Kano, the capital of a province of the same name, and the principnl commerclal elty of lloussa, is situnted in N. lut. $12^{\circ} 0^{\prime} 19^{\prime \prime}$, and E. long. $8^{\circ} 30^{\prime}$. It may contalu teetween 30,000 and 10,000 inhathitants, of whom a great proportion are whaes. Thin number ls exchasivet of strangers, who crowd thither during the dry monthe from all parts of Afrien. Tho city is of an Irregular oval shape, ahout 15 miles in eircumferenee, and surrounded by a elay wall 30 feet in helght, having a dry ditelt on hoth shles of it . There are 14 gates made of wood, and covered with ahect lron, and theso are regularly opeued nud slut at sunrise and sunset A platforn Inside, with two guard-houses below It , serves to defend each entrance. The houses

within the walle to not occupy more than one fourth of tho ground inclosed, the remaining space belng laid out in tlelds and gardens. The city la alnowst divided into two parts by a large morass, which stretches from east to west. This swamp is crossed by a small neek of land, which is overflowed during the rainy season, but in the dry geason the market is held upen it.

The great market is leld upon the neck of land which intersects the morass. Ilero atreets consisting of aheds or stalls of bambeo are regularly arranged, different places being allotled to those who traffic in different commodities. The latter consist of cattle, vegetables, fruits, the fine cotton fabrics of the sountry, gora or kolla nuts, which are called African coffee, and crude antimony, with which every eyebrow in IIonssa is dyed. The Arabs also dispose of sunilry commodities, such as various dresses. Tho slaves, who constitute the staple article of trade, have a spesclal market appropriated to them, consisting of two long ranges of sheds, one for males and the other for females. Here these poor creatures, drawn up in regniar array, and dressed in attractive attire, are linspeeted and serutluized by purchasers, in much the name manner es horses are in the cattle-markets of this country. The market of Kano is under the superintendence of a sheik, who regulates the pollce, and is said ulso to possess the exorbitant power of fixing the prices. The merlium of exchange consists of the small shells called cowries, 480 of which make a shilling, so that paying a large sum is here rather a tedlous precess. Kano is celebrated all over Central Africa for the dyeing of cluth, for which process there are numerous establishments. Some ingeluity is displayed in the manufurture of leathern jars, which are faghioned upon a clay mold out of the raw hille. The luhabitants are also acpuainted with the art of tanning. The negroes here are very polite and ceremonlous, espectally to those mbanced in yeare. A part of the city is aypropriaterl to the use of these who are afflicted with blinduess, which is a prevalent disease.

By the most correct accounts, it would appear that the Fallatas sre an off-shoot from the l'orlalis of western Africa, and may be lilentitlen with them. They are a mixture of Dloors, Arabs, Berbers, and protalily other races of men, and are gralually extending thelr authority over central Africa. They are much superlor to the native negrues, nith whom they very rarely mix their blood. Captain Lyon, npraking of the ledlatas, observes, "thelr complexluns being of a much llghter hue than that of the other tribes, they call themselves white; their color resembles that of our gy posies in Eugland. Many female slaves are trought to Mourzouk from their nation, and are very handsome woaten." Other obsorvers describe their complexion ar being very dark, uni of a made intermedlate Letween that of the decpest Aifican and the Moors. The fact neems to le, that their color varies in a very remarkable manner, from being nearly white to nenrly black. Uuth men and women pay consideratile uttenthon to their drens, which mong the wealthy linhastants is rather whowy. In their domenti: liblist they are regular, urderly, and cleanly, and the maves arn generally well treatel. 'ilhe Mohamoredan is the predominant religion, and conshbrable attention beprill to iceeping upan uppearance of it. l'rayers are rogularly suid tive !lmes n day in the Aratio language, which both the male nod female whiliren of the teetter sort of Fellatan are taught to real antl write. Thelr marriages are celebrated without any jomp or nobse, and anch contracts are of a lews artitrary nature than weflind them to lie abomg the lnferior racen of mankind. Captain Clapperton makes the following retharks regarding llousan:-" The goverument of the Fellatas in soudun is in its infancy. Tha governure of tha different provincen are appohtiol luring* deasure; and all their ןryerty, on their doath or to.
moval, falls to the sultan. The appolatment to a vacancy is sold to the highest bldder, who is generally a near relation, provided that his property la sufficient to enable him to bld up to the mark, All the inferlor officee in the towns are sold in like manner by the govornors, who also succeed to the property of those petty oflicers at their death or removal. A great deal of marketable property is claimed by the governer, such us two thlrds of the produce of all the date-trees and other fruit-trees, the proprietor being allowed only the remalning third. A small duty is also levied on every article sold in the market ; or, In liau thereof, a certain rent is paid for the stall or shed. A duty ls also tlxed on every tobe that is dyed blue, and sold. (1n grain there is no duty. Kano produces the greatest revenue that the sultan recelves; it is paid menthly, in horses, eloth, and cowries. Adamown pays yearly in slaves; Yacols in slaves and lead ore; Zegzeg in Naves and cowries; Zamfra the same; IIadeja and Katugum in herses, bullocks, and slaves; Casha in slaves, cowrica, and cloth; Ader, or Tadela, in thallocks, shecp, camels, and a coarse lind of cotton cloth, like what is callel by us a counterpane." Of the number of negroes and Fellatas who inhalit the camntry of Honssa no correct idea can be formed Much additional and more precise Information on these countries may be expected from the pen of Dr. Barth, that energetic traveler, who has so thoroughly explored these regions.

The exporta are principally civet and blue chock tobes ealled sharie, which are manufactured by the slaves from Ny fit, of whom the men are considered as the most expert weavera in Soudan, and the women as the best spinners. The common limports are brought from the borders of Ashantl ; and coarse calico and woolen cloth, in small quantities, with trass and pewter dishes, and some fow spices, from Nyff. The Arabs, from Tripoll and Ghadamis, bring unwrought silk, ottar of roses, splices, and beads. Slaves are both exported and imported. A great quantity of Guine: corn is taken every year by the Tuarieks, in exchange for sult. The market is extremoly well supplied, and is hehl daily from sunrise to sunset. On the north ride of Sonoto there is a low marsh, with some stagnant pools of water, between the city and the river; this, ferhaps, may be the cause of the great prevslence of ague, as the city atands in a fine airy situation."

Sokoto is described by Dr. Barth as forming nearly a regular nquare, and having 8 gates, hit 12 , as formerly supposed. Sokofo bas a mixed population, the Zoromana forming the chicf portlon of the inhahitants, They are, unlike the tribes of pure lullo or Fellion urigin, very intustrious, and are excellent workmen in leather, iron, and gehhegu or cotton-stripes. Tho nrticles of Iron made at Sokoto are the best in all Sousdan; und Ir. Hirth purchased some npectmens if beautiful workmanship. The Zaremana are the principal luhabitants of the town, while the Sylletman, is very interesting tribe, ditferent from, but unitem with the Follatas from time immemorial, inhalit the villages round the tuwn.-F.. II.

Fouston, a city of T'rxas, I'nited States of North Amerlab, capital of IDarris county, aml the secoml commervinl city in the state. Eudson, Henry, a distingutshed and ill-fated navigator of the 17 th century. Ilis early history is quite unknown, and he dld not emerge from obscurity till the year 1607, when he was sent ont by a company of rich London merchants $\ln$ quest of a shorter passage to Chinn, than that loy the Cape of Good Hope. In that year lis penetrated as far as the 82d 13gree, beyend which bls passage was barred by the lce. In the following year, he nltered his course, mastward, and, consting along Spitzbergen, react ed the Stralta of Waygatz. Unable to force his way any further, in that direction, he again returned home without effecting his purpose. In 1609 a company of Gut h merchants supplied him with the means of again attempting a north-east passage. Again the ice stopped his
 sailed away to America, where he 1 N :cred the great river which now bears his na: ${ }^{\prime \prime}$, and at the mooth of whleh New York is situated. Scarcity of provisions drove him once mere to Iingland, which he reached on the 7 thl November. In the following yoar (1610), he salled from London on the forlorn quest of the north-west pasange. In the end of May his sailors mutiaied, and the revolt was only quelled with great difficulty. In June he entered the atrait and bay now called by his name, and was in high hopes that he hasl at last solved the mystery that had lonffied so many inquirers. Stricter investigation, however, showed him that he had been caught in a cul-de-sac, and as summer was now drawing to a close, he found himself compelled to winter on those inlospitable shores with a mutinous crew, and a very scanty stoek of provisious. Commander and sailors were alike out of temper at the bad success of the whole expedltion, and heart-buruinge and dissensions embittered the winter thonac. On the way home in the bummer of 1611 , the crew again mutinied, and taking posseasion of the ship, they turned arlrift IUdson and such of the crew as remained faithful to him in ans open boat, and with a scanty supply of provlsions. What was the fate of the boat and her crew is unknown; nothing was ever heard of them. The details of IIudson's progress are given at length in P'unchas's Pilyrim, and in Ilamuses logages. See Sparks's Am. Biog., vol. x.

Hudson's Bay, a large sea of North America, lying between 51 und 60 degrees of north lat., discovered la 1610 by Menry IIudson. See IItubon, Ilenny, and Polan Regions. A charter for a eompany, incerporated under the name of the Mudson's Bay Company, was obtained in the year 1670 . See Fur Thade.

Hudson's Bay Territory. The first internal explorers of the vast region surrombling Iluison's Bay were traders from Canada while it was yet lu the possession of l'rance. Cunadian traders had, previous to the conquest, ascended the St. Lawrence und Ottawa Rivers to their sources, and had formed estallishments on the great lakes. From the north-western end of lake Superior, they threaled the intricate communication which leads by lakes, streams, und pertages to Lake Whnipeg, and thence penetrated some distance up the Saskntchewan River, where their most distant establishment was situated, in north lat. $53^{\circ}$, west long. $103^{\circ}$. These enterprises were, in a great measure, suspended iow the strugigles which ended in the conquest of Canadn liy Grent Iritaln. In 1767 a party hemed by a llritikh suliject, bigaln penetrated tos the Saskatchownn. The Misshipl, or Churchill River, was visited by Mr. Joseph lirohisher in 1735, and Lake 1slean-In-Crosse, in 1776. In the year 1781, the fur tride had reached the Imits of Lake Athubnea, nearly 1000 miles beyond the most distant point attained by the French. These explorations wers greatly extended by tho establishnent, $\mathrm{In}_{1} 17 \mathrm{Bil}$, of the North-West Company of Montreal-an assochation formed of the learl-
lag individuals engaged in this traffic-who, in the energetic pursuit of the fur trade, exteaded their establishments to the Arctic Circle and the Pacific Ocean. The chsitar of the IIndson's Bay Compaiay, conferring the exclusive right of trade with the Indiana, having been granted without the sanction of Purliament, has generally been held lnvalld; and it was prebably the dread, owing to this defect, of attracting public observation to their proceedings that induced the Company for many years to confine their trading stations olmost entirely to the coast. In 1769, a century after the date of their charter, their fartheat advance was about 400 miles inland. In that year, however, being $\approx=$ sirous of oltaining information regarding some mines of copper described by the natives as existing near a river flowing into the aea to the northward, called the Coppermine River, they directed Mr. Haarne, a gentleman in their service, to proceed overland for that river which he had orders to survey, if pessible, down to its embouchure-an enterprise in which, after two unsuccessful attempts, he succeeded, reaching the sea at the month of the Coppermine River on the 13th July, 1771 , having been thus the first to establish the existence of a great Northern Ocean, washing the shores of North America. Mr. IIearne'a Jeurnals and charts were, however, withheld from the public for nearly 20 years after the date of his journey. On the capture of Fort Churchill by the French these documents fell into the hands of La Perouse, who commanded the French squadron, and were restored to the Company only on condition of their being publiahed. It was doubtless owing to this circumstance that Ilearne's claims to this important discovery were for many years discredited; although the existence of a Northern Ocean was confirmed by Sir Alexaader M'Kenzie, who, in 1789, descended the river issuing from Great Slave Lake, which bears his name, it was not until the overland expeditions of Franklin and Richardson in 1820 and 1825, that Hearne's merits as a discoverer were fully recognized. To the expeditions last named we owe the first accurate geographical delineation of this extensive region, from the shores of IIudson's Bay as far as M'Kenzie's River. Of the country west of this stream, and extending as fiar as Russlan America, a careful survey has been more recently executed by Professor A. K. Isbister of Londen, and published in the journal of the Royral Geographical Society, for 1846. To this gentleman we ewe also an elaborate geological map of the entire region, published in 1856 by the Geological Society of London.

The new association, which retained the name of the Ilulson's Bay Compnay, obtained ia 1821 a license of exclaslve trate fer 21 yenrs, renewed in 1842 for a similar period, over the territeriea wost of the Rocky Mountuins-the country on the enst sldo being consitered suthciently protected from rival traders, by the establishments of the two Companies already formed there, and such vague rights as might be claimed under the charter of $16 i 0$. Grave doubta existing as to the validity of this charter, and numerous complaints having arisen from the arbitrary exercise of the powers chamed inder it by the Company, un address to the erown has heen recintly moved by the llouse of Commons, for an inuuiry (which bs now pendlage) into the legality of the very wide and anomalous powers at pressint oxurelsed by the Company.

The territory emi raced withla the present operations of the lludson's Bay Company may the roughly estimuted at noarly $4,000,000$ of 8 quas miles, or somewhat groater than the entire extent of Europe. Thls vast uren, which is covered by a net-work of ahout 100 traling-posts, senttored at distances of nbout 300 or 400 milea apart, is dlvidod into four large departments -1 st. The Montreal department, rhich includes all the establishments situated hetween the Rivor St. lawrence and the great lakes of Canada, phd along
the north shore of the Gulf of St. Lawrence and the coast of Labrador 1 2d. The Southorn dopartment, which includes the country along the north shores of Lake Superior and the soathern shores of Hudson's Bay; 8d. The Northern departmont, which comprehends all the establishments porth of this as far as the ahores of the Polar Sea ; and 1th. The Columbla dopartmont, Inoluding the, territory watered by the Cofambia and other rivert west of the Rocky Monntains, The departmente are divided inte a number of districte, each under the direction of a superior officer ; and these again are sinbdivided into numerons factories, forts, poots, and outposts.
-In a googriphical view the Hudeon's Bay territoriea may be divided into four great nataral regions-1. The Columbia or Oregon Territory, a county of varied features, oxtending from the Rocky Mountains to the Pacific; 2. The wooded region, occupying the country from Canada northward along the shores of Hudeon's Bay, and extending along the veller of the M•Kenzie and Peace Rivere nearly to the Arctic Ocean ; 8. The prairio region, situated betwoen the forementioned divisions, and occupying the valley of Saskatchewan and Red Rivers, and the upper waters of the Miseonri and Missinsippl; 4. Tho strip of sterilo conntry along the northern shores of Hudson's Bay and the coast of the Poiar Sea, tamiliarly known as the Barren Grounds. Of these divislone the wooded region is the most extensive and the most valuahlo for tho purposea of the fur trade; all the finer ekins $\mathrm{w}^{2}$ ich find their way to tho Jondon market, being obtained from it. It has, in conseqrence, been long occupied and thoroughly worked by the trading-posts and agencies of the Company. The Indiane inhablting it are in genoral a mild, inoffensive race. Iong famillarity with the whites, and the habits of trade, have produced a friendly feeling anoong them toward Europeans; and their denire to supply them witt the commodities of trade rendran them by far the moat valuable and industrious cicas of the population of the IIndson's Bay torritories. The relation of the Company toward them is an extremely simple one: the Indiaps bunt and trap for the furs whleh the Company receive, giving in exchange such articles sa nre auited to the simple wante and tastes of the nativen. Trade is carriel on by means of a standari valuation, based on the market price of a leaver-akin, and hence denominated a made bearer. This la to chviate the neressity of circulating money, which is q. ce unknown in any part of the Indian count ${ }^{-}$. A heaver-sking is considered, in the Indian trade, equivalent to two, hree, or more skins of Inferior vilue. The rates at which the akins can be obtained under the complete misnopoly enjoyed by the Compapy reader the :ar trude probably one of the mont lucrative species of truffic in the worid.

It in difficuit to form an estimats appronching to accaracy of the population of the IIudsen's Bay teriterien. From 40 to 50 different tribes, speaking diatinrt diaiects, have been enumerated; but the discordaict eatimates oven of the oldest and mont experienced reaicients in the Indian country forbid ali idea of arriving at any acenrate estimate of their numbers. They probably do not exceed 150,000 . Their numiers are, by the mert truntworthy accounts, rapialy diminishing. Through the benevoient exertions of the Church Mispionary and other Societien, misaions and schools have betn estallished in various parts of the country east of cie Rocky Mountains. These miwsions, supported entirsly from the funds of benavolent bodien in England and Canaila, afford the only means of edueation hitherto available to the inhabitants of those remote regions.
The climate and soll of the Hudson's Bay territoriea, oxcept in the extreme northern dintricts, differ littie from those of Canada, and are equally adapted for coionization. On the banks of the Red River, flowing into Iake Winnipeg, a smali setticment has been formed, consisting ehiefly of retired servante of the Company;
with thair familliea. The colony now numbers a population of about 10,000 : eouls; but from its icolated position, the liulky nature of auch exports as could be furnished, and the long and dangeroua navigation to Hadson's Bay, there is but littlo probability of its rising to commorcial importance.
The neconalty for creating a new penal colony for England has caused attention to be directed to the advantages which nome portions of Hadeon's Bay poseess for such a purpose; and at the same time it is urged that these sectiona of country would be thereby brought within the circle of civilization, and the resources of the whole region oponed out for man'e enterprine; while it would be the means of subverting that exclusive monopoly of the Hudson's Bay Com-
 interest, and is antagonistic to the spirit of the age in which we live.

At this moment it is unnocessary to pronounce Whother such a colony, located in some northern portion of Indson's Bay, would be prejudicial to the intereste of Canads.
It is urged by the Cenadiane that, under the charter, the Hadson's Bay Company originally only claimed around Hudson's hay;, and did not extend their claims beyond ite limite until about 100 years after the date of their charter, which was made in 1670, between that year and 1690. The Company discovered that the chartor was illegal und unconstitational. and petitioned the imperial Legislature for the confirmation of that charter. An act of Parimment was passed, conforring it for a period of seven years, and no longer. In 1697 the charter had ceased to exist, and has never agrain been renewed. Nevertheleus, under color of that charter, about the year 1800, they set up a clain to the poessession of all that country lying this side of the Rocky Mountaine. L.et our readera choose the opithet which will most truly charucterize the monatmous imponition, which bas the nudacity now to claim possession of a country which the very words of the charter itself exaiuded from the operation of the aupposed grant--and which only professed to give such " lands, territoriea, oto., as were not possensed by the anbject of any Christian prince or Slate. 34 years prior to the date of this charter, Louis XIII. of France granted a charter to a company called the Company of New France, granting them the oxclusive trade over that very country which the IIudson's Bay Company now asaume to ciaim under the illegul and invelid charter of Chariea the Second, and the French possensed, enjoyed, and traded throughout that conntry, which was always recogniaed as within the doninion of France until 1768, when Caneda was ceried to the liritish crown; and it was not until about 40 years after, that the Hudeon's Bay Company had the presumption to set up a claim to that country which had been won by British blood. Canada maintains that the whole country is a portion of Canada, anil as such ahould be thrown open to her peojle. See Blackrood, 1xili., 869 ; Monthly Her., Ixxxvil., 66 ; Dem. Ser., xii., 345; Living Age, xxill., 588.
Eiudson, a river of the State of New York, though less in its length and in the amount of water which it dincharges than many others, is one of the moat important in the United States. The Hudson, proper, rines by two brnnches in the Adirondack moantains. The eastern branch from the north passen tirrugh Schroon lake, and is sometimes callell Schroon liranch; and the western has a circnitous course from the nerth-weet, and is considered as the main branch or iladmon. Alont 40 milea from the source of each, they unite in Warren county. After a course of 15 mifies south, the Hudion rocelioss the Sacandiaga, on the line between Montgomery and Saratoga counties. The Secandaga rines in Ilamilton county, sod first rune south-eart and then nortlı-west and went to its junction below Jessup'a Falis. The IIudson then runs
to the east of south, 15 iniles to Hadiey Falls; it then tuins to the north-east 20 miles to Glen's Falls. Its direction is then nearly south to its entrance into New York Bsy: 40 miles below Glen's Falls it recelves from the weet the Mohawk, it greatest tributary. From the junction of the Muhawk to its mouth, is sbout 170 miles. Tho length of the Hudson, from its entrance into New York Bay, is a little over 800 miles. So straight is this river between Albany und Now York, that the distance is less by water than by land. The tide flows to a little above Albany. It is navigabie for the largest shipe 118 miles, to Hudson, and for sloops and large steamboate, 145 miles above New York to Albeny. Small sloops also proceed to Troy, and throagh the dam and lock to Waterronit; about 8 miles farther. Through a considerable pani of lts courso the banks are elevated, and In some parts high, rocky, and precipitous; particularly in its passage through the Highlands, 53 miles above the city of New York. The scenery on the banks of the Hadson is highiy picturesque. The clty of New York owes uuch of its prosperity, and its pre-eminent advantages, to this noble river, connected as it is by the Erie Canal with the great lakes, and by the Champlain Caasl with the St. Lawrence River. By no other route can an equally favorable water communication be had with the great West. There are many large and flourlahing towns on the Hudson. The principal on the east side are Troy, Hudson, and Poughkeepeie; and on the west alde Albany, Catskill, and Newburg; besides many others on both sides. Its waters were tha theatre of the firat successful attempt to apply steam to the propelling of vessels by Fulton and Livingston, in 1807-1808. As a navigable medium of commerce this river is unrivaled. During the year 1850 there passed from the interior through its channel, or by railroad conveyance along its basin, products of the forest valned at $\$ 10,000,000$; agriculture, $\$ 38,000,000$; menufactures, $\$ 4,000,000$; merchandise $\$ 563,000$; and various other articles, $\quad 2,300,000$; showing a grand total of about $\$ 54,000,000$. The total value of the various kinds of property sent from the seaboard, via the Hudson River, in $\mathbf{1 8 5 0}$, smounted to $\$ 74,000,000$, and in 1851, to $\$ 80,000,000$, while that of the year 1856 is retimated at $\$ 150,000,000$. See I ake Trade.

Ifudson River Naerigation.-Table showing the opening and cloaing of the IIudson Rlver in each of the past 15 years :

Hulk, the name given to an old ship laid up as unfit for further mervice.
Eull, tha body of a ship, exclusive of the masts, rigging, etc.
IIull down, axprecses that the hull of the ship is concealed by the convexity of the sea.

Eiull, or Kingston-upou-EXuli, one of the prinespal commercial towns of England, is situated on the nerth bank of the Humber, at the mouth of the Rlver IIull, 85 miles south-east of York. It is a mnnielpal and parilamentary borough, and though locally in the East Alding of Yorkshire, is a county in itaelf. The ancient name of this town was Wyke, or Wyke-uponHull. For more than a century previous to 1269 it was a place of considerable mercantile impritance,
and possessed from the Abbotiof Meanx, who was lond of the manor, the privilege of holding a weekly market, and a yearly fair. The town of Hull la admirably situated for trade. Vessels of the largest size can come up to the town; while the Hull, Ouse, and Trent, affluents of the Humber, with their tributary atreams and canals, afford facilitios for trade with a large extent of country. It is also connected by rallways with all parts of the kingdom. These advantages have been improved by the activity of the inhabitants, so that Hull ranks as the third port in the kingdom, the value of lte exports being inferior only to these from Liverpool and London. The sita of the old fortifications is occupied by docks, and thua the old town is surrounded with water from the Hull to the Hamber. The old harbor was that part of the River Hull which faced the old town; but, as it was found to be inconvenient for the shipping, an act was passec. In 1774 for forming a dock, now called the old dock, which has its entrance at the upper end of the old harbor. It is 1703 feet in length, 254 in breadth, and 24 in depth. Betwaen 1805 and 1809 another dock was erected, called the Humber dock.... It communicates with the Humber bv a lock, and is 914 feet in leugth, 842 in breadth, and 81 in depth. The accommodation becoming iasufficat for the increasing trade, another dock was constructed between 1828 snd 1829, called the Junction dock, from being formed on the land that intervened between the old and the Humber docks, and thus forming a connection between them. It is 914 feet in length, 342 in breadth, and 81 in depth. The locks are 120 feet long, 86 broad, and 25 deep. The two bricres acrose the locks are of cast iron, and 24 feet wide. The rallway dock, near the terminus of the Hull and Selby railway, and the Victoria, to the east of the citadel, are of recent construction. The following taole exhibits ?ice area and cost of the different docks:

| Doek. | Arem | Cost. |
| :---: | :---: | :---: |
| Old dock. | ${ }_{10}{ }^{\text {a }} \mathrm{i}$ Pi | [78,830 |

| Junction dock | 805 | 165,038 |
| Rallway dock | 239 | 115,000 |
| Vletorla dock | 2018 | 470,000 |
| Tohal. | 49118 | 1,056,449 |

A considerable quantity of ohipping is also accommodated within the old harbor, which may be computed at 10 acree of tidal water. A timber pond of 9 acres wes constructed in 1853. The quays around the docks are spacions, and are entirely surrounded with warehouses and deal yarde. Hull has of late years become a principal steam-packet station. Steamers asil regularly to and from London, Leith, Aberdeen, Nowcastle, Yarmonth, Hamburg, Rotterdam, Copenhigen, Antwerp, etc. Hull is the princlpal entrepot of the Baltic timber trade on the east coast of Britain. The etaple imports are timber, deals, grain, and seeds, sheep'e wool, tallow, hemp, flax, hides, iron bars, green fruit, bonea, madder, bark, turpentine, cattle, supgar, etc. The chief articles of export sre coton stuffe and twist ; woolen goods and woolen yarn ; iron and hardware; linens and linen yarn; earthenware; machinery and mill-work; coal, salt, and more recently raw cotton, lrought from Liverpool and Manohester. The whaie fiahery was formerly extenaively carried on. In 1819 it employed 64 vessels, hut from that period it rapidly declined to 1837, and in thst and the seven subsequent years employed only one vessel annually. More recently, however, a reaction has taken jilace, and from 1846 to 1852, incluslve, from 12 to 14 veseels have annually aet out for this fishery. The number and tonnage of veasele registered at the port on 81st Deoember, 1854, were as follows: Sailing vessels-under 56 tons, 238 , tonnage, 8822 ; above 50 tons, 105, tonnage, 42,861. Steum vesaels-under 50 tons, 10, tonnsge, 824 ; above 50 tons, 36 , tonaage, 9924. The following table gives the sinipa and ton-
nage (including both sailing and steam vessels), employed in the colonial und foreiga trade, for 1854, and the three preceding years :

|  | (NWAR), |  | OUTWARD. |  |  |  |

The number and tonnage of vessels that entered and cleared coastwise during 1854, were: Entered, sailing veasela, 716, tonnage, 52,414 ; steani vesself, 424 , tohnage, 76,406 ; cleared, aalling vessele, 1162 , tonnage, 117,279 ; steam veesels, 468 , tonnage, 84,072 . In 1852 the amount of dock dutien pald was $£ 34,961$; the amount of customs revenue, $£ 324,819$; and the value of British manufactured goods exported, $£ 9,915,414$. The staple articles of import being subject to low duties, or altogether free, the customs revenue is smaller than that of less jmpertant ports. The port charges of llull have been reduced in the aggregnte about $\mathbf{~} 18,000$ per annum. Tho industrial establishments of Ilull are chlefly conrected with th. butlding and equipment of ships, comprising shlp-building yards, rope-walks, and manufactories of canvas, chains, chain cailes, and stean. machinery. Population in 1851, 84,690.-E. B.

Humber, a large river or rather eatuary of England, formed by the junctien of the Ouse and Trent, and eeqarating Yorkshire from Lincoinshire. It fows first east fer about 18 miles to 11 ull, and then southeast for 22 miles to its meutis between the Spurn-head on the north, and the opponite coast of Linculn on the south. Ita a verage breadth is from two to three miles, but near its mouth it widens to six or aeven. 1ly means of its numerous tributaries it drains sbont 10,000 square miles, comprising some of the most fertile and jupulous districts of Eingland. Veasels of considerabie burden can ascend to its head, and those of the largest size to Holl.

