direds of milee farther into the interior; then opening up to Canadu not only the fertile regions of her own most westerly districts, but the famous Far West of the United States, etretching even to the territorien of the Mlssissippl; snd It may be at no remote period to the yet dlstant shores of the Pacifle.

Cpper Canada.-We will now briefly describe the leading features of Upper Canada. This division of the cenntry, er nmuncing about 80 miles up the St. Lawrence from Montreal, upon the north side of the river, extends for about 100 miles farther slong this shore of the river to the eity of Kingston, at the foot of Lake Ontario, and thence along the north shorea of the greut lakes Outario, Eric, St. Clair, Huron, and Superior, with their connecting rivers or straits, and stretching to the head waters of the streams which flow into Lake Superior. This great stretel of territory, with its almost unsurpassed extent of inland coast navigation, extends from $74^{\circ} 80^{\prime}$ to $117^{\circ} \mathrm{W}$. long. The grand course of navigable waters directly inland through Cangda, by the St. La wrence and grest lakes, may be safely stated to exceed 2000 miles. The coast of the lakes alone has been.estimated at upward of 5000 miles. The shores of this great valley, through which these waters tako their course, embruce a country which has been styled " the Garden of North America." It hus alreudy in our own duy presented an increase in population, and in agricultural and commercial wealth, so wonderfully rapid as to be unprecedented in history. Upper Cansila, thus so fuvorally situated-comprehending one side of tha entire upper portion of tho great valley of the St. Lawrence-is bouncled on the south by the territories of the United States, on the north ly the 11 udson's Bay Territory, and on the esst by Lower Canada, while to the west extends that vast truct of country within British dominion, but as yet in a comparstively primeval state. and most generally known hitherto as the Northwest Indian Territory:

That portion of Upper Cunada which has been ret apart and divided for settlement, extends from its extreme ecatern point, where it leaves Lower Canadn, 80 miles abova Montreul, and raaches aloug the northern shore of the St. Lawrence, and upward along the lakes to the shores of Lake II uron-a direct conrse of about 700 miles. This breudth of settled country toward the north may be said to vary from 50 to 80 miles. Throughout the whole of this tract the soil is excellent, and is not aurpassed by any other part of the American continent. It consista, generally speaking, of a fine dark loam, mixed with a vegetuble mould. but it is in a great nesasure so varled as to present solls adspted to almost every rpecies of produce. From the commencement of Upper Cansila to the head of the Bay of Quinte, on Lake Ontario, the land is spread out into an ahmost uniform levei of great benuty, which rises only a few fect from the banks of the St. Lawrence. It is in every direction wesi watered by numerous streams, which are generally navigable for boats and canoes, und at the same time present the most desirable situntions for the erection of machinery. Farther into the interior, ulong the conrse of the grent streum of the Ottawa, which flows into the St. Lawrence a ahort dlatance above Montresi, and thetween the O'tawn and Lake Ontario, the face of the country-whleh we have notical us being apreal ont into n plain so attractive-is, in parts, heru diversified by rhigen and tolet heights, and also by numerous streams and Inlsud lakes. The Nhleun Canal, a work construeted by the imperial government for militury purposen, pussing through this purt of the interior, from the town of Ilytown, on the Ottowa, 120 nalles above Montreal, through the country to Klngaton-a distunce of 135 milen-Is almost one continued chnin of uatural lakes and streams. The chief link of these waters is kidean lake, 24 miles in length, forming the aummit level of the canal, and beling 280 feet abovo
the level of the Ottawa River, and 150 feet above Lake Ontario. Lake Ontario, which racelves the waters of the upper lakes from the Nlagara River, and dlacharges them Into the St. Lawrence, nearly $\mathbf{8 0 0}$ miles from the mouth of thut river, may be said to be the firat link in our upward progress of the chaln of great lakes which so distingulsh Canada, and confer upon the country unsurpassed means of internal communlcation. The height of this lake above the sea is 232 feet. It is 180 miles in length, 50 miles in breadth, and 470 miles in circumference. While tho shores of thia lake present the most populous and prosperous parts of Canadn, the lake itseif is believed to be the safest of the three lower lakes for the purposes or navigation. It possesses several excellent harbors; and from its great depth of 500 feet, compared with the two lakes abjve it, it is not so easily moved by storms as Lako Erle, while it is quite exempt from the shallows, or flats, as they are called, of Lake St. Clair.

There are several pretty large lelands scattered over the lower extremity of Lake Ontario, one of which, Amherst laland, is abont 10 miles in length ant 0 in breadth. One of tho most fertile and beautiful portlons of this lake is the magnificent iniet of the Bay of Quinte, commencing near the clty of Kingston, at the foot of the lake, and forming a opacions indentation of sbout 70 milics to the mouthe of the rivers Trent and Moirs. The shores of this bay are more diversified and pleasing in their features than thoog of the great lake itaelf, whose Indian name, "Ontarif," signifies the Beautiful. Lako Ontario is never frozen over, and throughout winter steamboats frequently run across tho npper part of the lake from Toronto to Niagara when the westher is finc. All along the north shore of Lake Ontario, a distance of 180 miles, one extensive fertile plain presents itself, now and then agreeably sloping to the very edge of the lake, and bearing evidences of successful cultivation end progress. Several thriving towns are growing up rapidly along the shores of Ontario, the chief of which are, Kingston, st the foot of the lake; Toronto, 35 miles from the head; and Hamilton, at the extreme head. Toronto, which is very finely situated, tpresiing over a wide and gentiy rising piateau, and in a protected part of the lake shore, is the largest city of Upper Canada. The generaliy lovel atretch of wellcultivated plain which forms this northern ehore of Lake Ontario is only partially broken by an Inconsiderable ridge which runs through it, and which, coursing around the rasd of the lake, and crossing into the United States at the Falls of Nisgara, forms the commencement of the exiensive and fertile table-iand which atretches westward from Lake Ontario, and, situated between Lakes Erie and Huron, forms the great western peninsula of Upper Cansila. The eastern hourdary of this peninsula, thus aituated between these three great lakes, is the neck of lund of $\mathbf{8 6}$ miles between the shores of Lake Ontario, at Toronto, and Lake Simcon, which communieates liy means of the Rlver Severn with the Georgian Bay, on Iake Ifiron. The settled parts of this great peninsuia embrace about one-half of the settled parta of Upper Canedn; and It is eatimated to have at present a cultivated aurfice equal to about a fourth part of the cultivated aurface of Scotiand. This eettied and partially oceupied portion of the peninsula contalns upward of $9,000,000$ neres. The entire district has been atyled "the Garden of Upper Canada." "I am delighted to have meen this part of the country," sald the :ate Lord Sycienham, In recording his Impressions to a friend, after having visited thifs diatrict in the course of a tour which he performed in the capaclty of governor general of Ganada, In the auturra of 1840-"I am deligited to have seen this part of the country; I mean the great ilatrict, nearly an targe as Ireland, jlaced between the three lakes-Erie, Ontario, and Huron. Yuu can conceive nothing finer! The most magniffent soil in the
world-4 feet of vegetable monld; a climate certalnly" the best $\ln$ North America-the greater part of it audmirably watered. In a word, there is land erough and capabilities enough for some millions of people, and in one of the finust provinces in the worid."-E. B.

The number of acres held by the $19 \cdot 1,809$ occupierg of land in Canads is $17,987,148,9,283,333$ acres of which are in Upper Canada. The number of acrea under sultivation In Canada in 1852 was 7,308,241, the greater proportion of this cultivated land being in the upper provinces. The increasing quantity of cultivated land in Upper Canada is another of the gratifying proofs of the aubstantlal progrese of the country; and this increase of the area of cnitivation keeps full pace with the Increase of popnlation. In 1842 the population of Upper Canada, amounting to 486,055 , possessed $1,927,816$ acree of iand under cultivation; and In 1852 the population, which had increased to 952,004 , possessed an area under cultivation of $3,697,724$ acres. The proportlon of occupled lands in Canada under cultlyation, under crops, pasture, and used as gerdens ani orchards, and also in forest or wild state, were us follows:

| Land under cropa | $4 \stackrel{\text { Acrea. }}{347,639}$ |
| :---: | :---: |
| land under pastur | 2,80,064 |
| 1,and under gardons | 85,098 |
| Land forest or wild. | 10,633,907 |
| Total. | 17,967,148 |

Tho distribution of the land under crops, and the produce of these crope respectigely, were:

| Under | Acren. | Produce. |
| :---: | :---: | :---: |
| Wheat | 1,209,296 | Huaheh. <br> 15,76s,720 |

| Trurnips . . . . . . . . . . . . . . . . . . | 21,082 | 4,014,651 |
| Fallow and other crops ..... | 1,240,854 |  |
|  |  |  |
| Total produce of above spectifed crops. . |  | 68,820,37\% |

Besides these amounte of apecified produce from these $4,347,589$ acres of land under crojis, the Canadian farmers pussessed other crops, such as hay, clover, and grass seeds, carrota, mangel-wurzel, beans, hops, fiax, hemp, and tobacco. The quantity of tobacco prodined In Cunada in 1852 amounted to $1,253,128$ pounds; of this 764,476 pounds were the produce of Upper Canada; and the greater portion of which was grown along the shorea of the upper part of Lako Erie, and of the River Detroit, where the soil and climate seem best adapted for this description of crop, and where the furmers in those parts have had the best opportunities of receivIng the aervices of the colored or runaway alave population of the United Stutes, who have been accuatomed to the management of such proluce in the tolinece plantatlons of the South. The produce in tobacce of the two countles of Kent and Essex sione, sitisated in this southwestern point of Cunudu, amounteci lin 1852 to 760,300 ponnds.

The growth of hemp In Canarla assumes a position of grent national importar. ${ }^{\circ}$ at the present time, when Iritish supplies have beer oa aeriousiy checked hy the war with Ikusala. The Iniportant tawns upon the cast coast of Scotland, which are the chicf seats of tie flax trade, have suffered eeverely by the check received ly their dependence upon Russia for this great staple of a growing liranch of national manufuctures.

One effect of the Canadian Reelprocity Trenty has been to give business to the leading rallroads of New York and Massachusetts, and to reduce the import and export trade of Quebec; thus benefliting the towns of Canada West, while those on the St. Iawrence are irecomilig less and less the polnts of transhipuent. Thus the exports of Quobee in two years have decjlined
e certalnly rt of it ad. nd erough of people, Id."-E. B 9 occupiers 33 acres of er of acrea 108,241 , the eling in the $y$ of cultihe gratifye country; keeps full n 1842 the to 486,055 , ultivation creased to of $3,697,724$ in Cansda nd used as wild state,
one-third, and the imports in the same ratio; waile at Toronto the exports have nearly doubled, and the imports have increased twenty per cent, between the years 1853 and 1855. The exports and imports of the leading towns for the years 1853, 1854, and 1855 are as follows:

The Canadian $\mathcal{E}$ is equal to four dollars United States currency; the shilling being equal to twenty cents. Fomerly, all the importations into Canada were made vis Quebec, but the opening of the Atlantic and St. Lawrence Railroad, between Portland and Montreal, has developed a large and increasing import and export trude with Montreul direct. At the same time, the Reciprocity Treaty is the meane of facilitating, by s period of fifteen to twenty days, the delivery of goods at Toronto via New York, in lieu of Quebec. Tho export trade of the lstter is malnly products of the forest, grain, etc.

The value of exports from the United States to Conada for the liscal year 1852 -' 63 was $87,829,000$, excoeding these to any country, except Great Britain, France, and the Hanse Towis. Since then the trade with Canade has been increasing rapidly, and assumhog each year a greater importance to us.

Reciprocity Trealy between the U'nited States and Great Britain.-This treaty was coneluded and sigued by the reapeetive miniatera of the two governmenta on the bth of June, 1854. The following is a synopsis of it:

Art. 1. It is agreed that United States tlahermen shall have the privilege of taking tish on the sea-consts and shores, in the bays, harlors, and ereeks of Canada, New Brauswick, Nova Scotia, I'rince Edward's Islund, and the aljacent ialands, without being restrleted to any distanee fron the ahore; with permission to land on these coants and islunds for the purpose of drying their nuta and euring their flsh, provided thry du not interfere with any prior right of Dritish fisinermen. It is understood thint this Includes only sem-tish-shell-flsh, salmon, and shad theheries, and all river fisheries, are resorved exclualvely for llritish fishermen.

Art. 2. It is agreed that Britlah fishermen shall have similar privileges to take lish on the sea-coasts and shorea of the United Stutes nurth of the B6th parallel of lutitude.

Art. 3. It is agreed that the articles enumerated in the following schedule, being the growth and product of the uforemald IIritish colonien, or of the United States, shall be admitted into eael country free of duty:
Gratn and breadstuff of alt Manuroa,
kinds,

Animain of all kinde. Fresh, moked, sad salted meatig.
Seeds and vegstable:
Undrisd fuite.
Dried fruits.
Fish of all kided.
2roducts ot fish, and of all oth
or el satures dyving in the water.

## Poultry.

Egga
Hldce, furs, wiking, or talle, undressed.
Stons or marble in its crude or u' "rought stals.

Cnmennfactured tobacco.
Lume
luge.

Art. 4. It is agreed that the citizens and inhabitants of the United States shall have the right to navigute the River St. Lawrence and the canals in Cauada used as a means of communicating between the Great Lakes and the Atlantic Ocean, with their veasels, boats, and crafts, as fully and freely ss the subjects of her Britannic majesty, subject only to the sama tolls and other assessments as are now exacted of Britith subjects.

Art. 5. It is agreed that British subjects shall have the right to navigate Lake Michigan on the same terms, as long as the Canada canels and St. Lawrence River are open.

Art. 6. It is agreed that no export duty shall be levied on lumber or timber cut on that portion of the State of Maine watered by the River St. John and its tributaries, and floated down that river and shipped to the United Statea from the province of New Brunswick.
The offect of this treaty, eepecially of Art. 3, has been to give a great impetus to the trade between the United States and the British possessions, especially Canada. This treaty has been and will be of great advuntage to both countries, promoting intercourse and extending comnercial relations.

Canal, Canals. A canal is an artificial channel, filled with water kept at the desired lovel by meana of locks or sluices, forming a communicatlon between two or more plares.

Ancient Canals.-The comparative cheepness and facility with which goods may bo conveyed by sea, or by means of navigable rivers, seem to have suggested at a very early period the formation of canals. The bestauthenticated accounts of ancient Iigypt represent that country as lutersected by camala conveying the waters of the Nile to the more distant parts of the country, partly for the purpose of irrigation, and partly for that of Internal navigation. The efforta made by the old Lgyptian monarehs, and by the I'tolemies, to construct a canal between the Red Sea and the Nile, are well known, and evince the high sense which they entertained of the importance of this specien of communiear tion,-Amellion, Comm. des Eyyptiens, p.76. Greece was too amall a territory, too much hintersected by arms of the sea, and subdivided into too many Judependent states, to afford much ssupe for inland nutigation. At. tempre were, however, made to cut a eanal neross tho lsthmus of Corinth; but thoy did nut ancceed. The Liumung didy not distiuguish themselves in canal navigation, Their agueducts, the stupendous rulus of which attust the wealth mad power of their fomuiern, wero intended to furnish suipilies of water to womo addjoinhig elty, mul nut for the cunveyance of vessels or produce,

Chinese Canals.-In China, eanals, partly for Irrigution and partly fur nuvigution, have existed from a very early periol. The must celebrated among then is the Imperial or Grund Camal, cummeneing at IIang-tchou, near the month of the Teling-tang-chlang rizer, in

es north, and, crossing the great rivers Yang-tse-Kiang and Hoang-ho, terminates at Lang-tIng, on the Eu-ho River, In about lat. $37^{\circ}$ N., long. $116^{\circ}$ E. The direct distance between the extreme llmits of the canal Is about 512 miles, but, Including its bends, it is above 650 miles in length; and as the Eu-ho, which is a navlgable river, unites with the Pel-ho, also navigable, an internal water communication is thus established between Hang-t chou and Pekin acrose $10^{\circ}$ of latitude. But, apart from Ita magnltude and utllity, the Grand Canal does not rank high as a work of art. A vast amount of laber has, however, been expended upon it; for though It mostly passes through a flat country, and winds alw, at to preserve its level, its bed is in parts cut down to a great depth, while In other parta it is carried over extensive hollows, and even lakes and morasses, on vat mounds of earth and stone. The sluices, which preserve its wuters at the necessary level, are all of very sinuple construction, being merely intended to elevate or depress the height of the water by a few Inches; as, exceptiag these, there is not a single lock or interruptlon to tise navigation throughout the whole length of the canal. It is seldom more than five or six feet in depth, snd in dry sessons is sometimes conalderably less. The vessela by which it is navlgated are sometlmes rowed, and sométimes dragged by men, so that the navigation ls for the most part slow. The canal is frequently faced with stone. The construction of this great work Is usually accribed to the Tartars, but the Chinese allege that it was merely repaired and renovated by the latter, and that It had been completed in the remotest period of their history.-Barnow'h Chima, p. 335, etc.; La Lande, Canaux de Navigation, p. $\$ 29$, etc.

Italian Canale.-The Italians were the first peoplein modem Europe that attempted to plan and executa canals. They were principally, however, undertaken for the purpose of irrigation; and the works of this sort executed in the Mllanese and wher; arts of Lombardy, in the eleventh, twelfth, and thirteenth centuries, are still regarded as models, and exclte the warm admiration of every one capalle of appreciating them. In 1271, the Naville Grande, or canal leuding from Milan to Abbiste Grasso and the Tesino, was renderen naviga-ble.-Yuung's Trarels in Prance, etc. vol. II. p. 170.

Dutch Cinnals,-No country in Europe contains, in proportion to lte slze, so many navh ble canals as the kinglom of the Netheriands, and par.icular'y the provInce of Holland. Tha constru' 'on or thene canalse mmenced as early as the twelfth century, v:hen, oving to Its central and convenient ituation, Flanders becan to be the entrapót of commerce between th" north and south of Europe. Their number has since been nstonishingly increased. "Hollend," says Mr. I'hillipa, in his Ilistory of Inland Navigutiun, "is intersected whih Innuinerable canals. They may be compared in number and size to our public roads and highweys; and us the latter with us are continually full of vehicles and hormemen going from and to the different citles, towns, and villages, so, on the former, tho Mellunders In tieir boats and pleasure barges, their treekschuyts, and vessels of hurien, are continnally joumeying and conveyIng commoditles for consumption or exportation from the interiar of the country to the great citles and rivers. An Inhabltant of Rotteriam may, by means of these canala, breakfast at Delft or the Hague, dine at. Leyden, and sup at Amsterdam, or return home again before night. Ity thom, also, a most prodigious Inland trade in carried on between Holland and every part of France, Flandern, and Gemmany. When the canals are frozen over, they travel on them with skates, and perform long journeys in a very ahort time, while beavy burdens are conveyed in carts and sledges, which are then as much used on the canals as on our atreeta. The yearly profitn produced by these canals are almont beyond telicf; but ithas been incontestably proved that they amount to more than $\mathbf{£ 2 5 0 , 0 0 0}$ for sbout $\mathbf{4 0 0}$ miliea
of inland navigation, which is $\mathbf{x 6 2 6}$ per mile, the square surface of which mile does not exceed two acres of ground; a proft so amazing, that it is no wonder other natlons should imitate what has been found so advantageona. The canals of Holland are generally 60 feat wide and 6 deep, and are carefully kept cleen; the mud, as manure, is very profitable. The canals being generally level, but few locks are required. From Rotterdam to Delft, the Hague, and Leyden, the canal is quite level, but is sometimes affected by strong winds. For the mest part, the canals are elevated above the fields or the country, to enable them to csrry off the water, which In winter inundates the land. To drain the water from Delftland, a province not more than 60 miles long, they employ 200 wind-mills in spring. thine to ralse it into the canals. All the canals of Holland are bordered with dams or banks of Immense thickneas, and on these depends the security of the country from Inundation; of course, It Is of great moment to keep them in tho begt repair; to effect wh; ! there is a kind of militia, and in every village is a magazine of proper stores, and men whose bnsiness it is to convey stones and rubbish in carts to any damaged place. When a certain bell rings, or the watcrs are at a fixed height, every man repsirs to his post. To every house or family there is assigned a certain part of the bank, in the repair of which they are to as sist. When a breach is apprehended, they cover the banks all over with cloth end stones."

Canal from A materdum to Nieredit $p$, near the Ihelder.The object of this canal, which is the greatest work of its kind In IIolland, and probably in the world, is to afford a safo and essy passage for large vessels from Amster. dam to the German Ocean. This city has 40 fect of water in the road in front of Its port ; but the pampas or thar at the junction of the $Y$ with the Zuyder Zee, 7 miles below, has only a depth of 10 feet ; and hence all slips of any considerable burden entering or leaving the port must unlead and load part of thelr cargoes without the bar. As the Zuyder Zee is every where full of sinallows, all ordinary means of improving the accees to Amsterdam were necessarily Ineffectuai; and the resolution was, therefore, at length adopted of centting a canai from the city to the Ilelder, the most northerm point of the province of Holland. The distance bet ween these extrame points is 41 English millea, but the length of the canal is sbout 50 . The breadth at the surface of tine water la 124 English feet ( 120 Kh Incland feet); the breadth at bottom, 86 feet ; the depth, 20 feet 9 Inches. like the Dutch canals generally, its level is that of the inighest tides, and It recelves its supply of water from the sea. The oniy lecks it requires are two tide-locks at the extremities; but there are, bealdes, two sluices, with flood-rates in the intermediate apace. It In crossed by ahout 1s draw-bridges. The locks and aluices are douthe--that is, there are two In the breadth of the canal; and their construction and workmanship are said to be excellent. They aro bullt of brick, for economy; but bands of limestone are interposed at intervals, and these project about an Inch beyond the brick to protect It from abrasion by the aides of vesacls. There is a broad towlng-path on each alde, and the ranal la wide chough to admit of two frigates pasaing. The line which the cannl follows may be earlly traced on a map of Holland. From the $Y$, at Amsterdum, It proceeds north to l'urmerend; thence west to Alkmaur Iake; again north by Aikmaar to a point wlthtn 2 miles of the coast, near Jetten; whence it runs nearly parallel to the coast, till it joins the see a little to the east of the Helder, ut the fine harbor of Nlewdlep, formed within the last 30 years. At the latter place there in a juwerful ateam-engine for supplying the canal with water during neap-tiden, and other purposes. The thme rpent In towing vessela from Niewiliep to Amsterdsm is 18 bours. The IIelder is the only apot on the aheres of Holland that has deep water; and it owes this sdvantage to lta being opposite to the Toxel, whin a by contract-

Ing the communication between the German Ocean and |the canal. This is a sufficient evidence of ita utllity. the Zuyder Zee to a breadth of about a mile, produces a current which scours and deepens the channel. Immediately opposite the Helder there are 100 feet water at high tides, and at the shallowest part of the bar to the westward there are 27 feet. In the same way, the artiftial meund which runs into the $Y$ opposite Amsterdatn, by contructing the water-way to about 1000 feet, keeps a depth of 40 feet in the port (at high water), while above and below there are only 10 or 12 . The catnal was begun in 1810, and finished in 1825. The cost was eatimated at $10,000,000$ or $12,006,000$ flerins, or shout $£ 1,000,000$ sterling. If we compute the magnitude of this canal by the chibie contents of its bed, it is the greatest, we believe, in the world, unless some of th Chinese canals be exceptions. The volume of water which it contains, or the prisme de remplissage, is twice us great as that of the Now York and Erie Canal, or the canal of Languedoc, and two and a half times as grent as that of the artificial part of the Caledonian Canal. In consequence, however, of the facility with which the Dutch canal was dug, and of the evenness of the ground through which it passes, the difficulties with which the engineer had to contend in making it wers tritling compared to those which had to be overcome in construeting the cunala now mentioned. We have not learned what returns this canal yields; mest probably it is not, at luast in a direct point of view, a prefitable cencern. Even in liolland, notwithatanding the lewness of interest, it would require tolls to the amount of $£ 40,000$ a year to cover interest and expenses; and so large a sum cun hardiy, we should think, be raised by the very moderate toils laid on the ships passing through it.-Sea Amsterdam, This, hewever, is net the only consideration to be attended to in estimating the value of a work of this sert. Its influence in promoting the trade of Amsterdam, and, indeed, of Holland, may far more than compensate for its cost. It is evident, too, that the imposition of oppressive tells would have effectually counteracted this advantage; that is, they would have defeated the very olject for which the canal was constructed,

Ianish Cancls.-The Iloldein Canal, in Denmark, is of very considerable importance. It joins the River Eyder with Kiel Bay, on the northeast cosst of Melstein, forming a navigable conimunication between the North Sea, a little te the north of Ifelligolind, and the Buitic; enabling vessels to puss from the one to the other by a short cut of about 100 miles, instead of the lengthened and difficult voyage round Jutland, and through the Cattegat nnd the Sound. The Eyder is navigatle for vessels not drawing more than 9 feet of water, from Tonningen, near its month, te Rendeburg, where it is joined by the canal, which cemmunicates with the Baltic at IIoltemm, abent 3 miles north of Kiel. The canal is abont 26 Inglish miles in length, laciuding about 6 niles of what is principally rive: navigation. The excavated pertion is 95 feet wide at tep, 51 feet 6 inches at bottom, and 9 feet 6 inches deep (Euglish measure). It highest elevation nhove the lovet of the sea is 21 feet 4 inches; to which helght vessels nre raised and let down by 6 locks or slulees. It la navigable by veasels of 120 tons bu;den, or more, provided they are construeted in that view. The totai coat of the eanal was about $£ 500,000$. It was opened $\ln 1786$, und has se far realized the views of its projectors, as to ennble consting vesaels frem the Danish blands in the Baitic and the east coast of llolatein, Juthund, ete, to proceed to IIaminarg, lloilind, Eagland, ete., in less time, and with much leas risk, than, in the ordinary course of navigation; they could have cleared the point of the Skaw; and eonversely with shipe from the weat. The amaller class of forelgn vessels, purticularly thone under the Dntch and Ilanseatic fluys, uavigating the Baitic and North Sean, have largely availed themaelves of the facilities afforded by this canal. About 8000 vessels pass annuaily through

It would, however, be much mere frequented, were it not for the difficult navigation of the Eyder from the ses to Rendshurg. The dues are moderate.-Coxe's Travels in the North of Eur,pe, 5th editien, vol. v. p. 239, where there is a plan of the canal; Catteau, Tableau des Eitata Danois, tome ii. p. 300-304; and private information.

Swedish Canals.-The formation of an internal navigation connecting the Cuttegat and the Baltic has long engaged the attention, and occupicd the efforts, of the peopic snd government of Sweden. Varieus motives conspired io make them embark in this arduous undertaking: The Sound and other cbannels to the Baltic being commanded by the Danes, they were able, when at war with the Swedes, greatly to annoy the latter, ly cutting off all communication by sea between the eastern and western provinces of the kingdom. And hence, in the view, partly of obviating this annoyance, and partly of facilitating the conveyance of iron, timber, and other bulky products, from the interior to the coast, it was determined to attempt forming an internal navigation, by means of th: Yiver Gothu, and the Lakes Wener, Wetter, etc., from Gottenburg to Soderkœping, on the Baltic. The firat and most difficult part of this enterprise was the perfecting of the communication from Gottenburg to the Lake Wener. The Gotha, which flows from the latter to the fermer, ia navigable, through by far the greater part of its course, for vessels of considerable burden; but, besidea others iess difficult to overcome, the navigation at the point called Trölhnetta is interrupted by a series of eataraets alout 112 feet in height. Owing to the rapidity of the river, the stubbern red grayite rocks ever which it flowa, and the perpendicular banks by which it ia bounded, the attempt to cut a lateral canal, and still more to render it directly navigahle, presented the most formidable obstacles. But undismay 1 by these, on which it is, indeed, most probable he had not sufficiently reflected, Polhem, a native engineer, undertook, about the riddle of last century, the Herculean task of constructing locks in the channel of the river, and rendering it navigable. Whether, however, it were owing to the all but insuperable obstaclea opposed to such a plan, to the defective execution, or deficient atrength of the werks, they were wholly awept away, after being considerably advanced, and after vast sums had been expended upon them. From this period, down to 1798, the undertaking was abandoned; but in that year the plan was propesed, which sheuld have been adopted at first, of cutting a lateral canal through the aolid rock, abont $1 \frac{1}{2}$ mile from the river. This new enterjrise was begun under the auspices of a company Incorporated for the purpose in 1794, and was successfully completed in 1800 . The canal is about 3 miles in length, and has about $6 \frac{1}{2}$ feet water.-CAttesiv, Tableau de la Mer Baltique, tome li. p. 77; Ondy, int his European Cummerce, p. 306, and 13at.mi, Abrégé de lo Geographie, p. 385, say that the depth of water is 10 feet. It has 8 sluices, nad admits vessels of ahove 100 tons. In one part it is cut threugh the solld rock to the depth of 72 feet. The expense was a gool deal less than might have been expected, being only about $\mathbf{\& 8 0 , 0 0 0}$. The Lake Wener, the navigation of which was thms opened with Gottenburg, is very large, deep, and encircled by seme of the richest of the Swedish provinces, whieh now possuss the inestimable ndvantuge of a convenient and ready outlet fer their products. As soon as the Trollizetta canal had been completed, there conld be ne roon for doubt as to the practicabillty of extending the navigation to Snderkcoping. In furtherunce of this ohject, the Lake Wener was joined to the Lake Wetter hy the Gotha Canal, whleh admits vesala of the same aize as that of Trollhwotta; and the prolongatien of the navigation to the Baltie from tas Wetter, partly hy two canala of equal magnitude with the above, and partly by lakes, has slnce been com-
pleted．The entire undertaking is called the Gotha Navigation，and deservediy ranks among the very firat of the kind in Europe．Besides the above，the canal of Arboga unites the Lake IIjelmar to the Lake Mae－ Isr ；and，since 1819，a eanal has been constructed from the latter to the Baltic at Sodertelge．The canal of Strcemabalm，so called from its passing pear the castle of that nume，has effected a navigable communication between the province of Dalecarlia and the Lake Mae－ lar，etc．－For further detoils，see，besides the authori－ ties already referred to，Coxs＇s Travels in the North of Europe，5th ed．vol．jv，p．253－266，and vol．v．p． 58－66；Thomson＇s Travels in Suceden，p．35，ete．

French Conals，－The first canal executed in Franee was that of Briare，342 Engliah miles in length，intend－ ed to form a communication between the Seine and the Loire．It was commenced in $1 \mathbf{1 0 0 5}$ ，in the reign of Ilenry IV．，and was completed in $16 \pm 2$ ，under his auc－ cessor，Louis XIII．The canal of Orleans，which joins the ．．Jove，was commenced in 1675．But the most stupendoua underaking of this sort that has been exp． suted in Frunce，or indeed on the contioant，is the ca－ nal of Languedoc．It was proje sted i ader Francis I．； but was begun and completed in the reign of Louis XIV．It reaches from Nurbonne to Toulouse；nid was intended to form a safa and speedy means of com－ munication between the Atlantic Ocean und the Medi－ terranean．It is 64 French leagues in length，and 6 feet deep；and has in all 114 locks and sluices．In its highest part it is $\mathbf{6 0 0}$ feet above the level of the sea． In some places it ia conveyed，by bridges of great lengtlı and strength，over large rivers．It cost upward of $£ 1,300,000$ ；and reflects infinite eredit on the engi－ neer，Riquet，by whom it was planned and executed． Besides this great work，France posseases several mag－ nificent canals，such as that of the Centre，connecting the Loire with the Saone；of St．Quentin，joining the Scheldt and the Somme；of Besancon，joining the Saone，and consequently the Rhone，to the Rhine；of Burgundy，joining the Rhonn to the Scine，etc．Some of thess are of very considerable magnitude．The ca－ nal of the Centre in about 72 English miles in length． It was completed in 1791 ，at an expense of about $11,000,000$ francs．Its summit level is shout 240 feet atove the level of the Loire at Digoin；the breadth at the water＇s edge is aloout 48 feet，and int hottom 30 feet； depth of water，bi feet；number of locks，81．The csnal of St．Quentin， 28 English miles in length，was compicted in 1810．The canal joining the Ihone to the lhine is tive most extensive of any．It atretcies from the Saone，a little above St．Joan do Losne，by Dole，Benaucon，and Muihouse，to Strasburg，where it joins the Rhine－a distance of ahout 200 English miles．From Dole to Vogeaucourt，near Montbéliard， the canal is principully excavated in the bed of the Douhs．It is not quite finisised．The canal of Bur－ gundy wiil，when completed，be about 242 kilometren， or 100 Euglish miles，in length；but ut present it is only navigable to the distance of about 90 kilometres． In addition to these，a great many other canala have been finished，while several are in progress，and oth－ ers projected．There is an excelient account of the French canala，in the Histoire de la Narigution Inte－ rieure de la France，by M．Dutens，in 2 vols．4to，and to It we beg to refer the roader for further detaila．Ile wiil find，at the end of this socond volume，a very inoull－ tifui map of the rivers nud canais of Franee．The rall－ roads now in the course of construction in France have， however，cherked the progress of eansla．We mayob－ serve，too，that tha state of the law in France is very unfavorable to tha undertaking and success of all great publie works；and we are inelined to attribute the comparative fowneas of canals in France，and the re－ cent period at which most of them have been eonatruct－ ad，to its influence．In that country，canals，docks， and such like works，are montly carried on at the cx－ peuse and for behoof of governmant，under the control
of its agents．No soape has been given to the enterpries of individuals or associations．Before either a road or a canal can be constructed，plans and estimates must be made out and laid before the Minlster of the Inte－ rior，by whom they are referred to the prefect of the department，and then to the Bureuu des Ponts et des Chnusses；and supposing the project to be approved by these，and the other functionaries consulted with re－ spect to it，the work muat after atl be carried on under the superintendence of some public officer．In conse－ quence of this preposterous aystem，very few works of thia deacription lase been undertaken as private spec． nlatious．And while not a few of those thegun by gov－ erument remain unfinished and comparatively useless， those that are completed have，as was to be expected， rarely proved protitable．There are some good re－ marks on this subject in the usnful work of M．Dupin， on the fiorces Cunmerciales of Great Britain．

Prussian Canald．－The I＇ruesian states are traversed by the great navigable rivers the Elbe，the Oder，and the Viatula；the tirst having its embouchure in the North Sea，and the others in the Haltic．The forma－ tion of an intermal navigation，that should join these great wouter－uvays，excited the attention of govermment at a diatant period；and this olject has been success－ fully accompliahed，partly by the rid of the secondary rivers fulling into the alove，and partly by csnals， In 1662，the canal of Muhlrose was undertoken，unit－ ing the Oder and the Spree；the latter being a naviga－ bie river failing into the Havel，also a navigaile riv－ er joining the Ellie near Havellourg．But the navigs－ tion from the Oder to the lilbe by this ehunnel was dif－ ficuit，and liable to frequent interruption；and to ob－ viate these defects，Frederick the Great construeted， toward the middle of last century，the Finnow Cunal， wtretching from the Oder，at Oderiourg，to the linvel， near Lielenwulde；the communication is thence con－ tinued by the latter and a chuin of lakes to llauen； from which point a canal has been opened，joining the Elte near Magdoburg．The lilbe being in this way connected with the Oder by a comparatively easy nav－ igation，the latter has been united to the Vistula，part－ ly by the liver Netze，and partly ly a cansl juining that river to the lirahe，whieh fain into the Vistuia near Bromberg．A vast inland navigation has thus been completrd，barka passing freely through the whole extent of the country from Jlamburg to Dantzic；uf－ fording the means of shipping the products of the inte－ rior，and of importiry those of foreign countries，either by the North Sea or the Baltic，as may be found most udvantageous，－Catteav，Tablema de la Mer Balique， tome ii．p．11－18．
Russian Canals，－The inland navigation of Russia is of vast oxtent，and very considerable importance．By means partly of rivers，and partly of canals，St．Peters－ hurg is connected with the Caspisn Sea．Goods are conveyed from the latter to the capital，a distunce of 7434 iniles，without reahipment．

Bavarian Comuls．－A grand canul，which was for a lengthened period in progress in havaiju，was com－ ileted in 1846，and promises to become of great puilic ntility．It extends from Dietfurth，on the Altminhi，a navigalle afluent of the Danube，to Hamberg，on the Mayn，a distance of $28 \frac{1}{2}$ Germun，or nbout 112 Englisin miles．It is on a large scale，nud lise cost utiove fl，000，000．This maguifleant undertuking，which enr－ ries an inland navigation through tho centre of liurope， and realizes the projeet of Charlemagne for uniting the Hack Sea with the German Ocean，is conducted liy a joint－stock compuny，with the assiatance of the llava－ rian government．Ilut the navigation of the Mayn and the Danube requirea to be considerably improved thefore this grand channel of communication nçuires all the importance which，most probatbly，it is deso tined to olbtain．

ages that might reault to the fersign trade of the empire from so great a command of river navigation have been materisily abridged by the jealousy of the Turks, who command the embouchure of the river, and by the difficuities that are in some piaces incident to its navigation. Twe pretty extensive canals have been constructed in Hungary. Th.t called the Bega Canal is 73 English miles in length: it stretches frem Fascat through the Bannat, by Tameswar to Becskerek, whence vessels pass by the Bega into the Thelss, a littie above lts junctlon with the Danuhe. The other llungarian canal is calied after the Emperor Francis. It stretches from the Danube by Zamber te the Theiss, which it jeins noar Feldvar, being 62 Engilsh miles in length; its eievatlon, where highest, tioes net exceed 27 feet. Besides the above, the cansl of Vlenna establishes a communicatlon between that city and Neustadt. It is sald to be the intention to centinue this canal to Trleste; but however desirable, we doult much whether this be practicable. A railrosd has been made from Munchausen, on the Dumbe, to Iludwelss, on the Moldau, $n$ navigable river that falls into the lilie, which promises to be a highiy useful com-munication.- Bricirt'd Travels in IIungary, p. 246; Baloi, Abregd de la Geographie, p. 216.
Spanish Canals.-Newhere are cansis more necesaary, beth for the purposes of navigation and irrigation, than in Spain; but the nature of the seil, and the poverty and lgnorance of the gevernment, as well as of the peopie, oppese fermidable obstacles to thelr constriction. During the reign of Charles II., a company of Dutch contractors offered to render the Mancansres pavigabie from Madrid to the Tagus, and the latter from tisat point to Lisben, provided they were allowed to levy a duty for a certain number of years on t'se qeeds cenveyed by this channel. The Ceuncii of Castile twok this proposai into their aerious conslderaion, an $\$, after maturely weighing it, pronounced the singuia decision, "That if it had pleased God that these two rivers should have been navigable, he wouid not have wanted human assistance to have made them such; but that, as he has net dens it, It ls plain he did not think it proper that it shouid he lene. To attempt it, therefore, would be to vlolate the decrees of his providence, and to mend the imperfections which he deslgnedly left in his works!"-Clanke's Letters on the Spronish Nation, p. 284. But such undertakings are no ionger looked upen as sinful; and many have been projected since the sccession of the Bourbon dyansty, though fow have been perfected. The canal of the Eibro, hegun under the Emperor Charles V., Is the most important of the Spanish canals ; but it is only purtlally compieted, and during dry seasens it suffers from want of water. It runs paraliei te the right bank of the Ebro, from Tudela, in Navarre, to helow Sarsgosea; the intentlon being to carry it to Sastago, where it is to unite with the Eiro. The canul of Castile Is intended to lay open the country letween the Douro and ikeynosa, and to facilltate the conveyance of grain from the interior to Ssintander and ililibao. It passes by Vaiiadaidd, Pulencin, and Aguilar del Campes; a smaii part has been exceuted, atid is now in operation. A company has aiso undertaken, what the Dutch contractors formerly offered, to render the Tagus navigable frem Aranjuez to Lishon-the iree navigation of the river having been stipuinted at the Congress of Vienar. A preject for deepening the Guadaiquiver and seme ethers are aiso on foot.-Gsographical Dictionary, il. 710.

British Canale.-Owing partly to the rise of extensive manufactures and commerce in Grent Mritaln, but more, perlups, to the insulur situution of the country, no part of whieh is vary distant from the sen, or from a navigabie river, no attempt was made in England to censtruct canals tiil a comparatively recent peried. The etforts of those whin tirst begnin to impreve the means of internal navigution were limited to attempts
to deapen the bells of rivers, and to render them better fitted for the conveysnce of vessels. So early as 1685 , a project was formed for rendering the Avon navigable frem the Severn, near Tewkeslury, through the ceunties of Warwick, Worcester, and Gloncester, "that the towns and country might be better supplied with woed, iron, pit-ceal, and other commodlties." This scheme was approved by the principal nelility and land-owners in the adjolning counties; but tl. civii war having breken out soen after, the project was abandoned, and does net seem to have been revived. After the restoration, and during the earlier part of last century, various acts were at different times alitained for cheapening and improving river navigatien. For the mest part, however, thase attempta were net very successful. The current of the rivers gradually changed the form of their channels; the dikes and other artlficlal constructions were apt to be destroyed by inuudations; alluvial sand banks were formed below the weirs; in summer the channels were freçuently too dry te sdmit of being navigated, while at otiner periods the current was se strong as to render it quite impossitle te ascond the river, which at all times, Indeed, was a laborieus and expenslve undertaking. These difficultles in the way of river navigation seem to have suggested the expediency of elandoning the channels of most rivers, and of digging parallel to them artificial channeis, in which the water might be kept at the proper level hy means of locks. The sct passed by Pariament in 1755 for impreving the navigation of Sankey l3reok, on the Mersey, gave rise te a lateral canal of this descriptlon, about $11 \ddagger$ miles in length, which deserves te the mentloned as the eariiest effort of the sert in England. But before this canal had heen completed, the celebrated Duke of Bridgewater, and his equaliy celabrated engineer, tha self-instructed James Brindley, had concelved a pian of Inland navigation independent altogether of naturui channeis, and intended to affori the greatest facilities to commerce, by carrying canals across rivers and through mountains, wherever it was practicable to censtruct them. The duke was proprictor of a large estate at Worsley, 7 miles from Mifnchester, in which were some very rieh ceal-mines that had hitherto been in grest measure useless, ewing to the cest of carrying coai to market. Being desirous of turning hls mines to sems account, it eccurred to his grace that his purpose would be best accomplished by cutting a canai from Woraley to Manchester. Mr. Irindley, having been consulted, declared that the ocheme was practicable; and an act having been obtained, the work was immedlately commenced. "she principle," says Mr. PhIllips, "laid down at the commencement of this husiness reflects as much honor on the noble undertaker as it does upon hid engineer. It was resolved that the canal sheuld be perfect in its kind; and that, In erder to preserve the level of the water, it should be free from the usual obstruction of locks. But in accomplishing this end many difficulties were tleemed Insurmountatio. It was necessury that the canal should be carried over rivers, and many iarge and deep valleys, where it was evident that such stupendons mounds of earth must be raised ns would scarcely, it was thought by numbers, be cempleted by the lator ef ages; and, above all, it was not known from what source so large $n$ supply of water could be drawn, even on this improved plan, as would supply the navigation. But Mr. Brindiey, with a strengtil of mind pecuifine to hinaelf, and being possessed of the confidence of his great patron, centrived such admirable inachines, and took such methods to facilitate the progress of the werk, that the world soon began to wonder how it could be thought no difficult.

The success that attended the Duke of Bridgewater's canal stimulated pubitc-spirited indivlduais in other districts to undertake similar works. Mr. Brindley had early formed the magnificent scheme of joining
the great port of London, Liverpool, Bristol, and II ull, by a aystem of internal navigation; and theugh he died in 1772, at the early age of 56 , he had the aatisfaction to see his grand project fal a fair way of being reallzed. The Treat and Mersey, or, as it has lieen more commonly termed, the Grind Trunk Canal, 96 miles in leagth, was legan in 1766, and completed in 1777. A wate: communication between IIull and Liverpool was thus completed; and by means of the Stafferdshire and Worcestershire Canal, which joins the Grund Trunk near Haywood in the former, and the Severn near Stourport in the latter, the same means of communication was extended to Briatol. During the time that the Grand Trunk Casal was being made, a canal was undertaken from Liverpool to Leeds, 130 miles In length; another from Biriningham to the Stafforishire nud Worcestershire Caunl, joining it near Wolverbamy. '; and one from Birminghn to Fazely, and thears to Covintsy. By can a rtabequently undertaken, communieation was formed between the Grand Trun's Caual and Oxford, and cousequently, with London, coinjleting Jriudley's magnificeut scheme. In 1792 the Grand Junction Canal was begun, which ruas in a pretty struight line from Brentford, on the Thames, a hittle above the metropolis, to Hrannston, in Northamptonshire, where it unites with the Oxford and other central cannls. It is about 00 miles in length. There is also a direct water communication, by means of tha River Les navigatlon, the Cambridge Innction Canal, otc., between London and the Wash. In addition to these, an immense number of other canals, soma of them of great magnitude and importance, have lieen eonstruc ${ }^{\wedge}$ d in different parta of the country ; so that a command of intemal uavigation has been obt vined, unparalleled in any Liuropeas country, with the exception of Holland.

In Scotland, the great canal to join the Forth and Clyde was begun in 1788, but it was auspended in 1777, and was not reaumed till after the close of the American war. It was finally completed in 1790. Its total longth, including the collateral cuts to Glasgow and the Monkland Canal, is 381 miles. Where highest, it Is 150 feet above the level of the sea. It is on a larger scale than any of the English canals. Its medium width at the surface is 66 , and at the hettom 27 fect. Originally it was about 8 feet $G$ inches deep; but within these few yeara lits banks have been ralsed, so that the depth of water is now about 10 feet. It has in all 39 locks. In completing thia camal mary serious difticulties had to be encountered. These, however, were all auccesafully overcome; and though anprofitable for a while, it has for many yerrs past yielded a handsome return to Its proprietors, the dividend having latterly been ahout 20 per cent. on the original steck. Swift beats on the plan of thoes subsegu itly deseribed were astablished on this canal in 185́s.Ses Cleland's Statistics of Jlagonv, p. 170, etc. The Lnion Canal joins the Fortil and Clyde Canal near Falkirk, and stretehes thence to lidiaburgh, beIng 31 f miles in length. It is 40 feet wide at the top, 20 at the bottom, and 5 deep. It was cempleted in 1822. But It appears to havo been on extremely illadvised undertaking; se much so that its proprietors have sold it, at a heavy loas, to the Edinburgh and Glnogow lnilway Company, whe employ it in the conveyance of coal and other heavy goods. A canal intended to form a communication between filoggow, Paisley, and Ardrossan, was cemmenced in 1807 ; but only that portion connecting Glaagovy with l'aisley and the village of Johustonn has hitherto been finished. Thls part is about 12 milles long; the caual being 30 feet hroad at top, 18 at bottom, and $4 \frac{1}{4}$ deep. It $w$ as here that the experlmenta were erigimally mate on quiek traveling by conala, which are sald to have demonstrated that it was praeticatle to limpel a proper-ly-constructed boat, carrylng pasaengers and goods, along a canal at the rate of 9 or 10 milea an hour, with-
out Injury to the banks! The Crinan Canal across the peninsula of Kintyre, admitting vessels of 160 tons burden, is 9 milea in length, and 12 feet $\ln$ depth. The Caledonian Canal is the greatest undertaking of the sort attempted In the empire. It atretches southwest and nurtheast acresa the island from a point near Inverness to another near lort William. It is cliftly formed by Loch Ness, Loch Oich, and Loch Lor by: The total length of the canal, including the laked, is 601 miles; but the excavated part is only about 23 miles. At the $8,1 m m$ it $t$. la $96 \frac{1}{2}$ feet above the level of the Western Ciean. It is mostly constrncted upon a grand scale, weing intended to be 20 feet deep, 50 feet wide at bottom, and 122 at top; the locks are 20 feet deep, 172 long, and 10 liroad; and had it tieen wholty executed as vis winally intended, frigates of 32 ar: 17, aut l: ant ips of 1000 t wa burden, wight
 th er ely or thexpense of gevernnient, from Telerai. $\qquad$ is entire cost amounted, exclusise vi intwe k, was lie lnt May, 1858, tu $£ 1,347,780$. It would $a_{i}{ }^{\prime}$ (ext, how ene to have been projected without due considerittle", und caas been a most unprotitalle speculation. The revemuc of the canal amounted. in 1852-53, to only $£ 8889$, whereas the expenditure during the same year amounted to $£ \mathbf{5 2 9}$ ! Hut this is not all. Owing to a wish to lessen the expeuse, ond to hasten the opening of the canal, paris of it were not excavated to their proper depth, while others wete executed In a hurried and Insufficient manner. Hence the canal does not really arhuit vessels of above 250 or 300 tons burden; and previonsly to steam-tugs being provided on the lakea, they were frequently delayed in making their passage across for a !engthened jeriod. During 1837 and 180, the works sustained considerablo danage ; and the reader need not be surprised to hear that it was gravely debated whether it weuld not fie hetter entlrely to break up and abandon the canal! There was naturally, however, an extreme disinclitation to destroy a work which, how inexpedient soever oripitally, has been executed at in enornous expenee; and various schemes have been suggested for relieving the public from the expense of keeping it up without involving its teatruction. Aroug others, it has tieen proposed to assign it to s joint-storv company, on their agreeing to complete the werks and keep them in repair; and an act authorizing such transfer was passed in 1840. But hitherto it has not beco found possibile to dispose of the canal in than way; und Parliament has since voted large sums for the purtinl repair of the works, which, though a goed deal impreved, will every now and then require fresh outlays. Nome other canals have been projected and completed in different parts of Scotland. Of theae the Monklund Canal, for the supply of Giaggow with ceul, has leen the most successful.

Irish C'annls.-Varieas canals have beer undertaken In Ireland, of which the Girand Canal sud the Koyel Canal are the principal. The Grand Canal was licgun in 1765, by a body of aubseribers; but they coutd not have completed the work without very large advances from govemment. The cansl commences at Dublin, aud stretches in a westerly direction, incliniag a little to the routh, to the Shannon, with which it unites near Janagher, a dintance of 85 stutute miles, and thence on the weat side of the river to Jiallinasloe, 14 miles. Hut, oxcluklvo of the min truak, there is a braneln to Athy, where it joins the Jharnow, a distance of shout 27 mlles ; and there are branchea to PortarIlngton, Mount-Mellick, and nome ofher places. The total lencth of the canal, with lta varicias brancles is ahout 164 English milea. Its summit elovation is two hundred feet above the level of the sea at Dublin. It Is 40 feet wide at the surface, frem 24 to 20 feet st lnottom, hes six feet water, and cost in ull abvve £2,000,000.

in re passed ossible of the
 tinguished by the arirlt with which they hava undertaken, and the perseverance they have displayad in executing, tha most aagalficent plans for ianproving and extending internal navlgation. The following is a dascription of the principal canals at the United States:
 igation, partly natural and pe '" artificlal, extend" shout 50 mifes from Portland, $10 \% \%$. to Sebuge Lake. The head of the canal is at the er.s. Lot $g$ Poud, which is 10 miles in leagth.

New Youk. -This Stata has th. most extended and important system of canals, coun cting tl.e suigation of the II udson Piver with that ese great 1 akes, and Lako Champlain, Delaware, $s: 1 \perp$ Alleghany Rivers. Champlat a is eg mile in length, 40 feet wide it tho suriace, $2 \dot{c}$ fest at the bottom, and 4 foot in dentt. and cunnecte Albany, on the Hudson River, with Wiltehall on Lake Champlain.

Inyortant Connection of New York Canals.-The Lateral Caual, connecting the canals of New York State with the hend waters of tha Alleghany River, has just been linished to lts terminus at Olean, on that rlver, in Cattaraugas coaniv, New York. From thence it extends to the Geneaee Canal, on the Genesee Miver, in Alleghany county, New York, which runs north to Rochester, where it commands the trade of Lake Ontarlo, and, connecting with tha Erie Canal, Jeads to Buffalo and Albany. The connection of Pittsburg and Rochester, by this route, depends on the navigation of the Alleghany liver. Tha whole distance to Olean, 240 milies, is said to be navigable, and fer 200 milea above littsburg it is navigable for small steamloate. The consummation of this work will be of vital importance to the people of the Alleghany Valley, and a large share of the raplaly increas $g$ trade of that section will find its way to this city over the Penusylvania Railroad. The distance from Pittsburg to Philadelphia is 353 miles, and from Olean to New York, by the New York and Eris Rallroad, is 306 miles.

Delaware and Hudson Canal, built by a private company. It is 33 miles in leugth, 32 feet wide at tha surface, 20 feet at the bottom, and 4 feet leep. It connects the Iladson at Iondout with the Delaware River, and coonects with the Laekawaxen Camal, in Pennsylvania. The principal trade of this canal is in coal, as it extends by its connections into the coal region of Penusylvania.

New Jeasey.-Morris Canal is 102 miles long, 32 feet wite at the surface, and 18 fect at the bottom, and 4 feet deep. It extenls from Jersey City, on the 11 udson, to Easton, Peunsylvania, where it connects with the lehigh Canal, Pennsylvania.

Pexngilvania.-Schuyikili Canal or Navigatlon. It is 108 miles In length, is 36 feet wide at the surface, 24 feet at the bottom, and 4 feet deep. It extends from Philadelphia to Reading, and from thence to Mount Carbon, where It has connections with the anthracite cosl mines.
The leunsylvania Canal la formed of several divisions: it ls to comect Colombia with Pittsburg, on the Ohis; but its middle divislon over the Alleghany Monatains, from IJollidaysburg, on the eastern side, to Johustown, on the westeru side, is a division of railread. Its total length, including 37 miles of railroad, is 315 miles.

The Chesapeake and Ohlo Canal, had it been completed, would have been a great and nseful werk. It beghins at the tide-water of the lotomac River, above Georgetown, in the District of Columbia, and is intended to terminate at I'ittshurg, in Pennsylvania, n distance of $311 \frac{1}{2}$ miles. Its dluensions are nearly identical with those of the new Frie Canal ; its breadth at the surface being from 60 to 80 feet, 50 feet at the bottonn, with a depth of water varying from 6 to 7 feet. Several tumels ocenr in the line, which crosses the A1. leghany ridge. The cost of this work w'as estimated at
$822,275,000$, which were to te subscribed partly by indlvlduals, and partly by the United States and the States of Maryland and Pennayivanis. This canal now terminates at Cumberland, Maryland, aad thers la but a slight proliability of Its ever beling completed.

Omo.-The inclpal canal in this State la from Portamutth, on itho Ohic, to Cleveland, on Lake Erie: it is 307 miles long.

Illinots,-The canal from Chicago, on Lake Michlgan, wlert, on the Illinols Hever, is of the first importance to the trade of this State.

Indiana.-The Louieville and Yotland Camal, now the sole property of the United Stotes, has been under the direction of the Treasury Depurtment the past two years. The tolis, by curection of the departwent, were redumen one-half, and the receipts for the past two years he. : cen expended in the repair of the locks and enlargement of the casal, improvement of the bridgee, etc.

Eric Canal.-Besldea othera of great, though inferior, magnitude, a canal has been formed connecting the IIudson with Lake Erle. This work is 363 miles in leugth, the rise and fall along the entire line being 602 feet. It was originally 40 feet wide at the surface, 28 feet at the bottom, and 4 fcet deep. But these dimensious being found, from the rapidly increasing traffic and importance of the canal, to be far too limited, an act was passed in 1835 provilling for its ethlargement. Under thls act the canal has been increased, 80 as to be 70 feet wide on the surface, 42 feet at the bottom, and 7 feet in depth, the locks belng of corresponding dimensions. The original cest of the canal was $\$ 9,027,456$; and the cost of the enlargement has been about $\$ 25,000,000$, or nearly three times its first cost. The Erie Canal is the property of the State of New York, and is one of tha greatest and most important works of its kind in the world. Notwithstanding the contracted scale ou which it was originally constracted, it has completely verified the predictions of its projector, De Witt Ciinton, having been of siagular adrantage, in a public point of view, to the State of New York and the Unicn generally. This work was first suggested as early as the year 1816, by a memorial from the City of New York to the Legislature. An artificial canal from the II udson to Lake Erie had, in fact, been under consideratlon by eminent citizens of the Siate for a century before. As early as 1724 , Cadwallader Colden, then aurveyor general of the province of New York, described the route as practicable to Lakes Champlain and Ontario. Daring the Revolution, the importance of such a work was made evident. After that period, General Washington made a tour to the interior of New York, and also westwardly to Pittsburg, and at that early day urged the conaection of the OLio with tha waters of tha Chesapeake. President Jefferson took a deep interest in the same subject, andsald, "there will be a competition between the II adson and Potomac Rivers for the residue of the commerce of all the country westward of Lake Erie."-See IIUnt's Merchants' Magnzine, September, 1850, p. 262. IIe urged the construction of a canal from the Ohio to the Chesapeake, as nearer to Alexandria than New York by 580 miles; and that navigation through New York woul' be closed several moaths of the year; "whereas the channel to the Chesapeake leads directly into a warmer climate, so that vessels may pass the wholo whter, subject only to short delays."-Ibid. The inpertance of adding facilities for communlestion with the western parts of New York was also urged ly Governor Clinton, in 1791 and 1792; by General Schuyler; Surveyor general De Witt, in 1808 ; and at every meeting of the Legislature from the thme of the adoption of the Constitution, the subject was strongly urgel upon the consideration of the inembers. In Mareh, 1810, a joint resolntion was introduced for the appointment of Govarneur Morris, Stephen Von Rensseluer, De Witt Clinton, Petcr B. Porter, and others,
as commissionera for exploring the route for inland navigation from the Murson to Lakes Ontario and Erie; and $\$ 3000$ appropriated for expensea of surveys. A through canal was then considerel as the acme of human wishes, se far as communication with the Far Went was concerned, Railroads were not dreamed of then, nor in fact, until the years 1820 and 1825.

The commlasioners said In 1812: "Vlewing the extent and fexcility of tho country with which this canal is to open a cominunication, it is not extravagant to suppose that, when sottled, its produce will equal the present export of the United Siates." (The forelgn exports of that year amonntel to the eaormous sum of $888,000,000$, and four years hefore were $\$ 108,000,000$ ). And they add, "Will it appear improbable that twenty years hence (1832) the canal should annually bring down 250,000 tons?"

The prophecy of the commissioners was more than fulfilled. In twenty jears after the completion of the Erie Caaal, there camo to tide-water on that canal $1,10 \overline{7}, 000$ tons, valued at more than $\$ 45,000,000$; and the tolls smounted to two and e half millions of dollars.

On the 26th of October, $1 \varepsilon^{\wedge} \div$, eight years and four months from tho time of ita commencement, the Eric Canal was completed. Tho original profile of the Eric Canal, published in 1825 , shows 83 locks, and a rise and fall equal to 687 feet. These were finally reduced to 71 locke, and a rise and fall of 610 fcet.

In 1828, an act was passel to connect the Cayuga and Seneca Canal with Cayuga Lake. In 1829 the constrnction of the Chenango Canal wss anthorizetl, and survers ordered of a route from tho Lirin Canal to the Alleghany Rlver; 2. For the Black River Canal 3. For a canal from Otsego Lako to tho Eriu Canal.

In July, 1835, the Canal Boarl resolved that tho Erio Canal be enlarget, so as to give 6 feet depth and 60 feet width of water on tho surface, and that the locks bo 105 feet long and 15 feet wido in tho clear. It was finally tecided 10 make the locks 110 feet long and 18 feet wide.

Previous to this time, in addition to the Erie and Champlain Canals, the following had beea authorized:

1. The orwego Canal: from the Eric Canal at Syracuse th Iake Ontario thirty-elgit mifers, finished in 183s, at a cost of ..
2. The Cayıga and seneca $-\cdots n a 1$, connecting the Cayugn and Seneca lakea with the Erie Canai at Monteznma, twenty-tiree miles, finlshed in at Munteznma,
$182 h$, at n cost of
3. The Chemnng Cunai, comecting the Chemuing liver ul Elmitra rith the hemd of seneca Lako: lengih in all, thirty-ntwe milea; flaisied in 1833 , at a cost af.
4. Crnoked Lake Crail, eiglit mitez, finiuliced in 1830
$\$ 405,437$
5. The Chenango Canai, from the susquehsana River at Binghamton to the Eric Canal at Ctica, ninety-aix mifer, filithed in $183^{\circ}$
................ $\$ 2,417,000$

Recupitulation of canals (including slack-water navigation) In cach State in 1854.

Camadian Canals,-The British government has expended a very large sum upon the Rideau River and Canal, atretching from Kingstoo, on Lake Ontario, to Bytown, on the Ottawa, or Grand River, an affluent of the St. Lawrence. But this work was undertaken as mach in tho vien of improving the military defensea of Cunada ar of protecting its commerce, though in the latter respect it has bean of considerable utility. The British government has also constructed the Welland Cannl, uniting Lakes Erie and Ontario, the navigatien between which by the river is interrupted by the Falls of Nlagara. Thls canal has become a well-frequented commercial channel, and is every day rising in importance. The publie works of Canadn have already attained aome degree of celebrity, both in America and England. "There is no country," observes Mr. I. D. Andrews, in his report to tie United States Senate, "which possesses canals of the magnitude and importance of these in Cunada." The Erle Canai, which is the rival American water route for carrying the produce of the great Western wheat-growing ceuntries to the Atlantic sea-board, is capable only of transporting barges of 75 tons burden; whereas the cansls of Cnnada are on a scale to allow of ocean-going veasels of from 350 te 500 tons, and carrying 4000 harrels of flour, to proceed through them, and thus accomplish in inland uavigation into the heart of the continent fer a dlatance of 1587 iniles from tide water at Quebec. The public productive works of Cansia, consistlng of canals, light-houses, etc., yielded a net revenue in 1851 of $£ 58,738$. The work yielding the largest amount of revenue was the Welland Canal, extending frem the head of Lake Ontario to the foot of Lake Eric, thus orarcoming the interruption to navigntion cansed by the Fialis of Niagsaru. The length of the main trunk of this canal is 28 miles, and of a feeder branch, from the Grand River to the main trunk, 21 miles. Its width at bottom is 35 feet, st top 71 feet, and the depth is 10 feet. The dimenslens of the locks are from 150 to 200 feet in length, the width from $26 \frac{1}{2}$ to 45 feet, and the depth on metre $9 \frac{1}{2}$ feet. Tho arhount of Jocknge is 346 feet, nad the number of locks 27 . This canal is also important as affording an nnliraited supply of water-power to numbers of mills and factories on Its banks. The St. Lawrence Canals, connecting Lake Ontario with the River St. Lawrence at Montrenl, extend in all to $40 \frac{1}{2}$ miles, hnving 27 locks, ned an amount of locknge of $204 \$$ feet. The wholo of these have the dimensions of their locks as large as those of the Wellanl Canal, and have all 9 feet of water in these locks. The Lachine Canal, cutting through the island of Montrenl, is 8 miles $\ln$ length and 10 feet doep. It is now in contemplation to construct another important canal, cennecting Lake Chumplaln with the St. Lawrence, and thus afford a more desirnble route for the trade between the IIudson River and Canada and the Western States.
Increased Speed of Traveling by Canals,-Great, however, as have been the advantages derivod from the formation of canals, thelr progress has been to a censiderable degree checked by the formation of RailRoans (which sce). We believe, however, that canals will always be preferred for the conveyance of coal and other bulky and heavy products; and even passengets are now cenveyod along them with a rapidity that would previously have been supposed lmpossible. This new system was introduced on the Palsley and Glasgow Canal, by Mr. Monatnn, in June, 1831. The resuits are described In the fellowing statements, to which it is nnnecessary to eall the reader's attention.
Mr. Thomas Grahame, civil engineer, in hls "Letter to Canal Proprieters and Traders," says, "The experi-
ments of great velocity have been tried and proved on the narroweat, shallonoset, and noat curved canal in Seotland, viz., the Ardrossan or Palaley Canal, connecting the city of Glasgow with the towa of Paisley and vlllage of Johnstoun, a distance of 12 mlles." The result has disproved every previous theory as to difficulty and expense of attuinlag great velocity on canals, and as to the danger or damage to their banks by great velecIty in moving vessele alning them. "The ordinary speed for the conveyance of passengers on the Arirossan Canal has, for nearly two years, been from nive to ten miles an hour; and, although there are jourteen journeys along the canal per day at this rapill apeed, its banks have sustained no injury. The boats are 70 feet in length, about 5 feet: 6 laches broud, and, but fer the extreme narrowness of the csnal, might be made broader. They carry easlly from 70 to 80 passengers; and, when required, can and have carried upward of 110 passengers. The entire cost of a beat and fittlugs up is abont £125. The hulls are formed of light iron plates and riba, and the covering is of wood and Jight oiled cleth. They are more airy; light, and oomfortable than any coach. They permit the passengers to move about frem the outer to the Inner cabin, and the fares per mile are one penny in the first, and three furthings in the second cabin. The passengers are all carried under cover, having the privilege also of an ancovered apaco. These beats are drawn by two horses (the prices of which may be from $£ 50$ te $£ 60$ per pair), In stages of four miles in length, which aro done in from 22 to 25 minntes, including stoppages to let out and take in passengers, cach set of horses doing three or four stages alternately each day. In fact, the boats are drawn through this narrow and shallow canal at a velocity which many celebrated engineers had demonstrated, and which the public believed, to be impossible. The entire amount of the whole expenses of attendants and horses, and of running one of these boats four trips of 12 miles each (the length of the canal), or 48 mile: daily, including interest on tho capital, and 20 per cent. laid aside annually tor replacement of the boats, or loss on the capital therein vested, and a considerable sum Juld nside for nccidents and replacement of the horses, is $\boldsymbol{\Gamma} \mathbf{5 0 0}$ some odd shillings; or, taking the number of working days to be 312 annually, semething under f2 2s. $4 d$. per day, or about $11 d$. per mile. The actual cost of carrying 80 to 100 persons a distance of 80 miles (the length of the Liverpool Inailway), at a velocity of nearly 10 miles an hour, on the Paisley Canal, one of the most curved, narrow, and shallow in Britain, is therefore just $\boldsymbol{L 1}^{\mathbf{7}} \mathbf{7 s} .6 \boldsymbol{l}$. sterling. Such are the fucts, and, incredible as they may appear, they are facts which ne one who inquires can possibly deubt. Boats on this principle have since been established on a great many British canals, and on tho Grand and Royal Canals in Ircland.

Proits of Canals.-It is a well-known fact that ennuls, at an nverage, and allowing for the length of time that must clapse from the first ontlay of capital before they vield any return, are not very preductive. When, indeed, they connect places that have an extensive In. tcrcourse, and when no very extraordinary difficulties have to be summounted in their construction, they most commonly yleld very large profits; but, generally speaking, thls does not appear to bo the case; and, on the whele, they ouem to have been mere beneficial to the public than to their projectors.

Canary Islands. They IIe In the Nortl Atlantic Ocenn, between the parallels of lat. $27^{\circ} 40^{\prime}$ and $29^{\circ} 30^{\prime}$ N., nud the meridians of long. $13^{\circ} 30^{\prime}$ and $18^{\circ} 20^{\prime} \mathrm{W}$. The names of the soven principal islands, their respective aren in English square miles, and thelr population in 1835, are given in the following table:

|  | Teneriffo. | Grand Canary. | Palma. | Lamentote | Fuerteventira. | Gomera. | Hierro. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Area, sq. miles.... 1'omintion . . . . | $\begin{aligned} & 8777 \\ & 85,000 \end{aligned}$ | $\begin{aligned} & 758 \cdot 3 \\ & 68,000 \end{aligned}$ |  | $\begin{array}{r} 323.5 \\ 17400 \end{array}$ | $\begin{aligned} & 820 \cdot 1 \\ & 13800 \end{aligned}$ | $\begin{array}{r} 169.7 \\ 11.700 \end{array}$ | $\begin{aligned} & 82 \cdot 2 \\ & 4400 \end{aligned}$ |

Fuerteventura lies nearest to the African coast, the interval being between 50 and 00 miles. Besides these, there are many ialeta, moat of which are pininhabited. The grape disense made its appearance at the Cunariea In 1863, and deatroyed nearly the whole crop. Previously the total anaual produce wae estimated at about 40,000 pipes, of which 25,000 pipes were produced In Teneriffe. Hetween 8000 and 9000 pipes were exported. The price per plpe on board ranged from $\mathbf{5 8}$ to $\mathbf{E 2 0}$. Some of the wine la distlled into good brandy. Sumach for the tannera, cenary-seed, and a little flax, are grown. The gardene produce, In addition to the vegetables of Euglleh gariens, pumpkins, gourda, yams (taro), garlic, red pejper, and the caatoroil plant. The fruit trees are budly managed, so that the fruit is generally inferior. Here are found fruits from every quarter of the globe, including oranges, figs, bananas, dates, pine-apples, pomegranates, papaws, guavas, custurd apples, and prickly pears (the fruit of the cactus). There are no cocoa-nnt trees or bread-fruit trees, as II umboldt reports. A little oil is obtained from the olive in Grand Canary. The agave is abundant, and supplies a material for ropes, girths, etc. The leaves of the clate palm are made into hata and baskets. A good deal of orchillia lichen is guthered for exportation ; and the ice-plant is cultivated for barilla. The sugar mannfacture, onee so largely carried on, has fallen before the American and West Indian trade; the only two existing mills are on Palina. Wine having been for some time so little remunerative, other things have received attention, the chief of which is the coehineal insect, which feede on the commen cactus (Cpuatia tume), and is now largely produced on all the islands, land formerly occupied by grain and vioes being devoted to its cultivation. The insect hus not been long introduced, but the cultivation has rapidly extended. In $1840,800,000$ pounds were exported, principally to krance and England. Since that year the exports have much increased; the price paid to the Canary exporter is about a dellar per pound. The silkwcrm is reared to a small extent, chiefiy on Pulma. Raw silk is exported, and some is manufactured on the spot inte stockings, ribbons, etc. Some linen and woolen atuffis of a coarse kind are made for home consumption, lont the great bulk of the clothing in use is of British manufacture. The island geats (a peculiar and cateemed breed) furnish milk, from which butter and cheese are mude. Sheep, of a amall coarse-wooled breed, are numerons. Horses and cattle are searce ; domestic fowls and rabbits are plentiful. Asses and mules are mach used. A fishery on the African coast, at present engaging from 40 to 50 vessels, and giving eniployinent to many persons, has existed since an early period. It was deemed of such importance, that the home government lately sent out a commissioner to report on it with a view to its improvement. The fish taken is principally hream, It is salted, and largely consumed at the Canaries. There is an extensive intercourse by meane of boats and amall sailing vessels among the different islands. In this way wine, raw silk, cochineal, harilla, and dried fruits are taken to the places of expert; and grain is conveyed from those islands where it is abundant to those where the supply is defiecent. The principal foreign trade is with England, the chief exports being wine, cechineal, barilla, and orchilla. The imports consiat of irun, met${ }^{\text {al }}$ goc. is, j lass, erockery, leather, pilk, cotton, anil woolen manimaetures. There is also a consideratile trade with the United States, and the conntries berdering the Mediterranean. With Hamburg and France an exchange of commodities takes place. The ahips employed in this commeree are foreign, chiefly British, but the islanders aend a few vessels of tieir own with brandy, coarse earthen-ware, and silk goods to the Spanish West Indiea, loringing back cigars, angar, coffee, rum, cacao (the material of chocolate), and a few other articles. Santa Cruz, Orotava, and Las Paloas,
are the only ports edgaged in foreign trade: nearly 200 vessela enter these porta in the cuurse of a yeur. In 1852 the porte were pructically made free-the ainail duty of 22. per cent. only being now levied upon himported goode, with the exception of tobacee, which paye $6 d$. per pound and cigare, which pay 10d. per pound. A Spanish steamer from Cadiz makes two voyages to Santa Cruz every month. The Spanisi goverament pucket, on her outward voyage to $\mathrm{H}_{\mathrm{a}}$. vana, touches at Santa Crua once a month; and the asme port in viaited monthly by the English mail steamers to Brazill and the African cousth, both on their outward and homeward vayges.

Temeriffe, the largeat jeland of the group, llee between Canary and Gomera. It is of en Irregular shape, 60 miles in length, with an extreme breadth of 30 miles. Not more than one-seventh is cultivable. A chain of mountains traverses the island in the direction of its greatest length, and in the middle of the broadest part rises the celebrated peak locally known as the lico da Teyde, which, with its supports and apurs, occupies nearly two-thirds of the whete laland. It has a doutie tep; the highest, E1 liten, le 12,180 feet above the sea ; the second, Chahorra, connected with the first ly a short and narrow ridge, has a height of 0880 feet. They ars hoth orifices in the same grand dome of trachyte. Noither reaches the line of perpetual snow. There is, however, a natural cavern, 11,000 feet ateve the sea, where snow ls preserved all the year. Snow remains about four months on the upper part of the peak.-E. B.
There are several epecies of nopal (la Tunera nilrestre), Indian fig (Cactuas tuna), short leaf with numereus tharns, which serves only for coloring angar, fruit, and wafers; and $h 1$ Tunera annarilla, with large, yellow, sweet fruit, and ronnd green leaves. The Tunera blanca is best adapted for the culture of cochineal; but it is incenvenient on account of its numerons thorns. Lastiy, there is an American species, with very soft therna, which is likewise available for cochineal cuiture.

The following table shows the increased product and exportation of cochineal from the Cazaries:

| Yoarb. | Pounde. | Year. | Pounda. |
| :---: | :---: | :---: | :---: |
| 180 | \% 7 | 1842. | 69, 116 |
| 1832. | 118 | 1843. | 74,964 |
| 1833. | 1.060 | 1844. | 88,294 |
| 184 | 1,752 | 1845. | 168,109 |
| 1835 | 4,561 | 1846. | 252,550 |
| 1836 | 8,960 | 1847. | 286,292 |
| 183\% | 7,001 | 1848. | 375,685 |
| 1533. | 23,119 | 1849. | 449,757 |
| 1830 | 27,061 | 1850. | 752,670 |
| 1946 | 66,521 | 1851. | 868,119 |
| 1841 | 90,010 | 1852. | Smbi, 25 |

Thus, in the year 1853, the exportation " uld probably amount to $1,300,000$ pounda; and the valae of this, since the increased price consequent on the failure of cropa in Ilonduras, woull be $£ 225,000$.

Candle (Ger. Lichter, Kerzen; Du. Kanzen; Fr. Chandelle; 1t. Candelle; Sp. and Port. 'elas; Kuss. Sujetschi; Lat. Candela), n taper of tallow, wax, or spermaceti, the wick of which is conimoniy of severai threads of cotton spun and twisted together. The Roman candles were composed of atrings surrounded ty wax or dipped in pitch. Splinters of wood, fatted. were used for light among the lower elasses in Engiand about A.d. 1300. At this time wax candies were litthe used, and esteemed a luxury, and dipped candies usuaily burued. The Wax Chandiers' Company, of London, was incorporated 1484. Mould candies are said to be the invention of the sieur Le Brez, of Paris, Spermaceti candles are of modern manufacture. The Chinese candles are made from the berries of the ean-debury-myrtle, and they univerally burn this wax, which is fragrant, and yields a bright light.- Hayns.
Dr. Ure gives the feilowing table, as containing the result of certain experimenta he had made, in order to determine the relative intensity of the light, and the duration of different sorts of tallow cundies:

| Number ta a Pound. | Duration of a Candlo. | Warint in Grules. | Cocomploin por | Proponglise of | Eocogis) of | Canallee equal Qav Argahd. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 10 mould | 6 hrs 9 mm . | 689 | 182 | 128 | 68 | 57 |
| 10 dipped | $4 \because 86$ | ${ }^{678}$ | 160 | 18 | 65 |  |
| 8 mould | ${ }^{6}$ "18 81.1 | 858 | 118 | 104 | 604 |  |
| 4 moutd | $\begin{array}{lllll}7 & 4 & 84 \\ 9 & 14 & 86\end{array}$ | 1160 1787 | 163 186 | 141 | 86 | 8.5 |
| 4 mould | $9{ }^{16}$ | 1788 | 1819 | 60.4 | 100 | 8 |

"A Scetch mutchkin," saya Dr. Ure, " or th of a gsilien of good seal oll, weighs 6010 gr ., or 18 1-10 ox. aveirdupois, and laats in a bright Argand lamp 11 heurs 44 minutes. The weight of cil it conaumes per hour is equal to fonr timea the weight of tallow in candies eight to the pound, and three timea and a quarter the weight of taliow in candles six to the pound. But tita light being equal to that of 5 of the latter candies, it uppeara from the ahove table, that 2 pounds weight of eili, value 9 d., in un Argand, are equivalent in illaminating power to 8 pounda of tallow candies, which cost about 2 s. The larger the flama in the above candies, the greater the economy of light."
Untii of late years, candles were solely manufactared from beeswax, spermaceti, or tallow. The appilcation of scientific chemical rescarch, however, to this branch of art, coupled with the withdrawul of the vexations excise supervision, which prevents improvements in every trade which comes under its influence, has so improved the materiala used, as well as the manufacture itself, that all the beat candles are new made from the pure solid and crystallizatie margaric and stearic 0 .ids. These nre freed from the fluid olele acid, and from glycerin, which exist in combination with them in urdinary tailow, as weil as from other maslogous substances, as from paraffine (a carlo-hydrogenous substance resembling spermaceti, prepared from tar and peat), the stearic and margaric acids of the cocoa-nut oil and the palm oil (Elais guineensis), besides the old substances spermaceti, and wax, both vegetahie and animal.
The discovery by the celebrated French chemiat Chevreul, that fats wera composed of three highly intammabie bodics, stearic and margaric acids (solids), and oleic acid (a iiquid), combined with a comparatively uninflammable hody, glycerin, has led to the creation of the great new manufacture of stearic and composite eandies; the importance and growth of which wiil be understood when we state, that whiie in 1833 the new candlea were unknown in England, and the quantity manufactured in France amounted to only twenty-five tons annually, a single London house (that of E. Price and Co.) manufactured last winter (1854) more than that quantity of atearic and composite candies daily, and employs in thia business above 900 hands, and a capital of nearly three-quarters of a miliion. The old procesa for making stearic acid may ye thus described: Tallow is boilcd up with thin cream of lime, which causes the fat acida by superior affinity to forsake their giycerin and combine with the lime, the giycerin dissolving in the water; this combination is then broken hy means of sulphuric acid, which, seizing on the lime, sets free the fat acids; these are then separated (the iiquid from the soiid) by means of pressure. This process of making fat aclds is called "lime saponification." The hard matter remaining in the press is stearic, or a mixture of stearic and margaric acids, and the candles made from it are called stearin, or mere properiy stenric candles.
In 1840, it was discovered in Engiand that by combining steario acid with the solid matter, or stearin obtsined by pressure from cocoa-nut oil, good candiea not requiring snuffing might be made at a considerably less cest than stearic candles. These werc cailed by the inventor "cemposite." The trade in these composite candics ia now very great. Since 18:i0, numerous great improvements have been invented, which bave reauited in the present manufacture of candles having ail the good qualities of the oid stearic, while
they are sold at prices little exceeding that of tallow candlea. The present improved process la thla : Palm oil or other fatty matter is exposed at a high temperature to the action of concentrated aulphuric acid, which changes it into a mixture of fat acida of a very dark color, with a high melting point; thia is then distilled in an atmosphere of steam. The distilled material is either used for making the cheaper descriptions of composite candles; or is subjected to hydraulic pressure, firat at the temperature of the air, and then at a high heat ; the result of pressure being the material used for making what are known as "Belmont sperm," correaponding with atearic candies.

A great improvement has been made in the mannfacture of wicks; Instead of the common twisted wick, a wick la now uaed plaited hy machinery. The new wick, together with an improved process of preparing stearin, are used in the manufacture of the Star candles, which are burned In Jarge quantities in the TVited States.
Wax candlea do not appear to have participated in the improvementa which have attende, the manufacture of the improved stearic or composite candlea, and they appear to be atill chiefly manufactured by hand. They are made of a cotton or flaxen wick, slightly $t$ wisted, and covered with white or yeliow wax. Of these there are saveral kinds; some of a conical figure, used to illuminate churches, and in religious processions, funeral ceremonies, ctc.; others of a cylindrical form, used on ordinary occasiens.--E. B.

Sale or Auction by Inch of Candle, is when a amall piece of candle being lighted, the by-atanders are allowed to bid for the merchandise that is seliing; but the moment the candie is out, the commodity is adjudged to the last bidder.
Candy, or Sugar Candy, a preparation of sugar made by melting and crystallizing it six or asven times, to render it hard and transparent. Candying la the method of preserving fruita, etc., in substance, by boiling them in sugar.

Canella Alba (Fr. Canelle blanche; Ger. Weisser Zimmet; It. Canella bianca; Sp. Canella blanca; Lat. Canella alba), the inner bark of the Canella alba, a tree growing in the West Indics. It is exported packed in casks and cases, in long pieces, some rolled in quills and others flat ; the quilied sort is considersbly thicker than cinnamon, and the flat nearly one-fourth of an inch in thickness. The quilled pieces are yellow on both sides; the flat pieces are yeliow on the outside and pale brown within. The odor of both kinda, when fresh broken, is aromatic, something like a mixture of cloves and cinnamon; and the taste slightly bitter, and estremely warm and pungent.
Canea. See Bamboo, Ratans.
Cannon, Cannons (Du. Kanonen; Fr. Canons; Ger. Kamonen; It. Cannoni; Pol. Dziala; Port. Canhoes; Russ. Puscllki; Sp. Canones; Sw. Kanon), a kind of long holiow engines for throwing Iron, lend, or stone balis by the force of gunpowder, commonly made of iron, but frequently alse of a mixture of copper, tin, and brass. They are either cast hollow, or solid and then bored; those made in the latter way being very superior. Brass cannons, or cannons made of mixed metal, are aiad not to be so well calculated for hard service, or quick and continued firing, aa those made of iron. The proportions of the ingrediente uacd in making the former do not differ materially in different col.atries, though they rareiy coincide. To 240 pounds of metal fit for casting, is commonly put 68 pounds of copper,

52 pounds of brass, and 12 pounds of tin. To 4200 pounds of metal fit for casting, the Germans put 3687 3-41 pounds af copper, $20411-41$ pounds of brass,

 pounds. The inseriptl on it shows that it was made by one Simon in 15\%. In Dover Custle is a brass gum called Queen Elizabeth's pocket-pistol, which was presented to her by the States of Holland: this plece is 24 feet long, and is heautifully ornamented, having on it tho arms of the states, and a motto in Dutch, importing thus,
"Charge me wett, and sponge me clean,
I'th the ow a ball to Catals Creen."
Some fine specimens are to be seen in the Tower, A leathern cannon was fired thrce times in the King's Park, Edinl urgh, Oetober 23, 1788.-Puninirs.

The precise date of the first enst-iron guns is not known, hut it has been nsserted hy Genernillaguenin, that a plece of this deseription at look-le-1)uc lears the date 1411. Some doubt, however, has been expressed on this suljeed, and it has heen thonght more ?rolaHe, with reference to the invention of high smilting furnaces, to suppose this date 1011 . In 1510 talph Page cast eight fron guas at lackstalt ; aml :-i 1517 the use of sieh artillery hestan to become general, mad was for neariy n eentury exchasively adopted in some countries. In France cast-iron gitns were not manufactured before 1600 ; but so evident were the nlvantnges to be gained by their use, hoth as regards tho qualities of the gions anil their moderate cont, that they were siectily adopted in most commeries; fonmerics for fron guns having been established in Sitesia in 1170, in Germany in 15:\%, in Saxony in 159, in the 1lart\% in t626, and in Sweten in 16.10; one foundery alose, in the datter comitry, having heen sall to have supplisal for some time from 400 to 500 cammons annually.

All these pieces of ordnanco were cast hollow until 1724, when a horizontal lorhg machine was established at lyons, aml, ufter some trinls made in 1731, M. Marizz ubsuloneal hollow casting ut Strasburg in 1744-45, and alopted the boring mathines.- $\$: 11$.

Canoe, or Canoa, the term generally used to designate the amall vessels whieh murivhized poojile, livlug near the water, bse. In ihe East lmines there is a khid of boat known hy this name, sometimes fron. 10 to 50 feet fong, nud 5 or 6 bromi. The North American Inilians generally imjel their canoes with paddes, which have a very large blale mad are managed perpendicularly. The canoes of Camala are of the most
and $30736-41$ pouads of tin. Others, again, use 100 brass, and 15 pounds of tin. Capmany hus produced some statements which render it almost certain that some sort of artillery was used
 for ": welghs 180 pount" ulls charge of powder 9.1
fragile texture, and of so ilttle welght, that in passing from one river to another, the hoatmen carry them on their heads acroes their portages. They are mostly covered with bark, the pieces of which are sewed together with a kind of grass. This bark ls generally not moro than a quarter of an inch in thickness; yet, in these frsil vessels, the Indians and Canadians do not hesitate to descend very dangerous rapids. The Esquimaux are exceedingly dexterous in the management of thelr canoes. These consiat of a light, wooden frame, covered with senl-skins, sowed together with sinews. The skius are not only extended round the bottom and sides, but likewise over the top, forming a complete deck, and having only one opening to admit the Indiun to his seat. To this hole a flat hoop, rising about four Incles, is iltted, to which is fastencil the surrounding skin. The paddle is alout 10 feet long, light, and flat at each end. In the Eequimaux lunguage, the canoe is called a kaiak, of man's boat, to distinguish it from umiak, the roman's boat, which latter is a large boat for transporting the women with their familles and possesslons. The Greenlanders and Esquimaux use the sume kind of canoes, and it is astonishing, when we consider their insignificant construction, at what a distance from the reglons they conmonly Inhubit, these people, expecially the former, are found in them. In the islands of the South sea, the nativea have a double canoe, united by a strong platform, serving in this way as ono vessel. Suchn cance is capable of earrying a number of persons, and a considerable lading. Captain Cook gives us a long secount of the different kiuds of canoes used in Otaheite. -l:. A.

Canoe Birch (Betula papyracea). By the lirench Canadians Bouleau Blanc, white birch, and Bouleun à Cimot, canow lirch: it is known to the American also by these denominations, and sumetimes by that of paper birch. The henrt or perfect wood of this tree, when first laid open, is of a reddish hue, und the sap is perfectly white. It has a tine glossy grain, with a considerable share of strength; that it is but little employed is attributed partly to its spreedy decay when exposed to the succession of dryness and moisture, and partly to the existence, in the countries whith produce it, of several species of wool, which are fur preferable for the uses of the carpenter and the wheclwright. It is sometinses employed by cabinet-mukers for tables which are stnined in imitation of mahogumy. But the most important purpuse for which it is employed, and one in which it is replaced by the bark of no other tree, is the construction of camoes. To procure proper pieces, the largest and smoothest trunks are seletted: in the spring two cireuhar incisions are made several feet apart, and two longitudinal ones on opposite sides of the tree; after which, by intraducing a woulen wedge, the ibark is ensily detached. These phates are usually ten or twalve fect lomg, and two feet nine Inches liroad. (ireat use is made of these canoss by the Indians and by the French Camalimas in their lonig journeys into the interior of the conntry ; they ure very light, and are easily transportel on the shoulilers from one lake or river to mother, which is called the poruge. A canoe ralculatel for four persons, with their hage gage, weighs frum forty to tifty pounds: some of then are mate to carry fifteen passengers. Such are the ordinary uses of the hark and of the wood of this tree.lluown's sylua Amerieana.

Cantharides, or Bpanish Fly (Ir. (iuntharides, Wouches d'Expuyn"; tier. Spanische flifgen; it. 'unlurelle; Lat. E'muthıria; liuss, Mischpanshie murhi; Sp. Chnturilus). This losect is found on a variety of shoubs in Spain, luly, lirance, etc. 'Those used in lingland are imported purtly from Nibily, tut primilpully from Astracan, jacked in caskos and small chests: the most esteemed come from St. I'utershing. The Lest are of a lively fresh coller, a small size, and not monldy. They are frequently adulterated whith the

There were four now varisties of cantharides from Indla abown at the London Exhlbition of 1851.

Canton, one of the greatest emporiums in the East, rankling, es a port of trade, elther before, or immediately after, Calcutta, in the province of Quantong, in Chlea; belng, proviously to 1843, the only placo in that empire open by authority to European rraders: lat. $23^{\circ} 7^{\prime} 10^{\prime \prime} \mathrm{N}$. , lon. $113^{\circ} 14^{\circ} \mathrm{E}$. Canton stands on the eastern bank of the Pekin River, which flows from the interior in a nevigable stream of 800 miles to this city, where it is rather broader than the Thames at London Bridge; falling, after an adilitional course of 80 mlles , Into the sonthern sen of China. Near its jubction with tho sea, it is called by foreigners Bocea Tigris. The town is surrounded by a thase wall, partly of stone and partly briek, and is divided Into two parts by another wall running enst and west. The northern division is ealled the old, and the southern the new elty. In the old city is the Mantchon or Tirtar general, with his garrison of Mantehou troops. The lientenant governor or Fooyuen's office is also in the old eity, hitt tho governor and hoppo (principal customs officer) reside in the sow elty, not far from the river.

All forelgn eommerce is conducted in the sonthwest suburb, where the foreign factories are situated; and which, with the other suburbs, is probalily not less populous than the eity itself. The residenco of liuropears is confined to a very smnll space, on the lunks of the river; which might, however, be as pleasant as a crowded mereantile placo can well be, were it not for the great number of small dweling boats which cover the face of the river. The peoplo who ocetpy the larger portion of these boats aro hall to have eome origlanly from the south; and leing a forelgn und despised race, were not, at first, allowed to dwell on shore; but most of the distlinctions between them and the rest of the people have been abolished. Although Canten is situated nearly in the same parallel of latitude as Calentta, there is a considerable difference is their temperature; the former helng much the coolest, and requiring fires during the winter months. The streets are very narrow, paved with little round stones, and flagged close to the sides of the houses. The frost of every house is a shop, and those of particuiar atreets are latd out for the supply of stinngers, Chlas Strect is npproprinted to Europenias; and here the productions of nlmost every part of the globe are to the found. One of the rhop-kecpers is always to he found sitting on the eonnter, writling with $a$ comel'shalr hrash, or ealeulating with his swampan, on which instrumeat a Chinese will perform operatons in numbers with an much celerty as the most expert liuropeess arithmetlelan, 'Ihls purt of Canton belng mueh freguented by the meanen, every artifice is used by the Chinese retallers to attinct thelr uttention; ench of them having an English name for himzelf pabited on the outside of his shop, besides n mumer of alvertisements composed for them by the anllors in their own peruliar lillom, 'The latter, it may he supposed, ars often duped by thelr Chinese frlends, who have, in general, picked up a few sea phrases, lyy whith the seamen are iuduced to enter their shops; hut they sult each other extremdy well, as the Chhese denlers possess an lmperturbable command of temper, langh heartily it their jokes whthout understanding them. noth humor the seamen in all thele sallles. Ships only asceul the river as far as Whumpon, ahout 15 mhea liclow (Gaton, loading anil unlonding by means of native hoats.
The Chinese, conshlered as truders, are mmirently active, persevering, and intelligent. They aro, in
fact, a highly commerclal people; and the notion that was once very genorally entertained of their being peculiarly charaoterized by a contempt of commerce and of strangers is as utterly unfounded as any notion can possibly be. Business is transacted at Canton with great dispatch; and nowhere in the world may cargoes be sold and bought, loaded and unloaded, with more business-like speed and activity. Provisions and refreshmonts or ull sorts are abundant in Canton, and, in general, of an excellent quality; nor is the price exorbitant. Every deseription of them, dead and allve, is sold by welght. It la a curious fact that the Chinese make no use of milk, elther in Ita liquid state, or in tho shape of curile, butter, or cheese. Among the dolleacles of a Chinese market are to be seen horseflesh, dogs, eats, hawks, and owls. The country is well supplled with fish from the numerous canals and rivers by which it is intersceted.

Foreign Factories.-These extend for a conslderable way along the banks of the river, at the diatance of about 100 yards. They aro named, by the Chinese, hongs, and resemble long courts, or closes, without a thoroughfaro, whirl generally contain four or five separate honses. They are built on a broad quay, and havo a paride in front. This promenade is railed in , and is genorally called Respondentia Walk; and here the European merchants, commanders, and officers of the ships meet after dinner and enjoy the cool of the evening. The English liong, or factory, far surpasses the others in elegance and extent. Thls, with the American and Dutch hongs, are the only ones that keep their national flugs flying. The neighborhood of the factorles is occupled with warehouses for the reception of European goods, or of Chineso productions, untll they are shipped. In 1822, during a dreadful conflagration that took place at Cunton, the British factorics and above $\mathbf{1 0 , 0 0 G}$ houses were destroyed; on which oceasion the East Indla Company'n loss was estimated at $£ 500,000$ sterling, threefiftlis in woolens.

For the space of four or five miles opposite to Canton tho river resembles an extensive floating city, conslsting of bonts and vessels ranged parullel to each other, leaving a narrow passage for others to pass and repass. In theso the owners reside with their families, the latter rarely visiting the shore. All the business nt Canton with Europeans is transacted In a jurgon or the Engllsh language. The sounds of such letters as B, D, K, and X are unknown In China. Instead of these they substitute some other letter, such as I. for R , which oceaslons a Chinese dender lin rico to offer for nule la English a rather unmarketable commodity. The name mandarin lo unknown among the Chinese, the word used ly thom to denote a person in authority belng quan. Mandarin is a Portugnese word derived from tho verb mandar, to command.-llamidon's Lisast India tiazetter; Munume's Orient. Commerce; Companion to 1 uglo-Chinese Calendar, ete.
The trade of Canton is retrograling, while that of Shanghini is Inereasing; and indeed it is not unlikely that the latter will in time supplant Canton in the Eirrepean trule, as it enjoys the additlonal alvantage of helng nenrer the tea districts. Canton was no doubt tlxed upon ly the Chinese government for the Buropean trale, as belng the most distant from the eapital, lekln.

Formerly only a llmited number of merehants, ealled the hong or necurity merehants, were allowed to trate with forelgners. 'they were commonly men of large property, ind wero famed for lategrity in thelr transactions. All forelgu caryoes pussed through tho hands of these merchants, and liy them ulno the return corrgoes were furnkind. They became scenrity for the payment of duties, and it was trensos for miny other berchant to engruge la the trade with forelgoers. This never law, however, has reeently been abollahel, and forelguers may now deal with any merehurip they think fit to employ.

All goods are sold by weight in China-oven articles of food, such as fowls, hoge, and the like.

The foreign trade of Canton is very extensive ; but the great article of export is tea, for which the demand in Europe has been increasing for upward of a century. This artiole was formerly monopolized by the East India Company; and from their accounts it appears that they imported annually into England abont $80,000,000$ of ponnds. But this monopoly was abolished in 1884, and the commerce with China was thrown open to all. The other exports are raw silk and ailk manufectures, nankeen cloth, cassia, lignea, etc. The principal imports are cotton and woolen goods, earthen-ware, iron, steel, etc. In 1948, 176 British vessels of 73,975 tons, with goods of the velue of $8,653,088$ dollars, left, and 171 of 72,815 tons, with goods to the value of $6,534,597$ dollars, entered the port of Canton. The Ainericans, Fresich, and Dutch, also carry on a considerabie trade with Canton.

Although situated in the same parallel of latitude as Calcutta, the climate of Canton is much cooler, snd is considered superior to that of most places situated between the tropics. The thermometer, during the months of Jaly and August, nverages from $80^{\circ}$ to $88^{\circ}$; and in January and Fehruary from $50^{\circ}$ to $60^{\circ}$. The highest recorded observation in 1831 was $94^{\circ}$ in July, and the lowest $29^{\circ}$ in January. In ehallow vessels ice sometimes forms at Canton a line or two in thickness. A fall of anow, nearly two inches deep, oceurred at Canton in February, 1835, and remainedi on the ground three hours-a circumstance so ununual that the cifizens hardly knew its proper name. Fogs are common turing February and March. Moet of the rnin falls during May and June, but it is nothing in comparison of a rainy season in Calcutta. July, Auguat, and September are the regular monsnon montis, the wind coming from the southwest, with frequent showers, which allay the heat. In the succeeding months the northerly winds commence, with some interruptions at first; but from October to January the temperature is sgreeable, the sky clear, and the air invigorating. Few large cities are more healthy than Canton; no epidemice nor malaria prevail there, though much of the town is built upon piles.

The intercourse between Chinn and Europe liy the way of the Cape of Good Ilope begnn in 1517, when Emanael, king of Portugal, sent $n$ fleet of eight whips, with an embsssador, wio was conveyed to Pekin, and who oltained the sanction of the emperor to establish a trade at Canton. It was in 1596, in the reign of Queen Elizabeth, that the English first attenipted, with two shipn, to open an intercourse with China; but they were fost in the outward voysye. About 1634 neveral Fingliah shipa visited Cantun; but a minunderatanding having oceurred with the Chinese authorities, by the tresehery of the Portuguese, in rupture and a battie took place, and it was with difficulty that this misunderstanding was rectilled. Cibima was again vieited in 1673 by an Engiish ship that was refused admiasion into Japan. In 1677 a factory was establiahed at Amoy; but in 1,880 the factoriy was deatroyed by an irrnption of the Turtara, and it was not till 1685 that the emperor permitted any truide with the Europeans. Upon the union of the two East India companies in London, an imperiai edtict wanissued, reatricting the Europeain comneree to the port of Canton. Tea was first inported about the year 1 tiki. This is nne of the tive Chinese ports opened to Europeans by $\mathbf{t}^{\prime}$ : .. - © 1842.-E. 11 .
 (AND APPL.TINU TO ASL FORELGNPRB) IB TO HR CONDEGTRH
 Nimupor ant Silandinat.

- Filota-Whenover a Britiah merchantman ahall arrave of the five ports ojened to traile, viz., Canton, Foo-chow foo, Amoy, Nlngpo, or Bhanghal, pllotw mhall be allowed to take her Immediately Into port; and In like mannar, when such Brilikh vilj ablall have nettled all logal dutien mul charges, and ls about
to return homo, pllote ahail beimmediately granted to take her out to sea, without any atoppage or delay. Reganding tha remuneration to be given these pilots, that will be equitably settied by tha Brilith conall appointed to each partieular port, who will determine it with due reference to the distance gone over, the risk rua, ete.

2. Custom-house Guards.-The Chinese Buperintendent of Customa nt esch port wili adopt the means that he may judge mont proper to prevent the revenne auftering by fraud or amuggling. Whenaver the pilot ahall have brought any Britlah merchantman into port, the puperintendent of customa wlit depute one or two trusty custom-house officers, whose duty it will be to watch against franda on the revenue. These will elther live in a boat of their own, or atey on beard tho Engllsh ship, as may beat suit their convenience. Their food and expenses will be aupplied them from dey to day from the custom-house, and they may not axact any fee whetover from cither the commanuer or consignee. Should they violate this regulation, they shall be punisicd proportionately to the amount so exacted.
3. Maters of Shipe reporting themselves on Arrival.Whenever a Hritish vessel shall have cast anchor at any one of tho above-named ports, the captain wilt, within forr-sindtwenty hours after arrival, proceed to the Britinh consulate and deposit his ship's papers, hills of !adlng, manlfest, ete., in the bands of tha conaul; falling to do which he will subject litm. self to a penalty of $\mathbf{2 0 0}$ dollars, For presenting a false mand. fest the penalty will be 800 dollars. For breaking hutk and commencing to discharga before due permission shali be obtained, the penalty will be 500 dollars, and confiscation of the goods se diseharged. The consul, havlug taken possession of the Ahlo's papers, will immediately send a written communleathon to the auparintendent of customs, specifying the register tonnage of the ship, and particulars of the cargo she has on board; all of which being dona in die form, permission will then be given to dlscharge, and the dutlee levled as provided for In the tariff.
4. Commercial Dealings between English and China Mer-chants.-It having been stipulated that Engllah merchants may trade with whatever natlve merchanta they please, should any Chmese merchant fraudulently aiscond, or Incur dehts which he is unable to discharge, the Chinese authorities, upon complalnt being mada thereof, will of course do their utme st to bring tha offender to Justice; it must, however, be fistiuetly muderstood that if the defaulter really can not be found, or the dead or hankrupt, and there bo not wherewlthat to pay, the Engilsh merchanta may not appeal to the former customes of tho Ilong merchants paying for one another, and can no longer expect to have their losses made fond to them.
5. Tonnage Dues-Every Fingllsh merchantman, on enterlag any one of the above-mentloned fivo ports, shall pry tonnage dues at the rato of five mace per register ton, in fult of all charges. TI a feen formerty lovied on entry nud departure, of every deseriptlon, are henerforth abolished.
6. Inyort and Irport Duties.- (ioods, whether imported Into or exported from any one of the above-mentioned five norts, are thenceforward to be taxed according to the tariff as now fixed and ngreed upon, and no further sums are ta be levled beyond those which aro speciflid la the turiff. Alt dution Incurred by an English merchant vessel, whether on goods im. ported or in the dhape of tonnage dues, must first be paid up in futl; which done, tho whigerintendent of customs will grant port clearance, and this being shown to tho Jritlsh consul, he wlil thrreupon return the ahip's japers, and permit the vessel to dejpart.
7. Eramimation of the Goods at the Custom-house.-Every l'uglish merchant liaving eargo to toad or diaeliarge numbt pivi Ino Intlmation thereof, and linind particulars of the same to the consul, who will lmmedlately dingatch a recognized l'nguist of bis own establisiment to communtate the particulars to tha 3uperintendent of customs, that tho goods may be (xmmined, and nolther party subjected to loss. The Fingtish merehant must have a properly qualifled person on the apot, to nttend to h]s interests when his goods are belng examined for duty; othcrwise, should there be eomplalnth, theme can not be atternded to. IRegurding auch goodia as are subject by the tariff to an ad walorm daty, If the Finglish merehant can not agree with the Chineas offleer in fixing a value, then ead party shail call too or three mextilants to look at the goods, ant the highowt pirtee at which any of thene merchanta would bo willing to purchase whall be asmimed as the value of the goodn, To fix the tare on any srticle, such natea: If the Fugliwh merchnnt can not agme with the enstom-lionse officer, then each party flall choome an many chexth out of evary 100, whlch, being first welghed in grosa, alanll aftetward le tared, and the sverage taro ligen theme alall be asaumed as the taro upon the wholo, and ujon this prinelplo aliall the ture be fixed upout nll other goods in packages. If there alioult ntili he any dimputed polnts which ean not be mettled, the Einglish merchant may appal to the

While auch pointa are still open, the eupertntendeat'of enstoms will delay to Insert the same in his books, thus affording an opportunity that the morits of the case may be duly tried and sitted.
9. Manner of paying the Iruties.-It is harein-bofore prorided, that overy Engllah vessel that enters any one of the five ports niali pay ali dutice and tonaage dues before she be permitted to depart. The auperirtendent of cuatoms will select certaln shroffs, or banking eatablishmonta of knewn stabillty, to whom ho will give licenses authorizing them to receivo duHes from the English merelatata on behalf of government, and the recelpts of these ahroffe for any money paid them shall be consldered as a government voucher. In tha naving of theso dutler, different kinds of forelgn moncy may be maido use of; bul as foreign money is not of equal purity with sycea silver, the English consuls appolnted to the different ports will, acconding to time, place, and circumutances, arrange with tho superintendent of customa at each port what coins may be taker in payment, and what percentage may be necessary to make them equal to standard or pure silver.
9. Heights and Measures--Sets of bulance-yards for the welgling of goolla, of money weights, and of measures, prepared in cxact cenformity to those histherto in uso at tho cus-tor-iouse of Canton, and duly atamped and seated in proof thereot, will be kept in possession of the superiatendent of customs, and also at the Brtish consulate, at each of the five ports, sad these ahnil be the standard by which all dutles shall be charged, and all auma pald to government. In case of any dispute arising between liritish merchants and the Chinesc officers of customs regarding the weights or meseures of goods, referenco whall be madu to there atandards, and disputee deeded secordingly.
10. Lightern or Cargo Boats.-Whenever an English merchant shall have to load or discharge cargo, he may hire whisterer kind of lighter or cargo boat ho pieasea, and the sum to be puld for such hont can be settled between tho parties themselves, without tho interfereace of gevernment. The number of ticse brats shail not bo limited, nor shall a monopoly of them be granted to wny parties. If any smuggllng taku place in them, the offenders will, of course, he punished according to daw. Should any of these loat people, whilo engeged in rouseying goods for Eingllah merchants, fraudutently abscond with the property, the Chisnese authoritses will do their best to sppreheme them; but, at the same tlme, the English merehanth must take every due precantion fer the safety of their goods.
1i. Thansh:pment of Goods--No Englian merchant ahips may tranship goods without ajecial permission; should any urgent ease linpien where transhipment is necessary, the circumstances must first be aubinlted to the consul, who will give a certificate to that effect, and the superintendent of chatoms will send a apecial oficer to be present at the tranalipment. If any one presumes to tranship uithout anch permission belng sakell for and ohtulued, the whole of the goode so hilicitiy tranoilpped will le cenflacated.
12. Subordimate Constlar Oftcers.-At any placo selected for the anchorage of the Engilsh merchant slijjs, there may be appolntel subordinate consuiar officers, of approved good conduct, to exercime due control over tho seamen and others. lle must exert himsetf to prevent quarrets between the Eugish semmen nad the natives, this being of the atmost importance. Should any thing of the k!nd unfortunately take place, fie wlll in the like manner to hils best to arrango it amicaliy; When sailors go en shore to walk, oflicers shall be required to accompany them; and shonid disturbances take place, such ofticers wifi he held wsponsible. The Chinese otheers may not mpede natives from coning aloupside the shipa to seli clothes, or other necensarles to tho sailorn fiving on hoard.
Opium.-A notion having been eritertainod that oplum might be legally imported into Chinn, under the provisions of this tariff, on paying an ad valorem duty of 5 per cent., tha foilowing proclamation has heen issued in the nulbject:

Phorasmation.-It having been lmought to my notice that stich a atep hats been contemplated as sending traseln with optun on butird into tha porta of Chinn to be opened hy trenty fo foreign trade, and damanding that the sold opium shall be mimitted to importation, by rirtue of tha conctuding clause of the new tariff, which provides for all articles not actudly enumergted in that tariff pasating at an ad valorom duty of 5 per rent. I think it cxpredient, by thfs poriamation, to $j$ woint out to all whom it may concern, that opfum being in artirte the trufice in which in well knowen to to derlared illeqnal ant contraband byt he lurs and imyerial ediets of China, any peraon to he
may take such a step will do so at his oun risk, and will, if a British oubject, mesl with no support or pnotection from her Majesty's consuts or other afficers. This proclamation will be translated and published in Chinese, so that no one may plead. ignorance of $i t$.
Goveanment-nouse, Victoris, thie1st daj of August, 1843.
But, notwithstanding this proclamation, and in defiance of the strong denunciation of amuggling in the proclamation of the 2d day of July it is distinctly stated in Hong Kong papera that there was, on the 21at day of September, 1848 , alnost In sight of the consular flags, a "fleet of British vessels openly engaged in the vending of opium to the Chinese!" This certalnly is a curious commentary on the above proclamation; and it wero much to be wishel, seoing that the trado can not be suppressed, that it were legalized on opium paylng a reasonable duty. The consula for the United States have salaries.-See Consuls. The payment of British conauls by fees is mnch, snd we believe justly, objected to at Canton. Supposing, howover, that the treaty with Cbina is bona fule carried into effect, still it may be doubted whether the trade with that empire will ever be so extensive as many suppose. We believe, Indeed, that China will afford a most extensive outlet for various deseriptions of manufactured goode, provided we can bring away equivalents suitable for the European and other foreign markets. But this, we incline to think, will be no easy matter. Excepting ten, China has few articles suitable for extensive uso in Europe, other than silk and silver. Chinese silk is, however, losing ground as comparod with that of Italy and Turkey, while it is most probable that the enhancement of its price, conaequent to uny great inerense la the exportation of nilver, would in no very long time bring it tr a close. Ten is the grand equivalent which the Chimese have to exchange for our protucts, and this trade is increasing very rapidly.-For tho exports of tea to the United States for the last ten years, see Cinma.

Hong Kong.-The island of this name, ceded to Enghand by the above treaty, is situated on the northern side of the entrance from the sea to the estuary of the Canton River, being aeparated from the main land by a narrow channel having 14 fathoms water. It stretches about 8 miles from enst to west, and is of $n$ very irregular figure, having several promontories, and being deeply indented with hays. It consists principally of a series of high hills, the highest having an elevation of ahout 1200 feet. Victoria, the principal British settlement on the north side of the island, in lat. $22^{\circ}$ $16^{\prime} 27^{\prime \prime}$ N., long. $114^{\circ} 10^{\prime} 48^{\prime \prime}$ E., has tho advantage of an excellent roadstend, with from 8 to 7 fathoms water nid good holding ground. Thero are also numerous well-shelterell roads and bays with deep water on the eouth side of the island, which, indeed, appears, from its position and other advantuges, extremely well titted for a naval station. Fivery thing, however, will depend on the fact of its being healthy, of which, we are anrry to observe, grave doubts are entertained. Shouli these happily prove unfounded, it is probable that in no very lengthened period a consideruble portion of the trade which is at present centred in Canton will he transferred to IIonge Kong; and, under the ahove condition, it can hardly fail to become an importunt entrepót not merely for trado with the Canton liver, bat with China generally.

In 1814 the total population of IIong Kiong (consisting of Chinese) was 11,463 ; while on tho 31et of December, 1853, the Chinese population was 37,536 ; Ettropeans and Americans, 476 ; other racea, 1008. In 1853,1103 square-rigged vessels, carrying in all 447,058 tons, arrived in Vietorin harbor. Of these vessels 201 imported, anil 154 exported goods into and from the colony, being an lncrease over 1852 of 74 and 79 vesrels respectivoly; while the tot 1 ] tonnage of veesels arrived as compared with the preceding year shows an tncreaso of $\mathbf{1 3 , 6 7 0}$ tons.-SSee IIono Kioner.

"Irovdled that nothing hereln contained ahalt be deemed or taken to rendor it comp liaory on any person to accept at any one payment a larger amonat In allver colus of the Luited Kingdon of lower denomination than 18., or in the half, quarter, or etghth rupe pleces herein-before mentioned, than thr equivalent to 20a. aterilng monoy, or a larger amoint la copper colng of the Untted Kingdom, or in the Chinese ropper colna tefore me m . oned, then the equivalent to 1 s . ateriling.

 pola; 1 tacl $=583 \mathrm{f}$ grulne Troy ; 400 Ibw , avoirdupois z: 8 phents; 1 cwt. avoirdupois $=84$ cuttles; 1 lb . avolriluy is $=12$ tinels.

Chinese Meastres: 1 chang $=141$ Engllait Inchea, or

12 chang $=4 \overline{7}$ yards．Liquids，and generally grain， are soll by weight．

Chiness ． 1 oneys： 1 tael $=10$ mace $=100$ cendareen $=1000 \mathrm{cash}$

The principal monetary integer，the tael，is this weight of sycee sllver，there being no Chinese coins In gold，and no other Chinese currancy，or medinm of payment，in sllver，than small ingots of sycee sil－ ver，stamped by the shroffs or bankers appointed by the government．The sverage purity of aycee silver may le reekoned at 98 touch，or $13 \$$ dwts．，better than British standurd；and as it contains，on the average， sbout 12 grains of gold in the pound Troy，the net value at 60 pence per ounce standard，after making the usual allowance for the extraction of the gold，is rery nearly equal to 78 si pence sterling per tael．

In mercantile currency，or the money of account of foreigo merchnnts trading with Chlna，the dollar is divided into 100 cents，and 720 taels of Chinese necount are reckoned equal to 1000 dollars in this curreney， making the tael equal to $\$ 1888-9$ th centa ；but in small amounts it is reckoned at $\$ 140$ cents．This is， however，only n nominal valuation，by which the dol－ lar is made nearly 56 多 pence sterling，or $13 \nmid$ per cent． abovo lts real value．

According to the 8 th article of the general regula－ tions under which the British trade is to be conducted at tho five ports of Canten，Amoy，Foo－chow－foo，Ning－ po，and Shanghai，the English consula appointed to these ports are to arrange with the superintendents of the cnstoms at each what coins may be taken in the payment of the duties，and what percentage may be nec－ essary to make them equal to standuril or pure silver． In purauance of thia regulation，the following estims－ tiens have theen made ut Canton，and will，probably，be followed at the other perts of trade：rupees welghing 109t． 7 m ．2c．Oc．；l＇eruvian dollars．111t．4m．5c．5c．； Mexican dollars，111t．9m．0c．Oc．；Bolivan dollars， 112 t .1 m ． 5 c .0 c ．；Chillan dollars， $112 \mathrm{t} .5 \mathrm{~m} .2 \mathrm{c} .0 \mathrm{c} . ;$ and chopped dollars， 113 s .2 m .0 c ． 7 c ．：are to bo accounted as 100 taels of sycee silver，being．acearding to this menetary tariff，respectively equal to 2 dwts．， $5 \frac{1}{2}$ dwts．， 64 dwte．， $6 \frac{1}{2}$ dwte．， $7 \frac{1}{2}$ dwts．，and $8 \frac{1}{4}$ dwts．worse than British standard．To these percentnges are to be added $\frac{1}{2}$ per cent．for difference between the hoppo＇s and the sliroft＇s welghta，and another $\frac{1}{2}$ per cent．for refining．Ilence the value of the tael of syeen silver is rendered very nearly equal to 79$\}$ pence，nad with the 1 per cent．，to 80$\}$ pence sterling，nt which value the Chinese rates in the above schedule have been re－ daced．－Trite．

Monejs．－Accounts are kept at Canton in taels， mace，candarines，and cash；the tael being divided lato 10 mace， 100 candarines，or 1000 cash．There is hut one kind of money made in China，called cnsh， which is not colned，but cast，and whleh is only used for small payments ：It is composed of aix parts of cop－ per and four of lead；it is round，narked on one side， and rather ralsed at the elges，with a square hole in the inidlle．Thesn pleces are commonly carriad，like beads，on $n$ string of wire．A tael of tine silver should be worth 1000 eash；lut，on account of thelr conven． ience for cemmon use，their price is sometlmes so much raised that only 750 cash are given for the tael．

Forcign coins，however，eireulate here，particularly Spanish dollars；and for small change they are cut Into very exact proportions，but afterward weighed； fur which purpose merehants generally enrry senlea， eullod dotchin，made somowhat after the plan of tho Euglishasteelyards．

Tho tael used to be reckoned at tis， $8 l$ ，atering in the hooks of the Jast India Compuny；but lts value varies，and fs generally computed accordling to the price paili per ounce for Spanish dollarn in London． The tahlon given for thin proportionsl value may be ealeulated in penee aterling，liy the multiplier 1－208． Thus，if the price of the Spanish dollar be GOd．per
ounce，the value of the tael will he $60 \times 1 \cdot 208=72 \cdot 48 d$ ； if at 668 ．，the value of the tael will be $78 \cdot 728 d$ ．；and for any other price In the same proportion．

Fineness of Gold and Silver．－The fineness of gold snd silver is expressed by dividing the weight into 100 parts，called toques or touch；similar to the mod－ ern practice of France．Thus，if an ingot be 03 tonch， it is understood to coutain 7 parts of alloy and 98 of pure metal，making in the whole 100.

The fineness of the precious metuls，expressed in these declmal proportions，may be cenverted into En－ glish proportlons by the following analogies：Suppose gold is $91 \cdot 66$ tonch；say，ns $100: 91 \cdot 66:: 12: 11$ ，the stundard，and vice versa；and to convert standurd silver into touch，say，as $240: 222:: 100: 92 \cdot 5$ ，the touch of sterling silver．Pure gold or silver without alloy is ealled by the Chinese sycee；and sometimes，when of less purity，the metal is accepted as aycee．

Silver Ingots are used as money，and welgh from $\frac{1}{\frac{1}{2}}$ a tael to 100 taels，their valne being determined by their weight．These ingots are of the hest sort of sil－ ver；that is，about 94 touch．

Gald Ingots．－Gold is not considered as money，hut as merchandias：it is sold in regular ingote of a de－ termined weight，which the English eall shoes of gold； the largest of these weigh 10 taels each；and the gold is reckoned 94 touch，though it may be only 92 or 93.

Weights．－Gold and silver are weighed by the catty of 16 taels；the tacl is divided into 10 mace， 100 can－ dareens，or 1000 cssh .100 taels are reekoned to weigh $120 \mathrm{oz}, 16$ dwts．Troy，which makes the tael equal to $579 \cdot 8$ English grains or $37 \cdot 566$ grammes．

The principal weights for merchandise are the picul， the catty，and the tnel；the picul being divided into 100 catties，or 1600 taels．

ILence the picul weighs $60 \cdot 472$ kilogrammes，or 162 lus． 0 oz .8 dwts． 13 grs ．Troy．

The above weights are sometimes otherwise denom－ inated，especially by the natives：thus，the catty is called gin；the tael，lyang；the mace，tchen；the can－ dureen，fivun；and the eash，lis．
There are no commercial measures in Chins，as all dry goods and liquids are sold by welght．In deliver－ ing a cargo，English weights are used，and afterward turned into Chinese piculs and catties．

Long Measure．－That used in Chinn is the covid or cobre；it Is divided into 10 punts，anl is equal to 0.3713 metre，or $14 \cdot 625$ English tnches．

The Chinese have four different measures answering to the foot，viz．：

The foot of the mathematical tribunal．$=0 . \%$ Men $\stackrel{\text { Eng．Tach．}}{=} 13 \cdot 125$
The foot of the mathematical tribunal．＝0．20̈3 $=13.125$
The builders＇foot，ealled congpu．
$=0.3248=12 \cdot 7$
The tallors＇and tradesmen＇s foot．． $=0.3383-13.93$
The foot used by englueers $=0.3211=12.65$
The li contains 180 fathoms，each 10 feet of the last－ mentionel length；therefore the $\mathrm{li}=1897 \frac{1}{2}$ English feet；und 192⿺ lla measure $n$ mean degres of the me－ ridian nearly；lut Eurepena missionarles in Chins have divided the degree into 200 lis ，each it making 1820 linglish feet，which gives the degree 69＇166 En－ glish miles，or 11／131 lirench myriametres．
fiuropoan Trade at Canton．－As soon ns n vessel ar－ rives among the islunds which front the entrance to the Canton lliver，she is generully hoaried ly a pllot， who comluct her into Macno or llong Kong roads． The entrance is，however，so sufe that ships push on withont waiting for the pilot，whe，If the weather be bad，is sometimes long in coming on board．The pi－ Ints＇names are registered at the Keun－min－fon＇s office near Macno；and for in license to act the sum of $\$ 600$ is pall．The person who takes out thn litense some－ thmes knows nothing alout shipe or the river，but omploys fishermen to do the duty，On the vessel＇s

## CAN

arrival in the roads, the pilot goes on shore to repert ber at the effice of the kean-min-foo, who, when re has recelved anewers to his inquiries, gives a permit for her to pass threugh the Bogue, and orders a river pilet on beard. This pilot seldom repairs on board the vessel before 24 hours have elapeed. When arrived, the vessel proceeds through the Bogue, and up the Canton River to Whampoa.

Every ship that enters the port requires the service of a lingulat and comprador befere ahe can commence unloading. The master used to be required to give a written declaration, in duplicate, solemnly affirming that the ship has brought no opium. Ail the trade with foreigners used to be confined to the hong or security merchants; but this restrlction has recently been abolished; and forelgners may now deal with any merchant or other party they think fit to employ. The linguista are government interpreters, who procure permits for delivering and taking in cargo, transact all the custom-house business, and keep accounts of tha dnties. All the minor charges of the government, also, are paid by them; in consideration of which they receive a fee of abont $\$ 173$ previously to the vessel's departure. When a vessel wishes to discharge or recelve cargo, the lingnist ls informed a day or two prevlously what kind of goods are to be received or discharged, and in what quantities. He then applies for a permit, whlch being issued, the lighters or chopboats proceed to Whampos, where they usually arrive on the evening of the accond or morning of the third day. For a single loat the linguist used to receive a fee of $\$ 23$; lut if a permit be obtained for from two to alx boats at a time, the fee for each beat was enly 11 taels 2 mace 6 cand., or about $\$ 15$ ?

When the goods are ready to te landed from or sent to the ship, the hoppo (principal custom-house officer) sends a domestic, a writer, and s. police rmmer; the hong merchant who has secured the fhip sendr a domestic, called a court-going man (one who attends at the public offices on ordinary occasions in behalf of his master); and the linguist sends an acconntant and interpreter to attend at the exambination of the goods. The hong merchants used to be held responsible ly government for all intice, whether on imports or exports in forcign vessels; and therefore, when goods were purchased, it was customary for the parties, before fixlag the price, to arrange between themselves who was actunlly to pay the duties. Of an impert cargo, each chop-bont, according to rule, which, however, la not rigidly enforced, shonld contain-of woolens, camlets, end long-ells, 140 bales; tin, 500 hare; lead, 600 pigs; Bombay cotton, 55 bales; llengal cotton, 80 liales ; betel-nut, pepper, etc., 306 piculs.

Of export goods, a chop-bout should take-of ten, 600 chests ; of other sorts of goods, 500 piculs. If more than this, the hong merchant gives to the chop-bost, for each additional picul, $\boldsymbol{\$ 6 2}$. In calculating the duties on export goods, 90 rattles are considered 100. The woolens, long-ells, and camlets, are meusured by the chang of 10 covids, without any deduction; and slagle erticles are numbered.

If, after entering the port, any persons transhlp goods, it is consilered that the one ship wold them to the other; and In that case the same duty has to be paid as if the goods were brought up to Canton. Provisions are not lueluded In this regulation. Ships' bsats are not allowed to carry up or down any thing chargeatle with duty. Geld, silver, coppor, and Iron are prohibited to be exposted; a few culinary utensila are the only exceptions. When it is clesired te export treasure, the hong merchant must make an estimate of the value of the import and export cargoes, and whatever balance there may be In favor of the shlp may then be ahipped off as treasure. If more cargo ho sent to a ship than she can take on board, and she wishes it to the shippell on boarl another, it must be done within 3 daya afive amnounclne tite goods at the
custom-horse, and a hong merchant must state it to government; if granted, a hong merchant and lingulst are ordered to go to Whampoa and take an account of sach goods; all whlch, with the expenae of boats, runners, etc., at Whampos, coste 40 or 50 dollars.Companion to Anglo-Chinese Calender, p. 99-101.

Ifong Mferchants.-Previoudly to the cominencement of the new system, it had been the invariable practice, enforced by law, that all foreign vessels arriving in the port shoula omploy, aa broker or agent, a hong or security merchant, who became, by deing ao, responsible to the government for the dutles. These merchants, who were lut few In number, were the only individuale in the empire legally authorlzed to trade with forcigners, a privilege for whlch they had to pay very largely. But after an arrangement had betn made with any particular hong merchant for securing a ship, her captaln or supercargo might deal with pay other hong merchant, or, even with any outside marchant (or merchant not belonging to the hong): pleased. The peculiar duty of the hong merchart was to pay the duties on both the inward and outwaric caryoes; and hence arose the practice of foreiguers buying all goods for export duty paid, and selling all the g veds brought with them free of duty, the dutles being, In both casce, paid by the hong merchants who had sec ired the ship; and hence, also, the ignorance of mos: forelgaers is to the amount of the duties. But now that the privilege of the hong merchants has been aboli bed, the luties will have to be paid to the Chinese a thorities by the parties lmperting and exporting, in the same way as in this country.

Port Tharges are fixed widue the new treaty at five mace pe. register ton, in full of all charges; so that the complix system that previously obtained for charginf those duties is now, in so fur at least as liritish $\mathrm{s}^{\prime} i^{+}$, are concerned, at an end. Vessels Inmorting rice us other grain into any of the five ports open to Bricish vessels, are liable to no charges whatever; but if they take away an export carge, they then have to pay the duties on such cargo agreealily to the turiff, and one moiety of the tomage dues, or $2 \frac{1}{2}$ mace per ton.

The whole number of vessels arriving at Canton in 1854 was 320 , with the tonnage of 154,157 . Of this number, 137 were British, 65 American, 23 Duteh, 21 Spanish, 11 Danish, and 18 Peruvian. The latter, we imagine, are all engaged in kidnapplng, a system which condemins hunilreds of Chinese to a speedy death among the guano islanda of Callara. These vessels brought in the same year goods to the value of $£ 795,255$, constituting Canton a good, but not a first-rste customer to Europe. Of cotton goods our merchants purchased $\$ 2,706,425$; of rice, $\$ 300,000$ worth; and every thing clse In intinitesimal quantity. Fleh-maws, beche-demer, cloves, shark-fins, sandul-wood, liquors, upear to meet with the resdlest sale in the great sea-port of China. The exports make a little better appearance; but still they are far from lurge. The tea trade has flown to Shanghal, the value exported from Canton being In 1854 only $84,627,552$, but a fraction of the export at the northern port. Silk is sold to the value of about $81,140,000$, and curiesities make up the remainder. Bamiwo and rattan ware, bone and Ivory toys, China dishes and lacquered ware, mother-of-pearl ana marble slabs, preserves and drugs, sugar-candy mid pitchers, all testily to the ingenuity of the Chinece. and the boundess opulence of certuin classes in Furope and America. The whole amounts only to $\mathbf{E 1 , H 5 , 3 4 8}$ a year, and this endires an exorhitant weight of taxathon.
The tonnage paid by llritiah ships alone amounted to $\mathbf{4 1 1 7} 8: 4$, or nearly 10 per cent. ad valorem npon the whole movemunt of Ilritish trate in that port. The customs dues of Caleutta, heavy as wo believe them to be, are a tritle when compured to those of Canton, which avenge very nearly 17 rupeea a toth.-Hong Kong Gorernment liazette.

Foreign Merchants.-These consist of Brltish, American, French, Dutch, Danlsh, Swedish, Spanlsh, and Portuguese, with Parsee and Indla a Mohammedan British subjects. The Americans, French, and Dutch have esch consular agents recognized by the imperial government. The same privileges have been, or are to be, coneer sd to all foreigners that have been granted to the Engllsh.

Opinm, which is hy far the most prolitnble of all the urticles imported linto Chlua, is oxcluded from the
official account of imports, whlch comprises those articles only that are legslly adnisalble. Although, however, it be nominally exclnded, opium is openly; systemstlcally, and easily introduced; the trade in it leing, in fact, as safe and as regular as that in any other commodity, while it is incomparably more extensive. Notwithstanding the efforts that have sometlmes been made to effect its exelusion, the imports have cont'nued rapidly to increase. In 1816-'17 they amounted to only 3210 ehests, whereas in 1829-'30 they had increased to abont 14,000 ehests; and they are now estimated at about 54,000 chests, werth about $\$ 33,000,000$. So rapid an increase in the production and consumption of a drug is, perhaps, unparalleled in the history of commerce. It is probable, however, that its importation will shortly receive a clieck; for it ls believed that the Chinese, aware at last of the Impotency of the attempts to prevent its introduction, sre about to legalize its importutionand culture in the empire. And as the soil in muny parts of China is understood to we well suited to the growth of the poppy, there can be little doubt that its cultivation will be rapilly extended. Should this expectation be realized, it will produce a very important change in the trade of China. On the whole, however, we incline to think that the ehange will be beneficial. It will go far to restore the balance between the imports and exports without draining China of her bullion; and it will enable her to purchase larger quantities of the manufactures and other produets of this and other countriea. The change in question, supposinir it to be ralized, will, however, seriously affect India, which furnishes almost all the opium sent to China, and the culture and sale of which, besides affording emplnyment and subsistence to a large population, yields a net revenue to the East India Company of considerably more than $\boldsymbol{£ 3}, 000,000$ a year!

Shanghai is situated in the southern part of the province of Kiang-Su, at a considerable distance from the sea, on the Kiver Woo-Sung, in about lat. $31^{\circ} 10^{\prime} \mathrm{N}$., long. $120^{\circ} 50^{\prime} \mathrm{E}$. The river, which may be navigated by large ships for a considerable distance alsove the town, erosses the granil eanal, and, consequently, makes Shanghai an entrepót for all the vast and fertile comntries traversed by the canal and by the great rivers with whieh it is connected; and hence the present importance of this emporimm, as evinced by the extent of our trade with it in 1848 ; and hence, also, the infinitely greater importance to which its conuneree will hereafter most probally attain.

Expoats of Ten prom Ghina.

|  | Black Tea. | Green Ten. | Total. |
| :---: | :---: | :---: | :---: |

Trade with the Indian Islomds, ete.-In his evtdence Irfore the select committee of the Ilouse of Commons, Mr. Crawfurd gave the fullowing details with respect to the native foreign trado with China:
"The prinelpal part of the junk or hilippisg trade is earried on ly the four eontiguous provincer of Canten, Fokien, Ohekiang, and Kiannen. No foreign trado In permitted with the Island of Formosa; and 1 havo no meank of dewcrihing the ex-
tent of the traffio which may be conductad between Chinth, Corea, and the Lepchew lalands The foilowing ary the coun. trica with which China carrien on a trado Ju junka: viz, Japan, tho Philinpines, the Sor-loo Isiands, Celebes, the Moluccas, Norneo, Jara, Sunintra, Singapore, thio, the cast const of the Malayan peninsuia, Simm, Cochin China, Caubodith, and Tonquin; and these m*y, In all, employ about ex'd junks The ports of Chlns at which this trade la conducted are, Can. ton, Tehan-tcheou, Nomhong, Iloeiteheon, Suheng, Kongmson, Changlim, and Ilaiban, in the province of Cunton; Amoy and Chinchew, in the province of Fokien; Ningpo and slang-hal, in the provisco of Chekiang; and Soutcheon, in the frovince of Kiannan. The above estimate doea not inciude a great number of small Junks weionging to tise lainnd of IIalnan, which carry on trade wth Tonquin, tookin China. Cambudia, Siano, and Slugapore. Thoge for Slam anoount yeariy to about 50 , and for tha Cochin Chinese alominiona to ahont 42 ; these alone would bring the total number of veasels carrying on a direct trade between Chita and forelgn conntries to $50 \%$. The trade with Jajan is confined to the port of Ningpo, io Cinckiang, and expressly limited to 10 vesaels: hut as tho diatance from Nangasukl is a voyage of ro more than four days, it in performed twice a year. With the exception of thim nranch of trade, the foretgn intercouree of the two provinces, t'rokiang and kiannan, which aro famous for the production of ra* ailk, teas, and nankecns, is confined to the Ihilippine Isiands, Tonquin, Cochlu Chimn, Cambodia, athd Slam: and none of this class of vessels, that I an aware of have ever fonnd their way to the western jurte of the Indian Archipeiago. The number of these trailing with siam is 24, all of conkiderablu aize; those trading with the Cochin ethinese dominions, 16 , also of considerahio size; and those trading witis the litilippines, 5 ; naking in all 45 , of which tho evcrage burien does not fail mhort of 17,000 tons, Bealdea the junks now dencribed, there is another numerous class, which may be denomiated the colonial alpplag of the Chtinese. Wherever the Chlurse aro settled in any numbers, junks of this $d$ scription are to be found: much as In Java, Sumatra, the $\cdot=$ " Malacea, elc. ; bu, the largest commerce of this des '. onducted from the Cochin Chinese dominiona, eupeciaily Irom Slam, where the number was estimated to mo at 200 . Several junks
escrijtion from the intter country come annuaily to $\$ H_{6 j} \quad e_{0}$ of which the burden is not less than froun 800 to 400 tons. The junks wisich trade between Chion and the eljacent countrics are some of them owned and huilt In China; but a considerabie zamber aise in the latter countries, particuiarly In Slam and Cochin China. Of those carrying on the Siamese trude, Indeed, no less than 81 out of the $\mathrm{S9}$, of considerabie size, were represented to me at lofigg buit and owned in sinus. The small junk i, however, carrying on the trade of Ilainan, are alf hilit an! wod in China. The junks, whetioer coionial or truiling wide t with China, vary in berden from 8000 pienls to $15,0 \mathrm{~m}$, or at ry dend welgit from 120 to 900 tons, Of thone of the lavt sise have only scen tiree or forr, and theso were at Siam, and the same which were commonily empioyed la carrying a mission and a tribute yeariy from Slam to Canton. Of the whote of the largu class of Junks, $\boldsymbol{I}$ thoutd think tho avirage burdun wili not le overrated at 800 tons eneh, which woulil make tije total tonnage employed in the nativa forelgn trade of ('hilna between 60,000 and 70,000 tons, ezclusi ve of the small junks of 11 ainsh, which, eatimated at 100 tona each, woutd make in ail about 80,000 tons.
"The junks buit in China are panaily constructed of fir and other infarior wouds. When they arrive in Cambodin, Sinm, and the Malaynin istanda, they commoniy furnish them. selves with masts, rudders, und wooden anchors, of the supe. rior timber of these countrics, Tite junks lmilt in Siam are a superior class of vesacls, the pianks and upper works being invariahly teak. The cost of ainip-inilding is inginett at the port of Amoy, in Fokien, and iowest in Siam, At these places, and at Chang-lim, in Canton, the cont of a junk of Sono pleuis, or 476 tons lonrden, was atated to me, by neverat commandern of
 Amoy, $\$ 21,1 \times N$, A juok of the mize Junt named has commoniy a crew of 90 hands, consisting of the following officem, beridea tho erew i a conmandier, a pilot, an nccountant, a capitain of the heinh, a captain of the anchor, and a captaln of the hold. The commander recuiven no pay, but han the adiantago of tho cabin accommodation for passengers, reckonod on the voyage tetween Canton and Singapore worth 150 Spaninh doliars, Ilo is atse the agent of the owners, and recelvea a commisalon, commonly of 10 per cent, on the gmoftr of nuch aliare of tho adventure, generaliy a very considerabite one, in whieh they are concurned. The pilot recolven for tho voyage $\$ 200$ of wagen, and 50 pienis of freight out and home. The beimamun lise is pieult of frelight and no wayges. Thu captalas of the anctior and the luid lave 9 picuia of freight cach; and the beanen i
piculs each. Nona of these bave any wages. The oftcers and endien of the coloulal junks are differently rewurded. bu Siamese Junk, for exampie, trading bet ween the Siamese cap. ital and Singupore, of 0060 plevis burden. the commander and pilot had eaci $\$ 100$ for tho voyage, with 12 piculs of frelght aplece. Tho accountant and heimaman had half of thits aliow. suce, and each seaman had $\$ 13$, with 5 picuio of iruight. In construction and outit, Chinese junks are clumsy and awk. ward In the extreme. The Chiuess are quite unacquainted whth narlgatlon, saving the knowledge of the compass; netwithstardinf this, as their pilots are expert, their voyagea thort, and as they hardly ever sall except at the height of the munsoons, when a falr and ateady $\hat{f}$ or 8 knota' oreeze curries them direetly from poit to poit, the sen risk is very semall. Iuring 13 years' acquaintance $w^{\frac{1}{t} \text { th }}$ this branch of trade, 1 can recollect huaring of but fuur shipw recku; and in all thes. jostances the crewa ware saved, The conctruction and rigging of a Chituese junk miny be louked upon as her proper registry, and they are a very iffectual one; fur the least deviation from them would subject her at once to forelgn elarges and forelgn duties, and to ali kinds of suspicion, Tho colonial funks, which are of a moro commodous form and ontfit, if vistime China, aro subjected to the sunte dutien us forcign vessels, Junks buitt in siam, or any oticer adjeent country, if constructed and fitted out after the custenary model, ne ndmitted to trade to China upon the aame terman an those bult and owned in the conntry, If noy part of the erew consist of Slamese, (cochin thinese, or edicr forelgnerg, the later aro ad. mitted only at the port of Canton; sud if funnd in any other part of Chinu, would be seized und inken up by tinc police ex. actly ln the same manner as if they vers Europeans. The native trade of Chima condu*ted with foreign combtricu is eot a ciandentine rommeree, unacknowiedged by ihe Chinese lawr, Int has in every case at least the express sanction of the rice roy or governer of the province, who, or petition, decides the number of jumks tiat shait be aliowed to engago in it, and even emumemater the articles which it alag? bo legal to export and import. At every port, alko, where mach a forelga trade is manctloned, there in a hong or body of security merchante, an at Canton: a fact whicll nhows cleariy enough that this 'ristitution fa jured of tise laws or customs of Cinna, und not a peculiar restraint imposed upen the intercourse with Duro pennk. The Chinese junks jroucrly enmatrueted pry no ueasurement duty, and no enmshaw or present; dutles, hurever, are paid upon goods exported and imporied, which seem to differ at the different jrovinces. They are highest at Imoy, and lowest in the island of Ilainan. The Chaese truders of Slam Informed the that they carried on tho finirest and casiest trade, suligect to tiv fewest reatrictions, In the jorte of Ningpo and Slang-lai, in Cheklang, and Soutcheon, in Kiann::n. Eireat dexterity seems every where to be exerelsed ly the Chinese in evading the datics. Onc juractice, which in very often follow. ed, wili afford a good example of this, The coasting-trude of China is neariy free from all duties and other imports. The mercinant takes udvantape of thin: and, fatending In rerlity to proceed to slam or f'ochin Chlan, for exumpic, cioars a junk ont for the faland of Ilainan, and thus avolifa tho paymut of duthes, When alhe returns she wild ife four or five days off the month of the pori, nutif a roguiar hargain be made with the enstom-house oflicers fur the reduction of duties. Tis thereat boid out in meh cases in to procecd to another jort, and thus deprive the publie officera of their custonnary perquiltes. $\mathbf{I}$ wat usaured of the frequenry of thia practice by thinose merchants of Cochin China, as well an by seversi commanders of junks at singapore. Fruri the iast-named persuns I had au. uther fact of some consifucnce, as conacted with the Lhinese trade; viz., that a good many of the Junks carrying on tnde with forogign jorts to the wertward of China often proceded on voyages to the northward in the mame aeason. In this nanner they ntated that nlout 20 considerable junke, bealdes a kreat many amail unes, proaceded ansuatily from fianton to ronchotgg, one of the capituts of Kianuan, nitd in woalth and commerec the rivai of Canton, where tiney sold about 200 chests of opium ut un advance of to per cent. beyond the liunton prires. Anotiner place where the Canton janks, to the number of five or six, repair annamify, is Chinchew, in the province of Ganton, withln tho finif of leehuley, or Yeliow Sen, and ta far nortil at tise 87th degree of latitude."-Apmendix, Iifmit of 1500, p. 298.

A Chinese ship or junk is seldom the properiy of one individual. Sometimes 10,50 , or oven 110 ditiferent merchants purchase a veskel, und divile her into ass many diliferent compartuents as thero are partncrs, so that each knows his own partieular part of the ship, which he is at llherty to the up and recure us he pleases. The luilk-henits, by which these divisions are formed, conkist of slout planke, so well cuulked as to be con-
pletely water-tight. A ship thus formed may atrike on a rock, and yet sustain no serious injury; a leak springing in one division of the hoid will not be attanded with any damage to articles placed in another ; unt, from ber tirmmess, she is qualified to resist a moro chan orilisary shock. A considerable loss of stowage is, of course, austained; but tho Chinese exports generully contain a considerable value in small bulk. It is only the very largest class of junks that have so many owners; but even in the smallest clase the number is very considerable.-See Cunsa.

Canvas ( Fr , Toile is voile; Ger. Segeltuch; It. Canevaze, Lona; Kuss. I'urussnoe polotno, I'arussina; Sp. Lom $)$, unbleached cloth of hemp or fax, chiefly used for suils for shipping.

Caoutchouc. "This substance, which has been improperly termed clastic gum, and valgarly, from jts common application to rub out pencil marks on paper, India rubber, is obtained from the milky juice of different phants in hot countries. The chief of these are the Jatropha elastica, and L'rcrola elasticu. The jusee is applied in successive coatings on a mould of clay, and dried by the fire or in the sun; and when of a satheient thickness, the mould is crushed and the pieces sluken out. Acids separato the caoulehoue from the thinner part of the juice at once, by coagulating it. The juice of old plants yields nearly two-thirds of its weight; that of younger plants less. Its color, when fresh, is yellowish-white, but it grows darker by exposure to tho air. The elasticity of this substance is its most remurkuble property; when warmed, as by inmersion in hot water, slipis of it may be drawis out to $7 \mathrm{or}, 8$ times their original length, and will retarn to their former dinsensions nearly. Cold renders it stift and igid, but warmoth restores its original elasticity. Exposed to the fire, lt softens, sweils up, and burms with a bright flume. In Cayenne it is used to give light as a canalle."-ITar's lict. Sec Inima Rimmea.

Caontchoue has become nu article of very considernble importance. M, do In Condamine, who was one of tho tirst to communiente authentic information with respect to it, mentions that, owing to its being impervious to water, it wns made into boots by the Indians. - l cyage de la Riviere des A mazones, p. 76 . It is now empl" j ed in a similar way here. Dleuns have, within these few yeurs, been discovered of reducing it to a state of solution; and when thin tilaments of it are apreat over cloth or any othet substunce, it is rendered impervious alike to air and water. Air-cushions nnd pillows are manufactured in this way; us are waterproof clonks, now in very extensive demand, hats, boots, shoes, ete. It is ulso extensively used in the manufucture of bruces and other artleles which it is desirable should possess consideruble elasticity; and there can be little doubt that it will bo employed still more extensi vely, mud in a still greater varicty of ways.

The great variety of purposes to which its elasticity' and impervionsness to water and to air have occasioned its applicntion are too numerous and fumiliar to be particularized in this place. The extent of its employment in Britain in the severnl branches of manafarture is shown by the quantity of enout choue imported, which, for the year eniling January 5, 1854, amonuted to $1 \overline{17} 326 \mathrm{cwt}$. The total quantity exported from l'ara alone, in 1852 , was 32,860 ewt., and 116,465 puirs of shoes. The tiluture of enoutchoue, for the manofacture of clastic fabrics, such as cloth, cord, tape, braces, etc., is nu important and increasing branch of our nutional industry. This operation has been mute the sulject of various putents, all moditlentions mere or les. perfect of our general prineiple, numely, that of reducing it to threads by meuns of sted ediges ucting either on the bottle caoutcheuc compressed in a mouh, on the solid eake, or by eutting it when stretched on a mandre] of woot, which is aet in rupid revolution. In this operation water is nllowed to trickle over the cuttiag blades in order to provent the colsesion that would
otherwise impede their progress. In thia mamer thread of 5000 yards to a pound weight is produced. l'revlous to its employment in the manafacture of textile fabrics, it is ${ }^{\prime \prime}$, essary to render the thread inelastic, which is effected by winding it tightly on reels and allowing it to remain in that condition until neurly deprived of Its elastlcity-which is afterward reatored by exposing it to the action of a heated smooth-ing-iron. Sheets are sometimes cut from the solid cake, and may likewiae be obtained of any size, and of extreme temulty, by apreading a solution in naphths upon eloth previously atzed, stripplng it off when dry. The use of rollers, with a piece of cloth similarly jrepared and auperimposed on the varnished surface of the first, may also be employed in this operation,-E. II.

Cap. The Romans went for many ages without regular covering for the head, and lence the heuds of all the ancient statues appear bare. lout at one period the enp was a symblol of liberty, snd when the Romuns gave it to their slaves it entitled them to freedom. The cap was sometimes used as a mark of infuny ; in Italy the Jews were distingulshed by a yellow cap, and in France those who had been bankrapts were forever after obliged to wear a green cap. The general use of eaps and hats is referred to the year 1449; the first seen in these parts of the world beling at the entry of Charles Vll. into Rouen, from which timo they took the phace of chuperons or hoods. A statute was passed that none should sell any hat sbove 20d. (40 centa) nor cap above 2s. 8.l. (G6 centa), 5 Henry VII., 1489.IIAvun.

Cape FIatteras, a headland, Nortb Carelina. Lat. $35^{\circ} 15^{\prime} 12^{\prime \prime}$ N., long. $75^{\circ} 30^{\prime} 54^{\prime \prime} \mathrm{W}$. The light-house was built in 1798 of brown sand-stone. The light is fixed, elevated 112 feet above the sea, and is visible for a distance of 17 nautical miles. Very dangerous shoals extend off from this point 10 navtical miles.

Cape Eaytien, fomerly Cape Francais, and Cape Henry, a sea-port town of the island of Hayti, on its north coast, 90 miles north of Port au Prince. Lat. $19^{\circ} 40^{\prime}$ N., long. $69^{\circ} 54^{\prime} \mathrm{W}$. J'opalation probably from 12,000 to 16,000 . Previously to the IJaytian revolution it whs a hantsome city, and it still has some tine buildings, with a secure and tolesably defended harbor, and a considerable trade, chiefly with tho United States, Great Britain, France, and Germany:

Cape Fenlopen, Delaware, a headland on the south side of the entrance to Delaware Bay. Lat. $38^{\circ}$ $46^{\prime} 36^{\prime \prime}$ N., long. $75^{\circ} 4^{\prime} 42^{\prime \prime} \mathrm{W}$. The light-house shows a fixed white light elevated 170 feet above the sea, mul is visible for a distance of $18 \frac{1}{2}$ nautical miles.

Cape Eenry, VIrginia, a headland on the south side of the entrance to Chesapeais Bay. Lat. $36^{\circ} 55^{\prime}$ $30^{\prime \prime} \mathrm{N}$., long. $76^{\circ} 0^{\prime} 12^{\prime \prime} \mathrm{W}$. The tight-house, huilt in 1791, is the leading mark for ressels bound into Chesapeako Bay. It shows a fixed white light elevated 120 feet above the sea, and is visilile for a distance of 18 nautical miles.

Cape of Good Hope, an important celony of Grest Britain, occupying the south part of the peninsula of Africa, between lat. $20^{\circ} 41^{\prime}$ and $34^{\circ} 51^{\prime} \mathrm{S}$, and long. $17^{\circ} 10^{\prime}$ and $27^{\circ} 32^{\prime}$ E. ; bounded on the sonth and east by the Indian Ocenn, and on the west by the Atlantic Ocean, on the north by the ceuntries of the Namnquas, Griquas, nud other Hottentot tribes, and on the northeast by British Kafraria. Length, west to enst (Cape peninsula to Keiskamma River), 550 miles; average breatth, 250 miles. Area, estimated at 110,000 square miles. Population in 1850, 261,436, mostly Africans, Dutch, negroes, and a amall number of Ilottentots. The country is formed of a series of territories rising in successive stages from south to north. Bays, Itelena, Table, False (the west part of which forms Simon's Bay), St. Sebastian, Mossel, Plettenberg, and Algon. Streams ne numerous but rapid, mostly dry in summer, and untit for navigation; the
chief are, on the east and sonth coart, Kelakamma, Great Jiah, Buahman, Sunday, Camtoes, and Hreode; on the west, Berg and Efephant or Oliphant ; and on the north, several small streams tributary to the Orange. The climate is mild ind healthy, but very dry; rains irregular, often falling in torrents on the coast, but rare in the plaina of the interior. Snow falls only in the mountains, and is not permanent, even on the most elevated. December and January are the warmest, and June and July the coldest months. Mean tempernture at Cape Town-in summer, 58.3 ; in winter, $76^{\circ} .6$ Fahrenheit. The greater number of discases are unknown at the Cape; the moat cemmon are consamption and spoplexy. Few of the inhabitanta attain an advanced age. Soil fertile where sufficiently watered, but the genemal appearauce of the country is sterile and menotonous. The arid steppes or Karoos of the fiterior are destitute of trees, and covered with an ephemeral vegetation, only after heavy ralas. The fora of the celony is of a peculiar character, comprising 1200 apecies, which, however, are more remarkable for the variety and beauty of their flowers than for their uses. The nost valuable is the aloe, the produce of which has been exporied in one year to the annount of \$12, 1000 ; a apecies of soda found in the Karoo, is ennplovert be tre "ailituts in the nunufacture of soap, and cances are made from the covering of the waxbeiry. European grains, and the fruits of temperate and tropical regions, have been successfulty introduced. Corn is raised more than requisite for consumption, and the cultivation of the vine is an important source of wealth; in good white wine is produced in the intcrior, but only the small vincyard at the foot of Table Mountain produces the celelrated liqueur called Com stantit. Cattle-rearing is the chief branch of rural indestry; and the introduction of the Merino sheep has rendered the rural trade of the colony important. The value of produce of the colony exported in 1840 amonnted to $\mathfrak{f} 359,517$. The coasts ahound with niackerel and herrings, and in 1812 the whale and seal fishery employed 144 boats. Some of the wild animals of Africa are still met with, lut the larger apecies decrease in proportion as colonization extends. The lion, hyena, buffalo, hippopotamus, and zebra, are occasionally seen: the rhinoceros is rare, and the elephant is driven beyond the bomniary. The ostrich and eagle are found io the monntains, and snakes are numerous. The commerce of the colony is extensive; the ports are Cape Town and Simon's Town in the west, anif fort Elizabetin in the oast. Total valuc of exports in 1814, f. 350,435 , of which $£ 2.6,217$ were to the United Kingdom. Imperts samo jear, $\mathbf{£ 1 , 1 2 3 , 0 6 1 . ~ I n ~} 1845,35$ ships ( 3713 tons) and $30{ }^{7}$ men belonged to the colony; and itr 1847, 791 ships ( 209,426 tons) entered, and 782 ships ( 205,618 tons) cleared from its ports. The colony consists of an east and a west province, and these are divided into 14 districts; viz., Cape Division and Stellenbosch in the southwest; Zwellendain, George, Uitenhage, and Albany, on tho south coast ; Clanwilliam on the northwest; Woreester and Reanfort, Graaf Reynet, and Somerset in the interior; CGlesherg on the northeast ; Cradock and Victorla on the east. The capitals have the same names as the districts, except Graham's Town, which is the capital of Albany, and Fredericksburg, of Victorin district. Stellenborch is the chief wine, and Zwellendam the principal corngrowing district; the otbers are mostly approprinted to grazing. Government is administered by a Parliament, compesed of the governor, legislative Councll of 16 members, and a $l$ louso of Assembly of 16 menbers, elected for a term of fivo years. (Salary of yovernor and commander-in-chief, $\mathbf{5 0 0 0}$.) The Dutch fornded $r$, colony at the Cape in 1648, which was taken by the Sritish in 1795.-See Cape Town.

Ft.d heers or farmers of the Cape colony, deacendrats of the original Dutch settlers, have lost much of their ancestral induatry and cleanliness; they are affec-
tionate in their family relations, and strict in religionn observanced, but prejudiced and illiterate. Education has been long neglected in the colony; the only institutions of importance were, till lately, the South African college, and the South African institution at Cape Town; but a comprehensive system, ombracing primary and classical scho-1s, was iastituted by the goverument in 1839. In 14 / of the diatriets are mission. ary achools supported ${ }^{2} c^{2}$ erent Protestant aceietics. In 1842 there were 40 p...bice and 102 private schools, attended by 2700 children. The colonial grants in the asme year were, for educational purposes, $\mathcal{L 6 0 2 1}$, and for religious purposes, distributed among the difierent sects, $£ 10,481$. Slavery was abolished in 1833. The Finglish language is alono used in the courts of law, but the Duteh is also taught in the governnient schools. The money in use ia exelusively British; and Dutch weights and maanures are nearly superseded by the English. The peaee of the celony is frequently interrupted by incursions of the Kaffers, and other savage tribes on the frontier.

Capers (Fr. Capres; Germ, Kappern; Du. Kuppers; It. Cappari; Su. Alcaparras; Russ. Kıuperszu; Lat. Capparis), the pickled buds of the Capparis spinosat, a low shrul, generally growing out of tho joints of olit walis and tho tlssures of rocks, in most of the warm parts of Europo. Capers ire imported from different parts of the Mediterrancan ; the best from Toulon, in France. Some small salt capers come from Majorca, and a few flat ones from the neighborhood of lyons. In 1852, 117,067 pounds of cajers wers retained for consumption.

Cape Town, the rapital of the British territory in Sonth Africa, at the bottom of Table Bay, about 32 miles north from the Cope of Good Ilope, and on the western side of the territory to which it gives its name; Iat. $83^{\circ} 55^{\prime} 56^{\prime \prime} \mathrm{S}$., long. $18^{\circ} 21^{\prime} \mathrm{E}$. . The town was founded by tho Dutch ir 1650 ; and remaincel, with the territory sialject to it, in their possession tiil it was taken by the liritish in 1795 . It was restored to the Dutch liy the treaty of Amiens; but heing agsin coptured ly the British in 1806, it was finally ceded to then in 1815. The streets are laid out in atraight linea, crossing each other nt right angles; many of then being watered by canals, and pianted on each side with oaks. The population in 1.42 amounted, according to the statement in the C'aje Almanac, to 22,543 , of whom about a third were blacks. 'The town is defended by a castlo of considerable at rength. Table Bsy is capabie of containing sny number of ships; but it is exposed to the viesterly winda, which, doring the nonths of June, Jaly, and Angust, throw in a heary awell, that has teen productive of many distressing necidenta. This, in fact, is the great irswback apon Cape Town, which in sll other respects is most admirably fitted for a commercial station. At the preper scason, howe ver, or during the prevalence of the easterly monsoon, Table Bay is perfeetly safe; while the cheapness and nbundance of provisions, the healthiness of the climate, and, alove all, its poaition, render it a peculiarly desirable resting-place for ships bound to or from India, China, Anstralia, etc.

The plan of Tablo Bay on the opposite page is taken from the survey of the Cape of Good IIope, exceuted by Licutenant Vidal and others, under the direction of Captsin Owen.

Port Insiructions.-Art. 1. On the arrival of nerchant vessels in Table Bay, a proper berth will he pointed out to the masters thereof by the port captain when he boards them; and no master of a merchant vessel shall sbift his birth without permiasion from the port cajtain, unless in case of extreme emergency, when lie must report his having done so as early as possible at the port-office.

Art. 2. Should it be the intention of a master of a vesael to discharge or recelve on board any considerable quantity of merchandise, a berth will be pointed

out to him as elose to the jetty, or other landing-place, by the bearings of two landmarks, and the depth of as the safety of the vessel aud other circumstances will, the water; and should aecident oecur, by which the sdmit. And the master will then moor with two bower anchers, with an open hawse to the north-northeast, taking especial carc, in so mooring, not to overlay the anchors of any other ship, or in any way to give the vessel near him a foul berth. Ships and vessels touching in Table Bay for water and refreshmenta alone may ride at aingle anchor in the outer anchorage; but In this case it is particularly recommended to veer out 80 or 90 futhoms, if they ride by a ehain cablo, as the liability of starting or fouling the anehor, or breaking the chain, will theraby be greatly lessened; and if riding by a rope or coir cable, to run out a stream or geod kedge, to steady the ship; and In both cases the oflser bower anehor ahould ba kept in perfeet readiness to let go. When the vessel is properly moored with hower anchors, or well seeured with a bower and atreain ancher, and with good calles, buoys, and buoy-ropes, the master wlll then take the exact place of the ahip
vessel may drift from this situation, or lose her anchors, a good bearing and depth of water must be taken at the time, and the sanus inust be notified in writing to the port eaptain. It is partieularly recommended that vessels be kept as snug as possible, to counteract the effects of the periodical winds, which at times blow with considerable violence.
The district subject to Cape Town ls of very great extent, and contains every variety of sill, from the richest level lund to the wildest mountain, and tracts destitute of even the nppearance of vegetation. The elimate fluctuates between the two extremes of rain and drought. On the whole, its advantages and disadvantages seem to be pretty equally balanced; and the prospects whieh it holds out to the industrious emigrant, if not very alluring, are cartainly not diseouruging.
Population.-Aceording to the officinl returns, the

popnlation of the Cape Colony 1,1847 conaisted of 167,995.
Produce.-Large quantities of corn of a very good deacription are produced in the immediate neighborhood of Cape Town, and in other parts of the colony; but agriculture is crippled by the Dutch law of succession, which, by dividing a man's property equally among his children, hinders the accumulation of oapital in masses, and the formation of proper farming es-tabllshments.-Thosson's Travels in Southern Africa, p. 824.

The Marritius and Rio Janelro are the principal markets for the corn of the Cape. The exports of wool have increased very rapldly within the last ten years, and it now forms by far the most important article sent from the colony. The native breed of eheep is very inferior ; its fleece is worth nothing, and it is remarkable only for the size of the tail, which sometimes weighs 20 lbs.! But fine-wooled Spaniah merinos, Saxon and English sheep, succeed remarkably well, and their wool fetches a high price. The eastern district of Albany is eapecially suitable for sheep.
Large quantlies of wine, and of what is called brandy, are produced at the Cape; but, with the ox. ceptlon of Constantia, they are very inferlor. The effect of allowing the importation of Cape wines into the United Kingdom at a comparatively law duty le, not to occasion thelr direct consumption, but to cause them to be employed as a convenient means of adulterating others ; so that, beeides being injurious to the revenue, such reducition of duty promotes frand-
ulent practices, and detracts from the comforts of the pnbilic.
Considerable quantities of hides, akina, and horns are exported. They are principally brought from Algoa Bay, on the eastern side of the colony; and the trade has increased very fast during the last six or seven years. Aloes aro an important product; and harses, butter, beef, ivory, argol, and vatious other articles, are smong the exports. The latter also include dried fish, whale and seal oll, etc., the Cape fisheries being of considerable value.
The imports at the Cape consist of woolens, cottons, hardware, earthen-ware, furuiture, haberdashery, soap, paper, books, and portions of most articles nsed in this country. Plece goods and teak tlmber are imported from India, tea from China, sugar from India, the Mauritius, etc.

Trade.-The trade between the colonists and the independent natives is subjected to various restraints, of which it is not always very easy to discover the policy. The sale of gunpowder and fire arms to the nstives bas been prohibited: a regulation which might have been a judicious one, had they not been able to obtain them from any one eise. The Americans bave, hawever, treded with the eastern coast, and have liberally supplied the natives with these and various other articles; so that by keeping up the regulation in queation, the English exclude themselves from participating in what might be an advantageaus trade But since they have taken possession of Natal, this intercourse may perhaps have been stopped.

By an act passed by the colonial government of the Cape of therotn, being originai packsges as imported, to be shipped Cood Ilope, It is provided, "That it shall be lawfil for the propor officers of endiome to deliver, from any of tho bonded warehounen in this coiony, any articlus whatever duly warchnused free from ouatoms duty as atores for the use of any veasel, not
being then on any voyage from sny one port to any othrr being then on any voyage from any ond port to any othrr
port of this colony: auel delivery and alipmont ulinil be un-

der auch rales and regulationa as the eollector of custome chall dinect; and any auch artiolee shipped as storea contrary to such rutes and regulations shall, be, forfelted, and shall be deali $w$ ith to the same manner as is provided in the ordinance Yo. 6 of 1S63, in respect of goods forfited, or liahle to forfolture, Ifir breaches of the cuatomis Itive."
${ }^{1}$ Hy an'set passed June' 8th,' 1850;" it is further provided, "Thet the following articles shall be exempt from the payment of wharfage and cramage duttes, npon belag landed or mbipped ta Table, Bay or Simen'a Bay reapeotively-that is to to say, oll surplue storea or provistons for the use of whallog vensels; all whatcbone, whale-head matter, and whale or flath oll, innded or shlpped from or on board of whallag vessels, or from or on board of any other vesset conveying auch whalebone, whele-head metter, or oll, from or to any whaling vesael; provided, that such whalebone, whale-hesd matter, be not eotered for colonlal conaumption. ${ }^{\text {.", }}$, $)$

Cape Ferd, the most: western cape of Africa, in the Atiantic Ocean, between the rivers Senegal and Gambia. Lat. $14^{\circ} 43^{\prime}$ N., long. $17^{\circ} 34^{\prime}$ W. Its name is derived from a group of enormous baobab-trees which crowns its aummit.

Capa Ford Islands are situated 829 miles west of the Cape, between lat. $14^{\circ} 45^{\prime}$ and $17^{\circ} 13^{\prime} \mathrm{N}$., and iong. $22^{\circ} 45^{\prime}$ and $25^{\circ} 25^{\prime}$.W. The Archipolago consists of the following ten islands: Sal, Beavista, Mayo, Santiago (St. James), the: largest, Forgo, Brava, Grande, Rombo, St. Nicoläo, and St. Luzia; and feur islets, Branco, Razo, St. Vicente, and St. Antio. Area estimated at 1680 square miles. Population in 1850, 80,738. The white population, in the whele Archipelago is to the colored as 1 to 20 . The surface of the isiands is ${ }^{\text {t }} \mathrm{n}$ general mountainons, and some of their peaks have a considerable elevation. The volcano of Fogo is 0167 feet in height. The soil is extremely various, but mestly fertile; the absence of trees and the scarcity of water are the causes of frequent and severe distress. Climate very het, but tempered by the sea-breezes; mean temperature of May and August, $70^{\circ} 9$, A pril to September $70^{\circ}$, during the other months $65^{\circ}$ Fabrenheit ; the mornings and eveninge are cool, and dews abundant. Chief vegetable products, maize, rice, and French beans. Coffee, introdnced in 1790, has completely succeeded; the cotten shrub is indigenous; indige growa wild, and tobaeco is cuitivated in some of the islands; little sugar is grown, and wine of inferier quality; tropical fruits are abondant.-See Portugal.

Capital, in political aconomy, is that portion of the produce of industry existing in a country which may be made directly available, either for the suppert of haman existence or the facilitating of production. But in conmerce, and an applied to indirlduals, capital is understood to mean the sum of money which a merchant, banker, or tracler, adventures in any undertaking, or which he contributes to the commen stock of a partnership. It signifies likewise the fund of a truding company or corporation; in which sense the word stock is generally added to it. Thus we suy the capifal stock of the bank, etc. The profit derived from any undertaking is estimated by the rate which it bears to the capital that was employed.

A desiro to accumulate some pertion of the produce of industry being natural to mankind, and nearly universal, the growth of capital may be expected wherever the means of accumulation exist; or, in other werds, wherever men are not obliged to consume the whole products of tieir labor in their own subsistence. From the mement at which a man produces more thou he consumes, he is creating a capital; and the accumuinted surplus of production over the coneumption ef a whele community is the capital of a country.Kniant's Cyclopedia. Puhlie credit and publio order are essentially bound up with each other, and with the maintenence of generai prosperity. An infringement of either, or both, is the first and surest aignal of derangement in commerce, and iessened employment. At the preaent moment, when the atate of Euroje furniahen mo many rad axamples of the minery and ruin
which have resulted to the commercial and working classes, it is of the greatest impertance that we should form a just eutimate of the consequences which would result, In this conntry, to the various classes of soclety from any important interraption of that peace and order for which it has been generally so much distinguished; and under which, in comparison with those countries whicin have been exposed to continual outbreaks, it has riser tormo mach apoial and general prosperity.

Capoo, anort of cotton, so short and fine, that it can not be spun. It is used in the East Indies to line palanquins, to maks beds, mattresses, etc.

Caprioorn, Tropio of a lesser circle of the sphere, which is parallel to the equinoctial and at $23^{\circ}$ $30^{\prime}$ distance from it southward, passing through the heginning of Capricorn.

Capaioum. See Prpper.
Capatan, or Capstern, a strong massive column of timber, formed llke a truncated cone, and having its upper extremity pierced with a number of holes to receive the bars or levers. It/is let perpendicularly dewn through the decks of a ship, and is flyed in such a manner that the men, by torning it horizontally with their bars, may perform any work which requires an extriordinary effort.

Conslderable improvements have of late years been made in Phillips' capatans, which in their original form are not now much used in her majesty's service. A part of Phillips' plan, however, is retained, that, namely, of connecting the upper and lower capstan together. A' Fronch plan was recently devised, in which, instead of the wheel, an iron flange is fitted to take the three cables (the one ahove and the other below the class, or rate, for ships), and by this means a messenger is net required. Mcssengers are generally of chain; but rope ones are also supplied to each ship, in case the chain onee sheuld becone defective. The chain-messenger is made with a large link and a small one. This latter the apikes of the whesl enter as the wheel revelves. This messenger is passed half round the capstan, taken forward round the roliers in the bow, and the two parts of the messenger shackled together. Rope-messengers are passed three times round the capstan, and with an eye at each end lashed together. The rope-messengers in all ships are cut from five to cight fathoms longer than the distance between the capstan and the bow, in order that the men may hold on when the cable is hove in. Nlppers, made of rope, from four to five futhoms long are used to attach the cables to the messenger. These are taken off when the cable is hove in, and come aft to the chain locker (or, if the cable is hempen, to the hatchwsy near the tier).

A patent has Jately been taken out by Mr. Thomas Brown, of Lonilon, in which various improvements ure intreduced. The principal of these are illustrated in the following weod-cuts. The numbers 1 mal 2 represent the pian and elevation of the capstun flunge, for working various sizes of chain cable; 3 and 4 are the plan and elevation of the deck-pipe stopper, to be used for checking the cable when bringing the ship to, and for riding by when at ancher; 5 and 6 are the pian and elevation of the ciearing guide.

