected ; and the matrix heing carefully adjusted upon it, they are placed under a vory powerful fly-press, and two or three blows bo directed ns to commence ant impression of the matrix upon the plug; thls in then annealed, and the operation repeated till the plag recolves a perfect impression of the work upon the matrix. This impression if of conrse in relict, the origlnal work upen the mutrix being ladented, and producos what is termed the punch. This, lelag duly shaped in the lathe, is hardened, and is employed in the produetion of impressions in soft ateel or dies, which, being properly turned or hardened, whe exact facsimiles of the orighal mutrix, und aro used ln the process of coinage. When a pair of dles are made of good steel, duly hardenod and temperd, and wise carefilly used, they will sometimes yidl from two to threo hundred thousand impreasions lefore they become so
far worn or injured as to require to be removed from the coining pressea.
Dieppe, a commune and seaport town of France, capital arrondissement, Department Seine Inferjeure, at the mouth of the Arques on the English Channel, and 38 miles north of Ro"en, and by railrond 125 milles from Puris. Lat. of light-hnuse, $49^{\circ} 55^{\prime} 7^{\prime \prime}$ north, long. $1^{\circ} 5^{\prime} 2^{\prime \prime}$ east. Population 17,000. It is divided into the town proper, and the suburb le Pollet, which conmunicate ly a flying bridge, both being well furniehed with water from an aqueduct supplying nearly 200 fountains. Principal edifices, mn old castle on a cliff west of the town, 2 churches, the town hall, commune college, theatre, public library, bathe, and a school of navigation. The port, inclosed liy two jettlen, and borlered by quays, can accommodnte from 60 to 80 vessels under 600 tons; but it dries at low wator, nnd it is otherwiso inconvenlent. Dieppe has nn active general trade, shlp-building docks, manufactories of ivory wares, watehes, lace, etc., and it is a packet station, communicating daily, by ateamboats with Brighton; the traffic having incrensed consideraWy since the opening of the Paris and Rouen Railrond. It is also resorted to hy summer visitors; but its inhabitants depend chiefly on its fisheries of herringe, manckerel, and oysters.
Digit, or Monade, in Arithmetic, any integer under 10, as, $1,2,3,4,5,6,7,8,9$, and by menns of which all numbers are expressed. Diyit, in Astronomy, the $t$ welfth part of the diamerer of the sun or moon; a term used to express the quantity of an eclipee. Thus, an eclipse is aaid to be of sir digits when one hnlf of the disk is hid.
Dike, or Dyke, in its primary sense, denotee a ditch or drain. The word seems to have lieen furmell from the verh to dig; though athers derive it from the Dutch dijk, n dam, sea-bank, or wnll. It is generally usell to signify n work of stone, timber, or fascines, raisel to oppose the entrance or passage of the waters of the sea, a river, lake or the like. Junius and Mónage concelve the Flemish to havo hurrowed their worll from the (ireak teitor, wall; hut tinichard derives it from the llebrew daghah.
Dimity (Frencl, Basin; Italian, Doblefto; Spmninh, Dimite), a species of cross-burrell stuff entirely composed of cotton, similar in faliric to fustlian. Diniity was originally imperted from Indin. Dr. Johnsen cails it dimmity, and describes it as a kimd of fustinn. The distinction letween fustiun and dimity seems to be, that the former iesignates a commen tweoled cutton cloth of a atout fatric, which recelves no ornament in the loom, but is most frequently dyed after being woven. Dinity is also a a tout cotton cloth, thit nut usually of so thick a texture ; ond is ormmentell in the loom, either with raised stripes or fancy figures, is seldum dyed, hut usually worn white, ae for thell mud bedrom forniture. The stripel dimities are the most commen, they require less lator in weaving, than the others ; and the mounting of the loom being nore sim. ple, and consequently. less expensive, they cau to solld at much lower rates.

Dime, a ailver coia uf the Unived Stutes, welghing, accorling to the art uf Congress of $1553,8840-104$ graine. The half-dime welghing one half, or 1! $20-100$ graine; luth legal tenulers of the amount of fire atol-

Dipping-Needle, n magnetic neclle that dips or inclines to the earth ; an lastrument for aspertaning the anount of the magnetic inclination at the ditterent
ruts of the earth's surfince. 'This fact was first ofsserved by ono loobert Norman, an Linglishman, and a makur of compasses for mariners, abuut the year 157 t , who, flading that he was alvays obliged to emuterbalance that end which turns to the north ly a hit of wax or such other substance, though the balanee lua! lieen ever so exact hefure, ;ubhished an account of his discovery as a matter of hafortance. Tho aulject was
instantly attended to ; and instruments ware not only contrived for ascertaining the quantity of the dip, but various epaculstions were formed concerning the cause of ao surprisling a phenomenon. The general phenomena of the dipping-needle are, that in the equatorial regions it remalna in a horizontal position, but as wo recede from the equator toward either pole, it dips; the north end, if we go northward, and the aonth end, if we proceed soutbward; and the further north or south we go, the greater is the inelination. Its inclination is likewise found to vary very considerably at different times in different places of the eurth.-E. B.
In the most improved form of construction of the dipping-needle, the axis, instead of being a cylinder, is a knife-edge, resting perpendlcularly, like the aupports of a pendulum, on two agate planes. A needle thus supported, however, must necessarily make small oscillations; consequently it must be ao adjusted that when it points in the direction of the magnetic furce, the knife edgea may be perpendleular to the agate planes. The mean value of the angle of the dip must therefore be known previously to its construction ; but it is the best adapted, on account of ita delicacy, for ascertaining the minute variatlons of the dip at the arme place. The ungle of the dip, like that of the variation, changes its value when at the same place, following, of course, the motion of the magnetic poles, which, from the observations made by Secresby, Parry, Ross, and others, in high latitudes, appear to have a motion weet warl, the annual amount of which is ahout $11^{\prime} 4^{\prime \prime}$. In the summer of 1831, Commander Rove, in an excursion from the veseel in which his party were so long detained in the polar sens, reached a spout on the continent of North America, which had been calculated to the the position of the magnetic pole. There he fund the dip of the needle to he $x y^{\circ}$ $599^{\prime}$, within one minute of the vertical; nul cempassneedles sukjendent in the most delicate manner possible exhitited no polarity whatever. The latitude of this spot is $70^{\circ} 5^{\prime} 17^{\prime \prime}$ north, and its longitude $96^{\circ} 46^{\prime}$ $40^{\prime \prime}$ west. For $n$ deseription of some other furms of the dipping-ueelle, see Buewsien's Treatise on :Mag. netism.
Diplomacy, in its most restricted sense, is used to express the nit of conducting negetiations or arrauging treaties lutween nations hy means of their fore gn ministers, or written correspondence; hat in its most extended signification, it emhraces the whole science of negotintiun with foreign states as fomuded on public law, positive engagements, or an enlightened view of the interests of each. Hut, upon this sulject, wa can not do hetter than emboly in our pages sane remarks from the Intreduction of Marten's. Manuel Diplomatinue, in which a distinct view is exhilited of the importance amel maln objeets of diphomary. 1hiplomacy, says that athe statersman, mast he placell in the foremost rank if the useful sciences. The fate of nutimue, in the present state of the worlit, depends grently on their relations with othery; and these again ars materially influencell and determinel hy the nature of thelr foreign policy, that is, hy the success with which they have cultivated and applied the principlea of thia science. Diplomacy eubraces-1. The law of nations, by which the relations of one state with nother are acturmineal huth in peace and war. 2. The pulitical prineiples of indivilual status, as de. duecel from a regaril to their peenliar interests; and a knowledpe of the way la which these intrerent may te reconciled with, and made sulservient to, the law of mations. 8. An nequaintance with the privileges and datios of liphomatic agents. 4. The combuct if negotiations, or the rourse to be pursuel in treatime of the interents of dilifrent atates. 5. The moral und physient statistics of each prower, 6. The pulitical anil military listory of the states having diphomatic relatiens; and tho projects, tendency, and pollty of their reapective governments. 7. The various ays-
tems of g equililiriu be broug diplomati tion the culation a

Amony the Trait. de: Relitia M. Lat Co
tems of government, supremacy, concession, retention, equilibrium, centralization, confederacy, ctc., that may be brought into operation. 8. The art of composing diplematic despatches. To this multifurious informatlen the diplomatist should unite the powers of calculation and application peculiar to strong minds-the "tact des convenances," which may be felt, but can not lee expressed-circumspection, address, and perfect integrity. The combination of these varions qualities will procure fer the diplomatist such a character for sagacity, rectitude, and straightforwsrdness, and will, sooner or later, obtain for him an ascendency over the minds of others, and give grest weight to hls opinions.

It must be remembered that the diplomacy of every nation is more or less within tha range of casualties; being subject to the versatility inscparable from human affairs, the ficklenesa and passions of man, and the uncertuinty of ovents-an unlooked-for denth, a change of ninistry, treacherous designs, undue influence frem nny quarter, a false calenlation, corruption-each of these causes may clsange the policy or course of a gevernment; and this will more or less affect every ether gevernment, in proportion to tho extent of its influence. In addition to these numerons causes of vuriation, if ambitious projects he entertained by any great power, diplomscy becomes still more intricnte and difficult. Every state desires to be protected sgainst the storm which its rulers imagine they can prognosticate, and of whose lursting they are apprehensive. Again, wo must remark, that the schemes of a government, how admirably soever centrived, have often miscarried, either from subordinate persons or those intrusted with putting them in execution having misapplied or misunderstood the instructions of their superiars.
From what has been said, it will be easily understod, that in diplomacy, fulse estimates are frequently formed of the merits of orlginal plans or designs from looking at their results only. The diplomatist is, of course, exempted from all responsibility in regaril to operations mixed $n p$ with the events of war-ho is answeralile only for the success of his prejects under the eanditions on which he proposed them.
A diplomatist of moderate eapacity, if favored by circunstances, may accomplish much more than the man of genlus who has to contend with alverse fortune ; but this difference of success makes no change in their relative ability, and thuse aequainted with the cireumstances readily discriminate between sagacity sud aecident.
Diplomacy has been practiced in substance ever since mankind have been fermed into Independent states, though it is difficult to ascortain the precise periul ut which the term came into use. The system, however, of the regular and unlaterrupted residence of foreign minlsters during pease at the Liuronean conrta, as at present practiced, is said to have originated with the tharilinal de Rlelselien. Hefore that time embassles had been omly sent in special oceasions, but attended with murh greater show and retinue than has heen the fashion In motern thenes; while the substantial business of states at the nelighboring courts was transacted ly :ugnts of a lower stamp and character. Diplonatic ngenta are now rankel, in Eitrope, in the following order, accoriling to the reguliations of the Comgress of Vienna:-1. Ambassadors; 2. Fuvoya extriordinary and ministers plenlpotenthary; 3. Minlsters reshdent; l. Chargés des andines ; 5. Secretaries of legation und attachés; the later, however, have no preciso aliphomatic character, and are only consideral by courtesy as attached to the legation.

Among tho best works on this important suliject are the Traits compht de Iliplomatie, on Theorie generale des Relutions extrieures des Puissances de l'Aurope, par M. lee Comte de Ganden (1'ails, Is:il), 3 vols. 8 vo.; and De Wiequefirt's A mbassadeur et ces t'unctions (lid.

Opt.) 1746,12 vols., 4to. See also the Manuel Diplomatique, by Von Manten (Paris, 1825); Flassan's Ihist. Gen et Raisonn. de la Diplom. Francaise, 7 vols. (Parls, 1811), and Von Marten's (senior) Grundriss einer Diplom. Geschichte der Europ, Staatshandel, etc., (Hamburg, 8vo.) Brande's Enc. See N. A, Rev., xxxix. 802 (by E. Everett) ; xxiv., p. 82 (by T. Pitkin) ; U. S. Lit. Gaz., v., p. 1 (by C. Cusiino); Fraser's Afagazine, xli., p. 605; Foreign Quarterly. xiii., p. 1.

Disoharge of Seamen. Whenever a ship or vessel belonging to a citizen of the United States is sold in a foreign country, and her company discharged, or when a sesman or mariner, a citizen of the United Stutes, is with his own consent discharged in a forcign country, it is the duty of the master or commander to produce to the consular officer the certified llat of his ship's company, and pay to such consular officer for every seaman or mariner so discharged, being designated on such list as a citizen of the United States, three months' psy, over and above the wages which may then be due to such mariner or scaman, two thirds thereof to be paid by such consular officer to each seaman or mariner so discharged, upon his engagement on board of any vessel to return to the Unitel States, and the other remaining third to be retaized for the purpose of creating a fund for the payment of the passuges of seamen or mariners, citizens of the United States, who may be desirous of returning to the United States, and for the maintemance of Amerlcun eamen who may be destitute, and may be in such forcign port. The soveral sums retained for the seamen's fund are to be accounted for to the Tressury Department by' the consular ofticers receivint the same.-Statutes at Large, U. S. See IItnst's JIag., xi., p. 344; Ibid., p. 230; Kent's Cominentories; Parse ns' Ifercantile Law.

According to the laws of the United States, consular officers are not to discharge a seamme for slight or venial oftenses, and cettainly net for a single offenso unless of a very aggravated character. If the charge bo negligence, drunkenness, disobedience, or dishonesty, the question should be, whether the misconduct was of such a degree as to show a habitual inattention to or unfitness fer duty, having always in view the particular station of the party and the nature of his duty. If the allegation be that the seaman is a dangerous person, from a spirit of insubordinutlon, or hostility to the minster, it has heen held that the master nust show that the danger is such as would affect the mind of a man of ordinary firmmess. liat even in cases of aggravated offenses, or of a continued course of conduct which wonld justify the discharge of a scaman, if he repents and offers amends, the principle which is always eperating in his favor against all kinds of forfeiture, with very fare exceptions, intervenes to restore him to his rights, and he is ordinarily entitled to be recelved again on lxard. To dieprive a mariner of the lenefit of this rule, it should appear that the misconluct nmounts to a radical disquallication, as dishonesty and habitual drunkenness in a steward; or that the party fa really dangerous to tho peace and srefety of the ship. These principles receive additional force from the general policy of the itws of the Enited States, which diseountennees the disebarge of seamen in fureign ports. 'the various enactments in respect te ilestituto scamen sufliciently sliow the paternal solicitude of the goverment for the preservation and protection of the seamen if the country.-- Ifautal for Consuls. Sce IDesigution hy Seamon.
"The right of the seaman to he brought inuck to his own homo, is very joalously guarded ly our laws. The manter should alwayd present his shipping articles to the consul, or commercial agent of tho United States, at every foreign port which he visits, hut dues not seem to be requirel by law to do this, unless the coneul lesires it. He must, however, present them to the flrat boarding officer on his arrival at a home port.

And if apon an arrival at a home port from a forelgn voyage, it appears that any of the scamen are missing, the master must account for thelr absence. If he discharges a beaman abroad without his consent, he must pay to the American consul three months' wages, of which the consul gives two to the seaman, and remits one to the Treasury of tha United States to form a fund for bringing home seamen from abroad. Thls obligation des not apply when the voyage is necessarily broken up by a wreck, or similar misfortune. 13nt proper measures must be taken to repair the ship, if possible, or to obtain the restoration, if captured. And the seaman may bold on for a reasonable time for this purpose, and if diacharged before, may ciaim the extra Wages. Onr consuls and commercial agents may anthorize the dicharge of a seaman abroad for gross mlsconduct, and he then ha: 10 claim for the extra wages. They may also send our seamen home in American ahips, which are bound to bring them for a compensation not exceeding ten dollara each, and the seamen so sent must work and obey as if originally shipped. Besides this, if a master dischargen a beaman in a foreign port, he is liable to a fine of 500 dollars, or aix months imprisonment. And a seamsn nay recover full indemnity or compensation for his loss of time, or oxpenses incurred by reason of ench diseharge."Parbess' Mercantite Law, p. 393.

Discount, a sum of money deducted from a debt In consideration of its being paid berore the usual or stipulated tlme. The circnmstance on which its fairness is founded is, cast the creditor, by receiving his money before it comes due, has the Interest of the money during the interval. Consequently he should only receive so much as, jut ont to interest during the period in question, will realize the amount of his delit at the time when it would have become due. For Instance, 8100 is to be paid at the end of 3 years; what shonld be paid now, interest being 4 per cent. ? llers it is evident, that if we divide the whole delit into 112 (or $100+3 \times 4$ ) parts, 100 of titese parts will make the other 12 in thres years (at simple interest), wheace the payment now due is the 112th part of $£ 10,000$, or $£ 895 \mathrm{~s} .9 \mathrm{~d}$. The rule is, $n$ being the number of yeurs (a fraction, or number and fraction), $r$ the rate per cent, and D the sum due,

$$
\begin{aligned}
\text { Present value } & =\frac{100 \mathrm{D}}{100+\mathrm{nr}} \\
\text { Discount } & =\frac{10 n r}{100+n r}
\end{aligned}
$$

In practice, it is usual not to find the real discount, but to allow intersst on the whoie debt in the shape of abatement. Thus it wonld be coneidered that, in the praceding example, three years' discount upon $£ 100$,
 the present valne.

In transactions which usualiy proceed on componnd interest, as in kaluing laases, unnuities, ete., the principuie of disconnt is ntrictly preserved. Tho present value in the preceding case is, in its most naual form,

$$
\frac{1)}{(1+\rho)^{n}} \text {, and the discount } n-\frac{1}{(1+p)^{n}}
$$

whare $\rho$ is the rate per ponnd (not per cent.: thus it is - 04 for 4 per cent.). Lut reconrse is usuaily ind to the tahies of present valnes which accompany ali works on annuities e $c$ a mpound interest.

The nurro, iscount is also anolied to certain trade allowances uphe thic sume the: jrite of goomis. Iu some brunches of trads then $n!$, wauce vy according to the circumstances win. $\cdot$ : th the markets; and what is eailed cisconnt is in face orewaioned by fluctuations In priees wi ich. $i$ aine iht veni to mathialn

 business, and " ber inafore is a lent of pricen
 at Sheffield, in v. Me aminal price of eachartlele
is continued the same st which It has atood for many years, while to every different specisa of tool there is applied a different and a fluctustin! rate of disconnt, this fluctuation constituting In fact 11 difference of prico between one period and another. The rates of discount in this list vary from 5 to 10 per cent. upon the nomiual prices of the different articles.
The term discount ia also employed to eignify other mercantile allowances, auch for example as the ulratement of 12 per cent. made upon the balunces which underwriters, or insurcrs of sea riska, receive at the end of the year from the brokers by whom the insurances have been effected. The word disconnt is further used, in contradistinction to premium, to denote the diminution in value of seourities which are sold according to a fixed nominal value, or according to the price they may have originally cost. If, for example, a ehare in a campl company, upon which $\mathbb{C l 0 0}$ has been paid, is sold in the market for c98, thie value of the share is stated to be at 2 per cent. discount.-Bons.
Discriminating Duties. The discriminating duty of 10 per cent., under the 11 th section of the $U$. S. tariff law of 1842 , is an additional duty of 10 per cent. on the rute of legal duties chargeuble on the imports, and not a duty of 10 per cent. on the vulue of the goods; as, for example, an import chargeahle witb a regular duty of 20 per cent., and also with the discrininating dinty of 10 per cent., under the 1 : H hection of tariff act of 1842 , would become chargeable with a duty of 22 per cent., and not 30 per cent.
It has been deched that a diseriminating dufy exacter? on a Spanish veasel elearing frem u port of the United States for Cubs or Porto Rico, under the 2 d section of the aet of 30th June, 1834, "concerning tonnage duty on Spanish veasels," can not be refuuded, although the vessel may never arrive at her destination, being wrecked on the voyage.-Manual for Consuls.

Dispensary, a piace where medicines are made up and distributed; but used more generaly for a charituble institution, where the poor are supplied with medicines and advice. Institutions of this mature are of comparatively recent origin; though they are now to lie met with in every town of any importane, inoth in this country and in Europe. To every dispeasary there are always attached one or more jhysicians, surgeons, and ajothecaries, whoso duty it is respectively to prescribe and dispense modicines to the poar, und to viait them in their own houses in the event of their being too ili to attend personaily at the institution. In most cases dispeusuries are supported by voluntry; contributions.

Distaff, the staff to which hemp, fiax, wool, or other substances to be spun, is fastened. Georgetown is the principal port, and is a port of entry, situated at the head of the Potomac navigatlon, 120 miles from the see, and is divided from Wasbington by Rock Creek. It is built on a range of bllls, and com-
mands a megnificent landscape. The city is one of the handsomest in the country, and the seqt of aeveral well-known educational establlahments, and is the residence of many persons of distiaction. It manufactures are increasing, and perhaps no other place is so celebrated for its fisheries of shad and herring, thousands of barrols of which are packed in the fishing season. The Alexandria branch of the Chesapeake and Ohic Canal here crosses the Potomac on a magnificent aqueduct, 1,446 feet long, and 86 feet above the ordinary tide. The tonnage of Georgetown in 1856, was 20,968 tous.
Alexandria, formerly in the District of Columble, is situated 6 miles below Washington. It has a good harber, and considerable trade in flour aud coal. Since 1850 the commerce has nearly doubled. The tonnage in 1850 was 7,221 tens.

The foreign commerce of the District has been decreasing since 1831, and is now coufined to the imports of West India. produce.

Foreion Commerce of the Distriot of Columbia, prom Ootober 1, 1820, to Jult 1, 1856. Includino Alexandeia To JUnE 80, 1846.

- Nine months to $\bar{J}$ une 80 , and the fiscal year from this tiace beglas July 1.

Distillation (Lat.), the evuporation and subsequent condensation of llquids hy means of a still and refrigeratiry, or a retort and receiver. The discovery of the art of distillution is genernliy ascribed to the slehemists; but it was douhtless knowu in more remote ages to the Arablans, and by them probably derived from nations further east. The process of disbilation, though in continual use in the chemical and pharmaceutical laberatory, is earried on upon the most extensive sesie for the production of ardent spirits in the distillerifg. Under the werld Aiconoct, Branior, Frimentation, Wing, etc., will he found some details bearling upon the unture, sources, and production of apirituous liquors ; iu the present artieie, therefore, we shall limit ourselves to an outline of the different processes which are conducted in the distlliery. There are two distinct operations in the production of ardont
spirits : the one is the conversion of certaln vegetable principles inte alechol; and the other, the sepsration of the alcohol fron the other substances with which it is necessarily bleuded durling its production. Tho vegetalile principle which is essential to the formation of alcohol is sugar ; and this is sometimes used directly, as where molasses and analogous saccharine products are subjected to lmuodiate fermentation ; or it is indirectly oltained by suljecting amylaceous grains to certain precesses, by which the stareh they contain is inst eonverted into sugar, and then that sugar afterward nicoholized.

In many distilleries the latter alternative is adopted ${ }_{3}$ and variens kinds of grain, but chiefly barley, wheat, and rye, with mere or less malt, are subjected to the operation of mashing. For thls purpose the ground grain and the braised malt aro duly mixed, and infused
under constant agitation in a proper quantity of hot water in the mash-tun; the wort is then run off, and freah water added, till the soluble materials of the grain are extracted. In this way the mixed worta or wash is obtalned, which ia afterward to be anbjected to fermentation. When the wash is adjusted as to denslty, It is run into the fermenting-vats, where, mixed with a small quantity of yeast, it is auhjected to the procese of fermentation, which continnes from 6 to 10 or 12 days-the time ruquired for its completion varyIng. The proof spirit of commerce, and thet of the Pharmacopcin, is generally stated to be of the specifle gravity of 0.920 at $62^{\circ}$ and is considered as a mixture of equal veights of absolute alcohol at the specijic gravity of 0.791 at $60^{\circ}$ and of water. The rectified spirit of commorce, or rather that of the Pharmacopela, is directed to be of the specific gravity of 0.833 at $60^{\circ}$, and may be regarded as a mixture of about 82 parts of absolnte alcchol and 18 of wuter.-Brandi's Cyclo. See also Ency. Brit., 8th edition.

Divan (Aralic diuan), among the Arabs, Persians, and Turks, is a word that bears very various significations. It primarily denoted a book of accounts, a mus-ter-roll of troops, etc.; and hence came to be applied to a colloction of lyric poeme (called gazelles) arranged in a kind of alphabetical order. Thua we have the Diwan of Saci, the Dival. of Hafiz, etc.; a practice which has been imitated ly Goethe in his Westöstlic her I. iwan, a collection of poems in the Orientel atyle. The vord among the Orientals denotes also a council-chambir, a tribunal of justice, and in like manner is applied to lie general council of state. Under the khaliffs of 1315 dad, the diwan was a court of justice over which tle khaliff presided in person. At Constantinople in th present day the term is used to denote the great ceuncil of the empire. It is also a common application among the Turks for a seloon or chanber of rer tion, or in which business is transacied, or used place of occasional repose. The ativan more properly is a kind of stage, raised about a foot above the floor of the saloon, covered with rich tnpestry, and furnlshed with a number of embroidered cushions leaning against the wall ; nut on this the master of the house is seated when he recelves visitors. Hence the word is irequently applied by other nations to a kiod of public coffee-room, furnished in a manner somew hat similur. - E. 11.

Divi Divi, the commercial name of the pod of the Cresalpinin coriaria, a leguminous plant, found in low marshy situations on the north const of South America, and in some parts of the Weat Indies. It is used hoth for dyeing and tanning, but chietly for the latter purpose. The pod is from 2 to 3 inclies in length lyy $\frac{9}{4}$ inch in brealth, and when la perfection is of a rich brown color. It contains a few small sceds; but the only valuble portion is a resinous matter, of a brighit yellow color, casily pulverized, which lies betwixt the outer skin and the husk thut incloses the seed, and contains a large quantity of tannin. About $9-10$ has of the inports into England come to Liverpool, where the following quantitics were recelved during the last four years, viz. : In 1849, 3660 tons; 1850, 2700 tons; 1851, 2280 tons; 1852, $20: 10$ tons. It might be supposed from this statement that the article was going out of favor; but suth is not the case. When, however, the price in England ts under f 10 per ton, the imports decrease; and it has latterly leen bolow this limit. liecently, however, its price has risen considuratily; and with this rise the inports may be expected to increase. Maracails, Ro de la Ilache, and Savanilla are almost the only places whence this article is imported. That brought from Maracaibo is the leses, that from Savanilla the most inferior. During the last 1 years prices have ranged between $\mathbf{f 8} 1 \mathrm{Cg}$. and f 14 per tom for dio Hache and Maracallo, and $\mathbf{8 7}$ and flo 15s. for Savanilla, the highest quotations being now current (Sejitembor, 1853). IHvi livi is used by dyera, not for the coloring principle which it contains, but for ita strong
astringent qualities as a mordant. For thla purpose fs is at present usech, to some extent, instead of aumaoh, which is acarce and dear; and hence the recent high price of the article. In tanning, it accelerates the procoss, and imparts to the leather a clean and healthy apearance.

Dividend, in commerce, is a worl which hns twe very distlact meanings. In its more general employment it is understood to express the money which is divlded, pro rata, among the creditors of a bankrupt's en.tate, out of the amount realized from his asseta. The other meaning attached to the werd dividend aigr: fies the periodical division of profts among shareholders of Insurance, rallroad, bank, and other corporations.

Diving-bell. First mentioned, though obacurely, by Aristotle, 325 n. c. The d'ving-bell was first used in Europe A. D. 1509. It is aaid to have been used on the coast of Mull, in oearching for the wreck of part of the Spanish Armada, before A. D. 1669 . Lalley greutly improved this machine, and was, it is aaif, the first who, by means of a diving-bell, set his aot on dry ground at the bottom of the sea. Sm saton applied the condensing-pump to force down air. Mr. Spmlting and his assistants going down in a diving-bell in lieland were drowned, June 1, 1783. The Royal Giforge man-of-war, which was aunk off Portsmouth in 1782, was first surveyed, by means of a diving-hell, in May, 1817. Lately, and particularly in 1840, it has been employed in sub-marine surveys. The first divingbelle was the wife of Captain Norris, at Plymouth, who descended in one a fow years ago.-llaydy. It is an apparatus ly means of which persons are let down and enabled to remain under water, and execute various operatigno: such as leveling or clearing the buttom of harbors, preparing a foundation for buildings, bringing up sanken mnterials, etc. The principle of the diving-hell depends on the impenetrability of atmoapheric air, and may he illustrated by a very famitiar experiment. Bring the edge of an inverted tumbier, or any close vessel, to the surface of the water, ant, keeping the mouth horizontal, press it down in the water. It will be seen that, though some portions of water ascend into the tumbler, the greater part of the space remains empty, or only filled with air ; and any object placed in this apace, thingh aurrounded on all sides with water, would remain perfectly ${ }^{\circ}$ dry, In fact, the quantity of air remains the same, hut is compressed Into a smaller volume, in proportion to the depth to which it is made to descend. Now, if we conceive a vessel of wood or iron, suffleiently capacious to hold several men, to be suspended hy a chain, and lowered, ty means of welghts attachel to it, to any momerate depth under water, it is evldent that they may remain there for a conviderable time, and perfurm atiy operattion that could be exceuted on land in the same comfined space. The machine, however, us thus describeit, is liable to two great defects, which must be obviated by other contrivances before any great alvantares can be derived from it. In the tirst place, as the uir by its compressibility allows the water to enter the lower part of the 'sell, the dry space is not only diminished, but the bottom on which the lell rests, nud where the operations are to be carried on, is also covered with water to a proportional depth. In the recond place, the air within the bell, by the repented respiration: soon frecones mephitie, and unfit to suport life; so that it is neceasary to clevate the apparatus after short intervals to admit a fresh supply.
it is not known at what period the diving-iell was Invented. Heckman, in his "1listory of Inventime," ment lons that nt 'Toledo, in the 1 ith century, $t$ wo (irecks, In the presence of the emperor Charles V. nnd several thousand spectators, let themselves down uniler water In a large inverted kitle, whth a burning light, and rose again without heing wet. (ieorge Sinchair, the author of "Satan's Invisible World Displayed," in his work entitled "Ars Nova et Magna Gravitatis et Le*
vitatis,' the year treasure went to bridea, ployed. have allt sittle use means of der wate alr to esc as havin feet in it: whose di tom 5.

vitatis," mentions soma attempts that were made about the year 1605 to ralse, by means of a diving-bell, the treasure from the ships of the Invinclble Armada that went to the bottom near the Isle of Mull, in the Hebriden, and describes the kind of bell that was employed. But on account of the defects to whlelı we have alluded, the divlug-bell contlnued to be of Very inttle uee till the tlme of Dr. Halley, who contrived a means of introdueing freeh air lnto the bell while under water, and of allowing the mephitic or breathed air to escape. The bell he made use of he describes as having been of wood, containing about 60 cubic feet In lts cavity, and of the form of a truncated cone, whose diameter at the top was 3 feet, and at the bottom 5 . This was coated with lead, so heavy that it conld sink empty, and the welght so distributed about its bottom that it conld only descend in a perpendicular direction. In the top a clear glass was fixed, to let in the light from above, and a cock to let out the alr that had been breathed. To snpply the air to the bell, he caused a couple of barrels, of about Bi gallona each, to be cased with lead, so as to sink empty, each of them having a lonng-hole in lts lower part, to let in the water as the air in them condensed on their descent, and to let it out again when they were drawn up full from below. To a hole in the uppermost part of the barrels a trank or hose was fixed, long enough to fall below the bung-hole, and kept down by a welght, so that no air could escape by the hose till its end was raised up. The barrels thus prepared were let down by the side of the bell. A man etatlonod on a stage suspended from the bell was ready to take up the hose; and as soon as their ends were brought to the surface of the water in the barrels, all the alr that was included in the upper parts of them, was blown with great violence into the bell, while the water entered at the bung-holes below and filled the barrels. Ily means of this contrivsnce the air was not only kept freeh, but another great advantage was gained, namely, that by admitíng a sufficient quantity of it the whole of tho water was expelled from the inelde of the bell, and the bottom of the sea lsid dry.

By means of this contrivance for the admission of fresh alr, it was now possible to remain for any length of time under water; but the use of the apparatus was still found to be attended with sune inconveniences, and even considerable danger. The divers within the bell having no power over it, its rising or sinking tlepends entirely upen the people at the surface of the wster; and as the hell, even when in the water, has considerable weight, there is always a possibility of the chain by which it is raised breaking, which would inevitably be attended with the destruction of the divers. Another danger, atill inore to he npprehended, is, that if the mouth of the bell, in it descent, shonld come upon a sunken ship, or a rock projecting abruptly from the bottom, it inight he overset hefore any slignat cauld he given to those above. These defects were obviated by the very ingenious contrivances of Mr. Spadiling of Edinburg. In order to avoid the risk of being upset when the bell descends on a rocky or uneven bottom, he suspended a considerable weight, which ho called a balance-reight, helow the bell, by a rope passing over a pulley fixed in the Inside; and the other welghts aitached to the hell being so aljusted that they could not sink it without the balance-welght, as son as the latter rested on the ground the bell remained suspended in the water. In case of the mouth of the bell being caught by any obstacle, the babanceweight is immectiately lowered, till it rests on the bottom; and as the bell, when thus relieved, is buoyant, the divers, having disengaged it from the rock, have it in their power elther to descend, by pulling in the rope, or, hy allowing it to run, to asecend to the surface. Another contrivance of Mr. Spalding deserves mention. Ifediviled the bell Into two compariments, the one above the other, and conmmicating by means of a
stop-cock. The divers are statloned ln the lower one, and the welghts are so adjivated that when the cavlty above ls empty, the bell is buoyant; when it is filled with water, the bell slnks. Immediately above tho partition are some slits in che sldes of the bell; and at the top is an orifico, which can be opened or shut at pleasure. Suppose, now, thls orifice being open, the bell is required to be lowered; as it descends, the water enters at the slits, and the air escapes by the orifice. When the apparatus is entirely under water, and the cavity coneequently completely filled, let the orifice be shut. The bell will now continue to descend ; but If the stop-cock communicating with the upper compartment be opened, the air will rush from the under to the upper, and displace a quantity of the water, and the apparatus will be lightened ly the whole of the water so displaced. The divers have it thue lu thelr power to regulate the descent or rise as they please. By admitting a certain quantity of air Into the upper oavity, the deecent of the bell is arrested; by admitting a greater quantity, it becomes buoyant, and rises to the top. This method of constructing the diving-bell has not, however, been adopted.

The greatest lmprovement on the diving-bell, since that of IIalley, was made by the celebrated Mr. Smeaton, and consists in forcing down a continued stream of air, by means of an air-pump, through a flexible tube; and this plan is now always adopted. In the year 1788, Smeaton constructed a diving-hell, to be used in the operations then contemplated at Ramsgate harbor, on a new and improved nlan. Instead of a bell-shaped vessel sunk by weights, his apparatus consisted of a square chest of cast-iron, $4 \frac{1}{2}$ feet loug, $4 \frac{1}{3}$ feet high, and 3 feet wide, affording sufficient room for 2 men under it. It was cast of such a thicknese that its own weight was sufficient to sink it ; and its thickness was gre? $\cdot r$ near the mouth or lower part, to provent it from $b$ 13: easily overset. This construction of the diving +11 gave the men within it no power of raising or sinkin ${ }_{e}$ it ; but as the apparatus was made to be used nt a place where the nature of the bottom was known, this disadvantage was not considered of great consequence; and, in fact, it is found by experience that it is better to leave the bell to be entirely guided from above. On account of the fucility with which water conveys sound, the atrokes of a hammer on the inside of the bell can ba heard at a great distance; and thd sound coming through the water has a peculiar character, which can not be mistaken. By provious arrangement, any directions can be given in this manner. For instance, 1 blow may denote more air ; 2, stand fast ; 3, heave up; 4, lower down, and so on. With these successive in1provements, tho diving-hell is found to be a most important machine in all the great operations to bo performed under water. It was used with great advantage by Mr. Rennie in the construction of the vurious harbors he projected; and it has recently been successfully employed in deepening tho Clyde between Glasgow and Grecnock, and Inproving the navigation of the river. Sce the article Diving-bell, in the new edition of the Eincyclopedia Britannica. See Am. Jour. Scince, xxii., p. 825 ; Nlewkwod, xvii., 336; L1TTEL's's Museum, vi., p. 515.

Djidda, $a$ town of Arabia, on the Red Sea, cliont 21 miles from Mecen, of which it is the seaport, in lat. $21^{\circ} 29^{\prime}$ N., loug. $19^{\circ} 14^{\prime} \mathrm{E}$. It is well built. Tho strects are unpared, hut spacious and airy; the houses hijgh, and constructed, for the most part, of madrepores and other mariue fossils. The supply of water is seanty, and its quality Indifferent. Small vessels upproach close to the quays; but large vessels are obliged to anchor in the ronds, nhout 2 miles off, loading and unlouling ly moans of lighters. The entrance to the roads is diffenlt, and should not be attempted withont a pilot. Djidita le a place of considerable commercial importance. It is the entrepft in which is centered the greater part of the conunerco between India, Egypt,
and Arabla. Many ol its inerchant possess large capitals: some of them as unuch ss from $£ 150,000$ to $\mathbf{\varepsilon} \mathbf{\varepsilon} 00,000$. The trade in coffee brought from Mochs and cther ports in Yemen, is the moct considerable, but it is said alsc to be the mest hazardous. The returna ure princlpally made in cash. The trade with India and the Gulf of Persin is asfer than the coffee trade, and is very considerable. Djldda hns also a good deal of intercourse with the ports of Cusseir, Sounkin, and Masseuah, on the opposite coast of the Red Ser. The imports from the last two principally consiat of alaves, gold, tebacco, dheurra or barley, hides, butter (of which immense quantities are maile nee of in Arabia), matn, ete.; In return for which the Africsns receive Indian goods suitsble for their markets, drusses and ornaments for their women, dates (which are not proluced in any part of Nubia), iron, etc. The prinelpal article of import from Cosseir is wheat ; and net only Djidda, but the whole Hedjaz, or Hely Iand of Arabia, is almost entlrcly dependent upon Egypt for corn. Coffee is the principal article sent in return. Business is transueted at Djidda with ease and expedition. The number of ahips belonging to the port la estimated at 250 . Owing to the acarcity of timber, nene of them are huilt sit Djidda-these lielonging to it leing either purchased at Bombay or Muscat, or at Mocha, Ilodeida, or Suez. For a conslderable perlod each yenr, lefore and after the feast of Ramadian, whan pilgrima come from all quartera to visit Merca, the town is thronged with sirangera, and a great deal of mercantile Imsiness is transaeted. Djidda is at present, and han lreen for a number of years, under the government of the Racha of Eigy?t. The moneys, weights, and meas-
ef the latter coontry (for which see Alexanidia) ..re now generally unel in Djidda, the commerce of which ha tran much improved and extended in consequence $u$. comparatlve security and good order enforced by we pachn.-Bunckilaind, Travels in Ambia, vul. i., pp. 1-100.

Dock, an inclosed place for the reception of ships, either for their aecurity or for the convenience of building or giving them repairs. This worl has benn derived by some, hosurilly enough, from the Greek iexopal, to recejve. That we lit jt , along with almost the whele of ous aen tern:, from tha northern continental nations, is sufficiently o svious. Thus, in J'lemish, it is dok; Tentonle, dock Swedish, docka; Sulo-Gothic, docka; perhaps originally from dekken, to cover, protect, secure, inclese. The dock for inclesing the prisoner In a court of justice is evidently from the sama origin.

Docks for the reception of ships are of two kinds, tret and dry. A rect-dock may either have gates to retaia the water In It, so that ships shall constantly remain afleat, or be left open for the tide to flow into and ehb out of it at pleasure, either leaving it dry at low water, or with a certain depth of water remsining in it, according to its construction and situation with regard to the low-water mark, and to the elbing of the sea at rpring or neap tides. A wet-lock without gates is generally distinguiahed lyy the name of a basin, which, however, is sometimes indiscriminately applied to a wet-dock, whether with or witheut gates. A dry-dock either becomes dry by the chbing of the thle when the gates are left open, or by shutting the gates at low water, and pumping out whatever water may remain in it at that time, by the power of men, hersea, wind, ar by the atean engine.

IFet-docks.-A wet-dock may bo defined to be "a basin of water, in which rhips may te kept afloat at ull times of the tide;" a dry-doch, a "receptacle in which every part of a ship can he examined, and its lefects repaired." Ship may also be conveniently lulit in dry-locks, and floated out by openiag the gates; though in all dockyards there are places aet apsart fer this purpose, under the name of alips. A wet-dock is calied by the Franch un basin; a dry-dock,
une forme; and a slip, une calle. The digging out the earth, and bullding the surrounding walls of masenry to prevent the sidea falling in, and the preparation of the mortar and puzzolana, in the construction of a wet-dock, are atzended with great labor and expense. The two wet-decks or basinn of Cherberrg (nee BreakWATER), which are ameng the finest rpeeimens that exiat in the world, are eatimated to have ecast $\mathbf{£ 3 , 0 0 0 , -}$ ( 00 sterling. The jabor of excavation may sometimes be sparod, and a series of wet-docks or basias convenisntly made, by turning the course of a tide-river throngh an isthmus, and placing a pair of gates at aach end of the old channel. In this way, were the new decks of Bristol constructed out of the bed of the Avon. Wet-docks are ar improvement in navigation and commerce oi the aimost importance, but of very modern date in this country; indeed, they owe their introduction entirely to a spirit of intividual enterprise In commerslal spectilation. Liverpool might still have remained a poor fishing-viliage but for its cenvenient dorks, which net conly produce to the town and corporation a large revenue, but insure to the merchant every possible facility in refitting, loading, ases discharging his shlps, whatever their burilen or their cargo may be, without being exposed to the risk of lesing both ship and cargo in a rapid tide-river; and at all events, to an unavoidable delny, occasioned by distance, the vesther, or tue state of the tides.

London, though unquestionably the first city in the world for its opulence, its commerce, and public apirit, and possessing withtn itself the powerinl internal mesns of supporting docks, and all other conveniences that trade and shipping nusy require on the most extensive plans; Lordon wos the last to try the experiment of docks, except in the cose of two spitited individuals, Mr. Perry, at Blackwall, and Mr. Wells, at Greenland Dock, both private ship-builders. Notwithstanding the totnl inadequacy of legal quays, which subjected the merchants to incalculable losses and delays, and in many cares proved absolutely ruinous; notwithstanding the effect of the heary, expensive, and fatal embarrassments experienced regularly on the arrival of the Weat India fleets, and the annual leases, hy plunder in the rivar, on Weat India produce, which alone were calculate! to amount to $\mathbf{\leq 1 5 0 , 0 ( 4 )}$ to the proprieter, and $£ 50,000$ to the revenue, and more than the double of those alima, including other branches of commerce; it was net till the year 1799 that prejudices and private intereats wera so far removed as to enalife the merchanta concerned in the West India trade to obtain an act of Purliament to catry Into execution a plan of docks, quays, and warehouses, for the convenience of that trade on the Isle of llogs. Since that time the London Decka, St. Katharine Docks, and various othe:s, have been completed, to the incalculable benefit of the shipping interest and the commezce of the metropolis.
The docks of Liverpool were the first of the kind that were construeted in this kinglom, by virtue of an act of Parliament, jassed in 1708 ; and from that period the town of Liverpool has rapilly nuised itself from a poor fishing-village, and a port for ceastingveasels, to the the second commercial town and port in the empire ; and the improvements carrici out for the enlargement and better arrangement of the decks, rendered it, for convenience and appearance, in this respect the very tirst, not even London excepted.
It appears from a statement, apparently authentic, that in the ten years ending with 1808 the number of ships which entered these docks was 48,497 , tonnage $4,054,204$; nnd the dock duties received, $£ 329,566$; and that in the following ten yenrs, ending in 1818 , the number of shipa was 60,200 , the tomnage $6,375,560$, and the amount of dutien, $\boldsymbol{f} 660 \% 38$; while for a singie year, endiag June, 1853, no less than 20,490 vessels entered the docks, the tonnage of which was $\mathbf{3 , 8 8 9 , 9 8 1}$, and the amount of dutiea, $£ 256,702$-the
largest amount yet received-the following being the return for the last ten $y$ gars :

| Yoar. | Number of vensele. | Tonanga. | Amount of duales recelved. |
| :---: | :---: | :---: | :---: |
| 198 | 16,906 | 2,445,278 | 2188230 |
| 1814 | 18,411 | 2,682,712 | 185,164 |
| 1943. | 20,52t | 8,016, 0.41 | 2:88,247 |
| 18.15. | 19,98t | 3,094,444 | 213,428 |
| 1817. | 20, 8,9 | 8,851,539 | 244,435 |
| 1835 | 20,811 | 8,294,963 | 197,617 |
| 149. | 20,783 | 3,4230,146 | 234,224 |
| 1*) .................. | 20,4.7 | 8,546,897 | 811,718 |
| 151. | 21,071 | 8,787,086 | 285,527 |
| 1542................. | 21,473 | 3,912,506 | 243,686 |
| 1453.... ......... | 20,490 | 8,890,981 | 250,702 |

It may also be ohserved, that this extraordinary increase has taken place since the abolition of the slavetrade, which, it was formerly asserted, would bo the ruin of Liverpool.

The W'est India Docks, on the River Thames, were comnenced in lebruary, 1800, and opened in Augrist, 1802. They conslst of an outwarl and a homewardbound dock, and communicate by means of locke with a busin of five or six acres on the end next to llackwall, and with another of more than two neres at the end next to Limehouse, both of which basins communleate with the Thames. The outwarl-bound dock is about 870 yards in length, by $13 \overline{5}$ in width, containing consequently an araa of more than 24 acres; the home-ward-bound dock is of the same length, sind 166 yards in width, its area being little short of 30 aeres; and the two together will contain with ease st least 500 vessels of from 250 to 500 tons. The whole are surrounted with a high wall, and, as a security against fire, th:e moment that a ship enters the dock the crows are discharged, and no person whatever is allowed to remain on board, or within the premises, the gates of which are closed at a certain hour. They are surrounded by immense warehouses, winich are estimated to contain nearly 10,000 hogsheads of sugar, and an imnense quantity of rum. The sum authorized by Parliament to be raised for completing these docks and warehonses was $£ 1,200,000$, and the total expense was probably not far short of $£ 1,500,000$; yet on this eaptital the subseribers have been receiving from a very shert period after their opening, 10 per cent., which, by the terms of the net, is not to be exceeded, and the term granted ls limited to $\mathbf{2} 1$ years; lut, like most otler property, these docks have been greatly depreciated in value, and at present barely pay 8 per cent.
The next set of docks that were undertaken for the advantage of the trade of the capital were the Levidoit Docks. These docks are situated In Wapping, and are appropriated for the reception of all ships arriving in the port of London with wine, spirits, tobaeco, and rice on board, but not exelusively, ships having on boaril other cargoes being admitted on the payment of certain fees. The act of larliament for incorporating the Dock Company was passed in 1800 , anthorizing them to raise a capital of $£ 1,200,000$; but such was the number of houses to be purchased. (we betieve not lesa than 1200) occupying the site of the dock, that this capital, ty subsequent acts, was extended to $£ 2$,200,000 , the dividends on whieh are limited, as in the West Inctia Docks, to 10 per cent. The great dock is 420 yarls in length, and $2: 30$ yaris in width, covering an area of 20 acres. A lasin of 3 acres nearly, connects it with the river. The warehouses are very naggnificent, and the tomacco warelouse is the grandent and most spacious bullding of its kind in the worlit, being capable of containing 25,000 hogsheads of tohacco, and the vaults underneath as muny pipes of wine. This aingle building, under one roof, is said to occupy upward of 4 acres of ground. These docks were npened in February, 1800.
The East India Ducks, for the exclusive reception and accommodation of the Eant India shlow, were the last in successinn. The act for the incorporation of the comjany was passed in July, 1803, authorizing
them to raise a capitsl of $\mathbf{\Sigma 2 0 0 , 0 0 0}$, which was afterward increased to $£ 600,000$, the dividend, as in the case of the two others, to be limited to 10 per cent. These reks are altuated at Blackwall. That for the reception of homeward-bound ships la 470 yards in length by 187 in width, containing a surface of rather more than 18 acres; the outward-bound dock is 200 by 178 yards, snd is consequently something moro than 9 acres. An entrance-baeln of 3 acree nearly, and n spacions lock, connect them with the Thames.

Beeides these there are the London Docks, the St. Katharine's Docks, and the Victoria Docks, in course of construction; of these, detailed secounts will be found nader the article, London.

In other yortions of England and Scotland, there have been costly docke constructed of late years, viz. : Ilull has 5 docks, occupying, with their basins, a water area of 494 acres. A timber-pond of 9 acree wasp constructed in 1853 . The tonnage of shipping in 1852 was 799,866 sulling-vessels, and 305,021 steam-vessels; the amount of dock dues, $£ 433,755$. Southampton, tho station for the West India mail and Liebon and Alexanilria steamers, is now constructing extensive doeks and quaya to accommodate their great and increaslug traffic. Grinsby IIarbor has lately been greatly improved. Wei and dry docks have been constructed, on the most approved principles, st tl -xpense of $£ 250,000$, and a cunal cut into the Humber calculated to alinit vessels of 1,000 tons' burden. Hertlepool has also been of late years greatiy enlarging its harbor and dock accommodation. Sunderland has new doeks of 18 acres' extent, which were opened in 1850 , and which can accommodate 300 sail. Dundee has lately immensely improved her barbor and docke; besides two emaller docks, the wet-dnek now conatrueting will occupy $14 \frac{1}{2}$ acres, the lock of which will be 60 feet broad. Aberdees has a wet-duck, where the largest vessele may float in safety; it covers nearly $\cdot 10$ acres, with quay room of about 9,000 feet. Leith, the port of Edinburg, has 3 wet-docks, containing about 15 acres of whter room. Detailed accounts $0 \dot{f}^{\circ}$ these docks will be given under the names of the respectito ports.

The naval dry-docks of the United States are among the most stupendous mechnaical enterprises of the country; they are constructed at the navy-gurds of New York, Charlestown, Norfolk, ete. By far the mest extensive and magnificent of these atructares is the granite dry-dpek at Brooklyn; 80,000 tone ot atone have been nsel in its construction; the masonry fonntations are 400 feet in length, and 120 in breadth. The main chamber is 286 feet long, and 30 feet broad on the bottom; 307 feet long, and 98 fect broad at the top within the lolling-gowes; the haight of the wall is 36 feet. The work was commenced in 1841, and took 10 years to complete it; the aggregate expenditure was above $\$ 2,100,000$.

Dry-docks.-A dry-dock, requiring to bo perfectly water-tight, demamils the greatest care in its construction. It is sometimes lined all around with wool, but more generally with masonry, mostly of hewn granite. The expense is rery considerable, as the foundation, by means of piles or otherwise, must be well secured, all leakuge prevented, and the enlvers or drains prop)erly constructed, to let in and carry off the water without its untermining the quays or piers. The cost of a complete dry-dock will vay probably from $£ 20,000$ to $\mathbf{£ 1 0 0 , 0 0 0}$, accorling to the size of the ships it is intended to admit, and the nature of the ground on which it is to lie constructed. A ilry-dock may be single, or mude to contaln only one ship; or double, to contain two ships; but the former is the most common, hecause most convenient. As it is of the utmost importance to preserve the water is a wet-dock, and to keep it ont of a dry-dock, it may be proper to describe the ditlerent kinds of gates which are in use for this purpose.
bock Gatez.-Tho most common, and on the whole perhaps the best and nost convenient, fre swinginggates, which open in the middle, and lie flat, one part against each wharf or side-wall of the passage leading into the dock or basln. This kind of dock-gate reguires to lee made of great strengith, with sound timber and good iron, and the guilgeons on which the hinges turn to be well secured into the stone abutnents. Care also must he tuken to make the tottom of the passage and the bottom of the gates perfectly plane and parallel, to prevent leakage, and give facility to their opening and shutting, which is usually usslsted ty roliers fixed in a groove, and performed by meana of a small capstan on each pier. Attached to the top of the gates is nsually a foot-bridge with railing, which, separating in the middle, opens and shuts with the gates.
The most simple but by no menns the most effective contrivance for keeping out the water, is the wicketgate, It consists of three parts, which when opened are removed separately. This gate is rarely made use of unless whare the ubutnents are not sufficiently strong, or their foundation suffielently secure, to bear tho welght of a pair of swinging-gates.

A thind kind of gate consists of a floatiugodam or caissoor, first introduced Into this country by General 13. widan, and first appied to the great new hasin in Port-mouth dechyarl. They are built somewhat in the shape of a Greenhand fikhing-loat, sharp at the two ends, narrow, and deep in proportion to the depth of water at the eutrance of tho dock. The keel fits inte a groeve at the bottom of the passage, and the two slauting ends rise and fall iu correrponding grooves cut into the two abintments. Py letting in the water, the caissoon sinks in the grooves, and acts as a closed gate; and by pumping out the water, or letting it out to a certain dejth, the dam thoats as the tide rives, nud the nurrow part, rising to the top, is readily disengarged from the groores, and easily floated wway as a hoat. The advantages of these floating-dams, as stated by General Bentham, are, that they are cheaper of conetruction than the gates heretofore in use for closing docks or lasins; that they occupy less space, are more easily repaired, and one and the same dam is capable of being used, an need may require, in different places at different times. These calssoons have also the atvantage of serving as bridges of communication for losded carriages across the entrances they close, and they require much less labor than athtes in opening or shutting up passages into docks or basins, since their occasional buovaney anay be obtained without pumping water or untoading ballast.

Docking a Ship.-When a ship is brought Into a dry or graving doek, she gradually subsides as the water flows out, till ber keel rests upon the line of square blocks which are placed to receive it along the middie for the whole length; and on these blocks whe is kepi steady and upright by a number of shores or poles on each alde, one of their ends loeing placed on the altars or steps of the dock, the other under the sblp's bends and bottom. Ao a ship under repair generally requires something to be done to the main or faise ked, or at any rate these parts require to lee inspected, sometimes to whift the main keel, or to add to the whole length of th. false keel, it was always found necessary in such cases to remove the blocka, in onle- to get at the bottom of the ship; but this operation could not be performed withsut the more serious one of first liffing bodily the ship clear of all the blockn, and suspending her as it were in the air. This process was performed liy driving wedges sinuitaneonsiy uniler the eudn of nill the shores that supported the ship; an operation that required from four to five hundred men to enatile thens to suspend a ship of the first rate. When the Son Josef, a large three-decker, regulred lier bottom to be examined in 1800, the assistance of almest every artificer in the dockyard was found necessary to per-
form thia process of lifting her; ner was this the only inconvenience; the shlp, thus suspended, suffered very material Injury by the pressure of her ewn enermous weight against the ends of the shores that supported her, such as forcing in her sides, straining the knees and all her fastening, breaking the treenalla, etc.

Tu remedy these gharing incenveniences and very serious injurim that ships thus placed were apt to sustuin, and $t($ et ct a saving of time and expense in the operation, , r. ( 'erward Sir Rebert) Seppings, then master shipn. 'gat, and afterward surveyor of the navy, contrived, several years ago, an improvement, as ingenlous as it simple, by which twenty men wifi suspend the largest slifip in the navy, or rather, which amonnts to the same thing, wlll disengage any ons block that may be required, in the space of two or three minutes, wlthout the necessity of suspending her st all; and, us a first rate in dock sits apon about fifty blocks, these twenty men will clear her of the whole of these blocks in alout two honrs; and as the saving of a day in compieting the repairs of a ship is frequently ths asving of a whole spring-tide, the decking and undock. ing of a ship may make, and frequently has made, by this new method the difference of a fortnight in the time of equipping her for sea.

The block of Mr. Seppings, instead of heing one solid piece, consisted of three wedges, or, more properly apeaking, cf one obtuse wedge and two inclined planes, which, when put together and placed under the shlp's keel, appear as under, when viewed ln the dircc-

tion or line of the keel, whera $G$ is the wedge on which the keel rests, having its obtuase angle equal to $170^{\circ}$, and IIII are the two inclined planes, each having an acute angle of $5^{\circ}$. The wedge is of hard wood, having its two sides lined with iron; the two inclincd planes are of cast iron. When one of these blocks is to be disengaged from under a whip's bottom, nothing more is required than a few wibut blows alternately on the two sides of the two inclincl planes, when they fly out, and the middie part or wedge drops; and the facility of thus disengaging any of the blocks is in proportion to the quantity of pressure upon that hlock. The strokes are usually given by a kind of catapulta or battering-rans, being a thick apar or pole moving on a pair of whecls, as KK. This simple centri"ance to get

at any part of a ship's bottom by remeving In auccession all the blocks, without tho necessity of lifting ths ship, which the removal of any one block required to be done by the old method, is now universally adopited in all the dockyarls; and the lords of the admiraity marked their sense of the great utllity of the improvement, ty bestowing on Mr. Seppings in reward of $\mathbf{£ 1 0 0 0}$ for the invention.

Ronfing the Docks.-Another very material improve-
ment intr bullding of war by of the $d r$ sffects we were ente quite ollv moisture activity to and that a open to th to frost, r her timbe water-seal rifted with f. king d. .s.ace ol workmen, the vichssi and their I detriment roofing ov edly been false econo practice, b roofs are having the to the qua liy this col ing, as it draught of vented fro numerous are in gene sred with no répair, s ships in 81 statement of the Nar tions and into the do iavention house over afford " me artificially duction of within the for assisti mure labori on all the s sides a vari iaconvenie to have ex ter's shop only he et crowiled st: With rega slips, they morial ; an Mr. Stran year 1792, that two-at cred slips, Carlserona both are : sbips under

Hutling were made pediting th, of which m that the : with mest was that o sions, on b docks. It of this kis basins, ner
ment introdnced is that of covering the dry-docks and bulling slips with roofs. The rapid decay of shipe of war by that species of diaease known by the name of the dry rot, attracted very general attention; ita effects were well known, hut a variety of opinions were entertained as to its causes and its curo. It was quite olvvione, however, that exclusion of air and molsture wore the two great operating causes in giving activity to the progress of the disease (see Dry Rot) ; and that a ship in dock, atripped of her planking, and open to the weather in every part, niternately exposed to frost, rain, wind, and sunshine, muat at least have her timbers dtfferently affected, aome swelied and water-soaked, others shrunk with heat, and others rifter with the wind and frost ; and, if closed up with r. king in this stato, might be expected, at no great d. .ice of time, to exhibit bymptoms of decay. The workmen, too, in the open docks or sllps, suffered from the vicissitudes of the weather ne less than the ships, and their iabor was frequently anspended, to the great detriment of the naval service. The measure of roofing over tho docks and slips had long and ropeatedly been suggested, but, oither from prejudice or a faise economy, it was only of late years carried into practice, but is now universal in all the yarde. These roofs are generally constructed so as to be capable of having the siles and ends occasionally closed, neconling to the quarter from which the wind may blow; and by this contrivance the timber ia prevented from rifting, as it is liable to do, by the action of a thorough draugit of wind, and the henith of the artificer ta prevented from injury. The $\mathrm{l}_{\mathrm{g}} \mathrm{ht}$ is admitted through namerous windows placed in the roof. These roofa are in general supported on a row of pillara, and covared with plates of iron. The same roof, with little or no repair, serves as a covertng for eight or ten different ships in ancecssion. General Bentliam, who, in his statement of Services rendered in the Civil Department of the Nary, seems to claim to himself all the inventions and improvements which have been introduced into the dockyards for the last forty years, carries bis iavention beyond a mera covering, and proposes to house over the docks and ships ao completely as to afford "means of heating, warming, ventilating, and artificialiy llghting the interior at pleasure; the introdaction of boilers or steam-kilns for bending the planks within the inclosure; the introdaction of machinery for assisting in various operatinns, particularly the mure iaborious ones; the providing room for carrying on ull the shipwright's work within the building; besides a variety of lesser works, such as it is found very inconvenient during the building or repairing of a ship to have executed, for example, in a smith's or carpenter's shop at a distance." Such buildings would not only he enormously expensive, but, in the present crowided state of the dockyards, utterly impracticable. With regard to the invention of covered doeks and slijp, they have heen used in Venice from time tmmemoriai; and it appeared from the evidence given by Mr. Strange, the British consul at that port in the year 1792, before the commissioners of land revenue, that two-and-twenty large ships had heen under coverel silips, sume of them for sixty years nearly. At Cariscrona, also, there nre several covered docks, and both are strongly recommended for the building of ships under cover.
Huuling up Ships.-Among other experiments which were mate in the dockyards for facititating and expeliting the repairs of shlps, one may be mentioned, of which many persons were sanguine enough to think that the successful resuit was likely to be attended witio most important benelits to the naval service. It was that of hatuling up ships of war, of any dhnensions, on building sifis, instead of taking them into docks. It is no uncommon practice, at various ports of this kingdom, where thero are nelther artificial basins, nor natural harbors, to haul vessels of the bur.
den of ffity to two hundred tons, or probably larger, upon the beach, by means of capatane, to give them repairs ; in like manner, most of the large filbing amacks are hanled up for security in tempestuons weather; but the practicability of hauling up ohlpe of war, especially of the larger classes, was a matter of some doubt. Several frigates had, at various times, been hauled upon slips, when the docks were all occupied; and the ease with which the operation was performed induced the officers of the dockyard to propeas the bauling up of a line-of-battle ship. The Kent of 74 guns was selected for this purpose. It was necesary, in the first place, to take her into a dock, to have proper bllgeways prepared, and to be stripped, 80 as to be made as light as posaible ; her weight being, according to a calculation made from the water she displaced when afloat, about fourteen hundred tona. To heave up this weight fourteen capstans were employed, and the number of men to work these were as under:
Nine men to each bar and awifter
1,512
Eight men to hold on at each 112 Three men to esch capstan, to attend the fail.............. 42 Men on board the ship, and employed in other opera-

450
Total of men employed.......................... 2,110
The time occupied in hauling her up, after all the purchasea were brought to bear, was forty minutes. The expense of preparing her, and the loas and wear and tear of the materials, was eatimated at somewhere about $£ 2,000$.

The advantages which slips are auppoed to posseas over dry-docks are many and lmportant, They can be constructed at one twentieth part of the expense; they occupy lesa space; they can be constructed on a steep or a sheiving shore; and ships can be hauled upon them either in spring or neap tidea; whereas a dry. dock can only be made in particular aituations, and, when made, shipa can only be docked and undocked in certain states of the tides; from which circumstance a considerabla delay and inconvenience are frequently experienced. It should be recollected, however, that a large ship must necessarily go into a dock preparatory to her being hauled up on a slip.
It has been considered aa not at all impossible, as was anggested some time ago by Mr. Perring, then the ingenlous clerk of the check in Plymouth dockyard, that the whole ordinary might heroafter bo laid up on sllps, which, if housed over, would unquestionaliy be the best means of increasing their duribility, and preserving them from partial decay. Nor is it certain that in the end it would not be the most economical mode of preserving then. The expense, as appears from the Estimates of the Ordinary of the Nary for the year 1817, is $£ 187,300$ for harbor victuala, harbor moorings and rigginge, etc., besides $£ 135,000$ for wages; tlie chief part of both which aums is on account of ahlps of war laid up in ordinary, nove of which would be required by placing them on slips. It would indeed form a aingular revolution in naval management, if shipe hereafter should be laid up in ordinary on dry land, while the timber of which they are built was considered to be the best preserved under salt water; a process which, from aome experimenta recently mode, promises fair to be the most effectual prevention of, and a probable care for, the dry rot. (See Dny Rot.) This method of preserving timber bas long been practiced at Brest, Carthagena, and several other places on the continent; and the only objection to it in some of our ports appears to bo the attack of the worm known to naturalista by the nsme of Teredo nuvalis, whose bite is almoat aa destructive as the iry rot.

On the other hand, there are very many and aerious objections, even were the measure practicable, of hauling up shipa of the line in particular, to be laid in ordinary on slips. In the first place, the length of seabeach which would be required ia greater than probably all the dockyards in the kingdom could furnish. Sco-

ondly, the three warrant officers who are !: Jw employed in each ship, and who are the beet men in the service, being no longer necessary, would be turned adrift, and, in all probability, ntterly lost to the navy. Thirily, no large ship could be havied on the slips without being proviously taken into a dock to have her bilgeways fitted, and her bottom prepared for placing her on the slip. The time taken for this purpose must necussarily interfere with the other works of the yard; and after taking her ont, the preparations for heaving; her up, the capstans, blocke, parchaee-falle, chains, and a varicty of other articles, amount to a very largs expenee, not less, with the expense of the roof to cover the ship, than $\mathrm{E} 10,000$ for each ship so bsuled up.
Dockyards.-Previously to the reign of Henry VIII. the kings of England had neither navy arsensls ncr dockyards, nor any regular establishment of civil or naval officers to provide ships of war, or to fight them. They had admirals, howeves, poesessing a high jurisdiction and very great powerr And it would appear, from a very curious poem in IIfackluit's Collection, called The Policic of Keeping the Sea, that Henry V. had both shipe, officere, and men exclusively appropriated to his service, and Independently of those which the Cinque Porte were bound, and the other ports were occasionally called apon to furnish, on any emergency. By this poem it slso appears that Little Hampton, unfit as it now is, was the port at which Henry built hla great Dromions
Which passed other great shlppes of the commons.
But what these dromione were no une can now tell; nor is it easy to conceive how the building and repairing of the (ireat Harry, which in the reign of Henry VII. was launched at Portsmouth, and cost $£ 15,000$, was managed, considering the very rapid strides made at once from the small Cinique Port vessels, manned with 21 men and a boy, to this enormous floating castle. At that time it is well known that thoy had no docks, nor even subatitutes for them.

The foundation of a regular navy, by the eatablishn.ent of dockyards, and the formation of a board, consisting of certain commissionors for the management of its affairs, was first laid by IIenry VIII., snd the first dockyard erected under his reign was that of Woolwich. Those of Portsmouth, Deptford, Chatham, and Sheerness, followrd in succession ; and the last, excepting the new and unfinished yard of Pembroke, was Plymouth, which was founded by William III,

From the first establishment of the dockyards to the present time, most of them have gradually been enlarged and improved ly a succession of expedients and make-shifts, which answered the purposes of the moment; but the beet of them possess not those conveniences and advantages whlch might be obtaiued from a doekyard syetematically laid out on a uniform and consistent plan, with its wharfs, hatins, docks, alips, magazines, and workshops, arranged according to certain fixed principles, calcuiated to produce convenience, economy, and despatch.

Neither at the time when dockyards were firat eatablished, nor any subsequent periods of their enlargemer! as the nacessities of the service demanded, conld it have been foreseen what incalculsbie advantages would one day be derived from the aubstitution of machinery for human labor; and without a reference to thie vast improvennent in all mechanical operations, it could not be expected that any provision would be made for its future introduction; on the contrary, the docks and slips, the workshops and atorehouses, were successivoly built at random, and placed wherever a vacant space would most conveniently admlt them, and in auch mannor as in most casea to render the suim sequent introduction of machinery and iron rallways, and those various contrivances found in the large manufacturing estabilshments of privato individuals, quite imposalule, even in the mout commodious and roomy dockyerds.
i The perfection of a dockyard, independently of the advantages of machinery, which are but contingent, may be considered to depend upon one or more extensive basins, surronnded by spacious wharfs or qusys. By means of these a prodigious saving of time, labor, and expense may be saved, in every stage of the progrees of fitting out a ship for sea, from the moment ohe is lamahed from the slip, or taken out of a dock, as well as in dismantling a ship on returning to port to be paid off and repaired, or lald op in ordinary. For this purpose the docks and slips should occupy one of the sides of the basin, with working-sheds for carpenters and joiners, smiths' shops, saw-pits, and seasoningsheds between them. The ship, when completed on the slip sad launched into the basin, may then be taken immediately into the adjoining dock to lee coppered. From this she proceeds to the second side of the hasin, in the corner of which is the ballast-wharf. The remainder of the side will prolimbly be occupied by the victualing department, with appropriate stores in the rear for various kinds of provieions, and behind these the bakery, brewery, and slaughter-houses; on the wharf the iron tanks for holding water, now univeraally used for the ground tier in lieu of wooden casks. These are taken on board next after the ballast, and, together with the superincumbent casks, would be filled in the ship's hold by means of fiexible pipes to convey the water into them. The provisions would at the seme time be taken on board st the same wharf, in front of the victualing stores. The third side might be appropriated to the ordnence department, with the gun-wharf extending along the whole side, and the gun-carriage storehousea, magazines, etc., in the rear. The fourth side would be occupied as the anchor wharf, with the cable storehouses, the sail-lofts and stores, rigging-loft, and magazines for various stores, in the rear. Bohind these, again, on the first side, contalning the dry-docke, and building-8lips, the ground would be appropristed to the reception, berthing and converting of timber, from whence iron railways would lead to the saw-mills, saw-pits, and workshops, all of which would be placed on that side. On the second sido a pond or basin for the victualing lightere and craft, with wharfs communicating with the manufactories and storehonses; the same on the ordance or third side; and on the fourth side ulght be placed the ropery, hemp etorehouses, tar-houses, with a basin for hemp-vessels, lighters, and the like. Coumunicating with the great beain on the building side, and siso with the river or harbor on ti: a shore of which the dockyard is to be formed, shonld be a mastpond, with a lock for the storing of spars. In front the mast-houses, top-houses, capstan-houses, and a slip to launch the masts into the pond. IIere siso might be placed the boat-houses and boat-pond.
A Systematic Dockyard. $-\mathbf{A}$ peninsuiar situation, having at least three fourths of its shore surrounded with deep water, is peouliarly favorable for some such arrangenient as is hera mentioned, as any number of loeks and canals might be made to communicate with the river, so that ships coming into the basin might not interfere with those golng out, nor the lighters aad other eraft bringing their several species of storea, with either or with one another. By such an arrangement a ship would be equipped for sea at half the present oxjense, and within half the uausl time. A ship fitting out for an anchorage distant from the dock yard, Ia liable to every inconvenience atd delay, as afl her guns, stores, provisions, and water, must be carried to her in dockyard lighters and other craft, into which and out of which they must be hoisted and re-hoisted; lialie to delay from bad weathor and contrary winds; to be stove aiongside the shity, to the total loas or dumaging of their cargoes. Added to which is the loss of time in going baekwarl and forward, eapechally to the artificers; the desertion of the men; the aceidents from the upsetting of boats; and many other ovila, of a
magnitude not easlly to be calculated, and exceeded only by the disappointment and vexation that navzoidsbly occur when ahips are preparing for some partionlar and pressing service ; all of which, when ships are fitted out in a basin for aes, are avoided. Here no delay, no embezzlement, no desertion can take place. A ahip in roturning from aea may be docked and undocked into the basin with all her stores on board; and If to be puid off, instead of keeping the crew on board for weeks, till all the stores have been delivered into the dockysrd, tine ahip, by the proposed plan of basins, would remain aecurely in the basin, to be atripped at leisure by the riggers and laborers of the yard, and the crew become immediately avallable for other ahips.
Portsmouth Dockyard.-Portamouth dockyard will stways be considered as the grand naval arsensl of England, and the headquarters or general rendezvous of tie British fleet. The dockyard, accordingly, is by far the most cspacious; and the safe and extensive harbor, the noble anchorage at Spithead, the central situation with respect to the English Chunnel and the opposite coast of France, and particularly with regard to the asval arsenal at Cherbourg, render Portsmouth of the very first importance as a naval station; and in this view of it, every posslble attention sppears to have been paid to the extenaion and improvement of its dockyard. The noble ateam-basin, which was opened by the Queen, in May, 1848, with grest ceremony; is one of tha most important of the recent limprovements. Tho sea wharf-wall of this yard, extending $\ln$ the direction of north and south, rlong the western shore of the harbor, is about 3,900 feet in length, and the mean depth may be 2,000 feot ; and it incloses an area of more than 100 seres.

Ia the centre of the wharf-wall, fucing the harbor, is tha antrance into the great basin, whose dimensions are 380 by 260 feet, and its area 21 acres. Into this basin open 4 excellent dry-docks, and on esch of its sides is a dry-dock opening into the harbor; and all of these 6 docks are capable of receiving ships of the largsst class. Besides these, is a deubie dock for frigstes, the atern dock communicating, through a lock, with the harbor, and the hesd dock with another basin about 250 feet square. There is also a chamber, with a wharf-wall on each side, 660 feat in length, and of sufficient width to admit of transporta and merchantships bringing stores to the dockyard. In the same fsce of the yard are 8 building-slips, capable of recsiving the largest ships, and a small one for sluops, besides 2 building-slips for frigates on the northern face of the yard, and a amaller alip for sloops. The range of atorehousea on the north-eust aide, and the rigginghouse and suil-loft on the south-west sidie of the chamber, are magnlificant huildinge, the former occupying nearly 600 feet in length, exclusive of the two intermediate spaces, and nearly 60 feet in width, and the two latter 400 feet. The two hemp-houses and the two ses-store houses occupy a line of buitling which, with the three narrow openinge between them, of 20 feet aach, extend 800 fast. Thie rope-house, tarring-house, sad other appendages of the ropery; are on the same scala. The two sets of quadrangular storehouses, and tha two corresponding buildings, with the intervening timber-bertha and saw-pits, at the bead of the drydocks, losuing from the grent basin, are all excellent, and conveuiently placed. The smithery is on a large scalo, and contiguens to it is an iron-mill, a coppermill, and a copper-reflaery, at which is remelted and rolied all tho old copper which is taken from shipa' bettons; and here, also, are cast bolts, gudgeons, and various articlea of copper used in the navy. The number of sheets manafsetured In one year of the war, amountod to about 300,000 , weighing above 12,000 tuns; on which it has been calculated that a aaving of at least $£ 20,000$ was effected for the public, besidea obtaining a good, pure article. Most of these were constructed under the direction of General Bentham.
(Bentham's Servicea.) At the head of the nerth dock are the wood-mills, at which every article of turnery; rabetting, etc., is performed for the use of the navy, from boring the chamber of a purnp to the turning of a button for a cheat of druwers. But the principal part of these mills is the machinery for making blocks, contrived by that ingentous artist, Mr. Brunoll (see Tbedgoln'a Carpenty y), which can not be regarded without exclting the highest respect for the talents and skill of the inventor.
The northern extremity of the dockyard ls chiefly occupied with seasoning-sheds, saw-pits, and timberberths, the working boat-house, and bout storehouse. On the eastern extremity are situsted the housea and gardens of the superintendent and principal officers of the yurd, the chapel, and the royal uaval college.
Capacity of a Dockyard.- The eapacity of a dockyard for building, repairing, and rofitting ships of war, depends npon so many circumstances that to acarcely admits of calculation; chlefly, however, on the facilities afforded by a suitable arrangement of dry-docks, buidding-slips, and basins, and on the number of shilpwrighta and other srtificers borne on the strength of the yard. In building new ahips, where the materisla are at hand, and no interruptions occur, the capacity may be ascertained to a tolerable degree of accuracy. To complete the building of a $74-\mathrm{gun}$ ship, it-is ciateulated that the labor of one man would be required for 18,000 days, or of 18 men for 1,000 days, or about 54 men to finish her in the spane of one year. A dockyard, therefore, with 500 geod shipwrights, might be expected to launch from 8 to 1074 -gun ships every year, if the cenveniences of the yard sdmitted them all to be employed on the building ; but this kind of ship ia now aupplinnted by ships of 120 and 130 gans, requiring a relative incroase of hands. With regard to repairs, they are so varlous and so uncertain, that it would be next to impossible to form any calculstion that should at all approach to the truth. A writer well versed in naval matters, in attempting to prove the sufficiency of our dockyards, without having recourse to private merchant-yards during, war, has stated, that by a uniform system of management, "the annual regeneration of ships-of-the-line may be safely reckoned at twelve sail, and that of frigstes, at eight sail; and that, besides, there might be docked for casual repairs, in the course of one year, two hundred and sixty-seren sail of ships and vessola of war." -Letter to Lord Melville on the General State of the British Navy.-E. B.

The Brooklyn Nayy Yard ls the most extensive naval dépôt in the United States, situated on the south side of Wallabout Buy, at the north-eastern part of the city, and contains 45 acres of land. It is inclosed by a substantial brick wall on the land side, and on the left hand, as you enter its gate, there ta a flower-garden most tastefully arranged.

This spacious yard affords sufficient room for the residence of the officers, machine-shops, storehouses, etc. The most conspicuous buildings are two large edificea, 250 fect long by 125 feet wide, and 120 feet high, capable of containing the largest ships of war white being bullt. In time of peace several national versels are usually to be seen here, sither laid up or undergolng repairs. A vast amount of cannon, can-non-bulls, bombs, and all kinds of munitions of war, ls always on hand at this deppôt. The Brooklyn drydoek is locnted at the Navy Yard, and is capable of receiving the largest ships of war. This is a magniflcent work, unequaled by any of the kind lu America, and acarcely aurpassed by any in the world. The foumintion is 400 feet long by 120 wide, and the main chamber or baain is 286 feet long ly 30 wide at the botton, and 307 feet long and 08 wide at the top. The weight of the lron folding-gutes is 150 tons; the pumps discharge 40,000 gallous per miuute. The enginehouse is a fire-proof building, containing machinery of
the most perfect kind. The whole occupied 16 yeare in the course of construction.' See Appleror'a Dic tionary of Mechanics.
Doswood (Cornus Florida). The wood of this troe is hard, compact, heavy, and fine-grained, and is suscoptible of a brilliant polish, from which circumatance it may be anbstitated for numeroras purposes to which boxwood is applied. The eap-wood is perfectly white, and the heart-wood is of the color of chocolate: In the United States, it enters into the conetruction of many articles, both for utility and ornament,' such as the handles of light tools, mailets, toys, etc. "It is sometimes used by farmera for harrow teeth, for the hames of horse-coliars, and also for shoeing the runners of aleds ; but to whatever purpose it is applied, heing liable to eplit, it ahould never be wrought till it ie perfectly seasoned. The ehoots, when three or four years old, are found enitable for tha light hoope of emall casks, and $\ln$ the Middle States, the cogs of millwheels are made of them, and the forked branches are converted into the yokes which are put npon the necks of swine, to prevent them from breaking into inclosed fieids. In the parts of the country where it abounds, it serves for excellent fael. The inner bark of this tree is extremely bitter, and is nsed as a good sabstitute for the Peruvian berk. The bark also may be substituted for galls in the manufacture of ink, and from the bark of more flhrous roots, the American Indians obtain a scarlet dye. An infusion of the flowers of this tree is also used by them in the cure of intermittents. The fruit is sometimes taken as a tonic, in the form of a spirituous impregnation, and it likewise forms a favorite repast for various spucies of birds. In England the sole use of this species is an ornamental ahrub, and from its large, white flowers, "emulous of the purity of anow," which finely contrast with tha "forest green," it richly deserves a place in every coilectlon where it will thrive.-Bnowne's Trees of America.

Doldrums. Seafaring peopie have, as if hy common consent, divided the ocean off into regions, and characterized them according to the winds ; e. g., there are the "trade-wind regions," the "variables," the " horse latitudes," the "doldrums," etc. The "equatorial doldrums" ${ }^{\prime \prime}$ is another of these caim piacee. Beaides being a region of calma and baffing winde, it is a region noted for its rains and clouds, which make it one of the most oppressive and disagrseable places at gea. The emigrant ships from Europe for Australia, have to cross it. They are often baffled in it for two or three weeks; then the children and the passengers who are of delicate health suffer most. It la a frightfal grave-jard on the way-side to that golden land. -Maury's Phyz. Geog. of the Sea, p. 209.
Dollar, the name of a ailiver coin of Spain and of the United States; worth 100 centa. The dollar appeare to have been originally a German coln; and in various parts of Germany there are coina of different values so called. This word corresponds to the German thaler, the Low-German dahler, the Danish daler, the Itallan tallero. All these worde, together with our dollar, are derived from the name of the Boheminn town Joachims-Thal (Joschim's Valley), whers, in 1518, the Count of Schlick coined allver pieces of an ounce weight. These, indeed, were not the firat of the kind coined; yet, as they were numerous and very good they became generally known by the name of Joachim'a-thaler, which is the German adjective of Joachim's that, and alao Schllckenthaler from the name of the Counts. As these coins were In good repute, thaters were aleo coined in other countries, but of different value; thus originated the laub-thaler (lenfdollar), Phil $h_{1 p p s}$ thaler, the Swedish copper dollar eto. In Russia, a doliar is called jephimock, from Joachim. -F. A. See Corma.
Dolphin, in nantical langusge, a rope or strap factened round the mast of a ship to give aupport to
the puddening (a mass of yarn or oakum used to provent chafing), where the lower yards rest on tha slings: Dolphin ie also applied to a spar or buoy furnished with a large ring, and anchored, to which a vessel may bend its cable.
Domioll. In' regard to the etates not Christian, not only the Mohammedan states, but all the rest, the true rale appears to be, that contracts of citizens of the United States in general, and especiaily the contract of marriage, are not aubject to the lex loci, bnt must be goverued by the law of tha domicil ; and that, therefore, in auch countries, a valid contract of marriage may be oolemnized, and the contract authenticated, not only by an ambassador, but by a consul of the United States. The English authoritiea come to subatantisily the same conclusion, for similar reasons. "Nobody can suppose," eays Lord Stowell, "that while the Mogul empire existed, an Englishman (in Hindostan) wae bound to consult the Koran for the celebration of his marruge." In mest of the Asiatic and African countries, indeed, law is personnl, not local, as it was in many parts of modern Europe in the formative period of ite present organizatien. Hence, In British Indin, Hindoos, Parsees, Jews, Sohammedans, Christians, all marry according to the law of their reitgion. The ecclesisatical inw of England goes further than this, for it recognizes the marriage of Engllshmen, celebrated according to the English iaw, that is, by a clergyman, in British factories abroad, though situated in Christian countries, but countries of the Roman Catholic or Greek religien.Manual for Consuls, U.S.
Merchants.-The national charactor of merchants residing in Europe and America, is derived from that of the conntry in which they reside. In the eastera parts of the worli, European persons, trading under the shelter and protection of the factories founded there, take their national character from that association under which they live and carry on their trade. This distinction arises from the nature and habits of the countries. In the western parts of the worid, alien merchants mix in the society of the natives; access and intermixture are permitted; and they become incorporated to nearly the full extent. But, in the East, from almost the oldest times, an immiscibie character hns been kept up: foreigners are not admitted into the general body and mass of the nation; they continue strangers and eojourners, as all their fathers were. Thus, with respect to establishments in Turkey, the British courts of prize, during war with IIol. iand, determined that a merchant carrying on trade at Smyma, under the protection of the Dutch consul, was to be considered a Dutchman, and condemned his property as belonging to an enemy. And thus in China, and generaily throughout the East, persons admilted into a factory, are not known in their own pecullar national character ; and not being permitted to assume the character of the country, are considered only in the character of that association or factory.
But these princlples are considered not to be applicable to the vast territories occupied by the Britlish in Hindostan ; because, as Sir W. Scott observes, "though the sovereignty of the Mogul is occusionaily hrought forward for the purpose of pollcy, it hardly exists otherwise than as a phantom; it is net applited in any way for the regulation of their estallisiments. Great Britaln exercises the power of deciaring war and peace, which is among the atrongest marke of actual sovereignty ; and if the high and empyrean soverelgnty of the Mogul is sometimes brought down from the clouils, as it were, for the purposes of poilcy, it hy no means interferes with the actual autkority which that country, and the Enat India Company-a cres. ture of that country - xercise there with full effect. Merchants residing there, are hence consldered British subjects."-Whraton's Internatinnal Lav, Part If., ch. 1, p. 408.

Dominion, one of the Leeward group of islands in the Weat Indles, belonging to Britaln, and lying between the French Islands of Martinique and Guada loupe, 24 mlies north of the former, and about the same distance south of the latter. Dominica was so named by Columbus from his having discovered it on a Sunday (In 1493). It was ceded to England by the peace of Paris, in 1763, but was taken by the French In 1778. At the peace of 1788 it was restored to England, in whose possession It has since remained. Dominica is 29 miles in length from north to south, and 16 in breadth, and has an area of about 186,436 acres. The princlpal town Rosesu, sitnated on the S.W. side of the island, is in lat. $15^{\circ} 19^{\prime}$ N., long. $61^{\circ} 28^{\prime} \mathrm{W}$. The sarface is generally rugged and mountalnous, Interspersed with fertlle and well-watered veileys. The highest polnt is 8,814 feet above the level of the eea, The origin of this island is volcanlo, and sulphir and other volcanic products are abundant. The soil is light and well adapted for the growth of coffee. The hills are covered with valuable tlmber trees of the kinds commonly found in the West Indies. Game is shundatit, and the fiaheries on the coast are very productive. The princlpal productions are sugar, molasses, rum, coffee, cocoa, and oranges. The cultivation of cotton has lately been introduced to $a$ amall extent, and has been found to answar very well, particularly on land near the sea-coast. The princlpul staple products exported in the years ending 5th January, 1852, and 5th January, 1853, were as follows :

The value of exports and imports, and the revenue for the years 1849, 1850, and 1851, were as follows :

|  | 1849. | 1850. | 1881. |
| :---: | :---: | :---: | :---: |
| Imports. | 250,616 | 257,656 | 271,828 |
| Experts. | 45,070 | 58,265 | 62,527 |
| Revenne | 8,918 | 10,2i5 | 12,901 |

The population in 1844 was 22,200 , of whom 11,604 were females. The principal harbors are Roseau and Prince Rapert's Bay.-E.B.
Dornock is a species of figured linen of stout fabric, Which derives its name from a town in Scotland, where it was first manufactured for table-clotha. It is the most simple pattern of all the varleties of the dispes or dumask style, and therefore the goods are usually of coarse quality for common household wear. It receives the figure by reversing the flushing of the warp and woof at certaln intervals, so as to form squares or oblong rectangles upon the cioth. The most simple of these is a succession of alternate squares, forming an lmitation of a checker hoard or mosale work. The coarsest kinde are generally woven as tweels of three leaves, where every thread floats over two, and is Intersected by the third In succession. Some of the finer are tweele of four or five leaves, hut few of more; for the six or seven lesf tweels are seldom or never used, and the eight lesf tweel is confined almost exclusively to damask.

Dort, or Dordreoht, an important commerclal city of IIolland, capital of a cognominal district in the province of South Holland, 10 mlles south-east of Rotterdam. It ls sltuated on un Island of tise Meuse, sald to have been separated from the mulnland in 1421, by an Inundation which swept a way 72 villages, and about 100,000 inhabitants. Thls is one of the oldest cities of Holland, but the period of its rise is uncertain. It Was surrounded by walis in 1231 by Florent IV., Count of Holland, who inade It hls residence, and granted it many important privilegee. In 1457, almost the entire town, includlog the church of Notre Dame, founded in 1366, and other publio bulldings, was dentroyed by fire. It was one of the first towns to emirace the Re-
formed religion, and to throw off the yoke of the Spanish king. In 1572 a meetligg of depnties was held here, when the independence of the United Provincen was first declared; and In 1618 and 1610 ant the celebrated Synod of Dort. The town-hall is a handsome lbulding; and the principal church is an old Gothic structure 800 feet long by 125 feet wide, with a heavy square tower, and numerous monumental stones, some of great antiquity. The hall in which the synod was held is now a public house. The houses are generally of an untique fashion, with the gables turned outward, and many of them date from the period of the Spanish ocenpation. "Dort possesses a good harbor, from whlch two canals lead to the centre of the town, and thus facilltate the conveyance of goods to the warehouses. It carries on sn extensive trade in corn, flax, salt fish, train oll, and timber, bronght down the Rhine ; and has. ship-building docks, saw-mills, eugar and salt refinories, tobacco factorles, llnen-bleaching and whitelend works. Dort is the blethplace of the brothers De Witt. Population (1850), 20,878.

Doubling, in navigution, the act of salling round or pasaing beyond a cape or promontory.

Doubloon, or Doblon, a Spanish and Portnguese coin, being the double of a platole,-E. B. See Corns. Dover, Stra'is of, the narrow channel between Dover and Calais, whlch scparates Great Britaln from the French coast. Britnin is aupposed by many to have been once a peninsula-the present straits occupying the site of the isthmus which joined it to Gaul, "The correspondency of strata," says Mr. Pennant, in his Arct. Zoology, " on part of the opposite shores of Britain and France, lesves no room to doubt that they were once united. The chalky cliffs of Blancuez, between Culais and Boulogne, and those to the westward of Dover, exactly tally. The last are vast and continued; the former short, and the termination of the immense bed. Between Boulogne sud Folkestone (about 6 niles from the latter) is another memorial of the junction of the two countries: a narrow submarine inill, called the Rip-raps, aloout a quarcer of a milo broad, and 10 miles long, extending eastward toward the Goodwin Sands. Its materials are boulder-stones, adventitions to many strata. The depth of water on it, in very low spriag-tides, is only 14 feet. The fishermen from Foikeatone have often touched it with a 15 -feet oar, so that it is justly the dread of navigutors. Many a tall ship has struck on it, and ounk lnstantiy Into 21 futhoms of water." In July, 1782, the Belleisle, of of 64 guns, struck, and lay on It during three hours, but by startlig her beer and water, got clear off. These celebrated straits are only 21 miles wide in the narrowest part ; from the pier of Dover to that of Calais, 24 miles. It is e id that thelr breadth ls diminlahing, and that they are $t$ wo miles narrower than they were iu anclent thines. An accurate observer for 50 years, romarks that the increased helght of water, from a decrease of breadth, has been appurent, even In that space. The depth of the channel, at a medium, In tine hlghest springtides, is about 25 fathoms; the bottom is either coarse sand or rugged seare, whlch have, for ages unknown, reslated the attrition of the currents.-E. A.
Down (Ger, Dunen, Flaumfedern; Du, Dons; Fr. Duvet; It. Penna matta, Piumini; Sp. Flojel, Plumazo; Rus. Puch; Lat. Plumas), the fine feuthers from the breasts of several birds, partlcularly those of the duck kind. That of the elder duck is the most valuable. These birds pluck it from thelr breasts, and line their nests with lt. Mr. Pennant says that le is so very elastio, that a quantity of it welighing only $\frac{n}{3}$ of an ounce, more than tills the crown of the largest hat. That found in the nest is most valued, and termed live down; It la much more elastle than thut plucked from the deud bird, which is comparatively little esteemed. The elder duck is found on the western islands of Scotland, but the down is princlpally imported from Norway and Ireiand.

Downs, a bank or elevation of sand, which the sea gathers and forms along its shores, and which sarves it as a barrier. The word is formed from the French dume, or the Celtio dun, a mountain. Charles de Visch (Compend. Chronolog. Bixord. el Progress. Abbat. Churiss, B. Marice, de Dunis) ssys, lallem reperit arenarwm collibus, quos incolas Duynen vocant, undique cinctam. It is also applied to a large open plain, primarily on elevated land.

Downs is particularly applied to a famous roadstead for ships along the eastern coast of the county of Kent, from Dover to the North Foreland, where both outward and homeward-bound shlpa frequently, make some stay, and squadrons of men-of-war rendezvous in time of war. It affords excellent anchorage, and is defended by the casties of Deal, Dover, and Sundwich.

Dragoman, or Drogueman, sn interpreter; a term of general use in the Levant and throughout the East. There are dragomans attached to the embassies and consulates of Christlan nstions residing at the Porte. The word ls formed from the Arahic targeman or targiman, of the verb taragem, " he has interpreted." From dragoman the Italians formed dragomarno, and, with a nearer relation to its Arabio etymology, turcimanne; whence comes trucheman, as well as dragoman and drogueman. See Turkey.

Dragon's Blood (Sang dracon, Fir.; Drachenblüt, Germ.) is a reanous aulastance, which comes to us aometimes in sinnll balla about the slze of a pigeon's egg, sometimu in rods like tho finger, und sonetimes liko it:egular cakes. Its color, in lump, is dark brown-red; in powder, bright red; friable; of a shining fracture; sp. grav., $1 \cdot 196$. It contains a little benzoic acid, is insoluble in water, but di-molves readily in alcohol, ether, and oils. It is brought from the East Indies, Africa, South America, as the produce of several trees, the Dracana Draco, the P'erocarpus santalinus, Pterocarpus draco, and the Calamus rotung. Dragon'a bion' is used chiefly for tinging spirit and turpentine varniches, ior preparing gold lacquer, for tooth tinctures and ;owders, for staining marble, etc. According to llerisenter, it conaists of $9 \cdot 07$ parts of red resin, 2 of fat oid, $\mathbf{3}$ of benzoic acid, $1 \cdot 6$ of oxalate, and 8.7 of phosphate of lime.

Dralce, Bir Francis, a celebrated Finglish admiral, was born near Tavistock, Devonshire, in 1540. His father, who had been bred a aailor, obtaiued a naval chaplainey from Queen Eiizabeth, and was afterward vicar of Upnor church, on the Medway. Young Drske was educated at the expense and under the care of Sir John Hnwkins, who was his kinsman ; and, at the age of eighteen, he had risen to be purser of a ship trading to Biscay. At twenty he inade a voysge to Guinea; and at twenty-two he was made captain of the Judith. In that capacity he was in the harbor of San Juan d'Ulloa, in the Gulf of Mexico, where be behaved most gallantly in the actione under Sir Join Hawkins, and returued with him to England, having aequired great reputation, though with the losa of ail the money which he had embarked in the expecition. Having next projected an attaek against the Spaniards in the West Indies, to indemnify himself for his former losses, he set sail in 1572, with two small ships named the Pasha and the Swan. IIe was afterward joined by another vessel; and with this emall squadron he took and plundered the Spanish town of Nombre de Dios. With his men he penetrated across the Isthmus of Pauama, and committed great havoc sinong the Spanish shipping. In these expeditions he was much assisted by a nation of Indians, who were titen eugaged in a desultory warfare with the Spaniards. Having embarked his men and filied his ships with plunder, he bore away for England, where he arrived in August, 1753.

In 1080 , Sir Francis Drake comınaniled the fleet sent to restore Don Antonio, King of Portugal, the land forces being under the orders of Sir John Norris; but
they had hardiy put to sea when the commanders differed, and thus the attempt proved abortive. But as the war with Spain coatinued, a more formidable expedition was fitted out, under Sir John Hawkins and Sir Francis Drake, against their settlements in the Weat Indies, than had hitherto been undertaken during tho whole course of it. Here, however, the commanders again disagreed about the plan; and the resuit, in like manner, disappointed public expectation. These disastere were keenly felt by Drake, and were the principal cause of his deuth, which took place on board his own ship, near the town of Nombre de Dios, in the West Indies, January 28th, 1590̄.-E. B. See Vdinb. Kev., 1xxx., 197; Lublin Univ., xxiii., p. 551 ; $N$. Am. Kev. [Pealuody], lix., p. 70; Littela's Living Age, iii., p. 289.

Drawback, a term used in commerco to signify the remitting or paying buck of the duties previously paid on a commodity on its heing exported. A drawback is a device resorted to for enabling a commodity affected by taxes to be exported and sold in the fureign market on the oume teras as if it had not heen taxed at all. It differs in this from a bounty, that the latter enables a commodity to be sold abroad for less than its natural cost, whereas a drawback enables it to be sold exactly at its natural cost. Drawlacks, as Dr. Smith has ebserved, "do not occasion the exportation of a greater quantity of goods than would have been exported hall no duty been imposed. They do not tend to turn toward any particulur employment a greater share of the capitni of the country than would ge to that employment of its own accord, but oniy to hinder the duty from driving away any part of that share to other employments. They tend not to overturn that balance which naturally eatubllishes itself among ail the various employments of the society, but to himeler it from being overturned by the duty. They tend not to destroy, but to preserve, what it is in most cases advantageons to preserve-the natural division and distribution of labor in the society." Were it not for the system of drawbacks, it would be impossible, unless when a country enjoyed some very peculiar facilities of production, to export any commodity that was more heavily taxed at home than abroad. But the drawhack obviates thia difficulty, and eanbies merchants to export commoslities loaled at home with heavy duties, und to sell them in the foreign market on the samo terms as those fetched from cunntries where they are not tuxed. Most forelgn artictles imported into this country may be wareboused for subsequent exportation. In his case tilcy pay no duties on being imported, and, of course, get no drawbuck on their sulisequent exportation. Shmetimes a irawhack exceeds the duty or duties laid on the article; and in such cases the excess forms a real bounty of that umount, and shonid be so considered.

Dredging Machine. A machine for clearing out or deejening the heds of navigable rivers, harbors, cunais, etc., by the removal of cieposited matter.

Dresclen China. The fine porcelain ware known as Dresden china was discovered by M. Bathcher, who was at the time an ajothecary's boy, 1700. Services of this ware have cost many thousands of pounds each. A costiy service, each piece exquisiteiy juinted, and the battles represented, and subjects ali different, was presented to the Duke of Wollington by tha King of 1'russia, in 1816, and is the finest in Englami.

Dressing. A term applied to gum, starch, and other articies used in stiffening or prejaring sik, linen, and other fabrics.

Drift, in navigation, tiee sugle which the iiue of a ship's motion makee with the nearest moridian, when ahe drives with her aide to the wind and waves, and is not governed by the heim. It also implies the distance which the sinij drives on that line. Drift, in mining, a passage cut between shaft and shaft, or a way wroaght under the earth.

Drift of Eottles. It is a cuatom often practiced by geafuring people to throw a bottle overboaril, with a paper, stating the time and place at which it is done. In the absence of other information as to currents, that afforded by these mute little navigators is of great value. They leave no tracks behind them, it is true, and their routo can not be ascertained. But knowing where they wore cast, and seeing where they are found, some idea may be formed as to their course. 'Striight llnes may at leust be drawn, showing the shortest distance from the beginining to the end of their voyage, with the time elapsed. Admiral Beechey; R. N., has prepared a chart, representing, In this way, the tracks of more than 100 bottles. From it it appears that the waters from every quarter of the Atlantic tend toward the Gulf of Mexico and its stream. Bottles cast into the sel midway between the Old and Now Worlds, near the coasts of Europe, Africa, and America; at the extreme north, or further south, have been found either In the West Indies or the British isles, or within the weil-kriown range of Gulf Stream waters. Of two cnet oat together in south latitude on the coast of Africa, oae was found on the island of Trinidad, the other on Guernaey, in the English Channel. In the absence of positive information on the aubject, the circumatanthal evidence that the latter performed the tour of the Gulf is all but conclusive. And there is reason to supnose that zome of the bottles of the admiral's chart L. $7 e$ also performed the tour of the Gulf Stream ; then, without being cast ashore, have returned with the drift along the coast of Africa Into the inter-tropical region; thence through the Caribbean Sea, and so on with the Gulf Stream again. Another bottle thrown over off Cape Horn by an American master in 1837, has been recently picked up on the coast of Ireland. An inspection of the chart, and of the drift of the other bottles, seems to force the conclusion that this hottle too went even from that remote region to the so-called higher level of the Gulf Stream reservoir.-Madry, Phys. Geog. of the Sea.
Drift-Bail, a sail used under water, veered out right a-head by sheets, as other anils are. It serves to keep the ehip's head right upon the bea in a storm, and to prevent her driving too fast in a current.
Drift-wood, trees or timber carried ont to sea by rivers when in flood; timber drifted or floated by water.

Driving, in sea language, is said of a ship when her anchor falis to hold her fast, and site fioats away with the wind or tide. A vessel is also said to drive when she scuds before a gale.
Droits of Admiralty. The perquiaites reaulting chisfly from the seizure of the property of an eaemy at the coinmencement of a war, und nttached to the office of Lord-high-admiral, or to the crown when that office is vacant. These perquisites were originally vested in the sovereign, to enable him to provide for the expense of defending the realm, and clearing the seas of pirates; and their value and importance will be st once pertcived from the following lrief statemeat. In 1798, one ship which had been captured brought $\mathbf{5 5 5 , 0 0 0}$; in 1800 , another brought $\mathbf{5 6 5 , 0 0 0 ;}$ in 1804, one captured ship was worth $£ 105,000$; and in 1806, several taken at once netted $£ 155,000$. I)uring the last war, also, the Duteh ships at one seizure brought $£ 1,030,000$; the Spaniah ships, $£ 2,200,000$; and so large wers the sums made nt one and tho aame mement in this rich fund, that tho crown one yoar, after paying many hundreds of thousands to captors, and large suins to different branchea of the rayal family, gave a million out of the residue to the pubile service. (Edinb. Rev., vol. xxxiil., p. 482.) By the civll jist, Introduced on the accession of Wililam IV., it was arranged that all droits of admiralty which might accrue during his relgn should be paid into the exchequer for the benefit of the public service; and the civil list of her present majesty hus made no alteration in that arrangement.-Brands.

Drowned Persons. Directions for Restoring Persons Apparently Drowned. From R. B. Foreses, Esq., of Boston, an officer of the Maseachusetts IIumane Society.-Convey the body to the nearest house, with head raiaed. Strip, and rub dry; wrap in blankets; inflate the lungs by closing the nostrils with thumb and finger, and blowing into the mouth forcibly, then pressing with hand on the cheet. Again blow in the mouth and preas on the chest, and so on for ten minutes, or until he breathes. Keep the body warm, extremities also. Continue rubbing. Do not give up as long as there is any chance of success.
, Drugs, Inapeotion of. By an act of Congreas, pasied June 20, 1848, to prevent the Importation of aduiterated and spurions drugs and medicines, it was provided, that all drigg and medicines, medicinal preparations, including medicinal essential oils and chemical preparations ueed wholly or in part as medicine, imported into the United States from abroad, shall, before passing the custom-house, be examined and approved, as well in reference to their quality, purity, and fitneas for medicinal purposes as to their value and identity specifted in the invoice.
Also, that all medicinal preparations, whether chemical or otherwiee, uaually imported with the name of the manufucturer, shall have the true name of the manufacturer, and the place whcre they are prepared, permanently and legibly affixed to each parcel, by stamp, label, or otherwise ; and all such medicinal preparationa imported without such names, affixed as aforeaid, shall be adjudged to be forfeited.

That if, on examination, any drugs, medicines, medicinal preparations, whether chemical or otherwise, including medicinal essential oils, are found, in the opinion of the examiner, to le so far adulterated, or in any manner deteriorated, as to render them in strength and purity inferior to the atandard eatablished by the United States, Edinburg, London, France, and German pharmacopœias and diapensaries, and thereby improper, unsafe, or dangerous to be used for medirinal purpores, a return to that effect shall be made upon the invoice; and the articles so notod shall not pass the customhouse, unless, on re-examination of a atrictly analytical character, called for by the ownar or conaignee, the retarn of the examiner shall be found erroneous; and it ahall be declared as the result of such analyais, that the said articlea may properly, safely, and without danger, be used for medicinal purpores.
That the owner or consignee shall at all times, when diesatisfled with the examiner's return, have the privilege of calling, at his own expense, for a re-examination; and depositing with the coliector such sum as the latter may deem aufficient to defray such expense, it shall be the duty of that officer to procure some competent analytical chemist posacasing the confidence of the medical profesaion, as well as ef the colleges of medicine and pharmacy, If any such inatitutiona exist in the State in which the collection dietrict is situated, a enreful analyais of the articles included in said return, and a report upon the samo, under oath ; and in case the report, which shall be final, shall declare the return of the examiner to be erroneous, and the said articles to be of the requisite atrength and purity, according to the standards referred to in the next preceding eection ot this act, the entire invcice shail be passed without reservation, on payment of the customary duties; but in case the examiner's return shall be sustained by the analysis and report, the gaid articiea shall remain in charge of the collector, $r$ d the owner or consignee, on payment of the charges of storage and other expenses neceasarily incurred by the United States, and on giving of bond, with suroties satiafactory to the collector, to land eaid artleles out of the linits of the United States, alall have the privilege of re-exporting them at any time within the perlod of six monthe after the report of the analysis; but If the said articles shall not be sent out of the United States within the time specified, it
shall be the duty of the collector, at the expiration of the said tlme, to cause the same to be destroyed, holdIng the owner or conelgnoe responaible to the United States for payment of all charges, in the same manner as if said articles had boen re-exported.

Drugget, a coanse and flimsy woolen texture, chiefly uaed for covering carpets. . It was formerly extensively employed as an article of elothing among the poorer classes, more eapecially of females; but this and similar fabries are now almost wholly superseded by cotton goods, which induce greater cleanliness.

Drummond Ifight. The three, angles of the onormous triangles by which a topographical survey is primarily conducted, sometimes 80 or 100 miles asunder, must be viaible one from another; but how to produce the vlsibillty? In the esrlier aurveys, where suoh daring distances were not attompted, a signal light was in aome cases obtained by refeeting the light of the sun from a well-adjusted surface of polished tin, or by Bengal lighta being fired at night, or by a poworful Argand lamp being placed bekind a lena or before a parabolic reflector; but Lieutenant Drummoud, during the progress of the Irish survey, made a happy auggestion whica eclipeed in efficiency all others. In what is culied the Druminond or Lime Light, a small ball of lime is exposed to the aetion of a spirit-flame fed by pure oxygen gas; the flame, In a highly-vivid state, heats the lime to an intense degree, and in . is heated state, it emits a light of surprising lurillianey, far exceeding that of any flame jet seen. So beautifully was Drummend's apparatus constructed, that the lamp fed itself with spirit and with oxygen, supplied itself with balls of lime as each one slowly wasted, and reflected its surpassing $H_{\text {ght }}$ from un exquinltelypolished parabolic surface of silvered copper. It was not merely figuratively but literally true, that a piece of lime, net bigger than a boy's marble, enittod a light at Londonderry which was visible at Belfast-a distance in a direct line of, nearly seventy miles. On a later occasion Colonel Colhy made a lime-light signal visible from Antrim in Ireland to Ben Lomond in Seotland, a atraight-lins distance of 95 miles. See Light-hovazs.

Dry Distillation. This term is applied to the distillation of aubstances per se, or without the addition of water : thus if we put wood into a retort or other distillatory apparatus, and aubject it to heat, it ylelds tar, vinegar, water, and various gaseous and other inatters. See Distihiation,

Drying Maohines. The drying process, by centrifugal agency, is of vory wile spuplication. Bleachers, dyers, and ealico-printers use it. The wet mass of cloth or yarn la put into a hollow cylinder; this eylinder is made to revolve from 1 to 2 thousand times in a minute; the molsture is driven from the cioth with great violenee; openings are left to afford an exit for thls water into an outer vegsel, and in a few aeconds the cloth is nearly dry. Nothing lut actually witnessing the process, can eonvey an adequate idea of the rapidity of this drying process. In some of the baths and laundries now eatsblished, machines of this kind are eniployed to supersede the hard neeessity of "wringing" the wet lineu-a grent boon to the poor women who avail themsalves of these mivantages.

Dry Rot. A most deatruetive, and apparently infectious disease in timber, which, by decomposing the fibres, deprives it of all strength, and in no great length of time, reduces it to a mass of dry dust; a elreumstanes from which it acems to have derived its name, which, perhape, would be better axpressed by that of sap rot.

Though this disease must from its nature have been co-existent with the timber-trees, it would not seem to have exeited much attention, and perhape was not known, certuinly nut by its present name, before the middle of the last century; at some period, we
rather think, of Bir John Pringle's prealdency of the Royal Society of London. But for a long time after thia little notice appears to have been taken of it; Ita ravagea being, in all probability, Inconsiderable, in comparison with what they have been of late years. E. on now, the disease is, in fact, chiefly confined to modern-built houses and modern-built shipe, and more particularly to the ships of the navy. The proximate cause of it has, therefore, rightiy enough, as it would seem, been ascribed to the unseasomalile state of the timber, when placed in certaln altuations, and under partleular circumstanees. It could not fail, in the course of the late long-protracted war, to become a matter of general observation, that a more rapid decay than usual had become almost universal throughout the fleat, and aspeeially among the neweat and most recently repaired ships. Many anxious inquiries were instituted, and experiments made, with the view of ascertaining the real cause of a decay, the further prevention of whieh was so highly important to the national walfare and securlty. The alarm was greatly increased when, in 1810, the Queen Charlotte, a firat rate ship of war, ahortly afterward launched at Deptford, was discovered, after a close examination, to have all her upper works infected with the dry rot; or, in other words, the ends of moat of the beams, carlings, and ledgen, the joinings of the planks, ete., were observed to be covered with a mouldy, fibrous, and reticulated crust, and the parts of the timber so eovered to be perfectly rotten. All the newspapers and jouraals of the day were filled with this alarming faet, and, in consequence thereof, a multitude of dry rot doctors proffered their ussistance: one having a nostrum for eradicating the disease where it had made its appearance, and another for preventing its further approach. Some of these specifies were expensive and incenvenient, many of them impractlcable of application, and most of them futile and objectionable in one way or anether. These doctors, in fact, like the pliysicians for tho human body, when the eeat of the disease is unknown, were laboring altogather in the dark, having no other gulde to direct them than their own whims and fanciea, each being ignorant of the effect of the respective experiments which they wished to try on this diseased machine.
Process of the Common Rot.-Anthers are at variance among themselves, whether the common rot in timber, or the dry rol, be not one and the name disease. A littie refiection, howsver, will, we conceive, lead us to consider them as essentially different, both in the symptoms, the progress, and the causes, though the effect of destroying the fibre of the wood is pretty nearly the same. If a post of wood, for instance, be driven inte the ground, scasoned, or unseasoned, it will speedily begin to decay just at the surface of the ground, or, as it were, between the earth and the air; if driven into the earth through water, as in a pond, tho deeay will cemmence at the surface of the water, or, as it is teehnically expressed, hetween wind and wator, while all above water, and all that is constantly immerged in the water, as well as the part in the earth, will remain sound. Thus, also, a beam of wood let Into a damp wall, will begin to rot just where it enters the wall; so will wooden Uannisters when they are let through the top and foot-rails. In these, and similar cases, the rot begina externaily, and its progress is in. ward, and is more or less aecelerated by the altermato action of wind, heat, and moisture, being greatest when the alternatives of exposure to wet and drought are moat frequent, and least when eonstantly immersed in water, or constantly preserved in a dry atmosphere. Such we believo to be the usual process of the common rot in wood, and it is evidently occasioned by alternate exposure to the vieissitudes of the weather, to moisture and dryness, to heat and cold.

Process of the Dry Rot.-If the same pust be well charred, or covered ovor with a thick coating of paint,
or varnish, or tar, no such wfiect will be prodaced exter ally, the coating being sufficient to protect it agginst the action of the weather; but if it ahould happen to he a green, or unseasoned piece of wood so tarred or painted, in no great length of time the wood will be found to have begun to decay internally, while the outer aurfuce appears uninjured, but at length it will sleo yield to the disease. If this piece of wood had been placed ins warm celler or close room, where there is little or no circulation of air, and more particularly if the room or cellar ware damp, there would be perceived, in no great length of time, a fine mouldy coating spread over ith surface, of a brownish yellow or dirty white; and shortly afterward it would be found, on examination, to resemble in its form and struature some of the beautifully ramified alga, or sea weeds: which, in process of time would become more compact, the interatices being so completely flled up as to give the whole mase the appearance and consistence of lesther. "At first," sayr one writer, "its appearance is that of fins fibres running on the surface in endless rumifications, resembling the nervous fibres of leaves; presently the interstices are filled up with a spongy or leather-like subatance, asauming the character of cryptogamous plants distiaguished by the name of fungus."

By Mr. Wade, the general aymptoms of $d r y$ rot are thus described: "The wood at first awells; after some time it changes its color, then emite gases which have a mouldy or musty smell. $:$. In the more advanced stages of it the mass arises, and cracks in transverse directiona. Laatiy, it becomes pulverulent, and forma vegetabie earth; and, generally, in aome of these stages of decay; the different species of fungus are fouad to vegetste, on the mass."-Trratise on the Dry Iot in Timber, by Thomas Wade.

These appearances do not invariably take place, the aurfsee of the diseased timber sometimes remaining unchanged, while the process of rotting is going on within; they are, however, pretty constant. But however sound the surface may be, it will sppear, on oxsmining the piece of wood, placed in a situation similar to thoae above mentioned, that the whole of the interior fibres are decomposed, and become a mass of dust inclosed within a thin external shell. No charring of the surface, no paint, tar, or varnish, will prevent this process from taking place, when the seeds of the dry rot exist, and are placed in a situation favorable for their growth, though thay may prevent the external character of mouldineas from taking place on the surface.

Characteristio Difference of the two Rots.-The bymptomatic difference, then, between the common rot and the dry rot may perhaps be thus defined: Common rot is a disease in timber, occasioned by the alternstions of the weather acting on its surface, and destroying its fibres externally inward. Dry rot is a disease in timber, occasioned by being shut up in wrim, close, and moist situations, the effect of which is to destroy ita fibrea by a procesa acting internally outward.

Causes of the Dry Rot.-Without stopping to inquire in what manner, and by what agency, chemical or mochanical, or both, the common rot acts on the external fibres of the wood, the effect of alternate exposure to tho westher is too well known to require any further proof ss to its being the immediate cause. The immediato cause of the dry rot is equally obvious; but the predisposing siate of the timber to contract the disease is not so clear a problem. Accordingly, theories without end have been hatched to explain the phenomenon. A writer in a public jourual, who has alightly touched on the subject, thus explains it: " lt is well known," he observes, "that if a piece of green wood be laid scross a fire, the air within, expanied by the heat, will driva out at each extremity a viscous fluid, possessing the property of disposing itself on the surface in retic-
ulated filamente. The mame appearance of nervous foliation ls not uneommon in the intermediate spacea of the concentric layers of the alburnum of wood; and the core or heart of trees, and particularly of the pitchpine, after ita passage in the heated hold of a ship, is often enveloped with a membranous corticle, like that which lise immediately beneath the bark. . All these appearances are cortain indications of the dry rot $;$ and they point out, with anfficient clearness, that the sap, or principle of vegetation, brought into activity, is tho cause of the disease; ths effect, though infinitely more rapid, is the same as that of the common rot. It is atill a prollem, in what manner. this sap circulates; hut there is no doubt that the tabes and cells of the alburnum, or sap-wood, are filled with it in the spring of the year, and that they are empty in the winter; that it is organized matter, daveloping itself by heat in all the various forms of new bark, leaves, and branchea. The stem of a tree cut down, will, on the return of aummer, make an effort to pubh out leaves; a more feeble effort of this organized sap ends in the production of fungus only."-Quarterly Review, No. xv.

The real efficient cause of the dry rot, is that of the juices of the timber being brought into a state of putrefaction, ocoacioned generally by exposure to a moderate degree of heat and moisture in a stagnant atmosphere. "To favor this process," asya Mr. Wade, "as much aa possible, the air and water should not be renewed, as they undergo a decomposition, which takes place very slowly." From the atructure of timber being composed longitudinally of an assemblage of pipes or tubes, it is only necessary that one end of a log of wood ahould be pli ced in a damp or wet situation, to ocorsion the moistuia to be conveyed to the opposite ond by capilary attriction ; and hence arises the inifctious nature of the c'isease, which will alwaya apread wherever the moisture finds its way; and even where there is no moiature, it wiil be created by the filaments of the fungl working their way through the tubes of the dry wood and carrying it with them. Hence, also, the rapid decay in ships of war, from the great internal heat occasioned by the number of men, the moisture, and the close air. Hence, also, in housea, the dry rot always first appears in tha lower apurtments, where the floors, partitions, skirting-boards, etc., are aupplied with moisture from the wet walls on the ground. In the London houses there is genorally a room on the basement story, called the bouse-keeper's room, which is boarded, and carefully covsred over with an oiled floor-cloth. In such a room the dry rot is sure to make its appearance. The wood absorba the aqueous vapor which the oll-cloth will not allow to escape, and being assisted by the heat of the air in such apartments, the decay goes on most rupidly ; and, as Mr. Wade observes, " if the seed of fungus be present, the plant is developed in all the superifuity of vigor exhibited in a hot-house, where the same means are resorted to, namely, an atomosphero scientifically and artificially heated, and highly charged with aqueous vapor." Timber may, in fact, have the seeds of dry rot within it, and yet by proper treatment be kept sound for a great length of time. Thus, ships laden with particular cargoes, aftord remarkable instances of the effects of such eargoes on their duration. The warin moisture creuted by a cargo of hemp is communicated to the timber, and promotes a rapid putrefaction. Mr. Chapman says, thut the ship Brothers, built at Whitly, of green timber, proceeded to letersburg for a cargo of hemp. The next year it was found, on examination, that her timbers were rotten, and all the planking, excepting a thin external skin. A lading of cotton is always injurious to the ship, and even teak is affected by a curgo of pepper. The timber which is brought from America in thie heated hold of a ship, is invariubly covered over, on being landed, with a complete coating of fungus. It was the too general use of this timber in ahips of the royal navy that at one time
increased the disence to anch an alarming degree. Those nhips, on the contrary, which are employed conatantiy in the coal and lime-trade, are very durable, and have heen known to last for a centnry. These effects are olviously to be aecribed to the exclunion of alr in the one case from, and the free admission of it in the other to, the interior anirface of the ohip, asoisted in the latter instance by the absorption of moisture by the emals and lime from the timber and planking.

Precention of Dry Ror.-If we arrive at the right conclusion as to the cuase of dry-not in timber, we can be at no loss with regand to the mode of treatment for the precention of the dinease. The experiments for this purpose have been very numerous, but may be classed under three general heads; deslecation or seasoning ; immersion in earth, eand, or water ; and impregnation with scise foreign matter, which will resist putrefaction.

The most simple and common mode of preventing the decomposition of vegetable matter, is by depriving it of noisture. Various schemes have been fut in practice for drying the juices in large logn of timber. Tlme alone will do it when the wood io placed in favorable situations, that is to say, in a dry atmosphere, and constantly expoeed to a free circulation of air ; lut time will aleo produce the rot in timber when piled np in stecka in the open air, imbibing meistinre from the earth, and exposed to the viciseltndes of the seaoons, and the alternatives of weather; ncorched at one time by the heat of the sun, at another drenched with rain, and rent and split in every possible way by the freesing of the water which has insinuuted itself into the pores and erevices of the wood. It was formerly, and, indeed, thll very litely, the practice to let shipa of war remain on the stocks in frume for two, three, or four years, to season, as it wan called; but there never was so mistaken a notion. "When a ahip," eays Mr. Wade, " is built, exposed to the weather, the lower part forms a grand reservoir for all the rain that falle ; and as the timbere in that part are placed as close together as possible, the wet escapes very slowly. Those timbere are always soaked with molstnre, and, to some distance from the keel, exhibit a green appearance ; their green matter, when viewed through a microscope, is found to be a beantiful and completely formed mons, which vegetates at the expense of the timber. If to seakon timber be only to dry it, the sooner it is dried the letter ; and when completely dry, it can not too soon be employed in ship-building, when it ahouid be kept dry. It can not answer any end to have seven years' wear ont of a ship on the atockn." At length our shipwrighte are convinced of this truth, and the plan now generally adopted in ship-building is to protect the vessel by a roofed atructure, with the sides open to adinit a free enrrent of ait, but to exclude all moistare, ate well as the rays of the sun (see DockYards); a practice which we have tardily adopted from the 8 wedes and tho Venetians. A new system scems also to have been adopted in the piling of the timber stacks. Instead of their leing placed on old, useless, and often rotten logs of timber reating on the ground, they are now insulated from the earth on stone or iron pillars; and in place of their surfaces coming in contact with each other, pieces of wood are placed between them so as to admit of a circulation of air. Nothing further appeara to be wanting but to protect the tops and the enda of the stocks or piles from the effects of the weather.

Of the various modes of artificial and rapid desjecatlon, that of charring is perhaps the beat; but it is liable to twe oljoctions; the first ls , that if the surface be complate'? charred, It diminisies very much the strength of the timber; and, secondly, it the more readily attracta moisture. The juices of timber may the drawn off or harlened by kiln-itrying; lut this also disturbs the arrangeinent of the filirea, and deprives the wood of a great part of its strength.

Experimenta-Seasoning Timber.-The experiments made by Mr. Lukin for the rapld seasoning of green oak : nber, promised at one time much success, but onded in disappolatment. His conceived, that if the acid and the watery particlea were driven out of a plece of oak timber by some procesa which shnuld prevent the nurface from splitting; the fibres would he brought closer hito contact, and whilat the log lost in weight it would gain in atrength. With this view he buried a plece of wood in pulverized charcoal, in a hented oven. The log wore a promiaing appearance; the aurface wap close and compact ; it had lont in its weight and dimensions; but when divided with the saw, the filbres were discovered to have started from each other, oxhiliting a plece of fine net-work, resembling the inner bark of a tree.

The barl effects of applying artificial heat to the seasoning of green tin ser, were atrongly exemplified by a practice introduced very generally linto our ships of war whieh had exhlbited indications of the dry rot, particularly in the Queen Charlotte.: Enormous firea, wore made in stoves placed in various parts of the ship, and the heat led in tubes to the cavities leet ween the timbers, etc. The coneequence of which was, as might be expected, in increase of the mischief they were intended to prevent. Every part of the ship was converted into a hot-house, and every part where tha seode of fungi had been deposited liegan to throw out a luxuriant crop of mushrooma; and where these did not appear, the julcee of the wood were thrown into a state of fermentation, and, in the course of a tweive-month, a great part of her upper works became a mass of rot. tennean. After staving the powder magazines of some of the shipa, there appeared under their floors, which are contiguous to mucb moisture, numbers of large exerescences of a lev.hery consistence, of the size ani shape of a quart glase-decanter ; and in all such parts where two surfaces of the wood were imperfectly brought into contaet, were whole masses of fungi.

Wincerfflled Timber.-Another mode, of vary ancient atanding, was practiced for getting rid of the juices of timber. This was supposed to be effected by felling the tree in the wintar season, when the sap had deacended and the veasele were empty. l3y this pructice the bark of the oak, so valuablo in the process of tanning, was lost, as It will atrip only from the wood In the spring of the year, when the sap is said to be rising. The supposed superior quality of the wood, when winter-felled, and the general practice of feling oak timier at that season, may be inferred from a statute of James I., by which it is enacted, that no person or persons shall fell, or cause to be felled, suy oaken trees meet to be barked, when bark is worth 2s. a cartload (timber for the needful building and reparation of houses, ships, or mills, only excepted), but between the first day of April and the last day of lune, not even for the king's use, out of barking-time, except for building or repairing his majesty's houses or shijis.

The : Sorereign of the Seas is the standing example generally quoted to prove the beneficial effects of winter-felled timber. We are informed by one writer that, when taken in pleces, after 47 yeurs' service, the old timber was stili so hard that it was no easy mutter to drive a nail into it, and all future writers have taken it for granted that this was owing to its leing winterrelled. Mr. Pett, however, who built her, tukes r.e notice of any such circumstance. He merely says he was commanded by the king, on the 14th of sixy, 1633, to hasten tuto the north to procure the frame-tinubers, plank, and treenaile, for the great new ship at Woul. wich. But he left his son hehind to ship the mouids, provisions, and workmen, in a hired ship, to transport them to Newcastle ; thut the frame, as it was got seady, was sent in colliers from Newcastle and Sunderland; and that, on the 21st December, in the same year, the keel was laid in the dock; and in less thau two years after this she was launched. Now, as it was
the mid esty's a as she $w$ prohable from Ne much le the sprin as Mr. W Nelthe

ing the $f$
which ar
the middle of May before Mr. Pett recelved his maf esty's oommande to procure timber for this ahip, and as she was on the stocks the same year, it is not very probable that the timber procured and sent in collere from Nowcastle to Woolwheh, was felied in the winter 1 much leas could it have been "stripped of ite bark in the spring, and felled the second ancceeding antumn," as Mr. Wade has it.
Neither is there the least proof of the old Royal William, recently broken up, when a century old, being built of winter-felled timber. The fact ls, that ohe was rebuilt half a dozen times, and the only old and original timber remaining in her was in the loweat part of her hull, always immersed in the salt-water externally, and washed with the bllge-water intersully; and the wood from this part of her, when broken up, was perfectly mound, bnt quite Liack, having the appearance of beling charred.
As far as experimente have been made, there is no reason to comelude that t!mber felled In the winter le at all more durahle than that which la felled at the usual tlme. In se year 1793, the Hawke, sloop-ofwar, was ordered to be bnilt, one side belng of tlmber thet had been barked in the spring and felled in the winter, and the other side with timber felled at the usual time. In 1803 she was reported to be ln so bsd s atate of rottennese, that she was ordered to be taken in pieces, when no diffo. ance whatever could be discovered in the state of the timbers of the two sldes. It is ald, however, in Derrak's Memoirs of the Navy, "that the timber hed been atripped in the spring of 1787, and not felled untll the autumn of 1790," and thle is given ss an explanation of tise fullure. Why the barking in the spring shonld add to the darabllity of timber, is not easlly conceived, if the object be to fell the timber when sll the sap-veesels are empty, as, if the sap descends at all, which is doubtful, it might be axpected to descend more freely when the bark is on than off the tree. This suliject has not escaped the sttention of the commissioners of the royal woods and forests, and various experiments have been made with a view to throw more light on $n$ enbject so vitally lm portant to the British Navy. In France, bo long ago as 1669 , a royal ordinance limited the felling of timber from the 1st October to the 15th April ; and the conservators of the foreats dlrected that the trees should be felled when the "wind was at north," and "in the wane of the moon ;" and we find an instruction of Bonaparte, that "as ships bnilt of timier felled at the moment of vegetation must be liable to rapld decny, sad require lmmedinte repalrs, from the effect of the fermentation of the sap in thoso pieces which hud nut been felled nt the proper soanon ;" the agente of the forests ahould abridge the time for felling naval timber, which shonld take place " in the decrease of the moon, from the ist November to tie 15th March."

Immersion in Earth, Sand, or Water.-The facts are so aumerous and so strong in favor of tise durability of timber when steeped In water, or buried in earth or sand, that no doubt whatover can be ontertained of the effieacy of such a practice. At I3rest, all the timbor ased in ship-building is deposited in the narrow creek of the harbor which runs throngh the middle of the dockyard, and it le sald that tho l3rest-built ainjes never had the dry rot. The same practice prevailed at Cudiz and Carthagena. Indeed there is reason to thlnk that steeping in fresh water is a preventive of dry rot, probsbly by dissolving the julces of the thiber. It was an ancient practice, and we ielieve it is still foliowed in some parts of lingland, to plince the timber Intended for threshing-floors $\ln$ the midst of a atrenm of water to harden it; and all the onk planks Intendod for the wainscoating of the old mansions were previously eteeped in running water.

It is said, and there seems to be no reason for donbting the fact, that the planks of ships near the bows, which are obllged to be boiled in water or steam in
order to wad them, are never infected with the dry. rot: if the water in which they are boiled be atrongly impregnated with salt, the effects wuald probably be more durable and decisive.

In a lecture read by Mr. Ogg, a salt-refinar, to the Plymouth Institation, on the prevention and cure of dry rot in thlips of war, common aalt is atrongly recommended, for lit oheapnese, ite wholesomenees, and its easy application; but he proposes a saturuted solutlon of salt, in which he would ateep not only single logs or planks, but the whole frame of a ship, or even the shlp Itself. "Let every ship in the navy," says the ealt-refiner, " be immersed a eufficlent time in this fluld, and let every new shlp be prepared in the asme way, and dry rot would be heard of no more. Bat how is this to be accomplish si ? I anewer, provide a dock or docka aufficiently capaclous to recoive five, ten or twenty ships, and the work is done." As common sea-water will answer the purpese equally well, the apparatus of extonsive docks and water astursted wlth balt are wholly unneceseary. But Mr. Ogg, like Mr. Bowden, appeara to mistake the real oanse of dry rot. "I affirm," says he, " that dry rot is occasioned by the vegetative princlple; brine will deatroy thle princlple ; then sink the ship ln brine." The experiments in the case of the Resistance and the Eden show that brine is not neceseary.
The Dutch having observed that their busses, in whlch the herrlags were caught and stowed awsy In pickle, lasted longer thun any other craft, adopted the practice of filling up the vacancies between the tlmbers and planks of ahlpe with salt, and of boring holes In the large tlmbers and crsiaming them full of aalt. The Americans also found, that the chipe employed in carrying out salt for their fisherles and domestic purposes, were the most durable; and both they and the Dutch are glad to get a cargo of salt into a new shlp, ss the surest mesns of preserving her. The carpenter of the Franklin, an American 74 gun ship, when at Spithead, told some of her visitors, that at the junction of the beams, and at the butt end of the timbers, pieces were cut, and the hollow part filled with aalt, and covered with felt, for the purpose of preserving those parts where two surfaces are imperfectly brought together, from the dry rot, where it is always most prevalent.
There are, however, very eerions objections to the immersion of ships in a strong solution of asl, and the practlce of inserting salt in the vacant spnce between the timbers, which may not, perhape, spply with equsl force to their immersion in sea-water. It is observed by a writer in the Quarterly Revien for Octoher, 1814, that " the attraction for moisture whlch oalts and aclde possess, would keep the whole interior of the ohlp dripping wet ; which would not only destroy the shlp with the wet rot, but the ship's company also, whose healti, experlence has proved, is best preserved by keeping the ainip us dry as possible; and thus the remedy would be worse than the disease." These bad effects have unquestionably been experlenced, the muriate of magnesia, which exlate in sea-wator, belng one of the most deliquescent salts; but whether the abstraction of moisture from the atmosphere the of long duration, is a fuct which remains to be proved. In corroboration of the injurious effects sbove described, Mr. Strange In hls Evidences, observes, "that the practice at Venlce of the fresh cut tlmber being thrown into ealt wnter prevents its evor becoming dry in the ships, and that the salt water rusted and corroded the iron bolts." Mr. Chapman also observes that "the Florida, a 20 gun shlp, taken from the Americans, and subsequently commissioned In the Britloh service, had been salt-sessoned; and the result was, that in damp weather every thing became moist, the lron-work was rusted, sad the health of the crew was impalred; in fine," he adds, "vessels so circumstanced are perfect hygrometers; being as sensible to changes of the

## D. $Y$

mointure in the atmosphere an lumpe of rock salt, or slips of fuci, or the plater of inside walle where sean sand has heen used."
Mr. Chapman, however, in of opinion, that vessola impregnated with bay-salt, or the large grained salt of Limington or of Liverpool, (being pure muriate of soda, without admixture with the bitter deliquescent salts), will possesa deciled advantages, as would also vensele laden with saltpetre, if it has been dlspersed among their timbers; and Mr. Ogg sees no dificulty In refining salt so as to deprive it of its deliquescent quality. But if a very weak solution of aalt, or even freeh water, shall be found to anawer the purpose, the objection against immersing timber in sea-water seems to be got rid of. That it will immediately deatroy all vegetable life in the delicate fibres of the fungus, and aloo prevent its future growth, in quite clear ; and if it ahall be found to prevent aleo the putrefactive process, it may be coneidered the most advisable way to pre. pare timber for all purposes of house earpentry, and ship-building.
Impregmation of Timber with Foreign Subatances.A great variety of subatances besides common sait, indeed almost any salt or acid, will destroy and prevent the growth of fungus. Sir Humphrey Davy recommends a weak solution of the corrosive sublimate as the most efficient. A solution of sulphate of iron or copperas, is much used in Sweden for hardening and preserving wood for wheel-carriagee, etc. It is boiled in this solution for three or four houre, and then kept in a warm place to dry, by which process it is said to become so hard and comp tet that moisture can not penetrate it. "The wooden vessels," anys Mr. Chapman, "in which the sulpho-ferruginous solution in finaliy placed for the copperas to crystallize, lecome exceedingly bard and not subject to decay." A solution of alum has been recommended; but Mr. Chap;man seems to think that its esrthy batis would become a midus of putrefaction. The wood, however, which ia nsed ebout alum worka, heconses hard and durabie, and resists fire in an extraorlinary manner. All timber, in fact, when compietely saturated with saline matter, is more or less indestructilile, and absolutely incombustible. A solution of arsenic has not been fonnd to prevent the dry rot. With regard to the impregnation of vils, there are various opinions, some thinking them beneficial, and others injurious to the duratillty of timber. it is known, however, that shipa in the Greenland trade have their timher uad planks preserved as high up as they are impregnated with whale oil from the blubber; and Mr. Chapman says, that one of the mastere of a Greenland ship having payed her upper works with tweive or more successive coste of while uil in hut weather, they becane covered with a thin varnish, much harder and more compact than if filled with successive conts of tarpentine. lesinous eubstances, however, are prolably better than oil.
After a variety of experimente and sensible observations, Mr. Chapman sums up the three great operations by which timber may be brought to resist the tendency to dry rot. 1. To deprive the timber of its mucilage, which is very liable to fermentation. 2. Ty impregnate timber with any strongly antiseptic and non-deiiquescent matter. 3. To dry timber progressively by the aun and wind, or by the latter alone; and then to close ite pores completely with any subatance inpervious to air and moisture, and at the sume time highly repellant to putrescencs.

Mr. Wule recommends the iupregnation of timber with sulphates of copper, zine, or iron, rejecting deliquescent saltes, as they rorrode metais, and would deetroy the iolts and inetal fasteniugs of a ship. He observes, that timber impregnated with alline matter is no logger capable of fermentation, and that, of course, the gases necessary for the nutriment of fungi are not evolved. Selenite is recommended as being
incoluble, or Learly so, and not liable to any alteration in the ordinary tomperaturs of the atmosphere, hut all salta, he observes, composed of baryten, ahould be rejected, brecause, though thay are plentiful, sheap, and have some qualities eminently fitting tham to be employed for this purpose, yot they are, wlthout any: exception, very poisonous.
From all experiments that havo boon made, it appears that the most effectual method of preventing the dry rot, and of giving durability to timber, is that of depriving the sap of its mucilage, more especially in the alburnum, where it most abounda; for though seasoning in the dry way will coagulate and harden the extractive matter of timber, yet when exposed to heat, moisture, and a stagnant alr, the process of putrefaction will commance, and ail the symptoms of dry rot will opeedily make their appearance. It will be preferable, therefore, that such timber an is likely to the expoeed to the vicissitudes of weather, should the aeasoned by immesaion or impregnation, ruther than by the dry way.
Cure of the Dry Rot.-In this disease, as in those Incident to animal life, provention is much asier than cure. In fact, there is no other cure for the part affected than excision, and the sooner it is done the better, as the disesse apreads most rapidly when fungiare propagated, throwing their minate fibros into the tubes of the contiguous sound wood, and producing that mointure which is a condition absolutely necessary to the putrefactive process. If, bowever, the filre of the wool is stili sound, and the roots of the fungi extend not beyond the alburnum near to the surface, immersion in sen-waier, ay in casea of the Resistance and biden, or impregnation with some of the nolutions above mentioned, may stop the progress of tine disease; but the only safe cure, we apprehend, is that of cutting out the infected part. The sinking of the Royal Geurge at her noorings has not been the means of preserving her timbers. On being visited in the diving-leell, her onken sides were broken down Into a confused mass of timber and black mul; having, ao duulit, been too far gone in decay, when the fatal accident happened; but her tir deck appeared as sound us the day when mhe sunk.
Miscellaneous Observations.-It is a great mistake to suppose that the anciente were unacquainted with the dry rot or premature decay of timiter. Piny has a number of valuabie observations on the preservation of timber, and on its decay occasioned ly the juices; and, among other things, recommends that a tree should be cut to the heart ail round, in order to let the juices encape, and that it should not be felled matil the whole had run out. Lle knew that the sapipy part of ouk was more sulject to rot, and advised that it should be cut away in squaring. Hie knew, too, that resinous and olenginous matter in wood preserved it ; observing, that the more oluriferous a piece of tiulier is, the more durnble. He knew that much dejended on the cluse texture of timber, and that box, clony, cypress, and cedar might almost the considered us indentructible. Wo ulso know that cedar, teak, and mahugany, are very durable woods.
The felling of timber while young and full of vigur, making use of the sup-wood or alburnum, 'and applying it to rhipe and buildinge in an unseasonel state, have, no doult, contributed to make the disease of dry rot infinitely more common and extensive than it was in former tines, when our einips were "hparts of ouk," and when in our lurge nansions the wind was sufferel to hiow freely through them, and a aurrent of air to circulate through the wide spuce left hetween the panneled wainscout und the wall. In thaso ofl munsions which yet remsin, and in the nncient cathedrals, we find nothing iike the dry rot, though jerhaps perforuted sore

## - The $p$

 noticed, as ing the t! appears to as dry rot preparing wood-wor purposes, tougher, a is as follo which isNumerons examples of the extreordinary duration of timber may be producet, both from complete desiceation and expoeare to the air, and from the complete exclusion of air and immeraion in earth or water. Without adducing the surturbraadt of Iceland, covered with eeveral atrata of eolid roek, or the logs of wood dug out ef peat-moes, the antiquity of which ts mere conjecture, we may inetance the mummy-casee of Egypt as leing in all probablifty the most ancient timber in existeace that han been worked by the hand of man. When Belzoni entered the eplendid tomb of the kings of Thebes, in whlch was the tranaparent earcophagus of gypeum, he found two human figuree larger than Hfe sculptured in wood, is as good preservation as if it had been worked in his own time; but the sockete of the eye, which had been copper, were entirely waeted away. We are told hy Pliny, that the image of Diana at Epheaus, mpposed to be of obony, remained entire and unchanged, thongh the templa itaelf wae ruined and rebuilt seven times. He adds that, in his own time, the image of Jupiter in the capitol, made of cypress wood, was atill freeh and beautiful, though aet up la the year after the foundation of Rome 551, nearly three hundred yeare before. He further asys that there was a temple of Apoilo at Utica, the timbera of which, beiag of Numidian cedar, are sald to have atood 1188 years. The roof of Westminster IIall, which is constructed of oak, has atood for more than three hundred years, and la probably better now than whea newly erected. Similar instances of the long duration of timber have occurred in eituations where the atmospheric air has been excluded. In the Leverian Museam was a post eaid to be dug out of Fleet Ditch, charred at the lower end, having the name of Julius Casar cut into it. The foundation on which the stone piers of London Bridge are laid consiat of huge piles of timber driven close to one another, on the top of which is a floor of planks tan jaches thlck, atrongly bolted together; on these the etone piers rest, at above nine feet above the bed of the river, and, at low water, may be seen or felt at a very fow inches below the surface. These piles have been driven upwarl of six hundred years, and, from the solidity of the superincumbent weight, it may be conciuded that they are perfectly sosad. In the old city wall of Jondon, timber ia froquently dug out as sound and perfoct as when first deposited there. As the last instance of the extraordinary preservation of timber, we may mention that in digging awsy the foundation of tha Old Savoy Pulace, which was built about six bundred and fifty years ;o, the whole of the pllea, consisting of oak, clm, beech, and chestaut, were found in a state of perfect soundness, without the least appearanco of rottenness in any part of them, and the plank which covered the pile-heads was equally sound. Some of the beech, howover, after being exposed a few weeks to the air, but under cover, had a coating of fungus spread over the surface; which affords a striking proof of the linmense length of time that the seeds of this parasite will remain dormant, without parting with the princlple of vegetable hife, which is called into activity from tho moment that they are deposited in a situation favorable to their growth. In this instance we have only to suppese that the indurated juices of the wood became dissolved by its exposure to the nolst atmosphere, and the phevomenon of fungous vegetation is capable of receiving a satisfactory explanatinn.* Commmuicated to the

[^7]Encyelopredia Britannica, by Sir Johm Banhow, Bart. See Am. Jour. Sc., it., p. 114, xxxiv., p. 169 ; Wentminater Rev., x., p. 414 ; Iondon Quar., xil., p. 227, xxx., 216; Monthly Rev., Ixxxvi., 361, xc., 887; Une's Dict. Arts.

Dubber, or Dupper, a leatkern veesel, bottle, or jar, nsed in India to hold oll, ghee, etc. Barrels, as already observed, are entirely a European invention. Liquide, in eastern countriea, are for the most part packed for exportation in leathern veesels. Dubbers are made of thin untanned gost akina; and are of all aizes, from a quart up to nearly a barrel.

Dublln, the metropolis of Ireland, in the county to which it gives name, and province of Leineter, ranking in importance as the second city In the United Kingdom. It is distant $\mathbf{9 9 2}$ miles W.N.W. Prom London, 188 miles west from Liverpool, and 60 miles west from Holyhead, in lat. $58^{\circ}{ }^{7} 0^{\prime} 88^{\prime \prime}$ N., and long $6^{\circ} 7^{\prime}$ $18^{\prime \prime}$ W., agreesbly situate in the great centrel limeetone district which reachen acrose the isiand from the Irish Sea to the Atiantic Ocean on the River Liffey, and extendlag to the junction of that riv r with the Bay of Dublin, the waters of which wa its suburban shores.
The population of the city 0 . Lubliu was eatimated by Rutter, in 1753, at 161,088; in 1798, by Whitelaw, at 182,037, and was ascertained by the census of 1821 to amount at that period to 185,881, and by the censue of 1881 to 204,155 . The population of the city, accordin. $\%$ to the most recent enumerations, in 1841 was 232,726 , and in 1851 it was 258,961 .

In order atill further to promote the conimercial intersats of Dublin, an aseociation was formed about thirty yeare ago, under the name of the Chamber of Commerce, which soon decayed; but the ides was revived in 1820, when a number of merchants formed themalves into a society uncer ohe same name, which otill exists. Its sbjecta are the protection and promotion of the manufacturing and commercial interests of Dublin, and of the country in general. The business is transacted by a president, vice-presidenta, and committee, instructed to communicate with the officers of government on the oubjects of the association. Their office is held in the Commercial Buildings. The Ouzel Guliey is another voluntary aseociation of merchants for dotermining commercial differences by arbitration. It takes its name from that of a vessel, which was the occasion of a complicsted and protracted suit, that was ultimntely adjusted in an amicable manner by the interference of some of the most reapectable merchanta in Dublin. The effect of ateam aavigation on the cross-channel trade has produced a great alteration in the state of commerce $\ln$ Dublin.

The Bank of Ireland was formed in 1783 in order to give security to commerce. It was opened at first lis some old housee in Mary'a Abbey, with a capital of $£ 600,000$, which was afterward increased to $£ 3,000,000$. In the year 1802 the parliament house was purchased by the direct, re, and adapted to its preaent destination. This ediffee was erocted in 1729 ; and notwithstanding the changes made in it aince it was diverted from its original purpose, the exterior has been but little altered. It consiats of three fronts. The principal, toward College Green, a colonnade of the Ionic order, formed of a façade and two projecting wings, is much admired for the noble simplicity of lts elovation. The western front, a portico of four Ionic columna, was connected with the other by a colonnade of the same order, form-
containing creasote, and with pyroilgalto of iron: the alr is then exhausted by powerfui air-pumps; after which more of the saturatlog fuld is forced in by hydroatatic pumps. Whon the wood has been subjected for aix or seven hours to a pressure of from t00 to 150 pounds on the square inch, the process is complete, and the wood la found to weigh from 8 to 12 pounds per cuble foot heavier than before. It also preserves Irou boite driven Into It frem corrosion. Wood thus prepared has been used for sieepers on neveral of the great Engilish raliroads, and is sald to have proved extremeiy darabto. (See Ube'a Dict. of Arts, etc., vol. II., p. 063.)
ing the quadrant of a circle. The eantern front, which was the ontrance of tho House of Lords, was, by thoir apecial onder, a colonnade of the Corintbian order, which the architect found great dificulty in aniting with the other parts. The spertment for the lords, a fine room, was hang with tapestry. That of the commons having been burned in 1792 (whether by accident or design has never been fully ascertained), was reconstructed after $a$ more elegant desigra, in the form of a circle surrounded by pillars, betveen which was a gallery for hearens. This fine hall was taken down by the bank directorn, and converted into a square room, now the cash-office.