Eungary. The kinglom of llungary eonsists of Ilungary Proper, Sclavenia, Croatia, Ilungarian Dalmatia on the sea-coast, Trausylvania, and the Military Frontier. It is situated between $46^{\circ}$ and $80^{\circ} \mathrm{N}$. int., and between $15^{\circ}$ and $25^{\circ} \mathrm{E}$. long. It is bounded on the north by Galiela, on the enat by the Danutian I'rincipalities, on the south by Servia, Bosnia, and tise Adriatic, and on the west by Styria, Lower Austria, Nor". via, and Silesia. The north-eastern frontlers are formed by the Carpathiana, which jut out in different franches toward the banks of the Dannise, and inclose Transylvania in the form of a double crescent. A no less natural boundary la the Danube, separating southern llungary from the Turklah provinces. The leant marked frontier is the western, neparating llungary from lawer Austria: it is In part formed by the smali March River. The \#xact extent of llungary and ita dependercien has not yet been precisely ancertained. Acconiling to the Austrian official statintica, published by Caösnis, the auperficial area amounta to 125,087 Finglisin mpare miles; more recent Austrian tablen refuce that number, whereas the Hungarian statist, Alexius Feuyen, reckons the superfichal area at $\mathbf{1 : 0 0 , 9 1 0}$ Finglish square miles, of which Transyivania orcupien nhout one sixth, or upwand of 20,000 miles. The Ilangarian kingdom is thua larger than fireat Iritain and Ireland by about 10,000 , and than l'russia by 20,000 square miles. The physieal aspect of limgary Iroper is sharply marked by the centrant between the northern Carpathians, forming large piateaus, and the vast ievel land Intersected by the Dannbe, Theisa, and Maroth; while in 'Transylvania, whare the Alpine character predominaten, the wudilen diminution of the mountains, allowa only of undulating table-land, alternating whith narrow valleys. The greatent part of Croatia, and part of Sclavonia, likewise conslst of
mountalnous land, formed by the outlines of the Alpa, the level land in the latter lylng to the north.
Rivert.-Turning to the bydrographle survey of the country, the Danube, the largest European river next to the Volga, first elaims notice. Reaching the lIungarian territory at Preaburg, where the Carpathians begin to rife on Its left bank, the Danube puraues a south-easterly courso, dividing Into three branches, which receive the waters of the Layta, Raab, and the Waag, embrecing, moreover, the two Schütt lslands about Comorn, and then the St. Andrew Island nt Waitzen, after whleh its directlon becomes more southerly, and, after leaving Buda and the Osepel Island, It rolls along the IIungarlan plaln and the Banat, its right banks reaching the Turkish territory at Semlin. There, where its course becomes retarded by the Servien Mountains, it recelves the waters of the Save, leaving the kingdom at Orbova, after forcing its impetuous waves through the Iron Gate. The breadth of the Denube varies in different parts, being, about l'resburg, 900 feet; at Foldvar, 1800 feet; between the former and Vanek, 4000 fcet; at Petervardeln, 3500 feet ; at Belgrade, 508 feet, and at the Iron Gate between 158 and 80 feet. The depth varies between $20,40,60$, and 120 feet. The greatest tributary of the Danube, the Theise (Tibiscum), rises from a double source in the county of Marmaroa, near Galicia, reaches the level land at Nagy Szoles, end winds its course through the large plain as far as Titel, where it tlows into the bed of the Danube. The chicf tribataries of the Theiss, remarkable for richness in fish, are the LIernad, Sajo, Bodrog, Szamos, Körös, and tho Miarosh, which is the chief river in Transylvanla. The Drave, which rises in the Tyrol, flows through Styrin into Croatia, and, divlding it from liungary, fallo into the Danube near Essek. The Save, rising in Carinola, winds its course through Crostia, is fed by tho Unna, and Kulpa, forms purt of the frontior tuward Bosnia and Servia, and falla Into the Danube at Belgrade. The Morosh, which ranke next to the Theise, falle into the latter at Szegedin, after having received the Aranyos, fumeus for its gold washings, and the Kokel or Kükulö. The Alt or Aluta rises likewise in the Transylvanian Mountains, entering Wallachia through the lied-Tower l'ass. All the Hungarian rivers flow into the Black Sea, with the exception of the I'opard, "hieli rises in the Zips from the Kongsberg, and flows into the Vistula.

Lates.-Among the lakes the largest is the Ilattennee or Balaton, situated hetween the countries of Zala and Schmmeg. Its length ia about $\$ 0$ miles, and its lreadth between eight und nine miles; and with the surrounding marshes, it oceupies about $\mathbf{0 0 0}$ square milea. Its principal feeter is the Zala, and its only outiet is the March Sio. Tine Neusiedler-see, in liungarian Ferto, between the counties of Wieselburg nad Gedenhurg, fed by tho Vulka, is 70 miles long and 10 miles bread; its ahallow waters are impregnated with nalt, and exhibit un eld and dow, hs yet unexplained. The l'alver-see is, properly speaking, a marsh, resimbling many which aro formed lyy the Thish ani Lower Danuile. The Star-ret, in lihar, the Fesecier, in Szathonar, tho Feketels, in the llanat, are the Inrgest marshes. Tho marshes cevared with aquatic plants, such as lieseder, are generally ilistinguished fiv the name lap. The omly canal of importance is that in the county of Ince, called the lirancis tamal, cut from Monowter to Foldvar, and uniting the Danube with the Thelss. It is abont ti0 miles long, and shortens the pansage by about 200) milen. The Ifega ('anal, near Temenvar, is rather a river than a canal. The Alriatle touches only the sunth-western extremity of the Hlungarian kingdom, the nea-coast being varionsly called Hungarian Dalnatia or Illyris, the principal gorts belng Fiume, a flonrishing town inhabited chichy by Italians, I uecari, Port-re-Zungg St. (icorge, Talslonz, and Carlopage, The whole const is mountain-

The climate of Hungary varies greatly. "In the counties of Arva, Liptau, Zips, and Marmaros, winter continues for fully bix monthe, whereas in southern Ilungary the trees blossom as early as March, and in June the heat becomes burdensome, reaching its culminating point in July, From the partial meteorological observations that have been made, it appeara that the highest temperature in Buda is $30^{\circ .6} \mathrm{R}$., and in Klauseaburg, in Trensylvania, $32^{\circ} \cdot 6$; and the mean is, in Bula $15^{\circ} \cdot 19$, and $\ln$ Klausenbarg $53^{\circ}$. This, however, is fur from giving an idea of the climate in the different parts of the conntry, and especially in the level land in the aouth, or the lurger plain, where, at midday, the heat is at times almost African; and yet in thoee very parts, as a geographer observes, even quicksilver was frozen in the unusually sovere winter of 1816. The heat of the smaller or western plain is much tempered by the Bakonywood. The first half of January marks the minimum, and the second half of July the maximum of the temperature; while April and the first part of October colncide with the mean temperature. Blasts a.d the falling of hail happen moat frequently nmong the Carpathians.

At the end of the great war in the beginning of tho present century, the population of IIungary, Transylvavia included, was $12,000,000$; and according to the last censua, before the late war of 1848 , it amounted to about $14,500,000$. Of this number, $2,200,000$ belong to Transylvania, and 490,267 to Croatia; the population of the military frontier being estimnted at more than $1,000,000$. With regard to the different races, the proportion is as follows:

| Macyars........... $5,418,778$ <br> Slovaks............ $1,722,008$ |  | Rusniaks.......... 450, 50 |
| :---: | :---: | :---: |

The character of the races i, as different as their origin. The Magyars, both nobles and peasants, nre marked hy their Oriental ride and nobleness; by their love of liberty, hospit sble customs, conviviality, and warlike ppirit. Clinglag with filial love to his superiors, the peasant-a genticman in languago and bearing-is, at the same time, alive to the sense of his own worth. In the fiedd of lutor and horsemanship, the Magyars surpass all the rest. The Selavonians of north-western IInngary are mild, fragal, nud industrious. The southern Sclavonian or Raitzen are, In character, very much like the Greeks, being, moreover, merry, warlike, and of a therce disposition. The Croats partake more of the character of the Raitzen than of that of the north-western Sclavoninns ; nnd, as to the Germans, they preserve their nsual traits of industry and peaccableness. The most neglected race is, perhape, the Wallachians. Strongly resembling in physiognomy the Italians, a fact clearly verifying their intermixture with the Romana, they, like the Sciavonlans, are bony, and of tall stature, und aro considered na one of the least active races. The town population is estimated to form one eighth of tho inhabitants, a circumstance sufficiently proving the backwarl state of the country. The total number of towns in llungary and Transylvania is 146 ; of hosoughs, $6 \cdot 12$; end of
villages, 16,450. The population in the principal towns and boroughs was, In 1851, as follows: Pesth
Bodn (rivited to Pesth
by auspenaion bridge).............. $\$ 0,127$ Prebbnrg............ 00,906 Presbarg ............. 48,178 Sregedin. . . . . . . . . . . . 80,244 $\begin{array}{ll}\text { Wasarbely............ } & 88,090 \\ \text { Kesskemet.......... } & 88,808\end{array}$ $\begin{array}{ccc}\text { Keesk amet . . . . . . . . . . } & 88,808 \\ \text { Csoba .............. } & 889\end{array}$

The fertility of the Hungarian soil, and the variety of its produce are universally known. Beside the different species or corn and malze, raised in great quantities, Hungary produces hemp and flax, varions kinds of delicious apples, pears, and plums ; two sorts of melons, rich crops of tohacco, and lastly a great variety of winea; while the vast pastures and oak wooda afford ample sustenance to herds of horned cattle, sheep, and swine. It is nssumed, that with the ald of modern improvements in agricultore, and a little more industry, it could abundantly bustain a popnlation twice as large as it actually possesses. "The badness of the roads, the neglected state of the rivers, which, besides being closed to navigntion, entail great lossea by annual inundations, no less than the fendal institutions, and prohibitive system of Austria, all contribute to keep agriculture in a backward state, so that the vast produce may be said to come from the hand of nuture alone. The home of the wheat la the Bnnat, and the counties of Baes, Baranya, Simla, Arad, and Borsod. Rye is ralsed chlefly in the north among the Slovaks ; barley, oats, and maize, In different parts. The list occupies an important place in the Ilungarian harvest. With some of the Sclavonian population, such aa the Croats and Rascians, and the Wallachs, maize bread is a great favorite. Melona are ralsed in gordens and the open field, occupying sometimea continuous tracts of land of 100 acres. Of tho water-melons the most famons are those of Heves, of more than two feet in diameter. The yellow or sugar melons are generally of a much smaller size. Tobnceo grows almost every where, and greatly varies in flavor; the Csetneker of tho county of Gömor, the Verpeleter nud Debrocr of Hevea being the most highly prized. The annual erop is upward of $650,000 \mathrm{cwts}$. Potntoes form but a secoudary article in Hungarian economy.

Wines.-Among the vine-hills and gardens, cultivated since the thirteenth century, and which occupy no inconsiderable part of the Ilungarian soil, the most valuable is the IIegy-aljn, or southern promontory of the Carpathians, and which comprehends the Tokny mountnins situated round the town of that name. The whole promontory occupies above 50 Engllsh square miles, of which only one third is under cultivation. The Tokay wine is of a crystalline yellow, and sometimes greenish color, and is known under two naunes, the Ausbruch, the atronger, containing more of the essence, and the Maslas. The whole nanual produce is 180,000 gallons. Next in rank to the Tokay is the Menes, a red wine of the comnty of Arad; and inferior to it, though by no means inferior to llurgundy, ure the red wines of Erlan, Szekanrl, Villnuy, and lhda. Among the yellow tahle-wines, particuiar mention may he made of the Nesmeler, Somloer, lladacsoner, and limeleker. The connty of Simin is, moreover, particularly famous for its red winee, the most known of which is found on the Fruska Gora mountain. No less famous are some of the Crontian wines, marked by a apirituous flavor, as ns well as the wines of Transylvania. The total proluce of wine, Transyivania not included, is estiinated nt $328,748,000$ galions.
The animal kingdom exhibits no less abundance. The llungarian oxen are the largost breed in Europe. They have a grayish whitu skin and long straight horns. The largest lierds graze on the wide pastures

## IIUN

situated between the Theisa and tho Danabe. The original Ilungarian horse, marked by its middle alze, broad neek, and compact buili, is now only to be foond in some parts of Transylvania. The introductlon of English full-blood stallions by several of the magnates, has of late years eanobled the hreed, and the genaral Improvement has beel. hastened by the ruyal studa at Mezo-hegyea and Babolna. Of latú years $\boldsymbol{w}$ veh progrese has been made in the breeding of sheep, though the first step dates from the relgn of Maria Theresa, when the Merino was, for the firnt time, imported into 11 ungary. The oak-woods pasturage large herds of awine, part of which arrlve annually from Servia, Bosnia, and the Danublan Princlpalities, for the purpose of being fattened, and thereafter exported to Austria. Mulea, asses, baffaloee, and goats, are only to be found in very small numbers. As the war of 18.8 made a great havoc in the animal kingdom the census of 1850 can not afferd a $f$ : sentatio. the cernabilities of thematry. Bits ainalt therefore five here the atutiaties of the ye... i which stood as follows: Horses, 1,000,000:
 In Transylvania, the nombere were these: ilor 397,888 ; horned cattle, 800,000 ; eheep, $2,000,00 \mathrm{~h}$ hogs, $350,(000$. To thils abundance must be added $n$ great sumber of domesticated fuwl, especially geese and turkeys, and a variety of game, such as ducks, partridges, pheasants, etc: Tho rivers abouad in carp, pike, athd eturgeon-the Theiss being reckoned the richest ; the pecullar liungarian tish called fogos, is only found in the lialaton Jake, or llatton-see. Some of the watery yield trout, and largo quantities of leerhen.

The approxinate mount of the productive aoil, both In llangary and Tranayliania, in the latter of which the forests form more than one half, in, according to the Austrtan official tablea, 40,200,000 joch, or $57,201,600$ kinglish acrea, of which $10,431,-60$ belong to Trasaylvania. The relative division is as follows, in Fingliss acres:

Soft ander thlage. za, A.s11.499 Vlocyards....... 1,65,9,962
alca...... dita
In the above numbera is not included the military frontior, the productive aoil of which occupies abont $6,000,000$ acres; the forest forming one third. The produce In corn fs- Hungary, $281,000.000$ boshels ; Transylvaaia, $80,000,000$; military frostiers, 12,000, 000 ; total, $822,000,000$ English bushels. The value of the natural product is estimated at $£ 25,000,000$, while the value of the crope in Eingland and Wales is estimated by M'Culioch to be only ER3,656,074.
Mineruls.-The mountaine, which are partly worked by the government and partly by privato enterprise, coatsin aretale of alavat every $\mathrm{kin}^{2}$ viz., foll, silver, Iron, copper, lead, antimony, zinc, alums oriphment, tellurium, and many other mineraln, besides coal and salt. In the neglected ntate in which the gold mines are kept, the produce is only alout 2400 marks. The ailver mines yield 65,000 marks. Of great importance are the copper minea in the llanat ; the richeat vein, however, is at Sthmolnitz. Those in Transylvania, at Damokos and Jeva, yield 1200 cwts . The oroduce of leall Is entimated at $26,000 \mathrm{cwts}$. The Iron minen are found chlefy In the connties of diomor, Suhl, Vng, and Kips ; the aveiage produce of the former being $250,000 \mathrm{cwts}$. The richest rock-salt mines ate In the connty of Marmorom, and the total produce amounts to upward of $800,000 \mathrm{cwta}$, a quantity which, however great, is fur from sumicient for the wants of the conntry. Soveral places yicld alpo soda, raltpetre, alum, and potash. Fit eckaln, shleh, till very lately, and before the intruluction of railways, had been entirely neglacted, lle deep in formations almoet unwrought. The total produce is $1,000,000$
cwts. The value of the mineral proluce in Huagary is $£ 872,000$, that of Trinsylvonla, $£ 169,000$; the mill. tary fros.tiers yield almost nothing in this respect. It must be added that IIungary possesses also precious stones and marhle of various descriptions.

Afanyfactures.-Thz chief articles of manufacture are cloth, Ilnen, and silk stuffs, carpets, leather, Iron waroo, and chemical products, Including alum, aatpetre, and jotash manufactures. All there are as yet in an inclpient atate, eapecially cloth menufacture, if it be considered that in wool Hungary is the richest country In Europe. Linens are chiefly manufactured in the north. No county of Zlps produces about 6, 00 ', tid yards. The largeat allk manufacture is at Peth, givlag employment to between 400 and 500 $\mathrm{m} * \mathrm{~m}$. Of greater extent are the leather manufacturee ; but even of this article much is imported. The moet prsiuctive iron-works are In the colinty of $f \cdot \cdots$ is in ag which are particularly distinglu : "'it. tories of l'olorela, and "nroske, belongwht to t : ince of Saxe-Cobourg. The whole inon * of li:mgary is catimated at 500,000 ewts. per half of which belengs to Gömör. Iu several , whthe ct.re are potteries and glass-works, some of Which, fi" Debreczin and Papa, produce 20,000 buwle woul: Soap la chiefly manufactured in Szege. din, Kecusomed and Debreczin, the last of which produces 7000 ewis, annually. The distillerica are mostly in tho north among the Sclavonle population ; and the breweries, 300 in number, aro situated round the large towns of mixed population, beer is no favorite drink with the Magyara. Sugar refineries have also of late risen in several parta of the country; but this artic lo also requires importation. The segar manufactories, introduced within a very recent periol, had imparted a new impetus to the cultivation of tobece; fut the introduction of the tobacco monopoly at the end of the late war, at once extinguished this branch of industry.

Trade. - The inferiority of the roads, only compenmated to some extent by two railvay Ines, and steam navlgation on the Danube and Theiss, but enpecially the restrictive conmercial syatem of Austria, sufficiently accounts for the insignificanco of Ilungarian commerce, lwoth forelgn and internal. The centre of comunerce is the eapital, Pesth, situated on the banks of the in!ghty artery of the kin, dom, the Janube. The chicf feature of interm:? trade is thie exchange of problucts between the arthern and southern districts ; the formor azading to tho mouth minerals ond timber, and the batter carrying to the north grain and cattle, an intercourse ficcilitated by the great number of riverw uavigable to vessela and hroate of small frelight. The annual faire held at l'cesh mark the culminating points of commercial uctivity, the chlef marketable article being wool, of which, according to Fenyes, upward of $120,0(0) \mathrm{cmta}$ are sold amually. 'lle other towns of commercial linportunce are-in the south, llecse, exporting to Austria; Fiume, the IIangarian Jittorale, and Semlin, communiceting with the Tarkish provincos; in the weat, Waitzen and Presbarg; in the north, Koshua and Eperies.

The following details, collected by Fenyes, will glve a general liea of the extent and progress of the foreign comanerce during the five yeara muncdintely preceling the late war:

Import .-The value of importa, both from Austria and other countries, was, in the same year, 68,514, 487 flor'ns, oif $£ 6,851,443$. Forelgn countries, it mupi be added, enter only for one fourth of thile latercourse, the reat belongs catirely to the Austrlan dominiens. Since the end of the lato war the custem-dutien between Hungery ind Austria have been abolished. In how far this ebs 're 'as hitherto affected the commerce of the former, in hd, in consequence of $i t$ abnormal political state, 1 , ifficult to declpher, even if the rim quisite data had, m ousde publle. As diffic at would it be to for a to re estumate of the revelane and expenditure of Huw ;ary since the late war, as both rest on momentar:' a bitrary m"nsurea undertaken either us precautions s. "nat revoution or in consequence of the periodical naess of the Austrian finances. Ample data, hown er, are extant as to the puhlic ravenue didexpenditure of II ungary hefors y: 8 . ? ochief sonrees of revenue up to chat date were-the housetax, war-tax, the toll duties, the crown and fireal domains, and salt revenues, which, with the minor sources of inceme, such as the lottery, the post-office, and the minea, yleided, according to Fenyea, £ 8 ,400,000, s sum leas than that of Iowbardy, but more than sufficient to cover public expenses, In consequence or the internal organlzation of the counties, where the salaries of the constitutienal officiuls were but neminal. In the now rigime a not nnimpertant item in the public revenue is the tobacco monopoly introduced luto the IIangarian dominions by an imperial edict of November, 1850. By this ediet no one may cuitivate tohacco, except by previous permissien, specifying the place and mode of cultivation, each owner being obliged to deliver up his produce to the government, which determines its value. The monopoly in itself, no less than the domiciliary visits to which it gave rise, greatly injured this thriving branch of 11 agarisn industry. A great many, indeed, have in consequence of this given up its cultivation, dispensing even with its use.-m. B.
For commerce of Ilungary, see Huxt's Mug., xxi., 191 (Cassart); Dre Bow's Review, xiii., 43ä; Rares of Hungary; Nor. Am. Ree., Ixx., and Ixxii. ; Ch. Eram., xlvili., 44.

Huron, Lake, one of the five great lakes of North America, lies between Lake Superior on the northwest, Lake Michigen on the west, and Lake Frie and Lake Ontario on the sonth and south-east. Its shape is so irregular that it is difficult accurately to determine its exact dimensions. Its length from north to mouth is 260 milies, and 160 miles in breadth from east to west, in its widest part, but exclusive of the bay on the north-east, it is only 90, and its circumference 1100 miles. Its principal indentations are Saginaw Bay, extending lito Mehigan, and two others; one imniedjately north of Manitou Islands, and the other south-east of them. The latter, called Georgian lhy, is about 170 miles long, by 70 hrond; almost a separate sheet of water, divided fro:n Huron by a nearly continuous series of islands which are elosely connected by the great penineula of Cubot's Ilead, and with loint de Tour, the easternment cape of northem Michlgan. Manitou (or Great Spirit) Island is the largest of the group, and Drumowond Jsland reparates another sheet $0^{\circ}$ water from thie main lake, 80 miles long and 20 hroad. The boundary hetween the United States and Canada passes along the midille of the main Huron 225 miles, and between Lesser Manitou and Drummond Islands, by what is called the Nidile Passage, and curves round to the north and west $\$ 5$ miles, to the entrance of St. Mary's river. The elevation of the surface of Lake Huron alove the surface of the ocean is 574 feet, or less than that of Lake Superior by 63 feet, or than that of Jake Michigen by 4 feet.

The greatest depth toward its west shore is at least 1000 feet, and its mean depth 900 feet, or about 300 feet below the level of the Atlantic. See Lakes,
Hurioaje (Sp. Ifuracan), a violent storm, generally accompanied by thunder and lightning, and distinguished from every other kind of tex pest by the "ehemence of the wind, and the suiden changes to which is is aubject. Hurricanes prevail chiefly in the $\dot{x}$. st and West. Inlies, the Isle of France, and in seme parts of China. The following graphic description of the usual phenomena attoniling the West Indian Lurricanes, from the ${ }^{\prime \prime}$ of Eamund Burke, may be interestiag to the rcader; "It is in the rainy season, prineipally in the month of Augast, more rarely in July and E'ptem'ser, that they are assaulted by hurricanes, the most terrible calamity to which they are subject from the climate. This destroye at one stroke the labor of many years, and frastratee tine most exalted hopes of the planter, and often just at the mo ment when he thinks bimself out of the reach of fortune. It is a sudden and violent storm of wind, rain, thunder, and lightning, attended with a furious swelling of the sea, and semetimes with sn earthquake; in short, with every circumstance which the elements can osseuble that is terrible and destructive. First they see, as a prelude to the ensuing havoc, whole fields of sugar-canes whirled into the air, and scattered over the face of the country. The strongest trees of the forest are torn up by the roots and driven about like stubhle. Their wind-mills are swept awsy in a moment. Their works, their fixtures, the ponderous copper boilers and stills of several hundred weight, ar: wrenched from the ground and battered to pieces Their houses are ne protection; the roofs are torn of at one blast, while the rain, which in an hour risus feet, rushes in upon them with an irresistible violes There are gigns which the Iadians of these isla taught our planters, by which they can prognostica. the approsch of a hurricane. It comes on ejehes ir. the quarters, or at the full or chunge of the moon. If it will come en at the fuil moon, you being at the chasge, observe there signs. That day you will see the sky very turbulent. You will observe the sky more red than at other times. You will perceive s dead culm, and the hills clear of all those clouds and mists which usualiy hover alout them. In the elefts of the earth, und in the wells, you will hear a hollow, rumbling sound, like the rushing of a great wind. At night the stars scem much larger than usual, and surrounded with a sort of burs. The north-west sky has a sort of menacing look, and the sea emits a strong amell, and rises inte vast waves, often without any wind. The wind itself now forsakes its usually steady easterly stream, and shifts about to the weet, from whence is sometines blows with intermissions violently and irregularly for ahout two hours at a time. You have the same signs at the full of the moon. The moon itself is surrounded with a great bur, and sometimes the sun hus the name appearnnce."

Hydrographical Charts or Maps, usuully called sea-charts, are projections of some part of the sea or coast for the use of navigation. In these, are laid down all the rhumbs or points of the compass, the meridians, paraliels, etc., with the cousta, cupes, tslands, rocks, shoals, shallows, ete., in their proper places and proportions.

Hydrography, the art of measnring and describing the sea, rivers, canals, lakes and the like. With regard to the sea, it gives an account of its tides, cemntertides, soundings, bays, gulfs, ereeks, and also of the rocks, shelves, sands, shallows, pioniontories, and harbors; the distance and bearing of oue port trom another, with every thing that is remarkable, whethor out at sea or on the coast.

Ice. The eale of lee and anow preaerved in the civerne of Vesuyhus and on the more elevated parts ot' Atna, has long been a considerable branch of trade in Naples, Citanla, and the adjoining towns: but it was reserved for the Anericans to carry the trado In lee to an extent which could net previousiy have been anticipated. The extreme heat of the summer in the Now Fingland Etates occasions a natural demand for jee, which tho extreme cold of the winter glven the means of supplying. The fresh water lukes adjoining Hoston and other iarge towns lieing deeply frozen in winter, large Ice-houses are tilled with the lce taken from them, which is retailed in summer at a low price. The practice had not, howevor, lieen long estabilished till it occurred to anme lingenlous apeculators to attempt to realize a profit by shlpping ice to the aouthern parts of the Union and the Weat Indies: and the speculation having succeeded, tho "trate was subsequently extended to the Spai "sh Maln and South America, and more recently to kurope, India, and China! The bosinews las, in fact, beeome of the firat Importance; nomerous companies and a very large amount of $t$ mnage being now engaged in the lco trade from Boaton. And owing to the greater skill and economy with which the businers is at prement conducted, the ice which usell a few years ago to cost 6 cents per 1 h . in New Orieans and llavana, may now he hat for 1 cent ; and there has lieen a like fall in its priee in fublia and other more distant placer. An Innmense warehouse has recontly lieen constructed ut Cajentta for the reception of the lee brought ly the ships, whence it la auppliest in the quantities required for the pubicic accommodatlon. This singular fabrie has tripie walla, five distinct roofs, incloses alwout thrue forthe of an sere, aull is fitted to hold npwarl of 30,000 tons of iee? It is said that a similar dijot in about to hie formed at Canton.

The Ire Truile of the U'nifell States.--The ice trade of the United States was commenced by Mr. Frederic Tuder, of lboston, in 1805. This gentionan, having provjousi, zant agents to the Weat Indies to procure Infurmation, determined to make his first experiment In that region. Fhading no one willing to receive so strange an article on rhiploand, he wns compelled tu punhase a vessei, the tirik ramorife, of ubout 130 tons, whicl he loadeil with fee from a poni in Suugus, Mapmachusetts, belonging to his father, und aent to st, IPlefre, Martinlyue. This flont enterprise resulted in a leses of ahout ofboo, lint was, nevertlieless, followed up untii the aminurg and war put an and to the forelgn trade, at which perical it haid gielded 110 profit to lex projector. Its operations had tseen contined to Martinique and Janmicas. After the close of the war with England in $1 \times 15$, Mr. Tudor recommencel his operations by shipmentr to llavana under a contract with the govirnment of Clabm, which enabied him to jursue fis undertaking; without loss, and extend it, in 1417, to Clasrlentori, Sonth Garolina; In the following year to Savantah, fieworgia; and in $1 \mathrm{x}: \mathbf{0} 0$, to Now Grleans. in the mean time it had teen tried agaln (by other parthen) at Martininge and sto. Thoman, and filled, and by Mr, Tuifor at st. Japo du Cuha, where it also failed, after a trial of three yeam.

On the 1xth May, ix:is, the first shipment of lue was made to the Fiant julieen by Mr. Tudor in the ship Tuecony, for Caicutta, and nimes that perion he has ex. tended his operutions to Mulras and Iboniay. Previondy to 1 N 32 the trale hal heen chiefly confined to the operations of the original prifector, although several enterprises had lueen undertakion hy other jurnons, ami abandoned. The increase of mijuments to this period had been mmald, the whole amounting, in $1 \times 32$,
to 4,852 tons, which was taken ontisely from Fresh Pond, In Camliridge, and shipped by Mr. Tudor, who was then alono in the traile. Up to this time the ice bualinose was of a very complicated nature, Shipownern oljected to receive It on freight, fearing its effect on the durability of their vessels and the safoty of voyages l lee-houses at home and abrond were required, and the proper mode of constructing them yas to be ancortmined. The bent modes ot preparing ships to receive cargoes were the subject of expenaive and almost endless experimenta. The machines to cut and prepars lec for shlpping and stoxing, and to perform the operations of holsting it into store-hounes and luw. ering it into thio holds of vesseis, wese all to he invented, Invoiving much oxpense and vexation. Many of these difficuities have now beon overcome, and since 1832 the trade has Increased much, and appears destined to a still more rapid increase for some years. It has also been divided among many partles, and its methods have heen further impruved, and a knowledse of them more widely diffused.

The lce has been chlefly taken from Fresh and Spy Jouds, and since 1841 muiniy tramsported on the Chariestown Iranch lailroad, which was eonstructed for that purpose. Quito recently, lee estatilisliments have licen mude st mont of the ponds near lloston, and ii in probable that in a few years the products of all theso waters may be reyoired to eupply the trade. In the year 1839 the great quantity of lee cut at Fresh fond, and the consequent ditticalties which had arisen imung the proprietera, as to where each should take lee, influcad them to agree to listinet boundary fines wifich were aettied by three commissienars, viz., Simon Cireenleaf, Lavl farwell, hnd S. N. Feiton, espuipes, on the prinijple of giving to each the asme propurtion of contiguou. surface of the lake, as the length of his whore-line was to its whole lorder. This sutticment was male by partition teed, executed by all the owners, and recorded in the regintry of deeds of Mildlesex county. l'ublished maps wers also pinced in public institutions and private hands. These napes show the direction and length of the boundary lincs of esch owner, and the area. This arrangement has been of great alvantage to the parties, and enubled them to necure mine jee than could otherwise lie tuken from is poni of equal extent.

