reciprocity for what is practiced with the Spanish vossels procecelling from the same places In the United States, and with reference to the sane dutien." Tha official notification added, that correapouding opders had been given, "under data of the lith Inst., to the general direetion of cuatom-houses and tarifis," to curry linto effect the dispositions of this order.

The effect of the above-rected royal orter will he to place American shlpphing on an equality, as reapecta the duties of port and nuvligation, with national and privileged vessels, and thus ruciprocate the terms on whlch Spanish veasela hava lieen admitted into the port, of the United States since 1852. Should thia to followed up by a liberal modifleation, or an entire aloulttion, of tha enermons diacriminating duties levied on foreign lmports in tho ports of Spaln, the commerdal Intercourse between the two countries would soon become a source of ludustrial dovelopment and natlonal presperity, equally beneficial sull prelleabie to ench. The quarunthe regulations of Spain have alwaya been complicated and vexatioua, They were aimpllifed, however, hy a sanltary tarlif, promulgated December, 1855, a tranalation of which is subjoined,

TABIFF of g.anitaity neties exicter in tue

Ainfrance Iutifs.-Coasting vesxels of more than twenty tons burilen will pay one quarter of a real per ton for the round voyago.

Vessels jruceeding from the ports of the Mediterranean and othor ports of Eiurope, juefuding the coast of Africa to the parallel ef the Canary Ialands, will piay one half of a real per ton for the round veyage.

Vessels from other jlaces will pay one real jer ton each voyage.

Quaramine Dutien,-Vensels of every dlass will pay one quarter of a real jer ton each day they are sulject to quarantine, whether in actual lazarettos or mudergo ing observation.

Iazaretto /buties.-The fee for each person in the lazo aretto will be four reals per diem.

Merchandiso aulyect to puriflcation will pay as follows:
The elothing and baggage of each of the erew ..... \& reale The etothing and bagitge of each passenger. 10 tlites of cows jer $100 . .$. ............................. 6 Fine aklos. 6 ". Fhe sk108..................................................... smatl anlmalk, per Jut, ........................... l'enthera, goana'-hair, soft halr, wool, cetton, hemp, aul Max, per quintal

The marline aervice of Spuin $\ln 1855$ consisted of four vesvela of the llue, nine frigntes, elght corvettes, tifteen Lrigs of the Ilrst, and four of the necond elass; fiva schooners, alx sloope, forty steamers, nnd three hunilrell and nhineteen smaller craft, mounting in all 1250 ordinary, and 280 swivel guns.
The Imports lato and exports from Spala for the year 1856 are shown as folluws:

From thls exhllit we sea that in the aggregate thero was a deelided decrease in the trade of Spmin in the year 1856 over thut of 1850.
Statement ahowing the Amerlean merchant vessels which arrived at Cadiz In live years, 18.19 to 1853 ln clusivo:

| Years. | Veseelt. | Men. | Tona. |
| :---: | :---: | :---: | :---: |
| 1849 |  | 801 | 24.1310 |
| 18ix). | 47 | 10, 7 | 17.493 |

Ancrlenn and oither forelgn vessels can only trate between Spuin and other countries; they can not pirrticlpate in any Spaansh coasting, domestic, or Internal traile.
Tho navigation and trude bet ween the Unitel States and Spala does not Increase. The tariff of Spain excludes most of the staple artieles of the United States, such as grain, brendstuffis, rice, tolaceo, ete., the prinelpinl article of import from the United States being undressed ouk staves for wine-canks. In oriler to promote navigntion and trude hetween the two countries, it is necessary that high dutles, prohithlions, and restrictive mensures on hoth sldes should cease.

Of the changes in the commercial policy of Spain the following particutare, furnished by the United States consul at Cadiz, wlll be found intoresting :

## "Ocromen $8,1865$.

"The Queen's decree of the 30th, and order therron of the Ist of July of the present yenr, was issued, catabliaing a Junta constiltina de aranceles, or a board of cooaultation io celation to cuetom-houae tariffs, regulationa, and ail mattera relating to importn and exports, with extensive powers, and determinitug their attributions. Thu object of thia beard is seciared to be to discuss and propose to the m?alster of the hacionda all roforms which they way conceive ought to bo mado in the custom-houns tariffs, and to occupy themselves with and direct oll the procecdiugs which may be found with respect to the undorstand'ng of the oame, their application nd modification; as aino with reapect to the rechamatione of foreign powers, and those which ought to be made on the part of Spain, with reapect to tho agreemonta and treatice of havigation or commerce, and any other affalr whatever relaive to the mercantile legislation. This Junta de aranceles is to be a corporation inucpendent in all pointa of any ther office of the state; and as auch is clothed with the same facultics, privileges, and pre-eminences which beiong to the other directive centres of the ministry of the hacienda, of a permensnt character. Tho junta is cmpowered, in the performance of Ite dutles, to comunnteate directiy with, and clalm from, Spanieh coasuia tu foreiga countriea, governors, and provernors of provincea, adminiatrators of custom-houses, juntas of commerce, economical societies, etc., and any other anthoritice, offices, and corporations whitover, alt datu they may conceive necessary frr the exccution of the husiness committed to them. Copies of this decreo and order are herewith, detaliing at iength the persone composing the junta, add the mode in which they are to prococd. This beard now organized, and fo expected to make a report pending the aext sesslon of the "Ortes It is presumed that tacy wifi reconmend the favorirg of navigation onder the Spaniah lieg; the admission of tertain kinds of cotton ananufacturce, and other articlea now prohibited; together with on angmentalton of two militions of doltars in the custom-house rovcoue on Iraports ; alse the maintenance of the present monopolics of tobacco, salt, stamped paper, and the dutles payabto therean."
Moneys, Weights, and Measures.-The welghts and measures are tho established ones of Castile; the arroba of solids being considered of 25 pounds. of 16 ounces to the pound; and of liquids, 32 cuartidas, except in the article of elive-oil, which will be deemed a solid. The quintal will be of 100 pounds, and the ton of 20 quintals. The yard will bo of 36 inches. The moncy is the real de cellon, which is divided into 100 parts, called entimes.

Aoncys.-The real vellon is valued at tho customhause of the Unlted States at 5 conts; 20 real vellons $=\$ 1$; tho real of plate is double tha real vellon $=10$
cents; 1 hard dollar $=12 \frac{1}{4}$ dollar of exchange $=10$ reals of new plate $=108$ of old plate $=20$ reals velion $=170$ quarters $=361 \nmid$ maravedis of old plate $=680$ reals veldou $=\$ 103$.

Goll Coirage.-The last date that we have noticed of the long-continued doubloon seriea of Peninsular colnagn was 1824. The half doubloon of that year weighed 0.433 ounce, 865 fine; value, $\$ 775$. The new gold coin is a piece of 100 reals, weighing 0.268 ounce, 896 fine, 84963.

Silver Coinage.-The principal coin (not the largest) seems to be the pleeo of 4 reals, or pistareen, which before 1837 was of the weight $0 \cdot 189$ ounce; fineness, 810 ; value, 20.7 cents. The standards havo been lately changed, and the new platareen weighs $0 \cdot 166$ ounce, fineness, 899 ; value, 20.3 cents. There is also a large piece of 20 reals (dollar), worth $101 \cdot 5$ cents; and pieces of $10,4,2$, and 1 real in proportion.-United Stutes Mint Report, 1857.

1Veights.-Gold and Silver Weight.-Gold and silver are weighed by the Castilian mark of 50 cestellanos, 403 tomines, or 4800 grains.

Apothecaries' Weight.-The apothecsries' weight is the Castilian, but the ounce is divided into 8 drachmss, 2.4 escrupulos, 48 obolos, 144 caracteres, or 576 grains.

Commercial Weight.-One commercial pound is equal to 2 marks (Castilian), or 16 ounces. One commercial ounce $=8$ drachmas $=16$ adarmes $=576$ grains. One quintal of 4 arrobas, or 100 pounds,$=101 \cdot 44$ pounds nvoirdupois, or 46 kilograms. One atroba $=25$ pounds 7 ounces.

Measures,-Dry Afeasure.-Corn, salt, and other dry articles are mcasured by the cahiz. One cahiz $=12$ fanegas; one fanega $=12$ celemines. The celemine has various subdivisions, as $\frac{1}{2}, \frac{1}{3}$, $\frac{1}{2}$, ete. Tho fanega measures 43223 Spanish, or 3439 English cubic inches, and is equivaleut to $1 \cdot 55$ English imperial bushels. Five fancgas are nearly equal to ono quarter Engllsh.

Wine Measure.-One arroba of wine measures 4245 English imporiul gallons. One arroba of oil, $3 \frac{1}{5} \mathrm{En}$ glish gallons. One botta $=30$ arrobss of wine, or 38 of oil. Tho botta contains 1271 English gallons, and the pipe 114 English gallons.

Long Measurc.-Ono Spanish foot $=12$ pulgadas, or 144 lincs, and is equivalent to $11 \cdot 128$ Englisl inches, or 0.2826 of a French metre. One palmo, of 9 pulgadas, or 12 dedos, $=8 \frac{1}{3}$ English inches. One vara, or 4 palmos, $=33.384$ English inches, or 0.847 of a metre. One braza $=2$ varas, or 6 fect. One passo $=5$ feet. One estadal $=4$ varas, or 12 feet. One cuerda $=81$ varas, or $25 \frac{1}{2}$ fect.
doberon Commerol of the Lnited Statee witif Sparibit Amemican Coloniege (incledino Mezico), faom Octonea 1, 1820, to Seitemuea 30, 1824

* Nine months te Juno 30, and the liscal year from this time beglue July 1 .

Specie (Fr. espice), coin and bullion used as a ctrculating medium in distinction from paper money.-See articles Lhanks, Conss, Puechors Metala, Gold, and Sinven.
Spectacles. An optical instrument, consisting of two lenses set in a frame, for assisting or correcting the defects of imperfect vision. The lenses are convex or concave, according to the nature of the defect to be remedied. In old age the pupil of the eye becomes flat, and the rays of light are consecpuently not refracted sufficiently in passing through it to meet on the retina and produce distinct vision. This defect is remedied by a convex lens, which proluces a slight convergency of the rays befure they enter the ege. Shortsighted people, on the contrary, require concave leuses ; because, in their cave, the Indistinctness of vixion proreeds from too great a curvature of the pupil, which causes the rays to meet in a point before they reach the retina-a defect which is remedied lyy giving the rays a silght divergency before they enter the eyc. Spectacles were unknown to the antients. They are generally supposed to have been invented in the 13th century, by Alexandir de Spha, a menk of Fiorence, in Italy, alout A.11, 1:85.,-fien. Hidt. They were invented by loger llacon, accorting to Jr. l'lott, atoont 12x0. Some affirm that tho real inventor was Salvino; and Mr. Manal gives proofs in favor of Salvine In his Treatise on Spectucles.-llarins.
Spelter, a name frequently given to Zive; whirh sec.
Epermaceti (Ger. Wallrath; Fr. Bltme de Du'eine, Sperme de Baleine; It. Spermaceti; Sp. Riperma de DilIma; liuss. Spermazet), a product ohtnined from the lirath of the physter macrocephetus, a species of whate Inhablting the Southern Ocean. The brain belug dug out from the cavily of tho hend, the ofl $\mathrm{i}_{\mathrm{s}}$ separated from
it by dripping. The residue is crude spernaceti, of which an ordinary-sized whale will yield twelve barrels. It then concretes into a white, crystallized, britte, semitransparent, unctuous substance, nenrly inolorous and insipis. On being cut into stmall pieces it assumes a tlaky aspect. It is very heavy, ita specific gravily beins; 9 433. It is used hin tho manatucture of candics, in medicine, etc.
Spices (Ger. Spezereyen; 1)u. Sprceryen; Ir. Lp iceriss, Epices; It. Npezj, Spezieric ; Sp. Ezpecius, beppo cerias; Port. Especiaria; Russ. I'rianüe hor nja). V'nder this denomination are included all thesa vegelable preductions which are fragrant to the smell and pungent to the palate; such as cloves, ginger, nutnerbs, allypice, etc.

The ordinary apices which are used in housekeepint, and are sold by the grocer are pepper (wlite, thach. and caymue), mustard, ginger, nutmegs, natre, pimint or allspice, clores, cinnamon, and carsia. All of theer spices are inore or less pungent to the taste and stintulatimg to the stonsuch, and are used as maditions b. foom, not as food itself. For these gualities they do penil upon an esaential oit in most cases, varyint in "zeh particular case. l'epper, howesor, has a nitrsenized principle, simitar in composition to thein and calfin, und ealled piperin.

Pepper is the proluce of two alled plants (known as Piper niyrum and lomyum), and the part used is the berry, dried in the sun. Nack and white pelper are boolh obtained from the herry of liprer niyrum; the former behg the entire berry, gromul, white the lithe consists of the leerry deprived of its utter covering, er husk, lefore it is reduced to powder. hong 1 "Hper is not greond, and is not much used in the present day. Pepper-corns, being these herrics, are imported from Penang, Malabar, and Sumatra. The best are those nodore:1s and It assumes a ic gravity be of eaudles, in
which are not too amall, nor too much shrunk in drying, but which feel heavy in the hand, and siak in water. In looking at a section, the outer part, which is black, or reddish black, is easily diztinguished from tha inner or central, which is more or less white, and brittle, hard toward the exterior, and sift anis powdery toward the centre. In separating these parts, as for the purpose of procuring the white pepier, an innar reddish covering remains attached to the internal white structure, and this being ground up with it, is faintly indicsted in the puro white pepper-pov-der by small reddish specks. The active propertips of this spice dupead upon an acrud resin, an essential oil, and a substance before alluded to, called piperin. The outer cortical part contains the rein. in it iner coat lies the oil, and withia the internci or ace structure is tie piperin.

Popper, both black and white, 18 adnlteratod with a varicty of articlas-as, the flour of linsced, mustard, wheat, sago, and arrow-root. Pepper-dust, alsu, being the sweepings of the floors of warehouses, and known as P.D., is largely used in making up low-priced pepper. Powiered cayenne is likewise said to be used, but, sccording to Dr. Hassall, not to any extent. Chemistry and our natural senses are greatly at fault in detecting these adulterations; and the microscope is the chief means upon which reliance can be placod, and, as is proved, a very sufficient one.

Cayenne pepper is composod of the pods of several species of copsicum, which is an annual herbaceous plant, a native of America, cultivated in the West and East Indies, and to some extent in the United States. Ench pad is made up of three parts, an outer skin, an maer parenchymatous substance, and a quantity of small seeds. All theso are ground op to constitute the pepper sold as cayenne, but it is to the first that it chiefly owes its pungent taste. It contains a very active principle which is called eapsicin, and of which a very minute quantity, even as little as half a grain, diffused tlroughout a room will set a whole party of peopla sneezing. This pepper is far mors subject to adulterntions than black and white pepper, and is in fact searcely ever free from mixture either with redlead, red-ochre, or common salt-four ouly out of nina-ty-eight samples examined by Dr. IIassall being perfectly genuine; thirteen presented red-lend, often in poisonous quantities, and in saven Venetinn-red, redochre, or lrick-dust, were found. Six of the samples coutaned sult in large quantities, with rice and coloring mater, and in the same mumber also appeared rice mixed with turmeric and eayenne, and colored with red-leal or some ferruginous earth. It is said that this pepper is often lmported in a ground state, and therefore a good deal of this sophistication is due to foreign roguery. The mineral ingredients are easily detected by chemical means, ns red-led, vermition, etc.; hat for the most of the other articles the nid of the mieroscope is again requirel. With a knowledge of the dificulty in detecting adnlterations, it behooves us all to deal for out peppers only with those who are of high characier and standing in the trade; but as our senses tell us pretty clenrly the strength of the spice, and ns all the ndulterations of black and white pepper are toler. tily immocent, no harm ncerues, except to the purse, from the substitution of a weak spice for n strong onc. In the case, however, of cavenne pepler, the presence of red-led, vermillon, or other minernl coloring matter is of serions importance, and should be cautiunsly avoided by a careful dealing with henest trudeamen,-Ste Cayenne and Peiperi.

Mustord is obtnincd from the plants known ns the black and white mustard plant (Sinapis nigra and alba). The former of these has smooth seed-vessels, and redHish or hlackish-brown seeds, which are very pungent; While the latter las rongh or hairy pods nnd yellow seeds, less pungent than those of the Hack mustaril. The seeds of the llack mustarl are compased of cel-
lulnse matter, containing in addition a voiatile and a fixed oil of mustard; also, two peculiar substances known as my ronic acid and myrocene, all of which are doficient in white mustard seed. The fixed oil exists in the seed, but the volatile oil is formed in the same manner as the essential oil of bitter slmonds; by the joint action of water, and a pecullar coagulable albuminoua matter, called mynocene, upon a substance very imperfectly known, which is termed nyronic acid. This acid has no smell, and is not volatile, but is Eitter to the taste, and contains sulphur and nitrogen. Heat cosgulates myrocene, which is necessary to the formatlon of the essential oil, and hence mustard should always be mixed with hat water to develop its pongent powers properly.

Adulterstion in this article seems to be the rule, and a pretty invariable one; for in no single case did Dr. Hassall find pure mustard seed sold in London. The nature of the admixture was in nearly all cases tho same, genuine mustard being mare or less mixed with wheston flour, and colored with turmeric. Even in the case of an article which was specially sent up from Newcastle-nn-Tyne as a perfectly pure specimen, a very small quantity of turmeric was discovered, which the manufacturer sfterward candidly admitted was added to the mustard for the purpose of heightening its color. This admissian must be highly gratifying to the Lancet Commissioners, as the quantity was only two aunces in fifty-six pounds, or one part in 448 . In parchasing mustard, there is no guide short of the microscope but the palate, as the full power is not developed until the flaur is mixed with hot water. The adulterations are, however, only of impertance as far as the money-value is concerned, as the turmeric is innocent enough of all other mischief. Most people can judge of the strength of this spice when it is used, and they may therefore readily take this as their guide in dealing with their grocer for future orders.

Ginger is cultivated in Asia, Africa, and the tropical parts of Americn, and is the root of the Zingiber officinale, a perennial plant, of which the stem reaches to the height of three or four feet. The roots are dug up at the end of the first year; they are well washed, and then they ara stripped of their outer skin, or left as they are, constituting in this way the two primary divislons of ginger into coated and uncoated; in addition to which, It is sometimes iniported from Jsmaica in a green state, preserved in jars with sirup. The two tirst divisions are sold either in the state in which they are Imported, or finely gromed, and sifted with great care. Ginger owes its pungency to a volatile oil, with an acrid resin, which are contained in it, and mixed up with other vegetable substances, as gum, starch, and woody fibre. Ground ginger contains all the elementary principles of the root. It is adulterated with wheat tlour, sago, potato flour, cayenne pepper, mustard lusks, and turmeric powder, none of which are prejudicial to health, and the fraud is only on the pocket.

Nutmegs and Mace are both obtalned trom the nut-meg-tree, of which there are three species-Myristica fragrans, M. fatua, and M. malabarica. Together they are the fruit of the tree, which is similar in apfenrance to a pear-tres, and produces a fruit nbout tho diza of $n$ peach but slaped like $n$ pear, and smooth externally. Tlia outer tieshy part of this is the perlcarp, and this when ripe sepnates into two longitudinal sections, within which lies the seed proper, or nutmeg, inclosed in two coats, vesides the muce, which tills up the spaco between theso and the pericarp. The tree known to botnnists as Mryristica fragrams, is cultivnted in the Molucea Islands, as well as in Java, Sumatra, Singapore, Penang, the island of llourbon, Bengnl, Madagascar, and the West Indies; and these trees produce the true nutmeg of comm- co, which is rount, and of a strong aromatic finvor and sn: sll. A second and Inferior kind, called the vild or false nutmeg, is olitained from the Mfyristica fatua and \& : mala-
barica, growing in a wild atate; and they may be distinguiahed from the true nutoseg by being longer and paler than it. Mace is also true or vild, according as it is obtained from either kind of nutmeg-tree. As imported into this country, the true mace is of a golden or orange yellow, transparent and horny. Faise or wild mace is of a dark red color, and deficient In flavor and smell. The nutmeg, as well as the mace, contains a fixed, and also a volatile oil, as well as starch and woody matter.
Adulteration.-It might readily be supposed, ns these spices are not powdered, but aro sold as imported, that no adulteration could poasibly be practlced; and it appears, in reality, that very little is attenipted. The oniy fraud is found to consist in the abstraction of the volatile oll by distillation, which deprives the nutmeg and mace of their chief favor and utiitty as apices. In order to preserve the nutmeg from insects, it is often soaked in lime water, or covered with powdered lime; but this does not seem to be a fraud, but rather a proservative. It therefore need not be guarded against, but the presence of the full complement of oil should, if possiblo, be insured. This can only be done in practice by attending to the flavor and smell, und compnring them with the recognized genuine article. The shape is a good guide to the true nutmeg, and purchasers shouid always select those of a round form, avoiding those which are like dates in appearance, or even at all elongated beyon : a vory slight departure from the true circle.
Pimento, or Allopire, also called Jamaica pepper, is the berry of a tree bearing the first name, and growing in the West Indies, from which it is imported in bags. There are two quaiitice of $i t$, but only one is extensively used in this country.

I'imento, like most other spices, owes its qualities as a coniiment to its cacentlal oil, which is centained in considerable quantitiea in the berries mixed with gummy and resinous matter, nastringent extract and fatty oii. This essential oii is readily obtained by distillation. The adulterntion of this spice is so trilling ns scarcely to require alinding to; and as the price of pimento at present it the London market is from $4 \frac{1}{d}$. to 41 d. per 16. , with a duty of $5 s$. per cowt., the retailers make a fair prefit in sellingt it at $8 l$. and need not have recourse to adulteration.-Sce framesto.

Cloves ; m the liower-'unds of the Caryophillus aromaticus, whic is grown in tho Molucea Islands, Sumatra, the 'launtius, Ilcurlon. Cayenne, Martinipur, and St. Vincent Thes' present, a peculiar oblong up;earnnee, tou well known to need minute descripition, with $n$ pungent and ammatic taste, which is highly agreeable to most people. Like the other apices, cloves contain an essential oil, besides risin, tarnin, and wooly fibre. The cil is extracted in considerabie quantities, and
sold aeparately for various purposes. Tho wholealo price is from $4 \frac{1}{2} \mathrm{~d}$. to 1 s .2 d . per 1 lb ; and the duty being 2d. per 1 lb ., together with tho retalier's profit, bring them up to the retaii price of 1 s . for liourbon and Cayenne, 1s. 4d. for superior Bourbon, and 2s, for Penang clovea.

Cinnamon and Cassia are the bark of two species of Cinnamonum; that producing the former bearing the speciflc name Zaylanicum. The cinnamon-tree is cultivated chiefly in Ceylon, but sparingly in Bombay, Malabar, and Java. The bark, as sohd, is peeled from the threeoyear old branches, and dried in the sun; and its quality varies conslderably, but its external characters are generally pretty nearly the same. Cassia, or the bark of the C'innamonum cassia, is brought from China, Nalabar, Bombny, and the Mauritins; lt resenibics the true cinnmmon in favor, though less detieate and not 80 aweet, and attended with a certain degree of bitterness. It is constantly substituted for cinnamon, and it is necessary, therefore, to endenvor to distinguish the one from the otier by our ordinary senses, if possible.

The bark of cinnamon is not much thicier thin drawing-paper, and breaks with an uneven margin, showing a coarse arrangement of its fibres. It also consists of several concentric layers of bark, one wiliin the other. These are called quills, and are of a paie brown, with a sweet aromatic tristo, unaccompanied by any bitterness or astringency.

Cassia bark is considerably thicker and coarser, and has a short fracture and smooth edge. It has generai. ly only one, or at most two quilis, within the external one; and the taste is a coarse linitation of cinnamon, with a strong tendency to leave an astringent bitter on the tongue. By these characters the bark of the ene, when whole, may be distinguisined from the other: but when powdered, the aill of the mieroscope is required to detect the imposition, which is extensively practiced; and, faiiing tinis, the character of the vendor is the only sufeguard. Cassia buds are also innorted.

Ti.e cinnamon of comnerce is chicfly produced in the island of Ceylon, from the Jaurus cinramomi of botanists, the Kooroondoo-gaha of the Singhalese, a plant which appears to have flourished in that island from the earliest period. We learn from Se-iptural history that this spice was employed by the Jlehrews in their reilgious ceremonies; and there can lie littfe dombe that their supplies were deri ved from the Arahian merchants who traded between the Ied Sca and the linst.

Mixed spice, as jmplied by the name, is a compond of the varions ordinary spices, as ginger, pimento, eassin, etc. It is largeiy adiulterated, and can not, therefore, be recommended, nor is its use at nll rejuired, inasmuch as tho cook may in all casea use her own judg. ment to greater advantage.

Spithead, a celebroted roadstaad, off tho soath coast of Euglaud, county of Hants, between Portsea island and the Islo of Wight. It communicates westward with the Solent and Southampton Water. It is so sccuro from all wiads oxcept the sontheast, as to have ieen termed by sailora "the king's bedchamber," and it is a principal rendezvous of the British navy. I'ortsmouth and liyde are on its opposite sides.

Splicing, among seamen, to join the two ends of a repe together, or to nuite the end of a rope to any part thercof, by interweaving tho strands in a regular manner. There are sevaral methods of splicing, according to the services for which it is intended; all of which are distinguished by particular epithets. The term is also used in architecture.
Splinters, the pieces of a slip's side, masta, decks, etc., which, being knocked off by a shot, acquire great velocity, and frequently do more damaga among tho mon than the shot itself.
Splinter-netting, sennit made Into webs, and nalled upon the inner parts of a ship's aides, to lessen the effect of the splinters.
Sponge (Ger. Schwamm ; Fr. Eponga; It. Spugna Sp. Exponja), a soft, light, very porous, and compressible substance, readily imbibing water, and as readily giving it out again. It is found adhering to rocks, particularly in the Medlterranean Sea, about the islands of tho Archipelago. It was formerly supposed to be a vegetable production, but is now classed among the zoophytes; and analyzed, it yields the samo principles as animal substances $\ln$ general. The inlabitants in several of the Greek Islands have heen trainod from their infancy to dive for sponges. They adhere firmly to the bottom, and are not detached wlthout a good deal of trouble. The extraordinary clearness of the water facilitates tho operations of the divers. Smyrma is the great market for sponga. The price varies from 6 to 16 plastres per oke for ordinary and dirty, and from 80 to 100 piastres per oke for the and picked specimens. Sponge is also fished for in the Red Sea.Une's Dictionary; Savain's Letters on Greece. About 20 miles southeast from Napoli di Romania (Nauplis), in the gulf of that name, is the small town of Cranidi, the inhabitants of whlch are the primcipal sponge-fishers of the Archipelago and Levant. Tho fishery is carried on partly by spearing, and partly by diving; the latter securing the sponge frea from injury, whilch is not tho case with the former. The Cranldiots are most expert dlvera, and anecdotes approaching to the marveloua are tolu of their feats. After the sponge is fiahed up, when perfectly freo from sand, and dry, it is so very light that large pieces of it ars moved with the slightest breath of air. It is customary, however, to Impregnate it with sand. This is done by atringing the apongea together, and laying thein on the sand to allow the ripple of the soa to sluah them with the finest particles. They are then placed in heaps under piles of stones 'which press them closely together, so that thay become when dry hard and flut, and have to be beateu and sifted. But though thia be done, and though they aro aometimes further washed and siftell, they wiil, though apparently quite clean, weigh three or four times thelr orlginal weight! It is, perhaps, need-
lesa to add that thay are alwaya sold by weight. The sponges found on the Florlda coast are vory good, and if the fishery was moro extensively prosecutad would furnith us with our consumption.
Equill (Ger. Meerzwiebel; Fr. Scille, Oignon marin; It. Scilla, Cipolla marina; Sp. Cebolla albarranna), or, as it is sometlimes denominsted, the Sea onion, is a plant with a large bulbous root, which is the only part that is used. It grows spontaneously on sandy shores in Spain and the Levant; whence wo aro annually supplied with the roots. They shoald bo chosen large, plump, fresh, and full of a clammy julce: some are of a reddish color, and otliere white; but no difference is observod in the qualities of the two sorts. The root is very nauseoua, intensely . ster, and acrimonious ; much handied, it ulcerates the skin. The bulbe are brought to market preserved fresh $\ln$ and. The acrimeny of the roots, on whicin their virtue depends, is partially destroyed by drying and long keeping, and ia completely destroyed by exposure to heat above $212^{\circ}$. Squill is one of tho most powerful and useful remerles in the materia medlca.-Luwis'a Materia Med.; Tuomson's Dispensatory.

Stade, a small city of Hanover, on the Schwinge, 22 niles west by north of Hainburg, lat. $53^{\circ} 36^{\prime} 32^{\prime \prime}$ N., long. $9^{\circ} 28^{\prime} 34^{\prime \prime}$ E. It has very little trade ; and would be quite unworthy of notice in a work of this sort, except for the circumstance that a toll or duty, charged by the ttanoverian government on goods conveyed up the Elie to Hamburg, whether for consumption or transit, used to be charged at the castlo of Brunshausen, contiguous to this town. All vessels bound for Hamburg had to heava to (and those of some countries to anchor) fas passing the guard-ship opposite to the castle, and send their papers, inclading manifests, bills of lading, cockets, etc., on shore, that the duty, which was in gencral about $\frac{1}{2}$ per cent. ad valorem, might be computed from them. Thls being done, the ship was allowed to proceed, and the duty was paid at Hamburg.-See Elne. It is remarkable that an obstruction of this sort should have been tolerated for so long a period. Tho datiea fell heavily on certain descriptions of goods, particularly on some manufactured articles; and were, at an average, decidedly lilgher than the duties charged in Hamburg. They are most oljectionable, however, from their requiring many troublesome regulations to be complicd with ; tho unintentional deviation from any one of which exposes the cargo to configcation, anil never fails to occasion a great deal of delay, troublo, and expense. As the principsl part of the foretgn trade of the Elbe is in our hands, we are, of course, principally affected by the Stade toll; and considering the source of the nuisance, it is not a little astonishing it should not have been abated long ago. The aum which the Ifanoverian government derived from the duties is but tritling compared wlth the injury they inflicted on trade; it would, consequently, be good policy for tho former to sell, and for tho government to buy, an exemption from so vexatious a duty ; and few things would do more to extend our trade with Hamburg than the completion of an arrangement of this sort. By an order from the IIanovertan government this daty has been abolished, and vessels are permitted to navigate the Elbe paying ordinary port dues.
Stained Glass. Whens certaln metallic oxyds or chlorids, ground up with proper fluxes, are painted uponglass, their colors fuse linto its surface at a moderate heat, and make durable pictures, whidh aro frequently employed in ornamenting the windows of charches as well as of other public and private buildings. The colors of stalned glass are all transparent, and are therefore to be viewed only by transmitted light. Many metallic pigments, which afford a tino effect when applied cold on canves or paper, are so changed by vitreous fusion as to be quite inapplicable to painting th stained glass.-See Glass.
Stamps, Btamp Acts. Stamps are impres-
sjons made upon paper or parchment by tha goverument or ita officem for the purpose of revenue. They always denote the price of the particular stainp, or, In other words, the tax levied upon a particular inatrument statmped, and sometimes they denote the nature of the instrument itself. If the instrument is written upon gaper, the stamp is linpressed It relief upon the paper itsolf; but to a parchment inatrument the stamp is attached by pasto and a small plece of load, which itself forms part of the impression. These stampe are easily forged, and at varlous timea forgeries of them upon a large scale have been discovered. The Starap Act was one of the main causes of the American iSerolution. In England all commercial paper must, bo stamped to givo it validity. The State of Maryland passed a Stamp Act in 1845 as a source of revenue. liy this act bills of exchange, promi ry notes, $\boldsymbol{b}_{\mathrm{w}}$ - $\mathrm{i}_{3}$, mortgages, and lottery tickets, witu io be e: .i. li The or inary anaual i whit of tiv te

Staple, "anciently written estaple, cometh," gaya Lork Coke, " of the French worl estupe, which aignifies a nart or market." It appears to have been used to indicate those marts treth in Greal Britain and nt Bruges, Antwerp, Calais, etc., on the continent, where the prineipal products of a country were sold. Probably, in the first instance, these were held at such places as possessed some convenience of situation for the purpose. Afterward "hey appear to have been conflmed, or others appointed tor the purpose by tho authorities of the country. All merchandise sold for the parpose of exportation was compelled either to he sold at the "staple," or aftexsard brought. them beforo exportation. This was done with the double viow of accommotating the forcign merchants and also enabling the duties on exporiation to be more conveniently and certalnly collected. Afterward the word ataple was applied to the merchundine itself which was sold at the staple. Hons's Cyclopedir.

Starch (tier. Amidan; Fr. Anidon; It. Ammdi, Amilo; Sp. Amidon, Almidon; Iuss. Kruchnal), a substance oblained from vegetables. It has a fine whito color, and is usually conereted in longish masses; it has scarcely any smell, and very litto taste. When kept dry, it continues for a long time uninjured, though expored to the air. It is insolublo in cold water; hat combines with boiling water-forming with it a kind of jelly. It exists chiefly in the white and brittle parts of vegetables, particularly in tuberose roots, and the seeds of the gramineous plants. It may be extracted ly nounding thesn; rts, and agitating them ln cold water, when the parein aymn or tibrous parts wiil first subside; and these being removed, a fine white powder, difluset through the water, will gradually subsild, which is the starch. Or the pounded or graced substance, as the roots of putatoes, neorna, or horse chostnuts, for instance, may be put into a hair sieve, and the Blarch washod through with colil water, leaving the grosser matters behind. Farinaceous seeds may be ground and treated in a similar mamaer. Oily seeds reguire to hnve the oil expressed from them before the farina is extracted.-Thomson's Chem.

11. Interkluction and Statistics of Ocean Steam. Vtrighe fiom.-The first ateamer that ever crossed the Atlantic was the Satannak, f'aptain Mosea fiogers-a vessel that was built In New York, in 1818, by Fitchet \& Crocket. The engine was luilt loy Stephen Vail and Danicl iod, the name tas, etc. be in the ail ln atregerd to nas of the countries. omprise Ste.m-
m-engine y of man gested by ventions, not, how oy benefif ilscovery. tho most he steam-
oi New Jersey, It was a paddle-wheol stea ner, of 350 tuly burdon and 90 horse power, and saller! from Now York Murch 29, 1819, to Savannah, Geo:gla, where ahe was owned. She next went to Char'eaton to take the I'resideat, James Monroe, to Savannr h, and from thare, on the 2 is of May, 1810, started for Liverpool, where sho arris i affely in 22 days. She was a full-iraged ship, a " Cast sailer; had stsam us fourteer day of the royd, and by steam alone could moke eight dnots a: ur. Steamboats coming into geaeral uss en rivers, lakes, and coastinge voyages soon after, it seems is li ls singular that ind furthor attempts were made sir aineteen "ars to cross the ocean by steam. The un ri uct of this auccossful voyage seema to have been ir rlooked; the great philosopher, Dionysius Larln $r$, having proved - to his owr atisfaction, at least-tha' atean regsela , ere. concui soose tha Atlantic!

Fiunlly, in Bristol, England-the very port that sent out John and Sobastian C'abot to make the first actual discovery of this continent-a lino of steamora was projectod, and the first vessel, the Sirius, arrived In New York on the 23d of April, 1838. Tho New York papers of that date say, "Myriads of persons erowded the Battory to havo a rlimpse of tho first steam vessel which had crossed the Atlantic frem the British Isles, and arrived safely in port." The London Times had spoken of the project doultfully. "There is really no mistake," sald the Times, "ia shis long-talked-of project of mavigating the Atlantic Ocean by steam. Thero is no iloubt of an intention to make the attempt, and to give the experiment, as anch, a fair trial. 'The Sirius is absolutely getting under welgh for America." Now, nfter a lapse of 20 years, thero are 15 lines of steamers, numbering 46 alips, trading between this coun ' $y$ and Europe; and 37 of these steamers run out of Now York. The earliest vessels-tho Sirius, the Great IV'estern, Royal IVilliam, Cidy of Liverpool, Hritish Queen, and the President-were none of them long in the trme. The line established by the enterprising Samuel Cunnrd, and to this day bearing his name, was started in 18.10 , and was the first permanently successful line of transulantic ateamors ever set afioat. The first Cunarl steamer (tho Britannit) arrived at Boston July 18, 1840.
of the transatlantic steamers cight have been lost. The President, the City of Glasgow, and the Pacific sailed, and, wilh alt on board, "wera never heard of more." 'Tho Aretie was sunk in a eollision with the French stenmer lesta, on the banks of Newfonndland, and but few llves were savod. The Columbia, tho Ilumboldt, the Pranklin, and the City of Philadelphia were all wrecked, but no lives were lost. Since the Sirius sailed from England to Now York, in 1838, not far from 500,000 persous have erossed tho Atlantie by ateamreckoniug both passengers and erews, and tho voyages both ways-and of this number about 1200 have been lost. This, in the doctrine of chances, is about onethirl of 1 per cent., or one voyngo in 300 . W'ith grenter care, with tho lessons of experience, and the
ald of practical selence, the pereeniage of loss will in fature undoubtedly be far less.

In comparing the serew with paddle-wheel steamers, the letter have always been considered the awiftest vessels, and have gonerally made the best time. Screw steamers have many advantages over those with pad-dle-wheels. As war vessels they are more seeure, the propelling power, as well as the most of the machinery, being below t'ie water-line, and out of tho reach of shot. The engine and machinery are less expensive, tako less $f_{i}$ - occupy far less apace, and consequently alford nors room for passengers and frelght. They are not usually as rapid, nor are they as great favorites witti the traveling publie as paddle-wheel atcamers. 'The motion of screw ateamers is more unpleasant than thoso with paddle-wheels ; there belng nothing on tho sldes to balanco and "trim" them, they have a lurching, rolling motion.

The ordianry time mule by the Cunard and Collins paddlewheel steamers between Liverpool and New York has been from 9 to 12 daya. Tho monster steamer /Iimalaya-a British serew steamer of over 5000 tona burden-was sent under steum from Halifax to Southampton in about 9 days. Threo other acrew vesselsthe Eiteu, Lebinon, and Alps-8teamed from Havre New York, respectlvely, in 11 days 17 hours, 13 21 hours, and 13 days 12 hours. Theso passager. not far bolind the 'sual speed of paddle-wheel $\varepsilon$ ' mis. cis.

The following is the record of the various : po transatlantic steamers, and the averago time ce.. ar going both east nnd west, during the yenr id w. 1 ean not bo taken as positive proof of the enr on s* spzed of the difierent lines, for sometimes $c$ : or two
 erage. The Boston branch of the Cunar

1. The muil routes from Great Britain to Australia are shown as followa :
The route from Great Britain to her Auntrallan colonies, via tho Cape of Good Hope, incluvies the following distanoes and lengths of paseage :

2. The Sucz and Sligapore ronte is made up as followe:

## 3. The distances hy way of Panaing ara:

The comparative diatances show a decided advantage by the Panama route, and prove that the course of trade from Great Britain to her colonies must evintually tend that way.

The ocean mall steamers of Great Britain run 2,582,231 niles per year, at a total cost to the Admlralty of $£ 1,062,727$, or $\oplus 5,333,980$. The ceean mult steamers of the United States run 735,702 iniles per year, at a total charge on the Post-office Department of $\$ 1,329,738$. The British stemmens run throe and a half times as many uilee as ours do, and recelve for it a pum more than four times as large. The avorage price paid to thelr principal companies, as the West India Royal Mail, the Cunard, the Ausiralian, and the Peninsular and Odental, Including its Mediterranean cousting scrvlee, is 9a. 7d., or 8239 per mile; while the average price paid ty us, or for tho Collins, Ilavre. Bricoest, Aspinwall, and I'anaua, San Francinco and

Oregon, Is $\$ 180 \%$ per mille: The highest sum paid per mille by the Briuah government la' 11 s; 4 td ., or © 831, to the Cuatard Company, 275 to tha Australian, and $\$ 46$ to the West India $;$ and the lowest, fe. 1:d, or 108 t to the Peninsular and Oriental, much of whoes cervice is consting. This is saying nothing of the Jaelto and the African coasting lines, The higheat cum whloh wo pay it to the Collins line, $\$ 10 \frac{1}{2}$ pormile f and the lowent to the Havre, $100 \$$ per mile; while tha sume pald to all of tho other companies range bet little above the last figuret. The lowest rate per mille paid to any of tha Ines endor the contruct was to the Pacifio Mall, $8170 . \cdot$ It must not be forgetten that the low ratee per mille of the Havriand Bremien result from those llines taking the postages afnce their contracts oxpired-a aom by' no means adjasted to the service done. They had ahlpe that they could not let lie Idle. Under their regular contracts the pay per mile of the Bremen Ilne was 828 , and of the Havre $\$ 176 t .91$ Whlle the Hritloh governmant paya to four of her princlpal transmarine services an average of \$2 8c per inile, we pay to tive of oure an average of 8180 only; or but about two-hinle ae much as she does. White our total annasl expenditure for foreign mails is $1,329,783$, a oum by 820,207 leas than that paid to the slogle service of the West Indla Royal Mail Company, that of Great Britain is $\$ 8,883,885$. And while our total income from trantmarlite postages ls $\$ 1,035, \div 40$, a sum but little short of that paid in sabsldy; taking the present Bremen and Havre services at the estlmates of last year for sea and inland postages comblned, the income from the whole transmarine service of Great Britaln, including ocean and inland postage, wes, when the laet report was made In 1853 , $\mathbf{£ 5 8 : , 5 7 3}$, or $82,957,865$; but llttle above half the sum paid in subsidy, and locluding the French, leelglan, and Dutch routes, where the postal yicld was much greater than from the occan lines. The estimntes whoh we present below have heen made with great care from diatances and subindies furnished us by the rellable FIrt Assistant Postmaster-general; Hon. Ilorstio King, from the last report of tha lato Postmastergeteral, ond from the report of the Ilitish Postmas-ten-general, Lort Canning, before noticed. Every Itan is conseruently authentle.

wayg seemed a myetery, that while the regular comparies in Fingland were making money, ncariy all of those in the United Statea not only had not made monoy, but were embarrsssed more or less, and were selllag their atock at 60 to 80 cents on the dollar.
The history of commercial nations admonishes us that no trading people can long maintain their ascendcncy without using all of the mout approved means of the age for prosecuting trade. Portugal was at one time the most powerful commercial nation of the globe; and at another Holland was the mistress of the seas. But while the latter is now only a fourth-rate commercial power, the former has sunk into olssearity, asd is nearly forgoteen of men. At that time England and France had but a limited forelgn trade, and acarcely any commercial reputation. France could more easily maintain her existonce' without a foreign trade than could England ; and yot her matured manufactures and her products of the aull became so valuable that she sought a forelgn market.' England, on the contrary, had not tarritory enough to remain at home and yet be a great power." She matured an Immense manufise turing aystem, and noeded a market, an well as the raw material; and food for her operatives. "She bugsn to stretch her arms to the outer world, and had made very considerable atride in fureign oommerce side by side with France and the German States, and In the face of the steady young opposition of tho American States.

It is interesting to trace thia rapid progress of steam siace its first applicstion to purposes of mall transport in 1833. An intelligent writer sajs," "The riso and progress of the ocean steam mall aervice of Great Britsin is second in interest to no chapter in the maritime history of the world;" and while we acknowledge a grateful pride in the triumphe of our transatlantle brethren, we mast blash with shame at our dereliction in this great; and eiviliaing, and enrichlng siervice of modern times. The atcam marine of the United States, portal, mereantile, and naval, is to-day so insignificant in extent that we do not feel entirely certain that it is a sufficient nucleus for the growth of a respectalle marjtime power. The fow ships that wa poaseas are among the fleetest and the most comfortable that traverse the ocean, and have excited the admiration of the world wherever they have been seen. But their number is so small, their aervice so limited, their field of operation so contracted, that our large commerce and trivel are dependent, in inost parts of the world, on British steam mail lines for correspondence and transport, or on the slow, irregular, and uncertain communications of sailing vessels. The question here naturally suggests itself: IInve we progreasad in ocean steom navigation in a ratio commensurate with tho Improvements of the age, or of our own linprovement in avery thing else? And has the government of the country afforded to the people the facilities of enterprise and commercial competition which are clearly necessary to enable them to enter the contest on equal terms with other commercial countries?

List of American Ocean Steamers.-The mail service has eight lines, and 21 steamers in commisalon, of 48,027 registered tonnage. Mach of this tonnage belongs to supply-ships, as for Instance those of the Pacific Mail Stcamshlp Company.
Colling Line.-Three steamers, 0727 tonst Adriatic, 4144 tons; Allanttc, 2849 tons; Baltic, 2733 tons
Havrs Line.-Two steamers, 4518 tonsi Arago, 2240 tods; Fulton, 2808 tons.
Fanderbill Bremen Line. - Threo steamers, 6523 tons: North Star; 1867 tons; Ardel, 1896 tons $i$ Vanderbilt, 8360 tona
United States Nail Stoamehip Compary,-81x steamera, 8544 tons: Illindie, 8189 tona; Empire City, 1751 tons; Philadelphia, 1238 tons; Granada, 1008 tons; Mosea Taylor, 1200 tons; Star of the Fest, ehartered, 1172 tins

From this exhibit it is upparent that, In point of num. bers, there has been no increase in the atoam-veasels built since the year 1851. If, however, we take into consideration the increased size of the vessels built, or the aggregate tonnage, there has been a healliyy increase corresponding to the grow th of the country.
 in mail thbtaiot of the l'Nited state dobine tur Yeay enting Jonm 80, 155 t.

From the sixth amnual report of the board of aupervising inapeetors of steauper, zasin to the Secretary of the Treasury, we glean the following interesting statiatics:
1)uring the five yenrs from 1848 to 18b2, incluaive, prior to the establishment of the Board of Supervisors, there wero 50 steamboat explosiona, eausing a loss of 1155 liven, and 475 pereons wounded. By other disas. tera during the same period, 416 lives were lost, muislug a total loss of 1571 lives in the five years. Itring the four years from 1854 to $1857_{\text {, inclusive, sabsequent }}$ to the parange of the steamboat law, there have been seven explosions, and 132 lives leat. By other disasters, coltisions, fire, sinking, ete., there have been lost during the same time 214 lives, making a totai loss for the fivo years of 346.

## SIE

By an examination of these statements we find that |management of our squadrens, our nationsl sianding, for five years prior to the pasange of the stemmbont act we have acceunts of the lose of 1671 lives, and for the five years since sald passage the total loss of life on the Western rivers in 840 , leaving a difference of 1226 lives.

The total number of ateamers inspecied during the year in the United States wae 1122, with an aggregate tennage of $\mathbf{4 6 4 , 3 7 0}$ tons. The number of pilote is 2584, and number of engineers 2854 . The total number of passengers carried by liconsed eteamera was $8,610,807$.

To show the advantagg which steam communication gives to a growing trado, it may be stated that "from 1840 to 1850 the total imports of Great Britain from Brazill made no increase. In 1853 they had advanced 150 per cent. on 1848; and in 1855 they had ndvanced over 1848-or the avarago of the ten yeare noticodabout 300 per cent. This, however, it nuat be recollected, was in coffee, for re-exportation;-a trade which was loat to our merchants and to our shipping. Her tetal exports to Brazil from $\mathbf{1 8 4 0}$ to $\mathbf{1 8 5 0}$ were siationary at about two and a half million pounds sterling annually. In 1851-the first year after steam by the Royal Mall Company - they advanced 40 per cent.; and in 1854 they had advanced 102 per cent. on 1860 . Thus her exports have doubled in five years, from a stationary point before the establishment of steam mail facilities; whereas ours have been thirteen years in making the samo increase. The total trade between Brazil and Great Britain hns increased in an unprocedented ratio. The combined British imports and exports up to 1850 averaged $£ 3,645,833$ annually; but in 1855 these had reached $£ 8,162,405$. Thus the British trado increased 225 per cent. in fite years after the first line of tteamers was established to Brazil."-Arazil and the Brazilians.

The many instances of our dereliction in the establishment of steam mail faeilities, and the failure to establish locomotive accommodations for our mercliants and other business clssses, call loudly for a change in our affaire, and the establishment of a national steam policy in tie plaec of the accidental and irregular support hitherto givon to tereign ateam cnterprise.
The conclusione which Mr. Rainey arrived at in his late werk on Ocean Steam Navigatien are set forth in a clear summary, which wo give as fellown:

1. That steam maile upon the ocean control the commerce and diplomacy of the world; that they are essential to our commercial and producing country ; that we have not eatablisied the ocean mail facilities cemmensurate with our national ability and the demands of our commerce; and that we to-day are largely dependent on, and tributary to our greatest commercial rival, Great Britain, for the postel facilitics which should be purely national, American, and under our own excluaive centrol.
2. That fast ocean mails are oxceedingly desirable for our commeree, our defenses, our diplomacy, the
and that they are demanded by our people at large.
3. That fast ateamers alone can furnish rapid trangport to the maile $;$ that these ateafiers can not rely on froights; that saliling veasels will ever carry staple freighte at a much lower figure, and sufficiently quickly; that whilh atoam is eminently onceesaful in tho coasting trade, it can not possibly be so in the transatlantio freighting bualness; and that the rapid transit of the mails, and the alower and more deliberate tranapert of freight, is the law of nuture.
4. That high, aclequate mill apeod is entremoly cost$l y$, in the prime construction of vessels, their repairs, and their more numeroun empleyes; that the quantity of fuel conanmed is enormone, and ruinous to nnalded private enterprise; and that thia is clenrly proven both by theory and indispuiable facts, as well an by the concurrent testiniony of the ablest writers on oceun steam navigation.
5. That ocean mail steamers can not llve on their own recelpts; that neither the latest nor the anticipated Improvements in ateam shipping promise any change in this fact ; that self-support is not likely to be attained by increasing the size of steamers; that the propelling power in fast steamers occupies all of the available space not devoted to passengers and exprese freight; and that steumers must be fast to do successfut mail and profitable passenger service.
6. That sailing vessels can not successfully transport the mails; that the propelier can not trensport them as rapidly or mere cilesply than side-wheel vessels; that with any coisiderable economy of fuel and other rumuing expenses, it is but littla faster than the sailing vessel; that to patronize these slov vessels with the mails, the government would unjuatly discriminate againat eailing vessels in the transport of freights; that we ran not in any sense depend on tho vessels of the navy fer the transport of the mails; that individual enterprise can not support fast steamers; and that not even American private enterprise can under any conditiens furnish a sufficiently rapid stcam mall and passenger marine : then it must he conecded,
I. That it is the duty of the gevernment to its people to establish and maintain an extensive, well-organized, and rapid ateam mail marine, for the benetlit of production, commerce, diplomacy, defenses, the public character, and the general interests of all classes; that our people appreciate the importance of commerce, and are willing to pay for liberal postal faeilities; that our trade has greatly suffered for the want of ocean mails; that wo have been forced to neglect many profitable branches of industry, and many large fields of effort; and that there is positively no means of gaining and maintaining commereial ascendency except through an ocoan steam mail system.
II. That the government can discharge the clear and unquestionable duty of catablishing foreign mail facilities only by paying liberal prices for the transport of the mails for a long term of years, by creating and suataining an occan postal sysicm, by legisiating upon it systematically, and by abandoning our slavish dependence upon Great Britain.
III. That the Britigh ocean mail syatem attains greater perfection and extent every year; that instead of becoming self-supperting, it costs the treasury more and more every year; that English atatesmen regard ite benefits as far outwcighing the losses to the Treasury; that so far from abandoning, they are regularly and systematically increasing it ; that it was never regarded by the wholo British public with more favor than at the present time; that it is evidently one of the most enduring institutions of the country; that it necessitates a bimilar American system; that withont it our people are denicd the right and privilege of competition; and that we are thua fer by no means adequately prepared for that competition, or for our own development.

- thiliding anoticer stramer of 250 tons for the Brazill Ine.
$\dagger$ These vessels avenige abont $2 t 0$ berse-power each, Tineir tonnage ta large, probably 1200 tons each.

There are several other lines of ocean steamers in Luropo; lut it is almost inpossible to asecrtain any thing definite about them. The list above embraces all fo the most important companies of the world. The lines are continunlly changhg, while the vessels are fassing theto new bands almost every week,--See artiche Tonnage and the United States.

Bteel (Fr. Acier; Gerr. Stahl; It. Icciajo; Lat. Chatyhs; Lhus4, Stal; Spl. Acroo; Swel. Shall), is iren comhinod with a suall portion of earton, and has been for that reason called carbureted iron. The proportion of earbon has not been aseertained with much preciston. It is apposed to amount at an average to $1 \frac{1}{10}$ part. Stecl is mu bard as to be unmallouble while cald; or at leazt it nequires :hat property ly being immersed, whilu ignited, is a cold licpuil; for this immersion, though it has no effect nom iron, aldes greatIy to the buritucsen of steel. It is brittle, rebimas the lile, cuts glass, alforls sparks with that, and refains the magnetic virtue for any length of tiew. It loses this harduess by belng iguiteel, and cooled very alowly. H ia nalieable when ret hot, but scarcely ao when raised to a white hoat. It may be hammered out into much thinner phates than iron. It is more amorous; and ita specifle gravity when hammered ia greater than that of iron-varying from $\overline{7} \%$ to $7 \times \mathrm{M} .4$. Stect is usually divided into three eorth, acteriling to the method in
which it is prepared; as natural sted, steel of cementis. tion, and cast steel. The later is the most valuable of all. as its texture is tho mont compact, and it adnits of the fiucst polish. It is used for razors, surgeons' iostrumenta, and similar purposera. Steel iv chiefly employed la the manufacturn of swords, kuives, mid citting instrunemts of ull sorts used in the arts; for which it is peculiarly adapted by its hardness, and the dineness of the edgo which may be given to it. - See Inos.

Steelyard and Bteelyard Company. A wort nucient instrument, the sh ne that is crmatated hal. ance in the I'entateuch. The statera lomam, or lioman atexyard, is mentioned is sis n.c. The itect. yart Company was a compnay of Iomdon merchants who had the steelyarl assigneil to them hy Itury III. A.1, 12:12. They wore all flemings aml ciermane, and the only exporters, for many yeara after, of the staple commodities of Emgland.-llaym.
Steer, to keep the ship on a given direction. Thls is tone by moving the ruditer hy the tilier, which kat is moved from that side to which the ship's heal is required to be moved.
Bteerage, in apartment before tho great calin, from which it in sepuruted ly a partition or bulk-bead. In merchant shlpa it is gonerally the bubltation of the Inferior officera and crew; but lin ships of war it serves
only as a hall or ante-chamber to the great or captain's oabin.-Steerage ls also used to express the effort of the helm.- stennage-uay lmplles a sufticlent degree of motion communlcated to a shlp for her to become susceptiblo of tho eflects of tho helm in governing her course.
Etem, a circular piece of timber Into wheh tho two sides of a ship are uaited at the fore end; tho lower ead of it is soarfed to the keel, and the bowsprit rests upon its upper end; the ends of the walls and planks of the sides and bottom aro lot into a groove or channel cut in the middle of its aurface from top to bottom. Tho outside of the atem le usually marked with a scale of feet answering to a perpendicular from tho keel. The use of thls scale is to ascortain tho irraught of water.-From stem to atern, from one end of the ahlp to the other.
Steppe (from the Rnssian otep, a dese t; also a dry plain). The steppes of Russla, which are not unliko the landes of Guienno in France, and tho heaths of northern Germany, are in part ansceptible of cultlvation, and thoy afford pasturago for the numorous herds of the nomadio tribes. In the extonsive steppes of Astrakhan, between the Volga and tho Ural, the Calmues and the Nogay Tartara rovo wlth thelr cattle. They produce several sorts of flowers, herbs, and are frequented hy wild goats and hirds.

Sterling, an old pound weight of geographical signiticance, namod Eastorling, divided into twelve ounces, was in uas anong tho Anglo-Saxons eome centuriea before the Norman Conquest. Tho samo weight, called the Tower and tho Monoyers' pound, was atyled by enrly Fronch writers the lioman and the Roehello jound; also known among tho Germans as the Cologne pound. A simple aystem of exchange, by which $n$ pound of silver money, in tale, was made to equal a pound in grose weight. had been arranged by Charles the Great, in France, toward the end of the 8th century. In l3ritain, under the firat William of Normandy, an ordinanco declared "the weights and moasures throughout tho kingdom shall remain as our worthy predecessors have established." An act of IIenry tho Third, in 1266, explains the primitive initials of these ancient British, Gallic, and German standards, to all which one common derivation is imputed. "By cartsunt of the whole realm the measure of the kiug was made, that is to say, an English penny of silvor, called a aterling, round and without any cllpping, shall woigh thirty-t wo wheat corns, taken from the middle of the ear. And twenty penco of silver to make ono ounce; and twelve ounces of silver do mako ono pound; and cight pounda of silver do mako a gallon of wino; and eight gallons of wine do make a London busiel, which is the eighth part of a quarter." This genoral arrangement for noney weights and mensures was that of the Lastern nations, by which Europe had been overrun. The term "Easterling" of the Norman Frenclu was transmuted on the Euglish tongue, first to "Eastorling,"and finally to"Sterling." Anether pound weight, alao divided into twelve ounces, hal heen brought from Cairo, in liprept, to Troces of Chnmpagne, in France, during tho Crusades, Carried into England by forcign gel!anitlis, Lombard merchants, possibly from Venice, ahout tho year 1406 , it gradually supersoded the old Easterling weights, and found access Into tho British Mint by decision of llenry the Bighth. Queen Elizabeth ordered the onnce of silver in Eughand to he cut into slxty pennies, so that tho penny, forming the twentleth of an ounce, thencoforth beeme the sixtleth part. "rom the termlnation of Queen Elizubeth's reign, the colnage of Engllah sifver has generally retalued a purity of 920 thonsandths, ealled the "Sterling standnri,"-See Pounis and Penny. Seo also Bankers' Mfagazine, N. Y., 1856, '67.

CItettin, n eity of Prussia, on the loft hank of the Oher, about 36 milles from Its mouth, in lat. $68^{\circ} 23^{\prime} 20^{\prime \prime}$ N., loug. $14^{\circ} \mathbf{3 3}$ F. it is well built, strongly fortlitid,
ant had in $1846 \cdot$ a population of 42,000. Stettin is tho seat of an extenalve and growling cominerce; and is now, Indeed, the principal port of importation in Prussia. Sho owes this diatinetion mainly to her situatlon. The Oder, which flowe through the centre of the Prussian dominions, is navlgable as far as Ratllor, near the extreme southern beundary of Prussian Silesla; and fa united, by means of canals, with the Viatula, the Elbo, tho Spree, etc. Stettin is, consequently, tho principal emporium oi some very extonsive and flourishlng countries; and is not only the port of Frank-fort-on-the-Oder, Breslau, etc., but alao of Berlin. A rallwey from tho latter to Stettin has been completed. Honcs at tho proper seasons ita wharves aro crowded with lighters that bring down the produce of the different countries traversed by the river, and bring baek colonlal products, and other articlea of foreign growth and manufacture. Veasela of considerablo burden, or those drawing about seven or eight feet water, load and unload, by means of lighters, at the mouth of tho rlver, at Swincmunde, the outport of Stettin, on the cast coast of the isle of Usedom, in lat. $53^{\circ} 55^{\prime} \mathrm{N}$., long. $14^{\circ} 15^{\prime} 15^{\prime \prime}$ E. Formerly thero were not inoro then seven feet water over the bar adjacent to Swinemundo; but the harbor of tho latter has recently been so much improved, by tho constriction of piers and breakwaters, (lredging, ete., thnt it is now the best on ths Prussian coast, and adinits vessels drawing from 18 to 19 feet water. A light-honse his been erected at tho extremity of tho eastern pier. Stettlin is a free port; thint Is, a port into and from which all sorte of goorls may bo imported and re-exported free of duty. Gooda brought through the Sound and imported at Stettin, and entered for homo consumption in tho l'russian states, wero formerly charged with $2 \frac{1}{2}$ per cent. less duty than if they had been imported through any other channel. 'This was intended to reimburse the merchant for tho Sound duties, and to encourage importation by this direct ronte la preferenco to that carried on through IIamburf nad Emiden; but now that tho Sound dues aro abollshed there no longer exists the necessity for tho bounty. There is at Stettin a great wool fair in tho month of June each year.

The Intercourse with the United States is solely dependent on the regulations of tho Zoll-Verein. Thero are no poivlleges in fnvor of any nation which are denied to the United States, nor any restrictions imposed upon the commerce of any other natlons. The moneys, weights, and measures, etc., etc., in the ports of this consular district aro the same as established by the luw of tho mother country. Commission, 2 per cent. l'right-mo rates can be mamed for want of busiacss. lusurance dono in England or tho United States. 1lills at threo months. There are no direct oxchanges with the Unlted States.

Steward, in Naral affairs, is an officer in a ship of war, appointed by the purser to distribute the ditierent species of provisions to the odicers nad erew. The same officer is employed for steamships and all classes ot vessels tor similar purposes.

Stocirholm, the capital city of Sweden, situated at tho junction of the Lake Maelar with an inlet of the linttic, in lat. $59^{\circ} 90^{\prime} 31^{\prime \prime}$ N., long. $17^{\circ}$ bit E.; a wellhuilt, hamlsomo city. Populatlon in 1851, 93,070. Tho entrance to the harbor is intricate and dangerous, and should not be attempted without a pilot; but the larboritself la capacions and excellent, the largest vessels lying in safety close to the quays. Stockhohm jossesses from athird to a half of the foreign trade of Sweden; thut this is contined within comparutively narrow limits. The government lins long been aceustomed to endeavor to promote industry by exciudiug foreign products; latterly, however, this system has been considicrably relaxed, with great advantage to the trade of the country, ant io woll-being of the people. Iron, timber, ans deals form the great articles of export. Swedish tron is of very suparior quality, and is
rather extensively used in Great Britain; the Importa of it amounting in ordinary years to about 16,000 tona exclusive of 600 tona of ateel. In addition to the above leading articles, Stockholm exports pitch, tar, copper, etc. The timber la inferior to that from the southern ports of tiee Baltic. The Imports principally conalat of colonial products, cotion, dye-stuffa, zalt, liritiah manufactured goods, hidas, fish, wine, brandy, wool, fruit, etc. In seasona of acarcity corn ia imported, but It is generally an artlelo of export.

Pibotage.-Vessela hound for Stockholm take a pllot at the amall ialand of Oja. Lands-hort light-house is erected on the southorn extrenity of this laland, in lat. $58^{\circ} 44^{\prime} 30^{\prime \prime}$ N., long. $17^{\circ} 52^{\prime} 15^{\prime \prime} \mathrm{F}$. It is painted white, and is furnished with a llxed light, elevated 158 feet abovo the levcl of the sea, which may be seen under favorable circunatances five leagucs off. Tho algnal for a pilot is a flag at the fore top-mast head, or firing a gun.

The following table exhibits the commercial movements at the port of Stockholm during the year 1851, comparet with the two preceding years:

| leare | Vrzaala entereil | Tonalage. | $\begin{aligned} & \text { Yeseeln } \\ & \text { eleorod } \end{aligned}$ | Tonsage. | Total | Total Tonasga |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1849 | 663 | 70,728 | 791 |  | 1452 | 14, 0,848 |

Beeldes the conatries included in tho preceding ta. be, Stockholm extenda lts commercial tradsactions to Spain, Italy, Austria, Malta and Gibraltar, Mocklenburg, Hanover, Oldenhurg, Belgiun, the Cape of Good Hope, and tho Antlllea.

It may be remarked that during this year tho general commerce of Swoden exhibited an advancing tendency. This was owing, in a great measare, to the liberal policy which characterized the commercial legis. lation of Eagland, dating from January 1, 1850-a policy the whalom of which could not be more appositely illustrated than by the fact that while the tolal trade of Sweden with all forcign nations during this year reachod as high as $65,000,000$ rix dalers, ${ }^{*}$ the trade with England alone covered 14,543,000 rix dalcrs, or niore than one-fourth of the whole.

In 1852 official returns show a slight falling of in the general trado of Stockholm. It will be seen from the annexed table, from Swedish officinl sources, that the entire trade, imports and exports united, represents in value $86,5039,027$, or about $\$ 487,070$ less than the total trade of 1851. This disuinution afficeted imports, especlally grains, fish, and brandica, to the extent of 1,523,494 francs, whilo coffeo and augar increased in value 838,816 francs; and in the export trade it was felt in the falling off the preceling year of $1,014,2 \pi 0$ franca, chiefly on iron, stecl, and copper, while the exportation of timber and pitch Increased over that of 1851. In 1852 a new article of commerco entered into the export trade of Sweden. The metal nickel tigures for the firat tlme in the returns for this year to the amount of 101,520 francs, or $\$ 18,88272$, chielly sent to the Ilanae Towne. Tho navigation of the pert of Stockholm during 1852 presented a total tomnage of 167,686 tons : viz., entered, 81,874 tons ; cleared, 85,812 tons. This is a falling off from $1 \times 01$ of 21,7 788 tons.

Erports.--It is mnnecessary to present a detailed atatement of exports, inssmuch as iron, sted, and cop. per constitute the articles of chief value exported from the port of Stockholin. Other exports consist juriacipally of timber (boarda), pitch, and tar. These amounted In value, in 1852 , to 8107,533 , to which is to be mideld for miscellanteus, not entmerated, $8230,04 \mathrm{~N}$. The total value of iron, stecl, and copper exported in 185 ? was: iron and steel, $\$ 1,747,515$; copper, 8327,213 . Value of iron and steel exported from Stockholm to the linitel statea in 1852 , $8 \times 10^{2}$. (ireat Eritain, the Il anse Towns, and Jenmark occupy tha first rankin the order in which they are given as exporters from Stoekholm. Prussia, Fiulant, l'ortugal, France, and the United States como next.

 Jmponts asid lixpoltg, akbigutively, dering the I bal 1453.

During the year 1so3 there was a great scarcity of vessels to carry of the froight to foreign marhete. The unmber that cutcered the port of Stockhohm was ise, with an agrorgate of 76,226 tons; and the munber eleared was ! $22^{\prime \prime}$, with an aggregete of 81,916 tens. 'The total number entered anl cleare! was 1.516 vessels; afo gregate tunage, 158,142 tons. The nmmber of iessels wasgreater, but the tomage was lesa ly 9500 tons than in 18.2 .2.

Money.-Accounts are kept hero, in Gottenburg, and generally throughout Sweden, in paper inonsy, conslating of rix dollars banco, one rix dollar being equal to 48 skillings, and one skilling to 12 rundstycks. The exchange with London is at about 12 rix dollars banco per $\mathcal{E}$, so that the rix dollar is worth about $1 \mathrm{~s}, 8 \mathrm{~d}$. sterling. Rix dollars benco may be exchanged for apecie rix dollars at the rate of $2 f$ the formor for one of the latter. But there are very fow coins, except of copper, in circulation, the currency consisting almost wholly of notma varying from 5 skillings to 500 rix dollars banco.

Weights and Measures.-The victuali or commercial weights are punds, lippunds, and skippunds; 20 punds being equal to 1 lispund, and 20 lispunds $=1$ skippund. 100 Jbs. Swediais cutismercial weight $=937 \mathrm{lbs}$. avoirdupois $=42 \frac{4}{4}$ kilograins $=874 \mathrm{lbs}$, of II amburg.

The iron weights are three-fifths of the victuali, or commercinl weights; 20 marks $=1$ mark pund; 20 mark punds $=1$ mark skippund; and $7 \frac{1}{2}$ sklppunds $=1$ ton English. Ilence 100 punds Swedish iron weight $=75$ Jus. avoirdupois, and 100 lbs . avoirdupois $=133 \frac{1}{3} \mathrm{lbs}$, Swedish iron weight.

In corn measure, 4 quarts $=1$ apann; 2 spann $=1$ tun, or barrol; 1 tun $=1 \frac{1}{b}$ Winchester bushels; a last of rye from liga $=18$ tuns; a last of ryo from Liebau $=19 \frac{1}{2}$ tuns; a last of rye from Stctin $=22 \frac{1}{2}$ tuns; a last of ryo from Strals. wit $=24$ tuns. The tun of 32 kappor contains 46 Winchester bushels.

In liquid measure, 2 stup $=1$ kanna; 15 kannor $=1$ anker; 2 ankers $=1$ cimer; 2 cimers $=1 \mathrm{ahm} ; 1 \frac{1}{2}$ ahın $=1$ oxhoft; 2 oxhoft $=1$ pipe. The pipo $=124 \nmid$ English wine gallons; and, consequently, the ahm $=41 \frac{5}{12}$ Eaglish wine gallons, and 100 kannor $=69 \frac{1}{5}$ Einglish gallons.

The Swedish foot $=11 \cdot 68 \pm$ English inches; the ell, or alua, $=t$ feet ; the fathom $=3$ ells; the rod $=8$ ells.

In estimating by lasts, 1 last of pitch, ashes, etc., $=$ 12 barrels; 1 last of tar, oil, etc., $=13$ tharrels; 1 last of homp, flax, tallow, etc., $=6$ skippunds $; 1$ ton of Liverpool common salt $=7$ tons Swedish.

Port Charges at Stockholm.-The total port charges for a vessel of 500 tons ( 250 lasts) amount to about 827't, incleding all expenses, in and out. For an unprivilegeai vessel this amount is nearly doubled.

Fort Charges at Gothenburg-Tonnage, pilotage, and all other dues and port charges on a vessel of 800 tons, amount at this port to about $\$ 167$,-Com. Relat. U.S.

Stockings, as overy one knows, are coverings for the legs. They are formed of only one thread entwined, so as to form a species of tissue, extremely clastic, and readily ndapting itself to the figure of the part it is employed to cover. 'This tissue can not be called eloth, for it has neither warp nor woof, but it approaches elosely to it ; and for the purpose to which it is applied it is very superior. Silk stockings were first worn by IIenry II. of France, in 1517. In 1560 Queen Elizabeth was presented with $n$ pnir of black silk stockings by her silk-woman, Mrs, Montague, nnd she never wore cloth ones any more.-IIowsith." He adds, "Henry V1ll. wore ordinary cloth hose, oxcept there came from Spain by great chance a pair of silk stockings; for spuin vory early abounded with silk." Edward V1, was presented with a pair of Spanish silk stockings by his merchant, Sir 'thomas Gresham; and the present was then much taken notice of.-IFoweta, Others relato that Williain Rider, a Iondon npprentlec, sceing at the house of on Italian merchant $n$ pair of knit worsted stockings from Mantua, ingeniously macie a pair like them, which ho presented to the Earl of Jemsbroke, the first of the kind made in Fingland, in 150.1.
It is well known that the Romans and other ancient nations had no particular clothing for the legs. During the Middle Ages, however, hose or leggins, unde of eloth, began to be used; and at a later perlod the art of knitting stocilags was discovered. Unlacklly, nothing certain is known ns to the individual by whom, the placu where, or when thts invention was made.

It would appear from this circumstantial account that tho art of knitting stockings, or at least that the first specimens of knit stockings, had been introduced into England from Spain about the middle of the 16th century; and such aeems to have been the general opinion, till an allusion to the practice of knitting, in the pretended poems of Rowley. forged by Chatterton, made the aubject be more carefully investigated. The esult of this investlgation showed clearly that the practice of knitting was well known In England, and had been referred to in aets of Parliament a good many years previously to the period mentionell by Howell. But it had then, moat probably, bcen applied only to the manufacture of woolen atockings; and the general une of cloth hose shows that even these had not been numerous. There is no evidence to ahow whether the art is native to England or has been imported.-See Beckmann's Inventions, article Stockings.

It is singular that the stocking-frame, which, oven in its rudest form, is a very complex and ingenious machine, that could not have been discovered accidentally, but must have been the result of dec ${ }_{F}^{-}$comhination and profound aagacity, shovld have been disenvcred so carly as 1589-before, inf fact, the business of knitting was generally introduct, The inventor of this admirable machine was Mr. William Tee, of Woodborough, in Nottinghamshirc. He attempted to set up an establishment at Calverton, near Nottingham, for the manufacturo of stockings, but met with no success. In this situation he applied to the queen for assistance; but, instead of meeting with that remuneration to which his genius and inventions so well entitled him, he wae discouraged and discountenaneed! It need not, therefore, excite aurprise that Lee aeceptod the invits. tion of IIenry IV. of "ran ee, who, having heard of the inveation, promised him a magnificent reward if he would carry it to Frince. IIenry kept his word, and Lee introduced tho stocking-frame at Ronen with distinguished success; but after the assassination of the king, the concern got into difficulties, and Lee riod in poverty nt Paris. A knowledge of the machine was brought back from France to Rngland by some of the workmen who had emigrated with Lee, and who established themselves in Nottinghamshire, whish still continues to be the principal seat of the manifacture.-See Beckmanv's Inventiona, vol. iv.; and Letters on the L'tility aud Policy of Machines, London, 1780.

Stock-jobber. It was about the ycar 1688 that the word atock-johtier was first heard in London. In the short space of four yeare a crowd of companies, every one of which held out ter subscribers the hope of immense gains, sprang into existerce; the Insurance Company, the Iaper Comprany, the Lute-string Compaty, the Pearl-flshery Compnay, the Glass-hottle Company, the Alum Company, tho Blythe Conl Company, the Sword-blade Company. There was a Tapestry Company, which would sorn furnish pretty hangings for all the parlor of the middlo class, and for all the bed-chamhers of the higher. There was a Copper Company, which proposed to explore the mines of England, and held out a hope that they would prove not less valuable than those of Potosl. There was a Diving Company, which undertook to bring up precions effecta from shipwrecked vessels, and which announced that it had Jnidl in a stock of wonderful machines resemlilins complete suits of armor. In front of the helmet was a huge glass eye like that of a cyelop; and
out of the crest went a pipe through which the air was to be admitted.

The procese waa exhibited on the Thamea. Fine gentlemen and fina ladies wara invited to the show, were hospitably regaled, and were dellghted by aeeing the divers in their panoply descend Inte the river and return Iaden with old iron and ships' tackie. There was a Greenland Fiahing Company, whlch could not fuil to drive the Dutch whalers and herring busses out of the Northern Ocean. There was a Thaning Company, which promised to furaish leather superior to the best that was brought from 'Turkey or Russia. There was a society which undertook the office of giving gentlemen a liberal education on iow terms, and which assumed the sounding name of the Royal Acedemles Company. In a pompuus advertisement it was announce. that the Directors of the Royal Academies Company had engaged the best masters in every branch of knowledge, and were bout to issue twenty thousand tickets at twenty alillings each.

There was to the a lottery; two thousand prizes were to be drawn; and the fortunate holders of the prize were to be taught, at the charge of the Comprany, Latin, Greek, IIebrew, French, Spanish, conle sections, trigonometry, heraldry, japanniis, fortlfication, brokkeeping, and the art of playing on the theoroho. Some of these companies took large mansions, and printed their advertiservents in gildel letters. Others, leas ostentatious, were content with ink, ned met at coffeehouses in the neighborhood of the lioyal Exchange. Ionathan's and Garraway's were in a constant furment with brokers, buyers, seilers, meetings of directors, meetings of proprietors. Time-bargains soon came into fashion. Extensive comblnations were formed, and monstrens fables were circulated, for the purpose of raising or depressing the price of shares.-Macautay.

Btocks. The public funding systom originated in Venice in the $12 t h$ centary, and was introduced into Florence in the year 1310. The English funding system may be said to have hat its rise in 1tio-'y.l. In the United States the term atocks includes I'nited States funded loans and State loans, and the stocks or shares in various corporations, such as railroal companies, banks, funded tebts of cities, etc.

In Engiand the term stocks is applied mainly to government funded delit-such as consois, llank of England stock, eto.; and the term shares is used when npflied to the capital or joint atock of railroad, banking, and mining companics.-. See artúle Fenos.

The difficulties in which individnais are involved ly th..ir real wants, but oftener hy their unruly passions, are the source of their dehts. The dehts of [European] nations bave not a dithrent origin. When the ordinary resources of a country were insutlicient to carry into effect the private views or impolitic wars of the despots who rujed, or the ministers who directed it, they situply resorted to the expedicut of bsrowing; but when the sums loaned were inadergate to the itscreased expenditure, they had recourse to all ourts of schetnes, decrphione, and contrierners, tho better to delude the lenders, and allure their avarice, Noch is the origin of the Jritish funting system. Among staters, delit may be connidered a nationai disense; and, like other diseases in our day, has made the tour of liurope, anli, ve may add, of many of the now nations of Ancrica.

holders ; and thet by thirty milliens of expenditure being in the hands of the stockholders or dissipatore, consumption is highly stimulated." The extinction of the national debt o Great Brltain, in the opinlon of these oconomical writ:rs, would, of course, bring misfortune aad evll. "It would," saga Colquhoin, "be attended with greater it conveniences than at present are experienced."

Anether cless of British vriters, with more truth, with greater force of argument, and with more evidenca of facis, contend that "poverty, misery, and the national debt, are also synonymous and identical terms;" that "taxation incurred to pay its annual interest (swallowing up thirty millions out of sixty millions of revenue, to satisfy the fund-holders), oppresses the people, destroys Industry, and is equal to the curse of heaven on the agriculture, conmerce, and manufactvres of the nation." (McCulloel): "To maintain that this enormous taxation enriches the nation, because it abstracts a portion of ita riches, is both a plain contradiction and an absurdity; taxation being always an engine of destruction to all the productive elasses." "To attribute to the clebt the increase of business, inprovements, etc., during the late war, is an error of the mest miseraile kind. It is to be attributed net to the incresse of llebt, bat to the monopoly of commerec, to the discoveries of Arkwright and Watt, and to various other causes. The nation did not improve trecause of the debt, but in spite of it; as it gave birth to the nefarlous praetice of stoek-jobbing, begetting a spirit of prombling, destructive of public mornls, dispraceful to the na'ioa; and hostile to the pursuit of sober indus. try." "No wagcs, 110 part of the lands, belongs to the stoekhoiders or dissipators; nor was any apecilied property pledged for the greatest part of the debt contracted. The lenders had not at the time any projerty mortgaged to them: consequontly, they can not have nt present more specitied rights than they possessed when they loaned their money. To maintain the contrary is a dangerous and arbitrary assumption." "They aifvanced money when ita value way tepreciated on an average of fifiecn per cent. They never entertained the idea of receiving payuent at par, when the leans were contractel at exceodingly low prices." " ft would the hoth folly and injustice to compel the nation to pay one hundred ounces of gold to the fund-holders, when they loaned less than eighty." "It is equally unj ist to exempt this sort of property from the alteration in value to which every other kind of property in the kiugdom is suljeet : and, consequently, the reduction of the deht-thut miflstone which destroys the industry and vigor of the people, double taxes, and spreads pau. prism, crime, ath wretchedness thronghout the cumb-try-cten be eflected without any vioiation of the poblie faith." "The nation mist not suflir on account of the errors of jart $y$ or ministerial men. The happiness of twruty-four millions of British subjects ought not! 0 he postioned for the sake of an insigniticant portiontwo humired and eighty thousand stockholders."
blefore we enter more filly on the sebject, we have thus dravit a brief summary of the leathing arguments aud opinions of the contending parties for and agaims the exintence of the present IIritish mational deht. It is not dithealt to anticipute the American side of the urgument; but on the opposite side what ean we expect, where the infection of gambling is so strong that Jopre, who knew his countrymen well, dechared -

In the lidh century, Richard 1. pawnel ile reve. mies of the crown for tho paymen of moneys horroupl to difray the experases of the fanatical compuret of the Holy liaml. Ilonry Jli, pawned the crown jemals and regal ormmenta and rotes of slate. Rdward 1 . borroned mency (o jay the debts of his fatioer, in ordet
to get his soul "out of purgatory," as the record atates. Rlchard II, was deposed for extorting $£ 1,100,000$ sterling, under pretext of borrowing, whinh was never repaid. This was one of the cinef causes of the York and Lancaster wars. In 1846, Edward IIF, ordered a sum of money to be Ient to him. Henry IV. obliged the rich men of the kingdom to lond him money upon the growing taxea. Menry VIII. escapod tho punishment he so justly merited for defrauding his creditors. He compelled Parliament to pass two acts, offering him "all the money he had received in loans;" thus discharging him of all obligationa he had come under, and all suits that might arise thereupon. In money matters in Elizabeth's time, the people insisted upon the payment of the sums advanced to her predecessers -a demand she was wise enough to comply with. Burleigh counseled her to lay the foundation of public credit. The conmonwealth cont racted a large debt : at Cromwell's death It amounted to $£ 2,474,290$. Charles, by closing the exchequer in 1672, defrauded the creditors of the state of the sum of $£ 2,800,000$; but an arraugement took place, by which the sum of $£ 664,226$ was left at an interest of $£ 19,027 \mathbf{1 8 s} .6 d$. This was the origin of the present national debt, and its whole amount before the English Revolution.

In former times, says a Britlsh writer, loans were generally contracted for short periods. It was, moreover, an established practice that the funds assigned for the repayment eliould be sufficient to pey the principal and interest, and that within a certain number of years. The British system, in practice, is quite the reverse. Their ministers are satisfied if they provide for the payment of the interest, without a thought on providing for the discharge of the principal ; or if they do, it is in conformity to the maxim of Linguet and T'erney, "to cancel the capital by a general bankruptcy, in order to briug the state home.". This maxim of Terney and Linguri was praetically adopted in France some centuries ago. Brisaon, in his history, enumerates five national bankruptcies; lut in the financial history of that country may be found a great many more. The new system originated in the republics of Venice and Genor; and being imported by Williain IFI., has been carried by the British to the highest perfection.

After the Irish Revolution, to supply deficiencies, Willhan had recourse to the long annuities which were created in 1692. $£ 881,493$ were ralsed on annuities of 99 years, learing interest at 10 par cent. until 1700 , and at 7 per cent. after that year, with benefit of survivorship for the lives of the nomituees of those who contributed. The short annuities began in 1698. Eight millions was borrowed by this expedient; every subsctiber receiving 14 per cent. for sixteen years, besides a lettery ticket. At this moment the acheme of the Bank of England was centrived by Patterson. The bank loaned Willianm $£ 1,200,000$, at 8 per cent. interest; thus at the very outset taking adpantage of the puble distress, and setting a usurious example to their successors, who, like true Shylocks, have ever since profited by tho example. Chancellor Montague about this period, to aid his sovereign, invented the scheme of issuing exchequer bills. Their issue has been at intervals ever since. The most exorbitant premiums were given for money, and the public debt was greatly increased. Publie credit sunk so low, that out of tive millions granted to carry on a war only two and a half, in Lavenant's opinion, over reached the exchequer. One of the censtituent parts of the funding system is the reluction of interest from the higher to the lower denemination. 'this expedlent, which has played so consjicuous a part In our tlay, was originally resorted to in 1699, when the higher interests were reduced to 6 per cent. It was the destiny of King William's relgn to create, lmprove, and to complote all the essential parts of the funding system as in practice at this day. William left a national debt at the close of his
reign of $£ 16,894, \% 02$. This aum formed the nuclens of the present national debt. (These facts are chlefly collected from British parliamentary history.)

The hlatory of the Stock Exohange a centory ago is its history at the present day. "The centre of jobbing," says a writer of that time, "ja the kingdom of 'Change Alley." The cnormous profits made by the association, the malpractices of the greater part of its members, and the insolence of the richer ones, excited the just alarm of a steady and reflecting nation unaccustomed to auch mancuvrea, and the public writers began to attack their increasing power. "The villainy of atock-jobbing is called a myatery or machine of trade," saya one of these writers. "This destructive hydra, thla new corporation of hell," exclaims another; while one of them gives directions, in order to beslege and bring to surrender "that infamous place, 'Change Alley," "to storm it," etc. Another writer declares that "the general cry against atock-jobbing has been so long, and it has been so justly complained of as a public nuisanice, that these people are hardened in crime; all their art is a mere system of cheat and delusion; their characters are as dirty as their employ. ments; ond the best thing that can be said of them is, that there happen to be two henest men among them." "Their omployment becomes a crime. Thls sat of men are more dangerous than all national enemies abroad." "Exchango Alley is, in fact, as dangereus to the public safety as a magazine of gunpowder to a populous city."

However, all these invectives did not obstruct the progress of the establishment; on the contrary, it became more powerful, and increased in proportion us the government was more extravagant and careless of the public money. It became, in short, an indispensable engine of the government itgelf; but the fatter was compelled, by public opinion against the detested operations of tho Exchange, and in order to keep up appearances, to pass several acts against the very operations and the very gambling it was so deeply, though secretly , fomenting. Avarice, idleness, and the hope of becoming rich in a short time without industry, eluded and evaded all the lawe of British wisdom, and sometimes disregarded even the common law of the land. By a variety of measures has the power of this corporation reached ita present height. Its members have not only become the exclusive masters of the British money market, but have acquired the immenss power of secretly controlling and regulating the funds and money market of all Kurope, and, we may add, all America. No financisl operation whatever can be safely undertaken in any ot those markets without consulting and oltaining the approbation of the Committee of the Stock Exchange. The agents of the Bank of Englant have surpassed their principals. A mere decision of a committee, composed of individuals unknown beyond their own immediate circle, is more powerftu, and will produce moro effect in regard to ony loan or financial measure than all the laws of the sovereigns of Europes put together. Hewever, the inapertance of the Stecis Exchange has somewhat declined since the failure of its gigantic operations on thls side of the Atlantic; and since the immense lesses sustained by the British puillis on that occasion, it has been loss attended; the number of its members being reluced at one time as low as 400 .

Funding System.-The first operation of the funding system, aiter the peace of 1815 , in censequence of the rise of public securities, was to reduce the interest on exchequer billa (1817) from $5 \neq$ to 81 per cent.; and while only three millions wete added to the debt. above twenty-three millions were canceled. The interest of a portion of the public funda was transferred froni a lower to a higher denomination; the? $\boldsymbol{y}^{\circ} \circ$ cent. stock was converted into $3 \frac{1}{2}$ per cent., thereb ith sting a reduction of the debt, by induciug the hold +3 of the former stock to buy in the latter at a higher price. Thus the small sum of $£ 3000$ whs created, while more
than nineteen millions of the national debt were redeemed in 1818. The noxt measure was tha reduction of the five per cents Into fonrs. The bank at that time had thirteen millions in their vanlts; and they increased the circulation by throwlng a large amount of paper into market, and by loweriag the rate of intorest from 5 to 4 per cent. By the union of govcrmment and banklig powers, the enormous sum of $£ 140,250,828$ of 5 per cents was readily converted into $£ 147,263,328$ of 4 per cents, at an annual saving of in terest of $£ 1,222,000$ at a small Increase of capital only, In 1824, 1 per centa to the amount of $£ 76,806,882$ were changed into an equal amount of atock bearing an intorest of 31 per cent. This operation, besidea effoeting an annual saving of $£ 381,034$, had the advantage of naking no addition to the capital of the debt. In $1827, \pm 8,500,000$ of deht wers creatod, while $£ 2,866,528$ were redeemed. In 1828 the sinking fund was destroyed. On the IIth of July, It was enacted that for the future "the amount of the siaking fand be the actual surplus of the revenue over the expenditures." (Came into operation 5th July, 1829.) At that time thera were no surpluses, bat a large defielency of revenue.
But although ono of the three elements of the funding system was thns lost, the antion of that system was not en that account discontin. ied. A prospective operation was contrived in May, 1,30, to transfer Into 3 per cents the fours created at the reduction of the lives in 1822. One of the condill ns was, that the new stock should not be subject to re lemption at any time before January 5,1849 ; and at option was offered to the holders to receive fio of tie new fives, or £100 uf the 3t per cents, for evory $£ 10{ }^{1}$ of 4 per cent annuities. This operation was called pospeetive, bocause the advantage of the plan is, that when the stipuluted term shall have expire." as muth relicf may be ubtained by t'is nation fro"r sy paynient of fio employed in canceling 5 per cents as by tho payment of $£ 100$ when applied to the discharge of 34 per centa, both being redcemable at par: annual eaving u: this step, $\mathbf{£ 7 0 0 , 0 0 0 . ~ I n ~ 1 8 2 9 , ~} £ 4,100,000$ were ereated, and $£ 6,000,000$ reduced; $£ 154,000,000$ were created in $18: 30$, and $£ 168,000,000$ reduced ; but what was the result? The committee of $18: 8$ state, that "in a few years [ sys the 4th report] which preceded the virtual abandonment of the system, ona handred and twenty millions had been added to tha capital of the national debt, while the purehases of the commissioners had fallen so far short of that sum that the unredeemed capital of tho unfunded delit was greater at the eommencement of 1823 than it had leen in $1 \times 18$, hy the sum of twenty-five millions." In 1 א19 twelvemillions, and in 1820 thirteen millions, were unwarrantably taken from the sinking fund. The netual reduction during the peace is, according to the Finance Committeo, who leclare "that the total reduetion effected from 1816 to 1828 in the national debt was ondy three millions and a hulf."

The writer from whom we have abridget the preceding facts concludes: "It appears that this enormons delth (which he states at eight hundred and sixty. four millions) has been chietly raised by means of the Bank and the Stock Exchange, aided by the delurion of the siaking fuid; and that it has been principally expemded in wars, most of them undertaken against the trua interests of the nation, whuse topographical situation reuders her independent of continental broils and fuarrels. Its amount has been immensely increased in time of war, while the reductions effected in time of peace have heen exceedingly limited. In the irst prrionl, of twelve years peace, ten millions wero redaced; in the second, which lasted ten years, only four and a half tillions; and in the last and longest, near thirty years, the mount of reduction has been so witling that it seemes almost incredible. When we cunsider :' vety inoonsiderablo reduction aflected
during ao long an lnterval of peace, the most alarming forebodings arise for the future. Tha Fritls i Leglslature, the economists, and the reflectlng men so numer. ous in England, have in this subject an anbounded field for the moat serious refloctlon." Thes wars were conducted through the ageney of paper money and the funding systom. Pope hais very happlly hit the expediente of the British minlatry in the following lines:
"Bleas'd paper eredit! last and beat supply, That lende corruption lighter wings to fly; Gold Imp'd by thee can compass 'Jardest thingen Can pocket atates-can fatch or siarry kinge; A sinule leay shall waft an anmy cio',
Or shlp off senstea to somo ditant shore."
-Compiled from IIamilton, Bailey, Pebrer, Parliamentary authorities, and on the authority of manuscript tables obtained from the office of the British Controller in London.

Stoppage in Transitu is the seizure by the seller of goods sold on credit, during the course of their passage (transitus) to the buj. . This princtiple is sald to have been establishrd about 1690 in the Court of Chsncery (2 Vern, 203); and it has since been acknowl. edged in the courts of common iaw. The transitus is deflned to be the passage of tho goods to tho place agreed upon by the buyer and seller, or the place at whieh they aro to come into the possession of the buyer. i'his definition does not mean that the term trausitus implies continual motion; goods aro in transitu while they are at rest, if they are still on tha road to the place to which thay have been sent. This doetrino of stoppage in transitu entities a seller, in case of the insolveney or bankruptey of the buyer, to stop the goods ictoro hey come into the buyer's possession. The right of stoppage in transitu is not contined to cases of buying and selling. A factor either at home or abread, if he consigns goods to his principal by the order of the principal, and has got the goods in his own wame or on his own credit, has the same right of stoppage in transitu as if he were the seller of the goods. Questions of stoppgge in transitu somatimes involve difticult points of law. The right of stoppage implies that the roods are in the possession of the seller or facter when he exercises this right. Accordingly, the law of stoppage involves the law of possession of movable thiags. -Bons's C'yclopedia; Ahnotr on Shippiny; Cuoss on Lien aml Stoppage in Transitus; Sminn's Leating Coses; JUusselle's T'reatise on the Laus relating to Factors and Brokers.

If the buyer has in good fuith and for value sold the gools, and indorsed and delivered the bill of lading, this second purchaser holds the goods free from the first seller's right to stop them. Ilut if the goods and bill ara transferred only as a security for a delt due from the first purchaser to the transferee, the ariginal seller may stop the gooils, and hold shem subject to his security, and need pay only the specific advances made on their credst or on that very bill of lading, and not a general indebtedness of the first purelaser to the seconui. The question has been much agitated whether the right of stoppage in transitu was a right to tescind the sale fur non-payment, or only an exten.sur of the common-law lien ot the buyer on tho thing stid fier his price. And it seems now quite well setiled, both in England and in this country, that it is the latter; that is, an extension of the llen. Important cousequences might flow from this cistinction. If the seller, by stopping the goods in transitu, reseinds the sale, he has no further claim for the price, nor any part of it; nor can the buyor, or any one representing him, pay the price and recover the gools against the will of the seller. If, however, he only exercises his right of lien, he holds the goode as the property of tho buyer; and they may be redeened by hinn or his representatives by isying the price for which they are a escurity ; and if not redecued, they become absolutely the seller's, in the sanse way as a juledge might lecomo his; and if he fails
to obtain from them the full price due, he has a claim for the balance upon tha buyer. All of this ia not positiveiy determined by adjudication, but it would acem to be deduciblu from the priveiple that the act of atoppage in transita la oniy the exerciae of a lien on the goods for their price.-PARsons's Mercantile Law, p. 63; see also Kenr's Comm., voi. ii.

Btores, in Commercial navigation, the onpplies of different articles provided for the aubsiatence and accommodation of the ahip's crew and passengera.

Stranding, In Navigation, the running of a ohip on shore, or on the beach.
It is important to define accurately what shall be deemed a stranding. But this la no easy matter; and much diversity of opinion has been entertained with respect to it. It wauid, however, appear that merely striking aguinat a rock, bank, or shore, is net a atranding; and that, to constitute it, the ship mrat be upon the rock, ete., for some time (how long?). Mr. Justice Park has the following observations on this aubject : "It is not every tauching or striking upon a fixed body in the sea or river that will constitute a stranding Thus Lord Elienborough heid that, in order to eatabiish a stranding, the ship must be stationary; for that mercly atriking on a rock, and remaining there a short tine (as in the case then at the bar, about a minute and a half), and then passing on, though the vessel may have received some injury, is not a stranding. Lord Eijenborough's langusge is important. Ex vi termini stranding means lying on the shore, or aomething analogons to that. To use a vulgar phrase, which has been applied to this subject, if it be touch and go with the ship, tbere is ne stranding. It can not be enough that the ship lie for a few moments on her beain ends. Every striking must necessarily produce a retardation of the shipis motion. If by the force of tine clements sha is ran aground, and beeomes stationary, it is immuterial whether this be on piles, on the muddy bank of a river, or on rocks on the seashore; but a mere striking will not do, whevever that may happen. I can not look to the consequences without considering the causa causans. Thero has been $n$ curiosity in the cases about stranding net ereditable to the law. A little cominoo sense may dispose of them more satisfactorily."

This is the clearest and most satisfactory statement we have met with on this subject; still, however, it is very vague. Lord Ellenborough and Mr. Juatice Park hold thas, to constitute a stranding, the ship must be stationary; but they also held that if she merely remain upon a rock, etc., for a short time, ahe is net to be considered as having been station:ory. Hence every thing turns upen what shail be considered as $n$ short time. And we can not help thinking that it wenld be better, in order to put to rest ail doubts upon the subject, to decide either that every atriking againat a roek, the shore, etc., by which damage is done to the ship, should te considered a stranding ; or that no atriking against a reek, ete., should he considered as such, provided the ship be got off within a sprcified time. Perhaps a tide would be the most proper period that could be tixed. The English insurance companies exclude the words, "or the ship be stranded," from the memo-randum.-See Insuliance [Mabine], Anandonment, and Avepage.

If the sinip be voluntarily stranded, to escape danger from tempest or chase of an enemy, the damages from that act are to be borne by a general average, if the ahip be afterward rocovered and perform her voyage. But if the ship be whoily lost or destroyod by the act of running iber ashors, it ins been a question much discussed, and different opinions maintained, whether the eargo saved war. bound to contribute to bear the loss of the ship. In the United States the general
conclasion seema to be that the lasa la not to be horne by general average of eargo; while the decislens in Europe go to eatabilah the opposite.-Kent's Comm., vol. iii. p. 306. It is understood that the mere atranding. a ship is not of itself to be deemed a total loss, yet it may be attended with circumataneea that will juatify an abandonment, even though the hull of the olip should not be materialiy damaged; if, for inatance, the coat of removal wauid exceed the worth of the ship.See Kesit's Comm., vol. lii. p. 402.
Eturgeon Fishery. The sturgeen is a large, vaiuable, and weil-known fiah, of which there are several species: viz., the atorgeon, properiy so called, or Accipenser sturo; the beluga, or Accipenser huso; the sevruga, or Accipenser stellatus, etc. The sturgeon is pientiful in the North American rivers, and on the southern shores of the Baitic; and is met with in the Mediterranean, etc. But it is found in the greatest abundance on the northern shores of the Caepinn. and in the rivers Woiga and Urai; and there ita fishery empioys a great number of hands, and is an important object of national industry. Owing to the length and strictness of the Lents in the Greek Church, the consumption of fish in Russia is immense; and from its central prosition, and the facilitica afiorded for their conveyance by the Wolga, the producta of the Caspian fisisery, and thase of ita tributary atreams, are easily diatributed over a vast extent of country. Beaides the pickled carcasaes of the fish, caviar is prepared from the roes; and isingiass, of the best quality, from the sounds. Tha cavisr made by the Ural Cossacks is reckoned superior to any other; and toth it and isingiass are exported in considerable quantities. The beiugas are sometimes of a very large size, weighing from 1000 to $15(0 \mathrm{ibs}$, and yield a good deal of oil. The seal-fishery is aiso pretty exter ${ }^{\circ}$. p'v prosecuted in the Caspian. The reader will vicl sotsiled account of the mode in which the fisi Fy: anied on in the Caspian, and in the rivers W0a_: i Ural, in Tooke's Russia.-See Fisilenies.

Sub-treasury. 'The sub-treasnry aystem is one pecuilar to the general government of the United States; whereby the separate and safo-keeping of the public funds is intrusted to special afficers appointed for this purpoes. From the year 1789 to the year 184t the public funds were entrusted as deposits in numerous banking instituticns throughout the Union. The failures of many of these during the years 1837-1842 led to the estabiighment, on the 6th Auguat, 1846, of the Independent Treasury, or Sub-treasury. By this law of Congress, the "rooms prepared and provided in the new treasury building at the seat of government (Washington), for the use of the Treasurer of the United States, his asaistants and clerks, and oecupied by them, and also the fire-proof vauits and safes erected in said rooms for the keeping of the public moneys in the pessession and under the immeuiate control of said treas urer, and such other apartments as are providec for in this act as piacce of deposit of the public mones, are hereby constituted and deciared to be the Treasurv of the United States." The aub-treasuries for the resepfion of the public funds are at Hoston, New York, Philadeiphia, and other cities; generally in the buifdings naed and known as the cnatom-louses. The assistant treasurers receive the following salaries: Boston, $\$ 2500$; New York, $\$ 4000$; Philadelphia, Charicston, New Orlesns, St. Louis, $\$ 2500$ each. After the 1st January, 1847, all duties, taxes, sales of public lands, poatage, and all other revenue, were made payable in gold or silver coin only; and all disbursements by or for acceunt of the Treasury were by law made payable in the same medium.

## Suocory. See Chicony.

Suez Canal. If we compare the mean distance: between the ports of Europe and India, by the Caje of Good Hopo on the one hand, ani by the intended cliannel between the two seas on the other, we ainali find an
onormous difference in favor of this latter ronte. This dlfferenco whil be still greater if we remember that a straight line on the chart of navigation is far from being the shortest diatance from one port to another, and the scaman can orly reach the point for which he is steering h y followiog a certain number of atuccensiva courses, approaching as near as posalble thee are of a great circle. Thus, far from making dizectly for the Cape of Good lfope, vessela leaving Europe or the Atlantic ports of North America, en routa for India, must steer for the Cannries or Azorea, In order to find the trade-winds of the northern hemiephere, to make the coast of Brazil, and sight Cape Frlo, or put into harbor at lio danciro. This is generaliy the route for the Cape of Good Hope, more Justly, perhaps, called the Cape of Storma. They then cross the Aguibas Baoh, reach Hourbon or Mauritus, and front thence eteer for India, following the routes aliowerl by the monscons. Vessels in the Nediterrancan again have to contend with still greater disadvantages. It often tabes them fiftsen days to reach the Straits of Glbraltar, westorly Winda generally prevailing in this quarter, where we also find a rapid tlow of the ocean waters inte the Medlterranean. Thus the voyage to India takes at least Hve months, or five monthe and a half, the voyuges home being rather more direct, without being sensibly shorter. Ships then run nearer to tho Afrlean shere, by reason of the trade-winds of the aonthern hemisphere; the place of call In this case being St. tlelena.

If we now examine the faciities for navigation in the three seas near the Canal of Suez, namely, the Mediterrancan, the Red Sea, and the tiulf of Oman, wo find:

Trat in tha Mediterranean the winds blow from the not th during the greater part of the year, change southeast in the spring, and return to the north, passing by

- weat and northwest.

That nearly the same takea place in the Ined Sea, where the north, which is the prevailing wind, heaps the waters in the direction of Bairelmandel, so that during a calon we observe a current setting northwari, evidently arising from the elevated waters in the south endeavoring to recover their level. Southerly winds generally succeed a altn.

Tha Gulf of Oma' . as two monsoons-tie nort heast monsoon, which gen. $r$ ! ly continues during the winter, and southwest monst $r_{5}$, which lasts during the summer, and is frenuently atormy. The change from one monsoon to the other is there, as elsewhere, accompanied by a series of storms and gales.

The considerable reduction of the tistance of linropean ports from those of India would not be the only advantage to trade from adopting the canal between the two seas; for not oniy would vessels reach their point of destination much aooner, but thoy would find places of anchorage throughout the entire route, and aiso, what is of more importance atill, they would meet with good markets. Tho navigator, after having followed tho unual easy routes of tho Mediterranean, would dispose of part of his cargo in the Canal of Suez, or at Djedita, would purchase ivery at Massarva, Souaken, or Derleera, which he would exchange in India for opium to take to China in exchange for ailk and tea. lie would complete his home eargo in colontal merchandise from Manilla, the Isles of Sunda and Ceylon: in cotton of India and Fgypt: in coffee of Abyssinia or Yemen; the gum of Soudon or Hedjaz; the corn of Lower Egypit, or rice of Damietta; and these numerous operutions, which now require yearn, would be accomplished rapilly and without danger with small capital aod small vessels. In short, by reducing the time necessary for the operationa of commerce, we reduce the general expense.

All aations would take advantage of tha Importance of the trade with India, China, and the istander of the ocean. Trade with the Hed Dea, aithough less consid. erable, deserves attention; but as there is scarcely
any earried on at present, it is very little known, and could only acpuire importance liy tho opening of a canal between the two seas. Tha Red Sea, which is so near to us in a atraight line, becomea far distant when we have to double the Cajo, liabelinandel is as far from us as I'ondicierry, and Souaken as far as Ba. tavia; Sucz, farther atlil, by this route becomes as near as licyrout by the canal; In ahort, the two routes, measured from the Straits of Gibraltar to Sounken, are in the propertien of one to five.

Very fow Ehropean vessels are now met with in the Rec. Sea. Every year we see a few belonging to the Parsecs of Bombay, and manned by lascars. The insternal srade of thla aca is now enrried on by Arabian barks, called dows, or boutres, constructed at ssuez, Djedilo, Kossair, Sonaken, or Morhn, with wood fron, India to Singapere. Theso vessels are of a very small tonnage, are very sharp, and have a handsome sheer; a heavy poop, which hloders thelr working, and lowers it at the stern; they carry one mast, rigging a square sail; this sall sull yard are struck to tho foot when they iay to; about thirty men are required to hoist it agaln, and this operation ean not be petformed in less Lhan half an hour. The tackinge of these ships is as ditlicult as it is dengerous. The dows only sait in the daytime; rluey get ander way about seven o'cloch in the morning, anil till about four in sight of the coast, then anchor 'y a grappling-iron, or run aground on the sand.-Ion!on Savtical Magazine. See also Southern Quarterly Rerifw, ix. 67.

Messis. Conrad, A. Renaut, Megrilli J. M'Leean, and Lieusson, the members of the interational commissiou for cutting a canal through the Isthmus of Sucz, have terminated their Investlgations In Egypt, and given in to the viceroy a irief preliminary report. They found insuperable ohstacles to directing the caral on Alexandria, and unespected facilitles for eatallishing a port in the diulf of l'elusiun. They are therefore minaimously of opinio:s that a direet canal from Suez toward the Gulf of Pulusinm is the only polution of the problem of the junction of the Rul Su'a and the Mediterranesm. "The exccution thercof is ensy, the success certnin, the resulte lmmense for the commerce of the world." The expense of the canni and of the works connected with it will not, it is added, exterd $200,009,000$ francs.

Sugar (Fr. Sucre ; (ier, Zucker; In. Zucchero; Russ. Sachar; Sp. Azucar; Aralb. Sukhir; Molay, Sola; Sans. Sorkorid), a $\quad$ weet granulated substance, ton well known to require any particular descripticn. It is every whore in oxtensive use, and in this country ranks rather amoat; the Indispensabls necessaries of life than among lifxuries. In point of commercial importance, it is acond to very few articies. It is chietiy prepared from the expressed juice of the A iwndo sacchavifere, or augar-cane; but it sa also procured from an immenso variety of other planta, as mapic, beet-root, hireh, paranep, etc.

Speries of Sugar.-The sugar met with in commerce is usually of four sorta; lirown, or muscovado suggr; clayed sugar ; refinet, or loaf sugar ; and sugar-candy. The dilf-rence between one sort of sugar acd nother depends altogether on the different modes in which they are jrepared.

Brourn, or Muscorado Sugar.-The plants or canes being crusbed in a mill, the joice, having passed through a strainer, is collected in the clarifier, where it is tirst oxposed to the action of a gentio fire, after bcing"tempered" (mixed with alkall), for the purpose of facilitating the aeparation of the liquor from its impurities. It is then conveyed into the large evaporating copper, and successively into two others, cach of smaller size: the superintending boiler frecing it during the process from the scum and fecolent matters which rise to the surface. The sirup then reaches the last copper ves. sel, called the "atriklag tache," where it is loijed till sulficiently concentrated to be capable of granulating in the coolor, whence it is transferred witl: the least
possible delay, to prevent charring. Elere it soon reases to ho 4 liquid; sund when fully crystallized, is put into hogsheadn (called "potting"), placed on their cuds in the caring-house, whth scveral apertures in their bottoms, through which the molasses drain into $:$ alstern belew. In this state they remain till properly cured, when the casks are tilied up and prepared for shipment.

Clayed sugar is prepared by taking the julce, as in tite case of muscovado sugar, when bolled to a proper censistency, and pouring it into conical pots with the apex downward. These pota have a hole at the lower extremity, through which the molasses and sirup are allowed to drain. After this drain has continued for some time, a ritratum of molstened clay is spread over the surfaco of the pets; the moisture of which, percolating through the mass, is \{ound to contribute powerfully to its purlfication.
llefined sngar may bo prepared from muscovado or clayed sugar by redissolving tho sugar in vater, and, after boiling it with sone purifylng substances, pouriug it, as before, into conleal pots, whleh aro agala covered with moistened clay. A repetition of this precess produces duuble refined sugar. But a variety of improved processes are now resorted to.

Suyar-candy.-Solutions of brown or clayed augar, beited until they becomo thick, and then removed inte a hot room, form, upon sticks or atrings put into the veskels for that purpose, into crystals or candy.

Mistorical Notice.-The history of augar is involved in a good deal of obscurity. It wrs very lmperfectly known by the Greeke and Rowasa. Theophrastus, who Jived about 320 years before ithe Chrlatian era, the first writer whose works have como down to us by whum it is mentioned, ealls it a sort of "honey extracted from canes or reeds." Strabo states, on tho autherity of Nearchas, Alexander's admiral, that "rueds in India yield honey without bees." Ant Sonoca, who was put to death A.c. G5, alludes to sugar in a way which shows how little was then known respecting it (Epist. 84): Aiunt, says he, inveniri apud fulos mel in arundinuint foliis, quol aut ros illius call, aut ipsius arundinis humor dulcis et pinyuior gignat. Of the ancients, Dioscorides and Pliny have given the most precise description of augar. The former says, it is " $a$ sort of concreted honey, found upon canes, in India and Arabia Felix; it is in consistenco like aalt, and is, like it, brittle between the teeth." And Pliny describes it as "honey collected froin canos, like a gum, white and brittle between the teeth; the largest is of the size of a hazel-nut: it is used in medieine only."-Saccharum at Arabia fert, sed laudatius Indin; est autem mel in arundinibus collectum, gummium modo candidum, dentibus fragile, amplissimum nucis avellane magnitudine, ad medicinas iantum usum.-hib. xii. c. 8. It is evident, from these statements, that the knowledge of the Greeks and Romans with respect to the mode of obtaining sugar was singularly imperfect. They appear to have theught that it was found adhering to the cane, or that it issued from it in the state of juice, and then concreted like gum. Itadeed, Lucan exprossly alludea to Indians near the Ganges-

Quique bibunt tenera dulces ab arundine succos. -Líb. III. t. 237.
But these statements are evidently without foundation. Sugar can not be ebtained tron the cane without the aid of art. It is never found native. Instead of flowing from the plant, it must be forcibly expressed, and then subjected to as variety of processes. It is not, lowever, quite se elear, as has been generally supposed, that the Remans were wholly unacquainted with the mode of procuring sugar. The remarkable line of Statius,

E't quas percoquit Ebusia cannas-Sylv. ILb. 1. v. 15,
has been conjoctured, apparently on geod grounds, to refer to the bolling of tho juice of the cane. But the pas-
sage has been differently read, and is too enigmatical to be mueh cieponded on. Dr. Moseley conjectures, epparently with much probablity, that the sugar described hy Pliny and Dioscorides, as being macte uso of at Jiome, wan engar-candy obtained from China. Th's, indeed, is the only sort of sugar to which thelr deact iption will at all apply. And it would seem that the modus of preparing sugar-candy $h^{\circ}$ j been undersiood and practleed in China from a very remote antiquity; and that large quantities of it have been in all ages exported to India, whence, it is most probable, smali quantitles found their way to Rome.-Treatiss on Sugar. This, ne well as Dr. Moseley's Treatise on Coffes, is a very learned and able work. Europe seems to be indebted to the Saracens not only for the first conslderable supplies of sugar, but for the carlicst example of its manufucture. Having, in the course of the 9 th sentury, conquered Khodes, Cyprus, Slcjly, and Crete, shey introduced into them the sugar-cane, with the cultivation and preparatlon of which they were familiar. It is mentioned by the Venetian historians that their countrymen imported, in the 12th century, sugar from Slelly at a cheaper rate than they could import it from Egypt.- Essai de I'IIstoire du Cummerce de Venise, p. 100. The crusades tended to apread $n$ taste for sugar throughout the Western World; but these can bo no doubt thit it was cultivated, as now stated, in modern Europo anteceilently to the era of tic crusades; and that it was also proviously Importel by the Venctians, Amalphitans, and othera, who carried on a comnereial intercourso from a very remote epoch with Alexandria and other cities in the Levant. It was certainly imported into Venice in 996.

The art of refining sugar, and making what is called loaf-sugar, is said by Dr. Moseley to be a modern European invention, the discovery of a Venctian about the end of the 15 th, or the beginning of the 16 th cen-tury.-Moseley, p. 66. But. this is doubtful, for le Grand D'Ausay lins shown that white, or, as he call 3 it, refined sugar (sucre blancou raffine), had been intreduced into and used in France for more than a century and a half previously to the date nssigned for the discovery of the process of refining in Venlec. But white sugar is not necessarily, as la Grand D'Aussy seems to suppose, refined: it may be merely clayed, likē-Iavana sugar, which is as white as refined sugar. Loaf or lump sugar is unknown in tho East, sugar-candy being the only species of refined augar that is made use of in India, China, etc. The manufacture of sugar-candy is carrled on in Ilindostan, but the process is extremely rude and imperfect. In China, however, it is manufacturod in a very superior manner, and large quantities are exported. When of the beat descriptlon, it is in large white crystals, and is a very beautiful article. Two acrts of sugar-candy are met with at Canton, viz., Clinchow and Canton; the former being the produce of the province of Fokien, and the lntter, as its name implies, of that of Canton. The Chinchew is by far the best, and is abent 50 per cent. dearer than the other. Chineso sugar-candy is extensively consumed by Europeans at the ditferent actilemente throughout the East. The exports of sugar-candy from Canton in 1846 for Britieh India and Australia amounted to 58,584 piculs, or $\$ 296$ tens. Within the last four or five years raw sugar has begun to be rather largely exported from China to England, the shipments for the latter in 13.6 having amounted to 18,620 tons. But the speculation did not turn out well; and it is doubttul whother the sugar of China will be able to withstand the competition of that of Brazil and Cuba.Vie Privde des 'rrangois, ii. 198, ed. 1815. This ougar was imported from Egypt principally by Italians; and the probability is, that the latter were the first Europeans who practiced the art, whieh, however, would appear to have originated in the East. The cane had, as already seen, been introduced into Sicily, and its culture practiced previously to the middle of the 12 th cen.
tury. It also was carried to Spain and cultivated by the Saracens soon after ther obtained a footing in that country. The flrat plantations were at Valencia; but they were afterward exteaded to Granada and Murcia. Mr. Thouas Willoughby, who traveled over the greater part of Spain in 160\%, has given an futersating account of the state of the Spaniah augar plantations, and of the mode of manufacturing the suga:. Ilanta of the augar-caue were carried by the Spaniarda and Portu guese to the Cunary Islands and Madeira, In the early part of tho lith century ; nod it has been asserted by many that these islands furuished the first plants of tho augar-cane that ever grew in America.

Barbadoes is the ohilest settiement of the Englialt in the West Indies. They took possession of it in 1627, and so carly as 1646 begnn to export sugar thesce to Einglanil. The trade of Barbadoes attained its inaximumin in 6 6, furnishing, it is sail, employment, at that poriond, for 400 sail of vessels, avoraging 150 tons burtlen; but this statemene is most probably exaggerated.

Januica was discovered by Columbus in his second voyage, and was tirst occupied by the Spaniards. It was wrested from them by an expedition sent against it by Cronwell in $\mathbf{1 6 5 6}$; and has since contlnued in the possession of the English, forming by far the most valuable on their West Indian colonies. At the time when it was conquered, there were only three smali sugar jlantations upon it. But, in consequence of the influx of English settlers from Llarbadoca and the mother country, fresh plantations were specdily formed, and continued rapidly to increase.

The sugar-cane is eaid to have been first cultivated in Sun Domingo, or Ilayti, in 1506. It succeeded better there than in any other of the Weat Indian lalands. Peter Martyr, in a work published in 1530, states that in 1518 there were 28 sugar-works in San Domiugro, established by the Spaniards. "It is marvelons," aays he, "to consider how alt things increase and prosw per in the inland. 'There are now 28 sugar-presses, wherewith great plenty of sugar is madic. The canes or reeds wherein the sugar groweth are higger and higher than in any other place, ant: are as big as a man's wrist, and higger than the staturo of a man by the half. This is more wonlerful, that whereas in Valencia, in Spain, where a great quantity of angar is mate yearly, whensoever they apply themselves to the greet increase thereof, yet doth every rout bring forth no! past 5 or 6 , or at most 7 of these recds; whereas in San Domingo one root beareth 20, and oftentimes 30. "

Sugar from San Domingo formed, for a lengthened period, the prineipal part of the European aupplies. Previously to its dovastation in 1790 , no fewer than 65,000 tons of augar wero exported from the French portion of the island.

Introduction and Cultiration of the Suyar-cane in America.-Sugar-cane occure in a wild atato on many of tho islands of the I'ucitic, but in no part of the American Continent, notwithstanding a contrary opinion has been expressed. Its coltivation and the manufacturo of sugar were introduced into Europe from the East by the Saracena, soon after their conqueats in the 9th century. It is stated by the Venctian historians, that their countrymen importec. augar from Sicily, in tho 12 th century, at a cheaper rate than they could obtain it from Egypt, where it was then extensive!y mate. The first plantatious in Spain were at Valencia, but they were extended to Granada, Murcia, Portugal, Madeira, and the Canary Islands, as early as the beginuing of the 15 th century. From Gomera, one of these ialands, the sugnt-cane was introduced into the West Indics by Columbus, in his second voyege to Anerica, in 1493. It was cultivated to some oxtent in San Domingo in 1506, where it succeeded better than In any of tho other jaiands. In 1518 there were twen-ty-eight plantations in that colony, established by the Spaniards, where an abundatice of augar was made, whlch for a long period formed the principal part of
the European supplies. Barbadoes, the oldeat English settlement in the West Indies, legan to export sugar in 1646, and in the year 1670 the trade requirod four hundred veasels, averaging 130 tons burden.

The introduction of angar-cane into Florida, 'l'ex. as, California, and Louisiana, probably ilates back to their earlieat settlement by the Spaniards or Frencl.
was not culcivated in the latter, however, as a staple $h_{4}$ " uct before the year 1751, when it was iutroduced . aeverai negroes, by the Jesuits, from San Domingo, They commenced a small plantation on the banks of the Misaiselppl, just above the old city of New Orleans. The year following, others cultivated tho plant, and made some rude attempts at the manufacture of sugar. In 1788 M . Dubreuil established a angar estato on a large scale, and orected the firat sugar-mill in Louisiana, in what is now the lower part of Now Oricaus. Jlis success was followed by other plantations, and in tho year 1765 there was augar enough manufactured for home consumption; and in 1750 it had beconte one of the staple products of the colony. Soon after the Jev. olation, a large number of onterpriaing advonturers emigrated from the United States to Lower Louisiana, whero, among other oljects of industry, they engagel in the cultivation of cane, and by the year 1803 there were no less than eighty-one sugar eatates on the belta alone. Since that period, while the production of canc sugar has been annually jucreasing at the South, the mannfacture of maple-augar bas been oxtenting in tho Nortls and West.

The comnon sugar-cane is a perennial plant, very sensitive to cold, and is therefore restricted in its cultivation to regions bordering on the tropies, whero there is little or no frost. In tho Eastern henispliere its proluction is principally confined to situations favorable to its growth, being between the fortieth parollel of north latitude and a corresponding degree south. On the Atlantic side of the Western Continent it will not thrive beyond the thirty -thirl degree of north latitude and the thirty-fifth purallel aouth. On the l'acific side it will perfect its growth aome fiv : thegrees farther north or south. From the flexibility of this plant, it is lighly probable that it is gradually becoming more harily, and will eventually endure an expos. ure, and yichl a jrotitable return, much farther north, along the borters of the Mississippi and some of its tributaica, than it has hitherto been produced. Ia most parts of Louisiana the canes yicld three ereps from one planting. The first season it is denominated "plant eane," and each of the subsequent growths "rstoons." Ihut sometimes, as on the prairies of Attakspas and Opelousas, and the higher northern rango of its cultivation, it requires to be replanted every year. Within the tropies, as in the West Indies and elsewhere, the ratoens continue to yield abundantly for twelve, fifteen, and even twenty-four years, from the same roots.
The eultivation of this plant is principally' confined to the Wesk Indies, Venezuela, Brazil, Mauritius, Britibh India, China, Japan, tlse Sunda, Jhilipfine, and Sandiwich isiands, and to the southern districts of the United States. The varieties moat cultivated in the latter are the atriped blue, and yellow ribbon, or Jsva; the red riblion, or violet, from Java; the Crede erystalline, or Malabar; the Otalicite, the puride, the yellow, tho purple-handed, and the gra. anes. The quantity of sugar produced on an acre varics from 500 to 3000 lba ., averaging, perhaps, from 800 to $1000 \mathrm{lls}$,

Iltherto the amount of sugar and molasses contsumed in the Linited States has exceeded the quantity produced, consequently there has been no direct occa$\sin$ for their oxportation. In the year 1815 it was estimated that the sugar made on the lanks of the Nissisaippi alone amounted to $10,000,000$ Jbr. In 1818 the entire crop of Loulaiana was only $25,000,000$ Ibs.; in 1850 it had reached the enormous quantity of $226,001,000 \mathrm{Ibs}$., besides about $12,000,000$ galious of

molasses. Aecording to the cenaus of 1840, the amount of cane and maple sugar was $155,100,800 \mathrm{lbs}$, of which 110,047,720 lbs, were ralsed in Louislana. By the census of 1800 the cane sugar made In this country was $247,581,000$ lbe., besldea $9,700,606$ gullons of molasses; maple-sugar, $84,249,8861 \mathrm{lb}$., amountligg to $281,880,886$ llos., showing an increasa in ton years of 126,780,0.7 Ibs.-United States Patent Office Report, 1800.

Aidulteration.-Sugar is an article which is sapeclally liable to adultaration; and its high price during the last fow yeara, coupled with tha ligh duty, has given a powerful stimulus to thia nefarious practice. Perhaps we might not be far from the mark were we to estimate the quantly of forelgn matters intentionally mixed up with sugar, and aold as auch in England, previously to the lata reduction of duties, at 10,000 or 12,000 tons a year! Sago and potato flour aro the articles which have been most oxtenaivoly used for this purpose. When mixed with augar they give it a whiter and finer appearance, and, unless the dose be overdonc, Increaso ita price about 48 . a cwt. It is axtremely difficult to deal with an abuse of this sort. No doubt the fall in the price of augar following the placing of the trade on a proper footing, and the reduction of the duty, have leasened the temptation to adulterate. But they lave not wholly removed it, the materlals employed to adulterata being decidedly cheaper than sagar, however supplied. In this, as in most cases of tho sort, the best security against adulteration is to deal only with grocera of the highest character.

Failure of the Sugar-cane in Louisiana.-The culture of sugar-cane in Louisiana has been suhjeet, from the period of its Introduction in 1751 up to tho preaent time, to certain imfavorable vicissitudes to which it is not linblo in more southern climes. Tho past lias been more marked, perhaps, than any preceding season, both in reapect to tho amount produced and to the diseases and condition or degeneracy of the cane. The spring of 1854 is represented to have been so extraordinarily dry that most of the cuttings put into the ground perished, even after they had vegetated. Indeed, nomo few sectlons only of the sugar-growing parishes were favored even with occaaional vernal showers, and the crops in these sections gavo better promise than those in other parts of tho State. But yet la these the yield wis not abundunt, as the aummer and fall proved otherwise unfavorable to the growth and maturity of the cane ; and many plantera, who had crops of fair appearance, found, upon grinding and boiling, that the actual yield of sugar to the acre was unusunlly small. The plant-cane, upon which the cultivators malaly depend, seems to have been a general failure throughout the State; and the small crop made was mostly saved from the stubbles or ratoons. The accuring of the crop was elso very unfavorable to the planter. At the commencement of the grinding there appeared to ba little or no erystallizable bugar in the juice. The cane was not ripe, and the cold and unusually wet winter, which consequently required a large ainount of fnel for boiling, was a great drawback; so much so that mnny of the planters lost a good portion of thelr crops by not being prepared for these exigencies, while others, rather than grind their immature cane, preferred to let it stand in the fields, cven at the risk of losing a part, and did not commence boiling before the 20th of December.

The detcrioration, or falling off of the crop, has been attributed to presmed causes, one of which is that based upon the thcory of Mr. Knight, of Herefordshirc, in England, in the latter part of the last century, namely, that plants propagated by cuttings, or slips, detcriorato and become extlnet, unless regenerated from tims to time by the production of fresh stocks directly from the reeds. Mr. Knlght, it woukl seem, based his hypothesis upon the fact that certain varietice of the apple in his nelghborhood wero believed to be running through their natural course, and named as instances
the "Golden Pippin" and the "Nonparell." But the particuinr cases thus cited failed to austain his assumption, for the Golden Plppin is believed still to thrivo well at Madeira, on many parta of the Continent of liurope, and in England, as well as the Nonpareil, just as they did in the days of Queen Anne.
The cultivated augar-cane very rarely produceas seeds, although this is said sumetimes to occur even in the Southern States of this Unlon; but it has not been shown that the seeda have vegetated when sown; yet thare is, no doubt, some country in which the course of nature is followed in this respect. Moreover, it has been averred that there in no region in which the cultlvators attempt to resort to thia mode of propagation, their dependence being always and entirely upon the cuttings. The theory, therofore, of the insufficiency of this means of propagating the sugar-cane, is withont tho least foundation, unlesa it can be shown that a gencral tendeney to docay and extinction is manifested in it throughout the globe-a fact that has not been assumed, and that certainly docs not exlat.

That the propagation of plants, by their seeds, is the natural methoi, seems like an infallible proposition; and to the inquiry it naturally suggests respecting their design, if not for this use, it may bo difticult to find a conclusive reply. But the vegetable kingdom presents to the mind of the observer so many apparent anomalice, that tho student who refuses to progresa farther until each in succession is made plain to hls understanding, la not likels to proceed far in this most interesting and profitable j, ursuit.

It is an unfortunate, though very prevalent error, to attribute the diacases of plunta to other than the real causes, since by doing so we deprive ouraelves of tho ability to apply the remedy appropriate to ench case. A deficiency or excess of rain, heat or coid, the elcetric state of the atmosplere, and, what is atill more likely, an unfavorable condition of the soil, doubtless moro or less Induce the disenace or debility of plants; and these may be either local or general. In the case of the augar-cano of Louisiann, for instance, although it is highly desirable to introduce cuttligg of new, and, if posisible, better varictics, than are now cultivated in that State, thero is a probable cause of deterioration to which the attention of planters has not been effectunlly directed. It is known that the continued production of a single species of plont upon almost any soil will evencoally exhanst that soil of those elementa eapecially required as the pabulum of that plant, if those elements be not carefully ascertained and systematically returned. Is not this probably the case with respect to the sugar-fields of Louiaiana? Chemical analyses have shown thit nearly one half of the inorganic matter contained in the cane itself is plosphate of lime, and nearly a fourth silica. The baro statement of this fact must assuredly suggest to every mind a prominent cause of the evil. In the continued culture of augar upon the same lands, as of every thing elso, a judicious syatem of rotation, with n liberal supply of guano, or other animal and phoaphated manure. in connection with a duo aupply of well decomposed vegetablo matter, is casential; and, as has been intimated, the latter must be of the kinds specially indicated.

That there has been $n$ degeneracy In the canc, cansed by exhaustion of the soil, and injudicious rotntion, is obvious, from the fact that the aame lands which have been under cultivation for a long period have yielded more than threo times the amount of augar to the acre in eome years than in others, the productiveness having been in thosa cases in which tha soil was lin its primitive fertllity, or when enriched by guano or other appropriate mnnures. For instance, the British and French West India Islands, some aixty or seventy yeara ago, yiclded from 3000 to 6000 pounds of 8 gar to the acre. At present they do not ylcld a third of this amount without manure. The product in Louisiana,

In order to show the fluctuations of the sugar－crop in Louisiana，we have compiled from our records the annexed statement of the sugar prodnct of Louisiena for the past twenty－three years，showing the amount of each year＇s crop in hogsheads and pounde，with the gross average value per hogehead and total，the pro－ portions taken by Atlaatic ports and Weatern States， and the date of the first receipt of eaoh crop．By this statement it will be ween that the total product of Louisiana from－ 1884 to 1856 inclusive，a period of twenty－three yeara，was $8,972,716$ hogoheads，valued at $\$ 204,181,228$ ，and that of this quantity the Atlantic ports took $1,817,883$ hogshead3，and the Western States $1,974,103$ hogsheade．The crops from 1828 （which is as far back as our estimates extend）to 1883 summed up 281，000 hogsheads；which would make the total product in a period of twenty－seven yeara 4，253，716 hogsheade，or $4,477,668,000$ pounds．We would here remark that up to 1848 the product in hogsheads is estinnated，and 1000 pounds taken as the average weight per hogshead，but for the crop since that date we have taken the figures of Mr．P．A．Champonier，as we find them in his anoual statementa．

In seeking $\boldsymbol{p}$－emedy for the evil hero complained of in Louisiana，the minds of many have very naturaliy been turned to the project of replenishing tho cane－ fields of that State by the importation of a fresh sup－ ply of cuttings，of such varieties as may be found best euited to the soil and climate．Resort to this means of restoration should be promptly mado on a liberal and extensive acale，so that tho experiment may be thorough，and，if possible，eflectual is its results．An intelligent agent should bo selected for the purpose， well acquainted with the character of the cane，and the nature of the soils and climates in which it grows，as well as with the best modes of packing and transport－ ing it to distant parts，either by land or sea；and， what would add much to his qualifications，oue who is also acquainted practicaliy with the culture of the plant and the manufacture of sugar．
Among the points on this continent from which the cuttings could be obtained might be inatanced the valicy of Aragua，in Venezuela，Britioh Guiana，or somo favorablie tocality on tho cosat of Brazil．On or near the Eastern contineut，porhapa British India or tho islands of Maritius and Java might prove suitable posi－ tions for the procurement of the varietics desired．The agont thus employed ahould be accurately informed or instructod with reference to the soil，cilimate，and elovation alove the sea，of the augar districts of these countries，as well as to the age and heaithiness of tho canes from which the cuttings are to be taken，the parte $x$ the plants from which they are to be obtained，
and the proper seasons of procuring them and deliver－ ing them at some accessible point in the United States near whero tincy are intend do grow．

The varietics of cane which have hitherto been mest cultivated in Louisiana aro the Striped－liuo Ribbon； tho Green Ribion；the Yellow Ribbon，or Java；the Rod Ribbon，or Violet；the Reddish Violet；the Red atripod；tho Creole；Crystalline，or Malabar；the Ota－ heite；the I＇urplo；the Yellow；the Purple－banded； the Gray ；the Grayish White．
The Redatriped canc，which was originally brought from tho Dutch colony of Java，and the Violet or Red－ dish Viobet，which is ouly a variation from tho former， are lesiieved to be the ouly two varietice that wiil gen－ oraliy prosper under the climate of the sugar districts of the Southern States．All tho other descriptions ore too senulive to cold，except in the warmer parts of the delta of the Mississippi，Florida，and Texss．When planted in now ground，it gives a certain anouut of whito canes，or those the outside of which is of a gray－ ish white．When cultivated in oid soii，however，it furnishea a good yiold of violet－red cane．Again，on new ground，a part，say，from one－tenth to one－iffeenth， of the striped cano becomes white，or a dirty grayish white．Thore are also to be found more or less red atripes on aome portions of the stalk，or on the joints； hut all the reat of the atalk is entireiy gray．On oid ground，on the contrary，the red－striped gives red or violet red canes in about the same proportion as sbove． The tendency of this cano to degenerate rapidily is of
tieties
erat
Jub
marksble in every part of America. The other varieties are not so liable to deterlorate. After once degenerating, these canes never recover their original coler. -Patent Office Report, 1855,

Sources whance the Supply of Sugar is derived.-The West Indies, United States, Jsva, Brazil, Bengal, Mauritius, Siam, the Isle de Bonrion, and the Philippines, are the principal sources wheace the supplies required for the European and American markets are derived. The quantities exported in 1857 from these countries, exclusive of molasses, may be estimated as followa:

Consumption of Sugar in the World.-In the aggregate we shall not, perhaps, bo far wrong in cstluating the consumption of exported colonial and tropical sugar for the ycar 1857 as follows:

| The United Kingdom | $\text { Tom. } \quad \text { Tons. }$ |
| :---: | :---: |
| France . . . . . . . . . . . | 165,000 |
| Tho Netheriands, Belgium, Germany, |  |

Consumption in the United States.--The censumption of sugar in the United States has been very variable, and the increase of consumption in the last half-dozen yesrs-since the price has been low-is very great. This will be seen in the following tables. We shall first show the impertation of foreign eugar. In this account we have subtracted from the quantity imported the amount re-axported, so that the statement belew gives the prime quantity inported and used in the country for the years given.

| Years. | Pounda. | Yeart. | Poundr. |
| :---: | :---: | :---: | :---: |
| 1837 | 98,141,352 | 1848. | 244,13!,753 |
| 184 | 110,041,297 | 1850 | 194,483,699 |
| 1842. | 160,863,475 | 1858. | 448,400,644 |
| 18.5 | 90,752,969 | 1856 | 440,000,000 |

It will be seen from this that since 1845 , a period of ten ycars, the importation of sugar has quadrupled.

It will also be seen that from 1887 to 1839, and from 1850 to 1853, in each period, the importation of sugar doubled. There can be no doubt, from the exhibition of the above figures, that the reduction of prices has had great influence on the importation of sugar. Let us now turn from the foreign to the domestic supply; and tirst the production of Louisiana and Texas.

The New Orleans Prics Current furnlshes the number of hogsheads raised in the United States for a series of years. Reducing it to pounds, at 1000 lhs, to the hogshead, we have the following result siace 1837 :

| Years. | Pounds. | Years. | Poan |
| :---: | :---: | :---: | :---: |
| 1881 | 65,000,000 | 1848. | 220,000 |
| 1840. | 87,000,000 | 1850. | 211,808,000 |
| 184 | 140,000,000 | 1868 | 449,824,000 |
| 184 | 186,000,000 | 1855. | 231,427,000 |

We find from the teble that the production of cane sugar has doubled in the last ten years, and quadrupled in fifteen. In additlon to thia, the common maplesugar averagea about thirty millions of peunde per annum.
Now, takiag the aggregate of sugar imperted, and that made in the country, we have the following supply, estimated in pounds, fer auccessive years:

It may safely be assamed that the average consamption of sugar in the United States is now equal to nine hundred millions of pounds per annum. Deducting from the population of the United States three mill. tons of slavee, who prohably use very littlo sagar, we have the consamption of sugar equal to abent 10 lbs.
average for each person. But this consumption of sugar hse actually trebled in ten years! This is certainly a vory extraordinary fact, and indicates a great change in the habits of living among the people of the United States. That it is a real, absolute change in the habits of life, can not be doubted. Let us ahow its magnitnde by comparing the increase of population with the increase of augar:

We then ses that the consumption of augar far outruns the increase of population. In 1840 the consumption of augar was but 16 lbs , per individual. In 1855 it is 40 lbs .

In the period of twelve years, from 1848 to 1854 incinsive, there has been a steady diminution in the price of sugar, but not enough to account for the change we see here. The change of prices in New Orleans sugar has been as follows:

## 

The price of augar to the consumer in the West has diminished much more rapidly than this. The increase of steamboats and the rapld decline of freights has produced a great reduction in the price of tropical prodacts in the West; which has been steadily going on for thirty years. The effect of this, together with the increase of population at the West, has produced an extraordioary inerease in the consumption of sugar, and eapecially in the valley of the Ohio. This increase in the Western States is quite remarkable. We find, by a statement in the New Orleans Price Current, that in twenty years, from 1834 to 1854 , the export of sugar from Now Orieans to the Western States amounted to one million eight hundred thousand hogsheads, or about ninety thousand hogsheads per annum; but when wa examine the detail, we find the average annual increase to be very rapid. Taking the aggregate of each five years, wo have the following reault:

The present consumption of Louisians sagar in the Western States, to which it is carried hy ateamboats, amounts to an avarage of 160,000 hogsheads per annum. This is mainly distributed through the three great distributing points of the Weat-Cincinnati, Louisville, and St, Louis.

Another remarkable fact in the commerce in sugar Is the increase of American refined sugar. At the present tima the amount of refined sugara imported is not hal' what it was twe?ty years since; whilo the amount of sugar exported is four times as much.

Buanty on Eipportation of refined Sugar.-Sugar refined in the United States, the growth and production of any other country, is entitied to an allowance of drawhack equal to the amount of duties paid on the raw aeticle, on due exportation thereof to any foreign port or piace, subject only to the provisions that no drawback shall be aliowed on any exportation when such drawback shall not amount to tweive dollars or more. To entitle the exporter to the benefit of asid allowance of drawbsek, such exporter, at least six hours previous to the putting or lading any of the anid refined sugar on board any vascel or other conveyance for exportation, shall jodge with the collector of the custome, for the district from which auch importation is to be made, an ontry selting forth hia intention to export the same, and describing the marks, numbers, and packages, and designating the place where depos-
ited, and the name of the vessel or other convayance in or by which, and the port or place to which, the aame is intended to be exported. This entry muat be according to form, and, upon presentation, be verified by the oath or affirmation of the owner or agent, or other proper officer of the manufactory in which such augar may have been refined. If any of such sugar, after it shall have been shipped for exportation, shall be unshipped for any purpose whatever, either within the limits of the United States or within four leagues of the coast thereof, or shali be relanded within the United States from on board the vessel wherein the same shall have been laden for exportation, unless the voyage ahall not be proceeded on, or shall be altered from necessity or distress, to save the ship and goods from perishing, which shall be immediately made known to the coljector of the nearest district; then the sugar so unshipped, together with tho vessel, her boats and equipment, siall be forfcited, and may be seized by any off. cer of the customs or inspection.

The comparative consumption of sugar in Europe if no other could be had, that the people of the United and America is a aubject of interost. Mr. M'Culloch, the political oconomist, eatinated the consumption of sugar in Great Britain at 24 liss. per individual, and says this is much more then is consumed in France or any part of the continent. At present the consumption in the United States is 40 lbs. per individual; and thus we see it is much greater then in Europe, or probably any part of the worid. This fact is conclusive

"The foregoing statistics present in a cleur and concise view the extent of this branch of our commerce for the past ycar. It will be scen that tho total receipta of foreign nnrefined sugar into tho United States, luring the year ending December 31, 1857, were 269,180 tons, against receipts in 1856 of 275,662 tons, and in 1805 of 205,064 tons ; and the quantity of this description taken for consumjtion in 1857 was 211, 765 tons, agalnst 255,292 tous in 1856, and 192,607 tons in 1855, being a decrease in the consumption of foreign in 1857, as compared with 1856, of 13,527 tons, or $5_{\frac{3}{10}}^{3}$ per cent.; while the total consumption of fureign and domestic in 1857 was 280,765 tons, against a total consumption in 1856 of $\mathbf{3 7 8 , 9 6 0}$ tons; in 1855, 374, 752 tons; in 1854, 385,298 tone; in 1853, 372,989 tons; in 1852, 315,217 tons; and in 1851, 288, 485 tons-making a decrease in the total deliverles for consumption in 1857, as compared with 1866, of 97,995 tons, or 258 per cent. If we discard entircly the Melado, etc., the deliciency in the consumption of 1857 will be considerably greater, as it would then stand-Consumption of foreign, 220,644 tons, against a consumption of foreign in 1856 of 255,292 tons, decrease 133 per cent.; or, total consumption of foreign and domestic cane sugar $\ln 1857,259,644$ tons, agaiust a total consumption in 1856 of 378,760 tons, being the large decrease of $31 \frac{48}{180}$ per cent.
"We reduce our estimate of the quanity of augar made from molasses during the past year; the high and very unusual pricea which prevailed during the largeat part of it made the business an unprolitable one. After the heavy declino in the price of molassea.
which took place in October, manufacturing was ra sumed with considerablo vigor, hut not to $n$ suffcient extent to repair the previoua large deficiency. an intelligent observer ontimatea tho quantity of sugar made from molasses in 1857 at 10,300 tous, yiedded from 46,000 hhds. molnsses, against 11,875 tuns, from 53,000 hilds. in 1856; 11,160 tons, from 50,000 hids, in 1855 ; and 14,923 tons, from 66,500 hhds. in 1851 ; if we add to this the product of the maple-tree the past year, say 35,000 tons, and the estimated consumption of Callfornia and Oregon, 6000 tons, would imnke the total consumption of raw sugar in the C'nited States in 1857, 332,065 tons, against a total consunugtion in 1856 of 412,135 tons-making the decreas? in the conaumption of all kinda, sny ${ }^{19} 9_{10}^{42}$ per cent. The quantly of foreign sugar consumed in 1857 by the soveral ports (nut including tho coastwiso receipts, they being embraced in the calculation at the origmel port of entry), was-New York, 142,187 tons; Bloston, 28,111 ; l'hiladelphia, 21,157; 13altimoro, 18,860: New Orleans, 20,448 ; and other ports, 10,993 : total, 241,765 tons.
"A aomewhat novel feature in this trade has heen the large importation during the past year of the articte known as melado, etc., the receipts into the country having reached equal to abont $\mathbf{7 0 , 0 0 0}$ lidids. - say 23,400 tons angar (deducting 50 per cent. from weight, to make them equal to ordinary grades sugar, which, it will be observed, wo have done tiroughout the statement In all cabes of recelpta, stocks, and exporis). We understand, however, that the importation of this article has proved far from lucrative, and the probse
bilitien are that the commerce in these goods for the year now entered npon will be comparatively small.
"Mercantile enterprise seems to have ransacked the 'uttermost parts of the earth' to procure supplies of this artiele, ao essential to the comfort of the human famlly; and not only the 'lighwaya;' but the 'byways' of commerce have been diligently explored, and searce a field left ungleaned; hence we have seen within the twelve-month cargoes and invoices landed here from parts of the globe hitherto scarcely known as angar-produciag countriea.
"The very extraordinary prices that augar has commanded daring the past two or threo years, but eapecialiy the first half of last year, has been the meana of transferring this articie from the catalogue of the necesearies to that of the luxuries of life, and the consumption, as we have seen, has been greatly curtailed. If we add to thia the partial, and in many parts of the country the entire failure of the fruit crope (very large quantities of sugar being usualiy consumed, when fruits are abundant, in the mannfacturs of conserves, jellica, ete.), together with the intense and almoat unparalieled money janic, and rigid economic contraction, which supurvened from early autumn till now, the great diminution in the consumption is readily accounted fo:: Brean, and a few other articles of daily use, aro vary difficult to economize in, at almost any valuation; but the caso ia difierent with sugar-it assumea the character of a iuxary, or necessity, accordiag to its cont.
"A by no meana insignificant cauae aiding the reduction of the conamption of cano sugar in this conntry the past year, may be traced to the unusual, end, we believe, unprecedented yield of sugar made from the maple-tree. The season was one of the most favorable reniembered, extending over a period of nine weeks (three to four weeks belng the usual jength), and the farmers, atimulated by the prices that were current for sugar, labored indefatigably at the anp ketties; and the resuit is, that the product of the United Stetes, the past season, of this deseription of sugar, is set down at 36 (c) 38,000 tons. There are, unfortunately, no reliable data to determine the extent of the crop, but after carefully collating the information in our possession, we have no doubt that the yield was fully up to 35,000 tons-a very important item in our consumption, and contributing in no inconsiderable degree to the relief of the last year's deficieney in the product of the sugarfieids of Louisiana.
"The sangulne expectations that were eatertained by many in the early part of the year with regard to the sorgo, or African and Chinese imphee, have not been ralized. The experiment of cultivating this piant for its sugar properties has been entered into the past season quite extensively in many parts of the country, but, as far as wo can gather, though there have been a few isolated cases of success, the general result has been unsatisfactory. A very fair quality of molasses ins been produced, but there scems to be a difficulty in concentrating and granulating the sirup, owing either to a doficlency of saccharine qualities, or an ignorance in treating the julee of the cane; at all events, wo believe it is generally conceded thet erystallizablo sugar can not be obtained liere from the imphee in sufficient quantities to repay the labor and expense of cultiva: ng it, even when angars rule at a high currency.
"The supply of foreign needed, is governed in agreat mensure by our domestic crop, and hence there is a general intereat felt as to the probabic extent of the yield. In our last annual atatement we said that the Louisiana crop, then coming forward, was estimated at from 80,000 to 120,000 hhds.; the actual out-turn was only 73,976 hhds., ngainst 449,324 hhds. in 1853, the large crop year."-N. Y. Price Current, January, 1858.

The present erop of Louisiana, conecrning which such high expectations were entertained during the
early part of lant year, while yet growing, has again proved a comparative fallure, notwithatanding a larger breadth of land was placed under cultivation. Plantera having been greatly atimulated by the high currency, and having during the fall and winter months of 1858 and 1857, little or no sugar to make, were enabied to place all their laborers into their fields, and put them into a very high state of coltlvation; but a late spring, a dry summer and fall, and a heavy and unexpected frost oceurring on the 20 th November,
appointed their hopes, and the yield will not, aecuading to the best anthorities, exceed 250,000 hhds., and It may not reach that figure. The consumption of the valley of the Mississippl, including New Orleans and neighborhood, with sugars at a moderate price, ls estimated at 150,000 @ $160,000 \mathrm{~h}$ hds. (it has reached 208 (1) 210,000 hhds. when low ratea prevailed), leaving available for shipment to the Gulf and Atlantic ports 80,000 -3 90,000 hhds.