The commerce of the port of Dublin had increased no much toward the close of the last century that the accommodation afforded in the river for shipping was found inaufficient, and the Iriah parliament granted $\mathbf{£ 1 5 , 0 0 0}$ for forming docks on both sides of it. The flowing and graving docks, commennicating with the grand canal on the south side, including a basin covering 40 statuto acres, with a fine quay and store frontage of 7,500 feet, were opened in 1796 ; and St. George's; the latest of the cuatom house docks, in 1821. These lattor covar an area of 8 acres, having 16 feet depth of water, and 1200 yards of quay; they are capabie of accommodating 40,000 tons of shipping, and the storen have apace for 8000 easks of augar and tohaceo, and 20,000 chests of tes, with cellarage for 12,000 pipes of wine. The docks on the sonth aide atford commodions wharfage for 100 aail of merchantmen and celliers, exclusive of that aupplied by the river quays. The formation of the asylum-harbor et Kingstown, then Dunleary, which was commenced in 1817, gave additional aid to the commerce of the port, by the increased protection it afforded to shipping. The improvements made on the bar, in the arection of the great northern wall or breakwater, and the steam dredging of the bed of the Liffey by the ballast board, by rendering the channel sufficientiy deep for the navigation of vensela of 1400 tons, has also contributed greatiy to the same effect.
There ware in 1852 belongiag to the port, incinding steamers, 454 vessels, of overy size, from 15 to 1200 tons ; the registered burden amounting to 89,814 tons. Most of those vessels were employed in the coasting or cross-channel trade, there having heen but 6 or 8 in thet of the West Indiea, the same number In that of France and the Spanish Peninsula, end 20 or 30 in the North American timber trade. The amount of cuatoma collected averages about $\mathbf{£ 9 5 0 , 0 0 0}$, and has not varied much during the last tweive years, the reduction of eluties having more than balaaced the increase in the 'fuantity of artieies imported.
"First impressions of Dublin," aaya Inglis, "are iecidedly favorabia. Dublin, for ita size, is a handsomer city than London. Sackville $-8 t r e o t$ will compare with any etrent in Europe; Merrion Square and St. Stephen's Green aurpase. extent any of the nquares in the British in. "-upolis. There are joints of view in Dublin, the quays, and some of the finest publio edifices, more striking, 1 think, than any that aro to be found in London; aud aithough the Irish capital can boast of no St. I'uul's, yet, in the erchltectural beanty of scane of her puilic buildings, she has juat reaton for pride. I need but name the Custom House, and the Bank of Ireland with its magnificent yet classically chaste colonnaiea, in proof thin asaer. tion." There is mach truth in this description, yet the chief sdivantage which Jubilin has in picturesquo leauty lies in the concentration of the objecta of interest within a mall compass, and furtier examination doea not confirm the first favorsble impression. Sir John Fories, who visited Ireiand in 1852, asys: "I own myself to have been a good deal disappointed with JubIfin as a city. To say nothing of its extent, it is greatly inferior in many other respects, not only to London, but to aeveral towns in England, and nome in Scotlund. its alte ls flat and monotonous, and ita streets and
squares possess no architectural beauty. The former, to be aure, are often very wide, and some of the latter, as Merrion Square and Staphen's Green, are of immense extent, but there is throughout a general want of ologance and grandeur.' Most of the streets seem to want dignity, and the majority of the housea are common-looking, and even mean and dingy. While denying both, beanty. and grandeur to Dublin as a city, I must jois in the universal judgment as to the splendor of many of its publio buildings, as the Bank of Ireland-formerly the Parliament House, the Custom House, the Post Office, the Royal Exchange," eto. Fow citles present a more striking picture of the extremea of aplendor and destitution than Dublin. A line drawn from the King's Inns in the north of Dablin, directly sonth, through Capelostreet, the castie, and Aungiar-street, will, together with the line of the Liffey, divide the whole erea into four districts, materially different from each other in appesranoe and character. The south-eastern distriot, which comprehends three of the great squares, and the north-eastern, which includes the two remaining squares, are chiefly inhabited by the nobility, the landed gentry, end the liberal professions. These two districts present many aymptoms of affiuence and luxury. But on proceeding westward the acene anddenly changea, A considerable portion of the south-western district, which included the liberties of St. Sepulchrs's and Thomas Court, snd wae formerly the seat of the silk and woolen manufactares, and also of the north-weatern portion of the city, are in a state of almost hopelens decay. The squalid misery visible in the ruinous portions of the city is relieved to the eyo by the beauty of the environs of the city; and in its immediate vicinity is the Phonix Park, of which the citizens are justly proud. It comprises an area of 1753 acres, within which are contained tho Viceregol Loige, the usual residence of the iord-lieuteuant, with 160 acres of demesne and gardens, the chief and nuder socretary's lodgea, and the lodges of the park rangers a d their aseistants, with their respective inclosed grounds, the Hibernian achool for soldiers' childrea, the military magazine, the vilitary infirmary, the zoological gardens, the constabulary barracks, etc. Inglis, a good authority on auch aubjects, pronounced this park as auperior, both in extent and diversity of surface, to any public park, promenade, prater, or prado, belonging to any other European city. (Wurxlaw und Walsa'a Ilistory of Dublin; Thosis Irich Almanac; Gunbert's History of the fity of Dublin, 1854.)-E. B. Dublin Univ. Mag., viii., Xvi., iii., iv., v., vii.

Ducat, a foreign coin, either of goid or silver, struck in the dominions of a duke. The dacat was first coined by Longinius, governor of Italy, who revoited against the Jimperor Justin the Younger, and mada himself duke of Kavenna, calling himeelf Eisnrcha, that is, without lord or ruler; and he struck picces of money, of very pure gold, with his own stamp, which, as Procopius relates, were called ducati, ducats. According to Du Cange, ducats were colned by loget, King of Siclly, in the year 1240. The Venetian ducrat was first struck by John Dandolo, in 1280, and inacribed with this legend :
"sl Tibl, "liriste, datum, quem Tu regia iste Ducatus."
Duoato (Cupe), the modern name of the ancicat Leucate, promontory at the south end of Suats Maura, one of the Ioniun Islanda; celebrated na the rock from which Sapphe precipitated horaeif finte the ses,

Ducatoon, a silver coin, struck chiefiy in Italy, particularly at Milsn, Venice, Florence, Genos, Luces, Mantua, and l'arina; though there are, also, Dutch and Flemish ducatoons.
Dundee, a seaport town of Scotlond, county of Forfar, 42 miles N.N.E. from Edinburg ; N. lat. $56^{\circ}$ $2^{\prime} ; \mathbf{W}$. long. $8^{\circ} 2^{\prime}$. It is situated on the north side of the RIver Tay, about 12 milen from itg mouth. Population (1855) 78,931 ; and as a cunslderabie increaso

has since taken place, it may now be entimated at 90,000 to 100,000 . Dundee is thus the third town in Scotland in respect of population. The name applied to it by the carliest writers is Alectum or Taodunum. It was oubsequently designated Deidonum, of which the present name is supposed to be a corruption." The eariy history of the town is involved in obscurity, but it sppeate to have been a place of importance as early as the 12th century. "Frequent mention is made of it in conneotion with the diepntes regarding the enceession to the orown of Scotland; and it was the scene of severe conflicts between the English forces, who invaded the country in the reign of Edward I., and the Scotte, under the patriotle Wallace, and the other supportery of Seottish independence.

Dundee was at one time enrrounded by strong walls, and portions ot them are yet to be ceen.' The Cowgate port atill etands, and is regarded with veneration as a memorial of George Wishart, the Reformer, who is aild to havo preached from it in the year 1544, when the plague prevailed, the sick being placed on oise eide of the wall, and the healthy on the other.
The ground on which the town is built slopes gently toward the river, and is bounded on the north liy the Law of Dundee and the Hill of Balgay. The former rises to the helght of 595 feet; and must in warlike times have been a atrong position. The walls of a fortification are still to be traced on lte eummit. The towa in general is Irregularly bnilt; but within the last 20 or 80 years eeveral new and spacious streets have been opened up. The principal public buildinge are the Exchange Reading-Room; the Royal Arch, erected by pablic subscription to commemorate the landing of Queen Victoria in 1844, at a cost of nearly 88,000 ; the Publio Seminaries ; and the New Baltic Exchange Coffee-Room, a splendid specimen of the Memish-Gothie style.
Within a comparatively recent period a number of important publio nudertakings have been completed. The Dundee and Newtyle Railway was opened for traffic in 1826 ; the Dundee and Arbroath Railway in 1838; and the Dundee and Perth Railway in 1847. By measa of these rallwaye, and of the Edinburg, Perth, and Dnadee Railway, which joins the Dundee and Arbrosth Rall way by means of a ferry and branch line at Broughty Castic, four miles eaet from the town, Dandee has direct communication with all parta of the kingdom. There are two gas-light companies, each ef them with a capital of about $\mathbf{f} 50,000$ invested in their works and apparstus. The Dundee Water Company was formed in 1846. Its capital is about $£ 180$,000 . Its reservoire are situated in the parish of Monikie, about 10 miles diatant from the town; and from these an abundant eupply of water has been procnred.

The most important of the public works are the harbor and docks. Previonsly to 1815 the harbor was of very limited extent. In that year an net of Parliament was obtaized for enlarging it, and erecting a wretdock of $6 \frac{1}{4}$ aerea (King Whiliam's), a tide-harbor of 4! acrea, graving-dock, and other accommodation suitable for the increasing trade of the port. Tho plan wae afterward greatly enlarged, embracing now docke (Earl Grey's of 5t acree, and Victoria Dock of 141 acrea), patent alip, careening-beach, and additional tide-harbors. The Victoris Dock, though for some years open to vessels, is not quite completed. The quays are wide, and afford convenient berthage for sbout 70 vessela. On the soutin quay of Barl Grey's Dock, la erected a large crano, oapable of raising 80 tons. It is used chiefly for lifting the boilers and heavy machinery of ateam-vesesls. Benides the ordinary branches of ship-buiding, the bullding of iron vessele in carried on at the port. Owing to the increased burden of the veseels now employed in the trade of the place, and the greater depth of water required by them, additional works at the harbor are projected. The cost of the dockn and harbor waa about $£ 600,000$.

The number and tonnage of vessels entored at the harbor for the year ending 81et May, 1854, was as tollowa:

The following stntement shows the progresaive increase in the harbor and shipping duee. It was,

The staple trade of Dundee ts the manufacture of lieen and hemp fabrics, chiefly of the coarser descriptions. The manufacture of linens appears to have been introduced from Germany in the beginning of the last century. : Insignificant in extent at first, it gradually increased till the close of that century, when, machinery having been applied to the spinning of flax, a great impulse was given to it. Spinning-mills were orected, and of these there are now about 60 in Dundee and its immediate neighborhood. Hand-eplnning has been entirely saperseded by mill-apinning. The coaraer fabrics are still woven in hand-looms; bnt there are now eix or eeven large power-loom factories, and some emaller ones. The chief articles of maiufacture are obeetinge, sail-cloth, drille, dowlas, sacking, and bagging. Nearly one half of the quantity made is cent to London, Manchester, Glasgow, and Leeds, for home consumption. The remainder is exported, either directly or indirectly, to foreign conntries. The manufacture of jute carpeting is also now carried on to a large extent. The number of person $\beta$ employed in the linen trade of the place is eatimated to be from 20,000 to 25,000 .

The quantity of flax, hemp, codilla, and jute, imported for the year ending 81st May, 1854, was as follows : At the harbor, 54,341 tone; by raliway, 11,406 tons; total, 65,747 tone.

The quantity of linen goods sent away for exporta. tion and home-consumption for the same period, was as follows : Linens of all deseriptions shipped at the harbor, 421,432 pleces ; by railway, 686,110 plecee ; total, 1,107,542 pleces.

Assuming the value of the material at $£ 30$ per ton, ita total value used in mannfacturee will be $£ 1,872,410$. Assuming the value of the goods manufacturad to be 608. per piece, their grose value will be $\boldsymbol{4 3}, 822,628$; and on thle sesumption, the balance of $£ 1,450,216$ represents the cost of the manufacture, including wages, the rente of premises, and machinery employed in it, and the profite of the manufacturers. From the foregoing statementr, come ides may he formed of the rapid incresse of the town in commerce, wealth, and population. Dundee is now the principal sest of the ilnun-trade of the United Kingdom, and its fubrice are to be met with in all quarters of the world. In proof of the prudential habits of the people, it may be mentioned that a national security savinge-bank, opened in $\mathbf{1 8 8 8}$, now contains upward of $\mathbf{\Sigma 7 0 , 0 0 0}$, lodged by 4,032 depositore.

The country surrounding the town is fertile, and well cultivated ; and has shared largely in its prosperity, the rents having increneed much, and the value of the land being angmented in proportion. With the natural advantages which it enjoys, and the energy and enterprise for which its inhabitante are dietin. guished, Dundee may be expected to maintain the poeitiot. which it now holds among the coinmercial towns of the British Empire.-FF. B.

Dunnage, in commercial navigation, loose wood, consinting of pioces of timber, loughis of trees, faggote, etc., Juid in the bottom and against the eide of the ship's hold, either, let, by raining the cargo when ohe is loaded with heavy goods, to prevent her from becoming too etiff (bee Baidiar); or, 2d, to prevent the eargo, should it be ausceptible of damage by water,
from belng injured in the event of her becoming leaky. A ship is not reckoned eearrorthy unless she be provided with proper and aufficlent dunnage.-FalconEr'a Marine Dictionary ; Abbott (Lond Tenterien) on the Law of Shipping, Part iil., c. 8.

Duplicate, a copy or transcript of any thing ; as of a deed, lettor, bill of exchange, eto. Dupllcation, the act of doubling; the multiplication of a number by 2. Also a folding ; a fold.

Dupondius, in antlquity, a welght of 2 pounds, or money of the value of 2 asses.

Dust, or Dustee, a river of Persia, flowlag from the interior through the province of Mekran, from the southern shore of whlch it fulls into the Indian Ocean. Its course is supposed to extend, under different appellatlone, about 1,000 miles.

Dutch Gold, the commercial name of a coarse imitation of gold leaf, made of copper, of braes, or of bronze. It is chlefly used for ornamentiag toys.

Dyoing (Teinture, Fr. ; Färberei, Germ.) is the art of impregnating wool, silk, cotton, halr, and akins, with colors not removable by washing, or the ordinary usage to whlch these fibrous bodies are exposed, when worked up into articles of fumilture or raiment. We ehall here consider the general principles of the art, referring for the particular dyea, and pecaliar treatment of the stuffe to be dyed, to the different tinctorial substances in their alphabetical places; such as cochInasl, indigo, madder, etc. Dyeing is altogether a chemlcal process, and requires for its due explanation and practlce an acquaintance with the properties of the elementary bodies, and the laws which regulute their comblnations. It la true that many operations of thia, as of other chemical arts, have been practiced from the most ancient times, long before any just vlews were entertaiued of the nature of the changee that took place. Mankind, equally in the rudeat and most refined state, have always sought to gratify the love of distinction by stalning their dress, sometimes even their skin with gandy colors. Mosea speaks of ralment dyed blue, and purple, and scarlet, and of shcepskins dyed red-celreumstance. which Indicate no small degree of tinctorial sklli. IIe enjoins purple stuffs for the works of the tabernacie and the veatments of the high priest. The ancient Eigyptlans cultivated this art with some degree of acientitic precision, since they knew the use of mordants, or those anbstances which, though they lmpart no color themselves, yet enalle white robes (candida rela) to absorb coloring drugs (colorem sorbendibus medicamentis). Tyre, however, was the nation of antiquity which made dyeing its chlef occupstion and the staple of lts commerce. There is little doubt that purple, the sacred symulol of royal and sacerdotal dignity, was a color discovered in that city, and that it contributed to its opulence anil grandeur. Ifomer marks no less the value than the antiquity of thls dye, by deacribing his herves as arruyed in purple robes. J'urple habits are mentioned among the presente made to Gideon by the Iaraelites from the spoils of the kings of Midian.

The juice employed for communleating this slye was obtained from two different kinds of shell-fisit, descritied by Pliny under the names of purpura and bucrinum; and was extracted from a small vessel, or sac, In their throats, to the nmount of only one drop from each animal. A darker and inferior color was also procured ly crushing the whole aulistance of the bucrinum. A certain quantity of the julee, collected from a vast number of allels, being treated with sea-salt, was allowed to ripen for three days; after whleh it was diluted with 's times its bulk of water, kept at a moderate heat for 6 days more, occuaionally akimmed to separste the animal membranes, and when thus clarified, was applied directly as a dye to white wool, previously prepared for this purpose liy the action of lime-water, or of a species of llchen called fucus. Two operations were requisite to communicate the $\vec{i}$ aest

Tyrian purple: the 1st consisted in plunging the wool into the julce of the purpura; the 2d, into that of the bnccinum. 50 drachms of wool required 100 of the former liquor, and 200 of the latter. Sometimes a prellminary tht was given with coccub-the kermos of the present day-and the cloth recelved merely a finish from the precious animal julce. The colors, thongh probably not nearly so brilliant as those producible by our cochlneal, seem to have been very durable, for Plutarch eays, in his Life of A lexander (chap. 86), that the Greeks found in the treasury of the King of Persla a large quantity of purple cloth, whlch was as beautiful as at first, though it was 190 years old. The difficulty of collectlng the purple julce, and the tedions complication of the dyelng procese, made the purple wool of Tyre so expenive at Rome, that in the time of Augustus a pound of it coet nearly $\mathbf{x} 30$ of English money. Notwithatanding this enormous price, such was the wealth accumulated in that capitel, that many of the loading citizens decorated themselves in purple attire, till the emperore srrogated to themselves tho privilege of wearing purble, and prohlbited its use to every other person. Thls probllition operated so much to discourage this curious art as eventusliy to occasion its extlaction, first in the western, and then in the eastern empire, where, however, it existed in certain imperial manufactories till the eleventh cantury.
Dyeing was little cultlvated in anclent Greece; the people of Athens wore generally woolen dresses of the natural color. But the Romane muat have bestowed some pains upon this art. In the games of the circus, parties were distinguished by colors. Four of these are deacribed by Pliny-the green, the ornige, the gray, and the white. The following ingredients were used by their dyers. A crude native alum mixed with copperas, copperas ltself, blue vitriol, alkanet, lichen rocellus, or archil, broom, madder, woad, nut-galls, the seed of pomegranate, and of en Egyptian acacia.

Ilut the vast superiority of our dyes over those of former times must be ascribed princlpaliy to the use of pure alun and solutlon of tin as mordants, either alone or mixed with other bases; substances which give to our common dye-stuffis remarkable depth, durability, and lustre. Another Improvement In dyeing, of more recent date, is the application to textile substsnces of metullic compunds, such as Prussian blue, chrome yellow, manganese brown, etc.

The compound or mixed colors, are auch as reanlt frour the comblnatlon of two different colored dye-stuffs, or from dyoing stuffs with one color and tien with another. The simple colors of tho dyer are red, yeilow, blun, and black, with whlch, when skillfully blended, he can produce every varlety of tint. l'erhape the dun or fawn color might be oilded to the above, as it is directly obtained from a great muny vegetable aubatances.

1. Ihed with yelluw, produces orange; a color which, upon woot, la given namally wlth the apent acartet bath. To this ahado may the referred flame color, poloegranaie, capnelitn, prawn, Jonqull, cussis, chamola, caft au lait, aurora, marbgold, orange peed, morioris, clunamon, gold, otc. Snuff, cheatnnt, muak, and other alindes are prodoceed by substi. tuting wainut peeln or aumach for bright yollow. If a fittie blue be added to nrange, an olive is obtalned. The onty direct orauge dyen are anotio and subchronato of lead.
2. lied with biue producen purpio, violot, lliac, plgeoa's neok, mailow, pench hlonsom, bleu de roi, Int-hlossom, amaranth.
3. Hed with black; brown, chocolate, marone, ath
4. Yeilow with blue; green of a great varifty of alisdes, auch an nament green, gay green, grama green, apring green, haured green, mea green, celadon green, parrot green, omblage green, applo green, duck green.
b. Mixturea of colora, 3 and 8 , and 4 and 4 , produce an Indefinite diversity of tinta; thum red, yellow, and blue, form browa oilven and greentih graya; in which the Wue dyo ought alvaya to be frat given, leat the Indlgo vat ahould be solled by cther colora. orange, manti color, etc. Red, blue, and gray, give a vast variety of ahades as lead gray, alnte gray, wood-pigeod gray, and other colore, too numerons to speelify.
The following liot of dyea, and the coloring subutances which produce thom, may prove asefol:
Red. Coohineal, kermen, lao, madder, archil, carthamus or saflower, brazll wood, logwood, periodide of mercury, alknnet.
Yellow. Quercitron; weld, funtio (yellow wood), annotto, sawwort, dyer's broom, tarmerio, fuatet (rhes cotinus), Perdan and Avignon borries (rhamnuas infectorius), willow, peroxyd of tron; chromate of lead (chrome yellow), sulphuret of arsenig, hydrosulpharet of antimony ; aitric acld on silk. Blue. Indlgo, woad or pastel, Prussian Blas, tarnsole or litmus, logwood with a salt of copper.
Black. Galls, sumnch, logwood, walnut peels, and other regetables whish contaln tannin and gallio seld, slong with forroginous mordants t the anscardium of India.
Green. Theme are produced by the blue and ybllow dyen sillifully combined; with the exception of the chrome green, aod perhape the copper green of Sobweinfurt.
Orango. Annolto, and mixtures of red and yollow dyes; anbehromate of lead.
Fawn, Dun, or Rool. Walnat peels, sumach, blrch-tree, henna, natudal wood.-Usars Dict. of Arto.
Indigo and Cochineal.-In 1548 nelther of these important dye-stuffs had made thelr way into Europe. Pliny mentions indigo under the name of inclicum; but It appeare to have been used by the Greeks and Romans anly ss a paint; yet there can be little donbt that in India lt had been employed from time immemorlal as a dyestuff. Cochineal could not be known tlll after the discovery of America. It was used by the Mexicans as $s$ dyestuff. In 1523 Cortez recelved orders from the court of Spain to maltlply this precions insect, to collect it and send it to Spain. Cochineal by itself gives only a crimson color; It dyea scarlet when mixed with a solution of tin. Thla fact was discovered accidentally by Cornelius Drebbel about the year 1630. He communicated his obsorvation to his son-in-law Kuffelar, who wse s dyer at Leyden. He soon brought the proceas to perfection, kept it a secret, and brought the scarlet color into fashion. Soon after, the aame process was dlscovered by a German chemist called Keffier, who carnied his secret to Iondon in 1649. A Flemiah dyer called John Kloeci got information of the procesa in 1647, and it gradually made ita way through every country of Europe. Indigo, though a much more important dye-atuff than cochlneal, did not make its wsy into goneral use without the greatent difficnlty. The use of it was prohiblted In England daring the reign of Ellzabeth; and the prohlbltion was not taken
off till the time of Charlea II. . It was equally prohibited in Saxony, whero it was styled in the prohlbition a corrosive sabatance, and called food for the devil. Restrictlons on the use of indigo in dyeing were imposed also in France, though it was not altogether prohlbited, as it had been In England and Saxony. See Benthollet, on Dyeing; Bancroft, on Colors.
There has been much speculation among phliosophlcal dyers respecting the nature of the coloring matters, and the way in whlch the different colors are induced by dyelng; but these speculations have not led to any information of mnch value. . There ia reason for believing that the coloring matters employed as dyeatuffa are all transparent, and that the color is produced by their action on the light tranamitted throngh them from the white fibres of the cloth. Those coloring matters that transuit all the rays equally leave the cloth white; if the blue ray be tranamitted and the rest absorbed, the color of the cloth will be blue, and so on. This is all that we know sbout the mechanical nature of the dyeatuffs.

With respect to the aptitude of being dyed, and the brillisncy of the colors thus communlcated, there is found to be very great difference in different tisaues. Animal subatances are much more easily dyed than vegetable substances. Of snimal aubstances, silk receiven color, and the shades given are brighter and more beautlful than those which can be imbibed by any other tlasue. Woolen cloth is also vary fit for being dyed, and receives very brilliant colors with avidity; though in thls reapect it la inferior to silk. Cotton and IInen are mach more difficult to dye, and can not be made to imbibe such brilliant colore as ailk or woolen. Thus the rich searlet given to cloth by the combined action of cochlueal and the oxyd of tin, has never been communlosted to cotton cloth or linen. The Turkey-red dye, which is by far the finaat and most permanent red that has ever been communicated to cotton cloth, is a crimson, or rather a crimson with a ahade of brown. It has not the least approach to a gcarlet.-E. B.

Dyke, or Dike. When a mass of unatratified or lgneons rock, such as granite, trap, or lava, appears as If Injectad Into renta and fisaures in the atratified rock, ao as to intersect the atrata, it is called a dyke. Dyke Is also the name given to a mound of earth, stonas, or other materials, intended to pravent luw land from beling inundated by the sea, etc. ; as the dykes of Holland.

## E.

Eagle, In ramismatlca, a aort of base money which was current in Ireland in the early peat of the relgn of Edward I., that is, about the year 1272. There wers also lionines, rosades, and many other colns of the same sort, named aecording to the figures with which they were impressed. The current coin of the kingdom at that time was a composition of copper and sllver, in determinste projortlons; liut these ware so machinferlor to the standard of that time, that they were not worth, intrinsicaliy, half ao much as the others. They were linported from France and other foreign countries. When Edward had been a few years established on the throne, he aet up mints in Ireland for colingig gool money, and then prohibited the uss of eagles, and other kinds of base coiu-making it desti, with contiscation of effects, to import any more of thein Into the kingdom. Fugle is the ilealgnation of the prinolpal gold coin of the United Statesvalue equal to 10 tollura.
Earing, In nuutical language, n rope attached to the cringle of a sall, hy means of which it is bent or reefed,
Earnesty in commerolal law, is the sum advanced by the buyer of goods in order to bind the seller to the
terms of the agreement. It is onacted by the 17th sectlon of the famous Statute of Frauds, 29 Charles II., o. 8, that " no contract for the sale of any goods, wares, and merchandlses, for the prices of $\mathbf{£ 1 0}$ sterling, or npward, shall be allowed to be good, except the buyer shall accept part of the goods so aold, and actually recelve the same, or give something ln earnest to bind the bargain, or in part payment, or that some note or memorandum in writing of the said bargain be made and slgned hy the parties to be charged by such contract, or their agents thereunto lawfully authorIned." As to what amounts to sufficient earnest, Blackstone lays it down, that, "lf any part of the price la pald down, if it la but a penny, or any portlon of the goods is delivored by way of earnest, it la binding." To constitute earnost, the thing must be given as a token of ratlication of the contruct, and it ahould be expresaly stated so by the giver.-Cilittr's Commercial Law, vol. III., p. 289.

Bar-ring, an ornament worn at the ear; a peudant or jewel auspended by means of a ring or a hook passing through the pendulous lobe of the ear. The use of thia kind of omament dntes from the remotest antiquity, since the first mentlon of ear-rings occura in the
book of Geneefir Ear-rings of certain kinds were anciontly, and otill are, in the East, instruments or appendages of idolatry and auperstition-being regarded as taliamans and amulets. Such, probubly, were the ear-ringe of Jacob'e family, which he boried with the atrange gods at Bethol. This somowhat barbarous opecies of adornment was used (as it still is in some conntries) by both sexes among many Oriental nations; eupecially by the Lydiaus, Persians, Babylonians, Libyazs, and Carthaginiana, as may be gathered from various ancient authors. Among the Hebrews and the Egyptians, their use appears to have been confined to women : but that they were axtensively used by the mon of various other nations is sufficiently proved by the Egyptian monumento. Among the Greoks and Romans ear-ringe wore worn only by fomales, and were sometimes of onormous value. It is a ourious fact that the ears of the Venus de Medici, and of come other female statuen, are plerced, as if for the purpose of bearing these appendages.
Barth, Figure of the The detormination of the figure and dimensions of the earth is a problem of very great importance in astronomy, inasmuch es it is in reference to the earth's diametor that the distances of the planets from the sun and from each other are evtimated. It in aleo a prohlem of very great interest and curiosity; and has accordingly attracted the attention of mankind since the earlieat dawn of civilization. There are two points of view under which this great question may be considered. The figure of the earth may be regarded as a fact to be determined hy invertigation and experience, like any other phenomena or law of nature ; in which case it is necessary to find, by the actua! iueasurement and comparison of different portions of the terrestrial surface, the pature of its curvature, and the magnitude of its diameters. Under the second point of viow, the quaetion is one of pure theory. The earth mas be regarded as a congeriea of materiul particles, attracting each other with forcea reciprocally proportional to their mutual distances, and endowed with a rotatory motion about a fixed axis; and the problem is to detarmine the form the whole mass would assume in virtue of the attractive and centrifugal forcea by which the particles ase impelied. Viewed in this light, the actual figure of the earth becomes one of the serien of consequences reaulting from the universal gravitation of matter, and depeading on the same laws which regulate its motion in its orbit about the sun.

It would be a waste of time to inquire what were the notions of the figure of the earth, which were or might have bean entertajned by ite carliest and most ignorant inhabitants. A very slight attention to the most common phenomena renders the fact of its general roundness almost palpable to the senses. The uniform level appearance of the aenaible horiaen in overy pituation in which a apectator can the placedthe depression of the circum-polar atars as he advances towsrd the anth, and their elavation as he proceeda in a contrary direction - the disappearance of a ship standing out to sea-the projection of the earth as seen in a iunar eclipee, and a number of other familiar ap-pearances-pat the globular figure of our pianet beyond all manner of doult, leasoning from auch appearances, the earliest antronomers univeraaliy regaried the earth as a aphere; and their attention was solely directed, in their variona measurements and computations, to ascertain its dimensione. Modern science has discovered that its tigure devintes slightly from that of a sphere, being compressed or iattened at the extremitiea of its axis of rotution; and the object of the astronomer, at the present time, is to dotarmine not only ite dimensiona, hut also the oxact amount of ite comprestion.
Attempts to estimate the magnitude of the carth were made at a very early date; for Ariatotle relaten
that the methematicians prior to hin time had found the circumference to be 400,000 atadia. But Eratosthenes appears to have been the first who entertained on accurate idea of the principles on which the determination of the figure of the earth really depends, and attempted to reduce these principles to practice. His results, in consequence of the imperfect data from which they. were deduced, were very ingecurate; but his method is the same as that which is followed at ths present day, depending, in feot, on the comparison of a line actually measared on the aurface of the earth with the corresponding colestial arc. He had remarked, or been informed, that at Syene in Upper Egypt, on the day of the summer solatice, at noon, objects cast no shadows; whence he concluded that the sun was ex. actly in the senith at mid-day. On the same day, at Alexandria, he ohserved the aun's meridional distance from the zenith to be $7^{\circ} 12$, or a B0th part of the circumference. Then, assuming Syene to be exactly nnder the meridian of Alexandria (the error in this essumption was about $3^{\circ}$ ), and the distance between the two places, meaeured in a straight line, to be 5,000 stadia, he had $6,000 \times 50=250,000$ etadia for the whels circumference of the earth, , It le sasy to see how very imperfect this operation must have been. Without mentioning smaller errors, the neglect of the solar diameter would alone occasion an uncertainty as to the sun's declination, and consequently as to the jength of the celestial arc, amounting to half a degree on the observation at Syene ; and there is no reason to sup. pose that that at Alexandria was more exact. The terreetrial distance between the two places was asuumed on equally, or probsbly atill more loose and inaccurate determinations.

The neat attempt to ascertain the dimensions of the earth was made by Posidonius. This astronamer adopted a method which differed from that of Eratosthenes only in determining the celostial arc by means of the altitude of a ztar, instead of the aun'e zenith distance. At Rhodes, the bright atar Canopus, when on the meridian, barely appears above the horizen. At Alexandria the same star was observed to hive e meridional altitude of a $\frac{1}{8}$ of a nign, or it degrees, which, therefore, was the celestial arc intercepted hetween the zenith of Alexandria and Rhodes. The terrestrial distance betwoen the two places was estimated, like that between Alexandria and Syene, at 5,000 atadia, and they were both aupposed to be ander the same moridian. Hence, since 74 degrees is the 48th of the circumference, we have $5000 \times 48=240,000$ stadia, for the whole circumference of the giobe.

It is impossible to form nny correct opinion of the degree of approximation attained in these ancient measurea, as the length of the atadium is not known with any certainty. That it varied in different piaces, and at different times, is sufficiently obvious frum the statement of Ptolemy, who, in his work on geography, assigna the length of the degree at 500 stadia, ani censequently the whole circumference at 180,000 , ditfering from the determination of Poaidonius in the projortion of 3 to 4, and still more from that of Eratosthenen. Ptolemy remarked that it was not necessary that the line measured should lie exactiy in the meridian: it was sufficient to know its inclination to the meridian, or tha azimuthal angla, together with the latitudes of its extreme points, in order to compare it with the meridional arc. The determination of the asimuth is, however, an operation of considerable difficulty; and I'tolemy has given no detaila of the method by which he pioposed to eatiniato it. lie has been equaliy cilent In respect of the means by which the mean length of a degree was ascertained to be 500 etadia, so that the reault which ho has recorded is stili leas satisfactory than those of the two noore ancient astronomers.

The active curioalty of the Arabians, which was exerted as auccesafully in promoting practical astron-

omy, did not overlook the meisure of the earth. The Caliph Almamoun, who began his reign in the year 814, ordered a company of astronomere to measure a degree on the level plain of Mesepotamia. Dividing themselves into two parties, the one proceeded northward, and the other enthward, in the direction of the meridian, through a degree of latitude, and measured with rods the itinerary distance as they proceeded. The porfect agreement of their conclusion with that of Ptelemy, throws it open to great ansplcion; and when it is considered that their operation was repented at a different place, with exactly the same result, there can be no donbt that they blindly adopted the statement of the Greek astronomer, elther from insbility to execute the task assigned to them, or because they had no confidence in their own determination.
From the time of Alamamoun, the problem of determining the dimensions of the esth was neglected, till the revival of astronomy with general learning in Earope. The first attempt to solve it was made by Fernel, who, abont the middie of the 16th century, measured the distance from Paris to Amiens, along the high road, by observing the number of revolutions made by his cosch-wheel in the journey between theae two cities. Supposing them to be under the same meridian, which is nesrly true, and having ascertained the difference of their latitudes, Fernel found by this means the length of the degree to be 57,070 French toines, or about 864,960 English feet. A degree was measured long afterward at the same place by Lacailie, in a far more adequate and acientific manner, and he fonnd it to be $\mathbf{5 7}, 074$ toises. This agreement is rendered the leas extraordinsry by the circumstance that the tolse of Fernel was not exactly of the same leogth of that of Lacaille. After all, it must be allewed that Fernel made a fortunate guess. (DElambre, Astronomie, tom. 3il., chsp. xxxv.)
But the first who had the merit of attempting to execate the geodetic operations that are indispensably necessary to effect the accurste measurement of a long line on the surface of the earth, was Willebrord Sneil, a native of Holland, and a teacher of mathematics. Having establiehed a chain of trianglas between Alkmaer and Bergen-op-Zoom, and observed the sngles of each triangle, by mesns of a quadrant of $5 \frac{1}{5}$ feet radius, he measured a base on the frozen surface of the meadows between Leyden and the village of Soeterwoud, and deternined the distance between the two places by trigonometrical computation. The iength of the degree which he found was 28,500 Rynland perches, er about 55,020 toises, which is sbout 2050 toises too amsll. This result was published by Muschenbroek, who in fact revised or calculated the observations from the original papers a contury after the death of Sneli.
Norwood, in the year 1635, attempted to measure a degree in England nearly ln the same manner as Fernef. Lie measured the distance between Londen and York along the publlo road, taking the bearings and reduring the direction to the meridian in a rough way. The difference of latitudes he found by observations of the solutice to be $2^{\circ} 28^{\circ}$, and thence concluded the length of the degree to he 367, 176 Engliah feet. Like the measurement of Fernel, this has beeu found to be a mach nearer approximation than the methed empleyed would have led us to expect.

The application of the telescope to circular instrnments gave a far higher degree of precision to geodetio operations. Picard, to whom practical sstronomy is indeliterl for this capital improvement, was the firat who meannred the aro of the meridian with sach precautiona and eare as the delicate nature of the nperation roquiren. IIe twice measured with wooden perches a base of nearly seven English miles in length ; and observed the angles of his trisngles with a quadrant, having a telescope adapted to it with orons wires in lts focus. He even calcalated the orror pro-
duced by the instrament being placed out of the centre of the station, and detormined the zenith distance of a star In the constellation Cassiopela with a sector, for the purpose of ebtaining the differences of latitude. The distance between Amiens' and Malvoisine was fand to be 78,850 toisen, and the difference of latitude $1^{\circ} 22^{\prime} 55^{\prime \prime}$, whence the reanilt gave for the degree at Amiens 57,060 toises ; but as the sberration and mutation were unknown at that time, and the refraction was not taken into account-canses of error to which it is indispensably nacessary to have regard-a determination which agrees so nearly with the results of recent measury could only have arisen from a fortunate compensation of errore. In fact, his toise was somewhst shorter than that which has since been adopted as the standard; and the error occasioned by this circumstance nearly compensated that which was committed in determining the celestisl are; so thst in recaiculating all the observations, the degree is found to be very nearly the same as wes found by Picard.

French Experiments.-Hitherso geodetic operations had been confined to the determination of the magnitude of the earth; but a discovery made by Richer turned the attention of mathematicians to its deviation from the spherical form. This astronomer having been sent, by the Academy of Sciences of Paris, to the island of Cayenne in S.uth America, for the purpose of determining the amount of terrestrial refraction and other astronomical objecta, ohserved that his clock, which had been regulated at Paris to beat seconds, lost sbout $2 \frac{1}{2}$ minutes daily at Cayenne, snd that, in order to bring it to messure mean solar time, it was necessary to shorten the pendulum by more than a line. This fact, which appeared exceedingly curious, and was scarcely credited till it had been confirmed by the aubsequent observations of Varin and Deshavea, was first explained in the third book of the Principia, by Newton, whe showed that it could only be referred to a dimination of gravity arising from one of two causea-n protuberance of the equatorial parts of the earth, and consequent increase of the distance from the centre, or from the counteracting effect of the centrifugal farce, occasioned by the rotation of the earth. The former could not, on any reasonable supposition regarding the figure of the earth, be regarded as adequate to produce the effect; but the lstter, which would produce a retarlation of the pendulum st Cayenue in the ratio of the equare of the sine of $6^{\circ}$ to that of $49^{\circ}$ (the reapective latitudes of Cayenne and Paris), might amount to 1.46 seconds. This was the first direct proof of the diurnsl rotation of the earth.

From this time the exact determination of the figure of the earth began to assume $\&$ degree of importance whicis had not formerly attached to it. The centrifugal force arising from the diurnsl rotation completely act aside the ldea of perfect sphericity. Newton, assuming that the earth had been origiually fluld, and supposing its density to be the aame throughout the whele mase, and kupposing, moreover, that ite constltuent malecales attract one another in proportion to the inverse square of the diatance, demonstrated that it would assume, in consequence of the rotation, the form of a spheroid flattened at the poles; and that the proportion of its equatorial to ite polar sxis would be 230 to 231 . But the supposition of the squal density of the earth la obviously very improbable, and consequentiy the ratiu of the equatorial and polar diameters must be different from that now mentioned. Newten erroneoualy concluded that if the density is greater in the interior of the earth than st the centre, the comprossion would be greater than in the cabe of a spherold of equal density. This mistake was pointed out by Huygens, who, in order to determine the amonnt of the compres sion from theery, reasoned in this way. Suppose twe tubes to be united at the centre of the earth, forming a right angle with each other at that point, and extending to the surface, one ln the plans
of the equator, and the other along the polar axis, and filled with a homogeneons fluid. Now the fluld contained in the polar branch exerta a prossure on the centre equal to the whole of its weight, white the pressure of that in the other tube will be diminished by the centrifugal force. The second column; therefore, if of the aame length, will be lens heavy than the first; and in order to restore the equilibrinm, it is necessary that the equatorisl tube shali have gained as mneh in length as it has lost in weight through the effect of rotation. Hence the sea in the equatorial regions must be higher, or at a grester distance from the centre, than the polar sen, and consequently the earth must have a flattened form. Calculating from the supposition that the density increases regularly from the surface to the centre, where it is infinite, Huygens fonnd the ratio of the diameters to be that of 578 to 579. This investlgation is given in his work $D e$ Causa Graritatis, published in 1690.
French Theory.-The theoretical determinations of the form of the earth by Newton and Haygene were at variance with the results of geodetic operations that had been carried on in France under the superintendence of the firat Casaini, from 1680 tlll 1716, for the purpose of making in geometrical survey of that country. Cassini fonnd the degree of the meridian to the south of Paris to be 57,092 tolises, while on the north of that city it was only 56,960 toines. This result led to the conclusion that the earth is a protracted spheroid, or elongated at the poles; a conclusion entirely inconsistent with the principles of hydrostatic equilibrium, and the deductions of Newton and Haygens. The question, however, was of too great importance to astronomy to be allowed to remain undecided. Accordingly, the Academy of Sciences of - Paris determined to apply a decisive test, by the measurement of ares at a gres' distance from each other. For this purpose, some of the mont diatingulshed membera of thelr body undertook the measurement of two meridional arcs, one in the neighborhood of the equator, and the other in a high latitude. In 1735, Godh, Bouguer, and La Condamine, proceeded to Peru, where they were joined by two spanish officers, Don Georges Juan, and Antonio d'Ulioa, and, after ten years of laborious excrtion, they mearured an anc of above 3 degrees, between the parallels of $2^{\prime} 31^{\prime \prime}$ north, and $3^{\circ} 4^{\prime} 32^{\prime \prime}$ gonth latitude. The other party, consisting of Maupertuis, Clairant, Camus, Lemonnier, Onthier, and Celsius, were in some reapecta mere fortunate, inasmuch as they completed the measurement of an are near the polar clicle, of 57 minutes, and returmed to Enrope within 16 months from the period of their departure. The messurement of Bonguer whs execnted with great care; and, on account of the locality (the extremities being on different sides of the equator), as well as the excellent manner in which all the detalis were conducted, it has always been regarded as a most valuable determination. The original base wan determined twice, and the difference het ween the two measares was acarcely $2 \xi$ inches.

About the middie of the last century several ares of meridian were measured in varions countries, which, though of inferior importance in comparison of the more extensive surveys which have since been andertaken, are navertheless deserving of enumeration. In 1751 Lacaille measured an are at the Cape of Good Hope, whither he had gone for the purpose of detertermining the lunar parallax, and making other astronomical observations. At the latitude of $33^{\circ} 18 \mathrm{t}^{\prime} \mathrm{hn}$ found the degree of the meridian to be 67,037 toises. Thin resuit was nearly the eame as hall been obtained In France, $10^{\circ}$ further from the equator; and clearly proved either the existence of great local irregalarities in the form of the earth, or the diasimilarity of the two terrestrial hemispheres. As theory reccgnized no such abnormal condition of flgure, and on the othor hand, Lecalle': observations, all the detaile of which had
bsen preserved, appeared to have been carefully made and correctly computed, the reanit which they gave was for some generations a very vexala queatio among all geodesiato. After the lapee, however, of nearly a centary, the arc has been lately remassured under the auspices of the British government, with all the modern improved meana and appliances; and an approximate calculation of the observations ahows, that the greater part of Lacnilie's anomaly was produced by mountain attraction on his plamb-line." (1855).

In 1751 the measurement of a terrestrial arc was nndertaken in the Roman states, by the Jesults Maire and Boacovich. : It extended nearly two degrees between Rome and Rimini, and it was found that the degree of meridian betweun these parallels, namely, $42^{6}$ and $44^{\circ}$, contained 56,973 tolses. The details are given at length hy Bosoovioh, in a work of great elegance, and entitled De Litteraria Expeditione per Pontifeiam ditionem, etc. Romm, 175 b .
Liesganig, a Jesnit in 1762 also executed two measures of a meridional degree, one in Hungary and the other in the Austrian states; but it has been shown by Baron Zach, in his Correspondence Astronomique, voi. vii., that the results merit no confidence, and, in fact, would lead to certain error if employed as elements in determining the figure of the earth.

Abont the same time, in 1764, an are of meridian was measured in North America, on the peninsula between the Chesapeake and Deiaware bays, by two Engliahmen, Charles Mason and Jeremiah Dixon. They employed no triangulation but measured the line with deal-rode along the whole extent of the are, the mean latitude of which was $89^{\circ} 12^{\prime}$. Their ro' 3 were afterwarda compared with the five-feet brase rods made by Bird. The latltudes were determined with a zenith sector. The length of the degree, after the necessary correctiona and reductions were made, was found to be 60,625 Engilsh fathoms, or 50,888 toises. There is no doubt that great care was beetowed on this operation; it le, however, easy to see that the measurement of so long a line hy means of rods is lisble to many causea of error from which the method of triangulation in exempt.
In 1762 Beccaria undertook to measure a degree in the plains of Piedmont. He found the degree of the meridian at the latitude of $44^{\circ} \mathbf{4 4 ^ { \prime }}$ to contain 57,468 tolses; but great urcertainty remained respecting the correctness of the latitudes, the extreme points of the arc being in the near nelghborhood of immense ranges of mountains, which could not fail to produce a very considerable deviation of the plumb-line. It was suppesed that as both ends of the arc were terminated by mountsin ranges, whereas Boscovich's arc had been carriell across the Apennines and terminsted at the sea const, tire errors of the two measures occasioned by the tocal attraction, being of opposite kinds, would neutralize each other, and give a correct mean reault.
Amid the rapld advances of mathenatical science toward the end of the last century, the determination of the figure of the earth was not overlooked. In the year 1783 a memoriai was presented to the British government by Cassini de Thury, atating the import. ant advantages that would result to astronomy sud navigation, from having the difference of longitule of the Greenwich and Paris ohservatories deterained by a geodetic measurement. Fortunately this proposal was agreed to. The English operations were pisced under the superintendence of General Roy, who to active and indefutigable zeal united great shili and oxperience in practical astronomy and surveying. In the snmmer of 1784 a base of rather more than flve miles was mensured on Hounslow Heati. In the measurement of this base, deal-rods were first employed ; but as these were found to warp, and be affected with the variations of the hygremetrical state of the atmosphere, glass tubes wore subatituted; and, in 1791, the same base was measured with a steel chain

carefully made by Ramsden, yet the difference from the former measare was found to be only three ir thes. The mean reault was $27,404 \cdot 2$ feet reduced to the vel of the ses, and the ecale being taken at the temperature of $62^{\circ}$ of Fahrenheit. A chain of 32 trianglea, in connection with this base, extended over the country to Dover and Hastings; and two more, stretching across the Channel, conneoted them with the French signals on the opposite elde. The instrumenta employed in this survey were of the most excellent descriptina, and far superior to any that had ever been amployed in almilar operationa. The angles of each tringgle were measured by a large theodolite constructed by Ramsden ; and it was this spleadid instrament that first exhibited the spherical excess, or the minute quantity by which, on account of the sphericity of the earth, the aum of the three angles of a triangle on the earth'a surface exceeds $180^{\circ}$.

The French part of this great operation was condactsd with equal ability by Cassini (the fourth of that name), Mechain, and Delambre. The angles were measured with the repeating circle of Borda; an instrument of a very differeat deacription from the theodolite, but which in geodetic operationa may fairly be allowed to give, if not equally, at least aufficiently correct results, while in practice it is much more commodieus. The result of the combined measures ahowed tha meridian of Paris to be $2^{\circ} 19^{\prime} 51^{\prime \prime}$ east of Greenwich, or $9^{\prime \prime}$ less than had been determined by Dr. Magkelyne.
Soen after this time, a series of geodetic measurementa both in France and England, [and also in the United Statea, in 1805, for an account of which, eee Coast Surver,] which, in point of extent, as well as minute accuracy, far surpassed all the operations which had yet been undertaken with a view to determine the figure of the earth. In 1791 the Natlonal Convention of France haviog agreed to remodal the system of weights and measures, determined to adopt a standard taken from nature, which might be universally applicable in all countries, and capable of being restored at any futurs age, if by accident is should happen to be lost. Two such standards were proposed, namely, the length of the pendulum, which makes a given number of vibrations in a given latitude; and the quadrunt of the terrestrial meridian. Of these, the pendulum is by far the most easy to be determined; but it was objected, that se the length of the pendulum varies at different latitudes, and also depends in some degree on the geological character of the country where it is measured its length, if it should happen to be lost, could not be racovered, without knowing the precise place at which it had formerly been determined. The length of the quadrant of the moridiun is, however, iavariable, and, if tie earth ls a regular apheroid of revolution, must be the same ut all places. Accordingly the Cenvention chose the ten millionth part of the meridian from the equator to the pole as the unit of their new scals; and in order that this unit might be determined with the grestest possible preciaion, it was reaolved to remeasure the meridian of the arc of Paris, and to extend it from Dunkirk to Burcelona, a distance comprehending altogether an are of about nine degrees. The practical execution of this nudertaking was confided to twe astronomers of distinguished ability, Jelambre and Mechain, by whom the requisite operations were carried on during the years 1792, 1793, nnd 179.1, anid sll the dangers and difficulties arising from the disorganized state of the country, with a resolution and courage of which the annals of acience afford few examples. The triangles amounted to 115 in number. Each of the three ongles of every triangle was separately observed with the repeatiog circle. The different observations, with the originul rogisters and remarks of the observers, were coinpared by commissioners, annong whom were some of the ablest men in France. A form was drawn up, after which all the
calculatione were made. The calculations of the triangles, as well as of the azimuths, were examined by Trallea, Van Swinden, Legendre, and Delambre himself. The triangles were connected in the nelghborhood of Paria with a base of upward of seven miles in longth, being 6075.9 toisen, at the temperature 16 $\frac{1}{6}$ centrigrade, or $61 t$ of Fahrenhelt. A base of verifica tion of 6006.25 toises was measured hy Mechain, near Perplgnan, at the southern extremity of the arc; and the measured length was found to differ by less than a foot from the length deduced by calculation from the first base, though the distance was more than 436 miles. A line of this length, measured with extreme precision, is obviously quite sufficient to enable us to infer, with all the requisite exactness, the length of the quadrantal are ; but the French astronomers resolved to extend the triangulation atill further. Accordingly, Mechain repaired again to Spain, and in the year 1805 continued the chain of trianglea from Barcelona to Tortosa, on the coast of the Mediterranean. At thia place his labors were prematurely terminated by an epidemic fever. The prolongation of the arc was, however, committed to two philoaophere of distingulahed reputation, Biot and Arago. An Immense triangle, one of the aides of which exceeded 100 miles, connected the coast of Valentla with the island of Iviza, which was joined by another triangle with Formentera, distant no leas than $12^{\circ} 22^{\prime} 13^{\prime \prime} \cdot 39$ from Dunkirk, the northern extremity of the arc. The result of the whole gave a value of the quadrantal arc, differing somewhat from that determined by Delambre and Mechain, bat so little that the length of the metre would be scarcely affected by four times the millionth part of itself. The details of this magnilicent operation are given at length in the four volumes of the Base Metrique.

The English gurvey, which had been interrupted by the death of General Roy, in 1790 , was resumed in 1793 under the direction of Colonel Mudge. The original triangles between Greenwich and Dover were extended along the coast to Dunnose in the Isle of Wight, and thence through Devonshire and Wiltshire, and connscted with a base of verification moasured on Salisbury plain. The length of this base was found, after the proper reductions, to be $36574 \cdot 4$ feet, differing acarcely one inch from the length deduced by cal culation from the base on Hounalow Heath. So near a coincldence, though probably owing in some degree to a compensation of errors, affords a convincing proof of the extreme accuracy with which every part of the operation had been conducted. In 1802 the triangulation was carried into Yorkshire, and a meridian are measured from Dunnose to Clifton. The latitudes at the terminal pointa wero detarmined with Ramsden'a zenith aector. The are was afterward extended to Burleigh Niour, and has since been carried to the Shetlands. It may be remarked that both the French and English arca present this singular anomaly, that when portions of them at particulur places, are considered separately, the length of the degree appeara to increase on going southward.

The survey has been continued, up to the present time, and the triangulation has been carrisd to the remotest parts of Scotland, and a considerable part of Ireland. In the course of the operations, several importunt improvemients, both in respect of the inatru ments employed, and in the method of conducting geodetic measurements in general, have been introduced into practice. A bnse of upward of soven miles has been measured near londonderry ; and it now only remuins to determins the latitudes of some stations, to give us the clements of a new and greatly prolonged arc.

In the yeara 1801, 1802, and 1803, Maupertuis' Swedish arc was remeasured by Svanborg, and extended nearly $40^{\prime}$ in amplitude. The methode were the same as hud been einployed by Dolambre. Tho extremities
of the now are were at Mallorn and Pahtawara. The distance was found to be 92,778 toisea, and the difference of the latitudes $1^{\circ} 87^{\prime} 20^{\prime \prime} \cdot 8$; whence $1^{\circ}=57$,196 telsen. This agrees mach better than the reeult of Mavpertnis ( 57,422 tolses) with other measu"3a; but the difference, which implies an error of $12^{\prime \prime}$ in the latitude of Kittis as determined by the French academiciana, has not been satisfactorily accounted for; to that there is still some doubt about the length of a degree in that latitude. See Svanbera's Exposition des Operations faites en Lapponie, etc. Stockholm, 1805.
Since the beginning of the present century, two ares of meridian have been surveryed in India. The first was in the neighborhood of Madras, and comprehended only $1^{\circ} 35^{\prime}$. The secend, however, is the longent which has yet been measured. The firat, and a large part of the second, was accemplished under the direction of Colonel Lambton; and the instruments and methods of observation and calculation were exactly the same as those that had been employed by Colonel Madge in the English anrver. The south extremity of the second arc, was at Pume, near Cape Comorin, latitude $8^{\circ} 9^{\prime} 32^{\prime \prime} \cdot 51$; and the northern at Danmergidda, latitnde $18^{\circ} 9^{\prime} 16^{\prime \prime} \cdot 07$. The amplitude is consequently $9^{\circ} 63^{\prime} 43^{\prime \prime} \cdot 56$, and the distance betwesn the extremities was found to be $595,629 \cdot 98$ fathoms (about 680 miles), giving 60,495 fathems, or $\mathbf{3 6 2 , 9 7 0}$ feet, for the length of the degree. Several basea were measured, and the whole of the operations appear to have been conducted with great skill and accuracy. Thin are has aince been extended by Captain Everest to Kaliana, tatitude $20^{\circ} 30^{\prime \prime} 48^{\prime \prime} .8$; so that $i$ i. e whole length now incindes more than $21^{\circ}$. The details of Colonel Lamibton's operations are given in the different volumes of the Asiatic Researches (see vols. > Hit, x., xil.), and those of Captain Everest, In hia " !ccount of the Measurement of an Arc of the Meridian beticeen the Parallels of $18^{\circ} 8^{\prime}$ and $24^{\circ} 7^{\prime}$," printed at the expense of the East India Company.
Various geodetic operations on a less extenaive scale have been recently executed, which aro better edapted, perhaps, to give linformation respecting the local curvature than the general form of the earth. Beccaria's arc has been remeasured by Plana and Carlini: the results clearly demonstrata the existence of some errors in the original measurement, but they are not yet altogether satisfactory, and the country is very unfavorable. The diatance between Gottingen and Altona has been measured by Gauss ; and the amplitude of the corresponding celestial are is known with the utmont precision, from observations of the latitule made at the respective observatories of the two piaces. The amplitude, hewever, is only about two degrees, and there is some doubt about the exact length of the Iron bare with which the base was measnrei. A more extensive aro hat been measured in Russia by Struve. It extends at present to three and a half degrees, and it is understood that it is in contomplation to prolong it still further. Many new methoda have been employed in this measurement ; and it acquires additional value from its high latitude, and the acknowledged okill and accuracy of the observer.
The above are the principal ares of merisitan, but come arcs of parallel have alno been measured. Theoretically apeaking, the figure of the earth may be determined from the measurement of ares of rarallel, as readily as from meridional arcs; and the geodetical operations in the one case differ in no respect from those in the other. But the great, and, we fear, insnrmountable difficulty, is to determine with aufficient precision the difference of astronomical longitudes. In a subsequent part of tiis article we shail have again occasion to mention Cassini's measurement of an arc of parallel acrose the moath of the Rhone; of the Engitsh arc between Beachy IIead and Dunnose; and that recently made from Marennes to Padua.

Our limita de not permit us to enter into details respecting the numerous experiments that have been made of tate years to determine the figure of the earth by measuring the varistions of gravity at different places by means of the pendulum. The most valuable series of observations of this kind we yet possess, are those of Captain Foster, reduced ander the direction of Mr. Baily, and published in the Memoirs of the Royal Astronomical Society, vol. vil. But a discovery recently made by Bessel proves that less accnracy has been obtained by this method than was onpposed. It has been fonnd, that a pendulum, when vibrating, drags along with it a portion of air, the precise effect of which can be ascertained in no other way than by actual experiment in vecuo with each individual pendulum. The prebable correction which it would be necessary to apply to the resulta that bnve aiready been found, cun not le satisfactorily determined.

The mean of the pendnlum experiments gives rather a higher value of the ellipticity than the results of geodetle measares ; but there are many elements, partieularly the Irregular constitution of the exterior crast of the earth, and the denaity of the gtruta surrounding the station, which can acarcely be determined, and which yet affect materially the results of the experiments.

Besiles the methods which have now been alluded to, physical ast-vnomy furniahes other meass of arriving at a knowledge of the figure of the earth. The precession of the eqninoxes, the nntation of the earth's axis, are phenomena depending on the compression of the earth; and as their amoant la now ascertained, from astronomical observations, with the utmost aecuraey, we can reciprocally deduce from them a knowledge of the compreesion. They do not, however, give us an absolute value of the amount of compression, bnt they inake known the limita within which it must necessarily be confinel. These limits are 1-279 and 1-578. But a more delicate measure of the name element is fornished by some irregularities in the moon's motion to which it gives riae; and as the fanar theory has now attained a very high state of perfection, and as the smail irregularities which canre so much perplexity in geodetical meaanres here entircly disuppear, this is periaps, the most satiafuctory method of all of determining the ellipticity of the earth. The equatiens into which the irregularity question enters, were diecovered by Laplace; and the ellipticity necessary to produce the obeerved effect was found, on calcula-
tion, tc manner and the Tho ..The : square is wates of the 1 diversif mounta stretehi the mo Arabia sis, and land. The Surface of the Earth, and its Geveral Divisions. -The aurface of the earth contains about 106,603,400 square miles. By much the larger portion of this space is weter, whlch is, indeed, more than twice the extent of the land. The surface of the land ia exceedingly diversified, almost everywhere rising Into hilla and mountains, or sinking into valleys, and sometimes stretching ont into plains of grest extent. Among the most extensive plains, are the sandy deserts of Arabis and Africa, the internal part of European Russia, and a tract of considersble extent in Prussian Poland. But the most remarksble extent of level ground is the vast table-plain of Thibet, in Asia, which is the most elevated tract of level ground on the globe. The principal mountain ridges are the Alps and Pyrenees, in Europe, the Aitai and Himalaya Mountalne, in Asia, the mountains of Atlas, ln Africa, and the Andes or Cordilleras, in South Americs. The grentest concavitie of the globe are those which are occupied by the waters of the ocean ; and of thoge, by far the largest forms the bed of the Pacific Ocean, which, stretching from the eastern ohore of Asia sad of New Holland to the weatern ceast of America, covers nearly hall the globe. The concavity next in extent is that which forms the bed of the Atisntic Ocean, extending between the new and the old worlde ; and a third cencevity is occupied by the Indian Ocean. The Arctic and Antarctic Oceans fill up the remaining concavities.
Smaller collections of water which communicate freely with the oceans, are called seas ; and of these, the priacipal are the Mediterranean, the Baltie, the Eaxine or Black Sea, and the White Sea. Seas sometimes take their names from the ceuntries near which thoy flew; as the Irish Sea, the German Ocean. Some large collections of water, though they have no immediate connection with the great body of waters, heing ca sll sides surrounded by land, are yet called seas; as the Caspian Sea. A part of the sea running up into the lund, so as to form a large hollow, is called a bay or gulf, as the Bay of Blscay, the Gulf of Mexico; but if the hollow be small, it is called a creek, a road, a ha ren. When two large bodiee of water communicate by a narrow pess between twe adjacent lands, the pass is called a strait or straits, as the Straits of Gibraltar, the Straite of Dover, the Straits of Babelmandel. A channel is a wider kind of strait. The water usually fows through a strait with coneidernble force and velocity, forming what is called a current ; and frequently this current, as in the case of the Straits of Gibraltar, flows continually in the eame direction.

A body of fresh water entircly surrounded hy land, is called a laks; ae the Lake of Genova, Lake Champlain. A considerable atream of water rising inland, and draining a portion of country more or less extensive, discharging its waters into the sea, is called a river; a smaller stream of the oamo kind is called a rivulet or brook:

Of the land, which forms the rest of the surface of the glebe, twe portions, of vast oxtent, are called continents ; the one the eastern continent, or the old world, comprehending Europe, Asia, and Afrien; the othor, the western continent, or new world, cemprehending North and South America. New Holland is a third portion of land, hewever, which has by some been also reckonel a contiaent on sccount of its great extent.

A portion of land of comparatively sinall dimensiens entirely surrounded by wuter, is called an island; as Britain, Ireland, Jamaice, Madagascar. New IIolland is the largest portion of land which ls called in island. When a number of small islands lio near each other, they aro said to form a group of islands. A portion of land which is slmost entirely surrounded by wster, is called a penineula; as the Peninsula of Malacca, the Morea or Grecian Peloponnesus, etc. Tho
term penineula la often applied to a large extent of country. Thus we epeak of Spain as a peninsula The narrow neck of land which joins a penineule to the mainland, or which connects two tracte of country togother, is called an isthmus. The most remarkable isthmuses in the world are the Isthmus of Snea, which joins Africa and Asia, and the Isthmus of Darias, which connects the continent of North and South America. A uarrow tract of land etretching out into the sea, and appearing to terminate in a point, is called a cape. The most remarkable capes are, the Cape of Good Hope, at the sonthern extremity of Africa; Cape Horn, at the sonthern extremity of South America; and the North Cape, at the northern extremity of Europe. A large portion of land jutting out into the ses is called a promontory.

Until of late, in eystems of geography, the earth used to be considered se divided into four quarters ; Europe, Asia, Africa, and America. A classification in which the whole world is arranged under seven divlsions hae now, hnw vver, been very generally adopted. These diviaions art , Jurope, Asla, Africa, North Americs, Sonth America, Australasia, and Polynesia. With regard to the last twe, the one, Australasia, or Sonth Asia. comprehends certain of the great isiands, particularly New Holland, which are usually considered as belonging to Asis ; and the other, Pelynesia, signifying many islands, comprehends all the omsller lalands which are scattered over the great expanse of the $\mathrm{Pa}-$ cific Ocean. This classification of tho parta of the earth's surface is founded on the most obvious points of distinction. We shall now explain twe divislens employed by the accients, which are fonnded upon different principles ; that into zones, and that into climates.

The divisions into zones is suggested hy the different degrees of temperature which prevail in different regions of the earth. The temperature of a ceuntry depends on a variety of clrcumatances; but of these, one of the most obvious is the position of the ann with regard to the zenith. The more nearly his rays are received vertically, the higher will be the temperature; and, on the contrary, the more obliquely they fall, the less effect will they produco in raising the tempersture. Now to every point of the earth's surface between the tropics the aun is vertical twlee in the year. It is in this region, then, that the highest temperature will prevail. Again, within the polar circles the sun's rays at all timea fall very obliquely; and for a length of time they de not reach these two regions of the globe at all. Here, then, the temperature must be lower than anywhere else, as all other places enjoy more of the eun's genial influence. In the two regions between the tropics and the polar circles, a medium temperature is found, increasing as we epproach the former, and diminishing as we approsch the latter. Thus is the earth's eurface divided, by the two tropics and two pelar circles, into five zones, distinguished from one another by the pravailing temperatura.in each. That between the tropice is called the torrid zone, bocause there the heat is understood to be extreme. This region, which has the equator passing through the middle of lt , the ancients, indeed, considered as uninhabitable. The two regions comprehended within the arctic and antarctic polar circles, are called the northern and southern frigid zones, on account of the severity of the cold which there prevails. The two regions situated between the tropics and the polar circles, the one in the northern hemisphere, bounded by the tropio of cancer and the srctic circle, the other In the southern hemisphere, bounded by the tropie of capricorn L. 1 the antarctic circle, are called the northern and southern temperato zones, bocause there neither the heat nor cold ls excessive; but the heat reachea the highost temperature of summer, and the cold sinke to the lowest temperature of winter, without either becoming extreme.

The divislon of the earth's surface into climates was amployed by the ancients for ascertaining the aitua tion of places. They aupposed the northern and sontharn hemispheree to be esch divided into small monea, to which thoy gave the name of dimatet, the breadth of each none being nuch as to make half an hour of difference in the length of the longest day at the two parallela of latitude by which the climate was bounded. Proceeding from the equator, where the langth of the day le alwaye 12 bours, they thes divided the space bet ween it and each polar circle lato 24 climates. Havlng reached the polar circlea northward and south ward, where the longest day is 24 hours, they divided the apace hetween each polar circle in such a manner as to make the difference in the length of the longeat day at the beginning and termination of ench climate, one month. Hence, as the poles are alternately illuminated for six months, there were jast six climates within each polar circle.

E. B. (See Geognapity.).

Earthenware (Ger. Irdene Waaren; Du. Aardegoed; Fr. Vaisselle de terre Poterie; 1t. Stoviglie, Terraglie; Sp. Loza de barro; Rus. Gorschetachnite possodiz ; Pol. Gliniana naczynia), or crockery, as it is sometimes termed, comprises every sort of honsehold utensila made of elay hardened in the fire. Ita manufacture is, in F...gland, of very considerable Importance, and the improvemente that have been made in it since the middle of the last century have contrihuted powerfully to its extenslon, and have added greativ to the comfort and convenience of ali classes. "There is scarcely any manufucture which is so interesting to contemplate in its gradual improvement and extension es that of earthenware, presenting, as it does, so beautiful a union of aclence and art, in furnishing us with the comforts and ornamente of civilized life. Chemistry administers her part, by investigating the several species of earths, and ascertaining, as well their most appropriate combinations as the reapective degrees of heat which the several compositions require. Art has studied the denigns of antiquity, and produced from them vessels even more exquisite in form than the modela by which they bave iseen suggested. The ware has been provided in such gradations of quality es to suit every atation, from the highest to the ioweat. It is to be seen in every country, and almoat in every house, through the whole extent of America, in many
parts of Aaia, and in most of the oountries of Enrope. At home it has anperseded the less cleanly vesseln of pewter and of wood, and, by ita cheapnens, has been brought within the means of our poorent house-keepers. Formed from aubatances origiaally of no valne, the fabrication has induced labor of nuch various classes, and created akill of anch various degreen, that nearly the whole value of the annual produce may be considored as an addition made to the mane of national wealth. The abundance of the vare exhilited in every dwelling-house is sufficient evidence of the vast augmentation of the manufacture, which is also demonetrated by the rapid increase of the popuiation in the districta where the potteries have been es-tablished."-London Quar. Rev.

For the great and rapld extension of the mannfacture, the English are chtefly indebted to the late Mr, Joslah Wedgwood, whose original and inventive genins enabled bim to make many mont important discoveries in the art; and who was equally successful in bringing hie inventions into nee. The principal sent of the manufacture is in Stafiordshire, where there is a district denominated the Potteries, comprising a number of villages, and a population whlch is supposed to emount, at this moment, to above 85,000 , by far the greater portion of which la engaged in the manufacture. There are no authentic accounta of the population of this district $\ln$ 1760, when Mr. Wedgwood hegan his discoveries; but the general opinion ls, that It did not at that time exseed 20,000 . The village of Etruria, in the Potterien, was built by Mr. Wedgwood. The manufacture has been carried on at Burslem, in the same district, for several centuries.

Eant Indies (British). See India.
Eant Indies (Dutch). See Holland.
Eant Indien (French). See Fravce.
Dast India Company, a fumous association, originally establiahed for prosecuting the trade between England and India, which they acquired a right to carry on exclusively. Since the middle of last century, however, the Company's political have hecome of more importance than their commercial concems. Eant Indies, a popular geographical term not very well defined, but generally understood to siguify the continents and islands to the enat and soath of the River Indus, as far as the borders of China, including 'Tinar and the Moluccas, but excluding the Phillppine Islands, New Guinea, and New Holland. China and the Philippine Islands were, however, Included within tire linits of the East Indin Comipany's peculiar privileges. See India.

1. East Intha Company (Ifistonical Sketci or).-The persevering efforts of the Portuguese to discover a ronte to India, by sailing roond Africa, were crowned with auccess in 1497. And it may appear siagular, that, notwithstanding the exaggerated accounts that had been prevalent in Europe, from the remotest antiquity, with respect to the wealth of Indin, and the inuportance to which the commerec with it had rasel the Phonicians and Egyptiana in sntiquity, the Venetians in the middle ages, nnd which it was then acen to confer on the Portuguese, the latter should have been allowed to monopolize it for nearly a century after it had been turned into a chnnnel accessible to every nation. But the prejudices ty which the people of most European statea were actuated in the sixteenth century, and the peeuliar circumstances under which they were placed, hindered them from embarking with that olaerity and ardor that might have been expected in this new commercial career. Soon after the l'ortuguese began to prosecute their discoveries along the coast of Africa, they applied to the prope for a luili, securing to them the exclusivo rigit ts and possession of all countries oceupied by inlidels, they either had discovered, or might discover, to the south of Cape Non, on the west conet of Africk, in $27^{\circ} 64^{\prime}$ north iatitude : and the pontiff, desirous to diaplay, and at the

same time to extend, his power, immedintely issued a bull to thie effect. Nor, preposterous as a proceeding of thls gort would now appear, did any one then doubt that the pope had a right to iseue ench a hall, and that all statea and empires were bound to obey it. In consequence, tha Portuguese were, for a leagthened period, allower to prosecute their conquest in Indie without the interference of any other European power. And it was not till a conslderable period after the beginning of the war, which the blind and brutal bigotry of I'hilip II. kindled in the Low Countries, that the Dutch navigatora legan to display their flag on the Eastern Ocean, und laid the foundations of their Indian empire.
The desire to comply with the injunctions in the pope's ball, and to avold ceming into collision, firat with the Portuguese, and subsequently with the Spaniarls, who had conquered Portugal in 1580 , seems to have been the principal cause that led the English to make repented attempts, in the relgus of IIenry VIII. and Ldward VI., and the early part of the retgn of Elizalogth, to discover a route to India by a north-west ur north-east passage; channels from whleh the Portuguese would have had no pretense for excluding them. But these attompts having proved unsuccessful, and the pope's hull having ceased to be of any effect in this cuuntry, the English merchants and navigators resolvad to be no longer deterred by the imaginary rights of the Portuguese from directly entering upon what was then reckoned by far the most lucrative and advantageous branch of commerce. Ceptain Stephens, who performed the voyage $\ln$ 1582, was the firat Engishman who sailed to Iadis by the Cape of Good Ilope. The voyage of the famous Sir Francis Dreke contributed greatiy to diffuse a apirit of naval enterprise, and to render the English better acquainted with the newly-opened route to India. But the voyage of the celebrated Mr. Thomas Cavendish was, it tha latter respect, the moat important. Cavendi is saiied from Eingland in a little equadron, fitted $o$ it at his own expense, in July, 1586 ; and having exilored the greater part of the Indian Ocean, as far as the Philippine Isiands, and carefully observed the most important and characteristic features of the pcople and countries which he visited, returned to England after a proepervus navigation, in September, 1588. Perhaps, however, nothing contributed so much to inspire the Eugiish with a desire to embark in the Indian trade, as the captures that ware made about this period from the Spaniurds. A Portuguese East India ship, or carrack, captured by Sir Francis Drake, during his expedition to the coast of Spain, inflamed the cupidity of the merchanta by the richness of her cargo, at the samo time that the papers found on hoard gave specitic iniormation reapectitg the traffic in which sho had veen engaged. A stiil more important capture, of the same sort, was made in 1593. An armament, fitted out for the Bast Indies by Sir Walter Ralelgh, and commanded by Sir John Burrougha, fell in, near the Azores, with the largest of all the Portuguese carracks, a ship of 1600 tons' burden, carrying 700 men and 36 brasa cannon; and, after an obstinate conflict, carricd her into Durtmonth. She was the largest vessel that had been seen in England; and her cargo, consisting of gold, apices, calicoes, silks, pearls, drugs, porceiain, jvory, etc., exclted the ardor of the English to engage in so opnient a commeree.
In consequence of these and other concurring causes, as association was formed in Jondon, in 1599, for prosecuting the trade to India. The adventurers applied to the queen for a charter of Incorporation, and also for power to exclude all other English subjects, who hail not oltained a licenso from them, from carrying on any species of traflic beyond the Cape of Good Ilope or the Struits of Magellan. As exclusive compenies were then very generally looked upon as the best inatruments fur prosecuting most branchos of commerce and

Industry, the adventurers asem to have had little diff. culty in obtaining their charter, which was dated the 81at of Dacember, 1680. The corporation was entitled "The Governor and Company of Merchants of London trading to the Eant Indies;" the first governor (Thomas 8mythe, Feq.) and 24 directors were nominated in the charter; but power was given to the Company to rlect a doputy governor, and, in future, to elect thair governor and directora, and such other office-bearers as they might think fit to appoint. They were empowered to make by-lawa 1 to inflict punishmenta, either corporal or pecuniary, provided anch punishmente were in accordance with the lawe of England; to export all sorts of goode free of duty for 4 years ; and to export foreign coin, or bullion, to the amount of $£ 30,000$ a year, $£ 6,000$ of the name being preciously coined at the mint; but they were obliged 1. amport, within 8 months after the completion of every voynge, except the first, the same quantly of ailver, gold, and foreign coin that thay had exported. The duration of the charter was limited to a period of 15 years: but with and under the condition that, If it were not found for the pabllo advantage, it might be canceled at any time upon 2 yeara' notice belag given. Such was the origln of the British East India Com-pany-the most celabrated commercial associstion of ancient or modern times, and which has now extended its away over the whole of the Mogul empire.
It might have been expected that, ofter the charter was oltalined, considerable eagerness would huve been manifested to engage in the trade. But such was not the case. Notwithstanding the earnest calis and threate of the directora, many of the adventurere could not be induced to come forward to pay thair proportion of the charges incident to the fitting out of the first expedition. And as the directors seem either to have wanted power to enforee their resolutlons, or thought it better not to exercise it, they formed a subordinate assoclation, consisting of such membors of the Company as were realiy willing to defray the cest of the voyage, and to bear all the risks and losses attending it, on condition of their having the exclusive right to whatever profits migint arise from it. And it was by such suboidinate associations that the trade was conducted during the first 18 years of the Company's existence.

The first expedition to India, the cost of which amounted, ships and cargoes included, to 569,091 , consisted of five ships, the largest being 600 and the sme': r 130 tons' burden. The goode put on board wen principaliy bullion, iron, tin, broad-cloths, cutlery, glass, etc. The chief command was entrusted to Captain James Lancaster, who had already been in India. They set all from Torbay on the 15 th of February, 1601. Being very imperfectly acquainted with the seas and countries they were to visit, they did not arrive at their deatination, Acheen, In Sumatra, till the 5th of June, 1602. But though tedlous, the voyage was, on the whole, uncommonly prosperous. Lancaster entcred into commercial treaties with the kings of Acheen and Bantam; and having taken on board a valuable cargo of pepper and other produce, he was fortunate enough, in his way home, to fall in with and capture, in concert with a Dutch vessel, a Portuguese carrack of 980 tona' burden, richly laden. Lancaster returned to the Downs on the 11th of September, 1603. -Modern Universal Mistory, vol. x., p. 16; Macpienson's Commerce of the European Powers with India, p. 81. But notwithstanding the favorable result of this voyage, the expeditions fitted out in the years inmediately following, though sometimes consisting of larger shipa, were not, on an aver age, materially increased. In 1612, Captain Best obtained from the court nt Delhi aeveral conslderable privileges; and, among others, that of eatablishlag a factory at Surat; which city was, henceforth, looked upon as the principal British atation in the west of India, till the acquisition of Bombuy.

In metablishing factories in Iadia, the English ouly sollowed the axamples of the Portuguese and Datch. It was contended that they were necessary to aurvi as diptes for the goods coilected in the country for exportation to Europe, am well as for thone imported into India, in the ovent of their not meeting with a ready market oA the arrival of the ships. Qach entabilahmonte, it was admitted, are mot requirod in civilised countries ; but the peculiar and nnsettled atate of India was aald to render them indispenseabia there. Whatover weight may be attached to this statement, it is obvious that factorien formed for auch parposes could hardly fail of apoedily degenerating into a apecies of 80rts. The security of the valuable property depooited in them, farniahed a apecious protext for putting them in condition to withatand an attack; whilo the agenta, clerks, warehousemen, otc., formed a sort of garrison, Posseaning auch atrong-holds, the Europeans were early omboldened to act in a manier quile inconsistent with their character as morchants, and hut a very short tlme elapsed before thay began to form achemes for monopolizing the commerce of particular districts, and acquiring territorial dominion.

Thought the Company met with several heary iosses during the early part of their traffic with India, from ahipwrecks and other unforseen accidents, and atill more from the hoetlility of the Dutch, yot, on the whele, the trade wat decidedly profitable. There can, however, be little doult, that their gains, at this eariy period, have been very much oxaggerated. During the first 13 years, they are sald to have amounted to 132 por cent. But then It ahould be bornc in mind, as Mr. Grant has justly atated, that the voyages were seldom accomplished in lean than 30 monthe, and nometimes extended to 3 or 4 years : and it ohould further be remarked that, on the arrival of the ships at home, the cargoes were dinposed of at long credits of 18 months or 2 years ; and that it was frequently even 6 or 7 years before the concerns of a single voyage were finaliy adjusted. - Sketch of the History of the Compony, p. 13. When these circumstances aro taken into view, it will be immediately neen that the Company's profits were not, really, by any means so great as has been represented. It may not, howover, be uninatructive to remark, that the principal complaint that was then made against the Company, did not proceed so much on the circumstance of its charter excluding the publio from eny share in an advantageons traffic, as in Its authorizing the Counpany to export gold and silver of the value of $£ 30,000$. It is true that the charter stipulated that the Conpany should import an equal quantity of gold and silver within 6 months of the termination of every voyage; but the enemies of the Company contended that this condition was not complied with; and that it was, besides, highiy injurious to the pubilic interest, and contrary to all primciple, to allow goid and silver to be sent out of the king dom. The merchants and others interested in the support of the Company, could not controvert the reasoning of their opponents without openly impugning the ancient policy of absolutely proventing the exportation of the precious metals. They did not, however, venture to contend, if the idea really occurred to them, that the exportation of bullion to the East was advantageous, on the broad ground of the commodities purchased by it being of greater value in Engiand. But they contended that the exportation of bullion to India was advantageous, because the commolities thence imported were chiefly re-exported to other countriea from which a much greater quantity of bullion was obtained than had been required to pay for them in India. Mr. Thomas Mon, a director of the East India Company, und the ablent of it: eariy advocates, ingeniously compares the operations of the merchaut in conducting a trade carried on by the exportation of gold aud uilver to the secd-time and harvest of agriculture. "If we only behold," saya
hay, "the actions of tt, husbandman in the eeedtime, whon he casteth away much cood corn into the ground, we shall weeonat him rathor a madmaa than a busbandınan. But when we conaldor his labors in the harveat, which is the end of his endeavors, wo find the worth and plentiful incroase of his ac-tions."-Treasure by Foreign Tmul, p. B0, odition of 1664.

We rany here remark, that what has been called tie mercantils agotem of political economy, or that aystem which measures the progress of a country in the career of woaith by the aupposed balance of poymenta in its favor, or by the estimated excese of the value of tis exporta over that of its imports, appears to have originated in the excuses now set up for the exportation of bullion. Previeusly to this epoek, the policy of probilhiting the exportation of buillion had been oniverally almiltted; bat it now began to be pretty generally allowed, that ite exportation might be productive of advantage, provided it occasloned the subsequent exportation of a greater amount of raw or manufactured products to conntries whence bullion was obtained for them. This, whon compared with the proviously existing prejudice-for it hardly deserven the name of aystem-which wholly interdicted the exportation of gold and ailver, must be aliowed to be a considorable atop in the progress to aounder opinions. The maxim, ce n'st que lo premier pas qui coute, was atrikingly verified on this occeasion. The advocatea of the East India Company began gradually to aeanme a higher tone, and, at length, boldly contended that bullion was nothing but a commodity, and that its exportation should be rendered as free aa that of any thing else. Nor were theae opinlons confined to the partuers of the East India Company. They were gradually communicated to othors ; and many eminent merchants were tanght to look with suspicion on sevaral of the previously recoived dogmas with reapect to commerce, and were, in consequence, led to sçpuire more correct and comprehensive views. The new ideas ultimatoly made their way into the House of Commons; and, in 1663, the statutee prohibiting the exportation of foreign coin and bullion wore repealed, and full liberty given to the East India Cumpany and to privato tradens to export them in unlimited quantities.
But tho objection to the East India Company, or rativir the East India trade, on the ground of its causing the exportation of gold and silver, admitted of a mure direct and conclusive, if not a more ingenious relly. Hlow compendicus soever the ancient intercourse with India by the Red Sea and the Mediterranoan, it was unavoidably attended with a good dea! of expense. The productions of the remote parts of Asia, Urought to Ceylon, or the ports on the Maiabar coast, by the natives, were there put on board the ships which arrived from the Arabic gulf. At Bereniee they were landed, and carried by camels 250 miles to the banks of the Nile. Thoy were there again embarked, and conveyed down the river to Alexandria, whence they were dexpatched to different markets. The addition to the price c. goods by such a multiplicity of operationa must have been considerabile; more especially as the price charged on each operation was fixed hy nionopolists, subject to no competition or cuntrol. l'iny says, that the cost of tho Arabian and Indian products brought to home when he flourished (a.D. 70), was incruased a hundredfold by the expenses of tranait-(IIist. Nat., lib. vi., c. 23); but there can be littie or no doalt that this is to be regarded ns a rhetorical exaggeration. Thero aro good grounds for thinking that the lese bulky sorta of Eastern products, auch as silka, apicos, balaams, precious atones, etc., which were those principally made use of at Rome, might, supposing there were no political obstacles in the way, be conveyed from moat parta of India to the ports on the Mediterranean by way of Egypt, at a do- ient interne Mediter-- geod des te parts of be Malabar rd the ships renice they niles to the embarked, ia, whence The additiplicity ef more espen was fixed? or cuntrol. and Indian ished ( $\mathrm{A}, \mathrm{D}$. xpensics of here can be ed as a rherrounds for in products, tones, ate, $f$ at leme, obstacles in India to the pt, at a de-
cldeily cheaper rate than they could be conveyed to them by the Cape of Good Hope.

But at the period when the latter monte to Indh. began to be frequented, Syria, EgJpt, etc., were ocenpied by Turks and Mamelukes; barbarians whe deopised commerce and navigatlon, and were, at the ame time, extremely fealous of strangere, eapecially of Christlans or infidels. The price of the commodities obtained through the Intervantion of auch permons was necessarily very much enhanced; and the discovory of the route by the Cape of Good Hope was, consequently, of the atmost Importance; for, by putting an end to the monopoly enjoyed by the Torka and Mamelukea, it Introduced, for the first time, eomething like competition Into the Inilian trade, and enabled the western parta of Europe to obtaln supplles of Indlan producta for abont a thlnd part of what they had previously cest. Mr. Mun, in a tract pahllshed In 1621, estimates the quantlty of Indian commodities Imported into Furope, and their coat when bought in Aleppo, and in India, as follows:
Cost of Indian Commoditisa consumido in Enaope wimen
Bevoht in Alsppo (ou Alfxandila).

| $0,000,000$ tbe, pepper cost, with chargea, etc., at Aleppo 2s, per lb . | $\begin{array}{ccc} \kappa 00,000 & 0 & d . \\ 0 \end{array}$ |
| :---: | :---: |
| 450,1000 lbs, cloves, at is. 9 d ............. | 106.875 100 |
| $150,000 \mathrm{lbs}$, mace, at 4 s .9 d | 85,6260 |
| $400,000 \mathrm{lbs}$ nutmegs, at 2.48 | 46,068 24 |
| $850,000 \mathrm{lhs}$, Indigo, at 4 s . 4 d | 75,888 68 |
| 1,000,000 lbs. Persian raw atlk | 600,000 |

Total.
\&1,465,000 $19 \quad 0$
But the same quantliles of the same commoditica cost, when bought in the East Indlen, according to Mr. Mun, as follows:

| $451,000 \mathrm{Ib}$ $400,000 \mathrm{lb}$ <br> $850,000 \mathrm{lb}$ <br> $1,000,000 \mathrm{Jb}$ |
| :---: |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  | $\begin{array}{lll}62,500 & 0 & 0 \\ 0\end{array}$ $\begin{array}{ll}16,875 & 0 \\ 0\end{array}$ 5,000 00 $6,666 \quad 18 \quad 4$ $20,41612 \quad 4$ 400,000 $0 \quad 0$

,

Whleh, being deducted from the former, leaves a balsnce of $£ 053,542$ 18s. 4d. And supposing that the atatements made by Mr. Mun are correct, and that sllowance Ia made for the difference between the freight from Aleppo and Indla, the reault would indicate the saving whlch the discovery of the route by the Cape of Good Hepe occasioned in the purchase of the above-mentloned artleles.-A Discourse of Trade from Eingland to the East Indies, by T. M., orlginal ed. p .10 . (This tract, whlch Is very scarce, is reprinted in Purchas's Pilgrima).
In the same publleatlen (p. 37), Mr. Mun Informs ua that from the beginning of the Company's trade, $t 0$ July, 1620 , they liad sent 79 ships to India; of which 34 had come heme aafely, and richly laden; 4 had been worn out by long service In Indla; 2 had been lest in careening; 6 had been lest by the perils of the ses, and 12 had been captured by the Dutch. Mr. Mun further atstes, that the exports to India since the formation of the Company had amounted to $£ 840,876$; that the produce brought from Indis had cost $£ 356,288$, and had produced here the enorinous sum of $£ 1,914$,600; that the quarrels with the Dutch had occasloned a losa of $\mathbf{£ 8 4 , 0 6 8}$; and that the stock of the Company, in ships, goods in India, etc., nmounted to $£ 400,000$.
The hostility of the Dutch, to which Mr. Mun has here alluded, was leng a very formidable obstacle to the Company's success. The Dutch early endenvored to obtain the excluslve posseasion of the spice traile, and were not at all scrupulnus about the means by whlcl, they attempted to bring about thls their favorite elject ; the English, on thelr part, naturally exerted themrelves to obtain a share of so valuaiblo a commerce; and as nelther party was disposed to abandon ike views and pretensions, the most vlolent animositice grew up between them. In thls state of things, it would be ridiculous to suppose that unjustifleble acte
were not committed by the one party as wroll at the other; thongh the worst Let of the English appears renlal, when compared whth the condact of the Duteh In the massacre of Amboyna, in 1622. While, howover, the Dutch Company was vigoroualy aupported by the government at home; the English Comnany met with no effielent asoistance from the feeble and vaclllating policy of Jamen and Charlea. The Dutch elther desplaed their remonatrancen, or defeated them by en epparent compllance; so that no real reparation was ohtained for the ontragea they had committed. During the clvil war, Indian affelrs were necensarily loat alght of 3 and the Dateh continned, untll the ascendancy of the repnbiican party had been eatablished, to relgn triumphant in the Eaet, where the Engllah commerce was nearly mnilhllated.

But notwithstanding thelr depressed condition, the Company's servants In India laid the foundacion, durIng the period In questlon, of the settlements at Madras and In lBengal. I'ermisaion to bulld Fort St. George was obtalned from the nitlve authoritles in 1640 . In 1658, Madras was ralsed to the atation of a presidency. In 1645, the Company began to establish factories in Bengal ; the princlpal of which was at Hooghly. These were, for a lengthened period, subordinate to the presldeney of Madras.

No sooner, however, had the clvil wars terminated than the srmlea end conncils of Cromwell retrieved the altuation of our affialre in Indla. The war whlch broke out between the long Parllainent and the Datch In 1652 was eminently injuriona to the latter. In the treaty of peace, concluded In 1664, it waa stlpulated that Indemnification should be made by thy Dutch for the losses and Injuries sustained by the English merchants and factors in India. The 27th article bears, "that the lords, the atates-general of the United Prov. Inces, shall take care that justice be done upon those whe were partakers or nccomplices in the masacre of the English at Amboyna, as the republle of England is pleased to term the fact, provided any of them be living." A commlssion was at the same time appointed, conformably to another article of the treaty, to inquire into the reciprocal clalms which the smbjects of the contracting partles had npon each other for lespes sustajned in India, Brazil, etc. ; and upon thelr declsion, the Dutch pald the sum of $£ 85,000$ to the East India Company, and e8615 to the heirs or execrtors of the sufferers at Amboyna.-Bruce'a Annals, vel. 1. p. 489.

The charter nnder which the East India Company prosecuted thelr exclualve trade to Indla bsing merely a grant from the crown, and not ratified by any act of Parliament, was underatood by the merchants to be at an end when Charles I. was deposed. They were confirmed in thls vlew of the matter, from the circumstance of Charles having himself granted, In 1635, a charter to Slr William Courten and others, authorizing them to trade with those parts of India with whlch the Company had not established any regular intercourse. The reasons alleged in justlfication of 'his measure, by the crown, were, that "the East India Company had neglected to establlsh forified factories, or seats of trade, to whlch the klng's subjects conld resort with safety: that they had consulted their own interente only, without any regard to the king's revenue; and In general, that they had broken the condition on which their charter and excluslve privileges had been granted to them."-Rim. Fadera, vol. xx., p. 146.

Courten'e association, for the foundation of which euch satisfactory reasons has been masigned, continued to trade with India drring the remainder of Charles's relgn; and no sooner had the arms of the Commenweslth forced the Dutch to desist from their depredstions, and to make reparati , for the anjuries they had Inficted on the English in 1adla, than private adventurers engaged in great numbers in the Indin trade, and carrled it on with a meal, economy, and auccess,
that monopoly can never expect to rival. It is atated in a little work, entltled "Britannia Languene," publlshed in 1680, the author of whlch has evidently been a well-Informed and Intelllgent person, that during the years $1653,1654,1655$, and 1656 , when the trade to Iudie was open, the private traders imported East India commoditios in such large quantities, and sold them at auch reduced pricen, that they not only fully supplled the British markets, but had even come into anccessful competition with the Dutch in the market of Ansterdsm, "and very much sunk the actions (sharea) of the l)utch East Indla Company."-(p. 122.) This elrcumstance naturally excited the greatest apprehenslons on the part of the Dutch Company ; for bealdea the danger that they now ran of being deprlved, by the active competlition of the Engllsh merchants, of a consideralise part of the trade which they had previously onjoyed, they could hardly expect that, if the trade were thrown open in England, the monopoly would be sllowed to continue in Holland. A striking proof of what is now stated is to be found in a letter in the thinl volume of "Thurlow'a State l'spers," dated at the Hague, the 15th of January, 1654, where it is said, that "the merchants of Amsterdam have advice that the Lord l'rotector intends to dissolve the Fast India Company st London, and to declare the navigation and commerce of the East Inilies free and open: which doth cause great jealousy at Amsterdan, as a thing that will eery much prejudice the biast India Company in Holland."

Feeling that lt was impossible to contend with the private adventurers under a system of fair compretition, the moment the tresty with the Duteh had been conc!uded, the Company liegan to selicit a renewn of their charter; but in this they were not only opposed by the free traders, but by a part of themselves, To understand how this happened, it may ho proper to nention that Courten's association, the origin of which hus heen already noticed, had begun, in 1648, to found a colony $\ln$ Ansuda, an island nesr Managascar. The Company, alarmed at this project, applied to the Council of state to prevent its being carried into effect; and the council, without entering on the quention of either party's rights, recommeniled them to form a union; which was accordingly effected ln 1649. Hut the uniou was, for a considersble time, rather nomilnal than read; and when the Dutch war had been put all end to, most of those holders of the Company's ntock who had belonged to t'ourten's association joined in petitloning the Council of State that the trude might in future $t$ carried on, not by a juint-stock, hut by a regulated company; so that each individual engagiug in it might be allowed to employ his own ntork, servan*s, nnd shipping, in whatever way he might conceive most for his own advnitage.-I'etition of Adrenturers, 17th of Nov., 16 ant ; Bruce's dnnals, vol. I., p. 51 N.

This proporal was obviounly mont reunomable. The Company had slwayn founded their clain to a monopoly of the trate on the alleged ground of its being necessary to mahutain forts, factorles, nud whips of war in India; and that as this was not done by government, it cosid ouly be done by a company, lhut, Dy forming the traders with Indin into a regular company, they might have been subjerted to whatever rulen were conaldered mont alviablib; and soch special dutien might have heen laid on the commmolitien they exported and limported as would have sulliced to defray the public expenses required for carrying on the trade, at the asme time that the inestimable .alvantager of free competition would have been secured; each andividual trader lielng left at llwerty to conduct his enterprines, subject only to a few general regulathons, in his own way and for his own sdvantage. See Companien.
llut not wit atanding the etforts of the petitionern, and the succens that was clesrly proved to have nttemed the operations of the privite traders, the Company
succoeded ln obtainlag a renewal of thelr charter from Cromwell ln 1657. Charles II. confirmed thla charter in 1661; and at the same time conferred on them the power of making peace or war with any power or people not of the Christian religion; of establishing furtlications, gerrisons, and colonies; of exporting ammunition and stores to their settlements duty free; of asizing and sending to Englan 1 auch Britlsh sul) jects as should be found trading to Indle without thelr leave; and of excrelsing clvil and criminal jurisdiction in their settloments, according to the laws of England. Still, however, as this chartar was not fully confirmod by any act of Parlinment, it did nut prevent traders, or interlopors as they were termed from appearing within the limits of the Company's territories. The energy of private commerce, which, to use the words of Mr. Orme, "sees its irift with eugh'ss' eyes," formed assoeintions at the rlak of trying tho conseqcence at law, being safe at the outset, und during the voyage, since the Company were nut authorized to stop or ceize the ships of those who thus nttempted to come into competition with them. Hence their monopoly was ly no mems complete; and it was not till after tho Revolutlon, and when a froe system of goverument hasd been establlshed at home, that, hy a singular contradiction, the authority of Parlianent wus interposed to enable the Company wholly to engross the trade with the East.

In nuldition to the losses arising from this source the Company's trade suffered severely, during the reign of Charles II., from the hostilities that w.mo then wiged with the Dutch, and from the confusion and disorders eaused by contesta amotab the native princes; but in lified the Company oltainel a yery valuable aequisition in the island of lombay. Charles 1I. sectinired this island as a part of the marriage portion of his wife, Cutharine of l'ortugal; aul it was now made over to the Compuny, on conditlun of their mit selling or alieuating it to any personn whatever, except such as were sulyjects of the IIrlish crown. They wero allowed to leginlate for their new possession; hut it was enjoined that their laws should be consonant with reasoln, and, "as near an might be," agreeable to the practice of England, They were authorized to maintain their dominion by fore of arms; and the natives of lhmbay wore declared to have the name liberties as matural-born subjucts. The Company's weatern presidency was soon after transferred from Surat to Itomlay.

In 16t-f, the French Jiast India Company was formed; and 10 years afterward they laid the fomdition of their settlement at londicherry.

Ilut the reign of tharles 11 . in chictly memordide in the Company's anmals, from its heing the ora of the commencement of the tea trade. 'lhe tirst motice of tea in the Company's records in found in a deopatch, ahliressed to their agent at llantam, Hated ehth of Jannary, litio-y, in whel he is desired to send houe 100 lln , of tea-" the thent he con get." (bincrs's Anmala, vol. il., p. 210.) Such was tho late aul feetble beghning of the tea trade, a branch of comanere that has long been of vast importance to the ltritish mation, and without which it is more than probable that tho Fant India tompany wonld long slice have ceased to exist, ut least as a mercantile body.

In 1637 tho Company obtained a fresh ronewal of their charter: receiving the thenne time an hatemity for all past misuse of their privileges, that nulburity to eatablish a mint at llumbay.
During the greater part of the rejgun of tharles 11. and James Jl., the Company's allairs at home were princlpally manuged by the eelehated sir Josiah Child, the ablest commerclul writer of the time; and In Indin, by his brother, Sir John Chill. In lewn, Sir doalah publinhed an apology for the company, under the nlgnators of 中idorarous-" A Troatina wherereln le Demonstrated that the Luat India Trade

Is the most National of all Forelgn Trades"-in whleb, besides endeavoring to vindicate the Cnmpany from the objections that had been made againsi : $:$, he gives an account of lts state at the time. From this account; it appears thst the Company consisted of 556 partners; that they had from 35 to $\mathbf{8 6}$ ships, of from 775 to 100 tons, employed In the trade between England and India, and from port to port in India (p. 23); that the customs daties upon the trade amounted to about £ 60,000 a year; and that the value of the exports, "in lead, tin, eloth, und stuffs, and other commodities of the production and manufacture of England," anounted to about $\mathbf{£ 6 0 , 0 0 0}$ or $\mathbf{£ 7 0 , 0 0 0}$ a year. Sir Josiah seemus to have heen struck, as he well might, by the inconsiderable amoont of the trade; and he therefore dwells on the advantages of which it was indlrectly productlve, In enabling us to obtaln supplies of raw silk, lepper, otc., at a much lower price than they would otherwlse have fetched. But this, though true, proved nothing in favor of the Company-It being an sdmitted thet, that thoso articles were furnished at s still lower price by the interlopers or private traders.
Sir Josiah Child was ons of the first who projected the formation of a territorial einpire In Indla. But the expedition fitted out in 1686, in the vlew of necomplishing this purpose, proved unsuccessful ; and the Compuny were glad to secept peace on the terms offered by the Mogul. Sir John Chllh, having died during the course of these transactions, wan succeeded in the prinelpal management of the Company's affills in India by Mr. Vaux. On the appointment of the latter, Sir Josiah Child, to whom he owed his advancement, exhorted hion to act with vigor, and to carry whatever instructions he might recelve from home into immediate effect. Mr. Vaux returned for answer, that be should endeavor to nequit himself with integnity and justice, and that he would make the laws of his country the rule of his coniluct. Sir Josinh Child's answer to this letter ls eurious: " He told Mr. Vaux roundly that he expected his orders were to he his rules, and not tho laws of lingland, which were a heap of nonsense, compiled by a few ignorant coantry geatlemea, who harily knew how to make laws for the good government of their own private families, much less for the regulating of companies and forgifn commerce." (IIAmimon's Neve Aecount of the fiasf Indies, vol. 1., p. 232.)

During the latter part of the reign of Charles II. and that of his successor, the number of private adventurers, or interlopers, in tho Indian trade, Increased $\ln$ an unusual degree. The Company vigeronsly exerted theuselves in defense of what they conceivert to be their rights; and the question with resperet to the validity of the powers conferred on them by their charter was at length brought to insue, by i prosecution carried on at their instance against Mr. Thomas Sandys, for trading to the Fast lndles without their Hicense. Judgment was gi en lin favor of the Cempany in ltiri. Ihat this decision was aseribed to corrupt influmere; and Instead of allaylag, only served to herrease the clamor against them. The meeting of the Coavention Parliament gave the ('empany's opponeuts hopes of n successful issue to their efforts; and had they been united, they might probalily have succeeded. Their opinhons were, however, ilivided-rart being for throwitg the trude open, and part for the formation of a new company on a more lheral footing. The latter being formed into a houly, and acting in mison, the struggle against the Company was chlofly earried un by them. The proceedings that took place on this oreasion are among the most diagraceful in the history of the country. The most opeu anil unblushing cormotion was practleed hy all partles. "It ras, in foct, "t trial which shonld bribe the highest; public autharity indining to one or other os the irresistible force of gold directel." (Jfodern Unirersal IIistary, vol. x., p. 127.) Govermment appeurs, on the whole, to havo
been favorable to the Company; and they ohtained a fresh charter from the crown in 1690 . But in tho following year the trade was virtually lald open by a vote of the House of Commons, "that all the subjects of England had an equal right to trade to the East Indles, unless prohibited hy aet of Parlament.", Matters continued on thls footing till 1698. The pecuniary difficulties in whlch government was then involved, induced them to apply to the Company for a loan of
 The Company offered to advance $£ 700,000$ at 4 per cent.; lut the eredit of government was at the time so low, that thoy preferred accepting an offer from the assoclated merchants, who had previously opposed the Company, of the $£ 2,000,000$, at 8 per cent., on condition of thelr being formed into a new and exclusive company. While thla project was in agitation, the advocatea of free trade were not idle, but exerted themselves to show that, instead of establishing a new company, the old one ought to be abolished. But, however concluslve, their argumenta, having no adventitious recommendations in their favor, failed of maklng any Impreasion. The new company wae established by anthority of the legislature; and as tha charter of the nld company was not yet explred, the novel spectacle was exhitited of two legally constituted bedles, each elalming an exclusive right to the trade of the same possesaions !

Notwithstanding all the pretensions set up by those who lud obtulned tho new charter, during their struggle with the old company, it was immedistely seen that they wero as anxloui as the latter to suppress every thing like free trade. They had not, it was obvious, been actuated liy any enlarged viaws, but merely by a wish to grasp at the mol.. I, whieh they belleved would redound to thelr own Indivhlual interest. The public, in consequence, became equally disgusted with both parties ; or, If there were any difference, it is protable that the new company was looked upon with the greatest aversion, hasmuch as we ure naturally mono exasperated by what we conrelve to be duplicity nnd bad falth, than by fair undisguised hostilty.

At first the mutual hatred of the rival associatlons knew no lonnds. llut they were not long in perceivhig that such conduct would infallibly end in their ruin; and that while one was laboring to destroy the other, the friends of free trade might atep in and proenre the dissolution of both. In ennsequonce, they became gradally reconciled; and in $17^{-9}$, having adjusted their differenees, they resolved to 1 mm thenseves into one company, entitled The I/mited Company of Mferchauts of Eingland trating to the East Indies.
The authority of Parliament was soon after interpmed to give effect to this agreement.

The Walted Company enguged to advance $£ 1,200$,1000 to government without lnterest, whleh, as a previells alrance hal heen mude of $£ 2,000,000$ at 8 per cent., mate the totnl sum due to them by the putblic £ $5,200,000$, hearing interest at 5 per cent.; and government agreed to ratify the terms of their ngreement, and extend the charter to the 25th of March, 1726, with 3 yeara' notice.

While these importunt nutters were trnnsacting at. home, the ''ompmy had acquired some additional possessions in Intia. In 1692, the llengal ageney was transferred from Hooghly to Calcutta. In 16i8, the ('ompany nequirel a grant from one of the grandsons of Aurengrelie, of C'alcutta and 2 ndjolning villages; with leave to exprcise juliefary powers over the inhalo Itants, anil to erect fortlicatlona. These were soon after constructed, and recolved, in compliment to Willian IIt., then king of lingland, the nume of Fort William. The agency at llengal, which had hitherto been milisidlary only, wan now ralsed to the rank of a presldency.

The vigorous competition that had been earried on
for some years before the coalition of the old and new Companies, between them and the private truders, had occasioned a great additional Importation of Indian silks, piece goods, and other products, and a great re duction of their price. These circumstances occasioned the most vehement complaints among the home manufacturers, who resorted to the arguments invariamade use of on such occasions by those who wish to exclude foreign competition; affirming that manufactured Indis goods had been largely substituted for those of Fingland; that the Einglish manufucturers had been reduced to the cruel necessity either of selling nothing, or of selling their commodities at such a price as left them no proflt; that great number of their workmen had been thrown out of employment ; and, last of all, that Inclian goods were not bought by British goods, but ly gold and silver, the exportation of which had caused the general impoverishment of the kingdomi The merchants and othors interested in the India trade could not, as had previously happened to them in the controversy wlth respect to the exportation of bullion, meet these etatements without stacking the princlples on which they restod, and maintaining, in opposition to them, that it was for the advantage of every people to buy the products they wanted in the cheapest market. This just and sound principle was, in consequence, enforced in soveral petitions presented to Parliament by the importers of Indlan goods; and it was also enforced in several able publications that $n_{i} p$ peared at the time. But these arguments, how unanswerable soover thoy may now appear, had then but little influence; and, in 1701, an act was passed, prohibiting the importation of Indian manufuctured gools for home consimption.

For some years after the re-estullishment of the Compsny, it continued to prosecute its efforts to coneolidute and extend its commerce. Hut the unsettlod state of the Mogul empire, coupled with the determiation of the Company to establish factories In every convenient situntion, exposed their affairs to perpetus) vicissitudes. In 1715 , it was resolved to send an embass ${ }^{\text {r }}$ to LDelhl, to solicit from Furtucksur, an unworthy descendant of Aurengzebe, an extension and contirmation of the Company's territory and privileges. Alldreas, accident, and the proper applicution of presends, conspired to insure the succens of the embassy. Tha grants or patents aolicited thy the Company, wero Issued in 1717. They wero in all 34 . The substance of the privileges they conferred wim, that English vessels wreeked on the consts of the empire should be exempt from plunder; that the annual payment of a ntipulated sum to the government of Surat should free the Englimli trade at that port from nll duties and exactions; that those villages contiguons to Madras formerly granted und afterward refused by the government of Aroot, whould be restored to the Company; that the island of Din, near the pout of Masulpatam, ahould helens to the tompany, paying for it a flxed rent ; that in ljengal, all persons, whether European or native, Indehted or accountable to the Company, shoull be alelivered up to the presidency on demand; that goole of export or jmport, belonging to the Vinglah, might, under a dustuck or pasaport from the preaident of Calcutta, be conveyed duty free through the llengal jrovinces; and that tho linglinh should be at liberty to purchase the lordahip of 37 town contiguous to Calcutta, and, in fact, commanding both bankn of the river for 10 milen south of that city.-(imant'a sketch of the Mistory of the Eiast Intia Company, J. 128.

The important privilegen thos granted were Jong regarded as constituting the great charter of the Englimh in India. Some of them, however, were not fully conceded; but were withheld or moditied by the inlluence of the limporor's lieutenants, or sonbahiarn.

In 3717, the Company found themselves in clanger from a new competitor. In the course of that your
some ships appeared in Indla, fitted ont by privato adventurers from Ostend. Thelr euccess encouraged others to engage in the same line; and in 1722, the adventurers were formed into a company under a charter from hla Imperlal Majesty. The Dutch and Engllsh Companien, who hud so long been hostile to each other, at once laid asjde their animositles, aod joined heartily in an attempt to crush thelr new competitors. Remonstrances being fonnd ineffectual, force was resorted to; and the vessels of the Ostend Company were captured, under the most frivolous pretenses, in the open seas and on the coasts of Brazil. The Hritish and Dutch governments abetted the self: ish spirit of hostility displayed by their respective Companics. And the emperor was, in the end, glad to jurchase the support of Great Britain and IIelland to the pragmatic sanction, by the sacrlfice of the Company et Ostend.

Though the Company's trade had increased, it was still inconslderable, and it is very difficult, indeed, when one oxamines the accounts that have from time to time been publiahed of the Company's mercuntile affairs, to imagine how the idea ever came to be enter. tuined that their commerce was of any considerable, much less paramount, importance. At an averuge of the 10 years enting with 1724 , the total value of the British manufactures und other products annually exported to Indla, amounted to only $\boldsymbol{£ 9 2 , 4 1 0} 12 \mathrm{~s}$. Gd. The average value of the bullion annually exported, during the same period, amounted to $£ 518,10211 \mathrm{~s}$. Od., making the total annual average export $\mathbf{x} 617,513$ 3s. 10d. ; a truly pitiful sum, when we consider the woalth, population, nnd industry of the countries between which the Company's commerce was carried on ; and affording, by its smallness, a atrong presumptive proof of the effect of the monopoly in preventing the grow th of the trade.

At this period (1773) the total number of proprietors of last India stock, with their qualifications as they stool in the Company's lrook, were as follows:

| Lughshmen, possesslog $\mathbf{N 1}$ | ropreletor |  |
| :---: | :---: | :---: |
| stork and upwari. . .... | 487 | 21,012,399 |
| Foreigners, possessing $£ 1,000$ | 325 | 890,940 |
| Engilshmen, possessing di50 stock and upward. | 1,246 | 634,464 |
| Foreligners, pessrssing es500 stock and upward. ......... | 95 | 50,220 |
| Total. | 2,15: | £2, 594,029 |

Not withstanding the vast extension of the ('ompany's territories, their trade continued to bo uparently inaignificnnt. During the 3 years ending with liais, the value of the entirt exports of Hritish produce and manufactures, inclading military atores, exported by the Company to India and Chmn, amomed to $£ 1,400^{\circ}$, 411 , leing at the rate of $\mathrm{f} \mathbf{8} 8,803$ a year: the ammal exports of bullion during the mame perion being only: ext,933. During the sumo 3 years, 23 ships wailed unnually for India. The truth, indeed, seens to be, that, but for the lucreased consumption of tea in. tireat Britain, the Company would have entirely ceased to earry on may liranch of trade with the liast ; and that the monopoly would have excluded us as efrectually from the markets of India anl Chima as if the trade had reverted to lts ancient chameln, and tha route by the thape of Good llope been relinquished.

In 1081 , the exclusive privileges of the Compuny were extented to 1591, whth three years' notice; tho dividend on the Compinay's stock was fixed nt 8 per cent. ; three fuurths of their surplus reventes, after paying the dividend, and the sum of $£ 500,000$ parable to govermment, was to be uplifed to the public service, and tho remalning fourth to tho Company's own use. In 1780, the value of IIritish produce and manufactures expurted by the Company to India und Chima amounted wonly tide6,152; the bulllen exported during the same year was $\mathbf{6 1 5 , 0 1 \%}$. The total value of the exports during tho same year was $212,648,616$; showing that

the East India trade formed only one thirty-second part of the entire foreign trade of the empire !

The administration of Mr. Hastinga was one continued scene of war, negotistion, and intrigue. The state of the country, instead of being improved, becsme worse ; $\mathbf{s 0}$ mach so, that in a council minute by Marquis Cornwallis, dated the 18 th of September, 1789, it is distinctly stated, "that one third part of the Company's territory is now a jungle for wild beasts." Some abuses in the conduct of their nervants were, indeed, rectified; but, notwithstanding, the nett revenue of Bengal, Bahar, end Orisaa, which, in 1772, had amounted to $\boldsymbol{£} 2,126,766$, declined, in $\mathbf{1 7 8 5}$, to $\boldsymbol{£ 2 , 0 7 2 , 9 6 8}$. Thls exhaustion of the country, and tho expenses incurred in the war with Hyder All and France, involved the Company in freeh difficultics; and being uneble to mect them, they were obliged, in 1783, to present a petition to Parliament, setting forth their Inability to pay the stipulated sum of $£ 400,000$ a yesr to the public, and praying to be excused from that payment and to be supported by a loan of $£ 900,000$.

During the administrstion of Narquis Cornwallis, who succeeded Mr. Hastings, Tippoo Sait, the son of Ifyder Ali, was atripped of nearly half his dominions; the Company's territorial revenue was, in consequence, greatly increased; at the same time that the permanent settlement was carried Into effect in Bengal, and ether important changes accomplished. Opinlon has been long divided as to the influence of these changes. On the whole, however, we are inclined to think that they have heen decidediy advantageous. Lord Cornwallis was, beyond all question, a aincere friend to the people of India; and labored esrnestly, if not slways saccessfully, to promote their interesta, which he well knew were identified witli those of the British nation. During the 3 years ending with 1793 , the value of the Company's exports of British produce and manufactures fluctuated from $£ 928,781$ to $£ 1,031,262$. But this increuse is wholly to be ascribed to the reduction of the duty on tea in 1784, snd the vast increase that, consequently, took pisce in its consumption. (See article Tra.) IIad the consumption of tea continued stationory, there appear no grounds for thinking that the Company's exports in 1798 weuld have been greater than in 1780 , unless an increase had taken place in tho quantity of military stores exported.
in 1793, the Company's charter was prolonged till the 1st of March, 1814. In the act for this purpose, a species of provision was made for opening the trade to ludia to private individuals. All his msjesty's subjects, residing in any part of his European deminions, were allowed to export to India any articie of the produce or manufacture of the British deminions, except military stores, ammunition, masts, spars, corlage, pitch, tar, and copper; and the Company's sivil servants in India, and the freo merchants rewident there, were allowed to ship, on their own account and risk, all kinds of Indian goods, excejt calicoes, dimities, muslins, and other plece goods. Hut neither the merchants in Engiand, nor the Company's servants or merchants in Indin, were allowed to export or import except in Company's whips. And in order to lusure such conveyanep, it was enacted that the Company should anmally appropriate 3,000 tons of shipping for the use of private traders; it heing stipniated that they were to pay, in time of pence, $\mathrm{e}^{\prime \prime}$ notward, anit at 15 homeward, for overy ton oceupied by them in the Company's ships; and that thils freight might be raised In time of war, with the approbation of the Bonrd of Contrul.
it might have heen, unt, indeed, most probshly was, foreseen that very few IIritish merchants or manufactarers wonid lie inclined to avail themaelvea of the privilege of sending nut goods in Company's shipe; or of engaging in n trado fettered on all aidea by the jealousy of pewerful monopotiste, and where, consequentis, their auperior judgment and economy would have
avalled almost nothing. As far, therefore, as they werc concerned, the relaxation was more apparent than real, and did not produce any nseful reaults. It was, however, made use of to a conaiderable extent by private morchants in India; and also by the Compsny's servants returning from India, many of whom inveated a part, and some the whole, of their fortune, in pruduce fit for the European markets.

Notwlthstanding the vast sdditions made to their territories, the Company's commerce with them continued to be very inconsidersble. During the 5 years ending with 1811, the exports to India by the Company, exclusive of those made on account of individuals in their shipa, were as under:

| 1807. | 5952,416 | 1810......... $21,010,815$ |
| :---: | :---: | :---: |
| 1808. | 919,514 | 1811......... 1,088,816 |
|  | 866,158 |  |

The exporta by the private trade, and the privilegs trade, that is, the commanders and officers of tho Company's ships, during the above-mentioned years, were about as large. During the 5 years ending with 1807-8, the annual average imports into India by British private traders only, amounted to $£ 805,496$.Papers published by the East India Company in 1813, 4te. p. 56 .
The Company's exports include the value of the military stores sent from Great Britain to Indie. The ships employed in the trade to India and Chins, during the same 5 years, varied from 44 to 53 , and their hurden from 36,671 te 45,342 tons.

For some years previously to the terminstion of the Company's eharter in 1813, the conviction had been grining ground among sll classes, that the trade to the East was capable of being very greatly extended; and that it was solely owing to the want nf enterprise and competition, occasioned by its being subjected to a monopoly, that it was confined within such nurrow limits. Very great efferts were, consequently, msde by the manufacturing and conmercial interests to have the menopoly set aside, and the trade to the Dast thrown open. The Compsny vigorously resisted these pretensions; and had interest enough to procure a prolongation of the privilcgo of carrying on an excluaive trade to Chins to the 10th of April, 1831, with 3 years' notice; the government of India being continued in their hands for the same period. Fertunately, however, tho trade to India was opened under certain conditions to the public. The principal of these conditions were, that private individuals should trade, directly only, with the presidencies of Culeutta, Madras, and Bombay, and the port of Penang; that the versels fitted out by them alould not be under 350 tons' burden; and that they ahould abatain, unlese permitted by the Company, or the lloard of Control, from engaging in the carrying trade of India, or in the trade letween India and China. And yet, despite these disadvantages, sucis is the energy of individual enterprise as compared with monopoly, that the private traders guined an uimost immediute ascendancy over the Fast India Company, and in a very short time more than trebled our trade with India!

Int liexides leing injurions to the privato trader, and to the publie generally, hoth in Imdia and Enghand, this trade was of no advantage to the liast India ('ompuny. liuw indeed, could it he otherwise? A Company that maintained armien and retailed ten, that carried a swomi In the one land and a ledger in the ather, was a contradietion; and, had she traded with success, would have been a prodlgy. It was inpossibie for her to pay that attention to details that is indispensalite to the carrying on of commerce with advantuge. She may have gained something by tiue monopoly of the tea trade, though even that is questionalife; lut it la admitted on all hands that abe lost heavliy ly her trade to India. When, therefore, the question as to the renewal of the charter eame to he thacnased in 1832, the Company had no reasonabla
objection to urge egainat thelr beling deprived of the privilege of trading. And the act 8 and 4 Will. 4. o. $85_{1}$ for continuing the charter till 1854, terminated the Company's commercial character; by enacting, that the Compsny'e trade to Chins was to cease on the 22d of April, 1834, and that the Company was as soon as pos. aible after that date to diapose of their atocks on hand, and close thelr commercial husiness. And the wonderful Increase that hae since taken place in the trade with the East is the best proof of the sagacity and soundnesa of the oplnions of those by whose efforts the incubus of monopoly was removed.
II. Eaat India Company (Conatitution of).-At present the functions of the East Indis Compeny are wholly polltical. She is said to govern India, with the concurrence and under the supervision of the Board of Control, nearly on the plan laid down in Mr. Pitt's act. But, in point of fact, the government is substanthally vested in the latter; the Company's directors acting, except on some rare occasions, rather as a council to the l'resldent of the Board of Control, than as exercising an independent, or co-equal authority. All the real and personal property belongling to the Company on the 22d of April, 1834, was vested in the crown, and is held or mansiged by the Company in trust for the same, subject of course to all claims, debts, contructs, etc., already in existence, or that may hereafter be brought into exlatence by competent suthority. The Company's debts and liabllitien are all charged on India. The divilead, which is $10 \frac{1}{\text { per cent., is paid }}$ in England out of the revenues of India; and provision is made for the establishment of a security fund for its diacharge. The dividend may be redeented ly Purliament, on payment of $£ 200$ for $£ 100$ stock, any thine after April, 1874 ; but it was provided, in the event of the Company being deprived of the gevernment of India in 1854, that they might claim redemption of the dividend any time thereafter, upon three yeara' notlce.-(3 \& 4 Will. 4. c. 85.)-J. H. McCulloch.

East, (Germ. Ost.) The point of the horizon at which the sun rises at the time of the equinoxes; or the point determined ly a perpendleular to the meridian drawn toward the quarter of sunrise. The east is one of the four cardinal points of the compas.

## Dast India. See Inmi.

Bast River communicates with the IIudson in the Bay of New York, and is foimed by the narrowints of long Island Sound, which opens with a liroal uiouth at the eastern end lute, und receives a strong impulse from the tides In the Atlantic. Thils channel is so called in contradistinction to the North Kiver (the IIudsen). As the Sound contracts, to the west of the broud expanse in front of New IIsven, and forms what is called Riast River, the ocoanle currents act with a force that increases with the diminishing width of the atrean; und this causes higher tides here than at any other place around the island, arriving at New York about three quarters of an hour earler than those by the Narrows. This current drives upward along the east shore of the IIndson many miles in advance of the other, on the west; and thus the liulson has two tides, which hurdly unite their action till they have passed Tappan and liaverstraw blya, IIorll-Gate, IIeli-Gate, or IIurl-i iate, a ilnngerons and very erooked atrait li East Hiver, eight miles N. E. of New York, wan called by the lutch HorllGatt, signifylng whirlpool. The strait is formed ly projecting roeks that confine the water to n narrow and crooked clannel, occanioning strong eddy currents. Thery is a sufficlent depth of water for any vessels, but the pasage of large ships should only be utteinpted with skilliul pileta.--K. A.

Dau de Cologne. This well-known perfume la a solution of different volatile olls in pure atrong spirit. The principal condition for the preparation of a fine water is the employment of a apirit quite devold
of fusil-oil (oil of grain), and of all forelgn odor. In reapect to the proportion and kind of oils employed, wo have numerous formuls. It is of importance that these oila, which are usually purchaved of the druggists of the south of France, should be of the finest quality, and that no oil should be used in suffiolent quantity to allow of Its peculiar odor being recognizable in the mixture. The oile are to be diesolved in apirit, and the mixture allowed to stand for some weeks (or still better for some monthe), to improve its oder. Distillation does not affect thia; on the contrary a fresh distilled water requires to be kept a much longer time. Distllation is Indeed objectionable; for on account of the great volatility of the splrit, the oils in part remain behind in the etill. Distiliation can improve the odor only when the less volatile oil has been used in too great a quantity, and we wish to obtain a better proportion. Before all things, we should employ a pure, old, atrong epirit, and net too much of, nor too strongly smelling oil. The different sorts of volatile oil which are ohtained from varietles of citrons, oranges, and lemens, in dlfferent states of maturity; are the most important ; and, therefore, it is most important to ascertain their purity and goodness. Forster gives the following formula for the preparation of the eau de Celogne: Take of rectified spirit 82 per cent., of Trslles (=sp. gr. 0.855 ), 6 (wine) quarts; es sence of oranges, essence of bergamot, essence of citron, essence of limette, and essence of petits grains, of esch, $\overline{3} j$; easence of cedro, easence of sedrat essence de Portugal, and esseace de neroli, of each $\overline{3} \mathrm{ss}$; oil of rosemary, 3 ij ; and eill of thyme, 3 j .
Otto gives the following formula for a good eau rie Cologne: Hectifled spirit of 86 per cent.; of Tralles ( $=0.846 \mathrm{sp} . \mathrm{gr}$.), 200 (wine) quarts ; oil of citrons, th . iv ; oil of bergumot, th. ij; oil of neroli $\|$ th. ; oii of lavender, th. as; oil of roecmary, $\pm$ th. ; and spirit of ammeniu, $\bar{z}$ as. Nix: den't distill.

This preparation has long possessed great colebrity, in consequence chiefly of the numerous virtues as cribed to it by its venders; and is reserted to hy many votarics of fashion as a panacea against ailments of every kind. It is, however, nothing more than aromatized alcohol, and as such an agreeable companion for the toilet. Numerous fictitions recipes have been offered for prepuring eau de Cologne; the fullowing may be reckoned authentic, inving been iuparted by Fiarina himself to a friend.
'Take 60 galions of silent brandy; eage, and thyme, each 3 vi ; balin-mint and spearnint, each $\overline{3} \mathrm{xij}$; calanus aromaticus, 3 iv; root of angelica, 3 ij ; cimphor, 3 J ; petale of roses and violets, each $\frac{3}{3}$ iv; tlowera of lavender, $\bar{z} j$; llowers of orange, $\overline{3}$ iv; wormwood, $3^{j} j$; nuthegs, cloves, enswia, lignea, and mace, ench 3 iv; 2 oranges and 2 lemonn, cut in pieces. Allow the whole to macerate in the npirit during 24 hours, then distill off 40 gullons by the heat of a water bath. Add to the proluct; ensence ef lemens, of cedrat, of lmbin-mint, and of lavender, each 3 xij; neroii and the essence of the seed of anthos, each 3 iv; essence of jasmin, $3 j$; of bergamot, 3 xij . Filter, and preserve for use.

Cadet de Gassiucourt has proposed to prepare can do Cologne by the following recipe: Take alcohol at $33^{\circ}$ 13., 2 quarts ; neroll, essence of cedrat, of orange, of lemon, of hergamot, of rosemary, ench $2 \cdot 1$ drojes; add 3 ij of the seeds of leaser cartamoms; distill by the heat of a water isuth a plint und a half. When preparel as thus by simple mixture of essences, without distiliation, it ls never no geod. There in a curious content in Germiny concerning the veritable farina, who maken the celobrated ean le Cologne. The conteat was carrled even into the Crystal Palace, where there were four John Maria Farinas, all claiming to be the origlanl. It appears that apeculation la carried to ao high a piteh in Cologne, that any child entitied to the surnante of Furina is bargained for as aoon ay
born, and chri is even anticif

Eau de I scented, and $\mathbf{r}$ mastlc and bil remedy in Ind Ebony (G It. Egypt, a cit tremity of Afri and lic long. north by the Nubis, on the Sea, and on the
born, and christened Jean Maria. At times thls event is even anticipated.

Eau de Euce. A strong solution of ammonia, scented, and rendered milky by the addition of a little mastic and bil of amber. It is considered an effective remedy in India against the bite of poisonous snakes.

Ebony (Ger. Ebenholz; Da. Ebbenout; Fr. Ebène; It. Ebano; Rus. Ebenowoederevo; Lat. Ebenus), a species of wood brought principally from the East. It is exceedingly hard and heavy, of great durability, susceptilie of a very fine polish, and on that aecount rused in mosalc and other lnlail work. There are many sjecies of ebony. The best is that which is jet black, free from veins and rind, very compact, astringent, and of an acrid pungent taste. This species (denominated by botanists Diospyrus Ebenus) is found principaliy in Msdagascar, the Mauritius, and Ceylon. The centre oniy of the tree is snid to be valuable. In $1837,2160 \mathrm{cwt}$. of ebony, of the eatimated value of $£ 1275$ were exported from the Manritius. Besides the black, there are red, green, and yellow ebony; but the latter are not so mueh esteemed as the furmer. Cahinet-makers are in the habit of anbstituting penrtree and other woods dyed black, in the place of genuine ehony; these however, want ite polish and lustre, though they hold glue better. The price of ebony varies in the London market from $£ 5$ to $£ 20$ a ton. The quantities imported are but inconsiderable.

Ecuador. See Equador.
Eddy (Sax. ed, water, and en, bachoard), is the water of a stream or tide which, in consequence of striking against some obstacle, is thrown buekward, and runs in a direction opposite to that of the general current. More frequently, however, the term is used to denote the whirling or circulur motion caused hy the meeting of two opposite currente; snd in this sense it is aiso applied to a similar motion of atmosphere.

Eel (Anguilla muraena of Linneus), a fish, the appearance of which is too well known to require any description. It is a native of almost all the waters of Europe, frequenting not only rivers hut stagnant pools. Eels are, in many places, extremely ahundant, particularly in Holland nnd Jutland. Several ponds aro appropriaied in England to the rnising of eeis; and considerable numbers are taken in the Thames nud other rivers. But a large portion of the eeis used in England are furnished by llolland. Indeed, very few except Dutch eels are ever aeen in London; and even liampton and Rieimnond are principally supplied by them. The trade is earried on hy Duteh traders, who employ in it several smail vessels, by means of which the market is regularly and aniply provided for.

Effervescence (Int. effervesco). The escape of gaseous matter from liquids, us in the act of termentstion. Ail liguids from which bubbles of gus rapidily escupe, so as to resemble isuiling, are suid to effervesce.

Efflorescence (lat. effloresen, I fiuzer). The spontaneous crumbling down of transparent crystala, in eonseguence of tise loss of water.

Egge (Fr. (Bitfs ; lat. Ora), nre too well known to require to he dencribed. They differ in aize, color, taste, etc., necording to the different apecios of birds that lay them. The eggs of ponitry are those most commoniy used as food; and torm an article of very considerabie importance in a commercini point of view. The egge of plovers are esteemed a grent dellency, and make, indeed, it perpetunily recurring dish at fushionable dinners.

Egypt, a country situated ut the north-enstorn extremity of Afriea, leetween N. lat, $81^{\circ} 37^{\prime}$ nad $24^{\circ} 1^{\prime}$, and E . leng. $27^{\circ} 13^{\prime}$ and $84^{\circ} 12^{\prime}$; bonnded on the nortin iy the Meliterranean Sea, on the sonth by Nubia, on the east hy Paleatine, Arabia, and the Reid Sea, and on the west by the Groat Desert. The chief
field-produce is wheat (which is more grown than any uther kind of corn), barley, several aorts of millet, maize, rice, osts, elover, peas, the augar-cane, roses, two speciea of the tohacco-plant, and cotton. The sugar-cane is extensively cultivated, and excellent angar is manufactured from tt. There are fields of roses in the Feiyoon, which supply the market with rose-water. The tobacco produced in Egypt is conrse and atrong compared with that which is used by the middle and upper classes, and imported from Syria and Turkey. That of Syria is considered the beat. Of textile plants, the principal are hemp, cotton, and fiax ; and of plants used for dyeing, bastard, saffron, madder, woad, and the indigo-plant. The intoxicating hasheesh, which some smoke in a kind of waterpipe, formed of a cocoa-nut, two tubes, and a bowl, seldom used for any other narcotic, is not, as has been erroneously supposed, opinm, hut hemp. The effect is most baneful. The leaves of the hinnd-plant, grown in abundance, are used to tinge, of a bright-red celor, the palms of the hande, the soles of the feet, and the nails of both hande and feet, of women and children, the lasir of old ladies, and the tails of horses. Indige is very extensively employed to dye the shirts of the natives, of the poorer classes, and is, when very dark, the color of mourning ; therefore women, at funerals, and generally after a death, smear themselves with it. Oil is extracted from the seeds of the cottonplant, hemp, colewort, the poppy, the castor-oil plant, sesame, and flax. The high, coarse grass, called halieh (Poa synosuroides) grows in great quantity in waste places and smong ancient ruins.
Mr. Lane (1834) estimates the population of Egypt at less than $2,000,000$, and gives the following numbers as neariy those of the several classes of which it is mainly composed :

| Moslom Egyptlans (f and townspeople | 1,750,000 |
| :---: | :---: |
| Chrlstlan Egyptlans | 150,000 |
| Osminlves, or Tarks. | 10,900 |
| Syrians | \$,000 |
| Greeks | 5,000 |
| Arioenlan | 2,010 |
| Jews | b,000 |

und the remainder, exclusive of the Arabs of the desert, nliout 70,000 .

Sir Gardner Wilkinson (1843) computes the total at about $1,800,000$; but Clot-Bey (1840), not always an impartial writer, places it inuch higher, upward of $3,000,000$. The following result of the government census, taken in 1847-8, is remarkuble as shewing the system of fulsifying statistics for state purposes. It is copied from un official return :

| Mldde Ezypt... | 501,294 | E1 | 35 |
| :---: | :---: | :---: | :---: |
| Ei-Gharbeeyeh | 520,931) | 1 losetta. | 18,405 |

Since the conclusion of the Syrian war, until the present struggie, the bavy has been totally inactive. At tine former period, it numbered 11 sinips of the line, 6 trigates (one moved by stoam-jower), 5 corvettes, 9 irige (il being stenmers), and 2 cutters. Some of these were constructed in the naval yard at Alexandria, but the larger number were contracted for in Enrope. Great care was bestowed on the formation of the navy, and the eatnblishments connected with it at Alexanirita, lut the Egyitians do not seem to he a maritime peuple, or, at any rate, their men-of-war have none of the tantneas and neatness of European ahips of the class.-1: 13.

The trade with liurope is carried on through Alexandria, The traftie with the intorior of Africa is carried on ly means of carnvnns, winich bring, i.n exchango for European and Egyjutian products, ivory, gold-dast,
akins, wool, gnm, ostrich-feathers, and metals. The chief commercial relations with Arabia and India are carried on ly Coseeir and Suez. Since the establishment of regular steam-packets in the Mediterranean and the Indian Ocean, Egypt has become the reute to India fer all the correapondence of Europe, as well aa for the greater portion of travelers. The principal means of communication at present are the Nile, which is traversed by ateam-packets, and the canals, many of which have been repaired by Mehemet Ali; but even the best of them are often unnavigable during a great part of the year. The route from Caire to Suez ( 180 miles) is traversed by horses and vans, and the mail is conveyed in 13 hours. Tho project of uniting the Mediterranean with the Red Sea, by re-opening the ancient canal, inas been recently revived, but it is surrounded with difficulties, and not likely to be earried into effect. The more praeticable and safe plan of a railroad communication between Cairo and Suez has been resolved on, and a portion of it built. This may again remiler Egy'pt the principal entrepót of commerce between the eastern and the western worlds.
Commerce.-The general commerce of Egypt in 1851, reaehed a total of $144,509,000$ franes, or, in round numbers, $228,902,000$; which shows an increase, when compared with 1841, of $4,000,000$ francs, or nearly $\$ 9,000,000$.
It is difficult to obtain any sccurate returns of the cemmercial movements of Egypt, except such as are prepared by the foreign consuis residing at the different ports of that country, and transmitted to their respective governments. From such sourees the following talile is compiled, showing the export trade of Egypt, and vessels employed, during a period of 11 years, ending with 1851:

| Yearn. | Plavires, | Dollars. | Vensal\|\%. |
| :---: | :---: | :---: | :---: |
| 1841. | 198,270,150 | 0,918,507 | 1,280 |
| 1842. | 180,446,600 | 9,022,830 | 1,854) |
| 1848. | 191,58\%,400 | 9,576,920 | 1,870 |
| 1844. | 167, 968,430 | 8,398,421 | 1,2017 |
| 1845. | 155,782,200 | $0.249,110$ | 1,197 |
| 1846 | 187.841.980 | 9,367,054 | 1,221 |
| 1847. | 801,343, 600 | 15,067,175 | 1,46 |
| 1844. | 157,286,546 | 7. 61,427 | 1,068 |
| 1849. | 208,0, 6, 232 | 10,152,811 | 1,619 |
| 1851. | 315,807,400 | 15,767,990 | 1,650 |
| 1851. | 825, 004,695 | 16,290,2:34 | 1.70:3 |

The value of the plestre varles. That of dlexandria is reekoned at 5 rents United States* eurreacy; that of Turkey generally is equivalont to 4 eents.
The import trade in 18.41 , the first year given in the table, reached $187,000,000$ pisstres $=89,350,000$, und ascended in 1851, the last year, to $230,000,000$ pinstres, or about $\$ 11,500,000$. The articles which diminished in the lmpert returns during the period, were sugar, linenk, certain kinds of silks, and rum; and the diminution was athout equal to the increased praluction of those articles in Egypt. The huportation Sncrensed in woolens, cottons, French allks, and articles of fushion.

The English thag oceupies the first rank in the returns from which the preceding ligures are taken, though, since the repeal of the uavigution laws of Great Britain in 18.50 , the inlwortations under the thags of other countries of northern Europe have largely litcreased.
Alexuadra.--The trade of this port has increased rapidly since the opening of the canal which communieates between Alexambria nul the Nile at Atfeh. This communication han takell a way from the ports of Damietta and Rosetta the extensive commerce formerly enjoyed by them, and for witich, from their po-
sition on the two mouthe of the Nile, they posseased great advantages. The total trade of Alexandris in 1840, amounted in value to $\$ 11,097,145$, of which thero were for imports $\$ 6,636,980$, and for exports 45,860 ,165. This trade in 1842 reached in value $\$ 21,000,000$, an increase over 1840 of ever $\$ 9,000,000$. The tresty of 1838, plaeing foroign commerce on a more secure basis than had previously existed, and the tranqnillity which followed the settlement of the dimculties of 1840, were the causes of this grest augmentation in the trade of 1842. Among the exports of this year, ruw cotton reached in value $\$ 1,800,000$, of which Austria reeeived upward of $\$ 1,000,000$ in value. The trade of 1843 exhibits a falling off from that of the preceding year, aggregating only (imports and exports united) about $\$ 19,000,0110$, of which rav: cotton reached in value alout $\$ 2,000,000$. In 1844 the total trate of this port fell again to alout $\mathbf{~} 13,000,000$; and in 1846 the totale reached nearly $\$ 18,000,000$, of which, for cotton, there were $\$ 2,000,000$. In 1849 the foreign trude of Alexandria reached $\$ 16,000,000$, of which for imports, there were $\$ 7,500,000$, and for exports, $\$ 8$, , 500,000 . The raw eotton experted this year reached in quantity 258,000 quintals (the quintal, or cuntar, is estimated at 100 lbs. ), or $25,800,000 \mathrm{lbs}$., vulued at \&2,775,000. The tranquillity whieh prevai'ed in Ekypt during the ten yeurs anterior to 3850 , wa highly favorable to the dovelopment of its foreign commerce. The treaty of 1838, guarantying the unreatricted circulation through Egypt of European merchandise, and its freedom from the vexatious taxes to which it was subjected before that perioul, contributed in like manner to the prosperity of this port in 1800. The total trade exceeted in value $\$ 19$, 1600,000 , a tigure which it had never before reached, excepting in the year 18.12, when the large augmentation was lirought about by causes paroly nceidental. Of this kum, imports reached nearly $\$ 8,000,000$, and exports about $11,000,000$. Of the lutter, raw cotton amounted in quantity to $82,084,500 \mathrm{lbs}$., and in value to $\$ 1,200,1000$.
The establishment of a national lank in Alexandria, under the title of lank of Expyt, has already, though not in operation, commenced a revolution in the ideas of the fellaas, or cultivators of the soil, with respect to money matters. It is well known that the fellahs lave hitherto hoaried or buried the cash thry have recelyed for their prolnce. Since they have heen paid ly drafts on the liank of Egypt, and they final the node in which those drafts are carbed is so satisfactory, some of the more wealthy have opencll atrounts with the bank, and deposited their savings there for safe keeping. Should this practice leeome general, and the many millions which are known to to hoarded by the fellaha lie brought into circulation and laid out in prolitable investments, it must produce an mormons elfect on the prosperity of the country in general.
It is worthy of notice, that, in the voluminous reports from which the preceding statoments of the trade, both of Lisypt and its principal port, Alexandria, are extracted, the C'nited States does not unce appear. A despatch to the State Depuirtment, dated Alexandria, May I, 1 nubi, states that "the increase in forcign traders is very perceptille, but there are few l,ranches of American houses umong them." Lingland, France, and Austria, seen to have been the priacipal foreign countries which participated in this trade. The total trade of 1851 reached *20, $000,(\mu)$, and that of $180^{2}$ ascended to upward of $\$ 1,000,000$, of which a large share is ussigned to Turkey and Syria. The quantity of raw cotton exported the latter year was 718,65is quintals, valued at $\$ 6,960,243$. The whole of this cotton was sent to Eingland, France, and Austrin, in the following proportions: to Englani, 126,118 quintals ; to Austria, 159,300 quintals; and to lrance, 128,030 quintals. These figures, as well as those cur-
ployed througho from Freneh offle on those of $\mathbf{E g}$ ever, are deemed

*The cantar of Egypt is estimated at 100 pounds.
During the same year, an English house at Alexandria sent two vessels to New York, and an Austrian house two more to the same destination, loaded chiefly with gums, rags, ete. There is 10 doult that s profitable trade might be established between the United States and the port of Alexnndria, by sending out such merchandise as usually finds a market in Egypt, and receiving in return the rich and vuried exports of that extensive emporium.
Colton.-The cotton culturo of Egypt commenced in 1818, and exportation to England in 1823. The seed is said to have been imported by the pacha "from America, the Mediterrancan, and Brazil;" and these different kinds of cotton may, therefore, be met in cultivation. The attempt to enltivate the sea Ishand cutton is pronounced a fuilure-the quality deteriorating rapilly after the first crop-although the best ligyptian cetton, ealled Maho (so called from Maho-Bey, in whose garden, at Cairo, the plant was first discovered, having, probably, been introduced from the Isle of Bourbon during the French invasion, is ranked next to sea island in length of staple. The comparative tabular statement subjoined, made up from consular returns (the bale being estimated at 300 lbs .), shows the quantities of cotton exported at the port of Alexandria, snd the countries to which exported, respectively, during a period of threo years. The quantity exported in 1852 is stated to have been as follows: to Great Britain, $57,623,400 \mathrm{lbs}$; to France, 12,350,100 1bs. ; to Austria, 11,429,700 liss. ; elsewhere, $\mathbf{3 5 9 , 1 0 0 ~ \mathrm { lhs } \text { . ; pre- }}$ senting an aggregate of $81, .62,300 \mathrm{lbs}$., und far exceeding that of either of the threc ensuing years, as given in the following table :

Pounis of Cotton expoatid from Alexandaia, 1868-1855.

| Total | 43,855,200 | 43,546,500 | 56, 974,300 |

If to the aggragate exported, be added from tive to six millions pounds consumed in the country, a liberal extimate of the nunual amomet of cotton produced in Fsypt-between lifty and sixty million pounds-will have been marle. The factories established by Mohemet Ali are, it is stated, going rapidly to ruin. The cotton goods manufactured are coarse "captns," or soldiers' "nizam" unifurm. Duch cotton is used also in making up divans, the usual furniture in Egryt.Com, Refations U. S. See article Alexannhia.
The Eigypthan measures are, the "titr," or space measured ly the extension of the thumb nind tirst finger; the " shibr," or span ; the common cubit $=22$ 2 inches, the cubit of about 25 helhes, used principally for Indian goorls, and the cubit of about $26 \frac{1}{2}$ inches, used for European cloth. Of the measures of hand, the feddan was equal to about one English acro und one tenth; it is now less than an were. It is divided into " keeráts," or $\quad$-fthas, and consist s of $333 \%$ kasuleh or rods. The kasaboh is 22 "kubclalis," and the kabdah, alout $6 \mathbf{f}$ inches, or the measure of a man's tist with the thumb erect. The Eisyptian league varies in Upper and Lower Egypt, and Is stated to be, in the of dueklings is liatehed, the uest le again visited and
former, equal to a journey of an hour and a half, and in the latter, to one hour's journey. The "ardeb" is equal to very nearly five bushels, and consists of six " woybehs," and each weybeh of four "rubas."

Weights.-The weights are the "kamhah" (or gralu of wheat), the 64 th of a " dirhem," and 4th of a "keerat." It ls equal to about $\frac{8}{4}$ of an English grain. The "habbeh" (or grain of burley) is the 48th of a dirhem and $3 d$ of a keerit, and $=127-128$ th English grain. The keerat, or carst, is the 24th of a "mitkal ;" and= from 2 125-128ths to 3 English grains. The dirhem $=47$ 5-8ths to 48 English grains. The mitkál= weight of a deenár=from 71 7-16ths to 72 English grains. The "wukceyeh," or ounce=from $571 \frac{1}{2}$ to 576 English grains. 'The "ratl," or pound =from 1 li. 2 oz. $5 \frac{8}{4}$ dwt. to about 1 lb .2 oz .8 dwt. troy. The "wukkah," or oke $=$ from $3 \mathrm{lb} .3 \mathrm{oz}, 13$ 年 dwt. to 3 lb . 4 oz. troy. The "cantár," or 100 weight $=$ from 98 lbs., less 200 grs ., to about 98 lb . avoirdupois.