The shipments of ice from loston caastwise for the year eniling December 31 nt, 1817 , mounted to 51,887 tons. 'The ice shippeid to forelgn ports during the same proriod amounted to 22,591 tobn, and was sent to the following places, vir.; Havana, Mat.anas, Trinidad, St. Jago. Culta, Martinlque, St. Thomas, St. John'a, Mayasuez, Porto Rice, Guadaloupe, Barbadoen, Trinidad, Autigua, it. Vincent, Nassau, Jamaica, Pernambuco, Demerara, Ionduras, Vera Crua, lio de Janeiro, Mauritius, Isie of ISourbon, Manilla, Calenata, Madraf, Jombay, Ceylon, Hong Kong, it hamjos, Jlatavla, and I iverpool.

The freight paid during, this yenr is supposed to luve averaged as high as \$8:2 60 grr ton, at which rate it wonlis amount, (111 the id, fis tons shipyerd abroad
 in the cost of mecuring ice and stowing it on board vesucls, caused by winters favorahle or otherwise for securing it, anl by the greater or it an expense of the ilttings requirel for vogages of differnent duration, or by difference of season when the Nhumunte are made. Taking all these contingencies into convideration, the cost of ice when atowed on toari may bee entimated to averuge 蒌2 per ton, which woull give tor the quantity shipperi $\sin ^{148,9513 \text {. There were in } 1 k 47 \text { upwarl of } 29}$ cargoes of jrovisions, fruits, and vagetables shipged in
ice to ports where otherwine such artlelea conlil not be sent-ay to Harbaloen, Trinidad, Demerara, Antigua, St. Vincent, Guadnloupe, St. Thomar, IIonduraa, and Calcutti-the Invoicerl cont of which nt lBoston would average nbout $\$ 2500$ each, $\mathbf{9 7 2 , 5 0 0}$. To thene liems may be added the profitn of the trude to those engaged in it, 9100,000 . Total returns,
The lee trade hiss been without deubt one of the main stays which preserved the Calentta trade almost exclusively to Ihoston, and it would do no for China if that country were in a more quiet condition. The freights pail to India by Mr. 'Tudor for ice amount to from 10 to 15 per cent. of the earnings for the whole run of the ship out sud heme, and it la earned without coat or deluction to the churterer or ship-owner.
It is probable that the cemmereial marine of the United Stater has been materinlly increased by the operation of the ice trade. A large portion of the vessels form aly engaged in the frelghting trute frem Boston asiled in ballast, depending for remunerntion on frelghts of cetton, rice, iobacco, sugar, otc., to he obtained in more aouthern latitudes, ofton competing with the versels of other natlens which coull earn a freight out and home. Now a amall outward frelght from loston can usunliy be oltained for the trunsportation of ice to those places where freighting vessels ordinarily obtain cargeos. The lec traile has generally been unsuccessful to places where preflitale return freights can not be obtained, becmuso to nuch places n heavy freight nust be puid on the ice, which it can not benr; and also bocause souther: places which do not produce valuable exports, are usually unable to contume expensive luxurles.

The methods and materials for preparing vessels for the transportation of lee havo been various. lormerly their bulds were realed up at the siden, bottom, and top, with boards nailed to jolst ribs secured to the skin of the vesmei, and with double buikheads forward and aft. The spuces thus formed were thlel with refuse tan, rice-hults, meadew-hay, atrnw, weol-shavings, or like materials. These npacen were made of a thickness propertionate to the length of the voynge, and with reference to the sonson. The immediate surface of the ice was covered with the anme mnterinls, excepting tan. At the present tins amw-tlust is used almost exclusively for voyages of considerable length. It is placed iumediately between the ice and the skin of the vessel. This materinl is ottuned from the Stute of Maine, and before its use for this purpose was entirely wanted at the water-nills, nul, fulling into the strams, occnsioned seriens obstructions. During the year 1847, 4600 cordn were brought to Bonton, at an average value of $\$ 250$ per cond, delivered. The lumber is also wholly from the State of Mnino. The value of it is, however, mmall, in the prenont mode of fitting vessels. Almost the whole vulue of the returus of the ice trade, inclualling freight, is a gain to this country. The ice itself, the laber expended on it, the materials for its preservation, and the means of its transportation, would tho worthless if the trade did not exist. The prices at which ice selis in places where there Is compotition vary constantly. In llavana, where it is ramonoly, it is sold at fif rents per pound. and thore the trade has nut incrensed since $1 \mathrm{NiP}^{2}$, when the shipments were 1112 tons, while at New Orlenns, whore it has ticen sold at from hulf a cent to three centa por pound, it has increased during the same pertod from 2310 tons to upward of 28 , (om). At Cralcutta the trade commencod, in 18:3t, with $n$ shipmont for that yeur of 201 tons, nut the price has never been atove 6 cents per pound, and is now about $2 \frac{1}{2}$ conts. The export to that place had incrensed in 18.17 to 3100 tons, but proinalily less than one fifth of that quantity is actually sold, owing to the great length of the voyuge.
lee being shipped arid used at nil acnsons, large storehouses are required to presorve it. Exclusivo of ice-honses on the wharves at liast Charlostown and

Eant Boaton, in which lee is stored for short periods, there had been erected in 1847, and previoualy:

The lee-housen now in use are built above ground. In senthorn countrios, where ice is most valuable, they nre constructed at great expense, unually of trick or atone, and the protection to the lce consists in air spacen, or in dry, light vegetable aubstances inclosed hetween two walls. In this vicinity, on the borders of the laken, where lee la least valuable, they are usually buitt of wood, in which case they are of two walla, formed hy placing two ranges of joists upright, framed into pintes at the top, and placed in the gronad nt the bottom, or framed into sills; these $t$ wo ranges are celled with boards secured to that slde of each runge which ls nonrest the other, and the apace between the two bonrilings filled with refuse tan wet from the yards. This wet tan la frozen during the winter, and until it is thawed In the apring and aummer, little wasto occurs; nfterward tho waste is more rapid, but, as a large portion of the lice is nhipped or otherwise used before this takes place, tho lose in quantity is amnil, andl, occurring before the expenses of transportation have been pald, is of lees pecuniary moment.

In one instance, brick $h_{t}, s$ been used in the conatruction of an ice-house which covers $\mathbf{3 6 , 0 9 0}$ feet of land, anil the vauits of this lce-house are 40 feet in depth, and its whlis are four feet thick from outside to inside, inclosing two sets of air-spaces. Such a construction is more costly, but has the advantage of durablity and safety from fire, to which ice-honses are much exposed from the frequent juxtaposition of railrond-engines, and the light, dry materin! uned ubout then to cover and otherwise preserve ice. At first, the implemente of husbandry only were used in securing ice, but as the trade became more important, other machines and different nethoda were ndopted, and abnndened when better wero lorought forwarl, or when the increasod magnitude of the business required greater facilities. Wore lca is now secured in one favaruble day than would have supplied the whole trade in 1832 . Ordinarily, before there has been colli enough to form ice of auitable thickness, snow falls on its surface. If this occurs when the ice is four or more inches in thickness, nud the snow not heavy enough to sink the ice, it can he removel by using lorses nttached to the " snow-scrajer :" and under such citcumstances this is tho method in common use. Hut if snow falls so heavy as to bring the water above the surface of the ice, it is removed, nfter it has congealed into snowice, with the "ice-plane," which takes off about two inches decp and 22 inches wide of its surfaco. This machine is drawn by two torses, and is guided by innerting its "guldes" into grooves previously made with the "ice-cutter." The chips made by it are seraped off in the same manner as dry anow, These preliminary expenses are often very arent; frequently, after much expense has heen incurred to remove a body of nnow or snow-ice, the weather becomes warm nud spoils the ice on which so much has heen expenicd. And, on the other hund, if it is not done und the cold continues, there will be little or no increase of thickness to the leo, which is equnily a lisaster.

When ice ins been formed of aufficient thicknoss, and freed from snow nud snow-ice, it is reduced to bloekn of uniform size, ordinarily 22 inches nquare, by the "ice eutter." 'This machine ls eimilur to a car-
penter'a plow, except that it has a series of outtingchisels, one aucceeding another, and deepening the gmove. It in drawn by a horne, and cats at one pasaage about two inches deep, and If the lee requiren to be planed to remove anow-lce, the guiden of the "nnowplane" are uned in groovea of thim depth, lut when grooven are required to apllt from, the "lee-cutter" ahould he drawn two or three tlmes through each. Thene grooven ahould the parallel to each other, and to make them so, the " lee-cutter" has a gulde, whirh is placed in the last groove made. When the grooven in one direction have been made, others at right anules with them are produced in the aame manner. After thic hat been dene, one groove at the end is opened, and also the two outaile grooved ; a wedging bar is then etrirken inte the groove next the end one, and at several places along its length, which detachea It easily from the mans; then the same bar is forced, with a allght blow, into the transverse grooven, which reduces the lee to very uniform square blocks. The blocks of ice thus formed are lorought to the receivinkdoors of the ice-houses (which are built on the inmediate bonders of the ponds), elther by placing them on slerla, or footing In canals cat through the ice. Varioun modee of elevating the lee are in use; the endless chain, in comblnation with the inclined plane, has been successfully uaed, and also tho common plledriving ateam-engine; but nt present herse-power is more used than any other. The lce in placed in the housea in regular coursen, every block exactly coverIng the next below it. When a vault has leeen fllled, it is inmediutely covered with wood-shavings and the recelving-doors fitted up, to prevent waste, until the contente are required for shipment aliroal or use at home. The weight of lee for shipment in usually te termined at the wharven, immedlately before being put on ahipboard, on scales which have leen constructed for the parpose; and this single operation mettles the weight to be pald for by the party fir whose aceount the ice In shipped; the amount due for freight on ahipboard, for transportation on the raliroad, and that which is to be recelved ly the owner of the lee.Americun Almanac, year 1849.

The aggregnte of freighta paid for ice shipped In Boston in 1856, was $2 \mathbf{2} 50$ the ton, clean and clear to the ahip-ownee; therefore he received from this trade last year $\$ 365,000$ (a large Interest), and probally more protit than any other intereat whatever in the bualness. Hallroads and wagons were paid $\& 100,000$; laborem, $\$ 160,000 ;$ towns, fur taxee of lee privilegen and ice in atore, 1500 ; and wharves $\$ 20,000$ to 25,000 . There are 93 wagons and alout 150 horsen employed in diatributing lee in Boston and vicinity ; 60,000 tons are thua retailed, aupplying 18,000 fanilies, hoteln, stores, and factoriea.

The tons of lee prepared for market, its value, capltal inventeri, and number of persons employeal in thla husiness in Maraachunette, in the year Ix55, are shown In the annexed aumnary :

In the minaller towna, especially in those where water is intmoluced by reservoirs, the conaumption of ice is about two thirds as grvat in proportion to their population as in the larger cities.

Now York, up to thin Hime, has exported but littis lee, bolng chiefly engaged In procuring an amount aufflelent for ita domeatio aupply. New York city and vicluity is, for the moat part, aupplied with ice by four or five joint-stock companies. The amount of ice placed in storage for the winter of 1856-7, by these varlous companies, la entimated as followa:

The Knickerbocker Coinpanj; which engrosses a large proportion of the businese, is a conmolitiation of three neparate concerna into one company, with a capital of $\mathbf{8 0 0 , 0 0 0}$. Ita anpply of ice is derived from Rockland and Highland laken. The New York and Ilrooklyn Company obtains its supply from the Hudeon Hiver at Athons; the Independent from tho same place; the l'mple's from the sume river at Catskill; and the laasaic from the reservoir at Jersey Clty

Eirport Trade.-The export of lee during the vear 1856, from llosto:4, has been as follows:

Iooberge. The accumulation upon elevated situations of frozen snow, produces those moving mseses of ice called glaciers. In the Alps, and In Norway, these glaciers coming down to a mild region melt away; but In the aretle reglons, they often flow into the sea and produce lceberga. While floating about, these masses may increase indefinitely ln size, from receiving fresh acceasions of anow, or by the freezing of the water continnally splaehed against them, as well as by the sudden freealng of the water which falln ne rail. They are of all sigen, from mere fragmenta to upward of half a mille in diamer' $c$, and of all welghts, from s few pounds to $\mathbf{1 0 0 , 0 0 0}$ tons. They rise sometimes 150 feet above the water, and this is but an eighth of the whole mass. They flont about In hundreds, and are often driven by winds far into the ocean, and bocome exceedingly dangeronn to navigation. Jceberga from anch pole have spproached nearer the equater than $40^{\circ}$ north and south latitude; they bave been met with In the nelghborhood of the Cape of Good Hope. Many of these leebergs originating on land, present the eame phenomena as glaciers. Hence, upon near Inspection, they are found to be loaded with the debrls which, an glaclers, tiney soraped off the mountain alden, past which they flowed to the sea. This dehris contains masses of greenstone, clay-elate, gneiss, granite, etc. In the polar circle, where the flosting masses reach to many hunireds of miles in length, they are called ice inlands, When two of these approach each other, sny veasel which happens to be between them in almost certain to be crushed to pieces. The larger of the two, by its grenter momentam, urges itself beneath the smaller, whlch is thun tilted up on the shoulder, of the lsgger, whose mass it gnes to increuse. The iceblink is an apperance produced on the horizon by these loo islands when atationary, and which indicates the existence of an leeiniand before it is itself viaible.

Ice-bonts, hoats so constructed as to sall upon lce, and which are very common in liolland. They go with incredible swiftness, sometimes so quickly as to affect the breath, and are found vary useful In conveyIng goods and passengers across lakes nud great rivers. Hoats of different glzes are placed in a traverse form apon a 21 or 3 Inch deal board. At the extremity of ench end are fixed lrons, which turn up In the form of skates. Upon this plank the boat rests, and the two ends serve ss outriggers to prevent oversetting, whence ropes are fastened that lead to the head of the mast in the nature of shrouds, and others passed through a block geross the bowsprit. The rudider is made somewhat like s hatchet with the head placed downward, which being pressed down, cuts the ice, and serves all the purposes of a rudder in the master, by enabling the helmaman to atecr.

Ioe Islande, a name given by allors to a great quently of ice collected Into one huge solld mass, and floating about the ness near or within the polar elreles, The motlon of the lesser pleces is as rapld as the currents; the greater, which are somethes 200 leagues long, and 60 or 80 broad, move slowly and majestically ; often fix by the thls, Immovable by the power of the ocean, and then produce near the horizon that bright white appearance called the iceblink. The approximation of two great fields produces a mont oingulur phenomenon; it forces the leaser (if the term can be applled to pieces of neveral acres square), out of the water, and adda it to the surface:
a aecond and often a thind aucceeds, 20 that the whole forms an aggregate of a tremendous walght. Thace float in the nea like so many rugged monntains, and are sometimes 600 or $\mathbf{6 0 0}$ yards thlek; but the far greater part ls concealed beneath the water. Theee ara continually Increased in height by the freeaing of the spray of the sea, or the melting of the anow whioh falls on them. Those which remain In this frosen elfmate recelva continual additions; others are gradually wafted by the northern winda into southern letituden, and melt by degrees by the heat of the sun, till they waste away; or disappear in the boundless olement.

Ioeland, one of the largest lalanda In Eurupe (beIng Ittele Inferior, In point of auperficial extent, to Ireland), fa situated in the north purt of the Atlantlo Ocean, between N. lat. $63^{\circ} 23^{\prime} 90^{\prime \prime}$, and $66^{\circ} 32^{\prime}$; and W. long. $13^{\circ} 32^{\prime} 14^{\prime \prime}$, and $24^{\circ} 34^{\prime} 14^{\prime \prime}$; the north polnt belng thus vory near to the arctic circle, hut not passing beyond It, as all maps but a recent suthoritatlve one have represented It. Ite extreme length from east to weat Is about 280 miles, and lts breadth from north to south varies from 180 to 200 miles.

The preclse period at which thle ialand was diecovered and first colonized ts unknown; but from the Landnamabok, an anclens Icelandic chronlele, and a work generally relied upon as authentle, we learn that the Norwegisns were the first settlers upon lts coasta. Naddodr, a famous pirate of that adventurous nation, was, on his return to the Faroe Islands from a predatory excursion, sbout the year 860, driven by a tempest upon the coast of Iceland. Ile ascended to the gutumit of a mountain, bu't observing around him neither the vestige of a human residence, nor aught else than vast and trackleas fields of snow, he lmmediately abandoned it. Probahly aware of this dlscovery, Gardar Svarfarson, a Swede, fellowed the same track a few years afterward, and succeeding in circumnavigating the country, discovered if to be sn leland. He there spent the winter; but finding littio inducement to make it a permanent resldence, he, in the following spring, returned to Norway. The third adventurer on this coast was one Floki, another celebrsted Norweglan plrate, who, during the two seasgns, explored a considerable portion of the southern and western coaste. His attempt at forming a permanent settlement proved, however, like that of his predecessors, a failure; his cattle died, his expected crops were rulned, and, after experlencing Innumerable distreasea and hardships from the inclemency of the weather, he determined to repair to a warmer reglon, and gave to the islund at his departure the name by which it has ever alnce been known. That this name, and the report which he spread on his return of the fuhospitable nature of the island, wero principally the effect of prejudice and disappointmoat, is evident from the contradietory account given of It by his companions, ono of whom thought he could only convey an udequate idea of its richness and fertlity by decluring that butter dropped from every plant.

The unclent Icelanders possessed, as is atill the case with their posterity, few of the luxuries or refinements of life ; and were occasionally exposed to severe privations, from the nature of their eoil, and the climate under which they lived. There is reason, however, to belleve, though the fact can not with perfect accuracy the ascertained, that the climate of Iceland was once less anstere than it now Is; and that not only trees and shrubs, but even corn, were grown upon the island. Of the ancient existence of the former, the trunks occaslonally discovered In the bogs afford pretty satisfuctory evilence. Grain of any description is not now a native of this island; and a few birches, not rising much more thas a yard in height, affori the only approach toward tlmber. Like the present inhabltants, the ancient Icelanders were much dispersed over the country, thelr habitations heing seldom
grouped together, but placed wherever the situation and nuture of the soil appenred suitable, Their oceupations and modes of life appear alsu to have borne mubh similitude, The produco of the farm, and the capture of fish, afforded them, as they to the present inhabitants, the princlpal mieans of abisistence; and their tratie with forejgn eountries made a valuable ad dithon to their demestle ermforts.

I'e, lation.-The population of Icelnud has undergone a walleruble vieissitudes through the operation of epillemies. At $50,44^{\prime}$ in 1703, It ham sunk, in 1760, to 46,241, nor did it rise mueh alove this point thronghout the remainder of the eentury. In 18,50 it was 69,157. This is small for mishanil whose surface is to that of Ireland as four to llve; but that surface, both from lis own nature, amil the character of the climate, is perhaps as unfivorable as any which exists between the limits of the two arctic cirules. Deducting the areas of the numerous fiorids atth which it is interaected, the aquare contents of the fand may ho caleulated at $37,36 \%$ statute miles: Lut as the eentre of the island consiats entirely of snowy and uninhalited mountains, the peoplet portion oun not be conalitered more than 25,060 aquam milen ; and the pojulation therefore will not much exped two permous to each square mile. At present the population must be increasing with great rapiolity, if we may juige from the proportion of births to leatha, the respective nambers in $1 \times 52$ being 2.135 (of which ild wemollongitimate) and 1417 . The whote population is employed either in farming, which ocenpies about three fourths of the men, or in tishing. Other emphoyments do not exist, ner is there anyother chans of poople or towramen, save the small Ammber of merthants in Reikiavik nod the other traling establishments. livery branch of inelustry is thereforo domestic, aul contimed shietly to articles of clothing, surh as coarse clath, gloves, inittens, and stowkings. The peasantry are genornlly ingenlous, und manufacture such simple pieces of firmlture ns their cottages require: mome also aspire to make trinkets of silver, aml articles irm the walras' tunks. The trade of Ievianl tan never, till the pres. ent time, been mannged in what modern sctenere points unt as the most advantareous way. The Danish goyemment long had a munoply of the lusiness of this remote dependency. For many years, while this was abolished, Danisa merchants hal a preveronce to trad. ing. by virtue of higher duties exneted from those of other vountries. It was not untii lasil that the foreign morehant was encouraged to come to Iechand hy a perfect equality of terms. The mily place in the island entitled to be consindered as a port is lieikiavik: only a few trading atations exist ela. where. There in an annual export of from 1,000, ton $:, 1,200,000$ prounds of raw woot, besides ahmit 200,060 pais of knlted storkinga, and $\mathbf{3}$ un, 000 mittens, or glowes without tingers. The loeland whepp have remarkably the theces of woml, which the farmers, in the spring of the year, take nef whole; their weight Jeing unally frem four to tive ponals. 'The wher principal brameh of indnstre in tcelaad is fishing, which must be consilered as in a thriving state. The fixhing-lanks around the imand alound in "enl ami uther aper?es, and the nombier
 3006 , being an advanon of nowrly bit per rent. in 20 years. Fishberil, whale-hiubier, wims, eider-rlowin, feathers, nad the Lichen Salondiows, for wediehai purporses, may alme la fucluleal amoning their line of ex.
 merthams in oxthange for roffer, shaper, folbaceo, enutf, a mall quentity of brandy, rate and rye-hromi,
 articlen an are In constant use firr clomestic purposes. These wher van afloral it, purchash a mupply of ilinems and rottens, which of tate rears have lecome of' hups common une, sul which mint tomit greatiy to eloandinesm, and the prevention of thone liseases whim word-
en clothing wom next the skin tends to engender. The truffic thus occuaioned taked place in the early' part of stmmer, and while It lasts creates a kind of fair with no littlo burtie and husiness in the capitad. Aif the artieles lirought from the interior for sade it the gea-ports, and all those taken buck for winter consumption, are trinsported on pack-horses. There is not, in fact, in all lcelnnd such a machine as at whelcarriage; befure any such can be used, thare must he rouds, of which, up to the present time, none exhst. The lines of transit along the country are mere tracks, eut deep by une where the ground is soft, and encumbered by blocks where it is haril. Yet full as these puths are of difficulties, it is surprising at what a purce the small, hardy, sure-footell horses of the country will proceed. For foot traveling they are in general impractlcable.

The revenue of the island, urising; from crown proporty, commercial chargen, a emali tas on tramaference
of property, etcon mounted in the sear coding 31 st March, 1854 , to 29,949 rix-dollars (E:1119), while the expenditure for ofleers' asalaries, ellucating the clergy, and other items, was 56,743 rix-dullars, or more than domble the income, the excess leling suppilied by the central guvernment. The income, however, appears to be increasing in proportion.

The manty produce of the land is, however, to a great degree comjensated fur by the abundance of tine fish which occurs on the const. In several pantes of the island, jarticularly on the north und uorth-west, the whark dinh ry is it regular oceupation. Stron; hooks faxtene? to chains are laited and anchored a litthe way ont to sea, and the fish when canght are thas towed to shore. Of the skin, shoes are male; a comsiderable quantity of oil is extracter, nal some parts of the lienh are oceasionally smoked and used ly the natives for food 'The coll is very plentiful ; the huldork grows to a large size; ling, skite, Hounders, und hadibut, are liknwise very common; the herring, too, frequentes the thoris in vast shoals, fut this bramet: of the fishery has hitherto been ditt te attember to. The sadmon in the rivers are said to lio very fibe, and mit country in the wonld prombee them ingreater quatity. Shals are particularly numpernes un the shares of the 1 brelle-flord and the western comast. See Eil. Lerro, iji.,
 xix., 2!1, vii., f! (lt. Sucturv) ; Ifistm. Kiv., lii.,
 For. Quar., ix., 11.

Illinois, one of the lyited states, is bumbled north by Wixemsin, east ly Lake Michigan and ladiana, from which it is meparated for a thind uf its longth by the Wabash Giver, routh hy the Ohin, which sulp arates it frow Kentucky, and wext by the Misnisijpis. It lies insween N. dat. $30^{\circ}$ and $12^{\circ}: 10^{\prime}$, and hetwern

 average lireadth, 140 miden. its area is extimatel at 55, t09 whare miles, being only about 3000 spare milen lene than that of lingland and Wialen, Acording to the comans of 1 Ris, little mure than a sis th part uf the Sitate wan umber coltivation.
llimuis is ong of the mont levid stater in the linion. With the exception of a range if low hills in the sonth, and a gerid deal of loroken daml in the morth. west, as well an a few elevathons mear the illinoin, and aone dofty binfis nong the Misalssippi, the State may bet repariled as an oxtemade table-lami, gently in lin. ing towarif the soulh-went. with a rich black loam, and exceedingly fertle. They are covered with a conrse klnd of grass, whloh grows to an enormous slac. The soll of the high and "rolling" pralrles is, in general, only of seconil-rate quality, nud abounils In aprings. Gripe-vines are abundant. The prairios furnisis an Inexhaustible summer ronge fir cattle. From the exceeding flatnese of aome of the plalns, the rains that fall ore nllowed to stagnate, and thus render the situation unhealthy, The Grumd Prairie, which is the largest tract of this deseription, is probably the highest table-lnin het ween the Misslssippl and the Wabash. It extends from the county of dackson, in a morth-enst ilrection, to the Iropuols county, anil varies In breadth from 1 to upward of 12 nilos, Athough passing under one name, if dous not custist of one single tract of land, but is broken up into several reaches of yralrio ground, with atrips of wood running hetween them. It is rich anil fertile, and reveral mettlements have been located on its heriler, which is everywhere skirted with wood. The praities, genera'!'y, are net plentifully supplied with timber, most of them heing only interspersed with groulps of trees, or skirted with strijs of forest. Much of tha young wool is destroyed by the unnual wieter hurning of the conrse grass, which revers at leant two thirds of the prairle land. In spring the prairies ugain hecomo profisely slecked with the greatest variety of beantiful and delieate flewers of every hue.

Himois is distant from the rea, but is well provided with rivers. Nearly three fourtho of its heundary is formed ly navlgalide rivers; and on the morth-cast it has Lake Michigam for upwarl of go miles. Ithe Mississidpi, which forms its entire western, and the Ohin, which forms the routhern bommary, give commarcind access to those valley's which hear their names. The Wahash, a nohle stream which hombla the State on the east for more than 100 miles, is mavigable for more than that sistance. For internal communk ation, thu Illinois, which belongs entirely to this State, is mavigable at all seasons for stemmbats for 260 niles, to la Salle, where navigation is atopped oreasionally: by the little raphls, and where a ranal bramehes off, comecting the river with Jake Michigan. The prlacipal tributaries of the Illimols, whinh is it self furmen by the junction of the Kankakre and the Dee I lianes, are the Fox River, which rises in llurun 'Waritury, and hat a course of 200 miles lnefore it joins the llifnois: the Vermillom River, whinh falls into it from the south-eust ; the Sangmon from the east, the Sickinaw from the northorast, and the Spoon liver from the north-west. 'These aro almost all mavi able for comsiderable distances. The Sangamon is navigaHe for $1: 16$ milea. The little Wabash mat the limburrass, which flow inte tho Wathash, are likewiso navigable for upwarl of 150 milon. The liock liver, which rises in Wisconsin, nul falls into the Misslssippi, after a comese of ahout 300 miles, is navispable for soute distance, but its niper course is impeded by rapils.

The climate of Ithinoin, extemitig us it hees over a space of 5! clegrops of latitude, munt neressarity be varied. The matural diffrenco of temperature between the northern ant the mathern parts is, however, inereased, hy the mumeronand harge rivers which fomim! and int risect the country, had ly fis state of coitivation. livery whare tive winters are acvere, the summers low uni long, and the temperature suligocet to frequent and wuditul changes, In tho sonthern parts. of the Atate the sumuner heat is rery oppressive and anersating ; and is only occasionally relievol hy fresh breezes frem the prairies, In wiuter the smow falis to a comelderable depth, and lies oreasionally for threw montha ; and mang of the rivers remain frozen for the name lamith of there. In sume parts of the State only a few linches of snow falls, and it quickly dis. appears.

Illinnls possesses as vast extent of arable land. The soil, although varled, is generally highly productive, and for agriculture, it has been consldored as unsurpassed by any State in the American confederacy. The Boll In "the bottems," or along the rlver valleys, such as those of the Rock Rlver, the Sangamon, und Kaskaskla, consists chiefly of rieh alluvial deposits, and is so productive as frequently to yleld 40 bushels of wheat or 100 lnshels of Indian cern te the acre. Nearly all the tracts adjacont to the rlvers ore of thls charscter. "The American llottom," as it ls culled, is the richest river alluvlum, and has heen oropped without deterioration for a century. It extends along the Mississippi for 90 miles; but In consequence of its linbllity to inundation, much of it is uncultivated. The pruirles, although lesa prialuctive, are still vary fertle, and on avcoant of thelr greater sulubrity are preferred for farb.s, wherever wood is to he ohtained. In 1850, there were $76,60 \mathrm{f}$ farms in Illinois, centalning 5,039 ,0.55 acres of improved gromul.