The precelling tables ahow that the reeeipts into this port direct, of foreign unrefined sugar, for the year ending December 31, 1857, were 161,942 , against an import of 171,156 tons in 1856, 126,844 in 1855, and 09,491 in 1854 ; and the quantity of foreign taken from hero for consumption in 1857 was 148,802 tons, against a consumption of Soreign in 1856 of 161,455 ; in 1855, 121,356; and in 1854, 92,500.

The port of New York has received and delivered for conaumption $58 \frac{81}{80}$ per cent. of the whole quantity of foreign inported into the United Statea during the past year.

It having been abcertained at an early period of the season that the crop of Louisiana augar would prove not only deficient, but almost an entire failure, and that the fields of Cuba would scarcely return an average yield, an impetus was immediately given to the foreign trade, seldom if ever before witnessed, and the importation of the first six months was without a parallel in its history. The extreme and unusual pricea soon told, howover, with unerring effect upon the consumption, and the contrast between the departure of the year 1857 and its commencement ia sharply defined; luoyancy, elasticity, and confidence marked the opening months-depression, languor, and timidity the closing ones.

The past year will be long remembered by those engaged in tho sugar trade as one of unparalleled ex citement, great fluctuations, and nu littie disaster, stamping it as far the most eventful one, at least in the present century. The prices of this article, which had been steadily advancing for nearly three years, reached in early summer their maxinum, and the deeline since then has heen rapid and extreme; there are, however, but few interests that have suffered 80 greatly from the effects of tho finaneial hurricane, that has devastated almost the whole commercial worid during the past four monthe, as the one now under review, and the number is also still less that have with stood the storm more bravely; this fact seems to war rant the belief thet the trade resta on a more than ordinary substantial basis. The losacs that have been sustained, though considerable, have fallen in a great measure upon the pianters and speculators of Cuba, on whose account the bulk of the stock here waa lield, and they having during the preceding two years realized farge advances by the rapid appreciation in prices which have ruled in all tho marta of tho worid, and which placed them in a very strong position, have been enalled to support these losses, it is believed, with coisparatively little inconvenience.-I bid.

At the commencement of the year the stock of forcign at this port was 9816 tons, againat a stock of 3049 tone, January 1, 1856. During the early part of the month of January: the demand was quite moderato from the trade, and the refinera being generally engaged, according to cuatom, in making their annual repaira, ete., to their machinery, the business was
mmall; this dullness, however, was poon followed by an being if a 8 cents. The saleo and resaleo for the jncreasad activity. It having been satiofactorily abcertained that the crop of Louisiana would be a very amall one, refiners entered the markot with apirit, and pricea advanced on all kinde $t$ a $\boldsymbol{f}$ of a cent. A firm, buoyant feeling provailed throughout the month, though at the close a folling off in the demand was obsorvable ; full prices were, however, realizod without difficulty, holders having constantly the advantage. On the 13th, the firat arrival of dew crop melado reached here, and solic at 7it cents; and on the 15th, 87 hhds. new Cubm muscuveio arrived, and was placed at 10 (1) $10 \frac{1}{2}$ cents, the opening price the previous year
month were 75 hhds. New Orleans, 4800 hbdu. and 18,600 box es ; Cuba, 1850 hhds. ; Porto Rico, 280 hhds. ; Knglish Ialand, 288 cases and 4328 bags Brazil, and 818 thda. metado.-For further information, see De Bow'e Review, vil. 56 (R. S. M'CulLoch), iii. 244, 294, x. 218, xil. 646, xili. 57,178, iv. 229, 883, bil, v. $349 ;$ Southern Quarterly Review, Iil. 829; North American Review, x1. 415; Edinburgh Review, 1. 426.

Beet-root Sugar.--Tho manufecture of sugar from beot-root is cerried on to a very considerable extent in several parts of the Continent, particularly in France and the north of Germany. It began in France during the exclusion of colonial preducts in the reign of Napoieon, and recelved a aovero check at the return of peace, by tho admission of Weat India augars at a ressonable duty. It in probable, indeed, that it wonld long since have been entirely extinguished but for the additions made to the dutics on colonial and forelgn sugars in 1820 and 1822. After the last-mentloned epoch, however, the production of beet-root sugar began rapidly to increase; and such was its progreas, that though, $\ln 1828$, its produco did not exceed
$4,000,000$ kllograma, it amounted in 1838 to $39,199,408$ kilograms.

Up to the middle of the 18th century the caue was the only plant known to contain sugar. In 1747 M . Marggref, director of a departnient of the licyal Academy of Sciences in Borlin, firat called attention to the anccharine subatance in the parsnep, the birch juice, and carrot. At a later period, Parmentier discovered the same ingredient in the composition of corn and chastnuts. But the chemical oxperiments made by these asvana accomplished no prectical reault. Yet, oven heforo Napolcon I. had Impoegd on Europe the principle of absolute prohibtion, the necesaity of a substitute
for the expenaive colonial sugar was urgentiy felt. As
esrly as 1706 the beet-root was analyzed by Aohard In Berlin, who ubtained from 100 lbs , of the raw materiaj 5 lbs. of white augar and three of molasses.
It was only since 1830 that the production of indigenous sugar began to manifeat its inherent atreagth. From three million tons is 1830, it rose to sixty-five millions, or half the consumption of the empire, in 1850, and this was accomplished under the preasare of an impost of from $16+$ to 22 francs per 100 kilograms upon the home manufacture. "The last ten yeara have shown," remarka Mr. Tegoboraky, "that thore is a vitality about the manufacture of beet-root sugar on the continent of Europe which was far from being imagined twenty or thirty yeara ago." Considering that in France it so quickly recovered from the blow deait in 1843, by an impost placing it gradually on a level with the augar of the colonies; that t'a terror then experienced by the French manufacturer, which made him, in many inatancea, abendon hia eatablishments, was now feit by the rival colonists; that in Germany, where the tax of 1842 at firat arreated the home manufacture, it immediately resumed the ascending movement, so that the production of 124,000 centacrs in 1813 had risen to 660,000 in 1849, or quintupled in the short space of six years.

The quantity of crystalizzable augar contained in the cane and beet-root is equally variabie in both, fopending on the quality of the plant, soll and climate, etc. The saccharine substance in the cane varies from 10 to 30 per cent, ; in the beet-root from 5 to 13 . In the former 18 , in the latter 10 per cent. are generally admitted as a fair average. The difference, however, in favor of the cane is, as will be seen presently, equalized in consequence of the advantages attending the manufacturo of augar from beet-root, irreapective of those derived from the culture of the latter. In the cono 90 per cent. is liquid to 10 per cent. solid matter; in the beot-root 05 is liquid to 5 per cent. only of solld filamentous substance. The extraction of juice, by means of the hydraulic press, from the latter exceeds, therefore, by five por cent. the quantity obtained from cane. Of tho 95 per cent. of liquid absolutely contained in the beet-root, from 75 to 85 per cent., on an average, are practically gained by the process of compreasion, while the juice extracted from the cane in the colonies represents only 50 per cent., on an avorage. In Beagal it is no moro than 30, and whern the best appliances are used it does not exceed 60 . Thus, of the 10 per cent. of aaccharine matter, which is absolutely contained in the beet-root, from $7 \frac{1}{2}$ to $8 \frac{1}{2}$ per cent. are realized as sugar, while from the 18 per cent. of tho cane from 10 to 12 per cent. of sugar are realized, and in Bengal only 7. Hence, at this stage of the demonstration of the comparativo value of cane and beetroot, respecting the practical resalts obtained from them, we find the difference already reduced from 9 to 5 , representing their proportion of aaccharine matter, to 12 to $8 \frac{1}{2}$, representing the sugar actualiy realized. The sugar of which wo apeak here is not yet crystal lized. The process of crystallization modifics still further the above difference in favor of the beet-root. Of the $7 \frac{1}{2}$ to $8 \frac{1}{2}$ per cont. of bect-root sugar, the residue, in the form of molasses, has bee dimini 'ed, in consequence of modern improvements, to from $1 \frac{1}{2}$ to $2 \frac{1}{2}$ per cent., which leaves from 6 to 7 per cent. as solid crystallizod and marketable sugar.

The results obtainedi in this respect from cane-juice in the tropical colonies we present in the following table:

The natural apperiority of the cane, thus redaced in the process of manafacturing, is nearly neutralized, when the fact is taken into conalderation that more time is required for the cane to ripen than for the beetroot. According to an accurate eatimato, four crops of the latter can be harveated againat three of cane. M. Stolzel, basing his calculation upon this propartion and the foregoing data, arrives at the final result that, on an average, one hundred pounds of cane yield aix pounds of cryatallized sugar and three pounde of molasses; while, an above stated, one hundred pounds of beat-root yleld from aix to seven pounda of augar, and from one and a half to two and a balf pounds of molasses.

Thoro is, according to the anthority quoted, no difference, thorefore, in the manufacture of augar from beet-root or cane, as regarda tho quantity of the marketable article obtained from an equal weight of either raw material. But then there are several other important subjecta yet to be considered before an opinion can be formed of the relative merits of angar productlon in the tropical colonice and northern and temperate regions. In the first case, the productiveness of each acre of land in the former countriea by far excceds that of the ame aren in the latter. We find the difference illuatrated in two tablea, computed from the best authorities, by M. Stolzel. After a deduction of 15 per cent. for waste in preparing for the press, and asouming a yield of sagar equivalent to 0 per cent. on the remainder, we obtain,

|  | Averagas Crop <br> of Beol.root <br> per Aere. | $\begin{aligned} & \text { Prodncl of } \\ & \text { eryulallisable } \end{aligned}$ fugar. |
| :---: | :---: | :---: |
|  | Contoer. | Pounds. |

| In Islu Beurbon | 3368 |
| In Cube | 40 |

Thus the average of all these figures, or the mean annual produce of sugar per acre in the colonies, is 2400 lbs., in Europe 1360 lbs. The proportion is $18 \cdot 10$ in faver of cane, which is still increased by the higher value of land in Europe than in the tropica. The mean price of land per acre, according to authentic statements, is,

The average of the whole is $\boldsymbol{£ 4 0} 17 \mathrm{~s}$. per acre for Europe, and $\boldsymbol{£ 8}$ per acre for the colonics. (The average valuo of farm lands thronghout the United States is, according to the censms of $1850, \$ 1079$; and in the Northern Statea it varies between $\$ 12$ and $\$ 60$.) To show in what manner these advantages of greater pro-
ductiveness of the land, and Its lower price la the colonies, are more than counterbalanced in Europe by tha lower rates of Intereat on the capital required for the purchase of these ianda, and the erection of the factories; the more Intelligent, efficient, and cheaper labor; the greater abundance and cheapneas of the important ltem of fuel; the advantages of a home market; and the accessary prollts derived from the culture of beet-root, In the slape of fodder for cattlis, wo reselve for a coucluding article, together with a review of the practical lnducements offered to the cultivators of beet-root, and the manufacture of augar, by the conditlons of the Northern and Middlo States of the Ualon.

Maple-sugar.-A apecles of maple (Acer saccharisum, Llan.) ylolds a conslderable quantity of sugar. It growa plentifully in the United Statea and In Canada, and in some districts furnishes the inhabltanta with mont of the angar they make use of. Though fuferior both in grala and atrength to that which is produced from the cane, maple-sugar granulatea better than that of the beet-roos, or any other vegetable, the cane excepted. It la produced frons the sap, which is obtaiaed by parforating the troe la the apring to the dopth of about two inchen, and setting a vesael for lta reception. The quantity afforded varies with the tree and the acason. From two to three gallons may be about the dally aycrage yield of a sligle tree; but some trees liave yrelded more than twenty gallons in a day, aud others not more than a pint. The procesa of bolling the juice does not differ materially from what is followed with the cane juice In the Weat Indies. It la necessary that it should be boiled as acon after it is drawn irom the tree as possible. If it be allowed to atand above twenty-four hours, it is apt to undergo the vinous and acetous fermentation, by which its aaccharlne quality is deatroyed.-Botcueste's British America, Timber Trees and Fruita, Library of Entertaining Knowladge. See article Maple-sugar.

Chinese sugar-canc.-This new plant seems to be deatined to take an important postion among our economical prolucts. Its aecds wero aent some six yeara ago from the north of China, by M. de Montigny, to the Geographical Society of Paris. From a cursory examination of a amall field of it, growing at Verrieres la France, In the sutumn of 1854, Mr. 1. J. Browno. then on a mission from the U. S. Patent Office for col leeting agricultural information and produets, was led to infer that, from the peculiarity of the climute in whieh it was growing and its resemblance to Indian corn, it would fourish in any reglon wherover that plant would thrive. From this suurce he obtained some 200 pounds of the seed, which was diatributed in small packages among nembera of Congress, with the vlew of experimenting with it in all parts of the Union, and thereby ascertalining its adaptation to tho soil and climate, and its economical value in tho Cnited States. In numerous instances the results proved highly satisfactory, as it attained the height of , lve or fifteen feet as far north as St. Paul, Minnesota, and inatured Its aeeds at varieus points in Massachusctts, New York, Pennaylvania, and Illinols. The following year, while in France on a almilar mission as above, Nr. Browne obtained aeveral bushels of the seed of this plant, grown from that reputed to have been brought from South Africa by Mr. Leonard Wray, of London, and which has since proved to be idertical with that obtained in 1854.

There appears to be a doubt among many la Europe, as well as In thla country, as to the true botanical name of this plant. N. Louis Vilmorin, a acientific cultivator of Paris, provisionally gave it the name of Holcus saecharatus, which had provloualy been applied to the common liroom-corn, if not to other epecies, or at least varieties, of some allied plant. Ile also conjectured that it might be the Sorghum rulgare (Andropogon sorghum of others), and thought that it might comprehend a variety, as well as Andropogon cafra,
bicola, etc., of Kunth. Mr. Wray, who has devoted mneh time and attention to the cultivation of this plant, with the view of extracting sugar from lt juice, at Cape Natal and other placea, atatea that ln the southeast part of Caffraria thers are at lasat ffteen varieties of ft , eome of them growing to a height of twelve and afteen feet, with stoms as thlek of thoso of the stgar-cane (Sacchartm officinale): M. Vilunorin also says that, In a colloction of soeds eent to the Musum of Natural Illatory at Paris in 1840, hy M. d'Abadre, there were thirty kinds of sorghum, aniong the growth of whioh he recogniaed several plants hurlog atems of a asccharine thavor. Others are of tho oplnion that the common broom-corn (Hokcus atcrharytus), the chocolate or Gulnea corn (Sorghum ruigitre), and the Chinese sugar-cane (Sorghtem aaceharatum), all of which contain more or less saccharine matter, helong co the same apecles, hut aro variations caused by differences of soil and cllmate, or by a diaposition to sport after the manner of Indian corn, and other plants under eultivation. The Chinese sogar-cane illffera from tho othera in containing a far larger proportion of juice, and consequently is more valanble for fodder and other economical uses.

In 1760 a piant analogous to the one In queation was experimented upon at Florence, In Italy, ly lietre Arduino, for the extraetlon of augar; yot it inukt hare been of a very different variety, as he describes its seeds as of a clear hrown color, while those of the Chineae angar-cane are of a shining jet black, and in appearance identical with those of the Surghtm rulgare of the old collection.

Description and Habit of its Groveth.-The Chinese sugar-cane, when cultivated on ordinary land in the United Staten, somewhat after the manner of broomcorn, growa to a leight of from eight to sisteen feet, while in Europe It does not attain more than haif this altitude. Its atems are atralght and smooth, often covered with a white bloom or down, having leaves somewhat flexuous, falling over and greatly resembling in appearance those of Indian corn, tut nore clugant in its fortw. Where cultivated In hills, containing cight or ten atalks each, it puts forth at its top a cunical pinnacle of dense flowera, green at first, but changing into violet shades, and finally into dark purple, at ma. turity. In France, and in the contral and northern sections of tho United Stateo, It has thus far proved an annual; but from observations mate by M. Vilmorin, as well as some experiments in our Southern States, it is conjectured that, from the vigor and fullness of the lower part of the atalks in autumu, by protecting them during the winter, they would protuco new plants the following spring. It stands dearth far better than Indian com, and will resist the efiects of conaiderable frost without lnjury, after the prannicles appear, but not in ith younger and more tender state. If suffered to remaln in the field after tie eceds have ripened and been removed, when the season is sufficiently warm and long, now pannjeles will shoot out st the topmont joints ons or more to cach stalk, and mature a second crop of needs. The average ylela of sced to each panniclo ia at least a gill.

Bulphur, or Brimstone (Fr. Soufre; Ger. Schcefel; It. Zolfo, Sulfo; Sp. Azufre; Aral. K'ibref), a crystallizel, hard, brittle aubstance, commonly of a greonisit yellow color, without any amell, and of a weak though perceptible taste; fts apecific gravity is from 1.9 to $2 \cdot 1$. It hurna with a pale blue finme, and emits a great quantity of pungent, anffocating vapors. In some parta of Italy and Sicily it is dug ap in a state of comparative purity. That which is manufactured in England is obtained hy the roasting of pyrites. It is denominated rough or roll sulphur, f.um its being cast in cylindrieal monlds, and contains 7 per cent. of orpiment. Tho Itallan roll aulphur doea not contain more than 3 per cent. of a simple earth; and is, therefore, in higher eatimation than the Finglish. Whea
ro.a sulphur la purified, It recelves the name of sublimed oulphur, and is in tine form of a luright yellow powder. -Tılomson's Chemietry, ete.

Gumatra, the mont western of the Sunda lslands, Asiatio Archipelago, and, next to Borneo, the largest In the eastern seas, between lat. $b^{\circ} 40^{\prime} N_{n}$, and $6^{\circ} \mathrm{S}$., and 'ong. $05^{\circ} 20^{\prime}$ and $106^{\circ} \mathrm{E}_{1}$, eeparated on the northeast from the Malay penlnaula by the Stralt of Malacea, having east the Java Sea, and the Strait of Sunda separatlug it from the island of Java, on other sldes the Indlan Ocean. Length northweat to southeast 1100 miles; braudth 60 to 240 miles. The area has been estiunated at from 128,000 to 130,000 aquare miles; population $1,437,360$, moatly Malays, but partly of the l'apuan negro race, with Moors in the northwest, and Dutch and other foroiguers. The eastern half of the island is mostly levisl or undulating, and along the coasts thore are many sandy and marahy plains traversed by the Siak, Judrageri, Jambl, Palembang, and other rivers of large size, hut which have been little oxplored by Europeans. Climato in the plains Is lesa oppreasive than might have been expected; at mldday the thernometer usually ranges between $82^{\circ}$ and $85^{\circ}$, sometlmes rising to $88^{\circ}$; but at sunrise not more than $\mathrm{U}^{\circ}$ Fair. Denae foga, thunder-storms, and waterspouts off the const are frequent. Much of the island is ancupied by dense forests. Iroducte consist of rice, sago, millet, cocos-nuts, betel, sugar-cane, an abundance of tropical fruits, turmeric, ginger, coffeo, ratans, scentel wood, teak and other timber, and the European coloaists successfully eultlvate the vine; but the prinelpal articlos of export nro pepper to about threo million pounde yearly, gold dust, copper ore, sulphur, camphor, in tho north ; nutnegs, cloves, and mace, in the Dutch territory of Bencoolen; and coral, benzoln, gutta pereha, tin, in l'alembang and Menankabow; many of which articles aro brought by natives from the interior, and bartered at tho ports for Indian and European manufactured goods. Iron, coal of an inferior quality, and naphtha, are among the mineral products. The inhabitanta luild their houses on posts, and adopt other usages of ultra-Gangetle nations; they manufacture gold and silver filagree work with great skill, also silk and cotton fabries, earthen-wares, armis, and domestic goods generally; from PalomLang, laequored basina, cane boxes, and ratan mats of the best quality are exported to Singapore ; and it le said that cannon were formerly cast at Acheen, in the northwest, which territory is, however, peopled by a race of Moorish descent. Imports, besides manufactured goocis already mentioned, are opium and salt from India, coarse porcclain, iron wures, gold thread from Chins, striped cottons, apices, krises and othor weapons from Java, Colebes, and other islands of the Archipelago. The island ta divided among a number of native states, the chiof boing Acheen, MLenankabow in the contral mountain region, Batak, Siak, Jambi, Palembang, Lampong, along the east from north to south, moatly noder the supremacy of tho Dutch, who possess the aettlements of Bencoolen and Padang, on the western coast.

Eumptuary Iaws. Laws to restraln excess in dress, furniture, eating, etc. Those of Zaleucus ordained that no woman should go attended hy moro than one maid in the atreel, unless sho were drunk; and that she should not wear gold or embroidered apparol, unless she designed to act unchnstely, 450 n.c. -Dtog. Lafrt. This law checked luxury. The Lex Orchia among the Romans limited the guests at feasta, and the number and quality of the dishes at an entertainment; and it also enforced that during supper, which was the chief meal among the Romans, the doors of every houso ahould be left open. The Engllsh sumptuary laws were chiefly in the reigns of Edward III. and Henty VIII.-See Dreas, Lexuity, ete.

Superoargo, a person employed to oversee the cargo or sale of the cargo. The duties of a supercargo aro not apecially regulated by law, hut are dependent
upon special agroemeat between the owners of the cargo and himsclf. Generally the power of a supereargo does not extend beyond the cargo, the master alone being reaponalble, and haa Ita limita in the arrival and departure from trading ports. However extended may be the authority conceded to a eupercargo, such authority must be aubordinate to the common Interest of the vessel and cargo. When the powers of a supercargo extend to the navigation $o_{0}^{\text {a a alilp, they must }}$ be commi:nlcated through the captaln, and have reference only to the destlation of the shlp, and not to the particular management of the ship. Even a supercargo, in cases of necesslty, and acting with discretion, may bind the owners of a ship.-I'otinen, CharteI'artie; Dodson's Admirally Rep., 1. 278. Ses articles Master, Insurance, Simpino.

Buperior, Lake, the largest sheet of fresh water on the face of the globe, and the most remarkable of the great American lakes, not only from its magnitude, but also from the picturesque scenery of Its borders, and the Intereat and value attaching to jta geological features. As a mining region It ls one of the most important in this country, and is rich in veins of metallie copper and sllver, as well as in the ores of those metals. At the prosent moment it may be regarded as the mont valuable mining district in North Amerlca, with the exception only of the gold deposles of California.

Thir great lake is comprised between the 46th and 49th dogrees of north latitude, and the 84th and 92d degrees of longitude, weat of Greenwich. Its greatest length is 100 miles; fis width in the m ! dle is 160 miles, sand its mean depth has been estimated at 900 fect. Its surface is about 600 feet above the level of the Atlantle Ocean, and its bottom la 300 feet below the lovel of the sea. The anclent French Jesult fathers, who first explored and described this great lake, and published an account of it in Paris in 1636, describe the form of its shores as slmilar to that of a bended bow, the northern shore being the are, and the southern the chord, whilo Keweenaw Polnt, projecting from the southern shore to the middle of the lake, is the arrow. This graphic description is illustrated by a map, prepared by them, which displays the geograplical position of its shores with as much fidelity as most of the maps of our day, and proves that those early explorers were perfectly familiar with its shores. The const of Lake $S$ verior is formed of rocks of various kinds and of diffe, ent geological groups. The whole coast of the lake is rock-bound; and in some places mountain masses of considerable elevation rear themselves from the immediate shore, waile mural precipices and beetling erags oppose themselves to the aurges of this mighty lake, and threaten the unfortunate mariner who may be caught in a storm upon a lee-shoro with almost inevitable destruction. Small coves, or boat harbors, are abundantly afforded by the myrlads of indentations upon the rocky coast ; and there are a few good saug harbore for vessels of moderate capacity, such as steamborta, schooners, and the like.

The fisheries of Lake Superlor are of great value to the people living upon the shores of the lake, and of some impertance to the states bordering on the other and lower lakes, and the inland towns near their borders. To the poor Indian the bounties of the great lakes are of vital Importance, for without the fish the native tribes would soon periah. Game hns become exceedingly acarce in these thickly-wooded regions, only a few bears, rabbita, and porcupines, and some partridges, belng found in the woods, and ducks in moderate numbera upon the waters. Agriculture has scarcely begun to tame the wilderness in the vicinity of the copper mines, and the only crops raised are potatoes and $\mathfrak{a}$ few hardy northern esculents. Small cereal grains-such as oats, barley, and rye-will do well here as in Canada; and Indlan corn of the northern varietles, in places not too much exposed to the
chill breezes of the lake, thrives and ripena. Eingliah grassea have not yet been oultivated, but they will undioubtedly thrive as well on the sonth ahore of Lake Superlor as in New Ilrunswick and Nova Scotia. The native graseen are abundant and good, but are limited to small nataral prairiea or to dried-up ponds. The foresta are also flled with excellent tlmber for bullding purposes ; and where the growth ls of mixed trees, auch as anger-maple, yellow blreh, and plnea, the white mut yeilow plaes are of large dimenalona, and furnish grood luncher. - Sae Laxkes, Commeree of.

Eweden (Sverige), a country of northern Europe, forming the east and larger portion of the Scandinavian peninsula, and one of the kingdoms composing the monarchy of Sweden and Norway $\mid$ situated between lat. $55^{\circ} 20^{\prime}$ and $69^{\circ} 10^{\prime} \mathrm{N}$., long. $11^{\circ} 15^{\prime}$ and $24^{\circ} 10^{\prime}$ F., boonded east by the Baltle, the Gulf of Bothnia and Ruania, south by the Baltle, west by Norway, the Kattegat, and the Sound. Capital, Stockholm. The soil is not geaeraliy fertile, and the corn produced was formerly only about two-thirda of that required; but from the great improvements in agrioulture introduced hy the government within the present contury, and the general introduction of the potate, the produce is now adequate to the consumption. Barley is coltivated as fur north as lat. $69^{\circ}$, but the crops frequentiy fail. Rye, hemp, and potatoes are grown to lat. $66^{\circ}$ N. Oata ripen to $63^{\circ} 30^{\prime}$; whoat and hops ceaso to be cuitlvated with advantage beyond lat. $68^{\circ} \mathrm{N}$. Ono-fonrth of the surface la covered with foresta, but the produce of timber is small; much is used for fuel, and maile into charcoal for use in tho mines. There are few woods to the north of lat. $64^{\circ} \mathrm{N}$. The princlpal trees are the pine, fir, and birch. Fiah are abundant on the coast, and in the lakea and rivers; the herring-fishery has freatly declined, but lobaters are exporterl, and salmon is caught in all the principal rivers. The mining districts of Sweden, mostly in the central provinces, extend over 16,000 square miles; the chief proiucts aro irou, which is distributed over nearly all the country, but the best is found in the loon Upsala; the annuai produce of all the mines is about 70,000 ) tona of bar iron. The richest copper mines are at Fahlun; the annual prodnce in all is abont 1000 tons. Gold is not now mought for, and silver la procured only to a amail extent. The other mineral products are cobnlt, lime, coal of inferior quality, and porphyry. Manufactures are chiefly contined to articles of domestio nee; the principal are woolens, angar, tohacco, paper, llnens, cotton (in amall quantity); tanning is an important branch of indnstry. Ship-bnilding is carriedi on to some extent in the ports of the Baltic. Distiliing and brewing are extenalvely prosecuted. The Internal commerce of Sweden is considierable, and Swediah vessels visit most of the Atlantic ports of America, and the Mediterrancan. Government is a constitutional mon-archy.-SCe Nonwar.

The Swedish monarchy, comprising Sweden and Nurway, embraces an arca of 292,104 squaro miles, and contains a population of $1,615,000$ inhahilants, viz. : siteder.-Area, 170,006 mgare milles: poputation, $8,016,530$ .Vorway, - " 122,003

Siveden and Norway havo different constitutions, though they are governod liy the same king. Their commercial regulations, their tariffs of dutles, their laws and revenues, are all separate. Several treatios of peace, amity, and commerce liave been negotiated between the Uuited States and these countriea; the latest, that of July Jth, 1827, being based upon the liberal principle of entire reciprocity, as weil with Sweden and Norway as with the small but flonrlshing colony of St. Bartholomew, in the Weat Indies. Tho following abstract prosents the principal atipulations respecting commerce and navigetion :
The citizens and sulyects of each of the two high contracting parties may, with perfect eecurity for their jersona, vessels, and cargoes, freely enter all the porta,
places, anm. rivers of tbe territories of the other, wher. over forelgn eommerce la permitted. The veacels of both natlona, including those of the islaad of 8t. llartholomew, whether latien or in ballast, to be treated in the porta of each, on thoir eutrance, during their atay, and at their departure, upon the asme footing aa natlonal veasels coming from the asina place, with reapeet to the dutien of tonnage, lighthouses, pllotage, anil port charges, and all other perquiattes, duties, and charges, of whatevor kind, levied lit the name or to the protit of the govermment, the local authoritics, or any private eatablishment whatever. All merchandise of 'every deacription, no matter of what country it may be the produce or manufacture, that may be imported finto either coantry in nntional vessels (or Into Siwcion or Norway In vessels of the isiand of St. Bartholomew), may in litio manner, and without paying othar or higher duties or charges, of whatever kind or deuomi. nation, bo 1 mported in the voraels of tho other full anil perfect reciprocity and equality ln this reapect he Ing estabished. Siniliar reciprocity and equality between the vessels of each of the high contracting partles, Including those of ths island of St. Bartholomew, In respect to exports from elther conntry, fa established. This equality with the national fiag bs applicable to the vessela of the United Statea proceedlng, either Jaden or In ballast, to the colony of St. Bartholotnow, in the West Indies, whether from ports of the klugdem of Sweden and Norway, or from any other place whatsoover, or proceeding from tho said colony, either laden or In baliast, whether iound for Sweden or Norway, or any other place whatever. The coasting trado is reserved by each party to its own flag, reajuectively; the navigation from one port to another in the kingdem. of Sweden and Norway, or between these two ceunt ries, being considered anch ceasting trade as respects Sweden. Duties on the navigation between their respectire territories, including the isiand of St. Lhartholounew, in tho vessels of either, to be no higher or other than those imposel on every other nation; and no prohilitions, restrictlons, or differential duties, of any kind or de. nomination whatsoever, to be established in respect of the products of the soli or Industry of either country, lucluding the ialand of St. Bartholomew, which shall not erjualiy apply to artictes of tike nature, the growith of any other country. The privileges of trausit, and all bounties and drawbacks wilch may be allowed within the territories of one of the high contractio. partles upon the importation or exportation of any article whatover, ahall likewise be allowed on the articles of liko naturo, the products of the soil or industry of the other contracting party, ani on the lupportation or exportation mado in its vessels.

The 11 th and 12th articles exempt from import and navigation dues (jilotage, wharfage, and lightadues ex. cepted) the vessels of eithor party arriving in the ports of the other, not wishing to unloail any part of their cargoes, or perform any act of trade; and the privilege is mutualiy conceded to untond in the ports of either such portions only of their cargoes as the captain or owner may wish, and to depart with tho remainder, without paying ony dutles, imposts, or charges whatsoever, except for that part which shail be lumdet, the proper entrics having been made on tho vessel's manifest. It is understood, however, that all dutics, ithposts, or charges whatsoover, which are or may becomo chargeablo upon the vessela thomseives, inust be pald at the first port where they shall lireak bulk, or unload part of their cargoes; but that such duties, etc., shall not be paitl twice in the ports of the same conntry which enel vessele may afterward wish to enter, unless national vessels be, in such cases, subject to such ulterior duties.

Article 16 stipulates that on direct voyages between the two countries, reepectively, a bili of hesith, granted at the port of departure by an officer having competeds power to that offect, wlll excmpt the vessel from any 8t. Harreated in cir stay, g as na. h reapect and port clargen, he protht y private of every ay be the rted into weden or olomew), othor or denomither ' fult espeet be uality be cting parholomer, tablished. licable to thor laden $0 w$, in tho ngdom of e whatsoher laden iorway, or lvely; the klagdons countrixs, rects Swerespectire slomew, in than those ohilititons, Inif or de. reapect of $r$ country, hich shall he growth ransit, and e allowed ontractins on of any on the arti. or industry nportation
mport and hitalues exn the purts rt of their e privilege s of eithe captain or remainder, rges what tanded. the sel's mani dutics, inor may be. ces, must be ak bulk, or duties, etc. same coun. h to enter, subject to
other quarantine than such af may be necessary for the visit of the heaith officer of the port where auch veasel shali have arrived. Other asatitsry reguiations are mutualiy atipulated between the high contracting parlies, equally liberal and benefleial to commerce. The ireaty of 1788 , no far as lts atipuiations are not inconsistent with the present treaty, is revived; and the usual tweive montha' notlee, after the expiration of nine years from the exchange of raifications, is provided for. A separate article reserves, on the part of Sweden, certain commercial privileges to Finiand, appilieable to the products of that duchy, and of Sweden and Norway, reapectively.
The fisheriee, the mines, and the forests of thin kingdom wero the early sources of Sweulish commerce. Macgregor, in ais Tarlff Regaiations of Sweden, eltes from l'uffeniorf, ono of the counselors of stato to the King of Sweden, the fuliowing pasagege, written in $\mathbf{1 6 8 0}$, relnife to the productions of this kingdom: "Sweden produces more cepperand jron than nny other kingdom in the world, and the mines aro fitted by nature for that purpose, being aurrounded by woode and rivers. There is a silver mine in Westmaniand. Finland brings forth piteh, and tar, and deal; and Wermanland [Carlatadt] good atore of masta. The native commodities of 8 woden aro copper, iron, tar, pitch, masts, deals, hoards, etc. In lieu of which, Sweden receivos from ahroad wine, brandy, salt, apices, cloth, silks, and woolen stuffs, fine linen, French manufactures of ail sorts, furs, paper, and such like; all which, in some years, surpass in valuo the commodities expoited henee. To recompense this, navigation and commerce has been encouraged of late yeara among the natives, and several sorts of mnnufactures aro made, whereof those made of copper, tron, and brass wonld, questionless, turn to the beat account, if thoso artists [blacksmiths and copper-smiths] weroduly encouraged to a 3ttle in this kingiom."

The generni character of the resonrces and foreign commereo of Sweden has undergone but littie change since the forcgoing was writtell. The extort and value have varied eomewhat, but by no means in a ratio corresponding with the more enlightened and the more liberal commercial poliey of the age. This is mainly owing to the restrictive tariff policy, which atill obtains in Sweden, by which duties, equivalent in many eases to netual prohibition, are levied upon many articles of prine necessity, both for Immediate consumption and manufacturing purposes.

Tho following tahle exhibits the general forelgn trade of Sweden during tho year 1854, compared with the generai result for tho preceding years designated:

Notwithatanding the annual augmentation in tho general foreign commerce of Sweden, which the above summary exbibits, the trade with the United States has been marked with but little variation.

The total trade with tho United States in 1847, according to Swedish official anthorities, amounted In value to $3,341,000 \mathrm{rix}$ dollars banco, or 858,880 rix dollars banco less than 1840, while It oxeeeded that of $1845^{\circ}$ by 779,000 rix dollars banco. In the trade between the United States and Sweden and Norway, there are but comparatively few American vessels employed. Tho following comparative statements will ohow tho proportion between American and foreign (mostiy Swedish and Norwegian) tonnage employed in this trade. A period of ten years, from $18: 5 \mathrm{t}$ to 1854 , is selected, as affording a fair average: American tonnage empioyed in the direct trade between the United States and Swoden and Norwny, from 1845 to 1854, 47,038 tons. Average annual tonnago, 4763.8 tons. Foreign (chiefly Swedish and Norwegian) tomnage employed in the trade between the United States and Siweden and Norsayy, during tho above period, 232,089 tons. Average ailnual tonnage, $23,208.9$ tons, or nearly 500 per cent. of foreign over Aunerican tonnage annually employed in the trade letween the United States and Norway and Swedeu. In 1847 tho imports of Sweden amounted to neariy 11,160,000 dollars (United States currency). Of this sum Swedish and Norwegian vessels floated nearly nine million dollars, or four-fiftias of the whole. The oxports reached tho sum of $\$ 12,276,000$, of which the Swediah flag covored over seven and a half millions, or about three-fifths of the whole.

The following are tho principal colonial products entering into the imports during 1847, in kiiograms of $2 \cdot 20$ ibs. each.

Of the exporte, iron oecupies the next rank to timber. The quantity exported in bars reached 82,212,000 kilograms, or about $185,000,000 \mathrm{lbs}$.

## SWE

Inen（ingluding（iakt and othen Etern）imponted into tire Cinitep Statze fhom swemen and Norway．

The value of iron quite equals the entire value of imports into the United Statos from Sweden for each yenr during the period specifled．The export of iron ore is prohibited．The annual average quantity pro－ luced the last five years is estimated at 300,000 tons． The quantity manufactured during the saine period is stated to have been 140,000 ，and 100,000 tous of bar iron．The annual average of the latter experted was 80,000 tons．The average price of plg－iron in Sweden is 8 rix dollars banco the skeppund $-7 \frac{1}{3}$ skeppunds to the ton，or 24 the ton．The Iron mines of Sweden le－ long to jolnt－stock companles princlpally．About two－ fifthe of the pig－iron ls purchased and manufactured inio bar－Iron by Iron－masters who own no mines；but the remaining three－fifths are manufactured by the com－ panies that own the mines theinselves．The produc－ tion of pig－iron was formerly limited to a certaln spec－ ified quantity，whether the capabilities of the mines and miners would admit of more or not．Under this unwise regulation of the government，which it is said was adoptel to prevent the exhaustion of the fuel of the ilngilom，the coal and foresta，the anaual produc－ tlon never exceeded 90,000 tons．These limitations have for some years been done away with；norls thore at present any limitution，beyond a matter of form，to the manufacture of bar－iron．The following statement， showing the exportation of iron from 1834 to 1849 ，is from Swedish official returns ：

The above exports were destined principally to the following countrles，and in aanual averago quantitice as follows：

| Great Britaln | 33，000 tona． |
| :---: | :---: |
| Lalted statem | 19，850） |
| llenmark | R，150） |
|  |  |

Small quantitles，in the shape of cannon，bomb－ shells，etes，are gent to Norway，Molland，and Den－ mark．The number of blast furnaces in operation in 1850 was 220 ；of worknen employed in mining the ore， 5241 ；of mines，586．The importation of cotton in 1851，nccording＇Swedlish official authoritles，amount－ ed to 7,98 ？，ıba．，againnt $1,832,431$ Jba．in 1841 ，and 794，434．… in 1831．In 1843 these authoritios show an Importation of $2,600,000 \mathrm{lbs}$ ．，against $9,883,572$ lbe． in $1 \times 53$ ，whieh latter amount exceeded that of the im－ portation of 1852 by $1,247,041$ ths．，and that of 1850 by nore than $5,200,000$ Jha．，being the largent of any pre－ ceding vear．In 1848 the amount was $8,074,020$ 1he． The value of cotton mannfactures exported to Sweden in 1850 was $* 46,000$ ，against 87500 only in 1851．It may he well now to inquire into the operation of the tariff of the two countriea respectively upon the lead－ ing staples of each，chiefly with a view to ascortain to what extent the importation of such products contrib． uten to the respective cuntoms revenue of ench conntry． The character of the commercial legislation of the two nations，in its effects upon the importation of staple articles of prime necessity，from each into the other， will hest ahow how far the reciprocity stipulated in the treaty of 1827 has been carrieil into practical operation． This inquiry may lead to useful and obvloun nugges－
tions，especially if it reaults In demonstrating that a poaltive inequallty exlats in practice，under which one government derives fully one－fifth of its entire customs revenue annally from a cent－per－cent．Juty on a lead－ Ing staple of the other，wlthont tendering any compen． sating equivalent for a tax so oppressive．

The inportation of unmanufactured American to－ bacco into Sweden and Norway（including direct and indlrect importations）amounted in 1851 to more than $0,500,000$ lbs．，which，under a duty equal to cent－per－ cent．ad valorem，palil into the Swellith troaeury alout $\$ 330,000$ ，or one－fifth of the whole cuatome rerenue of the kingdom－and this upon the alngle article of to－ bacco；whlle the entire exporta of Sweden and Nor－ way to the United States（amounting to 8967,237 ）paid into the Treasury of the Unlted Statoe，nt $\mathbf{3 0}$ per cent．， but a trifle more than $8200,000 \mathrm{i}$ In the mean time， nearly $\mathbf{4 0 , 0 0 0}$ tons of Swedish and Norweglan shlpping were carrying profitable American frelghts on every sea，while but 4000 tona of United Statea shlpping made single voyages direct to Sweden and Norway．Not． withatanding the most earnent and repeated remon－ strances against these unequal restrictions，and this one－sided reciprocity，no amelloration has yet taken place in the tariff regulatione of $S$ weden．It is true， some reductlons have been admitted in the tariff of 1852 on certain artlcles which enter into American ex－ ports．The duties upon coffee，sugar，arrack，and un－ dressell hides were aeverally reduced $83 t, 25,12 \frac{1}{2}$ ，and $8 \frac{1}{2}$ per cent．，and upon rice in the huak，or paddy， $16 \%$ per cent．But these concessions were clogged to such an extent hy the repeal of the $\mathbf{2 4 t h}$ artlele of the tariff of 1849 ，that American commerce，so far from guiniag any sdvantage by them，will be found，by the siuple process of atriking a balance between the results of the reductions and of the repeal，to he subjected to new and oppressive buriens．The 24 th article，or the dif． ferential clause，appended to the tariff of 1849 ，reduced the duties upon certain merchandise imported and ex－ ported in Swedish or Norwegian vessola，as foltows： Swedish vessols navigating to distant countries will continue to enjoy the advantage of the following re－ duction in dutios of cuatoms and convoy imposta，viz．：

Of 15 per cont．on the probluco and manufactures of count riea situaterl on the continent of America north of the 25th degree of north latitude，or of any of the for－ eign colunlen in the West Indios，if imported direct from thence in Swodlsh elips；and of the like reduc－ tion on Sivedish produce and manufactures exported direct t． $\mathbf{f}$ oreign colonies in the West Indies．

Of 25 per cent．on Swedish produce end manufuc－ tures exported In Swedish ships direct to the is：ad of St．Jartholomew，to places on the cast coust of the cin－ tinent of America south of the 25 th degree of north lat－ itule，or to the Cape of Good IInpe：nad the like re－ duction on the produce and manufact．＇es of those coun－ trice imported ilirect into Swerlen in Swedish vessels．

Of 3 ： 1 per cent．on Swellish proluce and manufic－ tures exported in Swedish ships direct to places no the other aite of the Cape of Gool llope，as also to ports on the other side of Caje Horn；and on the protuce and munufacturen of those ports and phaces imported from thence direct in Swedish whij，Us．Under the treaty， these privlleges apply equally to American vessels．

The effect of the repreal of this article is，that every thing imported fron America，except the articles above enumerated，hus hoen chargeable aince 1at of January； 1853－the day when the repoal took etfect－with duties 15 per cent．higher than before that pericm．The re－ peal of this clause was granted as a concession，to sileue the united and vigorous remontrances of liaglatiland IIolland against the operation of the Swedish tariff regulations．On the article of tnhacco alone the com－ merce of the United States is burdenal with additional duties amounting to $\$ 35,000$ per annum－enough to affect materially the salo of this Ameriean staple in the markets of that country；ant a tritling reduction of
that a one sustoms a lealompen.
duty npon rice is the only acknowledgment which the government of Sweden has yet made of the injustice of these oppressive restrictions. The following table exhihits the working of the existing treaty between the United States and Sweden during the years 1845, 1846, 1847, 1848, and 1849, so far, at least, sa it relates to the commerce between the two countries. It is translated and compiled from Swedish official publica tions:
fivont and beport Tinain of Sweign with tag Uxiteis itatge during tie lears gproifirn.

According to the laws of Sweden, each triennial Diet proposes n new tariff, which is designed to remnin in forco three years; the king laving, in the mean time, cu. stitutional power to lower, but not to raiso, any du+i s whatever, provided a certain sum be obtained from the custems. The tariff of 1852 continuod in force untii January 1, 1855. In the liet of 1854 many important reduetions were recommended by the committee on revenue, but they declinel recommending any preciso change on totneeo duties. They reforred this subject to the king, to whom s recommendation was made to enter into nogotiations with foreign governments, with a view to obtain reductions upon Swodish produce in exchange for lighter tobncco duties. 'lhose negotiations were understood to refer chiefiy to iron duties in tho Unitel States. Among the reductions proposed by this connmitteo aro the following:
Indlan corn to be rediced from 40 to 10 cents per barrel.
Collon itreail, from 20 to 13 cuuts per pound.
Wesit, from to centa to 1 i eent per pound.
llyw.wonta, from 1 per cent. ad valoremi to free.
Hopea, from 20 to 13 eents per 181 lbe.
sult, from 30 to 14 cents per barret.
Copper, raw, frem $\$ 2$ to 40 centa per 875 ltin
copper, reflied from $\$ 3$ in 4160 per 875 lbo
Copper platea, from it 1335 to $\$ y 70$ per 875 tia.
 Rivant
Troils nad machinary, not epecially enumerated, from 25 to 5 per cent. ad valorem.

The alterations recommended by this committeo were genorally adopterl. After January 1, 1856, the articles prohibited by the tariff of 1855 are to be admitted at a duty equal, generally, to 25 per cent., except ganpowder, pig-iron, and certain kinds of brendy. Tobacco remsina as under the tariff of 1852 , and will doubtless be reserved as a basis for such negotiations as the Swedith government may have in contemplation relative to Iron duties in the United Staies. The prineipsl reductions, though not of great importance to American commerce with Sweden, apply to fire-arms cheese, printed cotton, undyed cotton, yarn, codfish (dried nnd ealted), logwood (made free), Indian corn (committee's rocommendation sdopted), salted mest, smoked or dried do., spermseetl candlos (reduced 50 per cent.), rosin (do.), rice.

Besides the nrtieles above apecificd, the returns for 1852 show an increase over 1851 in the following doscriptions of merchandise, viz.:

The principal articles of which the importation in 1852 was less than that of 1851 were cocoa, fish (dried and smoked), salt, elicese, spirits of turpentine, tobaceo (lesf and cut), fieli-oil, weol, ete.

The exports of articles of tomestic produce from the United States to Sweden and Norway for the year ending June 30, 1857, may be thus divited: Cotton, $\$ 1,249,042$; tobacco, $\$ 84,871$; other articles, $39,393-$ totnl, $\$ 1,373,306$.

The navigation returns for 1852 show a total of 7303 vessels entered, with an aggregste of 343,693 lusta. Of the total number of vessels, there were Swodish 4164, measuring on aggregate of 133,963 lasts; 1288 vessela, carrying in all 109,272 lasts, under the Norwegian flag ; 550 vessela of 34,025 lasts, belonging to Finland; and 1311 vessels, measuring 66,483 lasts, undor foreign flugs.-Com. Rel. U. S.

Principal Ports,-Gottenburgo, or more properly Göthaborg, on tho aouthwest coast of Sweden, bordering the Cattegat, nenr the mouth of the River Gotha, lat. $57^{\circ} 42^{\prime} 4^{\prime \prime}$ N., long. $11^{\circ} 57^{\prime} 45^{\prime \prime}$ E. Vessels do not come up closo to the city, but lie in the river or liarbor, at a short distance from the shore-goods being conveyed to und from them by lighters. The depth of wuter in the port is $\mathbf{1 7}$ fect, and there is no tide, bar, or slallow.
Stockholm, the capital of Sweden, situnted at the junction of Lake Meler with an inlet into the Baltie. The entrance to tho harbor is intriente and dangerous, and should not be attemnted without a pilot; but the harhor itself is capacious and excellent-the Iargest vessels lying in closo to the qunys.-See Stoceniolar.
Bergen, the first commercial city of Norway, sit uated at the head of a deep bny, in lat, $60^{\circ} 24^{\prime} \mathrm{N}$., and long. $5^{\circ} 20^{\prime}$ E. The bay is inclosed on nll sides by rugged rocks and islands; the wnter is deep, but the entrance to the town is difficult, and needs a pilot

Manvfactures.-The vaiue of manufactures of all kinds at registered factories was: In 1889, $\$ 5,439,123$; in 1846, $87,084,947$; In $1848,48,868,848$; in 1849 ©9,209,899; in 1850, $89,891,072$; in 1851, $99,918,806$, showing an inerease since 1839 of $\widehat{4,474,743 \text {; since }}$ 1846, of $42,828,919$; and since 1849 , of $\$ 073,967$.

- Nine monthe to June 30 , and the fincal year from this time begins July 1.

The importation of raw cotton into $\$$ weden in 1851 amounted to $7,989,428$ lbs., beling larger than the importation of the provious year by $8,888,588$ lbs. It was, moreover, the largest quantity over imported in a single year, except in 1848, when the amount was $8,074,020$ Iba. In 1831 the amount imported was 794,434 lbs., and in $1841,1,832,431$ lbe. The amount of cotton twist produced in Swreden ta 1851 was $6,008,081$ lbe. (chiefly No. 26), and was valued at $01,611,777$. In 1860 the quantity was $5,784,832 \mathrm{lh}$. ., end the value $81,270,960$. The amount of cotton cloth manufactared in 1851 was $1,780,000$ Duglish yards, and the number of people employed in registered cotton factories was over 8000. In 1850 the value of erported cotton manufacturee was © $\mathbf{4 6 , 0 0 0}$. In 1851 it decreased to $\mathbf{\$ 7 5 0 0}$. In 1850, imported cotton cloth, $170,000 \mathrm{lhs}$; imported cotton twiet, 898,000 lbs. : total, 1,063,000 lbs. In 1851, imp ported cotton cloth, $195,600 \mathrm{ibs} ;$ imported cotton twist, $1,068,000$ lbs. : total, $1,263,500 \mathrm{ibs}$. Tobaceo was imported in 1851 into $S$ weden to the amount of $4,141,609$ ibe., of which only 42,642 lbs. were manufactared. Of the whole amonnt $2,587,982$ lba. came direet from the United States; the remainder chlefly from German ports. In 1850 the importation was $8,870,809$ line. 41,796 lbs. mazufactared. At 79 tobacco manufactories in the kingdom there were employed, In 1851, 1277 workmen, and the sales were valued at 9647,120 ; consieting of 200,175 lbs. of cigars, $2,750,723$ lbis. of enuff, and $1,632,605 \mathrm{lba}$ of other prepared tobacee; in all $4,688,468$ lba. Tobacco, in mall quantity, and of very bed quality, is grown in the noighborhoed of Stockholm, bet I bolleve in no other part of the kingdom. It should to rumembered that the accompanying table and the foregoing notices of $\$$ wredish woven goods refer only to the regtestered fretorien, and do not exhithit half of the actual mannfactures of the lingdom. None of the homespan clothy are includea, for which, of avery
deacription, the Swedish pessantry are remarkable, and of which, unfortunately, it is impossible to obtain exact accounts of the value or quantity. The province or county mont distinguished for these productions is that of Elfoborg, of which Gottenburg is the market. The home-made manufactures of this province, over and above the amount consumed by its own inbabitante, Fere, In 1850 and 1851 (Inclusive of atockings, quilts, and ribbons), as followa:

| 1850-Cotton stuffi. . . . . . . . . . 4, 848,000 English yards. |  |  |
| :---: | :---: | :---: |
|  | 1.tuen at | 275,200 |
| " | Woolen atuff | 802,170 |
| " | Cotton handkerchle | 1,448,028 pisecs. |
| 1851-Cotton ataffe. . . . . . . . . . 4, 752,000 Einglua |  |  |
| " | Linen atu | 970,890 |
| " | Woolen stufth | 840,161 |
| 3 | Cotton handkerchlefm | 1,088,281 pleces. |

These quantities have olightly diminished of late years, and the registered factories are accordingiy encournged.

The homespun mannfacture of Gefleborg which wore nold In 1849 amounted to $1,428,888$ yards ; those of Westmoreland to 805,883 yards; and those of H (o. land to 162,700 yards.

The prodactions of other provinces are not given reliably; but enough is known to prove that the amount of auch fabrics is considerably greater than that of the regietered manafactures; and their productions, especially of linen cloth, surpasa in darability, and rival in finenees, the beet productions of the factories.

The value of manufactures of all kinds at registered factoriee was: In 1839, $85,489,128$; in 1846, $97,044,947$; In 1850, $89,801,072$; in 1853, $010,151,724$; In 1854, $11,841,618$; and In $1855,414,437,645$. It will be aeen, therefore, that the incriase in ten years has been nearly $77,000,000$ ( 100 per cent.), and in tweive months 22,500,000. The importation of raw cotion into $\$$ weo den in 1855 reached to $14,788,029$ lbs.; In 1858 the
amount was 9,888, b72 lbs.; in $1848,2,000,000$ lbs. ; in
$1881,794,4941 \mathrm{lbs}$; showing an increase in twelve yeara of more than 12,000,000 lbs. The amount of cotton twist produced in 1855, chlefly of a quality under "No. $26, "$ was $10,598,098 \mathrm{lbs}$. , valued at $82,168,625$, exceeding the amount of the preceding year by $2,803,828 \mathrm{lbs}$. The amount of cotton cloth produced does not appear to have been ascertained, as the official report gives the amount indiscriminately with linen. Their joint valne in 1855 was equivalent to $\$ 652,489$, nearily twice great. er than in 1853. In 1845 their value was 188,787 . The importation of unmanufactured tobacco into Sweden in 1855 amounted to $4,532,610$ lbs., being 578,626 lbs, more than in 1854. In 1858 the amount was $4,851,722$ lbs. The importation of manufactured tobacco in 1855 was 55,205 lbs., somewhat more than 10,000 lbs. less than in 1852 . Considerably more than half the tobacco consumed in Sweden is imported directly from the United States. The amount directly from the United States in 1858 was over $\mathbf{8 , 1 0 0 , 0 0 0} \mathrm{lbs}$, The accompanying table is necessarily confined to the returns of registered factories, and, uufortunately, exact sccounts of homespun fabrice, for which this country is remarkable, can not be had. The province most distinguisbed for these productions is that of Elisborg, adjoining the province of Gottenburg. In Elisborg it appears that in 1855 the home-made goods, over and sbove the quantity consumed by its own inhabitants (about 250,000 souls), amounted to $9,047,506$ English yards of cotton cloth, together with $1,568,556$ cotton handkerchiefs. Also, linen fabrics, 259,329 English yards; woolen fabrics, 892,425 English yards; showing an increase in cotton weaving eince 1853 of more than $3,300,000$ English yards. In the province of Gefleborg there were woven by the peasants, in their homes, no iess than 2,077,000 ells (or 1,384,666 English yards) of heary linen. Other districts also are almost
oqually distingaished for cotion and linen homespun fabrice of excellent quality:

* Nino monthe to Juse 30, and the flacal year from thite time begins July 1.
them, shall pay the same duties as the merchandise of such nation! under any othor flag it ahall be treated as the merchandise of the country to which the vessel belongs. Th aremaining articles relate to the extra dition of criminals.

By a provision of the Swise conatitution of 1848, raw materiale required for manufactures, as well as for the necessarios of life, are to be admitted at the lewest possilule rate of duty, while the highest import tax they can bear. is to be levied upon articles of luxury. it In all the other governments of Europe, if we except trHanae Towna, tobacco la considered as an article or luxury; and it might be added, In behalf of France and England, as an article of convenience, aleo, for raisIng revenue. In these countries it is, consequently, subjected-in the former to the arbitrary exactions of the regie,* and in the latter to such daties an are almost equivalent to a prehibition. In Swlezerland; hewever, whatever may be the light in whlch they viow tobaceo, whether as an article of luxury or of necessity; it is treated as an article of trade, and admitted at a rate of duty leas for 1104 lbs . than Great Britain charges on the aingle pound. The effect of this liberal treatment of ene of our leading staples is seen in the disproportional quantities, relatively to population, which are sent to these different countries. For example: France, with a population of $36,000,000$, received an annual average of $15,000,000 \mathrm{lbs}$. of American tobacce during a period of three years ( 1851,1852 , and 1853), which gives about one-third of a pound to each person. Great Britain, with a population of $27,000,000$, received an annual average, the aame period, of $20,000,000 \mathrm{lbs}$., or nearly one pound per head; while Switzerland, with a population of $2,400,000$, received more than $7,000,000$ lba., or seme three pounds for each persen.

The manufactures of Switzerland are the chief basia of its trade with foreign countries. As early as the 14th century Zurich became the great emporium and market for Italian products and in iustry ; and Schw ytz and Unterwalden, which, with Zurich, censtituted the three original cantons, ware at that period fumed for their ingenious and industrions hablts. The principal seata of Swiss manufactures at the present day are:

The canton of Neufchatel for printed cottons, lace, jewelry, clocke, watches, and various miner articles. Wine and cheese are alse produced in thia canton. Geneva for watchea, $\dagger$ clocka, jowolry, musical boxes, enameled articles, phileaephical instruments, toels, cutiery, fire-arms, etc. Zurich, Aargau, and Thurgau chiefly for cotton and silk manufactures, woolen goods, straw platting, linens, and various minor articles. St. Gail and part of Appenzel for linens, muslins, cambrics, embroidery, tambouring, etc. Basle chlefly for silk ribbona, having upward of 4000 looms employed in their manufacture. The raw materiala for these manufactures are greatly enhanced in price by the expense of carriage (transit); and bread, flour, and other articles of food cest higher than in most other countries ef Europe. The restrictions on trausit through France and other adjacent countries are a heavy drawback upon the industry of Switzerland; but the proverbial frugality of the people, and the low price of labor, te gether witil the admitted superiority of most of their manufactures ever those of England and France, enable them to compete auccessfully with those countries in forelgn markets.
The commerce of all nations enjoys equal priviloges In Switzerland, but the foderal council is empowered to adopt immediate measnres in case the commerce of Switzeriand ls aubjected to any extraordinary restrictions in other countries; notifying, howaver, such measures to the noxt succeeding federal assernbly. Conaumption duties are levied in elghteen cantens; but

* For an explanation of this term, aee Digcst of France, p. 128.
$\dagger$ It is eatimatod that from (ieneva alone 240,000 watches are annuaily ahipped, via Harre, to the United States.
as they apply to only two articles-namely, wines and alcohelio liquore, neither of which the United States exports to that ceuntry-it is doemed needlens to apecify them. The suppreseion of these dutles, however, affecting as they do one of the staples of France, might be compensated by a melieration in the laws sppllcable to the transitage of Swise manufactures across the territories of France-a result which woold prove highly edvantageons to the commercial relations between the United States and Switzerland.

The whole foroign commerce of Switzerland during the year 1840 ameunted to about $400,000,000$ francs, or $\$ 85,000,000$. Several causes have combined to develop and promote the industrial and commercial prosperity of Switaerland. In a monntainotis conntry, covered with mow duting six or elght montha in the year, the inhabitants have recourse to in-door labor as a mattar of necessity. Besides, their position in the centre of Europe, surronnded on all sides by manufactaring commanities, stimulates their emulation, encouraged ss it la by the facilities which the adjacent markets afford for the supply of raw materials. The people, at once agriculturists and artiaans, and natarally induatrious, find ample scope for constant and profitable empleyruent In these two occupations, and are thus enablea to live on mederate wages. These causes have contributed to the mest remarkable development of industrial purstuits, especially in the northern and western cantons. Witheut dwelling upon minute detaile in regard to the different brenchea of manufactures into which this mechenlcal induatry has entered, the extraordinary success of cotton manufacturea in Switzerland will be briefly considered, as necessarily bearing upon the consumption of ene of the leading staples of the United States. There is, mereever, no branch of industry which mere forcibly illuatrates the energy and mechanical genios of the Swiss than their cotton mannfacturos. In 1830 the republic had in operation 400,000 apindles; in 1840, 750,000; and in 1850, 950,000; the number having more than deubled in twenty years. The cotton-spinnling facteries in the year last named were 200, estimated to produce annually from $18,000,000$ to $20,000,000 \mathrm{lbs}$ of yarn. This progress In cotton manufactures is the more surprising, because of the heavy expense with which the raw material is burdened by translt tells before it can reach the territery of Switzerland. The quentity passed in tranait from Havre for Switzerland in 1883 and 1834 was nearly $6,000,000 \mathrm{lbs}$; in 1843 lt reached nearly $17,000,000 \mathrm{lbs} .$, and constltuted fonr-fifths of all consumed during that year in Switzerland. The entire receipt of cotten that year is put down at $22,000,000 \mathrm{lbs}$.

The following table exhiblte the tetal quantity of raw cotton which.passed through Havre in trangit for Switzerlsnd during a period embracing thirteen yeara:

| Years. | Kilogramm. | Vearn. | Kllogr |
| :---: | :---: | :---: | :---: |
| 1833. | 2,633,000 | 1840 | 000 |
| 1834 | 4,290,000 | 1841 | 7,307,090 |
| 1835. | 4,302,000 | 1842. | 9,830,000 |
| 1830 | 0,480,000 | 1843. | 7,622,000 |
| 1837 | 5,498,000 | 1844 | 7,440,000 |
| 183 | 7,120,000 | 1845. | 0,431,000 |
| 1839 | 4,475, |  |  |

1839. . . . . . . . . . . . . 4, 475,000

In 1851 the Importation of cetton into Switzerland smounted to 27,035 V lbs., of which $18,729,820 \mathrm{lbs}$. were from the U:, +d Statea. According to the Tableau Génernal of rance for the years designated, Switzerland recelved cotten in pounds as followe, in 1851, 1852, and 1858:

|  | 1851. | 1859. | 1856. |
| :---: | :---: | :---: | :---: |
| Through France | 15,816,751 | 15,815,473 | 14,078,257 |
| Of which fiom the Luited 8 tates. | 15,812,161 | 15,765,560 | 14,879,881 |
| From other places.... | 4,690\| | - 49,017 | 98,920 |

A severe restriction on the lmportation of cetton; and alse of tobscce, to Switzerland, as well as on the reception by the United States of Swiss wares and manufactures in return, is, as already mentioned, the
vexations and expensive tranaitage, epecially through France. The oppression of this burden may bo inferred from the fact that the annual average aggregate value of merchandise on which transit tolls are paid, proceeding from 8 witzerinud, was in 1853 nearly $880,000,000$; and the value of that proceeding to that republic more than half as much.

Switzerland sent in tranaitu to France, cotton tissues $t$ the value of nearly $\$ 3,000,000$ in 1852 , and to the value of nearly $\$ 4,000,000$ in 1853 . By the French tariff such fabrics are oxcluded from France for conaumption. Since 1845, Switzeriand, it is stated offcially, has quite auperseded, in the markets of Gormany and Austria, the yarns of $C$ reat Britain.

The following statement shovs the quantitios of cotton received by Switzerland from the United States, and of cotton atuffes sent to the United States from Switzerland, mede up from Swiss efficial sources:

Cotton from tun Uxitzd States to Switzerland.
 Cotton Stcept flou Switherland to tha Cimited statibs.
 1851.
a 1855 Switacrland returned to the United States, In exchange for raw cotton, the same article manufactured, to the value of $\$ 212,700$.
In this branch of industry Switzerland is said to compete auccessfully with France. Her chintzes, and also her embroidered mousselines, are superior to those of Alsace; and if the French markets are closed against their admission under the operation of restrictive tarIffa, they find an ample outlet in the Levant, or ncross the Anstrian territory by the Danube. They also find markets in North and South America, the Barbary States, the East and Weat Indies, in the faire and markets of Central Germany, as well as in the entrepôts of the Hans Towns. The manufacture of tobacco in Switzeriand is stated to amploy 4000 persons, and to produce alout $9,000,000$ pounds, valued at $\$ 1,116,000$. There is inported of the article annually into Switzerland, and produced in the country, as follows:

Of this there is consumed in Switzerland 6,740,502 ibs., of the value of $\$ 558,100$; leaving for exportation $1,091,000$ lhs. ; and if to the value which this latter amount represents to the manufacturer be added wagea of hanila and other expenses of manufacturiag, it is eatimated that the raw tobacco custa the Swiss manufacturer about six cents per pound, while he expects to realize from the salo of the mannfactured articlo about $72 \frac{1}{3}$ cents per pound.
Todacco impoutad into Switzkland dizing a \&rhizs or Yяske.

As American products generaily reach Switzeriand ria Havre, the following tabie is suhjoined, exhibiting the transit trade between France and Switzerland during a period of eight years, ending with 1858:

| Yane. | From Switxerlaod | To Switresland. |
| :---: | :---: | :---: |
| 14.6 | \$13,7/4,090) | \$10,416,5MM |
| 1857. | 14, 230,000 | 9,309,010 |
| 1848. | 16,193,609 | $9,114,000$ |
| 1549. | 18,600,000 | 10,002,000 |
| 1890. | 18,414,000 | 8,929,000 |
| $1 \times 51$. | 18,425,000 | 8,928,000 |
| 1859. | 18,798,000 | 11,846,000 |
| $18 \% 3$. | 26698,000 | 10,788,000 |

It may be inferred from the above statement that the chief obstacle to trade between the United States

[^48]and Switserland is fonnd in the restrictions of transitage, especially over the territories of France. If $\mathrm{S}_{\text {wiss }}$ manufacturere could have their goods destined for the United Statea fina'ly examined and sealed (plombe) at the first French frontier custom-house, then to pass on to their final deatination under the protection of that seal, anopemed, and consequently exempt from the roexamination and repacking which they undergo at each poet, it is believed that the trade with the United Statea would all pass through Havre, instead of seeking, as is the case at present, the more circuitous and expensive routes via Liverpool and other ports. Such a change in the French transit reguiations would reault, also, in an annaal augmentation in the general $\times x$ changes betwoen the United States and Switzeriand. Commercial returna from Switzerland aro necessarily imperfect, owing to the difficulty in procuring requisite statistics from the varions ports through which Swiss merchandise reaches the United States. The exports which passed through the consular district of Basle during the last six months of 1804 for the United States, amounted to $\$ 728,68985$. The total value of merchandise that passed through the consulate at Zu . rich for the United States was:

> In 1888. $\$ 8,800,699$ 4,406,072

The following statement shows the values of tha goole, wares, and merchandise sent from Switzeriand to the United States, covered by invoices authenticated at the consulate of Baele, for the six monthe endiag July 1at, 1855 :

Imports from the United States Into Switzerland are maile, for the most part, through the customs frontiors of Bern, Soleuro, Basle, and Aargau, bordering on Frunce and the southern part of Germany. Swiss atatistica, especinily such as relate to commerce, are so far behind those of other European governments, ow ing mainly to the geographical position of Switzerland that an approximation only to fixed facts is attempted in the foliowing tables, designed to illustrate the preceding summary of tho trade between the two countriea.

The trade between the United States and Switzerland is gradnaliy on tho increase. American flour, which, prior to 1847, never reached that country, is in common uae now, and if reduction can be obtained on the expense of tranaportation through France, or on the Rhine, it may in time become as much in use aa that obtained from the Baltic. During the year 1853 the foliowing amounta of Swiss manufactured articles wers exported to the United Statea, the papers of which passed through this consulate, nine-tenths of which wera manufactured aione in the Canton of Zu rich, which contains a population of but 250,000 :

Swords were originaliy formed of iron taken from a mountain by the Chineae, 1879 b.c.-Univ. Mist. The sword was one of the eariiest implementa of war. The Roman swords were from twenty to thirty inches long. The broadsword and cimeter are of modern adoption. The sword of state was carried at an English king's coronation by a king of Scotiand, 1194. Damescus steel swords are highly prized, and next the sword of Ferrara steei. The Scotch Highianders were accustomed to procure the latter from the celebrated

- The Swiss ceataer is equivaleat to $110 t$ lbe.
artificer named Andrea di Forrara, and used to call them their Andrew Ferraras. . The broadsword was forbidden to be worn in Edinburgh in 1724.-Hards.

Eydney, the capital of New South Waiea, and of the British settiemente in New Holland, or Auntralia, on: a cove on the south side of Port exackson, about seven milea from its mouth, lat. $88^{\circ} 55^{\prime}$ s., long. $150^{\circ}$ $10^{\prime}$ E. Population in $1840,88,858$, and now (1858) estimated at above 50,000 . Owing to a want of attention at first, the atreets of Bydney were laid ont, and the housea built, according to the views of individuala, without eny fixed or regular plan. But latteriy this defect has been to a considerabie degree remedied in the old streets ; and the new ones are systematicelly laid out. The town covers a great extent of land, almost every house having a conaiderable piece of ground attached to $\mathbf{i t}$. Schoola for the inatruction of poor children have been eatablished, and there are, besidea two establishments dignified with the pompous title of colieges, numerous seminaries, some of them said to be very well conducted, for the education of the middle and npper clasaea. There are several newspapers and other periodical pablicationa.

Sydney is admirably adapted for the capital of a great trading colony. Port Jackson is one of the finest natural basins in the worid. It stretches abont fifteen miles into the country; and has numeroua creeks and baya; the anchorage ia every where excellent, and ships are protected from every wind. The entrance to thia fine bay is between two gigantic cliffs, not quite two miles apart. On the moat southerly, in lat. $88^{\circ}$ $51^{\prime} 80^{\prime \prime}$ S., long. $151^{\circ} 16^{\prime} 80^{\prime \prime}$ E., a light-house has been erected, the lantern of which ia elevated 07 feet above the groand, and about 845 feet above the aea. It is navigable for shipe of any bnrden to the distance of fifteen miles frum its entrance, or seven miles above Sydney, up what ia called the Paramatta River. Shipa come close np to the wharves and stores of the town, their cargoea being hoisted from the ship's hold into the warehouaes. Sydney is conaequently the emporium of all the settiements in this pert of Australia, and has a very extensive trade. Down to the discovery of the gold fielda in 1851, wool was by far the moat important product raised in the colony. The incraase of cattle and sheep, but eapecially the latter, in Anatralia haa in truth been altogether extraordinary. Previousiy to the arrival of the Engilsh eettlera in New South Wales in 1788, neither horie nor cow, sheep nor hog, had ever set foot on the continent. The atock they brought with them was limited in the extreme, consiating only of 7 horses, 7 head of cattle, 29 sheep 19 goats, and 74 pige. And from this late and scanty stock, assisted by a few subaequent importations, have been derived all the vast nnmbers of sheep and other useful animala now to be found in the Australian continent. For a while the rate of increase was comparatively siow. But from 1810 down to 1851, when the revolution occasioned by the goid diacovery affected every branch of industry, the multiplication of sheep and other stock, especially the former, has been rapid beyond all pracedent. This is ahown by the foilowing account of the aheep's wool annally inported from Australia into the United Kingdom aince 1840:

| Vears. | Pounds. | Years. | Poun |
| :---: | :---: | :---: | :---: |
| 1840 | 0,721,423 | 1847. | 26,056.815 |

| 1845 | 94, 150,687 | 1858. | 43,197,301 |
| 1810. | 21,865,270 |  |  |

Down to 1851 the colony of New South Wales comprised the extensive province of Port Phillip, now Victoria. But the latter was then separated from the former, and formed into an independent state, with a governor and Legislature of'its own.-See Melbounne.
At the close of December, 1851, the colony of New South Walen (exclusive of Victoria) had a population
of 107,168. It had also, at the same time, 162,057 acrea under erop, 116,897 horses, $1,875,257$ head of oattle, and $7,306,895$ aheap. Daring the same yoar the value of the imports (nootly from Ingiand) amonnted to $81,568,982$, and that of the exports to E1,708,012. The latter comprieed, among othert, the following items, vis. $t$

with neat cattle, flour and bread, bones, soap, cedar, and other woods, eto.
Harbor Dmee, etc.-TThe colonial Legislature has aleo, by an act paseed in 1852, auppreased sll chargen on shipping for harbor dues, lighthouse duen, fees on entaring and elearing, water police dues, ato. Sydney is tharefore really a free port. See articlea Avstraha, Melnournis, and Naw South Walme,

Moneys, Weights, and M/easures.-Accounts ars kept in starling money ; but Spanisb dollars are moat abundant. They pass current at bo. eaeh. The weights and measures are the mame as those of England.

Byra, the ancient Syron, one of the ialands of the Greek Archipelago, whose salubrity and fortility have been celebrated by IIomer (Porz'a Odyadey, book xv. v. 438 , etc.), in the group called the Northern Cyclades, afteen miles west from the greater Delon, its port, on the east side of the island, being in lat. $37^{\circ} 26^{\prime}$ $30^{\prime \prime} \mathrm{N}$., long. $24^{\circ} 57^{\prime} \mathrm{E}$. It is from nine to ten milea in length, by about five in brendth. Though rugged, it is carefully oultivated, and prodnces garden stuffa, wine, olivea, figs, cotton, etce, with a little barley, The population in 1880 was set down by Mr. Urquhart at 4000 ; but wo have been assured that it is at present ( 1853 ) !ittle, if at all, short of $27 \mathbf{2 0 0 .}$

It is indebted for this extraon inary increase of population to the convenience and excelience of its port and its central eituation, which have made it a considerable commercial entroput. Though amall, its harbor is acoenalble to lineof-battle ships. The holding ground is good, and it lias in itg centre abont ten fathoms water. Merchantmen of from 400 to 500 tons burden moor within about 100 yards of the wharves. Winda from the mouthewat round to enat-northeast throw in a heavy swell; but the port is well protected from winds from all other points. A lighthouse, with a revolving light, has been orected on Gaidoro Island, about $1 \frac{1}{2}$ mile southeast from the port. Most part of the trais that formerly centred at Scio is now carried on here; and the island has not only received numerous immigrants from Sclo, but also from many other parts of Greece. Great Iritain and mont Kuropean powers have consuls in Syra; and it is aiso the principal seat of the Protestant missionaries to the Levant. The town in on tha north sile of the harbor. The oldest portion occupiea the summit of a conical-bhaped hill, probably the site of the ecropolis of the ancient city. -sice Tournefont, Vogage du Leeant. But the new streets and houses, of which there are many, come duwn to the water's edge. It has an appearance of great bustic and animation. Its copioas opring of pure fresh water has been eulogized by Cliarke (Trarels). in 1848 no fewer than 468 vessels were registered at Syra, being a greater amount of shipping than belonged to any Greek port.

Byria (wi'h Palestive), a large division of Asiatic Turkey, mostly letween lat. $31^{\circ}$ and $37^{\circ} \mathrm{N}$., and
long. $84^{\circ} 80^{\prime}$ and $40^{\circ} \mathrm{E}$; ; bounded north by the Ams. nhan Mountains, east by the Enphrates and the Arubisn desert, south by Arabja Petrasa, and west by the Mediterranean Sea. Estimated area, 50,000 equare miles. Population ahout $1,865,000$, mostly Muhammedans, 'ut comprising about 345,000 Greek Christisne, 260,000 Maronikea and Roman Catholica, 175,000 Jews, 48,000 Druses, and 17,000 Metualis and Yezldis.- The weat, or coast portion, is mountainous; the east chiefly in elevated plain. After the Dead Sea, the principal lakes are thoee of Tlberlas, or Genesareth, and liulahh, in the valley of the Jordan; some smiller ones exist near Damascus and Antloch. The aurface'being very nneven, the climate and products vary greatly within short distances. Along the coasts the heat is great, and the orange, banana, and date flourish, while the summits of tise mountains are seen covered with snow.: In the north, and on the elevated plain east of the mountalns, the climate is colder, but at Aleppo frosts are seldom severe, and snow rarely lies on the ground for more than a day at a time. The com is nearly ripe early in May; and from June to Sejitem. ber summer heats prevall, unhroken by any rain, though tempered in the west by sea-breezes. It is stated that the country is capable of producing suff. cient to maintain ten times its present popalntion; yet such is the rude method of agriculture, the depressed condition and Insecurity of the rural population, and the nncertainty of taxation and government regula. tions, that in bad years com most frequently be im. ported from Fgypt and elsewhere, Wheat, barley, malzs, millet, lentils, and sesamum, are raised in the plains, principally in tho Haouran, which has alwnys lwen considered the granary of Syria. Cotton nad the mulberry flonrish on tho coast, and silk is produced en the elopes of Iebanon. The cotton annually raised in the south is eotimsted to amount in value to $£ 3 \mathrm{i} 0,000$; and about 1700 cantars of silks, 10,700 cantars of tobaceo, from 8000 to 10,000 cantars of gall-nuts, and 800 cantari of madder roota are annually proluced. Other chief products aro sheepa' wool, olivo-oil, sugar, indigo, scammony, and other gums, saflowel, dates, timber, hides, and skins. Sheep and other lire-stock form, as in antiquity, a chief part of tho wealth of the inhabitants ; and, nll merchandise being conveyel on the hacks of animals, it is estimated that the Irunsit trade employs 80,000 beasts, nni nbout 30,000 drivers. Abont 3500 akes of sponge firhed on the coast are sent to the porta of the Mediterranean annually; other fisheries are comparatively unimportant, as is mining industry. Damascus has abont 4000 looms engaged in the manufacture of silks, ond the same manufacture is carried on to a conaiderable extent in Aleppo. Cotton, ani some woolen fabries, shawls, gold and silver thread stuffs, are also woven there and elsewhere, and the total produce of the looms of Aleppo is estimated at $\boldsymbol{\Sigma 2 5 0 , 0 0 0}$ in annual valuc. Glass, carthen-wares, leather, nud soap, are made in the aiove and other towns; and in Palestine great numbers of religioua ornaments are manufactured for sale. Commerce is greatly imjeded liy the want of roads, those that exirt being mere muie or camel tracka; also lyy the deficieney of good harbors. But as Syria is on the high route from lag. dad, Mosul, aud Erzeroum, to Meccn, caravans annualiy traverse it, bringing gulia, indigo, Mocha coffee, sking, Casiunere shawls, and other Imdian mannfactures, siso the products of Asia Minor, Menopotamia, and l'ersia, which are exchanged licre for European manufacturee and cochincal.

Tac
tandra tandra In fiag tle, an has an musk, ing no

Tacamahac, a reain obtained from the Fagara octandra; and likewise, it is aupposed, from the Populua boleamifera. It comes in large oblong masses wrapped in flag leavas. It is of a light brown color, very brittle, and easily melted when heated. When pure, it has an aromatic amell, betwsen that of lavender and musk, and dissolves completely in alcohol, water having no action upon it.-Tиомsos's Chemistry.
Tack, a rope used to confine the foremost lower corners of the courses and stay-sails in a fixed position when the wind crosses the ship's course obliquely. The same name is also given to the rope employed to pull out the lower corner of a atudding-sall or driver to the extremity of its boom. The mainsali and foresail of a ship are furninheri with a tack on each aide, which is formed of a thick rope tapering to the end, and having a kuot wrought upon the largest end, by which it in firmly retained in the clew of the sail. By this means one tuck is alwaye fastened to windward, st the same tine that the sheet extenda the sail to the leeward.

To tack, to change the course from one board w another, or turn the ship sbout from the sterboard to the lurboard tack in a contrary wind. Thus, a ship being close-hauled on the larboard taik, and turning her prow suddenly to windward, receives the impression of the wind on her head sails, by which she falis off upon the line of the starioard tack. Tacking is also used in a more enlarged aense, to employ that maneuver in navigation by which a thip makes an oblique progression windward in a zigzag direction. This, however, is more usually called beating or turning to windieard.

Tackle, a machine formed by the communication of a rope with an assemblage of blocke, and known in mechanics by the name of pulley. Tackles are used in a ship to raise, remove, or to secure weighty bodies, to support the masts, or to extend the sails and rigging. They are movable as communicating with a runner, or rixed as being hooked in ạn immevable situation; and they are more or less complicated in proportion to the effect which they are intended to produce. The application of the tackle to mechanical purposes is calied hoisting or bovsing. Ground tackie implies the anchora, cables, etc.

Tafferel, the uppermest part of a ship's stern, being a curved piece of wood, and osually ornamented with some device in sculpturo.

Taffeta, one of the earliest species of silken manufacture, more prized formerly than now, woven very smooth and glossy. It was worn by queens, and was first made in England by John Tyce, of Shoreditch, London, 41 Elizabeth, 1598.-STonn's Chron. Taffeta has heen superseded by numerous descriptions of manufacture more estcemed by the female world.Hayd.

Taganrog, a eity of European Ruasia, on the north coast of the Sea of Azof, near the mouth of the River Don, lat. $47^{\circ} 12^{\prime} 48^{\prime \prime}$ N., long. $88^{\circ} 89^{\prime}$ E. Population, 18,000 . It has a naval hospital, a lazaretto, etc.; and there are annual fairs in May, August, and November. Taganrog is a place of considerable commorcial importance. It was intended by its illustrious founder, Peter the Great, to replace Azof, the ancient emporium of the Don, the port of which had become ail but inaccessible; and its whole consequence is derived from this circumstance, or from its being the entrepot of the commerce of the countrics traversed by that great river. The largest portion by far of tiie trade is carried on with Constantinople, Smyrna, and other Turkish ports, but a good deal is also carried on with the Italian and other foreign ports; and there is an extensive coasting trade with Odessa and other Russian ports. In 1852 the exports to fereign countrics comprised, among otiler articles, $1,102,047$ chet-
werts whest, 112,510 ponds tallow, 175,836 poode wool, 26,104 pooda caviare, 846,880 chetwerts linseed, etc. Seeing that Taganrog was built to obviate the difficuities that had to be ancountered by vessels entering the Don, through the shallownees of the water, it night have been supposed that care would be taken to place it in a position in which it should be, in as far as poseible, free from this defect. This important censideration seems, however, to have been to a great degree overlooked. The Gulf of the Don is aeldom navigable by vessels drawing more than from ten to eleven feet water, and even these can not approach within lees than about 700 yards of the town. They are principally loaded by carts, drawn each by a single horse, the expenses being so very considerable that it costs from 120 to 150 copecks to ship a chetwert of wheat. Without, however, altering the position of the town, theee defecte might be obviated with but little diffleulty, by constructing a wooden pier by which vessele in the roads might be sheitered, and from which they might be laden.

It is imposible to form a correct estimate of the future msgnitude of the trade of the See of Azof. No doubt, however, it is very great, being the natural seat of the commerce of some of the most extensive and fertilo countries of Eastern Europe.

Were the navigation of the Don improved, and facilities given to foreigners entering the sea, the exports might be largely increased, even with recent prices, which have been nearly the same as those of Odessa. The harvests in the sonth of Russia fluctuate very greatly. The imports into the Sea of Azof are hut inconsiderable, principally coneisting of Greek wines, oils, dry salteries, and such like articles.
Talc, a apecies of fossil nearly ailied to mica. It is soft, smooth, greasy to the feel, and may be spit into fine plates or leaves, which are flexibie, but not elastic. It has a greenish, whitish, or silver-like luatre. The leaves are transparent, and are used in many parts of India and China, as they were used in ancient Rome (Pliny, Hist. Nat., lib. xxvi.), in windows instead of glass. In Bengal a seer of talc costs about two rupees, and will sometimes yield a dozen panes 12 inches hy 9 , or 10 by 10 , according to the form of the mase, transparent enough to allow ordinary subjects to be seen at twenty or thirty yards' distance. It should be chosen of a beautiful pearl color; but it has, in general, either a yellowish or faint blue tinge. Ite pure tranolucent flakes are frequently used by the Indians for ornamenting the bawbles employed in their ceremonies. Talc is employed in the composition of rouge vegetal. The Romans prepared with it a beautiful blue, by combining it with the coloring fluid of particolar kinds of testacecus animals. The taic brought from the Tyrolese mountains is called in commerce Venetian taic. Several varieties are found in. India and Ceylon. - Thomson's Chemistry; Rees' Cyclopedia; Milnurn's Oriental Commerce; Ainslie's Mat. Indica.
Talent signifies beth a weigat and a coin very common among the anciente, but very different ameng different nations. The common Attic talent of weight contains 60 Attic minee, or 6000 Attic drachme; and weighed, according to Dr. Arbuthnot, 59 lbs. 11 oz . $17 \frac{1}{4} \mathrm{grs}$. English Troy weight. There was another Attic talent, by some suid to consist of 80 , by others of 100 mine. The Egyptian talent was 80 minw ; the Antiochian also 80 ; the Ptolemaic of Cleopatra $80 \frac{9}{5}$ that of Alexandria, 06; and the insular talent, 120. In the valuation of money, the Grecian talent, according to Dr. Arbuthnot, was equal to 60 mine ; or, reckening the mina at $£ 348.7 d_{\text {., }}$ equal to $£ 19315 \mathrm{~s}$. The Syrian talent, in this valuation, consisted of 15 Attic mine, the Ptolemaic of 20, the Antiochian of 60, the

Eubcean of 60, the Babylonio of 70, the greater Attic of 80 , the Tyrian of 80 , the Eginesen of 100 , the Rhiodian of 100, and the Egyptian of 80 mines. There is another talont much more analent, whlch Dr. Arbuthnot calls the Homerie talent of gold, which seeme to have woighed six Attle drachme, or throe Dorioa, a Dorio weighing very little more than a guinea. Aocoriling to the taleat come reckon the treasuse of King Dusid, partloularly that mentioned 1 Chron. xx. 14, which, according to the cummon reckoning, would amount in gold telents to the valoe of $\mathbf{\Sigma 5 4 7 , 6 0 0 , 0 0 0 ,}$ and the ailver to above $£ 342,000$. An David relgned in Judea after the oiege of Troy, it is not improbable but liomer and he might use the same nameral talent of gold. Among the Lomans there were two kinds of talents, the little and the groat taient. The littlo was the cormmon talent; and whenevor they say simply tolentum, thay are to be underatood of this. The little talent was 60 mine or Roman pounds, the inina or pound being estumated at 100 drachmes or denarii. It was also ostimated at twenty-four groat essterces, which amounted to $\mathbf{8 6 0}$. The great talent excesied the lese by one. chird part. Budmus computes that tho littie talent of oliver wan worth $\mathbf{\Sigma 7 5}$ sterling, and tho greater $\mathbf{8 9 9} \mathbf{6 0 . 8 d}$. sterling. The groator of gold was worth $£ 1125$ aterling.

Talent, at a species of money amuig the IIebrewn, was sometimes used for a goid coin, the eame with the shekel of gold, caliod also stater, and weighing only four drachma. Tho liebrewe reckoned by these talents, at we do by pounds, etc. Thua a million of gold, or a million of talents of gold, among thom was a million of shekele, or nummi; the nummus of gold being the same weight with the shekel; viz., 4 drachms. But the Hibbrew talent weight of silver, which they called cicar, was equivalent to that of 3000 shekele, or 113 lbe. 10 oz. 1 dwt. 104 gre. English Tray weight., according to Arbuthnot's computation.-F. B. See Corsm.
Tallow (Fr. Suif; Ger. Talg; It. Seen, Sego; Russ. Salo, toplenoe; Sp. Sebo), animal fat metted and separated from the fibrous matter mixed with it. Its qual3ty depends partly on the animal from which it has ween prepared, but more, perhape, on the care taken in Ito parification. It is firm, brittle, and has a peculiar heavy odor. When para, it is white, tanteless, nand nearly insipid; but the tallow of commerce has usually a yellowish tinge, and is divided, according to the degree of its parity and consisteuce, into candle and sonp taliow. Tellow is an erticle of great importance. It is menufactured into candles and poap, and is extensjively uned in the dressing of leather, and In various processes of the arts. The exports of tallow from Rusain emount, at an average, to about $3,810,000$ poodh, or 137,160,000 libs. а year.-Twaobonski, Yorces Productives de la Ruarie, i. 233. Of this Immense sapply, the export of the largest portion is to lingland; the remainder being exported to Pruseia, France, the lianso Towns, Turkey, ete.
We borrow from the work of Mr. Borrisow, on the commerce of Petarsbarg, the following details with respect to the tallow trade of that city: Tallow is ilivided into different morta; namely, white and yeilow candle tallove, and common and sitherian soap tallow; although it is allowed that the same mort often differs in upality. Tallow is brought to letershurg from the interior; and the best soap tallow from sileria, by various rivers, to the Lake Ladoga, and thence hy the canal of Sehlusselburg to the Neva. Ycllow candle taliew, when good, ahould be elean, dry, harl when broken, and of a fine yellow color throughout. The white candle tallow, when good, is white, irittle, hard, dry, and clean. The best white tallow is brought from Woronesch. As for soap taliow, the more greasy and yellow it is, the letter the quality. That from Siberia is the purest, and commonly fetches a highor price than the other sorts. The exports of tallow
from Petersburg in 1852 amounted to 2,002,101 poods. Formerly the oil and tollow warehousen wore the same, and thie oceanioned great dimfleultion in shipping, be. cause all vessela or lighters taking in tallow o' oil were obliged to haul down to the ambare, and wait in rotution for thoir cargoes. The connequence was, that, when much businoss was doing, a veasel was often detained for several wooks at the ambare before athe could got her cargo on board. Now the tallow and oil warehouses are esparated, and every article hay its own place. Whon a mhipment of tallow is mada, the agent In furniehed by the nelector (bracker) with a sample from each cask. Captaine, in order to obtaih more frelght, usually load mome casks of tallow upon deck; but it is more for the interest of the owner to ayoind this, if poncible, becauee the tollow loses, through the heat of the sun, conalderably, both in woight and quality. One hundred and twenty poods of tallow, gross weight, make a Petersburg last, and 68 poods a ton. The value of the tallow exported from Russia is seld by M. Togoborakl to amount, at an average, to about $8,871,000$ roublea, or about $615,500,000$.
Exiobte of nommatio Tallow pbom the Limited State deano the Yeab expino June 30, 1567 .

Tally Trade, the name given to a system of desiing carried on in london and other large towns, by which ehop-keepers furnish certain articles on credit to their cuastomers, the latter agreeing to pay the stip ulated price by cerain weekly or monthly installments. In London there are alout sixty or seventy tally-shops of note, and from 600 to $\mathbf{C 0 0}$ on a smaller scaje. They are also apread over the country to a consideratje extent, particularly in the manufiacturing districts. The chatomern of the tally-shopi aro mestly women, consisting principally of the wiven of intorers, mechanics, portera, etc., servant girls, and femulos of loose character. Few oniy of the more respectalile classes have been infatuated enough to resort to them.

Tamarinds (Ger. Tamarinden; Fr. Tamarns; lt. and Sp. Tamarindo ; Arab. Umblie; Hind. Tintiri), the frolt of the Tamarindus Indica, a tree which grows in the Eant and West Indies, in Arabia, end Fgypt. In the Weat ladies the pods or frult, being gathered when ripe, and freed from the shelly fragments, are placed in layers in a cask, and holliog airup poured over them, till the cssk be filled; the sirup pervades every part quite lown to the lottom; and when cool, the cask is lieaded for sale. The East India tamarinds are darker
coloh sugar gree the et into $t$ thoul sox's introul to flov that i our 8 There the W ety, d its fru
colored and drier, and are said to be preserved withont augar. When good, tamarinde are free trom any dogree of mustiness ; the seeda are hard, flat, and clean I the atringe tough and entire; and a clean knifa thraat inta them doee not receive any coating of copper. They should be preaerved in elosely-cevored jara.-Тномson's Dispeneatory. 'The tamarlad-tree was very early introluced into England, where it nometimes is known to flower; from which olreumatanee it may be inferred that it would proaper in favorable localities in some of our Southern States, and probaily mature its fruit. There is, perhaps, only one speeces of this genus; bot the West Indian tamarind, believed to be only a variety, differs much from the East Indian, in the form of its fruit and the number of its seeds.

Tampico, or Banta Ana de Tamaulipas, a sen-port town of the Mexican confedoration, department, und 215 milles north-northwest from Vera Crus, on the south shore of the Lake of Ta...t..ec. Popalation, 7000. It is regularly laid out on a slope, and has some gooi dweliings in the old Spanish style, with military and naval hospitals, some publio monumenta, and welisupplied markets. It is better drained and leas unhestity than formerly. Principal exports are specie, hides, tallow, hones, and jerked beef.

| 1859. | 849,564 | 089,678 |

The exports hence to the United Statee during the yenr 1837 amounted to $1,283,157$, whereas the returns of the year 1855 only nmount to the sum of 208,571 . In 1834 the total amount of specie from this port was, by officinl returns, $\% 9,165,178$, of which over $\$ 2,000,000$ went to the United States, the balance to Europe. A serious drawback to thu commercial intercourse between this port and the Jnited States is the want of direct ateam conveyancer The geugraphical position of Tampico has many ed antages over any other port in the republic, in consec sence of its proximily to San Luis Potosi, where goolu cati be rent at 60 per cent. less in the charges of freight than from Vera Cruz, and San Luis being the key to all the principal places in the sections of the country whose commerce is supplied with foreign goods, and the spot where the goods meet from the states of Durango, Jalisco, Guannjuato, and Zacatecns, these being the principal mining statee in the republic. There wero twelve arrivals and departures of Einglish packets, bringing to ". mpico 3431 quicksilver flakks, and taking thence cargoes of an ag. gregate velue of $83,459,061$; which, added to the aggregnte value of other ontward cargoes, makes a total of $83,994,772$.

Tauning. The process of tanning lenther with the bark of trees was enrly practiced by various nations. The use of tan was introduced into these countries from Holisnd by William III., for raising orange-trees. It was discontinued until alout 1710, when enanas were first brought into Fingland. Since then tan has been in general use in gardening. Great lauprovements were made in tanning in 1790, et seq.

Tapeatry, an art of weaving borrowed from the Saracens; and hence its original workers in France were called Sarazinois. The invention of tapestry hangiugs belongs (the date is not mentioned) to the Netheriands.-Gutcctandisi. Manufactured in France
under Henry IV., by artinta Invited from Flanders, 1606. The art was hrought into England by Wulliam Sheldon, and the firgt manufactory of it was established at Mortlake by Sir Yrancis Crane; 17 Jamen I., 1010.-SAlmon. Under Louia XIV. the art of tapertry was much improved In Franee.-Sec Gobelis Tapzetay. Very oarly instanees of making tapeatry are mentioned by the ancient poete, and aleo in Scrip. ture; so that the Saracen manufacture ts a revival of the art. For the tapestry wrought by Matllda of England, see Baykadx, Tapestry, p. 74.

Taploca, a species of starch or white coarse powder derived from the roots of the bitter cassava (Jairopa mamihot), an American plant raised all over South Amerien, but princlpally in Brazll, where it is called mandioc or manioc. The roots of the piant, heing peeled, are aubjected to pressure in a kind of bag made of rushes; the juice which le forced nut by this process being a dendiy poison, and employed nis such by the Indians to poison their arrows. But the residuum, or farinaceous mattar remaining after the expuision of the juice, is perfectly wholesome, and makes excellent bread. Taploca, as atated above, is prepared from this residuam; and being nutritious end easy of digestion, is extensively used in the making of padidings. When dressed, it is not easily distingulshed from sago.

Tar (Fr. Goudron; Ger. Theer ; It. Catrame ; Pol. Smola genta; Russ. Degot, Smola shitkaju; Swed. Tjara), a thiek, black, unctuoua subatance, chiefly obtained from the pline and other turpentine trees, by burning them in a close, smothering heat.
Exponte of Tan from titg Uniten Statib for Tit Ygas ENDINO JOES 30, 1857.

Tar Ia an artio of great commereial Importance. The process followed in makiag it has been deseribed as followa by Dr. Clarke: "The aituation mont favorable to the procens is in a forest near to a marsh or bogi because the roots of the fir, from which tar is princlpally extracted, are alway most productive in owh places. A conical cavity is then made In the ground (generally in the sid of a bank or aloping hili), and the roota of the fir, together with loga anil billets of the sama, being nestly trussed in astuck of the aame conical shope, are let into this cavity. The whole is then covered with turf, to prevent the volatile parts from 'velng dinolpated, which by mease of a heavy wooden mallet, and a wooden stamper, workel separately by two men, la beaten dows and rendered as frm en piastble abuve the wood. The stack of billetn Is then ifindled, and a slow eombustion of the fir taken place, without flame, as In making charcoal. During this combustion the tar exudes; and a caet-iron pan being at the bottom of the funnel, wlth a apout which projects through the side of the bank, barrela are placed beneath this apont to collect the fluld as it comes away, As faot as the barcels are filled they are bunged and ready for immedlate exportation. Irom thin description it will be evldent that the mode of obtaining tar Is hy a kind of distiliation per deacenown ; the turpentine, melced by fire, mixing with the asp and juicen of the fr, while the woed itsolf, becoming charred, is converted into charcoal."
Tare, an abatement or deduction made from the weight of a parcel of goods, on account of the weight of the chest, cssk, lang, etc., lu which they are contuined. Tare is distinguished Into real tare, rustomary tare, and average tare. The firat la the actual welight of the package; the second its supposed welght secording to the practice among merchants ; and the third Is the medium tare, deduced from weighing a few packages, and taking it as the atandarl for the whole. In some commereial cities tares are generally flxed by custom. The prevailing practice, as to all goods that can be unpacked without injury, both at the cuatomhouse and among merchante, la to ascertain the real tare. Sometimes, however, the buyer and seller mske a particular agreement about is.
Tare, Vetoh, or Fitoh, a plant (Vicia sativa, Linn.) that is cultivated principally for its atom and leaves, which are used in the feeting of sheop, horses, and cattle; but partly, also, fur its seed. Dorses thrive better upon tarea than upon cluver and rye grass ; and cows that are fed upon them give most milk. The seed is principally used to the feeding of pigeons and other poultry.

Tariff, or Tarif. First, a list of certain goods, merchandine, etc.; then a liat of duties on Importa or ex. ports of such articles. This word, liko many others used in commerce, is derived from the Italian, in which it is tariffir ; this again, like numerous other expressions relating to commerce and navigation, comes from the Viast. In l'ersian It is tarif; In Arablen the verb arf aignifies to kwour, which in the second form becomes sarif; signifying to make known. The substantive derived from the verb therefore signifies notificution. The principles of a tariff depend upon the commercial policy of the state by which it is framed; and the detalla are constantly fluctuating with the change of intereste, and with the wante of the government or community, or In pursuance of comnnercial treaties with other nations. The British tariff underwent seven important changes bet ween the years 1772 and $1842 ;$ viz., in 1787, in 1809 , in 1819, in 1825 , in 1833, and in 18 s 2 . Finally, on $26 \mathrm{th}_{\mathrm{h}}$ June, 1846, the royal assent wes given to Sir Robert I'eel': noted tariff-a measure which canceled the duties on several hundred articies, and pressed ujon the country the adoption of free trade.

The able report of I. D. Campirell, of the Jlouse of Iegresentatives, 1856, to the Committee of Waya and Means, is a jost and comprehenaive exposition of the
protectiva (not prohibitive) ayotem ; and as such, and as bel' ig the report upon which our preseut tariff was mainly coastructed, we noed not apologian for giving extend ed extracts. The moderately protective tariff le easential in the eariy comunercial and manufacturigg atages of a country. Anl the fact that free trudo may at come future time be advantageona to us does not prove ite present anceesity. It will be seen thit, though generally assonting to tha aoserted fact that the purpoee of revenoe alone can juatify the imposition of dutios, yet the proofs and atatistice given prove too much, and prove to the uuprajulliced reader that duties are not alone neceasary for revenue, but nay be necessary for protection.

Prinolple and Iulicy of the Proposition.-The propristy of the proposed reluction of the tariff of dutles upon imponte In mada by the I'reaident'e annuel meso auke to rest, first, upon the principle that "the purposen of revenue alone can Justify thair impoaition;" and, necond, Ejon the policy of "roilucing the tariff of duties upon limports, as the means of reducing the revenue to the amount annually needed for the prudent and economical administration of public affiaira."

The recommendation of the message, thus enalyzed, affurls a principle which the Iresident contents himself with asying "is so generally conceded, that, is reuljusting the impoat tablea and sehedulea, which unquestionably require essential modificstion, a departure from tho principiea of the present tariff is not onthelpated," and a policy which be does not in any manner undertake to verify or illustrate. It stands in the mesache as a position asoumed without proof, or as too plain to require demonatration.

Revenue limited by Expendidures--Your committee perceive only one sense in which the I'resident's doc. trine concerning the purpose for which import duties may be imposed can be regarded as generally conceded. Inpests empioyed as a measure of taxation must bo conformed to the requirements of the public revenue, or they miss the controlling oljject of their imposition.

Taxes of every ikind must be levied at once up to the necesslties, sid within the limits of governncent expemses; in other woris, the grosa amount of revenue muat be regulated by the demand of the goverament for its current expenses ; and, where foreign inports are selected by the policy of the nation to bear the chief burden of its support, the tax inposed must be determIned in amount by the reguirements of the national tmeasury.

Thus far it is conceded that the purpose of revenue alone can justify thelr luposition; and thus far the doctrine of the message is in accordence with the sentimenta of the American people. Ilut tariffs have other legitimate purposes, and are capable of other and inportant uses, while kept in strict conformity to the requirement ${ }^{2}$ of the national treasury.

Impost syatems of all Niations protectice of their productire Industry.-Our ourn Policy persistenily goremed by this Intention. -The protectlon of the rational industry, by means of duties laid upon foreign imports, is one of the purposes whluh characterize the impost sy-t-ass of all the governmenter of the earth, whose rank entities them to consideration as authorities with us, This policy, since its aloption by the first-class nations, has under sone changes corresponiling to changes of condition, both in Europe and America, but the principle has never been absodoned. Tho Continent of Europe holds it as firmly an ever, and Great Britaia, by worklng it to its utmost capacity of beneficial servlee, has thoroughly justified the theory. Iler experience is ita must perfect domonstration. In the Coited States the doctrine has its clisciples and supporters as numes.‥s and influential as principles, rightly underatood, ever secured among an Intelilgent and patriotic people. In the forty years of controversy to which it has been subjected in thite cuuntry, the opposing theory has never olitained a victury or a concesmion which can

The nationa people promise The resulter of the : twenty

In any way entitle len adroentes to claim posmension of the field. Fifteen genaral acta of legislation have made as many changes in the dete " 1 of our tariff laves, but none of tham has yielded the inciple of protection, direct or indirect, to our national induntry.
Inuties less than protective, firtetuatione of the Reve onue, and Viciasiluder in the Business of the Country.The eompromise of 1833, of all the general sets of Congrens imposing duties upon imports, alone seems to yiekl prospectively to tha doctrine of a tariff for rev. enue without effeotual lacisiental protection. It ls the only instance of a horizontul rate of duties carried below the folnt of adequate encouragement of our homo inciustry... lut evan under thia act, the level 20 per cent. which lte proviaions contemplated was nat to take effeet untll after the 80th of June, 1842. Till that date the successive reductions of all excess in the rates over 20 per cent, contlaned to wear the discriminating foatures of the protective tariff, which it modified, ulthough the rates ran belew the polnt of protection; and its large fres list decidodly expressed the same Intention. Nine yoars' experience of the operation of this act abundantly manifeated ita unfliness for any of the purposen which a polloy of impoate should anawer. The revenue derived from it declined in fuur years from twenty-nine milliona to eleven; rose again in two years to twenty-three j aunk the next year to thirteen and a halr; and atood three years afterward at elghteen millions. The viejsaltudes in the business of the country, and tho disastera which its monetary intereeta encountered In this period, are well remembered. They are ladioated sufficiontly by the fallowing facte. The price of flour in 1837 was - 1025 per barrel in 1842 it had fallen to $\$ 6$, In 1836 twenty-five mllifiona of dollarn' worth of public lands were sold; in 1842 less than two millions of dollars' worth. In 1836 cotton was at 18.8 cento per Jb., in 18.12 at 8.1 cents per 1 b . The export had in alx years risen one hundred and sixty millions of pounds, and the total value had fallen twenty-three millions of dollars.

The tariff of 1842 was a convulsive reaction of tho national mentiment, awakened by the aufferinge of the people under the operation of the ayatem of the Compromise Aet.

The general bankruptcy of the people whlch had reaulted was reflected by a correaponding bankruptcy of the national treasury. . In 1836 a surplue fund of twenty-eight anillions had been disposed of by orler-

Ing that amount to be deponited whith the States o hut sixicen monthe nfterward the fourth Intalliment of that deposis was arrented liy the necesalitios of the treasury i and In six years from the deta of the act required to relleve the plothora, it wae nfty-four millione in debt !
The single instance of a tariff that looked to rovque only, and had the opportualty to practleally demanatrate lis worklug qualities, thua proved Itealifto bo the only one ever put upen ita trial wholly incapable of aneworing that special intentlon, and at the aame tlme had proved more mischievous to every othar object which the system of import dutien affects, than any other that has ever been attempted.
Sinablibided Principles of our Revenue Byotem.-Your committee, faeling well matisfied that the pollcy of the nation In reapect to all the pointo involved in legislation upon the subject of impori dutien le suffieientily manat font, think it well to atate its principel doctrinen for the service whilh such a statement will reader to the purpoace and objects of this report :

1. The revenve of the government is to be raised from the sulen of publle lande, duties upon limports, and from miscellaneous sourcee, without resorting to internal taxation, direct or indirect.
2. The reyenue to be derivad from import dutlee, amounting in the average, since the foundation of the government, to six-seventhe of the resourcea relied upon, shall be levied under direction of the following priaciplea: 1at. No more money shall be collected than is necessary ior the wanta of the government, economically administered. 2d. The dution shall be imponsed so as to operace as equally as possible throughutut the Union, diacrin 'aating aelther for nor againat any clase, or section, or interest.
1II. Conforming to the objects and limitations of these rules, certain kicida of imports shall be subject to varied rates of duty, and certain othors shall be exompt from duty, in such manner as shall best foater and promote home production and the general welfare of the ration ; taking care to dietribute the protection eo afforded over every intereat of the people as equally as posalble.

Recenue accruing under High and Low Tarift, respectively, in the las thirty-tuo Years,-LLet us seo how either of these points, thut necessary to the valldity of the calculation, is sustained or contradicted by the history of our foreign commerce in the last thirty-two years:

Productivenass of the higher and lower Tarifs of thirty-fien Years. Steadiness of the former: Unoteadiness of the latter.-The income from custome, nnder the same tarif, rose from thirteen millions in 1821, to seventeen and a half millious in 1822. Under the tariff of 1824, from 1825 to 1828 , it rose from twenty to twentythrey and a quirser millions ; under that of 1828 , from 1829 to 1832, it rose gradually from twenty-two and a half to twenty-elght and a half millions. Under the Compromise Act of 1833, which reduced the duties under the act of 1832, by biennially deducting one-tenth of the excess over 20 per cent., from and after the 81st of December, 1833, until the 81at of Decomber, 1841, when one half of the remaining excess was struck off, and on the BOth of Jane, 1842, the othor half thereof, the revenue from the castoms rose in the first three years of ite operation from sixteen to twenty-three and a half millions; in the next year, 1837, sank to oleven millions-falling twelve and a half miliions in one year-and rose again $\ln 1839$ to twenty-three milllons, another difference of $t$ wolve millions in two years. In 1840 it ran down nine and a half millions, and in two years more rose four and a half miliions.

The first year of the operation of the tariff of 1842, the customs amounted to no more than sixteen milliona; the three following years it atood very steadily at twenty-six, twonty-seven and a haif, and twentysix and a half millions, reapectively. In the years 1846-47, during eeven montha of which the present tariff was in operation, the caetome foll two and a halif milions; in the following year of famine in Eampe they rose elght millions; in the year 1848-40 they declined three and a half millions, and in the succeeding year increased cleven and a quarter millions. In the year 1850-'b1 they rose again nine and a half millions above the preceding year; in 1851-'b2 they decined one and three-quarter millions; in 1852-'68 they rose eleven and three-quartir millions; in 185s-' 04 they again increased five millione; and in 1854-55 fell eleven millions.

Fluctuations of the Customs, and Tendency to Excess under the same hot-duty Tariff. - In this summary it will be perceived that within the last nine years the revenue from customs has five times varied from tho amounts yielded in the years immediately preceding these several changes, from eight to eleven miliions of dollars. During these nine years the present tariff was in operation, and an unvarying rate of ducies was ch. rged upon the imports. Its changea of productiveness to the revenue have been changes of increase, indeed, but not in any balancing proportion to the naturally increasing expenditure of a growing population; for we find ly statement No. 23, of the Secretary's report, that the consumption of foreign imports, per copita, rowo in the first four years of the period from $\$ 660$ to 10 ; and ties aurplus in the treasury after all ordinary expenditures, and the payment of over forty millions of the public delt benides, is concluaive of this point.

Your committea have not in these statements considered the causes of the great dipparity of the revenues yieided to tho treasury by the differsnt rates of duty levied upon foreign imports. They have been looking simply to the question how far, and to what effect, impost percentagen of themselves affect the revenue. For the proposition presented for their consideration by the 1resident and Secretary embruces no more, either of facts or principles, than the nakoi assumption that the reduction of the percentage of itself must work a reduction of tie revenue.
"Low Duties yield the larger Revenue." The Doctrine and Experience of the I'ast.-That this ductrine is not in accordance with the facts of a large and varied experience, covering and embrucing every variety of conditions which can affect the question, is abundantly manifested by the statistics iresented. Indeod the directly opposite doctrinc has been held by the aulvo-
cates of low duties in ell controversies which the mattor has hitherto undergone. In 1845, pending the dis. onssion which substituted the present reduced tariff for the higher one of 1842, it was argued by the Secretary of the Treasury, in his report of that year, that the larger revenue is produced by the lower ratea of duty. Ile says, "The revenne from ad valorem duties last year oxceeded that realized from specifie duties, although the average of the ad ralorem daties was only 23.57 per cent., and the average of the specific duties $41 \cdot 80$, presenting another strong proof that lower duties inerease the revenue." And again, he says, "While it is impossible to adopt any horizontel scale of duties, or even any'arbitrary maximum, experience proves that, as a general rule, 20 per cent. ad ralarem will yieid the largent revenue."
This principle, which is a sound one, does not apply to either of the extremes of impost rates, for the one may be carried ap to the point which is prohibitory, or near to it, and the other down to that which would be as nearly nugatory, and so both extremes may be made to operate alike apol. the treasury ; but it is true within a comparatively moderate range of difference-that is, within any such difference of percentage ss any advocate of reduction would now undertake to recom. mend.

The facte which our finencial history offors in support of this dectrine are, in general, as conclusive as these following, which your committee select from a muititude for its proof.

Under the tariff of 1842 the - rerage duties apon protected articles was something above 40 per cent.; the average monthly receipts from customs under that act amounted to $\$ 1,991,267$. Under the tariff of 1846 , with its a verage duties below $\mathbf{3 0}$ per cent., the monthly receipte during the first two years of its operation reached the sum of $\$ 2,575,207$.

Mr. Walker, in his roport, December 11, 1848, page 8, says: "As the high duties under the act of 1842 were rapidly substituting the domestic articies, and excluding the foreign rival, the revenue must have declined. From this disastrous conätion we have beer saved by the tariff of 1846, yielding from reduced taxes an average excess, thus far, of more than seven millions of doliars over the average receipts from the teriff of 1842."

Twice under the operation of the Comprenisa Act, once after the second deduction was made upon the rates of the act of 1832, and onco after the third deduction, the revenue from customs rose to the annual average of the high tariff of 1828. And in the year 181?, when its lowest ratee were nearly touched, and the level 20 per cent. was nendy ita maximum, the customa stool higher than in flve of the previous yarrs of its operation, and above the averago of the eight pre. ceding years.

The average annual amount of tho customs yielded by the tariff of 1824 was twenty-ono and a hail millions; of the tariff of 1828, was twenty-four and a fourth millions. In a period of twenty-two years, rising five millions, or 23 per cent. The average of tie first four years of the tariff of 1846 was thirty-three emil a fourth millions-25 per cent. In fuur years; the average of its second four years was fifty-four and three-fourths will. ions; riving in eigit years twenty-seven and a haff millions jeer annum, or 133 per cent.

Thio average annual consumption of foreigu inuports per capita under the tariff of 1824 amounted to 8526 ; under the tariff of 1828,8521 ; uniler that of 1812, to के 20 ; while under the lower tariff of 18.16 , during the four years of its operation previous to the influx of the California gold, the consumption roas to 8650 per capita of the popuiation, and under the very low average duties of the whole period of the comyromise the conaumption stood at $\$ 728$.

These facta show how much more produrtive of rovenue the lower tariffs rates are than those which,
thoug
iting
though considered higher, are set far short of prohib-
 prosperity of the carrying trade.

Causes of larger Revenue from lower Duties. - As a means of lessening the revenue derived from cnstoms, or of lessening its proportion to the publio expenditure, it is thus made spparent, by the facts of a conclusive experience, that a mere reduction of the rates of duty can not be relied upon; but, on the contrary, that the policy has always the directly opposite effect, and this for many obvious reasons.

A reduction of duties induces increased importations of foreign commodities, disturbing our money market by diminishing the available capital, and enhancing its rate of interest to our own manufacturers. The importer obtains command of the market, and to the extent to which the home competition is crippled in the production of snch articles, it opens a vacancy to be supplied by importation, and adds just so much more to the customs as such supply from abroad will yield; and, therefore, so long as the country has the means of purchasing sach increased quantity of foreign goods, su replacing tha home product, the revenues will continue to augment, instead of diminishing, inder the lower rates.

Again, an increased demand for onr breadstuffis and provisions in Europe, occasioned by failure of crops there, will have the effeet, under a low tariff, of indncing large importations, and, consequently, a large enhancement of the customs. In the famine year of 1847 the customs rose eight millions above the receipts of the year immediately preceding; and every deficiency of crops abroad, to the extent to whieh it occurs, muet have a proportionate effect in the same direction.

Again, a large increase in our agricultural and manufacturing products, by affording a surpius for exportation at ony price which will pay transportation, will have a similar effect.

Again, foreign wars, by increasing the demand upon us for provisions, induces a corresponding increase of our importations, and a corresponding angmentation of the revenues resulting from it.

Again, abnndant products of the precious metals, by affording the means of large purchases, operate in the same way.
And again, the system of railroad and other enterprises now in active operation in this conntry, which demand large capital on long credits, bring loans in immense amounts, in the shape of dutiable merchandise, to swell the cnstoms.

All the causes above mentioned, except diminished rates of duty, and great failure of crops abroad, have been in operation upon the customs since the flacal yenr 1849-'50, and we have their combined effect in raising the revenue derived from this source from less than forty to over sixty-four millions of dollars per annum in the spsce of four years.

In the last year they fell off eleven millions, owing to the absence of eome of the canses which we have noticed, but their proiuct atill stood at thirteen millions above that of the year 1849-'50, and neariy six millions above that of 1851-'52.

Alternations of Excess and Deficiency in the Revenue under Duties lower than protective.-Frcm these facts, and the laws of national finance which they ilinstrate, it is olvious that the ratio of percentage imposed apon imports, aeting within a moderato range of differences, is the least influential, and the most likely to deceive expectntion, of all the canses which uaually affect the revennes ariaing from them. But low duties not only disappoint the intention for which they are recommended, in the manner and for the reasons given, but, by their own inherent vices, they are not only liable, but certain, in despite of all modifying influences, ordinary and extraordinnry, to work mischievonaly in the opposite direction-in spasmodic alternations from excess to deficiency.

The first rednction of the duties of the act of 1832 , providel for by the compromise of 1888, took effect on the 1st January, 1834. At the end of that year the public debt was paid off, and there was a balance in the tressury of a little less than nine millions of dollars. In 1885 the revenue from customs and the sale of public lands rose thirteen millione and a half above the receipts from the same eources in the preceding year; and in the year 1886 they rose fourteen and a half millions more; so that at the end of the year 1886 there was s balance in the treasury of forty-six and a half millions. To dispose of thie enormous surplus of public moneys, the act of 23d June, 1836, was passed, directing the deposit of twenty-eight millions with the States. But euch tendency to excess in the syatem of national finances, like the fehrile paroxyams of the human constitntion, apeedily passes into the stage of exhaustion. In 1837 the revenue from public lands and customs fell to eighteen millions, from forty-eight millions the year before; and on the 12th October of that year, the isaue of ten millions of treasury notes was anthorized to supply its deficiency for the services of the government. In 1889 the revenues rose to thirty millions-twelve millions in two years; and in two years more sunk to fifteen and three-fourth millions-another fall of nearly 100 per cent. in two years.

Thus, in the first three years of the Compromise Act We have the whole difference between twenty-one and forty-eight millions of revenue per annum reaulting to the treasury, and in the next five years the atill greater difference of a decline from forty-eight to fifteen and three-quarter millions: Under the operation of the aerond reduction, while the dr' remained the same, the customs fell off from twenty-three and a half to eleven millions; and under the operation of the third reduction, they roee again to twenty-three milionsfluetuations in the revenue which baffled all calculation ond deatroyed all reliance.

Steadiness of the Revenue, and Adjustment to Expenditure, under protective Tariffs.-Under the tariff of 1824 tite revenue varied no moro than from twenty-two to twenty-flve millions in four years; and under that of 1828 from twenty-five to thirty-two miliions by regular increase in four years. Under that of 1842 the clstome rose from the depressed point of eighteen to the steady and adequate one of twenty-seven and $a$ half millions in four yesrs, and the receipts from 'he public lande rnised only from one and a third millions to two millions.
The public expenditures during the three periods of these comparatively high tariffis were very regularly covered by the national income-the firat yielding five mililons, the second four millions, and the last thirteen millions, or from one to three $:$ ililions per annum more than the current ordinary expenses of their respective periods of operation; amounting annually to no more than such halance in the treasury as it is prudent to hold for its incidental uses.

Plethore of the Treasury under the Compromise Act and under the Tariff of 1846.-Under the low tariff of 1833 we have first an enormous surplus in the treasury, then $n$ large deficiency and debt. Under that of 1846 wo have arrived at such a surplus of public moneys as again calls for relief; we have a baiance in the treasury now of nineteen millions, and we are threatened with its augmentation to the smount of thirty millions in a year to come.

It is not intended hy this contrast of the stcadinesa of the revenue nnder the highest tariffs and their happier adaptation to the wanta of the treasury, against the unsteadiness of the income and its maladjuatment to expenditure under the lower tariffs, to espouse the rates of duty of the particular systems cited of the one class, or to condemn the systems of the other by 60 sweeping a generalization ; but they are arrayed here now simply to exhibit their respective workings, as

## TAR

the facts and figures of their history present them to us, and that they may serve as data for the inquiry before us.

Your committee are ae well aware, and feel as forcibly as any objector can, that where a number of causes are in existence, and co-operating in the result, eapecially when several of them are inter-dependent, and some of them independent of the others, the difficulty of determining their reapective agencies is great in proportion to the complexity and diversity of the forces at work; bnt such diffioulty, in a matter of the vast importance of that under investigation, only increases the necessity for endeavoring a solntion.

The fluctustions of the national revenue during the operation of the low tariffe, and its steadiness under the higher ones, occurring in a constant connection in the last thirty-five years of our financlsl experience, seem to admit of a clear and instructive explanation.

The following propositions, which embrace the facts involved correctly and sufficiently to cover all the operative canses, jmmediate and collateral, very fully eatisfy the inquiry.

A tariff of duties ranging generally below the point of adequate protection to our home production, induces large importations by the effect of diminished prices, to the extent to which the purchaser's means are relatively increased, and to the further extent of aupplying the vacancy occasioned by withdrawing from the market the amount of commodities of home production which are so excluded.

Effect of low Tariffs upon the Income from the pub. lic lands.-In 1834, the first year of the reduction under the Compromise Act, the imports for consumption rose three and a half millions, and the revenue fell off twelve millions.
In the year 1830 the imports rose again thirty-five millions, and the reventu from them was less by ten miliione than in the year 1833; but nearly fifteen milllons of dollars fiowed into the treasury that year from the sales of the public lande, bringing the total revenue up to the total of 1833, and more than a million above it.

In the following year, 1836, the imports for consumption took another rise of thirty-seven millions; the customs reached within five and a half millions of the higheat point they had ever attained under the preceding tariffs. The jubllic lands rose to the enormous umount of twenty-five millions; and the total revenue of the year stood at eeventeen millions nbove that of 1833-the highest mark of the high tariff years.

Under the lowest of our Tariffs the greatest Excess and the greateat Deficiency of Revenue both reached.For nine yeara before 1834, the public lands had never in any one year yielded quite four millions, and the average was two, or nineteen millions in nine years; but in three years, $1834,{ }^{\prime} 35$, and ' 36 , their product to the treanury was over forty-four millione. The customs for these three years, under the compromise, had failen off from the sum of eighty-one and 8 half millions afforded by the three previons years of the higher tariff, to fifty-nine millions-a reduction of twenty-two. and a half millions; but the rovenue of the treasury, by the addition of thirty-six milions from the pullic lands, above their average previous yield, nmounted to fourteen milions more for theso three years of the compromise than for the three preceding years ; and the proceeds from the eales of lands continued for three years longer to yield ten millions more than their product under any higher tariff which we had before or aince. At the close of the year 1839 these movements had exhausted themselves. The customs for the three following yearn ran down to forty-six milliuns, twenty eight millions below the ordianry expenditures of the period; the lands fell to two millions per annum, and the principal of the pubiic debt contractod in the five preceding years atood at ten millions.

The operation of a tariff of dutien below the point of
protection, with the long run of nine years for its developments, is here fully presented. All the causes which could affect the results bad room and time for their natursl action, and their combined results are openly exhibited.

Its first effect was to nearly double our foreign $\ln$ portations in three yeara. This had the effect, by reduction of prices and glut of the market, of crushing the rival manufacturing indnstry at liome; mills sad work-shops were orippled and closed; the capital and labor driven from them sought employment in agri. culture; the esles of public lands amounted to move than seven-fold the average quantity of any other period of ten years before or ten years afterward; und the term wound up with a general bankruptcy of the national treasury, and of the people, bringing with it a complete political revolution, and compelling a total change in the financial policy of the government.

The fluctuations of revenue under it are strikingly marked by the facts that the income from all sources never afterward rose to within elght millions of that of 1836, until the year 1850-'51, and bad not fullen so low as in the year 1841 since the year 1821 ; it, in fact, touched a point below the receipts into the treasury of the year 1808. Its fluctuations in a period of five years touched both extremes of the revenue of the hiltion, runaing through thirty-four years of change: that is, the revenue had not been so low for twenty: five years hefore the year 18 $\$ 1$, nor so high for fourteen years after 1836.

Greatest Flurtuation in Prices under the lowest Tar-iffs.-The business of the country felt these vieissitudes in our foreign commerce, and answered to them like their echo. Within a period of six years, while this tariff was developing its extremes of change, from 1830 to 1842 , the highest and lowest prises of elghteen years were touched. Cotton, flour, provisions, tobacco, comimodities of all kinds, labor and real estate, went up in price almost in the exact ratio that importations in. creased-that is, to nenriy double the amount of $183 \%$, in 1836; and in 1842, the imports falling to one huif in nmount, so the property, labor, and products of the country stood at half the market value of aix years before. Not an interest of the country on which its national or individual welfare depended, but lad in that brief period undergone convulajons unpuralleled olnce similar canses had resulted in the great busiacss catastrophe of $1820-21$.

Such is the bistory of the policy which abandoned the revenues of the government, and the judustrial interests of the country, to the operation of causes not within its control.

Undue Firpansion of Bank Circulation inseparable from excessive Imports of foreign Mferchandise.--It has been customary with the advocates of low tariff duties to charge the inflation of prices, the rage of speculation, and the resulting revulaions in the business prosperity of the country, to excessive issues of bank paper.

The fact that such overissues always concur with inorlinate rise of prices is remarkablo indeed, and offers a plausiblo explanation of the mischief; but the ether fact, of the invariable concurrence of greatly enhanced pricen and excewsivo hank issues with the reign of low tarifis, comnest theso phenomenn in our financial history in n category of relatione which very clearly shows that they are in their nuture inseparalle. if this be so, the government, which has the direct centrol of one of these agencies in the mischicf, has au indirect but atsolute control over the others, and shoulid exert it.

Fized Ratio of Rank Issues to foreign Imports.-In 1830 the bunk circulation was estimnted by Mr. Gullatin at sixty-one millions; in Aprif, 18i4, the Secretary of the Treasury, Alr. Taney, estimated the circulation nt eighty millions. In the four years, 1830, 1831, 1832, and 1838, which immediately precedel the first reduction under the Compromise Act, the imports con-
sumed amounted to two hundred and ninety-one milllons. At the end of the next five years, 1837, the bank circulation had swollen to one hnndred and fortynine millions, and the imports for consumption for 1834, 1835, 1836, and 1837, to four hundred and eightyone millions. Thus the incrense of the importe amounted to 75 per cent. for the period of four years, and the increase of tho bank circulation to 80 per cent.; and if ra add the increased purchase of public lands of the latter term over the former, we have the propertion of the circulation to the expansion of business speculations induced by the reduced tariff very exactly balnnced.

In May, 1837, the banks, with one consent all over tise Union, suspended specis payments, and did not permanently or offectually resume till the spring of 1842; then their circulation had fallen to eighty-three millions; nor did it rise bigher than eighty-nine millions again during the operation of the tariff of 1842.

Since the year 1846, the increase and decrease of bank circuintlon hold so exact a ratlo to the several instances and rates of increase and diminution of imperts for consumption for each year of the whole period, as involves a direct and unquestionable connection between them.

The tabular atatement appended to this report exhibits the constancy of thls connection for every single year of our finsncial history since 1833, and for periods of years before and aince, in a ratio so nearly mathematical that there seems no doubt of the law which rules the subject, as there is none of the facts which serve to demonstrate it.

It will be seen, by reference to the tabular statements of this repori, how little pewer other causes, which were undoubtedly active in modifying the results, had to disturb the working of that one which is leere nssumed to be the principal. The expansions and contractions of bank credits and issues are certainly Influenced by mony other cnuses, but the fact that they have occurred during the last forty yeare, year by year, in an invariable relation to the fluctuations in the amount of our foreign imports, goes fur to establish the idea that the variations in onr imports rule the fluctuutions in our paper currency; and thls law is, moreover, so energetic that it even overrules the effects naturally expected from the large eupply of gold furnished to the currency from the California mines. For it is ns true ne it is surprising that since 1850, as before, cvery year of incrensed import has been marked by an equifalent increase of bank circulation, and every year of dminished imports has been marked by a diminlshed bank circulntion, correaponding in amount ns nenrly as it ls possible to conceive a primary and ruling cause can operate whilo minor and subordinate ones are also in play.

Lov Tariffs responsible for excessice Bank Issues.That low tariff duties nre responsible for the excess of foreign importation-that these augmented imports induce oxcessive bank issues, and excessive bank issucs awell prices inordinotely, in the series of dependency which is here alleged-is rendered unquestionable, by the fact that these expansions of imports, paper circulation, and prices, never havo occurred when our tarifls were high enough to foster, but always when they were so low us to discourage, home production, nnd to substltute the forelgn commodities for domestic products in our market.

Summary of the Reasons which forbid the Abandonment of protective Duties.-Yonr committee derive from this investigation of the effects of our varied tariff systems upon the revenue the following conclusions:

1. The immediate etfect of dutles below tho rates which protect onr own industry from the rivairy of forelgn commodities of the aame kind, is a proportionate onhancement of such imports, and a corresponding increase of the revenne from oustoms, which eithor appronch, equal, or excecd the revenue from customs of
the higher tariffs; but in all instances is certaln to disappoint any expectation of a reduction of the customs in proportion to the abatement of the rates.
2. The increase of imports consequent upon a reduction of duties below the point of adequate protection drives manufactnring capital and labor into agriculture and trade, and by this means vaatly increases the revenues from the sale of the public lands and from foreign commerce, and thus makee up all deficiency in the customs, and greatly overpasees it, and so tends to a plethora in the treasury, instead of limiting its income and restraining its overflow.
3. The indirect effects of the same policy is to exhaust the sourcea of national and individual prosperity, and hy its reaction to bankrupt the treasury and prostrate the enterprise of the country, leaving debt, public and private, to punish the extravagance which it induced and indulged.

Your committee, therefore, for reasons cogent as these, and many others which depead upon these, but are irrelevant to this issue of mere national finance, would carnestly discourage any' measure which, either in principle or in details, aims at relieving the treasury of its present and prospective surplua by a reduction of the present rates of impost dutics below the point which any branch of our home industry requires for its sccurity and prosperity. To guard egainst any possible misconstruction, it must be observed that by the frcquent allusions of this report to exceseive importations of foreign goods, and the influences drawn trom such excess of importation, the apparent " bolance of trade" against the United States, which the statements of the Tressury Department exhibit for any single year, or for any series or groups of years, is not taken, or intended to any effect or purpose for which the difference in official value between our imports and exports has been used ly either party to the controveray.

The total value or valuation of our importe, as given by the department statements, from the beginning of the government to the 30th June, 1855, amounts to 6983 millions of dollurs; the exports for the same period of domestic and foreign merchandise and specie, to 6170 millions-a difference of 813 millions.

No conclusions whetever are drawn, gither as to effect or amount of effect, from the data which our International account current thus offers, or seeme to offer. The discussion which this point would awaken has been avoided as wholiy unnecessary to the argument of thls report, and possibly inconclusive and uncertain for any purpose. But although the enormous apparent balance against us in the account of our foreign trade he not reliable for the actual difference in our exchangee with the rest of the world, as it probably is net, yet the amount of the national, State, municipal, railroad, lank, aad other corporation atacka and bonds held by forelgaers, should be recsived as a subsisting balunce of debt, resulting from a past balance of trade, which it must represent.

Effcets of the present Tariff upon Wool-growers, Manufacturers, and upon the Revenue.-The tariff of 1846 unhappily raised the duty on all imported wools to 30 per eent., while it reduced the duty on imported flannels and bianketa to 25 and 20 per cent., and on the coarser woolen fabrics to 25 per cent.

Now these low-priced manufactures of wool being the chief in quantity and value of which we were then capable, the business was prostrnted by the premium which that act in effect offered to the forelgn manufucturer ; and the nominal protection of the wool-grower resulted in the ruin of his business, as in that of the cloth-maker. The home market was destroyed for the farmer; in the foreign he could not compete, and the flocks were seat to the slaughter, because tha woolen factories had been sold at auctlon or converted to other services. The effects of this policy on the treasury are seen in the fact that twenty-two millions of the
surplus $\ln$ the treasury, acoumulated $\ln$ the years 1853, 1854, and 1855, have come from customa upon woolens. In 1844 woolens ylelded $\$ 3,813,495$ to the customs, cottons $\$ 4,850,781$; in 1855 woolens ylelded $\$ 6,088,157$, cottens but 3,$823 ; 294$.

The cotton manufucturo was protected; the woolen was abandoned; and while all the intereste dependent upon it have been sacrificed, the revenue hua been infiated at least four millions per annum during the last four years beyond what it would have recelved if the pollcy of the government had been as friendly to it as it has been to tho cotton manufacturer; a striking illustration of the law that the certain method of limiting the amount of taxes is by limiting the amount of imports, by duties adequate to guarding the home-made conmodity against extinguishinent by the forelgn.

Exemption of the coarser and finer Wools from Duty. -Your committee, looking straight af the question of the revenue, therefore, reeommend you to exempt all wools of those qualitios not generally grown ln thls country, costing less than ilfteen and more than fifty cents per pound at the port of entry in the United States, from duty, retaining the existling tariff rate upon the intermediate qualities, and at the aame time to raise the dutles apon all woolen manufactures to the point of adequate protection.

The recommendation to fix the duty upon all such wools as our furmers now produce, or can eatily produce, at 30 per cent., and to raise the duties upon all woolen fabrics into whose manufacture such wool enters, is made for the purpose of opening a market at home for the raw material whleh it can not find slrosd, and diminlshing the customa flowing into the treasury from woolen imports to the extent which such enhanced domestic production will replace them.

Magnitude of the Woolen Interest.-Special consideration to this interest ls here given because of its magnitude, which may bo estimuted ly the fuct that, both in value of the imports and the amount of duty yielded to the treasury, woolen manufactures have been equal to those of iron, greater than cottone, and next $\ln$ importance to silka, during the last ten yoars of our financial history.

The Secretary of the Treasury, notleing the great progress made in the manufucture and production of iron since thes yeas 1840, states the fuct that the American production in the yeur 1850 was $\mathbf{6 6 0 , 4 8 5 , 6 0 5}$, and the foreign import of tho same year only $\$ 16,333,145$, and saye: "The conclueion is inevitable, that the production and manufacture of iron in the United States within a very short period of years will exclude the foreign production and manufacture." Of cotton he says: "That already the Amorican manufacturo is in possession of the bome market as to all coarser fabrics, and leginning succesefully the manufacture of the finer fabrics."

These are the good parts of a policy of protection so moderate that without the help of a number of independent causes, co-operating with the imposed dutles, even these branclies of the lron and cotton manufacture, to which the Secretary's report justly upplles, would not have been sastalned in the past, or given such flattering promisea for the finture. The protection extended to them, and which now appears in thelr prosperity, covers a periol of not mone than fourteen years, and has been efficiently operative for only ubout half of that time; yet, with all favoring lulluences concurring, under a stalsle policy, the enterprise and skill of our manufacturers may in time achlevo a vietory over the competition of cheaper and more abuudint capital and labor abroad.
Depression of the Woolen Interest.-Ilat our woolens have languisbed to the verge of extinction, while these two branchea, of not more than equal importance, have so far prospered. In 1840 we imported for consumpition $\$ 10,000,000$ of woolene und $\$ 18,000,000$ of cottons. In $18: 5$ we lmported fur consumption $\$ 22,000,000$ of wool-
ens and only $\$ 15,500,000$ of cottons, and exported of domestle cottons nesrly $\$ 6,000,000$; in the one case more than doubling our dependence npon forelgn production, and ln the other reducing it, in effect, 27 per ct.
Now we are just as capable of growling wool and nanufacturing it as we are of the corresponding cotton production und manufacture. The territory of the United States, adapted to wool-growing, is as large and as favorable as all Europe ponsesses and devotes to the purpose ; and lf those qualities of the article which we do not or can not profitably cultivate were exempted from duty, and so afforded equally cheap to our own as to the forelgn manufacturer, there is no natural cause in existence to prevent the immediato establishment of woolen fuctories oufficient to open a remuneratlng market for our fariners to an almost unlimited oxtent. Thero are portions of tho United States in which the finest and best wool of the world has alrealy been grown ; and It is possible that this might in time be brought up to supply our entiro demand for sach first quality of staple; but it is certain that all the qualities between the finest and the coarsest could be supplied quite up to the demund of the market within thve ycars from the establishment of an encouraging policy; and Congress is imperatively called upon now to decide whether no vast an interest as this shall be sustained or destroyed.

Protection to the IFool-grower and Manufacturer, or Destruction to one of the three greatest Jranches of American Iudustry.-As the question now stands, moreover, let it not be overlooked that, if tho manufacture shall be relieved of all weight which the duties upon all qualities of wool impose on it, by placing them in the freo list, the wool-growing interests of the country may be eeriously injured. If the manufacture is protected, as it must be by a duty of 30 per cent., the agriculturists will be taxed that much upon all the woolens they must use, while their own interests in the production of the fabrics are destroyed; and if woolens shall not be thus protected, then manufacturer and farmer are both overwhelmed, and the country ls deprived of all shure in one of tho threa greatest branches of human industry.

Tho consumption of woolens is at least equal in value to that of cottons in the United Stutes, and to surrender their production and manufueture to destruction is so nuwise thut it is nut to he supposed pessible to an intelligent people. Let a home nurket for all the wool that esn be profitably produced in this country lie created by a change in tho present tariff which will exenipt the coarsest and tinest qualities from duty, raise the duties on flannels, blankets, and those fabrics which requiro the middling qualities of wool which the United States can supply ubundantly, and farmer and manufacturer will be restoned to that prosperity of which they have been deprived, and tho revenues will ise reduced by the dininution of imports ollected liy the home supply, and all the objects of a just and wise legislation will be equally niet.

Reduction of the Revenue by I'rotection of the W'oolen Manufactures.-The euatoms have risen on woolens in eleven years from $\AA 8,318,495$ to $£ 6,088,157$, while those on cottons have fallen from $\$ 4,850,781$ to $\$ 3,8: 23,284$. Here we have a rato of reduction in the revenue, from this source, which under parallel circomstances would, ly its direct operation, reduce the sunual surphas of the treasury at lenst four millions.

Ald this prolable reduction to the Secretary's estimrte of the dlminution promised ly his proposed free list, and ahout nine millione of diminution in the annual revenue are fairly provided for-live millions inmediately, and four millions just as soon as factories can le built, or those which have been converted from woslen to other manufacturas can be restored; and sheep, which by natural incresso more than double their number every year, can be reared to supply the demand.

## TAR

Silks, Revenue from them.-Another and more inmediately effective reduction of the revenues may be made by revising the tariff upon silks, 80 as to reduce the rates upon all qualities and kinds which do not compete with any established production of the artlcle at home.

The imports have risen in value since 1847 from less than twelve to ovor twenty-four millions, and the customs from $\$ 2,838,850$ to $\$ 0,129,583$. In these nine years the total ameunt of duties received into the treasury from manufuctures of silk is $\$ 51,893,871$; while the totul revenue from iron, manufactures of iron, and iron and steel, amount to only $\$ 50,136,942$.

Lsxuries, and the Rule for taxing them.-Silk manufactures stand highest in productiveness to the treasury of all articles enumerated in the tariff schedules. They owe this rank as sources of revenue, lt seems to your committee, mainly to tho misapplication of a general rule which has governed turiff legislation during those periods of finuncial necessity when import duties wero resorted to to supply the treasury's deficiencies, and were felt to be a necessary lncrease of the burdens of taxation for revenue parposes. This rule holds, with some justice, that the wealthy shall contribute more liberally to the national wants than can be fairly demanded of the comparntively poor. Hence the maxim that luxuries should lear tho highest revenuc duties.

When this rule has the cffect of lessening tho burden of taxation upon the poor, it ought to have its operation; but when in iltered circumstances, both of the national fanances and the general condition of the people, it only operates to bar the people of moderate independence from the enjoyment of such luxuries withont affording them a corresponding and compensating rolief from taxation; it takes the character of ministering to the privileges of the rich, and preventing the otherwise possible enjoyment of luxuries by the whole people.

Luxury is a relative term, and must change ite meaning or its npplication with all chnnges of condition in its subjects. Before the year 1832 tea and coffee were treated as luxuries by the previons turiffs, although they were more than aufficiently productive of revenue for all the wants of the government. By the set of that year they were put into the free list, probably because they did not enter into competition with any home production of a sinsilar character and use, and possibly for the additional and equally good reason that a repuhlican Legislature ought, by every legitimate use of the powers intrusted to it, aim at leveling up the comforts and enjoyments of the peopls of every condition to the better and higher that can ly any means be bronght within the reach of their lndustry and nspirations.

The imports of silk manufactures are greatly larger in value overy year than those of wool; their consumption by the people of the United States must, therefore, be not only very large but very general, and whatever can be done to bring them more easily within the means of the whole communlty, which at the same time shall help to relieve the excess of annual revenue and damige no industrial interest of the nilthon, ought to be done.

For the like reasons, troplesl frults, splces, and ether commodities not produced In the United Ststes, or not embraced by, or adapted to, the industriul enterprise of our people, should bo put under the same rule. With a sufficiency of revenue aceruing to the treasury from ther sources, the princlple of free trado in all such commodities should have its utmost npplication in practice.

Reduction of Customs by enlarging the free List, enrouraying Woolens and modifying Duties upon Silhs, sufficient to relieve the bicess of Revenne.-In a judicions modification of the duties upon silks and other luxurles, your committee see a promised reduction of
the revenue, based upon the atatistical dats hefore us, which, taken in connection with the measures already indicated, comes very well op to the amount of diminution demanded by the present and prospectlve exigencles of the treanury.

Cslculatlons of revenue to be yielded by percentages, when the princlpal is of unsettled ameunt, and llable to be disturbed, not only by various other causes, bat by the changes in the rate of dutles adopted upon those calculatlons, are of course uncertain; but where there is nothing else to gulde than estimates so based, they must be taken, and a future experience be left to settle their results into certainties. We can be safely confident that the measures whlch conform to the princlples and laws of the subject will work in the direction Intended, and this is sufficient assurance of correctness to warrant tie trial. In this confidence, corroborated as it is by the teachings of the past, your committee snbmit these suggested changes of the present tariff for adoption.

Our System of Finance unsound and nischierous.The management of the national revenue so as to adjust it fairly to the national expenditure, kceping the pollicy well within the constitutional powers of the goverament, and conforming it at the same time to the movements and interests of our national industry in nll its vast varicties and values, is a problem which has not yet been satlsfactorily solved in the practice of the government. Deficiencies and excesses have alternated in the treasury so rapidly and so largely in our past experience, that Congress is at length fairly driven from the ground of temporary experiments, and compelled to scarch for the principles that naturally rule the subject.

The Policy of Industrial Independence.-If the experience of mistskes teaches any thing clenrly and reliably, our tariff histories are full of evidence that our home affairs can not be safely left to foreign infiuences, and that the accidents which lie in wait for them are not to be prevented by abandoning all legislative care of them. A nation must govern itself, or its nelghbors will; and that for their own purposes and profit. If the United States were exclusively a manufacturing, or as exclusively an agricultural people, absolute free trade would be their policy, and custom-houses an absurdity.

The most extensive trade which they could sttain to with forelgn nations would then le their highest interest, and direct taxation for the support of the government the soundest system of nutional finance.

But our manufactures have now quite reached to the value of our agricultural products. Fifteen hundred millions of dollars per annum is the value of each of these two great classes of productive Labor, according to the estimate of the most reliable authority ; and it is neither in the character nor destiny of this great people to enduro a perpotual dependence upon foreign nutions for the products of skilled industry which they need for every-day consumption. British legislation nimed at restralning us, while we were her colonies, to the production of raw material from her market. If our own system were permitted to drift to the same result, we should, by our own act, voluntarily restore her empire over us in the only particular that is, or ever was, a substantlal olject of her ambltion, and onr Revolution would be a failure in every thing but the boast of politlcal independence.

The despotism of wealth fears no rebellions; predestinated poverty has no independence to assert. lts spirit und its necessities are passire submission. The rights and literties of a nation are declared ln its polltical constitutlon, but their substance is in the industrial independence of the people. True froedom is found only in the commund that men lisve over the reslatance of the forces of nature to their dominion; and a peoplo which achleres the control of thelr own conditions are never the slaves of any other power.

Dependence upon a forelgn people for a market, elther for agricultural or mechanical products, is ladustrial vassalage.

England has made herself the work-shop of the world by a viciously exaggeruted syatem of manufacturing and she depends day by day upon the world's unnatural subuissiou to her aysten for her prosperity.
Turkey abandoned the guardianshlp of her prosperity to foreign dominion, and has aunk from the yauk of a first-rate power in the earth to the very verge of national ruln. Her internal trade ls wholly in tire hauds of forelgn hucketers, as her natlonal integrity is under the guardianship of forelgn soverelgns. A peoplo impoverished by a syatem of the lowest and least remunerative Industry, and degraded in character and spirit by its necessary lgnorance and feelleness, is inevitably at the mercy of its superiora in these respects.

The American people, of the same lineage, equal skIll and enterprise, superior inventlve genins, and holdings a hetter territory by all the difference of lts extent and variety of climate, soil, and commercial relations, as cumpared with Western Europe, can not possibly te held to inferlor and subordinate ladustrial avocations.

The necessary comunand of our welfare, the current disposition of our own affalre, imperatively demand that we shall guand ourselves against all injurious foreiga agencies and influeaces, by a nettled system of self-defense.
Home aml foreign Market for Provisions and Bread-atypls.-The home market for all our products now is at twenty-seven hundred and fifty millions to two hundred and ifty millions; but the corresponding two hundred and fifty nilllons of imports, for which we exchange our surplus, has the power to disturb and distract our currency, domestic exchanges, and domestlc industry, to an extent which puts the treasury of the nation and the prosperity of the people at the mercy of cvery fluctuation in the market of London. Wo must conquer our independence of the meney power of Europe, and we must control our national tinances into conformity with our own necessities. This, it is obvious, can te done only by bracing the home market against all disturbing agencles.

The mischievous error of preferrligg a foreign to the home market for breadstufis and provisions, and seducing the agriculturist into the policy of favoring it, is clearly exposed and coavincingly proved by the fullowing statemeat:
The populatlon of Great Britaln and Ireiand is. . $27,000,000$ American insadatuffe and provistons alipped to the t'nited KIagdom in 1545.