Money,-European sovereigns and dollara are current in Egypt, the former beingt now equivalent to about 100 piastres, the latter, if French, to about 20 piastres, and if Spanish (pillur-dollars), to about 22 piastres; but the value of these coins is constuntly changing. The Spanish doubloon, and Venetian sequin are also current, and so are Constantinople coins. Of native coin, the "faddah," or para, is equal to 6 -25ths of a farthing, and there are pieces of 5,10 , and 20 faddalis. The "kirsh," or Egyptian piastre, contains 40 fuddabs, and is equal to 2 and 2 -5ths peneo. These coins are of silver and copper. Of gold coins, there are the " khoyreeyeh," of 4 piastres, and the kheyrecyeh of 9 piastres (but the valne of these coins hus recently depreciated), and pieces of $5,10,20$, and 100 piastres. The "riyal beledee," or native dollar, is equal to 90 paras, but is only a nominal money, as is the " kees," or purse, which contains 500 piastres, and the "khazneh," or treasury' of 1,000 pursee. For the welghts, measures, and money, we are indebted tc the Modern Egyptians.-E. B. See Alexanimia.

Eider-duck. The species of duck so-called is one of the lurgest and most valunblo of tho inatide, and, from certain moditications of the beak and sternum, constitutes the type of a subgenus, called Somateria. The common eider (Somateria mollissima) frequents, in great numbers, the Orkneys, Hebrides, and Shetland isles. It is defended from the celd of the dreary uorthern coasts by the development of an unusual (fuuntity of the linest duwn benenth its denso exterior plumage, which is equally well adapted to form an impenetrable barrier to the wet. The duwn of the eider constitutes its chief value, as it combines with its peculiar softness, tineness, and lightness, so groat a degree of elasticity that the quantity of this material which might ba compressed and concealed hetween twe lands will serve to stuff a coverlet. As the fomule plucks from her own body a quantity of her finest down to line ber nest, the Oreadians avall themselves of this instinct, and take an early opportunity to rob the nest of both eggs und down. She then begins to lay afresh, and envelopes her eggs with mother fayer of down; and if thls be removed, the male is said to contribute his own down, when the
the dorin removed. Thus a cenalderable quantity of the valuable material furniahed by tha elder-duck la obtained independently of that which la plucked from the slaughtered birds. Kesiden the down and eggs, the Ialandera turn the akins and flenh of the eldera to proft; whlle these birds cost them no expenae, as they feed entirely on sen-weed and other natural productinns of the ocean.

Blantio Bands. (Tissus Elastiques, Fr.; Feder-harz-zeige, Germ.) The manufacture of lraces and garters, with thremls of caontchouc, either naked or covered, acems to have originated, aemo tlme ago, in Vienna, whence it was a few years aince imported inte Paris, and thence into thls country. At first, the pear-ahaped bottle of the Indian rubleer wna cut into long narrow strips by the scissors; a single operative turning off only sbout 100 yards in a day, by cutting the pear in a spirui direction. IIs succeeded next in soparating with a pair of pincers the several layers of which the bottle was compesed. Another modo of ohtaining fine threads was to cut them out of a bottle which had been rendered thin by inflution with a forcing pump. All these operations are furilitated by previously steeping the caoutchouc in boiling water, in its moderately inflated atate. More recently, machlnen have been successfully employed for cutting ont these filautents, but for this purpose the loottle of canutchoue la transformed into a dise of equal thickness in all its parts, and perfectly circular. Thia prelimianry operation is executed as follows: 1. The bottle, moftenad in he: water, is squeezed between the two platen of a press, the neck liaving been removed beforehand, as useless in this point of view; 2. The bottle is then cut into $t$ wo equal parts, and is a!lowed to consolklate hy cooling, hefore sutjecting it to the cutting Instrument. When the bottle is atrong enough, and of variable thickness in its different pointe, each half is submitted to powerful pressure in a very atrong cylindrienl mold of metal, into which a metallic planger descends, which forces the cuoutchoue to take the form of a flat cylinder with a circnlar base. The mold is planged into hot waser during the compression. A stem or rod of lron, which goes neross the hollow mold and piston, retains the latter in lts place, notwithataniling the resilien o of the canutchonc, when the mold is taken from the press. The mold being then cooled in water, the caoutchouc is withdrawn.

The tranaformation of the dise of caoutchenc into fine threads is performed by two mnehines; the flrst of which cuts it linto a ribion of equal thickness in itn whole extent, running In a apiral direction from the circumference to the centra; the second subdivides this ribuon lengthwlse into several parallel filamenta much narrower but equally thick.-Uus's Died.

Elba, ealled Jiva by the Jomans, and Nethatin by the Greeks, ass island in the Mediterranean Sea lying off the pronsontory of Populonium, at equal clistames from Corslea and the Italian mainland, though somewhat nearer the latter. Its outline is extremely irregular, and its sides are indented by numerous inlets and arms of the sea, reducing its breadth In some places to niont 3 miles. The extreme length of the island is about 1 s miles; its extreme trendth ahont 12 mlles ; nnil its area atont 150 miles. The whole length of the island la oceupled by a mountain range, one peak of which (that of (apanna) rises to the hoight of about 3000 feet above the sen. The mountains of thals range, though themselves barren, Inclose valleys of considerable fertility. Vines, olives, and mulberries, grow in large quantlies in this lasland, which alao produces whent, Inilian corn, and vegetnbled in abundance. Some of the wine proluced in Elba ls of excellent quality, and a consiulerable quantity of it is annually exported. The smaller domestic nnimals thrive well and are very numerous In the lsland; bat the larger
kinds, auch as oxen and horses, are somewhat scarce The fisheriea off the coast are lmportant.

The Iren mines of Elba, in modera, as in anclent times, are extremely valuablo. The great faclity with whlch the metal is worked, and the abundance in which it is found, renilor these mines among the most valuable of their kind in the world. Tha ore ls dug from a hill, 500 feet high and nearly 2 miles in eircumference, which is Itself almoat entirely one masa of ore. When rmelted, it is fonmil to contsln on an average about 60 per cent. of pure iron. Fuel on the lsland is very rearce; and the ore is consequently conveyed on shiphonrd to the adjoining mainland to he momelted. The total quantity of iron ore annually extracted amounts to nearly 20,000 tons, giving employment to 130 miners. The asit mines of Elba are hardly inferior in celelority to the iron ones. About $4,000,000$ ponnds ara annually produced, giving employment to ubout 100 workmen. Ilesides Porto Ferrajo, the capital, and the town of Porto Longene, Elba contalins no town of any size or importance. Campo, Capo Liveri, Marclana, and Rio are mere villages or fishing stiations. In ancient hlatory, tha name of lilba very rarely occurs; and in modern times it is chiefly mema. ratule as having been the residence of the Emperer Napoleon, after his first abslication, from May 1814 till Februnry 1815. From that time till the present, Ellha has heen an appanage of the Grand Duchy of Tuscany. Pop. (1851) 21,559.

Elbe (the Alhis of the ancients), a large river of Germany, which rises in the Riesen Gebirge, or Glant's Mountains, letween Silesia and Bohemia, and is known at its source by the Sclavonic name of Iadbe, Its principal seurces are the White Fountain, at the base of the Schnee-Kuppe, and the 11 fountains of the Flto in the Navnrian meadow. To the number of strenms which descend into lohemia from the neighloring monntains it owes its early increase. After its junction with the river Eger, it becomes naviguthle; and, entering Saxony, it passes successively Dresden, Melssen, Torgan, and Wittenberg. In Its course, which is northerly, It recelves as tributaries the Muldau and the Saale; mud running through the territory of Magiehnrg and the duchies of Mecklenburg and Lamenfiorg, it ilischurges itself at last into the German Ocean, about 70 miles below Jamburg, after a course of 500 miles. 'The lille has always been an important river in a military point of view. With respect ta commeree, it is of lnestimabla value to the comntries of north-west and central Germnny, being the channel by which they export their surplus products, and recelvo their imports from nbroad. It pives to llamburg its eommand of the navigation far into the interior, although the voyage is difficult on account of the numerous sand-tanks with which the estuary and the rivers are encumbered. It communicates with the Havel by the canal of Plauen, in tho territory of Magrleburg; and nt Itamburg it is coonected in tike manner with the Trive nt lubec. It is alse joined to the Wesse by a rannl running between Vegessk and Stade. By the rallway from Leitmeritz to Viema It communicates with the janube; and the other railways that tonch wism other quarters of the river supply channels for at ributing merchandise through the varions distriet:, which they traverse. A bout 40 miles from its noures, the elevation of the river above the level of the sea, is only foss feet ; at Schandau it is 311 feet ; at Drosilen, 279 feet ; and at Arneburg in Urandenhurg, only 176 feet.

Formerly ${ }^{3}$ entrepóts (Pirua, Dremlen, and Magdeburg), and 35 tolls, nad numerous corporations of privileged watermen, opposed nlmost lusurmountahio difficultiea to the nuvigation: the Austrins and the Suxons coald nlone navigate the Upper Elbe, that is, from Magleburg to where it ceuses to be navigablo, and the I'rusaians and Ilamburgers had the nole privilege of navigating the lower Filoo. Ilut the navigu-
tion of the river tlen concluded or bordering states, ever, Denmark brand duchy of principalitles of the principle of chant, to whatev with his own ve course of the riv were reduced to upon goods of th which are pald, other for the shl was bound to w passed through tl every thing injuı But netwithatan still exposed to Wood, stones, frı cipal articles the salt, and colonis which are carried the dutien are le to the abollishmes onlinary port chi

Electrogra line engraving, electro-copper fauiliar process lines of the eng may, tho depos distinctly-so it compared with cain produce. tiful procesmes, pose that a lar, copied. The p of eopper, and electro deposit. from the phate, to the plato, pro and cavitiex in film is cmploye turn, immersed a secont deposit to continue unt duced; and thit film, is seen to graved plata fir semblance, that an inked impr from one print explerienced juc all respecta.
tion of the river was definitely iogulated by a conventlon concluded on the 18th June, 1821, between all the bordering states, viz., Austria, Saxony, Pruseia, Hanover, Denmark (for IIolstein and Lainenburg), the $k^{\text {rand }}$ duchy of Mecklenbarg-Schwerin, and the three principalities of Anhalc. Thls convention eatablished the principle of free aavigatlon, allowing every merchant, to whatever bordering etato he might belong, with his own vessel and crew to navigate the whole course of the river without interruption ; the 35 tolle were reduced to 14 ; the heavy dues which were levied upon groods of the first necessity were reduced to those which are pald, oue for the cargo (Elbe Toll), and the other for the shlp (Recognitionsgebuhr); and each state was bound to watch over the portion of river which passed throngh their territories, and to preserve it from every thlng injurious to the commerce or navigation. But notwithatanding these regulations, merchants are still exposed to vexatious burdens and interraptions. Wood, stones, fruits, and earthenware, are the principal artleles that are brought down the Bibe. Corn, salt, and colonial produce are the principal articles which are carried up, and on these the greater part of the duties are levied. lior a later ordinnnce relating to the abollshment of all tolls on the Elbe except the ordioary port charges, see article Hambung.

Ei Dorado (Span, the golden region). The mame given hy the Spaniards to an imaginary country, supposed in the 16 th century to be situated in the interior of South America, between the Rivers Orinoco snd Amazon, and, as the name implied, abounding in gold sid all manner of precious stones. After the Spsnish conquest of Mexico and l'ern, the most exsggerated accounts of the wealth and riches of the newly ncquired territory were circulated and believed. A new region was falifed to exist far surpassing the weslth and splendor of Peru; expeditions were fitted out for the parpose of discovering it ; and though all such nttempts proved abortive, the rumors of its existence continued to bo believed down to the begimning of last century. The term has now passed into the language of poetry, in which it is used to express a land of boundless wealth and felicity, like the nncient Elysium or the Mohamimedan Paradise. See a lenrned article on "Sir Wralter Raleigh," in vol. Ixxii., of the Bilin. Reviero, which contuins a resumé of all the speculations that have been entertained upon this subject.
Electrography. The copying of an exquisite lins engraving, from a copper or stecl plate to an electro-copper deposit, although now become a very famitiar process, ls really a wonderful one; for, let the lines of the engraving be as fine and minute as they mav, the deposited atoms of copper mark them all distinetly-so infinitely small is ench intom or particle compared with any magnitude which human hands can produce. Like mnny other wonderful and beantiful processes, this is a very simple one. Let us suppose thut a large steel or copper engraving is to he so copiel. The plate is immersed in a chemical solution of enprer, mud a thick tilin is precipitated on it by electru deposit. This film may be eusily loosened from the plate, and its aurface then iresents a reverse to the phate, protubennces instend of engraved lines, and cavities instead of plain or raised portions. The film is cmpleyed us a sort of molul ; for it is in its furn, imnersed in the solution, and made the basis for a second deposition. This second deposition is nllowed to continue until a phate as thick as the original is produced; and this plute, when separated from its parent film, is seen to be an exnet counterpart of the engraved plate first operated upon. So jerfect is the resemilance, that, if the electro-plate be mule with cure, an inked impression printed from it can be detected from one printed from the orlgiual plate only liy an experienced judge ; to ordinary eyes they are equal in slì respects.

To M. Jacobl-almost simultaneously with Mr. Spencer-we are indebted for one of the simplest end moet elegant applications of electricity-the galvanoplastic art, or Volatype. In this, advantage is taken of the perfectly metallic state in which the base of a metallie salt is deposited at the negatlve pole of a volatile combination. In the case, for example, of the decomposition of sulphate of copper, the sulphurio acid unites with the positive wire, or remains enepended, while the metallic copper is slowly and homogeneously deposited on the eurfuce of any object (rendered conducting by the application of black lead or otherwise), of which it forms a perfect mold, from which a fresh cast or fac-simile in metal of the original object may be obtained by a repetition of the process. To see the veins of a leaf, or the delicate wing of an insect thus metallized, is certainly an astonishing thing ; and the applications to the useful arts are far too numerous to be noticed here. Daniel'e invention of the Constant Battery evidently euggested tho Volatype.

Elemi, a resin olitained from the Amyris elemifera, a tree growing in different parts of Amerlca, Turkey, etc. It is obtained by wounding the bark in dry weather, the juice being left to thicken in the oun. It is of a pale yellow color, semi-transparent-at first softish, but it hardens by keeping. lts taste is slightly litter nad warm. Its smell, which is, at first, strong nad fragrant, grudually diminishos. It used to be imported in long roundish cakes, wrapped in flag-leaves, tut it is now usually imported in mats and chests.-Tuomson's Chemistry.

Elixir (Arab), a term applled in old pharmacy to certain essences or tinctures; a mixture of an aromatic tincture with sulphuric acld was called elixir of ritriol. The alchemists applied the term elixir to various eoluthons employed in the art of transmutation.

Ell (Lat. Ulna), a measure used chiefly for cloth, and varying in length in different countries. The IInglish and Flemish ells were those most in use in Great Britain. The English ell is 45 inches, while the limemish ell is only 27 inches or $\frac{8}{4}$ of a yard. In Scotland the ell is 37 1-5 Finglish inches.

Elm (Ulmus), a forest tree of which there are eeveral varieties. It attains to a grent size, and lives to a great age. Its trunk is often rugged and crooked, und it is of slow growth. The color of the heart-wood of elm is generally darker than that of oak, and of a rcilder brown. The sup-wood is of a ycllowish or brownish white, with pores inclined to red. It is in general porous und cross-grained, sometimes coursegrained, and has no large sopta. It hus a peculiar odor. It twists and warps much in drying, and shrinks very much both in length and breadth. It is difficult to work, hut is not liuhle to split, and bears the driving of bolts and nails better than sny other timber. In Scotland, chuirs and other articles or household furniture are frequently inade of elm wood; Int in England, where the wool is inferior, it is chiefly used in the manufacture of coffins, casks, pumps, pipes, etc. It is appropriated to these purposes because of its grent durability in water, which also oceasions its extensive use as piles, and planking for wet foundations. The naves of wheels are frequently made of olm ; those of the heavy wagons and drays are male of oak, which supports a heavier weight, but does not holl the spokes so firmly. Nin is said to bear transplanting better than any other large troe.Tusbgom's Irinciples of Carpentry.

The wood of the Ulmus Americanc, like that of the European elu, is of 4 dark hrown color, und is linble to decay when exposed to the alternations of moisture and dryness; and when cut transversely or obliquely to the longitudinsl tibres, it exhibits the same numerons und tine undulatlons; but it splits more easily und has less compactness, hardness, und strengthweighing, when perfectly dry, only 33 pounds to a
oublo foot. The priacipal usea to which thia timber is epplied, are for making naves or hubs to whoels, for piles and foundation-piecea to milla, canal-locks, and for many other purposes where atrength is required, and the work is constantly buried in water or mud. In the State of Malne it in occasionally employed for the keele to vessels, for which purpose it to well adapted on account of ita aixe. It is alao employed for the awingle-krees of the carriages of great-guna, and in some parts of the country, where more appropriate wood is not to be found, it in used for making ox-yokea, aleds, and other implements of hushandry. The berk, which is easily detached from the tree daring 8 months of the year, is sometimes need for making bast-mats, ropes or withes, and for the bottoms of chalrs. The wood, when dry, makes excellent fuel, and, when burned, yields a large proportion of ashen, which abound in alkaline salta. In Canada, and in the northern parts of the States of Maine, New Hampshire, Vermont, and New York, a profitahle business is foilowed, especially in connection with clearing the foresta, in preparing the salta of lay, for the manufacture of potash.-Bnowns'a Trees of A merica.
glaineur, or Eelmingor, a town of Zanland, on the Sound, about 22 miles north of Copenhagen, lat. $56^{\circ}$ $2^{\prime} 17^{\prime \prime}$ N., long. $12^{\circ} 38^{\prime} 2^{\prime \prime}$ E. Population about 8,000 . Adjuceat to Elsineur is the castle of Croniborg, which

The statements in tais table for the yesra 1777 and 1780 are taken from the valuable work entitled Voyage de Deux Prangois au Norl de l'Europe (1. 860); the other yeare are taken from the returns sent by the British consul at Edsinaur, printed in various Parliamentary papern. We have seen no two returns of the shipping that pass tho Sound quite agree, tiough tio differences are not very matcrial. The British consui first began to send returna of the tonnage in 1831.
The Oder, Vistula, sud other great rivers which flow ilito the Baltic, and the many large cities that are built on or near its shores, have made it the theatre of a very extensive commerce. In this respect its insportance was much increased by the foundation of Petersburg, the trade of which is now of great extent and value. Raw producta, including corn, timber, hemp and flax, tallow, hiden, linseed, bristies, wool, etc., constitute the principal articiag of export from the Baltic ports; colonial prolucta, manufactured goodn, dry stuffs, wine, salt, coal, etc., being among the priacipal articies of import. The leading porth, setting out from the Sound, are Copentragen, Lubec, Wismar, lostock, Swinemunde, Dantzic (which next to Odessa, is the principal European port for the shipment of wheat), Konigsierg, Memei, Riga, Petersburg, and Stockhnim. The Uuited Kingdom han hy far the largest portion of the foreign trade of the Bultic. This is evident from the fact of the British ships pasing
commands the entrance to tha Baitic by the Sound. All merchant ahipa passing to and from the Bultic were obliged, untll 1857, to salute Cronborg castle by hoisting their colors when abreast of the same ; and no merchant dblp was allowed to pasan the Sound without clearing out at Elsinear, and paying toll, according to the provisions in the treaties to that effect negotiated with Denmark by the different European powers. The frat treaty with Eagland having refarence to this aubject, is dated in 1450. The Sonnd dutiea had their origin in an agreement between the King of Denmark on the one part, and the linase Towns on the other, by which the former undertook to construct light. housea, landmarko, ato., nlong the Cattegat, and the latter to pay duty for the same. The duties have since been varied at difierent periods. (See articie, Danish Sound Duea.) Ships of war are exempted from the payment of duties. Most maritime nations have consuls reaident at Elsineur. The foilowing plan of the Sound is taken frn the admiraity clart, compiled from Danish suthorities. (See opposite paga.)
Navigation of the Baltic.-This is oxhibited in the following account of the number of ships that have passed (koing and returning) the Sound at different periods, from the year 1777 to the year 1852, specifying the countries to which they belonged.
the Souad exceeded those of any other country. In 1852 England imported from tho Beitic alout 818,000 qra. wheat, 344,000 do. barley, and 628,000 do. otts, exclusive of very large quantities of tallow, themp and flax, timber, linseed, bristies, etc.

Pilotage, etc. When ships come into Elaineur rogds, or lie wind-bound near the Lappen, watermen come on board to inquire if the master will be carried asiore to ciear; and in rough weather it is always best to make use of ${ }^{1}$ leir services, their loats being generaliy very safo. The Danish authorities have publisbed a table of rates, being the highest charge that can be made ly any isestmen upon such occasions; but captains muy bargain with them for as much less as they piease. Most ships passing the Sound take on board pilota, the signal for one being a flag at the fore-topmast-head. Thoso bound for the Baltic take a pilot at Eisineur, who either carries the ship to Copenhagen, or Dragoe, a smail town on the soulli-east extremity of the islund of Amack, where she is clear of the grounds. Those leaving the Baltic take a pilot from Dragoe, who carrien the ship to Eiaineur. Sometimes, when the wind is fresh from the east and mouth-east, it is impossilise for a ship bound for Copenhagen or tho Baltic to doulic the point of Cronborg; and in that case an Elsineur pilot is sometimes employed to moor the ship in the channel toward Kull Point on the Swedish shore, in in lat. $56^{\circ} 18^{\prime} 8^{\prime \prime}$ N., long. $12^{\circ} 26^{\prime}$ E. But this does

References to Plan.-A, Castle and 11 ght of Cronborg; B, Elsinear ; C, Helsingborg in Sweden; D, the bank ealled the Lappen; $\mathbf{E}$, the bank called the Disken. The soundings are in fathoma,
not oiten happen, ss the Danish government employ ${ }^{\text {are }}$ fixed by authority, and depend on the ship's steam lugs for the specinl purpose of bringing ships, in draught of water. We subjoin a copy of the tariff apadverse weather, round Cronborg Point. The pilots plicable to pilots taken on board at Elsinenr to carry are regularly licensed, so that, by employing them, ships to Dragoe, Copenhagen, or Kull Point, with the the captain'a responsibility is at an ond. Their charges sums both in silver and in Rigsbank paper dollars.

Pilotage fhom tile 1gt of Apall to tue 80th of September.

When a pllot is taken on board at Dragoe to carry a shio to Exsinear, the eharge la the same as that given uth ar the first head of the above column. (Archives d. cummerce, tome Ifi., p. 145.) The Moneys, Weights, and Measures of Eleineur are the aame as those of Copenhagen (whlch see), except that the rixdollar la divided into 4 orts instead of 6 marcs: thus 24 skulliaga make 1 ort; and 4 orts 1 rixdollar. The Sound dutios aro, however, levied and pald in apeele rixdollara of 48 stlvers, $9 \frac{1}{1}$ such specie rixdellars constituting 1 marc fine silver, Cologne weight. Taking silver at 6s. 2 d . an ounce, the value of the specle rixiollar is 4n. 6 fd ., and taking it at 5a, an ounce, it is worth $52 \cdot 7 \mathrm{~d}$. , or 4 s .4 fd . nearly. In either case the value of tha stiver may be taken at $1 \cdot 1 \mathrm{~d}$. See Sound Durs.

Emall ©mbrant. This name, which seems to mean "shaded enamel," has been given by the Baren du Tremblay to a manufacture by whlch articles are produced, remarkable alike for cheapness, for novel and agreeable effect, and for the lagenuity of the process whereby they , re produced. It coosiete In floodlag colored but tranaparent glazes over designs stumped upon the surfaces of porcelain vessels. A plain surfice is thus produced, in which the cavities of the stamped design appear as shadows of various depths-the parts in higheat relief coming nearest to the surface of the ${ }^{\prime}$ laze, and thus having the effect of the lights of a pictur It has been said that "perhaps there is no other process in the ceraunic art ly which, at so chesp a rate, designs of high arthatic mertt can be reproduced in the most harmonious tintlng, for dessert or table services, and for other useful domestle purposes."
Embalming (Lat. balaamm, bginz), a process adopted by the ancient Eggitians, chiefly for the preservation of dead bolles from putrefaction. The term la derived from the use of balmamic subatances in the operation; In addition to these, saline substances and tanning materials seem also to have been used.
Embargo, a restralut or prohibition imposed by the public authorities of a country on merchant vessels or other shipa, to prevent their ieaving its ports. Embargoes are usually lmposed only in time of war, or $\ln$ apprehension of an Invaslon; in which cases the governasent emplays the ships underembargo in armaments, expeditione, and transiortation of truops, etc. When it is found necessary to rtop the communicstion of intelligence between any two places, an embargo in laid upon sll ships, ivoth foreign and under the national flag. In England, this power is invested in the crown, but it is rarely exerciaed except in extreme cases, and sometimes as a prelude to war. The most memorasio instances of embargo were those for the prevention of corn going out of the kiogdom $\ln$ 1766; and for tho detention of all Russian, Dunisi, and Swedish ships in the aeveral ports of the kingtom, owing to the Armed Neutrality, January 14, 1801. See Ansmi Nevtaality.
Embargo in the Cnited States.-Embargo on all vesseis in the ports of the United States, passed by Congress with reference to the quarrel with Gireat Britain after the attack on the United States' frigate Cheropeake, 1807. Repealed, and non-intercourse act passed, 1809. Enslargo agaln lald for 90 daya, April, 1812. War declared June 19, 1812. An insurance against loss by reason of the acts of one's own govemment, as an arrest or embargo, is valid. There la no distinction on thily point leetwern a foreign and dumestic embargo; and if the embargo intervene after the commencement of the risk, it eusjends, but does not dissolve, the coutract of insurance, and the insured may abanden and claim a total loss. The ame principle is incorporsted into tise new French commercial code, and it pervades universaily the law of insurance. It is no objection to the right of recovery ly the insured, that the loss happened by the act of the goverament of his own country, thugh he and the
innurer are subjects of different atates.-Kinerts Com. See also Pansons on Mereontile Contracta, p. 866.

Embassador, or Ambasaador, a word of dis. puted orgin, but probebly adopted Into the Eaglish language from the P'rench, means, lo its general sense, a minnster authorized by any otate to represent it in sume other. In its distinctive senre, as indicating a partlenlar kind of minlster so appolntod, it mesns the highest class; and by authority as well as practice, there are atates whlch may be represented at others, yet are understood not to be entitled to appoint so high a reprosentative as an embaseador. Messages require to be interchanged ty all moderately elvilized nations, unless those whleh, like the Chinese or the Japanere, peculiarly isolste themselves. lience such measnges, and the manner in which they were sent and received, are familiar occurrences in all iisisturies. Sonic unileratanding that the persuns who undertook such a function shoukl enjoy freedom and safety in the state to whlch they were sent was absolutely necessary for lts performance. The Romans adopted strict rules for the safety of embassadors ; but the less def. inite provisions of other nations were liable to be affectell ly momentary lmpulses, and many incidents of ancient warfare arose out of insults or injuries committed on embassadors. It was on the ground of an insult offerell to his eminassadors that Alexander deatroyed Tyre. The I'erslan invasions of Grece were stimulated by the slaughter of the embassadors of Darius-who, however, demending earth and water ae tokens of dejendence, were rather mes.engers of hostility than ombassadors, in any thing like the modern sense of the term. Vimliassadors now communicate irivately with soverelgns or official persons, not with legislative bodies. In Greece, however, enibassaders sometimes pleaded the eause of their state in the public assemblies, and in lome they were formaily recelved liy the senate. The legatus of the Ronisns answered pretty nearly to our enibassador extraordinary; but the terin was also used to mean anether and tutally different officer who accompanied the proconsul or governor of a province, and was more like a colonial secretary: It liecame tire practice to give honorary legations of this kind on account of the priv. ileges which they conferred on the hoider in the province to which he was accredited. There is, hewever, a diatinction of a generic and very ebaracteristic kind tetween the embassador of modiern dipiomacy and sny ancient representatives of states. The embassadur of old was chosen fer a particular meswage or negotiation, and a permanent estdent representative of one state within annther wa . . known, at least es a system. It is not yet inteligible to nations beyond the elrele of Eurupenn diplomacy. The Turks had the inveterate practice, on going to war with a state, of committing its rejresentatise to the seven towers; and though the reason nasigned for the practice was tine safety of the person of the embassador from outrage, even this, if it were sincere, slowed that the feelings of hatred indulged against a member of a hostile state would lireak out tow strongly to lie contrelled even by that despotic government. The Chinese, and their neighiors nearer liindostan, ean louk on an emDassador or diplonatic agent us merely a dignified spy, to whose presence nothing but nceessity compels them to sulmit. Nor are they entircily wrong, since the Furupean embassies may lie counted a mutuaily tolerated system of espionage. Even Whekefort callis the embasmador an honoralile spy, protected by the 'aw of nations; and La liruyire anys epigramanatically, that the embassador's function is to cheat without being cheated. The understanding that an enalassulur was a person ever ready to do wintever he could with naffety to the advantage of his own country, and the injury of that to which he was accreditei, became a atanding object of sarcasm with tise wits of the seventeenth century. Sir IIeury Wutton, hinself an embassudur
when aak burg, cou and spok lie for the bis apopi in the wo 18, howev as a deel and lirou KIng Ja. gerous system ooverelg Perma privilege feudal E of an lng the sollte t: arose, claimed Eurujiea dor ulid fonnded tice of $t$ his own part of investit! rule an leges wi posterou laws, el were se places of jnals fe fact, thit by them ereign : substitu by sove then.

when asked to write comuthing In an album at Augoburg, could not reolat a sarcasm on the same subject, and upokn of an enibansador as a person sent abroad to lle for tha good of his country. In lts English form, his apophthegm generully lavolves a pun or equivolce in the werda " lie abroad," of which the original Latin 14, however, not susceptible. Scioppius published it at a declaration of the morality of English diplomacy, and brought Wotton under temporary disgrace with King Janses; to whom the jest neemed the more dangerous that it announced that fulse and treacherous system of diplomacy on which he, with most of the soverelgns of the age, acted when lt was safe to do so.

Permanent enbassies, with the eminent personal privileges conceded to embassadors, have existed in feudal Europe from an early time. To find the origin of ant inatitution weamingly so much at variance with the selfish and ravenoua national habits am'd which :t arose, we must look to the pacullar sacredneas claimed for their persuns by the great community of European monarchs. The privileges of the orrbassndor dill not "ise from principles of jurisprudence founded on general publie utlity, but from the practice of the sovereign investing his representative with his own aacredness, and the acknowledgment on the part of the brother soverelign of the sufficiency of the investiture. Thus in ages when international law was rude and little respected, embassadors claimed privileges which would in the present day be deemed preposterous; such as total exeniption from liability to the laws, civil or criminal, of the country to which they were accredited, and the right to have their official places of residence rospected, as sanctuaries for crinninals fleeing from justice. Embussudurs of old, in fact, thus received concessions which, though claimed by them as belonging properly to thelr masters an sovereign princes, and descending to themaulves only as substitutes, would not practically have been enjoyed by suvereign princes though theoreticaliy conceded to then. The advantage obtained over a state by seizing the person of the soverelgn, would have rendered it unsafe for the principal to trust to privileges which, in the less avallable person of his representative, were scrupulously respected.

It has always been difficult in countries not deapotic to preserve the sacredness of embassies when circumstances have made them offensive to the people. Thus it was difficult to keep Gundomar the celcbrated Spanish embaseador in James the First's reign from vlolence by the London mob for introducing sedan-chairs, which they called a device for enslaving Englishmen and making them do the work of beasts. In the antiPopery riots of $\mathbf{1 7 8 0}$ the chapels of the Bavarian and Sardinian embassies were burned. It has ever been usual to exact high satisfaction for injuries offered to embassadors, and dospotic courts have had no difficulty in conceding the demand where this was rendered prudent by the power of the offended party. Diplematic difficulties of a serious kind have often vecurred, however, in constitutional countries where the asserted privileges of the fureign embassador were found to clash with the undoulited rights of the home citizen. in 1668 the Portuguese minister was imprisoned for debt in llolland, and in 1708 a similar eveut produed a serious diplomatic difficulty in England. The lussian embessador, having had his audience of leave, was arrested for delt by some tradeamen in the opien streets of London. Deeming that he was attacked by bravos, he defended himself, and was not seeured without suffering much violence and indignity. The Czar imosediately demanded the infliction of capital punishment on those who lad been guilty of the outrage. Much parade was mude about Instituting proaecutiona against all the parties concerned in the affair; but it was impossible for the government ulthutely to treat it otherwise than as a matter for which unfurtunately the law made no provision. All that could be
done was to pass an act to retnedy the defect 1 and to sootha the Cuar its preamhle denounced in very angry terms the unparalleled wickedness of those turbulent ond disorderiy persona who had outrageoualy insulted the gerson of his excellency the embassador extraordinary of his Czarish majesty, emperor of Great Fussla, to whom a cepy of the act was sent with diatingulshed pomp. The diplomatic body In general, discontented with the haughty tone of the English court, took up the questien. When the bill was passing they objected to some parta of lt , and particulariy to a condltlon of the protection of embassadors' retlnues, that their names should be recorded with the Secretary of State and the sheriffs of London; but Parlinment, then exulting $\ln$ the continental triumphs of Marlborough, received their demands with haughty silence.

It has been usual since the Congress of Vienna to divide representatives into three great classos-embassadors, envoys, and residents or chargéa dea affaires. The first and second are acervdited from the head of the government, and communicate with the head; the third class have instructlons from the foreign department of their own government, and communicate with that of he atate they are sent to. The term embesaudor extraordinary having been applied to those sent on temporary missions of high importance, the term extraordinary came to be extended to the permanent embassadors at the courts of the great powers, as it was deemed desirable that no diplomatic rank ahould be deerned higher than theirs.

The cuatom of adinitting resident ministers at each aoverelgn'a court, was an linportant Improvement in the security and facility of national intercourse; and thls led to the settlement of a great question, which was very frequently discussed in the 15 th and 16th centuries, concerning the inviolability of embassadors. It became at last a lefinite principle of publie law, that embassadors were exempted from all local jurisdiction, civil and eriminal ; tbough Lord Coke considered the law in his day to be, that if an embasaador committed any crime which was not merely malum prohilitum, he lost his privileged dignity as an embassador, and might be punished as any other private alien, and that he was even bound to answer civilly for his contracts that were good, jure gentium.Kent's Com., vol. 1., p. 15.

It sometimes becomes a grave question, in national diacussions, how far the sovereign is bound by the act of his minister. This will depend upon the nature and terms of his authority. It is now the naual course for every government to reserve to itself the right to ratify or dissent from the treaty agreed to by its embassador. A general letter of credence is the ordinary letter of attorney, or credential of the minister; and it is not understood to confer a power upon the minister to bind his soverelgn conclusively. To do so important an aet would require, at least, a diatinct and special power, containing an expreas authority to bind the principal defluitely, without the right of reviow, or the necessity of ratification on his part. This is not the ordinary or prudent course of business. Ministers always act under inatructions which are confidentlal, and which, it is admitted, they are not bound to diaclose; and it ia a well-grounded custom, as Vattel observes, that any engagement which the minister shall enter into, is of no force among soverelgns, unless ratifled by his principal. This is now the usage, although the treaty may have been signed by plenipetentiaries.-Kent's Com., vol. i., p. 48.

A safe conduct or paseport contaios a pledge of tho public faith, that it shali lo duly reapected, and the olservance of this duty is essential to the character of the government which grants it. The statute law of the Livited Statea has provided, in furtherance of the general sanction of public law, that if any person shall violate any safe conduct or passport, granted under the authority of the United States, he shall, on con-
viction, be imprisoned not exceeding 3 years, and fined at the discretion of the court.

The same puaishment is Inflicted upen those persons who infringe the law of natlons, ly offering vlom lence to the persons of embsssailors and other public miuisters, or by Laing concerned in prosecuting or arreating them or their domestic servants. This is an offense highly Injurious to a free and liberal communication between different governmenta, and mlsc' 'evous in its consequences to the dignity and well-being of the nation. It tends to provoke the resentment of $\$ 1$. sovereign whom the embassador represents, nnd tu bring upon the state the calamities of war. The English Parliament, under an irupression of the danger to the communlty from violatlen of the rights of emsbassy, and urged by the spur of a partlerelar oecasion, carried the provisions of the statute of $i$ Anne, c. 12, to a dangerous cxtent. That statute prestrated all the safeguarda to life, liberty, and property, which the wisdom of the English common law had established. It deelared that any person convicted of suing out or executing clvil process, upon an embassador or his domestle servants, by the oath of the party, or of one witness, before the lord chancellor and the two chlef justices, or any two of them, might have such penalties and corporeal punishments inflicted ujon hin as the judges should thlnk fit. The preamble to the statute contains a speelal and inflamed recltal of the breach of the law of nations whlch produced it, by the arrest of the Russian minister.

The Congress of the United States, furing the American war, discovered great solicitude to maintuin laviolate the obllgations of the law of nations, and to have infractions of it punished in the only way that was then lawful-hy the exercise of the aithority of the leglslatures of the several States. They recommended to the States to provide expeditlous, exemplary, and idequate punishment for the violation of safe conducts or passports, granted under the authority of Congress, to the subjeets of a forelgn power in time of war; and for the commission of rets of hostility agalnet persons In amity or league with the United States; and for the Infiactions of treaties and conventlons to which the United States were a purty; and for infractions of inmunites of embassadors and other public minlsters.-Kent's Com., vol. 1., p. 18f.

A marriage, celebrated in any given place, must be celebrated accorling to the law of the place, and by a person whom the laws designate, unless the person by whom, or the premisea in which, it is celchratel, possess the privileges of exterritoriality. Therefore it may be, accorling to the opinion of Lord Stowell, that the presence of a forelign soverelign sojourning in a friendly country, or that of his miniater plemipotentiary, or the act of a clergyman in the chapel or hotel of such sovereign or his embassador, may give legality to marriage between subjeets of his, or members of his suite. Accoriling to the American view, the courtesy between the Initel States and forchgn nations, In mil. tatlly exempting from luty articles imported hy eprtain of their public officers reshlent abroal, woes wot extend tieyonil ministers or chargis des affaires, representing their respective governments, and chethed with diphomatic powers and privileges, und down not comprehend attarhes or persons belonghing to the minister's suite, nor consular officers,- Mamal for C'onsuls

From the moment a public minister enters the territory of the atate to which he is aent, durligg the thme -f hin rembidence, and until be leaver the country, lie is entitled to an entire exemptlon from the locni jurlsdiction, looth civil and crlminal. Representing the lights, Interesta, and dignity of the Aoverclign or atate by whom he la delegated, lils persobi in mapred and laviolahle. To glve a more lively hen of this complete exemption from the local jurisaliction, the firtion of extraterritoriality has been Invented, by which the
minister, though actually in a forelgn country, is sapposed still to remaln wlthin the territory of his own sovereign. He contlnuea stlll subject to the laws of his own country, which govern hils personal atatus and rights of property, whether derived from contract, in. heritance, or testament. Ills chlldren born nbroad are consldered as natlves. This exemption from the local laws and jurisdiction is founded upon mutual ntility, growing out of the necessity that public ministers should be entirely independent of the local authority, in order to fultill the dutiea of their misaion. The act of nending the minister, on the one hand, and of recelving hilm, on the other, amounts to a tacit compact between the two States, that he shall be subject only to the authority of his own nation. The passports or safe conduets granted by has own government, in time of peace, or by the government. 5 which he is sent, in time of war, are sufficient evidence of hls publle character for thls purpose.- Wrieatos's International Law, p. 283.

Embezzlement, In law, is a felony, consisting of the rame class of acts which would in any other case amount to larceny, when committed by ove cmpleyed as a clerk or servint, and by virtue of his otfice, on the goods and chattels of his employer.

Embezzlement by Neamen,-Marinera are boand to contribute out of their wages for embezzlements of the eargo, or injuries produced by the miseonduct of any of the crew. But the circumistancea must be such as to fix the wrong npon some of the crew ; and then, if tho individual he unknown, these of the erew upen whom the presumption of guilt resta, stand as sureties for each other, and they must contribute ratably to the loss. Some of the enses in the books have established a general contribution from all the crow for sudi enhezzlement, even when aome of them ware in a situathon to repel every presumption of gailt; lut neither publis poliey nor priuciples of justice extend the contribution or forfeltore of wages for such embezalements, beyond the parties lmmedintely in dilicto.Kent's Com., vol. hii., sect. 252.
As carriers by water were liable at comnon law to the same extent an land carriers, and th their reaponsibility was more extensive, und their risk greater, from the facilities for the commission of acts of fraud and violence upon the water, it was deemed in lingland a proper conse for legislative interference, to a grariled and limited extent. The statute of 7 tieorge II., ch. $\mathbf{1 5}$, and 26 George III., ch. 86, and 53 George IIt., (1). 159, exempted owners of vessela from respmansithlity, as common carriers, for losses by tire, and proviled further that the owner whould not be liabis fur the loss of goll, silver, dianonds, watches, jewels, or prechusstumes, ly robbery or ombezalement, unless the shipper luserted in the lill of ladiug, or otherwise dechared in writing to the master or owner of the vessel, the muture, quality mad value of the articles; nor should he be liable for embezalements, or lose or ilanago to the goed a nrising from any net or negle"t, without his fault or privity, heyond the valate of the whip and frelglit; nor should part owners In those enses be llable beyond their renprative shares in the shlp and freight.-Kisvr's t'om., vol. li., p. 789.

Embersing, tho forming of works in relief upon any subsance, whother hy cutting, stampins, casting, or any other inethoul. In scolpture particularly, uccorilng an the tigures are more or less jrominent, they are salil to be in alte, mezzo, or baso-relievo; or high, Intermeiliath, or low rellef.

Embossing of Leather. Heautiful ormaments In hasso-rellevo for flecorating the exteriors or interiors of haldiugs, medallions, picture-framen, catinet work, etc., have lreen reeently made by the pressure of metallic blocks and dien, for whilh invention a patent was obtuined in June, 18:19, hy M. Claudo Schroth. The dies are male of tyje-metal, or of the fusithe alloy with bismuth, callel d'Arect's. The leather is beaten

soft in water, then wrung, pressed, rolled and falled as It were, by working it with the bands till it becomes thicker, and quite supple. In this state it is lald on the mold, and forced into all its cavitles by means of a wooden, bone, or copper tool. In other cases the emhossing is performed by the force of a press. The leather, when it has become dry, is easily taken off of the mold, however deeply it may be inserted into its crovices, by virtue of its elastlcity. A full detall of all the processes is given in Newton's Journal, vol. xi., p. 122.

Embossing Wood (Mossage, Fr.; Erhabrnes, Arbeit, Ger.), ruised tlgures upon wood, such as are enployed in pleture-frames and other articles of ornamentul cabinet work, are usually produced by means of carving, or hy casting the pattern in plaster of Paris or other composition, and cementing or otherwise fixing it on the surface of the wood. The former mode is expensive; the litter is inapplicalile on many eccasions. The invention of Mr. Streaker may be used either by itself, or In ald of carving; and depends on the fact, that if a depression be made by a blunt instrmment on the surfuce of the wood, such dopressed part will egain rise to its original level hy salbsequent immerslon in the water. Tho wood to be ornamented having been first worked out to its proposed shape, Is in a state to recelve the druwing of the pattern; this boiug put on, a blunt steel tool, or buruisher, or die, is to be applied suceessively to ail those parts of the pattern intended to he in relief, and, at the same tlme, is to be driven very cantionsly, without breaking the grain of the wood, till the depth of the depression ls equal to the intended prominence of the digure. The ground is then to be reduced by planing or filing to the level of the depressed part ; after which, the plece of wood leeing placed in water, either hot or cold, the part previuusly depressed will nise to its former helght, and will then form an ealbossed pattern, which may be finished by the usual operations of carving.
Embouchure (lir.), slignifies the mouth of a river: it is used also for the month-plece of a musical instrunent.

Embsoidering Machine. (Machine ì broder, 1.r.; Steckmaschint, Ger.) Thils art has been tlll of late merely a handleraft employment, cultivated on account of lts elegance by ladics of ronk, 13ut a fow yeurs ago M. Iteilmann, of Malhanse, invented a machine of a most ingenious kind, which ematiles a female to cmbirolder any design with 80 or 100 needles as accurately nond expeditlously as ahe formerly could do with one. A brlef acconnt of this remarkable inrention will, therefure, be acceptable to many readers. It was displayed at the nationat exposition of the prodnets of in'ristry in I'aris for 1831, and was unquestionahls the object whleh stood highest in public esteeni ; for whether at rest or In motlon, it was always surroanted with a crowd of curlons visitors, uslmirling the figures which it has formed, or lispertlyp its morements and livestignting its mechanlsm. law needles were accuphed in copying tho same pattern with perfect regularity, alt set in motion by one person.-Une's Ihitiomiry of Arta.
Embroidery is the numo given to the art of workligg figures on stufts or muslins with a neetle ant thread, Alt embroldery muy be divided into two sorts, embrollery on stufis und on masin: the former is ised chielly in chureh vestments, housinge, stand aris, articles of furniture, ote., and is oxecutod with silk, cotton, wool, gold and silver threads, and sometimes ormamented with spangles, rent or mock pearla, precions or imitntion stones, etc. The latter is employed mostly in articies of femnte nparel, ae cap, rollars, etc., and is perfiormed only with cotton. In Gemany this division is hadicated by the expresslen meise (ichite or musiln), and bunte Ntickervi (colored or cloth) embroidery. The embroidery of stuff's is per-
formed on a kind of loom or frame; that of muslin by stretching it on a pattern already designed. The modes of embroldering etuffs or muslins with the common necule are extremely varlons; but a minute description of these processes would be as difficult as It would bo unintereating to the general reader. They consiat for the most part of a combination of ordinary stitches ; bat no limit can be assigned to their number or variety. The art of embroldery was well known to the ancients. As early as the tlime of Moses we find it practleed successfully by the Hebrews; and long before the Trojan war the womon of Sidon had acquired celebrity for their akill in embroidery. At a later period, this aut was introdnced inte Greece, probably by the $\boldsymbol{f}$ hrygtans (by some considered as the inventors); and to such a degree of skill did the Greclan women attain in it, that their performances were said to rival the finest paintings. In our own times, the art of embroidery has been cultivated with grest success, more especially in Germany and France; and though for a long period it was practiced only by the ladies of these conntrles as an elegant accomplishment, it is now regarded as a staple of traffic, and furnishes employment for a large portlon of the population. In England also it appears to have taken doep root, as it now forms an accomplishment of which almost every lady is in possession. Abont seven years ngo a great lmpetus was given to the cultivation of this art, both on the Continent and in lingland, ty the invention of a machine which enalles a female to execute the most complex patterns with 130 needles, all in motion at once, as accurately as sho could formerly do with one. Ihit as no account of this remarkable invention which we might glve conld be intelligltule withont the aid of illustrations, which would bo out of place in thls work, we must refer the roader to Dr. Ure's Dictionary of Arts, etc., for full information respecting it. One such machino, with 130 needles, is ostimated to perform dally the work of 15 hand embroiterers employed in the orllmary way. Many of then are now mounted in Germany, France, and Switzerland; and in Manchester thero is one factory where they do beautiful work. See tho Art of Needlework, edited by the Countess of Wilton. London, 1840.-BuANDe, Ency.

There is one branch of manufacturo connected witl. :otton cmbroiderles to which it would be wrong not to partlcularly allude, ond that is the embrolitering of muslins, better known under the common deslignation of " $e$ wed muslins." This is comparatively a new manufacture, having only being tirst started In Scotland about the year 1825 . At that perlod there were only two or thireo persons ongaged in the manntiseture; now there are fifty or sixty. The importance of this branch may in somo measure the estlmated from the fact that it fives employnent to a vast number of females ln the rural districts, for whom no other useful work is providel in tho intervuls of dield labor. In Ireland alone, where it is practle from the tibant's Couseway to Cape Clear, and from St. (ieorge's Channel to the Achill and other remote islands, it ls a source of great comfort to the female popuiation, an it emables them to add to the food and clathing of their familles without entailing on them any of the evils of the factory system, the work being supplied to them by agents of the large manufacturers scattered over ili the country, and excented entirely at thelr own fireshdes. As the workers are only engaged a portion of their then at this spiecies of industry, it is limpossitile to estlunate their numbers ; but it ls computed that the amount paid in the western counties of Scotland and in Ireland, renches no less a sum than three quarteta of a million sterilng nnuually. J.lke all other fancy trudes, It inas been subject to its periods of depiresslon, but its prugress has lieen regular, from atotal produce of a fow thousand pounds a your pald for lnhor $\ln 1825$ to the
amount above stated, the greatest increase having, however, taken place since 1845 .

Emerald (Fr. Einéraude; Germ. Smaragd; It. Sneruldo ; Lat. Smaragdus ; Sp. Eismeralda), a preclous stone in high eatlmation. It is diatinguiahed from all other gems by lts peculiar emerald green lustre, varying In intensity from the palest possible tinge to a full and deep color, than which, as Pliny has truly stated, nothing can be more beautiful and pleasing; nullius coloris aspectus jucundior est. "It emulates," he continues, "if it does not surpass, the verdure of the apring; and the eye satiated by the dazzling glare of the more brilliant gems, or wearied by intense application, is refreshed and strengthenod by the quiet enlivening green of tho emerald." In Pliny's time the best came from Scythla. Those met with in modern times do not often exceed the size of a walaut. Some of a much larger size, and perfect, have been found, but they aro extremly rare. Nero used one as un eye-glass in aurveying the combats of the gladiators. Litherto it has always been found crystallized. Specitic gravity from $2 \cdot 6$ to $2 \cdot 77$.- I'lisy's Mist. Nat., lib. xxxvii., chap. 5 ; Tuomson's Chemistry.

For the last two centuries and more, the only country known to yield emeralds is Peru, where they occur in Santa Fó, and in tho valley of Tunca. Several large stonea have appeared in Europe. About two years ago I cut one, exceeding two ounces in weight, for the Emperor of Moroceo, but it was full of lmperfections. The largest specinen known is a hexagonal crystal, nearly six inches long, and about two in diameter. This gem, however smali, is so rarely seen perfect that "an emerald without a thaw" has passed into a proverb. A fine stone of four carats may be
 ferior atones of one or two carats are sohl at from 40 s . to $70 s$. per carat ; and lf amaller, and defective, at 10 s . or 15 s. per carat. Fine emeralds are rare, and in such deruand, that a particular suit has been known to have passed into the possession of a scries of purchasers, and to have nade the tour of Europe in the course of half a century.-Ma've on Diamonuls, ed ed., p. 104.

Emery (Fr. Emeril, Emeri; Germ. Smiryrl; It. Smerglio, Stmeregio; Sp. E'smeril; Rus. Nashdak; lat. smiris). This mineral wos long regarded as an ore of iron ; and was called by llaüy fer oxide quartifere. It is very abundant in the island of Naxos, at Cape limeri, whence it is imported In large quantities. It occurs nlse in the islands of Jersey and Guerney, at Almaden, in Poland, Saxony, Sweden, lersia, ete. Its color varles from red brown to dark brown; lis apecific gravity is about 4.000 . It la so hard as to seratch quarti und many precious stones. 13y Mr. Tenant'a analysis, it consists of alun' 1,80 ; silica, 3 ; iron, t. Another inferior kind yiela 52 of iron, and only 50 of alumian. We have recent accounts of enery discoverien In Minnesuta; but nearly all that is used at present in the arts comes from Turkey, near ancient Smyrna. Ir. Lawrence Smith, the American geologist, made a discovery of a doposit of emory while residing in Smyrna, and he muld an examination of the locality in 1817 . Dr. Smith havimg reported his discoveries to the Turkish guvernment, a commission of inguiry was instituted, and the business soon aysumed a mercantile form. The monojnily of the emery of Turkey was suld to a mercantile house in Simyrna, and aince then the price las diminished in the market. The mhing of tho emery is of the slonpleve dharacter. The natural decomponition of the rock in which il occurs facilitates itr extraction. The rock decomposen into ma earth, in which the emery is found embedided. The quastity prowured maler these circumstances is no great that it is rarcly necosoury to explure the rock. The earth in the neighborhored of the block la almost always of a red eolor, and serves as an indication to those who are in search of the mineral. Sometimes, before beginning to excavate, the
spots are sonnded by an lron rod with a steel point, and when any resistance is met with, the rod is rubbed in contact with the resisting. body, and the effect produced on the point enables a practlced eye to decide whether it has been dune by emery or not. The bloeks which are of a convenient slze are transported in their natural state, but are frequently broken by large hammers. When they resist the action of the hammer, they are oubjected to the action of fire for several hours, and on cooling they most commonly yield to blows. It sometimes happens that large masses are abandoned frem the lmporaibility of breaking them into pieces of a convendent size.

Eimery paper is prepared by brushing the paper over with thin glue, and dusting the emery-powder over it from a sieve. There are about six degrees of coarse. ness. Sieves with 30 and 90 meahes per linear inch, aro in general the coarsest and finest sizes employed, When used by artizans, the emery-paper ls conmonly wrapped uround a file or slip of wood, and applied just like a file, with or without oil, according to circumstances. The emery-paper cuts more smoothly with oil, but leaves the work dull.

Emery-cloth only differs from emery-paper in the use of thin cotton cloth instend of paper, as the material upon which the emery is fixed by means of glue. The emery-cloth, when folded around a tile, does not ply so readily to it as emery-paper, and is apt to unroll. Hence smiths, engincers, and others prefer emerypaper and emery-sticks; but for household and other purposes, where the hand alone is used, the greater durability of the cloth is advantageous.

Einery-sticks are rods of bourl, about 8 or 12 inches loug, phanel upsquare; or with one, aide rounded like a half-rounded tile. Nails are driven into earch end of the stick as temporary handles; they are then brushed over, one at a fime, with thin glue, and dabbed at all parts in a heap of emery-powder, and knocked at une end to shake off the excess. Two confs of glue and emery are generally used. The emery-sticks are much more economical than emery-paper wripped on a file, which ia liable to be torn.
Eimery-coke consists of emery mixed with a little heeswax, so as to constitute a solid limp, with whirh to dress the edjes of buff and glaze wheels. The ingredients should be thoroughly incorporated by stirring the mixture while fluid, ufter which it is frequently poured into water, und thoroughly kneated with the hands, and rolled into lumps before it has time to cool. The emery-cake is sometimes aiplied to the wheels while they are revolving; but the more usmal toursy is, to atop the wheel, und rub in the emery- eake by the hand. It is afterward smoothed down liy the thumb.

Vimery-paper, or putent razor-strop paper, an article in which tine emery and glass nre mixed with puprer pulp, and made into eheets, as in making orilimary jupur; the emery nul glass aro saill to eonstitute together to per cent. of the weight of tho paper, which respmbles drawing-paper, except that it lus a delicute fawn color. Tho emery-papor in directel to he jasted or ghaed upon a piece of wood, and when rubhed with a little oil, to le used as razor-strop. See C'afis Jito tionnry of arts.

Emigration in the act of lenving the country or placo in which one has previonsly residel, in the view of reshiting in some other country or plate. I'ersons no leaving the phate of their residenea are called emigrants; und laterly the term inmigrants hiw hecn
 in somo place or comintry with the intention of settling In it. Bermons leaving in country for awhile, to whid they intend to return, aro not reckonel emigrants. This torm is appropriated to those who leave their present habitations to extablith themaelves permanoutly elses where. The motives which lead to emigration are various in the extreme; but, whatever its fimmediate cause

And, culties in the w been sujuradided kiul minimuen been set on all theugh it shoule pasture a single :
may be, all emigrants expect either to avoid some considerable evll, or to improve or amend their altuation. The natural multiplication of man and of the animais which he domesticates, and the tendency of both to increase beyond such means of subsistence as may be ensily made available for their suppert, have been in all ages the great cause of emlgrations. When the flocks and herds of the oceuplers of particular districts began to be so numerous that pasture became defictent, it was an obvious resource, in the event of any unoccupied lands belng in their vicinity, for a portion of the tribe to emigrate to them. The Book of Genesis affords a striking illustration of what is now stated. The herde of Abraham and Lot, it is there stated, had so greatly increased, that, there not being room for them both, contests took place between their servants. Whereupon Abraham said to Lot, "Is not the whole land before thee? Separate thyself, I pray thee, from me. If thou wilt take the left hand, then I will go to the right ; or if thou depart to the right land, then I will go to the left. Then Lot chose him all the plain of Jordan, and Lot journeyed enst ; and they separated themselves, the one from the other." (Chap. iii. 8-11.)

Female Emigrants.-Owing to causee which are too obvious to need being pointed ont, the greater number of emigrants, especially of those who go to new settlements, conslst of males; and the want of a proper proportion of femsles is often productive of the worat consequences. Inasmuch, too, es the female portion of the pepulation in old settleil countries is generally that which is most in excess, it is plain that every facilty and encouragement should be given to the emigration of women. Nothing, therefore, can be more cobsistent with sound policy than the efforts which have recently been made by govervment, and by privale individusle, to send out well-a nducted females to Aastralia; and it is to be hoped that they will not ruax in their benevolent lahors till the wide disproportion which now (1857) exists between the acxes in that conthent be materially reduced.'
The application of steam to the propulsion of vessels and the other improvements that have been made in the art of navigation, have greatly dimiulshed the cust, risk, and time apent in distant voyages, and have given a proportional extension to emigration. Notwithstaming their great listance, the emigration from Europe to America and Australia, but expecially the forner, has latterly attained to a magnitule which, previously to the employnnent of ateam in navigation, would not have been conceived poraible. For a lengthened period the United Kingilom has furnished the largest supply of transatlantic emigrants; but of late years the emigration from Germany has hecome very extensive, and promises at no distant period to equal, if it do not surpass, that which is carried on from Great Mritain. The vast majority of the German emigrants are dentined for the United Statea, where they occupy exiensive diatricts, and have extahilished themaelves in great numbers. The States have ulso become, sinco Isis, the principal resort of the emigrants from the Inited Kingilom, more particularly of those from Ire. land; theugh large numbers of the Englishand Scotch emigrants, with a smuller number of lrial, eontinue to resort in preference to Canada. Since the iliscovery of the gold fiches of Australia, grent numbers of emigrants have gone to that contineut. Ihat its mush grater ilistance, and the consenuent length and cost of the voyage, wake it dillenit for the poorer classes to find, without assintance, their way to thin new lii Thorado. Anil we maty adh, that to the notural dills. cuties in the way of emlgration to Australia lave been superadied those whilh ariso from an extravagut minimum price of five dollars nu neres having been set on all wasto land in that continent, even though it should require threo, four, or tlvo acres to pusturo a single sheep.

Next to the United Kingdom and Germany, China furpishes the greater number of over-sea emigrants. A Chinese population has long been aettled in large numbers in many parts of the Eastern Archipelago, where they are distlnguished by their industry and good order; and recently many thousands of them have found their way to California and Australia. We subjoin an ascount of the number of emigrants from the United Kingdom in each year from 1815 to 1853 , buth inclusive, specifying the countries for which they asiled, and the numbers that sailed for each :

Emigration to America. Report from the State Department. Departinent of State, 18is6.-In compliance with the act of Congress of March 2d, 1819, regulnting passenger ships and vessels, I have the honor to commanicate herewith the annual stntement of the numiber und denignation of passengers arriving in the United States ly sea from foreign countries, during the year ending lecemtier 31, 1855 , compiled from returns made to this Department ly collectors of customs pursuant to providions of said net.

The measures adopted hy the Department in 18:3; with a view to obviate the previons alsence of uniformity, unl to secure nccuracy in the returns of collectors, on which the ntatement is based, and which were refarred to in the letter that accompunied the last annabl statement, und in that whieh accompanied the preceding one, have conduced most fivorably to the desired emi.
l'revionsly to the atatement of 1851 hat two reen pitulations were "ppended to the returns, namely, ono emforacing tho "arrivals" in each State during the year; the other tho number of passengers lelonging to each "country." The atatement now sulmiliter will he found to embrace recapitulations exhithiting the following facts :

1. Arrival of pasemgers in 1855.
2. Country where horn.
3. Country where they mean to reside.
4. Age and sex.
5. Occupation.
6. Dled on the voyage.
7. Comparative statement ehowing the conatries in which were born passengers arriving in the United States from forelgn cuuntries, from December 31, 1852, to December 81, 1855.
8. Comparative statement showing the age and sex of passengere arriving in the United States from foreign countries, from December 31, 1852, to December 31, 1855.
9. Comprative statement showing the occupation of paseengers arriving in the United States from foreign countries, from December 81, 1852, to December 31, 1855.
10. Compurative statement of the number of passengers arriving in the United States, by sen, from foreign countries, from September 30, 1843, to December 31, 1855.

Attentlon is once more invited to the fact, that by the net of Congreas of 1819 , requiring Immigration returns, passengers " arriving by sea" seem alone con-
templated, and that an amendment of that act, so as to embrace also those arriving by land, seema to be demanded. The attention of collectors at frontier custom-houses, especially on the northern border, has been directed to auch immigration by this Department, and the result has been returns from the cullector at Oswego, embracing the arrivals of 5,072 passengers during the last three quarters of the year.

Although the returns of collectors of customs of the passengers arriving within their distriets have been characterized by greater precislon during the past year than horetofore, there is still room for improvement, and the present statement will, like its predecessors for the last two yeara, be transmitted to them with a view to aid them in causing their returns to conform to the requirements of law.

I have the bonor to be sir, your obedient servant,
W. L. Marey.

Llon. N, P. Banks, Jr., Speaker of the Loase of Representatives.

Suljolned are the more important tablos accomjanying tho Socretary's letter:

| 1855......... | 230,478 | 200,877 |

We also add the following table, which shows the rapid sdvance of the German emigration to the United States. Up to 1851, it is from a paper by Dr. Gaebler in llubnen's Statistik; and includes only thuse whe sailed from German ports. The years 1852 and 1853 are from nur government returns, and include all arrivals. There is a considerable business done in
bringing German emigrants to England for them to take passage thence to Americs; others sail from Anlwerp and Havre. Gaebler's Statistics after 1845 are made. up from the returns of different sea-ports:

The arrivals from Germany and Prussia in the gevernment tahles are here added tegether.

Ages of Emigrants.-Tho following table, which was among those scnt to Congress by the State Department a few days since, has not till now been published. It gives the details of a matter which has been a good deal discussed, the age and chance of life of the foreigners who arrive here:

Comearative Statement bitowing the Agr and Ser of l'aseenorbs ahmiving in tire United Statrs frem Foreign Counthies, faom Dec. 81, 1852, to Deo. 81, 1855.

Last year there was an unusunlly gmall amount of emigration, owing to the war, the irafts for the army and navy, increased employment nt home, nud the check given to emigration to the Uniteil States by thn striugent Anerican regulations and the political oljecetions to Catholies and the Irish, and to naturalization,
which had before heen freely granted. The employment of many large steamers now disengaged from the transport service and reduced fares, coupled with the prosperous state of Cannda and Australia, will lead to an increased emigration in 1857 .

Statistics of Emigration to the United States.-The emigration of the past year shows an increase as combared with that of the year 1850 , but is nuch less than any other year since 1848. The following are the figures :

| From 1800-1810 | T0,081 | 1851............ 299,601 |
| :---: | :---: | :---: |
| 1810-1820 | 114,006 | 1852. . . . . . . . . . 800, 982 |
| 1820-1530 | 135,086 | 1853. . . . . . . . . . 284,945 |
| $41830-1840$ | 870, 090 | 1844. . . . . . . . . . 310,223 |
| " 1840-1800 | 1,678,338 | 1855. . . . . . . . . . 186,233 |
|  |  | 1856. . . . . . . . . . 141,915 |

The tide of empration during the year 1856 did not set in steadily until June and ©iuly.

The following shows the number of arrivals and the proportion of emigrants :

From the want of conl, I reland is Ill-fitted for manufueturing industry ; and from tho nature of its soil and rliunate, it is much better suited to pasturage than tu tillage. In 1854 the further reduction of lts populatim hy one or two milliona, by emigration, was considered favorable to its well-being.

The total number of arrivala dinring the year in alsout alx thousand more than the provious year, and the proportion of cash means to esch passenger is con-
silerable larger than during the last five months of 1855. The account of cash means was not kept until after the first seven months of 1805 . The number of vessels bringing emigrants last year was 579, from 21 dIfferent ports of Eurcpe, and not one serlous accident has oecurred during the disembarkatiou. Some emlgrants, Ill-advised by Interested parties, have declined to avall themselvea of the facilities afforded ly tha Comanissioners of Emlgration, and have consequenty been plundered in various way*, sometimes irremediably. The governments of Hamburg and Bremen have mude it a penal offense to solicit or book emingrants for inland travel in forelgn countries, and it is to be hoyed that other European governments will follow their example.

Since the 22d of August last a syatem of diding desticute emigrents has been establishel, which has proved highly beneficial. Since that date in 1855, 210 familles were assiated to the nmount of $\$ 2,30925$; in 158 the advances have already been rejaid, amounting to $\$ 1,45625$.

The following is a list of arrivals during two weeks of Januayy, 1857, only .

Whether the foreign immigration can be kept up / grated in the two years having been respectively 134,very long at Ita present high tigure must be doubted, The wars in Europe, which it was thought would check the tide, have, however, had no effect as yet. Thd number arrived in New York for the quarter ending March 31st, 1854 , was 20,023 , agalnst 29,657 in the corresponding quarter of 1853.
The following table shows the occupations of the eanigrants from Englund in 1854 and '55:

|  | 1854. | 1835. |

To this ntatement the following remarks are suljoined: The tutal number of such adults who emi-

789 and 65,363 , it fullows that the mechanics and skilled workmen connested with the building and constructive trades, who leave the country, form the proportion of about one slath of the whole number. Formers, agricultural and general laborers, and those identlfied with land, constitute one half of the bulk of emigrants.

The number of foreigners who errived in the United States, since 1790 , may be stated as follows; the arrivale from 1790 to 1820 are given on the authority of Professor Theker; those subsequent to that period, are ohtained from the custom-house reports.

Law in Regard to Kimigranta.- liy the law of the State of New York, passed April, 1857, it is provided that,
No peraon ohall, in any eliy of thia State, aolicit emigrant pasmengers or their huggage for emigrant boarding-houses, pass-senger-ellizes, forwurding trasportation llnen, or for ateamero, shipa or voumela bound or about to proceed to any port not withio thia State; or for any perion or for any company weling, er offaring for sate, passaga-thekets, or contrating or offering to costraet for passage ith any auoh ateamer, ahip or
vessel without a licenae for that purposo, whieh ahall exptre at the end ef one year from ita date; auch license may be isaned and reveked in the diacration of the Mayor of the city whero auch license may havo beon granted, except to the elty of Now York, in whteh auch license may bo tasuad or rovok ed only by and In the diacretion of the Commissioners ef Emigra. Hon. Sueh persona recetving auch license ahall pay the sum of 20 , and give a lond, wlth two auffieient guretiea, in the penalty of \$500, conditioned for the good behavior und the observance to him of the provistena thia aet, to the Mayor of the elly ianning the name, or to the Cemmisstonara of Emi-
gration, at the case may be. The money thus recelved or collected on sald bonds shail be for the bencfit of aald city, or of the emlgrant fund. Every person so leensed ohall wear In a conapicuous plave about hila person a hadge or ptate, of such character and in such timo and manner as auld Mayor, In the city of New York, at auch Commlasioners shall prescribe, with the words, "Licenacd Emigrant liunner" In. ecribed thercont, with hla namo and the number of hila licenae. No perten who ia not of approved good moral charaoter ainall be licensed aa auch runner. Every persen who shail sollelt allen emtgrant passengers or others, for the bonefit of heard-Ing-houses, passenger-oflices, or forwarding or trantportation lines, or for any ateamer, alip or vessel bonnd or ahont to procecd to any port not within the State of New York, or for any pereon or company seifing or offoring for sale passagetickets, or contracting or offering to contract fur pasange in any such ateam-ship or veasel, upon any atrcet, lane, alley; or upon any dock, pier or puble hughway, or In any other placo within the corpornte bounda of any city tn thin state, or upon any waters adjacent thereto, over wilch any of sald eltica may have jurisdiction, without auch license, shnil bo deemed guilty of a misdemeanor, and shall be punished by Imprisonment In the county prison or jail not less than three montha, nor exceeding one year.
The bonds mentluned io the foregolng acctions may be aued hy and in the name of the Mayor of the clty in which mach Hecnso may have been issucd, and in the city of New York by and In the name of the Commissloners of Enigration In any court having cognizance thercof ; and In case of a breach, the Mayor, or the said Commissioners, shall recover the full penalty of said boud.

All personal laggeage of embrant passengers arriving at the port of and destlned for the city of Now York, Nhall be landed at the piace or pler deaignated as the landing-place in said clty for emlgrant passengera; and the captain, owners, and consignees of overy ahlp or veasel arriving at sald port with emprant passengers destined for suld city, shasl be Jolully and severally aubject and liahle to a penalty of $\boldsymbol{q}_{5} 0$ for each and every emigrant passenger, or hla personal buygage, Ianded at any place or pler other than the piace or pler aforesaid ; which ponalty shall be a lien upon such ahip or vessel, and may be enforced and recovered by and in the unme of the Comalsaionera of Emigration, either by an action or by warrant of attachment, under and pursuant to articie first of title elghth of chapter elghth of the firat part of the IRevised Statutes.

The Health Officer ahall give notice in wrlting to the owner or ownera, conslgnce or conalgnees, mater, commander or person having charge of every vessel having emigrant passengers on board of nuch veasei, dcatined for the efty of New York, to land anch passengers and their personal baggage, at auch pler or place in the sald rity of New York as has been or may at any time be deslgnated njeclally by the Commlasioners of Emilgration for the landing of emigrant passengers and their personal laggage $t$ and it ahall not be Inwfui to land such pasaengers or their personal baggage at any other pler or place ; and the owner and master of any veaaci, from Whtch paseengers or their persoval baggage ahall be landed, In violstion of the proviaions of thla scetlon, shall be subject to a penalty of 80 for each and every perbon or his baggage monded la violation thereof; which penalty ahall be forthwith a lien on auch ahlp or veseni, and ray be lmmediately, npon such violation, aued for, enforced and recovered, with costis of sult, in the name of and by the Commissloners of Emlgration, cither hy an action In any court having cognlzance thereof, or hy an aitachment under and puravant to article first of title ejghth, chapiter righth, of the first part of the Revised statutes, for which purjose the sald tiommisslonera of Finggration shali forthwith be eredtiors of atieh alip or vessel, and having a direct ilen on such ship or vessel, for said penalty; the sald punalty, when recovered, to be applied and used by the asid Comunlasionera fur the purposes for which said Comninsioners aro constituted.

Eminent Domain. The right of the Stito to Ite publle property or domaln is absoznte, and excludes that of its own subjects as well as other nations. The national proprietary right in respect to those things lrelonging ta private intiviluals, or bodies corporate, within its territoria? limits, is absolute, so fur as it excludes that of other nations; but in respect to the numbers of the State, it is paramomat only, and forms what is called the eminent domain; that is, the right, in case of necesslty or for the pablic safety, of dinjusing of all the property of every kind within the linsits of the State.-Winfat. Inter. Law. See Correb. hetween Mr. Weastea and Lord Asunvutos, Dee. 1837.

Empire (Lat. Imperium). Origlnally the territory or extent of land under the command and jurisdietien of an emperor. The dominions under the sway of anclent home were the first to which the term ennpire was applled; they consisted of two grand divisions -the Empire of the East, or, as it was afterwarl culled, the Lower Erapire; and the Empire of the West. The former admitted of varlona aubdivisiens In reference to the different dynasties to whieh it was suljeet; and the latter became, about the end of the 9 th eentury, the German or IIoly Roman Empire. In all these cases, the sovereign, or chlof person in the empire, was named the emperor. But the term empir. has in several lustances been employed to designate at large extent of dominion, without reference to the title of the ruler or soverelgn of a country; thas we hear of the empire of Persia, IIndostan, etc. The dominlons of the Queen of England aro invariably designated the British Empire ; and the epithet "imperial" is officially prefixed to the larliament of the Unitel Kingdom. The term empire was applied from 1804 to 1814 to the dominions of Franco, including all the countries then ineorporated with it by the conquests of Napoleon.
Emporium, in a general aense, signifles a rity or a place where extensive commercial transuctions are carried on; but it is more particularly applied to tho commercial centre of a country, or the place to which buyers and sellers, from various countries, resort.
Empyreuma (Gr. equvpeve, I kinille). A hurned edor; henee, the oils oltained by distilling various organic substances at high temperatures, are calted empyreumatic oils.
Enamel (Fr. émail) a semi-transparent or opaque vitrified sulstance, of the nature of glass, hut difforing from it ly posseasing a greater degree of fivilility and opacity. The compound which serves an a basis to most kinils of enamel is formed by the fusiun of a pure erystal glass or frit, ground up with a fine calyx of lead und tin, in eertain proprortions; to which is usually added white salt of tirtar. The different kinds of enamel are made by the addition of coloring substances, and melting or incorporating the whole by fusion. For white enamel, Neri (De Arte V"uthiar.) directa galy manganese to be added to the mutter which constitutes the basis; for azure, zaffer mised with calx of brass; for green, calx of brass with seales of Iron, or with crocus martia; for black, zalfer with manganese or with crocus martis, or mangamese with turtar; for red, manganese, or ealx of copper and ertude tartar; for purple, munganese with culx of brass; fer yollow, tartur and manganese ; and for vio-let-colored enumel, manganese with thrice-calcined brass; in making these enamels great nicety is requisite. The general way of making the colored enamel is this: Powder, sift, and grind all tho colors very wieely, and first mix them with one snother, and then with the common matter of enamels; next set them in pots in a furnace, and when they are well mixed and incorporated, cast them into water; when dry, set them in a furnace aguin to melt; and when melted, take a proof of the enamel. If too deep-coleret, uld more of the common matter of enamels; and if too pale, adh more of the celers.
Enameling, the art of luying enamel upon metals, as gold, silver, copper, etc. Kiumel ormaments for trinkets, in almost endless variety, may be prodneel ly the nid of the blowfipe. The enamel is ustally first drawn out into threade, or reduced to thin laniinw, to facilitato the process of fusion; and by the same means the enamel may be laid upon metals. Very elegant ornamental work may be thus proluced. Enameling also signilies to paint in enumel.
Einamel phinting is performed on plates of goll or of copper, but seldem on silver, as this metal is apt to occasion lmperfections in the anrfuce of the emmel. Copper is the metal most generally used for this pur-
pose, enameled ing is executed tiro, where they of glass. This for ity peeuliar manent, the for etfaced or sulli continuing alwa workman's hand entirely confline liable to certain perfect kind of gold, the other instance, somet silver turns the ing of the enum the round or ov zsually commer enamel on both metal from swel serves for the gy otep is to draw with red vitriol, parts of the des this, the colors oil of spike som tion being given to the different pose it is neceas ture. Its superficia?
pose, enameled with the white enamel, on whleh painting ls executed with colors which are melted in the fire, where they take a brightneas and luater like that of glass. This kind of painting is particularly prized for lts pecular brightness and vlvacity, which is permunent, the force of its colors not leing liable to be otfaced or sullied with time, as in other painting, and continuing slways as fresh as when it came out of the workman's hands. This method of painting is nlmoet entirely confined to miniature; larger works being llable to certain accldenta in the operation. The most perfect kind of enameling ts practiced on plates of gold, the other metals being less pure. Copper, for instance, sometimes scales with the applicatlon; and silverturns the yellow white. To obviate the cracking of the enumel, the plates are generally made a littie round or oval and rather thin. The operation is asually commenced by laying on a couch of white cunnel on both sides of the plate, which prevents the metal from swelling and blistering; and this first layer serves for the ground of all the other colors. The next ftep is to draw out exactly the subject to bo painted with red vitriol, mlxed with oil of epike, marking all parts of the design very lightly with a pencil. After this, tho colors (very tinely ground, and mixed with oil of epike somewhat thick), are to be laid on, attention being given to the mixtures and colors which agree to the different parts of the enhject ; for which purpose it is neceasary to understand painting in miniature. When the colors ure all laid, the painting ls to be gently dried over a elow ilre to evaporate the oll, and the colors are afterward nelted to incorporate them with the ennnel, making the plate red-hot in a fire such as enamelers use.

Enchasing, or Chasing, the art of embossing or making figures in low relicf upon gold, silver, and other metals. It is practiced only on hollow thin works, dach as watch-cases, tankards, cups, etc. The design having been traced on the exterior surfnce of the metal, the work is hammered upon steel blocks or puncheons introduced within; and thus the workman proceeds to indent the metal by the successive application of the bloek anil hammer to the several parts of the design; after which the work is cleared with small chisels and gravers. In this simple manner a skillfut artist is able to represent foliages, figures, etc., with admirable precision.

Encyolopzedia ( $\varepsilon v$, in, кúк $\lambda o s, ~ a ~ r i r c l e, ~ \pi a t i e i a, ~$ instruction), a term nearly synonymous with Crcloresma, but sometimes adopted in preferenco to it, as being etymologically more definite and completc. For, as it has been justly remarked-Cycloperia may denote "the h.struction of a circle," as Cyropedia is "the instraction of Cyrus;" whereas in Excycloperdia, the preposition determines the meaning to be "instructiun in a eircle." Vossius, in lifs book De l'itiis Scrmonis, observes, "that Cyclopediza is used by sonse anthors, but lincyclopaedia by the best." See Cyclopamia.
England, the southern, and hy far the most fertile division of Britain, correspouds in Intitnde with Ilolhand and the north of Germany, extending from $50^{\circ}$ to $35^{\circ} 45^{\prime} \mathrm{N}$. It a figure is nearly triangular, und its extent of coast is very great, both from lieing much indented, and from the sea bounding it on all sides exeept along a wilth of 70 miles on the Scottish border. The adjacent seas are the German Ocean on the east, St. Leorge's Channel on the west, and the English Channel on the south. No country can be more fortanately situated ; its elimate is temporate; its extent is suficient for its political secarity; whi!e its insular position not only presents the greatest capabilities of aggrandizement in a commercial sense, but has, by rendering itgreat military force unneeessary, in all probability heeu the chief cause of preventing the excentive branch from usurping absolute power, at in tho countries of the Contiment.
lts superficial extent had long been a question of
considerable doubt, and the different estimstes varied no less than $10,000,000$ of scres. Mr. Pitt, on the suthority of Arthur Young, assumed, In 1798, the ouperfleisl extent of England and Wales to be nearly $47,000,000$ of acres ; a later calculation by Dr. Beoke, approaching more to accuracy than any preceding one, fixed it at $38,500,000$ acres. But according to the census of 1851 , the area of the great territorial subdivisions of Great liritian is as follows, viz. : England, 50,922 square miles; Scotland, 31,324; Wales, 7398 ; und the Islands in the Britlsh Seas, 894 square miles; making the aroa of England and Wales 58,320 aquare miles, or $87,324,015$ Imperial acres. The forms of the islands are irregular, and do not approseh simple geonetrical figures, if we except England, which waa not inaptly compared by the ancients to a triangle. The area of Great Britain is equal to a equare of 299 miles to the side; England to a square of 226 miles to the oldo; Scotland to a equnre of 177 miles to the side; Wales to a square of 80 miles to the side; the Islands in the British Seas to a square of 20 miles to the side. While the urea is in the ratlo of these squares, or as $51,31,7$, and $4-10$, the population is nearly as 17, 3, 1, and 1-7; England has, on an average, to a square mile 322 persons, Wales 136, Scotland only 92 , the lslunds in the British Seas 363 persons. While alsont $21,200,000$ acres of territory lie north, and $36,400,000$ acres south of $55^{\circ}$ of north latitude; the populations on the north and south side of the line are respectively about $3,173,000$ and $17,787,000$.
Mfarbors.-l'urtsmouth, Milford IIaven, sud Ilymouth, are the finest Iarbors in England, and are surpassed by fow, if any, in the world. Of these, Portsmouth is entitled to the pre-eminence. This noble lurbor is about as wide at its mouth as the Thanes is at Westininster Irilge, expanding within into a capacious lusin, almost sufficient to contuin the wholo navy of Great Britain. Its entrance is unobstructed by any bar or shallow; and it has throughout water adequate to float the largest man-of-war at the lowest tides. The anchorage-ground is excellent, and it is entirely free from sunken rocks, sand-banks, or any similar obstructions. The western side of the harbor is formed by the island of l'ortsea; and on its southwestern extremity, at the entrance to the harbor, is situated the town of Portsmonth, and its large and important suburb of Portsea. Here are docks and other establishments for the building, repair, and outfit of ships of war, constructed upon a very large seule, and furnishell with evory eanvenience. 11. Portsmonth harbor has tho additional and lmportant advantage of opening into the celebrated road of Spithead, lying between the Hampshire coast and the 1sle of Wight, and forming a safe and convenient retreat for the largest fleets. 11I. Milford IInven deeply indents the sonthern part of lembrokeshire. It is on great extent, and has within it many bays, ereeks, and ronds. The water is deep, and the anchorage-ground excellent; and being completely land-locked, ships lis as safely in it as if they were in dock. IV. Ply: mouth, which, after l'ortsmouth, is the principal naval dépot of England, has un almirable double harbor. The roulstead in l'lymouth Sonnd has been much improved by the construction, at a vast expense, of a stupendous l, reak water more than 1,700 yards in lenglh. This bulwark protects the ships lying inside from the effects of the heavy swell thrown into the Sonnd by southerly and sonth-easterly winds.

Lomdon stands at the head of the river ports of Grent Iritain. Considering the limited cosist of the Thames, there is probably no river that is navignble for large ships to so grent a dir ance from the sea, or whoso month is less obstrueted by banks. London is mainly indebted for tha marivaled magnitude of her commerce to her favorable situation on this noble river; which not only gives her all the advantiges of an excellont port, necessiblo at all times to the largest
ships, bnt readers her the emporiain of the extenelve, rich, and populous country comprised in the basin of the Thames. The port of Londen extends from London Bridge to a littlo below Bleckwall, and is divided Into the Pool, Limehouse Reach, Greenwich Reach, Blackwall : Reach, and Bugshy's Reach. - The coashing trade of London la greater than that of any port in the world, and givee -it 'superiority over Liverpool.

Liverpool, the principal eeaport of Fingland, lat. $83^{\circ}$ $25^{\circ}$ N., long. $2^{\circ} 69^{\circ}$ W., is sttuated on the eastern benk of the Mersey river, while on the west side are the docke, wareheuses, and other commercial buildings. The area of the wet dockn is about 185 acres, and of the dry dock 20 acres. The entrance of the Mersey is impeded by shoals, but at high water may be entered by the largeet shlpe. The docks are the finest In the worid, and In connection with its situation and Inland communication, give it the position it holds, of the first port in England, and having, next to New York; the largest commercial marine. Thr Mersey, now the second commerclal river in the empire, is more Incommoded with banks than the Thamen, and is in all respecta inforior, as a channel of navigation, to the latter. Still, however, it given to Liverpool very great adrantagee; and the new channel which has recently been discovered in the banka promisen to be of much impertance in facilitating the access to and from the pert.

Briatol and Hull are hoth river ports. Owing to the extrmordinary rise in the Bristol chanael, the former is accessible even to the largent shlps. The Humber is a good deal impeded by banks ; but it also it navigable as far as Hull by very large vessela. The Tyne admits vesseln of very conaiderable burden as for as Neweastle, which la one of the most important shippling ports in the empire.
Slatiotics.-The total length of rallwayt in England and Wales open for truffic at 81et December, 1858, was 5,811 miles. The number of passengers conveyed in that year was $84,222,96 \mathrm{I}$, of whom considerably more thap one half were first and second class pasengers. The receipts from the goods traffic somewhat exceed those from the passenger traffic. The length of lines in course of conatruction at 30 th June, 1853, was 491, while the length authorised was 2,969 miles, nearly 2,500 miles being neither open nor in course of construction. The total amount of capital and loans anthorised to be raised by railwey companies in the United Kingdon previous to 3ist December, 1852 (after deducting amonnts proponed for lines anbsequently abandoned), was $£ 556,610,456$, of which $\boldsymbol{\mathcal { E }} 6 \mathbf{6}, \mathbf{1 6 5 , 6 8 0}$ had heen rained: the amount raised in 1852 was $£ 16,898,098$. The namber of passengers that traveled by rallway In the half year onded soth June, 1854, was $45,080,816$; the amount of receipts from passengera was $\boldsymbol{x 4}, 092,661$; from horsea, carriages, luggage, and malls, $\boldsymbol{x 8 0 6 , 1 1 0 ;}$ from general merchandise, eattle, mincrals, etc., $£ 4,826,825$; total for alx monthe, $\mathbf{x 9} 424,602$. See Rarluoatos.

Electric Tolegraph.-Connected with the railwayn is the electrie tolegraph, which is now stretched along thousands of miles across the length and hreadth of the land, or ank in the depths of the ocean, conveying intelligence betweea diatant points with the rapidlty of lightning." In 1846, an associntion under the title of the Electric Telograph Company, obtalned an act of incorporation, and having bought up the various patents for electric telegraphs, they necured the exclusive right of sending intelligence through the xingdom by this meana. Since then chey have been extending their operations in all directiona; but great as are the advantages conferred on the country by this invention, there is reamon to expect that they will lo vantiy increased and extended, an the instrument is capable of atill greater fmprovements ; and when the charges for the conveyance of intelligence are reduced to their
propet lavel, the slectrio telograph will be muoh more generally used.
Comale.-The oamals of Englend are extromely numerous ; In fact no country excopt Holland can enter inte rompotition with her in this raspect. : The Engliph canals are of moderate siae, beling from 25 to 30 , 85, and 40 feet in width, and, in general, from 5 to 6 feet In depth; the bargen navigatiag them are very long, frequently 70 or 80 feet, on a width of 10,12 , or 14 feet ; but In caany cases their dimensions, at least their width, are necessarily amaller, the lese frequented canale being nerrower than thoee we have mentioned. Could the applicstion of ateam to navigation have been foreseen, the canaly of England would probably have been made wider. For fall detalis with respect to the canale of England, and tho recent improvemente in thelr conetruction, and In traveling by them, the reader is referred to the article Canals.
Bridges.-The principal bridges In the kinerdem are the raliway bridges across the Tweed and ine Tyne, and the seven erected scrose the Thames, at London, four of which have been opened aince 1817. Of these, two, the Southwerk and Vanxhall, are of cast-Iron, the one being of three very large arches, and the other of nine archea, each of 78 feet apan. The first example of an iron bridge on a large scale, either In England or any other conntry, was that erected In 7796, et Wearmouth In Darham, the span of which was 210 feet. The chain bridge over the Menal Straits, and the tubular bridge over the same place, ore wenderfal examples of engimeering skill. See article Bnidges, etc.
The principal erops caltivated in England and Walea are wheat, oats and beans, barley and rye, tumips and potatoes, with clover, hops, flax, etc. It is in be regretted that no estimate, derived from suthentio returns, has been formed on which much reliance can be placed, either of the extent of land under different cropa, or of the arernge product per acre. Mr. Caird, in his work on Einglish Agriculture, p. 522, gives the following estinate as the result of his survey of Eingland $\ln 1860-51$ of the extent of land nuder the dif. farent apecies of crops, and in fallow, In England:

| Wheat. | 8,416,750 |
| :---: | :---: |
| Barley and rye | 1,416,750 |
| Oats and rye. | 2,000,000 |
| Beans and peas. | 1,139,000 |
| Clover. | 2,277,730 |
| Roots (turnlpa, mangold, potatoes, etc.).. | 2,116,450 |
| liops, gardens of sll sorts, etc............ | 150,000 |
| Falow eod rape.. | 1,810,000 |
|  | 18,317,000 |

Mines-Quarries-Iron, Copper, Tin, and Salt Works. -In regard to minerals, England does not yield to any country in Europe in nataral abundance, and takes the lead of all In the extent to which these rude treasures have been converted to purposes of utility. England'e great superiority lies in her coal mines, which are not only more productive, but more advantageously situated, than those of the Continent. To the mines along the coast a ready conveyance is afforded by her insular position, and to those in the Interior by her inland navigation. The consumption of coal In England for domestic use has beon estimated at $20,000,000$ tons annually. Large as this quantity is, and larger as it muat be when wa add to it the vast cons amption of manufactories, auch as iron-works, cop-per-workn, salt-works, glass-houses, and the like, there is no reason to apprehend the exhaustion of this precious mineral; the depth of the coal-beds being very great, and the extent of ground containing them amounting to many hundred thousand scres. The principal coalbeds Ito in Northumberland, Durham, Derbyehire, Itaffordehire, and Glamorgenshire. The ports for shipping coal in largu quantitics are Nowcastle, Sunderiand, and liartlepool. The motive of the tax on coal exported to forelgn countries was thus neither an

apprehension of oventual scarcity, nor oven a calculstion of revenue, 80 much as a dread of giving her Continental nelghbors the means of rivaling her manufactures. Coal is not wanting In Prance and Germany, but the mines are at a diotauce from watercarriage, and as yot very imperfectly wroug'at; while for the purpose of domestio fuel the inhabitants give a preference to wood. After various changes, the export duty on soal was totally abolished in 1850.

According to the census of 1851 the tcial number of persons engaged in the coal trade is 239,459.
in 1858 the exports of coal to foreign countries, according to the real or declared value, amounted to £1,602,762. See article Coal.

In quarries, whether of atone or slate, England is not rich; partioularly the eastern half of the kingdom; and hence the almost unlversal use of brick in ordinary buildings. It is not till the-traveler reacheo Durham that he finds stone commoniy used. In the northern conntios quarries occur frequently; In the southern, those of Portiand and Bath aro the most considerable. Still the annual profits of the whole are small.

No branch of industry has increased more rapldiy in the present age than Iron-works. A centary ago it was computed that England required an annual Importation of 20,000 tons of foreign Iron; an importation, which, for many years scems to have been on the Increase, so as, after the middle of last century, to carry the quantlity required to $80,000,40$,000 , and even to 50,000 tons. This aupply was brought from Sweden and Rusala, and, though burdened with daty, It wae In quantity more than double the native produce. But fortunately, after the year 1780, discoveries were made which Increased greatly the supply at home. Bar Iron had been manufactured in England as ou the Continent, wlth charcoal fuel only, cosl belag deemed Inapplioable to that purpose. Under that impression, the rapid consmmption of the wood In the neighborhood of the different Iren-works had necessitated a removal, at a great expense, of materials from one spot to another, and was on the point of causing sn alarming decay in the business, when the ironmasters, after long peraoverence, succeeded In applying coal to their manufacture. They had to contend with various prejadices, particularly the supposed inferiority of Iron so made; but, in the course of years, the manufacture ocquired such an extent that there were, $\ln 1805,220$ blast-farnaces, makling $\mathbf{2 5 0 , 0 0 0}$ tons of pig iron.
The tranaition from war to peace did a good deal of infury to soms branches of the lron trade; but the affect of the ciange was not of long duration, and the production of Iron in England has since been astonishingly increased. In 1820 the produce was calculated at 400,000 tons." The excitement and speculation of 1824 and 1825 had a wonderfu] Influence on this department. Accorling to careful Inquiries made at the time, the furnaces at work In Engisud and Wales in 1827, with their produce, were as under :

Owing to the fallure of various rallroad and other projects set on foot in 1826 and IV26, the supply of iron seems to have greatly oxceeded the demand; nnd there was a very heavy fall of prices in 1828, 1829, and 1830 , and again in 1850 and 1851. But within the last two years pricea have again risen; and the iron traide is, at this moment, in a state of great activity. The produce of the varlous furnaces of England and Wales, may be entimated at nearly $2,000,000$ tons.

The quantity of Iron of all kinda manufactured and unmanufactured, exported in 1852, amounted to 1,035 , 884 tons, besides 25,289 toris of cutlery of the declared value of $\mathbf{£ 2 , 6 9 1 , 6 9 7 \text { . Now that the rall ways are nearly }}$ completed, it might have been expected that thls would have caused a stagnation in Ite manufacture; but iron is now so extansively used in the construction of ateam-vessels, that the demand has been maintained. For more ample detaila, the reader is referred to the article Inos.
Copper-mines have long been known in England, but they were wrought with very little akill or effect until toward the year 1700. Evon at that time the annual produce, after smelting the metal from the ore, was only a few hundred tona of copper; aud it hardly exceeded 1000 tons annually, down to the middle of last century. From that time forward, the increase became considerable, as woll in Cornwall as in Devon, North Wales, and Derhyshire; in all of which, cop-per-mines were discovered and wrought.r In North Wales, there were two mines, Parys and Mona, whloh, for some time after the year 1780 , ylelded annually a iarge quantity of ore, hut they are uo longer so productive ; the mines of Devon and Derbyshire continue to be wrought, but the great product is from Cornwall; the mines of Cornwall and Devon $\ln 1853$ yielded 181,969 tons of copper ore, the metal obtained froin which, at the rate of $6 \frac{1}{2}$ per 100 , produced 11,823 tons of standard copper, which, at the average rate of $£ I 40$ per ton, amounted to $£ 1,655,220$. It is the Welsh collleries which afford to Cornwall, as to Dew vonshire; the means of amelting; and as the ore is less heavy than the coal required for thie operation ( 1 ton of ore requiring from 2 to $2 \frac{1}{2}$ tons of coal), the praotice is to convey the ore in vast quantities to Wales, particuiarly to Swansea. In this, as in ctherminerals, France is greatly behind England. She has various copper-mines, but her coal-mines, at least those hitherto wrought, are at too great a distance to make anch undertakings profitable; and she consequently requires an annual importation from England.

In 1854 there were exported of brass and copper mannfactures $1,851,689 \mathrm{cwt}$., of the valne of $\mathbf{x 1 , 7 6 1 , -}$ 878.

Cornwall ls also the great seat of the tin-mines of Engiand. A century ago, the average pr ance of the tin-mines hardly exceede? 1500 tons; it may now be estimated at 5000 tone a-y ar. From sbroad England receives tin principally from her Indian possessions, Holland, and the Uniter States. Of this, was imported in 1858, 49,740 owt. The value of tin unwrought, and in plates, exported in 1854, was $£ 1$,307,246.
The lesd-minas of England are princlpally in Cumberland, Northumberland, Derbyshire, Flintshire, and Salop. In 1852 England and Wales produced 80,700 tons of lead ore, and 57,621 tous of lead. Blaok lead Is found in Cumberland, in the romantio district of Borrowdale. The mine was formerly opened only periodicaily, in order that the market might not be overstocked, but for a coneiderable number of years past, It has been constantly open.

There in no country better aupplied than England,
loth with brine-springs and beds of fotail, or rocksalt. The brine-springm are found in Cheshire, In the sonthern part of the county, in places contiguous to the river Weaver, und at Droitwich, in Worcestershire. The beds of rock-salt, which sre of great thickneas, were discovered in the vicinity of Northwich and Lawton. The greater part of the salt produced la obtained from the brine-springs. Formerly considerable quantitiea were produced by the eve juration of seawater, but since the ubolltion of the duties most of the works appropriated to this manufactuce have been abandened. From the brine-springs it ls obtained at the rate of one galton of solid salt from four gallons of Hquid, while common sea-water doen not yield above one in twenty-elght. The consumption of salt is immense. Necker eatimated its consumption in those provinces of France which had puschased an exemption from the gabelle (pays francs redimies) at about 191 Ibs. (Eng.) for each Individval,-Administration des F'ingnces, tome li., p. 12. From all that we have been able te learn on the sutject, we believe that the consumption of the people of Great Britain may be eatimated a little higher, or at 22 lba. ; the ilfference in food and hablts, as compared with those of the Freneh, fully aecountling for this increased sliowance. On this anpposition, and taking the popuiation of Great Britain at $21,000,000$, the entire consumption will amount to $462,000,000 \mathrm{lbs}$., or 206,250 tons.

Exelusive of this immense home-conanmption, Fngland unnoally exports alout $18,000,000$ bushels, which, at 56 ibs, a buahel, are equivalent to 857,143 tone. The Americans are the largeat consumers of British salt.

The cheapness of this important necessary of life is not less remarkable than its diffusion. Ita present cost may be eatimated, at a medium, at from 14s, to 160. at ton.

Sait has been at ali times a favorite aubject of taxa tion. It was first taxed in the reign of Wiliiam III. In 1798 the duties amounted to 5 A , a bushel, but tiney were subaequently increased to 15 a . a bushel, or about forty timea the coat of the ealt. So exorbitant in duty was productive of the worst effects, and, in particular, occasioned a great deal of amuggling. The duty having, in conseqnence, become exceedingly unpopular, was finaliy repealed in 1823,

Fiaheries.-At present our space aliows no more than a brief notice of the principal branchea of the fiaheries.

The mackerel fishery in carried on with great vigor on the coast of Kent and Sussex, in May, June, anil July. Large as the supply is, it wonld stiil admit of augmentation; and herrings aiso might be canght in vast quantities on the coast of Kent in October and November. The desideratum with the fishermen is not so mneh a high price as a certain market ; ond the most effectual way to procure that is, to quicken, by overy possible means, the conveyance to london, which has been accomplisherl by the employment of ateambuats and ruilways.
The pilehard fishery taken place chiefly on the coast of Devonshire and Cornwall, and, though sobject to great fluctuations, as well from the seasons as from England's political altuation relative to the continent, forms on the whole an important branch, employing a numier of aeamen both in eatching the fish and in carrying it to foreign markets. Its season is generally from June to Sejtember.

The herring, the most important of wil the fisherics, is happily now in a state of rapid extension. It formed, during the 17th centary, the great employment of the Duteh seamien, and was contempiated by their neightora with very jealous evea. Accordingly, in the reign of Charlen II., particularly nfter the rupture with Holland in 1672, several acts wore passed for the encomragement of the fimbermen, and in a spirit of hostility to the Dutch. The aubsequent aecession of Whllam to the throne, and the long friendahip between
the two countries, relaxed the exertlons of the gov ernment ; and it was not till after the peace of 1748 , that a large bounty was given on the tonnage of the bussea, or masted vessels, so employed, Stiil Engllih fishermen were unable to compete with the experience and patient persevarance of the Dntch, and it was found necessary to ralse the lrounty from 30 s . to 50 m . per ton. Thia had the desired effect, and the number of husace inereased; but the additional 206. being withdrawn in 1771, the fishery again declised. Tise American war, and, aubsequentjy, the wars of the French revolution, proved extremely adverse to its extension. At last, in 1808, an aet wis pasaed carrying the bounty to fB a ton on the buesea, with a further grant of 2s. per barrel on all herrings canght, whether in bussen or boata. Thia aet was further conifrmed in 1815, and the bounty per barrel raised to 46., with the qualification that the herrings ahould be gntted hefore curing.

In consequeuce of the encouragement thus afforded, the flshery was materially extended; but this was effecterl at a great expense, and had, beaides, severa: bad consequences. The lrounties given by government tempted persons without capital or skill to enter into the business, to the great injury of the reguiar fishermen; so that notwithstandling the extension of the busineas, it was found, as is invariably tise case with all departments carriel on by means of a bounty, to be in a very unhealthy atate. In consequence partly of the clrcunstances now statel, and partly in consideration of the real and substantial relief given to the fishery liy the abolition of the dutles on salt, it was reaolved gradually to withdraw the bounty, which cotally ceased in 1830. And it may be ntated, that though the fishery fell off while the bounty was in the course of being withdrawn, it has since been materially increased, and is now in a better aituation than at any former periol. From the year 1811 to 1830, the year when the bounty ceased, the greatest nunber of barreis cured in Great Britain was 442,195; and in the year ending December, 1853, they moiounted to 778.039, the largest number cured in any previous year. The quantities cured in each year vary consideratily, according to the abundance of the shoals that appear upon the coasts in different seasons; but since 1838 , the annual quantity cured has never falien below 500,000 barrels, whilo for the 25 previous years they would acarcely average 300,000 . In 1851 there wers exported 239,330 barrels of the declared vaiue of £228,835.

The cod fishery ia next in importance to that of the herring. It is carried on in a great varicty of places contiguons to the British shores. The finest tish is canght round the edges of the Dogger Ilank, but within theee few years London has been prineipally suppiied with cod taken between Yarmouth and the Nore. The fisheries ln the ncightorhood of the Shetland and Orkney Islanda, are productive and valuable, but the great bank of Nowfoundland is the principal atation of the alstant cod fishery. About 2,000 men aro euployed in tho sole fishery.

Salinon are rarely caught except in estuaries or rivors, which in most instances are private property. It is found in most English rivens, but in such mmall quantitjes us to make the fishing an olject of littio consequence.

England is chiefiy supplied from the fisheries in the Scotch and Irish rivers, but from some cause or cther there is a growing scarcity in this fish, probably from the weira or salmon-traps placed in the rivers and estuaries in the way of the fish when ascending the rivera to spawn.

Greenland was flrst diseovered by tho Eng:ish; lut in this, as in other brapches of navigation she long allowed the Dutch to take a lead. It was not till after 1750 that, the government having granted a bounty of 10s. a ton on every vessel employed in ths

whale fishery, considerahle inerease took place in this branch.

In 1750, the veseels empioyed were only 10 ; in 1756, they had increased to 07. The war soon causod a decrease of ons half; bat at the return of peace in 1763 this fishery revived, and in 1770 the veasels employed amounted to 50 ; in 1778 , to 65 ; in 1775 , to 96. The American war again caused a decrease, and in 1682 the vessels so employed were only 38 . In 1784 they increased to 80 , and in 1785 to 140. After thid, they exceeded 200 annually till 1703 ; but the long continuance of the late wars reduced them below half the number employed previousiy. In 1852, the whale fishery employed ahips, of the aggregate hurden of 16,113 tons.

The Newfoundiand fishery has been considerable for fuliy a century past. As a nuraery for seamen, it is accounted of such consequence as to have formed the object of a spacific article In most of the treatiea of peace. The fish caught, particularly in time of pesce, is sent less to Britain than to the Catholic countries in the south of Europe; a market subject to all the interruptions attendant on a cliange of political relations. The number of vessels employed in this fishery at different timea was as follows:

$$
\begin{aligned}
& \text { Ia } 1731 . \\
& \text { 1761 }
\end{aligned}
$$

> The American war caused a diminution; but
> In 1784 the namber was. 986

At this rate the fishery continuad until the war of 1793, after which, particulariy after the rupture with Spain In 1797, It fell off greatly; the fishing-vessele in 1798 being oniy 140.
The continuance of war, and the aggrandizement of the French in Italy, occasloned additional depreasion; so that in 1810 the number of English veasels employed at Nowfoundiund did not exceed 92. The peace seamed to promise a revival of thls important nursery of seamen; and in the year 1816 the number of veasels which arrived in Newfoundland was 795, manned by 6,000 seamen ; but the trade, both then and in 1817 and 1818, proved unprofitable, in consequence of indifferent acasons, of the higa duty impored on fish imported in British vessela Into Naplea, and of the competition of the French fihermen, supported by a high bounty from their government. The total value of fish exported from the Iritish colonies in North America $\ln 1851$, was $£ 827,738$.

It is a matter of surprige to foreigners that a maritime nation should not have more effectually cultivated this great means of facilitating the support of the people. The ample supply which might have been afforded by the Nymph Bank, on the south-east coast of Ireland, has heen avowedly neglected; and it was only in 1818 that the discovery of a bank of aimost equal productiveness in the vicinity of Orkney, was made.

Fish is little known to the mass of the people in the inisnd counties, thongh the facilitles of transport afforded ity the railways ia gradually distributing it In larger quantities. London has always been amply supplied. Mr. Mayhew, In his pamphlet on " london Labor and the London Poor," estimates the weight of fish annually consumed in London at ahove 450,000 ,000 pounds, besides an enormous quantity of shellfish. Culculating tho fish of all kinds at 3d. per 1b. on an average, the amount would exceed $£ 5,000,000$ sterling. See the artlele Fisueries,

Manufactures.-In this great department of Engllsh productive industry, we begin with woolgus, which, slthough no longer the largest of these manufactures In point of exportation, nor even in the value annually made, is entitled to the first place from the priority of its estallishment, as well as from the substantial basis on which it reats. England, from the extent of her pastares, abounded in wool from a very remote age,
and the inhabitants were doutitlens capeble of manufacturing it into rude clothing ; each weaver working in hif separate cottage, and with very littie aid from machlnery. In the 12th and 13th centuries she appeara to hava had only the mont humble fabrlce, and to have fmported all cloth of finer texture ; seading abroad her wool in quantities to Flauders, a country the inhabitante of which were at that period much further advanced than the reat of Europe, with the exception of Italy. It wus in the middle of the 14th century that a better aystam was introduced. Flemieh manufacturers vere invited over to England, and improved greatly the quality of her home-made woolens. The aeats of thic branch of industry appear at that time to have been Kent and Easex; afterward Gloucestershire, end subsequently tha West Riding of Yorkshirs. It occupied at first the southern and more improved districta, and spread afterward to the northward, on account of the cheapness of laber, the ahundance of coal, and the convenience of water-falls for the machinery. The genaral charucter of the woolen manufacture of England has been that of slow progreas, but of little fluctuation; the latter evidently a consequence of its der ading more on home-conaumption than on exportation. In the long period from 1700 to 1780, the exports experionced a regular, but not rapid rise, amounting in the latter years to about $£ 3,500,000$, while the home-conaumption increased in proportion to lier augmenting numbers. More recently the manufacture has been materialiy improved by the adoption of various important mechenical inventions in the spinning, weaving, and dressing departmenta. On the whole, however, lmprovement has been much loss rapid in it than in the cotton manufecture ; so that while har exports of cotton stuffs and yarn have increased bey nd all precedent, those of woolens have been compuratively stationary.

As we ahall enter fully, in the article Woonen Manufacture, Into the details connected with its blatory, progrese, and pres ant state, it would be useiess, even if our limits permitted, to anticipate these here. We ahsil only obsorve, therefore, that the entire value of the manufacture is eatimated at about $\mathbf{£ 2 5 , 0 0 0 , 0 0 0}$. According to the census of $\mathbf{1 8 5 1}$, there were employed in the various branches of the woolen manufactures 176,131 males, and 118,642 females. By far the largeat proportion of the raw material of the manufucture is the produce of her own flocks; but for many years past she has imported large quantities. Previously to 1800 the average importe did not excead $8,000,000$ lha., mostly brought from Spain, tho wool of which long maintained a high character. In 1800 the lmporta increased to $9,000,000 \mathrm{lbs}$. Since then they have gone on increasing, till, in 1852, they reachel $93,761,458$ lbs., of which $48,197,301$ lbs. came from her own dependencles ln Australia. In 1831 tho exports of woolen manufuctures amounted to $£ 5,232$, 0I3. Since then they have annually increaaed, till, in 1852, thay roached $£ 8,730,934$. For an account of the prices and qualities of wool, etc., the reader is referred to articis Wool.

The cotton manufacture of England is entitled to the greatest attention on different accounts. Of all her manufactures, it affords the largeat export, and exhibits the most rapid improvements in machinary. Its introduction, though not remote, is less recent than is commonly suppoaed. It appears to have taken place early in the 17 th century, when it was eatablished at Manchester; but it was long conducted upon a very limited acale. The raw material, imported at first ouly from the Levant, in particular from Smyrns, began, after 1660 , to be supplied by her West India colonies. Tho quantity imported amounted, about the year 1700, to 3,500 bales; but, increasing with the extended cultivation of hor colonies, it averaged, about the year 1720, something more than 7,000 balea. From the colonial conquests of the war of 1756 her import of
cotton recelved further angmentation ; but the manufacture inereasedi very slowly, a great part of her cotcon belag re-exported to Holland, for the eupply of Dutch and German weavers. It was not till after the pence of 1/68, and the invention first of the carding machine, and next of the epinning-jenny, that this manufacture beoame conslderahly extended. In 1775, the average Import of cotton approached 18,000 hales. A variety of inventions, unequaled in the history of manufacturing induatry, were now made (see artlcle on the Cotion Maxofactures), which gave an astonighint timulus to the busineas. Fine calicoes and musling were latroduced; the workmen ware withdrewn from their dotached dwellings, and collected into larsefactorles ; and the price of the finlshed article experienced a reduction, notwithstanding a rise in the raw material, and In the wages of labor. The period which followed the peace of 1783 Is perhaps unexampled for the reduction of price, and the consequent extension of anle that took place I : regard to cotton goode. The commencement of hostlities in 1703 gave a pretty severe abock to the businese; but the improvements in machinery continuing, the manufueture soon recovered, and has gone on increasing, under many viclasitudes, with a rapidity unparalieled by any other businesa, either in that or any other country. Nelther does there aeem to be any ground for fearing that thle progress will be speedily ohecked. On the contrary, her superiority in the majority of what contributes to the advancenent of the mannfacture is so very decided, that, provided the public tranquillity be preserved unimpaired, she need not fear from the competition of othera.

The rader ia referred to the article "Cutron ManuFactore' In this work for an necount of the rise and progresa of this great branch of national industry, and for tabular statements, exhititing the present magri. tude and lmportance of the trade, the sources whence the raw cotton 18 derived, and the forelgn markets for the raw material and manafactured artieles.

Hardoware.-We have already noticed the aurpriaing Increase in the produce of the iron mines of Fingland since 1780. This Increase of the raw unaterial, joined In rome cases to the cominand of coul in the vicinity, anit in all to a facllity of conveys ce of coal and irum by canaia and rallroads, has, in the last 50 yeare, given a great extenslon to her hardwars manufacture. in nodepartment has the subdivislon of emploviment been curried to so great a length; in none ary its effects In choapaning production so eonsplenous. Birmingham and Shefliedd are the two great workshops for Binglish hardwave; tho latter is confined to iron and steel, white in the former not only lron and ateel, hut copporer and Irase, constitute the msterials of iahor. Sheftield fahrieates articles which are leas for ornament than utility, and which posaess in general a certain bulk, such as grates, apades, sickies, files, knives, fonderk, fire-irona; winile In llirmingham vaere in, in addition to artleles of nolidity, a surprising variety of toys, fancy goads, and petty manufacturas ; ench trifliog, when considered noperatuly, but the whole forming an ugyregate of great value. 'ihe most insignificant of these, aneh as a brass cock or a hutton shank, pansea through a number of handa, and each artizan jerforms oniy a single operation. lie thox acquirea an extraorlinary dexterity in his limited department, ami in the course of a day vienpatehes soveral hurdred, perhaps even a thumand artivlex, thromgh his particular stage; the result of al! which le, tiat the price, wion sold in quantities, is ineredibiy low. Another and very interesting feature in tho althation of itirmingham, is the popuinunnes of itm neighlorional. Yet in none of the large towns of lingland ia living lean expensive; an advantage owlug partly to the aimaiance of conl, partly to the rendy auplily of milk and vegetablea from the wide apace oceupled hy the jophlation.
Nails.-The nail trade in carried on, not in the
town of of Birmingham, but in a part of the surrounding district. It ls computed, by the censum of 1851, to employ, in England and Waloe, 16,065 malea, and 9976 females, of whom 7625 are under 20 years of age; for even this heavy artlcle admitts of subdivision of omployment, which lightens the labor, and enublea the workman to avail himself of tho aid of his family. Of the twi towns, Sheffield ia by much the nore ancient ; thin command of coal and iron in the same neighborhoon' having rendered it, so far back as the 18th or 14th century, a place for the fabrication of the homely articles used in thone days by our sncostors. It is about a centary aince its razors, knlves, and files began to take a more delicate shape. Birminghum, however, emifuced a wider range, and advanced with mush greater rapidity ; but Shefficld also has Its adjacent diatrict, Inhalited by manufucturera, though to a unoh less extent than the vicinlty of Birmingham. This district, called IIallamshire, oxtends six or soven milea to the weat of Sheffield.

Hardware is made in eeveral other places, anch as Eilston, Wolverhampton, Dudley, and Walsutl. Each of these towns is aituated in Staffordshire, and, in point of manufucture, la small only in comparison with Birmiogham or Sheffield, Articlea apparently very trifling are msnufnctured to a surprising extent $\ln$ different placea, such as pins at Gloucester, needles nt Red-ilitch in Worceatershire, watch-movements and main-springs at Prescott in Lancashire. The total value of articles of iron, steel, brass, und copper, incluling tho manufacture from its earliest to its most finished stage, is necessarily fluctuating, but may be computed at $\mathbf{£ 3 0 , 0 0 0 , 0 0 0}$ annually; two thinds of whieh apnear to be consumed at home, whife the other third is exported to twa great markets-the Continent of Europe and the United Stutes of America. The number of persons employci in the hardware manufacture in England in 1801 was about 460,000 . in the Unlied States, iron nud coal are found, where land and provisions are certainly much cheaper than in Britain; but the scatterenl state of Americnt faplulation inust, duriog several ages, opposo serious obstaclea to the division of employunent necessary in ali the aicer luranches of the luriwnre manufacture; partichlariy as the ease with which tio Miasissippi and Ohio are navigated hy steum opess even the Western Statea to tho importutiou of Britlsi goods. Upon the whole, therefore, we look on Einglish hardware manufactures as resting on a seldi basin, because in them nre combined several advantages:-the raw material, the comarmad of eherpy fuel, und the ase of machinery, which tho more it is adopted, will brlag is greater proportion of the work within the compass of women ani boys, and thus lesnen the proportion borne by wuges in the cost of the dinisited article.

Linen Tride.-Linen has never formed oue of the staple manufactures of Inglaui, thax having been less cultivated there than on the ofjosite mhore of the Netheriande ; a country which, in the 1 Ith und lith centuries, auplienl the rest of liurupe with the tinent linena and woslens. When linghand sulserguently advanced in inanufacturing rts, the abundant sughiy of wool pointed ont the most nuitable brancia; ani nine was contented to continuo her imports of fluen from the Netherinnis, from Franee, mid from (icrmany, or to favor the munuficture of then sister laland in a dieo partuent which did not exeded her joalonay. in fro. land, the linen manufactum datee about two centurion mgo, and is anill to have owal nuein of its extension to the mensures of tho unfortunato Wintworth, in the

shlre. In 1745, government, apprised of the extemalon of the manufacture of coarse linen in Slleais and other parts of Germany; and actuated by the fallacloua notlon of making a monopoly of all kinds of productive Industry, granted a bounty of 11/d; per yard on the exportation of all Britlah linen of a value from 6d. to 18d. per yard; in other words, a premlum of 20 or 25 per cent. on the prime cost of all Inforior quallties exported, So large a grant soon augmented the manufisture of osnaburgs and other coarse cloths, partleularly In Scotland, although the ratlo of increate was Infinltely smaller than la the case of cotton, where there was r's premium, but a rapid improvement of machinery. The demand for bounty in the ten years
 cenily these impolitlc issues were greatly lacreased, but at length the impolley of forcing a manufacturn in thls way having becomo obvious to every one, the bounties, after being gradually reduced, ceased finally in 1830.

The manufnctore is princlpally carrled on in the West Riding of Yorkshlro, its chlef seat being $\ln$ Ieeds and its nelghborhood, nud In Lancashlre, Dorset, Durham, and Salop.

Ireland arid Scotland, partlcularly Dondee, nre both superior to Fingiand in the manufacture of linen. But some of the flax mills established nt IInll are on a more extensive scale than any other in the emplre.

silk. Monufacture.-In the sllk mannfacture, as in the linen, England has had to contend with a formilable opposition in other countries, particularly in France and Italy ; and she has also had to lmport the whole of the raw material. It would therefore hardly have been attemptell by her countrymen, but for the great profits expected from an artlele of general use among the higher classes. Its introd.ection goes back to the $15 t h$ centary. About the beginnlup, of the $\mathbf{1 7 t h}$ it seems to have been carried to a consideralle extent, owing certainly not to the luxury of the age, nor to any great proportion of affinent persona in the community, but to slik hoing almost the only artiple of apparel in which the vanity of dreas conild ilaplay lteelf. Toward the end of the relign of Charles II., about the your 1680, raw silk began to he imported In quantitjes from India; and the Finglsh manafucture received a substuntial aldition by the numbers and ingenulty of the Frenchmen who settled in that country nf'er the sevoeation of the edict of Nantes in 168: Varmus cirenmatances thus centributed to preservo nud extend the manufncture, which eontluued rather upon the increase till the genoral substltution of cuttons for silks alout $1 ; 90$. This pave a serious shock to the manufacture, from which it recovered ouly by slow degreen. Its sitmelon hai nut lndeed treen at any tho prowperous; and the continued complalints of tha munufnoturers accasioned within these fow yoars a fundmmental change la the poliey under which it hat previoualy heen comduc ted.

From the first introduction of the manufacture into Fngland down to 1825, forolign allks were elther positively or virtually wishluled. Ifit the monopoly which was thins aecured to the manufucturars prodiced; what nil monopolles invalatily do, an lidifteronce to binfinsement. Inveal of trusting to the lingenulty or ${ }^{\text {t }}$ the superior akill whith they mhint Sodve ent al to their ald for proserving their aseendeney in the raarket, the manufiacturers sepended upon the cuatom-house regilithons, ind abliltlunal permition on maugglings. In consequenco, Inventlon was quite at a atanil. Such, Indeed, was the intuence of the system in this respect, that in 1826 the member for Coventry (Mr. Blward

Elliee) affirmed in his place in the Iouse of Commons that the improved silk looms in use in various parts of the Continent enai! $d$ the workman to execute five timea as much work as ho could do In England, while in every buslness not protected by a monopoly the result was precisely opposite. At length, after a great deal of discussion, it was rosolved to udopt a noro liberal system. In 1825, a bill was in consequence paseed, allowing the importation of forelgn silks on payment of an ad ealorem duty of 30 per ecnt., accompanled, however, by the effectual reduction of the singularly oppresslve dutles whleh had proviously b en lmposed on the limports of raw and tarawn silk. Thls measure, though vehemently opposed at the time, has proved most auccessful. Wo thing that the sllk trude has made more progress einco 1826, when the nevy syge tem was introduced, than it did during the whole of the preceding century. The following quantitjes of the raw and thrown silk were imported into the Unitod King dom in

| Yearr. | 1 the | Yexis. |
| :---: | :---: | :---: |
| 1822. | 2,080, 0808 | 1850.......... 8,411,094 |
| 1892. | 4,224 597 | 1851.. . . . . . . . $2,020,979$ |
| 1840.. | 6,608,242 | 1859, . . . . . . . 7,809,017 |

This table show conclusively that the manufact are has increased nearly 200 per cent. alnce the sdeption of those sound and liberal measures which have heen the theme of so much lgnorant luvective. : It ls. of importance, too, to observe, that not only the imports of raw silk, but also the exports of manufuctured silk goods, are rapldly increasing. The following table shows this:

| 182. | caxt, 708 |  |
| :---: | :---: | :---: |
| 1889. | 629,490 | 1859......... 1, |
| 1850 | 1,425, 641 | 1853. ....... $9,044,912$ |

It is plain, therefore, that the manufneture la not incrensing merely by reuson of an increased demand is the home market, but beeause lingland is ruplilly gain. ing on her rivals in the markets of foreign countrizs. This nffords unquestlomalite evidence of the improvement ns well an the extenslon of the manufncture. In 1852 her exports of wrought sllks to lirance amountel to $\S 257,550$, nul to the Vnited States to $£ \cdot 16 \cdot 1,590$.
Leuther, however little it may flgure an min article of export, in necessurily one of extensive home consuniption In overy civilized country, particularty in such a climate us that of England, tind where there nre so many rich and smmptuous equipuges. It is matter of regret that there are so very few data, ofticinl or otherwhe, on whleh to form an estimnte of the export or import of hlles in former aye., Such an estimate would posesess intorest, ns indicating the extent of her pasturage and the number of her eattle in comparison with her pepulation. Whatover may have been tho cuse at a remoto date, the custom-house returns, for many years past, show, by the manual limports, that tho deinand for louther jus greatly exceeded the home supply oi hlies. For a lung the this importation took phace from tho Continent of Burope, nul from the luast civilized quarters; frem countries such as lithunula unil l'olund, where the quantly of hides furnished by the cattle waterally asceeds that of tho leather required by tho inhbiltants. Hut since the opening of tha trade to South Americn, it hiss heen found more ndvantageous to lmport hides from that continent, where the herds of wild cattle nro no numerous us to meet the eyo of the traveler fin nhost every polnt of the horizon.

On nu wirage, there are importal munally nbout $2,000,000$ hivises, tansed und untanned. The quantity of leather ammaliy malo la lingland nad Wates may ter witunted at alrout $50,000,000$ :"in. Tho largest taunuries aro at llermonileey, in Southwark; but thero are almo very extenslve establlshments of the kinal iu the country, us in Cheshire, Jancanhlre, WestmureIand, Cumberland, and also in Lincolnahire. The iate war, lig its long continuance, and the mignitude of her arniy und nevy, produced grat orders from gov-
ernment for her leather manufacture. Shoes were and still are made wholesale in soveral towns of Staffordshira, Cheshire, and Northamptonabire; but those made in Londmn, by: the principal dealers, are, though expensivo, by far the bert.

Of the annnal value of the leather manufectured into shoes, boots, harness, saddlery, ete., there are no means of forming a correct estimate; but we have merely to consider the population of England, and the unavoidable extent of their wanta, to be aatisfied that frem $£ 10,000,000$ to $£ 12,000,000$ are rather below than above the mark. But while her home consumption is so considerable, hor export is comparatively amall-mn ordinary years not exceeding $£ 800,000$; but in 1853 the exports of me:-ifactured leather rose to $£ 1,578,595$. Thia large ircrease was probably oceasioned by the recklesa con ignment3 to Anstralia. The leather shipped to Ireland is merely tanned: to other conntries the exports are in a manufactured shape. The duty on leather was wholly abolished in 1830 .

Connected with the general manufacturo of leather is the glove trade, a branch of no inconsiderable extent, being carried on in several of the midland and western counties, viz., it Woodstock, Worceater, Ludiow, Hareford, Yeovil in Somersetshire, etc. This branch of Industry enjoyed for a lengthened period the protection of monopoly, which, howeyer, was abolished in 1825. Many contradictory statements have been made as to the effects of this measure. We believe, however, that the depression so much complained of has not beela produced by it, but $t_{v}$, the substitution
of cotton gloves for those of leather $;$ and we have no doubt that, had it not been for the greater cheapness and improved quality of losther gloves, caused by the abolition of the monopoly, this aubstitution would have been carried much farther than it nas been. The increased imports of the lamb and kid akins, used in the manufacture, show conclusively that it is not deelining.

The manufacture of paper, and the trades connected with it, such as printing, bookselling, bookbinding, otc., give occupation to between 60,000 and 70,000 persons. From the excise returna, it appears that the quantity of paper of all kinds manufactured in England in $185:$ was $114,=2 \pm, 3041 \mathrm{be}$, ; and the duty, which is at the rate of $1 \frac{1}{4} \mathrm{~d}$. per $1 \mathrm{~b} .$, plus .5 per. cent., amounted to $\mathbf{£ 7 5 1 , 5 4 6}$. It is dificult to say what portion of this was used in printlug books, and how much was consumed by the newspapers; but the quantity used by some of the latter is 80 great, that 2 single nowspaper, The Times, is said to consume about 50 tons a week.

We como next to a branch of industry of a very different deacription, namely, the brewery, the amount of capital and lubor invested in browing establishments in England is very large, and particularly atriking to those who have lived on the Continent, and have contristod the situation of England with that of the wine countries of tho south of Europe. It ia only in Flandars and Germany that breweries are numerous; and in tho latter, from the limited eapital, and the scattered state of their population, there are hardly any of those large extablishments which exist in London.

Quantitica of apirits charged with excise duties in are made in Eingland is amply bhown by the excise the United Kingdom in returns; but the list of her exjorts is of more consequence to tho political economist, not from the wuigar notion sint it is lyy export only that nutional jrolit is realized, but as indicative of those commodities for which she possesses, in her soil, her climate, or her colonial poasessious-mivantuges that givo them a superiority ove their neighbors. Thus, in the case of glase, the abundance and theapness of her coal enabies her to make on onnual export of above $\mathbf{5} 500,000$. In the manufacture of hats, likewise, her conmund of wool for tho coarser kina, and of firs from her North American colonies for hearer hate, enables her to ship to un extent of nearly 45,000 dozen, or $\mathbf{£ 4 , 0 0 0}$ n yoar. In earthenware linghand has the advantage of elay, of fuel, and of rendy communication by eanals. These, joined to the tusto ani ingenuity of individuals engaged in the inanufacture, carriet it, in the course of the 18 th century, to an extent whici, has rendered it a national object-a tract of 7 or 8 mifen in Staifordshire, called the fottery District, hoing almost entirely appropriated to it. This popuhation of this tract is ntoout 60,000 . The great outlet is Livarpool, and the ripments take place partly to the United Statos-purtly to the continent of kurope. Lixports (comprising porcelain) in 1853 reached $£ 1,137,911$ in real value.

The stocking manufacture is carried on chiefly in the counties of Nottingham, Deriy; and I oicester. It formerly employed great numbers of women in knitting; but in this, as in moat other liranchea, machinery has greatly superseded manual labor. Lace is mude in vast quantities in the indland counties; and here also machinery is extensively ajplied. And so
extraordinary has been the progress of invention in this department, that Britiah lace at present commands a ready aale in all foreign markets, and is largely smuggled ever into France.
Commerce and Shipping.-With Ireland the intercourse of England is very great-that country sending them grain, salted and fresh provisions, live cattle, butter, etc., to the amount of $£ 6,000,000$ or $£ 7,000,000$ annually, and taking largely in return her manufactures, particularly cotton, weolen, and hardware.
North of Europe,-From Russia her chief imports are tallow, hemp, flax, corn, linen, timber, pitch, etc. ; from the Swediah dominions, iron and timber; from Poland, wheat, timber, and potash; from Prussia, whent, timber, and flax. All theae countries take her cottons, hardware, and colonial produce.

Central part ( $f$ Europe.-From Holland her imports are not 'oreign merchandise, as in the 17th century, when the Dutch were thn carriers of Europe, but agricultural produce, as oats, wheat, $8=\frac{1}{2} / \mathrm{s}$, hemp, cheese, butter; aiso gin; the whole to a large amount; in return for which the Dutch take her h irdware, cottons, and woolens. From France her inuports have long been burdened with heavy duties, but still they are large and increasing, consisting chiefly of wine and brandy, silk, lace, gloves, etc. With Germany, her chief intercourse is through the medinm of Holiand and Hamburg. With these : 'n atries her exports are large, particularly in cottons, hardware, and colonial produce. Her imports are also very various and
large, consisting of wool, corn, flax, timber, linen, and wine, from the vicinity of the Rhine

South of Europe.-Here we enter on countriea of much less indus ry. From Portugal England takes wine in very large, and fruit in smaller quantities, in return for her cottons, her woolens, and hor hardware. From Spain she receives wool, wine, brandy, oil, fruits, barilla, etc. Italy, without any commercial trenty, takes a large quantity of her manufactures and gives in return silk, oil, and fruit. With the Levant her traffic is similar-consisting of an export of manufactures, particularly printed cottons and hard ware, and of an import of silk, fruit, and drugs.
The United States are, notwithstanding their tariff, her best cuatemers, receiving from England manufactures of almost every kind to a great amount, and sending her in retarn vast quantitios of cotton, tobscco, rice, and flour; but the merchandiso received from the United States being far inferior to the value of English exports, the difference is paid by remittances in money from the continent of Europe, arising from American merchandise sold there. With South America a wide field of commercial intercourse has been opened; at present, however, the chief articles received from that vast region are bullion, hides, skins, indigo, and cochineal. The trade is, and will long be subject to the varions disadvantages of a newly-settlad conntry, bare of capital, deficient in industry, and possessing but a small number of consumers of European commoditics in proportion to its extent and fertility.

Commercr of the United Btates witif England, From Ootohiri 1, 1820, to Jely 1, 1856.

For a more exteniled account of the commerce of ale sonds to Asia woolen goids, copper, and a great Engiani, as well as of Great liritain, see Gakat Blatmin.
From Asin lingland imports tea, indigo, cotton, coffee, sugar, piece goods, ivory, drugs, etc. IIer principal article of export is cotton goonis, for which, how singular eoever it may appear, Indis hat, aince the opening of the trade in 1814, becone one of the very best markets. Besides cotton atuffe and yirn.

## ENG

The recent discovery of the gold fields in Australla, and the consequent infux of immigrants into that country, bave made it an Important market for England's prodnce and manufactures. The declared value of her home produce and manufactures exported to the Australian colonies, Ineluding Van Dieman's Land and Now Zealnnd, In 1850, was $£ 1,574,145$, while in 1851, 1852, and 1853 It respectively amounted to $£ 2,807,356, £ 4,222,205$, and $£ 14,506,532$. The number of ships that cleured from the United Kingdom for the various Australian colonies was 272 in 1851, 568 in 1852, and 1201 in 1853. A return of the exports and imports to the Austrulian colonies for 1851, 1852, and 1853, shows some curions resuits. The exports for 1853 exhlhit in some instances an extinction, and in almost every article a decline, except wool, and of course gold, which is not noticed in the return; thus tanners' bark, of which 85,804 ewts. were exported in 1852, was reducerl to $4: 76$ cwts, in 1853 ; and tanned hldes, of which 642,198 lis. were exported in 1852, only amounted to 9842 lbs. in 1853 ; while untanned hides rose from $20,243 \mathrm{cwts}$. in 1852, to 41,987 in 1853. Flax and hemp, guano, wine, timber, tortoise-shell, whale-fina, etc., all daclined or disappeared from tho return. So did copper and lead ore ; but copper, partly wronght, that is, in bars, rods, or ingots, increased from 373 tons In 1852, to 686 tons in 1853. Quicksilver fell from 14,631 lhs. in 1852, to 6933 lhs . In 1853; and wool rose from $43,197,301$ lhe. in 1852, to $47,075,963$ liss. in 1853.

The amount of exports in 1851 being doubled in 1852, and quintupled in 1853, and probilily incraased still more in 1854, could not fail to cause a glut in the market, which has produced great enalurrassment in the colony, and entailed heavy losses on the specula-tors.-E. B. For complete statistics of Great Britain, see article Gneat ilhumain.

English Channel (called by the French la manche), is that part of the Atlantic Ocean which lies between the north-west coant of France mad the southern coast of England. Its easitern extremity is conneeted with the German Ocern liy the Strait of Calais, and on the weat it is imperceptibly confounded with the Atiantic Ocean. It lies hetween lat. $38^{\circ} 48^{\prime}$ and $51^{\circ}$ north, and long. $1^{\circ} 20^{\prime}$ east and $5^{\circ} 43^{\prime}$ west. At its termination-din a line drawn from Land'a Find to the extreme casteriy joint of the department of Finisterre, in Frnnee, it is about 40 leagues wide. On the French soant it forms three considerabite bays; the must easterly receives the Sevarne; the second receives the Seine and several nmaller rivers; the third and largest lies on the south-west of the peninsuia of Coteulin. On the English const is Monnt liay, hetween Lizand Point and Land"\% Find. Letween Lizard I'oint and Start l'oint is a large gulf, on which are sitnated Talnouth and Plymouth; the Gulf of lixeter ites to the east of Start Point. The principal iniands in the English Chaunei are, the Isie of Wight, on the Englian coast, and the Norman Islands, lying en the French coast, the principal of $v$ inich are Guernaey and Jersey. The prevailing winds are from the west. The Channei, being shaliow and confined, is subject, from its communication with the Atiantic, to high and inpetnous tides, its watera contain many fish, of which the most inuportant are the mackerei and the horring. The oynters of Consat are also famons.

Engraving (Sax. grafian, to dig). The urt of producing ly tncision or corrosion designs ujon biocks of wool, plates of metai, or other materiala, from which impressions or prints upon piacer or other auft sulp atances are obtained by presmure. Engraviog, an an art, aeenas wo tis re neariy the mane reiation to design and painting an typography bears to written langnage ; and its utiity anil great importance must be obvions to every one from its capahility of giving a bouniless circulation to representations of the most valuabie
examples of the arts and of ohjects connected with acience. By some authors it is plased among the representations called monochromes ( $\mu$ орохоњ́цагоt). Xylography, or wood engraving, was the earliest method practiced; but its origin is involved in obscurity. If we might rely on Du Halde (Description, ctc., de l'Empirs do la Chine, 4to. 1785), it is possibio that it was known in China 1120 yeare before Christ; thongh we think lts invention is of a much later period, as the Chinese were not acquainted with the art of making paper till 95 B.C. It has been stated that this art was introduced Into Europe from China through the Intercourse of the Venetian merchanta with its inhabitants; for it is proved that engraving on wood hat been practiced in that part of Italy which borders on the Adriatic as eariy as the 18th century. The first wood engravings in Europo of which any thing is known with certainty were oxecuted in 1285 , ly a brother and sister of a noble family of the name of Canio. They represent the netions of Alexander; and though doulta of their authenticity are expressed by Heinecken, Mr. Williain Young Outloy, the author of the elegant and learned IIstory of Eingruaing, to which we are much Indeited, thinks otherwise. But for the accidental discovery by a Venetian architect ef the name of Temanza of a decree of the magistracy of Venice, in 1441, we might have been wittont positive proof of the practice of the art in Italy previous to 1467, and the Germans might atill have continued to clalm the honor of ita introduction into liurope. This decree, dated 11th Oetober, 1441, states in sul)stance that the art und myatery of making cards and pointed figures had fallen to decay owing to their extensive importation; and in order that the native artiats might find encouragement rather than foreigners, it was ordered that no work of the said art, printed and painted on cloth or paper-via, ait:ir pieces, or imagee, and playing-cards, and whatever other work of the said art is done with a lirush and printed-should be ailowed to he brought into the city; on pain of forfeiting the works, hesides a pecuniary penalty. Thin decree mlainly inciicates that wood elgraving was practiced in Venice as eariy as the commencement of the fifteenth century. In Germany and the Low Countries, the early block books seem to hate existed as early as $1+220$, and to have given Gutteabarg the hint for usiug movable typer. At Rome, in $1 / \mathrm{tiz}^{7}$, a work entitled Jeditutiones Jnhuunis de Turreere mata, insued from the press of Uiric lian, embelilished with wood engravinge, in which the design and execution of an Itation arint are evident. The decorations if the work of Valturius by Matteo I'asti, of Verona, pubinshed fice years afterwari, exihinst considerahte npirit and accurdey; und before the end of the ifitenth century the art had been carried to great jerfection. as muy be proved by the delicacy and $\mathrm{p}^{\prime}$ urity with which the designs are engraved in the celohratel Hyprerotonachia of Colonna. At this period, howover, the diacovery of copper-phate engraving had been made, and to thin the more ancient art videmi phace. Mano Finiguerra, agohismith and soulphor of Fiorence, nal jupil of Masacelo, about the unilife on the fifteenth century, seems from the mont authentic accounts to have been the person to, whom the worid is indebted for the discovery. In his time, and for a considerabid perion jreviously, it wat the practice to decorate charein and otiber piate with works in nifllo, which wore dowigns hatched with a steci peint upon gold or ailiver, then ongraved with the burin, and run in, white hot, with a eomposition calied niello- 1 compommi of wiver, lend, eopjer, suiphur, and lwarax, which was more eanily fusibie than nityor, and of a biack color. The миpertinum jurt of this nieilo whidh remained nbove the surfice of the piate was then rubised off with scrapers, und cieaned away with pumice-stonu, ieaving the engraved design on the plape with all the efiect of a print. In order to pre-
serve copies of their designs, the artists were in the habit before filling the design with the niello to take impressions of the plates with earth, over which liquid sulphur was poured, and from which, when cold, the enrta was removed. But Finiguerra carried his practice "eyond thls; for with a mixture of soot and oll he filled the cavitles of the engraviag, and by pressing damp paper upon it with a roller, obtained Impressions on the paper, having, as Vassari says, all the appearance of drawings done with a pen, "venlvane come disigaate di penna."

Eingraving on Wood, or Xylography,-In this branch of the art the material nsed is a block of box or-peartree wood, cut at right angles to the direction of the filires, its thickness being regulated by the size of the print to be executed The subject is drawn on the block with a black-lead pencil, or with a pen and Indian ink, taking care that the whole effect is represented in tho lines so drawn. The whole of the wood is then cut away, except where the lines are drawn, which are left as ruised parts ; in which point it is that this mode of engraving diffors rasentially from copper-plate engraving, wherein the lines are cut out or aunk in the metal, instead of being raised from it. The impressions $f$ sm wood blocks are taken in the sonie munner as from printing types.
Engraving on Copper is performed by cutting lines representing the subject on a copper-plate by means of a steel instrument ending in an unequal-sidet pyramidal point, such instrument being called a graver or burin, without the use of aquafortis; which mode will be seen below under the art. litcining. Besides the graver there are other instruments used in the process; viz., a scraper, a burnisher, an eil-stone, gnd a cushion for supporting tho plate. In cutting the lines ca the copper the graver is pushed forward in tho direction required, being held in the hand at a sasall inclination to the plane of the copper. The use of the hurnisher ls to soften down lines that nre cut too deep, and for burnishing out scratches In the copper: it is about three inches long. The scraper, like the last, is of stcel, with three sharp edges to it, and about six inches long, tapering toward the end. Its use is to scrape off the burr, ralsed by the action of the graver. To show the appearance of the work during its progress, und to polish off the burr, engravers use a roll of woolen or felt calle ${ }^{2}$ a rubber, which is put in action with a little olive oil. The cualion, which is a leather hag aho:t nine inches diameter flled with suml for laylay the plate on, is now rarely used except by writing engravera, For architectural subjects, or in skies, where a series of parallel lines nre wated, in ingeaious machine was invented by the late Mr. Wilson Lowry, called a ruling machine, the accuracy of whose operation is exceedingly perfect. 'This ia mado to act on an etching ground ly a point or knife, connected with the apparatus, nud bit in with nequafortis in the ordinary way.

Fitching ia a suecies of engraving on cepper or other metals with a sharp-pointed instrument cnlled an eteh-ing-ncedle. The plate is covered with nground or varnish capable of resisting the action of mumfortis. The usual method is to dras the design on paper with. a black-lead pencil; the paper beling damped and laid upon the plate, prepared as alove, with the drawing next the etching ground, is passed through tho rollink press, and this the design in tranafe red froms the paper to the gromnd. The needhe then sf atehes out the lines of the design; and aquafortis being poured over tho plate, which is bordered round with wax, it is allowed to remain on is long enough to corrokio or bito in the lines which the etching needle has made. Eitehing with a dry point, as it is eallod, is porformed eutirels with the point without nny grounl, the burr raised heing taken off ly tho acraper. Etching with a aoft gromad ts used to limitato chalk or black-lend drawings. for this purpose the ground is mixed with a portion of
tallow or lard, according to the temperature of the air. A piece of thin paper being attached to the plate at the four corners by some turner's pitch and lylng over the ground, the drawing is made on the paper and shaddowed with the black-lead pencil. The actlon of the pencil thus detaches the ground whlch adheres to the paper, according to the degree to which the finlshing is carried: the paper being then removed, the work is bit in the ordinary way. Stippling ls also executed on the etching ground by dots insiad of lines made with tbe etching-needle, which, according' to the intenslty of the shndow to be represented are mado thlcker and closer. The work is then bit in. Etching on Steel is execnted much in the same wny as in the process on copper. The plate ls hedded on common glazier's putty, and a ground of Brunswick black ls laid in the usual way, through which the needle scratches. It is then bit in, In the wny above deacribed.

Mezzotinto Engraving.-In this specles of engraving the artist, with a knife or inatrument made for the purpose, roughs over the whele surface of the copper in every direction, so as to make it susceptlble of delivering a uniform black, smooth, or flat tint. After thls process the outline is traced with an etching-needle, and the lightest parts are scruped out, then the middle tints so as to leave a greater portion of the ground, and so on necording to the depth required in the several parts of the work.

Aquatinta Engraving, whose effect somewhat resenbles that of an Indian-ink drawlag. The mode of effecting this (the design being nlready etched) to cover the plate with a ground made of resin and Burgundy pitch or mastle dissolved in rectified splrit of wine, whlch is poured over the plate lying in an inclined positiou. The spirit of wine, from its rapid evaperation, leaves the rest of the composition with a granulated texture over tho whole of the plate, by which menns a grain is produced by the aquafortis on the parts left open by the evaporation of the spirit of whe. The margin of the plate is of course protected in the usual way. After the aquafortis has bitten the lighter parts they are stopt out, and the aquafortis is again opplied, and so on as often as any parts continue to require mere depth. Formerly the graia used to be produced by covering the copper with a pewder or some sulistance which took a granulated form, instead of using the compound above mentioned; lut this process was found to be both uncertain and iniperfect. In the compound the grain is rendered finer or conrser, in propertion to the quantity of resin introducel. This mode of engraving was invented by a lirenchman of the name of St. Non, about 1662. IIe communicated it to Jean Baptiste le Prince, who died in 1781 , from whom it was acquired by Paul Sandly, who introluced it though the medium of Mr. Jukes into Fingland. It has been practiced In this country with much greater surcess than elsewhere.

Etching on tiluss.-The ghass is covered with a thin ground of heeswax: nud the design being drawn with the etchinis-needle, it is sutijected to tho action of sulpharic acid sprinkled over with pounded four or Derhiswire spar. After four or five hours this is removed, and the ghass clemed off with oil of turpeutine, lenvlige the parts covered with the bees-wax untouched. l'his operation may be lnverted by drawing the design on the glass with in solution of bees-wax and turpentine, and suljecting the gromul to tho nction of the acid.

Eugruring on Stone, or Lithugraphy (âflos, a stone. und jpaфعu, to urite or (draw). - I madern invention, l,y means whereof inpressions may bo taken from drawings male on stonc. The merit of this diseovery belougs to Aloya Senefelder, a musienl performer of the thentre nt Munich about the year 1800. The followhyg are the prineiphes on which the art of lithography depends: First, the facility with which enleareons stense imbibe water; second, the great disposition the?
have to adhere to resinous and oily anbstances; third, the affinlty between each other of oily and reeinous substances, and the power they possess of repelling water or a body moiatened with water. Heace, when drawinga are made on a poliahed surface of calcareons atone with a resinous or olly medium, they are so adheaive that nothing short of mechanical means can effect their geparation from it, and while tho other parts of the stone take in the wnter poured upon them, the resinons or oily parts repel it. Lastly, when over a atone prepared in this manner a colored oily or reslnous substance is passed, it will adhere to the drawings made as above, and not to the watery parts of the stone. It was formerly thought that England did not possess a sort of stone like that of Germany snitable to the purposes of lithography; this, however, is now known to ve erroneons, as the neighborhood of Bsth abounds with it, being the white lias, which lies immediately under the blue. It is also found in Scotland. The ink and chalk used in lithography are of a saponsceous quality: the former is prepared in Germany from a compound of tallow soap, pure white wax, a amall quantity of tallow, and a portion of lamp-black, all boiled together, and when cool dissolved in distilled water. The chalk for the crayons used in drawing on the stone is a composition consisting of the ingredients above mentioned, but to it is added when bolling a small quantity of potush. After the drawing on the stcne has been executed, and is perfectly dry, $n$ very weak solntion of vitriolic acid is poured upon the stone, which not only takes up the alkali from the chalk or Ink, as the casc may be, leaving an insoluble substance behind it, but it lowers in a very small degree that part of the surface of the stone not drawn upos, and prepares it for absorbing water with greater freedom. Weak gum water is then npplied to tho stone, to close its pores and keep it moist. The atone is now washed with water, and the danhing ink applied with halls as in jrinting ; after which it is passed in the nsunl way through the press, the process of watering and daubing being applied for every impression.