Important and valuable minerals abound in this State. Bituminous coal orcurs in ulmost every county; anl in some instances may he ohtained without exenvation. Vast heds are foimel on the blaffr adjacent to the " American llottom;" and it has been reporten thert. anthracite wol has been founil in the comnty of darkson. Lhat the great roal region is an extensive tratt which extemils quite neross the State from Mlsw souri to ludiana, and from Jowa to Kentucky, Iron has heen fombl in the southern part of the state, and Is said to be plentiful in the northern. The great lead region is shared letween tllinols, lewa, end Wisconsin. Galena in the north-west is nearly supported by this minoral. Silver has also leen iound in the west purt of tho St:te, and ropper is obtalned In reveral phaces. The other minerals found here are, zinc, gypsum, quartz, erystals, ete.

Manufuctures, ctc.-There were in the State in 1850, 16 woolen fuctories, with a caplal invested of $\% 154,500$, employing 124 mates and 5.1 females, manutacturing $: 306,995$ yards of rloth, nud $1: 17,000$ ponnds of yarn valuelif at with 4 capital of (is, 0000, employing 150 persons, prolacing 2,700 toms of ping iron, ete., valuel at $\geqslant 70,200$; $2!1$ estahlishuruts with a eapital of $\$ 260,400$, empleying atis prosoms, and making 4,160 tous of casthgs, etc., valuet at *.1 11,185 ; 280 thouring and grist mills, |N7 naw mills; 0.1 printing othees, 10 dhily, 4 triweokly, of weokly, 2 semf-monthly, 7 monthly, snd 1 quarters publicathos. 'Total value of manufactured urticles, $\$ 5,2(0), 001$. There were in January 1*5t, 2,215 miles of railrond In operation, and 1,045 miles in course of eonstrustion.

The intermal trude of this State is heconing considerathe, and increasing in proportion to the means of Listermal comammination. Its direct forejgn commere is small, and is chiefly with direat Uritain.

Its internal improvementa for nome years past hase been very great. Canals have been formed to compensate fur the natural harriere to navigation in souse of ita river, and recently its grent canal from Chicago to Peru, on the llinois River, has heen completed, uniting the waters of Lake Michigan with the Missin. sippi; thus opening direct communicstion bet ween the whole of the Lake district in the north, nud the river navigation on the aouth. The aystem of railroadn, profected on a grand scale upward of 20 years ago, and which had been temporarily auspended, has beea reaumed some yeara sgo on a still groater scale, and ind being earried on with vigor. Chicago, its principal commercial city, is connected with liurhford, St. Charles, Aurora, l'eru, and many othec places within the State, and beyond it, either directly or indirectly, with Detroit, Cincinnati, New York, Philadelphia, and Boaton. Beaiden these there were railroals uniting Springfield with Jackrouville, and Naples, Alton, ard Quincy, with Columbus. When its railsoada under construction are fininhed, Illinons will the aurpassed for its railroad commmication by hut few States in the Linion.

Immigration. I'rogress and Artent of Immigration to the lnited sitates.-We will review the progreas and extent of immigration the the litad States of America prior to IN19, the year In which the present officlai listory acgins. As, on this point, no anthentic inismation exista, it mast he aletermined by much evidence as atatistichan of that pertor poscessed, and liy the relations then existing berween the Uniterl States and the rountries from whilh persoms mingrated. The current of emigration commenced fia thow from England, Ireland, wall Seot. Land, and from (iermany though she Firench and JiritCh ports. It was nubject to msing fluctuations durimg a part of this timer, but comtinued with conaiderables unisformity, if is belleved untif Inoti. Mr. Samuel lloolget, a atatiatician of more than ordinary reaearch sud aceuracy, wrote in 1 M06, while avery fact in regaril to lmmigration wan frexh in the rinals of the people, that from "the beat recorda and eat'maten int jreacnt attainabie"
the immigrants arriviag in the United Statea did net average, for the 10 years from 1784 to 1794, more than 4000 per annum. During 1794, 10,000 persona were eatimated to have arrived in the Unlted Statea from foreign countries. In 1818, Dr. Adam Seybert, member of the House of Representativea from Pennsylvania, in his exceedingly valuable "Statistical Annald" of the United States, wrots to the following effect : "Theugh we admit that 10,000 foreigners may have srrived in the United States in 1794, we can not allow that they did so, in an equal number, in any preceding or subsequent year until 1817 ;" and he assumes that 6000 persons arrived in the United States from foreign countries in each year from 1790 to 1810; to blim, and to the authorities he consulted, this average scemed a generous one.--Seydent's Anvals, pp. 28, 29.

During the 10 years from 1806 to 1816, axtensive Imaigration to the United States was precluded by the unfriendly relatiens at that time existing between Great Britain, France, and the United States. England maintained the doctrine, and, for s while enforced it with aucceas, that "s man once a subject, was alwaya a subject." This deterred many from pmigrating to the Un:ted States from tho British empire. Numbers had previously come for the purpose of entering the merchant-service, and numbers might atill have come whom the fear of llitish imprensment friglitened from carrying out their design. Auother influence retarded immigration : in 1806 Great llritain issued a decree declaring the coasts of France in a atnie of blockade. A retaliatory decrec was, in No. vember of the same year, issued by France decharing the British lslen in a state of blockade. To these restrictions on commerce, sad, consequently, on the unobstructed passuge from Enropes, succeerled the British orders in council, and the Milan decree of Napoleon. In March, 1809, the linitel states' law was passed prohiliting, for one year, intercourse with tireat Jritain or France. In 1810, the Najoleonic decrees wero annulled, and the commerce of the I'nited States hal, in Ix11, fairly commenced with Frasce, tut ouly to have their vesaela fall iate the hands of the Itritish. I'reparations were now making for active hostilities, aml, on the 18th of June, Ix12, war was formally declared ly the United States to exist with tireat flritail.

The (iermun emigration sensibly felt this unfavorable condition of affairs, inasmuch as the Germans emoarked principally at the ports of liverpool and Havre; facilitios for migrationg thence to this conntry being more munerous, aud the expronse of the voyuge lews onerous. Thus, from 180t, was the strean of emigration pent up at its fontatain. In February, 1815, peace was concluded tatween the Inited Etates and Great lBritain; and after several months repuisite to restore tranguillity, and to secure the conlidance of thone deairing to leave the ohd World, tho tide roturned to its thow, and, with a xpeed kreatly accelerated; as, trom authentic information, collected principally it the aevaral chatom-houses, it иpparn that, during the year 1817 , not less than 20, ?ft persuns arrived at parts of the l"nited Statev from forvign countries. Thiv number inchaded American citizeus returning from abroad. -SEynent" dnals, 11. 29. In wo year previons th that hat one ha. If so many forcifin panempers reached our shores. Many sutioriugs were incident to a vogage moross the AtI:antic in a crowiled emigrant vesvel; and there were no dawn of the I'nited States aither limiting the numler of persons which a passenges nhip or vessel shookt lie entitled to carry, or providing any measures for the henlth of accommodation of the pasmensere. The auliject acemed to daserve the fimmediato attention of Congress. In lsis (March 10), Mr. I.onis M'Lane, of Jelaware, reported to the Iloune of lieprementatises a bill "regulating pansenger nhipe and vensels," which was read twice and referred to a committee for inves-
tigntion subject wa Newton, 0 its pasaag the House the Senate proved Ma ment of reported q numiser of tricts, by age, and o try in whic Iny that same act, Secretary these repor compiled. tion is, don 930 persons to have bee of the 1,31 "Great Brl States, 1,00 thus makin Sce Euign Tural Nom

Legurl Rig States.-. Ilii Concirresw, a the Irited and to the the single p tha allice of taen native. the tilue of Congressa cal of their rel speech. Th pryers, and reizares, is
tigatlon into the subject．In December，1818，the sulject was brought before Congress by Mr．Thomas Newton，of Virginin，who explalned the necessity of its passage．It was read a third time and passed by the House．After recelving amendments from both the Senate and House，it wan finally passed and ap－ proved March 2，1819．In complance with a require－ ment of this act，collectors of the customs have reported quarter－yearly to the Secretary of State the number of passengers arriving in thelr coilection dis－ tricts，by sea from forelgn countries；also，the sex， age，and occupation of such passengers，and the coun－ try in which they were born．Annual reports embrac－ lag that Information，have，in cenformity with the same act，been communlcated to Congress by the Secretary of State；and，as before indicated，from these reports chlefly，tiiiz inistorical sketch has been compiled．The country having the largest emigra－ tion is，donbtless，Ireland ；for，In addition to the 747，－ 030 persons arriving from the Unlted Kingilom，known to have been born in Ireland，it is safe to assume that of the $1,348,682$ others，born as Indefinitely stated in ＂Great Britaln and Ireland，＂arriviag in the United States， $1,000,000$ at least，were born in Ireland alone； thus making $1,747,930$ os the tetal Irish emigration． See Emionition．

Next in numerical order comes Germany；Ergland thirl；and France，fourth．The emigration of Chinese te this country，was very inconsiderable until 1854 ； previous to which year，the aggregate number known to have arrivell was only 88．In that year，however， 13,100 came to the United States；end in 1855， 3526 ； all of whom，with the exceptlon of a single passenger， landed at the port of San Franclsco；15，950 were meles，ond were designated in the returns of the col－ lector as＂laborers．＂
As regards passengers from Britlsh America，the fact may be deemed worthy of mention，that many of them，especially of these arrivirg during the last four years are known to have come with the intention of returning，and not of residing in the Unlted States． The number of such can not，however，be determined． Finally，to the $4,212,624$ passengers of forelgn birth arriving in the United States since September 30, 1819，may be added 250,000 as the number of immi－ grants who arrived prior to that date；making the total foreign arrivals from the close of the Revolution－ ary War te December 31，1855，4，462，624．－Bnom－ wela＇s History of Inimigration．New York ：1856．To this large number may be added，as variously poti－ materl，from 500,000 to $1,000,000$ ，who emigrated to the western States through Canada．

Importation and Exportation, the bringing of conmodities from and sending them to other countries. $\therefore$ very large portion of the revenue of a commercial country is derived from customs duties, or from dutiea on commolities imported from almond; and drawbacks being given on many, and hounties on a few, articles exported; the buainess of importation and exportation is sulbjected to various regulations which must be carefully observed by those who would avoid incurring penalties, and sulsjacting their property to contiscation. See articles Taniffand Unithen States for the imports and exports of this country.
Impressment, the forcible taking away of seamen from their ordinary employment, and compeling them to serve, againat their will, in national ships. Sen Lid. Rer., xli., 154 ; Westm. Rer., xx., 489 ; Blacktocord, xx., $\mathbf{7 4}$.

Indemnity, is where one persons secures another from responsilility against any jarticular avent ; thus a policy of insurance is a contract of indemnity against any particular loss. Where one person also becomes lisil for anther, a bond of indemnity is frequently executed; and where a bond or bill of exchange has leen loat or mislaid, the acceptor or obligee would nos: act pradently in paying it, without being secured by a boud of indemnity.

India, or Bindoostan, has from the earliest ages been celebrated as one of the most highly-favored conntrien on the globe, and as abounding in the choicest preductions both of nature and art. In ancient times, this dintant region was very imperfectly known to the Greeks and other nations of the west; lut they innportel ity most valuable prodnce, its diamonds, its aromatics, its nilks, and its costly manufactures. The country which alounded in those expensive luxuries was naturally reputed to lo the arat of immense riehen, und every romantic tale of its feliefty and glory was readily believed. In the mildle nges an extensive commerce with India was stiil muntalned theongh the yorts of Figyt and the led Sea; and its precious proluce, imported into Europe ly the merchants of Fonice, contrmed the popular opinion of its high rofinement and its vant wealth. After the diseovery of a passage to ludia by the Cape of Gooll Hope, tho same isleas still prevailed; and the maritime at ates of Einrope contended with their tiects and armies for the dominion of the Asiatic seas, and for the commerce of the coantry: The lortuguese, and afterward the I)uteln, made importan, conluestr, and esrried on an extensive trade. In ater times, Great Hritain and France a!peated on the fiell an competitors for the prize of lmian commerce and dominion, and ware allowed to estallinh factories on the coasts for the seception and the store of goods. Theme were gralually converted into military posts, defended hy soldiers and camon; and in dia tine those two powers ware ranged on opmosite miles in nil. the wars and politios of India. This rontest torminated in the trlumph of the Britiah arma. "rance lont lier preombinese on the continent of In", wat lipr great rival, entat ring her powern on

barbarism, the scene of many eventful revolutions, from the Mohammed invasion $t^{2} l l$ its conquest by the armies of Britain, and inhallted by a people of peciliar manners, laws, institutions, and religion, still presents a wide field for interesting iaquiry and speculation. In the following account of tivia interesting country, we propose to describe-1. Its geography and natural features; its produce, its animala, its manufactures, and commerce; the numerous races ly whicit it is inhalsited, with their manners, religion, anc nolicy ; and the wars and political revolutions which have terminated in eatablishing the sway of Great Britain over nearly the whole continent of India.
I. The ancient geographers hall no precise ideas of the extent of Hindoostan or India, terms which we mean to use aynonymously in the following artiele; and they accordingly exteniled its frontier westward as fur us 1'ersia, und eastward to China. In after ages ita limits often flucturted with the events of war, and served only to mark out the course of conquest, with little or no attention to geegraphical accuracy. Yet in no part of the earth lias nature pointed ont, in the great features of the country, more diatinct and mugniticent houodaries. On the north it is separated fromthe elevated table-land of Thibet by the precipitons wall of the Ilmalaya Mountains, the highest land of the Asiatic continent ; on the west the Suliman range, a continuation of the Sufeid Koh Mountains, separates it from Afghanistan and Heloochistan ; its east bound. ary is formed hy parallel offishoots from the opposite extremity of the Ilimalayas, and by the contimuns runges of forest-covered hills, which, skirting the liengal district of Chittagong, Atreteh southward to the recentiy-acquired , rovince of l'egu, and separate the liritish dominons from the territory of lhumah. The Indus und the Ganges discharge themselves intu the ocean on the westorn and eastern couasts of liindoostan, in about morth latitude $24^{\circ}$ and $22^{\circ}$; und to the south the country is eontracted into an irregular triangle, projecting into the hadian Ocean to within eight de. groes of the equator, or about 1000 miles, and un all sides inciosed ly the sea. 'The extensive region situatel within these limita is noarly comprohended lietween the 8th and 35th degrees of north inticute, and between tlie iongitudes $1 ; 5^{\circ}$ and $99^{\circ}$ past; and its length from the northern harrier of the Ilimalaya Mountains to t'ape Comorin is about J!00, while in breadth it may lee entimated at 1800 miles, thongh, owing to the irregularity of its tigure, it dues nut ex. ceed $1,484,367$ English square milen.

Ilindoostan is of an extremely diversified aypect, and comprehemda within it thonds all the sarietipe of climate, of aoli, and of natural acenery, froth the inare and nakul rock, and lofty mountain barimi umber eter. oal nows, to the low and fertile plain, woupched ly the trupical sun, und the reat or luxuriant vegetation. This diversity in the aspert of the country has piven rise to the fullowing territorial divinions, mamely: 1 . Northern llimesostan, whilh comprehemis the limalaya Nomatalas on the nucth, with their lower rampes of hilln stretching sonthwarif to the plainn of the Indun and the Gianges, and extending from l'eahaw and Cashmere on the west, to Hootan mand Assam on the east. 2. Ilimionstan 1'criper which extemin nouthward as far as the Nurlmalah Biser, where the becran rommenere, and which includen the hower prove inces of ildagai, the north-westorn phovinces, tugether with, Oule, Malwa, or Contral India, the ['mujal, Guze etat, siade, and C'utch. A. The Jecean, houmdeel on the north liy the Serhondah Yiver, ami on the sonth by thos Rivery Krishma mal 'lommbuita, compronemls the latger portion of the presideney of Ihomata, to gether with Grima, the Nizam'n dominions, and the torritory of Nagpore. 4. Inti.s gonth of the ('rishma lives, comizrehending the territories under the administrathon of the govermment of Mosiras, togather with the native states of Cochin, Travancore, and the Mysore.

aspect with ranges of in level of per tures of alpi mountain, $t$ springing 1 mass; and with the fon laxuriant fif lower hills; often seen ; ing the mot and unvary level the col its the mon valiey is cl with the ma trees, the op lovely or od riant alpine the head wa the Sutlicj, $t$ Alkananda, riced anll 811 The valiey harren moun cur of lofty throurg wh dark chasms with forts, with trues $t$ of the lumn will, aro wo the hills fer somrce, the still mit nea ruttee, The rugged, and

The Ilimnlaya Mountaina contain the sonrces of the great rivera whlch flow through the burning plains of llindoost:mn. The deep valleys between the mountalns are the chanuela through which the waters flow from the higher grounds; and, by the melting of the snow, those streams, sudderly swollen Into torrents, and rushlng down the declivity, work out a doep and narrow channel among the rocks, where, imprisoned as it were between steep and perpenclicular rocks, they roas and foam amid precipices, or in dark and unfathomablo glons, exhibiting, in the conflict of their troubled waters, all the great phenomena which belong to rivers, namely, the cataract, the ranld, the boiling eddy, snd the dangerous whirlpool, and only subside into smoothness when they break ont and spread over the plains. Huge rocks were seen by Dr. Gerard whirled along with frightful velocity; nothing visible but an entire shect of fomm and spray, thrown up and showered upon the surrounding rocks with loud concusslon, and re-echoed from hank to bank with the noise of the feudest thunder. Across these streams are thrown rude bridges mate of ropes or of wood, the usual expedieot by which rivers are crossed in all mountain ceuntrics. Where the breadth of the river is small, the passage is effected by one or two fir spurs laid acwoss from rock to rock; lut where the space is wiler, a bridge of ropes is constructed, on the principle of the chain-brhige. In attempting the passnge by one of these ruile bridges, a carrier who necompanied Fraser in his journey to tho sources of the Ganges unfortunately lost his footing and fell inte the water. Ile was instantly swept down the stream to its junction with the Bhagirnttee, ahout 50 yards, "when his head," says the truveler, "appeared for a moment, and his lual floatiag lieside lim; hat the faming current of the Baghiruttee here tumbling over large rocks with a mighty' roar, seized him and hurricd him along with its tremendous torrent."
Northern Ilindoostan varies in its climate and in its aspect with the height of the grounl. The lower ranges of mountains, though they searcely reach the level ef perpetual snows, still retain the sublime features of alpine scenery; namely, the rugged and bure mountain, tho criggy rock, white, gray, red, or brown, sprioging up in fantastic forms above the general mass; and the deep and suddeuly descending chasm, with the foul torrent foaning over jts rocky hed. The luxurinat foliage is wanting which embellishes the lower hills; the rich and smiliag valley is not so often seen; while the forests of dark lirown fir fringing the monntains and the hollowa impart a sombire and unvarying appearance to the scene At a lower level the country improves; and thongh it still exhibits the mountain and the precipice, the intervening valtey is clothed with verdure, and the lower hills with the most magnificent forests of large und lofty trees, the upen country with roses, jasmines, and other lovely or edoriferens shrubs, and with the mont luxuriant apine plants. The vallegs through which flow the head waters of the Indus and the Ginuges, mamely, the Sullej, the Pabur, the Jumma, the Baghiruttee, the Alkananda, with their tributaries, exhibit all the varied and sublime scenery of this romantic conntry, The valley of the sutlej is hemmed in hy brown ani harren mountalis, steep and rocky, without the gramdcur of lofty precipices or friaging woml. The hollows throbgh which it receives its tributary streans are dark chasms, without cuitivation ; the heights erowned with forts, but without any neat villages surmouled with trees to reieve the a djacent desert. The banks of the dman:, on the other hand, though rouky amil wini, are wooled and green, and the blophing faees of the hilis fertile and well cultivutod; and even at its source, the country, however wild mul pirturesque, is stili not neariy so dreary ns the valley of the Ihaghrutteo. The fentures of the landsempe are here lofty, ragged, und inaccosalble, with loas of the heantiful
than of the sublime and terrible. A pleasing contrast to this wlld scenery is presented by the smiling valley through which the Pabur meanders, checkered as it is with pacture and cropa, and the banks and the hilla clothed with cultivation, illlagea, and vood. Such is the usual aspect of the lower vallev of northern Hindoostan, the height of which is for the most part from 3000 to $\mathbf{6 0 0 0}$ feet above the plaina. The difference between the northern and southern exposures of this mountainous country is remarkable, not only in the formation and structure of the billa and rock- but in the vege atlon. The country on its southern face is of a brown and dusky color ; the grass short and parched; the hills rough and lumpy, with rocks atanding through the ground; the lower parts bsre of wood; and above, the Weymouth pine, with a few stunted larches surinkled among the rocks; while the higher parts are sprosil over with oak, holly, and alder, their leaves of brownish green, harmoniving with the burned appearance of the hills, and giving a sombre hue to the whole scene. On the northern exposure a rich color of dark green is diffused over the whole landscape; the rocky sides of the glens are bolder and grander; and they are clothed with noble forests of larch, siiver and spruce firs, which shrould from tie view the highest and steepest cliffs. "All," says Fraser, "was rich and dark; and here and there a glade opened, or a high slope extended from the base of the rock, or projected between $t$ wo streams, of a bright beautiful green shining through the sombre forest." This difference between the northern and southem exposures is strongly marked all over the hills.

That strip of flat country, about 20 miles in breadth, which lics at the base of the great H1malaya ragge, dividing it from the plain of the Ganges, is called Terrue or Terrecana. It is covered with thick forests and low swanps, and, though fertile, it is so unheslthy that it is little cultivated. Hishop Heber graphically describes it as a long, back, level line, extending nt the foot of the lowest hills; "so black and level," he adds, "that it might seem to have heen drawn' with ink and a ruler." This that does not extend further north-west thun through a portion of Rohilcund, where the heulthy cultivated country reaches to the foot of the hills, which rise abruptly from the asandy that beneath. These low hills are watered by streams from the higher mountains, that rise to the level of 1500 or 5000 feet, from whieh the lower range is frequently sepurated by fine valleys of some length, which are called doon by the nstives, answering to tho scottish name of st "ath. The hills which rise beyond this lower range, to the height of about 5000 to 7000 foet, are lofty anil majestic, and broken into numorous ridges, divided by deep shaggy dells. This appearance lraser ascribes to the quality of the rock of which they are composed, which consists of a strongly indurated chay, with a mixture of siliceous matter, forming a rock exceedingly hari, though easily destructiblo hy exposura to the nir, and splitting into variouslyaized fruments leaving hard marbly musses staring through the acanty soil. it may be timally remarked of this singuiar and interesting country, that though it uppars rom the plains to be divided into distinct raluges of terraces, it is really a vast collection of mountains heaped in masses one nlove another, without nuy order or phan that can be discoverol, uatil the height of land is reaticed at the great Himalaya rilge which extemis from beyond the sources of the Inthas in a continuous chan fir into Chima.

The following are the chief rivers of 1 lindoostim, with the length of their respective conses to the sea: Indus, 1700 mides; Brahmapootra, 1900; (hamges, 1,00; Jumat (to its junction with the (ianges, $\overline{8} 80$ ). 1500; Sutiege (to the Indus, 90M), 1-190; (ihylum (t) the ludus, 750 ), 1250; (iunduek (to the Ginges 150), 980. In the Deccan, and south of India, the Godavery;

850 ; Kiatna, 700; Nerbuddah, 700 ; Mahanuddy, 650 ; Tuptee, 460 ; Cavery, 400. There are few coasts of ouch extent so destitute of islanda and harbors as that of Ilindoostsn. With the exception of emerged sea-banks and mere rocks, Ceyion is the only island near its shores ; and on the eastern coast, Masulipatam, which admita vessels of 300 tons burden, is the only harbor for large vessels between Trincomalee, in the iniand of Ceylon, and the Ganges, which is free from raging surf. To this Inconvenience Mairas, though an important British settiement, is peculiarly liable. On the western coast, the only harbors capable of ailnitting large vessels are Bombay and $\mathcal{K}^{-1}$ arachee, in Scinde; Mangalore admits no vessels drawing more than 10 feet.
Mindoostan comprehends within its bounds the opposite extremes of heat and cold. The phains are bnmt up with intense heat ; while winter, with every intermediate variety of temperature, prevails in the mountains. Philosophers have in vain endeavored to fix the point of perpetual congelation under different degrees of Intituile. They have, indeed, frumed a graduated scale of the respectlve heights at which, according to ealenlation, this point should begin at corresponding distances from the equator; but theory is here at variance with actual observation. The clinate ef motntalnous tracts tepends so much on localities, and the marticular course of the winds, as to ba, Healigencral speculation. Hence, on the llinalaya Mountains harvests of graln are fonnil, where, accordin; to hypothesis, the ground should he buried und ir tleep snow; and trees are seen to flourish in the reg ons of perpetual winter. Captain Webls, in ascemili or the llimalayn range, saw around him, at the height of 11, 630 feet alove the level of C'alcutta, rich fores's of oak, pine, fud rhododendra, the ground eoveres! vith vegetation as high as the knee, strawherry-ieat In full thower, and currant-bushes in hossom: and in 1818, at the Niti Pass, Jti, \& I f feet in height ; ilosophy was apain at fault, as the found wo ceco. of snow, thoukh aloove the line of jerpetuai comgelation, anil many guatrupeds were feeling on the grassy banks of the statege. It was remarkel by lor. tieraril that vegetation att:ined a higher level on the northern than on the southern face of the llimainy rilge, where the extreme height of cultivation is 10,000 feet; the limit of the forest, $11,80 \%$ thet, and 12,000 fert that of bushes. In the northern side eultivation risen to the height of 11, lion feet ; in other places to 13,600 feat : birch-trees to 14,060 feet ; and tama-huwhes, which form exrellent fuel, to the helght of about $17,0 \%$ feet. In northern llindoostan. great and sadilen changes of $t$ emperature occur, which is the cause of pulmonary affections. Iluring summer, the thermometer, which is often lin the morning at $32^{\circ}$ or under it, rises to $\mathrm{a}_{1} 1^{\circ}$. $75^{\circ}$, and $80^{\circ}$, or upward, durhig the day; the winters are, however, unifomly severe. In this also, us in other hilly countries, the traveler may be fainting today under a tropleal sun, and shivering thmorrow amid the rigor of perpetinal snows. From the hanks of the Sutege, where the tharmometer frequently ntands at 104\% and 10RO, three days climbing will carry hin intothergions of winter.

In the plains of Ilimbeostan, the heat during the greater part of the rear is unintermitting and intense, excent where it :s nowlitied live the ranges of mountains, or the tabie-lands towanl the wext. The seasone here are commenly divided into the hit, cold, and rainy. The apring and the slry measom throuphont the valley of the lianges lant abenit fiour ment ha, the heat grailu. ally increasing with the seanes, untii, in May and Tune, the thermoneter riaps to $10.1^{\circ}$ and frequentiy, in the interior, to $10 x^{\circ}$ and $110^{\circ}$, when it in almost intolerabie even to the nativen, and still more so to lillmopeanm, who remort to varioun moxlea of alleviation, wuch as the cuscus fatty, which in a frame of wood intermenen with twiga, lectwern which is dixtributed a
layer of a partlcular kind of sweet-scented grass. Thls being hung before an open window, in the quar. ter of the prevalling wind, and constantly moister ad on the outside by a water-carrier, diffuses a refresning coolneas.

Vegetable produce.-IIindoostan comprehends all tha known varietles of the vegetable tribes. The maunt. ainous tructe of northern Hindoostan produce all the Alpine plants, and the varioue specles of luropent grain, frults, and flowers. Deep wools cover those lower sanges of mountains, in which are found the pine-tree of various species, "the tallest, straightent, and moat magnificent," alya l'razer (l'raser'e Journal of a Tour throngh the llimalaya Mountains p. (3it), he ever heheld, the larch, the silver, aud the spruce-tir, from the bark and twigs of which resin exudes in abundance; the yew-tree, several species of oak, holly, nider, Nyemmore, nad birch, with $r$-ulherry und chestnut-trees, İere is ulso found the minosa-t ree, from which is made the eatechu or In.lin-rubber: the resinous part of this tir, cut into slipn, unswers the commo uses of the lamp. These nohle foreata extend over inisamese tracts, and would affurd inexhanstille supplies os simber if they cunll le transported to the proper market. Fruits in great variety ure also proluced in this elevated resion, such as apricats, peaches, and grapes, apples, pears, curtants, raspberries, blackberries, anil ntrawherries; roots, anch as turnips, earrots, garilic, and onions; thowers and plants, as roses, both red and white, lilies of the vailey, jesmines, butter-cups, yellow, bltte, and white, cowslips, and aweet-!riar, with numerous other beautiful and fragrant plants. The vallegs exhihit, according to their altitude nini temperature, the jroductions of Eumpe or of the tropical countries. It the height of cono fret appear the oak und the pine; at that of $\mathbf{f 1 0 0}$ feet matans and bamboos of enormons dimensions; in some parts the pine-spple, the oringe, and the sugar-cune, frow to maturity ; in others, barley, millef, and similar grains are produced. The luwer part of these hills is the seat of the situl foreses. The lower valleys vield rice, sown bromberast, maize, wheat, barley, pulse of various kidds, sugarecane, cotton, Imilian malifer, a large species of carilamum, hesinlen other prodnctions. The pastomi tribics of morthern llimhostan feed comsiderable tlocks on the lower hills und valleys ; in summer they clion the $H_{\text {pine }}$ conntry, and browse on the herbage adjacent to the region of jerpetuai frost.