The annexed wood-cut represents Mr. Aylen's mode

CAP
872
CAR
caput), literally a head, or chjef officer ; bat the term is used in particnlar to denote an officer holding a certain zank in the arny or the navy. In the army, a captain is the officer who commands a troop of eavalry; or a company of infantry, or of artillery. His full pay in Britioh cavalry regimenta is 14 s . 7d. a day; in the infantry 11s. 7 d . Captains in the Life and Foot Gucrds rank with the colonela of other regiments, and their full pay la 15 s , a day. Captain General, the commander-inchief of an army, or of the militia. Captain Lieutenant is an officer who, with the rank of captain, but the pay of lientenant, commands a troop or company in the name and place of some other person. Thus the colonel of a regiment being uaually captain of the first company, that company is commanded by his deputy under the title of ceptain lleutenant. Cajtain of a ship of war, the officer who commands a ship of the lle or a frigate. Officers who command amaller veesels are called commanders. In ships of the line a commander ls also appointed with the captain; the former is therefore second captain. The charge of a captain in the navy ls very comprehenaive, inasmuch as he is not only anawerable for any bad conduct in the military government, navigation, and equipment of the ship he commands, but also for any neglect of duty or mismanagement on the part of his inferior officers, whose several charges he is appointed to anperintend and reg. nlute. Captain of a merchant ship, he who has tho direction of the ship, crew, lading, etc.
of anchoring a ship during a ealm, when out of soundings, to prevent her drifting when astrong current is running against her.
Sopposing a sbip of from 500 to $\mathbf{6 0 0}$ tons in a calm, with the corrent running three knota againat her, and out of soundings; let go the kedge anchor, having previouly secured two pieces of canvas to it as per figuro, No. 1 and 2 ; veer out 40 to 50 fathoms of 3 to 4 inch hawser; then lower the quarter boat or cutter, and atop the above hawser to the ring in the how and atern of the boat; then veer from the ghip 70 to 80 fathoms on the hawser, between the boat and ship; put on a anatch-block to traverae, with one or two pigs of ballast, to be nsed according to the etrength of the current.
Sapposing that the current at from 40 to 60 fathoms deep is running in a different direction from that of the aurface-as has been frequently observed in clear water at sea-it is prain that a great stranil is taken off the anchor by using the beat, inammuch as the whole atrain would be on the hawser bc, the greater part of which is borne by hawsor $a b$; tinat if the sthip rode immediate at $b$, the whole of the strain being at $b c$, would naturally require a greater weight to hold her; in fact, a bower anchor with $\mathbf{6 0}$ fathome of cable would not be aufficient, beaides the difficulty of again reoovering the anchor.
If the eurface and deep current shouid happen to run in the same direction, the ship would not then separate from the bont; all would drif together. This pinn for anchoring, there is every reason to suppose, will nnswer near the equator, or at any phace at a distance from the main land, but it is not intended for a tide way.-1.. 1.
Captain (Fr. capitaine; It. capitano, from the Latin

Caracas, or Caracoas, the capital eity of Venezuela, South Anserica, department and provinee of Caracas, lat. $10^{\circ} 30^{\prime} 13^{\prime \prime}$ N., long. $67^{\circ} 4^{\prime} 45^{\prime} \mathrm{W}$., on a declivity 2880 feet in elevation, and 16 milcs southsontheast of La Guayra, its port, on the Caribbean Sea. Population estimated from 35,000 to 50,000 . It is regularly built, well supplied with water, and has a heulthy climate. Mean temperature of June $\mathbf{7 2}{ }^{\circ}$, Feliruary $68^{\circ} 2$ Falireuboit. Principal buildings, a eatiedrsi, the fine church of Alte Gracia, and three hospitals. Exports from La Guayra consiat principally of cacao, cotton, indigo, tobacco, coffee, hides, and live cuttie. By the earthquake of 1812, 12,000 persons perished; aince which time most of its houses have been constructed of aun-dried bricks. It is the seat of a university, and the residence of the principal merchunte, on whose account the trate of La Guayra is conducted. It is the hirth-place of Bolivar. The provinee lies between lat. $7^{\circ} 38^{\prime}$ and $10^{\circ} 26^{\prime} \mathrm{N}$., and long. $65^{\circ} 30^{\prime}$ and $68^{\circ}$ W. Area, 2842 square lesguen. Population, 242,888 . Surface partiy mountainoun and partly flat; the former toward the sea-coast, where acvorsl deep inicntations oceur, and form good harbors; the latter in the interior, and on the sonth, where the country atretehes out into vast plains. It jroduces the hest cacao, und anf tropical fruits are grown in perfection. It is divided into 16 cantons.
Carat, the weight which expresses the degree of fineness of gold. The word is also written carvact, carrat, karruet, and karrat. Its origin in contested; but the inost probable opinion is that of Kemnet, who derives it from carecta, a term which anciently denoted any weight, und came afterward to be approprinted to that which expreases the tineness of gold and the gravity of dlamonds. Carata are not real theterminate

## y of Vene-

 rovine of f' W., on a iles southbbean Sea. It is reg8 a healtity , February cathedral, hespitals. of cacae, ive cuttle. perished; been contof a unimerchants, conducted. ree lies be$30^{\prime}$ and $68^{\circ}$ n, 242,888. the former dentations It the interetches out 10, anil all is divided degree of in carract, contested ; nuet, who y denoted printed to the gravterninateweights, but only imaginary. The whole maas, whatever be the weight, is conceived to be divided into twenty-four carats; and aa many twenty-fourth parts as it contsins of pure gold, it is called gold of eo many carats, or 80 many carate fine. Thus, gold of eighteen carats is mixtnre, of which elghteen parts are pure gold, and the other aix of inferior metal. Carat is also a certain waight which goldamitha and jewelers use for waighing preelous stones snd pearla. In this sense the werd is supposed by some to be derived from the Greek кepúrıov; a fruit which in Latin is called siliqua, the carob bean, each of whirh may weigh above four grains of wheat; and hence tbe Latin siliqua has been used for the waight of four graina. This carat weighs four grains; hut they are sometimea lighter than the grains of other weights. Each of these grains is subdivided into $\frac{1}{1}, \frac{1}{1}$, t, $\frac{1}{16}$, etc. Sea Weiraits and Meas-unes.-E. B.
Caravan, an organizad company of merchants, or pilgrims, or both, who associate together in many parts of Aaia and Africa, that they may travel wlth greater security through the deaerta and other places infested with robbers; or where the road is naturally dangerous. The word ia derived from the Persian kervan, or carvin, a trader or dealer.-Shaw's Travels in the Lerant, p. 9, 4te ed.
Every earavan is under the command of a chief or aga (caravan-bachi), who has frequently at his dispoasl suci a number of troops or forces as is deemed sufficient fer its defense. When it is practicable; they encamp near wells or rivulets, and observe a regular discipline. Camels aro used as a means of conveyence, almest uniformly, in preference to the horse or any other animal, on account of their wonderful patience of fatigue, eating little, and subsiating three or four days or more without water. There aro generaliy more camals in a caravan than men.-See Cambl.

The commereisl intercourse of Eastern and African nations has been principally carried on, from the remotest neriod, by meana of caravans. During antiquity, tne products of India and China were conveyed elther from Suez to Rhinoculura, or frem Buasorah, nesr the head of the Parsian Gulf, by the Euphratee, to Babylon, and thenes by Palmyra, in the Syrian desert, to the ports of Phoenicia, on the Medterranean; where they were exchanged fer the European productians in demand in the East. Sometimes, however, caravans set out directly from China, and, oceupying shout 250 days in the jeurney, arrived on the sineres of the Levant, after traveraing tho whole extent of Asia,-Gininon, vol. vii. p. 03. The formation of caravass is, in fuet, the only way in which it has ever been possible to carry on any considerable interual commaree with Aaia or Africa. The gevernments that have grown up in those continents have seldom been sbia, and aeldomer indeed have they attempted, to render traveling practicable or safe for individuals. The wandering tribes of Arabs have always infested the immense deserta by which they are intersected; and those oniy who are enffieiently powerful to protect themselves, or sufficiently rich to purchase an exemp. tian from the predatory attacka of these freehooters, can expect to pasa through territories sutiject to their incursiene, without being exposed to the risk of robbery and murder.
Since the eatablishment of the Mehammedan faith, religious motives, consplring with thoee of a less exaited character, have tended to angment the intercourse between different parts of the Jastern world.
The numerous camels of each earavan are loaded with thoso conmodities of every country which are of emaleat carriage and readiest sule. The holy city is crowded during tise month of Dhalhajjn, eorreaponding to tise latter part of June and the begiuning of Juiy, not only witi zealous devotees, but with opulent merchunts. . fair or market is hold in Maces and its vicinity on the twalve days that the pilgrims
are allowed to remain in that city, which ueed to be one of the best frequented in the world, and continues to be well attended. "Few pilgrims," aays Burckhardt, "except the mendicants, arrive witheut bringing some productions of their respective countries for sale ; and thla remark is applicable as well to the marchants, with whom commerelal pursuits are the main object, as to those whe are actuated by religious zasl; tor, to the latter, the profits derived from seling a fow articles at Mecca diminiah, in some degree, the hesvy expenses of the journay. Tho Moggrebyns (pilgrims from Moroceo and the north coast of Africa) bring their red bonnets and woolen closks; the European Turks, shoes and slippers, hardware, embroidered stnffa, sweetmeats, amber, trinkets of European manufacture, knit silk purses, etc.; the Turks of Anatolia bring carpets, silks, and Angors shawle; the Persians, Cashmere shawls and large silk handkerchiefa; the Afghans, tooth-brushes, called Mesenak Kattary, made of the spongy boughs of a tree growing, in Bokhara, beads of a yeliow soap-stene, and plain coarse shawls manufectured in their own ceuntry; the Indians, the numerous productiona of their rich and extensive region; the people of Yemen, saskes for the Persian pipee, sandals and various other works in leather; and the Africans bring various articles adapted to the slave-trade. The pilgrims are cowever, often disappolnted in their expectations of gain ; want of money makes them hastily aell their little adventures at the public auctions, and often obliges tham to accept very low pricea."-Trarels in Arabia, vol. ii. p. 21.

The two principal caravans which yearly rendezvous at Mecea are those of Damaseus and Cairo. The first is composed of pilgrims from Europe and Western Asla; the second of Mohammedans from all parts of Afries. The Syrian caravan ia said by Burekhardt to bo very well regulated. It is always accompanied by the pachs of Damascus, or one of his prineipal officers, who gives the signal for encamping and starting by firing a musket. On the route, a troop of horsemen ride in the front, and another in the rear to bring up the atragglers. The different parties of pilgrima, diatinguished by their provinces or towns, keep clese together. At night torehea are lighted, snd the daily diatance ia usually performed between three o'clock in the afternoen and an hour or two sfter sunrise on the following day. The Bedouins or Arahs, who earry proviaiona for the troops, travel by day only, and in adrance of the caravans; the encampment of which they pass in the morning, and are overtaken in turn and passed lyy the caravan on the following night, st their own rest-ing-place. The journey with these Bedouins is less fatiguing than with the great body of the caravan, as a regular night'a reat is ebtained; but their bad charneter deters most pilgrima from joining them.

At every watering-place on the route is a amall castic and a large tank, at which the camels water. The caatlea are garriaoned by a few persons, who remain the whole year to guard the provisions deposited there. It is at these watering-places, which belong to the Bedeuins, that the aheikho of the tribe meet the caravan, and receive the accustomed tribute for allowing it to pass. Water is plentiful on the route; the statiens are nowhere more distant than 11 or 12 hours' mareh; and in winter pools of rain-water are frequently found. Those pilgrims who ean travel with a litter, or on commodious eamel-saddles, may sleep at night, and perform the jeurney with little incenvenience; lut of those whom poverty, or tie desire of apeedily acquiring a iarge sum of money, induces to follow the caravan on foot, or to hire theinselves as servants, many die on the resd from fatigue.-Travels in Arabia, vol. ii. p. 8-9. The caravan which sets out from Cairo for Meces is net genurally so large as that of Damascus; and its ronte aleng the ahores of tha Red Sea ia more dangerona and fatiguing, But many of the African and Egyptian merehants and pilgrims asill from Suen, Cos-
seir, and other port on the western shore of the Red Sea, for Djidda, wheuce tha journey to Mecca is short and easy. The Persian caravan for Mecce sets out from Bagdad; but many of the Porsian pilgrims are now in the habit of embarking at Bussorah, and coming to Djidde by, sea... Carevans from Bagdad and Bussorah proceed to Aleppo, Damascus, and Diarbeker, laden with all sorts of Indian, A-abian, and Persian commodities ; and large quantities of European goods, principally of Engiish cottons, imported at Bussorah, are now diatributed throughnut all the eastern parts of the Turkiah enpire by the same means. The intercourse carried on in thia way is, indeed, every day becoming of more importance.

The commerce carried on by caravans in the interior of Africa is widely extended, and of considerable value. Besides the great caravan which proceeds from Nubia to Cairo, and is joined by Mohammedan pil. grims from every part of Africa, thare are caravans which have no object but commeree, which set out from Fea, Algiers, Tunis, Tripoll, and other states on the sea-coast, and penatrate far into the interior. Some of them take as many as 60 days to reach the place of their destination; and as their rate of travaling may be estimated at about 18 miles a day at an average, the extent of their journeys may easily be computed. As both the time of their ontset end their route is known, they are met by the people of the countries through which they travel, who trade with them. Indian goods of every kind form a considerable article in thia traffic; in exchange for which the chief commodity the inhabitants huve to give is alaves. Three diatinct caravens are employed in bringing slavcy and other commoditias from Central Africa to Calro. One of them comea direct from Mourzouk, the capital of Fezzsn, across the Lilyyan desert ; another from Senaar ; and the third from Darfur. Thay do not arrive st atated perioda, but after a greater or less interval, according to tho auccess they have had in procuring slaves, ivory, gold dust, drugs, and auch other articies as are fitted for the Egyptian markete. The Mourzouk caravan is said to be under the best regulations. It ia generally about 50 daya on its passage ; and aeldom consiats of less than 100 , or of more than 300 , travelers. The caravans from Senaar and Darfur used formerly to be very irregular, and were somatimes not seen in ligypt for two or three years together; but since the occupation of the former by the troops of Mohummed Ali, the intercourse between it and Egypt has become comparatively frequent and rogular. The number of siaves imported into Egypt ly these caravana is said to amount at present to about 10,000 a year. The departure of a caravan from Darfur is looked upon as a most important ovent ; it engagea for a while the attention of the whole country, and oven forms a kind of cra.-Bhowne's Travels in Africa, 2ci ed. p. 78. A caravan from Darfur is considered large if it has 2000 cameis and 1000 slaves. Many of the Moorish pilgrims to Mecca cross the sea from Sounkin and Massounh to the opposito coast of Arabia, and then travel by land to Mecca; and Burckhardt states, that of all the poor pilgrima who arrive in the IIedjaz, none bear a more reapectable character for induatry than those from Ceutral Africa.

Caravans are distinguished into heary and light. Camels loatied with from 500 to 750 lise. form a heavy caravan; light caravans boing the term applled to designate those formed of camels under a more moderato load, or perhaps oniy Jialf londed. The mean daily rate at which heavy caravans truvel iu about $18 \frac{1}{2}$ miliea, and that of ligist caravans 22 milica,

The safety of a caravan dependa materialiy on the conduct of the caracambachi, or leader. Niebutir aays, that when the latter is intelifigent and honest, and tho traveler undarstands the language, and is accustous. ed to the Oriental method of traveiing, an excursion through the desert is rarely oithar diaggreeable or dan-
gerous. - But it is not unusual for the Turkish pachias to realize considerabie sums by selling the privilege of conducting caravans; and it is generally belleved in the East that leaders so appointed, in order to indemnify themselves, not unfrequently arrange with the Arabian ahaikha as to the attack of the caravans, and share with them in the booty. At all events, a leader who has paid a large aum for the situation, even if he shouid be honeat, mast impose proportionally heavy charges on the association. Hence the best way in travaling with caravans is, to attach one's asif to one conducted by an active and experienced merchant, who has a considerable property embarked in tho expedi. tion. With ordinary precaution, the danger is then very trifling. It would be easy, indeed, were there any thing like proper arrangements made by government, to rendar traveling by caravans, at lesat on all the great routes, abundantiy secure.-Niesonik, Voyage en Arabue, tome ii. p. 194, ed. Amst. 1780.

No particular formsilites are required in the formation of a caravan. Thoae that atart at fixed perioda are moatly under the control of government, by whom the leadera are appointed. But, generally apeaking, any dealer ia at liberty to form a company and make one. The individual in whose name it is raised is considered as the leader, or cararan-bachi, unless ho appoint some one else in his place. When a number of merchants associate together in the design, they elect a chief, and appoint officers to decide whatever controversies may arias during the jonrney.-For further detaile with respect to caravans, see the Modern Part of the Universal History, vol. xiv. p. 214-243; Roneritson's Disquisition on Anciuni India, Note 54; Reres' Cyclopedic, art. Cararan, most of which is copied from Rovertson, though without a aingle word of acknowiedgment; Buнckuandt's Travels in Arabia, vel. ii. passim; Unquilart on Turkey and its Resources, p. 187,151 , etc.

Caravanserat, a large public building or inn appropriated for tho reception and lodgment of the caravans. Though aerving in lieu of inns, there is thls radical difficrence between them-that, generaily speaking, tho traveler finds nothing in a caravanacral for the use elther of himself or his cattle. He must carry all his provisions and necessurlea with him. They are chiefly built in dry, barren, desert placea; and are mostly furnished with waler brought from a great distance and at a vast expense. A well of water is, indeed, indispenaable to a caravansersi. Caravanserais aro also numerous in cities; where they servo not only as inns, but as shops, warehouses, and even exchanges.

Caraway-seed (Fr. Carii, Cumin des pris; Ger. Keummel, Brodkümmel; It. Carvi), a smail seed, of an obiong and siender figure, pointed at botin ends, and thickest in the middle. It is the produce of a biennial plant (Carum carus), with a taper root like a parsulp, but much amalier. It ahould be chosen Jarge, new, of n good coior, not duaty, and of a at rong agreeable smell. It is priacipaliy used by confectioners. The stem rises from two to three feet in helgit, and produces numerous umbela of smail whitisin or reddish flowera; and each flower is aneceeded by two singlo-scecied capauies, which are the caraway-seeds of commerce. These have a strong poculiar odor, with an nromatic bitter taste, and yield, on distlijation, about 4 per cent. of a voiatife oil, on which their properties depend.

Carboy, a large globular bottlo of green glass, protected by wicker-work; uscd chiefly for hoiding acids and inghiy corrosivo iiquidis. The average capncity of these bottles is 12 gnilions.

Carbunole (Gor. Karfunkel; Fr. Wacarbouhie; 11. Cnraonchio; Sp. Carbunculo; Lat. Carbunculus), a precious stone of tho ruby kind, of a very rich glowing blood-red coior, higisly catcemed by the ancients.See Runy.

Card (Fr, Cardes; Ger. Kardiatschen, Karden, Wollkratzen; It. Cardi; Russ, Bardü; Sp. Cardas), an in-

The stem nd produces eddish flow-ingle-sceded of commerce. an nromatic ut 4 per cent. 3 depend. en ciass, pronolding acids ago capncity
rrboukie; It. culus), a prerich glowing s ancients.-

Karden, IFollridas), an in
strament, or comb, tor arranging or sorting the halrs of wool, cotton, etc. Cards are either fastened to a flat plece of wood, and wrought by the hand; or to a cylinder, wrought by maehinery:-Sce Playino Cards.

Cardamoms (Fr. Cardamomes; Ger. Kardomom; It. Cardamomi; Sp. Kardomomos; Hind. Gujarati elachi), seed capsulea prodaced by a plant, of which there are different species growing in India, Cochin China, Siam, and Caylon." The capsulea are gathered as they ripen; and when dried in the sun, are fit for sale. The small capaulés, or leaser cardamoms, are prodnced by a particular species of the plant, and are the inost valuatle. They should be chosen full, plnmp, and difficult to be broken; of a bright yellow color; a piereing smell; with an aerid, hitterish, though not very unpleasant taste; anil particular care should be taken that they are properly dried. They are reckoned to keep best in a body, and are therefore packed in large chests, well jointed, pitched at the seams, and otherwise properly secured, as the least damp greatly reduces their value. The best enrdamoms are brought from the Malabar coast. They are produced in the recesses of the mountains by felling trees, and afterward burning them $;$ for wherever the aahes fall in the openings or fissures of the rocks, the cardamom plant naturally springs up. In Soonda Balagat, and other places where cardanoms are planted, the fruit or berry is very inferior to that produced in the way now mentioned. The Malahar cardamom is described as a species of bulbous plant, growing 3 or 4 feet high. The growers are obliged to sell all their preduce to the agents of government at prices flxed by the latter, varying from 550 to 700 rupees the candy of 600 lbs , aroirdupois; and it la stated that the contructor often puts an exhanced value on the coins with which he pays the mountaineers; or makes them take in exchange tobacco, cloths, salt, oil, betel-nut, and auch neecssary articles, at prices which are frequently, no doubt, estimated above their proper level. Such a system ought a asuredily to be put an immediate end to. Not more than one hundredth part of the cardamons raised in Malabar are used in the country. They are sent in large quantities to the ports on the Red Sea and the Persian Gulf, to Sind, up the Indus, to Bengal, Bombay, etc. They form a universal ingredient in curries, pillans, cte. The market price, at the places of exportation on the Malabar coast, varies from 800 to 1200 rupees tho candy,-Mnlnuns's Orient. Commerce, sod the valuablo evidence of T. II. Baber, Esq., before Parilament, 1830.

Cardinal Points, in Cosmography, are the four intersections of the horizon with the meridian and the prime vertical clrcle, or North and South, Eust and liest. The cardinal points, therefore, coincide with the four cardinal regions of the heavens, and are $90^{\circ}$ distant from each other. Tho intermediate points are called collateral points.

Cards, or Playing Cards (Du. Knarten, Speelkarden; Fr. Cartes à jouer; Ger. Karten, Spicl Karten; It. Carte da giuoco; Russ. Kartu; Sp. Carras, Napes; Siv. Kort), manufactured of pleces of paste-board, having various devices, and arranged in paeks, gencrally of 52 pleces in n pack and used for playing numerous games.-Sce Playina Canms.

Careening (F. nch Faire abbattre carèner), heaving a vessel down on one pide, hy applying a strong purchase to the inasts, so that the vessel may be cleared from any filh that adheres to it hy breaming. A half careen takes place when it is not possiblo to cone at the bottom of the ship, so that only half of it can be carcened.

Caribbean Bea, that part of the Atlantic Ocean lying between the consts of Central and South Ameries and the islands of Cubs, Haytl, Porto Kico, and the Leeward and Windward Islands.

Caribbee Islands, in its more extended sense, is spplied to the whole of the West Indies; but efrictly

It only comprehends that clnster of lalands atretehing from Porto Rico to the coast of Soath America, and known as the Leeward and Windward Islands.

Carline, or Caroline, a ailver coln current at Naples, worth about 4d. sterling.

Carlines, or Caringes, in a ship, two pieces of timber ranging fore and aft from one beam to another directly over the keel. On these reat the ledgen to which the planks of the deck are fixed. Carline kneea are timbers lying athwart the ship, from the sides to the hatchway, and serving to sustain the deck.

Carmine' (Ger, Karmin; Du. Karmyn; Fr. Cormine; It. Carminio; Lat. Carmintum), a powder of a very beautiful red color, bordering upon purple, and used by painters in miniature. It is a species of lake, and is formed of finely pulverized cochineal. It is very high priced.

Carnelian. See Aartr.
Carpet, Carpets (Ger. Teppiche; Du. Tapyten, Vloer-fapyten; Fr. Tapis; It. Tappeti; Sp. Alfombras, Aleatifas, Tapetes; Russ. Kourni, Kilimi), is supposed to be derived from Cairo (whence also the French Cairan, a Turkey carpet), and from the Latin tapes, tapestry, corresponding to the Italian carpetta and the Dutch karpet. It is lagitimately applied to an article of manufacture used for covering the floors of chambers or spreading on the ground, although, while it wes a novelty in Europe, tables also were covered with it. Carpets and rugs were manufactured at a very remote period in Egypt, India, and China; but those of Persia an-1 Turkey are the most celebrated. They were originally used for sitting and reclining upon, as may still be observed in Eastern countries, where they conatitute the entire furniture of the people. In Egypt they were first applied to religions purposes by the priests of Heliopolis, and were also used to garnish the palaces of the Pharaohs. It was also a custom of antiquity to place them under the couchea of guests at banquets. Sardinian carpets are mentioned by Plato, the comic poet, as being disposed in this manner-" henenth the ivory feet of purple-cushioned couches." The carpets of the EIomeric Age were generally white or plain cloths; but they were also sometimea produced with various colors and embroidered designs. At the supper of Iphicrates, purple carpets were spread on the floor; and at the magnificent banquet of Ptolemy Philadelphus (nn aecount of which is given by Callixenus of Rhodes) we learn that underneath 200 golden couches "were strewed purple carpets of the finest wool, with the carpet pattern on both sides ; and there were handsomely embroidered rugs, very beantifully elaborated with figures. Besides this," ho adds, "thin Persian cloths covered all the centre space where the ghests walked, having most accurate representations of aniinals embroidered on them."-Athenceus, v. 26. The Babylonians, who were very skillful in weaving cloths of divers colors (PLiny, viii. 48), delineated upon their carpets entire groups of human figures, together with such fahulous animals as the dragon, the sphinx, and the irriffin. These were numbered among the luxuries of IIcliogabalus. On the tomb of Cyrus was spread a purple Babylonian carpet, end another covered the bed whereon his body was placed.-Armins, vi. 29. These earpets were exported in conslderable quantities to Greece and Rome, where they were highly esteemed, Carthige was also noted by ilemippus, Antiphanes, and others, for its magnificent carpets.
"Carpets we"e in use, nt least in some kind, as early as the thys c. Amos, ahout 800 n.c.-Amos, ii. 8. Carpets were spread on the ground, on which persons sat who dwelt in tents; but when first used in houses, even in the East, wo have no reeord. In the twelfth century carpets wero articles of luxury; and in Encland, it is nientinned as an instanee of Beeket's splendid style of living, that his sumptuous apartments were every day in whiter strewn with elean straw or hay; about A.d. 1160 . The manufacture of woolen
carpets was Introduced Into France from Persla, in the relgn of Heary IV., between 1589 and 1610. Some artisans who had quitted France in disguat went to England, and establisthed the carpet manufacture about 1750. There, as wlth most nations, Persian and Turkey carpets, especlaily the former, are most prized. The famous Axminster, Wilton, and Kiddernic ser manufacture is the growth of the last hurdred years. The manufacture of Kidderminater and Brussels carpets has much advanced within fifteen yeare, at Lowell, Massuchusette, and Thomsonville, Connecticnt."Hayds.
Sir J. Gardiner Wilkinson gives us an account of an ancient carpet-rug of Egyptiun manufacture. "This rug," he tells us, "is made, like many clothe of the present day, with woolen threads on linen strings. In the centre is the figure of a boy $\ln$ white, with a goose above, the hleroglyphic of a 'child,' upon a green ground, around which is a border composed of red and blue llnes," etc.-Manners and Customs of the Ancient Egyptians, vol. iii. p. 141-2. He further informs us that there are in the Turin Museum some specimens of worked worsted upon linen, "in which the linen threads of the weft had been pleked out, and celored worsted sewed on the warp." In thers two examples we hare evidence of the existence, at a very early time, of a syatem of tapestry-weaving. The anclent carpet manufacture of the Asiatle countries may resolvo itself under the appeilation rif needle-werk. Of this, the present process of carpet-weaving ${ }^{1 n}$ Persla and Turkey, and the tapestry manufacture oi France, may be considered aa fitting examples. The tapestry, as is weil known, consists of woolen or other thresda sewed on the strings of the warp by means of smali shuttle-needles. The Persian carpet is formed by knotting into the warp tuft after tuft of woolen yarn, over ench row of which a woof shot is passed, the fingers being hers employ ed Instead of the shuttle-needles, as the fubric is of a coarser description. In both methods the principle is the same. Both are fermed in leoma of very simple construction, the warp threads are arranged in parallel order, whether upright or horizontal, and the fabrle and pattern are produced by colored threads, hand-wrought upon the warp. This may be designated the hand-wrought or needle-work method, which only nakes one stitch or loop at a time, in contradistinctlon to the machine-wrought process, the result of meehanical appliances, wheroby a theusand stitches are effected at once. Herein lies the easential difference between the nncient and modern, the simple and complnx carpet manufacture.
rersia.-In Persla there ere eutire tribea and families whose enly occupation is that of carpet-weaving. These dispose of their productions at the bazars to native merchunts, who remove them to Smyrns or Constantinople, where they meet with European purchasers. The trade in real Persian carpeta is, however, very limited, owing to their small size. They are seldom larger than hearth-rugs, long and narrow. Very many of them, moreover, are considerably tarnished by exposure in bazars, if they have not indeed been already used. To render them more salable they are cleaned. Thls is done by cropping the surface, which in some cases is shaved quite close to the knet; hence a great proportion of those brought to this country have not their originai richness and depth of pile. Felted curpets or nurmuds are alse made in Persia, but do not constitute an export commodity. SIr Henry Bethune, late Perslan embassader, hail in his pessesslen a very singular specimen of this felt carpeting, in which colored tufts of worsted had been Inserted durIng the process of manufacture, producing a regular pattern when finished.

Turkey.-The greuter part of those Turkey carpets imported Into Western Europe are manufactured at Usaisk or Ouchsk, in the province of Aldin, about six days' journey from Smyrna, and ruge princlpally at

Kulah or Koula, an adjacent village. In the provincen of Hoodavendignlar, Adana, and Nish, numerous householda are employed in their production, as also in the districts of Bozah, the city of Aleppo, and the villages of Trebizoud. Here and there, throughout Caramania, anch carpete are also made. The Turco mans of Tripoll, the women of Candla, and the peasantry of Tunla and Algiers, are likewise engaged In their fabrication. In none of these places, however, does any large manufactory exlat ; the carpets are the work of familles and households. These carpets are woven in one plece, and there is this notable pecullarity in their manufacture, that the same pattern ls never again exactly reproduced; no two carpete are quite alike. The patterns are very remarkable, and their origln is unknown even to Mussulmans. The Turkey carpet pattern represents Inlald jeweled work, which accords with Eastern tales of jewels and dlsmonds. If thls were rightly understood, it would prevent such speculations as these of Mr. Redgrave in hir Great Exhibition Report on Design, where he remarks, that "the Turkish carpets are generally designed with a fuct berder of fiowers of the natural size, and with a centre of larger forms conventionalizen in sems cases even to the extent of obscuring the forms-a fault to be aveided." This is doubtless a very ingenleus mede of aecounting for the curlous forms of a Turkey carpet ; but these, hewever fantastle, are never obscured, nor are there any flowers, flat or otherwise, tn the borders or elsewhere. The great beauty of these carpets lies in the equal balance of color, of dull nexitrul shades, some what sembre in effect.
India.-Generally throughout British India the carpet manufacture is carried on. At Beasres snd Moorshedebad are produced velvet carpets with gold embroidery. A very elaborate carpet, sent from Cashmere to the Great Exhibition by Maharajnh Goolab Singh, was composed entirely of silk, and excited great admiration. In every square foot of this carpet, we are informed, thero were at least 10,000 tles or knots. Silk emlroidered hookah carpets are made at Lahore, Mooltan, Khyrpoor, Tanjore, and Bengal; cotton carpets, or satrunjees at Rungpore, Agra, and Sasserum; printed cotton carpets at Ahmedabad; printed floor-cloth at Mlooltan. Woolen carpets are far mere extensively manufactured; seme of which come from Ellore, Mirzapore, and Goruck pore; but the prineipal manufacturs is at Masulipstam, 292 miles north from Madras. There the capital and enterprise of Great Britain have lent their ald to the rather tardy movements of the natives, and this artlele is new in general demand. Of late years llnen warp laa been introduced instead of cotten, and the faliric is therely much improved. The deslghs of the Indian carpets have more regularity than those of Turkey, and the colers are moatly warm negatives, enlivenef with brilliant hues Interspersed. For the Introductlon of Masulipatam carpets, as of msny others, the English are indebted to the firm of Watson, Bell, \& Co., whoso Indian connection is the sole means of obtaining these beautful fabries.-EE. B.
The total value of Persian, Turkey, and Indian carpets imperted into England may be computed at about $£ 20,000$ per annum.

Oriental carpets were first introduced into Spsin by the Moors ; end at a later date the Venetlans inported them Into Italy, and supplled Western Europe with this luxurious manufacture. We have frequent mention of them during the Middie Ages, and their costliness and magnifficence are celebrated in the illuminated puges of fabliaux and romances. They were sprea. In the presence-chambers of royaity, before the high altars of chapels and cathedrals, in the bowers of " ladyes faire," and on the summer grass. Many artlcles of furniture were also covered with them-heds, couches, tables, and regal faldestels; but here it becomes difficult to distingulsh between carpet and tap-

estry, both boing naed promiscuously. Tapestry of Buldekine or Baldachine (from Baldak, ancient name of Bagdad), was a carpet inwronght with geld and siiver threads. Such were carried on poies, and uplifted as a canopy over the host, and over great personages in procesaion. The troubedoure had carpets of gold embroidery which they laid upon the grass beneath them. Hearth-rugs and throne carpets, gorgeously embiazoned with heraldic ceatre-piecee, were the handiwork of high-born dames during the romence period. To some of these were attached frlages, but such were mere usually composed of the fag-ends of the warp, like those of Persia, India, and Turkey. A biack veivet carpet, "fringed with silver and goid, and lined with taffeta," is enumerated In the inventory of Archbishop Parke's househeld furniture'in 1577. Rushes were strewn on the floor of Quer.a Mary's presence-chamber, and that of Eiizabeth had the additional covering of a Turkey carpet. Long prior to this, however, Eastern carpets had been introduced. In the reign of Edward V1. we read that before com-munion-tabies were placed
"Carpeta full gay,
That wrought wore tn the Orient."
Checisered matting appears to have been very generaliy used about the fifteenth century. The samo articie is produced in many parts of Asla from the grassy fibres of tite ratan. $\boldsymbol{A}$ superior description is now mude from cocea-nut fibre and Manillan flax. In Lydgate's metrical lifo of St. Edmund (MS. Harl. No. 2278 ) is a representation of the room wherein that saint was born; the floor is covered with checkered matting, and a fringed hearth-rug of Gothic design is before the fire-place. Carpets composed entirely of leather strips interlaced together may be seen in our antiquarian museums, A sample of this cescription was iately prepared for the inapection of the new houses of Parilament, and offered as a covering for their halls and passages, but was rejected.

F'rance, -in the reign of Henry IV, the carpet mp.asfacture appeare to have been introduced from Persia into Frunce. Coibert, the miniater of Louis XIV., established the manufactory at Beuuvais in 1664 , which is now in the hands of the French government, and produces very artistic specimenp. A variety of these, "in Turkiah, Peruvian, aid Chinese btyics," was exhibited in London in 1851. The national manufactory of Gobelins, which likewise sent its beautiful carpets and tupestry to the great exhibition, was established shortly after that of Beanvaia. It was purchased in 1677 ly Colbert from the Gobelin family, whose progenitors, a century ago (Gilles and Jean Gebelin), brought their art, as was supposed, from Flanders. An attempt was made, in the time of Henry ViIt., by Wiiiiam Sheidon, to start this manufuctare in Engiand; but under the patronage of James I. it was more succesafully establiahed, with the superintendence of Sir Francis Crane, at Mortlake, in Surrey, where both carpets and tapestry were produced. Toward this object the sum of $£ 2676$ sterling was contributed by its royal patron, and French weavers were brought over to assiat. But it does not appear that any thing considerable was effected until afteit the revocation of the edict of Nantea $\ln 1685$, when articans of every trude fled to England, among whom were tapestry and carpet weavers, who settled in vilous parts. Abeut the year 1750, Mr. Dloore was awarded s premium by the Society of Arts for the best Imitation Turkey carpets; and Parisot conducted an nstabs lishment for their mnuufacture at Paddington, under the patroage of the Duke of Cumberinnd. Suisequently, carpets were wrought on the same principle at Axminster, in Devonahire, whence the name; and afterward at Wilton, where they are still manufactured. The board of trustecs for the encouragement ef arts and manufactures in Scotland offered prizes for the best Perslan and Turkey carpets. About ninety
years previously they had been made in the vicinity of Holyrood Palace. These expensive and magnificent carpets are now made in many parts of Europe, hut more particuiarly at the Gobelins manufactory, at Aubusson and Fellitla, In the department of Creuse, at the mannfacture royal de tapis de touruai in Belgiam, and at Deventer in the Netherlands. They are ulso made in London and Kidderminster.

Hitherto we have been treating of the simple handwrought or needle-work process, which implies great expense and waste of time and iabor, and is therefore not calculated to snppiy a general demand. The ma-chine-wrought fabric now ciaims onr attention; and first in arder, the common ingrain, Kidderminster, or Scotch carpet, which is mado in many parts of Scotiand, the north of England, and in the United States. This consists of worsted warp traversed by woolen weft, and is woven in pieces about a yard wide. It is composed of two distinct welss interlaced together at one operation, and is therefore a double or two-ply carpet, similar on either side. In this artiole only two colors can with propriety be introduced, as otherwise it has a striped or mixed appearance. A pure or plain color can oniy be obtained where the weft traveraes the warp of the aame color. Suppose a orimson figure on a maroon ground; the one web is maroon, the other is arimson, and the pattern is produced ly theso intersecting and decussating each other at points predetermined; thus what is crimson on one siue is maroon on the other, and vice rersa. One beam contains the warp of both pliea, arranged in two tiars, which is passed through the mails or metalic eyes of the harne日s-two threada through each eye-and thence through the reed. The harnese drawe up certain warp threade, to admit of the pasage of the ahnttie with the weft, the pattern depending upon auch warp threada as are so drawn : Th. This was formerly effected by means of a tevolving barre!, whose surface was studded with pins, which by retatic.e a cied upon the warp threads. These studs being arranged so at to produce one pattern, a separate berrel, or a new arrangement of the atuda, was requiaite for every other pattern. But this machine is now superseded by the more efficient Jacquard apparatus, which produces the pattern by means of an endlesa chain of perforated cards working against paralicl rowa of needles. This double fabric is also made in France, and apriga of divera colors inserted. A detalied account of this process, with elsborate diagrams, is given by M. Roland de la Platiere, in the Encyclopedie Methodigue. An improvement upon the Kidderminster carpet is the triple or three-ply fabric, the invention of Mr. Thomaa Morton, of Kilmarnock. This is composed of three distinct webs, which, by interchanging their threads, produce the pattern on both sides. A variety of color is thus obtained, and the texture is of great thickness and durability. Fignred Venetian carpeting is of aimilar description; here the woof is compietely covered by a heavy body of. warp. Dutch carpeting is much Inferior in quality, and was originaliy made of cow-hsir, but now of the coarsest wooi. Neither fabric has great capabilities of design; simple diced patterns are wrought in the Venetian, at: 'pes and checkers in the Dutch.

The Brusseis carpet is a very superior texture. It is composed of worsted and linen, and has a rich corded appearance. The figures are raised entircly from the warp, by inserting a serics of wires between the iinen foundation and the superficial yarn. These wires are afterward withdrawn, leaving a looped surface. In this manufacture there is a great waste of material, and the colors are usually limited to five. Each color inas itz continuous layer of thiread, running from end to end of the web, which rises to the surface at intervals indicated by the deaign, and then ainks into the body of the fabric. Thus there are flve layers or covers, only a fifth part of which is visible; and owing to the lrregularity of their ascent to the surface, they can
not be placed upon ano bean, but esch thread is wonnd on a aeparate bobbin, with a weight attached to give a proper tenaion. These boblins are arranged in five framer juttiog ont behind the loom, two hundred and sixty bobbina in each frame for the ordinary width. Additional frumes are requiaite for additional colors introduced; but where more than flive are engaged the pattern ia rather indiatinet. The threads of all the bobbine are then drawn through the harnese, heddlea, and reed, to unite with the linan yarn in the compound fabric, the inequard machine being employed to produce the pattern. Brussela carpets were first introduced into Wiiton about a century ago, from Tournai, in Belgium. Kidderminater is now the chief aeat of this manufacture, where upward of 2000 looms are in operation.

Moquette or Wilton curpeta are woven in the same manner, and differ only in this, that the loopa are cut open into an clastio vejvet pile. To effect this, the wires are not circular as in the Brussela fabric, but fiat, and furnished with a groove in the upper edge, wherein the aharp point of a knife is inserted and drawn across the yarn, cutting the pilc. These carpeta, besides being manufactured in many parts of England and Scotland, are also made in Frauce.

Recent Improvements.- We now proceed to deacribe a very ingenioua improvement in this branch of carpet manufacture, the invention of Mr. Rielsard Whytock, of Edinburgh. This is a combination of the arts of printing and weaving, at the same time simplifying beth. These arts may be said to be combinced when any woven faluric is primed; but hero the process is reversed, the threada : ging printed before they are in cloth. This, to be sure, is the case when warps are printed and then woven; but the grand novelty of this invention is that the threads are printed beforo even the sarp is formed. One thread, or two treated as one, in some cases milies in length, are colored by steps of half an iach, faster than a swift runner would make the distance. When these threads have been all particolored in this manner, they form the elements, as it were, of the intended deaign or fabric. Singly, they exhibit no regular figure or pattern; but when arranged in their proper order, ready for the weaver's beam, the figure comes into view, much elengated of course, inasmuch as eighteen feet of the warp will sometimes be gathered into four feet of cloth, in order to secure the due propertions of the intended object. It has been said that the two combined arts of printing and weaving are aimpilifed by this contrivance. With regard to the weaving: First. The loom occupies only one-third of the space in length that the Brussels loom requires. Second. The latter must have 1300 little beama or bobbina, from which the werated pile has to be gathered; wherea3 this toom requires only one beam for the whole of the worsted threada. Third. While the Brussels or Wilton, on a wels of twenty-seven inches, requires for the best fabric 2860 threads, only 780 are here requisite-one layer instead of five-to produce an good or a better surface. Lastly. While the number of colors in auccession tengthwise, on the ofd principle, must not exceed six or seven, upward of twenty er thirty can be introdnced by the new method. Then, again, as a aimplification of the printing process: whereas formerly a change of blocks was required for every change of pattern, in thia new process the same blocks serve for all patterns, as the pen serves for every form of type. Nany of those manufacturers who are now availing themselves of this invention do not see wherein its true economy consists. If an object, say a rosebud, recurs a thonsand times in the length of a web, at inter/ala of four feet, the block printer must apply hio ziock a thousand times to point the opening bud; but here the huds are congregated, so that one stroke may dye them all. If it be desired to have a thousand buils in the length of the web, let a thread be wound reund a hoilow cylinder a thousand timea, and a trav-
ersing wheel charged with color be passed acroas ithe coil. The threai, when uncoiled, will be found to be marksd in a thouand places, exactly where it is wanted to tip the opening bud with red from end to end of the web. Deaign-paper, whereon the pattern is indicated in amall squares, eerves as a guide to the printer; each aquave being one atroke of the color-pnlley. After the threada are thus atreaked ncrose with color, they are removed from the cylinder or drum, and the dyea are fixed by the action of ateam. The threads are then arringed in setting-frames, according to the squares of the deaign-paper, to conatitnte the warp of the projected web. The Jacqua. . a now so far at a discount, and the loom restored to nearly the same simplicity as of old, when
"Between two trees the web was linng."
The principle here referred to is only in ita infancy. The workr of the first masters may yet he multiplicd by this process, if they will condescend to furnish the cartoons. Already flowers are produced which the betaniat can clasaify withent mistake.

Like cvery other improvement, this invention met with considerable opposition, particularly en the part of manufacturers and dealers. During the first fourteen years, the number of looms employed gradualiy increased from one to fifty-six, the greatest number in operation at Lasawade in 1847. Now, so extensive is the manufacture in England, that one house preduces to the extent of half a million sterling per annum, having upward of thres hundred loonss at werk by steanpower. It is gratifying to learn that these pewerlooms, instead of thro sing out of employment, engage more operstives with letter wages and easier work. Messrs. IIenderson and Widnell of Lasswade, John Crosstey and Sons of Ilalifax, Pardoe, Hoemans, and Pardoe of Kidderminater, and Sutherland and Ted of Lanark, are the principal manufacturers engaged upon this patent. An extraordinary consequence upon the introduction of this article is that it has not interferel with other branclics of the carpet manufacture, not one of which appears to have been diminished. There is, therefore, an addition to the trade of the conntry, to the whole amount of its prodace, itself no mean result; the whole trade being at least donbled. as fir ns fine carpets are concerned. Whytock's carpets are known under the designation of Patent Tapestry and Velvat Pite Carpets. Rugs, table-covers, fine velvets, and tapestry hangings, are wrought on the same principlc.

Another great improvement in carpet-making, which originated also in Scotland, was patented hy Mr. James Templeton, of Glasgow. It is on the chenilite principle, and consists of a process of double weaving. First a thin striped fabric is made; rand this, when cut up, is again woven inte a denser fabric for carpets, rugs, and table-covers. The ehenille atripes, like the parti-colored threads in Whytock's invention, form the elements of the second fabric, only these clements go to compose the woof instead of the warp, as in the former case. Extremely beautiful carpets have been made on this pr. iple, and these being woven in large squares, have interfered much with the Tournai or Axminster carpets, having the same depth of pile, withont being 80 expenalve. Hitherto, however, the manufacture has been confined to the place where it originated.

Patent woel mosaic is another novelty. This mnnufacture was introduced into England frem Germiny. It is produced by cementing with caoutchoue $n$ close velvet pile on a plain cloth. "Messrs. John Cressley and Sons of Halifax have brought out some ndmiralile specimens of this mesaic-work, in carpets, rugs, and hangings for walls; but as yet this method has teen more oxtensively applied to the manufacture of small articles. A very cheap description of carpet is now made near Manchester. It is first woven in plain colors hy ateam-power, under Scivier's patent, by Bright \& Co. It is then printed with colored blocks ly machinery patented by Burch \& Co. This article has a gier work. sde, John nans, and nd Tod of aged upon upon the interferell c, not one There is, ountry, to an result; far as tine re known mi Velvet , and tapneiple. ng, which Hr. James prineinle,

large export sale. T The carpet menufecture is rapidly increasing in Great Britain. Upward of 6000 looms, It is computed, are now in operation, upon every description.

It remaine to spesk of earpet design. This matter is regulated by prevalling fashion and caprise, under the ever-varying semblance of good taste. There are revolutiona in decorative art as in ali things eloe, and ia these carpet design is involved.- An acute observer can discover here aymptomatic Indicationa of national or individual character. The supremacy of Gothic architecture, in our day, implles the revival of mediseval art. Simple ornamental deaigns, in quict and subdued coloring, are now about to take the place of their
L..ure brilliant predectasors. Many colors will only be tolerated in Moorish and Arabesque ornament, or in the bizarra Turkey carpet.-E. B.
The production of carpets is carried on extensively in the United States, especialiy in Massachusetts, Rhode Island, Connecticut, New York, and New Jersey. In Mussachusetts alone, in 1850, the capitsi invested in this branch of business amounted to $\mathbf{2 , 2 0 4 , 0 0 0}$, and the annual product about $\$ 1,400,000$, in wh'ch 1600 persons were employed. Oar manufacture of carpets is increaslag, and will probably equal the demand when the production of wool shall supply the wants of our manufacturers. Of the imports into this country fuily nine-tenths come from Great Britain.

Carriages.". The invention of them is ascribed to King's Bench on a case of this sprt, Lord Mansfield Ericthonius of Athens, who produced the first chariot said: "A carrier, by the nature of his contrect, obliabout 1486, n.- Carriages were known in France in the reign of IIenry II. A.D. 1547; but they were of very rude coustruction, and rare. They seem to have been known in England in 1555; but not the art of making them. Close carriages of good workmanship lregan to be uaed by persons of tha highest quality at the close of the ei ateenth century. Henry IV. had one, Lhut without straps or aprings. Thelr construction was various: they were firat made in England in the reigu of Elizaleth, and were then called whirlicotes. The i)uke of Buckingham, in 1619, drove six horses; and the Duke of Northumberland, in rivalry, drove eigit. They were ilrat let for hire in Paris, in 1650, at the IIotel Fiacre; and hence their name.- IIaydn. Premiume at tha World's Fair held in London were given to the makers of carriages in the United States, as tiey were superior in lightness and strength, with an equal finish. New York carriages are very celebrated.
Carriers are persons undertakling for hire to carry goods from ona piace to another. Proprietore of carts and wagons, masters and ownere of shipa, hoymen, lishterncu, bargenen, ferrymen, etc., are denominated common carriers. The master of a atage-coach who only carries pasisengers for hire is not llable for goods; but if he undertake to carry goods and passengers, then he is liahie for both as a common carrier. The post-muster-gencral is not a carrior in the common acceptation of tise term, nor is he subjectod to hie Habilitien.
Duties and Liabilities of Carriers.-Carriess are bound to receive and earry the goods of ail persons for a reasonable hire or reward; to take proper care of them in their passage; to deliver them asfely, and in the same condition as when they were received (exceptiag only such losges as may arise from the act of God); or, in defailt thereof, to make compensation to the owner for wiatever loss or damage the goods may have received while in their custody, that might bave been prevented. Henco a carrier is liable, though he be robired of tine goods or they be taken from him by irresistibie force; and though this may seem a hard rule, yet it is the only one that could be safely adopted; for if a carrier were not llable for loases unless it could be ahown that he had conducted himself dishouestly or negligently, a door would he opened for ev.'y species of fraud and colluaion, inasmuch as it would be linpossible, in most caece, to ascertain whether the facts were ouch as tho carrier represented. On the sams princlple a carrier has been held accountabie for goods accidentally consumed by fire whils in his warehouse. In deliveriag the oplaion of the Court of
ges himself to use all due care snd diligance, and is answerable for any neglect. But there is something more imposed upon him by custom, that is, by the common law. $\boldsymbol{A}$ common carrier is in the nature of an insurer. All the casep ahow him to be so. This maken him liable for every thing except the act of God and the king's enemiss ; that is, even for ineritable accidents, with ticse exceptions. The question then is, What is the act of Gods I consider it to be laid down in opposition to the act of man; such as lightning, storms, tempests, and the ilke, which could not happen by any human intervention. To prevent litigation and collusion, the law presumes negligence excapt in those eireumatances. An armed foree, though ever so great and irresistible, does not excuse; the reason is, for fear it may give room for collusion, which can never happen with respect to the act of God. We all, therefore, are of opinion that there should be judgment for the plaintiff."-Forward v. Pittcrd, 1 T. R. 27. A carrier is not obliged to have a new carriage for every journey; it is sufficient if he rovido one that, without any extraordinary accident, may be fairly preaumed capahis of performing the journey. A carrier inay be disciarged from his liability by any fraud or concealment on the part of the individual emp'oying inim, or of the baiier; as if the latter copresent a parcel as containing things of little or no vulue, when, in fact, it contains thinge of great value. But when the carrier has not given a notica limiting his responsibility, and when he puts no queations with respect to tho parcel to the beiler, the latter need not say any thing with respect to it; ard though the bailer should represent the thing dellivered to tha carrier as of no valne, yet, if the latter knovo it to be otherwise, he will ibe reaponsible in the event of its being lost or damaged. If the bailer deliver goods imporfectiy packed, and the carricr does at perceice $\dot{i}$, he is not liable in the event of a loss occurring; but if the defect in the paekage were such that the carrier could not but perceive it, he would bs liabie. On this principle a carricr was made to anawer for the loss of a greyhound that had been improperly secured when given to him. A carrier may refuse to admit goods into his warehouse at an unseasonuble time, or before he is ready to take his jouruey; but he can not refuse to do the ordinary duties incumbent on a person in his situation. It is felony if a carrier open a parcel and take goods out of it with intent to ateal them; and it has been decided that if goods he delivered to a carrier to be carried to a specitied piace, and he carry them to a different
siace, and diapose of them for his own profth, ha is guilty of felony; but the emberzlement of goods by a carrier without a felonious taking merely exposes to a civil action.

A carrier is always, unlees thare be an exprees agreement to the contrary, entltied to a reward for his care and trouble. In some cases hila reward la regulated by the Legislature, and in othera by a apeclal stipulation between the parties; but though there be no legislative provislon or express agreement, he can not claim more than a ; vasonable compenaation.

Commencement and Termination of Liubility,-A carrler's liablility commences from the time the goods are actually delivered to him in the character of carrier. A delivery to o carrier's servant le a delivery to himself, and ho will tee responsible. The delivery of goode at an inn yard or warehouse, at which other carriera put up, lo not a delivery so as to charge a carrier, unless a special notice be given him of their having been so delivered, or some previons intimation to that effect.
"In New York it was held that placing goode on the wharf without notice to the consignee is not a deIlvery to the consignee, so as to diacharge the carrier, even though there was a usage to deliver goods in that manner. The carrier must not leave or abandon the goods on the wharf, even though there be an insbility or refusal of the conaignee to receive them."Kent's Commentaries.
A carrier'a liability ceases when he vesta the property committed to his charge In the hands of the consignee or his agents, by actusi dellvery; or when the property is resumed by the consigner, in pursuance of his right of atopping it in tranritu. It in in all cases the duty of the carrier to deliver the goods. The leaving goods at an inn is not a sufficient delivery. The rule in such cases, in deciding upon the carrier's liability, is to conalder whether any thing remains to be done by the carrier, as auch; and if nothing remains to be done, $b^{2}$ liability ceasea, and conversely.

A carrier has a lien upon gooda for his bire. Even if the gooda be atolen, the rightful owner ls not to have them withent paying the carriage.

Fer further details as to this subject, see Jearemy on the Lave of Carriers, pasuim; Chitry'e Commercial Law, vol. iii. p. 369-486; Buans' Justice of the Peace, title Carriers; and Kent's Commentaries, Lect. XL. There are some excellent observatione with reapect to it in Sir Wilhiam Joneg's kimay on the Lavo ('Bail-ments.-For en account of the regulations as w the conveyance of passengers in stage-coaches in England, ses M'Culloch's Dictionary.

Carrot (Duucus carota, Llnn.), a biennial plant, s native of Britain. Though long known as a garden plant, its introduction into agriculture has been comparatively recent. The uses of the carrot in domeatic economy are well known.

Cart, a carriage with two wheele, drawn commonly by horses, and used to carry heavy goods, etc. The word seema formed from the French charrette, or the Latin carrela, s diminutive of carrus. Curts of War, a peculiar kind of artillery anciently in use ameng the Scotclı. In an act of Parliament, passed in 1456, they are thue deacribed: "It in thought speidfull, that the king may requeist to certain of the great burrous of the land that are of ony myght, to mak carta of weir, and in ilk cart twa gunnia, and ilk ane to have twa chalmers, with the remnant of the graith that effeire thereto, and an cunnand man to shute thame." By another act passed in 1471, the prelatee and barons are commanded to provide auch carts of war againat their old enemies the English.-E.B.

Cartagena (Carthogo Nowa, or "New Carthage," it having been a principal colony of the Carthaginiane), a celebrated city and sea-port, and the chief naval arsenal of Spain, on a noble bay of the Mediterranein, province, and 27 miles south-woutheast of Murcia. Lat.
$87^{\circ} 36^{\prime} 5^{\prime \prime}$ N., long. $0^{\circ} 566^{\prime \prime} \mathbf{~ W . ~ P o p u l a t i o n ~} 27,787$; In 1786 it contained 60,000 inhabitants. It oceupies the declivity of a hill, and a small plain extending to the harbor, which in one of the best in the Mediterraneen, and protected from all winda by surrounding heights, and by an ialand on the south, which, at well an the city, la strongly fortified. The city, though dull, dilapidated, and unhealthy, owing to an adjacent awamp, has some good atreate and houses, numerous churches and convents, a marlne achool, lurge royal heapital, foundling hoapital, to wn-hall and cuatom-houee, observatory, theatre, circus, etc. In its westarn diviaion, an arsenal, docks for building man-of-war, and a bagme for galleyslaves. Ita port communicatea with the Segura Hiver, by tho Lorca Canal. Its manufactares of cordage and canvas, with trado in barilla and agricultural produce, bave decayed, hut it atill has a valuable tonny fishery, and a glase factory recently established by an English house; and in 1848, 14 new smeltlng works had been set up bere. The minea of Cartagena, criginally wrought by the Carthaginians, were re-discovered a few years agn; and in 1839 the new mine of La Carmen was opened succesafully by a joint-1 sck company. Since then, drainages and mining have proceeded vigorously. Cartagena was taken by Scipio b.c. 208, at which period Livy states that it was one of the richest oities in the world. It was ruined by the Gotles; and its modern importance dates only from the time of Philip II.

Cartagena, or Carthagens, a strongly fortified city and eea-port of Now Granads, South America, of which repablic it ia the chief naval arsenel, capital of ths provinco, on a sandy peninaula in the Caribbean Sen. Lat, of the dome $10^{\circ} 25^{\prime} 36^{\prime \prime} \mathrm{N}$. , leng. $75^{\circ} 34^{\prime}$ W. Population 10,000, nine-tentha of whom are a mixed black race. It is well laid eut, and built mostly of atone. It has a massive citsdel, several churches, a college with about 200 pupils, various seminaries, and two hospitals. The tempersture is very high, from $80^{\circ}$ to $86^{\circ}$ Fahrenhelt, but the air dry and healthy. Its excellent port is defended by two forts, and is the only harbor on the north coast of New Granada adapted for repairing vessels. Cartagona in the principal depot for the produce of the provincea watered by the Cauca and Magdalena Rivers, and la cotinected with the Magdaleus by a cenal. It exporta sugar, cotton, coffee, tobacco, hides, apecie, hullion, etc. Under the Spaniards, this city was the seat of a captain general, and of one of the three tribunals of the Inquisition in America. It was the first town that proclaimed independence, and in 1815 endured a most vigorous siege, and was subdued only by famine. Population of the province, 108,783.

Cartaldge, in the military art a case of pasteboard or parchment, holding the exact charge of a fire-arm. The cartridges for muskets, carabines, and pistola, contain both the powder and ball. Thoee made for cannon and mortars are cases of pasteboard or tin, sometimes of wood; and simple flannel laga have been found convenient In practice. Cartridge-bor, a case of wcod or turned iron, covered with leather, with celle for holding a dezen or more cartridges. It is worn upon a belt thrown over the left shoulder, and hanga a little below the pocket-hole on the right side.-E. B.

Carving. We have Scriptural authority for it early ir roduction.-See Exodus $x \times x i$. The art of carving is firat mentioned in profene history 772 n.c., and ls referred to the Egyptians. It was firat in wood, next in atone, and afterward in marble and brasa. Dipcenus and Scyilia were eminent carvere and sculptors, and opened a acheol of atatasry, 568 n.c.-Pisiny. See articls Wood. Carvers of meat were called by the Greeks deribitares, as mantioned by Homer.Haydn.

Cane, In Printing, a large, flat, oblong frame or box, placed aslope, and divided Inte nameroua little square compartmente, each containlng a number of
typen the P matte
types of the same kInd, whence the cempositor takes the particular letters he requires in composing his matter.
Case-hardoning, the prosess of converting the superficies or outer part of iron into steel. This is effected by placiog the artiele in a box with some animal or vegetable eharcoal, and exposligg it to a red heat. It diffirs only from the making of stecl in the aborter duration of the process. Iron tools, etc., when thus treaterl, combine the toughness of Iron with the hariness of steel.
Cash, in Commerce, means the coln, bank bills, drafts, bonds, and all immediately negotiable paper in an individual's possession.

Cash Aocount, in Book-keeping, an account to which nothing but cush ls earried on the oue hend, and from which all the disbursements of the concern are drawn on the other. The balance is the cash in hanl. When the credit side more than belances the deblt or disbursement side, the account is anid to he in cash; when the contrary, to be out of cash. Cash account, in Banking, is the name given to the account of the advances made by a banker in Scotland to an iadividual who has given security for their repayment.

Cashew-nute (Ger. Akajunüsse, Westindische A nakarden; Du. Catajuenooten; Ir. Noix d'acajou; It. Acyu; Sp. Nueces ducaju; Port. Nozes d'acaju), the produce of the A narcardium occidentale. They are exterouliy of a grayish or brownish coler, of the shape of a kidney, somewhat convex on the one side, and depressed on the other. The shell ls very hard; and the kernel, which is sweet and of a very fine flevor, is covered with e thin film. Between this and the sheli is lodged a thick, blackish, infiemmatle oli, of such a caustic auture in the fresh nuts, that if the lips chance to touch it, wlisters immediately follow. The kernels are used in eooking, and in the preparation of chocolate.
Cashier, a eash-keeper; he who receives and pays the delits of a society. In the generality of founda tions the cashier is calied treasurer. In a banking iastitution the cashier is the officer who superintends the books, payments, and receipts of the bank. He also signs or counteraigns the notes, and superintends ail the transactions uader the order of the ilirectors.
Canhmore, a kingdom in Northern Inciia, so called from its principal division, the celebrated valley of that name, and comprehending within its limits the various territories which constitute the dominions of Gholab Singh. Its boundaries are, the Kar: ;orum Mountalns on the north; Thibet on the east ; the British possessions of Spiti, Lahoul, and the Punjaub on the sonth; and the II uzareh country on the west. It extenda from lat. $32^{\circ} 17^{\prime}$ to lat. $36^{\circ}$, and from long. $73^{\circ} 20^{\prime}$ to long. $79^{\circ} 10^{\prime}$; Its extreme leng th from east to west belng 350 miles, and its breadth about 270 . Area about 25,000 square miles. The population has been estimated at 750,000. Within its limits are included the valley of Cashmere, and the provinces of Jamoo, Ladahk, IBulti or Iskardoh, Chamba, and some others. Cashmere hae been long famed for the manufacture of shawla, which are distributed all over northern and western Asia, and are exported in great quantities to Europe. These shawls owe their peculiar beanty and fine texture to the wool which is brought from Thibet, lying at a distance of a month's journey to the northeast. The wool forms the inner coat with which the goat is covered, and the breed is peculiar to Thibet; all attempts to introduce It inte India or Persia having invariably failed. The wool, which is originally of a dark gray color, is Dleached in Cashmere by a preparstion of rice flour. The process of manufacture is very slow, not more than one inch being adcied to the finest shawis in the course of a day. It is estimated that about $\mathbf{1 6 , 0 0 0}$ looms were at one time employed in this manufacture; but of late years the demand has declined, owing to the decay of the Persian and Ottoman empires, and
the desolation and poverty of the Eastern conntries. Whea Cashmere was tributary to Afghanisten, a great portion of the public revenus was exacted in shawla. The yarn into which the wool $\mathrm{j}_{\mathrm{a}}$ apun is dyed with various colors, and, after being woven, the piece ls once washed, and the border, in which is displayed a variaty of figures and colors, la attached to the shawls In so dexterous a manner that it is hardly possible to discover the junction. The price varies in proportion to the quality. A species of writing-paper is also made in Canhmere, whish is highly praised throughout the East, and was formerly a great erticle of traffie; as were also its lasquered ware, cutlery, und sugar. A wine resembling Madeira is manafactured, and a spirituous liquer is diatilled from the grape. The internal intercourso of the country lo chiefly maintained by means of the numerous streams which intersect it, and which are navigated in long and narrow boate moved by paddles,-E. B.

Cashmere Bhawle. The district from whence come these costly shawls is described as being "the happy valiey, and a paradis in perpetual spring." Tho true Cashmere shaw) an be manufactured of no nther wool than that - Thibet. They were firat brought to England in ludif; but they were well imltated by the epinning at Bradford, and the looms of Huddersfield. Shawla for the omrahs, of the "thibetian wool, cost 150 rupees each, about the yeur $160^{\circ} 0$.Bernien.

Caspian Bea, the Mare IIyrcanum of the ancients, derives its name from the Caspii, is tribe who settled on Its shores. Among the Orientals it is known under a variety of names; by the Russians it la called the Sea of Astracan, and by the Turks Buhri-Ghong. It is situated between $36^{\circ} 35^{\prime}$ and $47^{\circ} 25^{\prime}$ N. lat., sud $46^{\circ} 15^{\prime}$ and $55^{\circ} 10^{\prime}$ F. $1 . n g$., is the largest inland lake in the wrold, and has no outlet to the ocean. It is surrounded by the Ruasian governments of Astracan and Orenberg, the Caucasian countries, Persia, and 'lartary; its greatest length is about 760 miles , end its greatest hreadth about 400 from esst to west; generaliy, however, only half that breadth, and where narrowest not more than 120 miles across. Ite estimated area is from 120,000 to 140,000 square miles. There are no tides in this sea, nor are there any regular currents; but the high winds which occasionally blow over its large surface cause considerable and irregular agitations in its motions. The mean depth of the Caspian Sea is from 400 to 600 feet, and in some places is found to bo 2700 feet; but its waters are every where very shallow near the shore, especially toward the west. Vessels drawing 9 or 10 feet water are thus compelled to unlead far from the shore, excepting near Bakou and some other parts of the lake. Navigation is, in general, dangerous, owing to the frequency and violence of the east and west winds; and the contracted space forces the navigator to beat about in order to avoid the sand banks concealed near its shores. The waters of the Caspian havo a elightly bitter taate, communicated by the naphtha which abounde $\mathrm{I}_{1}$ the surrouriding countrics, and is cariied into it by the streams which it receives; but they are not so alt as those of the ocean, in consequence of the great volume of water poured into it by the Volga and its other tributaries. Horses do not refuse todrink along the shores and near the mouths of the rivers.-E. B.
Cassia. There are four species of cassia in the market; viz., Cassia Lignea, or Cassia Bark; Cassia Fiztula; Cassia Buds; and Cassia Senna.

1. Cassia Lignea, or Cassia Bark (Fr. Casse; Ger. Cassia: Port. Cassia lenhosa; Arab, Seleekeh; IIind. T'uj; Malsy, Kayü-legi), the bark of a tree (Jaurus Cossin, Linn.) growing in Sumatra, Borneo, the Malabar coast, Philippine Ialands, etc.; but chictly in the provinces of Quantong and Kingri, in China, which furnish the greatest pert of the cassia met with in the markets. The tree growa to the height of 50 or 60
feet, with large, spreading, horizontal branehes. The bark reaembles that of cinnamon in appearance, amell, and taste, and is very often substituted for it ; but it may be reudily distingulshed; it is thicker in substance, less quilled, breaks ohorter, and is more puncent. It ahould be chosen in thin plecea; the best being that which appronehea nearest to cinnamon in flavor: that which is small end broken should be rejected. A good doal of the cassia in the Indian markets is brought from Borneo, Sumatra, and Ceylon. Malabar cassia is thicker and darker-colored than that of China, and more sulject to foul packing; each bundle should be separately inspeeted.-Ainslin's Materan Inliea, Mabunn's Urient. Com., etc. See Cinnamon.
2. Cassia Buds, the dried fruit or berry of the tree (Jurus Cassia) which yields tho bark deseribed in the previous article. They bear some resemblance to a clove, int are smaller, and, when fresh, have a rich cinnamon fiavor. They should be chosen round, fresh, and free from stalk and dirt. Cassia luds are the produce of China. -Mrnuns's Orient. Com.; AngloChinese Kalewdar; and Part. Poper, No. 257, Sess. 1843.
3. Cassia Fistuln (Fr. Casse; Ger. Rhonkasie; It. Polpa di cassic ; Lat. Cossive pulpa; Arab. Khyar aheber) is a tree which grows in the East and Weat Indies, anl Egypt (Casein fistula, Lina.). The fruit is a woody, datk-brown pod, ntont the thickness of the thumit, and nearly two feet in length." It is oxported principally from the West Indies, packed in easks and cases; hut a superiar kind is brought from the Enst Indies, and is ensily diatinguisied by its smaller smooth pod, and by the greater biackness of the pulp.

Castanet (Spmish Castantia, or rather Castañuela, probalily from Coutaña, a chestnut), an instrument much used by the Spaniards and Moors as an accompaniment to their dances and guitars. It is composed of two smaii pieces of elony, or other well-dried hard wood, shaped like apoons, which are placed together with the concavities inward, fustened by a string to the thumb, and beat with the middle tinger, so as to prodnce a rattling sound. This instrument is very similar to the ancient crotalum, which appears to have consiated, in its original form, of two pleces of reed, which made $n$ elattering noise when shaken with the hand.-E. B.

Casting, the rumning of liquid metal into a mould propared for that purjose. Cating in Sand or Earth, is tive running of metals between two frames or moulds flled with sand or earth, in which the figure that the metal is to tuke has been impressed en ereux, liy means of the pattern. Castiny, among neuiptors, implies the tuking of easts and impressions of figures, busta, medals, leaves, or the like. The method of taking casts of figures and husta is most generally by the use of plaster of laris, that is, alahast alcined by a gentle hent. The advantage of $\cdot \cdots$ this substance in preference to others is, that notwithstanding a slight calcination reduces it to a pulverized stnte, it becamos again a tenaciens and cohering hooly by being moistened with water, nodi afterwari sulfered to dry. 13y this means either a ecacave or a convex figure maty he given liva a poper mould or model to it when wet, and retained hy the hardiness it acguires when dry ; and, from these qualtics. it is fitted for the doubie jurpose of making casts, anci mouids for forming ensts. Tho particuiar manner of making easts deqends on the form of the suliject to be taken. Where there are no projocting parts it is very simple and easy, as likewise where there are sucit as form only a right or any greater angle with the principal surfice of the boty; but where parts project in lesser angles, or form a enrve incined towari the principal surface of the body, the work is more cilfienlt.-W.. I3.

Castor (Kr. Ganoreum: (inr. Kosforennt; It. Castoro; Sp. Custoveo), the produce of the beaver. In the
inguinal region of this animal are found four bags, a large and a small one on each side: in the two large ones there is contained a softish, grayish-yellow, or light-brown subatance, which, on exposire to the air, becomes dry and brittle, and of a brown color. This is castor. It has a heavy bui somewhat aromatic smell, not unlike musk; and a bitter, nauseous, and subactid taste. The best comes from Russia; bnt of late years it has been very acarce; and all that is now fonnd in the shopa is the produce of Canada. The goodness of enstor is determined by its senaible qualities; that which is black is insipid, inodorous, oily, and unfit for nse. Castor is said to be sometimes counterfcited by a mixture of some gummy and resinous substances; but the fraud ia easily detected'by comparing the small and faste with those of real castor.-THomson's Dispensatory.

Castor-oil (Fr. Ifuile du Ricin; Ger. Rizinusohl; 1t. Olin di Ricino; Sp. Ricinsoel) is obtained from the seeds of the Ricinus communis, or Palma Christi, an annual plant found in most tropical countries, and in Greece, the south of Spein, ete. The oil is separated from the seeds either by boiling them in water, or $1, y$ sulbjecting them to the action of the press. It is said that though the largent qoantity of oil may be procured by the first method, it is less sweet, and more apt to become ranctd, than that procured by expression, which, in consequence, is tho process now most commonly followed. Good expressed castor-oil is nearly inodorous and insipid; but the leest leaves a alight sensation of aerimony in the throat after it is swaliowed. It is thicker and heavier than the fat oils, leing viscid, transparent, and colorless, or of a very pale straw color. That which is obtained by loiling the needs has a hrownish hoe; and both kinds, when they hecome rancid, thicken, deepen in color to a red-dish-brown, and aequire a hot, nauseous taste. It is very extensively employed in the materia medica as a cathartie.-Titomson's Dispenentory.

Culture and Man" facture of ''ustor-oil.-Sonthern 11 linois is tine source whence all the castor beans are lirought that are sold or mannfactured in St. Louis. The ground is prepared as for other crope, and when there is no longer any danger from the spring frasts the seeds are planted in hilis and rows, much in the manner of planting Indian corn, with the exception that there is hut one reed put into ench hill, and that at every fourth row a space is left sufficiently wide to admit of the passage of a team for the purpose of guthering the crop. Colike the cereal grains, the ririnus liears at the same time flowers and froit, and the severity of our climate, which renders it in this latitude an annual plant, destroys its vitality while yet deeked with biom. Tise ripening commences in Augast, and the crop is gathered at intervals from this date asial the plants are destroyed hy frost.

The yield, of course, varies with the quallty of the koil and the care of the culture. Twenty-five hushels from an arre of gronnd is considered a very largo crop, and is hut ecliom olitained. From sixteen to twenty lushels per acre is a very fuir yield in a scuson not marked by drought or other unfavorable fenture.

The primitive moxie of making enstor-ail was hy putting the (hruiked) lieans in a liag, and jlacing the same in a kettle of water, and as the ienns were hatled the oil eame to the surface and was akimmed off. Sulisequently there were adopteif the serew and lever presaes, and other devices for pressing the heans, and many mills aprang up thronghont the aonticern part of Illinois, some of whiein remain in use until tiois time. The licans aro first kiln-dried, and then pressed without grinding, the oil thus oltained being called "coll pressed," to distinguish it from the bolled oil (that ohtained by boiling the beans in winter).

About ten yeara ago, the St. Lonis manufacturera commenced using tha ordinary hydraulic prean, inerensing the yleld from the raw material, and work.
bsge, it ro large llow, or the air, le This subacrid te years found in dness of es ; that unfit for cited by stances; ring the zinusohl; from the $i$, an sn, and in eparated I $t$ is said be prond more - expresow most or-oil is leaves a

log the heans with greater rapidity and economy. About two yesrs since there was introduced a now press, which has brought the business to a greater stute of perfection, by increasing the product of oll from the bean $87 \frac{1}{2}$ per cent. over the ordinary hydranlic prssa, and securing other advantages in the economy of labor and fuel. One of these presses will work 100,000 bushels of beans per annum, producing as much as 400,000 gallons of oil. It is said that one of these presses worked on castor-oil, in connection with others on linseed-oll, furnishes auficient combustlble refuse from the castor bean to supply fluel for the works; and in this way the fuel from the besn is of sufficient value to pay all the expenses of manufacturing the oil. The amount saved in Latourette's establishment by burning the above refuse, when in full operation, is sbout lifty dollars per week. After the oil is pressed from the beans, it is clurifted by boiling In large kettles with a small portion of water, and when perfectiy cloar is uliowed to cool, and is then drawn off into barrels ready for market. During the months of July, August, and September, 1854, there wers manufactured thirty-two thoussend gallons of castor-oil at this establishment alone. The manufacture of the oil, which, in 1850, was largely carried on in Ilinois, is now mostly effected in the city of St. Louis.

|  | 1850. | 1851. | 1852. | 1853. |
| :---: | :---: | :---: | :---: | :---: |

The estimated crop of beans for 1854 was but 10,000 bushels, being almost a total failare; arising from the excessive drought that prevailed during the summer over that part of the country. The number of mills in operation in 1854 was only flve, and those ouly em ployed part of the thme. These statements exhibit a graduat decline in the amount of oil produced, which arises partly from the decreased crops, and partly, probalily, from a limitation in the demand. The price of oil in 1852-53 was aq low as 60 to 80 cents per gallon, and is at present nbout $\$ 125$ hy the barrel, whieh, with the short erop of the past year, will probably prove an inducement to the farmers to ngain turn their attention to raising the hems. It has been stuted that castor-oii had been used on one of the Western ruilroads for oiling the axles of cars, and probably also on the locomotives. Since the rise in the price of whale oil, the attention of machinists has been turned to various sutstitutes, and it is probable that the notdrying quality of the castor-oil, when pure, will render it very valuable for lubricating purposes, if it can be produced at a sunfctently low price.-Atererican Journal of Pharmacy, 180̄5.

Catechu (Fr. Cuchou; Ger. Kaschn; Ilind. Cut, Gantbir), a brown astringent anbstunee, formerly known by the name of Terva Japonict, becauso supposed to be a bind of earth. It Is, howover, a vegetable substance obtalued from two plants; viz. the Uimosth, or more correctly the Acacia catechu, and the E'nearia gambir. The lirst of theso is a tree from 20 to 80 feet high, found in abundance in many of the forests of India, from $16^{3}$ of lat. up to $30^{\circ}$. The places most reinarkabic for its production are the llurnese territoriea; a large provhnce on the Malabar coast called the Conenn; and the forests skirting the northorn part of Bengal, under the hills whinh divide lt from Nepmul. The catechu is obitulued from this tree liy the simple proeese of boiling the heart of the wood for a fow hours, when it assumes the look and consistency of tar. The suis stunce hardens by cooling; is formed tuto anmill baila or squares; and being dried in the sun, is tit for the market. Joinsou, in his "Cheinistry af Common Life," says, "In the most roluxing cltnintes of the Einst this atrougly natringent anbstance acta beneticially upon
the system." Perron, the traveler, states that he preeerved his health during a long and difficult voysge by the habitual use of betel, while his companions, who did not nse it, died, mostly of dysentery.

Cat-head, a atrong timber projocting from either bow of a ship, to which the anchor is ralsed and nocured.

Cat'm Bye, a minoral of a beautiful appearance, brought from Ceylon. Its colors ere gray, green, brown, red, of various shades. Its internal lustre is ahining, lis fracture imperfoctly conchoidsl, and it is tranalucent. From a peculiar play of light, ariaing from white fibres interspersed, it has derived its name. The French call the appesrance chatoyant. It seratches quartz, is easily broken, and resiats the blow-pipe. It is set by the jewelers as a precious stone.

Cat Skins. Tho skin or fur of the cat is used for a variety of purposes, but is principally dyed and sold as false sable. It appears from evidence taken before a late Committee of tho IIouse of Commona, thst it in a common prsctice in Iondon to decoy the animal and kill it for the suke of lts skin. The fur of the wildcat in, however, fur more valuable than that of the domestie cut. The wild-cat akins imported Into Europe are brought almost wholly from the territories of the II udson's Bay Compuny. The animal from which they are taken is a good doal larger than the English wild-eat, and is somotimes called the loup servier, or Canadian lynx.

Cattle, a collective term applied to designate all those quadropede that are used cither as food for insn or in tilling the ground. By neat or horned catth is meant the two species included under the names of the ox (bos) and the buffolo (bubulus); but an the tatter is principslly confined to Asiatic countriea, it is the former only that we have here in view. The ratsing and feeding of cuttle, and the preparation of the various products which they yield, have formed, in all countries cuerged from the savage state, an important braneli of industry. It would be quite inconsistent with the oljjects and limits of this work to enter into any details with respect to the difforent breeds of cattlo raised in this or other countries. They are exceedingly various. In Great Britain and in this country they have been vastly improved, both in the weight of carcass, the quality of the beef, and the abunlance of the milk, by the extruordinary attention that has been given to the selection and crossing of the best breeds, according to the objects in view. This sort of improvement began about the middle of lust century, or rather later, and was excited and very mueh forwarded by the skill and enterprise of two individuals- Mr . ljakewell, of Dishley ; and Mr. Culloy, of Northumberland, England. The suecess by which their efforts wero attended roused a spirit of omulation in others; and tho rapid growth of commeree and manufncturea aince 1760 huving occasioned a corresponding increase in the demund for loutcher's meat, improved systems of lireeding, and improved breeds, have lieen very generally introduced. Hut the improvoment in the sizo unl condition of eattle has not been nlone owing to the circumatsnces now mentioned. Much of it is certninly to be aseribed to the great improvement that lus been male in their feeding. The introduction and universal extenaion of the turnip and clover cultivation has had, in this respeet, a most nstouishing intluence, und has wonderfully incressed the food of catlle, and consequently tho aupily of butcher's ment.

Among the various races of cattle exiathig minoigg us, where strict regaril is puid to breeding with n dellnIte object in viow, a preferenco in given to the Durliame or short horns, the Herefords, the Ayrshirea, and the Devons. The Durinma, from their rapile growth, carly maturity, and capubility of taking on fat, are adajted only for high keeping, or to the richest pustures of the Middle and Northern States, und thean of Ohio, Kentucky, and other parts of the West. Tho
males, when judiciously crossed with the other breeds, or with the common cows of the country, often beget the beat of milkers, and for this purpose they have been eapecially recommended. The Hereforda, on the contrary, from their peculiar organization, are better adapted for poor or indifiorent pastures, and regions sabject to continued drought; aud for this reason they are well auited for California, New Mexico, Texas, and other parts of the South. The oxen of this breed are good in the yoke, and the cowa, when properly fed, give an abundance of milk. The Ayrahirea are best suited for a cool, mountainous region, or a cold, rigorous climate. They aucceed well in Massachusetts, New Hampshire, sind Vermont, and are highly prized for their tameness, docile tenupers, and rich milk. The Devons, from their hardihood, comparatively small aize, and peculiar structure, appear to be adapted to almost every climate, and to all kinds of pasturage. From their atoutness, good tempers, honesty, and quickness of action, they make the beat teams, and in this reapect their chief exceliency consists. The cows make fair milkers, and their tiesh very good beef. They also possess great aptituds to take on fat.-Wes Abattoir.
Caullaing, or Cavising, the driving of oakum or old rope untwisted into the seams between the planks in a ship's deck or sides, to prevent the entrance of water or leakage. Tha seama are then covered with melted pitch or rosin, to keep the oakum from rotting.

Cavendish, Thomas, was the son of a gentleman of good estate in Suffolk, England, but having impoverished himself by early extravagances, with a view to retrieve hia affairs he titted out three veasela for a predatory expedition againat the Spaniah American colonies, for which he sailed in July, 1585. After ravaging the weatern consts, and taking a Spanish veswel richly ladeaed, he sailed acress the South Sea, and returned to England by way of the Cape of Good Hope, in September, 1668, having circumnavigated tho globe in a shorter time than any preceding adventurer. The great wealth which he acquired from thia undertaking prompted him to engage in another voyage, on which he embarked in August, 1501. Tempestuous weather, aickneas, and other causes contributed to render this acheme unfortunate; and Cavendiah himaclf died on the coant of Brazil on bis passage home, in 1502.

Caviar (Fr. Cuviar, Cavial ; Ger. Kaviar ; It. Caciario, Cuviale; Sp. Coviario; Russ. Ikrw; Lat. Caviarium), a subatance prepared in Ruasia, consiating of the salted roen of large fiah. The best, which is made of the roe of the sturgeen, appears to conalat entirely of the eggs, and does not easily become fetid. It is packed in amall casks or kega, the inferior aort being in the form of dry cakes. Caviar is highiy eateemed in Ruasia, and considerabie quantitica are exported to other countries. It is principally made of tho roo of the aturgeon caught in the Wolga, in the neighborhood of Aatrachan, as many as 30,000 barrele of cavjar have lng been exported from that city in a single seanon.See Gegg, Lict. art. Astrachan.

Cayenne, a mea-port town, and the capltal of French Guiana, on the weat point of the faland of same name, at the mouth of the Cayenne or Oyaque River, In the Atlantic. Lat. $4^{\circ} 56^{\prime} 5^{\prime \prime}$ N., long. $52^{\circ} 30^{\prime}$ W. Popus. lation 6000. It ia built mostly of wood, and consista of an old town, with the governinent-house and Jesuits ${ }^{\text {a }}$ college, and the new town, with wide and clean atreet, large warehouses, and good residencee, between whieh two divisiona is a large open apace planted with orangetreea. Nlarbor ahallow: it has two queya, and in protected by a fort and several batterics. Cayenne in the seat of a court of asaize, and the centre of all the trade of French Guiana. Exporta to France amount to $6,000,000$ francs, and Importa thence to $5,000,000$ francs. The ialand of Cayenne, in the Atlantic, aeparated from the continent of Sonth America by a narrow chanmel, Is 30 milies in circumference; chief productu, sugar, cotton, coffec, and fruits. Population (excilan of
the town of Cayenne) 8000. First settled by the French in 1625 , but they left it in 1654 . It was afterward succesaively in the handa of the English, French, and Dutch. These Iast were expelled hy the French in 1677. Cayenne was taken by the British, January 12 , 1809, but was restored to the French at the peace in 1814. In this settiement is produced the copsicum baccatum, or Cayenne pepper, to esteemed in Europe. -Haydn.

Cayenne Pepper la prepared from several varieties of capsicum, a genus of solanaceous plants which produce a fleahy-colored fruft. This fruit contains an extremely pungent principle, that exiats in greateat activity in the seed. The capsicum from which the Cayenne is procured Is a native of the East Indiee and America. The principal Indian speciea is $C$. frutescenr, and the American C. annutum. The capsicum entera largely into the seesoaing of food end the preparation of pickles; and is also used in medicine, both internaily and externally. The pods may be preserved in vinegar, or in a dry state in sait. The strongest variety of Cayenne pepper comes from tho West Indies, and is prepared from the capsicum baccatum (bird pepper).
Cedar (Germ. Zeder; Du. Ccder; Fr. Cedre; It. and Sp. Cedro; Rues. Kedr; Lat. Cedrua). Tise Cedar of Lebanen, or great cedar (Pinus cedrus), is fumeus in Scripture: it is a tall, majestic-looking tree. "Behold," says the inspired writer, "the Absyrian was a cedar in Lebanon with fair branchea, and with a shadowing shroud, and of a high stature; and his top was among the thick boughs. Ilia height was exalted above all the treca of the ficld, and hia houghs wera muitiplied, and hia branches became long. The firtrees were not like his boughs, and the chestnut-trees were not like hia branchee, nor any tree in the garden of God was like unto him in beauty."-Eizekiel, xxxi. $\mathbf{8 , 6}, 8$. The cedar grows to a very great size. The timber is resinous, has a peculiar and powerful oder, a slightly bitter taste, a rich yellowish brown color, and is not aubject to the worm. Ita durability is very great ; and it was on thic account (pivpter aternitatem, Vitruviua, Hib. hi. \$9) employed in the construction of temples and other pubilo buildings, in the formation of the atatues of the goda, and as tablets for writing upon. In the time of Vitruvius, cedars were princjpally produced in Crete, Africs, and some parts of Syria.-Loc, cit. Very few are now found on Lebanon; but some of those that still remain are of immense bulk, and in the highest preservation. Cedar exceeds the oak in tougloness, but is very inferior to it in streogth and atifiness. Some very fine cedars have been produced in Engiand.

There are several other kinds of timber that are naually called cedar : thus a species of cypress is called white cedar in America; and the cedar used by the Japancse for building bridges, ships, houses, etc., is a kind of cyprese, whi: : Thunberg describes as a heautiful wood, that lasts long without decay. The Jumiperns orycedrus is a native of Spain, the south of France, and the Levant; it is usually called the brown-berrled cetlar. The Bermudian cedar (Juniperus Bermudiana), n native of the Hermuda and Bahama islanda, is anether apeciea that proilucea valuable timber for many purpones ; such as interns] joincra' work, furniture, and the like. The red cedar, so well known from its being used in making black-lead penella, is produced by the Virginian cedar (Juniperus lírginiana), a native of North America, the West India islands, and Japan. The tree seldoin exceeds 45 feet in helgit. The wood ia very durable, and, like the Cedar of Lebanon, is not attacked liy worms. It ia employed in varlous ways, but principaliy in the manufacture of drawers, wardrobea, etc., and as a cover to pencils. The internal wood is of a dark red collor, and has a very strong odor. It is of a neariy uniform texture, brittle, and light.See Tukibuolid's I'rinciples of Curpentry.

Com

French erward :h, and ench in lary 12 , eace in paicum Europe.

Coments. The auhbtances used for producing coo basion between different materimis are very varions. Thsy are mostly, however, eoft, or, semi-fluid, and harden in the course of time. The number amployed is very great. We can mention ouly a few. The joints of iron plpen and the flanges of steam-engines ure cemented with mixture composed of aulphur and muriate of ammonis, together with a large quantity of iron chippings. The putty of glaziest is a mifture of linseed oil and powdered chalk. Plaster of Paria, dried by heat, and mixed with watar, or with resin and wax, is used for uniting pleces of marble. A cement composed of brick-dust and resin, or pltch, is employed by turners, and some othor machanics, to confine the material on which they are working. Common paint, made of white-lead and oil, is used to ecement Chins ware. So also are resinous substances, sucis as mastic and shellac, or isinglass dissolvad in proof-spirit or water. The paste of book-hinders and paper-hangers is made by boiling flour. Rice-glue is made by boiling ground rice in aoft water to the consistence of a thin jelly. Wafers are mado of flour, isinglase, yeast, and whito of eggs, driod in thin layera upon tin plates, and cut by a circular instrument. They are colored by red-lead, etc. Sealing-wax is composed of shellac and rosin, and is commonly colored with vermiiion. Cominon glue is mostly employad for unitiag wood, and similar porous subatances. It does not answer for surfacea not porous, such as those of metals, and is not durable if exposed to water. The caments moatly used in buiding are composed of lime and sand. Lims is procured hy burning substancea is which it exists in combination with carbonic acid, such as linnestous, marbles, chalk, and shells. By this process, the carbonic acid is driven off, and quicklime is oltained. The quicklime is elaked by mixture with water, after which it swelis and cracks, becomes hot, and assumes the form of a white and inpalpshle powder. This is a hydrato of limo, and contains about thres parts of lime to ono of water. When intendod for mortar, it should imınediately be mixed with sand, and used without delay, before it imbibes carbonic acid anew from the atmospiere. The lime adheres to and unites the particies of sand. Coments thus mado lacrease in strength and aolidity for an indefinite perod. Fresh ssnd, wholly silicious and sharp, is the best. That taken from the sea-shore is unfit for makiag noortar, as the salt is apt to deliquesce and weaken the mortar. The amount of sand is always greater than that of the lime. From two to four perts of sand are used, according to the quality of the lime and the labor beatowed on it. Water cements, calied also Romas cemente, harden under water, and consolidato atmost inmpediately on belng mixed. Common mortar dissoives or crumbles sway if lrid under water befors it has had time to hardon; but certain rocks, which bave an argillaceous as well as a silicious character, communicate to lime or mortar the property of hardening in a very few minutes, both in and out of water. The ascient Romana, in making their water coments, employed a pecullar earth, oltained at tho town of Puteoli. This thay called pulvis Puteolanur. It is the sams as is now called Puzzolana, and is evidently of volcauic origin. Thu Dutch, in their great aquatic structures, have mostly employed a substanco denominated tarras, terras, or trasw, found noar Andernach, in the vieiuity of the Rhine. It is said to be a kind of decomposed hasalt, but resemblos puzzolana. It is very durable in water, but iuferior to the other kinds in ths open alr. Baked clay and the cominon greenstone afford the basis of very toleralio water cemento, when mixad with lime. Some of the ores of manganese may be used fur the samo purpose. Some limestones calcingd, and mixed with sand and water, alao affiord water cements, usualiy in consequence of containing some argiliaceous oarth. Soune cementa, of grest hurilneas and permanency, have been obtainod
from mixtures into which animal and vegetable anbstances enter, euch as oil, milk, mneilage, etc: The name of maliha or mastic is given them. They are not mueh used. The principal manufacturing places of cament in the United States are in the 8tate of New York, along the Delaware and Hudson Canal.

Census is now almest solely used to denote that enumeration of the people made at intervals in most European countrien, and in Britain decennially. The term had its origin in Rome, where a group of the many functions performed by the high officer called censor received the name of census. An enuiaeration of the people was only one of them, but they were chlefly of a statistical character. : They were eapecially directed to fiacal objecta; and it does not appear that the ennmeration of the people was then deemed. of velue as a source of statistical knowledge which might influence morala and legisiation. It was connected with the Servian constitution, which apportioned the rights and duties of citizens to the amount of property, dividing them into aix classes, which were aubdivided into centuries by a mixed ratio of wsalth and numbere.
The Roman census must have been minute and full. It indicated not only the number and respective classes of all free parsons, but their domestic position as husbande and wives, fathers and mothers, and sons and daughters. The slaves and freedmen wero indicated in connection with the possessions of the head of the house, and landed property was analyzed into anveral classes, according to its character and produce. The important practical effect of the census caused it to be conductad at intervals generally so frequent as every fifth year. It was followad by a sacrifice of purification or lustration, whence the term of five years came to be denoted a lustrum.

While the word census was thus applied to the taxation of the Mlddle Agea, it will readily be understood that in its modern sense it received no practical appllcation, since neither taxation nor the adjustment of social rank required a numbering of the people; and the statistic or acononinic ends of such a procens were as little known as they had been to the Romans. Under the despotic goveruments of the Continent, howover, the tendency to central organization for purposes of administration and police prepared the way for statistical inquiries into tho numbers of tho inhsbitants of particular areas whenever there should occur an occasion for enumerating them. It was in Britain, with its abstinent government and unrestrained people, that tho want of population statistica becamo most flagrantly conspicuous. It is difficult at present to realize the idea that, long after Adam Smith's day, the simicier of ths inhabitants of the British empire could only be gucesed at, as tho popilousness of Chins is at tho present day ; and, as in all mstters of statiatics, which tave their own simple solution through specifio inquiry, the gueeses about the population of the empire were not only vague but extravagantly contradictory. During the aighteenth century, the most trust-worthy geographers were generally those who did not venture on an estimate of the population even in those European states which had the lest means of enumeration at their command.

Tho first effort to take a census of the population of Great Britain was made in 1801 ; It did not then extend to Ireland. The success which attended this and the two succeeding efforta was mainly owing to the zeal and ability of Mr. Rickmen, the assiatant clerk of tho llouse of Commons. Where there is an organIzation like that in many of the European states for preserving a constant official record of all the fluctustions of the population, not only in their absolute numbera throughout a whole tarritory but in the relstive numbers in its respective parts as thoy may be affected by fluctuations, systematio arrangements are thua prepared not only for obtuining a general consus at any one moment, but for checking its ascuracy and
classifying its elements. But te deal at once with the raw material in the self-governed British empire, required great ingenuity and sagacity, is cenaus, to be accurate, must be taken on aniform aystem, and must be taken simultaneously. m a.

The enumerations of 1841 and 1851 in England were much facilitated by the aniform aystem of registration of birthe, marriages, and deaths; eatabliched in 1886, which not ouly afiorded the means of checking the wcenracy of the returns, but provided a prompt and skilled machinery accustomed to statistical work. Far more dependence could now be placed on the discretion and skill of the officers 10 whom the local duties were committed; and tho returns were made more minute and complete. Scotland and Ireland are perhape the only considerablo countries in Christlan Europe where there is no uniform ayatem of registration. In Scotland it was necessary to.adopt the clumsy method of employing the parish schoolmasters to perform the local duty in the country diatricts. In Ireland the tirst attempt at a general ceneus was made in 1811, but it was decidedly unauccessful. It was repeated in 1821, but went no further than a bare enumeration of doubtful accuraoy. The census there taken in 1891 was subject to correction in 1834, to make it the basis of the new aystem of netional education. In the two subsequent enumerations the aid of the admirable conatabulary force, and the uso of an ordnance survey, nearly complete in 1841, have gono far to anpply the want of permanent local etatistical nachinery. The census of 1851 was taken on tho 81at day of March, the preriously-distributed schedules being then collected.

| Census of 18\% | 12,866,0\%0 |
| Census of 1840 | 17,063, 463 |
| Census of 1850 | 23,101,876 |

At the close of 1857, the total popuiation of the United States, upon the supposition that ita averago ratio of increase has been malutained, or nearly so, may be stated in round numbers at $28,600,000$.
The present population of the Uuion may be aald to conslist of, first, the number who were in the country on the furnation of the government in 1780, and their descendants; sccond, of those who have como luto the country since that period by lommgra:ion, and their descendanta (of thin class much will be said under the head of Nativitises) ; thind, of those who hesve been brought in by annexation, as in Lonisiana, Florida, New Mexico, ete., and their descendants. It is aufficient to say of the last class, that Loniniana, when purchaaed, had $\mathbf{7 7 , 0 0 0}$ inhalileants, including 63,000
slaven ; Florda about 10,000 ; California and New Mexico about 60,000; and that Texas and Oregon: only brought back into the Union clizens who had emigrated thither but a short time before. 'The num. ber of Indians (taxed) domestleated and absorbed in the population can not be aecertalned. The colonial population was ewelled, in 1765, by the extension of the boundary to the Missiesippl, and the introduction of 2000 French residents of the territory incorporsted.

Cent, a contraction of the Latin centum, a hundred, in used in commerce to denote a certain rate by the handred; thua 10 per cent. profit or 10 per cent. loss upon the sale of any merchandise implies that the seller has gained or lost $\$ 10$ on every; $\$ 100$ of the price at which be bought that merchandise. The rate is termed percentage,--See Dolisar.
Cent Is also the neme of a copper coin of the United States, equal to the hundredth part of a dollar, or rather more than a halfpenny Engllsh money. The copper colnage of the United States to the end of 1853 amounted to $\$ 1,518,987$. We have of that ponderone currency about 1590 tona of 2000 pounda apoirdupois. This circulation le almost entirely confined to the Northern and Middle States, as it lo rejected ly the South and Weat. Accoriling to the lawe establishing the Mint of the United States, "of the copper coins, the weight of the cent shall be ono hundred and sixtyeight grains, and the weight of tho balf cent eightyfour graine; and the cent elhall be consldered of the value of one hundredth part of a dollar, and the half cent of the value of one two-hundredth part of a dolisr. Copper lullion shall be purchased for the Mint, from time to time, by the treasurer, under instructiona from the directur; the cost shall te pald from the fund hereinafter provided for ; and the copper bullion shall be of good quality, and in the form of planchets fit for passing at onee into the hands of the chlef coiner. The copper planchets shall bo delivered, from time to time, by the treagurer to the chief eoiner, to be by him coined; and all such copper shall he returned to the treasurer Ly thochlef coiner, weight for welght, without sllowance for waste. It shall be the duty of the treasurer of the Mint to deliver the copper coink, in exchange for their legal equivalent In other money, to any person who shall apply for them : Provided, 'That the sum ssked for be not less than a certain amount, to be determined hy the director, and that it be not so great as in his judgment to Interfere with the capacity of the Mint to supply other applicants. The copper colas miey, at the discretion of the director, bo delivered $\ln$ any of the principal eitles and towne of tho Unlted States, st the cost of the Mint for transportation. The money received by the treasurer in exchange for copper coins shall form a fund in his hande, which shall he nsed to pureliase copper planchete, and to pay the expense of transportation of copper colns; and lf there be a surpine, the came shall bo appropriated to defrey the contingent expenses of the Mint. No copper colns or pieces whatsoever, except cents and hslf sents, shall pass curreut as money, or shall be pald, or offered to he paid, or received in payment for any delit, demand, claim, matter, or thing whatsoever; and all copper coins or pieces, except the cente and half centa, which whall be paid, or offered to be paid, or recelved in payment, contrary to the prohibition aforesald, shall be forfeited, and overy person ty whom any of them shall have been so pisid, or offered to be paid, or ruceived in payment, alaill also forfelt the sum of ten dollars, ond the aaid forfeiture and penalty shall and may be recorered, with costs of sult, icr the benefit of sny person or persons by whon inforinstion of the incurring thereof shall have been given."-See Corns, Comagr.
According to the acts of Congrens prior to 1800, the gola and silver coins of tho United States were legal tender to sny extont, but hy the law of 1853, autharizlug the debased silver coine, the iatter are receivable in small suma only. Copper colne are not ly statute le- a fortreas cipal edit brary.

gal tender to any amount. Frequent suggetions in Congress hava been recently made to reduce the weight of the copper coins, but thus far withont effect.
Cereal Grassee (Lat, ceres, corn), grassea which produce the bread corns; auch as wheat, rye, barley, oats, usize, rice, and millet.

Cette, a commercial and fortified sea-port town of France, department of Herault, capital of the canton, at the head of the rallroad from Beaucaire, between the Mediterranean and the lagoon of Thau, 17 miles southwest of Montpellier. Lat. of light-house, $43^{\circ} 28^{\prime}$ $48^{\prime \prime} \mathrm{N}$., long. $8^{\circ} 42^{\prime} 16^{\prime \prime}$ E. Population 16,613. It is a fortreas of the first clans, defended by a citadel; principal edifices, Chureh of St. Loeis, public baths, and library. Its harbor is specious and secure, from 16 to 19 feet in dopth, formed by two piers with a breakweter in front, defended by two forta, one on either pier. A broad and deep canal, bordered with quays and warehouses, connects the port with the lagoon of Than and the canal du. Midi, and with canals leading to the Bhoas, by which moans Cette has an extensive traffic with the interior, Imports comprise Benicarlo wine from Spain, for mixing with French wines for the English and other marketa. It has a large eatablishment where is manufactured aulphate of soda, magneeia, and potash, from sea-water. The exports consist of about 33,000 tane of wine, and 4000 ditto of brandy annually, with almonds, Montpellier verdigris, salt from adjacent salt-worke, and siraps, liquors, soap, perfantery, and glass-wares, the products of its owa fuctorice. Cetto is the entrepôt for an extencive coasting-traile, and posseases much foreign comnerce. It has ship-bullding yards, and an active oyster and anchovy tishery; and is the residence of various Eeropean consula. It is wholly of modern origin, having teen founderl by Louis XIV, at the base of the ancient Alons Setius (whenee its aame). Steamboata to Marseilles daily.

Ceylon, an isiand in the Indian Ocean, situated at the suuthern extremity of the Coromandel coast, from which it is separated by the Gulf of Manaar. It lies between lat. $5^{\circ} \overline{6} 4^{\prime}$ and $9^{\circ} 50^{\prime} \mathrm{N}$., and long. $79^{\circ} 50^{\prime}$ s-d $82^{\circ} 10^{\prime} \mathrm{E}$. Its length is $2 \overline{0} 0$ miles, and ite greatest breadth 145 miles. It is of an oval form, pointing morth and soath; ita broadest part being at its southera extremity, whore also is to be found the great mass of lts high lands. It is distant from Cape Conomin, the southerumest point of the Indian peninsula, about 170 miles. Tho most important cultivation is that of coffec, a branch of industry which, since the year 184i, has assumed a position of groat and growing prominence. Coffeo was an articie of growth and export from Ceylen 80 far back as the time of the i'ortuguese, but like the cinnamon it grew wild without any attempt at cultivation. l'atchos of it were to be seen aroend the Kandian villagges in wild laxariance, and the berry gathered before ripe, and imperfectly cared, seldem possessed inach flavor, and was lighty esteened as un article of Duropean commerce. Cofleo caltivatiou on the West Indian plan wae first connnenced by Sir E. Llarnes, the then governor of Cayion, in 182j, who hoped by his examplo to introduce collee-planting hy Leropeans into the island.

The Cocos nueifera, or coces-nut palm, is a native of the islund, and may justiy be considered the most valestio of its trees. It grows in vast numbers aleng the cutire sea-coast of the west and south sides of the island, and furnishes almost all that a Siaghalese villager requires. Its fruit, when green, supplies food und drink; when ripe, it yields oil. Ita sap gives him toddy and arrack. The fibrous casing of the frait, when woven, makes him ropes, nets, and matting. Tho nat-shells form drinking-veasels, spoons, ete. The pluited leaves aerve as plates and diahes, and as thutch for his cottage. The dried tlower-atalks are used as torchee, the large leaf-stalks as garden fencea. The trunk of the treo aswit up is employed for every possiblo jurpose, from knife-landlea to door-pesta; hollow-
ed ont, it forma alike a canoe or a coffin. There ara fous' kinds of this palm; the common, the king cocoa-nut, the dwarf, and the Maldive sorts. The Palmyra and Areca palma grow luxuriantly and abundantly; the former in the northern, the latter in the weatern and central diftricts. The one is valuable chiefly for its timber, of which large quantlties ure exported to the Indian coasta; the other supplies the betel-nnt, in such common use among natives of the Eastorn tropics as a masticatory. The export trade in this latter to India and Eastern ports is very considerable, amounting in some years to $£ 12,000$. Next in importance to the cocoa-nub psim among the indigenous producta of Ceylon is the cinnamon-pl+, yielding the well-known spice of that name.-See Uinnailon. The fruite indlgenous to Ceylon are few and Inelgnificant. Others of more value' have been introduced with success froin various troplcal and extra-tropical countries $;$ smong these are the citron, orange, lime, shaddock; banana, pomegranate, custard apple, guava, grape, rambatam, alligator-pear, ete.

Pearl Fishery.-Although the once far-famed and lucrative pearl fishery of thie island has ceased since the year 1837, It will bo well to give in this place a passing netice of the pearl-oyster, especially as a survey of tho "banke" or beds off Aripo, made in 1852, holds out promise of a good fishing at no distant date. The banks on which these oyaters are usually found lie off the northern part if the west coast of Ceylon, at a distance of from 16 to 20 miles from the shore. They extend for many miles north and south, varying conslderably in their size and productivenese. The oyster arrives at maturity in its eeventh year; the pearl within is then of full growth, and if the fish be not then taken up, it will shortly die, and the pearl bo lost. The fishery, which ia in the hands of tho local government, took place in the month of March, when the water was perfectly calm, and most favorable for the work of the divers. It was formerly rented to native specalators, who paid a certain aum for the privilege of fishing with a fixed number of divors daring a given perlod. In 1797 and the following yeat, the rental of the fishery realized $£ 128,982$ and $£ 142,780$ respectively. Sinco that time the government have flohed on their own account, selling the produce of each boat by auction on the beach beforo the fish could be examined. This mode, however, had not proved so lucrative as tho old method; the annual returns never having oxceeded £87,000, and frequently falling as low as $£ 10,000$; in some cases, indoed, amounting to but a few hundred pounds atcrllug. Various causes liave been assigned for the falluro of these fisheries. It may, however, be properly attributed to the mismanagement of an inspector of the pearl banks, who in 1836 took charge of them, and, from neglecting to attend to tho iustractions given him by his prodecessors, caused the wrong beds to be fiahed. The rosult was a complete falluro of the fishery; the oysters which should have been brought up were left to die; young beds were disturbed, and from that time this large source of revenue hus been lost to the island. A survey of the pearl banks made in March, 1853, induced the local government to look for a ilshery of eome oxtent in 1855 or the following year.-E. $\mathbf{B}$.
llowever, the pearl fishery of Ceylon continues to engross a large share of publionttention. The importanco of any dlacovery which would enable us to preserve and flsh the mature oysters is ovident from the statement made by Captain Stuart, that from the fifth to the sixth year the pearl-oyster cloubles in value, and again doubles should he sarvive the seventh year. The pearl-oyater, though called the mother-of-pearl shell, and though its interior surface ia beautifully lined with the pearly secretion, is valuoless as "mother-of-pearl." Tho latest, Intelligenco from the acene of the fisherlea is as follows 1

17th Sale.-205,000 oysters broaght on ahore on the 7th (by 42 boata) were aohl at ratea varying from 15 to

18 rupees per 1000, and produced £315. Total recelpta 49080.-Overland Calonibo Observer, April 18th, 1855.

The trade of Coylon has been greatly augmented since the opening of the clnnamon trade and the commenceinent of coffee plating. In 1832 the imports amounted to $£ 351,222$; the exports to $£ 163,587$. In 1842 the imports and exports amounted to $£ 622,447$ and $£ 421,418$ reapectively. In 1852 those amounts were $£ 1,000,474$ and $£ 948,400$. The largest increase in exported produce has been in coffee, whlch from 17,287 cwis. In 1881 grew to $77,475 \mathrm{cwts}$. Ia 1841 , and to $287,910 \mathrm{cwts}$. in 1851. In 1854 the crops of native and plantation kinds are expected to amonnt to 500,000 cwts. Tha cinnamon trade of Ceylon forma a remerkable exception to the rule that by the removal of fircal restrictions the consumption of articles will be increased. Cinnamon is now exported from Ceylon duty free, yet the anaual demand for the splce is found to be no greater than when burdened with an export duty of 8 a. the lb . When the ialand was transferred from the admluistration of the East Indla Company to that of the crown in 1802, the governoient entered into a contract with the company by which tha latter acquired the exciusive privilege of exporting cinnamon from the colony. It was agreed that the Ceylon government should deliver annaally 400,000 pounds of cinnamon, for which the company was to grant a credit of $£ 60,000$, making the price of tho cinnamon $3 s$. per pound. In 1814 the company agreed to allow to the Ceylon government a sum of $\mathbf{\Sigma} 200,000$ eterling for aurplua profits on their sales of einnamon; and to give in futuro $£ 101,000$ sterling annualiy, instead of $\mathbf{£ 6 0 , 0 0 0}$, for a supply of 400,000 pounds of that commodity. This contract was entered into for aeven yeara, and it does not appear that during this period tha stipulated quantity of cinnamon was ever delivered. In 1821 the cxclusive privilege of exporting cinnamon was given up by the company; and in 1833 the government abar oned their monepoly of the trade, throwing it open to the publlc, but levyIng a duty of 3s. per pound on its exportation.

In $1835^{\circ}$ an inferior or third sort was allowed to bo shipped on payment of $2 s$, the pound. Two yeare later, the duty on the beat sorta was lowered to 2 s .5 bd .; and in 1843 the duty on all kinds was fixed at 1s. It was sinco reduced to $4 d . ;$ and in 1853 the artlcle was declared duty free. These periodical reductions of duty were in all cases followed by heavy shlpments of the spice; the sole effect of which has been to overstock the European markets, and reduce its price beyond the reduction of duty. The annual European consumption is at the present time precisely what it was ifty years ago; thus proving that artlcles of mere luxury are not affected by the laws whleh govern the consumption of the neecssaries of Ilfa. Of the exports, fourfifthe are to Grest Britain; of the Imports, one-third is from the Unlted Kirgdom, and the remainder cliefly from India. The imported goods from Great Britaln consist of cotton manufacture, glass-ware, hardware, millinery, hosiery, metals, tools, beer, wines, etc. ; those from India are mainly rice and coarse cotton cloth. The exports to Europe belng larger than the Imports thence, the balance of value is drawn for by bills of exchange, a part of which are negotiated ln India to pay for rice, the rest for rupeea sent down to Ceylon to pay the Nalabar coolies on tho coffee eataten, who carry three-fourths of their earnings out of the island. The trade of Ceylon is carried on by upward of thenty Eurupean firms, and eight or nine natlve houses; tha lattor contining their transactlons to Hritish India. Besides these, there are nearly a dozen European estate agents in Kandy, and a great number of amall native dealers, called "Chitters," In connection with Madraa and Bouibay firms. Thero are no export duties, and the duty on imports is 5 per cent. on the declared value, with some few exceptious, buch af arms, wines, splrita, and grain. In 1852 the ravenue derived from custons dutles was $£ 121,354$.

The coasting and Indian trade is carried on by coun-try-bullt brige and dhomies, a craft pecullar to Ceylon. Of the former there are 56 , of 8178 tons In the aggregate, and 559 dhomles, of a tonnagy equal to 24,270 tone, belonging to the island. The value of the former is $£ 0$ per ton, and of the latter $£ 1$ per ton. In 1836 the custom-house shipping entries gave 1881 vessels illward, and 1200 outward; in 1852 they gave 8140 Inward, and 8074 outward, The banking business of the Island is conducted by branches of the Orlental Bsink Corporation of Loudon, and the Mercantile Bank of Bombay, in Colombo and Kandy. The former establlshment possesses the privllege of issuing notes of $10 s$. and upward,-E. B.

Chafi. The husk or withared calyx of grasses, and more especially of the bread corns. The terin is also applied to straw or hay cut into very ohort lengths, and used for mixing with corn, roots, or other food for horses or cattle. This kind of chaff, In greater lengths, Is also used for mixing with mortar on some parts of the Continent, mere particularly in Germany and Russia ; and it is used as a substltute for hair in making plaster for rooms. Both stubble and cut hay were nsed by the anclent Egyptians in making bricks.
Chain, in Surreying, a measare of length, composed of a certain nomber of linke made of Iron wlre, serving to take the distance between two or more places. Gunter's chain contains 100 such links, each measuring $792-100$ inches, consequently equal to 66 feet, or four poles.

Chaldron, a dry English measure of 36 coal bushels; 21 chaldrons make a acore. The coal bushel is $19 \frac{1}{2}$ inches wide from the outside, and 8 lr thes deep. It containg $2217 \cdot 0$ cubic Inches; but when heaped, $2815 \cdot 5$, making the chaldron $58 \cdot 65$ cubic feet. There are 12 sacks of coal in a chaldron; and If 5 chaldrons be purchased at the same time, the aeller must deliver 63 sacks: the 8 sacks additlonal are called the ingrain. liut coals are now sold in Londen and almest every where else by the ton of 20 cwt . avolidupeis. The Newcastle chaldron of coals is 53 cwt ., and is exactly double the London chaldron.

Chaleura, Bay of, an inlet of the Gulf of St. Lawrence, In North Ancrica. Lat. $48^{\circ} \mathrm{N} .$, leng, $65^{\circ} \mathrm{W}$. Length from east to west about 90 miles; breadth varies from 12 to 20 m iles. It separates Canada East from New Brunswlek, and at lis western extremity recelves the Ristigouche River. This bay possesses grest advantages for the prosecution of the flsherles. The entire bay may be considened one grest harber, as throughout its entire breadth and extent there is not a single rock, reef, or shoal. During the summer it literally swarms with fish of every description known on the ahores of thla portion of America; and lts ancient name of "Echetaun 'Nemaoch"一the bea of fish-well denotes its character.

Challe (from calx), in Latin called creta, a species of carbonate of lime, found abundantly in Britsin, France, Norway, and other parts of Europe. The island of Candla is sald to have received Its anclent name of Creta from the quantity of chalk found there. Chalk is used as an antl-acid; and from the readiness with which it Imbibes liquids, it is much employed as an ab)sorbent. When powdered and freed from gritty particles by washlng, it forms the subatance called rhitening, or Spanlsh white, used to pollsh metalline uteuslls and glass. It is prepared as follows : mix chalk thet has been well triturated with a large quantity of water, allow the sllicious and ferruglnons particles to subside, and then decant the supernatant fluld into a very fine sieve or linen beg, where the whltening will be ticpos-ited.-Black Chalk, a mineral used by artists for drawing. It la a variety of bituminous shale, the schistegraphique of IIany.-Frewch Chalk, steatite or soapstone, a hydrated ailicate of magnesia and alnmina. It oceurs of several colors, as whilte, brown, green, etc.; and is used In the preparation of crayons, the manu-
facture of basis of cet durated clo reddle, or E. B.

Chamber of Assurance, in France, denotes a socicty of merchants and others for carrying on the business of Insurance; but In Holland it algnifiea a court of justice, where causes relating to assurances are tried.

Chamber of Commerce. An assembly of merchants and traders, where affairs relating to trade are treuted of. There are several establishments of this gort in most of the chief citles. - Sice Board of Tnade.

Chamomile Flowers. The flower-heads of the Anthemis nobilis, or common chamomile. They are used in medicine in consequence of their bltter cxtract, which is strengthening, and of their cssential oil, which is aromatic and stimulant.

Champagne, one of the mose esteemed and celebrated of the French wines. An official report, made by the directors of the indlrect taxes for the department of Marne, furnishes the following Information as to the trade in champague between the lst of April, 1846, and the 1st of April, 1847. The produce is distributed among the arrondlssements of Chulons, Epernay, und Rheims. On the 1st of April last there were in the cellars of the wholesale deaters $18,815,367$ bottles of this wine; viz. at Chalons, $4,404,237$ bottles; at Epernay, $5,710,753$; and at Rhelms, 8,500,377. The number of hottles sold and delivered between the 1st of April, 1846, and the 1st of April, 1847, were, at Chalons, 2,497,355; at Epernay, 2,187,553; at Rheims, $4,090,577$; making a total of $8,775,485$ bottles. These quantities wero thus distributed:

Champlain Lake lies between the States of New York and Fermont. It extends from Whitehall, New York, to the 45th degreo of north latitude 102 miles, and thence about 24 miles to St. John's, in Canada, to which point it is navigable, making its whole length 126 miles. Ita breadtl is from one-fourth of a mile to 13 miles; but, including the expanse which contains Its large islands, it is 15 miles wide. Its broadest part, unobstructed by islands, is opposite Burlington, Vermont. Its chief islands are North Hero, South Hero, and La Motte, which, with some sinaller islands, and the peninsula of Alburg, constitate Grand Isle county, Vermont. This lake was discovered by Samuel Chantplaio, a French nobleman, in 1609. It was the theutre of many important milltary operations, in the French, Revolutionary, and the war of 1812. Tho scenery aloog its shores is highly picturesque, and rendered grand by the lofty monntains at a little distance from it on both sldes. It forms an important medium of commerce, and is navigated by steamboats, and by many sloops, generally from 80 to 100 tons burden. It receives a number of considerable rivers. Its ontlet is Sorelle or Richelicu River, the navigation of which has been Improved by the works of the Chambly Canal (Canada), so as to afford an easy communication for large vessels with the St. Lawrente River. The Champlain Canal, $6 \mathbf{4}$ miles long, connects It with the IIudson River on the south, and cost $81,079,872$. It abonnds with fish, among which nre salmon, lake shad, plke, and other fish. It ls generally frozen entirely over, and is passed on the ice, in winter. The hroad lake closes in Jsnuary or February, and opens early in March. The nerrow parts continue frozen conaldcrably longer. It hss three light-ltouses on lis coasts. It compriaes the collectlon districts of Burllngton and Champlaln. Ag-
gregate tonnage in 1853, 1,461,749. The aggregate ohipplag in 1851 measured 107,500 tona, and employed $11,850 \mathrm{men}$. The commerce of the lake in the same year amounted to $\mathbf{\$ 2 6 , 3 9 0 , 8 9 5}$; and the enrolled tonnage was, of steam, 4157 tons, and 8983 tona of sailing vessels.

Chanks, or Chank Bhelle, common conch shells (Voluta pyrum), are fished up by divers in the Gulf of Manaar, on the coast opposite Jaffinapatam, in Ceylon, In about two fathoms water; and at Travancore, Tuticoreen, and other places. Large fossil beds of chanks have also been found. They are of a spiral form, and constitute a considerable article of trade in India, whers they are in extensive demand all over the country. They are sawn into narrow rings or bracelets, and are worn as ornaments on the arms, legs, fingers, etc., by the Hindoo women; many of them are also buried wlth the bodies of opulent and distingulshed persons. Those which, from being taken with the fiah, are called green chanks, are most in demand. The white chank, which is the shell thrown upon the beach by atrong tides, having lost its gloss and consistency, is not worth the frelght up to Calcutta. The value of the green chank depends upon its aize. A chanl, opening to the right, called in Calcutts the right-handed chank, is so highly prized as sometlmes to scll for 400 or 500 , or even 1000 rupees.-Bellis Commerce of Bengal, and private commuaications.

The fishery of chanks used to be monopolized by government, who formerly let the banks for from $£ 3000$ to $£ 4000$ a year. But of late years the fishery, partly from the poaching of the fishermen of the contiguous coasts, and partly from a decrease in the supply of chanks, decllned so that the rental of the banks fell off to from $\boldsymbol{£} 300$ to $\boldsymbol{£} 400$ a year. And this smaller sum was not paid, as formerly, for a licenso to dive for live chanks, but for permission to dig up the dead shella along the shores of the Gulf of Mantar. Under these circumatances government have whely abandoned the chank monopoly, which, without being of any value in a financisl point of view, obstructed the employment of the inhabitant. on the shores of the Gulf.-See the valuable Report of Sir J. E. Tennent, p. 55, of Papers on Ceylon, presented to Parllament in 1848.
Charcoal (Fr. Charbon de bois; Ger. Reine Kohle; It. Carbone di legna; Sp. Carbon de lena; Lat. Carbo ligni), a sort of artificial coal, conslsting of wood burned with as little exposure to the action of the air as possible. "It was customary among the ancients to char the outside of those stakes which were to bo driven into the ground or placed in water, in order to proserve the wood from spoiling. New-made charcoal, by being rolled up In clothes which have contracted a disagrceable odor, effectually destroys it. When boiled with meat beginning to putrefy, it takes away the bad taint; It is, perhaps, tho best tooth-powder known. When putrid water at sea is mlxed with about one-ninth of lis weight of charcoal powder, it is rendered quite fresh ; und a much smaller quantity of charcoal will serve, if the precaution bo taken to add a little sulphuric acid provlously to the water. If the water casks he charred before they are filled with water, the llquor remains good in them for years; this precaution ought always to be taken for long sca voyages. The same precaution, when attended to for wine-casks, will be found very much to lmprove the quality of the wine." -Thomson's Chemistry. Common charcoal intenciud merely for fuel ls prepared by cutting pleces of wood from one to three inches in diameter into lengths of from one to three feet, forming them Into a conical pile, and covering them with turf or clay; leaving two or three small holes close to the ground for lighting the wood, and boring through the turf in the upper part of the cone, a few other small holes for the escape of the smoke. The pile beling lighted at the scveral holes along the bottom, continues burning with a slow smoullering flame for a week or two, and lo allowed to cool before
the turf is removed. In the case of very high winde, the holes to the wiadward are stopped, to prevent combuation from going on with too great rapidity. Charcoal obtained by distilling beach-wood, log-wood, willow, and other woods which are free from resin, is calied cylinder charcoal. The charcoal employed in the manufacture of guapowder is now always so prepared.

Charge d'Afintres. The third or lowest elass of forelgn minieters, accordlng to the regulations adopted at the Congress of Vienna.
Chariota. The Invention of chariots and the manner of harnessing horses to drsw them, is ascribed to Erichthoniue of Athens, 1486 n.c. Chariot-racing was one of the exercises of Greece. The chariot of the Ethlopian officer, mentloned in Acts vii. 27, 28, 81, was, It is supposed, something in the form of our modern chaise with four wheels. Casar relates that Cassibelanue, after diamissing all his other forces, retained no fewer than 4000 war chariots. Those of the ancients were like the modern phaetons, and drawn by one horse. -Haydns.

Charleston, city, port of entry, and capital of Charleston district, South Carolina. It is the metropolis of the State, and the tweifth elty in popalation in the United States. Situated in $32^{\circ} 46^{\prime} 33^{\prime \prime}$ N. Ist., and $79^{\circ} 55^{\prime} 38^{\prime \prime}$ W. long. from Greenwich, England; $2^{\circ} 56^{\prime} 3^{\prime \prime}$ W. long, from Washington; 124 miles southsoutheast from Columbis ; 110 miles from Savanuah, Georgis ; $\mathbf{1 6 5}$ nilles from Wilmlngton, North Carolina; 547 miles from Weshington; 587 miles from Baltimore; 684 mies from Philadelphis; 773 miles i.om New York, and 989 miles from Boston. The population in 1790 was 16,859 ; in 1800, 18,712; In 1810, 24,711 ; In 1820, 24,780; in 1830, 30,289; in 1840, 29,261; a1 i in 1850, 42,985; to whieh may be properly added th. inhabitants of the Neek, north of the elty, but lying without the charter limits, which contains about 15,090 inhabitans, Charleston is on a peninsula, formed by the confluence of Ashley and Cooper Rivers, which unite immediately below the city, and form a spacious and convenient harbor, communicating with the ocean at Sullivan's Island, seven miles suaticast of the city. The city is defended by Fort Plnckney, two miles below, and Fort Johnson, four miles; and hy Fort Mouitrie on Sullivan's Island. The city is divided into eight wards, and is buitt on ground but slightly elevated, being only abrit nine feet alove the level of the harlor at high tides. It extends from Battery Point on the south to the elty limits on the north, a distance of three miles, and at an average width of one and a quarter mile. Meeting Street, the principal strect, is aixty feet wide, and extends for a distance of three miles nearly in a direct line north; tho cross-streeta run neerly parsilel to each other, and at right angles to Mecting Street, and extend from east to west, and from Ashley to Cooper Rtvers. The houacs built within a few years aro of brick; none are now allowed to be constructed but of this material or of stone. The wooden houses are generaliy kept well painted, and moet of them have piazzas extending to the roof, tastefuily srranged with vines and creepers. Thoso in the suburbe are surreanded by gardens, planted with orange, peach, and other ornsmental and ueeful trees, andi s profusion of vines end shrubbery.

Charieston is a great mart for cotton, rice, and tobacco; and rice espeeisilly, as it ie the heart of the ricegrowing region, forms the great staple, of which it exports 125,000 therees annually. There is a line of steamers with New York weekly, a line with Maitimore and Philsdelphia, and also with IIavana and Cuba. Tonnage of the port in 1852,42,658 tons. The light-house at the entrancu of Charieston harbor is on Light-house Island, and weat of the ship channel. Lat. $32^{\circ} 41^{\prime} 54^{\prime \prime}$ N., long. $79^{\circ} 32^{\prime} 30^{\prime \prime} \mathrm{W}$. from Greenwich. The tower is 102 feet high, ehows a revolving Ilght elevated 125 feet above the surface of the sea, and is visible for $c$ distance
of $16 \frac{1}{\text { a }}$ antical milee. There is also a beacon, which with the light is used ae a range to crose the main bar, and two othera, the Morris Isiand and Sullivan's laiand beacons. By tis being the port of an extensive aystem of ralironde, it dralns supplies from a wide range of territory ; besides alnost the entire State of South Carolina, it comprises a large portion of North Carollna, Georgia, and of Last Tennessee." Charleston was frst settled in 1680. A colony of French refugees, exiled in 1690, in consequence of the revocation of the edict of Nantea, fled to Sonth Carollna, and a portion of them settled in Charleston, from whom some of ite most reapectable inhahitants have deacended. At the cluse of the year 1779 the city was captured by the British, who held it until the following May.

## -1Iunt's Merchants' Magnzine.

Port.-Charicaton harhor is apacious and convenient; but the entrance to it is incommoded by a range of sand banks, siretehing from Sullivan's Island on the north to Folly Island on the south, about 2! leagues. There are neveral cliannels through these banks, but only three, the middle or direct channel, the ship channei, and Lawford ciannel, between the latter and the main land, that ought to be attempted by ehips of congiderable burden. The entranco to the ehip channel is in lat. $82^{\circ} 40^{\circ}$. The depth of water on the shnllowest part ofthe bar at ebb-tide ie 12 feet, and at flood-tide from

17 to 18 feet; while the depth in the middle channel at low water does not axceed 9 feet, and in Lawford channel it does not exceed 10 or 11 fest. A light-house has been erecterl on the south point of Light-house Island, bearing from' the middle of the har of the ahip channel nerthwest by weat half west. It fa 80 feet high, having a revolving light, alternately brilliant and obscure, the period of obscuration belng doulle that of brilliancy; but on approaching the light, the Ister gains upen tho fermer, and within it league it is never wholly dark: The light may be aeen in fine wether at from 8 to 4 leagues off. After getting Into the channel, which is marked by the breakers and bueya on esch side, the propar course for a ship to steer la to bring the light-honae to bear nerthwesi by west, and stand direct for it till you get within the banka, when the course is north by west. But it is unnocessary to suter into further detalls on these points, as all ahlps entering Charleston harbor are bound, provided they sre hailed by a licensed pilot off the bar, to pay him fall pilotage fees, whether they accept his aervices or not In polnt of fact, however, they are alwaya accepted ; for the shifting of the aands, the influence of tha tlies, otc., render the entrance ao difficult to those not perfectly familler with 1 , that even the packet ships that aall regularly to and from New York uniformly heave to without the bar for a pllot.-See Plan of Charleston Harbor, reduced from the original survey of Major II. Bache.

Ships usually moer alengside quays or wharfs, where they are in perfect safety.
Shipping Charges.-The charges of a publle nature pald by|ahips entering this port differ but little in smount on a native and a foreign shlp. On a ressel supposed to be of 300 tons burden, entering, unloading, taking on board a mixed cargo and clearing ont, they would be as under:

| Fee on entry nt tho custom-hous |  |
| :---: | :---: |
| Surveyor's fee on s forelgn ship | 500.1114 |
| Surveyor's fee on n nativo ship | 3004012 \% |
| Ifrbor-master's fee | $200 \% 00861$ |
| Portwarden's eurvoy, when req | 1000 " 2228$\}$ |
| Fees, on clearance at the eurtom-house, \} of a native shtp | 350 " $01411 \%$ |
| Ditto, of s foretgn ship . . . . . . . . . . . . . . | 270 " 01164 |
| Hlotage in ward and outward, nupposing \} the slitp to draw 14 feet of water..... | 5000 * 1013 6t |
| Wharfage per dlem | 100 " 0488 |

The difference in the fees on the clearance at the custom-house of a native and a foreign ship is owing to the former being obliged to give certain bonds which are not required of the latter.
The greater or amalier tonnage of the ahip makes no difforence on any of the above charges except that of pilotage, which is in proportion to her draught of water, and is the same whether for a foreign or a native shlp.

Rates of Commission.-The rates of commlasion or fsctorage usually charged and allowed at Charleston on transacting different sorts of business, are as follows, viz. :

For aclling demestie produce, $2 \frac{1}{2}$ per cent.
For seliing foreign morchandise, 5 per cent.
For guaranteeing elther of these sales, $2 \frac{1}{2}$ per cent. additional ia commonly allowed.

For purchasing with funds in hand, or drawing domastlc billa for reimbursement, $2 \frac{1}{2}$ per cent.
For purchasing goods and drawing forelgn billa for reimbursement, $\overline{0}$ per cent. la charged.
For the sale of real or persenal estate the regular charge is 5 per cent. ; but where the property to be soid is of any considerablo value, the parties in general enter lnto an agreement beforehand, and a much lower rate of commission is allewed.-Ses Soutir Canolina.
Chart, or Bea-ohart, a hydrographieal map, or a projection of some part of the earth's superficies in plano, for the use of navlgators, Charts differ very considerably from geographical or land-innps, which sre of no use in -avigntion. Nor nre sea-charts all of
the asme kind; aoms being what are callsd plane charts, others Mercator charts, and others globular charts. Plane Chart is a representation of some part of the sinperficies of the terraqueous globe, in which the merldisna are aupposed parallel to each other, tho parallels of latitude at equal distances, and consequently the degrees of latitude and longitude every where equal to, each othor. Mercator's Chart is that where the ineridians ars atraight lines, parallel to each other, and equldistant; the parallels also straight lines, and par: allel to each other; but the distance between them ln= creasing from the equinoctlal toward cither pole, in the ratio of the secant of the latitude to the radlua. Globui lar Chart, a meridlonal projection, In whlch the distance of the eye from the plans of the meridlan, upon which the projection is made, is supposed to bo equal to the slng of the angle $45^{\circ}$. This profectlon comea the neareat of all to the natare of the globe, because the meridiana are placed at equal distances; the parallels also aro nearly equidistant, and consequently the several parta of the carth bave their proper proportlon of magnitude, distance, nd aituation, nearly tho aame indeed as on the globe itaelf. Hydrographic Charls, aheets of large paper on which aeveral prirts of the land and aea are deacribed, with thelr respective coasta, harbors, sounds, flats, rocks, abelves, aands, etc., together with the longltude and latitude of each place, and the points of the compass. Selenographic Charts represent the spots, appearancea, and macula of the moon. Topo graphic Charts, druughts of small parts of the earth, or of particular places. Anaximander, of Mlletua, was the inventor of geographicai and celestial charts, about 750 n.c. Modern seu-charts were hrought to England by Barthelomew Columbus, with a view to illustrate his brother's theory respecting a Western Continent, 1489. Mercater'a chart, In which the world ia taker as a plane, was drawn 1556.-E. B.

Charter-party, the name given to a contract in writing bet ween the owner or master of a ahip and the freighter, by which the former hires or lets the ship, or a part of the ship, under certain specified conditions, for the conveyunce of the goods of the freighter to some particular place or places. Generally, however, a char-ter-party is a contract for the use of the whole ship: it is in commercial law what an fndenture is at common law.-See Affneiontment.

No precise form of words, or set of atipulations, is requisite in a charter-party. The forms subjoined to this article are those most commonly in use; but these may, and, indeed, in many cases must, be varied, to suit the views and intentions of the partics. A char-ter-party is gencrally under seal; but sometimes a printed or written instrument is signed by the partles, called a memorandum of a charter-pet'ty; and thia, if a formal charter-party be not afterward executed, is binding. The atamp lin either case is the same. Charterpartics, when ships ars let or hired at the place of the owners' resldence, are generally cxecuted by them, or some of them ; but when the ship is in a foreign port, it must necessarily be executed by the master, and the merchant or his agent, unless the owners have an are it in auch port, having proper anthority to act for th in in such matters. A charter-party made by the master in his name, when he is in a forcign port in the uaual course of the alif's employment, and therefore under circunstances which do not afford evidence of fraud; or when it is mude by him at lome, under circomatances which afford evidence of the expressed or implied assent of the owners, is hinding upen the latter. But according to the law of England, no direct action can be maintained upon the instrument itself against the owners, unless it be signed and aealed by them, or unless they authorize the master (or agent, as the case may be) to enter into the contract, and unlesa it be distinctly expressed in the charter-party that he acts only as ngent. When a shlp is chartered by several owners to several persons, the charter-party should be
execuied by each，or they wili not be liable to an action for non－perfonnance．But if the charter－party be not expressed to be mado，between the partice，but runs thus：＂This charter－party ludented，wltnesseth，that C．，master of the alip W．，with congent of A．and B． the owners thereof，leta the ship to frelght to E．and $F$ ．，＂and the instrument containa covenants ly $E$ ．and F．to and with A．and B．；in this case A．and B．may bring an action upon the covenants expressed to be mado with them；but unless thoy aeal the deed，they can not be aued upon It．This，therefore，is a very proper form．The general rule of law adopted in the construction of this，as of other mercantile instruments， is，that the interpretation ahould be liberal，agreeable to the real intention of the parties，and conformaile to the usage of trade in general，and of the particular trade to which the contract relates．The clarter－par－ ty usually expresses the burden of the ship；and by the fumous French Ordinatice of 1681，it is required to do so．According to Molloy（book ii．c．4，§8），if a ship be freighted ly the ten，a：a found of less burden than expressed，the payment shall be only for the real burden；and if a ship be froightod for 200 tons，or there－ about，the addition of thereabout（says the same an－ thor）is commonly reduced to five tons，more or less；lu．： it is now usual to say so many tons＂register measure－ ment．＂The usual covenant that the ship shall be sea－ worthy，and in a condition to carry the gouds，binds the owners to prepare and complete overy thing to commenee and fulfilit the voyage．But though the char－ ter－party contained no such covenant，the owner of tho vessel woold be，at common law，bound，as a caryier， to take care that the ship shoold be fit to perform the voyago ；and even though he siould give notice，limit－ ing his responsibility from losses occasioned to any car－ go put on board his vessel，unless auch losa should a rise from want of ordinary eare，etc．，he would he liable if his silip were not sea－worthy，－See Sea－woutny．
In ail maritime transactione expedition is of tine ut－ most consequence ；for even by a short delay the ob－ ject or season of a voyage may be lost；and therefore， if either party bo not ready by the timo appointed fer the loadiag of the ship，the other may seek another ship or cargo，and bring an uction to recover the damages he has sustained．Tho manner in whiel tho owner is to lade the eargo ia，for the moot part，reguiated by the custom and usage of the place where he is to lado it， unless there be any express stipolation in the charter－ party with respect to it．Generully，however，tho own－ er io bound to arrange the difierent articies of the car－ go in the most proper manuer，and to tuke the greatest care of them．If a cask lo accidentally stavedi in let－ ting it down into the held of the ship，the maater must anawer for the less．If the owner covenants to load a fuil and complete cargo，the master must take as much on board as he can do with safety，and without injury to the vessel．The master must not take on board any contraband goods，wherety the ship or cargo may be liable to forfeiture and detention；nor must he take on board any false or colorable papers；but he must take and keep on board ail the pajiers and documents re－ quired for the protection and manifestation of the ship and eargo by the law of the countries from and to whieh the ship ts bound，by the law of nations in generai，or by any treaties between particular atates．If the mas－ ter receive goods at the quay or beaeh，or send his beat fer them，his responsiliility commences with the receipt in the port of London．With respects to goods intend－ ed to be sent coastwise，it has been held that the chief responsibility of the wharinger ceases ly the delivery of them to tha mate of the vessel upon the wharf．As sooll as he receives the goods，the master must provide adequate means for their protection and aceurity；for even if the crew be overpowered by a superior force， and the gooda taken while the ship is in a port or river within the country；the master and owners are liable for the loss，thoubh they may have committed neither
fraud nor fault．This may seem a harih rule；but it is necessary，to put down attempts at colluaive or fraud－ ulent conbinations．The mauter must，according to the terus of the charter－party，commence the voyage without delay，as soon as the weather is favoralle，but not otherwlae．
Sometimes it la covenanted and agreed upon between the partien that a apecified number of daya shall be allowed for loading and unloading，and that it ahall be lawfol for the freighter to dotain the vesael a further specified time，on payment of a daily sum an demur－ rage，－Niee Demurrage．If the vessel be detained beyond both period，the freighter ia liable to an aetion on the contract．The rate of demurrage mentioned in the charter－perty will，in general，be the measure of the damages to be paid；lut it is not the absolute or necessary measure；more or leas may be payabie，as justico may require，regard being had to the expense and loss ineurred by the owner．When the thine ia thus expressly ascertained and limited by the terms of the contract，the freighter is liable to an action for damages if the thing be not done within the time，al－ though this may not le attributabls to amy fuult or cmis－ sion on his part；for he has engaged that it shall be done．－Anuutt on the Lavo of Shipping，part iii．c．1． If there has beell any undertaking or warranty to sail with convoy，the vessel must repair to the place of rendezvous for that purpose；and if the mastor neglect to proceed with convoy，he will be answerabio for all losses that may arise from the want of it．The own－ ers or master should sail with the ship for the place of her destination with ali duo diligence，and by the usual or shortest course，uniess in cases of convoy，which the master muat follow as far as possible．Somatimes the course is pointed out in the eharter－party．A deriation from the usual course may be justilied for the purpose of repaire，or for avoiding an enemy or the perite of the seas，as well as by the sickness of the master or mar－ iners，and the mutiny of the crew．By an exception in the eharter－jurty，not to be liable for injuries arising from the act of God and the king＇t enemies，the onuer or master is not resionsilie for any injury arising from the sea or tho winde，uniess ic was in hie pewer to pre－ vent it，or it was occasioned by his imprudeuce or gross neglect．＂The question，＂said Lord Mansfeld，in an action brought by the East India Company，＂is， whether the owners are to pay for the damage ocea－ sioned liy the storm，the aet of God；and this must be determined by tho intention of the parties and the na－ ture of the centract．It is a charter of freight．The owners let thalr ships to hire，and there never was an idea that they insnre the curgo against the perils of the sea．What are the olligations of the ownere whieh nrise out of the fair construction of tho charter－party？ Why，that they shall be liable for damages incurred by their own fauit or that of their servante，as from defects in the ship，or improper stowage，ete．If they were liabie for damages oceasioned by storms，they would become inssurers．＂The House of Loris con－ firmed this ductrine by deeiding（20th of May，1788） that the owner is not liablie to make satisfaction for damage dene to goods by storm．The charterer of a ship may lado it eitier with his own goods，or，if ho have not sufficient，may take in the gooda of other per－ sons，or（if not prevented by a clause to that effect in the charter－party）ho may wholiy underlet the ship to another．－－For further details，see Annot on the Lav of Shipping，part iii．c． 1 ；Curtr＇s Commercial Law， vol．iii．c．9，ete．；and the articies Bilit of Lading， Fneight，and Master．
Forms of Charter－parties，－－The following is one of the most usual forms of a charter－party：
Thit oharter－party，indented，made，ete．，between A．B．，etc．， mariner，master，and owner of the good ahip or vassel，called， etc．，now riding at anchor，etc．，of the hurden of 200 tona，or thereabout，of the one part，and C．D．of，etc．，merchant，of the other parb，witnosseth，that the said A．B．，for the coneld－
at it is frauding to joyage le, but
eration berelaafter montioned, hath granted, and to freight letton, and by these precentin doth grant, and to freight let, unto the sald C. D., hita ozeentore, adminiotrators, and ansigns, the whole tonnage of tha hold, etern-aheeta, and haifdeck of the sald shlp or vemel, called, etc., from the port of London, to, etc., In a voyage to be made by the said A. I. with the aald ohip, In manner heretnafter mentioned, (that fe to asy, to aall with the firat falr wind and weather that aball happen after, etc., next, from the port of London with the goode and merchandise of the said C. D., bis factors or ataigna, on board, to, etc., aforemaid the act of God, the king'a enemies, fire, and all and every other dangera and aceldenta of the mena, rivera, and navigation, of whatever nature and kind, in wo fur at ohipa are liable thereto, during the aild royage, always excepted), and there unlade and make diecharge of the eaid goods and merchandises and almo shall there take Into and on board the mald thlp again the goods and merehandiven of the aald C. D., his factore or absigna and ahall then return to the pert of London with the raid roode, in the space of, etc., ilmittod for the end of the sald voy. age. In consideration whereof, the sald C. D., for himself his executors, and administratorm, doth covenant, promi and grant, to and with the and A. B., his executors, admin'trators, or sasigna, by theme presents, that the sadd C. D., his executorn, adminiatrutore, factork, or andgna, ehall and vill wetl and truly pay, or cauce to be pald, unto the aald $A$. B., hia executorm, administrators, or asaigns, for the freight of the satd ohip and gooda, the sum of, ets. (or se much per ton), within twenty-one daya after the sald ohip arrived, and gooda returoed, and discharged at the port of Yondon aforesald, for the end of the nald voyage: and aiso shall and will pay for demurrage (if any abail be by defantt of him, the sald C. D., hia factora or aselgna) the aum of, etc, per day, daily, and every day, me the mame ahall grow due. And the $^{\text {a }}$ cald A. B., for himmelf, ble executora and adminletratore, doth covenant, promise, and grant, to and with the said C. D., his executors, adminiatratore, and asielgns, by thene presenta, that the sald ship or vessel shall be ready at the port of London to tske in goods by the sald C. D., on or before, etc. next coming. And the aaid C. D., for himeelf, hia, ete, doth covenant and promice, within ten dayn after the amid ship or vessel ahali be thus ready, to bave hla gooda on board the eald nhip, to proceed on in the aald voyago; and also, on arrival of the sald ahlp at, ete., within, ete., daya to have hils pooda ready to put on board the anid yhlp, to refurn on the id voyage. And the sald A. B., for himself, his executora a indministrators, doth further covenant and grant, to and w th the sald C. D., his executors, administrators, and assignr that the aald ablp or veseel now is, and at all times during the voyage ahall be, to the beat endeavors of him, the sald A. B., his executors and administrators, and at bls and their own proper costs and charges, in silt thinga made and kept atif, staunch, strong, well-appareled, furnished, and provided, as well with men and marinera sufficient and able to sell, gulde, and govern the asid aht p , as with all manner of rigging, boata, tackie, and apparel, furniture, provislon, and appurtanances, fittiog and ascessary for the sald men and marinera, end for the sald uhip during tho voyage aforemaid. In witoess, etc.

The great rariety of clrcumstances under which dlfferent voyages aro made produce a corresponding diversity In charter-parties. The charter-party of which the following is a copy affords a good example of the more complex species of these instrumenta.

It la this dey mutually agreed between Mr. T. B. Rann, owner of the good ehlp or vessel called the Mormaid, Wiliam Henniker, master, of the measurement of 472 tons, or thereabout, now in the River Thames, and Mr. Devid Thomson, of the firm of Messra. Thomaon, Passmore, \& Thomson, of Maurituk, merelanta, that the sajd ship, belog tight, staunch, and strong, and every way fitted for the voyage, alhall, with slf corvenlont speed, sail and proceed to Calcutta, with leave to take conviets out to Ncw south Wales, and from thence troops, merchandise, or passengers, to the afore-mentioned port of Calcutta, with leave to touch at Madras on her wsy thither, if required on uwner's account, or so near thereunto as she mey safely get, and thers load, from the factors of the sald merelianls at Calcutto, a full and complete cargo of rice, or any othcr la wful goods which the cherterer engagea to allip. and proceed whth the same to Port Louls, in the Islo of Framec, and deliver the ssme freo of frelght; afterward load there a full and completo eargo of angur in bags, or other lawful merchandise of as favorable tonnage, which the charterer engages to ship, not exceeding what she can reatonably stow and carry over and above her tackle, apparel, provisions, and furniture; and, being so lomded, ahail therewith proceed to London, or so near thereunto as ohe may mafely get, and de-

Ilver the aame on being paid freight, riz., for auch quantity of sugar equal to the setual quantity of rice, or other gooda that may be ahipped at Calcutte, at the rate of 25122 . ©d. per ton of 20 cwh net, shipped there; and ahould the vemel deIIver more net nugar in the port of London than the quantity of rice, or other goods, actailly shipped in Calcutta, the own. orm to be pald on the oxcema at the regular enirent rate of freight for sugar which other vessels, loading at the same time at Port Louls, receive ; the tonnage of the rice, wheat, or graln, to be reckonad at 20 ewt . net per ton; that of othes gooda at the unual measurement (the act of God, the kingia enemies, Br $_{1}$, and all and overy other dangera and aceldents of the seas, rivers, and novigation, of whatever natare and kind seever, during the mind voyage, alwaye excepted). The frelght to be pald on nnioading and right deilvery of the car. go, at is cuatomary in the port of Londod. Ninety running daye are to be aliowed the sald merchant tif the ship is not sooner dispatched) for loadiog the ship at Calcutta, dischargIng the cargo at Port 1ouls, and loading the cargo thene; the sold lay daya to commence on the veasel betng ready to recelve cargo, the master giving notice in writing of the same at Cnlcuttia, and to continue during the loading there; and from the time of her arrival at Port loula, and belng ready to discharge, till the final loading at that port, and to be discharged in the pert of London with all pomelble diapatch; and 20 daye on demurrage over and above the sald laying dayn at $\mathrm{E12}$ per day. Penalty for non-performance of thil agreement, 24000 . The cargo to be brought to and taken from alongside at the expense and risk of the merchanta. The necessary cash for the disbursementa of the vessel at Calcutta, not exceeding £350, to be advanced by the cbarterer's agents: they taking the master'e drafta on the owner for the same at the regular current rate of exchange, and at three monthe' atght; and if the aald bills be not regularif accepted and pald when due, the same to be deducted from the freight payable by this charter-party. The vessel to be distursed at Port Louis by the chartering agents; sum not to ezceed C 300 , free of commisolon: and tho amount to be deducted from the freight at the final settiement at the port of London. Captain not to ship gooda without consent. In the event of the ship being prevensed, by damage or any other cause, reaching the Mauritius on or before the Ist day of Jamuary, 1843, the charterer or his agents shalt be at ilberty to employ the vessel for one or two voyages to Caicutta, at the rate of $£ 2$ per ton of rice, or other gooda, delivered at Mauritius, Fifty running days, to load and diacharge, to be allowed on each voyage; it beligg understood that the charterer or his agents ahall foad the ohip, as before agreed, eltber at the end of the frat or becond voyage, as tha case may be. The freight on the intermodiate voyagea (if any) to be paid on delivery of the cargo, in cash, $0_{i}$ by bills on London at usance, at the option of the master. The vessel to be addressed, both at Calcutta and Isle of France, to the agente of the charterer, In witness whereof, the sald parties have hereunto set their bands and seain, at London, the 2d day of December, 1841.
Slgned, sealed, and daliv-?
Tuos. B, Rank, (l. en)
ered, in the presence of $\}$ D. Tnomson, (Signed) E. Fonsyтu.
Chase. In nautlcal language, pursult; also the veasel pursued.

Chaser. The vessel pursuing; also guns at the heed and stern for firing when in chase.

Chay, or Choy Root, the roots of a amall biennial, rarely trlennial, plant, growing spentanceusly in light, dry, sandy ground near the sea; and extensively cultivated, especially on tho coast of Coromandel. The cultivated roots are very alender, and from one to two feet in length, with a few lateral fibrea; but the wild nre shorter, and supposed to yield one-fourth part more of coloring matter, and of $a$ better quality The roots are employed to dye the durable reds for which the Indian cotton yarn and chintzes have been long famous, and which can only be equaled by the Turkey red.

Chay root forms a considerable article of export from Ceylon. Only a particular set of people are allowed to dig it. It used to be all bought up by government, who paid the diggers a tixed price of 75 or 80 rix-dollars a candy, and sold it for exportation at about 175 rix-dollurs.-Bentolacci's Ceylon, p. 270.

This root has been im* rted into Europe, but with no succesa. Dr. Bancroft auspects it may be injured by the long voyage; but he adds, that it can produce ne effect which may not be mora chesply produced from madder. It is a very bulky article, and is cen-
cequently burdened with a very heavy frelght. $-P_{\text {er }}$ mament Colory, vol. II. P. 282-303.

Chooks, Chequet, or Drafte, are ordors addressed to some perion, generally a banker, directing him to pay the aum apectiticd in the check to the pernon named in it, or bearer, on demand.

In point of form, checks nearly rosemt'e hille of axchange. They ure aalguable by delivery only; and are payable instantly on presentment, without any days of grace being allowed. But by the custom of aome places, a banker has untll tive of the afternoon of the day on which a cl rak la presented for payment, to return it; so that where a check was returned before five, with a memorandum of "eanceled by miatake" writion under it, it was held a refusal to pay., If a check upon a bauker be lodged with another banker, a presentment by the latter at the clearing-house is onfficient. Checks are usually taken conditionaliy as cash; for unless an exprese atipulation be made to tho contrary, If they be presented in due tine and not pald, they are not a payment. It is difficsilt to define what is the due or reasonable time within which checks, notes, or bills should be presented. A man, as Lord Ellenborough has observed, is not obliged to neglect all other buolness that he may immediately present them: nevertheless, it is the safest plan to preaent them without any avoidable delay; and if received in the place where payable, they had better be presented that day, or next at farthest. If a check be not presented withln a reasonsble time, the party on whom It is drawn will be justified in refusing to pay it; and the bolder will lose his recourso upon the drawer.Cintty on Commercial Law, vol. iil. p. 591 ; Woolrycil on Commercial Lawo. See Bilas of Excianan.

Choese (Germ. Käes; Du. Kaas; Fr. Fromage; It. Fornuagio, Cacio; Sp. Queso; Rues, Sur ; Lat. Caseus). The curd of milk compressed into solld masses of differont sises and shapes; and, when intended for keeping, salted and dried, and sonsetimes colored und flavored. It is almost always made from the milk of cows, but occaaionally from that of ewes, and sometimes, though very rarely, from the milk of goats. The following are the princlpal British cheeses: Bricibat, formed of new milk and cream, chiefly In Wiltshire, in the autumn, and sold in little square pleces about the size of brickhats. Cheddur, round thick cheeaes, weighing about 150 or 200 libs., with a spongy appearance, and the eyee or vesicles filled with a rich oil. Cheshire, large, round, thick cheeses, commonly welghing from 100 to 200 pounds each; solid, homogencous, and dry and friable rather than viscid. They are made from the whole of the milk and cream; the morning's milk heing mixed with that of the preceding evening previously warmed. Derbyshire is a small, white, rich cheese. Dunlop, orlginally made in Ayrahire, but now general throughout Scotland, is large, round, white, buttery, and weighs from 80 to 60 pounds. This and the Derioyshire cheese are very much alike in form, color, and flavor. Gloucester, large, round, and mild; battery rather than friable. There are two kinds, tho single and double Gloucester; the single is made of the milk deprived of about half the cream, and the doable of the milk with the whole of tho cream. Green or Sage cheese may be made of any of the other kinds, by mixlog the milk before it has curdled with a decoction of sage lesves, among which some put a few flowers of marigold and leaves of parsley. In the Highlands of Scotland tho leaves or seeds of lovage aro added to the sago, which communicate a very strong flavor. Livcolushire is made of new milk and cream; it is quite soft, not above two ibrhes thick, and will not keep more than two or three months. Norfolk, the welght is generally from 30 to 50 pounds the curd is dyed yellow with arnotto or satfion; snd though not a rich cheese, it is considered a good keeper. Sof or Slip-coat is a amall, soft, rich cheese, which might almost be
mistaken for butter, if $f^{\prime}$ were not white, and which muat be eaten in a week cr two after maklog. Siltion, so named from the town in lluntingdonshire where it was firot brought into notice, bnt which la made princlpally in Lejecstershire. It in solid, rich, butiery, and white ; and, unlike all the other cheesee which have been mentioned, It ls twice as high as it is broad. It is much improved by keeping, and is seldom used before it is two years old. It is the dea: ent of all English cheeses, the price being generally to that of Chester as 2 to 1 , or 2 to $1 \frac{1}{4}$. In order to Induce premature decay, and the consequent appearance of age in these cheesee, It is said the makers sometimes bury them in masses of fermenting straw. Cotfenham, so named from a town in Cambridgeahire: It differe chiefiy from the cream cheene of Stilion in being fiat, hroader, and superiorly flavored. The flavor is ald to be owing to the sleh grasses which grow on tho fens. Suffolk, or akim-milk, is round and thin, weighing from 25 to 30 pounds each, and in the beat-keeping cheese made in England. Wiltahire resembles the Cheshire; but is poorer, and of iuferior tavor. It la apt to become scarfy, to provent which it is generally conted over with red paint. Yorkshire, or Cream Cheese, is the same as the slip-cont cheese, already mentloned.

Luropeon Cheeses.-The mott remarkable of these are the following : Purmesan is chlefly made at Parma and other places in Lombardy, of the curd of skimmed milk hardened by heat. Its favor is asid to be owing to the rich pastures of that part of Italy, where all plants, from the greater quantlty of bright sunshine than in Britaln, have doubtlese their aromatic properties greatly increased. Swisa cheese is of varlous kinds; but the ehlef aorta are the Gruyere or Jura cheese, and Schaluzieger or green checee; the last is flavored with the seeds and leaves of the melilot (Melilofis officinalis). German cheeses are of difforent kinds; but nore are celebrated, unless we except that of Westphalla, which is made up into round balis or short cylinders, under a pound welght each. The pecullar gavor which this cheese acquires arises from the curd being allowed to become putrid before it is compressed. In Holland very good cheese is made, particularly the Edam and Gouda cheeses : the former is very ealt, and keeps well at sea. In many parts of the Continent, and even in the interior of Poland and Russin, there are insitations of English cheese made; but what may be called the Indigenous cheese of the Rusaian empire is nothing more than salted curd put into a bag and powerfuliy pressed, and taken to market as soon as it is made, in tho eame manner as hutter is. In some places, instesd of a press, tho whey is forced out of the curd by putting it into a lorg cloth midway hetween the two ende, while a person at each end twists the cloth in an opposite difection, and thus wri:'ga out the whey. In some miserable Russian viliages the curd is exposed for ealo in small lumpe, retaining the marks of the fingers, which shows that no other pressure has been employed than what can be given with the hand. In France the Roquefort cheese is the most eateemed, and pext that of Neufche ${ }^{\bullet}$ l. The former somewhat resembles Stilton, but is much Inferior; and the latter is - cream cheese, eeldorn exceeding a quarter of a pound in weight.-See Johsaton's Lectures on Chemistry.

Cheese, in the United States, except for local consumption, is manufactured principally in New York and Ohio. The New Xork Orange county cheese, when new, is equal to any of the mild cheeses; but it does not aequire by sge that richness of flavor that English cheese does, The Ohlo checse is procuced at a very low price, and is taking a rank among the important products of that agricultusal State. The prairice of the West, affording wild grasses of great nutriment and flue flavor, are exceedingly well adapted for the production of cheese of good quality, and at a price that exeludes foreign cheeso from the market, except for epicurean tastes.

Fully one-half of these luports came from France. -See Butten.
Chemistry and Diatiluing. Introduced into Europe ly the Spanish Moore about A.D. 1150; they had learned them from the African Moors, and these from the Egyptians. In Egypt they had, in very early ages, extracted salts from their bases, separated oila, and prepared vinegar and wine; and embaiming was and of chemical process. The Chinese also claim an early sequaintance with chemistry ; but the futhers of true chemical philosophy were, Bacon, Boylo, Hocke, Msyow, Newton, etc. The modern character of chemistry was formed under Beecher and Stabl, who perceived the connection of the stmosphere and the gasca with the production of phenomena. Bergman and Scheele were contemporsry with l'rieatley in England, and Lavoisier in France; then followed Thomson, Davy; and other distinguialied men.--Haydn.
Cherbourg, s commercial and fortificd sea-port town of France, and nearly opposite the western extrenity of the Isle of Wight, 10 milos east-southeast of Cape ia Hague. Latitude of Fort Hoyal, $49^{\circ}$ $40^{\prime} 3^{\prime \prime}$ N., longitude $1^{\circ} 35^{\prime}$ W. P'upulation, 22,460. Its climate is remarkably mild. Its naval docks are cut out of solid rock; and it has a commereial harhor lined with stone quays. Its roadstead, defended by several large forts and batteries, is now one of the Leat in the Channel, being sheltered by a digue, or break water, 411 yards in length (or considerably more than twice as long as the 1'lymauth breakwater), legun under Louis XVI., and completed in 1810. Cherbourg hus a maritime tribunal, a national academic society, commercial cellege, naval achool, and muscums ; sugar and sode refineries, and tanneries; and an active trade in eggs, cattle, lard, butter, wine, and other producc, exported to England and the Channel Islands. It was the last place in Normandy resigned by the English. Charles X. cmbarked here with his family, on quitting France, August 16, 1830. The tirst French transatlantic steamer arrived at New York from Cherbourg, 8th July, 1847.

Cherries. They were brought from Pontus, to Luculus, to Rome, about 70 a.c. Apricots from E:pirus; peaches from Persia; the finest plums from Damascus and Armenia; pears and fige from Greece and Egypt ; citrons from Media; and pomegranates from Carthage, 144 n.c. The cherry-tree was first planted in Britain, it is said, about A.d. 100 . Fine kinds were brought from Flanders, and planted in Kent, and with such success that an orchard of thirtytwo acres produced in one year $£ 1000$, A.D. 1540.
Cherry-tree (Cerasus lirginiana). The wildcherry tree is ene of the largest productions of the American forest. In the Atlantic as well as the Westcrn States, this tree is known only by the name whlch we have adopted. It is mere or less abundant as the soil and climate ure more or less favorable to lts growth, to which the extremcs of heat and cold in the seasons, sad of dryncss and humidity in the soil, are alike unpropitious. It sbeunds in Illinois, in New York, and in Upper Canada ; but it is nowhere more profusely multiplied nor more fully doveloped than beyond the monutains In the States of Ohlo, Kentucky, and Tennessee. The porfect wood is of a dall, light red tint,
which deepene with sge. It is compack, fine-grained, and brilliant, and no: liable to warp when perfectly eeaoned. It is oxtensively employed by cabineto makers for every species of furnitura, and when chosen near the ramification of the trunk it rivals mahogany in beauty. This wood is gentrally preferred to the black walnut, whose dim complexion with time becomes nearly black. On the lanks of the Ohlo it is employed in ship-building, and the French of Illinois use it for the felloes of wheels.-Bnowns's Sylra Amer.

Cheaspeake Bay (Maryland), is 190 milen long, and from 7 to 20 broud, and generally of futhoma deep, being the lurgest bay in the United States. Its entrance is wholly in the State of Virginia, between Cape Charles on the north and Cape lienry on the south, which are about 12 or 15 miles apart. But the bay lies moatly In Maryland, dividing the State into two parta, called the Eastera and the Weatern Shore. It has several commodious harbors, and a safo end easy navigation. It receives the waters of the Potomag, Rappahannoc, and Jumes rivers, which are all large and navigable; ulso of the Susquehanna and York rivers.

Chentnut (Fague castanea), is forest tree growing sbundantly in most parts of the southern countries of Europe. It is long-lived, grows to an immense size, and is very ornamental. The wood is hard and compact; when young, it is tough and flexible; but when old, it is brittle, and often shaky. The chestnut contains only a very small pruportion of sap-wood; and hence the wood of young trecs is found to be superior to even the oak in durubility. It is doubtful whether the roof of Westminster Had be of urk or chestnut, the two woods being, when old, very like each other, and having been formerly used alumost indifferently In the construction of buildings. A good deal of chestnut has been planted in England within the last thirty years.-Trabdgold's Principles of Carpentry.

Chentrut (Castanea l'esta). The American chestnut does not venture beyond the 4tth degree of Istitude. It is found in New Hampshire, Letween the 43d and 44th degrees; hut such is the severity of the winter, that it is less common than in Connecticut, New Jersey, nnd Pennsylvanla. It is the most multiplied In the mountainous districts of the Carolinas and of Georgia, and abounds in tho Cumberland Mountains and in East Tennessee. The coolness of the summer and the mildness of the winter in these regions are favorable to the chestnut; the face of the country, slso, is perfectly adupted to a tree which prefers the sides of mountains, or their immedinte vichity, where the soil in general ls gravelly, though deep enough to sustain its perfect development. It is a strsnger in Vermont, the Siate of Maine, and a great part of New York, to the maritime parts of Virginia, to the Carolinas, Georgis, the Floridas, Louisiuna, and as far as the mouth of the Ohio. The American chestnut sometimes attaina the height of 70 or 80 feet, with a ciroumference of 15 or 16 feet. The wood is strong, elsatic, and capable of enduring the succession o. dryness and moisture. Its durability renders it especially valuable for posts, which should be made of trees less than ten inches in diameter, and charred before they are set in the earth. It is also used for rails, and is said to lust more than fifty years. For shingles this wood is superior to any kind of oak, though it has the ssme defect of warping. It is not extensively used for staves, and its pores, like these of the red-oak, are so open, that it is proper only for dry wares. The chestnut is little esteemed for fuel, and is not much used; it is tilled with uir, and snaps whun it burns. The coal is excellent.Bhowne's Sylea Americana.

Chestnuts (Fr. Châtaigner: Ger. Kastanien; It. Castagne ; Sp. Casta. is), the fruit of the chestnat-tree. In some parts of Europe they are frequently used as a substitute for bread, and form a large proportion of the food of the intabitants. This is particularly the
case in the Limousin, in Coraica, and of eeveral districts of Spain and ltaly. The inhabitunta of the Limousin are euid to prepare them in a peculiar manner, which deprives them of their astringent and bitter properties. Chestnuts imported from Spain and Italy are frequently kiln-dried, to prevent their gormination on tho passage. In this country they are princlpally served up roasted at desserta.
Chetwert, or Tschetwert, a measure of corn in Russia, equal to 5.77 Imperial bushels; hence 100 chetwerts $=\mathbf{7 2} \cdot 12$ Imperial quarters.
Chicago, city and capital of Cook county, and the most coumercial place in Illinois, 204 miles northnortheast from Springfield and 717 from Washington. The city was laid out in 1830, and lots first sold in 1831. Population in 1840, 4470; in 1850, 29,964; in 1852, 38,734 ; and in 1854, 55,000 . It is beautifully situated at the terminus of the Michigan Central and Southern Railrond, on level ground, elevated about tive feet suove the lake, which secures it from ordinary floods, and extends on both sides of the river of the same name, between the junction of its north and south branches, and diatant $1 \frac{1}{2}$ milo from ita entrance into Lake Michigan. The harbor has a depth of from twelve to tifteon feet of water, which makes it a commudions and safo haven; and it has been much improved artificially by the construction of piers which extend on each side of the entrance of the river for some distanco into the lake, to prevent the accumolation of sanil upon the ber. The light-house is on the south side of the harbor, and shows a fixed light on a tower 40 fect above the surface of the lake; and there is a beacon on the end of the picr. Numerous ateamboats and vessela ply between this place and Buffalo, and the various intermediate places on tho upper lakea. West of the city, toward the Weat Plains road, ia a fertile prairie, which, for the firat three or four miles, is elswated and dry. Along the north branch of the Chicago and tho lake ahore are extensive bodies of fine timber. White pine lumber is obtained fiom the regions about Green Boy and Grand liver, in Mieligan, and acrozs the lake frem St. Joseph's liver. The city is a great shipping point for an immense and fertilo region. The llinois ant Miehigan Canal, which is 60 feet wide at the top, 6 feet deep, and 107 miles in length, including 5 miles of river navigation, through which is brought a large amount of produce from the south and southwest ; and the railroads radiating from Chicago, add to the vast acemmulation which is here shipped for the Atlantic sea-board. There are 10 steamers, 34 propeller , and 190 harks, brige, schooners, and sloops, engaged in the Chlengo trade. In 1836 the value of the exporte was $81000 ;$ in $1840,4228,635$; in 1845, $\$ 1,543,519$; and in 1852, $\$ 12,000,000$. The assessed value of real and personal estate in 1853 wos \$1t, $\mathrm{k}=11, k 31$. There are twelve trunk rallronds now constructed and in process of conatruction, all centreing at Chicago, and measuring in the aggregate 2485 miles. Of this amount, 1725 miles with lie within the State of Iltinois, and the remainder In Incliana, Mlehigan, and Wisconsin. Nesides these trunk roads, thero are several hundred miles of t,ranches, all centreing toward Chilegge. The trunk andl lirench roads reach the Miseissip $f^{\prime}$ River at ten different points from tialena sonth to Cairo. Chicago is supplied with the parest of water from the lake, is within a short distance of the mest extensive coul fiekds to he found in Illinols, ant is the natural outlet for the produce of one of the richest agriculturnl seetions of the Unimn.-Sied ¿AAKEs, commerce of.