There is a mode of transferring drawings made with the chemical ink on paper prepared with a solution of size or gum tragacanth, which heing laid on the atone and prased through the preas leaves the Irawing on the tone, and the process above described for preparing the stone and taking the impressions is carried into effect. In Germany many engravings are made on stone with the burin, in the amme way as on copper; but the very great inferiority of these to coppor engravings makes it improbable that this method will ever come into gencral use. Perhaps one of the greatesi advantages of the art of lithograjhy is the extraortinary number of copies that may be taken from a bock. As many as $\mathbf{7 0 , 0 0 0}$ copies or jurints have lieen taken fropn one block, and the last of them nearly an good as the tirst. Bxpelition is also gained, ibasmuch as a fifth more copies can the taken in the same time than from a copier-plate : and na regards economy the advintage over every other species of engraving is very great.

Zincography.-This art, which is of very recent introduetion in this country (so much so, imiped, that hut few sjecimens are as yet to be seen), is similar in principle to lithography, the surface of the piates of zinc on which it is executed being hit away, leaving tho design prominent, or in rolief. We have sern some besutiful examples of this art, but varying little in their appearance from those of stone engraving.Buanime's Jitt. of Seience.

Engromsing, is "tise buylug up of corn and other dead victuals, with intent to sell them again."-hicchstone, book Iv. cap. 42. It has beell shown how ab. surd it is to ouppose that this jrinetiee ahould have any injurious influence. Jut, for a long time, most acarcities that occurred were either entirely ascribed to the
intinence of engrossers and forestallers, or, at least, were supposed to be materially aggravated by their proceedings. In cousequence, however, of the prevalence of more just and enlarged views upon such subjects, the atatntes that had been made for the suppresaion and punishment of engrossing, forestalling, etc., were repealed in 1772, in Great britain. But notwithatanding this repeal, engresaing continues to bo an indictable offenso, punishable at common law, by fine and imprisonment ; though it is not at all likely, wero an attempt made, that any jury wonld now he found lignorant or prejudlced enough to convict any one on such a charge.

Entrepot (French), in Commerce, a warohouse or magazine for goods; and hence naed to designate a seaport or commercial town which exports the productions of a considerable adjacent territory, and imports foreign goods for its supply.

Envoy (Fr. enroyer, to send), a person deputed to negotiate a treaty, or to transact other husiness with a foreign prince or government. Envoys belong to the second order of diplomatic minlsters; ranking helow embassadors properly so called.

Epaulette (Fr. Apaule, a shoulder), a kind of shonlder-knot or ornamental badge worn on the shoulder by military men. Officers, both naval and military, wear epanjettes on one shoulder or on both, according to their rank in tho service.

Equador, or Ecuador, an independent state of South America, lying under the equator, from which it takes its name. It corresponds, with a trifling difference, to the old Spanish province or intentancy, of Quito; lut formed anciently the northern portion of the empire of the Incas of Peru, nud latterly the southwestern province of the now dissolvel republic of Co lumbin. It is situate between S. lat. $6^{\circ}$ and N. lat. $2^{\circ}$, and W. long. from Greenwich $70^{\circ}$ and $82^{\circ}$-heing about 830 miles in length from east to west, and 560 in breadth from north to sonth-and only contains an area of about 320,000 English squere miles. It is bounded on the aouth by the state of Peru, on the north ly New Granadn, on the east by Brazil, and on the west b (he tho Paeifle Ocenn; but the boundaries of the eastern portion of the etate are not yet very well defined.
l'egetable Peroluctions.-In the low countrics that flank the base of the Andes, the bamana, eycas, jlantaili, cacao, futrophn which produces cassava and manioe, the cotton-tree, indigo, coffee, and the sugar-cane ahound ; beneatis the elevation of $\mathbf{4 0 0 0}$ feet, the plants cinetly cultirated for food are the aweet potato, mandive, ynm. and hanama, with rice, mabe, and some legumes; but above 3100 feet most of these hecomo rare, and thrive only in particular situations. The sugar-eane, however, has been grown sofar up as 7500 feet. In some of the valleys aro extensive plantations of sugar-cane, cotton, tobnceo, and cocoa. The valley of ©uiyaumil is particularly fertile; the soil is alluvial, and there ure fow spots even between the tropies whicio call vie with it in richness and variety of regetation. It is coverel with growes of every kind of tropicni fruit, either wild or cultivated, ns the gineapile, pomegranate, whaldeck, orange, lime, lemon, peacis, apricot, clierimoyer, pulta, frandilia, tuma, mid pacay. In the amme region are fund the oilwe, pepper piant, tomatas, and sweet potatues, hum copar, copalba balsam, carana, drigon's lidond, sarsapariin, and vanitla. 'Io these suceced, in the humid und shated clefts on the slopes of the mount ins, tree. ferns anil cinchona or Peruvian bark, the tinest kind of which is ohtained nbout 8 to 12 mifes mouth of Loja among the mountains of Uritusinga, Villanaco, mal Humusitana, where the trees that yieh it grow in a soil resting on mica-slate and gneiss, at the modorate Blevation of 5756 to 7673 fect alrovo the level of the sea. Retween the elevations of 6000 to 9040 feet is the region hest suited for the European cereala. Whent
will not form the ear lower than at 4500 feet, or ripen higher than at 10,000 feet; but barley and rye grow at an elevation 2500 feet still higher. To theas may be added the guinoa, a moat useful production for domestic purposes. In this region also, and a little above it, grow the potato and its congeners, all of which are extenelvely used as food; the chick-pea broad-bean, cabbage, and other European vegetables, ara likewiae abundant. Within the cereril limits are found the oak, olm, ash, and beech, which never descend lower than 5500 feet, and are seldom found higher than 0200 feet above the level of the sea. Higher up, the larger forest trees, except the pine, begin to disappear; and on the mountains of Quite the escalionia mark the highest limit of trees at an elevation 11,600 feet. The bejarias, the highest of shruba, terminate at 13,400 feet, above which, in rich and beauteous verdure, rises the zone of the grasses. Above these, among the trachyte rocks, only lichen.;, lecidens, and the brightly-colored dnst-like lepraria are met with; snd to these, succeed the region of perpetual enow.
Animals.-In some parte of the low country the air swarms with musquetoes and other flies still more tormenting, while the ground teems with sankes, centipedes, and other reptiies. The banks of the grent rivers are crowded with cnimans or alligators. Bate are exceedingly numerous, and of great sizo; the foreats of the warmer regiona abound with armadilioos, moakeys, and cavys; and everywhere aro found the jaguar, the puma, tho ounce, the ocelot, and several varieties of the wild cat. The pecari and deer are likewise common, as well as that singular animat the ant-eater. The characteristic animaile of the Andes are the llama, the guanaco, the vicuna, and the paco or alpaca, some of which are trained as beasts of burden, while others, particuiarly the vicunas, run widd among tho mountains, where they are hunted by the Iadians. Sheep and cattle aro reared in great numbers, especinlly the former, in the valleys of the Andes, and on the declivities of the mountains. liorses, asses, and muies, aro reared in sufficient humbers to be articies of export. Tho chief of the birds is the condor, which is found all along tho Andos south ward as fur as the Strait of Magelian, but nowhere ty the north of the equator. Tho turkey, vulture, and gallinago, are frequently met with, together with many kinds of smaller birds. In somo districts, particularly along the coasts, conaidernbie quantities of beeswax are collected; and higher up there are spots in which the cochineal insect is reared. Along ties rivers of the great plain turtles aro numerous; and itheir fat, called manteca butter, forms a considerable article of trade. Fishing is carried on to some extent along tine consts, and a good deal of ealt-fish is prepared. A murex is also found which yields a juice used in dyeing parple.

Mineral Productions.-Equador is leso rich in mineraly, especially in the precious metrils, than any other ef the South American states. There are, indeed, several mines of geld and sllver, but the ycarly produce is inconsiderabio. In some places are found lead and quicksilver, but the latter is found, as usual, in combinstion with sulphur, in the form of cinnabar. Near Azogue, 15 miles north-enat by east of Cuenca, the ore is found in un immensely thick bed of quartzosc aanistone, containing fossil wood and asphalt. Sulphur is prepared in considerable quantities; gold has been washod from the sands of some of the rivers; and salt is obtained from sen-water along the coasts.

Poputation.-The settled pemulation is composed of Spunish creoles of pure lescent, meztisos, mulatoes, and negroes, tho greater part of thom hoing agricultarists, graziers, and growers of cocon. These form atout a half of the populution. The other half nre antive Indians, of whom those that livo among tho mountaina are mostly agriculturists, cultivating their
lands with much care, and making for themselves coarse atuffs of wool and cotton. The Indians who inhabit the oastern plains are in a mnch lower degree of civilization. They cultivate only small patches of ground, and apply themselves chiefly to hunting and fishing. Three fourths of the population dwell in the western or mountsinous part of the state; and the total number is now extimated at about 800,000 .

Manufactures.-The manufactures are unimportant, consisting chiefly of coarse woolen and cotton cloths and other neceasary articles. The foreign trade is almost confined to Guayaquil, and is ao trifing aa scarcely to deserve notice.

Political Condition.-Till 1812, Equador remained a portion of the Spanish Empire of the Indies. It then threw off the yoke of Spain, and in 1821 hecame a part of the newly conatituted republic of Columbia, This union, however, lasted only till 1831, when Equador became an independent state. It has gone through soveral revolutions; and by the last (1852-3) the democratic party has gained the ascendency, and ohown a tendency to adopt the United States of Jorth America as their political model. The state has, in consequence, received a now and more liberal cunstitution; the Jeauits have been expelled; and laws havo been made for the abolition of slavery. The government is vested in a president, with a vice-preaident and two chambers, all elective; but the constitution is still notably complicated by what has always been ite principal characteristic, a predominating mixture of military despotism, the preaident being always the master of the state. More, perhaps, than any other country of South America, Equador has been slow in the development of her resources and nationsl induatry. Frequent revolntions have paralyzed its trado, and prevented the regulation of its finamces. No interest has been paid on its public clebt since 1826. It is emphaticaliy the country of natural convulsions and political revolutions.
lor administ rative purposes, the state is divided into tho three departments of Equador, Guayaquil, and Assuay; and these are subdivided into the seven provinces, of Qnito, Riobamba, Ibarra, Guayaquil, Bababoyo, Cuenç, L^Jja, or Loxa (Loh-hn), and Jaen de Brscamor. The stnto likewise elaims the sovereignty of the Ialas de los Galapagos, or islands of land turtles, lying under the equator at a distance of 700 to 900 miles from the mainland. The chief towns are Quito, with from 50,000 to 80,000 inhabitants ; Gusyaquil, 25,000 ; Cueņa, 20,000; Riobamba, 15,000 ; Loja, Babahoyo, and Itbarra, about 10,000 ench. Quito is beantifully situated in the elevated plain to which it gives its name: and Gaayaquil on the lanks of a navigable river, opening into the spacious bay, to which it gives its name.

Tho foreign commerce of Equador is chiefly carried on at the port of Guayaquil, which, with the ports of Manta and San I.orenzo, is open for general importation and the exportation of national produce. The ports open for oxportation only are Santa Eiena, Calino, Bathia do Caraceas, Loja, and Ibarra. Guayaquil is the only port of yeneral deposit for re-exportation to foreign ports. Tho principul articles of export of this republic aro cocon, hides, enttlo, tobaceo, wool, straw-hats, coffee, orchilla, bark, India-rubber, and an Inferior description of cotton. Cocon is the leading staple, the quantity ammunily exported reaching over $15,000,000$ pounds. The total valuo of the foreign trade of Equador may be stated at $\$ 4,000,000$. The countries which participate in this trade nre the United States, Mexico, Guatemala, Chili, and Peru, in America ; and lingland, Spain, France, and Hamburg, in Europe.

The commoreial relations of the United States with Equador are regulated by trenty and the local legisinlation of that repuinlic. The treaty witi the Inited States was ratificd April 9, 1842, and stipuiatos for
perfect equality and entire reciprocity of navigation and conmerce, hoth in the direct and lidirect trade. The third article has this atipulation: "That whereas, by a law of Equalor, March 21, 1837, vessela hullt in the dock-yand of Gusyaquil shall be exempted from various charges ; therefore veasels of the United States can not claim this pifilege, hut shall enjoy it if it should be granted to vesseis belonging to Spain or Mexico and to the other Hispano-American republics." The following translation of the decree conferring special privileges on vessele constructed at Guayaquil, bearing date August 23, 1845, la made from El Comercio de Lima, October 6, 1846 :
"The provisional government consldering that the ship-yards of Gaayaquil, by reason of its favorable position, and in vlew of the interests of commerco and of the republic, merit special attention; therefore, in order to advance these interests, and to encomage the conetruction of ahips, it is decreed: Art. 1. Vessels constructed at Guayuquil, and retaining the national Alag, shall be excmpt from tonnage, ancherage, and other port dues. Art. 2. Such vessels shall be entitled to a reduction of thee per ce.t. on all produce, merchandise, etc., import d inio auy of the ports of the republic for consumpion."
The commerce bet ween ithe Uniteủ States and Equador is very limited, oriag raainly to the fact that the two great staples of the latter country, cocon and
straw-hate, find hut little demand in the United States -the former being of limited consumption, and the latter subject to a duty of 80 per cent. Before the treaty between Spain and Equador, in 1843, United States' vessele carried four and domestic manufactures direct to the port of Guayaquil, and were generaily chartered to transport cargoes of cocoa to Spain. Since that period, however, the high duties on cocos in Spsin, when imported in foreign vessels, havs been equivalent to a prohiblion. 'This, togetbse with the annually increasing importation of flour from Chill, has produced a depressing effect on Amoricun trade with that repuilic. The foliowing table will exhlbit the condition of this trade during a period of eleven successive years. Bat little improvement can be expected, it is thought, so long as the present tariff regulations of the United States continue In force. The duties ou navigation in the ports of Equador are -tonnage duties, 25 cents per ton; llght ducs, 64 cents per toli. When pilots am einployed, the fees are \$2 50 mr toot of the vessel's depth. See Com. Relatiows U. S., 1856-7.
Ecuadas, which c.ce formed part of the empire of the Incas, was discovered by Pizarro In 1526, and was held under the Spanish crown until the y ar 1812, when a revolution occurred, which ended in tho establishment of n separate republic. In 1821 Ecuador disconnected itsolf with New Grenada.

The only commercial legislation in this republic, of recent date, is embodied in a decree given at the capital, Quito, August 15, 1855, by the President, Josd Maria Urbina, imposing an export duty on bark and India-rubber. The United Ststes' consui at Guaysquil, in communicating tais decree, under date of September 30, 1855, says: "Againat this injudicious measure of the executive, strong representations will be made te the present Congress by the commercial and lndustrial classes, sa unlawful, and injurious to the present incrensing commercial prosperity of the country ; and it is probabie that it will be modified into renting or selling the lands, or done sway with sltogether.

A translation of this decree is aubjoined: "Consldbring that the naturs) productions met with in the uncultivated lands of the republic make part of the antional riches, and that that the India-ruhber and bark discovered and extracted from said lunda are beconing ohjects of speculation to many persons, and sheuld be made to yield a revenue to the country; therefore, be it decreed: Art. 1. In the ports of the repulilic where custom-houses are established, there shall be exacted a duty of two duilars on ordinary, snd threo doilars on refined India-rubber, on every 100 lbs. exported to foreign markets. Art. 2. The hark taken from governmeut lands, and exported to foreign countries, shall pay a duty of two doilars for every 100 ihs. on yellow, three on Callessaya, and eight on red. Art. 3. Tinoso persons who export In-dia-rubber and bark withot presenting the same at the custom-house, or place appointed for the collection of the duties specified in the previous articles, with the lutent of avoiding the paynient of said duties, shall be juiged according to the process detailed in the law of the 21st November, 1853. Art. 4. Every citizen whe proposes extracting Indin-rubber or iark from national lands, shall present inimself to the respective governe", who, after hearing his proposal, and antisfying himself that the land is netually government proje erty, shall give to the parties applying the required pernission in writing. Art. 5 . Thoso engaged in the cullection of Indin-rnbier must not cut down the tree; but, to oltain their oldect, should bore a small hole in we trunk, at the helght of ahout half a yard from the ground, penetrating the greater part of the tinickness of the tree, taking care not to bore through it. Art. 6. These who are found taking lndia-rubber or bark from natienal lands without huving compliod with the conditions prescribed ln articles 4 and 5 , slutll be treated as smuggiers, and the subatancec collected taken frim then and confseated. Art. 7. The governors of provinees in the lards under their jurisaliction will take ail possible measums to discover and apprehend all partles who endeavor to infringe the proceding din, sitions, Art. 8. Article 6 spplies, also, to those individuals who do net comply with the dispositions of articles 4 and 5 , under the pretext that they are collecting tho aforesaid
aubstances from their own lands, should it be discovered that the asid lands are national property. Art. 9. Those persons who collect India-rubber and bark from their own property, are not subject to any of the duties imposed in the present decree. Art. 10. The Secretery of the Treasury is charged with the due execution of tilis present decree, of which it is his duty to inform the Congress next ensuing."-Com. Relations, U. S. See Guayaquil.

Bquator (equare, to make equal), in astronomy and geography, a great circle of the sphere, equally distant from the two poles of the world, or having the same poleas as the world. It is called equator because when the aun is in it the daye and nights are equal ; whence also it is denominated the equinoctial; and when drawn on maps, planispheres, or globes, it is called the equinoctial line, or simply the line. Every point in the equator is 90 degrees, or a quadrant's distance from the poles of the worid; and hence the equator divides the sphere into two equal hemispheres, in one of which is the northern, and in tise other the southern jole. Terrestrial longitudes are measured on the equator, or some one of its paraliel circles ; commencirg from sume arbitrary point, which different nationa assume variously, most of them adopting the meridian which passes through their enpital city or principal observatory. Latitides are counted from the equator along the meridian.

Equinox (Lat. aquus und nox, night), in astronomy, is the time at which the sun passes through the equator in oue of the equinoctial points. When the sun is in the equator, the days and nights are of equal length all over the world, whence the derivation of the term. This happens twice every yeur, namely, sbout the 21et of March, and the 22d of September; the former is calied the rermal, and the latter the autumat equinox. The equinoxes do not divide the year into portions of equal leagth; for in consequence of the sun leing at his greatest distsnce from the esrth during the sumner months, and his angular motion in his orbit being consequently slower, the intorval from the vernal to the autumnai equinox is greater than that from the autumal to the vernal. In other words, the sun continues longer on the northern than on the southern side of the equator. At the beginning of the present century, the difference amounted to 7 days 16 hours and 51 minutes. The summer in the northern hemisphere is constantly longer than in the southern by this quantity ; nod to this circumatance some meteorologists ascribe, in part at least, the higher temperature that is found to prevaii in the northern hemisphere under the same parsliel of latitude.

Erie (lake), situated north of New York, Pennsylvania, and Ohio, and constitutes a part of the bound. ary between the United Stntes and Canada. It is 240 míes long, anil 60 broad, in its widest part. It recives the waters of Superior, Michigan, and IIuron inkes, through Detroit River, and discharges its watees through Niagara River into I,ake Ontario. Ita surfaca is elevated 565 feet sbove tide-water in the IIudson River at Albuny. The soundings by the U. S. Engincers show the lake to be divided into three sections of unequal depth, viz., ono extends from the head down to Point Pellee Isiand, and the bottom presents a general level, with $n$ depth of 30 feet in the average. The second is of much larger extent, and stretchos to Long Point ; is also a levei, with a depth of 60 to 70 feet. The third section extenda to Niagara liver, and is an uneven bottom, with various depths of water, ranging from 60 to 240 fect. The business done on this lake is immense, and increasing. The liconsed tonnage of the lake is $138,8{ }^{5} 2$ tone, of which a lurge nud increasing proportion is of steam-vessels. The estimated value of the commerce smounta to \& $220,000,000$ aunually. There are 26 light-houses and beacony on the Anteidean slde, and 10 on tie Canadian aide. A battle was fought near lts west end Septem-
ber 10th, 1818, between the American fleet, under Commodore Perry, and the English fleet, in which the latter was captured. See Lakzs, Comme te of.
Ermine (Ger. Hermelin ; Fr. Hermine, Ermine ; Rus, Gormostai), a speclea of weasel (mustela candida, Lin.), abundant in all cold countriea, particularly Russia, Norway, Lapland, etc., and producing a most valnable species of fur. In summer the ermine is of a brown color, and is called the atoat. It is in winter only that the fur has that beautiful snowy whiteness and consistence se much admired. See Funs.
Esparto, s species of rush, the stipa tenaciasima of botanists. It is found in the southern provinces of Spain; and is particularly sbundant on all the sterile, uncultivated, and mountainous districts of Valencla. Beckmann (IIist. of Invent., vol. 11., p. 288, Eng. ed.) supposes, spparently with good reason, that the stipa tenaciasima is the plant described by Pilny nader tho name of Sparta, who ascribes its application to useful purposes to the Carthaginians.-IIist, Nat., lib. xix., c. 2. It is still used for the same purposes as in entiquity, being manofuctured into cordage, ahoes, matting, baskets, nets, matresses, sacks, ete. Cables made of esparto are said to be excellent; being light, thay foat on the surface of the water, and are not, therefore, so liable as hempen cables to be cat or injured by a foul bottom. They are exelusively naade use of in the Spanish navy. Esparto is largely consumed in the manufacture of alpergates. These are light shoes worn by the Valencian peasantry, having platted soles made either of eaparte or bemp, but principally of the former. They are extremely chenp and commodious in hot climates; and besides being in extensive demand at home, used to be exported in immrase quantities to both Indlea; but since the emancipation of Spanish America, this trado has greatly fallen off. The Spanish peasantry have attalned to wonderful dexterity in the manufacture of esparto. "After having soaked the rush in water, the women and children, without either wheel or spindle, contrive to twist two threads at the same time. This they do by rubbing them between the palma of their hunds, in the smme manner as a shoemaker forms a thread upon bis knees, with this difference, that one motion gives the twist to each thread, and, at the same time, unites them. To keep the threads asunder, the thumb of the right band is interposel between them ; and when that is wanted for other purposes, the left thumb supplies its place. Two threads being thus tristed into one of the blgnesa of a large crowguill, 46 yards are sold for little more than $\frac{1 d}{}$., the materisls belng worth alount a fifth part of the price." -Townsend's Travels in Spain, vol. iii., p. 177; see also p. 129; Fiscuen's Picture of Valencia, ling. ed., p. 92, and p. 57, etc.

Essence D'Orient, the name of a pearly-looking matter procured from the blay or hleak, a fish of the genns cyprinus. This substance, which is for 1 yrincipally at the base of the scales, is used in the manufacture of artificial jearis. A largo quantity of the scales lieing scraped into water in a tul, are there rubbed lotween the bands to separate the shining stuff which subsides on repose. The first water being decanted, more is added with agitation till the essence is thoroughly washed from all inpurities; when the whole is thrown upon a stove ; the substance passes through, but the scales are retained. The water being decantel off, the essence is procurel in a viscid state, of a huish-white color, und a pearly uspect. Tho inteutincs of the eame fish ure also covered with this beautiful, glistening matter. Several other finh yield it, Lut in smaller proportion. When well prepared, it presents exactly the appearance and reflectlons of the real pearls, or the finest mother of pearl; propertlea which are probably oving to the interyosition of some portions of this same substance, bet ween the lamine of these sheliy cencretions. Its chemicai
neture has not been investigated; it putrafies readily when kept moist, an accident which may, however, be counteracted by water of ammonia. See Pe.irls.'
Eamential Oils, or Volatile Oils. Under this term are included alf those peculiar compounds obtained by distilling vegetable substances with water, and which pass over along with the steam, and are afterward condonsed in the liquid or solid form. They appear to conatitute the odorous prineiplen of vegetables. Their speeifio gravity fluetuates on either side that of water; they sre very spariagly soluble in water, and these solutions constitute the medicuted waters; rose, peppermiat, and other waters being such solutions of the respective essential olls. They dissolve in alcehol and form essencea, many of which are used as perfumes. When these oila are pure, they evaporate from papor when held before the fire ; but if adulterated with fixed oils, they leave a greasy stain, and seldom dissolve perfectly in alcohol. The more expensive of theso oils are frequently adulterated with the cheaper ones, and this frand can only be detected by an experienced nose. Their chief usu is in perfumery, on account of their odor, and in modicine they form valuable stimulants. They are inflamanable, and are, with fow exceptions, compounds of hydrogea, oxygen, and cartion. The essence of turpentine, of lemons, and a fow others, are hydrocarbons.
Establishment of the Port, a term used by writers on the tides, to denote the interval between the time of high water at any given port and the time of the moon's trausit immediately preceding the time of high water, when the moon is in syzygy ; thut is, at the new or full moon. This interval is influenced by local circuinstances, and consequently different at different places. Seo Tides.

Estrioh, or Estridge (Fr. Duvet d'autruche; 1t. Penna mutta di strozzo ; Sp. Plumazo de avestrux; ; Lat. Struthionum plumes molitiores), is the fine, soft down which lies immediately under the feuthers of the ostrich. The finest is used as a substitute for beaver in the manufacture of hats, and the coarser or stronger sort is employed in the fabrication of a stuff which resemGipa fine woolen cloth. Estridge is lirought from the Levant, Ituly, and other ports of the Mediterranean.
Ether ( $\mathbf{i r} . a t \theta \geqslant \rho$ ). In chemistry this term is npplieil to a highly volntile, fragrant, inflammuble, and intoxicating liquid, proluced hy distilling a mixture of equal welghts of sulphuric acid and nlechol. When these liquids mutually act on each other, a series of complicated changes ensue, which terminate in the conversion of alcolod into ether.
Euphorblum (Ger. Euphorbiengummi; Lat. Euphorbium; Fr. Euphorbe; Arab. Aknl-mafinh), the proluce of a pereanial plant, a native of Africa, and of manyy parts of India, etc. It is a concrete gum resin ; is Inodorous; when first chewed has little taste, bnt it soon gives a very acrid, burning impression to the tongue, palate, and throat, which is very permanent, and almost insupportalle. It is imported in serons, containing from 100 to 150 lls . It is in small, hollow, forked pieces, often mixed with seeds and other in-jurities.-Thomsos's Diapensutory.
Euphrates, the most considerable river of western Asia, is formed by the junction of two grent streauss rising in the mountains of Armenha, pashatis of Eirzeroum, and uniting in about N. lat. $39^{\circ}$, E. long. 39․ The Frat or nothern brunch has its priucipal sources about 20 miles north-enst of the town of Erzeroum; and the Murad, on the north declivity of the Arghi-dag.i mountains, 45 miles nurth-enst from the nearest polnt of Lake Van. The Euphrates flows first to the south, but, leing driven westward ly the AntiTaurus and Taurus mountains, it works its eircuitous way through narrow passes and over cataructs, until, breuking through a delle formed by the casiern extrenity of Mens Amanus (Alma-dagh) and the northwestern oxtremity of Mons Taurus, it reaches the
plain coun then whod Syria, and leagth, aft and thus 1 Guif. Below the Luphrates and turning t Tigris, thenee name of the In this last pu
plain country not far from Samosata (Sumeisat). It then wiuds south and south-esst, paesing the north of Syria, and the north-east of Arabia Deaerta, and at leagth, after many windings, unites with the Tigria, and thus united, finda its termination in the Persian Gulf. In conjunction with the Tigris, It forms the rich, alluvial lands of Mesopotamia, over which it Hows or is carried by canals, and thue diffuses abroad fertility sand beauty. At Baghdad and Hillah (Babylon) the Euphrates and Tlgris approsch comparatlvely aesr to each other, but separate again, forming a kind of ample basin, till they finally become one at Karnai. Although oecasionally much more, the breadth of the Eaphrates varies between 200 and 400 yards, but for a distance of 00 milea through the Lemlun marsies, the main st roam nsrrows to about 80 yards. The general depth of the Upper Eujhrstes exceeds 8 feet. In point of current it is for the most part a sluggish stream; for, except in the height of the flooded season, when its flow approaches 5 milee an honr, it varies from $2 t$ to $8 \frac{1}{4}$, with a nuch larger portion of its course uader 3 thsn abovo. Its general description for some distance below Erzingan, is that of a river of the first order, straggling through ligh hills, or rather low mountains, making an oxceedingly tortuous course, as it forces its way over a pebbly hed, from one natural barrier to snother. As it winds round its numerous barriers, it carries ocessionally toward each of the cardinal points a considerable body of water; and is shallow eaough in some places for loaded camels to pass in sutumn, the water ris!ng to about $4 \frac{1}{3}$ feet. Tho upper portion of the river is Inclosed between two parsillel runges of hills, covered for the most part with high brashwood and timber of moderate size, having a succession of long, narrow islands. The pric-tpal towas on its banks are Samsat, Henroum, Lomkala, Bir, Ciaber, Doir, Rava, Anah, Hadisa, El Oes, Jibba, Iit, Ifillah, Lemlan, Kurnah, and Bawrah. The acenery sbove IIt, in itself very picturesque, is greatly licightened by the frequent recarrence of ancient irrigating aqueduets, beautiful specimens of art, which are attributed by the Arabs to the Persians when tire-worshipers; they literally cover both banks, and prove that the borders of the Faphrates were once thickiy inhabited by a highly civiiized people. From ilit to Babylon the biack tent of tho Bedouin is almost the only kind of habitation to be seen. This distance is cultivated enly in part ; the rest is desert, occasionally interspersed with elusters of date-trees. In demcending, the lrrigating cuts and canals become more frequent. Babylon is oneircled by two streams, one above, the other below the principal ruins; beyond which they unite and prodace abundance. For about 30 miles below Ilillah both banke have numerous mud villages, shaded by date-trees: to theso aneceed huts formed of bunilles of reods. The country lower down toward Lemlun, is level and little elevated above the river; irrigation is therefore easy ; in consequence, both banks are covered with proluctive cultivation, and fringed with a double and nearly continuons belt of laxuriant date-troes, extending down to the Persian Gulf. At one mile and a half above the town of DeWania is the first considerable offshoot from this hitherto wajestic river; nnother takes placo 22 miles lewer; and 9 miles further, at iLemlun, it again separates into two branelies, forming a delta not unlike that of Damietta, and when the river is awollen, inundating the country for a space of about 60 miles in width, with a shallow sheet of water, forming tho iemfun marshes, nearly the whole of whieh is coverul with rieo and other grain, when the river recedes in Juae. Below Lemlun the Tigris sends a branch to the liuphrates, which is thms incressed in its volume; and turning to the east, receives the chicf brancli of the Tigris, thence running in a single stream, under tho name of the Shat-el-Arab, as far as the Persian Gulf. In this last part the river has a depth of from 3 to 5
fathoms; varies in breadth from 500 to 900 yards, and presents banks covered with villages and cultivation, having an appearance at once imposing and majestic. The length of the entire etream is 1,400 milea. It is very ahundant in fish. The water is some what turbid, but when purified, is pleasant and salubrious. The Arabians set a high value on it, and name It Morad Sou; that is, Water of Deaire or Longlng. The river begins to rise in March, and continues rising till the latter end of Msy. The consequent increase of its volume and rapidity is attributable to the early rains, which, falling in the Armenian mountains, swell its mountsin tributaries ; and also to the melting of the winter snows in those lofty regions. About the middie of October the Euphrates has reached its lower ebb, and ceasing to decrease, becomes iranquil and sluggish.

The expedition sent out by the British government under the direction of Colonel Chesney, navigated the Euphrates in 1830 from Bireh-jik to its estuary, a distance of 1,117 miles $;$ and besides throwing much light on a country then vory imperfectly known to Kuropeana, proved that there exist no sorious obstacles to the navigation of that river by moderate-sized steamers thus far; snd even for 88 miles sbove IBireh-jik to Beles, an important atation in a commercial point of view,-E. B.

Europe, one of the great divisions of the globe. On a first view Europe appears to be less favored by nature than the other quarters of the globe over which it has obtained so great an ascendency. It is much smaller in extent ; its rocky and mountalnous surface does not admit of those noble rivers, like inland seas, which lay open the remotest regions of Asia and of America to the commerce of the world. 1ts vegetable productions are neithor so various nor so exuberant; and it is poorly supplied with the precious metsls, and with many of those commodities on which mankind set the groatest value. On the othor hand, the climate of Europe, if it sourishes a less luxuriant vegetation, is of an equal and temperate kind, well adapted to preserve the haman frame in that atato of health and vigor which fits it for labor, and promotes the development of tho intelleetual snd moral powers. Tho mountsiss that intergect its surface are barriers which enabled infant communities to protect themselvos from violonce, and to lay the foundation of arts, knowledgo, and eivilization. If it has few large navigable rivers, itt inland seas and bays are, from their position and extent, the finest in the world, and have been the moans of creating and nourishing that commercial spirit which has been one great source of its improvement. Though comparatively deficient in gold and siiver, it is abundsntly supplied with those usefil metals and minerals which minister still moro essentially to the wants of civilized lifo. Its apparent defecte have become the source of real benefits, and the foundation of its grandeur. The lisadvantages of its soil and elinate have excited the industry of its inhahitants, given them clearor ideas of property, kindlod a resolute spirit to defend their rights, and calied into existence that skill and onterprise, and those innumerablo arts and inventions, which have enabled the inbabitunts of this apparently barron and rocky promontory to command the riches and laxuries of all the most favored regrions of the ghobe. It is only in Europe that knowledge and the nuts seem to be indigenous. Thongh they have appeared at times among some of the nations of Asia, they have either stopped short after advaneing a fow steps, or thoy have speedily retrograded and perished, like something foreign to the genius of the people. In Europe, on the contrary, they have sprung up at distant periods, and in a variety of situations; they have risen spontaneonsly and rapidly, and deslined slowly; and when they disappeared, it was evident they wore but erushed for the time by external violence, to rise again whal the
pressure had subsided. It is only in Europe, and among colonies of Europeans, that the powers of the human mind, hreaking through the slavish attachment to anelent usages and institutions, have deveioped that principle of progressive improvement of which it is imposesible to calculate the final resnits. The rudest tribe in Europe, in which this priaciple has taken root, has a certain source of superiority over the most improved nations of Asia and Africa, where society remains perfectly stationary. If these natious are ever deatined to advance in civiliaation, they mast borrow from Europe those arts which she has Invented, and which belong to civilized life in every climate. But the tenaclous adherence of rude nations to the customs and superstitions of their anceators, will not allow us to hope that the benefits of civilization will be rapidly diffused in this way. It is more probable that colonies from the older states of Europe will multiply as the population becomes more and moro redunduat; and that these colonies will carry the arts and knowledge, the language and munners, of Europe with them, to the other quarters of the world. From prejudices on both aldes, it is found that $t$ wo races, in very different atages of clvillzation, do not readily amalgamate ; and it is therefore probable that the feebler lnhabitants of these countries, like the Anerican Indians, will be gradually displaced by the continual encroachinents of the more energetic races of Enrope.
Europe is bonnded on the N. and W, by tho Aretic and Atlantic Oceans; on the S. liy the Mediterranean, the Black Sea, and Mount Caucasus ; on the E. by the Caspian Sea, the river Ural, and the Uralian Monnt ains. The greatest length of the contisent is from Cape St. Vincent to the Sea of Kara, ir the direction of N. E. and S.W., and is 3400 English miles. Its greatest extent from $N$. to $S$. is from Cupo Matapan to Cape North, 2420 miles. The supericios of Europe, ineluding the Azores, lceland, Nova Zembla, and all its nther islands, is $3,700,000$ English, or $2,800,000$ geographical aquare miles ; and tne length of its coast line is about 16,000 miles

Climate.-The climate of Europe is dlatinguished by two peeuliarites. It enjoya a higher mean temperature than any of the other great divisions of the world in the corresponding latitules; and it is not subject to such violent extremes of heat and coll. These advantages it owes chiefly to its numerous seas, iuland bays, and lakea, which render its temperature similar to that of islands; and jartly also, according to Ifumboldt, to its situation at the western extrenity of the greatest range of dry land on the surface of tho glove; the western sides of all continents theing warmer than the eantern. Europe lies almost entirely within the temperate zone, not more than one fourteenth part of its surface being within the arctle circle. Only a very amall part of it is uninhabitable from cold, ard it nowhere suffers from excessive heat. The mean temperature at its southern extremity, in the latitule of $36^{\circ}$, Is alout $66^{\circ}$ of Fahrenheit ; and at Cape North, in the latitule of $71^{\circ}$, whero the mean temperature is $32^{\circ}$, the cold is not greater than in the latitules of $55^{\circ}$ or $55^{\circ}$ on the east coasts of Asia and America. Hence Europe is halitahie at a higher latitude by $12^{\circ}$ or $14^{\circ}$ than either of these continents.

Temperature,-There is a difference of the name kind between the temperature of the sea-coasts of Enrope and the interior. In inlands, and on the sea-coast the mean temperature of the year is higher, and the heat is more equally distributed through the different seasons. As we alyance from the const eastward tho mesn annual temperature diminishen, but the heat of summer and the cold of winter Increase. Thus Lon don has the bame menn aznual temperature as Vienna, but it has the summer of St. Petersburg, and the winter is warmer than at Milan. The Mediterranean, the Bultic, and inland lakes, produce the same effect as the ocean, in an inferior degroe. Tho foliowing tabie
thows, I. The temperature of the year, and the va rious seasoas, in places having the same latitude; II. The different diatribution of heat through the various seasons in places having the same mean aanual tenperature.

The mountalns of Europe are more numerous in proportion to its extent than those of the other great continents, but they are of less elevation than the mountains of America and Asia. The highest and the most extensive chains in Europe run generally in the direction of east and west, and are piaced near its southern shores. The central mass of the Aips, with which all the other monntains in the south of lurope are connected, forms the summit of the coutinent, and determines the poaltion of the surface and the courses of most of the rivers.

Rivers.-Europe is well waterei. ith rivers, but they are mere brooks compared with the mighty streams of Asia and America, and, from the unevenness of the sur face, afforl in general no great extent of inland navigation. The Danabe, the largest river that is entirely in Europe, ia about 1500 wiles in length, and Irains an area of 370,000 square mlles, Hut the Amazon, though only twice the length of the Dannise, drains a surfaces seven times as large, and equal to four lifths of the continent of Europe; and, as the quantity of rain that fulls in tropicnl countries is much greater than in northern latitudea, it is proballe, notwitstanding the inereased evaporation thero, that the Amazon conveys more water than all the rivers of Europe jut together. If we divide the length of the Danube into a humdred parts, the length of the principal rivers of Enrope, exprensed in these parts, will he as follows: Danube 100 ; Volya, 130 ; Dnieper, 72 ; Don, 69 ; Rhine, 49 ; Elbe, 42; Vistuia, 41 ; Loire, 37; Tagna, 32; Oder, 31 ; Rhone, 30 ; Scine, 23 ; Po, 21 ; Tiluer, 10 ; Thames, 9 .

The courses of the great rivers show the f.ll of the conntry through which they flow, but it would be absurd to take the average of the fall per mile from the measurements of their whole lengtis, for, with the exeepition of the Volga, and other rivers of hussia, tho early parts of their respeetive courses are among monntains, or in elevatod valleys, where, and frou which, the full is very rapid ; and it is only when taken from the points where they leave their inountain cradles and resch the plains, that such an average will truly indleate the extont wlegree of the general slope of the continent. I source of the Volga is only about 560 feet above the level of the Caspian Sea, into which it flows, and the length of its courso being at least 2000 miles, withont any scrious rapils, tho average of its fall is consequently very regular, and littie more than three inches a mile; but, the direct distance behng only 900 milies, the slope of the conntry exceeds seven inches a mile. The source of the Danube, in Suabia, is about 2176 feet above the level of the Mack Sea; but its fall is in several places very rapld, particularly between Passan and Vienam, and nt the frongate, through which it passes from tho plaina of Hungary to the low lovel of Wallachia. The average fall, therefore, of such a river woull to a most fulacious index of the contiguration of the whole length of country through which it flows. Its course is indeed through a series of terraces, separated by deep falls. The sourees of the lhine, in the heart of Switzeriand, have un elevation of more than 7,90 fect,
but when ready fail it leaves and even uosity, fal burg, a dis ver, of itt about one en, or so but the ris that, after Bohemia, 280 feet.

but when it reaches the Lake if Constance it has already fallen to 1300 . 'From that lake to Basle, where it leaves the mountsins, it falls more than 500 feet, and even further down it still thows wlth great impetuosity, failing 400 feet more before it reaches Strasburg, a distance of only 70 mlles. The average, however, of lts fall from the latter city to the sea is only about one foot a milo. The elevation of the Elbbrunmen, or sources of the Elbe, In Bohemia, is 4260 feet, but the river falls so rapldly, within a short diatance, that, after passing the northern mountain border of Bohemia, lts elevation le found to be, at Dresden, only 280 feet. The average fall from that point to the sea is less than a foot a mile, The elevation of the source of the Oder is 1705 feet, but at Breslau it has already falien to 370 , and the average fall of the remainder of its course is likewlse about a foot a mile. The elevation of the soarce of the Vistula we have not been able to learn, but as it is navigable from Podgorze, near Cracow, to the sen, its average fall is probably much the same as that of the Elbe or the Oder.
Few of the rivers of Europe are of much Importsnce as moans of communication and transit. The Folga becomes navigahle at Rief, about 70 miles from its source, and so continues to the Caspian Sea, a distance of more than 2000 miles, following the course of the river. It is the groat highway of Central Russia, so many as 5000 loaded boats annually descending its sireani ; but as It ends unfortunately in an inland lake, it is of no use for the transport of other foreign wares thsn the prodnce of the sandy and barren regions that gurround the Caspian.
The Volga is so connected with the other great rivers and lakes of Russin by eanals, that there is uninterrupted navigation from the Baltio to the White Sea, the Black Sea, and the Caspian. The Don has a course of 900 miles, but has so many shallows as to be aowhere navigable for large or sharp-bottomed vessels. The Daieper, the next largest river of Russia, has a course of 1000 miles, and is navigable from Smolensk to Kief; but, further down, its channel is so obstracted with rocks and fulls, for a space of 150 miles, that anvigable communication between the sea und the inland provinces through which it flows is completely cot off. The Danube hecomes navigable at Ulm, 1500 miles from its mouth; but letween Passan and Vienua, it flows among mountaias, and navigation is readered difficult by the rapitity of the stream, and the frequent occurrence of rocks, shoals, eddies, and whiripools; and, in leaving llungary, through a narrow gorge of 60 miles in length, which it has cut for itself across the mountains that inclose that conntry, it fills in a series of rapids, the lowest of which ls the fasous Irongate, through whicit the stream risies with great rapidity in a narrow channel, het ween stupenilous rocks, ending in a series of whiripools, edilies, sal smaller falls. Here navigntion was considered to be effectually stopped; but wo have just learned (January, 1855) that steamboats have nt last been constructed so as to be considered capable of jussing these rapids in safety, and that they will be immedisteiy jint npon the river. It is also proposed to cut a channel through the rocks 1200 yards loag, 40 feet wide, and 6 fect deep, which will give plenty of ndditional depth for the steamers nal other loaded vessels. The number of workmen to be employed in this gigantic undertaking is 2000 , and the work will extend over a period of 6 years, at a cost of $2,000,000$ of florins. So mmerous, besides, aro the windings of the Danule throngh the comparatively lovel plains of Hungary, that between Presburg and the Black Sea, a direct distance of 650 milles, the course of the river actualiy measures $\mathbf{1 2 0 0}$. The Rhine is navigable above the lake of Constance, but the navigation is stopped by the Rhelnfall near Sehaff hausen. From that poiat to Basle it ls not very easy or always practicable; to Strasburg it is not free from danger; but
further down the river becomes fine navigable itresm, not quite free indeed from dimenlty and risk, particularly in the deep and narrow gorge which it passes through between Bingen and Coblentz; but below Coblentz the channel is uninterrupted and free from danger. Between the Rhine and the Danube there is a navigahle communleation by means of the rlvers Meyn and Altmuhl, which are connected by the Ludwig's canal la Bavaria. The Elbe, and lis tributary, the Moldaa, are beth navigable oven in Bohemia, and from their confluence to the sea there is no serious interruption. The Oder la ns vigable downward from Silesia, and is of the utmost Importance as the channel of conveyance for the productions of that country to the see. Bresiau, Frankfurt, and Stettln, three of the principal commercial towns of Prussia, stand on its banks, and it is connected by canals with the Vistula, the Havel, and the Spree. The Vistula is, like the Oder, the principal channel of transit between the Baltic Sea and the Polish provirices of Austria, Russia, and Prussia, and begins to be navigable at Podgorzo, near Cracow.

These are the only rivers that seem to require notice as navigable streams in a general survey of Europe, aithough there are many otheri of great importance to the sevoral conntries in which they are found, as the Thames, the Tyne, the Clyde, the Rhone, the Po, etc.

The Islands of Europe, Including Nova Zembla and Iceland, oceupy a space equal to 280,000 square miles, or 1-11th part of the surface of the continent; and of this space the area of the British isles amounts to
 sea connected with Europe in which there are no islands worthy of notlee.

Seas.-The Mediterranean, the neblest inland sea in the world, forms the southern boundary of Europe, separating it from Africa, and partly als, from Asia. It may be considered as the bottom of a vast basin formed by the Pyrenees, Alps, Balkans, Taurus, Libsnus, and Atlas. These mountains are everywhere near its shores, whlch are consequently narrow and much inclined. Henco there are no such extensive plains as Hungary or Poland near the coast of this sea, and hence, also, no very large rivers fall into it except the Nilo; and altogether it receives a smaller quantity of water from rivers than the Black Sea or the Baitic, though six times larger than either. Its length is about 2350 miles, its breadth is extremely vurious, and lts surface (exclusive of the Black Sea) is nearly equal to $1,000,000$ of square English miles, or something less than part of the continent of Europe. It is generally of great depth; and its numerous islands, whieh havo uniformly a rocky surface, appear to be the summits of marine mountains.

Baltic.-The Baltic, the greatest inland sea that is entirely in Europe, is about 1200 miles long, of very unequal hreadth, and presents a surface of $\mathbf{1 7 5 , 0 0 0}$ square miles, exclusive of islands. It occupies the bottom of another large basin, 850 miles in breadti, and 1400 in length, extending from the Norweglan mountains on the north and west, to the Carpathians on the suuth, and to the blgh lands on which tie Drieper, the Don, and tie Volga rise, on the east. This basin, equal to $\frac{1}{8}$ of the surface of Europe, has a very different eharacter from that of the Mediterranean. The monntains are not very elevnted, and are so placed as to leave a large traet of land, very little inclined, between them and the Baltic, ovor which, especialiy on the south side, many considerable rivers flow with n gentle current. IIence the country round the Baltic is mueh more level than round the Mediterranean; lakes are numerous in the low grounds, from the want of declivity; the soa itself is comparatively shallow, and receiving a much gronter quantity of river water, it ls much less salt. The commerce of the Baltic ls annually interrupted by the ico, which endures 4 months in tho gulfs of Bothnia and Finand

The whole of this inland sea has sometimes been frozen over for a short time, but this is of raro ocenrrence. See Baltic.

Black Sea.-The Black Sea, whlch helongs only partly to Europe, is 700 milas long and 380 miles broad, and, including the Sea of Azof, presents a surfaco of 170,000 square miles, belng almost of the same magnitude as the Baltic. It derives 4-5ths of its water from Europe, and is curiously distinguished from the other seas of this quarter of the globe, by $i t s$ being almost totally destitute of islands.

White Sea.-The White Sea is 450 miles in length, of a very irregular figure, and occupies a space equal to 35,000 square miles. It recelves some considerable rivers, but is frozen during six months of the year.
Lakes.-The lakes of Europe are numerous, and are of two kinds: those which lie in cavitles at the foot of high mountains, and which are generally deep, auch as the lakes in the $A_{[1 s}$, on the east side of the Norwegian mountains, and nmong tue mountains of England and Scotland; and those which are formed in level countries frem the want of a sufficient declivity to carry off the water, guci - 'he lakes in Finland, Polund, and Brandenlouro. t-uths of the lakes of Europe are in the conntry round the Baltie

I'getable Productions.-Tbe soil of Europe has not the extremes of luxuriance or sterility which belong to the soil of the other great continents. If it does not yield the rich fruits of tropical climates, it is not deformed by burning sands like Africs, or by pestilent swamps like America. It does not pour forth its riches spontaneously, but, soliciting the care nnd the labor of man, it requites his industry with what is necessary to sopply his wants; and, by exereising and sharpening his powers of mind, has given birth to those arts which place the productiens of the most favored elimates at his disposal. Nany of the phants which havo heen domesticated in Europe nre natives of distant countries. The vine, the olive, and the mulberry are said to have beea brought from Syria hy the Greeks ; the Arablans introduied cotton; malze was received from the Indian tribes of America; the whluut and the peach come from I'ersin; the ayricot from Armenis, and the sugar-cane and orange from China. There are not very many plands belonging to the tropleal regions that absolntely refuse to grove in Earme, but an enlightened economy finds other productions more profitable. llesides sugar and cotton, the banana, the orange, citron, fig, pomegrenate and date, grow in the south of Enople. lut the nore delleate frnits are confined $t$ southern latitudes, nud disappent one hy one as we advance northwarl. And it is worthy of remark, that the zones in which they grow generally follow the lines of eatual summer heac, "I run obliquely across the continent ir the direction of south-west and north-east. If a line be drawn on the map from Ilrest to Konigsherg, sikirting the southern shores of the Engiah Ghannel and the llaltic, the zenes that limit the growth of different plants will run nearly parallel with this line. This holis generally In the sonth and midile of Euroje; but in the extrene northern parta, and espectally with regard to plants that regeire a moderute heat continued : $r$ a consilerahlo tine, the lines that limit the growth of certain vegetables seem to fullow a different course, and decline toward the south is we mivance castwarl, in consequence of the lincreasing severity und longth of the winter. It la scarcely neecssary to say that the zones traced as proper for lifferent plants, only mark the llinits within which their cultivation is fonsul athvantageoun. Most of thell will grow heyond thase limits; but they either reguire some peenliar ulvantages of soil and situation, or thay are less proctable thin other kinds of proluce.

The sugar cane, one of the most iesirable tropical plants, grows in Sicily nud the sonth of $S_{j}$ min, In the latitule of $17^{\circ}$ and $38^{\circ}$. The cuiture of $i t$,
whlch was onct. extensive in the latter country, has not yet been enirely abandoned, even since eugar was procured from the West Indies. Cotton is cultivated in the south of Spain on a small scale; to a greater extent in Sleily, the aouth-east angle of Italy, and in Greece and its isles, as high as the latitnde of $41 \frac{1}{2}^{\circ}$; we find it again at Astracan, in the latitude of $46^{\circ}$. The orange and the lemon come to perfection in the west of Europe, only in the countrise to the seth of the Pyrenoes and Apenninee, within the latitude $48^{\circ}$ in Spain, and $44^{\circ}$ In Italy. The ollive does not succeed on the west cosst of Irance in the latitude of $43^{\circ}$, but growe as far north as $44^{\circ}$ or $45^{\circ}$ on the east of France, and in Italy. Attempts to raise It at Astracan, in latitude $46^{\circ}$, have not succeeded, on account of the rigor of the winter. The fig and the pomegranate, which accompany the olive in the west of Liurope, are found in the Crimea in the enst, at the latitude of $46^{\circ}$, where the olive will net grow, a proof that these trees hear the whter cold better. The -ilmate proper for malze is found to terminate on the west const of France at $45 \frac{1}{3}^{\circ}$; on the Rhine at $49^{\circ}$; on the Eibe at $50^{\circ}$ or $51^{\circ}$. Rice has nearly the sume geographical range, but requires a peenliar soi! and situation. The culture of the vine extends as far north as the latitude of $47 \frac{1}{2}^{\circ}$ on the Atlantic coast; on the Rline to $501^{\circ}$; and on the Oder to $52^{\circ}$. In Russia it grows as far north nearly us $52^{\circ}$, but is not cultivated beyond 50 ? The mulberry ganerally accompanies the vine. The llmits of the culture of the common cerenlia aro not so well defined, as the necessitles of man oblige him to raise corn under the most unfuvorable cireumstrnces. In n general point of view, however, the purallel of $57^{\circ}$ or $58^{\circ}$ may be regarded as the northern limit of the cultivation of wheat in Europe. It is raised ne far north as $60^{\circ}$ or $61^{\circ}$ in Finland, bat only in some favored spots. In Russin, generally, it is chiefly confined to the provinces under the latitude of $55^{\circ}$. The hardier cerechla, rye, oats, and harley, are cultivated in some shedtered situations on the coast of Norway, ne high ns the latithide $69^{\circ} 55^{\prime}$. Hat on the east side of the Nurwegian mountains these grains scarcoly ripen in the latitude of $67^{-0}$ or $68^{\circ}$; and farther east, In Russia, it has been found impossible to carry cultivation of any kind Beyond the latitnde of $60^{\circ}$ or $62^{\circ}$. Barley, which accommolates itself better than any other grain to these high Iatitules, by whortening the peried of its growth, is sown and reaper! within the symace of soven or eight weeks. Int the introluction of potatoes promises to be of vast advantage in theso colll regions, as this plant thrives and yields a produce of 30 or 50 fold in jilaces where grain often will net ripen. Penches and aprieots succeed with much care as far north only as the latitule of $50^{\circ}$ in Russia: melons ns far ass $\overline{5} 2^{\circ}$. The pium nud the cherry grow vill as far morth as $65^{\circ}$, hut are carried farther hy cultivation. lirult trees and the oak terminute in Sweden, nt liefle, in the latitude of $61^{\circ}$; bint the pine babl the birch numame within the nretic circle; nind the former grows tu the height of 60 feret in the latitude of $70^{\circ}$. The barkherry and the whortleberry grow in Lapland, nad the gooseberry even in Grecnland. Tobmeco is extensively cultivated over the greater part of the continent of liurofe, from Sichly to Swoden. Flax amb herup have as extensive a range as corn, but they are raised In the grentest perfection between the latitules of $15^{\circ}$ and $80^{\circ}$.

We have atnted that the superficial extent of lice rope is nbout $3,700,000$ equare miles. If we draw a curved line from a point in the Uralinn mountains, abont the latitude of $60^{\circ}$ or $61^{\circ}$, to the west coast of loorway, in the latitude of $69^{\circ}$, passing through the Lake (Buega, nud a little to the northward of the tiaif of Bothnha, this line will mark the extreme limita of eultivation, hul wiil cut of a space equal to 550,000 aqtare milen, or nently j-ith of Europe. The whare
cat off, however, is not entirely uselese, as a part of it $\mid$ tries of Europe. The most extenaive salt mines of produces pasturage and wood. The cultivation of rye, oats, and barley, is confined to the reglone sonth of this line, and inclades more than 6-6ths of Europe; but in the northern parts of this zone only a very small proportion of the land will bear corn. The region adapted to the cultivation of wheat comprehends about 4-7ths of Europe, and includes all the densely-peopled parts. The region of the vlue uxtends over 3-7ths of Europe.

Minerals.-Europe, in propartion to its oxtent, is probrbly richer in miaeral wealth than the other quaters of the globe. It contains all the metals except plat na ; and though it affords gold and silver only in limited quantities, iron, copper, lead, with coal and salt, commodities of greater valuo to society, are abundantly and widely diatributed. The mountains, consisting of primary and transition rocks, are the great depositerics of these mineral treasures. Iron is found in all the chains of mountains in Europe. The richest mines are in the Dovrefield, or Scandinavian Alps. But rich mines are also found in the Alps of Styria, Carinthin, and Bavarla; in the lyrenees, the Vorges, the Cevennes, the coal districts of Britain, the Urals, the Carpathians, the Hartz, nud many other places. Copper is also widely distributed, though less abundant than iron. The richest mines sre in Hungary, in the Carpathlan mountains. It abounds also in the Saxon and Bohemian mountains, in the Dovreficld, the Urals, the north of England, and the Alps; and it is found in the Vosges, the Pyrenees, and other mountains of Spain, In the north of Germany; and in Tuseany:
Lead exists in the Alps, Carpathians, Pyrences, Cevennes, Vosges, the British mountains, and the Urilian chain. Tln is found only in a few places in Europe. The rlchest mines are in Cornwall ; next to these sre the mines In the Eragebirge. It is also found in Ilungary and Spanish Galicia. Mercury, like tin, is contined to a few places. The mines of Idria, in Austria, which vield 8000 or 10,000 quintals per numum, are the most productive in Earope. There are also censiderable mines at leux lon's, in the Palatinate, in the Spanish province of La Mancha, und in Transylvania. Gold is widely diffosed through Furope, but generally in such quantities ns not to repay tho expense of working. It ls wrought, however, in the Carpathians, the Urula, the Dovrefield, and the Alps. Anciently there were rich mines of gold in Spain nad Grecee. Silver is more abundant than gold, though less widely distributed. There are productive mines of this metal in the Erzgelirge, the Carpathiana, the Urals, the Norwegian Jovrefield, and in Sardinin. It is found slso in the Alps, the Vosges, and the Sierra Morena.

Of coal, the richest mines are found in the north and west of Englaal. It abounds also on both sides of the midulle region of Scothand; in Ireland; in the Netherituds; 1, one fourth purt of the French territory; and occurs more sparingly in Saxony, Hanover, Demmark, Sweden, Kussia, Ilungary, Mohemia, Moravia, Silesia, llavaria, Austria, Frunconia, Westphalia, Swabia, Catalonia, und some other parts of Spaln, in Portugal, and In Sardinh. After liritain, Vrance and Belghum are the countrics in buropo best aupplied with thls mineral.

Salt is procured from the waters of the ocenn, and, Ia the interior of Europe, from numerons salt in'mes snid salt springs. The most productlve sult mines in Eurupe ure those in l'oland, on the north side of the Carpathians, and those in Salziourg, on the north side ef the $\mathrm{Al}_{\text {fas, }}$ both of which belong to Austrin. Thero ars also extensive depositories of mineral salt in 'Transylvania and Hungary ; in Valencia, Navarre, and Catalonia, in Spain; In Cheshire, in England; nnd in Bayaria, in Switzeriand. Salt springs are numerous along the sides of primitive monutains in most coun-

Russia are in Asis; but very large quantitles of salt are collected from the tuzlas, or salt, lakes in the Crimea.

Antimony, cobalt, zinc, manganese, sulphur, alum, and a great variety of other mineral productlons, arc found in Europe; but it is unnecessary to specify their localitles. It ls observed that the Alps, Pyrenees, Carpathians, and other mountain chalus which run east and west, are rlchest in metals on the south side; while the Dofrines, Urals, and others which run north and south, are richest on the east side. Of the mountain chains of Europe, the Apennines are the poorest in metals, the Carpathians probably the richest.

The progress of improvement tends to level all distinctions among states, but those founded, on the extent of their natural resources. Capital, skill, intelligenes, and all acquired advantages, tend to an equilibrium. When Europe was overrun with barharism, the sity of Venice, by its commercial wealth, was a counterpoise to two or three of the great monarchies of the Continent. The discovery of America, and of a passage by sea to the East Indies, gave a new direction to commerce, and ondermined the greatness of that city. The Dutch Republic rose by its freedom and industry, and was able, in the time of Charles II., to dispute the empire of the sea with the combined powers of England und France. But England increased her commerce, and improved her constitution; and having a lar ${ }_{b}$ ar and more fertile territory, as well as a greater population, she obtained at length the ascandency over IIolland, deprived her of the empire of the sea, and stripped her of most of her colonics. At the lieginning of the 17 th contury, Spain and Turkey were tho first powers in the west and east of Europe, and inspired their neighhors with the drend of conquest, Sweden raled with undisputed sway in the north; and Russia, now so formidnble, was scarcely known. Spain, under a better government, might recover a part of her influence; but the Turkish empire scems near its dissolution ; and the inaportance of Sweden and Holland is gone irretricvably, in consequence of tho growing strength of the nelghtoring jowers. The extent of territory and the linmense natural resources of Russia must, in the end, render her hifghly dangerous to all the other powers of Eirrope, if the empire do not fall to pieces fim its own weight, or get into discord from the vices of its government, or tho barbarism, lgnorance, and corruption of its people.-E. B.

Ify menns of steam-vessels, communication betwoen uli the maritime regions of karope has been rendered easy nud certain, while the seabonrd has been connected with the inland regions by railways running in all directions. During the hatter half of the last century; nud the earlier purt of the present, lingland was covered with a net-work of canals, forming navigable communication between all her princlpal towns and rivers. Thelgit on and Holland havo long heen famous for thelr can'is. In France, likowise, the great rivers were connected in the same why; and the great canal of Languedoc formed a navigatlo communication between the Bay of Biscay and the Mediterrenean Sea. In Prussia, likewise, and in Russia, tho great rivers havo been connected by cruals; and in Sweden, the Gotho Canal extends from the Cattegat, at Gottenburg, to the llatic, near Stockholm, through the lakes Wener and Wetter. These very useful means of transport have now, however, been very much, if not entirely superseded by railways. Of these, lingiand is covered with a net-work, as sho was with canals; and minterrupted lines of communicatlon extend from near the Land's Eind, through Scothand, to the Moray Firth. In Scotland, Ireland, France, and fiermany, the principal cities and towns are connected ly rilways; nud in lussia, we understand that one is furming to connect St. Petersburg with Moscow and tive Black Soa. In Italy, Milan and Venico are con-
neeted, and railways are projected at least in other parts of the country. The later invention of the electric telograph is likewise extcading every where ueross seas and continents; but the whole system of telegraphs and rallways will be understood more readily st. once by a glance at a map.

Consldered in respect to political constitution and clvil government, the states of Europe may be arranged in six classes. The first class comprisen 4 cmplres, the soverelgns of which are absolute monarche; the second, 16 kingdoms, partly absolute and partly constitutional; the fourth, 7 grand-duchies, all monarchles; the fifth, 24 duchics and princlpalities, likewise all monarchies, partly coustitutional and partly absolute; and the sixth, 32 republics. The third elass comprises 2 nondescrigts, both monarchlos indeed; but'in the one case the soveroign retalus the subject title Elector of the head of an empire that no longer exis a, and the sovereign of the other la at once the spiritual sovereign of the Roman Catholic world and the temporal sovereign of that portion of Italy colled the States of the Church. The preceding table eontains tho names, territorinl extent or area, and the popolation of these several states at the dates attached to them respectively. The grand total of the population, as it is not all of the same year, can only be considered as un approximation to the truth.

In linancial importance, Jritain stands at the head of all these states; for not only is her annual revenue the largest, excepting that of France, but she enjoys hesides the unenvinble pre-eminence of being burilened with the largest deht. The bud practice of anticipatIng revenne by borrowing money is common to them all; und, as will te seen in the table, ouly some of the less important have escajed the evor-growing evil. Within the last twenty yoars the deht of Austria has increased more than threefold, and the French emperor has been borrowlug largely to pay the eurrent ex penses of the war in which he and the British gevernment were engaged with Russin. Tho govemuents of Spain and Greece are virtunlly bankrupt, being neither able nor willing to pay either princlpal or interent of their large delets. Norway, on the contrary, the poorest country in Europe, has set the bright example of paying off that portion of the Danish debt with which she was burdened when separated from that momarchy in 181-1, while the Danish portlou has gone on increas ing. Tho Ottoman sultan has escaped, until lately, only by virtue of hils want of credit.

standing armles. Russla, safe from forelgn invasion, has long been preparing large armaments for purposea of aggression on her weaker neighbors, and of domination over all the rest; and at last her overt acta of aggression on Turkey have provoked a war with Great Britain and France, who [1854] armed ln defense of their anclent ally, the Sultan, and vith the view of not only maintalning the balance of power in Europe, but of effectually checking the undiagulsed attempts of the ezars of Russia at universal dominion. In these circumstances, with ail Europe arming, or beginning to arm, any numerical atatements of their milltary forces, however approximatoly correct when written, may have hecome quite erroneous by the time they are published. The following table, therefore, contains only the declared numbers spectively of the peace and war establicineats : ©e Continental armies, with the exception of $1 . \operatorname{st}$ of France, which gives the actual number of wers on foot, as stated in the emperor's address to bis Legislative Council in Decemtier, 1854.

The maritime powers that mnintain efficient navies worth notice ure, Britain, France, Russia, Austria, Turkey, Sardinia, Netherlands, Denmark, Sweden, and Norway. In Ilecember, 1854, the IBritish fleet in commission and actund service, consisted of 142 stemmers, and $10-1$ salling ships, witl $6: 1,000$ men ; that of France, of nearly the sume number of vessels niltogether, thaugh not no many steamers, with 62,000 men. The Russian fleet, in the suring of 18 n consistel of 52 lhe-of-tantle ships, 18 frigates, and 8.1 sumbler vessels (heshlea gun-boats), with 0000 guns, and 12,000 men. Austrla possessell 104 vessels cartying 7t2 guns; Turkey, 70 vessels, wilh $3.4,100$ semmen and 1000 marines; Sardinia, 19 vessels, with 359 guns; the Netherlands, 88 vessels, with 2000 guns and 6180 men; Denmark, 120 vessole, with $88: 1$ guns, and 2001 men; Sweden, $\overline{4}$ vessels beslides gun-boats; Norway, 19 whips besides gun-bouts, with but men.

In Eumpe there are two great nutioual confederncies, the Germanie and tio Swiss; hot in neither of them is there po close a union of the sovereigntien that compese it as there is in the Vuited States of North Aneriea. In (iermany, indeed, there is no principle or fereling of nity anoing either primes or prople, mud their confederation, as such, enjoys neither iniluence nur respect at home or nbroul. In Switzerland, on the contrary, recent circumsthaces soem to lave pros dured a cloger and more inthuate mion, aml given to the fellerative assembly tho nuthority indispensable to the eftivient warking of a central goverumurit.- Di. it.

Exchange, Principles of, by Joun Ramasy M'tematin, lisq.

In conmercial economy, the term "Exchange" Is commonly employed th designate that description of meremutilo transmetions ly which the debts of indivihtals residing at a distanco from ench other are lifulatad wilhont the intervention of money.

The object of thls article is to explsin the nature of these traneactions, and the principles on which they depend. This will be hest effected by treating, first, of the exchange between different parts of the same country ; and, secondly, of that between different and independent countries.

1. Inland Excirange.-Suppose a merchant of London orders his agent in Glasgov to eend him s thousand pounds' worth of cottons, and that it does not suit the agent to commission goods of equal value from his London correspondent, the latior may, notwithstanding, be under no necessity of remitting cash to Glasgow in diacharge of his debt. Among countries or citles having a considerable intercourse tugether, the debts mutually due by each other are found, in ordinary cases, to be nearly equal. The Glaegow agent, who has shipped the cottons for Loncion, does not, thorefore, transmit the hill drawn by him on his correspondent for their prico to London to be cashed, as that would suliject him to the expense of conveying the money home to Glasgow; but he gets ite value from some other party in Glaggow, who has a payment to make in London on account of tea or some other article bought in that city, and who, unless lie could procuro such a bill, would be obliged to remit its price in money. 'ihe bill on account of the cotton is, therefore, either drawn in favor of the party in London who furnished the tea, or it is drawn in favor of the tea-dealer in Glasgow, and indorsed by him to the former, who, on presenting it to the purchaser of the cottons, receives its value and consequently the price of the cottons, and the prico (or part of the price) of his ten, at the same moment. This simple contrivance obviates the expense and risk attending the transmisslon, first, of money from London to Glasgow, to pay the cottons; and, second, of money from Glasgow to Landon to pay the tea. The debtor in one is changed for the debtor in the other; and both accounts are setthed withont the intervention of a single farthing.

The bill drawn and negotiated in such a transaction ns this, is termed in inland bill of exchange. If the transaction lat taken place between London or Glasgow and a foreign city, it would have heen termed a foreign bill of exchange. A bill of exchange may, therefore, be detined to be, "sn oriler addiessed to some person residing at a distance, directing him to pay a certnin spectied aum to the person in whoso favor the hill Is drawn, or his orter."*

The price of hills tiuctuntes necording to thelr abundance or nearcity compared with tho demand. If the dehts reciprocilly due by Landon and Glasgow bo equal, whether they amount to $£ 100,000, £ 500,000$, or any other sum, they may be diacharged without the intervention of money; and the price of bills of exchange will the nt pan; that $i s$, s sum of $£ 100$ or $£ 1000$ In Glasgow will purchane a hill for $£ 100$ or $£ 1000$ puyuhle in loulon, and rice rersit. But if these cities be not mutually indelited in equal aums, then the price of hills will he increased in the city which has the greatest number of payments to nuke, and reduced in that which has the fewest. If Glasgow owe London £100,ton, while the la'ter only owes the formar $\pm 90,000$, it is clear, hasmuch as Glasgow has a larger num to romit to Lamion than Lenden lins to remit to dihagow, that the price of bills on landon will rise in Glasgow beranse of the increased temand, and that the price of hills on (ilasgow will fuli in London, heenuse of the thminished demumel. A sarger sum would, consequently, be required to diselurge a debt due by alas-

[^8]gow to London, and a less sum to discharge en equal debt due by the latter to the former; or, which is the mame thing, the exchange would be in favor of London, and against Glasgow. Bills on London would sell in Glasgow at a premium, and bills on Glasgow would aell in London at a discount; the premium in the one case being equal to the dlacount in the other.
On the aupposition that the balance of $£ 10,000$, due by Glasgow, depressea the exchange on London onc per ceut., it appears at first sight that it will cost Glasgow $£ 101,000$ to discharge her debt of $£ 100,000$ duo to London; and that, on the other hand, $£ 89,100$ would be sufficient to discharge the debt of London te Glasgow. But a very little consideration will serve to show that thia would not be the case. Exchange transactions can not take place between different cities until debtors and creditors of the one reside in the other. And hence, when the exchange became unfuvorable to Glasgow, the premium pald by its merchants for bills on London would not go into the pockets of their creditors in the latter, but into these of their neighbors in Glasgow to whum London was indebted, and from whom the bills were purehased. The loss to Glangow would, therefore, be limited to the preminm pald on the balance of $£ 10,000$. Thus, supposing that A, of Glasgow, owes D, of London $\boldsymbol{1 1 0 0 , 0 0 0}$ and that C , of London, owes B, of Glasgow $£ 90,000$, A will pay to $\mathbf{B} \mathbf{£} 91,000$ for a bill or order on $\mathbf{C}$ to pay D $£ 90,000$. In this way the $£ 90,000$ of London deit at Glasgow will be cleared off; the premium, which is lost by the debtor to lort.on lin Glasguw, being galreed lyy its creditor in the same place. If the business lad been transacted in Lendon, C , with $\mathbf{\mathcal { L } 8 9 , 1 0 0}$, would have purchased of $\mathrm{D}_{\text {a }}$ bill for $£ 00,000$, payable by A; so that, in this case, the gain would have fullen to the share of the debtor C , and the loss to that of the creditor $\mathbf{D}$, both of London. The complexity of real transactions does not affect the principles on which they are founded. And whatever may be the anount of the delts reciprocally due by different placen, the only diexdvantage under which any of them could be phaced ly a fall of the exchange would be the nuavoidalle one of pyying the expense of remitting the balance of delt.

The expense of transmitting money from one place to another limits the fuctuations in the exchange lietwoen them. If 20 s. sufflecit to cover the expensa and risk uttending the tranaminsion of elow from Glasigow to londor. ? woilli le indifferent to a merchant, in the event of the sxelange bocoming unfavorable to the fi ser, whether he po lone pre cent. preminm for a bill on London, or ren:itied money direct to the latter. If the premium were less than one per cent., it would te clecrly ils interest to mako lis payments hy means of hills rather than by remittances; and that it could not exceed one per cent. Is alslons, fur every iadivdual woud rather directly remit money than incur an umevessary expelase by furchasing trills on Lonilnn at a preater premium than would sutfice to, cover the expense of a money rematiance. If, owing to the baduens of roads, dintnriances in the country, or any other canse, the "xpeaise of remitting muncy from (ilaqgow to London were harreasel, the difference $\ln$ the rate of exchange bet ween them might alse be proportionally hereasel. Wht in every cave the extent to which this difference could nttain would be limitend ly, and coulin not for any considerable periond expees, the cost of remalting eash.
Exchange transactions hecome more complex when one place, as is often the case, discharges its deltes to annther ly means of hills drawn on a third place. Thus, though Donion should owe nothing to Clasgow, yet if Giasgow be Indelted to Lamdon, Lamdon to Manchenter, and Manchester to (ilasgoll, the latter nay wholly or partialiy discharge har dobt to Lomdon by renitting bills on Manchester. She may whiliy discharge it, provided the debt due to her hy Man-
chester exceed or is equal to the debt due by her to London. If, howover, it be not equal to the latter, Glasgow will either have to remilt money to Londen to pay the balance of debt, or bills on soms other place indehted to hor.

Transactiona in inland bllls of exchange are almost entirely conducted by bankers, who charge a certain rate per cent. for their troubio, and who, hy means of their credit and connections, are able on all occasions to supply the demands of their customers. London, because of its extenalve correspondence with other parts of the country, occasioned partly hy its immense commerce, partly by its being the seut of government and the place to which the revenue is remitted, und partly by its currency consisting of Bank of England paper, for which tl-, notes of the country banks are rendered exchangenble, has become the grand fenns in which the money transactions of the United Kingdom ceutre, and in which they are all ultimately adjusted. These circumstances, but especially the denand for bills on London to remit revenuc, and the far supertor value of lank of England paper, render the exchange between London and other parts of the country Invarially in her favor. Bills on London drawn in Elinburg and Glasgow were formerly nate payalle at 40 days' date, which was equivalent to a premiun of nbout $\frac{1}{\frac{1}{2}}$ per cent.; but, owing to the greater facility of communication, this premium is now reduced to 20 days' interest, or to about $\frac{1}{2}$ per cent. Bills for remitting the revenue from Scotland are now drawn at thirty days; previously to 1810, they were drawn at 60 days.
These statements are sufficient to show that, how well soever bills of exchange may he fitted for facilitating the operutions of commerce, and saving the trouble and expense attending the transportation of money, mercantile transactions can not he adjusted by their means except in so far as they mutualty balance each other. A real bili of exchange is metely an order entitling the holder to receive payment of a delt due by the person on whom It is driwn. It is essential to the existence of auch liill that an equivalent amount of debt shonlil be contractel. And hence, as the anount of the real bills of exchange drawn on any number of merchants can not exceel the amount of their debtes, if a greater sum be owing to them than they owe to others, the balance must either be paid in money or by the delivery of some surt of commodities. If, us in the case referred to, Glangow owe Londion $£ 100,000$, while London only owes Glasgow c90,000, a reciprocal transfer of delits may he mado to the extent of $\mathbf{f 9 0 , 0 0 0}$. But the Clasgow merchants can not diseharge the altional $£ 10,000$ by means of hills on London; for, by the supposition, Londen only owned them $£ 90,000$, and they have drawn fur its amount. This balance must therefore be ilselarged by an actual money payment, or by the delivery of some species of produce, or b,y bills mu some third party indebted to Glavgow.

It is not meant by this to insinuate that fictitions tills of exchange, or bills drawn on persens who are not really indel, ted to the drawer, are either unknown or very rare. In conmercial countries liils of this dencription are alwayn to be met with; hut they are a device for olitnining loans, and cun not trabsfer real delits. A of London may form a comection with It of Glaxpow, and draw bilis upon him payable a certain namber of daya after inte, which the later mily retire ly selling bilif mpon A. The merchants who purchase, or the bankers who discount these hills, manace their value to the drawiry, who, hy means of this nystem of draring and redruwiny, command a borrowed capital equal to the amount of the fictitious paper in circuhation. It is clear, howner, that the negotiation of such bills can not nssist in transferring and aettling the bond gide debta of two or more phaces. lictitious hills mutually balance ench other. Thone drawn is London on Glasgow equai those drawn ly Glangow on

London, for the one act is drawn to pay the otherthe second destroys the first, and the reeult is nothing.
The raising of money by means of fictltous bille has been severely censured by Adam Smith, who says it entalls a rulnous expense on those engaged in it, and is resorted to enly by projectors, or persons of auspicious credit. When fictitione bille are drawn at two months' date, it is common to charge, in addition to the ordinary interest, a commiselon of half or quarter per cent., whleh must he paid every time the bill is discounted, or, at least, six times a year. The tutal expense of money raised in this way conld not, therefore, supposing the transaction to be always on account of the same indlvidual, and interest 4 per cent., be estimated at leas than $5 \frac{1}{2}$ or 7 pici nent. per annum, ex stamps; and the payment of so high an interest on borrowed capital, is a country where tho ordinary rate of mercausile profit is not supposed to average more than from six to eight per cent., conld not fail to be frequently productive of ruin to the borrower. But it sellom happens that, in the negotiation of fictitious bills, the charge for commission falls on one individua] only. Loans obtained in this way are usnally on account of two or more parties. At one tlme a fictitious bill is Jrawn by $A$ of London on $B$ of Glasgow ; and, in this case, the latter will, before the bill becomes due, draw upon $A$ for its amount, including Interest and commission. At another time, the trangaction will be on account of B, who in that case has to pay commission to his friend in London; so that each party may, on the whole, as Mr. Thornton bas observed, gain about as much as he pays in the shape of commission.
It is often extremely difficult to distinguish fictitious bills from those which have arisen out of real transactions. Neither does it reem to be of any very material importance. The character and credit of the parties whose names are attached to bills, are the ouly criteria by whleh merchants or bunkers can judge whether they ought to negotiate them. The clrcumstances of an individual offoring accommodation paper for discount, ought unquestlonably, if it be known, to excite suspicions of hls credit. But unless in so far as the drawing of fietitlous blls may be held to be indicative of overtrading, or of a deflelency of capltal th carry on the business in which the party ls engaged, there does not appear to be any very good reason for refusing to discount them.
Within the last few years, it has been the practice to grant money orders, payable on presentation at the different post-offices, for sums of 55 and under. These orders cost 3 d . for sums of $£ 2$ and under, and Gd, for sums between $£ 2$ and 55 inclusive; and as they are not paid unless the partics in whese favor they are drawn, or other parties well known to the poatmasters by whom they are payable, appoar to receive payment, there is no risk of the money getting into limproper hands. This system has been found to be a very great accommodation to the publie, especlally to those having small sums to renuit, and has been very extensively resoried to. In $1850: 4,49,713$ noney orders were lssued In the Vnlted Fangdom; the argrogate sam transferred hy their agency beiag $\mathbf{C 8}, 494,198$.

These observations will, perhaps, suffice to explain the mamer in which transmetions hetween difierent parts of the name country are settled hy menns of bills of excharye. They are, in general, ext remely simple. The uniform value of the currency of a single country rendets unceessary any comparinon between the value of money at the plate where tho blll is drawn and negotisted, with its valus where It ls to ho pald; while the constant latercourso malntahed among difierent parts of the same klogilom, and the nsual absenee of those occurrences by whleh the lntercourse between distant and independent conntries la always sulijnet ta be huterrupted, prevent those audilen lluctuations which frequently arise In the prices of forelgu bllls of
exchenge. We shall, therefore, leave this part of our aubject, and proceed to liveatigate the circumstancea which Influence the course of exchange between different and independent countries.
II. Foneign Exciange.-The priee of foreign bills of exchange depends on two circumstances : first, On the value of the currency of the place where they are made payable, compared with the value of the currency of the place where they are drawn ; and, secondly, On the relation whieh the aupply of bills in the market bears to the demand.

If the value of the different coins and moneys which circulate in nations having dealings with each other were iuvariable, the exchange would be exclusively influenced by circumstances affecting the supply and demand for bllls. But, in addition to variations in its cost in particular countries, the welght and finenese of the bullion centained in their coins are liable to all sorts of variations. And it is almost needloss to say that the price of bills, as of every thing else, necessarily varies with these variations, increasing when the value of the money in which they are estimated falls, and falling when it increases. But these, it is plain, are merely nominal or numerical variations. They grow out of changes in the standard smpleyed to measure values, and not in $1 / 10$ values themselves. It is otherwise, however, with variations of price oceasioned by changes in the supply of bills, or in the demand for them; that is, by changes in the payments a country has to make compared with those it has to receive. These are real, not nominal variations, for they affeet the values in bills, and not the money in which these values are expressed. And hence the distinctions of nominal, real, and computed exchange. The first depends on alterations in the value of the currencies compared together; the second depends on the supply of bills in the mariet compared with the demand; and the third, or computed exchange, depends on the combined effects of the other two. For the aske of perspicuity we shall treat of these separately.*

IlI. Nominal Eacitange.- Bullion belng everywhere recognized as the standard currency of the commercial world, the comparatlve value of the curreacies of partictiar countries depends-first, On the value of bullion in those conntries; and, secondly, On the quantity of bullion contained in their colns, or on the quantity of bullien for which their paper money, or other circulating media, will exchange.

The value of freely produced commoditles being commonly proportioned to the cost of their production, including thercin the cost of their conveyanco from where they have hoen produced to where they are to he made use of, it follows, were the trade in the precious metala perfectly epen, and the commoditles produced in different countries about equally well fitted for exportation, that the value of bullion in one, compared with its value in another, would be chiefly determined by their respective distances from the mines. Thus, on the suppesition that neither England nor Poland lud any article except corn to exchange with the Americans or Australians for bullion, it is evident that the precious metals would he more valunhie in Poland than in Enghand, because of the greatet expense of aending so bulky a commodlty as corn the more distant voynge, and also of the somewhat preater expense of convoying the gold to Poland. Hail Potand succeeded in carrylng ber manufactures to a higher pitch of improvement than England, her merchants might be ahle, notwithstanding the disndvantage of distance, by oxportling commodities possessed of yreat value in smull hulk, the frelght of which would be comparativoty triflug, to buy bullion on cheaper terms

- Rapposing every country to be in ponseasion of lita proper supply of buttion, the exchaoge may be said to be nominally affected by the ameunt of the difference between the market and wint price of buttion, and to be really affected by any devation from par exceedlug or fr. 'ling ahort of tbat difarence.
than those of England. But when, as is nctually the case, the advantages of akill and machinery are on the side of England, another reason is added to that dorived from our leis distance from the mines, why gold and silvor abould be less valuable here than in Poland, and why the money price of commodities should be higher. ${ }^{*}$

Hence, among natlons which have attained to different degrees of excellence in manufacturing industry, the value of bullion does not wholly depend on their distance from the mines. But, whatever variations a different progress ln the arts may occasion in its valne in different countries, it is always less valuable in theee inte whlch it is imported than in those in which it is produced. Like every thing else, it is exported to find, not to destroy, its level. And unless lts value in Europe exceeded its value in America and Anstralia by a sum suficient to cover the expense of its importation, including ordinary profits to the importers, we should not, though the mines in these quarters were infinitely nore productive, import from them a single ounce of buliion in the ordinary course of trade. It ls obviously incorrect, therefore, co lay it down as a general proposition, "that the par of exchange between two count ${ }^{- \text {-. }}$ es is that smm of the currency of either of the two, which, in point of intrinsic worth, is precisoly equal to a given sum of the other; that is, contains precisely an equal reight of gold and silver of the same fineness." $\dagger$ For a giren quantity of gold and silver is not always, as is here assmned, of the same Intrinsic value in different countries. It may differ but little among nations bordering upen or near each other, and Which are all destitute of mines. lhit though, to use a familiar illustration, the value of sugar appronches nearly to a level in the great trialing cities of Europe, it can not surely te maintained that lts value la the West Indies is as great as in Itordeanx or Liverpool, or that the exchange would be really at par, if a bill, which cost a hundred hogsheals of sugar in London, oniy brought a huadred in Jamaica. Now, in respect of pinclple, this is precisely the case with bullion. Though the values of gold and silver, compared with corn, iabor, etc., may, and indeed must, vary very considerably among different nations, these variations are only the necessary result of their lifferent progress in industry, and of the different quality of their cultivatedi lande, etc. Such differences of price are in the natural order of things; and bullion has not found its proper level till a quantity has been introduced into those countries which excel in manufactories, sufficient to raise the price of their corn and labor. These variations have, therefore, no influence over the exchange. Notwithstanding thls lifference of price, an onnce of buliion in one country, owing to the facility of intercourae, is very nearly equivalent to an ounce of bulition in another; and supposing the trade in the precious metals to be perfoctiy free, the exchange will be at true par when bills are negotiated on this footing. But when we compare the values of these metais in distant countries, especially in thase where they are prodaced, with those into which they are imported, there are very considerable differences. Gold and silver, like iron, coai, tin, etc., are necessarily cheaper in countries pussessed oniy of extraorlinarily productive mines, than in those poasessed only of mines of a serondary degree of fortiity, or where they huve to be entireiy bronght from abroad. And the exchange het ween such places is not a true par, unless adecinate allowauce be rade for this difference of value. Thus If, because of the expense of earriage, the value of bilion in Great Britain be 5 per cent. greater than in San Francisco, 100 ounces of jure golid in the iatter would not be worth 100 ounces of pure goill in Loudon, but 5 per

[^9]cent. less; and the exehsnge wonld be at true par when lills for 105 ounoes atandard bullion, payable in San Francisco, sold in London for 100 onnces.
The different values of the precious metala in different countries do not depend alone on their respective distances from the mines, or on their greater or less progress in the arts. The opinlon formerly so very prevalent, that gold and sllver were the only real wealth, led most nations to fetter and restrain their exportation, and to adopt a variety of measures intended to facilitnte their importation. But these, even, when mast vigorously enforced, were singularly ineffectual. The great value and emall bulk of the precious metals rendered it not only advantageous, but cemparatively easy, clandeatinely to expori them, wheaever their relative value declined.
"When," nays Adam Sinith, "the quantity of gold and silver imported into any country exceeds the effectual demand, no vigilance of government can prevent their exportation. Ali the sanguinary laws of Spain and Portugal are not able to keep their gold and silver at heme. The continual importations from Peru and llrazil exceed the effectual demand of those conntries, and sink the price of those metals there below that in the neighboring countries. If, en the contrary, in any particular country, their quantity fell short of the effectual demand, so as to raise their price above that of the neighboring countries the government would have no occasion to take any pains to import thein. If it wero even to take the pains to prevent thelr importation, it would not be siole to effectuate it. Those metnls, when the Spartans hid got wherewithal to purchase them, broke through all the barriers which the laws of lyyurgis opposed to their entrance into Lacedemon. Alt the sanguinary laws of the customs are not able to prevent the importation of the teas of the Dutch and (iottenturg biast Indis Companies, because somewhat cheuper than those of the Mritish Company. A pound of tea, however, is about a 'iundred imes the bulk of one of the highest prices, 16s., that is commonly paid for it in silver, and more than two thousand times the buik of the same price in gold, and, consequently, just oo many times more difficult to snuggle."-Wealih of Nations, p. 190.
lint though ineffectual to prevent their egress, the restrictions on the exportation of the precious metals have, nevertholess, contributed to occasion some slipht variations in their value on different conntries. 'The risk formeriy incurred by the clandestine exporters of builion from Spain, is supposed to have been equivslent to about two per cent.; or, whifh is tho same thing, it is supposel that the restrictions maintained surli nn exress of gold and vilver in that country ns to sink them two percent. below their value in countries having a free traie in bulion. In calculating the true par of exchange between different countries, circumstances of this kind must be taken inte accomit. Vor, to whatever extent lublion in one country may be annk below lts value in those with whirh it maintaine an intercourse, tho nominal exchange will necessarily lie unfavorabie to that extent. All restraints on the exportation of the precious metals was utsilished in Great ilritain in 1819. Their effect for many years previously conid not be estimated at above one fiarth jer cent.

It consequently results, that whatever occasions a rise or fall in the vaiue of the precions metals in one conntry affects to the shme extent its nomimal exchange with other countries. If more coin, or convertible japer, circulated in Great Ilritain, compared with the business it has to perform, than in other conntrios, its relative vaiue would be proportionally less. Foreign linis wonll seli for a prenitum, the amount of whilh would measure the excess of the value of the precions metals in the foreign market, eaused by thelr redumlancy in the home market. And, on the other hanil, in the event of our currency becoming

IV. Par of Excitanges.-In estimating the quantitles of bullion contalned In the coins of different countries, a particular coin of one ls selected for a standard b. which to compare the others, and the proportion between it and them, supposing them to be all of their standard welght and fineness, is ascertalned by experiment. A par of exchange is thus established, or rather it is ascertalned that a cartain amount of the standard currency of one country contains as much gold or sllver of the same fineness, ns is contalned in the coin or integer with which it has been compared. This relation, or par, as it is technically tarmed, is considered Invariable; and allowance is made for subsequent variatlons in the coins of countries trading together, by rating the exchunge nt so much above or below par. In mercantile langusge, that country, by s comparison with one or other of whose coins the par of exchungen has been establibhed, is sald to glve the certain for the uncertain, and conversely. Thus in the exchange between London and Paris, London and Ilamburg, etc., London gives the cerfain, or the pound sterling, for nn uncertain or variable number of francs, florins, etc. Hence, the hlgher the exchunge between sny two countries, the more is it in favor of that which gives it the certain; nnd the lower, the more ls it in favor of that which gives the uncertain.
On the supposition that 25 francs contain the same quantity of standard buition as a pound sterling ( 25 fr. $\mathrm{of}^{\text {cent. is about the exnet par), and supposing, also, }}$ that the value of bullion ls the same in both countries, the exchange between London and Paris will be at par when $n$ blll drawn ln the one on the other sells at that rate ; that is, when a till of exchange for 2500 , or $\mathbf{2 5 , 0 0 0}$ francs, payuble in Paris, sells In London for $f 100$ or $£ 1000$, and vice aersd. It is but sellom, however, that the colns of any country correspond exactly with their mint standard. Unless when newly issued, they are elther more or less worn; and whenever thls defect becomes sensible, an allowance corresponding to the difference hetween their netmal value and their mint value ls made in estimating "the sum of the exiating curreney of either of two countriss whleh contains precisely the same quantity of bullion as is contnined in a given sum of the other." Thus, lf our pound sterling were so worn, elipped, or rubbed, as not to contnin so much bullion ns 25 fr ., but 10 per cent. less, the exchange between London and Paris would he at real par when it was nominully 10 per cent. against London ;* and if, on the other hand, the pound sterling were equal to its mint standsrd, while the franc was 10 per cent. less, it would be at par when it was neminally 10 per cent. against Paris and in favor of London. If the currencies of looth countriea were equally reduced below the standard of their respeetive mints, there would obviously be no variation of the par; but whenever the currency of count ries trading together is unequally depreciated, the exelange is nominally $\ln$ favor of that country whose curreney is least, and nominally agalust that whoso carrency ls most depreciated.

It is almost unnecessary to refer to exnmplas to shiw the practical operation of this principle; and we shall content ourselves with selectling the following,

- It in necessary to observe, that it is here nupposed that the elfpect or degraded money exists la such a degree of abundisnce as euly to pase current at to bution raiue. If the quantity of elipped money werd suficiontly limited, it might, notwithatanding the dimiuntion of welght, pans current at its mint value; and then the par weuld have to be eatimated, not by lts relative wegght to forelgn mutuey, but by the mint price of bullion. Thla prinelple must be constantly kept In view.
from an lafinite number of equally concluslve instances.

Previously to the great recoinage in the reign of Willlam III., silver being at the time legal tender, the exchange between England and Holland, calculated by the standsrd of their respective mints, was nomInally 25 per cent. against England. Inasmuch, however, as Engllsh silver coins were then, owing to rubblng and clipping, nepreciated more than 25 per cent. below thelr int value, the real exchange was probably at the time in our faver. And the circumstance of the nominal exchange having become favorable to us as soon as the new coin was issued, tenda to confirm this conjectiare.*
Tha guinea was ao much worn and degraded, prevlously to the geld recoinage in 1774, as to be from two to three per cent. under its standard weight. Inasmuch, however, ss the coins then circulating in France were nearly of their standard weight and purity, the exehange between London and Paris was nominally from two to three per cent. against the former. We say nominally, for as soon as guineas of full weight were issued, the exclisnge rose to par.

The Turkish government, during the past century, has made successive reductions in the value of its coin. Before the first of these in 1770 , the piastre contained nearly as much silver as the English habf-crown ; and, in exchange, the par was estimsted at eight piastres to the pound starling. But, in the interval, the degradation in the value of the piastre hus been such that it is now worth only about $2 \frac{1}{d}$.; and the exchange is said to be at par when Constantinople gives about 109 piastres for $£ 1$ sterling. It is needless, almost, to say, that the nominal exchange, estimated by the old par of eight piastros to $£ 1$, became more and mere unfavorable to Turkey with every successive enfeeblement of tho coin, though it is deubtful whether the real exchange, or that depending on the balance of payments, was not all the while in her faver.

When. one country uses gold as the standari of its currency, and another silver, the par of exchange between them is effected by variations in the relative values of these metals. When gold rises as compared with silver, the exchange becomes nominally fuvorable to the country which has the gold standard, and vice versí. And hence, in estlmating the par of exchange between countries using different standards, it is ulways necessary to inquire inte the comparative values of the metal selected as standards.
"For example," to use the words of Mr. Mushet, "if 84 sehillings 114 grotes of linmburg currency be equal in value to a pound sterling, or $20-21$ of a guinea, when silver is at 5s. 2d. per oz., they can no longer le so when silver falls to 5 s .1 ld . or 5 s . an oz., or when it rises to 5 s .3 d . or 5 s .4 d , ; because a pound sterling ingold being then worth more or less silver, is alse worth more or less Hamburg curroney. To find the real par, therefore, we must ascertain what was the relative value of gold and silver when the par was lixed at 34 s .11 fg . IInmburg currency, and what is their relative value at the time we wish to culculate it. For example, if the price of standurd geld was £3 17 s . $10 \frac{1}{2}$. per oz., and silver 5s. 2d., an ounce of gold would then be worth 15.07 ounces of silver, and 20 of our atandard shillings would then contain ns much puro silver as 3 ös. $11 \ddagger$ grotes of llamburg currency. llat if the ounce of gold were fill 17s. $10 \frac{1}{c} l$, and silver 5s. (which it was on 2d January, 1798), the ounce of gold would then be worth 10.57 ounces of silver. If E'1 sterling at par, therefore, be worth $15 \cdot 07$ otunces of allver, then at 15.57 It would be at three per cent. preminm; and three per cent. premiun on 34 s .11 d d . is 1 sehllling 1 grote and $9-10$, so that the par, when gold is to silver as $15 \cdot 3$ to 1 , will he 36 schillings 1 grote and 1-10. The nbove caleulution will he more casily
made by stating, as $15.07: 34-12 t: 15 \cdot 57: 30-1$ 1.10."

As it is theirintringic worth in bullion which determine the vulue of coins in exchange transactiona, those of oqual weight a: d purity are reckoned equivalent to each othar, though seme of tham may have been coined at the expense of the state, and athars charged with a daty or reigniorage on their coinage. The latter may, if not issued in excess, pass current in the country in which they are coined for their value in bullion gins the duty; but they will not pass anywher else, except at their bullion value. $\dagger$

Bat the princlpal source of finctuations in the nominal price of hills of exchange, ls to be founds lin the varying value of the paper currency of commercial countries. The disoniers which arose in remoter age. from diminishing the bullion contint id in tolntiof tha

retaining a comparatively large quantes of coin owllien, or of paper convertible into coin, in to parele lar country, limited the Issues of the Bank of lingian: previougly to the Reatriction Act of 1797 ; and lit las ecually limited them since the resumption of specie payments in 1821, and sustalned the value of the cur* rency on a level with gold. When the bank atarver the cinculation, or issuen less paper than is necessary, bulliou is imported, sent to the mint to be cuined, and thrown apon the warkot. And when, on the other hand, the 'vank lssues too much paper, and thereby depresses its value relatively to gold, it lecomes profita ble to demand payment of Its netes, and to export the specie thus obtained either as coin or as bullion. In this way the vacuam is filled up when bank-notes are deficient, the excess removed when they are redundant, and the value of the corrency prenervad nearly equal. But, from 1797 down to 1821, this principle was axapended. Duriag that period, the hank was reBleved from the obligation to pay her outes in gold ; while, owing to their belig made legal tender, their cirealation was lazured. IIence, their value exciusively depended on the extent to which they were issted compared with the demand. There is no difference, in its influence over the exchanjeg, between a degraded metallic and a iepureciated paper currency. And when a country with elther the one or the other, haa any dalinga with another whose currency is of its full valus, the exchunge is nominally against her to the extent of the degradation or depreciation. The nominal exchange letween any two or neere places is, in fact, aiways adjunted accerding to the values of their currencies, being most $t$ "orable to that whose currency approaches nearest . its atandarl, and nost unfavurable to that whose currency is most degraded or depreclated. The intercourse between Great Britain and Ircland subsequently to the reatriction on cash paynient in 1797, furniahes some striking proofs of the effect which inerdinate lesues of paper hava in depresen ing the exclange. The nominal value of the Irish whilling being raised in 1689 from 12d. to $134 ., \ddagger$ 建 108

6s. 8d. Irish maney becarae equal to only $£ 100$ of British money, so that the exchange between Great Britain and Ireland was sald to be at par when it was nominally 81 per cent. againet the latter. + . In the eight years previous to 1797, when the paper currency of both countries was convertible into gold, the exchange between London and Dablin fluctuated from $7 \frac{1}{2}$ to 9 per cent., that is from $6-6$ per cent. in favor of
 it was at 6 per cent., or $2 \frac{1}{2}$ par cent. in favor of Dul)lin. The amount of Bank of Ireland notes i circulation in January, 1797, was only £621,917; whereas in Aprll, 1801, thoy had increased to 22,286,471, and the exchango was then at 14 per cent., or $6 \frac{8}{g}$ per cent. against Dublin. In 1803, the Bank of Ireland notes In circulation avoraged $\boldsymbol{£ 2 , 7 0 7 , 9 5 8}$, and in Sctober of that year the exchange was quoted at 17 ever cent., 'avt is, 82 per :ent. against Dublin!
The fact of the exchang between London and Dublir haring fluctuated so little frum par for the elght years previonsly to the neatriction, shows that the circulating medium of Great Britain and Ireland had ren lieen adjuted nearly according to the wants of

- two countries. But, in these circumstances, it was evideatly impracticable, eupposing the value of British currency to remain nearly stationary, that the amonnt of Irish bank-paper cuuld be more than quad. rupled in the short space of eix years, without rendering the currency of Ireland redundant, and sinking its valne below that of Finglund. Had the Bank of England increased its notes in something lika the same ratio as the Bank of lreland, then, as the currency of both countriea would have been equally depreciated, the exchange bet ween London and Dablia would have continued at pur. While, however, the notes of the Iank of Ireland were increased from $£ 621,917$ to $£ 2$,707,956 , or in the proportion of $14,4 \cdot 3$, these of the luank of England were only increased from $£ 9,181,843$ (their number on the 7th Januury, 1797), to £16,505, 272 , or In the proportion of 1 to 1.8 . Int for this additlon to its issutes ly the Bank of Fingland, the exchange, it is plain, would have been still more unfavorable to Dublin.
In the debutes on the Bullion Report, it was contendel that the increase of lank of Ireland paper could not bave been the eause of the unfavorable exchange upon Dublin, seeing that it had again become favorable after the issues of the Bank of Ireland had been still further increasel. Ilat to give this reasonlng the least weight, it should have been shown that the enrrency of Great Britah retained its value in the interum, or that it had not been deprecinted to the esme extene as that of Ireland. For it is obvious that the depreciation of lrish lank-paper might go on subsequently to 1804, and yet if Einglish bank-paper were dequeciated still more rapldiy, the exchange would becon:s suoru in favor of Dublin. This is merely supposing the cireamstances which took place in the first six yeara of the restriction to be reversed in the secone' six. Let us inçuire how the fact ratands.

We have reen that, in 1803, when the exchange was nominally 10 per cent. against lublin, the issues of the Bank of England anonnted to $£ 16,500,272$, and those of the Bank of Ireland to $\mathbb{C e}^{2}, 700^{-9}, 956$. Anil by referring to the aceounts of the lssues of the latter from 1807 tu 1819 , published ly authority, it is seen that in 1805-1808 they were rather diminished; and that in 1810 they amwunted to only $23,251,750$, being an increase of nut more than $\{543,794$ in the space of seven yeara, or at the rate of 2 and 6.7 per cent. per annum; but in the same periot (from 1803 to 1810) the lisues of the Bunk of Eagland were increased from $£ 16,505,272$ to $£ 22,541,523$, or at the rate of $b$ per cent. per annum. And this is not all. According to Mr. Wakefield, there were 50 ragistered bankers in Ireland in 1804, and only 83 in 1810 , of which 1.1 were new houses, 31 of the old establithments having liso

appeared; and "I kelieve," says Mr. Wakefleld "for the most part fallod." This extraordinary diminution of ths country paper of Ireland, for the reduction of the issuea was at laast proportional to the reduction in the number of banks, could not fall greatly to raise its valae, and to conntervall a corresponding increase lat the iswi uf the national bank. Now, the revarae of all $\mathrm{t}_{\mathrm{s}}^{2}+{ }^{\circ}$ 冰 place in Britai... In 1900 there were 386 covnti". anks in this country; and !n 1810, this number, iraifad of being diminished as in Ireland, had inciensed o 721, baving at lingt three times the number of notse in circulation in the latter as in the former perice : It ayf" $\mathbf{1 H}$, therefore, that when, in the perin! 'wean 179:' and 1804, the amount of paper i. cirnvis ion in Ireland was increased, and its ralue depres. d, faster than in Englayd, the :clange between Iondon rad Duhl: able to the latter; and, on the other hand, it appears, that when, in the six years subsequent to 1804, the paper currency of England was increased more rapidly than that of lreinnd, its relative value was diminlshed, and the nominal exchange became more favorable to Dublin.
This is sufficiently conclusive. Brt there is still better evidence to shov that the uafavorable exchange of Dublin upon London, 1802, 1803, 1804, etc., was entirely owing to the comparative redundancy or depreciation of Irish bank-paper. The linen manufacturers and weavers, with the majority of the other inhalitennts of a few countles in Ulater, being at the periorl of the restriction strongly dissffected toward government, very generally refused to receive banknotes in payment either of commodities or wages. The landlords having nlso stipulated for the payment of their rents in specie, a gold currency was maintained in then northern long after it had been banished from the outhern parts of Ircland. If, therefore, tho depression of the exchange between Iondon and Dublin had been occasioned, as many contended, by an unfrvorable balance of trade between Ireland and Great Britaln, or by remittances from the foriner on account of absentees, it would have been equally depressed between London and the commerelal towns in the northem countiee. But 30 far was this from heing the case, that in Deeeniber, 1803, when the exchange of Doblin on Iondon wns at. $16 t$ per cent., that of Belfust on Iondon was at $5 \frac{1}{4}$; or, in other words, at the very time that the exchange bet ween Dublin, which had a paper currency, and London, was about 8 per. cent. against Ireland, the exchange between Belfast, which had a gold currency, and London, was about 3 per cent. in its favor. And this is not all; for while there was a difference of 11 per cent. in the rate of exchange between Dublin and London, and Belfast and London, the inland exchange between Dublin and Belfast was ahout 10 per cent. In favor of the latter; that in, bills drawn in Dublin, and peyable in the gold currency of Belfast, lirought a prenilum of 10 per cent., while bills drawn in Belfast, und payable in the paper currency of Dublin, sold at 10 per cent. discount!*

It is unnecessary to refer to the history of the French asnigmats, or of the paper carrency of the continental powers generally, sind of the United States, to corrohorate what has heen advanced. Such of onr readers as wish for further information upon these points may have recourse to the fourth volume of the "Cours l'Enconomie Politiquo" of M. Storch, $\dagger$ where they will sind an inatructive necount of the influence of inordinate issues of paper on the price of hullion and the exchange, in almost every rountry of Furope.

[^12]They are, in every case, similar to those now atated. It only remains to determino the infiuence of fuctustlons in the nominal exchange over axports and imports.
VI. Infloencer of Fiuctuations of Exchayeez oven Importa And Exponts.-When the exchange is at par, the operations of the merehant are regulated entirely ly the difference between foreign prices and home prices. Tie imports such commodities as eell at home for $\mathrm{n} \cdot \mathrm{m}$ meh more than they cost abrosd as will indems'fy inm for freight, insurance, etc., and yielde, becidea, sn adequate remumeration for his trouble, and fo the capital employed in the businens; and he exports those whose price abroad ia sufficient to cover all expenses, and to afford a similar profit. But when the nominal exchange hecomas unfavorable to a conntry, the premiam which its merchanta receive on forelgn billa has been aaid to enable them to export with proft, In cases whera the difference between the price of the exported commodities at hons and ahroad might not be guch as to permit their exportation with the exchange at par. Thus, if the nominal exchange were 10 per cent against this conntry, a merchant who had sonsigned goods to his agent abroad, would : celve a premium of 10 per cent, on the aale 0 N bill; and if we suppose freight, insurance, mercns? is profit, etc., to ainount to 6 or 7 per cent.; it wo 'f first sight appear se if we might, in auch circums: - \%, export commodities, although their price at ho::\% w 3 or 4 per cent, higher than in other countrier. the other hand, the nominal exchunge were $: 1, r$ in. vor, or if bills on this country cold at a nurui zm would appear as if forelguers would then $\cdot \rightarrow$ able is conslgn goods to our mercharts, or the lati: : ip ora:goods from shroad, when the difference of $\ldots .$. would not of itself lead to an importation.

But a very little consideration will suflice, show that the flucturtions in the nowinal exchange have no suich effects, That fall in the value of the currency which renders the exchange unfavorable, and causes foreign bills to sell at a premium, equally increases the price of eommodities. And hence, huwever great, the premiun which exporters gain by selling bills on their correspondents abroad, merely findemrifies them for the entanced price of the goods exported.' In such canes, mercantile operatlons are conducted preciaely as they would be were the exchange really at par; that is, hy a comparison of real prices at home and abroad. meaning by real prices, the prices at which commodi. ties would be sold provided there were no depreciation of the curreney. If these admit of exportation or inspostation with a profit, tho circumstance of the nominal exchange being favorable or unfavorable will make no difference whatever on the transaction.
"Suppose," says Mr. Blake, who has very successfully illustrated this part of the theory of exchange, "the currencies of IIamburg and London boing in their duo proportlons, and therefore, the nominal exchange at par, that sugar, which, from its abmadance, In Loniton sold at fin per hogshead, from its senreity at IIamburg would sell at $£ 100$. The merchant in this case would immediately export. Upon the sale of his sugar, he would draw a bill upon hia correspondent abroal for $£ 100$, which he conld at once convert into cash by relling it in the bili market at home, deriving fror this transaction a profit of $\mathbf{c 5 0}$, under deduction of the expenses of freight, insurance, cominission, ete. Now, aappose no alteration in the ncarcity or ahandance of augar in London or Hanburg, and that the aame transaction were to take piace after the currency in England had been so nuch increased that the prices were douhled, and, consequently, the nominal exchange 100 per cent. In fivor of Hamburg, the hogshead of sugar would then cost c100, leaving apparently no proflt whatever to the exporter. He would, however, as before, draw his hill on his correapondent for $\mathbf{£ 1 0 0}$; and, as foreign bills
world beer a premiam of 100 per cent., be vould sell this hill in the Engllah market for $\mathbf{5 2 0 0}$, aze thus derive a profit from the transaction $\mathrm{nf} \mathbf{\mathrm { Cl }} \mathbf{1 0 0}$ deprecinted, or $£ 50$, eatimated in undepreciated currency-deduct ing, as in the former iastance, the expense of frelght, ingurance, commiseion, etc.
"The case would he preciaely similar, sautatis mutandis, with the importing merchant. The unfavora ble nominal exchange would appear to occaaion a lose amounting to the premium on the foreign bill which he saust give in order to pay his correepondent ahroed. But if the difference of real prices in the home and forelgn markets were such as to admit of a profit apon the importation of produce, the merchant woald continue to linport, notwithstanding the premlam; for that would be repald to him in the advanced nominal price at which the imported prodace would be sold in the home market.
"Suppose, for lastance, the currenciea of IIambarg and London, leing in their due proportions, and therefore the nominal exchange at par, that linen which can be bought at Ilamburg for $£ 50$ will sell here at f100. Tre importer inmediately orders hia correspondent abroad to send the llnen for the payment of which he purchases at $\mathbf{x 5 0}$ a foreign biil in the English market ; and on the sale of the convignment for £100, he will derive a profit amounting ts the difference between $£ 50$ aud the expense attending the import.

Now, suppose the same transaction to take place without any alteration in the acarelty or abundnace of linen at Ilamburg and Iondon, but that the currency of England has been so augmentel as to be depreciated to half its value, the nominal exchnage will then be 100 per cent. againat Eingland, and the importer will not be able to purchase a $£ 50$ foreign bill for less than $\pm 100$. But as the prices of commodities here will have risen in the same proportion as the moaey has been depreciated, he will sell linen to the Euglish customer for 2200 , and will, as before, derive a profit amonnting to the difference bet ween $\mathbf{x} 100$ depreciated, and $\mathbf{5} 50$ estimated in undepreciated money; and the expenses attending the lmport.
"The same instances might be put in the case of a ©-orable exchange ; and it weull be seen, in the sance manner, that nominal prices and thn numinal exchnige being nlike dependent on the depreclation of currency, whatever appirent advantage night be derived from the former, would be counterbalanced by u loss on the latter, and vice rerse." "

It appears, therefore, that fiustaations in the nomsmal uxchange lave no effect on trate. A fall in the exchange obllyes the country to which it is unfavorable to expend a grestor nominal sum in clischarging a forvign delt than would otherwise be necestary; but it does not oblige it to expend a greater real valae. The depreason of the mominal exchange can neither exceed nor finll short of the comparative depreciation of the currency. If British currency ware depreciated 10 or 15 per cent., the mominat exchunge would be 10 or 15 per cent. againit $u$ : and wo should be compeilenf, in all transactioas with foreigners, to give them 2isa. or 23s. for what might otherwine have been procurad for $20 \%$. Ifnt as neither 22s, nor $23 \%$. of such deprecinted paper is more valuubie than 20 n . of paper undejureciated, payment of a foreign delit would, it is ovilent, be as eanily made in the one curreucy as in the other; ani memantile transactions would, in ruch elrcumatances, be conducted exacily as they wonid have been had there been no depreciation, and the nowinal exchange at par.
VII. Real. Fxchange.- Having thus endeavored to trace the influence which variations la the value of currenches have over the enchange, we proceed to conwider how firr it is influeuced by fuctuations in the sup-

- Paris, 1823, 4 rolia, 8ra.
ply and demand for bills. To facliltate this inquiry. we ahall exclude all consideration of changee in the value of money, and suppose the currenciea of the diferent countries having an intercourse agether to be equal in welght end purity to their mint standarda, and that each has its proper aupply of bullion. When twu nations trade together, and each purchases of the other commodities of the same value, their debts end credits are equal, and the real exchange lo, of course, at par. But it rurely happena that the debte reciprocally due hy any two countries are equal. There is almost always a balance owing on one side or other, which affects the exchange. If, for example, the debts due by London to Paris exceed those due by the former to the latter, the demand in London for bilis on Paris will be greater than the demand in Purin for bilia on London; and the real exchange will, consequentiy, be in favor of Paris, and against Londun.

The expense of transferring bullion from one country to another, limits the range within which the rise and fall of the real exchange between them is confined. In this respect, as in most others, transactions between forelign countries depend on the same principles which govern those let ween dilferent parts of the same country. We have already seen that the fluctuations in the real exchange between London and Glasgow can not exceed the expense of tranamitting money between those cities. And this principle holds univorsally. Whatever may be the expenee of transmittiag bullion, which is the money of the commercial world, between London and Paris, London und Ilamlurg, New York, etc., the real exchange of the one on the other, cas not for uny considerable period, be depreased to a greater extent. No merchant will puy a higher premium for a bill to ilischarge a debt abroad, ti.an will suffice to covar the expense of try zomitting bullion to his craditor.

Hence It uppours that whatever obstructs or fetters the Intercourse among different countries, proportionally widens tite litaits within which fluctuations in the real exchange mny extend. And hence the reason why it varies so much nore in war than in peace. The amount of the hilla drawn on a country engaged in hostlitios ia liable, from various cunses, to be suddenly increased; though, whatever nuy be the monousts thus thrown upon the market, the dupression of the exchange can not, for any length of time, exceed the exiense of conveying bulljon from the debtor to the ereditor country. But luring war this expense, which consists of freight, insuranee, ete., is sometimes much augunested. The ovidenco unnexed to the $R \in$ port of the Brillinn Committec shows that the cost of conveying gold from Landon to Hamburg, which, prior to the ICevointionary war, amounted to " er 2t, had increasen, in the latter part of 1809 , to about 7 per cent.; so that the limits within which fluctuations in the real exclange might range in 1809 were about three times as great as those within which they were confined in 1793. Owing to our laving the complete command of the sea, and onr commorce not being aubjected even to the depredations of privateers, the cost of frtight and the conveyunce of huliion between this country and othera, has not been affected by the war in which we are now ( 1850 ) unluckily engaged. The real exthange between neighboring countries is geaerally, on the principle now expiained, less likely to fluctuate than that between distant countries. It costs conaiderably less to tranamit bullion from iondon to Duhlin or Paris, than to New York or Canton. And, as fluctuations in the real nxchange are limited by its cost, thoy may evidently exteud proporibually further betwem distant places than between such as are contiguous. We have next to investlgate the circumstances which give rise to a favorable or an unfavorallo balance of payments, and to appreciate their effects on the real exchange, and on trade in general.

- Vili. Balance of Paymenta.-A very great, if not the principal, source of the errors into which merchante, and the majority of writers on exchange, have been betrayed in regard to the balance of payments, appears to have originated in their confounding the sum whioh imported commodities fetch in the home market, with their cost abroai.. It is obviously, however, by the smount of the latter only, that the balance of payments, and consequently the real exchange, is influenced. A cargo of corn, for example, which cost $£ 8000$ free on board at Oilessa, may be worth £ 4500 when imported into England; but the foreign merchant would not, unless ha sent hither the corn, be entitied to draw on London for more than ita original cost, or $£ 3000$. It la clesr, therefure, on the alighest conaideration, that the fact of the imports being more valuable than the exports, does not authorive the conelusion that the balanee of payments is againat us. A favorable or an unfavorable balance dependa entirely on the sum due to foreigners for commoditiea bought from them being less or more than the suin duc by them for commodities bought from us. It has nothing to do with the prices eventually obtained for the iupported or exported commodities.
The mercantile aystem of commercial policy, which continues to preserve a powerful influenee in most cosatries, had for its grand objeet the creation of a favorable balance of payments, by facilitating exportation and restricting importstion. It is foreign to our purpose to make any inquiry in regard to the principles of this aystem, e:cept in so far as they are connected with oxchanges. But it may bo easily shown, in opposition to the commonly received opinions, thas under ordinary circumstances the value of the inports into commercial countries always exceeds the vajue of their exports; and that this excess or balanco bas not, speaking gonerally, any tendency to render the real exchsngo unfavorable.
It is tho businees of the merchant to carry the products of different countries from those places where their valuo is least, to thoso places whero it is greatest ; or, which is the same thing, to distribute them sccording to the effective demand. Thero could, however, the no motive to export any articie, uniess that which was to be imported in its stead were more valuabic. When on English merchant orders a quantity oì 「eligh whest, he supposes it will seli for so much more than its price in Poland as will suffice to psy the cost of freight, insurance, etc., and to yield, besides, the orlinary rate of profit on the capital employed in the transfer. If the wheat did not sell for this much, its importation would be productive of loss. Merchants never oxport but in the view of lmporting articies of greater value. Instead of an excess of exports over imports being any criterion of an advantageoss commerce, it is quite the reverse. And the truth is, uotwithstanding ali that has been said and written to the contrary, that unless the value of the imports exceeded that of the exports, foreign trade could not be carried on. Wcre this not the case-were the value of the exports always greater than that of the imports, there would be a loss on every transaction with foreigners, and the trade with them wouid either not be undertakea, or, if begun, wouid bo speedily relinquished.

In England, the rates at which exports and imports are officiaily valued were fixed so far back as 1696. The very great alteration which has since taken place in the vaiuc of money, and in the cost of the greater number of the commodities of this and other countries, has rendered this official valuation, though valuable as a moans of determining their quantity, of no use whatever as a criterion of the truc value of thr imports sud exports. To olviate this defect, accounts of the real or ckeclared value of the exports, prepared from the declarations of the merchanta, are annually laid before parliament. There is, however, no such
cccount of the imports; and it is, perhapa, imposaible to frame one with any thing like securacy. It has also been alloged, and apparently, with some foundation, that merchants have frequently exaggerated the value of articlec entitled to drawbacks. But the extension and improvement of the warehousing syatem, and the decrease in the number of drai 'racke, has very materisily lessened whatevor fraud or inacouracy may have arisen from that score. The declared value of the exports may now be considered as protty near the truth, at least suffielently so for all practical purposes.

If perfectly accurate accounts could be obtained of the value of the exports aud imports, there can be no manner of doubt that in all ordinary years the latter would considerably exceed the former. The value of sus exported commodity is estimated when it is ahipped, before its value is increased hy the expense incurred in traneporting it to the place of destination; whereas the value of the commodity imported in its stead is estimated after it has arrived at its deatination, and been enhanced by the charges on aceount of frelght, insurance, importer'a profits, etc.
It is of little importance, in so far at least as the interests of commerce are concerned, whether a nation carries its own imports and exports, or employs other. A carrying nation appears to dorive a comparatively large protit from its commercial transsctions. But this exesss of profit is seldom more than a fair remnneration for the capital it omploys, and the risk it ineurs, in transporting commodities. Were tie trade betwoen this country and France whelly carried on in British bottoms, our merchants, in addition to the value of the exports, would also receive the cost of their carriago to France. This, however, would be no loss to the French. They must pay the freight of the commodities they import. And if English ships sail on cheaper terms than those of their own country, there is no good commercial reason, though there may be others of a different kind, why they should not employ them in preference.
In the United States, the value of the imports, deduced from the custom-house returna, almest always exceeds the value of the exports. And though we have been accustomed to consider the excess of exports over imports as the only sure criterion of an advantageous commerce, the practicsl politicians of America carly discovered "that the real gain of the United States has been nearly in proportion as their imports have excceded th air exports."* The great oxcess of imports in the Union is in part occasioned by the Americans generally exporting their own surplus proluce, and receiving from foreigners not only' an equivalent for the exports, but also for the cost of their conveyance to their markets. "In 1811," sajs the author just quoted, "flour sold in America for $\$ 950$ per barrel, and in Spain for $\S 10$. The value of the cargo of a vessel carrying 5000 barrels of flour would, therefore, be estimated, st the period of its exportation, ut 47,500 ; but as this flour would, becanse of freight, insurance, exporter's profits, etc., sell in Spain for 875,000 , the American merchant would be entitled to draw on his agent in Spain for $\$ 27,500$ more than the flour cost in America, or than the suns for which he could have drawn had the flour been exported on account of a Spanish merchant. But the transaction would not cad here; the $\$ 75,000$ would be vested in somo species of Spanish or othor European goods fit for the American market; and tine freight, insurance, etc., on account of the return cargo would, perhaps, increase its value to 100,000 ; so that, in all, the American merchant might have imported commodities worth $\$ 52,500$ more than the flour originally sont to Spain." It is as impossible to doubt thut this transaction is advantageous, as it is to douit that its advantage consists in the value of the imports exceeding that of the

- Pitkin on the Commerces of the Unitod States, 2d ed., p. 280.
exports. And it is clear that Amorica mitht have the balance of the payments in her favor, though anch transactlone as the above were maltiplied to any concelvable extent.

Instead, therefore, of endeavoring to limit the trade with countries from which the importe exceed the exporta, we should give it every posulble facility. Every man considers that market an the beat in which he obtains the higheat price for his goods. Why then ex: ciude bim from it? Why compel a merchant to sell a cargo of maslins, Iron, etc., for $\$ 10,500$, rather then 811,000 or $\$ 12,000$ ? The wealth of a atate is made np of the wealth of individuale. And what more effectual method of increasing indiviliual wealth can be devised than to permit buying in the cheapest and selling in the deareat markets ?

It would be difficuit to eatimate the minchief which abeund notions relative to the balance of trade have occasioned in most commercial countries. They have been particulariy injurious to Great Britnin. The reatrictions imposed on the trade in France orgginated in the prevalence of prejudicen to which they gave rise. The great, or rather the oniy, argument insiated on by those who prevailed on the legislature to declare the French trade a nuisance, was fonnded on the alleged fact, that the value of the imports from France considerably exceed the value of the exports to her. The balanee was termed a tribute paid by England; and it was argaciously anked, what had we dono that we should be obliged to pay 80 much money to our nutaral enemy P Those considerate and patriotic persons seem to have supposed that car merchauts brought commodities from France for no better reason than that they were French, or to oblige that ingenious peoplo. But they were not quite so disinterested. They imported French wines, silks, and so forth, for the same reasons that they imported the sugar of the Weat Indles, the teas and spices of the Mast, and the timber of the Baltic ; that is, because there was in demand for them, and becausd they were worth more in our markets than the native producte exported in their stead. The reason asaigned for prohibiting the trade affords a conclusive proof of its having been allvantageous. There can not, indeed, be a doubt, that an unlimited freedom of intercourse between the two countries would the of great eervice to both. Suppowing it to be so arranged, does any one Imagine that we ahould export or import any commodity to or from France, provided we could either sell or buy it on better terms allywhere eino? If reatrictions on the trade with any particular country be not injurious, that is, if it be either a losing or a less aivantageous trade tian that with other countriea, we may be assured that the throwing it completely open would not make a kingie indivldual engage in it.

Every body knows that these conclusions are not only theoreticsily true, but have been practically verIfed. The abolition of the discriminating duty on French wines, the relurtion of the exorlitant duty on brandy, the repeal of the prohibition against importing silks, and the opening of our ports to French corn and flour, bave all been advantageous. And though it be true that the prejudices of the French, and the high duties which they continue to impose on most articles of Iritish produce, confine the trade within comparatively narrow limits, they have not male it unprotitable, and ara more injurious to themselves than to us. It is a curious fact, that notwithstanding the grent amount of our imports from France, and our expenditure in that country on account of absenteea, the state of the exchanges show that the baiance of paymenta is usually in our favor. But the partignns of the exclusive or meroantile syatent may perhaps say, that they do not mean to contend that it is profitable to exprort more than is imported; but that, by exporting an access of raw and manufactured produce, the balunce

- Prohlbition Aet, Int Willam and Mary.
of payment is rendered favorable, and this balance (which they regard as representing the ontire not profit made by the country on fte transactions with foreiguera) is alway pald in bullion. It may, hnw. over, be easily ahown that this statement is alitogother orroneous $;$ that a balance, whether on the one side or the other, ia seldom or never cancelled by means of builion $t$ and that it is not a monature, and has, indeed, nothing to do with the pruflt or lose atteading foreign commercial tranaactions.

If the premium on foreign bille, in a country with an unfavorable real exchange, lie leas than the cost of sending bullion abroaci, it would be contradictory to suppose that it shonid be exported. And though the premiam on such hills were to increase, till it became equal to, for it ean not exceed, the cost of exporting the preclous metala, it does not follow that they will then be exported. That would depend on whether bullion were, at the time, the cheapest exportable commolity; or, in other words, whether a remittance of bullion was the moet advantageous way in which a debt might be discharged. If a Iondon merchant ows £1000, wr cther sum, in Paris, he endeavors to find out the cheapest method of paying it. On the supposition that the real exchange in 2 per cent. below par, and that the expense of remitting bullion is also 2 per cent., It will be indifferent to him whether he pays $£ 20$ of premium for a bill of $£ 1000$, payable in Paris, or incur an expence of $£ 20$ in remitting a $£ 1000$ worth of bul. lion direct to that eity. If the price of cioth in Paris end London be anch that it would require $£ 1030$ to purchaee and send as much cloth to Paris as would sell for $£ 1000$, he wonld no doubt prefer buying a bilf or exporting bullion. But if, by incurring an expense of f1010 the debtor may aend as much hardware or cotton to Paris as would sell for $£ 1000$, he would as certainly prefer paying his debt by exporting the one or the other. It would save him 1 per cent. more than if ho had bought a foreign bill or remitted bullion, and 2 per cent more than if he exported cloth. Hind there been any other commodity which might have been exported with more advantage, he would have used it in preference.

It is obvious, therefore, that the trade in bullion is governed by the asme principles which govern the trade in other things. It is exported when its exportation is advandageous; that is, when it is less valuable at home, and more vaiuible abroad, than any thing else; and it will not otherwise be exported. The balunce of payments might be twenty or thirty millions against a country, without depriring it of a single ounce of hullion. No merchant would romit a $£ 1000$ worth of gold ir eiliver from Fugland to discharge a debt in Pari if he conil invest $\pm 900$, $\mathbf{x} 980$, c990, of any sum under $\mathcal{L} f(000$, in any other apecies of merchandine which, exclusive of expense, wolld sell in France for that amount. Those who deal in ihe precions metaln are as much alive to their interests an thone who deal In coffee, or angar, or indigo. Hut who would nttempt to discharge a foreign debt by exporting coffee which cost $\mathbf{f 1 0 0}$, if he could effect the anme olject by exporting indign which cost only $£ 95$ ? No builion will ever the exported unless its vaine be less in the exporting country than in that to which it in sent; and unless it he, at tho same time, the most advantageolls articie of export.
2. It is in vuin to contend that an unrestricted frecdom of trade might renifer aome unfortunute conntry indeited to nnother so happily situnted that it hat no demand for any sort of ordinary merchandise, and would only accept of cash or lutilion in exchange for itn exports. A case of this sort suever did, and never will, oceur. It is not even posalble. A nation which in in want of money must he in want of other things for men deaire money only because it is the readiest meana of increasing their command over neceasarics and enjoyments. soils and olmatea-in the machinery, alili; anid induttry of the people of different countrien-- occasion extraordinary diferences in thelr producta and prices. Some arteles of the highest atility are peculiar to certaln diatricte. And there will ever be a demand, not only for such articles, hut also for those which, though thoy may be produced at home, may be imported of a better quality, or at a lower price: 'Ner, till the passion of gccumulation be baninhed from the haman breast, will there cease to he a desire to send commodities from places where their exchangeable value is least, to those where it is greatest.
3. In treating of the nominal exchange, we endenvered to thow that no single eountry can continue for any length of time to import or export a greater ameunt of bullion than may be necuesary to preserve the precious metals in it in their proper relation to these of other countries; or; which is the same thing, to have the real exchange elther permanently favorable or unfavorable. But though this principle be strictly trae in reference to its aggregate exchange, it may be incorrect if ita exchange wlth one country only be considered.. Great britain, for example, may generally have the exchange firher favor with America, previded the have it generally, and to a nearly equal extent, sgainat her with the Fant Indles, or sone other country. "She may," to use the worls of Mr. Ricardo; "be importlog from the north the bullion which she is exporting to the south. She may be collecting it trom countries where it in relatively abundant, for others where it is relatively scarce, or where, from some particular causes, it is in great demand. Spaln, who is the great importer of bullion from America, can never have an anfavorable exchnage with her colonies; and as she must distribute the bullion she recelves among the different nations of the world, she ean seldom haven favorable exchange with the countries with which she trades." See Reply to Mr. Bosquet's Observations on the Report of the Bullion Commiltee, p. 17.
On this principle, Lord King successfully accounted for the fivorable exchange between this country and Hamburg from 1770 to 1799. He showed that the Importation of bullion from IIamburg and other parts was not more than equivalent to the exports to the East Indiea and the home cousumption ; that the demand correapouded to the supply; and that its value remained pretty stationary. The extraordinary influx of bullion into this country from the Continent at the era of the bank restriction in 1707, and the faverable state of the exchange, were undoubtedly owing to the redaction in the lsaues of hank paper, and to the diminution of the gold currency, caused by the hoarding ot guineas. In 1797 and 1798, above $5,000,000$ of guineas were coined at the nulnt; and this extraordinary demand for gold Is of itself abundantly sufficient to account for the very favorable exchange of that period, and for the length of time during which it conthaued. But, at the same time that the demand for gold bullion for the mint was thus lucreased, the demand for silver bullion, for exports to Indin, was proportionally augmented.

$$

From this period the exportation rapidly decllned; apd in the yenrs in which the exchange was most unfavoralle, ilttle or no allver was sent to India.
Instead, therefore, of the extraordinary Importation of ballion from Hamburg in 1797 and 1798 affording, as Mr. Hossnquet and others supposed, a practical proof of the fallacy of the oplnion of those who contend that it is imposithie, for any length of time, to subvert the natural equality in the value of bulilon in different countries, it is a striking examplo of its truth, With-
out this infinx, ballion in this conntry could not have maintained ths proper comparative value. We.imp ported it, because the reduction of the paper currency, and the increamed exports of the East India Company, rendered lta valua higher here than on the Continent, and made it advantageoue for the Continentul merchants to cend it to na , in the same manner an they would have sent corn, of any thing else for which we had an unurual demand. For, however favorable the real exchange between Hamburg and London might have been to the latter, wa should not havs Imported an ounce of bullien, had it not been, at the time, the article with whieh Hamharg could most advantageously discharge her debt to London.
4. In the absence of other arguments, it would be sufficient to atnte, that it is physically impossible that the excess of exports over imports, as indicated by the cuntom-house retarna, should be paid in ballion. Fvery ccuntry, with the exception of the United States, has Its apparently favorable balance; and, of courne, if they really exlisted, they would have to be paid hy an inflax of bullion from the mines correspondent to their aggregate amount. It is certain, however, that; previously to the discoveries In California and Auntralla, the entire produce of the mines, though it had been increased in a ten fold proportion, would have been lisufficient for this purpose I This fact in decisIve of the degree of credit which ought to be attached to the commonly-received opinions on this subject.
b. In the last place, the profit on transactions with foreignera does nit consist in the quantity of bullion imported from abrasi, but ln "the excess of the value of the imports over tho value of the experts." If, in return for exported commodities worth 10 or 20 milliens, we lmport such as are worth 15 or 30 , we ehall gain 50 per cent. by the transaction, though the exports oliould consiat entirely of bullion, and the imports of corn, sugar, coffee, etc. It is a ridiculous prejudice that would make ballion be imported rather than any other article. But whatever the partisans of the exclusive syatem may say about its being a preferable product, a merchandise par excellence, we may he aseured that it will seldem appear in the list of exports or Imports, while there is any other thing with which to carry on trade that will yield a larger proft. Thus it appears that the excees of exports over imports, instead of heing any proof of an advantageous commerce, is distinctly and completely the reverse; that the vilue of the imports into commercial countries may, and almost always does, exceed the valuie of their exports, without rendering them indebted to foreigners; and that when a balance of debt has heen contructed, that is, when the sum payable to forelgners for luports as greater than the sum receirable from them for exports, bullion will not be sent from the dehtor to the creditor country, unleas It be at the time the mest profitable article of export.
iX. Efficts of Real Excinange upon Imponts and Exports.-We have shown that fluctuations in the nominal exchange do not influence foreign trade. When the currency is depreciated, the premlum which an exporter derives from the sale of bills on his correspondent abroad, la barely cquivalent to the incrense in the price of the exports, occasioned by the depreciatlon. But when the premium on foreign bills is not caused by a fall in the value of money, but by a deficient supply of tills, there is no rise of prices, and then the unfuvorable exchange undoubtedly operates as a stimulus to exportation. As soon as the real exchange diverges from par, the mere iaspection of price currents is no longer enough to gulde the operations of the merchant. If it be unfavorable, the premium which the exportora receive on the sale of bills must he included in the extimate of the proft they are llkely to derive from the transaction. The greater that premiam, the lese w'll be the difference of prices necessary to make them export. An unfavorable real
exchange has, in truth, exactly the aame effect on oxportation as a bounty equal to the promium on feroign bills.

But for the samo reason that an unfaverable real exchange increases exportation, it diminishes importation. When it is unfavorable, the prices of foreign products brought to our markets must be so much under their prices here, as not merely to afferd, exclusive of expenses, the ordinary profit on their sale, but also to pay the premium which the importer must give for a forelgn bill, if he remit one to his correspondent, or for the discount added te the lnvoice price, if the latter draw upon him. A less quantity of foreign gonds will therefore anit our markets when the exchange is really unfavorable; and fewer payments having to be made abroad, the competition for foreign bills is diminished, and the exchange rendered proportionally faverable. A favorable real oxchange, consequently, operates as a duty on exportation and a bounty on importation.
Hence it ia obvious that fluctuations in the real axchange have a necosasary tendency to correct themselves. They can never, for any considerabla period, exceed the expense of transmitting bullion from the debtor to the creditor country. And the exchange can not continue permmnently faverable or unfavorable even to this extent. When favorabie, it corrects Itself by restricting exportation and fucilitating importation; and when anfavornble, it produces the rame effect by atimulating exportation and whatructIng importation. The trua pan formey the centre of theg oseillatlons. And though the thousand cirenmstances which daily and hourly affoct the state of debt and rrellit, prevent the ordinary conrse of exchange from being almost ever preeiscly nt par, its ductuations, whether on the one sile or the other, are cenfined within certain limits, aud have a constant tendency to disnppear. The natural tendency which the exehango has to correct itself is powerfully assisted by the operatiens of tha bill merchants.
lingland, for examplo, may owe an excess of delt to Amsteriam, yet, as the aggregite amonat of the dehts due by a commercial country, is generally balaned by the amount of those which it has to receive, the deficiency of bills on Amsterdam in Lombon will most probaiby be countervailed liy their redundancy in somo other quarter. And, it is the businens of the merehants who deal in bills, as of those who doal in hullion or any thing else, to buy them where they are cheap, that they may sell them where they are doar. They, therefore, buy up the bills drawn hy other countries on Amsterinm, suld dispose of them in london; and, by so doing, frevent any great fall in the pice of bills on the former in the comntries in which their supply exceeds the demand, and noy great rise in tireat Ilritain and the country in which their supply haplrens to be deticient. It our trale with Italy, the bills drawn on liaghand penerally anount to a greater sum than those drawn on Italy. The bill merchants, however, by bying up iho exvens of Italian bills on london, and welling them in France, IIolland, and other comintries indehted to bingland, prevent the reab exchange from being much topressed.

An unusual üffiency in the mupply of corn, or of any horticle of prime neremsity, by causing a sablen angmentation of loports, taterially afferts forcign delits and erodit, and depresses thes exchange. In tinno of war, the balauce of paymente is li.ablat to be still further disturbed; the amoant of the biils drawn on a conntry carrying on furegan howtilitien, being increased by the whole expense of lts armamentes abroal, and of subailies to forelgn powers. Ilat noither the conjoines nor reparate intluence of both or elther of these caunes has any permanent intluence over the exchange. A sudden increase in the aecustomed supply of bille mast, for the firmt Inatanco, lyg ghationg the market, cecasion their selling at a dincount; Iut this
feffect wlll only be temporary. The unusual facilities which are then afforded for exportation, and the dithcultles which are thrown in the way of importation, never fail speedlly to bring the real exchanga to par.

During a period of peace we may, In the too great ardor of specnlative enterprise, export an excess of produce, overload the forelgn market, and eccasion such a decline in the price of our goods abrend, as to make tha importa less valuable than the exports with which they have been purchesed. But such a state of things can only be of limited duration. The distresa of which it is productive, ussisted by the fall of the exchange, occasions a diminutlon of export:. The supply of our commodities in the foreign markets is rendered more nearly commensurate with the demand; till in no leng tima tho value of the fimports again cxceeds, es it always ought to do, the value of the ex. ports. llut when a country has a large fereign expenditure to sustain, its experts are proportionally angmented. Whatever may have licen the foreign expenditure of Great Brituin during the lata war, it is evldent that it could not be defruyed otherwisa than by our anmually exporting on equal amonnt of the produce of our lind, capital, and labor, for which payment was not received, as in ordinary cases, by a corresponding importation of forelgn cemmolities, but from the treasury at home. This is strictly true, even though the expenditure bhould have happened to be, In the tirst instunce, discharged by remittances of bulli m ; for the incrensed supply of bullion which was thus required, could be obtained only by an equally inereased exportation of other products to the countries pussensed of mines, or from which it was imported. Foreign expenditure, by increasing experts in jroportion to its own muount, has no permanent intluence over the exrlange.

Thus it appeare that an excess of oxports, instead of leing nuy criterion of increasing wealth at home, is only a certain indication of commercial losses, or of expenditure abroad. "When," says Mr. Wiwatley, "the exports exceed the importa, as they must do when there is a large foreign expenditure, the equivalents for the excese are receivod abroml in as full and ample "manner as if the produce which they jurchasud were actually imported and entered in the chs-tom-house books, nad afte: witil wint to the seat of war for consumption. llat irom the cirrumstance of Its not being inserted in the custom-house eutries as valve received againat tho produce exported for its paymen, the latter is deemed to constitute a favorable balance, when it is in reality exported to liguilate a balance ngguinat us." *

But how conclusive soever this reasoming may appenr, it has locen sald to be at variance with the fate ; and the rise of the exchange at the end of the late war, during the suspension of cash payments, has been appealed to as whowing that lts prosions law rate had not been accasioned by any depreciation of the paner currence, but by the excemsive mount of the billn drawn bjon this country to defray war expenditure. The question, however, is not whether the exchange recoverel from les ilepression during the susperasion of eash paymente, for the influener of that measure depended entiroly on the uso made of it , het whother its recoswry took phace without the amonm of bank paper of ail sorta, or of the currency, bing diminished? The statements mallo ln the arthes Moskr are decisive upenthis point. They show that the currency was very greatly diminh hed in 1811 , 1815, and 1816 ; and that thia timanntion measioned the rise in its value, mul in the nomhal exchange.

Mr. Francla Ilorner, the well-informed datiman of the Committee an the Iligh I'rice of llullion, male the fillowing statement in regard to this very question la his jlace in tho llouse of Commons: "lirom inguiries
he had made, was convinced tion of the eirc in any ceuntry th's country, that had taker scheme, and a The reduction previous fall o That fall had r paper to an exte possible, withev The Bank of $\mathbf{E}$ As nuperars by avernge ameun last year, more 000,000 ; while $£ 29,000,000$, un 000,000 . ## EXC

he had made, and from the accounts on the table, he was convinced that a grenter and mere sudden reduction of the circuluting medium had never taken place in any country than had occurred aince the peace of this country, with the exception of those reductions that had taken place in France after the Missisaippl scheme, and after the destruction of the assignats. The reduction of the currency had originated in the proviaua fall of the prices of agricultural produce. That fall had produced a destruction of country ${ }^{-1}$ )nak paper to nt extent which would not have been thought possible, without more ruin than had actunlly ensued. The lank of England kad also restricted its iesues. As nppears by the accounts recently presented, the sverage umount of its currency was not, during the last year, more than between $£ 25,000,000$ and $£ 26,-$ 000,000 ; whlle two years ago it had been nearer $£ 29,000,000$, and at one time even amounted to $£ 31$,000,000 . But, without looking to the diminution of Bank of Lingland paper, the reduction of the country paper was enough to account for the rise which had taken place in the exclange." Hence it appears that the rise of the exchange in 1815 and 1816 had nothing, or but little, to do with the cesaation of hostilities, and was entirely, or mainly, a consequence of the inereased value of the currency, cuused by the reduction of its quantity. Instead of being at variance with the principles we linve been ondeavoring to elucidate, this fact afforls a strong confirmation of their correctness. And having been sanctioned hy the fulleat experience, may be considered as beyonl the rench of cavil nud dispute. An objuetion of a different wurt has been made, to another part of the theory maintained in this section, which it miny be proper to notice.

When the exchange becomes unfavorable, the premium, precured by the sale of the bill drawn on n fureign merchant to whom bullion has been consigned, is no greater than would be olitained by consigning to him un equivalent amount of colfer, tea, sugar, indigo, etc. An unfavorable real exebange jermita n merchant to export commodities which could not he exported were it at par, or favomale. That the mbantage still remains of exporting those commodities in jrefereace, whose prico in tho country from whieh they are sent, compared with their price in that to which they are exported, is lowest. Suppose, for example, that the expense of transmitting bullion from this country to France is 3 per cent., that the real exmange is 4 per cent, ngainst us, that the price of hultion is the same in loth countries, and that coffee exclusive of the expenses of carrlage, is rally worth + per :ent. more in Finuce than in lingland. In aucis a case, it is obvious that the exporters of ballion would realize n profit of only 1 per cent., while the exporters of eollee wonht realize, inctusive of tho preminm on thu sale of the fureign lill, a protit of f per cent. And hence the opinion maintained by Colonel Torrens,* that when the excisange becomes unfavorable, those commodities which contain the greatest value in the smallest bulk, or on which the expense of carriage is least, are exporte: in prefereme, ajpears to have no good fourdathan. The prices of the remmorlithes which nutions trading tegether are in the hatit of oxporting and importing, are mzulated not merely lig the wost of their production, hat also by the exjense of their rarriage from where they aro prodnced to where they are eonsumed. If tirent liritaiu were in the lanhit of supply, ing limare with cottoms and bultion, the average price of cottuns lat frame, because of the expense required to convey thou there, would probably be from 5 to 0 per cent. hib!er than in Iritain: while, lecenuse of the comparaive lacility with which bulion may be transported from the one to the other, its value in Jaris woukd but, prinaps, execed its value herm more than 1 per cent. Now, suppose that whan the jrices of cot-
tons and bullion in England and France are adjusted aceording to their natursl proportions, the real exchange, becomes unfsvorsble to us, it is clear that its fall gives no greuter advantage to the exporters of bulfion than to those of cottons. This rise in the price of foreign bllls does not increase the expense of exporting the one or the other. It leaves the cost of their reduction and transportation exactly where it found it. During the depression of the exchange, the exporters of both articles get the premium on the bills drawn on their correspondents. But there is no inducement to export bullion in preference to cottons, unless the price of bullion increase more rapidly in France, or decine more rapidly in Great Brituin, than that of cottons.