The facts and figures of every other kind of inported commoditles which a home proluction would exclude are duta for a slmillar calculetion of loss to the agricultural Intercst of thls country.
International Exchanges. - The surplus provisiens and breadstuffs which wo might produce, after an evenly balanced and independent system of manufucturligg should bo establisheil, would be the legitinate sulject for foreign commeree, contributing to sur necossary exchanges with other matlons, and thus to the generai welfare; but shipped nt such a loss in anount and value, as they must be whilo they are injuliciously denied a home consumption, tho undue amount of their export measures our distanco from a healthy systou, and from the wealth, prosperity, and independence which a true policy would secure to us.

Agricultural home Jarket agninst the foreign. - It Is only the least proiltable of the farmer'n crops whileb will bear distant voyages in search of a market, and all excess which his oxjorts find or make abroad falls back in diminished prices upon the hundred-full stork which he sells at home, sonetines scarcely repairing by the whole net value of the exports the dininatien of price which they reactively inffict upon the domestic market. For his green crops, fruits, and garden stuffe, his poultry, veal, mutton, and dairy products, ho must have a market at home, or he mint abuadon their culture for smle. Ilia land may be made to yield him thilty or forty dollars per acro in transpurtable grain, leas the cost of cultivntion, or he may make its product marketahle aliroad and worth about as nuch by feeding it to atock; hut ho can nelther diversify his crops, nor maintain the fertility of hla land agninst such a system of exhaustion; and, atovo all, he will not be alle to make it yleld three times the value of such crops in those vegetables which, with a well-sustained home market, is easlly effected Thodifference between the market value and the proft of a farm in the Far West, and one of an equal quantity of land aljacent to a large city, illustratea the difference bet ween a market nt hend for all possili,n agricuitural producta, and a forelgn one with an ocean intervening:

The farmer's wool crop has been amply protected for ninu or ten years, so far as a high tariff duty upon imported wool could do, or promise to do it; but his howe narket has been deatroyed by a comntervailing
legielation levelad against the manufacturer. The opportunity of a forelign market could not tempt, as it would not reward, him for his induatry in that direction. If the agriculturists of this country but considered the subject, they would discover that tho market opened to them abroad for the produce of their flelds is no better than for their wool.

In the year 1855 the total exports of breadstuffin and provisions from the United States fell short of thir-ty-nine miliions of dollars. What is this to the crop of the year, worth fifteen hundred millions, that the Amorican farmer should sacrifice the custem of a neighboring blacksmith, shoemaker, or weaver to secure it? In amount it is but the fortieth part of his crop, and ono family next deor to him would consume it nore profitably for him, and with greater certainty of demand. Prices may be high or low under the influence of accidental canses, but the laws of nature and the principles of trado are a safe directory in any combination of circumstances; their bearing upon nutional policy is absolute and unvarying, and they must be obeyod or they will be avenged.
IIarmony of all Industrial Interests, and Adjustment of the best econonical Policy to the Necessity of the national Treasury, - That a harmony of interests naturally and necessarily exists among all the departments of national industry is a fundamental principle in political, as it is in socinl and religious science. It is ono of these first principles which stand incontrovertible as the data of all reasoning upon the policy of human secieties. So far as this inquiry has proceeded, the truth of this principle is clearly supported; and it can not be doי', ted that the other branches of productive and commercial business, not specially considered, mast fall within the rule with an equally hapny accordance. If an integral, self-sustaining, well-balanced relation holds between the manufacturing and agricaltural welfare of the nation, and if the policy which is best for them is also well adjusted to tho requirements of our system of national finance, the truo Interests of the planter, the navigator, and the merchant can not possibly be at war with them.

Cottu. $\boldsymbol{z}$ and Commerce.-It would exceed the limits as well as the proper province of this report, to endeavor a formal demonstration of its doctrino ns it applies to cotton and commerce, and it must, therefore, be forborno; but some general considerations, which may be suggested in its support, will serve to show "the equal operation of the policy throughout the Union, discriminating neither for nor against any class, section, or intcrest," conformably with that maxim of our legislative system which has the dictates of justico and the spirit of the federal constitution for its authorities.

Erport of Gold ; Effects upon the Planting Interest.In the first place, the systom which looks to the industrial independence of the country would neccssarily have the effect of retaining the gold exported to forelgn countries for the purchase of all those commodities which we might advantageously munufacture for ourselves. The two hundred milliona which we have sent abroad within the last six ycurs is an excessive export, ly the amount to which it has diminished tho nccessary home aupply, and raised the rate of interest to its present Inordinato height. Scarcity of capital and extravagant rates of toans leave no interest of the conntry uninjured, except that of tho wealthy moneyholder.

At the place to which money flows it is most abundant and cheapest. The rates in London de not nyerage more than lalf those that are constantly paid in our Atlantic cities, and often stand at one-third, or oven lower.

Capital at 10 per cent. intereat, exposed to the competition of capital at 5 , hee a fearful odds to contend with; but it is abundance against scarcity which is even more disastreus than the difference of rates. A
proaperoua business man may endure heavy Interest, but a small capitsl must encounter the fluctuations of the market witheut relief, and la awsmped in a storm which the heavier craft will ride out under bare polea. From the revulsiena which our menetary affirs periodically auffer from this cauae, no department of production or trade escapea, and the planters are usually the esrliest and aeverest sufferers. They are nost shaken by depression of prices, and by bankruptcy of their customers, from the fact that their induatry is less varied, and the commoditios which they require for constant censumption are less within their reach, when business is embarrassed. They must bring then from abroad, where credit and confidence are not ao easily commanded as at home.

Fixed capitsl commands credit within the country, but mortgages are not negetiabie securities at a distance.

Limit to Exportation of the precious Afttals, - The drain of the precions metais, nnduly induced ly the import of articles which ought to be made nt home, is an ovil of such magnitude, that if thero were not another among the incidents of excessive importation, it would of itself deserve the utmost exertion of legislative powor to correct it. It is utterly from the purpeses of a sound policy to speak of gold as a product of the country, and a commodity of trade, like iron or cotton, while ita export is carried to the extent of crippling business, disturbing the currency, and enormonsly enbancing the rate of interest. However produced or dorived, it is maney to the extent required for the health of the circulation and tho prosperity of business, and any policy which runs the aupply below the demand is suicidai.

Cottcn and Iron Monufactures in the South.-In the next place, the older planting States are not only capablo of tho labor of converting their raw material, both cotion and iron, into at least the coarser fabrics which are conveniently and profitably marketable, lut they aro now under the compulsion of necessity to so far diversify their industry, and so to divert some portion of their labor from the one business which they have been so long helping to depress, and to derive from this change tho better remuneration which the work of conversion affords abore that of production.

Geergia, Virginia, and North Carolins made the experiment of applying a portion of their cheuper labor to the coarser cotton falrics, with a success which promised fairly to give them the home-market in a few years for anch articles; but New England was compelied to dispute this ground with them by the fuilure of the taritf of 1846 , to give the more advanced manufacturers of the Nerth the opportunity of making the finer fabrics in the then existing condition of the enterprise, and the South for the time was thrown back upon her staples and a foreign market for her dependence.

Protective Policy no longer a Party or sectional Ques-tioss.-13ut the spirit of progress, and the change of conditions which nine years have brought with them, have wrought their necessary clinnges in the movements of the whole country, and given us the happy promise of a better union in interesta and policy than wo havo known in the past.

The time and the occasion for harmonizing measures are now upon us, and the fond faith which we hold in the future destiny of the Union warrants the confidence that this great peoplo will show both the wisdom and virtue of a genuine patriotism in the settlement of all their differences.

A common Prosperity corrective of social Strifes. Every section of the Union should be the best judge of its own policy ; at all events, it will determine it for itself; but it is a happy circumstance for the United States that, in the things which work their way determinately into the desting of the nation, there exists so littlo contraricty of ophinion, and se much less difference
of drift, that thern is nething substantial required to be sacrificed by any part of the country for the good of the whole, and very littje even in apeculative opinion to be compronsised to effect an agreement.

Thn peopie may be agitated and divided upon conatitutional, moral, and religious questions, and their diseussion and settlement will have proportionate effect upon the general harmony; but the measures which carry with thein a general prosperity will hereatter, as heretofore, bear them through every strifs, and sceure the geneml welfare.

The prosperity of navigation, forelgn, coastwise, and internal, are necessarily so directly dependent upon the productiveness and wealth of the agricultural and manufacturing buainess of the natlon, that the aimplest iefinition of its functions contains the proof of our proposition. It is the common carrier of all exchanges. Its husiness is proportioned to, as it is depenient upon, produetion, and must grow with all growth, and decline with all diminution of the products demanding its agency.

Relutions of the Trader and the Laborer, and the Compensations of a general I'rogress for all Changes.-A sound political policy looks to a constant diminution of the proportionato number of lintermediates between the provlucer and consumer.

All the modern inprovements in the methods and inatruments of commerce tend to the accompliahment of this great aim. Time, distance, and enat of transportation are in rapld progresa of abridgment, and middlemen are, in corresponding ratio, eliminated by $t^{*}$. process. Yet all these movenents toward a better and directer relation thetween men whose reciprocating induatries requiro laproved conditions of intercourse is found to work as wnll for all the dependent as for the principal functionaries in the world's commerce. Steam has been largely nubstituted for human and lirute jower on the great thoroughfares of trude and travel, hut horses have increased in number and value in direct proportion to the growth of the ageney which threatened to deteriorate them. Wagea and demand for human labor have, in like manner, risen under the auspices of the machinery that now does so mireh of the work which iormerly belonged to them. All the natural labor in the nation beara but a amall proportion to the artificia, whieh has so largely replaced it in production and traneportation; yet that natural labor was never so fully employed ner so well rewarded as now; and the same law holds for every husiness function of society, and every species of employment which has any legitimate place or use in buman life.

Year 1824.-The tarlf change of thin year oreated considerable diseussion and feeling. The duties col. leeted that year were $\$ 17,878,000$, with a propulation of $12,000,000$, or $\$ 180$ to each individual.
1828.-The general change this year was accompanied by a light increase of duties ; vis., $\% 22,681,000$.
1832.-A nother general change took place, followed
by a rapid increase of duties after 1834, vin. :
$\begin{aligned} & \text { Years. } \\ & 1983 .\end{aligned}$
1834.
. . . . . . . . . . . . . . . . . . $\$ 29,488,000$
1815................... 19,397.014
1836. . . . . . . . . . . . . . . . $93,410,000$ \$1 60 per head.

The collapse of 1837 led to a reaction, and the duties diminished for 1837-'88, showing as follows:

Since the latter date the iluties have increased from $\$ 1$ per head to about $\$ 250$ per hend, viz. :

Since the year 1780, the aggregite revenue from all sourees has been $11,886,740,084$, viz.

| rom | 32 |
| :---: | :---: |
| From puill |  |
| From uniacel | 895,510,638 |
| Tota | \$1,898,749,044 |
| Tutal dioburser | 1,837,721,045 |

for a perfod of aixty-elght years; viz., from March 4 , 1789, to June $30,1856$.

By tho Constitution of the United States It is providerl that " no State shall, without the consent of Congress, lay any impost or duties on imports or exporta, except what may be absolutely necessary for executing its inspection laws; antl all such laws shall be sulject to the revision and control of Congress."

The following statement has theen furnished showing the changes from one rate of duty to another, as made by the tariff act of the year 1857 , when applied to the lmportations of the year ending 80th June, 1856:

| Vatuc. Rele, Acl of 1Rss. Rate, Ael of IKSt. $\$ 4,6 \times 2$ from 40 per cent. to 16 per cent. |  |  |  |  |  |

British Tariff-The following are some of the mest important regulations of the British tarlf:

Overpaymenta of duty made in error may be returned, if elaimed within six years after date.

In ease of dispute as to the preper rate of duty, the Importer to deposit the amount of duty der annded, and such deposit shall be deemed the proper duty payable, unless an actien be brought or sommenced within three menths. In the event of such action being deternIned agninst the revenuo, full Indemnity to bo made to the importer.

The Board of Cuatoms may remit or mitigate penalties Incurred through inadvertenee, or non-compliance with oxisting regulations.

The duties on the fellowing goods must be paid on the first importation, and auch goods shall not bo warehoused for home consumption or exportation : viz., cern, grain, meal, and flour, and wood goods from British possessions.
Diamonds, bullion, lebsters, and fresh fish of British taking, may be landed without report or entry ; ne other goods can be unshipped or landed, except with the authority of an officer of the eustoms.

Where ad ralorem goods shull bave heen detained as undervalued, the officers shall give a written notlee of such detention to the person entering the same, and of the value thereef as estimated by them. If such goods be retained for the use of the crown, the value cotered with an addition of 5 per cent., and the duties slready paid on such entry, te le paid to the owner.

Goods not entered, or landed within fourtoen days after the arrival of the ship, may be conveyed to the queen's warehouse; and if the duties and charges due upen such goods be not paid within three menths, they may be aeld, and the overplus, if any, paid to the proprietor.

Bonded goods to bo cleared within five yeare, unless the proprieter desire to re-warehouse them, In which case they shall be examined, and the duties due upon any detieiency ascertained and puid.
If such goods be not cleared or re-warehoused within the said peried, they shall be sold to defray duties and charges.
No person shull export honded goods in any ship of less burden than fifty tons, except to the islands of Guernsey and Jersey, by regular tralers not being of less than forty tens burden.
No drawlack shall le ndiowed on goods of less value than the drawbaek claimed, and all such goods eo entered shall be forfeited, and the person whe caused then to be entered shall forfeit tho sum of $£ 200$.
No tobacco, cigars, or snuff shall lie imperted into the Channel Islands in ships of less than 120 tona burden, nor unless in hegsheads or chests, each containing not less than twe hundred pounds' weight of such tobacee or snuff, ner unless in packages each containing not less than one lundred jounds' weight of such eigars, tebacce, or anuff, not being in any manner separated or divided within such package.
The islund of Malta and its dependencies shall be decmed to the in Europe.
Any person making a false deelaration in nuy document relating to the customs, or answering untruly autherized questions put to hin by the officers of eus$t$ oms, liable to a penalty of $£ 100$.

In case it shall appear that British vessels are subject in any foreign ceuntry to restrictions as to the voyages in whieh they may be engaged, or the articles

Imported or exported, It shall bo lawful for her majesty to Impose similiar restrictions upon the ships of suci foredgn country.

No foreign gooda upon which a higier duty is payable on their importation inte Great Britain than on their importatien inte the Isle of Man, shail, after they have been delivered eut of charge of the eustoms in the said lsle, be ahipped Into Great Britain.

Comparative Tariffs.-The following comparative statement exhibits the gross ameunt of duties recelved upon the principal articles of foreign and colonial merchandise in Great Britaln and France, respectively, during the year 1856, to which we have annexed a celumn showing the gross amount of duties received by the United States upon similar articles during the same year:

| Arlielea. | Oreat Mritaio. | France | Unlted Bratea, |

From an examination of the comparative duties on differeat articles, we find that the tariff of Great Britain more nearly approaches free trade than any other. The United States and Holland follow next ln orier, and Spain and Brazll are the nearest the other extrememaking, in fact, protection alnost prohilition. There is a great want of uniformity in the tariff charges gencrally, with the exception of those of the United States. In the tarims of Spain and Bazzil the dutlea seem to be levied arbitrarily in regard to home production, etc., and the tariff considered only in reference to the maxlmum duty under which the separate articles will be inported, and the total possible maximum revenue.
In the articles of every-day consumption, such as Hour, provisions, etc., the tariff of Spain shows almost a prohibition, while articies of luxury are admitted on low dutiea.
The commerce of the United States with these conntries in 1857 was in proportion to the total commerce of the country, es foliows:

| ar ending Juna 90, 1547. | Kispurta from Taited states. | imports into United Kistee. | Total. |
| :---: | :---: | :---: | :---: |
| Tireat liritala | \$155,845,754 | \$181,003, 3198 | 3316,48,977 |
| Fran | 38,238,097 | 47,792,827 | b0,031,514 |
| Spala | 10,703,007 | 2,723,016 | 13,406,113 |
| Hollan | 4,107, 77 | 2,401,709 | 0,57t,639 |
| Belginu | 6,614,326 | 5,040,811 | 10,704,637 |
| Brazll | 5,545,207 | 21,40,783 | 97, (n 5 5, 944 |
| Other countri | 112,875,404 | 150,340,299 | 203, 245, 603 |
| Thtal. | 3342, 960,6082 | 4300, 83010,141 | (1723, 250,093 |

From this table It appears that the six conntries of which we luve given a taziff summary bad the foliowIng proportion of the comnierce of this conntry for the tiscal year 1857:

> In the exporta from Inlled Statea fa the limports into
> a the totais commo
> " 60 per ceot
> .....

If we had included the colonies of the above countrien, which have the same tarifi regulations as their mother countries the percentage would have been materially increased.

 Goohb, Wabke, and Mahollanhlan impomthd into the C'nited stateg.

ical discoverer. Ife was a IIollander by birth, and appointed by the Dutch East Indla Company to the command of three vensels which they had fitted out at Batavia for the discovery of new countries and a mere extended commerclal power. Tasman sailed September 5, 1642, and the first-fruits of his enterprise wes the discovery of that part of New Halland cailed Yan Diemen's Land, which the navigators made on 2th November. Karly in December they set out again, and on the 13th they first saw the Iklends of New Zealand, on which the natlves succesefuliy opposed his landing. After viwiting several islands in the South Sea, some of which were previously unknown, ine returned to Inatavia, June 15th, 1643, having sailed round the southern hemiephern of the glate. The shortsighted policy of the Dutch Fast India Company prevented the publication of ony account of this voyage, hut a map or chart of the discoveriea of Tamman was preserved at the Stadt Houne at Amaterdam, and some years after I irk Rembranuts published an extrsct from the Journal of this enterprising seaman, of which tater geographical writers have been content to avail themselves. In 185 C a propositiun was made in Fingland to restore to the whole diatriet hitherto (but unjustly)
known as Van Diemen's Land, tha nama of Tasmania, in meritorious honor of its original discoverer.
Tatta, a town in the territory of Sinde, altuated about 60 miles $\ln$ a direet lina from the sea, at a short distance from the western bank of the River Indus, in lat. $24^{\circ} 44^{\prime}$ N., long. $68^{\circ} 17^{\prime} \mathrm{E}$. Population uncertain, probably about 8000 . The streets are narrow and dirty; but the houses, though built of mud, chepped struw, and uimber, are superior to the low huts seen in the adjoining towns and vlilages. Being situated a little above the part where the Indas divides into the two great liranches by which lts waters are poured into the Indian Ocean, it might be supposed thut Tatta would be a place of great trade. But, owing to the unwholesomeness of the climate, the berbarism of the tribes on its banks, and other causes, its commerce has never corresponded with what might have been anticipated, looking at its position on the map. It hud probably attained the scme of its prosperity in the beginning of the 16th century. In 1555 the Portuguesa, by way, as they stated, of avenging the treachery of the King of Sinde, inhumanly mase sacred 8000 of the inhabitants, and burned the town. -Conquốtea des Portugais, tome Iv. p. 183. It is probable that Tutte never fully recovered from this dreadful blow; but Mr. Hamilton mentions that $\ln$ the 17th century it was extensive and populous, possessing much commerce, with msnufactures of silk, worl, and rabinet ware. The decayed state $\ln$ which we now find it has been a consequence of the misgovernment and rupacity of Its present rulers, the Ameors of Sinde, under whose sway it fell more than 50 yeare ago. In 1635 the English established a factory at Tatta, in the view of facilitating the disposal of woolons and other goods in the countries traversed by the Indus; and the building occupied by the factory, though far from magnificent, was recently, if it be not still, the best, not in Tatta only, but in the whole country of Sinde. The chief exports are rice, shawls from Cashmere, oplum from Malwah, hides, ghee, cotton, goats' wool, carpets, drugs, etc. Putchock, an article largely consumed in Chins, is a peculiar export of Sinde. The imports comprise a variety of articles, but the quantities are trifling: they coasist princlpally of spices, dye-stuffs, hardware, tin, lron, etc., broadcloths, English cottons, allks, etc. But at present the trade is quite inconsiderable; and no one could believe, a priori, that the natural emporium of so great a river as the Indus, traversing many cxtensive countries, would cut so insignificant a figure $\ln$ the trading world.

A very well-informed party, Dr. Buist, editor of the Bombay Times, has, in his work on the late expedition into Afghanlstan, made the following olbervations on the trade of the Indns :
"The glowing descriptions of Burnes nppear to have given a very exaggerated idea of the value of the internul traffic of the countries beyond the Indus. It was forgotten that where there was no industry, no manufactures or mineral wealth, no sea-cotst or rivers
to permit exportatlon, there could be little or nothing to give In exchange for lmports; and that the wants of a population purely nomade must at all times be slmple and singularly few. The whole of our commerce with Persia has never exceeded two millions sterling a year, rarely above one; the total of our trade with Afghanistan certainly never exceeded a million annually, and has very rarely amonnted to much more than the half of one. Hesldes this, the Indus in reality was naver closed save by its own dangerous entrances and shallow depth of water. Lord Ellenborough has opened the Indus as far as Mithen Kote; and the Sutiej, in continuation of this, to tho Markunda, where it ceases to lo navigable for the smallest craft. Yet the gross value of the British goods consumed by the countries adjoinling does not at present amount to a quarter of a million sterling, and will not, in all likelihood, be doubled for ten yeurs to come; the expense of muintaining troops between Kurrachee and Bukkur, both stations includsd, exceeding $\boldsymbol{£ 6 0 0 , 0 0 0 ~ a ~ y e a r ; ~ w i t h ~ a ~ l e s s ~ f o r c e ~ i t ~ w o u l d ~ b e ~}$ unwise to think of keeping these stations at all. The great line of traffic was not along but across the Indus, by the Delhi frontier, or parallel to it at a distance of 100 miles, by Sonmeenee and Kelat. The countries beyond the Indus, besides, bave always been open to the free admission of every variety of foreign imports on puying a moderate fixed duty. The chief obstruction in reaching these is Irremediable by treaty, and arises from the attacks of the plundcring tribes in the passes, which can nat be restrained save by the payment of a black wail or subsidy."
The delta of the Indus has little in common with the delta of the Nile, excep: its shape. Not a fourth part of it is cultivated, and its few inhabitauts principally lead a pastoral life. It is overgrown with tamarisks and other wild shrubs; and though intereected by the numerous mouths of the river, its surface is dry snd arid, being almost destitute of fresh water.

Tax (Welsh Tasg; Fr. Taxe; Du. Taxe), a rate or duty laid by government on the income or property of individuals ; an impost, a tribute, or an excise, accordlng to the method of collecting, or the property from which collected. The first taxes levied on the people were by Solon, the first Athenian legislator, 540 B.c. The first class of citizens paid an Attic talent of silver, sbout $\mathbf{£ 5 5}$ sterling. The next was ky Darius, the son of Hystaspes, which was a land-tax by assessment, and deemed so odious that his subjects styled him, by way of derision, "Darius the Trader," 480 b.c.D'Eon's Historie des Finances. Taxes in specie were first introduced In England by Willian I., 1067, and He raised them arbitrarily; yet subsilies in kind, as ln wool, corn, and other products of England, continued till the accession of Richard II., 1377.-H.Hydx.

The following table exhibits the soveral taxes of ali the states of which there are any returns, and shows the aggregate of the taxes of each state, and also of the separate species of tax :

Annual Taxen in tue teitrd statre, 1850.

Adam Smith laye down four general maxime npon the subject of taxation, which are an follows: "1. The mubjecta of every otate ought to contribute toward the eupport of the government as nearly as poselble in proportion to their respective abillties; that fe , in proportion to the revenne which they reepecticaly enjoy under the protection of the etate. 2. The tax which each Indivitual in bound to pay ought to be certain, and not arbtrary. The time of payment, the manner of payment, the quantity to be paid, ought all to be clenr and plain to the contributor, and to every other person. 8. Every tax ought to be levied at the time, or in the manner most likely to be ennveniont for the contrilutor to pay it. 4. Fivery tax ought to be so contrived as toth to take nut and keep out of the poekets of the people as little as possible over and above what it brings into the public treasary of the state."
Tho aubject of taxation ia ably discuased in the Edinburgh Revierr, xxxlii. xc.; Democratic Reviere, xx.; Quarteriy Reriex, xxxv. ; American Quarterly Register, viii. For further articlen, see De Bow's Review, xilif.; Iluxt's Merchanta' Magazine, Iv. ; Somehern Reviere, viii.; North American Rerietr, xix. (Do Poxceav); Wextm. Reriex, xlvi., xl3.
Tea (in one Chinese dinlect, Chra, in another $\mathrm{Tr}_{\mathrm{r}}$; Du. Te; Fr. The; It. Te; Ruse. Tehai; Hind. Cha; Malay, Teh), the lenves of the tree or nhrub (Then riridin, Linn.). The ten-plant ordinarily grows to the height of from three to six feet, and has a general resemblance to the myrtie, as the latter is men in congenial situations in the southern countries of Europe. It is a polyandrous plant, of the natural orier Colemnifere, nud has a white blossons, with yellow style and anthere, not unlike those of a small dog-rowe. The stem is buihy, with numerous branches, and very leafy. The leaves are alternate, on short, thick, channeled footatalks, evergreen, of a longish eliiptic form, with a blunt, notched joint, and aerrated except at the inase. These leaves are the valuable part of the plant. The Camellias, particularly the C'amellia sasanqua, of the same natural family as the tea-tree, and very closely resembling it, are the only planta liable to be confounded with it by a careful observer. The leaven of the particular canieliia just named are, Indeed, often used in some parts of China as a substitate for those of the tea-tree. The effects of ten on the human frame are those of a very mild nareotic; and, like those of many other nareotics taken in amall quantities-oven of opiumitself-they are exhilarating. The green varieties of the piant possess this quality in a higher degree than the black; and $n$ atronger infusion of the former wili, in most constitutions, produce considerahle excitement and wakefulness. Of all nareotice, however, tea is the least pernicious; if, indeed, it he so in any degree, which we very much donbt.

The tea shrub may be described as a very hardy overgreen, growing readily In the open nir, from the equator to the 45 th degree of latitude. For the Jant alxty years it has been reared in this country, without diffleulty, in green-houses ; and thriving plants of it are to be seen in the gardens of Java, Singapore, Malaces, and Penang; all within six degrees of the equator. The climate inost congenial to it, however, seems to be that hetween the 25th and 238 degrees of latitude, judging from the succesn of tts caltivation in China, For the general purposes of commerce, the growth of grod tea is confined to China; and is there restricted to five provincen, or rather parts of provinces; viz., Foklen and Canton, but more particularly the first, for black tea; and Kiang-nan, Klang-si, and Che-kiang, but chiefly the first of these, for green. The tea dintricts all lie between the latitudes junt mentioned, and the 115 th and 122 d degrees of east longitude. However, simont every province of China proiuces more or lena ten, but generally of an Inferlor quality, and for local coneumption only ; or when of a superior quality, like some of the fine wines of France, losing its flavor when
exported. The plant is also extenaively cultivated in japan, Tonquin, and Cochin-China ; and in some of the meuntainous parts of Ava; the people of which country use it largely as a kind of prekle preserved in oill Iolanically considered, the tea-tree is a single apecies ; the green and black, with all the diversities of each, being'mers varieties, like the varieties of the grape, produced by difiorence of climate, null, locality; age of the crop when taken, and modea of preparation for the market. Considered as an object of agricultural produce, the tea-plant beare a close reacmiblance to the vinc. In the husbandry of China, ft may be raid to take the same place which the vine occupien in the monthern countries of Europe. Liske the latter, fts growth fa chiefly confined to hiliy iracta, not suited to the growtit of grain. The solla capalile of producing the finest kinds are within given districte, Jimited and partial. Skill and care, both in husbandry and preparution, are quite as neceneary to the production of good tea an to that of grod wine.

Cultiention.-The best wine is produced only in par. ticalar latituilen, as is the bent tea; although, jerhape, the Iatter is not reatricted to an equal degree. Only the most civilized nations of Europe anll Americn have as yet ancceeded in producing good wines; whlch is also the case in the Eant with tea; for the agricuitural and mannfacturing skill and industry of the Chinese are there unquestionably pre-eminent. These circumstances deserve te be attended to in estimating the difficaities which mnat to encountered in any attempt to propagate the tea-plant in colonial or other prossessions. These difficuities are obvlously very grest, and perhaps all but insuperable. Most of the at tempts hitherto made to raise it in forejgn countries were not, indeed, of a sort from ribich mach was to be expected. Within the lant few yeaw, however, considerable efforts bave been made by the Dutch government of Java to produce tea on the hilin of that islend; and having the easistance of Chinese cultivators from Foklen, who form a considerable part of the emigranta to Java, a degree of snccess has attended them, beyond what might have been expected in ae warm a climate. The Brazilians have made similar efforts; having slso, with the asaistance of Chinese laborers, attempted to propagate the tea shirul, near Hio de Janeira; and a mmall quantity of tolerably good tea has been produced. Hut owing to the high price of labor, and the quantity required in the cultivation and manipulstion of tes, there is no probability, oven were the moli anitable to the plant, that fts culture can be profitably carried on in that country: It may', perhape, ancceed in A ssm , where its cnlture is now being attempted; for inior is there comparatively cieap, and the hilly and tableIands are said to bear a close resemblance to these of the ten districts of Chinn; but we are not asnguine is our expectations ne to the reeult.

Cultiration of the Ter-ptant in the United States.This plant, which has ao long afforded a most grstefu! heverage to militons of people in every civtlizedi conntry of the globe, there is inuch reason to helieve, may be successfully cultivated in favorable situntions snd under proper management, for local consumption, at least, in most, If not all of our Southern States. This was partially realized from an experiment made st Greenville, in the mountainous parts of South CsroIina, by the late Junlus Smith, in 1848 to 1852 . He imported sevaral casee of Black and green tea piants, of Chinese ntock, of from five to seven years' growth, and planted them in the village above named, where they remained about two years. On their removal to a plantation in that vicinity, in March, 1851, Dr. Smith stated that "they' grew reniarkably last summer, and are now filly rooted, with tine large main and collateral mote, with un abiundance of fibirous radicles. They all ntood the snow, eight or nine inches deep unon the level on the 31 of January; and the severe froats of winter, without the allghteat covering or protection,
and without the loos of a single plant. They are now all forming part of the plantation, composed of these recalved from China last June, and a fow pla, ted the flrat week in June, which germinated the 17th of September. All these young plante were thinly envered with straw. Some of them have loet their foliage; othera have not. The stems du not appear to have anstained any injury, The fresh buds are beginaing to shoot. I can net help thinking that we have now demonstrated the adaptation of the tea-plant to thip soll and cllmate of thls country, and succeeded in lta permanent establishment within our borders."

Considering the practlcal bearing this subject has on the economy and agricultural interests of our South. ern States, It is aurprising that a slagle herb, which has proved of sucit universal acceptance, should retain this position in the world for centuries, and yet atill continus to be reatricted in its production almost entiraly to the country of Its origln, although correapondIng regions, with reapect to latitude, elevation above the eea, and other circumetances which modify the climate, are open to its introduction and culture, and the most intelligent, as well as the most enterprising merchants and others have over sought to lenrn every fact connected with its growth and subsecuent preparation. Though regarded, In geueral, as a luxury, and by some even as food, yet It is not an article from which the people of any' country should be deharred. On the contrary, it is the policy in thle case, as well as in most ethers, of every government to gratify the wishes of its people, and to faclitate the acqulsition of this luxury by its economical importation, or, what would be far more desirable, to extend the production to Its own soll. Respecting the expediency of such a measure in this country as thit last named, littie more need be stated than that most of our citizens will have it, and millions of dollara will annually bo paid for lte importation. To the argument which has often been advanced, that the very tow rate of wages in China is the reason why the production of tea has not been encouraged in. this coustry, it may be stated that, with improved machinery und other appliances, facility of transportation, robust and well-ted laborera, and probably with the aid of the Chinamen now in California, there ean be little douht that we can auccesafully compete, at least for local consumptlon, with the primitive utensils, tedious manipulations, and absence of railronds, canals, stean navigation, and even of common roads, of the enfeebled and pourly-fed Asiatics. The cost of the transportstlon of tea in China, say at a distance, upon an average, from the plantations to Canton, the port of shipment, of 800 to 1000 miles, at a waste of from six weeks' to two months' time, whole cargoes being constantly carried upon the backs of porters, is about four cents a pound, or about one-third of its value at the place of its growth. It is suppossble that lu no part of the United States, at a corresponding distance from the sea-board, would the cost of carringe be equal to one-fourth of that sum, or accupy one-tenth of the time. Dr. Jameren, superintendent of the tea plantations of the Fast India Company, on the Ilimalayan Mountains, in his report of 1847 , remarks that the task-work of one laborer is to dress, weed, and keep in order three acres of tea land. In our Middle and Southern States one hand cultivates annuaily, and keeps in order, six acres of cotton, or fifteen of Indian corn. Therefore, assuming the nmount of timo for cultivating the respective crops to be equal, the American laborer would perform moro than double the ameunt of work done by the Ilindoo, which, undoultedly, is about the difference in their physical force.

The tea-plant is not only found in China end Japan, chlefly in a cultivated atate, but is indigenous in the mountalins which separate China from the Burmese territories, especially In Upier Assam, bordering on the province of Yun-nan. It is also cultivated in Nepal, at an clevation of four thousand seven huadred
and eighty-four feet above Bengal, in latitude $27^{\circ}$ $42^{\prime} \mathrm{N}$.

Before proceeding in the inquiry, it would be desirable to aseartain whether ona or several species of the genus Thea yleld the neveral varietied of tea, as thif might explain somo of the diserepancies in the accounts respecting the aoll and clinnate required for lts cultivation, Soma authors, among whom are Mr. Fortune and Dr. Lettsom, who traveled extenelvely in Chira, and had ample opportunities for investigating this sulbject, consider that all the varieties of tea may be obtalned from tha same plant, and that the differences are therefore due to the soil or cllmate, or to the ago of the leaf and the mode of preparation. . Others, on the contrary, are of the opinion that they are produced from at least two distinct speeles, Thea viridis and Thea bohea. There is no doubt, however, that the planté usually known as "Green" and "Black," when cultivated under simllar circumstances, retain permanently their characteristica, and that their leaves, reapectlvely, geuerally reaemble those obtained after infuaing good apecimens of green and black tea. The green-tea-plant, moreover, la much more hardy than the hlack; one of the former having llved twenty years in the open air, near London, and being only killed in the very severe winter of 1887-'38, when the thermometer fell to $4 \frac{1}{1}^{\circ} \mathrm{F}$. Yet, from the great extent of territory over whlch the tea-plant is found, and from the variety of situations in which it is produced, there can be but littie uoubt that it ls grown in very different solls, though thers are, doubtless, certain physical conditions that are best suited to the produc. tion of the finest-flavored teas.

The tea-plant loves to grow in valleya, at the foot of mountaing, and upon the banks of streams, where it enjoys a southern exposure to the aun, though it endures considerable variations of dryness and moisture, aud of heat and cold; for it flourishes in tha climate of Pekia, In latitude $40^{\circ}$, as well as sbout Canton, in $23^{\circ} 8^{\prime} \mathrm{N}$. ; and it is observed that the degree of cold at the former place is nearly as severe in winter es it is in some of our Middle States. The hest tea, however, grows in a mild, temperate climate, the country about Nankin producing a better article than either Pekin or Canton. Mr. Bruce, who traveled in Upper Assam In 1836, describes the tea districts as consisting of little mounds or hlllocks of earth, on which large trees had grown, their roota alone appearing to asye them from being washed away. One thing he observes as worthy of notice, that all the Absam tea grows near water, of which it appears to be very fond, for wherever there is a small stream tea is sure to be found. IIe aubsequently discovered, however, that tea plantations in that country were very extensive, both on the hilis and in the plains. But excessivo moisture, either in the soil or in the air, is not congenial to the growth of the tea-plant, as it is ovident frem its preference for sundy or porous soils, or the moulds, in the moist climate of Assam, but which probably would not be requisite where the climate is dry.

Mr. Fortune, who had frequent opportunities to inspect sume of the most extensive tea districis of Canton, lokein, and Chekiang, atates that the soll of those of the northern provinces is much richer than it is in Quantung. "Tea slirubs," he says, "will not succeed well unless they have a rich sandy lesm to grow hu. The continual gathering of their leaves is very detrimental to their health, and, in fact, ultimately kills them. IIence a principal object with the grower is to keep his bushes in ns robust health as possible; nud this can not be done if the seil be poor. The tea plantations in the north of China are always situat d on the lower and most fertile sides of the hills, and never on the low lands. The shrubs are planted in rows, about four feet apart, and about tha same distance between each row, and look at a diatance like little slirubberies of evergreens. The farms are amall,
ench conalating of from one to four or five acrea; indeed, every farmer has his own little tea garden, the produce of which aupplias the wante of hia family, and the surplus bringe bim in a fow dollars that are spent on the other necensaried of life." In Japan, tea it planted around tho berlers of fielda, without regard to situatlon or soll.
species of Tea.-The teo-plants are ralsed from nuta, or seeds, usually sowin whots they are to remaln. Three or more are dropped luto a hole, and coverad wth earth four or five Inches dieep; these conie up withaut any further trouble, and require litile cu!ture, except that of removing weeds. The leaves are not collected from the sultivated p'anta until they are three years old; and, after growing nine or ten yeare, they are cut down, In order that the young shoots, which will then rise, may afford a greater supply of leaves. The tiest time to guther the tea is while the leaves are amall, yoang, and juicy. The firat gathering usually commences at aisout the end of February, when the leaves are young and unexpanted; the gecond about the leginning of Apri]; and the third In June. The first collection, whirh only consists of fine tender leavea, fis mont esteemed, and is called by us "Iniperial" ten. The secoud ls denominated "Tontajea," or Chlnese tea, because it in infused and imblised after the Chinese mannee. The last gatheringr, which are the coarsest and cheapest of all, are drunk by the people of the lowest class. Besides the three kinds of tea named above, it may be olserved that, hy sorting theme, the varietiea hecome atill further multiplied. The Chinese, luwever, know nothing of "Imperial" tea, "Hlower" tea, and many other names, which in kurope and America serve to distinguish the quality and the price of the article; but, besidea the cominon ten, they distingulah two other kinds, namely, the "Voul" and "Soumlo," which are reserved for people of the first order of society, and for those who are slick. The principal varieties used in Europe and In this country are the "Green" tea, which is the " lling," or common tea of the Chituese, and is gathered in April; the "Voul," or "Vou-tche," delicate kind of "Young Hyson," which differs only from the other in being gathered a few weeks earlier, and consists of the young leaf-Luds just as they begia to unfold; and tha varioun descriptions of "Black" tea, which diminish In quality and value as they are collected later in the season, until they reach the lowest kind, called by as "Bohea," and by the Chinese "Ta-cha," or large tea, on account of the maturity and size of the leaves. The early lesfboik, in spring, being covered with a white, allky down, are gathered to make "Pekse," a corruption of the Canton word Pa-ko, white down. A few days' later growth produces what is sometimes atyled "Dlackleaved Pekoe." The more fleshy and matured leaves constitute "Souchong;" as they grow atill larger and coarser, thoy form "Congo;" and the last and lateat pleking of all is the " Bohen." The variety named nhove, called "Voul," is a scarce and expensive article, and the picking of the leaves in so young a state doen considerable Injory to the plantations. The summer rains, however, which fall coplously atout this season, molaten the earth and alr, and, if the plants are young and vigoroun, they soon push out fresh leaves.
The proces of gathering tea is one of great nicety and importance. Bach leaf is plucked separately from the twig; the handa of the gatherer are kept elean : and in collecting seme of the finer sortn, It has been stated, upon credible authority, that he in otiliged for some weeks previons to aluctain from all groes food, lest his limath or permpiration might injure the flavori to wear fine gloves while at werk, and to lathe two or three times a day daring thie period. In the general harrest seanons, the natives are seen in little family groups on the side of every hill, when the weather is dry, engaged In gathering the tea leaves, which are stripped off rapidly and promiscuously into round
banketa, made for the perpose, of ajplit bamboo or ratan. When a auficient quantity is gathered, it is carried home to the cottage or barn, where the opera. tion of drying in performed. The Chinese dinlike gatbering the leaves on a rainy day for any deacription of tea, and never will do so unless neceanity requires it. Some even pretend to distinguish the teas made on a ralny duy from those maile on a sunny day. The proceas of rolling and drying the leaves, it is stated, can only be learned by actual oxperience ; yet the sy:tem adopted to attain this end is as simple as it is effcacloug. Let it be bome in mind, however, thit the grand object is to expel the molature, and at the anme time to retaln as much as possible of the aromatic and other desirable secretione.

As to the differences of fiavor and color peculiar to the green and black teas, it is well known that, in many Inatances, they are 'produced hy art. In de. seribing the green teas grown in the districts of Cheklang, Mr. Fortune remarke that "It must not ive mapposed that thry are the green tens which are exported. The leaf has a much more natural color, and has little or none of what we call the beautiful bloom upon it, whieh is no mueh admized In Europe and America. There is now no doubt that all theac hlooming green teas, which are manufnetured at Canton, are dyed with Pruasian blue and gypoum, to oult the tastes of the 'forelgn barbarians l' Indeed, the process may be seen any day during the season by those who will give themselves the trouble to meek after It. It is very likely that the same ingredients are also used in dyeing the northern green tean for the foreign market." The Chinese, it is assertel, never use these dyed tesn themnelvea; and certalnly their tante in this respect is more correct than ours. It is not to loe aupposed that the dye employed can produce any very bad effects upon the consumer, for, hall thia been the case, It would have long aince lieen Siscovered. As tu the opinion that green tea owes Its verdure to an Inforeacence acquired from plates of copper, on which It la supposed to be curled or dried, there is no fouadation for the suapleion, as the infustons undergo no change on the addition of volatile alkall, which would ietect the minutent por. tion of copper by turning the liquere thlue. And, be. aldes, the ilrying pans and farnacen used throughout China for this jurpese are sald to be invariably made of sheet-Iron.-I'reme Office Report.

Adulteration of Tev.-It might have been anticipa ted, from the high price of and the high duties in mome countrien or tea, and the fuellity with which it inny be mixed uj) with foreign subatances, that it would not escape adulteration; and the records of the conrts of Justice show that this is the caae, severul dealers having been convicted of thils pernicious practice. The adulteration is usually effeeted either by the intermixture of sloe or ash leaves with fremis teaf, or hy mixing the latter with tea that han lieen already natd. The penalties on such offenses are not specific; and the bent, or rather the only, eccurity on whichian.' reliance can be placed, is to be found in the charscter and respectability of the parties dealing in tea. Even were he infloenced by nothing else, it would be extreme folly in any person earrying on an extensive business to engage in such dishonent practicen, for they can hardly fail of iseing detected; and the ruin of his busineas that would follow auch exposure would far more than balance whatever gaino lie could hope to make by his fraudulent schemes.

Tea Trade in China.-The tea merchants commonly recelve advancen from the priucipal merchants anil other capitalista of Canton; but, with this exception, wre altogether independent of thein; nor have the latter any exclusive privilege or clalos of pre-emption. They are very numserous; thone connected with the green-tea diatricta alone being aiwut four husdred in nmilier. The black-ten merchnnts are less numerous, but more wealthy. The greater part of the tea is
brought to Canton by land carriage or iniand naviga- |other vegetable productiona, ia Injured by keeping, partion, but chiofly by the frat. It fo convoyed by porters; the roads of Chlna, in the southern provinces, not generaily admitting of whoel carriages, and beasta of burden boing very rare. A amall quantity of black tea is brought by sea, but probably anuggled; for this chesper mode of tranaportation is discouraged hy government, which it deprives of the tranait duties levied on inland carrjago. The length of Iand carriage from the principal distriets where the green teas are grown to Canton is probatily not less than 700 miles ; nor that of the hitack tea, over a mountainoua country, less than 200 milisa. The tea merchanta begin to arrive in Canton about the middle of October, and the busy season continues uutil the beglinning of March; being briekeat In November, Deeomber, and January. Tea, for the most part, could, previously to the lato changes, only be hought from the hoog or Ifeensed merchants; but soine of these, the least prosperous in their eireumstances, were supported by wealthy outside merchants, as they are called; and thus the trade was considerably extended. The pricen in the Canton market vary from year to year with the crop, the atock on hand, and the external demand, as in any other articlo and in ar other market. After the season is over, or when the westerly monsoon sets in, during the month of March, and impedes the regular intercourse of forelgoers with China, there is a fall in the price of tea, not only ariaing from this circumstance, but from a eertain depreciation in quality, from the age of the tea; which, like most
ticujarly in a hot and damp elimate.
There seema to be litzie mystery in tha molection and purchase of teas; for the butiness is both aafoly and effectively accompitahad, not only by the supercargoes of the American shipa, hut frequentiy by the mastera; and it was ascertained by the salea at the East India liouse, that thero was no difference between the qualities of the teas purchased by the commanders and officers of the company's shilpa, without assistance from the officers of the factory, and those purchased for the iumpany by the latter. An unusoal degree of good fulth, indeed, appears to be observed on the part of the Chinese merchants with respect to this commodity; for it wat proved before the aeleet committee of the House of Commons, in 1830, that it was the regular practice of the hong merchanta to reeelve back, and return good tea for, any chest or parcel upon which any fraulimight have have been prueticed, which sometimes happens in the conveyance of the teas from Canton on Lonril ship. Such restitution has occasionally been made, even at tho distance of one or two years. The company enjoyed no advantage over other purchasere in the Canton market exeept that which the largest purchaser has in every market, viz., a selection of the teas, on the payment of the same prices as others ; and this advantage they enjoyed only as respects the black teas, the Americnis being the largest purchasers oi green teas.

We herewith suljoin a tabie for calenlating the coat of tea :

Usual myt Weioift and Meabuegment of a Curbt of diftrafent dequobiptions of Tea.

Consumption of Tea in Europe--Of the Contivental atates, Russia and Holland are the only ones in which the consumption of tea is considerable. In 1818 the imports of tea Into Russia amounted to 253,429 pooda, or $9,123,444$ pounds, in chests, and 116,249 poods in bricks. The former consists almost entirely of the finest varieties of black tea. The consumption of tea in Iloliand amounts to about $3,000,000$ pounds a year, the duty on which varies from $1 \frac{1}{2} d$. to $4_{2} d$. per pound. The consumption of France does not exceed 350,000
pounds. The importations into Humburg vary between $1,500,000$ and $2,000,000$ penuds, tho greater part of which is forwarded to the interior of Germany.
Imports of Train tir United Kinodom in 1551 and 1852.

The Tea Trade of the C'nited States.-Tes is the chief article imported from China into the United States. The consumption of the United States nmounts to from
$30,000,000$ to $82,000,000$ pounds a year．Duties on tee used to form one of the largeat Items of American reve－ pue，having in sorue yeare produced $\$ 8,250,000$ ．Their magnitude，however，was justly complained of；and it is probably owing to this clrcumstance that，while the consumption of tea was for several years pretty statlonary in the United States，that of coffee increased with even greater rapidity than，in Englaus＇The Secretary of the＇Ireasury of the United States，in hin Report for 1827，observed＂＂The use of tea has itcome so general throughout the United States，as to ran＇s al－ most as a necessary of life．When to this we add that there is no rival production at home to be fostered by lossening the amount of Its importation，the duty upon it may safely be regarded as too high．Upon some of the variaties of the article it conslderably exceerla 100 per cent．，and is believed to be generally abovo the level which a true pollcy polnts out．A moderate re－ duction of the duty wili lead tu an increased consump－ tion of the article，to an extent that，in all probability； would in the end rather benefit than injure the revenue． Its cendency would be to enlergeour traderndexports to China－a trado of progressive value，as our cottons and other articles of home juroduction（aside from apecie）aro more and more untoring luto it．It would cause more of the trade in teas to centre in our ports $;$ the pres－ ent rate of duty driving sur tea ships not unfrequently to seek their markets in Europe，not in the form of re－ expr rtation，but in the tilrect voyage from China．It would also serve to diminish the risk of the United States losing any portion of a trade so vaiuable，through the poliey and regulations of other nations．＂These judicious suggestions couk，not fail to command atten－ tion；and the flourishing state of the revenue in sub－ sequent years having actmltted of a very great reduc－ tion of duties，those on tea wero wholly repealed．As was to le expected，the consumption has since rapid－ ly increased．The whole imporis from China to the Unitell Stated In $1855^{\circ}$ amounted to $11,048, \% 26$ ，of which tea covered $\{(6,806,463$ ．In 1854 the total ha－ ports reached $10,506,3{ }^{\circ}$ ），of which tea amounted to $\$ 6,515,115$ ；and in $1853,410,573,710$ ，of whleir tea

Duiy on Teas.-Tea or coffee, slipped from the country of j roduction, but not for a distinet and apecilic destination to persons or places in the United states, and transhipped at a foreign intermediate port for the inited States, is, on importation, liabic to a duty of 20 per cent. But if originally shipped in nationsl vensels, or vessels placed on that footing by treaty, for a apectic pary and place in the United Statea, from the conntry of production, and so imported inio the l'uited States, these articlea are entidled to free eatry, although a mere tracshipment may have taken place at a foreign intermediate port.
Tea or coffec, entitled to free entry when originally imported into the United States, afterward exported to a foreign port and brought lack as part of the returning cargo of the exporting vessel, not having been landed abrosd, is entified to free entry on ita reimportation under these circunsatances. Tea and coitee, when imported direct from the piace of their growtib or production in American vessels, or in fureign vesselu so entitled by reciprocal treaties, are exeupt from duty.
Cetfee, the product of a possessinn of the Netherlande, imported into the United States i:a a vessel of the Netheriands direct from such ponsessions, or from the Netheriands, is admitted free of dety under the tariff law of 1846, and the tirat artiele of the treaty between the United States and the Netheriands of August $\mathbf{2 6}, \mathbf{1 8 5 2}$. 'Jea or coffee imported direct from the place of lita production, in vessels of the kingiom of l'russic, and of the Hansentle republies of $l$ lainburg, liremen, and Labeck, is placed on the same footing with that imported in American or Duteh vesseis.
Tea or coffee, the production of China. imported rin singapore, is admitted to free entry, if it the sathfactorily shown at the time of entry that lt was Jaden on soard the American imperting vessel from Chinowe woats or junkz in Chinese waters, intended' in good
faith to be conveyed tharein direct to a specified port of the United States, as its ultimate deatination.

Teak Wood, or Indian Oak, the produce of the Tectona grandis, a large forest tree that grows In dry and elevated diatricts in the south of India, the Burman empire, Pegu, Ava, Siam, Java, ete. Teak timber is by far tho beat in the East; it works easily, and, though porous, ia strong and durable; it is easily seesoned, and shrinks very hittle; it is of an oily nature, and therefore does not Injure Iron. Mr. Crawfurd says that in comparing teak and oak together, the useful qualities of the former will be foand to preponderato. "It in equaliy atrong, nnd somewhat more buoyant. Its durability is more uniform and decided; and to insure that durablity it demands leas care and preparation; for it may be put In use almost green from the forest, without danger of dry or wet rot. It is fit to emiurn all climates and alternatlons of climate."--See Tamboold's Principles of Carpentry; Cnawfum's Eastern A rchipelago; Rees' Cyclopadia. The teak of Malabar, produced on the high table-land of tho south of Indis, is deemed the best of any. It is the closest is its inbre, and contains the largeat quantity of oil, being at once the hesviest and the most durable. This species of teak is uaed for the keel, limbers, and such parts of a shlp as aro under water: owlng to its great weight, it is less acitable for the upper works, and is not at all fit for apars. The teak of Java ranks next to thint of lifalabar, and is eapecially suitable for planking. The Rangoon or Burman teak, end that of Sism, is not so elone-grained or darable as the witers. It is, however, the most buoyant, and is therstic. ' 'est fitted for inasta and apars. Nalabar teak is exienaively used in the building-yards of Bombay. Ships built wiaily of it are almost indestructible by ordinary wear and iear, and instances are not rare of their having lasted from 80 to 100 yeare. They are asid to sail indifferently, but this is probably owing as muci to some defect in their construction as to the weight of the timber. Calcutta ships are never whoily bיilt of teak; the timbers and frame-work are niways o . .ve wood, and the planking and deck only of teak. I ne teak of Burma, being conveyed with comparatively littlo diff. culty to the ports of langoon and Maulmain, is the cheapest and most abundant of any ; and It is mainly owing to the facility with which supplies of it are obtained that ship-buliding is now carried on so veryextendively at Naulmain. It is largely exported to Caj. cutta and Madras.--Nee Rancioon. A species of timber called Afriesn teak is exported from the west coast of Africa; but in jwint of fact it is not tenk, sud it is destitate of acveral of its most valuabie propertics. It is, however, for some purposes, a useful species of timber.
Teasel, or Fhillers' Thistle (Ger. Heberilitel, Kratzdistel; Fr. Charton ì carder; It. Carda da rapdare; Sp. Cardeurha, Cardo peinador). This plant, which is cultivated in the north and west of lingiand, is an articio of conaldersbie importance to cluthiers, who employ the erooked awns of the heads for rasing the nap on woolen cloths. For this purpose they are fixed round the peripicery of a farge, broad wheel, agalust which the cloth is helid wilile the machine is curited. In choosing temaela, the preference should be given to those with the largest bur, and mast jwinted, which are generally called made toacels. They are mostly used in preparing and dresaing stockings and covericts; the smaller kind, commonly calied the fulters' or drapers', end nometimen the fomile teasels, are used in the preparation of the flier stufls, ns eleths, rateens, "te.

Tehuantepec, Gulf of, a hay of the Prefic Ocean, Contrsi America, hounded northwest by the state of Oaxaca, nud northenst liy the r"public of Giustemala, lut. $15^{\circ}$ N., iong. $9 j^{\circ}$ to $95^{\circ} \mathrm{W}$. It receives the liver Tehuantefec 10 milea nouth of the town.

The Jothmes of Twhuantrgee, states of Oaxacs, Vers Cruz, and Tabasco, is the farrowest part of the land
separating the Gulf of Moxico from the Pacitc, and la 130 mlias across. It produces mahogany, fustic, logwood, cotton, drugs, cacao, indigo, guin, salt, wlth vsrious klada of grain; and ite uplande sbound with fine pastures. It la traverfed almost throughout by the Aiver Coatzacoalcos. This is one of the places where it has been proposed to unite the Atlantle and Pacific oceans by a canal, of which the river and some lakes would form a part.

This new lnter-oceanic route is by the River Coatzacoalces to Suchil, something over 100 miles from the sea, all tho windings included, thence overland by stage to Ventosa, 130 to 140 mlies; making in all about 240 miles from the Atlantic to the Pacifie, to be accompliahed in a day and a half from the aas. This diatance will be materially dininished-the tiuse stll more so-on completlon of a projected railroad from Minatitlan to Suchil, already surveyed.

From the mouth of the river to Minatitlan, twenty miles, the channel is excellent, capaclous enough for the largest ocean sturamships. The depth of water on the bar at low tide ia 1 s to $\mathbf{1 6}$ feet (Major Barnard says 13), and only one obat uction, a large rock, has been diecovered, and that easily avoidable. From Minatitlan to Suchil the river becomes more difficnlt, and must be traveraed by ateamboata; those contemplated ore, in aize and fashion, not dissimilar from the Cumberland River boate. The Leonora, built in Nen York, and placed on this portion of the river a ahort tlme since, had proved of too large draught. The current is about two milea and a half an hour-from Suchil to Ninatitlan, thirty-six hours. These are the termini of the projected railway, by which, when completed, a distance of 45 miles will be saved.

From Suchil to Ventosa, on the Pacific, 130 to 140 miles, the route is by the newly-made stage-road over a rough, sometimea mountainous country. The heaviest work has been on this end of the road, where also the River Puerta, fordable at times, but high and marshy in the rainy scason, is to be spanned by a bridge a mile and a half in length. Some compensntion ia mada on the other side of the mountain, however, by an old road, which has proved available from Clivela l'ass to the P'acitlc plaln. The time contracted for on the stage-read ia five miles per hour-twenty-six to twenty-elght houra; Latween Mlinatitlan and Suchil the pasaage by steamboat will be from six to eight hours, in all about thitrty-fivo hours, or a day and a half from ocean to oceail. The harbor of Ventusa is good, but a broakwater will be necessary. As to the probable amount of travel and business on the 'Telisantepec road, when in full operation, we have no further information than is already, in varions speculations, bofore the public. The shortest route from England, New York, and New Orleans, to the ports of the I'acific, the most thatering expectations are of course entertained respecting it.

The present population of the territery of Teluantepec is estimated ais 00,000 , descendants, for tho most part, of the original Aztecs. They are gregarious in their habits, living in commmities numbering 3000 to 4000 each, and distant from ench other five to ter. miles. They are ludustrious, kini-hearted, and docile, but very thriftless. The government is, of course, that whleh at any time our mobile Mexican neighbors may chance to have. In general, the rights nud privileged of the old Spanish colonial towns ure fully enjoyed. Titles to lauded property are good, and nlway respected. The town of Minatitlan, thi capital and emporium of the turrltory, has at present a population of about tive hundred. The counuree in the native producta of the country, mahogany, dyewoois, coffee, etc., is large and increasing. The last quarter Mr. P. cleared twelve Antorlcan vessela, averaging 200 tuns each, and the foreign export business was ahout the same. The government, a short time since, appropriated the handsome sum of $\$ 50,000$ for the crece
tion of a new custom-house, the foundation of which Is already laid. On the whole, what with present business and future expectatians, our Tehusntepec neigh. bore are ovidently looking up.-United Sistes Consul at Minatitlan.

Telegraph. Long before the electric telegraph had been imagined, the art of rapidly conveying intelligeuce from point to point bad occupied the attention of mankind, and various expedients for the accomplishment of this object had been devised. The most primitlve modes of telegraphing were by means of signal-firea, torchea, trampets. More recently, aince the invention of gunpowder, the cannon and aky-rockets havs been used. On the luvention of tha aerlal telegraph, or semaphare, these means were sbandoned.

In the year 1684 Dr. Hooke described a plan for an acrial telegraph, and about 1704 M. Amontons instituted experiments with the same end in view. Howcver, nelther of these plans were carrled into effeet; and it was not until 1794 that the semaphore was actually used. In thnt year an aerial ielegraph, the invention of M. Claude Chappé, was employed for the transmission of irtelllgence between Paris and Lille; the conveyance of a aignal from one of these places to the other occupying only two minntes. Semaphores, mostly modificatlons of the plan of Chappe, ware soon in use throughout Europe-in England, in 1795; Denmark, in 1802; Indla, in 1823; Prussia und Anstria, about 1833; and Russia, in 1839.

This method of telegraphing is still in nse, but is rapidly being auperseded by the electric telegraph. In 1852 the only aerial telegraph lins in England was between Liverpool and Ilolyhesd. This lins now, we believe, been superseded by the establishmert of electric communication between these $t$ wo places.

The cost of working the aerial telegraph was enormous. The line above mentioned cost in the vicinity of $£ 1500$ (about $\$ 7500$ ) per annum; and a similar line, hetween London and Portsmouth, cost $£ 8300$ (about $(16,500)$ per annum.

These telegraphs were necessarlly imperfect; bcing himited in their power of conveying intelligence, exceedingly slow, and liable to total interruption by atorms of rain and snow, fogs and darknesa.

The idea of the employment of electrielty as a means of conveying intelligence to $a$ distance appears to have been long entertained, and experiments to uscertain the practicability of electrical communication between distant places were carly snade by acientific men throughout the civilized world. an 1729 Grey and Wheeler discevered that a current of electriclty could be made to flow through considerable lengths of wire. In 1746 Winckler at Lejpsic, and Le Monnier at Paris, experinented on the same subject of the transmission of the electric current through conducting bodies. In 1747 ] Ir. Watson, in linglaml, repented and extended the'se experiments, aending a current through two mileg of wire and two of earth; sending slocks across the Thames and the New River. Dr. Franklin in 1748, and De lac in 1749, repeated many of these experiments. In addition, experiments bearing more or less on the sulyject of electric telography were made by Lesage in 1774 , Reusser In 1794, Cnvallo in 1795, Betancourt in 1798, Noemmering in 1807, and Prof. Oersted ln 1819.

The first electric telegraph actually applied scema to have been the invention of M. D. F. Salva. IIumbollt says his telegraph was established between Madrid and Aranjuez $\ln 1798-a$ distance of about 26 miles.

In 1816 Francls lionalds, of llammersmith, Engiand, constructed a telegraph of elght miles in length. This
telegraph was one of the best that had then been invented, and was capable of transmitting Intelligence with eor giderable rapidity. In 1828 he urged the importance of his invention for government purposes, writing to Jord Melvilie on the auhject, but without offact.

In 1827 Harrison G. Dyer, an American, constructed a telugraph on Long Ialand, using frictional electricity. The lins was about two milea $\ln$ length.

Previous to 1809 no mode of electric telegraphing capable of any extended nee had been discovered. The principal cause of fallure seems to have been in the employment of frictional electricity, which is, on account of its high intensity, confined with great difficuity to conducting bodiew, rapid and Incontinuous in lta action, and, from its amall quantity, devoid of energetic force.
Soemmering mado a step forvard by hia application of galvaniam to the purpoees of telegraphing. In 1809 he constructed, at Munich, a teiegraphie apparatus, itsling 35 wires. The algnala were made by the decompesition of water in 85 tubes, which were in connection with the 35 wires of the line. Telegrapha employing the pure galvanic force were also invented by Schweigger, De Hacr, R. Sulth (Scotland, about 1843); Bain, 1846; and Morae, 1819.

Bain's was the only telegraph on this principle that was extensively used. He used a very simple apparatus, recetving the galvanic current upon chemicallypropared paper, where it made a light-llue mark. A comblastion of dote conatituted his alphabet. This telegreph was exceedingty rapid, being capalije of tranamitting 1200 lettera par minute. In 1850 about 200 miles of telegraph in Fingland, and 1506 in Anerlea, were worked under Ilain's patents. Jis plan has gone now almoat entireiy out of use, other and better instruments superseding 't.
The property which lightning possesses of reversing or destroying the polee of the natural magnet, and of imparting magnetism to iron, had long been knewn; but not natil 1820 was the fact turned to any useful purpose. Professor Oersted, of Copenhagen, discovered, during 1810, that if a wire charged with efectricity is piaced parallel to a magnetic needle, the needle wili deviate from Its naturai position, tending to assume a position at right angles with the conducting wire; and that thim deviation follews reguiar law. Proceeding on the grounlwork of Professor Oersted, many other discoveries were made by Arago, Aupère, Faraday, Davy, Sturgeon, and I'rofessor Menry.

Arago and Ampere in France, and sir 11. Wavy in England, discovered that a current of electricity woud render ateel magnetic; and Ampere found that ly coiling the wire in the form of a hefix round steet the effeet was greatiy increased. William Sturgeon, of Loundon, in the year 1825, discovered and constructed the electromagnet. The eiectromagnet in one of the most valuable parts of the electric telegraph now in use, and has entered more or less lato nearly every telegraph invented since its tiscovery.

Oersted'a great diwcovery gave a new direction to the sci-nce of electrie telegraphing. Gialvante telegraphs wree, in turn, discarded, and marnetoelectric telegraphes took their place.

Amijere was he tirnt to make nse of Clernted's discovery in teichraptilng. $\mathrm{I}_{1}$ iszo he invented a teife-
 practiontly enrried lato effect.

Baron de Schilling Invented a newtle telograph in 1832, at St. Peteralourg. Ilis instrument hall tive nee. dies, which, by their vilirations to the right or left, $\mathrm{i}_{\mathrm{r}}$ dicated aignala. Ife aftelward improved his instrirrent, using but one needle.

In 183 I Ir. Steiuheit had a telegraphic inatrment working a distance of 12 miles. Hin telegraph of one wire, and cither one or two magnetic needles, as might lie dealred, inade jermanent marks on paper, and alan telegraphed by wound. When writing, his needlea were
furnished with ink-tubes, and by their motiona marks were recorded on paper; when telegraphing by sound, the nsedjea were made to atrike belle of different tones. He used the earth as part of the circult. This was very nearly a perfect instrument, and is infinitely superior to the majority of telegraphic inatruments ainco invented.

June 12, 1887, Messra, Cooke \& Wheatatone, in England, obtained a patent for "improvements in giving algnals and sounding alarms in distant places, by meana of electrie currents tranamitted through metai. Ile circuite." This seems to have keen the first telegraph that was patented in Europe. Cooke \& Wheatstone'a firat telegraph was a needie telegraph. They used five magnetio needlea und five wirea. An ejectromagnet was used to sound an alarm. A second patent, taken out by Cooke only, was issued In April, 1838. These instruments were found to be very imperfect, and after a short trial were abandoned.

A different form of telegraph, the invention of the mame partiea, having lut two needles, haa, until very recentiy, been in general use in England; but the Morse nystem is now being adopted there and upon the Continent.

The last patent taken out by Cooke \& Wheatstene is dated May 6, 1846. Durine the same year an act of Parliament was olstained incorporating "The Electric T'elegraph Company," working these patents.

The needie telegraph ia, comparatively, very siow; the arerage apeed per mesage boing hut 14 words per minute. It is, however, yet extensively used in Eflgiand. Ceoke \& Wheatstone took out a patent in America, but their instrument was never practically used in the United States.

Since Cooke \& Wheatstone's first patent, upward of 40 patents have been taken out in England alone. Very few of the instrumenta since invented are in practical operation.

Morne's Tefrgraph.-In the year 1832 Professur S.F. 1l. Moree tirat conceived the idea of an electric telegraph; and in the year 1835 he had a telegrapit constructed, the basis of his present zimpite and beantiful instrument. In September, 18:37, he exhibited his inatroment at the New York Cniversity, working through 1700 fect of wire.

Morse appiled for a patent in the United States in April, 18iks. This application was afterward withdrawn, and his pacent was not takell out until June, 1840. In $1 \times 42$ he petitioned Congress, who appropriated $\leqslant 30,000$ to his use for the conatruction of a line betwern Washington and Baltimere. In June, 18H, Morse had hia invention in succesmful opieration be tween Washington and Ibaitimore -a dintsuce of 4) miles. Thim was the only tine in the Linited States constructed ander government patronage.

The Morse Eiectre-magnetie 'Telegraph consists mainly of two parts-tise receiving magnet and the registering apparatus. The recoiving magnes is surrounded by tine wire, and is of the horseaboe form. An adjustablo armature is placed before the poles of the receiving magnet. The main circuit prasses unbroken through the receiving magnet to the neat station.

The registering apparatus lias a powerful horse-shee magnet placet vertically. Alove the poles of the magnet is all armature attached to one emp of a movabie fever, on the other end of which is a steef style for the purpose of impressing marks on japror jlaced inmediately absue the ntylo. Intelligence is trans. mitred by means of breaking and ciosing the main circuit. For this purpose a stuali key is rupdored When this key is prossed down, the current passes to the receiving magnet of the distant station, causing the recolving magnet to close the locai circuit. On the local efrcuit being clused, the registering magnet hecomen exclted and attracts the armature downarl. cansing a mark on tho jajer: jiaced above the lever of
the armature. On the circuit being opened ngain by the operator's raising the key, all returns to Its usual quiescent position. Thlsoperation ls performed at every closing and breaking of the circuit. By keeping the key depressed for an instant, a dot is made; if it ls depressed for a longer time, a line. A comblnation of dots and lines forms the telegraphic alnhabet used with this system. The speed of this instrunent ls, in the hands of an expert, about twenty words per minute.

Professor Morse's instrument was for some time the only instrmment In use in this country, and is now used to a greater extent than all other telegraphe combined.

The Howse Telegraph, the lavention of Roysl E. lfouse, differs materiaily from all previously invented telegra; inic instruments, printing messages in the ordinary Roman letters. Directly under a set of keys like thuse of the piano-forte is a shaft inclosed by a cylinder. This shaft is made to revolve rapidly by means of a treadle. The shaft and cylinder are so arranged that tho cylinder can be arrested while the shaft atiil revoives. On one end of this cylinder is a brass wheel having fuurteen teeth. A spring is so arranged, that when the shaft and cylinder revolve it wali alternately strike a tooth of this brass wheel and pass into an open space; thus alternately breaking and closing the electric circuit. On the cylinder two lines of teeth project, fourteen in each line, one for each tooth and each space of the circnit wheel. These teeth are immediately below the keys, so that by pressing down a key the motion of the cylinder is stopped. Ily making the cylinder revolve, the circuit is rapidiy broken and clused, which continues tili at key is depressed. On the key being released, the revolution goes on as before. The electrical pulsations produced by the breaking and closing of the circuit are conveyed to the magnet of the dlstant instrument, each pulsation ennsing the magnet to act.

The type-wheel, a wieel having the letters of the alphabet cut upon it, is made to revolve, but is so checked by an escapement wheel that aty one letter goes forward at a time. This escapement is connected by a lever with the piston of an air-chamber. This piston is caused to move horizontally backward and forward, by means of compressed air admitted alternntely on different sides of the piston. A vaive attached to the magnet regulates the pressure of the air on the piston. Every breaking and closisg of the circuit causes the magnet, plston, and escape to net, so tiant for every time the eircuit is broken or closed the tyle-wheel is advanced one letter. If any letter of the type-wheel is piaced in a certuin position, and the key corresponding to it is depressed, raised, and again depressed, the chrcuit wheel nt the transmitting station and the type-wheel at the recelving station make one revolution, bringing the letter back to its former position. Any other letter is brought into the refuired position by pressing down its key on the keyboard of the instrment. Tho letter tirst brougint into position is the dash. The type-wheel is stopped at the dasi, nfter which the printing goes regularly on as the keys are depressed. Immediately before the typewheei is the press, containing a narrow strip of paper. At the depression of a key the typewwheel stops, sets a crank In motlon, which presses the paper forcibiy against the letter opposite to it on the type-wheei. On the key being alsed, the type-wheel revolves until the depression o auother key, which again uniocks tie press and prints a letter.

The cleetric current is used in this instrument to preserve equal time, that tho letters in one machine may correspond to those In the other. The number of puisstions required to indicate a succession of letters is exceedingly unequal; from a to $b$ requires one, from A to A twenty-eight pulsatlons.
liouse oltained a second patent in December, 1852. The llouse Instrument is used to a limited extent in
this country. It Is stili less used in England, where it is known as Jacol Brett's Telegraph. This iastrument is more rapid than Morse's, printing sccurately frem twenty-five to ttirty words per minute.

The Jfughes Telegraph is the invention of David E: Hughes, of Kentucky, who obtained a patent in 1855 and in 18j8. This, like the House Telegraph, is a printing telegraph, but in principle and in mechsnisms it is tetally unlike that instrument.

The Hughes system of teiegraphing combines not only all the sdvantages of all other existing systems, but rednces the labor which electricity has to perform to thu lowest possible peint. In sll other systems it requires several distinct electrical impulses to form a single letter. In tine House system, which is bueed upon the number of waves sent, the average number of impulses required to determine the intended letter ls seven : in the Morse syatem, which is based upon the number and duration of the waves sent, the average is tirree and a half. To print a letter every closing or breaking oi the circuit, so that every electrical impulse should determine a letter, has long been a desideratum, more particularly since the discovery that it requires an appreciable time to charge a long wire with electricity; sr that on long circuits we should bo obiiged to send a less number of electrical waves in a given time than on a short circuit. On submerged esbles this and other effects are still more marked, reducing the apeed of transmission upward of two-thirls. If every wave, instead of every three waves, produced a letter, it is evident enough that the speed of transmission through the calle would be equal to that of the air-lines with the systems now in use, and that the speed of the air-lines would be increased two-thirts. The IIughes system uses but one electrical impulse per letter, ead by the use of a new and exceedingly sensitive magnet can work on lines of far greater length, and with a rapidity exceeding that of any telegraph now in existence.

To carry out the onc-wave aystem, it is casential that the type-wheels of the different instruments should revolve at precisely the same speed, so that the same ietter on each type-wheel should be opposite a given point at the same time. Ciock-work governed by meane of a pendulum would be too slow for any prac. tical use. Instead of a pendulum, Hughes employs as a governor $n$ vibrating spring. This spring allows the type-wheels to revolve with any desired degree of rapidity. Tiis governor is dependent for its correct action on a law of aconstics, viz., "that a certain number of vibratious per second produces a certain musical toue; and if there are two or more springs of the same tone, they invariably glvo the same number of vibrations per seconci." If these springe by their vibrations are made to unlock an escespement, it foliows that all instruments governed by springs of the same tone must revolve in exactly the same time. The type-wheels, thus goverued, revolve at the rate of 100 rovoiutions per minute, and the average number of letters sent at each revolution being two, it follows that the speed of the instrument is 200 letters per minute, equal to about forty words.
Ithis is about the speed that an ordinary operntor touches the keys, but not by any means the utmost speed of the instrument, as the type-wheels wolld rerolve with undeviating accuracy at a speed of 500 in stead of 100 revolutions per minute.
The magnet of the Hughes instrument, which receives the electric current from the distant station, is a combination of a natural and an electro-magnet. The attractive power of the natural nugnet, exerted through the electro-magnet, holds a small armature in contact with the poles of the electro-magnet. A spring attached to the armature is so adjusted as nearly to pull the armsture away from the poles of the electro-inagnet. The slightest change in pelarity esuses the spring to puil the armsture away from its resting-
place. The armature is reatored to lte place by meana of a lover, which acts upon it at the inatant it is pulled away from the electro-magnet'a polen. This arrangement employa the current of electricity merely to efeet a ailght change in the force by which the armature is held to tha magnet'a poles, and it ia so romarkably seanitive that the mere contact of a piece of zinc against a copper wire has been found amply aufficient to work the magnet. From its sensitivenena it requires scarcely a tenth of the battery-power used by the moat nensitive of other aystems.

Another wonderful and beautiful feature of this Inatrument is its power of writing both waye, sending and receiving messages at the sama inatant over one Bire. This inatrument thus doublea the capacity of the wire, making it do the service of two ; transmitting with certainty and accuracy 200 letters each way per minute, an actual transmission of $\mathbf{4 0 0}$ letters, or 80 words, per minate. This result- Is accomplished by means of a peculiar arrangement of the batteries and magnets, so that the current from the traasmitting atation does not influence its own magnet, while it affects that of the recelving statlon, each magnet thus being placed under control of the distant operator.

The machinery which accomplishes reanlis so astonishing is simple in the extreme. It consists mainly of foar clock-wheels used to turn the type-wheel. These wheela are governed by the vibrating spring before explained. At the moment a current from the distant atation enters the magnet the armature flies off, opens a detent which causes a mmall press to be locked to the wheel-work of the instrument, and then to press a atrip of paper agninst the letter of the type-wheel opposite the press at that instant. A current ia sent upon the line by means of keys arranged like those of a plano, and having the letters of the alphabet engraved upon them. At the moment one of thene keya is depreased the magnet of the receiviag station ia made to act, and the press to print the letter cortesponding to the touched key. The recelving operator haa nothing to do but to tear off the mesanges as they arrive.

This inatrument, after more than ten years of persevering thought and lalor, Is at last perfeeted, and now fuifills all the regulatea of a perfect telegraph Instru-ment-more than realizing ail that has ever been claimed for it by the Inventor. The remarkatile ingenuity, talent, and knowledge of the principies of electrical selence displayed by Professor II uglses, In the invention of his loantiful machino, deservedly place him foremost in the ranks of the laborers in this liranch of art, and justify his clalin of having in vented a telegraph instrument whleh, for speed, neatness, and economy, is without a rival.
The numerous edvantagen that the Hughes instrument possesses over ail other existing syotema, particularly in the matter of apeed and power of working on long elreuits, will probalily give th the preference in the selection of telegraphle machines with which to work the Atlantic Submarine calis. Indeed It may weil be doubted if any other nystem can be made practically avaliabie for that purpose.
The following lirief summary of the telegraph lines of the worlil at the close of the year 1857 will furnish some idea of the Importance of the telegraphic art, and of its claime to public attention:
Cnited Stotes hinve upward of 35,000 milegof telegraph, casployidg a rapilal, an near at ran he amecitained, of $\$ 4,000,000$. The instruments used are the Ilaglies, House, and Morme machines
Ibrifish frownexs have 5000 miles of telegraph, ompiaying a cepital of
Cuba and Mexico have ahort and unrellable Itnea, which are controlled by the governmients.

Singland has about 10,000 miles of telegraph lines-upward of $40,000 \mathrm{mit} \mathrm{m}_{\text {o }}$ of condueting wire-employing a capital eattinated at a million and a haif poonda ateritng. In Fingland the government hee the powar of ordering all governasent usterges to taka precedence of any other commonications,
and wheu deemad nocesmary all telegrapha are required to ha pleced at the eole diapoenal of tho goveromest. Only one laatance of this kiod has occurred; on the occation of the an Helpated chartint riota in Aprit, 1840.
France han 8000 nillea of telegraph la operation, uader the oxelustve centrol of the government.
Beigium han about 650 milies of telegraph ilnem, constracted aded controlled by the goveiument
Germany and Austria hava nearly 10,000 milles of telegraph, controlled by the governmenta
Pruesia has about 4000 millee of telegraph in operation. The wren are mootly underground-controiled by the govemment.
Hothand han $60^{\wedge}$ mtlea of telegraph.
Saxony and Bavarit hare gevernment linea of about 1700 milea.
Italy has 2500 miloo, controlled by Ite different govern. mentu,
Switzerland has 1500 millea, under control of the Federal goverament.
Spain and Portugal bare some 800 miller-controlled by the goveramenta.
Rusota-- Of the namber and extent of Rassan telegraph Insee fittio la known. As near ce can be entimated, they ex. tend over 6000 millea-under government controt.
India han now in operation 6000 millea of telegraph, censtrueten and controlled by the Eaat Indla Company.
Si uscratia has 500 mllea in operallon, add 800 millea ncarily or quite completed.

Recapitelation.

The number of messages pasaing over all lines in the United States is estimated at about $4,000,000$ per annum.

In addition to the land linea, numerous submarine cables have been laid in different parta of the worid. Annexed is a brief account of the different submarine cablea, lengths, when laid, ote.
The first sulmarine cable was laid between Dover, England, and Calais, France, during August, 1850. This cabie wes aboul 24 miles in length. Eiectrical communication between lingland and France ceoitinted uninterrupted for about a month, when the cable was urcken. Upon examination it wan found that the clating of the cabie againat rocks off Cape Gricucz had caused it to part. A second cable was lmmediately relaid, larger and atronger than ita predecessor, wbidi has remained in good working order up to the present time.
In May, 1852, a submarine cable was successfully laid between Holylicaid and Howth, thus connectiag England with Ireiancl. This calie is tit milies in lenth.

During May, 1853, "the Port Patrick and Carrickfergua" cabie, 24 milea in leagth, connecting Scotiand and Ireland, was laid.
In June, 1854, a cable 115 miles in length was leid between Orfordneas, England, and tise Ilague, Ilolland.

A chird cabie, 75 milles in length, was inid in 1852, between Dover and Ostend.

In 1804 cables from Italy to Corsica, thence to Sardisia, were, after much difficulty, successfully laid down, a distance of about 75 miles.
The New Yurk, Newfoundland, and Lomion Tele. graph Cumpany, In 1855 made an attempt to connect the islande of Newfoundiand and Caje llreton. The attempt was unsuccessful. In 1856 another attenipt was made, rcsuiting in complete auccess.
Summary of Submarina Cubles.-The following is a correct taile of the number and length of the submarina calles laid down in different parts of the world:

| Cablen. | Milon. | Wiren | nate. |
| :---: | :---: | :---: | :---: |
| Dover and Calala. | 24 | 4 | 1851 |

The total length of submarine cables laid down is 950 miles, and the length of the condueting wires in ali is 2660 miles. Should the attompt to lay tho great Allautic Submarine Cable next June be successful, the lengtit of calie laid down will be increased to 2564, and the longth of condueting wires to 4075 miles.

The Atlantic Telegraph.-In the year 1856 Cyrus W. Field visited England. The result of his visit was the formation of the Atlantic Telegraph Company, with a capital of $£ 350,000$, for the purpose of connecting Europe witi Ameriea by a submarine telegraph cable. In August, 1857, an attempt was made to lay down the Atlantic Submarine Cablo, resulting in a disastrous failure. The cable was 2500 miles in longth, weighing nearly one ton per mile, eapablo of beasing a direct strain of over five tons without; fracture. The centro of tho callo was formed by geven fine copper wires, $t$ wisted into a cord $\frac{1}{15}$ of an inch thick. This atrand was coated with gutta porcha, forming a small rope of of an inch thick; then coated with hempen twine soaked in pitch and tar; lastly, an oxtornal sheathing of 18 iron wires, each wire belng a strand of eeven finer wires, making in all 126 wirss. The submersion was commonced on the 5 th August, 1857. There wero present the six steamers, Niagara, Agamemmon, Leopard, Susquehanna, Willing, and Mind, intended to assiat in various parts of the operation. The cable camo up from tho isold of the shilp, around a central block, so to the open space above decks; it was there wound round grooved sheaths, geared togetbse by cogs, and tirmly planted on girders. Thence it passed over a fifth sheath, out over tho stern into the soa, sinking by its own weight. A trifling aceident happoned on tho 6th; this was repaired; and on the 11th, 380 miles (statute) had been submerged. The engheer here concluded that thero was too mach "slack" in the cablo's course, and some modification in the machinery was consequently made. This appears to have been badly attended to by a subordinato. The eable saapped, and thus ended tio attempt of 1857 .

But ititle doubt is now entertalned that the year 1858 will see thie great enterprise successfuily aceomplished, and the Atlantic Submarine Cablo a fixed fact.

In regard to the possibllity of any transmission of signe': wlth rapidity sufficlent for preetical use, it may be atated that on the 9 th of October, 1856, a large number of scientific men met at the offices of the Magnetic Telegraph Company, In old Broad Street London, England, to witness the operation of telegraphing through upward of 2000 miles of subterranean and submarina
wires, throngh England, Ireland, and the Irish Sea, connected for this experlment. Signale were sent throughout the entire distanca with rapidity and certalnty, 250 being transmitted per minute. Professor Misse, who was present, wrote us follows: "There can be no queation but that, with a cable contalning a single conducting wire, of a size net exceeding that through which we worked, it would he easy to telegraph from Ireland to Newfoundland at the spoed of at least cight or ten word? per minute. Take it at ten words in the mlnute, and allowing ten words for name and address, we can safely ealculate upon the transmission of a twenty-words' message in three minutes; ${ }^{*}$ * * or fourteen thousand four handred words per day. In one word, the doubts are resolved-the difficulties overcome; success is within our reach; and tho great feat of the century must shortly be accompilshed."

The cost of the telegraph eable has been as foliows:

We learn from the London Times that a prospectas has been issued of a company to complete the long-expected telegraphic communication with British Indian territories. It is to be called the European and Indian Junction Telegraph Company, with a capital of $£ 200,000$, in $£ 10$ shares. The llne selected is the same as that for the Euphrates Railway-namely, from the port of Seleucia, on the Mediterranean, to tho head of the Persian Gulf, fc'lowing the valley of the Euphrates; and it will enanect, on tha one hand, with the Austrian system of telegraphs, which is to be carried to Seleucia, and on the other with a cable to be laid ly the East India Company from the Persian Gulf to the Indian port of Kurrachee. It will, therefore, supply the only link necessary to enable messages to bs transmitted from London to any of the several Presidenciea. Direct pecuniary support is expected from the government and tho East India Company, together with a concession from Turkey, and no call j . to be made until these arrangements shall have been cotnpleted. One half the shares are to be allotted to tho subscribers to the Euplirates Railway, and the other half to the public.

This, in connection witis the proposed construction of a continuous line of railroad from Germany to Calcutta, shows that the trade of the East is gradually assuming moro importanco in the oyes of European capitalists and merehnnts.

Tender, Legal. Legal tender of money varies in different countries. Thus, in England, Bank of England notes (except by the bank itself) and gold aro legal tender for any amount. Silver to the amount of 40 shillings oniy.

In the United States, the gold and silver coina of the United States wero made logal tender by the act of January 18, 1837, viz. : That doliars, half-dollars, quarter-dollars, dimes, and half-dimes, shall be legal tender, according to their nominal value, for any aums whatever; the gold eagle at ten doliars, the half-eagle at five dollnrs, and the quarter-eagle for two and a balf dollars. By the act of 1849 the coinage of the donbl eagle, value twenty dollars, and of the gold dollar, was authorized; both of which are legal tender for any amount.-See Coinage.

Owlng to the reduced weight of the new silver coins authorizod by Congress 3d March, 1851, and 21st Feb. ruary, 1853, they are no longer legal tender except in smali sums, viz. :
Three-cent ploces (Act March, 1851, and 1858) .... 30 cta. Ifsif-dolisrs, 102 gruins each, 21st Feb., 1851..
Quarter-dollarn 96 "
Ilaifer $\quad 88-40$
Ilalf-dimes 10.20

By the act of Februar 7,1857 , "all formor acte autherizing the currency of coreign gold and allver colna, and declaring the same a legal tender in paymeat of debts, are hereby repealed."

In the absence of any apecial agreement, the only payment known to the law is by cash. The tender ahould properly be in cash, and muat be ao, if that ia required. A tender of a larger sum than la due, with a requirement of change or of tho balance, is not good. A lawful tender, and payment of the money into court, la a good defense to an action for the debt. But the creditor may break down thin defense by proving that he demanded the money of the debtor, and the debtor refused to give it, subaequently to the tender,-Parsons on Mfercuntile Laso.

Teneriffo, the largeat island of tho group calied the Canarles, lies between Canary and Gemera. It is of an Irregular ahape, 60 milea $\ln$ length, with an extreme tireatth of 30 miles. Not more than onc-sevonth is cultivable. A chain of mountaina traverses the isiand In the direction of its greatest length, and in the middic of tho broalest part rises the celebrated penk lovally known as the I'lco de Teyde, which, with its aupporta and apurs, oceupies neart, twosin.rils of the whale islund.
The Canary Islan'a a $e$ in the North Atlantic Ocean, between $11,25^{\circ} 10^{\prime}$ and $99^{\circ} 30^{\circ} \mathrm{N}$., and long. $18^{\circ}$ an and $18^{\prime}$ av $W$. The manes of the seven principal
lalands, their reapective area $\ln$ Eagliah aquare milea, and their population in 1835, are given in the follewing table:

| lulanda. | Area. | Population. |
| :---: | :---: | :---: |
| Tenerifto....., | 817 | 85,000 |
| Grand Cianary | 758 | 68,040 |
| Palma | 718 | 88,000 |
| Lanzarote. | 828 | 17,410 |
| Fuertaventura | 826 | 18,801 |
| Comera. | 169 | 11.700 |
| Illermo | 62 | 4,400 |

Formerly the total annual prodico was estimated at about 40,000 pipea, of whlch 25,000 pipes were jorsduced in Tenrriffe. Between 8000 end 9000 plpes were exported. The elidef exports are wine, cochincal, barilia, and orchilla. The inporta cousist of woolen, silk, cotton, and iron manufactures, glass, etc.

Principal Ports.-The porta of Santa Cruz do Tene. riffe, Orotana, Cludad Real do los Palman, Anceiffe de Langarole, Puerto de Cabras, and San Sebasilan, in the Canary Inlands, having been declared freo hy royal decree proclaimed on the 10 th of Oetober, 1852 , and vessels of the United States and their cargoes arriving In said ports leling thus placed on the same foeting with those of Spain, no di criminating duty is levied on Epanisil vessels and their cargoes arriviag from those ports in the ports of the United States; provided that on evory such arrival the req-ired consular certificate be flided with the collector of the port.-See Canakies.

The Tennessee River has ils ehlef source in this Stata; it is 1250 miles long, and is navigable for steamboats to Florence in Alabama, 276 miles above Its eatrance into the Ohio, and from the head of the Muscle Shoals for boats 250 inlles farther. Cumberland River, which, rising in Kentucky, runs mainly in Tennessee; is navigable for steamboats 198 milles to Nash ville, and for boats 300 farther. It enters the Ohio Rlver in Kentucky, 60 miles from the Mississtppl River. The Holston, Clinch, French, Broad, and Hiwassee, are branches of tho Teunessee; Oblon, Farked Deer, und Wolf rivers, in the western part of the State, flow into the Mississiplyi, and are navigable for boats.

Sfanyfactures, ete.-There were in the State in 1850, 33 cottou factorics, with a capital invested of $\$ 66 y, 600$, employ hig 310 males and 581 females, producing 363,250 yards of sheeting, etc., and $2,326,250$ lbs. nf yarn, valued at $\$ 510,624$; four woolen factorics, with a cepital of $\$ 10,500$, employing fifteen males and two females. manufacturing articles valued at $\$ 6310 ; 23$ establishmants making plg-iron, with a capital of $\$ 1,021,400$, employing 1822 persnus, producing 30,420 tona of pigiron, etc., valued at $\$ 670,100 ; 16$ cstabjlshments with a capital of 139,500 , employing 269 persons, and making 3381 tons of castings, etc., valued at $\$ 264,325 ; 42$ establishments with a capital of $\$ 755,050$, employing 786 persons, inanufacturing 10,348 tons of wrought iron, etc., valnod at $\$ 600,018$. Capital hvested in manufuctures, $87,044,144$; value of manufactured articles, $80,413,701$. There wers in this State in 1557,51 hanks aml brauches, with an aggregato cash capital of $810,576,000$; and in January, 1856,15 railroads, with 455 miles of road completed and in operation.

Teredo, or Ship Worm. The tollowinge necount of this worm is from a paper written by James Tarvis, who has been engagel since 1849 di a series of e speriments concerning the teredo or ship worm, by orider of Commodore Smith, chiof of tho Bureau of Yards and Docks. In order to ascertain the lest composition for resistling the attucks of the teredo non wood, ho painted a ramber of blocks and boxes with various com-pounds-some he left unprepared, and some partly painted-and sunk them in Elizabeth River in the month of Aprll. "About tin $12 t h$ June the blocks and Loxes were generally lifted and examined, bat he never was able to dlscover any of the snimalcule (young tevedu) until about the 20th of Juns. At this period of tho year be generally diseo ared minute holes in the wood by the use of a magnifying glass. After this tho creature dally grows ahead, for it has ne powers
of locomotion; it grows like an oyster, and haq a calcarcous or shelly sheathing, whleh adheres to the surface of its burrow."
In Norfolk harbor, Virginla, they grow from six to twelve lnches in length, and from three-eightha to half an Inch in diameter. The wood excavated by one twelve inchea long, in a season, amounted to more than a cubic linch, If in a solid picce. No slgns of the teredo were discovered by him in wood dopasited after. Mr. Jarvis aupposes that the teredo commences to davelap about tha ist of July, and continues until cold weather arrives; in Charleston, South Carolina, and further south, they develop during the whole jear; whereas in the colder blasts, sueh as in the larbors of New End gland, they do but little lnjury, because the worm is feeblo there, belng like a fine thrond. It is believed to be a native of the torid sees. The tered, is not so destructive on piles sunk under water at New York city docks as thase on tho opposito side of the river, on tho Jorsey and Long Island shores; thls is owing, Mr. Jarvis thluks, to the amount of filth carried down in the elty sewers. In Boston, and Portsmauth, Now Ifampshire, harbor piles will stand twenty-five years. One open nail-hole in a sheet of copper upon a vessel's bottom will allow the worm access to pursue its work of destruction. All kinds of wood used in shlp-building are attacked by lt. To secure the bottoms of ships from the salt-water worn, and from caral deposits, Mr. Jarvis recommends puttling three coats of while zinc paint on the dry bottom of the vessel, then capper them; and to make the whole invulnerable, put three moro conts of white zinc paint upon the outer s..rface of the capper. To preserve piles, drive them with the bark on. There is no danger whilo tha bark remains. The barnacle on piles does no injury. Charring is excellent, provided the fissures are well filled with hot coal tar or zine paint, which will be found excellent to keep the shell-fish from the wood where piles may have the bark broken off before being driven.

Terra Japonica, the cominerclal name of catechu (cutch) and gambir. It is stated that it is ohtuined by boiling the wood of the trees of which it is a product. But cutch is also obtained direct from the tree by tapping in the sama way as caoutchouc (India rubher). Terra japonica gives out the largo portion of tannin which it contains more readily than oak bark or most other substances, and is, therefore, preferred by those tannera who work on the quick process. Lutterly, also, it has been extensively used as a dye, producing a brown color.

Texas, the most southern State in the Union, is situnted between lat. $26^{\circ}$ and $36^{\circ} 30^{\circ} \mathrm{N}$., and letiveen long. $94^{\circ}$ and $107^{\circ} \mathrm{W}$. from Greenwich, mad contalns 325,520 square miles.
Liarly Ilistory of Texcs.-Tha regions which we now comprise under the name of Texas, to the northwest of the Gulf of Mexico, were called liy the Spmilsh gorernor of Jamaica, Garay, when his Captain, Pineda (1519), had sailed along them, Irorincia ds A michel. It is a name of the origin of which wo are quite in the dark. Jerhaps, also, the whole northern shore of the Gulf was comprised under it. Thls expression, Prorincia de A michel, was pointed out as the original Indian namo of the land. Bceause it was discovered ly the exertions of Garay, the Spanish geographers, therefore, gavo to it also the Spanish name, Tierra de Garoy (Garay's country), which nama we see on many old maps round the whole northern shore of the Gulf, including Texas. When (about 1521) the King of Spain divided tho discoveries and governments of Cortez and Garay, and put the Rio do las Y'almas as the northern boundary of the government of Mexica, tha countries to tho north were very often called El Gobierno del Rio de los Palmas (the goverument of the Palm Rivar); and this elso inchaded a great part of the countries to tho north. Hecause, however, the offorts of Garay to form a province in the north were
unfortunato, and because all the firat attempta toward the north were elther made from Mexico or from the peninatala of Florida, so theso two namea prevalled, and divided the whole reglon among each other. The great conquerora of the north, Narvaez and De Soto, ontered frot Cuba and from the peninsula of Florida. The aames Provincia Amichel, Tierra Garay, (iobierno del lio de las I'alneas, disappeared soon after, and every thing round the whole Gulf of Moxico, up to the Palma lilver in the west, was comprised under the general name of Florlda. As soon as Mexican travelers traversed the Palma Iliver they conaidored themselves tu be in Floridn. When Moscoso (1642) made hila excursion from the Red liver weatward to the centre of Texas, he found thero innumerable herda of buffaloes, and called thls country, from which he returned to the east, La Procinen de loe V'nqueros (the province of the llerds). Some authors consequently gave that name to what we now call Texas. The Spaniards In Mexico conmonly called all chose wild Indians to the north of the civilized empiro of Montezuma Los Indias braeos (the anvage Indians), or los Chichinecas. The whole conntry north of the Palns River was, therefore, very oftos designated as "the Province of the Chichlimecas, or of the Savage Indians" (las I'rorincia de los Chichimecas, or de los Indios bracos). It was a custona from whicis also grew out the name of the Rio Jravo. When the French, under l.a Salle, arrived on the coasts of Texas (1685), they took possession of it under the name and as a part of their great country, La Nourelle France (New France); which name, according to their notions, covemd as much ground as the name of Florida, according to the Spanish ideas; that la to say, the whole eastern balf of North America The French from thia time considered Texaa to be a part of their dominion an far south as tho ISio Bravo, and called it also Loulsiana, when they had erected their Mississipyi colony after 1699, and had given to it officlally that name after 1712. All their old maps of Lovisiana go as far down as lijo Iravo, and include Texas. Meanwhile the Spaniards had, however, taken actual possession of that province, and gave another name ta it.
Some believe the word Texas to he Indien, and say that when Alonzo de leon, in 16889 , arrived among them he heard them often use the word Texas as a terot of loge or friendship. Othere suppose that the word is Spanish, and that it implles some indication of "the mander of the lindians in constructing or coverIng tente or wigwams." Hot this seems a not wellfounded supposition; for the Spasish word Teja (phur. Tejas) does not appear to have any thing to do with a covering of a tent or wigwam; fincans simply "a tile."—.ies lonat'm, llistory of Teras.
The first Frenchman who prononnced this name, in the year 1719, la llarpe (an officer in lonisiana, well known by his trnvels and writings), received ti evldently through thu Spaniar . He calls the coantry of the Cenis lodians las Z ekas. Bowe old French authors write also la prormese de lastikas. In the year $172 \overline{2}$, for the first fime, a separate "governor for tho province of Texas" alone was nominated; lut this provinco ixtended then only as far south as the Iliver Medina. The southwesterif part of vor present Texas lelonged still for a long white to "the proviuce of Coahuila."-Yo.shtM, 1. 303.

It is supposed that with this eatalilishment of Texas as a new nad separate sovernment for itself (in 1727) was also colncritel an introuluction of a new nameof las Xiueroa Filipivas ( 1 ho new lhilipplnes), given to this governument in benor of King J'hilip V. At least nefther dlarcia uor any other author used this same infore this time, while we afterward tind it repeatedly it official papers und docunents. The old and popular name of has Texas was, however, used besides it. Wo ane both names still on puaps of a very late date; as, for iustance, on a Mexican map of tho
year 1818, Prorincia de Texas o Nuevas Filhpinas (the province of 'Tesas, or the new Phillppines). Until 1R24, the dominion of this name did, however, southward, not reach the Rio llravo. The province of Coahails and of Nuevo Sant Ander took away the wholn southweatern quarter of Texas, as far east and north as tho Rlo Medina and the sources of the Colorado and Brazos. Eastward, toward Loulaiana, the province of Texas and New Philipplacs extended to the nelghbor. bood of the Reil Rlver, and on the phores of the Mexi. can Gulf to the Rio Calcesiu, and sometimes as far as the Merrmentau. In the year 1824, undor the domin. lon of the Mexican lepublic, the old connected jirov. lnces of Coahuila and Texes were again melted together into one atate, uader the name of El Bistudo de Texas y Coahuiln. The southerm part of our Texes, alout the lower Rio Bravo, as lar northeast as the Medlaa lliver, was not yet included in this name. It becamo art of the new created Bistado de Trmatilpas. Sometimes, ant on sonie mape, It was tried at this period to apply to the whole of Texas the name of Fredonia, whieh was the particular name of Austin's colony. This has lieen done, for instance, In that oth. erwles excellent Dietionnaire de Geographic," edited by a society of French geographers. In the year 1896 Coahulla and Texaa were divided again, and Texas becane a scparate nnd indrpendent State, which was (1845) annexed to the United States, and recelved then, after the war of 1846 , its present boundaries. These bounda. ries extend from thila time along the Gulf of Hexico, from the month of the Rio Bravo in the south to the mouth of the Sabina in the east. To show how far and In what manner the toundaries of this name and State were extended towarl the interior does not belong to our hydrographical reaearches,-J. G. Koul.

The genoral aspect of the country la that of a vast Inclined plane, gradually sloplag from the mountains castward to the sea, and traversed by numerous rivers, all having a eoutheast direction. It may bo naturally divided into three reglons; the first, which is level, extends along the coast with a breatith varying from 100 to 30 millos, being narrowest at the aonthwest. The soil of thla region is principally a rich alluvion, with scarcely a stone, and singularly free from stagnant swampa. lload woodands fringe the banks of the rivers, between which are extensive and rich pasture lands. The second division, the largest of the three, is the undulating prairie region whicu extends for 150 or 200 miles farther inland, its while, grassy tracts alternating with others that are thickly timbered. Limestone and sandstone form the common aubstrata of this section. The third, or mountainous region, sitaated prinelpally on the weat and sonthwest, fo. .uing part of the Sierra Madre, or Mexican Alpa, Is hut littio explored. At its remote extremity it consists of an elevated table-lund, resembling the vast steppes of Asia, except in their superior fertility. The nuoutain sidea are elothed with forests, and there are faw, If any districts of conntry of the ame extent as Texas, with se litte unproductive land.

The principal rivers In the State are the Sabine, Neches, Trinitlad, Ilrazos, Colorado, Guadaloupe, San Antonia, Nueces, nul the Rio Girande. The Neches is navigable for sinall steamboats for more than 100 miles, Trinldad lifer for 800 or 400 miles, and the IBrazos for half thet diatance. The Klo Colorato is obstructed by a raft 10 milea from Ita mouth; it will, when removed, be navigatile for atcamboats 200 miles to Austin City. The San Antonia and Neucea are navigable for only a short distance ; lut the 110 Grand del Norte, a notle streain, having a course of 1800 milea, will most probably, though in parts broken by rapids, become hereafter an important commercial channol. Galveston Bay, futo $n$ hich the Trinided flows, is about 85 miles In longth, and from 12 to 18 milea wide. The Gulf of Meaico bounds ita southeantern benicr, on which are many bays and some good harbors. The Texan year

is divided into wet and dry seasons; the former lasts mines have been wrought In the mountains, and bitufrom December to March, and the latter from March to men and salt are abundant. December. Snow fa aldom seen except on the mountalns. The country is in most parts covered with a Juxuriant native grass, and it is amply supplied with timber, among which are the live oak, white, black, and post oak, hickory, wa!nut, sycamore, caoutchouc, etc., and on the high lands pine and cedar. The "Cross Timbers" are two lines of continuous forests of great extent. Cotton and sugar-cane are the great agricultural staples, both of which attain to great perfection. The grains chlefly cultivated are Indlan corn and wheat. Peaches, melons, figs, oranges, lemons, pine-apples, dates, olives, grapea, etc., grow abundantiy. Great numbers of cattle and horses are reared, and vast herls of buffeloes and wild horses wander over the pralries, while deer and game are abundant. Among lis minerals are coal of a superlor qusilty, iron ore, Ilmestono, granite, elate, gypsum, etc. Silver

Manufuctures, etc.--There were In the State In 1850 one woolen factory, with a capital invested of $\$ 8000$, omploying four males and four fomales, manufactaring 14,000 yards of cloth, etc., valued at 15,$000 ;$ twn establishments with a capital of $\$ 16,000$, employing 35 persons, and making 200 tons of iron castings, etc., velued at $\$ 55,000$; 88 flourlng and grist milis, 89 sawmills, 22 tanncries, 84 printing-offices, threc tri-weekly, two seml-weekly, and 82 कreckly publications. Capital Invested In manafactures, 8613,238 ; value of manufactured aiticles, $81,202,885$.

The principal places in the State aro Austin, the capital, Galveston, Houston, Washington, Matagorda, San Felipe de Austin, San Augustine, Nacogdoehes, San Antonia de Bexar, Corpus Christi, and Brownville. Thern wero, January 1st, 1856, 36 milles of rallroad bullt.

Thaler, a German silver coin, first coined in Joachlusthal, a valley in Bolemia. The value of the thaler is about seventy cents,--See Coins, Germany, and Dolihan.

Thames (Tomesis), the princlpal though not the longest river of England, through the sonth part of which it flows mostly in an easterly direction. It rises under the name oi the Isis, about two miles south of Cirencester, and 876 feet above the sea, flows at first south to near Cricklaile, then east-northeast past Leechlade to near Oxford, and southeast past Oxford, Atingdon, and Wallingford to leading, after which lts course is mostly east ward to Gravesend. A few iniles beyond this it expands into an ectuary, which at its junction with the North Sea at the Nore, between the Iaie of Sheppey and Foulness Point, is fifteen milcs across, and has on its opposite banks the towns Sheerness and Southend. Total course estlmated at 215 miles. At Dorchester it recelves the Thamer from the north, and thenceforth assumes its proper name; other principal afluents are the Churnet, Coln, Wainrush, Evenlode, Cherwell, Colne, Brent, Lea, and Roding from the nerth, and the Colo, Konnet (its chief affluent), Wey, Mole, and some amaller rivere from the gouth. The Mersey joins its estuary at Sheernese. Its basin is of lees aize than that of the Severn, but no river in the world has moro commerclal importance. The tide fiows up it for about eighty miles; it is navigable for ehlps of any burden to Deptford, for vessels of 200 tons to Jondon Bridge, and for barges 180 miles farther, where it la united by the Thames and Severn Cunal with the Severa, below Gloucester; it is also connected wlth all the centre of England by the Oxford and Warwick and Grand Junction Canals, end iy other canals with Bristel, lasingsteke, Arundel, etc. Under the Romana it formed the north boundary of the province of Britannia prima.

The Thames is the richest river in the world. It has been erroneously sald that its name is Isis tlll it arrives at Dorchester, when, being joined by the

Thame or Tame, it asaumes the name of Thames. Whit was the orlgin of this common error can not now be traced : poetical fiction, however, has perpetuated the error, and invested it with a kind of classical sanctity. It was called Thames or Tems beforo it camo near the Thame.-Camiden. The river rose so high at Westminster that the lawyers wero broughit out of the hall in boats, A.D. 1235. Again lt rose to great height, 1786, 1747, 1762, and 1791. The conservation of the Thames was given to the mayors of London, 1489. The Thames was m.dde navigatle to Oxford, 1624. It ebbed and flowed twice in three hours, 1658. Again, three times in four hours, March 22, 1682. Agaln, twice in three hours, November 24, 1777.-See article Trynel.

Thermometer. The invention of this instrument is ascribed to several scientific persons, all about the same time. Galileo, 1597,-Linmi. Invented by Drebbel of Alcmaer, A.d. 1609.-Boenilanye. Invented by Paule Larpi in 1609.-Fcloentio. Invented by Sanctorio in 1610.-Boneleli. Fahrenheit's thermometer was invented ahout 1720 ; and the scale called Reaumur's soon after, 1730. The mode of construction by substituting quicksilver for spirits was invented some years aubsequently.-IIaybs.

Thimble. This simple yet nsefal, and now indispensable appendage to the ladles' work-table, is of Dutch inventlon. The art of making them was brought to England by John Lofting, a mechanic from Holland, whe set up a work-shop at Islington, near London, and practiced the manufacture of them in various metals with proft and success, about 1690.- Hardx.

Thread (Ger. Zwirn; Dn. Garen; Fr. Fil; It. Refe; Sp. Hilo, Torzal; Russ. Nitki), a sntall line made up of a number of flbrea of some vegetable or animal substance, such as fiax, cotton, or silk; whence its names of llnen, cotton, or sllk thread.-See Cotron Manufacture.

TIde Gauge, a mechanical contrivance for registering the state of the tide contlnuonsly at every in-
atant of time. In the Phites. Trems. for 1888, there in a description of very complete evelfregistering machine fur this parpoee, erected at Mristol by Mr. Bunt. Tho principal part are an oight-day elock, which turns a vertical eylinder revolving once in twenty-four howre i wheel, to which an altermate motion is communicated by a thoat rising and falling with the tide, and connected with the wheol by a wirs paoolng over a pulley, and kopt constantly strained by a counterpolee; and amall drum on the eame axis with the wheel, which, by anspending wire, communicates one-olghteenth of the vertical motion of the float to a bar carrying a pencll, whleh deseribes a curve on the cylinder, and therehy marks the fluctuationa, and the time and height of high water.

THdes, the alternate riee and fall of the water of the ocean. The moon is the principal agent in the proinction of the tiden; but they are modifed, both with reppect to their height and the tlmes at which they happen, by the action of the oun. The effect of the planets is inappreciable. Homer is the earlieat profane author who apeake of the tidea. Poaidonlua of Apamea accounted for the tides from the motion of the moon, about 79 a.c. ; and Ceemar apeaks of them in hia fourth book of the Gallic War. The theory of the tldea was first eutisfactorily expiained by Kepler, A.d. 1598; but the honor of a complete explanation of them wae reserved for Sir Isaac Newton, who lald hold of this class of phenomena to prove universal gravitation, about 1683.

The attractive force of a body on a diatant partlele of matter varying lnversely ra the aquare of the diatance, the particles of the rath on the alde next the moon will be attracted with a groater, and those on the oppoaite side with a amaller force, than those which are situated intermediately. The gravitation toward the earth's centre of the particiea neareat the moon will therefore be diminlshed, and consequently, if at liberty to move among themselvea, thoy will riso alove the general level. In like manner, the moon'a attraction on the most dintant particies being lewa than on the central onea, their relative gravitation toward the centre will also be iliminiahed, and the watere will consequently be heaped up on the alide of the esth whleh ls turned away from the moon. Hence, If the earth were at rest, the ocean would take the form of an ohiong spherold, with ita longer axis pasaing through the attracting bouly; and it may be ahown from theory that the spherold would be in equilibrium oniler the influence of the moon's attraction, if the longer semi-axis exceeded the shorter ly about 68 inchea. But in conaequence of the rapid rotation of the earth about its axis, the apherold of equillibrium is never fully formed: for before the watera can take their level, the vertex of the spheroid has shifted its position on the earth'a anrface, In conaequence of which on immensely broad and very flat wave in formed, whleh follows the motions of the moon at some interval of time. In the open sea the tims of high water is, in general, from two to three hours after the moon's trasait over the meridian olther above or below the horizon. The tidal wave, it is to be observed, Is entirely different from a current : the particles of water merely rise and fall; but except when the wave passes over shallowa, or approache the ahore, there in little or no progressive motion.

The waters of the ocean are affected in a mimilar manner by the action of the aun, onder the influence of which they have a tendency to anaume at every instant the form of an elongated apherold; but although the attractive forch of the sun is immensely greater than that of the moon, yet, by reason of the greater sistancw of the ann, the differwice of the effect on pertirles aituated on opposite sides of the earth (on which difference the phenomena depend) is very much lean. The wolar tides are therefore comparatively mall with respect to the lunar tides, and, in fact, are aever per-
colven as diatinet phenomena, but become senulble only from the moditiontions which they produce In the holighte and times of thoee whleh primarily dopend on the meon. At the ayaygies, when the aun and moon come to the moridian togother, the thiles are, ceteris paribes, the highent ; at the quadratures, or when the sun and moon ane $90^{\circ}$ distant, the thes aru least. The formar are called aprong tiles, tha lattor neap tides, Although we are not in possession of datit to onabie un to compete the exact holght olther of the apring or neap thlen, yot their relative holghte in the open ocean probisbly cerreapond very nearly to the elliptioitlen of the spherolds of equillibrium that would be formed under the action of the two bodlea exorted separately. Now the ollipticity of the squeoua spherold formed by the moon'a action is about five feet, and the ellipticity of that formed by the aun's actlon about two feet; therefore, the apring and neap tidea being the aum and difference of the reparate effecte, the sverage apring tide will be to the average neap in the ratio of alrout 7 to 8.
The apparent time of high water at any port, In the afternoon of the day of new or fall moon, is what is usually called the eatabliciment of the port. Mr. Whowell calla thata the vulyar oatablishment, and the mean of all the Intervala of tide and transit for a half Iuantion he terms the corrected eatalliahment. This corrected eatablishment la consequently the Iunitidal Interval correapending to the day on whleh the moon passes the meridian exactly at noon or midnight.

The two tldes immediately following one another, or the tidea of the day and nilght, vary, both in height and time of high water, at any particular place with the diatance of the san and noon from the equator. As the vertex of the tide wave always tends to place itself vertically under the luminary which producen it, It ls evident that, of two consecutive tides, that which happena when the moon is neareat the senitil or nadir wili be greater than the other; and consequently, when the moon'a declination le of the same denomination as the latitude of the place, the the which correaponda to the upper tranait will be greater than the opposite one, and vice reraa, thedlfferencea lieing greatest when the oun and moon are in oppouition, and in opponite tropica. This if called the diurnal inequality, becanse ita cycle is one day; but it variea greatiy at different places, and Ita laws, which appear to be goveraed by local elrcumutancen, are very imperfectiy known.

We have now deacribed the principal phenomena that would toke place were the earth a aphere, and covered entirely with a fluid of uniform depth. But the aetual phenoment of the tides are infinitely more compliented. From the interruption of the land, and the irregular form and depth of the ocean, combined with many other distnrbing circumstances, among which are the inertia of the watery, the friction on the bottem and aides the narrowness and leagth of the channels, the act. 1 of the wind, currents, diference of atmoepherio pressure, etc., great variation takes place in the mean times aud helght of hlyh wuter at places differontiy situated; and the inequalities alwore alluded to, as dependiag on the parallax of the meon, her position with respect to the aun, and the declination of the two bodles, are, in many cuses, altugether obliterated by the effecte of the diaturbing influences, or can only be detected by the calculation and comparison of long eeries of olseervatione.

By remson of these disturhing causea, it becomes a matter of great dificulty to trace the propagation of the tide wave, and the connection of the thles in different parts of the world. In the Philowophicat Transoctione for 1832, Sir John Lubbock publimhed a map of the world, In which he laserted the tinnes of high water at new and full neon at a great number of places on the globe, collected from various sources, an worka on navigation, voyages, salling directions, etc.; and,

In order that the march of the tide wave might be oacilationa produced under the direct agoney of the irnced more re illy, the timee were expreased in Greenwich time an rell as the time of the place. In the same Tramactione for 1888, Mr. Whewell prosecuted thls aubject at greater langth; and avallipg himeelf of a priori considerations, as wail as of a mane of information coilected in the hydrographer's offiee at the Admiralty, Inserted in the map a seriee of cotidat limea, or lines along whioh high water takes place at the mame instant of time. Uut these cotidal linee, as Sit J. Labbock remarks, are antireiy hypothetionf; for wo have few epportunities of detormining the time of high water at a dintance from ite easat, though this is somes times peocible by means of a solitary island, ss St. Heiena.-Lubnock's Etomendary Tratise on the Tides, 1809.

According to Mr. Whewell's deduetions, the general progrese of the great tide wave may be thue described: It is only in the Southern Ocean, between the latitudes of 30 and 70 degrees, that a zone of water exlat. of aufficient extont to aliow of the tide wave heing formed. Suppose, then, a Ine of contemporary thea, or cofidel lines, to be formed in the Indian Ocean, as the theory supposes, teat is to any, in the direction of the meridian, and at a certain distance to the asst ward of the meridian in which the moon is. ' As this tile wave passea the Cape of Good Hope, it sends off a derivative unduiation, whlch advancea northward up the Atlantlc Ocean, preserving ailways a certain proportion of its original magnitude and velocity. In traveling along this ocean the wave aoaumes a curved form, the convex part keeping near the mlddie of the ocean, and abead of the lranches, which, owing to the ahallower water, lag behind on the American and African coasts; so that the cotidal lines have siways a tendency, to make very oblique angles with the shore; and, in fact, run naarly parallel to it for great distances. The main tide, Mr. Whewell conceives, after reaching the Orkneys, will move forward In the sea bonnded by the shores of Norway and Siberia on the one side, and thone of Greeniand and America on the other, wili pass the pole of the earth, and finally end its course on the shores in the nelghborhood of Behriag's Straita. .. It may even propagate its influence through the atraits, and modify the tides of the North Pacific. But a branch tide is sent off from this maln tide into the German Ocean; and this, entering letween the Orkneys and the const of Norway, brings the tide to the east coast of England, and to the coarts of IIolland, Denmark, and Germany. Continuing its course, part of it, at least, passes through the Strait of Dover, and meets in the Britlah Channel the tide from the Atlantic, which arrives on the coust of Europe twelve hours later; hut in passing along the English coast, another part of it is refiected from the projecting iand of Norfolk upon the north coast of Germany, and again meets the tide wave on the ahores of Denmark. Owing to this interference of different tide waves, the tides are almost entirely obliterated on the coast of Jutland, where their place la supplied by continual high water.

In the Pacific Ocean the tides are very amall, but there are not sufficlent observations to determine the forms and progress of the cotidal lines. Off Cape Horn, and round the whole shorn oi Terra del Fuego, from the western extremity of the Strait of Magajhaens to Staten Island, it la very remarkable that the tidul wave, instead of following the moon in its diurnal course, travels to the eastrcard. This, however, is a partial phenomenon; and a little farther to the north of the last-uamed piaces the tidea set to the north and weat. In the Mediterranean and Baltic seas the tides are inconsiderable, but exhibit irregularities for which it is difficult to account. The Indian Ocean appears to have high water on all sides at once, though not in the central parts at the same time.

Since the tides on our coasts are derived from tho
aun and moon. in the Southern Ocean, and require a certain interval of time for thoir transfer, it follows that, in general, the thle is not due to the moon's tres. ait immediately preceding, but is regulated ly the position which the aun and moon had when thay determined the primary tide. The time elapeed between the original formatlon of the tide and its appearance at any place is ealled the age of the tide, and nometimen, After Bernoulli, the retard. On the ahores of Spain and North Americe the tide is day and a half old; in the port of London it appears to be two daya and a half old when it arriven.
Crelocity of the Tide Wave.-In the ppen ocean the orent of the tlde travels with enormous velocity. If the whole aurface were uniformly covered with water, the aummit of the tide wave, being mainly governed by the moon, would every where follow the moon's tranuit at the seme intorval of time, and consequentiy truvel round the earth in a llttle more than twentyfour hours. But the circumference of the earth at the equator being about 25,000 miles, the velocity of prapagation would therefore be ebont 1000 miles per hour. The actual velocity is perhaps nowhere equal to this, and is very different at different places. In latitude $60^{\circ}$ south, whers there is no iaterruption from land (excepting the nerrow promontory of Patagonia), the tlde wave will complete a revolution in a lunar day, and convequently travel at the rate of 670 miles an hour. On examining Mr. Wheweil's mep of cotidal lines, it will be seen that the great tide wave from the Southern Ocean travels from the Cepe of Good Ilope to the Azores in about twelve houra, and from the Azores to the southeramost point of Irelund in three houra more. In the Atlantio the hourly velocity in some cases appears to be $10^{\circ}$ of latitude, or near 700 miles, which is almost equai to the velocity of sound through the air. From the south point of Ireland to the north point of Scotland the time is eight hours, and the velocity, about 160 miles an hour along the shore. On the eastern coast of Britain, and in shallower water, the velocity is less. From Buchanness to Sunderland it is about sivity miles an. honr; from Scarborough to Cromer, thirty-five milies; from the North Foreland to London, thirty miles; from London to Kichinond thirteen milea an hour in that part of the river,-Whewell, Phil. Trawis, 1838 and 1836. It is scarcely necessary to remind the reader that the above velocities refer to the traasmission of the undulation, and are entirely different from the velocity of the current to which the tide wave gives riso in shallow water.

Theory of the Tides.-The theory of the tides, conaidered as a consequence of solar and lunar attraction, was first aketched by Newton in the Principia. In the 36th and 37 th propositions of the third book, he determines the forces of the sun and moon to elevate tise watere of the ocesn, on the supposition that the sea is a fluid of the same density as the earth, covering the whole terreatrial surface, and which takes at every instant the ffgure of equilibrium. He assumes, without demonstration, that this figure is an elongated opheroid. One spherold he supposes to be formed under the sction of the sun, another under the action of the moon; and, by reason of the amallness of their eccentricities, they may be conceived as auperposed the ono on the other. From these suppositions he deduced the general phenomena of tho ebb and flow of the sea; and iy comparing bis theory with observations of the heights of the epring tides made at the mouth of the Avon, near Bristol, be determined the ratio of the attraction of the moon to that of the sun to be nearis: 4.48 to 1 ; whence he deduced the mass of the earth to be to that of the moon as 39.788 to 1 , the density of the sun to that of the oarth as 1 to 4 , and the density of the moon to that of the earth as 11 to 9 . Newton's theory was defective in many points of view, but fifty
years elapsed before is received any improvement．In 1788 the subject of the tides was proposed as i prise question by the French Academy of Sciencer，which gave occasion to the celebrated trmatisea of Daniel Bernoulli，Machaurin，and Euler．Maclaurin＇a Essay is romari $\quad=b l e$ ，as containing a demonstration of the theorem assumed by Newton，that the elliptic apheroid afforde an equilibrium under the action of thr distarb－ ing forces：those of Beraoulli and Ealer，though they furnish no new principle of equal or aimilar import－ ance In point of theory，enter more into detalis，and contain many useful lilustrations．That of Bernoulii indeed，contains a table which has served as the model for all those（not purely emplrical）which have since been formed．The next important atop in the theory of the tides was taken by Laplace，who first treated the sabject as a general question of hydrodynamice， and attempted to dedace the principal phenomena from the equatlons of the motions of fuids．Bat in orde to simplify the equations，which are of a very compli－ cated naturc，he was forced to have recourse to the hypothesic of a flud covering entirely a ．＂herold of a regular aurface，and consequentiy the resulas were far from representing：ntual observations of the tides at any port．The＇© Thomas Young（Ency．Brit．， article Tidess）sxtended Laplace＇s noethul to the more general caue of an ocesn coveris gapart only of the earth＇e surface，and more or less irregular in its form， and attempted also to include in hila calculation the ef fects of hydraulic iriction on the times and magnitudea of the thles．

Influence of Asmospheric Pressure and Winds．－Ben oldes tite numerous causes of irregularity depending on the local circumstances，the tiden are also affected by the state of the atmosphere．At Brest，the height of high water varies inversely as the height of the berometer，and rises more than eight inches for a fall of alont half an inch of the barometer．At Liverpool， u fali of one－tenth of an inch in the barometer corre－ sponds to a rise In the lifiver Mersey of about an inch； and at the London Docks，a fall of one－tenth of an Inch correaponda to a rise In tive Thames of about neven－ tentha of an inch．With a low barometer，the tides muy therefore be expected to bo high，and vice versa， The tide is also lisble to be distortied ay winds．Sir J．Julibock ntates that，in the violent hurricane of January 8，1839，＂there was ne tide at Cainslorongh， which is tweoty－five milea up the Trent－a circum－ atance unknown before．At Salimarsh，only five miles up the Ouse from the ilumber，the tide went on ebbing，and never flowed til the river $\boldsymbol{\kappa}$ an dry in some placen ；while at Ostend，towand which the wind wan thowing，contrary etrects were observed．During atroug northwesterly gales the tide markn high water earlier In the Thamen than otherwine，and does not give mo much water，while the elb－tide runs out late，and marks lower；but upon the galea abating and the weather moderatigg，the thies put In ，and rise much higher while they aiso ren longer before high water is marked，and with more velocily of current ；nor do they run out so leng or so low．－Bhande＇s C＇yclpedia．

The tidal observations of the Pacific conat have can ually led to a detrumination of great scientitic inter－ ent，that of the average depth of the Pacific（Ocean be－ I ween the coasts of Japan and Califurnia．On the 23d of December，14S4，as earthquake oceurred in Japan by which tha town of Simoda，in the ieland of Niphon， was destroyed．From the imperfect accounts which have reached us，it appears that at nine $A . \mathrm{X}_{\text {．on }}$ on that day the aevere shock of an earthyuake wan felt on board the Ruseian frigate Diama，then lying In the har tor of Sinooda．lialf an hour later the ne．cume into the hay in an immense wave thirty feet in lright． overwhelming the town and then receding．Thin ad－ vance and recession oscurred five tim．vand liy $2 \cdot 30$ P．M．all was again quiet．The depth of the sea dur ing thene changes varied from lesa than eight to mone
than forty feet．Upon the same day an extraordiuary rise anil fall of water was observed at Peel＇s Island， one of the Bonin Jelands，and the tide continued to rise and full during the day at fotervale of fifteen min． utea，gradually lessening antil evening．－American Jourwal of Science，Janjary， 1858 ［Prof．Bachk］．
The foilowing table containg tha revised data for the principal tidal elements of a number of polats on the coast of the United States，with additions to the tables published last year，furmished by the discuasions of the tidal observations．These elements are selected from a large number of renults obtained in the progress of the Coast Survey，only thoae atations being reported， sa a general ruie，where the observations extended through at least two lunationa．

Tide-rips.-Near the equator, and especially on this side of it in the Atlantic, mention is msde, in the "abstract log," by almost every observer that passes that way, of "tide-rips," which are a commotion in the water, not unlike that produced by a conflict of tides or of other powerful currents. These "tide-rips" sometines move aloug with a roaring noise, and the inexperienced navigator always expects to find his vessel drifted by them a long way out of hor course; but when he cones to cast up his reckoning the next day at noon, he remarks with surprise that no current has been felt. Tide-rips are usually found in the neighborhood of the equatorial calas--that rogion of constant precipitation. And heace, if eurrents at all-if so, they are very superficial-I have thought they might be streams of rain-water, which old seamen tell us they have dipped up there freah from tho aca, runaing off. This conjecture, however, does not satisfy the phenomenon in sll of its aspects. It is sometimes ilescribed as starting up in a calm, and then approaching the vesael with great waves and a great noise; it acema threatening enough to excite a feeling of apprehension in the minds of seamen, for it looks as if it would daah over their frail hark as it lios wallowing in the sea, and helplessly flapping its sails against the nasts. Captain Diiggins, of the Maria, when bound frum Now York to Brazil, thus describes, in hia abstract log, one of these "tide-ripa," as aeen hy him, 10th October, 1855, in lat. $14^{\circ}$ N., long. $34^{\circ}$ W.: "At three F.M. saw a tide-rip; in the centry, temperature of air $80^{\circ}$, water $81^{\circ}$. From the time it was seen to windward, about three to five miles, until it had passed to leeward out of sight, it wa not five minutea. I should judge it traveied at not lesa than sixty milea jer hour, or as fist as the bores of India. Although ve have passed through several during the night, we do not find they lase aet the ahip to the west ward any; it may bo that they are so soon passel that they have no influonec on the ship, but they certainly beat very hard against the ship's aides, and jarred ber ull over. They are felt even when below, and will wake one out of sleep."Macry's Physicel Geography. For further information ua to 'Tides, refer to Amer. Jour. of Sei, xxxiv. 81, xvi. 78, xx. 205, xliv. 118, xil. (2d geriea) 341 (A. D. Bacue) ; Nouth. Lit. Mess., iv. 747 ; Mass. Quart. Rev., ii. 7 IT ; (Luart. Rev., vi. 74; A nal. Mag., ix. 231.

Tlles (Ger. Dachziegel; Fr. Tuiles; It. Tegole, Embrici; Sp. Tejas ; Russ. Tscherepiza), a sort of thin bricks, dried in kilna, and used in covering and paving different kirds of buildings. The best brick earth only should be made into tilea.

Timber (Ger. Bauholz, Zimmer; Du. Timmerhout; Fr. Bois de charpente, Bois à bâtir; It. Legname da fabbricare; Sp. Madera de construccion; Rass. Ströewoi Cess; Pol. Cembrovina), the term used to express every large tree squared, or capable of being squared, and ftt for being employed in house or ship-building. In the language of the Engliah customs, when a tree is sawn into thin piecea, not above seven inches broad, it is called batten; when above that breadth, such thin pieces are called deal. Wood is the genersi term, compreheading under it timber, dye-woods, fire-wood, etc.
The following are the contents of the loads of different apecies of timber, hewn and unhewn:

| load of | timber, unhewn | 40 cuble fe |
| :---: | :---: | :---: |

| * | 3) tnch plank | 170 |
| " | 4 lach plank. | 150 |

30 \& Ruagian standard deala, 12 feet long, if tach thick, 11 tuelies broad, make 1 load of timber.
5S\} Chriathana atandard denis, 11 feet long, $1 \%$ inch tbick, O luchee broad, make 1 load of timber.
53! Dram atanilard deate, 10 feet long, $1 \$$ fnch thick, 9 inches broad, mako 1 load of tmber.
3 Higa loge mako 1 load of timber.
-Sea Lumier Trade.
The annual demand of timber for the British nr.vy, in war, is 60,000 loads, or 40,000 full-grown treea, a ton each, of which thirty-five will stand on an acre; in peace, 82,000 tons, or 48,000 loads. A seventy-four gun ship consumes 3000 loads, or 2000 tons of trees, the producs of fifty-sesen acres in a century. Hence the whole navy consumes 102,600 acres, and 1026 per an-num.--Allevtr. Eingland imports sbout 800,000 loads of timber anuually, exclualvely of masts, yarda, staves, isthwood, etc., together with about $8,000,000$ of deals and deal-ends.-Parl. Ret.

Tw overcane the difficulty of bending timber, a method has boen discovered which, to judge from the accoun's given by the most eminent engineers, hoth of America and England, will be of the grentest service in ship-building and domestic architecture, and in the construction of all pieces of furniture in which it is necessary to employ curved timber. It has been already so employed in the United Statea.

By this invention, which has been patented in America, the strength of the wood ia incrensed at least 75 per cont. at the poiat where atrength is most required. The curve, moreover, never relaxes. The timber, as in the old process, is first suljected to the influence of steam, which softena $t$... whole mass, and puts it in a fit state for tho actlon of a machine. The principlo of
bending, as employed in this new application, is based on end-pressare, which, in condensing and turning at the same time, deatroys the capillary tubes by forcing them into each other. These tubes are only of use when the tree is growing; and their amalgamation increasea the density of the timber, the preseure belng so nicely adjusted that the wood is nelther flattened nor spread, nor is the outer circumference of the wood expanded, though the Inner is contracted. Now the error of the former process, as expounded by competent judges, has arisen from the disintegratlag of the fibre of the wood by expanding the whole mase over a rigid mould: Wood can be more easily compressed than expanded; therefore, it is plain that a process which induces a greater closeness in the component parts of the piece under operation-which, as it were, locks up the whole mass by knitting the fibres together-must augurent the degree of hardness and power of resiatance. The wood thua becomes almost impervious to damp and to the depredations of insects, while its increased density rendera it less liable to take fire; and the present method of cutting and shajing timber being anperseded, a saving of from two to threefourths of the naterial is brought about. The action of the machine throws the cross-gralns into right angles; the knots are compelled to follow the impulse of the bending; the juices are forced out of the cells of the wood, and the cavities are filled up by the interlacing fibres. In the same way, you muy sometiues ace in the iron of which the barrels of muskets aro made a kind $1:$ dark grain which indicates that the particles of the metal, either in the natural formation or in the welding, have been strongly clinched in ono another. The specimens are alwsys greatly valued for their extrnondinary toughnena, as well as for a certain fintastical and mottled beauty.

Another of the good results of this new method is that the wood is reasoned by the amue process as that. which etiects the liending. The seasoning of the word is simply the drying of the juices, and the reduction of the mass to ite minimum size before it is employed, so that there shall be no future warping. But, as we have already shown, the compresaion reaorted to in the American nyntem at once expeis the map; and a few huars are sufticient to convert green timber into thoronghly seasoned wood. Here is an obvious saving of time, and also of money; fur the ordinary mode of xcasoning, ly causing the wood to lle waste for a consideraule periosl, locks up the capital of the trader, nu, of course enluances the price to the purdiaser. lime wese will be saved in another way, in aearching ftri pleces of wood of the proper curve for carrying out certain designs. "Hluw delighted," nays Mr. dervis, ti-s Upited Scates inspector of timixer, "will the shipv.right lo woget clear of the neceasity of searching for cronkei pleces of tirnber! There need no longer be ans: breaklug of bats in the frame, as we have been woint to break the.n. We rhall see mumbers one, two, and thref futtocks, et leant, all in one plece." An Finglinh engineer (Mr. Charles Mayhew) remarks, that one of the advantzgen of the American methol is that, " in its uplicathon to all circular, wreathed, or twisted work, it not only preserves the continuous grain of the word, which is now usunlly and laborionsly done by narruw nliju of vencer alued on cores cut across the grain, with many masightly joints, ill concealel at bent; bit it will materialiy reduce the cont of all rurved work, which now varies aceording to the quickness of the oweep, and will give the artint greater freedom in his dexign, by allowing him to introduce linea which are now coutiounly avoided in orler to provent the cost of thelr execution." Ir. Hroker, Mr. Fiairbairn, Mr. Kennie, Mr. (iallway, civil engineer, and other ominent scientifle men, confirm these judgnents. A sjueciaen of bent oak now lien tefore us, and exhibits a beantiful continuity in the sweepr of tire fibres. Timber-bending has reached a new stage of dovelop-
ment; and it is not too much to antlcipate that it will have conslderable influence on the industrial arts.

THin (Ger. Blech, Weissblech; Fr. Fer blanc; It, Latta, Banda stagnata; Sp. Hoje de lata; Ruso. Blächa, Shest; Arah. Resas ; Sans. Trapu and Ranga), a metal which has a fine white color like silver; and when fresh, its brilliancy is very great. It has a olightly disagreesble taste, and emits a peculiar smell when rubbed. Its hardness is between that of gold and lead. Ita speclic gravity is $7 \cdot 29$. It is very mulleable, tion-foil, or tin leaf, is about $1000^{\text {th }}$ part of au inch thick ; and it might be beat out into leaves as thin again, if such were required for the purposes of art. In ductility and tenacity it is very inferior. A tin wire 0.078 inch in diameter is capable of supporting i. weight of 84.7 pounds only without breaking. Tin is very flexllhe, and producea a orackling noina whon bent. It may be readily alloyed with copper, zinc, etc., forming very valuable compounda.-Tuosson's Chemistry.

The Pheniciana traded with Fingland for this srticle for more than 1100 years before the Christian era. It Is said that this trade first gave them commercis! inportance in the ancient world. Uuder the Suxons, our tin mines appear to have been neglectel; but after the coming in of the Nornians, they produced considerable revenues to the earls of Cornwall, particulariy to Richard, brother of Henry 11I.; a charter and various Immunities were granted by Elmund, Earl Richard's brother, who alno framed the stannary laws, laying a duty on the tin, payable to the earls of Cornwall Edward III. contirmed the thners in their privilpges and crected Cornwall into a duxedonn, wlth which he Invested his son, Edward the Black P'rince, 13:17. Since that time, the heirs aypurent to the crown of England, If eldest кons, have enjoyed it succenalvely. Tin mines were discovered in Germuny, which lessened the value of those in Fingland, till then the onty tin mines in Europe, A.t. 1240.-Anthbition. Discovered in harbary, 1640 ; in Indin, 1740 ; in New Spain, 1782. Fingland exporta at present, on an average, 1500 tons of unwrought tin, hesides mannfactured tin and tinplater, of the value of alwiot $£ 4010$, thoo.

The ores of this meial are foond in comparatively faw places; the principal, and perhaps the onty, (nes are Cornwall, Galicia, Erzzeblrge in Snxeny, Botemia, the Malny eountries, China, and Banca In Anje. I bey are peculiar to primitive roeks, generally in granite, either in veins or heds, nad are orten asanciated with copper nad iron pyrites. Tin is much used as a covering to several other metala: Iron is simned, to prevent its rapid oxydation when exposed to air snd molsture; and the same process fa applied to eoplur, to avoid the injurious effects to which thowe who rre in the habit of employing cooking utensils made of this metal are alwaya liable. The solutions of tin in the nitric, muratic, nitro-sulphuric, nind tartaric neids, are much used is dyelng, an giving a degree of jermanency and finlliancy to neveral colurn, to the obtained ly ibe use of no other mordants with whleth we are at prewent acqualused: tin forms the basis of pewter, in the comjesition of which It in mlloyed with lead; when rulted into thin sheets, it ls called tin-foll, and is upplied, with the adilition of mercury, to cover the surface of plas, thum forming looking-glannes, mirrors, ctc.; uni in combination with suljhur, it conntitutes what iv called musaic arold.-alorec's Chem. Min. 'Jiuplates, known in scotland by the name of whity inem, are npilicalie $\omega$ a great variety of purponen. They are tormed of thin plates of lron dipped into molten tin. The in not only covers the nurface of the lron, hat penetrates It completely, and gives the whole a white color. It is unual to ald alout one-tenth of copper to the tin, to prevent It from forming too thich a coat upon the iron. -Tuomsos's Chemistry.

Sritish Tin Trade. - . he tia mines of Comwati have been worked from a very remote era. Tho voyages
of the Phicnlciana to the Cassiterices, or tin islands, are mentioned liy Herodotus (Hib. III. c. 115), Diodoras Siculus' (lib.' Iv. p. 801, ed. 1804), and Stralo (Geog., lib: mi.). Some difference of opiniton his, findeed, been entertained as to the particular islands to which the Phocniclans appliod the term Cassiterides; but Borlase (Account of the Scilly Islands, p. 72), Larcher (Herodote, tome iil. p. 344, ed. 1802), and the ablest critics, agree that they are the Scllly Islande, and the western extrenity of Corawall. After the destruction of Carthage, the Britlsh tin trule, whlch was alwaya reckoned of peculiar Importanco, was carted on by the merchants of Murselifee, and auhisequently ly the Romans. Besides Britain, Spain Purnished the ancients rith considerable quantitita of tin. "We have no very precise Information as to the ;irpposes to which they applied this metal. It has beesis supposed that the Phemicians, so famons for their purple dyes, were acqualnted with the use of the sofution of tin in nitro-muriatic acid in fixing that color. The best of the ancient mirrore, or spectila, were also made of a mixture of copper and tin; and tin was used in the conting of corper vessels. -Watson's Chenical Essays.
In modern times, the tin mines of Cornwall and Devon have been wrought with varions degrees of energy and success. Queen Elizabeth brought over some German miners, hy whom seme of the processes were Improved. During the civll ware the mines were much neglected. At the commencement of last century, however, the business of mining was carriled on with renewed vigor ; and from 1720 to 1740 the annual proluco wns about 2100 tons. The produce went on gradually lncreasing, tlll it amounted, in the ten years from 1750 to 1800, to 3254 tons a year. During the next fifteen years the produce fell off; and for tho five yenrs ending with 1815 it was always considorably under 3000 tons a yenr. Bat in the last-mentioned yenr a considershle incrense took place; and sinco 1816 the produce has been, with the exception of 1820, alwnys above 3000 tons a year. The a verago produce of the mines in the year 1843 was estimnted at above 5000 toms a year.
Tin, Oriental (Malay, Tima; Hind. Kalar; Siamose, Dibuk; Burmose, Kye-p'i, $\mu$, white copper), in Commercial langruye nisunlly called Bancen tin. It is found lis several provinces of China; but the most extensive, and probably richest tin dlstrict in the world, oxists in the Mnlay countries. This comprehends the whole of the peninsula, from the extreme cape to the fatitude of $14^{\circ}$ on its western side, and to $11^{\circ}$ on its enstern, and comprehends several of the small islands lying in the route leetween the peninsula and Java, ns fur as the latitude of $8^{\circ}$ gonth; so that the whole of this tin district has an extreme length of near 1200 miles. By far the greater number of the mines within theso limits are as yot unwronght and unexplored. It was only in the beginning of last century that tho mines of Banca, the most productive at present worked, wero acellentally discovered. Tho whole tin of the Malay countries is the pmiluce of nlluvial ores, nr what is called in Cornwall "Streati,-work;" and from the abundance in which the mineral has been founcl by the mere washing of the soll, no attempt has hitherto been male nt regular mining, or obtaining tho aro from its rooky matrix. Malay tin, consequently, is grain tin, or tin in a very puro stato; that belug tho species which alluvial ore uniformly produces. The milues, or rather exchyations, are perpendifular pits of from 15 to 25 feet deep; and when the sofl and a superstratum of conimon clay aro removed, the bed containing the ore, consisting of quartz and granitic gravel, is reached. The smini and gravel nre separuted trom the ore by pnssing a stream of water through the whole materials. The ore so obtalimed is preserved in henps, and smeltecd pertodically with charcoal in a tilast furnace. The mine or pit is kept clenr of water ty the Chinese wheel. No cattle are used in any part of the
process, human labor belng had recourse to througbout the whole of ita stages. V te most 1 mperfect part of the process is the smelting. The stream ores of Cornwall, which are generally poor, afford from 65 to 75 per cent. of graln tin; 'whereas,' owing to the ' Imperfection of the process, from those of Banca not more than 55 or 60 are usually obtnined. The difference In the prodace suggested, a iow years ago; the practicability of sendling the ore to England for the parpose of belng amelted; nnd the experiment was tried; but our cuatoma regnlatione not allowing the produce to be honded and re-exported wlthout duty, rendered the scheme abortive.
With very trifing exceptions, the whole tin of the Malny islands is minced and smelved by Chinese settlera; and before their ekill and enterprise were applied to its production, the metal seems to have been oltalined by the Inhabittents of the countries whicl produced it, by processeg harily more ekillful than those by which the precioas metals were procured by the native inhabitants of America prior to the introduction of European sklll and nuachinery. Tho following estimate has heen given of the annual produce of the principal states and placea producing tin:

Diagt Coagt of the Maliy Iemingula.

| . nnk Crylen | Piculs. <br> 5, 1000 |
| :---: | :---: |
| Quedia | 2,(\%) |
| Pern | 3,000 |
| Shiangore | 3,000 |
| Matacea. | 4,000 |
| Totat pi | 17,000 |

West Coabt of tife Malay Penishicla and lalands.

This can be consitcred only as a rough eatimate ; but we helieve it is not far wide of the truth. The ir $t$ considerable port of exportation is Inatavia; from which thero is sent nnnually, either directly or through orders from the Dutch government or the authorities at Banca, 2000 tons. Firom Prince of Wales Islancl there is also a considerable quantity exported; and a smaller one direct to Chian in junks, from several of the untive prorts on the eastern shore of the Malay peninsula. The great marts for the consumption of tin are China, Hindostan, and the continent of Europe. The quality of the different descriptiona of Malay tin, although there may be some inconsiderable difference in the quality of the original ores, scems to be derived chiefly from the greater or less skill with which tho process of amelting is conducted; and this, again, necessarily dependa upen the extent of capital and goodness of the machinery employed. The mining operations of Banca have long been conductel! upon a larger scale, and with more skill, than in any other of the Mulay countries; and, consequently, the metal produced in this is :nd is superior by fror 10 to 12 per cent. : in the market of Canton it is called "old tin," in contradistinction to "new tin," the produce of the other Mnlny countries. Next, in point of quality, to the produce of Banca, aro those of Tringanu and Singkep, which are not more than 5 per cent. inferior to it. The tin of the state of Pera, a considerable part of which is produced by the natives themselves, without Chluese assistance, is the worst, und nanally about 15 per cent. below that of lanca. The native tin of China ls 10 per cent inferior to that of Banen, and is probably block-tin, like the grenter part of that of Cornwall; and, like lt, the produce of regular mining operations, and not alluvlal. The produco of the Chinese mines Is sald of late years to have graatly decreased; probably owing to the grent increase which lias recently taken plice in the produco of the Malay conntrips, and the cheapness and abundance with which
it finds its way to Chins. It should be added, that of late years, and chiefly owing to the very low price and ahundance of German apolter (ainc) in the Indian market, this commodity has occationally been fraudulently mixed with tha. The Chinese brokers of Canton, however, are sufficiently expert to detect the adulteration; and it is belleved that this discreditabio practice has lately ceased. The price of tin, taking the market of Sligapore as the ntandari, has fiuctuated of Inte years from 14 to 20 Spanish dollare per pleul; :qual, at the exchange of 4a. per dollar, to 47a. and ifis. per ewt. At au average of these pricee, the annual valuo of the whole Malay tin will be about $£ 240,000$ per anmum.-Crawfurd's History of the Indian Archipelago; Dr. Ilonsyikld'e M/S. Statistical View of the Island of Banca; Singapore CAronicle; Canton Register, etc.

Tithes are the tenth part of the increase yearly arining and renewing from the profits of lands, the stock upon lands, and the pernonal industry of tho inhabitants, and are offerings puyaile to the Church by law. Under the Jewish aystem, the tenth part of the yearly increase of their gexwis was due to the priests. -Numbers, xviii. 21 ; Deut., xiv. 22 ; Lerit., $x \times x i l$. :30, 32.
In the earliest ages of the Christiun Church, offreiags were made i,y its members at tho altar, at collec. tions, und in other ways; and auch payuents were enjoinedl ly decrees of the Church, and sanetioned ly general usage. For many centuries, however, they were soluntary. Hint when the Church bad Increased
in power, and began to number among its members many who adhered to it because It was the pravalling religion, it was found necesasy to enforce certain fixed contributlons for the support of the ministers of re. ligien. The Church relied upon the example of the Jows, and claimed a tenth. Meanwhile, the conversion of temporal princes to Christlanity, and their zeal in favor of thelr new falth, enabled the Church to obtain the enactment of laws to compel the payment of tithes. In England, the first instance of a, law for the offering of tithes was that of Offa, King of Morcla, toward the end of the 8th centrry. He firat gave the Church a civil right ln tithes, and enabled the clergy to recever them as their legal due. The law of Oifa was at a later period extended to the whole of Enylsnd by Klig Ethelwulph.-Imaeaux on Tithes ; Bous's Cyclopedia.

Tobacco (Da. Tobal; Da. Tabak; Fr. Tabac; Ger. Taback; It. Tabacco; Pol. Tobala; Russ. T'skak; Sp. Tabaco; Arab. Bujerbhang; Ilind. Tumbaikū; Malay, Tambrdcoo), the dried leuves of the Nicoliana tabacum, a plant Indigenous to Annerica, but which succoede very well, and is extensively cultivated in most parts of the Old World. The recent leaves posseas very little odor or taste; but when dried, thoir odor is strong, narcotle, and somewhat fetid; their taste bitter and extremely acrid. When weil cured, they are of a yellowish green color. When distilled, thoy yield an essential oil, on which their virtue depends, and which is said to be a virulent poison. The leavea are used in varlous ways; being chewed, annoked, and grouad and manufactured into anuff. It is in the lust uien. tioned form that tobacco is princlpally used in Great Britain; and though the contrary has been often asserted, its use does not seem to be productivo of any perceptiblo bad consequence.