The lum'. er trade of Chieago is immense. During the year 1855 over three hundred millions of fett were received here. The following table will show the receipts for the past six years:

Chiengo has grown more rapidly up to this time than any city in the world. In 1823 Niajor Long ond party made a journey to examine the sources of the St. Peter's River, etc.; and in his account of the expedition writes as followa of Chiengo:
"The village presents no cheering prospect, as, notwithstanding its antiquity, it consista of but few huts, inhabited by a miserable race of men, scarcely equal to the Inclians from whom they aro descended. Their log or bark houses are low, filthy, and disgusting, displaying not the least trace of conifort. Chier , is, perhaps, one of the oldest settlements in the Indinn country; its name, derived from the I'otawatomi languge, signifies elther a skunk or a wild onion; and either of these significationa has occasionally been given for it. A fort ia said to have formerly existed there. Mention is made of the place as having been visited in $16 i 1$ ly Perot, who found 'Chicagou' to be the residence of a powerful chlef of the Miamis. The number of trails centering all at this spot, and their apparent antiquity, indicate that this was prohably for a long period the site of a large Indion village. As a place ef husiness, it ofiers no inducement to the settier; fin: the whole annual amount of the trade of the lake lid not exceed the eargo of five or six schooners, even at the time when the garrison received it supplies from Markinaw. It is not limpossible that at rome dlistant day, when the banks of the Ilitals shall have been covered with a dense population, and when the low prairies which extend hetween that river and Fort Wayne shall have nequired a population proportionate to the produce which they can yleld, Chileago may hecome one of the points in the direct line of communication between the northern lakea nod the Mississippi. Hut even the intercourse which will be carried on through this communiention will, we thluk, at all times lie a limited one; the dungers attending the navigatien of the lake, and the seareity of harbors along the shere, must ever prove a serious obstacle to the larrease of the commercial importance of Chicago. The extent of the sand hauks which are formed on the enstern and southern sheres by the prevailing north and nerthwesterly winds, will likewise prevent any important works from lelag umiertaken to improve the port of C'hicugo."
It Is estimated that tho city now (1857) cemains 100,000 inhablants, and does a larger trade in proportion to its size than any elty in the Union. What better illustration can be given of the rapid growith of the Weat at this place?

The population for the years hetween 1850 and 1860 (the last four years being estimatel) is as follows:

| Years. | Populailon. | Years. | Popainition, |
| :---: | :---: | :---: | :---: |

Taking the portions of the above lines which lie in the State of Illinois, and ndding tho length of the different roads completed in the central portions of tho State, we find that lllinois now contains two fhousand seren hundred and sixty-one miles of completed railucay. Five gears agg there were only ninoty-fivo miles. These facts show n most gratifying progress, of which every citizeu of Iliinois may well be proud.

Tho above facts and figures will be regarded with special satiafsction ly the people of the Northwest generally. They show a hesithy, but rapid and most astonishing progress. It may be doulted whether the history of the eivillzed world enn furniah a parallel to the vigorons growth and rapid development of the eountry which has Chicago for its commercial metropolis. When it is remembered that twenty yesrs ago it was not an incorporated city, and less than a quarter of a eentury since tho Indisns atill had possession of the largest portion of this magnificent country, these facts, stubborn and incontestablo though they be, ecem more like the dreams of some vagrant imagination thnn sober matters of renlity, which scores of men still among us havo themselves seen and realized.
Twenty years ago Chicago was an insignificsint town at the southern end of Lake Michigan, importing nearly nll its produce from Western New York and Northern Olio. Last year it shipped 21,583,22I bushels of grain, and tho total receipts were over twenty-four and a half millions. Six years ago she had only a single railrosd somo twenty miles long entering the city; now there aro 3676 miles completed and in operation, and the earnings of these lines for the last year amount to the enormous sum of $\$ 17,343,242$. The increase of earnings during tho year 1856 is over four mill of dollars. Nore thsin a hundred trains of cars arrivo nad depart daily. The trade in lumber exceeds ly far that of nny other eity in tho world, amountling to $456,673,169$ feet. Ten yeara ngo tho manufactures were in their Infaney, and were seareely worthy of commendation. In 1856 the eapital investod amounted to $87,759,400$, nnd the valuo of manufactured articles to more thanfifteen millions and a half of dollars. Six ycars ngo Chicago was repronched ns belng a city of wooden shanties; last year sho invested in mangnilicent atores, many of them with superb marblo and iron fronts, elegant palatial residences nncl other improvements, 85,708,624. And wonderful as has been the progress of the city, it has not been ablo to keep pacs with the improvements of the country hy whict li is surrounded.

The atntistics of the movement of population westward show that peopilo enough found their homes west of Chiengo lurlug the year 1857 to furn two entira States. Nor is this a movement of mero human bone and musclo; it is a concentration upon tho rieh rolling prairics and maid tho beautiful groves of a vast host of active, vigormin, intelligent men, who plant schools null churches wherever they settlo, and bring wilh them all the ejewents of nu enterprising Christian civllization-n deep, controlling, ever-nbiding reverence for likerty natd for law. They aro laying the foundations for an empiro of whoso wenlth, intelligence, and power, the sun in all hils course has never seen the equal. Lire tho next quarter of a century shall havo rolied nway, the heantiful valleys of the Upper Missont, the Yellow Stone, the Plate, and tho Kansas, ay, antl cyen that of the Red River of the North, wili all have heen setted, and this over-deepening ourrent of embration will meet an equally resistless atream from the Pacilio const, and roll back in mingling eddica from tho summlts of the Rocky Monntalns. lourteen Stutes as large as Ohio, but on an average more wealthy and pepulous, will have grown up on the magulifent eountry lietweon tho lakes and the Rock $y$ Mountains, nud how msuy will repose upon the "Pacille slope" wo dare not attempt to predict.

Chicory, or Euocory, the wild endive, or Cichorium Intybus of Linnous. This plant is found growing wild on calcareoua aolls in England, and la most countries of Europe. In its natural atate the stem rises from one to three feet high, but whon cultivated it shoots to the height of five or aix feet. The root, which runs deep into the ground, is white, fleshy, and yields a milky juice. In Germany, the Netherlands, and France, chicory has long been extenaively cultivated for the sake of its root, which la usod aa a subatitute for coffee. When prepared on a large scale, the ropta are partinlly dried, and sold to the manufacturers of the article, who wash them, eut them In pleces, klln-dry them, and grind them between fluted rollers into a powder, which in packed up in papers containing from two ounces to three or four pounds. The powder has a atriking resemblance to dark greund coffer, and a atrong odor of liquorice. It is largely used in Prussia, Brunswlek, and other parts of Germany ; but as it wants the essential oil and the rich aromatic flavor of coffee, it has little in conmmen with the latter except Its color, and has nothing to recommend it except its cheapness. Chicory is now grown in Westchester county, New York.
Chill. The republic of Chili occupies that long strip of lund whitch lles on the southwestern side of South America, extending from $24^{\circ}$ to $55^{\circ} 59^{\prime} \mathrm{S}$. lat.; and from $69^{\circ}$ to $72^{\circ} \mathrm{W}$. loug. It is bounded west by the Pucifle Oceun, and east by the Anles, by which it is separated from the Argentine Confederation. On the north, Chill is separated from Bolivia by the extensIve desert of Atacama; and it extends aonthward to the extreme limita of that Archipelage which embraces all the islanda between Chiled and the Straits of Magellan. Reckoning its length from the desert of Atacama to Cape IIorn, it comprehends 36 degrees of Jatitude. Its averuge breadth is only 150 , nuid where grentest not more than 210 geographical miles. The superitcial area of Chili is computed ut 218,925 Eughish square miles, which is about 3195 miles more extensive than that of France and Belglum together. Except where the Andes are intersected by ravines, which frequently chunge into vales or phains tit for cultivation, these mountains, with their parullel ranges and apurs, oceupy a great part of its area. South of tho Cuesta de Chacalnco there are extensive phans, broken only by a few ridges of hills; but the highluands are almost continueus from north to south ulong the coast of the Pacille.
Chili is rich In alnost every class of metals; but the silver mines of late years have yichled enormons quantitics of ore. The metals at present dlacovered are gold, silver, copper, lead, autimony, colualt, zine, nickel, blanuth, Iron, molyblenum, und quleksilver; but the only ores which are worked are gold, silver, copper, ned oecasionally quieksilver. The latter will now be abandoned in consequence of the low price of merenry, caused by the quantity produced in Culifornia. The metals are found in all the series of rocks letween granite and trachyte, in weins which generally run from north and northwest to south und southeast; In some places, however, their course is irregular, or they extend east and west. The nuriferons veins run nearly purallel to the grain or limperfect cleavage of the surrounding granite roeks. Gold is foumal most ulumdantly in the beds of detritus, derived from the legradation of the upyer portion of the rocks. Copper ores, contalulug a small puntity of gold, are generally associnted with mienceous apecular lron. In the hills of Altrue, almout four leagues from Ranengua, In the province of Santligo, are the only gold mines worked with any spirit, excepting aome new mines near Copiapo, anil they are remarkable for the viriety of minerals mixed with the gold, such us ghlena, blenise, copper and Iron pyrites, and peroxyd of fron. Tha suhatancea are found disseminuted in quartz velus ruming nearly worth and south, Near Illajel aro
some very poor gold mines, in the beds of the gypseous formation, in altered fellspathic clay-atate, which alternate with purple porphyritic conglomerate.

Until 1832, the only silver mines in Chili were those of Deheaa, San Francisco, San Lorenzo, Sema and San Pedro Nolazco, in the province of Santlago, and Arqueros mineral district, about 17 leaguea from Coquimto ; but these mines now produce very little silver, and are nearly alandoued for the rich silver mines in the province of Atacama, near to Coplapo. Within a circuit of 25 leagucs from Copiapo, there are 19 silver mineral districts; the richest are Chanurcillo and Tres Puntas. In Chuniarcillo the upper 1.art of tho mines produces untive silver, iodid, and bromid, associated with chlorid of silver and carbonate of lead. In the "Colorudo" mine of Chafiareillo, cmbolise with native silver is occasionally found. In the mine of San Antonio, in the same distriet, is found bismuthic silver ore, combined with native silver, copper, and arsenic. As the mines become deeper, the silver ores are changing principally into what the netives call "metales frios" (cold ores); these contain different proportions of antimony, sulphur, and one sort a little arsenic. The dark-red silver ore is a pyrargerito, containing sulphuret of silver nud antimony, with sometimes a little arsenle. The gray ore contains silver, arsenic, and anthony. Of these two sorts upward of 5000 tons were exported to England during 1852, ns the nutives are unable to extract the silver by the usual phan of numalgomation adopted with the other ores. The export of the "metales frios" to England will in a great moasure cense, as an English establishment is forming at Calilero, the port of Copiapo, to treat them on nn improved plan. Seme of the mines in Chanareillo yied nearly pure silver; the most productive nre in the hands of four or five larf. capitalists. The ground near some of the riebest mines is sometimes sold at enormens prices, the price beiog in some regulated hy the probatility of the rich veins of metal rumning into ft . In Cophapo a regular trufle is carried on in buying and selling "barras" (a 24th purt) in diflerent mines.
A ruilroad runs from Caldera to Copinpo, a distance of 54 miles, which is to le continued on to Chanarcillo, nlout 50 miles from the city ; and a trum-road is projected to the riel minerul Ilistrict of Tres Puntus ( $8+00$ fcet ulove the sea), which, when completed, will enaWe the miners to send down the poor silver ores which they now throw awny. The commerce of Chili has vastly incrensed since the tine when the conutry lay torpiil under the yoke of Spulin. As soon as it hail recovered from the unsettled condition caused by the revolution, business of all kinda acquired new energy, mid the trade, freed from tis oppressive restrietions, extendell to the larger ports of the United Stutes and Europe. A few years were suthelent to show a large increase ln its export nud lmport trade, and Yalpuraiso soon becane a douriahing port.

The procious metals are the most vuluable exports from Chilh. While obtuining nummully from her minies metal to the amount of $\$ 1,500,000$, she exported in the year 1851 gold to the vnlue of $\mathcal{L} 59,950$, silver to the value of $\mathcal{f} \% 09,467$, and copper to the value of $\mathcal{\&} 11,5,503$. Flour, whent, barlyy, and bisenits figure largely in her exports, but with considerable varintlous in amount. In 1850 ' there were shipped more than $6(6,000,10011 \mathrm{~s}$, of flour: in 18: $11,41,000,0610$; mind in 1852 maly $41,000,000$. Above 62,000 quarters of whent were exported in 1850; In 1851 the quintly was 26,470; and in 18.52, 56,570 quarters. In barley, however, there has heen a consideralido increase. Prom 17,750 quarters in 18in), it rose to 96,190 quarters in 1n52. The luerenseld export of whent and tlour in $\mathbf{I R} 50$ arlses from the oxiensive shipmenta made in that year to Callfornia.

In the latter half of 1852 the exports of wool nuounted lin vilue to $£ 32,3: 10$, pulse to $£ 20,818$, coal to $£ 13,970$, hides nul skins to $\mathbf{C 9}(62$, gnano to 55562 , and charqui

In return for her various exports Chili recelves from Euglanil cotton goods, from France silks and varlous srticles of luxury, sid from other countries a variety of articles for domestic use. Chill has reciproeal treaties of commerce with Austrif, Brazil, Belgium, Bremen, Sardinia, D nmark, France, Great Britain, Prussla, Sweden, Norway, Tuseany, 1 Iamburg, Lubeek, Oldenhurg, the United States, l'eru, Eeuador, and the Sundwich Islands. Hercommercial relations are most extensive whth Great Britain and the British colonies, the imports into Chili anounting in 1852 to $£ 1,159,613$, and the exporte to $£ 1,098,7 \overline{2}$. Next in importance la the trade with Franee, tho United States aud Callfornia. With the other republies of South America her conmereiul transuctions, which were ouee considerable, nppear to be ou the decline.
In 1851 several important restrietions were removed from the castoms eode of Chili, which had been only partially modified in 1834. The exportation of national produce was then deelared free in principle, but a small duty was to be maintained for a short timo upon a very few artieles. All imports, with the exeeption of iron, steel, zine, cotton, mereury, coal, ugrieultural tools, surgical Instruments, and books, aro liable to a moderate duty. Jewelry pays 2 per cent. ; horses, mules, and dried fruit, 6 per cont.; shoes, linen stufls, furniture, und articles used only ly the wealthy, 30 per cent. The daty on whito wine is reduced to 10 reals per dozen, and on red to 8 reals. Teas pay 2 teals tho pound. Grain of all kinds is suljeet to a movable taritf. As long as tho price in the lome market does not exceed 10 s .8 bl . the fanega of 150 lbs ., foreign grain pays an import duty of 12 reals the fanega; but If the prico rises to 20 shillings, the duty falls to 8 reals, and if it exceeds 25 shillings the import duty ceases altogether. Many of the merchunts of Valparilso aro desirous of the completo abolition of all restrictive dutles; but government will probably delay any further steps in this direction until the advantuge of the reform alrealy made has been tested by further experience. The effect of this legislation, introduced under tho admlnistration of General Buhes, Las hithcro been to increase the revemue.
Tho welghts and measures of Chili aro the same as those used in Spain; but necording to the decrec of January, 1818 , those of lirance are to ho substituted in Jamary, 1858. The largest dry measure of eapacity la the fanega, which is subdivided into twelve almuds, and contuins $0,430,626$ cubic inches. The usual corn measure is the half fanega, which is a long parallelopipedon having one of its narrow sides traplezodal. The imperial fushel contains $2,218,27.1$ cubie behes, so that the fangig of Chill is to the former as 2.48 tu 1 . The average weight of a fanega of wheat is 157 ll 1 s .

The uld tallo of long measure is divided into lineas, pulgulas, ples, varas, und enulras, or lines, inches, feet, yards, and quadras, Corresponding exuetly la value to Troy welght there aro the Spanish granos, onzas, and libras-or grains, ounces, and pronds; and to avoirdupis welght, onzas, libras, mal quintales, or cwt. In liquid measure the Engilsh quart is equal to 1022 Spanish euartillo, and the lmperfal gallon to toxy cuartilles. Gold is bought ly the castelluno or marce. Its relative llneness is expressed by quillates or earats, four grames or gralis making one quillate. The weight of the marco is equal to d800 Spunish gralus, or to 7 0z. 7 diwt. and 22 gr . Fnglish Troy weight, The stamard dineness of goll is 21 quillates. The relative fineness of silver is expressed by dineros, the dinero belng equal to 24 granos; and the standard fineness of that metal is 10 dineres and 20 granes. The oll gold coins aro the ounce, cqual to 17 dollars 2 reuls,
£3 98. sterling money; the half ounce, equal to 8 dollars 5 reuls, $\pm 114 s .6 d$. ; the quarter ounce, equal to 4 dollars $2 \frac{1}{2}$ reals, $17 \mathrm{~s} .3 d$. ; and the escudito, equal to 2 dollars $1 \frac{1}{4}$ real, $8 s .7 \frac{k}{2}$. Among the silver coins, besides the renl, whose value is $6 d$., there are now piecos representing various values, expressed in centavos, a copper coin, of which one hundred make dollar. Thero are silver pieces of 5,10 , and 20 centavos. One of 50 centavos $1 s$ equal to hulf a dollar, or $2 s$. English money. The new gold and silver coins contaln ninetenths of pora metal, and one-tenth of alloy. The copper colns are quite pure, containing no alloy. Their names, value, and weight may be most conveniently represented by meuns of the following table:

|  | c e.d. | Spenish Granos. | French Grammes. |
| :---: | :---: | :---: | :---: |

The communieation between the several towns of Chili is now greatly facilitated by roads, ruilways, rand steam-vessels. The excellent road from Santiago to Valparaiso was constructed at a great cost by Generul O'Iliggins, when l'resilent of the republic. A road, generally kept in gool repair, conneets the towns of Atnemma und Concepeion. By fur the most pleasant for the traveler is that by which Santiago und Talen are united. A ruilroad has been already estallished between Coplapo and Caldern; and in 1852 the President, M. Montt, laid the first stone on the line (about 90 miles in length) between Suntiago and Valparaiso, and it is now rapidly advuncing to completion. When tinished it will bo the most extensive work of the kind in South Ameriea. Proposils for ruilways from Screna to the sea, from Copiapo to Tres l'untas, nul from Concepcion to Taleahuano, have ulso heen laid before Congress. A line of electric telegraphi has also been established between Valparaiso and Santiago.

The revenue of Chili is in a very prosperous condltion, exhibiting a surplus of recoipts over expenditure in tho returns of several years. In 1845 the revenue umounted to $£ 1,083,16913 s$., leaving, after the nocessary outlay, a surplus of $£ 410,215$. In 1849 the revenue, ineluding the surplus from 18.48 , was $£ 1,352,210$. The surplus of 1849 was $£ 57,048$, whieh, together with the receipts of 1851 , nmounting to $£ 885,3818 \mathrm{~s}$., were entirely swallowed up during the revolution of the latter year. With tho restoration of pence in 1852, the revenue rose to $£ 1,096,096$, which, with the sum of $\pm \cdot p, 000$ paid by l'eruas interest for its debt, glves an incrense of $£ 234,71412$, over the Incoms of the preceding yeur.

Tabif of Jtevbnul for 1852.

－ 6 montis to Juno 30．
$\dagger 1$ year to June 30.

Chillies（Hind．Gas Murridge；Javan．I．ombok； Malay（＇habai），the pods or fruit of the C＇apsicum an－ nuum，or Guinen pepper．This is one of the hardiest and most productive plants found in tropical climates； growing luxuriantly in almost all dry soils，however Indifferent．In the wild state the pods are small，and ao pungent and arrid as to whister the tongue；int when raised on rich solls，they are large and compara－ tively mild．The phant is soid to lie a native of lonth Indies．It is very extensively cultivated；and，with the exerption of salt，it is far more extensively used than any other condlment．In tropical countries，the pods nie frequently made use of when unipe and green；when ripe，they liecome of a deep red color； and ln that state the are exported dry and entire，or relued to powder．－Se Carense Perren．
China．The conterminous empires of Rinssia and China occupy between them about one－lifth part of the habitahle globe，in pretty nearly equal portions；limt the populatlon of the latter is alout four times greater than that of the former，cuen after ineluding lis recent annexation of Poland．Weesn casily trace the hound－ aries and mark the extreme limits of these two great empires，by parallels of latitude and meritional lines of longitude ；but when wo cone to rednce them to spare miles，or speak of thelr contents in acres，the mind is hewilderd ly the magnitude of the mumbers reyuired to express them，and forms but an hadistinct ldea of their superficial extent．
No country in the werld is better adauted，from situ－ atlon，cllmate，and products，for extensive commerce， than China；yet no elvilized eotentry has proited less ly these arlvantages．The happy distributhon of its numerous rivers，alded thy artilicial caaals，afforis an almost uninterrupted water communication from the
northern to the southern，and from tho western to the enstern extremities of this grand empire；and thos a faellity is glven for the interchunge of the probluits of one province with those of another，unk nown in any other country，and unequaled even in Great Britain． The multitudes of barges of different serts and sizes， whieh vary in their construction on almost every riv－ er，are incredible．The Chinese are rarely to be irust－ ed where numbers are conecred；lhat they are prob－ nbly not far amiss in stating that the number of in－ perial barges employed in the grand canal and its lateral hranches，for the purpose of collecting and lis－ tributing among the public granarles the rice and grain paid in kind as taxes，mmounts to 10,0040 ，or， as they express it，where they mean to be correct，to 9999．A vast number of vessels are atso cuployed in conveying the copper currency from place to jilace， wherever it may he wanted；whers in collecting the silks，cottoms，inal varlous articles of taxes，puld in kind，and deymesiting them in tho publicemakaines； and the salt larges alone are probally not less numer－ ons than thase which carry gralla．It was calculated that the depuit of salt accumulated nt Them－sing for tho use of the calithl and the northern provinces was sulii－ elent fur a year＇s consmuntion for thirty millions of peto pile．This was all lirought up in the course of the summer，from the nea－cunst of Trele－klang and Fokien， In sen－going vessels．Cakes of coal－dinst and turf，for fuel，and cakes made up of varions logredients for gar－ den manure，employ a multitude of harges；and when to these are added tho various kinda of vessels an－ phoyed in general commerce，In the conveyunce of pas－ sengers，and in the fisherles of the Interiur，we may be suro that the number of persone who constantly reside upon the water amounts to many millians．

Conmence of the United States with Cilina, from Octobels 1, 1820, to Jelf 1, 1856.

- 6 monllhs to Junc 30.

All foreign commerce is systematically discouraged. them capable of ndmitting the largest Euronean shlps, The extent, fertility, and varicty of their soil and climate, happily situated lotween the extremes of heat and culd, partaking ot the advantages of both, without experiencing the inconveniences of either, supply the Clinese with the productions of nlmost all the world besides, whether to minister to the necessitios, tho comforts, or the luxuries of their numerons population; and leave this great empire, as a nation, ulmost independent of forelgn supplles throngh the methin of coumerec. Satished, or affecting to be satistied, with the prodigal bounty of nature, jealous of strangers, und goveraed by a gradation of arbitrary despots, the Chinese loug considered it us a fuvor bestowed on foreigners to open any of their ports for the interchange of coummentities. The revenue derived from this limitel inturconrse was of little or no importance at the chief seat of govermment.

A very extensive intereourse is carried on hy them with lajuan, the Philipplue Islands, Java, Sumatra, limer, tielolo, und the great Island of llorneo, in all of which are found multitudes of Chinese, living in hahits of penceful industry, in the midst of the mare idte and less civilized natives, conducting the soncerns of tralle, cultivating the ground, and exercising all the various branclies of the mechanical arts; in no place, however, varying in the smallest degree their origimal character. Hat though the Chimese spread lhemelves over every part of the Asiatic, and into mayy of the l'olynesian islands, there seems to be no reciprocity of commerce by the vessels of thoso countries visiling the ports of Chinn, excepting some ten or twelve junks that annually visit the southern ports of lokien from lapman, and perhaps as many from Cochln C'hha. "From Canton," says Lart Macartney, "to 'len-chou-foo, ut the entrance of the fiulf of Pe-tclie-lee (to say nothing of the country within tho liulf itself), is an extent of coast of near two thousmend miles, inclenled with innumerable harbors, many of
and all of them sufe and sufficiently deep for the vessels of the country. Fivery creek ur haven has a town or city upon it ; the inbabitants, who abound beyond credibility, aro mostly of a trafficking mercantile cast, and a great part of them, from their necessary employment in the fishery, whleh supplies them with a principal article of their sulisistence, ore accustomed to the sea, and the management of shipping." From Java alone they import birds' nests to the value of half a million dollars annually ; the sea-slug or biche-de-mer (holothuria), from the coast of Now Holland, 'Timor, and adjoining islunds, to a still greater extent; sharks' tins from the sume quarter; copper from Japan, and tin from llantam; pepper, arece-nut, splees of different kinds, ebony, sandal-wool, red-wood for dyelng, tortolse-shell, pearl-shell, coral, cumphor, wax, and a variety of articles, generally produced or collected by their own countrymen resident in the lslands of the East.

The Chinese levy no specific duties on the articles imported, nor ad talorem dutles on the cargoes; the only impost is on the ship liself, and is cstimuted lyy a rule sa absurd as it is partind and wequal. They measure the length from the centre of the foremast to the centre of the mizen-mast, and the breadth is tuken close abuft the mainmast. The length is then multiplied hy the breadth, nat the product, divided by ten, gives the measurement of the ship. All ships, according to this measurement, are classed under first, seeond, or third rates; all other vessels, however small, are classel as third-rates. By this rule a ship of a hundred tons would pay from ${ }^{3} 1000$ to $\$ 5000$, and a ship of a thousand not ahove clouble that sum.

Revenue.-'To ascertain exactly or even approximately the revenine of the Chinese Vimitro is nimost impossille. In 1587, Triganlt, a French missionary, stated it at $20,000,000$ taels- the thel lieing equal to about $5 s$, Bh. Einglish, or $\$ 125$ United States currency.

In 1655, Nieuhoff estimated it at $108,000,000$ taela. Tweive yeara later, Mageihaens reckoned it at about $\boldsymbol{£ 4 , 0 0 0 , 0 0 0}$ sterliog. In 1721, it was calculuted to have rlsen to $£ 10,000,000$ or $£ 14,000,000$ sterling. Toward the cloae of ths eighteenth century it was given by Sir George Staunton at $£ 66,000,000$; of which sum, however, little more than a fifth was transmitted to Pekin. According to the Chinese constitution each province is obliged to aupport itself, and to transmit a certain surpluaggo for the maintenance of the Emperor and his court. The manner in whlch the items of the revenue are divided are thus stated by $\mathrm{D}_{\mathrm{o}}$ Guignes, the last authority on this subject:
Income in money. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $27.7^{\text {Taelf. }} 0.000$ Equal revenue in ktud from gratn .................... 27,907,000 Tax on the recond crop in the sonthern provtnces. $2 t, 800,100$ Gubel, coal, transit duties. .......................... 6,470,401 Costoms at Canton .....
Revenue from slik porcidain, ......................... 800,100
Revenue from slik, porcelain, etc. . . . . . . . . . . . . . . . . . . $4,0100,000$
Taxes, licences, tonnage duties. . . . . . .
Total.

- $\frac{4,0,7}{80,73,410}$

Till within a few years ago, Canton was the principal mart for foreign commerce, and was in fact the only port open to foreigners. In virtue of the treaties, however, concluded at the termination of the war with England, four additional ports have heen thrown open, viz., Shanghal, Ningpo, Foo-chow, and Anoy. Under the respective heads of these articies will be found detailed accounts of the exports and imports of the distrieta in which they are respectively situated. The foreign commerce of China, as more fuily detailed leelow, may be roughiy estimated at between 20 und 25 millions sterling. This, however, bears a very small proportion to the iniand trade. It has been asserted that there is a greater amount of tonnage belonging to the Chinese than to ail the other nutions of the world combined; and from the length and number of the canals, and the myriads of bonts necessary for currying on the enormous inland trade of the empire, it is believed that this statement is not very wide of the truth.

The mode of conducting the trade is fally described in the Chinese Commercial Givide, where the forms of custom-house bianks are given both in English and Chinese. The forcigners themselves employ clorks calied linguists to transact their business, and these linguists net niso in many transuctions as brokers. Every Chinese who intends to engage in trade in this capaclty, or as n trader, previously lenrns to speak English by studying manuseript vocabuluries in whtch the English aounds of worda and phrases nre written underneath in the Chinese character, the student obtaining the arsistance of more advanced scholars to correct his pronunciation. The idions of the English learned in this rira roce manner are chietiy Chineso, which explains the inverted arrangement of sentences in the Canton Englisi, as this jargont is calied, and the utter disregard jnid to gender, number, person, time, and other propricties considered of importance in most languages. The whole trade is conducted in this meagre gibberish, whicis the nativen, however, suppose to be as copions and correct as forelgners themseives speak, tut which hardly aerves even the common purposes of trade noi household need, much iens enabies the two parties to exchange ideas upon recondite subjects. Duch of the mianderstunding and trouble experienced in daily intercourse with the Chinese is doultiess owing to thits imperfect medium, for they seldom take the trouble to ascertain if their itlea of what is told them ls the correct one; and mutuai vexathus nnd iil-will arise, when one piaty finds his orders to have been heediessly performed, and the other that his efforts to plesse have only earned muledletions inatead of commendation. These petty nnnoyancen have also had more sorions resuits in atrengthening the national disiikes, and atiii farther separating those who orlginatly intended, perhups, to endure each other only su long as they could make gain thereliy.

The total amount of the exporta and imports of the five towns now open to foreign commerce is given in the subjoined tabie for 1845:

| Canton | Imports in vessets of sill nations. | 48 |
| :---: | :---: | :---: |
| Canton | Exports in vessets of all nations | 0,022,726 |
|  | Illupors in British versels....... | 147,494 |
|  | Eixports in British vessels | 154,781 |
| Ningpo | Imports. | 18.000 |
|  | Exports. | 10,0100 |
| Foo-chow | Imports. | 100,000 |
| Foo-chow | Exports. | 85,000 |
| Slisnghal | Imports. | 1,223,080 |
| Shisughal | Exports. | 1,347,058 |

The contrabund trade ln opinm is estimated to amount to upward of 40,000 ehests, at a sale price of nearly $£ 5,000,000$ sterling, which with the pearls, foid and silver ware, precious stones, ned other articies snuggied, will swell the totnl of the foreign trade to about $£ 21,000,000$ sterling annualiy, exclusive of the Russian trude nt Kiakhta. The consumption of tea in England is about $60,000,000$ of pounds annually ; in the United Stutes it is nbout $20,000,000$; In the Netheriands, 2,000,000; in Russia, 5,000,000; in Germany, $3,000,000$; In New South Wales, 4,000,000; in Spain and France, $3,000,000$. The aggregate consumption of tea in Chinn itself has been estimated, though not on very good authority, at about $700,000,000$ of pounds. The prospects of the rapid extension of the foreign trade with China are not very promising, except in a few artleles. The raw produce furnished from that country is very trifling, silk and alum being the chief, and there is in the mean time littie prospect of any great increase in the exportation of her manufactured articles, excejt tea and silk goods. The opium trade inas been for many yenrs between three and four mil. lions sterling in excess of the regular exchange of commodlties, and the iruinage of the country for this balance will probably go on as long as the taste for this pernicions nureotic continues, or there is any specie to pay for it. To leguize the opium trado woutd make no material difference in the expurtation of specie, as long as tho baiance of imports ao greutly exceeds the exports. England may make every effort to supply China with her inanufactures, but so long as the (hinese furnish po little that she wanta leyond a suply of tea, it is ilifficuit to perceive with what they are to pay for all the cottuns nni woolens they may be expected to buy.
The Chinese nppear to have no reguiar established system of credit amonk themselves, and the only circulating metium in the ahape of coin is a small piece of hase metal (copper, tin, or lead mixed), of the valus of the one-thousindth part of six shillings and eightpence, of little more intrinsic value, in fact, than a cowric-shell, which the Chinese, as well us the llindus, would seem once to have used; as the same character in their languge which signities a shell stgnities also money and wealth, and it enters into the composition of characters which represent buying, selling, payiny, etc. Nilver in smuli ingots is used in commerce, bat they have no determinate vajuc, the prece finctuating with the demand, as in other articies of commerce. The high rate of interest operates as a discouragement to mercantite sjeculations, and the rigor of corporal punishment is added, with the view, ns it wonid appear, of deterring the most hardy specuintor. The law says, "whoever whali ient either money or goods, shatl only receive three parts in the hundred per month," and that "how much soever may be sulfered to necumulate, the enpital shail remuin the same." It is lent from month to month, and if the lemer shonhl complain of the interest not being punctuaily paid, the borrower is suljeet to the punishment of ten stripes of the bamboo the first month, twenty the recond, and so on. The legai rate of interest, however, is seldom paid, and In inrge transactiona among lmakness men it is from 12 to 15 per cent. per annum. 'The horrower makes a njecini agreement with tho lender for a rate of literest varyhig between these two sunus.

xE:s, ete,

On the 29th August, 1842, s treaty of pesco was signed before Nankin, on board of the Cornoullis, by Sir Henry Pottinger on the part of Grent Britaln, and by Ke-yling, Elepoo, and Niu-kien, on the part of the Eaperor of China. The most important provisions of the treaty were, lasting peuce and friendshlp het ween the two empires ; Chins to psy twenty-one millions of dollars during that and the three succeeding years; the ports of Canton, Amoy, Foo-chow, Ningpo, and Shanghai, to be thrown open to foreign trade; conaulir officers to be appolnted by forelgn powers to reside at these places; regular and just tarlifs of import anil export and inhund transit dues to be established and published; the Island of Hong Kong to be ceded in perpetuity to her Britannie majesty, fer heirs, and suceessors; and correspondence to be conducted on terms of perfect equality between the officers of hoth governments. To this important treaty the emperor signitied his assent on the 8th of September, and on the 31st of December it was ratified by the British government. In June, 1843, the ratifications were exchangel at IIong Kong, whileh was then taken possession of by proclamation, and the functionarles of gorermment appolnted.

The announcement of the treaty of Nankin excited coasiderable sensation in Europe and America, chiefly in the commercial elreles; and agents were sent to China frem the governments of lielglum, IIolland, Prussia, Spain, and Portligal, and most of them had ialerviews with Ke-ying at Canton before he returned to court. France and the United States of Amerlea seat embassators extraorlinary to tite court of l'ekjn, but neithor of them went farther than Canton. Keying having been reappointed commisslaner for the parpose, a treaty was aigned between China and the Uaited States, embodying all the important stipulations of the treatles and commercial regulations agreed to with Eugland, and providing further for the erection of hospitals, chapels, and cemeteries nt the five ports; for permission to slips of war to visit any part of the eoasts of China; sul for the extension of these privileges to all nations. The latifieations of this treaty were exchanged on 81st December, 1845. The I'rench embaswalor having also arrived at Canton, and entered into nerotiation with Ke-ying, s treaty was conclnded between them at Whampoa on the basis of that of the Cuited States.
Their naval arehitecture wenrs the stamp of grent antiquity, and is exceedingly grotesque. They have, in fact, made litule progress in maritime novigation, from tha inveterate dislike of the government to all forcign intercourse, and to all innovation. The very same kind of vessels as those described by Mareo Polo st the port near st to l'ekin, in the thirteenth century, were fonnd without varlation by Jord Macartney, five hundred years afterward, and securate to the ltalian's description, even to the number of compartments into which the hold of each vessel was livided. They had sachors of wood, and ropes and sails of bamboo. The boats and barges for internal commerce and commoniaation are very varied, generally commodious, especially the passage-boats on the grand canal, and all of them suited to the depth and velocity of the stream, and the width of the locks and lood-gates of the respective canals and rivers which they are intended to navigate. These vesgels ure so numerous as almost to sujursede the necessity of hand-earriage; and the most common und convenient mode of traveling in China is in barges, which are generally providetl with eabins for sleeping, and a kitehen and utensils for cooking victuals. Their milltary navy is unworthy of the name. It consists of a thotilla, whose principal oceupation is that of conveying soldiers where they may be wantel, and looking after pirates and smignlers. An linglish frigute would beat the whole nuval foree ef China.-Ghozient, Du llaldel, Bahnow, De GuigNes, cte.

The princlpal articles of export from China are tea and raw sllk; and of these the following quantitles have been exported during the ten yesrs ending 1st July, 1858:

| Tea exportely | Thom Cirs | TO THE Lnitel | Kingoon, |
| :---: | :---: | :---: | :---: |
| Year anding Jone. | Pounds. | Year ending June. | Poonds. |
| 1844. | 50,618,600 | 1851. | 64,020,000 |
| 1845. | 63,670,260 | 1852. | 65,187,000 |
| $18+6$. | 57,584,610 | $185{ }^{\circ}$. | 72,010,000 |
| 1847. | 63,365,000 | 1854. | 77,217,000 |
| 1848. | 47,004,800 | 1855. | 80,500,000 |
| 1849. . | 47,242,6u0 | 1850............ | 01,0:5,000 |
| 1850... | 53,401,000 |  |  |

Thus, in the last seven years, the quantity of tea shipped from China to the United KJngdom has become nearly doubled, and, even compared with 1852 , is nearly one half more. But, as wo have already intjmated, It is as important a question, as regarils the exchanges with China, what progress has been made in the shipments to the United States. These have been as follows:

Tea exionted fron Cinna to tie Únited Statras.

| Vear ending June. |  |  |
| :---: | :---: | :---: |
| 184! | 18,1072,000 | 1850. . . . . . . . . . 40,074,000 |
| $18 \% 0$ | 81,757,000 | 1854........... $27.867,040$ |
| 18 | 28,700,000 | 1855. . . . . . . . . . $81,615,000$ |
|  |  |  |

| $1851 \ldots . . . . .$. | $28,700,000$ | $1885 . . . . . . . . . .$. | $81,615,000$ |
| :---: | :---: | :---: | :---: |
| $1852 . . . . . . .$. | $84,834,000$ | $1856 . . . . . . . .$. | $40,246,000$ |

From these two tables it appears that since 1840 , only seven years ago, the quantity of tes axported from Chinn to the United Kingdom and the United States has inereased from $65,314,000 \mathrm{lbs}$. to $131,280,000 \mathrm{lbs}$, Since 1852 the incrense has leen from $99,471,000 \mathrm{lbs}$. to $131,282,000 \mathrm{lh}$. Then as to silk: the entire exports from China to the United Kingdom, eleven years ago, momoted only to 10,727 bales. In the year ending June, 1848 , there were 17,229 bales, since which time, particularly during the last four years, they have very rapidly increased. The followhing tuble shows the export in each yeer:

Silis exiontyd to the United Kinodom yhom Cilina, | Year onding Juno 30. |
| :---: |
| $18+9$ |

Imponts of Silig into the Unitrd States.

China Porcelain. This manufacture is first mentioned in history in 1531: It was introduced into England in the sixteenth century. Poreelain was made at Dresden In 1706 ; the ware in England, at Chelsea, 1752; at low in 1758; in various other parts of England, about 1760; and ly the Ingenious Joslah Wedrwool, who much improved the British manufaeture, in Stafiorishire, 1762 et beq.-IILuvs. See Poncelains.

China-root (Ger. Chinawurzel; Du. Chinavortel, Fr, Squine, Esquinc; Sp. Ruiz Chinte Cerebmera; Arab.

Rhubsinie), the root of a spocies of climber (Smilax China, Ilinn.). It comes from the West Indies, as woil as from China; but that from the latter ia best. It is ollong and thlek-jointed, full of irregular knots, of a reddisilmbown color on the outside, and a pale red within; whillo new, it will snap short, and look glittering within; if old, the duat flies from It when broken, and it is jight and kecky. It should be chosen large, sound, heavy, and of a pale red color internaily. It is of no value if the worm be in it.-Miliburn's Oriental Commerce.

Chints, or Chintz (Vr. Indiennes; Gcr. Zitze; It. Indiane; Rusa. Siz; Sp. C'hites, Zaraza), a pecuilar juttern upon printed calicocs, in which tlowers and other deviees are printed in five or aix different colors, upon white and colored grounds. A good chintz pattern in fast colors is one of the most surprising and dinticult efforts of the urt. It wus tirst manufactured in the East Indics, but is now largely manufacturel in Europe, particuiarly in Great Britain.-See Calico.
Chocolate (Du. Chocolude; Ir. Chnculat; Germ. Schokolate ; It. Cioccolata; Port. Chocolute ; Russ. Sehokodud; Sp. Chocolate), a kind of cake or confection, prepared principally from the cacao-nut. The muts are first roasted like coffeo; nad being reduced to powder and mixed with water, the paste is put into tin moulds of the desired shape, in which it specdily hardens, leing, when taken out and wrapped in paper, fit for tho market. Besides cacao, the Spanlsh use vaniilia, sugar, ma'ze, ctc., in the preparation of chocolate. Chocolate was first introc' ced into Europe from Mexico about A.1. 1520. It was sold in the London coffee-houses soon after their establishment in 1650.-Tafler.
"Alike ensy to convey and cmpley as an aliment, it containa a large quantity of nutritive and stimuluting particles in a smail compass. It has been said with truth that, in Africa, rice, gum, and shea butter, assist man in crossing the deserts. In the New Workl, eliocolate and the flour of maize have rendered necessible to him the tabie-lands of the Andes, and vast uninhabited forests."-llennon.dt's Personal Narrative, vol. iv. p. 234, Engl. transl.

Christiana, the capitai of Norway, situ.ted at the bottom of a tiord or gulf, in the province of Aggerhuus; in lut. $\left.59^{\circ} 5 \overline{5}\right\}^{\prime} \mathrm{N}$. , long. $10^{\circ} 4 \times \mathrm{F}^{\prime} \mathrm{I}$.. Population in 1845, 26,141. Christiana is alout 60 miles from the open sea: the guif is in some places very narrow, and its navigation somewhat difficult; but it is aufticiently deep for the largest vessels, laving 6 or 7 futhoms water close to the quay. It is compulsory on all ships to take a pilot on board at the mouth of the bay. The trade of the town is considerable. The prineipal exports are timber and deuls, which are largely imported into Eugland; gluss, porticularly bottles; iron and naiis, bones, smalts, onk burk, ete. Saited and piekled fish, one of the staple products of Norwny, is princi;ally exported from Bergen. The deals of Christiana have always been in the highest estima-tion-a consequenee of the excellence of the timber, anl of the cure with which the sap-wood and other defective parts are cut away; and not, as Mr. Coxe seems to have supposed, of the akiiffol sawing of the plank. The saw-mills were formerly licensed to cut a ecrtuin quantity only, and the proprictors were bound to muke oath that it was not excecied.-Coxse's Travels in the North of Europe, 5th edition, vol. iv. p. 2x. This absurd regulation no longer exists. There are far fewer restrictions on industry and commerco in Norway than in Sweden. In the formmr, manufacturel goods are admitted on moderate duties, and are very generully made use of. The principal articles of import are colontal produce ; iron and liardware; machinery ; woolen, linen, and cotton goots; coals, butter, wine, brandy, etc.; corn is sometimes extenslvely imported.
Customs Regulations.-Within 24 hours after a vessel has got to ler moorings, the master should defiver to the collector his generul report as to ship and cargo,
or present the requisite documents for having such report made out with the assistance of a ehip-broker, whoso services mastera of foreign vessela can nut entirely dispense with. On making thia general report, the measuring bill is to be exhibited, and payment of the tonnage and other dues inward is to be mado. If the ship have not Leen previonsly measured in Norway, and is, consequently, not provided with a Norwegian measuring bill, she ia to be measured, to ascertain her burden in Norwegian commerciai laats, for the calculation of the tomage duty. The gencral report having been made, the cuatom-house officera in clarge of the vessel are furnished with the books for delivery; and the discharge of the carge commences under their inspection ; and the cousignees may make their special reports under their responsibility and signature. If they are without preciso information as to the contents of any or all of the packnges or halcs to their address, these bales or packages may, at their request, te opened in the presence of the ollicers before report is made. If a cousignee omits a vailing himself of this permission, his pretending thereafter that more or ether goods than he had ordered or been advised of huve been sent to his aididess, will not be nutended to. In the reports or entries is to be atated whether it is intended to pay tho duties forthwith, whether the goods are intended for exportation, or whether they are to te landed. l'rior to commencing loading outwari, the master is to give verbal notice of his intestion at the custom-house. If he have no Norwegian measuring biil, the vessel is to be measured. 'This being done, the shipper or shippers of the outward-bound carge are each of them to make their special entrics as to the quajity, weight, and measure of the goods tiey mean to load. A copy of such entrics is to be deposited at the custom-house, und tho loadiug conmences under the control of the officers. This applics to all mixed curgoes; but if the outward-hound cargo consist exclusively of wood, the slipper or shippers are only to notify that they intend loading wood, without speeifying quantity, measure, etc., as the export duty on wood is charged aecording to the burden of the vessel. When the master clcars outward, he produces the proper documents for showing the burden ot his vessel, and to whit port ale belongs, and he is then, on proper application being made, provided with a pilot, who takes his vessel to sea.

Harehousing.-In Norway goods brought from abroad may be bonded or warehoused, with a view to their being again exported at some future period. (ioeds entered for home consumption may also be bonded for u certain period, in order to faellitate the payment of the dutics. The former is calicd "transil cplag;" that is, depositing or wareiousing goods for expertation, subject to transit duties only. The litter is called "credit oplag;" that is, warelousing or bonding on credit.

Trausit Oplag.-Under this system goods from alroarl may be warehoused for exportation frec of import duty, puying on exportation a transit duty, which in most cases is 1-10th of what they would pay if entered for home consumption. If tine goods are deposited in the custom-house wareh juses, they lie free of rent er dues during 14 days, $r$ id if in privato warehonses, under the key and aca' : the customs, during six mo.ths. If they remain long, viz., heyond 14 days in the one, und berond six montis in the other ense, they pay rent or dues equal to $\frac{2}{6}$ of the transit dinty per month, which, after the lapse of three months, as regaris goods in the custom-house warehouses, is increased to $\ddagger$ of the transit duty per month.

Credit Opleg.-This system nllows most grools importell from aliroad to be placed in the ownrr's or importer'a own warehonses, under his own lock, frec of duty, for a given time, on lis reporting to the customs, every three months, how much he has sold, otherwiee consumed, orexported, and then paying the dutyon such amonnt; the custom-house officers, who aro heund quar-

torly to examine the goods, convinclng themselves by ocular demonatration that no morc ia missing than the quantity reported to have been taken away. This credit on the duties in no case to exceed two yeara from the time the goods were imported.

By way of security for payment of the duties on which tho credit is granted, government reserve to themselves, 1. Priorlty of mortgago on all the goods in question. 2. Priority, or firat right, in the property, goeds, and effects of every deseriptlon belonging to the trader availling himself of this credit, in as far as such property is not previoualy legally mortgaged. 3. Liberty for the custom-house officera, when and as often as they shall deem It expedient, between the stated quarterly inspeetions, to look over tho atock on hand, with a view of ascertalaing whether there remains sufficient vslue for the duties; and if thay see reason to doubt this, full right, in default of other satisfactory security being offered, to seize the stock, and to sell the whole, or as much aa shall cover the duties. 4. In case of death or failure of the party, an equal right to sell forthwith the whole of his stock at public auction, and to retain as much of the proceeds as shall cover the duties; and in case of defleiency, an established claim for the remainder on the estate of the deceased or bankrupt, as tho caso may be. In charging tho duties no allowanee is mado for waste or damage in tho warehenses. The warehouse rent charged on gooda bonded under the transit syatem, in the custom-house waro-- Juses, is as follows:

On a quarter of wheat for the first 3$\} 0 \quad 0.6508$ per month

 On a ton of raw sugar for tho first 3 ) $011 \cdot 5394$ per mooth

Money, Weights, and Measures.-In Norway there are no gold coins. The principal silver coin, called a species dollar, is divided into 120 skillings. There are also half species, or 60 skilling pieces; 1 -5th apecies, or 21 skilling pieces; $1-15$ th species, or 8 skilling pieces; and what is denominated skillemynt, or small change -that is, 4 and 2 skilling picces. The ajecies dollar contains $390 \cdot 58$ English gruins of pure silver, aud is conseguently worth 48 . 6fd. sterling, the par of exchange being four species dollars $\mathbf{4 2} \mathbf{6}-17$ skillinga $=£ 1$. All Norway coins, except the simall change, are alloyed with 1-ith copper, so that the species dollar weighs 448:38 English grains, anal its divisions in proportion. spall change coins are alloyed with three times their weight of copper. Thero aro one and two akilling pieces of copper.

Weights and Mcasures, bamo as at Coreninagex ; whilh see.
Shipping Charges.-The various charges of a puldic nature payable by a ship of about 300 tons burden, entering the port of Christiana with a mixed eargo on board, unloading there, taking on board another cargo, and clearing out, are as follows:

1. Chargen Inimard.-Pllotage from Farder, at the month of Cliristiana Bay, where nll ellpa must take a pllot on board

hipa.-There thargea on naltue is, tho ships of countries and privileged forelgn ships, that is, the ships of countries having reelproedty treaties whiti Nor.
way; nor in the duties on gooda importes hy native ahipa and wuch privileged foretgn ohipa. Great Britala ta a privileged country.

The ahlpping of Norway has declined considerably of late years; a proof, If any such were wanting, of the groundlessnese of the clamors kept up in Great Britain as to tha supposed pernlcious influence of reciprocity treaties on shipping.

Banking.-There are no private banking establishments In Norway; but there is a public bank, having ita principal office at Dronthelm, with branches at Chriatlana, Bergen, and Chriatianaand. It was establistied by a compulsory assessument in 1816. Ita capital consists of $2,000,000$ species dollars, in transferable shares, divided among those who were forced to contribute to its formation. These sharea are now at a premium of 30 por cout. Its managera are appointed by, and are accountablo to, the Storthing or Norwegian Parliament. It lasuea notes for $100,50,10$, and so low as 1 species dollar. Theso notes should ba payable in specic on demand; but they are at a discount of 35 per cent., and are paid by the bank at that rate. It discounts bills at twoand three monthadate at 6 per cent. per annuin; advances money on mortgage at 4 per cent.; and transacts the ordina:y banking businese of individuals. It does not allow interest on deposits.

Credit.-Goods are sold partly for ready money, and partly on credit, but principally tho former.

Commission, etc.-The number of brokers in Christiana is limited to four. Commission on the sale of goods, 2 per cent., or, del credere included, 3 per cent. Jrokerage is fixed by law at 5-6ths per cent., which, in practice, is paid by the sellers.

Insurance.-All houses situated in Norwegian market towns must be insured in the General Insuraneo Company at Christiana, which is guaranteed by the state. The prenium is moderate, being, on buildlage situated in towns, th, and on thoso situated in the country, $\frac{1}{8}$ th per cent. Sumetimes, however, when very destructive tires occur, it is raised.

Provisions, etc.-Christlana is not $a$ favorable jlace for careeving and repairing ships; but supplies of beef, bread, water, and other sea-stores, may be had as cheap or cheaper than in any other port of Norway; but its distance from the sea is too great to allow of its being visited by ahips deairous merely of victualing.-We havo derived these detalla frous various sources, but principally from Consular Returns.

Timber.-A standard Christiana deal is 11 feet long, $1 \frac{1}{4}$ inch thick, and 0 inelses broad; and $51 \cdot 2$ such deals make a load. Freight of deals from Norway to England is calculated at the rate of single deals, the standard measure of which for Christiana and all the south ern ports of Norway, except I)ram (a small towa on the Drammen, about 20 miles southwest of Christiana), is 11 feet loug and $1 \neq$ in thickness. A singlo deal from Dram is reckoned 10 feet long and $1 \frac{1}{2}$ inch thick.

Battens.-Tharee batiens make 2 deals, retaining their own length ant thickiess. Half teals aro only counted as ileal ends, if they run under $C$ feet; but if they run 6 or 7 feet long, then two half deals aro counted a deal, retaining their own thlekness.

Ends of Deals.-Four ends of deals, although 5 feet long, mako but a leal 11 feet long, retaining their thickness; but as the freighters of ships seldom wish to have this assortment, which commonly run from 3 to 5 fect, and are taken on board as stowage, consequently for the advantage of the ship and not the freighter, the ship vught to bear the burden.

Ends of Buttens, called Larvick I'alings.-No less than six ought to be counted a single deal, 11 feet long and $1 \pm$ inch thick.

Pale-boarts, when they havo their proper length, are 7 feet long; three pale-hoards are counted a single deal.

Staves for hugsheads take up much room; in consequence of which more than ten can not be computed a singlo deal.

Christopher ( $\mathbf{8 t}$.), or $\mathbf{8 t}$. Kitt's, one of the BritIsh West India islands, Leeward group. Lat. (Fort Smith) $17^{\circ} 17^{\prime} 7^{\prime \prime}$ N., long. $60^{\circ} 42^{\prime} 2^{\prime \prime}$ W., 46 miles west-northweat from Antigua. Length, northweat to southeast, 20 mites, breadth 5 milea, except at ita southeastern extremity, whero a narrow tongue of land extends towarl the island of Nevis. Area, 68 squaro miles. Population in 18.18, 23,127, of whom abont 2000 are whites. The island is an irregular oblong, traversed in the centre from north to aouth by a mountain ridge of volcanic origin, in the middle of whith rises the perpendicular craggy summit of Mt. Misery, elevation 3711 feet, and overhnnging the crater of an extinct voleano: from thils central ridgo the land gradualiy and uniformly slopes to the sea, every portion of wheh is a rich fertite soil, and highly cultivated; pnsture and woodlands ascending almost to tho mountain summits. Four rivers water this country, anti in tho northeast there aro severnl salt ponds, producing abundance of salt. Soil composed of loam, clay, and volcanic asher, in somo places with a depth of it feet, resting on gravel. Brimatone-hill comalsts of granite, limestone, and primary schists. Sulphur is found in the central range, nnd some indication of siiver ore. The climate is dry nod healthy ; mean annual temperaturo of coast $80^{\circ}$, but the mornings and evenings are cooled by sea-breezes. The coldest month is February, the warmest August. Prevalling winds, nertheast and southenst; rains frequent, but not in excesa; hurricanes occur occasionally, and a terrific and fatal one uearly destroyed the island in 1722. The scenery, especially the vale of Basseterre, is rich and beautiful. The soil is particularly adapted for sugar plantations. Chief towns, lasseterre, the capital, and Sandy Point. Besides the parish churches, thero are three Methodist congregations, and several sehools. This island was discovered by Columbus in 1493, and was then densely peopled by Carils. In 162's it was simultancously taken possession of ly colonies of English and French, and divided into upper and lower portions. From that period it became the seene of frequent and bloody contests between the two nations, tili at last it was tinaily cedcia o the llitish in 178.3.
Chronometer (Greck xporoc, time, and $\mu \varepsilon \tau \rho o v$, metsure), a watch of peculiar coustruction, and great perfection of workmanship, used for determining geographical lougitudes, or other purposes where time must be measured with extreme accuracy. The chronometer difficrs from the ordinary wateh in the prineiple of its escapement, which is so constructed that the balance is entirely free from the wheels during the greater part of its vibration; anel also in having the balance compensated for varintions of temperature. Marine chronometers generally bent half seconds, and are hung in gimbals, it loxes alwut six or elght inches square. The pocket chronometer does not ditlier in appearance from tho ordiuary watch, excepting that it is generally a little larger. Chronometers nro of immense utility in nuvigation; and ships going on distani voyages are usually furnished with several, for the purpose of thecking onic noother, and nlso to guard against the effeets of accidental derangement in any. singlo one. The accurary with which some of the betthe sort of ehronometers have been foumb to perform is truly astonishing; the error in a two months' voyage not exceeding two or threo seconds.--iee Dext on the Construction and Manuyement of Clir, nometers.
Chunam, the name given in India to lime. The lest, obtained by the calcination of shells, is employed in the mastication of beted (which see), to provent, it is sainl, its injoring the stomach.
Cider or Cyder, a vinous liquor made from the expressed and fernented juico of the apple. In England, the counties of Devon and 11 creforil are noted as the cider counties; but good cider is also produced in the counties of Glourester, Monmouth, Worcester, Dorset, Somerset, and Cornwall. Normandy has long
been known for the exeelleneo of lts eider; and considerable quantities are manufactured in other districts of France, and also in Belgium, Germany, and in North America.

In England the manufacture of cider is almost entircly in the hands of the common farmer, so that litte or nothing has been done either to improvo the machinery or bring science to bear on the processes which are followed. Heneo mueh of the cider is of inferior guality, and much waste ensuea in the manufaeture. The apples for cider should only be gathered when fuily ripe, as it is only then that they contain their full jroportion of saccharino matter. As the apples are gathered they are laid in heapa, and are allowed to lis thus from 15 to 30 days, in ordier to become fully ripe or mellow. They are then thrown into a atono trough, round which a heavy cireular stone is turned hy means of one or two horses. When the applea are thoroughly ground, the pulp is carried in pails to the serew-press and poured into squaro picce of hair-cloth, the edges of the hair-cloth being so folded over the pulp us to prevent any escaping. The pulp is then suljected to pressure, when the juice eseapes, leaving a solid cake. The juice is now transferrel to casks, where it rapilly. undergoes a process of fermentation, without requiring any addition; and in three or four days the process is completed, when it is drawn off into casks. The lest cider is almost always that in which the process of fermentation has been moat slowly conducted. Whien the fermentation has been rapid the cider is apt to run to acidity.
In France several manufacturers of eider hnve lately employed improved apparatus for masbing their apples, somewhat similar to that used for mashing the beet-root in the manufacture of sugar; and have also given special attention to the management of the process of fermentation. The quality of the cider is said to lonve been thereby greatly improved. The cake after its first pressure is sometimes broken up with water, and smbjected to a second pressure, and the juice it then yields furnishes, on fermentation, an :nferior cider, which must be soon usel, as it will not kecp. Cider is not tit to be drunk till about three montiss after it is made. Good cider yields alout 6 per cent. of alcohol on distillation, and thus contains nearly the same amount of alcohol as the ordinary hitter Indian ales; but the inferior kinds do not contain above half that proportion. Cider appears to be a refreshing and healthful drink; and the natives of the connties in which it forms the ordinary drink are remarked to be nearly exempt from stone and from gravel complaints.-E. B.
Cigars. See Tonacco.
Cincinnati, the metropolis of Ohio, eapital of llamilton county, and the largest and most commereia! place west of the Alleghany Mountains. It is situnted on tho right bank of the Ohio River, $4 \overline{5} 5$ miles helew l'ittshurg, and 1548 miles above New Orleans, and 502 miles from Washington. It is the largest city of the Mississippi Vailey north of New Orlems, and the tifth in population in the Enited States. Jopulation in 1800, 750; in 1810, 2540; in 1830, 24,831; in 1840, 46,338 ; in 1845, 65,000 ; in 1850, 115,438 ; in 1853, 1ti0, 141 . The suburtus have 25,000 inhabitants additional.
This city is nenr the eastern extremity of n valley, ahout twelve miles in circumference, surrounded by a series of hills, which rise to the height of 300 feet hy geatle and varying slopes, and are partly covered with the native forest trees. lirom the summit of these hills is presented a beautiful and pieturesque view of the city and valley. It is built on two tahle innuls, the one elevated from 40 to 60 fect ahove the other. l.owwater mark in the river, which is 108 feet below the upper purt of the city, is 432 feet abovo tide-water at Albany, and 133 feet below the tevel of Lake Erie. Fultoo and the ailjacent parts of Mill Creek township on the north, are but suburbs of Cincinnati, and If aided to tho shove population would extend it to 185,000. The shore of the Ohie at the landing is substantially paved to low-water mark, and is supplied with flouting wharves, adapted to the great rise and fall of the river, which renders the landing and shipping of goods at all times convenient.
The Ohio Rlver at Cincinnati is 1800 feet, or abont one-third of a mile wide, and its mean annual range from low to high water is about 50 feet; the extreme range may be sbout 10 feet mere. The greatest depressions aro generally In August, September, sad Oetober, and the greatest rise in December, March, May, and Juno. The upward navigation is in winter very rarely suspended by floating ice, and in some whters not at all. Its current at its mean height is about three miles an hour; when higher or rising, it is more; gad when very low, It docs not exceed two miles

The commercial retutns for the ycar 1856 show that Cincinnati has participated in the general prosperity of the $W$ st. The tetal value of principsl imperts for the year ending September 1, 1856, was $\$ 75,205,000$, agginst $867,501,000$ the previous yesr; and of exports $\$ 50,744,000$, against $\$ 38,777,000$ the previous year, showing an increase in the value of lm ports of $87,794,000$, and in the value of our exports $\$ 11,967,000$ : these figures do not represent the total value of imperts and exports at Cinclnastl. To the value of the imports 10 per cent. msy be added, and to the exports 25 per cent., to cmbrace those articles not included in them. The flgures then would stand thus:

Value of lmports.
Value of exports. $\qquad$ $. . \$ 32,825,000$
Volue of exports. ...................... 63,430,000
No record being kept of imports by the Cincinnati cus-tom-house officers, except those which come under cus-tom-heuse bond, the Chamber of Commerce, at its own expense, keeps a record of the imports and exports.

Cinnabar (Germ. Zinnober; Du. Cinaber, Vermilioen; Fr. Cimaabre; It. Cinabro; Sp. Cinabrio; Russ. Kinurur ; Lat. Cimabrium).
Natire Cimnabar-a mineral substance, red, heavy, and brilliant. It is found in various places, chietly in quieksiiver mines, being one of the ores of that metal. The cimasbar of the Philippino lslands is said to be of the highest celer; but that of Almsiden, in Spain, is the richest. The best native cinuabar is of a ligh color, brilliant, and free from earthy or stony matter.
Artificial Cinnabur.-" When two pasts of mercury anio one of sulphur are triturated together in a nertar, tho mercury gradually disappears, and the whole assumes the form of a black powder, formorly called Ethings nineral. When this mineral is heated red hot,
it sublimes; and if a proper vessel bs placed to receive it, a cuke is obtained of a fine red color. This cake was formerly called cinnsbar; and, when reduced to a fine powder, is well known in commerce under the name of rermilion."-Tnonson's Chemistry.

Cinnamon (Du. Kaneel; Fr. Cannelle; Ger. Zimmet, Kanehl; It. Canella; Lat. Cinnamonum, Canella; l'ort. Canella; Sp. Canela; 1'ers. and IInd. Darchinie; Aral. Darsini; Malay Kaimanis; Greek Kıvapov), the bark of the cinnamon-tree ( Laurus cinnamomum), a native of Ceglon, where it grows in great abundance, Cochin China, and perhaps of seme other countries. It is brought home in bags or bales weighing $92 \frac{1}{2}$ lbs. each; snd, in stowing it, black prepper is mixed with the bales to preserve the cimnamon. The best cinnamen is thin and rather pliabie; it ought to be about the substance of royal paper, or somewhat thicker; is of a light yellow color, approaehing nearly to that of Venetian gold; it is smooth nad sifining; fractures splintery; has an agreeable, warm, arematic flaver, and a mild, sweetish taste; when chewed, the pieces become soft, and seem to melt in the mouth; it is not so pungent but that it may be borne on the tougne without pain, and is not succeeded by any after taste. Whatever is hard, thick as a half-crown piece, dark-colored or lirown, or so het that it can not be borne, should be rejected. Particular care should be taken that it he not false packed, or mixed with cimamon of an inferior sort. -Milavun's Oriental Commerce; Marshala's Essay.
The cinnamen of Cochin China grows in the dry sandy listricts lying northwest of the town of Faifoe, between the 15 th and 16 th degrees of nerth latitude.

It it eferred in China to the cinnamon of Ceylon. The a : ual imports into Cunton and other ports vary fromi 250,000 to $300,000 \mathrm{lba}$. There are no fower thau ten varietles of thls speeiea in the market. It is not cured, like that of Ceylon, by freeing it from the epidermia. Cbawrund's Eimbasy to Suim, etc., p. 475.

Cinnamon Monopoly.-Down to 1833, the cultivation of cinnaiuon ln Ceylon was restricted to a few gardens in the neighborhood of Colombo, the production and sale of the article being wholly monopolized by governinent. Upon the transference of the Island from the East India Company to tho king's government, the former agreed to pay $\mathbf{£ 6 0 , 0 0 0}$ a year for $400,000 \mathrm{lbs}$. or $4342 \frac{1}{2}$ balen of cinnamon; It being atipulated that if the quantity collected exceeded this amount the surplus was to be burned! But this agreement was afterward broken off; and the clmamen was sent to E:ngland by government, and sold on its account nt quarterly sales. The net reve $u$ derived from the chanamon monopoly, in 1831, is sald to have amounted to £127,961. As the monopoly could not be enforced, except by confining the culture of cinnamon to certain districte, it necessarlly led to the most oppressive interferences with the rights of individuals, to the creation of numberless imaginary offenses, and the multiplication of punishment forming a heavy drawback upon the prosperity of the Island. A sense of these disadvantages led at length to the abolition of the monopoly system in 1833, when England ceased to be amenable to the charge of upholding, without improvIng, the worst part of the Duteh policy, and restored to the natives their right to cultivate cinnamon anywhere and in any way they think fit.

Cinque Ports (i. e. the tive ports), five havens on the southenstern coast of Eugland, opposite lirance, ond thus called by way of eminence, on account of their importance as safeguards against invasion. These comprise IIastings, Romney, Ilythe, Dover, and Sandwich; to whleh were afterward added the two ancient towns of Winchelsea and Kye. These places were anciently deemed of so much importance in the defense of the kingdom against invasion, that they received royal grants of particular privileges, on condition of providing during war a certain number of ships at their own expense. They are governed hy n warden with the tltle of Lord Warden of the Clinque Ports, and each had the privilege formerly of returning to Parliament two members under the title of liarons of the Cinque Porta; but since 1831 this privilege has been contined to Hastings, Dover, and Sandwich. W'e are told by Camden that William the Conqueror appointed the first warden of the Cingue Jorts; but their charters are traced to the time of Edward the Confessor. The salary of the Lord Warlen is $\mathcal{L} 3000$ a year. E. B.-See Cinity's Commercial Jaic.

Circumnavigators. Among the greatest and most daring of human euterprises was the circumnavigation of the earth at the period when it was first attempted, a.d. 1519. The tirat ship that sailed round the earth, and hence determined its being globular, was Magellan's, or Magethoen's; he was a native of l'ortugal, In the service of spain, and by keeping a westerly course he returned to the sume place he had get out from in 1519. The voyage was completed in three years and twenty-nino days; but Magellan was killed on his homeward passage, at the Philippines, in 1521, - Iletlen. The following are the most renowned of this illuatrioua class of inen: their voyages were undertaken at the dates affixed to their names.-See Navigators.

Several voyages have been since undertaken, and, among other nations, ly the liussians.-llayns.
Cities. The word city has been in use in England only since the Conquest, at which the even London was cniled Iondonburgh, as the capital of Scotlaud is still called Edinburgh. The Engllsh cities were very Inconsiderable in the twelfth century. Clties were first ineorporated A.1). 1079. The Institution of elties lias aided mueh in introducing regular governments, police, monmers, and arts.-Honentson.
Citron (Ger. Succade; Ja. Sukkat; It. Confetti di cedro; Sp. Acitron terde; Fr. Citronat rerd), an agreeable fruit, resembling a lemon th color, smell, and taste. The prineipal difference lies in the juice of the eitron being somewhat less acid, and the yellew rind being somewhat hotter, and accompanled with a considerablo bitterness.-Lewis' Mot. Med. It is imported, preserved and candied, from Madeira, of the finest quality.

Civet (Germ. Zibeth; Dn. Ciret; Fr. Cirette; Jt. Zibetto; Sp . Alyalia), a perfume taken from the civet cat: it is ottensive unless extremely diluted, and then, in combination with other perfumea, it adds to their energy. It is hrought from the Brazils, Guinea, and the interior of Africa.
Civita Vecchia, a fortified sea-port town of the papal doninlons, on the Mediterranenn, Int. $42^{\circ} 4^{\prime} 38^{\prime \prime}$ N., lung. $11^{\circ} 44^{\prime} 6 z^{\prime \prime} \mathrm{E}$. Population 7000. The part of Civita Vecclin is artificial, and is formed by three large moles. Two of them projecting from the main land, inclined one to the north and the other to the south, form the sides of the harbor; while n third mole, or breakwater, constructed opposite to the gap between the other two, serves to protect the harbor from the heavy aea that would other $\cdot$ lse be thrown in by the westerly gales. A light-bou., ... ving the lnntern elevated seventy-four feet abova the level of the ses, is erceted on the southern extremity of the outward mole; the distance from its extremities to the extremities of tho lateral moles, on which there are towera, being about ninety fathoms. Vessels may enter cither ly the south or north end of the outer mole, but the zoutbern channel is the decpest, having from cight to six snd four fathoms. Ships may anchor within the port, in from sixteen to eighteen feet of water; or between it and the outer mole, where the water is deeper. Within the port there is a dock and an arsenal.-I'lan of Critita lechia.

Imports and Exports.-Though the wealth unl popuIation of tho country round Civita Veechia be much fullen off in modern times compared with antiguity, it still continues to be the entrepôt of lome, and engrosses almest the entire trade of the papal dominions on the side of tho Mediterranean. The imports consist principally of cotton, woolen, allk, and linen stuffs; coffec, sugar, cocoa, and other colonial products; salt and salted fifh, wines, jewelry, glass anil earthen ware, etc. The exports consist of staves and timber, corn, casl, wood, cheese, potash, pumice-stonc, alum, from Tolfa, in the vicinity, and other articles. The total value of the imports may be reckoned at from $£ 650,000$ to © 700,000 , and it may be fairly presumed that tha real value of the exports is not much Inferior. Marseilles

Inties.-Clivita Vecebla is a froe port; that ia, a port into which produce may be imported, and either con-s-med or re-exported, free of duty.
(Suarantine regulationa are strictly enforced, no veso sel with a foul blll of heaitll leing permitted to enter any of the papal ports.-Annunire du Commerce Maritim, tons. li. p. 366, etc.
Claret, one of the lest Firnch wines. It is derivel from the Latin Claretum, from Charere, to Le slear.- See the articles Bonmeavx aml Wise.

Clarification, the act of ciearing; partleularly the clearing or thing of liquids from feculent matter hy the separation of the insolublo particles. This is performad thy depuration, filtration, or coagulntion. Tho sul) stances usually omploved fur clarifying lifguors are tie nlbumen of eggs, blood, and lsinglasa. Tho first two are used for such liquors ns are clarified while boiling bot; the last for those which are clarified in the cold atate, wis wines, etc. The whites of eiges are beaten up into a froth and mixed with the liquor, when they unite with and entangle the fimpure matters that float in It; and, presently coagulating by the heat, carry these impuritles up to the surfice in the form of scum. Blood operates in the same manner. isinglass is much employed for fining wines. For this purpose, about a quarter of an ounce may he thrown into the cask, or the isinglass may ho previously dissolved and boiled down to a slimy consistence. It is then mixed with tho liquor by rolling the cask about; after which it is allowel to settle.
Clearing, among London bankers, is a method adopted for exchanging the drafts on each other's honses, and settling the differences. Thus, at half-past three o'elock, $n$ clerk from each bnnk attends at the elearinghouse, where he brings all the draftson the other bankers which have been paid into his house that dny, nnd deposits thein in their proper drnwers (a Irnwer heing allotted to each banker) ; ho then eredits thelr accomints separately with the articles which they havo against him, ns fount in the drawer. Balunces are then struck from ali the accounts, and the clalms transferred from one to another, untii they are so wound up and caneeled that each clerk has only to settle with two or three others, and their balaness are immedlately paid.
Clearing-house, the place where tho operation termed clearing is carricd on. The London clenringhouse was established some years sinee, for the convenience of hankers and joint-stock banks in the metropolis hy facilitating tho transfer, liquidation, or exchange of bank checks and hilis. This object is fully accomplished by each party, or some one representing it, meeting at a fixed place, at a fixed hour per dny, to dellver checks on each other, and recelving in retarn checks on themselves, or cash to balnnce. It follows, necessarily, that the pnyments and receipts daily must exactly counterbalsnce each other. The utility of this arrangement, Its cconomy of time and Inbor, nod avoidance of risk, may be estimnted from the fart that the annual clearings for one year (1839) amounted to £ $94,040,000$ sterling, or over $815,000,000$ each husiness day. In the year 1810 , the nvernge payments or clearings were $\$ 1, \dot{7} 00,000$ dnily, on an average.

The New York clearing-heuse was establlehed In 1853, and a constitution adopted In September of tbat year, when fify-two of the banks of the elty were represcited and became members. Operations were commenced the second week In October, 1853, and havo been carried on regularly ever since.

The hour for naking exchanges at the clearinghouse is 10 o'clock A.M., when all the checks or bllla of each bank are delivered by a clerk, and distributed by the manager or hla assistant to the clerk or representative of the lianks respectlvely. At 1 o'clock r.s., the dehtor banks jray to the manager the balances against them, elther in coin or in bank certificatesthe latter representing coln and used only by and among the banks, to nvold the carrying of speele to nud from the clearing-house. At the same hour the creditor banks receive from tho mannger, at the same place, the respective balances due to them. The manayer receives a salary of $\$ 3000$, and has two clerks under him. Tho expenses of the clearing-louse are horne by a tax ufon tho city lianka who are members, now fiff-three lil all. Ilanks liaving a capital lesa than 8. 0,000 pay 8100 euch, annually; lesa thnn $\$ 1,000,000$ pay $\$ 260$, and those over $\$ 1,000,000$ pay $\$ 300$ each, annually.
Tasisactions of the New Voak Gifammo-hotse, from ita Giommefempat, thtoben, t\%\%3, то October 1, 1856.

The Ihoston clearing-house was organized in that city September 26, A.1). 1855, and commenced business March 29, A.J. 1856. All the banks in the city (thirty-five in number) are connected with the institution, representing a capltul of $\$ 31,960,000$. The executive committee consigts of five gentlemen, all of whilh are presidents of banks. The total transactions from its commencement to Novemher $\mathbf{3 0 t h}, \mathbf{1 8 5 6}$, nmounted to $\$ 1,060,390,841$. The Merchants' l3ank is the depository bunk for the specinl deposit of coin from the several hanks connected with the association.

Cleveland, city, port of entry, and the capitnl of Cuynhogn county, Ohlo, on the south shore of Lake lirie. I, at. $41^{\circ} 30^{\prime} \mathrm{N}$., long. $81^{\circ} 47^{\prime} \mathrm{W}$. The population in 1799 consisted of one family; in 1825 about $500 \ln$ habitants ; in 1830, 1000; In 1834, 4300; in 18.10, 6071;
in $1850,17,034$; and in 1854 , about 25,000 ; and with the addition of Ohio City, 7000 more, making a total of 32,000 . Cleveland is the emporium of Northarn Ohio, snd, next to Cincinnati, the most important town in the Stato; possesses a commanding situation on Laxe Erie, at tho mouth of the Cuyahoga River, and the northern termination of the Ohio Canal, by which it is comected with tho Ohio River, and hy railroad to New York, to Buffalo, to Philadelphia via l'ittsburg, to Cincinnati, to Chicago. It is 130 miles north st from Pittsburg, 146 northeast from Columbus, 200 by water from Buffialo, 150 from Detroit, and 350 from Washington. The valuo of imports in 1851 amounted to $\$ 22,80,159$; exporta same year amounted to $\$ 12,026,497$. The licensed and enrolled tonnage of the district for 1851 was 36,070 tons; 11,355 steam, and 21,615 sail. The harbor of Cleveland is formed by the mouth of the Cnyahoga River, and improved by a pier on each side, extending 425 yarils into the lake, 200 teet apart, and faced with substantial stono masoury. Cleveland has a ready communication with New York vin railroad and the Erio Canal, with Philadelphia by railrond and canal, with Cincinnati by railrosd, had with the Ohio River by the Ohio Canal, and it experts much by the way of the Welland Canal to Canada.-Sce Onio.

Clock, Clocks (Ger. Lluren, Grosse L'hren, I"iandumhe; Du. Uuren, L'urwerketr, Horologien; Fr. Horloges; It. Orologgi, Oriuoli; Sp. Relojes; liuss. Tschasi"), a kind of machine put in motion by a gravituting body, and so constructed as to divide, measure, and indicate the successive portions of time with very great aecuracy. Most elocks mark the bour by striking or chiming. It is a highly useful instrument, ant is extensively employed for domestic ant philosophical purposes. Clocks are made of an endless variety of materials and models, so as to suit the different uses to which they are to be applied, and the different tastes of their purehasers. The Germans, Duteh, and Americans are particularly celebrated for their skill in the manufacture of clocks; while the Euglish, lrench, and Genevese, especially the former, have carried the art of making metallic clocks, so as to keep time with the greatest precision, to a highl legree of perfection. The history of the invention, introluction, mal nuccessive improvements in the manufucture of rlocks, has been carefully investigated by some very learned and induatrious antiquaries (see Bercmans"s IIst. at Incentions, vol. i. p. 419-162, English ed.; and liees' (yclopedia); but, notwithstanting theso researdios, the subject is still involved in conshlerable ohseurity. It seems, however, that the middle or the fourteenth century may bo regarded as the epoch when clocks, having weights suspended as a moving powar and a regulator began to log introduced. The periorl when, and the individual by whom, the pendolum was Brst applied to elock-work, havo been suljects of much contention. Galileo ond Huygens have disputed the honor of the discovery. "Hut whoever may have been the inventor, it is certaln that the invention never flourished till it came into the hanis of II uygens, wio Insists that if ever fialileo thought of such in thinf, he never brought it to any degree of perfection. Thr first pendulum clock made in Eing and was in the year 1662, by one Fromantel, a Ditelman."-llettos's Meth. Dictionary.

The origin of clock-work is involved in great obsscurity. Notwithstandlag the statemenis by muny writers that clocks, horologin, were in use so early us the ninth century, and that they were then invented by an arehdeucon of Verona, named Jacincus, there appenrs to be no clear evidence that they were machines at all resembling the se which have been in use for the last five or six centuries. But it is certain that for that period at least clocks limve heen made deprending on the action of a welght on a train of wheels, as disthiguished from the water-clocks, clepsydres, which aro well known to have been used many
centuries hefore. We will refer the reader who is curions about it to the articles on clocks, cte., in the Encyclopedia Britannica and the various werks there cited. We will only add to the information there given, that it appeurs from a communicatlon of Captuin Smith to the Antiquariun Society in 1851, that there is still a elock in existence at Dover Castle learing the date 1348 , earlier by thirty years than that of the elock made by De Vick for the palace of the Emperer Charles V., which has generally heen deseribel as the earliest clock of which the actual construction knowa. Mr. Denison also, in his Rudimentary Tratwe on Clocks (of which we havo largely avalled ourselves throughout this article, and also of various papers by him in the Cambridge Philosophical Transactions, and the Journal of the Society of Arts), mentions a clock in Peterborough Cuthedral, still in use as to the striking part, of which the construction is more like that of the Dover Castle clock than that of lle Vick ; and Lord Chief Justice Coke tells us that a eleck was set. up in Westminster Ilall in the thirteenth century out of a fino levied on one of his predecessors in that seat, from which, perhaps, the appropriate inseription liscite justitian moniti was copjed on to the sundial on a house now facing the hall.

The clock called the clepsydrs, or water-clock, was intwoduced ut Rome 158 a.c. by Scipio Nasica. Teothed wheels were applied to them by Ctesibins, about 140 n.c. Said to have been found by Cæsur on invading Ilritain, 55 n.c. The only cloek supposed to he then in the world was sent by i'ope Paul l. to J'epin, king of France, A.1). 760. Ineitieus, arehdeacon of Verona, invented one in the ninth century. Originally the wheels were three feet in cliameter. The earliest complete clock of which there is any certuin record was made by a Saracen mechanic, in the thirteenth century.

which in cold wonld remain among the dirty oil in the middle, unll in coll weather that fine oil of hot wenther will hecone moddy. There are various vegetable eils sold at tool-shops as oil for watches, including some for which a prize inedal was awarded in the Exhibitien, but not by any of the mechunical juries; wo have no information as to the test which was applied to it, and none bot actual use for a considerable time woald be of much value. We havo heard of 5 per cent. in power being saved in a manufuctory by the use of sperm instead of sweet oil to small spindles requiriug constant lubrication.-E. B.

Close-hauled ; that is, the tacks close down, the shects aft, the yards braced sharp up, and the bowlines hauled, the ship making her progress as neur the direction of the wind as sho can.

Cloth. Both woolen and linen eloth were known in very early times. Conrse woolens wero introduced iate England A.D. 1191; and seventy fumilies of clothwerkers from the Netherlands settled in England by Edward III.'s invitution, and the art of weaving was thereby introduced, 1331.-Rymun's Feder:3. Woolens were first made at Kendal in 1390. Medleys were manufictured 1614. The tine English broad-cloths were yet sent to IIolland to be tlyed, 1654 . Dyed and dressed in England by one Brewer, from the Low Countries, 1667. The manufacture was discouraged in Ireland and that of linen cotintenanced, at the request of both II ouses of Parthment, 1698.-Ilaybs. Nee Wool.

Clover (Ger. Klee; Din. Klater; Fr. Trefle, Luzerne, It. Trifoylio; Sp. Trebal; Russ. Trilistnik; lat. Tiff hum), a very important speeies of grass. Some of the species in cultivation are mnual, others biennial or trienaial, and others perennial. The seed used formerly to be principolly imported from IIolland; but that whieh is ratsal in liugland is now said to be of a superior quality. Culture for sced is, however, very precarious, and of uneertain profit. For erops of hay and grass seeds (including clover) raised in the United States, see arf. May.

Cloves (Ger. Nägleın, Gewurznelken; Du. Kruislnagelen; Fr. Clous de girytle, Girofles; 1t. Chiori di garofiena, Gerofina, (iuraffoli; Sp. Claros de cspecin, Cllorillos, "nss, tiuosdika; Arab. Kevenful; Malas, Charkef), the fruit, or rather eup of the unopened tlowers of the clove-tree, or Cetryophyllus aromaticus. The elove-tree is a native of the Moluccas, where it was originally found; but plants have since been carried to Cayenne und other places, where they succeed tolerably well. Cloves are sluped liko a nail, whence the name, from the French clon, mail. They are innported from the Dutel, setllements; the best in chests, and an infurior kind in bags. The hest varicty of the Amboyna cloves is smaller nad backer than the other varieties, very searce, and, as a mark of pre-eminence, is termed the royal elove. Good cloves have a strong, fragrant, aromatic odor; and a hot, aerid, aromatic taste, whieh is very permanent. They should he chosen large sized, jerfect in all parts; the color should be $n$ dark browh, almost approuching to black; aud, when handtel, shount leave an olly moisture , en the tingers. (iool cloves are sometimen adulterated by mixbig them with those from which oil has heen drawn; but thase are wenker than the rest, and of a paler color; and whenever they look shriveled, having lost the knob at the top, and are light anel broken, with but litthe smell or taste, they should he rejected. As cloves readily absorb, moistin? it is not uncommon, when a quantity is ordered, to keep them heside a vessel of water, hy which means a considerable midition is made to their welght.-T'tomson's Ihivenensatory; Mahuun's Oricntal Commerce.

Policy of the Dutch as to the Trade in Clowes.-From the expulsion of the English from Auboynn, in 1623, the Dutch have, n fow short intervals onjy excepted, enjoyed the exclusive pusseaston of the Moluceas, or Clove Islands. In thelr conduct as to the clove trade,
they have exhlbited a degree of short-sighted rapacity, which has been, we believe, seldont equaled even in the annuls of monopoly. Their object has not been to encourage the growth and trade of cloves, but to confine both within the nurrowest limits. They have preferred deriving a large profit from a stunted and petty trade to a moderute profit from a trade that might havo nfforded employment for a very large amount of capital; and to prevent their narrow and seltish projects from leing counteracted by the operations of the nativen, they have subjected them to the most revolting tyranny. "That they might," says Mr. Crawfurd, "regulate and control production and priee just as they thought proper, the clove-trees were extirpated every whero but in Amboyna, the seat of their power; and the surrounding princes were bribed by annual stipends to league witia them for the destruetion of their subjects' property and birthoright. This plan was begun abont the year 15051 . The contracts are still in force, and an annual flect visits the surrounding islands to suppress the growth of cloves, which in their native country, spring up with $n$ luxuriance which these measures of Satanic rigor, and of sacrilege toward hountiful nature, can scarce repress. lby the plan on which the clove trade is now eonducted-a plan carried into effect through so much iniquity and bloodshed-the country ot spices is rendered a petty farm, of which the natural owners ure redneed to the worst condition of predial slavery; and the great monopolizer and oppressor is that government, whose duty it should have been to insure freedom and afford protection. Junum ingenuity could harilly devise a plan more destructive of industry, more hostile to the growth of pullic wealth, or lujurious to morals, than this system frumed in a barharous age; and it rellects disgrace upon the chameter of a civilized people to persevere in it. It Is curious to remark how the nonopolizers, in carrying the detoils of this syetem into etleet, at once impose upon the natives and deecive themselver. The nominal price praid to the matives is aetually above the natural price of the commodity, but they are cheuted ha the details. The caltivator brings his promluce to the publice stores, where it is suljeeted at once to $n$ deduction of one-llfth for payment of the sularies of the civil and militory officers. The price of the remainder is inxed at the rate of $9 \cdot 6 \mathrm{Spanish}$ dollars the picul; but hefore puyment is mute, nother deluction of $r$ s-fifth is made; one-half of which is for the chicfs or $r(t) \cdot s$, and the ether for the native clders, who are overscers of the foreed culture. The real priee, thercfore, puid to the grower is \& Spunlsh dollurs per plenl, or if ac. per peund avoirdupois, instend of $1152-100$ Spanish dollars per pienl, or ligh., which is pretented to be given. When rloves have been sold on the spot, the price usunlly exucted hus heen about 6.1 Spanish tollars the picul, or eight times the price paid to the cultivator. The average price in llolland, previously to the war of the l'rench Revolution, may he tuken at fis. per pound, or 177 78-100 Spanish dullare per picut, being 2122 per cont. advance on the real cost of the commoditr lin the place of lts growth. When bought dlrect o England, they have cont at an nverago ds. 8a. the pound, making 100 6\&-100 Spunlsh dollars per picul, un advance ont tho matural expert price of 1268 per cent."-Lastern Archipelago, vol, iii. p. 388-3!0.
ofil of Clores is procured from cloves by dlatillation. When new, it is of a pule reddish brown coler, which beecmes darker by age. It is extremely hot and fiery, nus sinks lin water. The kind genernlly lmported from ludia contains nearly lanff its welght of an Insipid expressed oil, which is discovered by dropping a little into spirits of wine: and on shaking it, the genuine eil mixes with the apirit, and the insipid separathg, the frumd is discovered,-Mithanin.

Clyde, one of the largest and most Important rivers in scothad. It taken its rise from numerous streams tlowing from the mountain range in the south-
ern part of Lanarkshire and borders of Dumfriesshire; the chief summits of which are the Lowthers, Leadhills, Queensbury Hill, and Rodger Law, with elevation approaching 8000 feet. Its course is through rich and fertile valleys to Glasgow. From this city it expands into a river nsvigable for ships of 300 to 400 tons, and flows northwest, dividing the county of Renfrew on the west, from Dumbarton on the northeast, receiving the tributaries of the Kelvin, Cart, and Leven. After passing Dumbarton, it opens up into a noble estuary four miles in width, spreading northward Into Loch Long, and sonth ward into the Firth of Clyde, with the islsnds of Bute and Cumbraes, situated at the mouth of the eatuary. Here the Clyde expands into a firth averaging nbout 32 miles in width, and at the distance of 48 miles becomes identfied with the North Channel. The length of the river from its source to Glasgow, including windings, is about 75 miles. From Glasgow to the south point of Bute Island about 40 miles. In the Clyde was launohed the first steambost constructed in Rritain, 1812. Clydeddale is the district forming the valley of the Clyde, and is celebrated for its orchards, coal and Iron minea, and horses.

Coaches, vehicles for commodious traveling. They have sometimes two, and sometimes four wheels. Tho body of the coach is generally suspended, by means of springs, upon the frame-work to which the wheels are attached. They are usually drawn by horses, but recently have been impelted by steam. The forms and varieties of coaches are alinost innumerable.

Historical Notice.-Beckmann has investigated the early history of coaches with his usual care and learning. $t$ la certain that a species of coaches was used at Rome; but whether they were hung on aprings, like those now made use of, is not certain. After the subversion of the Roman power, horseback was almost the only mode of traveling. About the end of the fifteenth century, however, covered carriages began to be empioyed by persons of distinction on great occasions. In 1550, there were at Paris only three coaches; one of which belonged to the queen; another to the celebrated Diana of Poitiera ; and the third to a corpulent, unwlekiy nobleman, René de Laval, lord of Bols-Dauphin. Cosches were seen for the first time in Spain in 1546. They began to be used in England about 1580; and were in common use among the nobility in the beginning of the soventeenth century--Ilitory of Inventions, vol. i. p. 111, 127, English translation.
According 10 Hayds's Jictionary of Dates, the coach is of French inventloa. Undier Franels I., who was a contemporary with IIenry VIII., there were but two in Paris, ono of which belonged to tho queen, and the other to Diana, the natural daughter of lienry II. There were but three in Paris in 1550; anc enry IV. had one, but withont straps or springs. The first courtier who set up this equipage was John de Laval de Bels-Dauphin, who could not travel etherwise on account of hia enormous bulk. Previously to the uso of coaches the kings of France travelcd on horteback, the princessen were carried In litters, and ladies rode behind their squires. The first coach seen in Jingland was in the relgn of Mary, about 1553.-Pmestiev's Jerture. They were introinced much earlier.-AnDnews' Ilistory of Great Britain. They were litroduced by Fitz-Ailen, eari of Arundel, in 1580,-Stowk. And In eome years afterward the art of m:xing them.-Anbenbon's History of Commerce. A bill was bronght into Pariiament to prevent the effeminacy of men riding in coachen, 43 EHi . 1601 .--Hards.
Stage-coaches, Traveling by.-Owing to the Improvement in the breed of horses and thr building of carriages, but above ail, to the extraordinary improvements that were effected within the last half century in the laying out, construction, and keeping of rosds, the ordlnary rata of traveling liy atagocoaches, previously to their all but total extinction by railways, was seliom under 9 or 10 milea an hour, atoppagen included, and
on some roads was as much as 11 or 12 . The stages having been ahortened, this apeed was not found to be materially more injurious to the iorsea than the slower rate at which they previoualy traveied. The surface of the roads being perfectly smooth, and most sharn turns or rapid descents having been got rid of, truveling even at this rate was comparatively safe; and it was surprising, considering tho number ef cosches, how few aceidents occurred. They were occasioned, for the most part, thy the misconduct of the drivers ; and principally ty their endeavoring to. make up by increased apeed for time lost at stoppages, or by their attempting to pass each other. It ia, perhaps, needless to add that since the opening of rallways between ali the principal places of the country, traveling by stage-cosches in England no longer exista, except in a fow remote distriets, and has now bec.me almost a matter of histery.

Coal (Du. Steenkoolen; Fr. Charbon de terre; Ger. Steinkohlen; It. Carboni fossili; Lat. Jithanthrax; Port. Carvoes de terra, ou de pedra; Russ. Lgolj, Ka; mennoe; Sp. Carbones de tierra, Carbones de piedra; Swed. Stenkon). This highly important combustiblo mineral is divided by mineralogists into the three great fumilies of black coal, uninflammable coal, and trown coal; each of these belng agsin divided into many subordinate species.
It is contended, with much seeming truth, thnt coals, although they aro not mentioned by the Romans in their notices of Britain, were yet in uas hy the ancient Britons.-Brandt. They were first discovered at Neweastie-upon-Tyne in 1234; some say earlier, and others in 1239. Sea-coal wns prohibited from being used in and near London, as leing "prejudicial to hittman heuith;" and even smiths wero olligedi to hurn wooti, 1273.-Stowr. Coais were first made an article of trade from Newcastle to London, 4 Rich. II., 1381.-Rymen's F'edera.

This minerai will be considered under the general heads of-I. Origin of Coal; II. Cosl Stutistics of Great Britain; III. Areas of Coal-heds in the Worid, and a Comparison of their Extent ; IV. Comparison of the Coal Trade of the United States and Europe; V. Statistics of the Coal Traile in the United States.
I. Origin of Coal. Phenomena of Combustion, etc.Coal heds, or strata, lle among those of gravei, sand, chalk, clay, etc., which form grest part of the present surface of tie earth, and havo been evidently arcumulated during remote ages by the agency of "moving water"--similar to accumnlations now in process of formation at the moutha of all great rivers, sni in the bottoms of lakes and seas. When these struta had, by long contact and pressure, teen solidilied Into n rocky crust to the earth, this crust, by snisequent convulslous of nature, of which innumerahle other proofs remain, has been in various parts broken and heaved up above the level of the nea, so as to form the greater part of our dry or habitable land; in some places appearing as lofty mountains, in ethers as extended plalis. In many situatlons, the fracture of the crust exhibits the edges of the various distinct atratu found in a given thickness of it. When the fracture han the form of a precipltous clift, these edges appear one uheve another, like the eilges of plied plenks or books; but often also thoy am met with in horizontal succeasion along a plain, as the edges of a pile of tooks latd down ujon a table; or they may be seen surroumling hills of granite, which protrude throngh them. Coul, and other precimus minerain, were first disenvered nt the fractures of the strata ahove described, and by the continued dlgging of the atrate or velns the vant excnvs. tlans called mines have been gradually formed. When It was at last discovered that the minerai atrata oceur every where in nearly the aame order or anccession, so that the exposure of a portion of one atratum ls a good Indication of the other atrata leing noar, the operatlons of the miner beeame of much surer reanlt, and expenaive horing through superior strata might ise
prudently desired bu seen.

being
prudently nndertaken, even where no specimen of the desired but more deeply buried substance hsd yet been seen.

Before the discovery of coal mines, or the invention of cheap means of working them, wood was generally ased as fuel; and in many countries where the arts have not much flourished, it continues to be principally empleyod as such. Coal, however, for many purposes, answers much better than wood; and, in fact, the two, although in sppearance so different, are in their ultimate composition very nearly sllied. They both have for their busis or chief ingredient the substance calied by tire chemists carbon, and for their chief other ingredient the substance cslled hydrogen, which, when separated, exists in the form of air or gas. The hydrogen is casily driven awsy or volatilized from either coal or wood, by heating in a close place; and when it is caught and preserved, it forms the gas now used to light our atreats and public buildings. What remains of cosl, after leing so trested, is the substance called coke ; and what remains of wood, similarly treated, is the substance culled charcoal-both being nearly pure carbon, but differing as to the states of compactness. This kindred nature of cesl and wood does net surprise when the fact is known that much of our cosl is really transformed wood; many cosl mines being gridently the remsins of antediluvian forests, swept together in the course of the terrestrial changes slluided to, and afterward soliditied to the atate now seen. In these mines the apecies of the plants or trees which formed them are still quite evident in a sundant apecimens, mixed often with the reminants of the animnts which'iahabited the earth at the same tine. The extensive peat-mosses now existing on the surface of the earth consist chiefly of vegetable remsins at an early stage of the kind of change which terminates in the formation of coal.
A substance which, like ceal or wood, cheaply answers the purpose of producing great hent and light is called fuel, and the phenomenon of that production is called combustion. Now modern discovery has ascertained that, in every instance, combustion is morely sa appearance which accompanies the mutual action, when very intense, of two substunces in the act of fonning an intimste or chemical union. Wiere tint act is iess energetic, the heat produced is less intense, and there is no light. Thus, water and sulphurie acid, whan mixing, preduce great heat, but no light. Water aid duick-lime produce atill greater heat ; sufficient, it is known, te set tire to a ship in which the mixture uafortunately eccurs. It is an occurrence of the eame kiad when heat is ovolved from an seid dissolving a metal ; and it is atill of the aniso kind when a mass of coal or wood in a fire-grate is, with the appearance of combustion, undergoing solution in the oxygen of the atmospicere. In this last case, however, the temperiture of the fuel is, by the very intense action, raised so much thit the fuel becomes incsudescent or luminous; an appeurance assumed by every substance, whether burniug or not-of a stone, for instance, or piece of metal-when heated beyond the temperuture indicated by $800^{\circ}$ of Fahrenheit's thermmmeter. The inferior degrees of sucil incandescenco are called rol heat, the superior degrees whits heat. The reuson why any strongly heated body throws out liglit, we can not yet explain. When a quantity of wood or conl has feen burned to nsh in a consined portion of air, the whofe of the fuel, vanished from view, is held in solntion by tie air, as salt is held in water, and is agnin recoverable by the art of the cinemist. The phenomenon of common fire, or cominustion, then, is merely the fuei being chemically disaolved in the air of the atmospinere. If the fuel has nothiug volatils in it, as is trus of puro carben, and nearly truz of coke and charcosi, it burns with the appearsnce of sed-hot atones; but if there be an ingredient, as hydrogen, which, on being heuted, readlly assumes the firm of air, that in.
gredient dilates before burning, and in the act produces the mere bulky incandescence called flame.

Varieties of Coal. -There is a curious chain of links which connect living weod with dead coal. 'First, there is peat, consisting of various kinds of plants and moss, imbedded and pressed together into a mass, and exposed to the action of air or water, or both, and perhaps heat, for unnumbered centuries. Then there is lignite, formed in neariy the same way from trunks of trees, and accumuluted in layers of vast thickness in Germany and other parts of Europe; it has not hitherto been much used as fuel, but there are indications that it will so be ere long. Next comes jet, which appears to be a peculiar varicty of vegetable matter brought almost to a bituminous state. Then we have cannel coal, which not only yields the best and most abundant gas for street-lighting, but has often such a bsrdness, blackness, and polish, as te enable it to be worked up into vary besutiful ornsments. One peculiar kind of cannel coal, called the Breckinridge coal, was lately discovered in Kentucky, from which a burning oil has been manufuctured, which by experiment has proved quite equal to sperm whate oil, if not superior, and can be manufactured for one-half the cost of sperm oil. The United States government have under considcration a contract to use it in the light-house system. Next is the caking, or common bitumineus cond, which combines so many usoful qualitios for household purpeses. Somowhat different from this is the stratified coal of the midland countics of England, which is obtained in very long pieces, and has less bituminons or caking quality. A still less gaseeus cosl is that which, from the purpese to which it is now feund to be admirably adapted, is called steam coal; it is obtained chicfly from Wales, and burns with intense heat, and little flame or smoke. Last on the list is anthracite so nearly without gas as to consist almost entirely of carbon; its intense heat and freedom from sulphur render it invaluable for iron-smelting and other manufacturing processes.

The two great purposes which combustion serves to man are to give light and heat. By the former he may he aad to Jengthen considerably the duration of his natural existence; for he converts the dismal and almost aseless night into what, for many ends, serves him as well as day; and by the lattor, besides converting winter into any climate which he desires, ha is cnablod to effect mest important mutations in mnny of the substances which nuture offers for his use ; and since the invention of the steam-engine, he makes heat perform a great proportion of the work of society. From these considerations mas be perceived the Importance of hsving fire at command; and, as the cheapest means of commanding fire, of having abundance of conl.

1i. Conl in Great Rritain.-As respects the supply of coal, Great Britain is singulurly favored, a large portion of the surface of the conntry having under it continuous and thick lede of this valuable minerslvastly more precious than would have been mines of the precious metuls, like those of I'eru and Mexico; for conl, since it has been applied to the stemen-engine, is reully hourded jower, apillicablo to almost every purpose which human labor directed ly ingennity can nccomplish. It is the possession of her coul mines which has rendered Grent Britain, is relation to the whole world, what a city is to the rural district which surrounde it-the producer and dispenser of the variels products of art und industry. Calling her coal mines tine coul-ceilars of the great eity, there is in them a supply which, at the present rate of exjenditure, will last for 2000 yoars at least ${ }^{\text {j }}$ and, therefore, 11 irevision which, as coming improvements in the arts of life will unturally effect econony of fuel, or suistitution of other menus to effeet sinilar purposes, may be regariled as inexlaustible.

The kinds or differences of coal depend on their
comparetive proportlons of carbon and hydrogen, and of earthy impuritles totally incombustible. Whilo some specles of coal contain nearly a third of their weight of hydrogen, others have not a fifieth part. The former kinds are flaming coal, plessing in parlor fires, and fit for the manufacture of gas. The other kinds-some of the Welsh stone coul, for instancewill only burn when in large heaps, or when mixed with more inflammable coal: they have no flame. When flaming coal is burned where a snfficiency of oxygen can not pass through or enter above the fire, to combine with and consume the hydrogen as fast as it rises, a dense smoke Is given out, consisting of hy. drogen and curbon combined in the proportions which form a pitchy substance. The Welsh ceal above mentioned cun as little give out smoke as flame, and bence is now much used lin great breweries, and in the steamengine furnaces of towns, where smoke is a serious nuisance. The folisted or cubical coal, aud slate coal, are chiefly used as fuel in private houses; the caking coals, for smithy forges; the slate coal, from its keeping open, answers best for giving great heats in a wind furnace, as in distillation on a lurge scale; and glance coal, found in Staffordshire, is used for drying grain and malt. The coals of South Wales contain less velatile matter than either the English or the Scotch; and heace, when employed in smelting the ore, produce a greater quantity of iron. It ia supposed that three parts of gool Newcastle coal are equivalent, as fuel, to four parts of good Scotch coal.

Consumption of Coal. Number of Cersons engageis in the Trade. Supply of Coal. - The grent repoxitories of coal in England are in Northumberland and Durham, whence London and most parts of the south of England aro at present supplied; in Cumberland, whence large quantities of coal are exported to Ircland; and in Staffordshire, Derbyghire, Lancashire, Yorkshire, Lelcestershire, Warwickshire, South Wales, etc. In Scetland, coal is found in the Lothiana, Lanarkshire, Renfrewsitire, Ayrshire, and other counties. In Ireland, coal is hoth deficient in quantity and inferior in quality to that of Great Britain; and turf forms the great article of fuel.

The importance of coal as a necessary of life, and the degree In which superiority in arta and manufactures are dependent upon obtaining supplies of it at a cheap rate, has naturally attracted a good desl of attentiou to the question as to the period when the exhaustion of the coal mines may he nuticipated. But the inventigations hitherto made as to the magnitude and thickness of the different coal-heds, and the extent to which they may be wrongit, are too vague and unsatisfactory to afford grounds for forming any thing like a toterably near appreximation to $n$ eolution of this question. But such as they are, they are sufticient to show that many centurics must elapse before posterity can feel any serious difliculties frem a diminished supply of conl. According to an estimate prepared by Mr. Taylor, an intelligent coal engineer, In 1829, the cosl-flelds of Durham and Northumberland are adequate to furnish the present unnual supply for a vory long period. We subjoin Mr. Taylor's estimate.

This rematnder is adequate to supply the preaent vend from Newcastle, Sunderiand, 11 artley, 1lyth, and stockton, of $3,500,000$ tons, for a period of 1727 yesrs.
It will be understood that thla catimote of the quantity of coal in Durham and Northumberland can only be an approxImation, especially as the southeastern coal dlatriet of Durham ta yet almoat wholly unexplored; but theattempt is made, in the hope of eatisfylng your lordohlps that no spprehension need be entertalned of thla valuablo mineral being exhauated for many future gencrations.
Thero la aleo a conslderable extent of coal-field in the northern and southweatern districta of Northamberland, hat the foregolng comprises that which Is continuous, end mos: multable and avallable for eapurtation. It Is, however, to be obsorved that the ahlpments of coal from the ports mentioned by Mr. Taylor has been largely Increased during the last docen years: so that, aupposing the cestimate to be In other reapecta accurate, it must now be modified accordlagly. Lorda' Report, 1829, p. 124

Dr. Buekland, the celebrated geologist. considers Mr. Taylor's estimate as greatly exaggerated; but in his examiuation before the committes of the House of Commons in 1829, ho quoted with approbation a passage of Bakewell's Geology, in which it is stated that the coal-bede in South Wales wero alone sufficient to supply the then demand of England for coal for 2000 years. The passsge is us follows:
"Fortunately we have in South Wales, adjoining to the Bristol Ciannel, an almost exhaustless supply of coal and iren-stone, which are yet neurly unwrought. It hus lieen stated that thin coal-ficld extends over about 1200 square miles; and that there are 23 beds of workable coal, the total average thickness of which is 95 feet; and the quantity contained in each acre is 100,000 tons, or $65,000,000$ tons per square mile. If from this we deduct ons half for waste, and for the minor extent of the upper beds, we shall have a clear supply of coal equal to $32,000,000$ tens per square mile. Now if we adnit that $5,000,000$ tons from the Northumberland and Durham mines is equal to nearly one-third of the total consumption of coul In England, each square mile of the Welsh c,al-field would yield coal for two years' consumption; and as there are from 1000 to 1200 सquare miles in this coal-field, It would supply England with fuel for 2000 years, aftor all the Engllsh coul mines are worked out!"
But supposing this supply to lsst only 1000 years, that carries us so far into futurlty, that it nppenrs to bo quite idle either to prohibit or impose heavy dutics on the exportation of coal, on the ground of its accelerating the exhnustion of the mines.

Profits of Coal Mining. Cual Ouncrs' Jonopoly, etc. - Instead of the business of coal mining being, genernlly speaking, an advantageous one, it is cllstinctly tie reverse. Sometimes, no doubt, large fartunes havs been made by individuals and associations emgaged in this business; but these are rare lastances. The opening of a mine is a vory expensive snd hazardous ojerntion, and of very uncertain result. Collieries are exposed to in infinite number of accidents, ngainst which no caution can guard. The chances of explosion have, It in true, been a good deal lessened by the introiuction of Sir linmphry Davy's lamp; and some mines are now wrought that, but for the invention of tilis admirable instrument, must have been entirely abandoned. Llut besidea explosions, which are still every now and then oecurring, from the enrelessness of the worknen, and other contingenciea, mines are very liable to be destroyed by creeps, or by the sinking of ths roof, and by drowning, or the irruption of water from old workings, through fissurea which enn not be aeen, and consequentiy can not be guarded ngainst. So great, lndeed, is the hazard attenling this sort of
property, that it has never been possible to effect an insurunce on a conl-work aguinat fire, water, or any other aecident.

Coul Trade.-It is estimated that not less than forty million tons of coals are raised annually from the virious mines in the United Kingdom. Of these the greator part is either used in the immediate neighborhood of the mizes, or sent by inland navigation or land carriago to different parts of the kingdom. In $1852,12,709,771$ tons of coals, cinders, and culm were shipped from ports in the United Kingdom; of these, $9,069,577$ tons were sent coastwise to other ports of the kingdon; beiog, coais $8,805,934$ tons, cinders 43,376 tors, culm 220,267 tons. The quantities of coals, cinders, and calm shipped coastwise from the different ports of the United Kingdom in 1851 and 1852, were:

| $\begin{aligned} & 18.51 . . . . . . . . . \\ & 1852 . . . . . . . . \end{aligned}$ | $\begin{aligned} & \text { Tone. } \\ & 8,2346.512 \\ & 8,030,428 \end{aligned}$ | $\begin{aligned} & \text { Tons } \\ & 254,481 \\ & 414,017 \end{aligned}$ | $\begin{aligned} & \text { Tond } \\ & 8,490,909 \\ & 8,745,345 \end{aligned}$ |

During the six months ending 80th June, 1852, 179,386 tons of coal were imperted iuto London by rsilway, and 19,637 tons by canal : for the corresponding period of 1853 the imports by railwsy were 290,361 tons, and by canal 10,322 , showing a decrease by canal, but a very censiderable increase by railway.

The coal trade was 1 rig subjected to very heavy and oppressive duties. A duty of 17 s . per chaldren on large, and 4s. 6d. per chaldron on small coals, was levied on all coal exported to foreign countries. In 1831 these dutice were considerably modified, and in 1835 they were repealed, with the exception of an ad valorem duty of 10 s . per cent. on coal exported in British veasele, or in those of foreign countries entitled to the privileges conforred by treaties of reciprocity, while in other foreign vessels it was subjoct to a duty of 48 . n ton. These duties were, in 1840 , altered to 10 s . $6 d$. per cent., and $4 s .2 \frac{8}{20} d$. per ton respectively. In 1842, duties of $2 s$. per ton on largo, and 1s. per ton on small coal and culm were imposed, and on all coal exported in foreign vessels not entitled to the privileges conferred by treatics of reeiprocity a duty of $4 s$, per ton. The two former were abolished on 12th March, 1845, but tho last continued in foreo till 14th August, 1850.
In the reign of William III., a duty of $5 s$. per chaldron was laid upon coal carried eoastwise from one part of the kingdom to another. During the last war with France this wus raised to $9 s, 4 d$., but in 1824 it was reduced to $6 s$. , and in 1831 was repealed. This tax pressed unequally on different parts of the empire, for while it amounted to 6s. a chaldron, or $4 s$. a ton in the metropolis, and all the south of Eugland, it was only 1s. $7 \frac{1}{4}$. a ton on conl carried by sea to Ireland, and $1 s .8 d$. on that to Wales; while Seothand was for many yeurs entirely cxempted from this duty.

Though these duties are now abolished, the coal trade is still in some places burdencd with leavy local duties. Thus a duty of 1 s .1 ll . per ton is ehargeable upon all coad brought into the port of Louden. By aet 1st and 2d Willian IV., cap. 76, soveral oppressive acts were repealed, and the duties payable to the cerporation of tho eity of London were commuted for a duty of 1s. 1 ll . per ton; and by 8 th and 9 th Viet., eap. 101, a like duty was imposed on coal brought into Louden by railway, camal, or other inland carriage. Of this duty 8 a. per ton is carried to the London Bridge Approaches Fund, for effecting street improvements in the metropolis; 4d. jer ten is the property of the corporation of the city of London, and after defraying certain charges is carried to the genernl account of the cerporation; 1d. per ton is payable to her majesty'd commissioners of works, to be applied by them in effecting public improvements in the metropolis, anthorized by eoveral nets of Parliament. The produce of theso duties, with the drawbucks allowed upou coal exported, was, in 1852,

|  | Grous the | Drawback. | Nel Duty. |
| :---: | :---: | :---: | :---: |
| 8d. per ton to bth January, 1853 $\qquad$ | \} $£ 123,657$ | 210,098 | 2113,650 |
| $4 d$. per ton to 3tst Wecember, 1852. | 0 | 6, 010 | 67,501 |
| 1d. per ton to 31st December, 1852....... | 15,600 | 1,262 | 14,298 |
| Totas. | 2401,567 | (2) 6,416 | 1885,45 |

In 1851 the gress amount of duty was, on sea-berne cenl, $£ 175,840$; on conl brought landwise, $£ 12,1011$. The 4 ll . por ton duty, in 1851, ameunted to $£ 54,104$, of which $£ 215$ were eularies in relation to collection; £ 3009 drawlack allowed upon coal exported; $\mathbf{£ 7 6 0 7}$ retiring allowances paid to deputy sea-coal meters and others, upon the abolition of their offices in consequence of act 1st and 2d Will. IV., cap. 76, and which had uradually clecroased froin $£ 16,820$ in 1886 ; und f20,000 an anumal elmarge for making a now atreet in the line of Cuncn Street, und other improvemente. The attention if goverument is at present directed to these unjust local imposts, by which our home trade is unnecessarily burdened, and the merchant and ship-
owner made to pay for improvements which ought properly to be charged against the landlords or inhubitants; and it la expected that they will speedily be abolished.-E. H.
III. Areas of Coal-beds in the World, and a Comparison of their Extem.-From the clubornte work, "Statistics of Coal," by R. C. Taylor, we extract a comparison of the proportionute areas of coal land in Europe and America:

The following table shows the relative magnitude of the prineipal coal-producing countries, and their respective areas of coal land, together with the proportions which they geverally hear to each other. Those of France and Spain are considerably lesa than the actual nmount. Coal oceurs in almost every principal subdivision of Spain, but we have only included the Asturias region.

Hence, as regards European countries, Great Britain takes the first rank; lelgium, as regards territorial proportion, occupies the second rank, ulthough in relative coal area she is the least of the four. Pennaylvania, in respect to territorial proportion, is higher than any of these, being relatively one-third; hut in absolute area of coal formation, the four castern colonies of Hritish America united exceed thent ali, heing larger than that of Great Britain, France, Belgium, and Spain conjoined. This table is not strictly perfect, since we possess the arens of the concessions only in France; and in Spain, only of the single coal rogion of Asturias. We add the coal nreas of Prussia and Anstria, but can not state the proportions of conl formation thereln. The Anerican urea of coal is nearly three-fourths of the whole amount in our table.

| Counities. | Entire Area of enelh Country. | Area of Coal Ladas. | Propartion af Coal Iu thalt whala Areas. | Proportiona, Ralativa Parts of 1000 , of Coal Areas. |

| L'ntted States. ................................... | $2,280,000$ |  | 1-17 | $\cdots$ |
| Twetro principat coal-producing States............ | 10E5,283 | 100, 132 | 1.4 | 724 |
| Total. . . . . . . . . . . . . . . . . . . . . . . . . . | $\cdots$ | 144,073 | $\cdots$ | 1600 |

We assume these, in round numbers, as correct ; and here we perceive at a glance the vast resourees of the Lnited States in their coal-produclng regions, when compured with Europe. It must be recollected, too, that several of our States have not had geologieal surveys; and it would not be surprising if other States than those enamerated were fomad hereafter to pose sess coal in abundant quantities.

The whole coal region of Europe is by Mr. Tnylor siown to be only 50,941 square miles, being somewhat less than that of the IV'cstern States of Illinois and Indianz; while England has only 8139 miles, and Irclund 3520 miles, the aggregate being somewhat less than that of the State of Ohio. But Great Britain produces ammally upward of $3 \pm, 000,000$ tons of coal; while that of Pennsylvania is nbout $1 \mathrm{C}, 000,000$ tons.
IV. Comp rrisen of the Coal Thade of the United States and Eurepe.-Tie consumption of coal in Europe and the United States was estimated as follows in 18.5, showing also the square niles of coal formation, the relative proportions, and the valte in dollars:

| Countries. | $\begin{aligned} & \text { Byuare } \\ & \text { Miles. } \end{aligned}$ | $\begin{gathered} \text { Produclion, } \\ 1846 . \end{gathered}$ | Pruportiob. | Value. |

| Total... | . . . $\cdot$ | 49,160,000 | 1000 | \$72,462,0611 |

The quantities of conl imported into the United States from England and the Initish provinces were, in 1850, 180,439 tons; and in the year 1853, 231,508 tons. From a letter of Mr. E. K. Collina, we learn that the Collina line of stam vessela had used the Cumberland conl, lut had relinquished it, and ufterward tried the anthracite, whieh was used for three vears. In January, 1954 , they thought of using the Cumberland conl agnin.

Mr. Cunarl states that for hil line they use the Welsh er is on the voynge from liverpool, and the Cumberlaud coal on the return tripa.
"We have in the United states mere iron ore and more con!, with the unanl fuxes, ill conventent connection and of cheaper acceas, than all the other civifized natlons of the world, and have the n meonary capital, akili, and labor to pro-
duec all the tron and ateel, and manufactures of fron and steel, required for our consumption, or that may be required for our consumption, for centuries to come, and also to enabls us to supply the markets of other countries in fair compettion with the Iron and steel of other nations. Our production of fron and steel, sad manufactures of Iron and steel, was greater in proportion to population in 1850 than it was in 1840 , and that it was greater in 1855 than it was in 1850 , giving us the right to assume thas, in fluenced by the same canses, it will be greater in 1560 than it now is, and in time wilt be sufficient for our own conaumption, and then give us a aurplus for export. But taking into conalderation our present papulation nnd acenmulated eapital, with the amonnt of capitni ananasily drawn from other countries in the course of emigration, and the great cost of carringe to the interfor of our country, with the lato inprovements in the modes of production and manufacture of iron and steel, it woutd not be rasil to expect a full aupply for our owa consumption between this and the returns of the census of 1870. "-United States Treasury Report, 1860.

The question of duty on coal attracts considerable attention, and it is well to understand certalit facts which have a direct bearing upon its decision.

In the year 1815, when the duty on foreign coal was $\$ 360$, the price in New York was $\$ 23$ the chaldion of 36 businels.

From 1816 to 1823 the duty was $\$ 180$, and the nverage price was $\$ 11$.

From 1824 to 1834 the duty was $\$ 216$, and the average price was 14.

In 18.22 the duty was 175 per ton, anil the market price was $\$ 716$; and in 1841, with a duty of $\$ 1$, the price was $\$ 556$. In the year 18.16 the duty was altered to an ad valorem one of 30 per cent., or afout 45 cents per ton, ant the market price since has ranged from $\$ 650$ to $\$ 750$.
V. Statixtics of the Coal Trade of the Cnited States. -Penngylvania is rich in its conl product. This article is one of the great sources of woalth to tiant State, and ..d importance may be seen from tho single fact Ihat about $6,000,000$ tona are carricd over or through the varlons railroads nnd canais of that State cast wnedly, We refer only to the anthracito recrion, which mines gecm to be inexhauatible, and we leave oat of view the Immense production in Western Pennsylvania. The latter portion of the State owes its growtin mainly to its coal-leds, in conjunction with its iren and glass manufactures.
The maximum capabilitics of the transportation

If we may judge by the Increase of the last two or three years, the quantity of coul required by the above conveyances will be $7,500,000$ tous for the coming year, and between cight and nine millions for the year 1856. We have received from London the special Report of Professor W'ilson on the New York Industrial Exhibition, in which docunent wo find a variety of useful information in reference to the manufactures, minerals, mining, and metallurgy of the United States. Ilis remarks en the iron, lead, copper, snd zinc products and manufactures will be a valuable addition to the information nlready in possession, and will be uc sptaLie as well to the legislator as to the msnufacturer and merchant.
Virgiula takes the lead among the Eastern (or Atlantic) States ss the owner of coal-fields, and is, in fact, one of the prominent States of the whole Union as the pessessor of this valuable mineral.
Arg. of the erveral. States wimere Coal 18 mound, And the Coal Agea of eacit, and the l'ropoation of Coal.

North Carolina is reputed to hold about as much coal land as Georgia. Lown is one of the richest coal States, and has a coal arca simost equal to Ohio.
from this valuahle reforence-table it will be seen that Illineis takes the lead, having within her own borders one-third of the entire coal region of the United States. Next in importance ls Pennsylvania, producligg beth antliracite and bitaminous coals, Of these immense fields Professor Wilson says :
"These comprise the three anthracite coal-fields of Eastern l'ennsiyl vania, known as the Southern Schuylkill, the Middle of Shamokin, and the Northern or IFyoming, and the Frostburg or Cumberland coul-field (semi-hitumineus), In the State of Maryland. Besides these bels, a small outlying bed exists in Pennsylvanis of semi-bltuminous coals, known as the Brondtop, which, however, owing to its insulated position, being without uny means of access, is only available for loen purposes ; and some deposits of considerable areu in Vircinia, whose importance is being cluily recognizet, and whese produce is gradually finding its way into the markets. The demand at present, howover, is confined chiefly to gas-mnking phrposes.
"Of the three anthracite leds of Pennaylvania, the Southern is, beth by altuation and magnitude, the most impertant, aud furnishes a lurge propertion of the entire supply. It presents great facilities of access, which have been mado advantageons use of by two Canal Companies, the Lehlgh nnd the Sehuyikill, and by the leanling Railroad, whieh penetrate far into the interior, and form the great outlets for its proluce. Other rallways are now in progress, which will not only ufford additlonat facilities of transfer to the Atlantic citics, but also open $n$ communication to the fatter, and through them to the Western markets."

The thirl in importance is Ohio, haviug nearly onethird of its area in coal. The returns as to production
are not copious; hut Charies Lyell, who made critical inquirles on the subject, reported the following ss the yield for 1851-'52:

|  | Buahols. | Tons. |
| :---: | :---: | :---: |
| Western Pesitgylvania. ..... | 35,000,000 | 1,170,040 |
| Virglnla.................... | 15, 000,000 | 1000,000 |
| Eastern Ohlo | 16,000,000 | 535,000 |
| Tothl. | 66,000,000 | 2,205,000 |

At the Exhibition were produced ssmples of cosl from Valley Falls, Rhode Island, but the product is of inferior quality.

Of the Vlrginia cosl, twelve miles west of Richmond, and cxtending fifty miles, the seams are 800 feet in thickness, being the decpest mincs known in Amerlca. In Belgiunn some of the mines are known to be from 1140 to 1476 feet in depth. In England, 1000 to 1794 feet-with an average in Lancasnirs of 750 feet.

Imponted Conl.-.The only countries from which coal ever finds its way into the United States are Groat Britain and British America, and tho contributions from them appear to be annually diminishing. For a time there was an increasing foroign importation; viz., from 22,123 tons in 1821, to 181,551 tons in 1839. By the operation of the American tariff this advance was not only checked, but a retrograda movement was prodluced, so as in 1843 to amount to only 41,163 tons, by the United Ststos returns. By the last annual return, that for 1817, the entry of forcign coals, whether from Europe or from British America, was 148,021 tons ; of which from 12,000 to 15,000 tons were re-expurted for the scrvice of the English steamshipa. In 1850, 180,439 tons were imported into the United States; in 1853, 231,508 tons; showing an increase.

Incheased Produczion of Coal. Anthracite Coal. -The production of anthracite may bo said to be cntirely confined to Pennsylvania, which possesses a numerous and interesting group of coal basius of various slzes and character.

Our returns show that the consumption of anthracite, in other words, tho coal trade, commenced with 365 tons in the year 1820; that the production reached 48,017 tons in 1827; that it had increased to 881,026 tons in 1837, and advanced to $3,000,000$ of tons in 1847, without incluting much thst is consumed on the spot, in the mining districts, or interior of tho country.

The increased production, therefore, was, in the first ten years, viz., from 1827 to 1837,1735 per cent. ; in the second ten years, viz., from 1837 to 1847,240 per cent.; and in the twenty years previous to 1848 , that is, from 1827 to 1847,6100 per cent.

Wo introduco another vlew of the subject, which exhithits this accelerated increase in the consumption of anthracite, perhape, with yct greater perspicuity. The ameunt which was periodically forwarded to market, exclusive of tho consumption in or near the places of production, and which has not been estlmated, is as follows:

Bituminous Coal.-We have given, in the first part of this article, data by which the approximate increase of this description of fuel can be determined, and give hero all the statistics that can be collected.

The increase of seml-anthracite or bltuminous coai in iest includlng foreign, over the provions year, was 218,167 tons. This year (1855) there is a decrease of 1731 tons, making the total increase of all kinds in 1855 684,00\& tons, against 952,857 tons in 1854 .
Almost as luteresting as the atatiaties of the areas and preduction of the conl countries, is the consideration of the means of transportation and the facilities needed to give us fuel la abundance and at a low price. It is of grent importance to the cousumer, and an extract from a private letter will be of Interest, throwing some light on the ways and means, the cost and contingencies in the transit to market:
"] ly canal, besins the distance and cost of the atructure, there are so many contingencies, arising from too much or too little water, as to weaken the dependenea; and on the railroads, the gradea and the adaptation to the business are alono the objects by which the price can be regulated. If the grades be lavel or descending, tha capacity of the eagine is not only Inereased, but the expense is so much reduced as to determine its value, and it is only upon a road so graded and so conatructed as to endure the burden that the price can be
flxed or defined. On the down-hlll grade the momentum keeps up the speed, and relieves the engine, whlle on the up-hill gracle the apeed ia depressed, the power is reduced, the strain is increased, and the expense aug. monted.
"On the Readlng Rallroad, in operation since 1811, these facts are so illustrated and defined as to establish their existence beyond a question. On the stem ns upon the laterals, the descent is from 22 feet to a mille to a level of 36,000 feet, and as tho maximum is but four mlies in length, the balance descends to the level wlthout the allghtest rise to interfera with the speed. On this descent and over the level, a slngle engine ean take as many cars loaded as it can briag empty to the place of atarting. This difference, from the weight of the descending and ascending trains, is ascertained to be equal to two and three-quarters engines, or 175 per cent. more than on the downward grade-consequently a reversion of the trade; or upon a road where the grade is equal to twenty-two feet to the mile against the trade, the expense for engines, fuel, and wages, would be more for the same distance than the profits derived from the coal in market.
" Bot as these are the questions for railroad-makers, we wil] next consider the extent of the trade, and arrive at ourobject by the expenditure made to accommodate it. On the Lehlgh, we have an expenditure on the part of the Lehigh Coal and Navigation Company of $\$ 8,441,405$, and on the part of aome fourteen or fifteen companies passing over their works alout five millions more, making together $\$ 13,441,405$. From the commencement of tho company in 1820 mntil the elose of the aeason in 1855 , the production of the region is $12,278,012$-equal to 353,725 tons per annum. But if we take the amount sent to market during the year just closed, $1,274,986$ tons, and admit a clear profit of 75 cents per ton, which it did not give to the several partiea concerned, the income would be less than 7 per cent. on tho money expended. In the region it is also understood the mining operations are above waterlevel, and that until recently they were conducted on the prinelple of a quarry, and that the experses, togethei with the transit, prevented a dividend to the stockholders nntii the outslde operators came in to theit rellef.
"On the Lackawnna, the Delaware and IIudson Company, and the Pennsylvanla Coal Company, with capltals amounting to $\$ 11,626,761$, brought to market during $1855,1,092,000$ tons, and during the period they have been in exlstence the average is equal to 332,000 tons per annnm. The protuction of 1855 , at 75 cents per ton elear prefit, glves, however, but 7 per cent.
"On the Schuylkill, the operatlons aro more extensive, and the expendlture, Includling the

Besides thls expendlture for reaching .he traile, there is a populatlon depending upon it of $60,717 \mathrm{in} \mathrm{1850}$, which is divided into 10,927 families and 10,670 houses. In the region thero are also 300 stationary engines, equal to 10,000 horse power, used $\ln$ mining. In 1855, the production was $3,318,340$ tons, nad duriug the exIstence of the works (the Navlgntion Company thirtyfour years, and the Reading fifteen years), the product has been $28,508,944$ tons, equal to 838,495 tons per annum. At 75 cents on the product of the year just closell, clear profit, the percentage on $\$ 36,631,516$, including the improvements at the mines, wo:ld be between 7 and 8 per cent.
"Aitogether the cost for improving and reaching the three regions in operation, including tho castern division of the Pennsyivania works, is $\$ 62,272,898$. T? 10 product during 1855 amounted to $5,262,189$ tons, which, at 75 cents profit, would be equal to $7 \frac{1}{\text { p }}$ per cent. profit." -See articles Inon and United States.

Coasting-trade, the trade or intercourse carrled on by sea between two or more ports or places of the same country. It has been customary in most countrles to exclude forelgners from all participation in the coasting-trate. Thls policy began In England in tho reign of Elizabeth ( $5 \mathrm{Ellz} . \mathrm{c} .5$ ), or perhaps at a moro remote era; and it was perfected by the aets of navigathon passed in 1651 and 1660. Thls policy is now entirely abrogated In Great Britain.-See Gheat 13nitain.

Of Fessels which muy engage in the Domestic Trade of the linited States.- Vessels of twenty tons and upward, entolled, and having a license in force, and vessels of less than twenty tons, not cnrolled, but having a lieense in force, and no others, shall be deemed vessels of the United States, entitled to the privileges of vessels employed in the coastiag-trade and fisheries. Evary vessel of twenty tons or upward (other than such as are registered) trading between district and distriet, or between different places in the same district, or carrying on the fishery, without being enrolled and licensed, or if of less than twenty tons, and not less than five tons, without a license, if laden with goods the growth or manufacture of the United States only (distilled spirits only excepted), shall pay tho same fees and tonnege in every port at which she may arrive ss are payable by vessels not belonging to a citizen of the United States; and if she have on board any srticles of foreign growth or manufacture, or distilied spirits, other than sea-stores, she, together with her tackle, apparel, and furniture, and lading, found on board, shall be forfeited. But if such vessel be at sea at the expiration of the time for which the license was given, and the master shell swear that such was the case, and shall also, within forty-elght hours after his arrival, deliver to the collector of the district in which he iall first arrive the license which shall have expired, she shall not be forfeited, nor shall be liable to paysuch fees and tonnage. No goods shall be imported, under penalty of forfeiture thereof, from one to another port of the United States, in a vessel belonging wholly, or in part, to a subject of any foreign power; buts such - vessel may sail from one to another such ports, carrying such goods only as were imported in lier from some forcign port, and which shall not have been ualaden.

Of the Enrollment and License of l'pssels.-The like qualifications and requisites are necessary for the enrollment as for the registry and record of vessels, and the same duties are Imposed on, and authority given to, all oflcers respectively, in relation to such enroilments, and the aame proceedings shall be had in similar cases touching such enrolhments; and vessels so enrolled, with thair masters or owners, shall be sulject to the samo repuisltes as are in these respects provided for registered vessels. The record of such enrolhment shall he made, and an abstract or copy thereof granted, as nearly as may be, in the form directed by law. Enrolled and lleensed vesedis may be registered upon the registry beiag given up; and registered vessels may be enrolled, upon surrondering up the enrollment and license. And when any vessel sball he ln any other district than that to which she belengs, the collector, on application of the master, and on his making oath that, to the best of his knowledge sind belief, the property remalns as expressed in the register or enrolhment, propesed to be given up, and upon his giving the bonds required for granting register, shall make such exchanges; aud such collector shall transmit the rugister or enrollment given up to the register of the treasury. The register ur enrollment and hicense granted in lleu thereof, shall, within ten days after the arrival of the vessel within the distriet to which she belongs, bo delivered up to the collector of such district, and ba by him caneeled. And if the master shall neglect to deliver such register or earollment ond license within the time speelled, he shall forfelt one hundred dollars. In order to the licensing of any vessel for currylng on the cousthig-trade
or fiaheries, the hushand, together with the master, with one or more sureties, to the satisfaction of the collector, shall become bound to pay to the United States, if she be of the barten of five tons and less than twenty tons, the sum of one handred dollars ; and If twenty tons, and not exceeding thlrty tons, the aum of two hundred dollars; and If above thirty tons, and not exceeding slxty tons, the sum of flve hundred dellars; and if above sixty tons, the sum of one thousand dollars, in case it shall appear, within two years from the date of the boad, that she has been employed in any trade whereby the revenue of the United States has been defrauded, during the time her license remained in furce; and the master of such vessel shall also swear that he is a cltizen of the United States, and that such license sholl not be used for any other vessel, or any other emplyment, than that for which it is specially granted, or in any trade whereby the revenue may be defrauded; and if such vessel be less than twenty tons burden, her husband aball swear that she is wholly the property of a citizen or citizens of the United States; whereupon the collector of the district whereto such vessel may belong (the duty of six cents per ton being first pald) shall grant a license, In the form directed by law, for carrying on the constingtrade, whale fishery, cod fishery, or mackerel fishery. A steam-vessel, intended to be employed only in a rlver or hay of the United States, owned wholly or in part by an alien, resident withln the United States, shall be enrolled and liceused as if she belonged to a citizen of the United States, except that no oath shall be $\mathrm{r}^{-}$ quired that she belongs to a citizen or citizens of the United States. The owner of such stenm-vessel, upon application for enrollment or license, shall give bond to the collector of the district, to and for the use of the United States, in the penalty of one thousand dellarg, with sufficient surety, conditioned that she shall not be employed in other waters than the rivers and bays of the United States. When the master of any licensed vessel, ferry-boats excepted, shall be changed, the new master, or, in case of his absence, an owner, shall report such change to the collector residing at the pert where the same may hoppen, if there be one, otherwise to the collector residing at any port where such vessel may next arrive, who, upon the oath of such new master, or in case of his absence, of an owner, that he is a citizen of the United States, and that she shall not, whilo such license continues in force, be employed in any manner whereby the revenue may be defrauded, shall iadorse such change on the license, with the name of the new master; and when any ehange shall so happen, and shall not be reported, and the indorsement so made, such vessel, found carrying on the coasting-trads or fisheries, shall bo subjeet to pay the same fees and tonnage as a vessel of the United States having a register, and the new master shall forfeit and pay the sum of ten dollars. Before any veasel, of the burden of five tons, and less than twenty tous, shall be licensed, the same ndmensurement shall be made, and the samo provisions observed relative thereto, as are to be observed in ease of admeasuring vessels to be registered; but in all cases where such vessel, or any other licensed vessel, shall have been once admeasured, it shall not be necessary to measure her anew for the purpose of obtaining another enrollment or license, except she shall have undergone some alteration ns to her burden subseguent to the time of her former license. Every licensed vessel shall have her name, and the purt to which she belongs, painted on her stern. is is directed for registered vessels, and if found with:uut such painting, the owner shall pay twenty dollars. No collector shall grant to any vessel, whose enrollment or license for carrying on the coastling-trade has explired, a new eurollment or license, before the master shall have rendered a true necount of the number of seamen, and the time they have severally been employed on board such vessel during the continuance of the expired license,
and shall have paid to the collector twenty cents par month, for every month auch seamen have been so severnily employed, which sun the master may detaln from the wages of such seamen. If the master shall rendar a false account of the number of men, and the length of time they have aeverally been employed, ha ahall forfelt and pay one hundred dollara. Any boat, sloop, or other vessel of the United Statea, navigating the waters on our northern, northeastern, and northwestern frontiers, otherwisa than by sea, shall the enrolled and licensed in anch form as may be preseribed by the Secretary of the Treasury; which enrollment and license shall authoriza any such bout, aloop, or other vessel, to be employed either in the coasting or forelgn trala; and no certificate of registry shall be required for vessels so employed on sald frontiera: Provided, That such boat, aloop, or vessel, ahall be, in every other reapect, liable to the rules, regulations, and penaltics, now in foree, relating to regiatered vesacla on our northern, northeastern, and northwestern frontiers.-Laucs of the United States.

| 1835. | 702,301 | 1856. | 2,211,085 |

From this tahle we ace that our coasting-trade has increased 12 per cent. on an average for forty years, and has doubled in the past ten years-from 1845 to $185^{\circ} 5$. The total tomnage has increased from 435,066 tons $\ln 1815$ to $2,491,108$ tons in 1855 , glving an $\ln -$ crease of 10 per cent. per annum; alowing that we have at this thme a larger tonnage than any other nation.
"The coasting-trade of the United States has, from the begianing, heen atrictly reserved for vessels built within the United States, and owned by citizens of the United Statea, to the exclusion of foreign-built and foreign-owned vessels. The American tonnage engaged in foreign trade and in the coasting-trade has been American built, and has had the absolute protection of our laws, and the licensed tonnage alsolute protection, in the carrying-trade on our coast, and in our own waters. The protection given to our foreigncommercial and to our coasting-commercial marine has
aecured a larga and efficient body of skillful officers and sailors, at all times ready for the defense of our cities and const, for repelling aggresaion on our comsmerce, and for manning our ahipa of war. In the protestion given to our ahipplng intereat, for the purpose of having at all times the power to repel forelgn aggression, and protect our coast and trade, there appears to have been but little diviblon of acutiment, from the earliest time to the present, while the yearly lucrease of our tomage proves tho wlsdom of our laws in this particular. We have no data to ascertain the annuul number of persons, or the annual cona of freight carried, in our coasting-trade, nor the value theremf. Each person muat make hia own estimate of the tonnage employed, and the average number of trips the veasels can make, comblned with the facta that capital constantly tends to that bualness, and the growth of our enrolled and licensed tonnage keeps pace with our increasing population and wealth. The aluount of coaating-tonnage, and the annual number of tona of freight transported on our railroads, with an estimate of that carried by other modes of transfer, exhibit the magnitude of the means required for our interual trade."-U. S. Treasury Report, Decemher, 1856.
Coast Line. The following atatement of the river navigation and ahore line of the United States was prepared by Colonel Abert, of the Topographical Engiocers, at the requeat of the Treasury Department, Deecmier 7 th, 1845 . It has since been completed to date. The head of tide-water is assumed as the limit of steam navigation, as furpeding falls or rapida are encountered at that point, above which many rivers are adapted to steam navigation, but to what extent is not sufliciently known. The shore line of rivers to head of tide-wuter, from

Coast Burvey of the United Btates. It was to be expected that a people devoted to the pursuits of comnerce, and depending in some degree on the sea as a means of communication between distant parts of the national territory, should demand, at an carly period of thel history, a competent survey of their coasts and inland waters.
But $n$ short time previous to tho separation of the colonies, charts had been constructed of the shores and hartors of North Amorica, under the direction of F. W. Des llarres, his majesty's Surveyor General for the Colonles. The progress of his labors was interrupted by the Revolution. The surveys made under the personal superintendence of Des Barres atill bear testimony to his skill and fidelity, and present a generally correet viow of those parts of New Fingland and the British possessions whlel, being rocky, are but little liable to chauge. They continue to form the principal basis of the eharts of the northeastern const of this continent. In the Southern and Middle States, however, they have been reulered worso than useless by the inconstant character of the bottoms, and the unequal merit of the or.gimals. The surveys of Des Barres, covering a vast extent of coast, were originally deticient in minuteness of detail, and In hydrographical information; and these defects havo been incrensed by the rapid nud extensive changes in the direction, means, and wants of navigation caused by the growth of the conntry.

The project of a complete survey, conducted upon a uniform system and extending over the whols const, wss first proposed by the late Professor Patterson, In 1806. It comblned three oljeete, the astronomical determination of prominent poluts, a triangolation to connect those points, and a hydrogrnphic survey based upon this triangulation. Mr. Gallatin, then Secretary of the Treasury, encouraged the project, and obtained In writing the opinions of learned men as to the best mode of oxecuting it. Me selected the plan of operations recommended by Mr. Hassler, the first superinteadent of the Coast Survey. Thls gentleman, a na-
tive of Switzerland, had been employed in the trianguIntion of tho Canton of Berne, and had studied the selence of geodesy under the most distinguished masters. It was exceedingly fortunate that his presence and advice here secured the early adoption of the only methorl of condueting a comprelensive trigonometrical survey that selence approves-the only one of which the results have a certain and permanent value.

It is only, however, since the year 1832 that the sorvey of the coast has been in steady and netive operathon. During this long interval of negleet on the part of tho government, the coasting trado and forelgn commerce of the country have been chlefly indebted to the indefatigable labors of those distlnguished hydrographers, the Messrs. Blunt of New York (hoth father and son), for tho means of safe navigation.

The history of its fortunes, or rather misfortunes, lluring the preceding twenty-five years, may be recited in a few words. A law anthorizing a survey of the coast was passed in 1807 , but nothing was done under the Inw until 1811, when Mr. IIassler was sent to Europe to procure the instruments specified in his plan. They had all to bo constructed. Tis war of 1812, and the failure of remittnnees, preven: d Mr. Inssler's return before 1816, and in August of that year he was appointed to the offico of superintendent. In 1818 Mr . Hassler's connection with the work was broken off by the repeal of thit part of the law of 1807 which authorized the omployment of citizens. During the ten years that followed, the const survey seems to have been forgotten by the public and by Congress. In 1827 Mr. Southard, the Secretary of the Navy, a name never to be mentloned without an expression of the high respect which ability, pntriotism, and long, faithful, and valuable serviees must always command in the republic, took oceasion in his annual report to say that perfect surveys and charts of our harbors could not be made without the aid of the means contemplated by the act of 1807; and in February, 1828, the House dlrected the Committee on Naval Affalrs to inquire into the expe-
diency of carrying Into effect the ptovlaions of that act. Finally, in 1832, the act of 1807 was revised, and an appropriation made for carrying it into execution, and alnce that period regular annual appropriationa have been made, varylog in amouut, but geacrally auch as hare been called for by the eatlmated of the superinteadent.

In 1843 there was added to tha apprepriation a proviso atipulating that a board, conalsting of sclentific persona la the service of the government, ahould be empowered to reorganize the work, and the plan presented by them, whea approved by the prealdent, was to be, and is now, the law regulating the operatlons of the aurvey. The scientific methoda puraued by Mrr, 1lassler were continued, and it was directed that the topogrophy should be carried so far inland as might be necessary for a proper dellineation of the shore, and for purposea elther of commerce or defenac.

It is now understood that the alin of the coast aurvey is to furnish with the utmost attainable accuracy, and In a connected and uniform manner, all the geogrnphleal, topographical, and hydrographlcal data that can be made in any way useful to the navigation and defense of the coast. And it ls also supposed that, in collectlag these data, information will bo aceumulated that may become aerviceable in suggesting and directing local and general improvements; anch aa the placing and conatructing of light-houses, beacons, buoya, etc., the means of improving channels, the effeet of contemplated constructions upon harbors and tidal deposits, the sultableness of a submerged soil for building, ete. And, lastly, it is presumed that those States through which the survey passes will, suoner or later, avail themselves of the base it is able to apply, to form a correct geographical map of their own territory, under cireumstances very favorable to economy and accuracy. These are the practical bonetits, either direct er incidental, conferred by the const survey.

In alstract acienco it has also its mission, equally useful and distingulshed. It is to contribute a part of the means by which the irregularly clliptical form of the earth may be atisfactorily determined, the variations lu local gravitation, their canses, and thence the internal structure of the earth, be made known, and the phenomena of terrestrial magaetism be explained. It will lllustrate the astronomical prollem of the tides. Its numerous meteorological records will also contitbute to a better knowledge of the climates of the United States, and of the nature and netion of meteoric storms, and thus be of aervice to tha farmer as well as the navlgator.

The science of geodetica preseribea the principles upon which a survey of an extended region should be conducted. In the ordinary operations of land-surveying, the surveyor ba permitted to regard his field of work as a plane surfuce; but the engineer who is to construct a map of a whole country, or of a long line of continuous sea-coast, must take sato consideration the sphereidal figure of the earth, and present an exact delineation of that part of the spheroid upon which he is employed. This necessity controls the processes osed In computation, and the plan of projection upon which the detailed results are given, whether it be called a map or chart. Both the projection and the formula for computation involve the higher mathematics, and require an acquaintance with the most advanced state of the mathematice-physical sciences.

The system of projection fatroduced by Mr. Massler originated with Flamsteed. It is the development of a part of the earth's surftce upon a cone, either a tangent to a certain latitude, or cutting two glven parallels and two meridians equidistant from the middle merldian, and extended on both sides of the meridian and In latitude only so far as to admit of no deviation from the real magnitudes, such as would be sensible ln the detall surveys. In this method of reducing the curved aurface of the earth to a plane, the radii of curnat ie
of the parallels and meridians, depetdling upen the value given to the expresalon for the elliptleity, and the aasumed form of the globe, are important terma. For practical use, tables have heen computed In the office of tha coast aurvey, ahowing the length in metres of every minute and second of the ares of the meriliana and parallels cemprehended In the maps. It has been found necessary to recalculate these tables since 1844, on account of the now value of the elliptlelty announced by Ilessel, and adopted hy the present superIntendent. There wlll be occaaion to reeur to this subject.

The practical operatlons of the coasat aurvey are elass. ed unter the general heada of triangulation, astronomleal and magnetie observatlona, topography, and hydregraphy. The fundamental basla of the survey ls a net-work of great triangles, the sliles of which, varying from ten to one hundred and ten miles, are the longest that the limita of vision or the nature of the country wlll allow, and hence a mountalnous region is much the most favorable for a first or primary triungulation. The starting llae, or first side of the first triangle, ealled the base line, is measured Iy mechanleal means, and this ia a labor demanding, aa much as any other on the survey, accuracy, a philosophical regard to milnute detalla, and long prevlous preparation. Obscrving, in passing, that gev ernl $k \ln d s$ of measuring-rods have heen heretoforo used, as wood and glass, and that the apparatus of Mr. Ilassler consisted of an assemblage of four Iron bars, each of them two metres in length, with which he ohtalned excellent results. In 1817 the preliminary measurement of two base lines was made by Mr. Hassler, and In 1834 the length of the same lines was determhed by eompntation, carried from the new base on Thin Island leach. The difference between the measured and computed lengths of thesc lines was in one case less than a foot, and in the other about foer inches; the bases themselves were $5 \cdot 9$ and 4.8 miles long. It will, perhaps, lest serve to convey an idea of the difficulty of measuring a base-line if some account be given of Professor Bache'a bose-apparatus. The measuring bars are upen the compensuting system, first used by Colonel Collyy In Great Britain, and by Mr. Borden in the trigonometrical survey of the Stnte of Massachrsetts; but a principle not before applied was introduced in reference to the dimensions of the bars, which is thes stated. Burs of bruss and iron (the materials employed), of the same dimensions will not, owing to their different conducting powers and opecitic heats, heat equally in equal times, and thereforo. during changes of temperature, the aystem ceases to be compensating. This Mr. Bache corrected by giving a coating to the bars that made them abserb equally, and by proportioning the sections to each other, so that lieth wouhl have the same temperature during variable temperatures of tha atmosphere. In order to do this satisfactorily, it was nceessary to make direct experiments upon the materials of the bars themselves, ufter having first arranged them approximately by means of the numbers tuken from the books. The contact between two sets of bars is made by a blunt knife-edge and a plane of agate, and a lever of contact at tho ends of the bars is corrected by a level so delicate that several of its divisions make up a quantity entirely insignificant in the measurement. The bars aro covered with a doable conical case of tin, to keep the flactuations of the temperature within moderato limits, and the bases on which they are supported are covered with several thicknesses of imperfectly conducting material for the sume porpose. The leugth of the apparates is compared, before and after final measurement, with a standard jron bar that had been compared in the coast-aurvey otfice by means of Mr. Sayton's reflecting pyrometer. Ity this lastrument, a change of the one hundred thousandth part of an inch in the length of the atandard bar is perceptibie.

the bara (regulated in size by the relative apecifle heats of the two metals) were heated above the posaible temperature to which they could be exposed in use, In order to give them a set. This precaution was at first overlooked in the compensetion basc-apparatus of the Britisi ordlnance survey, and it was afterward found pecessary to resort to it . Those who are at all famillar with the suiject will perceive that Professor llache'a applicatlon of the lever of contact and level (first used by llessel in atandarila of measure) hat not only greatly increased the delicaey of the instrument and lessenet its complexity, but also removed aeveral sources of error. 1 ly optical contact, and the employment of a microscople apparatus to determine the distance betweed the compensation points, the measures are repeated $\ln$ two dlfferent terms, eacil inaving Its peculiar standard. Sueil was the cass in the British and Indian surveys, and Colonel Everest complains of the consequent lia. bility to error, and the burdenseme accumniation or petty correctlons. The remessurement of a base of seven ant a lialf mites, in Indin, dlffered, however, only $2 \cdot 4$ inches from the first length. In a base of geven miles, Professor llache found that the sume ditference might be about 0.5 inch , if all the errers were supposed to full on the same side, which is most improLable. The probable error in remeasuring one hundred and twelve yarda was less than five thousandtis of en inch, and the actual resulting error in remeasuring one-third of a mile was nothing.

This may appear like refining too mnch, but it must be known that the lines measured by the same bar in winter and summer might differ materially in nominal length. This difference in the original bnse of the coast survey mlght be about twenty feet, and, at a rough estimnte, an error of twenty feet in this place woukd anount, in one of the large triangies, of which the sidies are between fifty and sixty miles, to about one-tenth of a miie. The source of error and its correction being recognized, there is no other limit to aceuracy than the pessibic.

We return now to the great triangles of the survey; which, as has been said, form its fundameutal bnsis. The points of the prinary trisngulation are selected with scrupulous regsrd to all those conditions which make trisingles, in the technical acceptation, good. Scattered at distant Intervals over the vast field of work, they are certain guides hy which the more detsiled operations are conducted and controlled. Within them tie space is subdivided into smailer tringgles, constituting tine secondary and tertiary triangulations. They bring down the work to the minute detalls of topography and inydrography, and these subsidiary triangulations and details, circumscribed as they ure by the primary polnts, are restrained and corrected hy them in their deviations. As an additional expinnation of the necessity for this tirst net of great triangles, it may ho well to inform the general reader that there is no instrument, however delicste in construction, tiat Is aot liable to very small errors, whleh the most studious attention to every disturbing influence, whether mechanical or metcorological, can not altogether remove. Now this primary trianguiation, which in a mountaineus region spans the surface with giant strides, has fewer of these unaccountable errers, simply becanse it has fewer triangles. It is hardly necessary to ndd that better instruments also are used ln lt. The two and a half feet theodolite, made by Simms (after Troughton's death), under Mr. Hassler's supervision, and used by him and by Professor Ilache in the primary triangulation, is still regarded in this country and ia Europe as a master-piece of invention and mechanism. It reads to seconds.
Magnetic and astronomical observations accompany the primary trianpulation. The latter are for latitude, longitnde, and azimuth, or angular direction from the meridian.

Following the secondary triangulation in order comes
the Topography, the duty of which is to delineate faithfully the features of the ground. It exinituita the height and centour of elevations, the shape and extent of piains, the courses of atreams, all the constructions of man, and the waving and indented outiine of the shores. It dlstlngulabes the tiiled iand from the pasturege, and the grove from the orchard, and designatee the character of the wood-land. It speaka a nolversal language, and observes atrict fidelity to nature.

Dependiag opon the secondary trianguiation and the topography for ite ineans of progress, follows the Hydrography. In this term is included all that concerna local navigation, as the deptis and character of the bottom, the direction and strength of the currenta, the ebb and flow of the tides, and the information, comIng under the head of saillog directions and nautical instruction, which make up the valuable knowiedge of the local or generaj pilot. This branch enjoya the honor of announcing the nautleal discoverles of the coast survey, which, though resulting from the combined operations of all, are yet brought out by its meana.

In the preceding pages the plan of the surves ls presented, and the ge aral distribution of ita labora is stated; it remains now to speak of the exccution of the various details, and of the benefita that have been conferred by the ceast survey upon sclence, and upon the local and general commerce of the country and of the world. In doing this it will be most convenient to keep to its actual state at this clay.

It would not be just, however, to leave Its past histery without a tributc of respect to the menory and services of the man by whose enlightened efforts a right direction was given to the views of the government in founding the survey, who was faithful to it through thirty-five yenrs nâ checkered fortunes, and who literally died in the performance of its duties, having wrltten the fast few lines of his finel report after lie felt that he had been touchel by the hand of death. Educated in the best European schoels of theory and practice, and devoted to the pursuits of science, for which he was eminently qualified by natural endowments, Prufessor Hassler always brought to the task before him that zeal and tenacity of purpose which give spirit to enterprises of great moment, sud gain for them the name of action. Ile is honorably known for his mathematical and astronomical writings, and his papers in the American Philosophical Transactions, containing an account of the metheds employed by him on the coast survey, will nlways be regnrded as a valuabje contribution to gcorletical knowledge. Those who knew him intimately praise the nrdor of his friendship and the generosity of his disposition, while the labors of his life, and the mnnner in which they were performed, bear ample witness to his industry and integrity. Thnt he inad some defects of character it is hardly necessary to say, for tinis is the inevitable lot of humanity; but they were not such as it requires the exercise of magnanimity to forget, and time, which is rapidly drawing over them the veil of perfect obscarity, wilf endear his name and his virtues to the reverent and affectionate respect of all true lovers of American science.

On the death of Mr. Hassler, in 1843, the appointment of his successor was regarded with deep interest by the lenrned men of the country. The office of anjerintendent of the coast survey is recognized as one of the central positions of American science, and the incumbent is expected not only to be able to fulfill its prescribed duties, but to be qualified to direct his powers to the advancement of khowledge in every department of the work. IIow far the present superiniendent, Professor Bache, is suited to answer these expectations, to austain the national reputation, and to promote the cause of science, may be estimated from the fact that his appointment was solicited by gentlemen in all parts of the country engaged in the pursuits of learning. He was educated at West Point, and since graduating there ine has, in connection with the Franklin Institute
and the University of Pemsyivania, followed a course of physical science that has made him well known in this country nid in Europe. While traveling as the President of Girard College, he recelved from the principal European academies distinguished marks of conslderation. It ts but justice to Professor Bache to say that there is no branch of the work into which he has not been able to introduce improvements, either owing to the discoveries of the day, as in the use of the magnetic telegrapls for meridian differences, or owing (still oftener) to his own great and embnent scientifie attainme. . This must ajpear in the course of these remarks, but it is quite as creditable to his administration to state, as may be done with strict accuracy, hat the amount of results now ohtained is double that under the former plan, for an increase of 50 per cent. in the cost.

The points of the primary trianfulation are selected by neenns of a preliminary reconnoissance. The reconnoissances thr " precede the triangulations are indispensable, and 'equire great judgment. The object of the general rcomoissance is to mako known the facilities and difficulties of the work, and to discover the best plan for its execution. A puricular reconnoissance desides the position of the stations, and preserts a generrl sketch of the triangles in any section. As they constitute the authority to which the rest is subordinate, and by which it is controlled, it is of the greatest consequence to know the circumstances under which a satisfactory result may be secured with the least delay. The rule generally followed (and atopted ly the former superintendent) is to observe on those day conly that appear entirely mobjectionable. This rule is attended with a serious loss of time. Mr. Buche has increased the rapidity of the work, and improved rather than dimlaished lto valee, by applying the mathematleal test of the least probable error $t$, ohservations made under such conditions as are ordinarily favorable and of frequent ocenrence. The number of observations made under these conditions, which will reduce the prolable crror to what is attributalle to the unaroidable errors of instroment and observer, is ascertained and taken as a goveruing rulf. Six trimgles measured ly Mr. lache in 1841 gave for the greatest difference from $180^{\circ}$, after allowing for the spherical excess, $v^{\prime \prime \cdot} \cdot \mathbf{2}$ (of spnce) to each nugle; from this the difference descraded to nothing.

Allasion has lreen made to the necessit - of recomputing the first tables of projection, in consequente of the adopticn of Bessel's latest determination of the ellipecity. The tables for computing the triangles have also been atlieted by this chenge, anse the formule have leen revised, and undoubtedly grently improved in convenlence mat accuracy. 'The tables lave undergone a further modification ly substituting the legal ratio of the metre to the wise in the place of the arbltrary nambard resulting from the lugenious, lat (as Ilessel has said) "not allowable," comparisons of Mr. Hassler.

This is the proper plate to advert to the me le of opm eratimes pursued on the Suuthern coast. It was percelved, In the early progress of the work, that the innotitude of this level region for a compretsonsive triangulation was to be overcome, either hy great exprase, or by resonrece not yet developed. The mont apparent expentient was that employed in the northern section of the great meridional are of India, where it crosses the that tirritory of the Doab. Costly edillees of masonry, with walls five feet thick at the buse mad two at the summit, are crected at each of tho princijal statlons, and their height, about tifty fect, is sutheient to comman:: , : lew above the vegetation. And this expedient was, if contemplated, in accordance with the former progress of the Amerlean survey; which, alvanclug in two tircetions frum a central base, was nesessarily sluw.

In 1845 , however, the present superintenilent exhib-
ited in his annusl report a plan for the more rapid executlon of the surrey, which consisted in dividing the whole of our extended sea-board, fneluding the Gulf of Mexleo, Into nine sections, comprising a nearly equal extent of shore line, and in prosecuting the work sepa. rately and simnltancously in as many of these seetlons as the apprepriations would allow. The work of esch section is con menced by the measurement of a bescline, and, as the triangulation is extended, this base serves as the verification-base of an adjoining section. The rapidity of this plan is made spparent by considering that all the ditterent processes of the survey (in their necessary order) may be conducted at the same time in every section, and thus, if the appropriations were sufficiert, the whole coast might be completed in the time required for a single division of it. Ilut this plan accommodates itself more easily to the character of the ground than ono in whlch the direction and progress are derived from previous connections. Indeed, every latitude is allowed for the selection of sites for bases, and for the most fayorablo disposition of the triangles, because ench section is for the time a distinct undertaking. The combination of all wlll unite the exiended coast of the United States into one comprehensje schence of triangulation.

The value of permanent and conspleuous structures of minsonry to designate points of primary triangulstion is not, however, underrated. While temporary means of elevation are employed, such as the high tripods, with independent stands for the instruments, tirst used in Delaware Bay by the senlor assistant of the survey, Mr. Eelward lllunt, of New York, it must be remenbered that the coast survey is enabled to avail itself of the light-houses, and other lofty structures along the const. And it may be safely concluded that the govermments of the Southern States will raise appropriate edifices at those polnts of the primary trisngulation of the coast survey which limit the bases of their local operations.
diccompanying the primary triangulatlon, as an essential part of it, art, the astronomical and maynetic observotions. The fomer are for aximuth, Jatitude, and lomgltude. For the determination of azimaths, Mr . istche has employed (for the tirst time on the work) the elongations of l'oloris in its eastern and western digressions. At the time of clongation, when the change in altitude is most rajuid, the movement In aximuth is nothing; and thus the opportunity is enjoyed of making carefal and delibernte observations. This methed is independent of local time. Hy using several circmmelongation observations, a mean of a number of results is sulistituted for a simgle one. In this reduction a very simple formula, tirst investignted by Mr. Nulty, of lhidadelphin, has been applled, and the practice is simplif ed by the use of tables for the computations of latitude, suljeeted to a slight trigonometrical change. It is proper to state that this methed has been in use on the survey since 1845 , as one similar to it, if not identicul with it, lus recently been communicated to tho IRoynl Astronomical Nociety of London.

The sujerintendent has nilo'ted the suggestion of the nstronomer royal at Greenwieh, who propused referring the points of greatest clongation of cireumpolar stars to marks in the horizon, by perpendicular lines demitted by menns of an altitulo and azimuth cirele. Blongation sigmols are estublished about two miles distant, consisting of a delicate wand by day aud a lamp by night, the latter seen through a perforated heard.

The determinations of the Iatitude (as well as of the azinuths) are frequent. Sinco 1844 fourteen stations have heen occupied for latitude, nud seven for azimuth, in Sections I., II., and III. of the survey. A comparison of the latltudes theduced geodetically from a central pioint with astronenileal determinations led the super'ntendent, In 1844, to tho diseovery of certain varlations In the level, which conlil only be attributed to ehanges in form and density of the materlal compos-
ing the earth's crust. Theso variations are similar to thoso caused by the proximity of mountalns; but while the latter have been well understood, the former had escapel notice. Tho numerous determinations of this element will, therefore, occupy an important place in the future discussions of the general furm and internal structure of the earth. A similar discovery has since been made in ths ordinanco survey of Ireland by Ma-jor-general Colhy, and appears to havo been anticigoted by Laplace in tho opinion given by him in the Chamber of Peers, in 1817, upon the toplographical map of France: "If the latitudes of the extreme points (of certain lines) ond of several intermediate points aro observed, and tho length of the seconds pendulum corresponding to these points measured, a great deal of light will be thrown upon the figure of the earth, and upon the irregulurities of its degrees and of gravity."

It is very Interesting, in this respect, to know that lstitudes observel at the extremities of tho side of a triangle, and forward and backward azimuths on the same line, have ditfered by several seconds, and that these devintions in the plumb-lino have oceurred where the want of uniformity (whether arising from liffereaces in density, or the want of homogencousness of structure) was not $\rightarrow$ prarent as a tepographical feature of the coun.. $;$. After the computations from which the preceding conclusions aro derived wero verified, the results were confirmed by the introduction of new instrunents on the work. During the last year a zenith telescope has been used for obtaining tho latitude, by a method invented by Captain 'lalcott, which consists in observing the differences of zenith distances of stars colaninating within a short distance of each other, and at nearly tho same altitudes, on different sides of the zenith. The circummeridian altitudes by the repeating eircle, the prime verticul transits, and the alosolute messurement of zenith distances by tho zenith sector, sre atill used.

Olservations for the comparison of these instruments and methods havo been made by the superhatendent, and by Captain T. J. Lee, of the United States 'Tgoographical Engineers, an assistant in tho const survey, whoso valuable labors have been chiefly devoted to the astronomical and magnetic observations. Of tho magnetic ohservations it will be sufficient to say, as an inclication of their charaeter, that they are mude with the new instruments invented by I)r. Lioyd and Mr. Weber. Tho portable declinometer of Mr. Weher (perfected by Licotewant Riddle, and manipulated according to his instructions) ineusures inclination, and, by a subsidiary apparatus, tho horizental forec, by tho method of Gaus. Fox's dip eirele, with the use of the deffecting magnet, has givon very satisfactory result by means of these instruments, the cleclination, inclination, and intensity (horizontal and vertical) are determined in a manner that supplies all that is practically necessary, and contributes valuable additions to general magnetic resenrches.
Leugitudes have been letermined by oceultations, celipses, moon-eulminatjons, and the frequent transportation of ehronometers. Mr. Bond, the alirector of the observatory at Cambrilke, Massuchnsette, rommunicates the merdian ditterences hy chronomoters between the Iritish observatories and lloston. All determinations of this alement are referred to a principal purt on the sea-coast, and are connected in the nggregato with differences obtalaed from Europe ly chroannetric nul astronomleal compurisons. The sucurity against error adforded by employing persons to compute who are disconnected with the duties of the fieli: or the observatory, is well understood. Gentlemen is private life are engaged to repent the important enlenintions of the surve, and this system, which enlarges the p tere of lator in a way not less commendable for lis ecnnomy than for its other advantages, receives univeral sanction.

But tho di-coveries of Professor Ilenry (secretary
of tho Smithsonian Institute), resulting in the laventlon of the magnetle $t$.egraph, have provided a new and more preciso method of arriving at the difference between the times of two places, or their difference of longitude expressed in time. The details of these observations were consigned to Mr. S. C. Walker. The following concise account of the manner of transmitting the signals, of the possible errors of observation, and of the real value of the results, is from the pen of Dr. Bacho: "The signals are given at one of tho stations by pressing a key, which causes $f$. closing of tho circuit. This closing, it is intended, shall be simultaneous with the ticking of a clock or onometer at tho station. The circult heing elosed, if the electrical wavo or current fakes a sensible timo to propagate itself, or in pass from one station to another, the absolute time a which the signal reaches the second or receiving station is sensibly different frons that of making the signal ai the first or giving station. A coil about the poles of a horse-shoe magnet of soft iron forms part of tho circuit through which the electrical effect is transmitted. Unter its influened the soft iron becomes magnetic, attracting tho seft iron bar (armaturo or keeper) delicately poised at a determined distanee from tho poles of the magnet; thio inovement of this keeper gets in action a local battery, which gives suflicient power to make the dots and lines constituting the Morse telegraphic signals. The click of the keeper of this temporary magnet is compared, at the receiving station, with that of a clock $0^{\circ}$ chronemeter, thus marking the time at which the signal mado at a known time at the giving station is received. From this explanntion, it appars that there is llability to error."
Dr, Bacho then proceels to enumerate five possibto errors, numbered in order, nud shows that the numerieal values can be in each caso assigned to two (viz. I nnd 5), nul that one (viz, 2) is insensible. A comparison of tho observations proves that the errore denoted by 3 and 1 aro cancel d liy a very small residual quantity laving the opposito slgn, and "the interesting consequences follow, that tho telegraphic method $\mathrm{cf}^{\text {. }}$ comparing elocks, tistant two hundred miles from each other, is free from error when the methot of coincidencs of bents is employed; and that the probable error of tho longitude, from this method, is tho same as the mean result of the computed relutive correction of the clocks fer the nights of observation.' Ar investigation of the probable value of such error slows that, under faverable astronomical clrcumstances, und witht duo care in the use of the transit instrument, 'the astronomical difference of longitude hetween any two stations of a trigonometrical survey may be determined uy telegruphie f'guals, with a degree of precision of the same order as that of difference of latitude, the inaccurasy tepending pon the same causes as the teviation of the plumb-line." Before concluling with tho primary trlangulation, it musi bo observed that Dr. Hacho uses reelprocal vertical angles for determining diflerences of heights at the primary stations. These angles niny he measured at a timo of day when it is lupracticable to observe horlzontal angles, and the effect of vefraction near the surface is luvestigated by a long series of ohservations. Tho space circumserithed hy the terrestrial angles of the first order, and defined liy the celestrial olservations that accompany them, is subdivided into a minnte net-work of smaller trinny? constituting the seconlary and tertiary triangulations, the points of winch embrace and determine headlands, ligh . honses, bencons, churches, hills, and all c.mspicuUN objects along the ceast, that cun be made useful in its navigation. They also bring down the work to the details of the topography and hydrography, and supply the hases for these branches of the survey.

It has been ilroady mentloned that the topography is mhintely and exaetly deseriptlve of the ground, both in form and character. The Lehman system of topographical drawing has been adepited, but with such
modificationa as the nature of this conntry exacted, in order to preserve the beauty of the maps. The slopes are represented by hachurea, the atrength and distance apart of whicb ludicats tho degree of inclination. In the original maps, the horizontal curves limiting the different slopes are drawn in red ink, is the draughtsman progresses in hia sheet.

The scalco of the original aheet is rodou, or about 63 inches Eaglish to the mile. Plans are frequently executed in the field, and furnished from the office, when wanted for local improvement, on twice this scale. But tho charta designed for navigators are necesaarily redaced in dimension. The harbor charts are published on the acalo of $\frac{200}{200}$, or abouf $3 \frac{1}{f}$ inches English, and the nore general chatis on that of $\frac{0000}{}$, or ahout three-feurths of an inch to the mile; which last is the scale of the reat top graphical map of France. In all the maps, the topographical details ars faithfully preserved, including helght, contour, etc.