Whatever, therefore, may bo the depression of the exchange, the merchant selects those commoditles for exportation which, exclusive of the premium, yield the greateat protit on their bule. If bullion be one of these, it will of course be exportcd; if not, not. But of all commodities, builion is that of whleh the value approaches neareat to an equality in different countries, so that it is the least likely to be exported during an unfavoruble exchange. The demund for it is comparatively nteady, and no.great surplua quantity could be iuported into one country without reducing, or exported from another, without raising its value so us to unfit it either for exportation or importation. In most cases a small part only of an unfavorable balance is pail in bullion. The operations of the bullion merchants ure confined chiefiy to the distribution of the fresh supplies obtained from the mines, in proportion to the wants of differeut comntries.
X. Computer Exchanae.- Having thus endeavored to point out the munner in which variations in the values of the currencies of nutions truding togrether, and in the supply and demand for bills, separately atfect the oxchange, it now only remuins to ascertain their combined effect, or the computed or netual course of exclange. lrom what bas been already stated, it is ubvious, that when the nominal and real exchange are both favorable or both unfuvoraHe, the computed exchunge will expreas their sum; and that when one is favorable and the othor unfavorable, it will express their difference. When, for example, the eurrency of Great llritain is of the mint standard and jurity, while that of France is 5 per cent. dogruled, the nominal exclango will bo 5 per cent. in our favor. llut the real exchange may, at the sume time, le either favorable or unfavorable. If it be, ulao, favorable to the extent of $1,2,3$, etc., per cent., the computed exchange will he $6,7,8$, ete., per cent. in our tavor. And, on tho wther hand, if it he unfavorable to the extent of $1,2,3$, ete., per cent., the computed exchange will he only $4,3,2$, ote., jer ecat. in our favor. When the wol exchange is in favor of one country, und the now inal exchange equally against it, the computed exchange is nt pur, and vice versh.

A comparianon of the market with the mint price of bullion athords the hest and readiest means by which to ascertuin the state of tho exchange. When thero aro no restrintions on the trade in the jrecions metals, the excess of the market over the mint price of hollion athoris an uceurate measure of the depreciation of tha curreney. If the market and mint prico of bullion at l'aris and lawhon oxactly corresponded, then, inasmurlh as the real value of bullion must be very nourly the sume in both countries, the nominal exchange would te ai par; and whatover thactuations the comjuted exchange might exhilit, must, la such cases, be traced to fluctuations in the real oxchange, or in tho suphly and demand for bills. If, when the marict price of bullion in l'aris is equal to its mint prico, it oxceenfa it 2 per cont, in l.ouden, it is a proof that our rurrency is 2 per cent. dopreciated, and consequatly the nominnl exdinnge between l'arls and Lonaon mast be a per cent. ngatist the latter. Instead, however,
of the computed or netual course of exchange being 2 per cent. against London, It may be against it to a greater or less extent, or in its favor. It will be more againat it provided the real oxchange be alao nnfavorable; it will he lese agalnat it provided the real exchange be in favor of London, though to a less extent than the adverse nominal exchange; and it will be In favor of London, ahould the favorable real exceed the unfuvornble nominal exchange. Thur, if, while British currency is 5 per cent. deprecisted, and French currency at par, the computed or actoal course of exchange between Paris and London were 10 or 12 per cent. agalnst the latter, it would show that the real exchange was also against this country to the extent of 5 or 7 per cent. And if, on the other hand, the computed exchange were only 2 or 3 pur cent. agalnst London, it wonld show that the real exchange was 3 or 4 per cent. in its favor, and so on.

It has been already shown, that in go far at least as the question of exchange is involved, the differences in the value of bullion in different countrles are limited by the expense of its transit from one to another. And hence, by ascertainiug whether a partlcular country exports or Imports bullion to or froin other countries, we may determine its comparatlve value in these countrics. Supposo, for example, that the expense of conveylag bullion from this country to France, Including the profits of the bullion dealer, is 1 per ecut. ; it Is clear, Inasmuch as bullion is exported only to find its level, that whenever our merchants begin to export it to France, its value there must be at least 1 per cent. greater than in England; and, on the contrary, when they import bullion from France, its value here nust be, at least 1 per cent. greater than In France. In judging of the exchange between any two countries, this clrcumstance ahould always he attended to. If no bulllon be passing from the one to the other, we may conclude that lts value is nearly the same $\ln$ both; or, at all events, that the differenco of its vulue is not more than the expense of transit. On the supposition that the entire expense, including profic, of conveving bullion from San Francisco to London is 5 per cent., and that London ls importing bullion, it is clear, provided the real exchange be at par, and the currency of tooth cities at their mint standarla, that the nomisal, or, which In this ease ls the same thing, the computed exchange, will be 5 per cent. in favor of Iomdon, but if the currency of London he 5 per cent. depreclated, or, In other words, if the marke* price of bullion at Lonilun lo 5 per cent. above its mint price, the computed exchange between it and San lirancisco, supposing the real exchange to continue at par, will obvionsly be at par. It may therefore lie laid down as a general rule, that when bullion begina to paan from one country to snother, the exprone of transit, proviled the mint and market price of bullom in the exporting comntry correspond, will ludicate how much the value of bullon in it is lodow its value in the country into which it is Imported, nind will he ihentleal with its unfavorable nominal exchange; and that when the market exceeds : he mint price of bullion in the exporting country, the expense of iransit aidded to this excesa will give the total comparative reductlon of the value of the preclons metals in that country. The converse of thin takes place in the conutry importing bullun. When Its currensy is of the mint standard, the expense of transit la the meanare of ita favorable nombal exchange; but when its currency is relatively redundant or degraded, the differencs between the oxprose of transit and the excess of the market above the mint price of hullion, will mensure the extent of the favorable or mifavoralile nominal exchange. It will to favorable when the depreciation in less than the expense of tranait, and unfavorable whon it is greater.
From 1809 to 1815 Inclusive, Great Initain contlnued to exprort gold and wilver io the Continent. During thif periof, therefore, we munt add the expense of lts
export to the excess of the market over the mint price of bullion, to get at the true relative value of Britlsh currency, and the state of the real exchange. Mr. Goldsmid stated to the bullion committee that, during the last five or six months of 1809, the expense of tranaporting gold to Ilolland and Ilamburg, includlag freight, insurance, exporter'e profits, etc., varied from 4 to 7 per cent. But at the time that the relative value of bullion in Britain was at $5 \frac{1}{2}$ (medium of 4 and 7) per cent. below its value in llamburg, the market price of gold bulllon exceeded Its mint price 16 or 20 per cent., or 18 per cent. at an averago; so that the currency of this country, es compared with that of Hamburg, which differed very little from its mint standard, was depreclated to the extent of about 231 per cent. Now, as the computed or actual course of exchange varied, during the same period, from 19 to 21 per ceut. against London, It Is plain the real exchange could not be far from par. Had the computed exchange bees less unfavorable, it would have shown that the real exchange was in favor of London; had it been more unfavorable, it would, on the contriry, have shown that the real exchange was against Landon.
Provided an accurate account could be ohtrined of the expense atteniling the transit of hullion from this country to the Continent during the subsequent years of the war, it woald moat likely be found, notwithstaniling the extriordinary depression of the nominal, that the real exclange varied but little from pur; and that the exportation of gold and sllver was not a consequence of the balance of payments belng agininst us, but of its lesing advantngoous to export bullion, because of its belag more valuable on the Continent. None will contend that, in 1809, 1810, etc., gold and silver were ao redundant In this country as to sink their relative value. Any such supposition is out of the queation. Duringe the period reforred to, they were sent abroal, tecause the depreciation of paper exceeded the cost of the transit of hulilon; and it was every tody's interest to pay their thebts in the ilepreciated currency, and to export that which was undeprecinted to countrles where it passed at lis full value us coin, or $\ln$ which bullion was $\ln$ greater demand. IIad our paper currency been sufficiently reluced, the suiply of gold in the klugiom $\ln 1809$, 1810, etc., compared with the demand which must, under such circumstanees, have been experiencel, was so very small, that lustead of exportlag, we should have limported the precluns nutals from all pirts of the world.

The extraoriliuary exportation of Iiritish gookls to the Continent during the latter years of the war, has heen very generally supponed to have theen in grent measure owlag to the depression of the exchange. Ihit, in so far as this depresslen was occasioned tiy the redundancy ur deprecintion of the curreney, it could have no such effect. It Is impossible, indeed, to form any opinion ns to the influence of thutantions in tho computed exthange on export and laport trade, withont previonaly ancortalining whet her they ure a consequeuce of fluctuntons in the real or nominal exchange. It la only by an unfavorable real exchanga that exportation in facilitated; and It may le favoralle when the computed exchauge is unfuvorable. "Suppose," to use an example given liy Mr. Blake, "the computcal exilange liet ween IIamburg and London to lie 1 per cent. agalnst this country, and that this arises from the rval exclange whito is favorable to the rumount of 4 ber cent., and a nominal exchange unfavorable to tho extent of 5 per eent, ; let the real price of bullion at ldamburg and bomlon he precisely the anme, aml, consecfuently, the nominal prlees alfferent by the nmount of the nominal exclange, or 5 per cent.; now, if the expenses of frelght, Iasarance, etc., on the transit of tullion from llamburg are 3 per cent., It is evillant that a protit would be derlved from the lugort of that article, notwithetnniling the computed' exchange was 1

per cent. against as. In this case, the merchant must give a premium of 1 per cent. for the forelgn bill, to pay for the bullion; $£ 100$ worth of bitlion at Hamburg would therefore cost him £101, and the charges of importation would increase the sam to $£ 104$. Upon the subsequent anle, then, for $£ 105$ of deprecisted currency in the home market, he would derlve from the tratsaction a profit of £1. This oum is precisely the difference between the real exchange and the expenses of transit, that part of the computed exchange whlch depende on the nominal producing no effect; since whatever is lost by its nnfavorable state is counterbalanced by a corresponding inequality of nominal prices."* In the same manner it may be shown that, though the computed be favorable, the real exchange may be unfavorable; and that, consequently, it may be really advantageous to export when it is apparently sdvantageous to import. But it would be tedlous to multiply instances, which, as the intelligent reader will readlly concelve, may be infinitely varled, and which have been sufficiently explained in the foregoing sectlons.
The real cause of the extraordinary importation of British produce inis the Continent, in 1809, 1810, 1811 , etc., notwithstandliag the anti-commorcial syatem of Nopoleon, is to be found in the annihilation of the neutral trade, and our monopoly of the commerce of the world. The entire produce of the East and West was at our disposal. The Continental natlons could neither procure colonial products, nor raw cotton for the purpose of manufucturing, excopt from England. British merchandiee was thus almost indispensable; and to this our immense exportation, in epite of all prohibitions to the contrary, is to be ascribed.
X1. Histoity and Influence of Bills uf Ex-cinancr.-It is not easy to discover the era when billa of exchange were first employed to transfer and adjust the mutual chaims and obligations of merchants. Their invention has been ascribed to the Arabisns and Jews of the Middle Ages. But it seems certain that they were ln use in remote antiquity. Teocrates states that a stranger who brought some cargoes of corn to Athens, furnished a merchunt of the name of Strutocles sith an order or bill of exchange on a town on the Euxine, where money was owing tu him; and, because the person who had drawn the bill had no fixed domicile, Stratocles was to have recourse on a merchant in Athens, in the event of its belng protestel. The merchant, snys Isocrates, who procured this onder found it extremely advantageous, inusinuch re it enabled hilh to avoid risking hls fortune on sens covered with plrates, and the hostile squadrons of the Lacedemoninns.-De Pauw Recherehes aur les Grèes, l., 258.

There is also good ovldenco to show that the method of transferring and canceling the debts of purtics residing at a distance by means of letters of credit, which are in effect the samio as bllls of exchange, wins not unknown to the Romans. Cicero, in one of his epistles to Attions, $f$ inquires whether hils son must carry eash to defruy the expense of his studies with him to Athens, or whethicr he might not save this troulde and risk by obtainiog an assignment for an equivalent sum from a creditor li liome on his debtur in Athens. It ts evilent, from n sulisequent epistle of Clicero, that the hitter method lad been preferrel, anil that the transferenco of the money hail, in consequence, been renderad unnccessury $\ddagger$

exchange in modern history occurs in 1255. The pope, having quarreled with Manfred, King of Slcily, ongaged, on Heury III. of England agreeing to indemnify him for the expenee, to depose Minnfred, and raise Henry's second son, Edmund, to the Sicllian throne. The enterprise misgave. But the merchanta of Slenna and Florence, who originally advanced the money to carry it into effect, or rather to gratify the pope's rapaclty, were paid by bille drawn on the prelates of England, who, although they protested that they knew nothing at all about the transaction, were nevertheless compelled, uader pain of excommunication, to pay the bills and interest $\mathrm{i}^{\text {中 }}$

Capmany; In his "Memoirs" respecting the commeree, etc., of Barcelona, gives a copy of an ordonnance of the magistracy, dated in 1394, enacting that bills should be accepted within twenty-four hours after thelr presentation; a sufficlent proof that they were in geaeral use in the end of the fourteenth century.

But whatever be the era of the introduction of bille of exchange, few inventions have redounded more to the pullic advantage. Without this simple and ingenious contrivance, commerce could have made no great progress. IIad there been no means of adjusting the mutual claims of debtors and creditors otherwise than by the intervention of metallic money (for bank paper is only another apecies of bills of exchange), a very large portion of that capital which is setting productive labor in motion in every quarter of the globe, and ministering to the wants and enjoyments of mankind, must have been employed in effecting those exchanges which are much better effected by the agency of a few quires of paper. Instead of a perpetual importation and exportation of gold and ellver, necessarily attended with an immenslty of troublo and expense, bills, possessing littlu or no intrinsic worth, and which ure transferred with the utmost facility, suffice to adjust the most extensive and complicated transactions. But the mere setting free of an immense productive power, engaged in a comparatively unprotitable employment, is only one of the many benefits we owe to the use of bills. By cheepening the instruments by which commerce is carried on, they have materiai!y reduced the prices of most articles; ard have, in consequence, increased the cominand of all classes over necessnties und luxuries, und acceleruted the progress of civilization, by oecasioning a more extensive intercourse and intimate connection between diffirent and independent countrles than would otherwise have taken place.

In a political point of view their effects have been equally sulutary. They enuble individuals imperceptibly to trinsfer their fortune to other countries, and to preserve it safo alike from the rapucity of their own governments and the hostile attacks of others. The security of property has, in consequence, been vustly augmented. And though wo should concede to the satirist that paper credit has "lent corruption ligliter whigs," it has, at the same time, powerfully contributed to render sulijects less dependerit on the policy, and less lialle to be injurioudy affected ly the injudicious mensures of their rulers. In sountries in a low stage of cisllization the intabitants endeavor, by burying all the gold and sllver they tan collent, to preserve a purt of their property from the despots by whom they are alternately plundered and oppressed. This was universally the case in the Middle Ages; and in Turkey, Inilia, l'ersin, and other eastern, and also in aomo European countrien, tho practico ls still carrled on to a greater or leas extent. Some economists have endeavaren to account for the long-continued inportation and high value of the precious metals in India, Ly the loss which necessarily attends the practlee of honrding; und undoubtedly this lecking-up of capital, wille it evinces an extrome degreo of Insecurity, is a

* IIume's England, cap. 12.
main cause of the poverty of these countries. But the security afforded by bilis of exchunge is infinitely grentor than any whlch can be derived from the barbarous expediont of trueting property to the bosom of the earth. "Pregmant with thousands fits the serap unseen," and in a moment placea the largeat fortune beyond the reach of denger. . Mr. Hurris was therefore right in saying, "that the introduction of bille of exchange was the greatest seenrity to merchants, both as to their persons and effects, and conaequently the greatent encouragement to commerce, and the greatest blow to despotism, of any thing that ever was invented."

Its extensive commerce, the wealth and punntuality of ite merchants, and their intimate connection with ull the other great trading cities of the world, made Amstendam, previousiy to the peace of 1768 , the chief place whi. d the accounta of commercial countrice were balanced and adjusted. But the loss of foreign trade, and the other vexations to which Holland was snbjected during the ascendency of the French, neariy divested Amsteriam of all share in this buaineas; and it has not since recovered its former superiority. London is now the trading metropclis of Europe and the world, usirersi orbis terrarum emporium. The vast extent of its commercial dealings necessarily renders it the great mart for bille of exchange. Its bill-merchants, a class of man remarkable for their shrewiness and generally possessed of large capitals, assiat in trimning and edjusting the balance of debt and credit between the most remnte countrizs. They buy up bills where they are cheap, and sill them where they are dear, and, hy the extent of their correas ondence and the magnicude of their transactions, give a steadiness to the exehange to which it could not otherwise attain.

The following is a statement of the uance and days of grace for bilis drawn at Iondon upon some of the principal commercial cities :

and discover whether they are buyers or eallers of bilfs. A fow of the b sokers, of most influence, after ascertaining the stat/; of the relative supply and demand for bille, suggust a price at which the greater part of the transactling of the day are settled, with such deviations as particular bills, from their being in a very high or low cre lit, may be aubject to. Tha price fixed by the brokest is that which is published in Wittenhall's List ; but the first houses generally negotiate their billa on $\frac{1}{\frac{1}{2}} 1,1 \frac{1}{1}$, and 2 per cant. better terms than those quoted. In London and other great commercial cities, a class of middlemen specutate largely on the rise and fall of the exchange ; buying bllis when thoy expect a rise, and selling them when a fal: is anticipated.

It is usual, in drawing foreign bills of oxchange, to draw them in sete, or duplicates, leat the first should be loat or miscarry. When bills are drawn in aeta, each must contain a condition that it shali be payable only while the others remain unpaid; thus, the first is payrable only, "second and third unpaid ;" the secend "first and third unpaid;" and the third, "Frst and aecond unpaid."

Bllis of exchange purporting to be drawn at any place out of the United Kingdom are to be deemed to be linble to the stamp-duty on euch bills, though they may, in fact, have been drawn in the United Kingdom. (§ 4.) The holders of foreign bilis, or bilis drawn out of the United Kingdom, are to aflix proper adheaive atamps to the aame before negotiating them, under a penalty of $£ 50$. (§ 5.)

No une acquainted with the fundamental rules of arithmetic can have any difficulty whatever in estimating how much a sum of money in one country is worth in another, according to the atate of exchange st the time. The common arithmetieal books abound in examples of aveh computations. But, in conduct ing the busiuess of exchange, a direct remittance is not always preferred. When a merchant in London, for example, means to discharge a debt due by him in Paris, it if his busineas to ascertain not only the state of the direct exchange between London and Paris, aud, consequently, the sum which he luust pay in Iondon for a bill on Paris equivalent to his debt, but aiso the state of the exchange between London and Ilamburg, Ifamburg and Paris, etc.; for it frequently happens that it may be more advantageous for him to buy a bill on liumburg, Amsterdum, or Lishon, an l to direct his agent to invest the proceelis in a bill on Paris, rather than remit directly to the latter. This in termed the Amaitration of exchahige. An example or two will suffice to show the principie on which it is condineted.

Thus, if the exchnnge between London and Amaterdam be 35s. Flemish (old colasge) per pound sterling, and between l'sris and Amsterdam 1s. Gd. Flemisi per franc, then, in order to aseertain whether a direet or Indirect remittance to Paris would be most advantageous, we must caiculate what would be the value of the frane in Engilsh money if the remittance were made through Holland; for it be less than that resuiting fron, the direct exchange, it will obvousily be the preferable mede of remitting. This is deternined by stating, as ajon. Fiemish (the Amsteriam currency in a pound steriing): 1s. ©d. Heminin (Amsterdan eurrency in a frane) : : $\mathbf{~ 1}: 10 \mathrm{~d}$. the proportion or arbitrated value of the frane. Hence, if the lingtish mones, or till of exchange, to [any a debt in l'aris, were remitted by Amsterdam, it wouid require 10i. to discharge a delt of a franc, or $£ 1$ to diseharge a debt of $2 \cdot \mathrm{f}$ franes ; and, therctore, if the exchange bet ween London and Paris were nt 24 , it would be indifferent to the Engtisin mprehant whether be renitted directly to IParis, or indirectly rid Amsteriam; but if tho exchange between $\mathrm{t}_{\text {andon }}$ and Paris were abore 24 , then a direct remittance woull be preferable; white, if on the other land, the direct exchunge were lees than 24

It is
any of til an 0\%., 0 par of e
on Prine
the indirect remittance ought as plainly to be preferred.
"Suppose," to borrow ar example from Kelly (Universal Cambist, vol. il., p. 137), "the exchange of London and Lisbon to be at 68d. per milree, and that of Lisbon on Madrld 500 rees per dollar, the arbitrated price between London and Madrid is 34d. sterllng per dollar ; for, as 1000 rees: 68d. : : 500 rees : 34d. But, If the direct exchange of London on Madrid be 35d. sterling per dollar, then London, by remitting directly to Madrd, must pay $35 d$, for every doliar; whereas, by remitting through Lisbon, he will pay only 34d.; it is, therefere, the interest of London to remit indirectly to Madrid through Lisbon. On the other hand, If London draws directly on Madrid, he will recaive 85d. aterling per dollar; whereas, by drawing indirectly through Lisben, he would recelve only 34 ll ; it is, therefore, the interest of London to draw directly on Madrid. Hence, the followlog rules:
"1. Where the certain prics is given, draw through the place which produces the lowest arbitrated price, and remit through that which produces the higheat.
"2. Where the uncertain price ls given, draw through that place which produces the highest arbitrated price, anil remit through that which produces the lowest." In compound arbitration, "or when more than threa places are concerned, then, in order to find how much a remittince passing through them all will amonnt to in the last place, or, which is the same thing, to find the arbitrated price between tio first and the last, we have only to repeat the different atatements in the same manner as in the foregoing examples. Thus, if the exchange between London and Ansterlam be 35 s. Flemish for $£ 1$ sterling; between Amsterdam and Lishon t2d. Flemish for 1 oid crusade; and between Lisbon and Paris 480 rees for 3 francs; what is the arbitrated price heiween London and Paris? In the first plase, as 35s. Flemisin : £1: : 42d. Flemish: 28, sterling $=1$ old crusade.
Second, as 1 oll crusade, or 400 rees : 2s. aterling : : 480 rees : \%8. $4 \cdot 8 \mathrm{~d}$, sterling $=8$ francs.

Third, as $28,4 \times 8 \mathrm{sl}$. sterling : 3 francs : : $£ 1$ sterling: 25 frumes, the arbitrated price of the pound aterling between London and Paris.

This operation may ie abridged as follows:
\&1 stering.

1 eld crusade
480 rees
$=8$ franes.
$\begin{array}{ll}85 \times 400 \times 8 & 4200\end{array}$
Hence $\frac{80 \times 400 \times 8}{480 \times 8 i}=\frac{4200}{168}=25$ francs.
This alıridged operation evidentiy consists in arranglag the terms, ,o that thuse which would form the divisurs in continued statements in the Ruje of Three,

$$
\begin{aligned}
& \begin{array}{l}
\text { 3is Flum. }=1 \text { ald crusade. } \\
1 \text { eld crusade }
\end{array}
\end{aligned}
$$

ara multiplied tegether for a common divisor, and the other terms for a common dividend. The ordinary arithmetical books abound with expmples of such operations.
The fellowing account of ine manner in which a very large transaction was actually conducted by indirect remittancee, will enfficiently illustrate the principlea we have heen endeavoring to explain. In 1804, Spain was bound to pay to France a large subaidy; and, in order to do this, three distisct methods presented themselves:' 1. To aend do'Lars to Paris by land. 2. To remit bllls of exchange directly to Paris. 3. To autherize Paris to draw directly on Spuin. Tho first of these methods was tried, but it was found too slow and expensivs ; and the secend and third plane were considered likely to turn the exchange againgt Spaln. The following method by the indirect or circular exchange was therefore adopted.

A merchant or banquier at Paris was appointed to manage the operation, which be thus conducted: He chose London, Amsterdam, Hambarg, Cadiz, Madrid, and Paris, as the principal hinges on which the operation was to turn; and he engaged correapondents in each of these cities to support the circulation. Madrid and Cadiz were the places in Spain from whence remittances were to he made; snd dollars were, of course, to be sent to where they bore the highest price, for which bills were to be procured on Paris, or on any other places that might be deemed more advantageous. The principle being thus established, it only remained to regulate the extent of the operation, so as not to issue too much paper on Spain, and to give the circulation as much support as possible from real business. With this view, London was chosen as a place to which the operation might be chiefly directed, as the price of dollars was then high in England; a circumstance which rendered the proportional exchange advantageous to Spain.

This business was commenced at Paris, where tho negotiation of irnfts issued on Ilamburg and Anverardam served to answer the immediate demands of the state; and orders were transmitted to these places to draw for the reimbursements on London, Madrid, or Cudiz, nccordiny as tie course of exchange was most favorable. The proceedings were all conducted with judgment, and attended with complete success. At the commencement of the operation, the course of exclange of Cudiz on London was $36 d$; but by the plan adopted, Spain got 301 d ., or above 8 per cent. by the remittance of dollars to London, and considerable advantages were aloo gained by the circulation of bills through the several places on the continent.-Kelily'a Cambist, vol. ii., p. 168 ; Dunost's Elements of Commerce, 2d ed., p. 228. See Bills of Exchange.

* Aberactel from Tute's sodern Combint, to whelis the realer is referred for further explanations.

It is easy from this table to calculate the value of $/$ McCusiocut, in the lut edition Ency. Hrit. Qee Bills any of the nhove coins, taking silver at 5s. 2d., 5s. find. an ez., or any other price, nad thence to dednce the par of exchango at such rates. The preceding article of Bixchange.

Exchange signifies a place in most cu 3 iderable on l'rinciples of Exchunge, is from tho pen of $\mathrm{J}, \mathrm{li}$. kers, interpreters, and other persons concernel in com-
merce, assemble on certain days, at a fixed hour, to confer tegether in regard to matters relating to exchanges, remittances, payments, assurances, freights, etc. In Flanders, Holland, and France, these places are called Bourses, or Places de Change; and in the Hanse towns, Borsenhalle. The most considerable exchanges in Europe are these of London, Paris, and Amsterdam. The anclent Romans had places for merchants to meet in most of the considerable clties of thelr empire. That which is asld to bave been built at Romn in the year b.c. 493, wan called Collegium Mercatorum, of which it is alleged there are still some remalns, called by the modern Romans Leggia, the Lodge or place of St. George.

Exchequer Bills are bills of credit issued by authority of Parliament. They are for variors sums, and bear interest (generally from $1 \frac{1}{\mathrm{f}}$. to $2 \frac{1}{\mathrm{f}}$. per diem, per 5100 ) according to the usual rate at the time. The advances of tha bank to government are made upon exchequer bills; and the daily transactions between the bank and government are principally carried on through their interventlon. Notice of the time at which outstanding exchequer bills are to be paid off is glven by public advertisement. Bankers prefer vesting in exche fuer bills to any other species of stock, oven though the intorest be for the meat part comparatively low; because the capital may be received at the treasury an the rate originally pald for $i \pm$, the bolders being $3 x e m$ ted from any risk of fluctuation, except in the amout t of the premium or discount at which they may have bought the bills. Exchequer bills were first issued in 1696 , and have been annually issued ever since. The subjoined is an account of the unfnaded delt in exche puer bills, and of the annual charge thereon, on the $5 t \mathrm{t}$ of January 1817, and the 5th of January every bub equeut year down to $185^{\circ} 5$.

In 1853 , exchequer bonds were $i$, od bearing linterest at $2 \frac{4}{6}$ per cent. for ten year thereafter $9 \frac{1}{2}$ per cent. for thirty years, or ti' . 1894, to auch holders of South Sea, and three por cent. stock as chose to accept the same, a bond for $£ 100$ being given fur every $£ 100$ steck subseribed (16th and 17th Viet., cap. 23). But only a very small sum ( $£ 5000$ ) has been invested in mela bouds.

This description of temporary loan is unknown in thls country, but is a favorite investusent by British capitalists. The treanury has the power, by act of Purliament, to issue ways and means bills, or in other words, exrhequer bills, to the aid of the waya and means of the year, by issuing them in any one quarter, paysile out of the revenues of the following quarter. Indepenteut of these bills of supply, lssues are made in exchequer bills to the paymastar-general for thu ordinary service, to be aold in tho market to meet the publle demand. The bilis are signed either by the comptroller or ly the assistant-comptroller, and every means have been suggested to prevent forgery. Sounthaes the bill are lanued to the paymaster-general, and sometimes to the bank; and the bank either carrisu the amount of money for which it has contracted with the government, to the paymaster's account, or to the exchequer account. Then the credit is insued from the exchequer account for the public accountant. About 1500 bills are prepared in one day, and they aro signed in even quantitien. There aro constitutional reasons against the treanury having the insue of exchequer hills. Tho Constitution of England in founded on a jealousy of the executive govermment, and therefore chacks are required lo doaling with the action of the government, which a commerclal company like tho lank of lingland inay not in any respect reguire.

Frem the ist of January, 1812, to lith June, 1847, there were slgned liy the comptroliar-generai, and by the assistant-comptrolier, 186,707 exchequer hilis, for the amount of $\subset 197,983,423$. From the 1st January, 245, to 10th June, 1847, there were examiued and
controlled by the cemptroller-general and aseistantcumptroller, 288 royal orders of the ariourat of $£ 92$, 806,730 , and 900 treasury warrants of tha value of £283,681,258. From the first of Janua 'y, 1845, to 10th June, 1847, there were issized and su pplied to the paymaster, 90,109 bills of the amount of $£ 54,604,300$. The preparatlon of exchequer bills costs 'the public for paper-making, $£ 4000$; superintendence of ditto, $£ 30$; ongraving and pintligg, $£ 180$; superintendent, $£ 30$; and counterfoita, f10-total, $£ 6500$. . During 1855 , there were algaed 1455 credita, 1228 acquittanees, 427 Irlah transfera, 8842 Irish acqui'tances, 32,444 exchequer bille of $£ 31,827,117$; and s ntrolled 214 reyal orders of $£ 91,811,111$, and 869 trousury warrants of £178,981,985. In 1854, there were signed 22,054 exchequer bonds of $£ 6,009,400$.

The memb founded at $\mathbf{R}$ siens exlithite but it was in 1 Royal Acader in 1648) first These were their cominen meinbers of tl (by a decree were allowed in li96 was ag
The earliest in 1760 ; and united in the
means by which they conld raise fands to carry on the great contest in whleh thes had embarked. They were consequentiy introduced by a parliamentary ordinance it 1643; being then laid on the makers and vendera of ale, beer, clder, and perry. The royaliste soon after folluwed the example of the republicans; both aldes declaring that the excise should be continued no longer than the termination of the war. But it was found too productive a source of revenue to be again relinquished; and when the natlon had been accustomed to it for a few years, the Parliament declared, in 1649, that the "impost of excise was the most easy and indifferent levy that could be lald upon the people." It was placed on a new footing at the Bestoration; and, notwithstanding Mr. Justlce Blackatone says that "from lta first original to the present time its very name has been odious to the people of England" (Com. book l. c. 3), it has continued progreasively to gain ground ; and is at this moment imposed on various important articles, and furnishes a large share of the public revenue of the kingdom.
Ayount of the Exoise Revenur of Great Baitain in TUE following Years:

Exhibition (exhibere, to exhibit, furnish, maintain, etc.), a showing or presenting to view ; a display-. In law, delivery of writings in proof of facta; a bill of discovery. In our old writere it le aleo used for an allowance of meat and drink, a pension or salary; and it ls now applied to a benefaction settled for the rasintenance of scholars in English unlversities, not depeading on the foundation. In this sense the term is analogous to the Scottish bursary. Among physicians, exhbibition is a standard aud convenient term to express the admindstering a medicine.
Exhibitions of Worls of Fine Art.-A collection of works of fine urt, arranged in some suitable place for public inspection, Is atyled an exhibition. It is organized on a different principle from that of a natlonal gallery or museum ; for the works are not permanently coaserved, but contributed for a limited period annually, new examplea being provided for every successive exhibition.
Exhibitions are comparatively of modern institution. In former times artists were chiefly patronized by the church or the government; and the edifices in which their productions vere placed were patent to the pubilc; but now artists rely mainly on private patronage, aad generally obtain the sanction of those for whom they execute works to exhibit them publiely for a limited period as speclinens of their skill ; or if executed for asie, these exlibitions afford an opportunity of disposing of their works, while they themselves are improved in their art by the opportunity of comparing their own efforts with those of other artists.
The members of the Acadeny of the Fine Arts, founded at Roine in 1593, probably on particular occasions exbibited their works collectively to the public ; hut it was in France, in 1737, that the memilers of the Royal Academy of Palnting and Sculpture (feunded in 1648) first regularly instituted annual exhibitlons. These were made biennial in 1745, and were from their commencement confined to works executed by members of the academy; but during the Revolution (by a decree in 1791) all artists, French or foreign, were allowed to particlpate in the exhibition, which in 1796 wns again made arnual.
The earlieat attempt at an exhibition in England was in 1760; and the efforts of the artists were at leugth united in the loyal Acudemy's exhibitions, the first
of which was opened in 1769. Since then they have heen continned wlth increasing energy. In 1760; the number of works exhlbited was 130, contribnted by 69 artiste; in 1855 there were 1558 works, contributed by 918 exhlbitors. The annual revenue of the academy arises from a fee of one shilling from each visitor, and now exceeds $£ 8000$.
The Royal Scottish Academy's exhlbition is the second in importance In the United Kingdom. Though, according to Its present constitntion, it only dates from 1826, those who instituted it had prevlously organized oxhlbitlona in Edinburg; whlch had been annually continued, with some few interruptions, since 1808. At the first exhibitlon, 178 works were sent in by 27 contributors; at the exhibltion in 1855, 789 works were contributed by 287 exhibitors. The annual revenue exceeds $£ 2000$. Exhbitions are annually opened in Dublin by the Royal Hibernlan Academy. These are the only fine-art corporations in Great Britain alded by government, the two first mentioned being accommodnted in public galleries, and the last recelving an annual money grant. Besldes the above mentioned, the following societles in London have also oxhlbitions, namely, the British Institution, founded in 1806; the Society of British Artists, in 1824; the National Institution, in 1850; the Society of Paintore iu Water Colors, in 1805 ; and the New Society of Painters in Water Colors, in 1835. There are also annual exhibitions in Manchester, Liverpool, Glasgow, Birmingham, Cork, Newcastle, etc. But with the exception of those in London and the Royal Scottish and Hibernian Academies, they are mainly composed of worka collected all over the klngdom, but princ pally in London.

Exhibition of 1351 .-The great Exhibition of Works of Industry of all Natlons, held in $t$ ? : ori 'ish metropolis, was publicly announced in Oct or $r$, $1 \times 3$. Prince Albert, ne president of the Society os. 4* .."ered himself to the publlic as their leader in tho whertaking; and her Majesty's proclamation appointing a commission to promote the project was issued January 3, 1850. The amount of publle subscriptious to the Crystal Palace was $£ 67,399$ 3s. 10 d . After much discussion rclative to the site propoeed, a vast atructure was erected on the south side of Hyde Park, from a design of Mr. (afterward Sir Joseph) Paxton. This building (usually called the Crystal Palace from the material of which it was chiefly composed) resembled, upon a great scale, the Vlctoria Regia plant-house, erected at Chatsworth, after Mr. Paxton's own design. The contract with Messrs. Fox and IIenderson was for £79,800-a sum afterward somewhat increased by additions to the plan; or for $£ 150,000$, if the building was permanently retained. The exhibition was opened by her Majesty in state, May 1, 1851; and it remained open to the publle till 11th Octeber, shortly after which time the Crystal Palace was taken down.

This gigantic structure occupied an area of 21 acres, and was comprosed entirely of large sheets of glass set in frume-work of iron, except near the ground, where it was boarded. Its length was 1851 feet (a number corresponding to the year of the exhlibition); and its width, In the broadest part, 456 feet; the transept intersecting the building at right angles in the mlddle, was 408 feet leng, 108 high, and 72 wide. The entire structure consisted of three tiers of elevation, the central portion being 64 feet high, the adjecent side portions 44 feet, and the outer sides 24 feet high. The materials employed were as followis: $896,000 \mathrm{su}$ perficial feet of glass, weighing 400 tons; wroughtiron, 550 tons; cast-iron, 3500 tons; wood, including flooring, 600,000 cubic feet; nearly 2300 cast-lion girders, and 358 wrought-iren trusses for supporting the roof and the galleries (which extended nearly a mile in length); 30 milee of gutters ; 202 miles of sashbars, and 3390 cast-iron columns. The number of exhibitora was about 17,000 ; of prize medals awarded,

2918; of council medals, 170. The greatest number of visiturs in one week was in that eading 11th October, when the number of persons paying at the doors wus 478,773. The total amount of entrance fees durlug the saason was $£ 424,41815 \mathrm{~s}$.
The Great Exhlbitlon of 1851 wat altogether novel in priaciple, and unparalleled in mugnitudo and magniffence; comprehending under one rcof, in almoet ondless variety, specimens of the lndustrial productloas, uot only of Creat Britain, but of the Enropean atates generally, together with thoae of nearly every part of the habitable alobe. An account of these, as well as of the peculiar mode of construction of the Crystal Palace, may be found in the official deacriptive and Illustrated catalogaes and reports of the jurits.

Our limits preclude onr entering into the history of national industrial exhibitions, or to make more than a passing reference to the various locsl exhlbitions of works of industry which have taken place from time to thine in the United Kingdom; auch as those at Cork, Sheffield, Flymouth, and Salistury in 1852, Dublin In 1853, and in Birmingham in 1849, Similar exinlbltlons were organized in Belglum in 1830, In ti:e United Statea in 1858, at Munich in 1854, and eapecially in France $\ln 1798,1801,1802,1800,1819,1844$, and on a large acale in 1855. This last is constituted on an entirely different basis from the Eigglish Exhibition of 1851 ; being set on foot by the capital of a commercial company formed for the purpose, and on the prospect of remunerative profits; but the State also takes a distinet and positive share in the risks of the enterprise, as it does with rallways and other works of public utility. A certain percentage to the holders of stock Is goarantied by the government; and in right thereof ar iraperial commission it appointed which exercises "preme control. By this arrangement the proprletors a to receive whatever aurpius may remain after all expensea are paid ; whereas the $\mathbf{5 1 7 0 , 0 0 0}$ derived from the prices of admission to the Jondon Exhibition stands over as a public trust fund, under royal charter, to be applied to oljects in harmony with those for whlch the exhibition was held.

The French Exblibition is not contained ander one roof, nor of the sex il 1 holldinge nre all intended to he of a temporary chard: ter. The buildings, in the aggregate, will probabi'y includo a greater area than the Crystal Palace at 11, le Park. The main building is the Palais de l'Industrie, n permanent edifice of rectangular form, and with considerable pretenslons to architectural effect. In this will be exhibited all the hlgher productions of maunfacturing lndustry. There is also the "Annexe," a shed 4000 feet long, parallel to the Seine, for tho exhibition of machinery and raw produce. According to the plan, these two structurea are connected by a gallery running across the Champs Elysées, and having in its centre a tine circular space, which is appropriated to the productions of Sèvres, and the other national establishments ; and, in ndilition, there is an extra shed for the exhibition of carringea and other articlen of great bulk.-W. Ib.

The British government, in orler to secure nn adoquate representation of liritish art und industry in Paris, corresponding to the efforts whicin the French goverument had made lin 18, grantel $\mathrm{f} 50,000 \mathrm{ly}$ a parliamentary vote. The assistance of public assoriations and local committees was also ohtained for the purpose, and special reports were liy them published. The number of exhilitors from the Lnited Kingdern was 1505 , and from the liritish colonica 1070. The total number of exhibitors was 20,3339, vi\%.: 10,691 from the Frendl cmpine, and $\mathbf{1 0 , 1 4 8}$ from forcign States, viz. : France, 9790 ; Algerla, 724; French coloaies, 177 ; the 1)uchy of Anhalt, 15 ; the Argentine Confederation, 6; Austria, 1296; Grand Duchy of Baden, 88 ; Havaria, 172 ; 13elgium, 686 ; Ilrazil, 4 ; Duchy of Drunswiek, 16 ; Republie of Costa Rlea, 1 ;

New Vork Nohibition of the Imlustry of all Natione,Alt?.ough America achieved amo of the most signal and permanently valuable results which were hrought to the knowledge of mankind by the Exhbition in Hyde Park; still there was probably no Anserican Nho saw our contributions in London that did not feel some regret that they were not a more just and eqnally sustained exponent of our zesources, Industry; and arts. But stionger and more controlling than this sentiment whe the desire excited to afford the masses in Ame rica an onportunity to see the grund total of the werld'a industry, and the manifold productions and applientions of the arts of design broutht in one comprative vlew. It was seen, that while no motive but a proper regard for our own position in the great family of natlons cocild have induecd us, as a people. to aend our industrial products to Europe, where we find a market only for our jrent staple raw materials, that the fuct of our bocoming more and more every day the great purchnsers of the products of European skill and labor, expended, perhaps, upuo our own prolucts, wonld induce alf the manufacturing states of the old world to embrsce, engerly, an opportunity to expose their prolucts In the New York Crystal Palace. This convietlon, strengthened by the seatiments lefore alluded to, led a few public-spirited citizens of the United States, early in 183 , to contemplate the urganization of the effort whess results we see. It was not designed or desired to reproduce the London Exhibition, which, from the very atme of the case, must ever reminin unexnmpled; liut to draw forth such a reprosentation (f the worid's industry and resources as would enable us to measure the strength and value of our own, whilo it indicated new aims for our enterprise and skill.

There is no humiliation in the acknowledgment, that America has more to gain from such n comparison than any other uation in Christendom-and we believe she is also more willing to a vall herself of the suggedions it offers. It whe ebvious in the outset, that numerous lifficulties would embarrass the successful organization of an exhibition of Inlustry $\ln$ the United states, which should at once he universal in its scope, nad devold of the imputation of loesl or sectlonal influence. These difficulties were lnherent in the nature of our pelitical institutions. In England, the auggention of 1'rince Alliert to the Society of Arts was received with enthuslasm, and enlisted not ouly the cordial support of tho queen, but every member of a numetons and wealthy aristocracy joined his haed in setting forwarl the royal project. The government, however backwand and lukewarm they might have been at first, conld not rexist un litluence with which, as men, they were identified. Then the nlmest supreme power of the london Journals came in to swell noul direct the popular sentiment, and to make every E, glishman feel that he had an lmincliate personal stake in the suco

The countenance government was at
ceas-the triumphant and overwhelming anccess-of an enterprise to which the honor of his aovereign, and of the nution, stood pledged before all mankind.

Under the atimulus of anich powerful moti"'a, the univeral inteilect of the United Kingdom orbanized itself in counclle, committees, and jurics. Men whose names are identified with the halis of scionce, of litersturo, and of art, left their tripods, and were found heading the various corps of hard-working volunteers in considering or perfecting the eevaral details of the colossal scheme. The rooms of the Royai, the Geological, the Geographical, the Ethnological, and the Statistical Socicties, of the Institutions of Civil Engineers and Architects, of the Mueeum of Economic Geoingy-and even of the stald and conservative Unlversities, were for a time deserted to furnish men and mind for the emergency. In looking over the long catalogue of councilmen and chairmen, of commissionors, associates, and jurymen, whose nnwes are connected with the administration of the London Exhibition, it is astonishing to see what an array of talent and learning was gathered to secure its success. Nor wes this pecuitar to Great Britain; but from all parte of the worid, we find in its publishod iists men whose names are the guaranty of ominent success, not only in their own dupartments, but in whatever thoy may nndertake. Such was the nninus of ths London Exhibition. Compared with this royal espousal, and caormous personal influence brought to sustain and carry forward the exhibition of $\mathbf{2 8 5 1}$, the simple machinery and resources of an association of private gentlemen, however enterprising, might seem utteriy inadequato. Let the results docide. Such an association was formed, and stands committed to the suceessfal prosecution of the pian. Ail the world has been invited to co-operate in sustaining the effort, and the appeal has met a regponse as cordial as the design is liberal and catholic.

New York was selected as tho locality of the exhifition, becauso of ite great advantages as a commerciai centre, and as the chiof entrepôt of European goods. liad it been proposed to limit the exhibition to the products of American industry, some place more centrai, as Washington, Philadolphia, or Cincinaatl, might have been justly preferred, but in view of the foreign department of the scheme. Now York seemed the only piace at all suited for the purpose. The municipal authorities of the city of Now York, on the 31 of January, 1852, moved by an enlightened regard for the prosperity of the city, and the interests of its inhabitants, granted n lease for five years of Reservoir-square for this purpose upon two conditions: one, that the buiding should be constructed of gisss and iron, and the other, that no single entrance fee should exceed 50 ceuts. The Legisinture of the State of Now York, upon application, granted, on the Ilth of March, 1852, the charter under which the Association for the lixhibition of the Industry of ali Nations has been organized and carried forward. The act clothed the directors with ali the powers needed to carry out its pians, and the Legisiature have sinco that time extended its privileges, so that it can issue stock to the amount of $\$ 500,000$, in phace of the original limitation to $\$ 300,000$. The iloari of Directors flrst met on the 17 th of March, 1852 , and organized hy the election of Theodore Sedgwick, Fsq., I'resident, and William Whetten, Esq., as Secretary, No time was lost in pulbishing and cireulating a general statement of the ohjects of the enterprise. A call for suhscripthons to the stock was met is due time by about 150 persons nad firms coming forward to take up tho first so00,000. This wide distribution of the interest in a large number of hands compictely avoided the ohnoxlous charge, that the unijertaking was a specuintion designed for the benefit of a few.

The countenance and co-operation of the genctal government was sought with a view to the introdue-
tion of foreign gnods into the Exhibltion duty fres. And officiai assurances were given by Mr. Maxwel, the collector of the port of Now York, that the briiding of the association would be made a bonded rarehouse, thus entiting the association to receive the goods free of duty while on exhibition. The infuence of the genersl government was ciso most cheerfully extended on behalf of the association through the kind offices of Mr. Webater, then Secretary of State, who wrote to the representatives of the United States at the principal courts of Europe, atating to them his sense of the importance of the onterprise, and the numerous reasons why in his view they ahouid give to the association all the aid and support in their power. The minlsters of foreign powers resident in the United States had previousiy responded, in terms of entire cordiality, to the general circular of the association which had been addressed to them, stating lts plans, and soliciting the co-operation of European nations. They all expressed their convictions that their respective governments would look with favor upon the proposed exposition, and unite in sending to New York their most valued and characteristic objects of industry. The leading foreign newspapers also manifested a most friendiy desire to sustain the auccess of the undertaking, and the records of the office contain the most abundant evidence of their zealn= support ; 'wisile the daily journals in foreign languages in the United States were prominent in lending their services to the cause.

The organization of the foreign relations of the association was effected by the appointment of Mr. Charles Buschek, of London, as its general agent, through whom detaiis were arranged. This delicate and importanit trast, involving the greatest responsibility, required talents, knowledge, and experience. The associntion was truly fortunate in finding these qualities combined in one person. Mr. Baschek was the Austrian commissioner at the London Exhibition of 1851 , und through him the co-operation of the European manufacturers has been secured to an unexpected extent. At a later period in the history of the enterprise, it was thought to be expedient to aspd ont to Europe Colonel G. W. IIughes, of Maryland, to cooperate with Mr. Buschek in carrying out the pians of tho association. This gentleman added to the weight of his official commission the influence of personal qualities, fitting him, in a remarkable manner, for his delicate task of soliciting or directing the countenance and support of European govermments in favor of the objects of the New York Exhibition. 'The result of his labors was the securing from various governments important contributions, which would otherwise have remained u. known in the United States.

Although the "Now York Exhibition of the Industry of all Nations" was, as a financial scheme, unsuccessful, yet its effects upon the industry and inventive powers of the country were unquestionably important. These effects will lie felt for a century to come, and siouli confer honor unen thoso enterprising citizens of the metropolis and State who conceived and carried into effect the pian now descrihed. The exhibition was clesed in the year 1855.
Exotic. (Gr. $\varepsilon^{\xi}(\omega \tau / \kappa \partial \rho$, foreign.) Any thing introduced te one country from some other country. In gardening it is sometimes applied to plants which require protection in winter, or to plants in general which aro not natives.

Exploring Espedition (U. S.) consisting of the Vincomes, sloop of war ; Peacock, do. ; Porpoise, Reliff, Flying Fish, and Sea Gull, smaller vesseis, under tientenant Wilkes, U.S. N., sailed from IIampton Roads, Va., August 19th, 1838. Antsretic continent discovered, July 19, 1839. Attack on tho Fejees for mard ring two of the officers, duiy 25,1840 . The Peacock lost on the bar of Columbia River, Juiy 1841

The lincennes (Aleg-ship) returaed to Now Iork, after an absence of neurly four years, June 11, 1842. Captain Wilkes'a Narrative of tha Expeditlon, in 6 vole. imp. 8\%o. and quarto, was publiahed in 1845. The ccientific reperts of che expedition form about 20 quarto or folio volames.
Desportation, in Conmerce, the act of seuding or carrying comumodities from ons country to another.See Impontation and Eixportation.

5xpreas. There is no branch of businesa in country more extensive and important than the $c$. prase service. The over-buny handmaid of trude, agricuiture, and the useful arts, there is no community so amali as not to be auscaptible to lts uaefulness. Yet, while agricalture, art, and trade are world-old, the express is comparatively only a thing of to-lay. England had no part in creatling it. Europe has done nothing to establish it; and twenty yeare ago it was not dreamed of even in Americh, where it la now so iṇdiepensable. Pecaliarly American in Ita arigan and charsoteriatics, it has become so thoroughly interwoven with the dnily buainess of the coantry, that it seems to conatitato an inseparable jortion of its muscla and sinew.

The inquiry naturally arises, "If the express service in so indispensable an institution now, how did the American people do without it prior to its ereation ?" "the fact is, that the "expressman" is only an improvement (a great improvernent, it in true) upon the "common carrier" of olden times. It was not a very rare thing, at an earlier period, to hear of a special express run for a temporary purpose, auch es the transit of news of intense public interest, or intelligence of great private moment. In those cases tho enterprise employed one or more riders, with the necessary relays of fieet horsea at intervals upon the road. Browning's fine poem, "Hiow they brought the good news froin Ghent to Aix," vividly describes an express of this kind, bearing news of peace and safety to that belenguered city.

Ifit the express aervice, properiy so ealled, does net date back beyond the origin of American railroads. prior to that epoch, stage-drivers had performed duties similar to those now discharged by expresamen; and "baggage-ccayons" (so calied, though they carried merchandise as weli) served instead of freight-trains. With the innovation of railways, the atage-drivers and wagoners found, like Othello, their "oceupation gonc." The loas of their aervices seriously incommoded the pubilic; but the rallroad offored no remedy. Years passed; trade and intercominuuication between town and country suffering, in the mean while, from this cause. At longth, hardly realizing what an improvement he was about to effect, William F. Haraden, then a conductor upon the Boaton and Worcerter Hailroad, started the express business. It was in tha spring of 1839. The ldea was not original with him; but to him ia due the honor of having been the first to put it into execution.

The only through route from Boston to New York at that time (March, 1839) was by railroad to I'rovidence, and thence to this city, by the steamboat $J$. H: Richmond. The Old Line of ateaniboata ran from Stonington to New York. IIarnden had no jald agent in this city at the outsel. The messengers (called, during the first year or two, conduchri) attended to all the business. Marnien himself acted in that capacity, usually making thes trip in the J. W. Richmond, and carrying hia eutire express in an ordinary valise. E'pon his arrival in New York or Boston he would hasten to deliver tho parosle intrusted to him by his customers, who were mostly booksiliers and brokers.
The express was run by llarnden some time befora he mado a contract with the Old Line of bosts from Stonington to New York. Ilis messenger paid regular fare, and carried all the packages in a carpet-bag and trunk. After the lapese of six monthe or a year, he
made a contract with the Old Company and the Ston ington and I'rovidence llailrond Compuny to ruu a cur through. . Each mossenger then carried a season tiek. et-obtained by hoiding a few ahares of the company's atock. According to the termas of that contract, the Hoaton and Providence Railroad Company were entitled to one third of the gross receipte of the express for freight; and the Providence and Stoniugton Kailroad Company (including, we presume, the boats) were to secive oue third; the residus to be Harnden's. Ilis rat contract with tae owaers of the J. W. Jichmond waz to convey a car or crate for him between I'rovidence and Now York. He took five or six sharea of the stock, which entitled him or his measenger to a free passage.
The first opposition express was run on the 4th of May, 1840. Aivin Adams mado an effort to contract, In lts behalf, for privileges on tho Norwich and Worcester route from Beston to New York; but Harnden heing at that time better known, the directora gave his "well-astablished expreas" the preference; so that he was like to have the monopoly of the facilitiea ou both rontes. As Adame wea not to be defeated in that way, he went to Major Ilandy, agent for the Stonington line, and purchaned two season tiekets for himself and partner, to run aa often as they pleased between Baton and New York, until January, 18.11; with no other privilege, howover, than to carry a trunk and valise.

In the apring of 1841, the ooly express routes in the world werc those between Now York and lBoston; but, with a aucceasful rival competing for the business of those ciliea, IIarnden \& Co. thought it duo to their own credit, as pioneers, to take anether atride or two, and extend their line sonth to Philadelphia, and west to Albany, in this State.

An express was establiahed $23 d$ April, 18.11, between Boston and Albany, and another between Albaay and New York, by Harnden \& Co.

About that time, Adans \& Co. experienced not a little annoyance from their want of regular express facilities from Now York to l'hiladelph - and they nsed an infinity of "ahifts" to put their parceis through. In tho mean time, the Camden and Amboy Railroad directors had quarreled with Ifarnden \& Co. for nonpayment of compensation alleged to be due them, and bad stopped their expreas over that road. Nor were they more favorably disposed to make a similac contract with any one else. Still, at his partner's solicitation, Adams went to Philadelphia to apply for a contract. Steveas, who represented the Board upon that occasion, gavo him a very decided refusal at once. Adams then made another proposition; viz., to do the express busineas over that railroad in conncetion with the company; the latter to allow Adams \& Co. a portion of the avails. This impressed Stevens more favorably, and the inmediate result was a contract that Adams \& Co. ahould fill a certain number of erates dajly, and deliver the goods, receiving for their trouble a certain pertion of the freight money; the railroad company to have the rest.
In 1812 Haruden \& Co.'s Boston and Alibany Express was bonght out by ita Spriagfield agent, the enterprising Colonel Thompson, and called Thompson \& Co.'s Express. Messrs. Melcher and Johuson are his partners. Gay \& Co. (Gny and Iittlefield) started an express between Boston and Ne York, ria Stonington, in 18i2. They carried only a trunk of parcels, and had no contract. Gay would run one way, and littlefield tho other; and each had the protits which he hajioned to make upon each day's work, and pocketed the same, without being expected to render an accoput to hid nominal partner. This nrrangement, apparently ao primitive and simple, lid not work well in the long run, and Littlefield retirad from it. Kinsley next joined Gay, and tise firm was styled Gay \& Kinsicy. The latter, for some years past president of

a bank at Newport, Rhode Island, has become eminent as an expressman.
In 18.44 there were expresses between Boston and L.owell, Hoston and Salem, and on one or two other short routes in Massachusetts, and they were increasing. The first express weat of Buffalo was established April 1, 1845, under the name of Wells \& Co. The nembers of that firm were Henry Wella, W. G. Fargo, and D. Dunning. For the want of rallroad facilitiea (and whea the ateamers were lald up), it was a wagon express between Inaffilo and Detroit. In February, 1847, W. G. Fargo and William A. Livingston became sole proprietors of the express west of Buffalo, nnder the style of "Livingaten \& Fargo." The latter is deservlag of honorable mention for his indastry, perseverance, and sound sense. Wells \& Co.'s line extended from Now York to Buffalo, via Albany.
W. F. Harnden \& Co.'s Foreign Express elicited the applause of the community, and gave an eclat, at home and abroad, to their already well-known name. Stlll, it by ne means contributed to the advantage of their express in the United States. It only served to divide and weaken their energies. The result was, that the more concentrated effurts of their rivals here met with a larger share of suecess, and In 1846 Adams \& Co.'s business bet ween Boston, New York, and Philadelphia was more valuable than Harnden \& Co.'s.
Canada was without an express until Virgil \& Rice started one from Troy to Montreal, via Lake Champlain, in the summer, and by wagons and stages in the wiater. Thls, we think, was in 1847 or 1848 . Subsequently Rice retlred, and Messrs. Virgil \& Co. contracted with the Saratoga Rallroad for a car. The express from New York to Troy was owned by Pullen \& Co., who in the year 1849 unlted with Virgil \& Co., under the style of Pullen, Virgll, \& Co. Under the management of these experienced and able men, the business was nursed and tended with most pralseworthy perseverance, until it grew to considerable importaace.

In 1849a new order of express service was destined to spring up. The "California gold fever" had broken out, and thousands of young men were thronging to the newly-arquired Golconda, when Dandel Iale IIaskell, a highly-esteemed clerk in Adams \& Co.'s Boston office, suggested to his employera the expediency of establishing a California express. With characteristle prudence, Adans \& Dinsmore at first opposed the proposition; foreseeing that the most important point of oferations must necessarlly be in San Francisen, many thousands of miles beyond their supervision, and they preferred to have all their business where they could give it their frequent personal inspection. IIowever, they at length yielded to Haskell'e solicitations, and he weat out to San Francisco in the steamer of September, 1840 , to act as their partner in the proposed business. The huilding which lie took for an expressoftice was a little shanty, of which I. C. Woods was either the owner or the owner's agent. As the business increased rapidly, this building liad to be pieced out, or extended in depth every few weeks, to hold the multitudes which thronged to it to hear the news, obtain or send letters, and renit their gold dust. The enterprise compensated beyond the most sanguise dreams of its sanguine projector. Let us give some idea of the prices.
The charge made by Adams \& Co. for freight, from New York to San Francisco, was seventy-five cents per pound for packages not execeding fifteen pounds each ; and for parcels of less weight, not bulky, such price was made as could be agreed upon. Threo dollars was their price for conveylag an ordinary-aized daguerreotrpe; twolve dollars for a parcel not larger than a common size novel ; and this was always exacted in advance. It was paid cheerfully and without any haggling. Since then tho prices have fallen about 60 per cent.

Upon the arrival of the steamer at Chagrea with the express, the freight would be sent ashore in bosts-a tedlous and perilous job, for the sea usally ran high, and the boats were frequently awamped. At Chagres it was tranoferred to river-canoes, and propelled by nestives to Cruces, whore it was again tranoforred and placed npon the backe of males, which bors it (by * road that would have defied tha locomotion of any other kind of beast) to Psnema, where the Pacifio ateamohip awaited to convey it to Sen Francieco. Being liable to be asturated with water in being carried ashore at Chagres, and in crosing the Iathmes, by reason of rains and atreams, it was required of abippers to put up their merchandiee in water-proof packagea The load of a male rarely exceeded 800 lbs. Usually he bore two oblong boxes or trunks welghlng not over 125 Jbs. each.

Another class of messengers to which Adums \& Co.'s express in Callfornis gava rise were wont to perform their eervice on horseback between San Francisce (and other towns) and the namerous "diggins." Sometimes they made use of mules; but in elther case the beasts must be sare and swift of feot and easy under the staddle, or they were disearded and better procured in thelr stcad. To be able and willing to run fleetly at a word from its rider, was a sine qua non in the steed of an express messenger; and there are heard wonderful stories of the time made, under the saddle, In this service.

The express companies may be said to influence the domestic exchanges of the coontry, inssmuch as they transport nearly all the specie and bullion, as well as conslderable portions of the bank-notes, bills of exchange, drafts, bonds, and other eecurities; and the price of exchange between one city and another deperds in some measure ppon the express charges for conveyance. The rates pald for the transportation of bank-notes is usually flxcd by contract in writing; and are low. For instance, between New York and Cincinaatl, 900 miles, one dollar per thousand. The total value of the capital employed in the express businesa wes valued in 1856 at ten millions of dollars. Foar yeurs ago, the entire number of miles of express routes in America was estimated at 25,000 . As facillities have been ineressed, and express routes extended, the whole distance traveled by express dally is probably not less than 28,000 . The multifarious lines stretch in every direction, crossing each other lika the threads of the spider's web. And now we find the principal exprersmen undertaking the anterprise of conveying the United States mail overland to Callfornia. September 15, 1857, Messrs. Butterfield, Dinsmore, Fargo, and others, executed an agreement to that effect. The contract, which is to run six years, is to go into effect twelve months from that date. Six hundred thousand dollars per annum is the price to be paid the contractors. The extraordinary character of the labor thus confidently assumed can hardly he appreclated until the work shall have been accomplished. Certainly the establishment of euch a route is an appropriate reward for express enterprise.-For a full history of the express business, see Bankers' Magazine, New York, September, 1857.

Extract, or Extractive Matter. The term extract is applied in pharmacy to the brown substance which remains after the evaporation of certain decoctions or infusions of vegetables; thus we have extract of bark, extract of rhubarb, and so on. These extracts aro usually mixtures of gum, atarch, sugar, or other anluble matters, along with a certain portion of a peculiar vegetable principle of a brown color, or which becomes so hy exposure to air, and which is soluble in water and in alcohol, but scarcaly soluble in ether. It combines with alumins, and is often the basis of brown dyes; it is thle principle which chemiste call extractice, and which is frequently closely allied to various forma lof coloring matter.

Fao-almille (Lat. facere, to make, and simile, like), oxpreseed in French by fais-semblable, nignifios an oxact and faithfal copy of any writing, ongraviug; or other work of art.

- Factor, an agent employed by some one individual or individuale, to transact business on hie or their account. He is uot generally resident in the sume place as his principal, but usually in a foreign country. He is authorized, either by letter of attorney or othorwise, to receivo, buy, and sell goods and merchandise ; and, generally, to transsct all sorts of business on account of his employere, under euch limItatione and conditions as the lattor may choose to impose. A very large proportion of the foreign trade of this and most other countries, it now carried on by means of factors or agents. Factors and brokers are, in reme respects, nearly identical, but in othere they are radically difforent. "A factor," seid Mr. Juetice Holroyd, "differs materially from a broker. The former is a parson to whom goods are sent or consigned; and he has not only the posseasion, but, in consequence of its being usual to advance money upon them, hat also a special property in them, and a general lien upon them. When, therefore, he selle in his own name, It is within the acope of his authority; and it may be right, therefore, that the principal ahould be bound by the consequences of such sale. But the case of a broker is different; he has not the poseession of the goods, and so the vendor can not be deceived by the circumstance; and, beeides, the omploying a percon to nell goods as a broker doees not authorize him to soll in his own name. If, therefore, he selle in his own name, he acte boyond the acope of his authority; and his priacipal is not bound."
A factor is usually + vd by a percentage or commisaion on the goods he sells or buya. If he act under what is called a del credere commiosion, that is, if he guaranky the price of the goods sold on account of his principal, he receives an additional percentage to indemnify him for this additional reeponsibility. In cases of this sort the factor stands in the vendeo's place, and nust anawer to the principal for the value of the goods eold. But where the factor undertakes no rosponelbility, and intimates that he acte only on account of another, it is clearly establishod that he is not liable in the event of the vendeo's failing. The sound maxim, that the principal is responsible for the acts of his agant, prevalla universally in courts of law and equity. In order to bind the principal, it is necessary only that third partios should deal boná fide with the agient, and that the conduct of the latter should be conformable to the common usage and mode of dealing. Thus, a factor may soll goods upon credit, that beiag in the ordinary conrse of condneting mercantile affisirs i but a stock broker, though acting bond fide, and with a view to the benofit of his principal, can not sell stock apon eredit, unlese he have apecial instructions to that effeet; that being contrary to the usual course of buainess.
A sale by a factor creates a contract between the owner and buyer; and this rale holds oven in cases Where the factor acts apon a del credere commiasion. Hence, if a factor sell goode, and the owner give notice to the buyer to pay the price to him, and not to the faetor, the buyer will not be justified in afterward paying the factor, and the owner may bring hle action against the buyer for the price, unlean the factor has a lien thereon. But if no such notice be given, a payment to the Individual selling is quite auficient. If a factor buy gooda on account of his principal, where he is accustomod so to do, the contract of the factor binds the prinelpal to a performance of the bargain ; and the principal is the person to be sued for non-performance.

But it is ruled, that if a factor onter into a charterparty of affroightment with the master of a ship, the contract olliges him only, unless he lede the vessol with his principal's goods, in which case the principal and lading become liable, and not the factor. Where a factor, who is authorized to sell goods in his own name, maken the buyer debtor to himeelf; then, though he be not answerable to the priacipal for the debt, if the money be not paid, yet he has a right to receive it, if it . be paid, and his receipt is a sufficient discharga; the factor may, in such a case, enforce the payment by action, and the buyer can not defend himseir hy alleging that the principal was indelted to him in more than the amount.
"Where a factor,": said Lord Mansfield, "dealing for a prinoipal, but concealling that principsl, delivers goods in bis own name, the person contracting with him has a right to consider hin, to all intents and purposes, as the principal; and though the real principul may appear, and bring an action on that contract against the purchaser of the gooda, yet that purchaser may set off any claim he may have againat the factor, in answer to the demand of the principal."
Merchants employing the same factor ran the joint risk of his actlons, although they are strangers to each other; thus, if different merchants remit to a factor cifferent bales of goods, and the factor sell them as s single lot to an Individual who is to pay one molety of the price down and the other at uix monthg' end; if the buyer fail before the second payment, each merchant must bear a proportional share of the loss, and be content te accept his dividend of the money ad-vanced.-Beawes, Lex. Merc.
A factor emplojed, without his knowledge, in negotiating an illegal or fraudulent transaction, has an action against his principal. On this ground it was decided, that a merchant who had consigned counterfelt jewels to bis factor, representing them to be genaine, should make full compensation to the factor for the injury done to hina by being concerned in such a transaction, as well as to the persons to whom the jowels had boen sold.
The office of a factor or agent being one of very great trust ond responailillty, those who undertake it are bound, both legally and morally, to conduct themsclves with the utmost fidelity and circumspection. A factor uhould take the greatest care of his principal's goods In his hands; he should be punctuel in sdvising him as to his transactions on his behaif, in sales purchases, freights, and, more particularly, bills of exchange ; be should deviate as seldem as possible from the terms, and never from the apirit and tenor, of the orders he recelves as to the sale of commodities; In the execution of a commission for purchasiog goods, he shonld endeavor to conform as closely as practicable to his instructions as to the quality or kind of goods ; If he give mere for them than he fa authorized, they may be thrown on his hands; but he is bound to buy them for as much less as he possibly can. Afer the goods are bought, he must diapose of them accordIng to order. If he send them to a different place from that to which he was directed, they will be st his risk, unless the prineipal, on getting advice of the transaction, consent to acknowlodge it.

A faotor who aells a commodity under the price he in ordored, may be obliged to make good the difforence, unless the commodity be of a periohable nature and not in a condition longer to be kept. And if he purchase goods for another at a fixed rate, and, their price havigg afterward risen, be fraudulently takes them to himself, and sends them somewhere else, in order to secure an advantago, he will be found, by the custom
of mer factor, with directe transa profft t and ba formab bed, or charge goods dischar by steai tion the which prove and the nor exe own pm $a$ theft ments, iii., p. 8 his prin cording carryin compos orders $t$ ineuran ter, dire on this not not omissior make a land th quence, the dam his entr these pi discharg has a lle eldental the bala sension. he has a auch pri for. For fu and liabl mentaries Contracts percargoe
of merchants, liable in damages to his principal. If a factor, in conformity with a merchant's oriers, buy with his money, or on his credit, a commodity he is directed to purchase, and, without giving advice of the tranaaction, sells it again at a profit, appropriating that profit to himself, the merchant may recover it from him, and have him amerced for frand. If a factor buy, conformably to his inatructions, goods of which ho is robbed, or which suffer some unavoldable injury, he is discharged, and the loas fells on the principal. But if the goods be stolen from the factor, he will not be so easily discharged ; for the fact of their having been abstracted by stealth, and not by violence, raises a atrong preaumption that he had not taken that reasonahle care of them which was incumbent upon him. If, however, he can prove that the goods were lodged in a place of secnrity, and that he had not been guilty of positive negligence, nor exercised less care toward them than toward his own property, he will not be held responisible even for a theft committed by his servants.-Jowes on Bail ments, 2 d ed., p. 76 ; Chitty on Commercial Law, vol. Hin., p. 868.
If a factor, having money in his hands belonging to his principal, neglect to insure a ship and gooda, according to order, he must, in the event of the ehip miscarrying, make good the damage; and if he make any composition with the insurers after insurance, without orders to that effect, he is answerable for the whole insurance. A principal at the end of a very long letter, directed his agent thus; "Observe, the premium on this value is also to be insared." But the agent, not noticing this sentence, neglected to insare the premium; and being sued, was held liable for the omission. If goods are remitted to a factor, and he make a false entry of them at the cuatom-house, or land them without entry, and they are, in consequence, seized or forfeited, he is bound to make good the danage to his principal; but if the factor make his eatry according to invoice or letters of advice, and these proving erroneous, the goode are seized, he is discharged. It is now a settled point, that a factor has a llen on goods conaigned to him, not only for incidental charges, but es an item of mutual account for the balance due to him so long as he remains in possession. If he be surety in a bond for his priacipal, be has a lien on the goods sold by hin on account of anch principal, to the amount of the sum he is bound for.

It being the generai rule of law " that property does not change while in transitu," or in the hands of a carfier, a conalgnment made before the bankruptey of a consignor, but not arriving till after, remains the property of the consignor, except, indeed, where the delivery is made by the order and upon the account of the consignse, and is complete alienation from the consignor. In the case; therefore, of a consigament to a factor, the property remaine the consignor's, and passes. into the bande of his asaignees. When a factor has a lien on goods, he has a right to the price, though recelved after the bankruptcy. Where general or unlimited orders are given to a factor, he is left to buy and sell on the best couditions he can. And If detriment arise to a principal from the proceedings of a factor acting under auch authority, he has no redress, unless he can show thut he acted fraudulently or with gross negligence. A fuctor or troker acting against the interest of his principal, can not even receive hie commission. If he pay money on sccount of his principal, without being authorized, he can not recover it back. An agent can not delogate hifa rights to another so as to bind the principal, uniess expressiy authorizod to noulinste a sub-agent.

For further information as to the general powers and liabilitles of factorn and agente, see Kbrt's Commentaries ; Parsons on Mercantile Contracts ; Stony on Contracte; Beawis'e Lex Mfercatoria, arts. F'actors, Supercargoes, etc. ; Chitty's Cummercial Law, vol. Iil.,
0. 8.; Woonryon on Commercial Law; see also the article Baoker.
C Under the law with reapect to the tranasctions of factors or agents on third parties that prevailed down to the act 6 Geo. 4, c. 94, it was held, that a factor, as such, had no authority to pledge, but only to sell the goods of his pribcipal ; and it was repeatedly decided that a principal might recover back goods on which a bond fide advance of money had been made by a third party, without his being bound to repay such advance; and notwithatanding this third party was wholly Ignoe rant that the individual pledging the goods held them as a mera factor or agent. It used also to be held, that bond fide purchasers of goods from factors or agente not vested with the power of sale, might be made liable to pay the price of the goods a second time to the real owner. The extreme hardship and injurious influence of euch regulations is obvious. It is the business of a principal to satisfy himself as to the conduct and character of the fuctor or agent he employs ; and if he make a false estimate of them, it is more equitable, surely, that he should be the sufforer, than those who have no menns of knowing any thing of the matter.
"All agente who sell goods for their principals, and guaranty the price, are sald sbrosd to act under a del creders commisaion. In this country, this phrase is eeldom used, nor is auch guaranty usual. See Del Credere Commisaton.
" Generally, neither factor nor broker can olaim their commisnions until their whole service be perforned, and in good faith, and with proper akill, cere, and industry. But if the service begins, and is interrupted wholly without their fanlt, they may claim a proportlonste compensation. If either bargaine to give his whole time to hia employer, be will not be permitted to derive any compensation for eervices rendered to other persous. Nor can either have any valid claim againat any one for illegal services, or those which violste morality or public policy.
"A principal can not revoke an authority given to a fuctor, after advances made by the factor, without repaying or securing the factor.
"The diatinction between a foreign and a domeatic factor is quite important. A domestic factor is one who is employed and acts in the same country with bis principal. A foreign factor is one employed by a principal who lives in a different country. And a foreign factor is as to third parties, for moat parposes, and under most circumatances, a principsi. Thus they can not ane the principal, beoause they are anppoaed to contract with the factor alone, and on his credit, although the principal may ane them; and a forelgn factor is personsily liable, although he fully diaclose his agency, and his princlpal is known. But this doctrine is not extended to cases where a contract for personal services is made in the country where the factor is doing husiness, by a person resident there; but the contract is to be performed or executed in the country where the principal resides. For, if auch a contract be made in the name of the principal, he alone is responsible. One who deals with a domestic factor may aue the priacipal, unless it is ahown thst credit was given excluaively to the factor. And for the purpose of this diatinction, and the rules founded upon it, we hold, on the weight of authority, thet our atates are foreign to each other.
"Fvery factor is bound to reasonable care; and he is liahle for a loas by tire, or rolbery, or other aocident occurring without his default, if he had previously done some wrongful act, without which the property might have been safe. And this rule would apply even to a gratuitous agent."-Pansons' Mercantile Law, pp. 158-162.
Factorage, or Commisaion, the allowance given to factors by the merchente, manufucturers, etc., who employ them: it is a percentage on the goods they
purchase or sell on account of their principals, and ling. The grant nsually contains a cianse that it shall varies in different countries, and as it refers to difforent articles. It is customary for factors, as observed in the previous artlele, to insure the debts due to those for whom they sell for an sdditional, or del credert commission, generally averaging from $1+$ to 2 per cent. Factorage or commission is also frequently charged at a certain rate per cask, or other package, measure, or weight, especially when the factor is only employed to receive or deliver: this commiseion is nesaily fixed by special agreement between the merchant and factor.

Fatory, in commerce, a place where merchants and fuctors reside, to negotiate hasineas for themselvas and their correspondents on commission.
Fairs and Markets. These institutions are very closely allied. A fair, as the term is now generally understood, is only a greater apecies of market recnr ring at more distant intervals. Both are appropriated to the alle of one or more species of goods, the hiring of servante or laborens, etc.: hat fairs are, in mont cases, attonded by a great concourse of people, for whoee amusement various exhibitions are got up. Faira and wakes are of Saxon origin, and were firat Instituted in England by Aifred, A. D. 886.-Spelman. They were established by order of Gregory VII. in 1708, and termed Feriee, at which the monks celehrated the festival of their patron saint; the vast resort of people occasioned a great demand for goods, wares, eto. They were called wakes from the people making merry during the vigil or eve. Fairs were entahlished in France and England by Charlemagne and Wiliiam the Conqueror, about A. D. 800 in the first, snd 1071 in the intter kingdom. The fuira of Buncaire, Falniae, and Leipsie, are the most famous in Europe. Soe E. 13. - Maydn.

1. Origin of Fairs.-Institutions of this sort are peculiariy servicable in the earlier stages of society, sind in rude and inland countries. The number of shops, and the commodities in them, are then either comparatively limited, or they are but little frequented by dealere; mo that it is for the advantage of all, that fairs should he patablinhed, and merchants induced to attend them. I this porpose various privileges have been ann in fuirs, and nunerous facilities afforded to the disposal of property in them. To give them a greater degree of solemnity, they were originally, both in the ancient and modern world, asaociated with religious festivals. In mont places, indeed, they are still held on the same day with the wnke or feast of the saint to whom the chureh is dediested; and, till the practice was prohitited, it was custouary in England to hold them in ehurchyards!-(Jacob's lawe Diet., art. Fair.) Het since the growth of towns, and the opportunities afforded for the disposal and purchase of all sorts of produce at the weekly or monthly marketa held in them, the atility of fairs, in this rountry at least, has very much diminished; they have alno lont much of their ancient aplendor; and, though some of them are still well attended, and of real nas, a good number might he advantageously sappressell. Jut it is far ntherwise in infand countries, where the facilities for carrying on commercial transactions are comparatively cireumscribed. There it in of the utmost importance that certain convenient places and specified periods should be appointed for the bringing together of commodities and dealers. This is not oniy the readient and best means of promoting commerce, but also of softening national antipathies, and difusing a knowledge of the producta, arts, and customs of other conntrien.
2. Establishment of Einglish Finira.-No falr can be holden without grant from the crown, or a prescription which supposes nurli grant. And thefore a putent le granted, it is ustal to have a writ of ad quod dammum executed and returner, that it may not be fasued to the prejudice of a aimilar entainimiment already esist-
not be to the hart of another fair or market ; but this clanse, if omitted, will be implied in law; for if the franchise occasion damage either to the king or a subject, in this or any other respect, it will be revoked; and a perion whose ancient title is projudiced is entitled to have a scire facias in the king's name to repeal the letter patent. If his Majenty grant power to hold s falr or market in a particular place, the lieges cau resort to no other, even though it be inconvenient. But if no place be appointed, the grantees may keep the fair or market where they please, or rather where they can most conveniently.
3. Time of holding Faire and Markets.-These art either determined by the lettere patent appointing the fair or market, or by usage. The atatute 2 Edw. 3. enacte, that the duration of the fair shall be declared at its commencement, and that it shall not be continned beyond the apecified time. By etatute 5 Fdw. 3 , any merchant selling goods after the atipulated time is to forfeit douhie the value of tr.e grods sold.
4. Eiffecto of Sales in Fairs and Markets.-A bonâ fide sale made in a fair or open market, in general, trangfers the complete property of the thing nold to the vendee ; so that however vicious or illegal that titie of the vendor may be, the vendee's is good against overy one, except the king. But the sale, in order to come within this rule, must take place on the market day, and at the place assigned for the market. The city of London is saill to be a market overt every day of the week, except Sunday; every shop leing a market overt for such things as the shopkeeper profeases to deal in. The property of goods may, however, be changed, and effectuaily transferred to the buyer, by a boní fide sale in a ehop out of London, whether the shopkeeper be the vendor or vendee, if the goods are of the kind in which he trades. A wharf in London is not within the custom, and is not a market overt for articlen brouplit there. But a sale in a market will not be binding if it be such as carries with it a presumption of fraud; ss, for example, if it take place in s back room or secret place; If the sale the covinous, and intended to defraud the real owner, or if the buyer know that the vendor ia not the real owner of the goods, ete. It is very difficult to transfer the property of horses, even when they are mold in an open market, witheut the consent of the real owner.
5. Court of Pié Poudre.-According to English usage, at every fuir or market there is incident, even without any expreas words in the grant, a court of pió poudre, in aliusion to the iluaty feet of the suitors. The steward or mayor may proaide. It has cognizance of ali questions as to contracts made in the market respecting gooda brought and delivered thore, etc. Formerly pid poudre courts were held at every considerabie fair, but they are now entirely laid anide.
6. Principal British Foirn.-Among these may be specifial Stourbridge, in Worcestershire. Hristol has two consideratile faira, one in March and one in September. Exptor December fair, for cattic, horsea, and most morts of commodities. Weyhill fair, in liampishire (Octobar 10), has, probalily, the grentest dianjay of aheep of any fair in the kiugdom. llarthoiomew fair, in Iondon, need to be of conniderabie importance, bus: latterly it was appropriated only to shows of wild beasts, and such-like exhilitions, and has, within these few years, been very properiy suppressed. St. Faith's near Norwich (Uctoher 57 ), is the principal Finglish fair for Beotein enttic. They are noid to the grazigra and feelers of Norfoik, Nufluik, Fssex, ete., hy whom they are futtened for the Landon markets, where they are met with in great abundance. liut besides thoae sold at St. F'aith'r, inrge numiners of Scotch eattio are dinposed of at Market Ilarborough, (Jarlisie, Urmskirk, and other pinees. Ijswich hus two conalilerable faira : one in August, for lambe ; and one in September, for buttor and cheeve:
it is sold a west Wood: and horses castle, kingdo sale dr of dea from $t$ Ameri

it is reckoned that above 100,000 lambs are annually sold at the former. Woodborongh-hill, in Dorset, for weat country mannfactures, as kerseys, druggets, etc Woodetock October fair, for cheese. Northampton and Nottingham have esch several large fairs, for horses, cattle, cheese, etc. 'The August fair of Horncastle, in Lancolashire, is the largest horse-fair in' the kingdom, many thousand horses being exhibited for sale during its continuance: ${ }^{\circ} \mathrm{t}$ is resorted to by crowds of dealers frum all parts of Great Britain, by several from the Continent, and sometimes even from North America. Howden, in Yorkshire, has, also, a very large horse-fair, partlcularly for Yorkshire hunters. Devizes, in Wiltshlre, 'bas several large fulrs for sheep and cattle. There is usually a large display of cheese st the Gloncester April fair. A guild, or jubilee, commencing the last week of Anguet, is held every twentieth year at Preston, in Lancashire ; the last was held In 1842, and was well attended. The October falr of Market Harborough, Lelcestershlre, lasts 9 days, and s great deal of basiness is usnally done in cattle cheese, etc. Woodbridge Lady-day fair is celebrnted for the ehow of Suffolk horses. Falkirk fair, or tryst, is one of the most important in Scotland, for the sale of cattle and sheep. The Cctober fair of Ballinasloe, in the county Galway, is famous for the diaplay of cattle and sheep; by far the largest proportion of these animals ralsed for sale in Connaught being disposed of at it. The aheep are generally from three to foor, the heifers from three to fonr, and the bullocks from four to five years of age. They are mostly lean; and are kept for a year in Ieinster before they are fit for the Dublin or IAverpool markets.
7. Principal French Fairs.-Among these may be ppecifled the fairs of St. Germain's, Lyons, Rheims, Chartres, Ronen, Bordeaust, Troyes, and Bayonne; but they are mnch fallen off. The most important of the modern French fairs, is that of Beaucaire, on the right bank of the Rhone opposite to Tarrascon, 14 miles east of Nismes. It ' , very favorably situated for an entrep 0 , being, excluslve of the command of internal navigation afforded by the Phone, connected by canals with the sen and the Canal du Midi. The fair, which commences on the 22d and finishes on the 28th July, was formerly the grentest in Europe, and, though a good deal fallen off, it is still attended by a vast cencourse of people, not from France only, hat also from Switzerland, Germany, Italy, Spain, and the Levant. Almost every sort of article, whether of convenience or luxury, may then be met with in the town. It is aald that the number of visitors atill amounts to from $\mathbf{7 0 , 0 0 0}$ to 80,000 , and the amount of business done to $150,000,000 \mathrm{fr}$; but we have little doubt that these estimaten are very greatly exaggerated ; and that the first would be noarer the mark were it reduced to 50,000 or 60,000 . All bills due at this falr are presented on the 27 th, and protested on the 28th. A tribunal instituted for the purpose, takea cognizance of, and immediately settles all disputen growing out of transactions that take place at the falr. A military force attends to preserve oriler, and the prefect of the department, who is alwaya present, entertains the principal merchante and atrangers.
8. German Fairs.-The principal German, or rathor European falrs, are those of Frankfort-on-tho-Malne, Frankfort-on-the-Oder, and Lelpsic. The concourse of arerchants, and the business done at these faira, are generally very great. They are coplously aupplied with the cotton atuffs, twlat, cloths, and hardware of England; the allka and jowelry of France; the printed cottons of Switzerland nul Austrla; the raw, manafactured, and literary products of Germany ; the furs of the North; 'Turkey carpets; Ceahmere shawls, ete; and there, also, are to lo found merchants of all countrien, those of Ispahan negotiatlog with those of Montreal for the purchase of furs; and Gearglana and Servians supplying themselves with the cottons of

Manchester and the fewelry of Paris. There, in fact, are met the representatives, as it were, of every people in the world, leboring; thongh withont intending it, to promote each other's interest, and to extond and strongthen those tiea that bind together the great famly of the human race. The fairs at Frankfort-on-theMains shonld begin the first on Easter Taesday; and the secend on the Monday nesrest to the 8th of September. Their duration is limited to three weeks, but thay usnally begin from eight to fifteen days before their logal commencement. Acconnts are kept in rixdollars, 1 rixdoliar of account $=1 \frac{1}{2}$ florin, or $4 \frac{1}{2} \mathrm{cop}$ sticks, or $22 \frac{1}{\text { g }}$ batzen. The rixdollar $=38.1 .8 \mathrm{~d} . ;$ so that the par of exchange is 141 batzen per $£ 1$ sterling. 100 lb . common Frankfort weight $=1031 \mathrm{~b}$, avoirdib pois. The foot $=11 \cdot 27$ English inches. The fairs at Frankfort-on-the-Oder are three in number, viz.: Remiriscere, In February or March ; St. Margaret, in July ; and St. Martin, in November. They ought, atrictly apeaking, to terminate in elght days, but they usually extend to fifteen. The Pruseian government gives every facility to those who sttend these fairs. Accounts are kept in Pruasian money, that ie, in rixdollars of 2as. 114d. 1001b. Prussian $=1031 \mathrm{~b}$, avoirdnpois. The foot $=12.356$ English inches, The fairs of Leipsic are stili more celebrated than those of either Franhfort. They are held thrice a-year-on the 1st of January, at Easter, and at Michar nas. The first Is the least important. The Easter and Michaelmas fairs are famous, particularly the former, for the vast number of new publieations nsually offered for sale. They are attended by all the principal booksellers of Germany, and by many from the adjoining countries, who adjust their accounts, learn the state of trade in all parts of the world, and endeavor to form new connections. Most German publishers have agents in Leipsic; which ls to the literature of Germany, what London is to that of Great Britain. As many as 5000 new publicstions have been in a aingle Leipsic catalogue I They are also great markets for Saxon woolens and other goods, British calicoes, French silks, and, in fact, for most descriptions of produce. The fairs ought to close in elght days, but they usually continue for about tbree weeks. No days of grace are nllowed. The holder of a bill must demand psyment on the day it becomes due; and, if not paid, he must have it protested on that very day, and returned by the first opportunity. If he neglect any of these regulations, he loses all right of recourse upon the drawer and inderaera. Money of account at Leipsic asme sa Frankfort-on-the-Maine. 1001b. Leipaio $=1031 \mathrm{~b}$, av oirdupois. The foot $=11 \cdot 11$ English Inches.-Kelr iy's Cambist; Manuel de Nelkenbrecher; Howaing's Report on the Prussian Conmercial L'nion, pp. 255, 269, etc. Dr. Bright gives, in hls Tra"els in Hungary (pp. 201-223), an interestiag acconnt of the fairs held at Debretzin and l'esth. The latter has become the grand centre of Hungarian commerce; most part of which is conducted at its fairs.
9. Hulian F'airs.-Of these, the most celebrated is that of Sinigagia, a amall, but handsome town of the l'apal dominions, on the Misa, near its confluence with the Adrintle. The fair emmmences on the 20th of duly, and should terminate on the last day of that month, but it namally continnes elght or ten days longer. The duties on goods brought to the fair are oxtremely moderate, and every thing is done to promote the convenlence of those frequenting lt. All sorts of cotton, woolen, and silk goods, colonial produce, Iron end ateel, hariware, jowelry, brandy and liquore, timber, druga, apleca, ete., are brought here ly the English, French, Anstriana, Swisa, etc. These are exchanged for the varions raw and manufmetured products of Italy and the Iovant ; conslating, smong others, of raw, thrown, and wrought allka; oll, fruits, cheese, alum, soda, sumneh, sulphur, ete. The value of the imports for the fair of 1841 , was ontimated at about
\&1,500,000. Accounts are kept in mendi of 20 roldi ; the seudo $=4 \mathrm{a}$. 4d. very nearly. 1001b. Sinigaglia - 78 avoirdupois. The oll or bracolo measuren 25.88 English Inches.- Manuel do Nellienbrecher ; MiO enzaor'e Tarift, Italy; p. 121.
10. Ruasicen Fhirg.-These are numerous, and many of them are well attended. The most important is held at Nijnii-Novgorod, at the confliuence of the Oka with the Wolgga, int. $66^{\circ} 19^{\prime \prime} 40^{\prime \prime}$ north, long. $44^{\circ} 28^{\prime}$ $80^{\prime \prime}$ east. Previously to 1817 this fair was hold in a less convenient aituation, at Makarieff, lower down the Wolga. But the buildings for the accommodation of the merchante at the latter having been accidentally burnt down in 1816, goverament took advantage of the oircamstance to remove the fair to Nijail. It is principally carried on within the new basaare constructed for that purpose on the left bank of the Oka. These, whlch are divided into parallel rowe, or streets, are coustructed of stone walls and roofod with iron, having covered galleries in front aupported by fron pillars. They are built on piler, and, to guard againat Inundationg, the ground oa which they etand has been raited about 20 feet. Being inclosed on three siden by canala, and on the fourth by a navigabie iniet of the Oka, thore in evory faclity for the delivery and ahipment of goode. The establishmont is of great extont, comprising 2524 booths, and is adnilted on all hands to be at once the largest and most perfect of ita kind that is anywhere to be met with. But, in addition to the above, no fewer than 2506 shops and bootha belonging to private parties, and conatructed of wood, wore occupied during the fair of 1841. The fair begina on the let of July, and continues for a month or six weeks.
The total value of the various articlos of Assatic (lneluding Chinese) produce oxposed for sale at Novgorod in 1841 amounted to $9,146,719$ silver roubies, being more than double the value of the products of western Enrope oxposed in the aame year. Of the iatter, indigo, wine, and cottons rore the principal articies,-Journal des Manufactures, Petersburg, 1842. Tho atationary population of the town, which may amount to about 25,000 , is, during the fuir, sald to amonnt to from 180.000 to $\mathbf{1 6 0 , 0 0 0 ,}$ inclading Chineeo, Persians, Armeniand, Tartare, Bokharians, etc. Theatrical oxhibitions, shown of wild beasts, and other Bartholomew fair exhilitions, add to the attractions of the scene. Anothor celelirated Rusnian fair is held in the month of December, of Kiachta, in Mongolia, on the Clinese frontier, lat. $50^{\circ} 21^{\prime} 5^{\prime \prime}$ north, long. $100^{\circ} 28^{\prime} 15^{\prime \prime}$ east. The town is smali; the population not exceeding 4000 or 5000 ; but by far the largest part of the oemaierce botween the Ihussian and Chinese empires is transacted at its fali, and it is also the centre of the political intorcourse between them. The commodities brought hither by the Russians consist prineipaliy of Russian and German broadcloths, furs, sheep and lamb akins, leather, coarse linesa, worsted stuffi, cattle, etc., with, for the most part, bullion. These they change with the Chinese for tea, raw and manufactured silk, nankeens, porcelain, sugar candy, rhubarb, tobaceo, musk, etc., the value of the articles, however, other than tea, boing comparatively inconsidorable. The quantity of tea purchased at the Kinechta fairs by the Rusalana, which has iatterly increased very considerably, amoanted, in 1850, according to the official returna, to 210,173 poods, or $7,566,444$ pounds, of very superior tea, worth about 2s. 6d. per pound, and 85,440 pooda ( $8,076,840$ jonadr) inferior or black tea. At an averaye of the six years ending with 1850, the totai finports of all sorts of tee into Ituseia through Kiachts was estimated at $11,788,464$ pound, Eing., a year. Aceond ig to the anme necounta, the total vaine of the experts to China through Klachts, in 1850, amounted to $6,91 t, 071$ ailver noublea, and that of the imports to about the sume. The custome duty received at Kiachta in $18: 8$ amounted to $2 y 23,304$. The Ruaslan
trado in in the hands of a compurativoly amall number of morchanta, some of whom are vory rich; that of the Chinese to much more diffused. Commoditien may be convoyed from Kichta to European Rursia either by land or by water. In the formor case the journey takes a yoar; in the latter, it takes throe years, or rather three very short summers; the rivers being for the most part of the year frozen over.-Schnitis. ler, statistique Gíndrale de l'Empire de la Russie, p. 148, etc.
11. Turkish Fairs.-Several Important fairs, of which little or nothing in known in this country, are held at varions places in European Turkey. Among others may be apeeified those of Usundji, or Usundjova, in Roumelia ; Joanima, in Albania; Stronga on the Lake of Ocrids; Nov1-Bazar, In Upper Mcosia; Ialivni, in Thrace; Prelip and Nicopoll, in Macedonia; EeklDjouma, in Bulgaria; and Zeitoun and Pharsalia, in Thessaly. The largeat and moet important of these fairs is that of Usundji, held at tho villege of that name, on the Uanndjl, a tributary of the Maritza, about 44 miles W. by N. of Adrianople. It was vieited by M. Blanquil ln 1841, and by Mr. Spencer in 1850. The latter saya (but statemonts of this sort aro very apt to be exaggorated), that it was attended by from 80,000 to 100,000 peoplo, who had journeyed hither from all parts of European Tuirkey for the purpose of disposing of thoir wool, hldes, raw cotten, leeches, and other products of the country, and of purchasiag in retura tise manufactures of the West. The show of the latter lo very extensivo. Sheds are erected in the village by government, which serve as warehousea for the merchants, and every house is converted into a han for the reception of strangers. But by far the greater nu.aber of the latter have, notwithstanding, to eneamp with their cameis, horsee, etc., on the aurrounding plain. Blanqui apoake in high terms of commendation of the good ordor that prevailed, in the abeence of any thing like police, among the metley population at the fair.-(Blakqui, Voyage en Bulgarie, p. 252; Spen. cen's Travels in European Turkey, fi., \&46, etc.) This great fair, which lasts for 15 days (Blanqui) is held, like the other fairs, in autumn, immediately after harvest. But though it lie largely frequented by German, Swise, Italian, and Greek morchanta, who transact a great amount of businose, it is very littie, if at all, known in England. This ls the more surprising, seeing that we have consuls at Adrianople sad other places not very diatant from the seat of the fair. And it unight have been aupposed that these function. aries would have been anxious to aend home the mest ample detaila with respect to thic and other fairs in their vicinity ; deacribing the producta which might be most advantageously bought and sold at these marts; the routes by which they might be moat easilly reached, and so forth. But if such roports any where exist, they have not, at all events, been published. And hence, probably, the fact of the business of these faira being mostly in the hasds of forelgners.
12. Lastern Fairs.-The most important fair in the Eastern world is that held at Mecen during the resort of pilgrims in the month of Dhalhalja. It uned to be frequented by many theusands of Individuals of all ranks and orders, brought together from the remotest corners of the Mohammedan world; and though the numbers attending it have declined of late years, the concourse is atill very great. See Caravas. Ifurdwar, in Hindostan, in lat. $29^{\circ} 57^{\prime} \mathrm{N}$., long. $78^{\circ} 2^{\circ} \mathrm{E}$., 117 miles N.E. from Delhi, is fameus from lis belng one of the princlpal places of Ilindoo pligrimage, and the greatest fair in India. The town, which is but inconsiderablo, is situsted on the Ganges, at the point Where that anored stream isaues from the mountains. The pilgrimage and fuir are held together at the vernal equinox $;$ and Europeans, nowise eddicted to exaggeration, who have been repeatedly present on theso occashome. estiminte that from 200,000 to 300,000 atrangers
are then ascombled in the town and its vicinity. But overy twelfth year is reckoned peculiarly holy; and then it is 'supposed that from $1,000,000$ to $1,600,000$, and even $2,000,000$ pilgrims and dealers are congregated together from all parts of Indie and conntries to the north. In 1819, which happoned to be a twelfth year, whon the suspiclous moment for bathing in the Gangel wan announced to the impationt devotees, the rush was to tremendom that no fewer than 480 persons were eithar trampled to death nnder foot, or drowned in the river! The foreigners, resorting to Hurciwar fair for commencial purposes only, consist principally of natives of Nepanl, the Punjab, and Beshwaur, with Afghane, Uabeck Tartare, ete. They import vast numbers of horses, cattle, and camele ; Persian dried fruits, shawls, drugs, eto. 1 the returne are made in cotton piece gooda, indigo, angar, apices, and other tropical productions. The merchante never mention the price of their goods, but conduct the bargain by touching the different jointe of their fingers, to hinder the byatanders gaining any informatlon. During the Matrratta away, a kind of poll-tax and dutics on cattle were levied; but all is now free, withont impost or molestation of eny sort. Owing, aleo, to the precantions adopted by the Britioh government, the most perfect order is preserved; much to the surprise and satisfactlon of the natives; for, antecedent to our occapation of the country, the fairs usually ended in disorder and bloodrhed.-(Privals Information, and the excellent account us Hurdiear in Hayilion's Gazetteer.)

The fain of Portobello, Vera Crus, and Acapulco, once a famons, are now totally deserted; that of the Havang is also much fallen off.
In the United Statee, fairs are princlpally confined to exhibitlons of agricultural and mechanical articles, and also for the sale of fancy articles for charitable purposes, under the control of private compenlea, and not subject to especial restrictions or lawe. In the westera States, espeoially in the stock-growing districts of Kentucky, fairs are held in each county, at the county towns, once every month, for the sale of live atock, etc., subject only to local reatrictions. These fairs or aales are of great convenlence to the farmers or drovers, by iringing them together at stated times. As an instance of their usefalneas, in Paris, Bourbon county, Kentucky, a town of 1500 in habitants, Uve stock to the amount of 100,000 , on an average, changes hands overy court dey.
Falkland Inlande (Fr. Malouines, Sp. Malvinas), s group of lslands in the South Atlantle Ocean, beloaging to Great Britain, and lying about 250 miles east of the nearest mainland of South America, between $51^{\circ}$ and $88^{\circ} \mathrm{S}$. lat., and $57^{\circ}$ and $62^{\circ} \mathrm{W}$. long. or in precisely the same latitudes south as London and the midiand connties are north. The group conaiate of two principal Ialands, East and West Falkland, with saveral hundred others of different sizes clustered around and in the strait between them. East Falkland is about 85 miles in longth by 40 in breadth, and West Falkiand 80 miles long by 25 to 80 miles wide. They are weparated from each other by Falkland Sound. The other ialands range in size from 16 miles by 8 to mere islets of half a mile acroes. The whele group is deaply indented by namerous harbors and creeke, which, if they diminish the area, produr a more than counterbalancing sdvantages. Very little is known of West Falkland. It is uninhabited, but at certain seasons it is visited by whaling and other vessela. East Falkland is nearly divided into two unequal portions by the eatuarien called Breton Sound and Choiseul Sound, the two parts of the island being connected by an iathmus ne's more than a mile and a half across. The northem portion in crossed by a chain of rugged hilla, called the Wickham Helghta, extending due eatt and west from Port William to Port Snseex, and varying ln hoight from 800 to 2000 feet.

There are fow wild animals indigonous to the Falklands. The only quadruped is the warrah or wolffox (Camis Magellanicus), rather taller, but not much hesvier, then our fox. The other animals which are found in a wild state are those which have been left there by Europeans, as herned cattle, horses, sheep, wild hoge, and rabhlta, all of which are vory abundant. There is a plentiful supply of excellont fish in all the creeke, and of amall trout in the lahes and sivulets. Hair and fur seals abound, and the black whalo is atill numerons about thene coasta. The wild fowl are alao numerous, as owany, geeae, ducks, snipes, etc. Thera are fow land blrds or insects, and no soptilem. A gigentic sedgy grass, called tuseac, of the genus Carex, is very common on most of these islands... Its blade averages seven feet in length by about three quartera of an inch in width, is extremaly nutritious, and admirably adapted for fattening cattlo. Turnips, carrots, potatoes, and vegetables thrive well, and barley and oats have been anccessfully cnitivated. Furze and other shrubs grow well, bnt there are as yet no trees. Peet is ebundant, and some of it is highly bituminous. Coal has been discovered, but whether it can be profitably worked has not yet been ascertained.

The discovery of these felands has been by many attributed to Amerigo Veapucci, in 1502; but it is more probable that thoy were first discovered by $\mathrm{D}_{\text {bvis }}$ in 1592. In 1594 Hawkins sailed along their north shore; and in 1690 Strong sailed through the channel which eeparates East from West Falkiand, and cslled It Falkland Sound, whence the group afterward took its name. During the earlier parts of the elghteenth century these islands werefrequently visited by French vessels ; and in 1764 a French colony was ostablished at St. Louis, on East Falkland. Two years later the English planted a colony at Port Egmonton, West Falkland. In 1767 the Spaniards took possession of the French settlement, and three years later of the English. In consequence of this step, some negotiations were ontered into, the result of which was that the soverelgnty of these islands were ceded to the English, who, however, some time afterward abandoned them. Thongh frequently visited by whaling veaseis and others, they centinued without permanent inhabitants till 1820, when they were taken posseasion of by the republic of Buenos Ayrea. A settlement was formed st Port Louis, which rapldly Increased until 1881, when, in consequence of a dispute with the United States, it was destroyed by the Americans. In 1833 the English again assnmed possession of the Falklands, and stationed an officer and boat's crew at Port Louls. In 1840 the government resolved to colonize these islands, and sent out for that purpose a governor and a amall establishment, who settled at Port Louis. A more advantageeus sitnation for a settiement was aubaequently found on the south side of Stanley Harlor, whore, In 1844, a town was laid out. Mr. Lafone, a wealthy merchant, obtained from government an extenaive tract of land, and posseasion of all the wild cattle and other wild stock for six yeare, from 1at Jannary, 1848, in consideration of a payment by Installments of $\mathbf{x 6 0 , 0 0 0}$. Mr. Lafone's interests have recently been purchesed by a chartered company; which now possess, in East Fulkland, all the southern peninsula called Lafonia, consisting of about 000,000 acres, besides 138 islands and islets, with an aggregate area of about 200,000 acres, until January, 1856. The company possesses absolute right to all the wild cattle or other wild atock whlch may be found apon any of the islands, but after that period this right ceases except as to atock, etc., then In actual poasesaion of the company. In 1847 the population of the colony was 270. The governor of these islands, in January, 1853, reperts the colony to be steadily progressing. In 1851, the number of .tona of shipping that entered the port of Stanley was 17,538 , and in 1852 It was 22,024 , being
an tricrease of 4,486 tons. This necessarily produces a demand for prodnce and labor. t Onskilled Iaborers earn from ss, to bs. a day, and akilled from 6as to 10n! Provisions are abundant, and at 'reasonable prices. "The tranaference to the Falkland Islands Compeny of the large interests held 'by' Mr.' Lafone, and the commencement by that corporation of a more comprehenalve syatem of operation, supported by a large capItal, gives me very favorable hopes of benefit to the colony, and, I trust, to the shareholders." ' (Report.) In 1849, twelve allotments of one acre each; near the town, were' put np for esle; and wert sold on an average at $£ 6$ per acre; and cleven similar allotmenta, sold in 1852, prought on an average $\mathbf{2 1 2}$ per sere, or six timee the usual government price. "The master of a barque, the Record, lately in the harbor, publiely notified that he would take passengers to the gold diggings in Australia at $\mathbf{8 1 0}$ per head, and it giver me mach pleasure to add that not a person could be fonnd in the colony to accept hla proposition." (Report.) Being chiefly dependent apon the ships that call here to refit or for refreshments, the opening of a ship-canal between the Atlantic and Pacific Oceans would affect this sottloment very much, and might probably lead to its abandonment.-E. B.

Excopt as commorcial and military stations, these islands possess no importance. There is no tonnage duty levied on veasels ontering the ports of these islands; nor, indeed, any charges, except for otorage, which is offected in bulk, and for which there is a charge of from 45 to $\$ 10$ per day. In a recent official communication addresed by the present governor of the Falkland 1slands, that functionary observes: "I
to ntate that, as regarda the precine limit to which treat Britain will limit the right of tishing, I have no instractlous. " I will, however, communicate with her Majesty's government on the subject by the first opportunity." Aa American captains cruising about these islands have, on one or two recent occasions, bsen subjected to considerable inconvenience and expense by the execntive anthority of the Falkland Islands-so mnch so, indeed; as in one instance to render the interposition of a United Btates' vessel of war necessary-it becomes a matter of somo importance to American whaling intoreats to have the question settled as speedily as possible.-Com. Rel. U. S.
Fall, the name given in Scotland to a measure both of length and snperficies. As a measure of length, the fall is equal to six Scots olls, or 6.1764 English yards; and as a measure of superficies, to 36 square -lls.
Fall, the sea term for the rope of any pulley or aystem of pulleys. To, fall aboard signifies to run foul of another vessel.
Falling Home. The term applied to the timbera or upper parts of the sidea of a ahip when they enrve inwards. The old ships fell home, or tumbled in (as it is called), much more than the modern ones, which approach more nearly to being woll-sided.

Fall River, Massachusetts, 46 miles S. of Boston, situatex on the Fall River, at its junction with the Tannton, which falls into Mount Hope Bay, a branch of Narraganset Bay. The harbor on Tannton River is asfe and easy of access, and has depth of water sutflcient for the largent ohips. Fill River has a large coasting trade, and is engaged in the whole and other fieberies. It has oxtennive cotton and woolen factories, bleaching-works, founderies, etc., and communicates regulariy with New York hy steamers, and with beston by railway. Pop. (1850) 12,680.

Faimouth, a seaport town of Engiand, on a hranch of the estnary of the Falmouth, 14 m. N.N.E. the Llaard Point. Lat. $50^{\circ} 8^{\prime} 8^{\prime \prime}$ N., long. $5^{\circ} 2^{\prime} 7^{\prime \prime} \mathrm{W}$. The harbor is formed by the eatuary of the Falmonth, has nunerous creek, and is about five milee in length and one mille in breadth. The entrance in defended by Pendennla and St. Mawe's castles, both luilt in reign
of Henry VIII.; and the former containing large ban racks, maganines, etc. Its position at the ontranee of the English Channel, has rendered. Falmonth for the lave 150 years a principal station for the foreign mail-peckete, and the grent rondeavous for fleets proceeding to the sonth and weat.
Onalse Eeel the timber added below the main keel, both to sorve an a defense, and also, by deapening the plane aurfine, to enable the ahip to hold a better wind.
7. Fan; a almple and well-known implement employed to produce coolness by agitating the air. Upward of 8000 years ago the artiat of ancient Egypt painted the fin on the walls of the tombs at Thobes, where the Pharaoh alts aurrounded by his fan-bearers. These offioore acted as generals or marshals, using their fans as atandards in war, and in peace thoy assiated the Pharnoh in the temple, and waved their varlegated fana both to produce a cooling breese, and to guard the sacred offerings from the contamination of noxloas Ihsects. The fan is mentioned by Euripidee, and its Grectan forme were far more beantifal than the Egyptlan. The wings of a bird joined laterally and attached to a slender handle, formed the simple yet gracefnl fan of the priest of Ieis, when Isis became a Grecian deity. It was sometimes formed of fanthers of different lengthe, apread out in the form of a semicircle, but pointed at the top. This fan, the precise type of the state-fan of India and China of the present day, was waved by a female alave. The fan is mentioned by T ence and Ovid; and was termed indifferently "flabellum" or "muscarium." When the Romans were at meala, it was the duty of certain slavee, when the weather was warm, to cool the room with fans and drive away the flies. The modern Greek church places a fan in the handa of its deacons to guard the offliciating priest and the elements from desecration. When the fan was brought to France by Catherine de Mediels, it was so constructed that it could be folded in the manner of those used in the present day. Fans in the luxnrions relgns of Louis XiV. and XV., shone with gilding and geme, and were ornamented with the pictures of Boucher and Watteau. At that time no toliet was eateerned complete without a fan, the cost of which was frequently he high an from $\$ 60$ to $\$ 70$.

In fan-making, the Chinese and French are the groat rivals, and may be sald to monopollze the supply of the whole world. In the iacquered fane the auperiority of the natives of China is fully admitted. These are unrivaled both in lownews of price and in originallty of deaign, brilliancy of coloring, and io general correctness of workmanshlp. In Chins the manufacture of fans is aimost entirely confined to Canton, Sontehon, Hang-tehoo, and Nankin. The fans of ivory and bono, and of feathers, are made exclusively for exportation to Rurope or America. Those used hy the Chinese are of bamboo, polished or japanned, and covered with paper. They are sold at from 20 cents to 83 per dozen, according to the quality of the frame and the design of the leaf,-E. B.
In France, fan-making has arrived at a high degree of perfection, and presents a remarkaile instnnce of the aublivision of labor. About twenty different operationa, performed by as many paire of hands, are necesaary to the production of a fan which aplls for less than ons halfpenny. The processes are not all carried on in the aame manufactory, but forn four diatinci branches of trade, directed by distinct masters; bnt the operativen usually work at home at their own housen. The frame-work of fans is moetily made in the department of Oise, where 2000 men , women, all chlidren are thus employed. The woods employed are chiefly plum, obony, lime, and eandal-wood; and the plercings which form ouch a general decoratlon to fans, are performed by minute saws, which the workman makes for himself out of plecea of watch-spring.

In one piercinge printing, of fans factorien
"The who finis the provi ployed 10 166 child of fans. Paris, it makers, feuillistes, fans made ployed $5 \%$ youths, an carn 4 frax men were and printe painters,' illuminator in twenty had incre number of change is a enpecially bossing thi chromo-lith period. By abled great tion of chea Chinese.

The climate are frequent a only summer eevere. It BC and the harb grain erop is tainty of the ripe condition state, the infle to be to the ou It to 60. The suited to the :

In one fan there are in some opecimens 1600 sawpiarcings in a square inch of mother-of-pearl. - The $^{\text {a }}$ printing, the colorins, the mounting, and the finishing of fans are montly condncted at Paris, where the fanfactories are on e considerable acalo.
"The number of fan-makers, or eventaillites (those who enich the fans which have been roughly made in the provinces), in Paris, in. 1827, was 16, who ompioyed 1010 work-people ( 844 mon, 500 wemen, and 166 children), and wold about $1,010,500$ franes' worth of fans. According to the Statistique our l'rndustris \& Paris, it appears that in 1847 there were 122 fan. makers, comprising chamber-masters, mounters, feullistes, painters, and colorem. The value of the fans made whas 2,526,816 francs. These masters 6 m pioyed 575 work-peopls ( 202 men, 264 women, 29 youths, and 20 giris). 'The workmen on the average earn 4 france, and the women 21 francs per doy. The men were for the most part copper-piate engravers and printers, lithegraphie draughtsmen and prigters, painters, and colorers ; the women wore monnters, iliuminators, painters, colorers and overlookers. Thus in twenty yeare it appears that the produce in fans had increased in value nearly threefold, while the number of werk-peopie had diminished one half. This change is attributed to the employment of machinery, especialiy of the fiy-press, in stamping ont and embossing the ribs, and the extensive employment of chromo-ithography, an art not practiced at the former period. By these means the French have been enabled greatly to increase their exports by the production of cheap fans, to compete with those made by the Chinese.
Farina. (Lat. far, corm, of which it is made.) Meal or flour, obtained by grinding and aifting wheat nd other seeds; hence the term farinaceous food.
Faroe, or Feroe (Danish, Färjerne), a group of iulands belonging to Denmark, in the North Sea, between Iceland and the Sbetland Isiands, about 200 miles north-west of the latter, between N. lat. $81^{\circ} 20^{\prime}$ and $62^{\circ} 25^{\prime}$, and between W. long. $6^{\circ} 16^{\prime}$ and $7^{\circ} 40^{\prime}$. The group consists of 17 Inhabited and several uninhabited islands, the former having an area of 490 square miles, and (in 1850) 8150 inhabitanta. The principal islands, with their populations, in 1845, were Strömó, 2162 ; Osterō, 1909 ; Sûderỏ, 1156 ; Vaggö, 649 ; Sandö, 528 ; and Bordo, 804. They consiat throughout of roeks and hilis, rising to a considerable height, end separated from each other by narrow valleys, or rather ruvines. Although, however, these hills rise abruptly, there are often on their enmmits, or st different atages of their ancent, plains of considersbie magnitnds. They everywhere present to the sea perpendicnlar cilff, broken into a thousand fantastic forms, presenting to those who saii aiong the coast, at every turn, the most picturesque snd varicd seenery. The higheat peak is that of Skeliingfeli, in the island of Strömó, which rises to about 8000 feet above the sea. The rocks consiat generaily of trap, and exhibit little varieiy of composition, though they present some striking geological phenomena. The zeolites and chalcedonies here collected have long supplied the best specimens of these minerale to the cabinets of Europe. Coal is found in Sudero and some of the other islends, and turf is abundant.

The cimats is moiat and foggy, and violent storms are frequent at all seasons. July snis Auguat are the oaly summer months, but the winters are not very severe. It soldom freezes for more than one month, snd the harbors are rarely ice-bound. The oniy grain crop is bariey; and on account of the uncertsinty of the weather, it is frequentiy roaped in a halfripe condition. Agriculture is in a very backward state, the infield, or cultivated land, being calculated to be to the outfield, or uncuitivated, In the proportion 1 to 60 . The plow is aeldom used, being in fuct ill suited to the rugged and uneven surface of the iand.

The ground is therefore turned up with the apade, care boing taken not to deatroy the roots of the grass. Horsen and cows are fow in number, and the latter glve very little milk, in consequence, probably, of the very coaree hay upon which they are fed. Sheep are numerous, and form the chlef riches of the inlanderssoms individuals having fiocks of from three to five hundred. The sheep are never housed sithor in summer or winter, and in severe seasons they anfiar coniderably. The wool is generally coarse, and is torn off the animala in so rough a manner as often to lacerste the skin. . The catching of the numerous hiris which build their nents upon the face of the cliffs, forms a great source of subsintence to the inhabltants. The persons employed in this hazardous trado display great ingennity and the most adventuroua spirit. Sometimes the rowler is let down from the top of the cliff by a rope fastened to his waist; at other times, where there is any footing at all, he climbs the ateepest rocks, or, where that is impoasible, he is pushed upward by poles made for the purpose. The puffin (Alca arctica) is the most commen of these hirds, and the elder-duck is here often sbot for food. The fisherles are important and valuable.

The monopoly of the trade of the Faroe Islands was for seme time in the hands of a mercantile house at Copenhagen ; but it has alow been assumed by government, and neither Dane nor foreigner is allowed to interfore. The trade is carried on between Copen. hagen and Thorshavn. The chief exports are hosiory, taliow, dried and salt fish, train-oil, feathers, akins, and butter. Thorshavn, the capital if these islands, is situated on the south-east side of th island of Stromo, upon a narrow tongue of land, having creeks on each side, where ships may be safely mevred. Population about 1500. The houses are built of wood, and roofed with birch bain covered with turf, the greenness of which makes it impossibie, at a very short distance, to distinguish the place from the surrounding fislds. The character of the people is generally mariked by great simplicity of menners, kindness and hospitality. They are well fed and ciothed, and seem to be kindly treated by the Danish government. The average duration of life, as atated by Dr. Panum, is 44 2-5 years; while in Denmark it is only 86. The language of the people is a remnant of the old Norse, but that of the courta, churches, and schools is the modern Danich. See Forow and Fuerom Reserala, by Lucas Jacomskn Denes, translated from the Danish into Einglish, 1675 ; Description of the Faroe Ielands, by the Rev. G. Landt, London, 1810; an account of their geology and mineralogy, in the Trans. of the Royal Soc., Edin., vol. vil., by Sir G. S. Mackenzir, Bart., and Thomas Ahlen, Esq. ; Den Danske Stats Statistik, vol. iv., 1858 ; J. Nichol's Account of Iceland, Greenland, and the Feroe Iales; Dr. Panum'e Official Report on the Diseases of Feroe, 1849, of which an abatract in vol. vii. of the Medico-chirurgical Review. Tie scenery of these isiands is well illustrated in a work entitied Cruises of the Yacht Maria, London, 1855.-E. B.

Farthing, a amall Engliah copper coin, amounting to $\frac{f}{f}$ of a penny. It was ar sientiy called fourthing, as being the fourth of the integer or penny. A farthing of goid, equal in value to the fourth part of a noble, or 20d, in silver, is mentioned in statute 9th IIenry V., cap. 7.

Fascines (fascis, a bundle), in fortification, faggota, or bundles of rods, or small branches of trees, bound together in several places. They are used for various purposes, such as raising batterien, filling ditchea, forming parapets, etc., and vary in dimenaions according to the purposes to which they are to be applied. Fuscines dipped in pitch are sometimes employed to fire the enemy'e lodgments or other works.

Fashion (Fr. facon; originaily from the Lat. facere, to make or form), a term used to algnify the
prevalling mode or taste in any country, the only recognized quality which it possesien beiag mutability. It may safoly be a verred that, in proportion to the Infiuence which fashion exercisen in any country may the claim to civilization be vindicated-nothing being eo characteristic of a rude and barbarcua state of oxintance as a rigid adherence to the curtomin of antiquity. The term fashion has generally been conaidered as applicable chiefly to the adernment of the person, in conformity with the provailing taste as introduced by nome individual of consideration in society; but it hat a much wider signification, being applied to the most trivial kind of conventional nsages, a disregard or ignorance of which is sufficient, in the syes of the rotariea of this tyrannical goddets, to banish the offender beyond the pale of civilized societr.
Fat, an olly concreto eabatance, contained in the cella of the adipose or cellular membrane of antmal bodies. Fat also deuotes a measure of capacity, bat indofinito. Thus a fat of ioinglass containe from 84 cwt . to 4 cwt ; of yarn, from 220 to 221 bundlea, etc. Fat, or vat, a large wooden tub or vessel nsed in breweries and tanneries; also as a measure for malt, containing eight bushele.
Fathom, a measure of length, six feet, ehiefly used for measuring the length of cordage, and the depth of water and mines.
Fayal. The Azores, or Western Inlanda form a range situate in the Atlantic Ocean, extending in an oblique line from north-west to south-east, between $87^{\circ}$ and $40^{\circ} \mathrm{N}$. lat., and $25^{\circ}$ and $82^{\circ} \mathrm{W}$. long. It has been a subject of some controveray amorg geographers, to what division of the globe they ought to be referred; hut they are now generally considered as pertaining to Europe. It does not appear that the anclents had any knowledge of the Azores, or of any group in this sea, except the Canaries, to which they finally applied the colebrated appellation of the Fortonate Islands. But the Arabian geographers, Edrisi and Ibn al Vardi, describe, after the Camariea, nine other islands in the Western Ocean. That these were the Azores is highly probable, since their number is exactly nine; and because a species of hawk la specinlly noticed by these writers as existing there in great abandance-a circomstance that afterwand appeared to the Portuguese so remarkabie, that they gave them the name of Azores, or Hawk Islands. The climate in which they are placed also makes them north of the Canaries. Some other coincidences also mighte de pointed out ; and, upon the whole, there appears mo renaen to donbt that the Azores are really the nine islands enumersted by the Arabians. The Aralian writers represent them as having been populous, and as haviag contained elties of some magnitude; but they state thet the lahabitants had been greatly redaced by inteatine warfare. At the tima of their diacovery they were uninhabited, and covered with forests and underwood, which havi now entirely disappeared.

The first European discovery of this group is claimed by the Flemings. A Flemish merchant named Van der Berg, is reported, in saliing from Liston, to have been driven upon thesa shores in the year 1439. The intelligence soon reached tha court of Lhabon, where it excited censiderabie interest ; and the pavigator Cahral was sent to prosecute the discovery. In 1459 the islands begen to the planted and colonized, and in so fertile a soil the inhabitants rapidly multiplied. In 1580 they fell, with the other Portuguese territoriea, under the dominion of Spain. At this time tha Azores were the grand rendey vous in the voyage homeward of the fieets, rhleit came laden with the wealth of both the Indies. Hence they became a theatre of that maritlme warfare which was carried on wlth such spirit by the English ander Queen Elizabeth against the peninsular powers. In 1586 Sir Walter Raleigh equipped two plinnaees of 35 and 40 tona, the
command of which he gave to Captain Whiddon. Having taken two or three prizes, they fall in, off St. Michaol, with the great fleet of Spanieh galleons, connisting of 24 eail, two of them carracks of 1000 or 1200 tons. They attacked them, however, without henits. tlon, hoping to eat of soms atraggling momber of this great body, but wore unable to make any impression upon It.' In 1687, Sir Francle Drake, after having awept the harbor of Cedia, aniled for the Azores, whore he took an Eact India carrack, richly laden, and the firat that had ever fallon into the hends of the English. In 1589 the Earl of Cumberland fitted out a squadron, sallod for the Azorea, and made numsmua prizeo. Under the active administration of Pembal, considerable exertions wore made for the improvement of the Azores ; but the stapld and bigoted government which followed rather ton' 2 d to destroy these benefte, and to make the bilande take a retrograde course.
Pherical Aopect.-The Asores within a recent period attracted some attention as the theatre of contest botween the parties contending for the crown of Portugal. The adherents of the constitation, whe sapported against Miguol the rights of Maria da Gloria, obtalned possession of Terceira, where thay succeeded is raintalning themselves. After various atruggles, Queen Maria's authority was eventually established over all those islands.
The aspect of all the islands is vory similar in genoral characteriatics, presenting an olevated and nindulating outiline, with little or no tablo-land, and rising into peakn, of which the loweat (that of St. Mary's) is 1889 feet, and the highest (that of Pico) 7618 feet above the level of the sea. Their lines of sea-const are, with fow exception, bigh and nrecipiteun, with basee of accumalated masees of falien rock, in which open bays, or acarcely more inclosed inleta, form the harbors of the trading towne. The climate is particularly ternperate and equable, the extremes of sensible heat and cold being, however, increased by the degrea of humidity present in the atmoephere. The rangs of the thermometer is from $45^{\circ}$ Fahr., the lowest known extrome-or $48^{\circ}$ the ordinary lowest extreme of Jan-uary-to $82^{\circ}$ the ordinary, or $86^{\circ}$ the highest known oxtreme of July, and near the level of the sea. Between these twe points (both takan in the shade) there is from menth to month a protty regular gradation of increase or decrease, amounting to somewhat less than four degreas. (Geographical Journal, vol. xv.) They have au aggregate area of 700 square milea, and in 1841 had a population of 214,300 . St. Michaal, the largest and most populous of thess inlands, has an area of 224 aquare miles and (1840) 80,809 inhalitants. Procesding from east to west, this inland presents a conaiderable variety of surface. The enst end rises from a bluff soa-clifr of between 1200 and 1400 feet elevatien, to a lofty inland paak from which a central range, varying in height from 9000 to 2500 feet, runs to the wentward, terminating h he Serra de Agoa de Pao, 3060 feet above tha sea. The eea-coast grudually doclines in approaching the last point, where it is not more than alout 100 feet high. The part next seen is lower, and its outline, as presented by the summits of namerous volcanic menticules of about 1300 feet elevstion, united in a central ridge more undulating; the western oxtremity being marked by the conapicuous Serra Gorda, 1574 feet above the sea; and its shores on both sides are low, broken, and rocky. Of tha remalning part the aspect is that of a vast truncated cone, irregularly cut off at an elovation of about 800 feet, and falling on the north, south, and west sides to a perpendiculur coast of between 800 and 800 feet high. The outline is varied by the intervention of peaks, thrown ap on the summit and flanks, and round the foot of the mountain. In the highar parte, the surfacs is generally covered with an undergrowth of heatis, cedar, laurel, laureatinus, and other evergreen shruis

Like all volcanio conntrien, the face of the finfand is unevetiand irrogular, being deeply excavated by numerons ravines and roughened by atreame of semi-vitrified and scorlaceons lava that resiat all atmospheric infuencell and repel vegotation. Ifeavy rains falling on the mountains afiord a constant supply of water to four lakes at the bettom of extinct craters or auboidences, and a number of miner reservoirs; and through them to mall sireams running rapidly down on all sides into the sea.-Geographical Journal, vol. xv. See Huxr's Merck. Mag., 1806-6; Com. Rel. U. S., pp. 288, 284 : pub. by Dep. of State.

In the year 1891 a moot tremendous earthquake appears to have been felt all over the Azores, and to have shaken St. Micheol for twelve days without intermission. Since that period, there is ne record of any such great convulsion, excopt one in 1757, of which we have no particulars, and it was probably much leas formidable; nor are 'yy of its volcanoes at present in a state of action. \& ot springs abound in every part of the island, and from almost every crevice vapor is seen isauing. But the most remarkahle phenomena are the Caldeiras or bolling fountains, which rise chiefly from a valley called the Furnas, near the western extremity of the island. The water ascends In columns to the height of sbout 12 suet, after which it dissolves $\ln$ vapor, forming clouds of various shapes and colors. The heat is such as to boil an egg in two minutes, though the sulphureons impregation unflts it from being employed In culinary purposes. The ground in the immediate vicinity is entirely covered with native sulphur, like hoar frost. At a small distance is a remarkable phenomenon called the Muddy Crater, the vertex of which, 45 feet in dlameter, is on a ieval with the plain. Its contents are in a state of violent and continual ebuilition, accompanied with a sound resmbling the waves of a tempestuous ocean. Yat they never ripe above its level, unless occasionaliy to throw to a small distance a epray of the consistence of melted lead. The Furnas aboonds also in hot springs, some of which it is impossible to touch without being scalded. There is almost always, however, a cold apring near to the hot one, so that the water can be brought to any temperature that may he desired. These springa, after being long neglected, have, within the last half century, been greatly resorted to, and the cures performed in cases of paisy, rheumatism, and similar maladies, are said to have been very wonderful.
The pisins are fortile in wheat, harley, and Indian corn; while vines and oranges grow inxariantly on the sides of the mountains. They are made to spring even from the interstices of the volcanic rocks, which are sometimes blasted in order that they may receive the plants. Raised in this manner, there fruits are said to be of superior quality; but the great expense originally required in such a mode of cultivation confines it to persons of some capital. The western part of the island yields hemp, which might be raised to a considerable extent. The exports consist of wine, fruit, and provisions. Foreign intercourse nsed to be confined rigorously to Iishon; but since the emigration of the court, the inhabitants have assumed the privilege of trading directly with England, America, and other countries. The principal town on the ioland is Ponta Delgada, which contains about 20,000 inhabitsnts. It is built with tolerable regularity, the streets being atraight and hroad. The religious edifices are numerous and elegant. When visited by Captain Boid in 1831, it had six charches, aight monasteries, snd four convents; but these last, which were noted for the irregniar lives of their vestala, have since been suppressed. The harbor receives only small vessels : those of any magnitude mast anchor in an open road, which, theagh not dangerous, can not be occupied laring the prevalence of southerly gales. Its other
town are Villa Franca, Ribeira, Grando, Alagna, Agon de Pao, etc.

Sl. Mary,-St. Mary is a emall island immediately adjacent to St. Michaol, through the medinm of which Ite trade is conducted, an it has no good harbors of its own.' It has an area of 88 equare milles, producing wheat in abundance, of which a conalderable quantity is exported. "It is of trap formation, and contains beds of marine shella. Population in 1840, 4666.
Terceira.-Terceira, though smallor than St. MV chael, yet beligg placed in a mom central positlon with respeet to the other islands has been chosen as the seat of government. The port of Augra is also superior to any of those in St. Michael. This taland dow not exhibit nearly the same extenaive tracee of vol;anio action ; and the aummits of its mountains are finerally level. It is represented by Adsnson, however, as entirely composed of volcanic producta. The lava, he says, is of a thicker grain than that of Teneriffe." It abounds in grain and cattie ; but the wines are inferlor, and the fruits are raised meraly for internal consumption. The residence of the government renders the society somewhat superior to that which is fonnd in the other ielands. The namber of inhabitants Is estimated at 50,000 .

Fayal.-Fayal is the most frequented of all the islands after St. Michael, as it has one of the best harhors in the Azoren, and lies direculy in the track of vesseis that are crossing the Atlantio in any direction. Its principal town is Villa de Herta. Captain Cook fonnd that all sorts of fresh provisions might be obtained there; the bullocks and hogs are prod, but the sheep small and poor. The town is defonded by two casties and a wall, both in decay, and eerving rather for show than strength. The city contains two convents for monks and three for nuns, with eight churches. These are the only good buildings in it, no other having glass windows. The bay is two miles in length and three quarters of a milo in breadth, and the depth of water from 6 to 20 fathoms. Thongh a good road, it is not altogether free from danger in S.S.W. and S.E. winds. Population 23,000.

Pico.-A considerable quantity of wine is shipped from Fayal under the appellation of Fayal wine, but realiy the produce of Pico, one of the most remarkable of the Azores. This island is composed of an immense conical mountain, rising to the height of 7613 feet, and hearing every trace of volcanic formation. The soil consiats entirely of pulverized lava, and the ground has even heen said to sound hollow when strnck. All the lower parts of the mountain are in the highest state of cultivation, and covered with vine und orange plantations. The wine, which forms a sort of inferior Madeira, is in considerable demand. Pico produces also a valuable species of wood, resemblligg and equal in quality to mahogany. Population 26,000.

Graciese and St. George are two small islands, sitnated between Fayal and Terceira. Graciose is chiefly noted for the extreme heanty of its aspect and scenery. About fifty years ago St. George suffered from one of those awful vigitations to which the Azores are subject. In 1808 a caldeira, situate in the centre of the isiand, was observed to be in a state of violent fermentation. It continued during several days to emit subterranean noises, and to cause violent convulsions throughout every part of the island. At length the great crisis came; vast streams of fire iasued forth in every direction, with cloude of smoke, which, but for the volcanic light, would have involved every thing in midnight darkness. The principal stream took its direction toward the beautiful town of Ursula, which it eeemed on the point of swallowing up; but auddenly changing its direction, it rushed into the sea by a different channel; a happy event, which superstition ascribed to the prayers of the Ursuline nuns. Many hundred acrea of fertile land, however, were covered with scorim and

## FAY

achen; some liven were lost, and goveral gloom and consterantion diffused throughout the inland. The ine hablinate, howover, wom applied thomeelves to repair the injury which their land had austained. Population abont 20,000 .
2. The two mall and mot wemorly lilands of Corvo and Blores coom but happerfectly to bolong to the gromp. They lie aleo ont of the usual track of navigetors; bat io thoee tha, miooing theis course, are lod hither, Elorm affords goed shelitar in its numeroua baye. Its poultry le said to be the fanest in the world; and the catcle are numeroun, bat amall. Thu surplua prodmoe of theoe thlands is not of much importance. Population above 15,000.
Commeroe of the Asores with the Unied Blates.A comanunication to the Dopertmec: of State, dated Fayal, April 8d, 1857, lemones the inability to announce any improvement in thu commerce between the Azores and the United States. Tho vintages of 1855 and 1856 wors so much lajured by the "odism," both in ragard to quatitity sod quallty, that no wine has boen shipped abroad, and the quantity yet momaining of formor vimtagoe in oxcoedingly amall. $\subseteq$ From the Ioland of St. Michasio there were shippod last season, juat ondod, an amount equal to 800,000 sicily boxes of orangen, sbout 40,000 from Terceira, and shout 5,500 from this illand; and of all that quantity onily about 1,500 boxes were shlpped to
the United Statea. Shipmonto have been A. de on a lavger soale, but the results h; ve been unfuvorable; the vemels having to contond with almont conatant galoy of coatrary windo, and the frult boints of a more parishable nature than that of Slelly, Spaln and Portugal. The importation of ceveals will awell the amount of importa, but it will be very aphomeral, and the porta vill be closed as soon as circumatancen will permil.
The ceat of government of the Asores lu at Angra, In Tarceira. Ponta Dolgada, In St. Michaels, is, however, the chief commercial city. The exports of corn from the Asores from 1835 to 1841, principally to Portugal, are given in the following table:

| Years, | Quanilice. $\mathrm{Vr}^{-1}$ | Values. |
| :---: | :---: | :---: |
| 1835. |  | 299,280 |
| 1436. | $11,090=88,840=885,20$ | 872, 965 |
| 1897. | 0,505 = 18,005 a 182600 | 180,711) |
| 1888. |  | 448,75 |
| 1809. | 4,890 $=14,670=117,860$ | 112,625 |
| 1840 | $19,138=86,459=291,079$ | 811,025 |
| 1841. | $0,000=87,000-816,000$ | 835,000 |

The oranges exported in 1801 amounted in value to 850,000 ; in 1820 , to $\$ 125,000$; and in 1840 , to $\$ 450$. 000. For five years, onding with 1840, the average annual value of exports to Portugal was $\$ 215,645$; to foroiga countries, $\geqslant 260,815$. Avorage anaual value of imports during the aame period, from Portagal, $\$ 266$,600 ; from foreign countries, $1307,110$.

The harbor of Fayal is the beat in the Azores, and greater facilities are offersd to ahipa in distress, by affording rofuge or supplies. American whalers frequantly visit Fayal, and deposit large quantities of oll, to be transhipped to other porta, amounting annually to a value of upwarl of $\$ 300,000$, moot of which If forwarled to the markets of the Uniter Statea, The direct imports fron the United States to the Azores consist chiefly of timber, ataves, heads for bognheads, etc. The duties on tumber and staves are moderats. Oa cut nalis they exceed 100 per cent.,
and on window-glass they rise over 300 per cent. American cotton manufactures are in good demand, and during the past fow years have competed advantageously with those of Great Britain. The commercial regulations differ but little from those of the mother country. Foreign vessels, bringing the productions of the constry to which they belong, sad coming from the ports of the amme, are sdmitted en the same footing as Portuguese vensela. When laten with the produce of other countries, thoy aro subject to a differential Juty of 15 per cent. There are no

tonnage duties, light, of hompital ties, lovied un ahipping the Aisoren. The entire chargee to which vessel is aubject amount to $\mathbf{~} 1980$, whiek to ralsed to 02840 if the veesel has oroesed the equator. The navigation of these lolands omploges abont 8,000 tona in forelgn and coasting trade. The latter ta carried un with Lisbon, Madelra, and the difforent ports of the lifiande, and is reatricted to national vensela. In 1952, 77 vesaels, with a tonnage of 8,780 tons, entered these isiands ; of whioh number 8 wore Amerjean, with an sggregate tonnage of 1,800 tons.

The chief inconvenience to which foreign tonnage is auljected in these lalands, arines from the inconsistant and arbitrary sanitary reguiations, which emanate from the home government at Lisbon, and which preciude all discretionary power on the part of the local anthorities. For instance, ahenid the Portugueae consul at New Orleans notily his government that the yeliow fever prevalle in that city (asy in tha month of Sept *-nher', oders are immediately forwarded by the Board of Ifealth at Liabon to the authorities of the islands to consider that city as infected. These orders, by the ordinary mole of conveyance, will not reach the islands antil the following January ; and notwithstanding it may be netorions that the fever cassed in Octoler or November, a veasel that should srrive at Fayal, having left New Orleana in January, or later, would not be admitted, even ahould she be provided with a ciean bill of health, certified with all furmaity, hy the very aame conaul who had reported to his government the existence of the aickness ! This reguiation frequentiy exposes Amorican captains to great inconvenience and conaiderable loss.-Com. Rel. U. S.

Featherw, Bed-feathers (Fr. Plumes, Mlumea à Lit; Ger. Federn, Betf federn; Du. Bedveern, Pluimen; It. Jiume; Sp. Plumas), make a considerable article of commerce; particulerly those of the oatrich, goose, heron, swan, peacock, and other pouitry. The feathers of the ostrich have been held in the higheat eatimation from antiquity downward, and have furmiahed faverite decorations for thie funs and head-dressen of ladiea, the heimets of warriors, and the most splendid processions. Misny parts of Great Britain supply feathers for beds ; and an inferior sort ia brought from Ireiand. Fiderdown, the finest variety of its clasa, is imported from the aorth of Europe; the ducks that aupply lt being inhalitants of Greenland, Iceland, and Norway. The cider-duck breeds in tise isiands on the west of Scotlaad, bat not in anfficient numbers to form a profitable branch of trade to the inhalitants. Kudson'a Bay furnishes very tine feathers, especially for quilis. The down of the awen is brought from Dantaic, as well as large quantities of auperior feathers.

Ostrich and other Plumes.-The long feathere of the wings and the tail constitate the ordinary ostrich plume. The animal is captured and kilied with much care, to prevent any injury to the piumage. The feathers are aorted lnto various qualities, acoured or cieuned, lieached, dried, ahaken, and opened, tho rlbs scraped with a bit of glass, the filaments made to assume a cariy form by acraping, dyed or not, according to circuastances, and adapted for the adjustment of military hats or other garinents. Thote in England who are versed in the heraidry of pomp and formality would know the estrich plames worn by the Knlyghte of the Garter or the Knights Grand Crosses of the Bath from the court pinmes adapted for ladies, and the biack plumes for officers of the lighiand regiments. In recent years, means have heen devised for imparting brifiliant dyes to ostrich feathers, several different coiory to one feather, gradualiy shaded or bienderl one into another. Then, besidea the ostrich, We have the feathers of the marabout, the lbis, the bird of paradise, the vulture or rhea, the emu, the heron, the plotus, the agret, the pheasant, the peacock, the turkey, the swan, the eagle, and some other birds
-all appicied ac ormaments to dress, Some of these are very coetly : some are used almont exclusively for one particular purpose, while others heve their fashlonable and unfushionable perlods in the publio favor. Some of the marebout feathers are knotted with gold, to make a costiy trimming for dresees. The omu feathers are more worn on the Continent than in England. The heron festhers, worn by the Knighte of the Carter, frequently coet 50 guineay the plume, and sometimes above 100 guineas, on accornt of their scarcity. The large egret feathors are worn by the IIusmara.

Feoamp, seaport town in France, departenent of Seine-Inffrieure, situated on the English Channel, at the month of a amall cognominal river 28 milea N.N.E. of Havre. Population about 10,000 . It occupies the bottom and sides of a nerrow valley opeaing out toward the sea, between two clifis, on one of which standa a light-house. Its port, though amali. is oue of the beas on the Channel, and has lately been greatly Improved hy the conatruction of en inner port, with a fine quay, etc. It carries on a considersbla trade in Baltic ind colonial produce, brandy, salt, ete. $;$ and sends op ${ }^{4}$. opsela to the whale, cod, mackerel, and herring' aries. The river affords abundant water-power for numerous cotton, oil, and other milis. Fécamp has also sugar refineries, tanneriea, building-docka, and manufactures of hardware, candles, soda, te. The town conaiate aimost entirely of one atreet upward of two milea in length.

Feejee Inlands. These islands constitute a gronp in the South Pacific Ocean, farorabiy situated for the whaing interests of the United States, if the habita of the natives did not render it unsafe for whale-ehips to enter any of their porta, unless under the protection of a man-of-war. The group consista of $15-4$ inlauds in all, 65 of which are inhabited, and containa a population estimated at 134,000 zoule. The principal ielands are Viti Levu and Paou, or Sandal-wood Ialand; others are Vuna, Kandaboo, Ovolau, Bau, Mathuatu, and Gore ; each of the isiands containing from 5,000 to 13,000 inhabitants. Sandal-wood was formeriy a leading production of this group, bat it has now entirely dissppeared. The great fertility of the soil, how gver, und the low price at which veasels could recruit their stores, and olitain supplies of freah provisions and excelient water, taken in connection with the fact that the whaling interests of citizens of the United States in that quarter involve annuaily from aeven to eight millione of dollars, show how important this group might becor - to American whalers, if they were only strong enough to prevent or reeent acts of piracy and plunder.

An official commnnication to the State Departnsent, under date of January 1,1854 , says: "The chief and inhabitants of luu (at present the controlers of this group), causing the destruction of property nt Lavuke, live by the fruits of begging, theft, and robbery-one unbroken series of robleries and butcheries. In default of justice, these men escape." When our whalers are fortanate onough to escape from the atrocities above described, they can obtain a full supply of ali deacriptions of vegetablea, pork, poultry, etc., for an entire crew for about $\$ 66$, in trade. The same communication farther informs the Departntent, that American vessels are actualiy driven away from this archipelage, the natives being emboldened in the perpetration of these acts by the absence of American vessels of war in any of their ports. During the past year (I855) an American ship of war, the John Adams, visited the Feejee Isiands for the purpore of Inquiring into, and demanding reparation for, the cruolties and acta of piunder and piracy committed by the natives upon Aluericun sihips trading and fisining in the Feejeean archijelage. The result of this visit, it is beiieved, will put an end to the atrocities of these savagea, and seeure a safa and commodious retreat for Amerioan whalers in those distant eeus. It is understood that
this security is guarantied by a comvention or treaty agreed to by Tul Viti, the klug of the ialands. Thare are no quarant lae regulationa obeerved at any of these lalanda, and coneequeatly no bllis of health are required. Passengers are subjected to no port or landIng requirements, and are at liberty to go ashore when and as they plase.

There are no custom dutiee, nor are there asy light, hospital, or other dues or taxes exacted. For pilots, the ehsrges are auch as enn be agreed upon. It has been already etated that this group of islanda afforde a convenient and excellent etopping-place fur our whaleshipa engaged in their hgeardous and laborious toil In the South Pacific seas. It should be added, that our trading ahlps generally, in that quaster of the globe, could beneficially call at these islands, partictarly if freighted with miscellaneous cargoes of cotton goods, weapons of war, cutlery, and other similar vares suited to the barbarous and remi-civilized nutives, could they lut be taught to pay proper respect to the American fag. During the three years ending with 185il, the exports from the United States to the Feejee Islands amounted, in the aggregate, to 9136,000 , viz. : in 1851 , to $\$ 32,000 ; \ln 1852$, to $\$ 54,000 ; \ln 1853$, to $\$ 50,000$. The merchandise received lin barter for American imports consiat of blehe-de-mer, tortolse-shelf, gums, nrrow-root, and cocounut-oil. The exports from the United States consist of assorted cargoea, and the annual value may be estimnted from the preceding figurea, us the trade is almost exclusively one of burter, In which the American shippers usually realize 250 per cent. profit on their merchnntise. Duriag the last six monthe of 1850 , there arrived at the port of Lanthula five American vessela, including two whlps of war (the John Adams and the Sf. Mary's), measuring, excluslve of the two latter, an aggregate of 1 tis tons. Three whale-ships also touched at the islunds during the same period. The inward cargoes of two of the merchant vessels referred $t u$, mounting in value to 84000, consisted of general cargoes, of which was lunded, in value, 8000 . The remaining vessel was laden with outfits, storen, and whaling-lines, vilued at $\$ 30,000$, none of which was landed at the islands. The outward cargoes consisted of lische-de-mer, 1500 pecals, and shella, 1000 pouds, valued at $\$ 11, t h 0$. One of these vesaels made a voyage to Siviney with yams, cocounut-oil, and live stock, while the natives were collerting her eargo of biche-de-mer,-C, 1).-('um, Rel. U.S.
Felt, a kind of stuff resembling coarse cloth, mado of halr or wool, without weaving. 'The fur of the hare, rabhit, seal, leaver, and the wool of the sheep, are the materials chietly used tor maklnge elt. The hairs and loose flocks of wool are thoroughly mixed together ly an operation called boring, which depende on the vibrations of aus etastic atring; when, in consepuence * their anatumical atructure, they become matted tonsine r.

Teited Cloth. Thia woolen fabric in innde: .tat "phaning or weaving. J'arnished or Japanneaf Fedt in made by imbuing the stuff of coarse but landies with d. Abg wil, prepared lig hoiling in lba, of linseal oil wi,d whalte leal, litharge, nind umber, of earli one prond. The felt is to be dried in a ntove, and chen palinhed by pumberentone. Pive or aix coats of oill are raquired. The surface is at last varmished. When the oliject is intenidel to be stifi, like visors, the falirie is to be impreganteil firat of all with tlour-paste, then
 with the drying-sil, and pumivel ropeatedly; lasty, placed, to the number of 20 , In a hot iron molil, and exposed to atrong presaure. Japanned hats made in this way are soll in France at la. 8d. a piece ; and they will stand several years' weur.