Bice is the great staple of agritulture thromghout IVindoostan, in the phain of the tranger no well as in southern lodia. It is sown at the approach of the rains, and it is gathered during the rainy seasom, about the end of Augast ; the last "rop is sumn luring the same neason, uni is gathered in the hefinuing of 1hacember. It is esteemed the bent, mot being fipmally linhle with the other to decay. The diversity of somil and climate, and the several apanons of coltivation. have given rise to latinite varieties in thia sper'mes uf' grain. When the raina Gail throbghent limberstan. which oremionally hapmene the ricte erpos are att to In defliciont to a degree altogether maknown in the well-regulated agriculture of Europe, where the swerest searcity hanlly ever risen the price of conn mume than thres times its uanal rate. lat the fominev ol llindenstan leave thousabla without miloniotetues, and fill the laml with sormes of misery and death. In the
 the peagile perished ; the uir was molnfecten by the nos-

track of the Ganges, and in southern IItndoostan, especinlly on the low linds of the sea-coast; higher np the Ganges, whent and barley are moro generally cultivated, niso in the high grounds and elevated talle-lands of southern Indln. Other kinds of graln are cultivated, such as Indian $\mathbf{c}$ )rn; and great varieties of pulse unil coarse gralns, such as pasa, beans, chiches, gram, votches, ond raggy, whicis is the most important crop raised in the dry fleld, and in some parts of southern India is the subsistence of all classes, in others of the poorer clasges. These ore important articles of cultlvation, as they have each thelr particular season, and thrive even on poorer acils. Maize ls the general proluce of poor soita in hilly countries, and la commonly cultivated in the moro western provinces. Millet and other grains are also cultivnted, and vegetating rapilly, in every soason they fill up protitably for the farmer tho short intervals between the other modes of cultivation in lower lindoostan. Sugnr la everywhere cultivated, and at little expense by the IIindoo cultivator; and as the augar of India is ne longer subjected in the United Kingdom to an unequal import daty, there is reason to hope that the produce of India may competo net only with the sugars of Ilritish colonies, but these also of Cuba, Ilrazil, Siam, nnd Manilla. Theugh formerly unknown in Eurepe, sugar has been produced in Indin from the remotest times, and was thence tramsplanted into Arnbia, whence It has been introduced into liurope, Africa, the West Indies, and America. It grews luxurinntly thronghout all the valleys of the Ganges, and in the plains of southern india, and could be produced, with the help of Earopean akill and capital, to meet any demand. It thrives more especially in Ihahar and lienares, and in particutar districts of liengal. Opium is the peculiar and stnple prodnce of the province of Bahar, and is also extensively cultivated in Malwah, and in other parts of Ilindoostin. It is a precarious crop, producing alternately high prolits and henvy losses. The liguor extracted from the poppy la collected ns it exudes, and is then placed in pots, where it is dried nnd formed into lumps, in which process it loses from one tenth to one eighth of its weight. The opium produced in lahar and llengal heing monopolized by the Enst India Compnny, and bought at a fixed price, is a contrabanil article of trade, and its cultivation is confined to certain districts. Within Rengal no one is allowed to cultivate the poppy, except for the government. In Malwah a treaty was entered into with the different rulers and chiafs, by which the monopoly was extendel to that country, and all that was proluced delivered to the Company, at the rate of three rupees a seer, which is two prounds. But so great was the discontent excited by this extension of the monepoly, that, at the devire of the chief, the treaties were rescinded $\ln 1 \times 19$, 1820 ; and the trade in opiun and its cultivation is nuw free in that province, and everywhere throughout India, except in the Compuny'n dominions; but as Malwah is completely surrounded by Ilritish territory, a large revenue is derirod from the high duty levied on Dlalwah eplum, in transit to llonbaty for exportntion to Chima. Nalwah opiam equals that ef Bonga, and is bronght into competition with the Company's opinu in all the foreign markets, and especially in China (see appentix to the report on the Fiant India Company*s allairs, p. f5). The cotton phant has from time inmemorial been enc of the staple products of llimltestan, and is indigeneus from Ceylon in the south to the Ilimalaya Mountains. It is cultivnted extensively throughont lengal, and In the interior provimes, on the tranks of the Jumana; also in the Decean, and in suthern India, whence it is imported into llengal, and into Mirzapoor, and the district of lhmares, where it is manufactured. Flax and hemp nere also cultivated in several districts both in the north and in the muth of lidia. Silh was long the exclusive prislnet of ladia and China, Silk-sorms are now reared
princlpally in the dletrict of Burdwan, and In the vlelnity of the Ihagirati and the Ganges, and for about 100 miles down their streams. Four crops of mulberryleavea are obtained in the year, the last in December. A considerable quantity of sllk, of a coarse kind, is obtalned from wild silk-worms, which do not feed on the mulberry, and are found in the foresta of Sllhet, Agsam, and the Decean. Indigo was originally a product of India; and the plant was afterward carried to South America, whence Europe was for a long time supplied with this dye. The manufacture, on which the quality of the indige depends, waa very nnskillfully conducted until the year 1783. Since this period it luas been so much improzed by the skill and capital of Europeans that it is now a staple article of commerce; and in Jlengal the value of the produce in $\mathbf{1 8 5 4}+$ emennted to $\mathbf{8 1 , 7 0 1 , 2 0 6}$. Indigo is produced generally throughout the plain of the Ganges, and in southern India, bnt chiefly in Bengal. Tobacco, formerly unknown in Indin, and Introduced from Anerica probably about the beginning of the 17 th century, is now extensively cultivated in every part, chlefly however in the northern provinces, and mere rarely in the south. The tobacco grown in the Mahrntta territories is most esteemed, particularly that which is produced near Bilsea, a town in Malwah. Hengal does not yield good tobaceo; but the Company's territories in Guzerat, being principally of a rich hlack soil, are considered as peculiarly suitable to its cultivation (sae letter of the secretary to the Court of 1Hrectors, to the Secretary of the India Bonrd, 5 th September, 1828). The Hindoos having been already in the habit of inhaling the smoke of hemp-leaves and other intoxicating drugs, reatily ndopted tobacco as n moro agreeable subatitute, and it soon came into general use. Their recent knowledge of it appears from their having no name for it which is not a corruption of some European term. l'epper, though of inferior consequence, is a $-\cdots$ ?mble product of southera ladin, especially of Mas itare it is produced from a species of vine, which s 1um te t? twinc around the jack-tree. It bears fruit a. 1 , \& thiri or fourth year, amounting to from three to seven pounds' welght, and yiekls two crops in the year. The areca-nut and betel-leaf, universally chowed by the natlves, thrive in the low grounds, where water is abundant; and cardamoms, a spice in great repute. The universal and vast consumption of vegetable oils in Ilindoostan, for food, or unguents, or for the lamp, is supplied ly the extensive enltivation of mustardseed, linseed, sesanum, palma, christi, besides what is procured trom tho cocoa-nut. The tirst ripen in the cold season, the sosamum during the raina, or soon afterward.

The forests in the low plaina of llindoostun, of southern fulia, and those which cover the western range of the Chauts, and mere sparingly the eastern Ghauts, blound in the most valuable trees, applicable to many important ness. The extensive woods in southern India supply tho teak-tree, valuahle for shipInilding: und in Malubar, oxtensive tracts of waste lanil have within the last few yenrs been converted into teak plantutions by the government. Saul, ainsoo, tom, and bambor-trees abound; the last of which vield n nedicine much used by tho native doctors, and whirh sells for its weight in silver. There are many species of the puilm-tree, with its luxurimat and apreading leaves, of which the produce is extromely useful. The cocea-nut-tree is, in some provinces, an importnnt article of culture. Tho kernel is used for food live the richer matives, elther in the raw state, or iressed after various fashions; nod it yields by far the finest oil in India, if the nut he fresh, nat the oil quickly used. lixtensive tracta, many miles in length, are planted with the cocon-nut and betel-nut palnis. Many other sjecies of timber are found in the deep recesses of the woods, of which Dr. Huchnnan, in his acceunt of Mysore, glves a particular description, with the botan-
leal numea of the different trees, and to his work we refer; observing, generally, that the wood conalat of avery dencriptlon oí timber, black, benvy, and atrong, and adapted for the beams, and poata of houses; other kinds are white, hard, and durable, and adapted to all the purposes for whilch strong materinls are required; some are beastifully gralned, and take a fine polish, and are well sulted for furniture, or exnde resins and gums of a sweet sesnt, that are used $\ln$ temples for In cense; the wood of some kindlea readily Into a clear light, and la used for torches (see Journey from Madras, through Mysore, Canara, and Malabar, vol. I., p. 25). Other kinda of woed are employed for dyoing. The sandal-wood le valunile for its perfume, and for the essential oll which it ylelda. It regulres a atrong soll, and it is 12 years before it attains the proper size for being cut. The blllets of wool are prepared by belng buried In the dry gronnd for two months, when the ants eat up all the onter wood, leaving the heart, which la the sandit. The deeper the color, the higher the perfume. The best sandal-wood of Hindonstan is ncw in poesession of the rajah of Myaore, who succeeded to a sunall portion of Tippoo'a domisinns.

Animals,-IIndoostan, from the great extent and inequality of its surface; Its atupendona and anow-clad monntains, and lts vast and wooded plains, lylng under a hurning oun, comprehends all the moat intereat. Ing forms of animal life, more especially those anlmala of the tropieal regions remarkaile for ferocity or size, which have been the subjecta of acientific research an well as of popular corlosity in all agea, and which find ample cover in the deep woods and junglemovered wastee of those tracts of the country which have been desolated by t-ranny or war.

Hlowever rauch the following etatistice of the financlai concerns of the Britinh Fastern empire may be at variap $=-$ th the exaggerated ideas entertained reapecting well ly a large proportion of the people of Fingland as by foreigners, It will excite no surprise in the mind of any one who has ever reflected on the aubject. It is dre, indeen, to the directors, to state, that though they have occasionally actod on erroneous principles, they have always exerted themselves to enforco economy In every bronch of their expenditure, and to impoas and collect tin $r$ revanues in the best and chespeat menner. But ilough thoy have succeoded In repressing many abusea, it would be idle to anppose that they ahould ever es cirely sueceed in ronting them out. Huw can it be imaginel, that etrangers sent to India, conscious that they are armed with all the atrength of government, placed under no real responsitsility, exempted from the salutary Influence of publle opinion, fearing no effectual exposure through the medium of the press, and anxious only to accumulate mortune, should not occaslonally abuse their authority ? or that they ahould manage the compllcated and difficult affairs of a vast empire, inhahited by a race of people of whose language, manners, and bubita they are almoat wholly lgnorant, with that prudenee, economy, and vigilance, without which it were idle to expect that any great surplus revenue shonld ever lie realized?

India Company, the East.-The firat commercial intercourms of the Finglish with the Fant Indles, was a private alventure with three shlps fittel out in 1591; only one of them reached India, and after a voyage of three years, the commander, Captain Lancmater, was brought home in another ship, the sallors having seized on his own; but his Information gave rise to a cupital mercantile voyage, and the Company's first charter, in Jecember, 1600 . Their atock then consinted of $\mathbf{£ 7 2 , 0 0 0}$, and they fitted ont four uhips, and meeting with anccess, have continuel tol trade ever since. India stock sold at $\mathbf{C 5 0 0}$ for a share of $£ 100$, in 1683 . A new Company was furmed in 169 R ; and both were united in 1702. The Iudis Ifuuse wan built in 1720,
and enlarged in 1799. Roard of Control instituted IiR. See Eabt India Company.
Sailroads in India.-There are several railroads gohy forward in diferent parts of Indla, whleh promisa th be productive of a great increase in the trule of that country, though it la more questionable whether for aume years to come they will afford a very unple inscome to the proprietors, for the heavy cost of the eonatructlon. One of the lines firat undertaken is the East Indian, extending from n noylgable part of the Ganges towarl Delhi. This road is already partially opened, and the report of its operations for the first six months of the year 1856, contalned a return of $43:, 521$ passengers transported, and 38,010 tons of freight. The work irom Alinhabad to Cawnpore was going forwarl successfully at the date of this report, but it hat been since retardell hevond the expectatinest that had been entertuined, by the difficulty in carrylng forward the materials. The earth-work was nearly completed at that tione. Allahabad le near the Junction of the Jumam With the Ganges, 600 or 700 miles above Calcutta. The wrik was to be extended from Cawnpore to lelhi under the officers of tha Company, without contractors. We hnco lately seen on account of tho total loss of a contly loconotive, destined for this road, by being sunk in the Gaages, A portion of the Gireat Indlan Ier insular road, beginninus at Bombay, hus also been opened, and a locatlon for the extension of the line has been racently made, from Nagioro to Juhbulpore, where it will unite wlth the Bast Indian, thereby forming an entire line uf i.iland comununieation follow. ing, in part, the courso of the Ganges, trom llomhay to Caleutta.

The Scinde Kailway, another important work dealgned for opening the trade of the greut valley of the Indlus, has alrandy made considerable progress. It will extend from Ilyderalad tri the port of Kurrachee, a diatance of 110 milep, it being rendered necessary on account of the difficult navigation of the motitis of that river. As an appendage to this work, a more ex. teulve one called the Punjaub, Ruilway has been lately projected, and a prospectus of It is now advertised in the Iondon papers, It is to bog 230 miles in leugth, loginning at Moolten on the Indus 470 miles above Myderabail, and running thence to lahore and Unritsir, through a country of remarkable equality of surface. It Is to form, in connection with tho Scinde Ilailroad, and en Improved aystem of steam navigation on the intermedlate jx.rtion of tho Nlver Scinde or indus, between Ilyderabud and Mooltrn; a connected line of communication from Kurrachee, whleh is destined to be the princlpal port for western India, to lahore the capital of the Punjaub. Siron Lahere it will te further extended 86 miles to Umritair, the comuerclal capital of a very large and productive trading district, making in all, liy railrond and steam navigis tion, x]0 miles. For tho Panjauls rallroad nlono it is proposed to raise a enpital of $\mathbf{\Sigma 2 , 5 0 0 , 0 0 0 \text { , of which }}$ two tifthe of the ware are reserved to the shareholdern in the Scinile Company, in the propartion of two shares of the former to one held of tho laticr. The pruspectus advertised in the London papers contains the following deacription of the reghon of country through which this line of communication will pass, extending nearly the wholo length of the valley of the Indus:
"A railway from Monltan to lahore nnd Imsitsir will not ouly ufford an outlet to tho imperied traffic of 1'unjaub ani nelghboring territories, but would of necesaity greatly enhance the importance and value of the line from Kurracliee to llyderatad Scinde and the Junjaul, (iucluding the States under control) cover an area of 130,000 equare miles, with " population of nearly $\mathbf{2 5 , 0 0 0 , 0 0 0}$. The tlower of the Furopeas and native aray occuplen these provinces, and numbers 70,000 men, more than 15,000 of whon are Europeans."

The fin comutry, "Iahn the Punja The town ternal ira the large attached the Punja superior, tervening of ntyy niz is maintni thronged wheeled v sengers ; town than si far npa commerce ainons reg fruita, and nnd other mountainot of the whol are isere en military sta after its cor coming in ing link to Inilln, or $r$ situnted at Intn prospe probatly an being auper The dlat direct line it the indirect ninsular linn lgation or $t$ ly following route ls elly selecting th railrond, ta ovenness of population o will not be 1 sinuosities 0 estimnted ul is already ns of an excell law cost is railway ront no comparis lessaess of between the directions, t habitable, a alnost bid In one case, tries nilready affording vn jects of a pirn contributing every part o country to 1 projected rou afforling ev constructed ure incapathl, for its coust locomotives, employed ln

The great in a greater East, will be rapid strldes accomplished

The following further deseription of this region of country, is from the Culcutta Englishman :
" Lahore, situated on the Ravee, ia the capital of the Pungauh and the seat of its political administration. The town is very extensive, and carries on u briak internal trade. The civil atntion of Anarkullee, and tho large military station of Meean Meer, are likewiso attached to it. Umritair, the commercial capital of the Panjauh, elistant 36 miles, is at least eqnal, if not superior, to Delhi in popnlation and wealth. The interveniag country' fa level, and withont even a nullah of any size, and an intercourso of so grent an extent is maintained between them, that the road is literalls thronged day and night with every description of wheelet vehicles, horses, camels, etc., and foot passengers; in short, more resembling the street of a town than a mere communication lietween two cities so far apart. Umritsir is the grand entrepot for the commerce of the cis-Sutlej States-the rich and mountainons reginns enstward to Kote Kinngra-the horses, fruits, and wooleng of Cabnl and Bokhara, the shawla and other produce of Cashmere, Yarthand, and the mountainous conntry towarl the north-east-in fact, of the whole Pnnjauh and the countries encircling it, are here concentrated. Mooltan is a large town and military atation on the Sutlej or Gharra, so termed after its conjunction with tho Beas. It is quickly becoming in important emporium, for it is the connecting fink to the trado of northern with south-western India, or rather Bombay and Europe. Knrrachee, situated nt the month of the Indus, is fast advancing into prosperity and into notice as a sea-port; it will probality soon bo known as the first in the empire, being superior to Calcutta, Madras, or even Bombay."

The distance between Calcuttn and Homhay in a direct line is a little more than a thousand miles. By the indirect ronte which innst be pursned by the Peninsular line, to find one adapted elther to steam navigation or to the construction of a railirond-that is, by following the course of the Ganges, so fur ns the routo is eligithe, and from the point thus reached, tiy selecting the line best adnpted to the construction of a railroad, taking into consideration the comparative evenness of surfaco, and the production, resources and popalation of the country to be traversed, the distance will not be less than 1600 miles, exclusive of the minor sinuosities of the route, which can not be accurately estimated antil the line is definitively laid down. It is already ascertained that easterly from Nagpore, coal of an excellent quality for the making of coke at a low cost is found in ahundance. Extensive as these railway routes are, it will he perceived that they bear no comparison, in point of extravagance, snd hopelessness of execution, with the vast routes projected tetween the Mississippi and the Pacifte in various directions, traversing regions uninhabited and uninhabitable, and passing over mountain ranges, whieh almost bid defiance to the power of the locomotive. In ono ease, the projected routes pass through countries aiready covered by an inmenss population, and affording valuable products ndapted to become the objects of a profitable trade, and consequently capable of contributing to the support of the line throughont every part of it. In the other case, nearly the whole country to be trnversed, ly the most favored of the projected routes, is destituto not only of the means of affording even a partial support to the route when constructed and put in operation, but in a great measure incapable of furnishing even the timber necessary for its construction and repairs, the fuel necessary for locomotiver, or provisions for the men who must be eniployed in running tirem.
The great lever, however, by whilch Englanil will, in a greater ratio than ever, incrense her power in the East, will be the railmad system. And in this pollicy rapid strides and important resuita have ieen alrendy aceomplished. As earlv as August, 1k65, it was atated
in the House of Commons that the East India Company had sanctioned the construction of one road 690 miles in length, to be completed in the year 1856, with a guaranty of $\bar{b}$ per cent. dividend by the Company. In other words, private capitalists having anbscribed this required capital, the Company therefore gave a guaranty of 5 per cent. income, upon a capital of (21),000,000. Other roada have been projected, and are now in course of construction, with on dggregate line of over $\mathbf{6 0 0 0}$ miles. From one extremity of British India to the other, the magnetle telegraph is in full operation. The intelligence carried from England to Bombay, was, as far back as April, 1855, transmitted to Calcutta by telegraph. The three grand trunk railroads are:

4000 miles of telegraph wire are now set ip in India, and in constant use. In the construction of this immenke line of wire, 70 large rivers were crossed. In one cuse the cable over a river measures 15,840 feet, and in another aver two miles in length.
In order to carry out the views of the British government and of the Dast India Company especinlly, a standing army of 289,000 men (European and native), is maintained. It requires little foresight to show that it ia in India (at present) and in Chins (hervater) that the British power will for many yeass be developed to an extraordinary degree. With the gill of capital, now abundant in Indis, and with the further ald of railroads, manufacturing machinery, steamships and stenmbonts, the magnetic telegraph, and cheap labor, the commeroial and politicnl power of Great Britain will soon overshadow all others. ' 'he autject furnishes points of inquiry and consideration, which should be duly weighed by the statesman, the merchant, and the philanthropiat.

We have all looked with astonishment upon the vast commercial chungea that have transpired in the world within the past 20 or 30 years. Science, genius, enterprise, and capital are yet at work transforming, modifying, creating. America has witnessed grent transformations within that period. It would seem that Asia is likely to undergo equally important changes, through the menns of the British government and its thousand agents. There is no resson why the United States, availing themselves of the newly-enlarged field of operutions in the East, ahonld not find a profitable market for their manufactures, and further employment for their shipping.

Mefals.-From the wilt a. 4 inaccessible nature of the couniry in many parts of IIindoostan, its metallic producta are but iupperfectly known. It is found to produce all the metnilic ores, as well as diamonds and precious stonea, and other mineral substances. Gold is generally found in the sands of the mountain streams, and is extracted hy washing. The head atreams of the Ganges liring along with them particles of gold, which in Rohilcund are collected by a particular caste of people. It is found in various parts of Mysore, particularly nine miles enst of Boodicotta, where the conntry is impregnuted with it ; alao in the Niolgherry Mountains; and in great quantities in a?l that tract of country that liea west; and in the adjoining Koondanad and Ghaut Mountains. This whole tract, including tho mountains, and comprising a apace of 2000 milea, contains gold. Unrefined gold is regularly exchanged hy many of the mountain tribes of the north for the produce of the plains. It is estimated that ahout 1000 men are continually employed in colleeting this precions metal. Copper is produced in the province of Delhi, which the natives collect cither on the surfuce or with very slight excavations; also in the Rajpoot prineipality of Jeypoor in the province of Ajncer,
and in other parts of the same province, there are copper minea, und in the Carnatic, about $\mathbf{4 0}$ miles north-east from Cuddapuh. The metal is found in layers about two inches, and occasionally two feet thick; they are conted with ochre, ald are in general fast, as if they had undergone compreasion. The ore exista in nearty a metallic ntate, without any admixture of sulphur, arsenic, or any other substince that requiren acparation. The best ores yield 34, and the worst 6 per ceut, of pare metal. The granitic monntalne of Nepaul and northern Llindoostan contain much Iron, lead, and copper, with a little goid in the rivor cuurnes. The copper uninen are quite muperficial, the ore lieing dug from trenchen entirely open above, so that the work is laid ashle in the rainy seanon. Iron ore is found in many parts of Ilindoostan. There are mines of Iron in lahore and in Ajmeer. In Orissa many of the antives are iron ameltera, and mont of the irom sent from Balasere to Caleutta is proluced in this district. In Bejupor the working of iron fumiahes emphoyment to many of the inhsbitanta, who extraet it ly a very rude process. At Forto Novo, in the Iritiah distriet of South Areot, in the presidency of Madras, extensive iron-works have heen erected by a jointstock asociation called the Lant Inilia Iron Company; to whon also belonig the iron fuundery works at liey:pror, in Malabar, ou the opposite corast of the peninin. '?he ore pmeltud at these eatalilishments is found In great abuadauce and of exceltent quality in their respective vicimitien. The Mysore country nisounds in iron. There are also forges for manufacturing steel, which are minutely described by Dr. Buchanan in his account of the Mysore country,* In Cohmbeture and in Malatur the iron mines give employment to a consideratile number of persons. The process anil machinery fur extracting the iron are vory imperfect. Iron inines were formerly worked in the dintrict of Boglipoor, luat they have been long neglected. Nich iron ores are abugdant in Cutch. The ore is gathered in laskets from the surface of the earth, anil yields 22 per cent. of iren; und the ateel which in nade from this ore is the tinest in the word. Lead is prodnced in various parts ; also antimuny, blumbmgo, sulphur, aluns: and there are Inexhaustibis supplies of coal, though the mines are not worked with any effect. Coal is raisel in Burfiwan in conniderable quantitien sul of a the quality. Saltpetre is produced in Ilengai and lahar, though its manufacture does not go leyond the eastern limits of the latter province. it might, however, be attended with succeas in Hengat, where the tendency of the aoil to its prodnction in very great ; and there might le manufactories of sait in almont every part of the country, but they sre restricted by the Company monopoly. In the Mysore plains the welin are salt, amil the gronnil in frequently covered with a saline effloremcence. A range of hills, extending from the Indur to the ilydasp'o, yielda the famons rock-anit of Lahore, of which they are almost eutirely composerl. $\phi$ Many quarries nre found in the hilly dintrieqs, which proluce fine atone, that is ent by the inbabiltants into pillars, thage, statuef, and used for other ormamental purposen. Dr. Ijnchanan asw neveral the-grained apecimens of granite, also a black stone used in the conatruction of IIrder's monument, and a heautitul green atone which takes on a marlile pollish. The hilis of Guzerat contain marbies exhibiting many eolons and qualities; nud martiles are seen in the various tombs and monuments of ancient art still rentaining in the country, find! ground and of different colorn, white and yeliow with rad veins, nad green clouded with yrilow and Hack, of which the çuarries have never been discovered.
P. Juurney from Madrus, vol. L, pp. 170, 1 tiv: mol. th,

* Sin the observations of Lleuteunnt Bornes oa the commercial relation of the Punjaub.

Diamonila are no longer found in the eelelirated mines of Golconda, but they are atill gathered in the beds of the Krishna, and in the province of Gundwana. Near the confluence of the Hebe and the Mshanuddy, 18 miles beyond the town of Sumblulpoor, after the raius, the nativea find diamonds in the red earth washed down from the mountalna. The matrix containing them ls a clay which has a red appeariance like burned bricks. There are diamond mines in the south of Indis, bout 7 millea north-east of Cuilhnpah, on both $b$ is of the Pennar Kiver. These mines have been $w$. or neveral hundred years, and occasio!. ulty yisld iarge diamonds, which are either found is the alluvial moil, or are recognized hy their markling among the gravel after it is washed and apreal out, or In rocks of the latest formation. The grounds are loasel on behalf of the guverument te private speculatora at a moierate rent. In Bundelcund, ulmo, the table-iand which surrounds Pannah, wherever thin ground is of a gravelly nature, producen diainonds. Th soil is from two to eighte cubita deep, and diamonits are found intermixed with simall pelibles, though not ndheriug to them. A very few diamonds in the courve of a year repay the labors of the workmen. The diamonds found are moatly under the value of 500 rupees, or $\mathbf{t} 50$, though aome reachs the value of from 500 ta tho0 rupees. They aro weighed and nold to the merchants residing at l'unnal, and are by them carried to all parts of the comntry. The workmen are allowed three fuurtea, two thirds, or a lialf the diameonds they find, accorling to their size, and any man in at liberty to dig: but the business is less prosperoun than furmerly, and the workmen are peor. The dimend grommes are atrictly guaried againat the contraband trader, and the leant delimulucy draws down the prompl and burbarous vepgennce of the rajah. These nre supponed to be the diamond mines mentioned by Tholemy. Their annual proluce was estimated, in the reign of dehar, ut elght lacs of rupees. In licio it had fallen otf to one haif; the amount, comparatively indigniticant, is divided between the rajalis of Dennah. Banda, nud Chirkaren.