It appears from the report of tho council of the Roye al Astronomical Society to the twenty-seventh annual general meeting, that a similar seale of execution, and an equal fidelity of representation in the topographical detalls, have been fioally attained in the ordinance maps of England and Ireland. In both the American and English maps, the suldivisiona of tho meridians and parallels are so minute, that parts of a second of space can be estimated.
As the first olject of the coast survey is the knowledge of our own shorea and inland waters, a id the general improvement of the navigation, both external and internal, of the coast, so the large class of facts and researches embraced in the general term hydrograpiny are regarded aa being of paramount importauce. It is to tho hydrography that the frienda of the const survey direct the public attention for the evidences of its great practical utility, and the discoveries in this depariment have been so numerous and valuable as to secure for it a high degree of public favor. The first ponular inquiry conce ning the const survey is as to the progress it has made, and this inquiry ls satistied ly learning the extent of the shore line over which the hydrographer has passel. But beforo estimating ita performance in this way, it is necessary to soy, that, as the opr sations of the tring gulatlone, ete., must precede the hydrography, this leuda to an rafair estimate. The hydregraphy can only he laid down when the trigonometrical points on which its operations are based have been establlshed; thus two-thirds of the work may be completed when the hydrographleal labors commence. In 1844, the first year of Dr. Dacho's superintendence, nine States on the Atlantio sca-board shared in the benefits conferred hy the coast survey; in 1845, thirteen Statea; in 18.1G, fifteen; and in 1847, elghteen States. The estlmates for the present year inelude all the States on the Atlantic and the Gulf of Mexico, and it may he inferred at onee from this siatement that, if sufflechert appropriations aro supplied by Congress, a definite and net distant period can be assigned for the completien of the whole work.
Having premised this atatement, which was necessary to give a cerrect ilen of the progress of the work, it may he added that the nautical parts of tho survey havo extended genorally from Nantucket Sound to Hampton lloads nearly, includlag the Vineyard Sound, Hock Island and Long Island Sounds, with all their harbors, grent and small, New York llay and harbor, Delawne llay and river, a large part of Chesajeake Bay, together with most of the rivers emptying into it north of e Potomac, and all the external sea-const, from tho southern soast of Masaachusetts to the Capea of the Delawsre. In this broad seld a little remains to be done, but very little in comparison with the whole. In addition to the above, something has been accomplished in the hyilragraphy of Albenario and Missigslppi Sounds, anil in the latter especially great bencfits have already resulted to it local coumerce.

It will givo, perhapa, the best idea of the value of the hydrographical work to enumerato some of those discoveriea and corrections which, in different places, have signalized the progress of the cosat survey. The first of these in order and in merit is the discovery of a new channel, atraighter and deeper than the channels before known, over the outer bars of New York harbor, Such a gift as this to the first conmercial city of the continent, where it was very much needed, ought to gain permanent favor for the enterprise by which it has been made. Important changes in the main ship-channel near Sandy Hook were first noticed by Major Bache, of the Topograchical Engineers, by a comparison of his own limits with those of tho coast survey in 1842, and this discovery has since been confirmed by the latter. So rapid has been the accumulation upon the extreme point of the Hook, that the lighl-water mark now stands where there was a depth of 40 feet in 1836. The Chamber of Commerce of New York has graicfully acknowledged the communication of this innportant faci by the present auperintendent. In Delaware Bay a new and straight channel wae discovered, lying parallel to the main ship-channel, more narrow than the latter, but likely to prove acrviccablo in scant winds, and lecter sheltered from floating ice. Three chamnels were opencd through tho ridges of Cape May, and a passage made known through the "Cver-falls." The future clanges in the latter, which may prove to be the gern of a new pass to the ocean, will we watched with intercst. The resalt of the survey in Delaware Bay has been wholly to change the form of the bottom, as it stood on the old charts. Some shoals have heen erased altogether, a new one near the deep water of the chan-nel-way has been added, and the limits, shape, depth, and direction of every shoal in the bay have buen altered.
In Long Island Sound, Buzzard's Bay, Massachusetts Bay, and Chesapeake Day, so much has licen added to the safety of navigation by laying down positions correctly, and by good sailing directions, bot chiefly by the actual discovery of useful chanuels or of hi!!den and unknown dangers, that a list of these additions alono would oceupy too much space. In Long Island Sound, $n$ rock liaving ouly 13 f fect of water on it, on the Cerberus Sioal, was discovered and deternined ly the brig Washington, in September, 1815; and in the same year thecorocks were found in the most frequented jart of Buzzard's Bay hy the Galhath. Changes of the highest limportance, which, owing to nnturn causes, lad iaken place in the channel-way of the entrance to Mobile lay, were found out by the Phonix in 18.17.

In the off-shoro work, the most valuable discoveries have been made by the hydrographical party employed on the Nantueket Shoals. They deeply coneern the navigation, foreign and domestic, of the whole const: especially the Earopean trade from New York and the West India trade from the Eastern States. Tho insurance offices of New York and loston have publicly acknowiedged their oldigation for these discoverics.
To this part of the hydrugraphy belongs the exploration of the finlf steam, an enterjrise that origimated whth the present superintendent. 'I his is a work of diflevity and the. It was commenced by the hyibrogriphicinl assistant in command of the lirig Washington, in 1845, who obtalued bottom wear the imer cige of the stream at the depth of 5800 feet, mul the mathed and rapild change of temperature at this place fave reasou to hope that a eurve of similar depths might he traced, corresponding to the imer line of direction of the Gulf Stream, of which any point would he known when crossing, from the characteristic changes of temperature. The Intitude (the most casy of the two coordinates to ascertnin correctly) leling given, the ship's longitude would result sufficlently near the truth to lie of essential service in approaching the coast. 'The derp gea and surface temperatures were both taken in 18:10.

Licutenant Bache succeeded to the charge of this anty in 1846. Professor Henry has thus spoken of his merits and success: "In the last report, an account was given of a series of olservations on the Gulf Stream, made by Lieutenant George M. Bache, whose life fell a sacritice to his zeal in the discharge of hls duty, and whese loss science was called upon to mourn just as he was commencing, with hls accustomod ardor, the investigation of one of the most interesting phenomena of our globe. The results he obtained will bo given to the world in another publication, and it will be sufficient to state in thls place that he examined thre entire sections across the stream. His researches exhibit the remarkable fact that the whole current of warm water, to the depth of nt least 480 fathoms, divides itself into twe princlpnl branches, separated by a portion of cold water, and that the tratisition from the cold water, along and nex to the coast, is ... st instantancous, as if the two were separated by . searly perpendicular wsll, slightly inclining to the cast at the top."

The sutject of the tides is now recelving for the first tine, in thls country, proper attention. The tlde-tabtes on the charts contain all the irformation as to times, heights, and durations, that is required in practice. Corrected establishments are deduced from the mesos of the huni-tidal intervals combined for ench halfhour of trnesit. The astronomicnl problem of the tides is worked out for prominent points where the observations have sufficiently aecumulated.
The menn curves of semi-menstrual inequality of tinse and belght, corrected for the mean annual paralisx and declination, ara compared with the curves of observation (freed from the diurnal inequality) at each seml-lunation, and the variations in the times and helghts of high water, due to chnuges in the moon's declination and distance from the earth, ara tabulated for the future improvement of the tide-tnbles.
Hy the centinuance of careful and constant observations, the means will be supplied of adding to tho knowledge of the dlurnal and solar inequalities, and of studying nil other phenomena of the tides. Tho residunl errors that appear in the semi-menstrual curves, after elioinating the etfeets of parallax and declination, sre caused by atmospheric changes. The local hufluence, therefore, of particular winds, and the genernl effect ef chnnges in the pressure of the ntinosphere, are to be investignted, and enough is already known to prove that the scaman will derlve great profit from this part of the labors of the coast survey. The direction nud velocity of thal currents are now carefully determined for the normal cendition of the tides, and fur their disturbsnce by winds and storms, nud a knowlege of the courses and cenflets of the thles in the harbors and inland waters of tho United States (us Long Ishand and Vineyard Sounds) will alse result from the comparison of numerous recoris, kept with n special view to their investigntion.
To the preceding ncconnt of the operacions of the cosst survey it inust be ndded, that the reduction of be maps to the senle of publiention, the engraving and printling of them, are entirely executed in tho otlice at Washington. An exceptlon is made in the engraving of the smaller harbor mops, partleularly of the harhors of refuge. They are somethmes placed in the hunds of private nrtists, which serves the deuble olject of an carlier publication mid of encouraging the art of mapengraving lat this country. The jropriety of pulilistilig to the world the important resultis of the const surveyas ason as ohtained wns lumedintely recognized by Professer liaehe. In the enso of a discovery nffecting the genernl navigntion of the coast, like that of the "New South Shonl," a "preliminary aketch," anticipating the complete chart, has been freely tistributed. In other enses, information has been disseminated through the press, or furnlshed by authority, to ehartselfers. The oflec at Washington contalns nlso werkshops, at wheh the various instruments of the survey
are repaired and made. All the details of the office duties, whether relating to the verification and engraving of maps, or the occupation of the workmen, in the aliseace of the superintendent, are under the direction of Captain A. A. Humph: eys, of the Topographical Engineers, an assistant. As the operations of the coast survey are numerous and various, and its duties very multiplied in detail and complicated in their connection, it will be readily believed that the direction and adjustment of them-the instructions, the reports, and communications arising from them-make the office of superintendent one of increasing labor and respensibllIty. Besides personal attention to these duties, Dr. Bache occupies the station of the primary triangulation at the north, and the observations, whether geodetic, or astronemical, or magnetic, are either made by himself or under his immediate supervision. In the same manner he has also measured a buse line for Section VIII., on Dauphin Island, and carried the main triangulatlon across from the Chesapeake to Washingten. In a work of such magnitude and extent, occasional indirect contributions to knowledge may be expected, and there is every disposition to nake them.

A point of interest to the geologist, developed by the operations of the coast survey, is the changes that are constantly occurring in different parts of the coast. In this respece its present accurate determinations will furnish in futuro the means of interesting comparisons. It must bo remarked here, also, that too much importance com not be assigned to this view of the results of the coast survey. With regard to most harbors of consequence, the question is repeatedly asked whether they have undergone any change; and this question can rarely be satisfnctorily answered, for the want of a correct standard of comparison. The charts of the coast survey will enable the future hydrographer to point out the changes, If any, and the future engineer, in his endeavors to improve or to preserve the chamela of navigation, will, by a careful stady of these changes, be able to guard ngainst the causes of obstruction, and to co-operato intelligently with natural lnws, instead of blindly opposing their effects. The manner in which harbers aro atfected by the matter held in auspension loy the rivers emptying into them, that is, the place and form in which thls matter is deposited, will receive such elucidation from the inquiries of the coast survey as will nssist the coumsels of the constructing englneer.
The charts of the coast survey exhibit, as far as they go, a view of the topographical formation of the bottom of the sca. Specimens ars collected, and preserved in the office, of the bettem in all its varieties, and it was the intention of the lata Licutenant Bache to form a geelogical mmp, on which the materials thus collected should appear, in the naturnl order of their formation. lesides serving as useful indications to the navigator and pilot, they prove to be, when placed under th, microscope, highly interesting to the naturalist. The decp-sen soundings hava been examined by Professo: I. W. Hailey, of West Polnt, and have been found to be tilled with organisms, particulnrly those of the calenreous polythalamit. to an memeunt thint is reallyamizzing, hundreds of millions existling In overy cubic inch. "One speclmen, from the depth of ninety fathems, is crowded with remains, most of them large enough to Le recognized by a practiced eye without the ald of a marnitier." And it is not impossii.le that, in similar enses, science may supply the matines with nother mode recognizing the clanrncter of the bottom. In 18.17, J'rofessor I.. Agnssiz, of Camb idge, aecompanied one of the hydrographiens parties engaged in the offshore work, by the invitation of lts commander, and enjuyed nn opportunity of examining the animals inhabiting dopthis that are rarely accessible. It proved to the $n$ rich fleld of discovery. Not only many new species, bint acveral new genera, were ardleil to the known tists; the subject of embryolugy recelved fresh Hiustrations, and a now light wad thrown upon the
laws of the geographical diatributlon of anlmals, showing that in the different depths of the sea, as in the elavathons of the land, dlstinct families have each their assigned and native dwolling-place.
It would lead to but a partial eatimate of the value of the coast survey to omit these examples of its incldental benefits to knowledge. There are othere upon which there is not room to dwell. The friends of this work have reason to be satisfied with its progress, and it is confidently believed that they may lay aside all
apprehensiona for its future prosparity. It rests upon the firm support of a controlling pubilc oplaion in the government and among the people. Workiag, as it does, in a fiald that is useful and honorable, and belng conducted in all its branches with zeal and efficiency, it can not fall to add every year to the coasideration with which it is now regarded, not only at home, but in every country where scienco and its application to the arts of life are justly appreciated.-American Al. mamac for 1849.

Resclits of tue Coabt Survey at mifyerent Perione, from 1844 to 1864.

General List of Const Survey Discoveries and Deerlipments to 1853 inclusite, compiled by Lientenant 5: B. IIunt.-As the operations of the survey alvance along the coast, lmportant facts before unkuown are constantly brought to light. Many facilites for, anul dangers to, navigation are thus diseoverel, which had been before wholly unknown, and those before but inperfectly known aro developed by accurate surveys. Many such devolopmenta and discoverles oecur In the geodetle and topographical operations, some of which are of no slight value; but those wheh are embraced In the hydrographic work are often of vital importance to commerco and navigation. The following list presents some of the most limportant items of this nature,
and may collectlvely be regarded as exlibiting one of the most valuable results of the survey. In fact, each shoet which glves shere line and hydrograply with increased accuracy has somewhat of discovery or development to clain; but ln this list only thosa casez are Included $\ln$ which a spleclfic bencfit has theen conferred on navigatlon, elther by unfoldhig some new fucility, ullsclusing some serious danger, or Indlenting some İmportant change of contlguration. The arrangement is geographical, and in tho oriler of soctions.

1. A rock not on any clart, in the laner harbor ef Gloucester, Massachusetts-ilisco vered In 185 si .
2. A bank 90 miles eastward of Boston, whili about 36 futhoms water-probably a kuoll cennected with

Cashe's ledge, but with deep water between it and the ledge-185?.
3. Degton harbor : Broad Sound channel thorenghly -nri. ed, an ${ }^{\text {c marks recommended- } 1848 . ~}$
4. Nantucket Shoals: Davis's New South Shoal, dlscovered in 1846, slx miles south of the old Nantucket South Shoals, in the track of all vessela between Now York and Europe, or runnlig along the coast from the Eastern to the Southern States, or South America.
5. Ditto: Two new ghoals north and east of Nan-tucket-discovered $\ln 1817$.
i. Ditto: Six new shoals near Nantucket, the outermost one 14d miles from land, and with only ten feet water-discovered in 1848.
7. Ditto: McBlair's Shoals, off Nantucket-discovcred in 1849.
8. Ditto: Davis's Bank-discovered $\ln 1848$, and survey finisbed in 1851.
9. Ditto: Flshing Rip, a large shoal extending north and south abont 10 miles to the eastward of Dsvis's Bank and 30 from Nantucket, with $4 \frac{1}{2}$ fathoms -urrseyed in 1852.
10. Ditto: A ridge connecting Davis's New South Shoal and Davis's Bank-found in 1853.
11. Ditto: A small bank or knoll, with but five fathoms on it, about five miles east of Great Rip, with 12 fathoms between it and Davis's Bank and Fishing Rip, the water gradually deepening outside of it to the northward and castwarl, beyond the limits of the serics of shoals.
12. Contraction of the inlet at the north end of Monomoy Island, and opening of new entrance to Chatham barbor- 1853.

12 bis. Maskeget Channel-surveyed hy Lleutenant C. II. Davis in 1848, and Lieutenant C. II. MeBlair in 1850.
13. Numerous rocks in Martha'a Vineyard Sound, Long Island Sounl, and the varinus bays and harbors consected with them.
14. Gedney's Chamel into New York Bay, having two fect more water than the old channels. IIad the true depth of this ehanuel (which is scen, by comparing old and new charts, to have then probably existed) been known in 1778, the French tloet under Count D'Estaing would have passed into the bay and taken the assembled 13ritish vessels.
15. Sandy Ilook: its remarkabla Inerease out across the main ship-chamel has been traced from the surreys of the topographical engineers and others, and by several successive special surveys.

L5 bis. lnerease of depth lin Muttermilk Channol, ascertainet and made known in 1818, by survay of lieutenalac 1). 1). lorter.
16. Delaware Bay: Ilake's Channel nt the entrance discovered in 184-open when the enstern chanmel is closed by the lec. This illscovery has served to develop strikingly tho resources of that portion of Delaware.
17. Blunt's Channel in Dciaware Bay.
18. Changes in the Delaware near tho Pea Patch.
19. The true extent and position of the dangerous shouls near Chincoteagno Inlet, Virginin-1852.
20. Metompkin Inlet, Virginia, shoaling from 11 to A feet in the channel churing 1852 .
21. Two chamels lato Wachapreagne Inlet, Vir-ginia-one from the northward and the of .er from the castward-both with seven feet water at low thle1832.
22. A shaal half a mille in extont, not put down on any chart, $5 \frac{1}{2}$ milles cast from the north end of Praramore's Istand, Virghia : it his but four fathoms water on it, and his wine futhoms around $\mathrm{It}-1852$.
23. Grent Machipungo lulet, Virghia; found to have a the whle channel, with 11 feet water on the har at low tide and 14 at ligh; goot anehorage insido In from two to elght futhoms: the best harbor between the Chesapenke and Delaware enlrances-1852.
24. Two shoals near the entrance to the Chesapeake -one $4 \frac{3}{4}$ nautleal miles southeast by east fro:n Smlth's Island light-house, wlth 17 feet upon it; and the other cast by south nearly, 78 miles from the same light, with $19 \frac{1}{2}$ feet upon it-1853.
25. Only three feet water upon the "Inner Niddle," the shoal part of the Mlddle Ground west of the "North Channel," at the Chesapeake entrance-. $\mathbf{d 5 2}$.
26. A 25 fathom hole $2 \frac{1}{2}$ miles west-sonthwest from Tazewell triangalation polnt, eastern shore of the Chesapeake; all other charta give not more than 16 fathoms in this vlcinity.
27. A shoal at the mouth of the Great and Little Choptank, in Chesapeake Bay-1848.
28. Dceper water found on Diamond Shoal, and a dangerous nine-fect shoal off Cape Hatteras-1850.
29. A new channel, with 14 fect water, Into Hatteras Inlet, formed during the year 1852, which is better and straighter than the old channel.
30. The well-ascertained influence of prevailing winds in the movement of the bars at Cape Fear and New Inlet entrances, and the gradual shoaling of the main bar ; the latter fact being of grent importance to the extensive commerce seeking this harbor-1853.
31. Frying-pan Shoala, off Capo Fear, North Carolina. A channel of $2 \frac{1}{2}$ fathoms, upward of a mile wide, distant 11 naulical miles from Bald Head lighthonse, across tho Frying-pan Shoals. A channel extencling from 3 to 4 miles from the point of Cape Fear to 8 to $8 \frac{1}{2}$ miles from it, with aufficient water at low tido to allow vessels drawing nine or ten fect water to cross safely. A channel at the diatance of 14 nautical miles from Bald IIead light-house, one mile wide, with 8t to 7 fathoms water on It. The Frying-pan Shoals extond 20 nautical miles from Bald IIead light-house, and 16,17 , ant 18 feet water is found 17 and 18 nautical miles out from the light-1851.
32. Shoaling of Cape Fear Rlver bar thoronglily examined for purposes of improvement- 1852.
33. Changes at the entranco of Winyah Bay, Georgetown harbor, and the washing away of Lighthouso Point, at the same entrance- 1853 .
34. Maftitt's new channel, Charleston harbot, with the same tepth of water as the ship-channel-1850.
35. Changes in the chamels at tho entrance of Charleston harbor-1852.
36. The remarkable discovery of continuous deepsen soundings off Charleston, and of soundings in the dopth of hetween 400 and 500 fathoms beyond the Gulf Stream-1853.
37. The ilscovery of cold water at the hottom of the sen below the Gulf Strean, along tho coasts of North and South Carolina, Georgia, and Florida-1853.
38. The diseovery of tho cold wall, alternate warm and cold hands, and various other fentures of the Gulf Stream, espectally such as concern its superficial and deep temperatures on sectlons, and its distribution relative to the shore and botlom.
39. Various facts relative to the distribution of miunte shatls on the ocean-bottom, of prohable use to navigators for recognizing their positions.
10. Hetzel Shoal, otl Cape Canavernl, l'lorida--1850.
11. A new passage, with threo fathous water, through l'lorlda IRef to Legaró harhor, uniter Tri1 mph lieef (lat. $25^{\circ} 30^{\prime} \mathrm{N}$. , long. $80^{\circ} 03^{\prime} \mathrm{W}$.), which, if properly bnoyed, will be valuable as a harbor of refuge.
42. A new chmael lnto Key West harbor-1850.
43. Isatac Shoal, near Robocea Shoal, Florida Reef; not lald down on any chart-1852.
4. Channel, No. 4, a northweat entrance into Cc-Jar-Keys llay-1852.
15. Nobilo llay Lintrance Bar; In 1892 only 17 fect at low water could ho carried over lif in 1811 it was 19 fect; and in 18.17 It was 208 foct, as shown by successive surveys-18.17.
46. The dimhution, almost closing, of the pussage
between Dauphine and Pelican Islands, at the entrance of Moblle Bay-1853.
47. Horn Island Channel, on the Coast of Mississippi.
48. The removal of the East Spit of Petit Bois Island in tho hurrlcane of 1852 , opening a new communication between the Gulf and Mississippi Sound, and the rendering of IIorn Island Pass more casy of access by the removal of knolls- 1853 .
49. The accurate determination of Ship Shoal, off the coast of Louisjana, In connection with the site for a light-house- 1853 .
50. The changes at Aransas Pass, Texas, as beariag on the question of $a$ light-house site- 1853 .
51. The determination of the position and sonndings on Cortez Bank, near the island of San Clemente, coast of Califormia-1855.
52. A shoal inside of Ballast Point, San Diego Bay, with $12 \frac{1}{2}$ fect of water; not laid down on any chart1852.
53. Changea in the channels of entrance of II umbeldt Bay or harbor, California-1852 and 1853.
54. The depth of water on the bars at the entrance of Rogue River and Umquah River, Oregon- 1853.
55. Sonth Channel, Columbia River, surveyed and made avaifabie to conmerce-1851. Changes of channels, their sontliward tendeney, and a rew threc-fathom chanuel from Point Ilancock, duo west to open water, Colnmbia entrance-1852. Further changes1853.
56. Various surveys and charts of small harbors on the Pacifie, and a continuons recomoissance of the entire western coast and islands adjacent, a great part of which was very imperfectly known.

## Additional List for 1854.

57. Determination of the dimensions of Alden's Rock, near Cape Elizabeth, Maine.
58. A bank (Stellwagen's llank), with $10 \frac{1}{2}$ to $14 \frac{1}{2}$ fathoms of water on it, at the entrance to Massachusetts Bay, and serving as an inportant mark for approaching llosten and other harbors.
59. A dangerous sunken ledge (Davis's Ledge) to the eastward, nind in the neighborhood of Minot's Ledge.
60. Several rocks in the fair channel-way in Boston hartor entrance.
61. 'The tidal currents of Nantucket Shoals and the nptroaches.

6:. The tidal currents of I.ong Island Souml.
63. Tho changes in New York harbor, near the city, between 1845 and 1854.
64. The gencral peimanence of the Bodkin Channel and shoals in its ricinity, at the entrance of the I'atapsco Rlver-between 1844 and 1854.
65. A shoal (Now Point Shoal) in Chesapcake Bay, with 16 feet water on it, southeast from New Polist Comfort Jight-house, off Mohjack Ihny.
66. A reconnoissance of the Wimble Shoals near Nag's IJeall, const of North Carolina.
67. The general permanence in depth on the bar of Beaufort, North Carolina, with the change of position of the channel.
68. Tha changes in Mafitt's Channel, Charleston harbor, South Carolina, from $18: 2$ to 180.4 .
69. A harbor of refuge (Turtle harbor) to the northward and westward of Carysfort light-house, Florlda Reef, with a depth of water of 26 fect at the entrance.
70. A safe rule for crossing the Florlida licef near Indian Key.
71. Co-tidal linas for the Atlantic coast of the United States.
72. An increase of depth of water on the bar at lass Fonrehen, loulsiana.
73. A shoal at the entrance to the Stralts of Rosario, Washington Territory, glving good holding ground in 33 feet.
74. Belle Roek, in the middio of Rosarlo Strait,

Washington Territory, visible only at extreme low tides.
75. Entrance Rock, at the entrance of Rosario Strait.
76. Unit Kock, in the Canal de Haro, Washington Territory.
77. A five-fathom shoal in the Strait of Juan de Fuca, between Canal de Haro and Rosario Streit.
78. The non-existence of two islands at the northern entrance of Canal de Ifaro, lald down oll charts.
79. The non-existence of San Juan Island, nsually laid among the Santa Barbara group.
80. Tides of San Dlego, San Fra'icisco, and Astoria. - Coast Surrey Report for 1854.

Cobalt (Ger. Kobalt; Du. Kobal; Swed. Cobolt ; Fr. Cobalt; It. Coballo; Russ. Kobolt; Lat. Cobaltum), a mineral of a gray color, with a shade of red, and by no means brilliant. It has scarcely any taste or smell; is rather soft; specific gravity about 8.6. Sometimes it is composed of plates, sometimes of grains, and sometimes of small fibres adhering to each other. Its oxides are principally employed,-See Smalis, or Smaltz. They form the most permanent blue with which we are acquainted. The coloring power of oxide of cobalt on vitritiable mixtures ls greater, perhaps, than that of any other metal. One grain gives a fult blue to 240 grains of glass.-Tuonson's Chemistry and Une's Dictionary.
Cocculus Indicus, or Indian Berry (Sanse. Kukumari; Malay, Tubabidgi), the fruit of the Minispermum Cocculus, $n$ large trec of the Malabar coast, Ceyten, ete. It is a small kidney-shaped berry, having a white kerncl inside of a most mnpleasant taste. It is of a poisonous and intoxicating quality, and has been employed to adnlterate alo and beer.

Cochineal (Gcr. Koschenilje ; Du. Conchenilje; Fr. Cochenillc; It. Cocciniglia; Sp. Cochinilla, Girana; l'ort. Cochenilha; Russ. Konssenel), an insect (Coceus catil) found in Mexico, Georgia, Sonth Carolina, and some of the West India islands; recently, also, it has been introduced into Java, and promises to become an inportant product of that rapidily improving colony. Formerly it was in Mexico only that it was reared with care, and formed a valuablo articte of commerce; bat its culture is now more or less attended to in varioos parts of the West Indies and of the United States. It is a small insect, seldom exceeding the size of a grain of barley; and was generally believed, for a considerable time after it began to be imported into Europe, to be a sort of vegetable grain or seed. There are two sorts or variethes of cochincal: the best or domesticated, which the Spaniards called grana fint, or tine grain; and the wild, which they call grana sylrestra. Tho former is nearly twice as large as the latter, probably becanse its size has leen improved by the fasorabe effects of haman care, and of a more copious and suitable noarishment, derived solely from the Cutus coehinillifer, during many generations. Wild cochineai Is collerted six times in the year, but that which is cuitivated is only collected thrice during the same period. The insects, of which there are abont $70,000 \mathrm{in}$ a peund, being detached from the plants on which they feed by a blant knife, are put inte bags, nud dipped in boiling water to kill them, after which they are dried in the sun. It is principalty nsed in the dyeing of scarlet, crimson, and other esteemed colors. The watery infusion is of a violet crimson; the alcoholic, of a dec $j$ crinson; and the alkaline, of a deep purpte, or rather violet huc. It is imported lu bags, each containing atout two hundred penuds; and has the appearance of small, dry stariveled, rugose berries or seeds, of a deep brown, parple, or mutherry color, with a white matter between the wrinkles. In this state they suffer no change from length of keeping. Ir. Hancroft says that that cochineal ls the best which is "large, plamp, dry, and of a silecr-white color on the surface." The speeles of corhineal called granilla, or dost, is supposed by Dr. Ilancroft to be princlpally formed of

grana sylvestra. The insects of which it consiats are smaller than those compesing tho fine cochioeal, and it does not yield more than a third part of the coloring matter that is yielded by the latter. The cochineal insect was introduced into India in 1795; but a very inferior sort ouly ia produced. It has also been introdaced into Java and Spain, but with what success romains to be soen.-Thomson's Dispensatory; Bavchort on Colors, etc.

Tho cochineal plant (Cactus cochinillifer'), or some of its congeners, is found in varying abundance throughout the torrid zone, as well as in several warm and temperate countries without the tropics. But much doubt still oxista as to what particular species nourishes the cochincal insect, as it is believed that the plant wifich was named by Linnaus, and which has beenalmost universally called Cactus cochinillifer, it, not the one that produces the best Mexican cochineal; nor is it positively known in what part of America it was originally n nativo. Linnaeus spoaks of it as indigenous to Jumaica, and the warmer parts of the New Worid; but others assert that it was brought from South Ameriea by a Spanish priest.

Cochin China. This oxtousive kingdom is situated in the southern oxtremity of Asia, and forms part of the peninsula between China and Ilindostan. It is not separated, however, by any distinet boundary from the neighboring countries; and its limits have been gratily extended by conquest beyond thoso of Gochin China proper, which is merely a strip of land between the China Sea and tho mountains, and is not sbove sixty or seventy miles broad. Tho empire of Cocinin Ctina, which took lts present form in tho beginaing of the present century, comprehends Cochin China proper, Tonquin, the prineipal part of Cambo dia, and the littlo state of Chimmpa. This state, as it has been aggrandized by conquest, extends from the point of Cambodin, in about $8^{\circ} 30^{\prime}$ N. lat., to tho northern confines of Tompuin, which reach within n very few miles of the tropic of Cancer, and from the longithele of $102^{\circ}$ to about $100^{\circ} \mathrm{E}$. It is lounded on the north by the Cininese Quangsi or Kiangsi and Yunan; on the west by tive kingioms of Laos and Siam; while tho Gulfs of Siam, Tonquin, and tise Chisn Sea bound it on tise southwest, enst, and northeast. Its area is estimated at about 98,000 square miles, and its population at from $12,000,000$ to $16,000,000$. This great country is divided by long ranges of mountains, which rum nearly north and south, and in almost paralle' ehains, forming it into aeparate provinees, divided by physical boandaries, and iniabited by distinet tribes and nations, although subject to tho same sovereign. By these mountainous ridges Tonquin and Cochin China preper aro separated from Lactho, Laos, nnd Cumbodia. Another chain separates the three latter states from Siam and China, nud gradually diminishes in ieghit as it approaches tho south, terminating at tho soathern extremity of Cambolin.

The soil in Cochin China, especially in the low lands, is fertiie, and its products aro very valuable. Of theso rice, as being the general food of tho peopie, is tho staple commodity; and after supplying the wants of tho people, about 100,000 piculs romain aunually for exportation. The cultivation of the sugar-cane, as well as the preparation of sugar, has of late years much increased; and the annual exportation of sugar is considered to be not less than 70,000 pieuls, Cotton of the best quality is produced on the coast ; and of this probabiy about 60,000 piculs aro exported. 'Though raw siik is produced, it is principally for home consamption. Cimamon raml. high among its productions, and has always heen celebrated in China. In the soutiern jarts tho encon-nit grows very laxuriantiy, and honco there is a large exportation of oil. Periper of a good quality, but in smail quantity and of a high priee, is produced in the central provinees of Coehin China; but the quantity is inaderjuato to the de-
mand which the Chinese trade creates for its exportation. It grows among the central mountains of Cochin China, whence it is exported to Cambodia and Tonquin, but principally to China, where it is much more highly valued than any other quality of this aromatic. Another exclusive product of the central parta of the kingdom, which is extensively cultivated and aent to the nsighboring provinces, is tea, which is very coarse and only used by the poorer classes. The other productions of the country are, gamboge, gum, cardamoms, eaglewood, areca-palm, betel-nut, ivory, stick-lac; hides, consisting of deer-skins, buffalo, clephanta', and rhinoceros hides ; peltry, consisting of tiger, leopard, otter, and cat skins; feathers, salt fish, horns and bonea, dye-woods, and woods for ship-building and for domestic purposes. Valuable timber is only found in Cambodia, and a amall quantity of teak-wood is found in the forests; also ebony cedars, mimosas, walnuts, ironwood, and poon, and most of the other trees found in the woods of India. The wood used for ship-building and for domestic jurposes is strong and durable, and is carried to the capital in large quantities. There is a hard, black wood extensively used in cabinet-work, and of large dimensions, which takes a fine polish, and might form an article of exportation. Cambodia also produces the Portuguese rose-wood, which the Chinese export as they do from Siam; also sandal-wood and ether scented woods. Among the products of Tonquin is a specics of vegetable root, a cheap material, which forms the dead-weight of all the Chineso cargoes exported from Tonquin, and is used extensively both throughout Cochin China and the adjacent countries, and also in China, as the material of a red dye. Edible hirds'-nests, the sea-slug usually called biche-te-mer, or Nipunculus cdulis, and various marine productions of a gelatinous quality, form standing articles of trade with China, and are always in demand.

Tho geological formation of Cochin China is primitive; the mountains aro chiefly composed of granite and sienite. Mica slato and primary limestone here and there occur, while several hills consist of quartz rock. Among the mountains of Tonquin is the only portion of the Cochin Chineso empire which protucea iron, gold, and silver. The iron received from these mines, which is as chesp as that from Siam, supplies the whole kingdom, with the execption of Saigun, which is furnished from the latter country. Gold dust is found in many of the rivers; and thero are immense rocks of marble sitnated on the banks of the River Faifo, on a kind of sandy plain, of which large quantities have been exported. This romarkable range of limestone rocks rises almost perpendicularly from the low sand hills, to a height of from 300 to 400 feet, without a hill or mountain near them.
The foreign trado of the Cochin Chinese is almost exclusively with China; tho trado carried on with Sian being inconsiderable, and that with European nations still smaller. But there is no indisposition to trade, though among tho European nations the notion has been propagated by travelers that the resort of Luropean traders is in a great measuro interdieted in this kingdom, on the same prineiple as in Japan and China. In 1818, a new tariff was imposed on foreign vessels, by which the high duties impesed on all foreigu vessels prior to 1818 wero repealed, and equal duties substituted in their stead. IBy this regulation all vessels puy a rated measurement duty, moderate in ita nmount, and are exompted from all import duties paynble previous to 1818. Vessels that are driven into the perts of Cochin China by stress of weather, or that visit them fur the purpose of commercial inquiries, are free from all charges. Besides the exports above mentioned ure eardamoms, botel-nut, eagle-wood, dyce woods, stick-lae, gamboge, ivory, elephants hites and bones, and rhinocoros hones. The imports aro silk goods of various kinds, tho coarser kinds of teas, coarse china-waro, paper, cotton and woolen stufts, iron, opl-

deposit their eggs in rough ground, among rocks. Seme contlaue in roe till the beginning of Aprll. The col is only found in the Northern purts of the world; it is sn vecan Ish, and never met with in the Mediterramean. The great rendezvous of the codilish ls on the Banks of Newfoundland, and the other aand banks that jie ofl the coasts of Cape Breton, Nova Scotia, and New England. They prefer those situations, by reason of thequantity of worms produced in these sandy bottoms, which tempt them to resort there for food. But alsother cause of tha partieular attachment the fish have te these spots is their vicinity to the polar sess, where they retura to spawn: there they deposit their roes in full security; but want of food forees them, as soon as the mere southern seas are open, to repair thither for subsistence. Few are taken to the north of Iceland, bat they abound on its south and west coasts. They swarm on the coasts of Norway, in the Baltic, and otl ${ }^{+}$ the Orkney and Western Isles; after which their aumbers deerease in proportion as they advance toward the south, when they seem quite to cease before they reach the mouth of the Stralts of Gibraltar. Befars the discovery of Newfoundland, the greater tisheries of cod were on the scas of leeland, and ott the Western Isles, which were the grand resort of ships from all the commercial natlons; but the greatest plenty was met with near Iecland. The English resorted thither before the year 1415 ; for we tind that Henry V, was disposed to give satisfaction to the Kingt of Denmark for certain irregularities committed by his subjects on those seas. In the reign of Edward 1V. the laglish wero excluded from the tishery by treaty. Ia latter times, we find Queen Elizabeth condescending ta ask permission to fish in those seas from Christian IV. of Demark. In the reign of her suecessor, however, na fewer than 150 English ships were employed in the Ieclant tishery; which indulgence might urise from the marriage of Janes with a prineess of Den-mark."-l'vNvant's British Zoology. Cod is prepared in two diterent ways; it is either gutted, salted, and then harreled-in whichstate it is denominated green or pickled cod; or it is dried and cured-in which state it is ealled dried cod. Ready access to the shore is indispensable to the prosecution of the latter species of tishery.
bistant Corl f"ishery.-'the great Bank of New foundland, diseovered by John or Sebastian Cabot in 1197, was Jong, nad perhaps still is, the principal seat of the distant cod fishery. The extraordinary abundance of coldis' on its banks having been speedily ascertained, the french, l'ortuguese, and Spaniards soon after engaged in the ifshery. The Finglish were later in coming into the tied. In 1578 France had on the Banks of Newfoundland 150 vessels, Spain 120 or 130, Portugal 50, ant linglami from 30 to 50 . Duriug the tirst half of last century, the tishery was principally carried on hy the Euglish, including the Anglo-Americans and the Frumb; Lut the capture of Cape lireton, and of their other possessuns in America, gave a severe buw tothe fislery of tha latter. 't he Americam war divided 4... iritish tishery; that portion of it which had previously iecu carried on from New Enghand heing there after merged in that of the United States. During the last war, lue lirensh boing excluted from the fisheries, thom of Buglamal attained to an extraominary degree of prosicerity : the total value of the prohace of the New. fombland fisheryin 1814 having exceeded $£^{2} 2$, Row, 010 . lhe sime the peace, the lritish ilshery on the Newfommlland bunks has rapidly declimed; and can hardIy, inderd, $\mathrm{in}^{2}$ sand, ut thls moment, to exint. It is now carried on almost eatrely by the lrench ame the Americias; the facilities mjoyed ly the latter for its prosecution, being greater than those of any other people, nad the forner lecing rempted to engrge la it hy the extraordanary eneouragements ofered ly government. At present, the Mritish tishery carrical on hy the inhalitants of Newfoundland is confmed entirely to the shore or boat fishery. But this, though probably
not so good a nursery of allors as the bank fishery, is admitted to be "the most productive of merchantahle fish and oil."-M'Grkgdis's Brit. Amer., 2d ed. vol. I.

American Cod Fishery.-The Americans have at all times prosecutel the cod fishery with great vigor and surcess. Their tishermen ars remarkable for their ac, vity and enterprise, sobriety and frugality; and thei proximity to the fishing-greunds, and the other facuities they possess for carrying on the fishery, give them advantages with which it is very difficult to contend. In 1795 the Americans employed in the cod fishery about $3!, 000$ tons of shipping; in 1807 they are said to have employed 70,306 tons; but it subsequently deelined for several years, and was almost entirely suspended during the late war. According to the official returns (laid before Congress the lst of January, 1853), the Americans had, in the year ending the 30th of Juac, 1852, 102,659 tons shipping engaged in the cod fishery. During tho same year they exported 134,732 quintals of dried, and 19,879 barrels of pickled cod; their aggregate value being $4153,010$. "The Americans follow two or more modes of fitting ont for the fisheries. The first is accomplished bysix orseven faimers, or their sons, building a schooner during winter, whieh they man themselves (as all the Americsns on the sea-coast are more or less seamen as well as farmers); and after fittlag the vessel with necessary stores, they proceed to the banks, Gulf of St. Lawrence, or Labrador; and, loading their vessel with fish, make a voyage between spring and harrest. The proceeds they divide, after paying any balance they may owe for ontfit. They remain at home to assist in gathering their crops, and procect agaln for another cargo, which is salted elown, and not afterwarl! dried: this is termed mudtish, and kept for home consumptlon. The other plan is, when a merchant or uny other, owning a vessel, lets her to 10 or 15 men on shares. He fints the vessel and nets. The men pay for all the provisions, hooks and lines, and for the salt neces ary to eure their proportion of the fish. Ono of the number is acknowledged master; but he has to eateh ísh as well as the others, anl receives ouly about 20s. per montl for navigating the vessel; the crew have five-eighths of the fish caught, and the owners threceeighthe of the whole. The first spring royage is made to the banks; the second either to the banks, Gulf of St. Lawrence, or the coast of Labrador; the third or fall voyage is again to the banks; and a forrth, or second fali voyage, is ulso made, sometimes, to the banks."N"timedon, rol. i. p. $2 \geq 0$. It is stipulated in the tirst article of a convention between Great Iritain and the I'uited States, signel at London, $20 \mathrm{H}_{3}$ of October, 18 t , that the citizens of the United States shall have liberty to take all sorts of fish "on that part of the coast of Newioundland from Cape Ray to the lameau Islands, on the west ro and northern coasts of Newfoundland rom Cape Ray to the Quirpon Islands, on the Magdalen Islands, and also on the coasts, hays, barbors, as:il creeks, from Momet Joly, on the sonthem const of labrader, to and through the Straits of Belleisle, and thence northward indefinitely along tho coust, without prejulice, however, to any of the exclusive rights of the IIudsen's Hay Company; and that the American fishermen shall also have liberty forever to dry and cure tish in any of the unsettled bays, harbors, and erceks of the southern parts of the coast of Newfoundland here above described, and of the coast of Labirndor; but so soon as the same, or "ny portion thereof, shall be settled, it shall not be lawful fer the suid fishermen to dry or cure flsh without previous agreement for such purpose with the inhabitants, 1 roprietors, or possessors of the ground. A. al the United States herely renounce forever any liberty heretofore enjoyed or clamed by the inhabitants thereof, to take, dry, or curo llsh on or within three marlae mies of any of the ceasts, bays, creeks, or larbors of his Britannls majesty's dominions in

America not Included within tha above-mentioned llmits." The American fishermon are, however, admitted into all bays, ete., for the purpose $0^{\circ}$ shelter, of repairing damages, of purchasing wood, and of obtainIng water, and for no other purpose whatever ; and when there, they are to be placed under such restric-
tlons as may be necessary to prevent their abusing the privileges hereby reserved to them.-Ses Fisneines.

French Cod Fishery,-France has always enjoyed a considerable share of the cod fishery. The follow. ing tablo shows the extent to which she has carricd it since the peace:
 of france fboa tie Cod Fisifry heano the undpa-mentioned Yeara,

The quantitics of oil are exchustve of draches (hufles non epunis); there are afse sommds, etc. Marsetiles, Granvile, Daukirk, Bordesux, La lechelle, and Nantes are the priaclpal ports whence shlps are tlued out for the fishery.

But notwithstanding the apparent prosperity of this branch of industry, it may be doubted whether it be really so beneficial to France as would at first sight appear. It depends more upon artificial regulations than upon any thing else. Foreign cod is excluded from the French markets by the oppressive duty with which it is loaded; and the comparatively great demand for dried fish in Catholic countries revders this a very great boon to the French fishermen. But it is admitted that this would not be enough to sustain the fishery; and high bounties are paid to those engaged in it. These, however, have been reduced of late years; and they will probably in no long time undergo still further alterations. St. Pierro and M1quelon, small islands on the coast of Newfoundland, belong to the French. Their right of fishing upen the shores of that island, and upon the great bank, was replaced in 1814, upon the footing on which it stood in 1792. This concession has been mucli oljected to liy Mr. M'Gregor and others: we believe, however that they have materially overrated its influence.-For further infermation, afe Fishenies and Finanee.

Cod-liver Oil. Puro cod-liver oil is obtained from the livers of codfish; and is best prepared when tha liver is in a state most nearly approaching that in which it exists when alive, and is best adapted for medicinsl use. The finest oil is devoid of color, taste, and smell, three physical cliaracters that are more valuable than any chemical tests. The success which has attended the use of this oil in puhmonsry complaints has led to the introduction of a spurious oil, chiefly preparcd of hleached whale oil, ete., which does not possess the valuable medicinal properties of pure cod-liver oil.

Shark-diter Oil is an oil that has been lately imported from the coast of Africa. It gives the usual liveroil reactions with sulphuric acid: its peculiar interest, however, comes from its low specifie gravity. Until now, sperm oil, which has a specific gravity of 875 , wos the lightest oil known; but the specitic gra ty of this oil is only 866 , It is propared, as its name implies, from shark's liver.

Coffee (Ger. Koffe, Koffebohnen; Du. Kofy, Koffboonen; Da. Kaffe, Kuffelinner; Swed. Koffe; l'r. It. and Port. Caffe; Sp. Cafe; Kuss. Koft; Pol. Kara; Lat. Coffa, Caffen; Arali, Bun; Malay, Käue; l'ers. Tocheon, Kiveh; Turk. Chaube). The coffeetree is a native of Ethiopia and Abyssinia; but it was in Arsbia that it tirst lecame an olject of interast and importance to the civilized world. The plant is an evergreen, and is accurately described by lat hoque as follows: "The coffee-tree is from six to twelve feet high; the stem ten, twelve, and fifteen inches in circuntierence. When it is full grown, it much resembles in figure our apple-trees of eight or ten years' standing. The lower branches ordinarily bend when the tiee begins to grow old, and extend themselves inte a roumd form, komewhat like an umbrella; and the wood is so very limber and pliable, that the ends of the longest
branches may be bent down within two or three feet of the earth. The bark is whitish, and semewhat rough; its leof is mueh like that of the citron-trec. It continues green all the year, and the tree is never without leaves, which aro ranged almost opposite on each sido of the lough, and at small distanees from each other. Nothing is more singular in its kind than its productions; for almost in all seasons of the ycar hlossoms, and green and ripe fruit, may he seen on the same tree ot the same time. When the hlosson falls off, thero remains in its room, or rather springs from each hossom, a small fruit, green at tirst, liat which hecomes red as it ripens, and is not unlike a large ches $\%$, and is very good to eat. Under the flesh of this cherry, instend of the stone, is feund the bean or berry wo call coffee, wrapped round in a fine thia skin. The berry is then very soft, and of a disagrecabhe taste; but as the cherry ripens, the kerry in the inside grows harder, and the dried-up fruit, lifing the flesh or pulp of it, which was hefore eatahle, becomes a shell or pot of a deep brown color. The berry is now solia, und of a clear tramsuarent greem. Each shell contains one serry, which splits into two equal purts. When the fruit is sufliciently ripe to te shaken from the trec, the husks are seporated from the lerrics, and are used in Arabia by the natives; while the lierries are experted for the European tharkets."

From Arabia the plant was taken by the butch about the year 1690 to Java, whence its culture spread slowly among the islands of the Indian Arehipelugo. In the early part of the eighteenth century it found its way to the West lndia Islands. The jlant is now common in every botanieal garden of Europe, and there are few private conservatories without goodspecimens of the tree. When cultivated with a view to trade, it is most productive on hills and mountains, where its root is almost always dry, and its head frequently watered with gentle showers. It prefers a westerly exposure and a loose gravelly soil, but freed from weeds unl grass. The phants are inserted at distances of six or eight feet asunder, and in holes from twelve to cighteen lnches deep.

It left to themselves they would rise to the height of sixteen or eighteen feet; but in extensive plantations the trees are topped and stunted to ahout five feet, for the convenicuce of having the fruit within reach of the gatherer. Thus dwarfed, they extend their branches nutil they cover the whole spot round about them. They begin to yied fruit the thirl year. 13y the fifth, sixth, or seventh year, according to the nature of the foil, they are at finll licaring, and continue to hear for upward of twenty years.

It has but recently come to the knowledge of liuropeans that the leaves of the coflec-plant contain the sume essential principle for which the herries are so mucle valued, and that in the Dutch ikland of Sumatro, in the Indian Archipelago, the natives seareely use any thing else, and greatly prefer a heverage made from the beaf to the berry itself. The leaves undergo a proc-

 njeyel foliow rried itess of curing similar to ter, and they possess all the virtues of either tea or coffee. This may be leoked upn as the introduction of a new element among the innocent and beneflcial neeessaries of lifo; for while the eulture of the coffee plant for the aake of its fruit is limited to particular soils and high temperatures, the treo produces leaves in abundance any where within the treples where the soil ls suffielently fertlle. This extensive habitat, added to its nutritive qualities and frectom from any deleterious prineiple, points out the cotfee plant as the best adapted for general consumptien of ail the productions affording eaffein.

The cotfee berry (for which the piant has hitherto teen chiefly cultivated), when ripe, is cured in the West Indies, in Java, Ceylon, the Fast Indies, and South America, by a process cailed pulping and wasiing. In Aratia, Persla, ote., it is neither pulped nor washed, hut cured in the ancient fasinien by the labor of the hands and the action of the sun. The pulping process is performed by machinery, which greatly expellites the work ; but practical experienced West India planters admit that this process $\mathrm{i}_{\mathrm{s}}$ in somo important respects inferior to the Oriental mode. " $A$ manifest preference," says one, "is given in the leading Earopean markets to cofteo whieh has gone tiarough the pulping and washing process; lut, strunge to say, the consumers of this beverage are totaliy ignorant of the fact that the proluce which is cured in the pulp furnishes a stronger decoetion than an equal quantity of the same cotfee which has andeigone the other process. The muclaginous substance which is washed off by the pulping process is absorbed by the bean when cared in the julp. This gives strength to the produce, and enhances its aromatic flavor." Before the ber , is availathe for use, it undergoes a process called roasting. The valuable properties of coffee depend very much on the manner in which this process is performed. For the most recent and inteligent dissertation on this point, consult Dr. Jue's Dietiontry of :Irts, Mfunufuctures, and Mines, last edition, vol. 1. p. 456.

Species of Coffe. Runsting, etc.-The coftees of Ja maica, Ceylon, and Mocha aro generally estemed the best; then fellow the coffees of Costa Rica, Dominiea, Berbice, Demerara, Bourbon, Java, Martinique, and Ilayti. Arabian or Mocha cotfee is produced in a very dry climate, the best being raised uion mountainous slopes and sandy soils. The most fertile soils are mot suitabie for the growth of very flne cotfee. Mr. Ilryan Edwards ohserves, that "a rich ieep soil, frequently anelierated by showers, will prodace n luxuriant tree and a great crop; but the beans, which are large, and of a dingy green, prove for many years rank and vapin." Aud the same remark is made by Mr. Crawfurd with respect to the coffee of Java.-Liast Intian Archipelug', vol. i. p. 187. Cotfee is improved by being kept; it then becomes of a pater color. Nocha, or, ns it is commonly called, Turkey coffee, should he chosen of a greenisin light olive hue, fresh and new, free from any mastiness, the berries of a middling size, (lean, plump, and without any intermisture of stieks or ether impurities. Partieular care should be taken that it be not faise packed. Gool West India coffee shond be of a greenish color, fresh, free from any umpeasant smeli, the berries smali and untroken. Coffee herries readily imbile exhalations from other bodies, and thereby acquire an adventitions and disagreeable tiavor. Sugar placed near cotlee will, in a shart time, so impregnate the berries and injure their flavor, as to lower its value 10 or 20 per cent. Dr. Mosoley mentions that a few bags of pepper on board a ship from India spoiled a whole enrgo of coftee.
"The roasting of the herry to a proper llegree repuires great nicety: the virtue and agreeableness of the drink depend upon it; and botit are often injured by the orilinary method, Bernier says, when he was at Cairo, whear coffee is so much used, he was assured ty the best judges tinat there were only two people in
that great eity who understool how to prepare It in perfection. If it be underdone, its virtues will net he lmparted, and In use it wlll load and eppress the stomach; if it be overdone, it will yield a flat, burned, and bitter taste, ita virtues will be destroyed, and in use it will heat the body, and act as an astringent."

Coffee also denetes the driok which is made from the coffec berries. This beverage has been familiar in Eurepe for the last two hundred years. The lirst humun beings whe appear to have used the cofice berries were the half savage tribes of the hlgher Ethiopia. According to Bruce, the berries were first parched like any other grain, bruised into powder, and mixed up with eny sort of grease into paste rolled into little balls. The same authority declares that two or three of these balls wero aufficient to support a man for a whole day in a marauding excursion, or in active war against some neighboring tribe. They merely preferred the coffee berry to other grain, because it fed them as well, and cheered them more.

From Ethiopha, both the coffee plant and the use of its fruit were Introduced Into Persia and Arabia, nnd it is to the Arabs that wo are indebted both for tho first written account of it and for the manner of using it in n liquld state. But though we derive the only authentic necount of coffee from the Arabs, they admit that they were taught by the Persians; and it was in the city of Aden, In Arabia, about the middle of the tifteenth century, that the drinking of coffee first became general. The mufti of that city introduced the custom from l'ersia; his authority gave reputation to the practice-lawyers began to drink it-those who lovel reading followed their example-artisaus who were obliged to work in the night dit the sume thing, as well as travelers who journeyed in the night to avoid the heat of the day. In short, says M. Galland, "the whole inhabitants of Aden soon became drinkers of coffee, and not only at night to keep them awake, but even in the caytime for its other virtues."

From Aden the taste for coftee found its way to Mecca, from Meeca to Cairo, from Cairo to Damascus, from Dnmaseus to Aleppo and from Aleppo to Constantinople; but it was not until $16 t 5$ that the use of coffee found its way from Constantinople to Venice.

In 1644 it was introduced to Marseilles, in 1652 to Landon, and in 1669 to Paris.

The tirst English author who mentioned ceffee was Burton, in his Inatomy of Melancholy (vol. i. i. 130), published in 1621, thirty years before the introduction of the drink into London. "The Turks," says he, "have a drink called coffee (for they use no wine), so named of a berry as bluck as soot and as bitter, which they siju up as warm as they can sutfer, because they find by experience that that kind of drink so used helpeth digestion anil procureth nlacrity:"

It wonld be an error to infer that the mode of making coffee in Europe and $\Lambda$ sia is tho same. In Europe, n infusion or a decoction of the roasted herry is all that is consumed; but this is a refinement in cookery not appreciated in Asia; there the custom is now, and always has been, difficent.

A highly trust worthy traveler, Lamartine, in descriting the ordinary khan in Palesting and Syria, says, "a charcoal fire is constantiy burning on the hearth, and one or two copper coffec-pots are always fuli of thick furinactous eoffer, the habitual refreshment and only want of the Turks nnd Arabs."-Trarels in Syriz aud the Eitst, vol. i. p. 292. A cup of weil-made coffee exhilarates, arouses, ant keeps awake. It allays hunger, to a certain extent, gives to the weary incrensed strength and vigor, and imparts a feeling of comfort and repose. Its physiological effects upon the system, so far as they bave been scientifically investigated, appear to be that, while it makes the brain more active, it soothes the body generaily, makes the change and waste of matter much slower than usual, and the demand for food in consequence proportionately less.

All these effects are produced by the conjoined action of three ingredients, cither identical with, or similar to, those contained in tea. There is a volatile oil produced during the roasting; $a$ variety of tanaic acid, which is also altered in some degree daring tha ronsting; and the substance ealled theia or caffein, which ia commen to both tea and coffee, and is found in the leaven of Guarana officinalis and Ilex paraguenvis, both used ly the aborigines of South America, as tea in in the Old Continent, a remarkable result of chemical investigation. The chentical conatitution of caffeia is $\mathrm{C}_{14} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{4}$.
Coffee-trade. The extent to which the cultivation of coffee has beea carried in the British possessions, the vast amount of capital embarked in plantations suited to its growth, the multitude of hands engaged in its culture, and the shippiag necessarily employed lin connection with that trade, iavest the article, in a commercial point of view, with great importance; while as a beverage, the tendency of which is to wean the community from indulgence in intoxicating liquors, it is second to no commodity in the British tariff. The history of the coffee-trade prior to 1850 is only valuable now as an example of a commodity for which there is a oniversal craving among mankind, struggling successfully, and at last triumphantly, over fibcal restrictiona, high duties, differentiai daties, and an endless mass of antiquated olatructions. In commen with other important necessaries of life, it has now attained to the natural state of uarestricted competition, though it still pays a customs duty of three-pence per pound.-E. B.
The cultivation of coffee met with great : $n$ ceess in St. Domingo, and for many years that was the source whence Europe derived ita chlef supplies, hnving exported at one time about 38,000 tons, or about seven-ty-elx million pounds; and it was supposed that, had not the revolution broken out in 1792, it would in that year huve exported 42,000 tons, or alout elighty-four million pounds. The derastation by that event caused almost a total cessation in the anpplies. Being driven from St. Domingo, its culture was greatly augmented in Cuba, Jomaica, Surinam, and Jeva, and was subsequently introduced with great success into Brazill. As the cultare advanced in Brazil, It declined in Cuba, the growth of sugar having been found capuble of more rapid extension and beling more profitnble. It was some time after coffee was tirst planted in Brazil before it became an aricle of export to any great extcat.

In 1 īit a Franciscan friur, named Villaso, eultivated a single tree in the garden of the Convent of St. Antonio. Brazil was then governed by the Marquis de Lavadie as viceroy. The first fruits of the tree were presented to the marquis, who distributed them among the most respectable planters, explaining to them the advantages of adding another valuable article to the produce of the country; but being strong in their prejudices in fuvor of augar and indigo, fow took puins to cultivate it, and hence its progrese was very slow. In 1808 Don Joas VI, fled !rom Portagal to Nio Juneiro, and soon after opened the jort to foreign trade. The aunaal crop of coffec then did not exceed 30,000 bugs of 160 pounds each, or $8,000,000$ pounds. Although the revolution in St. Domingo had overthrown its cultare there, Cubsa and Jamaica continued, to aome extent, to sapply tho trader. In 1820 its :ncrease in Brazil had swelled to $\mathbf{1 0 0}, 000$ bags. The decrease of aupply, by the desolation of St. Domingo, caused it to reach the enormous price of 148 s. per cwt., or nearly 37 it cents per pound, in London, in the years 1817 and 1821. This great price atimulated the prodaction in Brazil. The fall of St. Domingo had caused the culture of indige to be transferred to Britigh Ladia, and its culture was abaadoned in Brazil, with sugar, for coffec. Hence emancipation in St. Domingo gave the monopoly of the caltivation and aupply of indigo to British India, where it has remained ever aince.'

In 1789, just provions to the revolution, Hayti exported $76,835,219$ pouads of coffee ; in 1818 we find the exports fell to about $26,000,000$ pounds, and at this time they do not probably exceed thirty or thirty-flve millions. The export of sugars in 1789, Just before the revolution, reached $140,000,000$ pnonde. It hat now ceased, and the population actually import supplies from Culas and Porto Rico. In 1834, the year in which the Emaacipation Act went into affect, Jamaica experted to England,

|  | 184. | 1608. |
| :---: | :---: | :---: |
| Sugar, cwt. .................. | 1,268,263 | 706,078 |
| Coffee, pounds.............. | 18,268,688 | 0,428,197 |

We thus find that the exports of coffee fell of the first flve yeare after emanclpation about one-half, and sugar nearly in an equal ratio. In Auguat, 1834, the negroes were cmancipated by the Eaglish government in Jamaica, which struck a death-blow at its culture there, while sagar had measurably superied dits growth in Caba. These causes combined, with the unreatricted sapply of African slave labor, to give its culture a pewerful impulse in Brazil. Hence we find by the year 1830 its crop had increased to 400,000 langs, or $64,000,000$ pounds. The slave-trade, by convention with Eagland, was to ceaso in February, 1830. This producect an enormous inport of slaves, which could ouly be disposed of at low prices and oa long credita. This, again, stimulated the plantling of new estates, and the crop rapidly increased, so that in 1840 it actually reached $1,060,898$ bags, or about $168,600,000$ pounds. The cultivation being found profitable, the demand for slaves continued, and notwithstanding the attempts of the British government to put a stop to it, the slavetrade has been continually carried on clandestinely ever since, the importations from Africa having amounted to from 80,000 to 50,000 annually, the vessels supplied for which having been chiefly built and fitted out in the Northern cities of the United States, and sailing under whatever colora best anawered their parpose.
The increase in the crop since 1840 has been very rapid, and in 1847 reached about $1,804,558$ bags, alout $288,333,000$ ponnds. The low prices in 1848 and 1849 had a tendency to check prodaction. The difficulties of importing slaves, under a new treaty made with England in 1845, cut off the sapply so far that those which were aecretly introduced barely supplied the annual loss, which was 10 per cent., and semetimes inore; and should the trade be atopped altogether, as aimed at by England, it will canse the cultivation of coffee to decrease in Brazil, to beconse augmented in the East Indies, and especially in British India; and should negro alavery be overthrown, coffee would to a great extent follow the course of indigo, and becone to some extent an article of British production and control. The climate of Brazii is highly favorable to the cultivation of coffee, the trees yielding nes ly double those of the West Indies.
The growth of Brazil, by 1854, reacued the astouishing quantity of $400,000,000$ pounds, while the production in the British West India Itlands has rapidy declined since the emancipation of the siaver in 1834, as will be seen from the follewing table:
In the year 1848 the British West India Im1ands ytilded
$10,000,000$ 1bs. In the yeara 1853,34 , and ow, they ytelded onty $\ldots . . . . . . . . . . . . . . . . . . . . . . . . . .$.

The coffee-growlog dietricta of razll are divided into the Serra Abalxo (or below the mountaina) and Serra Acima (above the mountaina). The produce of the former ia about one-aixth part of the whole erop in good years, but is much more uncertain than the Serra Acima, being more liabie to Injury from drought, which is sald of late years to have beea frequent. The quality is also inferior, and seldom ahipped to the United States. The treea usually flower three times each year, generally in Auguat, September, and October, and are ready for picking, In fivorable seasons, in Marki, Aprif, and May, with considerable variation according to situation. In April mall quantities of poor new. coffee appear in maricet. In May and June the quantity is greater, but never sbandant untii July and August. The trees of Serra Acims bloom later, but the crop is more aniform, enabling planters to gather a crop at a singie picking, which la a grest saving of labor. Entire cargoea are not generaily olbtained from the Serra Acima district until August and September. Usually the suppiles remaining over of the old crop are first sent to the msrket before planters clesn out the new, and hence it is often as late as October and November before the bulk of the new crop is in market.
The cost of transporting the coffeo to market is asid to average the planter about two cents per pound, owing to imperfect facilities. The actual cost of production is sald to be not much under $4 \frac{1}{4}$ cents per pound, and as negroes are decimated by cholers and other diseases, without new importations are required to supply their piaces, negrocs muat advance in value and enhance the cost of production.
The first import of Brazil coffee Into tho United

States wat made In 1809, which consinted of 1809 bagi, landed at Salem; by the ship Murquis de Someriulat. Hence, within the briel period of forty-seven yeare, the exports from Braall have incressed to the large amount of $400,000,000$ pounds in 1854, and $820,000,000$ in 1858. From 1809 to 1849, or in a period of forty years, the Imports of coffee from Brazil into the United States Increased from 1809 bage to over $100,000,000$ pounds.

Fqr the flacal year ending the 30 th of June, 1855, the United States imported from Brazil 185,869,883 pounda of ceffee, of the value of $811,815,818$; other Brazilian products, including somenugars, amountedto $8,408,117$. Total imports.
\$15,218,9\%6
Total exports to Miriail . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $4,281,270$
Balance of trade agalinat the Untted Staten .... $10,067,668$
The imports of coffee slone from Brazil in 1854-'56 exceeded the exports of the United States to that country by $\$ 7,558,546$.

The total importation of coflee into the United States for the year ending June 80 th, 1855 , amounted to $100,764,259$ pounds, valued at $\$ 16,764,2599^{\text { }}$ For the year ending June, 1856, the quantity has been much jarger, and ss priecs have ruied high, the value has been much greater.

The consumption of coffee has rapidly increased within the past twenty-five years, the greateat augmentation having been in the United States, where it has averaged $7 \frac{1}{2}$ per cent. per annum, while in Europe it has been $2 \frac{1}{2}$ per cent. per annum, or at the rate of 4 per cent. par sanum for the worid.

We submit the following table, showing the production and consumption of coffee for the world at different periods:

Comragatif: Statenknt of tur Produotion of Coffre in the Wohld at diftrebnt Priods, (Tue Production of onz Year exterg into tile Conguyption of the adocbedino Year.)

| Total. . . . . . . . . . . . . . . . . . . | 040,000,000 | 665,000,000 | 116,000,000 | 607,000,000 |

Jt will be seen from this table that the greatest increase in 1855 was in Ceylon, a British East Indis possession, where its future growth is to be mont largely sugmented should slavery be overthrown in Hrazil; with regard to which attempte have already been made by a member of the Legislature. A bill was introduced for gradual emancipation, but it, of course, did not pass. The question arises, if negro slavery in Brazil shouid be overthrown, where will the cuitivation of coffee next take refuge? Java can not materially augment the supplies. There are but two other points, viz., British India and the west coast of Africa. The iree is a native of the latter locality. The consumption of the world in time of pesce, and increased wealth from the influx of gold, has overtaken the iabor of production. The futnre consumption in England and in the United States is expected to be materialiy augmented.
France.-In France, also, owing to the failure of the vintage for several yesrs, the coneumption of coffee is likely to he increased. The annexed statement shows the present estimated consumption of the world:

| Cnited Statea and British provincea | Pounda. <br> 210,010,000 |
| :---: | :---: |
| German Zotverein ................. | 110,000,000 |
| Austria, and other German stato | 75,000,000 |
| Motland and Belgio | 00,000,000 |
| France, 8witzerland, and Southern Europe . | 125,000,000 |
| Great liritat | 40,000,000 |
| Denmark, Sweden. a | 30,000,000 |
| Rusaia | 16,000,000 |
| Cape of ciood Hope, Australia, and Califorula | 15,000,000 |

The question of lubor in the cultivation of this and other tropical productions which have become commercial necessities to the populations of the temperate northern latitudes, which embrace the largest civilized portions of the human race, is becoming one of great importance. The growing deficiency mast not only continue, but in time grestly enhance the pricee of these products, whlch have become necessaries of life, and tend to drain the money from Northern nations, in order to secure them, or, in other words, place them under heavy tribute for articles which are, from habit, necessary to their comfort and well-being. England, through her East India possessions, is, no doubt, anxious to secure as large a share of this tribute as possible, and may, to a certain extent, succeed with indigo, sugar, ind coffee; but she has failed, and will continue to fail, in the prodnction of cotton. The United States have secured, and are likely to keep, and, if necessary, by the sid of England to back the South in securing this indispensable production to her prosperity, as woil as the prosperity of Europe and the Northern States of this Union. The value of alaves in Bra-zil-the only South American state which has made any great progress, and that through African Jaborhas for several years ateadily increased. Prior to 1830, when the alave-trade was legal, alaves were sold at 120\|, or $\$ 66$. From 1830 to 1850 , when the trade was, under treaties with England, prohibited, and had to be conducted clandestinely, they advanced to 400 l , or $\mathbf{8 2 2 0}$. Since 1850 , the trade having been almost
ontlrely anppressed, they have gradually advanced, alded hy the decimstlon of $\overline{5}$ per cent. per annum, to $1100 \|$, or $\$ 605$, io 1858. Since then, 10 pur cent., it is entimated, have died from choiera, as appeare by a recent statement of the Minister of ths Emplre, and they are now stated to be worth $1500 \|$, or $\$ 825$ each. It was the low price of slaves prior to 1830 which stimulated the production of coffee, and caused pricen to rule so low, which were In 1885 to 1840 not much over half the present prices.
It takes four to five years to mature coffee-trees after planting them before they will yield a crop of berries; hence the audden rise or fell in prices can not so suddenly lofluence production, as is the caso with annual crope from new plantations of augar and cotton. At the present time, owing to the high prices of slaves, no new estates can be formed, and none have been for severul years; and it is statod that there are not hands enough left in the country to pick out a full crop.

It muy be remarked that the rite and fall of tropical productions have fluctuated with the supply of tie only labor auitable for their production bencath it tropleal cun, and that is African.

According to Mr. Cook, the pricen of Jamalca and London market, at the close of the following years, St. Domingo (llayti) coffec, exclusive of duty, in tinc were,

Crffee-houses. The first in England was kept by $n \mathrm{Jew}$, natied Jacobs, in Oxford, 1650 . In that year, Air. Edvarda, an English Turkey merchant, brought hone with Sim a Greek servant name 1 Pasquet, who kopt the firat hotsas for making coffee in London, which he opened in George-yard, Lombard Stroet, in 1652. Pasquet afterward went to Holland, and opened the firat house in that country.-Andenson. The Rainbow Cofice-honse, near Tesple-bar, was repreaented as a nuisance to the neighborhood, 1657. Coffee-houses were suppressed by proclamation, 26 Charles II., 1675. The proclamation was afterward suspended on the petition of the traders in tea and coffee.-IIAydn.
Coffer-dam. In architectare and bridge-building, a case of piling, water-tight, fixed in the bed of a river for the purpose of laylag the bottom dry for a apace lurge enough to bulld the pler on. Coffer-dama are formed in various ways, either by a single inclosure or a doublo one, whth clay or chalk rammed in between the two to prevent the water frem coming through the shes. They are also made either with piles only, driven close together, and sometimes notehed or dovetailed into one another; or, if the water ia not very decp, by piles driven at a distance of five or six feet from each other, and grooved in the sides, with boards ict down between them in the grooves. In order to build in coffer-dams a very good natural bottom of solid earth or elay is required; for though the aldes be made water-tight, if the lied of the river he of a loose consistence, the water will oozt, up through it in too great a quuntity to permit the eperatlons to be carrled on. It is almost neen!ion to remark that the silles must be very atrong, and well braced in the inslde to resist the pressure of the ambient water.-IIutcos's Tracts, vol. 1.

Coffins. The Athenian herees were buriel in coffirs of the cedar-tree, owing to Ita aromatic and incorruptible qualities.-Tutecyinioes. Coffins ef marbie and stone were used by the Romans. Alexander is said to have been buried in one of gold; and glass coffins have been found in England.-Gotgir. The sarltest record of wooden coffins in Engiand is that of tis binial of King Arthur, who was buried in an entire trunk of oak, hollowed, A.D. 542.-Assen. The patent cuffins were lnvented in 1790.-IIAydN.
Cognao (Conacum,) a commune and town of France, rapitul of arroadissement, department of Charente, 21 miles west from Angonlême, on the left bank of the Chureate. Population 4148 . It has an old castle, in which Francis I. was born. It la the entrepoft of the bramiy of the Charente, to which it gives its name, and whieh forms the object of a veryexteusive commeree Manufactures, earthea-ware and japer.

Coins, pleces of metad, most commonly gold, silver, or copper, impressed with a public stanip, and frequently insule legn! iesmer in payment of debts, either to $n$ limited or in undiniled extent. Whien the precluas metala fist legan to be used as money, or na standurds hy which to measure the value of different articies, and the equivalents for which they were most commonly exchanged, they were in an unfushioned state, in hars or ingots. The parties having agreed upon the quantity of metal to le given for a commodity, the exact amount was then ascertained by weight. llut it is elvious that a practice of this sort must have been attended with a great deal of trouble ani inconvenience. 'There can, however, be little donht that the greatest ohstacle to tile use of unfnahioned metals at money wonld be found in the diftlenty of determining their quality, or the tegree of their purity, with sufficient precislon. The operation of aspaying is one of great nicety and difleulty; and could not be perfummed in the early agea otherwise than in a clumsy, tedious and inaccurate manner. It is, indeed, most probahie that when the precious metala wero first used as meney their quality would be appreclated only by
theit welght and color. A very ohort experience would, however, be aufficient to show the extreme inexactness of conclusions derived from auch loose and ungatlsfactory criteria; and the deviaing of some method by which the finencsa of the metal might be easlly and corructly aacertained would very soon be felt as indispensable to the genoral use of gold and silver as money. Such a method was not long in presenting itaelf: it was early discovered that, to ascertain the purity' of the metal, and also to avoid the trouble and expense of weighing it, no more was necesaary than to mark ench piece with a atamp declaring ita weight and fineness. Thls Invention was made at a very early period. According to Herodotus, the Lydians were the first who coined money.-Lib. I. c. 94. Other ancient authors asy that the art of coining was invented durlag the period when Satnrn and Janus relgned in Italy; that ig, in a period antecedent to authentle history.-Gaguex, Del'Origins des Loiz, etc. tome 1. p. 267.

Mfetal used in tha Mfanufacturs of Coins.-Before the art of metallurgy was well understood, the baser metala were frequently used an money. Iren was the primltive money of the Lacedremonlans, and copper of the Romans. But both Iron and copper deteriorate by being kept; and besides this defect, the rapid improvement of the arts, by lowering their price, rendered their bulk too great in proportion to their value to permit of their continuing to be used as money. Copper, indeed, is still used, in the form of tokens convertible into siliver, in very small paymenta. In Figland, copper peuce and halfpence are rated at about 72 per cent. above their real value; but as their issue is exclusively in the hands of government, and as they are only legal tender to tho extent of one shilling in any one payment, this over-valuation is not productive of any bad effect. The use of copper in other countriea $i_{a}$ limited in much the same way'; gold and sllver belng every where the only metals made nae of in the manufheture of the coins used in considerable payments.

Standard of Cisins.-By the standari of a coin is meant the degree of its purity and its ... ight; that is, the flneness of the metal of which it is made and the quantity of metal contained in it. Silver Coins.-A pound Troy, or 12 vanmen, of the metal of which English silver colus are made, contains 11 uz. 2 dwts. pre ailver, and 18 dwts. alloy. This pound is coined into 66 shililings; so that cach shilling contains 80.727 gralus fine sllver, and $87 \cdot 27$ gralas standurd silver; and the money pound, conslsting of 20 shillinge, contains $161 \cdot \frac{545}{}$ grains pure silver, and $1745 \cdot 454$ grains standard silver. From 1600 down to 1816 , the ponnd weight of stundard silver bullion was colised lato 62 shiljings. Ail tho Engiish silver coins have been coined out of allver of 11 oz .2 dwts. fine, from the Conquest to this moment, except for the short period of 16 years, fr m the 3ith Henry VIII, to the 2d Eifznbeth. Gold Coins.-The purity of gold ls not est!mated ly the weights commonly In use, but by an Abyssinian weight called a carat. The earats are subdivided into four parts, called grains, and these agaia Into quarters; so that a carat grain, with respect to the common divislons of a pound Troy, is equivalent to $2 \frac{1}{2}$ dwts. Goltl of tho highest degree of tineness, or pi: $\boldsymbol{o}_{\text {, }}$ is said to be 21 earate time. When gold coins were first made at the English Mint, the standard of tho gold put th them was of 28 carats $8 \frac{1}{2}$ grains tine and $\frac{1}{2}$ grain alley; mal so it continued, without any variation, to the 18 th of [lenry Vll]., who in that year first introduced a new stundurd of gold of 22 carats the, and 2 eurats alloy. The first of these atandards was ealled the oll, and the second the new standard, or crown gold; because crowns, or pleces of the value of 5s., were flrat coined of this new standard. Ilenry VIII. made his gold coins of hoth theso standards utsder tifferent denominations; and thia practice wea continued by his successors untjl 1638. From that
period to the present, the gold of which the colns of England have been made has beet. Invariahly of the new atandurd, or crown gold ${ }_{i}$ though some of the colns made of the old standard, prevlously to 1633, contlnued to circulate till 1732, when they were forblddon to be any longer current.

Variations of the Standard.-The value of all sorts of property being eatimated, and the atipulatlons in almoat all contracts for its purchase, salo, or hire, belng made in money or colna, it la plaln that no change can take place $\ln$ the value of such meney or $r$;ina without virtually subverting these eitlmates and contracta, and earlehing the debtor portion of society at the expense of the creditor portlon, or vice versa. As the cost of producing all commodities is llable to vary, from improvements in the arts, the exhaustion of the present or the discovery of new sources of supply, nove can be selected to serve as money or coln that mas not vary in its real value. It is belleved, however, that the preclous metals vary less than any material that could be auggested. Airl with the exception of the extroordinary fall In their value caused by the dlscovery of the American mines, it seema to have been remarkably censtant at other perioda. Bet in additlon to the fluctuation's naturally inherent in the value of coins, arising from varialluns in the cost the metal of which they are made, their atandard has been repeatedly ehanged. Notwlthstanding that money or coin, from its beling universally used as a scalo by which to compute the value of all commoditles, and as the equivalent for which thay are commonly exchanged, is by far the mest important of ali measures used in society, and should, consequently, be preserved as invariable as possible, there is nene that has been so frequently altered. The necessi,ies or extravagance of governments have forced them to borrow; and to relieve themselves of the Incumbrances thus contraeted, they bave almost universally had recourse to the disgracuful expedient of degrading the coln; that is, of cheating those who lent them money, to the extent of the degradation, and of eablling evcry other debtor in their dominiona to do the same.

The lguerance of the pullic In remote ages facllltated this species of frand. Had the names of the coins been changed when the quantity of metal contained $\ln$ them was dininuished, there would have been no room for misapprehension. But although the weight of the coins was andergoing perpetnal, and their purity occasional, reductions, thelr anclent denopinations were alnost uniformly preserved; and the people, who saw the samo names still remaioing after the substanee was diminished-who sow colns of a certaln weight aud fineness circalate under the names of florina, livres, dollars, end pounde; and who saw them conthnue to circulate as such, after both thelr welght and the degree of their fineness had been lessened-legan to think that they derlved their value more from the stamp affixed to them by the autherity of government than from the quantity of precious metals they contained. This was long a very prevalent opinion. But the rise of prices whicle Invariably followed every reductlon of the standard, and the derangement that was thereby occasioned ln every pecunlary transation, undeceived the publie, and taught them and their rulers the expediency of preserving the standard of money Inviolate.

The standard may be reduced by almply raising the denomination of the coia; by ordering, for example, that a lialf-sovereign ahould pass for a sovereign, and the latter for a dooble soverelgn, etc. If injuatice be resolved upen, this la the least mischievous way la which it can be perpetrated, inmamuch as it sares all the trouble and expense of a recoluage. But ax it renders the fraud obvlous and glaring, it has rarely been resorted to $;$ and nost redutions have been effectel elther by diminiahing the weight of the colins, or by locreasing the proportion of alloy lu tho inetal of
wheh they are made, or both. Origlnally the coins of all countries seem to have had the same denomilnation as the weights commonly used in them, and centalned the exact quentity of the precious metale Indicated by thoir name. Thus tho talent was a weight used in the earliest perlod of the Greeka, the as or pondo by the Romans, the livre by the French, and the pound by the English and Scotch; and the ceins originslly $\ln$ use in Greece, Italy, France, and England, bore the sama namea, and welghed preclsely a talent, a pondo, a livre, and a pound. The otandard has not, however, been preserved inviolate, either in modern or anclent tlmes. It has been lese degraded in England than any where else; but oven there the quantity of vilver in a pound sterling is less than the third part of a pound weight-the quantity It contained $\ln$ 1300. In France, the livre current in 1789 cuntalned lesa than one sixty-sixth part of the silver implied In its name, and which it had actually contained pravlous to 1103. In Spain, and some other countries, the degradation lias been carried atill farther. From 1206 to 1355, the ceins of England and Scotland were of the same welght and purity; but at the last-mentioned epech tha standsrd of Seotch money was for the first tlme aunk below that of England; and by successive degradations, the value of Scotch money, at the union of the crowns in 1600, was only a tevelfih part of the value of the English money of the same denomination. It remained at this polnt till the union of the kingdone canceled the separate coinage of Scotland. The gold and silver coins of Ireland have been for a considerable period the same as those of Groat Britain; but, until 1825, they were nominally rated $8 \frac{1}{3}$ per cent. higher. This difference of valuatioe, which was attended with considerable ineonveniences, was put an end to by the act $\mathbf{G G e o}$. IV. e. 79, which assimilated the eurrency throughout the empire. Tho tables amexed to this article contain nll the information that can be desired by mercantiie men with respeet to the weight, finenesa, ete., of English and Seotch gold and silver colns, from the earliest periods to the present moment.

M/int, or Goternment Valuation of Gold and Silker Coins.-If beth gold and silver coins be made legal tenders, it is obviously indispensable that thelr value with respect to each other should be fixed by authority; or that it should be declared that individuala shall be entitled to discharge the claims upon them by paymentr, elther of gold or silver colns, according to some regulated proportion. The practice of making both metals legal tenders was long adopted in Legland. From 1257 to 1664, the value of gold coins was regulated by proclamation ; or, which is the same thing, it was oriered that the gold coins then current should te taken as equivalent to certain specifled sums of siliver. From 1664 down to 1717, the relation of gold to silver was not fixed by authority ; and silver being then the only legal tender, the value of gold colna fluctuated, according to the fluctuatlons in the relative worth of the metale In the market. But in 1717 tho ancient practico was again reverted to; and it was fixel that tho guinea should lie taken as the equivalent of 218. , and conversely. But the value of each of the precious metals is liable to perpetual change. Aul hence, how accurately soever their proportional value, as llxed by the Mi c agulations, may correspond with the propertion whasa they aetually bear to each other in the market whon the regulation is made, the chances are ten to one that it will speedily cease to express their relathon to each othor. But the moment that aueli a change takes place, It becomes the obvious laterest of every one whe has a puyment to make to make it in the orerralurd metul; whlech, consequently, becomes the sole, or nearly the sole, currency of the comatry. Hence tide reason why the colns of some countries are almost wholly of silver, and others almost whelly of gold. It is estinated, for example, that when It was
fixed, $\ln 1717_{1}$ that the guinea shonld exclange for 21s., gold was overvalued as compared with silver to the extent of 1 19-81 per cent.; and as the real valua of silver, with respect to gold continzed to increase during the greater part of last century, the advantuge of paying in gold in preference to silver became more decided, and ultimately led to the universal use of gold in all large payments, and to the fusion er exportation of all silvor coins of full weight.

In France, a different valuation of the metala hes had a different effect. Previous to the recolnage in 1785, the Louis d'or was rated in the Mint proportion ut only $2:$ livres, when it was reslly worth 20 livres 10 sols. Those, therefore, who abould hav discharged the obligations they had corcurinit ${ }^{2}$,yments of gold coin insteud of silver would pl ${ }^{-}$. , have lost 1 live 10 sols on every sum of 24 ivis. In consequence very few such payments were mado; gold was almost entirely banished from circulation, and silver became almost the only species of inctallic moncy used in France. Ia 1816, however, a new bystem was ndopted in Great Britain; it being thon enacted ( 56 Geo. 11 I. c. 68) that gold coins only should be legal tender in all payments of more than forly shillings. The pound of silver builion, that had previously beeri colncd into sixty-two shillings, was then also coined into sixty-six shillings, the additional four shillings being retained by the governmedt as a saignorage or duty (amounting to $6 \mathbf{1 4 - 3 1}$ per cent.) upon the coinage. To prevent tive silver coins from becoming redundant, government has retained the power to issue them in its own hands. Under these regulations, silver has ceased to be a standard of value, and forms merely a subordinate or mbsidiary species of currency or chango, occupying the same place in relation to gold that copr : occupies in relntion to itself. This system has been found to answer exceedingly well. A good deal of difference of opiniou has existed as to whether gold or silver coins aro beat fitted for heing made legal tender. It does not seem that the one possesses any very atriking ndvantage over the other; none, cartainly, that wonld justify a change ufter a selection had been made and neted upon for any considerable period. Down to 1626, a seignorage or duty upon the coinage wus usually charged upon the gold and sllver coins issuod by the Mint; and it may be ensily shown that the inposition of such a duty, when it is not carried to an undue height, is advuatageous. A coln is more useful than a plece of uncoined bullion of tho samo weight and purity, tho coiauge fitting it for being used as money, while it does not unfit it for being uaod for any other purpose. When, therefore, in duty or seignorage is lald upon coin equal to the expense of coinage, it circulates at its real value ; but when this charge ls defrayed hy the public, it circulates at lese than ita real value, nnd is consequently either melted down or exported whenever there is any demand for hullion in the arta, or any fall in the exchange. It is, indeed, true, that were a seignorage to be laid on gold colns, it would be necessury, to provent an enhancement of tho valno of the currency, that their weight should bo propertionsily reduced; and it is on this account hetter, perhape, to let them renain on tho present footing. But when in seignorage was lald on the cil"er coins in 1816, it was not necessary to take the circumstance now alluitod to into consideration; for as they were tuade suborilinate to gold, and were intended to serve as change merely, its imposition had no tendency to raise the value of the currency, at the aumo time that it was culculated effectually to prevent the furlon of the coine and to yield $s$ small revenue to goverumont.
Current Cimin; liss by wear.-From very caroful Investhgations mada hy the officers of the liritish Mint towsrd the cioso of the iast century, it was found that 78 1-10 ailvor ahilingg, taken as a fair averuge from ali those thon in circulation, wore required ta make 11b. Troy; whoreas 62 is tho number when now. Eleven
years afterward another fair average was taken, and another examiation made, when it was found that $829-40$ shillings were required to make a pound. But this diminution of weight is excessive, and is not likely to be exhibited by the less-worn and more frequent. ly renewed silver colnage of the present day. Still it is unquestionable that the gold and silver coins are exposed to daily wear and diminution. The British government requested Mr. Cavendish and Mr. Hatchett, two dlatinguighed fellows of the Royal Society, to make an extensive investigation respecting tho power of metals to resist friction; and their results are highly curious. They made various alloys of silver, copper, platina, jron, tin, lead, bismuth, manganese, nickel, cobslt, zinc, antimony, and arsenic, with gold; they rubhed plates of different kinds of metal over each other half a million times, to determine which resiat friction best; and they rotnted similar pieces among each other In a barrel. The effects were such as to reflect no little credit on those, whoever they were, who established the standurd of English gold coin; for the Enghah standard ( 22 gold to 2 alloy) and the quality of the alloy (silver and copper combined) were found about the best of all the combinutions sutijected to experiment. In 1807 the Mint officers, wishing to ascertain how mach tho current coln had actually lost by wear, sclected at rundom one thousand good guineas from a broker, and found that they had lost on an averago 19a. per cent. in value. A hundred guineas from a shop-keeper's till had lost 22 s. per cent. Two hundred half-gulneasexhibited a loss of $42 s$. per cent. -the smaller coins being subjected to more acvere wear than the larger. Mr. Jacob, a great authority on the sulject of prccious metals, stated it as hls opinion that, taking the average of all the gold coins in this country, and an averago of all tho hard usage to which the coins are exposed, each one bears an annual loss of about $1-900$ by frlction, which is a little more than a farthing in the pound. In silver colns the loss is aupposed to bo five or six tlmes grenter, owing to the more unceasing circulution of silver than gold, and to the less fitness of the metal to bear friction. The matter may he stated thus: put 900 new sovereigns and 900 new shillings into average ordinary circulation; in twelve months' time the former will be worth about 899, and the latter about 894.
"Recent Coins of the World.-A coin, once set in circulation, retains Its placo and use longer than any other part of the machinery of life, and is extremely slow in golng out of fashion; so that the information respecting it which the dealer, the collector, and the public at large require, does not aoon become olssolete.
"Pleces are current among us a full century old; and all that space of time is included in the history of coinage, contained In our large manual. But new coins, or modificutions of old ones, are continually appearing; and in the latter case, it often happens that the holder finds ho has become, if we nay so speak, an unconscious sutferer. Old mames aro retained, but cssentiel propertics are altered; nnd a new progeny of cloubloons, clollars, france, or shillings, is found by an assayer's scrutiny to be something different, most likely inferior, to the older stock. Keeping a stendy wateh on thesn, as it is impliedly our duty, we have collected n number of Itema which, as In our former publication, will he set forth in alphnhetical ordes, and as bricfiy as possiblo."-Manual of Coins, by Eekfislirs and Du 1 13016.

The welght ls expressed in grains, and the fineness in thouanandth parts.
Belgium.-Gold coin, 25 francs; a new denomlnation: 18.8 is the earliest dnte noticed. It expresses on its reverse the intended slandards, 7.915 gramines (cqual to $122 \cdot 12$ Troy grains), 900 fino. The a unge of twenty pleces tried is $121 \cdot 9$, finencss 899 ; value 84 72. This is a alight depreciation: it ought to be $\$ 479$, to compare with the former serioa of Bejginn goid coln, or 41 , to be equivalent with the French.

We notice also, in silver, a piece of $2 \downarrow$ francs, 1849 , weighing 192 grains; fineness (of a singlo specimen) 901 ; value $46 \frac{1}{3}$ cents.
Bolicia.-Tho dollars from 1841 to 1846, tried in parcels, vary in fineness from 896 to 001 ; a very large lot gave 897; showing some ' tendency downward. Weight, varying from 411 to 421, averagen 4161 ; value on a general average, $100 \cdot 6$ cents.

Britain.-The new florin, or two-shilling piece, being one-tenth of a pound sterling, is underatood to be an advance toward a decimal syatem. A considerable number have been coined, and the piece is fairly in cireulation; but, like other silver coins of that country, it seldoni makes its way out of the roaln.

California.-See Coins of United States, p. 344.
Central A merica.-It is not easy to keep pace with the fluctuations li' the coinage of this country, any more than with its poilitical history. Nino years ago, we averaged the doubloon $2 t \$ 1496$, and the dollar at $8100 \cdot 1$. The country now secins to bo divided (we judge by the coins) into two distinct republics, Central America and Costa Rica.

Of the recent gold colnage of Central America, we have had opportunities of examining the quarter-doubloon, the eighth or escuilo, and the sixteenth. The first, 1850 , weighed 97 grains, fincnés 863 , value $\$ 30$. The second, 1844 to 1849,48 grains, 809 fino, value 8167 . The third, 1825 to 1849,24 grains, 809 fine, value 83 cents. In silver, the dollar of 1847 is feund to vary from 880 to 820 thousand ${ }^{\text {hs }}$ in fineness; those of 1840 to 1842 averaged 887. It wuuld, therefore, not be bafo to give more than 92 cents for a single plece, or 95 by the quantity; the Jaws of wholesale and retail, in the coin merket, being directly opposite to those in other branches of trade.

Tho coins of Coata Rica, the seceding state, aro in several respects quito remarkable; and in this particularly; that the gold pieces *-3 among the haudsomest that are current in the world, while the silver are beyond comparison the rudest ; at least the samples that wo have sean. The ppecimens assayed here lately are the half-doubloon, weighing 208 graine, 851 fine, value 8762 ; and the quarter-doubloon, 97 grains, 845 fine, value $\$ 353$. The silver piece is the real (apparently shaped with hammer asd chisel), 1846, 29 to 45 grains, 550 to 637 fine; average valuo $\frac{1}{10}$ cents.

Chili.-In the dollar of 1848 wo find a variation of weight from 415 to 419 ; finenese 901 it, which is lewer than fermer $e r$. $;$; hut the average valuo is 101 cents.
Until iately. we had no opportunity of teating the fractionh coins. The quai er-dollar, 1843 to 1845, weighs only 92 , but is 903 flis; the eighth, or real, is sirictly propational. Value respectively, $22 \cdot 4$ and $11 \cdot 2$ cents ; making e profic to gevernment, and a loas to holders, of about $\$ 1$ per cent.

The newapepers of the daj contain she following statement, conceruing which we have ao uther inforination:
"The Chilian Congress, ncw in session, has passed a new coinago law, article first of which states that three classes of gold are to bo coined, of the standard of nine-tenths fine, to be denominated, respectively, condor, deulbloon (doblon), and escuio.
"1. The condor to weigh three hundred aud fivo $\frac{600}{100}$ grains, and to correapond in value with ten silver dollars.
" 2 . The doulloon to weigh one hundred and fifytwo $\frac{750}{1000}$ grains, and to correspond in valuo with fivo silver doliars.
" 3 . The escudo to weigh sixty-one $\frac{108}{1005}$ graina, and be of the value of two silver dollare.
"Art. 2. Thore shall be five classes of silver money", also of the standard of nine-tenthatine; viz.:
"A dollar, weighing five hundred $\frac{704}{70}{ }^{10} \mathbf{S}$ grains, nnd divided into hundredtif parts or cents.
"A piece of fifty ceats, containing two handred and fifty ${ }^{3804}$ graina.
"One of twenty cents, with ono hundred 1008 grains.
"One of ten cents, with fifty 1080 grains.
"One of five cents, with twenty-five $\frac{1880}{880}$ grains.
"Art. 8d eatablishen two classes of copper coinage, to be termed cents and half cents, to be composed of pure copper without any alloy:"
China.-The trashy coin of this great empire doserves notice only by way of recreation. In 1842 we quoted the cash (tong-tsien) at 800 to the Spanish dollar; in 1847 tho equivalent varied from 1200 to $1800-$ so hard is it to fasten a value upon that which is valueless. A carpenter or tailor, we are told, receives 160 of them (say thirteen cents) for a day's work, of which nixty are required for 'is daily bread. The coin is extremely convenient for alms-giving, a sloglo plece being the usual quietus for a beggar.
Ecuador.-The quarter-dollar, or two-real piece, 1847, weighs 104, and is only 675 fine ; value 18.9 cents. This depreciation corresponds with what prevails in some of the fractional coins of Peru.
France.-The twenty and five-franc pieces of the republic, although entirely changed in face, are the same for weight and fineness as befors.

Germany.-Here there is no change of standarils, but we observe the denominution of deable gulden, net in general circulation, value 79 cents. The whole German iasue of the gulden series given an average of 900 tine by actual assay.

Since the adoption of the new rate of chargea at this Mint, the thaler of Northern Germany, 750 fine, yielhs a return of $67 i$ to $68 \%$ cents, according to wear; the crown, 876 fine, 106 to 107 cents.
Hayti.-Large quantities of Haytian coins have been recoined here. They are so variable in weight and fineness that it is not easy to put a definite valuation upon them. They sheuli, hewever, yield 76 to 78 cents per ounce, taken promiseuously and unwushed. Tho piece of 100 centimes, dignified with the name of dollar, bearing the head of President Boyer, is worth abont 25 cents upon an average; while that of 25 centimes, both ef Petion and Boyer, averages $7 \frac{1}{2}$ cents. In a large promiscuous deposit of all sizes, we found the average net value of the "dollar" to be 25.7 cents. The coins rango from 600 to 625 fine, if free frem ceun-terfeics-a baser quality than is to be found iu any other coinage on this side of tho Atlantic. But sinee August, 1849, there has been a new order of things; and coin collectors and assayers are looking with inpatienco fer the heal of Faustin the First.
Mexico.-In 1842, we averaged recent dollare at 416 t grains, 898 fine, value $100 \cdot 6$ cents. The a verage tineness has sinco improved to 899, and value $100 \% 75$ cents.
The coins of two new Mints have rccently been tricd. The doubloon of Guadalupe $y$ Calvo, in ihe state of Durango, 1847, varies in weight from 417 to 420 ; fincneas 869 to 873 ; averago value $\$ 1569$. The dolinr of the same Mint, 1844 to 1847, everuges in weight 420 t, in fineness 908, and therefore in value as high as $102 \cdot 8$ cents. The Mint began operations in 1844; its distinctive mark is G. C., in the usial place in tie legend. The dollar of Culiacan, in Sinaloa, 1846 in $1 \times 48$, averages $415 \$$ grains, with a pretty wide varintion in individual pieces ; fineness 903 ; valuo 101 cents. The Mint-mark is the lotter C.

Mexican deliars are not flowing so abundantly in this direction as in former yearn, aithough they are yielding a better return.

Milim.-The revelution of 1848 produced a new gold coin in l.omhardy: it boara on the obverse a female figure with tho legend, Italia Libeia, Dio no vem.e -"Italy free, God wills it ;" and on the reverse, a wreath, within which is the deuemination, 20 liak Italiane-" 20 Italian livres;" and outside of it tha legend, Goveano Phovisomo in Lomian. A. It weight the same as the tweuty-frano plece ef France, and was evidently meant as a return to the Milaneso

## graing,

 coinsge, posed ofpire de1842 we nish delto 1800 I is valueeives 160 of which oin is exlece being alue 18.9
atandard of 1805. The coln is more rare than could be wished : only a single spectmen bas reached us. Coincollectors will considet it as a prize for its singular beauty and Its scarcity, and as the monument of a great event In history.
Netherlands.-The new $2 \frac{1}{2}$-gullders pleco was announced in our Manual as having been decreed, but had not then been received. The legal standards are, 25 grammes ( $385 \cdot 8$ grains) in weight, 945 thousandths in fineness. The actual results of dates 1842 to 1845 are, 380 grains, 944 fine; value $98 \cdot 2$ cents. The coin often appears here in mixed depos!ts. It is remarkable for its high grade of fineness; yet is is really a depreciated issuc, since, to be equal to the former guilder zeries, it ought to bo worth $100 \cdot 2$ cents.

Nem Granada.-This country continues to send a large supply of doubloons to our market, and thle makes it the more important to notice a very recent and considerable recuction in the value of the coln. Within a few months a new pices has appeared, with new devices and standards; the latter being expressed on the face of the coin by "Lei 0,900-Peso 25,8064 G." That is, fineness, 900 thousandths; weight, so many grammes-a long-drawn fraction, corresponding to 398.31 Troy grains. At those rates, the picco would be worth $\$ 1543 \cdot 8$, and would avowedly fall below the previous valuo of the doubloon; but upon actual trisi it is still worse, as will be shown directly. This change must have taken place since the beginning of 1849 , as we notice pleces of the old style bearing that date.
But as the doubloons of New Granada aro alloyed alnost entirely with silver, which ls now profitably parted at this Mint, it is necessary to restate the Mint value of tise older piece, as well as to give information respecting the new. The silver extracted makes a sensible addition to tho values of both kinds; that is, if they are offered in sufficient quantities to meet the requirement that the net product of a parting must be not less than five dollars; below that limit the operatien is not perforined. The following terms must therefore be notieed. The doubloon of the old style, down to the early part of 1849 , weighs on an average 416$\}$ grains, and contains 870 thousandths gold, and about 120 silve:; if presented in a quantity less than 58 ounces, its net Nint valne will bo $\$ 1561$; in a larger quantity than that, it will be $\$ 15$ C6. The new doubioon, beginning with 1849 , weighs 398 grnins, nud contains in parcels $893 \frac{1}{2}$ to 895 thousandthe gold, say 89.1 , and of silver ahout 100 ; net Nint value, in any quantity iess than 93 ounces, $\$ 1531$; in a larger quantity; $\$ 1536$.

Norray.-Tho fmmigration from this country brings us considerablo parcels of Norweginn and Swedish silver coins. The dalere of these two realins, which lave the same monarch, were stated in the Manual to be interchangeable as to value, although very different ss to their stnndards. Under onr new Mint charges there is aome variation of value, since those of Sweden are of so much lower fineness, and aro suljected to a greater charge for refining. They will be noticed in place. 'The daler, and half, of Norway, averago 878 the (the law enlling for only 875, or seven-eights), and their weights, unworn, aro respectively 440 and 223 grains; net Nint value of the daler, 105 cents; the half, $52 \frac{1}{2}$. This valuation lo down to 1818 , the latest date we have seen.
Peru.-A now half-dollar, with the word Pasco in the legend, 1844 , gives an average weight of 203 (varistion 200 to 219), fineness 906 ; value $49 \frac{1}{2}$ cents.
Prussin.-The years 1848 and 1819 , in other respects onsettled, show no change in tho gold colnage. It still maintains its superiority to the other classes of ten and five-thaler pieces. The double-Frederick, or ten-thaler, is 903 fine, weighe 200 grains, aud is worth $\$ 801$; practically, an even elght-doliar ploce for us.
Russin.--Flve-rouble pieces of 1848 and 1849 show the finencss of $910 \frac{1}{2}$; a proof that the assaying and al-
loylng are conducted with admirable exactness, the standard being $916 \frac{1}{3}$. The coin is worth $\$ 396.7$. As the Russian Mint depends, no doubt, upon the Ruselan mines, and not upon foreign coins, for its material, we felt an interest in examining as to what proportion of silver was left in the alloy of the coin, and found only $5 \frac{1}{2}$ thousandths. Hitherto we have found no gold coina so nearly desilvered.

Siam.-We were not aufficiently acquainted with the silver ballets of Sian to take account of them in the Mannal. Some specimens of this curious money have since been examined. They are of different calibres, and tolerably well proportioned to each other. The tical weighs, without much variation, 235 grains, and is 928 finc; value 58.7 cents. The salung, 61 grains, 929 fine, $15^{\circ} 2$ cents. The prang, 30 grains, 907 fine, $7 \cdot 3$ cents. Below this we have, as a present to the Mint collection, three varieties, weighing 10, 4, and $1 \frac{1}{2}$ grains; the last being worth aboui three-eighths of a cent, and very good silver withal. A sight of it would reconcile our peoplo to the gold dollar. Siam may claim the merit of originality in the shape of her coin, which will not admit of renting, and acarcely of lying still-the lively emblem oi at true circulating medium.

Sweden.-The specie daler of Oseal, 1847 and 1848, is 750 fine, weighs 525 grains, aud yields $104 \cdot 2$ cents after Mint charges.

T'u, key.-There was a new syatem of coinage promulgated in 1840, which did not prevail long; there is a still nower, beginning with 1845 . The gold coins aro ovidently designed to be 22 carats ( $916^{\circ} 6$ ) fine, as in the neighboring empire of Russia. By actual aseay they are 915 fine; the piece of 100 piastres weighs 111 grains, and is worth $\$ 437 \cdot 4$; the piece of 50 pisstres, $55 \downarrow$ grains, worth $\$ 218 \%$. In respect to value they compare with the former series of 20,10 , and 5 plase tres, though entirely of different standards.

The silver coins are grea... improved in quality, and apparently based upon tho Austriun standard of five-sixths ( 833$\}$ ) fine. They are the plece of 20 piastres, 371 g graius, 828 fine, net value 82 centa; 10 piastre3, 186 grains, 826 fine, 41 cents; and 5 plastres, 924 grains, 824 dne, 201 cents. These coins are well adjusted in their weight, and altogether show in their way a great advance in the progress of Turkish civillzation. The piastre of commerco seems to be hased upon the gold ; the exchange in 1845, when these coine wero received, rated the piastre at 4.3 cents.

United Stotes.-By the law of March 3, 1849, two new gold coins, the double-eagle and the dollar, were added to the list; the former weighlug 516 graine, or $21 \frac{1}{2}$ pennyweights, the latter $25 \frac{8}{10}$ grains; and both of the finencss of nine-tenths, as the other coinage. A very large number in both deliominations have been issued.

The new postago law of March 8, 1851, provided for the coinage of a three-cent piece, composed of thres, fourths sllver and one-fourth copper, and weighing 12? grains.

There are ecveral classes of gold coin which nre not of the United States, but which are struck within the national boundaries, and which ought to be notieed in this place. Theas aro the liecntlen's coins of North Carolina, and the various Californis coins. In the same conuection, it will be proper to give some details respecting several varietles of stnmped ingots.

The colas of (C. liechtler are fully described in the Mnnual (p. 160); but aince tho date of that publication, the mint has passed Into tho hands of A. Bechtler, as appears on the face of the coin; and there is a marked difference of valne between the $C$ and $A$. The five-doliar pleces of the former wero deficient from 1 to 6 per cent. upon the alleged value, averaging 8 per cent., or 8485 ; the one-dollar pleces were worth 951 to 97 cents. The five-dollar pieces of the latter vary, from the full alleged value, to a deficit of it per cent. There are no dates on tho coins to enable us to mark
the difference; but the pieces assayed in 1843 were better than those (apparently fresh) assayed in 1849. The last and neweat lot gave $\$ 49 t$ to the five-dollar piece. It is to be bosne in mind, that as Bechtler's piecea are alloyed with silver, they will prodace about a half of one per cent. more if offered in sufficient quantity. The dollars, as far as tried, are 2 per cent. below their nominal value. The coin appears to be considerahle in amount, but it is not current in the Mjddle and Northern States; It is frequently brought to the Mint for recoinage.

The number of private Mints which have been in operation in California, as indicated by sperlmens received here, is fourteen. Some of these have issued but a single denomination of coin. others two, and one (the Mormon) four. Besides these, there are the stamped ingots of Moffatt \& Co., and of F. D. Koliler, State Aseayer; and lastly, the coin of Augustus Humbert, a United States assayer under a legal provision of 1850. . 1. The coin of "N. G. \& N." doee not profess the zame degree of accuracy as Becheler's as to fineness. Its claim to be fullo weiont of hat feable is proved by a number of trials, the variation not excer ling one grain in any case; but the legend on the reve se, Calp ffarnia oole , ithout alloy, allows a pretij vide range. As far as our assays go, the truth of this stamp is proved; there is no alloy other than that already latroduced by the liand of nature, and which is generaily more than sufficient. Threa pieces gave severally the fineness of 870,880 , and 892 thousandths; all wero within the scope of "California gold." Thoy consequently are worth $\$ 483, \$ 489$, and $\$ 495 \frac{1}{2}$ respectively , withent the silver; and including that, $2 \frac{1}{2}$ centa more.

The coin is neatly exeeuted, and besides the two legends above quoted, bears un cagle, a circle of stars, the date 1849, and the name San Fanncisco. It wears the somewhat brassy tint which belonge to gold alloy. ed with silver only.
2. The Mint of the "Oregon Exchange Company" issues two denominatlons, 10 and 5 dollars. They respectively profess 260 and 130 grains weight of "native gold." One five-dollar piece was found to weigh $127 \frac{1}{2}$ grains, was 878 Ine, and contained only the natural slloy; resulting value, 84 ; with the ailver (in aufficiently large lots), $2 \frac{1}{2}$ cents more.

The coin is not well struck, but is pleasantly dlstinguished by the picture of a beaver, a good emblem of mining industry and of Weatern life.
3. Next is the mintage of the "Miners' Bank, San Francisco;" a ten-dollar plece, of plain appearuace.

The average weight is 263 graing, the finentss a bout 865 thousandths, part of the alloy being copper. Averige value $\$ 987$, with a risk of having it as low as - 975.
4. Coinage of Moffatt \& Co., 1849, 1850 ; pleces of 10 and S doilars, in imitation of the nationsl coinage. Several of the colning estalilishments, as will be sten, have adopted the same device, but evidently without evil intent, as most of their coins are worth what is professed, and some even more. The fineness, however, is in every case inferiur to the standard of the Mint, and this is likely to prove a source of discredit from European assayers, who will not take the trouble to assort. A large promiseuous lot of both kinds of Moffatt \& Co.'s coins, dates 18.19, 18ü0, shows an average of 897 ; average wolght, to the ten-doliar piece, $258 \$$ grains; average value, $\$ 997 \cdot 7$.

The S. M. V, on this and other colas is sald to mean "Standard Mint Value."
5. Ten-dollar piece oi J. S. O. (said to be Dr. Ormsby, of Pennsylvania); one plece assayed gave 842 fine; weight $258 \frac{1}{4}$ grains; value $\$ 937$. Very few have come to hand.
6. Twenty-five dollar and ten-dollar pieces of Templeton Reid; weigh respectively 649 and 260 grains. Being the only two specimeus receivod, they hare not
been cut for aasay, but appear to be of California gold without artificial alloy. Assuming this, the voiues would le about 2450 for the first, and 9975 for the aecond.
7. Ten-dollar and five-dollar pieces of the "Cincinnati Miniug and Trading Company," 1849. These elso have not been cut on account of their rarity, but oppear to be of native gold, and, at the weights of 258 and 132 grains, may be rated at 8970 and $\$ 495$ respectively.
8. Ten and five-dollar pieces of the "Pacific Company," 1849; very irregular in weight, and debased in fineneas ; a ten-duliar piece weighed 229 grains, a fivedullar, 130; assay of a third, 797 thousandths. At those rates, the larger piece would be worth $\$ 786$, the smaller 448 ; but the valuation is altogether uncertain.
9. Five-dollar piece of the "Massachusettr and CalIfornia Company," 1849; a very pretty coln, but apparently debased with copper. Oniy one specimen has been notlced here; It weighs $115 \frac{1}{2}$ grains; has uot been assayed.
10. Colns of Baldwin \& Co., four varleties; 1. A tendollar piece, 1850, distinguished by a horse and his rider, with a laseo;. 2. Twenty-dollar piece; 8 . Tendollar, 1851 ; 4. Five-dollar, 1850 ; the last two in imitation of Unlted States coinage. Of the first, ene piece tried weighed 263 grains, fineness 880, value $\$ 996$. Of the recond, four pieces tried varied from 511 to 523 grains; but one hundred pieces averaged 517 ; the fineness varied from 861 to 871 ; average fineness $868 \frac{1}{2}$, average value 1933 . Of the third, ten pieces averaged $259 \frac{1}{2}$ grains; average finesess 870 ; average vaiue 89 72. Of the fourth, average value 8492 . The Baldwin coins contain some copper; about 20 thousandths.
11. Ten and five-doliar pleces of Dubosq \& Co., 1850 , also in lmitation of the national coinge. The larger piece averages 262 grains, and three specinens gave the fineness of $899 \frac{1}{2}$, which is a mere shade lelow standard; consequent value, 810 15. A single fivedollar piece yieided 8402 . But a mixed parcel containing $\$ 1000$, gave the ineness of 887 , and the clese value of $\$ 1000$ 20. Consequently the pieces may be averaged at par.
12. Five-doliar plece of Shultz \& Co., 1851. Average weignt, 128 graina; fineness of threc pieces, 879 ; value, $8497 \cdot 4$. The devlces are in imitatiou of Cnited States coln.
13. The Mormon coinage, although executed in tie Territory of Utah, is without impropriety cisssed among California coins, on account of nelghverineai, aud the source whence the material is derived. These are the four denominations of tweniy, ten, five, and two and a half dollars. Although there is much irregularity both ia weight and fineness, the denominations are tolerably in proportion to each other. A parcei made up of all sizes, and counting $\$ 56200$, yicided at the Mint $\$ 47320$; say $\$ 852$ to tho ten-dollar piece. The fineness was 886.
14. Five-doliar piece of Dunbar \& Co., in imitation of United States coin. A lot of 111 picces averages 131 grains wejght, 883 fineness, value 498.
15. Fifly-doilar piece of the United States AssayOffico at San Francisco, established by act of Congress of 1850 . It first appeared hero in April, 1851. The coin is prepared and issued hy Mesars. Moflatt \& Ce. as contractors, and Lears the stamp of Augustus llumbert, assayer. The two professed rates of fineness, 880 and 887 thousandth3, are found upon assay here to be duly maintained, whether in single pieces or in large quantities. But some Irregularity ln the weight of so heavy a plece, alioyed with silver only, anis ufiering eight corners to wear ls to be expected. Wian prosented In quantities sufficient to allow for parting the silver, say 70 ouncea, the average Mint value is abent $\$ 5010$; in less quantities, the silver not being aliowed for, the average value is sbout 49 90. But aven with-
out the ollver they occasionally come up fully to the alleged value. 'This colnage is understood to have put a stop to all privata Iseuas In California.
The foregoing comprehend all the varietien of coin that have been brought to this Mint. ., There have been, beaides, two sorts of atamped bars or Ingots, evidently intended for currency.

1. The ingota of Moffatt \& Co., of varlous sizes, from about 8 to $\mathbf{8 2 6 0}$. It may be stated, in general, that some wera found to be rated too high, and others too lew. The sixteen-doilar Ingot ylelds about $\$ 15 \mathbf{7 5}$, but is irregolar.
2. The issue of bars by F. D. Kollor, Assayor of the State of Callfornia, cominenced in May, 1850. They are of various sizes, from $\$ 40$ to $\$ 150$. Wo find a slight undervaluing in his basis of calculation, and genersily an error of assay In the oamo direction; so that on the average his bars are worth at the mint 1 per cent., perhaps 1i, more than tho value atamped upon thern.

Recapitulation of the net Mint Value of Gold and Silter Coins isaued within twenty-fiva Yeurs past.-Inquiry Las been frequently made at the Mint for a compend of the values of foreign coina, without a due consideration of the difficulty of putling in a small space sueh a statement as would be satiafactory. The quarto volume, now entirely out of print, was not found too large for its purposo, which was to aupply auch information as dealers, anateurs, and legislatora would from time to time be likely to require. Still, a condensed table of the colns more usually seen, and within a contrected range of date, would certainly be uaeful to dealers and others, and especially with tho modifications occasioned by the new Mint tariff of charges. We therefore offer the following, inaerting valuea only, and teavlug tho details of logal weight and fineness, and of actual weight and fineneas, to be aought for elsewhere; as elso tho particulars concorning coinage of older date than just specified.

Double thaler, or 34 galden....
Compnisison of American and Forreign :1eng fly wa for Precious Metads.-The normal weight o. the States Mint is the Troy ounce, for considerable y wot tities, and the Troy grain, for single coins. This ounce is equal to 480 grains; to 31.09815 French grammes; to $1 \cdot 08108$ Spanish ounce. The grain 19 64.788 milligrammes. Our standarl French kilogramme weighs 15,435 grains, or $32 \cdot 15625$ ounces. The gramme is 1054.35 grains. The milligramme -0154 grain. The average estimate of the Spanish mark is 3552 Troy grains, or $7 \cdot 40$ ounces Troy. It is differently subdivided, aseording as it is applied to the weighing of gold or silver. For gold, it is divided into 50 castellanos; ench castellano into 8 tomines; each tomine into 12 granos, For silver, the mark is divided into 8 ounces; each ounce into 8 ochsvos; each ochavo into 6 tomines; each tomine into 12 grsnns. Consequent$1 y$, in gold weighings there are 4800 grains, and in silver 4608 grains to the mark. The castellano is much used, however, as a nornal weight for gold bullion. By deduction from the above, it should weigh $\mathbf{1 1} 04$ Troy grains; by an invoice from New Gramada, wo have found it to correspond with 70.935 ; so that 71 grains might be taken as the cquivalent, accurate enough in practice. This is just ono grain less than three pennyweights; or 1470 of a Troy onnce. This mark, being employed not only in Spain, but in all Spanish America, is of course a very important weight to the bullion and coin dealer, and should be duly understond. It is, perhaps, not more difficu't to master than the pounds 'I roy and avcirdupois, with their respective trains. The Cologne mark, normal moneyweight of Germany, by the German Convention of 1838, was estimated at 233.855 grammes, answering to $3649 \cdot 65$ grains Tr ro. It was beft rated usually at 360.3. Our silver dullar, since 1007, weighs 26.725 grammes. A kilogramme of atandard ( $\frac{9}{10}$ ) gold is worth $\$ 598255$.
Fiulk aid Packing of Irecious Metuls.-A solid or cubic inth of fine gold weighs $10 \cdot 1509$ ounces, num is worth $\$ 20984$. A cubic font of the same, $\$ 362,600$. A cubic inch of standard goid weighs 9.0989 ounces, and is worth \$169 28. A cubie foot of the same $\$ 292,500$. A cutie inch of fine sllver weighs $b \cdot 5225$ ousces, and le worth ©ris4. A cubie foot of the same, $\$ 12,338$. A cubic inch of standurd silver weighs 54173 ounces, and is worth 86803 . A cuble foot of the eame, $\$ 10,891$. Theso calculations are bnsed upon tho weight of water as $252 \cdot 458$ grains tn the cubic inch, the thermoneler being at $60^{\circ}$ and the barometor 30 inches,-Sunasau's F'irst Prin. Chem., 18:3. The apecific gravity of line gold is taken at $19 \cdot 3$, s.andard at 17.3 ; fine silver 10.5 , standerd 10.3 . As these gravities are only approximste, we may be excused for not carrying out the decimals very far, as is rather too often done in works of science. Gold is not measured by the pint, at least out of Caiifornia; yet it may be
interesting to know that a dry-measure pint of California grains is found to weigh from 141 to $143 \frac{1}{2}$ ounces; value atout $\$ 2560$. The average specifio gravity is consequently $9 \cdot 61$; no that It occipies about twice as much bulk, in that form, as when nelted and cast into bars. A pint of African dust was found to wetgh 148 ources. The advantage of having gold grains or dust cast into bars aa a preparative for exportation, is perhaps overrated. True, it has rather an insufficient ontit, if packed in paper, leather, muslin, Seidit/ boxes, or porser-bottlea, as it came at first from San Ir:uclseo. A good tin box, well soldered, will hold fast and keep dry ; and the Mint charges nothing for melting. This is tho most general kind of packing now used; Lit the tin case, if large, requires to be ir:$\because$ 'serer in a wooden box, and after that there is need vi" igth st watch and erre. A most daring thett was A " c. unitted, som where on $1 . \theta$ route, by boring hroo in ، $3 x$ and caso; and about $\$ 9000$ worth wss ab-$\because-$ ared. $1 \mathrm{keg} 13 \frac{1}{2}$ inches high, including the chine,
with a diameter of 10 inches at the head and $11 \frac{1}{2}$ ot is 4 : H re (outside measures), is a convenient size for
 wh obe tic u...rements are 19, 11, 13, as above, is a proper size for ${ }^{3} 000$ in sliver coln. A rectangular box, measaring inside 10 by 8 inches by $b$ in depth, is the size used at the Mint for $\$ 1000$ in silver coin. This allows the coin to be throwr in promiscuously; if plled, at least one-third more can bo put in. Such a hex would hold 336,000 in gold coin, laid in order; or $\$ 27,000$ in disorder. A lagg 6 inches by 9 holds $\$ 5000$ it gold coin, with room to tie. A bag 14 by 18 is a good size for 1000 in silver coin. One thousand pieces of our three-cent coin ( 830 worth) make a smaller budget than many of our customers seem to anticipate. A hag $3 \frac{1}{2}$ inclies by 5 easily contains them.-See Mantal of Coins, by Fekfelidt sad Du Bois of United States Mint. Publighed, New York, 1853, by G. P. Patnam \& Co.

Privilege of Cuining.--The privilege of coining money has always been claimed as a prerogative of the executive power, which was guarded with extreme jealousy. "The legitimation of money," says Sir Matthew Hase, "and the giving it its denominated value, is justly reckoncd in jura majestatis, and in England it is one apecial part of the king's prerogative." And linding observes, "As to the impression of the coins, the ataniping thereof la tho unquestionable prerogative of the crown, and it was in very fow instances communicated to those perasns on whom the privilego was conferted; for, in seneral, the dies were sent either from the Exchequer, or from the master of the mint in the Tower." The privilege implied that the avthority of the erown was necesary to give legal currency to the coin; and although Blackstone thinks it did not estend to the debusement of the coin to the injury of the people, no one can doubt that the power was not always legitimately exercised. In truth, it is only in the case of a depreciated currency that the king's proclamation is necessury to givo legal circulation to the coin of the venlm; and, ne a cetter protection to his subjects, the tender is limited within very narrow bounds.

Ancient Constitution of the Mints..-The constitution of tho mints in the eariiest limes of Britith history, and the regulations applied to the colnafe, are questlons of antiquarian research which will be deemed moro curious than j.rofitalile. The materials lor such an inquiry are extremely mengre and incomplete; for, according to Ruding, botb the Anglo-Saxor: laws and Domesday-Book are silent on the subject. They frequently mention the moneyers, but make no ailusion to any other officers of the mint ; though it is reasunable to suppose that the crown, whose prerugative it was to coln money, most have hal aome jurisdiction over those who were employed in the practical opera-tions.-E. B.

The London Assays In thits Table wero made by Robert Bingley, Fsq.. F. R. S., the Assay Master of tho Royal Mint, and those st l'arlm by Plerte Fredurick Lonnevilte, Essayer du Commerce, as published in its olaborate work on the colns of alt nations. specimens of all the foretgn eoine brougtit to London for commercial purpeses have been suppled for this Table trom the Bullion-ofioc, Bank of England, by order of the Bank Directors, and havo been meleeted by John liumble, Fsa., tho chicf clerk of that oftiee, who also nxamined the Tahkes in their progress. It msy likowlso bo added, that tho Mint Ileports of these commercial cotns aro chtet:y from average assays; and that all the computations havo been carefully verified by different calculators. -Note by Dr. Kerzy, to second edttion of tho Cambist, publlshed in 1821.
" By one of the articles of the Zollverein, or Cus-toms-union of Germany, it was atipulated that the settiements for the duties should be mada either in Prussian dollars or in florins, at the rate of 7 florins for four l'russian dollnrs. There were, however, no florins in existence exactly of this value; but as tha nearest approach to it was a valuation called the 24 gullenfuss, or florin-foet, these Zollvereln florins wero nominally reekoned to be $\ln$ thls rate, though the differenco smounts to more than 2 per cent. The term 24 guldenfuss implies that the mark weight of fine silver is rated at 24 gulden or florins. It was formed by glving to the coine minted or valued in 20 guldenfuss an increased value of one-fifth, as rating the 20 -kreutzer piece at 24 kreutzers. At $60 d$. per ounce standard, tho value of this mark of fine silver is worth 40s. 7id. sterjing, from which the value of the different German monetary integers is readily obtained; as reckoning 27 marks banco or 34 marks current of IIamburg, 14 doliars of Prussia, 2.1t florins of Scuth Germany, 20 flotins of Austria, and also 60 lire of Austriache of Lombsedy; to he of this anount. In order, therefore, to prevent the ioss or incon venience which would attend their adhering to this mode of valuation, a money convention was entered Into on the 208th of August, 1837, smong the states forming the unlon, by which it was agreed upon that a new basis of valuation should be sdopted for their coins, under the term of Suddeutscher Wairung, or South German valuation, nt the rate of $24!$ gulden or florins from the mark's weight of fine silver. Bavaria, Wirtemberg, Baden, and Saxony have shince issued their coins at this rate, and the other states of the confederation are doing or preparing to do the samic. Among them Frankfort, in 1840, began the mintage of coins of this value; und by a regulation of the Chamber of Commerce of this free city, all the rates of exchange, ns well ns the values of bullion and foreign coins, were ordered to be expressed in this Saddeuts cher Wilhrung from tho commencement of the year (1843). One of these new and very exactly-minted florins was assayed by Messrs. Johnson and Cock, of llatton Garden, who reported it to be, full welght, 6 dwts. $19 \frac{1}{2}$ grains, worse 6 dwts., gold under 2 grains; from which the value, at $60 d$. per ounce standard, ja very exaetly 197d. sterling, maklng the par of exchange wlth London 120 torins in S. D. W. for $£ 10$
sterling. I have been thwa particular in these explanations, protly becnuso several persons imagine that the late alteration in the rate of exchange with Frankfort was made in compliance with the wishes, or to auit the conventence, of one or more of our leading houses in exehange negotiations, but more particularly because it is maintained by many that the valuntion of this rate is not merely nominally, but realty, in 24 guldenfuss. This is a point of no small importance to the commercial world, for had it been so, the par of exchange with London would have bcen only 118 florins for $£ 10$ sterling, and the difference between this and the present price of gight bille on Frankfort would have exceeded 2 per cent.; a variation which every practieal cambist well knows could not exist, except under very extraordinary sircumstnnces, al d with nearly corresponding difforences in the other rates of exchango; neither of whlch causes is now in operation."-Letter. of William Tate, Esq., cambist to the Times.

Sterling silver remained in high repute all over the Continent, because it was auperior to any other currency; and even in England the words conveyed for centurics the ideas of goodness and purity. And we may remark here that the gold coins of England, from the reign of Henry III., when they were generally introduced, to the reign of IIenry VIII., who debased their parity, were made of nne gold. This is a remarkable circumstance, becouse as gold $\ln$ its native state is rarely discovered so pure, the existence for a loug period of a coinaga fabricated of that meta! in n state of parity necessarily implies the knowledge of the art of refining, which must have been practiced at a very early period. Pliny, indecd, says that in his time gold was refined by aercury, which mingled with it, but rejected all alloy, and the gold was freed from the mercury by squeezing both in skins, in which operation tho mercury ran through and left the gold in a pure state. Some of the Greek gold coins were also of great purity, ns those of Phllip of Macedon, and his son Alexander the Great, rivaled by those of the other prinees and cities which immediately followed. Those of the successors of Alexander in Eyypt were 23 carats 3 grains fine, and 1 carat grain alloy, which we glve on the anthority of Jacob in his book on the "Precious Metals." The Greek silver coins were inferior to vurs ; as also the Roman of the carliest perlod.-E. B.
 of all Countries, computed at the rato of Ge 9 d, per Ounce Btandard, from Aatay made both at the London and Puris Minta.

The sterling valua of the foreign coins, in the foregoing tables, has been computed from the assays as follows: Let it he required to assign the value, in sterling, of a French double Louis d'or coined since 1786, the assay master's report being as follows: "Weight, 9 dwts. 20 grs. ; assay W. 1t grs.," that is, 0 car. 1t grs. worso than the English standard. Wo proceed as under:

From 22 car. 0 gr . the fineness of English stantard goll, tako 0 car. $1 \frac{1}{2} \mathrm{gr}$. , there remalns 21 car. $2 \frac{1}{2} \mathrm{gr}$. Then, as 22 car. : 21 car. 21 grs. :: 1 dwts. 20 grs. : 9 dwts. 16 grs ., the standard gold contained in the Louis
 grs, : £1 17s. $7 \frac{1}{2}$ d., the value of the Louis in sterling moncy, and so for any of the other coins.

Arcient Coins.-Wo sulijoln, for the convenience of such of our readers as may nt any time have occasion
to consult works in which referenco is made to ancicnt to consult works in which referenco is made to ancicnt pally current among the Jews and Grecks. They were calculated by Dr. Arbulhnot (Tables of Incient Coins, IVeights, etc., 4 to ed., Loml., 1751), and to not differ materlally from the tahles of Paueton, whose Afitrologie ( 4 to Paria, 1780) is the nost complele nind elahorato work that has ever been published with reapect to ancient moneys, welghts, and monsures. $\Lambda 1$ the same time we confess we should not be disposed to place much reliance on these tahles, and we have clspwhere stated our reasons for holding this opinion,Encye. The curreney of France consiats chiefiy of gold and silver, in which larger payments are effected, and of copper coins for the amaller aums.

It appeara that from 1803 to 1814 there were coined, with the effigy of Napoleon, at the different mints, of which there are thirteen in France, in gold to the value of $£ 22,001,018$, and in silver to the value of $\boldsymbol{£ 3 6 , 9 9 2 , 5 0 2 \text { . }}$ From 1814 to 1828, the amount of the coinage was $£ 17,081,635$ in gold, of twenty and forty franc pieces; and in silver the amount in pieces of five francs down to five sous was $\boldsymbol{£ 3 3}, \mathbf{0 9 6}, 560$ bearing tho effigy of Lonls XVIII, and Charles X. On tho above data, the dmount of circulating apecie in the kingdom was catimated, on the 1st of Jamuary, 1828, at 2,713,731,183 france, cqual in value to $£ 118,072,132$ sterling. The geld and silver currency, prior to the Revolution in 1789 , was eatimated at $£ 87,500,000$ aterling. We can scarcely, however, draw any positivo inference from the quantity of gold and silver coined in France, respecting the amount of specie actually circulating, as within the last twenty-seven years the exportation of cein has been freely permitted. 'I'he coinage of Franco has accordingly become an article of trado; and bullioa and coin have been freely exported or imported,

The domestic production of gold, so far as is indieated by the deposits at the Mint, anounta to more than shree hundred and twenty-two inillions of dollars from the year 1793 to 1855 , both inclusive. Of this large suun, the gross product to the end of the year 1848 was little more than thirteen millions of dollars, as is shown by the annexed table. To tinis aggregato of three hundred and twenty-two millions ot dollars should be added several millions as tho export from California, vin Panama, to Southanpton, and alao the expert to China and elsewhere.
 di bosited at the Mint and bianchea and abaay ufyior at New York, from 1804 to the end of 1855.

Coinage of the United States.--Tho Aanual Report of the Director of the Mint, for the year 1855, shows elcarly the operation of the parent Mint and all the branches, as well as of the Assay Offico at New York, for the whole year of 1855. It appears that the total coinage for the year was over $\$ 56,000,000$; and thst the aggregate colnage of the Mint and all its branches (inelulling gold bara), from tho year 1793, has been $\$ 498,266,59582$. The portions executed at the parent Mint, and at each branch, have been as follows:

| Commenced natiaess. | Colonge, 1855. | Total Culoage 1793 to and of 1855. |
| :---: | :---: | :---: |
| 17 CB | \$12,045,952 98 | \$377,383,80897 |
| 1835 | 2,368,51000 | 67,3S6,665 00 |
| 1808 | 116,77850 | 6,600,260 00 |
| 1839 | 217,985 60 | 4,222,626 60 |
| 1854 | 21,121,752 43 | 30,858,320 64 |
| 1854 | 20,441,813 63 | 23,320,872 81 |
| ... | \$56,312,782 00 | \$498,866,566882 |

Of this aggregate, about ninety-four per cent. has been produced ly California, namely:

| Callfornia (oight years)... | $\$ 313,235,50277$ |

| Net product of the States. | \$322,061,13434 |

The gold mines of North Carolina are atill in working order, with a large outlay of capital for their prosecution; but the average resulta mny be considered as not very profitable to the shareholdera.
The roduced colnage at Philadelphia for 1855 is accounted for by the unavoldable delays in the repairs at the Mint, authcrized by an appropriation made by Congress for this purpose in 1855. These repairs and alterationa were commeneed 19th July last, and oceupied six months.

The total valuo of tho coinage of the United States, from the year 1703 to 1855 , both inclusive, has been within a fraction of five handred millions, namely:

| Miots. | Gold. | silver. | Copper. | Total. |
| :---: | :---: | :---: | :---: | :---: |
| 1'hitudetphita | \$205, 371,56266 | \$ $810,440,02090$ | \$1,672,11631 | \$377,983, 20887 |

| Dal.lonrga . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . | 118,778 50 | . | .... | 113,779 80 |
| Asay Ollice | 20,4tt, 8 t3 63 | … | … | 20,411,813 03 |
| Toisla. | \$ $02,795,45720$ | \$3,501,245 | \$16,030 78 | \$ $568,812,73409$ |

It will sppear from this tabular view that the branch the annexed summary of foreign coinage for the year Miats at New Orleans，Dablonega，aad Charlotto could bo advantageously dispensed with．The gold colagge last year it New Orleana was only $\$ 450,500$ ， and the silver，$\$ 1,918,000$ ．All this could have been done at Philadelphia；and now that the parent Mint is provided with new and improved machlnery，all the sllver cojnage may as well be dono at that point．

It appears that the annoal coinage at the Georgia and North Carolina brsaches is less than the years 1818－1853－having declined from $\$ 900,000$ in 1852 ，to $\$ 833,000$ in 1855 ．According to a report mado by Mr． J．Phillips Phenix，of the Conmitteo on Commerce， to the Ilouse of Representativea，in September，1850， when the coinage at these two branches was doubla what it is now，the expeuse of coinage was estimated as follows：

| At I＇hiladelphla | 2.23 per cent． |
| :---: | :---: |
| At New Orlcana． |  |
| At Charlotto． | 9.00 |
|  |  |

At this time，the percentage at the branch Mints must be greater，as the work is less．Every doliar coined at the Charlotte and Dahlonega，probably coats ten cents；whereas the raw materiai could be trans－ ported，at a small cost，to Philadelphia or New York． The annual expense of thirty or forty thousand doliars for the maintenance of these two Mints conid well be dispensed with，and the coinage executed at Philadel－ phia and New York．In fact，the heavy expense in－ curred by the government for the support of the Mint at New Orleans is eatirely superfluous．The receipts of gold at that quarter are now too amall to require the further working of a Mint there．

The Director of the Mint，in his report recently made，alludes to recent improvements in machinery which are calculated to facilitate coinage operations， and to produce more highly finished pieces，namely： ＂In the colnage of half eagles particularly，wo shali be materially aided by a very remarkable mehine lately invented．＊＊This machine was manufac－ tured at Paris，and las been introduced into the Mint there，and one of similar powers is also cmployed in the Mint of Engiand．The one imperted for the United States Mint is adapted to the half cagle onjy．It is justly regarded as a triumph of nechanism．＂

The largely increased production oi cold in Austra－ lia and California，of iste years，has，of course，stimu－ lated the workinga of the Mints of foreign countries． The colnago may be fairiy estimated at about two hun－ dred milions of dollars annually in gold，fifty millions in silver，and nearly one million in copper．We find

1853，the latest，to which we add that of the United States for the same year，all reduced to aterling：

The act of Congress to create now siiver coins sind to reduco the welght of the old denominations，has had a good effect in providing the country with an abund－ aace of the smail coins，and the new act passed by Con－ gress in February，1857，and now in force，will have the effect to drive out of circnlation the old and de－ preciated Spanish coina that havo for many years been in uso．

The Act of Congress of February，1857，in reference to the Coinage，will produce a very desirable reform in our currency of silver and copper coins．The new act authorizea the creation and distribution of a new cent，which relieves us of a hitherto ponderous coin－ the comparative weights being as followa：Ast of Jan－ uary 18，1837， 168 grains；Act of February，1857， 72 grains ：difference， 96 grains．The former acts of Con－ gress did not make copper coins a legal tender；and it has been disputed as to what amount they were re－ ceivable for debts；nor does the new act make them legal tenders for any sum．The new cent may be read－ ily distinguished In the dark from the current silyer coin．It presenta aliout the snme surface as the ten－cent piece，but is alout double the thickness with a smooth edge；whereas the ten－cent picce has a milled edge．

With the oid of the twenty millions of dollars ia small silver coina exceuted since the act of March 3， 1853，and the ccinage of two or thre millions more annually，for the next few yenrs，the country will be liberally proviled with small siiver coins，that will not only enter into general circulation and effect the purposes intended，but they will not be liable to be used for the arts and manufactures，their legal value being alout ten per cent．heyoud that of their intrinsic vaiue as metal．

According to a careful table prepared fer the Auga－ burg Allyemeine Zcitung，published Aprii 16，1856，the following table will ahow the annount of gold and sil－ ver that has been extructed luring various periods from the birth of Christ diown to the year 1855：

By an act of Congress, : The old Spanish cuhns are receivalle at the Tronsury of the United States sad several offiees, at the Poat-offices and Land-offices, st the followling rates :
[But by the sixth section, they will bs receivable at 20, 121 $\frac{1}{2}$, and $6 \frac{1}{4}$ cents, respectively, in exchangs for the new oents.]
2. Such old coins "shall not again be paid out or put in circulation, but shall be recoined at the Mint" for distribution.
3. All former acts authorizing tho currency of foreign gold or silver coins, and declaring the same a legal tender in payment for debts, are repealed; lut it shall he the duty of the Direetor of the Mint to cause assays to be made, from time to time, os such foreign coins as may be known to our commerce, to determine their average weight, fineness, and value, and to embrace in his annual report a statement of the results thereof.
4. The standard weight of the cent shall he seventytwo grains ; compozed of 88 per cent. of copper and 12 per cent. of nickel; and the coinage of the half-cent shall be discontinued.
5. Anthorizes the Treasurer of the Mint te purchase the materials necessary for the coinago of the new cent.
6. It shall be lawful to pay out tho sald cent at the Mint in exchange for any of the gold and silver coins of the United States, and also in exchange for the former copper coins issued; and to transmit parcels of the said cents, from time to time, to the assistant treasurers and other officers for exchange; and it shall also he lawful for the space of two years from the passage of this aet, and no longer, to pay out at tho Mint the cents aforesaid for the fractionel parts of the dollar herein hefore named at their nominal value of twenty-five. twelvo and a hrlf, and slx and a qua ter conts respectively.
7. IIereafter the Director 0 t the Mint shall make his Annual Keport up to the 30 th June (instead of 31 st Decemher, as heretofore), so that tho results of the yenr's operations may appear in tho Annual Report of the Secretary of the Treasury.

In the Annual Report of the Director of the Mint of the United States for 1857, ho says: "As my Report in January last presented a statement of the operations for the year 1806, this Report will embrace the operstions since that time, namely; from the first day of Jannary to the 30th of June, a period of six months.
"For the purpose of exhlliting in a condensed form the entire operations of the Mint and lits branches, I present the anmexed summary statement. It embraces the amount of gold and silver b=llion operated upon from the time of their respective organizations to the 30 th of June, 1857 :
Mint of the United Stales, established 1448.. $\$ 894,895,44981$ Hranch Mint at Now Orleans, $\quad$ " $1839 . . \quad 51,42.4,41560$ Branch M1nL at Dalitonega, ul $1835 . . \quad 3,526,74700$

 Total. $\qquad$ $1854 .$. . $\frac{62,19,413}{\$ 658,015,8817}$
"Of this amount there has been revived sirice the 1st of January, 18.t9, of native gold, the production of the United States, the sum of Gour hundred and two millions of dollars. If, in addition to thls sam, "u add the gold produced from Australia and other forelgn countries during the same period, which may be stated to bo abovt five hambred inllions of dollars, and the production of silver bullion from all sourees, which is at the rate of about forty millions per connum, it will Le seen that whin this comparatively bricf period the worli's supply of the precious metals has been Increased to the exlent of twelve humired and forty-two millions of tollars."-Further information on Cosns and Cons: Aae may be obtained by reference to the (Uuarterly Rev., Ixxil. 194; North American Review, IVL. 208 (U. F. (wnass); IIunt's Mferchants' Magazine, v. 379, vil. 267, iv. 434 ; De llow's Revicw, 11, 281 ; Bankers' Migazine, vol. x. (Professor De Mongav) ; Manual of Coins, ly Sickrelur and Du Bots, of United States Mint.

Coir, a species of yarn manufactured ont of the husk of cocoa-nuts. . The busks being steeped in water, the dry dusty substance mixed with the fibres is separated. These aro afterward spun into yarn, and inanufactured into cordage, that is deemed by some superior to that mede of hemp. The goodness of coir depends on the fineness of the filmments, and on their being of a bright yellow color. About $2,500,000 \mathrm{lbs}$. welght are annually exported from Ceylon, prinelpally to Calcutta, and other ports in the East Indies.' It is also prepared in the Maldive Islands, and many other places ; and is very extensively used throughout the East.-Bentolacci's Geylon; Bell's Commerce of Bengal, etc.

Colke, or Coale, charred plt-coal, prepared for the smelting of iron $o_{2}$, by igniting the coals piled up In long ridges in the open air, and closing in the cinders with earth when brought to a glowing red hent. For the use of the manufacturers, the method hitherto most In practice has been to burn the small or screened coal in conical ovens, built of fire-stone or brick, the floor belng generally about 6 feet in diameter, and the oren 8 feet high, while an aperture of 18 inches dlameter is left at the top. The small coal is thrown in to the depth of 15 Inches or more, and then ignited. The cren door is at first kept open, and the hole at the top left uncovered till the nuass is red hot. The door is then closed, and by degrece the hole at the top is covered over wlth two large flat stones, gradually opproaching esch other, when the whole is left to cool. When sufficiently cooled, it is drawn out with long lran. rakes, and the mass is found to have assumed a rudo columnar arrangement. The oven is immediately charged again with small conl, which the heat remainIng in the floor is found sufficient to ignite, and so the operation goes on. In both the above wsys good cokes are mads, but the celatile products are lost. To save these, Lord Dundonald proprosed to burn the ceals in a close furnace, to which he adapted an apparatus fur conveylng the coal-tar, with the ammonlacul produets, into proper recipients. About the 3 nme time, Haron Von Haak, a Germsn, constructed works in the neighborhood of Newcastle for distilling the smull coal In large cast-iren cylinders upon the plan which has since been adopted in the gas-workr, execpt that the soot from the furnace fires is, st Newcastle, during a certain period of the comlustion, before any gray ashes have begun to arise, conveyed into a chamber contrived for the purpose, and collected for lamp-hlack. It Is a curious circumstance, and illustrative of the chunges which the carboniferous structure undergoes, that the coel lncreases In lulk by getting rid of its gas; eight sacks of coal will yield ten aacks of coks.
One of the curlositins in coke is that, although so grannlar $\ln$ appearance, some of the partieles have almost the hardness of the diamond, and are found fitted for cuttlng glass.-E.E. 13 .

Colliery, a place where coal is found In stratified masses, and excavated by manual lubor, and commonly brought to the surface by mechanical power. The exact dute when cial hegan to be used as n fuel is not very certain; the appearance, If not the use of the mhicral, must havo been known fur a long time in disiricts where the deposit was naturally exposed; and, $8 \cdot \mathrm{~F}$. ling to some authorities it is mentioned as

 of digging coals 'c coctain pailis in New castle. Seven years afterwarc ed lad becone an article of export, and was 'frme' see en' $^{\prime}$; and in 1306, so extenstye wasita $\because$, if cus a lin lecelm that Iarliament com

famous clty of London petitiocied the Parliament of England egainst two nuisances or offensive commodjtics, which were likely to comg Into great use and esteem; and that was, Newcastle ioals, in regard of their stench, etc. ; and hops, in reger 1 they would spoyle the taste of drinck, and endanger t'se people." In Belgium the earllest reference to coal was in 1108 or 1200 , In the county of Llege, where, according to tradition, a blacksmith was the first to use it as fuel.' In France the precise period of ita sdoption as a sulustitute for wood is not ascertained. The commencement of its use in Paris was in 1520, the coal beling drawn, not from the mines of France, but from tho collieries of Neweastle. In Scotland coal was known and nsed probably at a very early date. We ure informed by Chalmers, the antiqusry, that coal was worked at Bo'ness by William de Verepont before the end of the twelfth century, snd that a tenth of the coals was paid to the monks of IIelyrood House. It is mere curious, however, than important here, to trace the dute when mineral coal was first used as a fuel. The earlicst employment of It in England in the manufactrre of iron was In 1713, at Colebrookdale, In Scotland, abeut the commencement of the eighteenth century, and in France in 1782.-E. 13. See Coal.

Collision (Fr. Abordage), in a general sense, is the act of any two or more bodles coming fercibly together; but In commerelal navigation it means the shock of two ships coming into sudden and violent contaet at s: a, by which one or both may the more or less injured. From tlo great Increase of navigation, the rlsk of accidents by collision at sea has been proportionally augmented. And it is, therefore, of much linportance, 1 st, to ndopt such measures as may be most likely to prevent their occurrence; and, $2 d$, to determine by whom a loss, when it does occur, should be borne.

In regard to the first and most essential of these objeets, it is eflected, in part at least, by whatever contributes to the general improvement and security of navigation. At common law, every master of a chlp Is hound to keep a proper wateh at eea, especiully in channels much frequented by shlpping, and to use every precantion to avoid coming into contact with other vessels. But this mutter has heen judged too important tu be left wholly to depeni on the good sense and care of individunls; and with a view to the securing of attention to the subject, and to the obviating of the confusion that would unavoidably arise were shipmasters left to follow thelr own ideas with respect to it, rules and ragulations huve been luid down in regard to the courses to be steered when ships are passing each other, the nignals to be made during fogs, the number and description of the lighta to be exhibited at night, and other particulars. In 1840, the Trinity llouse, in Great Irritain, promulgsted a rule of this sort ; and though not in Itself law, masters not complying with its instructions were held to be gullty of unseammalike conduct, and the owners were mude responsilile for ti. 3 consequences. Regulations similar to those contained In the Trinity rite havo since been enacted by the Iegislature. As there la no especial statute law in the United States, we follow in a measure the decisions of the English courts, and are governed by the precedents they have establishet,-See Kent's Comm., Lect. XLVII. The existing Fenglish statute law on the subjeet is embodied in the fullowing clauses of the English Nercentile Shipping Act of 1854,17 and 18 Vict. c. 104:

Regulations as to Lights and Fog Signals.-Tho fotiowing rutes mhall le obacred with regard is lighta and fog atgnals: viz. : 1. The Admiralty shain from time to timo make regulationa requiring the exhibition of auch lighta, by mely nasses of ablija, whether ateam or selling shipa, within such places and under sueh circumatancea as they think fit sud may from time to time revoko, alter, or vary the same. 2. Tho Adatralty may, If they think ft, make regulationa requiring tho use of nuels fog sugnala, by such clasaes of whipa, whether ateum or salligg eltipe, within nuch placer and undor suoh circumatances
as they think rary the same. ecection shall b coms into oper whteh they are nach regulation to any owner on production of th snfficlent evids dll owners and same, and shall sach lights, nd such places, in a are enjofaged ether lighte or the master, or fa faut, ahall \& are iofringed in Rule ata fo $S$ whether as ates meets another ing in another their reapective any risk of aco port no as to ps shall be obeye whelher on th hauled or not, to reader a dep fmmediate dan gard shall be ht sailing ohips on log sueh ships now Channels. row channel, to that slde of starboard sido Brach of the -Ifia any can the case is trie observanee of of fog slgnals taloed, or of and sailing al las been infri peoso whateve coiliston, unle the elreumatal cecessary. ws they think fit, and may from time to time revoke, alter, or rary the same. 3. All regulations made in pursuance of thla section shall be publiohed In the London Gazette, and shali come Into operation on a day to bo named in the Giazette In whicb they are pubiished, and the Admiralty ahall cause ali moch reguiations to be printed, and ahall furnich a copy thereof to niny owner or master of a ahip who applles for the name, and production of the Gazette containing such regulations shail be snficient evidence of the due makiog and purport thereof. 4. All owners sad mestera ahali be boind to take notice of the same, and shall, so long as the samo continuea In force, exhibit such lights, and use auch fog signals, at such times, within such piaces, In such manner, and under sueh ciroumstances is are enjoiaed by such regulations, and shall not exbibit any other lighta or use any other fog aignala, and in cace of defanit the master, or the owner of the shlp, If It appeara that he was in fauth, aball for each ocemaion upon which such regulstions are iafringed incur a penality not excoeding $\mathbf{2 2 0}$.
Bute as to Shipa meeting each other.- Whenever any shlp, whether a steam or sailing ship, proceeding in one directlon, meets anotiser ship, whether is ateam or salling ship, procecdiog in another direction, so that if both shipe were to continue their reapective courses they would pase bo near as to Involve any riak of a cellifion, the helms of both ships shasll be put to jort so as te pase on the portelde of each other; and this rule thalt be obeyed by sil ateamships and by all salilng ships, whether on the port or starbuard tack, and whether closehauled or not, unless the eireumatances of the ense are such as to render a departure from the rule necessary in order to avoid Immedlate danger, and aubject also to the proviso that due regard abnll be had to the dangera of uavigation, and, as regards sailiag aling on the atsrboard tack close-hanled, to the kecplog such silitps under commend. Rule for Steamers in narrene Channels. - Every ateamship, when navigating any narrow channel, ahalt, whenever it is safe and practicsbic, keep to that alde of the fair way or mid-channel which lies on the starboard side of such ateamehip. If Collision rnsues from Brach of the above Rules, Owner not to be entitled to recover. -ifin any case of oolilaion it appears to the court bofore which the case is tried that auch coltigion was occasioned by the nonsbservance of eny rule for the exhibition of lights or the use of fog signais issued in pursuance of the powers before contaloed, or of the foregoing ruice as to th. pasaing of steam and salling sinips, the owner of the shlp by which such rule lias been Infringed ghaft not be entitied to recover any recompenso whatever for any damage austalned by auch shlyp in such collision, unless it is ghown to the satistaction of the court that the elcumstances of the case made a departure from the rulo necesdary. Dreaches of such Rutes to maply willful Defautt. -In case any damage to person or property arises from tho nom-elservance liy any ahip of any of the sald rules, nuch dainage shatt be deemed to have been oceastoned by tho wilt fit dethult of the person In elisrge of the deek of such ship at the Hue, unless it la phown to the astlafaction of the conrt that the ofrcumstances of the case made a departure from the ruio necessary.
An authority similar to that given to the Lords of the Admiralty by the elause of the Meresntile Shipping Act now quoted had been already given to them, and under that authority they issued tho following regulations, which are now (1855) in force:

Steami lessels,-Ali Britiah sea-going stesm vesseis (wheth erpropelied by peddles or screw) shall, wlthin all segs, gulfs, channcis, atralts, bayf, creekg, roads, roarlsteads, harbere, harens, ports, sud rivers, and under all elrcumstancen, betreen sunset snd aunrise, exhiblt lighta of such deacriptlon, and in suc't manner as herelnafter mentioned; viz, when under steam: A bright white light at the foremast head; a green Heht on the starboard side; a red light on the port slde. 1. The mast-hesd ingit Is to he vialble est a distance of at ieast five mifea In a dark night, wilth a clear atmosphere, and the lanfom is to be se constructed os to show a uniform and unbroken light over an are of the horison of twenty points of the eompask, inelug ten pointa on cach side of the ship, yiz, from ricit ahead to two pointa abat the beam on either side. 2. The preen light en the starbonrd side is to be viallie at a diatance of at least two miles in a dark night, with a clesr atmosyhere ; and the tantern is to be so conatructed as to show a unlform and unbroken light over an are of the horison of ten pohite of the compass, vis., fom right alicad to two polits aboft the beain on the atarboard aide. 3. The red light on the poit alde Is likewise to be fitted ao an to throw lis ilght the amodiatance on that alde. 4. The side ilghits are, moreover, to be fitted with screcny, on the labourd alde, of at leant three foet long, to prevent the lights from being ween across the bow. HThen af anehor: A common bright tight.

Sailing Vissels.-We hereby require that all satilng vessela when under saii, or belag towed, approaching oi belng appraached by any other vessel, shall be bound to ahow between sunset and sunrise a bright light in such n position as can be best seen by such vessel or vessels, and In suffictent time to avoid collision. All salling vensels at anchor in romizeonis or fair wayn shall be also bound to exhlblt, between sanaet and aunrise, a constant bright Ught at the mast-head, except within harbora or other piaces where regulations for other IIghts for nilipe are legaily established. The lantern to be used when at snchor, both by steam versels and salling veascis, is to be so constructed as to show a clear good light all reund the herizon. We hereby revoke all minulations heretofore made by ns relating to ateam vesseis exhibiting or carrying lights1 and we require that the preceding reguistiens be etrictiy carried Into effect ofter the 1at day of August, 1352.

Directions for Fitting the Lights -The manner of fitting the colored lights is to bo particularly attended to. They should be fitted each wilth a sereen of wood on the Inbeard slde, In order to provent both being seen at the same moment from any direction but that of right sheed. This is important, for witheut the screens (a principle first introduced with this plan) any plan of bow-lights woutd be ineffective as a means of indicating the direction of steering. This will be readily understood by a reference to the tifuatrations, where it wili appear evilent thst $\ln$ sny eltuation In which two vesseis may appreach each other in the dark, the colored lighte will instantly Indicate to both the relative course of each; that is, each will know whether the other is spproaching directly or cressing the bows, elther to atarboard or to port. Thie intima. tion is ali that is required to enable vesaets to pass each other in the darkeet night, with almoet equal safety as in broad day, and for the want of which to many lamentable aceidents have occarred. Pattcrina of the Ienternes to be carried, and of the mode in which the sereens are to bo fitted, may be secta at the custom-houses of the princlpal commerclal ports in the United Kingdom. The eystem of night lights laid down in ti.e sbope regulations has been adopted in her majekty'n eervice, and by the governments of the principal foreiga martime natlons.

Every mneter of a ship is bound, as well by the duty ho owes to his employers and to those on board his ship, as by positive rule, to keep a proper watch at sea, especially in channels much frequented by shipping, and to uso every preeaution to avold eoming into contact with other vessels. In order still better to provide ngainst danger, and to obviate disputes, the Trinity House promulgated, on the 80th of Octoher, 1840, tho following Rule of Navigation:
Rule of Navigation issued by the Trinity Mouse.-The attention of this Corporation having been directed to the numerout severe, and in some inatancea fatal, accidents which have resulted from the collision of veasels navigated by Ateam, and it appearing to be Indeapensably neceasary, in order to guard against the recurrence of aimitar ceslamities, the is reguiation ahould be catabliahed for the guidance and gover ament of persons intrasted with the charge of such vessela; and whereas, 1. The recognized rule for sailing vessels is, that those hasIng the wind fair shall give wsy to those on a wind; that when both are golng by the wind, the veasei on the starboard tackahali keep her wind, and the one on tbe larboard tack bear up atrongly, 1 ,assing each other on the larboard hand; that when both vesseis have the wind large or abesm, and meet, they ahall pass each other In the same way on the larboard hand, to effect whileh two last-mentioned oljecte the helm muat bo put te port : and as ateam veracta masy be conaidered in the IIght of vessels navigating with a filr wind, and should gite ray to alifing vessels on a teind of either tack, it becomes only necessary to proride a rule for thele ohservance when meeting vther stenmers, or asifing vesmole golng linge.

Under these conslderations, and with the object before atated, this itonrd has deemed it right to freme and promulgate tho following rule, which, on communlestion with the Lords Comemisaloners of the Admiralty, the Eider liretiren find has been ulrendy adopted in respect of ateam veasels in her majesty's service! and they isesire earneatiy to press upon tho milnda of ati perama linving charge of ateam vesaels the propriety and urgent necessity of a strict adherence thereto; via. : 2, Rute for Steam leasels on different Courses.-When ouch vesseis mast Inevitahity or weccuarily cross so near that, by conthuing their reapective courses, there woutd bo a risk of their coming in coillifon, each venaid shall put her heim to port, so as alwaya to paes on tho larboard wide of each other. A steam veasel jowing another in a aarrow channel muat aiwaya leave the vessel she la pasaling on the Jarboard hand. Hy order,

J, Himbert, Beeretary.
Tusity IIovek, London, Both October, 1840.

It may, however, be proper to etate that ne:ther this nor any rule of the sort is to be regarded as inflexlble, or to be followed at all hazards. The aafety of the ship fa the paramount consideration, and nc master is justlifed in abiding by a rule, when by doing so be plainly ineurs danger, A. may be ln bis proper course, but if by pursuing it ha will run a graat riak of coming into collision with B., who is upon a wrong course, he is bound to alter his course so as to avoid a collision. The fact of one master being lgnorant, careless, or Ir fault, la no reason why another shoulc not use erery means in his power to provide for the safety of his ship, and, consequently, of the livea and proparty intrusted to his care.
The conilitions ander whlch cases of collislor. take place differ extremely. Thus, 1st. It may be merely accidental, or be occasioned by clrcumstances beyond the poiver of control, as by the violence of the wind or waves dashing or impelling the shipa together, without blame being imputablo to either party ; or, 2d. It may be owing to the culpable negligence or misconduct of one party ; or, 8d. Both parties may be to blame. In adjudicating upon losses growing out of collisions that have taken place under such different ilrcuastances, the conclusions must also be very different.

With reapect to the first class of cases there is little apparent difficalty: wherever a loss is oce sioned by a storm, a fog, or other accidental circumatas ce without any blame belng ascribable to either party it would appear to be equitable that it should be bor, $c$ by the sufferer. And this principla having been eml sdied in the Roman law, was subsequently ingrafted is to that of England.-Manshall on Insurance, cap. 17, \& 2. But other anthorlties, to whom the greateat del rence is due, contend that the loss arising irom accic ontal collisions, however it may afiect tho partir a should be equally divlded between them; and thir fact, la tho rule followed in moat malitime sta' -s.-Urdomnance of 1681, lib. lif. tit. xii. art. 10, witit the observations of Valin. It also is the rule sanctioned by the law of England in cases where both parties are ro blame, but where the blame can not be discriminated. Those cases in which the blame is clearly aseribable to either party present no diffieulty.

The leading doctrines of the law of England with regard to collisions have been elcarly and succinctly stated by Lord Stowell. "In the lirst place," asys his lordship, "a collsion may happen vithout blame being imfutable to either party, as when the loss ls occasioned by a storm or any other ris major. In that ease the misfortune must be bome by the party on whom it happena to light; the other not being reaponsible to him in any degree. Secondly, a miafortune of this kind may ariae where both parties are to blane, where there has been a want of due diligence or of akill on both sides; In auch a case the rule of law is, that the loss must be apportloned betwcen then, as having been oceasioned by the fault of both of them. Tbirdly, it may happen by the mlsconduct of the suffering party only ; and then the rule is, that the sufferer must bear his owir hurten. Lastly, it may have leen the fault of the ship which ran the other down, and In this caso the Innocent party would be entleled to an entlre compensation from the other."-2 Donsox's Admiraliy Reports, 83.

We may add that the rule of the equal division of the danage whore both vessels are to blame has been, since Lord Stowell's tlme, fully recognized sud finally entabllshed by a decision of the Ilonse of Lords, on an appeal from Scotland.

Varioun authorities havo speken disparagingly of tho rule now referred to, and liave called it a judicium ruaticorum ; and it would, no doult, be very desirable In cames of colliaion where both partleas are to blame, that the meglect or calpability of each whould be accurately tetermined, und the damages askeased necoriingety. But from i id obseurlty in whleh such cases are
alnost always involved, and the confleting tecalmo iy brought forward by the different partles, the difficulties in the way of thls being done are uaually quite insuperable; and it is better to adopt a rule which, though perhaps less equitable in prineln'., , la fairr r ln Its application than any other thist could be adopted. Of its expedfency there can, indeed, be no reasonable doubt. The obscrvations of Valln are, In thls respect, quite concinsive. "C'otolt," says he, "le moyen le plus propre ì rendre les capltalnes ou mafiris dea navires extremement attentifa id eviter tout abardago, surtout ceux des bâtínens foibles et plus suscept tbles d'être incommodés par le moindre choc, en leur rendrant tonjours présent la cralnte de aupporter la moltié du dommage qu'ils en pourroient reeevuir. Et al l'on dit qu'i] aureit été plus simple et plus court de lalsaer pour ie compte partlculler d'un chscun le dommage qu'il auroit reçu, comme provenant d'un eas fortult; la réponse est qu'alors les capltalnes da gros navires n'auroient plus cralnt de heurter les bûtimens d'uise :zaucoup moindre foree que le leurs: rien done de plus juste que la contribution par moltié,"-Commenicuire sur COrdonnance de 1681, ii. 179, ed. 1776.
In apportionling the damage in caaes where both partles have been in fault, the question occurs, whether the damage done to the cergo ahall be taken into account or left out In the eatimate on which the apportlonment is to the made. Thia knotty polnt has been differently deelded in different countrice. But the rule wbich limits the liabillty of owners to the value of the ship and freight applies to cases of damage by collision. For further observatioue on thls curious and important auoject, In addltion to Valin and the other authorities nlrcady referred to, the reader may consult the chapter on collisslon added by Mr. Serjeant Shee to his edition of Lord Tenterden's work on the Law of Shipping, and the chapter on the same subject in Maude and Pollock's Treatige on the Law of Merchant Shipplag.
Number of Colliviona at Sea.-A statement has been prepared by Mr. John A. Rueker, underwriter, giving a classlfication of the number of collisions at sea reported In Lloyd's lists during the five years from 1845 to 1849 inclusive. It thence appears that the annaul numbera were $608,564,699,633$, and 565 ; so that there wes a decrease in 1849, notwithatanding the increased traffic of that year. The total collisions of the five years amounted to 8064. Of these 279 were cases in which a vessel was sunk, run down, or abandoned; 189 were cases in whleh there was serious damage; 686 in which the damage, although less, was still conaiderable; and 1910 in which it was only slight. The average of steamers in contact with steamers during each year is about 11 ; of ateumere in contact with sailing vessels about 37 ; of sailing vessels In conta t with steamers 36 ; and of sailing vessels In contact with saillng vessels 533 . Since that time the number of collialons has been increusing; and In the years 1855 and 1856 they have lieen partieularly large lin nuaber; and attended with great loss of llfe, especially in the cases of the Arctic, the Pacific, and the Lymnais.
Colohioum Autumnale (Mendonc Satfion, or Atve tumn Crocus), a plant of the natural orier Melenthr cece, is largoly collected for medicinal use la Eonghnd. Ita infusion la well known as a powe:iul remedy for gout, and has long heen eolebrated in Franeo undor the name of kiau Medicinale. The cormus or bulb, and also the seeds, are used in mediclue, and hive a strong, persistent, bitter taste. Ita medicinal virtues appear to be derlved from n pecullar alkalold, which has been termed colchicia. The beat preparution is the whe of colehicum, propared by digesting elght ounces of the seeds in forty oun es of sherry for about a week, shaking the veasel daily, aud preasing out the liquor. The usual doan is from ten to fifty drops taken in water. It possesses intense actlvity as a poimon. The piant derive Its name from Colchis, In Armenia, where it is
snid to have abounded,-E, B. See Cinistison on foixons.

Colocynthid, Coloquintida, or Bitter Cucumber (Germ. Koloquinten; Du. Bitter-appelon; Fr. Coloquintes ; It. Coloquintida; Sp. Colequintidas; Arab. and Pers. Hunzil), the produce of an anaual plant ( Cu cumis colocynthis, Linn.), growing in Turkey, Nubia, Iadia, and other placss, much rasembling the cucumber in herbuge. When ripe, the fruit is peeled and dried in a stove, and In this state is brought to England. It is inodorous, but has an extremely nauseous taste. It is an exceedingly powerful drastic cathartic. When it is larger than a St. Michael's orange, and has black scute-pointed ends, it is not good.-Ainslie's Mataria Indica.

Cologne (Ger. Köln; ancient Agrippina colonia), a fortified city of Western Germany, formerly capital of electerate, now capital of Rhenish Prussia, on the left bank of the Rhine, across which a bridge of boats consects it with its auburb, Deutz, 45 miles north-L orthwest of Coblenz. Lat. of cathedral $50^{\circ} 56^{\prime} 29^{\prime \prime}$ N., leng. $6^{\circ} 57^{\prime} 52^{\prime \prime}$ E. Popuiation 78,500. It communicates by railroad with Hamm, Bonn, Aix-la-Chapelle, Mechiin, and has extensive passage trafic with gteamparkets on the Khine. It has manufactures of cottonyarn and stuffs, silk fabrics, velvets, woolen cloths, hosiery, lace, cordage, tobacce, hats, wax-lights, starch, neeties, clocks, gold and silver articles, vinegar, seal-ing-wax, earthen and lacquered wares, und twentyfour factories of Eau de Cologe. Its position gives it an extensive and increasing trade between Germany and the Netherlands, and under the French it was the capital dejpôt of Roêr. Population of arrondissement is $1849,437,330$.
Colonies: Colony Trade. Colonies are establishments founded in foreign countrles by indlviduals whe either voluntarily emigrate from, or are forcibly sent abroad by, their mother country. The colcny trade is the trado curried on between colonies and their parent states.

1. Witahlibiment of Colonies. Greek Colonies.Various motives have, in different countries and ages, led to the formation of colonjes. The Greek colonics of antiquity $\begin{gathered}\text { eem to } \\ \text { huve been chicfly founded ly citi- }\end{gathered}$ zens whom the violence and fury of contending fuctions forced to leave their native land; but they were sometimes formed for the purpose of relieving the mother country of a redundant population, and sometimes also for the purpose of extending the sphere of commercial trunactions, or of providing for their security. The reiations between the mother country and the colony depended, in a grent measure, on the motives which led to the cstablighment of the latter. When a colony was founded by fugitives forcibly expelled irom their ancient homes; or when it was founded, as was frequently the case, by bodies of voluntary emigrants, who received no assiatance from, and were in no respeet controlled by, the parent state, it was from the irst independent; and even in those rarer cases in which the emigration wus conducted under the superintendence of the parent city, and when the colony was protected by her power and influence, tho dependence wias montly fur from being absolute and complote. The great bulk of the Greek colonies were really independent states; and though they commonly regarded the land of thetr forefathers with filial respect, though they yiclded to ita citizens the plece of distinction at public games and religious solemnitiea, and were expected to nssist them in time of war, they did so as ailies only, on fuir and equal terms, and never as subjects. Owing to the freedom of their institutiona, and their superiority in the arts of civilized life to the native inhabitants of the countrics among whom they were generally placel, these crionies rose in a comprastively short periol to a high piteh of opulence and refinement; and many among then, wa Miletus and Ephesus in Asia Minor, Syracuse aud Agrigentum in

Sicily, and Tarenium and Locri in Italy, not only equaled, but greatly surpassed, their mother cities in wealth and power.