Historical Sketch.-The taste for tobacco, though apparently aduinisterigg ouly to a frivolous gratitication, has given birth to a most extenaive commerce, and been a powerful spur to industry. veing a native of the New World, its introduction snt. E Europe dates only from the early part of the 16 th century. Seeds of the plant were sent, $\ln \mathbf{1 5 6 0}$, from Portugal to Catherine de' Medicl, by Jean Nicot, the Fronch embarsador in that country, from whom it has received Its lotanleal name. The notion, at one time so general, that the spectic appellation tobacco was derived from its having been imported from Tobago, is now uuiversilly admitted to be without fonudution. Ilumioldt has ahown that tobacco was the term used la the llaytian language to designate the plpe, ur inatrument made use of by the natives in smoking the herb; und the term, having been transferred by the spaniaris from the pipe to the herb itself, has been adopted by the other nations of the aucient world.-Eissai l'olitique sur la Nouvelle Eispagme, vol. iii. p. 50, 2d. ed. Tobace is believed to have been dirat introduced into lingiand by the eettlers who returned, In 1586, frum the colony which it had been attempted to found in Virginia, under the auspices of Sir Waltor Haleigh, in the preceding year. llarriolt, who accompanied this expedition, gives, in his description of Virginia, an account of the tubacco plant, and of the munuer in which it was used by the natives; alding, that the English, during the time they were in Virginia, and since their return homo, were ueeustomed to smoke it affer the fashion of the Indians, "and found many rare and wonderful experiments of the virtue thereof."-llakLeyt, vol. I. p. 75. lalelgh, and other young men of fushiou, having adopted the pructice of snoking, it apreal among the English; an It had previousily apread among tho Spunards, lortugucse, French, aui other conthuental nations. But it made Its greatest progress in England after the foundation of the colony at jamestown, in Virginia, in 1607. The soil of tho coloay being found partlcularly well fitted for the culture of tobacco, considerable quantities wore raised and sest
home ; and the numerous indivldaals interested In the colony contributed to introduce that taste for it which was diffused among all clasees with sstonishing rapidity. James I. attempted, by repeated proclama tions and publications, some of them couched in very strong terms, to restrain the nse of tobacco. But his efforts had very littio effect; and the settiers in Virginis continued to experience a more rapidiy increasing and better demand for tobacco than for any other product of the colony. During tho eariier part of the reign of Charles I., the trade in tobacco was monopolized by the crown. This monopoly was not, however, of long continuance, and totally ceased at the breaking ont of the civil war.

Tobacco plants had been carly introdnced into Engiand, and were found to answer remarkably weli. Their cuitivation was, indeed, prohibited by James, and afterward by Charles, but apparently withont effect. At jength, however, the growing consumption of tobacco having excited the attention of the govern ment financiers, it was seen that, by imposing a duty on its importation, a considerable revenue might be raised; but that, were it allowed to be freely cultivated at home, it wonid be very difficult to collect a duty upon it. In 1643 the Lords and Commons imposed a moderate duty, for the sake of reveane, on plantation tobacco; but instead of directly prohibiting the use of native tobaceo, they burdened it with such a duty as, it wos supposed, wonid occasion its culture to le abandoned. The facility, however, with which the duty was evaded soon satisfled the repubilicun leaders that more vigorons measures were required to stop its cultivation, and consequently to render its importation a source of revenue. Hence, in 1652, in act was passed prohibiting the growth of tobacco in England, and appointing commissioners to see its provtsions carried into effect. This act was confirmed at the Restoration, by the act Charles II., c. 34, which ordered that ali tobacco plantations should be destroyed. These measures were believed at the time to have been principaliy brought about by the solicitations of the pianters; but their real intention was not so much to concllinte or benefit the latter, as to facilitate the collection of a revenue from tobacco; and, considered in this point of view, their policy seems quite unexceptionable.

Nicotiana Tabacum.-It is thought by some that this plant recelved its name from Tabacco, a province of Yucatan, New Spain; others say from the island of Tobago, one of the Caribbees ; and others that it is derived from Tobasco, in the Gulf of Florida. It was first observed at San Domingo, A.d. 1496 ; and was used freely by the Spaniards in Yucatan in 1520. Tohacco was first carried to England in the seventh gear of Elizabeth, 1565, by Sir John Hawkins; but Sir Waiter Raleigh and Sir Francis Drake are also mentioned as having first introduced it in England. According to Stowe's Chronicle, it was manufactored only for exportation for some years. The Pied Bull Inn, at Isiington, was the first house in Engiand where tobacco was smoked. In 1584 a proclamation of the Engilsh government was issued against it. The Star Chamber ordered the duties to be 6s. 10d. per lb., in the year 1614. Its cultivation was prohibited in England by Charles II. The act laying a specific duty on the importation into England was passed 1684. The cultivation was allowed in Ireland about the year 1779. In Anderson's History of Commerce we find that the tax wan increased, and put under the excise in 1789. Varions statutes have been passed by the English government relative to tobacco. The act to revive the act prohihiting the culture of tobacco in Ireland passed 2 Willism IV. (Augast, 1831). The act directing that tobacco grown in Ireland be parchased in order to lts being destroyed, March 24, 1832. The quantity consumed in England in 1791 was 9,500,000 lbs., and in 1829 about $15,000,000 \mathrm{lbs}$. In 1840 the
quantity had reached to $\mathbf{4 0 , 0 0 0 , 0 0 0} \mathbf{l b s}$. In 1854 the quantity imported into Great Britain was abont $85,000,000$ lbs., of which $2,710,000 \mathrm{Jbs}$. were manufac. tured as cigars or enuff, and the rest unmanufacturet.

## -Haydn.

In some countries tobscco is principally, perhaps, used in the form of snuff; in others it is principaily chewed, or again amoked; but, in one form or another, it is every where made use of. So early as 1624, Pope Urban VIII. issued a buil excommunicating those viso smoiked in churchea! Tho practice of smoking was at one time exceedingly provaient in Engiand; but during the reign of George III. it wos well-nigi enperseded, st least among the hlgher and middie clasi $\times n$, by the practice of snuff-taking. Latterly, however, smoking has been extensively revived among both the rich and the poor.

We quote the following statement as to the universality of the use of tobscco from a learned paper on it: "Introduction and Use," in the 22d volume (p. 142) of the Asiatic Journal: "In Spain, France, and Germany, in Holiand, Sweden, Denmark, and Kussia, the practice of smoking tobacco prevalls among the rich and poor, the learned and tho gay. In the United States smoking is often carried to excess. If we pas: to the East, we shall find the practice almost universai. In Turkey the pipe la perpetnaliy In the month; and the most solemn conferences aro generally conciuded with a friendly pipe, employed like the calumet of peace among the Indians. In the Fast Indiea not merely all classes, but both sexes, inhale the fragrant steam the oniy distinction among them consisting in the shape of tho instrument empioyed, and the speeles of the herb amoked. In China the hubit equally prevails; and a modern traveler in that country (Barrow) states, that every Chinese femaie, from the age of elght or nine years, wears, as an appendage to her dresa, a smail siiken purse or poeket to inold tobacco and a pipe, with the use of whicit many of them are not mnacquainted at this tender oge. This prevalence of the practice at an oarly period among the Chinese is appealed to by M. Pallas as an evidence that 'in Asia, and especialiy in China, the use of tobacco for smoking is more ancient than the discovery of the New World.' He adds: 'Among the Chinese, and among the Mongol tribes who had the most intercourge with them, the custom of smoking is so general, so frequent, and has become so indispensuble a luxury; the tobacco purse affixed to their belt so necessary an articie of dress ; the form of the pipes, from which the Dutch seem to bave taken the model of theirs, so original ; and, lastly, the preparation of the yellow leavea, which arc merely rubbed to pieces and then put into the pipe, so peculiar, that they could not possibly derive all this from America by way of Europe; eapecially as India, where the practico of smoking is not so general, intetvenes leetween Persia and China." This, however, is a very doultful proposition. It seems sufficiently eatablished that the tobaceo plant was first brought from Central America (see dute of introduction of tobacco), and it is most probable that it was thence carried to Siam, China, and other Eastern countries. The names given to it in all the languages of the East are obviousiy of European, or rather American, origilu; a fact which seems completely to negative the idea of its belng indigenous to the East.

Tobacco is extensively cultivated in Mexico, but only for home consumption. It might probably, however, were it not for the restrictions under which it is placed, form a considerable articie of export from that country. Under the Spanish government, the tobacco monopoly was one of the principal sources of revenue; rielding from $4,000,000$ to $4,500,000$ dollars, exclusive of the expenses of administration, amounting to about 800,000 dollars. No tobaccu was allowed to be cultivated, except in a fow specified places. Commissioners, or guardas de tabaco, were appointed, whose duty
it was to take caro that all tobacco plantations withnut the privileged diatricts should be destrryed. The govemiment fixed the price at which the oultivators of tobaceo were olliged to sell it to its agents. The ale of the manufacharul tobaeeo was farmed out; and cigars we e not allowent to be sold, except at the royal eatancos. No une was alluyed to uso cigary of his own manufacture. This oppressive monapoly was established in 1764. It has heen continued, from the diticulty of supplying the revenue which it produces, by the revolutionary governmonts.-Ifemboldr, souvelle Lispagne, iii. 49; Ponsyett's Notes on Mexien, noto 116, London ed.

We have no means of escertaining the vnlue of cigers smoked away In the United States annually.

Heten.--The cultivation of tobacco in the (irand Duchy of Baden was commenced in the early part of the present century. It has grently inereased within the last twenty years; and particularly so since the commencement of the exportation of palatinate cigars to the United States, and which oxport trade during the last twelve years has shown a constantly angmenting importance. In the Grand Duchy there are now from 18,000 to 20,000 acres of land devoted to the cultivation of tobacco. It Is particularly the Baden palatinate which yields the most and best; but the cultivation extends to other parts, and even as far as Offenburg, in Ireisgau. The crops of five years differed very much from onch other in regard to quantity, and still more in quality. The last two erops were superior to all others.

The cultivation and produce of the Pfalz (Rhenish Bavaria) anounts to about half of that of Baden. As compared with other crops, tho cultivation of tobaceo would appear to the traveler to be on very large plantations, but the vast oxteut of tobaeco ground in some paits of the Badish palatinate (as near Seckenheim, where thoy reach for miles) belong to hundreds of different persons, generally speaking, In the Baden and Mavarlan palatinates ; tobacco is cultivated only In dethehed and small jieces of ground; some few of the principal land-owners ralse from 150 to 200 cwt . per annum ; some not more tha: jest. ; and others, again, not more than 3 , and even down to 2 cwt . The to. baceo is not put up in hogsheads, as in America; it is put up in strong bales. The finer sorts and leaf ure pht up In bexes, and exported to Spain, England, etc. Conmon tobacco for inland consumption is mostly sold and dispatched in a loose state.

From 1844 to 1852 the prices of tobacco, with a few exceptions, remained shout tho same; the lowest nt 71 florins, and the highest 15 florins, per 50 kllograms. During the years 1852-'53 the export of cigars, princlpally to the United States, had become so great as to make the cigar manufacturers early and important purchasers. Large porchases were also made for the
regies of France and Austria. The latter alone lought 100,000 cwt., which; of courss, produced a great riso In the market; prices went up from 12 fiorins to 25 florins per 50 kllograms ; and since that period tobacco, like cotton and publie fanda, las become an article of "speculation."

The averago prices for the last five years may be quoted as follows :

| Say for |  | 12 to 22 forins per 50 kllogrnms. |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1859. | 7 to 18 | ${ }^{6}$ |  |  |
| 4 | 1553. | 10 to 14 | ${ }^{6}$ | ${ }^{4}$ | 4 |
| " | 1854. | 12 1125 | 14 | os | 16 |
| 14 | 1956. | 10 to 80) | 14 | 4 | 4 |
| ${ }_{6}$ | 1856. | 18 to 42 | " | 4 | 6 |

The whele of the last crop was disposed of lofore the close of the year. Between Curlsruhe and Bruehsal the prices were from 16 to 23 llorins. The firstrate tolutce of the palatinato was sold from 33 to 42 fiorins per 50 kilograms. According to estlmate, about one half of the produce ls manufactured, and the other half exported to England, Spain, and Switzerland, and to Austria nad Frence. It is quite clear that the growing of tobacco is profitable; for it is known that on an nverage it ensts tho planter not over 12 fiorins per 00 kilograms ; and in further evidence of tio fuet is the constantly fincreasing breadth of " + in chavoted to the cultivation of that crop. The tobaeco in the Grand Duehy ef, wot : wrectly ns-
 I have heard the quantity ess" ed a. . 0 owt. per annum.

The present high pricer: town in the face of good crops, aro caused in ,i,*a. int. Wh wy the activo export demand. The shinfry is igs to America, and who have now most, theit $x i f n$ manufactories, are large und ready pure? ors, a i:l for the beat kinds pay high prices. Tho "' "is egie is a very important eustomer, and ttic er-ih régic early last fall contraeted with some of wi.e Jaden clyar manufactories for $100,000, f 00$ of clgars. 'the improved export trade has increased the demand tor tobacco of foreign growth. In Baden and Rhenish Bavaria there are no other taxes on the cultivation of tobacco except land and ground taxes, while the duty on foreign tobacco is,

## -United States Com. Relat.

France, - The revenue derived from the tobaceo monepoly in France, during the first nine months of 1857, reaches the onorntous sum of $127,223,000$ francs, or ubout $\$ 25,44,600$-showing an increase over the revenue derived from the same sourco the corresponding period of 1856 of $7,488,000$ franes, or $\$ 1,497,600$. The inereaso is owing to the larger consumption of tobaceo in France, and would seem to indicate a sieady market for the article in the leading conntrics of Europe. The tobacco monopoly, under the rigie syatem, commenced in France in the year 1811. The following statement will show the amount of revenue derived from this nrticle in quinquennlal periods from that date :

The United States supplies ahont two-fifths of all the tobacco consumed in Europe, and usually from three-fourths to four-fifths of all the tobaeco consumed in France. Were tho monopoly abolished, and our tobaceo admitted at a moderato duty, our exports of the ertcle to France would increase at least ten-fold. The average price of Ameriean tobaceo delivered at the factories of the regie, all expenses included, is estimated as follows:

The profts reallzed by the rdgie, one year with another, average nearly 460 per cent.

Netherlamds.-The cultivation of tobacco in the Netherlands is aubject to no reatrictiona, with the exception of the excie duty, to which, hike all other producta, it is liable. From 1800 to 1900 morgena (equal to 8600 to 8800 acres) are anuually devoted to tobacco. The tobacco land is situated in the provincea of Guilderland, Overyssel, Itrecht, and Zealund. The averuge quantity of tobacco protuced on each morgen is about 4500 lbs . The total crop is estimated at from $8,000,000$ to $9,000,000$ lbs. per annum.-Anmales du Commerce Extírieur, No. 540 . The quantity reserved for home consumption is about $2,000,000$ lber, of which,

$$

| divis... | 800, 0 (0) | 4 | Arazil | 30,100 | " |
| Porta lico | 300,000 | 4 | Havins. | 60,000 | 0 |
| Cubue . . . . . | 187,9010 | 16 | Tobacco \&lenu | 145,000 | ${ }^{*}$ |
| San tromingo. | 180,009 | * |  |  |  |

A third part of the tobsacco imported from foreign countries is consumed in the Netherlands, tho other two-thirds are exported. Germany and Belgium rereive the larger portion, which consists altogether of Virginia, Maryland, Kentucky, and some Java tobacco. Hesides the inports above debignated, Mamburg supplien Ilolland annaally with large quantities of tobacco of American growih. The tothaceo manufactoriee in Holland, of the first elass, are numerous. They are chiefly located at Kotterlani and Ansterdam, though many amblar factories are seattered thronghout the provinces. The first-class factories omploy upward of a million of operativen. The avirage consumption of tolbaceo in Hollabd is about two kifograms ( $4 \cdot 408$ has.) for each individual, or $6,000,000 \mathrm{kilograms}$ or apward of $13,000,000$ lbs, for the whole population. Germany offers the principal market for the Dutch tobacco traile, thongh considerable quantities are exported to the Levant, Italy, Austria, Melglum, Denmark, Surinam, etc.-C. D.

Tobaceo in, next to salt, probably the artlcle mont universadly consumed by mea. In one form or an-
other, but most generally in the form of fums or smoke, there is no clinute in which it in not consumed, and no aationality that has nnt adopted It. To put down lts use has equally bafted legialators and moralista ; and, In the worda of Pope on a higher aulject, it may be said to be partaken of "by saint, by savage, and by sage." The eivilized Eurcpean and American nations are tha amalieat consumars of tolaceo of any people, in consequence of its being every where with them an object of heavy taxation, of lte being very generally a foreign commodity or high-priced, beenumg raised in uncongenial climates, and, finally, its being for the most part contined in use to the maie sex.
The duty on the importation of raw tobacco amounts,

## -German Custom Ünion.

All foreign vessels (Amerlcan excepted) must be entered at this port by a licensed ship-broker, the exemption in favor of American venaels having been conceded by the Bremen Semate in 185\%.
Guent Bhitain leviea a Inty of Th Centa per lb., and 5 per Cent, addutional.-Tobace 1 , snuff, and cigars arg prohibited to be Imported into Grent Britain, unless in vessels of not less than 120 tons burden, and into ports upproved by the commissioners of eustoms. These jorts are London, Liverpool, Jriatol, Hull, Lancaster, Cowes, Falmonth, Whitchavm, Mlymouth, Newrastle, Southampton, Ircston, and Swansea, in England; Alserdeen, leith, and Greenock, in Scotiand; and Dublin, Belfast, Galway, Limerick, londonderry, Newry, Sligo, Waterford, Wexford, and Droghedn, in Ireland. Jutiea ulike from all countries and in all fottoms. The consumption of tubacco in the L'nited Kingdom was:

| Senrs. | Conamplion. | Revenue. | Population. | Consump- tlon per Ilend. |
| :---: | :---: | :---: | :---: | :---: |
| 1821 | 15,53\%, 152 | $3,12 \frac{6}{6}, 5 \times 3$ | 21,292,900 | Oulires 11.1 |
| 1831 | 10,689,8.4 | 9,1604,502 | 21,410, 439 | 12.40 |
| 1941 | 29,300,360 | 3,5830,163 | 87,010,672 | 1321 |
| 18 it | 28, 1688.1078 | $4.486,764$ | 27,402,262 | 16:3 |

In 1853 the duty amounted to $\alpha 4,751,880$, or $\$ 23,000,000$.

Fhasck. - Tobacco a Gorermment Monopoly. - In 1629 the first duties on the tohacco trode were nevied. In 1674 Louis XIV, established the first monopoly in Europe. The cultivation of tobaceo is prohihitei except in six departniento. From 1811 to 1852 there were solf: by the government $1,308,838,075$ Itbe., which brought a clear revenue of $\$ 432,243,434$. The exjenses of the admipistrath $n$ were 24 per cunt. ad evalorem. By the terms of the treaty of June 24, 18:2, American produce, if imported direct to France in Vinited States bothoms, is admitted on the paymant of the same duties as apply to similar lmportations from countries out of Europe in French vessels. The origin of the merchandise must, lowever, be duly anhensicated and certified hy the collector st the fort of exportation, and by the French consul. American tohacco is purchased by the conmisaiuners of the rigis for the govermment factories, and is admitted either in French or American vessela free of duty. In foreign vessels the duty is 186 per 100 kilogranms (221 lbs.).

The $n$ cree.

The monopoly wat estabished in 1810 by imperial decree.

Holland levies a Duty of 28 Cemts per 221 lbe,-If imported direct from tha United States, admitted on the aame terms, whether in American or national vessels.

Spain.-Tobacco is a Gocernment Monopoly.-The gross receipta from the tobacco monopoly in the years 1830-'34 were $\$ 4,960,121$, and the net receipts $\$ 3,097,147$. The sold tobacco amounted to $2 \cdot 41 \mathrm{bs}$, per head of the population. The net receipts of 1851 were $88,100,000$. The expenses of the administration amounted to 40 per cent. of the tetal value. Admitted at the port of Malaga in Amorican veasels at a duty of 20 cents, and in Spanish at a duty of 15 cants per lb. The privilege of the tobacco monopoly in Spain is rented to individuals, and yielda a revenue of about $\$ 1,000,000$ to $\$ 0,000,000$ per annum.

Brigium levies a Duty of $\$ 186$ per 221 lbs.-In the direct trade between the United States and Belgium the vessels of both nations aro equalized by treaty. In the indirect or triangular trade there are discriminationa, though frequently auspended by Belgium.

Sardinia.-A Government Monopoly,-The annual revenue can net be calculated, as the Italian atates are grouped in official returns of commerce.

Austhia.-A Government Monopoly.-The monopoly existe aince 1784 . The gain of the government amounts to 76 per cent. ad valorem, The net receipts a: ounted in 1851 to $\$ 8,789,421$, and ln 1853 to $\$ 10,619,1$ 16. The consumption in the whole empiro was, in $1850,34,457,513 \mathrm{lbs}$; in 1851, $54,217,578 \mathrm{lbs}$; in 1852, 61,805,607 lbs, ; in 1853, $57,926,925 \mathrm{lbs}$; in $1854,62,020,333 \mathrm{lbs}$. When imported by permisslun of the government, the duty is $\$ 485$ per $110 \mathrm{lbs} .$, besides $\mathbf{5 7}$ centa per lb. for a license to import.

Sweden levies a Duty of 5 5-6 per lb.-The duty is over 100 per cent., and importations from the United States are diminishing annunlly.

Nonvay levies a Duly of 41 centa per $l b$.-Owing to a difference in the weights snd messures in use in Norway, the duty is about $33 \cdot 3$ per cent. lese than in Swoden.

Poncugal,-A Government Monnpoly. - The raw article for the factorice of the government is derived chiefly from Brazil, about half a million lus. per annum being received from the United Statea.
Stathment mximbiting the Quantities of Amyaioan Tohacoo mxponted from the United Statrb into the Codithifs bisionathd, with tisa Amounth of Dutize 1'AID tiesagon, deting the oommerctal Ykia 1855.

The total recelpts from custom duties in France for one year (1848), according to official returns, were $146,000,000$ fruncs, of which $86,000,000$ were derived from tobacco, nearly all grown in the United States.

The Anstrian empire contains $86,614,397$ Inhabitants. The annual yield (average) of tobacco in Austria is entimated at $79,000,000$ lba. The only places where the plant is permltted te be grown are IIuagary, Galicia, the Tyrol, and Venice. In IIungary it is the lesding ataple, the annual crop reaching as high aa $68,000,000$ los. Of this one-third la sold to the Austrian regie, one-third to foreign countriea, and the remaining third is consumed at home. The average annual importation from the United States is from two and a half to three millions of lbs. T2. a profit of 10 cents on each lb . of raw toluscco, and the snnual revenue to the government is $\$ 7,000,000$.
In the atates compoaing the Zoll-Vorein the annual crop of tobacco is estimated at $55,000,000 \mathrm{lbs}$. The revenue derived from American tobacco is about $\$ 1,800,000$ per annum. The duty on raw tobacco is $\$ 270$ per 110 Ibs., which, if re-exported, enjoya a drawbuck of 2220 per 110 lhs. Tobscco grown within the limits of the Customs Union pays only 40 centa for the eame quantity. The revenues which the government herefrom derives amount to 38 por cent. on the vulue.

Belgium produces anuually about $1,300,000 \mathrm{lbs}$, of tobacco, and importe from $9,000,000$ to $11,000,000 \mathrm{lbs}$.

Ilolland produces from $4,000,000$ to $5,000,000 \mathrm{lba}$., and imports annually from $80,000,000$ to $35,000,000$ lbs. The tobacco factories in this country are atated to give employment to "one mililen operatives."

Bremen imports yesrly from $35,000,000$ to $50,000,000$ Iha, of tobacco, most of which is manufactured in that city and re-exported to foreign markets.

Hamburg imports only from $1,000,000$ to $2,000,000$ Iha. annually, most of which, after beling manufactured, is re-exported.

The annual tobacco crop of Russia is about $25,000,000$ lbs.

The annual consumption of tobacco $\ln$ Spain is about $0,000,000 \mathrm{lba}$, one-third of which is imported for the government farturiea from the United States.

In Portugal the culture of tobacco is prohibited by law.

The quantity of American unmanufactured tobacco annually imported into the principal commercial countries of Europe may be thus stated: For each inhabitant of Grest Britain, 14 ounces; for esch inhabitant of France, 10 ounces; for each Inhabitant of Belgium, 21 lbe. ; for each inhabitant of ILolland, $2 \frac{1}{4} \mathrm{lbs} . ;$ for each inhabitant of the Hanse Towns, 5 lbs. ; for each inhubitant of Hanover, 81 lbs.; for each inhabitant of Mecklenburg Schwerin end Mecklenburg Strelitz, 2 lbs. ; for each inhabitant of the states of the ZollVerein, 1 lb .; for each inhabitant of Russia, $\frac{1}{t}$ ounce; for each Inhabitant of Austria, 1 ounce; for each inhabitant of Spain, 3 ounces; and for each inhabitant of Portugal, $1 \frac{1}{2}$ ounce. The aggregate quantity of tobacco annually raised in these countries (exclusive of their colonies) is about $210,000,000 \mathrm{lbs}$. The aggregate quantity of tobacco raised in the United States in 1850 was $199,752,515$ lbs.-Census of 1850.

The average annual quantity of American tobacco imported into Great Britnin during a priod of three years ( 1851, '52, '53) was $24,543,334 \mathrm{lbs}$, on whici there was levied an avcrage annual duty of $818,554,760$. The average annual quantity imported into France during the same period was $14,690,000 \mathrm{lbs}$; inte Holland, $18,660,000 \mathrm{lbs}$., on which the average annual amount of duty was $\$ 24,915$; into Belgium, $4,824,000$ lbs., on which the average annual ameunt of duty was $\$ 40,600$; and into the Hanse Towns, 38,637,667 lbs., on whlch was paid an average annual ameunt of \$12,643 91 .

The following table shows the average consumption per head of male population over 18 years of age; slso net revenne from tobacco, and tex per head of population. It will be seen that the cuuntries Steuer-Verein, Zoll-Verein, and Belgium, in their respective order, are the largest consumers per hesd of tobacco $;$ and
that Eaggland, the Papal Statos, and Epala, In thelr order, produce the greatent net revenue per head

Agreeably to official utatements received at the 200,000 hogsheads, of 1200 lbs each, of which foreign
chawing, plug ohewing tobaceo, and snuff. But a of aeed-leaf wrappers ruling at 10 to 15 cente, and very small quantity is now used of these crops for the making of elgars, as the manufacturing of common grades of cigars has almost entirely ceased in this country, for reasona which will be atated hereafter. The average srops of the last fow years have been under the above estimate, the exportations smalier the home consumption for the above uses some what larger; and foreign consumers of these kinds have been compelled to subatitute other furaign tobaccos, not as desirubis to them as our produce, to supply the deficiencies In our deliveries. Thus it will be perceived that of the largent product of tobacco of our own growth but one-fourth is required to supply the home demand, while, if the production conle be doubled, foreign countries would be ready oustomers fur the greatest part of it, as oi" tobacco leaf is of euch pecullar style and qual. lity, that, like cotton, or the leaf tobacco of the island of Cuba, it is indigenous to the soil and elimate, no other soll producing the same; and therefore its culture is confined to certain sections of the country, and attempts in others have proved unsuccessful. Besides the above described sorts of leaf tobaceo, five States of the Union produce a limited quantlty of leaf, mostly used for the manufacture of cigars, namely, Connectieut, New York, Ohio, P'ennsjlvania, and Florida. The average yield in these States has been of late jears as fullows :

| In bannecticut. | 5,000 camen of $\mathbf{3 5 0} \mathbf{1 b}$. cech. |  |  |  |

Deduct from the above one quarter, or 4000 cases, of the most inferior grades, called fillicrs, and now used mostly for the cutting of amoking totacco, and it leaves 12,000 cases, or about $4,000,000$ lbs. for the use of the cligar-maker. In former yoars, about one-third of these crops were bought for exportation, chiffly by German buyers; but for the last few years the consumption for the manufacture of cigara has so considerably increased, that of tho produce of the first four Stales very little is exported-our manufacturors puying higher prices than exporters aro willing to give; and only of the crop of Fiorida, about one-half to twothirds is annually exported, leaving from three to three and one half millions of libe. of leai' of our own growth, calied Spanish seed-leaf tobacco, for the home consumption of the cigar manufuctarers.
The manufacturing of cigars, nt prices to rival the foreign fubric, havirg become next to impossible, a great many operutives, who made fair wages for their own and their fumilies' eupport, were forced, in consequence, to turn to other employments, particularly so in Penusylvania and Connecticut. Other manufac. turers gave their attention to bettor grades of cigars, for the purpose of furnishing a medium between the common German and finer and high-priced Havana cigar. The Ament an cigar-mukera, being noted for their excellent work manship and tasty atyle of packing, succeeded in furnishing an article as handsomely made as the fine IIsvana, similiar to it in appearance and flavor, although not of as fine a quality, at a more moderate price than the latter, as palatable to the great majority of amokera, who are disinclined to use the common German fabric, and, finding the genuine Havana too expensive, content themselves with the fair medium, and thus became the great patrons of this branch of trado. This class of cigars are made from onr own seed Jeaf and Florida tobacco for wrappers, alld from Havana, Sagua, Cuba or Yera (all the produce of the isiand of Cuba), for fillera, and now the consumption of this sort reaches 300 to 400 millions of clgars a year, varying in prices from $\$ 12$ to $\$ 22$ per thousand. From 1848 to 1851, five thousand cases of eeed-leaf wrappers amnunlly were sufficient to supply the wants of the cigar-makers for home uee ; the value
fillers 4 to 51 cents; leaving a large surplus for export, princlpally to Germany, to be returned to us as a rival of our own offapring in the shape of low-priced German cigara. Since 1852, almost the entlve crope of seed-leaf totacoo have been manufuctured at honse Into Spanish cigars-prices for seed-leaf wrupperi ranging at 20 to 35 cents, and filiers at 10 to 18 cents per lb., and a corresponding increase in the importation and consumption of lte needful concomitant, the Spanish tobacco from the island of Cuiba, for fillers, has taken place.

The importations of this sort of tobacco were-

| In $1800,25,000 \mathrm{lbw}$; $\mathrm{valu}^{\text {a }}$, $\$ 310,000$, duty pald uuder $\$ 00,000$ |  |  |  |  |  |

To show the extent of the export of leaf tobacco and cigars from Cuba, a large portion of which is imported inte this country for clgar manufacture and consumption, we give the foliowing statement 1
Quantitier of leaf Tohacoo and Cigara expobtid moom c'uua ybon 1849 to 1804 , hota ingleeives

| Yearn. | $\begin{gathered} \text { T.enl } \\ \text { Tobscen, } \end{gathered}$ | Clgam. | Yeam. | l.maf Tobacea. | Cigara, |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1849. . | $\begin{gathered} \text { Pounda. } \\ 6,975,630 \end{gathered}$ | $\frac{\mathrm{M}}{161,480}$ | 1859.. | $9,787,448$ | $\begin{gathered} \text { d. } \\ 1+2,667 \end{gathered}$ |
| 1849.. | 4,010,133 | 123,720 | 1853. | 8,030,7117 | 237,350 |
| 1850.. | 7,978,148 | 212,040 | 1854.. | 9,808,150 | 251,318 |
| 1851.. | 0,430,501 | 270,313 |  |  |  |

From this we see that the exportation of leaf tobacco from Cubn has been steadily increasing, but not in the sume proportion with the exports of cigars.

Added to this we give the production of tobacco in the island of Porto Rico, only a small portion of which is imported into and used in this country :

| Yean | Pounds. | Yearn. | P0 |
| :---: | :---: | :---: | :---: |
| 1848. | 2,457,449 | 1351. | 6,478,084 |
| 184 | 2,48 4,540 | 1859 | 5,505,709 |
| 1850. | 8,973,308 | 1853 | 8,703,457 |

The fuct has now become incontrovertille, that to sustain this branch of industry, the use of the flner grades of foreign matcrial, to improve the quality of our own product, is indispensable. The census return of 1850 gives the number of tobacconiste and rigarmakers in the United States as 10,823 .

 isi6. In loliacro trade, nee American Almamai, 1Nili.
Tokay, a lown of northenat llmagary, coblity of Zemplin, on the ryght bank of the Theina, at the influs of the Malrog, 43 niles north-murthwest of Debrecain. I'mpuation, sifou). It is cefelirated as being the entrepuit tor the fammus Tokay wine, produced in the billy tract collel the IIgeralla, in the county of \%empliin, lat. $1 x^{\circ} \mathrm{N}$., latween the lodrug and liernad rivera. The wine of premiler qualiy is bought up for the linperial cellarn, and only the necondary and inferior growthy are exported. Much of the wine soll as

Tokay is produced in other parts of Hungary. In manufacturing the genuino Tokay wine, the dried grapes are carefully separated from the others, and three sorts of wine are produced. The best ls the Easence: thls is the oily juice which runs from the fruit without any pressure. When thls ceasea to ran, the grapes are molstened with common Tokay-must, and trodden out: this gives tho Ausbruch. A second infuaion of Tokay-must on the remuining grapes, pressed by hand, gives the Mászlás (Maeklase).-Dee Henderson on Wines; Hincy. Amer.

Tokens (Bank). These were silver pleces issued by the Bank of Englinnd, of the value of 5s., Jenuary 1, 1798. The Spanish dollar was at first lumpressed with a smnll profile of George III.; It was ptsniped on the neck of the Spanish king. Tokens were raised to the value of $58.6 i l$., November 14, 1811, Bank tokens were a!so current in Irelund, where those issued by the lank of Ireland passed for for, and lesser sums until 1817. They were soon after called in, on the revision of the lritish colnage.

Toll, from the Saxon Tolne; in German Zoll (called in law Latin Telonium und Tolnetun, with many other variations, which may be seen in 1)ucange, all which Latin terms are derived apparently from tihionoor, "eollection of tribute or revenue"). Tollis may be considered a payment in money, or in kind, fixed in amount, made either under a royul graut or under a prescriptive usage, from which the exiatence of kuch "grunt is implied, in considerntion of some service rendered, henefit conferred, or rlght forborne to be exercised ly the party who is entitled to such payment.

An ancient toll may ha claimed by the owner of a part in respect of goods shipped or handed there. Such tolle aro port tolls, more commonly called port durs. The place at which these tolla were set or assessecl was anclently called the Toisey, where, as at the mollern Exclange, the merchants uanally assembled, and whero commercial courts were held.-- Hors's Cyclop.

Marine tolls were first pail liy vessels passing the Stade on the Ellis, A.t. 1109. They were tirst demunded ly the banes of vessels passing the Sound, 1341. Toll-bars in England originated in 1267, in the grunt of a penay for every wagon that pussel through a certain manor; and the first regular toll was collected a few yesrs after for mending the roud in lunden between St. Giles and Temple Bur. Tolls were also gntherell for repuiring the highways of Hohlora lin Lane and Martin's Lane, 1846. Toll-gutes or turnpiken were used in 1663 . Numerous neta relating to tulls und turnpike ronds have been parsed in lireat Britain and the several States of the United Statcs.Haydn.
lyy order of the London Court ot Common Cornaid, the tolls taken at the several hars of the city of lunilin, for tho wagons, carts, ete., not heing the prejerty of a citiz'n of loudon, were abolished lyecember :5, 18:-1. These tolls hat lirought an ambal reveltie of only Ed. on each cart, or alout . EtOOO .

Ton, a welght used in Grent Britain nnel this rountry, usually of 2240 lis., but sometimes of $2010 \mathrm{lts}$. , callest a short ton. By aet of Congreps it is tecided that, unless specified to the contrary, in ton weight is to he underatood as two thousand two hundred and forty Ihs, avoirlupols.-Sre Wenimts and Meascmes.
Tomage, in commercial nurigutiom, the numbur if tune burden that a thip will carry. Tumnage has long teen tun wetheial term, intented ortginally to ixpress the hurden that a ship would carry, in order that the varlous dines and custom, which are levied upon shipping might lat levied acrording to the size of the ver wal, or rather in propmition to her capabiltty of earrying a burien. It has hence arisen that the term "tonnage," as applied to a ship, hat become almost nymymous with that of nize. It la, imiteed, the unly herm used to give an lilea of the magnitade of merclunt whip, which are invariably spoken of according to
their tons tons. N cording t times solt messuren and have portion to far as th to be a co

Measur an act of vided that vessel, the appolated the sanne, dieckell, ta the maln
their tonnage, or ae being ships of 50 , of 500 , or of 1000 tons. Not only are all dues and customs levied according to tonnage, but ships are also built, and sometimes sold and bought for a price per ton of their admeasurement; and they are also timbered, fastened, and have their anchors, cables, and hoats, all in proportion to the same datum. Tonnage, therefore, in so far as these considerations are involved, is assumed to be a correct representution of the size of a ship.

It is evident that tonnage may, express eeveral results of measurements, and in each case may be a sufficiently fair criterion of the burden of a merchant vessel by whith to levy dues; becauze all that is roquired thus far, oither on the part of the government a of private interests, or on that of the owner, is, that the dues should be levled in cqual proportion on all vessels. Thus, tonnage may be the product of a series of measurements, intended to oxpress the exact elzo, or an npproximation to the exact rize of the ship, It may be the artual displacement or welght of the shlp, either with or without the carge; it may le the disphecment of the carge, or the dead weight which she will curry to a fixed draught of water; or it may be the exnet cupacity of the space which she has for the stowage of cargo. Yet to each of these there are important ard practical objections. The first, or that by which' . measured bulk of the ship would he the tonmage, nuight be easily ovaded, and would lead to Injurious results; because, as there must necessarily be fixed measuring places, such a law would have the effect of restricting vessels to that shape which would earry the greatest amount of cargo under the least possible measurements at these places. If the actual displacement, either load or light, of a vessel were to be her tonnage, it would be subject to the intonvenience that it could only be calculated correctly from the drawing of the ship, and therefore would bo inapplicable to foreign ships arriviag at our ports, An exact account of the draught of water, either load or light, would also be necessary, which being a variable quantity when the lead druught is involved, and one of great difficulty to be determined when the light draught is required, would present nlmost insuperable objections; and, bosides, the dranght of water is a quantity easily concealed or falsibed for frauduleu' purpeses. Above all objections, huwever, may be reckoned this: that if either the load or the ship represent the tonnage, it would be to the interest of the ship-builder to build large vessels with slight scantling and Inadequate fastenings, that the welght of the vessel might be suall in prupertion to that of the cargo. If the tonnage were to express the difirence between the two displacenents, that is, the excess of the lond displacement over the light, or the dend weight of the loading, although this would be the nost correct in principle, and even mathematically correct, there is the objection that it involves a knowledge of both light and load draughts of water, and is therefore, on thls account, practically, at least, ns objectionable as the whole displueement. Jastly, if the tomange were to be the space or eapaeity for the stowing of cargo, numerous openings would be ufforded for fraudalent evasion; because the manner of mensuring the ship for this space must the dofined, and it is cusy to build space which will not come within the limits of the detined moasurements; or it is casy to build a vessel of such a form that the masurements made et given points shall not give a correct account of her capacity.

Measurement of Tomnage in the United States.-By an act of Congress, passed Mareh 2, 1799, it is provided that, to nscertain the tonnage of any ship or vessel, the survejor, or buch othet jerson ns shall be appointed by the collector of the district to measure the sitme, shall, If the said ship or vessel be denhledecked, take the length thereof frem the fore part of the main stem to the after part of the stern-post above the upper deck, the breadth thereof at the hreadest
part above the main wales, half of which breadth shall Le accounted the depth of auch vessel; and shall then deduct from the longth three-fleths of the breadth, multiplying the remainder by the breadth, and the prodnet by the depth, and shall divide this last product by ninety-five, the quotiont whereof shall be deemed the trus contents or tonnage of such ship or vecesl. And if such ship or vessel be singl6-decked, the surveyor, or other person authorized, shall take the length and breadth as above directed, In respect to a double-decked ship or vessel, shall deduct from the said length, three-fifthe of the breadth, and, taking the depth from the under side of the deck plank to the ceiling in the hold, shall multiply and divide as aforesald, and the quotient shall be deemed the tonnage of such ship or vessel.
METHOD AT PRESENT IN USE AMONG FORELGN NATIONS FOR
COMPUTING THE TONNAGE OF SHIPS.
France.-The three measures of length, breadth, and depth are multiplied together, and the product is dlvided by 94 for the tonnage.

In singlendecked vessels the length is taken from the after part of the stem on deck to the stern-post; the extreme bread $/ \mathrm{h}$ is taken, being measured inside from ceiling to eelling, and the depth from the celling to the under surface of the deck.

In evessels of tiro decks, at Bordentix, the length of the upper deck and that of the keelson is messured, and the mean taken for the length. But at Brest, Marsellies, and Boulogne, the mean of the length on the two decks, from the stem to the stern-post, is taken as the length. The depth of the hold from the ceiling to the under aurface of the lower deck is udded to that of the height between decks, and considered ns the dept a. The extreme inslde breadth is taken in the sane way as in single-decked vessela. At Bordeaux an allowance is sometimes made for the ruke of the stem und stern of the vessels.

At Joulogne, in measuring steamboats, the length of the coal and engine chambers is deducted from the length of the vessel, and her breadth is taken at the fore and aft extremities of the ssme, the mean of which Is considored ne the brenith. The dept? is taken inside the pumps, from the lower surface of the deek, between the timbers. At Brest measures are frequently taken with a string, although contrary to lnw, and an error of seven tons in the tonnage of a catter has been the result.

Gheat Bhitain, See art. Gineat Butain, p. 858.
Spain.-The breadths are measured at the following places: 1st, at the mizzen-mast ; 2d, a few feet abaft the feremast ; 8d, at a point half way between the two former. The heights at which the three breadths are taken at the above places are: 1st, on a level with the deck; 2d, on a level with the uper surface of the leelson; 3 d , at a level half-way between the two former positlons.
To find the area at each eection, the half of the sum of the upper and lower mensurements is added to the middle measurement, and this sum is multiplied ly the helght of one above the other. Then half the areas of the fore ind after seetion is added to that of the middle section, and th's sum is multiplled ly the length which the sections are upart from each other. The reanlt will express in Burgos cubic feet the capacity of tha part cithe hold hetween the fore and after sections, and It atill remalus to add the spaces between these and thes stem and stern-post. The former may he found, witheut any consideralile error, by multiplyIng the area of the foremost section by half Its distance from the stem; and the lutter in the same manner, by multiplying the area of the after section by half its distance from the stera-post. It is evldent that the room occupied by the pumps must be deducted from the foregoing resilt, in order to obtnin the fair quantity of space illed by the cargo.
Ilaviag thus found the capacity of the hold of any
vessel in the above mannor in Burgos cublc feet, it is to be divided hy $417_{7}^{0}$, and the result will be the amount of diaplacement of auch vessel in tons of Burgos measure, because each ton is reckoned equal to 11.8y feet of Burgos.

Pontvanl.-For single-decked ressels, the length is measured from the cabin bulkheads to the forecastle bulkheads. The depth is measured from the upper surface of the keelsen to the under surface of the beams. The extreme breadth of the deck is considered the breadth. The continued product ed these three dimensions will give the contents in cubic feet, which, divided by 57.7206 , gives the tonnage.

Vessels of tre Decks.-In these vessels two distinct operations are made; one for the hold, the other for the middle deck. For the hold: The length is measured froin the heel of the bowaprit to the stern-post. The breadth is tho extreme breadth of the upper deck, deducting two feet. The depth is from the upper ourface of the keelson to the under surface of the beama. For tho middlo deck: The length is conaidered as half of that for the hold, the other half heing allowed for cabins, etc..-tie breadth as before; and for the depth, the height of the midulle deck to the under surface of the heams.

The foregoing is the method adopted at Liabon; but nt Cporto the length of the vessel is taken from the second timber at the lows to the stern-post; the breadth at the wilest part from the inside of each bulwark on the upper deck; and the depth from the upper surface of the keelson, to the lower surface of tha beams of the upper deck at the main hatehway.

If the keelson be more than ordinarily thick, ailowance is made accordingly; and whero there are two decks, the thickness of the lower deck is niso dellucted from the depth. The length is then multiplied lyy the breadth, and the prodinct by the depth. The product is then divided 1 y 96 , the number of Portuguese cutic feet contained in a ton, and the result is the tonnage of the ressel.

Naples.-For ressels trith two decke, the leagth is measured from one end of the veasel to the other, over all. The length is also ineasured from the after part of the stem to the rudder hatch, under the poop. The mean between these two lengths is multiplied by the extreme lireadth of the vessel. The depth is then takea from the bottom of the well to the lower surface of the upper or joop deck; and the above proluct being miltiplied by this depth, and divided by 94 , gives the tonnage.

Fior singledecked cesels, the tonnage is found ly multiplying the ext reme length by the extreme breadth, and the product hy the extreme depth, and divided ly B, as alove.

Nkthentands.-The length is measnred on deck from the stem to the stern-post. For the breadth, the hold is divided into four portions, and two measurements taken at each of the three d!visiona: lat, acroas the keelson, on a level with tho ujper surface, from ceiling to ceiling; 2 d , the greatest lireadth of the hold at each division. The mean of these alx measurements is considered the breadth. The dejths are taken at each of the foregoing joints of division, from the upper surfice of the keeison to the lower aurface of the "ipper deck between the beams, and the mean of : heree three is resumed. The length, breadth, and "epas ox "hen muitiplied together, snd two-thirds of $^{\prime}$ the prethert is consilered as the tonnage. Allowance ©or provisions and water, cablı and shlp's stores, varyins, foth $\overline{1}$, to $\frac{10}{105}$, is dedust t from the depth befor it 14 , yltithied by she lan ; $; 1$ and lireadth.
Xink... A I I rom the deft r part of the stem. the tunstl $\because$ the rhip ia taken to the inner part of tho viesin ,nat D. Dividing ster 1 ngth of the veasel Into :-r equal parta, the lirent is measired at each of tu'f d.vibns. The depth of the vessel, from the
under surince of the upper deck to the keelson, Is taken at the abrive three points of division. Then multiply the length by the mean of the three breadtha, and this product liy the mean of the three depths. The resuit of the forcgoing is divided by 242t, if there he no fractional parts of feet; but if there are, the calculation is made in inchea, and the divisor becomes 822,776, the result thus oltained being the burden of the vessel in wood lasts, of 4000 Nova lbe. each. To reduce these into commerce lasts, one of which ls eqnal to 5200 Neva lbs., it is multiplied by 10, and divided by 18.

Ruasia. - Length of the keel in feet, multiplied hy the extreme breadth over the sheathlng, and the product multiplied again by half the breadth, and divided by 94, gives the number of English tons.

United Statea,-If the veasel be double-decked, the lemgth is taken from the fore part of the main stem to the after part of the stern-post, above the upper deck; the breadih, at the broadest part abovo the main wales, half of which breadth is accounted the depth. From the length three-fifths of the breadth is deducted; the remainder is multiplied by the breadth, and the proiuct by the depth. The last product is divided tyy 95 , und tho quotlent is deemea the true tonnage of such ship or veasel. See page 1855.

If the ship or vessel be single-decked, the length and breadth are taken aa above for a double-decked vessel, and three-fifths of the breadth are deducted from the length. The depth of the hold is taken from the under side of the deck-plank to the ceiling to the hold. These are multipiied and divided as aforesaid, and the quotient is the tonnage. At some places a system of measuring, called carpenter's tonnage, appears to be adopted. The rule is as follows:
For ressels with one deck, multiply the length ly the breaith of the main beam, and the product ly the depth. Divide this second product by 95 . For doubledecked ressfls, take half the breadth of the main bean for the depth, and work as for a single-decked vessel.
At New Orleans, the mode at present in use is to take the length from the stem to the after part of the stern-post, on the deck. Take the greatest lireadth over the main hatch, and the depth from the ceiling of the holit to the lower surface of the deck at the main bateh. From the length deduct three-fifths of the breadth, multipiy the remainder by the actual breadth and depth, and divide by 95 for a vessel with a siagle deck; but if the vessel have a duabio deck, halt the breadth of the beam is consideredi as equivalent to the depth, and is multiplicd accordingly.

Tonnage Duties.-13y an act of Congress, May 31, 1830, it is ordered that no tonnage duties shall he paid by ships or vesrels of the United States, of which the officers and two-thirds of the erew shald he citizens of the Uaited States; and all aets lmposing tonnage duties on such ship are repealed.

Lnder the provisions of the act of the 27th May, 1848, extending privileges to American vessels, hound from one port to another in the Unitel States, touching at a foreign jort for certain purposes, a boud for the return of the seamen and crew list, prescrited by law in cases of vessels brund on a foreign voyage, is required, and tho seamen must ali he accounted fer.

American vesseis, owned by Americans or others, withnut register, are suliject to a tommage dinty of ons dollar per ton, and 10 per cent. additionat doty on the cargo, as forelgn vesseits.

American-buit vesmeln, owned whully or in part ly foreigner:', are sulject to tomnage duty of thirty cents per tom, and 10 jer cent. additional duty on cargo, miless exempt ly treaty.
American vescels, on arrival from foreign prorts, are subject to a tonnage duty of fifty centa per ten, unless the officere and two-thinds of the crew for the whole voyage aro American cltizens.

The discharge of seamen from an American vessel, although by mutual consent, certified by a consul, will
not exern duty incu vided by or being 1 fied by ar All act and vesse the impos that all di foreign n vantage

These statistics are the latest that can be obtained, and are given to show the comparative tonnage rather than as nccurute statements. Several discrepancies, as in the case of the tonnage of France, are unavoid-able.-For more accurate atatistica, see the countries under their proper heads. For the statistics in regard to the tonnage of the United States, see article United Staties.

Tontine, a species of life annuity, with benefit of survivorship, so called from Lorenze Tonti, a Neapolitan, with whom the scheme originated, and whe introduced it into lirance, where the first tontine was opened in 1653. The subscribers were dividal into ten classes, accorling to their ages, or were allowed to appoint nominees, whe were so divided; and a proportionate annuity being assigned to each class, theso who lived longest had tho benefit of their survivorship, by the whole annuity being divided among the diminished number. The terms of this tontine mave been in the French Euclycopedie, Finance Dlvition, vel. iii. In 1689 a second tontins was opened in france. Tho last survivor was a widew, who at the period of her death, at the age of 96 , enjoyed an inceme of 73,500 livers for hor original subscription of 300 livres. The late celebrated Mr. Jemings was an original subseriber for a $£ 100$ share in a tontine company; and leing the lust survivor of the sharehelders, his share produced him $£ 306$;ev annum. Ile died worth $£ 2,115,244$, aged 103 years, June 19, 1798. The last French tontine was opened in 1759. They had been found very onerons, and in 1763 the Council of State determined that this sort of ilnancial operation should not be again mlopted. Tentines have oeldem been resorted to in England as a measure of tinance. The last fer which the governrient opened subscriptions wss in 1789. The
terms may be seen In Hamilton's Hist. Pullic Revenue, p. 210. There have been nunierous private tontines in England and in the United States. The Tentlne Bullding, Wall Street, New York, was erected during the years 1792-1794, upon this principle, by an association of merchants. By the constltution under which the assoclation was formed, 203 shares were sulscribed, at $\$ 200 \mathrm{a}$ share, severally depending upon a lifo selectell by each subscriber. T'he old building was razed to the ground in 1855, and was superseded in the bame year by a subatantlal edifice.

Top, a sort of platform surrounding the lower mastherd, from which it projects on all sides llko a scaffold. The principal intention of the top is to extend the angle with the mast, and thereby give edditional support to the latter. The tep Is alse very convenient to contain the materials necessary for extending the small sails, and for fixing and repairing the rigging and machinery with greater expedition. In ships of war the tops are furnished with siwlvels, musketry, and other firs-arms, and are guarded with a fence of hammecks in time of action. Flnally, the top is empleyed as a place for looking out, either in the day or night.-E. A.

Topaz (Ger. Topas; Fr. Topoce; It. Topozio; Sp. Topacio ; Russ. Topas). The name topaz has been restricted by M. Hauny to the stones called by mineralogists Occidental ruby, topaz, and sapphire; which, agreeing in their crystallization and mest of their properties, were arranged under one species hy M. Romé de Lisle. The word topaz, derived from an island in tho Red Sea, where the ancients used to find topazes, was applied by them to a mineral very different from ours. One variety of our topaz they denominated chrysolite. Color, wine yellow. From pale wine yellow it passes into yellowish white, greenish white, mountain green, sky blue; from deep wine yellow into flesh red and crimson red. Speclific gravity from 3.464 to 3.641.-THomsox's Chemistry.

Yellow Topaz. - In speaking of the topaz, a gem of a beautiful yellow color is always aderstoed: it is wine yellow, of different degrees of intensity; and the fuller and deeper the tinge, the more the atone is eateemed. In hardness it ylelds to the spinelle. There ari fow gems more universal favorites than the yellow topaz, when perfect; the rich warm tone of its color, the vivacity of its lustre (which it retains even by the sido of the diumond), and its large size, compared with many others, are characters which deservedly entitle it to distinction; it bears, accordingly, a high price when of gooul quality. It is chiefiy employed for necklaces, ear-drops, bracelets, etc., in suit. No littlo skill and taste are required in cutting and duly propertioning this gem; the table should to perfectly symmetrical, and not too large; the bizel of sufficient depth, and tho collet side should le formed in delicate steps. It works casily on the mill, and the lapiduries are in generul tolerably well acquainted with it; yet it is uncommon to meet with one well cut. The yellow topaz varies in price according to its leauty and perfection. A superlatively tine stone, perfect in color and workmanship, sufficiently large for an armlet, or any other ornament, and weighing nearly 80 carats, was seld for £100. Topazes have become more common since onr intercourse with Brazil ; consequently, they aro less in demand, and lower in price. A fine stono of 60 carats may bo purchased at from $£ 20$ to $£ 35$; and smaller, calculated for ring stones, at from $£ 2$ to $£ 5$, but it is not usual to sell them by weight.

Pink Topaz.-This is made from the yellew, which, when of intense color, is put into tho howl of a tobacce pipe or small crucible, covered with ashes or sand : on the application of a low dezree of heat, it changes its color from a yellow to a be, , if 1 pink. This is performed with Jittle hazaru; a; : $f$ the color produced happens to be fine, the price is much augmented.

Red Topaz. - This beautlful gem, which very seldons occurs naturally, is of a fine crimson color, tinged
with a rich brown it is extremely rare, and generally taken to be a variety of ruby, for which I have seen it offered for sale. Its price, from Its scarclty, is quite capriclous; it has an erquisite pleasing color, vary different from the glare of the antificial plak topaz.

Blue Tupas is also a beautiful gem, of a tiae celestial blue color. It has occurred of considerable magnitude; the finest specimen known I brought in the rough from 13razil; when cut and polished, it welghed nbout $1 \ddagger \mathrm{oz}$. Smaller specimena are not nncommen, and when light-co'rred are often taken for aqua-marinas, from which they may always bo distingulshed by their greater welght and hardness, etc.

White Topaz is familisrly called Minas Noev. It is a beautiful pelincid gem, and is used for bracelets, neeklacea, etc. It possossea greater brllliancy than crystal ; and, from its hardness, has been used to cover paste, etc., and to form doublets."-Mawe on Diamonds.

Top-mast, the sccond division of a mast, or that part next alove tho lower mast. Top-gallant mast, the mast next alsove the top-mast, and is generally the uppermost mast. Top-snils, large sails extenillng across the top-mnst. Top-grallan sails aro extended nlove the top-sail yards, in the same manner as the top-salls are extende above the lower yards.

Tornado (Spanle 1), a violent hurricane or gust of wind, which, arising i uddenly from the shore, veera round to all points of tl. 9 compass, and indeed has been lescribed as blowing $f, \mathrm{~m}$ all joints at once. Tornuloes are usually acco yanled with thunder-atorms, nul nre generally of short turatlon. They are freguent in the Chincse seas and tle West Indies.

Toronto, eity, at one l'me the capuial of Canada, is situated on Torunto lhay, in the township and county of York, Int. $43^{\circ} 32^{\prime} \mathrm{N}$. , long. $79^{\circ} 20^{\prime} \mathrm{W}$. It is 45 siles northeast fro Tamilton, $16 \mathbf{i}$ miles west from Kirgeston, $363 \mathrm{~m} . . . \mathrm{f}$, from Montreal, itil miles from Quebec, and isib3 from ilalifax, Nova Scotia.

The liny is $n$ heantiful sheet of water, separated from the main lesly of Lake Untario, except at its entrance, hy n long narrow strip of sandy beach, tho southwest termination of which is known as "filmultar foine." The city was founded in 1794 ly. Governor Simcoe, and is laid out in the form of $n$ parallelogram, heing alove three miles long by one and a half wide; tho streets, which are straight and wide, intersecting at right augles. The esplanale fronting the hay extends for a distance of two miles. In 1817 the population nnumnted to 1200 ; in 1830 to 2860 ; in 1842 to 15,386 ; in $1 \times 50$ to 25,166 ; in 1852 to 30,763 ; and in 1854 to over 10,000 . The city ia lighted with gas, nall is well sujpplied with water, by companies incorporated for thome purposen.-Ste Thang. From Toronto the cap-
 estahlished at Ottawa, fommerly lityown.

Tortoise-shell (Fr. Ecaille de Tortue; It. Scaglia de Turturugu; Gier. Schilpad; Malay, Sisid dmakurn), the brown and yellow senles of the Testude imbrieata, or tortoise, a native of the troplcal seas. It is extensively used in the manufacture of combs, anuffkoxus, etc., and in inslaying and other ornamental work. The beat tortense-shell is that of the Indian Archipelago: nul the finest of this quarter is olitained on the shores of the Spice Islands and New (ininea. When the finent Weat Indian tortoine-shell ia worth, in the London market, 46as, the fineat Fant Indian is worth 60 s . $\mathfrak{6}$ It. I mher the later name, however, a great deal of inferior ahell im inported, lrought from various parts of the Finst Intiea. The goodness of tortoisewhell dejenda mainly on the thickness and aize of the wales, and in a smaller degree on the clearnens amb lirilliancy of tha colors. liefore the opering of ite isritish intercourse with Indin, the greater part of the tortuise-shell which eventrally found its way to Eurupe was first carried to Canton, which then formed he principal mart for the commolity. It ia atill ant
article of trade from that city; but the Imports and exports are Inconslderabie, Slagapore belng now the chief mart for this artlele. I is price at the latter varies from 750 and 900 to from, 1000 to 1600 dollars per pleul, according to quality.-('Rawpuns's Indimad rehipelago; Sinsapore Chronicle, Canton Register.

Toulou (Telo Martiss), a commercial and important militury and naval port of France, departmer.c of Var, on a fino bay of the Mediterranean, 40 miles southwest fron I)ragulgnan. Lat. (of observatory) $48^{\circ} 7^{\prime} 5^{\prime \prime} \mathrm{N}$., long. $5^{\circ} 56^{\prime} \mathrm{E}$. Pofalntion, 40,000 . Mean teinpera. ture of year, 620.2 ; :vinter, $48^{\circ} .6$; вummer, 76.2 Fahrenheit. It is atrongly fortified, defended hy a double line of bastioned fortifications, and strengthened by forta on the aljacent heights. The Freneh con, sid $r$ it impregnable. It has a tribunal and chmmber of commerce, tribunal of marine, achool of mavigation, comnencial college, and public library. The strects are watered ; $y$ numerous fountalns. A round the har. bor are immeiras magazines and arsenals, ahip-building dieks, rope athi sail-worka, and the bague or conviet prison, ua,nlly oceupled by 4000 to 5000 culprits. Toulon was originally a Roman colony; it was taken ly the constable of Bourbon in 1524, and ly Charles V. in 1536. It was given up to the English in August, 1793; in INecember of the same year It was taken by the French republicans, ifter a memorable siege, luring which Nnpoleon commenced bls military career. Toulon-sur-Arrotur ls a commine and village, department of Snone-ct-Laire, elighteen miles north-nortliwest fromi ('havollea. Population about 1700.

Toys (Ger. Spirlzeug, Speilaachen; Inu. Sperfgied: Fr. Jonets, Simbelots ; It. Trastulli; Sp. Jijes, Juyuetes de nimnos: Russ. Jgruahki) include every tritling srticle made expressly for the amusement of children. How frivolous soever these articles may appear in the entimntion of auperticial observers, their mumbacture employs thousands of hands, and gives brend to many famllies.

Children's toys are brought in immense numbers from the hilly regions of Germany, Austria, and Switzerland. The forests aupply nbundance of timber ${ }^{+}$ very low cost ; and the peasant mountalncers, simple and frupal, employ their lelsure hours and the time of their children in: fabrieating these articles. Dealers are aure to lie found who will drive a trade in these tritlea in sume conntry or other. The Art I'nirn. Jinrnal, a few years ngo, gave some curlous information conceming the better kind of carved German toys: "The thest German toys come from the town of sonineberg, on the southeastern frontior of the forest of Tharingia. It has a pepulation of 4000 Inhalitants, of which the greater part are employed in the trade. The prineipal toy-merchants, numbering about thirty, provide themselves with gools from many hundred ditlerent mukens of common articles, resident in the town and its vielnity; these, again, are furnished liy the urighe boring villagers with the requiaite ronghly-p repared articles in woal, whlch nre fitted up, carved, and painted hy the makers in the town. Every year abont :3, (0.0) cwts. of these goods are expration to almont every part of the world, but the manufactu ars are confinet to the use of wood ar pastelound, or these two materials combined. The hatory from which the iswt tow are derived in that of Adoljh Flojachutann, whe cmploys none but tirst-rate workmen; and it is lateresting to notice the many admiraile proviuctions these muducated artists [rosluce-molela and groupugga of ligures that would cast no ilserelit on the atelier of a lhailey or a Weatmacutt."

Trade, Board of. Spe Boalıs of T1,31н. p. 312.

length it blows due erst; and so with the seutheast trade. 'I'his notion is, however, erroneous. The tralewinds in the Atlontic and Pacific oceans extend to about $28^{\circ}$ of latitude each side of the equator, so that a ship, after passing $80^{\circ}$; may expect to enter them every day. But, on firet entering them, they will be found to blow from the east, or even a little southerly, snd, as you advance, to draw round gradually to northeast, and even north, at, the oouthern limit of the nertheast trade, where it is commonly represented as being dae east. This limit varies with the position of the sun, reaching, when the sun has a southern declination, to within three or four degrees north latitude; and, as the sun acquires a more northern declination, receding ten or twelve degrees from the equator. At this point the mariner enters the region of calms and variables, as they are called, where the wind has more or less sontherly direction, nnd sometimes blows freshly from the south-sontiswest. This region varies from 150 to 550 miles, and is suhject to heavy rains. On passing this range the southeast trade begins, and is subject to the same phenomena as the northeast. To the nerth and south of the northeast and the southeast trades wester$1 y$ winds will be found generally to prevail, though less regular in the northern than in the southern hemisphere; and it has been remarked that the average of the pasanges made by the Liverpool packets from New York out, for n period of six yenrs, was twenty-three days, and from Liverpool to Now York, that is, from enst to west, thirty-elght days,-E. A. See Wisns.

Trade-winds is a name given to certain remarkable serial currents, on account of thoir sinal ald to navigation. In those parts of the Atlantic and Pacific ocenns which aro remote from the influence of the land, between the limits of aboat $28^{\circ}$ or $80^{\circ}$ north and south latitude, there is a constant ensterly wind. On the north side of the equator it hows from between the north and east, and on the south side frem tho south and east, nccording to the distance from the equator; these winds aro called the northeast and southeast trade-winde, and are the cold currents of air flowing from the poles to the equator, altered in direction by the rotation of the earth upon its axis. The direction and extent of the trade-winds vary with the aeasons of the year, and in different parts of the world their course is entirely altered, the most remarkable modification shown being the monsoons.-Nee Monsoons; also, articles Atlantic Ocean, Gelf Stream, Cenuents, Winds.

Tragacanth, a species of gum, the produco of the Astragnius tragacantha, a thorny shruh growing in Hersia, Crete, and the isinnds of the Levnnt. It exudes about the end of June from the stem and larger branches, and soen dries in the sun. It is inodorous, inpressing a very slightly litter taste as it softens in the month. It has a whitish celor ; is semi-transparent, and in very thin, wrinkled, vermiform pieces; it is brittle, hut not easily pulverized, except in frosty weather, or in a warmed mortar. It should be chosen in long twisted pieces, whito, very clear, and free from all other colors; the brown, and partleularly the hack pieces, shcald be wholly rejected.-Tuomson's Chemistry: 'luomson's Diepensatory; Miluurn's Oriental Commerce.

Treasury Notes. A specius of Treasury Notes, termed Continental currency, was lasned by order of tho Continental Congress. This dopreciated rapidly, and no provision was mado afterward for its redemption by Congress. The amount issned was estimated at $\$ 400,000,000 ; \mathrm{Mr}$. Jefferson calculated that the real value given for theso notes was only $872,000,000$. The assignats of the French Republio during the revolntion were authorized by the National Assembly, in April, 1790. At one period they amounted to the enormous aum of eight millaris of francs $(8,000,000,000)$, or erpivalent to nearly $£ 350,000,000$ sterling. - Als son' a History of Eturope. In May, 1812, Mr. Albert Gallatin, Secretary of the Trensury, recommented the
lesne of Treasury Notes to the extent of $\$ 4,000,000$, repayahle one year after date, and recelvable in the mean time for government dues, and bearing 5 2-5 per cent. interest. Theas were autherizel by act of Congrese, June 80, 1812. Tressury Notes wore also suggested by Mr. A. J. Dallas, Secretary of the Treasury, in January, 1815. He reported that the Treasury would require for the fiscal year $\$ 40,906,124$ in addition to the ordinary revenue (bee Funding Syotem. U, S., p. 607), of which $\$ 15,000,000$ was to be in 'Treusury Notes at 5 2-5 per cent. per annuin (or about $1 \frac{1}{2}$ cent per day for every hundred dollars).

Up to December 4, 1819, the amount iseued was \$36,680,704, viz.

| By act of | 20th June, 1812 | \$ $\mathbf{W}_{5}^{5}, 0000,000$ |
| :---: | :---: | :---: |
| 4 | 25th February, | 6,00n, 090 |

| Total. | \$198,360,112 | \$84,611,833 | \$182,971, 046 |

Of the issues between 1837 and 1843, there were oatstanding September 30, 1847, 8239,789. Further emissions were authorized by act of Congress, under date of 23d July, 1846, and 28th January, 1847 ; $\$ 10,000,000$ by the act of 1846 , not exceeding 6 per cent. interest ; and $\$ 23,000,000$ by the act of 1847 ; and a further issue by act of December, 1857,

In March, 1858, the bills for the new issuo of Treasury Notes were opened at tho Treasury Department. The result was, that $\$ 2,600,000$ wero taken at rates vnrying at $3 \frac{1}{3}, 3 \frac{9}{4}, 4,4 \frac{4}{4}, 4 \frac{1}{2}$, and $4 \frac{4}{4}$. The remainder of the $5,000,000$ was taken in 5 per cents. Some of the lids were for permanent investment, whlle others were for spaculation.

There is a species of Treasury Notes in commen use in England, known as Exehequer Bills. These were first ereated in the year 1696, $t$ wo years after the incorporation of the Bank of Englaiad. They have been issued annually ever since. These bills bear an interest of $1 d, 1 \frac{1}{2}, 2$ or $2 \frac{1}{4}$ pence per day on ench $£ 100$, equivulent to $1 \frac{1}{3}$ (c) 3 per cent. per annum. Of these lills there were issued in $1852, £ 17,742,800$, nt $11 / d$.; $1853, £ 17,742,500$, at 1 d . (1) $2 d$.; 1854, $£ 16,029,600$, at $21 d . ; 1855, £ 17,183,000$. These are a favorite investment for short periods.-See Excurequen.

In 1708 the Empress Catharine the Second, of Russia, estahlished the Banque d'Asslgnat, to issue government notes payable to bearer. The nmoant at flrst issued was $40,000,000$ of reubles. In 1786 the amount was extended to $100,000,000$, and they soon after rapidly deprecinted.

Treaties, Commercial. By a commercial treaty is meant a treaty between two independent nations, for facilitating, and most commonly also regulating, the commereo carricd on between them. Durine the

Middle Agen, and down, indeed, to a comparatively reeent period, forvignera resident in a country, whether for commercial or other purposes, were foz the most purt suliject to very harsh trsatment. At one time it was usual in England to make allens liable for the debta and crimes of each other; and the practice, formeriy so cemmon, of luying heavier duties on the goods limported and exported by aliena than by Ilritish snbj_cta, fs not oven yet, we grieve to say, altogether abandoned. In France and some other countries, during the 14 th and 15th centurlea, a stranger was incapaijie of bequeathing property by will; and the whole of hils personal as well as real estate, fell, at his denth, to the king or the lont of the barony. This barliarous law was known ly the name of Irwit d'Aubaine, and was not completely aholished in France till a very late period.-Ronehtson's Charles V'., vel, 2. Previously to last century, the laws with reapect to nhipwreck, though infinitely more humane than they had been at a more remote period, were calculated rathor to promote tho interest of the sovereign of the ccintry, or the feudal lends on whese territories chipw secied vessels might be thrown, than those of the upfortunate owners or survivers. The mest serious obstacles wero then also opposed by the prevalent insecurity, and the arhitrary nature of the tolls which the lorde wece in the habit of exacting, for the transit of commeditics through the territories of one state to those of another. The jractice of confiscating shipwrecked property cuntinued in France till 1681, when it was abollshed by an edict of Loula XIV. It was at one time common in Germany, to use the words of N. Bouchand, "pour les predicateurs de prier Dieu en chaire, qu'il se fasse bien des nnufrages sur beurs cútrs?"-Thiorie des Traites do Commerce, p. 118. And the fact that the celehrated jurist Themasius wrote a dissertation in defense of sach prayers, affords, if possible, a still more striking proof of the spirit of the period.

Vnder such eircumstances, it became of much imporcance for commercial states to endeavor to olitaln, by means of treaties, that protection and security for the persons and properties of their sulyects, when abroad, against unjust treatment and vexatious exaction , thich they could not have obtained from the laws ot tom countries in which they might happen to reside. "hus it was atipulated hy Eilward II., in 1325, that the merchants and mariners of Venice should have power to come to Eugland for ten years, with liberty to kell their merchandise and to return home in safety, " ucithout hurring either their persons or goods stopped on account of other jeople's crimaes or debts."-A noenson, anno 1825. The commercinl treatiee negotiated during the $15 \mathrm{th}, 1 \mathrm{th}$, and 17 th conturies, are full of similar conditions; and there can be no doubt that by provid. ing for the security of merchants and seamen when abroad, and suspeniling, with respect to them, the harbarons lawa and practlees then in force, they contributed materinlly to accelerate the progress of commerce and civilization. Commercial treaties were also negotiated at a very early periol for the regulation of neuteral commerce during war, and for defining the articles that should he deemed contraband, or which it should not be lawful for neutral ships to convey or carry to either lelligerent. There are olviously pointa that can only be derided lyy express stipulations,

Instead, however, of confining commerclal treatles to their logitimate and proper purposes-the security of merchants and navigatora, and the faclity of commercial tranmactions-othey very soon legan to be employed as engines for promating the commerce of one country at the expense of another. For more than two centuries, those engaged in framing commercial treaties have princlpally applied themselvea to secure, either by force or adilress, some exclusive advantage in faver of the ships and products of their particular rountries. Hence these compacts are full of regulathus as to the duties to be charged on certalu ertleles,
and the privileges to be enjoyed by certain shlps, according as they were either produced by or belonged to particular countries. It was in the adjustment of theee duties and regulations that the skill of the negothator was chieily put to the test. It was expected that he should be thuroughly acquainted with the state of every branch of isdustry, both in his ow conatry and in the country with which he was negrotiating: and he was to endeavor so to adjust the toritt duties, that these branclee in which his own country was deficient might be benelited, and those in which the othcr was superior might be depressel. The ldea of conducting a negotlation of this sort on a fair priuciple of recipiceity is of very late oricin; success in circums. venting, in overreaching, or ln extorting, from fear or ignorance, zome oppressive, lut at the same time worthless privilege, was long esteemed the only proof of superior talent in negothators.

In an able tract, attributed to Mr. Vden, afterward Jorl Anckland, published in $178^{\circ}$ ( Ihistorical anel Po. litical Remarks on the Toriff' (f the Freneh Treuty), there ls the following outline of the qualificutionk necessary to the negotiator of a conmerclul trenty: " lesides as general knowledge oi the trade and reciprocal interests of the contracting parties, he ought to he precisely acquainted with their several kinds of industry and skill; to discover theiz wants, to calculate their resuurces, nud to weigh with nicety the state of their finunces, ased the proportionute interest of their moncy; nay, further, he shonid he aule to ascertain the comparative populstion and st rength of each country, together with the price and quality hoth of first materials, and also of the lator bestowed upen them: for this purpose he whould inquire into the operations of every class of merchants and munufucturers concemed in the trade; dhould consalt their expectations on each of its several hranches; and collect their hopes and feara on the effect of such a commercial revolution, on the competition of rival nations. A good treaty of commerce, independent of the art of negetiation, is pronounced, by one who well knew the extent and diticulty of the subject, to be a 'master-piece of skici,'"

It is visionary to lmagine that any nation will ever contintio to grant to another any exclusive advantage in her markets, unjeas she olitain what she reckons an equivalent alvantage in tho markew of the other. And if a commercial treaty stipulating for an excluse ive privilage he really and bona fide olserved by the country granting the privilege; we may be sure that the concessions made ly the country in whose favor it is granted ere ufficient fully to cobintervail it. Those who grusp at exclasive privileges in mutlers of this sort, or who attempt to exturt valuable cencessions from the weakness or ignorance of their neighbors, are uniformly defeated in their olject. All really lieneficial commercial trnnasctinas are bottomed on a fair principle of reciprocity; aud that nathon will alwsys flourish most, und have the fonndutions of Ier pros. perity best secured, whe is a unlversal merchonl, and deals with all the world on the same fuir and liberal priniples.

As early as 1783, Mr. Pitt, then Chancellor of the lixchequer, proposed a bill in the British lurliament. lused upon the liberal principle of "admitting to all the ports of the Ilritish dominion Ameriman vessels londed with gools the growth or prodluce of the l'nited Statex, on the ammo termas as Iritisll vessels or goods:" liut the proposition at once startled the fears of the Iritisll merchanta, whe, with the ald of Jood North, Mr. Fox, and Lord shethehd, sucereded in transferring the whole sulbject to the disertion of the king and his council. The consequence was, that morder was inmediately issued, not only excluding American veasels from all participation in the colonlas trade, but prohihiting the exportation from the United States of provislens and fis 1 , even in British bottoms.

[^51]English Treaties. - The tirst formai and written treaty $\mid$ and Spain, 1308.-Annenson. The chtef treatios of the madu by England with any foreign nation was entered into A.j. 1217. The tirst commercial treaty was with the Flemings, 1 Edward, 1272; the aecond with Portugri
prineipal civilized nationa of Europe will be found de. seribed in their respective piaces. Thie following forms an Index to them :

Treatics of Commerce and Navigation betucens the Unitel Stules and foreign Nations,-The Untted States has treaties, conventions, or reciprocal regulatiens of commeree and navigation with thirty-eight foreign nations, all of which are in force, either in pur ranco of the stipulations and tekns expressed thereitit respectively, or hy virtue of decrees, royal orders, or other local regulations on the part of foreign governments, on the one side, and of proclumations by the President of the United States on the other. The difficulty of reforring to any partieular treaty, or of ascertaining at a glance the precise character of the commercial regulations of nny particular conntry, is ob-
vieus. With a view, chiefly, to remedy this inconvenience, the following summary of these trealies has be en prepared; and it will enable all interested in the fo. itgn trado of the United States readily to ascertain the footing on which our commerce and navigation are placed in foreign countries with which treatics exist, and the treatment to which the commerce and navigation of such forcign countries, respectively, are entitled in the porta of tha Unitod States.

The following are the forcign countries, arranged in alphabetical order, between which and the United States commercial treaties are now in foree, with the dates of such treaties, respectively:

By virtue of notice from the Unlted States, tho treaty with Denmark "ceased and determined," in accordsnce with the llth article of the same, April 1t, 1856.

On the 24th of May, 1828, an aet was passed ly the Congress of the United States, respoct ${ }^{1-4 g}$ commerce and navigation with forelgn matlons, 1,10 followlog words: "/he' it enacted, efe., That, 11 i. :isfactory evidence being given to the President $\therefore$ atse United Statea, by the government of any foreign nation, that no diseriminating duties of tonuage or impost aro inposed or levied in the ports of the said nation upon vessels wholly belonging to eitizens of the United States, or ujwin the produce, manufactures, or merchandise injrorted in tho same from the United States, or from any foreign coantry, the President is leroby autherized to issue his proclamation, declaring that the forcign diacriminating datles of tonnage nud inupost within the Cnited States are, and shall be, suspented and discontinued, so far as respects the ressels of the suld foreign nation, and the produce, manufactures, or merchandise imported into the United States in the sanes, from the sald forelgn natien, or from any other forcign conntry; the snid suspension to tnke effect from the timo of such nethication being given to the I'resident of the Jnited States, and to continus so loug as tho reciprocal exemption of ressels belonging to citlzens of the Linited States, and their cargoes, as atoresaid, shall bo continued, and no lenger."

Hy virtuo of proclamatiens issned by the l'resident of the Linited States, in accordnnee with the provisions of the law nbove recited, vessels belongines to 'luso cany, Hrazil, and Chili, are aduitted into the ports of tho Thined States on the samo terms as American vessels, with the produce or manufactures of their own, or any wher country; similar reciprocity being granted in those countries, respectively, to vessels and cargoes of the Linited States. Tho dates of the proclamations of the I'resident respecting these countries ato as follows: Tuscany, September 1, 1836; Hracil, November 4, 1817 : Chili, November 1, 1 sto.

By the President's proclamation of June 7,1827 , vessels of the lontifical states are admitted into the ports of the Linited States on the same terms as A merican vessels only when laden with the produce an ! manafietures of said l'ontifical states; and by simiar proclamation of April 20,1847 , French vessels in hallast, or laden with the produce of St. J'ierre and MigueJon, and coming directly from those islands, are treuted iuports of the United itates as national vessels. Likn favors antl privileges are, of course, conceded to vessels of the Lnited States In the I'ontitical states, and at the islands of St. I'ierre ar: : Micuclon, respectively.

Summary of Treatios with the linited Strites.-Arentine Conferleration.--Traties of July 10 and $27,1 \times 03$, both protlasmed Apris 9,1855 . The fornerer relates to the navigntion of the rivers J'arana and Uruguay, and the latter establinhes and regulates frieadship, connmerce, and nuvigation betweea the Argentiae confederation and the tinited States. I) uration of looth undefincd. Luited states vessuls enter all the places aut ports on the rivers Parana anul Vragnay which leloug to the Argentine Confeleracy, and which are open to commeree, on the paymant of the same costom-house duties, larlor, light, police, and pilotage dues that are paid by the vessels of tho most favored nation. This restriction to equality with the vessels of the most favored nation is qualitied and enlarged by the treaty of July 27, 1853 , which equalizes the vessels of the Enited States in all the places, ports, rivern, and territories of the confederation, with tie untional fiag, as to tonnabe, lifht or harhor dues, pilutage, salvage in case of shipwreck, or eny other local charges whatever. Merchandina introduced into any purt of the territories, ports, or places of the Argentine Confederatiou, in vessels of the United states, is treated, in respect of daties ent all other charges, as if imported in national ves-
sels ; and if such merchandise be of the growith, produce, or manufacture of the Inited States, it Is aulyject to no other or higher dutjes than slmilar morchandise, the growth, produce, or manufacture of any other country. In regnrd to oxports, United States yessels enjoy equality, as to drawbucks and bonuties, with the mational flag. The province of I uenos Ayres havlug aeceded from the other jrovinces of the Confederation, decreen have been lasued hy the federal power which afteet, in some respects, the commerelal regulations ef the rejublic. The latest decree of this kind is one improsing heavy diderential daties on forelgu merchats. dise introduced Into the other, or fluvial provinces, through the port of Buenos Ayres. This der s, should it be carried into efleet, will divert from tha, $\quad * t$, heretolore the getheral depot for the trade of the other grove laces, such foreign morehandise as is leatined for the diflerent polnts on the I'nrana and the Uruguay rivers.

Anstria.-Treaty of August 27, 18:29, to continue in force ten years from Felrnary 10, 1831, with the twelve montls' notica stipulation. United States vessels are trented as national vessels, coming from tho same places, in Austrian ports, whether in the dlrect or indirect trude. The aamo duties are charged on importa. thons inte Austrian porta, whether of merchandise the growth, produce, or mumufacture of the United States, or of any other country; and these duties are no higher than on similar merchandise from any other comery. Any favors hereafter granted by elther party to the commerec or navigation of anothe: country to become common to the other party on like conditions. The treaty estallishos perfect equality between the dagrs of the tiwo parties in the ports of each.

Helgium. - Treaty of November 10, 1845, to contiave in force ten years from the $30 t h$ SIareh, 18-16; each party reserving the right to renounco tho treaty after the cxpiration of that period, on giving to the other twelve months' notico of its intention to do so. United States vessels pay the smme duties of tonnage, pllotage, anchor. ate, boys, lighthouses, ch ance, brokerage, and all other charges, as lieldian vessels. Thia equality applies, no niatter whence tho vessel comes. The lichinan governmutut guarantees restitution for any duties levied by IIulland on Enited States vessels navigating the Scheldt. Steam-vessels of the United States engaged in regular asvigation between the United States and lelgium aro exempt from the payment of daties of tomare, anchorage, louys, and light-houses. Vessels of botif purties enjoy, as to coasting trade, equal privilege with the most favored nation. The traty restricts the equality of thags, as to duties, to the direet trade, hut contnins a clanse providing that, "it is well undrestood, 1st. That tho goods slull have been really put on board in the ports from whleh they are declared to have come; 2d. That putting in at an intermediate port by uncoutrollable circumstances, duly proved. does not occasion the forfelture of the advantage allowed to direct importation." In the indirect trale, the tlag of the United States ls placed on an "cquality with the thar of the most favored mation-exerpt the nation of production-as to inmort duics. The in. portations of salt, and of the produce of the national tisheries, are excepted from this equality. A law of the helprian government, of Jume 8,1853 , provides thas "the government, mpowered to allow vessels jrocecding from trans-Atlande comntries, or from a port theyond the Straits of Gibraltar, to touch at an intermediato port, whether for the purpose of receiving orders or carrying on commereinl transactions, by discharging or receiving eargoes." Jhis law, while it reunains ia force, suspends the practical operation of that article of the treaty restricting the equality of lags to the direct trado; under its operation, the llag of the United States is equslized with the Ilelgian flag, whether the vessel proeveds from a port In tho linited States or net.-See Ifrport from Itepurtment of Stat, Lix. Doc. No. 2, 31th Congress, 1st session, j. 130.

Bolirio.-Treaty, or general convention of peace, friendship, commerco, and navigation, of November 18, 1856. Latitications exchanged May 28,1838 , and proclamation of the President of the Unlted States issued October 3 of the same year. To continue in forco twelve yoars from date of ratification, and further, for one year after elther party gives the other notlee of lits intention to renounce it. The vessels of the United States visiting the "coasts or countries of Bolivia" (the port of Cobijn) are placed, as to all charges and privileges, on a footing of equality with the vessels of the most favored nation. Should United States veasels, either of war (public or privato), of trade, or employed 3a tho fishories, whether through stress of weather, wnit of water or provisions, pursuit of piratea or enemics, he foreed into the rivors, bays, or ports of Itolivia. they shall be received and treated with humanity, and nll favor and protection shall be givon to them sultahlo to their respectivo oxigencios. Merchandise and articles of commerce of every kind and description, the importation of which is not prohibited to all other nations, imported in vessels of the United Stutes Into Bolivia, are sulyoct to the samo daties as simllar merchandise and articles importod in the vessols of tho most favored nation. The morchanta nad citizens of the United States are nilowed to manage for themselves all their commercini transactions, whother of consignment and salo of their goods, or with respoct to tho purchase of their return enrgoes, or londing and sending off their vessels. "Ihis convention is stylod the "Peru-Bolivian," and was negotiated when these two republics were confedorated under one govornmont. l'erit having at a subsequent period re-establishod its independenco of Bolivia, disavowed tho convontion, and a now treaty was entered into with that republic. It is still in force, however, es regarts Bolivia. By a decree of Jannary 27, 1853, tho Holivian government dechared free to the commerce and merenutilo navigation of all the nutions of the globe the waters of the navigable rivers, which, tlowing through the torritories of Ibolivia, empty into the Amazon and Paraguay; and, by virtno of a treaty of Juno 14, 1856, between Brazil nnd Paragaay, the navigation of the Upper Paraguay river was made free, and Holivia opened to an Athantic market.

Borneo.-Convention of June 23, 1850, ratitied July 11, 185.--cstablishes perpetual peace, friendship, and food nuderstanding between tho eitizens and subjects of the two contracting parties. No higher dity than one dolinr per registered ton to bo levied on American vossels entoring the ports of tho Sultan of Itornoo; and this fixed duty to be in lion of all other charges or duties whatever. Importations in Unitol States vessels suliject only to the same duties as apply to similar importations in vessols of the most favored nation; and no prohibitions exist, either as respects importations or exportations; tho lattor of which, if the produce or manufacture of tho sultan's dominions, to bo always exempt from daty. Citizens of the United States aro permitted to enter, pass through, and trado in, all purts of the sultan's dominions, and to enjoy ali the privileges granted to the citizens of tho most favored nations. They may also purchase, rent, occupy, and acquiro, in a legal manner, all kinds of property within the dominions of the sultan.

China.-Treaty concluded July 3, 1844, and proclamation made by the President of the United States April 18, 1846 . Not limited as to duration; the United States, however, roserving the right, ofter the expiration of twelve years from the clate of the convention, to open negotiations, should it be deemed necessary to do so, for such modifications in the articles relating to commerco nnd navigation as may be requisite. Vessels of the United States may enter any of tho five ports open to forcign commerce, viz. : Canton, Amoy, Foo-chow-Fu, Ningpo, and Shanghai, but no other ports, under penalty of confiscation of vessel and cargo. When American vossels shall have entered port, otfi-
cers may be sent on board as a guard, at the expense of the custom-house ; and withitn forty-elght hours after a vessel shall have east anchor, the proper officer must deposit the ship's papers in the hands of the Amerlcan consal, who will fortiswith commun! ato to the superintendent of customs the name and tonnage of such vessel, tho names of her men, and the character of the eargo; after which tho superintendont will give a permit for discharging; or, if the master ao desiro, ho mas, within twonty-four hours depart, without break. ling bulk, for another port; lin which case he will not be llable to pay tonnage or other clutice until he proceods to discharge at such other port. Tounage datles to be, on vessels of over 150 tens, 5 mace ( 74 cents) per ton; 150 tols or under, 1 mace ( $14 \frac{4}{\delta}$ conts), puid only at one port. United States vessels may inport and export all kinds of morchandise not prohiblted in the tarlif. No new restrictione or monopolics to be created. Butics to be pald in Sycee silvor or in forelign monoy. Discharging cargo without a permit suljects the captain to n fino of $\$ 500$, and tho contiscation of the goods so landed; but if part of cargo only is landed, duties to he paid on such part only. Goods are not to be transhipped from on board one vessel to another, unless there bo some particular occasion for doing so, which occasion ahall be certified by the consul to the superintendent of customs. Imported Euds, having paid dutjes on their resalo or transit in any part of the empiro, are sutject to tho imposition of no other duty than thoy were accustomed to pay at tho date of the treaty. It is also provided that vossels forced in any way to take refuge in any port other than one of the freo ports, shall receive friendly troatment, and the means of enfety and socurity. The inportation of opiant is prohibited, but a largo contraband trade is regularly carried on in this article throngh the connivanco of Chioeso ofticials. Saitpetro and spelter are government monopolles, nud can ho suld only to the government merchants. litico and other grains nre frec of duty. Should a ditference ariso as to tho valuo of elocks, watches, jewelry, or of other merchandiso on which there is an ad valorem duty, and the partics can not agreo, the quostion may within twenty-four hours, but not afterward, be referred to the consul of tho party interested, to bo adjusted by him and the superintendent of customs.

Chili.-Convention of amity peace, commerce, and $^{\text {a }}$ navigation of May 16, 1832; ratifications exchanged, and proclamation mado $\Lambda$ pril 29,1834 . To continue in forco twelve years from date of exchange of ratiticetions, with tho usual stipulation providing for twelve months' notice after that period. Vessels of the United States are placed on an equal footing in respect of charges and privileges with those of tho most favored nation. Vessels driven into Chilian ports by stress of weather or other compuleory causes, to bo protected, and favored in overy respect, until they are placed in a condition to continuo their voyago. Imports, the produce or manufncture of any country, not prohibited to bo imported, subject to the same dutics, charges, and feos under tho United States flag as when Imported in vesscle of the most favored uation. Citizens and incrchante of tho United States are ellowed to manage for themselves their own commercial operations. All favors granted to the citizens or flag of any other nation to become common, on similar conditions, to the clit. zens and vessels of the United States; exceptions being reserved by Chili in favor of Bolivla, tho Central Ainerican atates, Mexico, Peru, and tho Argentine Confedoration. The government of the republio of Chili notified that of the United States, under date of October 31, 1850, that no other or higher dutics of tonnago or impost would be imposod on vessels of the United States, no matter whenco they came, or of what origin might be their cargoes, than were levled on national vessels under like circuinstances; consequently, the United States flag is now placed on a footing of

equality, both $\ln$ tha direct-and Indlrect trada, with that of Chili.

Corfa Rica.-Treaty of amity, commerce, and navigation, July 10, 1851. Perpetual amity eatabliahed, and the stipulations relating to navigution and commerce may be abrogated at the expiration of seven years, after the lapse of twelve months from the time that notice to that effect ahall have been given by either party to the uther. Veasels of the United States are placed on an equal footing with nationul vessels in the ports of Costa Rica as to tonnage duties, light or harbor dues, pilotage, salvage in case of damage or shipwreck, or any other local charges. Mail-packets of the United Stutes have liberty freely and securely to come to ali harbors, rivers, and places to which other foreign ahips of the same description are, or may be permitted to come; to enter, anchor, and remain there, and reflt, subject to the lawe and statutes of the country. The coasting trade reserved by each party, respectively, to Ita own flag; and all favors hereafter granted to other nations by either of the two partiea to become common to the other. Importa in United Statea vessels of articles the growth, produce, or manufacture of the United States, to be autject to the aame duties as If imported in national vessela; and these duties to be no higher, nor other than are charged on similar importa the growth, produce, or manufacture of any other foreign country; similar equality of flag as to exports. By a decree of Angust 31, 185́4, the local commercial legislation of Coata Rica was completely remodeled and materially modified. Liberty of commerce to the vessela of ali nations is granted; certain deacriptions of merchandise monojelized by the government, and other descriptions which are prohibited, being specified; among the latter being inciuded rum, firc-arms, and munitions of war, which can be imported only upon special permission; and the former consisting of tobacco, gunpowder, and saltpetre, which can be admitted oniy on government account.

Denmark.-Convention of friendship, commerce, and navigation of April 26, 1826; ratifieci August 10, 1826 ; proclamation made October 14 of the same year. Vessels of the United States permitted to frequent all the coasts and countries of Denmark, no matter whence they may come or how they are laden, on terma of the most perfect equality as to tonnage and other charges, with the national har the coasting trade excepted, which ia reserved by euch contracting party to its own flag. This equality of flags not to apply to the northern possessions of Denmark, viz.: Iceland, the Feroe Islands, and Greenland, nor to the direct navigation between Denmark and the Weat India colonies of his Daniah majesty. In passing the Sound or the lieits, United Statea vessela to pay the smme dues as the most favored nation. United States vessele permitted to import into any part of his Danish majesty's dominions merchandiae, whether of the growth, produce, or manafacture of the United Statea, or of uny foreign country, on the same terms, and with the same privileges as to duties, charges, und fess of every description whatever, as apply to similar imports under the national flag; and should the merchandise be of tha growth, produce, or inanufacture of the United Staten, to the subject to no other or higher duties than similiar merchnndise of any other foreign country. This equaility, however, not to apply to tho Danish possessione of Iceland, the Feroe Isiands, nor to Greenland; nor the flags to be equal in the clirect trade between Irenmark and her West India colonies. Merchandise in United States bottoms to pay at the Sound and lieits the asme duties as similar morehandise in vessels of the most favored nation. In consequence of the onerous, and, as the United Statem think, the iliegal taxes upon the navigation and commeree of the United Staten at the Sound, notice wan given April 14, 1855, in aecordance with the provisiona of articla 11 of the treaty, of the desire of the United States to terminate the anme at the
expiratiun of twelve montha from that date. The treaty accordingly " ceased and determined" April 14, 1856, and the commerce of the United States with Denmark is now unprotected by any treaty atipulations.

Ecuador.-Treuty of Jane 18, 1839 ; ratificstions exchanged April 9, 1842; proclamation made by the l'resident of the United Staten September 28, of the samo year. To continue in force twelve years from the date of ratifications, and after the expiration of that period until the end of one year after either of the parties shall have given notice to the other of its intention to renounce it. Veesels of the United States p'aced on a footing of equality in the ports of Ecuador with the national flag, no matter whence they come, certain privileges in favor of vessels built in tho dock-yard of Guayaquil being reserved; but these privileges also to be accorded to vessele of the United States, should thoy ever be granted to Spain, or to Mexico, or the other Hispano-American republica. Any favors hereafter granted to the commerce or narigation of other conntrice to become common to those of the Uuited Statea. Imports in veasele of the United States, whether of the growth, prodnce, or manufacture of the United States or of any other country, sabject to the same duties and charges as if imported in national vesaels; and merchandise, the growth, produce, or manufacture of the United States, admitted on the same terma as similar merchandise of mny other foreign country. United Statea commerce entitled to any privileges hereafter granted to the commerce of any other foreign nation. In all lawful commerce, whether as respacts imports, exports, duties, drawhacks, etc., the United States flag enjoys an equality with the flag of Eenodor; the consting trade and the reservation in favor of vessels buit at Guayaquii excepted. Such vessels, when under the national flag, are, by decree of August 23, 1845, exempt from tonnage, anchorage, and other port dues, and are entitled to a reduction of 8 per cent. on all produce, merchandise, etc., imported by them, for consumption, into any of tho ports of the republic.

France.-Convention of June 22, 1822, to be in foree for two yoars frem Oetober 1, 1822 ; and efter the expiration of that time, until one of tite purties shall have declared its intention to renounce it; which deciaration shall be made at least six months before it can take offect. Equality of treatment. Tonnage and other navigation dues in French ports upon American vessels, five franes per ton; in United Staten ports upon French vessels, 94 cents per ton. The navigation duty of 94 cents per ton is payable by American vessels, no matter from what port they may have last proceeded; but the equality of treatment as to cargoes with the French fiag is applicahle only when the voy日ge hes been direct, and the origin of the merchandise is attested by certificate from the custom-house at the port of departure, rised by the French consul at such port. In French perts an extra duty on articles of the growth, produce, or manufacture of the United States, imported in American vesseis, at 20 francs per ton of merchaudise; in United Statea ports, upon similar products of France, imported in French vessela, an extra dity at $\$ 375$ jer ton of merchandise ; these extra duties not applicablio in elther country to merchandise of the other destined for transit or re-expertation. Should this convention be continued in furco nfter $t$ wo years, the ndelitional duties, at the expiration of that period, to be reduced one-fourth of their amount, and auccessively from year to yenr, so long an neither nation shali give the six months' notice of its intention to renounce it. Neitier party having given the notice, the additional thuties ceased to exist by the manual reduction of ene-fourth, from October 1, 1827. Isy virtue of a ministeriai deeroe of December 17, 1851, Amerlcan veasela laden with cotion for France may touch at English ports witiont lusing the bencfit of direct importation, provided buik be not broken, and no operation of commerce be transneted. Nivigation and commerce betweon tho Unitod

## TRE

States and French coionial poseassions are regulated by the laws and decrees of the French government. American vesseis proceeding direct from the United States in baliaat, or laden with articles the growth or manufacture of their own country, to the isiands St. Pierre and Miquelon, are treated on the sipiac fictiug as national vessels.

Guatsmala.-Convention of peace, amity, cunmmeres, and navigation concluded Marcin 8, 1849, and proclaimed by the President of the United States July 28, 1852. To continue in force twelve years from the date of the exchange of ratifications ; and after that period, for twelve months after either party shall have given notice to the other of its intention to renounce it. Vessels of the United States are admitted into the porte of Guatemala, no matter whence they niay have sailed, on the same terms, as to tonnage and all other navigation ciues, as national vessels. Any favore granted to the navigation of other foreign nations are to become common to that of the United States, on equal conditions. The consting trade reserved by each nation to its own flag. Imports into the porta of Guatemais in vesseis of the United States, whether of articles the produce, growth, or manufacture of the United States, or of any other country, placed on tho same footing, as to duties and all other dues and charges, as similar imports under the nstional flag; and if the articies so innported are of the growth, produce, or manufacture of the United States, they are subject to no higher or other duties than similar articies, the growth, prodace, or msnufacture of any other foreign country. By decree of May 6,1852 , every vessei which shall anchor in the ports of Guatemaia, no mattor whence it may come, is roquired to pay a tonnage duty of twenty-fivo cents per ton of measurement ascertained from her papers. Among the vessels free of this duty arevessels in baliast anchoring for supplies, and discharging no cargo ; vessels of war and regular maii or steampackets not discharging over twenty tons of eargo; and vessels receiving on board, for exportation, produce of the country, execpting cochineal.

Great Britain.-Treaty of July 3, 1815, to continuo in force four years. Continued in force ten years by the 4 th articie of the convention of London, Octoier 20,1818 , and renewed indefinitely April 2,1828 , with an additional articlo containing the usuai stipulation as to tweive montis' notice. "Rociprocity treaty" concludici June 5 , ratified June 9 , and prociaimed by President of the United States September 11, 1854. 'To continue in force ten years from the date at which it went into operstion (1855), with the usual stipuiation as to tweive months' notice after that period. It secures reciprocal freedom of fishery on the coasts of the United States and the British provinces in America, and of trade in raw products. United States vesseis admitted into Britiah ports in Europe on the same footing as nationai vessels. Tho vessels must be built and owned in the United Statea, and navigated by a nasster and a crow three-fourtha of which are citizens of the United States. Vessois of the United States permitted to touci for refreshmente, but not for commerce, in the courso of their voyage to or from tho Britisin territory in India, or to or from the dominions of tho Emiveror of China, at the Cape of Good Hope, tho island of St. Holena, or aucin other places as may bo in the possession of Great Britain, in the African or Indian seas-such vessels being subject, in all that regardis this article, to the laws and regulatione of the British government from time to timo established. Marciandise imported into Britieh ports in United States bottomis must consist of artioles the growth, produce, or manufacturo of the Unitod States; and the same duties are charged, whether imported in United States or British veasels, as on similar produce of any other foreign country. The importation, in American vessels, of tie produetions of any country but the United States, in prohibited. The intercourso between the

Unitod Staies and the British Wesi Indies is not af fected by the tresty. The vessels of the United States are admitted into the British East India possessions on the footing of those of the most favored nation ; that is, they pay the esme tonnage and import duties and other charges as the vessels of such nations; but, when iaden, they must proceed direct to the United States. With the British West Indies the trade was regulated, prior to 1850, by diplomatic agreement. By reciprocity treaty of 1854, a free trado in the raw stsples of tio United Scates and Canada, Newfoundiand, New Brunse wick, Nova Scotia, and Prince Edwerd Isiand, reepectively, is established. By the act 12 and 13 Victoria, chapter 29 , which went into force January 1, 1850, the comprehensive principlo was adopted of admitting into the porte of Grent Britain, and of British possessions, goods of any sort, in a ship of any country, from any part of the world; certain restrictions, deemed necessary either for the safety of the state or for the protection of tho revenue, still remaining in force. American vessels in British ports are, therefore, equslized with British vessels as to tonnage and iniport duties, and all other charges whatever. By circular of the Treasury Department of the United States, October 15, 1849, instructions were issned to custom-house officers and othera interested, as foliours: " 1 . In consequence of the alteration of the British navigation laws, British vessels from British or other foreign ports will (under our existing laws), after the first day of Januery next, be allowed to enter in onr ports with cargoes of the growth, production, or manufacture of any part of the world. 2. Such veesels and their cargoes will be admitted, from and after the date before mentioned, on the same terms as to dutics, imposts and charges, as vessels of the Uuited States and their cargocs. By the act 17 Victoria, chapter 5, the coasting trade of Great Britain is opened to foreign flags, eubject only to the eame regulations as appiy to l ritish vossels engaged in tho same trade.
Hanover.-Treaty of June 10, 1846, to continuo in force twelve years from date; and further, until cither party gives to the other twelve months' notice of its intention to renounce it at the expiration of the period. Vessels of the United States received in Hanoverian ports on the samo terms, as to navigation dues of every description, as national vessels; and, in the navigation of the River Eibe, are equalized with Hanoverian vessels as to the tolio collected at Brunshausen or Stade. Whatever merchandise or produce may be imported in Hanoverian veesels may also be imported in United Statea vessels, on terms of perfect oquality as to duties, irrespective of the country of origin, or whence imported. Tho equaity guaranteed by the treaty extends only to such vessels of the high contracting parties as aro built within their respective territories, or lawfully condemned as prizes of war, or adjudged to be forfeited. It is also atipulated that vesseis of the kingdom of Hanover may select their crews from any of the states of the Germanic Confederation, provided that the masters of each be a subject of the kingdom of Hanover.

Hanss Tourns.-Treaty of December 20, 1827, to continue in force twelve years from date; cither party reserving the right, after the expiration of tint period, to renounce the treaty at the end of twelvo months, after having given notice of its intention to do so. Navigation inties of every description whatever, the same on United States vessels as on national, whether in the direct or indirect trade; and perfeet equality in all other respects. Inports into the ports of the Hanse Towns in vessels of the United States, aubject to the sanie duties, charges, etc., as eimilar imports under the flag of the Hanse Towns. Esch one of the threo Hanseatic towne, IIamburg, Branen, and Lnibeck, agrees separately, and each for itself, to the atipulations of the tresty. IIanseatic vesseis are entitled to equality in the porie of the United Siates with the national flag,

If owned exclusively by a citizen or citizans of any or either of the Hanse Towns, and of which the master ahall also be a citizen of any or either of then, und provided that three-fourthe of the crew shall be citizens or subjecta of any or oither of the said republics or towns, or of any or either of the atates of the Germanic Confederation. This privilege secures to the flag of the llanse Towns a large share of the carrying trade betweon the United States and the German states.

Holland.-Treaty of August 26, 1852, additional to that of Junuary 19,1839 , and substituting for articles 1 and 2 of the latter treaty other articles; and providing that the duration of the new treaty ahall be limited to the term of two years from the date of ratification (Fobruary 25, 1858), with the usual twelvo montha' notice. Vessels of the United States, whencesocvor coming, aro treated in Dutel ports, including also the forelgn posseasions of Holland, as national vessels, with respect to duties of tonnage, harbor duea, lighthouse, pilotage, quarantine, or other port charges of any kind whatever-the coasting trade and notional fisheries being reserved. Entire reciproclty guaraulteed to the tlag of the United States, and perfect equality with the national flag, as to the duties of import and export, both in Dutch ports in Europe and in thoso of Dutch possessions abroad. All differential and diacriminating dutien as respects the flag are abolished. The equality ns to export duties, atipulated in the treaty of $185 \%$, applies only when the vessels of tho United States clear for the same ports as national veascla. Thus the export duty ou cotlee in Java is the same when exported is United States bottons as when exported in Dutch. vessels, when loth havo the aamo dostination; but of the Duteh vessel procecds to Amaterdam, and the United States vessel clears for Boston, the former enjoys a discriminating privllege in respect of the amount of daty.

Jopan.-Treaty concluded March 31, 1804 ; ratificatlons exchanged February 21, 1855 ; and proclauation made by the l'resident of the United States June 22 of the aamo year. American vessela permitted to cuter the ports of Makodade and Simoda, and no other porta of the dapanese ompiro, unless in diatreas, or forced by stress of weather. The only charge for enteringr is for pilotage, the rates of which, for the pert of simoda, are as follows : Vessela drawiug over 18 feet pay $\$ 10$; over 13 , and less thau 18,810 ; under 13, 85. Vessels of the linited States are permitted to exchnuge only gold and silver coin, and articles of goods for other articles of goods, under such regulations as shall be tempornrily established by the Japunese government. Wood, water, provisions, coal, and goods required, can ouly le procured through the agency of Japanese otlicers, nipointed for that purpose. As a means of opening the commerce of Japan, or evon of tho porta opened to American vessels-viz., Siomoda and Makodade -the trenty has proved totully inefticieat. The treaty grants the privilise to ahipwrecked arsons and other citizene of the L'uited States, living temporarily at Simoda, to go where they please within the limits of seven Japanese miles from a small island in the harbor, and at Hakodado within limits hereafter to be defined. "Siving temporarily" has been detined hy the Japaneac authorities to mean "a sojourn of four or five days on ehore." Wood and water, and such supplies as could be had, have been freely sold at pretty good prices; lut permission to traile, in a mereantile sense, has been absolutely rufused. The privileges of this treaty are said to have been recently extended to all matlous.

Mecklenburg Schwerin.-Declaration of aecession to treaty with Ilanover, December 9, 1847, to continue in force until Iune 10, 1858, with the usual twelve months' notice stipulation after that period, and a conditional six montha' notice ly the United States, if a contingeney should occur renderiug it expedient, in the opinton of that govermment, to renounce the treaty. Veasels of
the United States subjoct to the same duties in the ports of the Grand Duchy of Mecklonhurg Schwerin at national vessela; the coasting trade being reserved. This equality applies oniy to vessels built within the respective territories of each party, or lawfally cone demned as prizes of war, or adjudged to be forfeited, etc., and belonging wholly to citizens of each. Importations of articles the growth, produce, or manufacture of the United States, subject to no higher duties than similar articles the growth, preduce, or manufacture of any other foreign country; sich duties to to the same, whether imported in veasela of the United States or in national vessels. This equality is applieable to tho indirect as well as to tho direct trade. Besides the atipulatlons containod in the treaty with Hanover, otlier articlea are added. Import duty on raw cotton and paddy, the produee of the United States, la abolished by the treaty; and naximum rates of inport duty on tobacco, rice, and whale-oll, and for transit on the Ber-lin-Hamburg railroad, are prescribed.
Sfexico.-Treaty of April 5, 1831, revived, as to general atipulations relatiug to commerce and navigation, by article 17 of the treaty of Fehruary 2, 1848, and to continne in force from date of ratification of sald treaty (May 30, 1848) for a period of eight years, with the nsual stipulation providing for twolve montha' notice after that perlod by either party wishing to renounce it. Fessels of the United States may enter all the open ports of the Mexican republic on the same terms, as to tonnage dutioa, light or herbor duea, pilotage, aalvage, nnd all other local charges, as apply to national vessela. The coasting trade is reserved by cach country respectlvely, to its own flag. Linited States vessels may import into Mexican ports merchandise, tho grewth, produce, or manufacture of the United States, on the same terms as if the said merchandiso were im ported under the national flag; the dutiea of import to be no higher or other than levied on similar merchandise, the growth, produce, or manufacture of the most favored nation.

Morocco.-1'reaty concluded Septemher 16, 1836, and proclamation there of made hy the President of the L nited States January 30,1837 ; to continue in force fifty years, with the usual stipulation requiring twelve months' notice after that period by cither party wishing to rerounce it. United States vessels permitted to put inte any ports in the dominions of the Emperor of Meroceo for provisions or other aupplics, without any interruption or molestation, and to put in for repairs, and to land and reload their cargoes, without paying any duty whatever. Should Anerican vessels be east ashore on any part of the coasts of Norocco, either by stress of weather or other cause, to be permitted to remain undisturbed until the commander may thlnk propier to proceed on his voyage. Importations from the Énited State, and American commerce generally, to be on the same footing as those froms Spain, or from the most fuvored nation for the timo being. Masters forbidden to tranajort their cargoes on hoard other vessels. Merchanta of the United States allowed to employ such interpreters and other agents as they shall think proper; and Amcrican citizens permitted to piss and repass tho country and sea-porta whenever they please, without molestation. The tariff' of duties is often arbitrarily raised in Morocco. The general rate is 10 per cent. on importa, excepting cortain sjecitied articles, on which specifle dutiea aro levied. (Tobacco is a monopoly of the government, and the trade is usually rented out at rates reacling as high as 100,000 per annum. Were the trade in this article freed from the pressure of this monopoly, its importation from the United States would be largely increased.)

Mueat.-Treaty of September 21, 1883; I'residents proclanation issued June 24, 1837. Estahlishes perpetual peace het ween the United States and his majesty the Sultan of Mluscat and his dominions. Vessels of the Luited Statea pay 8 per cent. duties on ths car-

goes landed, to be in full of all dutlas of inport and export, tonnage, license to trade, pilotage, anchorage, or of any other charge whatover. No charge to be pald by Aurerican vesaels entering any of the aultan's ports for the purpose of refitting, or refreshmenta, or to inquire the state of the market. The duties and other charges on conmerce in the dominicoss of the sultan are given under the head of Navigation. Tho articles of muskets, pewder, and halls, can be mold only to the governmeut, in the island of Zanzibar; but in other ports of the sultan's duminion' asid munitions of war may be cold to the hlghest bidder without reatriction. Dutios of tonaage, import and export, license to trade, etc., to be the same for American citizens as for citizens of the most favored nation. The trade between the United States and the dominlors of the Sultan of Muscat, especially the islund of Zanzibar, is yearly increasing. It reaches annually in value about $\$ 1,000,000$, and is carried on chiefly from Salem, Massachusetts. Articles of American manufacture most in demand in the market of Zanzibar are the various descriptions of cotten goods, the annual exportation amocnting to about 6000 bales. . Every facility for commercial opcrations is extendod to American vessels and mercantile houses, and the duties or other chargos never oxceed those stipulated in the treaty.

New Granada.-Treaty of Decomber 12, 1846, to conthuue in furce twenty yoars, unless either party should notlfy the ether, twolve menthsbofore thaexpiration of that period, of its intention to reform any or all of its stipuIations ; and beyond that period, for twelve months after cither shall have given notice of its intention to propese such modificatiens. Vessels of the United States to enter all the ports of New Granada on a footing of entire equality with the vessels of that republic, without regard to the pert or country whence they may have sailed. Should such vessels be driven into the perts of the republic by pirates, enemies, or from stress of weather, to be protected, and all facilities, etc., afforded them; and, unless they romain in port over forty-eight hours, to be exempt from all port or harber charges, pilotage excepted. The coasting trade reservod by each of the contracting parties to its own flag. Duties on imperts and oxports under the United States flay the same as under the national flag; and on articles the growth, produce, or manufacture of the United States, these dutiee net tu be higher or other than are levied upen similar, articlea, the growth, produce, or manufacture of any other foreign country. Merchandise belonging to citizens of the Unitod States, in transit across the Isthmus of Panama, to be free frem import dutics, and subject only to the same tolls that are levled in like cases on merchandise beionging to citizens of New Granada. For the privileges granted on the Isthmus of Panaaja, the United Stutes guarantee to New Graneda the perfect neutrality of that territory, and her eovereignty and righta of property over the same. The stipulations of the treaty respecting commerce have been modified by subsequent decrees of the governinent of New Granada. Those of chief interest provide that the coasting trado shail be thrown open to all flaga, and payment of navigation duties siall be demanded only at one port. Panama, Cartagena, Choco, Buenaventura, and Yumaco, are free ports-no other than navigation duties being charged. More recent enactments, however, impose a tonnage duty of 40 cents per ton on all vessels entoring pert; and a tax of $\$ 3$ per peund on all mail mattor crossing the Isthmus.

Oldenburg.-Declaration of accession of the Grand Duke of Oidenburg to treaty with Hanover, March 10 , 1817. The same stlpulations and prlvileges es are granted under the treaty with Hanover of June 10, 1846. The same privilegea, as respects the commerce of the Uuited States, as are extended to said commerce in IIanuverian ports. The stipulations relative to the Stade and Weser tolls, contalnod In the treaty botween
the United Statea and Hanover, are omitted in the declaration of acceasion by Oldenburg ; this government having no control over, or interest in, sald tolle.
Peru.-Treaty of July 26, 1851; ratifications exchanged the 16th, and proclamation made by President of the United States the 10 th July, 180̈2. To continue in force ten years from date of ratificatlon; and beyond that period, until twelve months shall heve elspsed after elther party shall have given the other notice of its intention to renounce it, No higher or other duties or charges on account of temnage, lighthouses, or harbor dues, pilotage, quarantine, salvage, eto., to bo lovied on United States vessela of 200 tons or upward, than are payable in the same ports on natienal vessels of the same tonnage. The coasting trucle is reserved by each country, reapectively, to its own flag. Imports in vessels of the United Statcs to be subject to the same dutics as similar imports in national vessels; and if of the growth or manufacture of the United States, the duties to be no higher or other then on similar merchandiso the growth or manufacture of any other nation. Like equality of flags as to experts. Slieuld the tariff of Peru be changed se as to augment the dutles of import or export, such change not to apply to United States commerce until the expiration of cight calendar monthe thereafter. Steam-vessels of the Ur ed States, if belenging to a regular line owned by citizens of the United States, to be permitted to navigate the porta of entry of Peru with the aame privilcge as any aasociation or company whatsoever. The treaty provides that whale-ships of the United States shall have access to the port of Tumbez, as well as to the perts of entry of Peru, and may sall from one port to another for the purposes of refreshment and retitting; and elasll be permitted to sell or barter their supplies or goods, including oil, to the amount of $\$ 200$ ad valorem for each vessel, without paying any tonnage or harbor dues, or any duties or imposts upon the articlos so sold or bartered. They shall be permitted, with like exemption from tonnage and harbor duce, to. aell or barter eupplice or goods, incloding oil, to the additional smount of $\$ 1000 \mathrm{ad}$ valorem for each vessel, upon payment, on said additional articles, of the same duties as are paysblo upon llke supplies or goods and oil when inported in the vessels and by the citizons of the most covored nation. A decree of the Peruvian goverament restricts the terms "supplies or goeds, including oil," to articles the produce of the fisheries, and withholds the privilegea of the stipulations of the treaty, above condensed, from all other descriptions of "gooda" or merchandise.

Portugah-Treaty of August 26, 1840; ratifications r zchanged April 23, 1841; and proclamation made . upril 24 of the same year; to continue in force six yeare from date of ratlications; and furthor, until the end of one year after either of the contracting parties shall have given notlce to the other of its intention to renounce lt. Vessels of the United States arriving, either laden or in bsilast, in the porta of Portugal (including Portuguese possesslons), to be treated on an equal footing with national vessels ceming from the saine place, with respect to the duties of tonnage, lighthouse dues, plletage, port charges, and all other tharges whatever. Each party reserves to its ovin tag, respectively, the coastlog trade. On the limporitation inte the kingdom of Portugal and ita possessions, whare forelgn commerce is allowed, in vessels of the United Statce, of any articles the growth, produce, or manufacture of the United States, no other or higher dutles to be levied than on similar articles the growth, produce, or manufacture of any other foreign country; ani?, in all cases of direct importation, the veasels of each country to be equalized in the ports of tho other. Sheuld the indirect trade of any other forelgn country be placed upon the same footlog as the direct trade, similar privileges to be accorded to the Unlted State: on equal condltions. Any favor granted since the date
of the treaty, or which may hereafter be granted by elther of the high contracting partles, as respects commerce and navigation, is to apply to the other party, freely If It has been freely granted, and on similar equivalente where it has been conditional. By virtue of the reciprocity, as It respects navigation, Portugucse vessela are exeinpt from tonnage duty in the ports of the United States. In the Indirect trade wlth Jortugal, inports under the Unlted States fing are subject to difierential duties.

Pruesia.-Trenty of May 1, 1828, to contlana In force twelve yeara, with the usual stlpulation requiring twelve months' notice after that poriod by elther party deairing to renounce lt. United Statea vassela to be treated In Prossian ports, as to the dutles of tonnage, light-houses, pliotare, salvage, and port-charges, as well as to all other duties, fees, or charges whatsoever, as national veasels. The coasting trade reserved to cach conntry. Cargoes under the United States flag, whatever the origin, or whencesoever imported, to be subject to the same dutics and charges oply as if imported under the national tlag. Like equality as to exportationa. Articles the growth, prodice, or manufacture of the United States, to be subject to the same dutles as like articlea the growth, prodice, or manufacture of any other forelgn country. Two traaties of anity and commerce wero antered into between the United States and Pruasia prior to that condensed above -one of July, August, and September, 178i; and the other of July 11, 1799. By article 12 of the treaty of May 1, 1828, the 12th article of the former treaty, and froin the 13 th artlcle to the 24th, incluslve, of the latter, with the exception of the lart, puragraph in artlele 19, are revived, in so far as thay do not affect treaties or conventions concluded by elther party with other powers, during the interval between the expiration of the treaty of 1799 and the commencement of the treaty of 1828. Articles 12 of the treatics of 1785 and 1749, respectively, relate to the principle of free ahlps makIng free goods. In reforence to this polnt, article 12 of the treaty of $18: 28$ provides that, the parties being still desirous to establish bet ween themselves, or in concert with other maritime powers, further provisions to insure just protection and freedom to neutral navigation and commerce, and which may, at the same time, advance the causes of clvilization and humanity, ellgrage again to treat on this subject at some future and convenient period.

Russia.-Treaty of December 6 [18], 1832, to continue in force until January 1, 1839, with the usual atlpulation for twelve montha' netice to renounce it by elther party desiriser to do so. No such notlee havIng been given, the treaty continuea In force. United States vessels arriving In Russian ports, either laden or in ballast, to bo treated on the same footing as national vessels, coming from the snine place, with respect to dutles of tonnage. In regard to light-honse dutlen, pilotage, and port charges, as well as to the fees and perguisites of public officers, and all other duties and charges ievied upon vesseis of commerce, the United States flag ts placed upon the footing of the most favored nation wheth which Russia has no special treaty stipuiating for entire reclprocity. Any favors hereafter granted to the navigation of any other foreign nation, to become common to the United States on similar or equal conditions. All kinds of merchandise and articles of commerce, being the growth, produce, or manufacture of the United States, may be Imported Into Rute sian ports on the same terms as apply to similar artleles the prowluce or manufacture of any other forelgn country ; and, whether the imports be of the growth, produce, or manufacture of the Unlted States, or of any other forcign country, perfect equality is granted with the natlonal flag. Any favor hereafter grantel to the commerce of other foreign nationa to become common to the commerce of the Vinited Statea. Certain special privileges to be retained liy linesia in referenes to com.
merce with Prussia, and Swoden and Norway; but they do not affect the general reciproelty stipulated in the treaty. The treaiy eatablishea entire reclprocity between the flags of the two countrles. July 22, 1854, a treaty was coneluded between Russia and the United Statea, establlshlng the princlple that "free ships make free goods," and containing a stipulation to the eflect that other nations may, by a formal declaration of a dealro to aceept and bo governad by the princlpic, become entited to all the resulting rights and privileges. The Russlan government, under date Novemiser 28 , 18056, offictally algniffes to the government of the United States Ita adhesion to the principles announced in the reply of the latter government to the declarations of the Colngress at Paris, April 16, 1856, In reference to privateering, Tho communleatlou of the representative of the Ruasian government at Washington thus conveys the concirrence of tha cmperor: "Jils majesty entirely concurs in the views of the government of the Unlted States which the Hon. Mr. Marcy Ins Iald down in hils equally lucld as temperate note of the 28th of July. The proposition of the federal government, in the opinion of hls imperlal majesty, descrves so much the more to be taken Into consideration that the honorable Secretary of State argues not for the exclusive Interest of the Unlted States, but for those of the whole of mankind. The underslgned is accorilingly Instructed to notlify the Hon. Mr. Marc; that his minjesty tho emperar accepts, for hia part, the condition under which the United States consent to the $\varepsilon^{2}$ 亿 Iltion of privateering-namely, that the private property of the suljecta nadicitizens of the contracting parthes shall la ilmes of war be respected by their respect. lve naval forces, ns well as by those of all the powers which may join in this declaration."

San Saleador.-Convention concluded January 2, 1850. To continue in foree twenty years, If neither party notify the other twelve months before the expiration of that period of lta desire to reform any of its stipulatlons; and beyond twenty years, until twolve months ahall have clapsed after such notice shall have been given by elther party. Vessels of the United States, 10 matter whence they may have come, or hew laden, to be trented In the ports of San Salvador, is to all dutles of tonnage, light-house, or any other charges of whatsoever denomination or character, as national vessels. From this equality the coasting trade is excepted, which is reserved to the national flay: but should any favors of navigation be granted hereafter to any other foreign nation, it will Immedlately apply to the fiag of the United Statea. Imports Inte San Salvador in vessels of the United States, no matter whence imported oz of what origin, to be sulyect to the same dutles, charges, and fees of every description, as similar importa in vessels of San Salvador; end if these importn conslst of articles the growth, produce, or manufacture of the United States, to bo sulyject to ne ligher or other dutles than aimilar imports, the growth, preduce, or manufacture of any other forelgu nation.

Sandrich Iflands.-Treaty concluded December:0, 1849; ratifications exchangel Angust 24, 1850, sad proclamation maile by the Presldent of the luited States November 9,1850 . Establishes perpetual peace and amity between the United States and the llawalIan Islanils, and provides that the treaty shail continue In force ten years, with the usual stlpulation proviling for twelve montha' notice by eitber party wishing to renounce It after that perlod. United States vessels in direct voyages, If laden, or in respect of any voyage, if in ballast, to pay the same dutles of tonnage, harhor, IIght-honses, pilotage, quarantine, or other navigatlon charges of whatever kind, that are paid ly nationsl vessela. Steam vessels employed In carrying the publie malla of the United States across the Pacific, or from one port to another therein, to lave free uccess to the porta of the Sandwleli Islanis, to retlt, refresh, land passengers and thelr baggage, or for any purpose per-
talulng out bel Whale of Itilo ports 0 or harl leges o pass frt procuri men or The pr ed veas diso, th ed Stat ported and the llar me of, or i liberty countri hiblted. trado or ous liqu vassel, the furt ports do from tor in spirit ralorem, or barto dise $\mathrm{Im} /$ tion.

Switze 1850; rat proclama continue neither p
taining to the mali service of the United States, without being subject to any of the duties above specili d. Whale-ships of the United States may enter the ports of Hiio, Kealukeakua, and lianalei, and aiso the open ports of Ilenoluiu and Lahaina, exempt from tonnage or inarbor dues of any description, with certain privileges of trade, as set forth herowith. They may also pass fromt port to port of the islands for the purpose of procuring rofreshntents, but may not land their seamen or passongers, except at Honolviu or Lahaina. The privilego of the aame ports ie alao granted to armed vessels of tho United States. Importe of merchendise, the growth, produce, or manufacture of the United States, to be subject to the same duties, whether intported in vesseis of the one country or of the other; and these dutios to be the eame as are levied upon similar merchandiae, tho growth, produce, or manufacture of, or imported from, any othor country. Absolute liberty of trade allowed between the eitizens of the two countrics, without restriction, unless in articies prohibited. Whaling vesseis of tiso United States may trade or bartor thoir supplics or goods, except spirituous iiquors, to the amovit of $\$ 200$ ad valorem for each vassel, without being liable to pay duties therefor; and the further privilege is granted to such vesseis at the porte designated o.bove, and exempt, as therein stated, from tonnago and harbor dues, to trade or barter, except in apirituous liquors, to the further amount of 1000 ad valerem, by paying on the additional goods so traded or bartered the uisual duties levied on similar merehandise imported under tho flag of tho moat favored nation.

Sardinia.-Treaty of November 26, 1853, to continue in force ton years from March 13, 18:39-the date of exchange of ratifications; and, after tho oxpiration of that period, until tweive months ahall have elapsed after either party shall have given notice to the other of its intention to renounco $i t$. Vessele of the United States arriving in Sardinian ports, either iaden or In ballaet, to be treatod, as to the duties of tonnage, lighthouses, piiotage, and port charges, as well as to all tees and charges of whatever kind or denomination, as national vessels coming from the same place. All imports in United States vessels into Sardinian ports to pay the same duties and charges only as if brought in Sardinian veascis. Imports, the growth or manafacture of the United States, to pay the same duties only as like produce of the most favored nation. The "Separate Article" of the treaty, respecting " differential duties," ceased to have effect, by virtue of a law of Sardinia, July 6,1850 . I'reedom of transitage, from and to the port of Genoa, through the territorice of Sardinia, is atipulated by the treaty, with specified exceptions.

Sweden and Norway.--l'reaty of Juiy 4, 1827, reviving certain articles of the troaty of April 3, 1783, together with the $1 \mathrm{st}, 2 \mathrm{~d}$, 4 th, and 5 th separate articles of tire said treaty, and containing additional commorcial stipulations; to continue in force ten ycars, with the usual stipulation requiring twelve months' notice to be given by either party desiring to renounce it, after the expiration of that period. Vessels of the United States proceoding from any port to tho ports of Sweden and Norway, including these of tho island of St. Barthoiomew, laden or in baliast, are treated as national veasels consing from the ame port, as to ali duties of navigation and tonnage. Entire reciprocity and perfect equality, as to import duties and ali other eharges, betiveon tho flag of tho United States and that of Sweden and Norway; and this reciprocity and equality applies, whethor the voyage be direct from the ports of tho Unitod States, or indirect from any other foroign port.

Switzerland. - Convention signed November 25, 1850; ratilications exchanged November 8, 1855; and proclamation made November 9 of the aamo year. To continue in force ten ycars from date of ratification, if neither party gives notice to the other one year before
the expiration of that period; and so on from year to year, untii the expiration of tivelve montha after such netice shall have been given. Imports and exporte to and from Switzeriand take place through the porte and territories of France and other adjacent countries; and the charges of tranaitage, in consequence, are a heavy drawback upon the induetry and commerce of the confederation. This remark applies especialiy to the reetrictions on transitage through France. In ali that relates to the importation, exportation, and trausit of their respective preducts, the United States and the Swisa Confederation to treat each other reciprocally as the most favored nation, uaion of natione, etc. All future commercial privileges granted by either party to any nation, union of nations, atc., immediately to become comonon to the other party on equal conditione. Should differential datiee be catablished in the Swhess Confederacy upon the products of any natlon, the United States to be at liberty to determine the manner of establishing the origin of its own products destined to enter that confederacy. The frontier territory of Swltzeriand is divided into six departments for the collection of cuatoms duties. The central points of these, respectively, aro at Busle, Schatifhausen, Coire, Lugano, Lausanne, and Geneva. No merchandise can be imported or exported, unless iy special license, except through one or otiter of those frontier custom-houses.

Siam.-Treaty of amity and commerce of March 20, 1833 ; ratifications exchanged April 14,1836; and proc. lamation mado by the Presldent of the United States June 24, 1837. Establishes perpetual peace between the United States and Siam, Vessels of the United States entering any port of the Siamose dominiens, and selling or, purchasing corgoes of merchandise, to pay, in lieu of all import and export duties, tonage, license to trade, or any other charges whatsoever, a mensurement duty of 1700 tleals, or bata (equal to $\$ 1037$ ), for every fathom of 78 English inches in breadth upon vessels selling merchandise, and of 1500 ticals (equal to \$915) per fathom, similar measurement, upon vessels purchasing eargoes with epecie. It is prohibited to sell munitions of war to any person except the king, and also to export rice or import opium, the latter being contraband. It is stipulated that if hereafter the duties payable by forelgn vessels be llminlshed in favor of any other nation, the vessels of the United States shall be entitled to like diminution; and should any foreign nation, other than Portugal, to hereafter permitted to have consule in Siam, tho eame privilege shall be accorded to tho United States. United States morchants, desirous of briaging thelr goods on shoro for tratie, must deposit them in the king's factories, paying the customary rent of the conntry therefor. The treaty of 1833 completeiy suspended all commercial operations between the United States and Siam. On a vessel, say of $2 \overline{0}$ feet beam, the duty, at 1700 ticals jer 78 inchea, would amount to $\$ 3988461$ In 1855 (April) a new treaty was negotiated between Great Ilritain and Siam, to the priviteges of which Anerican commerce is entitied by article 4 of the treaty of 1833 between the United States and Siam, This new treaty with Great Britain authorizes that nation to have a resident comsul at Bangkok, after April 6, 18006; and after the same date the measurement duty is to be abolished, and a general import duty of 3 per cent. to be paid in money or kind, at the option of the importer. Disputes as to the value of goods are to be settled hy arbitrators. Opium may be imported fo e, but cen be sold only to the opium farmer or his agent. Export duty apecific.

Tripoli.-Treaty of peace and amity of June 4, 1805, not limited as to duration. Estabiishea a firm, inviolable, and universal peace, and a sincere friendship "on the terms of tho most favored nation," and guarantees to the United States like favors with those horeafter granted to any other nation. Vessels of the United States in the ports of Tripoli to be subject to
the same daties, chargee, and privilegea as the vessel of the most favoreil nation. United States vessels deatined for Tripolitan ports must be provided with proper paspporta; ${ }^{1}$ to examine which, not more than two persens, beeidea the rowers, are allowed to proceed from any Tripolitan man-of-war, or to go on board, unless permitted 80 to do by the Arrerican captain. In ease of distress, Unlted Statea veasels may put In, land nnd re-embark cargo, and repair, wlthout the payment of duties. The commerce between the United States and Tripoli-the protection to be given to Amerfican merehants, mmaters of vessels, and seamen-the right of eatabliahing consule in the regeney of Tripoll, and the privileges, immunities, and juriedictions enjoyed ly such consuls, to be on the aame footling with those of the most favored nation.

Treo Sicilies.-Treaty of December 1, 1846, to be in force ten years from date, elther party reserving the right to terminate it after that poriod, on glving twelve montha' notice of its intention to do so. When importing artieles of the growth or the mannfneture of the United States, Amerienn vessels to be on the same footing as to duties, charges, etc., whth nationnl vessels. Thie equality as to navigation dues applies only in respect of direct voyages if iaden, or of any voyage If In lraliast. Merchant vessels of the United States, forced hy atrese of weathor, or other similar cause, into Sicilian ports, to be exempt from port and tonnage duties, provided no operation of commerce ?4 carried on. The coasting trade is rewerved by each conntry to lts own vessels. The dreet importation of articies of the growth, profluce, or manufaeture of the United States to be subject to tho same dutr, whether imported In vessels of the United States or In those of tho Two Blellies. In the indirect trade, importations ander the flag of the C̈nited States into the ports of the Two Sicilies to lie sulject to differential duties. A ilecree was issued, December 18, 1854, by the King of the Two Siclifirs, extending to the indirect trade of ouch foreign nations as would be willing to recmprocato all the ailvantagea of the national flag. Under the aet of 1R28, prevlously given at length in the artiche Sicisx, page 1714, the government of the United States hes reciprocated the privileges thus granted hy the government of the Two Sicllies $\mid$ and the flag of the United States is therefore equalizel, In Sleillan ports, with the national flag in tho indirect trade.

Thrkey.-Treaty coneluded May 7,1830, and ratified February 2, 1831. Not limited as to duration. Vesaela of the United States to be treated, in frorta of the Ottoman empire, In like manner as vessels of the most favored nation; to have the same literty to pass the canal of tho imperial residence, and to go into and come from tho Black Nea, either lacien or In ballast ; and may be laden with the produce, manafactures, and effecta of the Ottoman empire, except such as aro prohibited, ns well as with those of their own conniry. United States veasels must sail under their own flag, and are prohihited from lending their flige to the ressels of other foreign nations, or to those of the rajahs. Importationa into Ottoman ports in vestels of the United Statea to be anbject to the same dutlea, chargea, ctc., as Importationa under tho flag of the most farored nation. Amerienn merchants eatablished in the stutes of the Sublime l'orte for purposes of commerce, to be at liberty to empioy semsarg-brokers or factors-of any nation or religion; such merchants or other American citizens residing in the Turkish dominions not to be amonable to Turkish tribunale for offonses commltted, but to be tried hy their own minister or consul, and punished accorling to his sentence. IJy virtue of tire most favored-nation atipulation, vessels of the Ottoman Porte are admitted into Unitel States ports on tho amme terme as American vessele. Intles, accordIng to the tariff of the Ottoman Porte, are based upon the ad ralorem principle; and the treaty nations usmally unme commiasioners every five or slx years, who, in
concert with a commiesion named by the Subllme Porte, regulate the "fixed values" of merchandlee imported. The present rates were flxed by a Britlah commission of thle character; and, In regard to many artleles of Amerfcan importation, especially cottons and run, the mode of valuation worke a practical diserimination, which ean be remedied only by the action of an Amerlenn commlesion remodelligg existlng valuations, ns reapecta the mannfactures of the United States.

Tunis.-Treaty of August, 1797, modifled by ennvention of March 26, 1799, and by subsequent triaty of February 24, 1824. Eatablahes perpetual peace ard friendahip betwoen the United States and the Bey of Tunls.: Vessels of the United Btates permilted to en. ter all the porte of the kingiom of Tunis on paying the unaal dutlea which are pald by the vessels of the most favored nations. Should the government of Tanis have need of the services of an Amerlcan vessel not previousIr engaged, it mnst hare the preferenco on paying the same freight that is usual with merchants for the same service. Commerce with Tunis under the United States fing to be conducted on precieely the adme footing, as to import dutles, fees, and all charges whatsocver, as is commerce under the flag of the mont favored nation. American merchants to be permitted to estaillah themselves, transect their own business, or nppolnt their agents, factors, etc., In the territorics belonging to the kingiom of Tunis.

Venezucla.-Treaty of peace, fricnelship, navigution, and commerce, coneluded Jannary 20, 1836; ratified May 81, and proclamation made by President of the United States Juno 30, of the amo year. To conthue in force twelvo years from ciate of ratificatlons; and further, untll elther party gives tweive montins' notice of its intention to renounce It. Vesgels of the Unlted States, no matter whence they come, or with what laden, to bo on a footing with national ressela. The same equality, Inchuding bounties, dutics, and drawbacks, to apply in regard to exportation or re-exportation. Vessels of the United Statee slalpwreeked, foundered, or In any other way damazed, on the coasts, or within the dominiona of Venczucla, to recelve all necessary nasistance and protection. Whatever may be imported la Venezuelan vessels may also be imported In ressels of the United States, and on the samo terms, as to duties and all other charges. The same equality as to exports. Articles, the growth, prodnce, or manufacture of the United States, to be subject In Venczusia to no higher or other dutles than similar artleles, the growth, prodnee, or mannfacture of any other foreign country. All favors hereafter granted to other forelgn nations to apply eqaaliy to the Cnited States on slnalar conditions. The customs, tariffs, and commercial regulations of Venezuela are mitject to frequent, and, oceasionally, onerous changes. The latest of these-that of April 27, 1850 -imposes an extraorllnary contritution upon certain Imports and exports, to take effect frem and after Iuly 1, 185 f. Among the exports thus affected are coffer, cocoa, indigo, hides, quinia. sarsujarilla, dye-wood, ete. The extraordinary import tuty is 20 per cent. on the amount of regular duties, and 15 per cent. on all articles that are Included in the free list, excepting gold and ailver in bars, hullion, or dust, printing-presses, printed books, machinery, etc.--Cm. Relat. U.S.

Treblzond, anclently Trapezus, from its resemblance to a trapeaium, a town of Asia Ninor, on the southeast coast of the IBlack Sen, lat. $40^{\circ} \mathrm{v}^{\prime}$ N.. long. $39^{\circ} 41^{\prime} 52^{\prime \prime}$ F. Population varionsly estimated at from 15,000 to 30,000 . The town ls buite on the declivity of a hill rlaing gently from the sea. It is a place of great antlipuity; ami, from the year 1203 to the tinal suluversion of the Eastern empire liy Mohamried 11 . in the 15th century, was the seat of a dukedom, or, as it was sometimes called, an empire, comprising the country between the l'hasis and the Ilalys. Its fortiticgtions are still of considierable strength, at least for a

Turkish city. The space iacluded within the walls is employed to connect the planke of the ahip's side and of great extent; bat it is princlpally flled with gardena and groves. The honses are moan in their oustward appearance, and comfortless within. - Tounnefort, Voyags du Levant; Kinnein's Journey through Asia Minor. Trebiaond has two porte, one on the west and one on the east side of a small peninaula, or point of land, projacting a short way into the sea, That on the east la the best sheltercd, and ia the place of anchorage for the largest ships. It is, however, exposed to all but the southeriy gales; but it does not appear that, with ordinary precantion, any danger nced be appreherded. The ground, from one-fourth to half a mile cast from the point, is cleen, and holds extremely well. Ships moor with open hawse to the north, and a good hawser and stream anchor on shore, as a stern-fast. At night the wind slways comes off the innd. Captain Middicton anys that the only bad weather la from the northwest; but that, though the swell be considerable, it does not cause any heavy strain apon the cables.-Nuutical Magazine, vol. il. p. 181.-At Platana, noar Trehizond, and quite as exposed, Turkish vesseis have from time immumorial rode in safety the whole winter; a satisfuctory proof that the danger supposed to be incident to the roads along the coast is wholly visionary.-Ibid.

Trade.-In antiquity, and in more modem timas, previously to the conquest of Constantinople by the Turks, and tise exclusion of all foreign vessels from the Black Sea, Trebizond was the seat of an oxtensive trade. Any one, Indoed, who casts his eyo over a map of Western Asia must be satisiod that this city is the natural eniporium of ali the countries to the sontheast of the Black Sea, from Kars on tho east, round by Diarbeker to Aniasia on the west. Erzeroam, the principal city of Armenia, is only about 185 miles sontisenst from Trebizond. Its merchants aro distinguished by their superior attainments, and by their enterprise and activity. For a lengthened period they derived most part of their supplies of European commodities by way of Smyrns or Constantinople: nothing, however, but the impossibility of obtaining thom at so convenient a port as 'Trebizond could have made thom resort to auch distant markets as those now mentioned; and it may well excite surprise, consldering the period during whieh the Hack Son has been open, that efforts wero not sooner mado to estabiish an intercourso with Armenia, Georgia, and the northwestern parta of Persia, through this channel. We are glad, however, to bavo to atate, that within theae fow yesrs this has been done, and, notwithstanding the difficulties that necessarily attach to every attempt to open new clannels of comineree with somi-civilized nations, the experiment has proved more than ordinarily successful. 'The policy of Russia has, of late years, given to Trebizond an impertance it did not formerly possess. Previously to the 1st of Janusry, 1832, the trade between Europo and Persis, by way of tho Black Sea, prineipaily centred in the lussian port of Redout Knlo, nt the mouth of the Phssis. This was a consequence of the exemption granted in 1822 to the Russian provinces to the south of the Caucasus from the dutjes charged in the other parts of the empire. Jut the cxemption having ceasod at the period referred to, and the trans-Caucasian provinces having beess suijoctedi to tie same dutics as the other provinces, the transit trade to Persia by way of Rodont Kald, Tefils, and the Caspian Sca, almost entirely ceased, and it is now carried on through Trebizond, Erzeroum, and Tabreez. In consequence, the lncrease of trade at Trebizond has been very remarkable.

Of the exports, ailik is by far the most important; and next to it are nuts, saffiron, tobacco, copper, wax, shawls, beana, gails, locches, etc. Their total value was estimated in 1840 at $\mathbf{£ 4 7 9 , 8 7 4}$, of which slik made neariy a half, or $£ 210,080$. See Torker.

Tree-nails, certnin long cyiindrical wooden pins bottom to the corresponding timbers. Thay are superior to spike-nalis or bolis of iron, which are liable to rust and loosen. The thickness of the tree-nails is usually proportioned to the length of the ship, allowing one inch to every hundred feet.

Trees (Age of). Among others mantloned in pn article in the American Almanac for 1838, p. 102, are, the Wallace oak at Eilerslie, Scotland, 700 years. (Some oaks are oupposed to have lived 1500 years.) Oal on estate of James Wadaworth, Gencseo, New York, 500 yenrs. Yew trees at Fonntain's Abbey, England, 1200 years; and in Scotland, said to be 2500 years. Elms, In Switzorland, 885 yenrs. Cedars on Lebanon, 800 years. Olsves, in the Garden of Olivea, Jernsalem, 800 years. Banian, in Hindostan,' 8000 years. Cypresses, at Grenada, 800 years.

Tret. In Commerce, an allowance of 4 lbs . for overy 104 lbs . for the waste which certain kinds of goods are liable to from dust, etc.
Triente, a city and sen-port of the Anstrian dominlons, the capital of a district of Illyria, situated near the northeast extremity of the Gulf of Venice, lat. (of light-house) $45^{\circ} 88^{\prime} 6^{\prime \prime}$ N., long. $18^{\circ} 46^{\prime} 5^{\prime \prime}$ E. Population in 1850-51, of the city only, 50,000 (?), and including the distrlet comprised within the limite of the free port. 82,598 . It is divided isto the old and new towns. The former is built upon elevated ground; the latter, which is lower down, is laid out with greater regularity, and is partly intersected by a canai, into which vessels not drawing more than nine or ten feet water enter to load and nnload. Tha harbor of Trieste, thongh rather limited in size, is easy of access, and convenient. It is protected from southerly gales by the Molo Teresinno, so called frots the Empress Maria Theresi, at the oxtremity of which the now light-house, mentioned below, has been constructed. The port, wlth the mole, forms a crescent one aad a lsalf mile in length, being a continued quay, faced with hewn stones, with stairs and jetties for the convenience of embarkation. On the north side of the port is a dock or harbor, appropriated exclusively for vessels performing quarsntine. It is walled round; and is furuished with botels, warehouses, and every sort of accommodation required for the use of passengers and goods. Ships under 300 tons barden lie close to the quays; those of greater size mooring a little farther oust. The principai defects of the port are, its limited size, and ite being exposed to the north weat wiads, which sometimes blow with much violence, and throw in a henvy sen. The galcs, however, are seldom of long continuance; and the holding ground being grod, when the anchors are backed and proper precantlons taken, no accident occurs. The tide at Trieste is scarcely perceptiblo; but the depth of water is influenced by the wind, being increased by a long-continued sirocco or sontheast wind, and diminiahod by tho prevaience of the enst-northeast wind, known by the name of Bioro. The access to the port is not obstructed by any baror shallow ; and there is good anchorage in the roads, in from 6 to 7 and 10 fathonss water. A good sailing vessel may leat in by night or by day, except it blow hard from the northeast or east-northeast, when sho had better anchor In the Bay of Roses, or Pirano, where slse will ride in perfect safety. Ships bound for Trieste are under no obligation to take pilots; but those entering the port for the first time would do well to take one on making the coast of Istria. Boats are always hovering off Rovigiso; they are not mannod liy regular pilots, bat by fishermen, who, thongh unfit to be trusted with the management of the alip $p_{0}$ know tha bearings of the places and the ts $^{*}$ of water. The fee usually paid thom for pilotage is tw inty dollnrs; in addltion to which, they are eupported at the ship's expense during the performance of quarantine. The lighthouso at the extremity of the Theresian mole is 106 tset (Engl.) high. The light is intermittent ; and may
be seen, mupponing the eye of the observer to be eleva-
ted 12 feet above the lovel of the ees, sbout 12 nautical uilles, or from PIrano on the side of Iatria, and the shoals of Grado on the Itallan conat. A Ilght-liouse has also been erceted on the point of Salvore, bearing from 'Irleste west by south, distant about 18 milies. The lantern is elevated about 103 feet above the level of the sea. From this point Pirano Bay opens, where vessels may anchor in safety in all eorts of weather.