The other varietien of precious stones found in India are the ruby from the tuble-fand of Aysore, the lieryl, the tupaz, the chry nolite, gamet, cat's eyo, cte. There are cornelinu mines in the province of fiuzerat, in the wildest parts of the jnngle. They consint of numerous whaft* workel down jerpendicuiarly, about four feet wide, and soverul of them to the depth of lifty fect. Sone of them extend at the bottom in a horizontal direction, though not to any Jiatance; the heavy rains cause the lanks to fall in, no that now openings are alwaya made at the end of the rainy season. The nolutes weigh from a fow ouncen to two or even three pounds, mud lie close to each other in abundance, not in dintinct atrata, but seattered about. They are of various colors when they are found-of n hackish olive, like common lark thinte; others of a lighur bue, with a slight milky tinge: though it is guite uncertain what appearance they will nasume after the process of turning. They nre earried to Cambay, wher, they ure cut, pollshed, ind formed into the fine omament for which that ctty is so bighly celelirated. Heautiful jaspers and agsites are also found in this district, and in other parts of India.
Manufirturss.-In every country the nature and quality of the manufactures must depend on the condition of the consumers, and annong the denin"tic States of Asia these naturally consist of two chassen. Ist, of the great and powerful, in whose hands the propertyof the country is accumbinted, and who are comparatherely few ; and, 2ifly, of the mass of the people, op pressed under native rule, nul sunk in poverty. Such, acconlingly, has been from time immemarial the state of Miniloortan; and its manufactures, which are necesnarily sdapted to the use of these two claswes, have alwaya consisted of exquisitely tine faliries of cotton,
for the $u$ princes o mon peot that the wonderf the prod workman ory, or frc material stagea of plementa by patien duces an its inimit durability these tine touch, ani chiedly fa nated, wec texture ; denominut sort of m province southern of the most mure closel of Hengal in every d turiums, ha Ilindoontan thwered mi ful fabries silks which of hue that Indian ma Rearfs, whic dian manufa rival, either manafuctur equal those made, whici khas,ahs, wh the Ganges made near western fro Allahabad, are manuiac of Midnapor nomination Benares; w ered, in the brocades, an gauzes for a gal; ant at in the distr: cotton. Sa in many pla fir the clots inte canvas anti other p mon use. msteriain is factured in Gangen. F manent and province of worhood of $($ urigin in Imi degree neve varions kin l'atna, Tumd In ly yor iuto different men, women ban jieces. figured, and wrougith in
for the une of the limperial court or of the rajahs and princes of the country, or of coarse ntuffs for the common people ; and to such perfection have they attained, that the modern art of Europe, with all the aid of ita wonderful machinery, has never yet rivaled in beauty the product of the Indian loom. Yet the Hindoo workmun hus no advantage from capital, from muchinery, or from the division of labor; he preparea the raw material with his own skillful hand, in aii the varlous stages of ite manufacture; his loom and ali hia implements are of the rudent construction; and yet, by patience, perseverance, and unusual akilt, he produces an article which is prized all over the world for its inimitable richness and beauty, as weil as for its durability. The native artiasan distinguishes at once these tine fabrtes from ali counterfelts, by the eye, the touch, and the smell. In the district of Dacea are chietty fabricated plain musiins, varlously denominuted, nccording to the closeness or tineness of the texture; also flowered, striped, or checkered muslins, denominated from their patterns; and the thinnest sort of muslins, for the munufacture of whieh the province is much celebrated, as is Coromandel in southern india for its callcoes and other piece-goods, of the most brilliant and durubie colora. Other kinds more closely woven are faliricated in the western parts of llengal ; and another sort, of a more rigid texture, in every district. Coarse muslins, in the shnpe of turhans, handkerehiefs, etc., nre made in ati parts of llinicostan; and in its northern provinees, plain and fluwered musiins, but of inferior quality to the theautifut fabrics of Dacea. In Moutan are manufactured silks which possens astrongth of texture and brilliancy of hue that have gecured for them a preference in the Indian market. They are woven into shawla and searfs, which are in great demand, and which the Indian manufacturer in other parta has never been able to rival, either in color or clurability. Carpets nre niso manufactured in this province, thuugh they do not equal these of Persia. Varlous articles of calice nre made, which stili retain their Indian denuminations, ns khas, hs, which are manufactured north aul east of the Gugges; cioths of nearly the same quaity aro made near Tanda in Oude. Near Lackijsor, on the western frontier of Benares, in the ucighhorhood of Aliahabad, and aiso in the province of Bahar baftaes are manntactured ; samaes in Urissa, and in the district of Milinapoor' ; and a similar choth under the sume denomination in the eastern purts of the province of Benares ; woven siik nud taffeta, both plain and fowered, in the neighborhood of Moorshedabad; tinsues, brocades, and ornamented gauzes, at liennres; piain ganzes for domestic nae in the west and south of bengal ; and at Mouida, Boligpoor, and at severat towns in the district of Burdwan, mixed goodn of silk and cotton. Suckeloth is manufactured from puekthread in many phaces, especialiy in the northern provinces, for the clothing of the mountaheers. Cetton is made into canvas in the neighborhood of Chittagong, Patna, and other places; and blankets every where for common uso. A coarse cotton eloth dyed red with cheap materiain is very generally used, ond is chietly manufactured in the country botween the Jumna and tho Gangen. Fine and coarse calicees are dyed with permasent sud fugitive colors for common use in the province of Benares, the eity of Patna, and the neighlorrhond of Caleutta. This art appeary to have had its origin in India, and to have been there perferted to a degree never surpussed by Europeans. Dimitien of various kinds, and damask tinen, are mate at $\mathrm{J}_{\text {atcia }}$, Patha, Tanda, sidl various other places.
In Mysore, heur Bangulore, siik is manufactured into different urticles of drees, intos strong clotiss, which uen, women, or boys wrap ronnd them, and into turman jieces. These cloths are of a rich fabric, variously figured, and the pattern, if ordered, is elegantiy wrought in gold tiroad. Turbans are made of cotton
and silk. Thin white muslins with allk borders ornamented with geld and silver, and phain green muslins, with silk borders, are manufuctured for female dresses ; ulso striped and checkered muslins; cloth like the khasahs of lenyal, for wrupping round the shoulders of men, sometines with striped or silver loorders. Ilandkerchiefn with red lorders, a coarae thick white cotton cloth with red horders, and turbans ormanented with silver and gold thread at the ends, are also made in this distriet ; and the dyeing of cetton eloth, cutton thread, and silk, is earried on by a get of people who net ns tailors, cloth-printern, and dyers. Tanneries are extalilinhed, and manufactories of oil. At Chennapattana there are manufactories of glass-ware and of glass ringe, universally worn as bracelets by the women of the Ieccan. Steel wire is atso made here for the stringe of musleal instruments. At Vizigaputain, in the northern Circars, the inhabitants are very exwert in carring curious tittle boxes of ivory and bone. Throughout southern India manufactories of cotton silk are generaliy established. In the northern Circars the principal purt of the East India Company's investment of piece-gools was formeriy provided. This country, extending about 500 miles along the coast of Coromandel, from the liver Kistnah to the borders of Cuttack, has from very early times been the seat of an important and extensive manufacture of cotton piecegoods, of which the description of caticoes known as Madras loug cloths and salempores nre the chief, and, with Masuliputam dyed handkerchiefs, and other kinds of goods for the African and West India trapo, have, until fately, been in great demand. Masulipatam goods have, however, for some yeurs been entirely superveded by the manufactures of Manchester and Glasgow ; and in ull appoarance the northern Circars will at no distant period of time be deprived of the manufactures of white calicoes also. A great change has indeed heen brought about in the munnfactures of India by the introduction of British gools, which, in many branches, have supplanted those of the country; the peor Ilindoo, notwithastanding the low rate ut which be works, is thas undersold in his own market by the manufacturers of Manchester und Glasgow; und this competition of British goods neurly ruined the native manufacturers of Indin, deprived the workmen of empioyment, und reduced them to freat distress ; No that the directors remark concerning the Indian trate, that "it exhibits the picture of a commercial revolution, productive of inuch present suifering to numerous classes in India, and hardly to be paralleled in the histery of commerce."

Commerce.-Llindoostan, from its grent extent, and the diversity of its noil and climate, supplies the materials of an extensive commerce. Its internal trade is wreat, while its rare and precious products are exported to the remetest regions of the world. An extensive commerce takes place between Bengat and the other maritime districts, und the western provinces of Ifindoostan, consisting in the exportation of grain from the corn districts, in exchange for sait, in great stapie; for letel-nut, sugar, raw silk, silk and piecs goods. From the native States of central ludia Malwalh opium is sent down to l3ombay for exportation to China. In Bengat the culture nad manufacture of opium are conducted under a State monopoly, and the profuce is transmitted to Culeutta, where it is disjoned of by public sate. The Loly eity of Benares is a great mart of trade, in which are exchanged the shawls of the north for the diamonds of the sonth, and for the huslins of $\mathrm{D}_{\text {icea }}$ and the castern provinces: and it has hesides, very considerable silk, cotton, and fine woolen manufactures of its own, the produce of which is exchanged for other commodities. Through the northern provinees of Delhi and Lahere n great trade is carried on between the bill countries and the plains. The inconsiderable town of Ifurdwar or llardiwara, being a celebrated place of Hindoo piigrimage, is a

Photographic Sciences Corporation
great commercial emporium, to which multitudes resort for the purposes of trade, as well as f.om plety. This great annual concourse takes place $\mathrm{l}_{\mathrm{a}}$ the opring, when the produce of the northern and western conntries is exchanged for the manufuctures of the lower provinces. The principal articles brought here for sale from Cabul, Candahar, Moultan, and the Punjaub, are horses, mules, camels; some of these from Balk, Bokhara, and the countries on the northern side of the Ilindoo Coosh Mountaina; a particular speciea of tobacco, antimony, assafoetlda, dried fruits, auch as apricots, fgs, prunes, ralsius, almonds, platachio nuts, and pomegranates ; from Cashmero and Amritsir, shawls, dootas, and pattoos; spotted tnrbans, looking-glasses, toys, with various manufactures in lrasa and ivory from Jeypoor ; shiolds from Rohilcund, Lucknow, and Silhet ; bown and arrows from Moultan and the Doab; rock-salt from Lahore; baftas and piece-goods from Rahn, a large city In the Punjaub. The country of Marwar nlso supplies many camels, and a species of flannel called loo. In exchange are brought from the British provinces Kharwa muslins, mushroo or sarsnet, and woolen cloths, the coarsost of which only find a market. In this fair, Dutch and Venetian colns are current; and some toya of European manufactare were acen exposed to sale by Mr. Wobb. The northern merchants by whom it is frequented assemble at Amritsir in caravans about the end of February, and pursue their route in an easterly direction through the territorics of the protected Seikh powers. Still further to the north and west the provinces of Lahore and Moultan export to the countries to the west of the Indus, sugar, rice, indigo, wheat, and white cotton cloths, hides, ctc. The imports are swords, horses, fruit, lead, and spices; and into all these countries European goods are imported from the lower provinces. The southern provinces export to Bengal, pepper, betel-nut, sandal-wood, and cardamums, teak timber, etc.; while they recelve in return salt and rlee, cotton cloths, and articles of Europesn manufacture.

A very conalderable coasting trade is earried on between the ilfferent parts of Hindoostan. Bengal exports to Madras und the coast of Coromandel, grains of different descriptions, sugar, saltpetre, molassea, ginger, long pepper, oil, silk wrought and unwrought, muslins, spirits, and provisions. The returns are sait, red wood, fine long cloth, izarees, and chintzes. From the Malabar coast the imports are sandal-wood, colr rope, pepper, cardamums; and the returns are generally in the annual supplies which Bombay recelves from Bengal. From Bombay are broughs teak timber, elephant's tecth, lac, ete.

From the reputed wealth and precious produce of India forelgn nations were slways desirous to participate in its trade. Prior to Alexander's expedition to the East it was scarcoly known to the Greeks, nor la it certain thut they had ever seen its productions. But we know that these were brought to Rome, especlally silk, which so allured the vanity of the Roman ladies that it sold for its welght in gold. Other valunile commodities of Indla, such as callcoes, muslins, aromatics, Ivory, diamonds, pearla, and other gems, preclous aromaties, the pepper of Mulabar, turtle ahell, etc., and sone dry sugar and Indigo, were also Importerl into Alexandrla, the chjef emporitum of eastorn commerce, and were naturally attracted to the great metropolls of the ancient worid. This trade was carried on from Myon IIormos, the chief prort on the IRed Sea, whence, after the conutuest of Eigypt by the Romans, the annual fieets, sometimes of 120 vensels, set sail, and, under the propitious influence of the southwest monsoon, hollly stretched across tho Indiun Ocean for the western coast of IIindoostan, which they reached In aiout 40 daya; end afterward extended thelr voyruge ruund Cape Comorin to the coast of Coromandel and the mouths of the Ganges. Tha hlgh
price recelved for these esstern luxariea ln Rome encouraiged the merchants to provide larger vessels, and a band of archers to defend them against the plrates, Who then, and antil very lately that they were extirpated by British shlph of war, infested the western Shores of India. The commodities of the East being Innded at ' Myos Hormos, were carried on camels to Coptos, the seat of a flourishing trade, and therice by sea to the Nile, whence they reached Alexandria by water carriage, and were re-shipped to the different ports on the Mediterranean. The produce of Indis was also brought to Europe by other routes-namely, by the way of Palmyra, then a flourlahing city, and thence to Rome and other western countries, through the ports of Syria : or across the Himaluya Mountains to the Oxns, thence to the Casplan, and afterward to the Black Sea, and finally to itt ulterior markets In Furope. Bnt though there was a demand in Europe for the produce of Indla, there was 'no'demand in India for the proluce of Europe ; and bullion was the only article that could be seut out in exchange. The annual drain of gold from' Rome and its provinees for Indian goods was estimated by Pllny at $\overline{500}$ eestertia, equal to abiout $\mathbf{£ 4 0 0 , 0 0 0}$. In the convalsions which followed the decline of the Roman empire, the trade of the Fast was successively engrossed by the Persians and Arabians. The latter, in the year 686, built the elty' of Bussora; which soon grew into a great commercial mart ; and to this place, and to Ormus, long celebrated for its vast richea and its trade, the spliceries and merchandise of India were brought, and distributed through the various ports of the Mfediterranean. After the expulsion of the crusaders from Syria and Egypt, Alexandria again became the chie? entrepôt of eastern produce, whence it was carried to italy by the Venetians and others, and distributed throngbout Eu rope. But the diacovery of a passage to India in 1495 by the Cape of Good Hope changed the course of this trade, which now entirely left the Itslians, and was engrossed by the Portuguese for nearly a century without any molestation from European rivals. At length the Dutch and the English became their competitors, and eatablished joint-stock companies, with the exclusive privilege of the eastorn trude. But their anticipations of profit were not reallzed. The great distance of Europe from India, and tho want of an equivalent for its produce, precluded any extensive intercourse; the trade accordingly bore a very smali proportion to the trade of the coantry; and being besides cramped by monopolles, it never attained it nutural growth. In 1773 the average exports of Britain to Indin amounted to about $£ 489,000$ a year; in 1793, on a like average, to about a million a year; and it doen not appenr that a greater trade was carried on with India from any other part of Europe. Tho commerce of untions is limited to the surplus produce which they can mutually exchange; and, from the grest distance hetween India nnd Europe, this aurplus produce was long confined to those fow articles which, coutaining a grent valut in small bulk, could bear the expense of a long voyage. The demand was alao altogether on the alde of Europe, and lts trade with India consisted merely in tho purchase, with bullion, of a amall quantity of precious articles for tho consumption of the rich. The progreasive improvment of indastry in Europe, togother with the entire opening of the traile to Indla and China ainee the year 1834, has oc. casloned not only a greator exportation of Iritish goods, but a change alao in the minture of the trade. It is not so much the produce of the labor as of the climate and soli of Indle, which no Jugenuity can supply, that is in demand in IIritain ; and, necorilingly, while the import of Indian manufactures has fallen off, that of the raw material, and many varletles of vegetable produce, has increased. This the importation of cottun pisce-goods-namely, white callicoes and muslingwhich amounted in 1814 to $\mathbf{1 , 2 0 0 , 6 0 8}$ pieces had de-
creased in 1858 to 428,294 piecea; whilo within the same period the importation of cotton wool. had increased from 2,850,818 lbs, to $181,869,904$ lbe., and the exportation of cotton manufactures in a similar ratio. Even the inoomparable muslins of Dacca are in less demand since the introduction of British goods. Thue, in the progress of the trade hetween India and Europe, the former country, notwithstanding ita boasted wealth and auperior industry, has taken the loweat place, exporting her rude produce for the manufactures of the richer country: This ts the natare of the trade carried on between Britain and America and the countries in the north of Europe, and is a sure index to the respoctlve progrees of the two countries in wealth and improvement. Those countries which can not mannfacture their own rude produce send it to Britain, which ubounds in capital, and atill more in art and industry ; and both countries are benefited, the poorer country exchanging its surplus produce for a supply of manufactures of which it is in want, and the richer country the produce of its overflowing capital for a supply of tho raw material which its own soil does not afford. This is now the relative condition of Great Britain and Indla. The former having outstripped the latter country in industry and wealth, sends out a supply of cheaper goods than the native workman can furnish; and so prodigious have been the improvements in machinery, that the raw material of cotton is imported from India, and being manufactured in

Britain, is re-exported and sold at a cheaper rate than it can be made at home, though loaded with the oxpense of a double voyage across half the globe; and thus it has become an important staple in the trade of Great Britain with the East." A notion was long and/ anccessfuliy propagated by the' advocates of the monopoly, that the Hindoos, from their poverty and thair simple habits, would never become extensive conanmere of European goods, and that the demand waa amply aupplied by the exports of the East India Company. Evidence to this effect was given before the committen of the Hoase of Commons in 1810 by Sir Thomas Munro and other eminent servants of the Company. But such statements have been completely refuted by the rapidly increasing exportation of British goods to India since the complete opening of the trade in 1834. This will appear from the following table, showing the exports from Hindooatan for a period of 18 yeara :
Value of Exponts fhox Garat Baitain to Iindoobtan, exolueive of Bullhon.

The goods exported, as they are enumerated by Mr. Rickards in hils valuable work on India, consist of ali the staple manufactures of Britain. "Woolens and cottons," he mentions, " of every varlety and value; manufactured silks; hardware of all descriptlons; iron, coppor, lead, tla, and spelta, in largo quantities; marine and milltary atores; machinery for varlous uses; glass-wam of the metal speclmens, down to articles of the conmonest use; china-ware or porcelain, the same; jewelry of all sorts; gold und silver plate anil ornaments; elocks, watches, furniture, curriages, harness, haberdashery, hosiery, stationery, books; in short, every article of luxury, comfort, or convenience, which Britlsh Industry can produce." According aiso to all the most correct observers of Indian manners, the taste for Furopean fashfous, luxuries, and comforts, ls rapidly extending among the IIindoos. Bishop IIeher, in his interestling journal of a tour through India, strongly confirme thls fact. "The wealthy natives," Lhe observes, " now all affect to have their houses decorated witli Corlnthian pillars, and filled with English furniture; they drive the best horses and the most dashlng carrlagea in Calcutta. Many of them apeak linglish fluently, and are toler-
ahly read in English literature; and the children of one of our friende I saw one day dressed in jackets and trowsers, with round hats, ahoes, and stockings." At Benares he found "Engllah hardware, awords, shields, and spears, from Lucknow and Monghyr; and those European luxurles and elegancies, which are dally becouing more popular in India, circulate from hence through Bundelcund, Gorruekpoor, Nepaul, and other tructs which are removed from the main artery of the Ganges." At Nusseerabad, in the province of Berar, the same traveler mentlons that "English cotton cloths, loth whito and printed, are to be met with commonly in wear among the people of the country, nud may, I learn to my surpriee, be hought best and cheapest, as well as ali klnds of hardware, crockery, writing deaks, etc., at Pallee, a large town and celebrated mart in Marwar, on the edge of the desert, several daye' journey west of Joudpoor, where, till very lately, no European was ever known to have penetrated." In short, it appeare that Britlsh and other European manufactures, from thelr quallty and choapness, are everywhere in demand. They penetrate lato the remotest distrlets of Asla; und now that the termination of the East Inda Company'a
monopoly, whioh took place in 1884, has laid open Hindoostan to the capital and enterprise of Britain, experience proves that an equal damand for them may be anticipated in that country. The preoeding tables contaln a view of the extent and value of the trade of India to all parts of the world. The axcess of exports over imports arisea from the necesaity of making annual remittancen to Grent Britain t'defray the interest of debt, and to meet the expenditure of the home government.

The British prowsessions in Inilia are intermixed with the iluminions of vartous native governmenta, with which political relations, varying in nature and degree, are maintalned. The following table exhiblts the rel-
ative area and population of the presidencies of Bengal, Madras, and Bominy, and those aiso of the native Staten of Ifindoostan, and alao giving the area and population of the separate provinces of the presidencies.

Area and Population of the Batitim Pegsidenoles and the Native states of India.

Abetract of the Fondooino.

Notwithstanding the ravages committed by incessant wars and revolutions, as well ns by famine and pestilence, their usual concomitants, India has from the earlicst times theen a densely-peopled country. In different states of aoclety, tha lnw of the increnee of mankind will vary according to their relative circumstances and position; and the eame, or nearly the smine, principle will be found to apply to those classes who are placed in the opposite extromities of the senle. Among the people who are possessed of affluence, or the moans of commanding tho necessaries and comforts of life, the exercles of mornl restraint is unneceenary; among those who are reluced to a mere phyaical subelstence, withont the possibility, and consequently withont the dealre, of improving their condition, it wlll he disregarded; and henco the sams
results will follow from causes in their own nature diamotrically opposite. But in Indin the great mass of the popuiation have for ages been placed in a situation which excludes all idsa of improvemept ; and.religion has lent its powerfal eld to obstruct the operation of those natural causes which, in other countries, have served to ameliorate the condition of the people. It may, however, be permitted to hope, that though India always has been; it will not alwaya be, what it now fa; that the extension of commerce, under the protection of a vigorous and impartinl government, will awaken new ideas in the minds of the people ; that security to person and property will give a atrong stimulus to industry ; that the habitual contact with a higher and more rational form of civilization will aerve to mitigate their prejudices, and, in time, to deatroy the influence of a dehasing saperatition; and that, in proportion as their wants are multiplied, thair efforte to amsliorate their condition will be increaeed.

Calcutta is the principal eity of the province of Bengal, the capital of the Britlsh dominions in India, and, with the exception, perhapa, of Canioa, the greatest emporium to the enstward of the Cane of Good Hope. Its citadel is in latitude $22^{\circ} 34^{\prime} 49^{\prime \prime} \mathrm{N}$., longitude $88^{\circ}$ $27^{\prime} 16^{\prime \prime} \mathrm{E}$. It is about 100 miles from the sea, being situated on the eastern bank of the western branch of the Ganges, denominated by Europeans the Hooghly River, which is the only arm of the Ganges navigable to any coneiderable distanco ly large ships. At high water, the river pposite to the town is about a mile In breadth; but, during tue ebb, the side opposite to Calcutta, exposes a long range of dry sand-banks. Owing to the length and intricacy of the navigation from the sea, it can not be undertakon witbout a pilot; ao that, even if it did not exceed our limits, it would be useleas to attempt any description of it in this place. The principal merchants and traders consist of British and other Europeans, Portuguese, born in India, Armenians, Jewa, Porsians, from the coast of the Persian Gulf, commonly called Parsess, Moguls, Mohammedans of Iliadoostan, and IIindoos; the lutter uaually either of the Brahminical or mercantila castes, and natives of Bengal. The native Portugusse and Armenian inerchants have of late greatly declined in wsalth and importance. On the other hand, the Pereian merchants have increased in numbers and wealth, several of them being worth $£ 250,000$ sterling. The large fortunse of the Hindoo merchants have been much broken down of late years by litigation in the conrts, and naturally through the luw of equal coparcenary among brothers. To counterbalance this, there has been, since the opening of the free trade in 1814, a vast augmentation of the number of inferior merchanta, worth from $£ 20,000$ to $£ 50,000$ sterling. There are but few Hindoo merchants at present whose wealth exceeda $£ 200,000$ aterling. See Calcutta.

The aale of opium the last five years at Calcutta alone stand thus:

|  | Cheate moid. | Proceede realized by enle. Hupees. |
| :---: | :---: | :---: |
| 1549-50.. | 85,883 | 35,432,079 |
| 180 | . 84,400 | 82,250,839 |
| 1859 | . 88,561 | 87,245,185 |
| 1853 | . 89,468 | 88,848,083 |
| 1554 | . 48,319 | 36,727,584 |

The price paid to the cultivator is about 240 ru pees a chest, the rupee being worth 46 to 50 cents.
This revenue from opium amounts to one seventh o? the total income of the emplre. Of the $£ 4,000,06 \mathrm{\omega}$ which it representa, $£ 1,000,000$ in round numbers is proluced ty a duty levied in Bombay, and $£ 3,000,000$ ty the monthly eale of oplum in Calcutta. For some years past the average production in Bengal has been 36,000 chests, and the averago price of each chest 1050 rupeen, or 300 per cent. advance. Two or three yeara ago, however, the government removed certuln rastrictions on cultivation. Any body might grow it, to any oxtent he plaased, though he must atill sell it at a
fixed price, settled beforehand, and never altered to the opium agent. The profit on this price is so great that the peasants will oultivate it wherever it will grow. The result was an increase of production, whioh increased the eales to abont 56,000 chests.

Opium fall: the cheata which had bronght 1050 rupees sold for 600 rupeee, and the difference in quantity no longer compensates for the difference In price. Tha taste of oplnm, like the tasta of tobacco, naver leaves Its votarien.

Amateagt Vinw op the mxtramal Commeries of Bengal.

The other principal ports are-Bombay, a sea-port on the western comst of Iritish India, lat $18^{\circ} 56^{\prime} \mathrm{N}$., long. $72^{\circ} 57^{\prime}$ E. It is situated at the south-eastoriy extremity of a small island of same nume, separated from the main land by an arm of the sea, forming, with the contiguous islands of Colabah, Salsette, Ifutehers' and Curaigah, one of the best narbors in India. The entrance ls nearly three miles wide, and has a depth of from 36 to 40 feet.

Madras in the second Britiwh Indian presidency, and principal port on the western coast of the Bay of Bengal. It is without port or harbor, lying close to an open roadatead, and the shore having a constant surf. A rapld current runs along the coast, and typhoons are common. Jarge whipa nuchor alont two miles from shore, In the roads, in from 40 to 60 feet of water, and lighters are nsed to load and unload freight.
Ningapore, a British settleinent on an island of tha same name, at the eastern extremity of Malacca, lat. $1^{\circ} 17^{\prime} 22^{\prime \prime}$ N., loag. $103^{\circ} 51^{\prime} 45^{\prime \prime} \mathrm{E}$.

United States ond the Eant Indies.-The commercial intercourse of the United States with tha territories of the Fant India Company is reguisted by tha different local governments thereof, under the supreme control and approval of the Govarnor-General of India in council. The regulations prescribed by these authorities are not of a permanent character, being liable to modificationa and changes whenever, in their opinion, such lecome necessary. To present, however, the true hasis upon which this intercourse reatn, it will be necesnary to refer brietly to the treaty stipulations subsisting leetween the governmenta of the United States and Great Britain ; premising, that prior to the convention of London, signeal on the id of July, 1815 , between the IInited States and Great Mritain, the commercial intercourse of the former with the rimst Indim possessious was regulated, as was that of other forelgn nations, ly a general elause in tho Company's charter, provilling that "vessels of countries in amity with (ireat Hritain may import into, and export from, the Iritish poasessions in Iudia, nuch goods and commodities as may be spectifed in rules to be jreacribed by the Fast India Company; provided that nuch rules shal! not be incoasistent with any treaty now (then) made, or which may be mude between Great Iritain and any foreign State in amity with her, or with any act of Parifament for regulating the affairs of Inclia." liy the convention abova referred to, and the aubsequent
convention of October, 1818, continuing the former, it was etipulated:

1st. That vessele of the United States shall he admitted and hospitably received at the principsl settlements of the liritish dominions In the Eat Indies, viz. : Cnlcutta, Madras, llombay, and I'rince of Walea' Isiand; snd the citizens of the United States may freely trade between the said settlements and the United States, in ail articles of which the importation and exportation, respectively, to and from the aid territorien, shall not be entirely prohibited; and, $2 d$, it was provided, that the citizens of the United States shall pay for their vessels, when admitted, no higher or other duty or charges than shall be payable on the vessels of the most favored Furopean nation. And they shall pay no higher or other duties or charges on the importution or exportation of the cargoes of said vessels than shall he payable on the rame article when imported or exported in the veasels of the mest favored nation ; and, 3d, It was expresely agrued, that the veasels of the United States shall not carry any article from the suid settiements to any port or phace except to some jort or phace in the United States of America, whore the ne me shall be undaden.

This convention is at:! in force, and repriates the commercial Intercourse of the United States with the binst India possessions, except ne to paragrapta 3, which has been susperseded by the repenl of the liritish nuvigation laws in 18.19; the effect of which has been to ofpen the ports of Great Ibritain, and of ail her culonial possessions abroad, to "goods of any sort, in a ship of any conutry, from uny purt of the world.' By an net of the Imperiai Parliament, entitled 13 Victuria, chap. xxix., secs. 3, 4, 5, 6, the Governor-Generst of the laast India possessions was clothed with full puwers to admit, whenever he should doon it alvisabie su to do, to the coasting trade in the East ludiee, the vessels of all forcign nations. This privilege is now cthjoyed by every liag. With theso two exceptions, tho convention of 18 I is atill in full force, and constitutes the only guaranty which the C'nited States gossesses of equal priviloges with the most fuvored nation in its intercourse and commerce with the last India poossessions. Notwithatanding the express etiputations contained in the treaty above referred to, that the East India Company should preacribe no regulations "inconsistent with any treaty now mude, or which may be made, by Great Britain, with any mation in amity

with her," It has, on more than one occasion, been represented to the Department of State that the officers of this Company do not consider themselves bound by the commercial treatiss which exist between the United States and England." The diapatch from which the foregoligg extract is taken further aays, that " the speedy sattlement of thia quastion is deemed of paramount importance to the commercial interests of the United Statea." No case, however, having been presented to the Department, beyond the naked asser-
tion of the quasi independent movereignty by the offlcars of the East India Company, the necesenity has not yet arisen for an examination of the grounds upon which this claim is based. As the question may, however, hereafter ambarrass the commercial relations of the United States with this portion of her Britannic majesty'a possessions, it has been deemed proper to present the facts in relation to 1 t, whleh have come to the knowledge of the Department. See Commercial Relations U. A.

Coymeboh of the Unithd Statis wifit tai Britiaif East Indizs, from Octoegr 1, 1820, to Jult 1, 1856.

At Providence, 3 for Zancibar. Last year, 1.
At Philadelphia, 2. Last year, 4. For Calcutta, 1; Manilin, 1.

At Baltimoro, 2 for Capo Town. Last year, 3.
At Mobile, 2 for Calcutta. Last year, 0.
At Newburyport, 1 for Calcutta. Last year, 0.
At Portland, 1 for Calcutta viâ Buenes Ayres. Last year, 1: See Amuls Brit. Leg., July, 180̄6, p. 25, " Territorias Annexed."