Roman Colonies.-The Roman colonles were for the most part founded by and under the authority of government; being intended to serve both as outlets for poor and discontented citizens and as military atations or garrisons, to secure the snbjection of the cenquered provinces over which they were scattered. The most intimate pelitical union was always maintained between them and the mother city. Their internal government was modeled on that of Rome; and, while their superior offlcers were mostly sent from the capital, they were made to contribute their full quota of troope and taxes, to assist in carrying on the centests in which the Repablic was almost constantly engsged,
Spanish Colonies.-The early colonies of most modern nations were fornded by private adventurers, influenced either by the hope of gain or by a desire to escape from religious persecution, without any wish to relieve the mother conntry of a surplus population or to bridle subjugated provinces. On their first Institution, therefore, the modern colonies spproached, though with some essentlul variations, more nearly to the Greclan than the Roman model; but the period of their freedom was of very limited duration. They were very boon suljected to laws and regulations framed in the metropolis, and calculated, as was to be supposed, rather to promote its interests than those of the colony. At a somer hat later pexiod the foundation of colohial establishments was eagerly patronized by most European governments, in the view of extending commerce and of enriching the mother country, hy securing to her the exclusive possession of the "r rent of distant countries; and where, from the thi, nese. ! the aboriginal population, or their inferiority in 11 a wists of civilized life, the colonists were enatled \% n . ss fortunes with comparative rapidity. The Spaniards who first resorted to America after its discovery had no inteution of settling in the country, or of colonizing it. The idea that geld and silver slone constituted wealth was then universally prevaleut; and the bold and enterprising companious and followers of Columbus, instead of engaging in industrious undertakings, which they neither understond nor relished, sought only to enrich themselves by plundering the feeble and defenseless natives of the gold and silver in their possession, and of the abundance of which the most exaggeruted accounts were immediately spread throughout Europe. When new adventurers arrived on an unknown coast, their single inquiry was, whether it abounded in gold. If it did, they remained, for some time at least, in the country; if not, they immediately set sail for some other quarter. Auri rabida sitis a eultura Mispanos divertit, is the expresive statement of a contemporary writer (Petrus Martyrus, in the Novus Orbis of Gryneus, p. 511). The slow progress of the Spanish colonies after their first discovery must principally be aacribed to this cause. The gold and silver accunulated by the natives were very soon exhausted; and the skill and energy of the successive swarms uf adventurers, who continued to pour into the couns try, were princlpally directed to the unproductive snd generally ruinous trade of mining. The few large for tunes that were made in this way, like the large prizes In in iottery, infinmed the cupidity of the multitude, and gave an appearance of credibility to the fabulous accounta of the excessive productivencss of the mines. After the gnmbling epirit which had exclusively actuated the carly adventurers had hegun to aubside, the colonists gradually betook themselves to agricultural and commercial pursuits ; and the vast variety of valuable productions with which Mexico and the other Spenish colonies abounded, the extrema richness of the soli, und their advantayeous situation, wonld, had they been only tolerably well geverned, have oceasioned their rapid increase in wealth aud civilization. But
a blind and Intolerant despotism paralyzed thelr energies, and fettered and retarded their progress. All the abuses and defects of the government of Old Spain were transferred to, and multiplied 4 n , the colonles. The whole property of those vast reglons wan consid ered as seated In the crown of Spain; and every law or regulation, whether of a local or general nature, affecting their goverament, emanated from the council of the Indies, in which it was supposed the king was alwaya present. We can not stop to describe the sort of regulations to which the colonists wers subjected with any degree of minuteness; but we may notice n few of rhem, to furnish the means of judging of their general spirit and probablo effect. It was, for example, made a captajofiense to earry on any intercourse with forelgners; and the inhablants of the different colonies were even forhidden any intercourse with each other, unless under tho strictest and most vexatious regulations. There were severul articles, such as flax, hemp, and wine, which they wero not permitted to cultivate; at the eame tine that the crown reserved te itself the monopoly of salt, tobacco, gunpowder, aud some other less importnent articles. The alcavaln, snd other oppressive imposts, which had proved destructive of industry in Old Spain, were rigorously levied an well on the exports as on tho lmports of the colonies. No situation of power or emolument could be filled except by a nativo of Old Spain. Tbe Catholic religion was eatablished, to the exclusion of every other; and bishops, tithes, and the Inquisition followed in its train: while, in order still better to consolidate and strengthen the foundations of this monstrous despotism, the government endeavored to make the colonists inseusible of their degradation, by proscriblag every species of instruction, and watchfully opposfing in introduction and progress of all useful knowledge: . der such circumstances, we can not be surprised that the continental colonists, among whom the monupoly system was maintained in its grentest purity, should have languish d for above two centuries in a state of slaggish inactivity. Though surrounded by all the means of producing wealth, they were not genenally wealthy. Oppression renilered them indolent; and went far to deprive them ; : only of the power, but also of the wisb, to emerge iron poverty. The progress of the colonists who occt ped the West India Islands was not quite so slow. it is certain, however, that, lown to the middle of last century, Spain reaped no greater advantage from the possession of Cuba. Hispaniola, and Porto Rleo, than Eingland or France from the smallest of its dependencies, In proof of this we may nontion that the noble island of Cuba, which could without difficulty supply all Europo with sugar, did not, is 1750 , produce a sufficient quantity even for the consumption of Old Spain. But the conibined influence of an arlitrary and Intolerant goverilment, and of a degrading superstition, could not balance the means of inprovement which the fertility of the soll, and the command thence arising over most of the necessaries and many of the conreniences of life, gave to the colonists. Owling also to the total incapacity of Old Spain to furnish her transatlantic prov* inces with a sufficient supply of the articles sho had forced them to Import from Europe, and the consequent extension of the contraband trade earried on with thein by the other European nations, she had been compelled gradually to relax the severity of her commercial monopoly. A new impulso was thus given to the spirit of Industry. The colonists hegan to be more sensible of the natural advantages of their situation, and less laclined to sulmit to the blind and ligeted policy of the Spanish court. In 1781, a rebellion broke ont in Pern, in consequence of sn attempt made by the gov. ernment to establish a new monopoly In that province, which threatened to end in the total diasolution of the sonnectlon between Spain and South America, and was not quelled without great dificulty and much blood-
shed. But the spirit of liberty, when once exclted, could not he snppressed. It continued to gain ground progressively, until the commencement of the last con. test between France and Spuin Interrupted the communicatlon with the mother courtry, and gave the colonists an opportunity of proclaiming that independence which, after a lengthened and bloody struggle, they happily euccecded in achleving.

British Colonies.-The Engltsh, who, like all the other nations of Europe, had leen impressed with mingled fcelings of admiration and envy by the extent and importarce of the acqnisitions made by the Spaniards in the New World, apecally entered with enthusinsm and ardor into the career of discovery. Owing, however, to the lull whish Ferdinand and Jsabella had obtained from the l'ope, conveying to them the ample donation of oll the countries jnhnbited by lnidels that the Spaninrds had dlacosered or might discover, the English, to avcid encroaching on the dominions of their rivals, directed their efferts facther to the north. Several attempts to found colenies on the coast of America were mado in the reign of Elizabeth by Sir Humphrey Gilbert, Sir Richard Grenville, SIr Walter Raleigh, and others. But in consequence of their ignorance of the country, the leficiency of their iupplies of provisions, the loss of time in frultless searches after gold, and the various dificulties incident to the firut settlement of a colony, nune of these attempts proved sacceasful; and it was not until 1607 that a senall hody of edventurers founded the first permanert establiskment of the English in America, at Jamestown, in Vhrginia. Letters patent were granted in 1609 by King Jumes to the principal jersons resident in Iondon, by whom the expense attending the formation of the colony was to be defrayed, incorporating then into a company, and estatilishing a council in England for the direction of their proceedings, the members of which were te be chosen by, und removable at tho plensuro of, the majority of the partners of the company: permitting whatever was necessary for the support and sustenance of the colony for the ifst seven yenrs to be oxported free of duty; declaring that the colonists and their desecndants were to bosecurea in all the rights and prisileges of linglishmen, the same ns if they had remained at home or been born in England; and reserving only, as the stipulated price of these concessions. and in imitation of the policy of tho Sprulards, one-fifi part of tho gold and sllyer ore to be found in the colonies, which was to he paid to his Majesty nud his suceessors in all time to come. In virtur of these powers, the company issued, in 1621, a charter or srdinance, which gave a legal and permanent form to the constitution of the colony. By this charter tho supreme legislative authority was lodged, partly in the governor, who held the place of the soverelgn, partly in a council of state named by the company, and partly in a general council or assembly composed of the representatives of the people, in which were vested powers and privileges similar to those of the Jlouso of Commons. It was not long, however, before the king and the company quarreled. The latter were in consequence divested of all their rights, partly by open vlolence, and partly under color of law, without compensation, after having expended upward of $£ 160,000$ in founding tho colony; and a governor and council of state appointed ly the king succeeded to the powers of those tupponted by the committee.-lRoncmison's History of $\lambda$ merica, book ix. passim; Jeffenaon's Notes on I'ryinia. p. 179.

The founders of the colony in Vithitia had heen actuated solely hy the hopes of gain; but the colonies that were soon after established in New England were chlefly planted by men who flec: from religions and political persecution. The form of goverument in the New England colonles, though at first moditied a good deal hy tho peculfar religious opinions entertained by the colonists, was In Its lesding principles essentiall. freo. For a considershle period the colonists elected

## It has

 of the Jhi a device o tile systes rising up merce sho raw prod is, howevetheir own governors, colned money, and exerciaed most of the rights of sovereigniy ; while the English, wholly engrossed with the contest ketween freedom and prorogutive at home, had no leisure to attend to thelr proceedings. Subsequently to the Restoration, however, tho governments of most of the New Englund States were established nearly on the same footIng as that of Virginia; which, indeed, became the fuvorite moilel, not only for the constitutlon of the colonies estabiished on the continent, with the exeeption of the pruprietary governments of Pennsylvania and Maryland, but also for those that were established in the West India Islands. But under overy vicissitude of government and fortune, the New England colonitsts were distlaguishel by the same ardent and enthusiastic love of liberty that had first induced them to quit their native land. Evory thing relnting to the intermal regulatiou and administration of the different colouies was detormined, in the colonial assemulies, by representatives frecly chosen by the sottlers. Tho perscolul liberty of the citizens was well secured and vlgilantly proteeted. And, if wo except the restraints on tieir commerce, the monopoly of which was jealonsly guariled by the mother country, the inhabitants of Virginia, Pennsylvania, atd New England enjoyed nearly the simo degree of freedom when colonists of Eagland that they new enjoy as citizens of the powerful republic of North America. Their progress in wealth and population was in consequenee quite unprecedented in the history of the world. The white population of the colonies had lnereased in 1776, at the commencement of the Revolutionary war, to aloove $2,000,000$, and the value of the exports from Great Britain to theta amcunted to ahout $11,300,000$ a year !

It is not difficult to diacover the canses of the unexampled prosperity find rapid growth of our North Americme colonles, and generally of fll colonies placed under similar circumstancee. The North American colonists carried with them a knowledgo of the arts and sciences practleed by a elvilized and potished people. They had been tralned from their infancy to habits of industry nnd subordination. Thoy were practically acquainted with the best nud wisest form of eivil polity that had been estallished in Europe; and they wero placed in a situation that enalled them, without difficulty, to remedy its defecte, and to try cevery instltution by the test of utility. But the thinness of the aboriginal population, and the consequent fucility of obtaining inexhaustible supplies of fertile mud unocenpied land, must certninly be placed nt tho hend of all the causes which hive promoted the rapill increase of wealth and population in tho United States, and la all the other colonies both of North and South Anverica. On the first foundation of a colony, and for long after, each celonist gets an ample supply of land of the best quality; and having no rent, and scnrcely any taxes, to pay, hils Industry necessarily becomes exceedingly productive, and he has every means and every motive to amass espital. In consequence, ho is eager to co!leet laborers from all quorters, and is both willing and able to reward them with high wages. But theso high wages afford the means of accuminlation, nnd, joined to the plenty and cheapness of the land, specdily change the more industrious latorers into proprictors, and enahlo them, in their inrn, to become the employers of fresh laborers; so thint every class participntes in the gencral iuprovement, and capital and population ad. vence with a rapidity hardly conceivable in old-settled and fully-prepled ceuntries.
It has been frequently said that the establishment of the Buitish American and West Indin colonies was a device of the supporters of the exelusivn or mercantile system-that they founded them in the view of ralsing up a vast ngriculturul population, whose commerce should be confined ent!rely to an exchange of raw products for other manufuctured goods. There is, however, no truth In theso assertions. On the con-
trary, the chartera granted to the founders of the settlement In Virginia distinctly empower the colonists to carry on a direct intsrcourse with joreign atates. Nor rere they slow to avail themselves of th's permission; for they had, eo early ae 1620, established tobacco warehousee in Middleburg and Flushiry; and the subsequent proceedings of the British goverament depriving them of this freedom of conmerce, were the chicf eause of those disputee which broke out in 1076, in an open rebellion of oaninous and threatening im-port.-Roneritson's america. It was not until the colonists had surmounted tho difficulties and hardships incident to their first establishment, and had begun to increase rapidly in wealth, that thelr commerco hecame an oiject of importance, and that regulations were framed in the viow of restricting its freedom, and of rendering it peeuliarly advantugeous to the mother country. The act of 1650 , passeci by the republiean Parliament, haid the first foundatione of the monopoly system, by confining the import and expart trade of the colonies exclusively to British or colony built ships. But tho famous Navigaticn Act of 1660 ( 12 Charles II. c. 18) went much farther. It cuacted that certain specitied articles, the produce of the colonies, and since well known in commeree by the name of ennmerated articles, should not be exported directly from the colonies to sny foreign country; bu. that they should first le sent to Britain, and there nnladen (tho words of the act are, laid upon the shore) before they could he forwarded to their final deatination. Sugar, molasses, ginger, fustic, tobacco, cotton, and indigo, were originally enumerated; and the list was sulisequently enlarged by tho addition of coffee, hides and skins, iron, corn, lumber, etc. In 1739, the monopoly system was so far relaxed that sugars were permitted to be carried directly from tho British plantations to any port or place southward of Cape Finisterre; but the conditions under which this indulgence was granted contimed so strict and numerous down to 1803, when they were a good desl simplificd, as to render it in a great degreo nugatory (Edwaurs's West Indies); and with this exception, the oppressive and vexatious restrictions on their diroct exportations to foreign countries were maintalind on most of the other enumerated commodities of any importance down to a late period.

But hesides compeling the coloniste to sell their produce exchusively in the English markets, it was next thanght advisable to oblige them to buy such foreign articles ne tley might stand in need of entirely from the merchants and manufacturers of England. For this purpose it was enactsid, In 1663, that "no commodity of the growth, production, or manufacture of Europe shall be in ported into the British plantutions thut such as are laden and put on beard in Eugland, Wales, or lerwick-upon-Tweed, and ia English-built shipping, whereof the master and three-fourths of the crew are English." The preamble to this stntute, which effectually excluded the colonists from every market for European produce, except that of England, assigns the motive for this rastriction to be, "the malntainlug a greater correspondence and kindness bet ween the subjects at home and those in the plantations; keeping the colonies in a firmer dependence on the mother country; making them yet more beneficial to It, in the further employme:t and Increase of English shipping, ind the vent of English manufactures and comnodities; rendering the navigation to and from them mere safo and cheap; nad making that kingdom a staple, not ouly of tho commodities of the plantations, but ulso of the commodities of othor countries and places for their supply, it leing the nasge of other natlona to keep their plantation trade exclusively to themselves." It wus also a leading principle in the system of colonial policy, adopted aa well lyy England as by the other European natione, to discourage all attempts to manufacturo such articles In the colonies as could be provided for tiem by the mother country. The
history of the colenial syatem ls full of efforts of thla great parliamentary leader and $n$ friend to colonies, sort; and so essential was this pirinciple deomed to the we need not he aurprised at a declaration of the late Idea of a colony, that Lord Chathan dld not bealtate Lord Sheftield, who did no more, Indeed, than express to declare, in his place in Parliament, that "the Brit- thes oplulon of almost all the merchants und politiclans fah colonists of North America had no Riait to manu- ot his time, when be nffirmed that "the only ute of fucturs even a wai for a horseahoe!"-Edwatids's Weat dmerican colonies or West India islands is the monorIndies. And when such were the enactments made by oLy of their consumption, and the carriage of their prodthe legialature, and suth the avowed sentinents of a $\mid$ uce! "*

At the beginning of the Revolution the Bouthern coloniea had, therefore, 812,000 white lahabltants, and the Northern 1.491,000. Connecticut was the fourth Btate in rank. Massachusetts and P'ebnsylvanta wore each a third larger than New Lork, which whs even excelled liy Connecticat.-United States Cenorts leport, 1850.

II, Magnitude of the Buitisil Colonies.-Notwithstanding the loss of the United States, the colonies of Great Brltain, exclusive of Indla, exceed in aumber, extent, and value, those of every other country. Previously, indeed, to tlic breaking out of the late contesis, the colonial domini nns $\mathrm{t}^{+}$Spain far exceeded in extent aud lmportance those of any other power. But Cuba, Porto Rico, aud the Philipplne Islands are now all that remaln to her. These, lndeed, are very valuable posaessions, though inferior to those of England.

North American Colonics.-In North Amerlea, Great Britain possesses the provinces of Lower and Lyper, or of East and West Canada, Nova Scotia, Now Brunswick, l'rinco Edward's Istand, and their dependencies. The situation and boundaries of these provinces will be more casily learned from tho inspection of the map than they could he from any description. The shores of Nova Scotia and New lBrunswiek are washed by the Atlantic Ocean; and the noble River St. Lawrence, by its communication with the great American lakes, gives to Canada all the lenefits of a most extensive inlaud navigation, and forms a natural ontlet for her surplus produce, as well as for the surplus produce of that part of tho United States which is washed by the lakes. There is every variety in the soil snd climate of these regions. In Lower Canada the winter is very severe. Tho surface of the country is covered with anow for nearly lialf the year. From the begianing of December to the midille of $\Lambda_{\mathrm{p}}$ rill the St. Lawrence is frozen over, and affords a smooth and conrenient passage for the sledges hy which it is then covered. But though severe, the climate is far from being unhealthy or disagrecable. The weather is generally clear and hrscing; and the labor of artisuns, at their out-docr employments, is rarely suspended for auany days in succession. On the breaking up of tho ice in the latter end of Aprit or the begiming of May, the powers of vegetation slmost immediately resume their activity, and bring on the fine season with a rapility that is astonishing to a stranger. The highest temperature in Lower Canada varies from $96^{\circ}$ to $102^{\circ}$ of Fahrealicit ; but the purity of the atmosphere abates the oppressive heat that is felt in noat countries where the mercury ranges so high; and the weather is, on the whole, decidedly pleasant. That part of the province of Upper or Weat Canada which atretches from Lake Simeoe and the Rivers 'Irent and Severn, westward to Lake Iluron and the St. Clair IRiver, and sowhward to Lake Irie and part of Lake Ontario, has a soil of extraerdinary fertility, capable of producing luxuriant ereps of wheat and every sort of grain. "The climate," says Mr. Bouchette, late surveyor general of Low' r Canadn, " is so particularly saiubrious, that epidemic diseasea, either among men or cattie, are ulmost catirely unknown. Its influence on the fertility of the seil is mere generally perceptible than it is in Lower

Canada, and is supposed to be congenial to vegetation in a much superior degree. The winters are shorter, and not always marked with such riger as in the latter. The duration of frost is always accompanied with a fina clear sky and a dry atmesphere. Tha spring enens, and the resumption of agricultural labers tukes place, from six weeks to two months earlier than in the nelghborhood of Quebec. Ths summer heats rarely prevail to excess, and the autumas are usually very friendly to the harvests, and favorable for securing all the late crops."-Bovchette's Tepographical Description of Canada, p. 600. The ground on the shores of Lake Ontario and Lake Erie, as far west as the junctlon of tho Thames with the St. Clair Lake, is lald out in townships, and partly aettled. But the population is still very thin. To the nerth of the River Thames, along the banks of the St. Clair and the shores of Lake Iluron, round to the River Severn, and thence to the river that joins Lake Nippissing and Lake IIuron, is a boundless extent of country that is almost entirely unoccupied. The interior of this space has hitherto been but imperfectly explored; hut the lanks of the St. Claiz and tha shores of Lako IIuron afford the finest sltuations for settlemeats. The soil is in many places of the greateat fertility, the river and lake teem with tish, and every variety of the best timber is found in the greatest profusion. The winters in the provinces of Nova Scotia, Prines Edward's Island, und New Brunswick are more aevers than in Upper Canuda, and they aro a good deal lafested with foge and mista; but their proximity to England, and their favorable situation for tho fishing business, give them considerable advantages. In addition to tbe above, Great Britlan possesses the IIudson's Bay territory, a tract of vast extent, but situated in an inhospitable climate, and worth very little except as hunting-grounds, Sha also possesses the large islands of Newfoundland and Capo Breton, the Jatter being a dependency of Nova Scotia; hut their soil is harren, and the chimate severe and foggy ; so that they are valuahle principally as fishing stations. The following table exhibita the population of the different North American colenies at the under-mentioned epochs:

| Coloniea. | Population. | Date or Conilu |
| :---: | :---: | :---: |
| Eastern (Lower) Can | 1,048,000 | 1854 |
| Western (Lpper) Caneda. | 1,860,000 | 185. |
| New lbrunswick ................ | 198,800 | 1851 |
| Prince Didward's Isl. and C. Breton | 62,634 | 1849 |
| Newfoundiand. | 90,506 | 1845 |
| Nova Sectía | 276,117 | 1850 |

Of the Inhalitants of Lower Canada in 1844, no fewer than 518,565 were of French extraction, forming what is called the Nation Canadienne. In Upper Canada, on the other hand, the population is elmest wholly of British origin.

West India Colonies.-In the West Indies the English peasess Jamaica, Barbadoes, St. Lucia, Antigua,

Grenada, Trinidad, and some othar islands, besides Demerara and Berbice in South America. Jamaica, by far the largest and most valuable of her insular possessiona, is about 120 miles in length and 40 miles in mean breadth, containing about $2,800,000$ acres, of which from $1,100,000$ to $1,200,000$ are supposed to be in cultivation. Being altuated within the tropie of Cancer, the heat in the West Indles is Intense, but is moderated by the sea-breeze which blows regularly during the greater part of the dsy. The rains make the only diatinction of aeasons. They sometimes fall with prodiglous impetuosity, giving birth to innumereble torrente, and laying all the low country under water: the trees are green the whole year round: they have no snow, no frest, and but rarely some hail. Tho elimate is very humid; iron rusts and corrodes in a very short time; and it is this, perhaps, that renders the West Indies so unfriendly to European constitutions, and produces those malignant fevers that are so very fatal. The vegetable productions are numerous and valuable; but the sugar-cane and tho coffec-plant are incomparably more important than the others, and constitrite the natural riches of the islands.

The Weat Incies are occasionally assailed by the most dreadful hurricanes, which destroy ita a moment the hopes and labors of tho planters, snd devastnte entire islands. Whole fields of sugar-canes aro sometimes torn up by the roots, houses are either thrown down or nnroofed, and even the heavy copper boilers and stills in the works havo, in numerons instances, been wrenched from the ground and battered to pieces. The rain pours down in torrents, sweeping before it every thing that comes in its way. Tho destruction caused by such dreatlful scourges seldom fails to produce a very great scarcity, and not unfrequently famine; and we are grieved to have to add, that the severity of the distress he* on several occasions been materially aggravatea by a refusal on the part of the authorlties to aliow importation direct from tho U.ited States! This was the case at Dominica so luto as 1817. "It is stated in a report by a committeo of tho Assembly of Jainales, that 15,000 negroes perished between the lstter end of 1780 and the beginning of 1787 , through famine occasioned by hurricanes and the prohibition of importation from the United States."-Edwands's Weat Indies, vol. il. p. 515 .

Jsmalea was discovered by Columbus in 1494, and continued in possession of the Spaniards till 1655 , when it was wrested from them by the English. Although it had thus been for more than a century and a half under the power of Spain, such was the deadening influence of her colonisl system, that it did not, when it wan conquered, contain 1500 white inliabitants, and these were immersed in sloth and poverty. Of the many valuable articies which Jamalen soon after produced in such profusion, many were then altogether unknown ; and of those that were known, such a supply only was cuitivated as was required for the conamption of the inhabitants. "The Spanish settlers," asys Mr. Bryan Edwards, "poseessed none of the clegancies of life; nor were they scqualnted even with many of these gratifications which, in civil'red states, are consldered necessary to ita comfort and convonlence. They ware neither polished by sociel intercourso nor improved by education; but passed their days in gloomy languor, enfeebled by sloth and depressed by poverty. They bad been for many years in a atate of progresalve degeneracy, and would jrobably in a short time have explated the gulit of their ancestors by falling vietims thoniselves to the vengenace of their siaves."-IIistory of the Wrest Indies, voi. 1. p. 207, 8vo od.

For a consitcrabis number of years after Engisnd ohtained possession of Jamalea, the cillef exports were cocos, hidea, and indigo. Even so late as 1772 , the exports of augsr amounted to only 11,000 hogsheads. In 1774 they had inereased to 78,000 hogehcade of
sugar, 26,000 pnnchers ' of rum, and 6547 baga of coffoe. The American rar was very injurions to the West India settlementa; and thay may, indeed, be said to be still anffering from its effects, as the independence of Amerien led to the enactment of those restrictions to the importation of food, lumber, etc., that were so very hurtful to the planters. In 1780 Jamaics was visited by a most destructive hurricane, the devastation occasioned by which prodnced a dreadful fsmine; and other bnrricanes followed in the immediately succeeding years. But in 1787 a new era of improvement began. The devastation of St. Domingo by tho negro insurrection which broke ont in 1792, tirst diminished, and in a fow years almost entirely annihilated, the annual supply of 115,000 hogsheiads of sugar, which Franco and tho Continent had proviously been accustomed to rcceive from that island. This diminution of supply, by causing a greatly increased demend for, ant a con aquent rise in the price of, sugar raised in the other isiands, occasioned an extraordinary extension of cultivation. So powerful in this respect was Its influence, that Jamalen, which at an average of the slx years preceding 1790 hed produced only 83,000 hogsheads, exported in 1801 and 1802 upward of 280,300 hogsheads, or 143,000 a year !

The same rise of price, which operated so powerfully in Jamsica, occasionod a similar though less rapid extension of cultivetion in other islands, and In Cuba, Porto Rico, and the forcign colonies generally. The vacuun eaused by tho cessation of tho supplies from St. Domingo being thus mure than filied up, a reaction commenced. The prico of sagar rapilly deelined; and, notwithstanding a forced market was for $n$ while opened to It, by anbstituting it for malt in the distillery, priees did not attain to their former elevation. On tho opening of the Continental ports, in 1813 and 1814, they, indeed, rose, for a short time, to an extraragant helght; but they very soon fell, favolving in ruin many of the speculators upon an adrance. Prices, however, continued at a pretty high level down to 1818; hut they sustained a niaterial fali in the course of the following year, and were comparatively low from that period down to 1835, when tho extrsordluary falling off In tho supplies of sugar consequent to the measures connected with the emancipation of the slaves again occasioned a considerable riso of price. But, as already seen, this high price was ontirely factitious, being wholly caused by our excluding forelgn sugar from our market. Now that the augar of Brazil, Cuha, and Java is admitted on paying reasonable duties, prices are comparatively low. And from the extraordinary facility with which sugar may be ralsed in the comutries referred to and clsewhore, we have no ldea, provided they adopt no rash or lli-advised measure in relation to sis ves, thes its prico in thelr markets would be likely to sustain any material or permanent inerease, even though the demand for it were doubied or more. The imports to England of augar from her West Iudian colonies, which amounted to $4,103,800 \mathrm{cwts}$. In 1831 , sunk, In 1841, to 2,151,217 cwta.! In 1852 they amounted to $3,408,627$ cwts.

The devastation of St. Demingo gave the asme powerful stlmulus to the growth of coffoe in the other West Indian colonies that it did to tho growth of sugar; and owing to tho extraordinary icrease in the domand for coftee In England and other European countries, the supply went on increasing tIII it was checked hy the liffuence of the messures relating to slavery. In 1752, for exsmple, only 60,000 ibs. of coffee were exported from Jamaica; lin 1775 the export announted to $\mathbf{4 1 0 , 0 0 0} \mathrm{lbs}$; in 1707 it had incressed to $\mathbf{7 , 0 3 1 , 6 3 1}$ ibs, and in 1832, whien it had attained its moxinum, the exports to England oniy amounted to $19,405,033$ ibs. Such, however, and so rapid has been their subsequent decine, that In 1852 the exports to England from Jamsies smounted to only $3,780,700$ lbs. !

Wo have already seen that whon Jamaica wea iakon
from the Spaniards it only contaiaed 1500 white inhabitants. In 1678 the population almonated to 7768 whites, and 9504 siaves. It woutd have been well for the isiand had the rices continued to preserve this relation to each other; bot, unfortunateiy, the black population has increased more than five timea as rapidly as the white; the latter having only increased from 7768 to about 80,000 , while the former has increased from 9504 to about 310,000 , exclusive of persons of color. The real value of the exports to Jamaica amounts to about $£ 700,000$ a year, being about oae-third part of the exports to the West Indien colonies." It was formerly much more; but then a large portion of the articles sent to Jamsica, and some of the other coloniea, were oniy sent there as io an entrepôt; being subsequently exported to the Spanish main. During the ascendency of the Spanish dominion in Mexico and South America, this trade, which was then contrabend, was cerried on to a great extent. It is now much fallen off, and is principaliy carried on from St. Thomas and Honduras.
Barbadoes was the earliest English posscesion in the West Indies. It is the most easterly of the Caribbean islands; Brilgetown, the capital, being in long. $69^{\circ}$ $41^{\prime} \mathrm{W}$. Barbadoes is by far the best cultivated of ali the West Indian islands. It containe about 105,000 acres, having (in 1852) a popilation of about 13,000 whitee, 15,000 people of coior, and 110,000 blecks. Of isto years it has exported from 600,000 to $740,000 \mathrm{cwts}$. of sugar. Barbadoes had attained the acme of its prosperity in the latter part of the seventeenth century, when the white population is said to have amounted to abeut 50,000 , though this is probably en exaggeration. But it is only as compared with itself that it can be censidered as having fallen off; for, compared with the other West Indian ieiands, its auperiority is manifest. Jt raises nearly as much food as is adequate for its supply. Tite isiands next in importance are St. Vincent, Grenads, Trinidad, Antigua, etc. It is unnecessary to enter into any special detalis with respect to them, their population and trade being exhibited in the annoxed talices. During the late war Great Britain took from the Dutch the settlements of Demerare, Berbice, and Essequilo, In Guiaua, which were definitively ceded to them in 1814. Tite soll of these sottiements is natarsily very rich; and they have, in this respect, a decided advantage over most of the West Intlian islands. Their advance was for a whilie very great, but recently their progress has been checked, and their exports have declined most materialiy. This, however, is entirely in consequence of the want of labor; for in other reapects these colonies have every facility of production. Various achemes have been suggested for suppiying this want ; but none of them, uniess they involve the prineipie of compuisory service, will, we apprehend, be successtui. The rum of Demerara enjoys a high reputation. The hest samples of Berbice coffee are very auperior, and it used to be extensively cultivated both in that colony and in Demerare. In 1881 the exports amounted, from both colonies, to $8,576,744$ pounds ; but they have since declined to next to nothing, having ameunted in 1852 to only 84,890 pounds. Considerabis quantities of cotton were formerly exported from Guinna; but the Americans having superior facllities for its production, its cuiture has neariy censed. Cocoa, annotto, etc., aro produced, but not abundantly.

Exclusive of the above, the English possess the settiement of Balize, on the liay of IIondurss. This is of importance as affording a means of obtaining abundant suppilies of mahogany; but it is of more importnee as an entrepót for tise supply of Gustemsla and Central America witis English manufactured goods.

The exports from England to the West Indian colonien consist of coarse cottons, linons, cheeks, hats, and other articles of nogro clothing; Iron and atcel, wrought and unwrought; leather, including aaddlery and liarnesa ; glass; beer and ale; moap and candles ; atation-
ery; hardware and earthen-ware ; staves, hoops, coal, lime, paint, lead; Iriai provisions, herrings, and other sait fish; along with furniture, wine, beer, medicines, and indeed almost every article which a great manufactaring country can auppiy to one situated in a tropical climate, which has very few mechanics and hardly any manufactures. Since the opening of the ports on the Spanish Main to ships from England, the exports to the Weat Indies have decreased both in quantity and value; this decrease being, however, more than balanced by the increased shipments to Mexico, Co: umbin, etc. The declared or real value of the exports amounted, in 1852, to $£ 2,031,358$.

Money.- What used to be called West Indis currency was an imaginary money, and had a different value in different colonics. " The value it bore, as compared with sterling money, was supposed to represent the corresponding value of the coins in circulation in the different islands at the time the proportion was fixed: these coins being for the most part mutilated and otherwise worn and defaced, currency was in ali cases less valuahie than aterling. The following are the old values of $£ 100$ sterling, and of a dollar, in the currencies of the different islands:

But latterly these currencies have been in great measure superseded by the introduction of sterling money, current at the same rates 38 in Engiand, and of the Spanish doliar.

By an order in council of the 23d of March, 1825, British silver money was mede legal tender throughout ali British colonlal possessions at the same nominal value as in Eugland; and bills for the same are given on the treasury of London, of $£ 100$ each bill for $£ 103$ such silver money. By this order, also, the value of the Spanish dollar was fixed at 4s. 4d. British silver money throughout all the colonies where it is current; but this value was further reduced on the 21st of September, 1888 , to $\mathbf{4 s} .2 d$. The value of the doubloon was then also fixed st 64s.

Australian Colonies.-This gronp of colonies, though founded in a very distant part of the world, and at a comparatively receat epoch, will probably, at no very distant epoch, far surpass the others in magnitude and importance. The countries in which they are situeted, inciuding the great Austraiian continent, formerly called New Holiand, with Van Diemen's Land or Taemania, New Zealand, etc., are of vast extent, and dlffer in inany respects from each other. Hitherto, also, by far the larger portion of the continent is wholly unexplored; and even the islands are but very imperfectly known. Enough, however, has tranepired to show that this great division of the globe differs in some most lmportant respects from most or all countries with which we were previously acquainted; and that lt is, in fact, full of anomalies. The interior of the continent has not been sufficiently explored to enable any distinct opinion to be formed as to the height of the mountain chains; but it appears to be pretty well established that it has no great rivers, or at icsat none that reach the sea. Indeed, it seems, speaking generaliy, to be a law in this new world that rivers are largest near their source; and that they gradually diminish as they proceed, and most commonly dwindle into insiguilicance, or lose themselves in marshes, before they reach the occan. In consequence, pcrhaps, of this alngular constitution of its river system, it is found that in Austraila the best land is not at the mouths, but toward the sourees of the rivers. There are, no doubt, exceptions to this rule; hut it appears to hold in the grester number of instances. Generaily, elso, the extent of fine lsud appears to be comparatively limited; and in so far as the continental portion of the country has been ex-
plored, it appears to be mnch better adapted for pasturage than for tillage.

Gold Deposits.-The land, the pasturage, the sheep, the copper and other ordinary minerals, which are found is abundance in various parts of Australia, have all been rendered, for the present at least, of no lmportsnce compared with the gold deposits with which the continent is so largely endowed. These, which were discovered so late as 1851, are of the most extraordinary richuess. They exceed in productiveness not only the gold fielis of California, but every thing, indeed, of which any Idea could previously have been entertained. Australia has, in consequence, become an object of earnest and universal attention. An almost unparalleled amount of emlgration has boen directod to her shores. Her population and her trade are both iacreasing with gigantic strides; and her gold is influencing the wages, the pricos, and the industry of every civilized people.-See art. Adstnalia and Gold.

It were idle to indulge in speculations in regard to the period whea the exhaustlon of the Australian gold fields may be expected; there are no data on which to hazard even a conjecture on such a subject. But whether the supplies from them be destined to be of loag or ahort duration, they have already been, and no doubt will continue to be, of great advantage. Wa do not mean by this te say or insinuate that the good resulting from the influx of gold from Australia and California has been unaccompanied by any drawbacks. The gambling and dissipation to which it has given rise are obvious. But these, though consideralle, are but a triffing deduction from its many advantages; from the powerful stimulus it has given to industry and civilization, from the new chanaels it has opened to commerce, and from its greatly amellorating the condition of the lahoring classes in this and most other countries.

The northern portion of Australia, including, perhaps, about a third part of the entire continent, lies between the tropics; the other portion of the continent, with the adjacent islands of Van Dlemen's Land and New Zealand, belng in the south temperate zone. The climate of the different parts continent must, therefore, it is obvious, differ veld dely. Wo, however, know but ilttle of the climate of intertropical Australia, except that it is within the range of the Indian monsoon ; that the temperature along the const is rapIdly raised by a wind from the south, which has been supposed to atford a strong presumption of the existence of sandy deserts in the laterior; and that the air is so very moist that during the season of the monsoon iron implements are with the utmost difficulty preserved from ruating. It la commonly said that the cllmate of extra-tropical Australia, and especialiy of Now South Wales, assimilates closely to that of Southern Italy. But this statement must he taken with considerable limitation; for, 1st. The atmosphere is very decidedly denser; 2d. The extremes of temperaturo are Infinitely greater; 3d. The average heat in rather less ; and, 4 th. The temperature appears to decline more rapidly by increase of elevation. The grand defect in the cllmate of oxtra-tropical Australis appeare to consist in the periodical recurrence of wet and dry seasons. Sometimes hardly a single drop of rain falis for an entire year or more; and though, happily, dews aro in such seasons pecullariy abundant, they form no adoquate substitute for rain. During long-continued droughts crops of all kinds aro destroyed; and herbage, except in a faw favored spots, suffers severely. Hence, as already stated, all the eastern parts of extra-tropical Australla, and perhspa also the southern, would seem to be much better fitted for pasturage than for husbandry. The droughts are exceedingly injurious to the latter, and they would necessarily involve any large population that depended princlpaliy on the Indlgenous products of the soil in extreme privations. Certalnly, however, no country seema to be bettor fitted for graz.
ing, or rather for the growth of sheep and wool. A dry climate is especielly suitable to the latter; and though the pastures be far from luxuriant, thelr boundless extent compensates for every other defficlency. Sheep are not native to the country, a amall flock of tweaty-nine head having been introduced for the first time by the original English mettlers in 1788. For a while, however, their value was not appreciated; but the Importance of sheep-farming, and Ite suitableness to the country, having been demonstrated by John M'Arthur, Lsq. (to whom the colony is under the greateat obligations), It has since increased with unprecedented rapidity. In proof of this, It may be stated that winile the import of wool into Great Britain from Auatralia amounted, in 1822, to only 152,880 pounds, it had increased in 1825 to 411,600 pounds, in 1830 to 899,750 pounds, and in 1851 to the enormous amount of $41,810,137$ pounds. Van Dlemen's Land beiag less subject to droughts than New South Wales, husbandry is carried on in it to a greater extont, and with more advantage; but there elso sheep-farming is the principal, and perhaps the most advantageoua employment. -See Van Diemen's Land. New Zealand, which has only beea resorted to by regulaz colonists siace 1840, is better fitted for agriculture than either Australia or Ven Diemen's Land, and its cllmate is more like that of England. The ground in it is, however, rather difficult to clear; the natives are also much moro formidable, sad it is not so suitable for sheep-farming.
Population.-The European population of the Anstralian colonies is believed to have been, at the undermuationed dates, nearly as follows :

| Coloniea. | Yaara. | Popalation. |
| :---: | :---: | :---: |
| New Sonth Wales. | 1851 | 107,168 |
| Vietoria, 31at Decenuber | 1852 | 200,000 |
| Van Diemen's Land ................ | 1850 | 70,000 |
| Bouth Australin...................... |  | 64,000 |
| Weatern Australia ................. | 1850 | 7,000 |
| Now Zealand. | 1850 | 22,400 |
| Tofal.... | $\ldots$ | 660,568 |

Expenditure by Great Britain on the Australian Cob onies.--Englend does not appear to spend any money in Victorla : the last parliamentary retart on colonial expenditure does not mention thet oolony. The following table exhibits the amounts expended on four colonies in the yeara 1853-'54, and the purposes to which they wero spplied:

| Colonies. | Military Chargen. | $\begin{gathered} \text { civin } \\ \text { chargen } \end{gathered}$ | $\begin{gathered} \text { Naval } \\ \text { Chargan. } \end{gathered}$ | Total. |
| :---: | :---: | :---: | :---: | :---: |
| South Australia | \&10,248 | 42 |  | 210,250 |
| New South Walea | 61,198 | 10,096 | 83 | 71,313 |
| Van Dlemen's Land. | 65,110 | 209, 176 |  | 204,287 |
| West Australis. | 85,711 | 98,128 | . | 183,834 |
| Total. | 2162,262 | <817,837 | 253 | E4T0,684 |

These totals do not really represent $\mathbf{£ 4 7 9 , 6 8 5}$ spent by Great Britain on her Australian colonien: except South Australia, all are "penal settlemeats," or have been, and the large expenditure has mostly been incurred ir guarding, disciplii:ng, feeding, and clothing convicts. In fact, the Austrulian colonies cost her next to nothiag, being hut a small per cent. of what it would cost to keep convicts at home. Under the new constitution for the four free colonies, Weatern Australia has become a conviet sottiement by her own choice, and has the alvantage of a large expenditure in consecuuence, the followiag sums having been raserved out of the revenue annually for the purposes indicated. The civil list incluies the governor's salary, judicial salaries, and those of departmenta. The rotiring allowances are for oflicials liable to removal on political grounds.

| Colosien | $\begin{aligned} & \text { Civil } \\ & \text { Lima. } \end{aligned}$ | Reliring Allowancot. | Poblite. |

III．Oturr Colonies，Spamish Colonies．－Spain，of Megellan，is not at present possessed of a foot of whose colonial poseeselons oxtendad a few years ago ground in the whole American continent．Still，how－ from tha frontiers of the United States to the Strails $\left.\right|_{\text {ever，}}$ her colonlal posseasions are of great value and
importance. In the West Indies, sho is mistress of Cuba and Porto Rico-the former by far tho largest and fineat of tho West Indian islands, and the lutter also a vary valuable possession. In tha East, Spain is mistress of the Philippina Isiands, which, were they in the hands of an enterprisling people, would speedily become of very great commercial importance.-See the articles Havana, Manilla, Ponto Rico.

Dutch Colonies.-Java is the principal Dutch colonisl possession, and it is one of which it is not easy to exaggerate the valua and importance,-See Batayla. In the East, the Dutch also possess the Moluccas, Bencooien, on the coast of Sumatra, Macassar, and the eastern cosst of Cclebes, Banda, etc. They have saveral forts on the Gold Coast in Africa; and in the West Indies they possess the islands of Curacoa and St. Eustatius, Saba, and part of St. Murtin; and on the continent of South America they are masters of Dutch Surinam, Curacoa and St. Eustatius are nuturaliy barren, but they have been both highly improved. From its being vory conveniently situated for maintalining a contraband traffic with tha Caraccas and other districts in South America, Curacoa was formerly a place of great trade, particuiarly during war. But aince the independence of South America, Cura¢oa has ceased in great measure to be an entreput; the goods destined for the continent being now for tha most part forwarded direct to tho place of their destination. That district of Surinam ceded to the British
in 1814, comprising the settlements of Demerara, Berbice, and Easequibo, formed tha most valuable portion of Surinam, or Dutch Guians. Tha district which still belongs to the Dutch lies to the south of Berbico. It contains about 88,000 square miles, and a population of about 65,000 . It is daily becoming of more value and importance. The exports of sugar may amount to about $25,000,000$ pouads, and those of coffee to about 4,000,000 pounds.
French Colonies.-Previously to the negro insurrec tion that broke out in 1792, St. Domingo was by far the most valuablo colony in the Weat Indies. But this disastrous event, having first devastated theisiand, tarminated in the eatablishment of the independent black republic of Hayil.-See Pont au Prince. Having also sold Louiaiana to the Americans, and ceded the Mauritius to tha English, without making any new acquisition, the colonial dominions of Franco for Alglers can not be reckoned among them) are at this moment of very limited extent. They consist of Gusdeloupo and Martinique, and the smali islands of Ma-rie-Galanto and Descada, in the West Indies; Cayenne, in South America; Senegal and Goree, in Africa; the Isle de Bourbon, in the Eastarn Ocean; St. Marie, in Madagascar; and Pondicherry and Chandernagor, with a very amall aurrounding territory, in tha East Indics. The annexed tabular statements show tha population, trade, etc., of tho French colonics.

But it would appear from the foilowing account of the exports from Martinlgue and Guadeloupe, in 1851, that the emancipation of the slaves has had much tho same influence over production in the French colonics that it has had in the Britieh colonles, without being, wo believe, in any degree more ad vantageous to tho blacks.
Accoent of tife Exponta of Native Proncee ftom Martiniqua ant Ghabeloupe in $186 t$.

Mantinique.

Danish Colomies.-In the Weat Indies, these consist of the islanda of St. Croix, St. Themas, and St. John. St. Croix contains about 100 square miles, and has about 24,000 inhabitants. The soil is fertilo, and it is well cuitivated. The principai productions are sugar, rum, and coffec, the exports of sugar having fornerly amounted to about $25,000,000$ pounds a year. Prolably, however, they have been diminished in consequence of tho cmancipation of tha slaves in 1848. St. Thomas, which has about 14,000 ininabitnnts, has iong heen, and stili continues to be, one of the principal emproriums in the Weet Iadies. It owes this distinction partly to its convenient situation, partly to its spacious and safe harbor at St. Thomas, on the south side of the island, and partly and principally to the modoration of the import duties, which vary from 1 to $1 f$ per cent. St. Thomas has in consequence become, as It were, a depot for the supply of the neighboring istands, goods being sent to it to be warchoused till opportunity oicres for conveying tiem to their final destinstion. The great articies of importation are, manufactured goods, principally from England, but partly

also from other countries of Europe, with proviaions, lumber, ete., from the United States. In Indie the Danes formerly poasessed Tranquebar, near Madras; and Seranipoor, near Calcutta; but these they sold, in 1845, to the Esat India Company.
Swediah Colonies.-The Swades possess one colonythe amall laland of St. Bartholomew, in the West Indies. It is only about 25 square miles in extent, but is very fertlle. It has no springs, nor freah water of any sort, except such as is supplied by the rain. Populstion between 8000 and 9000 .
Stlection of Sites for Colonial Establishments.-Nothing ean be more unwise than the plan, if so we may cali it, hitherto followed in the selection of places at wiich to found colonies. The captain of a ship, withont any knowledge whatever of the nature of soils or the capacities of a country in an agricultural point of view, fails in after a loag cruise with a river or bay, sbounding with fish and fresh water, and surrounded with land that looks fertilo and is coverod with herbage. He forthwith reports all these circumstancea, duly embeliished, and atrongly recommending the situation as an sdmirahle ono at which to found a colony; and, in nine cases out of ten, this is all tine information that is required in taking a step of auch infinito importanco. No wondor, therefore, that many fino schemea of colonization should hava ended only in lase and disappointment; and that situations which the volonists wero taught to look upon as a apecies of paradise have proved to bo any thing but what they were represented. Botany Bay, though described by Captain Cook as one of the fincst places in the world, had to be abandoned by tite colonists that wero sent ont to $i t$, as the country round it, instead of being favorablo for cultivation, is a mero sandy swamp. Is it possible to suppose, had the proper inquiries been entered into, that sny attempt would havo been made to establish a colony in so pestilential a climate as that of Sierra Leone? The colony on Swan River, Australia, may be addueed gs another instanco of misplaced or premature contidence in the reports of those who wero really without the means of forming a correct estimate of the various circemstances necessary to be attended to in forming a cojony. We therefore hope that an end may be put to this system-s system which is in no common degreo injurious to the public interests, and is highly eriminal toward those who embark as colonists. The founding of a colony should be looked upon in its true point of view-as a great national enterprise. It is not an adventure to be intrusted to presumptuous ignorance, but should bo maturely woighed, and every circumstance connceted with it carefully investigated. Ahovo sil, the situation in which it is proposed to found tho colony should bo minutely surveyed; and its climate, soii, and capacities of production deliborately inquired into by competent persons employed for tho purpose. Were this tone, government and the puthlic would have the best attainsblo grounds upon which to proceed; aud neither party would have much reason to fear those disappointnents which have litherto so often followed the exaggerated representations of those to whom the important sud difficult task of selecting situations for colonies lass been delegated.
Columbia or Oregon River, In Washington and Oregon territories, and British possessions. Its northern branch takes its rise in tho Rocky Mountains, in lat. $50^{\circ} \mathrm{N}$., long. $116^{\circ} \mathrm{W}$, from thence it pursues $n$ northern course to nenr M'Gillivary's Pass of the llocky Hountains. At tiso boat encampment the river is 3600 feet above the level of the sea (here it receives two smali trihutaries-tine Canoe Iliver, nui that from the ('ommittee's Punch Bowl); from thence it turns sauth, faving somo obstructions to canoc navigation, and reeviving many tritutnries in its course to Colvilic, nmong which are the Kootania, or Flat Bow, and tho Fint Head, or Ciarke Iliver, from the east, and that of Coivilite from the west. I'his great river is bounded, tinus
far on its courso, by a range of high mountains, well wooded, sud in some places expands into $s$ line of lakea befors It reaches Colville, whero it is 2040 feet ahove the level of the sea, having a fall of 550 feet in 220 miles. To the soath of this it tends to the westward, receiving the Spokane River from the esst (which is not navigable), and takes its rise from the Cocur d'Alene. Thence It pursues a westerly coarse for about 60 miles, receiving several smaller streams, and at its bead to the south it is joined by the Ohanagun, a river that has its source in a line of lakes, affording canoe and boat navigation for a considerable extent to the northward. The Columbia thence passes to the southward until it reaches Wallawalla, in the latitude of $45^{\circ}$, a diatance of 160 miles, receiving the Piscous, Y'Aksma, and Foint de Boise, or Entyatecoom, from the west, which tako their riso in the Cascade range, and also its great southeastern branch, the Saptin, or Lewis; which has its source in the Wind River Mountains, and lings a large quantity of water to increase the volume of the main stream. The Lewis is not navigsble, even for canoes, except in resches. The rapids nre extensive, and of frequent occurrence. It generaliy passes between the Rocky Mountain spurs snd the Blue Mountains. It receives the Kooskooske, Salmon, and several other rivers from the east and west-the former from tho Rocky Mountains, the latter from the Blue Mountains-and, wero it narigable, would much facilitate the intercourso with this part of the country. Its length, to its junction with the Columbia, is 520 miles. The Columbla below this point forms the hoandary between Oregon and Washington territories to the Pscific. The river at Wulle walla is $\mathbf{1 2 8 6}$ feet above the level of the sea, ant about 3500 fect wide; it now takes its last turn to the westward, receiving the Umatilla, Quisnel's, John Day's and De Chute rivers from the south, and Cnthlatate's from the north, pursuing its rapid course of 80 miles, previous to passing tirough tine range of Cascade Mountains, in a series of falls and rapids that obstruct its flow, and form insurmountable barricrs to the passage of hoats by water during the fioots. These difficulties, however, are overcome by portages around the falls. The waters hero descend 40 feet in the distance of two miles. From thenen there is still-water navigation for 40 miles, when its course is ngain obstructed by rapids. At the Dalies the river is compressed into a narrow channel 300 feet wido and half a miio long, and flows between high walls of basalt, and the water falls 50 fect in the distance of two miles. Tience to the ocean, 120 miles, it is navignble for vessels of 12 feet draft of water nt tho lowest atato of the river, though obstructed by many sand bars. In this part it receives the Willamette from the south, and the Cowelitz from the north. The former is navigable for small vessels 20 miles, to the mouth of the Klaekamus, three miles below its falls; the latter can not be ealled navigable, except for n small part of the ycar, during the floods, and then only for canoes and larges. The width of the Columbin, within 20 miles of its mouth, is much increased, and it joins the ocean hetween Cape Disnppointment nud Point Adams, forming a sand-spit from each, by deposit, and causing a dangerous bar, whiel greatly impedes its navigation and entrance. The influmeo of the tides is felt 80 rilles ahovo its entranco into tho Paciflc. Its entire course is nbout 750 miles. During the year 1850,160 vessels entered and departed from the ports of Columbia River. Vessels of a draft of $17 \frac{1}{2}$ feet inve been safely taken over the south bar, and it is supposed that vessels drawing over 20 fect can euter safely. This noblo river was discovered by Captain Gray, of Boston, In the ycar 1792, in the ship Columbin, and named fron the ship. It was first explored from lits sources to the sea in 180t-'5, by Messrs. Lewis nud Cinrke, by orier of the goverument of the United States. By the Oregon trenty its navigation is open to Ilritish vessels. The Coast Survey are now preparing a chart of this river.

Columba, the modern capital of Ceylon, on the southwest coast of the Lsland; lat. $6^{\circ} 56^{\prime} 6^{\prime \prime}$ N., long. $79^{\circ} 49^{\circ} 48^{\prime \prime} \mathrm{E}$. It is defended by a very strong fort, nearly surrounded by the sea, In which in a ilgbt-house 97 feet high. Population of the town and fort, in 1831, 31,519. The housea, generally only one story bigh, are of elone, clay, and lime; and the town has more of a Furopean appearance than any other in India. The inhabitants are principally Cingalese. The temperature is remarkable for its equality; and though very bumid, the climate may, on the whoie, be eateemed salubrious and temperate. There la no harbor at Columbo for lar ${ }_{\text {b }}$ desselo, but only an opon roadstead. A projecting rock, ou which two batteries are erected, affords shalter to a small semlcircular bay on the north side of the fort, having a wooden quay to facilitate the loading and unloading of boats. The depth of water is not sufficient to allow sloops or large dhonics to come alongside the quay; those exceediag 100 tone burden lying at about a cable's length from it. A bar of aand, on which the wnter is not more than 12 feet deep, extends from the projecting rock across thls bay. The chanuel where it may be crossed by the larger class of ships is liable to shift; and it is only in the fine weath$r$ of the aafe season that they venturo within the bar. The outer road allords secure anchorage for half the year, from the beginning of October to the end of March, during the prevaience of the northeast monsoon, when the wind blows off the land; during the other, or southwest monsoon, when the winil blows from the sea on ahore, the road is very far from safe; and the ships that frequent it are sometimes obliged to slip their eables and atand ou' - sea.-Mninuns's Oriental Commerce; Hamiltc Gazetteer, eto.

As respects Its harbor, Columbo is, therefore, very inferlor to Trinconalee, the harbor of which is aeces aible at all times, and la one of the best in India; but the country In the vicinity of Columbo is more fertils; and it bas the command of an Interual navigstion, stretching in a lateral direction along the coast, from Putlam, to the north of the city, to Caltura on the south, a diatance of about 100 miles, partly obtainod by rivers, and parly by canals. Many flat-bottomed boats are employed in thia navlgation, the families dependent on which reside mostly on board. Nearly all the foreign trade of Ceylon ls carried on from Columbo and it has also a large share of the coasting traffic,
Moneya.-The rix doilar =1a. $6 d . ;$ but accounts are kept in pounds, shillings, and pence, na in England.

The Bank of Ctylon, established in 1840, has its head office iu London, its principal office in the isiand leing in Columbo. It transacts all sorts of banking business, romitting money to and from tho island, grsoting cash credits on the Scoteh system, discounting bills, etc.

Weights, sleasures, etc.-The weights are divided into ounces, pounds, etc., and are the sam? as in Great Britain. The candy or bahar $=500 \mathrm{lbs}$, avoirdupois, or 461 lbs . Dutch Troy Weight. The principal dry measures are aeers or parrahs. The former is a perfect cylinder, of the depth and diameter under-mentioned:
$\qquad$ 4.35 fichos.

The parrali is a perfect cube, its internal dimensions being in every way $11 \cdot 57$ in. .es.
The liquid measure consists of gallons, and their multiples and submultiples. 150 gallons $=1$ leagucr or legger.
The bale of cinnamon consiats of $92 \frac{1}{2}$ lbe. very nearly.

 that "he di at the equat hourf, of fift and sixty in the glubo of of T'yre, thas cients, extes sads, to thebique. It is not cultivated, but grows naturally in great ahundance. It is imported in c.rcular pieces from $\frac{1}{1}$ an inch to 3 inches in dlameter, gencrally from $\ddagger$ to ${ }^{4}$ of an inch thick; the bark is wrinkled and thick, of a brownish color without, and a brightish yellow within; the pith is spongy, yellowish, and allghtly stripe 1: when fresh, its smell is rather aromatic; it is disagreeably bitter, and slightly pungeat to the taste, somewhat resembling mustard that has been too long kept. Choose the largest pieces, fresh, and of a good color, as fres from worms as poasible, rejecting that which is small and broken. The freight is calculated at 16 ewt . to a ton.-Milbtan's Oriental Commerce.

Columbus, Christopher, the celchrated navigator and discoverer of the Western World, was born in Genoa about the year 1446. Although scveral Illustrious famillea have contended for his alliance to tham, hia father Domenico, and his ancestors, appear to liave followed tho trado of wool-combers or carders, and were of humble, though repntablo origin. Columbus received his education at the university of Padua, and, having evinced an early passion for the sea, entered lato nautical life at the age of fourtaen. The first voyage in which we havo any authentic accounts of his being engaged was a warlike expedition fittod out at Genea in 1469, when, assoclated with hardy and dariag adventurers, he acquired so much distinction as to be intrusted with a separato command. After this, it is supposed, he was eniployed in various commerclal, plous, and predatory expeditions against the Mohamsmedsus and Venctians, in company with a famous corsair of his own name and family, and acquired reputation and experjence in his profession. Ilis son Fernandu rolates that, in an engagement off the coast of Portugal with four Venctian galleys, returning riclily laden from lilanders, the vessel on board which he served, and one of the Venetian ships to which it was grappled, took fire. Columbus threw hiniself into the sea, seized an oar which was floating near him, and by this means, and his dexterity in swimming, reached the shore, although two leagues distant. Proceeding thereafter to Lisbon, he was induced to tako up lise residenco in that capital.

Columbus lecame acquanted in Lisbon with the most eninent men in scienco and maritimo art, whom the encouragement of Prince IIenry of Portugal hud attracted around him. At this period (anno 1470) he was in the vigor of manhood, of engaging appcarance, grave, courtcous, and affable in his deportment, moderate and slmple in his diet and apparel, eloquent in discourso, possessing high magnanimity, and a temper which, though irritable, was under tho control of a gentie and enthusiastic piety. Here he married Dona Felipa, danghter of Bartolomeo Monis de Palestrello, an ltalian cavalier lately deceased, and a distinguished vavigator, who had discovered and colonized the island of Porto Santo. IInving obtained posgession of the journals and charts of this sea captain, und also hearing accounts of his voyages from his widow, Columbus was seized with an irresistible desire of visiting unknown reglons. In order to indulge it, he made a voyage to Madeira, and continued during several yeas to trade with that island, tho Cansries, Azores, the settlements in Guinen, and the other places which the Portuguese had discovered on the continent of Africa. By the experience acquired in such a number of royages, Columhus became one of the most skillful navigators in liverope.

Ilis eminent hographer, Washington Irving, rolates thit "he divided the ciremimferenco from east to west at the equator, according to I'tolemy, into twenty-four hours, of fifteen degrees ench, making three hundred and sixty degrees. Of these he imsgined, comparing the globe of l'tolemy with the carller map of Marinus of Tyre, than fifteen hours had heen known to the ancients, extending from the Canary or Fortunate Islands, to the city of Thina, in Asia, the western and
eastern exiremitlea of the known world. The Portnguese had advanced the wastern frontler one hour more by the discovery of the Azores and Cape de Verd Islands; atill about eight hours, or one-third of the circumference of the earth, remained to be explored. This apace he imagined to be occupled in a great measura by the eastern regions of Aala, which might extend so far as to approach tho western shores of Europe and Africa. A navigator, therefore, by pursuing a direct courae from east to west, must arrive at the extremity of Asia, or diacover any intervening land. The great obstacle to be apprehended was from the tract of ocean that might intervene; but this could not be very wide, if the opinion of Alfraganus the Arablan were admitted, who, by diminishing the slze of the degreea, gave to the esrth a smaller circumferenco t"」an was aaslgned to it by other cosmographers-a theory to which Columbus seems gencrally to have given much faith. He was fortified aleo by the opinion of Aristotle, Seneca, Pliny, and Strabo, who considered the ocean as but of moderate bresdth, so that one might pass from Cadiz westward to the Indies in a few days."

On these grounds Columbus formed the vast and daring enterprise whlch was destined to hand down hly name to posterity with unfading honor; and, firmly eatablished in a belief of the successful result of hia projects, "ho never," says Irving, "spoke in cloubt or hesitation, but with as much certainty as it his eyes had beheld the promised land. A cleep religious sentiment also mingled with his thoughte, and gave them at times a tinge of superstition, but of a sublime and lofty kind. He looked upon himaclf as standing in the hand of lleaven, chosen from among men for the accomplishment of its high purpose; lie read, as he supposed, his contemplated discovery told in Holy Writ, and shadowed forth darkly in the prophecies. The ends of the earth were to be brought together, snd all nations, and tongues, and languages, united under the banners of the Redcentor." The disturbed atate of Portugal under Alphonso retarded the progress of discovery. The compass, though in general use, had not gained that reliance which induced mariners fearlessly to brave the dangers of the deep; and the project of a voyage through boundless wastes appeared extravagant and impracticable. Nothing claunted, however, by these disheartening symptonis, Columbuspursued his favorite schemes with ardor, and longed to put them into execution. So perilous nil adventure was not, however, to be attemptod without the patronage of some sovereign power; and John II., of lortugal, having at this juncture ascended the throne, and belng favorably Inclined to the cause of discovery, Columlus made his proposais, which were graciously received by the monarch, and referred to a leamed junto. The result of their conference therefore was, that they recommended the king to fit out a caravel privately, and attempt the proposed discovery by the designated route, which they ascertalned from charts and details craftily obtained from Columbus. John, in an evil hour, had the weskness to adopt this perfidious counsel. The caravel departed, but the pilots hat neither the genius nor fortitude of Columbus; their courago falled, and putting usck to the Cape the Verd Islands, they whed from thence to Lisbon, execrating tho project as extravagant and Irrational.

Columbus next carried hila proposition to Venice, where he wns equally unsuccessful. IIe also sent his brother IBartholomew to lay his plans lefore Henry VII. of Dingland, having in the mean time sailed himselt' fer $S_{j}$ )ain, where he arrived after having spent all his means. Columbus, in this state of alject poverty, set out for the Castilian court at Cordora in the spring of 1486 . The moment was unpropitlous for such a proposition, the Spanish sovereign treing at the time engaged in military proparations agulnst the Mcorish kings. At length, through the intercession of Cardinal Gonzaloz, he obtalned an interview, and submilted
his project to Ferdinand. Worn out with a serien of disappointments and delays, and supporting himself by making mape and oharts, Colombus, despairing of the Spanimh patrenage, began to look to other courta, in hopes of meeting more encouragement. He had already made proparations for thin purpose, and taken meacures for the disposal of hia children daring hla absence, when Juan Perez sollcited hlm to defer his jour. nay, making application at the aume time to Isabellathe result of which was a gracioun invilation of Columbus bmek to court, necompanied with the present of a amall num to equip hlm for tho journey. The monarcha were now pledged to attend to his proposale, and negotiations wore set on foot to carry them into execution. He proposed that a amall fleet should be fit ted out nader his command to attempt the discovery, and atipulating that he shonld be invested wlth the tities and privileges of admiral and viceroy of all the seais mad lands be ahould discover, with one-tenth of all gains, either by trade or commerce. He further offered to furnish man oighth of the cost, on condition of enjoying an eighth of the profts. Hia terms were, however, deemed inadmisulble ; the negotiation broke off, and Columbus, In indignation, mounting his mule, was already on the rosd to Cordova, with the intention of Immediately proceeding to France, when he was overtaken by a messenger from the queen, who had been prevailed upon ly the argaments of Quintanills and St. Angel, two of Columbus' patrona, to favor his undertakings. The negotiations were now completed, and the capitulations were signad by Ferdinand and Isabelle at Santa Fé, on the 17 th of April, 1492. The articles of agreement wars to the following effect: That Colambus ahould be constituted high admiral in all the seas, islands, and continonts he should diseover. with aimilar honors snd prerogatives to those eujoyed by the high adnuiral of Castile in his district. He was also nominated viceroy and governor genernl over all the asid lands and continents; and a tenth of all free prefits arising from the merchandise and productiona of the countries within his admiralty was granted to him forever. Columbus, or his lieutenant, was to be sole judge of all causen and disputes r rising out of traffic between those countries and Spein. He was further permitted to contribute an eighth part of the expence of expeditions to the countries ine expected to discover, and was entitled in return to an eighth part of the profits. A principal object of Columbus in this undertaking was the propagation of the Christian faith, to which he was a aealous devotee. Expeeting to arrive at the extrumity of Asia, he hoped to spresd the light of the Gospel among the barbarian nations of the East; and so confident were his anticipations that lettere were actually given him by the sovereigns for the Grand Khan of Turtary. Although the royal docuunents were signed both by Ferdinand and isabella, her separate crown of Castile defrayed all the expenso; and the queen in consequence reserved for hor subjects of that kinglom an exelusive right to ali the benefits which might accrue from the success of the expedition.

The arrangement being finaily completed, Columbus set sail on the 3 d of August, 1492, in three amail vessels, only one of which (commanded by himself) waa completely decked. The two othere were commanded by Martin Alouzo Pinzon and Vincente Xañez linzon. The expedition had sailed nearly 200 leagues to the westward, when Columbus porceived that the needle of the compass, when night met in, had varied; a circumatanco which filled the pilota with consternation. For this phenomenou he was obliged to invent p resson, whleh, though it did not catisfy himself, yet served to dispel their fears. As the squadron advanced, varlous indications of land, such as birds flying from the west, the water becoming less salt, and occasionally covered with weede, animuted and supported the courage of the crew ; but at length murmurs and feara began to prevail amoug them. They had sailod for eleven days,
wattod by a moet propitious breeza, over a tranquil sen, without lowering or uhifting a sail. The rude scamen began to be alarmed that no other winds blew but easterly, and that it would therefore be impossible for them ever to return home. A few light breezen from the weat allayed for a tlme their apprehensions, uad several amall alnging birds came in the morning and flew awny ut night. But the sailors lost all patience, and became so mutinous and refractory that it required the utmost address of Columbus to maintain his suthority. The appearances of land, though frequent, were in many lastances decelving; and at last the seamen broke forth into loud clamors, and lnalsted upon abandoning the voyage. Fortunately, however, on the following day the manifestations of land were such as no longer to admit of doubt. In the evenlag Colus. bus perceived a light glimmering at a distance, and the next morniog land was clearly seen about two leagues distant. The suilors now burst forth into the most extravagant transporta. They threw themselres at the feet of Columbus, implored his pardon, and prononnced him to be a person inspired by Heaven with moro than human sagncity and fortitude, to accomplish a deaign so far beyond the ldeas and conceptions of ull former ages. At daybreak, asys his blographer Spotorno, on the 12th of Oetober, the hero landed, "e di grand'orma il nuoro mondo imprima" (and with his great footstap inpressed the New World). Columbus and his followera threw themselves on their knees; and rising, the admiral drew his sword, planted the cross, hoistoc the royal stundard, and in the presence of the astonished natives, who imagined that the Spaniards hed dropped from heaven, took possession of these new countries in the names of the Cautilian sovereigns, giving the island the name of Sun Sulvador. IIaving visited several of the West India islanda, and setuled a colony in Hispaniola, he again set sail for Spain. On the voyage he fell in with the Pinta, which had seprrated from hlm for a long time through the wickedness of the captain, who had gone in search of gold. After encountering asveral viojent tempests, Columbus arrived in the Tagus, near Lisbon, on the 4th of March, 1493. Ile was treated with the most honorable attentions by the court of Portugal, and fnally reached the port of Palos on the 15 th of March.
.The triumphant return of Columbus excited the most unbounded transport. Wherever he went the air rang with acciamations, and he recelved such honors as aro paid to sovereigns. The court was then at Bareclona, and Columbus took care immediately to acquaint the king and queen of his arrival. They were no less delighted than astonished with this unexpected event. The admiral was conducted. into the city with ell imaginable pomp. The sovereigns roceived him scated in atato under a rich canopy of broeade of gold, surrounded ly their principal nobility. When he approached they stood up, and, raising him - ${ }^{-}$he knecled to kiss their hands, ordered him to be sem..d in their presence, and give a circumstantial aceount of his royage. When ho had finiahed his oration, which he dolivered with much modesty and aimplieity, the hing and queen, knecling down, offered up solemn thanks to God for the discovery. Every possible mark of hour that could be suggested by gratitude or admiration was conferred on Columbus ; the former capitulation was confirmed, his family was ennobled, and a fleet ordered to be equipped to eqable the navigator to go in quest of those more opulent countries which ho still confidentiy expected to find.
The successful attainment of the splendid discovery of Columbus, great ond manifold as were lis advantages to mankind, was the prelvie to the dark and troubled epoch of his life. By his second voyage to the Weatern World he no doubt in part roalized his expectations, extended his discoveries, snd came back to Spain with substautial proofs of success; but the ostensible parpose of his return was to obtain reparation

 its advantdark and voyage to ized his exme back to but the osreparutiouof injurions imputations which had been heaped npon him, and generally to have his privileges confirmed snd enlurged so as to enable him to exercise his authority over the coloniate, who had become refractery and unnanageable. But his third voyage only accelarated hin disastrous fate. The newly-diecovered possessions were distracted with the horrors of rebellion. The verdant and blooming lales, the expected abodes of peace and happiness, were converted into theutres of sanguinary confliets and misery; and Columbus foun" inself an object of fear and execration. It whe daring this voyage that he landed on the coast of Pa ria, ja South Americs. Meanwhile hle enemies in the Oid World were not idle. Aa invectigation into his conduct was iastituted under the control of Franclaco Bovadilla, who was empowered, should lie find the charges of maladministration proved, to supersede Columbus, and assume the government of Hispaniola. The result was, that he and his brothers Diego $r$ i Bartolomeo, after having been treated with the grea, eat indignities, were sent to Spain in chains. From these diagraceful bends he was immadiately on his arrivil released by the Spanish moaarche; but his complaints were tardily acknowledged; he again sank into obscurity, and was reduced to such straitened circumstances that, according to his own acconnt, "he had no pluce to repair to except an $\operatorname{lnn}$, and very frequently had not wherewithal to pay his reckoning."

At length he was again employed upon a fourth roysge, with restricted powers ; but the result was unpropitious, and he returned to Spain dejected in mind and worn out with bodily infirmitics. Death at last reliered him from his earthly afflictlons. He expired on the 2 (th of May, 1506 , commending, with his latest breati, his spirit to God. A marblo tomb was reared over his dust, bearing the lascription,

## A Castllla y a Leon, <br> Nuevo mondo dio Colon.

Columbus was a man of great and original genius, eaergetic in hls consluct, and possessed of lofty, daring, but nobla ambition. "The magnanimity of his nature," says Irving, "shone forth through all the troubles of hin stormy career. Though continualiy outraged in his dignity, braved in his authority, foiled in his plans, and endangered in his person, by tho seditions of turbulent and worthless men, and that too at times when suffering under anguiah of body aul anxiety of mind enough to excasperate the most patient, yet ho restrained his valiant and indignant opirit, and brought himself to forbear, and reason, and even to sapplicate." Ills piety, thougi tinctured with superstition, was genuine and fervent. If on certain ocensions his religion displnyed itself in harshness and severity, the spirit of the age he lived in must bo adverted to in palliation of his conduct. Ilis temperament was decply imbued with puetic enthusiasm. "It spreaci," romarks Irving, "a goiden and glorious world sround him, and tinged every thing with its own gorgeous coiors. It betrayed him into visionary speculations, which subjected him to tho sneers and cavils of meu of cooler and safer, but more groveling minds. It filied his mlud with solemn and visionary meditations on aystic passages of tho Scriptures, and on the shadowy partents of the prophecies." "IIls 80ul," observes a Spaniah writer, "was superior to the age in which ho lived. For him was reserved tho grent enterprise of tracersing a sea which had given rise to so many frbles, and of deciphering the mystery of his age." "With all the visionary fervor of his fimagination," adds Washington Irving, "its fondest dreams fell anort of the reality. IIe died in ignorance of the real grandcur of his dlscovery. Until his last breath he entertained the idea that he had merely opened a new way to the oid resorts of opulent commerce, and had discovered some of tho wild regions of the East. IJe supposed llispaniola to be the ancient Ophir which had been visited by the ships of King Solomon, aad that

Cuba and Terra Firma were but remote parta of Asia. What viaions of glory would have broken upon hie miad could he have known that he had indeed discovered a new continent, equal to the Old World in magnitude, and separated by two vaat oceana from all the earth hitherto known by civilized man ! aad. how would his inagranimous apirit have been consoled, amid the affictions of age and the caree of penary, the neglect of $a$ fickle publio and the injustice of an ongrateful king, could he have anticipated the oplendid empirsa which uculd ariee in the beautiful world he had discovered, and the nations, and tongues, and languages which were to fill its lande with his renown, and to revere and bless his name to the listeat posterity ${ }^{n}$ It will be remarked that Mr. Ircing, in aecordance with the generaily entertained beitef of all his biographers, alladea to Columhus as belng the first discoverer of the American continent, which is emphatically so, as far as the commercial world is concerned. It is, however, certain that the continent was visited by the Icelanders in the end of the tenth and the beginning of the eleventh centurjes; and Sebastian Cabot diecovered Newfoundland and Labrador in Juae, 1497, nearly a year previous to the visit of Columins on the ceast of Paria. It also seems more than probable that Columbus was uware of Cabot's discovery.

Several controversies have arisen bearing upon the claims of Columbus to the discovery of the Western World; but such disputes, in so far as they affect the discovery of the Columbian Archipelago, are proved to be idle and futile, as no doubt now remains of Columbus having been the first navigator of the Old World who reached the island of San Salvador, and the first who viaited the shores of the South American continent. One of the most current sianders on our navigator's fair fame, as related by Jnca Garcilaso, was that Alonzo Sanchez, sailing to the Canaries in 1484, reacied the island of St. Domingo, and communicated his voyage and route to Columbus. Some other Spanish writers notice the event without giving the name of the nuthor of tho discovery. Oviedo considers these reiatione ns mero vuigar fables. We are, however, told by Columbus himeelf that he took advantage of such accounts as were trunsmitted to him by Spanish and Portugucse mariners, some of whom had ealled westward so far as to perceive what they considered to be indications of land. Gallo and Giustiniani, authors contemporaneons with Columbus, assert that Bartiolomow Columbus first conceived the idea of western discovery, and communicated it to lise brother; but Columbus bas been triumphantiy vindicated from these ungenerous aspersions by the unanimots testimony of the Spanish writere, among whom Las Casae, who knew buth brothers, and preserved many papers bejonging to Columbus, merits cspeclal credence. But lf any doubts remained, they are completely removed by the written deciaration of Ferdinand and Isabelia, whe, in a communication dated the 4th of August, 1494, write thus to the admiral: "One of the principal reasons for which your discovery (the first) has caused eo much joy to us is, that it is to be ascribed to your gendua (por aer inventada), and that it has heen commenced and terminated by your own individual endeavors, by your conrage, your perseverance, and industry."-E. B.

Tte discoveries of Columbus were followed, $\ln 1497$, ly those of Cabot on tho northeast coast of America ; in 1000 by Cabrul, a Portuguese, who visited the coast of Brazil and the meuth of the Amazon ; in 1608 by Pinzon, who is said to have entered the Rio de la Plata. In 1511 Diego Columbus conquered the island of Cuba. In 1518 Halboa crossed the Isthmus of $\mathrm{D}_{\mathrm{u}}$ rien. In 1519 Cortéz landed in Maxico. In 1581 Peru was invaded and conquered by Pizarro.

Colsa, Oil of. The oll expressed from the seed of the Brassica oleracea, a apecies of cabbage. Colzu oil is much used in France and Belgium for burning in lumpe and other purposes.

S, amoroe. Commerce, in its most general sense, k. . - the e:cchange of articles of any kind for money or other articles. The earliest form of such exchangee is by barter, because the uee of gold and silver in not adopted until soclety has made a certain progress. "The armor of Diomed," says Homer, "was plain, and patd for by nine oxen; while the splendid armor of Glaueu cont a bundred.". Harter being now disused in all impreved countries, commerce is almoet always understood to denote the exchange of commoditien for money. In France and the south of Europe the words used to designate commerce are derived from the LatIn; In Holland, Germany, and other northern countries, a vernacular word is more frequent; but all ar alike in meaning, being applied equally to homv and ioreign trade.

We propose in the present essay to treat of,
I. The principles of commerce, and the evils of interfering with the free course of trade; II. The history of Conmerce, particularly in Great Britain, IIolland, and America; III. Prominent commercial changes of the nineteenth century:

1. Pannelples of Commence.-By " principles of commerce," we understand conclusions of $t$ wo kinds; those deduced from the practice of merchants, and applicable to the management of trade by individuals and those of a more comprehensive character, which, resulting from the course of productive industry generally, are entltled to the attention of a minister, or of ficer, of the Department engaged in the task of devising regulations for trade. Most of those conclusions seem so piain as to admit of little question; but it is a fact that several of tham have been the result of leng, and, in some casee, or uearly bought experience. As a spec Imen we give the following:
2. Mercantile Axioms; example of them.-Short credlts and quick returns, however smali the commission or profit, are eventually better than long credite and a large commission or charge.
3. The greatent mercantie profit arises from intercourse with populous and long-settled countries, such as Holland, becense tinc inhabitants are in general possessed of capital, and punctual in their prayments.
4. Recently-settled countries, llke the United States of America, the West Indies, Spanish and Portuguese America; are ulways bare of capital. There is a perpetual tendency in them to draw it from Europe; and mercantile transactions with these countries, profitable in the outset, often become otherwise, from delays of payment, and altimate insolvency.
5. Trade shouid be left as much ne possible to its natural courso, Interference being nimost always hurtful. Gorernments onght merely to rensove obstacles and grant facllitles. Privileges and monopolies were formerly very general; but these, if necessary in an carly age, when individual capital was too scanty for distant undertakings, should be withdrawn as soon as such capital becomes sufficient.
6. Division and aubdivision of employment can be carried to only a limited extent in agriculture. In manufactures thoy may be carried very far, and are productive of the greatest advantage. They affiord employment to persions of every age, and thay conduce greatly to the filished execution of work. Ilence the superiority of towns, in particular of the larger towns.

Rnies or observations like these are very seldom met with, either in printed works or in personal intercourse ; und the reason ls, that while few departmente of industry have been followed in practlee to $\mathbf{s b}$ great an extoat as commerce, hardly any other has been less an object of study in regard to its principles. There are hardly any books or written compositions for the purpose of Instructing the merchant in the practical management of his business, snd not many containIng statistical or other Information connected with trade. To no profession are written precepts considured to be so little applicabla; in none is proficiency
thought to depend so exclusively on practice. Hence an unacquaintance with principies or gencral rules, and the commission of grievous errors, as well by merchants in the pursuit of business, as by the cov. ernment in the enactment of commercial regulations. Of the former we thay take as examplee the repeated glutting of forelgn markets wilh goods, and the injudicious extensima of sugar cultivation in the West Indies; nf the latter, the fetters Imposed upon the bank ing syatem, without stability being given to the sys tem by the control and latereat which should ba taken by the general government.
Tha belief that it is for the advantage of a nation to manufacture alinost every articlu it consumes has been the cause of the most serious inconvenience and loss. It Is thus that in France the making of augar from beetroot, and the more serions error of ereeting hlast furnaces for naking iron in districts anprovided with coal fuel, have placed a large amount of capital in a situation whence it can not be withdrawn withont heavy loss. In like manner, the privileges so long conferred by act of parlinment on the silk manufacture in Fitgland frequently tended to product embarrassment, because they Interfered with the natural course of trade. No branch of Industry can be of permanent advantage to a nation, unless it can support itself without indirect or artificial ald. Were merehants and manufactarcrs left to themselves, the natural course of things would point out the branches of productive industry likely to anceaed or not in a particular country; and capital would not then be advanced on an insecure foundation. Plain as this appears, it is quite at varianco with the creed of our ancestors; a creed which, ander the name of "mercentile aystem," long retained an influence over our traders, and, In some degree, over members of the Legislature.

The Mercantile System explained.-The basis of that system was, that " wealth consisted in the precious metals; that what is gained in trade by one untion must be lost by another; and that our great object in receiring returns for our exports should be to get money instead of nuerchandise." It followed from such notions, that of all possessions, a mining country, such as MexIco and Pert, was the most desirable; and hence in a great measure the rupture of England with Spain in 1740, which led to the unfortunate British expedition to Carthagena, Involved her ir contest with France, and caused her in the courso of !ght years an inmenes vaste of blood and ireasure. The return to a state of peace in 1748 obliged her to desist from attempts on Spanish America, but the influenco of the mercantile system continued, and was singularly favored by tho annual custom-house returns. These retnras exhibit an apparent excess of exports ahove lmporta, and give rise to the notion that the balance is sent to this country in tho slape of money. Supposing the exports of England to the Continent of Europe to amount for any given year to $£ 20,000,000$, and the imports to $£ 14,000,000$; the difference, or $£ 6,000,000,1 \mathrm{ls}$, according to this alsurd notion, the amount of prefit paid in money. It is clear, howerer, that the cuistom-house returns take no netice of some very importent items, such as the export of public money for foreign garrisons, the transmission of bilis of exchange to forsign merchants, or the import of smuggled goods. Besides, if the quantum of circulating medium remain, as it probably does, very nearly on a par, what becomes of the supposed importntion of money? Were England In possession of all the annual halances which the advocates for this system suppose her to have received in money during tho last century, her metallic stock would not be below $\mathbf{£ 4 0 0 , 0 0 0 , 0 0 0}$ sterling ; that is, ten tines ite actual amount!

Wealth supposed to consist in Gold and Silver.-When a merchant exports goods, the sale, of course, takes place abroad, and a remittance is made, elther by bill or by the return of othor merchandise. It hardiy evet enters into the contemplation of the exporter that he

would find an advantage by obtaining a rotarn in coin or bullion. Money owes the reputation it has acquired, as an object of national interchange, to its convenience in other reapects; to ita being the commodity with which wo regularly go to markat, and to ite fitneas for the smallest purchases, by the minutenese of its subdivisions. But this recommendation, however important in private business, ahould have no weight in the intercourse of nations; merohants can be at no losa to dispose of a remittance made in the shape of goods, nor is it any object with them to multiply the meana of petty purchases.
Capital defined,-The interent of a cemamercial conntry is not to increase the amount of its currency, but to quicken its circulation; the same unm performing double and triple duty when paseed expeditiously from hand to hand. Now nothing pr notes circulation so much as exernption from arbitrary interferences, were the effect nolhing more than the general preservation of eredit. In France, the monstrous abuse made of the paper syatem in the beginning of the Revolution has leng proveuted the use of any other circulating medium than coin; the result is an annual loss of three millions starling to the public, anch being the difference between the cost of paper and the precious metvls, even after making an aliowance for the retention of a portion of the latter aufficient for the purpose of banking. Some people, however, imagine that to increase the amount of the cirenlating medium is to inyease the capital of a comintry. These persons ahould recollect that capital is by no means limited to money, but embraces ali tiot mass of property which is devoted to reproductive consumption. When we wish to lend capital, or to cmpioy it in business, we begin by selling the various articles at our disposal : the amount is then in our hand in the shape of money; but this is very transient ; the money disappears as soon as we make payment for the new purchases. Tho public not having time to enter iato all thia reasoning, judge from first 'mpressions, and take for granted that money is capital, because its ageacy ie required to put capital in motion. Governneents, however, might have saved themselves much trouble in providing supplics of metsllic currency, sti.ce the natural course of businese will invariably provido them for itself. The plenty or searcity of the precious metais depends on considerations altogether different from the imagined balanee of trade. Spccie was so scaree in England in 1809 that the government was not a littie embarrassed to find $\mathbf{\Phi 2 0 0 , 0 0 0}$ for the Walcheren expedition; yet in that year her custom-house returns presented an apparent balance of above $£ 7,000,000$ in her favor.
Losses to Einglend from the Mercantile System.-No conntry has suffered se much from the errors of the mercantllo system as England; partly on account of the influence of traders and manufacturers in her legislature; partly from the temporizing policy of the ministers, who have aeldom scrupled to buy the consent of any great body of the community to a new tax, by the grant of some injurioua preference. Hence a variety of pernicious regulations in faver of the landed, the shipping, and the manufacturing intoreate; hence, also, a namber of unfortunate measures in the foreign policy.

The 17 th and 18th Centuries.-Our English anceators laid it down as a fundamental rule, that there could bo no prefit on the one hand, without a corresponding loss on the other. They considerod trade as a game of mere trangfer, and had ne idea how a country could darive weaith by an intercourse between its own inhabitants. Charles II. entered on the war of $\mathbf{1 6 7 2}$ with high hnpes, imagining that, by deatroying the commerce of Hollaud, England would not only increase her ewn, but in a manner absorb that of the world. Political reasons led England afterward into close alliance with Holland, and prevented the ebullitions of jealousy in that direction; but the alarming power of Louis XIV, and the prospect of his acquiring the crown of Spain, led her to a closer connection with Portogal, and particulariy to
the well-known Mathven trenty, coacluded in 1703, the ohject of which was to favor the conaumption of port wing, in return for a almilar preference to her manufneturvs. The reault has been, that ahe has not scrupled, for more than a century, to import injurious commoditien for the sake of an imagirary political advantage ; we say imaginary, because France cuuld evidentiy have agreed to take English manufactures in return for her produce; and if the iacrease of French trade had, on one hand, the effect of augmenting, to a certain extent, her national power, it would, on the other, have increased her dependence on England, and have rendered a war extremely impolitio and unpopular.

English attachment to Portugal arose, in $t$ great measuro, from her not being a manufactaring country, and likely, in the opinion of the calculatori of the day, to be so much the more advantageons in the capacity of a cuatomer. This notion has prevailed to a very recent period; the adminiatration of 1808 and 1809 not scrupling to give encouragement to the caport of merchandise, on a large scale, to the unproductive occupante of 13razil and Spanish America. Now, the fact is, that the means of extending trade, and consequently profits, with a foreign country, are to be eatimated by a quite opposite rulo; they depend on the prodactive power of that conntry, on its meane of affording equivalente for our commodities; in other words, on itt capability of paying for that which it suita us te sell to it. Now, what country was ever wealthy withent industry? The mines of Mexico and Pern, the richest the world ever saw, fall, in point of annual produce, far short of the annual value of the cotton, the tobacco, the fleur, and other lesa tempting products of the United States. In like manner, the cochineal, the cocoa, the barilla, and even tho indigo of Spanish America, form a amall amount when put in competition with the exchangeable commoditiea possessed by the indnstrious nations, such as France, the Netherlands, or the north of Germany.

Mercautile Policy of other Countries.-If from England's fnvorite policy we turn our attention to that of Continental atates, wo find Holland ateering a course of impartiality, and guarded from an imitation of these trespasses, not indead by auperior knowledge, but by the characteristic moderation of her government. The northern kingdoms deserve comparatively little attention, their rulcra having in general given their thoughts much more to war than to ciscussions of internal policy. The same thing was long true of a country where the commercial interest has at ne time been very considerable; the personal will of the aovereign, and the influence of the noblesse, having afforded the grand raisons determinantes for public measures. Still the history of France is not without traces of the effects of mercantile prejudices. Among other regulations of the kind, there formerly existed reveral for the purpose of favoring linen manufactures instead of cotton, because flax was a home product, while the purchase of cotton carried money out of the country.

France.-At last it was found out by some Frenchmen of greater sagacity than the rest, that cotton might be safely admitted to entry, the money required to buy it proceeding necessarily from the employment of French industry in some shupe or other. But the extent of popular prejudice was most singulariy exemplified at the time when it was proposed to permit the unrestrained use of toiles peintes, or printed calicoes; every town that had a chamber of commerce remonatrated against it. A deputation sent from Ronen affirmed, that " the proposed measure would throw ite inhabitanta into despair, and make a desert of the surrounding country;" Lyons, the centre of the silk manufacture, declared that "the news had apread terror into all its workahops;" Tours "foresaw a comnintion likely to canse a convulsion in the body politic;" Amiens asserted "that the proposed act would becomo the tomb of the manutacturing induatry of France;" and Paris declared, "that
her merchants came forward that thay might bathe the throne with their tears." The government, however, stood firm; the duty oa printed callico was withdrawn, and the inspector-gmeral of matiufactures ventured some time afterward to challenge the authors of those elegant effuslons to compare their predictions with the result. "Will any of you," he sald, "deny that tho manufacture of printed calico has been the cause of giving a vast exteasion to the industry of the country, by employing a aumber of hands in splaning, weaving, bleaching, and printing? Look only to the branch of dyeing, and say whether this change has not done more for it in a fow years than other manufactures would have accompllshed in a century."

Commerce of A ustria. - In some countries government go much farther, and still act in a counmercial or manufacturlag capacity, notwithstanding all the admonitions of political economists, or the more home-felt lessons of experlonce. The Austrian government conducts the gold and eilver mines of Hungary to so littlo account, that tha profit roalized from these splondid establishments does not exceod a few thousands a year. In the year 1817 the French government, desirous of laying in a stock of corn for Paris, obtained a loan of money, with which they mado purchasea in various msrkets both in and out of the kingdom. The result was most distressiag; the price of cora rose from 80 s. to 120 s . per quarter. The people in the provincial towns becamo apprehensive of a scarcity, and, though in general submissive to a fault, attempted at Rouen and other places to impede the course of the market, and to prescribe a limit to the price of corn. The alarm, onee glveu, extended through great part of Europe, and gave occasion to a sudden risc, as may be seen by reference to the corn prices at the time in London, Amsterdam, and IIamburg. Nothing is, therefore, more impelitic than the interference of the public treasury with markets, however good the motive; a truth which hans been so thoroughly folt in Eugland as to provent any thing of the kinsl during the last sixty ycars, govomment having confined itself in seasons of searcity, as 1800 , 1810, 1816, to permitting the fres import of corn.
Modified State of the Mercantile System.-We aro next to advert to the mercantile system in its most limited sense, in the shape which it now bears, after all the moditicatlons of the experience of a century and a lisif. The predllection for the importation of "hard dollars" has dlsappeared among a portion of the public, particularly since making the discovery that bank paper can be made to answer tho purpose of geld and sitver. But even theso persons are far from admitting the doctrines of political conomists in all their extent ; they still cling to the notion that we should discourage tha import of a forelgn article whenever a corresponding commodity can be raised at home; that we shic.hll hapede, or even prohilit, all :...i. $\quad$ n manufactures; and that wo should not scruple :o "aco, race certain fabrics of our own by conntues. Sueia, 'o. o merly the creed of tho majorlty
 $y$ yrs the then of ministers and presidents of INads in it procecils on the plausible idea,
 8.2. "h: our "ppita would he in danger of falling short si. wurj vi.3 we to purchase finished articles at the hands of forelgners. Ilut there is not In the natural course of things any such deflelency of labor as to make It necessary, or even experllent, for us to turn things out of thelr regular order for the sake of giving employment to our populatlon. Providence has evidently ordalned that Industry shond be at no loss fur objects; the interruptions to ita peaceful course arisc from our ewn wayward pulicy ; from vur restraints, prohihitlons, and, alove all, from our sudden changes from war to peace, and from peace to war.

Equally erroneous is the notion that it is morn for our linterest to send abread manufactures than raw produce or money. If you grant a bounty on an export,
you do nothing more or less than bribe a forelgner to make a purchaso from you; you withdraw from lts natural destinstion a portion of your capltal and labor; for the sake of extending one branch of busluess, you weaken your means of compotition ia others. Mr. IIume has justly remarked, that in a question of personal right, the perception of a bslf-educated man may be sufficleatly sound; but that the case is difiercat in regard to matters of general policy, where the resl is often different from the apparent result. Now this state of half knowledge has been the origin of almost all mercautlle miscaleulations; we have listened to tirst impressions, and have not scrupled to glve them a practical operation by acts of government, whlthout ever considering that the remote consequences would bo itrjurious to ourselves.

The true Principles of Commerce.-We may safely discharge from our minds all that has been said, and all that has been written, in regard to the greater relative advantage attendant in trading in this or that particular commodity; wo may feel sutisfied that protits are much more on an equality than is commonly supposed; that ne one would long be a dealer in that which did not afford him advantage, or remaln a stranger to that which was throwing an extra gain into the pockets of his neighbor. The same rule is applicalle in a national senso, tho tratlic in one commodity being either directly or Indirectly as productivo of profit as in unother. liven fereign articles of lixury should not be diseournged, since the moncy required to pay for them must be previously raised by the employment of indastry in some useful manner. This affords a new proof of the fallacy of tirst impressions, and leads to tho grand practical conclusion of allowing people to "buy commodities wherever they can be got cheapest, without seeking to favor hemo produce abovo colonial, or colonial above forelgn."

Merchants should posses8 unrestricted freedom, not only in regard to tho articles they denl in, but in respect to the time of keeping them back or bringing them to market; and this not only fros. tho general title which every one has to the management of his own property, but from a conviction that whatever benefits the individual will be productive of corresponding benetit to the public. This is a point of the last importance, as reconciling the lower orders to a varicty of unpopular employments of capitsl, such as buying up goods to bo warehoused, and not brought to market till prices aro advanced. Take, for instance, the capitalist who buys a theusand hogsheads of sugar on its arrival from the West Indies in August, for tho purpose of selling it in the succeedling Mareh or April. Such a transactlon is of uso to all parties, aflorling, in tho tirst instunce, a customer for tho planter or plantter's correspondent; a clepository for the public during tho seasen that the article ought in great part to be stored up; and fir -ll y a seller, at a the when, without such dem. and such forthcoming of supply, tho prico mig.. nave beeome exorbitant, and might have continued so until the arrival of the next year's crop,

The more we study the natural progress of commerce, the more we shall be satisfled of the expediency of leaving al! lts various agonts to thelr uncontrolled management. Iusiness then divides Itself, particularly lin a large elty, lato a varlety of separate branches, each of which may bo carried on to a surprising extent by separate establishments. The commission charged by such persons is small, their dispatch extraordlnary; capital dees not remaln lockod up in their hands, and goods find their way te the market whenever prices are encouraging, that $I_{s}$, whenever the consumers are in want of them; they ara withheld only when the market is glutted, and when to force sales would be productive of eventual Injury to the huyers themselves. Tho dectrine of tho happy medlum ls nowhero moro appllicable than in commerce: If you reduce prices for one acason below what ls necessary to
indemnlfy th. the next, ano dearth.

indemnify the producer, you discourage production for the next, and you expose yourseli to the hazard of a desrth.

Monopolies.-Monopoly ia now generally admitted to be lighly impolitic. No new grants of the kind havo been issued in Great Britain for many years, and every renewal of the charter of the East India Company has been marked by a diminution of lits restrictve character, till in 1834 lis monopoly was abolished. In the United States monopolies liave nover been permitted, the goveroment having early seen their injurious etiects. The publie are now aware that a prlvileged company can not make its purchases abroad on better terms than individuals, and that the chief operation of the privilege is to enhance the sale prices, or, in other words, to put money into the hands of a few at the expense of the nation. They are further aware that the concerns of a large corporation can not be managed with the minute economy and vigilance of the private merchant, and that its grand advantage lies in the intelligence and dexterity acquired by tho transartion of business to a large extent by one eatablishment; an advantage of great importance, but which has nothling to do with the possession of exclusive privileges.

The thasl conclusions to be drawn from the principles of commerce are of the most comprehensive and beudicent mature. They teach us that every nation finds its account in tho prosperity of its neighbors; that it would expericnce a corresponding suffering from their decline; that to aim at engrossing more trsde thinn noturally falls to our share, is sooner or later iujurions to ourselves; and that war, even when successful, is attended with the most serious losses. War turns to waste a large portion of our productive means; it leaves us oppressed with a ruinous burden in peace; it impedes the future extension of our exports, for the injury done to our neighbors recoils on ourselves; in short, it is so replete with evil to the public and indiridjals, as to be justifiahle only jn an extreme case, such as the defense of national lndependence, or the overthrow of a tyrannical usurper.
Division of Employment ; its manifold Adrantages.Division and subdivision of employment form the great distinction bet ween a back ward and an improved stato of productive industry. It increases the etlleiency of the mechanic or manufacturer to an extent of which ne one who has not studied the subject can have un sdequate conception. Now, the degree to which employment is subdivided depends mainly on the sizo of a city or town; nnd in estimating the state of civilization in a purticular country, we ca.i not have a better guide than the proportion of the inhabitants of towns to thase of the open country. Flanders and llolland wero lung the most improved part of the north of Europe, anil had the greate. number of towns on a given extent of territory. This they still have, with the exeeption of the counties (Lancashire and the West Riding of York, lingland) which are the chef sents of English manufactures. After the Netherlunils in town population come the north of Italy and northeast of France, ulong with the western part of Germany, Prussia and Austria have each a comparatively small number of towns; Polnud has still fewer, and lussla is the most defichent of nny country in Europe. In England tho increase of town jopulation has been progressive during the last eighty or ninety years, and bids fair to go on in an equal or greater ratio.

The division of employment is the result of commerce and of tucreasel population. It he of two kinils : that nmong individuals, by which a specitic task is appropriated to each, and that among nations, by which partieutur kluds of products are rulsed to a greater extent in one country than in anther. Tho latter ls as yet only beginuing to elaim the attentlon of publle men, for it has been a frequent orror with govermment to establish, in their respective territorlen, a varlety
of manufactures, without sufficiently weighing the local obstacles or disadvantages. Of thls France furnishes some atriklng examples, partleularly In the case of iron. The abundance of coal in England, and the case in conveying it, and other bulky goods, by canals, glve to their manufactures of iron end liardware an advantage which Frnnce in vain endeavors to equal. Her true policy would be to repeal the very heavy duties on the import of forelgn manufactures, and to trust to her means of supplying the world with wine, brandy, and the other natural producta of her country to an equal or greater amount.

Principles of Commerce; how far understond.-In point of knowledge of the great doctrines of politicsl economy, Germsny, or, to speak more properly, the Protestaut part of Germany, particularly Saxony, may be salil to take the lead of other countrles on the Continent. The Duteh, however exemplary in thelr practical legislation, have little turn for speculative reasening; the French have not patience to follow through its various links a chain of philosophical deductions; but their admiration of whatever is humane or liberal makes them wonderfully delighted with the brilliant concluslens of the science. They have the advantsge of possessing, in the work of the late $\mathbf{J} . \mathbf{B}$. Say, the best arranged general treatise that has hitherto appeared on the subject; and they are by no means ifl prepared for a very extensive applicntion of political improvements, such as the nbolition of prirateering, the repeal of all heavy duties on foreign goods, and the substitution of inland taxes for those customhouse imposts which implede the free communication of nations. The rest of Europe ls so mueh In the dark in regsrd to the great truths of polltical science as to see merely through the medium of loeal govermments. Such is the case likewlse in Italy, although that country can boast individuals of some note among the writers on the principles of commerce, and the reflecting turn of the people is favorable to such investigations; and even in Britain a large party is still adverse to the unrestricted appllicatlon of these simple and beneficent principles, but this party is daily diminishing. The hnppy effects of the frec-traile prinelples, which lave been for some time in operation, as proved by the periodical returns of the English Beard of Trade, are facts which can not be withstood; and we may safeJy calculate that a few yenrs will convert the remalning alvocates of protectlon to the frec-trade faith.

Speculation in Trade,-Among men of husiness this expression is applled to incurring extenslve hazards in the hope of extensive emolument; in short, to whatever is fureign to the proper business of the indivilual, or beyond the control of common rules. It is to sueh undertakings that vulgar credulity ascribes extraordlnary profits; and even well-Informed men are apt to give way to the assertions so confidently made, of vast oceasional gaing in this line of business. Dr. Smith himself, after remarking (lleallh of Nations, hook i. ebap. 10) thint to make $n$ fortune In a regular line commonly requires a long life of industry and frugallty, adds, no toubt on the faith of repeatel assurances from merenntile friends, that there are many examples of fortunes renlized by speculators in the course of a few yeurs. Now, the men who embark in speculation are, If general, very loose accountnuts; thelr estimate of prolits applies to the gross, never to the net return; hesides, they are almost ulways ndventurers, and adventurers are seldom nuted for the observance of truth. Their favorite season of activity is a tlme like that of 1808, when the sudden stoppage of ordlaary Intercourse eaused a raphl fluctuntion in the price of commolities, and when the regular merehants withdrew from the seene. Now, whint sober estimate can ho formed of loss or galu In such a chsos? Add to this, that these men trude almost alwnys on eredit, are In need of all the support which flatterlug representatlons, and rumors of sudden proflt, can glve them. All these rea-
sons seem to justify a deliberate inquirer in doing what is seldom done on such occasions, we mean in withholding his belief from the confident allegatlons of speculators, se long as they are not supported by collateraj evidence.

Frequency of Disappointment.-Oar oplnlon is, that Inatead of tho large profits commonly ascrlbed to this conrse of trade, the individuals concerned in It experience little else than disappointments, and maintaln a perpetual strugglo to keep up a fair appearance to the world. This opinlon is founded partly on a knowledge of the actual career and circumstances of speculators, but more on tho well-known fact that slmost every line of buslneca is in the hands of eatablished merchants, whe, of course, aro too vigilant to overlook tho opportunity of omolament, and who havo much letter means of information than temporary interlopers. Still, should there remain doubts as to the accuracy of our oplnion, the question may be brought to a point by referenco to tho account-hooks of any given number of celebrated speculators; their nffairs end almost always in bankruptcy; thelr papers continue open to aceess for years in the hands of thelr solicitors or assignees; and wo are much nilstaken if an inspection of them would show, in ono caso out of ten, that the parties had at any period succeeded In realizing their loasted profits.

Pernicious Effects of Speculation.-We havo heen induced to dwell tho more on the boasts of speculatora, because they aro productive of great mischief in unsettling persons In buslness, particularly young men, and in making them look on their proper line with comparative indlfforence. It would be endless to nttempt an enumeration of the various ways in which the rage for apeculation has lrought misfortunc on merchants and manufacturers. The opening of a new country, auch as Buenos Ayres, Brazll, or Caraccas, led to the oxport not only of a prodiglous overstock of merchandise fittod for the country, hut of many articies totally unsaited to the ellmate and hables of the people. Again, in 1814, when the war with lrance was drawIng to a elose, goods, both colonial and manufactured, were poured into the Contlment of Europe, as if the compass of tho markets was untounded, and as if the calamlties of war had produced no decreaso of capital.

Holland; its instructive Emmple.-The country in which trate shone forth In all its splendor; where It was cultivated without the smpport of arms or prohilhitory regulations; where, in short, it doveloped its heneficial tendency In sll Its extent, was Ifoltanch. If wo look to the eariy enterprises of the Duteh, we find them enabled, by the power of thelr productive induatry, to assert thelr ladependence at bono, and to assail their enemies In the remotest part of their empire. The Portuguese in the East, and tho Sprantaris in tho West, were each found unequal to the task of rosisting these republicans. A proul stand was male by them against the navy of England, and they illd not fall into despalr even when assailed by linglish forces In conjunction with those of France. Afterwaril, when restored to an alliance with England, nud when they cooperated with her in the great etruggle agninst Louls XIV., it is surprising how large a proportion both of troops and subsidies was furnished hy this npparently Inconsiderable atate. "No country," bays Sir Willian 'Temple, "can be found where so vast a trude has been managed, yet the inhnhitants have no native commodities toward building vessels, and hardly any that are considerable for traffie with their nelghbors. Helinnd is grown rich hy force of industry, by improvement and manufacture of foreign growths." Procceding to apecify more particularly the causes of this mercantlle prosperlty, Sir Wlliam enumerates "the easy communiention of water, particularly ly the lhine and Maese; the security of property; the undiaturied llinerty of consclence, and the progresslve influx of jeople persecuted for their reilgioua opinions in Fianders, England,

France, and Germnny." Such were the origInal causes: those of subsequent operatlon were tho " general habit of industry and economy ; the formation of canals; the institution of hanks; tho low interest of money; tho appropristlon of partleular towns to partlcular branches of business ; application to the fisheries, and, what he regrets much should not exist in England, the practice of keepling an officlal register of all purchases of land or houses;" a practice introduced into Holland and Flanders in the relgn of Charles $V$., and which at present exlsts in Scotland, to the Incalculablo convenience and securlty of money transactiens.

Effects of Trade upon Indiciduals.-We aro now to say $n$ few worls on a different topie, namely, the effects of trade in forming tho elisracter of Indivhluals ; a matter of no little jmportance in a country like ours, whero merchants both constitute so large a portlon of the community, and exercise such infuence on tho proceedings of government. The mercantlle charactur has a number of good points, being exempt from the racuity and Indecision so frequent in frshionable life, as well as frem the various viees consequent on idleness, and which are so strikingly exemplified in the gambling and libertinism of the French metropolis. Whatever good is produced by continued nctivity, and by a pointed attention to the specitic objects of one's occhpation, may be contidently lookel for anoug commerclal men; with the furtlier advantnge, in large concerns, of an exemption from petty jealousies nad lnvidious interferences. In such eities na London and Amsterilani, merchants nere awnro that the fichi is ample for all; that the prosperity of one Js very far from impeding that of others; and that when disappointment and fallure oecur, their origin will be found in a very different cause than competition. Ilere, however, wo must elose our encomium, and, in the spirit ot impartiality, proceed to exhibit tho opposite side of the picture. The merchant's knowledge is particular, not genernl ; he ohtains $n$ hahit of understanding indlvilual character, anil a dexterity in mansging his own athira; but he has not, and esn not, from his conrse of occupation, nequire the power of reasonlng comprehensively on the Interests of trade. If he observe in war a tendency to raise prices, or to Invigorate particular lines of trnde, such as ship-owning or insurance, ho will probably be led to the general inference that to $n$ maritlme cometry wnr is advantageous. The contests of Great Britnin from 1750 to 1810 having been nttendel with the undisputed command of the oceun, nothing more was required to satisfy the ninjority of traders that her mercantlle mnrine was In a atnte of equal nscendency. They took an pied de la lettre the custons-house reports of annual exports, without observing how much was to be dedueted on nceount of the depreciation of bank paper, or how surely they were laylng the foundation of future dlatress by sul)mitting to enomous taxation. Again, when in 1807 the long continunnce of war hal given a serious wound to her trade and navjgation, a mnjorlty of the merchants ascribed it, not to the true eause, lunt to the andermining competition of the UnSted States. Their range of reflection was not such as to enable them to perceivo that, hy overturning the prosperity of the latter, they would sap the foundation of their own; and that overy million which they prevented us from adding to our caplenl was so nuch withlrawn from a fund devoted to the increase of the productive industry of Iritain. Ience the unfortunate orders in council, the main cause of the overthrow of her exchanges witi the Continent, of the lnerease of expenses in Spain and Germnny, of her war with tho United States; In short, of the long centlnuance of her aufferings sinco the peace.

Bad Fiffect of long Credits.-Nothing wouid, in our opinion, conduce more to the prosperity of trade than the adoption of the plan of doit $r$ all wholesale linsiness for ready money, and the reilaquishment of that habit
of long cr and has $f$ crowding To sho go at son apprise ol of our ma ufacturer course of honses; 11 Indies, th term of er not receiv mediate Still the 1 for the be: it comes to by merear stand inte gagement remote da eral, posse lic inagin not scrujl greater th smong ue next in co duli, and within the dulgence $f$ expected may, and out much the senuls of and can uc pleasing hi qeeming p prolit has r of a dicht however, ing up for the delay ile hegins as yet little friead, or llis corres fidence, an conflding a al ameunt obliged to keeping up year after with his e sirons (for tulalile to they are in of the cou since it is recenty-se give him t Affisirs 110 y manufactu give furtho circumstan serves to with more while the f consequenc delitor ef t of liepose, is evident general, bo It ls not o debts can held by so are so rare the capitai,
of long credit which prompts to anguarded anterprlac, and has for ao nuany yeara been the princlpal canse of crowding the columns of the gazettes.

To slow the reauits of long credit, it is necesaary to go at some length into practical illuatration, and to apprise our readers of the real situation of the majority of our manufacturers and export merchants. A manufacturer on the preaent footing receives orders in the course of the yeur from twenty or thirty mercantile houses; the goods to be exported probably to the :Vest Iadies, the Spanish Main, or Brazll; the understood terni of credit twelve months. The manufacturer does not receive the orders from abroad; ho has on intermediate guarantee, that of the exporting merchant. Still the risk is considerable; but he naturally hopes for the best, and is unwilling to decline an order when it comes to him from a quarter of respectabillty. Now by mercantile respectability vur readers are to understand integrity, and the intention of acting up to engagements; but the power of dohng so, especiully at a remote late, is a very different question, and is, in general, possessed in a much amaller degree than the public inogine. Tho trader whose capltal is large will not seruple to ship goods to the valine of 50 per cent. greater than his capital, first in the hope, so general anong merchants, of realizing a handsome profit, and aext in confidence that, shond the forelgn market bo dull, and should delays oceur in obtaining returns within the given tiae, his credit will procure him indulgence for several months, at the end of which the expected remittances can hardly fail to arrive. 110 may; and in general does go on fur several years without mueh embarrassment, recciving, lindeed, less than he sends ont, but informed that all has been well sold, and can not fail to be aoon realized. Ho thns goes on pleasing himself at every balance of his book with tho seeming profit, and only regretting that hitherto that profit hus not been tangible, sinceit exists in the slanpe of a debt due by hia correspondents. LIa contimues, however, under a favorable expectation of their muking up for past deficlencies, and flatters himself that the delay has resulted from partial or tenporary causes. lle berins to ind himself straltened for funds, but has as yet little difficulty in obtalning relief from a moneyed friead, or a prolonged credit from tho manufucturers. llis correspondents continue to write in a strein of confidence, and to call for moro gools, which if he be of a coufling character, will lead him to extend the ammal amount of his shipments; hut at all events he is obliged to continue a certain supply for tho saks of keeping up tho assortment of stock. Still he finds thint year ufter yenr a larger portion of his capital remains with his correspondents, and that they, howover desirons (for we by no means put an extreme case), are unalise to prevent nu arcmmulation of debt, becanse they are in like manner left unpaill by the inhabitants of the conntry. To go to law would be of no avail, slace it ls the policy of almost overy govermment in a recentif-settled country to favor the delitor, and to give hin the means of retaining capital in his hands. Affirs now begln to be serious with the exporter; the maunfaeturer und other creditors can not or will not give further time, and denrand an explanation of his circumstances. This explanation takes pluce, and serves to show that their debtor is a man of honor, with more nsseta than debts, but the latter are certain, while the former nre at a distance of 3000 miles. The consequence is a grant of time, an allownmes to the debtor of two, three, or four years, to net under letter of Heense, in the hope of accomplishing that which it is evident can not be performed sooner. This is, in general, both the wisest and most liberal courae; atill it is not often foumd to sueceed, because the foreign delits an seldom los realized in climates where life is hell liy so uncertain a tenure, where respectable agents are so rarely found, where buyers of goods have so litthe capital, and, above all, where the law allows them
such a length of time for payment. A few of the promised installments are prababiy made good, but in general the merchant recognizes the impracticability of fulfilling the remainder, and finds it eventually necesaary to submit to bankruptcy.

Holland a Country of short Credit.-In Holland wo find that in ita better days bargaina were almost always made for ready money, or for so short a date as six weeks or two montlis; profita were small in their ratio, but the quaekness of returns made them eventnally large; fallures were rare, even in so distressing an era as the occupation of thelr country by the French, which began in 1795, and involved from the outset a stoppage of maritime intercourso with all their posgessions in India and America. The consequence of this atoppago was a decay of trade, a suspension of various undertakings, a scarcity of werk, a miserable dullness in the sale of gooda; all leading, in the first instance, to diminished income, and evantually to encroaclment on capital; but, amid this distress, the failures were surprisingly few. Another example, equally replete with instruction, was the atate of France after tho double invasion of 1814 and 1815 . There prevailed at that time a general discouragement among the upper ranks, and a great deal of wretchedness among the lower, trade lieing at a stand, and stocks of goods lying unsold in shops or warehouses for years; still bankruptcy was exceedingly rare. All this sloows what a satisfactory prospect we may anticipate when we adopt tho plan of transacting the greater part of our business for ready money. Yet we are far from recommending nny law or measure to enforce that object; the evident advantage of the plan will not fall to secure its adoption.

1I. Histohy of Commence. Origin of Commerce. -It has been an olject with many writers to ascertain in what nation of nntiquity conmerce was flrat carried to $n$ considerable extent; lut as that extent implies a previous population, the more simple inquiry would be, in what country population first acquired density, particularly in towns. The answer is, that mankind first increased their numbers in warm latitudes, especially In situations where irrigation, whether effected by the overflowing of rivers, by tha deacent of atreams from a rango of mountains, or by any other means, was ao extensivo as to counteract the parching effect of beat, and give to vegetation a luxuriance unknown in colder refions. It was thus that the Nile gave fertility to Egyplt, the Euphrates to Chalden, and the Ganges, in the lower part of its course, to Bengal.

The earllest written notice of commercial intercourse is in Scripture, where we read of Joseph being sold by his brethren to a company of Islimaelites or Arabs, who were golng to Egypt with splees, balm, and myrrh, ronreyed on the backs of camels. These itherant traders probably brought back eorr, Egypt being, even at that remote period, an occasional granary for Syria and other adjacent countries. The conveying of geods on the backs of animals onght to be remarked as indicative of a primitive state of commercial intercourse-of that which is carried on hefore tho forming of ronds or the use of wheel-carringes. Such was tha case in England two centuries nge; such at present is tha case in Spanish Amerlen, nul, in some degree, in Old Spain, the mountalnous mature of that country making it a matter of some difficulty to form roads.

Phanicia, Sidou, ond Tyre.-Hut whatever mlght be the inland traffic of the Arahians, Chaldeana, or Egyptlane, they made very little progress in navigation; that wha the province of the lhomicians, who acted as naval carricra to the neighboring nations, in the same way ns the Dutch did during the sixteenth and seventeenth centuries to the rest of Europe. Thls almest exelusive poesession of navigation may seem atrange in the preaent nge, but the cause was the samo in beth casea-nninely, the difilculty in a rude ago of tinding nen capable of conducting vessels in the open sea.

Seamanship, now so familiar to the inhsbitants of almust every port in Europe, was in those days underatood by only a limited number, and was carried on with a degree of caution and alowness hardly credible to a modern reader. Thus the saamen of anclent timea made it a rule to keep within sight of land, as if trusting for protection to a situation which the mariners of our days look on as attended with considerable risk. This arose from the great difference in the mode of propelling vessels, for which the moderns trust chiefly to the wind, and navigate with comparatively fow hands. Tho small barks of tho ancients were fitted out with oars; a method which required a great sacritice of manual lalor, but was attended with the advantage of find ing a ready shelter in a bay or creek whenever the sky porteaded tempestuous weather.

What, it may be asked, was the chief cause of the extension of the navigation of Pheenicia? The vicinIty of Egypt, and the quantity of provisions and merchandise exported from that fertile country. The navIgation of the Red Sea, also, was conducted chicfly by Pheuicians. Iliatory is not anficiently explicit in regard to the commoditles forming the oljject of traffic along the Red Sea, nor have wo any certain knowledge of the era at which the trade with India by that channel commenced. Bouaparte, when meditating his expedition to Egypt, was led, in his sanguine estimato of its advantages, to consider the lled Sea as the fittest line of communication with Indin, and to ascribe the wealth of Thebes, in Egypt, one ot the carliest of commercial cities, to intercourse with the coast of Malabur. But whether tho navigators of the lied Sea proceeded at that esrly date as far as the shores of ludia, it is evident that an extensive traffic was carried on with Cosseir, or a sea-port on tha lied Sea which communiested with Thebes. The eproch at which llomer celebrated the wealth of that city is nearly tho same as that at which l'henician mariners navigated the Red Sea on account of the Jewlsh government in the relgn of Solomon; but no historical investigator has been abla to fix with certainty the situation of Ophir and Tarshish, the ports with which these vessels traded. Some confident calculators hare considered them to have been in India; but, judging from the limited skill of navigators in that early age, it scems more likely that these harbors were near the eastern or more remote parts of the Red Sea, a part from which there probably was a direct communication with India.

Greece.-Such was the traflic of the I'hwicians with the south and east; it extended also to countries less peopled and in a still more primitive stute in the west. The taland of Crete seems to have owed to them its early cirilization; and after Creto came Attica, Baotla, the I'cloponnesus, hu all of which tradition recoriled the carly introduction of the arts by settlers arriving from l'honicia or Eigypt. These arrivals seem to have taken place about a thousund years before the Christian era, nud half of that time elspsed in the gradual attainment of that stuta of civilization to which Greece hat arrived at the period of her political celeb-rity-the invasion of her territory ly the I'ersians under Darias and Xerxes. Greece is in several respects well fitted for forelgin commerce. Her coast is greatly indented by the sea, and presents a number of inlets hardly inferior to the well-known gulfs of Argos and Corinth. Ilence an early fantliarity with the use of shipping, and the practice of sending out colonies at so early a date as a century after the Trojun war. These coloules proceeded In various directiens, to Asia Minor In the east, to Thrace and the Euxine in the north, to Sicily and Italy in the west. The progress made by the linbabitants of these colonial settlentents was rapid, particularly at Syracuse, whose capacious harhor soon acquired it extensive commerca and a numerons popnlation, Agrigentum, Mcasina, Tarentum, were likewise places of considerable limportance. It was the custom of these and other colonies to maintain an al-
liance and inercantile connection with the parent states, such as Atluens, Corinth, Argos; and a number of characters eminent in literature and the arts appesed in the colonies at a time when their establishment might have been considered as too recent to afford more than the necessaries of life. But in a newly-settled country, such as the United States of America, various circumstances occur to lncrease the number and improve the condition of the inhabitants ; provisions nre abundant, in consequence of the extent of moccupied land; the connection with the mother country insures a certain exteat of trade; while the monopolies and other abuscs natural to a long-aettled community are in a manner unknown.

Athens.-Oa the other hand, the inland territory of Greece was not well fitted for commercial intercourse, It la traversed by ao navigable river; and being mountainous and rugged, it could not, oven in the days of ita prosperity, boust of roads, merchandiso being in thoso days, as at present, conveyed, not in earriages, bot on the backs of horses and oxen. This deficiency of communication by land was one cause of tho different states of Greece so long maintaining their independ. ence, and of the limited ascendency attained by Lacedemon, which, in extent of military means, wus so superior to the other states of the Peloponnesus. Sparta and Thebes being inland towns, and Corinth comparatively a small state, Athens was the chief commercial city of ancient Greecc. Iler distance from the sea, five miles, was such as to aftord her security abiliust a sudden desecnt from an invadiug armsment, while it was suthiciently near to her harbor, tho Piraus, for tho easy transmission of merchandise. The trade and shipping of Athens, however small it might appenr to a modern reader, was such as to give it an ascendency over the different islands to the cast ward of Grecee, and to enable it to maintain, in the Peloponnesiun war, a loug struggle against a strong confedersey. When overcome at last, in consequence of what may te termed an aceidental cause, the capture of its flect by lysander, its political depression was of short duration; the activity and industry of its inhabitants revived its trade, so thut Athens continued for ages the most propulous and commercial place in Greece.

Tyre.-Tyre, theugh at no time a tuwn of great extent, remained long in the enjojment of considerable trade. From the reign of Solomen, when its commereinl activity is described in Scripture, to its captare and destruction by Alexander the Great, there elapsed a period of seven centuries. The formidabla resistaned it made to the Macedonian arms impressed Alexander with a strong sense of the value of commeres, and of its eflect in increasing the sources of national power. Though known to the world chielly as a warrior, Alexander lisd considerable claims to tho character of a politician. Ilo adopted, and caused his followers to adopt, to a certain extent, the mamers of the nations they concquered; and by the expedition of Nenrehus from the mouth of the Indus to the l'ersian Gulf, he discovered a commendable zeal for maritime discovery: Equal judgment was ovinced by him in founding his new city of Alexandria in a position such as to command an extensive range of intercourse. The Nile brought to it on ona hand the valuable prodects of ligypt, and afforded on the other a rcady inlet to the merchnindise imported from Eisurope. To India, also, tho route by Alexandria and the lied Sea was preferable to that of the l'ersian Gulf, whilh thvelvad the necesaity of a considerable journcy by land.

Curthayp.--Contemporary with the dechine of Athrus and the rise of Alexandria, but superior to either in commercial activity, was Carthage, the efestruction of which forms one of the fenlest blots in the history of the Ilomans. 'lhe situation of Carthage was well adapted fur trade; its harior was good, its range of navigation extensive, buth to cast and went. Founded by a colony from Tyre, it maintained a friendly lutercourso

with Phonicia; while in the west of the Mediterranean, in Stcily, Spain, and the south of France, it met with no commercial rival. These countries, at that time uncivilized, and almost uncultivated, wero greatly indelted to Carthage for the introduction of intelligent gettlers, and derived from her tho game advantages which Greece, several centuries before, had recelved from Phœnicia and Egypt. In Spain the fine harbers of Carthagena and Cadiz were rendered the resort of shlpping by the Carthaginians ; and without calling on our readers to beliove the traditional assertions of the extent of their navigation, either to the north of Europe or the south of Africs, we may with contidence affirm that, had not this state unhappily fallen, frem the jealousy of the Romans, it would have been the means of diffusing industrious habits over a great part of the west of Europe, and of advancing by several centurlea the progress of the useful arts.

Reme.-The policy of Carthage, though not uniformly pacific, was far less perniclous than the perpetual tendency to aggression of a military state like Rome. In navigation the Romans were at no timo romarkable. During their conflicts with tho Carthaginians they sustained repeated losses, ehicfiy from the unskillfalness of their seamen, and their inalility to cone with the fury of tho elements. After they had triumphed over the Carthaginians, and extended their conquests to Macedon and Greece, the Romans wero no longer under the necessity of equipplug fleets, because no maritime power dared to dlspute their supremacy. But the extension of the Roman power was favorable, in several respecte, to commerce ; piracy ,ins suppressed, and merchant vessels had free access to almost every part of the Mediterrasean. Henca a gradual inerease in the length of mercantile voyages, which now extended on one hand to the nerth of France and Germany, on the other to the Indian Ocean, to whieh it became casy, from the progressive improvement of navigation, to proceed either by tho lied Sea or the Perslan Gulf. The mariners' compass was still unknown, but the uniform directlon of the wind in certain seasons enabled the navigaters to and from India to complete their voyares with little difficulty.

The dfiddle Ages, - It was toward the middle of the fifth century, aboat $n$ hundred years after the removal of the seat of emplre to Constantinojle, that the Romans lecame unablo to defend their frontier agalust the uncivilized tribes who pressed on them from the north and east. Tho consequence was that the coantry along the Rhino, the inlund provinces of Gaul, and, some time afterward, Spaln and thonerth of Italy, were overrun by these rude assailants. The increase fin the popalation of towns was clucked, nany places heing phudered, others sulyjected to heavy contributions, nnd property In general rendered unsafe. There was no longer a central or general goverument; tho territory of the empire was divided into a number of separate states, the rulers of which had no just idea of the inportance of commeree. These uneducated governors, accustomed to appeal on nlmost all occasions to the sword, were not sufficiently enightened to forego the temptation of a present seizure for the sake of tho lasting tivantage of mercantile intercourse.

Pisa,-Next to Venice in the history of modern commerce came l'isa, $n$ town built on the banks of the Arno, at a distanco of nenrly three leagues from tho sea. Its trade was chiefly with the western coasi of Italy, with Sardiula, Corsica, and Sicily. Its commercial importsnce was prier liy two centuries to that of Genon, although it never equaled the latter in extent of navigation, nor lin the number of distant settlements. I'isa decined from its commereial rauk in consequence of Leghorn, which was sltuated immedintely on the coast, being lietter indapted to foreign intercourse.
tienoa,-fienoa continued thourishing from the year 1000 untll its ill-judged hestilities with Venice in the iatter half of the fourteenth century. These were in-
jurious to both, yet both recovered from the effects so as to hold, during several centuries, a distinguished rank in trade. They were remarkuble also, particularly Venice, for a variety of the finer manufactures. Neither could boast of a supply of the raw materials of almost any manufacture in their respective territorles; but their numerous merchant vessels brought a varlety of products from a distance, and the amount of the population of either city was such as to render practicable that division of employment which is the soul of manufacture, and which was at that time almost unknown in other parts of Europe.

Constantinople.-Constantinoplo had the good fortuns to remain untouched by the enemies of the cm pire until the middle of the fifteenth century, a time when eivilization had made progress in the west of Europe, and literature was on the eve of receiving a great extension by the discovery of the art of printling. To this fortunate colucldence of the revival of the arts in the west, at a time when the east of Europe was sinking under the pressure of bsrbarism, we owe the preservation of mueh that was valuable in the anclent world; and, among other things, that of eertain manufaetures and branches of commerce. Constantinople had all along maintained a commereial intercourse with Venice and other ports in Italy, and, in general, with Alexandria. The same had been tha case in regaril to India; for when the oceupancy of Egypt by the Saracens prevented the trade to India liy the Ned Sea, it was kept up by the Caspian and Euxine. But by far the shortest conrsc from the east of Europe to India is by the Euphrates and the Persian Gulf. It was to the extent of intercourse carried on by this channel, some time after the Chisistian era, that we are to ascribe the wealth and grandeur of Palmyra, a city ereeted in the midst of deserts. This would have continued one of the chief routes of communication between Europe and India during the Mildlo Ages, had not the caravans been in perpetual danger from the Ar-iss after the decline of the civilized governinents in this part of $\Lambda$ sia.

Jenice.--The apprehension engendered by the approach of barbarians from the north and east, led a mmber of traders and manufacturers settled in the north of Italy to flx their families in the smsll islands near tha months of the Po. There the surrounding waters afforded them a degree of protection against invaders, who, however formidable by land, had no means of carrying on hostilities ly sea. Sueli was the orlgin of Venice, a city situated in the midst of the waters, and destined to acquire extensive trade from the security attendant on her position, and to take a lead amid the mercantile states of the Middle Ages.

The growing trade between Lurope and India, though of considernlilo value, was not extensive enough to be productive of the wealth ascribed to it by Dr. lobertson and other historians, who, unacquainted practically with commerce and its llmited gains, are realy to lend an ear to the sangulne statements of early writers. Thus the wealth of Venice, commonly ascribed to its trade with Alexandria and India, was the consequence of a variety of causes, no one being of particular importance, becanse several centuries were passed in the gradual increase of its population anil capital. Venice attorded a secure resort in ages when othor conntries wero in tlanger of invasion and plunder. It had also a prudent goverament in times when, in most parts of Europe, thero was little Iden of $u$ frec constitution, or of a regular arlministratlon of justice. Venice was in this state whell, in the twelfth and thirteenth centuries, the increaso of trafle, arising from conveying the crusaders, with their military stores, and the readiness of those zealous combatants to extend the sway of a Christian state, emblaled thut commerein] republic to increase her foreign territories. In general, the foreign poliey of Veulce was pacitic, but she found it ulfficult to aveid hostilities with tho Thrks, or to escape from takigg a part in the rejeated contests which took
place hatween France and Austria for the territory of the Milanese. Those wio take an intereat in tracing the gradual extenaion of industry will find in Venice the origin of aeveral important cominercial institutious. In that city was establiahed the first public bank, and there also was firat introduced a fundeú debt transferable from hand to hand. The same thing held in regard to lesser matters cennected with the details of mercantile business. Bills of exchango, if not invented by Venatian merchants, were first carried by them to a great extent; and the principles of book-keeping by doubla entry were there first understood and applied in practice. However familiar those principles may be to merchants of the present day, they ware too refined for the rude and primitive state of most parts of Europe in the Middle Ages.
Spain.-Here it may be well to point out the fallacy of a notion general in Spaln, and not uncommon in other parts of Europe, namely, that in tho Middla Ages Spain was a flouriahing country, and possessed, in Tarragona, Tortosa, and Zaragoza, great population and wealth, each of these towns being said to have contained several hundred thousand Inhabitants. This singular opinion was widely apread, in consequence of tho prominent figure mada by Spain in the politics of Europe, in the reigns of Charles V. and Phillp 11. The public did not take into accuunt the great aiddition of power conferred on Spain by her possessions in Italy and the Low Countries; wor were there In these days statisticians capable of expluining the very slow manner in which cither cultivation or commerce can acquire extension In a country so inountainous, and with so few means of transport, as Spain. Of roads she can boast only the few that are required for the purposes of government, the cross-roads being littlo more than bridlo paths, and the traffic of tho country being in genral carried on by mules. All this indicates a scanty population and backward state of society, as has been the case in Spaln in every ago; for there is no truth in the traditionary oplulon that her population was greatly thinned by emigration to America. The number of persons who proceoded annually from Spain to America never exceeded the tenth part of thase who at present go annually from Ireland to Canada. The truth is, that tha power of Cliarles V. and Phillp 11. was great only because the power of the other princes of Europe was very limited. The military establishments of that ago were quite insigniticant compared to those of the presént times.
The Hanse Towns.-One of tho chief features in mercantile history during the Middle Ages was the association of towns in the north of Europe for the purpose of glving securlty to mercantile property. At that time the different countries of Europe were very imperfectly governed; there were then no regular posts and very few roads, so that the means of redressing grievances, or of making communications from one part to another, wero very imperfect. Too much has been said of the pollteal power exercised by the llanse Towns, but the association wis of great use in protecting individunl property. It dated from the middle of the thirteenth ceutury, and originated at J.ubeck, a sen-port, which had not in those days more population or wealth thm at pregent, but possessed mueh more comparative inportance, becuuse very few places ln Europe could at that time boast of 30,000 or 40,000 inhahitants. The trade between the Baltic and the west of Germany centred In the harbor of Labeck, in ages when navigators were not sufficiently akilled to proceed to or come from the llaltic by the circuitous route of the Sound. The association of the IIanse Towns consisted first of Iubeck, Hamburg, and llrunswick, hut soon extended to other placen-to Amsterdam, Dordt, Cologne, on the one side, to Dantzle, Könlgsherg, Riga, on the other. These and many smaller towns, to the number of sixty and upward, becamo members of this protectlug body, which continued in a state of union during three cen-
turies. At the end of that time it was gradually dissolved, not by any violence or exerclae of authority, but by the continued progress of elvilization; the dif. ferent governments in the north of Europe having by that time acquired tho power of protecting their mercantila subjects. It is now ahout two conturies since the association of tha Hausa Towns ceased to exist in a comprehensive sense; and for a considerable tine the name has been contined to Hamburg, Lubeck, and Bremen. Hamburg took the lead of other trading towns of the north of Germany, by means clicify of the extent of lts river, and tho ronsequent casy communication with the sea on the one hand, and the interior of Germany on the other. It gained also by the improvement of navigation in the fifteenth and sixteenth centuries, when vessels from tho south of Europe found it no longer necessary to suspend their voyage at Bruges, but found it practicable, and even easy, to proceed at once aa far as tho Elba.
The Netherlands.--The wealth and possession of the Netherlanda belong, like the early opulence of Tyre, and the magnitudo of the trada of Carthage, to the remarkable phenomena of mercantile history. To judge from the physieal aspect of Holland, the general marshIness of the soil, the indifferent climate, and tha tots! ahsence of mineral products, we should be inclined to consider it among tho least favored countrics of Eurole; but all thesa adrantages were balanced, and more than balaaced, by the possesslon of extensive water communication. No part of Europo equals Flanders and IIolland in extent of inlcts from the sea, in the brealth of navigable rivers, or in the ease with which ennals may be excavated. To these advantages, much more than to civil institutions, wo are to ascribe the early prosperit" of the Netherlauls; for these apparently mpromis 'g countries took a lead in civilizntion almost as remarkable as the more favored regions of the north of Itnly. That they were not so carly in the career of improvement, was owing to the comparative barbarism of the countries in the north of liurope with which they held Intercourse; while Italy had communication on one hand with Constantinople and the Fastern empire, on the other hand with the south of lirance, the west of Italy, and various scu-ports which still preserved a portlon of ancient civilization.

Flunders; Holland.-The soil of Flanders, without being naturnlly fertile, was more easily cultivated than the comparatively marshy districts of Ilolland. Hence the early supriority of the Flemings in agriculture and munufactures. It was in the fourteenth century that the art of weaving the tiner woolens was introluced from Flanders inte England, and in the sixtecuth that we derived from the same quarter many useful imports in agriculture and gardening. The progrese of the Dutch in navigation was equally remarkable. The Maese and kiine enalied them to bring down the bulky produce of the interior, such es timber, corn or cattle, to their own const, as well as to carry up these rivers to the inland provinces the various articles of merchundise imported from the south of Europe. Henee the increase of Dorit at Rotterdam. The rise of Amsterdun was owing to a different canse ; to the extent of the Zuyder Zee; to the easy access which that expanse of water attorided to vessels from the Ellie, the Weser, and the Dhatic.

Irruges.- Ilruges owed Its increase to its adoption as an Intermedinte port for vessels from the north and south of Europe. A voyago from the Mediterraucan to the lualtic was in those days a formidable undertaking; sea-faring men accounted it too long to he performed out and home in one season, and gladly cmbraced the opportunity afforded ly the warehousea of liruges for landing their cargo from the south, and taking on board another from the north, without the delay of a passage through the Sound. This plan of dividing the voyages to the north continued during the thirteenth and fourteenth centuries; in the fiftenth it in a great

measure ceased, because the improvements in seamasship made it easy for veasels to proceed directly to Hamourg, Copenhagen, and other northern parts.

Antwerp.-Antwerp succeeded Bruges as the atation authorized by the Hanse Towns; butits prosperity was mainly owing to the width and depth of the Scheldt, which may be said to surpass any of the maritime inlets in the north of Europe. The time of the chief prosperity of Antwerp was in the sixteenth century; its population and wealth had attained a great height for so uniaproved an age, and would have continned to increase, had not the tyranny of Philip II. provoked the iahabitants to insurrection, and exposed them to all the evils of a slege and capture by a military force. The consequence of this misfortune, and of the continned intolerance of the Spanish government, was the removal to Amsterdam of many of the inhalitants, and of a great share of the mercantile businces of Antwerp. In the next century the Dutch acqulred great political weight, and took advantage of it to prevent the navigation of tho Scheldt, that Amsterdam and Rotterdain might poesese exclusively the trade with the interior provinces. This singular prolilition, unexumpled in the history of commerce, remained in force 150 yenre; for the Scheldt was not opened to merehant vessels until 1794, when the Netherlands fell under the dominion of france. During all that time Antwerp was deprived of the bencfit of foreign trade; its population ceascd to increase, and remained stationary at the number, on an average, of 50,000 .

Maritime Route to India.-.The grest olject of navicators in the fifteenth century was to reach India by the ccean, and to curry on what was aceounted a lucrative traffic without interruption from the Turks or Arabs. The discoveries required for this purpose were made by the Portugnese, who, in situation, were nearer than other Europeans to the western const of Africa, the line necessarlly followed by those who aimed at reaching India by a new coursc. The l'ortuguese had in these days more than one prince of the blood disposed to patrenize maritime discovery; but their seamen wore very unskillful, so that in following their uwkward eflorts at discovery, we find season after season passed in tracing the unknown part of the coast of Africa to a distance of only fifty or sixty lengues, This inconceivable slowness marked the navigation of the l'ortuguese in their progress towarl the equator, until, in 1481, they ventured to forsake the evast, stool out to the open ocean, sud peactrated 1500 miles to the south of the line. From that time a bolder course was taken by these adventurers, and at last the discovery of the route to India by the Cape of Good IIope was accomplished in 1497.

Discotery of America.-The discovery of America was etheeted in a very ditferent mumuer. Though necomplished by Spmish vessels, the honor of the enterprise belonged uore properly to Ituly; for it was only in a country aceustomed to navigation, and possessing weliedueated mariners, that so distant a voynge could have been accounted practicable. Mnny years wero passed, us is well known, by Columbus lu forming his plan, and solieiting the aid required to enrry it into effect; but, once embarked in the attempt, the suceess was speedy, becanse the mind of the conductor wne sufficiently enlightened to persevere in the voyage, instead of returning, as would probably have been done by an inferior navigalor before traversing the half of the Athantic.
We new come to the sixteenth century, the time when the productive industry of Europe received a considerable impule from the influx of the precions metals from America. At that time the chicf trading towns of Europe wero in Italy, the Netherlands, and, in s much less degree, In France, England, and Germany. In the latter countries the towns were very small, not being peopled to the extent of one third of their preseat numbers. Nothing shows more elearly the back-
warduess of manufactures in tha age, the imperfect division of employment, or the lin. sd communication between one province and another. There were in those daya few lines of intercourse entitled to the name of roads, or fit for conveying corn or merchandise by wheel carriages. Even in countries comparatively level, such as the south of England, the north of France, the north of Germany, there were no carriage roads, and goods were conveyed on the backs of mules ond Lorses, in the same mamner as over the mountainous regions of the Alps. Nor were there in that time post office establishments for the service of either governments or merchants.

An increase in town population is the beat evidence of improvement in agriculture, as in commerce. In a rude state of cultivation, the lahor of seventy or eighty persons io required to raise provisions for a hundred; so that three fourthe of the inhabitants are obliged to live in country distriets, for the mere purpose of raising subsistence. But as machinery and implements bccome improved, and the art of husbandry is better understood, the farmer can render more effectual the labor of himself and his assistants; there remains a greater surplus of provisions for the support of the inhabitants of towns; and somewhat more of the population are enabled to attach themselves to employmente distinct from agriculture, namely, those of mechanics and manufactures. To this improved condition Europe was slowly advancing, when the discovery of the filver mines of America liad the effect of materielly quickening its progress. This renders it proper to make a few remarks on the supply of gold and silver in early ages.

The precious Metals.-It is somewhat singular that Egypt, a country never remarkable for mines in its own territory, should have been among the first to give an example of mining on a large scale. But the Eryptinns hacl extended their conquests to the southward, where, in the mountains of Nubia, there were extensive mining districts. In these, as in the mines of other parts of the world, mosses of ore contained only par tieles of silver, and the task of raising the ore to the surface was very laberious. This was performed in the Nubian mines with little aid from machinery, and chiefly by munual labor, ns is still the case in many parts of Spanish and Portuguese Anicrica. The next accounts of mining in nucient history relate to Grecec, where, from the monntuinous nature of the conntry, the mines were numerous, though not particularly productive. They were wronglit in Attica, Thrace, and several of the islands. The laborers were paid partly in money, partly in provisions; and the accounts handed down to us by Greck writers show that mining, like agriculture, atforded a fair return for the capitel and labor employed, but no remarkable profit. Spain ha those times, as at present, was remarkable for extensive mining ; as were in a less degree Sardinia, Corsica, and the small island of Elba.

Such undertakings were long carricd on for the public account; but toward the tifth century of the Cliristian era, the Roman government withdrew from most of its mining establislments, allowing individuals to carry them on for their own necount. The quantity of gold und silver in circulation appears to have subsequently deereased; but we are greatly at a loss for correct information in regard either to the state of mines or the prices of commodities, as represented in money, during the Middle Ages.

Influx of Silier fiom dmerica.-It is now three centurice since the inportation of silver from America, in particular from Mexico and Peru, nmounted at first to hulf a million anmunlly, and inerensed to onc, and afterwnd to two millions. This sum was such as to affect the prices of corn, labor, and merchandise generally. It eunsed $n$ gradual rise of prices, earried to the greatest length in maritime districts, in parts comected with ench other liy nuvigation. The published works of the slxtecuth conlury contain many notices
of the risa in the price of commodities, and of the inconvenlence resulting to the consamers from such rise: the advantages to agriculturists and producers generally were not so clearly perceived, or the humble classes enjoying them had not equal means of stating them to the public. The supplies of gold and silver from America to Europe continued during the seventeenth and eighteent: centuries, and on a much larger scale than during the sixteenth; yet their effect was not so great for several reasous. First, the number of persons among whom silver now circulated was far greater than formerly. Gold also had become more common, and began to form the chjef, or almost the sole medium for large payments ; and, lastly, the use of silver for plate, jewelry, watches, and other ornamental purposes, increased greatly in consequenco of the improved circumstances of the middle and upper classes. There remained thus loss silver to add to the coin in circuiation.

Bank-notes.-It was in the elghteenth century, particularly after 1750, that the uso of bank-netes becmus general in England, and subsequently in tho United States of America. This may be compared In its effect on prices to an additional supply of gold from the mine, because its tendency to raise prices is conslderable, though not so great as is vulgarly supposed; because bank paper payable in cash on demand, of which alone we spenk, can never be unduly extended. Bank-notes have as yet obtained little currency on the Continent of Europe; bat in Great Britain, Ireland, and North Anerica, their effect on prices may be said to have been similar to that of the inportation of tho precions metais from America. In either case, the consequence was a rise in the moncy price of corn, and commoditios generally. To comprehend the benefit of auch rise, wo should consider society as divided into two great parts; the producing and the non-producing classes. The latter cousist of capitalists, landl...ders, or fixed annuitants ; the former of furmers, especially tonants on lease, manufacturers, merchants, and, in general, all persona whe carry on business with berrowed capital. If a tenant on leaso continue to pay during twenty-one years the same rent, while the market price of his crops experiences a progressive rise, it fullows that his circumstances will improve. Thas, on the augmented importation of silver from America to Great Britain, which began three centuries ago, there took place a slow but steady rise in prices, tho effect of which was of great advantage to agriculturista, in particular to those who held land on lease. The yeoman who was cantious and persevering thas laid the foundation of a little property, the next generation added to it, and the third rose from the condition of cottagers to that of farmers. This, or something liko this, was the course of circumstances in England, during the chicf part of tive sixteenth, soventeenth, and eighteenth centuries. If the effect was at no time very grent, it was continuod and progressive; for we can trace no great or general decline in the price of agricultural produce until the general peace of 1814.
Trade of Great Britain.--The trade nad navigation of Great Britain, great as it now is in extent, did not by any means make an eatly figure in the commercial listory of Europe. Of this the principal cause was the thinness of her population compared to that of the north of Italy or the Netherlunds, and the consequent insignificance of her towns. The slow progress in trate is also to be ascribed to prlitical causes, to the civil troubles originating with the great barons, the frequent wars with Frauce, and still more to the long and snnguinary contests in the fiftenth century, respecting the rival claims of the houses of York and Lancaster. It was net till the reign of Henry VII., little more than three centuries ogo, that tho ndvantages arising from the extent of coast and abundance of fucl licgan to be brought into active operation. Duriug the reign of his successor, the progress of improvement received lit-
tle patronage from the court, but a most efficient indirect aid from the introduction of Proteatantism. The advantages resulting fron that happy change, and tha development of national industry, were strongly displayed during the long reign of Elizabeth, under the wise adminiatration of Cecil. At that time, also, was felt the benefft arising to the productive cla seses, from the augmented import of gold and siiver from America.
Exports to North America.-A striklng feature in ths trado of England, compared to that of France, Germany, and other Continental countries, is the magnitudo of its exports to distant parts, such as India, North America, and tho West Indies. These different loranches of trade employ a number of seamen, and make a conspicuons figure in the list of yearly exports. They are considered as the piliars of commercial prosperity; but those who estimate them so highly have no idea of tho largo sums of capital that have lieen withdrawn by each of these countries from England. The United States of America consumed English manufactures largely for nearly a century, but in no one year did wo remit back to Great Britain the full value of the articles which we imported. The amount due from the United Statcs to England has exceeded the gencrai estimate, and is known only to the merchants, whe feci the deduction thus made from their pecuniary means. A similar drain has long been mado by her West India colonles, but in a less degree, until within these fifty years, slnce which the capital drawn from England hss amounted to many millions. With India commerciai intercourse was noro limicod; and the exports, cenfined to the East India Company and to a few merenntile houses in London, were on a comparatively smali scale until the present age, durin which the extension of the private trade from Livery. ol, and the alvance of capital on indigo plantations, made the India business assume a considerahle resemblance to that with North America and the West Indies. The real and substantinl benefit arising from commerce takes place at home, and shows itscif In the extension of maunfactures, the increase of towns. the improvement of roads, canals, and harbors.
Of the courso of trade in Great Britain during the last half century, the following is a bricf summary. After the peace with the United States of America in 1783, her trade suffered for some time by the transition from war to peace, but gradually improved; and in the yenrs $1780,1790,1791,1792$, was decidedly prosperous. After this cenme the war with France, which wns at first injurious to trade, but after the abundance of moncy consequent on the extendel circulation of bank paper in 1797, assumed a very different appearance, and seemed to bring a yearly addition to the national wealti. This ostensiblo incrensc of protits was kept up during the chief part of the war, but at the peace the state of circumstances underwent a completo changc ; the transition was great beyond example; prices fell in every department of business, and the year 1810 was among the most gloomy in the commerctal histury. A revival of trado took piace in 1817 and 1818, but it was succeeded ly a long depression. In 1823 trade revived once more ; in 182.1 it became prosperons, and in 1825 afforded a striking example of the abuse of mercantils prosperity; nt the end of that year a general f:ll of prices, and afterward the heavy callis to meet the expenses of the late gigantic railway undertakings, aggravated by the failure of the potnto crop of 1846 , occasioned the grentest difficulty in procuring pecuuiary accommodation, and led to the crisis of 1847.
Effect of War Expenditure.-From the case with whicin money was borrowed by the govornment of Great Britain during the eighteenth century, the wars carried on were both of frequent occurrence and on a scale of great expense. The result was a continued increase of delt and taxation; but the burden did not appear heyond her menns, untii the unprecedented length to which it was carried by the wars of 1793 and 1803.

Both took place the extreme to w ried was the mo lang experieuco his coming into atste of the trad measures, such a and the commer antitled to great not now entertai and it wase in a to be diverted fr of the aristocrac agsinst tho Fren atrocitics of thesc parte, and, ahow checked issue of to an unpreceder In the midst Mr. Pitt, and the suceesors, transf ces to the hands men unconscious rency, and of th pago of neutral, States of Americ tion of the bank waste of the pub trj of unparallel ed by a great de well in tho army great number of ductive employ crease of the wr socuplioyed, as y of persons who it been sceounted price of corn and of a state of war reat to increased lord: and that to ployment of wor of Gireat Briduin 1814, while in th there was a corr return to higher uee fowered rent the upper classes a want of cmplo excuplifies the prices as took p than any other a hereace to peace Decrease of the ud silver from Iy to increase un orders in Spani shortered the su baif, Mr. Jacol calculated the re coin, during the of 1814, nt not 1 the supply of the effect in lowering cxtent it is not form an opinion. nis in 1848 , and ap for any defic ters, but from th filrnished more nual produce of the worid in the ing. The offec prices very larg to give a great and especialiy f Germany.-See

Both took place under the ministry of Mr. Pitt, and the extreme to which he allowed expenditure to be carried was the moro remarkable when we consider hia loag experieuce in finance, and that from the time of his coming into cffice his attention was given to the state of the trade and revenue. Several of his early measares, such as the commutation of the duty on tea, and the commercial treaty with France in 1786, were eatitled to great commendation. A similar opinion ls net now entertained of his revival of the ainking fund; and it was in an evil hour that he ailowed himself to be diverted from his pacille ceurse by the urgency of the aristocracy and his sovereign to take up arms agaiast the French revolutionists. Unfortunately tho atrocitics of these men, the ondless usurpetions of Bonaparte, and, above all, the facilitiea afforded by the unchecked issue of bank paper, carried the expenditure to an unprecedented height.
Io the midst of this hazarious carecr, the death of Mr. Pitt, and the removal from office of his imorediate successors, tranaferred tho management of Britiah finances to the handa of men wholly unequal to the task: of men uncouacious of the precarious nature of paper currency, and of the danger of such measures as a steppaga of neutral navigation, or a war with the United Statcs of America. The consequence was a depreciation of tho bank paper during tive jears, an enormous wasto of the public money, and a burden on the country of anparalleled amount. $A$ state of war is attendel by a great demand for the service of individuals, as well in tho army and navy as in the public officea. A great number of persons are thus withdrawn from productive enployment, and the consequenco is an increase of tho wages and incomes of those who remain so employed, as well as briuging into activity a number of persons who in a season of peace would hardly have been accounted worthy of employment. A riso in the price of cern ant other produce is another consequence of a state of war; this leads to a riso of rent; a rise of reot to increased expenditure on the part of the landlord: and that to a geaeral activity and continued employment of working classes. Such was the condlition of Great Bribinin during the twenty years from 1794 to 1844, while in the tweaty years that followed the peace there was a correspondiag decline, and then a graciual retura to higher prices. Tho fall in the price of prodace lowered rents, and greatly lessened the income of the upper classea; hence a contracted expenditure, and a want of employment for the lower orders. All this exemplifies the precarious nature of auch a rise of prices as took place in the late wars, and will, more than any other argument, confirm the public in an adherence to peace.
Decrease of the precious Mfetals.-The supply of gold and silver from America to Europe continued regularIy to increase until the year 1810, since which the disorders in Spanish Amorica, particularly in Mexico, thortened the supply from that quarter by at least onebalf. Mr. Jacob, in his work on the precious metals, calculated the reduction in the quantity of circulating coin, dariug the twenty years that succeeded the peace of 1814 , at not less than 20 per cent. This decrease in the supply of tho precious metnis must have had some effect in lowering the prices of commorities, but to what extent it is not possible, with ov e perfect data, to form an opinion. But the discovety Ggold in Culifornia in 1848, and in Australia in 1851, has not only made ap for any deficiency in the aupplies from other quarters, bat from these two countries alone there has been futmished more than twice the amount of the entire annual produce of the precious metals from all parts of the world in the most productive perieds of their working. The effect of this has been to raise wages and prices very largely hoth in Europe and America, and to give a great atimulus to emigration from Britain, and especislly from Ireland, and to somse extent from Germany--See Euighation.

Firee Trade.-In 1845 Sir Robert Peel abolished the customs duties on 420 different articles. This measure wasa virtual abandonment of the system of protection, which was shortly after followed by the totai repeal of the cors laws.
Progress of A nerican Commerce.-The sixteenth century introduced the leading European powera to a minute acquaintance with the continent of America. Adventurous navigation had rescued a world from anage dominion, and there were adventurous spirits enough to peopla that world, and identify thenceforward their destinies with it. A hundred years after, and civilization planted her abodes through all this waste. Peculiar, indeed, is the feeling with which these infant days of our country are regarded, so like an illusion does it seem-so like a dream of glowing imagery. We look back as to a classic era, and the romance of Pocahontas, and of Raleigh, of Fernando de Soto, and Juan Ponce de Leon, do they thrill us less than the beatific visions of the Greek, recurring to ages long ago, when Ilion resisted the shock of Agamemnon's heroes, and the Argo sailed away to distant Colchis? The dim antiquity aeems gathered around both of them alike. But let it pass, all-the romance of our history. They imegined not, the men of that day imagined not the stapendous results which have occurred so soon. They saw not tho benign and regenerating influences of a virgin land, preserved for countlesa ages uncorrupted by tyranny, and ignorant of oppression. Could such a soil havo nurtured else than freemen? They saw it not, and do we-even we-seo other than darkly yet tho great consummation, tho mighty deatinies of the regions which, three centuries ago, were proclaimed from the inast-Jead of a crazy ocean bark, a speck upon the distant heaven?

The development of American character is replete with iustruction, and solves one of the most remarkable problems in tho listory of mankind. The untried scenes of a new world, cut off by trackless occans from contact and communion with the civilization of unaumbered generations, were sufficient to introduce, what might have been predicted of them, reaults new, striking, and without a precedent. The indonitable will, the stern endurance, the infloxible and hardy spirit of independence, tho high daring, the lofty patriotism, the adventurous, unlimited enterprise, the genius resolute, active, intrepid; inexhaustible in resources, elaatic in vigor and in freahnese, bueyant ever and hoping on, and executing amid every trying scene, every danger, and difficulty, and disaster-triumphing evory where and in all things. Philosoplyy could have argued this complexion for the men whose fathera braved so much beyond the ocean, and would philosophy hare won less than the fame of prophecy by her judgment?

But we pause not here to lament the causes which have counteracted these genial influences, and left whole regions of America stagnated, as it were, in the very elements of vitality and yct living hopelessly on. Should we refer to Mexico and the South American Statos? What is there here of progress to chronicle, and how much of humiliation? Regions blessed by IIeaven in every thing but in men. Changing ever their dynasties and their despots in revolution and in blood. In motion always, without pregress. In arms, without valor. Loving change rather than hating oppresoors. Proclaiming civilization and annihilating its advances. The bitterness of Voltaire's sneer has no cruclty or injustice in its application to many of them, "en pansant les chevaux de leurs maitres its se donnent lt titre d'electeurs des rois et de destructeurs des tyrans!" Under IIeaven, as it was the destiny of the savago aboriginal, incapable of civilization, and with no law ot progress ingrafted upon hia nature, to fade away beforc the steady advances of European arms and policy, so the Anglo-Saxon element of America, by its flexihility and its power, by tho now elements which it has taken to its if in the trying, yet triumphant scenos through
which it has passed, will and must, in the inevitable course of events, prenide over the destinien of the contiment of America, aiding and direeting them, adding Wre and vitality, rousing dormant and aleeping energies, and dovcloping, apon the theatre of the world, movementa in comparison with which all that hiatory can furniah before the deluge, before the ora of Christ, and since, shall dwindle into insignificance! It noeds ne ardent tomperamant to draw a atronger pieture.

American Commerces in the secenteenth Century.-The early coloniats were exposed for a fearful probation to the mest extraordinary vicisaitudes and necensities. With the axe in one hand they reduced the aturdy foracta into the farm-yard, and with the knifo in the other they reolsted the approaches of the stealthy and sanguinary savage. A meagre enbsiatonce rewarded the toila that knew ne rest, and the charties of the mother conintry were invoked for men whose determined wills grew atronger as they suffered. This period had Its different limits. Fifteen yeare after the landing of William Sale, we find tho proprietary gevernment in England complaining to the Carolinas, "we innet bo silly indeed to maintain idle men." Thirty-three yeare after the landing of Bienville in Louieiana, the Westorn Company threw up their charter in utter hopelessness and despair.

New England's rugged soil yieided a too reluctent tribate to the industry of her sona. They went out cariy upon the ocean by which they were girt in search of hread that the plow yielded not. To this hardy and daring people the boons of Nature were to be fonnd in her apparent denial of them ali.

The eeventeenth century afforde ns, however, but a fow particulars of the trade which had been started in the colonies. That it was limited can be readily imagined; that it should be worthy of any regard at all, is the oniy aource of surpriso. The materials of this portion of our history are meagre. It in sufficient that, in 1647, a trade had been opened from the Northern perts to Barbadoes and others of tho Weat Indies ; that a collector of tho customa was appointed at Charleston in 1685, and that the hardy enterprises of the Nantacket whalemen received their first impulse in 1690.

American Commerce from 1700 to the Revolution.-In the year 1781 we ind a petition read in Parliament from the American colonies that the African trade be thenceforward laid open to them. In the same Parliament it. was conceded that the whole gain of the mother country from the trade of Virginia and Maryland alone amounted annually to $£ 180,000$. The Pennsylvanians ware exporting corn to Spain and to Portugal, and with the proceeds of their shipa and cargoes selecting out merchandise in the English markets. To the Dutch alone they sold 5000 pistelea annnally in liquor and provisions. They had their invoices to Surinam, and Hispaniola, the Weat Indies, Canaries, Newfuundiand, and the other colonies, and $£ 150,000$ from the proceeds to traffic in Britain. "New York," says a chronicle of this epoch, "seuds fewer ships to England than some other colonies do, but those they do send are richer, as dealing more in furs and skina with the Indians, and they are at least of equal advantage to England with these of Pennaylvania. The soil of New England is not unlike that of Britain. It employs about 40,000 tous of ahipping, and about 600 sail of shipe, sloops, etc., about haif which shipping sails to Europe." Now began the parent's jealousy of her offipring. Nothing, it was said in Parliament, nothing is more prejudicial, and in prospect more dangerous to any mother king. dom than the increase of ahipping in her colories. The only use of colonies, added Lord Sioffieid, is the monopoly of their consumption and the carriage of their produce. In 1730 the Commons of England struck an ineffectual blow at the American trade with the French and Dutch colonies, it having been rapresented to them as greatiy detrimental to England and her colonies.
in 1782 a writer gravely announced that the con-
venience of the Americans from the plenty of beavers, hare, coney wool, and many uther furs, gave them euch advantages that, uniens reatrained, they would soon aupply all the world with hata. The Board of Trade of the same year roport that there are more tradea carried on and manufactures set up in the provinces on the continent of America, northward of Virginia, prejudicial to the trade and manfacturee of Great Britain than in any other of the British colenies. In 1750 the Americans were forbidden to work in iron, and Lord Chatham declared not long after in Parliament that the colonies of North America had not even the right of manufacturing a nail. So atringent had becone the protective policy.

In 1764 was imposed an onerona burden upon American commeree by the mother country, grown jealous of its $t 00$ great extenaien. This commeree had greetly enriched the home as well as the colonial government, but the former was too much bliniled by erroneous policy to perceive it. She heeded not the annual purchasea made in her markets with the availis of lumber, beef, fish, pork, butter, hersees, poultry, livestock, tobaceo, corn, flour, bread, cider, apples, cabbages, onions, eto., diaposed of by our traders to the eager West India planters; and Lord Sheffield, in his observations on the commerce of the American States, tells us that at this time the Carolinians, of their exporta to Kingston, Jamaica, took back one-half in the prodace of that country, the middle provinces oneforrth, New England one-tenth, and the balance in specie doliars. The trade of Britain with the Americsa colonies employed in 1769,1078 ships, and 28,910 seamen. The value of her imports from them for that year amounted to $£ 3,870,000$, and of their imports from her to $£ 3,724,606$, ahowing a large difference in favor of the parent country.

In 1770 the imports of Carolina were $\mathbf{E b 3 5 , 7 1 4 , \text { those }}$ of New England $\mathbf{£ 5 6 4 , 0 3 4 , \text { of Maryland and Virginia }}$ C851,140, the exports of Virginia at the same time being double the value of those of either of the others named. Mr. Burke triumphantly announced in the Hoase of Commens, "Our trade with America ie scarcely less than that we carried on at the beginning of the century with the whole world! In the six years endIng with 1774 there was an average import from the colonies into England of $£ 1,752,142$, and an averago export to them in turn of $£ 2,782,066$. Crippled as our energies were, they could not be repressed. It was a vain effort to confine the enterprise of a peoplo whoso views embraced tho world itself, into the narrow conipass afforded by English ports, and by portions of Europe eonthward of Cape Finisterre. When the day of reckoning came, as it did at last, for theso reckicese abmses of power, and they were proclaimed in the bill of rights, not the least of the uaurpationa for which retribution was demanded is to be found in the clause: 'She has cut off our trade with all parts of the world.'"
In the article Colonies a table will he found compiled from the most authentic sources, which exhibits the trade of the mother country during the whole of the periods we have heen conaldering; the tablo is of great interest, embracing as it does in one view almost the entire commerce of America for seventy-six years.
From these statistics we learn the relativo commercial position of the different provinces. Dividing the whole time einbraced inte periods of twenty-five years each, we observe in the first period that Virginia, Minryland, and Carolina furnish almost tho entire exports, and import much more largely than New England and New York. In the second period New York greatiy increases her importe, which still fall short of those of New England, or Virginia and Maryland, while her exporta are enhanced but llttle. The whole exports of New York, Pennsylvania, and New England combined did not reach the amount of these of Carolina singly. In the third period Pennaylvania imports mere

Conemerce of ths United States under the Articles of Federation.-During the Revolution all forelgn enterprise was of neresalty susponded, and in struggiling for liberty men taught themselves to forget and deapise every mera physical want. Leagued together for comnuon defense, the atates were able to reaist every device of power, and sustain a long and bloody contest. But when thist conteat ; is ended and liberty won, the confederation exhibited at once ita nervelessness for peace, ad for the arta, and policy, and dutiea of peace. The fabric which conld resiat the storm crumbled away when the aunshine succeeded. So true is it that the nceessities of men aro the only durable bond $0^{\circ}$ their onjen, and that without this union there is no strength.
From the close of the war until the adoption of the Constitution there may be considered to have been no great regulating head in America. No nniformity or system prevalied among the bintes, and their commerce wss consequently exposed to the utmost uncertainty, fluctustion, and loss. Tonnage dutien were ievied in diffirent ports, as it suited the esprices of the several governments, and as they were more or less desirous of encouraging partieular branches of navigation and trada at the expense of others. By a policy more astute than that of her neighbors, Now York managed in this way soon to increase largely her foreign trade, and Laid the foundation of the empire she now maintains. From 1784 to 1790 our commerce exhibited the most renarkable results. For seven years consecutively the imports into American cities from Britain were never etherwise than twice the amount of the exports to her, and for several years were three and even flve times their value. A drain of specie is sald to havo been the consequence, a very natural, though not necessary one, and great commereial embarrassment and distress.
Tha following table mado up from records of the English custon-house will be found of interest:

| Years. | Exporth, Amerien to Uritain. | Imports America from Britain. |

Commerce of the United States under the Constitution and until 1812.-In this crisis the attention ol thinking men and patriots in all parts of the nation was aroused, and there was perhaps nothing which contributed so moch in urging the States into a general convention, and into the adoption of a constitutional government and union, calculated to preserve their libertics, their fortunes, and their glory in sll the future. One of the first grants of power conceded to Congress under this Constitution was that of "regulating commerce irith forrign nations, nmong the several states, and raith the Indians." Referring to the state of thinge which existed under the articles of federation, an able writer observes, "Interfering regulations of trade and interfering elains of territory were dissolving the attachments aud the sense of the common intereat which had cemented and gustained the Union during the arduons struggles of the Revolution. Symptoms of distress and marks of humiliation were rapidly accumnlating. Tho finances of the nation were snnihilated. In short, to ues the language of tho authora of the Federalist, each state, yielding to the voice of immediato intereat or convenience, suceessively withdrew itt support from the confederation, till the frall and tottering edifice was ready to fall upon our heads, and to crush us benenth its ruins. Most of the federal constitutions of the world
have degenerated in the same way, and by the same means."-Kкат, voi. i. p. 217.

No more, said a memorial from Charleston, on the adoption of this Constitution-no more shall we lament our trade, almost wholly in the posseselon of foreigners, our vessels excluded from the porta of some nations and fettered with restrictions in others; our msterials, the produce of our own country, which should be retained for our own use, exported and increasing the maritime consequence of other powers. With this memorial before them, and others of a aimilar eharacter, Congress at its first secaion appointed a committee to report upon "the expediency of increasing the duty upon foreign tounage carrying American produce to places in America not admitting American vessels; and to frame a bill placing the same restraint pon the comnierce of foreign American atates that they place upon ua."
By the report of Alexander Hamilton in 1790, it appears that the total tonnage of the United States at that time was as follows:
Amerlonn veasels in foretgn trade 803,008 tona.
Conaters above twenty tons ..... $118,18 \mathrm{I}^{11}$
In the fisheries .................. 26,262 " $-502,626$ tons. Total foretgn tonnage 262,013 Un!ted States and Briti ish... United States and other foreign ........................... 838 is

Total. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 7 76,089
The tariff of 1789 was specific and ad valorem, and discriminated 10 per cent. in favor of the trade conducted by our own shipping. In this we but imitated the navigation acts of Europesn states, by means of which it has been supposed the enormous maritime consequence of some of them was principally secured. We shall not pauso to argue a point in political economy so long mooted among writers of the greatest ability. The jealousies of nations have gone and atill go very far. Even the philosol lical Voltaire thought that their gain could not othe wise acerue than with each other's loss. England lo g imposed the most onerous restrictions upon all other commerce than her own, and her advances in conseqnence, or notwithstanding, have been unprecedented. Her tonnage when she commenced this system was less than that of tho United States at the adoption of the Constitution.
There was one department of our maritime industry which demanded the earliest attention of government, and we think its general interest will bo sufficipnt apology for any space wo may nliot to its consid. ationtur fisurimes. Mr. Jefferson, in 1791, then Secretary of State, furnished an admirablo report upon the subject, which we proceed to analyze. As early as 1520 there were fifty ships upon the Newfoundland coasts at a time for cod. In 1577 the French had 150 vessels there, the Spaniards 100, Portuguese 50, and English 15. The French fisheries begen early to decline. In 1768 the Americans took but little less than the English, and the French took least of all. In 1789 England obtained double the quantity of America and France together. During the Rovolntion the American fisheries were almost entirely abandoned, and Mr. Jefferson left it to the wiadom of Congress to decide whether they should not be restored, by opposing prohibitions to prehibitions and high duties to high duties, on the fish of other antions.

The whale fishery was prosecuted by the Biacayans as early as the fifteenth century. The British began its encouragement in 1672 by bounties. The Americans opened their enterprises in 1715 . They suceceded carIy in the discovery in the Sonthern Seas of the spermaceti whale, which they attacked instead of the Greenland litherto known to navigators. In 1771 we had 204 whalers. During the war England held out the largeat hountles to the trade, and so Irresistible were these in the depressed condition of our fishermen, that it is said many of them were on the eve of removing to Halifax, to prosecute the business there, and wero only deterred by a letter

Frapes would abato ber duties upon oil. The fittia isle anic of Nantucket is the great heart of these fluheries. A sand-bar, said Mr. Jefferson, fifteen miles long and three broad, capable by its agrioulture of maintaining twenty familice, omployed in these fisheries, before the Rovolution, between 5 and 6000 men and boy, and contained in ita oniy harbor 140 vensels.' In agricuiture, then, they have no resource, and if that of their fisherios eat not bo pursued from their own habitations, It is natural hey should seek others from which it can be followed, and principaliy those where they will find a ammeness of language, religion, laws, hablit, and kindred.

In 1808 Mr. Huger atated to Congress in his report, that it would seem the cod fisheries liad gained ground since the Revolition, but that the whale fiaheries, on the contrary, had been for some time past on the deciline. The war of 1812 was most disastrous to the fisharmen, but thoy soon afterward recovered their prosperity, and on the first of January, 1844, we had 64t vesseis engaged at sea, of tho vaiue, including catch ings, of $27,784,000$. On the first of January, 1846, there were 680 ships, 84 brige, 21 schooners, and 1 aloop; tonnage 238,149 ; manned by about 20,000 seamen and officers, consuning over threo miliion dollars annually of American produce. Proceeds of whale fishcries $\$ 9,000,000$ per annum, of which only $\$ 2,000,000$ are re-exported.

## In 1844, Mr. Grinnell atated in Congress:

"Thla fleet of whaltag ahips Is larger than ever pursned the buainem before. Commercial hlatory furniahea no neconnt of any parallel. The voyagea of thone engaged in the aperm Ashery avarage three nad a half ycara; they mearch every sea, and often cruice three or four montha with a manat each mact-head on the look-out, wthout tho eheering aight of a whale. They are hurily, honest and patrioile, and will, an they did In the lant war, stand by thelr country when In dan. cer; they will man sar ahtpa, and fight our battles on the coean."

## Mr. Clayton remarked ia February, 1846 :

${ }^{\omega}$ We have at thfa time a commerce of $8,417,000$ tons of thip. ping, England has $2,480,000$ tona; so that we are nearly, nay, it ts my opinion, we are completely on a par with her. I doubt, atr, whether Engiaod han a greater commerclal marion or greater intereats to protect. We have more than 700 whale chipa tn the Pacifle, an extensive Iadlan commerce and a great and dally growiag commerve whth $^{\text {th }}$ China."-Baowni's Whating Cruise and Ifictory of the Whaling Fishery, 1840, p. 689.