Felting (Fr. feutruge; fier. Filzen), la the process by wheh loose flotks of woul, and bairs of varione atlnimale, an the beaver, rablit, hare, ete., are mutually
interlaced into a compact textle fabric. The first etep toward making felt is to mlx , in the propor proportions, the different kinde of fibres Intended to form the atuff $;$ and then, by the viliratory strokes of the bowntring, to tosa them up in the air, and to causo them to fall ss irregularly as possible upon the table, opened, apread, and ecattored. The workman covers thin layer of loose flocks with a plece of thlek blanket stuffalightly molstened; he preasea it with hile hands, moving the halr backward and forward In all direc. tions. Thus the different flbres get interlaced, by their ends pursuling ever tortuous paths; their ver. meular motion being always, however, root foremost. As the matting geta denser, the hand preasure ahould be increaad, In order to overcome the lneressing resletance to the decussation. A first thin sheet of seit, spongy felt belng now formed, a second is condeused upon it in like manner, and then a third, till the requisite strength and thlekneas be obtained. These different piecea are successively brought together, thaposed in a way anitalle to the wlahed-for articlo, and united by continued dextrous pressure. The stuff must be next aulijected to the fulling-mill.

Felling Timber. In arboriculture, when a fullgrown tree is cut down, it is suid to be felled ; but thls torm is never applied to young trees or bushes, undergrowth, or hedges, which are said to be rocted out or cut over. Duch has been written respecting the proper season for felling trees; some arguing in fuvor of inid. winter, and other in favar of midsummer. The questhon principally turns upon the quantity and the value of the soft or outer-wool lin the trunk of the tree to be telled, known by foresters and earpenters ns the sap. Aa this sap or outer-wood is the only portion of the tronk in which the sap or juices of the tree circulate, it is evident that if no value be set upon it the tree may he cut down ut any season, hecause the truly volmulle jart of the trunk, the maturo timber, is impermenlile to the sap in tis ascent through the soft wood, and la, therefore, In the same stnte at every scason of the yeur. On the other hand, where much value is attached to the soft o. outer-wool, where thia outerwood is wished to be mude as valuable as possibide, er where, an $\ln$ the ense of comparatively young treca, the greater part of the trunk consists of sap-wow, felling ought to take place when there is least sup in the course of circulation. This seanon is, withont donlt, milwinter, which, all other circmmatances bellfe rqual, is uncuestionably the best seasen for felling timber; the next best leing midsumuer, when the sap is chictly confined to the young shoots, the circumfurence of the suft wood, sind the bark; as the worst is the spring, juat before the dovelopment of the buis, when the treo is fullest of sat, and receiving constantly fresh suphies from tho root; and in autuun, innmedintely before the fail of the leaf, when there is a muperabondance of sap, from its leing as it were hrown out of employment by the falling of the laf. In generul, all the suft woods, anch as the elin, lime, poplar, willow, ete., shonlal he felleal during winter; hard woola, like the oak, leech, anli, ete., when the trunks aro af large size, and vulued chietly for their hart-wool, may be felled at any time. See articles IIIy llot and Wineil.
Felucca (Ital. filuca), a little vessel with oars and lateen salos, common In the Meliterranean. It has a rulder at tho atem and another at the stern, to Le apllied as occanion requires.
Ferment (lat. fervec, I hoil), the aubstance which Is essential to the process of fermentation. It ts wither naturally present in the fermentable juice, as in the grape, or it ls mided, as in the manufacture of heer, where youst constitutes the ferment. Ferments are of an albuminous or glutinoun character; the presence of nitrogen aeema casential in their compoaitlon, hence they are clased by chomists among azatized compounds. Their modus operand is still unexplained.

Fermentation (Lat.) When certain vegetable substnnces are disaolved in water, and subjected to a the temperature (between $65^{\circ}$ and $85^{\circ}$ ), they undergo $n$ series of changes which terminnte in the production of alcohol or spirit ; these changen constltute the phenomena of vinous fermentation. Sugar nnd some ferment are essential to the process; and during the formution of the alcohol the sugar disappears, and cartonic acid is more or less abundantly evolved. The simplest case of fermentation ls that of must, or of the expressed julce of the grape, which, when exposed, either in close or open vessels, to a tomperature of about $70^{\circ}$, soon begins to give off earbonic aedd, and to become turbld nnd frothy; aftor $n$ time $n$ aeum collects upon the surface, and a sedinent is deposited; the liguor which had grown warm gradually cools and clenrs, Ioses Its aweet taste, and is converted Into rine. The chief component parts of must are water, sugur, muelnge, gluten, nnd tartar. During the fermentation cartonle acid escapes, the sugar ilsappeara, and with it the greater part of the mucilnge; the glaten chiefly forms the seum and a portion of the sediment; and the tartar, originally in eolution, is thrown down in the form of a colored deposit. It aprears, therefore, that the new producta, which nre aicohol nod carbonic acil, are prinelpally formed nt the expense of the angar; nud Giny Lussac's experiments have shown that 45 pounds of sugar are resolved, in the process of fermentation, into 23 of nlcohol nud 22 of carbonic ncid. Sugar and water alone will not ferment; the ingredlent requisite to the commencement of the change is the gluten, which aboorhs in tho first instance a little oxygen from the air, hecomes insoluble, and induces the aubrequent changes. The reasons why grapes never ferment till the juice is expressed, seems to depend upon the exclusion of air liy the husk ar membranes; and if grapes he brulsed in a perfectly* close vessel, encefully excluding oxygen, the juice undergoes no ehnnge; so that the mere breaking down of the texturo of the fruit is insufficient. Hut a very short exposmre of the pulp to alr in sufficient to induce that change in the julce which leads on to fermentntion, and which is afterward independent of the further contact of air, the evolution of carbonle acill helng excluslvely referable to the decomposition of augar. In beer the alcolol is derlved from the sugar, origitul and produced, of the malt. When wine ls exposed to air and a due tempernture, n second fermentation ensues, which is called aretons formentution, and which terminates in the production of rinegar. During this process exygen is nbsorlied, and more or less enrbonie acil in mort enaes evolved; but the apparent canse of the formation of vinegar is the aliatraction of hydrogen from the nlcolol, so ne to leave the remaining elements in such proportlons ns to constltute acetic aciid. Thus alcohol is theoretionly constituted of eharcoal, water, and hyidrogen, and ncetie neld of charconl and water only; the oxygern of the alr, thasefore, converts the hydrogen of the nlcohol into water, and ao effects the change into vinegrar.

Fern, or Farn Islands, a group of small istets or rocks, 77 in mumber, lying off the const of Northumberland, lut included in the county of Durham. There are two light-lousen on these islanis. It was here, In [ 238 , that Graco 1)arling ard her futher, in stormy wenther, reseued the passengers of the Forfarshire stemmer. The lern lalands noe freguented by lunmense numbers of sea-hirils.

Fernando de Noronha, an islund in the South Atlantic, lying about 70 lengues from tho const of litazit. It is ahout 20 milea $\ln$ - circumference, and the surface is rugiged nnil motint ninous. It has sevemal harbork defended by forts, sud serves an a place of lunishment for criminals from Ilrazil. N. lat. $3^{\circ} 80^{\circ}$, W. lonts. $32^{\circ} 28^{\prime}$.

Fernando Po, or Fernao do Pao, an laland un the west coast of Africa, lying in the light of llenin,
about 20 miles from the mainland, in N. lat. $8^{\circ} 25^{\prime}$, E. long. $8^{\circ} 50^{\prime}$. It in about 44 milles in length from N.N.E. to S.S.W., nnd about $20 \ln$ breadth. 'The coasts are ateep and rocky, and the interior is mountalnous. A ridge of mountains toward the centre of the inland rises to the height of 8000 feet, and is terminated at each extremity by a peaked mountaln, the one nt the northern extremity nttaining a helght of 10,700 fert. The seuthern extremity of the Inland is also Intersected hy soveral ateep mountains, varying from 1,000 to 8,000 feiet. These mountains are covered, mest of them to their summits, together with the intervening valleys, with dense ferests of shrubs and lofty trees of luxuriant growth. The rocks are of volennic origin, nad the soll in rich and fertilo, producIng rice, sugar-enne, cotton, tobuceo, yams, palma, etc. Sheep, gonts, fowls, turtle, and fish, are abundant. The climnte is silubrous, though the ralny senson lasts from Mny to December, nnd is succeeded by a sensen of denso fogs. The harbors are small, the largeat heing Port Clarence on the northern shore. Thla island whs discovered in 1471 by a Portuguese navigitor, whose name it bears. It was taken possession $0^{\prime \prime}$ by Spain in 1778, but nbandoned in $\mathbf{1 7 8 2}$. The lingll h in 1827 formed a settlement here, but relinquinhed it in 1834; the Spnninrda reanmed posseanion of it in 184.1, und have given the name of Puerto de Isabel. The native pepulation is estimated at about $15,000$.

Ferrol, a seaport town of Spain, province of Coruña, and ome of the first naval nrsennls in the kingdom, is sitmated on the N. nrm of the Day of Betanzes, 12 miles north-west of the town of Coruna. The hnrhor, which is one of the best $\ln$ liurope, is deep, eapaclous, nud secure ; but the entrance, which la a strait about two miles in length nt the nhrrowest part, onlynimits one ship at $n$ time, and is comnanded on either side ly strong forts. The town is protected on the land-side ly a wall, on which 200 eannon might be mounted. The dockyanl is divided into two parts, the outer being the amuller, nnd the whole oceupying n space of more than 115,000 square yards. Behint the Inner dock nre the dwellings of the oparutives, and in the north nngle are the founderies, rope-walks, and magazines. They nre nll, however, as well as the arsenal, in a noglected and rulnous condition.

Ferry (Germ. nnd Sax. fuhren, to pass over), in law, n right arising from royal grant or preseription to have n loat to carry men and horses nerose a river, and to levy reasomable toll. The land on both sides onght to belong to the owner of the ferry-bonts.

Fescue grass, it valualite grass for mondows and pastures. (iestuce pratensis, lin.$)$ In deep, rich soils, somowhat moist, it is consldered ns the most bulky and nutritive of all grassea; but in poorer aoils it is equaled, if not aurpuased, liy the rye grass (Lolinm prrenne), and the meadow foxtail grasa (Aleopectrus prutensis). The meadow feacue growa to the height of leetween 2 and 3 feet; but the sheep fescue ( $F$. mermet, and several other species, seldom grow nlove G lncher or a foot in heiglit, and are chietly sown on sheep pastures, nuil used to lay down lawns and grissy anrfaces to be mown in pleasure grounds. All the faseues are peranifuls.

Fes, in extensive comintry of Africn, nud at one time the mont fourishing kingilou in the northern part of that continent. It now, however, forms a provinco of the empire of Morucoo. F'ez, or Fas, the enpital of this kingionn, was built in 793, A. b., ly n a prinen named bidris, and having somon risen to be n city of the first magnitude, beenme the capital of the western Molimmmedaus stites. In the 12th century it is mald to have contained 700 temples and mosks, und other public edilices, a ntmber of whld were erected upon a magulficent sealo, nod ndorued with a profusion of marlile pillara. 'The manufacturea of Fez consint at' woolen hhelks, sushes, and sllk hutulkerchiefs, wlipuers
of good loathar, which thay tan romarkably well, red |the 13th century; but the date of thair jatroduction is folt caps, woino coarse linen cloth, fine carpets, a ourious kind of earthenware, weapons of several kinds, saddliens' ware, joweliry, and oopper ntensilis. The arts here find little oncouragemeat, and are, indeed, far inferior to those of Enrope, oxcept in the proparation of leather, and in the fabrication of carpets and of hhaliks, which the manufucturers know how to waave as fine and as tranaparent as gauze. They are aleo expert workere in wax, weapona, and harness.. The heat during the aummer is vory great; bat in other seaeons of the year, particulurly winter, the climate is agreeable. With rogard to the number of inhabitante, much difference of opinion prevails among travelers.

Fibre (Lat. fibra), a fine thread or filament ; a fine slender body, such as those of which fiesh, nerves, plants, roots, otc., are composed. In our manufuctures vegetable filaments and fibres are among the most important of the whole earies of raw produce; furnishing thread, cloth, condage, and the like. For theae purposea the fllamentous parts of the Gossypium Cannabio, and Linum; or cotton, hemp, and lax, are used. The fibres of other plants have peen employed in different countrica for the same usea. Patrefaction deatroys the pulpy matter, and leaves the tough filaments entire, Different kinds of cloth are prepared in the East from the fibses of the bark of certain trees bolled in a strong lye. Some of thene clotha are very fine, and approach to the softness of ailk, but in durability fall ahert of cotton; othera, again, are coarser and atronger, and much exceed cotton in durability. See Flax.
Fid, a short har of wood or iron put through the heel or lower part of a topmest, and resting by its ends on the trestletrees, and on which the mast is therefore aupported. When the topmast is to be gut down, it is firat lifted to take the pressure off the id, which is then withdrawn.
Fid, or Bplicing-fid, is also a sharp cone of wood for opening the stranda of rope.

Fiddles, or Violins (Ger. Violinen, Geigns; Du. Vioolen; Fr. Violons; It. Violini; Sp. Violinea; Rus. Skripizii), musical instrunents, too well known to need any particular dencription. The finest-toned violins are those made in Italy; they are nsually called Cremonas, from the nume of the town where they were formerly manufactured in the highent perfection; $\$ 500$ and more huve not unfrequently been given for a firat-rate Cremona violin.

Fige (Ger. Feigen; Du. Vygen; Fr. Figues; It. Fichi; Sp. Higos; Lat. Fïci, Carico ; Arub. Teen), the fruit of the tig-tree (Ficus carrica), a native of Asia, but early introduced into Europe.

It flourishes in Turkey, Greece, Frunce, Spain, Italy, and northern Africa, and even somotimes ripens its fruit in the open air in this country. Figs, when ripe, are, for the must part, dried in ovena to preserve them; and then packed very closely in the small chests and baskets in which wa import them. The leent come from Turkoy; those of Kalamata, in the Mores, are euld to the the most luscious,-Tromson's Diapensentory.

Dried figa form a very conaiderable articie of commerce in Provence, Italy, and Spain ; Bendidea affordiag, as in the East, a principul article of sustenance for the poppubtion. In Spain, tige are ehiefly exported from Audulumia and Valencla; but they ure more or lean abumiant in overy province. In the northern parts of lirance there are many ilg gardena, particularly at Argenteuil.
Figure Head. The figure, atatue, or bust, on the projecting purt of the head of a ehip, called the cutwater.
Figures, in Arithmetie, are the numaral characters, or ton digit , by which nuasbers are expressed. Thoy are aupposed to be of Indian origin, and to have been Introluced into Europe by the Moorn of Spain in
much dispated.

Filbert, or Filberd, the well-known fruit of the cultivated hazel nut, or Corylus avellana, is a seedvensel inclosed within on involucre or cupule, which is the part commonly called the husk. This organ is of the same nature as the cup of the oak, and the prickly case in which the nuts of the sweet cheatnut and the mast of the beech are inclosed. In the filbert it is much larger than in the common nat; and it is this character, together with the lengthened figure of the nut, whinh distinguishes the two races of nuts and filberts. The hest hnown varieties of the filbert are the red, the frizzled, and the white, the latter being the kind most commonly grown.

File, Filles (Da. File; Du. Vylen ; Fr. Limes ; Ger. Feilen; It. Lime), an instrument of Iran or forged eteel, cut in little furrows, used to polish or smooth metale, timber, and other hard bodies. Files are of vurions forms, sizea, and cuts, aecording to the uses to whlch they are to be applied. When the surface is cut in transverse furrowa by a straight sharp-edged chisel and mallet, the instrument is properly called e file; but when it is raised by a triengular panch, it is termed a rasp. This last kind is chiefly employed for rubbing wood and horn. The larger kind of files are made of blistered steel; but the amall and fine files of cast steel. Various ingenious machines have been contrived for cutting the teeth of files, but these have not hitherto succeeded so well as to supersedo fle-making by the hand. After the file han been cut it must undergo the process of tempering. This is said to be well effected in the following manner: A saturated sulution of common salt, stiffened to the consistence of creum with ule grounds, or with any cheap farinaceous matter, such as beun-flour (somo use well-dried chimneysoot), is to be sprend over the ile, in order to preserve Its surfuce from oxydation during the process; it is then uniformly heated in a coke or charcoal fire to a eherry-red color; and on its removal from the fire it is to be suddenly quenched in cold and pure spring water. It is subsequently cleanud with charcoal and a rag; after which it is laid up in wheat bran to preserve it from rust. When the file la intended to cut iron or wteel, it is found preferable to substitute aninal carlion for the grouods or farinaceeus mitter mentloned alove, This will give even to iron a superficial hardness sufficient for any kind of file.
Filigree, or Fillagree (Ital. filigrano; Lat. filum, a thread, and granum, e gruin), a very delieate kind of ormamentul work ln gold or silver, wrought in the manner of little threads, or threads und grains interinixed. Filigree work is of eastern origin, und was first int oduced into Europe by the Itulings. In Sumatra, manufuctures of this kind huve been carried to the highant degree of perfectiva, and yet the towis employed are exceedingly coarae and clumsy. These are generally rudely and inartificlally formed from any piece of old Iron. A pieco of Iron hoop suffices fir making the wire-drawing instrument; an old hanmer head, stuck in a llock, serves as an anvil; and two old nuiln, tied together at one end, will suffice for a pair of compaseses. The gold la nielted in a piece of preewo or earthen rice-pot, or sometimes in a crucible of ordinary clay. In general no beilowa are used, but the fire is biown with the mouth, through a joint of bamino ; und if the cuantity of metal to be melted is consideratile, three or four persons sit round the furnace, which is an old broken gualiee or lron pot, and blow together. At Padung, where the manuffucture in most condidenuble, they have adojited the Chinese bejlows. The method of drawing the wire differs liut little from that which is used by Eufopenn workmen, When drawn to a auficient theness, it is flattened by beating it on the auvil; and when flattened, a twist io given to "s "y rubbing it on a block of wood with a flat stick. After twisting they agaln beat it upon the
anvil, and thus it becomies flattened wire with indented edges.' The end of the wire is folded down with a pair of pincers, and thus is formed a leaf, or clement of a flower, which ls cut off. The end is again folded and cnt of till they have a snficient number of leaves, whtch are laid on singly. Patterns of the flowern or foliage, in which there is seldom much variety, are prepared on paper of the size of the gold plate on which the filligree ls to be laid. According to these, they begin to disposu on the plate the larger compurtments of the follage; for which they use plain flattened wire of a larger size, and fill It up with the leaves bafore mentioned. In order to fix the work, they employ a gelatinous snbstance made of the berry called boca sago, ground to a pulp on a rough stone. After the leaves have bean all placed in order, and stuck on bit by bit, a solder is prepared of gold filings and borax moistened with water, which is strewed over the plate, when it is put in the fire for a short time, and the whole becomes united. This kind of work on a gold plate is called carrang papan; but when the work is open, it is called carrang trouse. In executing the latter, the foliage is laid out upon a card, or soft kind of wood, and stuck on, as before described, with the sago berry ; and the work, when finished; being strewed over with the solder, is put into the fire, when the card or soft wood burning away, the gold remains connected. If the plece be large it is soldered at several times. In the manufacture of badjoo buttons, they first make the lower part fiat, and having a mold formed of a plece of buffalo's hom, indented to saveral sizes, each like one half of a bullet mold, they lay their work over one of these holes, and with a horn punch press it into the form of a button ; after which they complete the upper part. When the filigree is finished they cleanse it by bolling it in water with common salt and alum, or sometimes lime juica; and in order to give tt that fine purpla color which they called sapo, they boll it in water mixed with brimstone. The manner of making the little balls with which their works are sometimes ornamented, is simple. They take a piece of charcoal, and having cut it flat and smooth, make in it a small hola, which they fill with gold dust, and this being melted in the fire becomes a little ball. They are very inexpert at finishing and polishing the plain parts, hinges, acrews, and the like, being in this as much excelled by the European artists as the latter fall short of them in the fneness and minuteness of the foliage. The Chinese also make filigree, mostly of silver, which looks elegent, but wants the extrasdinary delicacy of the Malay work. The price of the workmanship depends upon the difficulty or incommonness of the pattern. In some articles of nanal demand it does not exceed one third of the value of the gold, but in matters of fancy it ls generally equal to that of the metal.

In India, the articles nsually mede in gold and allver filigree nre bracelets, ear-rings, brooches, chains, groups of flowers, and nmall hoxes and caskets. Mr. Taylor, in his "Account of the Arts in India," anys: "The design best adapted for displaying the dellicate work of filigree is that of a lenf; it should be drawn 011 stout paper, and of the exact size of the articie intended to be made. The apparatus used in the nrt is exceedingly simple, consisting merely of a few rmall crucibles, a piece of bumboo for a biow-pipe, smatl huminers for flattening the wire, and seta of forceps for interveaving it. The gold and ailver wire ande by the Hindoon for this and other purposes is of varied character, according to the purposes for which it is intenied; thus, the goolrbatoon is made at Dacca for the emibroidering of muslins and silks; goshoo for caps and for covering the handies of chowriea; salmah for turbans, allppera, and hookah-snakes 1 and booiun for gold lace and brocades. For some of these purposes it is not strictly wire, but gold thread, that is, slik covered with silver and then with gold."-E. B.

E11. Tha cea term fortoracing a yand which hid been laid abbek, so that the wind may aot on the after or proper side of the sail.
Finesse (Fr.) may be defined simply as a peculiar aptitude of discovering, in any business, the best means of attaining the object in view ; or as the power of embracing in one comprehensive glance the varions Interests of any subjact, together with ingenuity to dovise and tact to carry ont the plan best calculated to obtain anccess.
Finland, called by the natives Suomemna, the Region of Lakes and Swamps, is a govemment of Rus. sia, comprising, besides the old SWedish province of Finland, the two Lapmarks of Kamt and Tornex̆, and the district of Wiborg. It liee between N. lat. $59^{\circ}$ $50^{\prime}$ and $70^{\circ} 6^{\prime}$, and $E$. long. $20^{\circ} 80^{\circ}$ and $82^{\circ} 45^{\prime}$ being bonnded on the N. by Norwegian Finmark, by Sweden W. and the Grif of Bothnia, S. by the Gulf of Finland, and E. by the governments of St. Petersburg, Olonetz, and Archangel. It is abont 780 miles in length from N. to S., with an average breadth of about 185 miles. The sea-coaet of Finland throughont its entire extent presents the same auccession of fiords and rocky headlands as characterize the whole seaward frontier of Sweden and Norway. The fiords of Finiand, how ever, are far more limited than those to the wast of the Gulf of Bothnia, and seldom exceed a few miles in extent, although their months contain an equal number of islands, some of which, as the fsles of Sveaborg, hava been converted into fortresses of great atrength. The coasts of the Bothnian and Finland Guifs are thickly etrewn with rocks of granite and limestone, presenting in soms places a labyrinthine archipelago of little islands, rendering the navigatlon extremely dangerons. The greater portion of the interior is a vast table-jand averaging in height from 400 to 600 feet, and interspersed with hills of no great elevation. In the north, however, are the Manselka Mountains, which attain a helght of nearly 4000 feet, and stretch southward, though with several interruptions, until they terminste in lofty cliffs on the Gulf of Bothnia. The grest mass of mountains is composed of red granite, and vast quantities of tha asme rock lie in boulders on the lower grounds, and prove a very serions obstacle to their cultivation. Many of the helghta are bare, but the greater part of them belag of moderate elevation are covered with forests chiefly of pine; and in their combination with the vast number of lakes inclosed by their bases, often form very romantic ecenery. Tha extensive foresta are some timas devastated by the tempests of winter, which seem to find access to their very centres in tornadoes, tearing up by the roots or bending and snapping the largest pines. Freque: dly also ravages are committed In them by conflagration occasioned often through the carelessness of the peasants. The interior of Finland is also intersected and broken up by a vast number of lakes, throwing out winding arms and branches in all directions, which, while they offer tha greatest facilities for inland navigation, render land traveling ciren itoun and dangeronn. Many of the high roade pass over isiands on theso lakes, the nuturai strength of whose nitnation hus been taken advantage of, to cover them with batteries; and some of them, as at Wiborg and Ny siot, are consilered impregnable, save to fraud or famine. The principal of these lakes are Ladega, the greater portion of which belonge to this government ; Lake Saima, which is crowded with isiands and discharges its superfinous waters in a series of cataracts into Lake Ladogn, but which is now connected by means of a canal with tho Gulf of Finland near Wl borg; and lake Enara in the extreme north, covering above 1000 square miles, and having its outiet in the Frozen Ocean. The chief rivers are the Ulea, which Is navigated by trading-vesseis, though its stream is very rapid; the Cann, which pasaen Biorneborg; the Aurajoki, which at Abo is about 100 yards broad; the

Kymon, which flows Into the middle of the Guif of Finland 1 and the Tornea, which diechargen lteolf at the northern extremity of the Gulf of Bothnia, and forme the present bounilary between Sweden and Ruscia. The cllmate varies much according to the locality. In Lapmark, in the north, it is polar eomewhat modified, and the enn disappears during December and Januarjo. Further sonth at Uleaborg, winter legins in October and continuee to May, to which month spring is limited. Summer commences in June and lasts three months, which are generally 80 hot and dry that the crops, particularly where the soil is of a sandy nature, often anffor from drought. The antumn, like the spring, is confined to one month, and may be asid to commence and terminate in Soptember. Even in summar the nighte are cold, particularly about the middie of August. During summer, however, the progrese of vegetation is remarkably rapld, and there have been instancen of grain being sown and reaped in six weeks. In tho more southern parts the climate is less severe; the winter being of five or six months' duration. Dense fogs are frequent, and heavy rains take place in antumn. . The soil is for the most part etony or aundy; but nothwithstanding this it is much more productive than the opposite part of the Scandinavian peninenla, and when in the possession of Sweden it wat termed the granary of that country. The principal crope are barley and rye, but owing to the nature of the aurface and climate a large portion of the land in fit only for pasture. In tire north, where vegetation is almost confined to the growth of mose and lichen, other domestic animals are superseded by the reindeer, of which great herds are kept. In addition to timber (chiefly fir), large quantities of potash, pitch, and rosin are obtained, and form the principal articles of export. The mineral productions are chiefly confined to iron, lead, salphur, slate, and granite. The tirst is only wrought to a limited extent for the supply of a fow furnaces; wrought iron belog now principally imported from Sweden. A great number of excelient granite quarrien have been opened chiefly on the borders of the iakes or sea-coasts to secure the advantage of water carriage. From these are obtained blocks of extraordinary maynitude and beauty, which are employed for architectural and artistic parposes. One of the finest specimens is the monolitit obelisk recentiy orected in St. Petershurg to the Emperor Alexauder. In its rough state it was 12 feet in diameter, and 80 feet in length. The mannfactures of Finiand are insignificant. Agriculture, the rearing of cattle, and fishing are the principal occupations of the lnhabltants. The coasts present many good harbors, but on sceount of the long winter they can not be extensively used. In winter siedges afford an casy and rapid communication with different parts, and oven with Sweden across the Gulf of Bothnia, In March, 1800, Barclay de Tolly croseed over with a division of the Runsisn army from Vesa to Umea in Sweden.

From official documents the returns of the trade of Finland for the year 1848, were, in silver roubles of the value of about 3 s .2 d. , si follows:

Expoats.
To Sweden and Norway.................... 197,942
To other countries.....

8howing an excess in the imperts over the exports of 476,816 roublen, which, however, wan in part covered by the frelght earned by the merchant shipping. The
above atatemeats indicate alling off as compared with former years in the export, trade to Norway and Swoden. To these two countries the lesding srticles of export and their value were-fish, 23,569 roubles; hides, 8616 ; beef, 24,578 ; grain, 15,083; tallow, 80,809 ; tar, 11,488 ; firewood, 11,488 . The imports wers-books, 16,200 roubles ; fish, 25,228 ; iron and steel, 250,870 ; ougar, 66,418; tobacco, 4677; dyewoods and atnfif, 23,990 . The exports to other counIries were also less than in former years; the chlef articles wero-potash, 16,733 roublea; butter, 183,409; tar, 824,717 ; wood and timber, 021,860 . The chiof imports from other countriee were-medicines, $20,911$. ronblen ; cotton, 138,318; arrack, rum, brandy, 169,794; coffee, 597,708 ; fruits, 106,042; dye-staffs, 134,550 ; yarn, 849,993 ; iron and steel, 89,709 ; salt, 531,665 ; suggar, 544,485 ; wine, 140,628 ; manufactures wove, 666,145.

In 1831 Finlend was divided administratively into eight circles or lïns, which are subdlvided into fogderier or districte, and herads or balliwicks. There is a distinct establishment at St. Petersburg for the government of this vast province. The governor-generil who resides at IIelsingfors, has the superintendence of the military affairs. Finland has a diet composed of the four orders of the nobility, clergy, citizens, and peasantry, and a code of laws and judicial system simHar to that of Sweden, but the diet is rarely convoked, except to consent to the imposition of fresh taxes, $s$ senate more recently eatablished having replaced it in the exercise of its functions. The regiments raised in Finland are not promiscuousily intermixed with the general forces of the Russian empire ; and their fleet, by far the best manned portion of the Russian navy, forms diatinct squadron under the Finuish flag. None but a native Finlander can hold any office of trust in the country. Almost all the inhabitants sre Lutherans under the bishops of Ato and Borgo, except in the circle of Wiborg, where they belong to the Russian church. Public education is in a very backward state. At Ifeleingfore is a university, transferrod from Abo in 1828; and all the towns have schools, but there is a great deficiency of country schools. The majority of the inhabitants are Fins, who call thenselves Suomalans or Suomes, but they are denominated Tschudes by the lussians. They are of mildde helght, robust, fint-faced, with prominent cheek-bones, llght , reddish, or yellowish-brewn hair, gray eyes, littlc beard, and a dull sallow consplexion. They are courageons, hospitable, and honest, but obstinate in the extreme, indolent, dirty, and, it. is said, revengeful. Their customs and hasbits have been handed down from time immemoring, and their costume forcibly bears out the supposition of their being of oriental origin. The peasants wear long loose robes of a coarse manufacture, sicured by a ailken cincture like the Rummerbund of the Diussulmans. The eight lins with their areas and populaLions are se follows, commencing from the south and east :

|  | Aron. | Population, |

Firo-Arms. Under this designtion is comprised all sorts of gans, fowling-pieces, blanderbusses, pistola, etc. The manufactare of these weapons is of considerable importance; employing at all times, but aspecially during war, a large number of persons. Small arms were contrived by Schwartz, A. D. 1878 ; thay were brought to England sbout 1888. Fire-arms were a prodigious rarity in Ireland in 1489, when six muskets were sant from Germany as a present to the earl of Kildare, who was then chlef-governor. Mnaketa were frat used at the alege of Rhegen, in 1425. The Spanfards were the first nation who armed the foot saldiar with theae weapons.-Ulloc. Voltaire states, that the Venatians were the first to use guns, in an engagement at sea against the Genoese, in 1877 ; but onr hietoriana affirm that the English had guna at the battle of Cressey, in 1846 ; and the ybar following at the siege of Calaia.

Fire-engine, a apecies of forcing-pnmp in which the water is aubjected to presanre sufficiently strong to raise it to the reqnired height. Thees of the ordinary construction conaiat of two forcing-pumpe, wrought by the reciprocating motions of twe transverse levers. The water ia forced into an air-vessel, by which means the inclesed air ia condensed, and by ita reaction it forces the water through a movable pipe, which terminates in a conical form, and is directed upon the flame. Braithwalte's steam fire-engins is an ingenions spplication of the moving power of steam to the working of fir cengines. ${ }^{1}$ The mechanical arrangement of this machine consists of two cylinders of about six inches in diameter, ons of them being the steam-cylinder, and the other the Fater-pump; and they are placed horizontally, so that a parallel motion is easily obtained. An engine of this kind will deliver about 9000 gallons an hour to the height of 90 teet. The time of getting the engine into action from the moment of igniting the fuel (the water being cold), is less than ten minutes. Mr. Miles Greenwood, of Cineinnati, made, $\ln 1852$, the first auccessful practical spplication of the ateam fire-engine; and enginea of bis construction are now in nse in "Cincinnati, St, Louis, and many other large cities,
Fire-damp, the explesive carburetted hydrogen of coal mines. See Safkty Lamp.

Firelock, or Fuail. A musket or amall gun, which is fired with a flint and steel ; and therehy distinguighed from the old musket, or match-lock, which was fired with a match. The date of the invention of frelocks is uncertain.
Fire-ships. They were first nsed in the aixteenth century, Among the most formidable contrivances of this kind evar user, was an explosion vessel to destroy a bridge of boata at the slege of Antwerp, in 1585. The firat use of them in the English navy was by Charies, Lord Howard of Effingham, afterward earl of Nottirgham, lord high admiral of England, in the engagement with the Spanish Armada, July, 1588.Rapin.

Firevorks. (F'eux d'artifice, Fr.; Feuerwerke, Germ.) The componition of luminous devices with explosive combustibles is a modern art reaulting from the discovery of gunpowder. The finest inventiona of thia kind are due to the celebrated Knguricri, father and son, who executed in leome and Paris, and the principal capitals of Europe, the most brilliant and beatiful freworks that ware aver acen. The following description of their processes wili probably prove interesting to many of my readera:

The three prime materials of thin art are, nitre, anlphur, and charcoal, along with flings of iron, steel, copper, sinc, and reain, camphor, lycopodium, ete. Gunpowler is used elther in grain, half crushed, or fiacly ground, for different purposes. The longer the iron-flings, the hrighter red and white sparks they
give; those being preferred which are made with a very coarse file, and quite free from rust. Steel-filings and cast-iron boringa contain carbon, and afford a mare brilliant fire, with wavy radiations. Copperflings give a greenish tint to flame; thoae of zinc a flue blne coler; the sulphuret of antimeny gives a less greenish blue than zinc, but with mnch smoke ; amber affords yellaw fire, aa well as colopheny, and common salt; but the last must be very dry. Lampblack prodncea a very red calar with gunpowder, and a pink with nitre in excesa. It aerves for making golden. ahowara. The yellow sand , glistening mica, communicatea to fireworka golden radiations. Verdigris imparts a pale green ; aulphate of copper and sal-ammoniac, a palm-tree green. Camphor yialda a very White flame and aromatic fumes, which mask the bad amell of other anbstances. Benzoin and atorax are used also on account of their agreeable edor. Lycopodium burna with a rose color and a magniflicent flame; but it is principally omployed in theatres to repreant lightning, or to charge tha torch of a fury.

Firlain, a meauure of capacity, equal to 9 ale gallons, or $7 \frac{1}{\frac{1}{2}}$ imperial gallens, or 2538 cublc inches. See Weigirts and Measubes.

Firlot, a dry measure used in Scotland. The Linlithgow wheat firlot is to the imperial uahel as -098 to 1 ; and the Linlithgow barley firlut is to the imperial bushel as $1 \mathbf{4 5 6}$ to 1 . See Weights and Meaaures.

Firman (mere properiy F'ermán), in the Persian language, signifies a command, and is the name given in Tarkey, Persia, and India, to mandates or certiflcates of the severeign, iasued for various purposes. Those beat known to Europeana are given to travelers, and serve as passporta. The Fermân has placed at its head in Turkey the cipher of the reigning Sultan, written in a complicated manner, affixed by the chief secretary of the sign manual. In the East Indies, the term firman is rsed for a written permission to trade.

Fiso (Lat. fiscua), in Civil Lav, the treasury or revenus of a state. Fiscus, in its primary sense, denoted a basket or hanaper used by the Romana for holding large aums of money, and hance was applied to a money-chest or a purse. Under the emperora the term fisens came to be applied to the imperial revenue or privy parse, in contradistinction to the ararium or publie treasury. Ultimately, when the emperors had concentrated in themaelves the wholo severelgn power, the word fiscus lost its distinctive character, and was used in the same aense as ararium under the republic. Various officere were employed in the adminiatration of the fiseus ; as procuratorea, advocati, patroni, and prafecti. Frem fiac, is derived the word confiscation, which signifies to take the goods of a condemned persen and appropriate them to the public treasury.

Fiscal Fear, The fiscal year of the United States formerly ended on 31st Deceinber, and up to the year 1843, on 30th September; but Congresa enncted, August 26, 1842, "That on and after the first dsy of July, in the year of our Lord 1843, the fiacal year of the treasury of the United States, in all matters of accounts, recaipts, oxpenditures, eatimatea, and appropriations, shall conumence on the firat day of July in each year; and the reports and estimates reanired to be propared and laid before Congrese at the commencement of each session by the Secretary of the Treasury, in obedience to the acta of Congresa, of the 2 d of September 1789, and of May 10th, 1800, shall lie a report and estlinate for ouch flseal year, commencing as aforesaid, and terminating on tho 30 th day of June, in the ancceeding calendar year."

Fish (Ger. Fische; Du. Vistachen; Da, and Sw. Fiak; Fr. Poiasons; It. Peaci; Sp. Pescades; Port. Peires; Rus. Rab; Pol. Rybi; Lat. Pisces), a term used in natural history to denota every variety of animal lahabiting ecas, rivers, lakes, ponds, etc., that
can not exist for any conoiderable time oat of the wator. - Bnt in acommercial point of viow, thone fishos only. are reforred to, that are caught by man, and used ailcher as food or for some othor neofal purpose. "Of these, herring, aulmon, ood, pilohard, mackorel, turbot, lobstar, cyster, whale, otc.; are among the most important. See the differeat artloles undor these titles.
As the seods of a plant are namorous anoagh to insure an immonse progeny. If sven a emall percentage of them be properly managed, so do Alshem produce eggs in such number as might soom overatock the waters, wore there pot destructive agencies at hand. It in not improbable that we are on the eve of valuable improvements la the management of fish. It has been found that trout and othor valnable fish have declined in some of the French rivers; and on careful investigation it has been made apparent that not one egg in a hundred comes to maturity-the reat being dovoured by other fish, wathed away; or deetroyed by mad. Two Fronch fishermen, olsorviag theee fecte, resolved on an attompt to collect some of the trouteggs, and to nocure the young fish from the voracity of tha larger ones; they did so, and placed the eggs on a layer of gravol, which they deposited in a box fall of holes. This box they fixed in the bod of a flowing atream, and covered it with pebbles, thus far imitating the practice of the mother-fish. In due tlme the eggs excluded, and almost every one was found to be good. Several hundred fish were thus obtalned, which were kept in wator free of danger, and supplied with food. Applying thin operation the next year to - great number of fish, thoy obtained sevaral thousend tront ; and in a year or two more the number had increased to millions. The rivers in many departments of France were aupplied from this artifcial source ; and the French government are now encouraging the symtom in every wny. Not only troat, but salmon, car, pike, tench, and perch, are thus preservel; and, moneover, the syatom has enabled finh of different apecies to be naturalised in atrange watora, or removed from river to river.

Fisheries. The fisheries may be divided Into deep-sen and ahore fisheries. The hatter are, of conres, under the control of the nation owning the shore along Whose line the fish are canght. But the deep-sea fishories and the ownership of dincovered ehore-linea, have alwaya given rise to disputen and quarrels. It haa, however, been aettled that a nation has exclusive control and right over the shore Aehories extending three miles from the coast ; giving, sometimes, under certain restrictiona, aight for other nations to use the shore for the purpose of curing and packing the fish caught beyond three miles of the ahore.
Although fiabing in an ancient and honorable employment, finheries were not of much importance until after the diseovery of Nawfoundland. Ilnlland had fisherias of aome note in the 15th century; but owing to the atate of maritime knowledge they were much conflued; when, however, Newfoundiand was discovered, an almost magicul change took place. In the litrary of Venice there is a map, which anthorises the conjecture that land was found before 1436. But IItle was known until 1497, when Calot made his frst voyage. From this time voyagen were made in pursuit of codish at Irmgular perioxis, until the latter part of the 16 th century, when enterprise and capltal thecame plenty. Colonien were formed firat at Newfoundland, and afterwand at Aeadla which comprised Nova Scotla and Now Branewiek, and part of Maine. So mach importance was given to the fisheries as u nursery of meamen, even at that early age, that laws were enacted in 1853 to prevent joersens from sating meat Wednsedaye and Saturdzys except under a license, so that fisheries might be lacreased.
The great heneft from the fisheries was from the early colonization of this country. It is questionable

Whother we ahould not have beon quito a century behind in this, had it rot boon for colonion soundod on our conats by the firbermon. The fint diract voyago made by the Raglinh was in 1602, and the veriol catching codilh neer the coutharn aape of Mascoahusette, gave the name it yet bears: wh firmo.
The disputes in regard to fishing havo dieturbed commerve aince this conntry was discovered. A full account of the disputes and treatiee settiling them, can bo found in the able report of Lorenwo ilabine, Eaq., to Cougreea in 1852.
We can notice but one or two affecting our own country. In 1782, Adam, Franklia, Jay, and laarens were commineloners to negotiate a treaty with Great Britain, .hich contained thia article :
5. " It lo agreed that the people of the United States shall continue to onjoy, unmoloated, the right to take fish of every kind on the Grand Bank, and on all the othor banke of Newfoundland; aleo, in the Gulf of St. Lawrence, and at all other places in tha sea where the inhabitante of both countriea used at any time haretofore to fish; and aleo, that the inhebltants of the United States ahall have liberty to take fish of every Kind on such part of the censt of Newfonndland as British fishormen shall nes (but not to dry or cure the oame on that island), and nieo on the coaste, bays, and creeks, of all other of his Britannio majesty's dominions In America; and that the Amorican fillermen shall have liberty to dry and oure fith ln any of the unsettled bays, harbors, and creeks of: Nova Scotia, Magdalene Islanda, and Labirador, eo long as the same shall remain unsettled; but so soon as the same, or oither of them, thall bo nottled, It ahall not be lawful for the aaid fiahermen to dry or cure fish at such settlement, without a previous agreement for that purpose with the Inhabitants, proprietors, or possessors of the ground."
Notwithstanding the position taken by Messrs. Adams, Clay, Bayard, and Gallatin, at Ghent, that our treaty righte were not abrogated by the war, the British govermment revived their protension to the contrary immediately after the peace. An American vessel was fallen in with by an armed ship, the Javeur, Locke, commander, in June, 1815, when about 45 milles from Cape Sable; and her papers were endorsed, "Warned off the coast, not to come within 60 miles." So extraordinary a procedure was promptly disavowed as unauthorized; hut discussions ensued, which were terminated In 1818, by the conclusion of a treaty that embodied a compromine of the adverse views of the two cabinets, and which is atill In force. The artinl $\mathrm{f}_{\mathrm{f}}$ is as follow:
"Wherean, differences have arisen respecting the liberty claimed by the United States, fur the inhabitunta thereof, to take, dry, and cure fiah on certain coasta, haya, harbors, and creeks, of his llritannic majesty's dominlona in America, it is agreed between the high contracting partien, that the inhabitants of the sald United States shall have forever, in common with the aubjects of hiis Britannic majesty, the liberty to take fish of every kind on that part of the southern coast of Newfoundlanil, which extends from Cape Ray to the Ramean Islunils, on the western and northern conat of Newfounilland; from the said Cape Hay to the Quirpon Ialands, on the ehoren of the Magdulene lalands and aleo, on the coasts, hays, hartors and ereeks, from Monnt Joly, on the southern coast of Labrador, to and through the Straits of Bellisle, and thence north warily indefuitely alung the cosst ; withont prejudice, however, to any of the exclusive rights of the Hodson'n llay Company; and that the American fiahermen ahall aiso have liverty, forever, to dry and cure fish In any of the nosettied baye, harliors and ereoke of the southern part of the conat of Newfonndland, hereabove described, and of the coast of Laibrailor; but so soon as the same, or any portion thereof, shall be aettled, It ahall not be lawful for the
anld settle with grous forev the if
ould fiohermon to dry of ours fish at such portion so settled, without previous agreement for anch porpose, with the inhabitants, proprietors, or poseessors of the ground. And the United States hereby renounce, forever, the liberty heretofore enjoyed or claimed by the Inhabitants theroof, to take, dry; or cure fieh, on or within three marine milies of any of the conats, bays, creeke, or harbore of his Britannio majesty's dominione in America, not included within the above mentioned limita : provided, howaver, that the American fishermer: ahs!l be permitted to enter anch bays or harbors for the purpose of sheiter, and of repairing damages therein, of purchaoing wood, and of oitaining water, and for no other purpose whatever. But they shall be ander such restrictions as may be necessary to prevent their taking, drying, or curing, fish therein, or in any other manner whatever, abuing the priviloges herehy remerved to them."
The diatinguishing features of this articie, as compared with the stipulations of the treaty of 1783, are obviously two: first, that we gave up the catehing slong certain shores; and, secondly, that our facilitios of drying and curing were increased. The practical construction of both governments has been, until a recent period, that our vessels could fish everywhere, as under the treaty of 1783, except within three miles of certain coasts ; in other words, that our rights were not impaired on the southerm shore of Newfoundland, between Cape Ray and the Ramesu Iblands, on the western and northern shores of Newfoundland, from said Cape Ray to the Quirpon Islands, at the Magdalene Islands, letween Mount Joly and the Straits of Bailisle, and throngh thees strsita to an indefinite extent along the alnores of Labrador; while eloeuhere in British America we retained the sea-fisheries, but antrendered the inner, or shore fisheries.
During the discussions abroad, in consequence of the outrage of the Jaseur and other British cruisers, Congress was not unmindful of the fishing interest, both to repair the wrongs of unauthorized captures and to afford protection against foreign competition. The tariff of 1816 imposed a duty of one dollar the quintal on foreign driod or amoked fish imported Into the United Ststes, two dollars the barrei on salmon, one dollar and fifty centa the barrel on mackerel, and one dillar the barrel on all other kinds of piekled fish.
So, in 1817, an aet was passed which required that ali officers, and three quarters on the crews of vessels employed in the cod-fishery, and claiming the bounty or allowance, should be Amorican citizens, " or persons not the suijects of any foreign prince or state;" while no such vessel, it was provided by further enactments, should be daprived of bounty, if prevented from fisiing the full time preseribed by law, by reason of detention or seizure by British ships-of-war.
In the revision of the tariff in 1824, there was no chango in the rates of duty imposed on foreign fish. These rates were continued alao in the tariffs of 1828 and 1832. Thus, in four revisions, the principle of smple protection was preserved, oxcept that the products of the sea, like all other commodities imported, were subject to the provisions of the "compromise" measire intreduced liy Mr. Clay. In the prenent tarIff, apeciffe dutiea on fish are entirely abolished, and tie uniform rate of 20 per cent. ad valorem substituted, which on some kinuls is merely nominal, and on all insufficient. The ad valurem system has proved extrewely beneficial to British colonists. In fact, having driven us from the marketa of Cntbolio Europe, they are in active competition with us for our own.
A iounty or allowence has been commonly aliowed by governmenta in consideration of the lisheries iseing nurseries for seamen, and a ehief dependence in time of war to supply the marine.
In 1852, the bounty iaws in this country, gave to vessels:
" 4 If measuriag more than five tone, and not exceedIng thirty tons, $\$ 80$ por ton. $\omega$ - 6 Ths "n "If Ir asuring more than thirty tons, 44 per ton. :" If the abova 30 tons, with crewa not less than 10 persons, and having been exclusivoly employed at sea in the cod-fiehery 84 calendar monthe, 8350 per ton. in "The aliuwance for one vescel: during the season, whatever may be her tonnage, can not exceed $\$ 860$.
" Vessels exelusively employed at sea in the codfishery the full time requined to entitle them to bountr, and afterward wrecked, may be allowed bounty under the previsions of the act of 26 th May, 1824, which requires the evidence of the loss of the vessel to be tranamitted to the Comptrolier for his decision thereon. Under the act of March 8, 1849, thia daty has been transferred to the Commiasioner of the Customs, to whom the proof, certified by the collector of the district to which the vessel belonged, uhould be sent for his official diraction thareon.
"Instructions will be given in due season in regard to the mode of payment of bounty aliowances, at and after the close of the year. To obviate any responsibility which might otherwise devolve on coliectors, shonld suoh payments be made upon proof regarded as Ineufficient under the present ingtructions, It will be advisable that probable claimants to fishing-bounty allowances be apprized, before the salling of vesselis on their first eod-tishing voyage, of the requirements of these instructions, which are intended to supersede and supply the place of all former instructions on this snbject. Thomas Oonwin, Secretary of the Treasury."

We make the following extracts from Sabine's able Report on the American fieherias:
Cod-fithery of France.-The French were the first European cod-fiehers in the American seas. There is a tradition among the fiehermen of Biseay that their countrymen visited Newfoundland before the time of Columbus. It is aaid, indeed, that the great discoverer was informed of the fact by a pilot who had been engaged in the enterprises. The story, improbable as it is, seems to have been treated with respect by some writers of the 16th century, but may be dismissed now as one which reste npon no clear and anthentio testimony.

But that the Newfoundland fisheries were known to the Biscayans and Normans as early as the year 1504, is quite eertaln. When Cabot discovered our continent, Europe, including England, was Catholic ; and during the fasts of the church, the pickled herring of IIolland was the principal food. The consumption of fish was immense; and the Dutch, having enjoyed the monapoly of the supply, had become immensoly rich. The knowledge communicated by Cabot and the voyagers who followed him, that the waters if America contained, not only an abundance, bnt many varietiea of fish, gave rise to an exeitament on the sulject of fishing hardly less intouse than is witnessed at the prasent time reiative to mining. Persons of the highest rank, and not engaged in commercial purauits, beeame sharchoiders in adventures to the new fishinggrounds. And though the Dutch refused to uibandon the particuler fighery by whieh they had olitained both wealth and celebrity, veasels wearing the flage of France, Engiand, Spain, and Portugal enme annually in sentch of tie eod for nearly a century befora a single European colony was founded in America north of the ancleit iimite of the United States.

We have seen that when, in 1778, France embarked in our revolutionary struggle, hor fishermen, alsent at Newfoundland, were recalled to enter her ships of war. The same relinnce is placed upon them now. War was apprehended in 1841, and M. Thiers foilowed the example of the etatesman referred to ; and M. Rodet affirmed that, "without the resources which were found in the sailors engaged in the fioheries, the expedition to Algiers could not have token place."

These reasons are not only sufiliciont to juatify, but to demand, national oncouragement. But It may bo urged, in addition, that the open or desp-aen cod-hahory diffore from almost evary othor omploymont; thas in war it is nearly or quite destroyed; that in peace it can not bo parsed for more than four or Ave moatha in a year; that often akill and induatry are insufficient to inaure good fares; and that, when succesa attends severe toll and exposure, the fiahermen buroly sabsiat. The offecte of a "" bed cateh" are, indeed, sad and calasitous. The disasters of 1817 afford a recent and a forcibic illustration. In that year the Freneh codfishery proved a faliure. The quantity of fish caught was acarcely a sixth part of that of former seasons; and the fiohormen, disconraged, abandoned the business as early as the middie of Auguat. The labor of the summer and the expenses of repairs and of outfits lost, the actual want of food and clothing until another year came round was alone provented by the bounty allowed by the govermment.
The manner of fishing is now the only topic that noed claim attention. It is to be observed that the principal fiehing-grounds are three, and that on each there is a difference in the mode of operatione and in the size of the vessels. First, the fishery on the coacte of Newfoundland, which has always been considered the most important, as being more certain and employing the greatest number of men. The veseois are of all aizes-from 80 to 200 , and even 300 tons. .The latter size is, however, rare. When the vessel arrives on the coast, which is generally early in June, she it dismantled. Her boats, with two men and a boy in each, are sent out every norning, when the weather will permit, to fish until night. On the return ia the ovening, the fish taken are apiit, salted, and put in "kewches" or piles; remaining in piles a fow daya, they are "washed out" and dried until they are fit to ship. These processes are repeated from day to day until the fare is completed or the aeason has possed away. Toward the close ot weptember, fiehing is auspended, and the vessels depart for France or the Weat Indies.

The Grand Bank fishery is pursued in vesseis of between 100 and 200 tons' burden, with two strong chaloupes, or boats, to each. From 16 to 20 men compose a crew. The vesseis proceed first to St. Plerre, land the shore fishermen and "eurers," and thence take position on the banks, anchoring in 70 or 80 fathoms of water. Every thing in readiness, the chaloupes are launched and seat out at night to place the "ground-lines," to which are attached some four or five thousand hooks. When not too boisterous, these lines are examined every day, and the fish attached to the hooks aplit, salted, and placed in the hold of the veseel. Meanwhille, the fish caaght on board by the men not assigned to the boata are treated in the same way. The first fare is usualiy secured in June, and carried to St. Pierre to be dried. The second fare is cured at the same place; but the third-if fortunately there be another-is commoniy carried to France "green."
This fishing io difficuit and dangerous. It requires expert and daring men. It is prosecated in an open, rough, and often a atormy sea, and frequently involvea the losa of bouts and their crews.
The thind fishery, at St. Pierre and Miquelon, ia aimilar, in some respects, to that between Cape Hay and Cape John, on the coast of Nowfoundland. Bouts, instead of veasela, are, however, employed in it. The boats of the two islands are between three and four handred in number, and require two men to each. They go out in the morning and return at night. Thus, as in all shore fisherien, the fishermen aiways sleep at their own homes. As this la the only businese of the islands, neariy all the men, women, and children are engaged in catching or caring. The season opens in April, and closes usually in Octrber.

Wo have seen the importance attached by France to her immenen Amorican domains, and with what pertinacity ahe maintained her pretenslone to the monopoly of the falhing-grounde. It remains to apeak more particularly than has yot been done of the two lone, base, and rocky lalands that romain to her as monu. ments of the vicissitudes of the human condition and of natlonal humalisitian.

The aituation of St. Plorre and Miquolon commands the entrance of the Gul? of St. Lawrence. The growth of wood is masufficient oven for fuel. They produce no food, and the inhabitants aro dependent on France and other countries for supplies. The population of St. Plerre in 1847 was 2030, of which about one quarter was "fioating," or non-resident. The population of Miquelon at the same time wea 625.

There are several Catholic churches and aciools, prieste, monke, and nune. In 1848 a hospital, suf ficiently commodious to receive upward of 100 sick persons, was erected. The dwellings are of wood. The government-house is of the sanse material, and plain and old-fashioned. The atreets are narrow ahort, and dirty. The official personages are a governor, a commissary or minister of marine, a harbor master, and some inferior functionariea. The military, limited by treaty to 50 men, consists of about 30 gene d'armes. Upon the station is a slagio armed alhip, thoagh other armed vessels are occasional visitors. The present light-house was erected in 1845, at a cost of 80,000 franca, and, well built of brick, is a sulutan. tial edlice.
Such are the two islands-Two leaoues in ex-text- hich remain to the power that once possessed the whole country bordering on the Mississippi, the limitless regiona penetrated by the St. Lawrence; Acadia, from Canseau, in Nova Scotia, to the Kennebec river, in. 'aine; the island of Cape Breton; and the huudred other isles of the bays of the northern and oastern poaeessions.
Tho extent of tho French cod-fishery may be estimated from the following statistics :

Fanem Cod-Fisarar.

Wyat, of Bristol, England, who made a voyage to the St. Lawrence and Newfoundland in 1698, found only oight Spanish ships in a fleet of upward of 80 sail of French and English veseela. From the remarks of Smith-who became the Father of Virginia-it would seem that in the early part of the 17th century, the Spaniah fishery was parsued with grester vigor than at the time last mentionec. But the greater wealth to be acquired in the gold regions of South America soon lured the Spaniarda from an avocation of so great toil, and of so uncertain rewards. No controveray between Spain and Eingland es to their reapective rights to the fishing-grounds ever arose.
Spain retired from our waters in peace, and at her own pleasure. Littie is heard of her in connexion with our anbject for quite a century, and until the peace of 1763. Her claim-reating on discovery-ever vague snd uncertain at the north, had become almost os obsolete as that of the King of England to the tille of King of France. Still, in the definitive treaty concluded nt Paris, she formally renounced "all pretensions which she has heretofore formed, or might form, to Nove Scotia or Acadia, in all its parts, and guaranties the whole of it, and with all its dependencies," and ceded and guarantied to England, "in full right, Canada, with all its dependencies, es well as the island of Cape Breton, and all other islands and coasts in the Gulf and River of St. Lawrence; and, in general, every thing that depende on the said countries, lands, islands, and coasis, with the sovereignty, property, possession, and all rights acquired by treaty or otherwipe." With this treaty the history of the Spanish fishery in America terminates. Spain relinquished her rights at the peace of 1763 , with reiuctance, though she had long ceased to exercise them. A letter of Sir Joseph Yorke is quoted in the correspondence of Horace Walpole, in which it is said: "By what I hear from Paris, my old scquaintance, Grimaldi, is the canse of the delay in aigning the preliminaries, insiating upon points nelther Frunce nor England would ever consent to grant, such as the literty of fishing at Newfoundiand-a point we should not dare to yield, as Mr. litt told them, though they wore masters of the Tower of London."

Cod-fithery of Portugal.-An account of this fishery may be embraced in a aingle paragraph. If materials exist by which to ascertain its progress and final extent, I have not heen able to find them.

Yortuguese vossels were at New foundland as early as those of Spain; and in 1577, the number employed there is estimated at 50 . These $\mathbf{t w o}$ facts comprise the subatance of my information upon the subject, except that Portugal, like Spain, soon abandoned all sttention to the claims derived from the voyages of her navigators to the northern parts of our continent, and devoted her energies and resources to colonization in South America, and tho acquisition of wealth in the mines of Brazil. The rivers and coasts of Portugal alound in fish; but the fisheries are neglected by the government. The whole number of alilors and fishermen who belonged to the kingdom in 1826, was only 18,700. I find in an official document s atatement which shows that duriug the 24 years ending in 1825 , the quantity of dry codtish imported into Portugal was $7,520,000$ quintals, of the vaiue of more than $\$ 39,000,000$ ! As late as the year 1839, certainly, the government parsued the policy of levying a tax or duty on the produce of the domestic or conat fisherya fact wiich enalles us to account for the miserabie condition of the kingdom, as regards its maritime strength and resources.

Kinglish Cod-fishery - Nerofoundland. - Newfoundland is the oldest colony of Fngland in America. It is said that in the public Illurary of Venice then is a map, constructed by Andrea Bianco, in 1436, which anthorizes the conjecture that it was known to fiehermen before the voyage of Cabot, in 1497. The stery,
to state ite aubetance in a word, is, that the islapA Scom rafiara, or Stoxafira, on the map, and the island of Newfoundiand, are identical, because the codifis ia called atockfich in the northern languages. The English resorted to Iceland for the cod, provious to the year 1415, but there in no account of their fishing at Newfoundland prior to 1517 . . Some writere suggest that the French commenced at the same time. But the fact, generally admitted, thet the ships from England, France, Spain, and Portugal, to the number of fifty, were employed in 1517; is alone oufficient to show that the fishing-grounda had been visited for sevoral years. Indeed to consider that the French went to Newfoundiand for the first time in 1504, and that in thirteen yeare, and in the infancy of distent and perilons voyages, their adventures had attracted the attention of three other nations to the extent just atated, is to allow an incresae of flage and of vessele so rapid as to still require explanation, without a knowledge of the fishing enthusiasm of the period. Besidas, some forty or fifty houses for the sccommodation of fishermen were built at Newfor : Iland as early as 1522.

A few miles back from the coast, Newfoundland is almost an unbroken wilderness. The inhabitants, as a body, are as ignozant of the interior of the isiand as are others. To them, and to all the world, the colony is known for its risheries, and for these alone. To enumerate St. John'e, Ferryland, Fugo, and Burin, and the settlements on the bays of Conception, Trinity, Bonavista, Fortune, Bull's, Placentia; and St. Mary'e, is to recall almost every place of note. There was no free port until 1828, and no bank until eight jears later. From the discovery of Cabot to the arrival of a bishop of the church, was 343 years. The popnlation in 1806-about two and a quarter centuries after the attempt at colonization by Gilbert-was less than 26,000 . It was leas than 74,000 in 1836 ; and lut 96,606 in 1845 .

It remains to speak of the fishing-grounds; of the manner of catching and curing, and of the habits of the persons who are employed in the fishery. As the vessel or " bank" tishery has been abandoned by the English, an account of it is reserved for the third part of this report. The boats used for the shore fishery require from two to four men each. The number of boats in 1838, was 6159 ; and in 1845,9989 . The fisb'rg is performed within the harbors, and early in the season, near the land. The men stand while at ther toil, and each is ablo to tend more than one line. At times tha fish fasten to the hooks so rapidly, that the fishermen display great activity. A boat is often filled in two or three hours. On the shores are "stages," or buildings erected on posts, and projecting into the sea, to allow boats to come to them as to wharves or piers. The fish are carried to these "stages," where, in the hands of the "cut-throat," the "header," the "splitter," and the "salter," as four classes of the " shoreamen" are called, they are prepared for the "dryer." When sufficientiy salted, they are washed, and transported on "hand-burrows" to the "flakes," whera they are spread and dried. Once cured, they are piled in warehouses to await sale or orders for shipment. The "saiter" and the " dryer" should he careful and expert men; the one to distributa the ault with a skillful hand-the other, that dampe and ruins do not injure the fish while exposed in tha air. Three qualitiea are usually sorted for exportation, and a fourth, consisting principally of broken and discolored fieh, is retained for consumption. Women and chilidren are sometimea employed in the loats, and very frequently assist the curers on shore. During the fisting season there are no illers of either eex.
'The labors of the fiehermen and shoreamen are almost incessant. The time devoted to sleep, under ciroumatances that often occur, is insufficient for the demands of nature; while long abstinence from food is not uncommon.

The fishermen formerty llved in the rident of struetureaf but they now occupy comfortable dwellings. Their food to coarse, and their mannera rongh. Intoxtcating drinka were once an common among them as tes or water. Of late yoarn there has been a senalble change for the better; and a large clase are moral and temperate. Their habits of lifo are irregalar, from the nocessities of tholr position ; but in hospitallty and acts of kindnese thoy are not excelled by men of the hligher walks of society. They are to judged in mercy, for their opportunitles to improve are few, and their temptatione to orr are many.

Enolun Cod-Frausay, Nzwfoendland.

The Nenfosndland Seal-Fishery, wo called,- This business is of recent origin. The first sceount of it is In 1795, bat it was not prosecuted to any extent until the general peace, In 1814. Seals frequent the coastm of Newfoundland In the spring. They go upon the lce in the polar meas to bring forth their young, and are awept along by the currents to millder regione, where, willt upon the lee, hundreds of thousunds of them are annually killed. Dering the passage from the remote north, they apparently live without much food, but yet are quite fat when meen by those who adventore in pareult of them. The vessels engaged in cotching seals are frum finy to twe hund.ed tons, and
carry from fifteen to forty men cach; ?7 They leave Nowfoundland In March, and proceed to sea until they meet the ice, and on falling In with fit, are forced into It ase far as poselble, by Implemunte whioh ore arranged for the purpose. Fast imbedded in the rast and soemingly limitiens fielde of ice the ereww disperse in avery directlon in aearch of soals, which are inactive, and are genorally easily caught. They are killed vith fire-arms and with clubs, and often while asleep. Occasionally the large amea rediat. Tha moans of the young during the alanghter are plteous.
The flesh of aeale fo unfit for food, and they are only valuable for thelr fat and skina. The common method ts, to atrip off the okine and fat together, and to carry these parta to the vencele, leaving the ren.alnder upen the lee; but when the weather or other circumstancea will not permit this, the carcess is traneported whole, and the valuable parta are stripped off subsequently.' Seal-catching closes toward the end of April.' The moat furtunate vessele make two voyagea in a season. After the arrival of the vessela in port, the fat la eoparated from tho skins, cut into pleces and pat into vata, where, hy the warmth of the oun, the ofl cozee ont. The akins are epread and saited in piles, and when rroperly oured, are packed in hundles of convenient eize. In the whole circle of human employments, few of nove are more exciting and perilous than the catcbing of seals. A storm of aleet and onow in the night is terrible, and the stoutest hearts quail. While the vessels ure absent, the greatcst anxiety prevaila in the porte of departure, and the most distressing rumora prevsil : at tlmes, a full month elapses before the arrival of a alngle vessel, and every imaginable cause ts asslgned by alarmed fanilies and friends for the delay of tidings from the sealingground. North-enet galea drive the lee toward the ohore, and frequently produce fearfol disasters to both Ife and property In 1843 the lose of vessela was very conalderable, und several entire crews perished. Some vernels were wrecked in 1849.

The year 1827 was uncommonly prosperous. Fortyone vessels laden wlth seals arrived at St. John's in a single week. They caught 69,814 of the oijjects of their search. One of these vessels took upwarl of 3000 in six days, and another, atill more auccessful, about 3500 in the aame time. The intense excitement which attended the alaughter of so large numbers, in so short a apace, can be readlly imagined.

Fisheries of Nove Scotia.--The original grantee of that half fabulous, nover dofined country, Acemili, was Pierre de Gast sionre de Monto, a Protostant, and a gentleman of the bed-chamber of Henry the Fourth of France In 1608, his royal manter, by lettere patent, gave him the territory botwoen the 40th and 46th degreen of latitudo, and in the following year $D_{0}$ Monta came in porson to explore and take posecesioe of his domaina. Sixteon yeare before the landlog of the pilgrims at Plymouth, he wintered upon an island ia the River St. Croix, which, since the adjustment of the bonadary-line between the Unlted States and Now Brunswiek, has been conaldered within the Umita of Maine. 1 This island i . claimed by the heirn of the late Genaral John Brewer, of Roblinston. Relica of De Monts' sojourn apon it centlane to be found. Ap-napolis-the Port Royal of the French-was founded before his return, and is the oldest settlement in Nova Scotia. The " lieutenant-general of Acadia, and the circuin, jacent country," accomplished but Itttle. His petent allowed tim to "carefully search after and to distinguish all corts of mines of gold and silver," and gave him the monepoly of the trade in furs. He seems to have conflimed his attention to measuren to secure the latter; yot fish were caught, cured, and carried to France. A permanent fishery was established at Caneeau. Acadia soon passed from De Monte fato Catholle hands, while the English grant to Sir Williom Aloxander, In 1021, emhruced a large part of It. As the ovente connected with our subject at this time appear in the account of the French fisheries, there is nothing te demand our attention antil after Nova Scotia was permanently annexed to the Britiah crown, by the treaty of Utrecht, $\ln 1713$.
Down to the period of our Rovolution, Nove Scotia was harilly known except for its fisheries. The resident English population was so small in 1719, that Phillips, the military governer, was compelled to select the council, required by his instructlons, from his garrison. Thirty-eix years later, the whole number of inhulitants was estimated at only 5000 . In 1760, the townshlp of Liverpool was settied by persons from Massachusetts, who designed to prosecute the salmonfakery, and who, anccessful in their labora, caught a thousand barrels in a aeason. They were followed in $1 i 63$ by about one hundrod and sixty famillies from Cape Cod, who aelected the spot called Barrington, transported thithar their stock and fishing vessels, and founded one of the most considerable flahing towns st present in the colony. The whele value of the imports at this period was less than five thensand doliars. In truth, the House of Assembly asserted in 17i55, that the amount of monsy In Nuva Scotia was $\varepsilon 1200$ (or $\$ 4800$ ), of which one tifth was in the hands of farmers. Such was the general condition. The settlement of Halifax, the capital, requires a more particular notice. Thomas Coran, a famous projector of the time, whose name occurs often in the history of Maine, engaged in a scheme to commence a town on the site of this city as early as the year 1718, and his petition for a grant of land received a favorable report from the Lords of Trade and Plantations; but the agents of Massachusetts opposed his plans, because they interfered with the freedom of the fisheries, and he was compeiled to abandon hle purpose.*

[^13]At the restoration $x$ Cape Broton, in 1746, the founding of a capital for Nova Scotis was undertaken as a government measure. "Aa a anbotitate. for Loulabourg restored to France,", sald Mr. Hartloy in the House of Commona, "you seetlled Halifex for a placs d'ermes, leaving the limits of the province as a matter of conteot with Frasee, whlch could not fail to prove, as it ild, the cauce of another war. Hed youkept Loninbourg, instead of sottling . Talifax, the Americans could not any, at least, that there would not have been that pretext for imputing the late war to thoir aco count." The new city was named in honor of the Earl of Hallfax, the president of the Lords of Trade and Plantatlons, "The sito," saya Hallbarton, "aboat midway between Cape Canseau and Cape Sable, was proferred to several uthers, where the noll was better, for the nake of ostablishing in Its noighborhood an extensive cod-fisher, nd fortifying one of the beat harbors in America.: Thus, Halifax wan designed as a fishing capital, and " as a auhutitute for Louisbourg." Liberal granta of land were made to officers and men Who were dismissed from the land and naval service at the close of the war, and Edward Cornwallis was appointed militery governor. Horatio Gates then an officer in the British army, and subsequently the victor at Saratoga, was among the first who landed at IIalifax, in 1749. The project involved the government in gerious difficulties, and the expenditure of enorinous sums of money. The amount first appropriated was $£ 40,000$. In a fow jears the cont to the nation was nearly two millions of dollars ! The fiaheriea were neglected, and the colonista, unable to support themsolvea, petitioned Parliament for additional relief, even after so large an amount of money had been disbursed for their benefit. Omitting dotaily, we may atate that five millions of dollars of pubHic money were expended finelly ln the colonlzation of Nova Scotia, according to the plan devised by the Boarc' of Trede and Plantatlons.

Un ed States.-Our continent was discovered in 1497, by Cabot; and from the moment that the chronicler of his vojage made known to the people of England that our watera teemed with fish-that here "were great seals, and those which we commonly call salmons; and also soles above a yard in length, but eapecially there is a great shundance of that kind which the savages call baccalos or codfish"-down to the year 1620, as we have seen in the first and second parts of thin report, the intercourse of the French and English th the northerly seas of AmerIca was constant $;$ and of all this were not the Puritans as well informed as others? Were they ignorant of what transpired in the New World in the ten years Immediately preceding their tlight from England, and during the ten yesrs of their reaidence in Holland? Whilo among the Dutch they were neglected, if not unkindly treated, and became poor and unhappy. Nany places to which to emigrate were mentioned, and the advantages and disadvantages of each were amply discussed. As soon as the decision of the littie flock was made, some were dissatisfied and withdrew. The question arises, why did they decide to come to America ?

I have no space to argue a question which involves so many inquirics, but can not forbeer to state that, in a few words, some of the principal incidents which attended their coming to their "wilderness home." Ouitting to notice the accounts of Amidas and Barlow, who explored the southern coast of the United States In 1584, under the auspices of Sir Walter Raleigh, and what is said of Sir Richard Grenville's expedition *: the same region the year following, es well as the various other enterprises which, in several particulura, are pertinent to the subject, we come at once to the voyage of Gosnuld, in the year 1602. He was the first Englishman who allled directly across the ocenn, and the tirst who attompted to make a eettlement within
the limits of New England. The atory of his adventarea was written by two of hin asesciaten, Archar and Breroton, and mubliahed in London immediately after Mie retnim. - Of Brereton Hitta seema to be known but Gonnold and Archer were aubeeqnently prominent among the aarly anttlers of Virgimia, and between the latter and the colebrated Amifis there was a long and a deapernte quarrel. From Brereton'a narrative, at well as from the tracte eppended thereto, it appearm that Raleigh was the patron, perhaps the original mover, of the onterprice. An containing the carlieat information of Masaschusetts printed in Eingiand, these pajers are of great valua. The attention of merchants, of fishermen, and of those intervated in colonination hitherto, and for nearly a century, directed exclusively to Newfoundland, was now to bo diverted, in some measure, to New Eingland. The reaults will appear aa we progrese.

Arrived or our const, Gosnold archored near land which he called "Shonl Hope;" but, catching a "great stere of codfish," he changed the name to Cape Cod. $t$ While there, saya Archer, "we saw wculls of herring, mackerel, and other emall fish, in great abnndance." Brereton, whose account is more exact and definite, remarks with much earnestness npon most matter connected with our inquiries. "Surely, I am persuaded," be ohserves, "that, in the months of March, April, and May, there is upon this coast better fahing, and in as grent plenty as in Nerfoumd land; for the ecults of mackevel, herringn, cod, and other fish, that we dally saw as we went and came from the shore, were wonderful ; and, benides, the places where we took these cods (and might in a faw days have laden our ship) were hut seven fathoms water, and within less than a league of the thore, when in Newfoundiand they fish in forty or fifty fathoms water, and far oft."

To pass the obeervations which were recorded as they continued their explorations, we find in the tracts appended to Brereton the prediction that, "forasmuch as merchants are diligent inquisitors afler gaine, they will $s 00 \mathrm{~m}$ remore their trade from Nearfuundland" to New Eingland, where there in a better climate, greater security against the depredations of piratee, and less expense for outfits, shorter voyages, and safer hariors. The writer, anticipating that a eelony would soon be founded, predicted further, that the ships of all the Dations that "have heen accuatomed to repair unto the Newfoundland for the commodity of flah and oils alone, will henceforth forsake" that island, "when once we have planted people in these parts; by whose industry shall be provided, for all commerce," the products of the nea, "and many commodities bealden, of goon. importance and value." Fighteen years elapsed ; the Pilgrima anchored off the same "Shoal Hope," and settled this very country.

Pring followed Gosnold, and explored the waters of Main in 1603. Ile saw and named the Fox Ialands, in Per. *cot Ilay, and fonnd gool mooring and fishing. wike Gosnold, he considerel the fish which be took superior to those of Newfoundiand. Ife made a second voyage three years later; and Gorges remarks that his dincovery of the eastern part of New England was perfect, and his account of it accarate. Waymouth, under the patronage of aeveral English noblemen, and other persons of rank, came in 1605. "A True Relation" of his adventures was written hy James Rosier, "a gentleman employed in the voyage," and printed in London in the same year. IIe egrees with those who had preceded him in every essential particular. As they departed for England, they caught very large fish; and he eays that those

[^14]on boand of the ship, Who were familiar whth 'he buginees, "would warrunt (by the holp of God), 11 a short voyage, with i feve good feliers, to make a morv jupitable nwirn from hence than from Nexpfoundland; the heh being oo much greater, better fed, and abumdance with (rain," etc."

The rioheries from the commencement of the Revolufiomany Controweray to the Dedaration of Independence. -In tracing the origin and progren of the fiaheries of New Eagland, we have seen that thay firnished our first articies of export, and laid the foundetion of our navigation and commerce. It wat mo in Eupope. Of the present maritime powern of the OH World, there in acarcely one that deea not ewe much of its commercial proaperity to the asme branch of induatry. Some fugitiven from the, wrath of the monster Attila fied to the islea of the Adriatic, where, of necessity, they adopted the avocation of fishermen. By this employment, steadily continued, Venice in a few centuries became renowned for her wealth, commerce, and naval atrength. The origin of the republic was celebrater for a long period, and the ospisaion or refusal of a Doge to provide the custonary banquet, and to suimit to the fishermen's ombrace, sllowed by his predecessors on this national festival, made the name of Contarini hateful, and wellnigh caused the subversion of all legal restraint, and the overthrow of the relyning family. Genon, teo, grew rich and powerful by the same means, and, not content with her own limited fishing-grounds, undertook the conquest of othere. Usurping the flsheries of the regions of the Bosphorua, she captured and for a while awed into sulmission their rightful owners. Amsterdam, from a village of herring-catchers, cabins, and curing-sheds, rose, by the skill of the inmates of these frail structures, by the fame of their commodil. tien in foroign countries, and by the immense consumption of them at home, to unexampled sffluence and grandeur; and the sayings everywhere current two centurien ago, that "Amsterdam is founded on herring-benes," and that "Dutchmen's bodies ars built of pickled herrings," wera harily more than quaint expreasions of historic truth.
So oteadily and maccensfully were the fisheries pursued by the people of Plymonth, Massachusetts, New liampahire, and Maine, that only fifty years elapsed from the landing of the Puritans, before an English writer of high anthority in matters of trade, expressed his apprehension an to the evente likely to resuit, in the following reinarkable worle: "New England," oaid he, "is the most prejudicial plantation to this kingdom." And w'.y ? Because, "of all tho American plantationa, his majesty has none so apt for building of ahippitug an Now England, nor any comparably so qualified for the breeding of seasien, not oniy by reason of tho natural induntry of that people, but princtpaily hy reason of their cod and mackerel fisheries; and, in ny poor opinion, there is nothing more prejudicial, and in prospect more dangerous, to any mother kingdom, than the incresee of ahipping in her colonies, plantations, or provinces." Sir Josiah Child was alarmed too much, probably, at what really was in his own time, but atill saw with a propiet's ej, what was to be. Isut the policy of Eingland, from the restonation of the Sturts down to the Revolution, was in strict accordance with the spprehensions expressed by him, and ahe not only negiected and declined all sappert to the navigation and commerce of Now England, but directly oppressed and reatrained them. Omitting notice of the acta of Parliament which do not relato specially to the suljeet before un, the first isw to claim our attention wan parsed In 1733, after a diacussion of two years. This act, by imposing dutien on rum, nuclasses, and sugar, imported into the colonies from any Weat India isianda other than British, was deaigred to break up an extensive and valuablo trade
with th thene pr flah. II of the away by now so put into diatilled of the ate inainted 1 the plant lanses frc domestic they coul losses. felture of ubmitter ence ; al Dutch, al period of Revolutic threatene produced, it, for qui

[^15]Fith the French, Duteh, and Spanioh blands, where thees products of the plantatione wore exchanged for fich. It If eald that, previone to the commencement of the trade to these lilands, molassen was thrown away by the plantors, and thint this article, which is now eo extensivaly need in food, was first aaved and pat into caska to be brought to New England, to be distilied into rumu. Cortaln it is, that on the paseage of the act of 1733, the people of the northern colenies Inslated that, nulous they could contlinue to moll finh to the planters of the forolgn islands, and to Import molasses from thence to be manufactured into spirit, for demestic consumption and for trade with the Indiann, they conld not prosecute the fisheries without ruinoun losses. The penalty for violating the act was the forfeiture of veseel and cargo. Yet Now Englend never snbmitted, though a fieet was ment to enfone obedlence; and the internleted trade with the Prench, Dutch, and Spanish Islands, did not ceane until a late period of the controversy which terminated in the Revolution. In fact, therefore, a measure which threatened to ruin the cod-fishery of New England, produced, as I lncline to believe, no serious injury to it, fir quite thirty years.
But in 1764 the act was renewed, and the collection of the duties it imposed on rum, molasses, and sugar, waa attempted by the officers of the crown, in a manner to creste the most anxlous concern; for, the jurisdiction of the admiralty courts was enlarged, and the people were deprived of the trial by jury in all cases arising between them and the government under this jow, and the trade and navigation laws generally.
The most alarming discontents followed the collisloas and quarrela which constantly occurred between ship-maters and merchants, on the one hand, and the officers of the customs on the other, in various parts of New England, and especialiy in Boston, Salem, Gloucester, Falmouth, and olsewhere in Massachugetts ; and the impression became general among commercial men, that their business and property were both to he sacrificed to appease the clamors of the planters of the British salanils, and to teat the ablity of the mother country to "raise a revenue in America" under the "augar and molasses act," ns this odious law was called in the politics of the day.
These incidents will serve to show the connection of
the finharles with the queations which cansed a dicmemberment oc the British ampirs. It rounalns to apeakk of the ac. $\because$, Parliamont pasced in 1776, which, by depriving the people of Naw England of the right of fishing, was designed to "atarve them into nabmitsslon." The trade arising from tha cod-fiahery alone, at that poriod, furniuhed the northern coloples with naarly half of thoir remittances to the mothor conntry, In payment for articles of Britinh mannfacture, and was thus the very lifo-blood of their commerce. The fishing towns had become populous and rich. Marblehead, for example, vext to Boaton, was the most lmportant place in Massaohusetts, and was second to the capleal only in popalation and taxable property: A fenrful change awalted all. The dispute was now to be determined by an appeal to arma, and every maritime enterpriee was to be interrupted and ruined.
We have already given in thin article a short historical account of the fishery of the United Staten, and of the treaties now or hitherto in force renpecting the fisheries ; so the remainder of this artlele will be confined to the atatintice of our fisheries since our separation from Great Britaln.

The Muckrel Fiahery, from the settiment of Veu Eingland to the year 1852.-It is fremuently sald that the mackerel fishery is of very recent origin, or that, al least, reashls were not employed in it unill about the close of the last or the beginning of the jresent century. isuth suplasilions are entirely erroneuas. The Indians, regarilless of the beautiful form and color of the lish, called it ranewune ${ }^{2}$ eseag, on actount of ila fainesa. There is mention of it In the earliest records of the country. Winthrop relates that hat 1033, the whil Griffin, two daya before her arrival ht loaton, lont a pasenger by drowatng, as he was canting forth a line to eatch mackerel. The tirst selthers must bave commenced the ffaliery soon after, alnce, to unit several minor incilente, we have the fact that Allerton, one of the lidgrims whe came over in the Jfoythurer, recelved mackerel for cale at Now Haven, on "half profita," in the year 1653. That the husiness wus prosecuted with success is evident from the additional
fact, that in $\mathbf{1 6 6 0}$ the commissionars of the colonies of Now Eigland reoommended to the general courta of the oonfederacy to regulate it, "considering" that "the fiah in the most staple commodity of this country." The muckerel fishery at Cape Cod was held by the government of the colony of Plymouth as publio property, and its profite were appropriated to publie uses. The records show that it was rented from time to time to individuals, who paid atipulated nums; and that a part of the fund to anpport the girst free. school eatablished by our Pilgrim fathers.uas derived from it.-Sabine's Report to Congress, $185 b$.

The proposition to found and endow a achool of this description seema to have been made in 1663 , but nut to have been adopted until seven yenrs Iater, when the general court, "upon due and aeriona consideration, did freely give and grant all such profits as might or should annually aecrue to the colony," from this and tha bass and herring fisberies, at the same place. In 1689, the "rout of the Cape fishery was added to the appropriation for magistrates' salaries for that year."

Exact atatements as 10 the progressanit extent of the mackerel tishery previous to the Revolution, are hardiy to be formd ; but it Is atilf eertaln that the peophe of thode Ishand and Connecticut, as welt as those of Massa-huselta, were " largely cuncerned in it "" and that iteets of aloojon employed in It were often scen ujon the coast and in the harbora. It is certain also that aiout the year 1770 the town of Scituato alone uwnel upward of 30 vessels that were annually titted out as "mackerel eatchers;" and that the whole number of vessels in Massachusetts was nut less thas 100.

There is little of Interest relating to this hranch of industry for several years after the period last mentioned. A highly renpectable shipmaster, who ts still ilving, entertaims the opinion that the fishery In vessels was commenced within to years; und that " he was personally engaged in the firat regular mackerel voyage ever maíd in New England." Ilk account, as related to me ly himself, would occupy too mueh room. Its substance is, that he engaged in the coasting business for
some tims between Massachusetts and Maine; he commonly saw and caught mackerel during the summer mouiais in the vlcinity of the island of Mount Desert ; that belleving that they might be takea in quantitiea, he resolved finslly to fit ont a vessel for the oxpress purpose ; that his success was even greater than he hed expected, and that others were indaced to follow his example. The mistake of this gentleman probably Is, that what he considered the erigin of the veasel fishery wan only a revival of it; slnce we can easily imagine that repeated losses and discouragemonts had caused a suapension of it.

The Iferring Fishery, from its commencement to the year 1852.-We hear of this fishery among the Pilgrims. In 1641 they rented the herring wear at Plymouth for three years to three men, "who were to deliver the shares of fish, and recelve 1s. 6d. per 1000 for their trouble." We hear of it on the coast of Maine also a few years afterward. Jesselyn saye that the "herrin" were " so numerous, they take of them all summer long. In 1670," he contlnues, "they were driven into Black Point harbor, by other great fish that prey upon them, so near the shore that they threw themselves (it belng high water) upon dry land la such infinite numbers that we might have gone half way the leg among them for near a quarter of a mile." He repeats the account in his "Chronological Observations of Amerlca;" where he states, that so "wonderful" was the quantlty, that "they were half-leg deep for a mile together." Of the manner of cooking at that period he remarks, that " we used to qualify a plckled horrin by boillng of him in milk." These incidents are sufficient to show the early origin.

From the fragmentary notices of the fiehery which are to be mot with, It seems probalie that, for a long time, as the scools of herrings came to our coasts, the inhalitants on the sea and rivers, from Maine to the Curolinas, generaily secured sufficient for consumption fresh; that the more caroful provided themselves wlth snlt to cure quantities for future use; and that some, becoming regulur fishermen, caught and cared the fish for sale to their nelghbors of the interlor. And that the practice was continued, substantlally, without interruptlon, until tho waters resorted to by the herring for the depesit of its spawn were obstructed by dams and mills, ls havily to be doubted. It is certainly true that on some of the rivera, where the fishery in now nearly extinot, the supply at this revolutlonary era was consldered lnexhaustible; and that farmers and fishermer were in the constant habit of filling wagons and loasts with scoop-nets and other simple implements.
The Ilalibut fishery-The halibut fishery on George's Bank is a new enterprise. It was commenced within a few yenrs by the adventurous fishermen of Cape Ann. Pursued in mid-winter, it is as hazardous an employment ns can well be imngined.

While the fishery wus confined to the coast, the consunuption of the tish was very limited. In April, 1848, the Norfolk. Ilervld announced that " our market, yesteriay morning, was enriched wlth a delicacy from the northern waters, the halibut-a strange fish in these parts, knoutw only to epicures and naturaliats."

The New Orleans Picayune, in May of the same year, contuined a similar paragraph. At present, the tish, packed his boxes with lee, is sent, sound und sweet, by railroads and vessels, to the most distant sectlons of the country. Veasels employed on the Bank are shsent from port from six to fourteen days. The average catch of halibut is perhapis 200 to a vessel, though some obtain double that number. The woight of the fish is from 60 to 200 pounds. [For nearly the wholo of thls artide we are indehted to Dlr. Saline's valasble Report on Fisheries, 1853.]

For some thee, dealers in Boston purchased, packed, and shlpped the fish almost exclusively; but a company was finally formed at Gloucester for the purpese of transacting this part of the business as well as the
other. The fishermen, however, resort again to Botton; for this company, after losing a conalderable part of their capital, relinquiehed their deoign.
The growth of the fiebery has been rapld. The number of veesela employed in it; owned at Glouces: tor, was 30 In 1844; 63 in 1848 ; and abont 75 in April, 1852. The precent fleet contains many new, wollmodeled, and fast-sailing vessela. The value of the halibnt caught in 1851 was upward of $\$ 60,000$.

I can not forbear to add, that had our atateamen stood by the doctrine which was asserted and maintained at Ghent by the Amorican commissloners, one source of calamity at least would have been spared to our fishermen. The rights guarantied to us formed a part of, and in their very nature were as perpetual as, our independence as a nation. The first article of the convention of 1818 ahould never have been agreed to by our government. The third artiole of the treaty of 1788 ought never to have been atrickon from that instrument. It'is now too late to correct the mistake.
The earnings of the vessels sent to the Bank are generaliy ample; but the fiehory is not profitable, in consequence of the extruordinary wear and tear of salls and rigging, and the frequent lose of cables and anchors. Dlove than all, herdly a seuson passes without appalling disasters. Whenever a vessel is lost on George's, all on board perish.
An American citizen may contend, if he will, for the repenl of our bountry laws; he may favor a low duty, or no daty whatever, on forelgn fish; but he is bound to honor the courage and perseverance of the halibut catchere of Cape Ann, who, mid the storms and gaies of a northern winter, procure for him the luscious napes and fins whleh garnish hia bonrd.

The statistics of the produce of the United Statee' fisheries for 1855 and 1856 are shown by the following table, taken from the Report on Cominerce and Navigation :

Fer a complete account of the political hlatory and preeent state of the Fisheries，see Sabing＇s Report to Congrese，1858．For more extended information in regarl to tho varions branches of the fisheries，see artieles Cod Fisiery，Hennina Fishery，and Whale Fishery；bee alao N．A．Rev．，lvii．and lxil． （by L．Sabine）；Quar．Rev．，lxix．，226， $1 \times$ ．，268， xxxvii．， 845 ；Edin．Rev．，lxxvlii．，46，xeili．，174； Herch．Mag．，xix．， 145 （Ealpour）；Blackwood， Hiil，640；Am．Whig Rev．，vi．， 400 （C．Lanman）； Nilks＇s Register，xxix．， 377 （Lloyd＇s Rep．）；Ency． Am．，Ency．Brit．，1856－7．Census Rep．U．S．， 1854.
Reciprovity Treaty betreen the United States of America and her Britannic Majesty ：concluded bth June，1854； ratified by the United States 9 th August，1854；ex－ changed 9 th September，1854；nnd proclaimed 11th September， 1854.
Artictes 1．It is agreed by the high contracting parties that，in addition to the liberty secured to the United States＇fishermen by the above－mentioned con－ ventlon of October 20，1818，of taking，curing，and drying fish on certain cossts of the British North American colonies thereln defined，the inhabitants of the United States shall have，in common with the sub－ jects of her Britannlo majesty，the liierty to take fieh of every kind，except shell－fish，on the sea－conste and shores，and in the bays，harbors，and creeks of Canada， New Brunswlek，Nova Scotia，Prince Edward＇s Isl－ and，and of the several islands thereunto adjacent， without leing restrictesl to any distance from the shore，with permisaion to land upon the coasts and shores of those coloniea，and the selonds thereof，and also upon the Magdalene Islands，for the purpose of drying their nets and curing their fish ：provided that， tn so doing，they do not interfere with the rights of private preperty，or with British fishermen，in the peacesile use of any part of the sald coast in their oc－ capancy for the same purpose．

It is understod that the above－mentioned liberty applles solely to the sea fishory；and that the salmon and shad fisheries，and all fisheries in rivers，and the mouths of rivers，are hereby reserved，exelusively，for British fishermen．

And it is further agreed，that in order to prevent or settle any disputes as to the plares to which the reser－ vation of exclusive right to 1 British finhermen，con－ tainel in this article，and that of fishermen of the United States，centained in the next anceceding arti－ cie，apply，each of tho high contracting parties，on tho application of either to the other，shall，within six months thereafter，appoint a commiskioner．The asil！ commissionera，hefore proceeding to any bosiness，shali make and subseribe a nolemn declaration that they will impartinlly und carefully exnmine and decide，to the best of their judgment，and accoriling to justice and equity，without fear，favor，or affection to their own cumntry；upon all such places as are intendod to be reserved and excluded froin the common liberty of fishing under this and the next succeeding article，and such declaration shall be entered on the record of thefr proceedings．

The commissioners shall name some third person to act as an arbitrater or umplre in any case or cases on which they may themselves difier in opinion．－If they should not be able to agree upon the name of such third person，they ehall each name a person，and it shall be determined hy lot which of the two persons so named shall be the arbitrator or nmpire in cases of dif－ ference or disagreement between the two commissien－ ers．The person so to be choten to be arbitrator or umpire shall，before proceeding to act as such ln any case，make and subscribe a solemn declaration in a form similar to that which shall already have been made and subscribed by the commissioners，which aball be entered on the record of their proceedings． In the event of the death，ahsence，or incapacity of either of the commissioners，or of the arbitrator or nmpire，or of their or his omitting，declining，or ceas－ ing to act as such commissioner，arbitrator，or umpire， another and different person shall be appointed or named as aforessid to act as anch commiseloner，arbi－ trator，or umpire，in the place or stead of the person so originolly appointed or named as aforesald，and shall make or subscribe such declaration as aforesald．
Such commissioners shall proceed to examine the cosats of the North American provinces and of the United States embraced within the provisions of the first and second articles of this treaty，and shall desig－ nate the places reserved by the sald article from the common right of tishlng therein．
The deelision of the commisioners and of the arbitra－ tor or umpire shnll be given in writing in each case， and shall be aigned by them respectively．
The high contracting parties hereby solemnly engage to consider the decision of the comminsioners co jointly； or of the arilitrator or umpire，as the cane may be，as absolutely final and concluaive in each case decided upon by them or him respectively．

Anticus 2．It is agreed by the hlgh contracting parties that British suljects shall have，in common with the citizens of the United States，the liberty to take fish of every kind，except sheil－fish，on the east－ ern sea－coasts and shores of the United States north of the aith parnllel of north latitude，and on the shores of the several ishunds thereunto adjacent，and in the haya，linriors，and ereeks of the said sea－coasts and ehores of the Unitel Stater，and of the suid islands， without being restricted to any distance from the shore，with perinission to land upon the said consts of the United Stater and of the Ixlands aforeanhl，for the purpose of drying their nets and curing their fish： provided that，in so doing，they do not interfere with the rights of private property，or with the fishermen of the United States in the peacenhle nso of any part of the sald censts in their oceupaney for the same purpose．

It is understool thint the above－mentionel llberty appliey nolely to the sea fishory；and that salmon and shad fisheries，and all fisheries in rivers and mouths of rivers，are hereby reserved exclusively for thshermen of the United St：Ites．
Anticies it it agreed that the artleles enumerated In the schednle hereunto annexed，being the growth and produce of the aforesald British colonies or of the

United States, shall be admitted into each country respectively free of duty :

Article 4. It is agreed that the citizens and inhabitanta of the United States ahall have the right to navigate the River St. Lawrence, and the canals in Canada used as the means of communicating between the great lakes and the Atlantlc Ocean, with their veaneln, ioats, and crafts, as fully and froely as the subjects of her Britannic majesty, subject only to the same tolla and other assessments as now ure or may hereafter le, exacted of her majesty'n sald aubjecta; it being understood, however, that the British government retaine the right of auspending this privilege on giving lue notice thereof to the government of the United States.

It is further agreed, that If at any time the British government should exercise the alaid reserved right, the government of the United States shall have the right of auspending, if it think fit, the operation of Article 3 of the present treaty, in so far as the province of Canada is affected thereliy, for so long us the suspension of the free navigation of the River St. Lawrence or the canals may continue.

It is further agreed that British subjecta shall have the right freely to navigate Lake Mlchigan with their vessels, boats, and crafts, so long as the privilege of navigating the River St. Iawrence, secured to AmerIcan citizens by the above clause of the present article, shall continue; and tho government of the United States further engages to urge upon the State governments to secure to the subjects of her Britannio maj-esty- the use of the several State oanals, on terma of equallty with the inhubitants of the United States.

And it is further ayreed, that no export duty, or other duty, shall the levied on lumber or timber of any kind cut on that portion of tho American territory liu the State of Maine watered by the River St. Joln and Its tributarles, and floated down that river to the aea, when the same is shipped to the United SLates from the province of New Brunswick.

Fish-hoolch (Ilamecons, F'r.; Fiahangeln, Ger.) are constructed with aimple tools, but reguire areat manual dexterity in the workmen. The iron wire of which they are inade whould tre of the best quality, suooth and sound. A bunsle of nuch wire is cot ia lengths, elther by shearn or by laying it down upon an angular wedge of hard stcel fixed horixontally in a block or anvil, and striking off the proper leagths loy the blowe of a lisamer. In fanhioning the burbs of tha books, the atraiglit piece of wire in laid down in the groove of an fron block made on purjose, and is dexterously atruck by the chisel in a slanting direction, acrosa so mueh of tha wire as may he deemed necenary. A aharj-pointed little wedga in thme formed, whose hase graduater luto the substance of the metal. The end of the wire where the linu is to be attached is now flattened or screw-tappel; the other end is sharppointed, and the proper twiated curvature is given.

The soft iron hooks are next case-hardened, to give them the eteely stiffness and elastielty, by imbedding them in animal charcoal contained in an earthen or iron box; after whlch they are brightened by heating and agitating them with bran, and finally tempered by exposine to a regulated temperature upon a hot Iron plate. Hooks for salt-water fishing are frequently tinned to prevent thein wearing rapidly awuy in rust.

Filah-pondes are ponde msde by art, in which different kinds of fish are bred and fattened. In general this is only attempted with fresh-water fish, but in some placee ponds have been formed on the sea shore, and so contrived as to have their watera renewed every tide, and in these aca fieh have been kept for use for a conaiderable time. The fresh-water fish whlch is the mont anocessfully managed in ponds is the carp.

Flume, a neaport town of Austria. The commerclal movementa in the port of Fiume in 1850, including coasting trade, were: importa, $16,604,000$ frsnes; exports, $17,808,000$ francs. The coanting trade of Flume, at all times more important in the general commerce of that port than the foreign trade, amounted in the year 1850 to 6,840,000 france for imports, and 8,473,000 francs for exports; leaving a total for foreign commerce of $19,094,000$ francs. The latter trsde was distributed between the Pontifical atates, Naples, Ionisn Isles, Turkey, Englund, and Frence. Total tonngge employed, 342,493 tons; of which more than two thirda under the Austrian flag.

Flag, an ensign or colors; cloth on which are usually displayed certain devices, and attached to a staff. In the array, It signifies a small banner by which one regiment is distinguished from another; in the marine, acertain banner by whlch an admiral is distinguished from the other ships of his squadron, or by which the shipe of one nation are diatinguished from thoae of another. The flag acquired its present form in the sixth century in Spain; it was previeusly small and square,-Ashe. The flag is said to have been Introduced there by the Saracens; before which time the ensligus of war were extended on cross pieces of wood.- Pandon. The term flag le more particularly used at ses to denote to what country a ohip belongs, und the quality of its commander. The honor of the flag salute at sea was exacted by England from very early times; hut it was furmally yielded by the Duteh in A.D. 16i3, at which period they had been defeated in many actions. Louir XIV. obliged the Spaniards to lower their flag to the French, 1680.Henault. After an engagement of three houre hetween Tourville and the Spanish Admiral Papachin, the latter ylelded hy firing a salute of nine guns to the French flag, June 2, 1688.-Idem.

To loncer or atrike the Flag, in the navy, is to pull it down upou the cap, or to take It in, as a token of the respect due from all ships or fleets to those which ars undeniably their superiora. To lower or atrike the Hag in an engagement ia a algn of submission or surrender. The methol of leading a ahip in triumph is to attach the flags to the shrouds, or the gallery in the hind part of the ship, letting them hang down toward the water, und to tow the vessels by the stern. Llvy relates that this was the mode in which the Romans used the ships of Carthage.

To heave out tha Fhg, is to ilisplay or put abread the thag.

To hang out the White Flog, is to usk quarter; or, when a vessel has urrived on a coast, it shows that it has no hostile Intention, but comes to trade, or the like. The red flay is a sign of defiance and battle.

Fhag tyficer are those who command the several squadrons of a tleet.

Flag of the United States.-The act to estalilish the flag of the United States was enacted hy Congress, April 4, 1818, viz.: "That from and after the Ath day of July next the flag of the United Statea he thirteen horizontal stripes, alternate red and white; that the

Flail, an instrument for threshing corn, consisting of the hand-staff, or piece hold in the thresher's hand; the swiple, or that part which strikes the corn; the rapiins, strong leathern thongs which uaite the handstaff and swiple; and the middle-band, a leathern thong er flsh-skin that ties the ceplins together.

Flambeau, a kind of torch made of thick wicks, covered with wax, and used in the streets at night, at iliuminations, and in processions. Flambeaux usually consiat of four wicks or branches, about an inch in thickness, and three feet long, made of coarse halftwisted hempen yarn ; and these, being suspended by one end, are conted with white or yeliow wax, which is poured over them from a ladle until the requisite thickness be obtained.

Flannel, a woolen stuff, composed of a woof and warp, and woven after the manner of baize. Dr. Black aseigns as a reason why flannel and other substances of the same kind keep the body warm, that they compose a rare and spongy mass, the fibres of which touch each other 80 Jightly that the heat moves siowly through the interstices, which being filed only with air, and that too in a atagnate atate, give little assistence in conducting the heat. From the experiments of Count Ramford, it appears that there is no relation between the power which the substances ueusily worn as clothing have of absorbing moisture, and that of keeping the body warm. Having provided a qaantity of seversl of these substances (as mentioned below), he exposed them, apread out upon clean chins plates for tha apace of twenty-four hours to the warm and dry air of a room which had been heated by a German stove for several months, and during the preceding six hours he had raised the thermometer to $85^{\circ}$ of Fahrenheit ; after which be weighed equai quantities of the different substances with a very accarate bsiance. They wers then spread out upon a chian plate, and removed into a very large uainhabited room upon the second floor, where they were exposed forty-eight hours upon a table placed in the middle of the room, the air of which was $45^{\circ}$ of Fahrenheit. At the end of this timo they were weighed, and then removed into a damp celiar, where they were placed on a table in the middle of the vault, the air of which was at the temperatare of $45^{\circ}$, and, by the hydrometer, aeemed to be fully saturated with moisture. In this situation they were suffered to remain three ciays and three nights, the vault being ali the while hung round with wet linen cloths, to render the air as completely damp as possible. At the end of three days they were weighed, and the weights at the different times were found as in the foilowing tabie:

in regard to these experiments Count lumford observes, that though linen, from the apparent ense with which it receives dampness from the atmosphere, teems to have a much greater attraction for water than any other, yet it would appear, from what is reiated above, that those bodies which receive water in its un-
elastio form with the greatest ease, or are most oasily wet, are not those which in all cases attract the humidity of the atmosphere with the greatest avidity. "Perkaps," says he, "the apparent dampness of linan to the touch arises more from the ease with which that substance parts with the water it contains than from the quantity of water it actualiy holds; in the same manner as o body appears hot to the touch in consequence of ita parting freely with fts heat; while anothor body which is realiy at the sama temperature, but which withholds its heat with great obstinscy, affects the sense of feeling mnch leas atrongly. It is well known that woolen cloths, such as flannala, etc., worn next the skin, greatiy promote insensible perspiration. May not this arise principally from the strong attraction which subsista between wool and the watery vapor which is continually issuing from the human body? That it doea not depend entireiy on the warmth of that covering, is ciear; for the same degree of warmth produced by waring more clothing of a different kind does not produce the same affect. The perspiration of the human body being abeorbed by a covering of flannel, it is immediately distributed through the whole thickness of that aubetance, and by that means exposed, by a very large surfaca, to be carried off by the atmosphere; and the loss of this watery vapor whici the flannal austaina on the one side by evaporation, being immediately restored from the other, in consequence of the strong attraction betwean the flannel and this vapor, the pares of the akin are disencumbered, and they are continually surronnded by a dry and salubrious atmosphere."-Philosophical Transactions, No. 483.

Flannela are much more luxurious productions than they were in years gone by. We knew them formerly only as woolen or worsted goods ; but modern ingenaity has devised flannel made of mingled wool and silk. Its inventora claim for it a auperiority over ordinary flannels, in being less irritating to the skin; it shrinks less in washing; the silk increases the strength and durability of the taxture, and renders it less liable to tear. Such flanneis have avan been embroidered, and used for ladies' opers cloaks. 'Then we have choice "Thibet" flanneis, made from the finest wool; and flax flannels, in which fiax, prepared on Claussen's process, is mixed with wool ; and fancy-colored flan-nels-pink, roae-color, cherry, crimson, biua, orango, and other dainty tints. The philosophy of chespness has also visited the flannel regions, for some of the low-priced flannels contaia a portion, more or less, of cotton. There are striped fiannels, and cricketers' flanneis, and "onti-rheumatic" flannels, and many other special and oddjy-named kinds.

Flax (Ger. Flachs; Du. Vlasch ; Fr. Lin; It. and Sp. Lino ; Rus. Len, Lon; Pol. Len; Lat. Linum), an important plent (Linum usitatissimum) that haa been cuitivated from the earliest ages in Great Britain and many ether countries ; its flbres heing manufactured into tiread, and its secd crushed for oil. Russia supplies by far the iargest portion of the flax imported into England, the principal sorts being Petersburg, Narva, Rign, Level, Pernau, Liabsu, Memel, and Otweriand. Peteraburg and Narva finx are nearly of the same quaity, the latter being but iittle inferior to the former. Both sorts come in bundies, of 12,9 , and 6 heads. The Riga flax seems to deserve the preference of any imported from the Baitic. It is the growth of the provinces of Marienturg, Druania, Thisenbhausen, und L.sthuania. The best Marien'ourg is called shmpiy* Marienburg (M), or Marienburg clean; the second quaiity, cut (GM) ; and the third, risten drayband (iRD); of the three other provinces, the first quailty ieers the name of rakitzer ; as, Druania rakitzer (DR), Thiesenhawen rakitzer (TR), and Lithuania mkilzer (IR). The cut flax of theas three provinces is tho seconil quality; and to the third quality belongs the badntub and badstub cut (il and $\mathbf{B 6}$ ); the patemoater
(PN); and hafo threo band (HD). Badotub and patermostier are the refuse of the rakizer; flax, and the three band again the refuse of the former sort, and consequently very ordinary. The Revel and Penau conaists of Xarienhurg, cuf, ritsen, hafs thres band, and thres band. The Liebau and Memel growths are distinguished by the denomination of four and three band. These two sorts, as well as the Oberland flax, come from Konigoberg, Elling, etc., and are little enteemed In the British market. Flandera or Dutch flax is well dressed, and of the finest quality. Flax is extensively cultivated In Egypt. Of late years, some of the Italinn ports, which used to be supplied from Russia, have been fully aupplled, on lower terms, fron Alexandria.

The Phormium tenax, or Now Zealand flax, has boen asid to exceed every other species in strength of fibre and whiteness; qualities which, if it really posesses them in the degree atated, must make it peculiarly well fitted for being made into canvas and cordage. In point of fact, however, there is a great diversity of opinion as to its real merits, and lt fetches at present bat a low price. In 1831 and 1832 the imports of New Zealand fax amounted raspectively to 15,725 and 15,867 ewts.; hut they fell off in 1835 to 7812 cwts., and since then only trifling quantities have been imported. It is alleged that this is in consequence of the imperfect preparation of the fax, which has hitherto boen entirely intrusted to the native women. But without presuming to say whether the defacts with Whieh it is charged be inherent in the flax itself, or depend on its preparation, it is abundantly certain that unlesa it be furnished of a superior quality, it will not anit our markets. When flax is brought to the principal Russian ports whence it is shipped, it is classified according to its qualities, and made up in bundes by sworn laspectors (brackers), appointed by government for the asaortment of that and all other merchandise. These functionaries are said to perform their task with landable impartiality and exactness. A ticket is attached to every bundle of assorted flax, containing the name of the inspector and owner, the sort of fax, and the period when lt was selected or inspected. See Hexp. Good fiax should be of a fine bright color, well separated from the tow, codila, or courser jortion of the plant ; and of a long, fine, and strong fibre. In purchasing flax, it is usual to employ agents wholly devoted to this peculiar business.

Flax has been hut little cultivated in the United States, and only for home conaumption. Efforts aro now being made to increase the proluction. Linen mills have heen erected in Fall River and other phaces; and the demand will after this equal the supply.

During the last half century various attempts have been made to effect the separation of the flurous from the woody portion of the flax stem by chemical and mecbanical means. In several cases the results at fist appeared to be very promining, but lu every instanse it was soon found that there were insupersoito practics! objectlons. Among chemical agenta, oolutlous of sul-
phuric acid, caustic potash, caustic eoda, quicklime, and saft soep, were all in turn trled and discarded and among mechanical processea, the ingenious contrivances of Mr. Jamea Lee, and Messre. Hill \& Buady, shared the same fate. Whatever may have been the comparatlve merits of the two processee of these rival inventors, in the courso of a few years both were relinquished and forgotten. Various other Ingenious mechanical arrangements have been devised, but hitherto they have had very little succeas.

Schenck'e process, for which he obtained a patent in 1846, is undoubtedly a very important improvement. It conaists merely in steepligg the flax stems in warm water, heated artificially to the temperature best suited to fermentation. In this simple way the operation is rendered rapid and certain, all uncertainty from fluctuation in temperature and weather ls avoided, and the whole process is entirely undar the command of the manufacturer. The temperature best suited for this purpose is about $80^{\circ}$, or from $80^{\circ}$ to nearly $90^{\circ}$. Above this point the process proceeds too rapidly, and the fibre is almost sure to be more or leas injured. The time required is from about 70 to 90 hours. It appears to be generally admitted that the warm-water stecping increases the percentage of fibro obtained from the flax stem over that ohtained by the old modes of retting by nearly one fifth; and that, while the fincuess and spinning qualities of the fibre are increased, the strength is in no way weakened or diminished, ualess the process be permitted to proceed too far-un acsident that need nover happen, from the complete control over it which the manufacturer has througheat. Although there is no doubt as to the practical value of the uee of warm water in flax retting, yet the introduction of Schenck's process is far from removing all the thificulties of the flax manufacturer; much still remains to be effected; and it is by no means improbable that ere long a yei more perfect proceas may be devised.
It is Interesting to observe, that the use of warm water in the preparation of vegetshle fibre is not altogether new, it having been employed by the Mulays, and by the natives of Rungpoor, in Bengal. The process adopted at Bencoolen is stated by Dr. Campleell to consist of steeping the stems of the hemp in warm water, In which it is allowed to remain for two days and nights. The old German proceas, called "Motkenröst," sometimes used in preparing the fincr sorts of Glax, is also, to some extent, an application of the same principle. In this mode of retting, the flax was ateeped for four or tive days in a warul mixtare of nillk and water, end thus the desired degree of fermentation in the flax stems was proluced. This oferation must te distinguished from tie more modern one, in which sour milk was used lu order to give a grod colur to linen-a process introduced by the Dutch toward the middle of the last century. The linen was Loiled in a weak alkaline lye, and subsequently treated with sour butter-milk, for the purpose of aiding in removing the aiknli, and diesolving the earthy inpurities present in the fibre. Occasionally, also, sult of norrel was used for the same purpose ; and in 1775 heuss states that sulphuric and muriatic acids might he used for the same end; but that being too costly, they had not as yet come into general use. Of course all processea in which toiling, or evell hot, water is used, are quite different in their mode of action from those in which only warm water is employed. When boilling water is used, it is with a view of dissolving and remeving the useless matters which hacrust the fibrous parts of the plant ; while, on the other hand, warm water is used to soften them, and to aid in their putrefaction or decompoitton, through the agency of fermentation In 1787 , much interest was exelted in Ireland thy the jubllcation of a plan for improving the retting of flax by the action of hot water, In this acheme it was proposed to scald the flax-stems in boiling water to
coften vegets concel ting of ageabl proces to yiel careful princip the be light o cated $t$ the ope is the la lution of to 200 or half an 1 fect of $t$ up" the f pletely t. convertec ton. It ovely use sppears uther fibr to several

The minuto and csreful experiments of Hermbetasdt on the chemical principles involved in the retting of flax (made about the beginning of the present contury) tbrew mueh Hight on the whole enbject, and, to some extent, indicated the influence of temperatare on the success of the operation.
Flax-cotton is a material prepared from fax, hemp, and other vegetabie fibres, and which very nearly resemilles the fibre of the Gosypium or cottonpiant. M. Claussen's ingenious prooess for making fiax-cotton (patented August, 1850) consiats easentially in boiling the cut and crushed stems of the flax, hemp, or other plant, in a dilute solution of caustic soda, containing about $1-2000$ th part of alknili, The flbrous matter is then removed, and plungeic into a bath of diate sulphuric acid, containing 1-5000th part of acla, in which it is boiled for about an hour. It is next transferred into $a$ solution contsining about 10 per cent. of carbonate of soda; and, lastly, when it has remained in tha latter for an hoorr, it is planged into a weak sojution of anlphuric acid, consisting of one part of acid to 200 or 500 parts of water; in this it is leff for shout half an hour, and the process in completed. The ef feet of these several processes is "to divide and split up" the flbro in a most remarkable manner, so as completely to aiter its character. Flax thus treated is converted into a subatanice very nearly resembling cotton. It is probable that flax-cotton can be advantageonsly used in the manufacture of mixed fabrics, as it appears capable of being spun with wool, silk, and other filires; it may, therefore, perhapa herenf:er lead to several new nond important practical applicatione.
The idea of modifying the flire of the fiax and hemp, so as to convert it into a kind of cotton, is by no means new. In 1747, Lilljikreuzea and Palmquist des eribed a mode of converting fisx into "cotton," by boing it for some time in a solution of caustic potash, and sulsequently wuehing it with soas. In 1775, considerable qanntitiee of refuse flax and hemp were convorted into "flax-cotton" by Lady Moira, with the uid of $T$. B. Bailey, of Hope, near Manchester. The full details of the proceese employed do not appear to have been pablisheel; but from Lady Moira's letters in the Trunsuctions of the Society of $A$ rts for 1775, it appears that the fibro was boiled in an alkaline lye, or a solution of kelp, contuining earbonate of aodh, and subsequently acoured. The result of this was that "the fibres seent to be aot at liberty from c wh other," after which it many be "earded on cotton cards." It appears that at this time flax-cotton "was made anil sold st 3u. per pound;" and L.ady Moira states, that sho believes that it takes collors better than flax. It is curious to olinerve the fate of Lady Moirn's scheme : she says: "I have no renson to he vain of the samplen 1 have sent yon: they merely ahow that the material of flax-cotton, in able hauds, will bear manufacturing, theugh it is my ill fortuno to have it discrealited by the artizans who work for me. I hasi, in Dullin, with great difficulty, n gown wove, nnd three waistcoats ; but hud not the persoul whe employed n weaver for me particulariy wished to olinigo me, 1 could not have got it uccomplisheci."
Sulsequently to this, several attompts were made in Germany to convert flax into a dilre resemilhing cotton. in 1777, llaron Meidinger proposed to convert fax into a sort of cotton, by the action of alkaline solutions, ete. In 1780, a fuctory was estanilisherl at Berchitoldsilarf, uear Vienna, for the practical working of this process ; and similiar plane were suisequently bruyght forward by Kroutzer in 1801, Stadler and

Haupfner in 1811, by Sokou in 1816, and by several othera. At the factory at Berchtoldddorf, not only was flax converted into cotton, but aleo a useful cotion. like fibre was propared from tow and refuse flax ; and the same le said to have been done by Hagg, near Pres. burg, in 1788, by Gsbbell in 1803, and Segalla in 1811. Whetber thees varions plans failed from the effects of jenlousy and oppooition, like, that which prevented Lady Moira from introduclag her "flax-cotton," is unknown ; bnt it does not appear that any of them were long perseovered in. It is probable that in most cases the neighboring marturscturers set themselves against the introduction of flax-cotton; for Beckman, who speaks of ita manufacture near Brune wlek, states that the work-people determined not to use the new material, though at the same time he obeerves, that oxcellent fustians were made, whleh could not be distinguished from those manufactured with ordinary cotton. The extreme similarity of flax-cotton to ordinary cotton is also remarked by Des Charmee (1799), who states, that if the etaple be cut before it is carded, it is not possible to distinguiah it from cotton, either in its raw atate or when manufuctured. The matter was subeequenily inveetigated by Berthollet, by Gay Lussac, and by Giobert, who employed alternately ateepings in hot solutions of goap, alkali, and sulphurio or muriatic acid. Berthollet observes, that equally fine cotton is obtanined from the commonest refuse tow ns from the beet flax.
For some valuable information on fibrous materiale, the produce of India, which may be cheaply and usefully substituted for Ruesian hemp and flax; aes "The Fibrous Plante of Jndia ftted for Cordage, Clothing, and Paper," by J. Forbes Royle, M. D., F.R.S. : London, 1855 ; and also sn article entitled "Indian Substitutes for Russian Produce," in the Edinburg Review for July, 1855.
In 1816, M. Girard found means to apply machinery and to substitute the spindle in the spinning of flax. To France, then, helongs the hooror of the discovery, but England was the first to profit by it and put it in practice, and ler example was followod, at the interval of some years, by France, Belgium, and Germany, in the order indicated. The progrese of this iddustry wae rapid, and the following table presents its present position (July, 1856):

While the progress of machine-spinning in Great Britain, Germany, anil Switzerland, independent of all kinds of protection, except in the case of Prussia, certuin premiums paid by the government to these who have extablished fuctories, its extension in France and Belgiom, and more especially in the former, is due to legisiative interference. Let us, then, direct our attention to France, where an extreme import dutyexists. Aithough the duty was made high in 1826, the import of English yarn was progressive, but alow, untii 1836, when the rate was considerably reduced. Inmelliately afterward the quantity increased rapidly. In 1830 Frunco received but $7,500 \mathrm{lbs}$. of linen yarn from Eugland. In 1835, in ajite of a high tariff, the import had inereasel to $11,700,000 \mathrm{Hbs}$. Undor the roduced iluties it went on auginenting until, in 1842, it reached $24,750,000 \mathrm{lbs}$. Then came the estailishment of the present exceasively protective acale of duty; its consequences are manifest in the rapid extension of llax-spinning in Frunce. In 1840 there wero 90,000 spindles ; in 1845, the number was 127,000 ; in 1850, 275,000 ; in $1855,490,000$. In the mean time the import of yarns from all countrica fell from $24,750,000$

Ibe. to $1,698,000 \mathrm{lbe}$. If wo had only to do with the establishment of a great apinning-trade in France, and the monopoly of the supply of yarn at home, these Aguren would be triamphant. But unfortapately for the consamer, as weli as for the wealth and renources of the nation, the operation of the tariff has been a costly affir. Whilit the capitalists who had placed their money in the apinning-factorien rejoiced at tho roeults detailed, and in the large profte which their government had given tbom a logalized right to derive from the mass of consumers, we may inquire whether overy one was equally eatiafied with nuch a syatem of political economy.-Report to the Refirm Congress of Bruasele, by Mr. J. Macadam, of Belfast, 1856.
Mr. Macadam's concluslons were as follown: I. In all cases I would advocate the free entry of the raw materiala, flax and tow. Where natural and social faclities exist for the cultivation of flax, no protection is required, as it only renders the growers careless of Improvement. Where these eloments of succesa are wanting, it is evident that the culture should be abandoned. A nation should never be suljected to a tax almply to supply itself with a material which it can have better and cheaper from elsewhere.
II. I would urge a moderate fixed ad valc,em daty for the exorbitant ones now levied In many Staten, and fix it for 10 per cent. on the present value of English yarns. If to this rate of duty be added the cost of packing, traneport, commission and other charges, the rate of protection wald really amount to 15 per ceat. Frencia and Belgian apinners may. perhapa, bay that this duty would be inadequate to protect them, but I can not admit this. It is true that the cost of fuel is higier in France and Belgium than in the United Kingdom. Rut, on the other hand, I can prove that in Ireland we pay more in proportion, as compared with Great Britain, than France or Belgium does, as compared with us. For example, while at Leeds coala cost 4s. 8d. per ton, and at Dundee 8s., they cost in Belfast 10s. to 11s, 6d. per ton, making a difference in favor of the English spinners of 140 per cent., and of the Scotch of 30 per cent. At Ghent, coals cost at present 14s., and have ieen much cheaper. At Lille they cost 158. 6d. ; the difference, therefore, In favor of the Irish spinnera, as compared with the French or Belyian, is 50 per cent. We might, consequently, at Belfast, Just as well demand protection from tha English and Scotch opinners, as the French and Belginne ask it against us. As to the cost of labor, the factories of Ghent and Lille are in a better position than ours. On what, then, do the apinners of France and Belgium base thelr clainn to protection? On the auperiority of Engiish machinery ? But these machines may enter Belgium free of duty ; and lately, in Frace, great advantages have been accorted in their import. Or is it on the great capital of England, and the sinaller rate of internat of money? Aa well might we, in poor Ireland, ask protection against these, and yet in the face of them, we have progressed more raplaly than either England or Scotland. Furtber, how does it happen that l'russia and Austria have progreased to such an extent in their spinning without this immediate protection? The first named had, in 1846, but 47,000 spladies, and has now 96,000 . The second, which, in 1845 , had but 21,000 , now numbers 82,000 . And 10 per cent. duty, I repeat, is abundantly sufficient to protect the Belgian and French spinnera, while it would provo of great lieneft to the manufacturch of linen in those countries.
III. A daiy' of 20 per cent. on unbleached linena might be proposed. When it is remembered that, in almost all parts of the Continent, weaving at present conts less than in the United Kingdom, it will be recoguized that the linen manufacturers of the Continent have on advantage over ours. There wan a time when weaving cost as little in Ireland as in any other country, and less than In many: But the thinning of
the population by the disastrous yeare of fumine which followed the potato disesee t the Jarge emigration which subeequently took place; the reeruitment of able-bodied men for the army ; and other causen, hive lod to different reenits.

In the United States of America, where the manufacture of linen is on an extremoly small acale, and the whole Union only containa 80,000 spindlen, a duty of 20 per cent. existed on yarma and linena up to July, 1857. The annual lmport reaches $£ 1,600,000$, ao that the nation pays a tax of $\mathbf{£ 3 2 0 , 0 0 0}$ on lits yeariy cononmption. Originally at 5 per cont., the duty was raised to $37 \frac{1}{2}$ per cent. In 1812 . In 1832 it was abolished, but in 1842 was re-ostablished- at 25 per cent., and reduced, In 1846, to 20 per cent. In 1853, the revenne of the United Statee had so much increased, and the cash in the Treasury was of so great an amount, that Mr. Guthrie, the Seeretary of the Tressury, lesued a circular to merchants, in which he proposed to reduce or aiolish the duties on many articles, and he requested their opinion as to those on which ouch a change might most beneficially take pisce, speeifying that it should be on such articles as were generally consumed by all clasess of the population, and yot not leading items of native manufacture, and the remission of the duty on which would tend to lighten the labors of the custom-hones. Now, thero could acarcely be an article more fully answering to these requirements than linen; largely consumed by all classes, the native manufacture was quite insigniticant, while the disputes as to value, in lavying the dutien, between the custom-house and the importers, gave endless trouble.
The following table shows the number of bushels of flax-seeds, and the number of pounds of flax produced, in the United States in the year 1850:

janoe; Lat. Lini semen), the seed of flax. It contains a great deal of oil, which it yields by expression ; and is cuitivated eithar that' it may be naed in sowing, or sent to the crushing-milia to be convertod into oli. As the quality of the crop depends much on the seed employed, a good deal of care is requisite in tolecting the best. Generally speaking, it should be chosen of a bright, browniah color, olly to the feel, heavy, and quite fresh. Dutch aced is in the highest estimation for sowing; it not only ripens sooner than any other that is imported, but produces larger crops, and of the quality that best suits our princlpal manufactures. American seed produces fine flax, but the produce is not so large as from Dutch seed. British flax-seed is somstimes used instead of Datch; but the risk of the crop misgiving is no much greater, "that those only whe are ignorant of the consequences, or whe are compelied from necessity, are chargeabie with this act of ili-judged parsimony."-Loudon's Einc, of Agriculture. Crushing-seed is principally imported from Russia, but considerable quantities are also brought from India, Itaiy, and Egypt.
Fleece, the covering of wool shom from a sheep. See Wool.
Fleet, a navy or a squadron of ships of war; or a number of ships in company, whether ships of war or of commerce.

Flint, silicious mineral. It consists of 98 silica, 0.50 lime, 0.25 alumina, 0.25 oxyd of iron, and 1.0 loss. This minera' occurs of various colors, bat generaliy yeliowish o. dark gray, and usually in a compact smorphous body, of various shapes. It is widely dispersed over the world, occurring chiefly in the chalk formations, but enpecialiy in limestone. Its principal use is for gun-flints, and for striking light with ateel; snd it siso forms, when reduced to powder, an ingredient in porcelain and glass. The manufacture of gon-flints is very simpie, and is performed with an ifon mallet and chisel. A dexterons workman will make 1000 in a day.

Flint-Clase, or Crystal, a species of glass which derives its name from flint, because that subatanee was formerly employed in its manufacture. It is very extensively used for domentic purposes; but is chiefly interesting to the philosopher on account of the property which it possesses of causing a greater dispersion of the rays of light which pass through a prism or iens formed of it than any other of the vitreaus compounds. Thin property renders it invaluable in the manufacture of the object-glasses of telescopes and microscopes ; for, by combining a concave lena of flintglass with one or two convex lenses of crourn-glass, which possesses a much less dispersive power, a compound lens is formed, in which the prismatlic colors arising from a simple refraction are destroyed, and the lens rendered achromatic. This construction of objectglasses whs first discovered by a Mr. IZali, a country gentleman in Worecstershire, about 1729; but the discovery was forgotten, and no further notice taken of it for nearly 30 years, when it was again brought to light by John Doilond, after a long-continued course ef experiments undertaken for the purpose of perfecting the telescope. It $i s$, foowever, very difficult to prepare flint-glass fit for the purposes of achromatic telescopes. This difficulty arises not from the want of sufficient dispernive power in the substance, but from the want of purity or homogeneity; the silghtest impurity or inequality of composition of the glass giving rise to a streaked or imperfect image by reason of the unequal refraction of the rays. The composition of pure flint-glass long remained a secret in the family of the Dollonds, and its munufucture formed a very profitable articie of exportstion; for, till about the heginning of the present century, no flint-giass of good quality was made on tha Continent. Of lata yeara, however, a great chunge has taken place in this respect, and glass of the best quality has been manu-
factured, both in France and Germany, In much largew masses than Engliah artists have yot sacceeded in obtaining. This result has been mainly produced by the experimental researches of $D^{2}$ Artigues, Franohofer, Cauchoix, Guinand, and Korner; Formerly, at ob-ject-glans oxceeding five inches in dlamoter could scarcely be produced. Fraunhofor succeeded in making thom of 9 , and even II inches. The object-glass of the large parallaetio telescope belonging to Sir James South, at Campden Hill, was manufactured by Cauchoix ; it excoeds 12 inches, and is throughout of the utmost purity. The exact proportion of the ingredients which enter into these choice apecimens is not known, and probably their edcellence depends in part on some accidental circumstances in the preparation. Korner produced some of his best specimens by employing tio following ingredients: 100 parts of quarta, first treated with muriatio acid ; 80 parts of litharge, or red lead; and 80 parts of the bitartrate of potanh. Flint-glass for common purposes is usually made of 120 parts of fine white sand, 40 parts of well-purified peariash, 85 parts litharge or mininm, 18 parts nitre, and a small quantity of the black'oxyd of manganesethe latter ingredient being uned to correct the green color occasioned by the presence of oxyd of iron in the sand. The principal difference between this and the glase used for optical purposes consists in the much greater quantity of lead in the Jatter, and whlch is introduced for the purpose of increasing its dispersive power. There is a vuluable paper on the manufacture of glass for optical purposes, containing the resulta of an extensive seriss of experiments npon the subject, made in the laboratory of the Royral Institution, by Mr. Faraday, in the Philosophical Transactions for the year 1830, vol. exx. See Glabs.
Floating Brealswater. This marine contrivance may consist of a series of square frames of tims ber, connected by mooring-chaina, or cables attached to anchors or blocks of marble. The framework may be made of logs of yellow pine, from 30 to 50 feet long, and from 18 to 20 inches square, bolted together very firmly, and inereased in height as the situation may be boisterous, in order to break the violence of violent waves, and to allow the verseis riding within these quadrangular basins more safety and protection. Such breaknaters are admirably adapted to bathing-places and swimming-stations, since they will always produce amooth water, and protect the machines.

Flogging. According to an act of Congress passed September 28th, 1850, it is provided, "That flogging in the navy, and on board ressels of commerce, is hereby abolished from and after the passage of this act."

Floor Cloth. This useful and ornamental maniafacture originated in Great Britain about the year 1740, when a manufactory of it was established at Knightshridge, near London, by Mr. Smith. It was originaily made of narrow canvas sewn together like sail-cloth, to which successive coats of paint ware applied; but the seams proving inconvenient, a canvas was wove for the purpose, about four yrards wide; it was then extended to seven yards in width, and afterward to nine, which is the widest at present made. The manufactory at Knightshridge, now carried on by Mr. Buber, is the largest estublishment of the kindthe common dimensions of the oil cloths produced there being 20 yarda by 8 , and 80 yurds by 7 , giving therefore entire pieces of 160 and 210 square yards without seams. These canvases are stretched upon frames, and aecesalble over their whale surfuee by stages erected for the purpose : theae are the circumstanees which render the large dimensions of the manufactory requisite. The canvas being duly strained, is rubbel over with pumice-stono, which renders its aurface smooth and even, and then brushed over with a waak soiution of size; when this is dry, the first cont of oll color is lald on, not with brushes, but with trow-
els, something in the manner of plastering; when this is dry a second coat follows it ; and in this way saven conta of paint are usually spplled in succession, three on the buck and four on the front. When the cloth in this state, and of one color, is aufficiently dry, it is removed from its frame upon a large rollor, and caro ried to the upper part of the building to be printed, that is, to receive ite pattern. This was originally effected by a process of ponciling; but in the yar 1780 , Mr. Smith introduced the great improvement of blockprinting, by which the colors are more correctly isid on and in greater body and variety. The printingtable, which is about 80 feet long, 4 wide, and 2 feet 6 inches high, is very firmly conatructed of deal timbers laid edgeways, and clamped together, the surface being truly planed; the roll of painted cloth is placed underneath :', and as it is onrolled it gradually passes over the tablu, where it is printed, and la then drawn forward so as to hang perfectly free while drying, the hoight of the bullding being such as convenientiy to adnait of this, without rolling, doubling, or folding the material, which In these atagee would of course injure it. The colors, which are the usual oll colors very aarefully propared, are put on in succession with wooden blocka, which are made of pear-tree, box, or holly-wood, and on whieh the patterns are cut in relief; they are ebout 18 inches square, and are applied in succession over the whole of the surface of the cloth lying upon the printing-table. Every color is put on by a separate block, and much dexterity ia required in so placing them that the patterns may correctly interlace and join each other, without in any case overlapping or interfering. To effect this, the workman is uided by guide-pins, or pitches, as they are termed, which direct him in placing the ilock. The colora are first brushed or tiered apon hard cushions, from which they are transferred to the block and thence to the cluth; and, though many are often required, it is astonishing how much effect is sometimes obtained by the judicions arrangement or mixture of two only, upon a third, which forms the gronnd. It will be obvious, from what has been stated, that the weight, of the finished oil-cluth, as compared with ine naked canvas, is no uninıportant criterion of its good-ness-each square yard, when finished, weighing from 34 ponuds to 4 or $4 \frac{1}{4}$ : this distiuguishes a good oilcloth from those which are vamped up and atiffened with size and other perishable materialg.

Independent of the common application of oil-cloth, it is not onfrequentiy advantageously eniployed as a roofing material, ospecialiy for covering verandas and other light structured. When used for this purpose, the canvas should be made of picked long flax, and thoroughly saturated with good oil paint ; it will then stand our climate and last for 14 or 15 years.

Florida, one of the southernmost Statea of the United States of Ameriea, lies between $21^{\circ} 32^{\prime}$ and $31^{\circ} \mathrm{N}$. lat., and between $81^{\circ} 30^{\prime}$ and $80^{\circ} 35^{\prime} \mathrm{W}$. long. It is 385 miles long, and from 50 to 250 wide, containIng 59,268 square niles. Population in 1830 , was 34,725 ; in $1640,54,447$; and in $1850,87,401$. The States was, in 1850 , divided luto 28 countiea.

Early Jistory of Florida.-The name which the conotry to the north of Caba had among the Indians of the Lucayan Islands was "Cautio," the signification of which is, as ilerrera gives it, rather olsscure. The Spaniaris heard this eountry "Cautio" alrealy apoken of befure they saw it. I'hey heard also of tho famoun and fabulous fountain of youth of which the Indians had a tradition, and which was cailed the fountain of Bimini. From this fonntain the country to the north itself was sometimes culled " Mimini." O" rome of the first majes of the 16th century it is also called "Terra de Cubu" (the country of Culab), as if there were, 1st, an island of Cuba, and, 24 , a continent of Culsa. When l'once de leon, in the spring of 1512, diecovered this coast, he gave to it the name of " $1 \% \mathrm{or}$.
ida" (the florid), from two reasons, at Herrora says t at first because the country presented a very flourishing and ploasant aspect, and then because he saw the conat at that feativul-day which the Spaniards call "Paecua Florida, which correaponds to our Palm Sunday. This name has aince that time always remained to the large peninaula which we to thin day call Florida, though the name was sometimes taken in different asases, an ithough aomotimes there have been at. tompts made quite to do away with it. At first, so long as Florida was supposed to be an island, thename had only a very limited application. When the Spanlarde, after the year 1520, discovered, however, the continuation of the coasts on both slden of Florida, they applied this name to the whole western half of North America, from the boundarlea of Mexieo find from Cape of Florida, toward the nerth, in indefinitum. The to-called "Government of HVorida" was often given to different Spanish governors within the said limits. The "Rio de las Palmas" (Inlm River in Mexico wan the eouth-weatern houndary of this government.
Wo see the name of Florida on many maps, with large letters, written through the whole Mississippi valley, throughont the whole area of the United States; and even aa inte as the year 1723, the Spanish "istorian Barcia treated, in the work which he calls "The History of Flurida," also of Canada, und even of the English expeditiona for a discovery of the northweat passugo. This latter passage the Spanish authors very often atyle "a strait through rlorida." Herrera, howevor, already remarks that the name of Florida was taken in two sensea: it had a more extensivo and a narrower meaning. In the latter eense tha peninsula was called "Florida par excellence." Some anthors looked upon this peninsula oniy as upon s large tongue or promontory attached to the great Floridlan continent, and named it the "Promontory of Hlorida' (Promontorium F'loridas). On many old maps we eet this name cover the whole peninsuls. Still other names for the whole peninsula grew out, as it were, from its root or from its southern point. At the time of the Spanish governor, Don Pedro Menendez, in the year 1566 , the Spaniards discovered near the Cape of Florila an Indian village called Tequesta, or Teguesta, also written Tegeata. This ofteu-spokenof viliuge the map-makers put down on their maps, and chrnged it to a "Provincio de Tegesta" (a province of Tegesto). Some authors applied this name to the whole peninsula of Florida: thus, for instance, did Lacit, in his work as well as on his msps (A.1). 16i3).
When the French discovered and settled the Mixsigsippi valley, and named it Joniaiana, they extended this name and their pretensions as far as possible; and on one Frean:h map by Nic. de Fer, of the year 1i13, we see the name "I'eainanle de Louisiane" even given to our poninsnla of Florida. This wus, however, only a single and unfortunate uttempt, which had no further consequences, either ln geography or politics. The Spaniards, on their wide, guve not up thein pretensions to chaim, under the name of Florida, much more than their neighbors, the Jiritish, to the north, und the Frencli, to the west, would allow them. But the Spaniards exteniled, before 1763, their actual porsesaion and goverument in Florida, toward the oast, not further than Mubile Ihay and Hiver, and to the north not further than the St. Mary's River. When, in the year 1763, the Floridas were ceded to Great Britain, and also all the Freuch dominions east of the Mississippi, then the boundaries of the name Florida were oxtended ayrain. Great Britain established two provinces of Florida, "Eiast and Hest Florida." The first extended as far north as the St . Mary's Miver, or about the M1at degree of north latitude, and the latter as far west an the Misuissippi Delta, to the Lakes Pontchartrain and Maurepas, In the year 1783 Great Britain retroceded the Floridas to Spain, and Spain at

the aume time received the possession of the whole of French Louisiana to the weat of the Mississippl. Now, for the first time, Spala held in actual possesaion sll the ahores of the Mexican Gulf, and all the countries lying aronnd it. Spain adopted the English division in Eastern and Western Morida-F'lorida Oriental and Occidental-and retained also the extension of this name as far as the Miselssippi Delta. The 81st degree of north latitude, which runs not much farther than 40 miles from the northern shores of the Mexican Gulf, and is parailel to it, was agreed upon as the northsin boundary of "the Floridas" toward the United States. So, since the year 1763, the name of Florida extended again over half the circuit of the shores of the Mexican Gulf. But soon after the cession of Lonisiana to the United States Florida was curtailed again. The United States claimed the western part of it as far east as Perdido River, received the possession of it in the year 1811, and joined lt to their "Territory of Misrissippi," and afterward of "Alabama." Since this time (1811) the dominion of the name of Florida has not changed, though the so-called country changed, till 1821, Its masters, when Spain ceded it to the United States. It was then at first called "the Territory of Florila," and since 1845, "the State of Florida." But the linits remained (with some slight exceptions) unchanged--Perlido River In the west, and St. Mary's River and the 81st degree north latitnde, in the north. The division into Fast and West Florida disappeared ander the American government.-KoisL.

Physical Features, etc.-The face of the country la uneven, but nowhere elevated over 800 feet above the ses. The whole extent of the coast is indented with bays snd lagoons. A large portion of the country is covered with pine forests, the trees of which standing st a considerable distance from each other, without brush or underwood, afford an opportunity for the grass and flowers to spread with laxariance over the surface of the earth during the whole year. The borders of the streams aro usually skirted by hammocks of hard timber entangled with grape and other rines. A large portion of Florida consiets of what are usually denominated "pine barrens," and much of it is sterije, though there are exteneive tracts of tuble land, hammock, and swamp of the richeet soil, and well adapted to the cnitivation of sugar, rice, cotton, Indian corn, tobaceo, and fruits. A considerable portion of the pine land is equally rich, and even the barrens afford extensive ranges of growing land, uaually intersected with atreams of pure water. Many parts of the State abound in yellow pine and live oak timb.r. The sea coast is generally healthy, and in parts remarkably so, and the interior is equally heaithy, unless it be in the neighboriood of extensive marshes. The peninsula, which is the sonthern portion of the State, presents a singular alternation of acvannaha, hammocks, and lagoons, called collectively the Evergiades, which extend into the heart of the country for 200 milee north of Cape Sable. They are drained on the north liy the St. John River, and or. the weat by Macao or Charlotte River.
There were in this State in 1850, 349,049 acres of land improved, and $1,246,240$ unimproved in furms. Cash value of farms $\$ 6,323,109$, and the value of linplements and machinery $6658,795$.

Live stock, etc.--llorses, 10,848 ; assea and mules, B002; milch cows, 72,876; working oxen, 5704; other cattle, 182,415; sheep, 23,311; swine ; 209,453. Value of live stock, $\$ 2,880,058$; of slaughtered animals, 514,685.

Agricultural Products, etc.-Wheat, 1027 bushels; rye, 1102 ; Indian corn, $1,006,809$; oats, 66,586 ; buckwheat, 55 ; peas and beans, 135,359 ; potatoes, 7828 ; sweet potatoea, 757,220 ; rice, $1,075,090$ pounds. Value of products of the orchard, 81280; produce of market gardens, 8i21. Pounds of butter made, 871,498 ; of cheese, 18,015 ; sugar, hhds., 2750 ; mo-
lassen, 802,808 gallone; beeswax and honey, 18,971 pounds ; wool, pounds prodnced, 28,247 ; cotton, 48,181 ; flax, 60 ; silk coecons, $C$ hops, 14 pounds; tohacco, 998,614 ; hay, tons of, 251u; and were made 10 gallons of wine. Value of home-made manufoturee, $75,582$.

Rivers, Bays, etc.-There are many bays on the western side of the peninsula, some of which form good harbors. They are Perdido, Pensacola, Choctawhatchee, St. Andrew, St. Joseph, Apalachlcola, Appalachee, Tampa, Carlos, and Gallivalns. On the east coast of the peninsula, the inlets afford harbora for consting vessels. The St. John is the principal river on the eastern coast ; it often spreads from three to five miles in width, and at other places it is not more than one fourth of a mile wide. It is exceedingly winding, and flowa through a beautiful and healthy country. St. Mary's River rises in Okefinoke Swamp, Georgia, and entera the Atlantic between Cumberland and Amelia Islands. Of the rivers which enter the Gulf of Mexico, the Apalachicols is the principal. It is formed by the junction of Chattahooches and Elint Rivers, about 100 miles from the Gulf of Mexico. The Chattahoochee branch of this river is navigable for steamboats 280 milea to Columbus, Georgia. The other principal rlvers are Escambla, Suwenee, Withlacoochee, Oscilla, Oclockony, and Choctawhatchoe. Perdido River forms the western boundary between Florida and Alabama, It is navigablo about seven miles above the bay, is a fine mill stream, and its banka are covered with superior yollow pine timber. There are in thia State eeveral streams of limpld water which sink into the earth and disappear, and several which rise suddenly from the earth: one in particular (the Wakulla) fa navigable from ita very source. The quantity of lumber shipped from the St. John River annualiy is estimated at $50,000,000$ feet. Total tonnage of the State in 1853 amounted to $12,124.25$ tons.

The principal places in the State are Tallahassee, the capital, Key Weat, St. Auguatine, Jackeonville, Penaacola, and Apalachicola. On the 1st of Janunry, 1856, there were 26 miles of rallroad in operation. May, 1856, Congrese granted to railroads lands amounting to over $1,000,000$ acres, which, if rightly managed, will huild all necessary railroads.

Manufactures, etc.-There were in the State in 1850, 1 cotton factory, with a capital of $\$ 80,000$, employing 28 anales and 67 females, producing 624, 000 yarda of sheeting, etc., valued at $\$ 49,920 ; 8$ flouring and grist mills, 48 asw-milis, 4 tanneriea, 10 printing-officea, 1 aemi-weokly, and 9 weekly nowspapers pablished. Capital invested in manufuctures, 547,140 ; value of manufactured articles, $\$ 668,435$

Principal Ports.-Key West is built on an islund of the same name, aixty miles south-west of Cape Sable, lat $24^{\circ} 32^{\prime}$, and long. $31^{\circ} 52^{\prime} \mathrm{W}$. It ia a port of entry, and one of the few populous towns in the State. Ita pusition commands the Florida Pass, and hence it Is important alse as a naval atation; but the principal occupation of the people at the present time is "wrecking," and here is located a special court for the adjudication of aalvages. From fifty to sixty vessela are wrecked in the vicinity every year, and upward of $\$ 250,000$ are paid on salvagea. Salt and eponges are the principal exports, but there is a large import trade for the supply of the military atationed hore. Stamera plying between the Atiantic porta and IIavana generally call here. The town contains about 4000 inhabitants. The tonnage of the port in 1856 was 3668 tons.

Pensacola is a town and port on the west side of Pensacola llay, ten miles from the Gulf, and has a fine harlour. The United States' government has here a first-rate naval station and a marine hospital. The trade of Penaacola is principally in cotton. The tonnage of the port in 1856 was 1960 tons. A railrood from Pensacola to Mobile is in course of construction.

* Nine montha to June 80, and the Ascal year from this time begina July 1.