The Britlah East India posnessions ombrace an almost boundless extent of territory, extending from the Himalaya range of mountalas on the north to the ocean, ineluding nearly the whole of the peninaula of Hindoostan, the laland of Coylon, and that portion of Burmah lying between $20^{\circ}$ of north latitude and the llay of Bengal. These vast poseesalons are supposed to contaln a pepulation of $152,000,000$ of aouls. The Fant Indls Company's posmeseions comprise the several presldencies of, 1st, the Bengal presidency; 2d, the Hlombay presidency; 3d, the Madras presldency; dth, the Agra presldency; and the meveral dependencles of each of these presidenclea.
Bengal.-The commerce of the Unlted Statea with the East Indiea ia principally confined to the presldencles of Bengal unil Bombry, and to $a$ fow of their dependencles. The leading exporta from the East India possessions to the United States are wool, oll-seeda, bldes, modicinal drags, aandal-woods, gams, spices, homs, Indigo, ivory, coir, saltpetre. The princlpal exports from the United States to the East Indies are, tobucco, naval stores, provlsions, ice, and miscellaneous merchandise, copper, plteh, tar, rualn, pine-loards, and apurs. Namber of American vessels antered the port of Calcutta in 1852, 65 ; tonnage, 34,849 . Number of reasels cleared from Calcuttu in the eame year, 101 ; tonnage, $\mathbf{5 9 , 3 4 0}$. In 1853, 109 vessela from the United States entered this port. See Calcutta, Bheoaly, and Gueat Bnitain.

Imports from Calcutta, 1851-1853, 89,676,072; value of exports during the same period, $61,490,899$; apparent balance against the United Statea, $88,185,673$. This heavy balance apparently against the Un. $\mathcal{d}$ States la accounted for by the large diacriminating datlea on all its manufnetures, in favor of similar merchandise importel from the nother country. American vessela usually euter the ports of Caleutta and Bengal in ballast, for the parpose of taking in a homeward cargo.

Bombay.-Exports from Thombay the aune ns from Calcutta. The same description of merchanilise ls imported from the United States. The following market prices at Bombay will show that the articles specified might enter advantageonsly into American exports, not only to that port, but to the other ports in the Fast ludica: Copper sheathing selia at $\mathbf{5 5}$ rupees, or 52745 per cwt. ; duty, 10 per cent ; aanual imports, $\$ 10$ tuns. Copper bolts sell at 50 rupees, or $\$ 25$ per cwt., duty, 10 per cent. ; annual lnports, 700 tons. l'itels, 4 rupees $=\$ 140$ per barrel; annnal importa, 1000 berrela; duty 10 per cent. Tar, 4 rupees $=\mathbf{z} 2$ per harrel ; annual imports, 620 barrels ; daty, 10 per cent. Tonnage duty in lombaty, 1-16 rupee, or nearly 8 cents per ton. Light-iouss dues on shipe from 15 20 rupens $=$ from $\& 750$ to 10 , according to the nature of the carge and time of the year. The rupee le valued by Pope at 46 cents: consular returns from Bombay value it at 50 cents.
l'ilotage la regulated by the season, and is aa follows:

| in | Fronn Sept, to Junm. | From Jwae to Mrint. |
| :---: | :---: | :---: |
| Tonk, Tuan | Eupeane Imoltars. | Rapes. Dillare, |

Indian Ocean, Indicum Mare, a v.sst oceania basin, separated from the Pacific on the east by the Aslatic Archipelagonnd Australla, bounded on the south by a line drawn from the Cape of Good Ilope to liass' Strait, divided from the Atiantle by Africa on the west, and inclosed by the countries of Asia on the north. It communleates with the Chinese Sen by the Strait of Malacea, Sundin Stmalt, and the Strait of Flores. I'rincipal Inleta, the Iay of Ilengul, the Sea of Oman, the Persian Gulf, and the Red Sea. Chief straits, the Channe' of Mozamblque, and Palk's Strait. The mest louportant falands are Madagascar, Mauritias, lkonrhon, the Comoro Islands, Seychelles, and Sucotra, belonising to Africa; the Laccadives, Maldives, Ceyton, thin Andaman and Nleobar Islands, to Asia. Its principal aflluents are, in Asia, the Salnen, Irrawsdi, IIrahnasputra, Ganges, Godnvery, Klatna, Nerbudda, Inilus, and the Shat-el-Arab, formed by the junction of the Thgris and Euphrates; in Africa, the Zanbeze. The chief aea-porta are, Calcutta and Iombáy in India; Malaecs, in the Aslatic Archipelago; Aden, Mocha, and Mnscat, In Aralla; Zanzibar, ete., in Africa. Steam-packeta are established between the principal ports. The monsoons, or periodical winds, prevnil in the north part of the ocean, blowing from the sonthweat letween April and October, and southeenst from Octolser to April. Tempests are genems at the periois of change, and between lat. $5^{\circ}$ and $40^{\circ} \mathrm{S}$. vielent hurrieanea frequently occur.
Indiana, one of the United States of North AmerICA, is bounded cast by the State of Ohio, south by the Kiver Ohio, which separates it from Kentucky, west by Illinols, from which it is partly separated by the Watushli Miver, and north by Michigan nud Lake Michigan. It lies between $37^{\circ} 51^{\prime}$ and $40^{\circ} 46^{\prime} \mathrm{N}$. lat., and $85^{\circ} 49^{\prime}$ and $88^{\circ} 2^{\prime}$ W. loug. Extreme length from north to south, 276 miles; grentest breaith, 175 nules, Area, 33,809 aquare miles.
Indiana may le generally charucterized as a great plain, inclining toward the south-west. A range of hilis extends along the Oblo from the mouth of the Great Mianl to Blue River, anil the shore of lake Michlyan is lined by large sundy hills, which rise to a helght of 200 feet. In some othor parts are to be fonnd "knobs," but these are sehlom of great extent or clevation. The surface of the conntry naturally divides itself into several extensive river valleys. 'I he valley of the Ohio, comprising an aren of nhout 5500 square miles, is a linestone tract, and was originally covered with forests. About one third of it is ruggeel and Groken, so an to be untlt fir cultivation. The White Kiver Valley, extemling through the centre of the State, from the Wabash to the Ohin, contains ahout 9010 en unre milles. This ilistrict is almost unifurmly level, and richly wooded, exeept in the west, where there are some ranges of low rugged hills, and several patches of prairie grount. The asi! is of the richent kind. The Whbash Valley ia much larger than the others, and contains upward of 12,000 equare miles. The eastern portion equaie the White iliver Valley in fertility, but the other parta are not no productive. The northern part of the state, watered hy tho St. Joseph and the Kanknkee Hivern, is somewhat inore

Indiana has a considerable on ties of agricultu ala communicat
swampy than the Wabach Valley 1 and a large tract, comprising the sand-hills on Lake Michigan, is covered only with stunted plaes and burr oake.

The State is well watered by nnmerous beantlful str"ams and rivers, but with the exception of the Ohlo and Wabash, fow of them are navigable. The Wabash is the largest river that has its course mainly within the State, and, together with its branchea, drains three fourth.s of the entlre surface. It rises in the west of Ohio, and flows first in a north-west direction, and then south-west tili It meets the boundary of Illinois, which it followf southward for more then 100 miles, till it falls Into the Ohlo, after a coarse of upward of 800 miles ; for $\mathbf{4 0 0}$ of which it is navigable for ateamboats at bigh water. The Ohlo forms the entire southern boundary of the State. The other principal rivers of Indlana sre tributaries of the Wabash. The White River, the most important of thees, is formed by the West and East Forks-iwo rivers, respectively about 300 and 200 miles long-whlch unite about 100 miles above its conflaence with the Wabash. The Miami is formed by the St. Joseph and St. Mary in the north-east, and falis into the Ohio. The Upper St. Joseph, with Its tribataries, passes throngh the northcrn countiea, and falla into Lake Michigsn,
Indisna resembles the other western Staten north of the Ohio in climate. They are generally milder than those on the Atlantic coasts, but very subject to sadden changes. The winter is very severe in the nortiern parts, but more genial in the southern. Except in the neighborhood of wet pralries and ewremps, the climate is averywhere healthy. Dr. Owen, speaking of the geological position of Indians, remarks, that "it posessses all the elements of extraordlnary fertility." The richest soll is that of the river bottoms, where it is very deep and exceedingly fertlle. The most prodactive are those inclosed by the river hills, which run parailel to the Ohlo and other rivers. The extensive valley of the Wabash is a tract of this description. Behind the river hllls, a table-land spreads out, forming what may be called the interior of the country, and here, instead of the bottom-lands, or river valieys, there are vast prairies. The soil of these is not so luxurisnt, but Is such as smply to repay the expense of culture. Even the wet and marshy parts of the State admit of being brought ander cultivation. Indiana ranks fourth of the States of the Union in the absolute amonnt of Indian com ralset. It also produces large quantitles of wheat, oats, and Irish potatoes, as well as a falr proportion of the other productions common to the western States.

The number of farms in Indiana noder cultivation in 1850 comprised 93,896 aeres, and the extent of improved land was $5,046,548$ scres ; of unimproved, $7,766,879$ acres. The value of the farms retnrned was $8135,050,000$. The orchard produce was estlmated at 8322,000, and market-garden producte, $\% 71,000$.
The chief minerals of Indiana are coal, iron, Itme, marble, freestone, and tome copper. Of these the first is by far the most important. It has been estimated that the coal beds of Indiana cover 7700 square miles, and are capable of yielding $50,000,000$ bushels to the square milie. One coal deposit commences in Perry county, and exiends north-west into the county of Vermilion upward of $\mathbf{1 5 0}$ miles.
The manufactrring capital of Indians in 1850 amounted to $87,941,602$. The value of raw material, etc., consumed in the yenr had been $910,214,837$. The products were valued at $1818,922,651$. There were on June 1, 1850, 4326 industrial establishments, prodncing anaually to the value of 8500 and upward. Of these, 2 were cotton factories, 23 woolen factories, 19 iron werks, and 858 tannerles.

Indiann has no direct forsign commerce, but it has s considerabie transit trade, and exports large quantithes of agricuitaral produce. The facilities for Interasl communication are great, and rapidly increseing.

The principal canals are the Wabash and Erle Canal between Evansville, on the Ohio, and Toledo, on Lake Erie, 467 miles, of which 879 milee are in Indiana; and the White Water Canal, 68 miles long, uniting Lawrenceburg, on the Ohfo, Vith Hagerstown. In 1858 the State had 755 miles of railroad completed, and 979 in conrse of construction. The princlpal rallroads centre in Indlanapolis, and radiate from thst clty In all directiona. See Dr Bow's Rev., 1., 512, vil., 246; Bankers' Mag., ill., 164; Hunt's Mfer. Mag. xxi., 147.

Indian Ink. A species of ink used in Europe for the lines and ehadows of drawings. It is principally manufactured in China, and there nsed for writing. From the experiments of Dr. Lewis, it appears to be a compound of fine lampbisck and animal glue. See INK.
India-rubber. Also called caoutchonc, frot brought to Europe from South America. Several plants produce various kinds of elastic gum; but that in commerce is chiefiy the juice of the Siphonia Elastica, or syringe-tree. Incisions in the bark of this tree give vent to a liquid whlch forma India-rubber. No substance is yet known which is so pliable, snd at the same time ao exceedingly elaatic ; it cozes ont undor the form of a vegetable milk, from inclsions made In the tree, and is gathered chiefly in the time of rain, because it flows then most abundantiy,-M. Macguer.
The most satonishing and useful discovery of the 19th centary, after the practlcal application of steam and electricity, is the employment of Indla-rubber for manufacturing purposes. The first knowledge of it is due to La Condsmine, a French philosopher, who in 1780 was sent by hie government to Peru to measure an arc of the meridian. The tree which yroduces rubber or caoutchouc (as it is called by the natives of South America), is found in the troplca of both hemlepheres. It rises to the height of 50 or 60 feet, without branches, and is crowned or tufted with rich foliage. The leaves are a deep green, thick and glosay, six or seven inchea in length; the bark ia amooth, and the fruit conaists of white almonds, of an agreeable flavor, much liked by the natives. In order to obtain this substance, the natives of the valley of the Amszon make a longitudinal gash in the bark of the tree with a narrow hatchet; a thick, white and oily liqnid (a sort of vegetable milk) flows out, a wedge of wood is inserted to keep the gash open, and a small clay cup is stack to the tree beneath the gash. In four or five houra the milk ceases to ran, and each wound has yielded from three to five table-spoonfuls. The "seringero," or rubber gatherer, then empties the contents of the cups into an oartian vessel and commences the operation of forming it into shapes and smoking it. This must be done at once as the milk soon cosgulates. A flre is made on the ground, of nute of the waason paim tree, over which is placed, inverted, an earthen pot with a hole in the bottom whence lssues a jet of pungent smoke. Molds are made either of clay or wood, whlch are dipped into the milk, snd then passed slowly through the hot smoke. When the required thickness is obtained, the molds are cut or washed out. Snoking changes the color of the rubber very little, but hy exposure to the sun snd atmosphere it beconies brown, and in thme biack. The superiority of the rubber 1 ir ported from the valley of the Amazon is sald to be owing to the pectuliar properties of the smoke of this nut, no other sunoke producing a similar effect upon the gum. A belt of forest trees extends 10 degrees each side of the equator, which yield Indiarubler of various kinds; so the aupply is literally inexhauatible. The gum from India snd the Pacifie coast of Sonth Americs is ohtained by allowing the sap to flow down the side of the tree, and is then gathered with the loose bark and dirt into ceroons or bandles for ahipment. For a loug time this substenco was valued simply as an object of curiosity, to be preserved

In collections of natural hiotory, anc. irst practical application was an an oracer of pencil marks.

Alout the year 1821, Charles Macintosh of England. having learued how to dissolve the gum in spirits of turpentiue, commeaced manufacturing the goods which now bear his name, by spreading the gum no dissolved between two layers of cloth. The rude overshoes made by the nativea in South America from the natural gum, were beginning to he worn, and in 1823, 500 pairs of shoes were imported into Boston. At a later date gum-elastic became the sntjject of seientitic investigation and :oany persons commenoed experimenting with it. in 1832, the considerable mannfacture of it was commenced in Massachusett, by John Haskina and Edwia M. Chaffee, who, in connection with oth-
ors, otarted the colebratel Roxbory Inderrubber Company, whioh was shortly after tacorporated with a capital of 400,000 . For thia Company Mr. Chaffes Invented the famous mammoth machins for apreading rubber withcut a aolvont-the machina itself costing nearly $\$ 30,000$. Similar machises are now required by all manufaeturore of raluber goods. . The apparent proaperity of this Company induced the atarting of factoriea In Boaton, Chelaba, Woborn and Framing. ham, Maes., Naw York city, Staten Island, and Troy N. Y., with capitala of from $\$ 50,000$ to $\$ 500,000$. These Companiea made their goods by diasolving the rubber in camphene or other molventa, then mixing lamphlack with It, and while in the forin of pasto aprosding it on cloth from which coata, ete., are made. The goods were then dried in the sun or in a warni room until the solvent avaporuted, leaving a coating of rubber. 300 Gutta Percha.

Indies, Dutoh See Java.
Indigo (Fr. Ir ligo; Gor. Indigo ; Sans. Nili; Arab. Neel; Malay, Taroom), the drug which yields tho beautiful blue dyo known by that name. It is obtained by the maceration in water of certain tropical plants ; but the indigo of commerce is almost entirely obtained from leguminous plante of the genus Indigo fera; that cultivated in India being the Indigojera tinctoria; and that in America the Imdigofera anil. The Indian plant has pinnate leaves and a alender lig neous atem ; and when auccessfully cultivnted, risea to the height of three, five, and oven six feet. Before the American colonies were entablished, nll the Indigo used in Europe came from the Eant Indies ; and until the discovery of a passage ronnd the Cape of Good Hope, it was conveyed, like other Indian products. partly throngh the Persian Gulf, and partly ly land to Babylon, or through Arabia and up the led Ses to Fgypt. The rual nature of indigo was so little known in Europe, that it was classed among the minerals, as appears by letters-patent for ereeting works to obtain it from mines in the principality of Halberstadt, dited December 23,1705 ; yet what Vitruvius and Pliny cali indicum is supposed to have been our indigo.- Beckmans. The first mention of indigo occura in English statuten in 1581. The first brought to Europe was procured from Mexico. Its cultivation was begun in Carolina, in 1747. It appears pretty certain that the cuiture of the indigo plant, and the preparation of the drug have been practiced ln India from a very remote epoch. It has been questioned, indeed, whether the indicum men. tloned by Pliny (Hiat. Nat. lib., xxxv., e. 6), was indiko, but, as it would seem, without any good reason. Pling states that it was brought from India; that when diluted it produced an admirable mixture of blue and purple color (in diluendo misturam purpure caruleique mirabilem reddit); and he gives tests ly which the genuine drug might be uiscriminated with sufficient precision. It is true that l'liny is egregionsly mistaken as to the mode in which the drug was produced; but there are many exampies in modern as well as ancient times, to prove that the posesssion of an tielo brought from a distanco implies no oceurate kno.ntedge of its nature, or of the processea followed in its manufucture. Beckmann (Hist. of Inerntions, vol. iv., art. Indico), and Dr. Baucroft ('ermanent Colora, vol. i., pp. 241, 252), have eaci investigated this subject with great learning and sagacity; and agree in the conclusion that the indicum of Pliny was real indigo, and not, as has been scpposed, a irug prepared from the isatia or woad. At ail events, there can be no question that indligo was imported into moderu Lurope, by way of Alexandria, previonsly to the discovery of the ronte to Iudia by the Cape of Good Hope. When first introduced, it was customary to mix a little of it with woad to heighten nnd impruve the color of the latter ; but, by degrees, the quantity of indigo was increased ; and woall was, it last, entirely auperseded. It is worth while, however, to
remark, uas with growere prohibit odict wa indigo, o be taken cause," dyod arti couatry! ther, and oath once continued urgent re the solicit was prohil 1737, that dye with pleased.who may h graph, smil tato nomine aition is ma importation reasona tha the importa Indigo is inces subjec 20th to the ince of Tint Java; in Lt unds ; and $h$ America.

It deserves of the trade, selves to the method, and whole annual ture of indigo respects the but also as r drug which th In the same as 41,000 chests, cheata; and maands, while than 172,249 increased for quantity. In from Calentta though the qua vailue rose to 1 was no corresp on tho contrar bo accounted placed on the of colonial nrti consequent diff lia, and an und article of India
remark, that indigo did not make Its way into genaral $\mid$ digos and tha quantity produced in the other placea is use without encountering mincl, oppoition, The grocere of reoad prevailed on meveral govermmenta to prohlbit the use of indigo ! In Germany, an imperiul edict was published in 1654, prohibiting the use of indigo, or "devir's dye," and directing great care to be taken to prevent ite clandeatine importation, "because," anys the edict, "the trade in woed is leseened, dyed articles injured, and money carried out of the country !" The magintraten of Nuremberg went further, and compelled the dyers of that city to take an oath once a year not to use indigo; which practice wha continued down to a late period. In 1898, upon an urgent representation of the States of Languedoc, at the aolieltation of the woad growert, the use of indigo was prohibited in that province; and lt was not till 1787, that the dyera of France were left at liberty to dya with such articies, and in such a way, as they plessed.-Beckmann, vol. iv., p. 142. Let not those who may happen to throw their eyes 0 is this paragraph, amile at the ignorance of their ancesterb-Mutato nomine, de te fabula narratur. How much opposition is made $f$ - most countriea at this moment to the importation of, any important articles, for no better reasona than wero allegod in the 16 th century against the impertation of indigo !

Indigo is produced in Bengal, and the other provinces subject to the presidency of that name, from the 20th to the 80th degree of north latitude; in the proviace of Tinnevelly, unuer the Madras government ; in Java; in Lucenia, the principal of the Philippine Islunds ; and In Guatemala, and the Caraccas, in Central America. Bengal is, however, the great msit for in-
comi: tively linconsiderathle.

Raynal was of opinion that the culture of indigo had been introduced Into Americ. by the Spaniards: bnt thie is nudoubtedly an error. Several speciea of indigefera belong to the Naw World; and the Spanlards used it as a anbetitute for ink, very soon after the conquest. (Homnourt, Nouvelle EEpagne.) For the first 20 years after the Einglish became masters of Bengal, the cultnre and manufactare of indige, nrw of such importance, was unknown as a branch of Bricish industry ; and the exporta were but trifing. The European markets were, at this period, principally suppliad Prom Americn. In 1788, however, the attention of the English began to be directed to this business $;$ and thangh the procensen pursued by them be nearly the same with thess foliowed by the natives, their greater akill, intelligence, and capital give tham immosae advantages. In their hands, the growth and preparation of indigo has become the most important employment, at least in a commercial point of view, which can be freely carried on in the conntry, the culture and preparation of opium being a monopoly. The indige made by the natives suppliee the internal demand; but a portion of that which is raised by them, with all that is raised by Europeans, is exported. In the Delta of the Gangen, where the beat and largent quantity of indigo ls produced, the plant laats only for s aingle aeason, being destroyed by the periodical innndation; but in the dry central and western provinces, one or two rattoon cropa are obtalned; and owing to this circamatance, the latter are enabied to furnish a large supply of reed to tbe former.

It deserves to be remarked, that since tho opening of the trade, Indian capitalists have betaken themselves to the manufacture of indigo on the Earopenn method, and that at present a considerablo part of the whole annual produce la preparod by them. The calture of indigo is very procarious, not only in ao far as respects the growtil of the plant from year to year, but also as regards the quantity and quality of the drug which the same amount of plant will afford even in the same sessen. Thus the produce or $1825-26$ was 41,000 chests, while thst of $1826-7$ was but 25,000 chests; and in 1842 the produce was only 79,000 mannds, while that of the following year was no less than 172,249 mannda! The price of Indigo in India, increased for a whila, in a far greater ratio than the quantity. In 1813-14, the real value of that exported from Calcutta waa $11,461,000$; but in 1827-28, although the quantity bad increased lout 20 per cent., the vaiue roes to $£ 2,920,000$, or was about doubled. There was no corresponding rise in the price in Europe, but, on the contrary, a decline; and the circumatance is to be accounted for by the restraints that were then placed on the Investment of capital in the production of colonial articles sulted to the European market, the conseqnent difficulty of making remittances from India, and an unnutural flow of capital to the only great article of Indian produce and export that was aupposed
capable of bearing its application. The consumption of indigo has varied but little in England during the last 10 years, having been, at an sverage of that period, about $2,000,000 \mathrm{lbs}$. a year. This staticnary demand, notwithstanding the fall in the price of the drug and the increase of popalation, is principally to be ascribed to the decreasing nse of bius cloth, in the dyeing of which it is principally made use of. Ita consumption In France is sbout as great as in Britain. Besides the experts to Great Britoin, France, and the United States, a good deal of Bengal indigo is exported to the perts on the Persian Gulf, whence it finds its way to southern Russia. It is singular that it is not used by the Chinese, with whom blue is a favorite color. The indigo of Bengal is divided into two classea, called, in commercial language, Bengal and Oude; the first being the prodice of the southern provinces of Bengal snd Bahar, and the last that of their northern provinces and of Benares. The first is, in point of quality, much superior to tha other. This arose at one time, in a considerable degree, from the practice which prevailed in the northern provinces, of the Europesn planter purchasing the wet fecula from the Ryet or native manufncturer, nnd completing the processes of curing and drying the drug. This is at present in a groat measure diacontinued; and the Oudo indigo has, in consequence, considerably improved In quality. Its

Inforlority is probalily more the result of soll and ellmate, than of any difference in the aklli with which the inanufacture is condacted.

In addition to the exports from India, indigo is exported from Java, the Pblifppine Ialande, Ceutral Amoriea, ond other pleces. In 1 it is the exports froni Batavta amounted to $1,653,869$ libe., and, we belleve, they have varied but little in the intarval. In 1850 the exports from Manilla ware estimated at about 450,000 lbe. According to Humt jut, $1,800,000$ lise of Indigo were exported from Guatemala in 1825. Hut if so, its production must huve fallen off greatly in the interval. It doen not now probably exceed 500,000 lbs. in all Central America. Indigo is also produced in some of the West Indla Ialands, but in small quantitios. Good ladigo is known by its lightness or small specific gravIty, indicatling the abeence of earthy impurities; by the mase not readly parting with its coloring matter when tested by drawing a atreak with it over a white surface: but above all, by the purity of the color itself. The first quality, entimated by this last test, is calld, in commercial language, fine bue; then follow ordinary Bue, five purple, purpis and violet, ordinary purple and violet, dull Bue, inferior purple and violet, strong copper, and ordinary copper. These distinctions refer to the Kengal luiligo oniy, the Oude being distinguished only into fine and orvi,uary. The indigo of Madras, which is superior to shat of Manilia, is abont equal to ordinary Bengai Indigo. The Indigo of Java is superior to these.

We subjoin an account of the prices of Bengal indigo of medium quality, at the quarteriy sales in London, from 1847 to 1801, both inclualve:

For further information as to indigo, nee Colknhooke's Ilusbandry of Rengal, p. 154; Minnurn's Orient. Com.; Wiskisson's Commerce of Bengal; Wrlann's Reriew of do. ; evidence of Giliian Maclaine, Feq., Fant India Committee, 1830-31, etc. The fixed capital required in the manufacture of indigo consists of a fow vits of common masonry for steeping the plant, and precijftating the coloring matter ; a twiling and drying-house; and a dwelling-house for the planter. These, for a factory of 10 pair of vatn, capathe of producing, at an average, $12,500 \mathrm{ibs}$. of indigo, wrorth on the spot about $£ 2500$, will not cost alove $£ 1500$ sterling. The buidings and machinery necesmary to produce an equal value in augar and ram, would probally cost about $\mathbf{£ 4 0 0 0}$. This fact, therefore, without any reference to municipal regutations, affords a ready answer to the question which has been frequently put, why the planters in India have selfoln engaged in the manuficture of augar in preference to that of indigo.

Cultiration of A merican Indigo.-At the present moment, and for the past two years, the supply of the first quality indigo has not been equal to the deniand for it, and that demand is constantiy increasing. Some very excellent indigo, well adapted for anaking chymic, used to be obtained from Guatemala, bat the kind most esteemed is the first quality of Bengal, for which we are dependent on a colony of Great Britain. About 12 years ago the best Bengal indigo could easily be obtained, but at present it in almont unknown in the
market. A spurious article, however, much resembiling it, ls abundant, but it does not possess one half the coloring matter of the genuine, and yet it is solch at a retail price varying from 6a. to 14n. per pound. Our object is to direct the attention of our southern plantera to the cultivation of the Indigo plant, and the manufacture of the bee kinds of indigo, for the inferior kinds are by far too plenty. Abont 60 vears ago and wlthin that period, some very fine qualities of is. digo used to be cultivated In South Carolina; its char acter was much hlgher than the finest Guatenula or the beat Bengal, but it is now unknown in the arta, to the great regret of calico-printers, dyers. and leatherdreasers. In the fermentation of the lad'go-piant no much oxygen ls absorbed, that lts manufecture was found to be very injurious to the health of the negroes on the plantations. This wan one reason for giving up its culture ; and another, and perhaps the strongent was the higher profits derlved from the cultivation of cotton. It appeare to us now, however, that with exercise of auflicient care, the health of the negroes may be maintained as well as in the rice culture: olso that the price which could now he obtained for it would be very remunerative. There are hundreds of persons in our conntry who would rather pay 82 per pound for the best kind of indigo-that quality wlich was manufactured at one time in South Carolinn, or the kind that was sold for the best Bengal 12 yeurs ago-than that which is now sold for 75 cents per pound. We think these considerations ought to induce some of our planters to engage in the cultivation of the tinest quailties of indigo. See Ilunr's Mer. Mrag., xiii., $227^{\text {; }}$ Jour. of Sci., x viii., 237 ; Bincy. Ilrit.