Trieste has no command of internal navigation; but being the most convenient, or rather the only sea-port, not therely of the Illyrlan provinces, but of the Duchy of Austrin, and the creater part of Ilungary, she possesses an extensive commerce. Thia has been lucreased ly the facilitien affiorded to all sorts of mercantlle transactions by the privilege of porto franco conferred on the town, and a considerable extent of contiguous country. Under this franchise, ali goods, with but very few exceptiona, may be himprted into and exported from the city free of all duties whatever. Forelgn products, whell taken for consumptlon from Trieste futo the interior, are sulject to the payment of duties regulated by the Interior tariff of Auatrla. These are very various, consistiug partly of the raw and partly of the manufactured producte of Austrla Proper, Illyria, Dalmatia, Itungary, and Italy; with forelgn articles imported and warehoused. Among the principal articies of raw produce may be specisied corn, chielly wheat and maize, with rice, wlnc, oil, shumac, tebacco, wax, etc.; silk, silk rags and waste, hemp, wool, tlax, Jinen rags, hides, furs, akins, ote. The produce of the mines :rakes an important Item, consiating of quicksilver, cinnabar, iron, leall, copper, brass, litharge, alum, vitriol, etc.; the forests of Carniola furnlsh timber, for ship-building and other purposes, of excellent quality and in great abundance, with staves, cork wood, bex, hoops, tte. ; marble also ranka under this head. Of manufactured articles, the most in cortant are, thrown silk, silk stuffs, printed cottons from Austris and Switzerland, coarse and fine linens, and all sorts of leather. Under thin head are also ranked soap, Venetian treacle, liquors, etc., with joweiry, tools and ntensils of all serts, glass-ware and mirrors, Veuetisn beads, refined sugar, and a host of other articies. Of foreign articies Imported and reshipped, the most insportant are sugar, coffee, and dye-stutfa. Tricate Is also a considerablo depit for all sorts of produce from the Black Sea, Turkey, and Egypt.

Customs Regulations.-The enstom-house at Trieste has nothing whatever to do with the entry, reporting, ete, of vessels. When a ship arrives, she is reported to the health oflice; which publishes a list of arrivala and departures, with a statement of their cargoes, as they appear in the manifests. Shipa are cleared by the same otice, tho masters being assistel by the consuis of the country to which they belong. As soon as a vessel has perforined quarantine, abe loads or unloads without any interference or inspect.. by tho customs officers, or ly any one else. Goods unsusreptible of contagion may be lanci, d during quarantine. lleing a free port, the bonding and warehousing systein is, of course, unknown at Trieste.

Quarantine is strictly enforced at 'Trieste, and the ese tablishments for facilitating its performance sre complete and efficlent. The Board of Health at this port is the central or principal one for the Austrian atates; and malutains an active corresjrondence with all tine principal ports, botil in the Mediterrancan and cisewhere. There are twolazareitos-that calledSt. Teresa, or I azaretto Nuoco, is appropriated to vessels from the I srant and bigypt, which are, for the most part, subjected to the lough or full quarantine of forty days, It is apacious, and properiy guarded; having $=$ antlicient number of military and medical officers and ansiatants; with extensive quays and magazines for honsing and airing goods, i weiling-houses and apartments for resident officers and passengers, etc. It is, in fuct, one of
the most perfect estaolishnienta of the kind in oxistonce. The other, or old (recehio) layaretto, contlgnsengere performing a quarantine of not more than twentyeeight days $\mid$ and, though inforior to tho former, is anfficiently cepacious and oonvenient. The sanitary ofticen, includling that of harber master, are near the centre of the port; where also are moored ves. sela umier observation for a term not oxceedling elght days. Here also are facillties for communicating tiví roce with peraons under guarantine; and apaclous warehouses, with adequate guards and other officers. Jhut, notwithatanding these convenjences, if a reasel arrive having an infectlous malady on board, abe is not al. lowed to enter elther lazaretto at Trieate, but is acnt to an island near Venice, titted out for the purpose, where assistance may he attiorded with less risk of propagating infectic..

Careening, Stores, etc.-Timber at Trlente is exeellent, workmen good, and their wages moderate ; so that It is a very favorable place for careenlug and repalring. Water is very good, but rather searce; so that if a large aupply be required, due notice must be given. Ships aro aerved lis reguiar rotation. Beef la very gooll, but rather bigh priced. Butter and cheese are dear ; and fuel is excesalvely so. On the whole, therefore, 'l'rieste can not be consldered aa a favorabic place for the provisioning of a ship.

Banking.-There are no pulilic Lanka at Trieste. The Bank of Vienna has an oflice here, but it la merely for the exchange of lia notes for cash, or, more frequent. ly, of large notes for amali ones. Theso notes, being guaranteed by chovernment, are legal tender, and a geuecal circulation, but no other company is allowed to isaue notea to ho used as a circulatling medium. There is not, however, any deticiency of currency, Banking busincse is tranascted by private companies, or by Indivilusia, who are sulject to certain regulathons, and are obliged to lay before compotent authority an atteated statement of the capital embarked in their concerns. Their buslucss prinelpally consists in procuring billa of exchange from other places for the use of the merchants of Trieste, or in discounting (in which latter operation they have many private compctitors), at the rate of from 4 to 6 per cent. per annum, accordlag to the nature of the pisper offered, and in proportion to the scarcity or abundance of cash.

The Austrian ofliclal returns of imports from the United States for Trieste alone, it ia seen, exceed the returus for all the Austrian ports, as per Linited States Tressury Keports. More than threc-fourthe ef the foreign commerce of Trieste is carried on slong the shores of the Mediterrancan. The remainder is distributed between England, the United States, Brazil, Mexico, the Antillea, Russia, and the Netherlanils. The tirect trade between the port of Trieste and the tro Americas, the Indies, and China, has within a few years become more actlve, and the tonnage apectally employed by thls inert in such direct trans-Atlantic commerce notsbly augmented, in consequence of the succesaful competition on the part of the states lying on the basin of the Mediterrancan with 'l'rieste for a portion of this trsde.

The average annual value of the general commerce of Trieste during the preceding ten years was: imperts $140,000,000$ francs; and exports $76,000,000$ francs; a total of $216,000,000$ francs.
The figures from 1839 to 1819 show an increase in imports of 70 per cent., and in exports of 8 per cent. The great ditterence between the increased values of total fimports and exporis is accountel for by the fact that but a small propertion of the produce or manufactures of Austria finds its way to foreign countries through the port of Trieste. Most of this kind of merchandise deathed for tho Elast, the Unitel States, and South America, is forwarded by the lower llanube, by the Eilie, and $b_{j}^{-}$IIamburg and Bremen. Besites, this diffurence can not be regarded as an evidence that the

balance of trade is so heavily agalnst Trieate, when it is considered that many milliona of dollars are annualiy exponded in the markets of this port by the 70,000 sailors, the 25,000 passengers conveyed by atemmahips, and the 10,000 vessels that yearly arrive there.
It is proposed, and not only with the sanction, bnt under the patronage of the Anatrian government, to construct three first-clasa steamohips to run regularly between. New York and Iriente, Louching at Corfu, Malta, Algiers, Cadiz, and Lisbon. Should thls profect prova auccessful (and the high character of ita originators is a atrong gnarantes of its auccess), its effoct uron the comueroial and political relations of the United States muat be very great. In opening new ehaonols to the industry of the Old World, it will also increaso the demand for the raw produce and manufactures of the Unitce's States. The advaragges of this proposed ateam coris.nunication betwoen Naw York and Tricste will be greaily increased by the completion of about aixty milces of rallrond between Trieate ar ' Vieuna. This, when completed (and the work is in .ctive progress), will connect Trleste with all the principal citlea of Europe, and make it the entrepôt of a larga German trada, It already enjoya steam communication with the Levant, Constantinople, and Alexandria; and, when the propased lino to New York ahall havo been astablished, Tricste will become an extensiva depot for the raw materials of the United States. During the four yames eading with 1853, Naw Yurk received direct from Tricato merchandise to the value of $82,085,282$, and oxported direct to the same place gooda of the value of $\$ 1,550,575$. The following eummary oxhilits the general ioreign trade of Trieste in 1851 compared with that of $\mathbf{1 8 5 0}$, and also the inerates:

| Years. | Imports. | Esporta. | Total. | $\begin{gathered} \text { Imparts } \\ \text { of from } \\ \text { V. States. } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: |
|  | $\begin{array}{r} \text { Frabect } \\ 225,3.37,000 \end{array}$ | $\begin{aligned} & \text { Fraigec, } \\ & 094,451,000 \end{aligned}$ | $319,788,000$ |  |
| 1850 | 202, 126,000 | 91,347,900 | - $491,473,000$ | 10,647.000 |
| Increa | 29,211,010 | 3.104, (10) | 20.816,000 | 4,041. |

The following table, translated and condensed from Austrian oflicial documonts, will present an interesting statement of the number of American vessels employed in the trade of Trieste from 1842 to 1851, inclusive:

| Yosm. | Venote | Yosif. | Vomele, |
| :---: | :---: | :---: | :---: |
|  |  |  |  |
|  |  | 1848. |  |
|  |  |  |  |
|  |  |  |  |

During the samo period, the largest number that entered (the Austrian flag excepted) was 8380 vessels, under the Greok fiag; and the smallest, 28 , under the Belgian flag. The relative importance of the fiag of
each vation in the general foreign commeree of Trieute wifl be seen from the fllowing condensed table:
Nuthen of Vegazla, of at, Nattong, whioh abrived at
 185t, AND THE l'moPontion whiou tur Fhan of zaOn neate to tite whote Nomegh.

Commabon of Tuieste ix t850.-(Valet in Flouing.)

|  |  |  |
| :---: | :---: | :---: |
| Auatrtan porta | 29,844, 802 | 47,727,308 |
| Forelga porte | 91,027,807 | 01,418,603 |
| Total by nea | $120,980,103$ | 163, 146,410 |
| Total by land. | 32,808,090 | 34,651,722 |

We add a tabular etatement of the commercial movement of that port during a period of ten years:

| Yesta. | shiph. | Tonoage. |
| :---: | :---: | :---: |
| 1846. | 16,183 | 985,514 |
| 1847. | 17,321 | 1,007,93 |
| 1843. | 17,812 | 924,816 |
| $184 \%$. | 20, EK3 | 1,200.258 |
| 1850. | 2t,124 | 1,323,796 |
| 1851. | 24,101 | 1,408,802 |
| 1852. | 27,931 | 1,656,653 |
| 1553. | 29,317 | 1,675.836 |
| 1854. | 26,650 | 1,780,911 |
| 1855. | 21,081 | 1,439,107 |

On comparing the average of the first three yeare of this period with the average of the last threo yeare ( 973,220 against $1,631,663$ ), the increase within so short a space is found to be in the proportion of 68 to 100. Marseillos is far from exhibiting the same rapldity of pregress. The basia of the prosperity of Trieste, besides, is all the moro solld, as it is owing to the increased intercourse both with purely Austrian and foreign ports. The natlonal trade, for instanee, from 1846 to 1848, amounted to $416,7^{\wedge n}$ tons avorage per analm; from 1853 to 1855 it had incr.ased to 854, ,i53tons average per year, or more than doublo. During the years 1850 and 1855, inclusive, the Austrian tonnage entered in and out at Trieste was 6,206,316; foreign, 2,981,928 tons. The trade with Greece, Egypt, ti.9 Levant, and Black Sea, had rlaen from $25 \overline{2}, 741$ tons to 496,394 tons averugo per year during the same period.

Commerde of Trieste and Vbmice for tar Vear 1851.

The treaty of 1829, between the Unlted States and Austris, establishes as perfect reciprocity of commarcin] intercourse between the two countrles. Its principal atipulations are as followat
There ahull lo, between thil United States ferritories and thuse of Austria, a reciprucal liberty of comnieree and navigation. All the ports, places, and rivers of the territories of alther power, open to forelgn comunece, ahull be open to the iuhabitants of each reapect!vely. Austrian vesasla arriving, elther laden or in ballast, In the rorts of the United States, and, reciprocally, vessels of the United States, elther laden or in ballast, arriving in the ports of Austria, shall be treated, on their entrance, during their atay, and at their departure, upon the same footing as uistonal vosacls coming from the same place, with respect to the duties of toninge, Jight-housen, pliotage, and port charges, of whatever kiad or denomination, Jevied in the name or to the profit of the government, the local auchoritien, or of any private estublishment whatever. All kinds of merchandise, and articles of commerce, either the produce of the soil or of the lndustry of either country; which may lawfully be imported into each reapectively, shall be admitted on payment of the saine datiea susd chargen, of whatever kind or denomination, as are applicable If imported under the national fiag. This equalization of import dutles and other charges to apply to the veasels and cargoes of each country respectiveiy, whether they clear directly from the ports of the counity to which they belong, or from the ports of any other foreign country. The produce or manufacture of elther counti; shall be admitted into the forts of the other on the same terms as the like articles, being the jroduce or manufacture of any other foreign country; and no prohlibition shall be imposed on the iniportation or exportation of any article, the produce or manufacture of either country, to or from the ports of the other, which shall not equatily extend to all other nations. The ressels of both powers, roapectiv ly, shall be adnitted into the ports of either, on the same terms as national vessels, with the produce or manufnctare of their own or of any other country. In exact reciprocity sliall be observed in the ports of the territories of either power, in reapect to the vessuls of the other exportiog or re-exporting merchandise or produce of any country not prohibited; and the same tountien and draw backs shall te aliowed, whether such exportation or re-expertation be inade in sessels of the one party or of the other. The coasting trade is reserved liy each power to its own ressels, reapectively. All favors hereafter granted hy either party, in respect of navigation or commerce, to any wher nation, slasil become commion to the other purty, freely, if it was freely granted to such other, or onl similar terms if it were conditional. The consuls, vice-consuls, agents, and commissioners of each of the high contracting parties shall enjoy, in the ports of the other, the same privileges and powers as those of the most favored nation. The treaty to continue in force for ten yeara, with the usual tweive menths' notice by cither party desiring to terminate it after that time.

Tonnage Ihties.-On the 24th January, 1sít, the central maritime government of Austria issued public notice that from that date the tomage duties in forco at the port of Trieate should be extended to all ports throughout the empire open to commerce. These dutles are regulated hy ordera dated 8 th November, 1815 , and are as fullows:

A mercantile house in Now lork, long engaged in the direct trade between thint port and Trieste, furnishes the following statement of charges on a vessel of 1000 tona hurden, entering the latter port:

C upersge, at 6 zrentsers per ton $\qquad$
Plotsge, st 3 kreutaer per ion
arecte
Ifeelth department upon mrrivel an
Marias lautiuto. Martas lantluto.

Total axpense on a reesel of 1000 tons ...... $\overline{881} 18$
The florin equala 60 kreatzera $=48$ \& cents; conae. quently, tide whole oxpenses amount th $\$ 13637 \mathrm{j}$. Whether veasels take froight for soveral partien, or a single house, the stevedores make the same charges for atowing away the goods. The following are their fees for prineipal merchandise, via. 1 for cotton, 2 fforms per ton; for wool, hemp, fax, oakum, and roots, 1 turin 30 kroutaora per ton. Goods of such weight as raisins (black and red), fige, ollve-oil, ateel, cream of tartar, argol, ete., 80 kreutzers per ton; ragn, grain, sumach, Laurel leavea, tobac:o, yelliow berrice, and Juniper herrien, 1 florin per ton. Goods which are measured, 30 kreutzers per ton measurement. Other articles in the amme proportion. In discharging veasela, the only espenses a:e tho lighters, which are provided by the agents of the vessels, and which are pald for by the receivers of the goods, in accordance with a general tariff, which the proprietora of the ligatera have fixed upon by general consent. The captaina are obllged to put the goode on board the lightere at their own espense. For this purpose hands can at all times be procured at 1 florin 16 kreutzera to 1 florin 80 kreutzers per diem. ( 55 cente to 64 cente). Men-of-war, national as well as foreign, and vesaels putting in from atross of weather, or other necessity (whleh must, however, be verified), and not trananeting any operations of commeree, are ailmitted to entrance, and sllowed to purchase frech provisions and other necespariea, and to take a pilot, exempt from tonnage duties. Tonnage of national vessela to be ascartaiued by their register; of forelgn vessela, by Austrian measurement.

Sanilary Regulations.-These are numerous and complicated; such only are suljoined an relate to vessels coming from all ports of the Anericas, inclading all the ports of the West Inilies: 1. Vessels with clean bills of health to be admitted, with crew and paseengere, immediately on arrival, to free pratique. 2. Veesels with suapicious bills of bealth, such as having touched on their passage at aunpected places, to be aubjected to ten days' quarantine at the lazaretto, for passengers, crewn, and susceptilile goods; and goods not susceptible, to 5 days. 3. Vessels with foul Lills of health to be suljected to fifteen days' quarantine at the lazaretto, for passengers, crews, and susceptible gools; and goods not ausceptible, 10 days. The quarantine charges are very moderate, being, fur entry and departure, upon a elhip of 100 tons and upward (exclusive of 72 cents per diem for wages and food to the gondoller), about 8432 ; quarantine dues upou goods, 6 kreutzera (a little more than $4 \frac{1}{2}$ cents) per 100 dorins value ( 48 (80); and upon susceptibic goods, 4 kreutzers ( 34 cents) per 1000 lbs. weight.

General Fiemarks.-The de velopment of the disitime comnerce of Austria dates hack as far as 18t5, or, rather, from that period down to 18:0; during whieh it grailuaily attained, chiefly by the aid of steatm navigation, a high state of prosperity. The great commercial activity of the empire is principally concentrated at the port of Trieste; Venice and Filume, su far, at least, as it respecta foreign trade, being hut subsidiary to this vast entrepuit. Desides these, Alastria postises onf the Adriatic, 25 prots of accondary rank, which ciaim importance chictly from their extensive coasting trade. The principal of these are Chiuggia, to miles south of Venice; Loviguo, in Istria; Zara, Spalato, and leaguan, in Dalmatia. This city was founded about the middie of ti:e 15 th century, and once enjoged an extensive trade. It still exports manufactures of silk, leather, rosogllo, anchovies, etc. It continued to be a republic under the successive protection of the Greekn, Venetians, and Turks, mitil 1806, when it was

erected by Napoleen lito a duchy for Marahal Marmont. Trierte, Venice, and Fiume, with some amall ports on the Croatian shore contiguoua to Flume, are free ports. Yrior to the year 1850, all produce and merchandise of whatever deacription, transported from one part of the Austrian territories into another (the empira being divided by an Internal cuatoma line), were subject to duties of entrance and clearance, equally an if they had been imported from, or exported to, a foreign country. 13y an imperial patent, iasued on the 7 th June, 1850, this line was suppreased, and all dutien, prohibitlons, etc., previously existiog, wore abolinhed; some formalities being reserved in respect to certain articles of which the government retained the inonopoly. In aubuntting to the omperor his projet for this reform, the minister of inance observed, thet "the influence of auch a measure, In consolidating the vast and widely-extended resources of the empire, in establishing Its unity and augmenting ita powor, would more than counterbaiance the inconsiderable reduction of $1,099,110$ which it would cause in the revenues of the emplre."

This tiberal measure was soon after followed by another, equally beneficial to the forelgn commorce ol Aus-tria-namely, the new tariff that weat into operation on tst Fehruary, 1852. In the complicated dotails of this tariff, there were various changes favorablo to American trade. The duty on cotton, although considerahly reduced from former rates, was, prior to the adoption of this tariff, $800^{7}$ g centa per 125.5 lba . The tariff of 1852 reduced it ugain $48 \frac{1}{2}$ cents per 110 libs. for one year, and the year following to about 4 cents per 1104 ibs. Since this iatter period-nancly, January 1, 1854 -the article has been made free. Still later modifications of the Austrian tariff have boen mate, but they do not apply to any of the United Statos staplos of expert. Previously, tohacco was a strict governneent monopoly; under the new tariff, individunls are al. lowed to enter it for their own uso, at reduced rates. Manufuctured, it paid before 1852, $\$ 1940$ per 100 lbs.; under the new tariff, tinis was reduced to $81212 \frac{1}{2}$ per 100 lbs . This duty has been retained in the new taritf of 185 J , with an additional daty, however, of 1 fiorin per livre de Vienua ( $48 \$$ cents), on ommunufactured, and 2 florins 30 kreutzers per livre do Vienna ( $\$ 121$ ), on manufactured. Tho duties were reduced also on riee, whale oll, and tho products of the whale-fishery, wood-eii-ware, tools, implements, and macbinery for agricultural and household purposes, Iadia rubber fabries, etc. During the first year of the operation of the tariff of 1852 , cotton $t$ wists paid $\$ 388$ per 1101 lbs.; the ensuing year this was reduced to $\$ 3$ 39h. The costuer before 1852 was equivalent to 125.5 lhs. ; but, in or ler to bring about a conformity to the centner of the German Customs Union, it was fixed thet year at 1101 ibs, ; that being the weight of the Prussian zoll-centnor. Several articles, when imported by sea, are admitted by the tariff of 1852 at rates atill more moderate; for oxample, alum, In general rated at $22 \$$ cents per $110 \neq \mathrm{lbs}$.. pays only $8 \frac{1}{2}$ cents when brought in by sea. As the United States stand on the footing of the most favored nation, by virtue of the treaty of 1829 , the provisions of the tariff of 1852 have contributed considerably to the employment of Einited States shipping.
'ithe commercial reform of 1852 was , in a great moasure, the result, or rather one of the resulta, of the revolution of 1848 . Immediately after tranquillity hat been restored, tho Haron de Bruck, then minister of commerce, was charged with an administrative commission to prepsre a new tariff upen the following bases, adopted by the Council of Ministers: An assimilation, as nearly as can be, to the tariff of the German Customs Association; the sulostitution of specific for ad valorem duties; the adoption of the quintal of 110: 1bs., as a basis of quantities. On imports: The abolition of prohibitions; adequate protection to aa-
tional inilustry ; a graduating scale of duties on manufactured articles, according to the amount of lebor etrployed thereen; a reduction of all taxes on araicles of frat necessity, elther for manufactures or consumption. On exporta : Batance-dutien (weighing-dues), and all necessary formalitiza as almple as possible ; a substitutlon of protective duties for prohibitions; the abolition of all premiams or drawbacks, unless in cortaln apecified cases. On the proceding busea, the tariff which fias lieen in part considered was submitted to the councll, and had been under consideration several montha, when the treaty of a custeins league lietween Pruasia and IInover permitting no further delay; it was submitted to the emperor, and signed on the 6th day of November, 1851, at the very time that a commercial congrasas, to be composed of delegates from the different German states, was summened to meet at Vienas in January, 18\%.' The imperial patent, which designated the 1st Feliruary, 1852, as tho day on which the new tariff ehould go into effect, contained several orders of a tamporary character. One was an extra duty of 10 per cent. on the ar wegate duties levied un cerlain merchandise bef prohibited. The duty on raw cotton was modifie., and other temporary provislons wore made, which, so far as they concern American trade, have benn already adverted to.

Indeed, tho tariff itself was not deaigned to be permanent. It was tried only as av experiment, and, by limitation, was to expire at the end of October, 1854; tise government being mean while precluded, on the one luand, from raling the dutles on importa for manufacturing purposes, and on the other from reducing them on articles manufactured haif or in whole. At the same time, the export duties on articles of the former class could not 1 a reduced, nor could similar duties on those of the latter be raised. The imperial patent, moreover, contained one notahle provision, viz. the duration of the tariff was to depend on the contingency of a treaty of cominerce (with I'russia) being effected before the period fixed for Its termination. It would shod but littlo light upon the commercial relations of tho Uinited States with Austris to follow up, and recount in this work, the proceedings of the commercial congress assembled at Vienna during the wintor of 1852, or to iccapitulate the resolutions adopted by the delegates of the southern states before presenting themselves at Berlin. It will suffice to say, that on the 19th February, 1853, a treaty was effected between Austria and Prussia, which was acqulesced in by all the other states of tho Zoll-Verein. This treaty, stipulating as it does for largo and reciprocal commercial concessions bctween tho two powers, as a fitting prelude to a general customs league between all the German atates, necessarily led to a revision of the tariff of 1852. This resulted in the adoption of the tariff now in force; to understand which, however, it must bo borne in mind that many of the articies enumerated in that portion of tho tariff, though rated at different duties when coming from foreign countries, aro free when imported by the frontiers of the Germen Association, or coming from the interior of the associated states.

Theso privileged articies aro specifically defined in a supplementul oppendix to the tariff, dated February 10, $180 \cdot 4$, and prefaced in the following terms: "As thio first result of the arrangement entered into at Berlin by tho Eisecutive Commission, conformably to the 23d article of the treaty of commerce and of customs of the 10tin February, 1853, and for the purpose of correcting some erroncous impressions, pulitic notice is given that the foliowing are the true constructions and modifications of the tariff of the 5th December, 1803. Said constructions and moditications shall bo carried ints effect so soon as they are received at the different bureaux of customs." (Then follows the list of artjcles coming under the special provisions of the treaty.)

The causes that compelled the revision of the teriff
of 1852, as well as the adoption of the present tariff (of 1854), are set forth In an articlo which appeared in the officlal journal, published at Vienna, of the 15th Decembor, 1853.
In reforence to the treaty with Prusela, this articlo holds tho following languago: "Other considerations induced a revision of tha tariff of 1852. The treaty with Prussla is the first step in reforming the commerciai policy of the ompire. From it must result, at no very distant day, an Anstro-Gernian Customs Union; and a gencral reduction in tariff dutles is the most fitting prelude to so desirablo an event. Besides, the commerelal trenty of Augast 7, 1852, concluded with Parma and Modena, removea all obstacles to an AustroItalian Customs Union; and thus tho event referred to (an Austro-German Customs Union) would present a guarantee for the prosperity and peace of the contlnent. The changes and modineations whielt could contribute to thls end should eommand our most serious consideration. These are principally such reiluctions in tariff dutles as aro dumanded ly the best interests of commerce-not, however, to an extent that
might in any way prove detrimental to tho industrial resources of tho empire. Succoeding, as It does, a reatrietivo system, in operation for more than half a century, tho tariff of 1852 is atill encuinbered with onerous duties and oppressive restrictions, repugnant to a great association of states accustomed to the most liberai system of eommercial policy. Besldes, the augmented exports of 1852 and 1853 demonstrato the wiso policy of a general reduction of taritf datles, and furnish liicontestable evidence that such a measure will most effectually repair the evils of past commercial legislatlon." The preceding remarks contnin a summary of tho official exposd already referred to, and oxplain thic motives that induced tho general remodification of the Austrian tariff. Tho abolition of the govermment monopoly of tohacco would remove the mest serious and the only reinaining restriction on Amerienn corrmeree. The custome mion with the Germanle atates, so much desired by Austria, will accomplish this, if it should not the effected before that event ehall happen. $-U . S$. Com. Relations. Trinidad. Trimitat is separated from the min land of south Amerlea by the Gulf of Paria. It is ahout to miles long nat iot miles wide, with an estimated superticial area of 2020 square miles. Capital, D'uerto il'Espana. Trintlad appars at a diotance tike sn humense ridge of rock along its whote morth front; but on entering the Gulf of larla, wne of the mowt magnificent, variegated, richly luxuriant panoramas that nature ever formed is presentel to the eye of the voy:ager. To the east the waves of the mighty trinuco rispute for the empire of the ocean wilh contending bllows, and the lofy montainx of Cumana rise from the horizon in stupentuas majesty; and on the wes! appear the cajen, ineadiands, mountains, hills, valleys,
and plains of Trinhlad, enameled with eternal verdute. The fecundity of the soil, its gignntic vegetation, is benutiful rivirs, enchanting slopes, forests of pilus, groves of eitrons, and herlgen of spices and pretimes, its fine azure skies and clastic ntmosphere, have ead and all combined to crown the isle with the appeliation of "The Indian l'aradise." The ishami is madeni"a section of the opposite continent; tho same strata, the same rocks, fossils, te., aro common to loth. Hs formation is evilently volcanic, and in many parts volcanic action is stifl going on, as Indicated by its mul voleanes and other cognate developments. The precious melals are not founl here, nor indeed are ath othere, exeepl in small yuantilites. Coal is fuond abous

on acy and bu funis, nhout portio pensio, nanco that it minist of the that sions, houses on thi
five miles from tho shore. But the most remarkable mineral phenomeaen is the asphaltum, or pitch lake, which covers an area of half a league.

Staples as in the other islands. United Statea vessels nise export heavy quantlties of Iron, brass, lead (old), and hides. Tho imports from the United States in 1853 were $\$ 537,604$, and exports to United States were $\$ 31,483$. Anerican vessels in Port of Spain in 1853, 59 ; tonnage, 11,172 . Imports from United States from 1st January to 30 th June, 1853, $\$ 308,716$; Imports from Ist July to 3Ist December, 1852, \$268,148.
l'ort Regulations.-Upon every ship or vessel of 50 tons and upward, for overy registered ton, 36 cents. Upon every ship or vessel of 25 tons and upward, but under 50 tons, for every ton of registered tomage, 30 cents; and upon every ship or vossel under 25 tons, for every registered ton, 6 conts. Lumber, staves, brieks, slates, shingles, coal, cte., are also sulyject to a small wharfnge duty. Sugar, cocoa, coffee, rum, indigo, ete., are liable to an oxport duty in thls island. Triuidad embraces an area of 1970 sijuaro miles, containing a population of 45,284 .

Trinity EIOuse. Tho full title of thls corporation is,"'The Master, Wardena, and Assistants of the Guild, lraternity, or Brotherhood of tho most Gloriens and Undivided Trinlty, and of Saint Clement, in the Parish of Depiford, Stroud, in the County of Kent" 一 an institution to whoso mombers is intrusted the mmagement of some of the most important Interests of the seamen and shipping of Eingland. The earlier records, togother with tho house of the corporation, were destroyod by tire in 1714; so that tho origin of tho institution can only now bo inferred from usigo and the occasional mention of its purposes in documents of a former period. A similnr society, for the like purposes, was nfterward established at Inall, nud also another nt Newcastle-upon-Tyne in 1537; which threa establishments, says Jlokluyt, were in imitntion of that founded by tho Einperor Charles V, at Seville, in Spain; who, observing the numerous shipwrecks in the voyages to and from tho West. Indies, occasioned by the ignornuce of scamen, established, at the Cusib de Coniratacion, lectures on navigntion, and a pllet-major for the examination of other pilots and mariners; having also direeted beoks to be published on that suliject for tho uso of navigators. According to some authorities the incorporation was founded in tho year 1515. It is probable that with IIenry VII. originated tho scheme, afterward carried into effect by his sen, II enry V1II., of forming efflciont Navy and Almiralty lloards, which then tirst became n separate branch of public service. During the reign of Ilenry V1II. tho arsenals at Woolwieh and Deptford were founded, and the Deptfordyard establishmeat was sulisequently placed under tho direction of the Trluity Ilouse, who likewiso surveyod the nava,, orlislons and stores. The earliest oflleinl document elating to tho Trinity IIonse now extant is a charter of incorporation made by Ienry V[II. in the sixth year of his reign. An exmplification of this charter was gratited by George II., in the third year of hls reign.

The revenue under the management of the Trinity IIouse arises from the dues payable to the corporation on account of light-houses, buoyage and beaconage, and ballustage; and from tho interest of money in the funds, and the rent of freehold property, monounting to uhout $£ 16 i 6,000$ amuunlly, Ititherto by far the greater portion of this large revenue has been expended on pensions to poor disabled semmen, and on the maintename of their widows, orphuns, etc. ; and it is admitted that it has been both judiciously and ecenomically administeres. It is heneeforth, however, to ferm part of the "Mercantlle Marine Fund." The net provides that puymonts now chargeable on tho "fund" tor pensions, ete., may bo commuted. The expenses of lighthouses, ballastage, and beaconago are also to he charged on the "fund," and the rates of toll are to be revised
nod fixod by her majesty in councll. The ballaatage rates under the Trinity House, being $n$ charge peculiar to the Thamea, are to be made peculiarly applicable to servlces performed for the safety ond convenience of the shipping frequenting that river.

Of thia corporntion Lord Palmerston lately remarked, at the annual dinner given by the board of managers, "Thare is, indeed, a unlty of operation between tha government that may have to administer the affairs of thia country and thla body; for it is the function of the Trinlty Corporation to provide pllots for those theussnds of keels that plow the waves that wash our shore; and, on the other hand, to ereet those lights which warn navigators from dangera which thoy would otherwise have to encounter, and whlch point out to them the havens where safety is to be obtalned."-Sec articla Lignt-novses.

Tripang, or Bea Elug (Biche do Mer), a species of lish of the genus IIoluthuria, found chlefly on coral recfs in the Eastern seas, and highly estemed in Chlna, into which country it is imported in large quantities. It is an unseemly-looking substance, of a dirty brown color, lard, rigid, scarcely possessing any power of locomotion, or appenrance of animation. Sometimes the slug is as much as two feet in length, and frem seven to eight inches in circumference, A span in length, and two or three inches in girth, is, however, the ordinary size. Tho quality and value of the fish, however, do not ly any menns depend upen its size, but upon propertles in it neither obvious to nor discerniblo by theso who have net been long and extensively engaged in the trade. In shallow water the animal is taken out by the hand, but in decper water it is sometimes speared. When taken, it is gutted, dried in the sun, and smoked over a woed fire; this being the only preparntiou it receives. The fishery is carried on from tho western shores of New Guinca, and the seuthern shores of Australia, to Ceylon inclusive. Indeed, within the last few years it has been suceessfully prosecuted on the shores of the Mauritius. The whole preduce goos to China. In the market of Macaasar, the grent staple of this fishery, net less than thirty varieties are distinguished, varying in price from five Spanish dollnrs a picul (133z llis.) to fourteen times that prlce, each varlety being distinguished by wellknewn names. The quantlty of tripang sent annually to China from Maenssar is s.bout 7000 piculs, or 8333 ert.; the price usually varying trom 8 dollars a picul to 110 nad 115, according to quality.-Cnawfersis Indian Archipelago, vol. iii. p. 441. There is also a considerable export of tripang from Manilla to Canton. Hesides tripang, fish maics and sharks' fins are exported to China from every maritime country of Indla.

Tripoll. This regency is the most advanced of all the larbary stntes, in civilization. It possesses a vast sea-const, extending 350 leagues, from Tunls to Egypt. With the excoption of where tho desert ineets the sea, near Monktar, the northern or naritime part of Tripoli, for n few miles from the coast, has the same fertility nud productions ns Morocco and Tunis. Its area is es. timnted at 100,000 square milles, with a pppulation of $1,800,000$. Its products aro corn and fruits, in great variety and abundance; also cotton, silk, tobaceo, saffron, madder, and castor-oil. In the interior, semna, dates, and galls are the prlucipal staples. ']ho exports consist of dates, olives, straw mats, eartheis-ware, and other domestic manufactures, partly exported ly sen. and partly disposed of in larter to Bedovin traders. The other munufactures of Tripoli are carpets, thick cloaks, camlets, gonts'-halr sacking, prepared skins, Moroceo leather, and potash. These, tegether with the produce of Central Africa, which ammally arrives in enravans, are exchanged for Furopean sad colonial roads, The principal toade of Tripoll is with Malta, Tunis, and the Levant. The sea-porta are Tripoll, llengnal, and Dermuh, with soveral others of little or no importnnce.

The navlgation and commerce of tho two principal ports, for a series of years, are thus glven by French suthorities: In 1846 there entered, Tיrkish vessels, 108; Greek, 35; Tuscan, 14; Maltese, 14 ; French, 14; Russlan, 4; English, 3 ; Sardinian, I; Austrian and Sicillan, esch, 1. Total, 195 vessels; of which 167 were laden with merehandise valued at $1,8: 2,000$ francs. Daring tha same year there cleared-l'urkish vessels, 78; Greek, 25; Tuscan, 15; Maltese, 18; French, 14 ; English, 3; Rusalan, 2; Sardinian, 2; Austrian and Sicliian, ench, 1. Total, 159 vessels ; of which 121 wore laden with produce valued at 983,000 francs. In the port of Bengazi thera entered the aamo year 142 vessels, of which 113 were laden. Proviaions (chiefly barley) and tobacco aro extensively and profitably imported into Tripoli. This trado is chiefly monopolized hy the Turks, Greeks, and Russians. Tho vessela of these countries trale with the ports of the Levant, carrying to those places eargoes of salt taken on board at Żoura.
Commerciab, Movements of tie Rzagncy of Tripoli in 1551 AND 1854.

Navigntion returns for this port in 1851 aro condensed as follows :

The duty exacted in the Tripolitan porta is four piastres per 80 kilogra.ns--equal to shout elght cents per ton. Filots are not often emplove 1 ; when required, the captain of tho port must furnish them free of expense. Quarantine regulations the same as at Constantinople. Notwithstanding Tripoli is tributary to the Ottoman empire, there is a separate treaty between the linited States and that regeney, ratilled Juno 4 , 1805, placing the commerce between the two countries on the footing of the most farored nation. - Com. Rel. C'. s.

Treaties.-By the treaty concluded with Tripoll Juno 4. 1805 , it is stipulated that the consuls and agents of hoth nations, respectively, ahall huve liberty to exercise their religion in their own houses; and those of the same religion shall not be impeded in groing to the consul's house at tho hour of prayer. The consuls shall have liberty and persomal security given them to travel within the territories of each other both by land and sea, and shall not be prevented from going on thard any vessel that they may thlnk proper to visit. They shall have, likewise, the liberty to appoint their own Iragomans and brokers. In case of any ilispute arising between the contracting partien, no appeal shall be made to arms, nor shalt war be declared under any pretext whatever; bot If the consul rexiling at the piace where the dispute shall happen shall not tre alile to settle tho same, the government of the country shall atate its grievances in writing, and transmit it to the other; and the period of twelve ealendar months ahall be allowed for anawers to be returucd, during which time no act of hostlity shall be permittel by either party; and in case the grievancea are not redressed, and a war should be the eveut, the consula and cltizelis or sulbjects of both parties, respectively, shall be permitted to embark, whth their eifects, uncolested, on
bosrd of what vessel or veasola they shall think proper. If any disputes shall ariso hetween citizena of tho United States, or any persons under their protection, such disputes shall be settled by the consul of tho United States in the samo manner as stated above, in Morocco. The sume provision is mado in the treaty with Tripoli, in respect of homicides, as $\ln$ the treaty with Moroceo. The cars of the property of citizens of the United States dying in the regency of Tripoli is to la committed to the care of the consul, unleas otherwise disposed of by will ; and no hinderanco is to bo interposed to the execution of any will that may appear.
"The commercial Intercourso of the United States withln this codsular distriet is dependent solely on the regulations of the mother country. Theso regulations aro set forth In the tariff settled between Turkey and Great Britain on the 31st of October, 1850, and which applies also to the United States, under that clause of our treaty with Turkoy which secures to us all the privileges of "the most favored nations." 'Tho com. merce of the United States with this regency stands on the same footing as that of the most favored nations. It enjoys no exclusivo privileges nor suffers any peculiar reatrictions. There is only a port charge of ahout threo centa the ton, which is levied equally on foreign and national vessels.
"The true par or intrinsic value of the piastre of this country is $12 \frac{1}{2}$ sous, French; but we reckon it at $12!$ cents. The present bey has, however, issued a golil currency, composed of pieces of $100,80,40,20$, and 10 piastres each, which are about 20 per cont. deficient in weight; snd, consequently, in gold money the piastre is worth ouly ten cents. The Christian population tefuse to accept this new gold currency at its nomin.il value, but the arbitrary power of tho bey compels its circulation among his own people, and prices have sdvanced nominally already since ita appearance, withont other apparent cause. Whether absolute power can effect the magical work of maintaining in free circulstion two currencies of the same denominations sud names, bui of different intrinsic values, renains to be seen.
"The lluties on exports to the United States, as to sll other countries, are, on oil, $2 \frac{1}{2}$ plastres the metal, which is about $5 \cdot 08$ gallons, Linited Statey liguid messire. Thus we have $6 \frac{1}{1}$ cente per gallon. This oil is olive. oil, and is of a puality highly esteemed in Europe. The exportation of horses and camels is prohibited, and only allowed as a special favor to individuals or governments. The exportation of grain is generally confined to the bey himself, who consequently makes his own price. A very large portion of the oil is slso exported by the bey. The import duties on goods of tho United States are estalsished at 3 per cent. od valorem by treaty. The intermal taxes on the products of the soil are levied at 10 per eent., but the mamagement of assessors, by assessing the crop in its growing state, frepuently crases the actual tax to exceed this rate. Llesiles, there are octroi duties, more or less heavy, on all nrticles of produce sold in the cities for Consumption."-Com. Rel. $l$. S. See Tueatirs, Com. HELCDS..

Frem Weight, the most ancient of the weights uscd an Scotland; and zough its use is now prolibitel by law, it is stil! occaslonally employed in sont of the rural districts in weighing wool, cheese, lutter, etc. The tron pound was not a welldetined weight, bat waried from twenty-one to twenty-aight ounces avoirilupois.

Trough of the Bea, In .Ifariue language, the surface of water luetween two waves.

Troy Weight, one of the thest ancient of the dif. ferent kinds used in llritain. The pound English T'roy contains twelve ounces, or 5760 grains. It is used in the welghing of gold, silver, and jewels; the cempounding of medicinen; in experiments in natural philosopliy i in comparing different weights with eacheth-

er ; and is now mado the general standard of English welght in Great Britain and in the Unlted Stutes.

Before tha American Association for the Advancement of Selence in 1857, J. B. Gibbon, Esq., Assayer of the Mint of North Caroline, read a paper on the rise and gradual discontlnuance of Troy weight ln coinage and commerce. No stated that about 1900 years ago, or about ffty-two years before the Christlan era, Jullus Casar had described the Inhabitants of Great Britain and Gaul as making use of brass and iron rings, by weight, for money. Gold-ring money of the Celts was also annually dug up in Ireland; and simllar money was employed by the Scandinavians, on the shores of the laltic. They were multiples of one certain ounce, or integers of its proportions-the word for ounce being claimed as a purely Celtic onc. Recently an embassador wrote from Antwerp that he had purchased a gold chain of Rubens with the links stampel by the goldsmiths of the day to mark their weight and fineness. In South Africa, at the present day, there was a similar omployment of metal rings; and a civil. ized country of antiquity, as appeared from paintings still remaining on walls, employed rings which were carried to Cush or Ethiopia. Another nation had pieces of coin stamped with the likenesses of itlols for the same purpose. The old pound of the Anglo-Saxons was called Easterling, from which eume the modern sterling. In Franco there was a pound called the pound of Rochelle, and the Germans named it the pound of Cologne. A new system, by which the pound of silver in tale was also mate tha pound in gross, was arranged by Charlemagne in the 8th ecatury. In England, under William the Conqueror, it was decreed that measures, weights, etc., should remain as they had been nider hils predecessors. In 1256, by consent of the whole renlm, it was determined that tho silver penny, called Easterling, should be round, and that it should be of the weight taken from the middle of the car. Twenty of these penny-weights were to make an ounce, twenty ounces one pound; eight pounds of silver a gallon of whe; and eight gallons of wine a bushel, the eighth part of a quarter. Troy weight was supposed to have been derived from the Eastern nations, and transmitted first to Troyes, in France, from Calro, during the erusades. Frou Troyes it was carried into England by the goldsmiths, and found favor there under Henry VIII., who began to debase the stamlard fueness of silver coins and to reduce their weight. Hefore this a statute established a common standard by which silver and wheat were assumed to be the natural tests, the one of the other. Unfortunately, neither was exactly saited for the purpose. It had been found by experiment with white and red wheat, forty to forty-three grains wers required to balance a grain of silver, and from twenty-elght to thirty-tive or thirty-six grains of white wheat effected the same thing. In short, grains were not intended to serve as a just measure for perfect comparison, multiplication, or division.

Acting upon the opinion that the laws of physical nature operute uniformly, and that the heavenly bodies are governed hy fixed rules alike applicablo to all matter, while Sir lsaac Newton was Mlaster of the Mint, in the roign of George I., the vibration of a pendulam in the lutitude of London, on a level with the sea, was measured, and the length made to serve as the standard of the linperial yard of (ireat Britain. Welghts have been based upon a stundard arising from a quantity of distilled water at a certain temperature, atul having a certain cuble content. Upon the advice of the Ilouse of Commons, and afterward of a committee of the Royal Soclety, adilressed to the Princs Regent, it was determisted, under George IV., that the stanlard made by Bird in 1760 should be the legal stambard of length in Great llritain; that the pound Troy should be atill continued; and that 7000 grains should be the pound avoirdupois in the British em. pire.

By act of Congress in 1828 it waa determined that the Troy pound procured by the inlaister in London in 1827 ahould be the atandard, In the United States, to regulate the coinage. Yet there were threo atandards still in use in the United States coinage-the standard for quantities from Great Britain, the standard for purity from France, and the standard for proportion from Spain.

In the United States system many changes had been effected in the system in force at the Mint. The Troy ouncs was divided decimally, and the other proportions were diacurded. Tho French gramme used for silver, and the half gramme used for gold, with their thou. sandth perts, had replaced the old carat grains; and the proportion was based upon the dollar-a eredited but erroneous ounce of silver, the sixtcenth part of a pound avoirdupois, divided decimally for account. The act of 1772, which established the Unlted States Mint, was founded on the report of the first Secretary; and notwithstanding many ehanges in the United States, the system there was still subject to the same objectiona as that of England, belng copied from erroncous models, and not founded with scientific accuracy on systematic, uniform, and intelligible viewa, auch as are required for the purposes of coinage, of commerce, of the arts and professions of life, as well in Great Britain as for her colonles, and hy the United States.-See Weigirts.

Truck System, or Store Accoust, a name given to a practice that has prevailés, particularly in the mining and manufacturing dist:icts, of paying the wages of workmen in goods instead of money. The plan has been for the masters to establish warchouses or shops; and the workmen in thelr employment have either got their wages accounted for to them by supplies of goods from such depôts, without receiving any money, or they havs got the money, with a tacit or express understanding that they were to resort to the warehouses or shops of their master for such articles as they were furnished with.

Truffles, a sort of vegetable production, like a moshroom, formed under ground. A few have been found in Northamptonshire; they are pretty ahuadant in Italy, the south of France, and several other countries. They are reckoned a great delicacy. The pátės au truffes d'Angoulime are highly estecmed, and are sent as presents to very distant places. - Rees' Cyclopadia.

Trust and Trustee. A trustee is he who undertakes to discharge a trust, end a cestui qui trust is the person who is entitled to the benefit of a trust. A trust, which is, in fact, a new name given to a use, is dafined hy Lord Coke to be "a confidenea reposed in some other, not lssuing out of the land, but as a thing collateral, annexed in privity to the estate of the land, and to the person touching the land, for which cestui que use has no remedy but by subpena in Chancery."
Tschaik (Turkish ship), is a light galley used on the Danube, and provided with a sail and rudder. The tschaik generally carries from two to twelve guns, and from ten to one hundred men.

Tulips. They came to England from Vienna, A.d. 1578, and have always been among our most csteemed flowers. They became an object of commerce in the 16 th eentury; and it is recorded in the register of the eity of Alcmaer, in Holland, that in the year 1639 , 120 tulips, with the offsets, sold for 90,000 florins; and in particular, that one of them, called the ticeroy, sold for 4203 guilders! The stutes at last put a stop to this extravagant and ruinous passion for flowers. The tulip-trec (Liriodentron tulipifera) was carried to England from America, about 1663.-IHardn.

Tulip-tree (Liriodendron tulipifera), one of the most remarkable of our North Anerican forest trecs. In moat parts of the Uuiled States the tres is known under the name of poplar-tree. The wnod is of a llght color, with a greater specitic gravity than white pine, and is found ia most of the States and Territories. The
qualitios are a moderato resiatance to decay, and aasy manipulation. The principal defect is the liability to shrink and warp. The wood is in common use, on account of its abundance and cheapuess, for the maullfacture of common furniture, shingles, and dry lumber.

Tunis. The state of Tunis possesses nearly the samo nutural advantages of soll and climate as Morocco. In ancient times it was one of the granaries of Rome, aupplying wheat, maize, barley, ollvea, grapes, dates, and other fruits. Tobacco, cotton, and indigo havo recently been introluced as articles of culture, and small quastitios of aaffion and opinm are also raised. The princlpal mannfactures of Tunis are of red caps, exported to all parts of the Mediterranean ; of soap, at Susn chiefly; and of woulen, silk, and linen fabrica, and moroceo leather. The chief tmports by sea are cochinenl, raw silk, coffee, angar, Spanish wool (to make tarbouches, or red capa), wines, speeie, ete. Carsvans artive annually from Central Africa, bringing slavea, senna, ostrich feathers, golil dust, gum, and lvory, which are bartered for manufactured gonds, spicea, and gunpowder; while others, from Constantinople, bring wax, dried skins, cattle, and sheep, in return for muslins and other woven fabrics, Tunis mantlea, coionial produce, essencen, ete.

There are no officlal or relialile data from which the value of the general forelgn export trade of Tunis can at the preseat time ba gathered. The following statement of the average anaual exports is based upon an estimate made by the Frenci consui, and found in Macinegou's Commercid Regulations:

| Olive-oll | $\begin{aligned} & \text { Franea. } \\ & \mathbf{4 . 0 0 0 , 0 0 0} \end{aligned}$ |

Total average of experts $9,259,000$ francs, or nearly 82,000,000. The principal port is Tunis, situnted on a salt lake, communicating with the sea by a eanal or strait. Large ships anchor in the road or bay. The other chief ports are lliserta, Farina, IIammamet, Sfax, and Gerbis. The commercial relations between the United States and Tunis are regulated hy treaty of February 21, 1821.-Se Theaties, Commencial. No official data aro at hand upon which to hase an estimate of the character or value of the traile between the United States and this regency. There is no direet trale, It is believed, between tho United States and Tunis, commercial movements passing mainly hy way of Maita and Marscilles. Maegregor gives n statement of the imports into and exports from Tumis in 1839, of which the following is a summary:

$$
\begin{aligned}
& \text { Imports } \ldots \ldots \ldots . \\
& \text { Totat....... } \sqrt{3}, 46,040) \text { a } \\
& =\$ 3,306,250
\end{aligned}
$$

In this total the luited States figured for:

| 1 mports from |  |  |  |
| :---: | :---: | :---: | :---: |
| Expurte to T | 206,000 |  |  |
| Tolal. | क/m.904 | ${ }^{*}$ | $=\$ 126,500$ |

In 1812 there entered 311 vessels, with an aggregate of 33,321 tons ; and there cleared 331 vessels, measuring ant aggregate of 33,425 tons. The trale is conducted chietly under the Jlitish, Maltese, French, Neapolitan, Sardinian, Tunisian, and Anstrian tiags. These import wine, spirits, iron, augar, colfee. cotton, beans, and manufactured goods; and enrry back wool, hides, wax, harilla, sponge, oli, aimonda, malted fish, nuts, bones, dates, corn and meai, wax, soap, tissucs of woul, ete., and iecelbers.

[^52]The authority cited gives the navlgation duties in the difierent porta of Trnis as follows:

| trutiea, | Tunis. | Suta Mononallar. | Stax mail Gerlin. |
| :---: | :---: | :---: | :---: |
| Ancluragy duties . | \$26\% | \$1064 | \$1 thit |
| Captain of port tax. |  | 25 | 31. |
| Water tax .......... | 125 | 124 | .... |
| Odaburlit tax ...... | 65 | . | $\ldots$ |
| Total.......... | \$4. 621 | \$1 431 | \$13ii |

Beaides these fixed charges, there are also lincidental expenges peculinr to Tunis, viz. : 1st. All veascla which enter the Goletta Canal for repairs, or for any other purpose, pay an entrance and departure duty of $\$ 5$, nnd 125 besides, daily, if the vessei ls above 50 tons; 2d. A vessel taking in hallast from the lant is taxed 8375 ; Bd. On every vessel which finds itself unsafo In the roadstead, on account of the bad quality of its cable, or from any other reason, and wishes to get nuder the shelter of the inole of the Golettn, a duty of 12 caronbes (183 cents) per ton is imposed so long as it remains there, renewable every six months. Besides this duty; the captnin of the port receives 75 cents. In addition to the foregolng, the following information is condensed from official returns communicated to this Jopartment: The total port charges on entering the Goletta (the harbor of Tunla) amount to 8650 for lights, anchorage, bealth officer, etc., for vessels of over 30 tons; under 80 tons, one half that charge. These eharges npply alike to ali vessels, cither Tunisian or foreign.

Export dutics-inennsiderable, however-are levied upon oil, wool, and soap.

The Import duties on goods and merchandise pre regulated by treaty, and amount to 3 per eent. ${ }^{1}$ Tie artieles from the United States which nsually find a good market in Tunis are run, tobacco, small frelghts of flour, cheap cotton fabrics, provisions, cheese, salt beef, dried beef, hams, plekles, and biseult; but it would not he advisable to risk inrge enrgoes of these articles. The coasting traile is permitted to all foreign vessels, without payiug auy other duty than those named in the tariff. The quarantine regulations are: Quarantine of observintion, fixed at 10 days, is only required 7 or 8 days, though the veasel pays for 10 ; nud when coming from any port in the Meliterrancan, she pays $81: 35$ per day. Hesiles this thx others are bivied, anomiting ln the whole to $8.2562 \frac{1}{2}$. On vessels from tise levant, these taxes, accenting to Mnegregor, are
 These nre the rates at the port of Tumis. At the other ports the quarnntine of oleservation is usualty 10 day; expenses nearly the anme.-Com. Rel. U. . . .

With the exeeption of certain privileges grantal to Great Iritain and Spain, no privileges permitted to the commerce of foreign nations are denied to the United States. By treaty, Great Britnin olitained the privilege of exporting annually for the support of the garrison of Gibraltar, on payment of a duty of 85 per ox (though the thed dnty is 810 ), 2000 oven. Symin. when formidnble, olitained by treaty the following privilcges, vir.: the exportation of oxen on paying a duty of 83 per ox, instend of 410 ; fowis at 15 cents per ducen Instend of 41 ; julse at 60 cents per 12 havhei instead of 90 cents; and a proportionato reduction on all other oatables. These privileges, however, are at present disregnrilel. No reatrietions aro imposed in the commeres of other nations nor on that of the United States.

The port elinrges nud dics levied on vessels of the Cuited States are aimjily the nuchorage dues, whilhare exacted according to the tollunge of the vessel. The U. S. Consui says, " 1 ain led to think that the reetrictions which ohatruct $n$ direct trale with the I'nitei Statea nre the high duties levied in the l'uited stateg on prodnce in generai of this enıntry. country, which enters so largely into onr manufactures. Remove entirely, when imported from Moroceo in American bottonis, tho daty from this one article, nud that direct trade which twenty-four yesrs ago existed will agsin spring up. The great market for the wool of Morocco is even now the United States; but our ship-owners derive no lenellt from the demsnd. It finds its way to the United Stntes through Marsellles and Gibraltar, and French and English vessels make a monopoly of the esrrying trade. If, with the oxtra expenses of transhipment, the additional transportation, the extra commissions, insurance, etc., our manufacturers now find it to their interest to purchase largely of the wool of this country, how much greater will be the demand, and consequently the employment, of American vessels, if a direct trade between the United States and Morocco ls brought about? It is true, the expert duties of this country aro liable to sudden fluetuations; but contracts for ecrtaln periods can be made with the sultan, which exempt tho contrncting pirtles from licing affeeted by those fluctuations."-Consiuar Returns U. S. 1854-'55.

Tunis, the eapital of the regency of the samo name, on the northern eonst of Africa, the Goletta fort being in lat. $36^{\circ} 48^{\prime} 30^{\prime \prime}$ N., long. $10^{\circ} 25^{\prime} 45^{\prime \prime}$ E. The Bay of Tunis is somowhat in the form of a horseshoe. Its western extremity, Cape Carthage, is situated about four iniles northeast from the Goletta; and its castern extremity, Cape Znfran, bears from Cape Carthsge east by south, distant about 13 miles. The bay is about 16 miles deep, and has good anehorage all over, in from 10 to 4 fathoms water. It is expesed to the north and northenst gales; but they seldom oecaslon any damage. Tunis lies on the west side of the bay, belng separated from it by a large lagoon, having, where deepest, about 7 feet wnter. The port is at the Goletts, or chnmel, pussing through the nurrow belt of land separating the lagoon from the sen; the entrance to it is by a ennal, in which there is at nll times 15 feet water; and ships may use it on paying a fee of three doliars a day. It is not, however, much resorted to-nll vessels of considernble burden loading nad unloading from their moorings in the bay by means of lighters. The population of Tunls has been varlously estimated; and mny probally amount to 100,000 , being the nost populons of any Afrienn city after Cairo. Tho streets are narrow, unpaved, and filthy. The buildings, theugh of stone, nre menn and poor; and the inhabitants present the picture of poverty and oppression. There is a fort at the foletta of considerable strength.

Trade. - Notwithstanding the various drawbacks arising out of tho nature of the gevernment, and the ignorance and prejudices of tho people, commerce and industry are in $n$ more advanced stnte in Tunds thin In any other part of Northern Africa, Egypt excepted. Though subject to droughts, the climnte is, on the whole, excellent. Tha soil still preserves that exuberant fertility for which it was famous in untlquity.

Non quiequid Lithyels tertt
Forreos arca mosaibus,-(Senzo. in Thyest.)
It seldom receives any other manure than that of sometimes lurning the weeds and stubble; and yet, in despite of its slevenly eulture, the crops are luxuriant; and there is generally a considerable excess of whent and barley for exportation. Corn is principally slipped at the lisertn, about 50 miles west of Tunis. Oliveoil is one of the prineijnal articles of expert. It is of various qualities: some good, and some very indifferent. Susa is said to be the hest place for its shipment. Sonp of an exeelient quality is largely manufactured in the regency. It may be had either soft or in wedges. The soft is made of barilla and pure oil, and is much estecmed. The hard soap is made from the lees of oil, and is reckoned very strong. The prlneipal soap-works are at Susa. Llttle, however, is prepared on a speculative inticipation of a demand for expertation; but any quantity may be lad by contracting for it a few
months before the period when it ls wanted. A sort of woolen skull-caps aro largely exported. They ara in extensive demand all over the Levant, and are nowhere made in such perfeetion as herc. Ivory and gold dust, hides, wax, moroeco leather, sponge, barilla, eoral, dates, astrich feathers, ete., are among the articles of expert. The inuports from Europe consist of woolens, coarse German and Irish linens, cotton stuffs, hardware, sugar, coffee, spices, tin plates, lead, alum, dye-stuffs, wine, sllk, Spanish wool, etc. There is very little direct trsde between Tunis and Englard; but a $\mathrm{g}^{n-1}$ deal is indirectly carried on, through the interVntion of Malta and Gibraltar. Marsellies has prolasbly the largest share of the trade with the regeney. In 1880 there entered the different ports of Tunls 194 ships, of the burden of 20,747 tons, exclusive of those engaged In the trade with the other Afrlcan states and Turkey. Exelusive of the trade by sea, a considerable trade is carried on between Tunis and the interior of Africa, by means of caravans. These import slaves, gold dust, lvory, feathers, drugs, etc. They esrry luack cotton stuffs, linens, hardware, spiees, cochinesl, etc. Naval and military stores imported into Tunis pay no duty. Other articles pay a duty of 3 per cent. ad valorem on a rated tariff. Obstructions arising out of monopolies, etc., are occasionally thrown in the way of exportation; and in general it is necessary, before proceeding to shlp, to obtsin a tiskery, or license to that effect, from the bey. That, however, may be, for the most part, procured without much diffieulty.

Tunnels. The earlicst tunnel for the purpose of internal navigation was executed by M. Riguet, in the reign of Louis XIV., at Beziercs, in France. The first in England was by Mr. Brindley, in the Duke of Bridgewater's nsvigstion, near Ilsnehester, about 1760. Era of the Gravesend Tunnel, 1800-the report upon $1 \mathrm{t}, 1801$. The Thames Tunnel projected by Mr. Brunel in 1823. This last wonderful undertaking was completed and opened for foot passengers March 25, 1843.-Haydn. See Thames Tunnel. The prineipsl railroad tumels in the United States are: 1. On the Dayton Railroad, at Cincinnatl, 10,080 feet in length. 2. Kingwood Tunnel, on the Baltimore and Ohio Railroad, 5000 feet. 3. Blue Ridge Tunnel, on the Virginia Central Railrosd, about 5000 fect. 4. The Hoosac Tunnel, through a granite formation, western portion of Massachusetts (now in progress). 5. On the Kentucky Central Railroad, between Cineinnati and leexington, about 3500 feet. 6. The Bergen Tumel, on the New York and Erie Railrosd, near Jersey City, about 5000 feet (now in progress).

Thames Tunnel.-Projected by Mr. Brunel, to form a communication botween the two sides of the river, at Rotherhithe and Wapping, the most extraordinary construction of ancient or modern times. The shnft was hegun in 1825. At a distanee of 544 feet from the shalt: the first irruption took place, May 18, 1827. The second irruption, by which six workmen perished, January 12, 1828. The length of the tunnel is 1300 feet; its widh is 35 feet; height 20 feet; clenr width of each nrchway, including foot-path, about 14 feet : thickness of enrth benenth the crown of the tunnel and the bed of the river, ahout 15 feet. The tunnel was opened throughout for foot passengers March 25, 18.13.

Turban, the head-dress of many of the Eastern nations, consisting of two parts, a cap and a sash, the latter artfully wrenthed about the head. The ensh of the Turk's turban is white linen; that of the Persians, red woolen. These are the distinguishing marks of their different religions. Lophi, King of Persin, being of the sect of Alf, was the first who assumed the red color, to tlistinguish himself from the Thrks, who are of the sect of Omar.-Mayns.

Turbith, or Turpeth, the eortical part of the root of a species of Convolvulus, brought from ditferent parts of the East Indics. It is a longish root nbont the thickness of the finger, resinous, heavy; of a brownish hue

## TUR

without and whitiah witinin. It is imported cloven in the middic, lengthwise, and the heart or woody matter taken out. The best is ponderous, not wrinkled, easy to.break, and diacovers to the eye a largo quantity of resinous matter. At first it makes an impreasion of sweetness on the taste; but, when chewed for some time, betrays a nauseous acrimeny. It is used in medicine, but enly to a smail extent.-Lewis'e Mfut. Medica.

Thabich (mineral), the name given by chemiata to the sub-sulphate of mercury.

Turbot ( $P$ leuronectes maximus), a well-known and highly estecmed apecies of fish. Considerably juantlties of turbot are now taken on various paris of the coasts of Great Britain, from the Orkners to the Land's End, yet a preference is given in the London markets to those caught by the Duteli. The latter aro said to hava sometimes drawn as moch as $\mathbf{£ 8 0 , 0 0 0}$ in a single year for turbots solld in London.

Turkey. The countries included under the alove general designation of Turkey, the Lovant, cte., ure Turkey (Europenn and Asiatic), tha pachalic or vice. royalty of Egypt, the kingdom of Greece, and the ropublic of the Ionian Iaiands-a grou ${ }^{2}$ in the Meliterrancan, off the west coast of Greece and Epirus, coneisting of seven priacipal and several smaller islands.

The Ottoman empire includes Turkey in Europo, Asia Minor, Syria, Egypt, and the other tributary states in Africa and Asia. Prior to the Greek revolution, Turkey in Europe possessed an extensive maritime fruntier (uearly two-thirls of her boundary), having many excellent sea-ports. The dismemberment of (ireece, and other subsequent political changes, and the cession of Bessarabia and a purt of Moldavin to Russia, have considerably reduced the limits of the dominions of Turkey in Eu ine. In Africa her power is almost annibilated, and even in . Asia her authority ${ }^{\circ}$ is considerably weakened. Algeria has been wrested from her hy France; ligypt merely acknowledges her sovereignty by the payment of an annual tribute; and the Arabians scarecly recognize the sultan as the head of their religion. The iimits und area of the Turkish empire are not exactiy defined, and, consequently, very different estimates have beea formed of the extent and population loth of European and Asiatic Turkey. Tho most recent anthority estimates the area of Turkey in Eurupe at 210,000 sjuare miles, and its population ut about $15,000,000$; and that of Turkey in Asia nt 437,000 sifuare iuiles, with a popalation of aloont $16,000,000$. Turkey in Euroie possesse's a suil remarkably fertile, and a cimate higiny favorable to the problution of the vine, olive, maize, wheat, and rice, vegetables of every deacription, froits, tobacco, hemp, dax, the mulherry, various trees from whicin the most valuable gums are extracted; and in the southern part the sugar-cane and the cotton-tree. To these adid the rich justurages for horses, cattle, and sheep, every variety of game and fish, with a great abundance of mineral riches, together with the geographical position and excelfent harbors of European Turkey, and a general ddea may be formed of her great natural resources. The prineipal species of grain cultivated in European Turkey is Indian corn. life is cultivated along the banks of the Maritza and other marshy tracts in the southern jrovinces, hut not in sufficient quantities f $\boldsymbol{r}$ consumption. The deflciency is supplied by Eggt and Asia Minor.
Turkey in $\mathrm{A}_{\text {ria }}$ jossesses nlmost every natural element of indust rial and commercial greatness; but agriculture is wholly neglected, and j,roductive industry is aitogether unknovin.

Atsout nine-tenthe of the extensive surface of Firyit is aterile and unproductive. The remaining one-tenth, heing irrigated by the averilowings of the Nile, yields the richest and mont luxuriant erops, which, with the varion* commodities that jass through ligent from Arabia, India, and Nubia, form the clements of a large
export trade. The crops of Egypt are wheat, Indian corn, malze, rice, flax, hemp, clover, cotten, Indigo, sugar-cane, tobacco, oranges, and the most delicious fruits.
The sea-ports of Turkey in Enrope are as follows: Constantinople, ons of the safest ports in the world, and capable of affording abeiter to 1200 of the largest class ships ; Salonica, at the bottom of the gulf of that name, an excelient roadetead, and much frequented; and Enos, the port of Adrianople, on the Maritzs, Galiipoll and Rodoato, on the Sea of Marmora; Vama, on the Black Sea; and Ibrahilow, Taultcha, Galatz, and Jassaktchi, on the Danube, are porta of considerable commerciai activity.

On the islund of Canlin there are twe ports, Candia and Canea, but their hurbors are neither commodious ner safe. Beaiden these, there are several other ports, which afford excellent sinclter, and in the posseasion of a more Indastrious anil commerclal people than the Turks would attruct considerable trado.

The sea-ports of Turkey in Asia are Erekli; Scutari, opposite Constantinople; some indifferent ports on the Sea of Marmora; and Smyrna, the principal port of Asia Minor, and the most important in forcign commerce.

In Egypt the sea-ports are Alexandria, Rosetta, Damictta, and Cairo, at the mouths of the Nile; and Suez and Kosscir, on the Red Sea.

The principal exports of Turkey aro wool, goats' hair, cattic, horses, hides, hare-skins, wheat, raw cotton and silk, tobacco, raisins, figs, almonds, mastic and other gums, gall-nuts, vallonea, leeches, honey; wax, saffron, madder, anise seed, linseed, turientine, safflower, orpiment, meerschaum pipes, whetstones, carpets, siik and cotton fabrics, leather, copper, and metaliic wures, with Arabian, Pcrsian, Indian, and Chinese goods.

Next to Constantinoplo, Alrianople and Saionica are the clicf centres of trade; the former, lieing a principal depit for goods brought to Constantinople from Eagland, France, and Italy, supplies all the fairs throughout leoumelia and Bulgarin.

Next to Smyrna, Aleppo is the chief seat of commercial movements in Asia. Caravans bring to tilis mart iearla, slawla, Indian and Chinese goods, from Bussorah and Bagdnal camels from Arabla; cutton stuffs nod thread, moroceo leather, goats' hair, and galls, from the pachaiies of Mosul, Diarickir, Orfa, Aintab, etc. ; furs, gouts' hair, wax, gum-ammoniac, etc., from Asia Minur; ailk, Muchn coffee, soap, scented woods, ambergris, drugs, and pourls, from Syria and Arabia; rice, cotfee, and Eigyptian jroduce, from Latakia; silk manufactures from Brusa and Damasces; European and United States cotton stuffs, woolens, printed musiins, hariware, watches, wronght amber, and fur, from Suyrna nud Constantinople.

The treaty of Adrianople opened the Black Sea to the commerce of the worid, and the passage cf the llosphorus and IIcilespont is free to the fiags of all nations. The importation of ail articles of forcign commerce is admitted at extremely moderate duties. These are only 5 jer cent., viz. : 3 jer cent. on goods when landed, and 2 per cent. on their being admitted to consumption. The luties on exports of native production are 12 jer cent., of which 9 per cent. is paid when the goods arrive at the prort whence they are to be exported, and 3 per cent. in their being shipped. This is a very liberal tarifr; though a reduction of the export duty, even ahoull the import duty of 5 per cent. be raised to 10 or 12, woull reault most favorahly to tio commerec of 'lurkey with foreign countries.

Constantinople. - The harlour of Constantinople is deep, well sheitered, and sufficiently capacious to afford safe anchorage for 1200 of the Jargest-sized ships. Senturi, on the offososite shore of the llosphoras, one mile distant from t'onstantinople, is the place of rendezvous for caravans from l'ersia, Armenia, nad othey
places in Asia that trade with European Turkey. It is also the seat of extensive silk, woc'en, and cotton manufactures.

The only European countries with which the United States could auccessfuliy compete in the trade of this port are Englund and Austria. The vesaels of tise former impert iron, colonial produeo, cotton and woolen tissuea; and from Trieste, Austria sends ulso colonial produce, such as cotton, suggr, moiasses, rum, rice, tobacco, etc., and the various manufactures which sre always found in sbundance in the extensive warehouses of that port. The number of vessels which entered Constantinople in 1852 were: sailing vessels, 9220 ; steau vessels, 599 ; total, 0819. Of these there were from Austria $4 \overline{0} 9$ ssiling veasols; from Great Britain, 584 ; from France, 244 ; from Brazil, 16; and from the United States, $\bar{J}$. The share assigned to these countries respectively, in carrylag the trade of Constantinople during 1852, is thus given: Under the British flag there ontered duriog the year 1687 sailiug vessels, and 66 stean vessels; under the French flag, 236 sailing, and 55 ateam vessels; and under the Austrian flag, 1280 sailing, and 213 steam vesaeis. Under the flug of the United States there arrived five sailing vessels, and one propelled by steam. It is estimated that Constantinople requires annually, for consumption alone, about $6,500,000 \mathrm{lbs}$. of coffee, $1,200,000$ lhs. of sugar, $300,000 \mathrm{lbs}$. of peppor and spice, 2000 pun cheons of rum, and large quantities of cheap cotton goods. These are supplied chiefly from the markets of Western Europe, Alexandria, and North and South America.

Salonica,-Next to Constantinople, Salonica (situated at the bottom of the Gulf of Saionica), the capital of Macedonia, is the most important port of Turkey in Europe. In 1850 its maritime commerce reached upward of $\$ 3,500,000$, viz. : about $\$ 2,000,000$ for imports, and $\$ 1,500,000$ for exjorts. The foreign trade of this port is chiefly engroseed by the British and French flags. The imports consist chiefly of cheup cotton and woolen cioths, and various other manufactures. Its exports are wheat, barley, maize, tlmber, wool, sponge, raw siik, wine, sesamum seed, tobacco, and staves. Colonial produce and manufactured goods are supplied to this port-the former from secend and third hands--by Englund and Austria. There is nothing to prevent the United States from participating in the trade in this species of merchundise. Neither Austria nor Engiand couid compete with this country in supplying the vast quantities of colonlul produce, and the cheap white and printed cottons, which are required for consumption in this anarket. In addition to the supplies needed to meet the daily wants of its 100,000 inhahitants, Salonica furnishes large quantities of colonial and manufactured goods for the yearly fairs of Parlepi, Lucca, and Seres, where the sules are ajways made for cash. The ligh price of French cotton and woolen cloths wiil always preclude the merchants of France from successful competition in this branch of trade; and the heavy expenses attending the circuitous trade through Marseilles, Smyrna, Constantinople, Trieste, and Venice, wonld neces;arily favor direct exportations from the United States. The prices at Salonica are always from 10 to 12 per cont. higher than at Constantinople or Smyrna.
'The navigation returns for the year 1853-'4 exhilit the following resuits:

Inwatd.
Oulward.

This decrease his been principaily under Turkish and Greek flags, thougi tinere has also been a decrease under British, French, and Sardinian flags, but not in the same proportion.

The gross returns of trade at tive port of Snlonica, for the year ending December 31, 1804, show a considerable increase in the import trade, viz.: Value of
imports in 1854, $\$ 3,770,235$; and in 1853, $82,857,765$. But the returns exhibit a stilt more considerable incresse in the value of the outward trade, viz.: Value of exporte in 185-1, $\$ 5,492,080$; and $\ln 1853, \$ 3,470,050$. This large increase, both in the inward and outward trade witi the port of Salonica, may be regarded as an evidence of the improving state of the country.

Gulatz, a town of Moldiavia, Turkey, on the Jeft bank of the Danube, in latitude $45^{\circ} 25^{\prime} \mathrm{N}$., longitude $28^{\circ} \mathrm{E}$. Though at some distance injend, Galatz may he alid to be the port of the Danube. Of the tirree principal mouthe of the river, the Soulinel (or middle) mouth, in latitude $45^{\circ} 10^{\prime} 30^{\prime \prime} \mathrm{N}$., and longltude $20^{\circ} 41^{\prime} 20^{\prime \prime}$ E., is the only one accessibie by vessels of large burden. The depth of water st ita entrance varics from 10 to 14 feet; from the bar up to Galatz there is nowhere less than 18 feet. Lightera are stationed without the bar to partialiy' unjoad large vessels. Vessels of 300 tons burden can lie at the quays.

Commareg of Moldavia in 1855.

Smyrna.-This port, the chief commercial emporiun of Turkey in Asia, has nn excellent harbor, and ships of large burden can load and diecharge close to the quays. Its principal foreign trade is conducted with Great Britain, Austria, France, and the United States. Its exports consist of silk, raw cotton, carpets, copper, opium, hides, madder, wool, besides goats' hair and skins, vallonea, olive-oil, drugs, gums, sponge, figs, raisins, and nut-galls. Imports comprise coffeo (upward of $6,000,000 \mathrm{lbs}$. annualiy); woolen, cotton, and siik fabrics; metals, raw and manufactured; sugar, indigo, spirits, cochineal, and spices. The following statement shows the quantities and values of wool imported into the United States from Turkey during the five years ending June 30, 1855, together with the aggregate quantities and values of the same from all countries during the same period:

From the Argentine repuldic the United States roceives one-third of its raw wool. Next to this country ranks Turkey, in this regard; and the third phace is due to Chili. In 1855 , of the entire quantity Imported, amounting to $\mathbf{1 8 , 5 3 4 , 4 1 5} \mathrm{lbs}$., valued at $\$ 2,072,139$, there came from Turkey $4,676,7 \cdot 17$ lbs., valned at ©. 16,222; of which Turkey in Asla supplied 4,261,250 the., valued nt $\$ 386,305$. The principal imports into Smyrna, in vesscis of the United States, nre coffee, sugar, rum, coarse cottons, spices, and dye-stuffs; for which they carry home, in return, cargoes of wool, opium, copper, fruit, oil of roses, and wine. The navigation of Smyrna is steadily increasing. In 18.10 there entered 969 vessels of all nations, measuring 107,596 tons; of which number there were 23 American vessels, measuring 4304 tons.-See Smyrna.
The commerce of this port duing 1851 rmounted to nearly cieven millions of dollars. This trade was thus distrihuted:

Beyrout.-Beyrout is the eca-port of Damascus, and
the chlef centre of the trade of Syria. Its importa consiat of musiina, cottons, tin, hardware, cloths, and vurious kinds of manufactures. Its exporta are silk, gails, madder, gums, wine, and olis. The importa at this port in 1851 amounted to about $84,000,000$, zad ita exports to $83,000,000$. Daring the same year there entered and cleared 2354 vessela, measuring an aggregate of 219,277 tona. The commercial movements of the port of Beyrout and its dependent trading towns, Tripoll, Caiffu, nad Jatakin, amounted in 1853 to a tutal of $45,689,142$ france, or an incrense over 1852 of $4,500,000$ francs. The following summary for theso years is taken from French official authorities:
 In $1883, \ldots .$. franen $28,944,740 \quad 91,840,402 \quad 40,649,149$

The tonnage employed in the trale of lieyrout the saine years was: In 1853, 209,861 tons; and in 1852, 241,98 tons. This decreaso is owing to a falling off in tho coasting trado, onpecially in cereals, oecasioned by the short crops of 1853 .

In the general import movement, Engiand holls tho first rank-tiasues, cotton yarn, and cotton gooda generally, being the ehief inmorts from Great IIritain into Syria, Jrance oceupies the second rank; the imports from that country into lieyront in 1853 amounting in value to $3,6 \pi 4,726$ francs. Next to Franec comes Austria. The returns show a value of $6,714,242$ frunes assigned to imports under the Austrian fiag; but these figures include the value of all the merchandise imported in the Aust cian steamers that ply between Consuntinople and Smyrna. The aet ini imports from Austria into lbeyrout amount to about one half of this sums. Trieste furniahes but fittle for the consumpition of Syria. Tho imports into Syria from ti it entrepoit do thit exceed 150,000 francs, and consist of colonial warrs, mad German tissies purchased in the warehouses of that city. Fhypt suppilies Syria, through the port o. .icyront, with grains, especialiy rice, to a value of alnut $2,+16,950$ franes. During the past few years mervantile houses of Ibstom, New York, and PhilaAclphia havo established direct relations with Syria. The washed and unwashed wool of that couniry forms the fania of their operations. In 1 Nat the firet cargo of refined sugar from lloston arrived at Beyrout. The success which has attended this enterprise will most protably lead to an important trate in this deseription of merchandise, in exchange for wool and other syrian products. The chief olistacle to an immediate expansion of this trado mpears to be the duty of 30 jer cent. with which the raw wool is burdened in the Cnited States, leaving but a amall nargin for protit on the importation of this leading proviuct. Llow important this trade with Syria, as well us with Turkey generally, and other wool-prolucing countries might thecone, may te inferred from the following statement of facts. In 18.55 there was imported into the C'nited Staten, as already stated, $18,524,418$ lbs. of wool. The annual production of wool in the Linited States, assumbing that the quantity returneal for 1850 , as per Linited States census, affords a fair arcrage-auounta to $52,516,95!1$ ins. This, added to the quantity importell, pives $71,001,5 \pi+4$ lls. The quantity annualiy oxported reducen thia figure, say, in rointi numbers, to T0,000, (H00 Iba, fur consumption in the different and numerous manufactorion in the Lnited Statea. How much of this is consumed in the manufacture of carpeta tisere is no menns at hand of determining with any ace curacy; the it is matell in a publication of highauthor-ity-the sicirntific imerican-that in the village of

Thompeonville, Connecticut, alone, thore ls used annually in the manufacture of Iirussels, Axminster, and other costiy quailites of carpeting, $10,000,000 \mathrm{lbs}$, of wool, or mnrs than one half the whole quantity im. ported, and one-seventh part of the nggregate quantity mported and grown in the United States.
The value of the foregoling statement of facts will he better understood when it is added that the United Stntes import annuaily-taklng the importations of 1855 as an average-woolen manafactures of various deacriptions to the value of $\mathbf{8} 27,000,000$, of which En. gland furnishes nearly two-thiris. The total number of woolen manufactories in the United States in 1850 was 1559 ; capital luveated, $828,118,650$; ths. of wool consumed, $70,862,869$; value of maw materiai, 202,755,991; handn employed, mnles, 22,678 ; females, 16,574 ; value of products, $48,207,545-$ In which are Ineindel $82,206,052$ yards of cloth, and 4,294,1356 liss. of yarn, hesides blankets, hats, cte. Were tha raw materinl suppitied in aufficlent quantitios, the eensus of 1860 wonld probably add 100 per cent. to the preceding fignres. The forelgn trade of Bejrout is earried on principally by large claks steamers, under the Austrian, French, ond lritish finge, which visit this port regnlarly, and find nlways nbundant frelght, consisting of the prodinets of Syria and the vast region whiels lies lietween Skaneroom and the rivers Eu. phrates and Tigria. The prosperity of Beyrout and the surrounding country is indicated hy the fuct, that while the population was only 8000 in the year $18 \cdot 14$, it is now estimated nt hetween 50,000 and 60,000 . The steamers of the Anstrian LIoyds Company, in March, 1856, are said to have numbered 50 , with 10,000 horse-punver, and a measurement of nearly 30,000 tons. The fonited States consui at that port, writing under date of October 5, 1855, anys: "I lenm, upon the best anthority, that the peopie of this eountry consiler the clotis inan. ufactured in tho Inited Statea anpering in qualite to that of England; but since the pieces of Awerican grods do not uniformly contain the same number of yneds like the Finglish pleces, they are slow to purchase, owing to the pewer of old Idens nnd halits, it would lie of great service to the manufueturers if they understoon this fart, and would regard it."

Candirt.-The conmerce of this island is ennducted throngh the porta of Retino, Canen, and Candia. Its exports consiat chiefly of olive-oll, harley, wheat, wine, raisins, eoteon, finx-meed, almends, Indian eorn, and soap. The agricuttural productions of Candia are es. timated at a value of $18,500,000$ franes jer anumm. tts manufacturea amount in value to ahout $6,0(1) 0,000$ franes, of which sonp rypupristea $4,000,000$, rind coarse elethe for consmmption $2,000,000$ franen. There are on the isiand 47 noap, factories, which yield annually alwut $13,000,200$ thas of anop ; and 3000 oil-presses thactive operation. Ahont 40,000 iths. of silk are prostected annuaily on this isiand, of a quality equal to that of Airianopic.

The imports and exports during a perlod of fout consecutive years were:

|  | Impmis. | E:rport. |
| :---: | :---: | :---: |
| In 18 | 1,1400,105 | - |
| \% 146 | 1,106, (1) | 1,277, +(6) |

Cundia abounds in prodace adapted to the American market; but the direct trade between the United States and that island is as yot unimportant. So long, indeed, as the present duties of 30 and 40 per cent. are levied on their staple exports of cosrse wool, oltve-oll, soap, etc., it can scarcely be expected that thls trade will increase to any considerable extent. It is stated, in a consular return from Candia, that a reduction of these dutles, as well as of the duty on ruw sllk, would tend to establish a highly respectable and direct AmerIcan intercourse with the ports of Candia, aufficient, probably, to compote with that of Great Britain and France. In consequence of the almost nominal duty upon the leading productions of the island in Great Britain, the commercial Intercour;c with England is fast increasing.

General Remarks on Turkey,-The treaty between the United States nad the Ottoman Porte dates as far back as May 7, 1830. Its preamble, however, declares that it is "not limitcd as to duration," and it consequently regulates the intercourse between the countries at the present time. Its principal commercinl features are-that the merchants of either country, in the provinces, ports, etc., of the other, shail pay the same duties and ether imposts that are paid by the merchants of the most friendly or favored nation ; and that merchant vessels of the United States alhall have liherty to pass the canal of the imperial resldence, and go and come In the Black Sea, in like manner as vessels of the most favered natlon. The tarlff of duties is based on an al ralovem system, viz. : Imperts 5 per cent., and exports 12 per cent., including, as to both, internal duties. The valuo of merchandise may bo revised every four or five years by commissioners on the part of the differont governments, conjointly with agents appointed for that purpose by the Turklsh governuent. The United States huve hitherto appointed no cetumissioners for this adjustment of valuation; and it has been represented to the lopartment that the existing valuation on Britlah merchandise, especially cotton goods and rum, subjects to heavy discriminations similar articles of the United States, owing chiefly to the difference in weight and prices. Since tho return of pence, many improvements, tending to fucilitate and improve the commercial intercourse of Turkoy with forelgn nations, have been completed or projected. Amoug others, the lighthouse system has undergone extensive improvements, and uniform light-dues established for the Besphorus and Wardanelles, viz.: 50 piastres (between $\$ 2$ and \$2 50) tor every 100 tons each strait, or 100 piastres per 100 tons for both, entering, nad the same returning. At Constantinople thore are, properly speaking, ne port charges; but a small fee is required on vessels passing through the Golden Gate to discharge their cargoes.
The idea of connecting the Mediterranean with the

Red Sea by means of a ship canal acrote the lathmus of Suez has long been entertalined. The level of the latter sea is knewn to be higgier than that of the former by thirty-two feet, and the isthmus was at ono thne oubmerged. The levelinga, with a vlew to a canal, which were prosecuted with care daring the occupstion of the French army, have been followed up by the Viceroy of Egypt, and a plan of the work has recently been settled by a European commission of englneera assembled in Paris to discuss the detalla. Thila commiavion has rejected all plans Invelving indirect routes across Egypt, and has adopted the princlple of a direct cutting from Suez to the Mediterranean. The entmance into the Mediterranean, to be called Port Said, will have an inner basin, and the channel will be 1312 feet in breadth. The entrance at the Red Sea, the port of Suez, will also liave an inner basin, and the channel will have a breadth of 084 feet. Capitul sufficient for the accomplishment of this work la sald to have been subscribed, and the work actually commenced. Another canal, which has long been centempla ', but opposed by Russia, as menucing the prosperity of Odessa and her trade in the Black Sea and the Levant, is now considered in a fair way of accomplishment. This canal will be uhent fifty miles in length, connecting the Danube with the Black Sea, and shortening the distance from Constantinople to Vienna some 500 miles, besides obviuting the difficult navigation and the pestilential miasma near the mouths of that river. A charter hus been granted, and a company of capitallists organized.-Com. Rel. U. S.
Consular Officers in Turkey.-In Mohammedun and pagan countries each Christian state asserts for its subjects nore or less of exemption from the authority of the local sovereign. Thus, at the present time, throughout Christendem, the general rule prevails that foreigners are eubject ln all criminal snd in most elvil matters to the local jurisdiction; but in all Mohammedan and pagan atates a different rule prevails.

The treaty between the United States and Turkey provides that "If litigations and disputes should arise between the suljects of the Sublime Porte and citizens of the United States, the parties shall not be heard, nor shall judgment be pronounced, unless the American dragoman be present. Causes in whieh the sum may exceed five hundred piastres shall be sulmitted to the sublime Porte, to be decided according to the laws of equity and justice. Citizens of the United Stutes of America, quictly pursuing their commerce, and not being clarged or convicted of any crime or offense, shall not be molested; and even when they may have committed some offinse, they shall not be arrested and put in prison by the local authorities, but they shall be tried by their minister or consul, and punished according to their offense, following in this respect the nsage observed toward other Franks." Under the existing treaty bet ween tho United States and Turkey, our commerce is placed on the footing of the moat favored nations; thus securing to our merchant vessels the privilege of tradieg to all the pointe of Turkey in Europe, Asia, and Africa, on the same voillions as those granted to the most fsvored nations. Thns our vessela may now trade to the ports of Egypt and Asia Minor, to the Turkish islands of the Archipelago, and to the Otteman ports of Europe, and on the Aslatic share of the Black Sea. This is at once an immense field for the enterprise of our merchants and seamen. Many facilities are thus offered for the extension of our commerce with the nations of the East; and consular offlcers may render important services to their countrymen by collecting all the information in their power in regard to the productions and commeree of these countries, and transmitting it to the State Dopartment, by which it will be published from tlme to time for the general advantage of American citizens. -See articles Congrantinorle, Beyrout, Galatz, and Smyra.

- Nine montin to June 30, and the fiveni year from thia time brgina July $i$.

Turkey Red, a fine and durable red dyed upon the sun's rays, in barrela perforated in tho botom, calico and woolen eloth : the coloring matter used in its production is medder, fut the process for produchig it in perfection is tedious and complicated.-Siee ilas. curt on I'ermanent Colors.

Turmeric, the root of the Curcnna lengrs. It Is exteraally grayish, and internally of a deep lively yellow or saffron color, very hard, and not unlike, either in figure or size, to ginger. That ahould be preferred which is large, new, resinous, difficult to break, and heavy. It is imported from llengal, Java, China, ete. It has a nomewhat uromatic and not very agreenblo rimeli, and a litterish, shightly acrid, but rather warm tuste. It used to be in considerable estimation as a medicine; and is extensively used In India for culinary piurposes, entering into the composition of curry puwier and other articies: in Europe it la oniy nsed as a dyc. It yieids a beautiful bright yellow celor, which, however, is extremely fugitlve, and no means have hitherto been discovered of fixing it. It is sometimes employed to heighten the yellows made with weld, and to give an orange tint to searlet; but the shute imparted by the turmeric soon disappears.Lekwin's Mat. Med.; Baxchort on Culora.
Turpentine (Ger. Turpentin; Fr. Terbenthine; It. Trementina; luss. skipidar: l'ol. Terpentyna). There are several apecies of turpentine, but all of thom posseas the same general and chemical properties.

1. C'ommon Turpentine is a resinous juice which exudes from the Scoteh fir or wild pine (linus sylirstria). The trees which are most exposed to the sun, and have the chickest barks, yield it in the greatest abundance. They legin to produce it when about forty years old. The bark of the tree is wounded and the turpentino flow out in dreps, which fall into a hole, or sort of cup, previously dug at the foot of the tree, holding ahont 1) pint. It la purified ly being exposed to liquefy in
the sun's rays, in barrela perforated in the bottom, through which It filters. In the Southern States the collection of turpentine is chiefly confided to negroes, cach of whom has the charge of from 3000 to 4000 trees. The process lants all the year, ulthough the Inciaions nre not made in the trees tili the middle of Mrich, and the flow of the turpentine generally ceases about the end of October. The boxes are enptied tirg or alx tlmes during the year, and it is estimuted that 250 boxes will produce a barrel welghing 320 lh . Turpentine has a strong, somewlut fragrant odor, and a bitter, disagrecable taste: its consistence is greater than that of honey ; its color dirty yellow; and it is more opaque than the other sorts.
2. Ienire Turpentine is the produce of the larch (Pinus larix). It Is olitained by loring a hale into the henrt of the tree about two fect from $t^{\prime}$ ie ground, and fitting into it n amali tube through which the turpentine howa into vessela prepared for its reception. It is purilied by atraining tlirough clothes or hain rieves. It is inore fluld, having the consistence of new honey, n yellowish color, and is less mpleasani to the smell and taste than the common turpentine. Gienujue Venctian turpentine is principally ohtained from the forests of llaye, ha l'rovence; but much of that to be found in the khops comes from America, and is, perhaps, olipained from a different spectes of fir.
3. Canadian Malsam, or Turpentise, is olitained from incisions in the bark of the linus balsamea, a native of the coldest regions of North Ancrica. It is imported in casks, each containing abotit 1 cwt. It has a etrong, not disagrecable onlor, and a bitterish taste $;$ is trankparent, whitish, and has the consistence of copalva halsam.
4. Chian, or Cyprus Turpentine, is obtalned from the I'stacin terebinthus, a mative of the north of Africa und the south of E.urope, and cultivated in Chios and

Cypru the in stralne eratoly and a consis tenaci turpen mest p turpen be tlise distlll belng , hol), tlon be tial oll dlstilla produe oll, as pentin a brow meited mixing comine table $S$

Tho
State of years, a the nnn gallons, In Nort ried on annual

Cyprus. It flowa out of Inclaions made in the bark of the tree in the month of July, and is subsequently strained and purifed. It has a fragrant odor, a moderatoly warm taste, devold of acrlmony or bitterness, and a white or very pale yellow oolor; it la about as consintent as thick honey, la clear, trensparent, and tenaclous. From lts comparative high price, Chian turpentine is seldom procured genuina, beling for the moet part adulterated either with Venetian or common turpentine. The different species of turpentine may be dissolved in rectified apirit, or pure alcohol; and by diatllatlon they ali give elnilar olls, which, from their being distilled (and not from any resemblance to alcohol), are termed apirit of turpentine. If the distillation be performed with water, the produce is an easential oil, the cominon spirit of turpeniline; and if the diatillution be carried on in a retort without $v$ tir, tho product is more volatlle and pungent-a cuncentrated oil, as It were-and ts called the ethoreal spirit of turpentine. The residunm that is left $\ln$ both cases is a brownish, resinous mass, brittle, capable of belng melted, highly inflammable, insoluble in water, but milxing freely with oila: It is the common roaln of commerce.-Library of Entertaining Knovledge, Vegetable Substances; Thomson's Digpensatory.

Explats of Spinits of TuEpRetine from the liniten htates for tie Year ending Jung $30,1857$.

The manufacture of spirits of turpentine in the Stato of Alubama was commenced within the last eight years, and, although upon a very limited scale at first, the nnnual product has now reached upward of $1,600,000$ gallons, and that of rosin to ahove 130,000 barrels. In North Carolina, where the business has been carried on for a much longer time, it is catimated that the annual product of spirits ar ats to $000,000 \mathrm{barrels}$,
and this would give a realdne of about $3,200,000$ barrele rosin. Upon thit eetimate the valua of the spirits of turpentine annually producod In the State of North Carolina is upward of $\$ 14,000,000-$ nearly equsl to the value of the annual agricultural product of the State of Maryland. Add to this the value of rosin when converted Into oil, which at the present market value wot $\mathrm{d}_{\mathrm{d}}$ be $\$ 19,200,000$, and we find a resource In this natural product of over $883,000,000 \mathrm{ln}$ the Stste of North Carolina alone; and this estimato does not include the tar, pitch, and naphtha, whlch are necessary and merchantable articlea, and would largely increase the amount.

Extoath of Rohin ann Turpenting from tin livitan States for tila Year eminne Jene 30, 1857.

Oil of Turpentine is the essential oil drawn from turpentine by distillation. There nre two sorts of this oil: the best, red; and the second, white. It is very extensively used by house painters, and in the manufacture of varnisli, etc. The distillers have been charged with using it in the preparation of gin. Oil of turpentine is very often adulterated.
Turpeth Mineral (from its yellow color, which resembles the powdered root of the Convolvulus turpethum), the yellow sub-pergulphate of mercury.
Turquoise (Ger. Tü. .kiss; Fr. Turquoise ; It. Turchina; Sp . Turquesa), a precious stone in considerable estimation. Its color, which is its principal recommendation, is a beantiful celestial blue, which migrates into pals blue, and is sometimies tingel with green. Specific gravity, $3 \cdot 127$. It is destitute of lustre, opaque, and does not admit of a high polish. It is
much worn in necklaces, and evary part of ornamantal jewalry, from the fize of a pin's head to that of an almond; It contranta beautifully, with brillianta or pearle set in tine gold.- Mawn on liomomile. Lieal turquoisen aro excluslvely furnlahed by l'ersia. The minea Whence they are obtalned are aituuted near Nlahapore. They are the property of the err $\mathbf{v n}$, and are farmed to the highest blider. They bring a rent of from $\mathbf{E 2 0 0 0}$ to c2700 a year.-Finasxa'n Truvela on the Shore of the C'aopian.

Turtle. Thla word is used to signify a apeclas of dove (Columbs tu. tur), and alao a genus of Chelonian reptiles (Chelone, Brongn).

Tuscany. The Grand Duchy of Tuacany comprises an area of 8586 aquare miles, anil contained In 1854 a population of $1,815,636$ Inhabitante. Its chlef port ls Leghorn, altuated on the Mediterranean, and ponsessing extensive artificial faclities for commerclal enterpilise; Indeed, the harior la entlrely artificial. Strictly apeaking, 'Iuncany la an agricultural country -the valley of the Amo being generally considered the nost fertlle in liurope. The nystem of culture is, however, lmperfect; and the consequence Is, that the grain raised is insuffielent for home eonsumption. Tuscany has long ticen celelirated for itn mineral productlons. Iron abounds in the island of Elba ; copper, argentlferous lend, sulphur, mercury, alum, coal, narhle, and alabanter are found in different purts of the Grand Ducliy ; and borax is supplied in great abundance from the lorax lagoona of Volterra.
The manufactures of Tuscany are in a highly flourishing condition. These connist of straw-platting and the mannufacture of atraw hath, and manufacturea of allk ; the princlpal reat of this latter branch of industry leing at Flurence, in which elty alone there aro upwarl of 4100 looms. There nre also manufactures of wool, eapecially of woolen cluths and carpeta; manufuctures of lisen, of paper, alabaster, marble, porcelaln, harlwares, and of metal. The Internal taxes levied on every branch of productive Industry throughout the Tuscan territorics have long fetterel the commercial activity of the country. Furniture, machinery, bookn, live stock-ln fact, every article In dally use, has to beur enormous duties. Fivery wulled city has its own system of taxation, so that the manufactures of one town are burdened with opjresslve duties (octroi) liefore they can be admitted fur aale Inte another. Such a zystem necessarily resulta injuriously to the commercial enterprise of 'luscany; and lta effects are jerceptifle in the atagnant condition of the forelgn commerce of that country. The chlef exports
of Tuacany are ofl re-oll, bldes, straw hate, borax, ragh, wool, hemp, potanh, coral, marhle, tallow, curk, Julhl-Ing-timber, and pe ver। and the chilef imports, colonlui produce, sult fish, and IBtithh, German, Swisa, and French innnufactures. The usual exports of tha United States to Tuacany are naval atoren i valua thereof in

 tures not anumerated, to the amnunt of between +2000 and 8000 . In 1865 the exporta of cotton from the United Statea to Tuacany amoungod in valne $H_{0} \& f^{(N)}(1)$ and of tobaceo to 171,621 . Tha Imports of the U'nited Statea from Tuacany are chiefly alik, plece guxin, oliveoll, slmonda, flgn, moap, mall quantities of oplum, nul raga; this lattor articla averaging annually some nix. million pounda.
Thare In no commerclal treaty betwaen the United States and Tuscany; but Amerlcan veasele anjoy perfect equallity, aa reapcets navlgation and import dutics, with the Tuscan fag-similar privilegea having heen granted to the Tuscan flag in the ports of the United States, por I'renldent'a proclamation, Sept. 1, 1886.

The genaral forelgn trade of Leghern $\ln 1851$ was, In imports, $\$ 14,442,800 ;$ and in exports, $10,304,120$. This is a falling off from tha general trade of the preceding year of 9933,720 . Thia diminution in the furelgn trada of Leghorn, which is avery year becoming more and more perceptitils, ts accounted for by the fuct that a large jortion of the extenaive trade with lombardy, Parma, Modena, and the l'outifical ntaten, heretofure the princlpal aource of the commercial prosperity of thin jort, han paased from Leghorn, and is now carried on through the jorts of Genos, 'Irlente; anl Ancona. Bealles, the port of Leghorn has of late years been nuch neglected, and offera nelther inducements nor proper facilities to forelgn flagh. Ships of heavy drunglit can not enter the harbor, especially If laden; and there are no suitalle warehouses, not even for the marble of Carrara, one of the leating exports to the United States. To these cuuses of the decline of the trude of Leghorn is to be added a tux of 3 franes 30 centimes fur every person who goes ashore, should he remaln buc, an hour. The merchant marine of Tuscuny in 1851 comprised 700 vessels, measuring 27,000 tons-averaging less than 40 tons to the vessel. In the year 1849 thero entered the port of leghorn 1282 vessels (exclusive of 457 steamers), of which $? 6$ wore American ; and there clearcd 1189 (exclusive of 154 ateamers), of which 24 were American. In 185 the arrivals were 3418 vessela, of which 23 wero Amerlean.

Quarantine.-The quarantine regulations of Leeghorn are the mout rigorous of any other jwrt in the Mediterrancun. Ships approaching leghorn are visited by two guarils sent from the health office, one of whom alwaya acts as pilot. The mort recent authority in the porsession of the Department on this sulject thus sums up the quarantine regulations of this jort, so far as they relate to vessels arriving from American ports :

Daya sf Quccrantime.-According to cases of auspicion for arrivals from America.

from the equator to the tropic of Cancar ; from lit December to Feliruary inclasive, seven days; from lat March to November Inclusive, ten days; vensilx of war two days less than merchant vessels. berond dlvishon: from the tropic of Cancer to Charlestan inclusively, and from the equator to al! South America, flve days, from 1st lecember to February inclusive; seven days, from 1at March to Novenatier indusive. Third division: from the Unlted States between Charleston and Camada.

Ioubeful Hills of Mealth-IDays of Quarantine,-Laz.
aretto of St. Roch, all seanona, and wherever from, from Ist Decemter to Felruary inclusive, etroteen duys ; from Iat March to Noveniber inclualve, ", iteen days; vessela of war, ten days; without ausceptivie commoditien, rigil, fuurteen daya, from 1st December to February inclunive ; elghteen dayn, from 1at March to November luclusive.

Foul Bills of Heolth-Days of Quarantine,-I Lazaretto of St. Roch, all reasons, and wherever from, twentyfive days ; without susceptible commodities, from 1nt December to February laclusivs, elghteen days; from 1st March to November Inclualve, twenty-five dayal tusceptible commodities, days not given, but time supposed to be arbltrary, and dependent on the contlinuance of auspiclous circumstancos.

Theae regulations are still more rigid when vessels arrive from countries in which the plague has been known to exist. Thene include the 'lurkish Levant, Egypt, and Barbary. When vessels are subjected to a long quarantine, three medical vislts are generally made; and when merely under inspectlon, two. In extraordinary cuses a guard-bont la stationed near the vessel, and paid for at the rate of 64 centa per day. In all cases of assistance from sanitary oflicers, the commandant of the port deterinines the amount of comjeasation. The vessels of all nutions, whether'Tuscan or forelgn, pay the same quarantine c'ues. These dues are, for each asnitary vlsit 80 cents, and $\$ 108$ for the boat conveying tho heulth officer. For oach guard, per day, 58 cente 1 or 48 cante if food ls supplied. Tho tonnage duties mmount to $\$ 1120$ on a aquare-rigged vessel of 200 tens, with an additional charge of $\$ 160$ for overy twenty flve tons over that capacity.-C. D.

Parma embraces an area of 2766 square miles, containing a population in 1804 of 608,784 inhabitants. The chief productions are maize, wheat, fruit, tobucco, and silk. The princlpal manufactures are ailk fabries, iren wares, glaag, oarthell-ware, paper, atraw hats, and gunpowier. Commerclally, Parma possesses but littic interest, her lmportations boing exclusively by lund, and limited to amall quentities of sugar, coffee, und a fow articles of luxury, principally of dress and ormament. Iler exporta are cattle, logs, anusages, aud cheese.

Modena.-This state is of less extent than Parma, and its productions acarcely auflico for the subslatence of the inhabitants. It derivea amo commercial importance from the marble quarries et Carrara, whleh seem to be inexhaustible. The trade of both these statea being inland, and but poorly aupplied with any basis for commercial exchanges, is, of course, very inconsiderable. By treaty of December 4, 1849, the two states of Parma and Modena edopted the tarlff of Austria, and duties are consequently levied at the aame rates and in the same manner as those of that empire.

Lucca.-This little state was annexed to Tuacany October 11, 1847. This took place in virtue of provisions of the Congress of Vienna, when, upon the decease of the Archluchess Maria Louisa, the Duke of Lucea liecume ruler of Parma. The soil is exceedingIy fertile, and tho culture of oil and silk lo acquiring some impertance-the former being generally esteemed the tiest in Italy, and the latter of fair quality. The imports of Lucen, when an independent state, consisted chietly of sugar, cofice, spices, wine and spirits, salt fish, hemp, flax, cotton, wool, and various manufactures. Salt and tolacco wera government monepolies, and their importation on private account was prohibited. The exports were olive-oil, to an nnuunl value of about $\$ 160,000$, and fresh fish, of $\$ 50,000-$ the latter sent chlefly to Leghern from the omall port of Vlareggio. In mannfacturing Industry lucca is suid to surpass beth Purma ard Modene. Silk ts the most important manufacture; and next rank common woolens end cottons, glving employment, in all, it is estimated, to about 6000 persons, chicfly in the city of
Lucca. Lucea.

Son Marino.-Rural industry and the manufucture of slik constitute the chief occupation of this little repubile.

Monaco.-This amall princlpaility, under the protection of Sardinla, by the treaty of November 21), 1815, onjoyn a tine climate, adi producea orangea, lemona, and olivea In ahundance. It has alwo rich panturages und productive firherics. It need only be added respecting these amall states, that auch artleles of their own produce and unnufucture, or of the United States, as are interchanged, are eo blended with the trade of other countries, that any attempt to speclfy the quantitiea or values of each respectively would prove abortive, eves were the amounts sufficiontiy large to warrant the effort.-Ses articles Aubtmia and Thieste.

Tutenag, the name glven in Commercial language to the zinc or speiter of China.-Aes Zinc. This commodity used to be smuggled from China (the exportatlon of unwrought metala from that emplre belng prohlbited) to Ilindostan, the Malay Archlpelago, and nelghboring countries, to ths amount, it is aupposed, of alout 60,000 cwt. a year. In 1820 the Britligh freetraders Introduced German apelter or sino for the first time into the Indien market. In 1826 the importation of tutenag from China Inte Calcutta ceased; and It has now been totally superseded throughout Indle by spelter. Of this latter commenlity there were exported from Great Britain, in 1850, to the East India Company's territories and Coylon, 11,628 cwt., besides the quantitiee furnlshed by IIemburg, Rotterdam, Antwerp, und other Continental ports.

Typhoon, the name given to a violent tornado or liurricane in the Chireas sear.--See Sronms.

Tyre, the prinelpal clty of Phoenicia, and the most celebrated emporiam of the anclent world. Thls fameus city was sltuated on the southeast cosst of the Mediterranean, where tho inconsiderable town of 'Tsour now stunds, in lat. $33^{\circ} 17^{\prime}$ N., leng. $85^{\circ} 14^{\prime} 35^{\prime \prime} \mathrm{E}$. The trade that is at present carried on at $\mathrm{T}_{\text {seur }}$ is too trifling to deserve notlce; bui as this work is Intended to give some account, however imperfect, of the revolutlons in the channela of commercial enterpriee, we may, perhaps, be excused for sulmitting a few etatementa with respect to the commerce carried on by 10 renowned a people as the Tyrlans. Tyre was founded by a colony from Sidon, the most anclent of the Phonician clties. The date of this ovent is not certalnly known, but Larcher supposes it to have been 1690 jears before the Christian era.-Chronologie d'Herodote. It is aingular, that while Homer mentions Sidon, he takes no notice of Tyre, whose glory speedily eclipaed that of the mether city; but this is no conclualve proof that the latter was not then a censideralle emporium. The prophets Isalah, Jereminh, and Ezeklel, who flourished from 700 to 600 years before Christ, represent Tyre as a city of unrivaled wealth, whose "merchants were princes, and her traffickers the honorable of the earth." Orlginally, the clty was built on the main land; but having been besieged for a lengthened period by the Babylonian monarch Ne'puchadnezzar, the inhabltants conveyed themealvea and their goods to an island at a little distance, where a new city was founded, which enjoyed an increased degree of celebrity and commercial prosperity. The old city was, on thint account, entitled l’aletyre, nud the other simply Tyre. The new city continued to fleurish, oxtendlag its colenies and lts commeree on all sides, till it was attacked by Alexander the Great. The resistance made by the Tyrians to that cenqueror ahowed that they had net been enervated by luxury, and that their martial virtues were nowlse inferior to their commercial skill and enterprlas. The overthrow of the Perslan empire was effected with less difficulty than the cajture of this gingle city. 'he victor and net magnanimity to treat the vanquishea' as their heroic conduct deserved. In despite, however, of the cruclties inflicted on the city; she rose again to considerable eminence. But the
foundation of Aloxandria, by diverting the commorce that had formerly centred at Tyre into a now channel, gave her an irreparable blow; and she gradually declined, till, consistently with the denanoiation of the prophet, her palaces have been lovoled with the dust, and she has become "a place for the sprending of nete In the midst of the sea."

Commerce.-Phwnicia was one of the emallost countries of antlquity: It occupied that part of the Syrian conest which atretches from Arndus (the modern Round) on the porth to a little below Tyre on the sonth, a dictance of about 50 leagues. Its breadth was much lesa considermble, being for the moat part bounded by Mount Libanns to tho esst, and Mount Carmel on the south. The anfface of this narrow tract was generally ruggod and monntainona; and the soil in the valleye, though moderately fertile, did not afford sufficient supplios of food to feed the population. Lhanus and ite dependont ridges were, bowever, covered with timber suitable for ohlp-bailding; and besidea Tyre and Sldon, Phconicia possessed the ports of Tripoll, Byblos, Berytus, etc. In this situation, oceupying a country unable to aupply them with sufficient quantities of corn, hemmed in by mountaine, and by powerful and warlike neighbore on the one hand, and having on the other the wide expanse of the Mediterranean, atudded with islands, and surrounded by fertlie countriea, to invite the enterprise of her citizena, they were naturally led to ongage In maritlme and commercial adventures; and became the boldeat and moat experienced marinore, and the greateat discoverers, of ancient timee.

From the remotest antiquity, a conaiderabie trade seems to have been carried on between the Eastern and Western worlds. The epices, drugs, precious atones, and other valuable prodncts of Arabla and India, have alwaya been highly eateemed in Europe, and have been exchanged for the gold and ailver, the tin, wines, etc., of the latter. At the first dawn of authentic history; we find Pheenicis the principal centre of this commerce. Her inhabitants are designated in the early nacred writings by the name of Canaanultes-a term which, in the language of the East, means merchants. The products of Arabis, India, Persia, etc., were originally conveyed to hor by companien of traveling merchants or caravans, which seem to have been constituted in the same way, and to have performed oxactly the same part in the commerce of the East, In the days of Jacob, that they do at present.-Gen. xxxvil. 25, etc. At a later period, however, is the relgns c.' David and Solomon, the Phoonicians, having formed an alliance with the Hebrews, aequired the ports of Elath and Ezion-geber, at the northnast oxtremity of the Red Sea. Here they fitted ont fleets, which traded with the ports on that sea, and probably with those of Southern Arabia, the west const of India, and Ethlopia. The shipe are eald to have visited Ophir; and a great desl of erudition has been expended in attempting to determine the exact situation of that emporiom or country. We agree, however, with Heeren, in thinking that it was not the name of any particular place, but that it was a sort of geueral desigantion given to the couste of Arabia, India, and Af-
rica, bordoring on the Indian Ocean; somowhat In the asme loose way as wa now use the terme East and Went Indies.

The distanos of the Red Sea from Tyre being very considerable, the conveyance of goode from the one to the other by land must have been tedions and expentive. To leseen this inconveniones, the Tyriane, shortly after thay got poscescion of Elath and Exlon-geber, seised apon Rhinoculura, the port in the Mediterranean nearest to the Red Sea. The products of Arabia, India, etc., being carried hither by the most compendious route, wore then put on board ships, and convejed by a briof and eaay vorage to Tyro. If we oxcept the transit by Egypt, this was the shortest and most direct, and for that reason, no doubt, the cheapeat channel by which the commerce between Sonthern Asia and Europe could then be conducted. But it is not believed that the Phoniciana posseased any permanont footing on the Red Sea after the death of Solomon. The want of It doea not, however, seem to have senaibly nffected their trade; and Tyre continued, till the foundation of Alexandria, to be the grand emporinm for Eastern products, with which it was abundantly supplied by caravana from Arabla, the bottom of the Persian Gulf, and from Babylon, by way of Palmyra.
The commerce of the Phuenicians with the countriea bordering on the Mediterranean was atill more extenoive and valuablo. At an eariy period thoy established anttlementa in Cyprua and Rhodes. The former was a very valuable acquiaition, from its proximity, the number of its ports, its fertillty, and the variety of its vegetabie and mineral productiona. Having passed ouccossivoly into Greece, Italy, and Sardinia, they proceeded to explore the southern shores of France and Spain, and the northern shores of Africa. They ofterward adventured upon the Atlantic, and were the first people whose flag was dlaplayed beyond the Pillare of Merculea.
The commerce and navigation of Tyre probably attained thoir maximum from 650 to 550 yeara before Christ. At that period the Tyrians wore the factors and merchants of the civilized world, and they enjoyed an undiepnted pre-eminence in maritime affairs. The prophut Ezeklel (chap. xxvil.) has deecribed in mag. nificent terms the glory of Tyre, and has enumerated several of the most valuable productiona found in her markets, snd the countries whence they were brought. The fir-trees of Senir (Hermon), the cedars of Lebanion, the oaks of Bashan (the country to the ecat of Galilee), the ivory of the Indies, the fine linen of Egypt, and the purple and hyacinth of the isles of Elishah (Peioponnesus), are opecified among the articlea need for her shipe. The inhabitante of Sidon, Arvad (Aradus), Gebel (lyblos), eerved her as marinera and carpenters. Gold, sillver, leed, tin, lron, and veenele of bress; plives, horsos, mulea, sheep, and goats; pearlo, precious stones, and coral ; wheat, baim, honey, oll, apicee, and gums; wine, wool, and silk, are mentioned as being brought into the port of Tyre ty sea, or to its markets by iand, from Syria, Arabia, Damsecus, Greece, Tarshish, and other places, the exact site of which it is difficuit to determine.-See M'Collocu's Com. Diet.

Oltramarine (Ger. Eltramarin; Fr. Blou doutremer ; It. Oluramarino ; Sp. Ultramat' ; Rass. Vltramarin), a very fine blue powder made from the blue parts of lapis lazuli. It has the valuable property of neither fading nor becoming tarnished on exposare to the air or a moderate heat, and on thls acconnt is highly prized by paintera. Owing to its great price, it is very apt to be adolterated. It was introdaced abont the end of the 15 th centary.
Umbrella. Described in early dictionaries as "a portable pent-house to carry in a person's hand, to screen him from violent rain or heat." Umbrelias are very ancient. It appears, by the carvinge at Persepolis, that umbrellas were need at very remote periode by the Eastern princes. Niebuhr, who visited the sonthern part of Arabia, informs us that he saw a great prince of that country retnruing from a mosqne preceded by soma hundreds of soldiers, and that he and each of the princes of his numarous family cansed a large ambrella to be carried by his side. The old china-ware in pantries and cupboards shows the Chinese shaded by an umbrella. It is said that the first person who used an umbrella in the streets of London was the benevolent Jonas Hanway, who died in 1786.-Haydn. Of late years the manufacture of umbrellas has been improved by the nse of steel ribs instead of whalebone. The coveringe sre mainly confined to cotton, sill, gingham, and alpaca.
Exports of Uybrellag and Pamasole of domegtio MantuFAOTURR FAOM THI UNITED STATM FOA THE YRAR END. ImO JUnE 80, 1857.

The exports of umbrellas and parasola of foreign manufacture for the same period were,

United Kingdom, a general term by which Great Britain and Ireiand are designated.-See articles Evgland, Giear Britaix, Ineland, and Scotland.

United Etates of Amerioa. Lat. $25^{\circ} \mathbf{2 0}$ and $49^{\circ} \mathrm{N}$. , and long. $07^{\circ} 47^{\prime}$ and $124^{\circ} 80^{\prime} \mathrm{W}$. Length, east and west, about 2600 miles; and breadth, north and sonth, abont 1700 miles. The United States occupy the middie zone of North America. The fronticr of this vast country measures about 10,000 miles in periphery, and of this about 4000 milos are sea-cosat and 1500 leke coast.

The sest of government was established as foliows: At "Philadelphia," Pennaylvania, commencing 5th September, 1774, and 10th May, 1778; at "Baltimoro," Maryland, 20th December, 1778; at "Philadelphla," Pennsylvania, 4th March, 1777; at "Lancaster," Penn-
sylvania, 27th Septomber, 1777; at "York," Pennaylvania, 80th September, 1777; at "Philadelphis," Pemnsylvania, 2d Jaly, 1778; at "Princeton," New Jersey, 80th June, 1783; at "Annapoilis," Maryland, 26th November, 1783; at "Trenton," New Jersey, 1st November, 1784; and st "Naw York Clty," New York, 11th January, 1785; Waahington City, district of CoInmbia, wan first occupiad in 1800.
Physical Features.-The United States are traversed by two ranges of mountaina, the Alleghanies, and the great mountain mass of North America, the Rocky Mountaias. These divide the conntry into three distinct geographical regions; the Atlantic slope, descending from the creat of the Alieghanies to the ocean on the southeast; the great Mississippi Valiey, between the Alleghanies and the Rocky Mountains; and the western declivity, from tha Rocky Mountains to the Pacific. The Alleghanies are a long plateau, crested with several mountain ridges, and groups separated from each other by wide and elevated valieys. Thay commence in Northern Alabama and Georgia, and reach their culminating point in North Caroliaa, where thoy attain an elevation of 6476 feet; thence passing northeasterly in parallel ridges, varying in height from 2000 feet to 6000 feet, and a breadth of from 20 to 100 milica, through Virginia, Pennaylvania, New Jersey, New York, Mssaachusetts, Vermont, New Hampshire, and Eastern Cavada, where they terminate in the bold headland of Capo Gaspe. In New York they reach their highest elevations in the spur branching off northwesterly, known as the Catskill pentains and the Adirondack gronp. In Massachusetu, at Mount Washington. In Vermont it attaias its highest elevation in the Green Monntains, known as the Mansfield Mountain and the Camel's Hump. In New Hampshire, in the White Mountains ; and in Canade, at Mount Logan.
The Rocky Mountains take a much greater breadth, and tho calminating pointa reach the region of eternal snows, rising in the portion pasaing through the United States to the height of 14,000 feat. This is the great mountain range of the continent, traversing it from Cape Horn to the Arctic Ocean, forming the longest continuous monntain mass on the face of the globe. Between this range and the Pacific coast are some minor mountain ridges, whose culmianations in sevaral places rise far above the snow line, and furniah seme active volcanoes.
The Missiasippi River has its entire course in the territory of the repubilc, and the valley drained by it, snd its numerons tributaries, is one of the most fertie tracts on the earth's surface. The moat noted feature of the United States is the alightly incl: ted plain, which extends along the entire Atlantic coast, with a breadth of from 50 to 100 miles in width; beyond this plain commences the hilly country extending to the foot of the Aileghany ridge. The soil of the Atlantic plain is asandy, but in many placcs highly productive; and the hiliy portion has a strong, fertila aoil, capable of supporting a dense population. The Pacific section is traversed by aevoral extensive rivera, and presenta a much diversified surface, with varied and picturesque acenery; but some portions are mere desart wastes. Such is said to be the case with tho great California basin, the water courses of which are lost in the sande and volcanic regions, or enter lakes with no visible outlet.
Lakes.-All the great lskes, with the exception of Michigan and Champlain, lie partiy in Canada, he division line pasting centraily through them, and their connecting streams, for a distance of about 1500 miles. The firat (the most extensive sheat of fresh water on the earth's surface) in the series is Lake Superior, the surplus watere of which, descending through the Strait of St. Marys into Lake Huron, which, with the accu-
muiated waters from Michigan, pass through the St. Clair Strait and Lake, and the Detroit into Lake Erie; whence, passing over the precipice of Niagara, and through Niagara Straite, enter Ontario ; Lake Ontario has its outlet by the magnificent St. Lawrence, through Canadian territory, into the Atlantic Ocean. The following is a tahular statement of the extent of these fresh-wator seas, with their depth and elevation:

| Laken. | $\text { Muan } \text { Langlh. }$ | $\begin{gathered} \text { Mann } \\ \text { greadih. } \end{gathered}$ | Ares | Mear Depth. | Klarallom above 80 |

Lake Champlain, lylag between New York and Vermont, is 128 milea long, and from 1 to 16 wide, and dischargea its watere through the Sorel into the St. Iawrence. It is computed that these lakes contala 14,000 cubic miles of water-aquantity more thanfive-sevenths of all the fresh wator of the earth. The extent of the conntry drained by them from the northwest angle of Lake Superior to the St. Lawrence, inclading also the ares of the lakes themselves, is estimated at 335,515 square miles.-Ses Lakes, Commerce of.

Rivers.-The water courses of the United States are on an extensive scale, and afford, with tho great artlficial connectiag links, a oystem of inlund navigation unsurpassed. Flrst in order are those of the Atlantic slope, the waters of which enter directly into the ocean; the principsl of these are the Peaobscot, the Keunebec, the Merrimac, the Connecticut, the Mudson, the Delaware, the Susquebsnna, the Potomac, the James, the Cape Fear, the Great Pedee, the Savanaah, the Altamaha, and St. Johns, etc. These are all navigable atreams, some for a great distance inland. Second, the rivers entering the Gulf of Mexico or Sea of Cortez. The Appalachicola, the Mohlle, the immease Mississippl, the Sabine, the Trinity, the Brazoe, the Colorado, and the Kio Grande. The rivers enteriag the Pacific are the Columbla, the Saeramento and San Joaquin, the Colorado, and Giia, the latter two discharging their waters luto the Gulf of California. There are many rivers entering the grest lakes, and also the St. Lawreace, the great artery of Canada.-Siee rirers under proper names.

A remarkabie analogy exiats in the atracture of the land in the United States and Central and Northern Earope. Gneiss, mica, schist, and granite, provail over wide areas in the Alleghanies; and on the Atiantic alope, and in the bigh and middle latitudes of the continent, silurian strats extend over 2000 miles. The Rocky Mountalns, aiso, are mostly siiurian, except the east ridge, which is of stratified cryataliine rocks, amygdaloid, and ancient volcanic productions. The coast range has the ame characteristies, with inmense traets of voleanic rocks, both ancient and modern, chiefly obsidian. In North America volcanic action is entirely confined to the coast and higblends along the Iracific; but within the United States at the present day this action is dormant (with the exception of Mount St. Itelens), although its activity in very apparent both to the north and sonth-to the north in Mount Se. Elias, and to the mouth in the Mexican volcanoes. The prineijal minerala produced in the Unit. ed States are iron, coal, copper, lead, and goid, whith a great number of less importance. Since 1818 the great field of gold gatheriug has been California, where large quantities have been obtained with litlle labor, and both ailver and quickailver abound in the same state. Silver, however, is mostly obtained from the lead and copper mines of the Upper Mississijpi and Lake Superior countrica, where it in found in combl. nation with these metals. The prineipal deposita of gold, otherwise than those of California, occur in tha
primsry rocks between the Fiver Rappshannock, in Virginis, and the Coosa, in Alabsma; hut it has been found in smaller cuantities as far north as Maine. Gold and silver abound also in New Mexico and Weatern Texas, and probably in the Meailla territory. The coal-fields of the States are of prodigious extent. Nearly one-fonrth of the country between the Alleghanies and the Missiasippi is composed of coal-beds; and in Pennsylvania, Maryland, Ohio, Iadlana, and Illinola, coal-mining has become of vast Importance to general industry. The ascertalned areas of the coal fomation in the under-mentioned States are as follows: In Alabama, 8400 square mlles; Georgia, 150 ; Tennessee, 4300; Kentueky, 13,500; Virginia, 21,10: Maryland, 550 ; Ohio, 11,900 ; Indiana, 7790 ; Illinois, 44,000; Pennsylvania, 15,487 ; Michlgan, 5000 ; and Missouri, 6000 i total, 183,132 equare mlies, Coal has also been found on the Pacific slope-in California, Oregon, and Washington-and the mincral will no doubt be found in 'Texas and the adjoining country. As a general remark, it may be atated that the coal east of the higheat Alloghanlea takes the form of anthra. cite, whilo west, and in the valleys of the great central rivers, it ia bituminoua. Iron is equally abundant with coal, and is usually found in juxtaposition with it. The prinelpal seats of iron mining aro Pennsylvania, New Jersey, Ohlo, Mlssoari, Kentucky, and Northorn Michigan; and it is also extenaively mined in Northern New York. Pennsylvania, however, is pro-eminent in this Industry, and produces at least one half the iron mined in the United Statea. Copper is miued chiefly in Northern Michigan, but to a less extent in Conneeticut, New York, Tennessee, Nopth Carolina, etc.; and rich copper mines exist also in New Mexico, near the head of the (iils River. Lend is worked chiefly in Illinois, Wisconsin, and lowa; on the Mississippi, and for many milea around the territory, in which are included Dubuque, Galenn, and Minoral Point ; and In these regions upward of 80,000 tons are annually produced. (With respect to other mineral products refor to the States beverally.)

IIstorical Summary.-Eighteen new States have been admitted into the Union since the confederation of the original thirteen colonies, as follows:

1. Vermont, which formed a part of the territory of New York and New IIampshire, was admitted on the 4th March, 1731.
2. Kentucky, which was formerly a part of Virginis, was admitted on the 1 st June, 1792.
3. Tennessee, formed from the territory ceded to the Unitel States by North Carolina, and which afterward was known as the "Territory south of the Ohio River," wus admitted on the lst June, 1796 .
4. Ohio, the first State fermed from the "Territory northwest of the Ohio liver"-a territory which had been celed to the United States by Virginia and other clainants, and which was erected into a government as eariy ns 1787, was aduitted on the 29th November, 1802.
5. Louisiana, a part of the vast territory of the same name purchased of France hy the United States in 1803, and subsequently known as the Territory of Orleans, was adinitted on the 8 th A pril, 1812.
6. Indianc, the second State formed to the northwest of Ohio, was admitted within its present limits on the 11th December, 1816.
7. Mississippi, which was formed from the territory ceded to the United States by Nouth Carolias and Georgia, was admitted on the i0th December, 1817.
\%. Jllinoie, the third of the Northwestern States, was admitted on the 3d Decenber, 1818.
8. Alabama, the second State formed from the South Carolina and Georgla cessions, was ailmitted on the 14th IVecember, 1819.
9. Maine, originaliy a province of Massachusetts, hut having been jermitted to frame a State fovernment by that State, waa adinitted on the 15th Mlarch, 1820 .
10. Mfissouri, the aecond State formed from the Frunch purchase, was admitted on the 10th Angust, 1821.
11. Arkansas, the third State formed from the Louiaiana cession, was admitted on the 15th June, 1836.
12. Michigan, the fourth Stata formed from the territery northwest of the Ohio River, was admitted on the 26th June, 1887.
13. Florida, which has the same limita as when seded by Spain, was almitted on the 8d March, 1845.
14. Texas, which had been an iadopendent republic for tha ten preceding yeara, was admitted by a joint resolution of both Hlouses of Congreas on the 29th December, 18 k 5.
15. Iowa, the fourth State formed from the Territory of Louisiana, was almitted on the 28th December, 1846.
16. Wisconsin, the fifth State formed from the territory northwest of the Ohio River, was admitted on the 29th May, 1848.

And, 18. California, having been governed as a State for upward of a ycar, was admitted on the 9th December, 1850 ; and though the last, it is by no meens the lenst important of the nembers of tho great confederacy.

Besides theae thirty-one States, which aend ropresentatives to Congreas, in number according to their population, there are aeveral local and dependent governinents, which are styled "Territeries of the United States." Such are the Territories of Oregon, Washington, Ulah, New Mexico, and Minnesota. The Territory of Nebraska ia not yet organized, nor hae the vast territery ael apart for the Indians ally aggregate exiatence, but each Indian nation, within its own linits, is governed by its own lawa.

1. Oregon was erected into a Territory on the 14th August, 1848;
2. Minnesota on the 8d March, 1849 ;
3. Utah; and,
4. New Mexico, on the 9th Scptember, 1850; and,
5. Washingion, originally a part of Oregon, was formed into a acparato Territory at the aession of Congress 1852-'53.

The only Territory new remaining withont local government is that portion of the United States cm braced in the Nebraska country, and the vnst domain extending beyond Minnesota and lowa westward to the Rocky Mountains, and north of the 43d parallel of north latitude. The tide of immigration, however, has already reached to the edge of the wilderneas, and but a few years will elapse before settlement has progressed eufficiently to justify the organization of new governments within theae immense solitudes.

The District of Columbia, or Federal District, is under the immediate anthority of Congrese, and ia not repreaented in that body. It ia the aeat of the General Government.

Area of the United States,-The limits of the United Statea when their independence was achieved (1783) did not exceed $820,68 \mathrm{~J}$ equare milea. Louisiana, purchased from France in 1808, and Fiorida from. Spain in 1819, added respectively an extent of 899,579 and 66,900 square miles. In 1842 and 1846 the Northern houndary was aettled by treatiea with Great Britain, confirming the rights of the United States to 808,052 aquare miles, included in the Territory of Oregon, etc. In 1840 Texas waa annexed, with an ares of 818,000 aquaro miles, and by a treaty soon afterward with Mexico an area of 522,955 additional aquare milea waa incorporated. Thua did the territory of the United Statea double Iteelf in the first twenty yeara of ita exiatence, and thus has it increased over three-fold in leas than aixty years. The figures are given upon the authority of a atatement prepared at the Topographical Burean for the Census office, and annexed.

Total. . . . . . . . . . . . . . . . . . . . . . . . . . . $2,963,666$
The territorial extent of the republic is, therefore, nearly ten times as large as that of Greal Britain and France combined; three times as large as the whole of France, Britain, Auatria, Pruasia, Spain, Portugal, Belgium, Holland, and Denmark, together; one and a half times as large as the Russian empire in Europe; one-aixth less only than the area covered by the fiftynine or sixty empires, atates, and republica of Europe; of equal extent with the Roman empire, or that of Alexander, neither of which is said to have exceeded $3,000,000$ aquaro milea,-Voltaire, Histoire da Russie.

Considered in lesser divisions, the calculations of the Topegraphical Bureau show the existence of an interior valley drained by the vaters of the Mississippi and its tributarics, neariy as large as the alopes of the Pacific and Atlantic proper together, and one-third larger than the whole domain of the republic upon the adoption of the present Constitution (1789).

Abea of eaon 8lope and Ratio to the total Aera of the United 8tateb.

Thus over two-fifths of the national territory is druined by the Mississippı and ita tributurica, nnd more than one half is embraced in what may be called ita Midelle Region. Ono-fourth of this total area belongs to the Paclic, one-sixth to the Atlantic proper, one-twea-ty-sixth to the Lakee, one-ninth to the Gulf, or oncthird to tho Atlantic, including the Lakes and the Gulf.

From the charts prepared aoine years ago by Colonel Gilpia, of Miasouri, it will be perceived that a circle deacribed from the forks of the Kinanaa River, west of Misaourl, will touch New Orleans and Galveston, or the Gulf frontior, and the 49th parallel of latitude, our
northern boundary, making these points equidistant from the centre. On a larger circle, with the same centre, the points of equidiatance will be San Francisce,

* These ostimates are lower than those usually made. Morse, In his Gazetteer, estimates the area of the Union in 1788 at $1,000,000$ square miles; and Major Stoddard, who took possemalon of Loululana under the treaty and prepared a very valuable history of $1 t$, consldera the area to be $1,307,260$. These, of course, were but vague estimates, subject to after correetion. Agaln, Oregon bas generaliy been estimated at 841,463; Texas, 402,907; Californts, 449,601.-Dz Bow's Industrial Resources, vol. iit.
$t$ The Mesilla valley ta fucluded in the computation.
in Califoraia, Fort Vancouver on the Columbia, in Oregon, Quebec and Boston upon the Atlantic, Hudsona Bay on the extreme north, and Havana, Vera Cruz, and the city of Mexico, on the extreme south. The various great basias, declivities, and table-jands on the continent he estimates as follows: Miselasippi basin, 1,123,100 square mlles; St. Lawrence, 475,400; Hudson'a, Bay, 1,077,200; Mackenzie baain, 898,500; Pacifio declivity, 420,000 ; Atlantic declivity, 270,700 square milles.
Mr. Darby, in bis Geographical Dictionary, gives the following aggregatea: Valley of the Ohio, 200,000 square milles ; Valley of the Miasiesippi preper, 180,000 ; Valiey of the Mlissouri, 600,000 ; and the Valley of the Lower Mississippi, 330,000. Total, 1,210,000 squaro miles.
Lieutenant Maury compares the basins of the OId World with those which are dralned into the Guif of Mexico and Caribbean seas.

Lieutenant Maury remarks, "'ithe area of all the valleys which are drained by tho rivers of Europe which enpty into the Atiantic, all tho valloys that are drained by the rivers of Asla which empty into tbe Iodian Ocean, and of all the valieys that are drained by the rivers of Africa and Europe which empty luto the Mediterranead, does not cover an extent of territory ns great as that included in the valleys drained by the American rivers alone, which discharge themaelvea into one central sea."

Dr. Jatterson, of Pbilactelphia, mado the centre of representative population of the Linion in $18: 10$ in the northwestern extremity of Virginia, and atates that it hasil travelcd weatwaid since 1790 , when it was in Baitimore county, Maryland, 182 miles in very nearly the same parallei of latitude.
The following table will show the area included within the several geographical divisious which are named:
AaEa of thg aeveral ageat Divibiong of tue Unitear STATES.

The United Statea conniat at the present time (IROS) of thirty-one independene States and nine Territories, incloding the Distriet of Columbia, whose areas will be found in the table amexed, prepared at the Topographicai Bureas. It is tho only official atatement. There wore in 1850 sixteon hundred and twenty coun-
ty divislons included within the organized States and Terrltories, but it is impossibio to give any eatisfactory atatement of their areas. By refereace to the statietical tables of thene countien in the United States Consua Report, it will be found bow liable they are to changes, and aiso what changes were actually effected between 1840 and 1850 .

The Territory of Nebraska conatitutes one-ninth, Utah one-eloventh, Texas one-twelfth, New Mexico one-fourteenth, Oregon one-ixxteenth, Missourl and Virginia a littie more than one-fiftieth cach, South Curolina one-hundredth, Maseachusetts one-three hundred and eightieth, and Rhode Island one-two thousand three hundredth part of the nstional area.
In addition to the abovo States, it is proposed to sid to the Union the Statea of Minnesota (the bill for the ndmission having already passed the Senate), Kansas, Oregon (anal, when this territory shall he more developed, a further division of Oregos will take place, siddiog one or more States), Ontouagnon (lacluding the northwestern part of Michijzan, and embraelug territory as iarge in extent as New York State), Nehreska, snd Washington. It is also proposed, when Texas shasli increase sufliciently in population to make a division of that Stato advisahle, te divide it Into cne or two more States. Ratios of representations for Congress, 1790 and 1800, 1 to 33,$000 ; 1810,35,000 ; 1820,40,000$; $1830,47,700 ; 1840,70,6 \times 0 ; 1850,93,420$. Aet of 1850 lixes the number of members at 233 , to which afterward was added 1 for Californin; Massachusetts, Mhode island, Connecticut, Pennaylvania, Marylend, Alabaums. Tennessee, Kentucky, Missonri, Indlana, Texes, South Carolina, and Georgia, 1 member each for isrgest frsetions. Future ratios of apportioninent to be determined by the Secretary of Interior, by dividing the number 233 into wholo representatice population, giving Ststes with largest fractions membere to raske up the total. Menibers from now States admitted ahill be in addition to the 233 untif the next census.

For an explanation of the princlple upoz which the following table may be constructed, see Professor Tucker's Progress of the United Slates, p. 107. By starting with the population of 1790 as a baala, whlch was $3,020,827$, and adding three per cent. for eyery
yoar, making $4,047,721$ for $1791,4,109,162$ for 1792 , and so on for every year until 1850, Mr. Darby, the well-known geographer, arrived at resulte whlch, when compared with tho particular census years, ahowed as follows :

| Yaar. | Earimated. | Coama ${ }^{\circ}$ |
| :---: | :---: | :---: |

The average number of acres embraced in each improved. In New England about twenty-six acresia farm in the United States 11203 , valued at 22258 , and upon each farm there is an average of 105 in implements and machinery. In Louisians, so complicated is the augar process, the average machinery is $\$ 863$ to the farm. By another table prepared by aections, it would seent that only about one-thirteenth of the whole area of the organized Slates and Territories is Improved, ad about one-elighth more is occuthed and not

The natlonal census was condricted ander the direction of the Secretary of State until the formation of the Department of the Interior (March 8, 1840), when tt was made aubordinate branch of that office. The atatiatics were obtained by the marahals of the district courte prior to 1850, and apecial deputies appointed under them. Several monthe were uaualiy devoted to the labor; and the roturns thas obtained, being subject to the errora arising from changes and removals in the intorim, consequently were not alwaye roliable.
The following is an estimato of the progress of popuIatlon from the year 1860 to the close of the century:

> Agriculure.-The following tgble wlil show the rele-
tive number of farmis, and quantity of acres $\ln$ each in the several States and Territorles of the United Statee, as well as tho value of farms and Implements. The unimproved land embraces such as is in occupancy and necessary to the enjoyment of the improved, though not Itself reclaimed. Meadow-lands In all of the States, are therefore regarded Improved.

The annexed tables embrace the returga of agricul- | were rejected altogether for inauficiency. Letters from
tural products according to the census of 1840 and 1850. The quantity of wheat in 1850 ia belioved to be uoderstated, aod the crop was also short. Rough rice Is returned for 1850 , and clean rice for 1840. Corrections have been made in tha cotton and augar returns since the publication of the Quarto Census, pounda having been intended by the enumeratora in many cases where they returned bales or hogsheads. It is impossible to reconcife the hemp and fiax returns of 1810 and 1850 . No doubt la both cases tons and pounda heve often been confousded. In a few of the States, such as Indians and Illinels, the returne of 1850

Kentucky entitied to high credit state the water-rotted hernp for that year to be not a third as much as the census gives, and the dew-rotted to be about 22,000 tona. In this cate the whole hemp crop of 1850 may have reached 85,000 or 40,000 tons, and that of 1840 25,000 to 30,000 tons. By the manufacturing sched. ulea it appears that 18,276 tona hemp were consumed by the manufacturers of Kentucky and Missouri, and by the receipta at the cities of St. Louis, Cincinnati and Now Orleans, with proper deductions, that fourteen or fifteen thousand tons hemp wero exported in the rough to other States.

Aomioultuatr Pronuctions of the States and Thiaitomizs, 1840 and 1850.

The aggregate for 1857 will, no doubt, prove much larger. It is quite apparent, from the foregolng, that this is an immense country, and that our resources are of vast extent and magnitude.

From offletal statements a comparison is made of the extent to which the various crops are raised in England and Wales and the United States. And from this it appeare that England and Wales together have oniy 10 per cont. of the fallow culture of the United States, and only 33 per cent. of the improved land.

| Articles. | England. | United Sto ten. |
| :---: | :---: | :---: |
| Wheat. | Acrea. <br> 8,807,846 | Acres. <br> $11,040,000$ |

| Marigolda | $\begin{aligned} & 177,163 \\ & 218,651 \end{aligned}$ | $\cdots$ |
| Total | 11,071,781 | 53,350,000 |
| And the total number of improved lands in gross, etc. | 37,824,015 | 113,012,614 |

From this comparison we can deduce that the United States has about fre times as many acres in cultivation, and, if the same silli in cultivating and sowing wore used, siould bo alile to maintain five times the population, and that without having resource to any more wid lands.

the exclasive right to their respective writirgs and discoverles ; 9 . To conatitute eribunale $\ln$ ferlor to the Supreme Courts; 10. To define and punith plracien anil felonles conimitted on the high seas, and offenses against the law of natlons; 11. 'To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water; 12. To raise and support armies; but no appropriation of money to that use shall bo for a longer torm than two years; 13. To provide and maintain a navy; 14. To make rules for the government and regutation of the land and naval forces; 15. To provide for calling forth the militila to execute the laws of the Unlon, supprese insurrections, and repel lavasions.

Constifutional Powers.-The power " to regulato forelgn commerce" enabled the goverument at once to place the whole country upon an equality with foreign nations ; to compel them to abandon their narrow and seliaht poliey toward ua; and to protect our own commerciai Interests agalnst their injurions competitions. The power to regulate commerce "among the severs States," in liko mannor, annihilatod tho causes of domestio feuds and rivalries. It compellod every Stato to regarl the interests of oach as the interests of all;
and thus diffused over all the blessinge of a free, active, and rapld exchange of eummoditias, upon the fonting of perfoet equallty. The worde being general, the sense must be gonoral also, and ombrace atl subljecta comprohended under them, unless thore be some obvlous miselifef, or repugnance to other clauses, to limit them. In the case there is nothing to Justify such a linitation. Commerce undoubtedly is traffic; but it is somothing nore-is in intercoursc. It deacribes thio comnierclal Intercoursa botweon nations and parts of uationa in all its branches, and la regulated by preecribing rules for earrylng on that intercourse.
Tho mind can scarcoly concelve a systom for regulating commerce between natlons which shall oxclute all laws concerning navigation; whleh shall be ailent on the admissien of the vessels of one nation into the porta of another, and bo cenfined to proseribling rules for the conduet of individuala in the actual omployment of buying and selling or barter. It may, thereforo, be sufely affirmed that the terms of the Constitution have at all thmea been understood to Include a power over navigntlon as well as over trade, over in?ercourse ns well as over trafle.--Sronix's Familiar Exposition of the Constitution of the U'nited States.

The power of Congress in laying taxes is not necen－
eariiy or naturaily ioconaistent with that of the Scates． Each may lay a tax on the aame propert；without In－ terfering with the action of the other；for taxation is but taking small postione from the mase of property， which is aucoptible of almost Infinite division．In imponing taxes for atate purposes，a state is not doing what Congrese is empowered to do．Congrese is not empowered to tax for those purposen which are within the exclusive province of the Staten．When，then， each goverament exercise：the power of taxation， neither in exorcising the power of the other．But when a Siate proceeds to regulate commerce with for－ eign netions or among the meveral Sitate，it is exer－ cising the very power which is granted to Congresa， and fis doing the very thing which Congress lo author－ ined to do．There is no snalogy，then，between the power of taxation and the power of regulating com－ merce．－Storr．
Domestic Truse．－And Arst，among the States．It is not donbted that the power of Congress extende to the regulation of navigation，and to the coasting trade and fishories，within as well as without any State，
wherever it is connected with the commerce or inter－ courve with any other State，or with foreign nations． It axtends oo the regulation and government of seamen on board ot American shipa，and to conferring privi－ leges upon ahlpa built and ornsed in the United States， in domestic as well as in for－ign trado．It extends to quarantine laws，and pilotage lawa，and wrecks of the sea．It extende as well to the navigation of vemels engaged in carrying passengers，and whelher etesm－ vesmals or of any other descripition，as to the nevigation of vessels engaced in traffic and general coasling busl－ ness．It extends to the laying of embargoss as well on domestic ae on foroign voyagas．It extenda to the construction of light－houses，the placing of buoye and beacons，the removal of abstruction to navigation in creoks，rivers，souncta，and bays，and the cotabilishmen！ of securities to navigation againat the inroads of the ocean．It extende also to the designation of a particulaf port or ports of ontry snd delivery for the purposes of forvign commerce．These powera have beon actusliy exerted by the National Government under a asstem of laws，many of which commenced with the eurly establishment of the Constitution；and thay have con－

tinued unquestioned unto our day, if not to the utmost | preferences and privileges ; and sometimes to regulate range of their reach, at least to that of their ordinary application.
Many of the like powera have heen applicd in the regulation of foreign commerce. The connucrial aystem of the United States has also been emplioyed sometimes for the purpose of rovenue; sometimes for the purpose of prohibition; sometimes for the purf ose of retaliation and commercial reciprocity ; sometines to lay embargoes; sometimes to encourage domestic navigation, and tho shipping and mercantile intercst, by bounties, by discriminating duties, and by apecial
intercourse with e view to mere political oljecte, such as to repel aggressions, increase the pressure of war, or vindicate tho rights of neitral sovereignty. In all theae casea the right and duty have been conceded to the National Government by the unequivocal volee of the people. It may be addec, that Congreas have also, from the caricst perigd of the government, applied the same power of regulating commerce for the purposo of encouraging and protecting domestio manufactores, and Cengress have never abandoned the exercise of it for such a purpoes.-Story on the Constitution.
 conguned anNualhy, fuom 1821 to. 1857, inoluaite; the egtimatell lopulation and Congtmition pes Capita.

Forelen Commerer of gaci State and Tebritory, ybom Juiy 1, 1856, to June 80, 1857.

From the above tablo wo get a clear exhibit of the direction of our foreign trado as regarda tise imports; making a brief anmmary, we see the proportion borne by the following countrios during the year 1856-'07:

This summary shows that 80 per cent. of the total imports for 1856-'57 was to countrica from which wa imported over 2 per cent. Of the tolal of this 80 per cent. 51 per cent. (ogainst 65 per cent. of oxporta) came from countries on the weat coast of Europe, thereby ahowing a balance of trade in our favor in our commerce with these countries. A aimilar examination of our trade with the East Indlea and countriea in the south of Europe would show a balance of trade agaiost thia cuuntry. The same course of trade is also particulerly to be remarked in regard to Cuha, Brazil, and China; as these three countriea ahow, on an average, an aggregate balance of trade against the United Statea of over fifty militions of dollers.

 notil incluelve.