Florin, a coin firat made by the Florentines. A floren was issued by Eiward III., which was current in England at the value of 6s. in 1387,-CAmper. This English coin was called floren after the Florentine coin, liecause the latter was of the hest gold.Asur. The florin of Germany is in value 2s. 4d.; that of Spain 4n. 4 Jd . ; that of Palermo and Sicily 2s. ©d.; that of Holland 2a,--Aytarpe. By mint valuation the forin of the southern states of Germany is worth $\mathbf{4 0}$ cents. The florin of Austria and the city of Aggsharg, $48 \frac{1}{2}$ cents.
A new English coin, by the name of florm, was authorized by acts of Parilament, 1849-1851, of the value of two shillings, or one teath of the sovereign or pound sterling. This is the first practical attempt at a decimal currency in Great Britain. Up to thita time (1857) few of the coina have been isaued or put in circulation, and there seems some doulit of its hecoming one of general use. The ohverse of the new florin has an exquinitely graceful bust of Queen Victoria in left profile-the fayorite side in all the coins of the present reign. Unilike all the previous coins of this reign, however, the effigy la crowned-the comnal "round and top of sovereignty" of the kingdom being falthfuily copied, with its borders of Jewein, its rim of fleura-de-lis and Maitese crosses. The legend, in bold, broad capitals, is "Victonia Regrya, 1849."
Moss-silk (Filosella, Birurre de moie, or Reuref, Fr.), is the naine given to the portions of raveled silk broken off in the filature of the coccons, which in candell like cotton or wool, and spun into a soft coarae yarn or threal, for making bands, shawla, socks, and other common siik fabrics. The foas or fleuret, as firot obtained, must be ateeped in water, and then subjected to pressure, in order to extract the gummy matter, which reuders it too harsh and short for the spinning-wheel. After being dried it is mado still mose pliant by working a little oil lato it with the
hands. It is now ready to be submitted to the carding engine. See Cotrox Maxupactone. It is spun upon the flax-wheel. The female pensants of Lombardy generally wear clother of homespun floss-silk. Of late yeara, by improved proceasea, pretty fine fabrics of thia material have been produced, both in En. gland and France. M. Ajac, of Lyous, presented at one of the French national exbibitions of the objects of industry, a great variety of scarfs and square shawls of bourne de noie, closely resembling those of cachemire.

Flota, a name given by the Spaniarda to the stips that formerly sailed together, or under convoy, rum Cadiz and the other ports of the Peninauia amtherized to trade directly with the transatlantic possessions of Epain.

Flotilla (Sp.), literally a little fleet; in which sense, however, it ia neldom used, iseing applied almost invarishly to a fleet, how large soever, composed of amall veanel. Thus the term flotilia was given to the immense naval force with which Napoleon melitated the Invasion of Great Britain, and which consistell of 2,865 vessels of every description, was manned by alout 17,000 sailora, and carried 160,060 noidiers, and $\mathbf{1 0 , 0 0 0}$ horses. In Spain the name fotilia is given to a number of vessels appointed to announce to the home government the departure and nature of the carge of the flota or mercantile ships from foreign ports na their homewarl royage.

Floteam, Jetsam, and Lagan. In order to ennatitute a legal wreck, the goods must come to land. If they continue at sea, the law distinguisties them by the foregoing uncoath and barbarous appellations: Antacm is when the goois continue awimning on the surface of the waves; jetaum ls when they are sunk under the surface of the water; and lagan is when they are sunk, but tied to a cork or hooy to be found again. -(Blackatone, ’ook l., c. vill.)

Flonr of Wheat, adulterations of, to detect.-The first metholl is by specific gravity. If potato flour be odded, which is frequently done in France, since a vessel which contains one pound of wheat flour will contain one poond and a half of the fecula, the proportion of this adulteration may be easily ostimated. If
gypsum or ground bonea be mixed with the flour, they will not only iocrease its density still more, but they will remain after burning away the meal.
The second method is iny ascertaining the quantity of gluten which the auspected sample will afford, by the process prescribed under the article Bread. The two following chemlcal criteria may also be employed :

1st. Nitric acid has the property of coloring wheat flour of a fline orange yellow, whereas It affects the color neither of fecula nor starch. 2d. Pare muriatic acid colors good wheat flour of a deep violet, but dissolves fecula or atarch, and forms with it a light, colorless, viscous fluid, decomposable by alkalies. It may also be observed, that as fecula absorbs less water than flour, this affords a ready means of detectlon. The adolteration with bean or pea flour may be detected by pouring boiling water upon it, whlch devolops the peculiar smell of these two aubstances.
 Sevanty-two Yrale.

Rye grain la very analysiv (the arramgement belng altered) of oats that coarsely powderen, and the mixture of ilour and hran hai been dried to $212^{\circ}$. Perhaps In this drying the made into fermented bread, which is distinguished loss of water would be about 20 per cent. Allomi- from ofther breal liy its black color. The following la neus compounds, $19 \cdot(11$; saecharine to., $68 \cdot 68$; oleagi- nu aualysis of rye flour, the water luving been prevnuas do., $7 \cdot 33$; husk, $2 \cdot 24$; ash, $2 \cdot 60$. The proportion fously expelled: Alhumbous compounds, $10 \cdot 5$; sacof ash, princlpally phosphates and aulphates of lims, potissa, and magueslin, la nomuctines In much lariour quantity. Ontmeal, therefore, contains ronsiderulily more nutritious malter than the same welght of whea charitue do., 78.0 ; oll, 3.5 ; sults, 6.0, prinelpally phosjhates uf potassa, soda, and inagnesia ; loss, $2 \cdot 0=$ $100 \cdot 0$. These threw eereal gralns constltute the basis of the food of the modern linropean nithons.

Flowera (Fleurs, Fr. ; Blumen, Ger.) of benzoin, of sulphur, of zine, etc., is the appellatlon given by the older chemista to such aubstances as were obtained in a pulverulent or rather minutely crystalline form by the process of aublimation.

Flowers, Artificial, Manufaoture of. The art of representing hy flowers, leaves, plants, etc., vegetable pature in her ornamental productions, constitutes the husinese of the artlficial florist. The Itallans appear to have been the first people in Europe who excelled in the art of making artificial flowers; but of late years the French have been moet ingenious in this branch of industry. Ribhons folded in different forms, and of different colore, were originally employed for imitating fiowers by being attached to wire stems, This imitation soon gave way to that by feathers, whlch are more delicate in texture, and more capable of assuming a variety of flower-liko figures. But a great difficulty was encountered in elyeing them with due vivacity. The eavages of South America manufacture perfect feather flowers, derived from tho britliant plumage of their birds, which closely resemble the products of vegetation. The blossoms and leaves are admirable, while the colors never fude. The Italians employ frequently the cocoons of the sllk-worm for this purpose; these take a brilliunt dye, preservo their color, and possess a transparent velvety appearance, suitalile for petals. Of late years, the French have adopted the finest cambric for making petals, and the taffeta of Florence for the leaves. M. do Hernardiere employs whalebone in very thin leaves for artificial flowers; and by bleaching and dyeing them of various hues, he has succeeded in naking his imitations of nature to be very remarkable.

The coloring matters used in flower dyeing are the foliowing: For red ; carmine dissolved in a solution of carhonate of potash. Fur blue; indigo dissolved in sulphuric acili, diluted and neutrallzed in part by Spenish whitening. For bright yellow ; a solution of turmeric in spirit of wine. Cream of tartar brightens all these colors. For violet ; archll, and a bine bath. For lilac; archil. Some petals are made of velvet, and are cotored merely by the application of the tinger dipped in the dye.

Flute, a wind-instrument of great antiquity, the older varieties of which are dencribed by Pere Merseone in hin IIarmonie Unirerselle, l'arin, 1636. The Flutseabec (disused for more than a century) was of varions dimensions. The largest was a bass-flute, with a compans from F in the bass-elef, below the first line, up to 13 below the firat inne of the treble clef. The next, a tenor-flute, extended from is flat on the second line of the baes clef up to Gr on the second line of the trebie clef; and each of these iarge tiutes wan counded through a bent tube, like the $S$ of a bassoon. The alto-flute reached from $F$ on the fourth line of the luss cief up to 1 ) on the fourth line of the trelide clef. The treble-flute extended from $F$ in tho first space of the trebie clef up to $\mathbf{F}$ two octares ahove. These two had beake, like the bill of a cock. Ilut all these finten gave way, eariy in the last century, to the fierman flute, whilh, however, was then very imperfect in its lutonation, having oniy one tinger-key. liy the addition of various flager-keym, for memitunes, the Gernum thute ham been much improved in the present century. Ilke the fife, it is hiown by an oval side-hole. It conmints of four meparable tulies, and han a compass of neariy three actaven, from the lowest C In the trebie clef upuand. Smalior tiutes of thin kind are ealled thind, fonrth, and octave tinten. The octave flute in the pecculo, nsed in nuxdern orchestras nul in militesy mияіс.

Fluke is appied in navigation to the broad part of the anchor which takes hoid of the ground.

Flux (Eng, and Fr.; Fluas, (ier.), signifien any oubstamee capablile of promoting the fusion of earths or metallic ores by heat. White thax is the realduin of
the deflagration in a red hot crucible, of a mixture of two parts of nitre, and one of cream of tartar. It is In fact merely a carbonate of potash. Black flux is obtained when equal parts of nitre and tartar are deflagrated. It owes its color to the carbonaceous matter of the tartaric acid, which remains unconsumed; the quantity of nitre being too small for that purpose. The presence of the charcoal rendere this preparation a convenient flux for reducing calcined or oxydized ores to the metallic state. Limestone, flior-spar, borax, and geveral earliy or metallic oxyds are employed as fluxes in metalinrgy.
Flying Fish, a name given to several speces of fishes which, by means of long fins, can sustain theinselves for some time in the air. The common flying fish of the Mediterranean is thus able to raise itgelf so far above the surface of the sea as frequeutiy to throw iteelf upon the dock of a ship; but the extreme limit of its flight is confined to an arch extending about 120 feet, when the drying of its tins necessitates its return to its proper element. See index to lcutnyology, in Ency, Brit., 1856-7.
Fodder (Ger. futter), in agriculture, the fool given to quadrupeds, which consists of the stems and leaves of plants, such as the culmiferous stems of the grasses, the haulm of legumes, potatoes, ete.; or, in short, whatever is given as the ordinary food is designated fodder; whereas corn, beans, and other articles, which present nourishment in $n$ more concentrated furm, are not included under the term fodder, but rather known as solid food.

Fodler is the name of a weight formerly used in the weighing of lead: it was of various magnitudes, but most commonly amounted to ubout 2100 lbs .
Fog (Dan. fog), in meteorology, a dense vapor near the aurface of the land or water. Foga, in general, are the consequence of the nocturnat cooling of the atmospliere. The air, by its rapid coeling, hecomes surcharged with molsture; a part of which being precipitated in the form of a cloud, gives rise to the ordinary fog. During the day the heat of the rua generaliy diaperses the fog, because the quantity of moisture which the air ls capable of helding becoucs more considerable in proportion as its temperature is increased.

In calm weather, the snrfaces of rivers, lakes, ete., are frequently in the morning coverod with fog. The reason is this. During the nigitt the air is colder than the water; the etrata of air In contact with the water are conaequently heated, and become saturated with mointure. The inixture of the vapor with the uir, together with its elevation of temperature, renilors tho air sueclticaily llghter. It rises in consequence, anil mi, $\%$ with the coid air in the ruperior strata, is cooled, and precipitates its molsture. The clond or fog resuiting from this precipitation ean only rise to a small height, becnuse the uniformity of temperature is menn restored. Hence, it is easy to see how winda, or a great sgitation of the air, prevent the formation of fogs over the surface of water. In the equinoctiad regions, foge sometimes continue during a considerable juart of the year. Iimmboldt reiates that fima is often covered with fog half the year, esperiaily in the morninge and evenings; and that along the whole of that coast fogs nupply the place of rain, wind is extremely rare. In the polar meas thick fogs often prevall, even during the warment menths; and they aro so dense that oljecte frequently can not be dintinguished at the lintance of a few yards.

Sometimen, though rarely, foggs oceiur of which the cause in not very weil understood. In 1783, the whole of Euroje was covered with a dense fog furing nearly two months. On the 2ihl of Miny, 1822, about live o'clock in the afternoon, a fog covered l'aris and the neighborhood, which had the odur of nitrous gas; it continued sbout an hour. Iry fogm, or those ln which no motature is present, are supposed to be the vapors

This port has no tries. Vessels enter recelve a permit to in rivais and departure year 1850 wero ove over the year immedi ever, coasting vessols were under the Itritik said to be rapidly ins the second port in Shanghai beling the it in commerce with the American vessels arr last six months of 1 tonnage of 10,540 ton of $18,0,26$ tons, and
and ashes ejected hy volcanoes, and diffused in the atmosphere by the winds.

Foil (Fr. feulile, or Lat. follnm, a leaf). Thls term is generally applied to varniehed metal. Common foil is manufactured as follows: a copper plate, covered with a thin layer of silver, is rolled out into sheets under the flatting mill; the silver surface is then highly polished or covered with a colorleas varnish. The colored foils are similariy prepared with colored varnishes.

Fold (Sax. fealde), a temporary inclosure for keeping cattie or other agricultural animals together, either for the purpose of protection during night, or jointly for protection and feeding. Sometimes, also, sheep are folded for the purpose of manuring. The barrier of which folds are constructed is commonly wooden hurdies; but sometimes, when the fold is only to contain ewes and lambs, nettling stretched bet ween ports is made use of, there being a strong rope fixed to the lower parts of the posts close to the ground, to whlch the under edge of the netting is attached, while its upper eilge is attached to a rope stretched along the tops of the same posts. The practice of folding sheep on naked fallows, with a view to manaring them, is still commen in several parts of England; but the more improved sheep farmers consider that it deteriorates the wool, and impedes the fattening of the sheep, by keeping them for the greater part of the night wholly witheut food.
Folio (It. a leaf), in account-books, signifies page. Thus fulio 7 -written abridgelly fo. 7 -denotes the seventh page; Follo reeto, or $F^{\circ}{ }^{\circ} \mathbf{R}^{\circ}$, signifies the first page ; Folio verso, or $\mathbf{F}^{\circ} \mathbf{V}^{\circ}$, the second page of a leaf. A book in folio, or simply a folio, is that where the sheet is only folded in two, each leaf making half a sheet.
Foo-Chow, Fou Tohow Fou, or Fuhohau Fu, a city of China, capital of the province of Fo-klen, and ene of the five ports recently oponed for commerce, stands on the north side of the Min liver, 34 miles from its meuth, and 9 miles from Pagoda Islnnd, where ships anchor. North lat. $26^{\circ} 5^{\prime}$, east long. $119^{\circ} 20^{\prime}$. The walled city is about three miles from the river, but extensive suhurhs stretch along both its banks. They are connected with ench other, and with a small islet in the river by a atone bridge 420 paces long, lined with shops, and resting on solid stone piers, 40 on the northern, and 9 on the southern side. Several binkout honsen are placed over the strecta, or upon the nuff of buildings, one of which immedintely attracts the attention of the visiter from its height, and its dock-lial with Roman characters. Few vncant apaces occur within the wails of the city, which is everywhere equally well-huilt. Serpentine canals divide the comitry nround iuto plats of greater or less extent, and help to truin the city, as well as provide channels for boats to come up from the river. These parts of the iandscape aro dotted with hamlets and cottuges, or, where the ground is higher, with graves and tombstones. The maritime cenmerce of the city is very considerable, and its manufactures of cotton goods and porcelain ware are extensive. The population of Fou Tchow Feu and sulurbs, is eatinated at alout 600,000 .
This port has no direct trade with foreign countries. Fessels enter at other ports, my duties, and receive a permit to land goole at Foo-Chow. The arrivaly sud departures of foreign vessels during the yeur 1855 were over 100 , showithg a large increase over the year immediatelv jreceding-inchuling, howcver, coasting vensels in the opium trade, ali of which were under the Ilritish thag. The trade of the port is sail to he rapidly increasing, bidding frir to render it the second port in China as rognris foreign trade, Shanghai heing the tirst. It already surpasses ('anton in commerce with the United Statea. The number of American vessels arriving at Foo-Chow lluring the last six months of 1855 was 13 , with an aggragate tonagge ef 10,540 tons; clearancen 20 , with a tonnage of 18,026 tons, and with $15,100,070$ lbs. of tea 1 of
which, $7,674,300 \mathrm{lbs}$. were for Now York, $523,200 \mathrm{lbs}$. for Boston, and 6,908,570 lbs. for London.

A correspondent residing at Foo-Chow writes to the State Department, U. S., that the tea exported in American ships visiting this port during the last quarter, amounted to $4,824,198 \mathrm{lbs}$., valued at $\$ 715,000$. "The entire number of American ehipe which arrived in 1856 was 84 , and one ship-0f-war, the United States' ship Levant. To give an idee of the increase of forelgn trade at thls port, I would remark that in the year 1853 (the year the port was opened for trade) there were only 6 American ships ; in 1854, there were 12 American ships; in 1855, 27 ; and in 1856, 34 . The whole number of foreign ships which entered this port in 1853, was 14; in 1854 there were 50 ; in 1855, 117; and in 1856, 175. There is very little done in the way of imports, except in opium. In this article there is an immense trade, a eingle firm selling in one month more than $\$ 200,000$ worth. Nearly every firm in the port import opium with the full sanction of the Chinese authorities. There is acarcely a day, and never a week in the year, when opium is not landed in open day, within 10 feet of the door of the custom-house, and of course in full view of the officers. There is, I believe, an underatanding between the importets of this articie and the officials, that the iatter aro to receive $\$ 10$ on each chest landed, which amount goes to the custom-house officers, anil is divided among them from the collector down to the custom-house bostmen, each receiving according to his rank."

Food. All substances susceptlble of digestion and assimilation may come under the denomination of food; but the proximate principles of organic bodien on which their nutritive powers depenil are comparatividy few. Hence, slthough the articles employed in ctiferent countries for the support of animal life are almost intinitely various, their sustaining powers may be referred to certaln gubstances capable of being separated and identified by chemical analyses and tests. Among the proximite elements of vegetable tood gluten and its modifications, starch, gum, sugar, and lignin or woody fibre, ure by far the most important ; and among those of animal food, nlbumen, gelatin, and their nodifications, together with fats and oils, which ure common to both kingdoins of nature.

To illustrate the actual simplicity of our food as compared with its apparent multifariousness and complexity, it may suffice to state, that wheat and almost nll the esculent grains consist principally of starch and pluten; that the same ingredients are found in many fruits and roots; that angar, gum, or a relation of guin which is calied vegretable jelly, together with minnte truces of nronatic principles which give fiavor, and more or less abundance of water, and of vegetable aclds, are the cllef component parts of apples, pears, pouches, currants, gooscberries, and ail analogous tribes of fruits; a very few aloo, contain wil. Then, as regards animal food, the muscular fibres of various animais closely resemble each other in composition and nutritive power; in some cases texture mercly, and in others minute additions of foreign matters, confer upon tiem their ralativo digestibilities, and their diflerent sspects and thavors: albumen or tibrin, und gelatin, smatl proportions of saline bodies, and a harge quantity of water are found in them alt.

It often happens that the truly nutritious part of food is wo combined with, or protected by indigestible matters, as to escape the solvent powers of the stomach, unless previously prepured and moditied by vart ous chemical and mechanical agents. Indurated woody llbre, for instance, or lignin, as chemints call it, wili often resist the joint action of the stomuch und bowels, nud pass through the alimentary cannl with ararcely muy alteration. The huaks of many sceds and fruits nre composed almost exclusively of this material. This is the case with the kernels of the apille, pear, etc.; the seeds of the currant, gooseberry,
melon, and 80 on; the skin, or husk of peas, beans, etc., and of wheat, barley, and oats; so that unless the woody part is elther broken down by the teeth, or previously removed, the food which it envelops is protected from the solvent action of the secretions of the stomach. This is in some respects a wise and carione provieion in nature ; for birds in thle way become the carriers of seede, whlch pass through them not only nndigested, but oven retaining their vegetatlve powera; and in this way, uninhabited and sterile portions of the globe may gradually become elothed with verdare, and shruba, and trees. Bones are highly nutritive ; hut unleas broken into very small fragments by the masticatory powers of the anlmals which eat them, they too, would elude digeetion. In reference, howe ver, to the food of man, much of its digestibility and nutritions power le referable to the important chemleal operatlons preparatory to its use which are carried on in the kitchen : in other wordn, cookery is ossentially a chemical art ; and substances totally unfit, in their raw state, for reception into the stomach, are rendered palatable, diyestible, and nutritious by the skill of the cook. And here salt, and a variety of condiments, at they are called, and which are aromatic and stimulant subatances, chiefly of vegetable origin, play an important part ; nor must the mere effect of hast be overlooked, for it in most important. Meat, by boiling and roasting, in not only softened In Its fibre, but new substances are generated lnit. Among these a peeullar extractive matter, and osmazome, or the principle which gives an agreeable flavor and odor to dreased meat, are especially recognized. Nor are the changes which vegetables suffer under the influence of heat less obvitus.

There is another important point in the hiatory of our food, namely, its ultimate composition. We have apoken of starch, sugar, gum, albumen, and other athbitances as the proximate principlen upon which we live; but what in the utimate constitution of these secondary pioducta, what are their true elements 9 It in curious that four elements only are principally concerned in the production of our food. These are earion, hydrogen, oxygen, und nitrogen. Among vegetable subatancea, gluten (ircluding vegetable albumen) is the only one whleh abounda in nitrogen; gum, augar, atarch, and the rest are constituted of carlon, hydrogen, and oxygen only; anil what In very remarkable is, that in ill these important princlples, and also in lignin, the oxygen and tyilrogen bear to each other the aeme relative proportions as in water, mo that they may be figuratively deteribed as compounds of charcoal and vater. Now there are two very curloun points in reference to that part. of the chemical history of our food, which las lieen adverted to: the one is, that no animal can subaiat for any length of time upon food whleh is dentitute of nitrogen ; and the other, that a certain mixture of different kinda of food is absolutely ensential. An animal fed exclusirely on atarch, or augar, or albumen, or jelly, soon ligeins to auffer in henlth; pecullar diseasen make their appearance, and his existence is painful and brief; lutit mix these together, and ocenslonally modify their proportions, and he then thrivea and fattens. Magendle's experlments on this subject, together with those of Thexlemann und Ontelin, well illustrate this fact. Thus, geese fed upon gum, ilied on the lfth day, those feel uron starch on the 24th, and those fed en loiled white of egg on the 46 th; in all these cases they dwlolled away and died an if of atarvation.

IIabit, as is well known, will do mach In aconstoming the atomach to particular dencripitous of fool ; many jersona live exelunively, or almost mo, on vegretatile, othera on animal mattera, and particular klnda of diet are forced on the Inhabitants of many regiona of the glole ; lut, as far an wo are comberned, a due mixture of vegetable and animal matter in nut only mont palatable, liut moat condecive to bealth. Nuthing is
fit for food whlch has not already undergone organiza tlon, and water, thengh an essential part of the food of all animala, is obviously not in itself nutritious, though lt performs the extremely important function of dissolving nutritive matter, so as to render it conveyable by the lacteals and other absorbents Into the blood. Ne compound, then, of nitrogen, hydrogen, carbon, and oxygen, whlch ean be formed artlicially, can constitute food. Air, water, and charcoal, though involving the elements of our nutriment, are themselves unfit for our support; and It is oaly by pasalng through the hldden processes which are carried on In the vessels of living things, that they are so recombined and mot. lfied as to be rendered capable of aupporting animal life. It is the vegetable world which commences this wonderful operation. Planta absorb their nutriment from the alr and from the soil ; they assimilate inorganic as well as organic matter; they become the food of the graminiverous tribes, and from these man derives the great bulk of his animal food.

In speaking of the compositlon of food, that of milk, the most important of all food, must not be forgotten; in It nature has wonderfully provided a mixture whelh, though secreted by on animal, partakes also of the nature of vegetable food, and it presents a perfect analogy to that combination of vegetable and snimul matter which has been mentioned as most congenial to the palate and stomach. The albumen or curd of milk is a highly elaborated animal principle, abounding in nitrogen, yet, from its attenuated and soluble state, easy of digestinn. A second princlple of milk is what is termed sugar of milk; in composition and properties it resembles a vegetable prodnct, and is intermediate between gum and augar. The third component of milk is butter, partuking of the nature of vegetalle oil and animal fat; there are certain saline and ucid sulastances in small projortion : and all these matters are either dissolved or snapended in a large relative projertlon of water.

The shove table represente the relative proporthon of solid digestible matter contained in luan parts of the diffrent articles of food which are annmerated. When blood, fur instance, in evaporated to Iryness, at a temperature not exceeding $212^{\circ}$, the residue amonnts to 215 parts in 1000 , and may he re. garied as almost entirely composed of digestible matters: it consints of nlhumen and coloring matter, with suall proportions of saline aulsatances. The different kinda of meat were dried in the amme way. The loas of weight Iuring their cesicention is aimost wholly referable to water; athl the try residue compasel of alhomen or flirin, with some gelatin, und jerlaps traces of fat aud sallne inattera, represente the true nutritive value. Upon an avarage, therefore, the nutritive matter in a pound of meat is not more than four ounces. This, however, only applien to raw meat ; for when dreased, a considerable portion of lin constituent water is often dissipated. The nutritive matter of wheat is chiefly starch and glutan, and in this species
of grain the tion to the rice there is 1 tle doubt that food, depends nitrogenous an the vegeto-an such as carro the leading n contain sugar, gether with a or Ilgnin, whic

Yearly Food of One Man.-From the army and davy diet sesles of France and England, which, of course, are based upon the recognized necessitles of large numbers of men in active llfe, it is inferred that about if pounds avoirdupois of dry food, per day, are required for ench indlvidun) ; of this about three fourthe are vegetable, and the rest animnl. At the close of an entire yenr the amount is npward of 800 pounds. Enumernting under the tltle of water ail the various drinks-cnffec, ten, alcohol, wine, etc.-Its estimated quantity is about 1500 pounds per annum. That for the air received hy breathing may be waken at 800 pounds. With these figuros before us, says the Med. ical World, we are alle to see how the case stands. The food, water, and air, which a man receivea, amount, in the aggregate, to more than 3000 pounds n-yenr; that is, to alout $1 \frac{1}{2}$ tons, or more than 20 times his weight. This enormous quantity may well attruct our attention to the expenditure of innterial required for supporting lifo. A llving being is the result and representation of change on a prodlgious scale.
Fool, Adulterations of:-It has long been known that very fraudulent, and sometimes very unwholesome, adulterations of food ure extensively practiced; but until lately it was not easy in all cases to pronounce decidedly on the nature of the fraud that had been committed. Now, howover, hy means of the miergrcope and the chemist's tent-tube, there is little difficulty in so doing, and many limportant diselosures hava liy thelr use been made. The proprieturs of the London Laneet employed 1)r. Inssull (one of the most accomplished of the microscopieal observers of our day) to thoroughly investigate the suhject, and his reports have appeared from time to time in that periodical. As he published the names of the diferent trades.people from whom he bought spurious or aldulterated articles of fool, and as none of thom have succerled in disproving (and, indeed, very few have ventured to contradiet) any of the statements, the thorough accurasy of the report may be relied upon, and the facts in this articlo are based upon .t. Although Dr. ILassall purchnsed the arti lon of food that he examined from london shop-keepers, there ean the no doubt that the same ndulterations will be foumd in the provinces. Indeed, the great adulterntors are the wholeasle honses, who supply indiscrimi. nately london and country ahop-keepers.
I. Abvetenations of Anticles ar Foon not ayowrbly of A Manufactured Natuak, - Milk, tively little so. In towns, water ia generally added to lt, and a portion of the cream is likewise abstracted; but chalk, gum, etc., are very rarely employed (as has often been alleged) to give the appearance of greater strength. Salted butter is frequently melted, snd when in that state has water added to $1 t .1 .1$ this manner 50 per cent of water may, it is aaid, he incorporated. Lard is mixed up with water, potato flour, and refuse mutton fat, and the mount of the potats starch has sometimes been known to amonnt to 20 per cant. Oatmeal, in London, and perhaps elsowhere, is extensively mixed with barley meal ; the latter, as it contains so much more water, only selling for about half the price of the former; hut wheat flour, unless it contains clum, as it perhape does, seems quite pure. Arrowroot is adulterated to a large extent. Of 50 samples bought from London shops, Dr. Hassall found 22 to be lmpure; of these, 10 scarcely contained any arrowroot at all, but were made up of sago, tapioca, and potuto starch; while in the others thero was a considerable admixture of these chesper articles. Raw sugar has many impurities, among which the immense number of acari with which it swarma are the most disgnsting ; but it is also extensively mixed with flour, apparently to make hmpure dark sugar appear like purer and lightor-colored, and perhaps with other foreign ingredients. Loaf-sugar seems sufficiently pure. Ten is in a lamentable state, for it is meddled with by both the Chinese and those through whose hands it passes here. With regard to black tes, Dickson maintains that the Chinese mix with their exportations of tea to this country many millions of pounds of leaves of other plants, which they mix with genuine tes plants. In other respecta, however, and even perhaps in this, the Chinese do not adulterate tho common black teas, as Congou, Souchong, and ordinary Pekoe; but other descriptions, as scented Orange Pekoe and Caper, are, alinost without an exception, impure; the former by being glazed with llack-lead, and the Caper by being extensively mixed with Paddy and Lie tea, i. e., an imitation of tea leaves obtained from other plants; or by not containing any tea leaves at all, but altogether oflicr leaves sprinkled with tes dust, and made up into little masses liy means of gam, and which masses are glazed with plumbago, tarmeric or l'russian-blue, and the wholo sprinkled over with mica, etc. But the imitation black teas are also entirely made up of the leaves of indigenous plants of this country, sa those of sycamore and horse-chestnut, broken duwn, sprinkled with eatechu (to communicate tannin), dried, and coated with gum. But a still more common imposition is to purchuse exhansted tea leaves, whieh are sold at about 3d. a lb., from hotel-keepers and the like, and attempt to imitate fresh tea by admixture with catechu, gum, sulphate of iron, to strike a dark color with the catechu, l'russian-blue, logwood, black-lead, talc, etc. Some of these alulterations, as the Prussian-blue, for exnmple, are calculated to have serluus effects upon the health. Green teas nre more adulterated than black ones, a really unadulterated specimen being very rarely to he met with. 'lhey are mixed in China with lenves of other plants, and are subsequently glazed with gum, l'rasslan-blue, turmoric, and various other sulbtances, some of which are very unwhulesome. I mitation green teas of home manufacture nro also occasionally. perhape even often, exposed fur sale. Coffeo, until the government Interfered to prohilit thit sale of a mixture of coffee and chicory as "cuffec," slmost invariably contnised a large, and sumetimes un amazingly large, admixture of chicory. Several contained, iil sildition, roasted corn, heans, potatues, sometimes red ferruginous earths, and other impurities. (iround chlcory itself, so mach e:upluyed to secretly mix with coffec, is itself an article extremelyadulterated. Nearly a half of the specimens cxaminel
were largely 80 , the aubstances employed for the.purpose being roasted wheat, ground acorns, mangelwartzel, carrots, mahogany sawduet, and ferruginous eartha, the two latter for the purpose of commuaicating coler. Cocos and chocolate are no better, the great majority of samples of them being largely mixed with augar, and with potato, and other atarch ; but a worse adulteration is, that they also contain ceioring, earthy matter, usually, probably, of a ferruginous nature, but which sometimes, perhaps, have for ingredionts red lead and vermilion, two very dangerous ingredients, and tallow and other fats seem to be sometimes mixed with them. The acknowledged aubstitutes for tea, coffee, and cocon, as Revalenta, Semola, I'rince of Wales't Food, otc., etc., are very familiar subatances. Du Barry's much vaunted "Revalenta" to a mixture of pounded lentila and bariey meal, and the syrup that accompanies it is treacie. Bullock's "Semels" is the gluten of wheat with a little starch ; and " the Prince of Wales's Food" is potato flour.
Ground gimger is very commonly, and very largely sdulterated. Dr. Hassall found three fiftha of his samplen to be oo, ths substancea admixed heing sagomeal, potato flour, common flour, ground rice, cayenne pepper, and mustard husks, and these generally conatituting the greater part of the of of the powder. Mustand, i. e., ground, is almost invariably aduiterated, the articies empleyed for the purpose being flour and turmeric, and these sometimes constitute neariy the whole of the article. Pepper is likewise very frequently mixed with linseed meat, pea meai, powdored mustard, and other aubstances cheaper than itself. Cayenno pepper is scarcely ever sold pure; and as the aduiteratiors empleyed are hisulphuret of mercury, red lesd, and othor mineral celering-matter, cayenae pepper ts often a pretty active polson. In like manner, curry-powdor, of which four sampies out of flve were found to be adulterated, frequontly containa red load, and is, therefore, very deleterious. Of the other spicen, cinnainon and mixed spices are often Impure ; but pimento, mace, cloves, and turmeric, are almost always pure. Vinegar was found hy Inr. llassall to vary a good deal In strength, and also in the quantity of aulphuric acid that most of tt contains ; many samples centaining more of this than was formerly aliowed when the vinegar-nakers were under the control of the exclee; but some specimens, and these very good vinegars, were found to contain none of it, and this la a satisfactory proof that the adidition of sulpharic acid is by no neans necensary to vinegar.
II. Adulithrations of Abticlees of Food avowminy of a Manvfacturad Nature.-Although some of the above aduiterations communicate poisonous propertien, yet most of them are frauds meraly; nome of which, however, must prens very neverely apon the artisan, to whom a nominaily clieap articio is almost irresintitle. Hut the adulterations now to be noticed are all of a deleterious nature, and probably produce an hnmente amount of chronic disease, and sometimes, indeed, speedy death. Every sample of breal- 49 in number-examined by Dr. Ifassail, contuived aium. Indeed, the saie of "stuff," which is a minture of alum and salt, to the hakera, is enrried on on a very large scale. The olject of the haker in using it is to take advantage of tho affinity that ft has for water, and therely make the lread retain more water than it otherwise weuld, and thus give bis leavea an artificial wolght, and also te whiten lind and discolored four, and make it pass for that of superior quality. Each four-jr ed loaf contalus on an aversge 82 grains, and a pa.con consuming two snch loaves a week, introluce. Into his system in that pericul 2 drachms and 14 gratan of aloni-a quantity which, as alum is a powerful astringent, muat be very injurious, and which prohality protuces a great deal of the dyapepsia of latge towns. Ite unnecessary
quantity of salt employed by bakers la also for the purpose of retaining water among the bread in unnecessary abundance. The plekles sold in bottiee in the ohops are very bad indeed. In the first place, few of them, if we take the definition of pickle as given in the artlcle Foon, are pickles at ail. The vegetables are greened wlth copper, preserved with aslt and water, and packed into bottles, into which some very weak vinegar and diluted sulphuric actd are poured. Even the vegetabies are not always genuine, and white cabbage is dyed to pass for red, slices of turnips made to look like cucumbers, etc. Of 20 specimens examined by Dr. Hassall, the supposed vinegar never contained the proper ameunt of acetic acid, and in generai oniy about half. All contained oil of vitriol, and, which is still worse, all ( 16 were tested for this purpose) salts of copper-two in small quantities only, eight in much, one in conslderable, three in very consideratile, one in highiy deleterlous, and two in inmediately poisonous amount. Of the extremely injurious effects upon the health of those who dally eat these pickles thus contaminated with copper, there can ho no doubt. Among the symptems produced by the continued use of cupreens nreparations in small doses, are paralysia, chronic inflammation of the respinatory and digestive apparatus, slow fever, and wasting of the body. The store auces are extensively adulterated. Of 28 samples of anchovy sauce, 23 contained Armenian bole, a ferruginous earth of a full red color. Ali the sampies of aoy were fonnd to consist of treacle and sait, or at least nearly so. Six out of seven lootthes of tomato sauce contained colering matter, in all cases save one Armeninn bole ; and a very extensivelyused fish-nstee contains ncetate of line and chips of charred wood. None of the sauces, hewevor, were found to contain lead or copper. This, however, is not the case with preserves and jams, and 33 of these out of 35 that were tested, were found to be adulterated with copper, and sone of them in very large amount. Fruits preserved in bottios, two, neariy all had copper, and French olives in particulur contained a largo amount. As in proparing lootled fruits no expper utensils are employed, the poison must be deliberately added. This, too, must often be the case with preserven. Articies of sugar confectiozery ara perhaps mest deleterious of ail. Besides often containing rulphate of lime, which ts not wholesome, the greater proportion of the colors employed are virntent peisons. Among these may be mentioned red oxyd of lead, carbonate of lead, and th3 chromate of leal, carbonate of copper, arsenite of copper, and bisuiphuret of mercury. Accorlingly, from time to time, cuses of viralent poisoning follow the uso of these colored articles of sugar confectionery.-E. B.
it is probuhly generally undentood that organic culsatances, that is, these of vegetabio or animal derivation, can not be distinguished from each other bychemical analymia, as minoral substances can be. They aro composed of few elements, carhon, hydrogen, uitrogen, and oxygen $\mid$ but these combine together in complicated forms among themselves, producing sulstances of very different properties, even whee the elements In the aggregate continue the same. Moreover, some sulitle essence, that chemicai akill can not detect, often glvea peculiar characters to organic substances. llut Natum does not leave herself without witnesses in the orgaule, any more than in the mineral world; and if theae ave not lifonght out by chenical researches, they must he lyy somo othrir. llut what these could be has been so fittle anspected, that as, Intely m the year 1850, when repated remonstrances were adidressed to the IItitish govermment to prohiblt the adufteration of coffee with chicory; the chancellor of the exchequer urged in the flouse of Commons non-interference with the inutter, on the ground that neither by chemistry, nor by any other meana, could the adulteration be detected. And this
piea, sustal tinguished Dr. Hassall croscopee, t be detected and mixed ample, each talinty' by th The principl Possil botany and species stone, tho de is more won stances, like veal to the $m$ of phants wh and indeiitly dences of ho epochs. In Laudon bake and grind the unimal mixtures $n$ increase its value. mixture, unless it the root of a plant no active eleurent greatly diminishes
plea, sustained hy the repori three of the most distinguished chemists of the day, was auccessful. Bot Dr. Ilassall finds, by the application of powerful mlcroscopes, that the identity of organic aulsatances can be detected, and that aven when these are ground up and mixed together, as different kinds of flour, for example, each kind can be recognized with absolute certainty by the peculiar structure of the fine particles. The principle was known before, and was applied in fossil botany, especially to the determination of genera sad species of plants. Even when converted into stone, the delicate organization still remains, and what is more wonderful than all, when fossil organic substances, like anthracite, are consumed, the ashes reveai to the microscope the peculiar forms of the famliy of plauts which prodaced the coel. Thus faithfally and indelibly does Nature record and preserve the evidences of her operations in the remotest geological eprochs. By the investigations of Dr. Hassall, the microscope has become a most convenient and efficient sid to organic analyaia, and while greatly adding to its precision, wonderfully simplifies and reduces the cost and labor of the procese. Illustrating the completeness and accuracy of his investigation, we find throughont the book numerous diagrams representing the appearsnce under the microscope of the various substances submitted to his examination. We ree the genuine ground coffee and the gennine clicery root, and the mixture of these and reasted whest, beans, and potatoes, plainly exposed in samples, that had been purchased with such high-sounding names as "Delicious Family Coffee"-really one fourth coffee and three fourths chicory ; "Coffee as in France"-principallychicory ; "Fine Ceglon Coffee"-very little coffee, in great deal of chicory with some rossted corn (wheat?) "Celebrated Jamaica"-very itttle coffee; principally chicory. "Fine Java Coffie"-much chicory and some roasted potato; very little coffee. And so through the varions articles of diet, as tea, cacoa, augar, milk, flour and lirend, butter, arrowroot, condiments, pickles, confectionery, hottled fruits, liquors, and drugs. In many of them the results of chemacai as well as microscopic examinations are given, each serving to aid the other, and together leaving little to be desired in the thoroughness and exactuess of the researches.

Coffee.-Thirty-four samplea of this were examined by Dr. Ilnssall, of which thirty-one were adulterated -all of the thirty-ane with chicory-twelve with roasted whent in addition; one of them contained lean and one potato fiour. In many instances the coffee was present in very small quantities; in some it amounted to one tifth, one third, and so on. But coffee is also aduiterated with other sulustances. In 1851 there were affered for sale, ot about two cents a pound, by a Scotch house, eighty tons of "coffina," a substance inforted expresaty for the allulteration of coffee, and described as the highly nutritious seed of a 'Turkish plant. It proved on examination to consist of the roasted aeeds of amme leguminous plant, prabably a lentii, and was no doubt prepared from an importation of 100 tons of lupine seeds, which arrived a littie beforo at Glaagow from Egypit. The sama tirm, it appears, war offered, about the same time, 600 tons of foreign acorna, at alout a cent por lh. for tise same purpose, no doubt, of aduiterating cotfec. Oak bark tan and exhausted tan are also osed, and the baked ivers of horses and cattle. Ilorse iiver appears to ha preferred for eoffee to ox liver, and brings a higher priee. In iandon, there are men whose business is to bake and grinil these articles. It Is stated that these unimal mixtures make the coffee go further, and tha increase its value. Chicory is in harmless sort of mixture, unless it operates to produce diarrhea; it is the rowt of a plant of the clanilelion family, contains no active element iike that of coffec, and no doult greatiy dininishes the evil effects attributed to the
free use of coffee. Perhaps for this reason its use ought to be encouraged; but as it is worth only one fifth or a quarter as much as coffee, the purchaser would naturally prefor to buy the articles separately, and mix them to suit himself. Sir Charles Wood, tho chancellor already referred to, appears to have a high opinion of its nutritive properties; bat the value of his opinion is somewhat lessened from the question having been raised, whether he was not largely interested in the great crops of chicory grown in Yorkshire, as well as from bis zealous efforts to sustain the practice of this adulteration. But Professor Beer, an eminent oculiat of Vienns, is cá opiaion that the continual use of chicory seriously affects the nervous system, sad gives rise to blindness from amanroais. In this city there are many like Sir Charlea Wood, who rather prefer chicory; but it is not so extensively used for artulteratiog coffee as a small variety of dried pea. In the grert coffee-roasting establishments this may be seen in large quantities, openly exposed, just as if the mixing a cheap and inferior article with one of considerable value, to sell at nearly the cost of the latter, was an houest business. It is a singular fact that chiccory, used to adulterate coffee, is itself adulterated with still cheaper materials. It is sold in powder, and this is found to coasist in part of other matters used for adulterating coffee, not excepting the laked livers. Carrots, beets, parsnips, and mangel wartzel are roasted and ground for the same purpose. One witness before the Parliamentary committee testified to having manafactured in one year 700 tons of carrots into chicory. Buraed augar and Venetian red are used to give the proper color of coffee.
Tea.-Tea is extensively adulterated in China, inferior qualities being made to resemble closely the most valuable, by mixtures of highly deleterious ingredients, and foreign substances introduced, as leaves of trees of various kinds, to take the place of genuine tea leavcs. Some of these are candidly sold by the Chinese with the name of " Lie Teas," or when mixed with other teas, the proportion is.stated of esch. The Souchongs and Congous imported into England are said to be rarely adulterated; but the black Gunpowders, Capers or Chulons and acented Orange Pekoe, are rarely otherwise than adulterated. In detecting the strang 3 leaves and determining ther names, the microscope is particularly useful. The green color of the Twankay, Hyson-skia, Young Hyson, Hyson, Imperial, and Gunpowder imported into Eingland, is stated to be imparted without exception by artificial coloring matters, such as ferrocyanide of iron, Prussian biue, turmeric, and China clay. Indigo ani sulphate of iime are also used, the last for fixing the color. The Chinese exhibit great akill in the mixture of the coloring matters to produce the desired shade, and also a remarkable readiness to execute the orders for any tea required, though it amounts to many timea the quantity of ail this tea grown. It must be admitted alse that they are not much more restrained by any conscientious scruples ns to the consoquences that may result froin their polsonous coloring mixture, than those "outside barbarians" who pructice aimitar arta in Christian cauntries. In England, besides the poisonous prussiater, it appears, from aome seizures that have theen made by the excias officers, that for the facing of tea, or giving the outxide gloss to the leaves, the highly-poisonons substances, carlonate and arsenite of coipere, and chromate of lead are used. Of the tens purchased in London and examined, it is found that some are made up of exhausted tea-leaves by the use of gum, and these are nrtiticiaily gluzed and colored; that the coloring matters are nore inJurious than thoae used by the Chinese, ant that it is not uncommon for tea, ioth black and green, to be faliricnted from Ilritish leaves, which possess none of the properties of tea leaves. The detection of the aduiterations of ten ls not very difficult, some being.
made hy the microscope, and some by chemical processes. Sand, which is added to the Lie tea, is deteeted by the increased weight of the ashea. These should amount to only from five to six per cent. of the whole wolght of the tea, hut they are found, in some impure articles, to welgh nearly one half of the whole.

Sugar.-Sugars are very little adulterated, even with sand, as is sapposed to be the case. This is easily detected by dissolving the suger in water, which will also expose any other insolnble forelgn aubatance. But though not mixed with other matters, the brown sugars of commerce are stated to he in general unfit for human conaumption, from the numerous acari, or small mites, which infeat them. The magnified mpresentutions of these upon the pages of Dr. IIasasll's book, are pictures of an anlmal that can be called extremely hideous and diaguating; and our impre:slona of it do not become any more favorable, when we learn that thls acarus sacchari is of the same family as the ararws acnbei, of Itch insect, only larger and possessed of a mors formidable organization than his brother; and further, as those grocers, who are employed in "handling" sagars, are said to be subject to a peculiar affection of the skin, a dissase that is consequently called the "grocer's itch," it is to be feared that the family tralts run through all the members, and the appearance of the augar-loving acarus does not belie his qualities. Sugar would seens to be thickly populated with them, for it is stated that they may " be seen of all sizea, that is, in all the atagee of their growith, and in every condition; nome alive, others dead; some entire and others broken into fragments; bodies here, legs there." llappily, in the process of refining these augars and the more impure inolusses, kuch substances, if they do not all turn to augar, are removed with the seum, and not a trace of their existence is detected in the pure whito article.

Milk.-The adulterations of milk are of a more serious character than any of those we have neticed; and there are few, but those whe profit by the ainful practice of contaminating the food given to infants and invalids, that will net welcome any new method of detecting asd exposing the imposture. It is now some years since public attention in thla city was directed to this anbject, and a general hope was entertained, that by the hydrometers and lactometers then introluced, the adulterations might be exposed anil prevented: but from the difference in the composition and speeific gravity of natural milk in ita different conditions, the subject was found to be attended with acrious difficulties, and we believe the use of the lastruments was given up; at least wh have heard nothing of the subject for a long time, anil the publie appear to heve relapmed into a state of hopeless indifference and submisaion to the evil, which appears irremediable. And this when, if we were to judige from the quality of milk served to us at some of the eating-houses of respectable repatation-stuff of thin, bluisli consistency, that sends a siekly acum over the surface of the tea or coffee it is poured upon-we might well doult whether we are in any better condition than the inhabitants of london, when it was estimated that all the cows supplying it with milk were lunufficient to give to each permon more than about a table-sponnfol per day. Fur if this is noticed in houses of respectable repuitation, bow is it likely to be in those of the poorer class? and what sort of milk do the children of the pror probably get, that in bought by their parenta at those corner groceries where it can be hall the cheapeat ?

The difficulty of detecting the degrees of adulterstion in milk is owing to its complex nature and the different properties it possesses, as its ingredienta cliange their condition or are removed, as the cream, for instance, is taken off when it rises to the surfice, and the skim-milk is left projurtionally heavler than when this lighter aubstance was mixed with it. If water, which is as heavy as or heavier than
the cream, be now made to replace it, the substitution can not be detected by any difference of specitic grav1ty. Thi, test must therefore be employed with another to determine the quantity of cream. This is effected by the use of a graduated tulie called a lactometer, in which the cream, by standing some time, collects in the upper end, and its proportion is at once seen to the milk at the lower end. Good milk should show about $9-100$ tha by measuro of cream, and tested by the hydrometer should indicate from 1026 to $10{ }^{2} 0$ specific gravity, water being 1000. To these tests and the more complicated ones of chemical analysis, are now added those of the microscope, by which an julen may be formed of the relative richness of diffierent samples by comparison. Cream is seen to be full of globular fatty bodica, which are of large size and closely collectel together; good milk lias similar globales, bat amaller and not нo closely united; while in adulterated milk they are seattered like the sturs in a clear night. Foreign substances, as sheep's bruins, are indicated by appearancea like nebula ameng the stara, intermixed with a multitude of comets. llat to follow out this subject, one should turn to the book itself, in which it is fally treated. The result of the examination of twenty-six samples of London milk was that fucelve were genuine, but of these two showed a deficiency of cream; and that fourteen were adalterated, principally with water, whicls rangerl from 10 to 50 per cent. It would be curioua to have a series of auch examinations of New York milk to compare with this of the London. We are strongly inclined to the opinion that Yankee ingenuity would be found as far alicad of the Ibritish in this respeet as the lititish were ahead of the Chinese in alalterating tea. Certainly, we need such an invertigation, and we hope it will be had.

Flour.-Flour is probably mach more allulterated in England than it is in this country. In this article wo are more likely to sutter by short weight than by substitutes of inferior ingredients. It is possible that damaged flour may, however, be mixed with good, or by adulterationa with various mattera be made to assime the appearance of geol thour. The unwise preference, нo universal, for flour extremely white, leads to the mixture of alum for the purpose of improving the appearance; and the baker frequently, ignorant that the miller had anticipated his worthy object, alds a second dose of alum to improve the appearance of the loaf. The effect of alum is to make the lireal indigestible, causing acidity and dyspepsia-besides, it enablea the baker to atd other articlea, which are themselves cheap substitutes for flour, and cause the bread to take up mone water, thus adding to its weight. Liebig remarks upon the indigestide quality of London bread; and he noticed, when in the alum works at Glasgow, quautities of linely-ground alum prepared for the london bakera. A ware of its injurious efliects, he recommended a substitite of lime water, which would produce the usefal without the injarious offrets; and his recommenlation has leen to some extent adopted. We know nothing of the practices of our lakers in these matters, but the thing might be easily investigated. In the country, particularly in New England, where the bread is almost universally loul, the greatert evil is probulily in the free use of earbonate of potash or aaleratus. Fifty-thres samples of London lireal were examined by Ir. Ilassall, all of which contained alam. Fraud was detected alnost as universaliy in the weight of the loaves. In bilinburg an oxcellent police act prevailx, requiring the bakers to stamp the weight upon all the haves they soll. The magniliced representations in 1r. Llasallis work of the different flours and their adulterated mixtures, an they appear under the microscope, are lighly interesting and instructive.

Engliah market of late yeare, and many of them have found their way to this country, with the high-sounding namea they were christened with there. The most famous and highly esteemed of these are Wharton's Eirralenta, and Du Barry's Revalenta A rabica. They sold in England at 2s, 9d. per pound, or about 67 cents. These, examined under the microscope, prove-the former to be a mixture of the French or German lentil, which is almost -precisely the same thing as the comnoon pea, and the remainder a substance resembilng Indian-corn meal, hut possibly the meal of the Sorghum. The latter was composed of the red, or Arabiun lentil, and barley-flour. Another sampla of it showed some bugar, and a third some salt, and also appeared to the flavored with celery seed. Edwards Brothers' Arabian Revalenta, at 18. ( 24 cents) per pound, was escertained to consist of lentil powderprobalily of the red and yollow lentil mixed. Lentils, it seems, being somewhat chenper than peas, are supplied to the work-houses for the preparation of soup for the paupors. It is certainly a much more profitabie operation to convert them into Reialenta, and sell them at 67 cents per pound, or export them in this fonn to this country, where, we belleve, hy our own experience, when acting, some time since, under medical advice, they cost half a dollar for a small paper, possibly weighing half a pound. In London, where these valuable lentils can be easily procured at 8 cents per quart, the preparation may be made hy mixing to a uniform powder red or Arabian lentil flour, 2 pounds; barley flour, 1 pound; salt, 3 ounces. This preparation will contain all the valuablo properties of the Kecalenta, and cost four cents per pound. Unfortunately, we have no Arabian lentils; but Dr. Hassall has given another recipe. equally good, designed for sach contingences, and of whin we can easily ayail oarselves, viz.: Pea flour, 2 los.; Indian-corn flour, 1 lb ; a alt, B og. Nlix as before. We do not know whether such shoice preparations as Prince Arthur's Farimaceous Food and the Prince of Wales's F'vod, would over be allowed to come to this country to nourish reputlican babies; but, by great good luck, we possess the materials of this royal diet, as Dr. Hassall's microscope proves the one to he composed entirely of baked wheat fuour, and the other of potato Aour. Maidman's Nutritions Fiarina conaists entirely of potate flour, artificially colored of a rosy tint.
Spices.-Cayenne pepper is very generaily adulterated, and frequently with red lead, in considerabie quantity. Vermilion, or the sulphuret of mercury, is sometines used for the samo purpose. As mineral polsons are apt to accumalate in the system, and finally produce very serious consequences, if taken frequently, even in asail quantities, this adulteration, as the similar treatment of colored confectionery, is one of the most reprehensible forms of this vile dystem. Inatances of peisoning from these causes are known, and alse from cheese poisoned by red lead, which was introluced into the annotto used to color the cheese. This coloring ingredient in cheese and butter is an entirely ukeless addition to these articles, possessing no good properties of its own; but being frequentiy made tho vehicle of introducing ita ditlerent aduiterating mixtares, its use ought to be almandoned.

Spices are to a considerabio extent adulterated, and probshiy as much 60 in this country as lu Enghand. Of ?l samples of ginger, 15 were thus impare, the mixtures consisting of the meai of sugo, tajioes, protatoes, wheat, rice; also, iayenne pepper, mustard husks, and turmeric powder, which, in the majority of the cases, constituted the principal part of the urticle. Every one has noticed lin cinnamon the ilart, tasteless hark, thicker than that which inas tite genaine flavor, but otherwise much resembling it. This la the bark of the cassia, a tree of the aame genus oa that which proxluces the cinnamon bark, but of very inferior quality. It is largely mixed with cinas-
mon, but, even in the ground state, is easily detected by the microscope. Of 12 samples of whole cinnamon examined, seven proved genuine, and five were nothing but cassia; and of 19 samples of the ground article, only six were genuine-three conslated entirely of cassia, three of cassia adulterated, and seven of clnnamon adulterated. The adulterating mixtures were baked wheat flour, eago, meal, potato-flour, and arrowroot. In his examination of the nutmeg, Dr. Hassall does not appear to bave found any of the famous wooden lmitations ; but a French author he quotes, states, that "nutmegs are eometimes mixed with riddled nuts, eaten by insecta, and becoms brittle; the small apertures are then closed with a kind of cement, formed of flour, oil, and the powder of nutmegs. This paste has even served to fabricate fulse nutmegs, inodorous and insipid." These qualities without doubt, characterize the Connecticut article also, and will enable any one to detect it. Dr. Hassall's advice to soak them in water, when, of course, they would readily break down, would not apply to these.

To present this subject in its most revolting features, it would be necessary to carry out this description through the loag list of liquors and druge; and tho data for this might easily be furnished to considerable extent from materials already at nand of our own operations, without drawing upon those so abundantly provided in the book before us. But enough has already been said to convince the most incredulous (if there le anywhere incredulity on this subject), that whatever wa purchase to eat or to drink, or to administer as medicine, we bave no security that we obtain the articie we ask and pay for. The chance is decidedily against us in all articles, which skillful ingenuity can imitate successfully, even if it be necessary to resort to dangerous poisonous substances. The lawe afford littlo protection, though they recognize the existenco of the ovil.
Ilut besides the repugnance we naturally feel to being cheated and poisoned, there are evils of groater consequence brought upon the community by the toleration of these practices, that should rouse a higher indignation. These are, that loose state of morals the system encourages, and the lowering of the respeet which should uttaeh to the mercantile profession. The encouragensent, too, of the unscrupulous trader, hy the advantages of profit it gives him over the honest ; thue drivigg the latter out of a business in which competition is not open to him. Then, again, its evil effects upon the poor, who, ignorant of these fraude, full helplessly into the snares of those who sell at the lowest rates. Judging from the qualities of articles sold by "respectabie" traders, it is probable we have little idea of what is palmed off upon the great bulk of the population of a city like this, in the cheap shops frequented liy the poorer classes. Our newspapers make frequent mention of the more prominent traude committed upon unsuspecious strungers by the emigrant runners; but of this under-current, which is filching without cessestion the hard earnings of the multitudes, poisoning heaith and moraid aike, roducing the standard of mer. cantile integrity, and taking from the mouths of the sick and of the liffants those most nutritious foods neture has kindiy provided for their benelit-of this we hear ittie mention. 'The disease lies too deep and works too insidiously for its eralication to be hoped for. 1 lut this is net so. There is a cure for it ; and this cure is the one adopted ly Dr. Hassall. Let thoeo wh.o have the skill, and the tine, and the taste for such pursuits, adopt the course ine followed. Let purchases of articies likely to be adultorated be made in various places, and the results of their exemination be exposed, togethor with the names of the tradesmen aeling them. There is no fear liut one would be sustalned in this. All honest dealers would enconrago it ; for it would restore them to their rightful position. Tho dishonest could not help themeelves. Such a
course, steadily pursued by a fow individuals, would, we believe, coon produce as marked a change in thla elty as it has done in London. If one would undertake It, others would be likely to follow. The field is large, and will accommodate many laborers. We wish a commencement might soon be made upon milk. -See Aduliterationa Defiscted ; or, Plain Inatructions for the Discovery of F'rauds in F'ood amel Medicine. Jy Arthur Hill Habsall, M. D.: London, 1857. II. Baillere, New York.

Foot, a measure of length derived from tho length of the human foot, and consisting of 12 linear inches. For its length in difforent countrias, see Weigits and Measures.

Fore. The sea term for the part of the ship near the head.

Fore and Aft Impliee lying in the direction of the head and stern; also, the whole of the vessel generally.

Forecantle, that part of the upper deck of a ship forward of the foremast; also, In merchant vesseis, the forward part of the ship, under the deck, where the sailors llve.

Forelgner, the natural-born subject of a foreign state.

Forelock, in nautlcal language, a flat wodge of Iron, driven through the end of a bolt to provent its drawing.

Foremast, the forward mast of all vessels.
Forestalling, in lav, is described to be the buying or contracting for any merchandise or victual coming in the way to market; or diasualing persons from hringing their goods or provisions there; or persuudIng them to enhance the price when there. This, as well as engrossing, which is the buying up of large quantities of com, or other dead victuals, with intent to sell them again, and regrating, the buying np of auch commodities in uny market, and selling them again in the same market, or within four miles of it, was looked upon as Injurious to the public, by unnecessarily tending to raise the price of provisions; und accordingly several atatuten were passed in Great Britain probibiting forestalling under severe penalties. Statute 31st Fdw. I. enacted that "no forestaller shall be suffered to dwell in any town who manifestly is an oppressor of the poore, a publike enemie of the whole cominaltie and countrie, who meeting grain, tish, herring, and other things coming by land or by water to bee solde, doeth make haste to buy them before other, thirsting after wicked gaine, oppressing the poore, and deceiving the rich." In Great Britain, by the statute of Edw. VI., it was enscted that whoever should buy any corn or grain with Intent to sell it argain, should, for the first offonse, suffor two noentlis' Imprisonment, for the second, six months' imprisoument, and forfeit double its value, and for tho thirl, be set in the pillory, suffer imprisonment during tho king's pleasure, and forfeit all his goods and chattels. This statute further enacted, that no one coulil transport corn from one part to another witiout a liceuse, ancertalning his qualifications as a man of probity and fuir deallog.

The very imperfect knowledge of political economy that then prevailed led to the belief that the intervention of a third party between the producer and consumer tendel to raise the price of provisions; and that corn would be bought from the farnier cheaper than from the corn-merchant. It inay seem some what atrsnge that though the law thus compelled the farmer to deal dlrectly with the consumer, yet it in many cases prohibited the manufacturer from selling bis own wares by retail, in order that the shopkeepers might not be undersold. The farmer was thun forced to carry on two trades; and part of the capital which ehould have been employed in the luprovement and cultivation of the land, was obliged to be kejt in hin granarien and atock-yard; whereas tho corn-merchant, by afford-
ing a ready market for the farmar's produce, enablea him to employ his whole eupltal In cultivation; and the exintence of a free competitlon obliges the cornmerchant to sell his corn as chemp as the farnuer could afford to do. Tha princip'e here is the same as in manual labor. The workruan who is wholly employed in one operation accomplishes a greuter quantlty of work, and can afford to do it at a cheaper rate, than one who has to carry on several operatione; and, In the seme way, the dealer whose whole otock is employed in a single branch of business ncquires so easy and ready in method of transacting businese that, with the sume capital, he can carry on a much larger business, and no dispose of his goods cheaper than If his capital and attention were employed in a greater variety of objecte. "If," says Adam Simith, "a merchant ever buye up corn, either going to a partleular market, or in a partlcular markot, in order to aell it again boon after in the same market, it must be because he julges that the market can not be so liberally supplied thruugh the whole season is upon that particulur occasion, and that the price must, therefore, soon rise. "-E. $\mathbf{B}$.

Fore-tnolele; tackle on the foremast, and also tackle used for stowing the anchor.

Foretop-men; men stationed in tho forctop, in readinoss to set or take in the smaller sails, end to keep the upper rigging in order.

Forge, a furnace where wrought iron or other metal is hammered and fushioned with the aid of heat. This is called a smith's forge. In ohlpa a very conveaicnt kind is the portable truck forge. Forge is nlso applied to the blast furnace, in which lron ore is amelted; alao, where tho production of the blast furnace is fused, and afterwards beaten with enormous haumers, or drawn through cyliaders of different diameden, in erder to reniler the metul soft, pure, and more malleable and ductilc. Such great workshops are otherwise called ohingling mills. See lnon-making.

An ordinury amith's forge consists of the hearth or fireplace, which is merely a cavity in masonry or brickwork, lined with fire-clay or brick, and contalining ignited fuel, npon which a powerful blast of air is driven through the nozzle of a double-bollowa, worked by a lund-lever. There are ulso portable forgen, of small dimensions, but answering all the ordinary purposes of a sinith's forge. Such are the traveling forges of armies, those used on bound ships, etc.

Forgery (from the Freuch jorger, signifying accudere fubricure, to beat on an anvil, forge, or form) may Le defined at common law to be the fraudulent making or alteration of a writing or seal, to the prejulice of another mun's right ; or it is the crime of imitating the subacription of another, adhibiting it to s deed, and putting that deed to use by acting under it, recelving property in virtue of it, founding on it ss a title to sue or to defend, or transferring it to another. In considering forgery, it is necessary to attend, first, to the mode of proof by which the crime is estahblished: and secondly, to the punishment which is indicted on thu perpetrator thereof.

Thu proof of forgery is either direct or indirect. The direct proof consists in the examination of the writer of the deed, and of tho witnesses who rign the deed and attest the subseription. As the subgeription of witnessea is an attertation to which the law gives effect to the extent of receiving it on their death as ovidence of the regularity of the deenl, und as weight la given to the aubacription of a witness, even whare he doos not recollect having adhibited it; so, to cut down a deod regularly attested, the instrumentary witnesses, as they are called in sicotland, inust be brought to swear to circumstances of authicient force to luvalidato the evidence piven by their subscriptions; a specioe of proof which the law doea nut and indeed can not reject. The inlirect mode of prof consists in an investigation of all the circumstances from which it may be inforred that the person by whom
a deed is salc scribe ; as, for the atamp, the the paper, or a of the handwr of the same dn and whore the the one found pronomaced on It is an establ forgery hy a in admisaible.

Forgery in $E$ evidence forger by standing in the noatrils oll and perpetual Forgery was fir

Forgery, Rem nate Daniel an merchants, wer The Rev. Dr. bond, in the nan greatest Interes was exerted to fore the council, III., " If your have murdered necordingly, Jur a London bank Joseph IIunton, December 8, 182 gery at the Old cember 81, 1829.

Fork, a wellbandle and a sha or prongs. The England till the re remarkable passag lstes the history mention a thlng fore in discourse served a custom in through the which other country that think any other na but enly Italy. T that are commorant use a little forke w - with their knife, cut the aueato out which they hold lit so that whatsoever of any others at dish of meate with doe cut, loo wlll giv pany as having tra nery, insonuuch that hrowleaten, if not r of feeding, I undurs of Italy, their forks yrona, steele, and a only by gentlemen. 18, because tho Italla
a deed is eald to be executed netually did not subacribe ; as, for instance, an orror in the date, an alibi, the stamp, the contexture of, or date impresaed upon the puper, or a comparatio literarum. The comparison of the handwriting is made with genuine aubseriptlons of the mame date as that alleged to liave been forged; and where the real mubacriptions differ muterially from the one founded on, the forgery of the latter may be pronounced on with a conaiderable degree of certainty. it is an established rule, however, that the proof of forgery by a mere comparison of handwriting la not admissible.

Forgery in England.-The forging of, or giving in evidence forged deeds, etc., made punishable by fine, by standing in the pillory, having both eare cut off, the nostrils alit up and seared, the forfelture of land, and perpetual imprisonment.-5 Elizanetir, 1562. Forgery was firat pumished ly death in 1634 .
forgery, Remarkable Erecutions for.-TThe onfortnnate Daniel and Robert Perreau, brothers and winemerchants, were hanged at Tyburn, January 17, 1776. The Rev. Dr. Dodd was found guilty of forging a bond, in the name of Lorl Chenterfield, for $£ 4200$ : the greatest interest was made, and the highent influence was exerted to arve him, but when the cane came before the council, the minister of the day nald to George III., "If your majesty parion Dr. Dodd, you will have murdered the Perreana;" and he wan hanged necordingly, June 27, 1777. Mr. Henry Fonntleroy, a London banker, was hanged November 30, 1824. Josejh IIunton, a Quaker merchant, sufferel death, December 8, 1828. The last criminal hanged for forgery at the Old Bailey, was Thomas Maynard, Decemier 81, 1829.

Forgery of Sea-Letters.-Congress enacted the following law, March 2, 1803 :-"That if any pernon ahall knowingly make, utter, or publish any false sealetter, Mediterranean passport, or certiflcate of registry, or shall knowingly avail himself of any such Mediterranean passiport, aea-letter, or certifleate of registry, he shall forfeit and pay a sum not exceeding $\$ 5000$ to be recovered by action of llebt, in the nume of the United States, in any court of competent jurisdiction, and if an officer of the United States, he shall ever thereafter be rendered incapable of holding any office of trust or profit under tho authority of the United States."

Fork, a well-known instrument, consisting of a bandle and a shaft terminating in two or more points or prongs. The table-fork did not come into use in Englsind till the reign of James I., he wo learn from a remarkable passage in Coryat, who thus solemnly relates the history of its introduction:-" Here I will mention s thing that might have been npoken of before in discourse of the first Itclian townes, I observed a custom in all those Italian cities and townes through the which I passed, that is not nsed in any other country that I saw in iny travels, neither do I think any other nation in Christendome doth ure it, but only Italy. The Italimes, and also most strangers that are commorant in Italy, doe aiways at their meals use a little forke when they eat their meate; for whilo - with their knife, which they hold in one hand, they cut the meate out of the dish, they fasten the forke, which they hold in the other hand, upon the same dish, so that whatsoever he be that sitting in the company of any others at meale shall unadviaedly touch the dish of meate with his ingers from which all the tabie doe cut, he will give oceasion of offence unto the company as having transgressed the lawes of good manaers, insomuch that for his error lie shall be at least browbeaten, if nat reprehendel in wordes. This form of freding, I understand, is generally used in all parts of Italy, their forks for the most part heing nuade of yronn, steele, and some of silver, but those are used only by gentlemen. The reason of this their curiasity is, because the Italian can not by any means indure to
have his dish touched with fingers, seeing all men's fingers are not ulike cleane. "Hereapon 1 myself thought good to imitate the Italian fashion by this forked cutting of nieate, not only while I was In Italy, but also in Cermany, and often timea in England alnce I came home: being once $u$ uipped for that frequently naing my fork, by a certaln learned gentleman, a familiar friend of mine, Mr. Lawrence Whitaker, who in hi- merry humor donbted not to call me a table furcifer, only by using a forke at feeding, but for no other cause."-E. B.

Formosa (Chinese, Taevan, 1. e., Terrace Beach), an island lying about 90 miles off the coast of China, from which it is apparated by the channel of Fo-kien. It ia about 250 miles in length from north to south, and 80 in breadth, lying between north lat. $22^{\circ}$ and $25^{\circ}$ $30^{\prime}$ and east long. $120^{\circ} 30^{\prime}$ and $122^{\circ}$. A voleanic mountain chain, rising to the height of upward of $\mathbf{1 2 , 0 0 0}$ feet, traversea the centre of the island from north to aonth, and anparates the Chineas portion of it on the weat from the independent portion on the east. Some parts of the coast present bold headlands; but all the west shore is flat and aurrounded with rocks and quicksands, presenting no good harbors, with the exception of Kélung at ita northern extremity. The Chinese portion of it is fertile and well watered, and possesses a very salubrious climate. Almost all grains and fruita may be produced on some part of the island, which is familiarly known as the granary of the maritime provinces of China. The rice-trade alone with these provinces employs more than 300 vessela. Among its other articles of trade, are maize, tobacco, sugar, fruits, timber, salt, sulphur, camphor, cotton, hemp, silk, etc. Of the eastern portion of the island little is known; the inhabitants bear no resemblance to the Chinese, but are apparently alilied to the Malay or Polynesian tribes. They are of a slender form, olivo eomplexion, wear long hnir, and blacken their teeth. They have no written lunguage, and their religion seems to be confined to a suporstitions belief in demons end sorcerers. Many of the aboriginal inhabitants are still to be found on the weatern postion of the ssland, living in independent villages; others, however, have become incorporated with the Chinese scttlers, or live in villages of their own, under the gelleral supervision of Chinese officers.

Forinosn was unknown to the Chinese till nbout 1403. Abont 1634 the Dutch eatablished themselves here, and built Fort Zealand on a amall island commanding the harber of the capital Taewan. After retaining posaession of it for 28 years, thoy were expelled by the famous Chinese rebel Coxinga, whose successors rulel in the island till 1688 , when it was taken by the Chinesc. Taewan, the capital, stands on the west coast in north lat. $23^{\circ}$, east long. $120^{\circ} 32^{\prime}$; but the entrance of its harbor is now choked up. The populution of Formosa is estimated at from $2,000,000$ to $3,000,000$.

Fort, a small fortified place, environed with a ditch, rampart, and parapet. The une of forts la to a sure some high ground, or the passage of a river, to lisake good an ndvantageous post; to defend the lines and quarters of a siege, and the like. Forts are built of different figures and limeasions, according to the exigences of the case. Some are provided with bastions, others with demi-bastions; some are of a square form, others pentagonal, and others again are stellated, having five or seven angles.
Forth, one of the largent rivers in Scotland. It is first formed of several amull streams rising on the north of llon Lomond, or tlowing fron Loch Katrine and the other lakes in the adjusent country, It proceeds ensterly in a direct course for above 100 miles, receiving In its progress the tributary waters of the Goodie, the T'eith, and the Allan ahovo Stirling, and below it th. Devon, the Carzon, the Avon, the A1monl, the Lelth, the Eak, the Leven, the Tyne, and
others; and it diacharges Itself Into the German Ocean in about $56^{\circ} 10^{\prime}$ of north latitude.

The Forth, like other streams connected with the ocean, eble and flows twlee in 24 hoars, hut the flood and ebbran about two hours longer in the middle than at the shore. The tide flows 41 milea above Stirling shore. At this harbor spring-tides rise 7 feet 9 inches, and at Alloa, 191 fect.

It was high water, according to Captaln Thomas's observations in 1815, at

The tides at leith and Kinghorn rine sometimes as high as 19 feet above low-water mark, the average being $17 \frac{1}{2}$ feet.
There sre in the Forth, as elsewhere In aimilar rivors and arins of the sea, particular currents. Among the most remarkable are those known ty the name of Leakies above the Queensferry, whleh are particularly observed from Culrons to Alloa. These consiat in an Internisaion of the tide at certain places during the flood, and before high water the sea ebbs. On the contraty, while inc sea ebbs, and before low water, the ebbintermits, and a How commencing, continues some time; after which the ebbing is resumed until low water. This ls aeen during two hours, and the irregalarity ocenples more or less of the river according as it is spring or neap tide.

The principal obstructions to the navigation of the Forth between Alloa and sitirling, have hiltherto arisen in a great measure from the two fords of the river, the onecalled the Town Ford and the other the Abbey Ford, and from the channel being rendered shullow partly by large boulders and partly by aceumulations of peat. The peat necumulations have arisen chlefly from the proprietors above Stirling clearing several thousand acres of their landa for cultivation, by removing the peat which covers them, and moving it into the river in order to be carried uway by the current to the sea. This practice han been followed since 1732. The moss covering the soil varies in depth from 14 to 4 or $\$$ feet, but the greater proportion is 10 feet. Mr. Drummond, of Blairbrummond, from 1783 to 1889, floated away upward of 1,600 acres of this sulistance.

The principal annt-banka which obatruct the navlgation further down the firth are the Druin-eands, near Cramond, and the Sandeend, on the east of Burntlaland harbor. The principal rocks which require to be uvoided by the mariner aro the Sonth Carr leef, lying N.N.W. from Danbar, the North Carr, about a mille and a quarter east of Fifeneas, the llae to the west of Kinghorn Ness, the Commons to the west of llurntisland, Craig Waugh S. F. one half E. of Inchkelth, and the Gunnet Rock, Pallas lRock, Iong Cralg, lsrigiga, and llarwit in its neighlorhood; and several milles further west, and nearer Inclicolm, the Oxcarea, Carcralg, and Mickry Stone. Many of these rocks are seen at the lowest eliss; their ponition, togetleer with the different land-marks, which are necessary to point them out to the mariner, ure dulineated on the admiralty cliarta, and the sailing directlons for the Firth of Forth, contained in the C'raster's Assistant, wlich is publified in Ielth. To show their position still ivetter, floating buoys have been placed upon C'raigh Waugh, the Gunnet, the IIarwit, and the Pullas Rocks; and bescons have been erected on the Oxcarel, the North Carr, and on the Inng Cralg, and on mont of the other dangerons rocke, and on several shoais and sand-banks. Ileslles the provisions for aillng the navigation, there are two light-houses on the Isle of May, one on the Ialand of Inchkeith, and various other light-houmea are now erected on all the harbors and landing-places of limportance In the firth.

The anchorage of the Firth of Forth is excellent.

Mr. Osborne, in a report to the Lords of the Adme]ralty on 2t May, 1858 , says of it t " Retween the llamber and the Frith of Cromarty there is no other harbor or anchorage into whileh large ahlps of war can aafely run for ahelter or randezvoua other than the Frith of Forth, and more partlcularly in the reach ahove the Queensferry; where the sheltar is complete. Hut as the Frits of Cromarty is away from all importent intereste, the Frith of Forth muet be consldered the only war port north of the Humber, and therefore a most fitting place for a naval arsenal." But besides the great and Important anchorage at Nt. Margaret's Hope, In the reach above the Queenaferry, which is more particularly referred to in this Admiralty report, leith loads to the west of Inchkeith Is another, which is capable of holding a large fleet of ahips of war of any size. The minor anchorages in the tirth, which arc ulso very good, are at Aberlady lay, the western part of Largo Bay, lurntisland, St. Davids, Llmekilns, etc.
The landing-placea or harbors In the Forth are, on the south side the harbors of Dunlasr, North lierwick, Port Seton, Morrison's IIaven, Flaherrow, 1,eith, Newhaven, Trinity, Granton, South Queensforry, Ikorrowstowneas, Grangemouth, and Stirling Shore, and on the north side, Crail, Anstruther, Blie, Pittenweem, Leven, Methel, West Wemysa, Dysart, Kirkcaldy, Kinghorn, Pettycur, Hurntinland, Starleyhurn, Aberdonr, ist. Davids, Inverkeithing, North tpueens. ferry, Charleston, Crombie Point, Culross, Kincardine, and Alloa. Great lmprovements and new erections have lately heen made at mont of these harbors which are of any note ; and ln particular, the Duke of lluceleuch's magnificent harbor in progress of formation at Granton, and the extension of Leith l'ier into deep water, may be referred to. Of leas magnitude is the deepening of the channel of the Forth lietween Alloa and Stirling ly commlasioners arting under the act of Parliament 6th and 7th Victoria, cap. 47. Since the passing of thls act In 1848, a channel of about 500 yanls in length has been formed thruigh the Abbey Ford, giving ahout $\mathbf{3}$ feet 6 lnches greater depth of water than formerly. A channel abont 1,000 yards in length has also been formed through the Town Ford, which ia not yet fully completed as regards its depth of water. In these operations many thousamis of large bouliler-atones and the peat accimulationa whleh formed obstractions to the navigation lave leen removed, nid no doult is entertai.,ed by the inspectors, who have reported to govermment on thls auliject, but a depth of 10 or 17 feet at springtides will te obtained up to Ntirling when the works in progress are completed. Upward of $£ 5,009$, inthding the expense of the act and of erecting a 'muy at Stirling, have alrealy heen expended by the H:arior Comminsioners on these operations, and $£ 7,000$ more In about to be expended ujon them. This sum is to be pald to the commissioners liy the Town Council of Glangow for damage likely to arise to the improvements in progreas on the Forth, from the liberty obtained by the city of (ilangow to draw a large quantity of water from loch Katrine. In millition to these sums, the revenue of the Forth Comminalonern, whinh ${ }^{\circ}$ Is considerable, will enable them ntill further toextend their works.

Further, the low-water ferry landing-place at llurntislind, belonging to the Filinburg, Perth, aud Hundee Ituilway Company, is a great improvement at that port; mud at Kirkealdy, lluckhaven, and oiher harrhorm, extensives works are in progresa ander llarbor Cominissioners.
'The coasting and foreign trade of the Forth is carried on in vessels varying in size from 18 to 500 tons. The traffic in goods and passeagers between the ports In the Forth and Iondon, Greenock, Glasgow, Liverpool, IIull, Neweastle, Dundee, Perth, Atberdeen, Inverness, l'etorhead, and almoat every conaiderable sea-port in Scotland, is conducted chlefly by veasels of joint-stock companies, which vessels alli perlodleally. doint-stock companies are also engaged in the Leith trade with IIamburg and Rotterdam. The Glaegow, Greenock, and Liverpool trade, is chlefly conducted through the Forth and Clyde canal.

The number and tonnage of the vessels belonging to the ports in the Forth in 1855 are as follows:

At Alloa including the ereeks of Klneardtne and Sttrling, 74 vessels, with a tonnnge of 12,402
At Borrowstownness, Inclading the creeks of Chaileoion and Lituekilns, 47 vessela, with a tonnage of..

8,781

At inverketihing, 28 vossels, with a tonnage of 2,361
At Ktrkealdy, including the ereeks of Iargo, Leven, Wemyas, Dysart, Kingtiorn, Bartithatand, and Abordour, 60 vessels, with a tonnage of. .
At Letth, tacluding the creeks of Granton Fisherruw, Cocketizle, and Dunbar, 176 vessels, with a tonnage of.

25,404

## Total 484 vessels, with a total tonnage of 60,968

E. 1.

Fortified Island, an laland in the Indla seas, lying of the cosst of Canara, about a mile from the land, a littie way north from the entrance to Lake Onore. The laland slounds in cocoa-nut, palm, nod plantain-trees, and has plenty of fresh water. It produces the best kind of carl, which is used by the natives in palnting their houses. Its name is derived from its fortificatlons, which were greatly strengthaned hy Tippoo Snih, from whom it was taken in 1792 by three Britinh frigates. It is upward of a mile in circuit. Long. $74^{\circ} 27^{\prime}$ E.; lut. $14^{\circ} 16^{\prime} \mathrm{N}$.

Fothering, a pecullar method of endeavoring to stop a leak in the bottom of a ship while she ls afloat, either at ses or at anchor, which is pertorined by fastening a eail at the four corners, letting it down under the ship's bottom, and then putting a quantity of chopped rope-yarn, oakum, wool, cotton, ete., between it and the ship's side. By repeating the latter part of this operation severnl times, the leak generally suck in a portion of the loose stuff, and thereby becomes partly and sometimes wholly stopped. Some persons prefer thrunming the sail, listead of letting down the bose stuff; but in this mode the sail is soon chated through by the hole if the ieak is conslderable, without affonling sufficient substance to atop it.
Foul, a sea phrase that is used in distinction from dear, and inplies entangled, embarrassed. IIence, foul anchor, when the cable is twisterl round the stoek and liukes; foul bottom, when a bay is covered with weeds, grass, shelis, filth, and rocks. Foul hawse means that the cables are turned round each other by the slip having swang the wrong way when moored. Foul rope, a rope enta gied and untit for immedinte use. Foul water, is water iroubled, and rendered turbid hy the ship's bottom rubbing on the ground. Fonl wind, is used to express that the wind 'is unfavorable, or contrary to the ship's course, as opposed to large or fair.
Foundery, or Foundry, the art of melting and casting metals. See Coriven; luon.
Foundery of Small Works, or Casting in Sand.-The and commonly used for casting small works is at first of a pretty soft, yellowiah, and clammy nature; but it heing necessary to at row charcoal dust in the mold, it at leugtin becomes of a quite biack color. The sand is worked over and over, on a board, with a roller and a kind of kaife; and is placed over a trough to receive it, after it has by these means been sufficiently prepared.
This being done, the workmen take $u$ wooden board of a length and breadth proportional to the things to
be cast, and putting a ledige round it, they fill lt with sand a little moistuned, to make it duly cohere. They then take either wood or metal models of what they intond to cast, and apply them to the mold, and press them into the sand so as to leave their impresaion there. Aleng the middle of the mold is laid half a small braes cyilnder, as the chlef canal for the metal to run through, when meltel, into the models or patterns; and from this chief canal are placed several others, which extend collaterally to each model or pattern placerl in the frame. After this frame is finliked, they take out the patterns, by first loosening them ali round, that the sand may not give way ; then they proceed to work the other half of the mold with the same patterns in juet such another frame, only that it has pins, which entering inte holes corresponding to it in the other, make the two cavitiea of the pattern fall exactly on each other. The frame, thus molded, is carried to the melser, whe, after extending the chief canal of the counterpart, and adding the croas canals to the several modela in both, and strewing mill-dust over them, dries them in a kind of oven repared for the purpose. Both parts of the mold heing dry, they are joined together by means of the pins; and to prevent then giving way, by reason of the melted metal passing through the chief cylindrical canal, they are screwed or wedged up as in a press. Whils the molds are thua preparing, the inetal is fusing in a crucible of a slze proportional to the quantity of metal intended to be cast. When the molds have cooled, the frames are unscrewed or unwedged, and the cast work ta taken out of the sand, which aand la worked over again for another casting.

Foundery of Stataes.-The casting oi atatues depends on the due preparation of the pit, the core, the wax, the outer mold, the inferior furnace to melt off the wax, and the upper to fuse the metul. The pit ia a hole dug in a dry place, somewhat deeper than ihe intended tigure, and made according to the prominence of centain parts of it. The inside of the pit is commonly lined with stone or brick; but when the figure is very large, they sometimes work on the ground, an' ralse a proper fance to rexist the impulsion of the meited metal. The inner mold, or core, is a rude mase, to which is given the intended attitude and contours. It is raised on an iron grating strong enough to sustain It, and is strengthened within by several bars of iron. It is generally made eititer of potters' clay mixed with cow-hair, or of plaster of Paris mixed with brick-dust. The use of the core is to support the wax and the ohell, and lessen the weight of the metal. The iron bars and the core are taken out of the brass figure through an aperture left in it for that purpose, which is soldered up afterward. It is necessary to leave some of the iron hars of the core, which contribute to the steadinees of the projecting part, within the brass figure. The wax is is representation of the intended statne. If it be a piece of sculpture, the wax should be all from the hand of the sculptor himself, who usually"forms it on the core; though it may be wrought separately In cavities, molded on a model, and afterward arranged on the ribs of iron over the grating, flling the vacant space in the middle with liquid plaster and brick-dust, by which means the linner core is proportioned as tie sculptor carrice on the wax. When the wax, which is of the intended thickness of the mutal, is finished, small waxen tubes, perpendicular to it from top to lottom, are filled, to serve loth as canale for the conveyance of the metal to all parts of the work, and as vent-hoies to give pasauge to the air, which would otherwise occasion great disorder when the hot metal came to encompass it.

The work lreing lirought thus far, must bo covered with its shell, which is a kind of crust laid over the wax, and which being of a soft matter, easily receives the impression of every part, whieh is afterward communicated to the metal upon its taking the place of

## FRA

the wax, between the ahell and the mold. The matter of this outer mold is varied according as different layers are applied. The first is generally a compositlon of clay and old white crucibles well ground and sifted, and mis.ed ap with water to the consistence of a color fit iur palnisingt and lt is applied with a brush, by means of whlch it is laid on seven or elght tlmes successively. For the second improssion horse-dung und aatural earth are added to the former composition ; but for the third impreseion oaly horsedung and earth are used. Lastly, th. thell tis finlehed by laying on several more Impresslons of thin last matter, made very thick, with the hand. The shell, thus finished, is secured by several Iron girthe bound round lt , at ahout half a foot dlatant from each other, and fastened at the bottom to the grating under the statue, and at top to a clrcle of Iron where they all terminate.

If the statue be so large that it would not lo easy to move the molde with eafety, 'hese muat be wrought on the spot where it la to be cast. This is performed in two ways. In the first place, s square hole is dug in the ground, much larger than the mold to be made therein, and its inside is lined with walls of freestone or brick. At the bottom la made a hole of the asme materials, with a kird of faruace, having its aperture outws:d; and in this a fire is made, to dry the mold, and afterwarl melt the wax. Over this furnace is placed the grating, and upon this the mold, formed as sbove. Lantly; at one of the edges of the aquart pit is made another large furnace, to melt the metal. In the other way, it is auflicient to work the mold above ground, but with the procaution of a furnace and grating underneath. When tinished, four walls are run around $i$, and by its adde a melting furgace la prepared. For the rent, the method la the aame ir both casen. The moll belng finished, and thelosed ns deseribed, whether below ground or above it, a moderate fire is lighted in the furnace und.r it, and the whole covered with planka, that the wax may melt gently down, and run out at piper, contrived for that purpone, at the foot of the mold, whiel are afterwand exactly closed with earth, as seon as the wax is all carried off. When this fa done, the whule ts filled up with brick, thrown in at raudom, and the fire in the furaace augwented, until both bricks and mold in come red-hot. The fire is then extinguinhed, and every thing being rold again, the brivks ars taken out, anil their place tilled up with earth, moistened, and beaten a little at the top of the mold, In orier to render it the flimer. These proparatory measuren being duly taken, there remaina nothing but to melt the netal, and run It into the mold. Thin in done by means of the furnace ahove describel, whieh is comnionly miade in the form of an oven, with three apertures, one to put in the wood, another for a vent, and a third to run the metal out at. From this last sperture, which is kept very close while the metal is in fusion, a small tube is laid, hy which the molten metal in con veged foto a large earthen hasin, over the mold, lutu the bottom of whirb all the large hranchea of the jats or cants, whleh are to cunvey the metal ints the different parts of the mold are insertel.

Fonndery of Rells.- The metal fer cantlag liells, it is to the olserved, is different from that employed for earting statuen; there boing notin In the atatue metal, whereas In the bell metal thare in a tifth or more.

Tho dimensions of the more and the wax for bella, expeclally a chime, are not left to chance, but most be meanured upon a meale. or diapason, which gives the holght, the aperture, and the thickneas necesmary for the several tones requirel. It in on the wax that tha neveral moldings and otbreornaments and lnecriptions, to be represented in relief on the ontalde of the bell, are tul he formed. The clapper or tongue ls not properly part of the bell, but in furnished from othar handa. In Europe it in uaually of lroe, with a large anol, at the extremity : and itsumpended in the middle of the bell. In China a wooden mallet in usel, whieh is
struck by the hand against the bell $;$ and hence the Chinese bells can have comparatlvely IIttle resonance. The Chinese have a method of increasing the sound of their bells, by leaving a hole uader the cannon; but this our bell-founders would reckon a defect.

The proportions of oar balle dlffer very much from those of the Chlnese. In ours, the modera proportions ere, to make the dianeter fifter a times the thickness of the brim, and the leight twelio tlmes. The purta of a bell are, first, the sounding bow, terminated by an inferior circle, which grows thinner and thinner; secondly, the brim, or that part of a bell whereon the clapper atribes, and which is thleker than the rest, thlrdly, the outward aloking of the middle of the bell, or the point under which it grown wider to the brim; fourthly, the walat or furnitnre, and the pitt that grows wider and thicker quite to the hrim; fifthly, the uppar vase, or that part which ls above the waist; aixthly, the pallet, which supports the staple of the clapper within; and, eoventhly, the bent and hollowed branches of meta' uniting with the cannons, to receive the lron keys, by which the bell is hung up to the beam, and which forms lte support and counterpoise when rung out.

Fountain-tree, or Pil-tree, a very extruoninary trce anill to have existed formerly in the wland of Ilierro, one of the Canarics, and to have distilled water from its lenves in such abundance as to satisfy the requirements of those who lived near lt. Whether auch a trec ever oxisted is questlonable; yet varicua writers lave mentioned the foumtain-tree of llierro in appazently gool faith. Glasee, in hls History of the Canary Islands, pullished at London in 1764 , slludes to it in the following terms:-" Many writers have made mention of thls fimeus tree, some In such manner as to make it appear miraculous; others, again, deny the existence of aoy auch tree, among whom la Fiather Feyjoo, a modern Spanlsh author, in hia Teatro Critico. But he, and those who agree with him in this natter, are as much mistaken as those who would make it appear to be miract lons. This is the only laland of all tho Canaries whleh I have not heen In; but I have ar.iled with natives of Ilierro, who, when questionell about the existence of this tree, answered in the aflimative."

Frankincense, or Olibanum tree (hosvelia serrala) is indigenous to the mountains of central lndia, where it la knowin under the name of sali, and as producing the olibanum of commerce, or the gom frankincense of the ancients. It is a lofty tree, with the follage crowdel at the extremity of the branches, and is frequent in the foresta between the thome and Nangpur, from which ciremonstance it may fa inferred that It would be adapted to the soll and clinate, in farorable locations, in some of our eouthern States.
litoanum ilistills from inelolona mado in, che lark of the tree durling the summer montha, oceurring in the form of aemi-transparont masfen, or tears, of a paloyellowlah or phak color, solisl, hard, and brittle. It has a bitteriah acrid taste, and, whon chewed, sticks to the teeth, nud renders tho aaliva milk! When heated, it lurns brilliantly, and diffuses an agreeable odor, in consequatnce of which, in the early uges, it was n.ush usel as incense in the macritices, and, in molers times, the tireek and ldoman Cutholle rharches still retain the une of frankincense, in mome of their ceremonien. It is seldom employed for other puposes, except as a perfume in the rooms of the aick, uithough other guma bearing that name are in unore general use, sud arn hy many regarded an ldenstical with it ; fur instunce, limarck dealgnates the gum of the Amyris gileadensis by this name; Forskal and sprongel, that of the Amyris kataf; while linmas erronequsty thus denominates the reain of the Juniperus lycia.-Pratent Office Repert, 185.5.

Leres level t many, or the greater on the whole, less mo and may with great pro with thila dlatinction,

Firanoe. This Important part of continental Eus rupe extends frum the $48 d$ to the 51st degree of north lat., and from long. $8^{\circ} 25^{\prime}$ east, to long. $4^{\circ} 48^{\prime}$ weat. The greatest length of France, exceeding 665 milee, is from east to weat-from Alases to Brittany, which projects into the Atlantic like a wedge, and without which France would approach in form to a square. Its hreaith from north to sonth is alx at 576 miles ; and its superficial extent, ss stated In the Statistique de la France, ia $52,768,618$ hestares, equal tc 204,855 square miles, or 130,787,16u English acres-nearly twice the total aren of the liritish Isles.

Though in pohnt of extent of criast and ready access from the interlor to the sea, France is far inferior to Great Britaln and lreland, she is, on the other hand, more fortunate in these reapects than the vast inland territorles of Austrin and Russia. She has the advantage over these conntries likewise in strength of natural barriers, the Pyreness forming a great bulwark in the south-wost, the Alps on tho south-east, and tho Jurn and tho Vosges Mountalns on the east. The Belgian is the only open part of tho frontier.

France enjoys, ujon the whole, greater natural adrantages than any other country in linrope. Ifer torritory is above a half larger than that of Grent Britain and Ireland, and both her suil a. d climate are betterthe climate being lesa equabie indeed, but thero being a greater amount of summer heat to bring the fruits of the earth to perfection. She has a greater propertion of arnble land than any of her noighbors ; the natural means of communication throughout her provinces are abundant and casy; she is well provided with all the usefui metals except tin; and is better supplied with coal than any other country of Europe, but Britain. Eren during the distractions of her great Rovolution, though her foreign trade was annihilated, her agriculture and manufactures were extonded and improved, her population was increased, and its condition ameliorated. The surface of France contains about $130,000,000$ of acres. It in estimateil that, of this quantity, the wasto land, including roule nod rivers, amounts to an eighth part; the arable land to near a hulf; the wood-land and pasture-land and mealows, each, to about a seventh; the vineyurds to a 2ath part; wild-lan!l, quarries, buildinga, oreharls gardens, olive, and other piantations, making up the remainder. - In uddition to the vegetahle productions that grow in Engiand, the cimate of France euables her to raise vines, olives, muiberries, and chestnuts. Wine and olivo oil are iro of her most valuable productions. The cotton trale has been for seme time rablly extending over the northern and eastern provinces; and lyons has been long famous as the centro of the silk trade of Earope, a brach of manufucture that has been brought to great perfoction in that eity. The manufuctures of woolen cioth, fin*, hemp, adid iron, ary also very extendive, and havs been earefulty fostered under the protective systen, which still provails here, na elsewhere on the Continent, notwithatanding the example wheh has lieen set by Great Britnin. Toward the and of the 17 tin centary, the territory of Frimee, then equal, or very neariy equal, to its present extent, nppears to have contained about $20,000,000$ of inhuhitants. In 1791, it was fomit to be nbove $26,000,000$, and in 18.31 nearly $\$ 6,000,0000$. Tho government alFays maintains a large standing army, amounting on the peace establishment to nbout $\mathbf{3 5 0} 0,0 \mathrm{~m}$ men, but net. ualiy in Decemher, 1851 , to 581,000 . Dier nomed fleet on servine is nhout equal in number of ahips to that of Britain, with 62,000 men.
Naffice.-The aurfice of France exhibits, lin gronfral, an advantngeous nuecession of ligh and fow groand. iness level than l'oland, the north of Germany, or the greater part of hiropenn hassin, it is, on the whole, less maustumous than Spuin or Italy, and may with great propriety le compared te Eugtand, with this distinction, that whilo in the latter, the
mountainona tracts are in the north ard west, in France they are in the south and east. I assing over lofty ridgee which form tho frontier line of France on the side of the Pyrenees, the Alps, the Jura, and the Vosges, and confining our attention to the interior, we fiad throughout Flandera, Picarly, Normandy, and the countries to the north and south of the Loire, a level tract, diversified occasionally by hills, olther insulated or in succession, but by none of the msssy elevations entitled to the name of mountalns. These we do not meet until resching the south of Champagne and north of Burgundy, near the sources of the Meuse, the Mosulle, the Saone, and the Seine. From this bleak quarter (lat. $47^{\circ}$ and $48^{\circ}$ ), in very long range of mountains proceeds from north to south in a direction parallel to the conraa, Arst of the Saône, and subsequently of the Rhône, untul, un approaching the Mediterranean, they branch off to the south-west and join the Pyrenees. Their greatest height is in Avvergne (about lat. $45^{\circ}$ ), whore this chain, or more properly a lateral branch of it attains, at the mountains callzd Cantal and Puy-de-Dóme, an elevation of fully 6355 feet, and has its highest ridge covered with snow daring the greater part of rhe year. Another, but a much lesa lofty range, extends from Bordeaux to the south-oast, a distance of 150 miles, until it reaches the Pyrenees. The smniler ehnins are numerous in the east and anoth-east of the kingdom-in Lorraine, the Nivernols, Dauphine, Provence; also in part of the interior, partlenlarly tho limousin and Guienne. They are interspersed with extensive plains, but, on the whole, the south and east of France are rigged and elovated tracta, and may lie anid io be to that counry what Wales and Scotiand are to Great liritain.

Rivers.-The course of the great rivers is easily connected with this view of the surface of the territory of Franco. The Moselle, the Meure, the Marne, the Anbe, the Seine, the Yonne, trking their rise on tho northern side of the mountain chuin, between lat. $7^{\circ}$ sad $48^{\circ}$, flow all to the north or north-west, until reaching the aea or quitting tho territnry of France. From the southern slope of tho same range proceed the Saônc, the Doubs, nad the Ain. These, along with many emaller strenms, ure all received by the Khone, which flows almost due south, with a full and rapid current, mintl it ranches the Mediterranean. The Loire har mueh the longeat courss of any river in France. It rises to the southwaril of lat. $45^{\circ}$, flows in a northeriy direction above $\mathbf{2 0 0}$ milea; turns, near Orlenns, to the west; is jolned by the Cher, Indre, and Vienne from the south, and, after receiving the Sartho from the north, falis into the Atlantic below Nantos. The Gnronge, $n$ river of less leugth of conrse, but of a grenter volume of wator, descends from the French side of the Pyrencen, flows northward, and after recoiving from these nounatains a number of tributary streans, of which the chief is the Arriege, turns to the west waril near Montnuban (lat. $44^{\circ}$ ), nad falla into the Athatic after being augmented by the waters of the Tarn, Aveyron, Lot, and firally the Doriogne-all Howing frons the western faco of tho mountains of Auverghe.

France has vary few lakes, either in the mountainous fistricts of the south, or in the grent levels of the north and west. it contnins, however $n$ umbler of maritime iniets, forming inland bays, and commanienting with the sea only by a channel of greater or less width. These ac inr partly in the south-west cosst, in Gascony; but norra : , the aouth and nonth-east, in Ianguedin and $\mathrm{l}_{2}$ rvence. Their wont of depth preventa them from ser.ing ns ronistends for shipiping, and they are usefut chietly for Ashing, or for the manafucture of hay-salt.

Forpata,--Frunce has mush less of artificial or ornamental plantation than lingland, and much mono of nitural foreat, the total extent of grounil covered by wood being eomputed at $17,000,000$ of acres, or one
elghth of the territorial surface of the kingdom. Forests are found in almost overy department. Lower Normandy contains several of considerable extent. There is a large one at Fontaineblean only 45 milee from Paris; and a linger one to the north of the Lolre; in the vicinity of Orleans. Those situated in the neighborhood of the sea, or of navigable rivers, or of great works, such as glass-hruses und fron-founderies, have long been sutijected to an improvident consumption, which is likely to be increased by the atill heavy though reduced duties imposed on forelgn coal, and by the undue encouragemente given to the smelting of iron by the heavy dutles which were, in 1814 and in 1822, laid on the importation of foreign iron; so that at present the principal forests are at a dintance iniand, particulsily in the east, in the cepartment of Ardennes, and in the long monntainons tract that forms the boundary of France on the side of Switzeriand.

Climate,-In a country of so great extent, and of such dive rified surface as France, it is difficult to condense a descriptlon of the cllmate under a faw comprehenslve l ds. The mont natural divialon is into the north, south, and central regims. The north, comprehending Flandera, Picardy, Nommandy, Brittany, and in general all thas part of France which would be bounded on the aouth by a dlagonal line from Int. $47^{\circ}$ on the west to lat. $49^{\circ}$ on the east frontior, beara a great resemblance, both in temperature and produce, to the south of England, raln occurring frequently, and the country being consequently fit for pasture. There, as with us, the predominent culture la wheat, barley, oata, rye, and auch frult as applen, pearn, cherries; ciso, hemp, flax, and rapeseed. It is here only in France, that the natural pastures are rich and extenaive; bere, also, the species of wood, oak, ash, cim, bear a close reseinblance to ours. The ceutral region may be sald to colaprehend the conntry to the south of the loire, or rather of the dlasonal line we have mentioned, until reaching a similar line in lat. $45^{\circ}$ on the weat and $47^{\circ}$ on the east frontier. Here, with the exception of tie mountainona parts, the winter is sensibly shorter and milder. Wheat, barley, onts, and rye, are still cultivated, but maize legins to appear, and vines become general. The weather in this great Iniend tract is inueli more stedy than in the north. In the summer months there is little rain, and atorms, when they occor, are frequer aly secompanied with hail; but, on the whole, the temperature is perhaps the mont pileasant in France, being exempt equally from the oppreasive heat of the south and the frequent humidity of the north. The third region, comprelending the whole breadth of the French territory from lat. $45^{\circ}$ and $46^{\prime}$ to lat. $43^{\circ}$, and in some parts to $42^{\circ} 30^{\prime}$, approaches in climate to the heat of Spain and Italy, rendering it necessary in the summer to sumpend ali active exertion during the middle of the day, and to reserve it for the moruing hnd evening. A shaded aituation is hero the deatideratum for a dweiling, and anplyly of water for agriculture. In this region the hout invarialily produces an pxalierant chop where an irrigation can be suppled; bence the frequency of wells, whieh are generally worked ly a wheel and some rode machinery. Wheat is partially cultivated; bariey, oats, and rye, only on the ligh grounds: maize is very general, and vines aupply not only the main articio of export, but the nsoni drink of the inhailants. The common fruite are ollves and mulberries, and, in a few very warm altuatlons, orangea and lemons. Pasturaje in geod oniy on mountalnous or irrigated tracts. 'To pulnonic invalida the climate may 1.advantagesars, but in this respect, also, muteris! diatinctlons cocur from locality, the winter in the anoth-east of France being at ibiervala very cold, from the rent de bise, a plercing wind that blown from the Alpm and the monntaliss of Auvergne. Ilere, notwithstanding the iatitude, the cold of winter is intense. Brittany, prujecting into the

Atlantic, is as rainy as Ireland or Cornwall. Normandy, with part of Picardy and French Flanders, may be compared to our intand countles. In the interior of France the ralng are lesn frequent, but far more heavy $;$ so that there is much less difference in the quantity of rain that falle in the courae of the year than in the number of rainy days. The stmosphere of France is much lese cloudy than that of Britain. The most freguent wind in the north of France, as in Grect l3ritain and Ireland, is the eouth-west; it prevails, also, but to a less degree, in the central part of the kingdom. In the south of France the more com. mon winds are from the north. The difference of temperatare between Londen and Paris is not considerable, nor is the degree of heat found to be lntense along the weat coast of France, until reacbing or rather fassing Poitou. In the interior it is much more perceptible, being strorgly folt at Lyons, Hordeanx, Toulouse, and still more in the latitude of Nimes, Aix, Marseilles, and Toulon. On the whole, the variations of cllmate between the north and routh of France are conalderably greater than between the north and south of Britain, where the effect of difference of latitude is ao much modified by the vicinity of the sea, end where no euch variation is known as the very material one indicated by the diagonal line from east to weat, the latter being two degrees colder in consequeace of the breezes and vapors of tho Atl ntic.

The harveat begina lis the north of France between the 20th and 25 th Jnly, in the central part shout the miduie of that month, in the pouth about the end of June. September and October are the montlis of vintage. The great hazard to the corn of the central part of the kingiloin arises from violent stomus of rain and hall ; in the nouth, from the want of ruin in the spring. In the winter, the cent de bise often proves destructive to the olives. The great heats are in July, Angust, and Septomber; a time of much a:noyance in the south of France, from masquitoes, gnats, tliea, and other insects; while even scorpions are found in that warm latitode.

Soil.-To exhilit a classification of the different kiads of soil is a task of diffeuity in any extensive country, and in aune more so than in France, where a striking difference prevails, not unly in coatiguous departments, tut in adjacent districts of the sume department. In Fiandera, l'icardy, Artois, Normandy, und the I'aya de Beance, a fertile tract to the fouth of l'arls, the soil connists frequently of a loumy meld; in the central and soothern parts of the kingdon it is often lighter; whito the grepter part of Brittany, and of the departments along the western coast, have a heathy soil, naturaliy anproductive, bat capalle of considerable improvement. Ilat these collertive estimatea are liablo to great deductions ; and the attempts made by Artiur Young, and other statistical writers, to caleulabe the proportion of the different descrijtions of soil, whether luam, henth, chalk, gravel, or the like, are consilered by the Irench as far from antecess. ful; even the more systematic effort mado by their own government, in the 'seginning of tinis centary, to compute the vaiue of land by mases de cultury, that is, ly classing all kinired soils under ono head, proved altugether alortive. We shall forbear, therefore, all wich vague calculations, and proceed to ntate the value of annmal produce in the ditierent departumens, endoavoring to cast the latter in loth, according to their ponition and relative productlveness.

Ihurbors, Rivers, Cinuls, Rosads, Bringes.-In this important paint Firance is eonsiderably inferior to Vingland, her long tract of const washed ly the Atlantic mui the liay of lliseay being indiflerently provided with sea-porte, and those on the sunthern whore of the Channel forming a ntriking contrant to the spacinus maritime indeta on the linglish side. To begin from the north-east, Hmikirk lus a small harlor, but improved in the interlor of the town, nppreacheti on

but sec equal there is ne eas the por and sec dockya L'Orien nary pa Nant shallow obllge:l dockya Brest Rom Inc... case is which t watea rondste ing pro cious century be of Grace, France,
thie Dutch plan by a canal leading from the ses. Boulogne has a roadstead-which, however, has been mach deepened and improved-indobted for its celebrity under Bonaparte to the facility of giving protec tion, by land batteries near its entrance, to a numerbua assemblage of small craft: The port of Dleppe is exposed, and of course unsultsble for winter ; that of St. Malo is better; whlle Cherbourg, on which immente soms have been expended, is now s port and arsenal of grest utility and impertance to the imperial navy. On doubling the projecting part of Britteny, we find, in the south-west of that province, L'Orient. Brittany also possesses Brest, the great maritime port of the Atlantio for the navy. Proceeding further to the euth, we find Rochefort, st La Rochelle, a amall but secure hsrbor, and at Bordeanx a river nearly equal in width to the Thames at London. From this there is no sea-port untll we reach Reyonne, a place of no easy access. On the Mediterranean, 1 rance has the ports of Celte and Marsellles, the latter spacious and secure, and the great maritlme port, arsenal, and dockysid of Tonlon, which, with Cherbourg, Brest, L'Orient, Rochefort, and Toulon, are called, in ordluary parlance, ports militaires.
Nantes, though a large commerclal town, adjoins a shallow part of the Loire, and vessels of burdan are obligen to load and unload at Palmbeuf. The grer. $i$ dockyards and naval statlons of the kingdom are $a^{\prime}$ Brest and Toulon, both excellent harbors, and at Fow finct, which is altuated on the River Charente, ncw... wuth. In all these the accommodation for shippiag is the glft of nature; but at Cherbonrg the case is very different, that port contalning works, of which the labor and expense (see the article Bneakwatea, Encyclo. Brit.) have been very great. Its roadstead, extensive but open, has a sea-wall, affording protection from the swe!l of the sea; and its spacious dock, excavated slnce the theginning of this century, at an expense of $\mathbf{£ 8 , 0 0 0 , 0 0 0}$ storling, is capahe of containing fifty anil of the line. Le llavre de Trace, the best mercantile harbor in the north of France, has also been furmed nt a large expense,
Inland Navigation,-The square form of France, farorable as it is for military defense, subjects the greater part of the country to the want of those ready and aconomicul means of transport by sea which form the great physleal advantuge of Great Britain and Irolnd. Unluckily, this want is very imperfectly supplied by the inland waters, cansle being very littlo extended, and the navigation of the great rivera subJect to many obstructions; occurring in one part from rapidity, in another from shallowness; at ono season from drought, at another from overfiow. The appllcation of steam to navigation has corrected in part this most inconvenient tariliness; but the accommodathon which is nfforded liy the Loire in the interior, the Rhone in the aouth, the Seine in the north, and the Garonne, witi its Canal du Canguedoe in the gouthwest, is lut a small portion of what is furniahed by our numerous Interacetions in Eingland, or of what is wanted for so extensive a territory as that of France. The Canal of Innginedoe, or the Conal dir Midi, an It is now generally called, begun in the relgn of looula XIV. and completed in the year 1668 , was the tirst example in liurope of Inlund navigation on a great scalc. It is tho uost atupenilons undertaking of the sort that has been expented in lirance. Its gremeral brealth is sixty feet, It a depth mix amil a half feet. It ham 11.1 locks mad sluices, and in its highest part it in tho fret above the level of the sea. As a nclentitic work, it did honor to an ago is yet ilitlo alvanced in engheering; lout in in peemilary polnt of vow it was unproductive, the tolls never having puld the interest of the very large sum (upwarl of $\mathbf{£ 1 , 2 0 0 , 0 0 0}$ aterling) expended upon it.* The eanal leglan at Toulouse on
the Garonne, remounts the valiey of the Lhers, travorses the chain of the Monts Corbieres, which joine the Cevennes to the Pyrenees, descends the valley of the Ande at Carcasonne, which It leaves at Ginestas to pass by Bézlers, where It traverses the Rive d'Orb. Passing throngh Hérault above and near Agdet, it ends at l'Etang de Thau, at the place called le Port des Onglons. The navigation is however continued to the port of Cette by the canal of Cette, and thus the Atiantic and Mediterranean are united.

The casal of Briare is of earlier date, and of much less extent. The object here was to open a navigation from the Loire on the south to the Seine on the north, by a canal running almost due north, a distance of forty miles. It then receivee from the west the canal of Orléans, commenced in 1675 , and proceeding also from the Lolre; after which the canal is continued to the north, under the name of Canal de l'Oing, till It reachea the Selne. This canal was begun in 1605, in the reign of Henri IV., and was completed in 1642, hider Louis XIII. There are, besides this great work, ee veral other important and extensive canals in Frence. The Canal du Centre unites the Saóne and the Loire in the upper part of the course of the latter. It is 72 English miles in length, and was completed in 1791, at an expense of $\mathbf{£ 4 5 6 , 0 0 0}$. Ita qummit level is about 240 feet above the level of the Loire at
igoin. It has 81 locks, $5 \frac{1}{8}$ feet of water, 48 of eadth at the water's edge, and 30 feet at the bottom. The Canal of St. Quentin, 28 English milea in length, was completed in 1810, but the navigation was far from perfect. In 1826 the necossary expenses to render the canal perfert were estimated at $4,000,000$ francs. A concession of the canal was made to a Sieur Honorez in 1827, for a period of twenty, years. On the 11th of July, 18.77, the state entared into full and entire possession of tho line which it had conceded. It joine tho Scheldt and the Somme. The Canal of Besançon is extensive. It joins the Saône, and consequently the Rhône, to the Khine. From the Saône it stretches a little above St. Jean de Losne, by Dôle, llesunçon, and Niulhumen, to Strashourg, a distance of 200 miles, where it joins the Rhine. The canal of Burgundy joins the Khone to the Seine. This canal was opened nlong its whole line In Docember, 1832, by wny of trial, and in the past year, 1804, it was completely openel. The cnnal of the Oureq wis dug, not for a commercial purpose, but to convey the water of that little river to l'aris for the consumption of the inlasitants. At a village called La Villette, on the north side of Paris, there whs some years ago excavated, it the cost of a million ste:ling, a basin, npproaching in size to our London docks, and adapted, when the necossury canuls shall he completed, for the deposit of merchandise brought from llavre and Rouen on the one side, and Flandera and Champagne on the other. In the acuth of France there is a short canal proceeding from the lhône, near Tarascon, in a aouth-went diroction, to the Mediterrunean, called, from Its vicinity to a well-known annual falr, Conal du Beaucaire. This canal traverses a great extent of marsh, which it has had the effect of Iraining. This water-way was opene. to supply the imperfect navigntion of the lesser Khone, and of the two canals by which the communlcatlon from the Garonne to the khone was formerly carried on. These are anning the chief canals of France. In the year 1836 there were seyenty-fuur camals, having a total length of $1,699,913$ metres. noarly equal to 2280 English milos. But nince then large sums have heen allocated by the state for amblization. In the lifteen years between the 12 th inaly, 1837, and the 28th Mareli, 1852, M. lirneat Grangers, chiel-de-inurenu at the minlatry of commerce and puib-
necording to M. Erncst Grangez (see Precis Historique et Statis.pue des roina navigables, p. 404), aceording to the present value of mooey, a sum of $30,000,000$ france.
lio works, tells us that, for this purpose, extreordinary oredits have been taken for $241,936,361$ france. - Of this sum 227,695,600 francs had been expended on 81st December, 1858. In 1854, a credit of $8,000,000$ france had heen granted.

The canailation of the Mayenne from Laval to Mayenue, of the Vire from the Pont de Gomrfaleur to Vire, of Rhoims to the Marne, of Bouc to Martigues, from Caen to the sea, from the Charente to Marennes, from La Rochelle to Marana, and from Saint Thébault to the lateral canial of the Loire, is in conree of execntion. But it is probable that this improved mode of communication may be superseded by the stlll greater improvement of the railroad, which had to a conaiderable degree engronsed the pablice attention in France. There are, however, obstacles to the progress of these improvements, ariaing partly from the mode of management adopted, and partly also from the high price of the materials required. All great worka for the bencfit of the community at large, such as canals, railroads, docks, and the like, are carried on at the expense, for the benefit, and ander the control of the government. Plans and eatimaten must be made out and laid hefore the minister of the interior, who refars them to other public functionaries, namely, the prefoct of the department, and afterward to the bureau des ponts et des chanssies; and when all those persons are satisfied, a public officer is then appointed to superintend the work. The tedious official routine, through which ali public undertakings have to pass, tenda to discourage individual enterprise, and accounta perhaps for the comparativeiy few worta of this description which have been undertaken in France. The high price of iron, in consequence of the tax on foreign iron, has iikewise operated as a great discouragement to the construction of railroads in France; and thne we have an adilitional illuatration of the ruinous effectn of this tax in obstructing the domestic improvements of the country.

Roals.-The great roads in France ary managed, not, as with us, by county commisaioners, but by goveroment byreacer, or boards, the chief of which are at Paris. These lwards are all under the direction of the minister of public works. The extent of moad under their direction is alsout 30,000 miliea; and the annual expenditure from $£ 1,800,000$ to $£ 1,500,000$, the whole of which is defrayed without one toli or turnpike. An attempt was made under fenaparte to levy toils ; but this excited so manch clamor in a country where conmercial intercourse is carried on almost whoily by land-carriage, that it was found indispensahie to seek the neceasary funds from another source-a tax on malt. The great roads in France are in general in tolerable condifion; but no epithet ean convey an idiea of the wretched atate of the crosa roads in almost every lepartine - full of hollows, encumbered with stones, or innn.". y ? ${ }^{\text {ot }}$ "h water, they receive harily any repair, $\boldsymbol{b}$ of the $1 i^{*} \quad$ Notwithatanding the little done by govertimi. $\quad$ es taver foconotion. the traflie on ronds increaked . afoid in the thirty years between 1811 anll 184t.

The grea: roads In France are lutuch wider than in England, e: hibiting frequentiy a long straight avenue ifned on each side wlith cheatnut or other large trees. Roads In France are ciassed uncler three categoriesimperial roads 14 metres In hreadth, departmental roads about il metren broal, and the chemins cicinaur. They are often paved like a street for many miles in succession: the art of road-making being oa yet toss littie understood to prevent material injury from the heavy wagons and ili-constructed wheeln, without resorting to thin unpieasant aiternative. Troveling is thus much leas agreeabie than in England, particularly as the villages want neatness and checrfuiness, while moat of the towns along the road are diatigured by natrow crooked streete, in which now otone building
are often mixed with antiquated mooden structures, anch as have disappeared from our provincial towns for nearly a centary past. The mails are now conveyed as with un by the railroad, bnt where there is no rail, in and of chariot called a mallo-poote. The diligences, though somewhat improved in structure, are still clumsy and lnmbering.

Railroads.- During the twonly rears between 1828 and the 24th February, 1848, the railmad conceded to privete eompanies in France amounted to 2267 miles. The revelution of February put a audden stop to all enterprises of this kind. There was not a single concession made in 1848, 1849, or 1850. Indeed, some companies, nnable to carry on the work conflded to them, wert either seqnestrated or taken possession of by the state. The concession of the line from Paris to Rheims was made on the 16th July, 1851, of the line round Puris on the 11th December, 1851, of the line from Paris to Lyons, 5th January, 1852, of the line from Lyons to Avignon, Bd January, 1852. These and other concessions in 1852 added 2050 milen to the extent of rail. In 1853 the progress continued, and concensions to the extent of 1326 miles were granted. The year 1854 has been consecrated to the execution of the werke, and more than 872 miles have been opened between the Ist January and the 31st December, 1854. At ths breaking out of the February revolution, the concessions for railways amounted to 2237 miles; in 1804 they smounted to more than 6214 miies. At the end of 1855,8728 milea additional wers opened to the publlc. The length of lines conceded and execnted have thus increased threefeld in the space of a few yeara, About $\boldsymbol{£ 8 0 , 0 0 0 , 0 0 0 ~ h a v e ~ h e e n ~}$ expeuted on these enterprises. The crodit required in the budget of 1856 for rallways is equal to that of 1855-numely, $65,435,909$ francs. At present (18:5) the brancit rail from Strashourg to Kheims, from lhec d'Allier to Ciermont, with a lranch to Nevers, from St. Gernain dea Fossés to Roanne, frum Mons to Laval, from Mareeilen to Toulon, from Caen to Cherbourg, from Bordeaux to llayonne, and from Narbonne to Perfigman, are in couree of construction. Some of these lines are to be opened thia year, some in 1857, and some in 1808.

Bridges.-The French hare few cast-iron bridges, all their great structures of this deacription being of atone. Of these, the ehief are the bridges over the ioire at Oribans, Toure, and Nantea; those on a amailer seale over the Seine at Purls ; find those over the Saina and thone at Lyons. The i'ont du st Esprit above Orange, over the Rhine, is a long structure of $\mathbf{1 6}$ arches. At no great distance from it is the l'ont du (iard, one of the ruost entire, stupendous, and beautiful nonuments of Roman architecture, composell of a tripie tier of arches, erected for the purpose of conducting an aqueduct over the river Gardon. This masmiticent atructure is $\mathbf{1 5 7}$ feet In height, 530 fect in length st the hottom, and 872 at the top. Of the fately-erected bridgen in France, the most remarkable are those over the Selne at Neulily near laris, and over the Oise at St. Maixent, with two of larger dimensions, vis., one over the Garonne at itorienix, the other over the Selua nt Rouen. Ilridges, as wrill an romis, and all other means of intercummunication are under the direction of the mininter of puibie works; a apecial school for the formathon of engiteres of bridges and roads is established at l'arla. The torritory of Frazee la divided into 16 faspectorshipa of ponts et chousties. The telegraphic commanications are principaily made by means of the electric telegraph, of which the government reserves do itsuif a monopoly, but private persons are allowed to avail thynseives of it.

Agriculture.-The agriculture of France is in a very different state from that of England or Scotland, being marked by a degree of backwardness not a little surprising in a ceuntry on far advanced in many departments of art $y^{*} 1$ scier $\cdot$ a. The causes of this, however, are not of difficult explanation. France enjoyed for acarcely more than 38 years, i. e., from 1814 to 1848 , the advantage of a representative body; and the condition of the pessantry was long far joferior to that of the same class in England. No ecelesisatical reformation had taken place to remove a valusils part of the national territory out of the hands of indolent life occupants ; and the grands seigneurs, the other great lody of landholders, devoted their stten. tion to Paris and Versailles, without bestowing a thonght on their lands or their tenantry, except to extruct from them the means of defraying their expenses in the capital. To this was added a system of taxation, less heavy, indeed, than that to which we nre saljected in linglend, inut extremely crude and impolitic, as evinced in the gabelle, or tax on salt used in private families, and in the corvee, or obligation on the peasantry to labor on the high roads. To these were joined the humiliating ensctments of the game laws, and the more auiostantial injury of tithes; for the elerical body in France levied this pernicious assessment as in England, though possessing in property, lands of the computed rent of five millions starling.
Another great drawback on French agriculture was the insigniticant size of the oceupancies, whether held as farms or as property. A French agriculturist on a small scale has little idea of solliag his paternal acres, and converting the smount into a capital for a farm. lie is much more likely to go on as the proprietor of elght or ten acres of land, and thic cultivator of as many more. The mote of paying rent was equally singalar; money rents were general only in the north or most fertile parts of France; they did not, on the whole, exist in more than a fifth or sixth of the kingdom before the Revolution. A more freguent specios of tenure was by a grant made under the reservation of a fine, of a quitrent, or of ceriain servitodes, of which the lenst burdensome were sending corn to the mill, or grapes to the press, of the proprictor. Hut of all indications of poverty and buekwardnesa, the most striking was the system of métaire (rent in kir l) ; a practice by which a tenant, having littlo capital of his own, receives from the proprietor the live stock and implements neecssary for eultivating his petty tenure, and divides with him its produce. This wretehed methol was and still is common, not indeed in the north and north-east of lrance, but in nuny of the poorer districts of the centre and south. There are, it is to be remarked, ae: ?ral distinctions in this system; the landholder, in some parts, providing ouly half the cattle and need, and in others the whole. There is, of conrse, a corresponding differenee in the apportionment of the produce.
Effects of the Revolution.-Ia Rimolution a éte faite pour le cultirateur is a common anying in Frunce. Indeed, that great convuinion improved ao muilh the aituaticn of the agrieulturists, ly canceling, nt one decisivo blow, the tithes, the game-luws, tho corrie, and other relies of feudal servitule, that, ufter all the horrors of Jacotinism, and ail the tyranny of Ifonaparto, a strong attachment to the Revolution $\begin{gathered}\text { arvive among }\end{gathered}$ this pucitie chasa. Further, the sule of tho ehurch landy transferred a valuatile mass of property from indolent into active hamis. llut with this must terminate the eulogy en the levolution, the further progress tmule by agrieulture, having been caused less by any political change, than by the gradual effect of experience, and the diffusion of information. The degree of agricultural improvement in France since the first Revolution has certainly been less than in Eingland and Scotland, and in one very materinl point that memorable convulsion hus tended to retard it;
we mean by the law suggested by a jealousy of tho sscendeacy of the noblesse, which obliges the owner of property, whether in land or money, to maka an almost equal division of it among his children. The parent of two children has the fres disposal of only one third of his property, and the parent of three children of only one fourth, the residue being shared equally among all. Tho claim of primogeniture is thus in a manner annulled; and a law which is apparently wise and equitable, proves the source of great injury to agriculture, by multiplying the petty plots of land throughout a country where they were previously far too numerons.

The following table, taken from official documents published ly M. Duchâtel, oxhibits in hectares the physical ard agricultural division of the French territory, which has not materially changed within tha last 20 years.

The surprising proportion of land in France under tillage is owing to the smalloess of the occupancies, the cheapness of labor, and the general use of bread instead of animal food hy the humbler orders. The last is connected with another remarkable circumstance; the very slender proportion of land under pusture, of which the main cause is the dry climate of the southern and central part of the kingdom. In the proportion of poor and unproductive land France and England are nearly on a par, but the French Incur a very heary disalvantage by using wood instead of coal for fuol, and covering with forests many tracts which might to made available for either pasture or tillage. All France in 1840 gave 13.14 hectolitres per heetare. The total vilue of cereals in 1813 was $1,780,478,000 \mathrm{fr}$., or 9387 fr . per hectare, or 59 fr . per head. In 1840 (which was the lust account) it was culculated at $2,565,238,000$, at $18,000 \mathrm{fr}$. per hectare, or 77 per head, In 1840 there were $5,586,787$ hectares in whent. In lingland $2,130,900$ heetares. Tho wheat pronluct in 1840 was $6 \cdot 0$ ? for 1 . In England it is 9 for 1. 'The total value in the United Kinglom, 978,500 ,00 fr . at 25 fr ; in lirasee, $1,400,000,000 \mathrm{fr}$. at 20 fr . the hectolitre. The arable land of Finince in 1840 was $22,240,090$ hectares. The value of the cereals, fallows, and artifleial meadows in France reaches 2,351,$518,9 \mathrm{i}$; fr ., and thelr mean value 106 fr . per hectare. 'The : ines in 18.80 covered $1,972,340$ hectares. The total return of French cultivation in ugriculture reaches:

 Exolisu Acpk, and calculated faon opficial scevete.

We proceed to add a fow remarks on French agricoltare, with reference to articles less known or lesd generally ralsed in Fingland. Buckwhent is cultivated extensively in Brittany, Normandy, and the north of srance, partiy as green food for cattie, partly for the diet of the peasantry; it is generally bown in June and reaped in the end of September. Wheat and meslia are prineipaly, cultivated in the north, but the prodice of the routh, though less abundaut, is gecerally preferred. Barley and outs are also more common in the north. Rye is raised pretty equally in all parte of France. llape-seed is very general In Frach Flanilers and Normandy; it anpplies oil for the market and food for cattle, either when green or in cakea. Colzs (coleseed) is raised for the same purposes. Tobacco would be generally caltivated in France, were it not monopolized for the benefit of the State; hence Its cultivation is eonfined to certain licensed listrictia, which are chiefly hin Alsace and Picardy. The iuality of the article produced under the royal monupoly is greatly inferior to that prodaced by private cultivators abroad, while the price being 400 per cent. ligher, the latter is smuggled Into rrance in great quantities, not withstanding all attenopts to prevent it. Jiax is ralsed very generally, not inerely' in French Flanders, Alsace, and Normandy, but in the provinces of the west and sonth, where the family of almont every peasant rears a little atock aanually to lee mpun by his wife nud daughters. Hops are almost exclusively grown ia these parte of Eirance 'mordering on Belginu. Ilemp also is raised la many parts of Firance, particularly In the north. Malze is a plant of great importaace, whether for the food of man or of cattle; when intended to atand for harvent, it is planted in rows with very little seed, and yielda nore than twice the quantity of wheat that would be produced on the name apace. Inaring It growth the loavea are atripued reg-
nlarly for the food of cattle; and in some districta it is sown thick and mown merely for that purpose. Maize and miliet are chiefly grown in the south and south-east. Such valuable subetituten have, as yet, prevented turnipa from being generally Introduced into France. Even potatoes were long very little knowa, and it is only during the last half century that the dialike to this tuber han disappeared. Potatoes are more cultivated In the east than in any other district. Cheatnuts are most common In the central part of Frunce, where they nupply no inconsiderable portion of the food of the peasantry, In the south the fruits are chiefly oliver, almonds, mulberries, figs, and prunee; oranges are partlally cultivated in the south-eastern extremity of the kingdom, on the verge of Italy, but with great uncertainty, for a severe winter la futal to these trees, and $\ln$ some measure also to the alives.

Irrigation is little uaderstood in the north of France, but in the south the want of frequent rain renders it a primary object of attention; it in fact doturmines the ratio of productivenese, eince the warmith of the sun seldom fuils to ripen whatever has received ar adequate supply of moisture. According to M. Ilecquerel, there has been a progressive annual increaso in the number of hectolitres produced since 1813. There bas been a very decided progress in agricultural im. provement in every part of France, but notably In the west and south-west. The Increase in productiveness in all munner of grains is estimated at $2,141,217$ hectulitres.

The culture of the vine extends more or less over fully the half of France, begianing as far north as Chainpagne, and spreading over the country to the sonth and the west. This culture is, however, very limited in Champagnc, and even in Ilurgundy; in Provence, and the lower part of Languedoc, the climate is warmer, and the culturo general, though not managed with such akill as along the banke of the Garomie, where the spirit of improvement is excited by a demand for foreign markets. Aa vines auceeed in light and unproductive suils, their culture gives: value to nuluch ground which would otherwise be uneless; und the petty subdivimions of land are here less injurioun than in tho caso of com. From the great variety of soil and climate, the quality of french wines is very various. The amount produced has been considerably Increased since 1790, ss well from the diviaton of many large estutes, as from the quantity of waxte land which has been lirought into culture. It In, however, remarked by M. Moreall de James (Statistique de l'.lgriculture de France, 1848) that the consumption of wine in France has remuined stationary aince 1791, and that the quantity consumed by each Individual is not more than it was half a century ago. Considering the increase of wealth and population, M. Jounes calculates that tho consumption should have increased 50 per cent. It is computed that nearly $5,000,000$ acres of land are planted with vines, and that the value of the unnual produce is from $£ 28,1000$, 000 to $£ 30,0 \%, 1000$, of which alout a tenth or twelfth part only is exjorted. It in very didicult to say to what extent the vine diacase and the excision of vine loranches in consequence thereof, has affected the peoduction of wine either in quantity or quality. It has unquestionably had the effert of rasing the price of the liner wines from 25 to dis per cent., and of raising the price of Lrandy, durling the last two years, nearly 800 per cent.

Quantity of Wine fromiogh is Fance bebing tife pollowino arvex Yeaba, is Inpeaial balfong.

Average annual produce befure the oidiun appeared, $424,000,000$ galluns, wurth $£ 22,516,220$ ster. ling.

It is a curious fuct that the effect of the oidium or vine disease has for the last few yeara caused an importation of foreign wine into France for home consumption. The following is an account of the imports of foreign wine and elirits into France for the years 1852-4:

It will be observed, that the import immensely increased during the last year, owing to the large quanfities used for the supply of the French army in the Crimea.
of the spirits in the above table, 802,010 gallons were rum Imported from Enyland.
A quantity equal to alout a sixth of the wine is made Into brandy, for brandy is dlatilled wherever viaes are grown ; and of It also the best in quality is ia the vicinity of the Garonne. This important and stuple branch of French industry has been very sodiously injured by the prohibitory system of customhouse laws, which were extended and inerensed in rigor during the relgns of Lonis XVIII. and Charles X., and were not much mitigated during the 18 years' relgn of Louis Philippe. Many of the leading statesmen of liranee still evince a most mistuken partiality to the prohiblive aystem. Franem, by excluding the pmoduce of other nations, virtually deprives, sr greatly linits, by the same laws, the reception of her own produce into foreign countries. It is clear that they must pay for the wines of Franee with their own produce, which, if France refuse to recoive, they have no other equivulent to give her in return; they must procure an equivalent from forelgn countries, and the effeet of thie is to restrict the tralle, ly ralsing the price of French wines. Accorlingly, it appears that white Franco exported to England from 16,100 to $90,-$ 000 tuns of wine when the propulation was only 5,000 ,000 , this supply lad fallen off, partly owing to the heary duties imposed in Great Itritain, and partly to the prohilitory duties imposed in France on British produce, $t$ o 1,800 tuns, while the population of the country had in the mean time greatly increased; a melancholy illustration of the effects of that illinerul policy which pretends to improve connne:ce by prohititing the free intercourse of vommercial countries.
France is the largest pronlucer of beet sugar in the world. The origin of the manufacture must be traced fonm the year 1sta, but to years elapsed before the manufacturer of this article was enabled to cope successfully with colonial sugars. From France the culture spreal through the difierent comentries of Linrope, even into the interior of Russia; und it is catculatel that there is now produced of this kind of sugar on the Coutinnt of laurope not less than $3: 30,000,010$ prounds, nearly one half of which is manufactured in France. In the vicinity of Loile, the average yield of the sugar is 16 tons per acre, and at Valenclennen, 19 luns; in souse localities 25 tons are produced. The
annual mannfacture of sugar is abont 40,000 toas, and the non-crystallized matter extracted from the leas and dregs, furnishes enormous quantities of sweetening matter to heweriea, and also to the wine-doctors and wine-falsifiers of Cette and the Gironde. Nor is this the only use to which beet is turned, as a larga quantity of apirit is distilled from it.
The minuteness of the Cadastral enrvey has led to official calculations in France of products which havo not yet engeged the attention of other governments. Madder ls cultivated on a dmall scale, partly in the north, partly in the south of France; Its chlef use is in dyeing woolens and cottons. Woad is uaed for yellow and green colors; saffron, cultivated formerly to a great extent, is now confined to one district (tho Gatineis) tit the south of France; hope are raleed only In Picaray and French Flanders.

Subjolued are the values of the following articles produced annually in France:

Of the pasturage ground of France, occupying one eighth of its territory, the chief part is in Normandy, Brittany, and other humid quarters of the north and west. In the south, the natuzal pasture is confined to particular districts, chiefly mountainous; in the low grounds, the grass, whether natural or sown, is brought forward only by moans of irrigation. Clever and sainfoin are cultivated in France, but chiefly in the uorth and north-east ; lucerne is much more general, being raisell not nerely in the north, but in the centrai and southern provinces, wherever irrigation is practicablo and the seil nad climate are favorable. The art of improving eattle ly breeding is little understood in France, nor is thers much judgment shown in gradually fattening them by a removal to richer pasturea. Still the beef and mutton of the north and west are very good, more especially what is called the pres sallo mutton, i. e., sheep fed on the salt marshes. Their prico varies from province to province, but very seldom from year to your ; the general rate was 30 per cent. less than in Englund, but within the last four or five years the price of meat has risen much in France, and closely approximates to the price in England. llutter is made and used throughout the chief part of Frunce, as in England, but cheese comparatively little. In the south, however, even butter is little known, and its place in cooking is supplied ly ollve-oil, whith is largely used throughout southern Europe. One of the latest novelties in French pasturage is the introduction, in 1819, of a large flock of Cashuere goats, which were sent to browee in the eastern Pyrences, and are sald to experience but little fuconvenience from the change of climute.
hlurses,--ln the number of horses, as well as in their sizo and beanty, l'rance is greatly inferior to this country. In the performance of labor, however, the liferierity is much less cunspicneus; lurge, oldfashioned carriages, drawn ly four or six horses, aro seen proceeding ulong a paved road much moro easily than we should nnticipute from the welight of tho vehicle, the knotted hurness, and the diminutivo sizo of the animals. The same olsaervation is applicable to the plows, the carta, and the wagons of France, which are nwkwardly built, but all dragged on with expedition, the strength of the horses sarpassing the promise of their appeurance. A French dillgence, in the proviaces in whilch such carriages still run, performs only five mlles an hour; but this is owing less to inferiority in the horses than to the state of thu

## FRA

roads, and to the general want of dlispatch at posthounea. Of the aggregate of horses in France, inore than half belong to the northern provinces-Normandy, Brittany, Picardy, Alsace, and the Isle of France. In the central and southern departmenta a great proportlon of the work is done by oxen, which are noore sultable to petty farms and mountainous districts.
Sheep.-Sheep are reared in almost every province of France, the gentle elevations of the north snd the mountains of the south belng elike favorable to them. The mutton lis good; but in the art of improving the fleece, the French have as yet much to learn. Nerinoes were firat brought from $S$ pain $\ln 1787$, and formed into a royal flock nt Rambonillet. The consumptlon of meat In the country then was amall, and consequently the first desire was to improve the wool. The quality, originally good, thas been progressively Improved, and distrihutions of Merinoes have been successively mede to proprietors of sheep pastures in all parts ( ${ }^{\text {t }}$ the kingdom The consequence has lieen, that in wout dietricts the weight of the ficece has been ne arly doubled. The sheep-farming of lirance appears just now to be in a transition etate; its post bistory offere many points of instructive deluction, while from its fature wo may expect very be, sfficial resulta. These limported aheer were used for crossing a 'th the natlve hreeds, to which but little attention : ' limen poild either as regarded the carcass or the flieee. As tinse advanced, these crossed lireels increased with varied success; in some distiliets the wool produce was permanently improvel by continuing to Introbluce pure blood; in others it was found more advantageous to develop the physical organization of the animal. The result han been tinat, notwithstanding the laudable endeavors of the fleck-mastera to obtaln a breed associating both weight and quality of wool with the production of ment, that end has not been antisfactorily obtained; the flocks still remain in an intermediate condition, neither prolucing the fine quality of wool of the Saxon, nor the weighty fleece or carcass of the Enfiltsh sheep. To encourage the rearing of shesp, a duty of 20 per cent. was in 1822 laid on foreign wool.
Mules.-Nules are alinnat as little known in the north of France as in England; but in the central and southern parta they cre very generally reared. I'oultry, in France, are both larger in size and more abundant than in England, more especially in Normandy and the department of La Sartice.

Even in the noith and north-east of Franee, the farms are of emall extent. Theect.py 200 ucres, of to pay a rent of c:00 a year, places one in the foremost rank of farmers. Laarger poseeseitus, are common in puature districts, that departinent of ngriculture admitting, in France, as in Englamd, of a greater concentration of eapital and extenvion of busibess than in the case of tillage. Hat surh disuricts are rare; nnt In liy far tha greater part of Franco the farms uniter tillage sre of fifty, forty, thisty, and often ns small as twenty, or even $t \in n$ acren, there bring;, it is computed, no fewer than three millions of such orcupancies in the kinglom. In the sonth of France the syste:n of metnirir (paying rent in kimil) is still prevalent, and nearly on the same footing as in Lombiarly and Tuscany. That nuch insignificant occupancies are adver: oto all enjrgod idean of furming, is sumeiently obvions; and to their many disadvanitagen there ean only he opposed this eingle heneint, that no ropet of tolerablo suil is neglected, even the npace given ify us to hedges being reserved for culture.

The beneficlal effect of long leases is as littie underatood in France as it still unfortunately le in a great part of Eingland. The common method is to let lmul for perlods of threo, slx, or nine years. The peasantry, though illterate, are not slow or phlegmatic. They: exhibit, ns Frenchmen in general do, no small ahare of intelligenco, of aprightliness, and of activity in the individual, with very little cancert or combination in the mass. They are content to hand down the family occupancy from father to son, without any ldea of altering their mode of life. The d wellings of the farmers, and still more of the cottagers, are like those of our forefathors half a century ago ; the outside having frequently a pool of water in its viciaity, while the inside is miserably bare of furniture. In the comparative trials that were made at the French Exhibition of 1855, the 'superior chnracter of the English agricultural implements over those of France was made very evident-in none, perhaps, more, than in the plowing trials, when the dynnmeter showed that while it reruired only a force equal to $17 \cdot 01$ to turn over a ecrtain quantity of earth in a r" rtain time with the best English plow, it required a forca of more than 27 to d the same with the best French ono. The diet of the French peasantry is exceedingly similc. Bread and clider, with soup, pens, cabbace, or other vegetaWhes, form its chief ingredients in the northern provinces; while in the central and southern ones tho sume nliments arn in nae. with the sulstitution of thin wino (rin du pays) for cider, and of chestnuts for the pears and npples of the north. Hutcher-meat is reserved for the talles of the middie aall wipper classes.

The landhulders in iranco, dive little or no attention to benut'rying the comutry; its aspe ef ix consequently monotoneus, w':hout plantations, seats, or cheerful cottages. The peasantry live in villages, frequeatly ill built and inconveniently s:tuated. The purchase of hamt, however, is the favorite mode of investing money in 'rance. It aclls, in gencral, for twenty-five years' purchase; while the publie funds seldoms fetch above sixteen oreighteen. There la at Paris a society sinilhar to the Boarl of Agriculture in England, and, forming, like it, a central point for corresponding with the different $u_{\mathrm{b}}$ ricultural societies in the kingions. It holias its sittings twice a month, and a public meeting annually for the distribution of prizes. The French have nlso (ance 1219) a corn law, pernitting imports and exports only when the homo market shali be ahove or below a specitle rate. The ebief difficulty the French government have to contend with in regari to the corn trate, is the popular prejudice that freedom of export raises the home price.

Timber.-Of the 18,3 3in, 093 arres which are coverel with woond, in 1835, there belonged to govermant $2,547,800$ ucres, which were divided into 1473 forents. A very smali pati of this is aliowed to grow into large timler. The reat ba subject to an mnual cutting and sald, for fuel; cord hieing very little used in Fruace, excejt for forgen, glasshonses, nud otive: large worke. In the govermmer: forests grose mis. management trok phace during the disorders of the first levolution. Exteas!re thacts were sold for an ingignife ant musideralion, while in those that remamed timber was felied wi a a lavish hand, and without eny reserird to the uthimute efiect on these valuable pronerties. In :801, newever, a special hoaru. njppinted for the care of the foreros, introluced the most bumpicial regulations. In the yeare of timancial jeesesure (1415, 18:6, and 2817), it was proposed to effect silles of these great domains; tut a faii price teing unatainabie, governneat continues to heep diem. incring the monaryly the revenue derived from the word annuatiy
 ling.

Tie adminlstration of the foreats is ( $185^{\circ}$ ) placed under the direction of the minister of Anance. The French territory, comprising Algerin, is divided inte??
arrond placed istratic inspect gartes nunst may be Eicole. 900 im generau Puel of irras ged silu kingdor quentiy officers, for woo recoura sultes in wolves. sre mu districts
arrondisements forestiers, at the head of whlch ls placed a conservateur who corresponds with the administration, and who has under his orders a number of inspectors and sub-inspectors. Under these are tho gardes géneraux. Every ono employed in the foresta nust be twenty-five years of age, but this provision may be dispensed with if the employo be a pupll of the Ecole Foreatiere. Thero are (1855) 32 conservateurs, y00 inspecteurs, 100 sous inspecterrs, and 500 girdes gineraux of foreste in France.
liuel being compuratively little wanted in the south of France, the foresta are confined io remote and rugged situntions. These, like most of tho foreats of the kingdom, harbor a multitude of wolves, which are frequently deatructive to the sheep and lambs. Regular officers, called lientenants de louretrie, are appointed for wooled distriets; and on occasions of heavy loss, recourse is had to a general battue, which seldom results in any sensibte rednetion of the number of wolves. Bears also are found in the forests; but they are much more rive, being eonfined to the elevated districts in the Alps and Pyrences.