At the close of the last century there were many canses which tended to add a vast importance to the commerce of the United States. For several years this commerce enjoyed unparalleled and almost unmeasnred prosperity. Scarc admitted into the family of uations, we found the whole civilized worid engaged In the fiercest and most sanguinary conflict. A wise and indeed " masterly" neutrality was of course the true policy of the nat : 2 . The carrying trade of the world fell at once inte ur hands. We suppiled the mother countries with the products of their own colonies. The East and West indies alike were opened to our shipping. Their rich products filied our warehouses, supplying consumption anil ro-export. Prosperity such an this, however, was fated to be brief. The conflicting powers sacrificed every thing to their mutual hatred, and minded littie the rights of a nation they had not even learned to respect. Protestation ended in war, and the rights of our saliors were established on every sea. With the return of peace in Europe, the carrying trade departed rapidiy from us.

In 1791 the king and council of England admitted American unmanufactured goods, except fish, oli, blubber, whale fins, certain naval stores, ctc., into Britain at the same duties as British American produce. The treaty of commerce of 1794 between the two governments was a reciprocity one, both parties binding tivemtelves to impone no greater reutrictions upon each other than they imposed upon others. This treaty regu-
lated our East Indis commeree, then newiy opened and promiving a great extension.

From 1790 until 1797 Pennayivania continued largely the greateat exporter in the Union. In 1791 South Carolina oecupied the thirl rank. In 1797 N ww York for tha flrst time took aluading position, which she has over after maintained. The tirst exports of Tennessee and Mississippi date from 1861, those of Kentucky and Indiana from 1802, of M'chigan 1808, Orienas Territory 1804, and Ohio 1806. This we shall see more particulariy hereafter. It is sufficient now to induige the reflections which the facts beforo us se naturally a waken. Mysterious have been the changea. Old age and premature deeay have falien upon cities once famous for thoir trade; and the quaya, where the flags of all nations floated, have come at last to be comparatively deserted. We look around, and there have started up othere like mature creations, full of vigor and staiwort oven in their infancy. How hardiy can reason realize that these wondrons changes are not all the picturen of a fertio imagination. Where is pleced Virginia now, that mother of states, who in 1769 exported to foreign lands four times as much as New lork ? and where is Carolins, whoee experts at the same time doubled those of New York and Pennsyivania together, und were equal to five timea those of ali New Englanif? If trade grow to colossal atature, its proud empire, liasteas aiso to swift decay.

The diffeulties which beset our commerce in the eariy part of the present century, when the rival hostile powers of Europe, jealous of our prosperous neutraily, strained every nerve to invoive us in titeir disputes, will be cailed to mind by every one familiar with history. We wero made the victims of the poilicy and arts of these nations, and even as early as 1703 their depredatione upon our commerce were cousiderabic. In five months aione of that year it was stated in the liouse of l'eers, that tix hundred $\boldsymbol{A}$ merican vessels were seized or deteined in Britigh ports for aileged violations of orders and decrees claimed as principles under the iaw of nations. These aggressions upon our rights were iong and extensively practiced, as the following table will extilbit:

Seizeris of Amarican Vesseles froy 1503 to 1812.
By the British.
. 917
By the Freach. K 8 Ily the Neapoiltan. ..................................................................................... 70 Total vessels. . . . . . . . . . . . . . . . . . . . . . . . . . . . 3 ity
And this at a time when we were at peace with all the nations on eartin! Indeninity for these spoliations has been the aubject of numerous treaties; among others, that of England in 1794, France 1803, and Spain in the Florida treaty of 1819. But this whole period, so interesting in our annals, deserved a minute survey.
On the conquest of Prussia in 1806, Bonaparte conceived the iden of crushing the maritime power of Britain, by prohibiting aii the world, in his famens Berlin Decree, from conducting any trade with her or her aumerous dependencies. The retaliatory British orders in Council followed at once, and all countries in the world connected in any way with Irrance, or opposed to England, were deciared to lo under preciseiy the same restraints as if actually Invested in strict bieckade by Jritish forces. Incensed by se unexpected and ruinous a measuro, Napoleon issued the menor abie Milan Decree, making lawful prize of all vessels subnittiug at any time or in any way to British searcin or taxation. It was natural that these iilegal and unauthor: ized proceedings should excite the atmost interest and concern in the United States so materialiy and even vitally affected by them. We protested in vain. The administration recommended as the sole remaining alternative of peace an embargo, which Congress adopted in 1807. This measure tho commercial intareats warmIy opposed as ruinous to them, and memoriais were forwaided from many quarters praying for ita repeal. To
these it was leaching fo merce and dition to pr try for art to supply matter, ho ieon, who to lirance, glish comn ingston, ${ }^{4}$ woaid be just ground In 1800, was substit er regarded ify her in American

The maining aless adopted reats warmsls were for repeal. To
hese it was replied by govermment, "The embargo, by leaching foreign nations the value of American commerce and productions, will inapire them with a disposition to practice juetice. They depeud upon thin country for articles of first receselty, and for raw materials to aupply their manufactures." Such a view of the matter, however, did not occur to the mind of Napoteon, who regarded the embargo as greatly favorable to lirance, and alding him in hia warfare againat English commeree. "Tro submit," said he to Mr. Livingaton, "to pay England the tribute ohe demanda, woald be for America to aid her against hims, and a just ground of war."
In 1800, a non-intercowris with Britain and France was substlituted for tho embargo, which the latter power regarded as such an ovidence of hoatility as to justliy her in proceeding at onco to condemn millions of American property aa lawful prize.
The Congreas of 1810 determined upon tho admission of the commercial vessels of the powers abovenamed, if the act were preceded by a revocation of their hoatile and arrogant decrees. Tho lirench government pretended to close in at once with the proposal, but it was nearly one year later before her repealing ordinance was aficialiy promulgated, evideneing a dispoaitlon on the part of Napoleon to play with na in bad faith, and te turn the game at any time to hifadvantage-so humilisting to our prido are the events of this entire era. With Eingland it was long doubtful what relationship re might expect to sustain. Hoatilo and peacesble siternately, according to her capricea or her intereata, she had provoked in American minds a resentment too deep to be subdued, and forbearance longer was regarded a crime. The Ordere of Council remmining in force, and the aggressions increasing daily, a nen-intercourac act ef sixty days was reaorted to, the preludo only to a scienn declaration of war. Then was the hour of severe retribution, and then was the national honor and dignity of Amorica triumphantly vindicated !
Commerce of the United States since 1812,-This has been an ers of prosperity and rapid advance, and the great powers of tie civilized world seem to have realized for once ine rich benefita of a prolonged armistice, or, If another expression be preferred, a protracted, and we hopo permanent pesce. In commercial rank, the United Statea of America, subordinate to Britaio only, and having outetripped all the world elac, is prepared to share a divided sceptre, until that aceptre cas be wielded alone by her hand, and tho empire of the seas be transferred to her keeping
The history of our trade for the last thirty years has material enough for many more pages than we can allot to it, even with the greateat condenaation. Tho period has been celebrated by an appreach to a more liberal internationality, and a reciprocity something else than in oume. The progrese in the last year or two has been most atrongly marked toward that ultimatum, in the minds of every lover of truth and of human advancement, perceived tirst by Lord Bacon, and ably, though imperfectly, presented by his followers-comnerce unfettered as the winds that waft it-free religion, free govermment, free press, free traffic-freedom every where, and in every righteons thlug throughout all th.e world $\mid$ When shall nations escrifice their foolish jeslonsies, and meet each other on this high, broad and Christian groand? We are no partisan here, but a coamopolite. We advucate a policy as wide as the carth, and as gencrous. No aingle nation can afford to set alone-the movement, if made at all, must lie universal.
The condition of Europe now, howover, argliea little or the early trinmph of those principles to which we have been referring. The latest British, French, and Anstrian tariff have been restrictive, though in the case of the first-nained nation her policy wonld appear about to be radically changed, as in the late repeal of the corn-lawe. The German states maintain the exclusive policy, as do also the Spanidrda and Portuguese. Russis wae

Intest In adopting the restrictive syatem, hat wo soe by her last tarif some evldences of lmprov is $\boldsymbol{n t}$, which nelther Sweden nor Denmark furnishes. the datte of the Italian statea have been generally moderate, ax cept for Rome and Naples, and we recognize a great improvement in these in the late tariff of his IIolinest the Pope. The commercial aystem of Holland is the most liberal in all Euroje, but the South American taten appear to be governed by the same spirit as that which dictated the policy of Spain.

In 1824, Great Britain seemed deairone of remeving in nome degree her reatrietions upon the navigation of other powers. She entered Into reciprocity treatlet with many of them, and in thia was soon after imitated by the United States, in the treatien of 1820-6-8-0 with Central America, Denmark, Sweden, Hanse Towna, Prussia, Brazil, Austria, Hungary and Bohemia, Mexico, Russia, Veneznela, Greece, Sardinis, Netherlanda, Ilanover, and Portugal. Wo also entered into similar but limited reciprocity treatica with France in 1822 continued afterward, and with England in 1821, 1825, and 1833 , and a full reelprocity treaty with Canada in 1854. These treatiea were arranged by Mr. Kennedy, Chairman of the Committee of Commerce, Into three classes.

1. Thoso securing mutual privileges of export and import of produce, the growth, prodince, or manufacture of the stlpulating powere, transported in their ewn vessels, without discrimination on tonnage.
2. Those providing fer a levy of dutles not less favorable unon the tonnage of cither than are levied upon the tonnage of other powers.
3. Those requiring equality of port charges.

For atatistica of the commerce of the United States, see articlo Unitel States.

Commercial Policy of tho United States.-wThe United Statea have, since tho very commencement of their existence as an findependent government, ever been willing and ready to reciprocate, to the fullest extent and in the most liberal epirit, all privileges and favors, whether of navigation or commerce, extended to their flag by foreign nations. To this end, and in order to antici. pate the usually dilatory procesa of treaty negotiations, the President of the United Statea is veated, by act of Congrees, with authorlty to tasne ble proclamstion granting to the vessele of foreign nations equal and similar privileges and favors to thoso extended to the vessels of the United States In the ports of such foreign nations, on recelving official notice thereof from the sccredited agenta of such governments.

Veasels belonging to the following nations are admitted, uncler the provisione of law, trestice of com: mereo nnd navigation, or conventlons, into the ports of the United States on the ssme terms as American vessela, with the produce or manufacturea of their own or any oticer country: Argentine Confereration, Austria, Belgium, Brazil, Chill, Denmark, ${ }^{*}$ Ecuador, Great Britain, Greece, New Granada, Gustemala, Hanover, Hanse Towns (Hamburg, Bremen, and Luhec), Mecklenburg-Schwerin, Netherlands, Oldenburg Peru, Prussia, Russia, San Salvador, Sardinia, Sweden and Norway, Tuscany, Two Sicilies, $\dagger$ Venezucla.

Vessels belonging to the following nations, with which the United States havo reciprocal treatics on the footing of the "most favored nntions," or with whom reciprocity exists, are admitted into the ports of the United States on the same terms, as respects tonnage or narigation duties, as vessels of the United States, with the produce or manufactures of their own or any other country : Bolivin, Costa Rica, Mexico, Muscat, Ottoman Empire, Portugal, and Uruguay.

- The treaty between the Linlted Statea and Denmark ex pired on the 14th day of Aprit, 1858.
+ By decree of December 18, 1854, equality with the national fleg is offered by the gevernment of the Two Siclles to the vesacis of such nations as reetprocate the favor. This equality appliee to the direct and Indireet trade.

Commerce, Code de. This was a part of the Codo Napoleon known as Les Cinq Codes and afterward as Les Six Codes. The Code de Commerce was promulgated in January, 1808. It was fombed in some measure upon the ordonnances of $1673-81$ of houis XIV. On account of the many modifications which the code of 1805 had undergone, a new text of the code was pronulgated in January, 1841. The Code de Commerce is considered the best part of French legislation. The institution of the commercial tribunals has been of great advantage to France, and has been adopted in other countries. These courts, of which there are 213, consist of a president and two or more judges, all chosen by the mereliants among themselves, and for a limited time: they are not paid for their services, but the greffier or reglatrar receives a salary. The Code de Commerce cousists of four books: the first treats of commerce in general; of tho various descriptions of consmercial men ; of the keeping of books; of companies and partuerships; of brokers, commissioners, carriers, etc. The second treats of maritime commerce; shipping; insurances; bankruptey, etc. The third concerns bankrupteies; and the fourth treats of the commercial tribunals, their jurisdietion, and proceedings. By a law of Apil, 1838, appeals in matters above 1000 franes (formerly 1000 francs) are carried to the Cour Roynle of the distriet.-Bons's Cyclopedia.

The French eode is retained in Rhenish I'russia; in the kingdom of Naples with some few modificntions; in the Cnuton of Geneva, in Switzerland, and in Belgium ; and formed the basis of tho code of Lonisiana, auggested or prepared by the late Lidward Liviugston.

Commercial Treaties. The first treaty of commerce made by England with any foreign nation, was entered into with the l-lemings, 1 Edward $1 ., 1 \geqslant i 2$. The second was with l'ortugal and Spain, 2 Edward II., 1308.-See Treities.

Commodore, a general oflicer in the navy, invested with the command of a detachment of ships of war destiped on any particular entorprise, and his ahip is distinguished from the rest of his aquadron by a broad pendant tapering toward the outer end, and sometimes forked. The word is corrupted from tho Spanish convendador, which signities both the superior of a monastery and a knight who holds a commandery. Commodere is also a name given to the convoy or leading ship in a fleet of merchantmen, which carries a light in her top to guide the other ships.-E. 13. See Convoy.
Companies. In commerce or the arts n company is a number of persons associated for the purpose of carrying on sonno commereinl or industrial undertaking. When there are only a few individuals associated, it is most commonly called a copartinery; tho term company being ustully applied to largo associations, like the Eust Jndia Company, the Bunk of England, ete., who conduet their operations by means of agents acting under the orders of a bonrd of directors. Companies have generally been divided into two great elasses -exclusive or joint-stock compnnies, and open and regulated companies.

1. Exclusire or ,oint-stock Companies.-By an instltution of this sort is meant a company having a eertuin amount of empital, divided into a greater or sumaller number of trausferable shares, matiaged for the common atvantage of tho shareholders by a body of directors ehosen by and responsible to then. After the stock of a company of this sort has been subscribed, 10 one can enter it withont proviously purchasing one or more shares belonging to some of the existing memhers. The partners do nothing individually; all their resolutions are taken in common, and aro carried into effect by tho directors and those whom they employ. According to the common law, all the partners in a joint-stock company are jointly and individually lable, to the whole extent of their fortunes, for the debts of the company. They may make arrangements anong
themselvea, l:miting their obligations with respeet to each other; but unless established by an authority competent to set aside the general rule, they are all indefnitely responaible to the publlc.
"In a privato copartnery, no partner, without the consent of the company, can transfer his sliare to another person, or introduce a new member into the company. Each member, however, inay, upon proper warning, withdraw from the copartnery, und demand payment from them of his ahare of the common stock. In a joint-stock company, on the contrary, to member can demand payment of his share from the company; but each member may, without their consent, transter his share to another person, and thereby introduce a new number. The value of a share in a joint atock is always the price which it will bring in the market; and this may be either greater or less, in any proper tion, than the sum which its owner atands eredited for in the stock of the company."-Wealth of Nations, p. 333.
2. L'tility of Joint-stock Companies.-Whenever the eapital required to carry on any undertaking exceeds what may be furnished by an individual, it is indispensable, in order to the prosecution of the undertaking, that an association should be formed. In all these cases, too, in which the chances of suecess are doubtful, or where a lengthened period must necessarily elnpse before an undertaking can bo completed, an individual, though ready enough to contribute a small sum in conneetlon with others, would, generally speaking, be very little inclined, even it ho had the means, to encounter the whole responsibility of such enterprises. IIence the necessity and advantage of companies or associations. It is to them that we are indebted for those caunls and railways by which every part of the conntry is intersected, for the formation of so many noble docks and warehouses, for the institution of our principal bunks and insurance offices, and for many other establishments of great public utility earried on by the combined eapltal mind energies of large bodies and individuals.
3. Branches of Industry, for the Prosecution of which Joint-stock Companies may be aldantageously establish$e d$.-In order to insure a rational prospect oî suecess to a company, the undertaking should admit of being carried on accordlag to a regular systematic plan. The reason of this is sutficiently obvious. The business of a great association nust be conducted by fuctors or agents; and unless it be of auch a nature ns to admit of their duties being clearly pointed out nud defined, the association would cease to have any eftectual control over them, and would be, in a great measure, at their merey. An individual who manages his own affairs renps all the advantage derivable from superior skill, industry, aud economy ; but the agents, and even directors of joint-stock companies labor, in nost cases, entirely or prineipally for the advantago of others; and ean not therefore, however conscientious, have the same powerful motives to act with energy, prudence, and ecenemy. "Like," snys Dr. Smith," the stewards of a rleh man, they are ajt to consider attention to small mintters as not for their master's honor, and very easily give themselves a dispensation from having it. Negligence and profugion therefore must always prevail more or less in the mangement of the aflitirs of such in company." It also not unfrequently happens that they suffer from the had faith, as well as the carelessness nid oxtravagnace of their gervants ; the latter having in many instances endenvored to advanco their own interests at the expenso of their emolnyers. Heneo the different success of companies whoso business may bo conducted according to a nearly uniform system-such as dock, canal, and insurance companies, railrond companies, etc.-and those whose business does not adinit of being reduced to any regular plan, and whero much must always be left to the sagacity and enterprise of those omployed. All purely commereial companies, trading upon a joint atock, belong to the latter clasa.

Not one tition of agents tant cou this circ ate then ment, $\mathbf{n}$ when it protecte

Not ons of them has boen able to withstand the competition of private adventurers; they can not subject the agents they employ to buy and sell conmodities in distant countries to any effectual responsibility ; and from this circumstance, and tho abuse that usually insinuato themselves into every department of their management, no such company has ever auceecded, unless when it has attaiaed some exclusive privilege, or been protected from competition.

The Abbec Morellet has given, in a tract published in 1769 (Examen de la Ripone de M. M., p. 35-38), a list of 45 joint-stock companies, for tho prosecution of various branches of foreign trade, established in different parts of Europe since 1600 , every one of which hind failed, though most of them had exclusive privileges Most of those that have been established since the publiention of the Abbe Morellet's tract lave had a similar fate. But notwithstanding both principlo and experience concur in showing how very ill fitted a large association is for the purpose of prosecuting commercial undertokings, there aro cases in which they can not be prosecuted except by associations of this sort, and when it may be expedient to grant them certnia pecaliar privileges. When, owing either to the disinclination or inability of government to afford protection to those engaged in any particalar department of trate, they are obliged to provide for their own defense and security, it is obviously necessary that they should havo the power to excludo such individuals as may refuse to submit to the measures, or to bear their due share of the expense, required for the common protection of all. Tha Russian Company, tho East India Company, tho Levant or Turkey Company, nnd most of the other great trading compnnies that have existed, seem principally to havo grown out of a real or sopposed neecssity of this sort. It was not believed that any safe or ndvantageoos intercourse could bo carried on with barbarous countries without the aid of ships of war, factories, interpreters, etc.; nnd as government was not able or willing to afford this assistance, the traders were formed into companies or associations, and rested with such peeuliar privileges as appeured to be necessury for enabling them to prosecute the trade without any oxtrinsic support. "When," says Dr. Smith, "a company of nerehants undertake, at their own risk and expense, to estublish a new trado with some remote and barbarous mation, it may not be unreasonaLee to hecotporute them into a joint-stock company, and to grant them, in casu of saccess, a monopoly of the trade for a certain number of years. It is the easiest sad most natural way in which the atate con recompense them for hazariling a dangerons and expensive experhnent, of which the public is afterward to reap the benefit. A temporary monopoly of this kind may be vindicated upon thu sumo principles upon which a like monopoly of a new machine is granted to its inventor, and that of a now book to its anthor. But upon the expiration of the term, tho monopoly ought eerainly to determine; the forts and garrisons, if it was found necessary to establish eny, to be taken into the haids of the govermment, their value to be paid to the company, and the trate to be lnid open to all the aubjects of the state."- Vealth of Nations, p. 339. It may be doubted, however, whether it bo really necessnry, even in such n case as that now mentioned, to estab lish a joint-stock compuny with peculiar privileges, nud whether the same thing might not lre more advantagcously effected by tha catablishment of an open or rogulated company.
4. Open or Regulated Companies. - Tho affairs of such compranios or associntions are mannged by directors appointed by the members. They do not, howerer, fessess a common or joint stock. Euch intividual pays a fino upon entering into the compuny, nut most commonly an annual contrlbution: a duty applicable to the business of the company is also somethmes charged upoa the goods lmported and exported from and to the
countries with which they trade. The sums so collected are applied by the directors to fit out embassadors, consuls, and auch public fanctionaries as may be required to facilltate commercial dealings, or to build factories, maintain cruisers, ete. The members of such companies trade apon their own stock, and at their own rlsk; so that when the fine, or the sum payable on admission into a regulated company, is moderate, it is impossible for its memhers to form any combination that woald have the effect of raising their profita above the common level; and there is the same keen and close competition among them that there is among other classes of traders. A regulated company is, in fact, a device for making thoso engaged in a particular branch of trado bear the public or political expenses incident to It , at the ame time that it leaves them to conduct their own business with their own capital, and in their own way. Should, therefore, government at any time refose, or be unable to afford, that protection to thoge engaged in any branch of trado which is necessary to enable them to carry it on, their formation Into a rer. ulated company would seem to be the most judicious measure that could be adcpted, inasmuch as it would obtain for them that protection which is indispensable, withoat encroaching on the freedom of individaal enterprise. The Afriean and the Levant companies in Great Britain, and some other branches of trade, were for a long timo condacted by open or regulated companies. These, however, have been recently abolished: tho African Company, by the aet 1 and 2 Geo. IV. e. 28 ; and the Levnnt Company, by the act 6 Geo. IV. c. 33 , Tho Russia Company still exists.-See Russia ComDANY.
Ia so far as relates to protection, it miny perhaps be thought, for the reasons given by Dr. Smith, tbat a joint-stock comprany is better colculated to afford it than a regulated company. The directors of the latter having, Dr. Smith alleges, no particuler linterest in the prosperity of the general trade of the company, for behoof of which, ships of war, fuetorics, or forts have to be maintained, are apt to neglect them, and to apply their whole energies to tho care of their own private concerns. Bat the interests of the directors of a jointstock company are, he centends, In a great measure jdentined with those of the nssociation. They have no private capltal employed in the trade; their profits must depend upon the prudent and profitable management of the common stock; and it may therefore, it is argued, be falrly presumed that they will be more dlsposed to attend carefully to all the means by which the prosperity of the association may be best secured. On the other hand, however, it is seldom that the directors of joint-stock compranies stop at the proper point ; having almost Invariably attempted to extend their commercial dealings by force, and to become not only merchauts but sovereigns. Nor is this nny thing but what might have been expected, seeing that the consideration and extensive patronage aceruing from suelı measures to the directors is generully of fur more importnnce to them then a moderate increase of the dividends on thelr stock. Whenever they have been able, they have seldom serupled to employ arma to ndvanee their projects; and iustead of contenting themselves with shops nud factorics, havo constructed fortifieations, embodied armies, and engaged in war. llut such has not been the enso with regalated compnies. The bushesses under their control have miformly been conducted in a comparntively frugal and parsimonlous manner; their estnblishments have been, for the most purt, confined to fuctories; and thicy have ravely, if ever, allowed themselves to be aeduced by schemes of conquest and dominion.

And hence, considering them ns commercial machines, It does not really seom that there can be any doubt as to tho auperiority of a regulated over $n$ joint-stock company. The latter has the defect, for which nothtng almost can compensato, of entirely excluding individual
enterprise and competition. . When such a company enjoya any peculiar privilege, it naturally, In pursuing its own intarest, endeavors to proft by lt; how injurious soever it may be to the public. if it have a monopoly of the trade with any particular country, or of any partlcular commodity, it rarely failo, by understocking the home and foreign markets, to sell the goods which it importa and exports at an artificially enhanced price. It is not lto object to euploy a comparatively large capital, but to make a large protit on a comparatively smail capital. The conduct of the Dutch East India Coupany, in burning spices, that their price might not be lowered by larger importations, is en example of the mode in which euch associations unlformly, and, indeed, almost necestarily act. All individuala are desirous of obtaining the highest possible price for what they have to sell: and if they are protectod by a monopoly, or an exclusive privilege, from tho risk of being undersold by others, they never hesitate about raising the price of their producte to the highest elevation that the compettion of the buyers will allow them; and thus frequently realize the most exorbitant profIts. And yet, notwithstanding these adrantages, such is the negligence, profusion, and peculation insepareble from the managemant of great commorcial companles, that even those that have had the monopoly of the most adventageous branches of commereo have rarely been ablo to keep out of debt. It will be shown in the erticla East India Company, that that association has lost by its trade; and that, had it not been for the ald derived from the rovenues of India, it must long aince have ceased to exlat. To buy in ono market; to sell with profit in another; to watch over the perpetually occurring variations in the prices end in the supply and demand of commodities; to suit with dexterity and judgment the quantity and quality of goods to the wants of each market, and to conduct each operatlon in the beat and cheapest inamer, requires a degres of unremitting vigilance and attention, which it would be visionary to expect from the directors or servants of a great joint-stock association. Hence it has happened, over and over egain, that branches of commerco whieh proved ruinous to companies havo become excoedingly profitable when carried on by individuala.
5. Constitution of Companies.-When epplication is made for an act to incorporate a nomier of individuals Into a joint-stock company for the prosecution of any useful undertaklng, cere ohould be taken not to concede to them any privileges that may be rendered injurious to the public. If a company be formed for tho construction of a dock, a road, or a canal, it may be necessary, in order to stimulate individuals to engage in the undertaking, to give them some peciliar privileges for a certain number of years. Wut if other persons were to be permanently hindered from constructing new docks, or opening new lines of communication, a lasting injury might be tone to the publle. It may be highly expedient to incorporato a company for the purpose of luringing water into a city; but, Bupposing there ware no springs in the vicinity other than those to which this company had acquired a right, they might, unless restrained by the act incorporating them, raise the prico of water to an exorbitant height, and make large profits for themselves at the expense and to the injury of the publle. In all cases of this sort, and in the case, indeed, of all joint-stock companies established for the formation of canals, railroads, ete., It would be sound polloy to limit the ratee charged for their servlees, or on account of tho water, ships, goods, etc., conveyed by their means, and also to limit the dividends, or to fix a maximum beyond which they should not be augmented: enacting, that if the rates charged by the company produce more than aufticient to pay the maximum rate of dividend, and to defray the wear and tear of the aqueduct, canal, etc., they ahall be allowed to reduce them till they only yield thia nuch;
and, in the event of their declining to do ac; that the whole surplas ebove paying the divldend shall be applied to parchese up the stock of the assoclation, so that ultimately the charges on account of d!vidends may be entirely abielished.
6. Companies en Commandite.-In France there is a sort of companies denominated socields en commandite. A society of thia descriptlon consiats of one or more partners, liable, without limitatlon, for the debts of the company; and one or more partnors, or commanditaires, liable only to the oxtent of the funds they have subsacriled. A commanditaire mnst not, however, take any part in the business of the company ; if he do this, he loses his inviolability, and makes hlmeelf responsible for the debts of the associatlon. The names of the partners in euch societios must be publlshed, and the amount of the amms contributed by the commanditaires: It has been proposed to introduco partnerships of this sort into this country; but it secms very douhtful whether any thing woold be gained by such a measure. Pertnerships en commandite mny be very easily abused, or rendered a means of defrauding the public. It is quito visionary to imagino that the commanditaires can be prevented from Indirectly influencing the other partnors ; and supposing a collusion to exlst among then, it inight be possilule for thom to divido large sums as protits, when perhaps they had really sustained a loss; and to heve the books of tho association so contrived that it might he very difficult to detect the fraud. This, it la alieged, is by no means a rare occurrence in France.
7. Cirio Companics, or Corporations.-Fxclusive of the companies previously mentioned, a number of ancient companies or corporations exist in most European countries, the menbers of which enjoy certain politicsl es well as commercinl privileges. When the feudal system hegan to be anbverted by the establishment of good order and regular government in the towns, the inlalitants wero divided into certain trades or corporations, by which the magistrates end other functionaries wero chosen. The members of those trades, or corporations, partly to enhance the value of their privileges, and partly to provide a rosource, in case of qd. verstty, for theniselves, acquired or usurped the power of enacting by-laws regulating the ardmission of new meinbers, and at the same time set about providing a fund for tho support of such as accident or milsfortune might reduce to $n$ state of indlgence. Hence the origin of apprenticcships, the refusal to allow any one not a momber of $n$ corporatlon to carry on any business within the precincts of any town corporate, and the various regulations that had to be submitted to, and tho fees that had to bo paid by the clalmants for enroliment in corporations. For a Jengthened perlod these privileges and regulations were very oppressive. Within the last eentury, however, their influenco has been progressively diminlahing. In France, wherc the abuses inseparable from the system had attained to a very great helght, it was entirely swept off by the Revolution : and though corporations still exist in Great Britain, they have been stripped of several of their pecullar franchises; and should now, for tho most part, bo regarded moro perhapa in the light of charitnble than of political institutions. It would be well, however, wero they reduced entirely to tho former character, ant were the few political and commercial privileges which they stlil onjoy communicated to the rest of tho cltizens. At their first institution, and for some the nfter, corporntions, consldered as political bodies, wero proliably useful: bi: anch is no longer the case; and in so fur as they now possess any apecial immunitles, they tend to obstruct that free competition that is so advantageous.

advantages rebulting from the unrestricted freedom of Industry, in a very striking point of view. "No cause," says he, "has, perhapa, more promoted In every respeot the general improvement of the United Statea, than the absence of those systeme of Internal restrictions and monopoly which continue to diafigure the state of society in other countries. No laws exlat here, direetly or indirectly, confinlag men to a partloular occupation or place, or exciuding any cittzen frem any branch he may, at' any time think proper to pursue. Industry is, in every rcapect, free and unfettered; cvery opecies of trade, cominerce, and profession, and manufacture, being equally open to all, wikout requiring any regular apprenticeship, admisaion, or license. Hance the lmprovement of America has not been confined to the improvement of hor agriculture, and to the rapid formation and settlement of new states in the wildernees $;$. but her cltiaens have extended their commerce to every part of tho globe, and carry on wlth complete anccess even those branchea for which a nonopoly had heretofore been consldered cssontially necessary."
There is in Rers' Cyclopedia, art, Company, a list of the different civic companice belonging to the city of London, in which the periods of their incorporation, and various other important partlculars with respect to several of them, aro specified.

Among the earliest commercial companiesin England msy be namod the Steel-yard Society, established A.D. 1232. The second company was the mercbants of St. Thomas a Beckot, in 1248.-Stowe. Tho third was the Merchant Adventurers incorporated by Elizabath, 1564. There are ninety-one city companics in London; the first iwelve are,

Companies, Bubble. Ruinous speculations coming under this namo have been formed, commonly by deaigning persons. Law's Bubblo, in 1720-'21, was perhapa the most extrsordinary of its kind, and the South Sea Bubble, in the samo year, was scarcely less memorablo for ita ruin of thousands of familice. Many companies were established in Great Britain in 1824 and 1825, and most of them turned out to bo bubbles ; and owing to the rage for taking ehares in each scheme as it was projected, lmmonec losses were incurred by fadividuals, and the famllics of thousands of apeculators wore totally ruined.-See Law'a Buahle and Banknupts.
Compases (Gorm. Ein Kompass; Du. Zeelompass; Ds. süekompass; Sw. Sjöcompass ; Fr. Boussole, Compas de mer; It. Bussola; Sp. Aguja de marear ; Port. Compasso de marear; Russ. Kompass korabelniri), or mariner's compass, an instrument composed of a needle and card, by which tho ship's courso is directod. The needle, with little variation, always points to the north; and henco tho mode of steering by the compass.
The common opinion is that the compass was invented by Flavio Gioia, a citizen of the onco famous repoblic of Amalphi, very near tho begianing of tho fourteenth century. Dr. leoberteon has adopted this opinlon, and regrets that contemporary historians furnish no details as to the Ilfo of a man to whose genius society ls so deeply indebted.-History of America, vol. 1. p. 47, 8vo ed. But though Gioia may have made improvements on tho compass, It has been shown that he has no claim to be conaidered as Its discoverer. Pastages have been produced frem writers who flourished more than a century boforo Gioia, in which the polar-

Ity of the needle, when touchad by tho magnet; is distinctly pointed out Not only, however, had thie siagular property been discovered, but also its application to the purposes of navigation, long previously to the fourteenth. century. Old French writere have been quoted (Macpinkraon'a Annals of Commerce, anno 1200; Rees' Cyclopedia), that seem fully to establish this fact. But whytever doubts may exist with reapeet to them can not affect the passugie which the learned Spanish antiquary, Don Antonio de Capmeny (Questiones Criticas, p. 78-132), has given from a work of the famous Raymond Lally (De Contemplatione) published in 1272. In one placo Lully says, "ss tite needle, when touched by the inagnet, naturally turne to the north" (sicut acus per naturam vertitur ad septentrionem dum sit tacta àmagnete). This is concluslve ss to the suthor's acquaintance with the polarity of the'ncedle; and the fellowing passage from the same work-" as the nautical needle directs mariners in their navlgetion" (sicut acus nautica dirigit marinarios in sua natigitione, efc.), is no less conclusive as to its being used by sailora in regulating their course. There aro no means of ascertaining the modo in which the needle Raymond Lully bad in view was made use of. It has been sufficiently established (see the authorities already referred to, and Azusi, Dissertation sur l'Origine de la Boussole) that it was usual to flost the needle, by means of a straw, on tho surfaco of a basin of water; and Capmany contends tisat we are indebted to Gioia for the card and the method now followed of suspendIng the needle ; improvemente which have given to the compass all its convenlence, and a very large portion of its utility. But this part of his Dissertation, though cqually lcarned and ingenious, is by no means so satlafactory as tho other. It is difficult to conceive how mariners at sea could have availed themselvea of a floating needlo; but, however thls may be, it seems most probable that Giola had conaiderably improved tho conat ruction of the compase; and that, the Amalphitons having been the first to introduce it to genersl use, he w. , with excusable partiality, represonted by them, and subsequently regarded by others, $B E$ ite inventor.

The reader will not consider these details out of place in a work on commerce, which the compase has done to mach to extend. "Ita diacovery," to borrow the language of Mr. Macpherson, "has given birth to a new era in the bietory of commerce and navigation. The former it has extended to every shore of the giobe, and increased end multiplied ita operatione snd beneficial effects in a degree which wee not concelvable by those who lived in the earlier ages. The latter it has rendered expeditious, and comparatively safe, by enabling the navigator to launch out upon the ocean free from the danger of rocks and shoals. By tho use of this noble instrument, the whole world has become one vast commercial commonwealth, the most distant inhabitants of the earth are brought together for their mutual advantago, ancient prejudices are obliterated, and mankind are civilized end enlightened."

According to the parposes to which the instrument is chiefly applied, it becomes the muriner's ccmpass, the asimuth compass, the eariation compass, each particular application requiring some peculiarity of construction; but whatover modifications it may receive, the essential parts are the same in all cascs. These are a magnetized bar of atecl, called the needle, having fitted to it at Its centro a cap, which is supported on an upright pivot mado sharp at the point in order to diminiah the friction as much as possible and allow the needle to turn with tho slightost force. The mariner's compass has a circular card attached to ita needle, which turne with it, and on tho circumference of which are marked the degrees, and alao the thirty-two points or thumbe, Jikawise divided into half and quarter points. The pivot risos from the contre of the bottom of a circular box, called the compass-box, whioh contains the needle
and its card, and which is covered with a glass top to prevent the needle from being diaturbed by the agitotion of the air. The compass-box is sospended within a large box by means of two concentrlc brass circles or gimbals; the outer one being fixed by horlzontal plvots, both to the innor circle which carries the compssabox, and aleo the outer box, the two sets of axes being at right angles to each other. By meana of this arrangement, the inner circle, with the compass-box, needle, and card, always retain a horizontal position, notwlthatanding the rolling of the ship.

The notation of the marlaer's compass is as foliows: The circumference being divided into the four quadrants by two dlameters at right angles, the extremities of these clismeters are the four cardinal polats (cardo, a hinge), marked N., S., E., W. (north, south, east, west). Bisecting each of the quadrants, the sevoral foints of bleestion are denoted by placing the two letters at the extremities of the quadrant in juxtaposition. Thus N.E. (northeast) denotes the polst which is half wsy between north and east; and so with N.W.,

S.E., S.W. (northwest, southeast, southwest). Let the octants next be bisected; the points of divlsion are denoted by prefixing to esch of the above combinations first the one sud then the other of the two cardinsl points of which it is formed. Thus N.E. gives N.N.E. and E.N.E. (north-northeast and esst-northeast); and so in respect of the others. Sixteen points have thus been named. Let the distances be again bisected, then each of the points so found is expressed by that one of the preceding points already named to which it is nearest, followed by the name of the cardinal point toward which its departure from the nearest point leads it, the two being separated by the letter $b$ (by). Thus the polnt half way between N. and N.N.E. is N. by E. (north-by-east); that which is half way between N.N.E. snd N.E. is N.E. by N. (northeast-by-north), ete. The whold of the thirty-two polats are thus dlstinguished in the figure.

The princlpal requisites of a compass are intensity of directive force, and suaceptibilty. The first of these is obtained by constructing the needle of the materled and form best aulted to receive and retain the nagnetic virtue. A number of experiments on this anbject were inade by Conlomo, and inore recently by Captain Kater, an account of which is given in the Phil. Trans. for 1821. Captain Kater found that the kind of steel capable of recciving the greateat magnetic forec is shear steel; and that the best form is that of a lozengn or rhomboit, cut out in tlie middle, so as to diminish the extent of surface in proportion to the mass, it being found that the directive force of the needle, whon magnetized to saturation, depends not on the extent of surface, but on the mass. Bevond a certain limit (about five inches) no additional power is gained by increusing the length of tho needle; and needlee oxceeding a very moderate iength are apt to have several consecutive poles, the effoct of which is to produce a great diminutlon of directive force. On this account ahort needles, made very hard, are to be preferred.Brande's Encyelopedia of Arts.

Like many other of the most valuable arts of iife, the origin of the compass is entlrely unknown. By some
writers it is aseribed to Flavio Giola, who lived in the thlrteenth century; yet Guyot do Provence, who llved a century earler, speaks of the loadstone, to whlch he gives the name of marinetti, or mariner's stone, as useful to navigstion. Others pretend that it was invented in France; but there seems to be no other reason for this suppesition than the fact that from time immemorial the north point of the compass card has been distinguished and ornamented with a fleur de lis. For a reason of a tlifferent kind, but perhaps of tho ssme degree of welght, Dr. Wallis and others have supposed the inventlon to belong to Eagland, the namo compass, which is given to the instrument by most Europesn countries, being used in England to signify a circle. The term bursola in Italisn and boussole la French, has also been supposed to be derived from our term box, by which tho compass is frequently designated. Gilbert, in his celebratod work De Magnete, sffirms that Mareo Polo brought the invention to Europe from China, about the year 1260. It appears very probablo that the Chineso were acquainted with tho directive property of the loadstono at an early perlod.

The azinuth compass, being intended to show tho bearing of objecta in respect of the magnetic meridian, has its circle divlded merely into degrees, instead of the rhnmbs used in navigation, snd is provided with sights to allow tho angles to be taken more accurately.

The rariation compuss is designed to exhibit the diurnal changes in tho deviation of the magaetic from the true meritian; and tho needle is generally made $\therefore$ much greater length than the mariner's compass, in order to render minute variations more sensible.

Compass Variations.-In a recent publication on the danger to which vescels are exposed from compass variations, there was suggested a plan of much importance to conmerce: that in all large porte at least, where vessels are equipped, a competent person ought to be appointed, whose dutles should be to select in every shlp an sdvantageous position for a standard comiass, combining the two requisites in such selection of a managesble local attrnction, and of convenient access for navigating the ehi - to determine experimentally the local deviations of the standard compass in different azimuths, to inst iuct the master how to repent the same on future occaslous, and to see that he rightly and thoroughly understands the deduction of the true magnetic courses from those of the standard compass, and of the course hy the standard compass corresponding to the true course whlch he desires to steer.

Self-registering Compass,-The self-registering compras, by M . Delull, is designed to register the changes of direction In a vessel for every three minutes during the twenty-four hours. The marking is made upon a sompses card. It conslate of a clock movenent placed at the centre of the apparatus for causiog the point or pivot carrying the needles to move up and down at regular intervals-of an endless acrew, furnished with a nut carryling the point, for piercing the paper-and of the compass card, made of three needles fixed to a sheot of mica. The mica is covered with a disk of velvet, firmly glued to it hy means of atrong glue, and whoso tissue has been ssturated with a kind of glue that is soft when cold. When the needle lis fixed toward the north, the axis or diametral line of the compass card ia placed in the line of the axis of the ship, and the punctures male every three minutes indicate the devintion of this nxls.

Composition, in Commerce, commonly implies the dividend or sum puid by sin insolvent debtor to his creditors, and accepted by them in payment for their debta.

Coney Wool (Ger. Kaninchenwolle; Du. Konynhair; Fr. Poil de lapin; It. Pelo di Caniglio; Sp. Conejuna), the fur of ralibits. This article is extensirely used in tho hat manufacturo; and besldee the large supplice raised at home, a great deai is lmported. The imports usually range from sbout 300,000 to about 500,000 skins a year.

Congreve Rooketa. - Invented hy General Sir Willam Congreve in 1808 . The Congreve rockets, first used against Boulogna in 1800, are of varlous dimensions, and differently armed, as they are intended for the field or for bombardment. Those of the fermer class carry shells or case-shot; those of the latter are armed with a very combuatlile material contalned in a strong metallic cylindrical case with a conleal head. When once infiamed, thla substance is unextinguishabe, it acatters ite burning particles in every directien, and when spent, the ball explodes like a grenade. The rocket is projected horizontally, and makes a loud whizaing nolse in its passage throngh the air. The ammunition used varlea from 6 to 42 lbs , and upward. These rockets wero certainly a very impertant invention; but from their liability to deflection and other defeets, they aro now regarded as less advantageous than the ordinary red-hot shot and bombs. The secret of their compoaition also is not 80 great as to defy imitation by foreign artlllerists. Sir William Congreef, Bart. (1772-1828), inventer of the rocket called by his name, was a general of artlliery, and co-operated with the Duke of York in reforming the British anmy: IIc wrote an Elementary Treatise on the Mounting of Naval Ordnance (Loud. 1812); and a Description of the Mydro-pneumatic Lock (Lond, 181ō). He died at Toulouse in 1828.-E. B.

Connecticut, the southeramest of the New England Siates, is situated between $10^{\prime} .41^{\circ}$ and $42^{\circ} 2^{\prime}$ N., and long. $71^{\circ} 20^{\prime}$ and $73^{\circ} 15^{\prime} \mathrm{W}$., and betweer $3^{\circ}$ $46^{\prime} 24^{\prime \prime}$ and $5^{\circ} 41^{\prime} 24^{\prime \prime}$ E. long, from Washington. It is brunded north by Massachusetts, east by Rhode Island, seuth by Long Islaad Sound, and west by New York. It contains 4750 square miles, or $3,040,000$ acres. Its population in 1790 , was 237,946 ; in 1800 , 251,002 ; in 1810, 261,942; in 1820, 273,248 ; in 1830, 297,711 ; in 1840, 300,015; in 1850, 370,702. The capitals are, Hartford, on the right bank of the Connecticut, at the head of steamboat navigation, 50 miles from its eutrance into Long Island Sound, and New IIaven, at the hend of a bay which sets up 4 miles from the sound. It centained, in 1850 , cigbt counties.

The beantiful river from which the State of Connecticut derives its name was first discovered (in the year I6I4) by the Dutch Captain Adrlan Block, who sailed into it as far up as the present site of Ilartford, and who named it "De Fersche Rivier" (the Fresh Rlver), probally from the fresh appearance : ${ }^{*}$ its waters and green valleys. The Dutch from New Amsterdam made some attempts at scttlement along this river. But the English colonists and explorers from Plymouth and Boston, on their way to the west, reached it about the year 1630, and became seon the exclusive proprietors of the river and its valley. They adopted for it the original name of the aborigines, which, in its true Indisn shape, is said to have been "Quonehtucut." The meaning of this word is stated to be "The Long Rirer," and it appears to be a designation whieh the Indians applied often as a river name. Among others, we find also in Long Island a Connecticut River. The nnme was at first written in dlfferent ways. We find, for instance, on one napy of the year I695, the orthography "R. Conokteook:" At last the orthography" Connecticut" prevniled. The Euglish colonists npplied the name of the river for the first time to a territory in the year 1631, when they elalmed a tract of land nround the present site of IIartford, and intended to ereet there a colony, to which the name of "Colony of C'onnectirut" was given. This whs an inland country, sometimes also called "the Colony of IIartforl." In the year 1662 King Charles II, united with thls colony that of New llaven, which was planted on the shores of Long Island Sound, and which had existed for aome time scparately under a particular name. The king named both united coloaies "The Province of Connecticut;" and in this way thls name was extended to the sea-coast. It iacluded then also a great part of Leng Island,
which had been settled and waa clalmed by planters ant emigrants from the Connecticut valleys. But seen after the conquest of New Netherland by the English (1664) the Duka of York claimed the whele of Long Island, which now was separated from the colony of Connectleut and bacame a part of the province of Now York. In compensation for this loss the houndaries of Connectleut were extended to the west as far as Mormaromek or liyram's Rlver, within thirty mlles from New York, so that now the name Connectieut covered nearly the whole of the northern shore of Long Island Sound. These boundaries along the sea-coast have, upon tho whole, remained unchanged ever since. -J. G. Kont.
Though generally hilly and broken, no part of the surface rises to a great height above tho sea. The greatest elevation is a range of mountains commencing at a bluff called Last Rock, near New Haven, nnd continuing northward through the state. The hills are gencrally of moderate size, and occur in quiek succession in rauges trending northward, presenting to the traveler an ever-varying aspect. The sotl is generally fertile, but better adapted to grazing than tillage. There were in this state, in $1850,1,768,178$ acres of Inud improved, and 615,701 of unimproved lnad in farms. Cash vnlue of farms $\$ 72,726,422$; and the value of implements and machinery, $\$ 1,892,541$; live-stock : horses, 26,879; asses and mules, 49 ; milch cows, 85,461 ; working oxen, 46,988 ; other cattle, 80,226 ; shecp, 174,181 ; swine, 76,472 ; value of live-stock, $\% 7,467,490$.
Nanufactures.-Thero were in the state, in 1850, 106 cotton factories, with a eapital invested of $84,012,600$, employing 2665 males, and 8313 females, producing $54,370,527$ yards of sheeting, etc., and 950,000 pounds of yarn, valued at $84,122,952$; 149 woolen factories, with a capital of $\$ 2,583,742$, employing 1893 males, and 1665 females, producing $8,950,372$ yards of cloth, valued at $\$ 4,021,152 ; 12$ establishments making pig iron, with a capital of $\$ 207,600$, employing 120 persons, producing 13,020 teus of plg-iron, etc.; the entire value of preducts, $\$ 379,600 ; 60$ cstablishments, with a capital of $\$ 580,800$, employing 949 persens, and making I1,210 tons of censtings, etc., valued at $\$ 981,400 ; 18$ es tablishments, with a capital of $\$ 529,500$, empleying 874 persons mannfacturing 6325 tons of wrought iron, ctc., valued at $\$ 667,560 ; 117$ flouring mills, 115 tanneries, with a capital of $\$ 360,500$, employing 407 persons; value of products, $\$ 781,006$. Capital invested in manufactures, $223,890,848$; value of manufactured articlea, $\$ 41,897,848$.
The state is watered by numerous rivers and streams. Few of the rivers nre navigable for more than a short distance from their mouths. The principal is the Connecticut, which rises on the northern border of New 11 ampshirc , and after a course of about 400 mlles falls into Long Island Seund between Saybrook and lyinc. Its general direction ls seuth-by-west, separating New Hampshire from Verment, and afterward passing through the western part of Massachusetts and the central part of Cennceticut. Below Middletown it turns to the south-southeast, and continues in that direction to its mouth. It is navigable to Middletown, 30 miles from the sca, for vessels drawing 10 feet, and to IInrtford, 20 niles higher, for vessels drewing 8 feet of water. The canals and other improvements recently made to overcome the rapids and fulls, have rendered it navigable for small boats us fur as Wells River, 250 miles nibeve Ilartford. The principal tributary of the Conncetient in this stute is the Tunxis or Farmingten, which rises in the eastern slope of the Green Mountains in Massachusetts, and flows southward to Farmington, where it abruptly changea its course to the northward. On breaking through the trap range of the 'I'alcott Mountains, it again takes a southerly direction, and falla Into the Connecticut opposite East Whindsor. The Housatonic rises in the westeru part of Massachuaetta and entera this state near ite nerthwest corner, after which it
has a south and sontheast course to the Sound. Its entrance is obstructed by a bar, but there is a sloop navigation for 12 miles. Tho Thames, formed by the junction of the Quinebang, Shetucket, and Yantic Rivcrs near Norwich, falis into the Sound at New London. The mineral wealth of Connecticat is considerable. Iron ore of oxcellent quality is found abundantly in varioue parts. The coppor mines of Bristol and Plymouth are asid to be the most proftalle in the United States. According to Professor Silliman, the Bristol veln extends in a southerly diroction for more than 30 miles, and if fuliy workad is capable of affordidg employment to 30,000 minars. The Plymouth mines are considered to bo erually rich. Copper is also found at Granby. Fine m. rbles of different kinds are abundait, and extensive quarrios of freestone exist in the mountain regions, and furnish an excellent

- Nine months to Juno 80, and fiscal year begius July $1,1848$.

Consolldated Fund. Down to 1816 the ex- $\left\lvert\, \begin{aligned} & \text { act was at the same time passed consolldeting certain } \\ & \text { portions of the jolnt revenue of Great Britain end Ire- }\end{aligned}\right.$ chequers of Gress Britain and Ireland were kept separate, certals portions of the public revenue arising in each kingdom being especially appropriated to the discharge of the intereat or Ite own debts, and other pecallar purposes. But wil January 5th, 1816, the separate exchequers were consolldated into one; and an
bailding material. Zinc, cobalt, manganese, and plambage are aleo found $\mathrm{j}_{\text {; }}$ and the mineral watera of Stafford have long been celebrated.

Connecticut has a larger productive school fund, in proportion to its population, than any other state, amounting to $\$ 2,040,482$. This originated chiefly from 1he sale of the. Wostern Resprve, constituting a large part of the northern portion of the State of Ohio included in its orlginal charter, and ceded to it iny the United States by way of compromise. In 1852 there were in the etate 53 banke, with a capital of $\$ 12,509,808$. It has no state debt. There is a etate prison at Wethersinield, erected in 1826.

The following synopsis of the length, cost, capital, earnings, etc., of the Connecticut railroads, is from the Official Report of the Railroad Commiasioners of that state for 1850 :
 and into one fund, hence called the Consolidated Fund, and providing for Its indiscriminnte applicstion to the payment of the public debts, civil lists, and other speciffed expenses of toth kingdoma. Some portions of revenue are not incladed in this fond; but it embrnces

by far the largest part of the publie income. Thus, in | view, one of the finest imaginsble. Standing on the 1838, of a total net income of $£ 47,383,460$, tha Consolidated Fand included no less than $\mathbf{£ 4 4 , 1 4 4 , 4 3 8 \text { : the ex- }}$ peaditure on account of the pecullar charges to be defrayed by the fund during the ame year amonnted to £31,742,918, leaving a surplus of $£ 12,401,570$ applicablo to ether objects.-Faimman on the Funde, 7th ed. p. 896 ; Parl. Paper, No. 849. Sess. 1839, etc.

Conatantinople, a famous city of southeastern Europe, formerly the metropolis of the Eastern, as it still is of the Turkish ompire, on a triangular point of land, on the European side of the Sea of Marmera (Propontis), at the peint where It unites with the Bosphorus, or channel leading to the Black Sea, lat. $41^{\circ}$ $\sigma^{\prime} 12^{\prime \prime}$ N., long. $28^{\circ} 59^{\prime} 2^{\prime \prime}$ E. Populatlon variously estimsted at from 300,000 to 600,000 , but believed, by the lest authorities, to be sbout 450,000 . The eituation of this renowned city is, in a commerclal point of

POET OE CONGTANTINOPLE
References to Plan-A, Seragllo Potnt; 13, Gatsta; C, Scutarl; D, Tower and Light-heuse of Leander. The arrows show tad direction of the currents. The ooundinge are inf fathoms.
and driven on Seraglio Point. It may to worth while, however, to remark that, notwithetanding thls laconvenience, the curront hae boen of aignal service to the eity, by wcouriag the barber, and carrying away the filth and bellest by whleh it must other wise have been loog since choked up. The distance acrose from Soraglio Point to the opposite suburb of Scutari, on the Asiatio coast, iy rather more than an English mile. Within less than a quarter of a mile of the latter is a rocky inlet, opon which is a tower and light-houso, known by the name of the Tower of Leander. Foroignera reoide in Galata, Pera, and the anburbs, on the eastern aide of the harbor; and it is there, conseruento 1y, that the principal trade of the place is carried on. The quays are good, and oblpa lie close alongride.
The Bosphorus, or chancel of Constantineple, rune in a northeast by uorth direction about 15 mlies, varying in breadth from $1 \ddagger$ to $t$ a mille. It is swopt by a rapid current, which it requires a brisk gale to atem, and has throughout a great depth of water. The Helleapont, or Strait of the Dardanclles, lealing from the Archipelago to tho Sea of Marmora, la abont 18 leagnes in length. In direction is nearly northeast. Where narrowest, it la little more than a mile across. It also is swept by a atrong current, aud has deep water throughont.
The subjoined plan of part of Conatantinople and lis port is cepied, without reduction, from the beautiful plan of the city and Bosphorus, drawn and engraved by M. Merzoff Robert of Munich, and published by Mr. Wilde of London.
Nothing cun be more imposing than the appearance of the city when seen from the sea, but on landing the illusion vanishes. The strets are narrow, dark, illpaved, and irregular. Owing to the want of any effective systen of police, and of the most ordinary atteation to cleanliaess, they are extremely filthy; and are infested with herds of dogs, and also with rats, which perform the functions of scavengers. The houses are mostly built of wood, and fires are frequent. Most of these happen designudiy; the burning of a few hundred houses being deemed the readicst and most effectual means of maklag the government aware of the public dissatiafuction, and of procuring a redress of grievances.

Money.-Accounts are kept in piastres of 40 paras, or 120 aspers. The Turkish coin has been so much degraded, that the piastre, which a few years ago was worth $2 s$ s. sterling, is now worth little more than $4 d$. A bag of silver (kefer) $=500$ piastrea, and a bag of goid (kiuze) $=30,000$ pinstres.

Weights and Mearures.-The commerciai weights are: 176 drams $=1$ rottolo; 2.272 rottoli $=1$ oke; 6 okes $=1$ batman; $7 \dagger$ batmans $=1$ quintal or cantaro $=$ $124 \cdot 457$ ( 124$\}$ very nearly) Ibs. avoirdupois $=56 \cdot 437$ kilogrummes $=116.527 \mathrm{lhs}$. of Ilamburg. Tho quintul of cotton is 45 okes $=127.2 \mathrm{lbs}$. avoirdupois.
The pik or pike ls of two sorts, the greater aud the lesser. The greater, calied halebi or arschim, used in the measurement of silks and woolens, is very near 28 inches ( 27.9 ). The lesser, called endese, used in the mensuring of cottons, carpets, etc. $=27$ inehes. Hence 100 long piks $=77.498$ English yards, and 100 short piks $=75 \cdot 154$ English yards. But in ordinary commercisl affairs the pik is estimated at \{ths of an English yard.

Corn is measured hy the kisloz or killow $=0.941$ of a Wineheater hushel $8 \downarrow$ kisloz $=1$ quarter. The fortin $=4$ kisioz.
Oil and other liquids are sold by the alma or meter $=$ 1 gallon 3 pints, Engligh wine measure. The alua of oil should weigh 8 okes.-Nelkenahecher and Dr. Kelly.

The Port charges on account of English vessels in the harbors of the Ottoman empire are fixed by treaty at 800 aspers, neither more nor less.

Trade, etc.-Owing to the vicious institutions of the

Turks, and the disorganized atate of the empire, the trade of Conacantinople is vary far from being so ex. tenaive ae might be aupposed from ite aituation and population. The imports consiat of corn, iron, timber, tallow, and furn, principally from the Black Sea ; and of cotton stuffs and yarn, coal, tin, tin plates, wooiens, ailks, cutiery, watches and jowelry, paper, glaes, furniture, indigo, cochineal, eto., from England and other Earopean countrica. Corn and cotioo are Imported from Aloxandria; but considerablo quantities of Braail and Weat India coffee are also imported, particularIy in British and American bottoms. Sugar is partly Imported from the East, but principally froms the West Indies. The exporta conalsc of silk, which is hy far the most important article, carpeta, hides, wool, Angola goate' hair, yellow berries, boxwood, oplum, galls, builion and diamonds, and a few other articies. But the expors are alwaye very much less than the imports; and ships carrying goods to Conatantinople either return in ballast, or get return cargoce at Smyrna, Odessa, Salonica, etc., on which places they frequently procure bilis at Constantinople. By far the largest proportion of the trade of the city, and of the Levant generally, is in the hands of Greek merchants, who by thair auperior skili, i...astry, and knowledge of those with whom they have to deal, heve completoly dietanced their English, French, and other European competitors (deneminated Franks). The Armenians only have been able to withstand the competition of the Greeke. Bargaina are uegotiated by Jew brokera, some of whom are rich.

Constantinople was known as the Stanboli of the Greeks, or Istanboul of the Torke. An attempt was made to chango this iatter name into Islamboui, that is, the town of Islam or Mohammedanism, and colns were even struck bearing the new name; but the attempt failed, and the coinsge again bears the impression "struck at Latanboul." The entire civii and ecclesiastical authority of the Turkish empire is concentrated in the city, where reside the chlef pashas, muftis, and ulemas ; the patriarch and synod of the Greek Church; an Armenian and a Catholic archillshop. That part of it which is now occupied by the seraglio, and which is seprarated from the reat by a wali, is nuderatood to have been the Byzantiam of the ancients.
Commercial Policy.-It is singular that, as respects commerce, the policy of the Turkish governucnt, whether originating in design or carelessness, is entitled to the highest praise. "No restrictions," says Mr. Thornton, "are laid on commerce, except in the instance of a general prohibition of exporting the articlea necessary for the enpport of human life to foreign countries, especinlly from the capital, where alone it is rigorously enferced; and this impolitic restraint will no doubt be removed when the Turkish goverument shall become sensible that what is intended as the means of securing abundance is, In fact, the sole cause of that searcity which is sometimes experienced. With this one exception, commerce is perfectly free and unfettered. Every article of forcign or domestic growth or manufactere is conveyed into overy port, and over every province, without any interferenee on the part of the magistrates, after payment of the dutics. On this subject I speak from actuai experience, and may appeal to every forcign or native merchant in Turkcy for lis general truth."-Present State of Turkey, voi. i. p. 82.

The duties, too, are extremely moderate, being only five per cent. on imports, viz., three per cent. on geods when landed, and two per cent. on their being admitted to consumption (Ubicini, I. 281), and about three per cent. on most articles of export. Hence, in almost ali that relatea to her commercial reguiations, Turkcy is entitled to read a lesson to the most civilized European powers; and thie she did.in a very able manner, In an official paper published in the Jfoniteur Ottoman, in September, 1832. We extract a few paragraph from this intoresting document.
" Good cence, tolerance, and houptaltty have long age done for the Uttoman empire what the other atates of Europe ars condeavering to effect by mora or lese hapyy political comilis. mations. slace the throns of the sultana hat been olevated at Conatantinopie, commercial prolifittona heva been unknown : tbey opened all the porti of thetr emplre to the commaree, to the mianufhotures, to the territorial prodnce of the Oceldent, or, to may better, of the whole world. Liberty of rombierce han relgned here without fimita, at large, an ex. teaded an it was powillie to be.
"Here every ouject of exchange in admitted, and circulatea withous meeting any ohstacie other than the paynent of an Infinluly small portion of the value to the cuatom-house. The chimers of a balanco of trade never entered tato heads mensible enough not to dresm of calculating whether there was mont proft in buying or eeiling. Thus the markets of Tarkey, anpplted from all countries, refuaing no objecte which mercantile spirit puta ta circulation, and tapponiag no charge on the veasls that tranaport them, are soldom or never the scenes of those disordored movements occasioned by the audden deficieney of auch or auch merchandise, which, exor:-. tantiy ralaling pricea, are the scourges of the lawer orders, hy ansetting their habita, and by igficting privations. From the nyatem of restrictions and prohtbitions arise thone devourtug tideu and ebba whitch eweop away in a day the tabor of yeurh, and convert commerce futo a career of alarins and perpetual dangers. In Turkey, where this ayntem does not exloh, these disustrone effecte are unknown.
"The extreme moderation of the dutica to the complement of thit rigime of commercial tlberiy ; and ta no portion of the globe ere the officers charged with the collectlon of moro confling factily for the valuations, and of so dectdediy conciliatory a apirit in every transaction regardtug commerce.
"Away with the suppoattion that theme faclitilea granted to strangers are concesslons extorted from weakneeni The dates of the contracta termed capliniattons, which cotablah the righta acturity enjoyed by forefgn merchatith, recall perods at which the Mussuiman power was altogether predomi. nant in Europe. The Arat capituintion whlch France obtained was in 1635, from Soltman the Canontat ithe Magnticent). The dispositlons of theme coniracta have become antiquated, the fumdmental principten remain. Thus, $8 \subset 0$ years ago, the aultana, by an act of munficence and of reason, antictpated the moat ardent destres of civilized Europe, and proclaimed unlimitted frecdom of commerce,"
Dil the policy of Turkey in other respects harmonize with this, she would be one of the most civilized and powerful of nations, instead of being one of tise most ebject and degraded. Unfortunately, however, this is very far from being the case. Tyranny and inaecurity universally prevail. "liso cultivator of the soil," says one of her eulogiats, "is ever a helpless prey to injastice and oppression. The government agents have to suffer in their turn from the eruelty and rapacity of which they themselves have been guilty; and the manafacturer has to bear hia full share of the commoa insecurity; lie is fixed to the spot, and can not escape the grasp of the local governor. The raw matenisl monopolized by a bey or ayan, may be forced upon him at a ligher price than he could purchase it himself, anif periaps of inferior quality ; thes may be imposed upon him, he may be taken for forced labor, 0 : troops may lo quartered on his workshop."-Unevhant on Turkey and its Resources, p. 139.

Some vigorous efforts have been mado of late years by tho Turkish government to refurm abusea; but with listle or no practical effect. There is, in truth, aeitice pubiic virtue nor principle in the country to scoond these efforts. Corruption of every kind is as prevalent as ever; and tite rayalis continue to be exposed to every aort of oppression. There are no roads in any part of the empire; and egriculture is everywhere in the most abject condition. Indeed, vast tracts of the most fertile fand of old the most flourishlug) districts of Asia Minor are wholly waste and unoceupied ; and the evil, instead of diminishing, is continually increasing. Tine greater density of population in European T'urkey, and the litto induatry found in it, are due to the energies of the Chriatian population. And when the latter bave heen emancipated from the slavery in which they have been long held, ty the expuision of their barbarian taak-masters from Europe,
the beartifll provincea in which thay have been so long permitted to encamp wlil again become the favorite seats of indnstry and civilization. "But the degradation in which the native inhabitanis are involved would have been atill more complete, but for the freedom of commerce they have always enjoyed. Thia has tended to keep aliva the seeda of linduatry, and to coantervail to some small extent the deatraetiva infuence of oppresaion and insecurity. Had thalr intercoure with foreigners been either prohibited or placed under oppressiva reatrictiona, the berbarism of Tarkey would have been completed, and it ie difficult to suppose that there could have been any thing like wealth or indusm try in the empire
"Aa the Turks do not allow a censua to be taken, all atatements of the number of inhabitante in their dominions must be doubtful and conjectural. Eton calculates the population of Constantinople at no more than 300,000 ; while General Andréonsy calculated it, withont including Seutari, at 597,600 ; his et sulation being founded on the daily conammption of bread. The number of honses is about 88,100. According to Andreosay, the division of the inhebltante is as follows: 800,000 Turks, 'Tatars, and other Musailmens; 200,000 Greeks ; 50,000 Armenians; 30,000 Jews; and the remainder of the various Frank nations. In 1851, the cenaus of the resident Britiah gave only 200. The mortality is said to be greater than in any other city in Europe; but the recruits that arrive from all parts of the Turkish dominions, and especially the slavea brought for sale, tili up the numbers faster than thay fall away by death. Of late yeary, too, the rayabs seek refuge from the exactions of the provincial pashas in the neighborhood of the seat of government, where the Tanzimat or new constitution lo better observed. Although the public slave-market hes been shut for a fow yeara, the trade in slaves is atill carried on with all fis episodes of horror and abomination. The closely latticed windewe of the harems of the rich, the pris-on-like aspect of tha better atreets, and the caravan of gaunt, shoeless Nubian girls in their cotton wrappers, are part and parcel of the odlous system.
"The trade of Constantinople consiats chiefly in the aupply of the wants of the atate officers, and of the military and naval peraona who are attracted to the eapital; but it is chiefly by foreigners that the handicraft oprerations are performed. The priacipal manufactures are those of cotton and silk goods. The Armenians are the chicf jewelers and silversmiths. The Jews are perfumers, druggiats, and brokers; the Franka are the principal mechanics; and the chief business is transacted at the several hazars.
"The foreign trade of Constantinople is favored by its excellent harbor, capable of containing 1200 ahips. It is the mediam of intercourao between that part of Asia whence laden camels arrive, and the different divisions of Europe, collecting the drugs and silks of the one, and distributing thein among the others. It would require much apace to colleet and enumerate the ramifications of such a trade as is carried on in minute articles to and from the city of Constantinople. The city is distant 1680 miles from London."-E. B. Sea Tunkey.

Consuls. We propose to divide thia article into three parts: I. Consuls, their Origin, and Lawe respecting them; II. Duties of Consula; III. Diplomatje and Consular Law of the United Statee.

Consul (vixaros), the highest ordinary magistrate of the loman republic. It is probabla that the word is compounded of con and aclio, and is formed like exsul and prosul, so that consules signifies those who go together. They were anciently called pratores, imperatores, or judices.
I. Conbula, tikir Origin, and I.aws respecting tiem.-Consula, in the nineteenth century, are commercial agenta, appointed to reaide in the sea-ports of foreign countries, with a commission to watch over the
voramercial righte and privileges of the nation deputjag them. The eatablishment of consuls is one of the most useful of modern commercial institutions. They were appointed about the twelfth century in the opulent states of Italy, such as Pisa, Lneca, Genoa, and Venice, and their origin has been ascribed to the necessity for extraondinary assistance in those branches of commerce formerly carried on with barbarous and uncivilized nations. The utility of euch a mercantile oficer has been perceived and felt by all trading nations, and the Mediterramean trade in particular stands highly in need of such accradited persons.: Consula have been multiplied and sent to every part of the world where navigation and commerce can successfully penetrate; and their duties and privileges are now generally limited and defined by treaties of commerce, or by the statnte regulations of the country which they represent. In some placee they have been invested with judicial powers over disputes between their own merchants in foreign ports; but in the coramercial tresties made by Great Britain there ia rarely any atipulation for clothing them with judicial authority, except in treaties with the Barbary powers; and in Eagiand it has been held that a consul is not strictly a judicial officer, and they have there no judicial power. It has been urged by some writers, as a matter highly expedient, to establish rules requiring merchants abroad to sulmit their disputes to the jadicial authority of their own consuls, particularly with reference to shipping concerns. But no government can invest its consuis with judicial power over their own subjecta in a foreiga country, without the consent of the government of the foreign country, founded on treaty ; and there is no instance in any nation of Earope, of the admission of criminal juriadiction in foreign consuls. The laws of the Urited States, on the subject of consuls und vice-consulf, especialiy suthorize them to receive the protests of mastera and othere in relation to American commerce, and they decisre that consular certificates under sesi, shall receive credit in the courts of the United Staten. It is likewise made their duty, where the laws of the country permit, to administer the personal estates of American citizens dying within their consuiates, snd lesving no legal representative; and to take charge of and secure the effects of stranded American vessels in the slisence of the master, owner, or consignee; and they are bound to provide for destitute seamen within their consulstea, and to send thom at the pubiic oxpense to the United States. It is made tho duty of American consuls and commorcial ageats to reclain deserters, and to discountenanco insubordinstion, and to lead their rid to the local authorities for that purpose, and to discharge the searaen craelly trested. It is also made the duty of masters of American vessels on arrival at a foreign port, to deposit their registers, sea-letters, and pastporte, with the consul, vice-consul, or commerciai agent, if any, at the port. These particular powers and duties are similar to those prescribed to Britieh consuls, and to consula under the consular convention between the United States and France, in 1788; and they aro in accordance with the uages of nations, and are not to be constresd to the exclusion of others, resulting from the nailire of the consular appointment. The consular convention between France and thin country in 1778 , allowed consula to exereise police over ali veszeis of their respective nations, "within the interior of the vessels," and to exercise a apecies of civiljuristiction by determluing dinputes concere'ng wages, and Letween the masters and crews of vessels belonging to their own country. The jurisdiction ciaimed under the consular convention with France, was merely voluntary, and aitogether exclusive of any coercive authority; and we have no treaty at present which concedes even such consular fonctions. The doctrine of our courts is, that a foreign consul, duly recognized by our government, may assert and defend, as a compe-
tent party, the rights of property of the individusis of his nation in the conrts of the United States, and masy institute suits for that purpose without any specini authority from that party for whose benefit he acts. But tiue courta, in that case, said that they could not go so far as to recognize a right in a vice-consul to receive actual restitution of the property, or its proceeds, without showing some specific pou ur for the purpose from the party in interest. No nation is bound to receive a foreign consul unless it has agreed odo so by tresty, and the refossl is no violation of the peace and smity between the nations. Consuls are to be approved und admitted in the unual form; and if any consul be gaiity of illegsl or improper conduct, he is liable to have his exequatur (a writte? recognition of his charscter) revoked, and to be punished according to the laws of the country in which he is censul; or fie may be sent back* to his own country, at the diacretion of the government which he has offended. The French snd American consuls are forbidden to be concerned in mermerce, but British consuts are generally allowed to be concerned in trade; and in such cases the character of consul does not give any protection to that of merchant, when these characters are united in the ssme person. Though the functions of a cousul would seem to require that he should not be a subject of the state in which he resides, yet the practice of the maritime powers is quite lax on this point; snd it is useful, and thought most convenient, to appoint subjects of the foreign country to be consuls at its ports.
A consul is not such a public minister as to be entitied to the privileges appertaining to that chsructer, nor is ho under the special protection of the law of nations. He is entitled to privileges to a certain extent, such as for safe conduct; but he is not entitled to the jus gentium. Vattel thinks that his functions require that he should be independent of the ordinary criminal juriadiction of the country, and thst he eught not to bo molested unleas he violatea the law of natiens by some enormous crime, and that if guilty of any crime he ought to be sent home to be panishicu. But no such immunities have been conferred on consuis by the modern practice of nations ; and it may be censidered as sottlod law that cunsuls do not enjoy the protection of the law of nstions, any more than other persons who enter the country under a safe-conduet. In civil and criminal casen they are equsily subject to the lawn of the country in which they reaide. The same doctrine, deciared by the public juriats, has been frequently laid dowa in the Engiieh and American courts of justice. It eeems, however, from some decisions in France, mentioned by Mr. Warden, that foreigu censula can not be prosecuted before a French tribunal for acta done by them in France by order of their government, and with the authorization of the French govornment, and that in general a consul can not be prosecuted without the previoas consent of his govermnent.
Consular: privileges are much jess extensive in Christian than in Moltammedan countries. In the Inter, they can not be imprisonod for any cause whatever, except by demanding justice against them of the Porte, and thoy partake very considerably of the ehsracter of resident ministers. They are dlplomatic agents under the name of consuls, and enjoy the rights atd privileges which the Ottoman Porte recognizes in relation to the foreign mininters resident at Constantinepite. By treaty an entire immunity in usually given to the persons, domestics, and effecte of tho resident consuls, and no consula reside with the Barbary States but under tl: e protection of treatien.
Considering the Importance of the consular functions, and the activity which in required of them in ali great maritime ports, and the approach which consula

make to the efficacy and dignity of diplomatic characters, it was a wise provision in the Constitution of the United States, which gave to the Supreme Coart orig. inal jurisdiction in all cases affecting consuls as weli as embassindors and other public ministers; and the federal jurisdiction is understood to be excluaive of the state courts.-Kent's Comm., Lect. II.
In the treaty between Sweden and the United Statee of America, ratified on the 24th of July, 1818, it is atipulated that the consuls appointed by either government to reside within the dominions of the other, or their aubstitutes, "ahcoll, as auch, have the right of acting as jadges or arbiters in aill cases of differences which may arise between the captains and crewe of the vessels of the nation whose affairs are intrusted to their care. The respective governmenta shall have no right to interfere in this sort of affairs, exeept in the case of the conduct of the crews disturbing jublic order and tranquility in the country in which the vessel may happen to be, or in which the consul of the place may be obliged to call for the intervention and support of the executive power, in order to cause his decision to be respected; it being, however, well understood, that thia sort of judgment or arbitration can not deprive the contending parties of their rights of appessing, on thair return, to the judicial authoritiea of their country."
II. Duties of Consuls.-The dutica of a consul, even in the confined sense in which they are commonly understood, are important and multifarious. It is his business to be alwaya on the spet, to watch over the conmercial interests of the subjects of the state whose agent ho is; to bo ready to assist them with advice on all coubtful occasions; to see that the conditions in commercial treatics are properly olseerved; that these he is appointed to protect are subjected to no unnecessary or unjustifiable demands in conducting their business; to represent their griovances to the authoritiea of the place where they reside, or to the embaseader of the sovereign uppointing him at the court on which tho consulship depends, or to tho government at home; in a word, to exert himself to render the condition of $t$. soljects of the country employing him, within the limits of his consulship, as comfortable, and their transaclions as advantageous and accure as possible.
The following more detailed exposition of the generol duties of a cousul is taken from Mr. Chitty's work on Commercial Law: "A censul, in order to be properly qualitied for his employment, should take care to make himself master of the langunge used by the court and tho magistracy of the country where ho residea, so as to converse with ease upen subjects relating to his daties. If tho common peopie of the coart wes another, he must acquire that aloo, that he may be able *: settic littie differences withont troubling the magistrasy of the place for the interposition of their authority; weh as accidents happening in the harbor, by the shipe ot his nation running foul of and doing damage to each other. Lie ia to mak.! himself acquainted, if lie be not iready, with tho law of nations and treaties, with the turiff or apecification of dutier on articles imported or exported, and with all the municipal ordinances and laws.
" Ile muat, tako especial notice of all prohibitiona to prevent the export or import of any articles, as well on the part ef the state wherein he resides, as of the govemment employing him; so that he may adinonish all his countrymon against carrying on an illicit commerce, to the detriment of tho revenues, and in violafien of the laws of either ; and it is his duty to attend diligently to this part of his oflice, in order to prevent muggling, and consequent hazard of confiscation or detention of ships, and imprisonment of the masters and mariners. It is alse his duty to protect from in. silt or impeaition his countrymen of evary description within hia jurisdiction. If redreas for injury auffored if not obtained, ho is to carry his complaint by memo-
rial to the minister residing at the court on which the consulahip depends." If there be none, he is to address himself directly to the court ; and if, in an import. ant :ase, his complaint be not answered, he is to transmit. the memorial to the eccretary of state.-Beawes, Warden, ate.
"When insult or outrage is offered by one from hia country to a native of tho place, and the magistrate thereof complains to the consul, he should aummon, and in case of diaobediance, may by armed foree bring before him the offender, and order him to give immediate satisfaction; and if he refuse, he reaigns him to the civil jurisdiction of the magistrate, or to the military law of the garrison; nevertheleas always acting as counselor or advocate at his trial, when there is question of life or property. But if a subject be accuaed of an offense alleged to have been committed at aea, within the dominion or juriadictien of his sovereign, it is then the duty of the conanl to claim cognizance of the cause for his country, and to require the relcase of the parties, if detained in prison by the magiatracy of the place on any such accusation brought before them, and that all judicial proceedinge againat them do instantly cease; and he may demand the aid of the power of the conntry, civil and military, to enable him to securo and put the accused partics on board such a abip as he shall think fit, that they may be conveyed home to be tried by their proper judges. If, contrary to this requiaition, the magistratea of the country persiat in proceeding to try the offense, ihe consul should then draw up and transmit a memorial to the minister at the court of that country; and if that court give an evasive answer, the consul ahoald, if it be a sca offense, spply to the proper authorities, stating the case; and upon their representation, the ascretary for the proper departmeut will lay the matter before the king, who will cause the embassador of the foreign state to write to his court abroad, desiring that orders mny immediately be given by that government that all jndicial proceedings agninst the prisoner be stayed, and that he be released. -Ses Cass of Horseman and his Crew, Beawes, vol. ii. p. 422.

1"The consul is nnt to permit a merchant ahip to leave the port where he resides without his passport, which he is not to grant until the master ani rew thereef have aatisfied all just demands upon them; and for this purpose he ought to sce the governer'a pass of a garrisoned town, or tho burgomaster't, unless the merchant or factor to whem the ship was consigned will make himself responsible.-Benwes, Lex. Merc., vol. il. p. 423. It is also his duty to claim and recover all wrecks, cables and anchors belonging to the ships of his country found at aes by fishermen or other persons, to pay the usual salrage, and to communicate a report thereof to nuthorities at home. The consuls nnd vice-consuls are, by express enactment ( 46 Geo. 8 , c. 98,899 ), empowered to administer caths in all cases resp. cting quarantine, in liko $n$. nner at if they ${ }^{* \prime}$.e magistrates of the several towns or places where they respectively reside. It is alao laid down that a conaul is to attend, if requeated, all arbitrations whero propetey is concerned between masters of ships and the freighters, being inhabitants of the place where he re-sides."-Ciitty on Conmercial Law, vol. i. p. 58-61, and the nuacrous nuthorities there queted.

Any individual, whether he be a sulject of the state by which he is appointed, or of another, may be selectcd to fill the office of consul, provided he be appreved and admitted hy the government in whose territory be is to reside. In most instances, however, but not always, consuls are the subjects of the atato appointing them. Much, however, of the peculiar chaties of a consul must alwhys diepend on the nature of the intercoarse with the country to which he is sent, and of the instructions given him. Consula are regularly sup. plied with coples of all acia rolating to trade and navigation, quarantine, slave-trade suppression, emigra.
tlon, etc., and with the treatios between thls and other countries, and must of course shape their conduct accordingly... They are atrietly forbidden from corresponding with private parties on publio mattors. Undor the General Inetructions for Britich Consuls, "he will bear in mind that it is hls principal duty to protect and promote the lawful trade and trading interests of his country by overy fair and proper nieans, taking care to conform to the lawe and regulatione in question; and while he is supporting the lawful trade, he will take special notice of all prohllitions with reapect to the export or import of specitied artlcles as well on the part of the stato in which he resides as of his govornment, so that he may caution all his countrymen against carrylug on an illicit commerce to the detrlment of the revenue, and in vlolation of the laws and reguiations of either country; and he will not fail to give thls Department immediate notice of any attempt to contravene those laws and reguiations.
"The consul will give bls beat advico and asalstance, when called upon, to bis countrymen, quieting their differences, promoting peace, harmony, and good-will among them, and conclilating as mueh as possible the subjects of the two countries upon all pointe of differonce whlch may fall under his oognizance. In tho ovent of any attempt being made to injure his countrymen, either in their persons or property, he will uphold their rightfui interests, and the privileges secured to thom by treaty, by due representation in the proper official quarter. He will, at the same thme, be careful to conduct himeelf with mildness and moderation in all his transactlons with the public authorities, and ho will not, upon any account, urge claims on behalf of his countrymen to which they are not justly and fairly entitlec. If redress can not be obtained from the locai administration, or if the matter of couplaint be not within thelr jurisdiction, the consul will apply to the consul-general, or to his minlater, if there be no constigeneral in the country wherein he resides, lu order tha: ho may make a representation to the higher authorities, or take auch other stops in the case as ho may think proper; and tho consul will pay strict attention to the instructions which he may receive from the minister or consul-general. "--See M'Culcocn's Dictionary of Commerce ; Ḱsnt's Commentaries; Aincyclopedia Mritannica, 8th ed. publithed by Messrs. Littlo, brown and Co., Boaton; Munual for United States Consuls, 1857 ; 'I'vasos's British Consul's Afanual, Loudon, 1856. The reader may with advantage refer to the articles on Consuls andi Consular Duties containod In Dis llow's Review, voi i. p. 56 ; Husx's Merchants' Magazine, vol. vi. p. 297, vol. xiii. p. 551, vol. x. p. 447, vol. xif. p. 211, vol, xvll. p. 43, vol. x viii. p. 60; Fbreign Quarterly Hz riew, vol. $x \mid x, p .106$.

Jurisdiction, Privileges, and Immunities of Consuls.-"The juriadiction of a consul only extends over the subjects of tho nation he ia nominated by, either resident in, or arriving at, the place in which he has been appointed to reside. In countries where there are embassics as weli as consulates the jurisdiction of the latter generally only extonils over the sea-faring sutjecta of our nation, at the aame time it watches over her commercial interests. That of a consul-general presides over the consul, and that of a cousul, in most instances, over that of the vice-consuls. The consular jurisiliction depends more entireiy into what country the consul may be sent. I'hus forelgn consuis in England have no judicial authority whatever. British consuls, however, in most conntries, have judicial jower, and consequontly their juriadiction lecomes either retrenchel or extended, according to the nature of the atlpuiations of the ratified treaty.
"When the consul is appointed ho Is always provided with coples of the conventlons with the country he la sent to. In rugaril to the privilegee and immumitlea a consul enjoys, there have always existed doubts whether he may be cousldered exempt from the civil
jurisdiction of the state to whlch he ie nominated; and aithough many others have laid down to the contrary, stlll it may be maintalned, and in perfect conformity to the law of nations, that where the regular exequatur has been accorded to the consul, he ought to be exempt from the civli juriadiction of the stato to which ho la accredited. By the exequatur the sovereign acknowledges him as the consular representative of his empire, hoaring her appointment, and protected by her passport; and, as regards the nature of his mission, only resident for a short time at the state. Under these circumstances he ought to be exempt.
"In countries out of Europe, or where there is no embasky, the consul enjoys the same privileges as an ombassador, and is de fucto tho embassador or reprc: soutative of his sovereigu, only under another name. He call perform all acts of a notary pubic, all deede oxecutod by him being hold to be valid, and acknowledged in our courta of law. He can attend ali levees of the sovorelgn after recolving hie oxequatur and either after having been presented to the sovereign by the embassador, or, in hla absence, by tho miniater of foreign affulra. The consulate ls generaliy considered as the territory of tho power by which It is tenanted, and all deeds, acts, and any other documenta executod under the seal of the consul are valid in the country from which ho has been sent. At tho same time, it must be perfectly understool that all acts thus issued by the consul are, with a fow exceptions, not valid in thu country in which be resldes, except there be a spoclal conveution to that effect. All documents, required to to valid before the tribunals of the country he is in, ought to be made out by the proper lawyers appointed for that purpose; for it can not be expected that where a consul is only authorized as judiciai authority for his own country, that hia acts shonid bo acknowledged and received as iegal lustrumente in the tribunals of tho country ho is accredited to, although his acts shouiti be reapected, as it might he poasibie that they could be grounded upon guite a different lix mercatorio, and could not, therefore, be taken in evidenco against documenta perhaps quite opposite in a legai point of viuw, and it would be unjust to aliow them to be reeeived."-Tuson's Brotiah C'onsul's Manual, 1856.
III. Consular System of the United Stutes.-'line establishment of a consuler system in the United States was neariy coeval with that of the general povermment. In the second annual address of President Washington to the tirst Congress, ho informed that bodiy that "the patromage of our commerce, of our merchants, and seamen, calledf the appointmont of consuls in foreign countries; thi, at seemed expedlent to regulate by iaw the exercise of that jurisiliction aml those functiona which are permitted either hy express conveution or by a friendily indulgence in the jlaces of their residence." Prior to this period consuis were not ailowed saiaries, ner permitted to domand fees or receiva jerquisites.

In each branch of Congress this recommendation of the l'resident was referred to the appropriate committee, and consular bils were :ciorted in accoriance therewith. They falied, howevor, to become laws, the llouse having strieken out the whole of the Senate hill with the exception of the tirst section.

In the early part of the second Congress substantialIy the same bili, probitily drawn by Mr. Eilswurth (afterward Chief Justice), was reported to tho Scnate by a committce to whom the recommemiation of the l'reshient had been referred; and, subsoquently, after tho adoption of severai amenimenta, it passod botí lirsuches of Congress unanimousiy, and became, on the 1 th of April, 1792, a law of the land.

From this period till the year 1855, with the exeeption of the act of July 20th, 1840, regulating the shipment and discharge of seamen and the duties of consuls, scarcely any change was mado in the laws afiectIng the consular system.

In the year 1854, Mr. Perkins, of Louiblana, then a member of the Ilouse of Representatives from Loulsiann, having devoted himself mont asaiduously to the study of the aubject, prepared a bill to remodel the diplornatic and consular syatems of the United Statea.

The bill was advocnted in the House, and finally passed by a vote of 148 yeas to 88 naya.

In tho Senate it passed unanimously, recelved the approval of the President on the lat of March, 1855, and went into operation on the 1at of July, in the eanio year.

Aecording to the recommendation of Mr. Marcy, Seeretary of State, the sebject was again brought forward in August, 1850, and a new act passed by a vote in the Ilouse of Representativen of 103 to 56 , and passed the Senate unanimoualy on the 16 th of that month.
it lias rarely happened that a law so important as this has passed Congress with anch nnaninity-mono Involving inany and important changes in the diplomatic and consular syatems of the United States; creating new offices ; increasing, reducing, or entirely abodishing the salaries of many consutar officors; containing provisions affecting every American merchant and shipmaster engaged in foreign trade, and every Amerlan traveler in Europe; repealing provisions of existing laws; rnacting others for the regulation of the agents of the goverument in forcign countrice, and of civil officers in the United States; imposing heavy penaltics for the vielation of the provisions of tise etatnto; and authorizing and requiring tio performance of important duties by tho higheat executive officers of the government. Thie favor which the bill roceived in both brancires of Congress was doubtiess duc, in part, to the fact that the near approach of the cloas of the session left littlo time for its disenssion and amendment, and to tive respect entertalned by the House for the committec on forcign sffairs, which reported tho bili, whose chairman, It was understood, had doveted much time and eare in its preparation. Tho law provides for the rate of compenastion to bo received by all diplomatic and consular officers, of whatever grade; fixes their compensation; peruits tho latter to transact businoss, or prohibits them from doing so, in certain places; prescribes the conditions of officinl bonds; imposes penalties for the violution of the provisione of tise $\ln w$, and indicates the manner in which aetions for the recovery of penalties shall be tried; authorizes tho appolutment of consular pupils, of interpreters, and of additional secretaries of legations; fixes the period at which the compensation of the officers named in the act shall commence and terminate ; provides for the filing of diplomatic and consular oflices teniporarily vacant, and the psy to bo received by officers acting ad interim; forbids the exercise of diplomatic functions by unauthorized persons; authorizes the President to deflne tho limite of the several consular and commercial agencies, to provilie for the appointment of aubordinato consular officers and their compensation, and likewise to fix tho rate or tariff of fees for consular services, and designate what shall bo regardell as official services; requlres the consular tarlfi to iee reporied to Congress annusliy, and also the ameunt of foes received at the several consulates; directs the modo in which the payment of foes shatl be mnde and accounted for, and the coin In which they shall be payntilo; impores additional intles upon coliectors and shipmasters in respect to consular eervices, receipts, and involces ; forblds diplomatio and consuinr oflicers to bo absent from their posts, or to hold correspondence in regard to the public aftairs of any forelgn government with the prese, or private persons, or otiserwise then with the proper officers of the United States; forbids consular officera being pecunlarily Interested in the receipt or diaburaoment of tho wages of seamen, or In oxpenditures made for tiselr relief or tranaportation; provides that no compensation shall be paid to diplomatic and consular officera, unlese they shall be citizens of the United Statea; ua-
thorizes the President to supply the legrations and consulaten of the United States with certain articlea necessary for the transaction of the public buaineas, and to prescribe anch regulations, and make and issue auch orders and instructions, not inconaistent with the Constitutlon or any law of the United States, in relation to the duties of ali diplomatic and consular officers, the traneaction of their business, the rendering of accounts and returne, the payment of compensation; the onfen keeping of the archives and publie property In the hands of all such officers, the communication of information, and the procurement and transmission of the products of the arts, sciences, manufactures, agriculture, and commerce, from time to time, aa he may think conducivo to tho publio intereats; requires these officers to conform to auch regulations, orders, and instructiona; makea it the duty of the Secretary of State to publish official notlficationa, from time to time, of sucis commercial information commanicated to him by the diplomatio and consular officera as he may deem important to tho publio interesta, and to report to Congresa, at least once in each year, a aynopsis of so much of tho information on all subjecte, which sliall be co communicated to him, as he may deem valuable for public information; authorizes the granting and issuring of passports, under certaln conditions, and the perfomnance of notarial duties by secretaries of legation and consular efficers; enacte various provisions in rogard to the desertion of seamen, the payment and tie forfeiture of wages and extra wages in certain cases, and the se thement of sesmeris accounts, and their discharge in foreign countries; provides for the accountablity of consular officers for tho extra wages of seamen; preseribes the kind of returns and reperts to be made by consular officers, and requires all shipmasters to apply to consular officers for the transaction of consular businesn, and pormits the detention of shipa' papers till payment shall be made of alt demands and wages on account of euch shlps and vessels; detince the duties of consular ofticers in respect to all citizens of the United States dying abroad, and the meaning to be affixed to the several titiee by which consular offlcers aro designuted; imposes heavy penaities for ali malfeasance, and for the violation of the provisiona of the act; repeals all acts and parte of acts inconslstent with its provisions; and, tinally, provides that the act shall take effect on the firet of January, 1857. It wiil thus be seen that tho law which now rngulates the diplomatic and consular aystems of the United Statea enbraces a great number of subjects, and enters into much detail with reapect to ali matters pertaining to the consulnr office. Many of its provislona are eminently judicious; the expediency of others must lue tested by tine and their practical operation. The treaties and conventions of the Unitod States with forelgn nations contaln many iliportant provisions relating to the dutios, rights, and priviieges of consuls, ess pecially those which have been negotlated with China and the Ottonan Porte.
Hut "the most complete consuiar conventlons ever concluded," as remarks Mr. Tuson, the latest writer on the aubject of the dutles of consuls, "aro those between France and the United States, and between the latter country and Holland; the former negotiated at Weshington by Mr. liverett and M. Sartiges, and the latter nt the Hingue, under the Inatructions of Mr. Marcy. The rules laid down thereln are very explicit, and ought to tie taken as examples by all other nations. They will be of great utllity to all consuls, in showing them what their present dutles are, and what they are most likely to bocomo. These conventions are suchas nro likely to he taken as precedente for future trentiea on the same anlject." Occurrences which have taken place in the United Statea and eleewhere, within the last few yeurs, have shown how defective is the legislation of thle country In respect to consuls. The subject attracted Mr. Welonter'a attention, while Secrotary
of State; and, at his auggestion, the atteation of Congress was called to it. He remarked that no country has a deeper interest in securing the protection of diplomatic and consular agents than the United States. Thsir commerce spreads over every sea, and visita nvory clime; and these agents are appointed to protect its interests, as well as to guard the peace of the country, and maintain the bonor of ita flag. While thus eagaged in the discharge of important functions, they should bo objects of especial respect and protection, aach according to the rights belonging to his rank and station.

As much has been done during the last four years as at any former perlod in this country, by means of cunsular conventions, by legislation, and by circulars issued by the Secretary of State, not only to secure these oljects, but to perfect the consular system, and to render it usefol to the country. In obedience to the circulars issued by Mr. Marcy to coneular officera on the 8 th of Octeber, 1853, the 15 th of March, 1854, the 11th of July, 1855, and also tho general and special instructions of the Dspartment of State, a vast amount of information rolating to ship-building, ehipping, navigation, tonnage, seamen, foreign tarifts, commercial regulations, and other subjects, has been transmitted to the Department by the United States consuls. The matter thus collected is Important and valuable; ite preparation reflects great credit on the industry and intelligence of the conaular corps, and atfords a striking illustration of the Importance of their services.

At the prosent time the consular corps of the United States conslsts of seven consuls-general, one hundred and seventeen consuls, and nine commercial agente, who receive for their compensation fixed salarics; nincty consals, ten commercial agents, and cighty-five consular agents, who are anthorized to retain for their compensation the official fces which they recelve. Resilling as these officers do in all the principal marts of traffic and commerce throughout the world, and having their dutics carefuliy defined by law and the instractions of the Executive, it may reasonably be expected that all information affecting the commercial raletions of the United States with foreign nations will be furnished by tham to the Department of State, and published for the benefit of their fellow-citizens.
As an illustration of the value to be placed on the correspondence of conauls, it may be stated that in a debato which took place in 1842, in the IIouse of Commons, Lord Palmerston remarked, that, during the time he had the honor of being at the lowad of the foreign department, he had read every report and every letter received from the consular officers abroad, from tho most elaborate report of the highest consul-general down to the least-importaot letter of the lowest viceconsul. "Very laborions reading it was," he adds, "but, scattered through the voluminous papers that thus came under my eye, I found many important matters with which it was my duty to be acqualnted; and it is quite a mistake to suppose that, because there is a superintendent of the consular department, the Secretary of State does not give the same minute attention to the consular as to the other duties of the ofllce, though the consular corraspondence amounts to one-half of the whole correspondence of the foreign ofllee." The perfection to which the consular system lias attained in France furnishes an Illustration of what mey ba accomplished by a thoroughly orgnnized consular establishment. The ohjects contemplated by such a system, as has been well remarked by a writer practically acquainted with the suljoct, are nothing less than the advancement of the prosperlty and power of nations. Deputed to watch over tho commerclal rights and privilages of their respective countries, consular oflicers are Intrusted with the care of the highest Interests, and excreise a more limportant lathence upon mercantile prosperity, the foundation of nationel greatness, than any other foreign agents of government.

Scattered throughout the whole world, occupying an eminent social position in all the mercantile clties of every nation, and perforoling duties which bring them more or less into collision with the people among whom they reside, they, by their coaduct and manners, influence the judgment whicis is formed of the country they represent, and either add to its digalty or reflect dishonor on its astional character.

1. Naturs and Duties of the Consular Office.-The word "consuls," as used in the Constitution of the United States, designates a class of public officers appointed by thelr government to reside In forcign countries, and especially in aca-ports and other pleces of commerce, to discharge administrative and sometimes judicial functione in regard to their countrymen who dwell or may be in tho country where they reside; to ald in the authentication of documents abroad, and generally to perform auch other duties as may be assigned to them by the lawa and orders of their government.
2. Classes of Consular Officers.-Accordingly, by various lawa of the United States, duties are imposed and rights confcrred on this description of public officers, under the names of consuls-general, consuls, viceconsuls, depnty-consuls, commercial agents, vicc-commorcial agents, and consular agents. It is provided by the 31st section of the act of Congress approved August 18, 1856, that these official designetions shall be deemed to have tho respective meanings therein assigned to them, namely: "consul-gencral," "consul," and "commercial agent," shall be taken to denote full, principal, and permanent "consular officers," as listinguished from subordinates and substitutes; "deputy-consal" and "consular agent" to denote "consular officere" subordinete to such principals, exercisIng the powers and performing the dutics within the limits of their consalates or commercial agencies re-spectively-the former at the same ports or places, and the latter at ports or places different from those at which such prenclpals are located respectively; and " vice-consuls" and "vice-commercial agents" to denote "cousular officers" who shall be substituted, tenporarily, to fill the pleces of "consuls-general," "consuls," or "commercisl agents," when they shr" be temporarily absent or relioved from duty ; and the term "consular officer" to include all auch officers as are mentioned in the seid section, and none others.
3. Application of Acts of Congress.-It is further provided by the samo section that, in the construction and for the purposes of all other acts and parts of acta which shall remain In force after the act above mentioned shall take effect, defining any of the powers, declaring any of the rlghts, prescribing any of the duties, or limposing any penalty or punishment for any act of omission or commission of any consul, commercial agent, vice-consul, or vice-commercial agent, or allowing or enjolning the performance of any act, matter; or thing, with or before any sach oficer, all such acts and parta of acts shall in all these several respects, so for as may be consistent with the subject-matter and context of the same, and with the eald act and the treatics of the United Status, be deemed and taken to include and apply to all consular offleers just as though all such officers were specifically named thereln.
4. Certain Consular Powers,-Tho Importent act of 1792 contains a declaratory provision, which is to be understood as implled In all other acts of Cougress, as follows :
"The specifiention of certain powers and daties, * *, to be exarclsed or performed by the consula and vice-consuls of the United States, shall not be construed to the exclasion of others resultling from the nature of thelr appointments, or any treaty or conventhon under which they niay ect."*

who may
being defined by acts of Congress, are indicated by general treaties and consular conventiens entered into between the United States and other sovereign powers.
5. International Law.-Consula possess, moreover, by the law of nations, nany functions, rights, and privileges, other than such as are defined by convention, by legislative act, or by regulation.
6. Consular Privileges.-Thcir privileges necessarily arise from the character of their appointments; but they are net, llke those of embaseadors and other public ministers, precisely defined by international jaw; and, consequently, they may be extended or limited among different natione, either by treaties or the legisJative policy of these countries. Altheugh the commissions which United States consuls receive from their government are expressed in the same terms and confer the same authority; yet, as the consuiar functions sre to be exercised in a forcign country, and in accord ance with an exequatur issued by its sovereign, they msy be more or less restricted. Whenever the imms. aitics, rights, and duties of consuls are prescribed by muturl consular conventions, they are to be enjoyed or excreised in accordance with the stipulations of such cenventions. In these countrics with which the United States have entered into no consalar convention, consular officers may discharge such duties as a e allowed or are net ferbidden by the laws of these countries, or which are allowed by common usage; and sometimes they are permitted to exercise such privileges as are granted to foreign consuls by the United States within lts own territory.
7. When Obstacles are interposed.-If the autheritics of the places where consuls reside oppose eny olstacles to their enjoyment of the privilegea which may have been accorded by consular conventions, or which, founded on usage or reciprocity, may have been claimed by thennelves, they will refor the subject to the legation of the United States residing in the country, and ruport the facts, together with their own proceedinge and a copy of all their correspondence in relation to the same, to the Department of State, and await its instructions. In no case will they strike the consular figg or abandon their post without the express permission of the Department.
8. Personal Demeanor.-One of the first duties of consular officere is to exhibit in their official conduct, and in their interceurse with the lecal authorities and with the people of the conntry, a proper respect for the supreme nuthority.
9. Style of Official Communications.-In their communications with official functionaries, they will be carcful to set forth their viows and opinions courtcousty but firmiy, avolding in all cases the use of vivient or intemperate language. All diseugsions extending beyoud the limits of a just moderation are injurious and defeat thelr owr ohject.
10. Influcnce of Personal Character.-1t is, above all, by their personal influence and character, by circuinapect conduct and a conciliatory apirit, that consuls will best succecd in settling difficulties and in the accomplishment of important objects. Commercial intercuurse is a common bond of interest aniong all countries and ail men, and it is by arguments drawn from this source, rather than by unreasonabite pretensions and disputes, thast injurious restrictions can be re-moved.-De Cuence, tome ii. p. 32 et seq.
11. Dutifs imposed by Laws.-The laws of the United States on the sulject of consuis and vice-consuls sf. cisliy authorlze them to recelve the protests of masters and others relating to American commerce, snd decine that consular certificentes under scal shail recclve falth and credit in the courts of the United States. It is likewise made the duty of consular officers, where the laws of the country permit, to collect and remit the assets of the personal estates of American citizens who may die within their consulatea and leave no legal representative, and to take charge of and secure the
effects of stranded vessela, in the absence of the master, owner, or consignee; and they are bound to provide for deatitute seamen within their consulaten, and to send thein, at the public expense, to the United States. It is their duty, likewise, to reclaim deserters, to discountenance insubordination and lend their aid to the local authoritice for this purpoae, to discharge seamen cruelly treated, and to receive from the masters of American vessels, on their arrival at a foreign port, and after the voesel shall have come to an entry, the registers, sea letters, and passports of such vessels. These duties, and some others which are prescribed by legal enactment, are in accordance with the usages of nations [Kent, vol. i. p. 42], and with special treaty stipulations with certain countries.
12. Variety and Importance of Consular Duties.-Many of the consular duties arise from peculiar circumstances: such as the character and habits of the nation in which the consul resides, its laws and customs, and the nature of its intercourse with the United States. In the most restricted sense, they are important and multifarious, are quite difierent from those of other officers employed in foreign affisirs, and require for their proper performance an amount of practical information for which the consular officer needs a special training. Consuls are so situated as to exercise $t$ ward their countrymen within their consular jurisdiction the duties of judges, arbiters, and peaceinakers; they are the registers of marriages, births, and denths; they act as notaries, and cometimes as revenne officers; they watch over and verify the sanitary condition of their consulstes; and, by their domestic relations, they can furnish a full and accurate idea of the commerce, navigation, and industry peculiar to the country of their residence.
13. Commercial Regulations.-The commercial interests of their own country are, in a measure, conmitted to their caro. They are to bee whether the stipulations In commercial treaties are observed, and report all changes in commercial regulations and municipal ordinances.

Every law, edict, or regulation of the government where they reside, in any way affecting the commerce of the United States, which comes to the knowledge of consular officers, must be immediately transmitted to the State Department; and, if it be a local regulation, operating only on a particular port, they must also give immediate notice thercof to the minister, if there be one in the country to which the district belongs.
14. Suggestions.-Consular officers are expected, in their correspondence, to note all events which bear upon the commerce between the country where they reside and the United States, the establishment of new branches of industry within the limite of their consular jurisdiction, nnd the increase and decline of such as have been before established. They should also make such suggestions as, in their opinion, msy lead to an increase of trade, and point out any circumstances which may have produced a contrary effect, with the means that appear proper for avolding such a result. When new products of the arts, sciences, or manufactures appear to be valuable elther for expert or import, cnd this is not gencrally known, the fact siould be cominumicated to the Deparment, and samples sent, if not too bulky, with the conenlar letters; but if too bulky they may be addressed to the collector of some $\because$ do of our principal ports. Sceds of plants and grain suitable for cultivation in tite United States shoutd also be sent. In general, the duties of a consular officer require an attention to cyery thing that can promete the commerce and navigation of this country, and the intererts of its citizens.
14. Contentions to bs avoided.-Consular officers are particularly cautioned not to enter into any contenthons which can be avolded, either with their countrymen or the authorities of the country in which they reside; reforring questions of that nature to the min-
lster or to the Department; ysing every endeavor to settla in at amicablo manner all disputes in which their countrymen may be concerned; and countenancing and protecting them before the authorities of the country in all cases in which they may be injured or oppressed, but withholding from them support when they have been wilffully guilty of an infraction of the laws, particularly in any attempt to defraud the revenuc. In this last case they will aid the proper officers in checking any such practices.
16. Foreign Politics.-All consular officers are forbldden to participate in any manner whatever, direct or indireet, in the political concerns of the conntries by whose governments they are severally acknowledged and recognized in their public character; and they will be on their guard against the ealistment of their feelings upon the side of any of tho political or sectional parties which may exist in these commtries. In their letters upon such subjects, even to this Department, they will confino themselves to the conmunication of important or interesting public events, as they oceur, in a clear and concise form, avoiding all unnecessary reflections or criticism upon the character or conduct of Indivlduals or governments; and will not give publicity, through the prees or olherwise, to opinions or speculations injurious to the public inslitutions of those countries, or the persons concerned in the administration of them; but it is, at the sano time, no less their duty to report, frecly and seasonably, to their own government, all imporiant fiscts which may come to their knowledge, through nuthentic channels, touching the political condition of these countries, especially if their commusications cnn be mado subservient to, or may affect, the interest and well-being of their own.
17. Prohibitions.-All consular officers are prohibited by the 19th saction of the act epproved August 18, 1856, from corresponding in regard to tho public affuirs of any foreign government with any privato person, nowspaper, or other periodical, or otherwise than with the proper officers of the United States, and from recommending any person, at homo or abroad, for any employment of trust or proit nnder tho governinent of the country in which they are located; as well es from asking or accepting, for themselves or any other porson or persons, any present, emolument, peciniary favor, office, or title of any kind, from any such goverument.
18. Diplomatic Functions.-As consuls, excepting in Moliammedan states, are not invested with diplomatic pawers, they aro not entitled to communicate dircetly, except under special circumstances, with tho government of the country in which they reside. Consular officers are forbidden by the 12 th section of the act to exercise diplomatic functions, or hold any dijlomatic correspondence or relation on the part of the United States, in, with, or to the government or ronntry to whieh they shall be appointed, or any other comitry or government, when there shali be in such conntry any officer of the United Siates nuthorized to perform diplomatic functions thercin, unless expressly authorized by tho I'resillent.
19. Morle of addressing foreign Governments.-Whenever application is to be made to such government, it must he done through the minister of the United Staten, If there he one; if not, and the case slould require it, the consul may make the application to the proper department, but in respectful ierms, stating the exigency of the ease, aud that an application to the subordinnte officers could not bo made, or that it had 1 -ved ineffectual.
20. Pririleges:-A consul is not auch a public minister as to be entitled to the privileges appertaining to that eharacter, nor is lie under the special protection of the law of nations. In civil and criminal cases, where not otherwise proviled by treaty stipulations, he is subject to the laws of the country in whith he reaiden.
21. 7reaties and Conventions.-It is the duty of consuls to be conversant with all treaties, conventlons, and consular conventions, also witht the laws and commercial and other regulations relating to their consular funcions.-Manual for Consuls, issued by the Department of State, Washington, 1857.
An Act to regulate the Diplomatio and Consular Systems of the United States, passed August 10, 18t6. - Re it enacted by the Senate and House of Rapresentatives of the. United States of Amerlea, in Congress assembled, that embassaderg envey: extraordinary and ministars pientpotentiary, ministerg resident, commlesioners, chargés d'affalrea, and secretaries of tegatlon, appolnted to the countriea hereinafter named in schedute $A$, shall he entitled to compensation for their serv. lees, respectively, at the rates per anhum hereinafter apeelfied; that is to say, embaspadors and envoys extraorilnsry and ministere planipotentiary, the fuli amonnts speclifed therefor in said schedulo A; ministers reuldent nad commiasloners, is per contum ; chargos d'affalres, 60 per centum; and secretariea of legation, 15 per centum of the sald amounts, respectively; Irovided, that the compensation of the Secretary of the le. gation to China, neting as interpreter, shall be at the rate of $\$ 5000$, and If not acting as such, at the rato of $\$ 3000$; snd that of the Secretary of Legation to Turkey, acting an dragoman, at the rate of $\$ 3000$, and If not acting as such, at the rate of $\$ 2000$ per annum.
Scheduls A.-Great Dritaln, \$17,500; France, \$17,500; Ruskla, $\$ 12,000$; Spalu, $\$ 12,000$; Austria, $\$ 12,000$; Prusela, $\$ 12,000$; Brazll, $\$ 12,000$; Mexico, $\$ 12,000$; Clilna, $\$ 12,000$; all other countries, each $\$ 10,000$.
Secf. 2. And be it firther enacted, that the President be, and la hereby authorized to appoint for the legatiens at london and Phris, respectively, an asslatant eecretary of legation, who slinil be entitied to compensation for their services respectively, it the rate of fifteen hundred dollars per ammon; for the legation to China, an Interpreter, when the secrelary of legation shall not be neting as anms, who alanli be entilled to compensation at the rate of $\$ 000$; and for the legation to Furkey, a dmgoman, when tho eecretary of legation shall not the acting na such, who shall be eatitled to compensation at the rute of $\$ 1000$ per annum.
Sect. 3. And be it further onacted, that consuls-genersl, consuls, and commercial agenta, appolnted to the ports and places herelnafter specified in schedules $B$ and $C$, shall bo cutitled to compensation for their services, respectively, at the rates per annum herelnafter speelfied in sald schedutes $I I$ und C : and if tho President shall think proper to appoist a consul to any port or place named In the sald sechedules 11 nod $c$; for $n$ commereial agent, instend of such commercial agent, or tice lersa, and an appolatment shall be made necordingly, the compensation for such consutar officer shall bo the same ln any such case as that fixed for wuch port or place In the sclicilule embrachag the same ; amt If he shasit think the publle interests will be subserved by appoliting to any such port or place a consul-generat, Instend of a cancul or commerdal agent, and an appolntment ahall be mado necordligly, the compensation for auch consul-general shall be tha same as that dxed for such port or placo in the sehedule emLrachag the same.
Sect. 4. And be it further enacted, that consuts-gencral, consuls, and commerelal ugents, not embraced In schedules II and $\mathrm{C}_{\text {, }}$ khall be entltled, as compensation for their servfeen, to such feem as they may collect in purnuance of the provisions of thia act, rebpectively:
Sect. 5. And be it further enarted, that no consul-general, consul, or conmerclal agent, embruced in sehadule 1 , shall, while he holda lisa ofike, be interested in or transuct any busluess as a merchunt, factor, liroker, or other trader, or as a clerk or cther agent for any wich person, to, from, or within the port, place, or limltn of his connulate or commerdni ngeacy, directly or Indlecetly, etther in hifa own name, or in tha name or throngh the ngency of any other person; aud if uppoiuted ufter thita act shall take effeet, he eliall, th hita official bond, at! puinte, as a condition thereof, not to volute this proathtion; and lf appelated before, and retalned thoflee ufter this act shall take effect, he ohall, within such rensonable time as the f'reshlent shall preverilio, enter into n new officdul bend, with auch st!puintion na a condtion thereof; and If any nuch ronsut-general, consul, or commerclal agent, ehan! volate anch prohibiton, he shalt be llable to a penalty therefor, for the use of the Unfted Statea, equal In umount to the annual compensation speelfied for him in sald schedule $H_{1}$ which mny be recoviret in un action of debt at the nuit of the cinlted states, eitiner difreetly for the penalty, as anch, against mach consul.general, or consui, or commereini ngent, or unon his officlai hond, as liquidated damagen, for the bruch of such condifton, agaiuat auch conani-general, consul, or

Exterritorial and o.her Privileges of Consuls.-According to an claborato opinion prepared by Mr. Cushing, Attornoy-General of tho United States, under dato July 14, 1855, the United Statea may, with consent of the government of another country, superadd to tho regular dutles therein of conenl any of thoso of a minsister. There aro two great classes of canes in which this fact exists, and might well be systeniatized, or at least more explicitly recognized, in consular stipulationa with foreign governmunta.
Consular Privileges in Colonial or other Irependencieanf Foreign States.- One is, that of the transmarine possessions of suadry of tho states of Europo. Here, many cogent reasona dictate that tho concession should be granted to our consuls, by such states, of the right to address the colonial or jrovincial governomr. There is nothing in tho law of nations to prevent this ; it is convenient for ail parties; it is a consular right exercised by treaty in the great pashalics of the Turkish enpirc. Tho United Statea havo recently made provision to tho same effect in treaty wlih a Christian power, namely , the Netheriands ; and that governinent having thus wisely reliaquished ita long-subsisting scruples on this point, we may reasonably expect aimilar liberality in futuro commercial negotiationa with other countries of Europe.
Consular Duties where there is no Ihiplomatic Representatire of the L'ntted States. -The other class of casss of this nature is that of a consul residing near a metropolitan government where there is no minister, either because of temporary cessation, or becsuac inducementa havo not existed for the interchange of dipionatic representatives between such government and tho United States. In this case it becomea the office, perlaps it may be aaid the right, of tie consul to place himself, with the permission of his oon government, in direct communication with the political authority of such govermment. Here, as in the other case, tho fact occurs, anii is of common coavenience; it is not inconsistent with public law; and so far as regards the Cinited States, it has example in treaties, for instance, in our last consular convention with France. It is a thing of manifest necessity as between tho United States and some of the countries of Germany, with which our reJationa are entirely amicable, without calling for permanent diplomatic representation. The German Bund, though in aomo featurea resembling our own federal republic, yet differs essentially in this, that, in the former, the federal authority, in matters of peace and war, acts on states, not individuals, and of course each stata retains the power of foreign representation and negotiation. Hence, if wa do not see cause to interchange miniaters, wo may yet well reciprucally enlarge the consular functions, in our re'nations with such states as

Bavari the Me Bund. Heri would cause a of Bav address dipion such, a commis niticn the loea sull in t1 quasi-e: the luw by genc govern any cas their co ss they offics of politieal lomatic d'affaire duplieat of consu of tho Pagan servel, $t$ privileg of haw al of other quires su for insta "diploma have in 1 exterritor enjop; th mecause atives in cause the true expl to consul penilent the suzer Eyypt, a they ase, commanit with us, $t$ Insitut stratei hii afirm, th rapscity 0 fact of diff modern E . nationalit ieci head, a distinet Comsuls ganized those of $t$ ministerec nominatio tion to thi incilent of also, at th iation to o the same poilitical or In Conn states, in t paired, ant tions of m

Bavaria, Saxony, Wurtemberg, Hanover, the IIesaen, the Nechlenbarga, or any other of the members of the Bund.

Ilerivation of Prieileges by Consuls.- Meanwhile, it woulit not is either of theae classes of casce follow, becatise a conaul of the United States in Bavaria, or one of liavaria in tho United States, may be admitted to addruss the government, that therefore he becones a dipionatic personage, with international rights as such, and among them that of exterritoriality. If his commission be that of consul only, if his public recogniticil be an exequatur, the forejgn consul is subject to the local law in the United States; and our own conlsul in the foreign conntry, if inveated in any case with quasi-exterritorial righta, does not deriva these from the law of nations, but orly from the special conecssion, by general law or otherwise, of the particular foreign govermment. If, Indeed, the United States see fit, in any case, to confer the function of chargo d'aflaires on their consul, either with or without linsitation of tlrae, ss they may lawfully do, that is, to superimpose the office of minister on that of consul, then lie lins a double political capacity, and, though inveated with fuli diplematic privilege, yet becomes so invested as chargé d'affaires, not as consul; and the fact of such casual duplication of function docs not change the legal status of consuls, whether they be regarded through the eye of the law of nations, or that of tho United States.
Pugan and Mohammedan Countries.-It hins been obseved, that "in Egypt, Twis, Tripoli, China, the islands of the Pacific, the consuls enjoy ali the diplomatic privileges. The notive is not only in the difference of haw and religion with ours, but also in the absence of other diplomatic representatives." This remark requires qualification. In the case of China and Turkey, for instance, our consnls havo not, quid consuls, any "dip/omatic privileges," except such as they might have in France during the alisence of a minister; sweh exterritorial, not diplomatle, privileges, ns they really enjoy, they enjoy, not beenuse they are consuls, ror because of the absence of proper diplomatic representatives in those countries, for we have them, bint becanse they are citizens of the United States. And the :rue explanntion of the diplumatic rights appertaining to consuls in thic Mohammedan states, whether independent ones, like Moroceo and Muscat, or subject to the suzerainty of the Porte, like Tripoli, Tunis, and Egyt, and so of the Pacific or Indian islands, is, that they are not Christians, and are not admitted to n full community of international law, public or private, with us, the nations of Christendom.
Insitution of the consular Office.-It might he lemonstrated historically, what in this place it will suffice to affirm, that the institution of consuls, in their present rapacity of international agents, originated in the mere fact of differences in law and religion at that period of modern Furope in which it was customary for tistinet nationnlities, coexiating under the same gencral politicll head, and oren in the same city, to maint 'n each a distinet municipai government.
Consuls in the Lerant,-Sucia municipal colonies, orgrnized by the Latin Cbristinns, and especially by those of the Italian republics in the Levant, were admanstered each by ita consuls, that is, its proper municipal magistrates of the well-known municipal denomination of ancient Italy. Their commercial relatien to the husiness of their countrymen was a mere incident of their general municipal authority. Such, 3lao, at the entset, was the nature of their political relation to other cocxisting nationalities around them in the same country, and to that country's own supreme political or millitary power.

In Conentries not Christian.-The consuls of Christian states, in the countries not Christian, still retain unimpaired, and halitualiy exereise, their primitive functions of municlpal magistrates for their countrymen, their commercial or international capacity in thoso
countries being but a part of their general capacity as the delegated adminiatrative and judicial agents of their nations.

Origin of the Lavo of Nations.-This condition of things came to he permanent in the Levant, that is, Greek Europe and its dependencies, by reason of the tide of Arabie and Tartar conquest having overfowel so large a part of the Eastern emplre, and establlshed the Mohammedan religien there. But the result was different in Latin Europe, lecause the modern nations, formed In this quarter unt of the broken fragments of the Western empire, being Chiristian, and thus derive ing their rellgion and their civilization from the same fountain-head of Rome, settled into something of approximatlon to ono great political community, undec the influences, potential when combined, of the military power of the Frankish or Germanic emperors, aud the moral power of the I'apal See. Thus it was that the mass of legal ideas, which we now call the law of nations, came to exist and have authority. It is, In its origh at least, the system of puhlic law of Latin or Western Europe.

Approximate Cnity of Public Law.-This imperfect political unity of Western Europe was obstructed at first by the antagonism of the Celto-Romanic and the Germanic races, and was threatened with complete dissolution when that original antagonism reappeared in the separation of some of the Germanic populations from the Papal Sec, cander the popularly assumed reJigious title of Protestants. But after thisty contlnuous years of reciprocal devastation and slaughter, the states of tho old and new faith concluded a truce at least, if not a peace, and agreed, whilo acquiesciag in the fact of religious ilifference, to maintain approximate unity of public law, and thus, by subordinating the religious idea to the legal one, to live together in some sort, as they have continued to do, with only occasional spasms of fanatical intolerance breaking out into civil or forcign war. At a late period, Russia, though of Greek faith, came into the European system of putbic law, with the less difficulty, indeed, for the reason that Latin Europe and Greek Europe alike neurished the legal traditions of the Roman empire, though these be derived in the former case from Rome, and in the latter from Constantinople.

Change in the Nature of the consular Office among Christian Netions.- Thus, by the combination of Romanic law and Christian faith it is that we bave come to have a common public law, under whose gradual operation claims of private exterritoriality soon fell into desuetnde among the governmente of Christendom; Italians in England, and Englishmen in Italy, at length submitted to the local law; foreign colonial nationalities finally ceased to exist of right; their consuls procecded to sink from the condition of municipal functionariea into that of mere commercial or semi-diplomatic ones; and thus, in process of linic, by traditional usage, by positive provisions of local law, and by treaty stipulations, the existing legal character, with its limited rights, was fixed on the foreign consuls mutually accredited in the countrics of Christian Europe and America.
In Jfohammedan Statcs,-In our relations with nations out of the pale of Christendom, we retain for our own citizens and consuls, though we can not concede to theirs, the rights of exterritoriality. Religion is tho chicf representative sign, and it is an elenient of the question of public law. But the critical fact is the difference of law. The legislation of Mohamined, for instance, is inseparable from his religion. We can not submit to one without also undergoing the other. The same legal incompatibility exists, for one reason or another, betwcen us and the unchriatian states not Mohainmedan.

Institutes and Pundecta,-Whereas Christendom, on the other hand, in all ita subdivisions of race, nationality, and religion, is the common heir of the political
ideas, and especially the legislation, of the Roman emplre; for the Inatitutes and Pandects thomselves, though compriaing the sum of the legal science of Some, were compiled and promulgated at Constantinople, and consticute the broad foundation of the jurispradence, publio and private, of the whole of Christendom.

Uniy in Christendom.- Wher the countries now Mohammedan shall be reaubjected to the doctrines of the Roman law, then can they be adinitted to the samo reclprocal community of private rights with us, which provails In Chrlstian Lurope and America. Until that event happens, Turkey, and ' ' or Modem atates $^{\text {M }}$ in Africa or Asia, may, liko China or uapan, enter into the sphere of our public law in the relation of government to government, but not la the relation of government to men. That full interchange of international rights is adinissible only among the nations which have unity of legal thought, in being governed by, or constituted out of, the once dissevered, but since then partially remited, conatituent of the Grarom loman empire.-Manual for Consuls, l'nited States, 1857.

Contraband, in commerce, a commodity prohibIted to be exparted or imported, bought or sold. Contrnband is alse a term ajpied to designate that clasa of commodities whick neutrals are not allowed to carry during war io a belligerent power. It is a recognized general principle of tho law of nations, that ships may sail to and trade with all kingdoms, countrics, and states $\ln$ peace with the princes or authorities whese flags they bear; and that they are not to be molested by the alips of any othe power at war with the country with which they are trading, unless they engage in the conveyance of contrabaid goods. Hat great ditfleulty has arisen in deciding as to the goods comprised under this term. The reason of the limitation suggest, however, the epecies of articles to which it principally applies. It is indispensable that those who profesa to act upen a princlile of neutrality, should carefully abstain from doing suy thing that may discover a lias in favor of cither party. Hut a liation whe should fornish ese of the belligerents with supplltes of Narlike atorez, or with supplies of any artiche, without which that belligerent might not lie able to carry on the contest, would obviously forfeit her neutral character; and the wher belligerent wouhl be warranted in preventing such succors from bolngs sent, and confiscating then ns lawful prize. All the best writers on fiternctional law admit this prineiple; which, besiles being enforced during erory contest, has been sanstioned by rejeatel treutics. In order to obviate all disputes as to what commodities should lee deemed contraband, they have sometimes been specified in treaties ur conventions. (See the references in Iamphent De'Commercio de Dopoli Drutrali, § 9. .) But this classification is not alwaya respected during hostilities; and it is sufliciently evident that an article which uight not be contraband at one time, or muder certalin circumstances, may lecome contrahaml at another time, or under dilferent circumstances. It is allmitted on all hands, even ly. M. Jubner, the great advocate for the fruedom of neetral commerce (le le Suisie des bitimens Neutres, tom. 1. p. 143), that every thing that inay be made dircetly aroilnble for laostile purpeses is contraband, as arms, ammunitlon, horses, timber for ship-building, and nll swrts of naval atores, The greatest difticully has oecurred in ilechling as to provisions, which are sometiner held to be contrabanl, and somethes not. Jord Stowell has ahown that the character of the port to which tha provistuns are deathed, is the principal circumstance to be attenced to In deciling whellier they are to be looked upen as contraband. A curgo of provisions intended for an enemy's port, in which it was known that a warlike armament was in preparation, would le liable to arrest and confacation; while, if the same cargo were intended for a port where hute lint merclontmen were
fitted ont, the most that could be done would be to detain it, paying the neutral the samo price for it he would have got from the enemy.

Contraband of War. "Queatlons of contraband were much discussed during the continuance of eur neutral character, in the furious war between England and France, commencing in 1793, and the United Statea professed to be govarned by the modern usage of nations on this point. The national convontion of France, on the 9 th of May, 1793, decreed, that neutral vessels lacien with provisions, deatined to an enemy ${ }^{2}$ s part, should be arrested and carried into France, and one of tha carliest acts of England, in that war, was to cletain all neutral vessela going to France, and taden with corn, meal, or tlour. It was insisted, on the part of Fugland, that, by the law of nations, all provisions were to be considered as contraband, in the case where the depriving of an enemy of those aupplies was one of the means employed to reluce him to reasonalile terms of peaca; and that the actual situatlon of France was such as to lead to that niode of distressing her, inasmuch as she had armed almest the whole laboring class of her people, for the purpose of commencing and supperting hostilities against all the geveruments of Eiurope. This claim on the part of England was promptly and perseveringly resistad by the Vnited States; and they contended that corn, flour, and meal, leling the produce of the suil and labor of the country, were not contraband of war, unless enrried to a place wetually invested. The treaty of commerce with lingland, ju 17at, in the list of centrabaud, statell, that whatever materials served directly to the building and equipment of vessels, with the exception of unw rought iron and tir planks, should be considered contrabanil, and linble to contiscation; but the treaty left the yluesthon of provisions open and unsettled, and weither power was t:derstood to have relinetuished the construction of the law of rathens which it hat assumed. The treaIy admitted that provisions wero not gemerally contruband, but might become so according to the exinting law of nations, an certaln cases, and those cases were not definet.
"It was only stlpulated, by way of relasation of the penaltv of the law, that whenever provisions were contrabane, the eaptors or 'isir goverument should puy to the owner the full value of the artieles, together with the freight and a reasomalle protit. Our government has reparedly admitted that, ar far as that trenty emmerut"il contrahand articlen, it was dedaratory of the law of mations, nud that the treaty conceded nothing on the subject of contraband.
"The doctrine of the Einglinh admiralty on the subject of provisions being considered conimband, was laid down very fully and elearly in the case of the Jompe Margoretha. It was there observed, that tho: eatulogue of contraband had varied marh, and sometimes in aurlo a manmer us to make it diflicult to assign the reasons of the variations, owing to particuiar circumstances, the history of which hail not arcompanien the history of the dwisions. In 163 , certuin articles oí provisions, as érn, wine, and oil, were demed contrabund, accordling to the juldinent of a jurson of great Know ledge med expericuce in the practice of the admiral:y ; and, in much later tinnes, masy oflier sorts of proviskos lume been condemarel as coutrahand. In $17.17^{3}$ and $1: 4 x$, butter and salted ilsh and rico wive condemned as rontraband ; and those cass's chow that artictes of human food have been conshidered as montriband when it was prohmble they were lutended for maval or military une. The modern establinhed rulo is, that provisions aro not generally contrabumd, lut may hecome so under clrcumatances arising ont of the particular altuation of the war, or the comdition of the parties engaged ta it. Among the circumatancera whith tond to preserve provisions from being liable to he trouted ne contrahmal, one is, that the." are the growth of the eountry which exports theil. Asother eircunstance
to which nations, manufact ence, tho out of it orably co sidered a to an ene of it for $:$ is, wheth use of life they wer milhary which the If the por the artiel a ship of if the gre Brest in of a port sumed the though it applied to ascertain usus, it is i use from $t$ tion of a nilitary 1 when the $n$ was notori articles wo l'hese d sentially $t$ Congress i to whomsot necessaties calonies, sl They were Court of $t]$ and feel the party to a cen, a neut in the aet o ish armies being nentr country, m military or observed, t1 jons wero become so war, or on for the orili mere not o for the arm militury or were the g for the cne band, and er navy we rect interp,
"This et seots, and flided to juro royage of the intlle tion "It wast le contraba ments of wa In the rema from time $t$ not Indeed I, in the applis to meret the are at once tion to the c the practice ing provisio
to which some indulgence is shown by the practice of nations, is when the articles are in thelr native or unmanulaetured state. Thas iron is trested with indulgonce, though anchors and other instruments fabricated cot of it are directly contraband. Hemp is more favorsibly considered than cordage, and wheat ls not considered as so oljjectionable a commodity, when golag to an enemy's country, as any of the final preparations of it for human use. The most important distinction is, whether the articles were intended for the ordinary use of life, or even for mercantile ship's nse, or whether they were golng with a highly presiable destination to military use. The nature and quality of the port to which the articles are going is not an irrational test. If the port be a general commereial one, it is presumed the articles are golng for civil use, though occasionally a ship of war may ho constructed in that port. But If the grent predominant eharacter in thut port, like Brest in l'rance, or lortsmouth in lingland, be that of a port of naval military equipment, it will be presmacd that the articles were going for military use, although it is possible that the articles might have been spplied to civil consumption. As it is impossible to oscertaia positively the tinal use of an article ancipitis usus, it is not an injurious rule which deduces the tinal use from the immediate destination; and the presumption of a hostllo use, founded on its destinetion to a military port, is very much inflamed, if, at the time when the articles were going, a considerable armament was notoriously preparing, to which a sujply of those articles would be eminently useful."
These doctrines of the Jinglish prize law were essentially the same with those adopted by the American Congress in 1755 , for they declared, that all vessels, to whomsoever belongiag, carrying provisions or other necessaries, to the liritish army or mavy within the colonies, shoukd bo liable to scizure and contlseation. They were likewise fully adopted by tho Supreme Court of the Cuted States, when we cane to know and fet the value of helligerent rights, by hecoming a party to a maritime war. In the case of the Commercen, a nentral vessel, captured by one of our cruisers in the act of carrying provisions for the use of the British armies in spain, the court held, that provisions, being nutral property, but the growth of the enemy's country, aul destined for the supply of the enemy's military or naval foree, were contrabual. 'l'he court observed, that, by the mudern law of nations, provise ions were not generally contraband, but they might becono so on accomit of the particular situation of the war, or on meiomit of their destination. If destiaed for the ordinary use of life in the 'nemy's conntry they nute not contraband, lint it was otherwise if destined for tho army or navy of the enemy, or for his ports of ailiary or naval equijment. And if the provisions were the growth of the enemys country, and destined fot the enemy's use, they welo to be treated as contraband, and liable to forfuitu e, even though the army er nayy were in a neutral prert, for it would be a direct interposition in the war
"This case followed the decisions of Sir Willian Scot, and carrided the doctrine of contralmend, as appiicd to provisions, to as grat an extent. It held the royage of the swrilish neutral so illegal as to deserve the intliction of the pualty of loss of freight.
"It was the usis belliri whidh determined an article to be contrahand ; and us articles come linto use us intobmeats of war which were before innocent, there is truth In the remurk that as the means of war vary nat shift from time to then, the law of nations shifts with them; not inded lig the clange of prineiples, but by a change in the application of them to new cases, nint in order to met the varying inventions of war. When goots are ot onco clearly shown to be contraband, contiser. tion to the captor is the natural conseqronce. This is the prartice in all cases, as to the aiticle itself, excepting provivions; and us to them when they heome con-
traband, the ancient and atrict right of forfeiture is softened down to a right of pre-emption on ressonable terms. But, generally, to stop contraband goode would, as Vattel observes, prove an ineffectual relief, especially at sea. The penalty of confiscation la applied, in order that the fear of loss might operste as a check on the avidity for gain, and deter the neutral merchant from supplying the enemy with contrahand articlea. The ancient practice was, to seize the contraband goods, and keep them on paying the value. But the modern practice of confiscation is far more agrecable to the mutual dutles of nations, and more adapted to the preservation of their rights. It is a general understanding, grounded on true principles, that the powers at war may seize and confiscate all contraband goods, without any complaint on the part of the reutral merchant, and without any imputation of a breach of neutrality in the neutral sovereig a! 'mself. It was contended on the part of the French nation in 1706, that neutral govermments were bound to restrain their subjects from selling or exporting articles contraband of war to tho belligerent powsrs. But it was successfully shown on tho part of the Etited States, that neutrals may lawfully sell, at home, to a belligerent purchaser, or carry, themselves, to the belligerent powers, contrahand articles sulject to the right of seizure, in tronsitu. This right has since been explicitly declared by the judicial autherities of thls country. The right of the neutral to transport, and of tho lostile power to seize, are conflicting rights, and neither party can charge the other with a criminsl act."--Kenr's Commentaries, Leet. VIII.

Contraband articles are sald to be of an infectious nature, and they contaminate the whole cargo belonging to the ssme owners. Jy the ancleat laws of Europe, the ship also was lialile to contemnation when captured. But the modern view, since Grotius, is milder, and latterly the ship is liable to confiscation, and when fraud is detected, the innocent portions of the eargo are also liable.
liy the ancient law of Europe, a ship conreying any contraband article was liable to confiscation as well as the articis. But in the modern practice of the courts of admi. nlty of this and other countries, a milder rule has been ailopted, and the carriage of contraband articles is attended only with the loss of frelght and expenses, unless when the ship lielongs to the owner of the contraband cargo, or when the simple nisconduct of conveying such a cargo has been connected with ot her malignant and nggravating circumstnnces. Of theso a ialse destination and false papers are justiy held to he the worst.-(5 Roninson's Almivaity R'ports, 275.) The right of visitation and seareh is a right inherent in all belligerents; for it would be absurd to allege that they had a right to prevent the conveyance of contraband goods to an enemy, and to deny them tho use of the only means hig which they can give ethect to such right.-(VATTE, book iii. c. \%. § 114.) The olject of the seureh is two-fold: first, to useertaln whether the ship is nentrul or an enemy, for the circumstance of its hoisting a nentral flag allords no security that it is really such: and, secondly, to ascertain whether it has contraband articles, or enemies' property, on board. All nentral ships that would havigate sceurely during whr must, consequently, he provided with passports from their government, and with all the papers or doemments mecessary to prove the property of the ship nud cargo; and they must carofully noold taking uny con-trat-und artieles or belligerent jroperty on hard; and bence, as lampredi has observed, a merchant ship which seeks to a voith is exarch .. . crowding sall, or by open force, may justly be captured and suljected to confiscation.

It has, inderd, been often contended that free shins make, free goods (yue le parillon courre ho marchandise), and that a ledligerent is not warranted in seizing the property of an enemy in a mentral ship, unless it be
contraband. The discussion of this important question would lesd us into details which do not properly come within tho scope of this work. Wo may, however, shortly observe, that no such privilege could ioo conceded to neutrals, without taking from belligerents the right, iuseparable from a state of war, of seizing an enemy's property if found in places where hostilitier may be lawfully carried on, as on tho high seas. In fact, were the principle in question admitted, the commerce of a belligerent power with its colonies, or other countrles beyond the sea, might bo prosceuted in neutral ships, with as much sccurity during war as in peace; so that neutrals would, in this way, bo anthorized to render a belligerent more important assistanco than, perhaps, they could ha 4 done had they supplied tim with troops and ammunition! But it is surely unneceasary to say, that to act in this way is a proceedin's altogether at variance with tho idea of neutrality. Neutrals are bound to conduct themselves in the spirit of impartiality, and must not afford such aid or assistaneo to one party as may ho better enablo him to make head against the other. It is their duty "non interponere se bello, non hoste imminente hostcm eripere." And yet it is manifest that tho lending of neutral bottoms to carry on a belligerent's trado is in direct contradiction to this rule. The ships or cruisers of a particusar power may have swept those of its enemy from the sea, snd reduced him to a state of great difficulty, by putting a stop to his commerco with foreigners, or with his own colonies; but of what consequenco would this be if nentrals inight step in to rescue him from such difficulties, by earrying on that intercourie for him which he can no longer carry on for himself? It is nstural enough that such a privilege should be coveted by neutrals; but, however advantageous to then, it is wholly subversive of the universally admittea rights of belligerent powers, as well as of the principles of neutrality; and can not, therefore, be truly said to be Lottomed on any sound prituciple.
In the war of 1756 , the rule was laid down uy Great Britsin, that neutrale are not to be allowed to carry on a trade during war that they were exeluded from during pence; so that, supposing a nation at war vith Great Britain lad, while at peace, prohibited foreigners from engsging in her colonial or consting trade, neutrals would not have been permitted to engago in it during war. 'This rule has been much complained of ; but the principle on whieh it is founded seems a sount one, and it may in most cases be safely adopted. The duims of neutrals eau not surely be carried farther than that they should be allowed to carry on their trate during war as they had been accustomed to carry it on thring peace, except with places under blockade; but it is quite a dlfferent thing when they daim to bo allowed to employ themselves during war in a trade in which they hai not previously any right to engnge. 'To grant them this, would not be to preserve to them their former rights, but to give them new ones which may be fairly withheld. Suppesing, however, that either of the belligerent powers has forco sufficient t" prevent any intercourse betwein the oher ant its colomiss, or any interconrse beficeen lifferent ports of the other, she misht, in the exercise of the legitimate rights of a belligerent, exclude neutrals from such trade, even though it hat formerly been open to them; becanse otherwise she would bo deprived of the advantage of her superior fore: and the neutrals would, in fact, when employed in this way, be acting as the most eflicient allies of her enemy.

For a full discussion of thle Important and diflicult questlon, and of the various distinctions to whicis it gives rlse, see tho work of Hubuer (I)e la suisie des Batimens Neutres, 2 tomes, 12110,1767 ), in which tho difforent arguments in favor of the primelple that "the thag covers the cargo," are stated with great pernpienlity and talent. The opposite principie has been advocated by Lampredi, in lifs very abio trratise lhel Com.
mercio de' Pcpoli Neutrali, § 10; by Lord Liverpool, in his Discourse on the Conduct of Great Britain in respect to Neutrals, written iu 1757 ; and, nbove all, by Lord Stowell, in his justly celebrated declaions in the Admiralty Court; and Kenx's Commertaries, Lect. 111. Martens incllnes to IIubner's opinion.--See Précis du Droit des Gents, liv. vili. c. 7.

Contracts. An exccutory contract is an agree. ment of two or moze persons, upou sufficient consideration, to do or not to do a particular thing. The agreement is elther under seal or not under seal. If under seal, it is denominated a speciality, and if not under a seal, an agreement by parol; and the latte: ineludes equally verbal and written contracts not under seal. Tho agreement convers an interesteither in possession or in action, If, for instance, one person sells and delivers goods to another for a price paid, the agreement is executed, and becomes complete and absolute; but if the vendor agrees to sell and deliver at a future time, and for a stipulated price, and the other party to accept and pay, the contract is executory, and rests in action merely. There aro also express and implied contracts. Tho former exists when tho parties centract in express words, or lyy writing ; and the latter are those contracts which the law raises or presumes, by reason of some value or service rendered, and beeanse common justice requires it.

Every contract, valid in lav, is mado between par. fics having sullicient molerstanding and age and freclom of will, and of the exerciso of it, for tho given case. If the contract be entered into by meaus of violenee offered to the will, or under the influence of undue constraint, the party may avoid it by the plea of duress; and it is requisite to the validity of every agreement, thet it be the result of free and lona jide exercise of the will. Nor will a contraet be valid if obtained byy mis. representation or concealment, or if it be founded in mistake ns to the subject matter of tho contract. A contruct, valid by the law of the place where it is made, is generally speaking valid every where, jure gentiom, and ly tacit consent.

The lex leci contivetus controls the anture, constraction, and validity of the contract ; and on this broad fumbation the law of contracts, founded on necessity and commurcial convenience, is said to have been originally ecablished. If the rule were othe -wise, the citizens of one cotmiry could not safcly contract, or carry on commerce in the territories of another. 'The necessary intercourse of mankind requires that the acts of parties, valid where made, should be recognized i:l other comntries, provided they be not contrary to food morals, nor repugrant to the policy and positive institutions of the state. Partics are presumed to centract in reference to the laws of the country in which the contract is made, and where it ls to be paid, unless otherwise expressed. Ilut if a contract be made under one government, and is to he performed mader mother, and the parties had in view the haws of such other country in refirence to the execntion of the contract, tho general rule is, that the contract, is respect to its construction and force, is to be governed by the law of the country or state in which it is to be executed; the foreign law is in such cuses adopted and etfect given to it. Thus, the doys of grace allowed upen bilis of exchange are to be completed ncrorling to the usage of the place in which they are to bo paid, and not of the phace in which they are drawn, for that is presumed to have been the intention of the pretles.

It is essential to the valldity of a contract that it he fombed on a sumeient consideration. It was an eariy prinelple of the common law, that a mere voluntary aet of courtesy would not upheld an assumpsit, but a courtesy alown by a prevlous request would suphert it. There must be something given in exchange, something that is mutnal, or something which is the inducement to the contract, and it must be a thing which is lawful and competent In value to sustain the
sssumption to the rali and agreen bills of exc leen negot cent indors are affected as to third paper in th origianl de be alleged.

assumption. The rule, that a consideration is necessary to the validity of a contract, applies to all contracts and agreements not under seal, with the exception of bills of exchange and negotiable notes after they have been negotiated and passed fato the hands of an innocent indorsee. The immediato parties to a bill or note sre affected by tho want of consideration, and it is only as to third persons, who come to the possession of the paper in the usual course of trade, without notice of the original defect, that the want of consideration can not be aileged.

Of the Contract of Sale.-A sale is a contract for the transfer of property from ono person to another, for a valuable consideration; and three things are requisite to its validity, viz.: the thing sold, which is tho olject of the contract, the price, and the consent of the contracting parties. The thing sold must have an actual er potential existence, and be specific or identified, and eapable of delivery, otherwise it is not strictly a contract of sale, but n special or executory agreement. If the subject matter be in existence, and only constructively in tho possession of the seller, as by leeing in the pessession of his agent or carrier abroat, it is nevertheless a sale, though a conditional or imperfect une depending on the future actual delivery. But if the artiele intended to be sold has no existence, there can be no contract of sale. Thus if $\mathbf{A}$ sells his horso to 1 , and it turns out that the horse was dead at the time, thought tho faet . contract is necessaril-
; bown to the parties, the
The price is $n n$ essential ingredient in the contract of sale; and it must be real and not merely nominal, and fixeci, or bo susceptiblo of being aseertained in the mode prescribed by the contract, without further negotiation between the partics. Mutual consent is requisits to the creation of the contract ; and it becomes binding when a proposition is made on one side and accepted on the other; and on the other hand, it is no contract if there be an error or mistake of a fact, or in circumstanees geing to the essence of it. In creating the contract the negotiation may be carried on by mail; and the contract is complete when tho nuswer is sent with all due diligenee after the receipt of propossi, and is ont of the control of the party accepting.
In every sale of a ehattel, if the possession be at the time in anotiser, and there be no warranty of title, the party buys at his peril. But if the selier has possession, and he sells as his own and not as agent for another, and for $n$ fair price, he is understood to warrant the title. With regard to the quality, the seller is not bound to answer unless he expressly warrants, or unless he inas made a false representation or concealment. The rommon law requires the purchaser to attend to the qualities of the artiele he buys, which are supposed to lef within tho reach of his observation and juigment, sad which it is equaily his interest and duty to exert.
When the groets are discovered to be unsound the purchaser ought immediately to give notico or return them, and therely rescind the contract. In the enso of brach of warranty, he may sue unon it withent returuing the geods; but he nust return them aud rescind the contract before he ent maintain an action to recover the priee. Jic ean not denl with the goodis after discovery of frund in a sale, withont losing his right of netion.
If there he intentional concealment or suppression of material fects in the making of a contract, in coses where both parties lave not equal aceess for juformntion, it wili bo deened unfuir dicaling, and wijk vitiate the contract.
Winn the bergnin is completed, hy the terms of aslo being agreed mpon, the contrnet hecomes binding between the partios nuld without netnal dellivery of goods, and the property is nt the risk of the buyer; and he is entitied to the goods en paynent of priee when no contitions have been made. Specinl conditions may be made as to risk, time of tellivery, credit, \&e. In the
first instance to make the contract valid, there must be a delivery or tender of payment, or earnest given, or a memnrandum in writing signed by the purchaser. When goods are to be delivered, delivery to an agent, carrier, or master of a vessel is equivalont to delivery to purchaser. The delivery to agent or carrier must be such as to create responsibility in that agent or carrier, and if insurance is the usage it ought to be done, and also the buyer informed, with diligence, of consignment and delivery. Symbolical delivery will, in many cascs, be sufficient, such as transfer of key of warehouse from seller to buyer, or putting private mark by buyer upon the goods. Unless time and place are specified, the common rule is eash payment and place where 'hey are at time of sale.-KENT's Commentaries, Lect. XXXIX.

Convoy, in navigation, the tern applied to designate a ship or ships of war, appointed by government, or by the commander-in-ihief on a particular station, to escort or protect the me'chant ships proceeding to certain ports. Convoys a:e mostly appointed during war; but they aro sometimes also appointed during peace, for the security of ships navigating seas infested with pirates.

Individuals lar atways been left to themselves to judge as to the expediency of sailing with or without convoy. The fovernments ; f most maritime states have thought proper, when they were engaged in hostilities, to oblige their subjects to place thenselves under an escort of this sort, that the enemy might not be enriched by their capture. Acts to this effect wers passed in Great Britsin during the American war and the last French war. The last of these acts ( 43 Geo. III. c. 57) enacted, that it should not be lawful for any ship belonging to any of his majesty's subjects (except as therein provided) to depart from any port or place whatever, unless under such convoy as should-be appointed for that purpose. The master wns required to use his utmost endeavors to continue with the convoy during the whole voyage, or such part thereof as it should be directed to necompany his ship; and not to sepnrato therefrom without leave of the commander, under very heavy pecuniary penalties. And in cass of any ship departing without convoy contrary to the act, or willfully separnting therefrom, sll insurnnees on the ship, cargo, or freight, belonging to the master, or to any other person directing or privy to such departurc or separation, were rendered null and voill. The customs officers were directed no to allow any ship that ought to suil with convoy to clear out from any place in the United Kingdom for foreign parts, without requiring from the master bond with one surety, with condition that the ship should not depart withont convoy, nor afterwaril desert or willfully separate from it. The regulations of this act did not extend to ships not requiring to be registered, nor to those licensed to sail without convoy, ner ro those engaged in the coasting trade, nor to those belonging to the East India Company, ete.

It is very common, during periods of war, to mnke sailing or departing with corroy n condition in policies of insurance. This, like other warranties in a poliey, must he stricrly performed. And if a ship warranted to sail with conroy, snil withont it, the policy becomes roid, whether this be imputable to any negligence on the part of the insureil, or the reriusal of government to appeint a convoy.

There aro five things ossentinl to sailing with convoy, viz. : first, it must he with a reguinr cenvoy under nn ollicer njpointed ly government; accondly, it must be from tho place of rendezvous appointed by government ; thirdly, it must be a convoy for the voyage ; fourthly, the master of the ship must have aalling instructions from the commanding oflleer of the convoy; and fifhly, the ship must depari and continue with the convoy tili the ead of the voyage, unless separated by neeessity.

With respect to the third of these conditions we may obacrve, that a warranty to sail with convoy generally means a convoy for the royage; and it is not neceasary to add the words "for the voyage" to inake it ao. Neither will the adding of these words in some instances make the omission of them In any case the ground of a different construction. A warranty to sail with convoy does not, however, uniformly meen a convoy that is to act mpany the ahip insured the entire way from the port of departure to her port of destination; but auch convoy as government may think fit to appoint ns a sufficient protection for ships going the voyage insured, whather it be for the whole or only a part of the voyage.

Sailing instructions, referred to in the fourth condition, are written or printed directions delivered by the commanding officer of the convoy to tho saveral masters of the ships under his care, that they may understand and answer signals, and know the place of rendezvons appointed for the fleet in case of dispersion by storm, or by an enemy, ete. Those sailling instructions are so very indispensable, that no vessel can havo the fill protection and benefit of the convoy without them; hence, when, through the negligence of the msster, they are not obtained, tho ship is not said to have sailed with convoy; and a warranty in a policy of lasuranco to that effect is held not to be complied with. If, however, the master do all in his power to obtaln sailing Instructions, bat is prevented from obtaining them by any insuperable obstacle, as the badness of the weather, or if they be refused by the commander of the convoy, the warranty in the policy is held to be complied with.

For further information as to convoy, see Anbot on the Law of Shipping, parı ii. c. 3; Miamsitals, on Insurance, book i. c. 9 § 5.

Cook, Captain James. This celebrated navigator was born at Marton, near Stockton-on-Tees, October 27, 1728, nud was originally apprenticed to a merehant in lorkshire; but having a stroug predilection for a sailor's life, ho sacceeded in obtaining bis discharge, and immediately entered into new indentures with some coal shippers in tho same county. In their omploy he became a good seaman, and was promoted to mate, but subsequently entered the liritish navy as volunteer. In 1755 he was a!pointed to the mastership of a sloon, nul joined the fleet operating agalust the Vrench, in the St. Hawrence. His judgment, lravery, and great skill in conducting hydrographle surveys, gained for him a lasting reputation and Incrensing honors; and in 176.1 he was appointed marine surveyor of Newfoundland and Labrador. In 1767, on the recommendation of the Royal Society, he was aent to the South "nelfic to olserve the appronching transit of Venc. ""1" . \& aceompanied by Messrs. Green, Solander,
Banks. All the jt [afterward Sir Joseph] were successfully observed at Otaheite, June o,

Cook then sailed in quest of tho supposed south. a continent, circummaviguting New Zealand, and after other scieatific observations he crossed to Batavia, and thence returned to Fingiund in the summer of 1771, vad was promoted nhortly after. In July, 1772, ho commenced bis second vosage, which lasted three years, when he was ralsed to a post-captaincy, with n lucrativo appolntment in Girenwich llospital. In 1770 ite volunter red to lead the seientifie expelition to determine the problem of a northwest passage between tho Atlantic and l'ucltic oceaus, nud running from the Cape to New Zenlund, and thence through the Pacific, he diseovered the Sandwich Islands, which he left for further olsservations, returning, however, to winter at Owyhse. An unfortunate uleunderstanding botween some of hls poople and the natives terminated in a fray, in which Cook was killed, after a desperate realstance, Fobruary 11, 1779.
Cooperage. This art must be coeval with the dswn of hiatory, and seems to have been early known
in every country. The coopers of London were incorporated in 1501.

Copal, a resin which exudes apontaneously from two trees, the Rhus copallinum, and the Elaocarpus copelifer, the first of which grows in America, and the second in the East Indlea. A third specles of copaltree grows on the coasts of Guinea, especially on the banks of some rivers, among whose sands the resin is found. It occurs in lumps of various sizes and of varions ahades of color, from the palest greenish yeliow to darkish brown. Its specific gravity is fourd to vary in different apecimena from 1.059 to 1.071 , being intermediate in density between its two kindred resins, animed and amber. Soms rate its specilic gravity so high as $1 \cdot 139$, which is probably one of the errors with which chemical compilatons teem. Copsl is too hard to be scratched by tho nail, whence the excellence of its varnish. It has a conchoidal fracture, and is without smell or taste. When exposed to heat in a glass retort over a spirit lamp, it readily melts into a liquid, which belng further heated bolls with explosive jets. A viscid, oily-looking matter then distills over. After continuing the process for sone time, no succinic acid is found in the receiver, but the copal blackens in the retort. Anhydrous alcohol boiled upon it canses it to swell, and tranaforms it ly degrees into an elastic, viscid substance. It is not soluble in alcohol of 0.825 at the boiling point, according to experiment. Copal dissolves in cther, and this ethercous solution may be mised with alcohol without decomposition. Caoutchoucine acts very slightly upon it by an experiment, even at the boiling temperature of this very volatile fluid; but a mixture of it with alcohol of 0.825 , in equal parts, dissolves it very ruplilly in the cold into a perfectly liquid varnish. Alcohol holding camphor in solition also dissolves it, but not nearly so well as the last solvent. According to Unverdorben, copal may be complete!y dissolved by digesting one jart of it for 24 hours with one part and a half of alcoliol (iprobably anhydrous), lecenuse that portion of copul which is insoluble in alcohol dissolves in a very concentrated solution of the soluble portion. Oil of petroleum and turpentine dissolve only one or two per cent. of raw copal. Hy particular management, Indeed, oil of turpentine may bo combined with copal.
lused copal possesses different properties from the substance in its solid state; for it then may be made to combine both witlı alcohol and oil of turpentine.

Unverdorben has extracted from the copal of Ifrica five different kinds of resin, none of which has, hewever, been appled to any hise in the arts.

Tho altimate constituents of eopal by an amalysis are, carbon 79.87 , hydrogen $9 \cdot 00$, oxygen $11 \cdot 1$; being of hydregen $7 \cdot 6$ In excess niove the gunntity necessary to form water with tho oxygen.

Much information has been received from various sources concerning this somewhat ill-understood prodnet of late years. It is now known that there are three different tinds of copal lin commerce, hat nething is known of their distingulshing characteristics. We have last Indian and West Indian copal, and, ander the latter nome, two very different aulistances. The Eist Indian, ealled also African, la more colorless, suft, and transparent than the others; it forms in line surface, and when heated emits an ngrecable odor. It furnishes the flnest vamish. Fresh essence of turpentine tissolves it completely, hut not ohl. Vissence ligested upon sulphur will dibsoive doublo its own weight, withont letting any full. Fresh rectified oll of rosemary will dissolva it in any propurtion, lut if the oit is thickened by ago it serves only to swell this copal.

When enutiously melted, it niay bo then dlasulved in good easence of turpentine in any proportion, jro* dueing a flun varnish, of little color.

A good varalsh may bo made ly dissolving one part of coplal, one of essence of rosemary, with frum two to three of pure alcoliol. Thia varnish sheuld bo
applled hot, durable.

Heiglts an
applied hot, and when cold becomes very hard and durable.

The West India species, or American, comes, noi in lumps of a globular form, but in small lat ${ }^{\text {s iugmencs, }}$ which are harl, rough, and without tasue or amell. It is usually yollow, and never colorless iike the other. Insects are very rarely found in it. It is also found in the Antilles, Mexico, and North America. It wili not dissolve in essence of rosemary.

The third kind of copal, known also as West Indian, was formerly sold as a product of tho East Indies. It is found in fragments of a concavo-convex form, the outer covering of which appears to have been removed. It contains many inseets. When rubbed it emits an aromatie odor. It gives out much ethereous and empyremmatic oll when melted. It forms a soft varnish, which dries slowly.

Fusel oil, or amyle spirit, has been lately used as a solvent of the hard copal; bnt it does not dry into a very solid varnish.
Copal varnish was first discovered in France, and was long known by the name of rernis martin. It is applided to snuff-boxes, tea-boards, and other utensils. It preserves and gives lustre to paintings ; and contributes to restore the decnyed colors of old pictures, by filling up eracks, and rendering the surface capable of reflecting light more uniformly. Copal is liable to be confounded with gum anime, when the latter is very clear and good. But it is of importance to distinguish between them, as the anime, thongh valuablo os a varnish, is much less so than the finest copal ; the varnish with the former being darker colored, and not so hard. Besides the extornal nppearance of ench, which is pretty distinct to a practiced eye, the solubility in alcohol furntshes a useful test, the animé being readily soluble in this fluid, whlle tho copal is herdly affected by it ; copal is also brittle between the tecth, whereas anime softens in the mouth.-Rees' Cyclopedia; Une's Dictionary, ctc.
Copeck (kopeika), a Russian copper coin, so called from the impression of St. George bearing a lunce. A huadred of them make one ruble. The value of the copper coin, compared with the assignation-ruble, vnLies in the different governments.
Copenhagen, the capital of Denmark, on the east coast of the island of Zealand, in the channel of the llaltic enlled the Sound: lat. $65^{\circ} 41^{\prime} 4^{\prime \prime}$ N., long. $12^{\circ}$ $33^{\prime} 46^{\prime \prime}$ E. Population, in $1815,126,787$. It is a wellbuilt, handsome city. In going into Copenhagen, the course is leetween the buoy on the Stublen llank to the left, and the buoy on the Mildle-grounds, and those in advance of the three Crown batteries on the right, westronthwest by compass. lirom the three C. swas to the roads the course is south-southwest. The water in the chanel is from six to four fathoms deep; but it is narrow, and the mavigation rather diffentt. There is no obligation to take a pilot on hoard; lant If a vessel wish for one, she inay heave to abreast of tho hattery, when be will come to her, Vessels not intending to come into harbor bring up in the ronds, at from a quarter to half a mile from shore, fil about four fathoms, the town bearing south-southwest. In the harbor, within the boom, the water is from 17 to 18 fect deep. Vessels in barbor load anil miload alongside the quay. The anchorage in the roads is good and safe,
Money.-Accomats are kept in rix dollars of 6 mares, of 96 skillings ; the rix dollar being formerly worth nbout $4 s$. 1d. sterling. Ilut in 1813, a new monelary system was adoped, necording to whieh the new or mightome dollar is worth $2 s, 3$ fid, being half the value of the uld specio dollar, and of the old current dollar. Bat the money generally used in commercial tranaace tions is bank monoy, which is commonly at a henvy discount. The per of exchange, estimated by the Rlgras bank dollar, would le 8 dollars $7 \cdot 6$ skillings per pound sterling.
lieights and Measures --Tha commerelal welghts
are, 16 pounds $=1$ lispound; 20 lispound $=1$ shippound; 100 llss. $=1104$ lbs. a voirdupois $=134$ lbs. Troy $=101 \mathrm{llss}$. of Amsterdam=103 lhs. of Hamburg.

The liquid measures are, 4 ankers $=1 \mathrm{ahm}$ or ohm; $1 \frac{1}{4} \mathrm{ahm}=1$ hogshead; 2 hogsheads $=1$ pipe; 2 pipes $=1$ quarter. The anker $=10$ (very nearly) English wine gallons. A fuder of wine $=930$ pots; and 100 pots $=25 \frac{1}{2}$ wine gallons.

The dry measures are, 4 viertels $=1$ scheffel ; 8 scheffels $=1$ toende or ton; 12 tons $=1$ last $=47 \frac{1}{3}$ Winchester bushels. The last of oil, butter, harrings, and other oily substances should weigh 224 llos. net.

The measure of length is the Rhineland foot $=12 \frac{1}{2}$ inches very nearly. The Danish ell $=2$ feet; 100 ells $=68$ English yards.

Trade of Copenhagen.-The trade of Copenhagen has latterly increased considerably, particulanly the grain trade with England. At the commencement of 1852, 297 merchant vessels of about 35,000 tons burden belonged to the port. The harbor is large and commodious, capable of contalning 500 merchant vessels besides the navy; and by the aid of canals, large vessels can com almost to the centre of the town. The entrance is commanded by the powerful batteries of Trekroner and Sextus. The principal imports are timber, piteh, and tar, chicfly from Norway and Sweden; fiax, hemp, masts, saileloth, and cordage, from liussia; tobacco from America; wines and brandy from France; conl, earthenware, Iron, steel, and salt from England; and West Indin produce. The principal exports are corn, raje-seed, butter, cheese, beef, pork, horses, cattle, wool, hides, skins, bones, grain-spirits.
The manufactures of Copenhagen are not important, but are making considerable advances. There are extensive eloth and ealico factories, founderies, and ironworks; nlso breweries, distilleries, tanneries, sugar-refincries, etc. Piano-fortes, elneks, watches, surgieal and mathementical instruments, tobacco, chocolate, poreclain are among its other productions. The royal China fuctory is celebrated for its models of Thorwaldsen's works in biscult China. The population of Copenhagen was in $1769,92,571$; in 1801, 100,975; in 15:14, 119, 292; in $18.10,120,819$; in $1845,126,787$; and in $1855,143,591$; of which last about 67,000 were mnles, a :d over 76,000 females, including a Jewish propulation of 2500 . The climate is damp, ehangeable, and unhealthy; which, added to the almost total want of sanntory regulntions, reuders the mortality greater here, it is sald, than in any other town of Europe with the exception of Vienna.

The Port Charges at Copenhagen vary according as the vessel has come from this or the farther side of Cnpe Finisterre, or from the Indian seas; ns she is wholly, or only part loaded; and as she elears out with goods that have heen in transitu, and are for the most part frea of daty, or has on board a eargo of uative produce suliject to duty. On a shtp of 300 tons belonging to a privileged nation from this side Cape Finisterre, unloading and loading mixed eargoes in Copenhagen, the different publie charges, Including Sound dues, brokerage, \&e., would exceed $\mathbf{f} 60$; and from tha farther side of Cape lifutsterre, tho charges would be nearly fion. When a ship is not fully londed, lastage money and light dues are only eharged in proportion to the cargo on board. lastage money is not charged on ships ontwarll bou d, laden with transit goods, as tar, pitch, iron, de. Hut notwithstanding these deluctlons, it is obvious that port charges are very heavy, and there can be no dondi that they are a material obstacle to the extension of trade.

Citizenship,-To enable a fordguer to trade as a merelant in l)enmark, he must become a burgher, whleh costs about $\mathbf{f 1 0 0}$, and it will require aboat $\mathbf{f} 60$ more to free him from the ohligation of aerving in the milltin. The obstacles in the way of a forelguer establishlug himaelf in Denmaris is a mannfacturer are much greater, on account of the excluslve privileges
enjoyed by the guilda or corporations into which the principal crafts or trades are divided.

Credit.-Gooda imported into Copenhagen are commonly sold on credit; three moaths is the term generally allowed on moat sorts of goods, and in a few instances six months. The discount for ready money is 4 per cent. Bankruptey ia of rare occurrence.

Insurance.-Mariae insurance is effected, on liberal terms, by a company established in 1746. Many Copenhagen risks are, however, iusured at Amsterdam and Jlamburg. Copenliagen has good building yards, and is $\ln$ all respects an oligible plnce for tho repair of shlps, and for supplying then with provisions:

General Remarks.-On the whole, the commereo of Denmark used to be in a stationary atate; a consequence partly of the peculiar eircumstances uader which the country is placed, and partly of the policy of government. The latter loug exerted itself to bolater up a manufacturing interost, by laying oppressive duties on most species of inanufactured artieles. Even under the most favorable circumstances, such conduct, though it may benefit a few individnals, la sure to be productive of great nationsl loss. But in tho case of Denmark, the cireumatances were such as to render the restrietive syatem peculiarly injurions. AH, or nearly all, the branches of industry carried on in the kiugdom wero subject to the governinent of guilds or corporations; no person could engage in any line of business until he was authorized by its peculiar guild; and as the sanction of thle body was rarely obtained without a considerable sacrifice, the real effect of the system was to fetter competition and improvement, and to perpetuate monopoly and routine. Even the Danish writers acknowletge that such was the influence of the late regulations. "Vos oucriers," say they, "sont chers, traraillent lentement, et sourent mal 't sans gout; leur education est neyligie. On ne les forme point it penser, et l'apprentif suit machisalement ce qu'il roit fuire au mai-tre."- Cutienc, Tablenu des Fitats Danois, tome ii. p. 260. But within the last few years this systen! has been guite changed. Industry has heen emancipated from many troublesome regulations, and moderate duties have heen substituted for prohibitions. Ilnt, however favorably situated in other respects, it would be idla to expect that a country withont waterfalls, and withnit coal, shonid be able to manufacture cottons, woolens, etc., at so cheap a rato as they may be imported from others enjoying greater nutural facilities for their production. The staple business of Denmark, her agriuultural and rural cconomy, has been most materially improved of late years; and, as already seen, her exports of raw produce are now of great value and importar . The trade of the country suffiers from the too great aagnitude of the port dues and of the transit daties; and the Sound duties, being charged on native as well as forelern ahips, operate as an inland duty on trade. Conslderablo improvements have, however, been offected in the commercial legislntlon of the country during the last dozen years, by the opening of the trade to tho East and West Indies, and the abolition and reduction of other regulations and duties; and it may he fairly prestuned that the benefta resulting from these measures will pave the way for the lintrofuction of others of a similnr chnacter. - Sire llexm suk.

Copper (Germ. Krupfer; 1)n. K̈oper; 11a. Kobler; Sw. Kopper; Fr. Cuirve; It. Rame; Sp. Cubre; Port. Cobre; IRuss. Mjed, Krasnoi mjed; l'ol. Mirdin; l.nt. Cuprum; Arab. Sehass; Snus. Thmra), a well-known ractal, so called from its having leeen lirst discovered, or at least, wrought to any extent, in the islame of Cy prus. It is of $n$ tine red color, and has a great deal of brilliancy. Its tasto is styptic and nauseuus; aud the hands, when rubbed for some thme on it, acquire a peeculiar anil disagreeablo odor. It is harder than silver : Its specitic gravity varies according to its state, belug, when quite pure, near $9 \cdot 000$. Its mallenallity is great; It may be hammered out lito leaves so thin as to be
blown about by the slightest breeze. Its ductility is slso considerable. Its tonseity is so great, that a copper wire 0.078 of an inch ia diameter is capable of supporting 802.26 lbs . avoirdupols without breaking. Its liability to oxydation from exposure to air or damp is its greateat defect. The rust with which it is then covered is known by the namo of verdigris, and is one of the most actlve poisons.- 'Inosisox's Chemistry.

It is onc of the six primitive metals; its discovery is said to havo preceded that of iron. We read in the Scriptures of two vessols of fine copper, precious as gold. - Eizra viii. 27. The great divisibility of this metal almost exceeds belief; a grain of lt dissolved in alkali, as pearl ashes, soda, etc., will give a sensible color to more than 500,000 times its weight in water; and when copper ia in a state of fusion, if the least drop of water touch the melted ore, it will fly about like shot from a gun.-Boyle. The mine of Fahlun, in Sweden, is the most surprising artificial excavation in the world. In England, copper mines were discovered in 1561 , and copper now forms an immenso branch ias the British trade.-llayin.

If we except gold and silver, copper seems to have been more carly known than any other metal. In the first ages of the world, before the method of working iron was diseovered, copper was the principal ingredient in all domestic utensils and instruments of war. Even now it is applied to so many purposes, as to rank next, in point of utility, to iron.

Alliys of Copper are numerous and of great value. Those of tin nre of most importance. Tin addel to copper makes it more fusible, less liable to rust, or to be corroded by the air and other common substances, harder, tenscr, and more sonorous. In these respects the alloy has a real advantage over ummixel copper; but this is in many cases more than comnterbatanced by the great brittleness which even a moderate portion of tin imparts; and which is a singular circumstance, considering that both metals are sejparately very matleable.

In a pure state, copjer is a very brilhiant metal, and susceptible of a high polish. It is of a tine red color, differing in this respect from every other metal exerpt titanium. Its sjeecific gravity varies, accoriling to its density, from 8.581 to 8.9 .