Tha limited rpace allotted to the article United Statsa in this work preeludeaany attempt to givo moro than the statistice of the production, commerce, and navIgatlon of the United States proper. Undor thelr separate heads are given the imports and exports of every article of comurerce-as Cotron, Bheadnturfg, Ricer, Suanh, Tonaceo, etc.; also the trade of each Individual State under its proper head; and under their proper healls the commercial law asd the latest atatiatics refrirding the United Statea in aubjects-as Conss, Coma. tee, Cinala, Consuls, Ifaihioahb, Tkleomaizi, Sumbing, Tonsmur, ete. To nil of which referenco is made for more particular Information regarding the United States.

Uruguay. This small republic, known alao as the IBanda Uriental, or the Cisplatine Republic, lies on the north coast of the estuary of the kio da la PJata, und contains a population estimnted at 120,000 -the Jeast of a y of the South American States-of which about 16,000 reside at the capital, Montevideo. The soil of Uruguay is fertile, well watered lyy large rivera, and is peculiarly adapted to grazing and agriculture. Animal producta aro the staple donestic exports, and consise prineipally of hides, dry or salted, of hornod cattic and hurses ; tallow, grease, bones, animal carbon, horns, horse-hair, cow-taila, sheep-sklin, and wool.

Thourh there is ne treaty existing letween the United Statea and Uruguay, our commereial intorcourse is on a footing of equality with that of other countries; being favored by no privileges, and being suljected to no regtrictions not common to all other foreign nations. This intercourse is regulated by the egislation of the republic, and during the past few yearg has undergono several liberal and important modilications. D'rior to 1819 , an exorbitant impost of 115 per tharrel was levied on the article of tlour, lly deeree dated April 6:h of that year, this duty was reduced to 6250 per harrel, with a provision that "this impost shall Jast no longer than necessary to pay the delt ineurred on the article of flour, the liquidution of whish shall commence immediately." Hy aubsequent decrees of April. IXis? the export duty on horse-hides, dry or
salted, and tha transit duties upon all marchandise were abolished; and the former duty of 20 cents per hide on ox and cow hidea, iry or salted, was reduces to $7 \frac{1}{2}$ centa per hide. By tho new tarlif, however, of October 11, 1853, now in force, the duty on flour is fixed at 35 per cent.; and all prodnets of the country, and all irreign merchandiso free of import duty, or that has prald such duty on lmportation, are free of duty on Leing exported. The tranat duty ts also abolished. This larlff has teen superseded by another, bearing date July 19, 1856. Tho provislona referred to remain, however, quite the same.

The port regalations are liberal-vegsels belng allowed to remain in pert twelve daya without entering at the custom-house, and to land samples, so as to dispose of a part or the whole of their cargoes. Should they leave within that porlod without effecting a salg, they are subject only to pilotage, health-visit, bill of health, and stamps.
A treaty of commerco and navigation, ete, was rallfied be: ween Eugland and Uruguay, July 17, 1843, which expired toward tho close of 1853 , and was not renowal at the lateat dates from Montevideo. With France a preliminary treaty was concluded Aprll 8, 1836, to conlinue in force until another treaty ahould be agreed upen; or, should none such bo sulisequontly entered into, then to contlaue fifteen years. 'I'ho treaty whilh lingland, now lapsed, was based ujon a principle of reciprocity; und that with France is upon the principle of the most favored natien. The merchant marine of Uruguay, it is helieved, comprises but few, if any, venrels of more than sixty lens burden. It consisls of about 800 vessels of between twenty and fify tons oach, averaging each about six men, or from 1800 to 2000 men in all. These aro mostly engaged in the inIermal and coaating trade, the latter chlefly with lliazil; which trade is also open to foreign vessels, on tho payment of the diseriminating tonnage. Besides tho uhove, there are five vessels, all of foreign construction, under the Uruguayan flag, measurling in the argregato about 1500 tens, which make voyages north of tho equator.

- Nino montha to Jume 3a, and the fise ! year from this the begtan tuly $\overline{1}$.

In $|\times 5|$, the mumber of vessels under the Linited States in $\mid$ NiII, according to official returns of Iruguay, Stutes lia; which entered the jort of Montwideo was s.venty, with an aggregate tommago of 22,01 tolls; and the number eleared was thirty-nine, with an afgregate tonnage of 12,701 tons. Imjorts from the Unifed consisted of rum, 15:i barrels; spirite of lurpentibe, 2f: harrels; starch, 2506 canks and hoxes; rice, 2149 canks; refined sugar, 1797 easks; coditish, 312 loxess; tubs and buckets, 829 dozen; Btumen, 133 barrds;
cinnamon, 150 boxes; Chinese crackers, $998 \frac{1}{2}$ packages; brooms, 1474 dozon; flour, 19,993 barrels; hams, 2300 ; gin in bottles, 34,438 dozen; gin in demijohus, 31,748; yin in plpes, 200 ; lumber, 3,662,881 reet; chairs, 1655 cases; tolacco (chewing), 1142 bexes; sterrin candles, 1070 bexes.
Ily a decree of Octolser 11, 1853, the government of Uruguay opened to all thags the nuvigation of the rivers und atreams of the republic, on a foeting of equalty with the national flag; which tecree was auperaeded by a brief enactment of Juna 17, 1854, as followa; Ait. 1. Tho navigable rivers and atreama of the repullic are open to the navigation and commerce of all nations. 2. In the navigation of the rivers and streama, foreign vessels are aubjocted to the same regulations of police and of custom-houses with national vesada. The precise meaning of thia act was at lirat in some doubt. It did not expressly declare whs ther or not it was applicable to the port of Montevideo. Upon reference to tho government of Urugaay, however, by the agents of forelgn governmente reaident at that pert, it was announced that the law appllea to the pert of Montevideo.

Usance, a peried of one, tiro, or three months, or of a lixed number of days, after the date of a lill of evchangu, nccording to the custom of ditierent places, betore the bill becomes due. Double or treble usance is doublo or treble tho usual then ; and half usance is half tho the. When a month is divided, the half usance, notwithstundling the dillerences in the lengths of the months, is uniformly lifieen days. Uaances are calculated exclusively of the date of the bill. Bills of exchange drawn at usance are allowod the uaual days of grace, and on the last of the three days ihe bill should be presented for jayment.--Sea Milds of Lixemanae and Excianal.

When a bill is drawn at a certaln number of days after date or after sight, those days aro reckoned exclusive of tlie day on wheh the bill is drawn or acecpted, and inelusive of the day on whieh it fills due. "After sight" is equivalent to "after acceptance;" and with regaril to botes, it means "after presentmont for sight." Hy tho ene:om of trade, in bills and notes, a month is deemed to bo a ealendar or solar month, The irregularity of the despective montha is net taken into the account. If a bill at one montl be drawn on the 31st Janmary, it will he due on the 28th of Febrmary, or 23th if leap-year, and, reekoning the days of grace, will be payable on the Bd of Mareh.
The threo days of graco generally allowed are reckoned extusive of the thy on which the blll falls dne, and haclusive of the last day of grace. When thero are no days of grace, and the bill falls due on a Sunday, Christmas-day, or Gue: Friduy, public fust or Thankggiving-day, or when tice last of the days of graco latyens on such a day, the bill becomes payable on the day preeceling, and if not then paid mast le treated as dishonored. A presentment for payment beforn tho expiration of the days of grace is promature, and will not entitle the holder to charge the nntecedent parties.
Days of grace are allowed on promisgory notes as well us on bills, but they are not allowed un ehecks, or on bills or notes payable on demand.
When a month is the ordinary usance, a half usanco is lifteen slay̧y.

The calculation of the time depends upon the differrut modes of computing time.

All places with which we are in the habit of negotinting bills compute their times as we do (exee, at that loussin ullieres to the old style), by years reckoned i.a a series from the birth of our Saviour, and wided each into (welve months, or 365 (or in every fourth year, 366 )days.

Upon a hill Jrawn at a place using one style, and payable at a place using the other, if the time is to be reckoned from the shate, it shall be computed necording to the atyle of the place at which it was drawn; otherwise arcording to the style of the place where it is pay-
able; and in the former case the date muat be reducad or carried forward to the atyle of the place where the bill is payable o the time reckoned from thence.

Thua, on a Lill dated the lst May, old style, and payable here two mouths after date, the thmo must be computed from the correaponding day of May, new style, viz., May 13th; and on a bill dated 1st of May, new style, and prayable at St. Petershurg iwo monthe after date, irom the corresponding day of April, old atyle, viz., A pril 11Jth.-Lleone Levi's Com. Law of the World, vol. i. p. 24.

Usquebaugh, an Irial, spirituous lif or, compoundel of apirita, raiains, cimmamon, and cloves.

Usury, an illegal rate of intereat or compensation for the nse of money. Usury is generally supposed to ba unequivocally condemned lin the Scrlptarea; but it must be remembered that the present algnification of the term is very different from that in tormer thos, Wu find in Exodus, xxil. 25, "If thou lend money to any of my people that is poor by thee, thou shalt jot bo to him as an esurer, neither shalt then lay apon him usury ;" nud in Levitieus, xxv. 35, "If thy urother be waxen poer * * * * take thou no usur of him or increasc." It will be seen from these ext:acts that the taking of any compensation from the peor ia forbidden, and not a limited rate fa regurded na naury. We apprehend that, in a strict acceptation of the term, 7 per cent. per annum is usury, ua well as the same per cent. a month. In the present time, however, no urguments are needed to prove that money is a merehantablo commodity, and therefore as much a mattor of protit and aulject to fluctuation as other merchandise. Wo will, therefore, confine ouraelves to a short necount of the ctlorts to repeal this relle of a pust age, and the Jaws now in force in the different Statea.

The repeal of the usury lawa in Great Iritain took place August 5 th, 1804, by an act of the british I'urliansont. Such an important change the the commorcial poliey of that country could not have been adopted cither suddenly or without maturu ecnsideration. In fact, the change had been roing on gralually for more than twenty years; and tho advantages of experienco were thus sought from the to time, as the restrictions were, step by step, removel, omit the cummercial eircles of the country thus tinally relieved from the operstion of the former vicious lews. In the year 1833 the first importunt linovation upon tho usury-law jelicy was mado in England.

After four years' triat, it was found that commerclal and manufacturing people of all classes prononnced the new features of the law to be advantageons in their operation to horrowers, if not to lenders. 'The next step was in the year 18:3, when I'urlhment granted further relief by removing the usury restrictions upon ali commercial paper having twelve months or less to mature. 'Ihis would seem to cover the goound butirely, and to furnish all the relief that commercial rireles eould reasomably demand. llut so satisfied were the linglish peoplo amd the English gevernment, that the nsury laws, even in their milhest lorm, were inoperative or projudicial, that, after various petitions and investigations, the total atolishment of these lawe was etleeted on the 5 th August, 185. The hill to this effeet had passed the House of Lords on the 2ith July preceding, aud was fmmediately brought forward in the llouse of Commons, where it was favoualily considered and timally passed. The passage of the hill was atrongly urged in the lleuse of Lurds ly tho Marglis of lamsdowne, by Lord Camphedl, and the lord Chancellor. Lord Ilrougham supported the b.ll, leoth on merenntile and moral groums. The Mariuis of Lanslowne remarked that:
"'The inconvenience whieh had heen found to result from tho operation of the laws against usury has been so many and so great, that notwithstanding atrong prejudices on the subject of usury and usurers, it had been found necessary to relax thase lawa from than to
time. At the time of the commerclal fallures in the years 1886 and 1887, It was found that the greateat relief which was exparienced was the reault of a provisiou which ind been introduced not long previousiy inte the act for the renevila of the Bank charter, enabling the Bank of Engiand to dispense with the uaury laws."

Many people, in their averalon to any moditication of the asary laws, are noder the convietlon that If the price of money is not regulated by isw, they will be compelled to pay an enommoua tax (ranging from $2 \delta$ to 75 per cent. per anaum) on loans of mency. Those whe seriously reflect upon the matier-who have any practical or familiar knowledge of the lawn of irnde-are nnanimous in thelr opinions that all shackles of the kind shouid be permanently removed.
If we examine the nsury laws of the different States, $w$, wlil fipd in all olaberate and stringent enactmenta providing puaishment and penalties for the exercise of every one's inalienable right; namely; that of using their property to the best advantage.
. We give a synopsis of the usury laws of the United States as they are now in force.

| states. <br> Malno | t.egal rat. 6 per et. | Penallies. <br> Loas of excess of loterest and law |
| :---: | :---: | :---: |

| Tuxas ........ 8 | 4 | 12 per cent. allowed on contracts. Forfelture of all intereat. |
| Wlemndn . . . I? | * | L.oss of interest. |
| Callforula ....l) | * | No penalty. |

From thie synopsis we see that the usury laws of Naw York are tho most rigorous, anul Inelude, in criminal actions, a thas of $\$ 1000$ and imprisomment of aix months; in mercly civil actiona, a forfeiture of contract.

Califuruia la the only State that provide no penalty. The Territories are also net subject to any natury Inws.

No argoment in needed to prove that such alsuri iaws nre cloge on the commercial prosperity of the cound $\gamma$, and that in linancial revulsiona likn the present they effect:sally provent the exerclse of any cons. merclal clasticity, A parall.l could be found by aupposing restrictive laws against selling tlour above ${ }^{3} 5$ per barrel; we would thon run as goord a chance of starving as uur suerchanta do of commercially atarving for waut of money when there la an ahundance around them, but when the legal lateredt does not juy capleal.
lsts ior the riak, -Ses arricles Banks, Commerice, Intenest, etc. For Usury Lawa, Discussions on, etc., see Rdinburgh Review, xxvii. 899 (Defense of); American Quarterly Revisw, xxli. 177, xxi. 145 ; North Amarican Review, $x \times x i x .168$ (A. H. Ever 7 TT) ; Blackwood's Magazine, xxiv. 68; Bankers' Maganine, New York, lv. 581 (Joun Whipple), 688 (J. R. Utalh, a territory of the Uniter! States, mostly 00 m prised in the Great California Basin, and extending from the crest of the Rocky Mountains on the east to the Slerra Nevada on the west. It has Oregon un the nerth, California on the west, and New Mexico on the south. Area, 208,776 squsre miles. In 1850 It was divided Into aeven crunties, and the nimber of dwell. Ings and population were as follows: Dweliings, 2322; white inhabitants, 11,830 ; free colored, 24 . The counties erected since 1860 aro Deseret, Green River, Miilard, Juab, and Washington.
The easiern portion of Utah is drained by the Colo. rado lliver of the Gulf of Califoruia. Its valley has been butimperfectly explored, but, as far as ourknowledge exists of It a very small portion of it only can be limught into cultivation. Tho rem. ining portion of Utah is comprised In the Great Basin, and forms a distinct and mont pecuilar reg.on. The rivers nil terminate within les Jimits, in lakes with no visible ontlete, Tho Great Sait Lake in nbout 35 miles broad and 70 lone, and the watera contaln more salt than can be hold in solution; hence its borders abound with erystalized. salt, and the bottom of the lake is Incruated with it. Ne living, creature can exist In lts waters. The valieys are susceptlble of cultivation, and are very fertile, where they can be irrigated. Timber, althongh acarce, is very dur:ble. Iron ose exists In the mountrin ridges, and several furnaces are already in operation smelting it. The temperature is more uniform in the Great Salt Iake valiey than on the Atlantio coust; it rarely falls below zero. There is but fittle rain, except on tine mountalns, from March to October.

Thoro wero in this territory, in $1850,16,3 \mathrm{~h} 3$ acres of land improved, and 30,516 of unimproved in farms; cash value of farma $\$ 3 t 1,799$, and the vaiue of fimplements and machinery 88,288 . Live stock-horge, 2429 ; as and mnies, 125 ; milch cows, 4861 ; worklugexen. 5266 ; other cattie, 2.189 ; sheep, 3262 ; swine, 914 ; value of live stock, $\mathbf{\beta}^{2} 546,968$.

Agricultural Products, efe.-Whent, 107,702 lushels produced ; rye, 210; Indlan corn, 8890 ; oats, 10,900 ; bariey, 1799 ; buckwhent, 332 ; peas and benns, 299 ; potatoes, $4 i 1,068$; aweet do, 60 lushels. Value of prod. uce of market gardens, 23,868 ; nounds of lutter made, 83,309 ; of cheese, 30,998 ; motasaca, 68 gallons; beeswax and honey, 10 lbs. ; wool, lbs. produced, $\mathbf{0 2 2}$; flax, 550 ; hepr, 50 ; tobacec, 70 ; tons of hay, $4 \times 05$; clover nceds, 2 hushels; thax-seed, 6 ; value of homemade manufacturea, c 1392 ; of slaughtered animals, $467,980$.

The eapital is Fillmore City, but the Grent Salt Iake City is where tie Iogisinture meets, and it is uiso the resittence of the governor. The other towns are I'aluyra, Sprlugvilie, l'rove, Cedar, P'arewan, Mrutl, Lehi, Ilrownsville, ete.

Utah was a part of Alta California, which was cedell to tho Unitod States at the treaty of Gumbalupe llidalgo Fehruary, 1848. Irevious to the Mexican war this territory was oniy known and occupied by trappers and Indlans. About the time of the opening of the war, the Mormons were driven fron Nanvou, Illinoia, and, after making a temporary snjourn at Council Hinlis, Iowa, they settled in Vtals. They organizel a government under the title of the State of Deserat, but the United States establiahed a torriturial government la 1850, by which the territory is nomiually under sulijection.

Valonia, a species of acorn, forming a very con- United States, and constituteo a leacing article of sidorable artiols of export from the Morea and the Lovant. The more aubstance there is in the huak, or cup of the acorn, the better. It is of a bright drab color, which it preserves so long as it is kept dry: any dampnees Injures it, as it then turns black, and loses both its atrength and value. It is principally used by tanners, and is alwaya in demand. Though a very bulky article, it is uniformly bought and sold by welght. A ship can only take a small proportion of her registered tonnage of valonia, oo that its freight per ton is always hlgh.
Valparaiso, the principal sea-port of Chili, lat. (Fort St. Antonio) $33^{\circ} 1^{\prime} 9^{\prime \prime}$ S., long. $71^{\circ} 41^{\prime} 5^{\prime \prime} \mathrm{W}$. Popnlation perhaps 28,000 or 30,000 . The water in the bay in deep, and it affords secure anchorage, except during northerly gales, to the violen.ce of which it is exposed; but as the holding ground is good, and the pull of the anchor against a stoep hill, accidents seldom occar to shipe properly found in sachors and cables. There is no mole or jetty ; but the water close to the shore is so deep, that it is customary for the smaller class of vessels to carry out an anchor to the northward, and to moor the ship with the stern ashore by another cable made fast to the shore. Large ships lie a litthe farther off, and loed and unload by means of lighters. The best shelter is in that part called the Fisherman's Bay, lying between the castle and fort St. Antonio, where, close to a clear shingle beach, there is 9 fathoms water. : In the very worst weather a landing may be effected in thls part of the bay.- See Minas's Chili and La Plata, i. 440, where there is a plan of Valparaiso. Tho hstbors of Valdivis and Concepcion are much superior to that of Valparsiso; the former being, indeed, not only the best in Chill, but second to fow in any part of the world. But Valparaiso, belng near the capital, Santlago, and being the central depót for the resources of the province, is most frequented. The town is convenlently situsted, at the extremity of a mountainous ridge; most part of the houses belng built either upon its acclivity or in its breaches. Largc quantities of corn and other artcles of provision are shipped hero for Callao and San Francisco, but principaily for the latter.

In Valparalso, the phenomenon of the sea-breeze is finely developed. Valparaiso is situated near the eouthern border of the calm belt of Capricorn when it is at its farthest southern reach, which happens in our late winter and eariy spring-the Southern summer and autumn. This is the dry season, when the sky is singalarly clear and bright. The atmosphere, belng uesrly in a state of equilibrlum, is then ready to obey oven the most feelle impulse, and to hasten toward the place of any, the alightest rarefaralion.

At about ten in the morning the land begins to feel the sun, and there is a movement in the air. By 3 or 4 P.m., the sea-breeze comes rushing in from the southward and westward, and strikes the shipping in the harbor with the force of a gale. Vessels sometimes drag before it , and communication with tho shore is suspended. By $G$ r.s., howevor, tho wind has spent its fury, and thero is a perfoct caln.-Maury's Phys. Geography.

United States.-The United States has ranked next ntter Eagland and France in the foreign trade of Chitif; but, since tho Incorporation of Califorula an a State of tho American Union, the first rank in this trado is now assigned to the United States Bag. This trado consiste in the exportation of cotton textiles, flour, salted provisions, and miscellaneous cargoes. The article of cotton manafacture called tucuyos is much demanded In Chill, and, until lately, Imported from the marufactorica of England exclnsively, is now suppled, by the
trade. Besides chose countrles, Chilli has also considerable trade with several other European and South American nationis. ' From Belglum shè receives elgars, refined sugar, woolens, window-glass, gin, cheese, paper, and books ; from Central America, bastard pearls, hides, indigo, cochineal, sugar, sarsaparilla, dye-woods, cotton, and coffee ; for which she sends in return, from the warehouses of Valparaiso, textles of cotton calicoes. Brazll sends no veseels to the ports of Chill; but there is some trade carried on between the two countries under the Chilisn and forelgn flag." Neither has Mexico any direct trade with Chill; but Hamburgian and English vessels annually supply the port of Mazatlan with valusble cargoes of European merchandise taken on board at Valparaiso. 'Owing to the restrictive character of Mexican commercial regulations, this trade is mostly contraband. Valparaiso is the chief port of transit for the commerce of all the republics of South America. The manufacturing industry of the southern provinces of Chili has mada but little progress. There is but one establishment worthy of being specially noticed-namely, a copper foundery, which at the commencement of $18: 16$ was in active operation ; and from which that year were experted to forelgn countries 4000 quintals of Its productions. The ore wes supplied from tho ports in the northern parts of the republic, and even from the Bolivian port of Cobije. Chili is, however, essentially an agricultural country. Ind pendently of the working of the mines $\mathrm{c}^{f}$ gold, silver, and copper, and the casting of these metals, almost all the mechanical industry of the republic is to be found in the flour-millis, the tanneriss and currying establishments, and the talloring shops, where tho ponchos or mangos aro made. There are, besides theso, some establishments for the mannfacture of candles and common soap. Still, there is but little probability that the manufacturing industry of Chill, at least for a great many years to come, will present any comptition with the manufactured productions imported from Europe and the United States. The revenues of Cbill have augmented in a ratio cqual to the increase of ite commerclal prosperity. Its forelgn debt is yearly curtalled, and the interest on it puld with such punctuslity as to have raised the 6 per cent. stock in London to 108. This debt, contracted during the war of Independence, cousistod originally of a loan raised in England of $£ 1,000,000$. Owing to civil wars, and the generally unsettled state of the country, the debt, with the accrulng interest, soon donbled itself. Under the administration of Secretary Rengifo (in 1830), a compromise was effected with the English creditore, and its terms have since been faithfully adhered to. In 1852 thls delt was reduced to $87,104,000$-one half at 6 per cent., and the remainder at 3. Tho home debt has been reduced to less than $\$ 1,500,000$, bearing 8 per cent. interest. The merchant marino of Chlli has also shared in the general prosperity of the republic. Steam-vessels can at all times obtain coal in the greatest abundanco, and of an excellent quality, from the mines of Talcahuano, and at many points along the coast. With such advantages for the active development of her phyalcal and commercial resources, Chilt has long since drawn to her ports the merchants of the great industrial and commerclal ngtions of the world. Among these, England, France, Germany, and the United States, are the chief competitors for her foreign trsio.
The revenues derived from import duties in 1851 amonnted to $\$ 2,724,718$, of which there was collected at the port of Valparaiso $\$ 2,426,631$. The total amonnt. in 1852 was $\$ 3,465,03877$. The following table exhiblts the quantitles and values of copper, in bars, ex-
ported from Chill to the Usited States, from 1850 to 1855, both inclosive:

In 1852 the imports into Chili reached in value $815,347,332$; and the exporta from Chili amonnted to \$14,087,556. Comparod with the preceding year, imports fall off $\$ 537,640$, while the exports of 1852 show an increase over those of 1851 of $81,941,227$. This perceptible advance in the export trade of Chili in 1852 is attributed to the increased activity in working the copper ininea of Coquimbo and the ailver mines of Copiano, as also to soveral heavy shipments of flour and other producta to California.

The following tabular statement exhibita the number of foreign vessels and their tonnage, and the number of sational vessels, that entered Chilian ports from 1844 to 1851, both inclusive :

| Years. | Voralgn Vemeels. | Tounake. | Chillan Vorsela, |
| :---: | :---: | :---: | :---: |
| 1814. | 1487 | 374,026 | 14.9 |
| 1845. | 1458 | 359,850 | 1480 |
| 1543. | 1523 | 888,567 | 1599 |
| 1847. | 1484 | 860,097 | 1621 |
| 1848. | 1897 | 34, 463 | 1523 ) |
| 1849. | 1777 | (538,259 | 1511 |
| 1850.. | 2599 | 740,425 | 1784 |
| 1851...... | 2351 | 680,185 | 899 |

The number of vessels that cleared in 1850 was 2497 , making an aggregate of (entered and cleared) 5096 vessels, with an aggregate tonnago of $1,4 \cdot 12,425$ tons. The number cleared in 1851 was 2205 , whici, with the 2351 given in the table, makes a total of 4556 vessels, measuring in all $1,233,978$ tons. This shows a falling off in 1851 of 540 vesaels, and 208,417 tons. It will be perceived that the number of national vessels that entered Chilian ports in 1851 is put down in the table at 890. It must not, however, be inferred from this that the merchant marine of Chili actually counts that number of vessels. The figures merely indicate the number of times the national neerchont flag entered Chilian ports duing the year. Still, within the past few years the merchant marine of Chili haa largely Increasel. Staring from 1848, this increase is found to bemof vessels, 100 per cent., and of tonnage over 300 per cent. Thls is shown by the following statoment :

| Yeara. | No. of | Aggregata |
| :---: | :---: | :---: |
| 18 | 115 | 12,028 |
| 1849 | 119 | 20,022 |
| 1850 | . 153 | 27,60t |
| 1851 | 182 | 34,517 |
| $185 \pm$. | 215 | 41,609 |

An official dispatch to the British government from Chili, under date of September 13, 1855, states that the returns of Chilian trade for 1853 and 1854 shows a great increase in both branches of import and export; but that the markets were consideralicy atfected by the high price of proviaions, which commenced in 1854, and centinued up to the date of the dispatch; owing mainIy to the large exportation of wheat to Australia, where it brought as high as $\mathbf{8} \mathbf{8 6}$ per quarter of eight bushels. Wool may be sald to be, after copper, the chief articio of import into the United States from Chili. The following tabuiar statement exhibits the quantities and values of wool imported into the United States from Chili, during the five years ending with Jone 30, 1855, together with the aggregate quantitiea and values of the same imported from all olher countrics for the same period-ss given by United States authorities:

| Yeam. | Frosisilc Countiten. | Valanc. | Frome lihlit. | Valuen. |
| :---: | :---: | :---: | :---: | :---: |
| 18:51 | Pounds. <br> 31848,491 | \$3,833,157 | Bounde. 2109,845 | \$125,650 |
| 1852 | 14,341,208 | 1,930, 711 | 1.863.189 | 109,616 |
| 1RK3 | 2 t .575 S (\%)9 | 2,600,718 | 2.64, 300 | 255, 190 |
| 1884 | ce.2mi 110 | 2,582,145 | 1,857,447 | 161.066 |
| 1865 | 18.514.415 | 2,072,189 | 2,841,902 | 317,604 |

In 1848 a decree was passed by the Chillan governa ment providing for the establishment of a statistical board. Since that period full commercial returns hevo been regalarly published, uader the title of Estadistica Comercial de la Republica de Chile. From these publications the following tables, exhibitiug the general foreign commercial movements of Chili, from 1844 to 1851, have been compiled:
 gign lapost and Export Teade of Chili, tif pain OIPAL COUNTBIAB FARTIOIPATINO THERRTN, AND THW NHAER ABIONED TO EAOM, IN 185t, AND ALBO THE TOTAL TBADE FOA A ygelon or Elour yeaea.

The princlpal ,orta of Chili open to general foreign trade are Valparslso, Coquimbo, Huasco, Coplabo, Tulcahuano, Constltucion, Valdivla, and Ancud. Vessela from abroad, entering any other than open ports, are lisble to seizure. Under the Chlllan commercial regulations, the cosstlag trade ls prohibited to foreign vessela; but they may diacharge portions of their original cargoes in one or more porte, and load Chilian produce for a forcign pori. The port chargea are as follows: Tonnage dued, 25 cents per ton; light dacs (where light-housos exist), $3 \frac{1}{8}$ cents por ton ; roll anú captain of the port's fees, $\$ 4$; harbor-master's fecs, $\$ 8$. National or foreign vessels of war, national or forcign steamers, whalcoshipa, vessols in distress, or in ballast, or dlscharging under twenty packages, are exempt from tonuago and light dues. When tonuage dues have been jaid at one port, they are not iovled in another.

Commercial relations between the United States and Chili are regulated by the treaty of May 16, 1832ratifications having baen exchanged and proclamation made April 29, 1834. Thia treaty establishes the principle of "the me it favored nation," und contains, besides, a stipulatlon providing thst "free ships make free goods," and the usual guarantees for commercial reciprocity. The duration of the treaty was limited to twelve years; but, by virtue of the twelve-montha' notice clause, it fs still in force. Srbsequent and recent commercial legislation of the Chilian goverament has moditied and eularged the provisions of the treaty of 1834. The princlple of "the most favored nation" is but another name for differential duties between the national flag and that of the country with which such treaty is negotiated. Theso ditferential duties have been defined by Chill in a law bearlng date January 8 , 1834, and by various subsequent enactments. Such duties, however, have been suppressed, under certain limitations, chiefly by a law of July 16,1850 . The following la a translation of this law, ao far as it relates to thla subject:

Art. 1. Are suppressed, and of $n o$ force, articles 15 , 16,17 , and 18 of the law of importation of the 8 th January, 1834. The law defining differential duties. Is also euppressed that sectic of the law of August 7, 1834, by virtue of which aational ressels were excmpted from tonnage dutics, such ressels hereafter heing subjected to the samo dutles as foreitg vessels. 2. The products of the soil and industry, and, in general, artlcles of commerco importod luto Chill for consumption, in bottons under a forcign flag, shatl pay ouly the same dutles as if imported under the national flag. 3. Articles of commerce imported into the republic in vessels of any natlon that shall not have accepted the conditions of reciprocity establlshed by tha present law, will be subject to a surcharge, or extra duty, equel
to that imposed by such nation on merchandise brought into its porta In Chillan vessela. 4. To give effect to the foregoing article, the President of the repulblle shall fix the amount of dlfferentlal duties authorized by the foregoling artlele.
Several decreea have been since lssued regulating the amount of these dlfferential or countervalling duties. Thelr princlpal polnte are: 1. Vessels of natione that have not accepted the reciprocity law of July 16, 1850, shall pay, instead of 25 centa per ton of the vessels' measurement, 75 cents per ton. 2. Merchandise inported In such vessels shall psy, in sddltion to exlating dutles, an additional duty of 6 per cent. ad ralorem. The President of the United States, by his proclamation bearing date November 1, 1850, accepted the reciproclty granted In the above-recited law and decrees, and all restrictions and diacriminations in tho commerclal relatlons of the two countries liave ceased since that period.

The cuatoma ratea of the tariff of Chill are ad ralorem on a fixed valuatlon of the articles of merchandise. By the 8 th chapter, srtlcles 2, 3, and 4, of the Chillan custom-house ordnance, it ls provlded that the tariff of valucs shall be adjusted hy a commission of from five to nine mcrehants and custom-house officiale at Valparaiso, subject to the approval of the government, and the values thus flxed shall be in force ons year without change.-See Cititr.

Value. The exchangeable value of commodities, depends, at any given perlod, partly on the comparative facility of thelr production, and partly on the relation of the supply and demand. If any two or more commoditiea respectively requlred the same outlay of capital and labor to bring them te market, and if the supply of each were adjusted exactly according to the effectual demand; that is, were they sll in sufficient abundance, and no more, to supply the wants of those able and wllling to pay the outloy upon them and the ordinary rate of profit at the time, they would each bring the aame price, or be exchanged for the same quantity of any other commodity. But if any single commodity should happen to require more or less capital and labor for its production, while the quantity requircd to produce the others contlnued stationary, ite value, as compared whth them, would in the first case rise, and in the second fall ; and, supposing the cost of Its productlon not to vary, its value might be increased by a falling off lit the supply, or by sn increase of demand, and conversely. But it is of Importance to bear in mind that all variations in price arising from suy dispropertion in the supply and demand of such commoditles as may be freely produced In indefinite quantities are temporary only; while those that are occasioned by change In the cost of their production are permanent, at least as much so as the cause in which they orlginate. A general mourning occasions $\mathbf{n}$ transient rise in the price of bluok cloth; but, supposing that the fushion of wearlag black were to continue, its price wonld not jermanently vary ; for those who prevlously manufactured bluc and brown cloths, etc., would honceforth manufacture only black cloth; and, the supply being thls way increased to the same extent as the demand, the price would eettlo at its old level. When the price of a freely produced commodity rises or falls, such variation may evldently be occasioned either by something affecting the commodity, or by something affecting the valuo of moncy. But when, instead of being confined to one, tho gencrality of commodities rise or fall, the fair presumption ls that the change is not in them, hut in the monoy witl which they are compared. Exclusive, however, of the commodlties now alluded to, there is a conslderable class whose producere or holders either enjoy $n \mathbf{n}$ abselute or a partial monopoly of the supply. When such is tho case, prices depend entirely or princlpally on tho proportion between the supply and demand, and are not liable to be influenced, or only in a secondary degreo, ly changea in the cost of production.

Prices have been often affected by variations in the cost and supply of gold and siliver, whether arising from the exhaustion of old, or the dlacovery of new mines, improvements in the art of mining, ohanges of fashion, ote. Hence it is that tablea of the prices of commodi. ties, extending for a considerable period, communicate far leas solid information than ia generally supposed, azd, uniess the necessary allowances be made, may lead to the most unfounded conclusions. The real value of any commodity dapends on the quantity of labor required for its production; but supposing that we were to set about inferring this real value, or the ultimate sacritice required to obtain the commodity, from its prles, it might happen (had the quantity of labor required for its production declined, but in a lese degree than the quantity required to produce gold and ailver), when its value would appear to riee when it had really dimlaiahed. When, however, the rate of wages, as well as the price of commodities, is given opon authentic data, a table of prices is valuable, jnasmuch as it shows the extent of the command over the nececsaries and conveniences of life enjoyed by the bulk of the community during the period though which It extends. Those desirous of detailed information as to the prices of commodities in Great Britain in distant times, may consult the elaborate tables in the third volume of Sir F. M. Eues'a work On the Poor, and the fourth volumo of MacPirersox's Anwals of Commerce. Arbutunot's Tables of Ancient Coins, Weights, Measures, Prices, etc., are well known, but the statements are not much to be depended upon. The Traite de Metrologie of M. Paucton (4to, Paris, 1780) is the best work on thia curious and difficult subject. See also Tooke's History of Prices, vols. i.-vi., which is the most complete history of prices extant.-See articles Commencr, Gold, Mener, Pincka, eto.

Vancouver (or, more properly, Quadra and Vancouver) Island, Britlsh North America, between iat. $48^{\circ} 20^{\prime}$ and $51^{\circ}$ N., and long. $123^{\circ}$ and $128^{\circ}$ W., separated from the main land by Queen Charlote Sound and tho Guif of Georgia. Length, northwest to southeast, $\mathbf{3 0 0}$ miles; greatest breadth, $\mathbf{7 5}$ miles. Estimated area, 16,000 squaro miles; and population, 11,463. Surface mountainous, and richly wooded. On its weat coast are Nootka Sound, and many other harbors. This land was named in honor of George Vancouver. This British navigatur was born about 1750. IIo served as inidshipinan under Captain Cook, in hia aecond and third voyages. In 1790 he was appointed to command the expedition to explore the western coast of North America, to ascertain whether any navigable communication existed between the Atluntic and Pacific oceans. Of thia voyage, which occupied from 1790 to 1795, he coinpiled an account, but died before ita entire completion, May 10, 1798. The island is intersected by high mountain ranges, but it has, notwithatanding, a considierable extont of luvel and undulating land susceptible of cuitivation. Suils very various, being priucipaliy, however, of a friable description. The best is a black vegetable mould, producing a most laxuriant vegetation. Climate peculiariy mild; hut in winter the rains, aecompanied with vislent thunder-storms, are heavy, and uimost incessant. The baye, rivers, and adjacent seas, swarm with a variety of fish, including saimon, sturgeon, herriugs, etc., with seals, sca-otters, tortoises, etc., and they are aiso resorted to by whales. The herbors of the island are consequently well situated for carrying on an extensive and profilabie fishery, and well fittei for ship-bailding. The inineral riches of the island have been very imperfectly expiored. Ileds of coal are to be met with In its northeast parts. In various localities the beds have been found cropping out at the anrface, and large supplies have beeh obtained with but little difficulty and little expense. The native inhabitanta subsiat principaliy by hunting and fishing, eapecialiy the latter, and by cultivating the potato.

They are remarkable for indolence and filth; their heads are Aattened when young by artifleial means ; and their lege are ill formed, those of the women being frequently swollen. A settlement established by the English at Nootka Sound in 1788 was $8 \cdot$.pprossed in the following year by the Spaniards, an outrage which nearly occasioned a war with Spain. Since then it has been almost wholly neglected; tlll within these fow years that some establishments have been forined opon it by the IIudson'a Bay Company. Latterly it has been proposed to make it the site of a colony thst ahouid proeecute the seal and whale fishery, for which, as already stated, it is supposed to be peculiarly weil cituaied; and, with a viaw to the realizing of this projoct, it has been mads over to the Hudson's Bay Company, on condition of their establishing a colony within its linits in the course of the five years foliow. ing 1848. Coal ia procured at the settlemant of Nanaimo, where the Hudson's Bay Company have mado a large purchase of land and commenced an extensive coal work. Two valuablo beds of coal, varying from five to eeven fect in thickness, are found within 160 feet of the surface ; the coal ls bituminous, and ia greasly prized for domeatic consumption and for steaning purposes. The produce of these works may be increased, by fincreaslng tha number of hands, to any desirable extent. Another source of wealth and onterprise may bo found in the maguificent ship apars produced on Vancouver'a Island, which, in point of size and comparative atrength, are probably the most valuable in the world, and may bo procured in any number, even were the demand to includo the supply of apars for the whole British navy. The oil exported from this colony is procured from the native tribes inhabiting the weat coast of Vancouver'a Islandi, and is manufactured by thein from tha whale and dog-fish; it is of exceilent quality, and has a high character in California, whero it brings from two to thres ciollars a galion, in consequance of its retainlog its fluidity and burning freely in the coldest weather. It is estimated that a quantity equal to 10,000 galions was purchased from tho nativea of the weat coast last year ; and, censidering the imperfect means they possess for taking the fish and trying out the oil, it is not unreasonabia to propose that with the use of proper means the returns of oil would be greatly increased. The oil trade is carried on by a fuw enterprising individuals who live among the Indians, and collect the article as it is manufaetured by the natives. The number of ships with cargoes which between July 5,1854 , and Juiy 5 , 1850 , entered inward was 25 ; tonnage, 4054. In ballast, 3 ; tonnage, 260. Cleared outward with cargocs, 16 ; tonnage, 2350 . In baliast, 9 ; tonnage, 1353. Pert Vietoria has five vesseis belonging to It, and Vanconver's Islend ls a riaing and flourishlng littlo colony, all the more to be cherished as its peopie aeem to be on good terms with the natives and enconrage then in Industrial pursuits.

Van Diemen's Land, or Tasmania, a iarge ialand boionging to Great Britain, forming part of Australia, lying between lat. $41^{\circ} 20^{\prime}$ and $43^{\circ} 30^{\prime} \mathrm{S}_{4}$ and loug. $144^{\circ} 40^{\prime}$ and $1.18^{\circ} 20^{\prime} \mathrm{W}$. It is aupposed to contain about 27,000 squaro iniles. This lanil was discovered by the 1)ntch navigator Tasman in 1642, and was named in honor of Anthony Van Diemen, at that time governor-general of the Duteli possegsions in the East Irdies; but it is now frequently called Tasmanis, from its discoverer. J'reviousiy to 1798, It was supposed to form part of New lioliand, but it was tien ascertained to bo an isinnd. It was taken jossession of by the British in 1803; and in 1804 Hubart Town, the capital, was founded. The surface is generuily biliy and mountainous; but though none of the land bo of the first quality, there are several moderately fertile plains, and a good deal of the hilly ground is susceptibie of being cuitivated. On the whole, however, it is not supposed that moro than about a third
part of the entire surface of the island can be considered srable; but about s third more may be advantageoualy used as sheep pasture. As compared with Now Holiand, it is wall watered. The cliante, thongh variable, is, generslly speaking, good, and aultable for European constitutions $;$ and it is not exposed to thè tromendous droughts that occasion so much miachief in New South Wales. Wheat is raiecu in considerable quanilties; though wool is at present the atapla produce of the colony. Van Llemen's Land, liko New South Walcs, was originally Intended to serve as a penal colony, and it received between 1828 and 1850 no fower than 58,243 convlets. It has also ruceived, especialiy of late years, large numbers of free settlers. In 1850 the total population of the laland, excluaive of aborigines, who parhape do not axceed 8000 or 4000 , amounted to 70,194 . Of these, 45,916 were free, and 24,188 convicts. For some consideruble time back
great diesatisfactlon was falt by the colonists at the continued importation of convicts ; and latterly very vigorous measures ware taken to affect its sapprecsion. For this purpose it was in 1852-'53 finally abandoned. In truth, after the discovery of the gold-flelds In the adjoining continent, it could no longer be contianed.

Trade of Van Diemen's Land.-Hardware, haberdashery, apparcl, cotteri and linen goods, woolens, malt llquor, spirits, wine, etc., form the principal articles of import. Here, as in New South Wales, wool forma by far the most important article of export ; next, to it is whale-oll, and then follows wheat and flowr, live atock, timber, whalebone, mimosa bark, and various less important articles. The uaual excess of the imports over the exports is sccounted for by the remittances to defray the cost of the convict estsblishment.

Pofulation, Teade, kto, of Vax Diemin'a Land rhom 1830 to t848, bota imolubive

The trade between the United States and Van Diemen's Land commenced in 1834, in which year our exports amounted to $\$ 7120$, and from that period up to 1817 averaged annually upward of 820,000 ; while our imports from that colony during the same period did not exceed an annual sverage amount of $\$ 7000,-$ See article Austradia.

Vanilla, the fruit of the Epidendrum vanilla, a apecies of vins cxtenalvely cultivated in Mexico. It has a trailing stem, not unlike the common tvy, but not so woody, which sttaches itself to siny tree that grows near it. The Indians propagate it Ly planting cuttings at the foot of tress selected for that purpose. It rises to the helght of eighteen or twenty feet; the flowers are of a greenish yaliow color, mixed with white; the fruit is abont eight or ten inches long, of a ycilow coior when gathered, but dark brown or black when imported into Europe; it is wrinkled on the outside, and fuil of a vast number of aeads liks grains of sand, having, when properly prepared, a peculiar and delicious fragrance. It is principally used for mixing with and perfoming chocolate ; and is, on that account, largely lmported finto Spain. Vanilla is principally gathered In the intendancy of Verz Cruz, in Mexico, at Misantla, Collpa, Vacuatla, zind other places. It is collected by the Indians, who sell it to the whites (gente de razon), who prepare it for market. They spread it to dry in the sun for soma hours, then wrap it in woolen cloths to sweat. Like pepper, it changes its color in this operation-becoming almost black. It is finally dr?ed by exposing it to the sun for a day. There are four varietics of vanilla, all differing in price and excellence; viz., the vanilla fina, the zacate, the rezaeate, and the vacura. The best comes frem the forests surrounding the viliage of Zentila, in the intendency of Onxaca. According to Humbeldt, the mean exportation of vanilla from Vera Cruz may amount to from 900 to 1000 miliares, worth at Vera Cruz from 80,000 to $\mathbf{4 0 , 0 0 0}$ dollars. Vesilla is also imported from Brazil, bat it is very aferior. The finest Mexican vanilla is extremely high priced.-Seo IIvmaoldt, Nouvelle Espagne; Poinsett's Notes on Mexico.

Variation of the Compass, the angle which the magnetic ncedle makes with the plane of the true meridian. It is otherwlse called the declination.-.See Compass. For tables showing the variation in a great
number of places, and its progressive, annual, and diurnal changes, see Buewaten's Treatise on Magnetism, 1837, reprinted from the Ejucyclopadia Britannica.

Varnish (Fr, Vernie), a fluld which, when spread thin upon a solid surface, becomes dry, and forms a costing impervious to alr and molsture. Thare are two kinds of varnish, namely, spirit and oil varnishes : rectified alcohol is used for the former; and for the latter fixed and volatile oils, or mixture of the two. The solid substances dissolved in the above menstrua, and which constitute what is termed the body of the varnish, are almost exclusively resinons, and ale chiefly the following: 1. Turpentine, all the varleties of which are employed hy the varnisher: they form an excellent body, and give strength and glossiness at a amall expense; but they do not dry without other additions. 2. Copal, a peculiar resin, very difficult to dissolve, but formiug a hard and durable ingredient. It is generally melted over a gentle firs previous to use. 3. Lac, which gives grest tonghness and hardness; but is often inadmissible, on account of its reddlsh-brown color. 4. Mastic, which yields a tough, hard, brilliant, and colorless varnish. 5. Elemi, a resin of a palo yellow green tint, end a valuable ingredient, on account of its toughness and durabllity. 6. Sandarach, a resin which imparts splendor, but which alone is not durable. 7. A mber, a valuable ingredient, on account of its hardness and durability; but diffienlt of transparent solution, and hence chlefly used in opaque varnishes. 8. Benzoin, added on account of Its fragrancy. 9. Anime, which gives brilliancy and some scent. 10. Gamboge, for yellow varnishes. 11. Dragon's blood, for red varniali. Thess, togather with tarmeric, saffron, and annotta, are chicfly used on account of their color, and to cover brass and copper under the name of lacquers. 12. Caoutchouc: this extracrdinary vegetable product has of late been much employed in a variety of preparations used as varnishes. It is invaluable wherc materials are to be rendered alr-tight, as balloons, for example, and where at the same time flexibllity, and oven elasticity, are required; but tts principal application In this way is in the manufncture of varlous voater-proof articles. 18. Asphaltum, the varietles of which are indispensable in black oil varnishes. In making spirit varnishes, the strongest alcohol of commerce should be nised (of a specific grayity not exceed-

## VEN

ing 820), and its solvent power over aoms of the more intractable resina is eometimes improved by the addition of a little camphor. In order to prevent the agglutination of the resin, it la often requislte to mix it with sanil or pounded glass, by which the surface ls much Increased, and the solvent energy of the aplrit facilltated. The proportions in whielh the several ingredienta are used, and the seloctions for partlcular purposes, are infinltely varions. The following are a few good varniahes, in illuairation of thoir varieties: 1. Spirit Varnish.-Sandarach 4 oa., aeed lao 2 oz., elemi 1oz.; digeat the whole In a quart of moderately warm alcohol, and when dissoived add Venico turpentine 2 oz. 2. Lac Varniah.-Sced lao 8 oz ; dlgest for four days in a warm place with a quart of alcohol, and then atrain through flannel. 3. Turpentins Varnioh.-Mastlc 12 oz., mixed with 5 oz , of poisoded glass, and digested in a quart of cil of turpentino, adding at intervala about half an ounce of camphor in omall pieces. When the mastie is dissolved, add to the warm fluld in ounce and a half of proviously injuefied Venice turpentinc. and atir the whole together. 4. Copal l'arnish.-Copal which has been pieviously rinited by gentle heat 8 oz ., oil of tarpesitine 20 oz . (masara): put the oil into a flask placed in boillng wat ss, and add the powlered copal in amall portions at a time, so that it may be gralually dissolved; let it stand a fow days to clear, and then pour It ott, and If too thick for use. add to it a little warm oil of turpentine. This varniali dries alowly, hut ts very durable.-Seo article Paints.

Vellum, a species of fine parchment.-Sec Pancument.

Felvet, a rich kind of stnff all silk, covered on the outside with a close, short, fine, soft shag, the other side being a very strong, cluse tissue. The nap or sheg, called also the velveting of this atuff, is formed of pait of the threads of the warp, which the workman puio on a long narrow-channeled ruier or needle, which he afterward cuts by drawing a sharp ateel tool along the channel of the needle to the ends of the warp. Fioronce, Genoa, and some other cities of italy, are most noted for the manufacture of velvot. There are cotton velvets manufactured in imitation of the silk ones in England.

Venezuela, a republic of Sonth America; its territory lies chiefly between lat. $2^{\circ}$ and $12^{\circ} \mathrm{N}$., and long. $60^{\circ}$ and $73^{\circ}$ W., having on the eust British Gulana, on the scuth Brazil, on the wost New Granada, and on the north the Caribbean Sea. The chief wealth of Venezuela consists in its rich and extensive pastures, its mines of the precious metals, and of lead, iron, copper, etc, aud its valuable furest timber. The agricultural and other productiz of the couniry which enter into its forcign commerce as articley of export are coffee, cocon, cured bides, indigo, fustic, tobacco, cotton, cattle, nיyles and horses, and specle. These form the basis of the forelign commeres of Vencauela, and are exchanged for tisates of cotton, thread, silk, and rool; flour, provisions, hardware, soap, furniture, glasswere, urandies, wines, etc. Conformably to the law of May 5, 1349, the ports open to foreign commerce ure divided latc three classes, namely : ports open for im portation and exportation; ports open for importation for local consuaption only, and for exportation; , 1 ort open for exportation only. This organization was simplitied by a deereo of April 15, 1854, of which the following is 4 transiation:

Ciudad Bollvar, in the province of tiuiana; La Guayra, In that of Caraccas; I'uerto Cabello, In that of Caraboto; La Veis, in that of Coro; Maracuibo and Warcelona, in the two provinces bearing those nalses, ara deciared ports open to commerce, both for imp taLion and exportation, without any rertriction. Cumana, Carupano, Cariaquito, and Barrancas, in the province of Cumana; Pampatar and Juan Griego, In the province of Matguerita ; Soledad, in the provicce of l'arcelcna; and Cumarebo, in that of Cbro, are declared ports open to commerce for iniportation for local
conaumption only, and for exportation. The customhouses of the ports open for importation for local consumption only can not clear, under a certificato, foreign produce for other ports, open or not to commerce, except the custom-housed of Cumana, Carupano, and Cariaquito, which'are allowed to deliver cockets (certificates of cargo), the two former for the ports of Cariaco and Rio Carlbe, the others for the por:z of Irapa and Yaguarapara.

In the year 1803 the exports of Veljezuela ware eatimated at a value of nearly $\$ 7,000,000$; of this amount La Guayra oxported $\$ 2,500,000$, Cumana and Bareelona $81,600,000$, Maracalbo and Angostura $\$ 1,000,000$, Carupano and the smaller ports the remainter. These amourts are in Venezuelan curreney - In which all values, derived from Veneauelan official sources, are genorally stated. The dollar of the United Statea is equivalent in value to $8131 \frac{2}{8}$ in the present currency of Venozuela. The dolfar of Mexicu, Peru, Chill, Central Amuca, and of Cuba, is that of the United Stntes,

Inteiwal Commerce.-The River Orino ou is :ow navigated as high up as jutrias, In the province of Varinas; and the productions of the tertile countries watered by this magnlieent river are thus added to tto commorcial wealth of the republic. A recent communicathon from Puerto Cabelto affords the following facts: "Several inercantile firms of l'uerto Cabello have applisd for tud oltained from the Congress of Venezucla 2 ebserter for a railioad to run nearty west from that city-5: miles-tc San Felipe, in the province of laarquisimeit. Tho estimated cost Is $\$ 1,400,000$ (United States currencs ), xclusive of land, which, for the most part, will be afforded free of expense. The government gives atl the public land and tlmber which may be renuirec, elther for the road or buitdinge, and acdmilts the tools, iron, etc., froe of duty; subscribes for $\$ 186,916$ of the stock ( $\$ 250,000$ in Venezuelan currency). Tho provinces of Barquisimetc and Curaboio together take 86,290 of the atock. Of the grades, 70 per c.nt. will be bolow 30 feet to the mile, and only 5 per cent, above 50 feet. There will be 15 bridges, estinated to cost $\$ 104,590$. The charter is to continue 40 years as an exclusive privilege, and 40 years more the right of property in the road is guaranteed to the company; after which it reverts to the government. The road must be commenced within two yeara from Ist July, 1855 , and be complated within four years from the date of its commencement. John lougherty; of New York, chief englncer of the road, estimates the amual net licome at $\$ 242,222$. San Fclipo is situated on the: Yarieiu Iliver, and is a commaniling point for the collection of the products of the lnterior. Puerto Cabeile is the best hartior in Vencaueia."

The provinces of Varinas, Apure, and the two Guyanas, are now brought into direct cummunication with the sec: and by the establishment, In 1845, of a line of stearuera under the ausplees of a company from the United Staws, specially charu red by the Venczuelsn fivernment, and by means of the 240 asiling vess ide wito a eapacity of 36,900 tons, whic annualiy asecnd as high a, Angosiura (Ciudud Bolivar), some 250 iniles from the sea, thero is but little room to loubt that Venezaela is alsut to enter upon a career of commer. cial prospority. At presenl, the annuat exports foom A pure and Varhuas consist of dry hildes (abont 100,000), buckskins, coffee, ratton, indigo, cocoa; and irom the latter provicee bet ween $1,000,000$ and $2,000,000$ pounds of tobacco. The valuc of this trade to the United States will im percejived, when is is known that nearly a! the hidi $3 x$ offered in the Venezuetan markets are taken by th.s cuautry.

Ths vaiue of the tolal trade of Venezuela for the fiscal year endinc: June 30, 1845, las alrendy been given. For the year enling December 31, I845, it reached a cotal of $\$ 8,021,040$, and the nurigation emjloyed 3209 veasels, mensui ing in the aggreigals 140,732 tons. ilave apencrucla rom that e of Bar0 (United the most e governhich may 8 , and adacribes for relan curCurabolo grades, 70 and only 5 oridgen, ts0 continue years more teed to the verminent.

During the same year there entered tho differsat posts of Venezuela 262 vessois, measuring an aggreg ate of 11,608 tone; and there clearod 392 veasels, with an afgregate of $17, \mathrm{c}_{\mathrm{s}} 5$ tons-all under the mational flag. Of foreign vessela there entered 494 veasols, measuring in ali 76,760 tons; and thoro cleared 743 vessels, with an aggregate of 98,152 tone-making a total of 1237 vessels, and an aggregate of 174,912 tons, under foroign flags.

The Culture and Exporiation of Cotton.-Notwithstanding many portions of the republic of Vonezucla are well adapted to the cultivation of the cotton-plant, this branch of industry has been gradually doclining duriue the past ten years. This has been attributed principslly to two canses: 18t. The want of roads, or other art ficial means of transpurtation, which reduces the planters to the necessity of employing mules to convey their produce to market; thus ab. bing all the profit which this branch of industry might otherwise realize. 2d. The superior inducements which the cultivation of coffec, cocoa, and other tropleal produce otier, as respects the anonnt of labor bestuwed on their
production, the expense of transportation to market, and the price which such produco usually commands. To these may be added the suporior quality of these latter products, for which Venezuela has nequired a higit reputation in the markots of the world.

All cutton textiles which are consumed in the republic are imported from forclgn countries. From tho 1st July, 1849, to the 80th June, 1950, the total valne of cottons imported amounted to $\$ 258,586$, namely: in national vessels, $\$ 26,464$; and in fureign veasels, 9227,122 . During the aame perind, the exports of raw cotton reached $660,117 \mathrm{lbs}$, valued at $\$ 44,248$, viz. 1 in national vessels, 95,200 l ls. , valued at $\$ 5810$; and in foreign vessels, $564,917 \mathrm{lbs}$., valued at $\$ 38,438$. The ports from which rav cotton was exported in 1849-'50, to gether with tho quantitias esported during that period, were as follows:

| Puerto Cabelio | 461,024 pounds |
| :---: | :---: |
| Maturin. | 98,200 |
| La Grayra . . . . . . . . . . . . . . . . . | 00,608 |
| La Vela. . . . . . . . . . . . . . . . . . . | 4,800 |
| Cludad Bollvar | 2.800 " |
| Jto Coribe. | 2,1100 |

From the above it will be perccived that, out of the fifteen ports of Venezuela, ṇs cotton was exported from nlne; among them veing two of the most importantCumnna and Maracaibo-although the previnces of Cumana and Maracaibo are not only very extensive, but eminently adspted to the cultivation of this e.rticle. The species of cotton cultivated in Veneznela is what lo denominated the long ataplo (black seed) of Louisiana and Geurgia, and was introduced from tho United States.

Commercial Regulations.-All foreign nations enjoy equal commercial privileges in Veneznela. Treaties exiat between the repnblic and most of the governments of Europe and Americn. That wlth the United Stases was ratified May 31, 1836, and was to continue In firce twelve years, with the usual twelve months' notico after that period. Such notice not having been given by either party, its provisions atill continuo in force. This treaty guarantees entire reelprocity and perfect liberty of trade, direct and indireet, between the two republics; and stipulates that all favors to other pations in reppect of commerce and navigation, granted by either party, shall immediately become common to the other. Under the provisions of this treaty, and the commercial legislation of Venezuela, Uuited States vessels enjoy the same priviloges, and are subject to the eane restrictions, as those of all other nations. Amorican trade, however, would, it is thought, reat upon a firmer basis, and inight be greatly extended by a new treaty with that republic, better adapted to the exigenries of present commercial relations than
that of 1836, entered into in the very infancy, political an well an commercial, of Venezuela.

In 1840, foar years after the ratification of this treaty the United Statea exported to that country 20,034 barrels of tour, valued at 147,304 . In 1854 our exporte of that erticle reachod 40,097 barrels, valued at 318,732; showing an lacrease in the quantity and value of that one artlele, which we exchanged for the thdes, coffee, and indigo of Venezuela, of 100 per cent.

The hides imported into the United Staten In 1840 mounted in value to $\mathbf{8 2 8 8 , 3 7 2}$. In 1854 thoy reached as high as $1,623,605$; showing an increase, In that single article of our imports, of over $\mathbf{4 0 0}$ per cent. A more liberal tariff of duties on our fiour and cotton goods in the ports of Venezuela wouid continue to augment still more largely this growing trade. The justice of such a measure will be obvious when it is considered that the prineipal article which the United Staten import from Venezuela (hiden) is subject in our ports to a duty of 5 per cent. only; while the principal article which we furnish in exchange (dour) is taxed in its ports with a duty of $\mathbf{8 4}$ per barrel, which, at a value of from 812 to $\$ 16$ per barrel (its average price in the Veneanelan markets), is equal to 25 act $30 t$ per cent., besides sundry other duties which are superadded before the articie can get into market. These facte are anfficiently suggentive without further comment. Duties are levied on a valuation basia, though many articlea in the tariff are liable to specific duties. Instesd of specifying each oxtra charge separately, these beavy imposts can be best illustrated by an actual case:
Custom duttea on 100 berrela American flour landed at tbe port of La Guayra, at \$4 per barret import

10 por cent. on amount of dutlea on account of late internal war.
I per cent. on amount of duties for wharfage.......
9 per cenan road tax
20 per cent on eggregata amount ; contribation extraerdinary

I per cent. for the new church on \$ $\$ \mathbf{W 7} 00$ Total dutles, extras, elts. \$5

Navioation Deka.

The ton is Venezuelan measurement, generally $12 \frac{1}{2}$ per cent. more than that of the United States. The value of Venezuelan money differs considers ${ }^{*}$, as already noted, from that of the other South American utates, though of the amme denomination. The foliowing are the tegal values of somo of the forelgn colns in circulation in Vonezueia, as fixed by the law of May 30, 1848 :

$$
\begin{aligned}
& \text { One dollar of the Unlted Statea equal to ........ \$1 84\} }
\end{aligned}
$$

$$

\end{aligned}
$$

Articlea noted free in the tarifipay, in llen of all extras, 15 per cent. One of tho greatest inipediments heretofore existing to the increase of American trade with Venezuela was tho restriction impored on the tranaitago of American merchandise importe-l expressly for the markets of New Granads. Some years since, Maracailo was declared a place of deposit for such mer-chandise-a messure of the greatest importance to commerce, as nearly half the impo ant that port are destined for San Jose de Cucuta, in New Granada. The privilege thus granted was subsequently rendered nu-
gatory by severe reatrictions and onerons duties. A more liberal decree, however, han very lately been promulgated (Auguat 10, 1856), which must nocensarily largely augment the imports into Venezuela, and thus promote the general commerce of the republic.-Sec articles Caraccas ind la Giayra.

Venice (It. Veneria; Ger. Venedio; ancient, Venetia), a fortified eity of Austrian Italy, formerly the capltal of the republic of that name, on a clunter of small islands toward the northern extremity of the Adriatic, In lat. $45^{\circ} 25^{\prime} 53^{\prime \prime}$ N., long. $12^{\circ} 20^{\circ} 81^{\prime \prime}$ E. Population In 1851 about 123,000. The commerce of Venice, once the most extensive of any European clty, la now comparatively talfing; and tho population is gradually diminiahing both in numbers and in woalth. Iler Importa consist of wheat and other sorts of grain from the adjoining pruvinces of Lombardy and the Biack Sea; olive-oll, prineipally from the Ionian Ialands; cotton atufis and hardware from England; sagar, coffee, and other colonial products from England, the United States, Brazil, etc. $;$ dried fish, dye-stuffs, etc. The exports principally conaist of grain, raw and wrought silk, silk goods, glass warea, books, paper, woolen n.anufactures, fruits, choces, etc., the products of tho adjoining provinces of Italy, and of her own induatry; but her manufactures, so fnmous in the Middle Agea, are now much decayed. The origla of Venice dates from the period of the invasion of Attila in 452, when a number of the inhabitants of Venetia, and other parts of Italy, taking refige in the islands of the Adriatic, formed a confederation to oppose the barbarians. In 697 they elected, as the head of their government, a doge or duke (dux). The Venetian atates formed themselves into a republic In 809 . In 997 they took posgession of the town of Narenta, a nest of pirstes, and thus commenced their maritime power; they afterward subjugated ali the towns of Dalmstia. The crusades were a souree of aggrandizement for Venice. At the end of the $12 t /$ century, the Venetisns made themselvee masters of p: rt of the Morca, Corfu, Cophalonia, and Crete. During two centuries they usmopolized the commerce of India by the route of Egypt ; but they lo.t this on the discovery of the passago by the Cupe of Good Hope. The state aitained the helight of ite prosperity in the 15th contury. It began to deeline at the beginning of tho 16 th centary, and its overthrow was completed by the French in 1797. By the treaty of Presburg in 1805, it was made over, with the provir.ces of the continent, to the kingdom of Italy, and was held by the French till 1814, when ft reverted to Austria. In 1818 the Venctions revoited against the Austrians, and hold the city for seversl months. The government of Venice comprises eight delegations, which benr the names of their capitals: Venice, Padua, Vicenza, Verona, Rovigo, Treviso, Belluno, and Utine. Population in 1850, 2,281,732; do. of provinces, 298,425. The Gulf of Venico is formed by the Adriatic, on the northeast coast of Italy, bounded by the Piave and Brenta.

Iort.-The islands on which Venice is hulit lle within a line of long, low, narrow islanda, running north and south, and inclosing what is termed the lagoon, or' shallows, that surround the elty, and separate it from tho main land. The principal entrance from the aca to the Isgoon is at Malamoceo, about 11 league south from the cit y ; but thereare other, though leas frequented entrances, both to the south und the north of this one. There is a bar outside Malamocco, on which there are not more than 10 feet at high water at spring tidea; but there is a channel between the western point of the bar and the village of San Pletro, which has 16 feet water at aprings, and 14 at neaps. Merehant vessels usualiy moor off the ducal palaco; but sometimes tilcy come into the grand canal which intersects the eity, and sometimes they moor in the wider channel of the Gludecea. Vessels coming from the south for the most part make Pirano or Rovigno; on the cuast of Istria, where they take on board pilots, who carry them to the
bar opposite to Malamoceo. But the employment of Ietrian pilots is quite optional with the master, and is not, as in sometimes represented, a compulsory regufation. When one is taken, the usual fae from l'irano or Rovigno to the bar is $\mathbf{2 0}$ Anstrian dollars. On arriving at the bar, ahipa are conducted acrose it and into port by pilots, whose duty it is to meet them outside, or on the bar, and of whose servicea they must avall themselvea.

Money.-Formerly there were various methods of accounting here; but now accounta are kept, as at Ge nos, in lire Italiane, divided into sentesimi, or 100 th parts. The lira is supposed to be of the same weight, fineness, and, consequently, value, as the franc. Jlut the colins actualiy in circulation, denominsted lire, are respectively equal in value to alout ten cents. The latter are coined by the Austrisn government.

Weights and Measures.-The commercial weighta are here, as at Genoa, of two sorts: the peso sottile and the peso grosso. The French kilogram, called the libra ltaliana, is also sometimes introduced.

The moggio, or measure for corn, is divided into 4 stajo, 16 quarto, or 64 quartaroll. The staja $=2 \cdot 27$ bushcls. The measure for wine, anfora $=4$ bigonzl, or 8 mastelli, or 48 sechil, or 192 bozzo, or 768 quart $\cdot z x i$. It contains 137 English wine gallons. The botta $=j$ bigonzl. Oll is sold by weight or measure. The botta contains 2 mighlaje, or 80 miri of 25 lbs . peso grosso. The miro $=4.028$ English wine gallions. The braccio for woolen $=26.6$ English inches; the bracelo for silks $=24.8$ do. The foot of Venice $=13 \cdot 68$ English inches.

The foreign comnserce of Venico in 1847 amounted in value to $86,500,000$ francs. 'liso revolutionary movements of 1818 , the long siege which it endured, and the suspension of its privileges as a free port, completely paralyzed ite commercial movements. In 1851 these privileges were restored, and the commerce of Venice has again resumed its wonted aciivity.

The imports into the port of Venice in the years 1847 and 1848 were:

$$
\begin{aligned}
& \text { 1847. -Forelgn traports. } \\
& \text { 18:18.-Forolgu Imports. } \\
& \text { 86,484,000 france. }
\end{aligned}
$$

mpoats and Exponte to and

It will thus be seen that the commereial movements of the port of Venlce $\ln 1852$ oxceeded In value the sum of $50,000,000$ francs (nesrly $\$ 10,000,000$ ), and ehow an increase over the totals of 1851 of $17,500,000$ francs. This is to be attributed to the restoration of the commercial franclise of the port-an act of justice which was delayed until the operations of the second half year of 1851 had already commenced.

The following table exhibits the navigation of Venice during the two years under review :
2851. - Total vesscia entered ead clearod 1281 , of 173,714 tonss 1859.-Tots1

1743, of 234,240
The following statement exhiblts the imports and exports to and from Venice in 1858 compared with 1852:

| Yoars. |  | Importa. | Exports. | Total Trade. |
| :---: | :---: | :---: | :---: | :---: |
| 1853 |  | 38,798,700 | 15,614, 200 | 51,403,400 |
| 1852 | " | 35,798,700 | $14.200,300$ | 50,005,000 |
| Incre | " | 3,000,000 | 1,398,400 | 4,398,400 |

The cossting trade during the year 1853, added to the foregoing, figures a total of $20,544,400$ francs, a gainst 19,699,100 francs in 1852. Thus:

Coamfing Tabid on Vimice in the Yeame 1869 and 1858.

| Youmb | fram 10, |  | Tual ${ }^{\text {a }}$ Trede. |

| Cheese | 003,600 |
| sugar (brown and | 1,484,800 |

From a consular return, dated Vanice, April 24, 1856, it appesrs that there entered that port in November and December, 1855, two Ainerican vessels, measuring respectively 663 and 527 tons, having cleared from Richmond and bound to Palermo, after discharge of cargo, consiating of tobacco, valued at $\mathbf{\text { 年5,000. They }}$ ieft Venice for their destination in ballast. In January nnother American vessel, measuring 248 tons, entered in baliast, and cleared for Conatantinople with a cargo of hay vslued at $\$ 2500$.-Com. Rel. U. S.

Vera Crus, the principal sea-port on the eastern cosst of Mexico; lat. $19^{\circ} 11^{\prime} 52^{\prime \prime}$ N., long. $96^{\circ} 8^{\prime} 45^{\prime \prime}$ W. Population about 16,000. Opposite the town, at the distance of a bout 400 fathoms, is a small island on which le bulit the strong castle of San Juan d'Ulloa, which commands the town. The harhor lies between the town and the eastle, and is exceedingly insecure; the anchorage being so very bad that no vessel is ceasidered safo unless mado fast to rings fixed for the purpose is the castle wall: nor is this always a sufficient protection from the fury of the northerly winde (los nortes), which sometimes blow with tremendous violence. Humboldt mentione, in proof of what is now stated, that a ship of the line, moored by nine cables to the castlo, tore, during a tempest, the brass rings from the wall, and was dashed to pieces on the opposlte shore.-Nourelle Espagne, ed. 2de, iv. 59. Its extreme unhealthiness ts, however, a more serious drawhack upon Vera Criz than the badness of its port. It ts said to be the original seat of the yellow fever. The city is well built, and the streets clean; but it le surrounded by sand hills and ponds of stagnant water, which, within the troplcs, are quite enough to gencrate disease. The inhabitants, and those accustomed to the climate, are not subject to this formidablo disorder; but all strangers, even those from tho Havana and the Wcst India Islands, are liable to the infection. No precsutions can prevent its attack; and many have died at Xalaps, on the road to Mexico, who merely passed through this pestilential spot. During the perlod that the foreign trado of Mexico was carricd on exclusively by tho flota, which eailed periodicaliy from Cadiz, Vera Cruz was celebrated for its fair, held at the arrival of the ships. It was then crowdod with dealers from Mexico and most parts of Spanish Amorica; but the abolition of the system of regular flcets in 1778 proved fatal to thils fair, as well ss to the still more celebrated fair of Porto Belio. A light-house has been erected on the northwest angle of
the Castie of San Juan. The light, which is a revolving one of great power and brilliancy, is elevated 79 fent above the leval of the sea.

For a considerable period after the town of Vera Cruz had thrown off the Spanish yoke, the Castle of San Juan d'Uiloa continued In posmesion of the Spanlarils. Daring this Interva! the commerce of Vera Crua was almost entirely transfurred to the port of Alvarado, 12 leaguen to the southeast. Alvarado is limit apon the left bank of a river of the same name. The bar at the mouth of the river, abont it mille below the town, renders it lnaccenalble for vessela drawIng above 10 or 12 feet water. Large shipe ars obliged to anchor in the roads, where they are exposed to all the violence of the north whind, loailing and ualoading by meana of lighters. Alvarado is supposed, but probatily without much foundation, to be a littie healthier than Vera Crua. The trade has now mostly reverted to its old ehannel.

The commerclal intorcourse of the United States with Vera Cruz depends now solely on the regulationa of the mothar country (i. e., the capital). Locial leglsJation has nothing to do with 1t, except as regards a fow unimportant harbor dues, and municlpal taxes inposed by the "ayuntamiento" (eity counel). The exinting regulations are permanent in name, but may be regarded as temporary in fact, being liable to be changed at any moment by arbitrary decree, or utterly deatroy. eil by "pronunciamento." There are no privilegen permitted the commerce of other nationa whid are dealet to tha United States, nor are there any res e"ctions Imposed on the commerce of other nations and not on that of the United States. It is understood that the Danish commercial treaty in the least favorable to Mexico; but, practically, all nations may be regarded as on an equal footlng. Moxico takes care to make no national dintinctions, but she very frequently sells apecial privilegos to individuels, as in the caser at San Blas, Mata-
moras, and Maxatlan. At Vera Cras an Immonse ainount of raw cotton in being imported from Nuw Orieans, on the payment of about one half the duty indieated by the exieting tarifi-" parmits" to linport that artiele at a greatiy roduced rate having boen granted to favored individuals. The regular duty in tiree cents per pound, but permita can now be bought up at seconil hand at two ceals per pound.

Vord [Cape] Islands. The Cape Verd Ialanda are situated 329 milea weat of Cape Verd, between lat. $14^{\circ} 45^{\prime}$ and $17^{\circ} 13^{\prime}$ N., and long. $82^{\circ} 45^{\prime}$ and $25^{\circ} 25^{\circ}$ W. The Arelipelago conaista of the following ten Iflande: Sal, Boavista, Mayo, Santiago (St, James), the largeat, Forgo, Brava, (irande, Itombo, St. Nicoliae, and St. Luzia; and four Ialets, Branco, Razo, St. VIcente, and St. Antion. Area eatimated at 1680 square milfes. Population in 1850, 86,788. The white popuIation In the whole Archipelago is to the colored an one to twenty. Tho surface of the ialanda is in general mountalineua, and some of their peaks havo a collsiderabla elevation. The voleano of Fugo is 9167 feet in height. The suil is extrenely varlous, but mostly furtile ; the absence of trees and the acarcity of water are the causes of frequent and eevere distress. Chief vegetable products, maizo, riee, and French beans. Coffice, Introduced Ia 1790, has completely aucceeded; the cotton shrub is indigenous; indigo growa wild, and tobaceo Ia cultivated in some of the islands; tropical fruite are alundant. The sugar-cene and the vine are cultivated, but the manufacturo of wine is prohibited. The cllmate of these lislands is much varied by extrente heats and droughts, no rain falling during some periods for three or four years. Hence the population are frequently aubject to dist ress and suffering. Thase visitatlons have, on several occasions during the past fow years, atrongly appealed to the sympathies of the civilized natiuns of the world In behalf of the 87,000 lilhabliants of these islanda,-See article Mexico.

Port chargea in Madeira amount to about 818 on a vessil of any tonnage, for health officer, government visita, and custom.houno fees. - For Weronte and Meabuaka, zee p. 1013.

Verdigris (Ger. Grünapan; Mr. Vertele-gris, Verdet; It. Verderame; Sp. Cardonillo, Verdete, Verde-gria; Russ, Jar), a kind of rust of copper, of a beautiful bluish green color, formed from the corronion of copper by fermented vegetables.

Its apecitie gravity in 1-78. Ita taate ta diagreenbly metalle, and, liko all the compounds into which copper entera, it is polsonous. It was known to the ancients, and various ways of preparing it are deseribed by Pliny. It la very extensively used by painters and In dyeling ; it is also used to some extent in medicine. The best verdligris is made at Montpellier; the wines of Languedoc being partlcularly well puited for corroding copper, and forming this aubstance. It is genorally exported in cakes of about 25 lbs, weight each. It is also manafactured in this country, by means of the refuse of cider, ete. The goodness of verdigris is judged of from the deepness and brightness of its color, ita drynees, and ita forming, when rubbed on the hand with a Ilttle water or anllva, amooth pante, free from grittiness. -Thomsox's Chemistry; Kerg' Cyclopodia.

None of this was re-exported, so that the whole may bo set down for home consumption.

Verjuice (Ger. Agrest; Fr. Verjus ; It. Agresto; Sp. Agraz), a klad of harsh, austere vinegar, made of the expressel julee of the wild apple, or crab. The French give this namo to unripo grupes, and to the sour liquer obtalned from them.

Vermioell (Ger, Nuleln; Dı, Meelneepen, Proppen; Fr. Vermicelli; It. Vermicelli, Tayliolini; Sp. Aletrias), a specles of wheaten paste formed Into long, slender, hollow tubes, or threads, used among us in soups, broths, etc.-See Macanoni.

Vermilion. See Cinnabari.
Vermont, one of the United States of America, lics between lat. $42^{\circ} 44^{\prime}$ and $45^{\circ} 00^{\prime} 30^{\prime \prime} \mathrm{N}$., and long. $73^{\circ}$ $20^{\prime}$ W., and contalns an aren of 8000 square miles. Population in 1740, 85,589; in 1800, 154,465; In 1810, 217,805 ; in $1820,235,764$; in $1840,291,948$; and in 1850, 313,611.

Physical F'eatures, ctc.-This State presents a rery considerable variety of surface. It is traversed from north to south by the Green Mountain range, some summits of which rise to a height of 4279 feet above the sea. About the centre of the State they divide into two ridges, the principal of which passes in a north-northeast direction into Canada. Tho Green Mountains are from ten to ffiteen miles wido, much intersected by valleys abounding with aprings and brooks, and are mostly covered with evergreens to their summits, from which they have derived their name. The rivers are inconsiderable; most of those flowing enst are merely small tributaries of the Connecticut; those on the weat alde are larger; and the three principal, viz.,

Lamoille, Missisque, and Winooski, rise ou the sast side of the 1 duclpal nountalir range, which they break through and enter Lake Champlain.

Lake Ciamoloin, a considerable body of water between the States of New York and Vermont, and penetrating for a few millea into Canada. It in 140 miles In length, and from 1 to 10 in breadth, lying nearly north and south; and contains a great number of small islands, noat of which belong to Vermont. The Chanplain Canal, 68 miles in length, connects it with the Ifudnon, and large steamboats and vessols of 100 tome navigate the Jake from ond to end. The seenery along Ita shores la highly pleturesque, and Its watera abound In salmon, salmon-trout, sturgeon, and other flah. Lake Champlain Is navigablo for large veasela, and has aeveral good harbors on the Verment side. It is of tie greateat importance to ${ }^{\text {armont }}$ by giving her facllitles for internal commerce. From the shape of the lake It glves the large amount of conat line and length of navigatlon, and makes up for the deficiency of navigalile rivers. The American commerce of Lake Champlain in 1856 was over 20,000 tons. The climate varies accordling to differences of lovel and other circumatances. It is healthy, although tho winters are severe. The soll Is fertle, but more suitable for pasturage than tillinge. Wool is the staple production; sheep, horses, and cattle aro raised in great numbers; marble, granite, and alnte are abundant, and valuable quarries of each are worked; Jeon ore abounds in several localities throughout the State, and from the sulphuret of iron, In Stratferit and Shrewebury, cepperas is extenslvely manufacturel. Sevoral mineral springs occur.

There wers in this State in $1800,2,601,409$ acres of land improved, and $\$ 1,524,413$ of unimproved in farms ; caeh value of farms, $\$ 68,307,227$, and the value of implements nad machinery, $92,789,282$. Lire Stock.Horses, 01,057; asses and mules, 218; milleh cows, 140,128 ; working oxen, 48,577 ; ot her cattle, 154,143 ; sheep, $1,014,122$; swine, 66,296 ; value of live stock. \$12,043,228.

Agricultural Products, etc.-Wheat, 535,955 bushels; rye, 176,233; Indiun corn, 2,032,890; oats, 2,307,734; barley, 42,150; buck wheat, 209,819; peas and beans, 104,640 ; potatoes, $4,951,014$; value of products of the orchard, $\$ 315,255$; prolluce of market gardens, 818,853 ; pounds of butter made, $12,137,980$; of cheese, $8,720,834$; maple-sugar, $6,349,557$; molasses, 5997 gallons; beeswax and boney, 249,422 lbs.; wool, pounds producel, 3,400,717 ; flax, 20,852; allk cocoons, 268 ; hops, 288,023; tons of hay, 866,153 ; clover seeds, 760 hushels; other grass sceds, 14,936; flaxseed, 030 bushels; and were made 659 gallons of wine. Value of home-made mannfactures, $\$ 267,710$; of slaughtered animals, $\$ 1,861,386$.

Manufactures, etc.-There were in the State in 1850, 11 cotton fuctorles, with a capital Invested of $\$ 197,500$, employing 123 males and 207 females, producing sheetings, etc., valued at 280,300; 96 wooleu factorles, with a capital of $\$ 1,015,175$, employing 800 males and 812 females, manufacturing $3,180,400$ yards of cloth, valued at $\$ 1,820,769$; three establishments making pig-iron, with a capital of $\$ 88,000$, employing 133 persons, producing pig-iron, etc., valued at $\$ 80,000 ; 26$ cetablishments, with a capital of $\$ 200,720$, employing 381 persous, and making 5000 tons of castings, etc., valued at $\$ 460,831 ; 8$ establishments, with a capital of $\$ 62,700$, employing 57 persens, manufacturing 2045 tons of wrought iron, valued at $\$ 168,986$; 83 flouring and grist mills; 321 saw-mills ; 156 tanneriea, with a capital of $\$ 411,150$, employing 897 persons, valued at $\$ 587,466$; 80 priuting-offices; 2 daily, 1 semi-weekly, 81 weekly; and 2 monthly publicatiens. There were on the 1st January, 1856,8 railroade, with 516 miles of road finsished and in operation. Capital employed in manufactures, $\$ 5,001,877$; value of manufactured articles, $\$ 8,570,920$. The principal places in the State are Montpelier, the capital, Burlington, Middlebury, Brattleboro, Norwich, St. Allians, and Castleton.

Burlington, Vermont, is the principal port of the State. Ita commerce hy Lake Ciamplain, on a bay of which the town is built, is important, and its connections by rai'road and steambont afford il every Pacility in its prosecution. The harbor of Burjington ts the beat on the lake, and more vessels nariguting tine lake are owned here than at any other place. It is ensy of access from the north and sonth, and to protect It from the west winds a breakwater 900 feet long was erected. Juniper Island is distant four milies from the wharf, and contains eleven acres of ground. A lighthouse was erected on this island in 1826; it is in the form of s truncated cone, thirty feet highi, eightern fect in dlameter at the base, and lwelve at the top, and is kept lighted at night during the season of navigation, from the middie of April to the ist of December. llurlington bas an extenaive and fertile back country, and the mercantile business of the place amounta to about 41,000,000 annually. Tonnage in 1853,6875 ; in 1856 ic was 7448 tons.

Vensels. See articlea Smin nud Tonsugr.
Victoria (formerly called Australia Felix nnd Port Philip), a British colonial territory, comprising all the part of Australis south of the rivers Mfurrumbigee and Murray, between tat. $34^{\circ}$ and $39^{\circ} \mathrm{S}$., and long. $141^{\circ}$ and $150^{\circ}$ E., having on the northeast New Sonth Wales, on the west the coleng of South Australla, and on the soutio the occan and Hass's Strait, separating it from Tasmania. Area, 98,000 square miles. Population in 1851, 75,315, of which 46,202 were malea, and 31,143 females ; in $1855,300,000$, and of these it is estinated that 5000 are aborigines. The territory derived its former name from the fine bay of Port Phillip, near the centre of its coast line; besides which, here are the inlets iVestern Port. Corver Injet, Lake Klng, Port Feiry, and I'ortiand Bay, most of which afford good anchorage, nul are the seuth of in-
cipient towns. Surface mostly undulating or level, separated into different river basins by hill chains. Temperature at Port Philip ranges from $32^{\circ}$ to $!10^{\circ}$ in $t$ ''e ycar, and may average about $61^{\circ}$ Fahr. Soil more fertile generaliy than in New Sunth Vales, though around the borders are extensive tracts of barren Inul. for about 50 miles from the const the country is aimost overy where of high fertility; there is also much gooi land on the tanks of tite Ilume and llovell; and nithough filtherto the corn raised has been Inadequate for houe consumption, and n supply haa been imported frotis Tasmania, thin colony bills fair to become ethriving agricultural region. Sheep and cattle rearing are, however, the principal occupationa of the popuiation, and in 1851 the live stock in the province emennted to 5,$000 ; 000$ sheep, 16,500 horses, and 340,000 hormed eattle. In the same yenr, 100 acres were pianted wilh vines, and 130 gallons of wine were made, chiefly neaGeelong. Wheat, oats, barley, potatoes, salt from the lakes, pumice-stone, lava, and other volcanic products ainndant in the western platns, nre other chief articles of produce. Seme veina of coal, ar $d$ ores of eopper, lead, and manganese, have been met with near the const; hut few, if any, mines are at present wrought. The principal towns are Nelbourne and Geelong. The coleny was formeriy cailed Austrnlia Felix, and was attached to New South Wales. It was formed into $n$ distinct colony in 1850, under the name of the l'ruvince of Vieloria. It was first settled by the IIritish ahout $18: 31$.

The commercial relations of the Visited States with ihe British possessions in Australia, Now Zealand, and the Caie of Good Hope, are regulated by the orders of the lucal governments, whition the limits preseribed to their authorly by the legislatlon of the Imperial Parilament. 'itie repeal of the British navigation laws atulished all the restrictions uipon foreign commerce, which tefore that period secured to tho lifish merchant the
mono. lly of supplying the markets of these dlatant colonica, The trude ls now open to all flaga, and the vecsels of every nation having conimercial treaties with the mother country can freely and upon equal terms entur in thie race of commerclal competition. Co-operating with thle llberal poliey of the mother coantry, the discovery of gold in some of the Australlan possessions in 1851 contrlinted largely to infuse new commercial life and vigor luto that distapt part of the glabe. Some eatlmata may be formed as to the oxtent of the wonderful advance of these coloniea in commarclal and colonial greatness, the increase of their impoits and exports, and the aupmentation of thelr resources generally, by glancing over tho subjolned atatisties.

In 1843 the value of tha imports of the colony of Victoria was $\$ 1,229,810$; that of their exports, $\$ 1,639,830$. Of this latter suin wool covered nearly $\$ 1,000,000$, all of which was shipped to Great Britain. Value of imsorts in 18.17, $2,188,480$; of whleh $\$ 1,592,120$ wero from Great Britain. Value of oxports in $1847, \$ 3,342,555$; of which wool covered $\$ 2,820,02 i$, dlstributing the balance ( $\% 518,680$ ) bet weon the articlesof beef, pork, horses, horned cattle, and tallow. Number of vessels in 1817, 42:1, with a tomage of $\mathbf{4 7 , 8 8 5}$.

The following tuliles will exhiblt the trade of the colony of Victoria from 1851 to the end of the first lialf of 185 x :

| In the year 1851 | Importa. <br> $\$ 4,329,140$ | $4.1$ |
| :---: | :---: | :---: |
| 18.9 | 17.6:4,425 | 85,685, 375 |
| 150 | 70.473,23\% | 45,412,87) |
| In the half year | 44,780,840 | 24,50\%,400 |

Amount of flour from the United $S^{+}$ntes Importid in 1853, 15,036 tons; and more than one half of the wholo quantity Imported. Amount Imported from the United states in the half year of 185:, 3720 tons ; or more than one-third of all limported.

The total exports from the Uulted States to Australia for tho year entiling June 30, 1857, were as followa:

| Boards | \$214,892 | Tobacs | \$235,128 |
| :---: | :---: | :---: | :---: |
| Manufur, of Wool . | 25t,219 | Heous and ahoca. . | 140,405 |

| Flour | 803,070 | Tetal. | 3,254,1 |

 Jandauy, 185\%, to Siftemure, 1804.

From New York.

Four imesican brigs made the passage ln 90 days, and one sehooner in 91 days. These vessels were laden with tlour, provlslons, lumber, and general cargo. When the market is not overstockod, as was the case in 1853, American flour of the best quality (and none clse need be exported) brlugs from 81560 to $\$ 1680$ per barrel. Twelve dollars can be laid as the tixed market prico for tirat quality flour, at least unth the Australinus pay more attention to agricultural parsuits, which will hardly be the case so loug as they can thd golit nugfits weighing 981 lbs , each. American provisions, lianss, bacon, butter, cheess, beef, perk, preserves, farnlture, wooden housen, earriages, wagons, boots, etc., are much aought for In the markets of Victorla, aid always command remuneratlve prices. The facllitles for discharging and dispatehing ships have greatly inereased within the past year. Hefore that [eriod, 90 days was consklered good dispatch; now from 12 to 30 days is the time; and, Indeed, 30 days is consitered unwarrantably long.

It may be lnteresting, and not altogether inappropri-
ate, to notlee in this place the astonishing production of gold in thls colony, compared with the aggregate ininIng operations In other parts of the world, especlally In Cullfornis. The gold diggings in Vletorla extend from long. $142^{\circ} 85^{\prime}$ to $147^{\circ} 30^{\prime}$, and from lat. $88^{\circ} 20^{\prime}$ to $87^{\circ} 40^{\prime}$, over districts embracing more than 300,600 square miles, or more than hali the aras of the colony. Victosia Gold.

Vikings, or Bea Kinga, aniong tho Danes or Normans leaders of piratical squadrons, who passed thelr llres in roving the seas in search of spoil and adventures. The younger sons of the Scandinavian kliggs or garls, lanving no inheritance but the ocean, naturally eollected around their atandards the youth of inferlor order, who were equally destltate with themselves. These were the same who in England and Seotland, under the aume of Danes, sud on the continent under that of Normams, at first desulated the maritime coasts, and afterwarl penetrated into the interior of countries, und formed permanent aettlements in their conquests.

Vine. The vine was known to Noah. A colony of vhe-dressers from Phocen, In Ionin, settled at Marseilles, and instructed the South Ganls in tillage, vinedressing, and commerce, ahout 600 b.c. Somo think the vines aro aborlgines of Lauguedoc, Provence, and Sicily, and that they grew spontaneously on tha Mediterranean shores of Italy, Frauce, and Spain. The vine wea carried into Chmmpagne, and part of Germany, A.d. 279. The vine and sugar-cane were flant. ed in Madeira in 1420. It was planted in England in 1552 ; and in the gardens of IIampton-court palace is sn old and eclebrated vine said to surpass any known vlue in Europe.-See Gbaifes and Wine. The fullowing is a tradition in relation to the vine: "When Adsm planted the first vine and left it, Satan approached it, and said, 'Lovely plant! I will cherish thee;' nad thereupon taklug three animals, a lamb, $n$ lion, and a hog, lie slayed them at the root of the tree, and their Meod lass been imbibed liy the fruit to this day. Thus, if you take one gollet of wine, you are cheered by its indluence, yet are mikl and docile as the lamb; if you take two goblets, you become furions, and ravo and belle, liko the llon; nut If you driuk of the third golslet, your reason sinks, ned, like the log, you wallow in the mire."-Asirk. See Wine.

Vinegar (Grr. Fissig; Du. Azyn; Fr. linaigre; lt. Accto; Sp. nud lort. l'inage; Russ. Uhzus; Lat. Acem tum).-See Acid (Ateric), for a description of vinegar. Vincgar was known nesrly ns eoon as wine. The ancients had several kinds of vinegar which they used for trink. The Roman soldiers were aceustomed to take it int thelr marthes. Tho Bible represents Boaz, n rich citizen of Ifethlehem, as providing vinegar for hls reapers, into which they might dip their bread, and kindil: luviting leath to sliare whth them in their repast : hence we may Infer that the harvesters at that period partook of this liquid for their refreshment-a eustom still prevalent In Spain and Italy. It is conjectured that the vinegar which the Roman soldiers oflered to nur Saviour at hils erucifixion was that whileh thoy used for their own drinking. There was, however, a kind of potent vinegar which was net proper for drinking till diluted.

Fixfohts of Vinkeat paom the Unitgd Stata yoe taz Year knding Jung 80, 1857.

There were no Imports of vinegar into the United States for the year 1857.
Viol and Violin. As the lyre of the Greeks was the harp of the moderns, so the viol and viella of the Midde Ages became the molern violin. The vlol was of various sizes formerly, as it is nt present, and was anciently very much in use for chamber airs and songs. That of three strings was introduced Into liurope by the jugglers of the 13th century, $\Delta$ he violin was Invented toward the close of the same century.-Ansé Lencleft. Tha fildle, however, is mentioned as early as A.m. 1200 , in the legendary lifs of St. Christepher. it was introduced linto England, aeme say, by Charles II. ill 1684 .

Virginia, one of the United States of America, lies bet ween lat. $36^{\circ} 33^{\prime}$ and $110^{\circ} 43^{\prime}$ N., and between long. $75^{\circ} 25^{\prime}$ and $83^{\circ} 40^{\prime} \mathrm{W}$. It is 370 miles long, and 200 miles broad at its rreatest breadth, contalning 61,852 squsra miles. Population In $1790,747,610$; in 1800 , 886,$149 ; \ln 1810,074,622$; in 1820, 1,065,366; In 1830, $1,211,272$; In 1840, 1,23., 797 ; and in 1850, 1,421,661.

Early Ilistory.-The coast of the country which we now name Virginia is aaid to have leen known to thin old Northmen. One of them, Gudleif Gudlaugsen, is said to have sailed in the year 1028 so far to the sonth. Ito is supposed to have called the conntry /luitiomonmolend, the land of the Whitemen, which may be considered the oldest and first name under which these reglons became ever knawn to the Enropeans.

The Spaniaris, sinca 1520 , ineluted the land under the names of Terra do Ayllon and Floridn, and the French, slince 156:s, under the name of Nourelle France. The English Inventel the namo Virginia at firat (1583) for the country lying round l'anlico and Albemarle Sound. They composed this name, it is snid, for two reasons: first, because It was tiscovered in the relfy of their Virgin Queen, lilizabeth; and, s scondly, " because the country seemed still to retain tha virgin purity and plenty of the first creation, and the people there the primitive hnocence."

They extended this name at once ovar a great part of the east coast, anil particularly over tho vleinity of Cherapeako llay, which was already discovered from the loanoko settlements, and which wo sue incluted under the name of Virginia on the first map of Virshluls, 1590.

When, since 1606, the Chesnpenke Hay was better explored and settlod, and when lt became the principal centre of the English settlements on the east const, this reglon was, par excellence, ealled Virginla, sometimes Nsw Virginia, while the former settlements anl conntry round Albemarle Somnd, then forsaken, were sometimes (for instance, on s map of Coptain J. Smith) call.
ed Ould Virginla. This was, hownver, more a popular manner of denominatlon. The officlal or legal name of the country was, in the year 1606, by King James I. thus confinad: He called Virginls, or the VIrginlan territory or coast, the whole east coast of North Amerlca, from the thirty-fourth to the forty-fifth degreo of north latitude. Thls whole territory was dlvided by the royal patent into two parts, a northern and a southern. Tha southern commenced In the south at $34^{\circ}$ north latitude, and ended In the morth at about $40^{\circ}$ north latitude. It was called the First Colony, or the Southern Settlements in VIrglnia, of Virginia proper.

When Captain J. Smith and Prince Charles Invented and Introduced (1616) for Northern Virginia the new name of New Enghand, the appellation Southern VirgInia disappeared, and was changed to Virginia.

By the separation of the territories of Maryland (1632), of Carolana (1629), and of Carolina (1668), the name and province of Virginia lest a great deal of their former extension, and recelved at last thelr present linilts, between $88^{\circ}$ and $864^{\circ}$ north latitule, so far as ont coast is concerned. The changes of the boundaries toward the interlor regions have no interest here for иa.-КонL.

Physical Features, etc.-As regnrds surface and soil, this Stato may be divided into four sections. The eastern includes a tract of about 100 to 120 miles in width, and is generally low and level, and in some places marsliy. It has a light sandy soil, mostly covered with pines. West of the line of the head of tilewater the country becomea undulatling and hilly, until it attains one continuous mountain elevation known as the Bluo Rlilge, crossing the eutlre width of the State. The alluvial lands in this tract are for the most part very fertile, those of James River especially being unuswally productiva. Thin third aection includes the valloy between the Blue Ridgo and the Alleghany Mountains. This tract, though in parts liroken by mountains, is generally the mest fertilo and healthy part of the State. The fourth section includes the country between tho Alleghany chnin and the Ohio. This portion, though in many places wild and broken, has a great deal of fine fertile land, and rast deposits of coal, irou, sait, etc. Gold is found in Fluvama and Buckinglame counties aul vicinity; and many valuable $n$ lueral springs exist.

There were in this State in 1850, 10,360,185 acres of land improved; and 15,792,176 unimproved land in farms; cash value of farms, $\$ 216,401,513$; and the value of implements and machinery, $97,0 \pm 1,7 \pi 2$. Live Stork,-llorses, 272,403; asses and mules, 21,483; milch cows, $31 \overline{7}, 619$; working oxen, 89,613 ; other cattle, ti69,137 ; sheep, $1,310,001$; swine, $1,829,843$. Value of tive stock, $\$ 33,656,659$.

Agricultural Products, etc.-Whent, 11,212,616 bushels; rye, 458,920 ; Inlinn corn, $35,224,314$; oats, $10,179,143$; barloy, 25,437 ; buckwheat, 214,808; peas and beans, 521,579 ; potntoes, $1,316,933$; swect potatoes, $1,813,634$; rice, $17,15 \mathrm{l} \mathrm{lbs}$. ; value of products of the orchard, 1777,137 ; produce of market gardens, \$183,017 ; pounds of hutter male, $11,089,359$; of cheese, H40, 292 ; maplesugar, $1,227,665 \mathrm{lis}$; molnsses, 40,322
 llos. rroduced; cotton, $894 ;$; flax, $1,000,450$; silk cocoons, 517; haps, 11,506 lbs.; tobacco, beb,803,227; hay, 369,098 tons; lemp, 88 tons : clover seeds, $2!, 727$ hushels; other grass seeds, 63,428 ; flax-seed, 52,318 bushels; and were mate, $5 \cdot 08$ gallons of wine; value of home-mnde manufactures, $\$ 2,15 i, 312$; of slauglitered nuimals, ® $_{7} 7,502,986$.
livers, ctc.-The Dotomnc lilver separates Virginia from Maryland. James ltiver is the largent which belongs to this State. It is 500 miles In length, and flows from the mountains in the laterior behind the Blue lidige, through which it passes. It is navigalile for sloons 120 miles, and for hoats much further, and
flows into Chesapeake Bay. The Appomatox is 130 |ued at $\$ 690,802$. Total carital inveated in manufacmiles long, and eatera James River 100 miles above Hampton Roads, and is navigablo 12 niles to Petoraburg. Tie Rappahannock, 130 miles long, and navigable 110 miles fur sluopa, risea in the Blue Ridge, and fows into the Ciesapeake. Yorl: liver enters the Cheaspeake 30 miles below the Rappahannock, and ia navigable 40 miles for sii.ps. Tho shonandoah enters the Iotomac juat hefore 'ta paasage through the Blue lildge. Of the rivere weat of the mountaina, the Great Kanawha riacs in North Carolina, jassea tirough this State and enters the Ohio. The Littie Kanawha also flows into the Ohio. The Monongahola rises in thia State, though it rune chiefly ir Pennsylvania. The lower part of Chesaf aiks $\mathrm{E}_{\mathrm{y}}$ "wholly in this State, is 15 miles wide at its mon't. ad entors the Atiantic

Manufactures, etc.-There were in the State in 1850, 24 cotton factorioa, with a capital invested of $\$ 1,893,200$, employing 1148 males and 1578 females, producing articles valued at $\$ 1,438,109 ; 41$ woolen factories, witin a capital of $\$ 324,700$, manufacturing wooien gooda vai-
tures, $\$ 18,108,793$. Value of manufactured articles, \$20,000,000. There were in Januury, 1856, 21 rail. roadd, with 1295 miles of railroad finishocl and in operation, and 1180 in courae of conatruction.
Principal Ports.-Alexandria, 100 miles from the Chesapeake Bay, lat. $38^{\circ} 48^{\prime}$ N., loug. $0^{\circ} 3^{\prime}$ W. frons Washington. It is finely situated on the right hank of the Potomac, which has a depth of water hero sufticient for vessels of the largest class, be:::- about 24 feot at tho wharves, and 40 feet in tho channel. The tonnage in 1856 was 7221 tons. Norfolk, situated on tho Elizabeth River, eight milea from Hampton Roada, Chesapeake Bay, in lat. $37^{\circ} 12^{\prime}$ N., and long. $76^{\circ} 4^{\prime \prime}$ W. Ita harbor is capacioua and deep, easy of access, and safe in all weathers. The Roals are formed by an enlargement of James River at ita mouth, in Chesapeake Bay, and they offer an anchorage unsurpassed in the world. On the opposito side of the river is Portsmouth, in connection with whlch it is the chief naval station of the Union. The tonnage of Norfolk in 1856 was 27,757 tona.

Foagion Commerole of the State of Virginta, from Ootober 1, 1820, to July 1, 1857, showino also the Dibtriot Tonnalatin 182t, 1831, 1841, and isti.

erly so calleci, was ly order of Necho, pharoalh of Egypt, when sune Phenician pilots sailed from Eegypt down tho Arabic Gulf, round what is now called the Cape of Good Ilope, enterod the Mediterrancan hy tho Sitraits of Gibraltar, eoasted along the norll of Afrtca, and at length arrived in Egypt, aftor a mavigation of about three years, $604 \mathrm{n} . \mathrm{c} .-\mathrm{Mh}$ aine, IIknodorcs. The first voyage round the world was made by $n$ shitp, part of a Spanish aquadron whith had been under the conmand of Magellan (who was killod at the Philippine Islands in a skirmish) in 1519-20. The ern of voyages of dlscovery wns the end of tha $18 . .1$ century.-See Commence, llistory of; Pacipic Ocean, etc.

Wagee. The wages of anndry workmen in En gland were first fixed ly act of Parifament, 25 Edward III., 1850. Hay-makora had but one penny a day. Master carpentera, masona, tilerp, and other covesers of houses, had not more than 8d. per day (about 9 d. of the present currency, aterling), and their sarvants $11 d$. -Visar's Slatutes. By the 28 d Heary VI., 1444, the wages of a baillf of husbendry was 23 s , 4 d , per annum, and clothing of the price of bs., with meat and drink; chief hind, carter, or shopbend, 200 . ; clething, $48 .:$ comulon servant of husbandry, $163 . ;$ clothing, $40 d^{2}$ : womanservant, 100 .; ciothing, 4f. . By the 11th Henry VII., 1495, there was a like rate of wages, only with a litcle advance ; as, for inotance, a free mason, master carpenter, rough maeon, brioklayer, master tiier, plumbor, glazier, carver, or joiner, was allowed from Enater to Michaeimas to take 6d. a day, without meat and drink; or with meat and drink, $4 d$; ; from Michaolmas to Easter, to abate Id. A master having under him oix men was allowed 1d. a day extra. The following were the wages of harvest-men in England at different periods:

Walke, the trick of a ship which ahe leaves in the wator. A vessel directly astern of anothor in sald to be in her wake.

Wales, a peninsular portion of South Britain, on Its weat slde, between lai. $7^{\circ} 23^{\prime}$ and $53^{\circ} 26^{\prime}$ N., and lol.g. $2^{\circ}$ i1 $1^{\prime}$ and $5^{\circ} 17^{\prime} W$., having on the east the Engliss countiea of Chester, Salop, Hereford, and Monmouth, and on other sides the Bristol and St. George's channela and the Irish Sea.

Agricuiture is extremely backward. Bariey and oats are the chief gruin raised ; the culture of potatoen and turnips is extending. Farme mostiy small, averaging in South Wales oniy from 50 to 60 acres, where, however, the tenaniry are far better lodged than in the north. "arge nambers of cattle are reared for the English mat nets. The number of sheep in estimated at $1,2^{\prime}, 000$, and the ammarl prodnce of wool at 10,000 packs. A hardy tuall bersed of ponies is reared, especiaily in the countles of Montgomery and Merioneth. The inining interest is highly liaportant. Iron, copper, lead, sliver, olate, lineestone, and in the aouth large quantitien of coal are saised, which last product is extensivoly exported, and uned is. large quantities on the spot for smeiting both Britsh sad foroign ores. In 1840 South Weles had 132 farsaces in operation, consuming annually about $1,436,000$ tons of coal, and producing 505,000 tons of iron; and North Walea 12 furnaces, consuming 110,000 tons of coal, nad producing 26,500 tonn of iron. The princlpal tron-works are at and around Merthyr-Tydvil, Tredegar, Abendare, and Bhuabon; at Swansea large quaititizs of American and other copper ores are reduced. Manufacturea of woolen fabrica, especially of flanoei and hosiery, are very generally pursued in the cottages of the peasantry, particularly in North Wales, where Welshpool is the chief mart for these products. The cotton manufacture has extended into some of the northern counties; and in 1847, 1860 hands were employed in woolen, cotton, and silk factorios. A manufactory of alate articles exists at Bangor. Trade principaliy in the export of mineral prodace, cattie, and woolen grods. Principal ports, Swansea, Newport, Cardiff, Caernarvon, and lleanmaris ; besides which Holyhead is a chief parkat station fur communication with Ireland, and Misford is a naval pori, and the seat of a government dock-yard. -See artieles Evglayu and Gheat Daitain.

Walnute, the frait of the Juglame, or walnuthtree, of which these are aoveral varioties. The walnut is a large, handeome tree, with atroug apreating branches. The frult is a pratty, large, amooth, ovate nut, containling an oily kernel divided into four lobes. .The nut has been always held in high estimation; it was called by the Romane Jovis glane, the acorn or mast of Jove, and hence the name of the tree.
The walnut-tree is indigenous to Peraia and the countries bordering on the Caspisn Soa. Previousiy to the very general introduction of mahogany, the wood of the walnut-tree was generally, and is jet ov. tensively used in making of furniture. . It is much used by turners, and is superior to overy other sort of wood for the mounting of guns. Great numbers of wal-nat-trees are annually coneumed in the Hauto Vienne and other departments of France, in the manufacture of the wooden shoes or clogs used by the peanantry. The zuts are elther gathered when ripe, being seryed up at deaserts without any preparation, or they are plucked green and pickled.-Poiret, Histoire Philosophique des Piances, tome vil. ; ReEs' Cyclopedia, ete.

Wampum (from Wampi or Wompi, eignifying, in the Massachusette Indian language, white, the color of the ahelis most frequent in wampum belte), ahells, or atringe of ahells, used by the American Indiana as money. These, when knited, form a broad belt, which is worn as an ornament or girdle. It in sometimes called wampumpague, or sannpeague, or vampampeague, of which rampum seems to be a contraction.

Wanghees, sometimes called Japan canes, a apecies of cane imported from China. ., They ahould bo chosen pilable, tough, round, and taper; tho knots at regular distances from each other, and the heavier the better. Such as are dark-colored, hadly glazed, and light, shouid be rejected.-Mraurn's Orient. Com. see article Caxe.
Warehousing Bymtem. By this aystem is meant the provisiona made for ledging importel articles in public warehouaes at a reasonable rent, without payment of the duties on importation tili they be withdrawn for homo conaumption. If ro-exported, no duty is claimed.
Expediency and Origin of the Warehousing System It ia laid down by Dr. Smith, in one of hia justly celebrated maxime on the subject of taxatlon, that "every tax onght to he levied at the time and in the manner that if most likely to be convenient for the contributor to pas It."-Wealth of Nations. No one can doubt the soundness of this maxim; and yet it was very strangely neglected, down to 1803, in the management of the castoma. Previousily to this period, the duties on most goods insported had either to be paid at the moment of their importation, or a bond, with sufficient security for their future payment, had to he given to the revenue officers. The hardship and inconvenienee of such a ajatem is obvious. It was often very difficult to find aureties; and the merchant, in orier to raise funda to pay the duties, was frequent!y reduced to the ruinuns necessity of selling his goods limmedlately on their arrivai, when, periaps, the market was airendy glutted. Neither was this the only Inceuvenience that grew out of this aysten ; for the duties huving to be paid ali at once, and not by degrees as the goods were sold for consumptlinn, their price was ruised by the amount of the proft on the capital advanced in payment of the duties; competition, too, was dininished in consequence of the grenter command of funds roquired to carry on trade under such disadvantages; and a few rich individuals were enabled to monopulize the importation of thone commodities I which beavy di: :ien were puyable. The aystem had, besides, an obvions tendoncs to disconrage the carrying trade. It prevented this country from becoming the entrepôt for
foreign produots, by hindering the importation of auch as were not immediately wanted for home consumption; and thus tended to lessen the resort of foreigners to our markets, inasmach as it rendered it difficult, or rather impossible, for them to complete an asaorted cargo. And in addition to all theae cireumstancea, the difficulty of granting a really equivalent drawback to the exporters of auch commodities as had paid duty, opensed a door for the commission of every species of fraud.
Warehousea, in which nnclaimed and honded merchandise shall be stored, will hereafter be knewn and designated aa followa:

1at. Stores owned by the United States, or hired by them, prior to the date of these instrustions, the leases of which have not yet expired or been canceled. All unclaimed gooda must be atored in these stores when there are auch at the port available for the purpose; and they are also to be need for the storage of other foreign merchandise, as hereinafter provided. All the labor in these stores shall be parformed under the superintendence of the offlcer in charge, at the expense of the owner or importer of the merchandise; and all charges for storage, labor, and other expenses accruing on the goods, shall not exceed the regular rates for auch objecta at the port.

Stores of this description will be known and designated as Clasa 1.

2d. Stores in the posassion of an importer and in his eole occupancy, which he may desire to place nnder the customs lock, in addition to his own lock (asid locks to be of a different character), for the purpoee of storing dutiable merchandise imported by himself only.

The entire store shall be appropriated to this solo purpose, under the regulations hereinafter provided; and for the time of the customs officer necessarily required in attendance at such atere, the proprietor shall pay monthly to the collector of tie port a sum equivalent to the pay of such officer. All the labor on goc ds so stored must be performed ly the importer at his own expense, under the supervision of the officer $\ln$ charge. Before any importer shall be permitted to ase his own store for auch purpose, he shall enter into a bond in such sum and with such securities as may be approved by the collector and this Department.

Storos of this description will be known and designated as Class 2.
3d. Storea in the ocoupancy of persons desiring to cugage in the business of atoring dutiablo merchandise under the warehouse aets, and of performing the labor on auch goods, in what is nsually termed the atorage businesa. The lahor performed on the goods in stores of this class shall be under the control and expense of the owner or occupant; and the atore shall be subject to such further rules as this Department may deem neceasary, from time to time, for the safekeeping of the goods and protection of the revenue, and to be discoutinued aa a bonded warehoueo when the publis interest may require. All arrangements as regards the rates of atorege and the price of labor in these stores must be made between the importer and the owner or occupant of the store, and all amounta duo for storage and lahor must be collected by the latter, the colioctor looking only to the aafe custody of the werchandise for the security of the revenne.

Before any person shall be permitted to open a storo of this description, he shall enter into bond in auch sum and with such securitles as may be approved by the collector and this Department.

Unclaimed and soized goods may he stored in this class of stores on the order of the collector; and the proprietor or occupant shall look to the goods for the storage and charges, at the nanal and customary rates, and chall be liable for the safe-keeping of the merchandise as for other storage. The collector ahall give no permit to withdraw such goods withont payment of the legal duties and charges ; and, if sold, shall cause the
storage and charges to be paid ont of the proceeds of the sale.

Stores of this description will be known and desigpated as Class 8 .

These atores ahall be placed in charge of an officer of the customa, nuder the separate and different locks, of the custom-house, and the owner or occupant acting as agent for the importers warehousing their merchandiae in auch storea. Should the amount of baslneas at any oue atore require, in the judgment of the collector, the aervices of more then one officer, the owner or occupant ahall be required to pay monthly anch additional sum aa will be equivalent to the aslary of auch officer or officers.

4th. For the atorage of wood, coal, mahogany, dyewooda, lumber, molasese, sugar in hogeheads and tierces, railroad, pig, and bar iron, anchors, chain cables, and othar articles specially authorized, yards or sheda of suitable construction may be used, to be honded in the manner herein before prescribed. These yards must he inclosed by anhatantial fences not less than twelve feet in height, with gates provided with suitable bars and other fastenings, $s 0$ as to admit of being aecured by customs locks, and must be used excluaively for the slorage of the above-named merchandise, duly entered for warehonslug by the owner or occupant, or for the purpose of general storage of warehoused gooda; the purpose to he set forth in the application, and the bond to be taken accordingly, as in case of warehouses of the second and third classes. The sheds must bo subatantially constructed, with or withont flooring or roofing, as this Department and the collector may require ; and, when required, the roof or exterior shall he covered with slate or metal. The doors and other openings must be provided with auitable fastenings, and be secured by the different and separate locks of the occupant and the cuatoms; and the occupant shall provide a proper room for the use of the officer in charge. Collectors of the cuatoms may order unclature and scized merchandise of the deecription anthorized (when duly eatered), to be deposited in sheds or yards, to be placed in such sheds or yards under the sime regulations and conditlons as are provided for the deposit of unclaimed or selzed gooda in warehouses of Class No. 3.

Sheds and yards of the foregoing deacription will be designated and known as Claga 4.

The owner or lessee of a store occupled for general husiness purposes may nae the cellar or vault of auch store, under the conditions hereinafter prescrihed, as a bonded warehouse of Class 2, for the storage of wines and distilled apirits only, and exclusively of hia own importation.

The entire cellar or vanit shall be appropristed to this purpose, nad shall have no opening or entrance oxcept the ons from the atreet, on which the aeparate and different locks of the customs and the owner or proprietor of the cellar shall be placed; and a hond shall he entered into by the owner eccording to the foregoing form of stores of Class 2.-For articles on Warehousing and Dock System, see Hust's Mferchanta' Magazine, vii., xiv., xv.; De Bow's Rev., l.; Niles's Register, xxxv., xxxvi.

Werp, in weaving, the longitudinal threade of a woven fahric; they are crossed by the transverse threads, or woof. Warp, a rope or hawser employed occasionally to remove a ship from one place to another in a port, road, or river. Hence to uarp is to change the position of a ship by pulling her from one part of a harbor, etc., to some other, by means of warps, which are attached to buoys, to other shipa, to anchore sunk in the bottom, or to certain atstions npon the shors, as poats, rings, trees, etc.

Washington, the capital of the United States of America, ia aituated on the left bank of the Potomac, st ita confluence with the Anacoatia, and at the termination of the Waalangton branch of the Baltimore and

Ohio Railroad. Lat. (of the National Observatory) $88^{\circ}$ $53^{\prime} 39^{\prime \prime} \cdot 3$ N., long. $77^{\circ} 2^{\prime} 48^{\prime \prime} \mathrm{W}$. from Greenwich, Engiand. It ia 295 miles from the ocean by the course of the river, 38 trom Baitimore, and 225 from New York. The popuistion in 1800 was 8210 ; in 1810, 8208 ; in 1820, 13,247; $\ln 1830,18,827 ; \ln 1840,28,864$; In 1850, 45,000 ; and in 1854, 46,000.

The Nary Yard is situated on the "Anacostla," a branch of the Potomac River, at the sonthern termination of Eighth Street, east. It covers an area of about twenty acres, and is inclosed by a subatantial brick wall, having a principal entrance at the foot of Eighth Street, through a handsome arched gateway. The mechanical operations of this establishment are various and extensive, and the akill of the workmen and tho excelience of the materials employed have been antisfactorily tested in every Bea. Anchors of variuus sizes, for the naval service, are mannfactured by the use of two heavy steam-hammers (termed the "Nasmyth Hammer"), one of which weighs 8600 lbs ., the other 2240 lbs. The forges for this roorik are kept in blast by a fan-blower attached to the ateam-engine in the machinist's lepartment. There is also in operation, in the anchor department, a direct action steam-bammer (called the "Kirk IIammer"), in connection with a blast furnace for working up into looms and bars ail the acrap iron of the navy. The massive chain cables are made in another shop, which is provided with a powerful hydrostatic press for testing their atrength. - See articie District of Columata fur comunerce of Washington.

Washington, a territory of the United States of America, lies between lat. $45^{\circ} 25^{\prime}$ N., long. $108^{\circ} 30^{\prime}$ and $124^{3} 30^{\prime} \mathrm{W}$. Area, 113,821 square miles. It is between the Rocky Mountains on the east and the Pacific Ocean on the west, has Oregon on its south border, and the British possessions on the north. The entire popuiation in 1850 was 1201 ; in 1854, estimated at 5000 . It is divided into six counties, viz. : Clirk, Lewis, Pacific, Pierce, Stevens, and Thurston. The country west of the Cascade Range is the only portion yet settled ly a white population; it has a diversified surfuce, and the vaileys bordering the streama have a iuxuriant soil. The streams are small, the Cowiitz and other smali streams entering the Columbia River on the south, the Chickeeies entering Gray 's harbor on the west, and a number of other atreanis entering Puget Sound on tho northwest. Puget Sound, licod's Canal, and Admiraity Indet abound with fine harbors. The Cascade Kange crosses the territory from the south (at the Cascades, on the Columbin River) entirely across it to the north, rising in several peaks alove the snow line, as Mount St. Heiens (an active voicano), Mount Rainier, Mount Boker, etc. East of this range iittle is known of the capabilities of the coantry as an agricultural region, aithough there is no donbt of its being well adapted for stock raising. It is drained by the constituents of the Columbin, cousiuting of Kooskonsky and Pelouse rivers of the Lewis Fork, and Spokane, Okonsgan, Barrier, and Yakima rivers of Clark'i Fork, and Cathilacades enteriag the Coinmbia liver.
The Strait of Juan de Fiuca, including the waters of Admirulty Inlet, liood Canai, and Puget Sound, with tie Arcinipeiago of Arro up to the 49 th paraliel, were ali surveyed by the United States Exploring Expedition. The whole is nnsurpassed by any estuary in the world. They comprise many very fine harbors and safe anciorages, are entirely free from dangers, and cover an area of about 2000 square miles. The conntry by which titese waters are surrounded is remarkabily saiubrious, sud offers every advantage for tho accommodations of a vast conomercial and military matrine, with conveniences for docks, and many sites for towan and cities, at all times well aupplied with water, and capabie of being provided with all needfui aupplies from the surrounring country, whici is well adiapted for agricuiture. This struit is ninety-fivo miles in
length; average, width eleven miles (ontrance eight miles in width); no dangers $e$ ist, and it may be safely navigated throughout. This territory was aeparated from Oregon in the year 1858, and conatituted a separate territory.-HARPER's Gazetteer.

Watohes (Ger: Uhren, Taschenuhren; Fr. Montres; It. Orinofi da tasca, o da saccoccia; Sp. Relojes de faltriquera; Russ. Karmonnie eschasu), portabie machines, generally of a amall size, and round, flat shapo, that messure and indicate the successive portions of time, having for the most part their motions reguiated liy a splral apring. When constructed on the most approved principles, and executed in the lest manner, a watch is not only an exceedingly useful, but a most adinirabie piece of mechanlam. It has exercised the genius and invention of the ciost skilliul mechaulcs, as well an of some of the ablest mathemuticians; for nearly three centuries. And, considering the amailness of its size, its capacity of being curried about uninjured in every variety of position, the number and complexity of its movements, and the extraordinary accuracy with which it represents the auccessive p ; tions of time as determined by the rotation of the earth on its axis, we need not wonder at Dr. Paley having referred to it as a atriking specimen of human ingenuity. Spring watches are constructed nearly on the same prineiple as pendulum clocks. Instead of the penduluin in the latter, a spring is used in the former, the isochronism of the vibrations of which corrects the unequal notions of the balance.

Ilistorical Notice.-The invention of apring watches dates from about the middie of the 16 th century, and has been warmly contested for Haygens- and Hooke. The English writere genernlly incline in favor of the latter. Dr. Hutton says (Mathematical Dictiorury, art. Warcit) that the words "Rol. Hooke inven' $i$, 1658 ," were inscribed on the dial plate of a watch presented to Charles II. in 1675. But Muntuola affitms (IIstoine des Mfathématiques, tome 3i. p. 413, ed. 1803) that iluygens made this "belle ddconverte" in 16056, and presented a spring watch to the states of Holland in 1657. Comparing these statements, it certainiy appears that tho claim of IIuygens to the priority of the discovery is the better established of the two. We do not, however, helieve that either of thoes distinguished persons owed, in this respect, any thing to tine other. The probability secms to be, thut the happy idea of empioying a spring to regulate tio motion of watches occurred to them both nearly at the suma time.

Improvement of Vatches.-Owing to the facility with which the iongitude may bo determined by the aid of accurately going watches, it is of great importance to have them insde as perfect as possible. In this view, liberai premiums havo been given to the makers of the best marine watches, or chronometers. In tihe reign of Queen Anne, Puriiament offored a reward of $£ 20,000$ to any one whe should make a watch, or other instrument capable of determining the longitude st sea, within certain limits. This magnificent premium was awarded, in 1764, to the celebrated John Harrison, for a marino watch, which, iseing tried in a voyage to larbadoes, đeternined its longitude with even more than the required accuracy. Otiner preminms, though of inferior amount, wera subsequently given to Miessrs. Mudge, Arnoid, Farnshaw, etc. Sinee 1822, two prizes, one of $£ 300$ and one of $£ 200$, have been annually given to the makers of the two chronometers adjudged to be the best, after having been subnitted to a tweivemonth's trial at the Royai Observatory at Greenwicin. And to such perfection has the manufacture attained, that some of the chronometers employed by nsvigators, though carried into the mont opposite climates, have not varied to the extent of two seconds in their mean rate of going throughout the year.

Watch Manufacture.-The watch-making business is largeiy csrried on in London; the artists of which have attained to a high degree of excelience in this de-
pertment. .There may be about 14,000 goid end 85,000 silver watches annitally assayed at Goldsmiths' Hall, London (Jacos on the Precious Metals, vol. ii. p. 418), the aggregate value of which is, probably, not much under $£ 60,000$. The manufacture is also carried on to a conelderable extent at Liverpool, Coventry, Fdinburgh, etc. Watch movementa used to he extensively manufactured at Preacot, in Lancashire; but latterly, we believe, the manufacturers have been withdrawlng to Liverpool. On the Continent watches are princlpally manufactured in Paris, Geneva, and in Neufchuttel. Some of the French and Swlse watches, particularly the latter, are excellent; but, generally speaking, they are slight, end inferior to those made in London. l'aris and Geneva watches are largely exported to foreign countries, and are every where In high estimation, particularly among the ladies. Watches impressed with any mark or atamp, appearing to be or to represent any logal British assay mark or atamp, or purporting by any mark or appearance to be of the manafacture of the United Kingdom, or not having the name and place of abode of some foreign maker abroad visible on the frame and also on the face, or not being in a complete state, with all the parts properly fixed in the case, may not be imported into the United Kingdom, even for the purpose of belng warehoused. -8 and 41 Will. IV., c. 52, § 58.

Watches in China.-Large numbers of European watches are imported into China; nnd it may be worth mentioning, as a curious instance of the diversity of tastes, that the Chinese, as well as most other Eastern nations, whn can afford it, uniformily wear watches in pairs ! This sort of extravegance is not, however, confined to watches, but extonds to a variety of other articles. Shawle, for example, are invariably worn in India in pairs of exactly the same pattern; and it is hardly possible, indeed, to find a native dealer who will sell a single shawl.

Watches and Clocks.-Out of thirty-one clock manufactoriea in New England in 1852, four have been destroyed by fire, nine have stopped by failure, and five have stopped manufacturing on account of amall profita. There are still thirteen factories making clocks, but only six of them are running full time, and with a full complement of hands. These six will produce about 95,000 clocks this ycar. The remainilug seven fuctorics will make about 48,000 clocks, so that the total production of clocks this year will not exceed 143,000 .

The Jerome Mannfacturing Company, in 1853 and 1854 , produced each year 444,000 clocks. Thue they must have produced more than an avcrage of one clock per minute. The factory of J. C. Brown, during 1851 and 1852 , isaued from 80,000 to 100,000 clocks annually, making a total from the two establishments of over 600,000 clocks each year. The Ansonia Company mnnufactured about 150,000 last year. Thus it will be seen that all the thirteen fuctories now running will mase hardiy one-fourth of what was produced by three of the large factories now atanding still. The question naturally arises, What shall we do for low-pricod clocks in the future? There is still a large amotint of fancy clocks on hand, but the wooden-frame "ogee" and "sharp-top Gothic" clocks are not being made, and there is comparatively none in the market. The wooden-frame elocks can not be made for the prices that they have been sold at. It is estlmated that nearly half a million of dollers have been lost in aelling clocks under the cost within the last three years. The clocks for exportation have amounted to about one million of dollars annually, which elded us in the exchanges with the old country. As an instance, we know one houne that imports shawls, linen, collars, and lace goods from Scotiand, and makes its exchange in clocks. But if they werv io serd a bill of exchange it would cost them from 7 to 8 per cent.; but aending out clocks at $\delta$ per cent. profit or more, it makes them
at least 13 per cent. on the elocks, which is a paying businese. There are douhtless many similar igents in the exportation of the artlele, which is an edvantage to ourselves; and for this reason we desire to see it fostered, and again take its place among the induatrial products of our conntry.-Bee Hexr's Merchants' Magazine, January, 1857.

The following table shows the value of clocks imported into and exported from the United States during the year ending June 80, 1855, derived from the annual ruport of the Secretal $y$ of the Tressury:

Jmports of Watoiks and Parts of Watciga into tul l'nited Statee yor the Yeab kndino June 30, 1857.

Water. It may be thought unnecessary, perhaps, to say any thing in a work of this sort with respect to a fiuid 80 well known and eo abundant. But, besides being an indispensable necessary of lifc, water is, In most large cities, an important commercial article. It is in the latter point of view principally that we mean to consider it. Inasmuch, however, as the mede of oupplying different places with water, and its price, necessarily vary in every possible way, we shall limit our remarks on these subjecta to the metropolis only. The few remarks we intend to offer of a general nature will apply Indifferently to any populous place, the aupply of whlch with water occasions a considerable expense.
Quality of Water.-Dr. Ure has made the following statements with respect to the quality of water: "Water," says he, "is a very transparent fluid, posaessing a moderate degree of activity with regard to organized substances, which rendera it friendiy to animal and vegetable life, for both which it is, indeed, indispensably necessary. Hence it acta but slightly on the organs of sense, and is therefore said to havo neither taste nor amell. It appears to possess considerable elssticity, and yields in a perceptible degree to the pressure of alr in the condensing machine. Native water is seldom, if ever, found perfectly pure. The waters that flow within or upon the surface of the earth contain various earthy, saline, metallic, vegetable, or animal particles, according to the substances over or through which they pass. Rain and snow water are much purer than these, although they also contaln whatever floats in the alr, or has been exhaled along with the watery vapors.
"The purity of water may be known by tie following marks or $\mathrm{g}^{\text {roperties of }}$ pure water: 1 . Pure water is lighter than water that is not pure. 2. Pure water is more fluid than water that is not pure. 3. It has no color, smell, or taste. 4. It wets more easily than the

## WAX

waters coutdining metallie and earthy salt 4 , called hard watera, and fels softer when tonched. ©. Soap, or a wolution of soap in aicohol, mixes easily and perfectly with it. G. It is not rendered turill hy adding to it a solurion of gold in aqua regia; or a solution of silver, or of lead, or of morcary, in nltric acid; or a solntion of acetate of lead in water.
"Water was, till modern times, considered as an clementary or simple substance; hut it is now ascertained to be a compound of oxygen and hydrogen."

To evaporate water enough annually from the ocaan to cover the earth, on the average, five feet deer with rain; to transport lt from one zone to ancther; and to preclpitate it in the right places, at saitablo times and
 tmosphericial machine. This wist is eve, Hed,
 of ocean three thousund milea in lver this atmosphere ovaporates a layt of $v$ ixteen feet in lepth. And to hoist ups a clouds, and lower down again all the water in a lidk rixteen feet deej, aud three thousant miloe broad, thd twenty-four thousund long, is the yoarly buriness of this invisible machinery. What a powerful engine is tho atmosphere! and how nicely adjosted must be all the cogs, and wheels, and springs, and compensations of this exqulsite pieco of machinery, that it never wears out nor breaks down, nor fuils to do its work at the right timn and in tho right way!

In his a- nual report to the society (Transactions of the Fombay Geagraphical Saciety from May, 1819, to duguat, 1850, vol. ix.), Dr. Piulst, the secretary, stuten, on the authority of Mr. Laidly, the evaporation at Cal$c$ utta to be "ahout fifteen feet annually; that betweea the Cape and Calcntta it averagea, in October and Novemiver, nearly three-fourths of an inch daily; beI ween $10^{\circ}$ and $20^{\circ}$, In the Jay of Thengal, it was found to exceed an inch daily. Supposing this to le double the averago tbroughout the year, wo should," continues the doctor, "have elghteen feet of evaporation aumu-mlly."-Maviky, Ihys, fieog.

Water for Shipa.-.-Varions improvements lavo been wate in the art of preserving water on loard ships, of these the principal are the charring the insldo of the earks in which the wati. is kept, and the sulstitation of fron taaks for casks. The latter, being made of the required shape, may bo conveniently stowed into any part of the ship. In men-of-war the iron tanks serve as ballaft, the water being brought up by a foreing-jmmp. Wuter is found to preserve better in them than in any other sort of veasel. Drip-stones may be employed with of ald antage in the purification of water. When ve cer is taken on board from a river into which the tide tlows, it should, of course, 1,0 raised at low ebb.-Sice article Aycencer for au sciount of the supply of water In New York fiven by the Croton Aqueduct. She articles Gulf Stutian, Habmobs, Ocran, Tibes, ete.

Water-clocks. The first instruments used to neasure the lapse of time, lalependently of the sunshlne, ware clepaydra, or water-clocks. These were dunst prohahly vessels of water, with a suall hole through the hottom; through this hole the water ran (ut in a certain time jossilly an hour; after which the ressel was again tilled, to be emptied as before, This invention was a manifest improvement on the old smn-dials, wbose perpenticular gmomon guve hours of different length at the varios scasons of the year. something similar to the hour-plass was ocensionally used; and Alfred the Great, probably ignorant of theso methods, allopted the burning of a taper as a measure of time.-IIAy $n$.

Water-line, the boundary of any horizontal secfion of tho loottom of a ship. The uppermost one is afled the load water-line; the lowest the light waterline.

Water-logged, a neutical term, denoting the state of a ship wheu a quantlty of water having been recelved into ti:o hold lyy leuling, etc., she has In a great measure lost her buoyancy, and ylelds to the effect of every wave passing over the deck.

Water-malles, used for grialing corn, invented by Bellsurius, the generul of Justlaian, whilo besieged in Rome by the Goths, A.v. 655. The anclenta purched their corn, and pounded it in mortars. Afterward riilla viere invented, which were turued by ioen und beasts with groat labor; and yet Iliny meutions wheels turned by water.-Haydn.

Water-ways, strong ploces of wood extending mund the ahip, at the junction of the deeks with the y'des, to carry off the water.

Wave. I'lus cominon eause of waves: ; the fricito the wind rion the sulice of tho water. Little de, rea or elovations firt apjear, whleh, by continuance of $t$ to force, gradually increase until thoy become rolling mountains, wbore the winds sweep over a great -. ient of water. In rounding the Cape of Good Ilope,

- as, or rather a swell, aro net with so vaet, that a Low figes and a fow depreselons occupy the extent of a mills. Wut those are not so, troublesome to ships as a short awell with more perpendicular waves. Tho slope in the former is so gentlo that the rising and falling are scarcely felt, while the latter, by the sudden plunging of tho vossel, is often deatructive. The velocity of waves has relation to their magnitude. The large waves just mentioned proceed at the rate of from thirty to forty miles an hour. It is a common orror to suppose that the water itself advances with the speed of the wave; hut, in fact, the form enly ails vances: the substanco, with the exception of a little spray, renains rising and falling in the same phace with the regularity of a pendulum. When a wave, however, reaches a shallow bank or heach, tho water becomes really progressivo; hecause then, as it can not slak directly down, it falls ovor forward. No wave rises more than ten feet alovo the level of tho water, which, with tho ten feet of descent, gives twenty feet for the whole height of the wave above the next depression. A wave coming/against any ohstacle may le dashed up to a nuch grenter elevation.-E. A. See American Jrurnul at'Sciowce, Ix. (IV. Scoresay). Ste also articles Ocean, Tines, Water, etc.
Wax (Ger. Wachs; Fr. Ciere; It. and Sp. Cera; Russ. Wosh), a vegetablo product. Several plants contain wax in such abundunce na to make it wortli while to extruct it from them. llut all that is known in commerce consists of heeswne. The honcy in first pressed from the comb, and the wax is then melted into cakes. It has a slight odor of honey, is insiphl, and of a bright yellow hua. It is brittle, yet soft, and nomowhat unctuous to the touch. It la often adiaterated with earth, jea meal, resin, etc. Tho presence of tho tormer may be suspected when tho cake is very brittle, or when its color laclines more to gray than to yellow; and tho presences of resin may be suspected when tho fracturo nepemrs sunoth and shining, insteal wi being granulated. Wux, when bleached or jurined, is white, perfectly insijdd, inodorous, and somewhit translucent ; it is hartor, less unctuons to the touch, heavier, and hesa fusible than yellow wax. It is sometimea adulterated with tho white oxyd of lead to increase its weight, with white tallow, and with gotato stareh. The tirat is detected by melting tho wax in water, when the oxyd falls to the hottom; the presence of tallow is indlcated by the wax being of a dull opaque white, and wauthig the transparency which distinguisbos furo wax : and starch may bo detected by applying sulphuric acid to tho euspected wax, as the acid carisonizes the starch, withut neting on the wax. - Thomaos's Chemistry, and Ir. A. T. 'Tnomsos's Dispematory.

Beeswax is prepasoć by draining and warhing the honey-comb, which is then melted in bollhig sater,
atralned, and cast futo cakes. Enciith and foreign was are found in the market; tho intter being ehiefly imported from the Baltic, the Levant, and the coast of liarbary. Fresh wax has a pecullar honey-like odr : : its speelfio gravity is 5 s At abr.ut $150^{\circ}$ it $f u=:$ sind at a high temperaturo volatilizes, and buens $v_{i n}$, hright white flane. it is ble "ched uy heing ex,m" win thin slices or riblons ti light, air, and moistute, or more rapidly hy the action of chlorina; but in the ) atter case it does wr answer fer the manufactura of - cadies, which is one of Its prineipal applicatlons. W ic eandles re made by suspending the wicks upon a .as op over the cauldron of melted wax, which 1 . 8. scessively poured over them from a ladio till they nave acquired the proper size, that the candlo consists of a हer! , of lay ars oi wax; the apper end is then shaped, and the lower cut off. Attempts have been made to cast wax candles in monlds, but when thus made they buria irregularly. Bleached or white wax is generally adulterated with more or less spermaceti, and seld at different prices accordingly ; 'n this cuse it has rot the peculiar lutere of pare wax, and is softer and more funible. It is also largely adulterated withs steuria or stearic ach, whien is detected by the odor of fat or tallow which it evolves when highly beated, and by its crumbly texture; it may also be separated to a certain extent by ether or alcohol. Wax is insoluble in water, and searcely acted apon by the acide, so that it forms a good late or cement: boiling alcohol and ether act partially upon it, and deposit the portion whth they had dlssoived, on cooling. Some varietice of yegetable wax appear to contain two distinct primciples, which Dr. Jobn has termed cerin and myricin; the former foluble, and the latter insoluble, in alcohol. Heated with the fixed alkalies, wax forins a diffeultly sotuble soap.

Way, the sea term for progress. A ehip in progress is said to have vay upon her; when stationary, to have no way.

Wealth. This is a relative torm ; for as there is only a certain amount of property in a country, bo the possession of a large share by one man is the poverty of others. The instances of wealth :... the early ages are many and most extraordinary. The mightiest cenflagration of wealth on record is that of Sardanapulus, where riches amounting to one thonaand four hundred milhions sterling weredestroyed.-ATuEnfus. Cecilius Isidorus died at Rome possebsed of 411 g slaves, 3600 oxen, 200,000 head of other cattle, and money equal to three milliens sterling, 8 b.c.-Univ. Hist. Dec artieles Banks, Conss, Gond Money, ete.
Wear, to put the ship on the other taok by turning her reund withs her stern to the wind.

Wearing Apparel, generally considered to inclade only the clothes and personal property aetually worn upoa the person, and as such it is ndmitted free of duty into the United States.
measures were provided for the whole kingdom of England by the sherifia of London, 8 Richard I., 1197. A public weighing-machlne was set up in London, and all commodities urdered to be weighed by the clty offieer, called the welgh-master, who was to do justiee bet ween buyer and aeller, statute $8 d$ Pdward II., 1309. -Stowe. The first statute, directing the use of avoirdupois weight, is that of 24 IIenry V1II., 1532.Philosophical Tramsactious, vol. 65, srt. 3. The French adopt the metre of 3.2808 d , or the 10 -millionth part of the distance from the pole to the equutor, ns the standand of measure: and the kilogram, equal to 2265 lbn. avoirdupois, an the standard of weight.-llinvis.

Neither the magnitude nor the weight of any body can be determinel, unless ly comparing it with aome other body selected as a standurd. it is impossible, indeed, to form any idea in respect of mugnitude or weight, except in relation to seme definite space or weight with which we are scqusinted. We say that one artic ${ }^{4}$ weighs 1 lb ., another 2 ths ., a third 3 , and so on; neaning not only that theso weights are to each other as $1,2,3$, ete., but also that the weight or rpecific gravity of the first is equal to tha known and determinate welght denominated a $\mathbf{l b}$., that the sceond is equal to 2 lbs., and so on.

Standards of 1 Veight and Ifeasure.-n-Standands of lineal measure must have been fixed upon at the earliest period, and appear to have consisted prinet, ally of parts of the humun booly-as the cubit, or length of the arm from the elbow to the tip of the middle finger ; the foot; the ulua, arm, or yard; the npun; the digit, or finger; the fathom, or apace from the extremity ef one hand to that of the other, when they are luth extended in opposite directions; the pace, ete. Large spaces were estimated hy meanures formed out of muitiples of the smaller ones; and sometimes in day's journeya, or by the space which it was supposeil an ordinary man might travel in a day, using a reason. nble degree of diligence. But lineal measures can only be used to determine the maguitude of solid bodies; the magnitude of hodies in a lifuid or fluid state has to be determined by what are called measnres of eapmeity. It is probable that, in the infancy of society, shells, or other hellow instruments affurded by nature, were used as standards. But the inaceurary of the conclusions drawa from referring to them must soon have become olvious; and it eariy oceurred that to olitain an accurate measure of liquids nothing nore was necessary than to constitute an artifichi one, tho dimensions, and consequently the capacity, of which should be determined by the lineal measures previously adopted. The determination of tho gravity or sreight of tifferent bodies supposes tho invention of the balance. Nothing is known of the steps which led to its iatroduction; but it was used in the remotest antlquity. It seems probable that, at first, cubes of some cominon tineal measure, as a foot, or the fraction of a foot, formed of enpler, Iron, or some other metal, were used as staninards of weight. When the standard was selected, if it was desired to ascertaln the specifie gravity or weight of any given article, all that was necessary wha to put it into one of the scales of tho laiance, and as many cubes or parts of cubes on tho other as mightit be necessary to counterpoise it. Weights have, howevar, boen frequently derived from grains of corn. Hence in this, and in some other European countrias, the lowest denomination of weight is a grain; and 82 of theso grains are directed, by the ancient statute called Componiio Mensurarum, tu compose a jennyweight, whereof 20 make an ounce, 12 ounces a pound, and so upward.

In avery country in which commercial transactions are extensively carried on, tha importance of having weights and measuren determined by some dixed atandurl becones obvious to every one. But as the size of difforent parts of the human body differs in differert individuals, it is necessary te select sumo durable article
-n metallie rod, for example-of the length of an ordinary cubit, foot, etc., and to make it a ataudard with which all the other cuhits, feet, etc.; nsed in mensuration ahall correapond. These atsindarde have alvays leen preserved with the greatest care: at llome they were kept in tha tample of Jupiter, ani among the Jew their custody was intrusted to the fumily of Aaren.-Pavcton, Métrolngie, p. 223. The priseipal atandards used in the ancient world were the cubit of the Jews, from which their other measures of lingth, eapaeity, and welght were derived; and the foot of the Greeks and Romans. In England, ancient historians tell us that a new, or rather a revived, standard of lineal ineasure was introduced by Ilenry I., who ordered that the ulna, or ancient ell, which corresponds to the modern yard, whould be made of the exact length of his own arni, and that the other measuree of length ahould be raised upon it. This standard has been maintained, without any sensible variation. In 17.12 the Ruyal Socisty had a yard made, from a very careful comparison of the standurd ells or yards of the reigna of Menry V1I. and Elizabeth kept at the Exxchequer. In 1758 an exact copy was made of the loyal Society's yard; and this copy having been oxamined by a eommittee of the Heuse of Commons, and reported by them to be equal to the atandurd yard, it was marked as auch; and this identical yard is declared, by the act 5 Geo. IV., c. 74, to be the standard of lineal measuro in Great Britain.

Uniformity of !raights and Measures.-The confusion and inconvenipnce attending the use of weights and messures of the anme denomination, but of different magnitudes, was early remarked; and there is huriljy a country in which offorts have not been uade to reduce them to the same uniform aystem. Numerous efforta have been made having this elject in view, and enjoining thn use of the samo weights and measures, under very severe penslties. But, owing to the inveteracy of ancient customs, and the difliculty of enforcing now regulations, these statutea have alwoys had a very limited influence, sad the greatest diversity. hsa continued to prevail, excopt in linoui measures.See article Neginial Wrighta and Meabuhes, p. 510.

Inraviable or Nitural Standards,-As tho standards adopted in most countries have been in a great degreo arbitrary, it has long been the opinion of scientific men that, to construct a moro perfeet system of weight; and measurea, nome natural and unchangeable basis should be adojited. It has, indeed, been contended that the menanres of the ancients were deduced from a basis of this sort; and that the stadium always formed an aliquot part of the earth's eircumference, that part differing among difforent nations and uuthors. llot no learning or ingennity can induce any one to helieve what is no obviously ineredible. The ancients had no means of detarmining the earth's circunference with any thing like the aceuracy required to render it the great unit of a system of measures ; and, what is equaily deeisive, nu ancient author ever makes the slightent allusion to any such atandard.

In modern times, however, the idea of seeking for a unit of weight and measure in some unchanging natural object has been practicaily eal ied into effect. The stanclardis that have been usualty proposed for this object have leen some aliquot jart of the quaminut of the meridian, or the jength of a pendutum ribrating seconds in some given latitude. Tho standard of the second pendulum has been in so far adopted into the existing rystem of weights and measures established in Great Britain by the act of 1823, that the length of the standard yard, as compareif with that of a pendulum vibrating seconds in the latitude of London, is specified In the act as fotlows:
"Whereas it has been ascertained by the commissioners appointed by his majesty to inquire into the sulject of welghts and mensurea, that the said yard herely declared to be the imperial standard yard,
when compared with a pendulum vibrating seconds of mean time in the latitude of London, in a vacuum at the level of the sea, is in the proportion of 88 inches to 39 lnches and 1893 ten-thousandth parts of an inch; he it therefore enacted and deciared, that if at any time hereafter the said imperial standard yard shail be lost, or shall be in any manner destroyed, defaced, or otherwise injured, it shall and may be restored by making, under the firection of the Lord Iligh Treasurer, or the commissioners of his mnjesty's treasury of the United Kingdom of Great Britain and Ireland, or any three of them for the time being, a new standard yard, bearing the same proportion to much pendulum as aforeasid, as the alid imperial standard yard beans to such pendulum."
"The brass Troy pound welght procured by the mininter of the United Staten at London $\ln 1827$," was declared by act of Congress, May 10, 1828, to be "the standard Troy pound of the Mint of the United States, conformably to which the colnage thereof shall be regulated." But no direct legislation appears to have taken place in the adoption of any general standards of weiglits and measures. On the 29th of May, 1830, a resolution passed the Senate directing a comparison to be made, under the authority of the Secretary of the Treasury, of the welghts and measures used at the princlpal custom-houses. This comparison was intrusted to a gentloman in every way qualified to undertake $\mathbf{i t}$, the lf cie Professor IIassler, and, ns might have been expectan, great discrepancies were found to exist. The mean, however, corresponded nearly with the standards, as fixed by the English laws previeusly to, and at the epoch of, the Declaratlon of American independence. Dleasures were then taken by the Secretary of the Treasury to have uniform and accurate weights and measures, and authentic standards, made under the immediate personal superintendence of Mr. Hassler, and supplied to all the custom-houses.

While thls was being done, on the 14th June, 1836, a joint resolution of Congress directed the Secretary of tho Treasury "to cause a complete set of all the weights and measures adopted as standards, and now elther made or in the progress of manufacture, for the use of the several custom-houses, and for other purposes, to be delivered to the governor of each State in the Union, or such person as ho may appoint, for the use of the States respectively, to the end that a uniform standard of weights and measures may bo established throughout the United States;" and on the 7th July, 1838, a section in the "act (chap. 169) to provide for the support of the Mlilitary Academy of the Unlted States" provided "that the Secretary of the Treasury cause to be made, under the superintendence of Mr. Hassler, one standard balance for each atate; and, when completed, that he cause them to be delivered to the respective governors for the use of the respectivo States."