Mines and Quarries.--Vrance yields in this essential article of produce, not enly to Britain, but to Germany, to Kuasit, to Sweden, and to IJungary. According to the most approvel works recently published, the mines of France may he clansed into five groups, namely, the mines of the Vusges and the Black Forest; thoso of the central provinces of France; those of Brittany; theso of the I'yrenees; and those of the Alpa. It is not many years since the mines of the Vosges yield 1 above 30,000 ewt. of lead, and a amall quantity of silver, besides copper mixed with silver. The produce did not, it is probable, repay the expense, as they have since been athandoned. There are now a very few copper mines in tho Vesges. in the central part of l'rance there are numerous mines of lead, but they are not productive. They are chiefly situated in the department of La Lazere; and they yield annually, along with the lead, 1600 mares of silver. The only metallic mines of any consequence in Brittan' now are the three great inines of gatire argentif. e of Joultaouen und Iluelgiet ; and there is one :nine of what is called in the divisional nomenclatio ef the minister of commerco and publie works, plomb argentifere. In the chain of the Pyrenees there is only one mine of cupper, which has ling since been ahandoned. Titere are, however, numerons iron mines, which furnish nuterinls for more than 100 furges. The chain of the $\mathrm{Al}_{\mathrm{j}}{ }^{\mathbf{s}}$ contains many mines of lron, but is not rich in other metals; it possesses some unpordetive mines of lead, and one of silver, which hata long been abnndonet. There are some appearances of gold in the department of the lsere, but not such as to encournge any trial of their value. If there are few other mines, those of Iron aro in great abundance, teing thity-elght in number, scattered throughout the country, und of theen the produce is everydey im oving. The whole value of the metaliac nonduce of rance win estimated in 1828 to be eciral to $\mathfrak{f 3}:\{y, \dot{v} 95$. Tue number of minns was extimated in Octuber, 1454 , at 824 , viz., 448 of coall, 177 of iron, 199 of other sebstimces; and the number of workmen they employed in $185^{\circ}$, at 31,1334 . (Trapaux Statisfiques des lfines de 18.17 is 1852 . Inprimerio 1 mperiate, oitolire, 185..) The working of mines is intperled $i=$ lirance ty the want of gocil roads and cannis which to convey the ore and the coal for smelting it. The production of fron has lneen encouraged ty the heavy dutles on foreign iron. So 18 f a duty was imposed of fifteen franes per fifty kilogrambies, or 12s. 6 d , per 110 lbs , inperial, on ull foreiga iron imported, which was, in 132:, ineluling tha decimo or the tenth added to all duties, ruisell to $\mathrm{CI} \mathrm{E}_{\mathrm{s}}$. Ihd, on ali coal-wurked foreign lern. Hut this prohihithon dill not liring prosperity to the trade, though by these daties the price of iron in France wus $\mathrm{S}^{23} 9 \mathrm{9s}$. 2d. per ton,
while English iron was zold at $£ 9$ 6a, 8d. It is extlmated that these heavy duties on forelgn iron cost the agriculturists of France, In the additional expense of plows and other implements of agrioulture, a sam varying from $£ 1,500,000$ to $£ 2,000,000$ a year. (See First Report on the Commercial Relations betuceen France and Great Britain, p. 2. ) Estimating the annual consumption of Iron in Fras -s to be 160,000 tons, and the difference of price betw. in French and English Iron to be $£ 10$ per ton, the law of 1814, whleh imposed a duty on forelgn iron, and the law of 1822 which increased that duty, can not bave cost tha French people less than $£ 80,000,000$ sterling of direct losa; while it is searcely possible to ealeulate the Indirect evil of this monopoly or protecting duty in favor of the iron-masters. One reason of the high price of French iron is the want of coal, an ovil which is aggruvated by the heavy duty on foreign coal in consequence of which the French are compelled to employ wood in their forges ; and it is calculated that one fourth part of the wood eut down in the feresta is conammed in the manufacture of iron. Coal has been discovered in more than half the departments of the kingdom (in fortyfive departments), and would doubtless be traced in others; but the want of water communication limits the consumption of this articio almost to the place where it is produced. In a report to the present Emperor of the French in 1854, by the minister of commerce and public works, that functionary attributes tho bigh price of native coal in France not to the method of working tho mines, or to the insufficiency of the mnehinery, but to the want of better intercommuaication both by land and water. (Resumé des Travaux Statistiques des Mines de 18.47 jusqu'a 1852.) It is a fact that more than half the departments that consume the coal of the Loiro pay for it a price four, five, and six times higher than it costs at the mouth of the pit. (Rapport addressé à l' Empereur par ls Ministre on department de l'Agrienlture et du Cominerce, 1854.) Ono fifth part of the conl consumed in France is used in the department Iu Norl. At St. Etienne, near I.yons, are excellent conl mines; but there being no iron mines in the vicinity, nor of course iron-works, there ls no consunoption of fuel on a large scale. The coal ls only used for demestic fuel, and for the mannfacture of hardware. M. Costaz, In an estimate contained in his work on the agriculture and commerce of France, makes the coal produced in France to amount to $15,310,687$ netrienl quintals; tho value of which he estimated at between $£ \mathbf{f} 00,000$ and $£ 800,000$. The quantity of coal imported from Grent Britain amounted in 1831 to 40,000 tons, though subject to a heavy duty of one frane sixty-seven centimes per hundred kilogrammes, or 1s. thlu. per 220 lbs . imperiai ; and there were imported from lelgium, the duty being thirty-three centimes per hundred hilngramises, 440,000 tons. The importation of coal in 1853 iose to $2,224,555$ tons, of iron (fonte brutc), to 73,689 tcns. In December, 1853, the importation of iron went on Inereasing. The beavy duty ill coal operates most injuriously on the industry of France. It is a most seilous impediment to the working of the iron mines, for the encouragement of which such henvy duties ars Imposed on foreign iron:. llut such is always the effeet of the prohilitory system. It pulls down with one hand whut it buids up with another. The iron-masters and the coal-ow'ers have each a monojoly of the home market. Ilut is it not clear that these two monopolies run counter to each other, anm that the iron trado is encournged by the cme, while it is most gerionsly dise couraged by the other, and the whole inhabitants of lirance aro taxed in a much higher price for fuel liy the heary duty laid en the importation of thia useful article? Stemboat na Igntion is also discouraged, so that no siemutrents ply regulariy between any of the Atlantic ports of Frumce. A steamboat which in Eingland cuuld be navigable at an expense of £2280 for coal, would
cost in Franne C5700, about 18 per cent. on the capltal employed. It is the owners of foreat property who are the mont ecalous supporters of thin duty, an lmpont which benefita them at the expense of the whole of France, and Indirectly depressea the national commerce and induatry in its mont Important hranches. For many years only a amsll portion of Parin was lighted with gas, which is aseribed to the high price of iron pipes; and the supply of water is also impeded by the same causa. (An imperial decree of the 22d November, 1853 , materially redaces the custems duties on the Importation of coal and imon. Coal pald with tha decime 55 centimes per $100 \mathrm{k} l$ logrammes upon the greater part of the French frontler from the Sables d' Olonne to Dunkirk; upon the remalning portion of the frontier it paid 83 centimen, by the land frontier, except in certain placen, by the Meuse, and In the dopartment of the Moselle. Hanceforth the great zone from the Sables d'Oionne, and from that by land to Helluin, ls to huve but one duty-ameanting to 83 francs for French, and to 88 france for forelgn vesaels. The rent of the maritime frontier is assimilated to the prinelpal part of the land frontier. A double duty to that levied on coal was charged on coke. Henceforth coke la only to pay a half beyond what is levied on coal. As to iron, from the 1st ef January, 1855, there is no distia thon between iron smelted hy coal or wood. Tiue fonte bruie is to pay 4 franes 40 centimes the larger bars, 11 francs the mualler bara, and steel 33 frames. Raila for railroads are to pay 132 franes. The grentest reduction is on ateel.) The mines, like other large undertakings in France, are under the direction of government, being auperintended by a board at I'aris (Consell tienernl), and having an Eiole Imperiale with putilic teacuers, the whole under the control of the minister of the home department. This, however, does not prevent their machinery being in general very elumay und antiguated.

Turf tit for fuel, or peat, la found in various parts of France, snd will be more used as wood beemmes progressively acarcer. Thia article in produced in the departments of Gand, Isere, the Lower Khino, the Summe, Pas de Calals, Iolre-Inferieure, I'Isere, Seine-et-Oise, Oiae, Aisae, Ioubs, Marne. The rutting anl preparation of turf Is computed to oecupy the lator of from 50,0c. to 65,000 workmen on an averaste of 40 days. The greatest turf-producing department in I'ran is Ian Sonme.

Salt is made in various parts of the kingdom. The works correaponding to the salt mines, or rather to the lirine aprings of Cheshire, are called, from thrir position, siclines de I'Kist, and are situated in the smsli town of Saline in Franche Camsté; they are wrought by undertakers on lease, yleld about 20,000 tons a year, and atford a considerable revenue to government. The heat of the climate on the south snd south-west const of France is favorable to tha evaporation of aait water, ond consequently to the formation of bay salt, the name given to silt made, not by the action of fire, but liy the haat of the ann, operating on sea water fuclosed In a shallow bay. The duty raised from asit in France in nearly $£ 2,000,000$, a sum of ereat importanee to the treasury, but attended with folly as woch injury to the productive powers of France as wat furmerly our malt tax to those of England. Since 1818 the droits on salt have been reduced two thirds. The first Revolution hegan by alolishing entirely the orlious gabelle; and salt Leing soon afterward made in great quanti$t i e s$, and sold very cheap, became the object of a most extensive consumptlon, being given to cattio as food, mixed with manure on the fielda, or swattored as a otimulant to vegetation at the fort of olive-trees, Jut this extended use of salt was of short duration. No sooner was the power of Bonapurte onnoblidated, than he vealured to impose a tax on salt, less impolitic ani -ppressive indeed than the gabelle, but which had the oflect of limiting the use of this article to auch a degree,
that the value of bay salt consumed, instead of amounting to $51,000,000$, did not in 1836 exceed $\mathrm{f} 10,000$. It was thought that a considerable increase in the consumption of sult would take place from the year 1849. There has no doubt been a certain increase, but it has la no degree corresponded with the diminution of the duty.
In 1847 the quantity of salt produced was $350,210,340$ kilogrammes; in 1848, 465,435,500; in 1840, 179,438,400 ; in $1850,495,183,900$; in 1851, $599,175,200$; but in 1852 the quantity produced fell to $428,037,600$ kilogrammea. Tho price of the metrical quintal of asit in 1847 was 3 franca 47 cen. In 1851 it feli to 1 frane 66 cen. The amount of sait produced from ail the sult mines and suline sources in France in 1832 was $7 \times 4,002$ metrical quintals, valued at $2,865,550$ france. The consumption is confined to dunestic purposes, and to a trilling export ; yet the fow cattle which atill receive salt as a prirt of their food are visibly in better condition than those that are deprived of it.

France is In general much better aupplied with quarries than England. The vicinity of Paris abounds in quarries of freentone. The case is similar in the mountainous districts, and even in aeveral, euch as Lower Normandy, that are comparitively level. The houses are consequently built of atone in those citics which, like Paris or Cuen, are in the vicinity of quarries.

Fine variegated murbles are quarried at Compan, in the Upper l'yrouees. It appeara from otlicial documents published by the gov yrnment that in the year 18.16 there were 22,000 quarries in course of working, which empioyed 75,396 workiuen. The value of the inaterial sent into the market was $41,047,519$ frimes. in 1849, 86,179 persoas were employed in quarrying; and in $1850, \times \overline{7}, 486$.
Munufuctures.-Our historical notices of French manufactures are very imperfect until toward the year 1600 , when the wara of religion were brought to a close, and penceful inalustry received encouragement frou Henri JV. and his minister Sully; a minister, however, who had a inorror of luxury of ail kinds, and who was much more favorably disposed to agriculture than to manufactures. It wua uuder the "roi cuillant," however, that the patronage of goverument was extended to the numufacture of silk, glass, jewelry, grid und silver tisaues: also of the timer woolens and linens, the coarser kinds having been estalitished many centuries lefore. Bat tho great extension of the liner manufactures of France took place after 1668 , during the reign of Louis XIV., and the ministry of Cotbert. It was then that workmen were invited from lienoa, Venice, and Iloliand, and induced to'settie at Sedan and Abteville, places still celabrated for their wowlens. In the south of France also entablishments wero formed for unking the light ciuth suited to the Turkey unarket; , that toward, the year 1700 the manufactures of Frauce, as well of woolens as of other articles, lad malle considurable progress. Cloth serges were improved under Colbert, and point de Gienes and point do lienise introduced. In 1656 , stocking-wearing, which had been introduced into France from linghad by two manufacturers of Nines, was extended and iimproved. The inanual labor of tho lirench workmen was ingenious, the muchinery extremely inuprfect. The linen, the puper, and in some measure the wool. ens and hurdware, found their way alroad, because in thin rest of liurope these manufactures werc very tamkward, and, in particular, becuase the exports of linfland wero then very limited. The repeal of the Edict of Nantos was a very Impolitic meaxure, but its consequences have heen overrated, for England has profited vary little by the extension of her silk fabrics; and Brandenturg, the chief resort of the French emigrants, has never become an exporting manufactarimg country: Ancther und a more important ertor is tha

current notion that French manufactures were formerly (from 1650 to 1750 ) more extenaive and flourishing than at preaent, also that they underwent an almost total extinction during the Revolution. Theae, like many other Impreasions in regard to France, reat on mere looke allegationa. Official dafu, far from sanctloning such fluctuations, are decidedly in favor of a pregresslve though alow increase.

Woolens.-To begin with the oldeat and most widely diffosed branch, woolens, we find that the relative numbers of workmen at three distinct intervals, and in very different parts of the country, were as follows, viz.:

|  | 1739. | 1800. | 1819. | 1940. |
| :---: | :---: | :---: | :---: | :---: |

Lisien, also, in the north, had nearly the amme numher of wrorkmen ( 5000 ) througheut. The finest quailties of black woolena are made at Sedan, in Ardennea, and at Louviers, in Normandy. In these the only materinal is merino wool. At Elbouf and larnetal, and in Normundy, the qualities are very varlous, the price being from 6s, to 28s, the Fingllah yard. Carcassone and Limoux owed the origin of their extensive manufactures on the nbundant supply of woel from the pastures in the Pyrenees. Since the reduction of their exports to the Levant, an alteration in the quality of their cloths has opencd to them a market in the interior of France. The mountainous districta in Languedoc contaln great numbers of sheep, and are the scat of the manufacture of serges, tricots, and other coarse woolens, most of which are made, not by workmen coliected in a factory, but in the hanilets or villages of the departments of the Tarn and Aveyron. Almost cvery house has its loom; and during the eveninge in winter, or in the daytime when the weather is ndverse to country labor, the women employ themselves in spinning, and the men in weaving. A highly finished species of the woolen mnnufacture, viz., shawis, vails, ladies' cioth, etc., has been introduced in the present age into France. Rheinss is the seat of this important brunch, and employs in the town and neighborhond no iess than $\mathbf{2 0 , 0 0 0}$ workmen. Similar artieles are made at Paris. The bounties granted on fils ef tissus de laise in 1852 amoun d to $7,500,000$ francs.

Shauls.-Shawls became fashonable in France as an indispenasble article of female appurel after the expedition of Ilonaparte to Eigypt. The first lady in France who wore one (in 1801) was Madame Gaudin, the beautiful Duchess of Gaeta, a Greek by birth, whose hushand was then a high functionary. Many of the officers who wero attached to the army brought back presents of shawls, and they were imported in great quantitics from Constantinople, Mosenw, Vienna, and Loudon. These shawle, however, brought an enormons price when imported into France, which necessarily limited their consumption to the richer classes. The great demand turned the attention of manufacturens to thls important articie; attempts were made to imitate the Cashmeres, and specimens were exhibited at the L rpasition of 1 k 01 . Ortinary viawls are new male of merine and other wools. Ilut this was only a step in the progress of the mannfacture; and a finer species of wow having been imported from tho counIries to the north of the Caspian Sea, the ingenious manufacturers with these materiais at last produced shawl: which rivaled in beanty those of the Fast, and in which it required the most practiced and skillful eye to discern any difference. In 1819 M. Jaubert procecied on the part of the shawl manufacturer, Ter-
nanx, to the countriea between the Black Sea and the Caspian to buy a numeroua flock of Astracan goat!, for the purpose of using the wool for shawl-makling. The apeculation was a complete fallurel and the French government, which was Interented in it, loat 800,000 francs.
Two towna very remete from each other, Lodeve in the sonth and Vire in the north-west of France, manufactured, under Bonaparte, very largely for the army. French woolens are, in general, much thicker than oars. In the fine qusitites the raw material forms (Citaptal, vol. il., p. 131) somewhat more than half the cost. In ordinazy qualities it ia momewhat leas; but it is only in the alight qualitiea that the price of fabor goea considerably beyond that of the materials. The computation for the whole country is, that a value of $\mathbf{£ 4}, 000,000$ aterling in wool hecomea converted into a manufuctured value of $£ 9,000,000$, of which a tenth only is exported. The cloth in France which corresponds to our auperfine, and which is worn in genaral by the upper ranks, is very fine and durable, but heavy, with the exception of the euperfine black. The price of the clotha produced at Sedan variea according to a graduated scale, from 15 to 50 france the yard, and of keraeymerea from 7 to 24 franca. The duty on foreign wool has heen very injurious to the French woolen manufacturers ; becauae, by compelling the French to pay a high price for the raw material, it prevented them manufacturing woolen cloth as cheaply as their Engilsh compotitors, to whom the forcign market, where the raw material had now fallen to a low price, was open.

Belgium, Spain, Germany, Turkey, Barbary, Atgiera, and England send wool to Frani 3. The exportation of wooten goods in 1839 reached $60,600,000$ francs. In 18.38 the exportation was $2,578,487$ kilogrammes, valued at $65,823,346$ france. The wool produced in France amounts to $20,350,000$ kilogrammes of fine wool ; $20,040,000$ of common; total, $44,350,000-$ about half that of England.

The wool imported from England in 1858 was 21,587 quintals, in value $0,481,836$ francs, and the cloth 2:31,419 kilogramines, valued at $5,795,332$ france. The worsted or thread was 19,630 kilogrammes, valued at 385,844 francs. The importation of the Thlbet far or hair was in value in 1830 8,576,480 francs, but haa since declined to $2,058,920$ francs. This material is spun in Paris, employing 500 or 600 persons. The wonif of France is of an inferior quality. Its annual value averages about $120,000,000$ franes, being $60,000,000$ kiogrammes. There are $5,500,000$ aheep of a superier breed, Saxons, Merinoes, and those imported from Finglanif; and $24,000,000$ of indigenous race. Since 1823 the l'rench shcep have increased nine per cent. The manuffacturo of merinoes and bombazines employs 17,000 hands: 6000 are employed at Amiens in the manufucture of aldpines, and aliout 36,000 pieces are made there, about a third of which are exported. The bonncterie in wool employs 15,000 workmen, 800,000 kilogrammes of colored wool, worth $8,000,000$ francs, and returis $\mathbf{1 7 , 5 0 0 , 0 0 0}$ france in manufactured goods. Coveriets are made at Rheims, Roven, Beauvals, Lilie, Iyon, Urléans, and at Sommieres (Gard). This faliric is valued at $20,000,000$ franes, and employ's 10,000 hands, besidea auxiliary assistance to the extent of 25,000 more.

Carpets,-Carpets are made to the annual value of 3,500,000 francs, the larger part at Aubusson and Felletin, two towns in the department of the Creuse, employing 1800 hands, and proifucing goods to the value of $1,500,000$. Carpets are also made at Ahbeville, at Amiens, Turcoing, and Besnnçon. The finest and
richest velvated carpeta, called " de Savonnerie," are made at Beauvais, and at the Gobelins in Paris. These are only made to order, and are not artlelea of trafflc. The exports of woolen goods reach on an average the sum of $65,600,000$ or $66,000,000$ france, conauming $2,578,487$ kllogrammes of wool. They conslat nf coverlete, carpete, cloth, cassimeres, and merinoes, varied stuffs, shawls woven or made by hand, bonneterie, ribbon of worsted, and similar llght goods, and stuffe of mingled materlals. Machlnery has been used for spinning wool in place of the hand only aince 1809. Rheims is the great centre of French wool-spinning, it being aitnated In that part of the country where sheep are most numerous. Thare are at Khelms 275 estallishmentif for spinning carded wool, anil nearly 55,000 spindles, or 60 establishnients for combed wool. The number of werkmen is 50,000 . Frnnce annually exports woolen yarn to the value of $2,000,000$ francs and upward. Neapolitan finnnels, English fisnnels or "bolivars," circassiens, lastings, cloths, cassimeres, merinoes, moussoline-de-lalne, culr-de-laine, made at Cartres tirst in 1819, and poplins, are noted manufacthres.

Cofton.-The cotton manufacture was introduced into Amlens In 1773, the raw material being supplied, not from America, but from the levant, with machinas procured from Fingland. In 1784 a privilege was conferred on an iohabitant of Seine and Oike for a manufactory; and soon afterward the manufacture passed to Romen, St. Quentin, Puris, Lille, and other parts In the fiorth, extending with a rapidity surpassed only hy that of England. At present, as for many years pust, the great import of cotton is from the United States. In this great department of mnnufucture tho French have only followed In the footsteps of Great Britain, whose machinery, after the lapse of a certain time, the French manufacturera bave Imitated; and though they have equaled the British manufacture in durability, they bave generally been inferior in cheapness. This is, in a great measure, owing to the centre of the manufacture belng at Rouen and Paris, places where the support of workmen, lncluding the extra price of fuel, is not less expensiva than in Lancashire. The districts most remarkahle for the cotton manufacture are Alasce and Normandy. The manufacture of cotton celret was begun at Amiens su carly as 1765 ; and in 1784 M . Martin of Amiens obtained, under the title of "the first importer from England of macbines inventel there for spinning cotton," the autherity to establish a cotton factory, with special privilegen. Nimes is celebrated for its fine hut not very durable cotton stockings. There are also manufuctories of bonneterie de cotton at Besadçon, Vitry. Ilar le Ihuc, ete.

The cotton mannfacture is prosecutel in many parts of France, and presents a great variety of falsrics and an extonsive division of labor. In one place the wearing alone ls followed; in other places the manufacture of threads, which nre sold to those who weave them into cloth. Such ls the case In the department Du Norl, which exports a great quantity of thread to the cloth manufneturers. In other places they bleach the linens, which are afterward dressed and stamped. The workmen employed in the cotton nuanufacture were estimated 20 years ago at 260,000 , and they now amount to 355,000 . Still, however, France in decidedly inferior to Great llritain in almost every branch of the cotton manufacture; and the consequence is, that as the limportation of Vinglish cotton goods is prohibltenl, they are amuggled into the country la great quantities. Among these, the introduction of cotton twist is most extensive; and as the French mills can not manafacturg the higher nusibers, from 170 to 200 , which are required in che fabrieation of bobbinet, it has been found inpossible to repress the contratand importation of thin article. "It makea its way," say the writers of the Report on the Commercial lelations between Great Hritain and

France, " both by land and sea, in apite of all interdictlona, and to a contlnually increasing amount." The English can be nold also at half the price of the French article, which presents an additional inducement to the smuggler. The annual value of the manufacturar thus illicitly introluced wan estimated in 1833 at $\mathrm{f} 500,000$ sterling $\mid$ but smuggling has been reduced more than a fourth since that tlme. It is difficult to eatimate the anount introduced, but very experienced persons in the trade doubt if it muchex. ceeds $£ 250,000$. English bohblnet was also smuggled 20 years ago into France to the estimated snnunl value of $£ 625,000$ sterling; but it in questionabla whether the amount of illelt traffic now amonnts to $\mathbf{£ 3 0 0 , 0 0 0 \text { , }}$ though English bobbinet sells at from soven to elight per cent. above the price of French goods of the sume nominal quality. Quiltings, cambrica, and muslins are also largely introduced ly the illleit truders; and the delivery of these goods is Insured at a premium of from 18 to 50 per cent., accerding as the risk is greater or less in the case of heavy or of lifht goolls. In 1852, $3,760,000$ francs were paid in hountics en fils et tissuz de coton. The average wages of men employed In the cotton trade is 2 fruncs 50 per centimes per day; of women 1 franc 20 centimes; chlldren are paid 50 centimes. The value of the cotton fubrics of Nermandy is $105,000,000$ francs, that of Alsace $80,000,000$ francs. In the last district 70,000 handa are employed In weaving; from 12,000 to 15,000 in printing; and 1000 in the bleaching grounds. In Normatidy and vi-inity, Incluling a part of the Somme, Pas do Calais, Alsue, Eure, and Masche, 129,000 hands are cmployeri. namely, 60,000 weavers for tho liouenneric, 20,000 for the callicoen, and 49,000 in other divisions of the labor. Alsace produces principally cotton cloths for printing, and exjorts a part into Switzerland. Tha number of pieces of printed cotton and muslins made is calculated at $1,100,000$, valued at 40, 000,000 francs. They are of three kinds and prices, but are unable to cope in cheapness with the English. Tulles, nt first made only in Normandy, are now manufactured wherover cotton fabrics are made; to the extent of $32,725,000$ francs, of which $20,000,000$ franes is the cost of the embroidery. The most important of this brunch of the manufneture is carried on at and near Calais, where from 600 to 700 looms, and 4800 men, women, and children, aro in constant employment. The manufactures of muslins are most in arrears of all, owing to the fineness of the thread required, which is not yet mude in France, but imported for the purpose. Tarare is the seat of this manufacture, valued at $20,000,000$ france. These muslins are generally embroidered. Blonds and lace are mude at Caen, layeux, and atove all, at Chantilly (Oisc) where 70,000 persons are employed. Cotton bonneto rie is made at Troyes to the vaiue of $7,040,000$ franca employing 10,000 looms, and from 10,000 to 12,000 hands.

In 1803 the import of cotton wool had reached 10 , $711,666^{\circ}$ kilogrammes, and in 1820 had doubled that momount. The cost of the raw mutcrial in lrance, and its manufacture, aro enhanced liy the expense of fuel and carriage. The profits, deducting all outlay and wear and tear of machinery, and making allowance for every oxpense, are considered to be about $30,000,000$ francs. It appeara, that prior to tho legal permisnionto inport entton thread frec, when above No. 143, not tess than $5,000,000$ kilogrammes were smuggled, when the duty was from 70 to 80 francs the kilogramme. This traflic: has not yet eeased. The spinuers number from 80,000 to 90,040 , and the mean waiges of culults and childrea are 1 franc 50 centines per head, who attend to $3,500,000$ spinales. No. 132 of the lirench thread corresponds to 120 of tho Euglish, because of the differance lretween the linglish pound weight and the French deml-kilogramme. In the year isub the utmost degree uf fineness attained in cottort thread was

No. 110. In the year 1809 it had reached No. 150. In general the French thread remalna much below the English, but it continually tmproves. No. 180, whlch In France sells at 30 france or 40 france, coats In England only 18 francs. In the Selne Inférieure, at Rouen, and vicinlty, there are about $1,000,000$ of aplndles at work. In the arroadlesement of Lisle 600,(000 are worked by 82 ateam-engines, of 850 horee-powar In all. St. Quentin worka 210,000 apindies with 200 horse-power of ateant, beskea water-power. The aplnaling in Alaace employa 18,000 persons of all ages. The dyeing of cotton occuples 87 establishments at Ronen and its velnity alone. The princlpal part of the weaving takea place In Normandy, Alsace, Amlens, St. Quentin, and Troyes. The looms are above 270,000 , and employ 385,000 hands, the mean of whose wages ls 75 centimes per day. Many of the looms there are worked by hand. The princlpal producte are calicoes for printing.

In tho departments of the Seine Inférieure, Somme, Paide Calala, Alane, Eure, and Las Manche, the spinners, weavara, dyers, muslin fubricators, machinlats, canlmakers, amount to 107,000. The indlviduals connectel with the manufactura in other ways, the whole comprising 150,000 familliea, carry the total number concerned up to 400,000 . Of the workinen lmmedlately deslgnated, the number la 107,000 , employed thus:-

In Alsace, inclucling the Ilaut and Bas Rhin, the Yosges, the Meurthe, IIaute Saone, and Doubs, above 100,000 persons are employed:

The princlpal places for the manufacture of yarn in Alsace aro Mulhausen, Wesselling, St. Mary aux Slines, and Guebwiller. In tho other parts of Vrance the principal are St. Quentin, Rouen, Caen, Amiens, Bar le bue, l.lle, Roubaix, 'Turcoing, Lyons, Paris, Dametal, llolbec, 'Troyes, Gisors, ete. Tho yarn made In the Seine Inforienre exceeds the whelo made in Alsace. In the departmente of the Somine, Pas to Calais, Aisne, Eure, and Mnnche, there are 60,000 weavers of Rouennrrie, 20,000 of calico, and $49,000 \mathrm{in}$ the other branches of the manufacture.
Linens,-In the extent of her linen manufacture, France is greatly superlor to Fingland; net that her soil is better adapted to the growth of hemp and flax, but hecause linglaud depends on importations of llnen from Ireland and Germany, and the spinning of fiax does ant form the occupation of our female peasantry. Ia France, particularly in the north, overy farmer, and almost every cottager, covers a little spot with hemp or flax to employ hils wife and daughters in spinning throughout the year; a atock of linen heing tho asual dowry of these humble occupunts of tho soil. The manufacture of this article la not exilusively concentrated in the towns, liko that of the other fabrics: many of the weavers reshto In villages and hamlets; and the hemp and the flax are spun by tho hand. This is a most valuatulo branch of domestic Industry; which gives employment to females under the roof of their parents: but it is lestined, in tho progress of capital and industry. to bo superseded by machinery and great establishments. In Normanily, Liaieux, Dieppe, the neighborhood of Ilavre, I vetot, Bolbec, and the more inland towns of Vimoirtiers and Domfronf, are all remarkable for one or more branches of
.he linen mannfacture. The more backwand provlnce of Ilrittany manufactures, at Rennes, St. Malo, and Vitré, quantlties ef cearse llnen, canvas, and sacking; but Anjou affords a much superior article; the toiles de Laval have leng been In repute, and gave employ. ment, In laval and the contliguous towns, to nearly 25,000 werkmen. Lille and lts populous district lave very extenslve manufactures of hemp and flax; for the number of workmen so employed, directly or Indlrectly, In thls part of French Flanders, is not short of 50,000. Siuce 1790, fine linen haa, in France as In England, been in a great measure' replaced by fine cotton; and the two together employ, at St. Quentin (in Pleardy) and the neighborhood, more than 30,000 workmen. In anether part of the klnglom, the provlnce of Dauphlné, there are carried on llnen manufactures of various quallties, the prlces being from 1 frane 10 centimes to 5 francs the yard. The value of the linen manufacture of France of every kind is no less than $525,000,000$ franca. The raw matertal grown in France ls valued nt $30,941,840$ franes for the hemp, and $19,000,000$ frane for the flax. The hemp $\mathbf{l m}$ ported, and the threud together, give $85,699,003$ francs value. About $1,000,000$ francs is the worth of the thax imported. Total, $20,000,000$ francs. The manufacture gives:

Tho manufactures of hemp and linen employ 600,000 workmen. The exports of linen, principally to England, wero, in 1840 , nearly $0,167,781$ kllogrammes. The manufacture has tluubled since the first Revolution. Lille, Dunkirk, Essonne, Pont Remy, Bellais, Vernon, and Alençon, are notel places for thelr linen manufacture. Normandy sende to Paris annually 20,000 pieces of linen. The llnens of Brittany are mestly consumed nt tome. The fine linen cloths called toiles de mulquinerie are principally made in the departmenta of the Aisne and Nord. St. Quentin was once noted for them ; now that town, Cambray, Valenciennes, and Solesmes, produce cloths so fine, called batiste and linon, that 70,000 pieces nre exported to lingland. Tho beantiful batist embruidery employs 1:1,(000 persons at Nancy. Coutils, a cutton cloth crussed with thread of linen, are waven $\ln$ the department of Dayenne, where 4500 looms nre employed upon this article. French linen differs in quality according to the place of manufacture; but in general it is thicker and stiffer than Irlsh linen, while in whiteness it is inferior to the linen of Flanders and Holland. It la, however, a substantial and durable article. Cambrics, threal, gauze, and lawn, rank amons the leading manufactures of the north-oast part of France. They are made nt St. Queritln, Valenclennes, Cambray, and to a sinaller extent at Doual, Chauney, and Guise. Lace is still moro peneral, being made in quantities at Valenciennes, Dieppe, Alençon, Caen, Hayeux, and Argentau. Maehinery had, up to 1820 , been very little applied to thls manufacture in France, and the number of women employed In it was very great. There are considerabse manufactures of printed linens; and the dyeing of linen thread gives rise to an extensive commerce. At Rouen, and in the surrounding ilistricts, this branch of inlustry is carried on; and many stuffe of great variety, and for which there is a lirisk demand, aro pronluced. In 1822 the luties on foreing thread and linen were ralsed by the French government till they were nearly prohibitory; and the annual linportation from Germany and llelglam, whleh formerly amounted to a million and a half, almost entlrely ceased. The price of home-made linen rose 25 und 30 per cent.; the consumers had recourse to cotton as a substitute; the French dyelng trade fell off, and nlso the entrepett traile in foreign linens, both of them sources of great business.

The vaine of the hemp annually grown in France may be oomputed at $£ 1,200,000$, the quantity imported at $£ 200,000$; together $£ 1,400,000$; a valne which is doubled in the coarse manufncturen, and tripled in the finer. Or thls quantity of. hemp, the haif is made into canvas and thread, a third into cordage, and the romalnder into cloth for domestlo use. Of the flax annually employed, the value is about $\pm 800,000$; a sum which ls tripled when lt is made up inte thread, linen, and mixed stuffs, and much mere than tripled In the finer qualities.

Iron.-F'rance had in 1855 about 669 furnaces, of which mare than 300 are and to be blast-furnaces. It is, however, almost impossllile to ascertain the exact number of blast-furnaces, the position of which is regulated by that of the iron mlnee. They are chiefly ln the mountainous departments of the Dordogne in the south-west, and of the Ilaute Marne, the Haute Saone, and the Cote do'Or, in the enst of the kingdom. Of forges for malleable iron, called forges ì la Catn lame, there are eighty-slx scattered throughout different departments, lant chleffy in the billy part of Languedoc. There nre also a numiser of wire-works Franec, in vihich, an in the blant-furnaces, there . heen since 1790 a progressive but very slow increase, altogether different from the rapid advance or the iron-werks of England previously to 1815.
The stationary character of these work ${ }^{\text {ans }}$ ling dently been owing to the deficiency of fuel and of water commanleation; disadvantages whlch prevent the hardware manufactures from treing concentrated in cities or pupuhous districta, and canse them to the spread over tho country in petty towns or villages, with a very limited division of labor, and a conseçuent inferiority of execution. The result is, that France does not export hurdware, and that in nothing is the inferiority of domestio secommodation in that country more consplicuous thnn in articles which beling to the province of the locksmith nnd cutler. The anount of pig-iron anoually made in France nppears to be about 100,000 tons. The value of the harlware of the kingdom, including cutlery, arms, and other articles of nice workmanship, is computed at $\mathbf{C H}, 000,-$ 000 or $\mathbf{C 9}, 000,000$ sterling. Fine cutlery in former times was largely smargled into France, but now to a murh smaller extent. The annual import of iron and ateel is only from $f^{\prime 2} 2,000,000$ to $\mathbf{C 3}, 000,000$. The high price of iron is a great obstruction to the progress of the hardware manufactures; and this circumatance places in a strong light the impolicy of the henvy dutien on foreign iron, by which, notwithstanding the change in the scale of duty in 1838 , all those impor-ant branchee of industry in which iron is used are stunted in their growth. In copper, the importations greatly exceed the hom produre. From (ireat lritain the quantity importell for the last ten years has increaned from 200 to 20,000 hundred weight. tyf lean, also, the chief part is imported. The manufacture of steel baz only lreen lately introluced into France. l'rlor to 1786 there was no manufactory of this useful article; and it was only after accounts hal been publiahed liy scientific peroons of the composition of that article, ned after repeated experimente, that in 1809 manufartorien of ateel were establiohod, which have been aince extended tis several departments, es. perislly to those of the falre.
sill:-As regaris silk, France possesses, both from physical causes and from tho long-entablished manafacture, a decided nuperiurity. Mulberry-trees were intronluced in the fifteenth century, and were tirat planted, not in the south, but in the ecntral part of the kingdom, near Tourw. 'That town was the seat of the earliest silk manufactures, and it was net till 1600) that the enture of the mulberry was earried mothwarl.

The muliserry thirivee in a varivty of soiln, and may be planted with success in neglected horlers or in waste land.

The manufacture of silk is censidered as an import. ant braneh of French industry, not cnly on account of the varlety and beauty of the falirles, but hecause the raw material is an indlgenous product of the country. It was estimated* 20 years ago that the amount of the annual sales to foreigners was $80,000,000 \mathrm{fr}$; that the home consumptim. of the kingdom amonuts to Eis, 838,834 ; and that the whele annnal value of the sllk manufacture was equal to $£ 4,598,889$. The manufacture of adk is not confined to any particular spot. It is carried on in different parts of the country, in all of whlch it diffuses prosperity. It has enriched the poor of Nimes, of Avignon, and of Tours. St. Chamond and St. Etienne owe a great part of their prosperity to the manufactura of ribions, and the town of Ganges to bohneterie. Paris derives immense profits from her manufncture of sille stockings, and other fisbries, either of silk with a mixture of silk, or of wool and cotton. Silk is also the great staple munufacture of Lyons, in which it is carried on in ail its branches with nstonich... succens : and rince the Revolution, ill addition to fatrics of ailk, all sorts of stuffs mixed with silk, and with cotton and wool, have been eanufactured; and to the ${ }^{2}$ manufacturee lyuns is in delted for ltas riches, having risen not only to be the seread tok $n$ ln France, but one of the most oppalent and fiourishing cities in the world. It was 20 years ago estimated that about 60,000 or 70,000 individuals, young and old, were supported ly the silk manuficture in Iyons and the adjacent dist rict ; hut the number has incriased 25 jer cent. alnce 1835. The dyeing of silk being an important branch of the manufacture, many experiments were made to bring it to perfection; and, in particular, a dye of perfect black that woula retaia its color was a desideratum. This dye was invented by a common dyer at lyons, wha received a pension, bealde boing made a member of the legion of Honor. Priser to this, the black dye which was naed changed in a few days to a brown, and cams off the stuti when it was lard pressed by the hand. Another improve. melat which was made cousisted in producing a silk of is ermanent white color. The egtss of the worm which protuced this silk were brought from China, nut how. ever with the ilesired sucesas. The worm was afterward purchased from a merchent of Alais, and distributed in the norehern departmeni of the country; and the produce of white silk is now very considerable, and of great importance in the manufacture of ganes, crapes, and tullcs. Other inventions wre devised for saving la'or a the sarious stages of the silk manufacture, by which, in this branch of industry, branco was long enabled to outstrip all her neighbors, though of late yeara the silk manufacture bas made immense advances in Great IJritain.

There were in 1820 no less thmn $9,831,624$ mulderry trees in l'rance for the nourlshment of the silk-warm. These supplied food for cocoons producing in 1819 , accoraling to Chapial, $5,147,609$ kilogrammes oi cocoons, In 1835 , the product had increased $9,0001,000$, yirlding
 granmen orgnazine. At present (1855) the quantity of silk furnixhed nmonnts to $1,600,000$ kilogrammes; whieh, nt 55 fr. per kilogramme, the nverage price, gives a sum of $K 8,000,010) \mathrm{fr}$. as the value of the mount prodaced. In 1810 the amount was only $4,038,1: 10$ kilogrammer of cocoons, at 3 fr . 15 enn. jur kilugranume. In 1830 it liad riacn to $9,007,967$, nt is fr. Switzarland, Turkey, and Greece, aupply the larger part. A amall quentity is oitained invm Austris and Sardinia. The exportation cf eilks, plsin aud fiowered, from 1787 to 1789 , on a mean of 10 yasis, was $87 \frac{1}{2}$ millions of francs in value. In 1829 it was 111,000,000, and in $1836206 \frac{1}{2}$ millions of francs, consisting of $2,720,94.4$ kilogrammes, under 22 different denominations of gooda. The United Statea, England, Germany, then ilelgium, and, lastly, Spaln, are the prificipal outlets for the sllks of France; but South America, Rusais, and Switzerland, are aleo conaiderable purchasers. France axporta ailka to a large amount in the way of transit. Lyona, Avignon, Tours, and Nimea, ara the principnal seats of the mannfacture of silk stuffs; and St. Etienne, St. Chamond, and Paris, for that of ribboas. In the arrondissement of lyons and Ville Franche, there are 81,083 looms. The manufacture of ribbons at St. Etienne employa 20,000 workmen and 30,000 looms, producing $27,473,000$ fr. value annually. The fabrication is divided into the manufactures unis and fuconnés. Under the first head are those with the prefix gros; as, gros de Naples; those called pout de soie, juntard, cripes, whleh last ars subdivided; then satins and the like. The ribbons are, in like manner, distinguished by different appellations, after the nature of the fabric. St. Dtienne omploys in all 279,000 spindes (broches); of which 165,000 work organzinea und trames, and 114,000 work tho silk intended for crojes and gauze ribbons. The number of lowms has been estimated in all at 65,000 for weaving silks, and 80,000 for riblons.

The raw sllk or silk-wool consumed in France in 1840 was valued at $53,731,586 \mathrm{fr}$; ; whits the value of the silke in transit reached $40,134,301 \mathrm{fr}$. 1'anin and flowered silk consmmed at home, $=5,299,190 \mathrm{fr}$. that which passed In transit $=37,204,483$ fr. ; being a total of $136,369,810 \mathrm{fr}$. A lecree of the 1 hth Augnst, $\mathbf{1 8 5 2}$, permits the free :- portatione of silk.
The silk-wool of French production exported in 1840 wss valued at $\mathbf{3 , 7 8 8}, 10: 1 \mathrm{fr}$; the foreign grown silkwool exported at $47,491,154 \mathrm{fr}$. The value of the export and import together was thus $380,256,696 \mathrm{fr}$. The following are the most important districts of the mallerry, with the growth respectively, and the cocoons produced in 1840:

| Matricts. | 14artarun. | Cormony. |
| :---: | :---: | :---: |
| Gard | 14,911 | Kíligerammet. 2,096,000) |

| Tetal | $89,7 \% 0$ | 11,058.358 |

About $\mathbf{0} 00,000 \mathrm{kllogrammes}$ of cocoons are produced in the other departments. The importatio: of E.nglish woven silk Into France In $1855^{3}$ was 52,702 kilogrammes, In value $5,464,609 \mathrm{fr}$.
Articles of leather are in France mach cheaper than in England.

Serciny, Porcelain, etc.-Jewelry is made in l'arls to tha value of $60,000,000 \mathrm{fr}$. Lyoms, Marseilles, Bordeaux, Clermont, and Strabbourg are also famous for jewehy. Wateh and clock-making are earried on to a great extent in Franen, particularly in l'aris. A time-piece la there a much moro freguent artlele of ornamental furnitire than in Fagland; and the number of clocks and watches made annually in the kinglon is not less in value than $80,(000,000$ fr., employing 10,000 hands. The works in bronze are chietty manisfactured in the cepital, and reach, in their ditherent branches nud stagea, of which gililing to the chief, a further annual value of $87,000,000 \mathrm{fr}$.
Paris is remarkable for other fabrien of tasto and laxury ; in particular, the porcelaln uf Sovvres, near St.

Cloud, and the beautiful bit very axpenaive tapeatry of the Gobelines. Tha materials of the latter are ailk and the finest woolen thread; the aubjecta woven into the work are taken from paintinga execnted on parpose. Both the establiahmenta have been long conducted by govermment at a eacrifice, and both are now on a reduced scale, the articles being far too coatly for ordinary fortunce. The articlea more frequently purchssed are passementerie, by which is understood artlficial flowers, fringas, gold and silver lace, with a variety of trifling but tasteful articles, all sufficiently adapted to a city where so much more is thought of display than of utility.
Soup,-The value of all the aoap sade in France ia computed at $80,000,000 \mathrm{f}:$. The main ingredient is olive oil; and Marseilles was formerly the seat of this manufacture for almost all France-an advantage owing hoth to tho extent of the olive-grounds in the south-east of the kingdom, and the vicinity of Marselles to Italy, the Levant, and Spain, whence soda and olive oil were imported in vast quantities. A milllon of franes were paid for bounties on the export of soap in 1852. The oxport of soap from France in 1838 was $2,911,631$ kilngrainmes, valued at $2,941,631 \mathrm{fr}$. The disorders of the first Revolution, and the establishment of similar manufactures in other parts of France, have caused to Marseilles the loss of a third of ita sonp works; they are etlll, however, very extensive. Of the oil used in lirance, whale oil forms a very small proportion: the great supply is of vegetable oil, viz., that extracted from the rape and cole-seed of the nerth, and the olive oil of the south.
Beer, formerly little drunk is France, has become of extended consumption since 1790 ; but even at present, the quantity used does not exceed $£ 2,000,000$ sterling, ita place beings supplied by cider in the north, and by wine in the south. Within the last few yoars thero is a considerable consumption of English bottled stout and porter, and a losser, though increasing, consumption of Einglish ale. The breweries have increased, and are inerersing, in Parls, as well as in the northern vepartments. The consumption which corresponds to that of linglish home-made spirits and rum, is in hrandy, of which the value annually made is between $£ 2,000,000$ and $£ 6,000,000$ sterling. The distillation varies in amount with the season. The irandies of Cognac, Jarnac, and Angouléme, are most in esteem. The best brandy is made in a district called Champagne, comprehending a part of Saintes Jonzac and Cognae territory. In liranche-Compto and Alsace, a brandy called Klrach la made, but littlo of which is exported. The liérault, Aude, and Gard, supply the largest quantity of spirit of wine. The hest in called that of trois-uix. The amount virles frem 40,000 to 80,000 plpes of 80 veltes, tive of which form a quintal. A velte is $; \cdot 61$ litres $=1 \times t i 5$ gallun. lheer is brewed in the northern and castern departmen's, viz.

Clder is made everywhere ; In largest quantity in the Nord Gecidental, and the best in la Mancha and Calvadas. Some is dlatilled for trandy. The quantity is extimated at $11,004,000$ hectolitres, at 7 fr. 75 cen. Nornundy fumishos laif. The whole is worth id,000,000 fr. 'There is also a conslderable distillation of spirit from potatoes, "which," says Chuptal (vol. il., p. 19:i), "has been generally approved, and hat been brought into competition with brandy.

Lesser Manufactures.-Of hats, the manufactures, formerly concentrated at I.yons and Marseilles, are now diffiused throughout soveral towna; and the value annually nude is about $24,600,000$ fr. 'T he lut nunufacture of laris is estimated at an minual production of $1,200,000$, of the average value of five france each, and employing 2000 men and 2500 wumen. Superior
qualities of silk hate ara aold to the retail tradesmen at from 9 fr . to 11 fr ., for which the latter olstain from 15 fr . to 18 fr . The hat manufacture in France einploya 17,000 hands, and ylelde a valus of $10,500,000 \mathrm{fr}$., In 1159 workshops. The second order of hutters, who finish tha hats according to the different tastes roquired, elovate the value of the trade to $24,375,000 \mathrm{fr}$. The manufacture of gloves-princlpally maile at Grenoble, though called "Paria gloves"-employs 25,000 persons. In 1839, the value of the gloves made in France was $0,436,000 \mathrm{fr}$. $;$ In $1840,5,556,000 \mathrm{fr}$. The tanneries prepare $33,286,004$ kilogrammes of leather, valued at $82,864,70 \mathrm{fr}$., for boots, shoes anddlery, ctc. Perfumery is made extenslvely in Paris, and in the south, chiefly at Montpellier, where, from the mildness of the climate, aromatic plants aro abumdant. The value of the manufucture ls sbout $13,000,000 \mathrm{fr}$. Phper being exempe from the heavy duties of England, is sold in France upon very reasonable terms, while in quality it is equal to our own. The value annuall'; used in printing and in writing is computel at 25,000 ,000 of fruncs; and the paper employed in the nanging of rooms is estimated at an equal value. Of glass, the manufacture has been nuch inproved and extended during the present age. Whether for mirrors, for windows, or for bottlea, this articlo In Franco is good, and of a moderate prico. The nuuber of glanshouses in 1818 was 185, and ls now over 220 . Small mirrors are manufactured much cheaper in Firance than in England. Bolsemis is the country with which the French manuficturers state they can not competc. AA to earthen ware, it is only since 1790 that Einglish pottery has leen auccessfully Imitated In France. It is now made to the value of $29,000,000 \mathrm{fr}$. ; while tho conrse carthenware, fabricated in slmost every province of the kingilom, is computed at $15,900,621 \mathrm{fr}$., employing 10,433 hands. French eartheuwure is very inferier to linglish. Saltpetre, till lately a monopolized manufacture, is now unrestricted. Sulphuric acid has, since the lieginning of the present century, been graatly lowered in price and increased in quantity.

Sugar.-The manufacture of augar from beet-root was introduced into France during the relgn of Napoleon Bunaparte, when, the cousts of Frnnce being blockaded by the lleets of Jritain, the Inportation of foreign articles, and among others that of sugar, wan rendered dangerous and dificult ; and its price was so high as entirely to preclude its consumption by the middle classen of society. Varions articles were resorted to as mulstitutes, such as honsy, and juice of rsisinn, etc., but they were not relished by the taste of the people; and in this case experiments were tried by eminent chemists to extract from leet-root the sugar which it containec. These experiments were auccessful. There were in $1 \times 31$ more than 200 establishmente, from which wero promuced arnually $7,480,009$ pounds of raw sugar; und there were in 1854301 , producing $62,205,600$ pounds. 'The largest sum paid by the admiuistration of the customs has been for refined augnr. It amounted in $180 \%$ to $16,-$ $000,000 \mathrm{fr}$.

Muchinery.-The manufacture of machinery has greatly increared. Steam-engines have been introduced Into France from Cireat Ilritaln, where they aro now employed in every department of indantry. It was in the year 1789, at the village of Challot, near Paris, that the first ateam-engine was establishedi in France: hut, owing to projudices, and attachunent to old customs, it wan loug beforn these engines came into very general une. I'rejudice, however, gradually fadell away before the productive jowirs and manifent atility of this extraorilieary application of science to the business of life, and there are now many establimhmenta for the manufacture of these machines. The acarelty of coal is a great olsotruction to the extenaive une of steam-engines; and the tax on foreign coal is, In thin view, peculrarly impolitic, and injuriotin to the
general interests of the community. The tax, though otely reduced by the Imperial government, requires still further reduction.

In 1836, of 17.19 steam-engines in France, 1893 were home made. In 1839 the linport surpassed the export. Since that year the reverse has been the case. Tho metalle castings in Franca are etlll very inferior to those of England. I'aris is the princlpal seat of the manufacture of French machlnery, then Arras, Creuzot, Jouen, Mulhausen, and Nantes. Lacomotive engines are mude at Bitschwiller, in the department of the It :at-Rhin; muchinery for staani-vessels at Indret. The value of French Industry has been estimated In the moan product as follows:

| Iron from the ore to the perfect state, minorals, ote. | $\begin{gathered} \text { Frances, } \\ 124,000,0000 \end{gathered}$ |

" Jabor in Paris is as much dearer relatively to the provincial towns of lirance, as labor in leendon is relatively to those of lingland. It still remains for us to remove from our capital some manufactures which bave been most injudiciously eatahlinhed there; but the French have carried this falme ealculation mach further, I'uris being the centre not only of ornamental fubrics, such an jowelry, bronze, sculpture, cabinetuaking, and the vast variety of elogant tritles comprised under the term "articlen de Jerix," but of a number of coarser emplnyments, which a very slight chunge of plan might transfer to a chemper guarter. Periodical exhibitions of French inunufactures are hed at l'aris every three or four years, at which are pres. ent the sovereign, the princes, the mobility, and all emisent men of sclence. In $1 \times 55$ was openel in Paris an Sixhibition of the Industry of all Nations, similar to that which took place in loudon in 1851, and in Doblin in Iñ3. The larisian exhilition, like the Dublin one, contuined a branch dediatel to tho fine arty. Thls exprosition contintued open from May till the mildle of November. It wan twico visited by her majenty Queen V'ictoria leet ween the 20 th and $25 t h$ Auguat in her nine days' vinit to lirunce. There is Who in that capital a Conservatoire des $A$ rts at dis Mitirers a collection, on a large acale, of nomelels uf all Instruments or machines that relate to arte ani manufacturen. It is more the practice also in lirame than in Hritan to emeorago ingenious inventions in the merhational arts, by premiunta, orders of morit. aus other homorary marks of diatinction. Yet, with ail theres advantagen, imlus".' 位 not made the same progreas as In this country.
"Topreseribe the mode of mannfacture was formenly a favorito course with government in lingl.ud as in France. Vronn the thme of Culbert ( 1 1i60) the French ordombances preseribel peremptorily the length nald brealth of sergen, of Iruggets, in whort, of every kind of viluth valculated fos export, under the phausible bleas that all theme premutions were necessary to extablish a reputation fur quality. It la $n$ rurions fict, that theve rules weris desired hy the manufucturers them-

selves, and wore long considered as the safeguard of ; them have been more proaperous, but for tho regula: French industry. A change was introduced i: 1779, and permission given to every manufacturer to follow his own method, provided he dletinguished the goods thus made from those which were in conformity with the reguiations. But this was of very ahort duration. The power of habit and prejudice prevalied. New ordonnances, lsaued the auccesdng year, revived the former i:nitations; and the manufacturers of France were $n$ is put on an uneestricted footing tiil the Revolution. Wuch inconvenience had also been suatalned from the absurd lnw which prevented a workman from setting in business in any town oxcepting that !n which he had served in apprenticeshlp. Thia law was alirugated in 1767.
"The manufacturing industry of France is confined, far more than ours, te the home market, whether we trok to the supply of the raw material, or to the export of the finiahed articles. Her imports are large only in cotton and elik; in wooien and iron they are not considerable; while in flax, hemp, and leather, they may be termed insignificant. In exports the llmitntion is atiil more striking, her hardware, her iinen, her woolens, her cotton, her leuther, and, in a great measure, her ailk, being confined to the home market; a restriction owing partly to our manufacturing superiority, but more to the capital of our merchants, their ability to give long credit, nod to deal with foreign traders and merchants in a liberal and not in a petty retail splrit. The productive induatry of France is consequently much less sulbject than nurs to sulden fluctuation. It fellows neariy the same routine year after year. On the occurrence of a war, or other political change, the commerce and mnnufactures of our neighbors, to borrow a phrase of Talleyrand (Letter to Mr. Fox, 1st April, 1806), re replient sur eurmémes."-E. B.
Commerce, Colonies, Fisheries, Shipping.-In no country in Europe has trade been lald under such gsiling restrictions as in Franco; and it is remarkable that this syatem of restriction has in $n$ great measure been the creation of modern times. The uncient legislation of the kingdom was rather frienilly to foreign trade. It encouraged haportation in preference to exportation. This Intter privilege of export was in 1577 ciaimed ly Henrl 1H, as his royal and aeignoriai right ; and he regulated by his ordonnances the export duty on a variety of articles, while the produce of foreign countries wns admitted on parment of an ad calorem duty of 2 per cent. Louis XIV. introducel a sort of navigation act, by which he levied a tax of 50 sous on all foreign ships. In 1667 further restrictions were introluced; and in 1687 the exclusive systen was established in its flll rigor. The ataternen of France neem to have imagined that a tlouristing comurere could be ereated by legal anthority, and that domestic Indiastry couid only be encouraged by the exchusion of nit fercign competition; and hence all the vices and olsolate maxins of the mercantile system will stili be found in the commerciat priticy of our nelghiors. The extensien of the restrictive system was promoted liy the antherity of Collest, a ninister who, though the introduced oriter into the tinancea, and improved in many particuiars the system of taxation, and was indeed a grent master of detail, miopted the roost efreneous maxima of commercini ieginlation. It is justiy olserved, in the report of Vifiers and flowring on the commereiai reinlions between Great ilritain and lranee, that the "whoie of the bounties by which ho induceni ndyenlurers to enter into remute apeculations, na well na the excessive dutiea which he impused on cheaper fureign articles, were aimost uncompensated sacritleas: while, on the other hand, of the manufactures wiich the 'ranuplanted Into Frnnce, and which he protected by the exeiusion of rival productions, nestrely one took permsnent root;" and even these which the inteniled to support hy special encourngement would all of
tions with which his mistaken zeal retarded the progrese of manufacturing industry. Hia whole syatem was an attempt to regulate by law what would have been betyer left so the sagacity of individunls, and to give a frced and artifcial direction to the national capital. Thus he encouraged a trade to the West indles by granting a bounty of 25 s . on every ton of yooda exparted, and of 41s. 8d. on every ton imported. He boasted of aettlng up 40,000 looms by virtue of legal ena, menta, without considering that the capital empluyed in these eatabliehinents would have taken a moro ratural direction, and been more profitably omployed. hut for his interference. The reatraints also whi - , re thus Inid on domestic industry were often ек.: : it by the deapotic authority of government. $\mathrm{M} \cdot$ :ig of the absurd and pernicious regulations of Colbert were broken down by the first French Revolution; but others rempined, and the tariff of 1791 was from heginning to end a system of prohibition, the object of which was to encourage the home manufactarer by frecing him from all foreign competitors. It must be confessed that England set the exampie of iliberality; and it was no wonder that the French of that day should be jealous of a country which excluded her aiiks und cambrics, and laid a discriminating duty of 334 per cent. on French wines ; and whose Parliament, under the reign of William III., declared the trade with France to be a nuisance. The commercial treaty concluded with France in 1786 by Mr. Pitt was the earnest of a better system. Since thls period the legislature of this country have been impreased with the injurions tendency of all commercial restrictiona. But in France the progress of improvement has been slower, and it has hesides been retarded by political events. The long and aanguinary war waged between Great Britain and France aubjected the latter to the maritime hostility of her powerful opponent, the consequence of whicin was, that her trade with foreign countries was interruptel, and tho supply of many of their staple artlcies of produce greatiy diminished, and raised enormourly in price. It became a great object, in this case, to produce these articles at home. In addition to the existing restrainta upon the importation of foreign manufactures, special encouragements were given to the production of articles for whicis nelther the soil nor the climnte of France was pecullarly fitted. Thus when the maritime blocknde of France was raised by the peace of 1814 , her industry, partly from ancient nad nistaken maxims, partly from the pressures of war, received a very artilicial direction, and was oppressed by ruinous and complicated rostrictlons. At the restoration of the Bourbons in 1814, the tariff of 1791 wne tho haw of the land. It had undergone a few modifications, but these were mostly in the restrictive and prohllititory spirit, and wero accommodated to the hostilo position which France occapied in regard to surcounding nations. When the barrier to a free interconrse with foreign nations was at length thrown lown ly the pence of 1814, tho exclusive provisions of the tariff of 1791 were lroight inte fuil operation; nnd when the elsstacles to the commereiai intercourse of Feance with forelga asetons raised up by the war were withdrawn, a no less effectnai fine of circumvailation was drawn around her commerve ly the restrictions nud prohilitions of her own erromeens policy. It is remarkalile, indeed, that a commaltee of the Clinmber of Deputies, in reporting on the luadget in 1832, enters into nn exposition and diefense of tho restrictive system, tie prineipie of whieh is to encnurage domentic industry ly the exciusion of the cheapor and better manufactures of foreign nations.
'The tariff of 1791 either excluded from lirance, or luid unier hony duties, almost all the great atnplo manufactures of other countries. Manufactured irou in every shapo, manufactared steel, oopper, tin, cut-
lery, and all articles manufactured from any of the metals; all fabries of wool, cotton, allk, or tissnes of halr, saddlery, aplrituons liquors, grain, refined sugar, tobacco, toys, and varions other inconslderable artleles, are Included In this charta of domestic commerce. The Inconsistency, and the fullacles on which this aystem is founded, are well expesed in the report of Villlors and Bowring. The passnge, though somewhat long, is replete with instruction.
"It requires merely to state come of the objections to Im . portations in order to show theis narrow and anti commercial spirlt. The introduction of manufactured tin, for exampio, is opposed becanme it might beneft Engiend, which in rich in iln mines, as if the Importation Into France could take piaee withont a ually bencfiting her. The reasons, too, whith are groundea on the superiority of other countrioa; as, for example, 'dnogeroun rivalry' in the case of manufactured steel : 'cheapness' of forelgn articles in the case of shipping ; threatened 'annilhitation of the Freach manufacture' In that of cutlery; 'extra advantages of the Finglidh' In pieted ware; 'apprehension of the Engilah' in articies of pottery ; 'imprudence of admittiag Einglish maddiery', as so many persons, regardless of price. prefer it; 'ndvantages of machinory' in works of iron; all are modes of annonucing the auperiority of the forelgn articles, and the powor which forcigners poseess of enjplylug them on cheaper terma than they can bo produced at home.
"There are other grounds of prohiblion by which particular French manufnetures are avowediy sacrificed to the Interest of other branchea of French tnduatry. The imporintion of extracts of dye-wooda la diantlowed for the purpose of encouraging the importation of the dye-woods themaeiven; thr interest of the dyer, the manafacturer, the consumier, being wholly forgotten. The importation of iron of certain aizes is prohilited, feat amail manufacturere should estabilish falirics, nad aupply the markets at a leas cost than the larger cstabHishments. Wiolen yarn is not aliowed to be imported tecanke It can be prodaced in France, though the high price must he a great detriment to the woolen manufacture ; a ad caat fron of a grent variety of aorts is prohibited, on the ground that a audicieney nuy be obtained at home, though the cost $h$ notoriously mure than double that of many artielen of torelgu cast Iron. Motasses is not allowed to be Introduced, because the price In France in so low, wind the exportation so large, on the gronnd that importation will lower the prices atilt more, though the lowness of prien woild olviously make importation unproftable 1 and the fact of conmiderable exportation te the best evidence that the average prices are icw'n France. Rock salt wan prohiblted in 1791, and the prohibition la now juatified on the ground that m!nes have futuly been diacorcred. The prohibition of refined sugar was supported on the ground that lis adalssion would not thencfit the troasury ; hut it is clear, If the interest of the fonatury were 1 spt in view, that sif prohibitions would be . ppriamed, or auperwided by a ayatem of deties. While poms artietes are prohibited becanse tho production os small th France, a: $d$ requalree protection, othern are prohblited (dressed skisa, for examptes because the productiou iagreat, and eugngen a large number of hands."

There is another franch of the French leginiation resarding commerce, which is ecqually exceptiopable with the prohilition to import forelga manufactures: namely, the system of drawhacks and bounties on the exportation of tomestic proiuce. Laving by sjecial encouragements created a surplus of certain articles at home, and which the high price prevented from being noll to foreignern, the public were called upon to pay the difference letween this ligh price and tho price abroal ; and thus they were taxed, by the exclusion of the fureign article, in a bligher price fur what was consumed at home, and also taxed for all that was consumed abroad, in the bounty which was phid on the exportation of the article. This is a duabia inlquity, which has gone on increasing in France. In 1817, the whole anount of what was concedel on this account amountel to tikitoo jer annum, while in 3 whi It amourted to $\mathbf{f} 600,(0) 0$, hearly one lifth of the nett amount of the whole custom-house revenues of france ; and as it was going on progreasively, it might aoon have absarbed the whule custom-house income, without In the least benefiting, but rather injusing, the genaral intereste of commerce, Juring the firat nine
months of the year 1832 premiums or bountiea were paid to the amount of $24,448,375$ francs, or $£ 1,018,682$.

The commerce of France, obatructed by these rsstrictive duties, has not made the same advances as her egriculture and manufsctares. The internal produce of every country necessarlly increases with its popuIntion; and the inhablanta of France having increased, since 1780 to 1855 , to full $36,000,000$ (for the census of 1851 makes the population $85,781,628$ ) from $24,800,010$ must produce as well as conaume more. But $\ln$ the mean time her commerce has not kept pace with this increase in her population. The value of the Imports into France amounted in 1787 to $631,790,700$ france, or about $£ 25,000,000$ sterling, and engaged 888,868 tons of shipping; and her whols imports only arrounted in 1830 to $\$ 25,500,000$ sterling, and employed $1,009,454$ tons of shipplng, which is far from being au inerease corresponding to her augmented population. According to the last accounts, the value of imports was in $1853 £ 65,2 \cdot 10,000$, of whleh to the value of $£ 44,120,000$ remained for home consumption, and engnged $4,605,000$ tons of shipping. The whole trade of France with its own coloniea and foreign powers amounted for the yesr 1853 to an official value of $8,448,000,000$ of francs, which was an increase of 12 per cent. on the year 185\%, and an increase of 32 per cent. on the average of the years between 1844 and 1848. The foreign commercs of England was, In the year 1787 about $7,000,000$ less than that of lirance, or about $£ 18,000,000$ sterling, and employed $1,349,419$ tons of shippling. Her popnlation was $9,000,000$. In 1830 her foreign trade had increased to $\mathbf{x} 69,700,748$, Including $\mathbf{5 1 7 , 1 2 7 , 7 6 4}$ to the colonies, which employed $2,866,615$ tona of shipping, Thu, while the official value of the cominerce of England had nearly quadruplen, and her shlpping nearty cloubled in forty-three years, not above one fiftieth part was allued to the foreign conmeres of lirance; a fact which strongly illustrates the pernicious influence of monopolies in damping the energiea of individual enterprise, and thus obstructing the national prosperity.

- Opfictar Valye or Inporys and Exporta,

The intereourse of France with $\mathrm{its}_{\text {colonies and for- }}$ eign States in 1853, exports and lmports united, formed a kuin in oflicial valuo equal to $3,40:, 000,000$ frazes, being an augmentation of $873,000,010$ franes ovor 1852. The actual value of tho imports in 1853 was $1,217,000,000$ franes against $1,006,000,000$ francs in 1802 , and of the exports the artual value was 1,572 ,000,600 francs againat $1,268,000,000$ franes in 18.52. The ceean imports were in actual value $1,070,000,000$ franen, and those hy land $626 i, 0001,900$ france. The exports by sen were $1,633,0 \times 0,400$ francs act unl valne, and those by land, $42(1,000,000$ france.

Obsereations on Tivide. - During the four years from 1850 to 1804 inclusive, the value of French commetre has augineuted 30d,329 franes, and the number of sesmen employed has increased 19,046 . The exporta to Kussin, owing to the war, wore reluced in leyb te three ouward-bound vessels. The commerce with England has increased with great rapidity, having nearly doniber! tho amonnt in 1800 . With sweden and Norway the lnerense has alao heen ronsiderable. With Aust rid, on the other haml, theru has been a iliminuthm, and also with the Koman States. With China there is an inerpasing trate, as well as with the United Statea of America, but with Kio de la Plata nnif licuador there has been a falling olf. Must of the other States with which Franco carries on a cummercial intercourse, exhilited an lacreast which, if suall, augmented the general comaneres so much as to show

Returns of the customs duties levied on the princlpal merchandise imported into France during the nine menths of 1855 onding on the 1st of October, give an amount of $£ 5,927,030$. Compared with those of 1854 , they show an angmentation of $£ 1,723,976$. The receipts during the month of September wero $£ 465,688$, or $£ 40,383$ less than in the corresponding month of last year. The ealt-tax pre luced during the nine menths of 1855, $£ 930,891$.
The value of exports in 1853 reached $£ 71,640,000$, of which $£ 54,520,000$ reprosented Fresch prosluce, and $£ 20,5 \pm 0,000$ was forelgn proxluce re-exported. The imports for home consumption showed an increase of \&4, 680,000 , and the exporta of French produce an In cresse of $£ 5,200,000$ nlove 1852 .
The following is a brief sketeh of the trade of France with other cometries :
The corn, the hemp, the finx, the tallow, whirh form such importint articlen of export from the worth of Farope to liagland, are comparntively unnecessary to France. Their timber and pitth are limported there, but the quantities required by a people where shipbuilding is so limited, are necossarly of little consequence. It would nppear, however, that in the progress of the recent war aguinst lissia, many nrticles imported from the north of Europe have hecone more neceasary to France, and by a decree puthlshed in the Moniterir on the whth Detober, 185s, buildingthmber, wool for cabinet-making, of a certaln thickness, rough castings, bar and shrit arom, hemp, etc., may be impurted for thrve years free from lmport duty. litch, tar, nid tallow, whom omployed in shipboliding, may to imported at a daty of 10 per cent. If it can toe proved they havo been ued bona file for the purpose within a year. The further articles of import are Iron, cepper, lent, anlt tish, all likewise on a small ncale. The returns from lirance are no longer in the sugar and coffee, which, before the lose of St. Domingo, furnluhed an anuual export to the north of fully $£ 2,(60,060$ aterling. They aro limited to wino and brandy, luxurles of which the consumption is cons-
burg, Lubec, Stockholm, and Dantzic.
With Germany the exchanges of France are now carried on by steam, canal, and land-carriage, and for lighter articles and articles de Paris by rallroad, and river navigation.
From Holland are Imported spirituous liquors, splces, butter, cheese. The returna from France consist chiefly of wine, silks, hrandy, and dried fruit. When the Netherlands were subject, to France, this intercourse was vety active.

From Italy, France lmports raw silk, corn, rice, otiva sill, and fruit, chiefly lemons, oranges, figs, and ralsins. The returns, various in kind, but small in quantity, vonsist of wine, brandy, cattle, woolens, linen, leather, hats, stockinga, jewelry, flass, hardware. From the Levant, the imports, though less than formerly, still consist of raw sllk, cotton, wool, corn, drled fruits ; the exports, manufactured silks, woolens, stockings, and, in a small degree, hardware, paper, liquors, linens, lace. With Spain the intercourse is more extensive; the exports from France consist of corn, flour, salt fish, wines, lirandy, alse woolens, cottons, eilke, leather, linen, lace, hats; all micles which have passed through some process of manufacture, and bear testimony to the industry of tho Frouch. The Spaniards, on the other hand, true to their charncter, make no returns except in produce and raw materials, viz.: wool, silk, frait, sweet wines, along with some iron and copper. During the years 1854 and 1855 there have been considerable exportations of Spanish wine into France for the use of the French troops serving in the Crimea. With Portugal the trade of France is not considerable, the ataple products, wine and brandy, being the sane in beth countries.

The intercourse between the French and Americans should be great, but the Americans require long credit, and to give credit exceeds the means $c$. the French. The cotton, tobacco, and rice of the United States are paid partly by wine and lorandy, but in a slight degres by man'facture 1 . This branch ot trade will increase with the population and wealth of the Unitel States. At present the intercourse with lingland is more conslderable than with almost any other country; but a reduction of the custom-house duties would extend greatly the mutual trade of the two countrics. Great liritain would supply France in frenter quantities with imports, consisting of cottons, hardware, eurthenware, copper, tin, iron, coals, etc.; while a correspondiag increase wanld take place in the French exports. it which the staple nrticles are wine and brandy, the smaller silks, wlive-oil, fruit, butter, poultry, corn, and butcher's meat.

The chicf commercial lusiness of Paris is necessnrily lnland; but it is the centre of exchange trunse actions for lirance, foreign as well ns inland; ns London is for Einghand, anil Amsterdam for llolland. Havre de Grace is the channel for the maritime intercourse of the enpital, the ontlet for its exports, and the medium through which it recelves colonial produco, raw materials, und foreign manifactures. Burdeanx is a sea-port of great netivity, ns well for tho exportation of wine and brandy, as for the importation of sugar, coffee, mad cotton. Marvelles, n harger but n less bustling city, continues the emporium for the trule with Italy and the levant. Nuntes lus suffered greatly ly the loss of ist. Domingo, as well ns by the abolition of the slave-trade, of which it was the centre. It still exports to Martinique and Gaulaloupe, limen, harlware, printed cottons; and, like Bordeanx, recelves in return augar, coffee, and raw cotton. Rouen, though necessible to ressels of burden, is, like Iyons and Lille, chicily remarkable for mannfactures.

The mercantile marho of France recently presented the following results, which aro remarkable while En-
gland and America are bullding vessels of such superior tonnage :

| Tonnage. | Fersella, | Tohnape. | Tonnage. | Versels. | Tomal |

Manned, Including the men of the fisheries, by 83,000 men and boys.

The steam and aalling-vessols of France and the nations trading with her from 1848 to 1853 were as follows:
Navioation fon 1843 to 1853 inclusive-Farsen and Fonsion.

of Louls XIV. the French, by financial sacrifices, obtalned a numerical superlority, one great battle, that of La Hogue, in 1692, was sufficient to change the ascendaney. The war of 1741, however successful on the part of France by land, was, particularly toward its close, unfortunate to ber at sea. In the succeeding interval of peace, great efforts were made to reinstate the French navy ; but the war of 1756, though the French admiral, De la Galissonièr, boasted of a success over Byng, proved doubly disastrous, and at last swept it almest entirely from the ocean. A very different scenc opened in the war of 1778, when France, unembarrassed by a continental struggle, was enabled to direct all her dlaposable resources to her marine, an object of great care and eolicitude to Louis XVI. She was then enabled to keep in an effective state aloout 70 sall of the line, the crewe of which, adiled to those of the frigates and corvettes, formed a total of $60,000 \mathrm{sid}$ men. The injuries sustained by this force, toward the end of the war were repaired with great dillgence during the peace; and to prepare young ofliccrs for the sen in preference to the land service became a favorite object in several of the government schools. In 1791, an official report stated the effective French navy at 74 sail of the line, 62 frigates, and 29 corvettes; a state of preparation which accounta for the reslatance made by the revolutionary government under all the disadvantages of an unparalleled continental struggle.

Thade and Navioation of Fianer witi Fomeign Nations-Aotual. Vazug-Oontinuad

The proud naval force, however, tisuppeared prorressively at the capture of Toulon, the vietery of the 1st dune, 179.1, and still more in the victory of Abookir ; so that Bonnjurte, on his aceession to power, found the French marine in a very reduced state. He labored, however, to reinstate it. The years of continental peace, $1801,1852,180 \mathrm{a}$, and 1804 , were fivorahle to his efforts; nut in 1805 he loasted of having in equipment bo sail of the line, a force destined to an early diminution at Trafalgar and St. Domingo. The Boarhons, on recovering their crown, found little more than half the force which existed prevlously to tha Revolution. It has since leen augmented, and in 1831 it amounted to 35 shipso of the line, 40 frigates, 23 corvettes, 57 lirigs, 29 galliota and cutcere of elght and four guns, 12 steambeats, 16 armed store-ships, 82 armed transports, and two yachts; total, 28.4 ; and in $1 \times 34$, nceording to the last authentio uccount, it connisted of

(1855)

In the present year (1855) 14 ships of iron (nine being vessels of the line) have been launched, and 32 new vessels aro on the stocks.

On the 3at January, 1855, the officera of the French navy consisted of two amirals, 17 vice-amirals, 37 contre-nmirals, 108 capitnines, 238 capitaines de fregnte, 6 . 8 lieutenants, and 614 ensigns.

Fisheries.-The beunties puill for the cod-fisheries in 1852 absorbed between $6,000,000$ and $7,000,000$ of franes, which was double the sum paid on the avererage of the live years hetween 1820 and 1830 . The vessole equippod for the firheries of Newfoundland, St. l'ierre, Miquelon, etc., proceed from the ports of St. Malo, St. lirieue, and Granville. Ths vessels proceedlng to leeland sall from Dimkirk. The Fronch fish aro of very luferior quality to those caught by the Auericans, the lattor seiling at 17 franes 35 centimos per quinta?, whille the French eod-fish only brought 26 fruncs 95 centimes. With all thls oxpense, however, the French tisheries are not adequate to the sup-
piy of the coioulea, which recelve conslderable quantities of fish from foreiguers, as will be seen from the following table:

The mean of the first five years is above 391,915 quintals. Vexsels of Frunce epplayed in the fishorles generally-1818, $815 ; 1819,685 ; 1 \times 50,838 ; 18.11$, $925 ; 1852,059 ; 1853,913$. The mean of five yearn in 851 vessels. The total amount of colfish exported in 1853 from all the ports of France anommted to $1,637,931$ kilogramases, or 55,307 quintals. See arricle Fisiterieg.

Whate-fishery.-The whale-fintery was eatalilished In France in 1884, loy mean of encouragetments held out ty Louls XVI., who ordered that no duty shouhl lie collected on the articles exported, and that the produce of the fisherien shoull pray no import iluty. He guarantied the adsenturers arginst loss, and nltimately pald, in adidtion to $£ 12,5 \%$, whish he ulvanced without interest, an additional sum of cifist, being the balance of loss on $1 \hat{i}$ vogages. Notwithstanding these enconragements, the whole project was abundened in 1767 . In 1816 the offer of imuntles attracted new adventurers into this branch of trade. The promium offered by the goverument was 60 franes (en) per man, and two thirils of the crews were allowed to be foreigners. In $1 \times 12$ 4) franes were allowed to forelgn vessels having a crew half firench, 50) franes when the captain and one thind of the crew ware French; tho fremium to be doubled if the vossel passed cupre Horn. In 1829 a new ordonnance granted 90 francs per ton on vessels wholly equipped by Frencism , to franes when ouly two thirds wero Frenchmen, a. 30 If the enptain was a forvigner. The premium was doubled If the vesmel passed C'ape JIorn. A supplementary premiom was allowed to versels fimhing to the southreast of the Caje of Giool Hope, and the donble premium was given to all sossela firhing at a higher northero latitude than $60^{\circ}$; and an the fishong las seldom or never prosecuted at a lower latitule, thity premium of 180 frames per tun ( $\mathrm{f}_{1}^{\prime}$ 44.) wan Invarlably palld. The law of $\mathbf{J}$ sas , whith regulates the whalefishery of France, entahilished a lananty of of framea per ton from Mareh 1802 to Mareh 1atiz, if the whole erew were l'rench; the lounty to be dimlnished four frances yearly till it reached 54 frames. If one thithl of the erew be earelgnera, the bounty to be 48 franes per ton, to diminkh two frame yourly till it reachosl 40 Ifanem per ton. A supplementary bounty to lie given of 50 franes purton if the erew bie Froncid, deareasing three franes jer annum perton; and 24 franes if ond thinl be foreigners, leceraving one frane per annum, to be paid to vesmels doubling Caje llorn, or reaching $02^{\circ}$ of month latitule, if returuing with leat than half
a eargo, or after an absence of $\mathbf{1 6}$ wonths: 500 tons to be the minlmun for a clagle whaler.

Wlth these extraordinary encouragements, capital was attructed to this now line of indastry; and in 1831 thres vessels cleared ont for the Green'and winalefishery, and 13 for the South Sea fizhery, wheh em ployed 6412 tons of shlpping, and were manned by 551 inen. Notwithstanding all the bonnties given to the whale-fishery, France has very few vessels engaged $1 /$ it. There were only 17 ships in the trade in 1844 and 7 ouly re-entered French ports. There were lut o vessels left Have in -853, of a tonnage of 20.15 tons, and with a erew of 127 men . The return of the product was 112, is $^{5}$ kilogrammen of the whale, 1689 of the caehalot, and 81,710 kilogrammes of whalebone.

It was estimnted iy the minister of commerce, in hi eqpori on the shtij to the Chamber of Deputies

$\qquad$ at t t:s, rate of $£ 7212 \mathrm{~s}$ 。 jer man, or $£ 6$ ontlı; () $2+2 \mathrm{l}_{10}$ hips of war ameunted to £l yer in (hat ance to the seamen employet in the firest land fielow is six times the ordinary allowance of seamen it the public: service. It is remarkable that liranco was grantiag these extravagant allowaness for the emouragement of the whale-finhery exactly at the time that Gireat Britain was withurawing the bounties by which she had furmerly endenv. ored to promote this liranch of trade as a nursery for seamen. Yet, in 1830 , the number of vessels that cleared out for the thabery in lingland was 123, conslatigy of 10,166 toms, navigated by 5014 seamen; being thas alout eight tines the canantity of the tonage employed by France. The government of Louis Pdilippe, aharmat at the large oatlay in bounty, endeavored to lessen it, and to reader it transitory and tempowary oniy. M. d'Argont, the minister of commerce, innisted that these bounties exhausted the reaoures of the State, and decreusing hounties were ufter a period adopted, brat M. Comin Gridahe, who was minister of commerce, relapsed linto the oll error ly introlucing supplemental hounties. The provisional goverament of 1849, liy one doeree anfrmentel the homaties, and hy a second extended the terin of the law to 3hat December 1851. On the 22d of 5 uly, 1851, the 入ational Assembly voted for the continuance of the bounties to 1861.

Shipging.-France scens destined, by the natural ad vantages whlch the possersen, to lerome a maritime power of the fient rank. Her mentemat axceets ia extent that of any other continental state. On the Atlantle whe has 130 leagaen of coask 104 on the Channel, and 90 on the Slediterranean ; while buer position betwen northern and sonthern Furope, unil her numerous ports and navirable rivers, are eminently forable to the extension of her navfigntion. Put in this as in all other branches of the lireach trade, the ferejulicial effects of the rastrictive aystem bave beenainudantly manifest. France, in forcing a trale with her motowies, cortaining lews than lalf a million of inhalit unts, has sucritheel her trade with other trephial somenties and their numerons jepulation, to the great injury of her shipying literest. A great increase has tiken place in the tonnage employed in the coasting trade of France, a fact which affords elear and consitting whdence of the extending resources of the country, whits would have cqually ocensloned an increase in the :hipping employed in the foreliga an well as the domentir trade, if this impurtuat lirameln of induatry had not heren stunted in its natural growth he the monpmelizing system. The navigation of liranoo no doubt suferel grievously during the last war, uader the maritime houtility of firpat Isritaln. Hut in the course of nearly 20 years it wobld have reoovared from this statio of d. pression, if the nat.aral energles of the country lad been allowed free seopem in thin line of imbustry.

Butcher', Meat.--The Revolution of 1830 dil not alter the systen. provalling antecedently with respect to the trade In hutcher's meat, but modiffed it. The asme may he said of the Revol not change the syatem but nowificd under certah heads the practice of the trads. Th3 droits d'octroi et to crisse de Poisay were at fir "ppressed, then riestahlished, but with a radicil eli, cc In this respect, and levied hy torgh' of the cattle年别 so much per hesi, nit I fore. This niter twin had loug lreen ineffectually il manded ly the ng. ricultural breeters. Butchers rom ths iterior of Prance were also to provile sto and meat for the l'aris market oo well as their :r, thren of the eapital. These reguintiers and medif ations astisfied nelther agricultutioin ne: I utehers. in the menth ne Jannars, 145!, the National Assembly directed an inquiry into the production and consuinption of butcher's meat. The commisston charged with this inquiry seriously engaged in it, but the events of the od December, 185i, prevented it from finishing its tnsk. From the portion of the report, however, that has been printed, we know that it was the opinlon of the committee that there should be liberty of commerce in meat, and that the local authorities should, under no pretext whatsoe ver, be allowed to interfere with this cardinal principle. The committee considered meat, like spice, silk, or doth, a mercantile commodity, and were of opinion that the police should only interfere as to frauds in reference to quantity or quality, or as to the wholesomeness of the victual ne an artele of foor. This was only retaming to the principle professed in the taws of the 14th and 17th June, 1791, and the 18t Brumuire An. VII. On the question of the oftroi they were of opinion that it interfored with the price and ronsumption of foed, anil tha. it should the alolished from the 1st Junuary, 1860. Since this report was pullished the price of hutcher's ment has increased, and the supply hae dimbinished nt l'oissy, the great market which supplies Paris. In consequence of this, recourse was had to an expecient which sound politimal sclence has proved to be utterly ineffectual. An ondunance appeared in the Monifeir of the 11th and 12th Octoler, 1855, of which the following is the sul)stance:
"On anil after the 16 th of the present month, butcher's ment ehall le sold at prices taxed hy the authorities. The prices shall he fixed every fortnight for every kind of ment, accorling to the returus made at the Ciuisse de Poissy, and to the weight of meat ascertsined to have been rent from the pullic slaughterhosses of Paris during the preceding fortuight. In the shops established in the markets, meat shall be sold at 10c. at least, per kilogramme (alout a halfpenny per pound) hetow tho fixed price."
This deceee, which violates every sound principle of political economy; appears to have heen well received by the poorer classes of the population, who had long complained of the dearness of meat, and of the exorhitant profita of the lintelers. But the way to redave the profits of the hutcher is to destroy the monopoly, and to render tra? in meat frue.
Revenue and E:rperaliture - in Franer, the ancient evaten of taxation and finance was extremely unequal and oppressive. Her various provincess, thangh they were united huder one head, retained many of their ewn pectuliar laws and privilegea, which were abssurd in themselves, and opposed to the groneral intoresta of the emplire. Among these was an exemption from certain impests, to which some were sutjecten!, and consequently over-taxelt ; and others, again, contributed a certain quota of revenue to government, which they raised hy taxes imposed hy their own local suthorities. The consequence war, that no uniform aysten of taxution could be oxtablished throughout the comery; The taxea on many commolities were bigher in one province than in another; nad custom-
houses were accordingly estabilished on their respective frontlers, to prevent the importation of goods until they bad paid the duties. In this manner, owing th the Inequality of taxation, commoditiea could not froely nass from one din:rict of the country to unother ; and the jingdona "us thus brokea into eeparate divistons, to the frreat interrioption of trad?. The partial Ity $\mathrm{s}^{\prime}$,wn to tho privileged orders was another serlous grievance to the ancient system a. French taxation The taxes by wheh the publir zevenue was raised were, first, the taille, a tax on real property, or on income derived from cominer ea and industry. From this tax the lanils of the noilesse and elergy were exempt. "The tax was called taille," says Borel, "becuuse the peas: collectors, not knowing how to write, marked down what they hid received on a wooden tally." Secondly, the ringtizme was the tax of $1-20$ th on property, from which the clergy alone were exempted. This tax was established in 1750 , and was Ievied upon all property of whatevor description. In 1754, it was taken off the alsount of income arising from personal Industry. Thirdly, a poll tnx was levled on all classes indiscriminately. Many of the taxes were farmed by rich capitalists, called farmers-general, or fermiersgerseraux, who paid annually into the treasury a fixed sum, and collected the taxes from the people. These farmer-general held the monopoly of the manufacture and sale of totaseco and salt; and also the octroi, which wne a duty on nll articles entering Paris and other large towns. The power delegated to these contructors, was the source of grievous oppression tu the peoplle. The duties called aides were imposed on apirituous liquors and other articlea of consumption they also include duties on all nrticles worked $\ln$ gold or silver, on wrought iron, playing. cards, leather, paper, starch, ete. These duties levied by collectors for the lenctit of government were nbolishel by the National Assembly in 1790. 'The corve', which consisted in so many daya' laber annually, of men, horses, oxen, carriages, etc., was nominally applicable to the maintenance of roals. The tax was payatle either in money or in lator. The system of taxntion, so prejudicial to internal commerce, was, to a certnin oxtent, refermed hy Collert, the minister of Lonis XIV., who, though his views in regard to the principles of connmerce were narrow and illiteral, yet improved in many particulars the system of taxution, by rendering it more uniform, and thus breaking down the barriers which ohstructed the free intercourse hetween the different provinces. Under his administration the public reverute of France amounted in 1682 to $£ 5,000,000$.
The long and expensive wars of louis XIV. produced a great accumulation of delit (nearly $\{100$, $000,100 \mathrm{sterling}$ ), which, after his death, was lossened by an appeal to a singular privilege, of which advantage has often been taken in France, viz., that a new sovereign is not lround to pay the delts of his predecessor in full. During the 18th century, the revenue of France increased progressively, but more slowly than that of Fingland: the vicious system of farming the taxes still continued. Neeker, uppointel to office in 1731, endeavored to teach the French court the value of publicity in fuancial statements; and exhinited the rare example of a war conilnctod far several years without new taxes, the supplies lieing found hy loana, the interest of which was provided for by successive retrendruents in the pullic expenditure. Ilis successor, M. do Colonne, pursued n very different course, and was found altogether incapabile of the measure necessary to remedy an anmual deficiency of $£ 2,000,000$ The revenue of France was then uhout $\pm 22,000,000$ sterling. The aum required for payment of the interext of the pultic deht was nearly $10,000,000$ (Report of Camns to the Nationat Assembly In September, 17a0), leaving only $£ 12,000,000$ for the ariny, navy civil list, and other puthic expensen.
Such was the state of the lirench finances at the era
of the Revolution of 1789 , which was followed by invaafon on the frontier, and in the interior by all the confusion conseqreant on the relgn of terror. In thin era of conflacation and judicial murder, the national debt could hardly bo respected. It was not, however, openly canceled, but the interest wam iasued in asm aignate of no value except for purchanea of national property. At last, In 1798, on an approximation to regularity in the management of public buslness, there was passed a law declaring that one third of the old national delit should be aacred, and the interest on it payable in bons, or paper recelvable in discharge of taxes. This thind was called la tiera prorisgira, hut Ita price in the market continued very low until Ilonaparte aucceedel to power, and placel Guadin, afterwarl Duke of Gaeta, at the head of the treasury, when meane vere found to redeem the public funds from their depression, and to resume the phyment of the diviterds in cash. The amount of the revenue was greatly impaired ly the general confusion of the Revolution. In 1709 the expenditure exceeded the receipt by $£ 8,000,000$ sterling. (Gandin, Notire Ifistorique dea Finances de la france.) A partinl ceduction of expenditure, and improvements in the collection of the taxes, brought, in 1803 , the receipts to $\mathbf{£ 1 9 , 5 0 0 , 0 0 0 , \text { while }}$ the exjrenditure was $£: 20,000,000$. In sulsevfuent years loth receivel a progressive augmentation; and in 1813 the revenne derived from France, exclusive of conquered territory, was alrout $27,000,000$. On the restoration of the llourlons, in 1814, the public delt, funded and unfunded, did not exceed $123,000,000$ (thignon, Erpase Comparutif de fic F'rance) : its interent $\mathbf{x 7 , 9 0 0}$,000. France had thus a fair prospeet of financial prosperity, when the return of Bonapaite, and a second Invanion liy the allied troops, overthrew public credit, and produced a national loss and a general derangement of trade. It has been estimated that the returis of Napolen from Elba, which led to the second invasion of France liy the allied troopa occarioned a loss to the country of $4,000,000,000$ of francs. The direct losa, which Incluted the exprenses paith to the nilled powers, and those incurred hy the malntenamee of their armics, placed in cantonments throbghout France, may be estimate.t. but the indirect evils oceasinned lis the ravages inseparable front the invasion of a hostile army, by the confusion and derangement of all comanercial relations, and the impossibility of cols lecting the revenue in such a time of trouble, can not be summed up in monys. At the name time there are seancely any national diffrulties which may not tre overcone hy the enervica and joduatry of a free and intelligent people su*h as the French. With an inconaideralife aldition to het delt, France han defrayen all these heavy expenseg, the contritutions Imposel on her lyy the allied poweri, the expensen of the temporary maintemance of their aranies, and her own warlike expenses. For thit purpose, bawever, it hecame necessary in 1 nis to imporse mblitional tavem. Injelit a lome was required of ase, !a! , MiO francs; and in 1818, to defray the extraordinary contribution of $6: 5,807,1: 77$ francen, paid ln that year to the allies, the nimister had recourse to another fan of $220,510,71 \mathrm{x}$ francs; white, by the toxes which had been lmposed, the revenue of that year was carried to $\boldsymbol{e}^{5} 5,0,00,000$.

Hesides the public revenue of the empire, the communes raised a revenue for their own local expenses. According to the lutest publishel accounts, this revenue arisea partly from octrois, which amount throughout France (there being 1436 octrois) to $95,176,602$ francs, and partly from other sources, the whele of which amounted to $230,633,209$ franca $\ln 1850$. The total of the ordinary waye and meana of France in the Buagt Prarieoire of 1855 amulunted to $1,528,110,288$ francs. During the administration of M. Videle the five per cents. in Frunce were converted into a three per cent. fund, at the rate of $133 \cdot 33$ cents. for every 100 of the fiva jer cent. stock; so that the whole live per cent. stocs, bearing an annual intereat of $30,57.4,116$ francs, was converted into a three per cent. fund, of which the capital was increased one third. The etlect of this traneaction was, in reality, to reduce the interest on the five jer cent. stork to four per cent., by which he raved anmual interest to the amount of $6,000,000$, though by a very uselese complexity in his operationa. The interest on the public delt of France, thus reduced, may be stated as follows: it mounted in 1855 to $418,370,42$ frases. Tho sinking fond, or caisse d'amorfissment, ceased altogether its operations on the 14th July, 184 N . In the 32 years of its operation the caisse damortimement liberated the country from lianilities to the a mount of $1,638,47,050$ francs, and placed nt the disposition of the treasury, from $1 \times 33$ te 1848, $1,014,69 \mathrm{a}, \mathrm{x} 5 \mathrm{f}$ franc:-
Taxation.-The mnelent syatem of taxation in Fraace was subverted ly the Natiomal Assembly in 1791, end new taxes were suhstituted in lieu of those formerly in force. These consisted of lirect and indirect taxes. The lirect taxes are, 1. Contribution fonciëre, or landtax; 2. Contribution permonelle ot mubiliere; 3. A tax on doors and windows ; 4. Droite de palente, or a license duty on pureicular trades and professions, and a duty on miner.
The contribution fonciere is saised equally on ali lunds and houses, in propartion to their nett revanue. There are no longer any exemptions in favor of the nebility aince the tirst Rovolution, in 17א9. The inn gerial domains and the property of the State arealone exempteit. The contribution permalle at mobitiere is divided into two parts. The tirst is a apecies of phal! tax, rated nt three diass' labor, calculated in money value to twe fron 11) to 30 sous per day, and levied on mill males above is years of age. The contribution mine bilitre is a house-tax, levied on rents from 200 to 3 3nto framen. For the constitusion peraomelle, the artroi, which is at customidaty on all grods enteringa town, is aubstituted in Pasis and other large citien. The tax on struet-Aloons, gatewuys, Hud winduws, varies in ןroo pertion to the nize of the town in which the house is sithated, armi alan in proportion to the wize abd value of the house, nfil the nmmber of windows. It is regufatent by a tariff, in which are two divising. The drotita di patentes, or license duty, is lavied on every per. son fullowing a profession, trade, or business ; aud is divlled into two heals-the proportional tax or the tixed tax, which lepend on the uxtent and population of the town where he exercises his prufussion, A merchunt prays from 40 to 5000 francs per annuo, aco cording to the population of the place where he resides, and an adilitional 10 pur cent. on the rent of his dwell.
ing-hous and ther ferior tn is in pro to their 1

The lat also deter required of finance municatea The sum lissement ilissement allotted to persons ap or asseasats taxable prof is, however some depart ment of the zation of the ital object in this view a y the landed $p$ was hegun in accurate as censitered as propriftes imp cording to the tivable land; 333 hectures nurseries, and 17,400 hectare of the land-ta: just complaint for a moro ac these have gen tery.
The Inillrect cipal kinds-op articies of cons dutics, dutles on on gold and sil tha monopoly pust office; the entering large imperial treasur expenses. The the French rev duties, are laid franes jer hectol rensored from on thes paya 10 fr cider, perry, and Ten per cent. of inoval from the w duty distinet frou of all wine or ap population of wh All communes wi 1000 are exempter heen established, 5000 inhabitants, $i$ of the department rate elasses-a ver uncertain standan duty e: wine and 1830 has theen red reduction of 3 per ers, and of 25 per retailethimself. 40 centimes, and hectolitre. lietaile tinct license, whic of the town, from pullic carriages ja pluce for passenger
ing-house. Bankera in all casee pay 510 francs a-year ; and there is in like manner a fixed rate for other inferior tradee and professiens. The daty on mines is in preportion to the extent of the surface, and also to their nett produce.
The law which fixes the amount of the direct taxes also determinc 1 the quota which each department in required to pay. This is annonnced by the minister of finance to the prefect of the department, who communicates it to his sous-prefect and to the mayora. The sum thus assigned by the prefect to each arrondisament is subdivided by the counciis of tha arrondissement and by the communes; and the amount allotted to ench is apportioned among the inhabitante by persons appointed for that purpose, ealled repartiteurs or assessors. These assensors regulate the amount of tixable property, and they fix tioe geale. The land-tax is, however, very unequally nseessed, amounting in some dopartments to eix per cent., while in the department of the Seine it la seventeen per cent. The equalizatien of the land-tux has always been accounted a capital ohject in the finnncial policy of France; and with this view a very minnte survey and meanurement of ail the landed property in France (termed the codastre) was hegua in 1808 , and finished $\ln 1847$. The cadastre, accurate as it generully in, can not, however, be considered as the expression of actual facts. The proprietls imposable, or taxable property, consists, according to the cadastre, of $25,581,658$ liectares of ralltivable land; $5,159,226$ hectares of meadows; 2,050,533 hectures of vincs; 628,235 hectares of orchards, nurscries, and gardens; 4,175 hectares of mines; and 17,400 hectares of lakes, ponds, etc. Tho lnequallty of the land-tax has long been a aubject of loud and just complaint; and vnrious plans have heea adopted for a more accurate classifiention of the land. But these have generally proved incfficient and unsatiafactory.
The indirect taxes consist ehiefly of fonrteen principal kinds-of the droits réunis or excise duties on articles of consumption, of atamp duties, registration duties, duties on carriages, on canals and ferry-honts, on goll and silver plate. A revenue is raised from the monepoly of tobaceo and gunpowder; (rom the post office; the octroi, or custom duty on all articles entering large towna, one tenth of which goes to the imperiai tresaury, the remalnder being applied to local expenses. The customs form an Important branch of the French roventos. The droits réunix, or exelse duties, ure laid on wioe brandy, etc., which pay $1 \frac{1}{2}$ francs per hectolitre of 120 linglish quarts, on being reasoed from one place to another. Wine in botties jays 10 francs per hectolitre on its removal; cider, jerry, and mead, pay 80 centlmea per heetoititre. Ten per cent. of the aloove duty is pald on their remeval from thie wholeanie warehouse. Irior to 1880 a daty distinct from the octroi was levied on the entry of all wine or apirituous liguors into communes the population of which amounted to 1500 an 1 upward . Afi communes whose populntion does not mmount to 4000 are exempted from this tax; and a new tarifl has been estnblished, rising progreasively from 4000 to 3000 inhabitants, in proportion to the eat imated wealti of the departutents, which are divided into four separate classes-a very vagne, na we ahouid suppowe, and uncertain standard of taxation. There is a further duty on wine and liquors sold by retali, which since 1830 has lieen reduced from 15 to 10 per cent. A reduction of 3 jer cent, on this duty is mado to dealers, uad of 25 per cent. if the wine le grown by the retaller himself. Strong beer pays a duty of 2 francs 40 centimes, and small heer in duty of 12 souf, per hectoitre. Retniaers of liquors must take out a distinct ifense, which varies, in proportion to the sizo of the town, from 6 to 20 france. Proprietors of public carriuges pay one tenth of the price of each piuce for passengers, a third being deducted for $\mathrm{va}_{\mathrm{a}}$ -
cant places, and one tenth of the price received for merchandise. Private carriages are anbjected to a moderate duty, according to their sise, of 40 france per annum for a carriage with $t$ wo wheele, and holling two persons; and of 150 franes per annum for a carriage with four wheels, and helding nine persons. The enregistrement, or regiatratlon duties, embraces a variety of transactions, where property is conveyed or given away by marriage-settlement or otherwise. There is a duty on gifts inter vivos, which increases with the distance of the relation between the parties. It was modified by an ordonnance of Louis Philippe in 1832. The duties payable on registry are either fixed or ad valorem; the fixed or certala dutieo apply to ecmmon certificaten, those of life or reaidence, accountbooks, bills of lading, appointments of arbltrations, valuationa of furniture, and the like. The ad valorem duty appliea to all bonds or obllgatione, dlacharges, judgments, deposits or releasea of sums of money, and for every transfer of property, etc. The atamp duty applies to receipts, blla of exchange, newspapers, handbills, playbills, admission cards to publio places, and upon paper uscal for civil and judicisl actes.

The total recoived frem the impot direet in 1854 was $411,273,000$ france. In 1853 the sum recolved was $420,064,000$ franes, which shows a defecit of nearly $9,000,000$ of francs in 1854 . The total receipts of the impôts indirects in 1854 were $817,260,000$ francs. The intpôt on rait produced in 1854 a sum of 33,270 ,131 frunce. The total of "droits" received in 1854 amounted to $149,337,510$ francs.

Land earriage or roulage $81,000,000$ of tons, the menn transport at 15 teagues, at tho wean prico of frano per ton., $465,000,000$
The publia valtures which travel 18 leagues per day, In place of the common earrlages of 8 or 10 leagues, yteld, per annum..
$60,000,000$
The daty on the publto conveyances ratarns $6,000,040$ fraties; three fourths are derived from thn passengers, aad one fourth from the goods they convey.
The share capital of the French railwaya in 1848 was $£ 49,044,000$ sterling. The total merchandise conveyed per transit in 1844 , was in value $229,820,795$ frnncs. In $1854=54,926,640$ franes official value. Value of wine, spirits, beer, and cider consumed in France, reckoned at $500,000,000$ france, give 811,000 ,000 francs wine, $54,000,000$ francs brandy, $59,000,000$ france beer, and $76,000,000$ francs eidor.

The duties levied on this branch of the French revenues produced $£ 5,483,765$ in 1852 and $£ 5,505,686$ in 1853. In France these duties are laid on in many cases more with a view to restriction and monepoly than to revenue. France aacrifices a large revenue for the encouragement of the colonial monopoly ; paying for the pruduce of the colonies an exorbitant price, and afterward, as in the case of augar, the stapie artlcle that is imported from the colonies, giving a grent portion of the luly as a bounty on its exportation to foreign countries, to indemnify the exporter for the loss that the would incur if he were selling the sugar nt its ordinary price in the markets of Europe. In 1830 the gross receipts from the sugar duty amounted to $£ 1,397,840$. of which one third, namely, $£ 420,903$, were paid back in bounties on the exportation of the surplus. Thus the nett duty only amounted to $£ 976$,437, while in 1822, though tho quantity of sugar consumed was ouly $1,086,596$ cwts., or $281,075 \mathrm{cwts}$. less than in 1830 , the bott amount of the luty was $£ 1,2: 4$, G0.:3. 'l'he consumption of sugar in France in 1847 only renched to about $2,570,000$ ewts. It is by means of heavy custom-dutios that the French legislators oudeavor to preserve the monojoly of the hoine market to their own manufacturers, hy which policy they compel the French community to iny at a high price the inferior articles of tineir own manufacture, rather than the better articles of the foreigner at a lower price. 'The

Increased numbers and nuperior vigilance of the ous-tom-houne officers have been utlll connteracted by the now expediente and persevering lagenulty of the emuggler.

The frontler of France it the scene of this persecntion againat commerce, where all the illegal, daring, and lingenious resourcen of the contraband traders are called Into activity. Ameng other expedients, they tralned packs of doga, uccording to Measra. Villiers and Hourtry, to carry prohlbited goods across the frontler. These doga being conducted to the frontier, are kept without food for many hours; they are then beaten and laden with goods, and are stisted on thelr travela when it begine to grow dark, and reach the aboies of their masters as soon as they can, where they are well tremted, and recelve a full meal. According to the accounts of the French custon-house, 40,278 of these doge were destroyed in the year 1830, on which account premiums were paid to the custom-house officers to the amount of 40,278 france. That the trade, though it may be obstructed, is not prevented, he evldent from the elrcumstance thut there are regular rutes of insurance on the conveyance of contraband goods into France, varying from 10 to 70 per cent. A revision, and If possible a reduction, of these hervy dutiea would be the true pollicy of France. Monopoly was never yet the eource of commercial greatness in any country.

National Income and Capital.- Population.-Of the official surveys of the French territory, by far the most minute and aceurate is the cadratre, a survey whleh became ladlspensable from the time it was determiaed to exchange the taxea on consumption fur taxem on prodace. A return of the rent of land, such as wus made under the property-tax act In England, would not have been practicable In France, where so many thousunds of petty lots are cullivated by thelr proprietors. At tiret the codkutre proceeded on the plan of an estimate par masses de culture, or continuous valuation of extennive tracts; but thla proving unsatisfactory, it ham been conducted since 1807 on a plan of auch minute detail, as to give the value of every separate parcelle or patch of land. The progress of thls milaute survey of the landed property in France has been retarded by many causen; and In 1830 not abore two thirds of the land had been surveyed. It was estimated in the report of one of the committees of the Chamber in 1832 , that it would atill require from that period about eight yeara, and an expense of above $£ 2,000,000$ sterling, to complete It . They had only surveyed $31,000,000$ of hectarea, or 68 , 000,000 of acres. The annual expense of the aurvey is $£ 120,000$.
The wages of mechanics are so fluctuating and various, that a satisfactory statement of them can scarcely be produced. It may, however, be assnmed that they are generally 20 or 30 per cent. lower than in England. The rate of wagen of the agricultural population was thus estimated in 1851 ;

Eirpense of Lieing.-A quarter of a century ago the difference in the expense of llving In France and In England was abont a third loss in favor of Eugland. As far as regards provision, this difference was somewhat greater; but it received a counturpoise In the greater cost of fuel. Paris is now as expensive compared to the rest of France, as London is compared to the rest of England. In 1855 pricen were generally on a par with pricea in London, and in house-rent and the prices of lodgings and fuel, Paris exceeda London.

In the end of the seventeenth centary, the territory of France, when very nearly equal to its present extent, appears, from the report of the intendants or provincial governors, to have contalned about 20,000 ."

000 of tnhabitants. Thle nutnber was found, by the cennus mude by order of the National Assembly, to have increased nearly a third in the course of a century 1 the mount, in 1701 , being $26,863,600$, a number which, by computation, made in 1817, had further inereased to above $99,000,000$. In the year $18: 0$ the population was $80,451,187$ : and, according to the urionnance of January 1832, it amounted to 32,601,678. Ily the ceneus of 1851 It appeare thut the population of France was 85,781,628. The marriages $\ln 1832$ and 1833 were annually about 236,996 , and the deatina bout 7R5,268, of which 895,250 were males, und 388 ,018 femalen. The blrtha were 967,583 , of which there were 498,707 boys and 468,826 giria. The number of Illegitimate childrea wae then $\mathbf{6 8}, 081$. In 1852 , $t$ wenty years nfter the periokl here spoken of, the total number of birtha was 965,080 , of whlch 805,236 were legitimate, and $69,84+$ liiegitimate. The number of children still-born In 1852 amounted to 37,901 , the number of deathn to 811,695 , and the number of marriages to 281,360 .
The eathmates of population In France, aubsequently to 1791, are formed, not by metual survey, but by adding for the period whleh has Intervened, the birthy, and dedueting the deaths, of which an accurate record is kept in the public offices.

The ratio of the lucrease of popuiation in France is greatest in the luwer classes; the malddllug and upper ranks have seldom large families. In that country the population evidently Inereases fuster since the adoption of vaceine inoculation.

French Weights and Measures.-The welghts and Diensures of France were reduced, as is well known, to a very simple and uniform scale soon af. the first Revolution ; but there has been much difu, ity s. accuatoming the inhatitants, particularly in cosntry districta, to the mloption of the new system, which unluckily preserved none of the numes with which they were fauillar. In 1812 a kind of compromise took plaee-government sanctiouling the retention of the old namea, much as pounds, ounces, ells, and bashels; but requiring that their contents should be calculated thy a reference to the new standard. It la accorlingly on this footing thut business is now transacted in France. The new welghts and measures are in general larger by a fraction than the old, and the use of the latter is prohllited by law.

The fundamental standard adopted in Frunce for the metrical ay-stem of welghts and measurea, is a quadrant of tie meridian-that is to say, the distance from the equator to the north pole. This quairant is divided Into $10,000,000$ of equal parta, and one of these parts ot divislons is called a metre, which is udopted as the unit of length ; and from it, by decinal multiplication and division, all the otier measures are derlved.

The length of this quadrant was ascertained by MM. Delambre and Méchain, by measuring an are of the meridlan between the parallels of Dunkirk and

Barcelona, and has been found to contaln $\mathbf{5 , 1 8 0}, 710$ French tolses, or $82,808,992$ Eaglioh feet. This number divided by $\mathbf{1 0 , 0 0 0 , 0 0 0}$ gives $8 \cdot 2808992$ English feet, or 30-37070 Fingliah Inches very naarly, for the true length of the French metre.

In order to express the decimal proportions, the following vocabulary of names has been adopted:

It may asoist the memory to observe that the prefixes for multiplying are Greek, and those for dividing Latin; thus decametre means 10 metrea, and decimetre 1-10th of a metre; hectemetre means 100 metres, and centimetre $1-100 \mathrm{~h}$ of a metre; kilin atre menns 1000 metree, and millimetre 1-1000th of a metre. The metre (as before stated) is the element or prime unlt of long measure, and is equal to $39 \cdot 37079$ English inches.

The are, which is a square decametre (or 100 square metres), is the elemental unit of squsre or superticini measure. It is equal to $119 \cdot 6033$ square yards, or very nearly $2-81$ parts of an acre.

The stere, which is a cubic metre, is the elemental pnit of solld meseure, and equal to $35 \cdot 3166$ cubio feet English, or nearly $85+$ cubic feet.
The litre, which is the cubic decimetre, is the elemental anit of all liquid measures, and of all other measures of cas wity. It is equal to $61 \cdot 02705$ cuble inches, or is very nearly 11-50ths or 22-100ths of an imperial gallon.

Lastly, the gramme, which is the weight of a cubic centimetre of distllled water at its temperature of greatest condensation, is the elemental unit of all weights, and is equal to $15 \cdot 4325$ grains troy, or 18 -23ds of an avolrdupois dram nearly.

In reducing French money to English, from any number of francs sultract their fifth part, and the remainder will be their value in shillings. Or multiply the france by four, point off the two right hand figures of the product for decimals, and the result will be their value in pounds and decimale of a pound ater-ling,-E. B.

Commercial Relations of the United States with France. -Prior to the ratification of the tresty of the 6th of Feliruary, 1778, we have no reliable account of the value of our trade with France. The navigation acts and other regulations imposed upon the colonies by the mother country, strongly tended to fetter and embarrass their intercourse with other nations; but, in spite of them, irregular, illicit commerce was carried on te a considerable extent. By the treaty alluded to, the high contracting parties reciprocally bound themselves to grant to each other, in reapect to commorce, all the privileges and immunities which either of them might thereafter grant to the most favored nations; to charge ne more in imposts, port dutiee, or other customary burdens of trade, to the subjects or citizens of each, respectively, than should be charged to the suljects or citizens of other powers; and to protect the vessels of each other when within their reepective urisdictions. The subjecte or citizens of either were excluded from the fisheries of the other, and the Uníced States became bound not to disturb the subjects of the King of France when fishing at the Bunks of New foundland. The citizens of the United States were exempted from the droit d'aubaine, and were empowered to devise real and personal property; and their helrs were permitted to inherit without becoming naturalized in France; and corresponding privileges were secured to French subjects residing in this country. The doctrine thut "free ohips make free goods" was recognized, and the articles to be teemed contraband of war were enumerated. The remaining stipulations refor exclusively to contingencies of war, and need not be enumerated. On the 146 of November, 1788 , a convention was entored into snd ratifled, defining the powers and daties of the consuls of the high contracting parties. This convention was
intended the more effectually to secure the falthful observance of the tresty stipulations.

These arrangements were ratifled whlle the Contloental Congress had no authorlty to regulate forelgn commerce; and the ratification, therefore, only amounted to a pledge that the States would conform to its provialons, they having the sole power to levy imposts and port and tonnage datles. The arrangements centinued in force, however, and were observed for more than w. ears, and until annulled by the act of the 7th July, 198 , on the ground of repeated violntions of trenty stipulations by the fuccessive revolutlonary governments of France. Many of the fetters of trade were removed by this treaty; and, although Importations and exportations were, for a tlme, exposed to thu depredations of British crubsers, the enterprise of our neamen opened a conmerce of no Inconsiderable value. It who estimated that, during the three years Immedlately preceding the French Revolution, the average anaual value of our exports to Franee was $81,520,000$, and of our imports from thence, $\$ 380,000$; showing an excess of exports of the value of $81,140,000$. The imports and exports up to the date of the amulment of the treaty of 1778 , were as follows :

| Years. | lemporte. | Exprorts. | Excens of axports. |
| :---: | :---: | :---: | :---: |
| 1795........ | \% $3,671,98 \mathrm{t}$ | 17,698,638 | C4,027,853 |
| 1746......... | 1,825,1066 | 8,171.759 | 1,836,604 |
| 1797........ | 8, 045,780 | 8,425,231 | 779,435 |
| 1795......... | 1,871,727 | 1.4i6,584 | 104, >61 |

This statement indicates ${ }^{1} 1$ at, from 1705, there was a rapid decrease oc: import, and exports, and a docrease of the excess of our exports, sttributatile, no donbt, partly to the feebleness of federal anthorit y, but chlefly to the convulsed condition of the French nation, the contiouance of war in Furope, and the conse. quent disregard of treaty nthligations.

Previnus to the aumulnient of the cominercinl treaty, Congress passed an act "to suspenil the commercial intercourne between the thiteit istates and France, and the dependencien thereof," upproved lune 13, 1798. It was provoked tiy repeated gross violntlons of the treaty by the French government and lts citizens. The act provided that no vessel should clear from the porta of the United States for France or Its dependencies; that no French veamel should enter our porta withont a pasporert from the l'resident, unleas in dintress; that French vessels foand in our ports, and refusing to depart, shoold be seired nnd thetaireed ; and that the President might dissolve the prohibition of the act whenever he became atisfied that the Frunch government and sil under its authorlty isere, in good falth, endeavoring to prevent her citizens froni intermedhlling with our commerce. This art was continued in force until the end of the ensuing scasion of Congress, when It expired by Its own limitation. Two days stabequent to the annulment of the treaty, another act wa s spproved, "further to protect the commerce "f the Inited States." The Presilhsit was therel,y authorized to inatruct the commandera of the naval forces of the Vinited States to eajiture French armed veamela, which were, ly the uct, to be forfeited, sud to grant letterm of marfue anil repriwal to private citizens. Tiresn acta had the desiren effact. The French government was in no comition to assunce an attitule of open hantility.

On the 30th of Septemior, 1800, a convention was Nhaned lyy the plenipontentiarlen of the Voited Staton and leance, which was ratified in due thme, for the miljuatment of all diffosences, and the regulation of their future commerilul intercourne. Ify itw termas, it raa to continue in force fur elight yeara. In respect to commerce, it proviled that the eitizons of paeh conntry shauld enjoy in the ports of the other all the privileges and immunlties of the mont favorem nutions: that the citizens of either rasident in the other should
have the right to devise their property without being naturalized, and their heirs the right of inheritance; that dix monthe should be allowed for the removal of property In case of war 1 that debts ehould not be gequesterud or configented in consequence of war ; thst consule ard other agents should be appointed; that the traders of each might buy sud sell of the enemnles of the other, save in ports blockadel; that certain epecified artleles only were to be considered contraband; that free ships should make free goods, and the ships of elther might carry enomy's property, eave only contraband articles; that property of elthor found in enemy'e vessels should be confiseated; that ships under convoy shonld never be examined; and that variots minor provisions enumerated in the treaty, ms means for the executlon of its provisions, should be observed. This was followed by the treaty of the 30th of April, 1803, for the cession of Loulslana, by which the right of nuvigating the Misslaslppi and its trlbutaries was reserved to France for 12 years ; and another convention of the name date, providing for the payment by France of debts due our cltizens.

The ennvention of 1800 regulated our commercial Interconras with France until the 24th day of June, 182:2. A fow fuets will show how our trade with that nation progressed during that important period. It must be borne in mind, that, nearly all kumpe was combined for three fourthe of that space of timo in waging war upon the French empire and its nllies, und that, for a conalderabe period, the whole of France was deelared by Grat liritain to be in a state of bockade. It nust also he remembered, that in 1812 the Congress of the United States declared war ngainst Greut Ifritaln, und that this war was waged with grest vigor on both sides, until lorought to a trinnuphant close in 1815. The vast superiority of the naval force of England rendered intercourse of European mutions with their colonles very hazarious, if hostile to her. Theso nations were hence comprelled to rely upon neutrals to carry on thin branch of trade, For a time, the productions of the French, Spaish, aul Jutch colonies conld be carried to their mother countries only under a neutral fligg. Gur vicinity to the West Inilia Islands ennbled us to monopolize most of this enrrying trade; and, ere the war closed, such Was our increase of tomage, that we olitninel a eonsiderable portion of the carrying trade to aud from the liast Inoles. Some colonial productions were carried in American twottonis directly to Varope. The greater part, however, was brought into our porta; whenee, ufter receiving a drawhack, it was shipped to Europe in our own vesmels. The innnufactures of Vurope, as well as thome of Chinn and the East Indies, were also Imported, and agnin exinrted, In large quantities, to the West Indles and Sonth America. Fron 179a up to 1807 , the profits of these mivantages were enormous. The exigencien of the war, and the nataral jealotsies engeniered by auch n condition of things, Involved us In disputes Ioth with Framee and Enghand. The latter, therefore, issued her cotebrated Orders In Council; in retallation of whteh, the former, or rathor her emperor, issued his Iherlinand lliIan Decrees, which were no Injurions tu onr trade ais to provoke the aloption of the embargo, whieh wat folfowed by the non-inturcourse act, and uhimately hy the derlaration of war against Grea: Mritnin. This annilaihated our carrying trade. On the return of peace, we ugito enjoyed sonm of it, but to a mach more limitell extent than formerly.

The tables of expirts and import* fully ithatrate the operation of the rausen onumeratid. In lith our importa from France were of the value of $\frac{\Delta}{5} 401,018$. The valse of exports is not known. The following table exhilita our expmists to Firance from lay to 18.20. We have ro thata on which to estimate the ims-
 In I $8: 0,0$, and $\%: 1], 02: 1,000$, in the amount of our domes.

The convention with Franee of July fth, 1831, 6.1y alighty modilles the enavention of 1 sige 'Ihe wines
of France, from the ratification of that convention until the pasange of the tariff act of 1846 , were imported at duties not exceeding the following rates by the gallon, United States' measure, viz.: For red wines, In casks, $f$ cents; for white wines, in casks, 10 cents; and for all kinds of wines, in bottles, 22 cents. This stipulation was li...ited to 10 years, and consequently expired on the 4th of July, 1841. Our trade has, therefore, been since regnlated by the convention of 1822, and guarded by the powera
and privileges secured to the consuls of each natlon by the consular convention of the 28th February, 1880. The results of the operation of the stipulatione of these conventions may be traced in the preceding and following tables of imports and exports.
The preceding table is made up from the annual Treasury Reports on Comnnerce and Nevigation of tbe United States. It will not prove uninteresting, however, to subjoin, for comparison, a almilar state-
ment put forth by the French government.

In these tables it is nut dificult to trace the effects of the controversy relative to the re-charter of the Bunk of the United States, the temporary expansion of the poper carrency, the necessary contraction following the restoration of the constitutionsl currency, and the addition to the goll circulation of the world made by the mines of California. All these historical factore of too recent occurrence to need comment in is work such as this. In like manaer may be trated the effects of the French revolution of 1830, the 18 years' policy of louis lhilippe, the convulsione of 184s, the temporary ascemilancy of reputbicun principlea, anil the re-estahbliment of the empirc. Causes like these, which affect commerce without a change of International obligations, would require more space for their clucidation in detail, than cun be accorded to them in this digest. They are, nowever, alluded to for the purpose of awakening suggestive trains of reasoning. From $18: 11$ to 1841 the general conmeres le$t$ ween the two countries increased $14,375,000$ frames, or ahout 83 per cent. This auginentation falls especially upon the products of the United States imported into France, the amount of which has tripled in this period. In the following yeurs the effect of the tuigh teriff of 1842 will be perceiven, capecially on the value of exports from France into the Unitel States. The article of cotton has, for a number of years, constitoted in value, upon an average, ithree quasiore of all our domestic exports to France. The average annual value of our exports of home products to l'rance from 1830 to 1833 , was $\$ 9,000,000$; and the experts of cotton for the same period, ef,000,000. The following tahle exhilits the quantilica of cotton exparted to France for the yesra enumerated, vir.. :

| Yeare. | Poturde. <br> 71, 110,0100 | $\begin{aligned} & \text { yeare. } \\ & \text { insti. } \end{aligned}$ | proade, $124,611, \cdot 00$ |

| I142. | $115,180,410$ | 155. | 162,429,909 |
| 1448 | [22,497, (140) | 1483. | 174,649, 94.4 |
| 1844 | 119,345,600 | 1515. | 144, 424.1204 |

The tables from which we extract do not give the ralues of our cotton exprorts for the years statell above, but, as in some preceling years, we learn from other data, they have been equal to the value of three feurths of our exports of home prolucts. It may he added, that, with the excepition of 1854, the atove figures have heen compiled from French custom-house returns. They are considerally below those given in the annual reports prepared by the United States' 'Treasury Dcpartment, and are not so reliable. The following table, compiled from these anoual reports, will show the exports of cotton to France for six years, ending with June 30 th 1850, and the valse; as also the total value of domestic exports to France during the said years, respectively :

| Sears, | Pounds, | Value. | Total rulue dotirstie exporta |
| :---: | :---: | :---: | :---: |
| 1 500 | [25, 234,697 | -14,395,49 |  |
| 18\%1. | 183, 161,571 | 18,124,518 | 25,302, $1 \times 5$ |

| $10^{5} 5$. | $240,118,509$ | 19,005, 423 | 81,628,493 |

- The expurt of cold and nllver cola sud bullion was unusualty large this year, anlounting to 6,609, (Mon.

Tibneco.-Our other chief export to lirance is tobacco. In that collutry, the trade in this article is monopolised by the government. Information on this au'ject is derived from a recent publicution, from the pen of a gentleman who has analyzed and studied our Furopenn tobacco trale in the principal markets of the eantern continent. The exclusive right to purchase lmported and indigenoun tulateo is invested in than regif, or commission-an nasoriation under the supervision of the Minister of Finance. This ragie alone can ashorizo its manufacture, fix the prices at which it in to be noll to retailers, nul the prices at whin the latter shall sell for consumption. The capital of the reyif, comsisting of houses, oflices, machinery, anm tobacice in atore, is of the value of about 40, 000,000 . There in usually kept on hand a suply of tobacen suflicient to meet the temand for three years. This enublen the regie to manufucture it more
perfectly, the supply one but llcense, w fixed by the syster portation, individual duties equ sales. Ont is constant at a stand. under the the metho certain de There is 1 the concur

perfectly, and to provide against accidental failures of the supply. No one can purchase at wholesale of any one but the regie; and ne one can retail without a license, which compels the purchaser to sell at prices fixed by that commisaion. Of late yeare, however, the system has been so far celaxed as to allow an importation, for personal use, of a certain quantity by individuals, upon the payment, by the importer, of duties equal to the profits reaped by the regie upon its sales. One fact lis encouraging: while the consumption is constantly increasing, the culture remains in France at a stand. It remuins at a stand, because it is alse under the supervision of the regie, which prescribes the methods of cultivation, and confines its produce to certain departments, and even to certat:- izdividuals. There is nothing to stimulate enterprise, or to secure the concurring energy of individunl interest.
Up to 1817 purchases were made upon the offers of merchants submitted to the director-general, and communicated by hlm to the Councll of Administration. The number of competitors created embarrassment, and the present system wan, after some years, adopted. The system is this: Proposals are published by the regie to make contracts for the supply of certain qualities and certuin quantities of specified kinds of tobsceo. Samplea of the kinds and qualities are submitted to the inspection of those who desire to contract, and they thereupon submit their offers to supply at certain prices within a time specified. The samples subnitted to the contractors are carefully preserved; and when the cargees arrive st the various ports, sam? ples of them are forwarded to Paris and compared with the model samples, and the acceptance or refusal depends upon this comparison.

It requires but little reflection to perceive that this system is seriously injurious to nur trade. It is a moderate estlmate to make, to suppose that, if tobacco were admilted into France ar other products are admitted, we should export ten times as much as we do st the present time. The nbolition of the system would, therefore, seem to be an object ennstuntly to be kept in view by our government. It has stood so many yenrs, however, and under so many forms of governinent, and is so protuctive to the revenues, and so important to the government itaelf, in the number of persona thus brought under its direct influence, that we can not hope to ree it aom materially changed. In sddition to the facte already detailed on the subject of this inportant staphe, the following extracts from ofticial dispatches, communicated to the Department of State, are presented as pertinent:
"Tohaceo is only permitted to he cultivated in six depurtments as a staple, and this cultivation is under the most rigid surreillance of the government. In the other departmente agriculturists are allowed to grow four planta for each tenement for medical uses. On the tobacee disposed of ly the regie, whether imported or proluced, the profit realized momis to 447 per ceat. The retail dealers in the article, anmbering about 30,000 , are under the control of the regie inspection, and are allowed a commission on their sales of from 10 to 12 per cent. There are only ton mannfactories. They nre loeatel at l'aris, Llavre, Lille, Strastourg, Morlaix, Tunneine, Lyens, Marseilles, Toulouse, and lordeaux. Bach has its circle of departmenta to aupply, and is restricted to transactlons, therein. The manufactured article is deprosited in magarines, of
 Switzerhuml, Germany, mal Helgium, the price entatlished is vastly below that whilh rales in the laterior. The object of this is to prevent smuggling. Whore froutler facilities are aflorded for illidt impurtailons, the mate is comparatively moderate, Where none exlist, it is enormous. Thus, it Straskourg a jound is Worth only 15 gous (cents), while at Orleans it is worth 8 francs ( 8106 ). Jaist year ( 1848 ) the recripts from tho customs only nuounto to ubout $1 \cdot 16,000,000$
francs- $86,000,000$ of which were derived from tobacco, nearly all grown in the United States-under the workings of the regie. Were this regie abielishes. and a moderate import duty aubstituted, instead of a market of 16.000 or 18,000 hagsheads of tebaceo per annum, France would take from us double that quantity Immediately thereafter."
At the present time, we export abont two fifths of all the tabacco consumed in Europe. Strict attention to its proper culture will enable us to furnish a much greater proportion. From 1827 to 1836, our exports to France amounted, annually, on an average, to $\overline{5}, 727,-$ 900 pounds. For many years we have exported from three fourths to four iffthe of the tobacco coneumed in France. From official reports of the French autherities, we gather the following statistice of our exports and sales to the regie in the years specified:

| Yeara, | Pounde. | Years. | Pounds. |
| :---: | :---: | :---: | :---: |
| 1887. | 10,622,104 | 1846. | 17.798,000 |
| 1838 | 11,649,710 | 1847. | 15,562,907 |
| 1899. | 18,089,036 | 1848. | 18.446,305 |
| 1840. | 17,840,618 | 1849. | 16,852,180 |
| 1841. | 21,040,924 | 1850. | 18,6t 2,628 |
| 1842. | 10.149,800 | 1851. | 12,058,876 |
| 1843. | 27,771,788 | 18\%2. | 82,805,240 |
| 1844. | 20,891,000 | 1858** | 9,741,000 |
| 1845. | 24,318,800 |  |  |

* Unlted States' Treasury reports give the quantlties o lobaceo exported to France for the fiscal years enting Juao 30,1854 and 1855 , respectively, as follows: 1854, 15,102,400 Its.; $1855,40,566,4091 b s$, hosides 2,905 cases, and 579 hales. Tho exeess of the lalter year was probably for tho army in tho Crimea. Tho Froneh fiscal year ends with that of the calendar.
No valucs are attached to these quantities, bat they may be estimated by the aid of other data. The cost of Anserican tobaccoes, on delivery at the factories of the regie, all expenses included, is given by a French legishative reprort as follows, on an average fo-several years: Maryland tohaceo, 95 cents per lb ; Vire inia, 8.2 cents ; Kentucky, 7.7 cents; Missouri, 8.5 cents. The following statement, also derived fron French authorities, shows the nett profits of the regie, which, after paying all expenses of purchase, transportation, manufacture, and sale of tobacco, it has paid over to the State treasury, annually, from the 1st of July, 1811 (commencement of the menopoly with the regie), to the 1st of January, 1853:

| Years. | Franch. | Years. | Frane |

| 1559 | 17,800 | " | 80,700 | 12,500 |

The preceding tables exhibit a total importation of cotton into Frunce, viz. t

|  | Balea, |
| :---: | :---: |
| In 1855 | 469,600 |
| 41864. | 470.010 |
| $\cdots 1853$. | 454,000 |
| 1502. | 462,800 |

The doeument from which the preceding tublea are tranalated and condensed, adds: "We may further remark, that, while England imp ts from the East Indies annually 400,000 hales of cotton, and thus finds profitulle employment for her commercial marine, France is deprived of the advantages of this trade. The fault is found in the apathy of our cotton spinners and in our custom-house regulations. Cotton from the Indjes, Imported In the direct trade in French vessets, ought to be almitted free of doty; and the impest on cotton Introducel from the entrepots of Euroje should be extremely molerate."
The articles of domestic produce usually shlpped from the United States to France, beskles cotton and tobacco, are hope, fish, pot and pearl-athes, whale-oll and whalebone; and those of forejgn produce are principally sugar, coffee, teas, cocoa, pepper, and other spijecs. The principal srticles imported Into the United States from France are wines, brandies, silka, ollve-oil, jewelry of all kinds, and, latterly, some cotton gools. An examination of the detalls of the trade in these artletes could add nothing to the lnferences whlch the general tables, already presented, auggent.
In the year 1793 an art was passed by the National Assembly, Interlictlng direet commercisl iniercourse between fureign nations and the lirench republice. This act, although never formally repealed, has lueen prastically abrognted lig the Introduction of nnmerous modifications. Even forcelgn goods actually prohihited are aluitted to entrepot for re-exportation at the ports of Marselllen, Bayonne, Bordeanx, Nantes, Havre, and Dunkirk, on payment of apeeffied duties; und these goodx may lee cransferred froua one honded warehouse to another. Goskn nor prohlsited way le thun transferred ly Innd, on the terms of the tranisfer, free of duties. Airles, Vort Vendée, and Strashwurg are pointa where merchandlse not prohilited ia received in bond, and from which it can be exported by nea ouly. There is also, at Lyons, a sperial depoit to which all the ports of toonding dépits may transmit merchandise for consumptlon or expurtation.
Hy the terma of the convention of the 24th of June, 1822, the time for levging diseriminating duties has long since explred. The only charges upon comineree, In articlew of home produce, which ean tee made ley either country, are duties upon tonnuse; and they are specifically limited to 5 francs (or 94 enta) per ton on the vensel's measurement, which is to fio caleulated accorling to the American vessel's register, and the French vessel's passport. This tounage duty excreds the manount levied ly fromo oll every other country, and thus operates linjuse ly to Anerican internsts.

 pay. so cent"; gring in ballinst frowz un onther wis utry, nothing. Other trivial port ciburb" anch as light-

 is the case as regandx Ac tha, of 16 custertias ; agne, and aeveral other country w!in) the terms of
their trenties with the United States, are per:nitted to carry on an indirect trade. The veseels of these nations, being subjected to a lower duty than ours in France, and a lower duty than French vessels in our ports, are thus enabled to carry merchandis, to and from the United States cheaper than the veisels of oither country can do it. In this way they havin monopolized no lnconsiderable portion of the carr, ing trade between the two conatries.
The reciprocity stipulated in the conventlon of 1822 extends only to articles of the growth, produce, at manufacture of the respective countries. To admit a cargu from the United States to the advantiges secured by the treaty, it must be certified by the French consul at the port of elearance to be of the growth, produce, or manufacture of the United Stutes. The American ahip-master is subjected, in a French port, to many emall charges for the authentication of certificaten, etc., from which the French master is cxempt in our ports. Most of these are, probably; shecr abusea, without authority of law. They practically operate as an increase of duties, not warranted by the provisions of the treaty. There la a stipulation in the convention of 1822, by which the products of tho United States, carried in American vossels, after a ceitain period, are to become liable to no higber rate of duty tluin if imported in French vessels. This does not inelude tin, the products of the fisheries, or spermaceti, slmply pressed. Copper and lead* ure nlso excepted; but, in point of fact, are admitted to the advantages of this provision, if it be shown that they aro of Ámerican production.
The prosperss of future commerce with France de. peud nfon a variety of facts and contingencies. The facts, of n permanent claracter, whlch operate upan them, are the natural capabilitiea of the countries, the populations, and the sulxlivisions of thelr halwr; the contingencies chiefly arino from their relations to other conntries and their legislution. The facts bescing upont tho suljeet, in the United States, are to he found in its history sud its census, and are familiar to all. Those respecting the lirench empire, may be brielly summed up In a suggestive rather than an elatorste form. France proper, to which alone reference is nuw hal, lies het ween $42^{\circ} 49^{\prime}$ und $51^{\circ} b^{\prime}$ north latitule, and emilraces an areat of 204,305 squara miles, greatly variegated lye mountainn, streams, and plains. The soils and their proportions are as follows:

Ono half the area of trance in cultivalile; and of this, 9 purts arn meadow; 4t parts vineyarl; 15 parls woold and foreets; 15 downs, pastures, and heaths; all the remainiler consisting of roals, cities, canals, vegetalile gundens, ete. It presents every varicty of geoboglcal format ton, exhblited in almost every vaiciety of known relations. All the departments, , Ni in numLeer, contain mineral aulutances. 'ilhere are 36 coalfielis in 30 depmirtments. The mast Impuitant are those of the Loire, embiracing an arra of te, 100 acere, lying between the loire and the Rhone, down which their prolluits reach markets. Next to these conme those of Nord, Saene, Avignon, Garl, thalvalos. The remainder are mall. The amual produco of coul ex-

About the eane distribution of employments yet prevails. Schools are proviled for only nbout one aixteenth of the children. The revenues of France are direct and indirect. Tho averuge aggregate annusl revenue, from all sources, is about $\$ 300,000,000$. The national delt is over $\$ 1,100,000,000$.
The number of acres under vine cultivation exceeds $5,000,000$, giving employment, in the cultivation of the vine and the manofacture of wine, to about $2,000,000$ of persons (́mostly females), and in its transportation and sale, to 250,000 . The average home value depeads, as does all other produce, on the supply sud demand; rarely, however, exceeding 20 cents, or fulling below 10 conts per gallon. The vine disease, now more or leas prevailing in all wine-producing countries, has increased the average price of wine from 100 to 175 per cent.
The following statements, showlag the produce of wine in France, anal the exports in 1845 and 18.46 , were furnished to the E'conomist from which we have taken them, by the authorities in Bordeaux.
Accolnt of the Pbodece of Wine in Faance in facit Depautnent, is the Ohdeh of thrin Jmpoatanee.

The ports of win sro tho prlatipal consumers of French wine. These statsties exhibit some curbous farts, and opposite to the belief of most persons. Algerin importa from France over tea times as much wine as England, and, what is more curious, wine of a highor price. The l'uited States imports from France not quite three times as much as England, but in valuo moro than four thues as great.

The wild animals are not numerous enough to have any material influence upon trade. It is not so with those domesticated. The annual value of the wool grown from aheep is nbout $18,000,000$. This branch of industry is very inadequately attended to. Thera aro 14 or 15 different species of beeves, and the total number of all kiuds is alout $\mathbf{1 2 , 0 0 0}, 000$. This branch of husbandry is also much neglected. In the southern departments oliveooil supersedes butter. The horse is not as well managed as in England, nor are there as many horses. llogs are abundant, and wo are domestic fowls. The latter are well attendel to.

Landed property is more minntelydivided in France than anywhere else in Europe, or even than in the I'nited States. In a fow departments may be found estates of 200 acres; hut they are rare, sud daily ecoming more m, ns the lnw divides the realty equally among the children. The greater portion of the farmis art now less than 20 acres. Inprovements in the methods of cultivation progress languidly, and the methods of manuriag; and rotation of crops, and of employing machinery, continue to be very defective.

Commerce and manufactures may be justly said to have commenced with Charlemagne. They were repressed during the feudal ages, when the barons enslavel the artisans and peasants. They were revived by the return of the erusalers, who breught a taste for the luxuries of the liast. Jonin XIV. well understood their importanes. The death of Colbert and the revocation of the Elict of Nantes again paralyzed then, and the indintry of France became subjected to monopolics. They continned enalaved, in a great measure, untlit the Revolution of 1889 unfettered them. Since that period, legisiation has favord them ly keeping them free, and fiving full seope to individual enterprise and geniun. They have only been retarded or dinturbed fyy the intervention of wara. Their jpogress has, of late years, been wonderfully accelerated by the progress of sciunce anil its application to machinery and the umeful and ormmental ares. Of selentitic sthumants, the moat important has been the application of steam-power. To wilence are also attributable metallurgy; the proceas of dyelog; the various preparations of nuimal substances; the weaving of clothe, cowhmeres, nul damanks; the making of puper, watches, and clockn, and of tine and common pottory; the mamafartures of nilknand tinsuea i mul namberlens other uneful and tanteful arts, which have apread whe the wing of conmmerce.

The average annual value of the exicorta of lirance, from 1825 to 1883 , was about ${ }^{2} 81,1 \mathrm{lis}, 164$, and of ita Imports $475,785,012$. The otlicial statement of the

Imports and exports, for the years 1844 to 1853, estlmated in franes, were as followe :

The following tahse, made up from materinla contained in "Annales du Commerce Extterieur," brings diwn this statement of the anount and charncter of th: foreign navigation statiatics of France to the year 18.3, the entrances and clearances being given in agg egate:
Navibation Tamle continueo to 1ses-the Entanzcea and Cleahanceb tenteg.

In 1856 the arrivals and departures were thus distrihuted :

| Entered. | $\begin{aligned} & \text { Veseata. } \\ & .25, ? 45 \end{aligned}$ | $\begin{aligned} & \text { Tone, } \\ & (, 1175,160) \end{aligned}$ |
| :---: | :---: | :---: |
| Cleared. | 14,455 | 2,820, \%k 0 |
| Total. | 412,290 | 6,990,900 |

The great disparity between arrivala and departures is explained by the fact that tho larger purtion of imports consists of bulky and cumbrous merchandise, destined for our workshops and manufactures, while vessels leaving French ports are usually froighted with manufactured products, the value of which cousists in their skillful workmanshl! rather than in their specilic welght or the rpace which they occupy. This year (1856), especially, the importation of cereuls was necessurily heavy.

A comparison of the different thags engaged in this general movement forces us to repent the remark which we are connt rained to tnako whene ver we examine this sulject-nasaely, that the Freuch thag is lavariably behind that of ather nations in her own commerce. How stands nar tlag in 1856?

The manufacture of cotton was first introduced in 1770, and has increased at an enormous rate. The total number of persons now employed in it is near 300,000 . The total value of all the manufactures of France, nunually, is $1,600,000,000$ france, and they nre rapidly Increasing.
The commercial legislation of France, which the tariff, inserted under its approprinte hend, ${ }^{*}$ is more especially desigmed to illustrute, has undergone, during the past few years, several important modifications. The fatest, and not the least divantageons to the tonnage interests of tho United Stater, is a decree which allows foreign-built vessels to he nuturalized, and to take the French flag with all its privileges, on the payment of 10 per cent. on their assessed value.

This will create a new market, and an active demand for Ameriean vessels of 500 to 960 tons, and especially for steamers of 1000 to 1200 tons. A decree has also been promulgated admitting lumber, timber, naval stores, etc., freo of duty for thres years, Ancther extends to December 31, 1856, the deeree of Octoher 9, 18i-4, exempting from tonnage duties all vessels wholly laden with hreadstuffs, fiour, rice, etc.; and if only partially hiden therewith, an exemption of tonnage duties proportionate to the quantities of such cargoes. A deereo has also been published, reviving an old decrec of 1816, excopting from tonunge duties all vessels entering French porta for the impose of exporting salt, on which article the export duty has been suppressed.
Early in 18.5 important movements were made in France, indicating an evilent disposition in favor of the introduction and more general consumption of Amerlean salted provisions. from 1850 to 185.4 the price of salt meats ndvanced at the extraorthary rate of $\mathbf{t 0}$ to 4. per cent. This state of the provision market immeuntryarrested the attention of the government, nomd arivis projects were adopted with a view, not only to prevent ifurther increase in prices, but also to raluce the rates already raised to so exurhitant a figuru. The impurt duty on forcign cattle was loweras, viz.: from S10 23 to It cents $\boldsymbol{p}^{4} \mathrm{r}$ hemd, on heef; nut every means wan rearorted to likely to encourage the use of sateed berfamong tho general matse of tho Fronch people. To this end, the duty on salted meats las leon surces.
 (4) 86; and In the month of soptember, 1 Non, it was forther loweral to ! 1 f cents per 100 kilogrammes ( 290 pounds). The effect of this reduction of duty has

- Purt $\mathrm{in}_{\mathrm{s}}$
been to open the markets of Frunce to Ameriean salted provisione; and the importation has increased, since that perlod, to such an extent as to render it not at all improbable that this article will, henceforth, become a leading staple of export from the United States to France.

England is now almost exclusively supplled with aalted meats by the United States and Ireland-the latter country exporting about an equal quantlty with the former. The supply from the United States could he made always to equal the demand; and if France should opon her ports to Ainerican aalted provislons, the consumption in that country would be alnnest exclusively supplled from the United States. The following brief summary of the trade in salted provisions in France during the past 20 yeurs wlll exblbit the development which thls article of Amerlcan produce has made in that country.

In 1834, tho importation into France of salted meats reached only. 3527 quintaux, equal to about $777,8.44 \cdot 58$ pounds. After a lapse of 21 years-that is to say, in January, 18a5, and during that single month-the importation reached as high as 3720 quintaux, exceeding the impertation of the whele year of 1852 by 203 quintaux, or 44,769 pounds. Prime pork is imported into France in barrels of $381 \frac{1}{2}$ pounds gross, in brine of gray salt, and ls usually sold at from $\$ 1480$ to $\$ 15$ 81 the barrel. For the English market such pork is exported from the United States in tierces of 304,320 , and $3: 6$ pounds, and in barrels of 200 pounds.

Amerienn mess pork is too fit for the French market, and seldom fints a purchaser; American sugarcured hams, however, always find a rendy market and a brisk competitlon nmong purchasers. Shoulders, well cured, and put $\mathrm{u}_{\mathrm{p}}$ in hoggheads of 994 'pounds, are equally in demand, and bring from $\$ 1860$ to $\$ 1953$ per 220 ths. A similar feeling is manitested in France In behalf of her colonies. By decree of 10th March, 18:5, the duty on salted meats has been reduced as follows: iuto Martinique, Gundaloupe, Guiana, and Licunion, snfted meats of whatever origin, or under whatever flag, pay $0 \frac{1}{8}$ cents per 220 pounds. This measure has attracted the attention of pork merchants of the United Stntes, and already heary frelghts of this urticle have heen forwardel to those islonds. Various other modifications have been derreed, but as they relato mostly to the tariff regulations, they are merely alluded to here for the purpose of noting the tendency to a more liberal commercial policy, which has, of late years been, observable in French legislation. Recent custom-house returns, puhlished in lirance, show that the revenue to the Stato during the first six months of 1855, upon 18 different artieles, the duties on which have been lowered, was $34,181,574$ franes, agninst $18,25 \mathrm{~N}, 808$ francs, derived from the same description of mer lundise during the corresponding six menths of 1854.

Such figures supply the hest argument in favor of free trade, especially in a conntry in which a problititivo and protective system has so tong prevailed. The annexed table will also ilhnstrate the wise policy ly which, it would appear, that the commercial legislition of France is henceforth to he shaped.

Acconding to the Juurnal des Economistes, during the tirst six months of the year $185 \%$, the commercial transactions of lrance exhibit a satisfactory condition; although tho receipts for customs, compared with those for the corresponding six months of last year, show 1 decided falling off; , mounting, for the entire perind, tu $1,36 \cdot, 886$ franes. lhis indieated a decrease in importations, which is to be regretted, but which, all thing being eomxidered, should ennse no disenietule. The novements in 18.55 cxhibited, in point of fict, results altogether excepitional : thas the first six months, compared with the corresponding period in 1851, shuwed an increase in inport duties of $21,000,000$

Natigation between France and Fogelon Countaips-1850, 1854, and 1853, compared.

The preceding statement. oxhibits the navigation exhilits the exports of prineppal manufactnred staples between France and forelgn natons in 1855, as com- in $180^{\circ} 5$ compared with 3854 : by which it may be seen pared with 1854 and 1853 .