Copper alloyed with from 1 to 5 per cent. of tin is rendered harder than before; its color is yellow, with n cast of red, and its fracture granular ; it has considerable malleahility. This uppears to havo been the usaal composition of many of the nneient edged tools and weapons, beforo the meihod of working tron was lirought to perfection. The $\lambda$ a $\lambda$ nog of the tirecks, and perhaps the as of the lomnns, was nothing de. Even their copper coins contain a mixture of tin. The ancients did not, fin fact, possess (as las heen often contemsed) any peeniar process for hardening copper, escept by adding $n$ small quantity of tin. An alloy in which the tin is from $0 \cdot 1$ to one-cighth of tho whole is hard, brittle, but still a little mallealle, close grainet, and yellowith white. When the tin is as mach as onv-sixth of the mass, it is entirely brittle; and continues so in every higher proportion. The ydlowness of thenlloy is not entirely lost till the tin amounts to 0.3 of the whale.
Copjer (or sometimes copper whth a little rine), alloged with as moch tin as will make from ahuat $0 \cdot 1$ to nie-sixth of the $w$ bole, forms an alloy whith is principally empluyal for bells, bruss cannon, hrouze statues, and vurious other parposes. Ience It is eallal hom:e or bell metal; and is excellently fited for the uses to which it is applied, by its harduess, density, sonoronsness and fusibillty. For cannon, a lower proportion of tin is commonly used. According to I)r. Watsm, the metal employed at Woolw leh consists of 100 parts of copper and from 8 to 12 of tin; heme it retains some little malleabillty, and, therefore, is tougher tham It would he with a larger portion of tin. This nlloy belng more sonorous than iron, brasa guns give a loud-

er repert than iron guns. A common alloy for bell metal is 80 parts of copper and 20 of tin ; some artists add to these ingredients zinc, antimony, and silver, in small proportlons; all of which add to the sonorousness ot the cempeund.-See Bel.Lemetal.

When in an alloy of copper and tin the latter inetal amounts co about one-thlird of the mass, the result is a l.eautiful compound, very hard, of the celor of steel, and susceptible of a very fine polish. It is well adapted for the reflection of light for optical purpeses; and is thereforo called speculum metal. Besides the above ingredlents, it usually contains a little arsenic, zinc, or gilver. The application of an alloy similar to the bibove to the construction of mirrors is of great antlquity, being mentioned by Pliny ; who says, that formerly the best mirrors were reckonel those of Brunduslum, of tin and copper mixed (atanno et are mistia). list. Nat, lib. xxxlii. \& 9 . See Tıonson's Chemistry; Ress' Cyclopedia; Dr. Watsos's Chemical Essays, vel. iv., ete.

British Cupper Trade.-Great Britain has various ropper mines in Cornwall, Devonshire, Wales, cte., but particularly in the first. Theugh knewn long before, the Cormish copper mlnes were not wrought with much spirit till last century. From 1726 to 1735 , they preduced at an averago abont 700 tons a year of pure copper. lluring the ten years from 1766 to 1765 , they producal at an averaga 2650 tens. In 1798, the produce exceeded 5000 tens; and it now anounts to from 11,000 to 12,500 tons, werth, at $£ 100$ a ton, from $\in 1,100,000$ to $£ 1,250,000$ sterling. In 1769 , the famous mines in the Parys Meuntains, near Amlwels, in Anglesea, were diseovered. Tho supplies of ore furnished by them were for a long time abundant leyond all precedent; but for many years past the productiveness of the mine has been declining, and it is new almost exhausted. At present the mines of Anglesea, and other parts of Wales, do not furnish 200 tons of copper. Theso of Ievonshire yieh nearly 2000 tons ; tho quantity produced in the other parts of England leing quite incousiderable. The Irishmines produce about 960 tons. Thuse of Seotland never were producthe, nod havo been almost entirely abandoned. Tho entiro prodnce of the copper mines of tho empire may, therefore, be estimated at present at from 15,000 to 10,000 tons. In coaseruence of the greatly lacreased supplies of copper that were thus ohtained, England, instead of being, as formerly, dependent on foreigners for the greater part of her supplies of this valuable metal, beeame, previously to 1793, one of the principal markets for the supply of others; and notwithstandling the vastly increased demand for copper daring the war for the sheathing of ships and other purposes, the exports continued to increase and the imperta to diminish; the greater productiveness of the Cornlsh mines laving suflived not only to balance the inereased demand, lint also to make up fir the falling off in the supplies from Anglesea. Owing to the want of coal In Cormwall, the ores are not suelted on the spot, but are all sunt to Swansea; it being found cheaprer to carry tho ores to the ceal than the contrary. 'The Fast Indies and China, France, the inited States, and Italy, aro the great markets for British copper. Thus, in IXbl, of the total puantity exported from (ireat Iritain, anomonting $1017,55.5$ tous, 3603 went to the East Iuties aud Chinn, $\$ 183$ to

France; 3085 to the United States; 1396 to Italy; and 2113 to the Hanse towns and Helland.-Parl. Paper, No. 462 ; Session, 1852.
Foreign Copper.-Copper ores are abundant in Sweden, Russia, Japan, Australia, Cuba, Chili, Columbia, etc. Near Fahlun, In the province of Dalecaria, in Sweden, is the celebrated copper mine of the same name, suppesed to have been wreught nearly one thousand years. For a leng tine It was extremely productive, yielding, teward tho beginning ef the seventeenth century, an annual produce of about $8,000,000$ peunds of pure metal; but it has since greatly deelined; and it is mest probable that at no distant peried it will be wholly abandened.-Tnomson's Travels in Sweden, p. 221. There are copper mines in other paris of Sweden; but the entlre produce of copper in that country does not at present exceed from 750 to 800 tons, of a quality inferior to that of England. The praduce of the copper mines of Russia has 1 een estimated at 200,000 poeds or 4G61 tons (English) a year.-Tegononski, Forces Productices de la Russie, J. 300. The copper mines of Japan are said to he among the richest in the warld. The Dutch and Chinese expert considerable quantities of their produce, which is spreed all over the East, and is regularly quoted in the prices eurrent of Canton, Calcutta, and Singapore. It is uniformly met with in the shaje of bars or ingots; and when tho copper of South America is worth in the Canton market frem $\$ 15$ to $\$ 16$ per picul, that of Japan is worth from $\$ 18$ to $\$ 20$ per pienl. Copser, the produce of the Persian mines, is imported inte Bombay and Calcutta from Bushiro and Jussorah. But, in a commercial point of view, the copper mines of the lnited States, Cuba, Chili, and Australia are, after those of England, by far the most important. The working of the mines of Cuba, which had been abandoned for a lengthened period, was resumed a few years ago, principally by an English company, which has been eminently successful. Jarge quantities of Cuba ore are taken to Swansen to be smelted; and large quantlites of Chill ore are also taken there for the same purpose. Of the total imports of copper ore in 1851 , amounting (including regulus) to 42,131 tons, Cuba furnished 20,875 tons; Chill, 8051 tons; and Australla, 7219 tous; the rest being supplied by Spain, Pur, cte. 'there was a very extraordinary increase in the suplies of copper from Australia during the four or live years preceding the discovery of tho gold flelds. The produce of the Burra Burra Mine, for esample, which in 18.16 was $6: 49 \frac{1}{2}$ tons of ore, had svielled in $18: 0$ to 18,692 tons. But since then some of the mlnes have beey aliandoned, and the progress of the ethers chedked. Foreign copiper imported into Great Britain, and the cepper obtained from the smelthig of foreign ore, were, previous1. to 1812 , wholly, or almost wholly, re-exportst ; the duty in Great Mritaln on the copler ore when it was taken or smelted for homs use being so very heavy as to mako ic le altogetier exported in un unwrught state. Ifut in 1812 that duty on copper ores and unwrought cepper was very materially rednced; and it was repealed in the course of the year 1853. The presumption, therrfore, is, that the imperts into Gircat Iritain of ore for smelting will Increase, and that censiderablo duantities of copper derived from foreign ores will he brought lato use.

Copper ia in extensive demand all over Indla, being largely used in the deck-yarda, in the manuffactare of cooking utensils, in alloying spelter and tin, etc. The funeral of every IIlndoo bringa an accesston to the demand, according to his atation; the relatives of the deceased giving a brass cup to every Brahmin present at the ceremeny : oo that five, ten, fifty, one hundred, one tbonsand, and sometimea mero than ten times thia last number, are dispensed upon such occasions.Bell's Commerce of Bengal.
A medern, and now a very extensiva usa of sheetcopper, is for the sheathing of ships. That part of tha hull of $n$ ship that is in the water is covered whth sheetcopper. Thls cevering preserves the wood from the attacks of the teredo, and thereby gives the ship the advantage of passing more rapilly through the water, as the copper bottom remains alwaya smooth; for seaweed and ohells will not take root nud attach themselves to copper, as they do to bare planks, owing to the galvanic effeet prodiced by the action of sea-water. Aa this action, hov avar, proluces ? rupld deray of copper, it was propesert :. Jir Iluaphry Davy to neutralize it by applyiner, wetallic protecters-an object which
romplished; but as thls also deprived the cepper
the effect it was intended to produce, nud allowed
a mollascous tribeg to attach themselves, the protectIn; recess was abandoned.
$r$ bo.'s are used for fastening the planks and tim .. $=5: \cdots$ This $n^{\text {a }}$ n grent improvement in ship. buit ins. A copper-fastened shits or bont is preterable to one with iron fastenings, because the copper bolts re. aln unaitered by rust, and endure longer than the wood which they hold together, particularly when used in the state of alloy, which preserveg it from waste by newtratazing the galvanic action. For the frames of dets ate dipping needles and magnetic compasses, cop. per is employed, as it has been found that the brass generally used in phllosophical instruments somethes centains iron, which of course might affect the mag netic needle. Copper is alrawn tnto wire, used for communication with the belts in houses, and for cther phopeses. Small pipes for conveying conl-gas from the level of the atreet to the aperture by whilitho gas issurs were formerly made of copper or of brass, till superseded hy tin. These pipes were fitted on an non cylindrical mandril, and a cylindrical riag dras.in ever the outside. By this means copper and bras tubes are drawn ont. The brass tubeg for telescopes are drawn out in the same manner.

Copper may be platet; that ls, its surface may be covered with a layer of silver, by rubbing the surfuce with a mixture of nitrate of filver, muriate of sodn, and arldulous tartrate of potass (cream of tartar). Ilut the metherl practiced at limingham is tho moat permanent and effectual. A plate of coplict, with a plato of sllver apalied to it, and horas placed in the interstice, is hasted to a pintlenar degree, which it requires the skill of a worknan to know-a degree of heat, in shors, nesr that at wheh copler and silver melt. The two thetals thus heated, and in contset, are then taken ont of the furmace and passed throngh rollers. There is a fision and combination of the adjament surfiees; and their allocsion ts perfectel be the pressure of the rollers. Cosper thus plated is manufactured at Mismlogham into candlesticks, teapots, butons, buckles, and n variety of other artictes.

Standaril sliver colns contain a snall propertion of copper, for the purpose of giving them harduess. Ihas proportion is regulated by government in the geseriat countrles of Europe, and varies in different states. The comblnathon of rold amd copper in various jropertions is used fer inakhig rings and other trinkets, Zopuer is gitded by applylug on its surfare an amalgan of gold with mercury. Itronze ernaments are gilde:I fin the amme way. Copper unitell with zine forms brass; when alloyed with tin it furms bronze. 'This romblnation is hard and britte if the proportlon of tin In
great; but when the propotion of tin is amall, the bronza ls soft, and possesses tenaclty so as not to be easily broken. The ancienta employed hard bronze, contalning much tin, in making aword blades, spear heads, hatchcts, and cutting instruments. Bronze cramps are found in anclent buildiugs in Egypt. Statucs and bas-reliefs, culinary vessels, and a variety of other articles of soft brenze, ard to be seen in different collections of antiquities. In modern times soft bronze is used for casting cannon and statues.

Copper melted with a large proportion of tin constitutea bell-ntetal, whtch ia hard and brittle. The metal of which the Chinese gongs are mado is compesed of the same ingredients ; and it has the property of belng In some ulcgree malleable at a certain atage of its cooling, for their gonga are covered with marks of the hnmmer. The most common ore of copper, from whtch the chief supplies of that metal are derived, is the yellow copper ore, or copper pyrites, essentially a combjnation of copper with sulphur and iron. There are, however, numerons other ores of copper in whleh the metal is in combination with oxygen, rarbonic acid, varleis other metals, etc. Soppet In ins varied artificial combinations, as in that of verdegris (acetate if cotper). blue vit"iol (sulphate of copper), Scheele's green (ar senite r fcepper), verditer (carbonate of copper), ete., is fargely used in tho arts of dyelng, painting, enamelites, glass and porcelain coloring, cte. The salts of copper aro poisonous; and from the facility with which copper mensils become oxydated, their unes sheuld be as restricted as pessible. One or two of the salts of copper are occasionally used in niedicine: and the sall. phate of copper has been found to be on of the must efficacious emeties in creup, checking the diseran ant preventing the effusivn of the fibrinotas matter into the trachea. This salt la also used as a lotion in the treatment of ulcers, etc.

American Copper.-Although the copper-mining interest in this countrv is, as yet, in its lufancy, it has already produced results that give promisa of lis some standing among the formost of our mineral products, and of adding greatly to the nlreaty diversified resources of wealth ant power of our people. l'revious to 1810 we were, in conimen with the rest of the world, entirely dependent upon England for our supply of this usefu! material.

We are this year, 1850 , produchig about 5000 tens of it, equal to one-seventecnth of the whole amount requited to meet the demand of the world. The cepper mines ot Curnwall, lingland, havo been worked for eenturies, whild ihoso of our Iake Superior segton have only been opened $n$ few years, and not successfilly and systmatically worked until withln the last five years. The opening of the Sinlt St. Marle camal, ly comecting the navigution of Lake Superlor with that of the chain of lower lakes, has given an impetus to tho business that will soon make it the freat soure of supply of copper to our own and foreign countries on arcount of its great purity anl tho hacxhaustihlo beds of its orc. Sightecn new stamplng milla have been a rected the past year, and at least fiby more will !n: phe into operation this year. The total shipure its of the lathe superiser ecpper mince are thins stated:

The value of the copper on the wharves on lake

 will be 1504 tons over 1 Nin. 'fl' gevermatent of 1 . AH o has had Mous. Rivot, of the fich of of Mines in Itanee, "xambing tho lane Suprior copiner, in consequene of the supyly from linssia ixing cut ofl'; and the An arlan coppor bas been testeil and found equal, if not ou*
perior to the Russian, and far superior to the English. The superior tenaclty of the American copper is a strong recommondation.
Copper Dusts and Statues.--These consist wholly of enpper, in a thlu sheet; and the whole of the metal has leen reduced or precipitated from a liquld solution. We believe that the first example of thls atriking production was a bust of the late Dr. Dalton, made by Mr، Choverton about ton years ago; and the practicability being thus demonstrated, the art may be now followed to any extent. Tho processes are carlous, The bust is tirst modeled In some kind of clay, which may afterward easily be broken away piecemeal; and on this a thick copper film is deposited by the electro process. The clay coro or model belng broken away, the copper remains as a hollow shell, tho inside of which has ta' en the exact impress (though reversed) of the outside of the bust. This copper shell, on belng properly prepared on tho inner surface, is mado the groundwork on which a second deposition takes place; it is used, in fact, as a mould, from which ono or more busts may be procured.

Architects and seulptors are gradually availing themselyes of this art in the furtherance of their profussional labors. The lato Bavarian seulptor, Etighmayer, who was employed by King Ladwig on so many important works at Munich, devis ed a mote of coating collossal plaster statues with copper, by the electro process, in a remarkably expeditious way. But onc of the most important applications of the art is that which is exhibited in tho new and splendid cathedral of St. Isaacs, at St. Petersburg, on wheh the emperor has expended largo sums. Certain parts have becn ornamented in a remarkablo way. The cathedral has scven very largo door3, or rather door-ways, three of which are it feet wide by 30 high; they are forned of himize, lut all the adornments are produced by the electro process. These adornments are of a most elaborate naturo; they comprise no less than 51 bus-reliefs, 63 statues, and $8: 4$ alto-rellevo busts. It is not simply ав а matter of econe:ny that the electro process has beea adopted, for the czar is not a man to entertain scruples on such 4 point ; but there are certain advantsges of an art'stic claracter. By the electro process the eculpter is sure to have his model faithfully copied and the lyghencss of the material enaliles him to mp arart bolder relief to his designs than if they wero cast in bronze; while this lighturss of weight also justifes him in anspending pendants or bosses from vaulting, of a larger size than would bo safe if nade otherwise.
Copperas, a term employed liy the ohler ehemists, and popularly as synonymeus with vitriol. Thero are three sorts of copperas: tho green, or sulphato of iron: the blue, or sulphate of copper ; and tho white, or sulphate of vine. Of these, the tirst is the mest impertant. Sulphate of iron is distimpuished in common by a vasiety of names, as Martial vitriol, Englirh vitriol, etc. Whan pure it $i$ considerahly transperent, of a tine |right, thesesth h..t very heep, grass green colur; ar: of a muysi su, astringcinc laste, accomprniod with a kind of sweetness. lis specific gravity is $1 \cdot 8 \mathrm{~d}$. It unifornuly reddena the regetable hlows. This sult was wilkuew to the nuclentr. and is mentloned by l'ling (Hist, Nat. lib, xaxiv. § 12) under the names of misy, sory, and coll huntum. It is not mado in the direct way, becanse it enn bo oltained at less charge from the dee comp sition of pyrite., on a harge seale tha the neighorheod oe rollierics. It esists ifi two tates, one containing oxyd of fron, with 0.22 of oxygen, with is of a pale groen, not altered by gallec achd, nud giving a white preclpitate wilh pruseiate of potass. The other, in which tho fron la comblued with 0 : 30 of oxygen, is rel, not erystallizaline, and gives a black preclpitate with gallic atid, and a blaw rith prussiate of potass. In the comunars sulphate, these two are oftom mixel in various propertions.

Sulphate of tron is of great importanco iat the arls.

It is a principal Ingredient in dyeing; In the manufacture of ink, and of prussian blue; it ls also used in tanning, painthg, medleine, etc. Sulphurlc acid, or oil of vitriol, was formerly manufactured from sulphate of iron.-SSec Acins.

Sulpbate of copper, b. blue vitriol, cemmonly called Roman or Cyprian vitrint, is of an elegant sapphire blue color, hard, compac: and serni-truusparent; when perfeetly crystallized, of a flattish, rhomboidal, deeabedral figure; its tate is extremely nauseous, styptic, and acrid; its speelfic gravity is $2 \cdot 1943$. It is used for various purposes in the arts, and also in medicine.
Sulphate of zinc, or white vitrlol, is found native in the mines of Goslar and other places. Sometimes it is met with in transparent pieces, but more commonly in white eftlorescences. These are dissolved in water, and crystallized into large irregular masses, somewhat resembling fine sugar, having a sweetish, nuuseous, styptic taste. Its specific gravity, when cryatallized, is 1.912 ; when in the state in which It commonly occurs in commerce, it is $1 \cdot 3275$. Sulphate of zinc is prepared in the large way from some varieties of the native sulphuret. The ore is rousted, wetted with water, and exposed to tho air. The sulphus attracts oxygen, and is converted into sulphuric ach: and the metal, being at tho same time oxydized, comblnes with tho aeid. After some time the sulphate is extracted by solution in water, and the solution being evaporated to dryness, the mass is run into moulis. Thus, tho white vitriol of the shops generally contains a small portion of iron, aud often of copper and leal.-Lewis's Mat. Medica; Une's Dictionary; Rees' Cyelopedia.
Copper Money. The liomans, prior to the reign of Servius Tullius, used rudo pieces of copper for money. In England, copper money is of extensive coinage. That proposed by Sir Robert Cotton was brought hato use in 1609 . Copper was extensively coined in 1665. It was again coined ly tho crown, 23 Car. II. 1672. Irivato traders had mado then jreviously to this act. In Ireland, copper was coincel as early as 1339; in Scotland in 1406; in France in 1580 . Wood's coinage in Ireland commenced in 1723. Penny and two-perny pieces were extenslvely issued in 1797. The half-farthing was coined in 1843.-See Cent.

Copyright. See Books.
Coracle, a small kind of boat, constructed of wicker, and covered with leather, or with cloth mado waterproof with oil or tar. From its extreme lightness it may be transported on tho shoulders from place to place. Coracles aro common in Wales. A similar klad of boat has been used in the East from remote antipuity.
Coral (Germ. Korallen; Du. Koraden; Fr. Corail; It. Corale; Sp . and 1'ort. Coral; Kuss. Koralli"; Lat. Corcllium; Arat. Besel; Jers. Altrjon; 11 ind. Moon$y a)$, a marino production, of which there aro several varieties. It was well known to the ancients, but it was reserved for the moderns to disoover its real nature. It is, in fact, the nidus or nest of a certain sperics of yermes, which hus the same relation to coral that a suail has to its shell. As an oriamen, bluck coral is most esteemed; lut the ret is atso very highly prized. Coral is fuend in very great abundance in the Red sea, the l'ersian Gulf, in various places in the Nediterranean, on the coast of Sumatra, ete. It grows on rucks, mal on any solnd snlmarine body ; mal it is necessary to its production that it sheuld remain dixed to its place. It has gencrull: a shrul--like appearmuce. In tho Straits of Messina, whero a great deal is Hshed un, it uanally grows to nearly a foot in length, and its thickuess is about that of the little finger. It requires eight or ten years to rive at its greatest size. The depth at which it is ottained is vasious-from 10 to 100 tathoms or moro; but it scems to bo necessary to its pielaction that the rays of the sun should reatily penetrute to the place of its habitation. Its valeo depends upon Its size, solidity, and the depth and bril-
liancy of its color，and is so very various，that while some of the Sicilian coral sella for eight or ten guineas an ounce，other descriptions of It will not feteh 1s，a pound．It is highly prized by opulent natives in In－ dia，as well as by the fair sex throughout Eurupe．The inferior or worm－eaten coral is used ln some parts of the Madraa coast，in the celebration of funcral rites． It is also used medicinally．Besidea the fishery in the Straits of Messins already alluded to，there are valu－ able fisherles on the shores of Majorea and Minorea， and on the coast of Provence．A good deal of Medl－ terranean coral is exported to India，which，however draws the larrest portion of its aupplies from the Per－ sian Gulf．＇the prodnce of the fishery at Messina is stated hy Spallanzani（Travels in the Two Sicilies，vol． iv．）to amount to 12 quintals of 250 lbs．each．

The manner of fishing coral ls nearly the same every－ where．That which is most commonly practiced in the Mediterranean is as foliows：seven or eight men go in a boat，commanded by the proprictor；the caster throws his net，if wo may so eall the machine which he uses to tear up the coral from the bottom of the sea；and the rest work the boat，and help to draw in tho net． This is composed of two beams of wood tied crosswise， with leads fixed to them to sink them；to theso beams is fastened a quantly of hemp，twisted loosely round， and intermiogled witi some loose netting．In this condlion the machine is iet down into the sea；and when the coral is pretty atrongly entwined in the hemp and nets，they draw it up with a rope，whieh they un－ whad according to the depth，and which it somethes requires half a dozen boats to draw．If this rope hap－ pens to break，the fishermen run the hazard of being lost．Before the fishers go to sen，they agree for the price of the coral：and the produce of the fishery is divided，at the end of tho season，into thirteen parts ； of which the proprictor has four，the caster two，and the other six men one each；the thirteenth belongs to the company for payment of boat－hire，etc．See Aiss－ lie＇s Materia Indica；Rees＇Cyctopedix；Encychpedia Metropolitana；Brla＇s Commerce of Beagal，etc．

Cordage（Germ．Tauterk；Du．Tourwerk；Fr． Mancurres，Cordage；1t．Caolame ；Sp．Jarcia，Cordaje）， a term used in geucral for all sorts of cord，whether small，middiing，or great，made use of in the rigging of ships．The following tablo shows how many fathoms， feet，and Inches，of a rope of any size，not exceeding 11 inches，make 1 cwt ．At the top of the table，mark－ ed inches，futhoms，fect，inches，the first column is the circumference of a ropo in inches and quarters；the sec－ ond，the fathoms，feet，and iuches that make up 1 cwt． of such a rope．One example will make it plain．

Suppose it is required how much of a 7 －inch rope will make 1 cwt ；find 7 in the third column，under inches，or circumference of the rope，and immediately opposito to it yon will find $9,5,6$ ；which shows that in a rope of 7 inches there will be 9 fathoms 5 feet 6 inches required to make 1 cwt ．

Cordwainers or Cordinern，the term by which shoemakers are designated in the statutes．Tho word is formed from the French cordonnier，which Ménago derives from cordouan，a kind of leather brought from Cordova，and used for tho upper leather of shoes．Oth－ ers derlve it from corde，rope，because shoes were an－ ciently made of cords；as，indeed，they still are in some parts of Spain，under the name of alpargates．But the former etymology ls evidently more proper．

Corea，a large jenibsula of Asia，formed on one side ly the Yellow Sea，and on the other by the Sea of Japan．It is aituated immediately to the east of Chi－ na；and its length may be estimated at 400 miles， by 150 in averago breadth．A great part of what was formerly supposed to bo its western coast was found by Captains Ilall and Maxweli to consist of an immense archipelago of amall islands，whlch have since been subdlvided into several groups，and are known as Amherst＇s Islands，tho Coreau，and Hall＇s Arehipelago．Tho largest of these is the island of Quelpmert，called by the natives Musa，in tho centro of which there is a mountain peak about 6000 feet above the Jevel of the sea．Though rocky and Lare，theso groups are for the most part inhabited．The peniusula itself is divided from the Japanese Island of Kiositu by the Straits of Corea，and by a hibh mountain range called the Shanalin or Chamjeshan，from the country of the Mantchoos．It embraces an area of about $95,000 \mathrm{milles}$ with a jopulation of ahout eight millions． The interior of the celmitry is rugged and mountainous， being intersected by a icfty branch of the northern range，which in turn sends of numerous othhouts to the sea．The principal valleys lic toward the western and southern coasts，and these districts alone enjoy a temperato climate．Tho eastern coast is bienk and precipitous，while the northern frontier is coll and dege olate，and thens subserves the purposes of despotism by cutting off all friendly communication with the main land．The principal jroducts of the country comprise wheat，millet，rice，ginseng，tobacco，silk，cutton，and hemp．The thre last are exported both in the raw and manufactured state．Timber and cattle are plenti－ fully supplied from the forests and pasture－grounds， as well as furs from the northern jungies．Its mineral wealth is said to include gold，silver，iron，rock－salt， and coal ；and from the tribute sent to the Emperur of Chima－consisting both of bullion and manufactured articles－the precious metals seem to be wrought to a considerable extent．The Corcans resembie the Jap－ anese and Chinese in dress，halits，and religion，but are said to be as inferior to cither of these in mental vigor as they are superior in strength and stature． Their mode of writing is ulphabetic，and they are said to possess an extensive literature；but as all ingress into the country is denied to Europenns，and all ervess to natives，little is known of these particulars．They keep up considerable e masercial intercourse with Chi－ na and Japm，whence they import pepper，aromstic woods，alum，and goods of Dutch manifucture；but most of the trude is managed by a circuitous overland route，and，being discouraged by the government，is carried on with secrecy and at considerable risk．The kinglom of Corea，although tributary to China，is gov－ erned at will hy its own king－the Chinese emperor doing littie more than formally ratifying his decrees． It is divided into eight provinces，and contains，ac－ cording to Chineso accounts， 161 towns．The capital， King－ti－tao，atunds on the river Kiang，a smail stream which thows fito the lellow Sea．It is the residence of the king，and contalns，among other things，an ex－ tenslve library．In modern timea a fow French mis－ sionaries liave pusetruted into the country，but with little suecess．

ber, Linnaus) abundant in dry mountalnous districts
in the south of France, and in Spalu, Fortugal, Italy, and Barbary. The tree grows to the helght of thirty feet or more, has a striking resemblance to the Quercus \#ex, or evergreen oak, and attains to n great age. After arriving at a certain state of maturity, it periodically sheds its bark; but this valuable product is found to lio of a much better quallty when it is artificially removel from the tree, which may be effected without any injury to tho latter. After a tree has attained to the ago of from twenty-slx to thirty years, it may be barked; and the operation may be subsequently repeated once every elght or ten years, the quality of the cork improving with the increasing ago of the tree. The bark is taken off In July and August; and trees that are regularly stripped are sald to live for one hundred and fifty years or more.-Ponnet, llist, Philosophique des Plantes, tonse vii. 419. Cork is Ilght, porous, readily compressible, and wonderfully elastic. It may be cut into any sort of figure, and notwithstanding its parosity, is nearly impervious to any common liquor. These qusllties make it superior to all other substances for stoppers for bottles, in the manufucture of which it is prinejpally made use of. It is also employed as buoys to flont nets, in the construction of life-boats, the makiog of water-proof shoes, and in varlous other wsys. licfore being manufactured into stoppers, the cork is charred on each side; this makes it contract, lessens its porosity, and consequently fits it tho better for cutting off all communication between the external sir sand the iiquidi in the bottle. Spanish black is made of catcined cork. The cork tree, and the uses to which the bark may bo applied, were known to the Greeks and Rornans. Pliny mentions that the Romans employed it to stop all kinds of vessels; but the use of it for this purpose does not appear to have been common till giass bottles came into general use, which, according to leekmann, was not till the fifteenth century. Other vegetalile productions have been sometimes emplayed instead of cork; as, for instanec, tho spondins lutea, a tree which grows in South America, prrticuiarIf in moist places, and which is there called monbin or munhin. The roots of liguorice are applied to the fome use, and on thls account the plant is caltivated in Sclavonia, and exported. A tree called nyssa, which grows in North America, has been found also to aftord a substitute for cork.
Considering it in a politic ns well as in an cconomjesl sebse, seasonable measures shouid be taken to form in the United States plantations of this tree, suflicient for the future supply of cork, particularly for the increasing demands for that $m$ - terial which are likely to arise from the culture of the vine. As a further argument in showing the importance of fostering this branch of rural ceonomy, it may be ritated, that the amome of cork which is yearly iniported into the United States, is ralued at more than $\$ 281,000$.

Cork Jacket, nu njp:aratus to buoy up the body in swinming. It censists of pieces of cork inelosed between two pieces of strong canvas, and is shaped so as to be worn like a jacket, but withont arms. It is row shost quite superseded by the air lielt made of waterproof clott. The cork jacket nppears to be a very old invention; for Plutnret, in hls life of Cmmiilus, mentions that the messenger sont by that general to his fellow-citizens when hesicged in the capitol, made use of a corh jacket in swimming neross the Tiber, the finuls being in possession of the bridge.
Cork, a city, partiamentary horough, and river port of Irefand, cenpital of the connty of Cork, and a comity of itself, on the lee, eleven miles nhove the entrance of Cork liarbor, nad 137 miles southwest of Dublin. Area of city, 18,006 acres ; cf the municipality, 2683 acres. Popuiation of county and city, or barony, 104, 153 ; of munlelpal borough (1851), 84,114. The city proper is huitt on an island formed by the lee. Principai mauufactures are of leather, iron, and other
metallic goods, glass, gloves, and paper, and there are some extensive breweries and distilleries; the woolen and cotton manufactures, formerly extensive, are now all but extinct. The trade is extensive, the exports conslst of corn, flour, butter, and other Irish produce; imports consist chlefly of manufactured goods from England; wines, fruits, and salt from Yortugal and the Mediterrsnean; timber from the Baltic and North America. Cork communicates by steam-packets witis Iondon, Dublin, Bristol, Liverpool, and Glasgow, Cork Harbor is a fine land-locked hasin, formed by the estuary of the Lee, which is navigable to $1 \frac{1}{2}$ miles above Cork city. It is large and deep enough to contain the whole British navy, and has an entrance one mile ncross, within which its breadth varies to eight miles. It contains Spike and Haulbowline Islands, on which are artillery barracks and various ordinance works. Lat. $51^{\circ} 50^{\circ} 4^{\prime \prime} \mathrm{N}$. , long. $8^{\circ} 19^{\prime \prime} \mathrm{W}$. On its shores are the towns of Cove and Passage, with quays four miles in length, and which were erectel at a cost of $£ 100,000$.

Corn (Saxon Corn), the grain or seeds of plants separated from the splea or ear, and used for making bread. Accorting to the European interpretation there are several speeles of corn, such as wheat, rye, and barley, millet and rice, oats, maize, nad lentits, pess, und a number of other kinds, each of which has its peculiar qualities and usefulness. Eygyt was anciently the most fertite of all countrics in corn. Thls appears hoth from sacred and profnne history. It supplied a considerable part of the people sulject to the Romnn empire, and was called the diy nurse of Rome and Ifaly. Ceres has the credit of being the first who taught them the use of corn, an which nccomt she was ranked by them is a deity. Some, however, attributed the honor to Triptolemus; while others award the fonor to both alike, making Ceres the dirst discoverer, and Triptelemus the first planter and cultivator of corn. Diodorus Siculus aseribes the whole to Isis; in which, as Polydiore Virgil observes, he does not differ from other au-thors-Isis and Ceres being in reality the same person. The Athenians pretended that it was among them the art of sowing corn took its rise; and the Cretans or Candiots, Sicilians, and Egyptians, also lay claim to the distinction. Sone think the title of the Sicilians best supported, Sicily loeing the country of Ceres; and it is alleged that she did not teach the secret to the Atheninns till sho had first instructed her own compatriots. Others say that Ceres passed first into Attic, , thence into Crete, and last of all into Sicily. Many scholars, however, maintrin that it was in Egypt the art of cultivating corn first legan ; and it is certain that there was corn in Egypt and the East long before the time of Ceres.-E. 13 .

Maize, or Indim ('orn.-Among the objects of culture in the United States, malze, or Indian corn, takes precelence in the seaic of crops, as it is best ndapted to the soit and climate, and furnishes the largest amount of nutritive food. Where due regard is paid to the selection of varicties, and cultivated in a proper soil, it may be accounted as a sure crop in almost every portion of the habitable globe between the 4 lth degree of nerth latitude and a corresponding parallel south. Besides its production in this country, its principal culture is limited to Mexico, the West Indies, mast of the states of Soutil America, France, Spain, Portugal, Lomhardy, and southern and central Europe generally. It Is alse cultivated with success in northern, southern, and western Africa, Indin, China, Japan, Australia, and the Sandwich Islands, the groups of the Azores, the Mudeiras, the Canarics, and numerous other ocean isles.

Although there has been much written on the Eastern origin of this grnis, it did not grow in that part of Asin watered by the Indus at the time of Alexander the Great's expedition, as it is not among the productions of that country mentinned hy Neurchus, the consmander of the fleet. Neititer is it noticed by Arrian,

Diodorus, Columella, nor any other ancient author. And even as late as 1491, tha year before Columbus discovored America, Joan. di Cnbe, in hia "Ortus Sanitatis," makeo no mention of it. It has nover been found in any ancient tumnlua, aarcophagus, or pyramid; nor has it ever boen represented in any ancient painting, sculpture, or work of art, except in America. But in this conntry, according to Garcilaso de la Vega, one of the earlioat Peruvian hitatorians, the palace gardena of the Inces were ornamented with malso in gold and aliver, with ail the grains, apiksa, otalks, and leaven; and in one inatance, in the "Garden of Gold and Siliver," there was an entire corn-feld of considerable size, representling the maize in its exact and natural shape, a proof no less of the wealth of the Incas, than of their veneration far this important grain.

In further proof of the American origin of thla plant, it may be atated that it is atill found growing in a wild state, from the Rocky Mountalna, in North America, to the humid forest of Paraguay, where, inatead of having each grain naked, as lo always the case after long cultivation, It ia completely covered with glumes or husks. It la, moreover, a well-authenticated fact, that maize was found in a atate of cultivation by the aborigines on the isiand of Cuba st the time of its discovery by Colambus, as well as in moat other places in America frat explored by Enropeans.

The first auccessful attempt of the English in North America to cultivato this grain wos made on James River, In Virginia, in 1608 . The colonista aent over by the "London Company" adopted the mode then practiced by the Indians, which, with some modifications, has been pursued ever since. The yield at that time la reprosented to have been from two hundred to more than a thousand fold. The same increase was noticed by the carly settlers in Illinois. The present yield, east of the Rocky Mountains, when judiciously cultivated, varies from twenty to ove hundred and thirty-ffve bushela to an acre.
The varieties of Indian corn are very numerous, exhiblting many grades of aize, color, and conformation. Among these are, the ahrubby reed that grows on the shores of Lake Superior ; the gigantic stalks of the Ohio Valley; the tiny cara, with flat, close-clinging gralns, of Canada; the brilliant, rounded little pearl; the tright-red grains and white cob of the elght-rowed hematite; the awelling ear of the big white; and the yellow gourd-seed of the South.
From the flexiblity of this plant, it may be accilmatized, by gradual cultivation, from Texas to Maine, or from Canada to Brazil ; bnt, in either case, its character la somewhat changed, and often now rarieties are the results. The blades of the plant are of great valuo as food for stock, and form an article hut rarely estimated sufficienily, when considering the agricultural products of the southern and sonth-western states especially.
The increase of production from 1840 to 1850 was $214,000,000$ bushels, equal to 56 per cent. The productlon of New England has advanced from 0,903,000 to 10,377,000 bushels, ahowing an increase of $3,384,000$ bushels-nearly 50 per cent. New York, New Jersey, Pennsylvaila, Delawire, and Maryland increased $20,812,000$ bushels-more than 50 per cent. In the production of this crop no state has retrograded. Ohio, which In 1840 occupied the fourth place as a corn-producing state, now ranks as the first; Kentucky, aecond; Illinois, third; Tennessec, fourth. The crop of Illinoia hiss increased from $22,000,000$ to $57,500,060$ bushels, or at the rate of 60 per cent. in ten years.
Of the numerous varieties, some are best adapted to the southern states, whlie others are bettor auited for the northern and eastern. Those genarally cullivated in the former are the Southern big and amall yellow, tha Southern big and ameil whlte-fint, the yollow Poravian, and the Virginia white gourd-seed. In the more northerly and easterly atatea, they cultivate the
goldan Sioux, or Northern yollow-fint, the King Phillp, or aight-rovod yellow, the Canada parly white, the Thecarort, the white flour, and the Rhode Iaiand whiteaint flour.
The oxtended cultivation of this grain is chiefly confined to tho aastern, middie, and western states, though much more succespfully grown in the latter. Thie amount oxported from South Carolina in 1748 was 39,308 bushela; from North Carollida, in 1753, 61,680 bushele ; from Virginia, for several years precediag the Revolution, annually, 000,000 bushela; from Phiil. adelphia, in 1752, 90,740 bushela; in 1767-'68, 60,205 bushela i in 1771, 250,441 buahals.

The total amonnt exported from this coantry ta 1730 was 578,39 bushela; in 1791, 2,064,930 huehela, 851,695 of which wore Indian meal; in $1800,2,032,435$ bushels, 338,108 of which were in meal ; in 1810, 1,140,960 bushels, 80,744 of which were in meal. In 1820-21, thicre were exported 607,277 buahels of corn and 131,669 barrela of Indian meal; in 1830-'31, 571,312 buahels of com and 207,604 barreis of meal; in 1840-41, 635,727 bushels of corn and 232,284 berrols of meal; in 1845-46, 1,286,068 buehels of corn and 208,790 barrels of menl in 1846-47, 10,826,050 bushels of corn and 948,060 barrels of meal; In 1850-61, $3,426,811$ bushels of corn and 208,622 barrela of meal. Moro than $11,000,000$ bushels of Indlan corn were conaumed in 1850 in the manufac. ture of malt and spirituous lyquors.
Accordlag to the ceasue of 1840, the corn crop of the Unlted Statea was $377,581,878^{\circ}$ bushels; of 1850 , 692,326,612 bushels.

Corn Lawse. An adequate supply of breadstum in evidently of the very first importance to every country, and should be as regular as is possibie, since sudden fluctuations in an article of auch universal necesaity are injurions, and scareity, with the consequent high prices, brings distress upon the poorer classes, and is a fruitful cause of discontent and convuisions. The best means of securing a aufficient and stealy supply of this article is a suijject of aome diversity of opininci, and the practice of governmenta has varied much at different times. One theory, urged by Adam Snith, but queationed by Mr. Malthua and moat othere, is, that the government ahouid do absolutely nothing in the matter, on the ground that the farmers and corn ite, the efy con, though t. The .78 was $3,61,580$
receding om Phit. 8, ce,205 $y$ ln 1730 4, 351,, 995 bushecis, 960 bush'21, there ,669 bar. ls of com 727 bush-1845-40, of meal; 8,060 har. corn and 20 bustiels manulac. ; of 1850 ,
merchants, if unchecked, will alwaya form correct views of their own Interest, and that their intereat will coinclde with that of the rest of the community. But broad, eweeping theories of this sort are rarely adopted in the practical adminatatration of atfaira; and a government, In making regulationa on this sulject, as on every other, looks at ite internal condition, the character and puruits of its population, and ita foreign comnerclal relations; and though it may not judge correctiy of the best meana of securing a ateady and sufficlent supply, this does not prove that a total neglect of the aubject woald be the wisest and the safent policy in all countries and at $\dot{\Sigma} l l$ times. It is cartain, however, that very unwise measures have often beon resorted to, and somotimes auch as tended rather to aggravate the evil then to provide a remedy. One way to guard agalnat a ecarcity is that adopted by the klog of Egypt in the time of Joseph-the purchasiug of corn by the goverament in time of plenty at home, or inporting it from abroad, and storing it in public magazines, to be distributed as the public wants may demand. But this system is attended with great expense, and affords but an uncertain'and inadequate provislon. Most governments, accordingly, lastead of making direct purchases, attempt to provide a remedy by tho paseage of laws. Tiis sublect of graln legislation ls by no means entirely modern. Tho Athenians had laws prohibitlog the exportation of corn, and requiring merchants who loaded their vesecls with it in foreign'ports to briug their cargoes to Athens. The public provision and distribution of com was an important branch of adminiatration at Rome, and very intimetely connected with the public tranquillity. The regulation in tho suppiy of corn, and the trade in the article, has been a fruitful subject of legislation in modern Europe. But it is to be olserved, that the public solicitude and current of legislation take this direction only in populous countries, or at least those in which the population presses hard upon the means of domestic production of breadstuff; for a country of which, like this, the staple exports are breadetuffe necde to take no measures for securing a supply; and, as flour and Indian meal are great articles of exportation in the United States, this country has had no occasion for laws to guard against a fanine, siace the ordinary course of industry and trade gives the greatest possible security, by producligg a surplus in provisions, which a high prico at home, ia anticipation of any scarcity, will bo sure to retain for the supply of domestic wants. In agricultural countries the object of sclicitude is to supply the want of arts and manufactores, as in populous and highly impreved countries it is to supply the want of food. But the laws directed to this object have been vory rarious, and some of them contradictory; for as in Athens, so in England at one period, the laws prohibited the exportation of corn; whercas, at another period, and for a very long ono in the iatter country, a bounty was given on the exportation; and both these laws had the same object, viz., the adequate nad stendy supply of the article. For this purpose the bounty is the measure undoubtedly calculated to produco the effect intended, and tho permanent prohibition of exportation must aggravate the scarcity which it is intended to prevent. Such a bounty tenda to stimulate a surplus production, and so to give a country, by this factitious encouragement, the same security in respect to a supply as results from the spontancous intercourse of industry and trade in Poland, the southern part of Russia, and the United States. But the objection to the bounty is its greet expense, requiring, as it docs, the imposition of a tax, and, at the same time, raising the price of the article to the domestic consumer. To secure the advantages and avoid some of the burdens of this law, Mr. Burke, in 1778, proposed the systen of corn laws so long adhered to in Great Britain, sccording to which no bounty is paid, bat the exportation of corn is permitted when it la sold under a certain
price in he home market. This price is dotermined by the average salea in certaln apocified placen for a given time; and when it risen above a cortain other Hixed prico, the importation la permitted. By Mr. Burko's blll, wheat might be exported when the price was under 44n. the quarter, and imported when it was over 48s. The home grower is, thorefore, aure to be free from a forelgn competition at any price under 480. and this gives him confluence in pursuing thia apeciea of caltivation. The rates or prices at which exportathon and Importatinn have since been allowed, have varied from time to time very materially; but the principles of the lawa and their effect are the same.E. A.

Reform of the Corn Laws of Exgland.-In 1843, a measure was adopted which made a wide breach in the corn laws. In 1842 the Legislature of Canada pasacd a law impusing a duty of 3 s. a quarter on all wheat imported into the proviace, unless from the United Kingdom, stating, in the preamblo to this act, that it was passed in the expectation and belief that a corresponding reduction would bo made in the duties on wheat and wheat flour imported into the United Kingdom from Canada. And conformably to this antlcipation, the act $6 \& 7$ Vict. c. 29, passed in 1843, reduced the duty on wheat imported from Canada to 1 . a quarter, and proportionately on wheat flour. This act met with much opposition from a part of the agricultural interest in England, who contended that it would lend to the introduction of anlimited supplies of corn from the United States, at a daty of only 4a. a quarter, or, allowing for smuggling, at perhaps only half that amount. But experience showed that thene anticipations were not likely to be realized; for, though the imports from Canada were materisliy increased the obstacles in the way of the importation of corn from the Ualted States into Canade, and the danger and expense of the voyage from Montreal or Quebec to England, must neccsearily have prevented the importation through thls channel from ever becoming of much importanco. Still, however, the measure was in so far an abondonment of the corn laws; and If Great Britain was juatified in admitting the produce of the United States to her markets in this indirect way, it was not easy to discover satisfactory grounds on which to exciude the produce of other conntries.
The success of the measures adopted in 1842 encouraged Sir Robert l'eel to attempt still more considerable changes in 1845, whon he abolished the customs' duties on about 420 artieles, some of which were of very considcrable importance. The measures then adopted were equivalent, in fact, to the virtual abandonment of the protective syetem; and, under such circumatances, it conid not be expected that the corn laws, on which so acrious an inroad had been made by the Canada act, would be able to maintein their place on the statute-book for any very leagthened period.
They might, however, have been continucd for some time longer, had not the unsatisfactory corn harvest, and the failure of the potato crop of 1845 , made it necessary to adopt measures for averting the anticipated deficiency in the supplies of food. Uyder the critical circumstances in which the population was then belic ved to be placed, the temporary suspension of the corn laws could hardly havo been avoided; but, if once suspended, their re-enactment would have been all but impossible, and it was better, perhaps, by at once providing for their ropeal, to make an end of the system, and of the dissatisfaction and agitation to which it had given birth, than to endeavor to continue it in any moditied shape. Such was the view of the matter taken by Sir Robert Peel; and he fortunately succeeded, despite difficulties that none ele could bave overcome, in carrying the act $9 \& 10$ Vict. 0.22 , for the immediate modification of the corn laws, and for their total repesi at the end of three years, or on the 1st Fehruary, 18:19. From that date wheat and other corn were suib-

Jected, on importation iuto Great Britain, to a fixed duty of is. a quarter; sud flour and meal, of all sorts, to a fixet duty of 4$\} d$. a cwt .-E. B.

Cornuoopia (Lat. cernu, a horn; and copia, plenty). In the tlie arts, na nrnament representiag a horn, from which issue flowers, fruits, leayea, and tho like. The orig:n of the cornicopla his been variously given. Some authors have traced it to the infant days of Jupiter, whose nurse, Amalthea, when one of her goats had broken off a horn against a tree, presented it to the gool wreathed with howers and filled with fruit. Hence it became the emblem of Plenty among the ancients, In which light it is regarded also by many modern uations. The cornucopia is found in the types of sncient coins, particularly upon those of Sicily.

Corporation is the term generally appitied to a body of men by special law endowed with the power and means of acting collectively, with tho distinctness and Individuality of une man pursulug the dictates of hls own will, while their existence is kept up by a perpetual succession, so that the collective body acts like an individual man with a perpetuated vitallty. Though the corporation might be deemed, from the admiratlon bestowed on it hy professional writers, to be the peculiar creation of English genius, there is little donbt that the system was derived from the municipia, universitates, and collcgia of the Romana; and there is oven reason to believe that there are corporations which date their history back to the institutions of the Western Empirc. The adage, indeed, expressed by a lloman jurisprude.t, that it required three to make a college -Ires facere collegium ( 50 Dieg. 16, 85)-shows a practicel consciousness of the most effective means of strengthening the action of a small corporation, in aia adjustment by which equal numbers with the chances of halanced divisions aze to be avoided, and that number is aelected which always affords a majority of two to one.-E. B. Corpozations aro stated by Livy to have been of very high antlquity among the Romans. They were introduced into other countries from Italy. These political bodies were first planned by Numa, in order to break the force of the two rival fuctions of Salines and Rommas, by inatituting separate societies of every mannal trade and profession.- Pleterancol.
Corsair (It. corsaro). A term used in the south of Europe and some other parts for a pirate or his ship. The corsairs of Barbary were commissioned ly their princes to attack tho merehant ships of hostile conntrics.

Corvette, a sloop of war; according to some autthorities, an advice-boat with fewer than twenty guns.
Cosmetio (кooff́co, to adorn), any preparation to render the skin soft and white, or to beantify and improve the complexion. The word cosmete among the Romans was used to denote a class of slaves whose business it was to dress and adorn their mistresses.E. B. Preparations for improving leanty were known to the ancients, and some anthorities refer them even to mythology, and others to thes Grecian stage. The loman ladies painted; and those of Italy exeefled in heightening their charms artlicinally, ly juices and colors, and iny perfumes. looage has always ineen in diarepute among the virtueus and well-ordered women of England, though some sinhle cosmetics are regnrided as innocent, and nre in general uso.-Asut. The females of France nod Germany palnt more highly than most other mations.-Ricuannson. In Great İritain a stamp was laid on coameties, perfumery, and such 2aedicines as really or supposithtiously benutify the skin or perfume the person, sud the vendors were obliged to take out licenses, 20 Geo. 111. Ji86,-11ayids.
Costa Rica, a republie of Centcal America, bounded on the north by Nicaragua, from which it is separated on the northeast by the river San Juan, on the east and north by the Cariliteen Ssa, on the enst by Now Giranada, from which it is separated by the river Chrigue entering the Caribhean Sea, and the Chirlqul entering the Pracilic, ant on tha south and west ly the

Pacific; botween lat. $8^{\circ}$ and $11^{\circ} \mathrm{N}$., and long. $81^{\circ} 45^{\prime}$ and $84^{\circ} 40^{\prime} \mathrm{W}$. Area, about 16,300 square miles. It is divided into six districta, viz, : San José, Cartago, Heredia, Alajucla, Guanaceute, and Punta Arenas, and estimated to contain 215,000 inhabitants, of whom 2500 are Indians. It is intersected diagonally by the primary range of tho isthmus, which throws of numerous spurs on elther side, giving to the surface a continued alternation of abrupt heights and sudden depressions. The principal range has several lofty eminences, and also several volcanoos, both active and dormant, including those of Orosi, Votos, and Cartago; from the summile of the last of which both the Pacific and the Atlantle waters are distinetly visible. Costa Rica contains sume exceediugly rich gold minea; hence the origin of its name. The mines, however, are now very little wrought. Silver and copper also exist. With the exception of the sea-coasts, the climate is mild and temperate, naver subject to excessive heata or colds, and rarely expericncing any other vicissitudes than those from the dry to the ruiny seaso... It is therefore extremely well adapted to agricultural purposes, and cap. of bringing to maturity most of the plants pectilia . tropics, and many exotles. The seil is remarkably fertile, especinlly the valleys and the tablolands. The productions aro coffec, cacao, Indian corn, tolincco, sugar, and some wheat. The horses of Costa Rica ure of an juferior description, but the mules are much esteemed; and cattle, sheep, goats, aud hogs are reared in great numbers, and of excelient quality.
Among the principal rivers of Costa Rica are the Tempisque and Grande, falling into the Bay of Nicoya; the Ueus or Macho, which afterward tukes the name of Reventason, and falls into the Caribbean Sea; the Matina, formed by the rivers Chirripo and Ba.hilla; the Essudo de Verugua, dividing Central from south America; the Banann, Tribec, and Culabra, all falling into the Caribbean Sen; the Chrico Moln or Cl-rickain Aula, falling into the Bay of Cherigui; the Costa Rica or San Carlus, and the Snrapiqul, into the San Juan. The Bayn is a canal, believed by some to be uatural, nod by others to have been cut by the aborigines, commencing at the port of Moin or Salt Creck, and ruming paraltel to the coast as far as I'earl Kay Lagoon, a distance of 180 miles.
Costa Rica protuces, in large cuantitie 3 , mal.ugany, cedar, Itrazil, and varions other kinds of timber. On the sea-coast of Nicoya some perls and large quanti ties of mother-of-penil shells ais feusd. Coltee, however, forms the most injportant preduct of the republis. Its cultiva . .o', though only introduced abent the year 1830, has lnereased so rapidly, thut 3000 to 4000 tons are now experted annally. Tobaceo, which is of excellent quality, is a govcrument monopoly, and is exported in small quantities. The other exports are gold, sugar, Brazil wood mother-of-pearl, ox nud cow hides, horns, etc. The imports consist chictly of manufactured goorls. Total revenne in 1852, \$16.1,157; exjenditure in the same yenr, $8415,207$.

The conmercial relations hetween tho Vinlted States and Costa Biea aro regulated by the treaty of July 10 , 1851, and by the local legislation of the comatry. The trenty guarantees reciprocal freedom of commeree, and phaces the two comutries, with respect to each other, ell the footing of the most favored nutions.
The loeal commercial Iegislation of Costa Rlea was completely remodeled and materially modified in the year 185i. The decree by whici thils was effected bears date August 31, 1 Roju.

The 1st article grants liberty of conımerce to the vessela of nll nations--specifying certain descriptions of merchandlen monopolizel by the a vernment, and othera prohibited; which are detalled fin the tariff of Costa Rlca.

The ed article provides that, at the minor ports, the export of prodactions of the country only can be permilted, uncer proper regulations.

Arr. 8. At the inland or frontier ports, cuatom-houses shall be establishad, under euch regulations as tho govcrnment may deem fit to adopt.
Art. 4. At such ports, inland and expurt commoree only shall be allowad, except in respeot of such mar chandise as shall be monopolized by the government or proliibited.
The second chapter of the law enntains a specification of free goods, together with a llat of prohitited articles; among the former beiog the personal effecte of, or merchandise exported for the use of, diplomatio agents or thoir sulte, but not those of consuls; and ln the latter are included rum, fire-arma, and munitions of war, which can be Imported ouly under apecial anthority. The monopolized articles are tobacco (in leaf or manufactured), powder, and saltpetre; whlch can be admitted only on government account.
This law extends to sixteen chapters; and such pai:a as apply to navigation and commerce would be translated and inserted at length, were it not underatood to have been matorially modified by a recent decree, of which n summary is glven, wind the tarlff of Costa Ricn.

Tha United Statas consul at San José (Costa Rica) communicates the following changes, under date October 8,1855 :
"I have the honor to Inclose horewith copies of three decrees itshed by this goverament, nambered, respectively, 1 , \& and 3 No. 1, dated November 24, 1854, ja merely prorogulng the time fixed for the new tariff (a copy of which han been (ransmitted), to take effoct from the 1at of December, 1854, ts the 1st of July, 1855. No. 2, of the same date, requires, artiele 1st, prerious to the landing of merchandise, in additioa to the manifest heretofore presented by the mastii of any vessel arriviag at the port of Punta Arenam, that permission to disembark be obtained from the collector of customs, and that in the document solleitiog this permisalon must be eppressed the quality f . origin of the goods intended to be janded, and elso their markot velue tin the port. Article 2 requires, previcas to the clenrance of a vessel from any port of the republic, the prasentation by the consigneea of a manlfest of the morchandise to be exported, and lis value in the
wirt of abipment Article 8, or the mame, requires, in cases whare a part only of a carga hes been lsnded, that the conaignees, previous to a clenrance, present another corrected manifest;' specifying the quelity and valne of the goode that have been landed. No. 3, rated July 24, 1855, ordern that all distilled spirits landed in lla port of Punts Areasas be deposited in the pubilio steres, and exacts the payment of four centa per pound, groes welght, upon their removal from bond. No further chamges have been made in the commercial syetera of this republlo within the time apecified.".

For the legt fifteer years the country has been rapidly progressing, owing to the peaceable and industrious character of the people; and the moderate course puraued by the government. Many internal improvements, prineic ally in common roads, have heen complated; and the productions of the country have increaned so that the exports now amount to $\$ 1,000,000$ yearly, while fifteen years ago they amonrited only to about 100,000 . In the eame time the population has been doubled, and may now (1856) be estlmated at 180,000 inhabilants. Some few emigrants, principally Germans, have gona Into the country; but the difficulties met with on the route to Costa Rlca will prevent tnuch immigration. The two principal ports of Costa Kica are l'unta Arenat, on the Gulf of Nicoya, and Mattina, on the Caribbean Sea.

Moneys.-The money of account is tha peso, or dollar, valued at the amme as tha United States dollar; but some ure colned of baso metal, which are worth only 75 cents. At Venezuela and Ecuador, the dollars are similar to thoae of New Granada. 1 dollar $=8$ reals ( 100 centu); 1 real = 16 quartos $=32$ maravedi, also 12 grani.-Cor. P.J. of T.

The values of imports and exporta between the U'nited States and Costa Rica can not be distinguished from those given for Central Ameriea generally. The following etatement, exhibiting the general foreign navigation and trade of the principal port of the republic (Punta Arenas), furnishes a fair average annual statement. It may be observed, that the values are given from ships' registers, or invoices, and are, consequently, considerably helow the market values.
 Endino Deoknter 31, $18 j 5$.

Costume. Accounts of magnificent attirc refer to very remote antiquity. The costume of the Grecian and llonasn ladies was comely and graceful. Tha women of Con, whose country was fameus for the silkworm, wore a manufacture of cotton and silk of so bealtiful and delicate a texture, and their garmenta, which were alwayn whito, were so clear and thia that their bodies could be sesn through them, -0 Or's. As reistes to costume worn on the stage, Jischylus the Athenian was, it is said, the first who erected a regular stage for his netorn, and ordered their dresses to bo suited to thoir characters, about $486 \mathrm{n} . \mathrm{c} .-\mathrm{Parion}$ Marblea. Excess in dress was restrained by a lew in England, in the reign of Edward IV., 1465. And again in the reign of Elizabeth, 1574.-Stown. Sir Walter Roleigh, we are told, wore a white satin-pinked vest, close-siseved to the wrist, and over the body a brown doublat finely flowered, and embroidered with pearla. In tha feather of his hat, a large rulyy and pearl drop
at the bottom of the sprig, in place of a batton. IIl breachen, with his stockinge and ribbon garters, iringed at the end, all white; and buff shoes, which on great court days, wers 80 gorgeously covered with precious stones as to have exceeded the value of $£ 6600$; and lie had a suit of armor of solld silver, with sword and belt blazing with diamonds, rubice, and pearls. King James's favortte, the duke of Buckinghau, could afford to have his diamonds tacked so loosaly on, that whan ho choas to stiake a few off on the ground, he obtained all tha fane he deaired from the pickera-up, who were generally les clames de la Cour.-Maydn.

Cott, or Cot, a particular sort of bed-frame, suspendod from the beams of a ship, batween decks, for the officers to sleep in. It consists of a large piece of canvas sewed into tho form of a chest, about six fect long, one foot deep, and threa feet wide, and is extended by a square wooden frams with a esnvas bottom, and used principally in the ward-room of a man-of-war.

Cotton. . This artlele will be nonsidered mader the general heads of I. Species and Places of Production. II. Cotton Climate : 1. Of the World ; 2 . Of the Unlted States; 3. Nlle ; 4. Algeria; 6. Arrica; 6. The Medlterranean; 7. British India. III. Cotton Trade of the United States: 1. History; 2. Statistles. IV. Cotton Trade of the United States with 1. Great Brit aln; 2. France; 3. Spain; 4. Haree Towns; 5. Belgium; 6. Sardinja; 7. Switzorland; 8. Rusila; 9. Sweden ; 10. Portngal ; 11. Brazll; 12 Egypt ; 13. Mexico. V. Capacity of the Cotton Bule.

Cotton Manufactures will he treatod under lto proper head.

1. Species and Placks of Prodection of Cot-ron.-Cotton (Goseypium) ie a vegetable down of exquisite softness, with beautifully flae fibres, and is an iudigenous product of all intertropical regions. Linnaus suldivided the cotton plant Into five apecles: 1. Goesypium herbaceum ; 2. G. arboreum ; 3. G. hirsutum; 4. G. religiosum; 5. G. Barbadence.

Other authorities have ennmerated as many na ten species, but for all practical purpesea the division into three classes will be sufficiently ininute. The varieties are exceedingly numerous; yet of those most widely diffused, herbaccow cotton, ahrub cotton, and tree cotton need ouly be espectally referred to. The inost useful cotton is tho herbaceous, which is an annual plant, chiefly cultivated In the Uuited States and in the Fast Indles. It grows from two to five feet in height, is rich in foliage, and its fibreus fruit is preceded by flowers, of white or pale yellow color, like those of the convolvulus. As the tlowers fade, a pod, or eapsule is formed of the size of a small walnut, containing tho filires of cotton, and as the pod ripens it expands, and the snow-white fibres burst forth ready to bo gathered.

1. The /Ierbaceous Cotton.-This plant grows to the hejght of elghteen to twenty-four inches, with leavea of dark green, blue-veined, and fivo-lobod. The flower is a pale ycllow, one piatil, dive petals or leaves, purplespotted at the bottom. On the falling of the flower a pod of triangular shape and triple shell is doveloped. The pod, In course of ripening, burste, disclosea a snowwhite or yellowish ball of down, in three locks, inclosIng and tightly-adhering to the ceeds, which resemblo those of the grape, though of several tlmes the size. The seed in planted in spring, and the cotton gathered at fall. The rows in the fields are five or slx feet apart ; the distance of the holes, in whlch several seeds aro deposited, is about eighteen inches. Much carn in weedIng, thluning, and prunlog, is required during the process of eulture. This Is the course pursued in the Unlted States, which has the atvantage over that pursued in India, by produclag a cotton varly more valuable. A field of cotton at the gataering, saya Mr. llalnes, when the globes of snowy wool are seen among the glossy dark leaves, is slingulariy beautiful ; and in the hottest conntrles, where the yellow blossom or flower and the ripened frilt are seen at the anme time, the Ineauty of the plantation Is, of course, still more remarkable. The herbaceous cotton is grown to the greatest extent, and sald to be cultivated in nearly every country omgenlal to the gossyplum, oxlating even at Alop$\omega_{0}$ In Upper Egypt, Arabia, and Senegal.
2. The Hirastum, or Shrub Cothon-It in suld to grow wherever the herhaceous is found, and to vary accorling to cllmate, belog blennlal or trieunial in the West Indies, Iasting from six to ten years In India and Egypt, perennis) In the hettent elimates, and in the mildest cotton regions an annual. The ahrub eotten is likenel to a currant bush, and Is of several varietles. The him sutum, a low shrub alrealy mentioned, the Indicwm, attalning ten or twelve fect; the riffofium, of the south of Vrance and South Amorica; the religiosum, of Surlnam and Iudia; the kuifulium of the Weat Indies ; the Harbalewse of Barbailoes; and the flerwiom. The pod of the shrub cotton differs from that of the heris in being egis-shaped. The Guiana and Ilrazil cotton is of
this kind, and is said to yield, in the hottest countries, two crups a year.
3. The Arburescent, or Tree Cotton,-This remarkable plant la of Indian, Chinese, Egyptiarr, and Amorican growth. The helght of the tree varles from fifteen to twenty feet. Marco Polo describes the tree at Guzerat six yards high, and bearligg frult for twenty years. There is a tree deacribed in South Anerica, Indlan Isles, West Indies, and on the Guinea coast, of a hundred feet high, bearing a silky cotton, only useful for making quilting and lseds. ... The justly-celebrated American sea-island, stem is derived from the arboreum. Its fibre is long, strong, silky, and of a yellowish tinge. The seed ls black and of Peralan origin, though originally introduced Into thls country from the Bahamia Islands, whero it had been introduced by the Board of Trade from Anguilla, an island of the Caribbean Sea. This cotton was raised first in Georgla in 1786, and tho tirst bag exported by Alexander Bissel, of St. Simon's Island, two years aiter. The soction of country capable of producing thle staple is vory limited, being confincd to the low sandy islande along the const of South Carolina and Georgia, from Charleston to Savaunah. The quantity grown in 1805 and in 1832 was precisely the same.

In the United S'rates the seed of the herbaceons cotton is sown gener:ily in tho months of March and April, and its marketable fruit ls usually gathered in the period commencing whth August and terminating with the year. Boweds and Orleans cottons constituto the great productions of the United States, and aro recognized in the Eugllah and European markets as "American cutton." Theso cottous are chictly cultivated in the great valley of the MIssiasippi, the fields of its growth now extending to Tezas. The cultiva. tion of cotton the the United Stetes ls most sclentifically and induatriourly pursued, and is attended with highly profitable results, the value of the crop being little less than $\$ 150,000,000$. It is expected that in 1856 tho entire crop will amount to $3 \frac{1}{2}$ millions of lages, of more than 400 llss. each. Ilut the skill of the American planter has been most conspicuons in tho production of fine sea-Island cotton. Tho seed of thls cotton, which is also an annual and herbaceous plant, was obtained in 1784, in the Ilahama Islands, where St had been Introduced from the West Indies, and was first cultivated in Georgia. The small islands which extend along the American coast from Charleaton to Savannah were found, from thelr sundy soil and contigulty to the sea, to be admirably adapted to the prodiction of exquisitely fine, long, and strong-stayled cotton. This cotton soon acquired great and doserved celebrity. A great demand arose for it; but from the limited extent of the islnuds upion whleh It can ho grown, and the expenso attending ite cultivation, It eun only be supplied at a conparatively high prics. Hence the prodection of this cottou was inet susceptille of indefinte exteasion like tho shorter-stajpled cottons of the United States; and from the beginuing to the middle of the present century the total yearly amount of the crop has not greatly varied, the ammal yield averaging aboot ten millions of pounda weight. From the circumstance of the seed of tbin cotton having been first introluced into (ieorgia, it was consequently called Georgia cotton, though its cultivation had ouly been successful upon the sea-const of that atate. Ita colelarity, howover, cansed it to be planted upon the high'atuos of fieorgis, where it was found to degenerate; but antl the quality, though shortened in staple, was found to be of a desirable class, and it aoouired the name of uplands, or bowed (ieorgia cotton, while tha same seed ylulded the famed sea-isiand cotton. Ilere It may be observed that a humld atmospliere and a sandy soil seem most conducive to thu production of good aseful cotton; but for the growth of very fine and long stapled cotton an impregration of salt, both in the soil and in the sir, appears to tre indiapensable. of Great sessell a for prod probable reasonal ests alon producti. ing hom fsptories. English or suping pmoduced increasin remunera plies of it the past, new and ture to co remaia, veloped pational which to classes ha source.
In the ufseture o ja any ot Cbristian manufoctu then consh etablo pro ceous cotte to manipu ufacturing clunged to years befor applying ton, India weaving, t of titne, re plant inclit for intellit, rism, it is to the mee times, and duction of been impro of India, il garded as to the iike questionali site clemen to an alino. night bo an tores of Eill of years tho and comaun tenth of thi ted at nour home-cunsu supply onls the manufi qually of t weull be vo largely aup colenles ha jart of the the possessi extent of la any other dd quality mig iu Australlin

Wlthout the energy of the American planter, it is dificult to conceive the possibility of the cotton trade of Eagland and of the world attaining the extent alid importance which it now possesses. As the colonies of Great Britaln-the West Iudies in particular-possessed all the natural advanteges of soil and climate for producing cotton to an extent much beyond the probshle conaumptlon of the United Kingdom, it might reasonably have been inferred that the colonial interests alono would ha a atimulated the cultivation and production of cotton $:$ supply the certain and Increasing homo demands of the constantly-enlarging manufartories. Whether the fataity of protection to the English colonias, maladministration of colonlal afiairs, or supineness on the part of the $c^{\prime}$ 'snists themselves, produced the indifference which caused an article of increasing importance like cotten to bo neglected when remuncrative marketa were opening for indefinita aupplies of it, may be wisely inquirel into, not to remedy the past, but for the purpose of ascertaining how far a new and profitable direction masy be given for the future to coionial labore and efforts; for the stigma will remaia, that while arta and inventions were being developed at home, which became the sources of great aational wealth, tho cultivation of the material on which to exercise the skill and labor of her workingclasses had to bo sought and obtainad from a foreign sunce.
In the British East Indies tho caltivation and manpfacturo of cotton hava certalnly existed longer than in any other country. Fior five centuries before the Christian era, cotton, was largely used in the domestic manufactures of India, and the clothing of the IIIndooa then consisted chiefly of garments mado from that vegctablo product. Earliest in possossion of the herbaceous cotion plant, tho natives of Indla were enabled to manipulato its fibres, and to ryiabliah a cotton-manuacturing industry which has remained almost unclunged to tho prosent time. More than two thousand years before Europe or England conceived the diea of applying modern industry to the manufacturo of cotton, India hat matured a system of hand-apinnieg, weaving, and ilyoing, which, during that vast period of timo, received no recordod improvement. With a plant indigenous to tho soil, and a peoplo remarkable for intelligenco when Europe was in a state of barbarism, it ia wonderfut that 110 approximation waa mado to tho mechanical manufacturing operations of modern times, and atill moro atrango that tho agricultural production of cotton should uot within that period have been laproved and considerably ealarged. Tho cotton of India, during its known existence, can only le regarded as a material for manufacture greatly inferior to the like productlons of other conutries. Indin unquestionnily possesses soll, cilmato, and all tho requisito elements from naturo for the cultivation of cotton to an aimest loundless extent, and of a quality whieh minht be uost useful and atceptable in tho manufacistes of Europe, and oven of America. During a serics of years the weight of cotton grown in the East Indies and consumed in Gront liritain may have beon onetenth of tho whule, whilo the valuo can not be estimated at more than one-twentieth of the total cost of home-consumed raw cotton. Tho British West Indies supply only sumbli portions of the cotton required by the manifseturers of the United Kingdom, though the qually of the cotton there produced is excellent; and would the very largoly bought and consumed it it were largely supitiled. For a conslderable time the Ifritisi colonies have not anjplied more than onotwentieth jart of the IBrltisi consumption of cotton, and yet in the poasension of Great Hritain there exiats a greater extent of land suited to tho growth of cotton than in any other dominion. At l'ort Natal cotton of excellent quality might be grown to any reasonable oxtent ; and in Anstralin, cotton equal to the finest of the fine might the pruluced to ant almost intefluite amount.

The mont remarkablo fact is, that although cotton was cultivated in gardens from remote antiquity in China, yet this ingenious people never turned it Into any account until the end of the thirteenth century, at which time its manufisctnre among thom began:
The following pasagges from the narratives of those who have visited India, are repiete with interesting information on the subject before us. Mareo Polo found cotton in Guzerat In lareo quantities, taken fiom a tree about six yaris hif $b$, and bearing for twenty years. The cotton from a tree of this age is adapted only to quilting, but that taken from trees of twelve ycara is suitalle for muslins and other manufactures of extraordinary finaness. Sir Joha Mandeville, in the fifteenth century, later by fifty yeara than Polo, says, that in many plates the sar in the cotton in Indla which we call tree woul, fs $r$ every year, and there spring up from it copses $c \cdot v$ ehrule on which the wool grows.

A luxuriant fieid, saye another, exhibiting at the same time the expanding blossom, the burating capsule, and the snowy flakes of ripo cotton, is one of the most beautiful objects in the agriculture of Hindostan. Malto Brun is equally instructive on the point : "The cotton tree grows on ali the Indian mountains, but ita produce is coarse in quality; the herbaceous colton proapers chiefly in Hengal and on the Coromandel Coast, and there tha best cotton goods are manufactured. Noxt to these two provinces, Madure, Marawar, Peacaria, and the const of Malabar produce the linest cotton. Tho plant ia cultivated in every part of India; tho flnest grows in the light, rocky soil of Gazerat, Hengal, Oude, and Agra. Tha cultivation of this plant is very lucrative, an acre producing about vino quintals of cotton annually."

Brazil is an extensive cotton-growing country, and sends steady supplies of it to the European marketa. The qualityofits cotton is avery where highly esteemad. I'eraia, Spain, I taly, Malta, and tho adjacent countries, are all capabic of producing excellent cotton; but in Africa there are probably greater undeveloped resources for the cultivation of cotton than can be found jun any other portion of the globe. The exampla of Egypt is a great lesson for the governors of those countrics whose agricultaral resources remain undeveloped. In 1821, Mohemet Ali conceived the possibility of affectwally cultivating cotton, and succeeded. From that year to the present timo large supplies of that useful and now indispensablo raw material have been obtained from Egypt, to tho great convenience of the Dritish manufacturer, who has found the quality second only to tho sea-island cotton of tho United States.
Tho herbaceous cotton plant unquestionably exhlbits ali the desirnble qualities of cotton applicable to manufactures, as proved by tho productions of the United States and of the East Indica. The cottons prodiuced in tho West Indice, in Brazil, and in Egypt, aro from the shrub; and It is obeerved that tho odier the plant the coaraer hecomo the fibres. Tree cotton, as a murkotable product, is almost unknown; hut in llorneo, and in many other tropical reglons, the piant on which it grows is fcund fiourishling in a will stato. To insure economy of cuiture, and of gnthering the cotton as it opens mui ripers, it is evident that the plant and tha shrub nre most aceessible, and that the trea ant not always be eithor aafely or convuniently climseri to olitnin its downy fruit.

In Central Africa, cotton has also been a staplo growth since the date of our carliest recoris. It is mentioned by travelers as abundant on the lianks of the Senegal, the Gambia, and the Niger, at Timbuetoo, Slerra Leone, the Cape de Verd Islanda, on the coart of Guinea, and in Abyashia. In hot climates, also, says an authority, the cotton plant grows ao ahundantly, that this is tho cheapent insterisi of which cloth easi lio matio. With auch recommondations, It can not fail to contime the staple and unlvernal manufacturo of Afrien.

In modern times, no material on whleh the industry of mankind is exerted can be conspared with the vast Importance of that bencticent gift of Providence, cotton. Millions of our fellow-creathres depend apon its cultivation and manlpulation for support. Capitalists enabark in its prodnction and manufacture, as also in Its trading and mercantile diatribution. Natlonal recources are enlarged and benefited by it ; and to Great Britain and the Unlted States it has proved ef fountain of wealth, from which streams of prosperity have flowed from the time of its first introduction as an agent of labor and traffic to the presart moment.

The upland cotion is a different epecies from the aeaisland, and is separated with such difficulty from the seed, that the expense of cleaning the wool must have put a atop to its further cultivation, had not a machlne, by which the o,w ration of eleaning is easily and successfully accomplished, been invented. This machlne was invented in 1795 by Mr. Eli Whitney of Massachusetts. There are two qualitiea of the cotton - the one termed Upiand Georgia, grown In the states of Georgis and South Carolina; nnd the other, of superior quality, raised upon the banks of the Misalsaippl, and diatinguished In the market by the name of New Orieans cotton. A strong prejudice existed for some time against the upland wool, which was thought to be of inferior quality, and not to take a good color in dyeing; bat belng found sultable to different coarse fabrics, its cultivation was so rapidly extender, that in 1807, $55,018,449 \mathrm{lbs}$. of upland cotion were exported from the United States.

The cotton of the finest quality ever brought to the English market, or probably ever grown, was that formerly mentioned as having been raised in the island of Tot , go, between the ygars 1789 and 1792, upon the estate of Mr. Robley. That gentleman carried the cultivation of this article to some extent; bat the price of cotton falling very low, and the cultivation of sugar becoming extremely protitable In consequence of the destruction of the sugar plantations in the French islands, be was induced to convert his cotion grounds into a augar plantation. The production of cotter of this very tine deacription has hardly ever been attempted by any other person, although it is believed that the price it would yituld would amply repay its expense.

Until about the year 1815 , it was thought that the cotton wool of India, from the ahortness ef its staple, could not be apun with advantage upon machinery; and, In consequence, the greater part of the Indian cetIon was apun upon the common jenay, and useds weft for the coarsest calicoes. It was discovercd, however, that by mixing it with the longer stapled $v$ fis of other countries, it mighi be brought into a state fit for thc mule and apinaling frames.

The United States consul at Naples, in answcr to the cotton circular lssued by the Commissiuner of I'at. ents, says: "The cotton cultivated in the plains near Castelamari, Angri, Scafata, and Nocura, is situilar to that of the United States. The plant is amall and annual, and ia cultivated with so much advartage that various projects by companles have been started to give extension to its cultivation; but withont belng carried into axecution. It has been cultivated for more than ten yeara. Before the French occupation there was a very limited quantity, but during the llerlin and Milan decrees of Napoleun, the cultlyation Increased very rapldiy, and the price reached a dollar a pound, though it had to be sent by land to Lombarily, Switzerland, and France. The quautity has since decreased. I have not been able to learn whether the French introduced seed, or sowed auch as they found here; but the cotton fibre has not deteriorated either as to lengeh, atrength, or unlformity. On the contra$r y$, the quality has improved.
"About two millious of pounds are produced here. In Stelly, to the south of the island, the cultivation is greater than in Naples. In past times, amall quantl.
tles: of cotton were shipped to Ilarseilles, but since manufactures have incriased here, It is all consumed in the country. The most extensive manufacturers (Vonwllier \& Co.) jmport annually from the United States two cargoes of cotton, of inoderate size, besides quantitlea indlrectly. Much twist is imported from England. Manufactures are improving, but are still far from reaching such perfectiou as to offer any inducement to export them.
"The price of ginned cotton is about 14 to 15 cents per pound. The cultivation in protected by a duty of 88 per cantar of 196 lbm . English if introduced direct from the United States, and 16 if indirect. It is ghined by the ordinary roller and by hand, as well as by the saw-gin; and 100 lbs of unginned will yield about one-thlrd clear cotton. It is packed with hands and feet, and is not exported, nor is there any fixed numier of pounds to the bale. The cost of preducing one pound of cotton fibre, well ginned, is from 10 to 12 cents.
"An aero of gronud will prodnce about 600 lbs , of unginned cotton. The value of an acre of cotton land is $\$ 450$, and the rest is $\$ 20$ to $\$ 25$ per annum; but you must take Inte consideration the annual land tax of from one-lifth to one-fourth of the rent, whlch mast lee paid by the owner of the land every two months in equal rates.
"If any causes operate Injurlously to the cotton crop, they are to be ascribed more to the social condition of the Inbabitants than to any thing else. The relations generally between the landowner and the cultivator - re not of the best kind, tho bad faith of the latter being characteristic, while the owner barely luaves him enough to miserably aubslat on. In sume seasons, too, worms do injury to the planta, as well as foge and mists in July and August."
11. Cotron Climates. 1. The Coiton Districts of the Globe considered with reference to their Climates.On inquiring lato the cllmate best suited to the cultivation of cotton, we must remember that we have to pay attention, not only to the air, but also to the vaper. These may be considered In some respects as forming two distinct atmospheres; the one uniform in quantity, and in the proportion of its ingredienta, but ever-varying in temperature; whlle the vapor varies not only in this respect, but in the quantity in which If Is jresent, anil also in its point of depesition, when alone it becomes perceptibie an molsture.

Cotton is coltivated in so many countries, that we can not but expect it to be capable of flourishing in considerable diversities of climato. Thus, the rich alluvial ands of the Misaissippl differ not only in soll, but a'su in temperature and dryness, from the sandy thelds of Georgla. In dryuess, both must differ from the uniformity of muisture which prevails in the islanda 'ahero sea-islabd cotton is produced. Some grows naturally fis the waruer parts of Mexico, as well ss In the countries sltuated along the east of the Andea; and much is culturated in the moist parts of Guiana and Hrazil. Hunibeldt has seen it at 900 feet of elevation In the equatorisi Andes, and at $\mathbf{5} 500$ feet In Mexico. llut here differnt apecies may, perhaps, be Inciuded, as we know that which yields Pernambuco cotton is cultivated In many parts of South America. In tho Old Werld, we find cotion growing in the interior, foth of Africa aad of India, where there must be considerable dryness of climate. It ls cultivated with some success lo Egypt, and slao, of late, In Algeria, ant near d'ort Natal, In South Africa; but, in the two former, only by the ald of artificial irrigation. It is produced In various lslanda of tho Indian Ocean, in many pasts of Chlna, and in almost every part of continental India. Thence it may be suld to extend into l'erala, Asis Minor, and to the nouthern parta n? Europe, ineluding the isianda of the Blediterrancan, whence the English manufacturers recelved their earliest supplies of cotton.

Within forty degr iiderable mer in ma as might 1 perature of tha amoun continents, greater cle compajativ lacrease ev radiation $\mathbf{v}$ mosphere. Bubadense favorite eli mean anna helt, but tl In tho tem heat of $73^{\circ}$ $46^{\circ}$ or $48^{\circ}$.

Haron Ifum out that, while beth in winter a continental rea climate ', with a cook kur

Within these limits, extending from the equator to forty dogrees of intitude, we know that there are considerable diversities of climate ; but the heat of summer in many of these localities, does not differ so much as might be expected from their latitudes. The temperature of tropical regions is known to be modified by the amount of moisture, while that of the interfor of continente, even in high latitudea, is increased by the greater clearness of sky, which is dependent on the comparative absence of moisture. This cause tende to iacrease even the cold of winter, from the more free radiation which takes place at night in a cloudiess atmosphere. Humboldt has remarked that Gossypium Baibadense, hirsutum, and religiosum, have each thoir favorito climate, from $0^{\circ}$ to $84^{\circ}$ of latitude, whero tho raesin annual temperature is from $82^{\circ}$ to $38^{\circ}$ Fahrenheit, but that $G$. herbaceum is successfully cultivated in the temporate zone, where, with a mean summer hest of $73^{\circ}$ to $75^{\circ}$, the mean of winter is not less than $46^{\circ}$ or $48^{\circ}$.
But, in takiog a general survey of the localities where cotton is chiefly cultivated, we should observo that many of them are in isiands, and others in tho vicinity of the sea. This is certaialy the case with the districts where the finest cottons are produced, and the jargest returns to tho acre obtained. It has frequently been stated that tho benefielal effeets of auch localities are chiefly due to the presence of salt in the soil, or to its being carried $u_{i}$ in the spray, which is transportel by winds into the interior. Koster, in his "Traveis in Brazil," states, on the contrary, that "tho districts which are universaily allowed to be tho best ulapted for the growth of cotton, nre far removed from the sea-coast, arld, and oftentimes very seantily supplied with water; also, that tho opinion is very generin, that the cotton plant wilt not thrive in the neighborhood of the coast, and also that plantations wero yearly reeeding farther into the interior, tho soil preferred teing a deep-red earth, whieh becomes extremeiy hard after n long interval without rain." Something, no doult, must he owing to the species which is cuitivated, and to tioc climato oi tho plantation belng more or less moist. Ihus, Spix and Martius, in their "Travels," state that "the cotton irte cultivated at Rio de daniero ( $G$. Barbadense-sometimes, but more rarely, the $G$. hertaceum) thrives very well, $i$, $t$ is atated net to furnish such durabie materiais as that in the higier and dryer distriets of Minna Novas."
Proximity to tho sea hos, however, other peculiarities besides the facility of affording saiine ingredients to the soll or to tho atmosphere. It participates, to $n$ certsin degree, in the peculiaritics of an insular climate ; that is, in greater unlformity of tenipernture than is foumi in places farther in the interior, and in the freer circulation of air from tho nsuaily aiternating isnd and sea breezes. Thero ts niso greater equability of moisture ; for air, passing over the aurface of tho *ea, necessarily takes up a larger proportion of water. This it does not inmediately deposit on tho coast, uniess it is baeked by hiliz, lecenise it usmaliy becomea $n$ lituls warmed by the heated iand, and is then eapaile of taking up more moisture. Hut, es it resches the coast in a comparatively moist atate, it necessarily rather checks than favors excessive evnporation, nud thus dioes not force thic foliage, exjosed to its intiuence, to give up an undue quantity of moisture. This, howerer, is necessarliy the case whenever a dry current of air passes over the surface of the ieaves. To the intluence of inoisture, therefore, we muat ascribe the more iuxariant vegetation of sume zen-coasts, and of many tropical isianda.
Haron llumbelit and Professor Dove have pointed out tinat, while Gurope has a true insular or sea climate, both in winter and summer, North America incilnes to a continental ,no in winter, and, in many parts, to a sea climato ' a smmer; that is, it has a cold winter, witis a coel xumber, with the excoption of certain dis-
tricts, which are excessively hot. Bat Northern and Central Asia have a true continental climate, both in wiater and summer, or a cold winter and a hot summer. Notwithstanding this, we must also recollect that, though each locality may participate in the char-- cteriatio climate of itt continent, all places near the coast will have more or less of an insular climate, while those in the interior have such as are of a continental nature, though in varying degrees.

The different varleties of cotton cultivated in the United States are believed to belong to one apecies; that is, that the "Georgian," or "Bhort-ataple," is the sea-island, carried into the interior; and that the "seaisiand" itscif was originally introduced from the Bahamas, or, more iemotely, from Anguilla, one of the West India Isiands. Ti.e "Now Orleane" does not differ spectieally from tha sea-island cotton, and is admitted by the planters of the South to be identical with the plant of Mexieo, whence they procure thelr tinest seeds. It ia coajectured that it was from the neighboring coast of Mexico that the indigenous cotton of that country was introduced into the Weat Indies, and thence taken to the island of Bourbon. Hence we may account for Gossypium Barbadense being identical in species with the New Orleans and sea-island, as well as with the Bourbon cotton.
The I Texiean plant is not a native of the temperate regions of that country, but of the tierras calientes, or hot diatricts. It is produced, for instance, in the neighborhood of Vera Cruz, and is represented as growing fpontaneonsly near Valladolid, a town situated on the great plain of the Peninaula of Yucatan, described by Iumboldt as one of the warmest regions in equatorial America. Mr. Stephens siates that the spontaneous growth of cotton around that town had led to the erection of a cotton-factory in the placo. Mr. Norman, in his " Rambles in Yucatan," says, "The cotton plantations, or, rather, the distriets where the material is raised that is conammed in the manufactory in this city, are to the north, and known as the Tizemen district. Tho same spot is seldom cultirated for two successive seasons. After the crop is gathesed, the ground is suffered to be overrun with weeds and brushwood, which, when years have clepsed, are cut down ard burned, and the field is replanted." This rude method of culture is addnced only to show how littlo attention is paid to the plant in its native comntry. Bnt, as it is desirabie to know something precise respecting the clf. mate of one ni least of its native districts, we take from Prefesnor Dove the sulyoined notice of the means of oisservations mado at Vera Cruz for thirteen years. This town, situnted on the coast, in latitude $19^{\circ} 12^{\prime}$ north, and in longitude $96^{\circ} 9^{\prime}$ west, has $n$ mean temperature of $77^{\circ} .02$ Falirenheit, with a difference of only $12^{\circ} .42$ between the hoteat and coldeat months, thus:

| Jannary | 00.98 | July . . . . . . . . . . . . 81 t0 |

The Mexican eotton has been introduced into Texas, ns weli as into Lonisiana and Aiabama. In the sonthern parts of 'Texas, where the climato is very congenial, the piant does not require to ho renew eid more frequentiy than once in threo or four years, to yicid a crop auperior in quality and ipuantity to the annual planting of Louisinne. Cotton pianting, in that part of Texas, commences in February, and picking legins at an eariler and continnea fur a longer period than in the other states; the average return, also, to the acre, is considerably greater in Texas than in the other states, and the expense of cuitlintion considerably less, in conse. quence, not only of the grenter richness of the ooll, but also of the peculiar miliness of the climate. The cotton, moreover, is of a superior quality, and planters of
acinnowsedged varacity atate that it is not uncommon to plek 4000 pounde of ased-cotton from an aere. No Mr. Featherstonhangh, after erossing Iuto Northern Texas, In about latitude $33^{\circ} 40^{\prime}$, observed that he had naver seen the cotton plant growing in greater perfection before; for, in the cotton districts he had passed through, the plant was a low dwarfy bush, not exceedIng two feet la helght; lut here the planta were five feet high, often bearing 800 bolla, and yielding from 1500 to 2500 pounds of seed-cotton to the acre, which gives from 25 to 80 per cent. in waight of raw, marketable fibre,
The most anceessful eulcivation of cotten in the United States, It is well known, is is the lower parts of Georgla, Alabama, Mlasissippi, Loulsiana, and 'lexas. In thise regions there la comparativaly little frost, and the winter is alwaya mild, with considerable heat in summer; but this is tompered, to a great extent, by the pleassint and salutary effects of the sea breeze, which sets in $f \mathrm{rm}$ the Gnlf or the Atlantic for a great part of the day. There are heavy dews at night, and frequent ahowers occur, in the spring as well as in tho sumber. In the Interior and more northern portions of thase atatel (which are in some parts elavated from

800 to 1000 fect above the level of tho sea), froat is axpected in October, and often continues until April sometimea it occurs oven In May, so as to injure, but does not then weually deatroy, the plant. 'I'he heat of snmmer, though frequently high, stlll is tompered by the influence of the ocean or the Gulf of Mexico, ani of the numerous grest rivers, as well as by the dews and occasional showers. Tha cultlvation of cotton is generally commenced about the beginning of April, when the land is atill saturated with the winter rains, and difficulty is sometimes experienced in getting the land aufficiently dry; otherwise, a good ahower is es. sential when cotton is firat sown, and It is desirable also to have occasfonal ahowors during the planting, plowing, and hoelng acasons. The bolls hogin to opea about the middle of July, and contlnue to do so until the appearance of frost, from the middie to the end of Octobar, and the first delivery of the new crop on the sea-board is from the firat to the twentict. of August.

In order to have a more preciae idea of the climates of the most favorable cotton dlatricts, and for the advantages of comparing thern with those ot other countrics, tac anijolnod Tabla la aelected from Prefessor Dove, as publiahed by the Britlsh Aasociation:
$82^{\circ} \cdot 69$ encea being while, being additi of the and 0
seen vea, ut Ahis resem winto cenata gether hawe as lou habit bay a stato and $u$ conal rally the 2 conto thero from of rai long, are fe oua d of the 1000 the al
much the best cotton distriets aro influenced by the Atlantic, or the Mexican Gulf. The climate, to the wout of the Alleghany Mountains, is considered more mild than that under the same parallels in the Anlantic atates, and, hy aome, even to the oxtent if three degrees of lathude. This has been explained as caused by the wartil air of tho Gulf of Mexico being driven up the basin of the Mlesiseippi and that of the thio. Thu direction of the valley, north and fouth, no deubt favors the coarse of the southern winds, while the roglons of the Atlantle slopes, being transverse, oppore any such transmission, and also the migration of plants. The majorlty of the places of which the mean tempuratures have been adduced are on the aca-coast, and neccesarily participate, to some oxtent, in the peculiarities of an lisular climate; that is, of seasone moderately eontrasted. Still, the dilfirence between the hottest and the coldeat month of the year is moch greater than at Vera Crua; that is, than $12^{\circ}$; being, at Mothle, Galveston, and Now Urleana, $2 i^{\circ} \cdot 23,29^{\circ} \cdot 10$, and $29^{\circ} 96$, reapectively. But in the Interior, at Natchez and Vlekalsurg, the differences are greater, beling
the aonthern bordera of Virginia, to the southwestern streama of the Mississippl. Thu mean quantity over all is estimated at 120 pounds of ginned cotton, of both sea-island and of the slourt ataple, to an acre, but the anount of labor la much greiter for tho former than for the latter.

In comparing the cllnates of the eetton regions above thoscribeu with those of other comntries, it is nec essary to remember the pecullarity of that of America, with which this sulject was commenced, and nlso how and the heavy rains of July and August. The cold weather seldom commences before the beginning of December, and terminates In March, but the wiuter is usually mild, and suow seldom falls near the sea, and soon melts away. The lilly parts, 200 miles from the sea, are agrecable and favorable to health. The winter is colder; snow falls to a depth of five or six inches. Thought the preceding talles are sufficient to give a general llea of the climates, it would be deairable, for agrlcultural purposes, to have also the maxime and minima for the opring, sumuser, and autumnal nomehs, fur a series of years, as a night of frost may destroy the plants, aud great heat, with drought, will ise equally injurlous, from drying them up. Cottun, as before observed, is sown in April; pleklng commences in July or August, and conthues until Novemier, and, on the coast, sometimes ever as late as December, The seaisland plant ylelds aboat 125 or 130 pounds of clean gianed cotton per acre. Of the shart staple, in the hill country, from tha Misslasippl to the Carolinas, not more than 600 pound of aced eotton, or 150 pounds of clean eotton, can be obtained to the acre. The short staple cotton ls more or lese cultivated all the way from
$82^{\circ} \cdot 69$ and $81^{\circ} \cdot 57$. In the Atlantic districts the differences are nearly as great as those on the south coast, bcing $81^{\circ} \cdot 73$ at Savannah, and $81^{\circ} .09$ at Charleston, while, in tha interior, the differences are much greater, being $36^{\circ} \cdot 02$ at Augusta, and $88^{\circ} \cdot 10$ at Columbia. In addition to the foregoing, it is desirable to notice some of the general features of the climate, both of the Gulf and of the Atlantio states, as it will then be readily seen how much it is modified by the vicinity of the sea, und by the configuration of the cosst :

Mississippi.mNear the Gulf of Mexico, the climate resembles that of the lower parts of Louisiana; the winter is mild, the summer warm, but tempered by the constant pravalence of the breeze from the Gulf, together with the elevation of the eurface. At Natehez, however, the thermometer in winter sometimes stands as low as $10^{\circ}$ Fuhrenhcic. In eickly seasons, the inhabitant frequently remove to the bigh banks of the bay of St. Louis.

Alabama.--In the low and gouthern parts of this stato the heat is very great. The climate of the inland nod upper parts resembles that of Georgia, snd may be considered remarkably mild. Frost commences generally in October, and continues sometimes as late as the 20 h of May, 30 as to injure, bat not destroy, the cotton, in the mere elevated parts. During summer, there is usuully a prevalence of westerly winds. Those from the seutheast are regarded as the sure harbingers of rain. At Mobile, from nine in the morning till evening, the pleasnnt and salutary effects of the sea breeze sre felt. The rich verdure of the earth, with the copicos dowe that fall during tho night, and tho elevation of the soil, which, in the upland parts, is from 600 to 1000 foct above the sea, produce a beneficial effect on the climate.

Louisiana,-The elimate of most parts of this state is somewhat variable. From the sea to Point Coupéc, it seldom snows or freezes, except in the months of December ani. Jnnviry, and then when the wind is from the north oi nort'west. There is less heat and more moisture than in similar latitudes on the Eastern Continent, and the climate is gencrally very mild. In winter, the therinometer seldom falls more than two degrees below the freczing point. In December, 1800, the thermometer asnk to $12^{\circ}$ near New Orleans, and anow fell for the first time in twenty years. In January, 1811, the mercury fell from $78^{\circ}$ to $10^{\circ}$, and the Mississippl was completely frozen over. At the present time (February, 1856), it is reperted ns low as $20^{\circ}$, and the Mississippi as frozen quite over with the ico severnl inches in thickness, and the ground eovered with ico and aleet to a depth of six or eight inches.

Georgia.-All the flat country of this state is described as moist nnd unhenlthy dirring the warmer montis, especiully the "rice swnmps;" the ellmate is somewhat warmer than that of South Carolina. The winter is the most pleasant senson of the year, when the thermometer usunily ranges from $40^{\circ}$ to $66^{\circ}$, though sometimes a considerable degree of cold has prevniled; snow is uncommon, but frosts have been experienced even ne Inte as April. A strong northeast wlnd will oecasionally hight a promising field of cotton, as inacets wlli sometimes deatroy it. The spring is usually rainy, the summer inconstant, with a temperature of from $71^{\circ}$ to $90^{\circ}$ from Jnne to September. The atmosphere feels apringy nul enlivening, being refreshed by geotie breezes, which blow almost daily from the nenshore. Abont the 20th of July the summer rains set in , often necompanied with storms of thunder, and severe winds, which, though not tropleal in their violence, are eften so heary an to deluge tho fields. About thu end of July, or begimning of August, the wind nsunlly changes its direction from sontheast to southwest. The menth of A agnst is the period of most solicitude to the cotton-grower, at heavy rains at that timo oceasionally cause the plant to part with its young bolls, and even its leaven. The nutumn is usaally fine and clear; and
about the 20th of October frosts are expected, but do not often come before the end of the menth. The inhabitants of the billy tracts, two hundred miles from the coast, enjoy an agreeable climate, which is favorable to health. The winter is colder, snow sometimes falling to s depth of ixve or aix inches. The summer is not so hot, and the winds of autumn are less violent; and the cotton, being less exposed, is allowed to hang longer, so as to become perfectly mature.

South Carolina. -The winter of the lower parts of this state is mild; and the difference between the mild. est and severest winter is nbout seventeen degrees, often with hoavy frosts, and sometimes anow, but with a hat sum during the day; though snow seldom falls near the sea. The winter may be considered as terminnting in March, when snow and heavy rains qaually occur ; but April and May are commonly dry months. In the low country the heat of summer is intense; but the climate is liable to sudden changes of temperature, when it is damp with fogs and heavy dews. Junc, July, and August are generally the wettest months, and the raina consist of henvy bursts and frequent showers, which are lable to occur in spring, semimer, and autumn. November is usually fine, eren after the coming of frosts, which sometimes do not occur until December. The avernge quantity of rain, for ten yeara, was 49.8 inches; the largest quantity, $83 \cdot 4$ inches, and the least, $30 \cdot 6$ inches, in any one year. In the upper country, frost appears earlier and continues later: but the weather is not so variable. In winter tho cold is consideruble, but does not last very long. The c!imate of the Santee Hills, which are situated eighty or nimety miles from the coast, is similar in character.

Teras.-The climate of Texas is decidedly more healthy than that of Lovisiana, or any other of the Gulf states; still, on the low alluvial coast, intermittents are prevnlent during the summer and autumand tnonths; but the yellow fever is rarely known. Comparatively little rain falls from Narch to October, though gusts of wind, with thunder, frequently oceur, with sufficient rain to make excellent crops. During the rest of the year, hot weather generally prevails. The winters are warm and mild on the coast, and, for some distance inland, snow is seldem seen, except on tho ligher table-lands or mountains. From April to September, the thermometer, near tho coast, usually ranges from $63^{\circ}$ to $100^{\circ}$. The grentest heats, however, nro tempered by strong and constant breezes, which begin to blow soon after the rising of the sun, and continue until past noon. The nights throughout the middle regions are cool and refreshing during the year.Report of the Drpartment of State of the United States.

In connection witi the climate of the United States, it is desirable to take some notice of that in which another species, the "Brazil" or "kidncy" cotton, is cultivated. From the observations of the late Dr. Loudon, at l'ernambuco, it is found, that the quantity of rain which falls at that place is considerable, and that the oir must nlways be in a moist state. As Koster states that cotton succeeds better from 50 to $\mathbf{1 5 0}$ lengues interior, the climate may atill be more moist than that on the const.
3. Climate of the Cotton Region of the Nile.-The soil and climate of lypyt are adapted to the growth of cotton, but the yieli diepends greatly on the rise of the Nile. When the river is low the crop suffers, as little or no rain falls before December. Alnost nll the land in Lower Fgypt is particularly well alnpted to the growth of this product, yet it is not all equally good.

It rains frequently in the vicinity of Alexandria, and but seldom on the Deltn.
The culture of cotton in Egypt, on a large scale, is comparstively recent. It was first undertaken by M. Jumel, a Frenchman, who, in 1821, lald before tho Viceroy all the ndvantages and results arising from its production. Previous to that period, the cotton produced in that country was of juferior quality. A few plants
only had bean introduced from India, and were to be found in the garden at Cairo, whore they aerved as ornaments. From these the culture was extended on a grand scale, and became one of the principal branches of the agricaltura of tha Viceroy. Although th3 soll along the Nile appeara to be generally well adapted to the growth of the "Jumel" or "Make" cotton, it is planted in preference in rich, heavy lands, which ratain considerable meisture, and whers the plant can acquire sufficient strength to produce well-filled bolla. The grounds where the cotton is cultivated are kept free from the overfluwing of the river, as tha standing water would rot the plants and canse them to perish. The agricultural labor of the country is performed exclusively by tha Fellahs (peasantry), a peculiar race, who labor under a system similar to that of the serfage of Russia. The black slaves (chiefly Nubians and Abyasinians) in the country are occupied exclusively in domestic duties, and live bett und labor lase than the Fellahs. The latur are not polanitted coleave the promises to which they beloag, and the reward of their later la left to the will of the proprictor, and generally is the minimum of subsistence. They hire in nud hovels, and are allowed to partake of animal food but once a year, and then as a religious duty. Like the Emperor of IUussia, the present Viceroy has unde aome cxperiments in making the Fellahs nominal propristors of amell farms ; but the exactions of the Turkish offcials never loava much margin in their protits. Therefore, having but little interest in the soif they ealtivate beyoad the merest subsistence, their lathor is slovenly, their fields poorly tilled, and, conseguently, hmprovements can not well be introduced. The lellahs tako great care to protect the fiedes by dikes of cart. where they are sulbect to inandation at the time of tho rise of the Nile. Neverthelegs the cottoriplanas are wetered periodically by means of Sohyiehs, Shourufi, or water-wheels. In winter, they water them wery fit. teen days; in the spring, if there is much ciew, every twelve days; and in aummer, every oight days. It may here be remarked that, in sumner and autumn, the dowa are very copious. The system of irrigation is admirable. The planters of some of our senthern States mlght prolit by its adgption. In every other respect the culture by the Fellahs is sloventy to the last éegree. They begin to prepare the lamifor culture by flooiling it in December, and allowing the water to remaln upon it from ten $t 0$ twenty days. No manare is empleyed, as the ordure of the animals of burden is used for fuel. The only fertilizer is the deposit of the sediment of the Nile when the land is overtiowed. They plant in March and April in Lower Egypt, before which they ysually give only one tillage to the ground, if it bo rich; but if the soil be indiftier. ent, it is werked two or three times. In the vicinity of the Said, they every where plow to a depth of about fifteen inches. They then run furrows at the ciatance of abont 31 feel. After plowing they level the gronnd by breakiug the clods, nind it reynisea no further preparatlon. They then maku holes from t'ree to four lnchice la depth, and 3if feet apart, in which they teposit from two to four sceds that have been previously steeped In water for twenty-four hours to haston their germination. In asme case the Fellahs cultivate vegetables, otc., in tho hatervala lefween the phants. At the time of the inundation they eradicate the weeds. The first year, they cut tho cotton plante with a kiad of pruning-hnife, and remeve all the branches, whleh they use for fuel. This operation plves more atrength to the plants, and pruteets them frons cold, which wnath otherwine cause the branches to perish. Tho second year, they only work the ground when makling a new weeding, and the plaste, which hat before eapuired a grow th of from 3 to to 5 foet $\ln$ helght tha first year, now grow only ln a less degree.

The colton begins to tlower early in July, and con. tnues to lloom till Decomber, and even into Fobruary
or March. The period of harvesting varles in different diatricts. The firat year, il commencas in July an: ends in January, when the season is not too cold. The product of each plant is $1 \nmid$ pounds in the rough; the second and third years, from $1+$ to 2 pounds: but, in tho aulsequent yeara, the plants lose their fecundity, and it has been found necensary to renew them every three, and in aome jastances avery two yesra. They would produce bolls, however, for a long period-say fifty years. At the expiratlon of three years the plant lucreases in its shrubby character, produciag a very thick follage with but few bolls.

The yiald of eotton varies waring to the circumstances under which it is euitivated. That which is sown in winter, ealled $\mathrm{Ban}_{5}$, aud which is watered only during the inundation of tho Nile, gives, on an average, shove 200 pounds to the acro. Tt watered by means of wheels, and ciled Miskor, aivis elout 300 poun is

 deticiency of rain, lin ery hig: tha reverse, from the hest of ws, the uxtrems tumn Nor ia the whole of Aleuri of corton ; it is necessary to select thoes parts which are the moat propitious. On the chala of the Atlas, as well as on the plaine which crown ita heights, the heat, although in summer excessive, does not continue long enough in antumn to permit the complete maturity of the bolls. In the region of 'lell, it becomes necessary to abandon its culture at an elevation of 2000 , or even 1600 feet above the level of the selu. Bat, beyont this centrel and mountainous country, there extend tro aones which aro declared suitable for the growth of cotton, and it is sald that proof has been given to that effect; ono is the region ot the coast from La Calle to Nemeurs ; the other, that of the Saharian oasis. Another olstade to its culture is, that cotton, in general, eall not be planted before the middle of April without ruming the risk of the seeds perishing from the excessivemoisture of the land. Consequently, it enn net arrive at maturity before the polonged rains of autama commence, which nearly stop its growth. 'The province of Oran is reputed to be hetter adapted to the growth of cotton than the other two, Algiers and Constantinc.

Algeris, sitantell as it is between tho 3th and 37 th degrees of north latitade, bounded on one side by the Mediterranean, and ens the other by the Desert of Salava, from which it is separated by mountains, prossezsea a climate, in most parta, similar to the zolies bortering on the tropies. It is not, however, sifletly a tropical, nether can it he sald to be stemperate degion. It is jarticularly remarkable for the miformity oi It a t- ajerature throughout the year.

The sfoniteur contains a mpert fieas Marshal Vaillant, uldiressed to the Finiperor, on the aubject of tha growth of cotton in Algeria. In the docament the Minister of War recognized tho good effects of the decrees of the 16 th of October, 1853 , by which an annun prize of 20,000 franes was alloted for five years to the lient cetton-grower in tha Franco-African colony'; and for three yeara, ermmencing whit $\mathbf{1 8 5 4}$, the whole cotton produce of Algerla was ordered to le purchased by the state at a price fixed heforehnind, at andrantagcous rate to the producer. In consequence of this encouragement the growth of entton han increasen, and it is said the quality is equal to that of American growth.
In the eultivation of cottou in Alreria, stableadung Is sometimes ased, though but fow farmera pay any attention to helr flebde. As their cattle nre never housed, their mrans of mahing manure become rery Hmised. They flant from the 15th of April till the l0th of May, fil rows about two feet apart. The crop is hoed four times, and irrlgnied ass often ta water can be spared from other plants; and, when abondant, it

5. Climate of the Cotton Districts of other Parts of Africa.-Cotton of a very good quality has bees: cultivated for som? years at Natal, nearly at the so. thers extremity of Arrica. The coast is low along ".w. Ps gion, and, in some parte, even swampy; but w:e 1:id within ten miles of the sea is considered nost "ir. rable to the coltiv:tiun of cottor, probably frum the constant molsture of the atmosphere and the warm $h$ of the climate; though, no doubt, it may be auces. ifully grown farther in tha interior. The country by nd is described as being better ad sted to the purposes of grazing. Various attemplis he beer made po obtain
 the best varieties here been introduced from the United States. In Liberia, Dahemey, and other places, fine sanples have been produced, principslly from tho green-seaded and kidney-seeded sorts. The clinate is represented as favorable, but a different population is required for an extended and p:ofitable production.
6. Climute of the Cotton Regions and Islands of the Mediterranean.-Considerable quantities of cotton are cultivated in other coentrles bordering on the Mediterranean. It is generally the product of the India species, though seeds have been introduced from Eyypt and the United States. These are cultivated in Asia Minor, in parts of Greece, and the islanda generally known ss the Levant. The Italian eottons are produced in Sicily, in Calabria, near Naples, and in Malta. Those of Sicily, Calabrta, and Castellamare are the best, and ara usually produced from American seed. A Nankin cotton Is cultivated in Malta, but is all manufsctured for domestic use.
At Nuples, the soil and climate are $w=l l$ anited to the growth of cotton, with the aid of artificial irrigation in times of drought. In some seasons, however, the plante receive injury from insects, as well as from foge and mista, in July and Augist.
The manure, when employed, is the dung of animals, but no other fertilizer is nsed. The seed is planted in Aprit, in rown, with anfficient space hetween them for the passage of water, for the purposes of irrigation. The plants are in flower in June and July; the cetten harvested from September to November; and the yield per acre, unginned, besides other crops inetween tho rows, 600 peunds.
The soil ard climate of Sicily are bettec adapted to the growth of cotton than those of Naples, partlcularly on the southeast side of the islend, and within twenty miles of the sca. Further inland, the heat is not sufficient to mature the crop. The maximum temperiture of the cotton regions, from May till October, is $77^{\circ}$ Fuhrenheit ; minlmum, $614^{\circ}$; the mean $68^{\circ}$. The quantity of rain whlch falle during the cottou-growing months is generally fully auffielent for the perfection of the plant. The prineipal linjury to the crop is occasioned by long-continaed nerth winds, which, however, but seldom occur.
7. Climate of the Cotton Districts of British India.-The Britiah Fast India possessions etabrace an almost boundless extenat of territory, extonding from the Ilimalaya range of mountains on the north, to the ocean, Including nearly the whole of the peninsula of liindostan, the ishond of Ceylon, and that pertion of Ihrmah bying between the $20^{\circ}$ of N. lat, and the bay of Bengnl. In the peninsula of Iudia, the chimate is greatly influeneed by the two monsoons-one from the northeast, which blows ehfetly on the eastern coast, and the other from the southwest, which is mostly felt in Malahar and the western parts of the country. In some parts, the utrantages of toth monsoons are enjoyed; but his others, the change from the mointure of the rains to the heat and dryness which succeed them, is nearly as
marked in its character as at Saliarnm,ore, and the cotton-plants auffer as much from the transition. Such heing che axtremes of temperature and of dryneas, as well as the shortness of the several scasons in which the plant may be miade to grow-that ls, during the hot and dry weather, from March to Juac, or during the stcaming moistare of the rainy season, followed, at firat, by a hot sud molst summer, and then by a cold and dry automn, aceected by a braciag winker-a plapt, must be hardy to sustain onlnjuret such extreme and sudden viclssitu ${ }^{2}$ a. But all India is not identicat in climath. In some parts the accession of the $r_{i}^{\prime}$ is is earlier, t? ir termination more gradaul, and the wid of "inter less, or the country enjoys tho odvant wiges of a wible monsoon; so that there is a lomeer period of growth.

Temperature, as we have acen, is only one of the clementa of cli cate $s$, though a very inportant one, is jet unaele of itself to do any thing toward the growth of a plant, unlegs water be within the reach of its roots to dissulvo and carry into the vegetable cells and vessels the elements of mutrition. It must be decomposed, in contact with air, not too dry, nor yet too damp, but containing its due proportion of oxygen and carbanic ncid gas, and illuminated by the light of the sun. There is no doubt that cotton-plants may eyist through a long range of temperature, and of moistore and dryness of the atmosphere; but it is equally certain that they will never attain liealthy vigor of growth unless there is a due supply of moisture in a moderately warm, or rather hot atmosphere. Though the degree of hent may be measured with a thermometer, moisture is not always indicated by the rain-gauge, for rain may fall and run off the surface, or percolate the soil, and the earth and the atmospliere both he left in a parched state, even during the season of growth. The molsture can only be deternined by the hygrometer, or the wet and dry-bulbed thermometer; and, imperfect as tha majority of such instromenta are, the information obtained from many sitnations would be invaluatle, ns we might then be mere sure of drawist correei inferences, becausc, thongh we might not lie able to calculate correctly the exaet quantity of moisture contained in the atmosphere, we could sce whether this was in a state of saturation, or was capable of taking up a still larger quantity, and thus in the one case checking, and in the other favoring, evaporation from the soll, nid from the surface of plants. To the comparative noisture of the nir on the sea-coast, and in places within the reach of the moist sea air, must chietly be nseriled the prefcrence of the cotton-plant for such situations, or, at least, for its successful culture in so many islands and along so many consts. But to this it may lie objected, that a long-stapled cotton is successtilly grown in the dry climate of Egypt. In that country, however, copious irrigation produces the same beneficial effects in a warm, dry stmosphere. Exeess ot motsture in a warm climate, however, may prove as injurious ns its deticiency ; for then the parts of vegetation may be altogether stimulated, or may be in a state of continual growth, when plenty of branches and leaves are produced, but few flowers and very llttle cotton.

The seasons of Indin, over a great part of the country, are divided into the cold, the hot, and the rainy; namea which sufficiently adicate the particular characteristies of each. If we take an equatorial climate, like that of Singapore, as a standard of compsrison, we whall ohserve a very great ditferenee between it and that of a northwestern situation in the plains, such as Saharumpore, in $30^{\circ}$ of north latitude, the tirst being remarkable for uniformity, and the latter for a great range, both of the dry and wet-julbed thermometer. l'lants which live throughont the year in the open air at Simgapore, will, in most casea, sulfer both from the cold and the heat of Saharunporo, thengh they may flourish in the raing aeason alnost as well in the one as the other.

-U. S. Patent Office Rezort, 1sib.
III. Cotron Trade of the Unitho States. 1. History.-Cotton, which administers so bountifally to the wants of eivilized as well as to savage man, and to the wealth and ecoucmy of the countries producing it, stauds pre-eminent in the United States, both as regards its auperior staple and the dogree of perfoction to which its cultivation has been brought. Ono or more of its species is found growing wild throughout the torrid zone, whence it has beon disseminated, and become an important object of culture in several countries thereto adjacent from time immemorial. It is mentioued by Ilerodotua as growing in India, where the natives manufactured it isto ctotis; by Theophristus as a proluct of Ethiopia; and by Pliny as growing in Edypt, toward Aralia, and near the borders of the Persian Gulf. Nieuhoff, wha visited China in 1655 , says that it was then cultivated in great nbundance in that country, whero the soed had lween introduced about 500 years before. Colambus found it in use by the American Indiann of Cuba, in 1/92; Cortez, by those of Mexico, in 1519; Pizarro und Almugro, by the Incas of Peru, in 1532 ; and Cabeca de Vuca, by the natives of Texas and California, in 1086.
Of the precise period of the first introluction of the caltivation of this plant into the North American colonles, history is silent. In a pamphlé entited "Nova llitamia offering most excellent fruits by planting in Virgisia," published in London in 1609 , it is stated that cotton would grow as well in that province as in 1taly. It is alao btated, on the authority of Beverley, in his Ilistory of Virginia, that Sir Eilmund dndrog, while governor of the colony, in 1692, "gare particular marka of his favor towned the propagating of cotton, whiel, aince his time, has been mueh neglected." It further appears that it was cultivated for a long time in the eastern parts of Maryland, Virginia, Carolina, and Georgia, in the garden, though not at all as a planter's crop, for donestic consumption. In another pamphlet, cotitled "A State of the Province of Georgin, attested upon oath, in the Court of Savamnah," in 1740, It was averred that " large quantitics have heen raised, and it is much planted; but the cotton, which in some parts is peremial, dies hera in the wheter; which, nevertheleas, the aunual is not inferior to in gyodneas,
bat requires moro troulle in eleanning from the seed." About the year 1742, M. Duhrenil invented a cotton gin, which created an epoch in the cultivation of this product in Louisiaua. During the Revolution, the inhabitants of St. Mary'e and Talbot comuties, In Maryland, as well as those of Cape May connty, Neir Jersey, raised a sufficient quantity of cotton to meet their wants for the time. It was formerly produred in small quantities, for family use, in the connty of Sussex, in Delaware, near the head-waters of the Choptank.
The scelt of the sea-ksland cotton was originally obs tained from the Bahama Islands, in about the year 1785, being the kind then known in the West ladies as the "Anguilla cotton." It was first cultirated by Josiah Tattnall and Nicholus Turnbull, on Skidawsy Islana, near Savamah; and subsequently ly Jances Spaulding and Alexnader Hisset, on St. Simon's Island, at the mouth of the Altamalia, and on Jckyl Island, by lichard leake. Foc many years after its introduction it was confinud to the inore elevated parts of these islands, bathed hy the saline atmozphere, and surrounded by the sal. Gradually, however, the cotton cultare was extencled to the lower grounds, and beyond the limits of the islands to the adjacent thores of the contlaent, into solla containing a mixture of clay; and lasily, inte coarse clays deposited along the great rivers, where they meet the orean tides.

Previous to 1794 the year after the invention of W'gitney's saw gin-The annual amount of cotton produced in North America wan comparatively inconsiderahle; bat since that period, there Is probalily nothing recorded in the history of Industry, inclading its manufacture in this country and Europe, that would combparo whth its sulgequeit increase.

In the Enstem hemiaplere, the growth of cotion is principally restricted to the maritlme countrics lying between the toth degres of north latitule and a correspendiag parsilol south. On the casterly side of the Wextern Continent, this plant will perfect its growth in most of the dletricta arjfacent to the tidal waters, insluding the regions bordering on the Missiselppi, the Amazon, and tho Parana, between latitude $39^{\circ}$ morth and $40^{\circ}$ south; and on the west coast of America, bo-
tween gree sou The dia, Chl Europe Africa, ish Gui Vrugua isles.
Aeco gated tl rieties in the f 1. $G$ plant 0 some pi 2. ${ }^{2}$ India.
tween the 40th parallel north and a correaponding degree south.

The growth of this atapla is ehinfly coafiaed to India, China, Japan, Australia, l'ersia, 'Turkey, , wouthern Europe, Arabia, Egypt, Algeria, southern and weatern Africa, tho southern section of the United States, 13ritish Guiana, New Granada, Venezuela, Pern, Hrazil, Uruguay, the West indies, anit nutuerous other ocean isles.

Accerding to Dr. Moyle, who has recently investlgatell the subject, the different localities of the four varictics or species of cotton (see page 431) may he ataied in the following manner :

1. Gossypium Indicum, or herbacenm-the cotton plant of India, China, Arabia, l'ersin, Asia Minor, and some parts of Africa.
2. Gosmypium urboreum-a tree cotton, indigenous to India.
3. Gossypium Barbadensc-tho Mexican o West Indian cotton, of which the sea-island, New Orleans, and uplaud Georgia, are varicties. It was long since introduect into the island of llourlon, and thence into India; hence it aequired the name of "Bourbon cotton."
4. (icssypium rerurionum, or acuminatum-whicis yieds the lernambuco, Peruvian, Moranham, and Brazilian cetton, especinlly distinguished by its black seeds, which adhero firmly together. This variety has long since been introduced into India.
the chief varicties inltivated in the United States are the black sced, or sea-island (G, arboreum), known slee by tho nanae of "long-staple," from its line, white, silky appearance and long fibres; the green seed ( $G$. herbuceum), called "short-staple," from its shorter, white stajle, with green seeds, and commercially knewn by tho name of "upland cotton:" and two kinds of Nankin or yellow (G. Barbadcuse), the Mexican ame Petit Gulf. Tho average yield is about 500 poonds per acre.
The earliest record of sending cotton from this country to Europe is in tho table of exports from Charleston, in 174"-'d8, when soven bags were shipped; anothor jurcei, consisting of 2000 pounds, was shippedi in 1700 ; and a thirl shipment of 71 bags was mado in 1784, which Engiand ecized, on the ground that Anerica could not produce a quantity so great. Tho amount experted from the United Statea in 1791 was 189,316 poutds; in 1793, 487,600 pounds; in 1794, 1,601,760 pounds; in 1795,6,276,300 pounds; in 1800, 17,789,803 pounds; in $1810,03,261,462$ pounds; in 1820-'21, $124,893,105$ pounds; iu 18:10-31, 276,979,784 pounds; in $1810-14 \mathrm{i}, 530,204,100$ peunds; iu $1850-$ 'ö $1,927,237,089$ pounds.

According to the Census returns of $18 \cdot 10$, the amount cultivated was $790,479,275$ pounds ; of $1850,987,449,600$ peunds; slowing an increnso of $196,970,325$ pounds.

It appears that the culture of cotton is rapidiy diminishing in Virginia and North Carolina. In those slates it is doubtless giving place to other productions of the soil. There has been a very heavy falling off also in Louisiana, and no appreciable increase in Mississippi; but the-diminution in the former state, and the failure of any advance in the latter, are accounted for by the terrible inundations of tho Mlississippi and its :rilutaries. Jut for that enlanity, it is probable that their increased yielil would have equaled that of Alabama, which now occupiea the lirst placo as a cot-ton-planting state, nud inss aimost doubiedi ita production since 18.10. Immense as the extent andi value of this erep lase become, it is not extravagsent to anticipate a rate of increase cor the current decennial preriol which will bring up the aggregate for the year 1800 to 4,000,000 baies.
The average annual yield for the fiva years ending with 1885 was extinated at $1,055,0 C 0$ bines; for the sanse period ending in 1840, 1,440,000 bulea; for a like period terminating with $1850,2,270,000$ bales. Ilad no disturbing cause diterrupted the progressive nul-
vance, the amount of 1800 would have exceeded $3,000,000$ baleo.

The export of colton from the United States to ths countries of northern Europe commenced some aixty years ago. In the year 1800, IIolland, Including the territory now known as the klngdom of Belglum, reecived 79,694 pounds ; in 1855 the aggregate quantity exported to the two countries was $17,100,967$ pounds. In 1803 Norway and Denmark first imported American cotton, anounting that year to 184,193 pounds; in 1855 the aggregate quantity exported to these two conntries, including Sweden, was some $7,000,000$ pounds. Prussia and Sweden legan importing cotton from tha United States in 1804. Russia, in 1809, received cotton from the United Statea for the first time, and to the amount of half a million of pounds; while $\ln 1858$, the year prior to the commencement of the late war, the exportation to that ceuntry amounted to more than 21 mil lions. The Hianse-towns received cotton from the United States prior to the year 1800, and the progreas of the trade with those citiea, which is exhibited in the sutijoined statement, atrikingly exemplifies, in connection with the remarks which have preceded, and the general statement which follows it, the rapld and powcrful advancement of the king-staple, not of the United States only, hut of the commercial world.

At the oponing of the present century, the imperta of cotton wool into Great Britain were ahont 75,000 hales per annum; now the consumption of that conntry is $2,600,000$ bales annually, while the rest of Lurope, and the United States, that then had no manufactories, use sbout $1,900,000$ more, to say nothing of the consumption of Asia. Of this $4,000,000$ lales, fivesixths are the proiluct of this country. The result of the paat three years proves, that neither the existence of a war involving the chief nationa of Europe, nor the Ifuctuatiens in tracle consequent on its cessntion, have had any effeet on the demand for our great southern staplo; thus establishing the faet that, the next to the leading articles of human food, it has become a great and fixed necessity.

A document compiled from the very best data, by ono peculiarly fitted for the task, was lately read before the Manchester Chamher of Comineree, exhiliting very important facts. The value of the cotton manufacturing industry of the world was estimated at $£ 120,000,000$ sterling, or $\$ 600,000,000$. Of this amount the entire population of Great Britain consumed, in value, aloout $\$ 3.85$ per lical per annum. England exports to the United States manufactured goods at the rate of 77 centa for cach individunl in this country, but being ourselves large manufacturers, and ill view of the general better condition of the lmik of our population, it is probable that our consumption of cotton goods will exered that of Great Britain 50 per cent. per head. England exports to her North American colonies cotton goods at the rate of $\$ 1 \cdot 53$ per head jer annum, for tho whole pejulation; to Russia, only at a rate of three-fiftis of a cont per head; to France, two cents per head; to her East india possessione, at the rate of 18 cents; but these three last countries manufacture at home, eapecially I'rance, who mainly providea for her own wants, while Russia receives goods from several sources. Estimating the population of the globe at $850,000,000$, the appertiennent of the whole value of manufactured goods would be ahout 70 cents for every inhabitant, man, womnn, and child.

The tendeney of the age is gradually toward an equalization of the moral and physical condition of tha human family. The wealthier and middle elasses expend much more than heretofore in artieles of taste and luxury, in household ant personal adornaient, wherelsy the artisan, mechanie, and laborer are benefited, and their condition improved. The barbarous and debased nations and tribes of the world are fast tending toward the habits, and acquiring the tastes of civilization; the flrst symptom of which is the exchange of
their former rude and scanty clothing for dremes of our zuanufactured goods.

Hence it requires naither reflection nor argument to show that a very amall general increase in the coosumption of cotton goode would demand a supply of raw material beyood the present ability of the world to afford. A reference to tabie "Generai Import of Cotton Inte Great Britain" will show that the emall product of the Weat Iudias is almost atationary-that the same is the case with Braiil, on an average of yeare; the export thenco, last year, was only 185,000 bales, weighing is a than 200 pounde each. In Egypt, the product of the past four yeara has averaged about twice as inuch as the proceding peried; and last year oniy 115,000 bales cante from that source, weighing 250 poundis each ; while the average shipments from the East Iudies for the past six yoars is but 340,000 baics per annum, weighing about 380 pounds each.
The main dependence of tho world is on this country, which last year furnished $3,000,000$ bales out of a total proluct of $4,200,000$. As the new lands of the West come inte cultivation, and the progress of our raiiroais briags the crup within reech of the sealourd, there will be a gradual incroase of our production; but to this even there must be a limit, cousidering the nature of the elimate and soil necessary; and the time may not ie very far tistant when we elall fail to meet the demand. Under this atate of things, it is net to be wondered at that the governments of Eugland and France are putting forth every effort to foster the eultivation of cotton in their colonies. We have, certainly, no cause for fear or jealonsy in view of these efforts. Not only are we, as producers, interested, but the foreign manufaeturer, the politicai economist, and the philantiropist, alike have taken the matier into serious consideration. We can acarcely contemplate, without emotion, the disastrous results commercialiy, politically, and socially, that might follow a general fallure of only one crop in this country. There would be no reserve to fall beek upon. The atock in Great Britain on tho 1st of January last was lut fittle larger, with a censumption of $2,100,000$ Lales, than it was in $\mathbf{1 8 . 1 1}$, with a consumption of a littie over $1,000,000$ bales; and not haif so large as the stock on January $1,1846$.

期HAEKB.
1839-First large crop. Season remarkably fine throughout. 1840 - Linfuvorablo season. Overtiow of Mt日sissippl Itiver. 1941-Weatern erop good. Bevere drought in Alabama, Georgla, Fiorida, and Minsinalppl.
184:-Geaerally good seamon and eariy plektng.
194. late apring, ralny summer, and eurly front

1844 -Very good season, and early pleking. Partial overdow of Mlaslas ppl RIver.
1845-Misalsaippl River and Weatern crop good anci early. Dronght reduced the eastern crop 300,000 bales.
1846-lata aping, early and general vialtation of army worms ; the iatter doatroylng 400,000 to 560,000 balen.
$187^{\circ}$-Late season, but fisvorablo fall. The occurrence of the French Revolution put down prices, and 200,000 bales were hetd back to the country.
1848-Summer rainy, but fioo fall | 200,000 bales bronght corward of prevloua crop.
1849-Froat In apring, heavy itina in July, partial overflow of Nusissippi River : lied liver bottomsoverflowed in aummer. 1850-1hackward spring, plek!ng began unuaually late. Partinl overflow of Misslailppl River.
18, 1-Favorable nummer and early pleking.
1852-hemarkably fine season, early picklng, and lato frost.
1853-1.ate and rainy acason.
15 5 -'55-1Backward season. About 250,000 hales kopt back by lowness of the waters in Alubams, Loulslana, Arksnsas, and Texas.
195'-'\$6-Fine season. Early pickIng, sufficiently good to ecunterbalance an early froat. Ahout 250,000 bavice of last erop recelved, which, in fact, will make the actual product of $1854-55,8,007,800$ bales, and reduce that of 1855-'56 to 8,577,800 bales.

Sen-Isand Cotton. The crop of this important ataple for the year ending Sept. 1, 1856, was 44,512 bales; 1854-'55, 40,841 bales, and in 1853-'54, 39,686 boles. The recelpts in 1855-506 being, from Florida, 10,900; Georgia, 13,245; South Carolinn, 20,367.
The extraordinary crop of the year $1855-56$ in the United States ( $3,527,300$ bales) has passed into the numerous channela of consumption at prices much higher than for five years past, leaving a stock on hand on 1st September laat of only $\mathbf{6 2 , 0 0 0}$ bales In all the United States ports. Thia consumption ia stlll going on throughout the British and Continental manufacturing districts; and the increase of machinery added to mills hitherto working, it is eatimated, will require in Great Britaln alone an additional weekly supply of 4000 bales.

Aconunt ahowing tim Dertination of thit Cotting ex PORTED YBOM THE CNITED 8TATER IN 1S47, 1848, AND 1849.

We give below a table of the amount of colton con－｜those States is increasing，as well as in Virginla，Ohie， gamed the past year in the States south and west of Virginia，and not incluied in the reerpips at the ports， We have largely increased the extimate from the year previous，but＇give it only for what it purports to lee， an estimate，which we believe approximates correct－ ness．

There are no statistical returns of the quantities of cotton manufactured in the States sonth of Virginia； but it ？s well known that the yearly conamption in
 emple；ed in the manufacture of cotion georls in tho Seuthern States was as follows：Maryinnil， $82,2,26,90 \%$ ；

 mergeamer Troutands or Bacge.)

Contrasted with the precedhg season, the yent just streams, during the whole season, have enabled the do6ed (1856), ns we have alrealy observed, may be consdered one upon whleh the trade may well be congratulated. The monetary pankes, the droughts .md the ravages of a dendly jestilenca in some of the Southern seaports, the periodical embarrassments consequent upon the clanging fortunes of the buropean war, all contribated to render the spring and summer of 1855 memorahle for the drawlacks and discouragements, not only to the cotton Interast, but to the general trade. Far different are the characteristles of the twelve monthe under review. With nothing to complain of in respect to the crop itself, the interior so liberally disposed of that the supplles on hand, on

Cos
speculative shlppers-when prices took another turn, and the imprevement obtained on the atrength of the peace propositions was quito lost. Subsequently, daring $s$ period of many weeks, which brings us down to the last if April, the market was very strong, and a rise of fully one cent was reallzed. Our domeetic epinnerc were, during nearly the whole of thls period, the moat heavy operatore, taking on an average 12 to 15,000 baies per week. Early in May, a complete change gems to have taken place in the milnds of our leading exporters. Large holdors, who had been sanguine of such an adrance in Liverpool as would enable them to recover their inveetments in the staple, were disappointed, the market agaln becoming dull and drooping.

The depression was not of long duration, however, fo: the redaced aupply not only here, but in every part of the United States, now began to attract sttention, and holders became indifferent about offering their supplies; and as the high prices checked consumption, the market assumed an ?nactivity nnusual for the eeason, which continued throughout Jnly and Auguet, holders all the time maintaining an unrelenting firmness.
The year closed with a reduced atock, both here and as the South, and the eupply in tie manufacturers' hands at the eastward being aleo limited, the inclination of prices wan to a higher range.
The trade of New York has apparently fallen off; a

in transitu cotton were purchasing from twenty to thirty thousand bales per wreek, and nct unfrequently tarning the staple over two or three times in the period which used to suffico, nnder the old system, of making but one fair pro lt ont of 1t. The theory of certain parties, based uinn an incorrect estimate of things as the; aro, favore tae impression that the cotton trade of New York is on the wane, but like all other theories resting only upon the basis of the imagination, it fades away before the recital of the hard facts that stare it in the face.

Neir York being the centre of the world's trade on this :oustiment-the grand focms of all the latest intelligenter from 'he old world, and sll sections of the new; rhe rendez rous of nearly all the most important lines of ocean steamers, the entrepot of more than five eighthe of the entire forelgn commerce of the country, the readiest medium, financially and every other way, between the producer and the consumer, the planter and agriculturist here, and the factor and manufacturer there-New York being all this and much more besides, we repeat, it must continue to control the cotton trade
of the conntry for a centary to come. But it is sometimes inferred that the Amerisan cotton trade at large is destined to an eventual decline, in consequence of the constant endeavors of Great Britain to eeek new fields for its cultivstion by mesins of what ls called free labor, near the pyramids of Egypt, and among the sickly malarias of the East Indies. These experiments, Wb think, have been sufficiently tested to justify the conclusion, that the cotton planter of the United States has nothing to apprehend, for at least a generation to come, from any competition from these sources. Even dld the endeavor to cultivate the plant in the Indles succeed to any conslderable extent, it must be conceded that the remoteness of the producer from the manufacturer, must always give us such an advantage, ts regards low freights and expeditious transit, as would render the colonial speculation comparatively profit leas. There are many other conslderations and arguments which might be adduced to substantiate this conclusion, but these, we take it for granted, are net required, to allay any serious apprehensions of domestic ruin from this specles of foreign competition.

IV. Cotton Trade of the United States with Great Bmitain. 1. General Information Respecting the Cotton Trade of the Unitel States.-Great Britain.The annual sverage importation of cotton from all couatries into England the last flve yesrs has been K38,335,984 pounds, of which quantities, according to ${ }^{\circ}$ British authoritics, $661,529,220$ pounds, or more than three fourths, were from the United States. The nnaral ercrage exportation to the Continent and elsewhere has been $122,810,688$ pounds, or abouc one sixth of the total quantity imported, leaving 715,525,296 pounds for the annusl average consumption. About mes sixth of the whole amount imported was from Brititsh possessions.
In 1781, Great Britain commenced the re-exportation of cotton to the Continent and elsewhere. In 1815 the quantity thus reexported had risen from the annual average of $1,000,000$ pounds to that of $6,000,000$ pounds. In 1853, the aggregate amount exported exceeded $148,500,000$ pounds, of which nearly $83,000,000$ pouads were derived from the United States, and more than $60,000,000$ pounds from the East Indles. The quantity of American cotton re-exported by Greut Britain to the different markets of Europe, when compared with the quantitics imported, is much less than of that imported from other countries-a fact which sugigets the superiority of the American article, and its betier adaptation to purposes of fabrile industry. For example, about one tenth of the cotton imported from the United St ins is ro-exported, against nearly one half of that linperted from the East Indies. A comparisen between American and liast India cotton, shows a differences of 100 per cent. in faver of the former ; the coltou of tho Fast Indies containing 25 per cent. of waste, whlle that of the United States contains only 12d jer cent. The fibre, aleo, of the latter excels that of the furmer.
In 1788 , the efforts of the East India Company commeaced for the prometion of the growth of cotton, and for the improvement of its quality, in British Iudia and the finst exportation of the artiele to England was mado the same year. In $181 /$ the exportation amounted to $4,000,600$ prunils ; it now averagea $165,000,000$
pounds per annum. An area of about 8000 square miles is aaid to be deveted to the culture. Liverpool is the great mart of the cotton trade of Great Britain and of Europe generally. Thus, while the total imports of the article into the United Kingem, according to British authorities, in 1852, amounted to 2,357,338 bales, the quantity at this port reached $2,205,738$ bales. About six sevenths of the cotton received at Liverpool cemes from the United States; and of this four fifths is estimated to be imported for the factories of Lanca ahire and Yorkshire. Since Mareh, 1845, cotton has been admitted into British ports free of duty. Prior to that period the duty was, of and from British possessiene, 8 cents; from other places, 70 eents per 112 pounds. The number of spindles in operation in England is eatimated at more than $20,000,000$. The value of cotton snpplied by the United States to Great Britain in 1853 was $\$ 57,616,749$, being about the average each year the last four. The quantity of cetton exported from the United States to England in 11 months of the fiseal year 1856 , is estimated at $2,755,000$ bales. It appears from "Commeree and Navigntion," that the importation of raw eotton from the British West Indies into the Uaited States has incroased, for some years past, in a ratio quite proportional to the ciecreaee of gueh importstion into Great Britain. Thus, the luportation of cotton into the United States and Great Britain, respectively, from the British West Indies, from 18.1 to 1855 , inclusive, was as follows :

| Years. |  | Into the Unlted Biates. | $\begin{aligned} & \text { Into } \\ & \text { Great Ifrtain. } \end{aligned}$ |

Exported to tho Continent.... 82,600 Liverpool................
Then for coasumption la England... 19,600 or 377 pr. wk. $[\ln 1304 . . \quad 7,000 \times 140$
The ubove figures show that the past year's consumption was double that of 1840 . The aggregate production of the past 12 years aums up $37,297,500$ bales, while the consumption has been $38,212,500$; the latior heing in excess of the former 925,000 balee, thus reduing the atock on new material by that much since 1845-a startling fuct in view of the great interesta invoived.
From a sellable source of intelligence across the wster, we leurn that new machinery added to milis now working, together with manufactories nuw in process of erection, will require in 1857 about 4,000 bales of cotton per week more than tho consumption of the present year, making an aggregate of nearly 45,000 balea per week. On the Continent, the extension of manufacturing power is aupposed to be going on at about the same rate. Consequently prices wili adrance till they rench a polnt tending to a diminution of consumption. What that point will be we have yet to learn. Though the stock of cotton, at present, is iarger in ilverpool than last year, it will he reduced very rapldly, as the imports up to the closo of the year can searcely be more than half so largo as inuling the iatter monthe of 18.5 , and periups not even that, in consequence of tie latenesm of the season aud diminished receipts at our ports.
2. France.-Cotton constitutes in value more than two thinds of the domestic exporta of the United States to France. By virtue of the treaty of 1805 , it is imported, ilke all other "articles of the growth, produce, ar munufacture of the United States," on the sume terms, whether ir: United States or natlonal veasels ; but the importation $m^{\cdot \cdot}$ t he ellrect, and the origin of the srticie duly authenticated, A ministerial decree
of December 17, 1851, enlarges the provision of the treaty relative to the direct voyage, so far as to extend the equality between the vessels of the two natlons when importing cotton, even ahould the American vesael touch at a British port ; but, in that case, the captain is required to exhibit a certificate from the Franch consul at that port, stating that no commercial transaction tiere took place. The French government is directing its efforts to the development and extenslon of the cotton culture in its colonial province of Algeria. To that end, in December, 1853, an aggrgate value of 20,000 france, In prizes, was offered by the emperor to the most successful cultivator of cotton in that province. The result is announced as most favorable. In December, 1854, the entire sum was divided between three rivals, whose merita were judged equal-two of them being French colonlats, and ons an Arab-a gold medal to each being also awarded. To the meritorious of the second rank, a sllver medal to each was presented. Tise amount produced in 1854 was 180,552 pounds. Next to Grent Britain, France is the largest importer of American cetton; and what Liverpool is to the former, Havre is to the latter. At those two polnts the importations are concentrated, and thence distributed to the different markets of either empire, or re-exported to foreign countries. The re-exportations of France are chiafly to Switzerland by railway; after which country, In this trade, come Sardinia and Holland; smaller quantities being sent also to Spain, the Zollverein and other countries. Next to the United States, France derives her supplies of cotton from the Levant ; and the third place is held by South America. These facts are illustrated by the following atntemants, made up from the "Tableau Géneral du Commerce de la France," for the year designated. [The quantities are given in kilogrnmmes, each kilogramme being equal to about $21-5$ pounds. Kilogrammes multiplied by 8 and divided by 4 will give pounds.]

The only country In Europe which can, in any sense, bo auld to competo with Great Hritain in the supply of the extra European demand for cotton goods ls France. And when the character and extent of this branch of the French export trade are described it will be seen that this most formidable rival is not yet much to be dreaded.

From the foregoing talise it will be seen that the isuportation of colton into France from other countrica than the United Statea, tncluding Brazil, from 18:0 to 1855, has fallen of more than 50 per cent. ; while frum the U. States it has incieased more than 600 per cent.
The Froneh tariff in 1858 imposed five different rates of duty on rave cotion imported in French vessels, accordlag to whare it eamo frons; and three uthor rates of duty, similarly is aig tsued, un cottom inported in foreigu vessels. The duty most extensively operative -that on Anerican cotcon entering in lrench bottoms -was 20 franes per 100 kilograms, or alout sixteen shilling* per 220 pounds. And as the whole quantity imported ( $73,091,000 \mathrm{kilograms}$ ) yielded to the rovenue $17,27 \mathrm{ti}, 000$ franes, giving an average of $22-23$ fraces per 100 kilograms, it is probable that by far the greater part of what was imported aclually puid this rate of duty.

The bounty on exportation was 25 francs pre 100 kilogratise of manufactures or yarn. It was allowed in 1853 on $7,117,864$ kilograms of manufacture and on 198, $\mathbf{6 0}$, kilograme of yarn. This, with a moderate allowatec fur waste of the raw material, though called a bounty, could in olfect have leeen little, if at all, more thas a drawlack of the import duty.

It would seem that the French exports in this kind are not more than a tenth in value of our own. And where werc they sent, and why? The largent customes for these French manufaclurers (taking two parte in veren of the whole value) was Algeria; but Alperian consumption may be deemed practically French consuuption. The iwo customers next on the list, when arranged In orelor of magnitude, are the U'ulted Statea and the Uuited Kingdom. These took hetween them two other seventh parts of the whoie. And the goorls sold in the English and American markets are well known to owe their peculiar value rather to the degigner and the dyer than to the splnner and weaver. Their cosisumption does not admil of any very rapiol or widr incrense. French taste and French ehemistry have deseryedly won for the Freach textile faluics, wherover they are applicable, a superiority as weli tnown as it is incontestable. But thin has little effect of the whole. With a fer trifling exceptions, of which Brazil :

lirom I'orto lico, according to offcial Halanzas of that inland, as follows:

$1854 . . \ldots \ldots \ldots \ldots . \begin{gathered}\text { Puanda. } \\ \text { No dala. } \\ \text { No data. }\end{gathered}$ 1855................... No data $\begin{array}{ll}\text { Average (8 years). } & \text { 284,147 }\end{array}$

From Brazil, according to the Proposta o Relatario of that empire, for the years 1852-'3, and 1853-'4, the quantities of cotton exported to Spain were as follows:

Spaln, eccording to the Cuadro General of that kingdom for 1849, imported that year, from countries of production, $26,136,881$ pounds of cotton ; of which quantity the Unitted States supplled $21,669,441$ poonds ; Cuba, 3,371,830 pounds ; llrazil, 832,604 pounds ; Porto Rlco, 370,881 pounds, and Venezuela 21,316 pounds.
4. Ilanse Towns.-The states of Germany are snpplied with the cotton consumed in their factories chiefly through the Ilanseatle cities, Ilamburg and Bremen. Bremen aent to the Zollvereln, in 1853, cotton Imported direct from the United States, to the value of $\mathbf{\$ 9 8 4 , 7 7 2}$ 14 , and to Austris to the valie of $\$ 156,153$ 21. The factorles of Prussla and Saxony aro numerous, and import not only the raw material from the cities, but also large quantitios of yarns. The number of splndles in operation in the states composing the Zollverein is estimated at upward of $1,000,000$. This ls, doubtless, an under estimate, as the industrial enterprise of the Zollvereln has made rapid progress since the date of the officinl document from which these tigures are derived. The export of cotton tissues from the Zollverein $\ln .1853$ amounted $\ln$ value to $\$ 2,394,497$ 34, of which ammant $\$ 2,075,29968$ in value cume from the factories of Saxony.

The IIanso Towns, from geographical positlon, are, and must always continue to be, the great marts from which raw materiai of all descriptions will be supplied to the states of the Germanic conmercial Union. Hence exports of American cotton and tobacco to these polnts are heavy, and constantly increasing. Theso commercial cities receive their sapplles of raw cotton not only from the Unitel States, in direct trade, as well as from Brazil and other countries of South America, but also in tho indirect trade from English ports and other entrepûts of Europo. In 1855, the Zollverein sent through the Hanse ports to the United States cotton falirics to the valuo of more than $\$ 1,500,000$ in return for the raw material.

The following statement shows the quantitics of cotton exported from the United States to the Hense Towns every 10 years, for a period of 51 years, from 1805 to 1855:

Tobaceo is borne in direct voyage from the United States; not so, however, with cotton, in the carrying trade, of which Great Britain has been for many yeare an active competitor. Entering the ports of the United Kingilom free of duty, her merchant flag can realize a profitable trade in its re-exportation to the various ports of continental Europe. Thus the llanse Towns reeelve their supplies of raw cotton nut only from the United States in the direct trade, but also in the indirect trade from English ports and other entrepots of Europe. The annual average quantity of cotton exported from the United States to the Hansn Towna, inelnding Prussia, daring the 4 years from 1851 to 1854 , both inclusive, was $24,811,626$ pounds; while the annual average exports from (ireat llritain during the 4 years ending Dec. 31,1851 , wus $36,563,996$ pounds.

The anmal average quantities of eotton exported from the anme countries, respectively, luring the samo periols, to the other nations of northern Europo, exhibit similar results. These facts are illustrated by the mulijoined statement, and suggest a strong argument for the ecrious consideration, by the navigation interests of the United States, of such measures as would be likoly to promote the direct exportation of our great staple from our own ports, in our own vessels, to those of the countrios by which it is consumed.

5. Belgium.-Most of the cotton imported into Belgium is from the United States, and is consumed by her own factories at Ghent, Llege, Antwerp, Malines (Mechlin), etc., whlch are sald to employ a capital of $\$ 12,000,000$, and more than 122,000 operatives, and to turn out an snnual value of $\$ 17,000,000$ in fabrics, which are in high repute. The Tableau General of Belgium for 1854 gives the importation of cotton into that kingdom as follows:
Statement exmifitino tue Quantitips of Cutton in-

|  |  | Pounds. |
| :---: | :---: | :---: |
| United Statea. . 15,829,266 | Hayt | 5 |
| England. ...... 14,208,765 | Brax | 10,901 |
| Holland....... 8, 888,259 | Other countriea | 80,094 |
| France........ 868,016 |  |  |
| Hanse Towns. 79,688 |  |  |

Of the above total, $25,783,292$ pounds were consumed, and $7,049,828$ exported.

The quantity imported by land and civers was $3,104,851$ pounds ; by sea, $29,729,263$ pounds.

Of the quantity exported, $6,959,965$ pounde was by land and rivers, and 89,858 pounds by sea.

The average annual amount of duties derived by Belgium from cotton for the five years ending with 1854 was upward of $\$ 40,000$, and, in the latter year, it ranked the thirteenth smong articles imported in this regard. The duty under the law of Junuary 81, 1852, was 1 franc 70 centimes per 220 pounds. By the law of April 12, 1854, cotton became free.

In 1854, Belgium exported cotton fabrics in value as follows:

> Cotton fisbries. .
> $\begin{aligned} & \text { Cotton fabrics......... } \\ & \text { Belgian manafuctnra. }\end{aligned}$ *4,701,572 2,698,586

Forelgn mannfactures re-exported.... 82,068,956
0. Sardinia.-Sardinla importa, on an average, some four or five million pounds of cotton each year from England und France, and about the same quantity from the United States; although, In 1855, the importation from the latter country suddenly rose from $1,645,372$ pounds the preceding year to $14,777,765$ pounds ! There seema no sufficient roason why American vessels ehould not convey the whole quantity roquired hy Sardinla directly to Gonoa, as well as for Eaglish and French versela to carry thither a portion of American cargoes landed at Liverpool or Ilavro. A aimilar remark in applicable to the other ports of Italy, and to those of Austria on the Adriatic; and the enterprise of establishing linas of ocean steamera between ports of the United States and those of the Mediterrancan will, if auecessful, tend greatly to encourage, if not to secure, auch direct imjortation.
Thbls ts an oxcess of 44,260 poands over the amount given above as exported, that quantly having beea entered for connumption but aubsequentiy withdrawn.
7. Swizzerland.-Four fifths of all the cotton consumed by the factories of Switzerland is estimated to be imported at Havre, whence it passes through France by railway, being burdened with heavy charges in the transit. In 1838, the quantity thus received amounted to nearly $6,000,000$ pounds. In 1848 it had reached nearly $17,000,000$ pounds. The entire receipt of cotton in 1848 was $22,000,000$ ponnds. In 1851 it amounted to $27,085,725$ pounds, of which $13,729,820$ pounds were from the United States. In 1852, Switzorland received through France $15,816,775$ pounds 1 in $1853,15,815,473$ pounds, and in $1854,14,978,257$ pounds, according to the Tableau Géneral of France for these years. Imports from the United States into Switzerland are made, for the most part, through the customs frontiers of Berne, Basle, Soleure, and Argovie, bordering on France and the southern part of Germany. A severe restriction on the importation of cotton, and also of tobacco, to Switzerland, as well as on the reception by the United States of Swiss ware and manufactures in retura, is the vexatious and expensive transitage, especially through France. The oppresion of this system may be inferred from the fact, that the annual average aggregate value of merchandise on which traneit tolls are paid, proceeding from Switzerland, is (1858) nearly $\$ 80,000,000$; and the value of that proceeding to that republic more than half as much. Switzerland sent, in transitu to France, cotton tissues to the value of nearly $\$ 3,000,000$ in 1852 ; and to the value of nearly $\$ 4,000,000$ in 1853. By the French tariff, such fubrics are excladed from France for consumption. Since 1845, Switzerland Is stated officially to have qulte superseded in the markets of Germany and Austria, the yarns of Great Britain. In 1830 that republic had in operation 400,000 spindles ; in 1840 , 750,000 , and in $1850,950,000$; the number having more than doubled in 20 years.
According to Swise official custom-house reporis, that republic recelved cotton from the United States as followe, the years specifled:

In return, cotton stuffs, as follows, wero sent to the United States:

In 1855, Switzerland returned to the United States, in exchange for raw cotton, the same article manufuctured, to the value of $\mathbf{\phi} 212,700$.
8. Russia.-llefore the breaking out of the late war, the manufucture of cotton in the Russlan empire was progreasing with extraordinary activity. The number of spindles exceedod 350,000 , producing annally upward of $10,000,000$ pounds of cotton yurns. The burter trade with the Chinese at Kiachte stimulates this trauch of manufacture in Russia, as the artiole of cotton velvets constitutes the leading staple of exehange, at that point, for the teas and other marchandise of China. In former yoars thie article was supplied alnost exclusively by Great Britaln; but the Chinase prefer the Russian manufacture, and hence the steady progress of that branch of Industry. Thus the annually increasing lmportetions of the raw material, and consequent diminution in the quantities of cotton yarns imported is accounted for. Were raw cotton

admitted, as in England, free of daty; the. United States would, moot probably, supply, in the direct trade. the whole quantity conenmed in that empire. As it is, the coumercial reforms in Russia, already announced offlicially, and now in progress, compreghending, as they do, the establishment of American housea at St. Petereburg, must necessarily tend to that result. There are at present in Russla, or there were previously to the war, 495 cotton factories, employing 112,427 operatives, and producing annually $40,907,736$ pounds of yarns, and corresponding amounts of textiles.
9. Sweden.-The importations of cotton in 1851, according to Swediah official authoritiea, amount to $7,989,4281$ lba. againat $1,832,481$ lba. in 1841, and 749,434 pounds in 1881. In 1843, these authorities ahow an importation of $2,60,000$ pounds against $9,888,572$ pounds in 1853; which latter amount exceeded that of the importation of 1852 by $1,247,041$ pounds, and that of 1850 by more than $5,200,000$ ponnds, being the largest of sny preceding year. In 1848 the amonnt was $8,074,020$ pounds. The value of cotton mannfactures exported from Sweden in 1850 was $\$ 46,000$ against $\$ 7,500$ only in 1851.
10. Portugal.-In the year 1855, the quantity of raw manufactured cetton imported into Oporto amounted to $6,697,454$ pounds, the value of which is eatimated at $81,516,644$, on which the duty paid was $\$ 899,57918$. This kingdom imported $1,911,451$ pounds of cotton $\ln$ 1855, of which quantity 144,006 pounds were exported from the United Statea, and the reaidue from Brazil. In 1853-54, according to Brazilinn official reporta, Portugal received thence $2,678,766$ pounds of cotton. Her importa of yarn in 1855 were $1,218,157$ pounds, valued at $\$ 171,817$ 07, and paying an aggregate of duties of $861,14284$.
11, Brazil.-The exportations of cotton from Brazil, in 1843-44 and 1853-54, are stated by Brazilisn official nathoritioa as follows:

The growth and export of cotton from Brazil appear to be nsarly atationary. Great Britain, whlch is the largest cuatomer, imported from Brazil the following quantities:

In 1852-53 the exportation amounted to $31,033,050$ pounds, of which quantity Great Britain received 26,881,201 pounds, Spain 2,201,578 pounds, Portugai 1,896,286 pounds, and France 889,048 pounds. Of the total exportations in 1853-54, Great Britain received 22,575,122 pounds, Spain 2,951,279 pounds, Portugal 2,673,766 pounda, and France, 543,611 pounds. Exports from Brazil to England began in 1781. There are insuperable drawbacks to the extension of the cotton cuiture in Brazll, among which may be reckoned the ravagen of insects, the peculiarities of the climate, and the expense and difficulties attendant upon its transmission from the interior to the conat. It has loay since been ascertained in Brazil that the cetton plant will not flourish near to the aen, and the plantations have, in coneequance, receded further inland, as well to avoid this difficulty as to seek new and frosh leads. Peruambuco ia the principal cotton-growing province of Brazil. The exports from that province were, according to Brazilian authoritles, in

12. Egypt.-The cotton culture in Egypt commenced in 1818, and exportation to England in 1829. The comparative tabular atatement subjoined, derived from Egyptian sourcea, showing the quantities exported at the port of Alexandria, and the countriea to whioh exported, respectively, for a period of 8 years, from 1853
to 1855, both inclusive, would indicate an increase in the culture by no means rapid in successive years:

| Years. | Pounde of Colton axported from İypt to |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Oreal Britain. | France. | Austria. | Elcewhore | All countr |
| 1858 | 86,489,000 | 10,726,500 | 6,821,000 | 897,800 | 43,885,20 |
| 1854 | 24,088,700 | 7,454,100 | 10,165,900 | 988,500 | 48,546,000 |
| 1850 | 88,980,100 | 9,451,200 | 12,774,000 | 668,100. | 66,874,800 |
| Tota | 85,858,700 | 97,681,800 | 29,261,100 | 4,504,400 | 144,808,000 |
| Average | 28,403,000 | 9,810,600 | 9,738,700 | 634,800 | 48,102,000 |

If to the aggregate sxported be added from 5 to 6 million pounds worked up in the country, a liberal eatimate of the annual amount of the cetton crops of Egypt will have been made. The factoriea established by Mehemet All are, it is atated, going rapidly to ruin. The cotton goods manufactured are coarse "caftas," or soldiers' "nizam" uniform. Much cotton la used, also, in making up divans, the usual furniture in Egypt. The Egyptian bale is estimated at Alexandria at 800 pounds. The United Statea' consul general at that port, in a despatch dated the 1st inatant, from which are derived the above facta, says: "The new crop is now coming in, and is supposed to be a little above the average."
13. Cotton Culture in Mexico.-The United States' consul at Tampico has furnished the following interesting information, in relation to the varistiea, culture, and manufacture of cotton in Mexico, in answer to a circular isaued by the Commissioner of Patenta In February last: "The greatest production in this country of this article is on the coast of Vera Cruz, and southward from the capital of the State of that name toward Alvar:do, and weatward toward Flacotalpan and In its neighborhood. A little over aeventy-five pounds of seed cotton yields, when ginned, twenty-five pounds of cotton wool. The quality is good, and the whole is sent up the country for consumption in the factories of Jalapa, Orizaba, and Puebia. From Vera Cruz to Matamoras, notwithstanding the territory being ao extensive, and so sdmirably adapted for the growth of cotton, none is produced beyond a littie in the neighborhood of Papantle, which the Indiana cultivate for their own use, and apin in the same primitive manner as did their ancestors at the time of the conquest, viz., by means of a species of wooden apindle, the point of which ja put in a common wooden bowl, and its gyrations given by the fingers. From the yarn thus apun they manufacture a narrow cloth, and thia is atill the custom in many parts of the country. In the neighborhood of Matamoras cotton is raised, but in liuited quantities, and is also cultivated in Monciova. One hundred pounds of eeed are required to produce twentyfive pounda of clean cotton. All that is produced in these places is consumed in the factores of Saltilio.
"On the west coast mention may be made of Santiago, a place situated between Tepic and Mazatlan, where a considerable quantity is raised, which is disposed of hy the factories of Tepie. Further south, and between the towns of Antlin and Colima, and downwand toward the aea, a very rich cotton country is to be seen, and whero immense quantities could be raiaed were there more hands to attend to its cultivation; as it is, however, sufficient is gathered for the supply of the factories of Colima, and soine of it even finds its way to Guadadajara, the capital of the State of Jalisco.
"From Colima, a stretch must be inade to the neighborhood of Acapuloo, where cotton is raised, but by no means in abundance; but all that is gathered in that gection of the country is sent to the market at the city of Mexien. That part of the country is called 'Conta Grande, and is aeparated from the 'Costa Chica' by the river l'apagayo. On the latter, and in the neighborhood of Ayutla, cotton ia raised, but in limited quantities, and sent to l'uebla for bale. The cotton on the whole of this coast only requires seventy-five pounds of seed to produce twenty-five pounds of cottonwool when ginned. The whole of the east, us well as
that of the west const, for aboot 40 leagem inland, is admirably adapted for the growth of cotton. The country is, however, entirely unpopulated, and considerable difficultr is experienced in getting in the harvest in consequence thereof. There are very. few landed proprietors who devote their attention to the oultivation of cotton, except on the ooast of Vera Crue. All the rest is raised by amall farmets (rancheros) who are content to get about one half the amount of its value. Such payments are made in a few goods and groceries, in anticipation for which they are charged exorbitant prices: An experiment hae been made to raise cotton on a farm about 12 leagues from San Luia Potosi, between 6 and 7 thonsand feet above the level of the sea, snd the result has been fivorable. An enterprising Spaniard is now raising cotton 5 leagues from Tula, with every prospect of a sstisfuctory return. His farm is abont 4500 or 5000 feet above the level of the sea. No care is bestowed on the plant. The seed is put Into the ground, and no further notice is taken of it until it is quite ripe and ready for picking. The consequence is, that the staple is not so long, nor the cotton very fine, although quite good enough for the manufactories of this country. The growth of cotton throughout Mexico is porennial."
V. Capactit of the Cottor Bale.-The commercial standard of quantity in the cotton trade is generally the bale. The weight of the bale, however, is hy no means uniform. Indeed, scarcely any weight, measure; or standsrd of capccity may be considered less so. It varies, from different causes, in different countries, and in different sections of the same country, at different periods, and according to the different kiads or qualities of the article. Improvemente in pressing and packing, to diminish expense in bagging sud freight, tend constantly to angment the weight of tho bale. Thus, in 1790, the United Statee' hale was computed at only 200 pounds. In 1824, the average weight of bales imported into Liverpool wae 266 pounds; but, increasing constantiy, 12 yeare Jater the average was 810 poands. M'Culloch, however, in
considered 800 to 810 pounde a fair average; and

## 1

310. At the same time, the upland cotton bale was estimated at 320 pounds, and the sea island at 280 pounds. According to Pitkine, the Egyptian bale weighed at one time but 90 pounde, thongh it now weighs more than 8 times as many. At the same period the Brazilian bele contained 180 pounds, though it now contains but 160 pounde, while the Weat Indian bale weighed 850 pounds, and the Colomioian bale 101 pounds, or the Spanish quintal. According to Burms, the United States' bale at Liverpool averaged 845 pounds, the Brazilian, 180 pound, the Egyptian, 220 pounds, the West Indian, 300 pounde, and the East Indian, 830 pounds. At the Lowell $\cdot$ factories, in 1831, uccording to Pitkins, the hale averaged 861 pounds. In 1836, the bale of the Allantic cotton States was eatimated at $\mathbf{3 0 0}$ and 325 poanda, and that of the Gule States at 300 snd 450 pounds. in Liverpool, at the same tine, the estimate for the hale of upland or shot stapie cotton was 321 pounds; for Orleans and Ala. bams, 402 pounds; for sea island 322 pounds; for Brazil, 173 pounds ; for Egyptian, 218 pounds ; for East Indian, 860 pounds; and for West Indian 280 pounds; while, according to Burns, bales importod into France were computed at only 200 pounds each. Waterston's Manual of Commerce, a reliabio Britlah publication (1855), gives the Virginin, Carolina, Georgia, and Wost Indinn hale at 800 to 810 pounds ; that of New Orleans and Alabama at 400 to 500 pounds; Enet Indies at 320 to 360 pounds; Brazil at 160 to 200 pounds; Esgyptian at 180 to 280 pounds. Alexarder's Univeraal Dictionary of Weights and Measures givea the bale of Alabama, Louislana, and Minsissippi at 500 pounds, that of Georgin at 875 pounds, and that of South Carolina at 362 pounds. At Rio de Janeiro the Brazil bsle is estimnted nt $\mathbf{1 6 0}$ pounds.

Prior to 1855, the United States' "Commerce and Navigation". gave exports of cotton in pounde only. They are now given in balos as well as in pounde-the aggregate amount of the year onding June 80, 1855, being $2,803,408$ hales, or $1,008,424,601$ pounds: the bale, accordingly, averaging sbout 488 pounds. Some bales, howaver, are evidsntly much hosvier, and some much lighter than this. For exnmple, the 210,113,809 pounds of cottion exported to France give 446 pounds to each of the 470,298 bales ; and the 955,114 pounds exported to Austria give 492 pounds to each of the 1,889 bales; while the $7,527,079$ pounds exported to Mexico give only 290 pounde to each of the 25,917 bales in which they were contained.
Liverpool Weight.-The relative average weights and cubical contents of bales of cotion imported into Liverpool, in 1862, are thus given :

| ripion of bele. Ar'ee wita lbo. Contents ! |  |  |
| :---: | :---: | :---: |
|  |  |  |
| New Orloan | 455 | 82 |
| Upland | 890 | 87 |
| Sea Isladd | 988 | 85 |
| East Indian | 888 | 15 |
| Egypttan | 245 | 27 |
| Weet India | 218 | 25 |
| Brasiltan. | 188 | 27 |

These fgures show not only the great variety of balea that enter Liverpool, but that the most eligible form of bale is that of the East Indies-double the weight being packed within the same compass as in any other description of bale. In the grest cotton marts of Liverpool and Havre, as in those of New Orleane and Mobile, the article is almost invarinbly treated of by merchanta, brokera, and commercial men, by the bale. Thus, a report on the trade of Liverpool gives the import of cotton Into Great Britain, in 1852, at $2,357,838$ bsles. The aggregste of cotton imported in that year is given in the officisl report by the Board of Trade, at 029,782,448 ponnde ; the bales everaging, accordingly, 395 pounds each.
Cotton Manufaoture. This subject will be considered nnder the geueral heads of, I. Origin ond Introduction. II. Invention and Improvements. 111 . Cotton Manufactures of Foreign Countries. IV. Statistics of Cotton Manufacture. V. Origin and Early History of Cotton Manufactures In America. Vi. Cotton Manufactare in the United States.
I. Omigin and Intnodection.-The manufacture of cotton had its origin in tho East, where the cotton plant is indigenous, and where the climate renders a light and absorbent fabric a suitabie clothing for the peopie. It has in consequence heen long eatablished over every part of Asia, although it was only in India that the fabric wes manufactured extensively, with a view to forelgn exchange. Arrian mentions cotton cloth emong the commodities which the Romans brought from Indis; but the quantity lmported by them was inconsiderable, arising from the preference which they gave to woolen clothing. Dr. Robertson remarks, that the difference between the cargoes inported from India in ancient and in modern times appears to have arisen, not from any diversity in the nature of the goods propared for sale in that country, but from variety in the tastes or in the wants of tioc nations with which they havo anccessively trased.
The antiquity of the manufacture of cottan can not be renched by any authentic records. Neither wool, silk, nor linen, can claim a higher antiquity. Ono thing is pretty certain, that its first manufucture may he traced to India, whence it passed to all the rest of the world. India, indeed, has been the source of many of the arts of civilized lifo. It was, in all prohability, the cradie of ciankind, and the source of Absyrian, Egjptian, and l'ersian civilization.
The Indians have in all agea maiutainedi an unapproached and ainost incredihie perfection in their fabrics of cotton. Indeed, some of their muslins might be thought the work of fairies or insecte rather than of

man; but theas are prodooed in amall quartities, and seldom have been exported. In the same province of India from which the ancient Greeks obtained the finest muslins then known, namely; Bengal, these astonishing fa'rics are manufactured at the present day.*.
We are told'by two Mohammoden travelers, who weat to India in the 9th century, that "in' that country they make garments of anch extriordinary perfectlon, that nowhere else are the like to be seen. ' They are woven to that' degree of fineness, that they may be drawn through a ring of moderate size." Ma so Polo, In the 16th century, mentions Coromandel, and especislly Masulipatam; as producing "the finest and most besutiful cottons that are to be found in any part of the world ;" and this is atill the case as to the fiowered and glased cottons, called chintzes.
The Portuguese adventarers who went to India im mediately after the discovery of the route by the Cape of Good Hope, speal of "the great quantities of cotton cloths admirably palnted, also some white, and some striped, held in the highest estimation, which were made in Beagal." Cresar Frederick; a Venetian merchant, who traveled in India in 1568, describes the extensive trade carried on between St. Thomé (a port 150 miles from Negapatam) and Pegn, in bumbast (cotton) cloth of every sort, painted, whieh is a rare thing, because thls kind. of cloth shows as if it were gilded with divers colors ; and the mors they are washed, the liveller the colors will become. And there is made ach account of this kind of cleth, that a amall bale of it will cost 1000 or 2000 ducats.
Tavernier, who traveled In Indla abont 200 years ago, spesks of the white callicoes (so called from the dity of Callicut, In India, where they were first seen by Europeans), or muslins woven in Bengnl, and rendered so remarkably white by being dipped in lemon jaice. He says: "Some oalicuts are so fine'that you can hardly feel them in your hand; and the thread, when apun, is searcety discernible." The anme writer says thut "there is made at Secenge, in the province of Malwa, a sort of calicut so fine, that when a man puts it on, his skin shall appear as plainly through it as if ha was quite naked; but the merchants are not pero mitted to transport it, for the governor is obliged to send lt all to the Great Mogul's eeraglie and the principal lords of the ceurt, to make the sultanesses and noblemen's wives' shifts nnd garments for the hot weather. And the king and the lords take great pleasure to beheld them in these, and see them dance with nothlig else upon them." Speaking of the turbans of the Mohammedan Indians, Tavernier aays: "The rich have them of so fine a cloth, that 25 or 80 ells of it put iato a turban will not weigh 4 ounces."
Eighteen hundred years ago, according to Arrian, suthor of the "Periplus," there were thoueands of men, nomen, and children employed at Baroche, in Guzerat, and the adjacent villages, in the manufucture of cotton, from the cosrsest anil-cloth to the finest musling. So that it is a grest inistake to auppose that cotton manufactories are of a molern origin. They existed in Indla centuries before the Christian era.
The ingenuity of the Hindoo cotton mannfacturers is truly wonderful. The late Rev. William Ward, a missionary of Serampore, says that " int twe places In Bengal musline are made so exceedingly fine that four month are required to weave one piece, which eells at 300 rupees. When thle muslin is laid on the grase, and the dew has fallen upon it, it is no longer discernihle." We might cite a great number of creditable authorities in proof of the fineness of Inulia cotton manufactures, and the Ingenulty of the Hindoes, but these will suffice. The orleutal hyperbole, which describes the muslins of Decca as "webs of woven wind," is less poetical than is generally supposed. No modern European manufacturer of cotton at all approaches the Hin-

- Batne'a IHistory of tha Cotton Manafacture, p. BK.
doos in respect to the fineness of his fabrics. The extreme of fineness to which yarns for muslina are now apnn in Great Britain is 250 hant to the ponnd, though cotton yarn has been apun in England making 850 hanks to the pound. This was, however, oaly an experiment, to ascertain how fine cotton could be spun.' No ench yarn is or could be nsed in making masling, or for any other purpose. The Hindoos are the only ones who have ever woven such yarn into fabrics,--DE Bow's Industrial Resouroes,
The implementr nsed by the Indians in the difierent processes of the cotton manufacture, from the cleaning of the wool to ite conversion into the finest muslin, may be purchased for the value of a few shillings, and are ao rude and simple a constriction so to be evidently the invention of a very early period. With the exception of the loom, none of them denerve the name of a machine, or display the slightest mechanical ingenuity. :" They spin the yarn upon the distaff; and yet, with ull the advantages which we in this country derive from machinery; we have only recently been sble to equal, elther in finenese or quality, the yarn which is produced by means of this primitive insurament. The well managed nse of the finger and thumb of the Indian spinner, patiently and carefully spplled in the formation of the thread, and the moisture at the same time communleated to it , aru found to have the effect of incorperating the fibres of the cotton more perfectly than can be accomplished by our most improved machines.