The dlatribution of these standard balances, weights snd measures, to the several States has been in a great measure, if not entirely, accomplished. By sn ect of the Legislature of Massachusetts, April 23, 1817, chap. 242 , it is provided that they shall be hereafter used as the sole authorized public standard of weights and measures of this Commonwealth.
The standards of welghts and measures, made in part or in whole under the direction of Mr. Hassier, says Professor Baclie, have the fallowing origin:

1. The actual standard of length is a brass as of 82 inches in length, prepared for the eurvey ${ }^{\circ}$ "he const of the United States, by Troughten, of London, and deposited in the office of weights and measure at Washington.
2. The units of capscity measure are the gallon for liquid, snd the bushel for dry measure. The galion is a vessel containing $58372 \cdot 2$ grains ( 8.3389 lbs. avoirdupois) of the standard pound of distllied water at the temperature of maximum density of water, the vessel
being weighed ln air in which the bsometer in 80 inches at $62^{\circ}$ Fahrenhelt.

The bushel is a measnre containing $548301 \times 89$ standard graing ( $77 \cdot 6274$ )hes, avolrdupoise; of distilled water, at the temperuture of maximum density of water, and barometer 30 inches at $52^{2}$ Fabrenheit.

The gallon is thus the wine gallon of 291 cubic inchen nearly, and the burhel the Wincheater bushel neariy.
3. The atandard of welght was the Troy pound, copled by Captaln Kater, in 1827, from the imperial Troy pound, for the United States Mint, and preserved in that establiahment. The avoirdupois pound is derived from this; lts welght leing greater than that of the Troy pound in the proportlon of 7000 to 5760 ; that is, the avolrdupols pound is equal in welght to 7000 grains Troy.

WEIOHT AND MEABURF GYSTEMS OP THE WOALD.
I. Arrica.-A byssinia.-Weights: I rotl or rottolo $=12$ wakea $=120$ dirhems. Dry Capacity : At Gondar, in the interior, 1 ardeb $=10$ atadega ; at Masuah, on the Red Sea, I ardeb $=24$ madega. The other measures are those of Cairo and Alexandria. There is no knowledge of any local system.

Algeria.-Since the acquisition of this territory by France, the French metricsl system is legalized, and may he expected gradually to come into use. As yet, however, the old usances are zetained.

Weights: The theory appears to be as followa:
24 carob aced $=1$ mitkal or metical, the weight for gold, ete. 8 mitkal $=1$ wakea or ounce.
27 wakea $=1$ rotl khebtr or market pound.
18 wakea 三 18 do. gheddari, for fruttu.
16 whkea $=1$ do. attarl, for aplces.
141 wakea
$=1$ do. feuddi, for silver
100 of each of these rotl $=1$ quintar or cantaro correspondtag.
The values of these denominstions in the Dictionsry are from reported observations, and fall below what world be dorived otherwise by ascending from the netual mitkal. Liquic Capacity is measured by the khoullé and its fractions, $\frac{1}{2}, \frac{1}{t}, \frac{1}{b}$, ete. ; as Dry Capacity, by the saa. Length is measured by two different pic, the Turkish and Arab; the latter of which is used for cloth. Each is subdivided by its rob, or eighth part. There are no itiderary or agrarian measures indlgenous.

Cape of Good Ilope (Colony).-English standards are legalized and used here. The same may be said, it is supposed, of the British colonies in Senegambia and at Sierra Leone, and che smaller establishments on the Gold Coast, as well as of St. Helena and their other islands in the Atlantic. As for Mauritius, on the other side of the continent, that ratains stlll a considersble admixture of its former French usances.

Canary Islauds.-In these islands, the originals of the weights and mensures are from Spain ; and the variations of the actual standards, which (exceept in the case of the vara) seem to be in the sense of degradstion, are not more than occur in continental Spain itself.

Cape Verd Islands.-This Archipelago, as well as the continental territory under the same Governor-Generalship, uses the weights and messures of Portugal. The same may be said of the Dladelra Group under the same domination ; of the Portuguese possessions in Angola and Bengucla; and of the colonies which dwell on the other ocean, along the cossts of Sofala and Mozambique.

Egypt.-The difference between the weights and measures actually used in Cairo and Alexandria, the principal markets of Egypt, is so small as to indicate a common origlana. The great variety which has been stated to exlst among the cantaros (or quintals), according to the various articles intended to be welghed, is probably the result of carelessness or fraud : nor is it clear, as yet, whether this variety' affects the hund-red-weight or the unitary pound. It may be supposed that the weights by which the articles of greateat con-aumption-the necessaries of life-are determined, were
the utandard from which aceldent or negligence has deviated. Weight: 1 cantaro $=36$ okn $\equiv 100 \mathrm{rotl}=$ 14400 drachma. The rotl doen not appeas to be aystematicully sulstivided. The harnela, applied to weighing allk, is ovidently the olk, ander a apecial name. Dry Capacity: 1 andab $=24$ roh. Rength: 1 gasab $=1$ derah. The Turkish pie is generally used for cloths ; it is very littie ionger than the derah, but not correlutive. Agrarian : 400 square gasab $=1$ feddan al riach, or unitary mere.
Guines. - Weight : 1 henda $=2$ benda-ofta $=8$ eggeba $=51$ seron $=8$ piso or uzan $=104$ quinto $=16$ aguirages $=82$ media-tabla $=48$ akey. The last denomination, which is the special woight for gold duat, is only theoretically connected here; its actual value as reported is nearly half a grain lese than the $\mathbf{\$} \mathbf{1}$ of the benda.

Liberia. - This Anglo-American pegru colony at Cape Mesurado, as well an the independent one of Maryinnd at Cape Palmas, uses, It ajay be mupposed, standarls from the United Staten.
Morocco.-All the dependencies of this ompire, along the western coast of Barbary, use the weighta and capacity measures of Spain. There are aevarul indigenous measures of length given in the Dietionsry, but they are without uniformity.

Tripoli.-In this appanage of the Turkish empire, as well as in the dependencies of Fenzan nad Barca, the weights nnd mensures appear to be of European derivation. Weights: 1 cantaro $=100$ rotl $=1600$ uzan $=12800$ termini. The metical, a special weight for gold and ailver, has no connection with the others, unless it be derived in theory from an ancient rotl or pound of 12 uzan or onnces. The actual weight is reported as being exactiy Tof of the Venetian pound, from which it may have orlginated. Liquil Capacily: The mataro for oil is given by galions in the Dictionary ; from its reported weight compared with the average epecific gravity, at ordinary temperatures, of that suistance. Iry Capacity: 1 cafiso $=20$ tileri.

Tunis.-Weight: 1 cantaro $=100$ rotl $=1600$ uzan $=$ 12800 metical or termini. In this aystem, where the same denominations appear to le lighter than the Tripolitan, the metical and uzsn ure apeelfic weights. Liquid Capucity is cleterminel by weight. Iry Capacity: 1 cafiso $=16$ quilia $=132$ saha or zah. Length: 1 pic (woolen) $=1 \frac{1}{1} 5$ pie (silk) $=1 \frac{18}{5}$ pie (linen). But these last proportions appenr altogethor eccidental. In this enumeration, the remaining European settlements, viz., those of France on opposite sides of the continent in Senegumbia and the Isle of Bourben, and those of Denmark and Ilelland in Guinea and Ashantl, have been enitted; partly because the weights and measures of the mother countries would be naturally accepted among the settlers, but chiefly because of the insignificance in popuiation and trade of the actual estshlishments. The insular appanages of the Imam of Muscat (viz., Quiloa, Zanzibur, Socotru, etc.), on the eastern side of the continent, are passed over for similar reasons; whila the native powere, from Morocco through and around to Madagascar, aro too uncivilized or too inaccessible, to have or to yielid any thing of interest in reapect to weights and measures.
II. Anemica.-This continent, for the present purpose, is iest divilied (instead of the usuul distinctions of Nerth, Centrul, and South) iuto Independent and Culonial Aluerica.

Bruzil.-In this empire the originals of weights and measures aro from Portugsi ; and tho sctual standards are in general illentical, though there ure a fow variations, inoth in value and denomination, shown in the Dictionary.

Mayti or San Domingo.-This island, which, in the numerous revolutions of jolicy that it has undergone, has been recently modifled from a republic into a form more absolute, und numinally an empire, retaine the impress of its doulile colonization frem Spain and France, as well as in the numes of localities-on the
weutorn side French, on the eastorn Spanich-as in the weighte and masaurva used there.
Mexico.-Under this repubilic, as well as undar the numerous governments which are continually ahifting or springing up in the territorias of Contral nnd South America, and which it would require a apecial and contemporaneoun researeh to bigmalize and varify, the welghte and neasures of Spein have been throughout and ure atill recognized; with only auch jucal varlations as other causes, besiden the cossution of European control and intercourse with a parent power, might be expected naturally to proluce. Of course, this comprehensive fleld for the influence of the Spanish ayatem does nut incluile vast tegritorien (auch as Patagonia, for instance) which, although clained iy forelgn or demestic powers, are yet, is fact, domineered over by various indigenous tribes, more or lesm nomadic and unclvilized. Of ayntematio welghts and measures in those territories, there are none in modern timen; and ancient enes (such an in Maxice and l'era), which recent revenclises have partially systematized, are omitted, as neither certifin nor of practical application.

United States of A mericu.- Height: 1 Mint or Troy pound $=12$ ounces $=240$ penny $w$ eight $=6760$ grains ; 1 apothecary pound $=12$ ouncea $=96$ drachmin $=288$ scruples $=6760 \mathrm{grains} ; 1$ commercial pound $=16$ aunees $=256$ drams $=7000$ grains; 1 long ton $=20 \mathrm{cwt} .=80$ quarters $=2240$ commercial pounds; 1 short ton $=20$ cwt. $=2000$ commercial pounds. In the actual govermnent atandurds the ounce Troy is divided decinually, down to the roteg part. These weights are identical with those of England. In both countrien, they repose, in fact, upon actaslly existing masses of netal (brass) which havo been individually declared by law to be the uujts of the aystem. In acientific theory, they are aupposed to rest upon a permanent and universal law of Nature-the gravitation of distilled water at a certain temperuture and under a certain atmospheric pressure. And in this aspect, the originution is with the grains; which must be such that 252,458 of these units, in brass, will be in just equilibrium with a chibic inch of distilled water, when the mercury stands at 30 inches in a barometer, and in a thermometer of Fahrenheit at 62 degrees both for the air and for the water. Unfertunately, the expounders of this theory in England used only the gencric term brass, and failed to define tho specific gravity of the metal to be cmployed: the consequence of tilia omission is to leave room for an error of rootor in every attempt to reproduce or compare the results. This is the minimum possible errur: the max ${ }^{\circ}$ atin would be a function of the difference in specific $s$.nvitw between the heaviest and lightest brass that can le :ast.

Liquid Capacity: 1 galion $=2$ half gallens $=4$ quarts $=8$ pinth $=16$ gilla. The gill is not among existing standarda of publio authority, though it is used in commerce. There are other denominations higher than the gallon, such as barrels, hogsheads, pijpes, cte.; but these are only cessels, not measures, and aro aiways gauged and sold by thair actual capacity in galions. The galion, in fact, is almost exactly equivalent to a cylinder 7 inches in diameter and 6 inches high. In theory, it must contain just 231 cubic inches; and, filled with distilled water at the temperature of maximum density (say $39^{\circ} 8$ Fahr.), weighs, according to the official rejoit, at that temperature and at 30 inches of the barometer, $8 \cdot 339$ commerciul or avoirdupois pounds; or more nearly 68372.1754 grains. It is in the temperature ouly that this unit dliffers from the former wine gailon of Great Iritain. The npothecuries use the same gallom, but divide it differentiy, as follows : 1 gallon $=8$ pints $=128$ thid ounces $=1024$ fuid drachms $=61440$ minime (or drops) $=231$ cubic inches. These are graduated meanures; they also use sometimes the following approximste ones from veasels in demestic use: 1 ten-cup $=2$ wine glasses $=8$ tablespoens $=32$ tea-spoous $=4$ fuid ounces.

## WEI

Ihy Capacify: 1 bushel $=2$ half hushols $=4$ pecks $\Rightarrow$ 8 gallons. There aro also in thls, at in the former measure, higher denominatloaa (barrela, sacka, otc.) known in commerce, whose capacity is Intended to be conntant. Thes are, however, alwaya gauged ly the bushel. This bushel is the old Wincheater buahel of England. In fact, it is a cylinder 18.5 laches in dlaimeter, and 8 inches deep. In theory, it mast contaln $2150 \cdot 42$ cuble inches; and holds of distilled water, at the tomperature of maximum density and at 80 Inches of the baremeter, 77.0274 commercial or avolrdapela pounda; or more nearly $543301 \cdot 80$ gralns.

Length : 1 yard $=8$ feet $=36$ inches $=432$ lines $=518$ seconds $=02208$ thirds. In the actual government standards, at the custom-houses, the yard is divided decimally into tenths and hundredths. In the measurement of cloths, muslins, linens, cotton, silk, and in general of what is termed dry goods, the yard only is used; aubulivided into halves, quarters, elghtha, sixteenthe, and half aixteenths. This lowest denomination $=1 \cdot 125$ inch. Surveyors and engineers employ neither the yard nor the inch, but uee the font and its decimal divisions. Architects and artificere reckon by the foot and subdivisions as given above, Nevartheless, the most usual and most recent workman's scules liear the foot divided into inchen, and aighths and sixteenths of an inch. Mariners measure by cable lengths and fathoms : 1 cable length $=120$ fathoms $=2.20$ yards $=720$ feet. The unit of length-the yard, upon whoso subdivisions all the weights and espacity measures repose for verifiention- - 1 s , in fact, derived from ancient urbitrary standards of England. In theory; the inch-the $\frac{1}{16}$ of the yard-is presumed to be contained $80 \cdot 18029$ times In tho length of a pendulom that, in a vacuum and at the level of mid-tide, in the futitude of London, vibrates seconds of mean time.

Itinerary : 1 statute mile $=2$ half miles $=4$ quarter miles $=7 \mathrm{f}$ cable-length $=8$ furlongs $=80$ chains $=320$ perches or poles $=880$ fathoms $=\mathbf{1 7 6 0}$ yards $=5280$ feet $=8000$ links $=68360$ inehes $; 1$ nautical leaguo $=3$ equatorial miles $=8 \cdot 457875$ statute miles. Chaina and links are denominations employed by land-surveyore, thus: 1 chain $=4$ poles $=66$ feet $=100$ links.

Agrarian and Superfirial: 1 square mils $=640$ acres ; 1 acre $=4$ roods $=10$ square chains $=160$ square perchea $=48.10$ square pards $=43560$ square feet; 1 square yard $=0$ square feet $=1206$ square inches. Architecta and builders reckon 1 square $=100$ square feet.

Solid: 1 cubio yard $=27$ cobic feet $=46656$ cubic inchea ; 1 cuble foot $=12$ reduced feet (plank measure) $=1728$ cuble inches; 1 reduced foot (plank measure) $=1$ squaro foot $\times 1$ inch thick $=144$ cubic inches. In practice, all planks and scsutlings less than an inch in thicknoss are reckoned at an jnch. 1 perch of masonry $=1$ perch ( 161 feet) long $\times 1$ foot high $\times 1 \frac{1}{1}$ feet thick $=\mathbf{2 5}$ cubie feet. In fact, the dimensions given for the perch do not result in 25 cubic feet; but this last number has been adopted for convenience. 1 cord of fire-wood $=8$ feet long $\times 4$ fect high $\times 4$ feet deep $=128$ cubic feet.

IJanish Possesaions,-Theae include Greenland, Icelind, and three of the Leewari Islands in the West Indies; viz., Senta Cruz or St. Croix, St. Thomns, and St. John. In all these the weights and measures of Denmark prevail, though in the islands the English longth measures are also used.

Dutch Possessions.- Holland holds on the continant of America, the government of Surinam, whtch inclates nominslly a territory of something less than 10,000 square miles, under the name of Dutch Guiana; on the coast of Venazuela, the islands of Curaçoa and Bonaire, with some lesser islets; and among the Leeward Antilles, St. Eastatius, the south part of St. Martin, and Sabn. In all these, the weights and measures of Ilolland prevell; except in Cureçoa, where the welghts are, in fact, and the length measures, beth in fact and name, those of Spain.

English Pceneasions,-Over the immenae territories of Britiah North America the weights and measures of England are logallzed; but in Lower Canada the French settlers atill use their furmer denominations to a great extent.

In the southern peniaaula, where the general name of English Guiana covers the former Dutch colonien of Larbice, Demerara, and Eseequito, the reckoning ta by the welghta and measures of Holland.

The aettiements in Patagonia and the adjoining Archipelago, made chinfly with a view to the whalefishery, recognize the Engilah atandarda. And as much may ine sald for the Falkland Iales.

Of the numerous lslands and isleta in the Weat Indies, among the Antilles and Lucayan, oniy the chlef ones need be mentioned. The weights and measures of a fow are still traceablo to the source of their earlier colonization.

In the following lalands the Eingliah weights und measures are used: Antigua, the Bahamas, Barbadoes, Barbuda, St. Chrietopher's or St. Kitts, Dominica, Grenada, Jamaica, St. Lucia (Freneh), Montserrat, Nevis, Tobago, Tortols, Trinidad (Spaniah), and St. Vincent.

In the Bermuda Group, English weights and messures are employed. All thase English measures are those before the change In 1825. It would le, therefore, more literal to asy, weights and measures of the United States.

French Possessions.-France bolds on the contlinent only what used in part to be Cayenae, and ls now on the maps as French Gulana; and among the West Indin islands, Martinique, Guedelouje izith its depeadencies, Deseada or Desirado, Marle-galante, and the group of Les Saintes, together with abont two-thirds (on the nerthern side) of St. Murtin.

In Guiana, the new metrical system is legalized; but the older one continues to be used.

St. Martin reckons by the welghts and measures of Holland, and Les Saintes by those of England.

The cthers employ the old French syatem, with some modifications. Thus the former English wine gallon seems to he the standard for liquids, divided as follows : 1 guilon $=2$ pots $=4$ pintes $=8$ chopines $=10$ roquilies $=92$ muces; of ngrarian mensure, 1 carré $=$ 10,000 pas carrés. Besides theso, France owns the isles of St. Plerre and Miquelon, to the senth of Nawfonndland, where the old aystem prevails.

Russian Possessions.-The extensive territories which Russia holds in the northwest corner of America across Behring's Straits are, It may be supposed, under *he domain of Russian customary measures. The establishment which that empire had for nearly forty yeara In Upper California, at Bodega, has been some time since abandoned.

Spanish Possessions. - The magnificent appanage, continental and insular, which Spain formerly held in Americn has now dwindled to the islande of Cuba and Porto Rico, where the weights end measures are still those of Spain.

Sucdiah Possessions.-The only territory of Sweden is the small island of St. Bartholomew or St. Bart's ; which, though originslly colonized from France, has been so long ceded (now nearly seventy years) as to have adopted Swedish weights and measures.
III. Asia.-An-nam.-Weights: 1 quăn $=5$ ta $=10$ binh $=50$ yen $=500$ cân; 1 cân (or pound) $=1 \cdot 6$ nen $=$ 10 luong $=160$ dong $=1000 \mathrm{ly}$. From the ly, the subdivisions are regularly decimal; viz., the beo, hes, châu, huy, trăn, and aj, which last is the ntom or mi:l lonth part of the ly . The most of theso are prirely theoretical, for the hao is itself only 0.06 of a ह.mis, very nesrly.

Capacity: In these there ls no uniformity nue ata thenticity, ench province using difforent measures. In In ue there appears to be the following theoreticic systom: 1 hoc $=10$ dau $=100$ thang $=1000$ hnp $=10000$
thuoc ; 1 thuoc $=1200$ grains of millet $=10 \mathrm{saO} ; 1$ sao (or a handful) $=120$ grains of mlllet; and 1 toat $=250$ grains of millet. The division of the thuoc into 10 sao and $4 \cdot 6875$ tort would seem to indicate two different systems; but as the Tonquin millet and our own are not of the same size, we have no standard of comparison or determinatlon.
Length: There are two thuce or cubits; ono fur general use, the other, which is $\frac{1}{\text { t }}$ longer than the former exclusively for cloths, silks, and other woven fabrics. 1. Mercers'. -1 gon $=10$ that $=30$ truong $=300$ thioe ; 1 thuoc $($ or ell $)=10$ tac $=100$ phan $=1000$ ly. 2. 月uilders', otc. -1 mau $=10690=30 \mathrm{ngu}=100$ thuoe; 1 thuoc (or cubit) $=10 \mathrm{tac}=100 \mathrm{phnn}=1000 \mathrm{ly}$.

Agrarian: This last series is also used by landmeauurers in giving the square content of land. They sometimes use another series (called ruong luc, in contradistinction to the ruong ngu, just given), in which the sao is equal to $16 \frac{1}{2}$ thuoc. The mau is, therefore, 10 per cent. longer in this last serles; and its superficial content, when squared, 21 per cent. greater.
Itinerary: These are very vague and only approximate : $1 \mathrm{dam}=2 \mathrm{ly}=$ rather leas than half a mile.
Birmuh, - Height: 1 vis $=3$ catty $=100$ tical. Length : 1 hanbou $=28$ taim $=50-1$ palgat. Xtinerary : 1 taing $=25^{\circ} 0$ banbou $=7000$ talm. But these are liy no neans certain.

China,-1Height: Amost every thing in China (timher, liquids, live stock, ete.) is sold ly weight, actual or . ominal. 1 shik $=1 \frac{1}{8}$ tam $=4 \mathrm{k}$ wan $=60$ yin $=120$ kan or catty; 1 kan $=16$ leung or tazl $=364$ chu $=3840$ lui $=38400$ shu, or kernels of grain. The weights above the yin are unly nominal and for account; and those below the tael are generally denoted by the adjuncts $l i$, ho, lsin, jut, etc., i. e., one tenth, one hundredth, one thousandth, ete.

Capacity: This is regulated, as before said, ly weight ; the existing dry meastres, which have been adopted for the convenience of conmerce for grain and seeds, vary considerably in consequence of tho irregularity of the material (bamboo) of which they are made. The theory is rupposed to be as follows: 1 ping $=5 ; \mathrm{u}=16$ hok $=: 32$ shik $=80$ tau; 1 tau $=10$ shing $=$ 100 kop $=200$ yeuk $=1060$ chenk $=10000$ chant $=100000$ tsut $=1000000 \mathrm{kwai}=6000000$ unk, or grains of maize. Of all these, there are on'y four actual measures; viz., the tau, the shing, the half-yhing, and the kop. These are also upon two ditjerent modules, distingulshed ly the adjuncts shiand hone; and in proportionate capucity as 100 to 65 respectively. It may the supposed that the latter were intended for $l i$, uid measures; and the: werage contents ure so reduced accordingly In the Dictionary.

Length : 1 yan $=10$ cheung $=100$ chik $=1000$ tsin $=$ 10000 fan . The chik, fixed hy the Mathematical Iloarl at lekin $=13 \cdot 125$ inches; used ly tradesmen in Canton $=14 \cdot 625$ to 14.81 inches; employed hy engineen of public works $=12.7$ liches; and that by which distances are usually measured $=12 \cdot 1$ inches.

Itinerary: 1 t 13.25 fan $=125$ tsin $=0.50$ li or miles; $1 \mathrm{lt}=18: 6$ English fect. This is the count since the Intervention of Eirojean mathematicians at 1'ckin. The former used to be 1 to $=192 \frac{1}{2} \mathrm{li}=\mathbf{7 9 3 0 0} \mathrm{po}=396 \mathbf{a}^{\circ} 00$ chik; $1 \mathrm{li}=1897 \frac{1}{1}$ linglish feet. Some anmbiguity arises from the use of the same worl, li (frohahly from liuropean ignorance of the language in not diseriminating between similar bit not dedentical terms), as a lower neasire, the $\frac{1}{10}$ of the fan. The sume aniblguity extends itself alsa to the following neries.

Agrarian: 1 king $=100$ man $=400 \mathrm{kok}=1000$ fan $=$ 24000 po. lut these are se uncertain that they have not been given.

Solid . Mrasures are products of tho choung, which is generally In this aeries 146 English feet.

Mindostan,--'The weights ani menwures of the indigenous goverminents of thls vust comentry (such as, for instance, Siudh, Nepaul, and the confederated

Sikhs, etc.), are elther too little known or too uncertaln to admit of any system. All that will be done is to give the relatlons of the princlpal measuros in common use, where European domination prevails or European commerce has established itself.

British Possessions: Bombay,-Weight : 1 candy $=$ 20 maunds or mans $=800$ seer $=24000$ pice. Dry Capacity : 1 candy $=8$ para $=128$ adoulie. Calcutta. Weight: 1 maon or mand $=40$ eeer $=640$ chattac $=$ 3200 sleca. Dry Capucity: 1 pullle $=4$ raik $=64$ khoonke $=320$ chattac. Length: 1 haut or covid $=8$ gheria $=72$ juob. Itinerary: 1 cosa $=4000$ haut. Agrarian: 1 biggali $=20$ cottah $=320$ chattack $=6400$ square corid. The chattack ls , in fact, a surface 5 covid in length by 4 covid in width. Madras.W'eight: 1 garé $=20$ candy or barmay $=400$ maund or mann $=3200$ visay; 1 visay $=40$ pollam $=400$ varahun. Diy Capacity: 1 garcó $=80$ pura $=400$ marcal $=3200$ puddy $=25600$ ollock. Liquid Capacity, like the dry, is determined by weight; and the denominations are tho same as in the latter. Agrarian: 1 casseney $=24$ maony $=240$ square covid.

Danish I'oosessions: Serampore and Tranquebar.The welghts and measures here are logally those of Denmark, and by custom those of Calcutta and Madras respectlvely.

French Possessions: Pondichery.-Tho colenial deun minations and diviklons ars ldentical with those of Madrus, although the values aro different.

Portugucse Possrssions: Goa.- Here Portuguese weights and measures are employed.

Japan.- Weight: 1 picul $=100$ catty $=1600$ tael = 16000 mas $=160000$ condurine. The connection of the: other measures is nut known.

Ottoman Asia: Aleppo, Smyma, etc.-The weights and measures liere are so variant, or are rather so mixed up with the units and values of foreign commerce, as nut to admit of satisfuctory classitication.

Persia,- H'right: 1 Latman $=6$ ratel $=300$ dirhem $=600$ mascais. This is the lontman of Tuuris; that of Shiraz, which is twice the value, appears properly to be part of the same system. The other metasures are unsystematic.

Siam. - Weight: 1 picul $=100$ eatty $=2000$ tall $=$ 8000 tical. Dry Capacity: 1 cohi $=40$ resti $=1600$ sat. Lenyth: 1 vouah $=\mathbf{2} \mathrm{ken}=8 \mathrm{ok}$. Itinerary: 1 roĕneng $=2000$ vouah.

1V. Eerons.-Austrian Eimpire: Viena.-Iright: 1 pfund $=2$ mark $=4$ vierling or vierding $=16$ moze $=$ 32 loth $=12 \times$ quent $=512$ pfennig. Apothecaries': 1 $\mathrm{p}_{\text {funl }}=1 \frac{1}{1}$ mark $=12$ unzo $=06$ drachma $=288$ scrupel $=55^{\circ} 50 \mathrm{gran}$. The murk is identical in both series, and $i_{3}$ the unit of gold and silver weight. 1 centher $=5$ steln $=100$ pfund. Liquid Capacity: 1 fuler $=3:$ eimer $=128$ viertel $=1312$ (imperial) mass; 1 mass $=2$ kanne $=4$ scidel $=8$ phlff. Jry Capacity: 1 unth $=30$ metze $=120$ viertel $=2.40$ achtel ; 1 achtel $=2$ utühmassel $=8$ futtermasuel $=16$ lecher $=128$ probmetze. Length: 1 hlafter $=6$ fuss $=72$ zoll $=864$ linie $=1036 \mathrm{~s}$ punkt. Itimerary: 1 maile $=4000$ klafter $=\mathbf{2} 4000$ fuss. Agrarian : 1 joch or jochart $=8$ metze $=586$ nyuare ruthe $=1600$ square klafter $=57600$ square fuss. Prague. - Height: 1 centner $=6$ stein $=120$ pfund. Tho luwer subdivisions are as in Vlenna; but their values, os well as of the terms just given, correspon! witt a lighter pound than tho imperlal standard. Liquil Capacity: 1 fase $=4$ elmer $=128$ pinte $=512$ scidel. Dry C'opacity: 1 atrieh $=1$ viertel $=10$ nassel $=192$ seidel. Agrarian: 1 joch of V'ienna $=2$ strich.
l'enetian Zombordy: Afilan.-I'right: 1'ess grosso: 1 libhra $=4$ quarto $=28$ uncia. Peso sottile: 1 libira $=12$ oncla $=288$ denaro $=$ tion 12 grano. Gold and silver are by the maren, subdlvided as follows: 1 maren $=H$ uncia $=102$ denars $=460^{6}$ grano. Apothecary : 1 llbbra peso sottle $=12$ oncia $=96$ drachma $=288$ serupolo $=6912$ grano. In 1808 the French kilogram, with decimul anhelivitions, was introduced; which is the
new Italian pound or metrical pound of the Dictionary. 1 rubbio $=10$ libbra metrica $=100$ oncis $=1000$ grosso $=10009$ deasro $=100000$ grano. Liquid Capucity: 1 Urenta $=8$ staja $=6$ mias $=12$ quartaro $=16$ bussa $=48$ pinta $=96$ boccale. - Dry Capacity: 1 moggio $=8$ stajo $=16$ starello $=32$ quartaro $=128$ meta $=512$ quartino. In the new metrical system capacity is reckoned as follows: 1 soma $=10$ mina $=100$ pinta $=1000$ coppo. Length: 1 braccio $=12$ oncia $=144$ puuto $=1728$ atomo. New measure in 1803: 1 metro or braccio $=10$ palmo $=100$ dito $=1000$ atomo. Itinerary since 1803: 1 mig lio $=1000$ metro. The old mile of Milsn is not correlative; but appesrs, In theory to be equivalont to 3000 braccio. Agrarian: 1 penica $=24$ tavola $=96$ square cavezzo $=3456$ square piede The piede, or foot, used here is not employed in any oiner part of the system. It seems to have beun orighally $\frac{\text { en }}{4}$ of the braccio. Since 1823: I tornatura $=100$ aquare palmo. The tornatura is identical with the French are. Venice. Weight: Peso grosso: 1 llbbra $=2$ marco $=12$ oncia $=$ 72 asggio $=2304$ carato $=0216$ grano. Peso sottile: 1 libbra $=12$ oncia $=72$ snggio $=1728$ carato $=6912$ grano. The pesogrosso is used ingeneral commereo; the marco and Its subdivisions are for gold and ailver and precious atones; the peso sottile for druge, colors, coffee, tea, sugar, silk, rice, and butter. This last ia estimated at $\frac{12}{19}$ of the former. When used for modicines, it is subdivided as the Austrian apothecary pound. Liquid Capacity: 1 anfora $=4$ bigonzio $=8$ concia or mastello $=48$ secchio $=152$ bozza $=512$ boccalo $=768$ quartuccio ; 1 botta $=5$ bigonzio. Dry Capacity: 1 moggio $=$ 4 stajo or staro $=16$ quarto $=64$ quartarolo. Length: 1 braccio $=2$ piede. This braccio is for woolens, etc. ; that for silk is shorter. Itinerary: 1 miglis $=1000$ passo $=5000$ piede. Agrarian: 1 campo $=640$ tavoln, or square pertica, or aquare cavezzu $=25920$ aquare piede. New measure: 1 migliajo $=1000$ square passo $=20000$ square piede. The metrical welghts and measures, described under Milan, are also employed here as there in all governmental transactions. Otherwise the local measures are still in use. In the other parts of the Austrian dominions, such as Dalmatia, Hungary, Moravia, etc., local systems, if they ever existed, are now only discornible in the names ant values of $n$ few disconnected and apparently arbitrary measures.

Haden.- 13pight : Old measure : 1 pfund $=32$ loth $=128$ quentchen. New mensure : 1 pfand $=10$ zehnling $=100$ centuss $=1000$ pfennig $=10000$ nes. The new ineasure was established $\ln 1810$, when the value of the pfund was taken at $\frac{1}{1}$ kilogram, and a decimal division adopted; but the old division is still retained, and is applied both to the old unit and to the new. The mark of Cologne is cmployed for gold and ailver; and the value and subdivisions of the Ntirnberg apothecary pound for drugs and medlicines. Liquid Capacity: 1 fuder $=10 \mathrm{olm}=100$ stütze $=1000$ mass $=10000$ glas ; 1 ohtn $=\mathbf{1 5}$ decalitres of France. Iry Capacity: 1 zuber $=: 10$ malter $=100$ sester $=1000$ minsslein $=10000$ becher; 1 sester $=15$ decalitres of France. Length: 1 rithe $=10$ fuss $=100$ zull $=1000$ linle $=10000$ punkt; 1 ruihe $=3$ mètres of l'rance. The olll fuss was 3 per cent. shorter, but has been merged into the now one. linerary: 1 meile $=2$ stundon $=88$ kilometres of France. Agrarian: 1 morgen $=4$ viertel or quart $=$ 400 square ruthe $=40000$ aquare fuss. Solid : 1 klafter, for flre-wood $=6$ foct long $\times 6$ feet high $\times 6$ fect deep $=128$ cubic fuss. What la here called deop signilies in every ense the length of the billet or log.

Ravaria.-Weight: 1 pfund $=16$ unze $=32$ loth $=128$ quentchen. A cniform value was established for the unit in 1811, corresponding with the new French welght. The apothecary pound was at the same time defined at $\frac{3 n}{3}$ of the unit, and is divided like the Nornberg apothecary pound. Gold and silver are by tbe mark Cologne. Liquid 'apacity': 1 eimer $=60$ mass. kanne $=240$ quartel. Dry Capacity: 1 scheffol $=6$
metze $=12$ viertel $=48$ massel or achtel $=96$ mäsglein $=102$ dreissiger ; 1 scheffel $=208$ liquid massasanne, in actual content. Length: 1 fuss $=12$ zoll $=144$ linle $=1728$ punht. Th/s unit was established in 1809 , and defined in terms of the old French measure, at 129.58 liynes de Paris. The near approach of this value to 8 decimetres in the new French system alluws the fuss, as is frequently done, to be decimally divided. Thas tho elle of Rhenish Bavaria is 4 fuss of this count, or 12 decimetres of France. Tho legal elle is 2 fuss $10 t$ zoll of the legal value above. Itinerary: 1 meile $=$ 2400 ruthe $=24000$ fuss; 1 meile of Anspach $=2$ stunde $=2880$ ruthe $=28800$ fuss. Agrarian : 1 juchart, morgen, or tagwerk $=400$ square ruthe $=40000$ square fues. Solid: 1 klafter, for fire-wood $=6$ feet long $\times 6$ feet hig i $\times 31$ fcet deep $=126$ cubic fuss. In Rhenish Bavan: generally, the blllets are 4 feet long, which makes the klafter $=144$ cuble fuss. Augsburg: Nürnberg.-Thu denominations and values of local measures retalned In both of these places, and elsewhere in Bavaria, are given in tho Lictionsry. The apothecary weight of Nurnberg, which is general over all Germany for medicines (as the mark of Cologne is for specie), is 是 of the old Nürnberg money pound, whirh last is sivided as follows: 1 pfund $=2$ murk $=16$ unze $=16$ luth $=128$ quart $=512$ pfennig $=8220$ as-ducat. The apothecary pound, as under: 1 pfund $=12$ unze $=96$ drachma $=$ 228 scrupel $=576$ obolus or heller $=5760$ gran.

Belgium,-Weight: Old measure of Brussels. Commercinl: 1 livre or pond $=4$ quarteron $=16$ once $=64$ satin $=128$ gros $=9216$ grains. Specie: 1 livre or pond $=2$ mark $=16$ once $=320$ esterlin $=1280$ felins $=10240$ as $=1$ pond Troy of IIolland. The new weight is the kilogram and its decimal subdivlsions, eatablished since 1816. The apothecaries' unitary pound, subdivided like that of Nürnberg, is, since 1817, 交 of the kilogranı of France; but in this respect there is not entire uniformity. The other measures are all in value corresponding with tho metrical system of lirance, and decimnlly subdivided. Thus the unit for liquida (the $v a t$ ) ind that fur try (the mudde) are each $=100$ litres of France. The unitary el or aune $=1$ metre; the agrarian unit (the vierkantebunder) $=1$ ere of France, or nearly 4 square perches English; the metrical mili or mile $=1$ kilomitro. Other terms remaining from the old systems, but now disconnected, are given in the Dietionary.

Bremen.-Weight : 1 pfund = 2 mark $=16$ unze $=82$ loth $=128$ quentchen $=512$ ort $=498.59$ grammes of France, since 1818. There is another piund used in retnil commerce, which is 6 per cent. lighter than the standard. Gold and silver are welghed by the mark of Cologne, and medicines ly the apothecary pound of Nurnberg. 1 schiffpfund $=20$ liespfund $=290$ pfund; 1 frachitpfund or pfundschwer $=300$ pfund ; 1 centner $=110$ pfund. Liquid Capacity: 1 fuder $=4$ oxhoft $=$ $6 \mathrm{ohm}=24$ anker $=120$ viertel $=270$ atubehen $=1050$ quartier $=4320$ mingel. Dry Capacity: 1 scheffel $=4$ viertel $=16$ spint. $\quad$ Length : 1 ell $-=2$ fuss $=24$ zoll = 240 linle. Surveyors divide the fuss decimally. Itin. evary: 1 ruthe $=2$ g klafter $=8$ elle $=16$ fuss. The usual meile contains 20000 Rhenisli feet. Agrarian: : morgen $=120$ square ruthe $=80720$ square fuss. Solid. : 1 faden $=6$ feet long $\times 6$ feet high $\times 2$ feet deep $=72$ cubic fuss. Fire-wood is also sometimes measured by the reep or reif, a cireular pille $17 \frac{1}{2}$ fuss in circumference, the billets varying from $4 \frac{1}{3}$ to 6 fuss in length. The reif yields from 1 to 2 faden, accordingly.

Brunsacick,-IVeight: 1 pfund $=2$ mark $=32$ loth $=$ 128 quentehen $=512$ pfennig $=1024$ heller; 1 schiffpfund $=20$ lies fund $=280$ pfund. Goid and silver by the mark of Cologree, medlcines by the apothecary puund of Nurnberg. 1 fuder $=4$ oxhoft $=6$ ohm $=240$ stabchen $=960$ c cartler $=1920$ nbssel ; 1 fass of beer $=$ 4 tonn ${ }^{*}=108$ stubehen $=432$ quartior $=864$ nössel ; 1 fuss of mum $=100$ st ahchen $=400$ quartier $=900$ nössel. Dry Cofacity: 1 schuftel $=10$ himt $=40$ vlerfass $=160$
becher or locher. Length: 1 elle $=2$ schuh $=24$ zoll. Itinsrary: 1 ruthe $=8$ elle $=16$ schuh. The usual meilo contains 34424 Rhenish foet. Agrarian: 1 morgen $=120$ aquare ruthe $=60720$ equare schuh.

Cracos. - Weight : 1 funt $=2$ mark $=48$ skoyelec. Apothecary weaght is that of Narmberg. Liquid Cupacity: 1 stangiew $=2$ beczka $=72$ garnioc $=28 \mathrm{kwart}$. Dry Capacity: 1 korzec $=2$ polkorzow $=4$ cwlore $=32$ garcy or garniec. Length: 1 stopa $=12$ calow $=144$ linlow $=1728$ punkt. The other measures are those of Poland.

Denmark.-Weight: 1 pund $=2$ maric $=16$ unze $=32$ lod $=128$ quintin $=512$ ort $; 62$ pund $=$ welght of 1 cublc fod of rain-water at $16 \xi^{\circ}$ centigrade. Gold and silver is waighed by a pund nearly 6 per cent. lighter than, but not aliquot with, the commercial pound, and is subdivided like this last, only more minutely, into 8192 as $=03036$ gran. The royal Mint, however, uses the mark of Cologne. Apothecaries' weight is that of Nurnberg. 1 last $=16 \frac{1}{2}$ skippund $=144 \frac{4}{4}$ wang $=825$ lispund $=433$ bismerpund $=5200$ pund; 1 skippund $=$ 20 lispund $=320$ pund. Liquid Capacity: 1 aam $=4$ anker $=20$ viortel $=40$ stubchen $=77 \frac{1}{2}$ kande $=105$ pot $=620$ pägel. Dry Capacity: 1 toende $=4$ f jerding $=8$ skleppe $=32$ fjerdingkar $=144$ pot. Length : $1 \mathrm{aln}=2$ fod $=24$ tomme $=288$ linie. The forl represents $\frac{12}{8}$ of the pendulum beating seconds, in a vacuum, at the lovel of the sea, under the mean parallel of $45^{\circ}$ north latitude. Itinerary: $1 \mathrm{miil}=2400$ rode $=4000 \mathrm{favn}=$ 12000 aln $=24000$ fod. Agrarian: 1 pflug $=8$ toonde (hartkorn) $=32$ toende (sädeland) $=64$ skieppe $=256$ fjerdingkar $=768$ allum $=8072$ penge $=17920$ square rote $=1792000$ square fort. The measures of Holstein ure chiefly those of Hamburg, and those of Norway differ only locally, net systematically, from the Danish.

France. - Weight: 1 kilogrum $=100$ hectogram $=100$ decagiuai $=1000 \mathrm{gram}=10000$ declgram $=100000$ contlgram $=1000000$ milligram. The unit, or kilogram, is the weight of a culic decimotro of distilled water ot the temperature of maximum density, takea at $4^{\circ}$ centigrade, or $39^{\circ} \cdot 2$ Fahrenheit. 1 tonnenu $=10$ quintal $=100$ myriagrams $=1000$ kilograms. Apothecary weight has rot been so symmetrically and mulformly constructed. In the French pharmaceutical Colex, the gramme has been adopted as the key of the syatem, ond is considered as equivalent to $t$ of the old drachme. The once, habitually of 8 drachmes, is then 32 grams. But as this number is irrational with a decintal divislon, a compromise has been made as follows: 1.1 double livro (kilogram) $=2$ livre $=4$ demilivre $=8$ quarterons (of $\ddagger$ onces) $=1000$ grans. 2. 1 once $=8$ gros, or drachme $=640 \mathrm{grain}=12 \$ 0$ demigrain $=32$ grams, lnstead of $31 \not$ grams, as it inust have been, if the same binary division had 'seen carried through.

Liquid and Dry Capacity: 1 kilolitre $=\mathbf{1 0}$ hectolitre $=100$ decalitre $=1000$ litre $=10000$, lecilitre $=100000$ centilitre $=1000000$ nillilitre. The unit or litre is the cubic decimetre; the kilolitre is therefore a cubic metre. The myrialitro $=心$ kilulitre.

Iength and lhistance: 1 m jrhumetre $=10$ kilometre $=100$ hectometre $=1000$ decametre $=10000$ metre $=$ 100000 declmetre $=1000000$ centimetre $=100000060$ millimetro. The metre, or unit, is assumed to be the tenmillionth of the quadrant, or the forty-millionth of the wholo circumference of tho globe, measured over the poles. The actual value assligned to tt , in apite of the pains taken in the gemetical nid ertiatical operations, is, after nll, owing to the nature of the very operations, to be considered as only n near npproximation. The provisional metre of $170^{\circ}$ is, in fact (as more recent investigations show), nearer the most probable value nimed at chan thas one adopted in the law of 1709. But the utnost error ls only alsout 3010 of the length, or absolutely less than moter of un inch.

Agrarian: 1 liectare $=100$ nre $=10000$ centlare or square metres. 'lhis oart of the system aduits the
same decimal multipllcation and subdivisions as the others in theory; but, in point of fact, the lntermodiate terms havo beon rejocted.

Solid: 1 decastere $=10$ store $=100$ declstere. The stere is the cuble metre; and lts content, therefore, is the same as the capacity of the kllolitre. The terme glven ure all that are retalned in the nomenclature. The names even of the old measures of France having been interdicted slnce 1840 by law, their relatlons and combinations are of no remalning pructlcul interest. Tho terms and values will be found in the Dictlonary.

Franlfort.-Weight: 1 pfund $=2$ mark $=16$ unze $=$ 32 loth $=128$ quentchen $=512$ pfennig $=1024$ lieller. There is also a commercial pound for retail, called silber-pfund, about 8 per cent. Iighter than the former, but ainnilarly divided. Flour and malt aro weighed by a pound of $32 \frac{10}{10}$ loth silber-pfund, meat and butter by 33 loth of tha same system, and fish by one of 35 loth. Gold and silver nro reckoned ly Cologne weight, nnd drugs and medicines by the apothecary pound of Nürnberg. Liquid Capacity: 1 fuder $=6$ ohm $=120$ viertel $=480$ eich-mass $=540$ neu-mass; 1 mass $=4$ schoppen. Dry Capacity: 1 malter or nchtel $=4$ slmmer $=8$ metzo $=16$ sechter $=64$ gescheld $=256$ mässchen or viertel $=1024$ schrott. A malter of wheat weighs from 175 to 190 lhs. flour welght; rye, 165 to 480 Jhs. flour welight ; barley, 150 to 165 lhs. flour weight ; oats, 95 to 110 lbs, flour welght; flour, 143 Hes. flour weight. This includes tho tare of the sack, which is reckoned at 3 flour pounds. Length: 1 werksehuh $=12$ zoll $=144$ linle $; 1$ ruthe $=12 \frac{1}{2}$ werkschuh $=$ 10 feldfuse $=100 \mathrm{zoll}=1000$ linle. Agrarian: 1 hufe $=30$ morgen $=4800$ square ruthe $=480000$ вчиare feldfuss. Solid, fur fire-wood: 1 klafter $=0 \mathrm{~W}$. long $\times 7$ W. high $\times 3$ W. deep $=126$ culic werkschuh; 1 stecken $=3 \frac{1}{}$ werkschuh, culsed $=43$ enhic werkschuh.

Great Britain. - Tho imperial standards adopted since 1825 nltered only the value of the capacity measures. The weights and the long, ngrarinn, and solid measures nre identieal with those of the United States. Cnpacity measures are the same, both for liquids and things ilry. The origination of these is with the gallon, which contains 10 pounds avolrdupois of distitled water at 30 inches of the harumeter and $62^{\circ}$ Fahreabeit loth for the air and the water. Fight of such gallons make the furbel. The old sulndivisions and nomenclature, as far as npplicable, nire retained.

Weight : Troy and apothecary have been given muder the hend Cxiten States. Avolniupois: 1 ton $=20$ hundred-welght $=80$ quarter $=22.10$ pound $=35810$ ounce $=5 \overline{3} 3440$ dram. Wool: 1 last $=12$ sack $=21$ wey $=156$ tod $=812$ кtone $=624$ clove $=4368$ pounl.
Liquid Cupacity: Old wine measure: 1 tum $=2$ pipe $=3$ puncheon $=4$ hogshead $=6$ tierce $=8$ quarter-ciasks $=252$ gallon $=1008$ quart $=2616$ pint. Ohd hecr measure: 1 lutt $=1 \frac{1}{2}$ puncheon $=2$ hogshend $=3$ harrel $=0$ killerkin $=12$ tirkin $=108$ gullon. Alo measure was the aame as to the gallon and its subdivisions; but th: firkin of alo was only 8 gallons, and the hogshead of ale 48 gallons, Instead of 0 and $6 f$ gallons respectively.

Iry Capacity: Old neasure: 1 last $=2$ wey $=10$ quarter $=20$ coom $=80$ bushel $=320$ peek $=610$ gallons $=5120$ pint.

Length: 1 yard $=3$ feet $=36$ linches $=10 \mathrm{x}$ bariny-corn $=432$ line. Thoth measure: 1 French ell $=1$ ! linglinh ell $=1 \frac{1}{2}$ yarl $=2$ Flenilsh ell $=6$ quartcos $=27^{\prime}$ nail $=5 \cdot 1$ Ineh.

Ifambury.- Weight: 1 pfund $=2$ mark $=16$ unze $=$ 32 loth $=128$ quentchen $=012$ prennig. Gohd nud silver ary welphed lyy the merk of Cologne, and medivino by Narnberg npothecary welght. 1 zchiffpfund $=2 \frac{1}{5}$ centner $=20$ Ileapifund $=2 x 0$ pfund. This is sed trelght ; wagon welght Is also calleil achiffifund, lut = 320 pfund. Liquid Capacity: 1 fuder $=1$ oxhoft $=5$ tonne $=0$ alm $=2.4$ miker $=86$ elucr $=\mathbf{1 2 0}$ viertel $=2.10$ stohehen $=480$ kanne $=000$ ( $\quad$ uartier $\Rightarrow 1920$ Ussel ; 1 fass, for whale-oll $=1 ;$ tonne $=7$; stechkanne $=120$
margel $=160$ quartier, Dry Capacity: 1 last, for wheat and grain generally, and seeds $=3$ wispel $=30$ scheffel $=60$ fass $=120$ hinit $=480$ spint ; 1 stock, for oats und barisy $=1+$ last, and similarly subulividert. The seheffel is hardly used; the fass is the principal measure. The iadications of the steelyard used for welghing graln, and quoted in the Prics Current, is upon $1 \frac{1}{4}$ fass of such grain respectively. The estallished weight of the fase ls: of harloy, 68 pfund; beans, 108 pfund; oats, 52 pfund; peas, 100 pfund; rye, 81 pfund; wheat, 86 pfund. Length: 1 elle $=2$ fuss $=24$ zoll $=192$ achtel. Ship-builders, for the measurement of apars, etc., divide the fuss into 3 palu. Englneers anul surveyors use the phenish foot and inch, decimsily divided. Itinerary: 1 meile $=200$ ruths $=24000$ Rhenish fuss. Agrarian: There are two ruthe or perches in land meusure, the marsehruthe equal to 7 ell, and the geestruthe to 8 ell. Oit course, 1 square geestruthe $=1 \frac{130}{8}$ marsehrithe $=256$ square fuss; 1 morgen $=600$ aquare marschruthe $=117600$ squaro fuss. Solid: 1 klafter or faden $=6$ F. long $\times 6$ F. high $\times 2$ F. deep $=88$ g cuhic fuss; 1 messbergerfaden $=6$ F $\mathbf{F}$. long $\times 8 \mathrm{~F}$. high $\times 2 \mathrm{~F}$. deep $=596$ culic fuss.

Hanorer.-Weight: 1 pfund $=2$ mark $=16$ unze $=32$ loth $=128$ quenteher $=512$ örteben. Gold and silver are weighed by th sark of Cologne. The apothecary pound is $\frac{3}{2}$ oi the commercial pfund, suldivided like that of Nürnberg, which last is itself frequontly used. Siquid Capacity: 1 fuder $=4$ oxheft $=6 \mathrm{ahm}=15$ eimer $=24$ anker $=120$ viertel $=240$ stübehen $=480$ kanne $=$ 060 quartier $=1920$ nëssel ; 1 fass for beer $=4$ tonne $=$ 10.1 stülchen $=208$ kanno $=410$ quartier. Dry Capacity: 1 last $=2$ wispel $=16$ malter $=96$ himt $=288$ drittel $=384$ vierfass. Length $: 1$ elle $=2$ fuss $=24$ zell $=$ 192 achtel $=288$ linis. Itinerary: 1 meile (siace 1818) $=1 \cdot 16 \frac{2}{2}$ ruthe $=11700 \mathrm{clle}=25400$ fuss. The old or polizei-meile was $22 \overline{4} 4$ ruthe. Agrarion: 1 mergen of Calenberg $=1 \frac{1}{2}$ droln $=2$ vorling $=120$ square ruthe $=$ $30 \overline{2} 20$ square fuss.

ICsse Cassel. - Weight $: 1$ pfund $=16$ unze $=32$ loth $=128$ quentehen. In retail the pfund of Berlin (which is ahnut 3 per cent. lighter) is employed, subdivided as above. Gold and silver are ly the Cologne; medicine, ete., by the Nürnberg weight. Liquid Capacity: 1 fuder $=6 \mathrm{ohm}=120$ viertel $=480 \mathrm{mass}=1020$ schoppen. Dry Capacity: 1 seheffel $=2$ him $=8$ metze $=$ 32 müsschen. Length: 1 waldfuss or standurd $=12$ zoll $=1.4$ linie. Itinerary: 1 rutho $=7$ elle $=14$ landfuss, or surveyors' foot. The ruthe is sometines divided decimally into 10 fuss, ete. Agrarian: 1 acker $=150$ square ruthe $=29400$ square landfuss. Solid: 1 klufter $=5$ F. long $\times 5$ F. high $\times 6$ F. deop $=150$ cubic waidfuss.
Messe-Darmstadt.-The old woights and measures wero those of Frunkfort. These established in 1821 are as follows: Wreight : 1 pfund $=32$ loth $=128$ quentchen $=512$ richtpfennig $=\$$ kilogram of France. Gold and silvor are still reckoned by tho mark of Cologne, and Narnberg furnishes the apothecary weight. Liquid Cupacity: 1 fuder $:=6$ ohm $=120$ viertel $=400 \mathrm{msss}=$ 1920 sehoppen. The schoppen $=\frac{1}{3}$ litro of Franco. Dry Capacity: I malter $=4$ simuner $=16$ אümpf $=64$ gescheld $=256$ mässchen $=128$ litre of France. Iength 1 klafter $=10$ fuss $=100 \mathrm{zell}=\mathbf{1 0 0 0}$ linio. The fuss is $\ddagger$ metre of Franco; the ello is : metre. Agrarian: 1 mergen $=4$ viertol $=400$ square klafter $=40100$ square fuss. Solid: 1 stecken $=5 \mathrm{~F}$. long $\times 5 \mathrm{~F}$. hith $\times 4 \mathrm{~F}$. deep $=100$ cubic fuss. The old stecken wat $6 \times 6 \times 4$ $=144$ cubic feet, old measure.

Holland.-Since 1816 tho values and divialons of the weights and mensures have been according to the metricul system of France, retaining more or less of the odd nomenclaturo, as will he found under that head.

Ionian Isles.-Since 1817, when the new Constitution of these Isles was ratified by the English Parliament, the standard welghta and measures have beca those of Greatillitain. There atill remair, however, several
detacaed nanaees of Turklsh and Venetian origin, which will be found under their proper heads.
Lübec. - Weight: 1 pfand=2 mark $=16$ unze $=32$ loth $=128$ quentehea $=512$ pfennig. Gold and sllver weight is that of Cologne ; apothecary weight of Nürnherg. The eehiffpfund and tonne are divided as at Hamburg. Liquid Capacity: 1 fuder $=4$ oxheft $=6$ $\mathrm{ahm}=2.1$ anker $=30$ eimer $=120$ viertel $=240$ stühchen $=480$ kanne $=960$ quartier $=1920$ plank $=3840$ ort. Dry Capacity: 1 hast $=8$ drömt $=24$ tonne $=96$ seheffel $=384$ fass. Length $; 1$ elle $=2$ fues $=24$ zoll $=144$ linle $=1728$ punkt. Other usances here are the eame as at Hamburg.

Lucca.-The welghts and messures of this territory are, in systom, the same as those of Tuseany, of which it will hereafter form a part.
Mecklenburg Schverin.-What is under this will also apply to the other Grand Duely of Meeklenburg Strelitz, both of whose systems of welghte and length measures are these of Hamburg; while the capacity measures are, In fuct, those of Lübec.

Modena.-Weight: 1 libsra or lira $=12$ oncia $=192$ ferlino; 1 libbrs, for gold $\varepsilon$ nd siliver $=12$ oneia $=96$ ottava $=102$ ferlino $=1920$ carato $=7680$ grano. Apotheeary : 1 liblra $=12$ oncia $=90$ drachma $=288$ serupolo $=6012$ grano. Liquid Capacity: 1 barile $=20$ iasco $=$ 40 beccale. Dry Capacity : 1 sacco $=2$ stajo. Agrarian : 1 biolea $=72$ tavela $=288$ square cavezzo $=10368$ square piede. The piede of Reggio has the same relations, but a different vulue, with that of Medena, the city. The other measures appear arisitrary.
Ottoman Empire, or Turkey in Europe.-Neither our knowledge nor, perhape, the actual state of weights and measures in this emplie, allow of their being arranged in any eatisfactory, eystematic exhilition ; and the same may l.e said of the modern kingdom of Greece. The value and denominations of isulated units have been given before.
Parma.-Weight : 1 llbbra= $=12$ oncia $=288$ denaro $=6912$ grano. Gold and silver are weighed by the mareo of Milan, or by the new Itulian pound. The apothecary pound is identical with the commercial litbra. The rubblo Is 25 libbra. Liquid Capacity is measured as at Milsn. Dry Capucity: 1 stajo $=2$ mina $=16$ quartsrole. Length: 1 pertica $=6$ bruccio di legno $=72$ oncia $=864$ punto $=10368$ atomc. Agrarian: 1 biolea $=6$ staro $=72$ tavols $=288$ square pertica $=10368$ square braccio.
Portugal.-Weight : 1 arratel $=2$ mareo or maio-arratel $=4$ quarta $=16$ onça $=128$ outava $=384$ escropulo $=9216$ grao. This weight, from the onça down, answers for all purposes. Gold and silver are reckoned by the maree of 8 en ;as, and medicines are weighed by a llibra of 12 onças, which is therefors ${ }^{\text {最 arratel. }} 1$ tonclada $=191$ quintal $=54$ arrela $=1728$ arratel. Liquid Capacity: 1 almude $=2$ slquelto or cantaro $=12$ canada $=24$ meia-canada $=48$ quartilho $=96$ meioquartilho; 1 tonelads $=2$ pipa or beta $=52$ alinude $=$ 10.4 alqueire. Dry Capacity: z moio $=15$ fanga $=60$ alqueire $=120$ meio-nlqueire $=640$ quarto $=480$ eutava $=060$ maquiu or nein-outava. Length: 1 eovado $=3$ palmo da craveira $=24$ polie zada $=36$ dedo $=144$ grao $=288$ linha $=3456$ ponto. The commercial covade, called corado avantrjado, has 243 pollegadas. Ativerary : 1 braca $=1 \mathrm{f}$ passo $=2$ vara $=6$ g pe $=10$ palmo da craveirs; 1 legoa $=3$ milb $:=24$ estadlo. Agrarian: 1 geira $=4840$ square vars.
Prussia.-The weights and measares were reformed here iu 1816. Weight: 1 pfund $=2$ mark $=16$ unze $=$ 32 loth $=128$ quentehen. The unitary pfund is of of a cubie foot of listillell water, weighed, und reduced to a vacuum at the temperature of $15^{\circ}$ Reaumur ( $65{ }^{\circ}{ }^{\circ}$ Fahrenheit). Gold and silver are still reckoned by the mark of Cologne, to which the Prussian mark is consldered as equivalont; and the apothecary pouad, divided like that of Nürnberg, is 号 pfund. 1 sehiffpfund $=3$ centner $=15$ etein $=20$ liesp,fund $=830$ pfund.

Liquid Capacity： 1 fuder $=0$ ohm $=12$ eimer $=24$ anker $=720$ quart $=1440$ össel．The elmer contains 3840 cu － bic zolle or luchea．Dry Capacity： 1 last，for wheat and rye $=4$ wispel $=6$ malter $=72$ scheffel $=288$ viertel $=1152$ metze $=4508$ masschen ； 1 last，for barley and oats $=48$ acheffel．The scheffel is $\frac{1}{5}$ of the eimer in abanlute capacity，or 3072 cublo zolle．Length： 1 fuss （rheinfuss）$=12$ zell $=144$ linie $=1 ; 28$ scrupel．This unit has been established at 139,13 llgnes de Paris． The elle is $25 \frac{1}{3}$ zolle．Itinerary： 1 ruthe $=10$ land－ fuss $=12$ rhelnfuss．The landfuss is also subulivided decimally into $\mathbf{1 0}$ zoll $=\mathbf{1 0 0}$ linis $=\mathbf{1 0 0 0}$ serupel ； 1 post－ meile $=2000$ ruthe $=24000$ rheinfuss．Agrarian： 1 morgen $=180$ square ruthe $=25920$ square rhelnfuss， Solid： 1 L after $=6 \mathrm{~F}$ ．lang $\times 6 \mathrm{~F}$ ．high $\times 3 \mathrm{~F}$ ．deep $=108$ culsie rheinfuss； 1 haufen $=41$ klafter $=18 \mathrm{~F}$ ． long $\times 9 \mathrm{~F}$ ．high $\times 3 \mathrm{~F}$ ．deep $=486$ cutic rheinfuas． The old values and denominationa which aro still re－ tained，as well in the capital as in aeveral principal cities，are given under those heads．
Roman States．－Under this name is intended what has，until recently，been known as the State of the Church．Late events have showi this last titlo to be uncortain．Two principal citles comprehend all thut is systematic in weights and measures．Bolognn．－ Weight： 1 liblura $=12$ oncia $=96$ ottava $=192$ forlino $=$ 1020 carato $=7686$ grano．This welght serves also for gold and nilver，though the new Italian metrical pound （the kilogram）is also employed，as well as the libtria of IRome．In Ferrara，uso is still had of tha riarco of Milan．Apothecary ： 1 libbra $=12$ oncin $=96$ drachma $=288$ serupolo $=6912$ grano．This lihura weighs $11 \frac{1}{6}$ commercial oucie．Liquid Cnpucity： 1 corba $=2$ mezza－ corba $=4$ quarterone or quarterole $=60$ boccale $=240$ foglietta．Dry C＇upucity： 1 corba $=2$ atajo or staro $=$ 8 quartervie $=32$ quarticino or quartuccione．These two corbe are of the snme capacity．Agrarian： 1 tor－ natura $=140 \mathrm{square}$ jertica $=1 \mathrm{f} 000 \mathrm{square}$ pie．Rome． - Height： 1 libbra $=12$ oncia $=288$ denaro $=6912$ grano．The sane weight serves for gold and silver， and for medicine．Liquid Capucity： 1 Lotta $=16$ barilo $=512$ boccale $=2048$ foglietta $=8192$ quartuccio．The harile for oil contains only $\frac{7}{8}$ of tho ubove，or 28 boc－ cale．But oil has a proper measure，viz．； 1 soma $=2$ mastello or pelle $=20$ cugnatcilo $=80$ boccale．Dry Capacity： 1 rubblo $=2$ rubbiatella $=4$ quarta $=8$ quar－ tarella $=12$ staja $=16$ atarello $=22$ scorzo $=88$ quartuc－ cio．Length and Distance： 1 canna（ordinary）$=2$ br cecto $=6$ pió $=8$ paluno $=24$ linea； 1 canna（urchi－ tects＇，etc．$)=-\frac{1}{2}$ pi $\delta=10$ paimo $=120$ oncia $=600$ minuto $=1200$ decimo $; 1$ canna di ara $=1 \frac{1}{2}$ bracelo di ara $=0$ palino di ara； 1 catenu $=10$ atajole $=031$ palmo（archi－ tects＇）．Agre riun： 1 rubbio $=4$ quarta $=7$ pezza $=1$ t seorzo $=32$ quartuccio $=112$ squaro catena $=11200$ square stajolo $=8 ; 0300$ spuare palmo（arciitects＇）．

Russia in Aurope：St．Peteraburg．－I Feight： 1 funt $=12$ lana $=32$ loth $=96$ zolotnic $=9216$ doli．This is ＂sed for gold and silver also，and tho Nurnherg veight ；$y$ apothecarice． 1 packen $=3$ berkowitz $=i 16$ pud $=$ 1200 funt．Liquid Capucity： 1 velro $=4$ twehetwerk

Poland had atill its own Leglalature，and which reated upon the French metrical system，is nearly as fol－ lows：Weight： 1 funt $:=16$ lann $=32$ leth $=48$ akeyclec $=128$ drachune $=884$ skivpulow $=0210$ granew $=50688$ granikow $=405504$ mili．grammow．The milligram－ mow la exactly the milligrim of France．The npothe－ cary pound is $358 \frac{1}{2}$ grams oi France，and divided like Nürnberg weight．The old funt of Waraaw proper was $\frac{1}{15}$ lighter；and the old quintal was of 5 kaminleck， or 160 funt．The new kaminleck la of 25 funt．Liquid Capacity： 1 stangiew $=2$ beczka $=50$ garniec $=200$ $k$ wart $i=800$ kwaterkj．The kwarti is the litre of Frnnce，and the beczka，therefore，the hectolltre．For－ merly the beczka was divided into 86 garniec，and 144 k warti．Dry Capacity： 1 korzec $=4$ ewiere $=82$ gar－ niec or garcy $=128 \mathrm{kwartl}=512 \mathrm{kwaterki}$ ．The kwartl is the same for all capacity；and the korzec is，there－ fore， 128 litres of France．Length： 1 lokioc $=2$ stopa $=4$ cwlerc $=24$ calow $=288$ liniow $=5.6$ millimetrow $=576$ millinetre of France ； 1 sznurow $=10$ pretow $=$ 100 precikow $=150$ stopa $=1000$ lawek $=1800$ calow． The precikow la the geometrical fint，used by survey－ ors．Itinerary distancea are measured by the verst of Ruasin， 8 of whilch（ $=29633$ atopa）mnke the unitary league．Agrarian： 1 wloka $=30$ morgow $=90$ square aznurow $=9000$ square pretow $=900000$ square prect－ kow．

Sordinia．－The weights and measures of the island of Sardinln，which can not be called systematic，will bo found in the Dicionary．Duchy of Genoa．－Weight； 1 libbra（peso scarso）$=12$ oncia $=288$ denaro $=6912$ grano．This is the ordinary weight of commerce， which is uned also by apothcearics．The rottolo is 11 libbra．The peso grosso is 10 per cent．heavier than the peso scarso，and has sometimes its rottolu．Goli and silver are weighed by the marce of Turin．The rubbio，or quarter of the centinajo，has 25 libhra in either weigbt．Liquid Capacity： 1 mezzaruola $=2$ barile $=100$ pinta $=180$ amula．Dry Capacity： 1 mina $=8$ quarte $=96$ gonbetta．Lenght： 1 piede liprando $=12$ oneia $=1.14$ junto $=1728$ atomo； .1 piede manuale $=8$ oncia ； 1 canma $=4 \frac{7}{7}$ bracelo $=10$ palmo $=6$ g piede manuale．Hut this last is hypothetical．The land surveyors use a camna of 12 palmo，which is property a canclia．Ilut canne are found of all lengtha，from $\$$ to 12 jualmi．Turin．－I＇cight： 1 libura $=1 \frac{1}{1}$ un roo $=12$ onela $=96$ ottavo $=288$ denaro $=6912$ grano 165889 granettino．For gold and silver the marro is divided as unter： 1 marce $=8$ oneia $=192$ denaro $=$ 1152 carato $=4608$ grano $=110592$ granettino．The apothecury pound is $1 t$ marco，und is divided like the samo welght at Belogna．Liquid Cnpacity： 1 carro $=10$ hrenta $=360$ pinta $=720$ boccale $=1.4 .10$ quartino． Dry Cupheity： 1 sacco $=3$ stajo $=6$ minn $=12$ yartiere $=48$ copello $=960$ cucchlaro．Length：The smalior neasurea are divthed as at Genoa． 1 pertica＝ 2 tra－ buceo $=10 \%$ raso $=12$ piede $\mathrm{lij}_{\mathrm{j}} \mathrm{ran}$ alo． ／tiverary： 1 iniglio $=1800$ tesa $=4: 183 \frac{1}{1}$ piede liprando： $\mathbf{t a} 500$ piche mannale．Agrarian： 1 giornata $=100$ tavola，or square pertica $=400$ squere trabucco $=14400$ square piede li－ pranto．

Sazony．－For the weights and measures of thisking－ dom，where there has heen no recent estabisiment， will bo taken what prevails at Leipsic．lifight：I pfund $=2$ mark $=16$ unze $=32$ loth $=128$ quenticin $516 \mathrm{pfennig}=7680 \mathrm{gran}$ ．Gold and silver are ly the mark of Cologne．Apothecary weight is that of Xörn． berg．The centner，or hundred－weight，consists gen－ eraliy of 110 pfond，but for live steck it is only 102 pfund；that called bergrgericht ut the mines，in 111 pfund；and stahl－gericht，for iren und steed，is 118 pfund．Liquid（＇apecity： 1 fuder $=2$ 亳 fass $=4$ tonmu $=6$ ahut $=12$ eimer $=14$ anker $=756$ kanns $=1612$ niss－ sel $=6048$ quartier．The fuder of Dresden is similary． divided，but la smaller，containing uniy $60^{2} 2$ kame of Leipsic，Dry C＇quacity： 1 wispel $=2$ maiter -2.4 nethef－

1 elle $=2$ fuss $=24$ zoll $=240$ linie. The fusa is also oats $)=400$ square estadale $=48400$ square ple : the esdecimaliy divided. 1 ruthe $=10$ elle $=16$ fuss. Itin- tadale being here hut 11 ple. erary : 1 polizei-meile $=2000$ ruthe $=16000$ elle $=32000$ fuss; 1 pest-meile $=1500$ ruthe $=12000$ olle $=24000$ fuss. Agrarian: 1 morgen $=800$ square ruihe $=76800$ square fuss.

The Two Sicilies.-The weights and meatures of the 1sland of Sicily are glven In the Dictionary, corresponding to the localitlea of Messina, Palerms, and Syrncuse; they are too unsyatematic to be detailed here. What followa belongs properly to the city and district of Naplea. Weight; 1 libbra $=12$ oncia $=360$ trapeso $=7200$ accino. This weight is for gold and silver, for silk, for spices, for drugs and colors. All other articles are welghed by the retolo of 27 libbre, or $33 \frac{1}{\frac{1}{3}}$ oncie. The apothecary unit is the same libbrn, but divided as follows: 1 libbra $=12$ oncia $=120$ drachna $=366$ scrupole $=7200$ accino. Liquid Capacity: 1 carto $=2$ butta $=24$ barile $=14.40$ caraffic ; 1 salma , for eil $=16$ staja $=256$ quarto $=320$ pignata $=1536$ mlsurella. Dry Capacity: 1 carro $=30$ tomolo $=864$ inlsura. Length and Distance: 1 canna $=8$ palmo $=06$ oncia $=480$ mlnato; 1 pertica or passo $=7 \frac{1}{2}$ palmo; 1 miglio $=9331$ passe $=7000$ palmo. Agrarian: 1 moggia $=900$ squave passo $=50625$ squara palmo.

Spain.-The weights and measures given for this kingedom apply especially to Castille, and are recognized nt Mladrid. Censiderable dlfferences in value, and gome also in nomenclature, will be found exlsting in several of the great provinces of Spain ; as, for example, in Valencia, where long comparative independence naturally led to a result of this kind, which is further contributed to elsewhere by the remarkable number of distinct races by which Spain is peopled. 3at these variations are not snfficiently materiul to be detailed here.

IVeight : 1 liors $=2$ marce $=16$ onza $=128$ ochava $=$ 256 ndurme $=768$ tomine $=9216$ grano. Gold and silver are by the same weight; but the marco is the unit, and is divided for gold only, as follows: 1 marco $=50$ castellane $=400$ tomine $=4800$ grano. This division lats been, to be sure, interdicted by law; but it still remains, and is especially exemplified in the former South American dependencles of Spain. In apothecary weight: 1 libra $=1 \frac{1}{2}$ mareo $=12$ onza $=96$ dracma $=\mathbf{2 8 8}$ escrupule $=576$ obole $=1728$ caracter, or quilate $=6912$ grano; 1 tonelada $=20$ quintal $=80$ arroba $=$ 2000 libra; 1 quintal mache $=6$ arroba $=150$ libra. Liquid Capucity: 1 arroha inayor, or cantara= $=1$ quartilia $=8$ azumbre $=32$ quartille $=128$ copa. This arroba, in theory, should contain 35 libras of distilled water, at the ordinary pressure and temperature. The arrob, mener for oil is divided in the same manner, but weighs only 271 libras, as before. Dry' Capacity: 1 cahiz $=12$ fanega $=1.4$ almule, or celemine $=288$ medio $=576$ quartills $=2304$ racion $=9216$ ochuvillo. Length : 1 vara $=3$ pie or tercia $=4$ palmo or quarta $=6$ немma $=36$ pulgada $=48$ dede $=442$ linen $=5184$ punto. Distance: 1 estadal $=2$ estado, tocsa, or braza $=2 \frac{2}{3}$ paso $=4$ varat $=8$ codo $=12$ pic. There is also $n$ formser estadal (before 1801), which still serves ns a basis for an agrarian measure, und $=11$ pie. 1 cuerdn $=84$ vara $=$ 2.l 1 pie $=33$ palmo mayer. lut in Valencia: 1 cuerda 20 brazn $=40$ vara; 1 legua (till 1568) $=3$ milla $=$ 2. estadio $=3000$ pase $=5000$ vara $=15000$ pie; 1 legua (of l'hilip V.) $=7605$ vara $=22815$ pic. This was a leagus of wblch $17 \frac{1}{2}$ were supposed to make a degree, and was directed to be used on thll maps, 1 legua (sinco $\mathbf{1 7 6 6}$ ) $=4800$ pase $=8000$ vara $=24000$ pie. It is by this that the distances aloug the great ronds nre murked. Hut there is ulso a legua frequently used, estimated at 800 cuerla $=6600$ vara $=19800$ pie. Agrarím: 1 yugada $=50$ fanegada $=600$ celemin $=2400$ quartillo $=28800$ square estadale $=460800$ square vars. But In Valencia: 1 yugnda $=6$ cahizada $=86$ fanegada $=7200$ square braza, und la but the $\frac{1}{1} \frac{1}{3}$ nearly of the legal yugada. 1 aranģada (for vineyards and crops of

Siveden.-Weight: 1 skălpund (viktuallewigt) $=16$ untz $=32$ lod $=128$ qwintin $=8848$ as. There are acv. eral commercial pounds in this kingdom, applicable onder dlfferent circumstances and to different articles; but none are commenaurable with the skălpund, except that called jernwigt, or the lron pound, which is 事 of the other. They are all to be found in the Dictionary under the word skeppund, by which multiple, indeed, they are usually counted. Guld and silver is weighed by the mark of Stockholm, which is incommenaurable with the akălpund, but very nearly half of it. It is divided as follows: 1 mark $=8$ untz $=10$ lod $=6-4$ qwintin $=4884$ as. The apothecary pound, or libre $=7416$ as, and is subdivided like the Narnberg pound. 1 skeppund $=20$ liapund $=400$ pund. Liquid Capacity : 1 tunna $=48$ kanna $=06$ stop $=384$ qwarter $=1586$ ort, or jungfru. Lry Ccpacity: 1 tunna $=2$ spann $=4$ halt-spann $=8$ fjerding $=32$ kappe $=50 \mathrm{kan}-$ $\mathrm{na}=112$ stop $=4.18$ qwarter $=1792$ ort. Length: 1 famn $=3 \mathrm{a}$ aln $=6$ fot $=72$ tum $=864$ linie. But in late times the foet is divided decimally for all purposes. 1 stăng $=8 \mathrm{uln}=16 \mathrm{fot} ; 1 \mathrm{mil}=2250$ stăng $=6000 \mathrm{famn}$ $=18000$ aln $=36000$ fot. Agrarian: 1 tunna $=2$ spannland $=4$ laulf-spannland $=8$ fjerding $=32 \mathrm{kapp}-$ land $=56$ kannland $=218 \frac{8}{4}$ v'fuare stăng $=14000$ square $\operatorname{aln}=56000$ square fot. Solid: 1 vedfamn $=6 \mathrm{~F}$. long $\times 6 \mathrm{~F}$. high $\times 3 \mathrm{~F}$. deep $=108$ cubic fut.

Suitzerland.-Nearly every ene of the twenty-two cantons of which this confederation is cempesed appears to present some variety in the valnos, subdivisions, and nomenclature of its weights and incasure. To explain them summarily is impossible; to expose them in detail would occupy a space manifestly disproportionate to their practical interest. What prevails ut Bern, Lucerne, and Zurich (the three legislative capitals, biennially in rotation, of the Swlss confederacy), is all that need he given here. Bern, ... Noight: 1 pfund $=16$ unze $=32$ loth $=128$ quent $=512$ pfennig. This is the ordinary commercial weight ; that for gold and gilver, etc., is divided into 2 marks, and then like the preceding. The mark in this weight is the old mare of France; the ordinary pfund $=17$ ounces poids de marc of France. The apothccary weight is, In fact, about $\frac{1}{8}$ of 1 per cent. lighter than the Nürnberg; it is, no doubt, in theory the same, and is divided sinilarly. Liquid Capacity: 1 landfass $=6$ saum $=24$ eimer or brenter $=600$ mass $=2400$ vierteli $=4800$ becher. Dry Capacity: 1 mûtt $=12$ mäss $=24$ măssli $=48$ imml $=06$ achterli $=192$ sechszehnerli. Lenyth: 1 fuss $=12$ zoll $=144$ linie $=1728$ secunde. The steinbrecher fuss, used for quarrying and building stone $=$ 13 zall. The elle happens to be exactly $\frac{158}{100}$ of the fuss; but this is an accidental coincidenco, as they are net used commensurably. Itinerary: 1 ruthe $=1 \frac{1}{4}$ klufter $=3$ f wald-achritt $=4$ feld-schritt $=10$ fuss. The ordinary Swiss meile is no lenger cemmensurable with any Swiss foet. It seems to have heen originally $26666 \frac{2}{3}$ fuss, for its length would not differ materially from that multiple of the fuss. Agrarian: 1 juchart, or feld acker $=400$ square ruthe $=40000$ square fuss. For woodlant, the juchart is 450 ; fer gardens, 360 ; for meadow land, 350 and 320 ; and, finally, for suburhan mensaration, $312 \frac{1}{2}$ square ruthe. Söti': 1 klafter $=6 \mathrm{~F}$. long $\times 5 \mathrm{~F}$. high $\times 3 \frac{1}{2} \mathrm{~F}$. deep $=108$. did fuss. Lucerne.-Weight: 1 pfund $=36$ loth $=144$ quentchen. This is the division of lucerne proper; but the weights of Zurich are also in use. Gold and silver are weighed by the mark of Zurich; but the npothecary pound Is the old medicinal weight of France. Liquid Capacity: 1 samm $=31$ ohm $=100$ mass $=400^{\circ}$-cheppen $=4000$ prima. Dry Capacity: 1 malter =s .nitit=16 viertel $=32 \mathrm{halh}$-vlertel $=160 \mathrm{jmml}=256$ becief $=2560$ prima. Length: 1 elle $=2$ schah, or rheinfuss. The carpenters' foot (tisehler-schuli) is nearly 3 per cent. shorter; and the huilders' and surveyers' font (feld-schuh) 10
per cent. shorter than the rheinfuss. Other measures are those of Zurich. Zurich. - Weight: 1 pfund $=18$ unze $=36$ loth $=144$ quenten; 1 pfund (of Antorf, for gold and ailver, etc. $)=2$ mark $=10$ unze $=82$ loth $=128$ quent $=512$ pfennig. Thla weight is $\frac{8}{6}$ of the commercial weifht. The apothecary pound la that of Lucerne. Liquid Capacily: 1 elmer. (lauter-mass) $=4$ viertel $=$ $30 \mathrm{kopf}=60$ masa $=120$ qualrtli $=240$ atotzen. The eimer (stadt-muss) for wine in retall is aubdivided in the same munver, but is 10 per cent. amaller. 1 eimer (trübes maas) $=4$ viertel $=32$ kopf $=64$ masa $=128$ qualrtli $=\mathbf{2 5 6}$ stotzen. This elmer (which, as its nama implies, is for wine unrefined, as the lanter-mass iz for fined wina) is $\frac{1}{1} 5$ largar than the lutter. Dry Capacity : 1 malter $=4$ mütt $=16$ viertel $=64$ vierllng $=256$ masseli $=5 \% 6$ immi. The malter for grain generally, and all dry seeds and fruita (glatte frucht), contains $12 \$$ cublic feet; that far oats and for green articles (leguminons growth, rauhe frucht) contains $12 \frac{7}{18}$ culbic feet. Length : 1 fuss $=12$ zoll $=144$ linie $=133$ lignea de Puris. The amme fuss is divided decimally by aurveyors. The nrchitectural foot, si.ace 1820, ia 13 hJo longer, but divided like the orlinary fuss. 1 ruthe $=$ 2 elle $=10$ fras. Agrarian: The or lnary juchart $=$ 400 square suthe $=.1000$ aquare foss. There are also juchart in the anme variety (except the very snallest), and ainilarly applicable as at Bern. Solid: 1 klafter, for fire-wood $=6 \mathrm{I}$. long $\times 6 \mathrm{~F}$. high $: 4 \mathrm{~F}$. deep $=$ 144 cuble fuss. The: $u$ are also klafter c " 72 and 108 cuble fuss, the billets being 2 and 3 feet l ng respectively. The klafter for turf (torb-klafter) ontains 12. korb of 6 cubic fuss, each $=72$ cubic fuss. In 1828 a new system of weights and measures was pro yosed and adopted for the Cantons of Aar:tu, P sic, Bern, Frelburg, Lucerne, Solol'? יrm, aml Van" "ich rested upon the metrical system of Frur e; but, except in the Canton of Vaud, it has not been genernlly carried out.

Tuscany.- IVeight: 1 libbra $=12$ oncia $=06$ drachna $=2 \varepsilon 8$ denaro $=6912$ grano. The same weight anawers for gold and silver, and for apothecary use. The legal centinajo or cantaro (as in all the ceses hitherto not specially mentioned) is 100 libbre; but the cantaro for wool, meat, and salt fish is yet 160 liblire. Liquil Cupacity : 1 barile $=20$ flasco $=40$ boceale $=80$ mezzetta $=160$ quartuceio, weighing 133t libbra; 1 barile for oil, or orcio $=16$ fiasco $=32$ boccale $=04 \mathrm{mez}$ zetta $=128$ quartuccio, weighing 120 Jibbre. The soma for oil is 2 barile. The barile of alcohol, brandy, and rum weighs 120 libbre. Iry Capacity: 1 noggrio $=8$ sacco $=24$ staje $=48 \mathrm{mina}=96$ quarto $=381$ neladella $=768$ mezzelta $=1536$ quartuccio $=3072$ bussole. Length: 1 canna $=4$ braccio $=8$ palmo $=80$ aoldo $=960$ denaro; 1 canna (architecta' and aurveyors') or pertica $=2 \frac{1}{3}$ passetto $=5$ braccio $=10$ palmo $=60$ crazia $=100$ soldo $=300$ quattrino $=1200$ denaro. Jtinerary: 1 ca vezzo $=2$ passo $=6$ braccio; 1 miglio $=566 \frac{1}{2}$ canna (architects') $=2833$ h braccio $=5666{ }^{2}$ palmo. Agrurian: 1 ascato $=10$ stajolo $=13$ estioro $=165$ panoro $=660$ square perica $=16500$ square braccio.

W'ürtenderg.-W'ight: Divided as the Pruasian, from which it differs but slightly in value. Gold and silver are weighed by the mark of Cologne, and medicine by the npothecary weight of Nurnberg. Liquid Capacity: 1 fuder $=6$ cimer $=96$ immi $=960$ mass $=$ 3840 achoppen. Tho eimer is of a different capacity; according as it is for clear or unrefined wine. The latter is nearly $4 \frac{1}{3}$ per cent. iarger than the former. Dry Capacity: 1 acheffel $=8$ simri $=32$ viorliag or viertel 04 achtel $=128$ maxsslein $=256$ ccklein $=1024$ viertelein. Jength: 1 fuss $=10 \mathrm{zoll}=100$ linié $=1000$ punkt. This measure was established in 1806, when the fuss was fixed at 127 lignes de Paris. The elle ia not aliquot with the fuss, being 2141 ligice de Parie. 1 ruthe $=1 \frac{1}{2}:$ after $=10$ fuss. Thia is the modern livision. In. older halits there was $1^{\circ}$, a ruthe of 16 fuss; $2^{\circ}$, one of 12 rhelnfuss; and $3^{\circ}$, one of 15
rheinfuis. These different lengths affected, of oarso the value of the acre. Agrarian: 1 morgen $=4$ viertelinorgen $=384$ square ruthe $=38400$ squace fusa. This is the legal measure, which corresponds in value with the old count of 150 square rathe (of 16 fuss in length) to the morgen. There is also the little morgen (old measure) of 150 square ruthe $(\mathrm{No}, \mathrm{B})=83750$ aquare rheinfusa; and the great morgen (old measure) containing 400 equare ruthe (No. 2) $=5{ }^{\prime} 600$ square rheinfuss. 1 juchart or jauchert $=1 \frac{1}{1}$ caorgen.

The variations in the compatation oi the mile, the gallon, the hhd., and the barrel, are ac great in various conntries, that we give a list by way of comparison. Mils.

(Percival), xiv. (Farrar); Westminster Rev., xvl.; Edinb. Rev., Ixxvii. 121; Hunt's Merchants' Mfagazine, xii. 549, iv. 333, 434 (D. J. Browne); Niles's Register, xiv., xv., xx., xxif., sxx., xl. ; Report of Mr. J. Q. Adams, 8vo.

Weld, or Dyer's Weed (Ger. Wau; Du. Woww, Woute ; Fr. Gaude; It. Guadarella; Lat. Luteola), is an imperfect biennial, with amall fusiform roots, and a leafy atem from one to three feet in height. It is a native of Graat Britain, Italy, atid various parts of Europe; and is cultivated for the sake of lts atalk, flowers, nad leaves, which are employed in the dyeing of yellow, whence its botanical name Reseda luteola. Weld requires the growth of nearly two aummers before it comes to maturity; and the crop is liable to fail from so many causes, and is besides 80 exhausting, that its cultivation is by no means profitable. Weld ls preferred to all other substances in giving the Rively green lemon yellow. It is, however, expensive ; and it is found, when employed in topical dyeing, to degrade and interfere wlth madder colors more than other yellows, and to stain the parts wanted to be kept white. Hence quercitron bark is now employed in calico-printlng, to the almost total exclusion of weld. It is stlll, however, employed in dyeing silk a golden yellow, and in paper-staining-LLoudon's Encyclopoedia.

Weant Indien (Antilla or Antilles), an Archipelago of inlonds which extend from the Gulf of Florida to the Gulf of Paria, und form part of the division Central America, hetween latt. $10^{\circ}$ and $28^{\circ} \mathrm{N}$., and long. $59^{\circ}$ and $85^{\circ}$ W.; bounded on the north and east ly the Atlantic, and on the south by the Caribbean Sen, which separates them from the north coast of South America. The northwest group contains the largeat lelands, or Greater Antilles, as Cuba, San Domingo, Jomalea, and Porto Rico. The other croup, or Ieesser Autillen, stretching from north to south, conelsts of Guadoloupe, Mertinique, Barbadoes, Trinidad, ote. The Bahamas form a third group. The Lesser Antlies, from Porto Rico to the Gulf of Paria, are by some writera zalled the Windward Islande, and the amaller group along the coast of Venezuela, the Leeward Islanda; but in British clarts the Wimirard Islands comprise those between lat. $10^{\circ}$ and $15^{\circ} \mathrm{N}$., and the Leeward those between lat. $15^{\circ}$ and $19^{\circ} \mathrm{N}$.

The total area of the Archipelago is 95,100 aquare miles. l'opulatig:1, $3,684,000$. Tho lesser Antilles are of volcanic origin. Climate of the whole trojicul, but moditied lyy the surrounding ocean and the elevated land of many of tho ielanda. Sugar, coflee, cotton, dye-woots, and spice wre the chief products and exports. Of these islar. its, France possesses Guadaloupe, Martinique, Deseada, Mitrie-Gialante, nad part of St. Martin; to Spain belos $g$ Culia and Porto lico; to Denmark, Sunta Cruz, St. Thomes, and St. John; to Holiand, St. Eustatius, Saba, Curacoa, and part of St. Martin ; to Sweden, St. Bartholomew; Hayti is governed liy rulers chosen from the citizens of cuel of its two governments; Margurita and adjacent ieles helong to the repablic of Venezuela; and Anguilla, Antigun, Rarbudoes, Dominica, Grenada, Jamnien, Montserrut, Nevia, St. Christopher, St. Lueia, St. Vincent, Tohago, Tortola, Trinidad, Mahumas, and Bermndan, belong to Great Britain. Columbus landed on St: Sulvadur, Buhana group, in Oetoler, 1492; nnd the Archipelago, under the orroncous impression, at the time of discovery, that it formed part of Asia, was called tho West Indies.

Particular deseriptions are given under the heads of the various islands, and we shall therefore limit this articie to the statisties of the trado between the United States and the reveral West Indics.

British West Imbies.-There are several amall inlands in the Weat India group, but they are, in a commerciul point of viow, too unimportant to require a separate or more apecial notice, being all comprised under нome of the consular diatricts for which full returns of trade, port regulations, etc., are given in the preceding pages. American trade with the W'ost Indies is piaced on un equal footing with that of the most fuvored nutions. Indeed, in some of the lalunds, an in Canada, American vessels aro allowed priviloges that are not zanctioned, if not expressly withheld, by the colonial regulathons of the mother country. In both these divieions of the British North American possessions they are mlanitted, to a certuin extent, to the benefits of the countong trade; thus proving how impossible it is for the mether country to frame commercial regulations adupted, in all reapects, to the wants and necessities of her alonies in distant quarters of the glohe, the effeet, if not the derign, of which would lie to embarrnas uni clog thyir intercourse with the neighboring marketa.
The act of the Imperial Parliament, 13 Victoria, chap. xxix., wees, $4,5,6$, clothes the governor-general of the liast India possensions with umple powers to utmit to the coasting trade, in that purt of the glohe, ail foreign vessels, whenever, in his opinion, the refuirements of commerce or the intereats of her majesty's sul,jects in the East Indies may demand sueh a etrinees. sion. By virtwo of this authority, the coasting trade of thase vast possesslons la now thrown , ien to every flag. A aimilar act in favor of the We:t India and North Anserican possessions would seem to he more imperatively demanded, even as a boun to British subjects in these parta, particulurly in the Weat Indier, where hut few of the staple articles of frod are produced, and such as are imported are necessurily hurdened with the taxes and Imposts ineitent to reshipmeni coastwise, and transportation into the interior, hefore they reach the consumer. Such a measure would be prodoctive of the happiert results; and, while it would impart additi nal stimulus to American enterprine, it would, at tho sone time, cheupen nill the necessuries of life to the North Americun subjects of Great Ilitair, who, b y reason of their geographical proximity and tineir different stuples of trade, are the untural customers of tho United Stutes.
Official returns received at the Department of State represent American comemercial intereourse with the British West Indies grnerally as being on the most satisfuctory footing. Indeed, nothing seems wating to render that intereourse whilly unemiarrassed, sive a moditication, if not a total repeat, of the protective tariff now in force in Great liritain, in faver of some of the stuple prodnctions of these islands.

Danish West Indics.-The colonial pussessions of Denisark are the lairoe 1 lands, Iceland, Greenland, and the islunds of Suntu Cruz, St. Thomas, nul it. Nhan, in the Wert lindies. Trumquchar and Seramnore, In the East Indies, were sold to the English Jinet India Company in 18.to. The extent and piop.ilation of there, in 1850 , were as foliows:

The trade to Beurbon Island, Gayana, Martinique, and Guadaloupe, out and home, emplojed in 1848, 492 ships; in 1819, 541; in 1850, 486; in 1851, 602; in 1852, 677 ; in 1853, 583. The mean of the six yeare, 563 vessels.
Swedish West In dies.-The ialand of St. Bartholomow is the only possession of the Swodes in America. It bolongs to the Leeward groinp, and is situate centrally in lat. $17^{\circ} 50^{\circ} \mathrm{N}$. , and long. $62^{\circ} 52^{\prime} \mathrm{W}$., distant trelve miles from St. Martin, and abuut thirty from St. Christopher. It is about eight miles long by from two to three miles wide, aud contains an area of about twentyfro square miles. Capital, Gustavia. The island is of ar: irregular shape, and deeply indented by numerous small sandy bays, separated by bold and esteep rocky acclivities, of moderate height. In the lnterior it is hiily, but its loftiest elevations are less than 1000 foet. In most parts it is barren and aterile, but has namerous well-cultivated valleys. It prodaces all the staplos of the West Indies-cotton, sugar, tobacco, indigo, otc., and also lignum vitm and iron-wood. Its only exports are cattle and some salt. Water is searce, and the inhabitants depend for supply on the rains. The oniy harbor is La Carenage, a aafo and commodious one, snd mach frequented. It is on the west aido of the island. Close by Is Gustavia, the prineipat town, s thriving place.-For articles on British Emancipation, British Celonies, etc., see Eelectic Revieno (4th series), iv., ix. ; Christiu 3 Quarterly Spectator, x. ; Yraarr's Magazine, vili.; Edinburgh Rev., xix., xii., xlv., xl.; Quarterly Rev., xxxil., xxxvili. (Sovtiney), xiv.; Westminster Reviev, i.; Blackwood's Mag., xir., xv., xvl., xxxi., xxxiv.f ixiii.
Whalebone, a substance of the nature of hern, adhering in thin parallel laminm to the upper jaw of the whale.' These vary in eize from three to twelve feet in length; the breadth of the largest at the thick ond, where they are attached to the jaw, is about a foot. They are extremely elastic. All above eix feet In length is called size bone. This article was first known in England about the year 1693. It may be worth while to remark, as evincing the ignorance that at one time prevailed with respect to the whale, that, by an oid English feudal isw, the tail of all whales bolonged to the queen, as a perquisite, to furnish her majesty's wardrobe with whalebone l-Brackstore, vol. i. p. 233. The import of whalebone lato the United Ststes for a number of yeurs past has been as followe :

|  | Pounde. |  | Pouads. |
| :---: | :---: | :---: | :---: |
|  | 3,3tt,490 | 1853. | ,800 |

| 1801. | 8,616,6.10 | 1856. | 9,587,400 |

-See Whalk-risiteriss. Whalebone first became in use in Europe in the 17th centary.-See p. 390.

Whale - fishery.-Whale (Common), the Balana mysticetus of Linnaus, a marine animal of the cetaceous apecies, and the largest of ali those with which men are acquainted. The whale has, it is affirmed, been found one huudred and aixty feet in length; hut this is most probahiy no exaggeration. In the Northern seas it is at preseat seldom found above sixty feet long: being, however, generaliy killed before it arrives at its full growth, this is no proof that the animal may not formeriy have attained to a much larger size. The bodies of whales are covered, immediately under the
tish is fre a tweive to eighteen inches thick. lin young whatea cais fatty matter resembles hog's lard, but in old ones it is of a reddish color. This is the vaiuable part of the whaie, and the desire to possess it has prompted man to attempt the capture of this mighty animal. The blubber yiehis, by expression, nearly its own weight of a thick, viscid oll (train oil). The common whale is now rarely found, except within the Arctic circle; but at a former period it was not unfrequentIy met with on our coaste. There is a good account of the common whale, and of the manner in which the fishery is carried on, In Mr. Joinn Laing's Voyage to Spitzbergen, one of the chortest, cheapest, and best of the innuinerable books published on this hackneyed subject.

1. The Sperm Whale (the Cachalot or Physeter mac-rocephalus).-The principal species are the black-headed with a dorsal fin, and the round-iteaded without a fin on the back, and with fistula in the snont. This whale is known at a distance by the peculiarity of his "spoutings" or "blowa." He can be easily detected by whelemen, if he happens to be in company with other species of whales. He blows the water or vapor from his nostrila in a single column, to the height, perhaps, of twelve feet, inclining in a forwart direction, in an angle of forty-five degrees with the horizon, and visible for seversl miles. There la also $n$ wonderful regularity as to time in which he "biows," perhaps once in ten minutes. He remaing on the surface of the water from forty-five to sixty miautes, and under water about the same time. Unless the whale is frightoned, whalemen make quite correct calculation as to the chances of overtaking him, or meoting him, or when he will rise to the surface after he has "turned flukes." Whet the aperm whale is near he can be oasily distinguished by the form of his itead, unlike any other variety of whale. Ita head is enormous in buik, being fulity more than one-third of the whole length of its boily, and it ends like an abrupt and ateep promonto$r y$, and so hard for several feet from its front, that it is quite difficuit, if not impossible, for an iron to enter it; as impervious, indeed, to a harpoon as a bale of cotton. Besides, the sperm whale has a hump on his back, which distinguishes him from others. Tbis hump is farther forward than the hump on the finback whale. Sperm whales have been captured from seventy to ninety feet in length, and from thirty to forty-five feet in ircumference round the largest part of their bodies. It is aupposed by whalemen, from their appearance, that they live, or some of them at least, to a great age. Oue writer on tinis subjeot thought that the aperm whaie would attain the age of many hundred years, and even to a thouaand yeara. This, however, is mere conjecture, becsuse there are no dates or facts upun which to foand a correct opinion.

It is supposed, that as the sperm whale advances in age, his head not only retains its ordinary prophortions, and to appearance becomea eniarged, but the truth is, the other parts of his body, especially his extremities, do sctualiy diminish in buik and circumference. In some instances more oli has been taken out of the head of a sperm whale than from the other part of his body. The principal food of the sperm whale is "squid," a moiluscous animial. "This is an animal of ao curious an order as to merit a word of special notice. The principal peculiarity of this molluscous tribe is the possession of powerful tentacula or arms, ranged round the mouth, and provided with suckers, which give them the power of adhering to rocks, or any other sulsstances, with surprising tenacity. Some of this tribe attain to a great size, and, as large na the whale is, will furnith it with no contemptible mouthful. In the gullet of one eperm whale an arm or tentaculum of a seaequid was found meaauring nearly twenty-soven feet long." Whalemen frequently discover large masses or junks of squid floating about, probably torn in pieces
hy whales in their search after food. The flesh of the squid is soft, without boses, and somewhat transpareut, like the common sun-fiah seen ou our shores. It ls said that squid have been seen as large as an ordinury whale. Thls food for the sperm whaie is found in great abundance in the Paciftio seas.
2. The Right Whale.-The whale having this general cognomen beloags to the apecies of Balana mysticetus. There are several varietiea ineluded in this apecies, as we shall hereafter observe, and which are diktinguished liy whalemon both in regard to some exteraal peculiarity as well as the differeat localities where they are usually found. The right whale differs from the sperm in the following particulars: His head is sharper, more pointed-he has no "hump" on his back -the colums of water which he throws up when he "blows" is divided like the tines of a fork, and it rises from his breathing-holes in a perpendicular direstion, from eight to turenty feet. The right whale furnisises the bone (baleen) so much in common use, and called "whalobone." This bone is taken from the mouth and upper jaw of the whale, and is set along laterally in tho inost exact order several Inchos apart, deereasing in lengtin from tiocentre of his mouth, or the arch of his palate, and becoming shorter farther back; while toward the lips the bone tapers away into mere bristles, forming a loose hanging fringe or border. At the botton of this row of bone, where it penetrates the gum, and from eighteen to thirty inches downward, we find a material that resemblos coarse hair, entwining and interlacing the bone, and thus forming a sort of network, and so thiek, that when the whale closes his lips to press out the water the smallest kind of fish are caught in tho meshes, and are unable to escape. Inleed, the edges of the bones or slabs, as they might be termed, are fringed with this coarse hair, and it extends to their extrenitles, as may be seen in the rough state when landed from whaie shlps. The length of the boues or slabs (averago eight feot, longest fourteen feet) vary, in a great measure, according to the sizo of tho fish, though somo varieties of this specles have larger and better bone than others. The value of the bone is enhanced, as a general thing, In proportion to ita length. The principal food of the right whale la $n$ very amall red fish, ealled "brit." - Immense shoals of these fish aro seen on whale grounds, and the water to a great distance, oven for milos, becomes colored with them.

The right wiale does not fight or contend with his mouth or head, as the sperm whalo does, but his means of attack and defense are chiefly in his enormous flukes. Ile will, however, when struck, "root around," as whalemen say, and not unfrequently in this manner upset a boat. This kind of whale, and other varieties distinguished ly the baleen or bone, havo no regular tlme for remaining on the surface of the water after they "breach," nor in remaining under water after they "turn flukes." The length of a large rigitt whalo is about eighty feet, and some have yielded their captors 250 to 300 barrels of oil. Such a whale wouid perhaps weigh not far from eighty tons. The oll of this species of whale ia less valuable tian the sperm. The whalebone, which now has an advanced price in the narket far leyond any previous value attacied to it , is obtained from the mouth of the whale about in proportion of 1000 pounds to 100 harrels of oll.
3. The Finback Whate.-This is a smooth, slim fish -smaller uaually than a right whalo. He is found in nearly all latitudios. Ilo has a "hump" on his back, which distinguisies him from the right whale. Ilis head and inouth are of the same construction. This whale is known by whalemeo, when seen at a suitalile distance, by his "hlows." The column of vapor risea in a single stream, in a vertical or perpendicular direction. This fish is termed Finback, on account of a fin on his back, differing in this particular from all otioer species of whale. The ofl obtained from him is of the same quality as the right-whale oll.
4. Bowhead Whale.-This whale is smooth all over, having no "bonnet on his head," as whalemen say; and as right whales have. Their heada difier In shape somewhat froni other whales, and hence the name Bowhead given to them. This species of whale, so far as known, have never been found except in the Ochotsk Sea aud Arctic Ocean. The Greenland whale, and also the epseiea ealied the great Rorqual, are doubtless includsd in the name, which our, whalensen give to the Boyhead. There are eaveral other varieties of the whale tribe, and difierent names are attached to them, such as the "Scragg," the "Humplack," etc. ; but the foregoing are all tho sinds whether of interest or profit to whalenen,-Rer. Lewis Holmes.
It is probably true, as has been sometimes eontended, that the Norwegians oceasionally captured the whale before any other European nation engaged in so difficult and perilous an enterprise. But the carly efliorts of the Norwegians were not conducted on any systematic plan, and should be regarded only in the same point of view as the fishing expeditions of the Esquiniaux. Tho Biacayans were certainly the first people who prosecuted the whale-fehery as a regular commercial pursuit. They carried it on with vigor and success in the 12th, 13th, and 14th centuries. . In 1388, Edward III. relinquished to Peter de Puyanne a duty of $\mathbf{5 6}$ sterling a whale, laid on those brought into the port of Biarritz, to indemnify him for the extraordinary expenses he had incurred in fitting out, a fleet for the servica of his majesty. This fact proves beyond dispute that the fishery carried on from Biarritz at the perind referred to must have been very considerable indeed; and it was also prosecuted to a greater or less extent from Cibourre, Vieux Boucan, and subaequently from Rochelle and other places.-See Minoire sur l'Antiquité de la Pêche de la Baleine, by Nosl, $12 m o$. Paris, 1795. The whales captured by the Biscajans wero not so large as those that are taken in the Polar seas, and are supposed to have been attracted southward in pursuit of herrings. They were not very productive of oil, but their fleth was used as an article of food, and the whalebone was applied to a variety of useful purposes, and brought a very high priee. This branch of industry ceased long since, and ficm the same cause that has occasioned the cessation of the whele-fishery in many other places-the want of fish. Whether it were that the whales, from a sense of the dangers to which they exposed themselves in coming southward, no longer left the dey Sea, or that the breed had been nearly deatroyed, ceriain it is, that they gradually became less numerous in the Bay of Biscay, and at length ceased almost entiroly to frequent that sea; and the fishers being obliged to pursue their prey upon tho banks of Nowfoundland and the coasts of Iceland, the French fishery rapidly fell off.

The voyages of the Dutch and English to the Northern Oeean, in order, if possible, to liscover a passage through it to India, though they failed of their maln object, laid open the inannte of the whale. The comnanions of Barentz, who discovered Spitzbergen in 1596, and of Hudson, who soon after explered the same seas, represented to their countrymen the amazingnumber of whalos with which they were crowded. Vessels wero in consequence fitted out for the Northern whaletishery by the English and Dutch, the harpooners and a part of the crew being Biesayans. They did not, however, confine their efforts to a fair competition with each other as fishera. The Muscovy Company obtained a moyal charter, prohibiting the ships of all other nations from fishing in the seas round Spitabergen, on pretext of its having been first discovered by Sir Hugh Willoughily. There ean, however, be no doult that Barentz, aid not Sir Hugh, was its original discoverer; though, supposing that the fact had been otherwise, tho attempt to exclude other nstions from the aurrounding seus, on auch a ground, was not one that could be tolerated. The Dutch, who were at the time prompt to
ombark in eviry commercial pursait that gave any hopes of ancoess, eagorly entered on this new carber, and sent ont ehips fitted equally for the parposes of tlshing and of defense against the attacks of others, The Muscovy Company having attempted to vindicate Its pretensions by force, several encounters took place between their shipa and those of the Dutch. The conviction at length became genoral that there was room enongh for all parties in the Northern seas; and in order to avold the chance of coming intd collision with each other, they parceled Spitabergen and the adjacent ocean into districts; which were reapectively assigned to the English, Dutch, Hamburgers, French, Dares, etc.

The Dutch, being thus left to prosecute the fishery without having their attention diverted by hostlle attaoks, speedily acquired a decided superiority over all their competitors. When the Europeans firat began to prosecute the fishery on the coast of Spltzbergen, whales were every where found in vast numbers. Ignorant of the strength and stratagems of the formidable foo by whom they were now assailed, instead of betraying any aymptoms of fear, they turrounded the ships and crowded all the baye. Their capture was in consiequence a compatatively easy task, and many wore killed which it was afterward necessary to abandon, from the ships being already full. While ftsh were thus easily obtained; it was tho practice to boli tho blubber on shore in the Noth, and to fetch home only the oil and whalebone. And perkaps nothing can gire a more vivid idea of the extent and importance of the Dutch fishery in the middle of the 17ch century, than the fact that they constracted a considerable vilinge, the houses of which were' all previously prepared in Holland, on the Isle of Amaterdam', on the northern shore of Spitziergen, to which they gave the appropriate name of Smeerenberg (from ameeren, to melt, and berg, mountaln): This was the grand rendezvous of the Datch whale ships, and was amply provided with boliera, tanks, and every sort of apparatus required for preparing the oll and the bone. But this was not alf. Tha whale f , " were attended with a number of provision shlps, $\quad$ ggoes of which were iunded at Smecrerberg; which aboanded during the busy season with well-furnished shopa, good inns, etc. ; so that many of the conveniences and enjoyments of Amsterdam were found within about eleven degrees of the Pole!, It is particularly mentioned that the saliors and others were every moraing sapplied with what a Dutchman regards as a very great laxury-hot rolls for breakfant. Bativia and Smeerenberg were founded nearly at the ame period, and it was for a considerable time dovited whether the latter was not the more important estab-lishment.-De Resta, Histoire des Paches:
Daring the flourishing rerrod of the Dutch fishery, the quantity of oil made in the North was 80 great that it could not he carried home by the whale ships; and ovory year vesecls were sent out in ballast to assiat in limporting the produce of the fishery'. But :he same cause that had destrojed the fishery of the Biscayans, ruined that which was carried on in the immediate uelghborhood of Spitzbergen. Whales became gradurally less common, and more and more timid and difincult to catch." They retreatell first to the open sons, and thai to the great bauks of ice on the eastern coast of Greenland. When the sits of the fiahery had been thus removed to a very great distance froin Splteker. gea, it was found most economical to mend the blubber direct to IVolland.' 'Smeerenberg was in consequencs totally desertod, and Ita poolition is now with difficuity Aiscoverablo.

1. Bat though very extensive, the Dutch whale-fishery wis mot, Curing the firit thirty jears of its existence, wiry prefitable. This arose frotn the circumatance of the right to carry It on having been conceded, in 1614; wan exolusive company. The expense inseparabie froin auch great desociations, the wastefuiness and unfalthfuinese of their servanta, who were much more in-
tent upon advancing their own Interesta than thooe of tha company, Increased the dutliys so much; that tho returns, great at they were, proved little more than adequate to dofray them, ath the fthery: was confined within far harrower limits thanit would otherwlae have reached. But after varlotis prolongstions of the chan ter of the firat company, and the formation of some new ones, the trade was finally thtown open in' 1642. The effects of this measiure "were most salutary, and afford one of the mont striking examples to be mot' with of the advantages of tree competition. Within a few years the flshery was vastly extended; and though it becane progressively more and more difficult from the growing scarcity of fish, it proved, notwithatanding these disadvantages, more proitable to the private adventurers than it had ever been to the company, ind continued for above a century to be prosecuted with equal energy and success, The famous John de Witt has alluded as follows to this change in the mode of conducting the trade :
"Iu this respect," bays he, "it is worthy of observation, that the authorized Oreenland Company made horetoforo IttHe profit by their fiakery, becaute of the great charge of tetting out their shipat and that the train oll, blabber, and whale fins wore not woll made, handled, or cured; and beb ing hrought hither and put into warehousea, were not sold noon enough, nor to the company's beat ndrantage. Where as, now that every one equips thelr, veswelin at the chespent rate, follow thelr fishing diligently, and manago all carefulIy, the blubber, trals olf, and whale fins are employed for so many usea th everal countriem, that they cinn eell them with that donventency, that though thers ere now fflecrs ahips yor ona that formerly cailed out of Holland on that acconnt, and conseguently each of them could not take mon nany whalen an herotofore, and potwithatandiog the new prohibition of France and other countries to Import these commodities, and though there is greater plenty of them lmported by our sishers-yet those cotntmodittes aro so much ralsed in the value above what thoy were while there was a company, that the common ini habltanate do exerclete that fishery with prosit; to the mueh greater benefit of our country that when it was (under the management of a company) earried on but by a few.'mTrua Intereet of Holland, p. $68,8 \mathrm{yo}$ ed, . London, 1746.

When in its moat flourishing state, toward the year 1680, the Dutch whale-fishery omployed about 260 ships and 14,000 sallors.

The English whale-fishery, like thet of Holland, was originally carried on by an cxclusive association. The Mubcovy Company was, Indeed, speedily driven from the field; lint it was immediately aucceeded by othera that did not prove more fortunate. In 1725 thio South Sea Company embarked iargely In the trade, and prosecuted it for eight years; at the end of whichi; having lost a large sum, they gave tt up.' But the Legisiature, having resoived to aspport the trade, granted, in 1789, a bounty of 20s: a ton to every ship of moro than 200 tons burden angaged in it; but this premium being insufficient, it was raised, in 1749; to 40s. a ton, when a number of ships were fitted out, as much certainly in the inte, "ion of eatching the bounty its of catching fish. Decelved by the prosperons appearance of the fishery, Parliament finagined that It was firmly established, and in 1777 the bounty was reduced to $\mathbf{3 0 s}$. The effect of this redaction ohowed the factitious nature of the trade, the vesscls engaged in it having fallen off in the couree of the next five yeare from 105 to 30 ! To arrest this alarming deciine, the bounty was rained to its old iavel In 1781, and of course the trede was soon restored to lt: previons state of apparent pruaperity. The hosthlitics oceasioned by the American war reinced the Dutch fishery to less than half its previons amount, and gave a proportional extension to that of England. The bounty, which had in consequence become very heavy, was reduced, in 1787, to 00s. a ton; in 1702 it was further reduced to 25e.; ;and in 1795 it was reduced to 20 s, at which sum it continued till 1824 , when it ceased.
'It appeara from accounts given in Marphenson's Annals of Commerce (voi. 13. and iv.), that the total
bonntias paid for the encouragement of the whale-fish-
ery, in the interval between 1760 and 1788 , amounted to no less then $\mathbf{E 1 , 5 7 7 , 9 3 5 . ~ I t ~ w i l l ~ b e ~ s e e n ~ f r o m ~ t h e ~}$ official account which follows, that there are no maans of furnishing any accurate acconnt of the sums paid as bonntles by Great Britaln from the year 1789 to 1813, inclusive; but it is, notwithatanding, abundantly certaln that the total bountios pald during the period from $1 / 89$ to 1824 conaiderably exceeded $\& 1,000,000$.

We have already noticed several changes of the localities in whicin the whale-fiahery has been earrled on at different perlods; and within these few yeare others of the samo $\boldsymbol{z}^{\prime}$ ad have taken place. Tho Duteh itshers first began $t$, frequent Davis'a Straits in 1719; and as the whalea had not hitherto been pursued inte this vast recess, they were found in greator numbers than in the seas round Spitzbergen. From about thls period it was usually resorted to by nbout three-tentha of the Dutch ships. It was not till a comparstively late period that Davis's. Straits began to be.frequented by English whalers; and down to 1820, when Captain Scoreaby published his elaborate and valuable work on the whaletishery, that carried on in the Greenland seas waa hy far the most considerable. But It will be seen from the suljoinod account, that from 1826 down to 1837 the Greenland seas were nearly abandoned. This was principally a consequence of the greater mbundance of whales in Davia's Straita, but it was also in part owing to the various diaceverles made by the expeditions fitted out hy government for cxploring the seas and inlets to the westward of Davis's Straits and Baffin's Bay having made the fishere acquainted with several new and advantageous nituntions for the prosecution of their business. Since 1837, however, the few ships that have been sent out hava gone mostly to the Greenland sens. The aca in Davis'a Straits la lass Incommoded with field-ice than the Greenland and Spitabergen aeas, but it abounda with iceberga; and the fishery, when carrled on In Baffin'e Bay and Lancaster Sound, is more dangerous, perhaps, than any that has hitherto been attempted. The aubjoined table shows how rapidly the Northern fishery declined down to 1842, from which period it continued nearly stationary ciown to 1846, when it revived a little. During the last three yeara there have salled for the Northern fiahery-

It should, howover, be ohserved that tho fiahery is rather for seala than for whales; the value of the produce obtained from the former considerably exceeding the value of that obtaineci from tha latter.

Durtug 1852 England imported 5519 tona opermaceli oll, which weru almast wholly retalaed for conaump-
tion. Daring the same year the imports and exports of train oll were, respectively, 14,500 and 2757 tons.

The import dutiea that in varions countries have been placed npon whalo oil, the prowuct of forelgn fishcries, have operated against the whale-fishery. This may be seen from the following atatement of the du ${ }_{\phi}$ ties now (1857) In force in the princlpal maritime conntries:

Southern Whale-fishery.-This conaists of three dis tinct branchea ; vlz., lst, the catch of the spermaceti whale, which furnishes the valuable substance called apermacetl (see the term); 2d, that of the common black whale of the Southern aeas ; and, 8d, that of the aea-elephant, or Southern walrus. The spermaceti whale (Physeter macrocephalus) is found in all trepical climates, and especially on the coasts of New Zealand and the adjolning seas. The ordinary duration of the voyage of a shtp emplo od in this department of the fishery Is about three years. The common black whale of the Southern seas (Physeter microps) is met with in various places, bat principally on the comat of Brazll, In the bays on the weat coast of Africe, and In some of the baya in New South Wales, Van Diemen's Land, etc. Sea-elephants (intermediate bebween the walros of the Northern seas and the seal) are principally met with in the scas round the islands of Deaolntion, South Georgia, and South Shetland, the coast of California, etc. Vast numbers of these animals are annually captured; vessela frequently load entirely with them; and they are believed to furnish more oil than the common South Ses whale. The ofl of the black whale and that of the soa-elephant are both known in' the market by the name of Sonthern oil, and they are eo very similar that those most versed in the trade can with difficulty distinguish the one from the other. Hence ships commonly engage Indifferently in either fishing, as opportunity offers. The usual duration of the voyage of a ship from England in elther of the last two departments, or In the two combined, varies from twelve to elghteen months.

The South Sea fishery was net prosecuted by the English to any extent till about the beginning of the American war; and as the Amerieans nad already entered on It with viryor and auccess, four American harpoonera were sent jut in each veseel. In 1791 seven-ty-five whale ahips were sent out to the South Sea; but the unmber has not been vo great alnce, and latterly it has been uaprosperous end declining, In consequence prartly of the competition of the colonists in Australia, who aro incomparably better sitnated for the prosecntion of thls branch of Industry, and partly of that of the Americans. The Macrocephalus, or spermaceti whale, is partleularly abundant in the nelghborhood of the Splce Islands ; and Mr. Craw: furd, In his valuable work on the Eastern Archipelago, entered into some datalla to show that the fishery carried on there was of greater importance than the apice trade. Unluckily, however, tho atatements on which Mr. Crawfurd founded his comparisona were entirely erroneove, nelther the shipa nor the men employed amounting to more than one-fifth or one-sixth part of what he represented. We subjoin a atetement of the Southern whale-fishery carried on from Great Britain since 1819 , exhibiting the total number of shipa annually abseat from Great Britaln on wheling expedi. tiona; the total namber of ahipe that annaally return ed to Great Britain; and the annual Imports of sperm and common oll, with the prices of each 1

The ships for thla end the aucceeding years, as for the prevtous ones, do not Includo colonial shilps, but thoso from Brit ain only.

+ lrom thin year commenced the tmperial ineusuro.

But alnce then tho fishory has rapidly declined, and is now quite Inslgnificant. This is seen from the following account of the ships and their tonnage cleared out for the Southern whale-fiahery, viz. :

French Whale-fishery.-France, which preceded the other natlona of Europa in the whale-fiehery, can hardly be said, for many yeara past, to lave had much share in tt. In 1784 Louis XVI. endeavored to revive the fishery. With this view he fitted out six ships at Dunkirk on his own account, which wero furuished with harpooners and a number of experienced seamen brought at a great expense from Nantncket. The adventure was more successful than could have been reasonably expected, considering the auspices under which It was carried on. Several private Individuais followed the example of his majesty, and in 1790 France hed about forty ships employed in the fishery. The Rev. olutionary war destroyed every vestige of this riaing trade. But since the peace, government has made great efforts for Its renewal; and at present high bounLies aro granted to all veseels fitted cot for the whalofisiorles, but eapecially to those esugaged in the sperm fishery. These, howrever, have not been so successful in forcing shipa into this trade as might liave been allticipated; for it appears from the official accoants that In 1852 tho aggregate burden of the ehips cleared out for the whale-fishery amounted to only 2306 tons.Administration des Douanes, 1852, p. 460 ; M'Culloch's Dict.

American Whale-fithery,-For a lengthened period the Americans huve prosecutod the whale-fishery with greater vigor and auccess than, perhaps, any other people. They commonced it in 1690, and for about flay years found an ample aupply of fish on their own shores. But the whale baviag abandoned them, the American navigators entered with extraordinary ardor Iato the fisherles earried on in the Northern and Southern oceans. From 1778 to 1785 Massachusetts employed ennually 183 vessela, carrying 13,820 tons, in the foriner; aud 121 vessele, carrying 14,026 tons, In the Iatter. Mr. Burke, in hile famous speech on American affilirs in 1774; adverted to this wonderful display of daring entarprise as follows 1 "As to the wealth," said be, "which the colonien have drawn from the sea by thoir fisherien, you had all that matter fully vjened at
your bar. You surely thought these acquistions of value, for they seemed to excite your envy; and yet ine apirit by which that enterprising employment has been exercised onght rether, in my oplnion, to have ralsed eateem and adiniration. And pray, sir, what In the world ls equal te it? Pass by the other parts, and look at the jnanner In which the New England people carry on the whale-fighery. While we follow them among the tremblling mountalna of ice, and behold them penetrating into the deepest frozen recesses of IIudsm's Bay and Davia's Straits; while we are looking for them beneath the Arctic circle, wo hear that thoy have piercod into the opposite region of polar cold-that they are at the antipodes, and engaged under the frozen serpent of the South. Falkland Island, which seemed too remote and too romantic an object for the grasp of national anbition, is but a stage and resing-piace for their victorious industry. Nor is the equinoctlal heat more discouraging to them than the accumulated winter of both poles. We learn that while aome of them draw the line or atrike the harpoon on the cosat of Africa, others run tise iongiturie and puraue their gigantic game along the const of Brazil. No sea but whint is vexed with their fisheries; no climate that is not witness of thelr toiln. Neither the perseverance of Holland nor the activity of France not the dexterous and firm aagacity of English enter-prise-ever carried this most perijous mode of hardy Industry to the extent to which it has been pursued by this recent people-a people who are still In the gristie, and not hardened into munhood."

United States Whate-fiahery.-The first sperm whaio taken by the Nantucket whaiera wan killed by Christupher Hussey. Ite was cruising near the shoro for "right" whales, and was blown oft some distance from tho land by a strong northerly wind, whon he fell in with a school of that species of whale, and killied one and brought it home.

At what date this adventure took place ia not fully ascertained, but it la aupposed that it was not far from 1712. This event imparted new life to the business, for they immediately began to build vessels of about forty tons, to whale out in the "deep," as it was then celled, to distingulah it from "shore whaling." They fittod ihree vessels for six weeke, carried a few hogsheads - sufficiont to contain the blubber of one whale -and tried out the oll after they returned home.

In 1715 there were six vessels engaged in the whal-

Ing busineas-all aloops, from thirty to forty tona burden cach, and which produced an income of nearly \$5000.-Macy'a History of Nan/ucket.

As the enterprise increased more capital was invested, iarger vessela were ballt, louger voyages wero made, and new localition for whales were diacovered.

Fifty yeara later, viz., from 1771 to 1775 , Massachusetts alone employed annually 183 vessels In the North Atlantlo Ocean, and 121 vessels of larger hurden in the South Atlantle Ocean.

The first attempt to estahliah the aperm-whale fishcry from Great Britain was made in 1775. Nino yesrs Iater the French undertook to revivo tho prosecntion of thls business. The klng, Louis XVI., fitted out alx ships himself from Dunkirk, and procured hls experienced harpoonere from Nantucket. Others emulated the example of that monarch; so that hefore the French Rovolution that nation had forty ships in the aervice.
The Revolutionery war of the American colonles, and the wars of the French Revolutlon, nearly destroyed thits flourishing branch of marino enteri,rice in both countries. Just previous to the wer, Massachuestts employed in thls service 300 vessels and 4000 seamen, about half of whom were from Ne,ntucket alono. During that war fifteen veasels belonging to thia island were loat at sea, and 134 were captured by the enemy.

It "as not untll the year 1782-many years after the commencemont of the enterprise In Nuntucket, Caps Cod, Martha's VIncyard, snil other places on the Sound-that the attention of New Bedford was turnel toward the whalc-fishery.
From this date until the present time no permanent obstruction, with the exception of the war of 1812-15, has occurred to impede the gradual and lncreasing intereat given to this enterprise, and which now assumcs commanding commercial importance, and dovelops unrivaled encrgy in Its prosecution.
The whole number of vessels employod in the whalefishery in this conintry, as beforo reported, is 670. Number of ships, 358; barks, 259 ; brigs, 17; schooners, 46. The tonnage msy be put down at 220,000 ; value of property, $\mathrm{nt} \$ 100$ per ton, $\$ 22,000,000$.
The number of sciamen engaged in this business; allowing 30 for cach shij, 24 for a bark, 20 for $n$ brig, and 18 far a schooner, would be more than 20,000 .
The following are the reccipts of the whale-fishery of the United States during tho ycar 1857:

The Whalemen's Shipping Liet, of Now Bedford, has complied an annual atateinent of the reaulta of the whale-fishery during the year 1857, including the amount of imports and exporta of oll and bone, pricoscurrent, otc. The number of American vesula ennployed in the whale-fishery at present Includes 687 ehipa and barks, 18 hrigs, and 49 zehoonere, making an aggregate of 203,148 tons. Of thla numice there has been $\ln$ the North Pacitio Ocean about 150 shlpa, which is a dininution of 80 aa compared with the fleet employed in that quarter in 1856. But few veasela have been addet to the whaling fleet during the past year, whilo suveral have been withdrawn, and two lost-the Nevton, uf New Bedford, and the Indian Chief, of New London-leaving the aggregate tonnuge some 665 tona lcas than at the leginnling of the year. The quantlty of oil obtolned by 109 ahips, whose arrivals at the Sandwich Islanda have been reported, averagea 808 barrels, whlch is not very much trom the average of the preceding year. In regard to the fleet $\ln$ the Okhotak Sea, tho accounts are somewhat confictingsome vessels have mot whith good success, while othera have done comparatively nothing.

The imports of oil and bone into the United Statee in 1857 wero brought in by 173 ahlps end barks, 38 brigs and schooncrs, of whlch 142 belong to the seven perta ombraced In tho diatrict of New Bedford, and the remainder to various ports east of New York. We annex a comparison of tha Imports since 1850:

It will be seen from the above that the Imports of sperm oil In 1857, as compared wlth 1856, fall short 501 barrols, while the imports of whale oil nro 33,051 barrels in excess of 1856. The increased importation of tho latter during the ycar las arisen ehlefiy from shipmenta via Sandwich Ielanda from veasels which had not completed thelr voyages; and consequently wo look for a dimlinisied import the present year, variously estimated at from 75,000 to 100,000 barrels. Considerable shipments of bone have also arrived in the sane manner, whlch will tend still further to reduce the import of tila article the present year. The atock of sperm oil, whele oll, and whalebono in Importers' and speculators' hands, on the ist of January, 1868, Is given as followa.

|  | Sperm 010 | Whala 015 | Whatrone |

Tho following is a statement of the exports of oll and whalebone from the Unlled States for two yeara:

| Voom. | Eperm orl. | Whate ofl. | Whatabone. |
| :---: | :---: | :---: | :---: |
| 1856........ |  |  |  |
| 1857 | 37,231 | 17,407 | 1,885,662 |

est The inernused shlpments of oll during 1857, ass dompared with the totalis for 1856, word less the result of an actual forelgo demand than a desire on the part of our importars to suatain the market here by: roducing the stock. The affict, howover, was directly the opposite of what had been anticipated, for,' by overstocking the London martet, prices deolined there very rapidiy, and our home markote were left without the competition rosulting from a domestic and forolgn demand, and prices of oil dealined to a lower point than they have been oinee 1840. The domand for tond, however, has been anuaualiy active, owing to the fashionable propenaity of the ladies to "apread," and the price of thle articlo advanced to a highar polnt in 1867 than was over before known.
We annex acomparison of the avatage prices of operun oll and whalebona for eovanteen years:

| Years: | Eperm Of. | Whals Od. | Whalgbont. |

Wharf, a sort of quay, constructed of wood or stone, on the margiri of a roadstead or harbor; along side of which shipa or lighters are brought for the aake of being oonveniantly loaded ot unloaded.
Wharfage, tho fee paid for landing goode on a wharf, or for shipping them of.

Wheat (Ger, Weilzens: Du. Tarwo Du. Horde; Sw. Ifecte; Fr. Nroment, Bled, Blf; It. Grano, Formento; 8p. and Port. Trigo; Busa. Pschentia; Pol. Pazenica), a apecles of bread-corn (Triticum, Linn.), by far the most important of any cultivated in Europe or North America. Wp aro totally ignorant of the conntry Whence this valuable grain was first derived; but it was very early cultivated In Sicily. It is rained in nlmost every: part of the temperate zones, and in some places as high as 2000 feet nbove the level of the saa.,

Wheat Producion of the United States. - Whent, where the soil and climate are adapted to its growth, and the requisite progress has been made in its culture, Is deoidedly preferred to ali other groins, and, next to malze, is the most important crop In the United States, not unly on account of ita general use for bread, but for its safety and convenience for exportation. It ja not known to what country it la indigenous, any more than our other cultivated ceroals, ali of which, no doubt, have been essentially improved by man. . By some, wheat is considered to have been coeval with the creation, as it is known that upward of a thousand years before our era it was cultivated; and a superior variety had been attained. It has steadily followed the progress of civillzation; from the earliest times, in ali countries where It would grow. The introduction of this grain lnto the North Amarican celoniea dates back to the earliest periods of their sottiement by Earopeans. It was first sown, with other grains, on the Elizsbeth Islands, in Massachusetts, by Gospeld, at the time he explered that coast in 1602 . In 1611, wheat, as weil as other grains, was also sown In Virginia; and by the year 1648 there were cultivated many hundred ecres in that colony. Although premiums were offered as an encouragement of its growth in 1651, it was not much cultivated for mere than a century after, in consequence of the inl-directed attention to the culture of tobaceo.

Wheat was introduced into the valley of the Missisaippi by the "Western Company" in 1718, where, from the careless mode of cultivating it by the early settlers, and the sudden alternations of temperature, it would oniy yield from five to cight fold, running to straw and blade without filling the ear.' In 1746, however, the culture had so tar extended, that six hundred harrels of flour were received at New Orleans from the Wabash; and by the year 1750 the French of Illinois ralsed three times as much wheat as they consumed, and large quantities of grain and fiour wero sent to the same place. Prior to the Revolution, the primitive soils of New York, New Jersey, and of New England, appear not to have rewarded the cultivation of this grain much, lf any, beyend the wants of the Inhabltants. Considerabie quantities were raised on the Hudson, end in some parts of New Jersey and Pennsylvania, which were exported to the West Indies, and New Englard, and to Great Britain, France, Portugal, and Spaln, In years of scarcity, previously to 1723.

In 1776 there wis entailed upon this country an enduring calamity, in consequence of the lntroduction of the IIessian or wheat fly, which was suppesed to have been brought from Germeny in some atraw employed in the debarkation of Howe's troops, on the west end of Jong Ialand. From that point this Insect gradualiy spread In various directions, at the rate of
twanty or thirty miles a yemr, and the wheat of the entire 'regions east of the Alieghanies is now more or less infested with the larvis, wa well as in large portions of the States berdering on the Ohio and Mianiaslppi, and on the great lakes; and so great hove been the raveges of these Insects, that the cultivation of this grain in thany places has beent abandoned.
Tha geographical ringe of the whent region In th Eaatern Continant and Anstralia lies priaclpally between the thirtiethiand alxtieth parallel of north latitude, and between the, thirtieth and fortleth degrieed mouth, being chiefly confined to France, Spain, Portugal; Italy; Sieily, Greece, Turkey, Russia, Denmark, Norway, Sweden, Poland, Prussia, Netherlands, Bel gium, Great Britaln, Ireland, Northern and Southern Africa, Tartary, India, China, Australla, Van Diemen's Land, and Japen. Along the Atlantic portion If the Weptern Coditinent it embraces the tracts lying between the thirtieth and fifteth parailels; and In th country westward of the Roeky Mountalns, one of more degrees farther north." Along the west coast of South America, as well as In situaticns within the torrid zone, auficiently elevated above the level of the sea and properly irrigated by natural or artficial means, abundant crops are often produced. The print cipal districts of the Unfted States in which thin 1 m portant grain ia prodiced in the greatest abundasie and forms a leading a + in ! or commerce, embrace the States of New York, New Jersey, Penisylivania, Delaf ware, Maryland, Virginia, Ohio, Kentocky, Michigan Indiana, Illinols, Miseouri, Wisconslu, und Iowa. Th chlef varieties cultivated in the Northern and Easter States are the white fint, tea, Slberian, hald, Blacl Sea, and the Italian spring whest; in the Middle and Weatezn States, the Mediterrancani, the Virginla whit May, the blue stem, the Indiana, the Kentucky whitebearded, the old red chaff, and the Talavera. The yield varies from ten to forty bushels and upward per acre, welghing per bushel from fifty-elght to sixtyoeven pounds. $s$ Within a few years a species of wheat lies been introduced from Egypt, whieh, although it has veen lying dormant two thousand yeurs, promises to be upusually prolific. Another species from Sonth Australia, weighing eeventy pounde to the bushel, has also been introduced.
It appears that on the whole crop of the United Statel there was a gain, during ten years, of $15,645,000$ bushels. The crop of New England decressed from 2,014,000 to $1,090,000$ bashels, exhibiting decline of 924,000 Lushels, and iodlcating that the attention of farmers has been much wlthdrawn from the culture of wheat. Grouping the States from the IIudson to the Potomac, Including the District of Columbia, it appears that they produced In $184935,085,000$ bushels, against 29,936,000 in 1839. (In Virginia there was an Increase of $1,128,004$ bushels.) These Statea embrace the oldest wheatgrowling region of the country, and that In which the soil and cllmate aeem to be adapted to the permanent cuiture of the graln. The incresse of production in the ten yeara has been $6,272,000$ bushels, equal to $17 \cdot 4$ per cent. The area of tilled land in these States is $80,000,000$ acres, only 30 per cent. of the number of acres returned for tho whole United States, while the proportiun of wheat p. oduced is 46 per cent. of the entire crop of the country. In North Carolins there has been an increase of $170,0 \mathrm{CO}$ bushels; but in the Southern States generally there was a considerable decrame. Indiana, Illineis, Michlgan, and Wisconsin contributed to the general aggregate, under the sixth censue, only $9,800,000$ Uusheis; under the last they are shown to heve produced upward of $25,000,000$ buehels, an ameant greater than the whole increase In the United State: for the perlod.-U. S. Patent Offics Report.
As a curious illostration of the floctuations in the price of grain in Great Britain for the last two centurias we give the following table, taken from the Encycl. Britannica.

Wheat Trade of the Elbe, etc.-Next to Dantzic, the fueding of ulfferent apeciea of adimala, and 2 par Hanburg ia, perhups, the greatest grain market in the north of Europe, being $c$ fepost for large quantitice of Baltic corn, and for the produce of the extensive countries traversed by the Eilbe. The exports of wheat from Hamburg amounted, at an average of the eleven yeare endiag with 1811, to 210,871 quartera a year. The price of wheat is frequently less in Hamburg than in Dantzic; but this lownese of price is altogetber ascribable to the inferiority of the Holstuin and Hanover wheats, which are generally met with in great abundance in Hamburg. Wheat from the Upper Eibe is of a better quality. Bohemian wheat ls occusionally forwarded by the river to Hamburg; but the tharges nttending its conveyance from Prague amount to fuli $15 s$. a quarter, and prevent iss being sent down, excopt when the price is comparatively high. In 1841 the shipments of wheat from Hamburg amounted to 507,400 quarters, of which 460,000 were for England.

French Wheat Trade.-It appears from the accounts given by the Marquis Gurnier, in the last edition of his transiation of the Wealth of Nations, that the price of the hectolite of wheat ut the market of Puris amounted, at an average of the ninetcen years beginuing with 1801 and onding with 1819 , to 20 francs 53 cents, which is equal to 30 francs 80 cents the septier; or, taking the exchange at 25 francs, to 45 s . 6 d. the guarter. Count Chnptui, in his valuable work Sur l'fndustre F'rangoise, pubilshed in 1810, estimates the ordinary average price of wheat threughout France at 18 fruncs the hectolitre, or 42s. 10.l. the quarter. The varions expensee atteniling the finportation of a quarter of French wheat into London may be taken at a mediam at nhout 6s. a quarter. Frunce, however, has very little surpius produce to dispose of; so that it would be impossible for her to export any considerable quantity without occasioning a great ndvance of price.

The mean of the different estimates framed hy Vauban, Quesuny, Expilly, Laveisier, and Arthur Young, gives 61,519,672 septlers, or $32,810,000$ quarters, as the total average growth of the ditferent kinds of grain lis France (Peuchet Statistique Elémentairs). We, hewcyer, took occasion, in a former articie on this subject, to observe that there could not be a doult that this estimato was a great deal too low; and tho mero careful investigations of late French statisticians fully confirm this rem.ork. The annual produce of tha harvest of France was lately (1843) estimated, from returus obtained under official autherity, at 63,508,000 hectolitres of wheat, and $112,958,000$ ditto of other sarts of grain; making in ail 182,517,000 hactolitres, or 62,740,000 imperial quarters. Of thle quantity it is supposed tbat ubout if per cent. is consumed as sead, 10 per cent. in
cent. in distilleries and breweriea.

The foreign grain trade of France waa regulated, tlll within these few years, by a law which forbade exportation, except when the heme pricee were below certain limits, and which restrained and absolutely forbade Impertation, except when they were above certain other limits. The prices regulating importation and expertation difiered in the rifferent districts Into whlch tha kingdom was divided. ' Latterly, however, importatien has been at all times allowed unier gruifuated duties, which, like those recently existing in England, become prohibitory when the prices sink to a certain level. The fronticr departments are divided into four separate districts, the prices in each district goveruing the duilies on importation into It, so that it sometimes happens that grain wnrehoused in a partleular port, where it is not admissilile except under a high duty, has been carricd to another port in anothor district, and sdmitted at a low duty. An officinl announcement is issued on the last day of each month, of whit the duties are to be in each district during the succeeding menth.
Spanish Grain Trade. - Tha exporta $3 n$ of grain from Spain was formerly prohibited under the severest penalties. But in 1820 gralu and four were beth allowed to be freely exported, and in 1823 this privilege was extendel to nli productions (fivios) the growth of the soil. Thero is now, in fact, no ubstacle whintrer, except the expense of carriage, to tho conveyance of grain to the sca-ports, and thenco to the forcigner. Owing, however, to the grain-growlitg provinces being principaliy situatei In the interior, and to the extreme balness of the reads, which renders carrlage to the coast both expensive and difficuit, the exporis aro comparatively trifling : this difficulty of carriugo frequently gives rlse to very great differences of prices at places in all parts of the country only a fow leagues distant.

Grnin Trade of Odessa.-Odessn, on tho Black Sea, is the only pert in southern Europe from which any considerable quantity of grain is exported. We believe, Indeed, that the fertility of the soil in its vicinity has been much exaggerated; but the wheat ahipped at Odessn is principally brought from Volhynia and the Polish provinces to the south of Cracow, t'e aupplies from which are sueceptible of an indafinite increase. Owing to the cataracts in the Dnieper, and the Duiester having a grest number of shaliows, most part of the grain brought to Odesaa comes by innd carringe. The expense of this mede of cenveyance is not, however, nearly so great as inlght be supposed. The carts with grain ard often in parties of 150 ; the oxen are pas.

Gered durlag the alythe, and thoy teles advantage of the pariod whon the peasantry are not ocempled with the harveet, 50 that the charge on aceount of convayance is comparatively trlfing:
Both coft and hard wheat are experted from Odease I but the formart, whloh it by far. the troent sbundant, is only brought to Fogiand, Sappoinig' British wheat to soll at about 600 , Odeases, wheat in good order would not be worth more than 82. fin the London market but it is a curioue fact, that in the Mediterranean the entimation in, thich thay are held is quite the reverme; at Maite, Marmollien, ILoghorn; ©lci, Odema wheal stebes a focidedly highor price than Itritiah wheat.

The hard whiost brought from the Diack Bea comes principally from Tagenrogs, It is a vary fine species of grain; it is full 10 per cent. heavjer then British wheat, and lias leps than half the bran. ${ }^{\text {. }}$ It is used In Italy for inaicing macaroal, vermionlli, and things of that sort $;$. littlo of it has found ita wey to Eogland.
The voyage from Orease to Britain Is of nneertain iuration, bat generaliy vary long. It is eamential to the inpurtation of wheat in a good condition, that it should be made during tie winter months. When the voyage is made in aummer, uniesa the whent be rery ouperior, and be thipped in exonedingly good order, it Is almost sure to heat, and has sometimen, indeed; been infured to such a degree tue to require to be dug from the hold with plckeaxee.. Uniass, therefore, means be devised for leamoning the riak of dimage during the voyage, there is litale; reason to think that Odesan wheat will over be very largely imported into Britais. f The entire expenes of importies a quarter of wheat from Odesse to London may be eatimated at fonn 160. to 18. The exporte of wheat from Odessa, and other ports or the Black Sea, to Constantinople, the Levant, Italy; the eouth of France, ete., have iatterly been very large indeed. In 1846 the exports from Odessa only amounted to 1,279,502 quartorn, and 's 1847 to $2,010,602$ ditto; the lacter being, wo believe, the largest oxpertation that ever took place in a single year from any siagie pert. Owing to the scarcity In England, above 400,000 quarters of the above quantity were ahipped for that country, bot the apeculatlos entalled a heavy loss on the importers. The price free on lhoard at Odenss conaiderabiy exceoded 40, a quarter.-E. B.

Cinited States.-When we see the growth of wheat keeping op with the progrese of popuiation in the oldeat States of the Linion, wo need have no apprehenaion of a decline in the cultivation of this important erop. The amount of floar exported from Now Jersey in 1751 was 6424 barrels; from Philadelphia, in 1752, 125,960 barrels, besides 86,500 bushels of wheat; in 1767, 108,816 barrels, besides 867,800 bushels of wheat; in 1771, 252,744 barrels; from Savanaah, in 1771, 7200 pounds; fron Virginia, for some years annually preceding the Revolution, 800,000 bushels of wheat. The total exporte of flour from the United States in 1701 were 619,681 barrels, besides $1,018,339$ bughels of wheat; in $1800,6033,052$ barrels, besidee 26,853 bushols of wheat; in 1810, 798,481 , barrels, beaides 325,924 bushele of wheat; in $1820-21,1,056,119$ berrels, besides 25,821 3ualiels of whest; in $1830-31,1,806,529$ barrela, booldes 408,910 bushels of wheat; in 1810-'41, 1,515,817 barrels, lealdes 868,585 bushela of wheat ; in 1845-i46, 2,289,476 barrels, beaiden 1,618,795 Lusheis of whoat; in 1816-' $47,4,382,496$ barrels, besides $4,899,951$ busheis of wheat; in 1850-'51, 2,202,335 barrels, besides $1,026,723$ bushele of wheat. According to the ceasus of 1840, the wheat crop of the United Statet amounted to 84,823,272 buahels; in 1849, according to the census of $1850,100,503,899$ bushais, although in some of the largeat wheat-growing Statee the crop of 1849 fell far below the average. The production of the year 1857 is the United States is estimated at about $200,000,000$ of Lushels.

In the State of Ohio, especially, there was great deficiency, as wes made apparent by the returns of the
whent erep for the onouing year, mado in puravanes of an act of the Legialature of that State.' From the almont univeral ruterna of "short crop" by the masd shain, in thit state in 1849, whieh fell below that of $1839,2,000,000$ bushols, and the eeceriaingd orop of 1850 wh are fally catisted that the averape wheat erop of Ohlo would appear 80 per sent. greater than showt by the censue returna. The same causes which opeŕn ated to diminish the wheat crop of Ohio, were not without thelr effects upon that of other States bordering on the uppar portion of thd valloy of the aliagianippl.
it In the Londom exhlbition very littlo wheat whe exhibited equal to that from the United States, espectely Iy that from Geacsee county, in the Stata of New York -a whi, whito variois-to the exbibltor of which e prise medal wes awarded by the Royal Commicelonera, and rocently tranamitted to Mr. Beli by the Proaidonil of the United States, the chairmin of the Americad Executive Committec. The red Mediterranean wheat exhibited from the United Stated attracted miveh ilf tantion. The wheat from South Australla was probe, Uly superior to any exhibited, while mueh from ous own country foll bot little behind, and waa unquestiona ably next In quality.-Patent Office Report.'

The imports of wheat into the United States are merely nominal, being, tor the year ending June 30, 1857, as followa:

| Whence imported. | Buahelo. | Velut. |
| :---: | :---: | :---: |
| Ilamburg | 834 | 8 |
| Snndwich Jelands |  | 204 |
| Other plicen | 94 | 27 |
|  | $\overline{\text { c }}$ | \$909 |

Formerly the export of breadstuffs from the United States was principally made up of flonr, but of late years It has been found advantageous to sinip wheat in bulk, eapecially from the interlor grain markets, without trashipmeat; and, as may be seen from the preced-
ing statement, at present tho export of wheat is neariy equal that of flour.

The consumption of tho country, per the census figures of product, popuiation, and export, for the years 1840 and 1850, and the rate of lncreaso in population being known, the reaulta are as follows:

| Yetrs. | Population. | f'onsumption et 34 Bushele. | Actaal Kisport. |

Whip, In ace language, a rope passed through a single block or pulley.
Whirlpool, a vortex, eddy, or gulf, where the water has a circular motion. Whirlpools are produced by the meoting of currenta which run in different directions. Their danger to navigation is well known, but is, perhaps, not equal to the dresd which ssilors entertain of them. Some of the most celebrated are tho Euripus, near the coast of Negropont; tho Charybdis, in the Straits of Sicily; and the Maolatrom, on tho northern cosst of Norwas.

Whirlwind, s revolving column or mass of air, supposed with most probability to be produced by tho mecting of two carrents of air blowing in opposite directions, but ascribed by some to electricity. It is analogous to the whirlpool. When the opposito currente have the asme velocity, the circuiation will be maintained at the same spot; but if the motion of ono of them la more rapid than that of the other, it will transport the whirling motion with its excess of celerity, and a progressive and rotatory motion are thus maintained at tite same time. Whirlwinds generally occur in summer, and aro most violent in tropical countries, where they frequently produco most destructive effects.

Whiaky, a spirit obtained by distillation from corh, augar, or molases, though generally from the former. Whisky is the national spirit, if we may so terin it, of Scotland and Ireland; but that distilied in the former ls genersily reckoned superior to that of the latter.-Sea Spinits. Whisky is a corruption of the Irish word usquebsugh. This ardent spirit mny be manufactured from barley malt alone; from the raw or unmalted barlay mixed with from a third to a ninth of malt ; from a mixture of raw barley, whent, rye, or oats, with from a sixth to a tenth of barioy malt; or from a mixture of raw barley, or big, with sugar; or from sugar or molasaes aione. When barley malt is alone used, the precessea are simple, and the ppirit produced has a more agreoable flavor, and la more esteemed; but, in consequonce of tho heavy duty on malt, distillers have been induced to employ large quantitles of
unmalted grain, and of late years no small proportion of angar and molasses, adding merely onough of malt to induce the chemical conversion of the starch in the unmalted grain into grape augar.
During the germination of barley (as in its conversion into malt) a peculiar subatance is generated in the grain calied diastase, which acta chemically on the atarch of the graln, converting it firat into a kind of gum called dextrine, and then into a aweet aubatance identicel in composition with grape auger. It bas been found that this diastase can convert 2000 parts of atarch into grape sugar; and it is of this valuable property that the distillor avails himbelf when he adds malt to his raw grain. To eave the more expenaive articlo malt, he uses only ao much as experiment has proved will auffice to change the starch of the raw grain into sugar when mixed with it in his mash-tun. The dietiller, therefore, to prepare the asccharine fluid for his operations, has to go tbrough all the processes of brewing before be gets it resdy for the atill.-See article Buewing.

The Manufacture of Whisky.-Cincinnati has become the greatest whisky market in the world, and the Ohio Valley the most important whisky-produclng region with which we are acquainted. The distilleries in the vicinity of Cincinnatiarc on a large acslo, and they are said to exhibit many improvements deviaed by inventive genius. Steam is made to perform nearly all the labor. Few men are employed, and they do little else than look at the machines as they perform the work. Tho quantity of corn consunied in a aingle distillery in Cincinnati is about one tbousand bushela per day, from which about 4000 gallons of whisky are produced. This givea for this single establiahment a consumption of 312,000 bushels of corn per annum, and a production of $1,248,000$ gallons of whisky. Wo have not the data upon which to base an estimate of the quantity of whisky produced in the Ohio Valley. The quantity sold in the Cinclnnati market annually is about 220,000 barrels, or about $9,000,000$ gallons. This is probably not more than one half the production of Ohio and Indiana alone. We presume that tho production ls $18,000,000$ gallona, and find the consumption of corn sveraging four and a half million bushels. It is probable that the production of whisky in the Ohio Valley is $50,000,000$ gallons per annum, involving a consumption of $12,500,000$ bushels of corn, the averaga value of which is $\$ 5,000,000$. The demand for the article is great, and daily increasing.

White Sea. The entrance to the port of Archangel, situated on the right bank of the Dwiaa, about thirty miles from its mouth, is interrupted by a bar, over which vessela drawing more than fourteen feet of water can not pass. Larger shipa discharge and load outside the bar. The trade of Archangel extenda aa far na Siberin, and along the coasts of the White Sea, enst and west. Previous to the founding of St. Petersburg this was the only place of maritime commerce in tho empirc. Siace that period ita trade has considerably declined. The River Dwiaa is connected with the Volga nnd Neva by cansla; but, owing to the rigor of the climate, the port of Archangel ls open only from July to Septemher. Its imports consist of colonial goods, salt, woolens, and hardwares. It 1852 there entered this port 715 vessels, with an aggregsto of 56,922 tons; of which 85 were laden and 630 in ballast. These all cleared with freight. Of the arrivals thero wero under the English flag 273 vessels, with an aggregato tpnnage of 24,297 tons.

Total custom-house receipte from the five ports of the White Sea, in 1852, 984,000 franca. These ports are Archangel, Oneg, Kola, Kemi, Sounaky. The Importe of Archangel consist of dry and salted filh, sugar,

## WIN

wines, and other liquers, salt, and peltries. The exports are flax, linens, linseed, timber, tar, etc.

Wigs. The wig-trade is one of tha most curious connected with manufactures $\ln$ hair. The French aro famous in this department. There is a regular hairharveat in some of the central districts of France; Paris firms send agents into those diatricts in tha apring of the year, who purchass the beautiful trussas which the country maidens havs been cultivating for that purpose: this hair-crop is as much an annual affair as a corn-crop in the fields. The price paid is about threepence (English) per ounce; but the agents usually pay for the hair wlth ribbons, handkerchiefs, and other trinkets, at faira and marksts. Not the least curious feature is, that the agents can distinguish ths hair of one district from that of another not far diatant-an athnographical feat which might puzzle a learned naturalist-and attach a money valua to this differenca. If it bo trua, as is aaserted, that tro hundred thousand pounda' weight of women's hair ia thus anuually sold in the country districts of France, it must bo admitted to form a very aingular kind of commerce. The agents sort und clean the hair, and then diapose of it to the Paris firms at about doubls the former price. Then comes the art of the peruquier to fashion this hair into wigs, perukea, and acnips-some of which command a very high price. Of tho "transparent wigs," tha "ventllating wigs," the " ball white wigs," tha " gos-samer-parting wigs," the "fronts with each hair fixed separately," and other wonders of wig-making, we have been abundantly informed by our atlvertixing peruquiera.

Wind-milis. They are of great antiquity, and some writers state them to be of Roman invention; but certainly we are indebted for the wind-mill to the Saracens. They aro aaid to have been originally lutroduced into Europa by tha knights of St. Jolin, who took the hint from whit they had aeen in the erusades. -Baken. Wind-mills were first known in Spain, France, and Germany, in 1299.-A mmenson. Wind saw-mills were invented by a Dutchman in 1633, when one was erected near the Strand, in London.

Windown. Sec Glass. There were windows in Pompeii, A.I, 79, as is evident from ita ruins. It is certain that windows of some kind were glazed so enrly as the third century, if not before, though the fashion was not introluced until it was done by Bennet, A.D. 633. Windows of glass were used in private houses, but the glass was imported, 1777.-Aninsuson. In Eugland about 6000 houses now have tifty windows and upward in each; about 275,000 have ten wintowa and upward; and 725,000 have seven windows, or less than seven. The window-tax in England was first enacted in order to defray the expense of and defeiency in the re-coinage of gold, 7 Withiam Iil., 1695.

Winds. The prevailing winds in the Caribbean Sen and southern parts of the Gulf of Mexico aro the northeast trade-winds. They bave their offices to perform in the river basins of inter-tropical America, und the rains which they may discharge into the Misaissippi Valicy now and then arcexceptions, not the rule. The winds from the north can not lringe vapors from the great lakes to make rains for the Mississippi, for two reasons: ist. The bnsin of the great lakes roceives frum the atmosphero more water in the shape of rain than they giva lack in the shape of vapor. The St. Lawrence River carries off the excess. 2d. The mean climate of the lake country is colder than that of the Mississipyl Valley, and therefore, as a general rule, the tempuerature of the Mississippi Valley is unfavorable for condensing vapor from that quarter. It can not come from the Atlantic, becanse the greater part of the Mississippi Valley is to the windward of the Atlantic. The winds that blow across this ocean go to Europe with their vapors; and in the I'acific, from the parallels of California down to the equator, the direction of thu wind at the surface is from, not toward,
the hasin of the Miasisslppi. Therefore it seemed to be established with soms degree of probebility, or, if that expression ba too strong, with something like apparent plausibility, that the rain winds of the Mississippi Valley do not, as a general rule, get their vapors from the North Atlantic Ocean, nor from the Gulf of Mexico, nor from the great lakes, nor from that part of the Pacific Ocean over which the northeast tradewinds prevail.

Southeast Trade-winds.-Afibr the northeast trades hava blown out their season, which in India ends in April, the great arid plains of Ceutral Asja, of Tartary, Thibet, sad Mongolia, become heated up; they rarefy tha air of the northeast trades, and cause it to ascend. This rarefaction and ascent, by their denasnd for an indraught, are felt by the air which the southeast tradewinds bring to the equatorial Doldrums of the Indian Ocean: It ruahes over into the northern heniaphere to supply the upward dranght from the heated plains as the southwest monsoons. The forces of diurnal rotation assjat to give these winds their westing. Thus the southeast trades, in certain parts of the Indian Ocean, are converted, during the summer and carly autumn, into south west nonsoena. Thess then coms from the Intian Qcean and Sea of Aralia loaded with moisture, and, striking with it perpenilicularly upon the Ghauts, precipitate upon that narrow atrip of land between thia range and the Arabian Sea an amount of water that is truly astonishing. Ilere, then, ara not only the conditiona for causing more rain, now on the west, now on the east sicle of this momitain range, but the conditions also for the most coplose precipitation. Accorlingly, when we come to consult rain-gauges, and to ask meteorologienl observers in India about the fall of rain, they tell us that on the western slopes of the Ghauts it sometimes reaches the enormous depth of twelva or fifteen inchea in one day. Were the Andes stretched along the eastern instead of the western coast of America, we should have an nmount of precipitation on their eastern slopes that would be truly astonishing; for the water which the Amazon and the other majestic atreama of Sonth America return to the ocean would still be precipitated between the sea-shore and the crest of these mountains. These winds of India then continue their course to the Ilimalaya range as dry winda. In crossing this range, they are sulijected to a lower temperature than that to which they were exposed in crossing the Gihauts. Here they drop more of their molsture in the shape of snow and rain, and then pass over linto the thirsty lands lieyond with scarcely enough vajor in them to make even n cloud. Thence they ascend into the upper air, there to become counter-currenta in the general system of atmosphericui circulation.

Rain-winds ars the winds whieh convey the vapor from the sea, where it is takels up, to other parts of the earth, where it is let down either as snow, haii, or rain. As ngeneral rule the trade-winds may be regarled as the evaporating winds; and when, in the course of their circuit, they are converted into monsoons, or the varialles of either hemispliere, they then generaily becomo also the rain-winds-especially the monsounsfor certain localities. Thus the southwest monsuons of the Imilian Ocenn nre the rain-winds for the west coast of Hindostan. In like manner, the African monsoons of the Atlantic are the winds which feed the springs of the Niger and the Senegal with rains. Epon every water-shed which is drained into the sea, the precipitatlon, for tha whole extent of tho shed sodrained, may be considered as greater than the evaporation, by the annount of water which runs off through the river into the ace. In this view, all rivers may be regarded as immense rain-gnuges, and the volume of water annually discharged ly any one as an expressic. a of the quantity which is annually evaporated trom the sea, carried binck by the winds, and precipitated throughout the whole extent of the valley that is drain-
ed by it. Now, if we knew the rain-winds from the dry, for each locality and sesson generally throughout such a basin, we should be enabled to determine, with some degree of probability at least, as to the part of the ocean from which such rains were evsporated. And thus, notwithstanding ail the eddies caused by mountain chains and other uneven surfaces, we might detect the general ceurse of the atmospherical circulation over the land as well as the sea, and make the general courses of eircuiation In each valley as obvious to the inind of the philosopher as is the current of the Misaissippi, or of any other great river, to his senses.

These investigations ss to the rain-winds at sea indicato that the vapors which suppiy the sources of the Amazon with raln are taken up from the Atlantic Ocean by the nertheast and southeast trade-winds; and many circumstances, some of which have already heen detailed, tend to show that the winds which feed the Nississippi with rains get their vapor in the southeast trade-wind region of the other hemisphere. For instance, we know from observation that the trade-wind regions of the occan, beyond the immediate vicinity of the land, are, for the most part, rainless regions, and that the trado-wind zones may be described, in a hyetographic eense, as the evaporating regions. They also show, or rather indicate, as a general rule, that, leaving the polar limits of the two trade-wind systems, and approaching the nearest pole, the precipitation is groater than the evaporation until the point of maximum cold is reached.

And we know also that, as a general rule, the southeast and northeast trade-winds, which come from a lower and go to a higher temporature, are the evaporatiug winds, i. e., they evaporate more than they precipitaie; while those winds which come from a higher and go to a lower temperature are the rain-winds, i.e., they precipitate more than they evapnrate. That such is the ease, not only do researches indicate, but reasen teaches, and philosophy intimates. These views, therefore, suggest the inquiry as to the sufficiency of the Atlantic, after supplying the sources of the Amazon and its tributaries with their waters, to supply also the sources of the Mississippi and the St. Lawrence, and of all the rivers, great and amali, of Nerth America and Europe. A careful study of the rain-winds, in connection with the Wind and Current Charts, wlll probsbly indieste to us the "springs in the ocean" which supply the vapors for the rains that are carried off by those great rivers. "All the rivers run into the sen; yet the sea is not full; unto the pince from whence the rivers come, thither they return again." - Maunr's Phys. Geag.

Wind-sails, in a ship, nre made of common sailcloth, and are usually twenty-five and thirty feet long secording to the size of the ship, and are of the ferm of a cone ending obtusely. When they are made use of, they are hoisted by ropes to about two-thirds or more of their height, with their bases distended circulariy, and their apex hanging downward in the hatehways of the shlp. Above each of these one of the common exils is so disposed that the greatest part of the air rushing against it is directed into the windsail, and conveyed into the body of the ship, to produce ventilation, ete.

Windward, in aea-language, denotes any thing toward that point from whence tho wind blows, in respect of a ship: thus windward tide is the tide which runs against the wind.

Wine (Ger. Wein; Fr. Vin; It. and Sp. Vine; Port. Finhe; Russ. Wino, Winogradnoe winoe; Lat. Vinum Gr. Oıvos; Arab. Khumr), the fermented juice of the grape, or berries of the vine (Vitis vinifera). The vine is indigenous to Persia and the Levant ; but it is now found in most temperate regions. The limits within which it is cultivated in the northern hemiaphere of the Old Worid vary from nbout $15^{\circ}$ to $48^{\circ}$ and $52^{\circ}$; but in North America it is not cultivated farther
north than $38^{\circ}$ or $40^{\circ}$. It is rarely grown at a greater altitude than 3000 feet. From Asin the vine was introduced into Greece, and thence into Italy. The Phoceans, who founded Marseilles, carried the vine to the south of France; but it is doubtful whether it was introduced into Burgundy till the age of the Antonines. The aucient writers give the most contradietory accounts with respect to the Introduction of the vine into Gaul.-See the learned and excellent work of Le Grand d'Aussy, Vie Prirée des Frangais. The species of Vitis Indigenous to North America is very different from the Vitis vinifera. In favorable seasons the vinc ripens in the open air in England; and in the 11th and 12th centuries considerable quantities of inferior wine were made from native grapes. Vineyserds are now, however, unknown in Great Britain; but the grapes raised in hot-houses, and used in desserte, are excellent. The vine grows in every sort of soil; but that which is light and gravelly seema best suited for the production of fine wines. It ancceeds extremely well in voicanic countrice. The hest wines of Italy aro produced in the neighborhood of Vesuvius; the famous Toksy wine is also made in a volcanie district, as are several of the best French wincs; many parts of the soath of France bearing evident marks of extinet volcanoes. Hermitage is grown among the debris of granite rocks. The inost favorable situstion for a vineyard ls upon a rising ground or hill facing the southeast, and the situation should not bo too confined;

## Bacchus amat colles.

Tho art of expressing and fermenting the juice of the grapo appears to liave been practiced from the remotest antiquity. The sacred writings tell us that Noalh planted a vineyard soon after the deluge (Gen. ix. 20 ); and a modern Latin poet ingeniously represents the vine as a gift from Ileaven, to console mankiad for tho miscries entailed upon them by that grand catastrophe !

> Omnta vastatis ergo quum cernoret arvis
> Desoluta Deus, nobls feltefa vinl
> Dona dedtt; tristes homtnum quo munere fovit Rellqulas, mundl solatus vite rulnam 1

Vanterii Pred. Rusticum, lib. $\mathbf{x}$.
Species of Wine.-There are many varieties of vines; and this circumstance, combined with differences of soil, climate, mode of preparation, etc., oceasions an extreme variety in the species of wine. But between places inmediately contiguous to each other, and where even a careful obearver would hardly remark any difference, the qualities of the wines, though produced by the same species of grape, and trested in the same way, are often very different. A great deal evidently depends upon the aspect of tho vineyard; and it is prolesble that $a$ good deal depends on peculiarities of soil. But whatever may be the enuse, it is certain that there aro wines raised in $n$ few limited districts, such as Tokay, Johonnisberger, Constantia, the best Burgundy, Chanipagne, Claret, ete., that no art or care has hitherto succeeded in producing of equal goodness in other places.

The leading charaeter of wine must be referred to the alcohol which it contains, and upon which its intoxicating powers princlpally depend; not exclusively, however; for some of the lighter wines, if brisk and effervescent, seem to derive from the admixture of carbonie acid a peeuliar exhilarating power not directly proportional to their alcoholic centente. And again, we find other wines, among which eertain Burgundies itand foremost, which are eminently heating, though not very strong. The following table shows the quantity of alcohol (of the apeeific gravity of 825 at $60^{\circ}$ ), by measure, contained in 100 parta by measure of the respectiva wines. Some other vlnous and spirituous liquors have been added, for the purpose of showing the reiation which they bear to wine in the proportion of alcoliol which they contain.

ences of the solla in which they are planted, in the exposure of the vineyarda, and in the treatment of the grapes, and the mode of manufacturing the wine. Though the rine grows in every sort of soil, a rising ground, or gently-sloping hill facing the aouth, with a loose, gravelly, or rather volcanic soil, is by far the best situation for a vineyard. It is in auch situatlona that all the finest wines are produced.
It would be useless, in a work of this kind, to attempt characterizing the different aorts of wine used. Port and aherry have long enjoyed a decided preponderance in the markets; and it must be admitted that, when of good quality and eparingly used, they are very unexceptionable wines. But they are often harsh, end have the disadvantage of being atrong and heating, so that they can not be taken, to any thing like oxcese, by most persons with impunity. They are well enough for a glass or two, but they are not wines for conversation or society. It is not probsble, indeed, had it not Lean for the high differential duties with which French winea were so long burdened, that the uee of port and sherry would ever have heen so general ; and aince tho alolition of the difforential duly in 188I, French wines have began gradually, though slowly, to make their way from the higheat, to which they have hitherto been mostly confined, among the middle claases. They are, indeed, superior in almost all respecta to every other variety. The best growths of claret, Champagne, and Burgundy, seon to uuite all the qualitiea required to constitute perfect wines. IIad thoy been knowa in antiquity, we appreicend they would have engrossed most part of the praiso so profusely lavishod on the Pramnlan, Cecuban, Falersian, and othor renowned wines of Greece and Rome.-- Bhande's Dict.

Ancient Wines.-The wines of Lestos and Chios among the Grecks, and the Falervian and Cecuban among tho Romans, have acquired an inmortality of renown. Great nncertainty, however, prevails as to the nature of these wines. Dr. Incuderson thinks that the niost celebrated of them all, tho Falernian, approached, in lis most essential charecters, near to Madeira. In preparing their wincs, the ancienta often inspissated them till they became of the consistence of honey, or even thicker. These were diluted with water previoualy to their heing drunk; and, indeed, the habit of mixing wine with water scems to have pravailed much more in entiquity than in modern times.
Modern Wines.-Tho princlpal wines made use of in England are port, sherry, claret, Champagne, Madeira, hock, Marsala, Cape, etc.

Port, the after-diuner wine, is produced in the province of Upper Douro, in Portural; and is shipped at Oporto, whence its name. When it arrives in England, it is of a dark purple or jnky color ; has a full, rough body, with an astringent litter-aw cet taste, and a atrong fiavor and oilor of brandy. After it has remained somo years longer in the wood, the sweetness, roughness, anil astringency of the flavor abate; but it is only after it has been kept 10 or 15 years ia bottle that the odor of the brandy is completcly subdued, and the genuine aroma of the wine developed. When kept to too great an age, it becomes taway, and loses its peculiar flavor. During the process of melioration, a considerable portion of the extractivo and coloring matter is precipitated on the aidea of the vesacla in the form of crust. In some wines this change occurs much earlier than in others. A large quantity of brandy is always mixed with the wine shipped from Cporto for Fagland. Geauine unmixed port-wine is very rarely met with. We have been so long accuatomed to tho compounded article, that, wero it possible to procure it unmixed, it is dsubtful whether it would be at all suited to our taste. Aecordlag to Mr. Brande's analyais, on which, however, owing to the differences $\ln$ the quality of the wine, no great stress can be laid, port, as used in Engiand, contains about 23 per cent. of alcohul.

Oporto Wine Company.-The quality of the wine shipped from Oporto has been materially injured by the monopoly so long enjoyed by the Opurto Wine Compnny. This compsny was origioally founded in

1756, daring the administration of the Marquis Pombal. A certain extent of territory was marked out by its charter as the only dietrict on the Dorro in which wine could be raised for exportation : the absolute disposal of the wines raised in this district was placed in the hands of the company, who were further authorized to fix the prices to be paid for them to the cultivators, to prepere them for exportation, and to fix the price at which they should be eold to foreigners ! It ta obvious that a company with such powers conld not be any thing else than an intolerabie nuisance. What could be more arbitrary.ad anjust than to futerdict the export of all wines raised out of the limita of the company's territory? But even in its own district, ita proceedings were oppresaivo and injurious. The company annually fixed, by a fiet of their own, two rates of prices-one for the rinho dofeitoria, or wine for exportation; the other for vinho de ramo, or wine for home consumption-at which the cultivators were to be paid, whatever might be the quality of their wines! Thay had, therefore, no molive to exert superior skill and ingenuity; but contented themselvea with endeavoring to raise, at the least possible expense, the greatest supply of vinhe de feitoria, for which the company aliowed the highest price. All emulation was thus effectually extinguighed, anc the proprietors who possessed vineyards of a superior quality adulterated their wines with inferior growths, so as to reduce then to the average standard. "In this way," aays Dr. Henderson, "the fincr products of the Douro vintages have remained, in a great measure, unknown to us; and port-wine has come to be considered as a aingle liquer, if I may use the expression, of nearly uniform flavor and strength ; varying, it is true, to a certain extent in quality, but still alwaye approaching to a defiaite atandard, and admitting of few degrees of excellence. The manipulations, the admixtures-in one word, the adulterations-to which the best wines of the Cimo do Vouro are aubjected, have much the same effect as if all the growths of Burgundy were to be mingled in one immense vat, and sent into the world aa the only true Burgundian wine. The deliclous produce of Romanée, Chambertin, and the Clos Vougeout, would disappear, and in their places we ahould find nothing better than a aecond-rate Baaune or Mecon wine."-Ilistory of Ancient and Modern Wines. Not only, however, did the Oporto Wine Company deteriorate the quality, but they also raised the price of their wines to an enormous height. Secured against the competition of their countrymen, and enjoying down to 1831 a nearly absolute monopoly of the British markets for red wines by means of the high duties on those of France, they filled their pockels at our expense. At the very moment when the company were shipping wine for England at $£ 40$ a pipe, they frequently shipped the same wine to other countries at $£ 20$.-Fleetwood Wikliams on the Wine Trade. And the authentic tables published by Balbi show that the price of wine was trebled and quadrupled under the management of this corporation.-Essai Statistique sur le Royaume de Portugal.
It is long since the injurious influence of the company on the commerce of England was distinctly perceived and pointed out. So far back aa 1767, the Board of Trade laid a memorial before his majesty in council, in which they stale, "With respect to many particular regulations of the Oporto Company, which we think justly objected to by the merchants as highly grievous and oppressive, wa have not thought it necessary to entar into a minute description of them, being of opinion that one general and fatal objaction lies against them all; viz., that they ali contribute to establish in the company a monopoly against your majesty's subjects from which by trealy they have a right to be exampted." But notwithstanding this anthoritative exposition of the injury done to the English by this monopoly, and the experience which every subse-
queat jear afforded of its mischievous influenca, such was the inveteracy of ancient prejudice, that it was not till 1831 that we took that step which, had It been taken a century hefore, would have rid ourselves of its evils as well as a host of others, hy equaliaing the duties on French and Portuguese wines, and putting an end to the Injurious preference given to the latter by the Methuen treaty. In 1833 Don Pedro, whose daughter had been ralsed to the Portuguese throne mainly by the intervention of the English, lasued a decree abollshling the Old Oporto Company. And it inight have been supposed that once abated, the nuisance would not heve been again revived. But such was not the case. A new wine company was subsequentiy established, with privijeges little less oppressive than those of the old company. And as the taste for French wine had made little progresa among us in the interval, we auffered from the monopely and adulteratione practiced and sanctioned by the new company, es we had done from those of its predecessor. Its mischievous influence being further aggravated by a heavy export duty on whe shipped to any port in Europe, was latterly ao intolerable, that to defeat it considerable quantities of port were imported by the circultous route of the United States. However, the firm remonstrances of the British government, and the growieg dissatisfaction of the Portuguese themselves, have at length succeeded lit establishing a more equitable and less illiberal eystem. In October 1852, the new company was abolished, equal duties (about 14s. a pipe) were Imposed on all wines exported, and considerable, though not entire, fretdom was given to the trade.-For further details, see article Oromro.
Sherry is of a deep amber color; when good, it has a fine aronatic odor; ita taste is warm, with si. 16 degree of the agreeable bitterness of the peach kernel. When new, it tastes harsh and fiery $;$ it is mellowed by being allowed to remain 4 or 5 years or longer in the wood; but it does not attain to lts full fiavor and perfection untll it be kepl for 15 or 20 years. It is a very atrong wine, contalning about 19 per cent. of alcohol. It is principally producod in the vlelnity of Xeres, not far from Cadiz, in Spain. It ls very exteasively used in England as a dinner wine. Dry sherry, or amontillado, when genuine and old, fetches a very ligh price. Perhaps no wine is so much adulterated as sherry. With the exception of Marsala, the conaumption of sherry has been far more influenced than that of any other wine by the reduction of the duties in 1825 . In 1852 the quantity retained for home consumption amounted to $2,606,857$ gallons, being 458,000 gatlons more than dontle the quantity retained for cousumption at an average of $18: 3$ and 1824.
The province of Valencla, in Spain, produces a great variety of wlaes. Large quantities of a strung, sweetish red wine, called Beaicarlo, from the port whence it is shipped, is exported to Cette. It is thence conveyed, by the Canal of Jagguedoc, to Bordeaux, where it is mixed up with the poorer sorts of the whics of the Glronde, to which it gives color, body, and durability. The I'al de Jeñas, a pleasant red wine of La Mancha, said by Swinburne to be "the inost drinkable, for common use, of any in Spain" (7'ravels in Spain, p. 319, 4to ed.), has probsbily been commended beyond lits deserts. But in whatever estimation it may be held in ita native province, we doubt whether it is ever likely to be acceptable to forelgners. When carried to the cosst, it ia conveyed in guat skina smeared with pitch. This gives it the olor do bota, by which it is disagreeably distinguiahed.

Claret, the term generally used in England, though not in France, to designate the red wines, the produce of the Gironde. Of these, Lafitte, Latour, ChâteauMargaux, and Ifaut-Brion, are so generally and deserredly esteemed, that they always sell at 20 to 30 per cent. higher than any others of the department. The firat-mentioned is the most choice and delicate,
and is characterised by ita silky foftneas on the palate, and lts charming perfume, which partakea of that of the violet and the raspberry. The Latour hes a fuller body, and at the same time a considerable aroma, but wanta the softness of the Lafitte. The Chatean-Mar. ganx, on the other hand, is lighter, and possesses all the delicate quaijties of the Lafitte, except that It has not guite so high a flevor. The Haut-Brion, agaln, has more spirit and body than any of the preceding, but is rough when new, and requires to be kept six or seven yeare int the wood; while the others become fit for bottling in much less time.

Among the second-rate wines, that of Rozan, In the parish of St. Margaux, approaehes in aome respects to the growth of the Chateau-Mergaux; Gorce, In the same territory, is little inferior to Latour; and the vineyards of Leoville, Larose, Bran-Monton, PlehonLongueville, and Calon, in the canton of Pauillac, afford wines of good flavor, which, in favorable years, have much of the excellence of the finer growths, from which, indeed, some of the best cen wlth difficulty be distingulshed. Among the third and fourth class wines are those of Paullee, St. Jullen de Regnsc, St. Eatephe, Canon, St. Emilion, the wines of Maus Medoc, etc. These bave each some distinguishing peculiarity; but it requires a connoisseur to discriminate hetween the cognate varictiea. In good years the quality is very superior. The aroma of the first growthe is aeldom fully developed till efter they have been kept eight or ulne years; but the secondary quallties come to perfectlon a year or two sooner. The color often grows darker as the wine advances in age, in consequence of the deposition of a portion of lta tartar; but when well made, and thoroughly tined, it seldom deposita any crust. See the valualije work of Dr. Hexpenson on Ancient and Modern Wines; and Julhiev, Tr pographie de Vignobles. Berdeaux wines are very rarely exported in a state of purity. We have glven in the article Bondetaux some account of the treatment to which those shipped for England are subjected, and to It we beg to refer the reader.

Champagne-so called from the province of France, of which it is the produce-is one of the most descrved. ly eateemed of the French wines. The winea of Chempagne are divided Inlo the two grand elasses of whita and red wines, and ench of these, again, Into still and sparkling; but there is a grest variety in the flavor of the produco of different vineyards. Sillery is universally allowed to be the best of the stlis wines. It is dry, of a light ainber color, has considerable body, and a charming aroma. "Lecorps" (says M. Jullien), "le spirituoux, le charmant bouquet, et les vertus toniques dont Il est pourvu, lui assurent la priorité sur tous les autres."-Topograpinic de tous les Vignobles. Dr. Ifenderson agrees with Jullien in considering it as one of the wholesomest of the Champagne wines. The sparkling wines are, however, the most popular, at least in England. Of these, the wine of Ay, five leagues south from Rheims, is perhaps the best. It is lighter and sweeter than Sillery, and has an exquisite flavor and aroma. That which mercly creams on the surface (demi-mousseur) is preferred to the full frothing winc (grand-mousscur). Ileing bright, elear, and sparkling, It is es plessing to the eye ns it is grateful to the palate.
> "Cornis micanti coscolor ist vitro
> Latex in auras, gemmeua aspict, Seintiliet exulim; utque dulces Naribus titecebras propinet
> " Buect intestls proditor halitus I
> Ut apuma motas tactes turbido
> Cryataltinum lintia referre Mox oculis properet nitorem."

Hsutvilliers, about foar leagues from Rheims and one from Epernay, used formerly to produce wine that equaled, and sometimes surpassed, the wine of Ay. But it to no longer cultivated with the same care; so that, though ati!! very good, it only ranks in the second
class. The best of the red whes of Champagn are qualifie dans certains pays de suins qui aident a la quathose of Verzy, Verzenay, Msily, Bouzy, and St. Bra ie. "Ile ont une belie coulour, du corps, du spirltueux, et surtout beancoup de finesse, de seve, et de bouquet."Julises. The Cios St. Thlerry, In the vicinlty of Rheims, producss wine whieh, accordlng to Jullien, unites the color and tho aroma of Burgundy to the Ilghtness of Champagne. The province of Champagne produces altogether about $1,100,000$ hectolitres of wine; of which, however, the fineat growths make but a smail part. The principal trade in whe la carrled on at Rhelms, Avise, and Epernay. The vaults in which tho vintages are stored are excavated in a rock of caleareous tufa to the depth of 30 or 40 feet. Those of M. Moet, at Epernay, are the most extensive, and few travelers pass through tho place wlthout going to see them. The briskest wines (grands-mousseux) keep the worst.-Julines.

Burgundy.-The best wines of thls province, though not so popular as those of Champagne, probably because they are very apt to be Injureil by a sea-voyage, enjoy the highest reputation. "In riehncess of fiavor and perfume, and all the more dellcate qualitles of the juice of tho grape, they unquestionably rank as the first in the world; and it was not whithout reason thast the dukes of Burgundy, In former thes, were deslonated as tho princes des bons vins."-Henderson. M. Jullien is not less decided: "Les vlas des premiers crus, lorsqu'ils provlennent d'une bonne annéo, réunissent, dans do justes proportions, toutes les qualites qui constituent les vins parfaits; lle n'ont bescin d'sucun méiange, d'sucune préparatlon pour attendre leur plua haut degré de perfection. Ces opérations, que l'on
lité, sont toufours nulailles aux vins de Bourgogne."
Romsné-Contl, Chamberth, the Cles Vougeôt, and Rlchsbourg, are the most celelrated of the red vines of Burgundy. Chambertin was the favorlte wino of Louis XIV. and of Napoleen. It ie the produce of a vineyard of that name, situated seven miles south from Dijon, and furnlehing each year from 180 to 150 puncheons, from an extent of about 65 acres. It has a fuller body and color, and greater durabillty, than the Romane, with as aroma nearly as fragrant. The white wines of Burguady are less numserous, and, consequently, less generally known, than the others; but they maintain the hlghest rank among French white winee, and are not inferlor to the red either in aroma or flavor. The enllre annual produce of wine in Burgundy and Beaujolals may at present be estimated, at an average, at nearly $3,500,000$ hectolitres, of which about 750,000 suffice for the consumption of the inhabitants. Since the revolution, the cultivation of the vine has been greatly exteaded in the provinco. Many of the new vincyards having necessarlly been planted in comparatlvely unfavorable sttuations, 8 notion has been galning ground that the wines of Burgundy are degeneraling. This, however, is not the case. On the contrary, the quantlty of lons crus, instead of being diminished, has incressed considersily; though, as the supply of inferior wines has Incressed in a still greater degree, the fine wlnes licar a less proportion to the whole than they did previously to the revolution.-Julilien. The principal trade In Burgundyia carrlod on at Dijon, Gevrcy, Châions-sur-Saône, etc. Besides the above, France has a great variety of other excellent wines.
 THOBE OF THE GLAONDS AND THOEE OF OTHER DEPAETMENTB, AND BETWEEN THOBE EEPOETED IN IJABES AND BOTTLRE and arecifting tue quantitike of tuobe gent to gacu Countey and taetib total Value. -(Adminigtration dee DoUANE FOE 1852, p. 241.)

This makes a total export of $2,410,604$ hectolitren, worth $95,403,464$ francs, or $\mathbf{\& 3 , 8 1 6 , 0 0 0 \text { . Abonl ten }}$ years ago the exporta did not exceed $1,600,000$ hectolitrea, so that there has been a large increase in the interval. "And were France to adopt a liberal commercial policy, it is not easy to may to how great an'extent her exporta of wine, in the production of which she is immeasurubly auperior to every other country, might be increased. Exclusive of the above, there were experted from France in the same year 18,968 hectolitres of cins de ligueury, valued at $2,003,836$ francs.

The total produce of the vineyartio of France is eas timated at about $85,000,000$ haetolitrea ( $\mathbf{7 7 0 , 0 0 0 , 0 0 0}$ imp. gailons), worth $540,000,000$ france ( $\mathbf{\$ 2 1 , 6 0 0 , 0 0 0 )}$. We beg to refer the reader to the article Bondzanax for an account of the influence of the French system of commercial poliey on this great department of industry. The question, whether the wines of Champagne or Burgundy were entitled to the preference, was agitated during the reign of Louid XIV, with extraordinary keenuesa. The culebrated Charles Coffin, rector of the University of lleauvais, putsished, during this controveray, the ciassieal ode, partly quoted above, in which Champagne is eulogized, and its superiority vindicated with a spirit, vivacity, and delicacy worthy of the theme. The citizens of Rheims were not ungratefui to the poet, but liberally rewarded him with an appropriate and muniticent donation of the wino he hat so happily panegyrized. Greneau wrute an oxie in praise of liurgundy; wut, unilike jts sulject, it was flat and insipid, and failed to procure any recompense to its author. The different pieces in this amusing controversy were coliected and published in octavo, at Paris, in 1712.-See Le Gmand n'At:ssr; l'ie Prirée des Franfais, and the Biographte C'nicerselle, art. Corfis (Ctianless). Erasmus attributes the resteration of his bealth to his having ilrt...t liberally of Burgundy; ani has eufogized it in the most extravagant terms. An epistlo of his, quoted by Le Grand d'Aussy, showe that Falstaff and he would have spent an evening together more agreeably than might have been supposed: "Le premier qui enseigna l'art de faire ee vin (Bourgogne), ou qui en fit present, ne ideit-il point passer plutut jour noos avoir douné la vie que pour nous avoir gratifié d'une liqueur."-V'ie Prired des Francais.

Bordeaux lintage of $\mathbf{3 8 5 6}$. - The following table exhibits the yield of wine in the Girchde in yeare of full crop, compared with the actual yield of 1856 , and the prices ruling at the close of the year :

wine that has long heen in high eatimation in thit and other countries. Ilants of the vine were conveyed from Crete to Madeira in 1421, and have aucceeded extremely well. There is a considerable difference in the favor and other qualities of the wines of Madeira: the best are produced on the south sile of the liland. Thoagh naturaity atrong, they receive an addition of brandy when racked from the vessels in which thoy have been fermented, and another portion is thrown In previously to their exportation. This is sald to he required to suatain the wine in the liggh temperature to which it is snibjected in its passage to and from India and China, to which large quantitics of it sre sent, it being found that it is meliowed and lis flavor materially improved hy the voyage. It does not, however, necessarily follow that the wines which have maile the longest voyages are always tho beat. Much must obviously depend on the original quality of the wine; and many of the parcels selected to be sent to India nre so inferior, that the wine, when brought to London, docs not rank so high as that which has been imported direct. Ilut. when the parecl sent out has been well chosen, it is vory much matured and improved liy the voynge; and it not only fetehes a higher price, but is in all respecta superior to the direct importations. Most of the adventitions apirit is dissipnted in the course of the Indian voyage.
Madelra winea may be kept for a very Iong period. "Iike the ancient vintages of the Surrentine bills, they are truly formissima vina, retaining their qualities unImpa'redi fo both extremes of climate, suffering no decay, and constently improving as they advance in age. Indeod, they can not be pronounced in condition until they has been kept for ten years in the wood, and afterware allowed to mellow noarly twice that time in bottle; and even then they will hardly have reached the utmost perfection of which they are susceptible. When of good quality, and matured as above described, they lose all their original harshuess, and acquire that agreeable pungency, that bitter sweetishncss, which was so highly prized in the choicest wines of antiquity, uaiting great strength and richnces of flavor with an excecilingly fragrant and diffusible aroma. The nutty taste, which is often very marked, is nut communicated, as some have imagined, hy means of bitter almonds, but is inherent in the wine,"-llempenson.

The wincs of Madeira have latteriy fallen into disrepute in England. Tice growth of the island, when greatest, was very limited-not exceeding 20,000 pipes. of which a considerable quantity went to the West I- . dies and Anserica. Mence, when Madeirs was a f shionable wine in Engiand, every sort of deceptio. was practiced with respect to ${ }^{\text {: }}$ and large quant' ies of spurious trash were disposed of for the genuin vintage of the island. This naturally hrought the wine into discredit, so that sinerry has been for sever al years the fashionable white wine. It is difficult, ho vever, to imagine that adulteration was ever practic.d to a greater oxtent upon Madeira than it is now prac'iced upon sherry. It is not, therefore, inprobable thet a reaction may take place in favor of Madeira. The quantity entered for home consumption in Eugland ir, 1827 amounted to 308,295 galions, whercas the quantity entered for home consumption in 1852 umounted to only 69,730 gallons.

Salmsey, a very rich, luscious species of Madeira, is made from grapes grown on rocky grounds exposed to the full influence of the sun's rays, and allowed to remain on the vine till they are over-ripe. The trade in Madeira wino is carried on at Funchal, the capital of the island, in lat. $32^{\circ} 37^{\prime} \mathrm{N}$. , long. $17^{\circ} 6^{\prime} \mathrm{W}$. Weights and measures same as at Liahon. Madeira is said to have suffered very severely from the disease that has recently attacked the vine.

Teneriffe wine-so called from the island of that name --resembles Mindeira, and is not unfrequently subatituted in its stead; isut it wants the fuli body and rich flavor of the beat growths of Madeira.

German Wines.-The wines of Germany Imported Into England are principally produced on the banka of the Khlne and Moselle. The Rhine wines conatitute a dlatlact order by themsolven. They are drler than the French white wlnes, and are characterized by a dellicato flavor and aroma, called In the country gare, which is quite poculiar to them; and of which it would, therefere, be in valn to attempt the description. A notion prevalla that they are naturally acid, and the inferler kinds, no doubt, are so; but this la not the constant character of the Rhine wines, which In good years have ao perceptible acidity to the taste, at least not more than la common to them with the growths of warmer regions. Thelr chlef distinetlon la thelr extreme durabllity. The wines made in warm, dry yeare are always in great demand, and fetch very high prices. The Johunnisberger stande at the head of the Rhine wlucs. It has a very cholce flavor and perfume, and is characterlzed by an almost total want of acidity. The vineyard la the property of Prince Mctternlch. The Stelnberger ranka next to the Johannlaberger. It is the strongest of all the Khenish whes, and in faverable years has much Havor and dellcacy. The produce of certain vineyards on the banks of the Moselle is of superior quality. The better sorts are clear and dry, with a light, pleasant flavor and high aroma; but they sometimes centract a slaty tasto from the atrata on which they grow. They arrive at maturity in five or six years; thongh, when mado in a favorable season, they will keep twice that time withont experiencing any deterioration,-Hendenson on Wines.

Tokay-so called from a town In II ungary, near which it is prodnced, on the Theiss, 44 miles north-northwest frem Dobreczin. It is the tinest of all the liqueur wines. It conslsts of three varietjes, vlz. : the Essence, flowing spontancously from the ripest grapes, and correapending with tho Mrustum aponts dofluens antequam calcentur ueos of the anclents; the Ausbruch, obtained by pressing the $g$ rapea with. Al.m: new * , of must, heing at the same time poured over .um; and the Maslas, or Inferior variety, produced by pouring a larger quantity of less choice must over the same leerries, and sabjecting them to the actlon of the press. Of these varioties, the first, which is made only in very sinall quantities, is in the highest degree swect and luscions, and is more sought for as a rarity than as being pleasant to the palate. It is on the Ausbruch that the reputation of Tokay depends. Mr. Paget says, "It is sweet, rich, bat not cloying; strong, full-bodied, but mild, bright, and clear; and has a pecallar flavor of most exgulsite dellcacy. I never tasted it in perfection but at private tables, and that only twice; I could then have willingly confessed It the fnest wine in the world." The Maslas, or inferier variety, is a much thinner wine, rather sweet, with a preponderatling flavor of the dried grape. Mr. Paget estimates the entire produce of the Tokay vineyarde in ordinary years at about 250,000 elmers, of about sixteen bottles euch. The best Ausbruch is very dear, and but littlo that is genuine is seen In Englend.-Pagart's Travels in Hungary, i. 481 ; Henderson, p. 228; Jullien, p. 446.

Italian Wines.-The Sicilian white wine called Marsula, from the town (the ancient Lilyboum) whence it is shippod, and near which it is made, is now pretty largely consumed in Eugland; the entries for home conaumption having increased from 79,686 gallens In 1823 to 387,750 in 1852; an extraordinary increase, particularly when It is considered that daring the aame period, the consumption of most sorts of wine has been nearly stationary. Latterly, however, it has been rather decllning. Marsala is a dry wine, the best qualities closely resembling the llghter sorts of Madeira; but the increased demand for it seems to have been owing as much to lis cheepness as to any peculiarity of quality. It is, however, when good, an agreoable dinner wine. Marsala has been bruught to its
present state of perfection and repate by the care and oxertions of two Engliohmen, the Mesprs. Woodhouse, eatablished in Slelly, who have an extensive factory in the neighborhood of Marsala. The wine is ohlpped In large quantlties for America, whence a considerable quantlty ls again conveyed to the West Indles, where It Is not unfreqnently disposed of as real Madelra. With the exceptioa of Mareala, very Ilttle wine elther of Sleily or Italy la Imported Into England. The wines of those countries are, indeed, wlthout perhapa a single exception, very Inferior to thoee of France. The nstives beatow ne care upon the culture of the vine, and their Ignorance, obstinacy, and want of akIII in the proparation of wine, are aaid to he almost incredible. In eome districts, as in Tuscany and parta of Naples, the art liu, no deubt, better understood and practlced than In others; the Montepulciano of the former, aeld, by Redl (Bacco in Toscana), to be dogni cino il re, and the Lacrma Christi of the latter, being the most celebrated varietles. Dut the lacrlma is better known by name than in realit it belng made in omall quantities, and mostly reser ved for the royal cellors.-Henderson. And, desplto the superior quallty of those now mentloned, had net the Falernian, Cecuban, and other iamous anclent wines, been incomparably bettor than the best of those that are at present produced, they never would have elicltet the glowing pancgyrics of IIorace,-M'Cullow's Com, Dict.

Fow things are more striklng to a visltor in Italy from the north of Europe than the stralght rows of troes of all kinds that run through the corn-fielle, at the foot of which vinee are planted, and tralned 00 as to extend in elegant festoona from one tree to another, exhlbiting the pendent clusters of grapes. If the eame mode of training the vines were attempted in the somowhat colder climates of France and Germany, the shade of the trees would prevent the grapes froni rlpening. This effect is not produced in Lombardy, where the berries become ripe, and, when taten, are of good flavor; but the wine produced from them is, in geaeral, of a bad or very indifferent quailty. Though much of the wine is produced from such vines in the corn-fields as are distingnished by the names of Campi Aratici Vitati, or of Campi Arborati Vitati, and from vines plantcil In rows at such a distance from each other as to admit of malzo being grown between them, and called Ronchi; yet in some parts are vinayards properly so called, because, like those of France and Germany, they alone occupy the ground, and are, like them, aupported by props. The best winc is produced from the Ronchi, and more especially from tho vineyards properly so called, in which, however, each vino produces less in quantity than those trained from tree to tree. The amount of prodnce varics greatly accordling to different years, differont districts, end different modes of cultivation. From an approximate estimation made on many farms of various coils, it wonld appear that in the most productive districts the average produce of large vincs tralned to the trees around the cornficlds is from 48 to 52 gallons for 100 vines; and the averago produce of vineyards, properly so colled, from 58 to 65 gallons of wine to the acre.

In Lombardy the wine is generally of a bad quality. Its production is left chlefly to that description of cultlvatore befors notlced under the name of colonists, who exercise little dlscretion and little care, either in the choice of the kind of grapes they plant or in the management of the jaice. Their chicf care is to obtain the largest quantity, without much regard to the flavor or the aptitude of kecping; and commonly, as soon as it is made, they divide it in equal shares with their landlorda. Onc cause to which the inferfority of the wine Is attributed arises from the general predilection in faver of red whe, or, as it is called, Vino Nero, which Is prized according to the darkness of lts color. In order to produce this deep color, the skins of tho grapes are left, In the first part of the process,
to ferment with the juice. Sometimes this is onflered to continue during eight or ten days in a vat before the liquor is drawn off, and nometimes stlll longer, te the longer it continues the darker the wine becomes. The beat wines are produced in the diatrict near Varese, on the sunny alopes of the billa round the lakee of Como and Garda, and In the Val Callepplo, In the province of Bergamo. The winea of the localitios of Sassella and Inferno, In the Valtelline, maintain the anclent renown of the Rhaetian wines, relished by Augnatus and celebrated by Virgil.

The wine of the Venetian provinces 1s, upon the whole, of a much better quality; fis superiority ls owIng to the nature of the soll, to a better shoice of the kinds of grapea that are planted, and to the more careful preparation of their julce. The beat qualltios are produced in the province of Troviso, in the llericl and Euganean Ilills, between Vicenza and I'alua, in somo districta of the province of Udine, and, above a11, ln the province of Verona, well known for its l'alpolicella, the best common wine in the kingdoin.

There is no old wine in the country, except In amall quantities, and in the hanils of a few amateur proprletors. The wine of each vintage le sold In the courso of the following year; and when any of it is kept, even theugh it should not have become, or shown a tendency to become, vinegar, It will aell at a lower price than new wine, because It is milder, and less agreeable to the taste of the consumer.-E. B.

Prevlous to 1851, the annual quantity of wine produced in the kingdom, in a verage years, was 85,837,705 gallons, of whikh $52,823,203$ gallons were producud in the Venetian, and $33,014,502$ in the Lombard provinces. The produce of Lombardy not leing sulticient for the consumptlon of lis population, nearly $4,402,000$ gallons a year more were imported elther from the Venctian provinces, which produced much moro than was required for their own consumption, or from the neighboring states of Modena, Pledmont, and the I'apal territory, according to the respectivo local produce and prices. But since 1851, when the oidium attacked all the vines of the country, the proiloce has ao fearfully diminished, that in $\mathbf{1 8 5 6}$ the goverminent found it necessary to grant a reduction of tha direct land-tax on lands chifliy cultivated with vines, in proportion to the ascertained amount of loss. The whole produce of Iombardy In 1852 was reduced to $11,004,834$ gallons, and that of tho Venetian provlnces, in 1854, to $7,538,311$ gallons of wine. The respeetive loss of each province was as follows :

Hines of Greecs and Cyprus.-The sail in most parta of Greeco and of the Grecian lslands is admirably fitted for the growth of the vine; and in antiquity they produced some of the choicest wines. Ihat the rapacity of the Turks, and the insecurity of person and property that has aiways prevailed under their miserable gov-
ernment, has offectually prevented the careful cultivation of the vine, and has occasioned in many places its total abandonment. It may, however, lie fairly presumed, now that Greece has emanclpated hersolf from the iron yoke of lier oppressors, that the culture of the vine will attract some portion of that attention to which It is juatly ontlited, and that at no d'atant period wine will form on Important article of expert from Greece. Nowhere, perhapa, has the destructlve Influence of Turklsh harbariam and miagoverument been so apparent as In Candla and Cyprus. Whila these two renowned and noble lslands were possessed by the Venotlans they supplled all Europe with the cholcest deasert wines. Bacel affirme that, toward the end of the 16th century, Candla sent annually 200,000 caska of malmany to the Atriatic, whereas at present It bardly produces sufficient to supply the wante of lta fow impoverished Inhalitants.-IIenienson. The wines of Cyprus, partleularly those produced from the vineyard called the Commandery, from Its having belonged to the Knlulits of Malta, were still more highly eatecmed than those of ('rete. In the earllar jart of last century the total produce of the vintage of the island was aupposed to amount to above $2,000,000 \mathrm{gal}$ lona, of which nearly one half was exported; hut now the wine grown and exported does not amount to onetenth part of these quantities! Tha oppression of which they have been the victims has reluced the peasantry to the extrenie of indlgence. The prescit population of the lsland la not supposed to exceed 60,000 -a number insufficient to have peopled one of Its many ancient dities; and small as this number is, It is constantly diminishing lyy the luhabitants avallIng themsolves of every opportunity of emigratling.

Cape IFines.-The famous Constantia wine is the produce of two contlguous farme of that name at the base of Table Mountain, leet ween eight and nine inlles from Cape 'lown. Tha wine is very rlch and luscious, though, according to Henderson, it yielils in point of flavor and aroma to the muscadine wines of Languedoc and Rouasillon. Hut, with this exception, most part of the Cape winee hrought to Fingland have in earthy, disagrecable taste, are often achl, want flavor and aroma , and are, In fact, altogether execrable.
American Wine.-The extent of our territory over which the wine culture may be advantageously diffused has long affordell a auliject of much speculation. It carly attracted the attention of the flrat colonists, who not only attempted to form vineyards of the Furopean vine, but to make wine from our own native grapes. Although the aubject has heen zealonsly and sedulously pursued at various pertoda since, all those dwelling on the easterly half of the continent whe have made trial of the forcign grape have never heen alle to bring thelr designs to perfection; and those who have tested their akill In our native varietles have only met with partial auccess; yet a degree of perseverance and onthusiaam seens to have pervaded all the vetaries of thls delightful pursuit, and a warm and mutual Interchange of vewa and sentinents has exiated among them, which has been comparatively unknown in oth. er species of culture. Although tho operators in recent times, from being interspersed over so great an extent of territory, are congequently more widely sejarated, still the conncoting link, by a frienilly co-operation in ono common cause, may justly and appropriately asaimilate their united exerions to that joyous period in the hiatory of Franee when, during the reign of I'robus, thousands of all ages and sexes united in uno ajontanoous and enthualatio effort for the restorstion of their vineyards. Indeed, when the far grester limits of our dumain are considered, the combined offorts of our fellow-countrymen can not fail to produce effects even more important, from the great extent of their Influence, and eause each section of our reproblic reciprocally to respond to the efforts of others, with all thelr attendant advantages and blessings.
cies, wan foand to contain of per cent. Buchanan
atatos that the proportion of alcohol in the American wines in about the mame as in the wines of France and Geriaany. Brande, lowever, contends that the French Graves wine contaline 13•94, Barsae 13•80, Sauterne 1 $1 \cdot 22$, Rudesheliner of 1800 12:22, and Hock $14 \cdot 37$ par cent. of alcohol.
The prices of American wines may be considered bigh. Ten to twelve bottles of stored atill wine cost from st to 88 , and aparkiling wine brought $\$ 12$ in 1854. Naw wine rangea from 40 centa to 110.

Of the recent territorlal aequisitions of the United States, Callifornia, and Vlonda will probably ere long be ranked among the ozine-producing States. In California the efforis of the old Catholio missionaries to cultivate the grape resulted sathefactorily, and the manufacture of wine froms the ciomeutic grape of Fiorida was also attended with success, Sir John Jluwking reports that is 1694 the mettlera in Florida realized wenty hogshoads of palatabie wine from the antive grape. The gond results which were anticipated from this discovery were, thanka to the political diaturbances in which that colony becamo involved, never realized.

In Canada West, where certain species of wild grapes are very abuadant, the manufacture of wine, recenily introduced, has been sttended with the moat signal auccesa. Buchanan's Journal pronounces it superior to the imported port-wine.-N. Y. Sire. J'ost.

Tho following statement shows the prodnction of wine in the several States of the Unioil In the years 1840 and 1850, according to the censue returns:

Wings. In naval matters, passages aling the sides of the ship between the fore and after cockpit.

Wire. The invention of drawigg wire is nseriled to Rodolyh of Nuremberg, A.b. 1410. Nills for this p,urpose were first set up at Nuremberg in 1563 . The first wire-mill in England was erected at Mortlake, in 1663.-Montrimea. The astonishing ductility, which Is one of the disilnguishing qualitles of gold, is no way more cnnspicuous than in gill wire. A cylioder of 48 ouncess of silver, covered with a coat of gold weighing only one ounce, is usually drawn into a wire two jards
of whiloh only weigh one grain ; so that 98 yarim of the | lakea within Ita borders are Winnebago, Horicon,
wire weigh no more than 49 graing, and onu singie grain of gold covera the whole 98 yarda ; and the thotsandth part of a grain in above one-eighth of an lici long.-lialuar. Elght grains of goid covering a eylinder of silver are commonly drawn into a wire 13,000 feot lung ; yot so perfectly does it cover the silver, that evell a microseope does not discover any appearance of the nilver underneath.-Bovis.

Wieconsin, one of the northwestern United Statea, liea between hut. $42^{\circ} 30^{\prime}$ and $49^{\circ} 30^{\prime} \mathrm{N}$. , and between long. $80^{\circ} 50^{\prime}$ and $96^{\circ} \mathrm{W}$., heling 600 miles long and 150 broad. It contains about $53,1,24$ square millea. I'opulation in 1840, 80,045; in 1845, 150,000; and in 1860, 305, 191 .
'l'he portion south of Green Bay, Fox and Wisconain rivers, la composed of thinhered and prairie lands, with some a wampa and wet prairies, having a vegetable soll from one to two feet deep. North of the Wisconain lifver commences a hilly region, swelling aa it proceeda north into a mountainous country, with a rugged and broken surface, creating many raplds and falls in the streains, and affurding many whll and picturesque views. The northwest part of the State ls covered with immonse forosts of pine and much rough land, especici1. bordering Lake Superior. Oa the rilge dividing the waters flowing north Into lake Suparior, and those flowing south Into tho Mississippi, aro many emall akes, in which flah are ahundant. Bordering on the Missiasippl and Whaconsin rivers the soil lis rich, and tho land gonorally heavily timbered. 'Visconsin It rich In minerals; the great Mississippi lead reglon lies mostly within Its limits; Iron oro of the best quallty exista thordering the sonrces of all the streams entering the Mississlppl, and copper along the shores of Lake Superior; marble, limestone, sandstone, g.psum, and other varlety of minerale abound.
Thers were In this Stato In 1850, 1,015,499 acres of land lmproved, and $1,931,150$ of unimproved land in farins; casli value of farms, $8: 28,528,503$; and the valuo of limpleinents and maclinory, $\$ 1,611,568$. Live Stock. - Horses, 30,179 ; asses and mules, 150 ; milleh cows, 64,339; working oxen, 42,801; other cattlo, 70,203; shoop, 124,896 ; owine, 159,276: value of live stock, 44,897,385.
Agriculturcl Prolucts.-Wheat, 4,280,131 bushels; rye, 81,253; Indian corn, 1,988,979; onts, 3,414,672; barley, 209,692; buck whent, 70,878 ; peas anil beans, 20,657; potatoes, $1,402,077$; sweet potatoes, 879 ; value of products of tho orchard, $\$ 4823$; produce of market gardens, $\$ 32,142$; pouads of buttor made, $3,633,750 ;$ of chcese, 400,283 ; maplo-sugar, 610,076 ; molasses, 9874 gallons; beoswax and honey, $131,005 \mathrm{lbs}$; wool, 253,961; flax, 68,393; hops, 15,930; tobaceo, 1268; hay, tons of, $27 \overline{\mathrm{~T}}, 662$; hemp, 2 ; clovor seods, 483 bushels; other grass seeds, 5003 ; thaxseed, 1101 ; and were made 113 gallens of wine : value of howe-made manufactures, \$43,6-4; of slaugitered aolmals, $8920,178$.

The prlacipai rlvers are the Mississippi, which flows along its western border for a distanes of $2-5$ miles. The Wisconsin has its entire courae within the State, flows centrally, and enters the Mississlppion its western berder. It is navigable to the portage of Fox or Neenah River, where a canal is being mado, which, when completed, with tho contemplated improvements of Fox River, will make a navigable communication between the Mlasissippi and the lakes. Tho Chippowa enters the Mlssissippi farther northwest, and is a large river, and St. Croix River forms a portion of its extreune reatern houndary. Rock River risea and flows partiy in this State. The other prinelpal rivers are the Menomineo on its eastern border, entering Green Bay, and the Montreal, entering Lake Superior; there are also othor small streams entering Lake Superior. Tho Milwaukee, Sheboygan, as well as othors, onter Lake Michigan. The other most noted atreams are the Wolf, Bad Axe, and Black Rlvers. Tho principal

Yaskohong, and the fuar lakea in the south, and many all onea in the north. The prinelpal places in the Stata are Madison, the capltal, Milwaikee, Raclne, Kenosha, Oaaukee, Green Bay, Jameaville, and I'rairia du Chien. There were in January, 1854, four ralire ads In the State, with CH7 miles of road tinished and In operation, and there ware 10 banka with a cash capital of 0600,000

Manufactures, elc.-There wero in the State in 1850, 9 woolen factorien, with a eapital invested of $\mathbf{~ B ~}_{31,225,}$ employing 25 malea, manufacturing 36,000 yarda of cloth and 74,250 lbs. of yarn, valued at 487,$992 ; 1$ astablishment maklag pig-iron, with a capital of 15,000 , employing 60 persons, and making 1000 tous of plgIron, valuerl at $\$ 27,000 ; 15$ estahliahments, with a capltal of 116,350 , omploying 228 persons, producing 1842 tons of castings, etc., valued at 216,195 ; i5 thouring and grlst milla, 412 saw-milla; 34 tanuerien; 42 print-ling-offices, lasuing 0 daily, 5 trl-weekly, 36 weekly, and 1 nonthly publication.
Fobeian Commegon op tab Stats of Wiscomein thon Julr t, 185s, to Julr 1, 1867 .

At the close of the yoar 1857, the number of banks in Wiseonsin hail Increased to 73, with a combined capital of $\% 5,600,000$, and bank-note circulation $83,000,000$, the latter belng secured by a collate.al deposit of Stata stocks.

Woad (Gor. Waid; Dı. Weerle; Fr. Pastel, Guede, Iouéde; It. Guadone, Guado, Glastro; $\mathrm{Sj}_{\mathrm{j}}$. I'asiel, Clasto), the /antis tinctoria of botanists, a biennlal plant, with a fusiform filurous root, and smooth branchy stem, rialng from three to flve fect $\ln$ height. Woad is Indigenoua to most parts of Europe; and was extensively used frem a very remote period, down to tho general introduction of indigo, in the dyeing of blue. It la atill cultivated to a conslderablo extent in France; hut In England its cultivatlon ls chiefly restrleted to a few distrinta In Lincolnshiro. After lieing brised by machinery, to express the watery purt, it is formed Into balls, which forment and fall into a dry powder, which is sold to the dyer. Wond is now seldom employed without a mixture of Indigo. Hy Itself it is Incapable of giving a bright and deop bluo color; but, the color which It does givo is very durable. The best methods of condueting the formentatlon and preparation of woad are still so very Ill understood, that the goodness of any parcel of it can novor be ascertalned till lt be actually used; so that it has the disadvantage of being purchased under the greatest uncertalnty as to lts true valuo. At the proper are, indigo plants yjeld about thirty times as much coloring matter, and of a far suparior quality, as an egnal welght of woad; so that there is no prospoct that any improvement that may be nade in lts preparation will ever render it, either in goodhess or cheapness, a rival of the former.-Lounon's Encyl. of Agriculture; Bancrort on Colors.
Woods. Mr. Holtzaptlel, in his elaborate work on "Turning," gives a very minute deseription and classification of the various kinds of wood used In the arta. He first points out the well-known struetural difference between exogens and endogens, which leads to a aoparation of all kinds of trees into two great groups; all the true woods (as they are sometimes termed) are exogens; whereas the endogens include the grassos, bamboos, palins, etc. In the countries where bainboos and palms ari intligenc. 3, the smaller stems are ueed as tubes fur : ie conveyance of water, and the larger picces as joista, etc. In tho larger kinds of palm, the flbres appear like streaks or wirea linhedded In a substance similar to cement or pith.

The natives of the Isthmus of Darien plek out tho fibres from some of the palms, and use them es nails; in some specimens they are as hard as rose-wood. Some of the amallest palms are imported into thls country for walking-stleks, under the namen of partidge and Penang canes. Of the four or five hundred varietles of paln-trees known to exint, only a very small number are imported. The palm woods so imported are aparingly employed for calinet and marquetry work, for bllliarll cues, for muff-boxes, etc. The twisted palm walking-stleks are the central stems or midribs of the leaves of the date palm: they are twlated when green, and atretched with heavy weights until they are thoroughly dry. The nut, or fruit, of many of this group of plants is applicable to uses In the arts; auch as the betel-nut or areca-nut, whose sulsstance is made into nechlaces, the tops of walking-stleks, und other small objects; the cocos-nut, whose shell yielde the fibre or colr, now used in England for a great reriety of parposea, anit the hard portion of the ahell, which is turned into cupa, vases, buttons, ote.; the corfullla-nut, the shell of which, lwing hard and close-textured, is turned Into knols of umbrellas and parasols, sinall toys, etc. With ispect to the simple wanta and primitlve arts of the people among whon the palms ansl bamboon grow, the uses of those plants are very numerous ; of the Cocos nucifera, or cocoa-nut palin, for exumple, the truit is eaten, the husk of the nut suppllea colr for cordage, the leavea are used for maklng laskets and mats, the lowar part of the stem yields wood fitted for joists anil other kinds of carpentry, and
dlfferent portiona of the plent are made to yield oil, sugar, paim wine, and arrack.

But it is the exogenous or true woinls which render the moro importani services to man, so far as regards the stem or wood itself. The fibres do not appear to differ in alze or bulk so much as in denaliy and distance: these two last-named differences glve rise to the distinction between harl and aoft woods- the former comprising oak, mahogany, ebony, rosc-wood, ete.; and the latter wlllow, alder, deal, ete. Another classification to that whlch springs from the direction of the fibres; if the annmal or longitudinal fibres be tolerably straight, and very IIttle Interwoven whit the medullary rays or interrupted by knots, the wood becomes elastic and easily rent; such are lance-wood, hickory, ash, etc.; but if the fibres are more crossed and Interlaced, the wood becomes less elastle, and more rigid and tough; such are oak, beech, mahogony, etc.; and If the fibres be entangled to a still greater degree, they produce the non-elastlo, tough, cross-grained woode, such as elm, lignum-vite, etc. Another mode of clasalfication, traced with some minvteness ly Mr. Holtzapifel, is that which is determined by the besaty of the surface presented by woods. The krote, occastoned by the junction of a brench with the stem; the curla, produced by the confused filling $\ln$ of the ppesce between the forks or springings of the branches, as in the yow ; the gnarled appesrance of the roots, formed at the pointa of junction of the rootlets or armia of the root with the body of the root itself, as in waluut wool; the pollard grewthe of the oak and othor trees, which
owe the beauty of their grain to a crowding together and for hydraulic engineering; another group inoludes of the little germs that produce the numerous shoots at the top; the ripple-mark surface, occasioned by a serpentine form of the grsin, as in satin-wood ani sycamore ; the bird's-eye pattern, occasionad by a peeuliar compression of the grain in lsolated spots, as in some kinds of maple; the silver-grain, which results from a marked distinctness in the modullary rays, as in the plane, sycamere, and beech-all give rise to variations In the appearance of the surface of wood, which are tho mainspring of the beauty obsorvable in callaet work. A nother and vory obvious mede of classlfylag woods is in respect to their color.
Mr. Holtzapffel gives a tabular view of all the kinds of wood commonly used in this country. The list incluies nearly eighty species of trees, without naming the varietios of each species. Ho classifics thom according to the aervices which they are calculated to render. One group includes building woods, subdivided into those fitted for ship-building, for house carpentry;
and for hydravlic eaglaering; anouher group inoludee the woods nost useful for machinery and mill-work, subdivided according as the wood is suitable for framework, for rollers, for teeth of wheels, or for foundery patierns; a third group comprises the turnery woods, subdivided into vommon soft woods, hard woods, and Tunbridgo-ware wroods; a fourth group is made up of furmiture woods, acparated into common and best; a Hfth group compriscs ornamental foreign woods; a slxth group consiats of dye-toods, arrsnged according to color; while a miscellaneous group is formen, snbdivided acm cording to the elasticity, the toughness, the even grain, or the durability of the wood. Of course many kinds of wood find a place in two or more of these groups; but the table is valuable, Inasmuch as it brings togethor before the oye the names of all those woods which resemble cachother in some one manufacturing quallty.

The following tables show the exports (distinguishing between domestic and foreigin production) of wood ing between domestic and foreign production) of wood
and ite manufactures for the year ending June 80,1857 :

Wool (Ger, Wolle; Du. I'ol; Da. Uld; Swed. Ull; Fr. Laine; It. and Sp. Lana; Port. Lai, Lăa; Russ. IIolna, Scherst; P'ol. Velna; Lat. Lana), a kind of soft hair or down. The term is not very well defined. It is applied both to the fino hair of animals, as sheep, rabbits, some species of goats, the vicuna, ete.; and to fine vegetable fibres, as eoton. In this article, however, we refer only to the wool of sheep-an article which has continued, from the earliest period down to the present day, to be of primary importanee, having always formed the prineipal part of tha elothing of mankind in most temperate regions.
Species of IVool.-It has been eustomary to divide wool into two great classes-long and short wools; and theso again into subordinate classes, according to the fineness of the fibre. Short wool la used in the clath manufacture; and is, therefore, frequently called elothing wool. It may vary in length from one to three or four inches; if it be longer, it recpuires to be cut or broken to prepare it for the manufacture. The felting property of wool is known to every one. The process of hat-making, for example, depends entirely upon it. The wool of which hats are made is neither spun nor woven; but locks of It, bring thoroughly Intermixed and compressed in warm water, cohero and form a solid, tenacions substance.
Cloth and woolen goods are mado from wool possessIng this pmperty; the wool is carded, spun, woven, and then, being put in the fuliing-mill, the process of felting takes place. The strokes of the mill make the fibres cohere ; the piece sulijected to the operation contraeta in length and lreadth, and its texture becomes more compact and uniform. Thin process is essential to the beauty and strength of woolen cloth. Hut tho long wool of whlch stuffs and worsted are made is deprived of its felting properties. This ls done by pase-
ing the wool through heated fron combs, which takes away the lamine or feathery part of the wool, and approximates it to the nature of silk or cotton. Long or combing wool may vary in length from tbree to elght inches. The shorter combing wools are prinsipally used for hone, and are spun softer than the long cemiing wools; the former being nade into wbat is callel hisrd, and tha Jatter into soft worsted yarn. The fineness of the hair or fibre can rarely be estimated, at least fur any useful purpose, except by the wool sorter or dealer, accustomed ly long halit to diseern those minote differences that are quite inappreclable by comthon obaervers. In sorting wools, there are frequemily eight or ten different spocies in a singlo fleece; and if tho best wool of one fleece be not equal to the finest sort, it is thrown to a 2d, 3d, or 4th, or to a still lower sort, of an equal degree of tineness with it. The best In plish short native fiecees, auch as the fine Norfolk and Southdown, are generally divided by the wool-sorter into the following sorts, oll varying in fineness from eseh other: viz. 1. Primo; 2. Choice; 3. Super; 4. Ilead; 5. Jownrights; 6. Seconds ; 7. Fine Alb; 8 . Course Abb; 9. Livery; 10. Short, coarse, or brcech wool. The rolative valne of each varies, according to the greater demand for coarse, fine, or middte cloths.
The sofness of the fibra is a quality of great importance. It is not dependent on the fineness of the fibre; and consists of a peculiar ferl, approathing to that of silk or down. The difference in the value of two pieces of cloth made of two klads of wool equaliy fine, but one distinguished for its softnoss anil the other for the opposito quality, is such, that, with the same process and expense of manufacture, the one will be werth from 20 to 25 per cent. maro than the other. Mr. Bakewell showed that the degree of aoftness depends principally on the nature of the soil on wheh slieep
are fed ; that sheep pastured on chalk districts, or light calcareous soils, usually produce hard wool; while the wool of those that are pasturgd on rich, loamy, argillaceous soils, is aiways distinguished by its sofness. Of the foreign wools, the Saxon is geaeraily softer than the Spanish. Hard woola are all defective in thsir felting preperties. In clothing wool, the color of the fleeco sheuld always approach as much as possible to the pures ${ }^{2}$ white; because anch wool is not only necessary for cloths dressed white, but for ail cloths that are to be liyed bright colors, for which a clear white ground is required to give a due degree of richness and lustre. Some of the English fine-wooled sheep, as the Norfolk and Southdowa, have black or gray faces and legs. In all such sheep there is a tendency to grow gray wool on some part of the body, or to produce senie gray fibres intermixed with the fleece, which renders the wool unfit for many kinds of white goods; for though the black hairs may be too few and minute to be detected by the wool sorter, yet when the cleth is stoved they become visible, forming reddish spots, by which its color is much injured. The IIcrsfordshire sheep, which have white faces, are antirely free from this defect, and yield a fleece without any admixture of gray hairs.

The cloanness of the wool is an important consideration. The Spanish wool, for example, is always scoured after it is shorn; whereas the English wool is only itmparfectly washed on the sheep previously to its being shorn. In consequence, it is said that while a pack of Enghsh clothing wool of 240 lbs . weight will wasta about 70 lbs . in the manufucture, the same quantity of Spanish will not waste more than 48 lbs. Cieanness, therefore, is an object of much importance to the buyer. Before the recent improvements in the spianing of wool by machinery, great length and strength of staple was considsred indispensable in most cembing wools. The fleeces of the long-wooled sheep fed in the rich marshes of Kent and Lincoln used to bs reckoned peculiarly auitable for the purposes of the wool-comber; but the insprovements alluded to have effected a very great change in this respect, and have enabied the manufacturer te substitute short wool of three inches staple in the place of long combing wool, in the preparation of most worsted articles. A great aiteration has, in consequence, taken place in the proportion of long to short wool since 1800; there having been in the interim, according to Mr. Hubbard's calculations, an increase of 132,053 packs in the quantity of the former produced in Eugiand, and a decrease of 72,820 in the quantity of the latter.

Whiteness of fleece is of less importance in the long cembing than in clotiling wool, provided it be free from gray hairs. Sometimes, however, the fioece has a dingy brown color, called a winter stain, which is a sure indication that the wool is not in a thoroughly sound state. Such flaeces are carcfully thrown out by the wool serter, being suitabie only for goods that are to be dyed black. The fineness of heavy combing wool is not of so much consequence as lts other qualities. The Merino or Spanlsh breed of sheop was introduced into England nbout the close of lust century. George III, was a great patron of this breed, which was for sevoral years a very great favorito. But it has been aseertained that, though the fleece does not much degenerate, tho ca:enss, which is naturally iil-formod, and affords compratively little weight of meat, does not improve; and as the farmer, in the kind of sheep which he keeps, must look not only to the produce of wool, but also to tine butcher market, his interest is rather to return to tho native breeds, and to give up the Spaniah sheep. Thoy have, howover, been of cousiderable servica to the flocks of Bugland; having been judiciously crossed with the Sonthdown, Ryelaud, etc.

Dr. Anderson, in a memorial subjoined to the "Report of the Committee of the llighland Society,"proves, from indisputable records, that from the earliest tinues
down to the reign of Queen Elizabeth, the wool of Great Britain was not only superior to that of Spain, but accounted the finest in the universe; and that even in the times of the Romans a manufacture of woolen cloths was established at Winchester for the use of the emperors. In later times, wool was manufactured in England, and is mentioned in A.b. 1185, but not in any quantity until 1331, when the weaving of it was iatroduced by John Kempe and other artianns from Fianders. This was the real origin of the English wool manufactures, Edward Ill., 1331,-Rymer's Foedera. The exportation prohibited, 1337. The exportation of Englisin wool, and the importation of Irish wool into England prohibited, 1696. The non-exportation law repeuled, 1824.-Haydn.

Alpaca Wool.-The alpaca is one among many species of the llama, the wool of which is very beautiful. The first visit of these animais to Europe was an adventurous one. Thirty-six traveled across the whole breadth of Sonth America, from Lima to Buenos Ayres, in 1808, and ware there shlpped to Europe as a present to the Empress Josephine. At Cadiz the poor animals wero ill-treated by a rabbie, and oniy a amall number were uitimately preserved in Spain; thoy never reached Joscphine. By degrees it was found that alpaca wool was longer, softer, nore pliant, and more lustrous than sheep's wool, and the manufacturers of Bradford began to import it for use. Queen Victoria possesses one or two of these animals at Windsor, and some articles of dress were made from the alpaca wool in 1844: one was an apron, catirely of alpaca; another was a striped and figured dress, with silk warp, alpaca weft, and alterna to silk and alpaca figures; a third was a plaid dress, woven with an intermixture of alpaca, silk, aud worsted; while a fourth was a plain black dress, with cotton warp and alpaca waft. Many attempts have been mada to establish the breed of tho alpaca In England, but hitherto the enterprise has not been commercially successful.

- That alpaca wool ia coming extensively into use in England is shown by the imports: in 1836 to 1840 they averaged 7000 bnles per annum; in 1841 to 1845 , the avernge was 13,000 bales; in 1846 to 1850 , more than 20,000.-See Alpaca.

Cashmere Wool.-It is an interesting feature in the modern history of the woelen manufacture, that the wool, or rather hair, of the Cashmere grat is becoming. a favorite material in cloth of the better kind. Not that all the "Cashmeres" of the shops are really Cashmeres; the morals of trade has not yet reached the point when things are called by their right names; and the beentiful Asiatic valley is quito innoceat of the greater part of thoso products which rejoics in tho name of "Cashmeres." Still the high-born and the wealthy occasionaliy purchaso shawls which were really made in that region, and (what is more interesting to us) attempts are being made to naturalize the antmal which produces the beantiful filamentous material in question. The fleece of the Cashmere goat consists of two very different kinds of fibre--one of which is a fine, soft, pliable, rich wool, cqual te the finest laub's wool; while the other, called kemp, is a hard, stiffi, coarse, rough kind of hair. The komp may he used in the manufactr of cearse cloth; but every tibre must be removed before tho fine wool can be empleyed in shawl-making. This removal is very difficuit and tedious, and will be a bar to the spread of tho mannfacture, unless some expeditious system to effect it can he ilevised. Prince Albert has some Casimere goats at Windsor; and some few months before the Great Exhibition was opened he caused the fleeces of thoso gouts to be forwarded to two manufacturing firns, one near leods, and one near Halifax, there to be subjected to manufacturing processes. The soparation of the fine wool from the komp was a slow manipulative process, which many persons undertook voluntarily and pieasurably. Of course the expense which would attend
such a mode of manufacture for ordinary sale would be quite disproportionate to the result obtainod; but the prince'a praisewor thy object was answered by ahowing that the Cashunere goat can be reared, and that the fleecy covering can be wrought into cloth. The articlea produced from the wool in question consiated of a , iece of white cloth, with silk warp and Cashmere weft, woven with a brocaded tigure; a plece of similar character, but dyed; two ahawla made wholly of the Cashmere wool; and a piece of cuaras woolen cloth made from the kemp or halr.-Sed Casumbre.

Nauchamp Merino Wool.-In 1828 M. Graux, a farmor at Mauchamp, in the French department of Aisue, had a lamb which, as it grew up, became remarkablo for the long, moooth, straight, and ailky character of tho fibres of the wool. He reaolved to insore, no far an he could, a perpetuation of these valuable qualitles in the progeny of the lamh. In 1830 he had one ram and one owe whose wool was of thls peculiar kind; in 1831 he had fuur rains and one ewe of the desired kind; and by 1833 the number was much increased. Thenceforward the progeny was very remarkable; some of the lambs, like their mothers, bad the curled elastic wool of ordinary merino aheep; while the others, like their sires, had the long silky wool. As years advanced, M. Graux waa able to oltain a breed of sheep which combined in the wool uearly all the qualitics of the two forner kinds; and thus originated the Mauchamp wool, which now sells lu France for 25 per cent. above the beat merino. It ia fuand to be nearly equal to the real Cashmere wool in flexible delicaey of filire, as a material for Cashmere obawls; and when combined with the real Cashmere, it inaparts a strength in which that wool is deficient.

Deterioration or Change in the Character of British Wool.-It appears to be sufficiently cstablished, by the evidence taken before the House of Lords in 1828, and other authorities, that a cousiderable deterioration, or rather, perhapa, change, has taken place in the quality of British wool, particolarly during the 30 preceding years. The great object of the agriculturist has been to increase the weight of the carcasa and the quantity of the wool; and it seems very difficult, if not quite impossible, to accomplish thia without injuring the tineness of the fiecece. Mr. Culley saym, that the Herefordshire sheep, that produce the fineat wool, are kept lean, and yield $1 \frac{\mathrm{IL}}{}$. each; he adds, "If they be lootter kept, they grow largo and produce thore wool, hat of an liferior quality." Thia would seem to be universally truc. The great extension of the turnip husbandry, and the general introduction of a larger ureed of aheep, appears, in every instance, to havo leascned the value of the fleece. Speaking of the Norfolk fleeeea, Mr. Fison, a wool sorter, bay that 25 years ago the weight was $2 \ddagger$ libe a fleece, amit that now it is 3 lha. or $3 \ddagger$ lhs. But according to a talle furniahed by the same gontleman, containingtro results of hisexperience, Jtappeazs that of 15 tods, or 420 lba., of clothing wool grown in Norfolk in 1790, 200 lls. were prime, while in 1828 the same quantity of Norfolk wool ouly yiehled 14 lba . prime. Tho statements of other witnesses are to the same effect. According to the estimato in Mr. Luccock'a Treatise on Einglish Wood, which has always enjoyed the highest reputation, the produce of ali sorts of wool in Engiand in 1800 was 384,000 packs, of 240 Hs. a pack. Hut Mr. Hubbard, a very litelligent and extensire wool-stapler at Leedn has shown that, sopposing Mr. Luccock's estimate of the number of shoep to be correct, the quantity of wool produced in 1828 could not, owing to tho greater weight of the fleeco, be eatimated at less than 463,109 packs ; and it ls now (1814) believed to amount to fully 600,000 packs. It is, therefore, probable, not withatanding the decline in the price of wool, that, taking into account the greatar weight of the carcass, and the greater welght of the flecee, sheep produce more at present to the farmer than at any former period.

We glve below a atatement of the quantity of the wrool imported inte Great Britaln in fifteen years, from 1810 to 1854, inclusive.

An Aooocnt of tif Quantities of Sitrfe and Iamné WOOL, FOREION AND COISONIAL, IMPOMTED INTO GERAT baitain in tun ligal 1Nbi, mistinguibhine tha cousTRIEG FROM WHICG THEX CAME, AND THB,QUANTITIEG BROVOLT FROM EAOLI.

Of late years Russia has become of primary importance amoug the wool oxporting countrien, especially frow her ports on the Black Sea. Provided tranquillity could be maintained in South Africa, the proliabilliy in that lt would In no very lengthened peried rival Now South Wales as a wool exporting country. Alpaca, and other wools of that sort, come from Peru; goats' wool comes principally from Turkey, but the best is that of Thibet.

United states.-Analogous in the nses for which it aerves to cotton, wool is a produet of only lese imporsance to the proapority of the country than that leading staple of our agriculture and commerce. It is a very gratifylng fact that though the number of sheep has

Increased in ten years but 12 per cent., the aggregate weight of their fleeces has augmented 46 per cent. In 1840 there were $10,811,874$ sheep; yiolding $35,802,114$ lbs. of wool, equal to 1.84 lb . per head. In 1850 the average weight of each fleece was $2 \cdot 48 \mathrm{lba}$., from which it wonld appear that such an improvement had taken place in the various breeds' of the American sheep as to increase their average product ahout 32 per cent. throughout the United States. And a critical analyals of the returns of sheep and wool proves not only that our breeds are capable of auch improvement, but that it has actually taken place.

In Vermont the greateat atteation has been given to aheop-breeding; time, money, and intelligence having been freely appliod to the great object of obtaining a breed combining weight and fineness of flecee. These efforts hava succeeded ao well, that although the nunsber of sheep in that State had declined nearly one half in the period from the sixth to the seventh census, the yiold of wool remained nearly the eame. The average weight of the fleece in thls State in 1840 was 2.2 lba., and in 1850 it had increased to 8.71 , the gain being almost equal to 70 per cent. In Massachusetts, also, where strenuous exertions have been made-though not on so larga a scale as in Vermont-to improve their sheep, a correspondingly beneficial result has been obtained, and the average weight of the fleece has been increased from 2.5 to 3.1 lbs. The State of New York produced 226,000 lbs, more wool in 1850, from $8,453,000$ sheep, than from $5,118,000$ in 1840 , showIng that the weight of the fleece had been raised from less than two to nearly three pounds. Our importa of wool during ten years have varied as follows:
Quantity and Valde of Wool impoated into the Enited Ntatre from 1841 to 1850, inolegive.

By this statement it is shown that the quantity of wool brought into the country of late years amounts to almust one-third of that produced init; while at former
pexiode, as from 1841 to 1845, the amount was nearly one haif. The largest proportion of thia imported wool came from Buenos Ayres and the neighboring states on the Rio de la Plata, and la of a coarse and cheap variety, costing from six to elght centa per pound. It always will be cheaper to bring this klad of wool from regloas where sheep are reared without care or labor, than to produce it at home; but there la no country in the world In which sheep may, by judiclous treatment, be mado a source of greater wealth and comfort to its inhabitants than the United States. The Importations of wool in 1850-'61 exhibit a remarkable increase over the preceding or any former year, amounting in quantity to $32,548,693$ lbe., and to the value of $\$ 3,800,000$.

Produotion of Wool Im the Unitrd Stateg in tha

Woolen Manufacture, the art of forming wool fnto cloth and stuffis. The manufacture of eloth was known, it is supposed, in all civilized countries, and in very renote agea, and probably of linen also. Woolen cloths were made an articlo of commerce in the time of Julius Cesesar, and are familiariy alluded to by him. They were made in England before A.D. I 200 , and the manufacture became exteasive in the reign of Edward III., 1331. They were then called Kendal cloth and Halifax eloth.-E. B. See article Wool. Blankets were first made in England about a.d. 1340.-Camden. No cloth but of Wales or Ireland to be imported into England, 1463. The art of dyeing brought into England, 10 Anne, 1712, and 2 George I., 1715. Greater in

Yorkshire in 1785, than In all England at the Revolu-tion.-CilalaErs.

Woolen Goods, Varieties of.-The variety of goods which come under the deslgation of woolen manufactures is obvlously increasling evary year. "Broadcloth" and "aarrow cloth," "Clarendons" and "Petershans," "Cashmercs," "Cashmerettea," "kerseys," "tweeds," "tartans," " llnseg - woolseys," "angoles," "vicunas," "Venetians," " llamas," "Sardlnlans," "Hinalayas," " moleskias," "doesklns," "beavers," "trowserings," " vestings," "costings"-there is really no end to the names; for the manufacturers, not content with having distlngulahing names for partletslar materials and particular moles of manufacture, conjure up new names, on any or no grounda, for tho sake of novelty. Many of the maines, however, might be innde signlficant of really curlous novoltles in the manufacture. Thus thera is a new " bis-unique cloth," of touble thlckness, the two surfaces having dillorent patterns, so that the wearer may have either sido outward at his pleasure. There is a cloth wholly mado from beaver fur-soft, light, and warm-for winter garmeats. There is, as a third example, the comical-Jy-named Irlsh "rumswizale," a very excelient brownish frleze mado of undyed forelgn wool.

Shoddy Trade.-The greater number, perhaps, of our renders may never have heard of that branch of the woolen manufacture called the ahoddy trade, which has grown up of late yeara, and is now of very considerablo valua and importance. It is principally carried on at Dewsbury, in England, in the centre of the clothing district. Shoddy cloth is fabricated oither wholly or partly of old wool ; and Instead of belng neglected, or used only as manure, old woolen rags aro now overy whare carefully collected, and conveyed to Dowabury. After belng subjected to varlous processes, they aro torn to pleces by the ald of powerful machinery; nnd reduced to their orighal state of wool; and thle wool, being respun, either with or withuut an admixture of fresh wool, is agaln made into cloth! Formerly, shotldy cloth was used only for padding and such like purposes; but now blankets, flnshinga, druggets, carpets, nud tahle-covers, cloth for pilot and Petersham greatcuats, etc., aro elther wholly or partly made of shodly. Tho elothing of tho ariny, and the greater part of that of the navy; consists principally of the same materin), which, in fact, is occasionally worn by every body. Large quantities of shoddy eloth aro exported. Great improvements have been effected of lute years, not ouly in the fabric of the cloth, but also in the dyes: this is especially seen in the cloth for soldiers' uniforms, which is no longer of a brick-dust color, but makes a much nearer approach to searlet. The beautifal woolen tablecovers are made wholly of shotdy, being printed by uqua fortis from designs drawn in London and Manchester, and cut on holly and other blocks on the spot. The analogy between thls mamifacture and that of paper ia so striking that it must force itself on the attention of every one, the vilest and most worthless materials being converted in both into the most beautiful and useful fabrice. The shoddy trade is, in fact, one of tho greatest triumphs of art and cirllization, Though of comparatively secent origin, it is rapidly extenting itnelf. It is anost actlve in summer, and is much more langulil in winter.

Linited States.-Tho development and growth of our woolen manufactures depends now entirely upon our lariff. To euahlo our mills to compete with freign milla, we must lave a tariff to counteract the costile legislation of those foreign countries whieh overrun our market with their falirics. When England, France, I'russia, and Austrin inport wool for their broadcloths, free of duty, the United Statee must do the same; or these European manufacturers, in whuse favor our tax ou imported wool operates, will surpass us so largely in our own markets, that we shall be compelled to atop all vur broadcloth spindles. This has been the effect
of the tarlff of 1846 upon our woolen manufactures; and the prospect of rellef to be afforded by Mr. Campbell's bill will give Iffa to this decaylng branch of our Industry.

The rolations of the tariff to our woolen manufactures has attractod so much attentlon of late, that the following table, showing the rate of duty fixed on wool by the varlous tariffs enacted by Congress sinco $\mathbf{1 7 8 9}$, wlll be found lnterosting.

Thaity lutizg on inportad Wool paom 1789. January, 1789, to Aprif, 1810-free,

Marchi 3, 185\%, wool 24 per cent. Lees than 20 cente a pound, at the place of exportation, free.

Tho fluctuations In this table are remarkable, and, considering thelr frequency and the extremes to which they ran, it is surprising that enpital should have been investod in woolen manufactures in this country.
"The atatlatices upon the proluction and Importation of wool, and manufactures of wool, have been prepared with care, in order to place the questions conneeted with the production and importation of wool and mannfactures of wool, Involved in tho proposition to almit wool as n raw material free of duty; fully and fairly before Congress. It will be seen that in $1 \times 40$, according to the census of that year, we mannfactured woolen goods to the value of $\$ 20,696,999$; and that In adilition we imported manufactures of wool to the value of $\$ 8,652,785$; making our constumption of the manufactures of wool $829,349,781$, and the consumption of $\$ 17194-100$ fur each person then in the United States. The census of 1810 does not givo the number of factories devoted to, nor the capital employed in the manufactura of wool. The census of 1850 shows there were 1559 factorles In the United States, with 28,118 , 650 of capital devoted to the manufacture of wool, with the particular States in which the factories were situated; also that tho manufactures of wool amounted to $813,207,645$, and we imported manufactures of wool to the value of $\$ 16,976,575$, making our consumption of manufactures of wool $860,18.140$, and the consumption of $\hat{6}^{2} 69 \frac{1}{2}$ for each person in the United States. If we estimate tho increased value uf our woolen manufactures since 1850 at tho ratio of tho increase between 1840 and 1850 , it gives our manufactures of wool at $\$ 56,406,786$, for the year 1855 ; and we find the value of our inportations of inanufactures of wool fur 1855 to bo $\$ 23,297,384$, making our consumptlon $\$ 79,701,170$, and $921 *-100$ as tho consunption of each pervon then In the United States. These tables nlso show, at the perioils of 1840,1850 , and 1855 , the value of the wool produced in the United States, and also the value of wool imported into tho Unitod States at the same periods, less the exports of wool. They also show the value of the wool, in the imported nianufactures of wool, at cach of those periods, estlmating the value of
the wool at one-third of the value of the importa, and oxhibit the value of the wool consumed by each person in 1840 at 71 20-100 cents; in 1850 at 75 18-100 cents; and in 1855 at $9210-100$ conts; and that we consumed in 1810 3,70t,092 more than we produced; in $1850,97,817,771$; and in $1855,99,078,690$. There ure no data from which to exhibit the number of factories, nor the amount of capital omployed in the manufacture of wool, in 1855 , nor the charscter of the goods manufactured; but it is represented that ali our factories herctofore engaged in the manufacture of broadcloths and the finer woolen tabrics have been forced to abandon that description of manufacture, and yiold our markets for thoge articles to the foreign manufacturer. These tables show that in 1855 we consumed $\$ 23,297,384$ of the manufactures of wool more than wo manufactured, and that we consumed $89,678,690$ of woot more than we produced, estimating the wool in the msulufactured article at one-third of the value. Now we import $\$ 1,940,697$ of wool for our manufacturers, who pay a duty of 30 per cent. upon it; and we import $\$ 23,297,384$ of the manufactures of wool, on which we pay dilicrent rates of duty, viz. : 30 per cent. oll part, 25 per cent. on part, and 20 per cent. on part; while with wool free of duty in other manufacturing countries, the duty operates a discrimination against the labor and aapital of our own peeple. This is peculiarly the case as to the cosrser fabrics, which wo almit at less duty than wo impose upon wool.
"The climate of the United States is such that manufactures of wool aro used winter and aummer in somo of the States, and in the winter months in all, and the finer fubrics are used in all. It is an article, for clothing and other uses, that our climate and our habits do not pormit us to dispense with, and which our people can and will manufacture for themselves, if our tariff laws are arranged so as not to discriminate sgainst them, and in favor of other manufacturing nations.
"When we first imposed a tax on foreign wool, Great Britain and othor manufacturing nations taxed it aiso, nud as high as wo taxed it. Fo diserininated in the tax upon the manufactures of wool, imposing a higher tax upen the finer fabrics; wheroupon Great Britain and other manufacturing mations repealod thoir tax on wool, and secured to their manufacturers the advantage of obtaining the raw material free of duty. This advantage over us thay will continue to enjoy as long as our tax is continued. The reasons why they admit wool free are to be sound in the fact that they manufacturo more than thoy produce, and it is nocessary they should bo able to sell cheap, in order to enter advantageously the markets of the world, and it may be also to secure the market of the United States, to the sappression of manufacturing in this country. We also manulaoture more wool than we produce, and consume more manufactures of wool than we manufacture, and continuo our tax on woul. The duty on wool was imposed to promote its production in the United States, und was expected to enhance the price. It has failed
to secure the object for which it was imposed. The proluction has not kept pace with our population and consumption of woolon manufactures, and although the prices have been fair, they have not been such as to make wool-growing as proftable a purauit as many others in the country. In the trial of ten years undar the tariff of 1810, there ia no greater production of wool, in proportion to the population, than there was prior to that time. It is said we do not produce the inferiorpriced wools, costing tweuty cents per pound or less; nor the higher-priced wools, costing fifty centa or more to tho pound, and that it is the lower and higher priced woois that we import for our manufactures, and that the duty has no effect, and docs not enhance tive price of the wool that we produce; in consequence of which we are undersold in our own markets, in both the finer and coarscr fabrles; and that the repeal of the tariff on low and the higher priced wools would not affect the price of the wool wo produce, and would enable our manufucturers to uae mora of our wool, by judicious mixture with foraign wool, and give them a fairer competition for the home market, and induce the manufacture of the finer fabrics in this country. Thare would be difficulty in the execution of such a tariff, becanse it would be the interest of the importer to put the foreign value of his wool above the fifty or below the twenty cents to obtain free entry. It is lelieved these causcs would reader the tax uncertain and unpopular, and make free trade in wool more desirable and more beneficial to the wool-grower as well as the manufacturer. In Great Britaiu the tax on the foreign wool, when it was as much as slxpence a pound, did not enhanco the prico to the English wool-grower, although it had been ioposed and continued, as well to encourage the growth of wool at home as for revenue. The English prices-current and statistics show that the price of wool ranged highor the very first year after tho duty was rencaled than it had for years before, and has continued to range higher ever slnee. It is confidontly bolieved such would be the case in this country if the duty on the importation of wool was repealed, therchy giving our manufacturers wool on the came terms tho forelgn manufacturers obtain theirs, viz. : by purchase in the open markets of the world, and that they would bo encouraged to incroase and extend their business in order to enjoy the beuefit of the home market for their goods, the consequences of which would be a constant and greater home demand, at higher and better prices.
"The ratio at which our population is increasing will render nacessary a continuod increase in the manufactures of wool required for coosumption. Tho importance of a hoine supply of this useful and indlspensable article of clothing calls for the most careful investigation of the effects of our laws, and a prompt remedy by their repeal wherever they shsll be found prejudicial to a constant and cheap supply from the capital and labor of our own people."-U. S. Treasury Report, December, 1856.

Imponts of Wooleng into tied United States fon the Yeare ending June 30, 1853, $1854,1855$.

Wreok, in Navigation, is usualiy understood to mean any ship or goods driven ashore, or found fleatIng at aca in a deserted or unmanageable condition. But in the legal sense of the word in England, wreck must have come to land; when at aes, it is distingulshed by the barbarous appeliations of flotsam, jetsam, and lagan. In nothing, perhaps, has the benefisial influence of the advance of socicty in civilization been more apparent than in the rogulatlons with respect to the persons and property of shipwrecked individuals. In most rude and uncivilizel countries thelr treatment ins been cruel in the extreme. Among the early Greeks and Romans atrangers and cuamies were regarded in the samo point of view.-Hostis apud antiquos, peregrinus dicebatur--Ponp. Festus; ece also Creeno de offic. Where such inhespitable sentiments prevailed, the conduct observed to ward those that were shipwrecked could not be otherwise than barbarous; and in fact they were, in most instances, either put to death or aold as alaves. But as law and good order grew up, and commerce and navigation wero extonded, those who escaped from the perils of the sea were treated In $n$ way less repugnant to the dletntes of humanity; nud at length the Roman law made it a capital offenso to destroy persons shipwrecked, or to prevent their snving the ahip; and the atealing even of $n$ plank from a vessel shipwrecked or in distress matio the party liahle to answer for the whole ahip and cargo.-Pand. 47, 9, 3.

During the gloomy period which followed the subversion of the Romnn ompire, and the establishment of the Northern nations In the southern parts of Europe, the ancient barbarous practices with respect to shipwreek were every where renewed. Thase who survived were in most countrics reduced to servitude, and their goods were every where confiacated for the use of the lord on whege manor they had been thrown.-Robentson's Charles V. But nothing, perhaps, can so strongly evince the prevalence and nature of the enormities as the efforts that were made, as soon as governments began to acquire authority, for their suppression. The regulations as to shipwreck in the Laws of Oleron are, in this respect, most remarkable. The 35th and 38 th
articles state, that "pilots, in order to ingratiate themselves with thelr lords, did, like falthless and treacherous villains, somethnes willingly run the ship upon the rocks," etc. ; for which offense they are held to be accursed and excommunlcated, and punished as thieves and robbers. The fate of tha lord is atlll more aevere. ${ }^{4}$ He is to be apprehenderl, his goods confiscated and sold, and himself fastened to a post or atake in the midst of his own manslon-house, which beling fired at the four corners, all shall bo burned together; the walls thereof be dumolished; the stones pulled down; and ihe site converted into a market-place, for the sale onl; of hogs and owine, to all posterity." The 31st article recites, that when a vessel was lost by runnling on shore, and the mariners had landed, they often, Instead of meetling with help, "wcre attacked by people more barbnrous, cruel, and inhuman, than madi dogs; who, to gain their monoss, apparel, and other goods, did sometimes murder and destroy theso poor distressed seamen. In thls casc, the lord of the country is to execute justico, by punishing them in their persons nnd their estates ; and is commanded to plunge them In the sea tlll they be half dead, and then to have them Irawn forth out of the sea and stoned to death." Such were the dreudfnl soveritiea by which it was attempted to put a stop to the crimes against which they were dlrected. The violence of the remedy shows better than any thing else how lnveterato the discase had become.

But the fact that divines did not scruplo to prostitute religious worship by praying that the adjacent cossts might be enriched with shlipwrecks, afiords, perhapa, the inost strlking proof of the barbarism of the times referred to. And incredible as It may seem, thls practico was continued down to a cemparatively recent epoch. "Cependant il y a encere en Allemagne des pays oin la coutume de confisquer les blens naufragés n'est point encore abolic. Il y a même dea endroits ou les ministres predicateurs ne font pas difficulté de prier Dien en chaire qu'il se fasse bien des naufrages sur leurs cótes. Et ces pricres, Thomasius a entrepris: séricusement de les justifier; mais par des raisone el aingulieres, qu'clles no valoient pas la peine que Bawbeyrac a prisé de les refuter."-Valis, Comméntaire sur COrdonnance de 1681, 1i. 586. See also Puffenmonff, Divit de la Noture et des Gens, par Barbeyrac, il. 706.

The law of Eagland, like thnt of other moderis countrles, aljudged wrecks to belong to the king. But the rigor and injustice of this law was modifled so early as
the reign of Henry l., when it was ruled, that if any person escaped slive out of the ship, it should be no wreck. And efter various modifications, it was decided, in the reign of Henry III., that if goods were cast on shore, having any marka by which they could be identifled, they were to revert to the owners, if claimed any time within a year and day. By the atatute 27 Edw. II I., c. 13, if a ahip be loat and the goodr come to land, they are to bo deljvered to the merchante, paying only a reatonsbie reward or Salyage (which ace) to those who asved or preserved them. But thase ancient statutes, owing to the confusion and disorder of the $t \mathrm{mss}$, were very ifl eaforced; and the diagraceful pracilecs previously alluded to continued to the middic of last century. A statnte of Anno (12 Ann. at. 2, c. 18), confirmed by the 4 Geo. I., c. 12, in order to put a stop to the atrocities in question, ordera all head officers and others of the towns near the sea, upon application made to them, to summon as many hands aa are necessary, and send them to the relicf of any ehip in distress, ont forfelture of $£ 100$; and in case of any assistance given, salvage is to be assessed by three justices, and paid by the owners. Peraons secreting any goods cast ashore aro to furfelt treble their value; and If they willfully do any act by which the ship la lost or deatroyed, they aro guilty of felony without benefit of elergy. But even this statute aeoms not to hava been sufficient to accomplish the end in view; and in 1763, a new statute ( 26 Geo. II., c. 10) was enacted, the preamble of which is as follows: "Whereas, not withstandlug the good and ealutary laws now in being against plundering and deatroying veasela in distross, and against taking away shipurecked, lost, or atranded goods, many wicked enormitiea have been committed, to the diagrace of the nation, and the grievous damage of merchants and mariners of our own and other countries, be it," etc.; and it is then enacted, that the preventing of the escape of any person endeavoring to save his life, or woundiug him whth intent to de: ;oy him, or putting out false lights in order to luring uny vessel into danger, olaall be capital felony. By the ame statute, the pilfering of any gools cast ashore is made petty larceny.

Wo regret, however, to have to state that the plunder of shipwrecked property ia still by no means nuconmon on the British coasts. The committec on shipwrecks in 1813 state, that "thero is on many parts of the cosst a want of that moral prinelple which should inculcate a just regard for the rights of such property. It is looked upon as a chance giff, which every one has a right to acramble for as he can, notwithatanding the laws which havo becn passed, from the carliest period, to pre ient or punish such depredations. The plunder of shipwrecked property on the coasts has been carried on to an enormous cxtent, and this secms to have arisen from there having been ito persons on the spot, when a wreck had taken place, to look after the property." The committee state that the establishment of the coast-guard has slone much to repress these abuses. The latter, however, can not legally interfere, oxcept when the castaway articles are suliject to customs duties; and the committec suggest that all abandoned preperty should bo vested in tire government in trust for those to whom it may belong, as is done in France and Holland.-Report of Comvittee of 1843, p. viii.
Theold English doctrine of wrecka was founded upon the anciont laws of Europe, confiscating stolen goods on conviction of the thief, without paying any regard to the right of the real owner.
"By the common law, as it was laid down by Sir Wiillam Blackstone, gooda wrecked were adjudged to belong to the king, and the property was loat to the owner. This headmita was not consonant to reason and humanity; and the rigor of the common law was softened by the statute of Wcst. 1, 3 Edw. I., eh. 4, which declared that if any thing alive cacaped the shipwreck, Le it man or allimai, it was not a legal wreck, and the
owner was ontitjed to reclaim his property within a year and a day. Upon this atatute the legal doctrine of wrecks has atnod to this day. St. Germain, tho muthor of the Doctor and Student, did not scem to think that even the law under this statute etood with consciesce, for wby should the owner forfult the shipwrecked goods, though it should happen that no man, dog, or eat (to une the words of the statute), should come alive unto the land out of the shlp? The only rational ground of the claim on the part of the crown is, that the true owner can not be ascertained. The imperial edlet of the Emperor Constantine was more Just than the Einglish atatute, for it gave the wrecked goods in every event to the owner; "and this atatate is upon just principles, not depending upon the casual escape of an sumal." "The statutes of New York, Massachuactts, and other American Statea, ara like the edict of Constantine," "for they declare that nothing that shall be cast hy the sea upon the land shall be adjudged a wreck, but the goods shall bo kept safely for the apace of a year for the true owner, to whom the same ls to be delivered on his paying a reasonable aalVage ; and If the goods be not reclaimed within that time, they shall be oold, and the proceede acconnted for the State."-Kent's Comm., Lect. XXXIV.
The journal of tho Sucield des Arts, gives in a Iate number an analyais of the atatiatica of the wrecke which occurred upon the coasts and in the seas of the British Isjes in the year 18b6, ys follows:

| Voam. | Wroeks. | Collibiona. | Togsther. | Lives losi. |
| :---: | :---: | :---: | :---: | :---: |
| 18,5. | 168 | ot | 1015 | 820 |
| 1563. | 750 | 73 | 832 | 989 |
| 1854. | 893 | 94 | 987 | 1549 |
| 1850. | 894 | 247 | 1141 | 469 |
| 1560. | 837 | 318 | 1158 | 591 |
| Total. | 4341 | 787 | 5128 | 4348 |

This shows that the number of collisione at sea has regulariy increased in a proportion truly frightful; from 57 in 1852, it became 816 in 1856, or five times greater.

Frr the year 1850, tho number of wrecke and collisions is distributed monthly as followe: January, 149; February, 154 ; March. 96 ; April, 74; May, 67 ; June, 32 ; July, 48 ; August, 51 ; September, 98 ; October, 99 ; November, 120: December, 106; total, 1153. The tonnage of these vessels amounted to 229,986 ; the number of men employed to 10,014 , of whom 521 perished.

Of the wrecked vessela, 314, or neariy one-third the cutire number, were employed solely in the carriage of coale. The coal trade is, then, for Engiand the most dangerous of all that which cauacs the greatest less of life, no doubt because the vessela employed for this trade are badly selected, badly commanded, in a very bad condition, and indeed often quito unseaworthy.
Of these wrecks 506 occurred on the east coast, between Dungeness and Pentiand Frith; 307 on the weat, from Land's Eud to Grenock; 119 on the south, from Land's Ind to Dungeness; 155 on the coasta of Irelaud; 12 upon the Isle of Sciliy; 11 upon the Isle of Lundy; 5 upon the Isle of Man; and 36 upon the Islee of the North, Orkiey, ctc.

Of the causes which led to these losses there were 148 wrecks from storms; 17 absindoned on account of unseaworthiness; $\mathbf{3 7}$ sunk on aame account; $\mathbf{1 0}$ losses from absenco of proper signals; 33 from fogs and currents; 5 from defective compass; 3 from inucifect charts ; 6 by error in calculation of the point; 12 hy error of estimation; 7 by error of pilot; 3 througit absence of jilot; 21 by neglect of soundings; 2 on account of drunkenness; 9 ou account of general negligence; 10 by neglecting to heave to ; 1 by coming in contact with a foundered vessel; 4 by fire; 4 by capsiz. ing; 7 by causes unknown.

The Duties of Consular Officers.-By the third section of tho act of Congress of April 14, 1792, const iar offcers, in casea where ships or vessels of the United Staten shall be atranded on the coast of their respective con-
sulstes, are required, as far as the laws of the country permit, to take proper measurea, as well for saving such shipa or vessela, their cargoes, and appurtenances, as for atoring and seouring the affects and merchandise saved, and for taking an inventory or inventories thereof; and the merchandise and effects asved, with the inventory or inventories, must, after deducting therefrom the expense, he delivered to the owner or owners. But no consular officer is permitted to take possesalion of any such goods, wares, morchandise, or other property, when the master, owner, or consignee thereof is pres ont, or capable of taking possession of the amme. In the execution of the dutics preacribed by thia part of tho act, every consular officer la inatructed that all vosseis, perts of vessels, and any portion of their cargo, belonging to cltizeas of tho United States, saved, and brought into the consular jurisdiction after being wrecked, or in consequence of any disaster at sea, aro to he proceeded with in the same manner as if the vessel had trandod within tha consular jurisdiction; and if sajvage be claimod and aliowed by a competeat tribunal, the remainder of tino etfects, or the proceeds thereof, if sold, shall be disposed of in the same manner as is directed in the twenty-first chapter of these inatructions respecting the estates of persona dylng intestate ; provided, in the case of aalvage, that the court deciding the sumo will permit the consular officer to receive the eflecta and rominder of the property after tiso salvago is paid. In some countries (as in Sweden) chartered companies have tho privilege of taking possession of all property wrecked; in others it may bo vested in particular magistrates or officers. In such cases tin consular officer is not to interfere with tho legal function of the proper officer, but he may ask leave, as tho cepresentative of the absent master or owner, or as his ofticial adviser if ho be present, to assiat at the takinf of tho inventory, the aale, and all other proccedings in relntion to the property. It is his duty to protect the interest of tho owner, and, if his reasonablo requests are not complied with, to take tho necessary evidenco of the facts in the case, and transmit It to tho Departmont of State.

When any American vessel is wreckod within his jurisdiction, the consular otficer is to give immediato notice to the Department of State, naming the vessel and her owners or master. and giving in detail as muny of the circumstances r.ttending tha loss of the proporty ns may be knu ïnt ai the time. When there is no impediment from the laws of the country, all proceedings in relation to property wrecked are to ba the same as those prescribed in the case of property of intestates, and so niso with regard to the taking possession and diaposing of whatavor effects, whether wrecked, abandoned, or otherwise, unrepresented within a consulate, belonging to any citizen of the United States. IIe will promptly render stuci assistanco as may be in his power to his shipwrecked countrymen, nad instituto, whenever it is practicablo, energetic proccedings for tho protection of therr property; but this instruction gives no authority to incur any oxpense therefor in the expectation of its boing defrayed by the Department of State, the appropriation for the relief and protection of American seamen in foreign countries which is made by Congress not being applicablo to such purposes. Whenover it is necessary for the safety of the property, the consular officer will apply to the local auth rities for assistance

Il'reck of an A merican Vessel.-No parts of an American vessel, nor any of hor equipments, wrecked either in our own or foreign wnters, are to be regardod in legal contemplation as " goods, wares, or merchandise," when roturned to tho person or persons owning tho vessel at the time of the wreck, and on proper proof of identification. If, however, they have been suinjects of purchaso and sale, thoy become "merchandise," within the meaning of the law, and, as each, becomo liablo to duty on importation, according to their classifi-
cation under : $2 e$ tariff, and value dotermined by appraisement.

The parta or equipmente of a foreign vessel wrucked In wators not of the United Statee, and brought Into our porta, muat be regarded, on inportation into the United States, as inerchandise, and liable to duty.

In the case of an Amcrican vessel bound on a coastIng voyage from Buffaio to Detroit, and forced by atress of weather on the Caaadian shore, whore aho was wrecked, it was docided by the Department that the merchandiac recovored from tho wreek was ontitied to free entry, on being returned to the United States, on satiafactory proof thet tho articles of foreign origln composing her cargo had once paid duty in the United States, and that sho was hound in good faith on a coasting voyage, with no intention of touching at a foroign port of destination.

The tackle, apparel, furniture, and ahlp atores of a forelgn versel wrecked on the coast of the United States, on being recovored and brought Into the ports of the United Statea, to be admitted to free entry, not heing considerot as goods, wares, or merchandiso subject to duty, within the meaning of the law.

Number of Shipuorecks. - The loss of property by shipwrock is vary grent. It appeara from an examination of Lloyd'z List from 1793 to 1829, that the losses in tho British mercantile navy only amounted, at an average of that period, to about 557 vesacla a year, of tho aggregate burdon of about 66,000 tons, or to above 1-40th part of ita entire nmount in ships and tonnage. The foliowlng account of the caaualties of British shipping in 1829 la taken from Lloyd's List:
On foreign Vogages.-157 wrecked; 284 driven on shore, of which 224 are known to have been got off, and probably more; 21 foundered or sunk; 1 run down; 35 abnndoned at eea, 8 of them afterward carried into port; 12 condemned as unseawortiny; 6 upset, 1 of thom righted; 27 missing, one of them a packet, no doubt foundered. Coasters und Colliers.- 100 wrecked; 297 driven on shore, of winich 121 known to have been got off, and probably more; 67 foundered or sunk, 4 of them raised; 6 run down; 18 abandoned, 5 of them afterward carried in; 8 upset, 2 of them righted; 16 missing, no doubt foundered. During the year, 4 steam vessels wero wrecked; 4 driven on shore, but got off; and 2 sunk. It seomed, from the returns glven in the Roport of tho Commons' Committeo of 1843 on Shipwrecks, that these casualties were becoming less frequent. At all ovents, it appeared that at an average of the three years ending with 1835,610 shipe were annually lost, and that notwithatanding the increase of shipping in the interval, at an average of 1841 and 1842, the annual losa amounted to only 611 ships ; the average burden of tho lost ships being in looth cases, as near as can be asecrtained, 210 toas. Hence, if we eatimate the value of tho ships and carzoes at $£ 20$ a ton, the loss of property in 1841 and 1842, from shipwreck only, will havo been $£ 2,566,200$ a year! The loss of life is not exactly knowin, but it may bo taken at from 1000 to 1500 individuals a year. The increased employment of steamships, the multiplication of lights, and the improvement of harhors, all tend to diminish the number of casualties; and yet they continue to be oxtremely numerous. In 1852, for example, when the mercantile navy of tho United Kingdom (exeept the colonies) comprised $26,146 \mathrm{ships}$, there were 1115 wrecks. Of these 533 were total losses, and 582 were partial but heavy losses, the ships being obliged to discharge; 38 of the former, and 24 of the latter, were occasioned by collisions. The loss of lives was estimated at 920 . These heovy losses might be diminished by building better and stronger ships. No doubt, howover, tho careleasness, ignorance, and incapacity of the mastera is the great source of loss; and nothing, certainjy, will do so much to obviate this as tho plan now adoptod of making the obtaining of a certificate of fitacss, after undergoing an examination by a public board,

Indispensable to er thed any Individual to be appoluted to the command of a ship. During the war with France, 32 ships of tha line went to the bottom, bealdes 7 fiftyogun abips, 86 frigates, and a vast number of amalier vessels. And the lonses suatained by the navien of France, Spain, Holland, I monmark, ote., muat have very greatly exceeded thowe of eurs. Henco, an Mr. Lyell has eliserved, it in probable that a greater number of monuments of tha skill and industry of man will, in the course of ages, be coilected together ia the bed of the ocuan, than will be seen at one sime on the surface of the continent.-Principles of Geolugy:

Writing. lieturen wers undoubtedly the firat sasay toward writing. The most ancient romaias of writing which have been transiaitted to ua are upon hard substances, auch as atones and motais, used by the ancints for edicts, and matters of publle notoriety. Athotes, or Hermes, in said to have writion a history
of the Fgyptiana, and to hava been the anthor of hiero. glyphics, 2112 n.c.-Ususa. Writing is sainl to have been taught to the Latina by Ruropa, danginter of Age-
 mun, the founder of Cadmen, 1498 n.c., hrought the Phosician letters Into (ireece.--Vinsica. The commandments were written on two tables of atome, 1491 a.c.-Usura. The Greeks and Romans uned waxed table-booka, and continued the use of them long after papyrus wan known.-See Papynus, I'ancumgnt, Papma. "I woula cireck the petty vanity of those who alight good penmansisip, as below the notice of a seholar, by remiading thom that Mr. Fox wan distingulshed by the clearnesa and firmness, Mr. Profesaer Porson ly the correetneas and elegance, and sir William donea hy* the case and beauty, of thu charactery they rospectively employed."-Dn. Pana.

## Y.

Xacht, formerly a veseel of atate, wailly employ. ed to convey princes, embaseadore, and e" er great persenages from one aingdom to another. As the princhal design of a yacht is to scenninodate the pasmengers, it is usually fitted with a variety of convenient apartments, with auitable furnitnre. Irivate pleaso are-boate, when aufficientiy large for a sea-voyage, are also termed gachto. A more modern une of the term is to deaignate the model bonts built for speed and for racing.

Yachte of the present day include botin ateam and salling vessels. The yacist Aneriaa, built by Mr. Steern, of New York, and afterward the winner of the pries at the yacht race, 22d August, 1851, at Cowee, in England, gave American ship-wrighta a wider reputation than lefore. Vessela belonging to the British, Ameriesn, French, and Kussian yacht clubs are released from quarantins upon the same conditions as ahips of war in British ports.

By acta of Congress, the Secretary of the Treanury If authorized to cause yachts, used and employed exclusively an pleanure vessele, and denigned an motels of naval architecture, and entitled to be enrolled as American vesseln, to to liceased on terma which will authorize them to proceed from port to port of the United Statea withont entering or clearing at the cus-tom-house. Such licenae ahall be in auch form an the Secretary of the Treasury may prescribe : Provided, such vessels ao enrolled and licensed shall not be allowed to tranaport merchandise or carry passengers for pay : And provided, further, that the owner of any much veasel, before taking out auch license, shall glve a bond, in such form and for anch amount as the secretary of the Treasury shail preseribe, conilitional that the said vessel shall not engage in any unlawful trade, nor in any way violate the revenue laws of the United States, and aball comply with the lawe in all other reapects.

All such vessels shall, in all respect except as above, be subject to the laws of the United States, and shail be liable to selzure and forfeiture for any violation of the provisions of this act.

All such llcensed yachts shall nee a signal, of the form, size, and colors preacribed by the Secretary of the Navy; and the owners thereof shail at ali times pernit the naval architects in the employ of the United Statea to examino and copy the models of said yaches.
Tanan, or Yanaon, a Freach settlement within the limits of the British prasidency of Madras, situate near the bifurcation of the Godavery (a river rising in the Deccan), and the river or harbor of Coringa, and about nine miles above the embouchure of the former. The mouth of the Godavery is obotructed by aand-
banka, which preclude the entrance of ahips i but the Ceringn lliver bas a deep channel, which admits of vessels of 200 tons burden proceeding an high as Ynnan. The French territory dependent on the factory atretehes along the banks of the two rivers a diatance of six miles, and contains an area of 8147 acres, which in 1836 were chasifled as follows:

| T.and under ruhivation | res 4 |
| :---: | :---: |
| Woods and foresta | 4 862 |
| Harreuland | 915 |
| 'ublle catator. | 2700 |

The population in 1840 was 688). Lat. $16^{\circ} 44^{\prime}$, and long. $82^{\circ} 16^{\prime}$.

Fard, a long measure used in Finglani, of 8 feet, or 36 inches.-Nee Weiouta and Mrasurys.

Yarn (Ger. Garm; Inu. Gayen; Fr. F'il; It. Filato; Sp. Hilo; Port. A'io ; lluse. I'rasha), worl, cotton, flex, etc., spun into thread.-See articho Cotron, IInes, Wool, etc.

Tear, Lunar. Thia is the space of time which comprehenda twelve lunar monthe, or 454 daye, 8 hours, 48 minutes, and was in use omong the Chaldeana, Persians, and ancient Jewa. Once in every three years was added anether lunar month, eo as to make the solar and lunar year nearly agree. But theugh the months were lunar, the year was that is, the first month wan of thirty dayn, and the second of twenty-nine, and so alternately; and the month added trienaially was ealled the second Adar. The dews afterward followed the Heman manner of computatlon.-Haydn. Nee Almanac, Calembar.

Yuoatan, a penlnsular state of Mexico, Central America, mostiy between lat. $15^{\circ} 30^{\prime}$ and $21^{\circ} 30^{\prime} \mathrm{N}$. , and long. $87^{\circ}$ anil $91^{\circ} \mathrm{W}$., having north and west the Gulf of Mexlco, east the Curibiean Sea, and landward British Honduras, Guatemala, Chinjas, and Tabasce. Area, 7364 square leagues, or $\mathbf{5 2 , 9 4 7}$ square miles. Popalation in 1850, 680,948. Surface mostly level, fertile in the south, but deficient in regular supplies of water, though so inundated in aummer as greatly to impede agricutture, in which, as weil as manufactures, it apjears to be behind the more northern portions of Mexico. Cattle are numerous. Other chief nources of wealth are maize, cotton, rice, tobacco, pepper, sugarcane, dye-woods, hides, and soap, mostly exported from Campeachy and Sisal. It is divided Into five dependencies and elghteen diatricts. Prineipal cities and towns, Merida, the capital, Vallatolid, Isumal, Campeachy, and Tekac. It also comprises the remarkable ruins of Uxmal, Chi-chen, Kaliah, and Zayi. The Bay of Yucatan is a name aometimes given to the saa immediately north of the Bay of Honduras. The Channel of Yucatan, between that country and Cuba, is $\mathbf{1 2 0}$ miliea acrosa.

Zaffer, or Zafre. After the andphmr, armenle, and other volutlle purts of cobalt have been expelled by calcinatio.., the reshluum to suld, mixed or unmixed with fine sund, under the alove name. When the residunm ia melted with sillcloun earth and potash, it forms a kind of blue glans, known thy the name of amalta (see Sscalitz), of great importance In the arts. When smalta is ground very tine, it receives in commerce the name of poucder blue, Zaffer, like stnaltz, In employed in the manufacture of earthen-ware and China, fur palnting the surface of the pleces a blue colnr. It auffere no change from the most violent fire. It la alno employed to tinge the cryatal glasses, made In imitation of opaque and trensparent proclous atonea, of a blue color. It la almost wholly brought from Germany:-See article Dyra.
Zante, one of the Iunian lslands, Meditorranean, eight milles nouth of Cephalonil. Lat. of north point, $37^{\circ} 5 i^{\circ} 5^{\prime \prime}$ N., long. $20^{\circ} 41^{\prime} 5^{\prime \prime}$ E. Length 234 iniles, breadth 0 to 11 miles. I'opulution in 1844, 38,929 . Surface mountainous in the west, flat and well cultivated in the east. Climate mild, and the lelund atill deserves to be called the Hower of the Levant, but is subject to destructlve earthquakes. It hae numerous olive gardens and vineyards, and produces pomegranates, melons, peaches, and citross; but its princlpal export is currants. A small quantity of wine is made, half of which is exported. Olive-oil is Inferior in quality. Illtumen is procured from pits in the south, and ealt ls manufactured chlefly for homo use. Zante, the capital and only town on tho cast cosst, is the largeat In the republic. Population, 20,000 . It is well built, and Its square has a monument to Sir T . Maitland; ito port ls protected by a wall, and has a light-house. - It is the see of a Greek protopapas and a Koman Cathollo bishop. It was nearly destrojed ly an earthquake on 30th October, 1841. Of the recent changes in the commercial policy of the lonian Islands, the following letter from the United States. Conaul at Zante, under date of October 4, 1855, givea the details:
"Cerrants. - The blight whleh has rulaed the crope of three anceessive yearm has alno damaged that of this year to anch ats "xtent that Zanto hea protuced ealy 000,000 peunds, and Ceplusloala $6,000,000$ pounds of frult, which has been already sold and shlpped for fingland at the enormons price of $\$ 100$, $\$ 120$, and $\$ 122$ per thousand poinds. It ly boped that next year, lyy applylug pulverized aulplur on tho frult before it gets attacked by the blight, the plants wlll yleld ac abundent crop. The oxperiment made this year has proved aatsfactory. Cargoea of sulphur dally arrive from slelly and lom. bardy for thin purpoae.
it Wine. -The grape vine is affented to tho anme extent as the currant. The proiluction of this year is not sufficlent for local conaumptlou.
"Ollve-oil.-The crop of the year 155 It Ia calculated thus: Zante, 60,000 barrela; Ceplaslonla, It Ia calculated thut : Zante, 60,000 barrela; Ceplaslonla,
tho0 barrela; Sta. Maura, 80,000 harrela; l'axo agd Ithaca, 0000 barrela; Sta. Maura, 80,000 barrels ; 1axo agd Ithaca,
30,000 barrela ; Corfu, 150,000 barrels : total, 276,000 lonian barrels for expertation. It is hoped thet this chormous proditellon will give vigor to Irade aad navigation, which has bees for so nuany years in perfect ntagnatluts. lleeldea the vacual affalra for Austria, England, abd France, a large quana tlly of thln fuld will probahly be exported to the porta of Kussla at the Black Sea by loniau veracls."

Tho principle upon which dutles are levicd upon goods imported in the Ionlan Islands, is the flag undor which these aro transported. If by vessols of nations under treaty with these atates, duty is from 10 to 14 per cent. loss, according to articles, than on those forwarded by vessels of nations which are not under treaty. In this last condition the American flag stands, and this is the princljal impedinent to a more regular intercourse of business between the Ionian Iaiands and the United States. To stop this, thers is but ons way, numely; to put tho American flag on an equal fortlag with tho Ionian. To insure this, Ionlan vessels must enjoy the same privileges in the United States that American vessels enjoy ln the Ionian Isl-
andu. The negotiation mut take place In London, thruugh the Ainerican embasador and the linglleh goverument; bacause, eccording to the Ionian constltution, all dipiomatic queations and agreements between these and forelgn atates must be attended to hy the government of the protecting sovereign. This done, every other difliculty in Introdacing and encouraging American trude In thia market can be easily obviated. T'he articles enumerated in the following tuble alway find a ready market here. The islands provide also the eastern coasta of the kingdom of Greece and Albania with these articles by transit. All these artleles, curn, etc., excepted, are imported here from second-hand markets. As regards freight, one example will suffice to prove whether it is worthy the atton in of American navigation or nut. A vessel of 200 toun chartered for the Biack Sea, going in Lallast, gets abont $\$ 3300,5$ per cent. primage, and a gratuity of about $\$ 40$ and even 100 , acconling to circumatances. Money can be returned to the Unlted States fir goods sold here by bllls drawn through London at three months date. In order to obtain money on goods shlpped for the United States, a credit must be opened In London to valae with bills of lading. Legal Interest on money, 16 per cent. per annnm.

Ulive-ail.-All the islands produce this flaid, and export for IRuesla, England, and Tricste. Its price varies accordlag to demand. The averge price ts from 88 to $\$ 10$ per barrel. Thi' is an extensive artlcie of commerce, and one of the principal productions of the islands. It not only affords wealth to the natives of overy clase, and encouragee commerce, but provides also the imniense soap factorles of the place with the princlpal material out of which soap is made for consumption and exportation.

Currants.-All remedies, other than sulphur, adopted by proprletors to stop the blight have proved abortive. Sulphur only gave a happy result. Althongh this is a remedy upon which proprietors can now rely, atill they have a great many difficulties to overcome before they nee their hopes realized. The first of these is the fixing the epoch or time when the plants and fruit thereof are to be sulphured. This varies according to the quality of the soil, the temperature of the atmosphere, and the difference of climate of the varions localitien that produce currants. Besides these primitive difficultlee, we percelve another, which we oonaider by far greater. The most part of the proprletors are so badly off, on account of the failure of the crop for four consecutive years, that it is absolutely ont of their power to provide sulphur and encountor the expenses required for such an operation. Still, in spite of all these difficulties, it is generally hoped that the crop of thia year will be comparatively abundant.

Zanzibar, or Zanguebar, an island off the east coast of Africa, lat. of town $0^{\circ} 27^{\prime} 7^{\prime \prime} \mathrm{S}$., long. $39^{\circ} 83^{\prime}$ E. Length of island about 40 miles, breadth 15 miles. Population upward of 200,000, consisting of Arabe, Sowily Africans, and Negro slaves. Population of the town of Zunzibar about 80,000 . The island is the metropolis of the Imanm of Muscat'a possessions on the east coast of Africa. The town called Slaanganny is situated on a low point of sand, has a wooden fort, and is irregularly built. The situation is very unhealthy for Europeane. A considerable trade is carried on with Aralia, and the ports in the Red Sce. Between the west sloce of the island and main land are dangerous shoals, and several islets, the largest of which is Tumbal. Ship-buildiog, stone masonry, carpenters, goldsmiths, silversmiths, coppersmiths, and blackamiths' work is carried on, besidee manufactures of inferior cotton goods and trinkets. The exports are cloves, ivory, sharks' fius, sandal-wood, amber, shells, and cocoa-nuts.

The prineipal produce of the island is eloves-the annual produce being from $2,000,000$ to $3,000,000 \mathrm{lhs}$. . of which the sultan himself produces about $1,000,000$ los. The value of American trade with Zanzibar may be eatimnted at about $\$ 1,000,000$ annuolly ; it is carricd on chiefly from Salom, Massachusetts. Ontward cargoes consist olroost exelusively of New England mannfacturcd cotton goods, the consumption of which reuches an annual average of about 6000 bales. The return cargoes are composed of ivory, gum-copal, cloves, hides, and some minor articles. Voyages from the United States nsmully occupy a year--vessels niways culling at the Peraian Gulf and porto of the Red Sen. In 1851 there were ten or twelvo American vessels, of about 250 tons each, regularly engaged in this trade. The relations existing between American houses (several of which have been for years entallished at Zanzibar) and the sultan and his officinls are of the most friendly and liberal eharacter. The atipulations of the treaty with the United States are faithfully observed, and every desirable commercial faclity freely extended to American commerce.

Zea, Indian Corn, or Maize. Sce Maize.
Zedoary (Ger. Zütterer; Fr. Zólonire; It. Zedo aria; Sp. Cedoaria; Arab. Judvar; Hind. Nirbisi), the root of a plant which grows in Malabnr, Ceylon, Cochin China, ete., of which there are three distinct species. It is brought home in pieces of varions sizes, externally wrinkled, and of an ash color, but internally of a brownish red. Those roots which are henvy and freo from worms are to be chosen, rejeeting those which are decayed and broken. The odor of zedoary is fragrant, and somewhat like that of camphor; the taste liting, aromatic, and bitterish, with some degree of acrimony. It was formerly employed in medicine, but is searcely ever used by modern practitioners.Milnun's Orient. Com.

Zinc, or Spelter (Ger. Zink; Fr. Zinc; It. Zinco; Sp. Zinco, Cinck; Ruse. Schpiauter; Lat. Zincum), a metal of a brilliant whito color, with a shade of blue, composed of a number of thin plates adhering together. When this metal is rubbed for nome time lietween the fingers, they aequire a peculiar tante, and enit a very pereeptible smell. It is rather noft; tinging the fingere, when rubbed upon them, with a black cotor. The specific gravity of melted aluc varies from $6 \cdot 861$ to $7 \cdot 1$, the lightest being esteemed the pureat. When banmered, it becomes as high as $7 \cdot 1908$. This metal forms, as it were, the limit between the liritile and the malleable metuls, Its malleability is by no means to be compared with that of eopper, lead, or tin; yet it la not brittle, like antimony or arsenic. When struck with a hammer, it does not break, hut yields, and hecomes somewhat flatter; and, by n enutious and equal prese sure, it miny be reduced to thin plates, whlchare supple and eiastle, but can not be folded without breaking. When heated to about $400^{\circ}$, it becomes so hritilo that it muy be reduced to powder in a mortnr. It posseases a certain degree of ductility, and may, with care, be drawn out into wire. Its tenacity is aneh, that a wire whose dlameter is equal to fith of an inch is eapalile of enpporting a waight of about 96 lha . Zine has never been found in a sitate of purity. The word sinc ocents for the first time to the writings of l'aracelsus, who died in 1541; but the method of extructing it from its ores was not known tlll the early part of last century. -Thomson': Chemizery. The compounds of zine and cepper are of great importance. - Nae Ilı,

The diseovery of this metal, mo far an the fact is known, in due to the molerna. It is anid to have heent long known in Chinn, however, and is noticed ly Enropean writers as early an A.1D. 1231 ; though the methof of extracting it from the ore wan unk nown for nearly b 00 y yars after. A mine of alnc was disocoved in Forkshire, Figland, in 1 H09. Zineography was Introduced in london mhortly after the Invention of lithography became known in tingland, in ind7.-liaytin.

Importa de zino into tite I'nithi Statsh fon tif Year ending Jong 30, 1557.

Zinc Paint.-The zine palnt, now brought before public notice, illustrates at once the ingenuity shown in devising means for remedying an evil, and the difficnlty of applying the remedy in opposition to popular enstom. White-lead is deleterious to health, and nothing has sncceeded in rendering it otherwise. Hence attempts ara being inado to find a substitute; and zinc seems at present the best fitted for this office. The manufacture of the white oxyd of zinc is a beautiful example of chemical netion. Metalle zlne is heated in a furnace to which a eurrent of nir is admitted; the zine vaporizes; the vapor passes into a serles of chambers; and here it collects on the walls as a light downy flocendent oxyd, which is sersped off and removed. When ground up with linsecd oil, the oxyd forms a white paint, which muy be the ground or substance for other colers used in house-palnting. Then conses the rivalry het ween the two " whites"-the oxyd of zine and the earbonato of lend. The chemical virtues of the furmer are insisted upon; but the advocntes for the latter have not falled to point ont the qualities in which it is unquestlonably the hetter of the two-espeeially in drying more quickly than the zine white, and having mere "hody" or substance. Oue among many proposed modes of applying the zine white is in tioor-cluth puinting. In this manufacture oll paint is laid on chickly, first with a brush and afterward through the medimin of carved blocks. The quantity of puint con sumed is so large, that the white-lend eontnined in it becomes a sad enemy to the men employed In the processes; and hence a recent attempt has been made to adopt zluc white as a substitute.

Zoll-Verein. The Germanic confederation of states for purporea of commerce came into practical operation liy the treaty ef March 22, 1833. I'rior to that period, the atates of which the union is eomposed did not allow of the introductlon of merehandise neross their respective frontiers without tho payment of duties; numerous prohlhitions exlsted, and the coumercial relations between sovereignties, whowe territorics were contignous, were fettered with opiressive and vexitious restrictions. To introduce n lietter system of commercinl poliey, and to remove all unoecesary burdena. which only tend to clog eommercial enterpise and rhoke $u_{j}$, the natural channels of trade between neighloring powers, theso indepeudent sovereignties have lecomo, for commerchal ןur $_{\text {bores, }}$ a consolhated govermment ; one lino of eustoms on the geographical homblary has been established; one tariff of dnties on imports, exports, and transit, is enforced for all ; and the revenue thas derived is distributed muong the members of the confederation, in propertion to the pupulation of euch.-For exception to this mode of distributing the revemo, are Fuanikint-on-the-Mane.

The origin of this castoms man may ha traced to enuses, political ns well as commercial, having their existence long noterior to the treaty of 1833 . Immedlately nfter lts organization, with I'russia at its head, had been proclalmed, alarms wero spread thronghout Fingland, hased upon the mistaken idea that the cunfederation was planned under the lnfuence of liussin, an a purt of her gramil political nchome againat liritish prosperity and minence; a fallacy wheh tor a time
derived no inconsiderable plasibility from the adoption, by most of the states of the confederation, of the long-oxisting restrietive tariff of Prussia. British merchants became alarmed; and oven the government itself shared, to some extent, in the popalar delusion, which Imaged forth the ruin of British trade, as the intovitable consequence of the united adoption, by nearly all the states ot northern and southwestern Germany, of the commercial policy of the power which it was supposed the secret diplomacy of Ruseia had placed at the head of the anti-British league.

This delusion, however, was but of short duration ; Indeed, the goneral panic which it excited throughout England was quieted by the more experienced minds of that nation itself, who, viewing the formation of tho Zoll-Verein in a more philosophic light, refuted the erroncous notions which had so generally obtained respecting it, and demonstrated its purely Germanic origin, by their panegyrics on thoso whose forecast and wisdom had conceived the project, and whose indomitable perseverance had necomplished its fulfillment. Among those whose able witings contributed most to enlighten England, as well as other nations, on the history and objects of the Zoll-Verein, Maegregor, the British statistician, occupies the first rank. Prussia, from her grographical position, was at that time more exposed to uttaek than any other country in Europe. Iler Rhenish provinces weakened rather than strengthened her power. Easily accessiblo from Austria, Hussia, and the Baltic, and, in the event of wur, open to immediate attaek on the sido of France and Belgium, the I'russian cabinet was convinced that in the military strength of the territorios possessed by Prussia before the treaty of Vienna consisted her only defensive strength. When the first Franch rovolution broko out, Anstria and several German states had to meet the troops of France long befors they approached the Prussian frontiers; now the latter lay immediately exposed to an army marching in from France and Belgium. Henco the safoty of Prassin dopended, in tho event of war, upon uniting all Germany by one common $b_{1}$.id of mutual interest and eccurity: Besides, the sagacity of the l'russian cabinet was doubly quickened by the lirench revolution of 1830 , which had spread apprehension throughoat the whole of Germany, partieularly when the republican infeetion had spreml atmong the students of the German universities, who, under the name of "Young Germany," had excited no little alarm on the part of the eeveral German governments. The IRelgian revolution succeeded; and then Austria shared in the apprehensions and uneasiness which hat so iong been felt by Prussia. The Polish revolation quickly followed; and now Prussia was * suly to make any sacrithes in order to unito Germany under an apparently commercial, but in reality a politieal and national hous.
'The necessity of such a union was at oneo promulgated with ex.ratorlinary industry. ith press and tho ablest political ceonomists were enlisted in the general eause. Volumes were seattored umong the peoplo. Ths illiberal commercial systems of England and lirance; the prohibitory duties which Russiu hal just imposed on lohand, virtually closing the best market which Saxony had hitherto found for her fabriesthese consileration, waro stronuously urged to prove that a general unlon of tiscal interests was necesnary for the present und future prosperity ond proteccion of the country, nul for maintaining Germany among the grent powers of Europe. Their governments and people beling thins prepared for union, the kingelome of Prussia, Bavarla, Wortemberg, and Saxony, with Hesse Cassel, sigued the treaty of March 22, 1833, orfranizing the German Customs Association, or ZollVoreln. The Thuringian and other states, Iladen, Nassitu, and the fres city of Frankfort-on-the-Maine, joined nt subsequent periods; and on the 1st of January, 1854 (by treaty of September 7, 1851, letween

Prussia and Hanover), Brunswick, IHanover, and Oldenburg. A new convention has been concluded, not varying, however, materlally from the one it superseded, but providing that in January, 1858, commissloners from all the federal statce shall meet at the place of sitting of the Diet, on being summened by it, in order to loring inte operation more extended relaxations than those now proposed; and then, if tho now existing Impediments (arising from the difference of cireumstances and interests) to a perfect commercial and customs union of the whole of Germany are removed, to effect that union by way of treaty. In the mean time. by a scparats article, every federal state is required to take cure, in coneluding or prolonging any treaties of commerce and traffic, that the same shall not hinder nor embarrass a complete commercial union of Germany, or a further approacla thereto, at least not beyond the year 1858.

In the annual and triennial congress of delegates from the several states of tho union, which the convention provides shall meet for settling the accounts, agreeing to alterations in the tariff, ete., I'russia has only ons vote, like each of the other states. This, however, is not the only concession which she has made to the other sovereigns of the league. $A$ reference to the geographicat positions of the several states of the Zoll-Verelr wili show that many have no customs frontler to guard against smuggling, or along which to maintain eustom-houses; while all receive an equal share of tho revenute collected on goods entering along the goneral line of the boundary. The consequence is, that Prussia sacrifices about two millions of dollars ammally to tho revenues of the other stntes, exclnsive of the fiseal loss sustained by the consumption of smuggled goods introduced along the Rhine, and along Lake Constance, into Haden, Würtemberg, und Bevaria. But Prussia was prepared for those, or oven greater fisenl sacrifices, to realize the primary object of her policy-that of exteuding her jower, as she may be said to have done, from the frontiere of France and Belgium to those of Austria and Russia-from the Alps to the Baltic; while the different states of Germany composing the union, by the removal of those barricades of national defense and in rational intercourse, and of the numerous lines of customs and customs offieers whieh proviously belted overy large and petty state in Germany-by free trado among themselves, and the free opportunity of interchanging idoas and of receiving intelligenco, may be said to have become consolidated and strengthened into one great uation.

Among the regulations of the Zoll-Verein, it is provided "that the advantage enjoyed by the inhabitants of the states of the union may be extented in reciprocity, accordiog to circumstances, to foreign comntries; while, on the contrary, disadvantageous restrictions imposed on the commeree of the union hy foreign states should' be retaliated by judicions measures, to he alopted for that purpose;" also, that the taritf of the noion may be rectilied every three years, and published for the next three yenrs, eight weeks before the commereement of the first year-alteration in the rates of certain dutics or items in the tarifi' to be made, if necessary, once a year, and to be published eight weeks before the Ist January, on which lay such olteration to be in force. Artlele 23 of the convention provides "that a meeting of plenipotentiaries of the respective states shall he convened in June each year, to settie accolnts, and agree to uny change or modification of duties." By this article alt the provislons for a change in the tarlft have been retained. It therefore remains for other comstries to reciprocate with the Zoli-Verein for an interchange of their respective prodnctions and fuliries.

Natural Resonrces of the principal Stutes composing the Zoll- J'erein.-Thestates composing the Zoll-Vereln possess the mosi abundant natural resourees. The forests of Germany aroextensive and valuable, and her mineral
riches are in many parts equal, and in some superior, to those of France. The soil, though in some parts of the north light and rocky, is generally fertile, and produces all kinds of corn and culinary vegetables, besides hemp, Hax, tobacco, maize, etc.; while in tho Rhenish countries, and in some parts south of Cologne, vinoyarde are extensively oultivated, which produce those agreeabio and cool wines generaliy called Hock and Moselie, tha consumption of which is rapidly increasing In the United States,, The phyaical aspect of the atatees, of the confederacy presents almoot overy feature of natural or cultivated appearance. "The lowlands, light soils, and alluvions of the north; the hilly country of Nassau ; the undulations of Westphalia, of the Moselle, and weat of the Rhine; the highleads of the Black Forest, and the Odenwald, Thurlingia, and Suabis, of Darmstsdt, Wurtemberg, ond Baden, to tho south; the mountains of the Harz end Taunue; the Erz-gebirge of Saxony ; tho valleys, plaing, and heights of Silesia ; the plains and Alps of Bavaria; tho lhine, Danube, Elbe, and numerous other rivers; rocks, cornfields, vincyards, and pastures, are the principal aspect of the confederation."
In facilities for commercial intercommunication, nature hus been equally bountiful to Germany. About sixty navigable rivers, or branches of rivera, intersect this country. They aro gencrally connected by means of canala and railroads, some of which are still in progress of construction.

The Bhine, from its oxcelient navigation to the ocoan, may be conaidered one vast port, the principal entrepôts of which are Cologne, Coblentz, Mayence, and Frankfort-ou-the-Maine. The Danubo carries down - the produce of Germany to Austria, Ilungary, and the Biack Sea. The Elbe, navigable from Bohemia to Ilemburg, and, to the sea, wators Bohomia, Saxony, and Prussia, ond is connected with the Danube by railroad, at a point where that river is navigabie to Lintz, the capital of Upper Austria, from which stoamboats piy to Vienna aod the Black Sea. The Demei, and lta numerous branches, bring down the cimber and other produce of Poiand and Lithuania to the ports of the Baitic; and the Oder and Vistula flow through Prossia, and are pavigalie to the Baltic.

On the 1st of January, 1854, the German Customa Union, or the Zoll-Varein, entered upon tho third poriod of its existeuce. The first continued eight yearsfrom the commencement of 1834 to the end of 1841 ; the second, twelve years-from the comnencement of 1842 to the end of 1853; and the third, upou which it antered
at the beginning of 1851, is to continue also for twelve years. Two facts of importance mark the commencement of the third period: one, the accession of the Steu-er-Verein; the ochar, the conciualon of a commercial treaty between Austria and Prussia, which may be regarded as the lasis of a future Austro-Germanic Customs League. The following recapltulation of facts connected with these two lmportant events are compiled from official documents, and aro deemed necessary to a clear comprehension of the present as well as of the prospective atatus of tho Zoll-Vercin. On the 7th of September, 1851, the two kingdoms of Pruseis and of Hanover aeparately concluded a treaty of a customa union, which, ten years befora, had been a enbject of fruitican degotiation, reeerving the queation of a union between their respectire Castoma Associations (the Zoll-Vereln and the Steuer-Verein). As the atipulatione of this treaty: would require a reconstruction of the Zoll-Verein, and, consequently, a rennnciation of the treaty of 1841 between the old members of that leaguo, the Prussian calinet, in the following Noveniber, gave notice of this renuncistion, not for the purpose of rotiring from a league so benoficial in ail ita results, but with a viev of reorganising it on a new basle. The Iruasian government further gave notice that it would aoon communicate propositions to that end, and that a conference, or congreas, to take the aubject into consideration, would assembie at Berlin.
The following statement will prove loteresting, as exhibiting the revenue and popuiation of the Zoll-Verein from its comnencement down to the year 1851 :

-Com. Rel. U. S. For the port reguiations of Prussia, see Pinussia; and for more extended information regarding the atates coniposing the Zoll-Verein tho reador is referred to the articles on the atates separateiy.