The loom is composed of a few sticks or reeds, which the Indian carries about with him, and pnts np in the fields under the shade of a tree, or at the side of his cottage. He digs a hole large enough to contain his legs and the lower part of the "geer," and fastens the balance to some convennint branch.over-hesd. Two loops underneath the geer, In which he inserts his great toes, serve as tradies: and he empleys ths shattle, formed like a large netting-needle, but of a length somewhat exceeding the breadth of the cloth, as "battoon," using ft alternately to draw through the wift and strike it up. The reed is the only part of the wesving apparatus which approaches, in the perfection of its construction, to the inetruments ve use. The loom has no beam, and the warp is laid out upon the ground the whole length of the piece of cloth. The weavers live entirely in villages, as they could not, if shat up in towns, work in this manner. Upon this rude man chine, worked in the wny we have mentioned, the Indlans produce these muslins, which have long been such objects of curiosity from the exquinite beauty and fineness of their texture.
*. It is probsble that the whole of the implements which we have just described existed as we now find them before the people of Indla were divided into castes. The transmission of the same einployment from father to son (which, althongh not specially enjoined by the Hindoo code, is the invariable practice in India), while it has the effect of conveying unimpaired the knowledge acquired in any art, tends to check lta further advancement. It is the oplnion of Mr. Rickards, whe eo ably advocated the intereats of the natives of Indis in the discussion in the Britleh Parliament on the renewal of the Company's charter (1814), that latterly this form of eociety, with all lts dependencies, habits, and restraints, has been held together chiefly by the oppression of the fiscal exactions, the want of a free trade, and the censequent niversal poverty of the people. In support of thle opinion, he refers to what the IIIndoo population of Calcutta and llombny have achieved in the purauits of commerce. We trust, however, that we may now look forward to the speedy sbolition of this system, so much opposed to all development of talent; and which, by reducing man to the condition of a machine, has paralyzed the exertions and arrested the improvement of the people of Iadia.

To the same canse, however, which thus provented improvement in India is to be attrinated that dexterity in his particular omployment which the Indian artisan possesses. From the earliest age he learns to spin and weave under the direction of his father ; and having no hope or desire of advancement in any other line, he gains, through constant practice, that wonderful skill, which may thus be considered almost as a family inheritance. To be abie to manage his ill-constructed loom, even in the production of ordinary fabrics, he is obliged to acquire such a sleight of hand, that it is not surprising if, ont of the multitude trained in this manner, a few should be found capable of producing those muslins which are said, when spread upon the grass, to appear like the gossamer web. From the superiority of these goods, and from their rotaining the beauty of their appearance longer than European mualins, it has been supposed that the cotton of which they are made is of better quality than any known to the European manufacturers. This, however, is a mistake: there is no cotton in India of a quality superior to the best sea islands. The exceilence which these muslina possess is to be ascribed wholiy to the skillful tact of the workman in the processes of spinning and weaving. The long cloths and fine pullicats are made chiefly within the presidency of Madras, the coarse piece goods and puilicats in Surst, the finest calicoee at Musulipatam, sad toblecintis of a superior quality at Patna. Each district viar. $\mathrm{s}^{1+\cdots}$ :n the others in the nature of its productionis, as may be seen from the dif ferent denominations of cotton goods to be found in every consignment coming from India.

An apprehension has sometimes been exprest $x$ that the inhabitante of India, in possession of the raw material, may obtain a knowiedge of machinery, and by combining with its peculiar advantages their cheaper laber and superior manual dexterity, may be enabled to undersell to such a degree as to ruin and put an end to British manufacture; but in the state of the people of India there are circumstances which render this impossibie, without a change being firat produced upon

their moral condition, their institutions, and their habits. The training which makes the Indian, with auch imperfect tools, able to perform his work so well, disqualifies him from doing it in any other was, or with any other implements than those to which he has been famillarized from his infancy. The attempt to introdnce machinery into India is, however, now being made. A spinning-mill has been built at Calcutta; and although the private company which commenced the nndertaking has failed, the work continues to be carried on. There are at present nearly 700 persons omployed in the mill, engaged at the rate of about seven shlliings each per month; but these people, it is found, can not continue to work beyond a few hours at a time; and a succession of hands to carry on the operations through the day is required. To train them, in such circumstances, to dexterity and akill is inpossible; and, accordingly, the yarn apun is not only of inferior quality, but even with the low nominal wages, costs so much as to disqualify it for competition with the yarn of Great Britain. An attempt is now being made to establish a cotton-spinning mill at Bombay.
The extensive introduction of machinery iato Great Britain has, meanwhile, by reducing the price of manufactures, enabled them to maintain a successful competition with the Indian goods at home, by sending cotton manufactures to a large amount to India itself. A complete revolution has in consequence taken place in the nature of the exports from that country to Europe, and, indoed, to all the markets on this side of the Cape of Good Hope. When England first got posscasion of India, her investmente at home were principally (in point of value almost entiryly) composed of manufactured produce. They are now, in a great measure, made up of the produce of the soil, indigo, cotton, wool, raw silk, saltpetre, etc., etc.
The following tabls shows the difference of the cost of cotton yarn produced in India and in Great Britain, and indicates the changeless nature of unaided human labor in the former, whist by mechanical appliances in the latter, cheapness and plenty result: Commirtek of parliament on kabr dndia ayfaige, and

It might have been expected that this change would $\mid$ date as that of Indis. Indeed, the lateness of its rise, have produced most distreasing effects upon the crowdel population of a country such as India, which in all ages has been a great manufacturing and exporting community; but no materially unfavorable consequences have resulted from it. In India, every manufacturgr is, at the same time, a husbandman. When not employed in making a web, he supports his funily by agricultural iabor. It tilus happened, that in proportion as the demand for goods for export declined, the natives, without difficulty, and without that distress which gencraliy attends a change of employment in other countries, were ahie to direct their attention more and more to agriculture ; and the result has hitherto been rather an improvement in their condition than otherwise.
The cotton manufacture of Chinn is of inmense amount, and in carried on aimest entireiy for home consumption; hut its origin is not of the same remote
It might have been expected that this change would and the slowness of its progress, in a situatien so favorabie, appear extraordinary. In the acceunts of the revenues and of the arts in Cinina during the period of the celelrated dynasty, which cominenced ebout 1100 years ijefore the Chriatian era, snd lasted for some centuries, no mention is made of the cetton plant; nor, indeed, is there any notice of cotton in these records until about 200 years befere the Christian era; from which peried to the sixth century, the cotton cloth, which was either paid in tribute, or offered in presents to the emperors, is always nuentioned as a thing rare and precious.

The cotton-trge was introduced into Chinn at tho time of the conquest of that country by the Mogul Tartarn, in the year 1280 ; after which period every encouragement was given by government to the culture and manufacture of cotton. But there wero considersbie difficuities to he encountered, in the pryju-
dices of engaged it was no altogethe of cotton of the pol

dices of the people, and in the opposition of those angaged in the manufactire of woolen and linen ; and it was not natil the yesr 1868 that theee cbstacles were altogether surmounted. After that date the progress of cotton manufacture was rapid; and now nine tenths of the population are clothed in its fabrics.

Almost the only cotton goods exported from Chins are nankeens. Barrow atates the production of all the fabrics of the Chinese mannfacture at the tima he visited the conntry (in 1792), to be stationsry, sttributing this to the want of proper encouragement from the government, und to the rigid adharence of the people to ancient usages. To keep a manufacture in a progressive state, there must be a progressive demand for its products ; and the Ohinese mannfacturers having no mesns of disposing of any surplus quantity, muet accommodate the supply to the wants of their own consumption. It is snid by travelars who have obtained access to that country, that the people show a great desire for articles of foreign manufacture. How veluable, then, to that country, as well as to others, must be the astablishment of a free interconrse, and how conducive, probably, to tha increase of the productions of all! The Chinese, over and above the cotton wool which they ralse at home, import largely from British India, and from the Burmase territories. This inte=-ourse commenced towsrd the close of the eighteenti century. A famine, which happened in Chica about that period, induced the government to direct, hy an imperial ediet, that a greater proportion of the land should be thrown into the cultivation of graia. Since then, the importation of cotton from India has been considerable, althongh constituting but s small part of what is consumed in their mnnufactare. The amount of their importstions is stated at 40,000 bales.
Introduction into Europe.-The manufactare of cotton goods in Europe is said to have been first attempted by the commerciel states of Italy, before the discovery of the pasasge to India by the Cape of Good Hope. Theas enterprising communities were the entrepôts through which the cotton fabrics of India passed to the different markets of the West; and being situsted in the neighborhood of countries where the cetton wool was grown, and familiar with manufacturing processes, it is supposed that they were led to sttempt the imitation of articles so much valued, snd bringing ao high a price. Another account assigns the introduction of the cotton manufacture into Eurepe to a later date, and givee to the people of the Low Countries the honor of having been the first manafectarers of these articles, in lmitation of the cotton fsbrics which the Dutch, aisout the beginning of the seventeenth century, began to import from India. But this last aecount can not be correct; for Guicciardini, in 1560 , in a very full list which ha gives of the different articles annually imported into and exported from Antwerp,* then the greatest commercial mart in Europe, specifies fustians and dimities of many fine sorts among the manufactured articles imported from Milan, and mentions cottons gencrally among those brought from Venice. But in the articles exported from Antwerp, althoagh we find linens sent to almost every country, cotton cloth is not nnce mentioned. Italy, therefore, at that time had a cotton manufacture, which, it is probnble, soon after made its way to the Netherlands; for we know it was brought from the latter country to Britain by Protestant refugees ubout the close of the sixtcenth or early in the seventeenth centary.
For the introduction and after improvement of many of these articles, Great Iiritain is indebted to the late Mr. John Wilson, of Ainsworth. This gentleman was originally a munufacturer of fustians at Manchester, but had early engaged in the masufacture of cot-
ton valvets, which by persevering efforts ha succeeded in bringing to the utmost degree of perfection. His improvement of the moda of dreasing, of finishing, and particularly of dyeing these goods, acquired for them so high a character, that both in the home and foreign market bls articles sold in preference to those of every other manufacturer. His plan for cleaning off the loose and nneven fibres, was by the use of razors. He afterward snccesoively employed for this end, eingeing by spirits of wine snd the application of a hot iron resembling a weaver's drying iron, which last instrumant had been introduced for the same purpose in the manufacture carried on in the Manchester House of Correctlon by Mr. Whitlow, governor of that institation. At a later period, Mr. Wilson effected his object by drawing the goods rapidly over a cylinder of cast iron heated to redness, by which they were in a superior manner clesred of the down or pile which had been raised upon them in the various operations of weaving, washing, bleaching; or dyeing. These successlve inventions of Mr. Wilison, for performing this process, glve ns some dea of the manner in which improvements are introduced into tha manufactures, when, fortunataly, the efforts of self-interest are directed by intelligence and talent. Mr. Wilson, having a turn for chemical inquiries, inventigated the different known proceeses of dyeing ; and, by the improvements he introduced in the application of them to his own mannfactnre, materially advanced that art. Having sncceeded to his satisfaction in dyeing the othar rich colors, he procured from the Greeks of Smyras, the aacret of dyeing Turkey red. An acconnt of this process was given by him in two essays, read to the Philosophical and Literary Society of Manchester, and which, on his retiring from business, he printed and distributed among his friends. The many valnable improvements introduced by Mr. Wilson into the different processes connected with the cotton manufacture had the effect not only to eatablish it more firmly, but rapidly to enlarge its extent.
II. Inventions and Imphovements in Cotton Manufacture.-It has been said that the yarn produced a century ago in England, by the one-thread wheel, the only spinning machine known, did not exceed ln quantity what 50,000 spindles of the present machinary can yield. To have reared and trained hands sufficient to have doubied this quantity, had it been possible, must have been the worik of a length of time, and the amount of manufacture would atill have been insignificant. A changa in the system, therefore, had become indiapensable ; and we find that different ingenious individuals had already begun to employ themselves in contriving a better mode of spinning. When we contrast the aplendid inventions connected with the cotton manufacture, which from this period burst forth in rapid succession, with the passive acquiescence in the use of imperfect machinery during the long period which preceded, we are apt to ascribe these improvements to the circumstance alone of a number of man of genius having at that moment ariaen, and to forget that the ultimate cause exists in the times which called their energies into action. About the year 1750, tha fly-shuttie had been invented by Kaye of Bury-one of tha most important eteps in the progress of the art of weaving ; and in the year 1760 improvements had begun to be made in the cariling process.
James Hargreaves, a weaver at Stanhiil, near Church, in Lancashire, Englan ${ }^{\circ}$ an iiliterate man, poescsed of no great mechanical knowledgo, had adaptod the stock carde, used in the woolen manufacture, to the carding of cotton, and had besides greatly im proved them. By his invention a person was able to do double the work, and with more ease thinn by handcarding. In the stock cards, one of the carda is fixed, while the other, being suapended by a cord over a pulley, is worked by the carder; and in this way, two or three cards can be npplied to the sama stock. This
contrivance was soon sueceeded by the cylinder cards, oz carding engine. It is not ascertained who wat the inventor of this valuable machine, but it is known that the father of the late SIr Robert Peel was among the persons who first used it; and that, so early as 1762, be, with the assistance of Hargresvat, erected a carding ongine with cylinders, at Blackburn. This machine did not differ materially from that now in ueo, except that it had ne contrivance for detaching the cotton from the card, an operation which was performed by women with hand-cards.
These anccesaful advantages show that the minds of the manufacturing clate had been awakened to discovery, and must have oncouraged and stimulated the offorte that were then making to effect corresponding improvements in apinning.
There had been several unsuccesaful attemptes to improve the mode of spinning before the year 1767, when James Hargreaves, whom we have already montioned, invented the "apinning-jenny." . The idea of this machine is said to have been suggested to him by saeing a common apinning-wheel, which had been accidantally overtarned, continue its motion while it lay on the gronnd. If euch was the cause, it marks a mind of no common description, which from so casaal an occurrence could elicit an invention of 80 muoh importance. After several musuccessful attempta to carry into exeention the conception he had formed, he auccesded in producing a radely-conetructed jenny of oight upindlea, turned by bands from a horizontal wheel. In it the eight rovings were passed between two pieces of weod laid horizontally the breadth of the machine; and these being grasped in the apinner's hand, and drawn out by him, formed the rovings into threads. The structure of thia jenny was soon afterward greatly improved, and it was at lant brought to work as many ae eighty epindles. This machine, altbongh of limited powers when compared with the beautiful inventions which encoeeded it, must be considered as the first and leading step in that progreas of discovery which carried improvement to every branch of the mannfacture -which, as it proceeded, changed the nature and character of the means of production, by substitnting mechanical operatiena for human labor-which caused the manufactured article to become more ard more a product of capital. The progrese of invention after this was rapid; for when it was seen that, with the aid of the few mechanical combinations we have mentioned, the apinner had been enabied to increase hia power of production eightyfoid, the attention of those engaged in other branches of manafacture, was awakened to the possibility of introducing changes equally beneflcial into their peculiar empioymenta.

Hargreavas' invention occasioned great alarm among those who earned their subaistence by the oid mode of epinning, and even produced popular commotion. A mob broke into his house and destroyed his machine; and some time after, when a better knowiedge of the advantage of his invention had begun to bring his opinning-jenny into general use, the peopie rose a seoond time, and ecouring the conntry, broke to pieces overy carding and opinning-machine they could find. Hargreaven himself had by this time removed to Nottingham, where he was enguged in erecting a smali spinning-werk, alout the same period that Mr. Arkwright came to aettie there, who had also been driven from Lanceshire by the fear of simiiar violence.

The jenny in s short time put an end to the ppinning of cotton by the common wheel; and the whoie wefte nsed in the manufacture continued to be apun upen that machine, antil the invention of the " mulejenny," by which it was in ite turn superseded. Ilargreaver died, in great poverty, a fow years after his removal to Nottingham.
While Hargreaves was producing the common jeany, Mr: Aricwright (afterward Sir Richard Arkwright) wat employed in contriving that wonderful
piece of mechanism, the spinning-frame, called first the water-frame, and afterward the throatle, which, when put into motion, performs of ltself the Whole procest of epinning; lesring to the werkman only the office of aupplying the roving or prepared material, and of joinin" or piecing the threed when it happens to break. In the jear 1769, Mr. Arkwright obtained his natent for apinning with rollers, and Mr; Need and Mr. Strutt became his partners in the concerna to be carried on under it. He erected: mill at Nottingham, which he worked by horse-power. But this mode of giving motion to the machinery being expensive, he, in the year 1771, built another, mill at Cromford, in Derbyshire, to which motion was given by water. Wo shall now proceed to give an account of the different machines used in cotton-spinnlog, invented by Sir Richand Arkwright, and of those afterward invented by others, describlog them in the order in which they are employed. In this manner we shall be abie to exhibit a view of the present state of the art. The inetruments used in the preparation and spinning of cotton-wool, re the following:
The opener ; the acutcher, and apreading-machine; the egrding-engine; the lap-machine; the drawingframe; the elabbing fly-frame; the intermediate $6 y$ frame; the finishing fly-frame; the throatle-frame for coarse werps; the self-acting jenny for numbers below 60; and the hand-mule jenny for higher numbers. The first three of these instruments are employed in $t^{-}$, rude process of cleansing the raw cotton, and separating its matted flocks. In the carding-machine it is carded and further purified; in the lap-machine it is fashioned in flat folds ; and in the drawing-frame it is formed inte a loose rope, the fibres of which have a parallel arrangement. In the slabbing-frame it is slightly twisted; and in the intermediate and finishing. frame it is atill further twisted, particularly in the higher numbers; but it is not yet yarn. The throstieframe ja chiefly used for coarse warpe; while upon the self-acting and hand-mule jennies, both coarse and fine yarna are epun.

This deacription of the carding-machine is atill spplicable for numbera of yarn above 100, which are made from sea-island cotton. For numbers above 50, a syatem of twice carding it is still enployed. The engines are generally 36 inches wide. The cotton is partially carded in the breaker or firat card; it is then re-formed into a lap; sod is lastly passed through the finisher or eecond card; for the finost yarns, however, combing is substituted.

Tu make the operations of the various machines just enumerated more plain, we will give the metamorphones of a bale of cotton, from the time it is brought to the manufacturers untii it becomes yarn ready to be made into eloth. Women and giria in the mill tske the cotton from the bale by handfulo, and feed with it the opening-machine. The cotton, laid upon an eadless ajron, is caugint between the teeth of revoiving roliers, which effectualiy tear and separate the locks asunder; the cotton is opened into a light and foculeat mass, and the few remaining seeds and the dirt are expelled. Then the scutching-machine comes into requisition; again is the cotton piaced upon an endlesa apron, and again exposed to the setion of revolving roliers; the impurities are yet further separated, and the beautiful downy cotton becomes lapped in a centinuous sheet upon a cylinder. These sheets of down -theas eoftest of all soft layers-how do we convert them into delicate yam? The broad, soft sheets go to the carling-machine, where a number of wire comba, or rather wire brushee, comb the cotton out into atraight fibree; and these fibree are dexteronsly whipped off by a "deffing" apparatus, to assume the form of dellcate, narrow ribbons, or slivers. Next we see all these slivers joined by another machine, so es to form a continuous lap; and this lap la again cardud and doffed, by whloh the substance bocomes equalized
as much to the sta inta use t yarn or tl roving-m we see nl cotten is and gives delicute 5 claborated

ss much as posalhle. The cotton is thus again brought to the state of a ribbon or alliver ; and then are bronght into use the machines which convert this ribbon into a yarn or thread. The drawing, the slubbing, and the roving-machines, all have relation to this conversion; we see numerous pairs of rollers, between which the cotton is drawn; the drawing rounds it, equalizes it, and gives it a slight twist; until at length we see the delicate yarn-fine, perchanco, as a spider's webelaborated from the thick but soft ropes of cotton.
More correctly, however, we should say that the cotton does rot become yarn till sfter the spinning. Nothing excites more astonishment in cotton fuctories than the self-acting mule. The complex carriage, 20 or 30 feet long, with its army of spindles (sometimes as many as 800 in number), travels elowly to and fro, and draws out dellicate threads to a state of atlll greater dellcacy and tenuity; the drawing out thins the cotton, the rapid revolution twiste it; and thus by drawing and spinning do the Houldeworths and the Bazleys of the nlaeteenth century produce cotton-yarn whose fineness almost exceeds belief. And while the mule-machine is thua maklng fine yarn for weft-thresds, the throatlemachine, by a different mode of action, produces the stronger yarn for warp-threads; then again, if it be sewieg-cotton, or hosiery-cotton that is required, we trace the yarn to the doubling-machine, where two or more are twisted, one around another, whereby a much denser thread is produced. The amount of machinery in the spinning-rooms of some of the mills is astonishing; in some cases 75,000 spindles whirling away at once in one room, each one requiring the co-operation of a number of other delicate little pleces of mechanism.

We have noticed, in speaking of the carding-engine, which Mr. Peel erected in 1762, that at that time the cotton was taken off the finishing-cylinder by means of haad-eards. But by the time Mr. Arkwright began his spinning, this operation was performed by the application of $n$ roller with tin plates upon it like the fleats of a water-wheel, which, revolving with a quick motion, seraped of the cotton from the card. This was a rude contrivance, and in Its operation injured both the cotton and the cards. Mr. Arkwright substituted for it a plate of metal, toothed at the edge like a comb, which, in place of being made to revolve like the other, ras moved rapidly in a perpendicolar directlon by a crank, and with slight but reiterated atrokes on the teeth of the cards, detached the cotton from them in a uaiform fleece. IIe employed narrow fillet-cards, wound round the doffing-cylinder in a spiral form, by which contrivance a continuity of fieece was produced, which, as it left the card, was gradually contracted in its size by being passed through a kind of funnel, and then flattened or compressed between two rollers; after which it was received into a tin can in the state of a oniform, continued carding. The taking off the cotton from the cards in this manner, is one of the most beautiful and curious operntions in the process of cat-ion-spinning ; and although the crank, which forme a part of the upparatus, had perhaps been ueed in some way or other prior to the date of Mr. Arkwright'e secand patent (as was urged in tho netion for having it set aside), the comb for taking off the fleece, and the spiral card which produces its continuity, were inventions indisputably his own.

Description of the Mulegenny.-The mule, $\ln$ its structure and operation, is a compound of the spluningframe and of Hargrenvea' jenny, from which circumthacea it has probably receivel it nume. It contains a system of rollers like that helonging; to the twistframe ; but in place of having every four or six of them in separate hands, as is the case in that macline, the whole ure couplod together; and the rove being drawn through them, is, in its conversion into thread, received on spindles revolving like those of the jenny. The carringe on which these spindles are placed is
movable, and is made to recede from the rollers a degree faster than the thread is given out. After a certain quantity of the roving has been thus delivered by the rollers, they are stopped; but the carriage continues to recede somewhat further; and the spindles continuing also to revolve, the thread is drawn ont to the fineness required, and then recalves its proper portion of twist. This last operation resenbles that performed by the common jenny, and produces a similar effect.

In an account of the means whlch contributed to that fall in the price of apinning which we have mentioned, we must not omit the progressive improvement in the cultivation of the raw material, and in the application of its different qualitles to their most profitable nses. Previous to the year 1793, the cotton used in the coarser articles of the manufacture, with the except.on of a small quantity imported from India and from the Levant for the fustian-trade, was wholly the growth of the English and of the French West India Islands. That for the better kind of goods was raised in Demerara, Surinam, and Berbice. The vool for fine goods was grown in the Brizils; and that for the few very fine muslins then manufactured, in the Isle of Bourben.

In 1787 the descriptions of cotton imported into Britain appear to have been as follows:

| From tie British West Indles. | Pound. $6,800,000$ |
| :---: | :---: |
| From the French and Spanish colontos... | 6,000,000 |
| From the Dutch . . . . . . . . . . . . . . . . . . . . | 1,700,000 |
| From the Portugue | 2,500,000 |
| From the Isto of Bourboo, hy Ostend .... | 100,000 |
| From Sayrda and Tarkey | 8,700,000 |

Had Britain continued to derive her sole supply of cotton from these countries, the progress of the manufacture would have been greatly retarded, not only from the difficulty of making the production of the raw material keep pace with the increasing consumption, but from the imposaibility of obtaining the quallties of wool suited to the finer descriptions of goods, which the improved machinery enabled ns to undertake.

The year 1770 has always been steted as the period at which the planters of the sonthern States began to turn their attention to the raising of cotton-wool. But we happen to know that in 1764, William Rathbone, an extensive American merchant in Liverpool, received from one of his correspondents in the sonthern States a consignment of eight bags of cotton. This cotton, on its arrival at liverpool, was seized by the custom-house officers, on the allegation that it could not have been grown in the United States, and that it was liable to scizure under the shipping-act, as not being imported in a vessol belonging to the country of its growth. When afterward released, it lay for many months unsold, in consequance of the spinners doubting whether it could be profitably worked up. But fortumately, about the year 1770, the planters in the sonthern States began to turn their attention to raising cotton-wool; and beaides currying the cultivation of the article to a great extent, they produced qualities of cotton before unknown. In 1792 the quantity of cotton exporter from the United States was only $138,328 \mathrm{lbs}$., no manufacture of cotton goods having heen attempted In America for inany years ufter that period. In 1831 they exported 619,000 bales to Great Britain, 127,000 to l'rance, and 27,000 to other parts. In 1845 the quantity grown in the United States was $2,100,537$ bales, and it is estimated that $3,500,000$ bales will be shipped in 1857.

The American cotton-wool first taken to Great Britain was very ill-cleaned, and, in consequence, was indiscrininately applied to the manufacture of the coarser species of goods. It was soon, however, perceived that the cotton rased upon the coast, termed sea island cotton, had a finer and longer ciaple than that grown further back in the conntry, and known by
the name of upland cotton. But it was not for neveral years, and untli after a aucceselion of trials, that this wool was ascertained to be of a quality ln every respect superior to the cotton of the Isle of Boaribon. Indeed, it was only in the year 1706 that the finest deacription of it was applled to the purposes for whleh Bourbon wool had till then been used, and which it soon entirely supplanted. The aecond quality of it about the same time supplanted the Brazil wool in many kinda of goods.

The cotion recelved from Egypt is found to be among the moat nseful that is grown, and that raised from sea island seed ranks in quality next to American sea island.
III. Cottox Manufactuak of Foreign Coun-tries.-Having succeeded in the production of cotton, the Pasha of Egypt thought he might advance another step, and have it spun Into yarn and woven into cloth. He accordingly formed eetahlighments for spinning and weaving ln Cairo, Bossco, Rosetta, and other places; and so early as 1826 he had at work 61 mills, moved by the power of buffaloes. The machinery was eupplied from France and England, oriers in council having leen obtained in the latter countr:' to authorize its export. Power-looma were also sent out, but did not succeed. A few years later, the pasha shipped 1,000 bales of yarn to Calcutta for sale; but it was not of a quality to enter into competition with English yarn, and it was found to be unsalable, excopt at a most disadvantageous price. He ordered it, therefore, to be woven into cloth, In Calcutta, on his own account, and to tee re-shipped to Egypt, in a 1 . anufactured state. Clapperton and Landere, on their expedition to trace the courses of the Niger, found the inhabitants everywhere clothed in cutton. They mention that cottonwool is produced in the different districts in the interior, and is apun Into cluth on the spot. There exista, therefore, in the heart of Africa, an extensive manufacture of cotton cloth. It is to be regretted that they give no information of the way $\ln$ which the yarn is spun, and no description of the loom employed to weave it. It would be interesting to know the nature of the instruments used by the natives in these processes, as euch knowledge might enable us to trace whence the Africans derive their acquaintance with the art of wenving, and thus perhaps throw some light on African history. It appears that the people of Eboe, anil of the countries near the const, are chiefly clothed in Manchester cotton goods ; a circumstance which would lead ue to expect, ehould we succeed in obtsining a commercial intercourse with the interior of Africa, that a valuable market for the manufactures may be found in that country.

Within the last 20 yeare (1854), the American settlers of Liberia have established a communication across the country to Timbuctoo, and have found there a considerable market for cotton cloth. For more extended information of this trade, see Lineria.

In France, cotton yarn is often made in a different place from cotton cloth. Paris and the northern departments are the chief quarters for the supply of the former article, which is sent in quantities to Rouen, St. Quentin, and other places. In former years, cotton yarn used to be smuggled in great quantities from England; but this is now limited to the finer qualities. The cotton manufactures of the more substantial kind, called bonneterie, such as stockings and caps, are carried on in the Ardenner, in Normandy, and the department of the Garil, in Languedoc, is also noted for this manufacture. The exportation of cotton goods from France in 184r, reached $5,000,000$ kilogrammes, valued at $105,-5,5,43$ francs. The importation of cotton thrend from Eagland in 1853, was 90,002 kilogrammes, in value, $1,559,311$ francs. That of raw cotton in 1839 was $40,534,278$ kilogrummes, In value, 71,204,784 francs ; in 1840, 52,941,581 kilogrammes, in value, $94,005,975$ francs. The cotton manufactures
of France consume between 50 and 60 millions of kiiogrammea, nnually imported.

We shall now resume our account of the progress of the manufacture in Grest Britain. From Sir Richard Arkwright having commenced his operations at Not. tingham, the seat of the stocking manufacture, and from his connection with Mr. Need, who wse largely engaged in $1 t$, the whole produce of his spinning was at first devoted to that trade. The cotton yarn for this manufacture requirea th be particularly smooth snd equal; and to eecore these qualitles, it is spun hy a procese differing a little from that employed for ordinary twist. Being from two roves in place of one, it is called double apun twist. The introduction of this article produced a great change apon the stocking manufacture. Hand-apun cotton was entirely lald aside; and stockings made of twist were of so superior a quality, that in a short time they wholly supplanted thread stockings.
The manufncture of cotton atockings in Notinghamshire, Derbyshire, and Leiceetershlre, ls now of great extent.

About the year 1773, Mr. Need and Mr. Strutt made the important discuvery, that the yarn produced by the spinning-frame had sufficient strength to fit it for warp, although its firmness and hardness rendered it less suitatile for weff. The weft, therefore, coatinued to be spun by Ilargreaves' jenny; and from this time the calicoes, and other articles in Imitation of India goods, which had hitherto heen manufactured with liven warp, enme to be made wholly of cotton; and the progressive increase of these mannfactures, particularly of calicoes, after this time, was uncxampled.
After having made a consideralle quantity of those grods, Mr. Need and Mr. Strutt discoverel that, when printed, they were anbject to doublo the duty charged upon calicoes woven with linen warp, and that their sale was even prohilitited in the home market. After a long and expensive application to the legistature, they succeeded in procuring the repoal of those impolitic laws. Nearly about the same period, calicoss entirely of cotton wero begun to be made at llackburn, and also nt Preston; which places seon becane the sent of their monufacture, and for a leng time the great market to which the printers from all parts of the kingdom rosorted for their supplies. This brauch went on lacreasing for many years in a most extraordinary degree. About the year 1805, it was culculated that the number of pieces sold annuully in the Blackhurn market was not less than a million; and by that timo the .. nufacture of this article was not confined to the country uround Blackhurn, tut had spreall into the north-west district of Yorkshire, principally akout Colne nnil Bradford, from which purt of the country 20,000 pieces weekly are said to have been sent to Manchester.
The nomenclature of Cotton Goods, and the admission of new names, nre nmong the oddities of the cottom manufacture. What these names mean, it would, perhapa, not be very ensy to say; sometimes they indicate a degree of tineness in the goods; somptines the mode of weaving; sometimes a color, $n$ pattern, " garnent for which they are suitalle, or a dist inguislued personage who first wore them; sometimes a foreign product which they imitate; sometimes a comutry for whose market they aro intended, or a tewn which is the chief seat of their mauufacture, or a firm which takee a lead in their production-it matters little what the meaning may be; a new namo has a commercial

value; and the Shakesperian dictum concerning "a rose by any other name, ${ }^{\text {" }}$ etc., is not always assented to in shopkeeping philosophy." Let ns run hastiy over a bundle of these names. We have dress ginghams and fancy ginghams, and umbrells ginghams, checked and etriped ginghams, and ginghams known by the high-sounding names of Camperdowns, Coromandels, matallas, vicufias, and briolas. We have book mualins, jaconet muslins, bishop lawn muslins, nacharilla muslins, tarlatan maslins, Scotch lawn mnslins, Victoria muslins, India and Swise mull musling, lene muslins, striped muslins, lappet muslins, spot musiins, sprig muslins, and a number of ther nembers of the musion family. We have table-cloths, dispers, hucksbacks, Jean-stripes, clan tartans, galas, Hung's rians, and Derries-all made of cotton. There are parongs, crossovers, selampores, Granvllies, denims, panes da costa-all, we believe, of the cotton shawl family. There are connterpanes, quiltings, veatings, dimities, swanedowns, mc ikins, doeskins, lambeking, veiveteens, beaverteens, custians, long-cloths, shirtings, calicoes, everlastings, nankeens, contils, and other cotton goods, the enumerstion of which would be almost wearisome. A few groupings will show the relations between these gouds. For instance, the gingham family consists of strut cotton, In which threads of two or more colors are woven together into stripea, etc. ; fustians, beaverteens, velveteens, molealins, and several others, are woven on the esme principle as velvet, with a nap or pile, which is either cut or left uncat; damaski, huckabacks, diupers, ticks, and cambrics, are cotton limitations of the similarly-named fuxen goods; quilts and counterpanes have downy tufte to iacrease the thickness and softness ; shirting calicoes, sheeting calicoes, printing calicoes, long-cloth, and duck, are varietles of plain, serviceable cotton goods, varying in stoutness ; chintz is a stout calico, nfterward printed in several colors; corduroys, jeans, quiltings, and many other varieties, are very sirong cotton goods, mostly twilled. As for muslins, their variety is almost interminable.
The first attempts to make muslins in Great Britain commenced simultaneously in Lancashire and at Glasgow about the year 1780 , but without success. 'There was ne yarn fitted for the weft of these goods, except that spun upon Hargreaves' jenny ; and when made of this, it was found they were not of a inarketable quality. Recourse was then had to wefts brought from India; and altheugh a better article than the former was by this means produced, it was still not of a quality to compete successfully with Indian muslin. As soon, however, as the invention of the mule jenny enabled the spinner to produce yarns suited to such fabrics, the manufacture of the finest cotton articles became an important branch of trade in Great Britain. That machine, as has been mentioned, came into use at the end of the year 1785 , upon Sir Richarl Arkwright's patent being cancelled; and it is from that period we ought to date the commencement of this part of the manufacture. So rapid was its progress, that in 1737 lt was computed that 500,000 pieces of muslin were in that year manufactured in Great Britain.
Muslin began to be made nearly at the wame time at Bolton, at Glaegow, and at Paisley, each place adopting the peculiar description of fabric which resembled most those goods it had been accustomed to manufacture ; and in consequence of this judicions distribtition at first, each place has continued to maintain a superiority in the production of its own article.
Jaconet, both coarse and fine, but of a stout fabric, checked and striped muslins, and other articles of the heavier description of this branch, are munufactured in Bolton nad in its neighborhood.
Book, mull, and lino mualins, and juconets of a fighter faibric than those made in Lancasiife, are manufactared in Giasgow. Sewed and tamboured maslins
are almost exclusively made there and in Paisley. A machine of most ingenious contrivance for performing the operation of tambouring, was, in the year 1807, invented by Mr. John Duncan of Glasgow, and a patent taken out for the discovery. Each machine contains abont 40 tambouring needies, and is auperintended by a girl, who pieces the thread when it breaks. This beantiful and, at first, promising piece of mechanism has never come into genersl use. At present there are only three or four machines kept at work by the Messrs. Mitchells of Glasgow, who at an early period became proprietora of the patent. What are calied fancy goods, woven in tha loom, were first made at Paisley, which had been the chief seat of the silk gauze manufacture of this conntry, In the silk trade, which was ther beginning to fall into decay, a body of most ingenious workmen had been bred. By omploying them, the taste and invention which had produced the varieties displayed in that beautiful article were immediately tranaferred to the production of similar fabrics of muslin. From this circumatance, Psisley for a long time retained the exclasive possession of this branch; but being only seven milos distant from Glasgow, the general seat of the cotton manufacture of Scotland, and the mart to which most purchasers of mnalin resort, many of its principsl manufacturers have been induced to move their establishments to that city, although the weaving of these muslins continnes to be executed in Paisley and its neighberhood.

There is a curious circumstance to be noticed with regard to the mannfacture of the very fine fabrica of muslins in Seotland-that a great ppat of the yarn used for them is bronght from Manciester, In consequence of thie Scotch spinners net having yet been able to produce the very fine numbers of yarn of the best quality. This inferiority does not proceed from a leas perfect conatruction of the machinery employed in Scotland, the mechanics and the machine-makers of Glasgow being admitted to be excellent workmen ; neither does it arise from the want of akill in these whe cenduct the business, or from any difference in the processes employed in the two countries ; but it is to be attributed to the same cause which produces the superior yarn of India, namely, an adroitness and mechsnical eleight of hand in the operative spinners of Manchester, acquired by a few out of the great multitudes bred there. The manufacture of the thicker cotton fabrics was, at the same time, rapidly rising in importance. The mannfacture of dimities has been exclusively confined to tho north of England, all nttempts to make them in Scotland having proved nnsuccessfui. Balason handkerchiefs were tirst manufactured abcut Preaton and Chorley, where they still continue to be made. The manufacture of ginghams was for a long time confined to Lancashire, but for many years it has been extenaively introduced at Glasgow, although Lencashire continues to be the chief sent of this branch.

Pullicat handkerchiefs were first made sbout the year 1785 , at Gilasgow, where the manufacture of them has been carried on to a grest extent. They were not made in Lancasbire till some time nfterward, and the manufacture of them there has never been to the same amount; Glasgow, therefore, continues to be the principal mart for this nrticie.

Blue and white checks and stripes for exportation were at first of a linen fabric, but were afterward woven with linen warp and cotton weft; and when Sir lichard Arkwright's discovery enabled the spinner to produce cotton yarms of sufficient atrength to $1, \mathrm{~d}$ used for warps, a great proportion of these goode cane to be made wholly of cotton. This manufacture is carried on in Lancashire, and in the county of Fife, and to a small extent at Aberdeen; its chief seat, howover, is Carlisle.

The manufacture of cotton cambrie was begun about the same period, and was separated into two branches; Into cambric to be used in garments in u
white or printed state, and Into cambric made in Imitation of French linen cambric, to be used for the same parpose as that articie. Tha firat io made nearly altogether in Lancashire, where the manufacture of it is carried on to a great extent ; and the second, of much less amount, wholly at Glaagow. The Scotch manufacturers have never been able to rival the Lancashire in the firat; nor the Lancashlve manufacturers to rival the Bcoteh in the last.
Bandana handkerchleff, and Bandana clotha for garments, were first made by Mr. Menry Monteith, at Glasgow, sbout the year 1802, and are now manufaccured there to a conaiderible amount. The cloth is iyed a bright Turkey red; and the color is diacharged from those parts which form the pattern or figure, by passing a chemical mixture through them. Glasgow till continues to be the chief seat of this manufacture, ind there are in that city several large works for carrying it on. The demand for Bandanas, however, has atterly failen off, while, in conaequence of the repeal f the Impolitic duty on printed clothe, the consumpion of these has greatiy increased; and most of the proprietors of the Turkey-red dyeing establishments lave therefore leen induced to add calico-printing to heir former buineas.
The value of the present annual production of the cotton manufacture of Great Britain is estimated at $\mathbf{£ 5 4 , 0 0 0 , 0 0 0}$ sterling, of which nearly $£ 38,000,000$ is the value of goods and yarn made for exportation. The caplial invested in buildings and machinery may be calculsted at nearly the same sa the annual amount of the manufacture, and more than double what it wae 80 yeare ago, while the quantity of goode annually produced is much more then tripie; yet, from the improvement of the processes, and consequent diminutio of the expense of production, with the reduction which has taken place at the same time in the price of the raw material, this more shan tripled quantity of the manufactured article does not reprecent more capital than was represented by, and required for the bringing to market the lesser amount during the preceding period. In the year 1812, when Mr. Crompton spplied to Parliament for a remuneration for his invantion, he found by as accurate an inveatigation as he could make, that the number of mule epindles in the country was between four and five millions; and Mr. Kennedy, in his memoir of Mr. Crompton, has etated, that the number in 1829 had increased to $7,000,000$. In 1817, he estimated the number of persons employed in the upinning of cotton in Great Britain at 110,763, and the number of spindles in motion at $6,645,833$, and the quantity of yarn produced at $09,687,500$ pounds. The quantity of cotton yarn spun in 1882 was $222,000,000$ pounde, of which $182,000,000$ pounds have been manufactured Into cloth, giving employment to 203,373 looms; but in 1853 the yarn apun was $685,440,000$ pounds.
IV. Statistice of the Cotron Manufactune.It is obvious that the home consumption in the United States has always borne a most disproportioned ratio to the entire growth, and that even in the last four years, when it had attained to the highest point which it has yet reached, the quantity reserved for domestic use never exceeded a seventh part of the whole, and generally fell considerably below it. It is deserving of notice, however, that in the period of time which this table comprehends, tho internal consumption of the United States has been trebled; but large as this increase may seem in the eye of $n$ native economist, the conclusion from it will not be satisfactory if the collateral circumatances are not considered; and the chief of these is, that it is an increase on small quantities, and indicstes no more than the gradual growth of an infant trade, which the cotton manufacture was in North America in 1829. We believe that in this manufacture Great Britain has as yet littic to fosr from competition; but we are not equally confident that its prosperity may
not be exposed to riek from her ill-judged anxiety to secure a monopoly of its advantagee. The practice of excluding from her markets the manufuctures of other countries la not only contrary to sound political principlen, but gives rise to a eplrit of hostility unfavorable to her intereata, and placea her in such a state thst when other nations in rotaliation, exclude her manufactures from thelr markete, she bas no right to complain.

That we may not declde this question rashly, let us examine what is the danger to which the would be ex. posed if ahe were to take the opposite aystem, and open her ports to the manufictures of other countries. If they can now export annually to the value of abont $\mathbf{~} 82,000,000$ aterling of cotton gooda, which, burdened with freight, charges, and the exporter's proft, they are alle to aell In competition with forelgn manufacture, can they have any thing to fear from a competition with that manufacture in her home market, where the circumstances of the competing partles would $\mathrm{l}_{3}$ reversed? So far from the introduction of foreign m"uufacture into her market beling an evil, we are inclined to think that It would be advantageous to her interests; and that, in the Interchange of various fabrics which would be the reault, the sale of her own manufactures would be Increased. Commerce being altogether a matter of berter, it is necessary for every country to purchase In order that she may sell; and, fortunstely, even in the same branch of manufacture, there ia always room for such exchanges. There are shades of difference in tha fabric of every srticle, upon which taste or fashion, or caprice, never falls to fix cn arbitrary value, thereby constituting them into separate commoditles capable of being exchanged. But the view we are taking of this important question does not rest altogether upon theory. Happily we have experience in support of it. No one diaputes the advantage reaulting from the Interchange of commoditiea between Maine and Louisiana, or alleges that it would be for the benefit of either to have the munufacture of the other excluded from its market. Yet these two districts have their dependence upon manufactures which in their general features are the same.

It is well known regarding the commercial treaty with France, in which some spproach was made to in free trade between the twu countries, that while it Ine ${ }^{2}$ ad, the sale warehouses of London and Manchester wc $s$ resorted to by purchaeers from the different towns of France, with the same frecdom, and in nearly an equal proportion of numbers, as from the towns in England. And although in these warehouses French and English commodities of a similar description were to be found, and British shopkeepers were at the samo time daily resorting to France to make purchases, in no period were her manufactures in a stute of grenter progressive prosperity than during the eight years (from 1786 to 1793) that this treaty existed. There is no one, we believe, who has taken the trouble to illveatigate the matter, that will not say that both were benefited by this treaty, and probably exactly in tho uegree that the exclusive system in both had been departed from.

In addition to this, it may be proper to notice, that Switzerland and Saxony have always been open to the reception of cotton goods free of duty; and that in no other countrics on the Contluent is the cotton manufacture in a more thriving state. Might it not, thercfore, be a wise measure to withdraw their restrictions against tho importation of foreign manufactures, since tho interference of these with her own products in the home market, supposing no interchange of the two to take place, never could counterbalance the amount of the sale she may be deprived of by following the opposite policy, and thus inducing the exclusion of her own goode from the foreign market?
Fears have been expreased that the lower wages for which tho laborers of other countries that compete
with upon they take this, ars th now dimin the in for ex work plecer thouse not tu halt in been t po' T ,
with Great Britain in the manufacture can work, and upon which, from the cherpnees of their provisions, they can afford to live, may ultimately enable them to take the manufacture out of her handa. In reply to this, it may, perhape, be eufficient to recall to our readers the umall pert of the cost of the commodity which now belongs to the labor of the hand, and the daily diminution which is taking place even of that part, by the introduction of new mechanical subatitutes. This, for example, in 1767 , each spindle requirad a person to work it ; but now one man, with the nid of a few piecers to take ap and join his broken ends, can work a thousand spindles. In Lancashire, in 1818, there were not more than 2000 power-looms, and of these not a half in employment ; whlle in 1832, so extensive had been the change from hand-weaving to weaving by po' r, the number hed incressed to $\mathbf{8 0 , 0 0 0}$.

Looking at the production of the past and the de- thongh with the prospect of better prices, As an illusmands for the future, it is not strange that the cotton manufactures ahould show unessinese lest their spindies should be idle for want of the raw material. The consumption of raw cotton has rapidly increased during the lat few years, and the unusualiy large crop of last year has been fully used up, leaving no reaidue,
tration of the increased consumption for the past year, we give the quantities of raw cotton consumed is Great Britain since 1847. It will be seen, that of the increase for the last year-equal to 15 per cent.-over three fourths, or 11 per cent., came from the United Statee.

According to official tables, the cotton Induatry of Great Britain and Ireland yioided last year about fiftyfour millions aterling, and which may bo ragarded ae half the cotton Industry of the whole world; but foreign countries, besidos taking half of the raw cotton sent to market, receive large supplies of cotton yarns from

Great Britain ; and in Aaia and Africa cotton is atill largoly apun by hand; hence the world's cotton industry may be valued at $120,000,000$, which would afford to every man, woman, and child, on the face $f$ the earth, 2s.98d. worth of cotton manufactures, or about fourteen yards per head per annum of excellent calico.

V. Origin and Early History of Cotton Manufactures of Ameaica.-Cotton io of indigenous American growth. On the first landing of the Spaniards in Mexieo, they found it in considerable perfection. The Moxicans are said to have been solely lependent upon this product, the wool of rabbits and hares, feathers, and a fibrous plant ealled maguet, for their elothing materials. They had neithor wool, hemp, nor silk, and their flax was not uaed for these purposes. Ont of cotton they fabricated webs of exceeding tenuity, and their cioths were woven into beautiful figures. Mantles, bel-curtains, and earpets, they finished elegantly with mingied cotton and feathers. Cortez aent to Charies V. of Spain, "cotton manties, some aii white, othors mixed with white and biack, or red, green, yellow, and blue, waistcoats, handkerchiefs, counterpanes, tapestries, and carpets of catton." A peculiar cotton paper was made in Mexico, smali cioths of the ame material constituted a part of their earreney, and their warriors are sald to have had cotton cuirasses. The modern Mexicans have lost the parfection of their ancient art of manafacture. The Ameriean plant was not confined to Mexico alone; Coiumbus found it wild in Ilispanioia sad on tise eontinent of South Anerica, where it had alrendy grown into an articie of nse for elothing and ether purposes. The Braziilans made their beds of it. The Abbe Ciavigam aays, that of "cotton, the MLexicans made large webs, and as delicate and fine as those of lioisnd, which were ao highiy esteemed in Europe. They wove their claths of different figures and colors, representing different animals and flowers. Of feathars, interwoven with cotton, they made manties, bedcartains, carpets, gowns, and other things, not less soft than beautiful. With entton, also, they interwove the finest hair of the beliy of rabbits and hares, after having spun it lnto thread; of this they made most boautiti cloths, and in particular, winter waisteoats for thair lords." Cochineal and indlgo being nativo products of Mexieo, they were weil supplied with dyeing materiais; but the fact of their having carriel the arts af manufacturing and dyeing cottan to sueh a high stage of perfection, is proof that they must have received their knowledge from India, by way of the west.
Mageilian, Drake, Cavendish, Dampier, Van Noort, ail agree that entton was one of tha articles of dress among the Anserican savages, on the discovery of the country. At St. Saivador the women are deacrihed as dressed in cotton coats. Eiven as fur nortii, raya M. Seabrook, na the Mos-chacebe, or Mississippl, tine eariest exjiorers of that river, and its tributary streama, saw catton growing wild in the pod, and in great plenty. Theso facta, and they might almost he indefinitely multipijed, are introdueed to rebut the opinion founded on the nogative testimony of Cuptain Cook, that the gossypuin is not a native of the western hemisphere. That eciebrated voyager found no cotton between New Zealand, $36^{\circ}$ S., and tho Sandwich istands, $20^{\circ} \mathrm{N}$. In addition to flax, and tho hark of the mulberry-tree, in whieh Captain Cook anys that the inhabitants of those regions were habited, the nations ail over the continent neariy, used us articies of dress, hesides eotton, feathers, the wool of rabbits, the maguei, and silk-grass. in 1726, eotton was a stapio product of llispanioia. In 175il, Jamuica exported 2,000 thage. On ani avoruge of eight years, from 1710 to 174\%, the oxport of cotton from Harladioes whe 600 bags annualiy. In 1787 , St. Domingo, St. Christopher, (iremada, Hominiea, Antigua, Montserrat, and Xivis, aul the Virgin Isiands, exportad the amme commortity. In 180及, tiero were grown five varioties of cotton in Jumaica, the common, the brown-bearided, the Nankin, the Frenci, and the Ilrasilian. From these farts, Mr. Baines draws the conclusion that the manufacture of cotton muat therefors be supposed to be ceeval with the orighal settioment of America; but
learned mon are much divided as to the date of this ovent, some carrying it nearly as high as the deluge, and others contending for a mach later period. The American mannfacture may at all evanta claim a high degree of antiquity.
VI. Cotton Manufactures in the United States.-Historical Sketch of the Rise and Progress of the Cotton Manufactories in the United States.--AB early as the year 1787, a society was formed in Philadelphia, under the name of the "Pennsylyania Soclety for the Encouragement of Manufactures and the Usefut Arts," whieh made aome progress in the manufucturing of various kinds of goods, such aa jeans, corduroys, fustians, plain and flowered cottons, flax linens, tow linens, ete. But the machinery employed in this manufacture seems to have been of the very rudest kind. A ahort time before the formation of thia society, an attempt to apin cotton-yarn by machinery had been made at Bridgewater and Beveriy, in the State of Massachnsetta. Two mechnnies from Seotland, Alexander and Robert Barr, brothers, were employed by a Mr. Orr, of East Bridgewater, to make carding, spinning, and roving-machines, which they compieted; and on the 16 th of November, 1786, the Generai Court of Masanchusetts made them a grant of $£ 200$, lawful money, for their encouragement, and afterward added to the bounty, by giving them six tiekets in the State iand lottery, in which there were no blanks.
In March, 1787, Thomas Somers, an Engiish midshipman, construeted a maehine, or model, under the direction of Mr. Orr ; and, by a resolution of the General Conrt, $£ 20$ were placed in the hands of the iatter, to encourago him in the enterprise.
The above remained in the possession of Mr. Orr for the inspection of ali disposed to see them, and he was requested ty the General Court, to exhibit and give ali information or explanation regarding them. It is heiieved that the above were the first machines made in tho United States for the manufacture of cotton.
The Beveriy Company commenced operations in 1787, and are aupposed to be the first company that made any progress in the manufacture of cotton goods (tinat at Bridgewater had been on a very limited seaie), yet the diffieulties under whieh they labored-the extraordinary ioss of materials in the instruction of their servants and workmen-the high prices of muchines, unknown to their mechanics, and both intricate and difficuit in their constraction, together with other incidents whieh usualiy attend a new busiaess-were such that the company were putt to the necessity of appiying to the State iegislature for assistance, to savo them from leing eempelled to abandon the enterpriso altogetiner.

In their petition to the Sennte and IIouse of Representatives of Massachusetts, presentel Junc 2d, 1790, only three years after they had commenced operations, they state: "That their expenditure had aiready amountod to neariy $£ 4,000$, while the value of their remaining stoek was not equai to $£ 2,000$, and a further very consideratie advance was absoiutely necesssry to obtain that degreo of perfection in tho manufacture, whieh aione could ensure success."

Aceordingiy a grant of $£ 1,000$ was presented them, to bo approprinted in such $n$ way as wouid effecturily promoto the manufacturing of eotton pieee-goods in the commonweaith.

The petition above referred to, and other coliateral fuets, sufficientiy prove that cotton-spinning in this country, further than tie hand-eard whi one threadwheel, was earried through its tirst struggies by tho Beveriy Company in Masaachusetts. And fron this Stato the manufacture was carried to Rhode Isiandthough it must be acknowiedged that both States wero indebited to foreign emigrants for instruction and assistance in spinntag and weaving, as well as in preparing the cotton.

Cotton-spinning commenced in Rhode Island in 1788,

In which year Daniel Anthony, Andrew Dexter, and Lewis Peck, all rf Provldence, entered into an agreement to make what was then called " home-spun cloth." The iden at first was to make jeans of linen warp spun by hand; but hearing that Mr. Orr, of Bridgewater, and the Beverly Company, had imported aome models or draughts of machinery from England, they aent thither and obtained drawings of them, according to which they constrncted machinery of their own. The first they made was a carding-machine, which was something slmilar to those now used for carding wool, the cotton being taken off the machine in rolls, and afterward roped by hand. The next was a spinningframe, something simitar to tho wster-frame, or rather the common jenny, but a very imperfect machine. It conslated of elght heads of four spindles each, being 32 spindlea in all, and was wrought by means of a crank turned by the hand; thls, after being tried for oome time in Providence, was taken to Pawtucket and attached to a wheel propelled by water; the work of turning the machine was too laborlous to be done by hand, and the machino Itself was too imperfect to be turned by water. Soon after, these machines were sold to Meses lbrown, of Providence; but as all the carding and roving was done ly hand, it was very im. perfect, and but very little could be done in this way. Such were the rude machines used for spinning cotton previous to 1790 ; and the wonder is, not that the manufacturers failed in thelr undertakings, but rather that they were able to persevere. And we can now parcelve that from these amall beginnings, the present brightened prospects recelved their foundation.
The tirst cotton-mill of the United States was crected in Pawtucket, Rhode Island, by the late Mr. Samuel Slater, a native of lielper, Derbyshire, England, in 1790. The machinory was that of the Arkwright patent. There is evidence that Hargreave's jennies were in uso in this country previous to 1790 , but by whom, and when introduced, is not known. They were worked principally by Scotch and Irlsh weavers, who produced mixed goods of linen and cotton. Great Britain, at that time, uacd every means to prevent the introduction of her spinning machinery Into other countries. IIer law expresaly forbld its exportation ; and every attempt to import the machinery Into America had falled. The Hon. Tench Coxe, of lhiladelphia, entered into a bond with a peraon, who engnged to send him from London complete brass models of Arkwright's patents. The machinery was completed and packed, but was detected by the examluing offeer, and forfeited, according to the exlsting Inws of Great Britain. No way remained to obtain the benefit of the British inventions but to manufacture them on our own soll. For this parpose Mr. Slater came to Amerlica. Ite had been a pupil of Arkwright, and was perfectly fumillar with all his patents. He brought with him nelther patterns nor niemormula to asslat him in his work, but depended entirely on his memory, a thing which the statutes of Great Iritain could not reach. The King of England had frequently made proclamations sgulnst nny traileaman leaving tho klogdom, and had called on his offeers for their most vighlant watel ngninst it; hut the professions of nen lesving the kligglom could not be always detected.

Some of the lirat yarn mude by Mr. Slater In America, and some of the thrst cotton cloth made from it, was sent to the Secretary of the 'Trensury, on the 15 th of Octoler, 17 il ; and it is probably in existence now. It is stated that Mr. Clay had some of the first yarn In hils possegsion in 1834, It was as fine as a No. 40.

Mr, Nater was Induced to leave his employment under Mr. Arkwright, In lingland, to come to America, hy seelng a premium offered by the Penusylvanla Society for a cortain machine to ajin cotton.

Mr. Slater labored under the grentest dlandvantages for the want of suitalito materiala, and mechanles of suffient ingenulty to assist him. The history of his
firat labors is deeply intereating, for the details of which we must refer the reader to his biographer. His first machine was what la called s water-frame, of only 24 aplndles. Such. was tho humble origin of cotton manufacturing in America. From that first machine the advancement of the cotton manufacture has been truly astonishlag. It has caused hundreds of populous villages, towns, and even citles, to epring up as if by magic, where only a few years ago nothing was seen but a barren wilderness. Astonishing as has been the increase of the various manufncturing towns and villages in the United States, Lowell, in Masaachusetts, surpasses every thing of the kind that has been witnessed within the memory of man. In 1810 its site was a wilderness, whither sportsmen went to shoot game. The entire population of the territory around it did net exceed 200 soula. It was a poor, barren district, with but a few house on the spot where the city now stands ; and the inhabltants supported themselves principally by fishing in the Concord and Merrinac rivers, at the junction of whleh Lowell is situnted. A company of wealthy men in Boston, eceing the valuable water-privileges of the apot, purchased it for mantfacturing purposes. The first cotton mill was erected there in 1822 ; and in 1830 the population of the place had increased to 6477 persons. In 1840 the population had increased to 20,796 ; and the value of property there was $\$ 12,400,000$. In 1856 the number of cottonmills was 35 , spindles 350,848 . Thus, what only 30 years ago was a wild pasture-ground has become a large and fiourishing city; a proof of what a waterpower, aecended by capital and enterprise, can do for a pluce. Lowell is a splendid example of an American manufacturing eity, and excites the attention, and in some measure the jealousy, anys Mr. McCulloch, of Manchester and Glasgew. We need no better proof of what manufactures can accompllah than the listory of Lowell. The Lowell cotton-mills, owned by twelve manufacturing companies, extend in a continuous line of about a mile, from the Merimuc to the Pawtucket Falls.
The rapld growth of the cotton manufacture in this country is unparalleled in the history of industry. The second cotton-mill in America was erected in 1795, at the aame place as the first. No more were built untll 1803, when a third was erected in Massachusetts, followed by a fourth is 1804. During the three followIng years ten more milla were erected in Rhode Island, and one in Conncetleut, making in all fifteen mills, with 8000 spindles, producing 300,000 pounds of yaru aunually. By a report mado to the government in 1810, It sppears that 87 additional mills had been erceled by the end of 1809 , of which 62 were then in operation by horse and water-power, running 81,000 spindles. The cetton manufucture continued to spread, and received a considerable impulse from the war of 1812. In that year there were in Rhorle latand 33 cotten fuctorles, with 80,003 spindles. In Massachuseits there were 20 mills , with 17,371 spinilles.

A report made to Congress in 1816 gives the followIng statement of the consumption of cotton by our milis, shewhig how rapidly the cetton manufacture had advanced. Tho consumption of cotton was, in

manufacturers. The amount of importations of those two years was about $\$ 180,000,000$. During the years 1817, 1818, 1819, and 1820, great distress prevailed among the manufacturera, but Congress wae not disposed to grant thelr petitions In full.
Tariff laws wore passed in 1824, 1828, and 1832, in each of which the duty upon forelgn cotton goods imported was 25 per cent. ad valorem. These duties, though they did not prevent our markets from being glutted with foreign goods, cnused our manufactures to gradually increase.

In 1820, the first cotton mill in Pennsylvania was erected at Manayunk by Captain John Towors. There were then only two amall cottages on the spot. It now contains 500 dwelllings, 5 churches, 15 stores, and about 30 mlll .

Among the numerous towne that have sprung into existence, owing to the influence of manufactures, may be mentioned-Waltham, Paterson, Ware, Fall River, Taunton, Pawtucket, Lowell, Lawrence, Providence, Rhode Island, Saco, Lewiston Falls, Muine, etc.

Cotton Dyeing. (Teinture de Coton, Fr. ; Baumwoollenfarberei, Germ.) Cotton and linen yarns and cloths have nearly the asme affinity for dyes, and may therefore with propriety be treated, in this respect, together. After they have acquired the proper degree of whiteness, they are atill unfit to recelve and retain the dyea in a permanent manner. It is necessary, before dipping them into the dye-bath, to give them a tendency to condense the coloring particlas within their cavities or pores, and to communicate anch chemical propertiea as will fix these particles 80 that they will not separate, to whatever ordinary trial they may be aubjected. All the colors which it would be deairable to transfer to these stuffs, unfortunstely do not possess this permanence. Men of acience engaged in this important art, have constantly almed at the discovery of some new processes which may transfer into the class of fast colors those dyes which are at present more or less fugitive. Almost all the gooda manufuctured of cetton, flax or hemp, are intended to be washed, and ought, therefore, to be so dyed as to resist the alkaline and soapy solutlons commonly used in the laundry. Vitalis distinguished dyed cottons into three classes: 1. the fugitire, or fancy-colored (petit teint), which change their hue or are destroyed by one or two boils with soap; 2. those which resist five or six careful washings with soap, are goad dyes (bon teint); and those which were still more durable, such as Turkey reds, may be called fast colors (grand teinf). The colors of Brazil-wood, logwood, annotto, baftlower, etc., are fugitive; those made with madder without an oily base, are good; and thoso of inadder with an oily mordant, are fast.

Cotton-wood. (Populus argentea.) This specios ls scattered over a great extent of country, comprising the middle, bouthern and wester!, States. It is, however, quite rare in the middle states. Now York city may be considered as the most northern point at which it grows. It is quite common along the Misslasippi rlver. The cotton-tree grows sometimos to the height of 70 or 80 feet, and 2 or 3 feet in dismeter. The leaves, while very young, are covered with a thick, white dewn, which gradunlly disappears, leaving them amooth above, and slightly downy benenth. The wood of the eotton-tree is soft, light, and unfit for use, and inferior to that of most of the uther poplars. It is appropriated to no purticular use in the sarts or for fuel.-Browne, Sylva 4 mericana.

Counterfeiting. Large sums of money have been expended with a view to devise plana for the prevention of counterfeiting bank notes, bank checks, etc., but thus far no successful plan has been devised. The New England Society for the Prevention of Counterfeiting, has for aome years been in operation at Boston, and is alded by the treasury of Massachasetts to the extent of $\$ 2,500$ per year. This society has been the means of detecting and puaishing numerous counterfeiters. Forging of government cer tificatos of United States stook, land warrants, etc., is, by act of Coagress, punishable by imprisonment not over 10 years. For counterfeiting a post-office frank, a time of 10 will he inıposed. The counterfeiting of coins of the United States, or of forelgn coins, shall be punislied by imprisonment between 3 and 10 years, or limprisonment of 5 years und a flne of $\$ 1,000$.-See Dunlal's Digest Lawe $U . S .$, ppr 76, 403, 404, 726, 728, 1002.

Countermark. In Numismatics, a stamp frequently aeen on mucient coins, often obliterating a large part of the impression. The countermark is generally a figure or inscription, aud some antiquaries have considered that their ase was to augment tho value of the money; others, that it was only struck on money taken from an eueny.

Coupons, from the French, is a term entployed in Eagland and elaewhere, to denote the warrants for the psyment of the perlolical dividenda or interest on
public atocka, a number of which being appended to the bonds, sre aeverally cut off for presentation as the dividends fall due, generally semi-annually-sometimes qusiterly. The prsctice of appending coupons to bonds is now generally adopted by States and corporstions, as they facilitste the collection of the semiannual or quarterly interest thereon.

Courier (Fr., courir, to run), a messenger sent post or express with dispatches. The couriers em ployed by the ancients were of two kinds; first, those who ran on foot, called by the Greeks hemerodromi, or dav-runners, regarding whom Pliny, Cornellua Nepos, anu. Casar mention that some of them would run twenty, thirty, thirty-six, and in the circus oven forty leagues a duy; second, riding couriers (cursores equitantes), who changed horses as modern couriers do. Xenophon attributes the first couriers to Cyrus. IIerodotus says thoy were very common among the lerslans, and that there was nothing in the world more swift than such messengers. That prinee, says Xenophon, proved how far a horse could run in a day, and bullt stables at corresponding distances; and at each station a courier was always reudy with a fresh horse to forward the psckage to the next stage, snd 60 on throughout the empire. But it does not appear thisi either the Greeks or Romans had any regnlar system of couriers till the time of Augustus. Under that prince they traveled in cars, about 24 n.c., though it would appear that they sfterward went on horseback. Under the Western Empire they were called viatores; and under that of Constantinople cr'sores, Couriers or posts are said to have been ins+ituted in France b; Charlemagne, about A.D. 800. The couriers or posts for letters were established in the early part of the reign of Louis XI. of France, owing to this monarch's extraordinary eagerness for news. They were tha first institution of the kind in Europe, A.D. 1463.

Court-plaster is a considerable object of manufacture. It is made as follows: Black silk is strained and brushed over ten or twelve times with the following preparation: Dissolve $\frac{1}{2}$ an ounce of balsaun of benzoin in 6 ounces of rectified spirits of wine; and in a separate vessel dissolve 1 ounce of isinglsss in as little whter ns may be. Strain each solution, mix them, and let the mixture rest, so that any undis. solved parts may aubside. When the clear liquid is cold it will form a jelly, which nust be warmed before it is applied to the silk. When the silk coated with it is quite dry, it must be finished nff with a coat of a solution of 4 onnces of China turpentine in 6 ounces of tincture of benzoin, to prevent its cracking.

Court of Claims. This is a now court, estnblished by act of Congress of the United States, Jebruary 24, 1854, having jurisdiction of chains by individuals nganst the United States, arising from disputed cuses at the Treasury. This obviates the necessity of petitioning Congress for indemuity for losses sustained under government contracts, etc. Sce Denlar's Digest Laws U. S., pp. 1457-1459.

Coutts, Thomas. This distinguished London banker, whose death eaused much excitement in the metropolis, was at one time, in wealth and importance, at tho head of the banking and moneyed interest in England. Ile was at first a partuer in the louse at St. Mary Axe, London, and afterward admitted it to his brother's banking-house, in the Strund, london. llis own bank atands on nearly tise centre of the site where stood, many years ngo, an exchunge, similar to lexeter Exchange. It was then considerel one of the hest-constructed places of eafety in Great Britain, except the Bank of England.

Mr. Coutta died on the 24th of February, 1822, having attained the rige of ninety-one. His will was read the Sundny evening after his denth, in the jresence of his family. To the surprise of many, be hequeathed his whole property, to the amount of $£ 900,000$, to Mrs. Coutte, formerly Miss Mellon, an actress, at her own
lisposal, with leaving a sling cape the legac to others, won Coutts snd dett Coutte, is don.-See Ban

disposal, without mentioning any other person, or leaving a aingle legacy. This was, probsbly, to eecape the legacy duty, which, if his fortnne were left to others, would have amounted to $\mathbf{x} 60,000$. The firm of Coutts and Co., said to be controlled by Miss Burdett Coutta, is still among the banking-housea of Lon-don.-See Bankers' Mag., N. Y., 11. p. 525 (1848).
Cove. An inlet on a rocky ceast. It is a term nearly aynonymous with harbor: the word cove beiag generally, though not always, used when the indentation on the cosat la too shallow or narrow to admit first-claas veaaela.
Cowes, West, a aeaport-town of the Isle of Wight, at the mouth of the Medina, 4 miles N. of Newport, and 78 miles from London. It occupies a rising ground on the W. bank of the river, presenting a striking appearance from the aea. The atreeta are arrrow and irregular ; but many of the modern buildings are handsome, and in the vicinity are numerous elegant villas. It is much resorted to for seabathing, and has numerous hotels and lodging-housea for the accommodation of visitors. The harbor is safe and convenient, and its entrance is defended by a battery. It forma the rendezrous of the Royal Yacht Club, who hold thelr andual regntta here. It has a vory considerable cossting trade. Experts, chiefly agricultural produce and malt ; lmporta, coal, colonial produce, manufactured goods, etc. Shipbuilding is extensively carried on. On the opposite side of the river, which is here about half a mile broad, is East Cowes, where is the custem-louse of the port, and near which is Osborne Houss, the marine resiience of her Majesty. Pop. (1851), 4,786.-E. 13.

Cowhage, or Cowitoh (Hind. Kizach), the fruit or bean of a perennial climbing plant (Dolichos pruriens, Lin.) It is a native of India, as well as of several other Eastern countries, and of America. The pod is about 4 or 5 inches long, a little curved, and contains from 3 to 5 oval and fiattish seeds; the outside is thickly covered with short, bristly, brown hairs, which, if incautiously tonched, etick to the skin, and occasion intolerablo itching.-Ainsme's Materia India.

Cowries (Ger. Kauris ; Du. Kauris ; Fr. Coris, Cauris, Bouges; It. Cori, Porcellane; Sp. Bucios Zimbos) are small shells lorought from the Maldives, which pass current as coin in amaller payments in Ilindostan, and throughout extensive distriets, in Africn. They used to he imported into England previously to the abolitien of the slave trade, in which they were subsequently employed. They are nn artiele of trade at Bombay. The best are small, clean, and white, having a beautiful gloss; those that are yellow, large, and without lustro, shonld the rejected. The freight is cnlculated at 20 cwt . to the ton.-Minnens's Orient. Com.
Cozening, tricking, defrauling. In law it denotes an offenso where mny thing is done deceitfully, either witin regard to contracts or otherwise, und which can net properly be definced ty any ajecial name. In the civil law it is called stellionatus.
Cranberries, or Red Whortleberries, the fruit of a moss plant, the iaccinium oxycoccus of Linnæus. The berries are globular, atout the size of currants; are found in mossy loggs. Cranberries have a peculiar flavor, and a sharp, acid, agreenble taste; they are eagily preserved, and are extensively used in muking tarts. They are very abundant in Norti America, and in the northern parts of Russia; the latter locing of a superior quality. It is said that some very fine ones lave recently been brought from New Sonth Woles. Considerable quantitics are produced in Now Eugland on the marshy lands near the coast.

Crank, in sea language, is applied to a vessel when, from too mucis top weight, or the want of sufficient bullast, ar cargo, or from any other cnuso, slie can not beur much sall without danger of oversetting.

It also denotes an Iron brace for smpporting the lanterns of the poop-quarters of the ahip.

Crape (Fr. Crépe; Ger. Flohr, Kraugfor ; It. Espumilla, Soplillo; Rus. Flior; Sp. Crespon), a light, traneparent atuff, in manner of gazze, made of raw ailk, gammed and twisted on the mill, and woven without croading. When dyed bleck it is much worn by ladies as a mourning dress. Crapen are crisped (crepis) or amooth; the former being double, are ueed in close mourning, the latter in less deep. White crape is appropriate to young unmarried females, and to virgins on taking the vail in nannoriea. The silk destined for the first is apun harder than for the second; aince the degree of twist, particularly for the warp, determines the degree of criaping which it assumes after being taken from the loom. It is for this purpose ateeped In clear water, and rubbed with prepared wax. Crapes are all woven and dyed wlth the silk In the raw atate. They are finished with a atiffening of gum-water. Crape is a Belognese invention, but has been long manufactured with auperior excellence at Lyona, in France, and Norwleh, in Fingland. There is now a magnificent fabric of it at Yarmouth. by po:er-loom machinery. There is another kind of otuff, called crepon, made either of fine wool, or of wool and silk, of which the warp is twisted much harder than the weft. The cripons of Naples consist altogether of silk.

Crayons. Colored cylinders used for drawing upon paper ; they are usually made of a fine plpe-clay, colored with metallic plgments or carmine. Crayons containing plumbago are styled solid lead pencils.

Cream. (Fr. Créme). A seml-fluld yellowish substance which collects on the surface of milk, and which is made into butter by the process of churning. When the mllk of any anima? is allowed to stand for some time, it spontaneously undergoes certaln changes -this substance rises to the surface and forms a thin stratum, which is called cream, and which consists chlefly of oily particles; while the milk below, which of course is thinner than it was before the cream separated from it, is of a pale blulsh color, and consiate of curd, cosgulum, or the matter of which cheese is made. When cream is kept for some days it gradaally becomes thicker, and partislly coagulated; and if put into a linen bag and suspended from the ceiling of a cool room, it will acquire the consistence of cheese; and this is one among other modes of making cream cheeses. When crenm is sbnken by churning, it is resolved into its component parts, and hence we have butter and buttermilk, In order to make butter it is not alwnys necessary that the cream should be separated from the milk; but whether separated or not, the process is facilitated by nllowing the liquid to stand for some timo, during which a part of the sugar contained In the serum is changed into an acld, which shortens the process of clurning by facilitating the separation of the butter from the milk. When either cream or milk is churned without having previougly become sour, the process is much more tedious; and sometimes, from causes not easily accounted for by the dniry-n aid, it is unsuccessfuh, nand the milk is said to be hewitched. The true causc, however, is the want of neility; because it has lieen found that the addition of $a$ small portion of vinegar will dissolve the charm, and canse the alnost immediate appearance of hutter. Cream, when sepnrated from milk and kept till it has become acid, is frequently mixed with milk newly drawn from the cow ; nud this eaten with sugar is one of the most delicious preparations of the dairy: Costorphin cream, so called from a village of that name in the neighborhood of Edinburg, is made by putting the milk of three or four dnys together with the cream into $n$ vessel, and nllowing it to remnin there till it has hecome sour and ceagulated. The whey is then drawn off and fresh ereain adiled; and when it is brought to tnble it is eaten with sugar,
and in the stratwerry season; with that fruit. Devonshire cream is simply sour curd, or sour cream eaton with freah milk, or fresh eream, with or without the addition of augar. Devonshire sealded or clouted cream ia millk and cream heated to the boiling point, and enfered to cool, when the cream will be found to have soparated from the milk, and when skimmed off may elther be made into butter or eaten with fresh cream and sugar. Common clotted cream is simply milk and eream in a coagulated stato, and sonr. When the clotted cream is broken and stirred, and the whey drawn off, the mass may' be turned into cheese by artificisl preasure, by which the whey is separated Instantaineonaly; or by suspending it in a poroas bag, in a cool, airy sitestion, whea it will be separated by degrees. See Butriar, Cimear.-Brandr's Em. of Art: See Burter Drary.:

Credentials, Iettere of. The instrument; in the forn of a letter, from one govermment to another, which constitntes the evidence of the title of a min. fister at is foreign court to the power which he exercises. There' are two sorts of credentials : the one sealed, drawn up and counteraigned by the minister of foreign'affairs ; the other open, signed oxly by the government. Unless the miaister be mentioned expreasly in his credentials as an embassador, he has only a right to the observances due to foreign ministers of inferior rank.

Credit, in the eense in which we generally treat of it, is the trust which ia given to a person when he obtsing a loan $f$ f money, or parchases any articie, the parment of which is to be made at an after periol. Every sum of credit, therefore, must be foanded on a tranafer of a cerreaponding sum of capital; and che whole amonnt of credit existing at any time can never exceed that of the lent capital. Credit is, in reference to the person who gives $i t$, the power of lending, and him who receives it, the power of borrowing. " Tho basia of credit is confidence, and this is fonnd to exist extensively oniy where good faith and punctuality have been allowed to grow into hatit, and where laws afford te creditors the easy and certain means of recovering their debts,

In young countries, before dealinge have become multiplied, we find people inattentive to their money engagemeata, when there is no want of property with the delitor, and even when the payment of the debt has been fixed by docnme ${ }^{-}$to a positive term. Bnt as transactions increase, and population preases more closely together, a knowledge of the ciroumatances of individasls is rendered difficnit, and a neceasity for punctuality arises, to prevent donbts being entertained of the ability to pay. And this apprehension of discredit entertained by the debtor, and of its consequeaces to his future transactions, has more effect to estabilish and maintain good faith and exactness than the operation of the laws ia able to produce. When capital is abundant, relatively to the means of employing it, the competition of capitalists produces a facility of obtaining credit; and parties become enabled to borrow and purchase upon credit who could not do so before. Credit is then maid to be high, but it is the value of the capital which, from the overstock, has become low. The capitalist, in these circamstances, growe lees scrupulous about his security, that he may bring within the range of his deniings a greater body of borrowere or purchasers, and therely be eusbled to keep up his price.

When the suppiy of eapitai continues in this state for any length of time, it gives rise to an imprudence of conduct which lays the foundation of much after evil. Sajes and lonns are made at credits far beyond the ordinary periods; and these into whose hands the extra capital by this means passes, considering it as a fund with which they may trade, go on also extending their dealinga and credita, antii the whole system is pat upon the strctch. In this situation any inter.
ruption to the sale of commodities ocetalona instant confualen and distress. The confidence which had prevalied gives placs to ciarm and distrust, and the sume effect is produced for the time hy the retardment of the circulation that woald have been experienced had the capital ltself been withdrawn.

By the operation of credit, not only ls the circnlatien of capital facilitated, and its omployment' increased; bnt by its means alone certain descriptions of capital can be brought into action.' When an article is soid npon otredit, the seilor placea, for the time, a portion of his capital at the command of a party who msy have no capital of hia own. "This person, neverthelesa, by mother operation of credit, is entbled to sell upon credit also, and ettll keep his engagement with the party from whom he bought. This he accomplishes by calling in the assiatance of the monay capitalist, the banker; who advances to him the amonnt of the sale opon his and his parchaser's joint security, and receives in consideration a rent for the snm advanced. By this proceas facility and extenaien are given to cincnlation, beyond what conid take place If the commodity coald be exehanged only for immediate value; while an opportunity is, at the same time, afforded of employing a branch of capital which would otherwise remsin inactive and without use. It is almost unneceasary to remark; that it is by the operation of credit that a return is got from the cspital of persons who are incapable of employing it themselvea, und which can be put into a state of nseful activity oniy by lending it to others.
In Scotland, after the disposition to commercial pursuits began to manifest itself, the progress was r -tarded, by the total want of commercial capital in $t$ o country. To get the better of this difficulty, and d.aw to these employmente any little capital that otherwise existod, it became the practice, when a commercial udertaking was to be entered upon, to associate in the adventure some persons of known aubstance, and upon the joint eredit of the parities forming the company, to borrow the capital aeceasary for carrying it on. The credit which was thus established is called company credit, and is effectual to its proposed end of borrowing or purchasing with advantage, according to the anpposed respensibility of the parties of whom the company is composed. Up to the year 1793 a considerable proportion of the manufacturing and mercantile concerns of Scotland were carried on epon this plan; and to give atreogth to their credit, and encourage those whe had money to lead to piace it with them, a rule was established, asd confirmed by deciaions of the courts of law, that, in case of bankruptoy, a creditor of a company should be entitied to claim upon each of the partoers' sepsrate eatates, in competi: 'on with the party's individual creditors, for the ifalance of his delet unpsid from the company's effects.
When a party purchaeing or borrowing capital gives a written obligation for the amount, payable to the order of his creditor at a certain fixed period, he embodies a som of credit capable of being exchanged again for capital ; and the tranaference of these documeata to new parties, who replace to the former crectitor the capital he had lent upon them, is what is called a circula ion of credit. Indecd, without the use of bills, or of some instrument of similar powers, credit must have been confined to a single operation between first contracting parties, and the circulation of capital limited to what could have been effected in this way. But a transferable document of the aun to be received becomea itaelf a negotiabie or marketable article; and the collective credit of the partics throngh whose hands it may successively pass continuing to be engrafted upon it, a new facility is gained to circulation by every movement which it makes. The whole of the credit cmbodied by bilis, however, is not brought into efrcuiation; a purt only

of the elifers or lenders requiring to heve their eapltal replaced to thom by anticipation. But it is according to the expected facility with which payment may be thus anticipated, that credit is at frat freely and readily given; and whenever' any thing occurs to impede the circulation of credit; there is an immediate disposition in the merchant to withhold or limit lt.

Every transfor of capital made npon a buyer or borrower's own obliggation of payment oreates a new sum of transferable credit; and this ls the ccase, although it should be the same capital that is again and again transforred. But a sale of geods, or an advance of money upon the obligation of a third party, Indorsed to the eelifer or lender, forms no addition to the sum of circulating credit, the transaotion being the circulation, not the creation, of a sum of credit. Nelther does, a auccession of purchases or borrowings, effected hy means of the same document indorsed from the one party to the other, add to the sum of credit in circulation. . For although each of these trensactione is the ground of a separate obliggtion between the parties contracting, there is with the whole but one aboolate creditor, the holder of the bill, and one ahsolute debtor, the acceptor of the bill, the others being merely contingent debtors to the one, and contingent creditors of the other.

Circulated credit is to be classed into that circulated by loan, and that which is circalated by means of sale. The first is the clrculation of the credit founded apon the obligation of individuals or private companies, and called private credit; the second, of that founded upon the obllgations of the state; or the transfers of the stock of corporate bodies, and called pablic credit. The docnments of these two descriptions of credit possess different and diatinct qualities, and are differently negotiable. It'may be proper, therefore, to examine hnw they are employed as means of borrowing or purchasing, what are their separute powers, and what is the probable extent of the circulution of each. We shall begin with those helonging to private credit, which are as follows:

First, Olliggations payable to the bearer on demand, and which, being passed without recourse, are employed as money. Secondly, Transferable obligaticas payable at an after date, as notes of hand and bilis of exchange, which, being negotiated with recourse upon the preceding obllgants, are taken as guarantied plediges of a sum to be received when they become due.
The circulation of obligations, payable to the bearer on demand, or notes employed as money, is the circulation of a credit borrowed by the issuer of the note from the public; the holder of the note at the time is the creditor; and the property he gave in exch.uge for it is a loan from him to the banker. As it is in the power of the party giving this credit at any time to put an end to it by culing for his money, these notes circulate upon the credit of the issucr alone. No sesuranco of payment is required from the person from whom they are received, as is the case with bale; the payment of which being at a future date, it is thought necessary to reserve recourse against the parties through whose hands they have passed. The circulation of notes payable on clemand is therefore a circulation of what may be termed singie credit, and bills a circulation of collective credit.

When bank-notes are iasued by a banker in discount of a bill, it may be supposed that a twofoll credit is put into circulation : a credit to the party to whom tho bill has been discounted, and a counter credit from lime to the issuer of the notes. But in shis stage of the trunsaction, no circulation of credit has taken place. Credit is circulated only when exchanged for capital, and in this case it lias been but the exchange of one credit for another. The banker, indeed, in giving his notes payablo on demand in exclange for a blll payable at a futare date, gives what is of a quality different from that which he receives;
for what he gives is immediatoly; exchangeable for capital, and to the person, recelying it is the same as capital.

- Bnt atill it is only credit he has parted with, which will not be in a state of circulation until it comee to be exchanged for cepital. In an far as relates to clrculation, the transaction is the eame with that of a person lending his oredit to another, by accepting a bill to him without value. 4 sum of credit la thereby created, but is not circulated until the bill comes to be exchanged for value. The oredit that is in circulation from the oxchange of bank-notes for a bill, is a credit from the party who at the time has given capital or value for the notes. When the hanker "cashes", them, he becomes the creditor, but while they remaln in circulation the publio is the creditor. : s. The amount of credit from the circulation of cash notee never can be pushed beyond what would have been the value of the epecie that would have been In clrculation had the currency been of the precions m'tals, which the noten only it ie to represent. Should the notes cease to be convertible into specie, their amount, ladeed, may le augmented at, the pleasure of the issuer; but their value, and the credit in circulation from them, will still be regulated by thls limit. The increased sum will represent the value which the smaller did before, and each note, will he reduced in its value, in the proportion of the increase that may have taken place of the whole. This description of circulating credit is of a quality different from the others. From eupplying the place of capital, in its character of currency, it is lent out as capital; but loans from thle fund are precarious, lte amount depending upon the state of public confldence, and being liable to be diminished ly every call upon the benks to replace the notes with specie.

Circulating notes, not convertible lato specle, issued under the authority of the state, have been called a fabric of unreal credit. But this currency, however unsnituble to its proper ends, affords a circulation of real credit. It is indeed exposed to constant fluctuation of value, according to the amonnt of it in the circle; and the party taking it is ouliged, for his own safety, to include in the price of what he gives for it, sufficient to cover the difference between it and specie, and the risk of further depieciation while it may remain in his hands. Still, however, an amount of credit, to the vaiue of what has been given for the notes, in the first instance, is put into circulation, und an amount continued in circulation, to the value always of what they are exchangeable for at the time; the holders of them elways remsining creditors of the issuer, to the extent of the whole sum which the notes profess to pay. A currency of this description, however, is inapplicable as a measure of value, and thercforn unfit to be emploved as a circulating medium. And as to the other object, intended by its issuers to supply an amount of funds to the stute; the depreciation with which it must be issued at first, and the loss to be sustained from taking it back again at par, render it an expensive means of borrowing.

With regard to obligations payable at a future date, which constitutes the second brunch of private credit, and which we are next to consider, tho credit founded on them is circulated, either in the trunsfers of the ordinary capital in aales, as when the credit of indorsed bills is eurployed to purchase goods, or in the trunsfers of the bunking enpital in loans, as when tho credit of indorsed bills is employed to borrow money; the transfer under tho latter, when the bill is exchangel for money, being often 4 further circulation of a credit previously circulated under the former, when the bill was exchanged for goods.
A fictitious bill, that is, an acceptance given without vulue, vests in the person in whose favor it is drawn a sum of transferable croait not less than
would have beon the case if it had been the document of a sale, or loan of property. Mr. Thornton, in his treatise on Paper Credit, established the doctrine, till then disputed, that the credit of a blll doea not reat npen the nature of the transaction in waich it has originated, but npon the concoived ability of the obllganta to discharge the debt. The beifg able to embody in bills every sum of credit, has furniahed the means of employing, with incalculable advantage to commerce, a portion of the capital of the conntry, which otherwise, it is probable, would have remalned inactive. The aeourity they afford for the repayment, at a atipulated period, of the sums lent upon them, furnishes the means of an interim employment of money held for after occaaions, which the paity would not otherwise venture to lend ont; of money which formerly lay idle in the handa of partiea nnacquainted with any safe means of using it; and of the monsy which traders are daily recoiving in the conrse of their business, bnt which they do not immediately require. These different aume collected in the hands of a banker, form what is called the banking capital of the conntry ; and which, lent out apon anch securitlen, producea not only a profit to him, but interest to the parties who have placed them at his disposal. The importance of thla intermediary fund in the transactiona of the country is such, that when, from distrust, at any time, these deposita are withheld or withdrawn from the bankere, the mercantile body is convulsed throughout.

We now come to the second division of credit, that circulated by sale; the documents of the first branch of which are, the negotiabla obligations of government, as excilequer bills, navy billa, etc., and the whole of the public funds, constituting what ia termed the credit of atate. When capital is to be competed for, this credit has an advantage in the market over the former. Its price risee according te the demand; and by that neans it is enabled to aecure whatever share it may require of the supply. Thls ia not the case with the credit circulated by transfers of capital apon loan, the price or stipulated rent of which can not, whatever may be the demand, rise beyond a prescribed limit. It has the effect, in these circumatances, to force the capital applicable to this part of the circulation to seek the employment of the other; so that the inconvenience produced by an interruption of circulation from a diminution of the general capital, falls entirely npon the circulation of bill credit, the supply for the circulation of the credit transferable ly sale being kept full, at the expense of that applicable to the circulation of credit transferable by loan.
The transferable shares of public stock companies, from being occasionally a means of temporary investment of capital, have by some been considered as forming a part of the circulating credit of the conntry. But this is not the case. The stecks of these companics form a part of the ordinary circulating capital; and of consequence, the transfera of their shares are not operations of credit, but exchnnges of capital between the buying and selling parties. The transfers of the premiums, however, paid in the purchase of this description of stock, which, although no part of the capital, form an immediate part of the price, may be fairly considered as a circnlation of credit, to be added to the amount of the circulating credit of tho country. The mode of clrculating thia credit being the sa,no with tint of the public funds, and its market value rising or falling with the general abnndance or acarcity of capital, ita circulation. When capital is scarce, immedistely interferes with the circulation of credit by aimple borrowing.-E. B. Seo also " Hoopen on Currency, Boston, 1856. Bankers' Magazine, N. Y., 18j̈5-1856. Credit Mobilier. The Credit Mobllier Bank, according to the provislens of its charter, is a jointatock company, organised at Paria, for the purpone of developing works of publio improvement by consolidat. ing the securities of variona enterprisea into one common fund. Its capital etock ia fixed at $60,000,000$ francs, divided into shares of 500 franes each, payable to bearer. It ia authoriaed to anbecribe for or acquire publie funds, the aharea or bonds of any jointatock company, and more particularly of railwsya, canals, mining, and other publlo worko, now exiating, or hereafter to cxist ; also to bid for any loan, or for the atock of any kind of public works, aad to dispose of and realize the same. It is also anthorized to lasue its own bonda for an amount equal to its antscriptions and purchases ; such bonds may be issued to the oxtent of ten times ita capital (that is, 600,000 ,. $\mathbf{0 0 0}$ ), but they shall not have less than forty-five days to run. This privilege has not yet been availed of, the Governmert having requented then to postpone the proposed issus of 240,000 bond $(120,000,000$ francs) in 1855, in order not to interfere with the forthcoming Stata loans, as well as to guard against increased em. barrass.ient in the money market. The aggregato amount of money received in account current, and of bonds issned having leas than a year to run, can not exceed twice the amonnt of capital paid in (that is, not over $120,000,000$ francas). The conipany has anthority to sell or hypothecate ite securities, and to exchange the same for others. It ran loan on public funds, ahares and bonds, and open credit in account current on the varions securities; it can take charge of all collections for acconnt of joint-stock companies, pay their coupons and dividends, and make other dis. bursements for them. It is, however, expressly understood (so runs the statnte) that it shall not sell "short" or buy on time. (ll est eapresaément entendu que la societs ne fera jamais do ventes à dicouvert, ni d'achats is prime.)

The company, which was created in November, 1852, han, thus far, issued but three very condensed and incomplete reports, and extensive az are its operations thus far, it atates that from its inability to lisue bonds at present, it has not yet been able te show the world the full merits of its working. The reports refer to the operations of the calendar years of 1853, 1854, and 1855, and bear date April, 1854, 1855, 1856.

The particular nature of the purchases and sales is not made public. We do not find in the papers befora us any reference to the dividends or total profits, except for the year 1855. Bnt the profits or Investnants and stock transactions at the Beurse alone, amounted to $3,618,000$ franes in 1858 , and to $0,207,000$ franes in 1854 ; and the profits of all kinds to $26,000,000$ franes in 1855. The profits on the "quick terms" at the Bourse are set down at $2,000,000$ francs $\ln 1853$, and

$8,400,000$ in 1854 ; therv in no meats of avidertaining those of 1860 , the report beling allent on the subject: Full particulars are wanting as to the varions transartions of the company relating to subacriptions to the capital stock of new companies, to loans to companien already ertablished, and to tha negotiations in which the company, without ongaging its fund, wots simply as sponsor and intermediary:. But the following comprise the chief traneactions whieh heve contriberted to give deld to this active corporation: In 1858 it confined itself to previously existing corporations. In 1854 it crented the company of the Grand Hotel du Lourre, in the Rue de Rlvoli, with a capital of $24,000,000$ frincs ; the Maritime Company (of clippers), with $80,000,000$ francs capita! ; and the 'Anstrisn Railway Company, with a eapital of $\mathbf{2 0 0 , 0 0 0 , -}$ 000 francs, the shares of which were issued' in the beginning of 1855. In 1865 it anbecribed for a large portion of the new stock of the Saint Rambert Railway, the Wescern Ralliond of France (Oweet), and the Central Railroad of Switzerland, and the Elro Canal Company-amounts not mentioned.
In 1858 it took a large amount of the Credit Foncier bonds, and $80,000,000$ franes of the Grand Central Railroad bonds, and $6,000,000$ franes of the Viellle Montagne (Zine) Company's bonds. In the aame year it sold uat all the Credit Foncier bonds, and most of the Vielile Montagne; the Grand Central bonds were, most of them, still unsold at the beginning of 1855. 'In 1854 it took sbout $5,500,000$ franes of the Eastern Railiroad (Est) bonds, and purchased sixteen thoasand bonds of the Dole and Salins Railrosd bonds; the amount of these bonds is not mentioned probably 500 franes each. In 1855 it guarantied the sales of $18,000,000$ franes of the Weatern Railrosd atock (Ouest), and of 100,000 bonds of the Southern railmads (Midi), representing $28,000,000$ francs ; and it took charge of the loan of $82,000,000$ franes for thAustrinn Rsilway Co., which passed rapidly ani almost wholly into the hands of German capitalists.
The rompany acted as sponsor or agent in 1854, for the re-formation of the mines of the Iolre, and for the fusion of the several omnibus companies in Paris into one joist concern; and in 1855 for the consolidation of the various Parisian gas companies. It has, moreover, been preparing for two years past the consolidation of the Eastern and Southern Salt Works. It put in a bld for the last government loan of $780,000,000$ in behalf of itself and its correspondents, for no less a sum than $625,000,000$; but its share was reduced when the hids were adjudicated to $1,281,000$ francs of the 3 per cent. rentes. At the close of isst year it embarked in grand specalstions, which remained unsettied at the date of the lnat balance-sheet, but they appear there as yielding an estimated loss of 500,000 francs. The amounts received in iccount current are mostly from large companies, and can only be withdrawn, according to express stipulation, to be expended on their raspective works. Individuals are glso allowed to make deposits, the company agreeing to take charge of their investment and atock speculation.

In order to fully appreciate the power of this vast machine as a $\quad$ peculative agent, it must be borne in mind that the managere sad leading depositors are men in the enjoyment of extraordinnry resources of wenith and position, and thst in their speculative operations at tho Bourse, they and the company all act in concert, thus aequiring a power over the market which nothing, in the sbsence of extraordinary circamstances, can hope to resist. This power is made the greater from the large amounts employed by the company in carrylng stocks for brokers and outside speculators, la the shape of stock contracts, or as the French call them, repoits, which contracts mostly mature on the same day in each month. The company are thus ensbled to depress the Bourse when they
wiuh to buy, by refusing to make now oontractia when settlement-day comes, thereby foroing sales on a tight monay market ; and to promote a rise when they wish to sell, by granting a great increase of facilition to othar dealers in atocks. $-N_{1}^{\prime}$ Y. Times. v Sed Bankera' Magazine, N, Y. : July 1855, July 1856.
Treel (Saxon creera, aaid to be derived from the Latin oropido) is a shore or bank on which the vatar beato, running in a amall channal from any part of the sea. It is aleo applied to any part of a large rivev which is recorted to is a harbor or landing-place by small craft. In the United Statea, the term creels la used us: synonymous with the. Binglish worde brook and rivulet.
Creole. (In Spanish Criollo.) A name given to the descendants of whites born in Mexico, Sonch America, ad the Weat Indies; in whom the European blood has been unmixed with that of other races. The variona jargons apoken in the West Indis islande by slaves, etc.; are called Creole dialects. 11 mmin 5
Creonote, or the flech-pireserver, from apeas and ouऽ $\omega$, is the most important of the five new chemical products obtained from wood tar by Dr. Reichenbach. The other four, parafine, oupions, picamar, and pittocal, have hitherto been applied to no use in the arts, and may be regarded at present as mere anelytlcal curionities. Creosote may be prepared elther from tar or from crude pyroligneous acid. The tar must be distllled till it acquires the oonsistence of pitch, and at the atmost till it begins to exhale the whito vapors of paraffine. The liquor which passes into the receiver divides itself into three strata, a watery one in the middie, placed between a heavy and a light oll. The lower atratam alone is adapted to the preparation of creosote. Creosote exists in the tar of beech-word, to the amount of from 20 to 25 per cent., and in crude pyroligneous acid, to that of 14 . It ought to be kept in well-stoppered bottles; beeause when left open it becomes progresaively. yellow, brown, and thick. Creosote has considerable power upon the nervous system, and has been applied to the teeth with advantage in odontalgia, as well as to the skin in recent ecalds. But its medicinal and surgical virtues have been much exaggerated. Its flesh-preserving quality is rendered of little use, from the diffcolty of ramoving the rank flavor which it imparts.

Cresset, a great light aet on a beacon, lighthonse, or watch tow r. It also signifies a lamp or torch; a large light 1 lantern fixed on a pole. Mfnshen derives the word from the Dutch keerse, kandela; but it is more probably from the French croisset, a little croes-that symbol having been usually placed upon beacons.

Crew, the company of eailors belonging to any ship or vessel. Ready obedience to the lnwful ordere of their superiors, ability to diseharge their duties, and slacrity In their performance, at all times and under the most perilous circumstances, are the distinguishing characteristics of good seamen.-See Skamen. See Kent's Com. Manuol for Consuls. Parsons' Mercantile Law.

Crimea, a peninsula in the Dlack Sea, forming part of the Russian government of Taurida, with the malnland of which it is connected hy the iathmus of Perekop. It is situate between $44^{\circ}$ and $46^{\circ} \mathrm{N}$. lat., and $32^{\circ}$ and $37^{\circ}$ E. long. It is of an irregular square, or rhomboid form, measuring diagonally abont 190 miles from east to west, and 123 from north to south, and contsining an area of about 8,000 square miles. Its south-eastern, western, and north-western coasts, sre washed by the Black Sea, and the easiorn by' a shallow lsgoon, callod the Sivash, or Putrid Sea, which is connected with the Ses of Azoff by a very narrow strait, and separated from it by a tongue of land, conslsting of sand and broken ehells, about 70 miles in length, and 1 to $1 \frac{1}{y}$ in breadth. The eastern part of the Crimea forme a minor peninsula,
serotehing eastward to the atrait of Kortsh or Cuffa, or Jonikaleh, the anolent Cimmerian Boaphorus, which forms the communication between the Black Sea and the soes of Asoff, but it is not nuvigable by large or deoply-laden vencsls. The moet valuable commercial production to aalt, which, an already mentioned, in obtained in very large quantition from tuslas, or malt lakee, noar Perekop, Koulov, Kaffa, and Kortsh. It is a government monopoly, and yields a conaidarable revenue. The other pririple articles of commorce and exports are wine, honey, wax, leather, Mlden, wool, and lambekins ; of the last of which, callod shmmeki, great quantitios are exported yearly to Poland and nther neighboring countries. The enly manufucture worth notice is what is called moroceo leathor, which to produced of good quality. The mountains contain masces of rod and white marblen, fall of cracks and flesures, which make thom well adapted for quarrying, if there were a demand.

Criminale. By the lawa of the United States, consular officere are required, in cases of the intended shipmont of paapers, or pardoned criminals, to the United States, to give timely notice of the fact, both to the Dopartment of State and to the collector of customs of the port to which the vessel having them on board may be boand; furaishing the names of the pasties, a deacription of their persons, the name of the veasel, and the date of anailing, in onder that proper steps may be taken for the enforcement of such police regalations as may have been adopted by the several States upon the anbjuct.-Manual for Conouls.
Crockery. In uee, and made mention of as prodncell by the Egyptians and Greeks, so early as 1890 s.c. The Romans excelled in this kind of ware, many of their domentio articles being of earthen manufacture. Crockery, of a fine kind, in various household utensils, was mado at Faenza, in Italy, about A.D. 1810 ; and is still callod fayence in French. Earthenware vessels were in use among the moat ancient nations. Various domestic articles were made by the Romana, 715 в. C. The art was revived and improved in Italy, A.v. 1810. Wedgewood's patent ware was first made in 1762. His pottery in Staffordshire was extended to a variety of curious compositions, sabservient not only to the ordinary purposes of lifo, bnt to the arts, antiquity, history, etc., and thereby rendered a very important branch of commerce, both foreigu and domestic.
Cronstadt, or Kronatadt, a atrongly-fortified seaport town of Ruseia, and the great naval atation of the Rusaian fleet in the northern seas, is situsted on the island of Kotline (frequently also called Cronstadt, from the town), at the head of the Gulf of Finland, 20 miles west of St. Pesersburg, in N. lat. $59^{\circ} 69^{\prime} 26^{\prime \prime}$; E. long. $29^{\circ} 46^{\prime} 30^{\prime \prime}$. The population in 1849 was 25,120 ; but it varies conaiderably at different timea of the year, and in anmmer generally amounts to aboat 50,000 . The isiand of Kotline is in general outline an acute triangle, 7 miles in length by abont 1 in breadth, with its base toward St. Petersburg, and its apex extending obliquely seaward. The eastern or broad end is occupied by the town of Cronatadt; and $1 \frac{1}{2}$ miles from the western point of the island is the lighthouse of Tolboochin or Tolbeacon. The atreets are regular, and in genersl well paved; but the houses, with the exception of those belonging to government, are chiefly of one atory. The town was originally built of wood, and wooden structures are still numerous; but such buildings are now forbidden by law, and the majority of the housee are now built of brick, and plastered. Cronstadt is divided into two parts-the Morskaia chast, sea district, and the Koopacheskaia chast, or commercial district-and into fonr aubdivisions Of the two canala which traverse the town, that of St. Peter, coastructed of granite, is 2,160 feet long, by about 80 yards wide. It commences between the Merchant and Middle Harhore,
and is in the form of a cross, of $\mathbf{x}$ hich one arm communicaten with a dock, where ten siujps of the line oan be repaired at once. The Catherine canal, 1,880 fathoms in length, communiestes with the Merchant Harbor, and thus enables vessois to take thoir atoren, munitiona, eto., directly from the store-houses. Between the two canals atood the old Italian palsce of Priceo Monschikoff, the alte of which is now occupied by a large building nsed as a school for pilota, and oducating above 300 pupila. On the northern side of the island the passage is impracticable, except for very amall oraft, being obstructed by rovis of piles and large masses of atone, extending from the island to Lisl Nosa, on the mainland. The southern channel is the only practicable passage from the Gulf of Finlund to St. Petersburg, and it is atrongly dofended on both sidea by forts and batteries. The priacipal of these are Forts Alexander, Kisbank, Peter, Cronslott, and that of Menechikoff, already mentioned. The Great Road is commanded by Forts Alexander and Risbank, sbout 1,600 yards apart. The former, on the left side of the passage, consiats of a front with 4 tiere of embrasures, and two flanka of 8 tiers each, and a rear wall mounted with gans en barbette. It is buist of blocks of granite on a foundation of piles in 18 foet of water, and commands the road by 1168 and 10 -inch guna, all in casemates. Fort Kisbank, which was not finished last year (1853), on the opposite side, is also of granite, resting on a foundation of piles, in 16 feet of water, and is armed with tiers of guns of the heaviest calibre. Further eastward, on the loft, is Fort Peter, or Citadel Fort, with 8 towera or bastions joined by 2 curtains; the first commanding the approach to the rear of Fort Alexander, whilie the eecond and third eweep the maln channel. These bastions have 28 guns in casemates, and 28 guna above en barbette: the curtaina have no casemates, but mount 20 guns en barbette. To the right of the Little Road is Cronslott, an irreguiar pentagon, originaliy built by Peter the Great. It presente to the sea a low line of timber casematea, forming a battery of 40 guns placed à fleur d'eau, and disposed in the half of each of two bastions with a connecting curtain. Ali thia work, however, has been deatroyed, and last year (1853) the piles had been driven on which a granite fort was to be built, which by this time (October, 1854) is probably complete. The mole forming the western flank of the Merchant Harbor mounts 70 guns, beidea 12 mortars; and the channel, between Cronalott and the mole, ia only 250 yards wide. Almost all vessels bound for St. Petersburg touch at Cronstadt, and those drawing more than 7 feet of water load and unload here-the goods being conveyed to and from the city in lighters. Vessels of 10 feet draught have, however, been known to go up with high water. The port ia ice-bound during the winter, from November to April. Cronatadt was founded by Peter the Great, 1703.-E. B.

Cronstadt is tho port through which the foreign commerce of St. Peteraburg is srincipally conducted. The number of vessels cleared in 1848-49, was as followe:

| Years. | Entered. | Cieared. |
| :---: | :---: | :---: |
| $1848 \ldots \ldots \ldots$ | 1,515 | 1,470 |
| $1849 \ldots \ldots \ldots$ | 1,570 | 1,650 |

In these figures Great Britain held the first rank. Tho number of British veasels entered and cleared was 920 , measuring an aggrogate of 209,318 tons. Under the French flag there entered and cleared 58 vessels, of 8,598 tons. The total value of French cargoes imported in 1849 , reached about $\$ 5,000,000$, against $\$ 1,000,000$ of exports direct to France. Official returns for 1853 exhibit a total of 1,898 vessels, under all flaga, having entered during that year; and the following table gives the nationality and number of these arrivals from each nation :

| Commertoes. | Na. of vemelo | Countrice. | No. of vowele. |

Cross-trees, in a ship, pieces of oak timber, supported by the cheoks and treatle-trees, at the upper ends of the lower and top-masts to cuatain the frame of the tops in the one, and to extend the top-gailint shrouds on the other.

Croton Oll is expressed from the seeds of an euphorbiaceous ehrub, the Croton tiglium, a native of Hindoetan and of the warmer parts of Asia. The frult is about the aize of a hazel-nat, of on ovate triangular shape, and containing three ovate seeds, sbout the size of a pea. The kerneia of these yield, on pressure, about 50 per cent. of oil, which is of a pole amber color, and a thickish conaistence, like castor oil. It has no udor, but has a peouliar acrid tante, which is felt moat atrongly in the back of the palate and throat. Croton oil is a speedy, powerful, and sure cathartic, in emali doses, of one to three drops ; and it possesses two valuable properties: 1st, that however active and powerfal the purgative action may be, it soon ceases, and leaves no debility ; and, 2d, thrt it excitec the biliary eecretion, more powerfuily than any known medicine. In consequence of one or two drops being a dose, and its action commencing very shortly ofter its administration, it is invaluabie in impending apopiexy, and in almost all diseasee in which torpor or paraiysis existe. In hydrocephaius, even when effusion of water on the brain appears to have taken piace, the late Dr. Abercromble stated that it wouid often bring about the recovery of the patient. It is a medicine which deserves far more attention then it has yet recelved.-E. B.

Crown, in Commerce, a common name for coins of sevoral nations, which are about the value of a dollar. See Coins, Tanle of.

Crown Glass, the best kind of window-glass. The hardest and most coloriess, is made almost entirely of aand and alkail, and a littie lime, without lead or any metallic oxyd, except a very amall quantity of manganese, and sornetimes cobalt. Crown glass is used in connection with fiint glass for dioptric instruments, in order to destroy the disagreeable effect of the aberration of colors. Both kinds of glass are now made in the highest perfection, in Benedictebura, where Riechenbach's famous manufactory of optical instruments is situated.
Cruciblea (Creusets, Fr.; Schmelztiegel, Germ.) are smali conical vessels, narrower at the bottom than the mouth, for reducing ores in docimasy by the dry analysis; for fusing mixtures of earthy and other substances; for melting metals, and compounding metallic alloys. They ought to be refractory in the strongest heats, not readily acted upen by the substances ignited in them, not porous to liquids, nnd capabie of bearing considerabie aiterations of tamperature without cracking; on which account they shouid not be made too thick. The best crucibles are formed from a pure fire-ciny, mixed with finely-ground cement of old crucibies, and a portion of black-lead or graphite. Some pounded coke may be mixed with the plumbas ${ }^{0}$. The clay should be prepured in a similar way as for making pottery ware; the vessels after being formed mnst be slowly dried, and then properly baked in the kiln. Platinn crucibiea are not fusibie, but are too costly for general use.
Cruise. (Germ., kreutzen, to cross.) A voyage within certain limits, for tho purpose of meeting with enemy's ships, plrates, etc., or for mere exercise, or for the relief of vessels in distress.

Cruisers, in naval affalrs, vossels, as the name imports, employed on a crulse. The nama is commonly given to amall men of war, made use of to secure merchant ohipe and veasein from the enemy's small frigates and privatesrs. They are generally formed for fast salling, and well-manned.

Cuba, the largest and richeos of the Weat Indis islands, and the most important colony of Spain, was discovered by Columbus on the 28th October, 1492, during his firat voyage. It was first called Juana in honor of Prince John, acn of Ferdinand and Isabella; but after Ferdinand's death it received the name of Fernandiana. It was subnequently designated Santiago, from the patron saint of Spain; and atill later Avs Maria, in honor of tho Virgin. Its present name is that by which it was known emong the natives at the time of its discovery. It was then divided into nine independent principalities, under as many caciques.
The island of Cuba is long and narrow, somewhat In the form of an irregular crescent, with ite convex side toward the north. It divides the entrance to the Gulf of Mexico into two passages : that to the N.W. being $32+$ leagues wide at the narrowest part, between the points of Hicacos in Cuba, and Tancha on the Fiorida coast ; and the S.W. pasaage 38 leagres wide between the Cabo de San Antonio of Cuba, and the Cabo de Catoche, the most salient extremity of the peninauia of Yucatan. Cuba lies between $74^{\circ}$ and $85^{\circ} \mathrm{W}$. long., and $10^{\circ}$ and $23^{\circ} \mathrm{N}$. lat. Its length, foliowing a curved line through ifa centre. is 790 miles, and its greatest breadth (from. Cape Liaternillos to Mota Cove) is 107 miles. The area is estimated at 31,468 square milea, or, including the othe: emall islands attached to it, 32,807 square miles. The coast of Cuba is generally low and flat, and is surrounded by numerous isiands and reefs, which render the approach both difficuit and dangerous to those not acquainted with the proper channels. The low nature of the coast subjects it to frequent floods and inundstions; and especially on the north side of the isiahd, there are many large lagoons from which a considerable quantity of salt is obtained. No island, however, in proportion to its size, has a greater number of excellent harbers, many of them accessible even to ships of the line. A range of mountains extends from one end of the island to the other, dividing it into two unequal portions, of which the northern is generally the narrower. The highest are those at the S.E. extremity of the isiand, to the N.W. of Santiago de Cuba, and have, according to IIIumboldt, an elevation of 1,200 toises, or 7,673 English feet. This Cordiliera is one great calcareous mass, resting on a schistose formation. The summits are for the most part rocky and naked, occasionsiliy interrupted by more gantie undulations. The central and western parts of the island contain two formations of compact limestone, one of clayey asndstone, and another of gypsum. The limestono formations abound in caverns. The secondary formations, east of IIavana, are pierced by syenitic and euphotide rocks united in groups. The syenite strata are intercaiated with serpentine, and inciined to the N.W. In some places petroieum runs out of rents in the serpentine ; and abundant springs of this fluid are also found in the eastern part of the island. The rivers in general are necessarily short, and flow toward the north and south. The largest is the Cauto, rising in the Sierra del Cobre, and faliing into the bay of Buena Esperanza on the southern const, after a course of 59 leagues, for 20 of which it is navigable, though at low water obstructed by bars. The Sagua le Grande rises in the Sierra del Escambray, passes Sunto Domingo, i i falis into the sea in front of the Boca de Maravilias, being navigabie for five leagues. The principal of the other rivers are the Sagna la Chica, the North and South Iatibonica. the Cuyaguateje, Sasa, Agobama, and the Hanabana. On soune of the rivers are beautiful cascades, while
several of them flow, during part of their courses, under ground.

The mineral riches of the island have not yet been explored to any considerable extent. Though gold and sllver have undoubtedly been fonnd on the island, the quantity has never been sufficient to repay the labor of search. Gold was sent to Spain from this laland by the early settlers, bnt it was more probably the accumulated wealth of the aborigines in previous centuries, whested from them by tyranny and rapine at the period of the conquest, than the product of honest labor on the part of the colonlats. Traces of auriferous sand are found in the rivers Holguin, Escawbray, etc. Some specimens of the finest gold have been obtained in recent times from the workings of Agabama and Sagus la Grande, but at an expense of time and labor that could not remunerate the parties engaged in it. In 1827, silver and copper were dise, vered in the jurisdiction of Villa Clara, and the first ores gave no less than 7 oz . of pure silver to the quintal ( $=107 \mathrm{~B}$ lbs.) of ore; but they have become less productive, probably from not belng properly worked. The copper mines near Santiago, in the eastern part of the island, are of great extent, and very rich, employing naarly 900 persons, and ylelding an ordinsry average of about 27 per cent. of pure metal. They were wrought with some success during the 17 th century, bnt had been abandoned for more than 100 years. About the year 1830, Mr. Hardy, a landed proprietor in the island, happened, when on a vialt to that part, to carry off some of the refuse of the old workings in order to suhject them to analysis, the result of which was, that the metal was found so rleh as smply to repay the expense of sending it to England for smelting. Several other mining companies have since been eatablished; and the amount of copper ore exported in 1850 was 552,288 quintals, or nearity 25,100 tons. Of the 35,683 tons of copper ore imported in 1851 into. the United Kingdom, 20,825 tons came from Cubs. Coal of a highly bituminous character, affording a strong heat, and leaving; very little solid residue in the form of ashes or cinclers, is very abundant. In some plures it degenerates into a form resembling asphaltum, and nenr the coast it ls often found in a semi-liquial state like petroleum or naphthn. In the quarries near Invina a thiek alate is found, fit for floors and pavements. Marblex and jaspers of various colors, and susceptible of a high poliah, are found in many parts of the island, and particularly in the Isle of l'ines. It is generally believed that iron exasts in various parts of C'ulsa; nnd many parts of the great Cordillera undoubtedly contain rocks of a ferrughous nature; bat from the dimlculty of aicess, the searcity of fuel, and the want of capital, no extensive mining operations have been engaged in. Nntive loadstone, however, has been found in various parts, and chalybeate spriugs are numerons.

The circulating medinm of Cuha, was until lately composed entirely of the preeious metals; paper money ts now issued by the bnak which has just gone Into operation. The coins in use are the spanish doohlon, or onzt de oro, whirh is a legal tender for 17 hard dollare, and at the orilinary rate of exchange of $84-37$ per cent., is worth $\pm 310 \mathrm{~s}$. 1 hd , sterling; and the aululivisions of the dohlon, the linif, the quarter, the elpith, and the slxteenth-the last being equivalent to a dollar and hulf a real. The Mexican, Colombian, and other South Anericuin doblons are a legal tender for 16 hard dellars, equal to 836 m .8 d . sterling, und are somethes in demand for exportation at a premium: their divishons are worth, $x, 4,2$, and 1 dollar respectively. Of silver colns, the Spmulsh dollar and lts divisions, und ulso Mexican, United States, and South American dollars, aro legal tenders at their nominal value.

The princlpal port is ILavana, or IIsvanali, on the north coast of the island of Cuba, of which it is the
capltal, the Moro castle being, according to Humboldt, in lat. $23^{\circ} 8^{\prime} 15^{\prime \prime} \mathrm{N}$., long. $82^{\circ} 22^{\prime} 45^{\prime \prime} \mathrm{W}$. The population of the city and suburbs was said to be, in 1851, about 200,000 . In 1827, the resident population amounted to 04,023 ; viz., 46,621 whites, 8,215 free colored, 15,347 free blacks, 1,010 colored sluves, and 22,830 black slaves. The port of Muvana is the finest in the West Indiea, or perhaps in the world. The entrance is narrow, but the water is deep, witheut bar or obstruction of any sort, and within it expands into a magniticent bay, capable of accommodating 1,000 large ships-vessels of the greatest draught of water coming close to the quays. The city lies along the entrance to, and on the west side of, the bay. From its positlon, which commands both inlets to the gulf of Mexico, its great atrength and excellent harior, Havana is, in a political point of view, hy far the most important maritime station in the West Indles. As a commercial city it also ranks in the first class. The ports of the islund licensed for fereign trade are IIavana, Santiago, I Puerto Prince, Matanzas, Trinidad, Baracoa, Gtbara, Cienfuegos, and Manzanilla, A bank has been recently established in Cubs, under a royal ebarter.

It is impossible, from the conflicting accounts of the different writera upon the subject, to arrive at any thing like certainty as to the number of inhatitants on the island at the time of its conquest ; but it may hes estimated at probably from 800,000 to 400,000 . There is little doubt, however, that before 1560 the whole of this population hat disappeared from the island. The first census of Cuba was taken in 1775, when the $p$ ulation was 170,862. In 1791 it was 272,140 . The following table gives the population since that period:

| Year. | Whites. | Free Blacke. | Slaves, | Total. |
| :---: | :---: | :---: | :---: | :---: |
| 1811 | 874,010 | 114,010) | 212,4010 | 600,000 |
| 1817 | 2\%0, 021 | 115,691 | 225.268 | 630,930 |
| 1827 | 841,05t | 106,494 | $2 \times 6,342$ | 704.547 |
| 1841 | 418,291 | 152.838 | 480.485 | 1,007,624 |
| 1846 | 425.769 | 149.228 | 828,769 | 193,752 |
| 1849 | 457.133 | 104,410 | 823,697 | 94, 4 ,49 |
| 1850 | 605,560 | 205,570 | 436,100 | 1,247,230 |

Neither of the last two censuses include the gar. rison, crews of vessels, or the floating population.

The following is a more minnte elassifleation of the people of the istand, according to the census of 1850:

| Creole whites. | b20,000 |
| :---: | :---: |
| Spanlards. | 80,040 |
| Troops and marlacs. | 2\%,000 |
| Forelinera. | 10.569 |
| Floating popuitation. Total whites, 603,0,40 | 17,010 |
| Free mulattees. | 118,200 |
| Free blacks. ............. Total free colorel po | 87,370 |
| Slaves, mulattoes | 11,100 |
| slaves, blacks, | 405,600 |
| Total slaves, 430,100. |  |
| Grand tetal. | 1,24i,230 |

The present population, adiling garrison and thating population, ts nearly $1,100,000$. The rousus of 1816 Glves the populathon of the principal towns as follows:
 Cuba, 21,005; Matanzas, 16,986; 'Trindad, 13,222. The poralation of llavana, ha 1849 , is glven at 142,0042 , and in 1850, nt 150,561.

The chinf agricultural products of Cuha nre sugar, collece, and tobaceo. The cultivation of these has mivanced with great raphlity alnco 1809, when the ports of the island were more fredy openel to foreis, rers. The cultivation of colfee ndvanced for a time with equal or even greater ruphlity than that of sugar; but latterly, from the low prices of cellee, the caltivation of sugar has liecome the inore protitable, and lit a great measuro supplanted coffee. Amoug the other productions are Inillan corn, rice, heans, plantains, cotton, conoa, pinc-ipples, lemons, oranges, lhues, ligs, molons, ete. Of tho manafactures, the principal are the

making of sugar, molasses, rum, and segars, and the preparation of coffee and wax.

The latest and most reliable statistics of the island present the following divisions of agrieultural industry, viz. : sugar estates, 1,442 ; coffee estates, 1,618 ; tobacco estates, 9,102 ; and grazing farms, 9,930, on which are reared about 808,199 head of cattle. Besides these, large herds of cattle are also reared on the extensive and fertile prairies of the uncultivated portion of the island.-E. B.

Politically, the isiand of Cuba is divided lnto three departmenta: tho Oriental, the Central, and the Occidental; and these are again subdivided into a number of governments, sub-governments, and colonies. The Central and Occidental departments form the civil province of Lavana, and the Oriental the civil proviace of Cnba.
In 1809, the restrictiona imposed upon Cuba, of tradiug to no foreiga country whatever, were removed; and from that period to the present, offlicial returna of the population, agriculture, commerce, and revenue of the island have been annually prepared, and, upparently, with great care. These reports, or "Balanzas Gcneraies," exhibit a regular and marked progress in the industrial and commercial movements of Cuba, from the period above specitied-its trade with foreign nations steadily advancing, and the supplies of its more prominent stapies regularly keeping pace with the increased demands of an enlarged and comparatively emaneipated commerce. In 1775 , the entire population of the island was 170,370 . In 1850 , it had risen to $1,247,230$, showing an increase during the intervening 75 years of $1,076,860$, or about 700 per cent.
Commerce with Cuba.-The increase of the trade of the United States with the port of Mavana over that of all other nations, notwithstanding the bid feeling that has existed between the two countries, is truiy wonderfui. The Havans Mercantile lleport of the 7th of August, 1850 , gives e. statement of the number of vessels, their tonnage, and the natione to which they belong, which eutered the port of Havana during the first 6 montis of the 10 years last past. The increaso in the total tonnage for the tirst 6 months of the year, from 1846 to 1855, is a tritle more than 100 per cent. While tho Anericnn tonnage has incroased more than 200 per cent., the Spanish and British are nearly atationary. For the first 6 months in 1846, the Americau tonnage employed in this trade was 71,722 ; the $\mathrm{Spmanish}, 50,528$; and the British, 32,969 . The total number of vessels which entered that port during the 6 monthe ending July 1st, 1855 , wne 1,080 , of a tonnage of 364,033 ; and of these, $\dot{\mathbf{j}} \mathbf{0}$, of a tonnage of $231,4 \times 4$, were American; $\overline{58,338}$ Spanisin; 32,165 liritisi. The Freuch tonnage has increased from 1,761, in the first 6 montiss of 1846, to 8,269, for the same period of 1854 , end 23,283 , more than two thirda of the Britisi, in 1855 . In the tennago of other nations, Beigian., Dutch, Danish, Bremea, Hanilurg, and others, there has heen no muterial increase. Prior to the removal of tho reetrictions on foreige commeree, there was some trade carried on between the Unitod States and Cuha, by virtue of Spmeish grants and occasional relaxntions of the law ; hut it was generally limited to the importation of articles neceasary to supply tho people of the isfand with tie means of subsistence.
The wars hetween the mother country and the Spanish Americun republics having driven the Spanbid fing from the ocenn, the laws of difierential duties remained in aboyance, nnd the commerce of Cuha, oxisting chielly with the Unitell States, was rarried on in American hottoms, which even extended thcir services to Spain, liringing the oil and wine of the leuinsula to the colonists. The graduul settlement of the dificulties with the revoltent provinces enabied the thag of Spain aguin to come upon the sea, nuid her mercantile marine received a new impulac. During the po-
riod that had elapsed aince the opening of the ports, the natural increase of the wants of the colonists, attendant upon an exchange of their products with those of fureign countries, opened $\varepsilon$ market in Cuba for many of the products of mechanical industry, which found their way there through the ports of the United States; so that, at the close of this era, in the year 1830, the foreign commerce of the island was confined almost exclusively to our marts, to which she looked even for those articles which were not produced in this country. This was the season of the most prosperons commerce between Cuba and the United States. The re-birth of the Spanish merchant-marine brought with it clamors for protection, and the tariff of Cuba was eltered, imposing a differential duty npon goods imported in foreign bottoms. The object of this duty was to encourage the employment of national vessels in the trade of the island with this country. Spanish ships very soon made their appearance in American ports, and were rapidly obtaining a iarge share of the carrying trade, which had, hefore that period, been enjoyed exclusively by American vesgels.
About this time, repeated but unavailing representations had been made to the Spanish government of the injustice of its course in imposing such discriminating duties both on the navigatien and commerce of foreign countries, and in favor of Spanish bottoms. Negotiations having proved abortive, a system of defensive or retaliatory measures was recommended, as the only means of gelf-protection, in an elaborate report made by the Committee on Commerce of the House of Representatives, in May, 1834, which concludes thus: "Your committee, thercfore, from a view of all the circumstances, have deemed it their duty to report a bill, authorizing the Secretary of the Treusury to collect such additional tonnage duties upon Spanish vesscis enteriag the ports of the United States from Cuba and Porto Rico as shall be equivalent to the discriminating duty that would have been imposed upon the cargoes of such vessels, respectively, if the same had been exported from Havana in American bottoms ; and also upon Spanish vessels clearing ont from the ports of tino United States, such additional tonnage duty ns would be equivalent to the discriminating duty payuble upon their cargoes, respectively, if imported into Havana in American bottoms."
The bill reported became a law in June, 1834, and conformally to its provisions, the Secretary of the Treasury, in February, 1835, issued to the collentors of the customs his cireular, in the foliowing wu.ds: "I have to call tire attention of the officers of the customs to the accompanying copy of the act of Congress concerning tonnage duty on Spanish vessels, approved the 30th June last, and winich goes into operation on the 1st day of March next. Tainular statements are annexed, showing the rate of duty to be levied, in the nature of tonnage duty, on the arrival of Spanish vessels at any port' in the United States, coming from the islands of Cuba or Porto Rico, either directly or after touching at any port or place, laden with merchandise sulject to discriminating duty when exported from the port of Huvana in American buttoms, together with the rate of duty to he exucted from the aforesaid vessels departing from a purt of the United States, with a cargo destined, directly or indirectly, to either of the islands before deseribed."

The alove extract from the cipcular contains, in substance, the first 3 sections of the act of 1884 . The 5th section slows the purport and scope of the act, and that it was designed by the committee from which it emanatoi, as well as ly Congress in its adoption, to force the government of Spain into a more liberul nud just course of legislation in regard to the commeree hotween the United States and this island, by placing Spanish vessels, with their cargoes, coming into or ileparting from the United States, in the same
condition, as to imposts of all kinds, that American vessels are subjected to in the colonies of Spain. This equality was demanded as imperatively in behalf of the interests of Cuba and Porto Rico, as ln vindication of our commerclal rights; and the 5th section expresaly limits its continuance and restricts its applicstion to the accomplishment of that end. This section is in these words:
"And be it further enacted, That whenever the President of the United States shall be satisfied that the discriminatiag dutles in fuver of Spanish bottoms levied upon the cargoes of American vessels in the ports of Cuba and Porto Rice have been abolished, or whenever, In his opinion, a satisfactory arrungement upon the subject of the said daties shall have been made between the United States and Spain, the PresIdent is hereby nuthorized to declnre the same by proclamation, and thereupon this act shall cease to have any further force or effect."

In 1849 the Treasury Department ascertained that certaln privileges had been accorded on the part of the Spanish government to vessels of the United Stutes entering and departing from ports in the island of Cuba. A circular was immediately issued from that department, which, after citing the provisions of the acts of 1832 and 1834, and specifying the privileges alluded to, says: "It consequently follows, that where no tonnage duty or discriminating duty on the cargoes of American vessels entering or departing from ports or places in the istand of Cuba la imposed and collected thereat, Spanish vessels coming from such ports or places are to be similurly treated, is regards tonnage duty, in the ports of the United States. The collectors of the customs are, therefore, instructed to abatain from the exactlon of any tonnago duty on Sanish vesaels coming from ports or places in the islund of Cuba, In lhallast, or when laden with cargoes of molasses taken $\ln$ at either of sald ports."

In 1852 a similur clrcular was issued to collectors, instructing them to admit Spanish vessels arrlving from Spanish or any other foreign ports, those of Cuba and Porto Rico exeepted [the royul decree of 3d Janhary, 1852, excepted Cuba and lorto Rico from the privileges thus reciprocated], to entry on the same footing as American vessels, as regarded tonnage duty, light-money, and all other dues to the United States, so far as respects vessels. These act. (of 1832-34) have been in force now during a period of 22 yenrs, and, with the exception of the allght privileges which called for the circulars already reforred to, have fulled to produce the effect contemplated by their caactment. The commerce between the United States and these iflunds, in the aggregate, lins not fallen off; but the increase has not been such as shoulld be expected from the great expansion of our general commerce, and the increased development of the agrienltaral and industrial resources of Cula, since that period. The moxt obvious effect has been to exclude Spanish ships from our ports, aad to destroy, in a measure, all that portion of the parrying trade hence to C'oba which comprised articles of forelign prodnct ; for the Spanish vessels, no longer permitted to engage In the earrying trade hetween the United Stater mal Cuba, on more favorable terms than Amerien vessels, were soon driven from our ports, and supplied tho wants of the island from the conntries where the articles were producell; noll thus the harlware, glass, delf, and Irygoods of Eugland, that had been previously lirought to the United States in Americnn packetahlys, principally, from Londun und Liverpool to New York, were now ilirect!y imported into Cuba; and the same result has attended the carrying trade from France in her silks amel fancy wares, and Germany in ber cottona, linens, and hoslery.
The following table exhilites the number and nationality of vessels employed in the trale of Cuba during the three yeara $1 \times 26,1820$, and 1834 :

An onalysis of tha precediag ligures will show an aggregate increase in the number of vessels entered from 1826 to 1829, of 43 ; and to 1834 , of 377 ; and in vessels cleared, an increase, for the first period, of 282 , and for the secend, of 629 . The increase in Spanish ressela entered from 1826 to 1829 was 208, and to 1834, 609 vessels. The decrense from 1826 to 1829 in the United States vessels was 137, and to 1834, 161; and the decrease in vessels from all other nations, for the first period, was 28, and to 1834, 71 vessels.

The preceding tables show an increase in the aggregate value of imports into the island in 1829 over 1826 of $43,770,102$; while, during the second period, from 1829 to 1834, this trade remained stationary. A minute annlysis of the figures, however, will show the gignificant fact that, while the enr rying trale in SpanIsh bottoms has risen from 8844,826 in 1829 to $81,570,-$ 013 in 183-, the imports from the United States, during the sume period, fell from $85,731,765$ to $83,690,101$. During the three years compred, the imports into the United States from Cuba remnined stationary, heing in 1826 \% $3,894,597$; in 1829, $83,191,535$; and in 1834, *3,824,724.

Imports of Flour.-During the periols umider review -indeed, at all thmes-provisions form the largest item in the imports from the Unitell States. The enormous discrimination in favor of the national llag on flour has ulways had the effect of restricting almost exclusively to national vessels the trale in this article. Thus, $\operatorname{In} 18: 9$ the vulue of flour imported into Cuba, in Spmish vessels, wus $\$ 1,582,768$, while from the Unitell States it amounted only to $\$ 345,315$, and from all other places to 813,602 ; and in 1849, or twenty years after, the value of Heur imported in SpaniNh het-
 and from all other pluess, 61,725 . The ants of $1 \times 32$ and 1834 can, unquestlomathy, be tracel in this great talling off in the articlo of thour ; but, that other eallises also contributed in securing for the spanish liag so complete a monopuly of the trate in this article idemonntrated by the fiet that, whilo the valne of thour imported from all uther phaces (than the Vinited Stater) in $1 \times 29$ amminted to 8113,$6 ; 2$, , representing 1,093 hurrels, we find thin Hgure in 18.6 dwinlled down to *1,725, representing only 138 barrels. That tho repeal of these acts would largely augneent the export na well ns the louport trade of the United States with Cubn, there can le no question; but, until the discriminations in favor of the natlomal thag ure moditiond or romovel, the carrying trude between the United

Statea end that faland would, under their nnequal and unjust operation, be almost exclusively monopolized by Spanish bottoms.

Commercial Policy of Spain.-The reatrictive policy of Spain, eepecially aa regards the trade of her colonies, is adhered to to-day, in Cuba and Porto Rico, almost as rigorously as when she was mistress of nearly the entire southern portion of this continent; and the stationary condition of the trade between the United States and these ialands since 1834 would seem to indicute the fruitleasness of any efforts to force her from this liae of policy by measures of retaliation or countervailing acts. So long as the ayatem itself shall continue to be the colonial policy of Spain but little modification in its details need be looked for, whether the influence to that end be countervailing acta or diplomacy. "Be careful," says the instructians of the king and Council of the Indies to Luis de Velaseo, viceroy of New Spain, early in the sixteenth century, "Be careful not to foater manufuctures, nor to allow the cultivation of vines, inasmuch aa there was al ways ample pravision of these things, and the comnerce of the kingdom should not be impuired by such colonial producta;" and in the year 1610 these royal instructions were repeated, with the addition of the following amphatic language: "Inasuuch as you understand perfectly how much the observance of these rules is necessury for the dependence of the colonies, we charge and command you to seo to their faithful executieu." The same spirit that dictated this protection for the wine and oil of Spain, and for the exclusive trade in these articles to her American colonies, in 1610, remains unchanged in any degree (because there is no practical distinction between prohisitive discrimiations und positive prohibitions) in the cemmercial policy, which, in 1856, two centuries and a lulf later, virtually excludes American flour, and many other staples, for which the inhabitants of Cubs must necessarily look to a foreign market.

Until the system itself is abolished, and Spain adopts the more liberal commercial policy which churacterize the present enlightened age; until she follows the example of Great Britain, Belgium, llolland, and other neighboring countries, in removing all unnocessary shackles from commercial enterprise, the commerce of Cuba, not only with the mother country, but with the United States, and all forcign nations, must remaln as it has during the past quarter of a century-crippled, restricted, and struggling ; incompetent as a source of revenue to the home government -indequate to mect the expenses of the colonial, and almost powerlese, from the restrictions with which it is burlened, in developing the exhanstless reaources of the island, or even in supplying the necessary meuns of comfortable subsistence to the great bulk of its inhabitants, unless at prices far above thpir scanty means.

If the gevermment of Spain could the induced to propose, or to agree, to a similnr commerelal rechprocity with the United States to that now existing hetween the latter country and the British Nortl American provhaces, it would not only supersede countervailing acts and retaliatory measures, by establishing the commercial relations between them on a busis of just and liheral reciprocity; lont, it is helieved that, while in a very short period it would make the ishond of Cuba the richest in wealth, as it is in natural resources, of any ishand of the smme size in the world, it would also eminently contribute to cement more strongly, if not render indissoluble, the bonds of unlon between it nul the mother comintry.

The following table exhibits the value of exporte from the United States to Cuba during two periods, embracing three years each:

| Years. | Valus. | Quantily of Flour. | Value. |
| :---: | :---: | :---: | :---: |
| 1884 | $08,690,101$ |  |  |
| 1885 | $5,406,919$ |  |  |
| 1836 | $6,558,281$ |  |  |
| 1858 | $6,287,959$ | 1,587 bbls. | 87,780 |
| 1854 | $8,551,752$ | 11,598 | 82,489 |
| 1855 | $8,004,582$ | 8,428 | 89,176 |

It will be seen from this table that the export trade of the United States to Cuba in 1853 is leas than it was in 1836, while the increase in 1854 and 1855 is by no means proportionate to the rapid increase of our general commerce, and of the agricultural producta of Cuba. Were the diacriminations removed, flour would unqueationably become our leading ataple export to Cuba. The importationa of this article into Cuba in 1847, were 235,243 barrels, of which 175,870 barrels were from Spain, and 59,378 barrels from the United States. In 1848 the number of barrels imported fell to 231,119 , of which only 18,175 barrels were from the United Statea. The most moderate eatimnte puts the consumption of flour in Cuba, were it admitted at reasonable duties, at from 800,000 to 900,000 barrels. That this trade would be enjoyed almost excluaively by the United States is evident from the fact that flour is among our heaviest articles of export, and European competition with a country within a few days' asil of the island would be out of the question.

The balance of trade between the United Statea and Cuba is enormously against the former. In 1853, this balance amounted to $\$ 12,297,796$; in 1855 it was $\$ 10,620,757$. The value of 500,000 barrels of flour, fixing the price at $\$ 5$ per barrel, would be $\$ 2,500,000$; or one fifth of the balance against the United States would be realized on the single article of flour alone. The increased quantities of bncon, park, lard, and provisions generally, of domestic manufactures, etc., would render the commerce between this country and Cuba moro equal, as well as more just; while the exporta from Cuba to the United States would be proportionsbly augmented. One year's trade, if conducted on principles of reciprocity, would be sufficient to demonstrate the advantages which would result to both countries from the adoption of a policy cemmended allks by the products and wants of each, respectively, and by every principle of commercial economy.

Great as is the productiveness of Cuba at present, some writers assert that under a good government it would be increnred flvefold; its mineral resources would then be fully developed, and it would be able fully to take advantage of its admirable position to develop its trade. The continuance of the present line of policy in reference to Cuba must in time lead to a revolution which Spain will be unable to quell.

Since the adoptlon of the Spanish tariff of the year 1830, in Cuba, several revisions have been made, and the rates of duty from time to tlmo have been materially diminished, to the eminent ndvantage of the revenue; but there has still been retalned, and in many instances increased, the differential duties in favor of Spanish products and nationnl bottons. The following instances of tho operation of these differential duties will sufficienti, oxhlbit their general character.
haril.-An article of great consumption in Cuba, imported nlmost exelusively from the United States, is subject to a dity of $4 \frac{1}{4}$ cents per pound when brought from this country in Ameriean bottoms; the coarser qualities of oil (olive), whleh are imported for the same purposes, ure delivered with a duty of $24-5$ cents per pound; and the result is, that $10,000,000$ pounds of lard, being a vastly superior article, aro imported, while $8,500,060$ prounds of oil from other countries, fur inferior to lard, are enabled to compete with it in the markets of Cubu, because of the ditlerence in price, in Its favor, produced by the duty.

Productions.-Aguardiente (tafia, or rum) is diatilled from molasses and the refune of sugar-worka. It is sold per pipe of 125 gallons, wlth or without caak, according to agreement; good tafia is of not less than 20 degreos, clear and transparent, slightly brown in color, and smooth taste. Tho exports of thla artiela for the year 1856 were about 15,473 pipea, of witich 7535 went to Spain; 150 to the United Statea; 294 to Great Britain; 2091 to Cowes, or Falmouth and a market; 640 to Haunburg and Bremen; 2637 to France; 588 to Tricste and Veutee; 1879 to South America and Moxico; and the balance to Italy, Glbraltar, and a market. The exports of 1855 very considerably exceed any previous year, and from the number of extenaive distiilories receatly astabliahed, the article is likely to form a considerable item of exportation in future. It has commanded the last year as high as $\$ 45$ and $\$ 48$ per plpe during a portion of It ; at the termination of the year it was quoted at $\$ 40$ to $\$ 42$, brisk. The number of pipes shipped were 21,102 , of which 840 went to the United States; 3499 to Great Britain; 798 to Germany; 2114 to Franeo; 12,787 to Spain; 809 to South America and inexico; and the balanco to Italy and other conatries.

Leaf Tobaceo.-Tobacco is one of the most important articles of production in the isiand of Cuba. Tho planters commence to plant is August or September, after the heavy rains are over, and when the northers may be looked ior, which generally como accompanied by a drizziing raln that is favorubie to the piant. In February or March, and as iate as April, the tobaceo is cot and taken to a house or shed, erected for tho purpose of affording shade, and at the same time a free circulation of air; it ls placed on cryes (poles), laid horizontally $\mathrm{D} \pm$ some distance from the ground, where it is allowed to become perfectly dry until the spring rains commence, when the hunidity seizes tho leaf, causes it to swall, and to take the silky appearance pecullar to it. It is then taken from the poles and laid In a heap on the ground, the leaves being slightly sprinkled with water; in this state it undergoes a apecies of fermentation. After this operation is gone through, the leaves are placed in manojos (liandis); afterward it is a very common practee to take a quantity of refuse leaves and lafuse them in a certain quantity of water, and, in sone instances, whe, and even alcohol, or, rather, tafia is nsell when the tobneco is light colored and weak, and it is desired to give it increased strength. This infosion undergoes a state of formentation, after which the refuse leaves denosit themeelves at the bottom. The tobaceo is dipped into this proparation before boing hung up in a room almost air-tight, where it undergoes the sweating, to which the namo of calentura (fever) is given; tho process of dipping is performed as many thmes as the tobacco may require. I am under the impression that this process might he used to great advantage with tho Connecticut tobacco. The qualities of Cuba tobacco vary according to the section or distriet in which it is prodocei: that grown on the western end of tho island is the celebrated Vuelta Abajo tolacco; that ralsed In other parta of the island, which is very inforior in quality, is known under the name of Vuelta Arriba. There is another class, called Yam, from which P'uerto I'rincipe eigars are made.

Tho lest Vuelta Abajo toliacco is grown on tho margins of certain rivers, which are periotlically overtlown, and is called tobacce de ria, distinguinhed from other tobacco by a fine tand founil in the creases of the leaves. Gool tolmaco is aromatie, of a rich irown color (this color is preferred by those who aro fumil of a strong elgar, but tinero is many a light-colored leaf that is quite as strong), without stains, and the loaf thin and elastic, imrna well without hitter or bithg taste. There is proinably no production of the earth that offers so many disappointments : the raising of it is suljected to many contretempw, If I nm not mis
taken, only one good crop ia made in three years on an average. Tobacco is usualiy divided into five ciasses, to wit:

Calidad or Libra: thia ia the beat tolacco; the lales alvays contain 60 hands or manojos, of 4 gavilias or fingers, of about 25 leaves each, und marked $\mathrm{L}^{2} 60$. Tha strongent cigar is mado witis this leaf. Infuriado Prineipal or Primera (firsts): has less finvor tian Libra, and la generally of lightor color. The leaves should be whole and elastic; 80 handa, of 4 gavillas (of 30 leavea), are in each bale, which is marked is 80 . Segundas (seconds): many good wrappers in these; but the majority of tha leaves are stalneti, lave a bad color, or have been slightiy touched by the worm. This wrapper is weaker than the firsts. This class is put up in bales of 80 manojos, of 4 gavillas, each of these of 85 to 40 leaves, and marked Y 2 a 80 . Terceras, or thirds, constitute the best fillers, and somo wrappers are found nmong them, eapeciaity if the tobacco ia new. The baies have 80 manojos, of 4 gavillas, having upward of 40 leaves each; the bales are marked 3 a 80 . Cuartas, or fourths: tho most inferior class, fit only for fillers. The balea contain 80 manofos, of 4 gavillas; no determined number of leaves in the gaviiias; marked 4a 80. Vnelta Arriba tobacco is put up in the same, or a similar, manner.
It wouid be dificult, lideed, for any one to nttempt to fix prices for tobacco; they vary from, say $\$ 10$ to \&170 generaily, lint occasionally fabulous prices are paill for that which is very good in quality, and which offers a falr prospect of yielding a large number of cigars. I have it from a very reflable source, that a little over a month since, the celebrated factory of $L_{a}$ Ilija de Cabañas y Carbajal paid the sum of $\$ 10,000$ casi fer a lot of oniy 45 lales, none of which excceded 100 liss. in weight. By the foliowing quotations, given by our latest price-current, it will ba perceived how varied the prices aro for tobacco:
$\$ 120$ to $\$ 140$ for firsts, sceonds, and thirds.

When tobacco is shipped, it is generaily covered with erash
Cigars are mado of all classea of tobacco, and of varions sizes and siapes, and therefore of various vaiues. There is probably no manufactured article so difficuit to estimate the true value of as cigars; there are certain well-known brands that enn command almost any price; they havo a fixed value; such, for lustance, as those of La Ilija de Cabañas y Cartajil, Cabargus, Iatargas, Ia Ifigura, etc., and even among those of high reputation, and having apparently thxed priess, cigars aro delivered at lower rates than thoso appuaring in the bill of rates to persons that advance them large sums of money for the purchase of tobaceo, and receive in payment large puantities of these cigars ier month. These celebrated brands are known to lie the purchasers of the best and lighest priced tobacco; at the same time, it is well known that they purchaso cigars from smalier factories, mako seloctions with great care, pack them in their own boxes with their own brands, and oitain for theso tha samo prices as for the cigars made at their own mmufactories; and just as good an article may he procored elsewhere for balf the price. Hut very few of the eigars jroceeding frem those celebrated factories are consumed on the island; and there are even amo, but compratively few of whoso citars aro sent to the United states, and thero are many whose works all go to the States. I mean, in the alove remarks, in the way of traio. It would he quite imioselble to give any positive figures in regard to the extent of manufucture of cigars in thia laland; notwithstanding all my diligence in procariag informaIlon, and the various modes employed for the parios', my cfforts have falled. The only mode I could find to

mako an approximating estimate of the quantlity manafactured is ly estimating first the number of smokers in the laland. And here I met one greet stumbling-block-"What is the populatlon of Cuba P": It is calculated as low as under one million and as high as one million and a half.

It must be horne in mind that alnost every man, and a very large portion of women, in the island smoke cigars; and although it is very true thnt a large number use the clgarritoa or paper cigars, stlll, it ia known that a very large portion of these also consume the other kind, or puros. My object has been to ascertain, in the first place, the home consumption. In my effo:ts to ostimate the number of smekers by inquirias from both Spaniards and Germans, I tind the estimate varying hetween 300,000 and $1,000,000$. Ten eigars per day ls considered about tho average quantity consumed by each person. As iny basis of calculation, I have put down the number at 400,000 . This would give for the cousumption of the island tho almost incredible amount of 1460 millions of eigara per annum, equal to $1,460,000$ boxes of 1000 each. Caleulating each thousand to weigh 12 lbs., each smoker consumes 44 lbs. per anuum. This, taken in conncetion with the amount of exports from all parts of the island, that can not bo less than the consumption, swells the figures to an extent that is startling, snd makes mo doubt the basis of my calculation. And yet I am told by many that I aur rather under than over the number of smokers, and the quantity they consume per dny.-Consular Report to the Department of State, United States.

Sugar.-Thia ls eonsidered the greatest staplo of the ishand of Cuba. The grinding of the cane generally commences in the month of December, and the sugars are brought to market from Janmary, and sometines as early as the mitdle of December, untll July; the greatest quantities come in Mareh, Mpril, and May, There are two kinds made, known as "clayed" and " lluscovado;" the greatest quantity by far is clayed. Of this, the principal division is: Florete, white, yellow, brown, and Cogucho. It is packed on the plantations. Tho clayed is put in boxes, weighing from 450 to 500 pounds gross; the tare usunlly is 47 pounds. A merchantable box of sugar must weigh 16 arrobas (of 25 los.) net; lf a little under, a deduction of 50 cents per box la made; and if much under, the augar is rejected, as the export duty is upon the box, and it would not be for tha intercst of the shipper or exporter to accept any box welghing less than 16 arrobas. Muscovado ls put in casks, weighing from 1200 to 1500 pounds gross; tare, 10 per cent. Clnyed sugar is usually sold in lots, assorted half whites ant half yellow or lorowns, per sample, by lleensed brokers; it is axamined before recelved, nnd that which is not equal to sample rejected. When sugar remains long in store it becomes moist and loses its grain.

The export of sugar from Havana, according to Ilumboldt, amounted, in the four years, 1760-'63, every year only to nhout 13,000 boxes. Nlue yenrs, 1770-'78, every yenr only to ahout 50,000 boxes.

The great inerense in the production of sugar in this island commeneed about the yenr 1820 , when stenm was subatituted upon plantations for ox or mule power. Nearly two-thirils of the quantity exported is from llavana, and the largest portion on Amerienn bottoms. The official returns of exports can not he considered ns correct; for many a vessel has been clenrel as laden with a full cargo of molasses when she carrled a full eargo of sugnrs, and thereby not only tefranded the roynl revenue of the export daty upon the sugar, hat had her tonnago duty not levied or returned to leer, and In former years many vessels having a full load of sugars cleared hin ballast; but even aupposing that they gavo the true quantity exported, they certainly give no liten of the extent of the crop. The consumption on the island it is impossible to cstimate; the quantity is almost incredible. No country in the
world consumes so lituch sugar as the people of this island in proportion to the population. Rich and poor, every table-almost wlthout exeeption, exclusive of the negroes upon plantations-is furnished; more or less, with the prescrved fruits of the country; and the quantity of preserved fruits sent to all parts of the world is very great. And then is to be considered the sugar that is consumed in a country where every white inhabltant, and a larga portion of the colored populstion also, take coffee three or four times a day, The prospects of the present crop, from all parts of the island, were nevar more flattering. It is probable that there will be a larga increase over tha last year's crop. Contrscts hava already been entered into, paying as high as $\$ 22$ per box. The boxes and casks are paid for separately, as will be exhibited in the proforma Invoices given in continnation. The brokerage upon sugar ls 1 per eent., of which the purchasar pays a half per cent. and the seller the other half per cent.-Consular Returns, United States, 1854-'55.

Coffee. -The production of thia article has rapidly diminished during the last 14 or 15 years on the north part of Cuba, owing to tho low prices, acarcity of laborcrs, and consequent high rates of wages, and the larger profits in the cultivation of the augar-cane. The berry begins to ripen about August, when the picking is comnenced, and continued until December or January next. It begins to flower in February, Mareh, April, or MIay ; the third flower gives the best coffee; the article is brought to market throughont the year; but in Deember, January, and February, and even as late as Mareb, it comes in greatest quantities. The pscking In sacks of from 0 to 8 arrobas of 25 pounds is effected on the plantations; the tare of a sack is 2 pounds. Coffec is sold by regular licensed brokers by sample, and before belog received Is examined, and if not equal to the samplo is rejected. It is usually classel into five grades : Superior, First, Second, Third, nnd Tréache. There is a class called Caracolillo, a ronnd bean, the produce of the first bearing year, when the pods have only ono kernel; after the flrst year the pods havo two kernels. Coffee, when a long time in store, loses its aromn, and fades in color; when good, the berries are amooth, cqual, and unbroken, free from stones or unplessant smell, and of a fresh green color. The cultivation of coffeo was introdnced in the island of Cuba In 1797-98 by the French emlgranta from IInyti. In 1804 the exports were 50,000 arrobas; In 1809, 320,000 arrobns.

It will be olserved how sadly the production of coffee has decreased wlthin the last few years. The time is now fast approaching when none will lee raised on this side of Cuba, and then the inhabltants will have to depend upon the coffee ralsed in the district of St. Jago de Cutia, whlch is still quite largo in quantity; and wero it not for the immense quantity of beans, corn, and other grain that are roasted and mixed with the renl coffee, the quantity of the lntter would seareely auffice for the consumption of a country where it is used in such great quantitles. It is belleved by many that the time will arrive when the island of Cuba will have to lmport coflee for the consumption of her inhab-itants.-Consular Returns, E'nited States.

Custom-house.-1husiness transucted at tho customhouse in IIavanais all done in writing, and pretty much all upon stamped paper, mostly nt 50 cents a sheot, excepthg that for out ward reglster, called papel de ilustres, costing 88 the sheet. Vessels that go to ontporis to lond have to pay anchorage and other small fees, averagiug somo 15 or $\$ 16$ ench. At Cienfucgos every. vessel pays the health commiesioner \$2, and as much more If orlered to quarantine. At Matanzas, hesides the charges recovered as here, the government exacts \& $\%$, and the royal exchequer $\$ 4$. At Sagua an extra fre is exactod of $\$ 4$ if she enters in hullast and lenves with cargo, and $\$ 8$ If sho brings cargo and carries away cargo.

Meats.-The existence of a differential duty on ineats inported in Spanish bottoms, draws the supply of this article in the markets of Cuba from Buenos Ayres to the extent of $30,000,000$ pounda annually; while from the United States it comes to a very limited extent, notwithstanding the quality of the article imported from the United States is far superiur to that from South America.

The following table exhibits the quantity of jerked beef imported into Cuba during the years, $1800,18.51$, 1852 , and 1853 , and the countries wheneo exported. The arroba equals about 251 lbs .

The duty in Cuba on tlour imported from Spain is $\$ 250$; on that Imported from the United Stales, in American or other foreign bottoms, is $\$ 1081$; the effect of which is to drive the American article entirely from the Cuban market, except at such times as when scarcity may have carried it up to famine point. The tonnage duty that exists on Spanish bottoms is $62 \frac{1}{2}$ cents per ton, and on foreign shippling $\$ 150$ per ton, contributlng, in combination with other differential duties and restrictions, to the Spanish tlag, advantages in the carrying trade of the products of that lslgad to the northern European ports.
The imperts of tlour lite Cuba from the United States, fruin 1853 to 1856 Inclusive, are ghowa in the following table:

| Year ending Jane 30. | Barrile. | Value. |
| :---: | :---: | :---: |
| 1683 | 1,6:17 | * 2.814 |

| 1455 | 8,424 | 88,176 |
| 1850 | 8,806 | 80,066 |

Board of Trude.-The annual report of the licard of Trade of the island, to tho superintendent of the royal treasury, of the general navigation und comuercial movements of the island, in the year 1850 , sets forth these facts In a manner worthy attention. It shows that In 1850 there had been an Increuse over the last year of $92,038,226$ In the value of goods imported In national vessels, but that the lmportation in forelgn vessels had only Inereased $\$ 574,540$; a result to be asscribed to the protectivo and differential syrstem which

- Balan
favors Spanish over forelgn shipping, and on which the present tariff is based. In regard to exportation, exactly the contrary atate of facta will appear. In 1850 the exports In foreign vessels increased $\$ 2,748,287$, while the lncrease $\ln$ natlonai bottoms was only $\$ 477,104$. These different results are tracesble to two causea, namely: as to imports, to the diacriminations, both in respect of tonnage and tariff duties, in favor of the national flag; and as to exports, to the advantages which foreign vessels, exporting the products of the island, enjoy as national vessela in the countries to which they respectively belong-advantages which, in general, more than countervail the discriminating oxport duty in Cuba in favor of the national flag.
In the year 1849 the value of importation was \$26,320,460, an increase over the previous year of 8885,892-an amount much lesa, however, than had been expected from the ateady progress of the island; and in the aame time the importation diminished, as it appears, in many articlea of provision. Forelgn flour, preserved meats, cod-fleh, bscon, jerked beef, lard, butter, and foreign wine (ulthough the national wine increased to an anount, in value, $\$ 200,000$ ), fell in the scale of quantity, and the article of rice increased more than 8,000 arrobas over the inportation of the last year, in consequence of the cargoes of that article from Manilla; 暗 that had it not been for this, and the increased amount of some other provisions imported, articles of manufacture and coin, the yearly account would have exhlited a still more considerable diminution. Thia state of things was considered by the Board* to be the result of some evident causes, such as the extreme drought, which afficted the crops of the season, and the prevalence of cholera in the ports of Europe and the United States, rendering sanitary measures necessary, which Interfered with the nutural flow of commerce. But, be these causes what they may, a result of the year was an amount of carrying trade under the Spanish flag to the island, of mere than $\$ 1,000,000$ in the value of effects imported; and if the prodace of the Peninsula, brought in antionul vessels, be taken into account, the increase of thls branch of basiness reached, in twelve monthe, near $\$ 700,000$, which was considered to be the result of the differential dutics exlating.
Value of the importation of Rice into Cuba, in the rears 1848 and 1849.

From earlier tables, it r ppears that in the year $18: 2$ the value of Spanish produce, nrriving at Cuba in Spanish ships, amounted to only $\$ 409,352$; in the year 1830 it reached $\$ 3,000,000$; it exceeded $\$ 5,000,000$ in 1840, and at the close of 1848 had risen to more than $87,000,000$. Foreign produce brought in national vessils in 1825 anounted to $\$ 2,449,440$, excceded $85,000,000$ in 1810 , and reached near $\$ 8,000,000$ in 1818, when the Spanish tlag, in both commercial movements, came to flont a value of $\$ 14,936,811$. The duties arising on importations in the year 18.19, wero \$5, 844,783 ; on exportations, $858.1,477$; making a totul of $86,429,200$, diminishing, when compared with the preceding year, in the one inatunce 8436,621 , and in the other, $\mathbf{8 1 2 4 , 8 3 6 ; ~ m a k i n g ~ a ~ t o t a l ~ o f ~} \$ \mathbf{j} 61,457$. Foreigu flours fell off 16,654 barrels, ulthough the Spanish increased 1,121 burrels; and a general increase of innportations of nutionai produce had ensued, anil a lessening of foreign, which tended greatly to decrease the amount of duties. The commerelal actlon of 1818 and 1849, and of succeeding years, is illustrated by the following tables, made up from the official exhibits compllcd, aunually, for the government:

- Balaeza General del Comerclo de la Isla de Cuba, 1849.

The imports under the Spanish flag exceeded those of 1850 by $\$ 1,444,104-a$ result that was considered chlefly atiributable to the syatem of duties in force; under foreign flags, the importations, which for several years had rarely exceeded cieven millions of dolfars, fnereased in 1851 to the smount of $\$ 1,884,098$ over the previous year. The merchandise brought from Spanish ports amounted to more than eight and a half millions of doilare, being $\$ 352,181$ more than the totai imports from the United States; $\$ 1,225,300$ more than those from Great Britain ; $\$ 5,740,461$ more than thess from the former Spanish possessions, and nearly 25 per cent. on the total amount of importe from ali wuntries.
The exports of 1861 exceeded those of 1850 by © $5,709,785$, which was an increase over 1849 of more than three millions of doilara. The following will ghew the relative proportion of the exporis in Spanish and foreign bettoms in 1851 :

|  |  |  |
| :---: | :---: | :---: |
| In natlonsl vessels. | Prporta,izo | $\begin{gathered} \text { Exporta } \\ \text { en, } 204,658 \end{gathered}$ |
| In forelgn vestels | 12,412,254 | 25,187,029 |
| Total in 1851. | \$32,811,480 | \$81,841,692 |

Of the exports this was an increase over 1850 of $\$ 184,013$ in nutional ships, and $\$ 5,525,721$ in fureign ships; which was nearly equal to the value of the increased production and exports of the isiand over the preceding year. The quantity of sugar exported from the island in 1801 was 281,381 boxes over 1850 , which exceeded the previous year nearly 150,000 bexes. The incrense of the important staples of molasses, coffee, and tobacco (raw and manufactured), though a. : su great, was highly important. Thess facts are signilleant of the force of forsign reciprocal duties, and forcibly demonstrate that any discriminating export or tonnnge duty on forcign vessels, sufficiently effective to give this ontward moveanent to the Spanish flag, must fataliy injure the productiveness, nationni commerce, and industry of the isiand.
The anount of shipping which entered the perts of Cuba during 1850 and 1851, was as follows :

|  | 1850 . | 1851. |
| :---: | :---: | :---: |
| Under the national flag. | 24,112 | 270,176 |
| Under forelgn flaga. . | 99,864 | 727,814 |
| Total. | 128,976 | 007,090 |

A comparison of the returns for the year 18.15 with those for the year under review gives to the Spanish flag in increase, during that period, of nearly one hundred per cent.
The raiue of the importations diminisied in the yesr $1852 \% 2,531,188$, and the exportntions $\$ 3,887,746$, below those of the provious year. The faliing off in imports was on the articies rice, 91,382 arrobas; pork, 187,413 pounds; hams, 878,532 pounds; lurd, 3,891 srrebas; butter, 133,775 poundis ; jerked heef, 118,317 arrabas; and in exports, on cotton, 1,036 pounds ; sugar, 130,982 boxes ; molasses, 55,834 hagsheads ; copper, 51,412 quintais ; segars, $127,746,000$. The great falling off in the item of sugar could not have frited to act in a corresponding inanner on the amount of tonage, and measurubly, on the valuo of imports.

The importation in 1858 reached an aggregate value of $827,789,800$-an amount exceeded, the preceding year, by $\$ 1,000,441$. The artiules which auffered the greatest diminution were codfish, flour, beef, iard, cheese, jorked beef, bacon, Sjunish and forelgn wines. While thus the value of imports diminished, that of exports considerably increased. The total increase over 1852 amounted to $\$ 3,756,468$.

The United States exported to Cuba In 1856 goods to the, value of $\$ 7,809,263$, being a decrease on the exportations of the preceding year of $\$ 195,819 ;$ and imported to the value of $824,435,603$, ohowing an increase of $\$ 5,810,2 \mathrm{~J}$. The tatal trade between Cuba and the United States is usually about the third part, or 331 per cent., of the total imports and exports of the island. The total number of vessels entering the porta of Cubn in 1853 was 3,918 ; totai number cleared, 3,827. The foliowing table exhibita the nationality of these vessels :

| Natlonality, | Ealered. | Cleared. |

In 1854 the total trade of Cnbn ascended to $864,-$ 078,309, viz. : imports to $\$ 31,394,578$, and exports to $\$ 32,688,731$. This movement exhibited the following result, when compared with the trade of the preceding year:

|  | Imports. |  |
| :---: | :---: | :---: |
|  | 881,394,578 | \%82,688,781 |
|  | 27,789,800 | 91,210,405 |

An enalysis of the retums from which the preceding figures are derived exhlbits the following details: Of imports, the increase is perceived especlaliy on the articles codfish, flour (national and foreign), pork, beef, hams, lard, cheese, jerked beef, bacon, and foregn wins; while there was a slight decranse on the articles rice, butter, and Spanish wine. Of experts, the inerease fell, chiefly, on rum, sugar, coffee, wax, woorls, honey, copper ore, leaf tobneco, and segars; while the articles raw cotton and molasses show a slight faliing off. Under the national flag, the increase of importations over those of 1853 , was, in value, $82,254,524$; in foreign bettoms there was a similar increase of $\$ 1,350,453$. Tha incrense in exports, under the Spanlsh flag, wns $\$ 1,232,759$; under foreign flage, $\mathbf{*} 20,566$. The exports from Cuhn to the United States, during this year, mmounted in value to $\$ 11,641,813$, or mors than one third of the exports of the isiand to ali countries; the imports into Culu from the Uuited States, during the same period, reached, in value, $\$ 7,867,680$, or over one fourth of the total imports from ali countries. Of the imports into Cubn from the United States, only 819,755 , in vaiue, was carried in Spanish vessels; while the vaiue of such imports, under foreign flags, reached ns high as $\$ 7,817,925$. The exports from Cubn to the United States were exclusively borne in foreign bottomstwo arrivals, one from llavann, carrying a value of 219; the othar from Gibarn, with frelgint amounting to $\$ 540$ : in nii, $\$ 759$-being too insignificant to constitute a noticenble exception.

The following "statements" of revenue colieeted by the muritime and terrestrial custom-houses of that island in the year 1855, compared with the jreceding year, pubished in the gevernment Gnzette, by order
nf the auperintendent-general of the royal exchequar indicate increased netivity of trade; the oxcess of revenue collected in December, 1855, over the eame
onth in 1854 , being nearly 264,000 , and the excess for the whole of 1855 over the whole of 1854 amounting to $\mathbf{8} 350,428489$.

It may be proper to remark in this place, that the Balanzas Generales, from which the preceding and anbsequent tables ara derived, are not to be considered as giving the precise quantitles and values of the commercial exchanges of the isiand of Cube with foreign nations. They, doubtless, present the minjmum amounts of each, as it would seem to be the policy of the custom-house offcials, by whom these annual reports are prepared, to undervalue the foreign trade of the island. As far back as the year 1825, the unrellability of these Balanzas, as authority in statistical compilations, requiring precise accuracy, was noticed by Raron Humboldt, in that portion of his "Personal Narrative" which relates to the island of Cuba. Alluding to them, he ob-arves: "t have examined, in another work, fifteen years since, the basis upon which are founded the tables published under the fallacious title of ' Dnlanzas de Comerico.'" Since that period, it would seem that but litilie improvement has been made in the preparation of these