Any bolder for hisak, whether he it has come throug name indorsel an o and this makes it a

Indormement.-The Jaw of Fudoratment, and the Rights and Dutiee of an Indorasp,-Only a note $6:$ bill payable to a payee or order, is, atricdly speaking, subfact to Indorsement. Thn :e who write their namem on the back of any note or blll, are indorsers in ons sense, and are sometimes called so. The payee of a negotiable bill or note-whather he be also maker or notmay indorse It , and afterward any person, or any number of pernons may indorse it. The maker promisen to pay to the payee or hin order; and the Indorsement is als order to pay to the Indornee, and the maker's prome. ise is then to him. But if the original promise was to the payae or order, this "or order," whloh is a negotbable eiement, passea over to the indornee, and he may indonse, and so may his indorsee, indefinitely. Each indorser, by his indorsement, doen two thinge; first, he orders the antecedent parties to pey to his indorsee; and next, he engages with his indorsee that if they do net pay, ha wili. What effect an indorsoment of a negotiable note or bili, by one not payee, before the ln dorsement by payee, ehould have, is not quite certain. U'pon the whole, however, we should hold, with some reason and authority, that where auch a name sppears, sa it may, be made to have the place of a second indorser whenever the payee chooses to write hls name over it, it ahall be held to be so Intended, in the absence of evidence; and then, of conrse, it gives the payee no claim against sach a party, becanse a first fadorser can have none agoinst a second, but the second may have a claim againat the first. Bnt evidence is receivable to prove that the party put his name on the note for the purpose of adding to its secarity, by becoming responsible for it to the payee. And then, If he indorse the note before It was received by the payee, the consideration of the note attaches to him, and he may be held either as surety for consideration or as a maker. If he wrote his name on the note after it was made, and, at the request of the payee or other holder, ho is bound only as a guarantor or surety, and the consideration of the note belng exhausted, he is bound only by showing some new and Independent conalderation. No one who thus Indorses a note not negotisblo can be treated or considered precisoly as a second judorser, whatever be the names on the paper before his own; but any indorser of auch s note or bill may be hold to be a new makor or drareer, or a guarantor or surcty, as the circumstances of the case indicate or require ; but elther the original conaideration or a new one must attach to him to affect him with a lagal obligation.
if the words " to order," or " to hearer," are o .itted accidentally and by mistake, it seems they may be afterward inserted withont injury to the bill or note: and whether a bill or note is negotiable or not, is held to be a question of law. By the law-merchant, bills and noten which are payablo to order can be effectually and fully transforred only by indorsement. This indersement may be in blank or in full. The writing of the name of the payee-cither the ariginal payee or an indorsee-with nothing more, is an indorsement in blank, and a biank indorsement makes the bill or note transferable by the delivery, in like manner as if It had originally been paid to bearer. If the indorsemeat consists not only of the name, but of an order above the name, to pay the note to some specified person, then it is an indorsement in full, and the note can be paid to no one eise; nor can the property In it be fuliy tranaferred, except by the indorsement of such indorseo; and he may again indorse it in blank or in fall. If the indorsement is paid to A 11 only, or its equivalent words, A II is indorsee, but can not indorse it over.
Any holder for valne of a bill or note Indorsed In bank, whether he be the first indorsee or one to whom it has come through many hands, may write over any same indorsed an order to pay the contents to himself, and this makes it a special indorsement, or an indorse-
ment in full. This is oftion done for mecnrity, that as to guard againat the lons Cf the note by aceldent or theft. For the rule of the law le, that negotiable paper, transferable by delivery (whether payable to bearer or indorsed In blank), Lis, Ike money, the property of whoever recelves it in good faith. The same rile has been extended, in England, to exchequer billa, to publio bonds payable to bearer, and to East India bonds ; and we think it wonld extend hare to our rallroad and other corporation bonds ; and, perhapa, to all such inetruments as are payable to bearer, whether nealed or not, and whatever they may be called. If one has such an instrument, and It be atclen, and the thief passes it for consideration to a bond fule holder, thie holder sequires a legal right to it, bucause the property and possesaion go together. But $I f$ the bill or note be apecially indoraed, no person can acquire any property In it, excejic by the indcrsement of the apecial indorsee. It lasald, however, that this precaution protects only the party who has thus mane himself a speclal indorsee, and that the former parties remain liable in the same way as If the indorsement continued blank.

At one time this acquirement of rroperty in negotiablc paper was defeasible by wr of proof or care; that is, if a holder lost hla nc sud a thiof or finder passed it off to a bona fule holuer, the property did not pass, if the clrcumstances ware such as to show negligence on the part of the purchaser, or a want of due inquiry. But this question of negligence scems inw to be at an end, and nothing less than fraud defeats the title of the purchaser.

The written transfer of negotiable paper is called an indorsement, because it is nimost always written on the back of the note; but it has its full legal effect if written on the face. Joint payees of a bill or note, who are not partners, must sll ídorse. An Indorser may always prevent his own romsibility by writing "without recourse," or other equivalent words, over his indossement; snd any bargain between the indorser and indorsee, written or oral, that the indorser sball not be sued, ls available againat that Indorsee, but not against subsequent indorsees, without notice. A bill or note may be Indorsed conditionally, and an acceptor of a bill so indorsed, who paid it before such condition is satisfled or complied with, has been held to pay it agaln after the condition is performed.

Every indorsement and acceptance admits conclusively the signature of every party who has put his name upon the bill previously in fact, and is also previous in order. Thus an acceptance admita the aignature of the inswer, but not the stgnature of one who actually indoraes before acceptance, because acceptance is in its nature prior to indorsement. If a holder strike out an indorsement by mistake, he may restore it ; if on purpose, the indorser is permanently discharged. If the plaintiff, in his declaration, derives his title through all the previous indorsemente, all must be there, and proved. But a holder may bring his action against any prior indorser, and fill any blank indorsement, specially to himself, and sue accordingly; but then he invalidates subsequent indorsements. The reason is, that he takes from them all right to ladorse; thus, for example, if A makes a note to B, snd B, C, D, E, and F, indorse it in blank, and $G$, the holder, writes over C's name, "pay to $G$," it is as if $C$ had written this himself, and then $G$ only, could indorse, and, of course, D, E, and F could not, as they wero mere atrangers. And a holder precluden himself from taking advantage of the title of sny party whose indorsement is thus voided. Nor can he strike out the nsme of any indorser prior to that one whom he makes dofendant; for, by so doing, he deprives the defendant of his right to look to the party whose nane is stricken out, and this discharges the defondant.

One may make a noto or bill payablo to his own order, and indorse it In blank; and this is now rery
common in our commercial cities, bocaune the holder of such a blll or noto oan tranefor it by delivery, and it needs not hir mdorsement to make it negotiable further.

A tranafor by delivery, withous indorioment; of a bill or note payable to bearer, or indorsed in blank, does not generaily make the tranufarrer responaible to the transferree, for the peymont of the instrument. Nor has the tranofesrete a right to fall back, in case of non-payment, upon the trinaforrer, for the original censideration of the transfor; if the bill were transforred in good falth, in exoharge for money or goods; for such tranafor would be heid to be a sale of the bill or note, and the purchater takes it with all risks. ${ }^{\text {c }}$ But it acems not to be so where such a note is delivered elther in payment or by way of security fos a proslously exioting debt. Then if the traneferrer has lost nothing by the reception of the note by the trans-forree-because if he had continued to bold the note, be would have. lost lt-there seems to be no reason why the tranaferree sheuld lose it. We have no doubt that such a tranoforrer may make himeelf liable, without indorsement, by express contract ; and that circumstances might warrant and require the implication that the bili or note no traniferred remained, by the agreement and understanding of both parties, at the risk of the transterrer. And every such transferrer warrants that the bill or note (or bank-note) is not forged or fctitious.
An indorseme at may be made on the paper before the till or note is drawn; and auch indorsement, saye Lord Mariafield, "is a letter of eredit for an Indefinite aum, and it will not lie in the Indorser's month to say that the indorcemente were not regular." The same rule applice to an acceptance on blank paper. ' 80 , an indorsement may bo made after or before acceptance. If made after a refusal of acceptance, which is known to the indorsee, he takes only the title of the indoreor, and is subject to all defenses available againat him. A bill or note once pald at or after maturity ceases to be negotiable, in reference to all who could be prejudiced ly ite tranafer. So, where a bill drawn payable to a third person, by whem it is incorsed, is dishonored and taken up by the drawer, it ceames to be a negotiable instroment; for the drawer has no title to indorse it. But if onc draw a bill payable to his oren order, and indorse it over, and, opon the bill being distonorel, take it up, he may indorse it ngain, and this latt indorsee can recover against the acceptor. And if a bill or note is paid before it is due, it is valid in the hands of a aubeequent bond fide indorseo.
A portion of a negotiable bill or noto can not be tranaferred so as to give the transferree a right of action fur that portion in his own name. Rut if the bill or note be partly pald, it may be indorsed over for the balance. If an aculon be brought on a blil or note, no transfor during the pendency of such action gives to the traneferree a sight of aro" $d$, unlesa he was ignorant of the action; "' ane transfer is valid. After a holder'a death his pernonal reprementotive ahould tranafer, But is, seemn that if a note neeaing indorsement was indorsed by the holder, bat net delivered, the executor can not complote the tranifer lyy delivery. The husland who acquires a right to a bill or note given to the wife, either bofore or after marriage, may indorse. One who may claim payment of a bill or note, and of whom payment may also to demanded, or one vie is liable to contribate for the paymont of a note, can net aue upon it. Hut if only the technical rule-that the same party can net be plaintiff and defondant-provente the action, in may be avolded by indornement over to another before maturity.Pansoxa' ELemente of Mercantils Lav; eh. ix. See articles Bulas of Exchaxas; Stoay on Billo; Xext'a Commewaries on American Iaso ; Danber's Mag., vole. V., vi., vili; En. Bril., artlele Excharge; Barcue on Bill ; Manmal for Noteries Public.

Indus. This great river of Asla has lits rise in Thitbet, at the aorth of the Kailas mountalin, regarded In Hindoo mythology as the mansion of the gods, in about lat. $82^{\circ}$, long. $81^{\circ} 80^{\prime}$, It frot takea a northweaberily direction for ahout 460 miles, whot it in jotned by the river of Dras, whleh, rising in the mountains of Cashmere, and roculving evveral atreams both from the east and west, diseharges a eonsiderable volume of wator at lts conflaonce. At Mekpon-i-Shageron, in lat. $85^{\circ} 48^{\prime}$, long. $74^{\circ} 80^{\prime}$, the Indas emerges from the mountainous region, and turning eouth (a course Which it thenceforth continues to the soas), takes its way through the country north of Attock. Close above this last-mentioned town, and at the distance of 870 miles from ite eource, the Indus recelves on the western aide the great river of Cabool. Hoth rivery have a large volume of water, and as they meet amid numorous rocka, the confluence is tarbalont; and attended with great nproar. The town of Attock is aitunte about 1000 feet above the sea-level, and sbont 17,000 foet bolow the source of the Indus, which falla, therefore, 16,000 feet in 870 milee, or at the average rate of alout 19 foet per mile. The length of its channel from Attock to the seas is 942 millea, and, consequently, In thet lower part of its course, It falis little more than 1 foot per millo. For about 10 miles below At. tock, the river, though in general rolling batween high cliffs of slato rock, has a calm, deep and rapld ourrent ; but for 100 milles further down to Kalubagh, it becones an enormous torrent. Lientenant Wood, descriling this section of Ita coarse, observes, "It here rashes down a valley, varying from 100 to 400 yards wide, between precipitous banks from 70 to 700 feet high." From Kalabagh southward, to Mittunkote, distant alont 850 miles, the banke, either right or leff, are is several places so low, that the first rise of the river covers the conntry ronnd with water, extending, as the inundation advances, as fur as the oye can reach. On entering the plain, the water loees ito clearness, and becomes lomded with mud. Two or three milies below Mititunkote, and about 490 miles from the ses, the Inciss receives the waters of the Punjand, the channel which conveys the cellected atream of the Puajoub. Above the confluence, the breadth of the Indus is iess than that of the other river, but in consequence of the greater depth and velocity, the former bas the greater volume of water. Wood found that the Indna, near the cenfluence, had a breadth of 608 yards, a velocity of about five milea an hour; a depth of 12 or 16 feet, and discharged 01,719 eubic feet per becond. The I'unjnul had a breadth $\mathbf{x} 1766$ yarda, a velocity of about two milea an hour, a depth of 12 or 15 feet, and discharged 68,955 cubic feet per second. Beiow the Juactien, the Indua in its lowest state in 2000 yards vide. Ite aspect in this part in weli described by Major Bolleau. He вayw, "At the plaes where we crossed the Indus, aimoot immediately below its janction with the Punjoud, ite atrean is 2047 yanis, or nearly a mile and a quarter in breadth, at a piace where ite width is unbroken, either by ixlazds or sand. banks. The banks are very lew, and the water very mudly, having juast began to rise from the melting saow at ita sources, nor is the streain of very great depth, except in the main channel; but with ail thene drawbacks, it in a magnificent aheet of water, a very prince of rivers." Below Mittunkote, the river passes in euccession the towns of Sukkur, Bukkur, Sehwan, Ityderabad, and Triecal. The last mentioned of these towna is altuate in lat. $25^{\circ} 9^{\prime}$, longe, $68^{\circ} 21^{\prime}$, and here the delta commences; all the country below it, and contained between the Fulailee hranch on tire enst, and the extreme wentern branch of the river, being, with little exception, alluvial, and obviously deposited by the atream. At about five milea below Tatta, and 60 milen from the aea, the Indas divaricates into two great branohee, the lloggnar, whloh flows westward, and the Sate, which maintains the previous course of

 Ivory black. black; but goid, silver, of vermillio is hrought if the people of the artilicial antiquily. quadranguld animal give Black JnThe
the Indus sonth ward, and 15 , in atrictness, the continuation of that river. The lower part of the delts is Intersected by rivers and creeks in almost overy direction, like the delta of the Gangea; hut it $\mathbf{n}$ far differs from the latter, that it has ne trees on lte aurface, the dry parts being covered with brashwood, and the remainder, hy much the largest part, being noisome owampe or muddy lakee. It is remarkable that the inflaence of the tides is not falt at a greater distance than 60 or 68 miles from the eon. At the mouths of the differeat lranches, the rueh or influy of the tide is high and dangerous, ranning, as has been eatimated, at the rate of fonr milee in honr, though varying greatly at different places. From the een up to Hy derabad, the Indus is in general about a mile in breadth, varying in depth from two to five fathome. The river begins to awell in the middle of July, from the molting of the snow, and contlanes to increase until the end of August. The most eastern of the estuaries cennected with the Indus is the Koree Moath, from which, proceeding westward, the romaining creake or eatuariea moet worthy of notice, occur in the following order: The Seer, Mull, Kaha, Kcokewarree, Kodywarree (discharging the watern of the Sata), Hujarareo, Jooa, Durbar, Pitteeanee, Ccondee, Pitty, and Gisree. The apring-tide rises nine feet. The length of the nevigable part of the river from the sea to Attook, has been ascertained by measurement to be 942 miles, that of the upper part is about 870 miles, making s total length in round numbers of 1800 miles. The average declivity of the water-course from the locality of the source to Attock is, per mile, 19 feet ; from Attock downward to Kalabagh, a dlstance of ubout 110 miles, it is 20 inches; from this placs to Mittunkote, a distance of about 850 milies, it is eight inches, and thence to the ess eix inchen. The Indus sppears destined to become an important channel of commercial communication.-EE. T.

Ingot, a mass of gold or ailver molted down and cast in a mold, but not coined or wrought. A large portion of the gold received from Callfornia at New York is put into this shape for more convenient export.
Ink (Du. Ink, Inkt; Fr. Eivcre; Ger. Dinte; It. Inchioatro; Lat. Atramentum; Ruc. Tochernilo; 8p. Tinta; Sw, Blak). Every llquor or pigment used for writing or printing is distinguished by the name of jak. Common pructice knows only black and red. Of black thers are three principal kinds: 1. Indian ink; 2. Printers' ink; and 8. Writing ink. The Indian ink is used in China for writing with a bruah, and for painting upon the soft fiexible paper of Chinese manufacture. It is ascertained, as well from experimeot an from information, that the cakes of this ink are made of lampliack and sizo, or animal glue, with the addition of perfumen or other substances not esseatial to its quality as an ink. The fine soot from the flame of a lamp or candite received by holding a plate over it, mlxed with clean sise from the shredi of prochment or giove-ieather not diyed, will make an lak equal to that imported. Good printers' ink is a biack paint, amooth, and uniform in itg composition, of a firm biack color, and possessee as singuiar aptitude to adhere to pajer thoroughly impregnated with moisture.
The ancient black inkn were composed of anot and ivory black, aad Vitruvlus and IHiny mention lampbleck; but they hud likewlee various coiors, as red, gold, silver, and purple. Ked lak was made by tiem of vermilion and various kinda of gum. Iadian ink is brought from China, and muat have been in tse by the people of the East from the earlinat agea, moat of the artiticial Chinees productions boing of very great antiquity. It is usnally brought to Europe in amall quadrangular oaken, aud is eompoeed of a fine black soimal glue.-BпскмАкм.

Black Jak,-Nutgalla, sulphate of Iron, and gum,
are the only substances truly useful in the preparation of ordinary ink; the other things often added morely modify the ohade, and considerably diminish the coos to the manufacturer upen the great scale. 1 Mary of thess inks contain littlo galle acid, or tannin, and are therefore of inferior quality. To make 12 gallons of Ink, we may take 12 lbs. of nutgalls, $B$ lhs, of green oulphate of iron, 5 lbs , of gam senegal, and 12 gallons of water.

The bruised nutgalls are to be put into e cylindrical copper, of a depth equal to its diameter, and bolled, during three hours, with three fourths of the above quantity of water, taking care to add fresh water to replace what is lost by evaporation. The decoction is to be omptied into a tuh, allowed to settie, and the clear liquor being drawn off, the lees are to be drained. Some recommend the addition of a littio bullock's blood or white of egg, to remove a part of the tannin. But this abetrection tends to leasen the product, and will seldom be practiced by the manufacturer intent upon a large return for his oapital. The gam is to be dissolved in a small quantity of hot water, and the mucilage thus formed, being filtered, is added to the ciear decoction. The suiphate of iron must likewise be separately dissolved, and well mixed with the ubove. The color darkens by degrees, in consequance of the peroxydizement of the iron on exposing the ink to the action of the air. But ink affords a more durable writing when used in the pale state, hecause its particles are then finer, and penetrate the paper more intimately. When ink consists chiefly of tennate of peroxyd of iron, however black, it is merely superficind, and is easily orased or effaced. Therefore, whenever the liquid made by the above prescription has acquired a moderatoly deep tint, it ohouid be drawn off clear into botties, and well cerked up. Some ink-makers ailow it to mold a little in the caaks before bottling, and snppose that it will therehy be not so ilisble to become moldy in the bottlee. A few brulsed cloves, or other aromatic perfume, added to ink, is aaid to prevent the formation of moldiness, which is produced by the ova of infusuria animalcules. I prefer digesting the galls to boilling them.

The operation may be abritged, by peroxydiaing the copperas beforehand, by moderate calcination in an open vessel ; but, for the reanens above assigned, luk made with such a suiphate of iron, however agreeable to the ignorant, when made to ghine with gam and ougar, under the name of japan ink, is neither the most durable nor the nost pleasant to write with. From the comparatively high price of gall-nnte, sumach, logwood, and even oak bark, are too frequently snbstituted, to a considerable degree, In the manufscture of ink. The ink made by the preacription given above, is much more rich and powerful than many of the inks commoniy sold. To bring it to their atandard, a half more water may safely be added, or even 20 gallona of tclerublo Ink may bo made from that weight of materiais. Sumach and logwood admit of only about one half of the copperas that gelle will take to bring out the maxinnm smonnt of black dye. Chaptal gives a prescription in his Chimie appliqtie aux arts, which, like many other things in that book, are publiehed with very little knowledge and discrimination. IIe uses logwood and sulphats of copper, in addition to the galis and sulphate of iron; a perniclous combination, productive of a epurious fugitive black, and a liquor corrosive of pens. It is, in fact, a modification of the vile dye of the hattera. Lewis, who made exsct e:sperimente on inks, asaigned the proportion of 8 parts of galis to 1 of sulphate of Iron, whioh, with average gaila, will anawer very well; but good galla will admit of more copperas.

Gold Ink is made by griuding upon a porphyry slab, with a muller, gold leaven along with white honey, till they be reduced to the finest poeslible division. The paste ia then collected upon the edge of a knife or
spatula, put into a large glass, and diffused through water. The gold by gravity soon falls to the botto: while the honey dissolves in the water, which must be decanted off. The sediment is to be repeatedly washed till entirely freed from the boney. The powder, when dried, ia very brilliant, and when to be used as an ink, may be mixed up with a little gum water. After the writing becomes dry, it should be burnished with a wolf's tooth.

Silver Ink in prepared in the same manner.
Indelible Ink.-A very good Ink, capable of resisting chlorine, oxalic acid, and ablution with a hair pencil or sponge, may be made by mixing some of the ink made by the preceding prescriptlon, with a little genuine Cbina ink. It writes well. Many other formula have been given for indelible inka, but they are all inferior in simplicity and usefniness to the one now prescribed. Solution of nitrate of silver thickened with gum, and written with upon linen or cotton cloth, prevlously imbued with a solution of soda, and dried, is the ordinary permanent ink of the shope. Before the cloths are washed, the writIng should be exposed to the sunbeams, or to bright daylight, which blackens and fixes the oxyd of silver. It is easlly discharged by chlorin and ammonia. A good permanent ink may be made by mixing a atrong solution of chlorid of platinum with a little potash sugar, and gum to thicken. The writing made therewith should be passed over with a hot amoothing iron to fix it.

By decompoeing vanadate of ammonia with lnfusion of galls, a liquid la obtained of a perfectly black hue, which flows freely from the pen, is rendered blue by acids, is insoluble in dilute alkalis, and resists the action of chlorin. Whenever the metal vanadium ahall become more abundant, as it probably may ere long, we ahall possess the means of making an ink, at a moderate price, much superior to the tannate and gallate of iron. To prepare the above vanadic ealt cheaply, the cinder or hammerschlag obtained from the Iron made at Ekeraholm, In Sweden, or other Iron which contains vanadium, being reduced to a fine powder, is to be mixed with two thirds of its weight of nitre, and one third of effloresced mola. The mixture is to le ignited in a crucible; sooled and lixiviated, whereby aolutions of the vansdates of potash and soda sre obtained, not pure, indeed, but sufficiently so for being decomposed, by merus of asl ammoniac, into a vanadate of ammonia. This being rendered nearly neutral with any acid, constitutes an excellent Indellble ink.

Iodelible Ind may be propared by a dding lamplanck and indigo to a solution of the giuten of wheat in acetic acid. This ink is of a beautiful black color, at the sanis time cheap, and can not le removed by water, chlorin, or dilute acids. M. Ilerberger gives the fullowing directlons for its preparation: Wheat-gluten is carefuily freed from the atareh, and then dissolved in it little weak acetic acid; the liquid is now mixed with so much rain water that the solution has about the strength of wine vinegar, i. e., neutrulizes 1-16 of its weight of carbonate of solla. 10 gra of the best lampblack and 2 grs , of indlgo are mixed with 4 oza , of the solntion of gluten, and a little oil of clovea added. This ink may ine einployed for marking linen, as it does not resint mechanleal force.

Ink, indelible, of Dr. Traill, ia easentlally the same an the above. French indelible ink connints of Indian Ink diffused through dilute muriatic acid, for writing with quills, and through weak potanh lye for writing with steel pens.

Red Imk.-This lnk may be made by infusing, for three or four daye in weak vinegar, llrazil wood chipped into small pleces ; the infusion may be then boiled upon the wood for an hour, atrained, and thickened ilightiy with gutu arabic and sugar. A little alum improves the color. A decoctlon of cochineal with a lituls water of ammonia, forms a more beantiful red
ink, bnt It is fugitive. An extemporaneona red ink of the aame kind may be made by dissolving carmine in weak water of ammonia, and adding a little mu. cilage.

Green Ink.-According to Klaproth, a fine Ink of this color may be prepared by boiling a mixture of two parts of verdigris in eight parts of water, with one of cream of tartar, till the total hulk be reduced one half. The solntion must be then passed through a oloth, cooled, and bottled for use.
Yellow Imk is made by dissolving 8 parts of alum in 100 of water, adding 25 parts of Persian or Avignon berries bruised, boiling the mixture for an hour, straining the liquor, and dissolving It in 4 parts of gnm arable. A oolution of gamboge ln water forms a convenient yellow Ink.
By examining the different dye-stuffs, and considering the processes used In dyeing with them, a vuriety of colored luks may be made.
China Ink,-Proust says, that lampblack purified hy potash ley, when mixed with s solution of giue, and dried, formed an ink which was preferred by artists to that of Cbina. Mr. Merimé, in his interesting treatise, entitied De la peinture d l'huile, says, that the Chinese do not use glue in the fabrication of their Ink, but that they add vegetable juices, which render it more brilliant and mors indelible upon paper. When the best lampblack is levigated with the purest gelatine or solution of glue, it ferme, no doubt, an ink of a good color, but wants the ahining fracture, and is not so permanent on paper as good China ink; and it stiffens in cold weather into a tremulous jelly. Ciue may be deprived of the gelatinizing property by boiling it for a long time, or antijecting it to a high heat in Papin's digester; but as ammonia is apt to be generated in this way, M. Merimée recommends starcii gum made by sulphuric acid (British gam) to be used in preference to glue. He glves, however, the fullowing directiona for preparing this lak with glue. Into a solution of glue he poura a concentrated solution of gall-nuta, which occanions an elastic resinous-lookiog precipitate. IIe washos this matter with hot water, and diesolves it in a apara solution of clarificd glue. He filters anew, and concentrates it to the proper degree for being incorporated with the purified lmmpblack. The astringent principle in vegetables dees net preoipilate gelatin when ite acid is saturated, as Is done ly boiling the nut-galla with lime-water or magnesia. The first mode of making the ink is to Le preferred. The lamplack is asid to be mands in China, by collecting the smoke of the oil of sesimue. A little camphor (about 2 per cent.) has been itetected in the ink of China, and is supposed to inprovo it. Infualon of galls renders the ink permanent ou paper.

Sympathetic Ink.-The best is a solution of muriats of cobalt.
I'rinters' Ink. See Uns's Iict. for full details.
Blue Ind.-Mr. Stepheus's patent blue ink is made by dissolving Yrussian blue in a solution of oxatic acill. The thue should be washed In dilutc untiatic acid. M. Mornung has given the following as the lest formula for blue ink: Mix 4 parts of perchiorid of iron, in solution, with $7 \cdot 50$ parts of water, titen adil 4 inarta of cyanid of potassiun dissolved in a little water; collect the precipitate formed; wash it with sevoral alditiona of water; allow it to draln until it weighs absut 200 parts ; add to thin 1 part of oxaile acid, and promote the solution of the cyanid by silaking the bottie containing the mlxture. The adiition of gum and augar is uselees, and even appears to exercise a jrejudieial effect on the beauty of the ink. It may be kept withont any addition for a long tine.--Uns's Dietionary of Manyfactures. Bee Indian ink.

Inlele, a sort of brood linen tajee, principally manufactured at Manchester and some other towns in Lancachire.

Inlatd vorory. There are many pretty and varied kinds of inlaid work mannfactured from small fragments of material. There ia the Marquetric or inlaid cabinetfurniture of France, consisting in inlaying woods of a grest variety of tinta, In the form of flowers, ornaments, etc. The Buhl, or Boul-work, is also of French invention, wherein metala are inlaid npon a ground of ebony or tortoise-shell. The elaborate German cabinets, made of ebony, are inlajd with precious atones and various woods and metals. There is the Mosaic inlay, in which the piecen inlaid are extremely amall, and of which exquisite boxea are made by the Hindoos; witnese, too, the marvelous Spanish table at the Great Exhibitlon of London in $8,000,000$ of pieces. The Parquetrie, or inlaid flowering, which differs from Marquetrie chiefly in the bolder acale of the designs; woods of different colors being cut to pattern, and inlaid. There is the novel and beantiful process of inlaying articles of furniture with porcelain; the inlaid portions are not merely pannels and pilasters, but paintad porcelaln flowera and other ornaments. The Pietra Dura is a kind of art carried to great perfection in Tuscany: its cultivation in that country has for a long period suppied most of the palaces of Europe with works in pietta dura, which rank among the finest examples of decorstive furniture.

Insolvency and Bankruptoy. The first Insolvent Act in England was passed in 1649, bnt it was of limited oparation; a number of acts of more extensive operation were passed at varione periods, and particularly in the reign of George III. The benefit of the act known as the Great Ineolvent Act wss taken in Englsnd by 50,783 insolvents from the time of ite passing, in 1814, to March, 1827, a period of 13 years. Since then, the acte relating to insolvency have been several times amended. Porsons not traders, or, being traders, whose debts are less than $\mathbf{£ 3 0 0}$, may petition the Court of Bankruptcy, and propose composition, and have pro tem. protection from all process againat their persons and property, 6 Vict., 1842. Act amended, 8 Vict., Augast, 1844.--1IAydn.

Bankruptcy,-Blackstone detines a bankrapt-"A traicr who secretes himself, or does certain other scte tending to defraud his creditors." But an intention to defraul ie not now hold to be essential to constitute a bankrupt; who may be either aimply an insolvent, or a person who is guilty of certain acts tending to defraud his creditors.
Insolvemer.-A nalysis of the Laws of Bamkruptcy. -In Great Britain, insolvency is applied to every class of persons, while bankruptcy in excluaively applied to traders. In forsign countries, insolvency is the general denomination. Laskruptoy ls declared when there la any degree of crimiaulity. The law of bankruptcy of England is consolidated in the 12 and 13 Vict., c. 106. in America, various attempts were made for a general ensctment for all the Statea, but with no success. The act of Congreas on the subject, passed in 1841, was ropesled in 1848. Special insolvency laws exist, of which an abatract ie given hereafter. In Scotiand, the bankrupt law is ineluded in the 2 and 8 Vict., chap. 41. The French law of the 28th of May, 1838, has modified the Code of Commerce of 1807. Article 437 permits declaration of the insolvency of a trader after his decease. Tie law of Scotiand authorizes the seqnestration of estates of a deceased debtor. The same is permitted in Portugal. In Eagland a Court of Bankruptey is instituted, which may adjudge the creditor a bankrupt. In Scotland the eame is placod with the Lord Ordinary. In France the same authority is given to the tribunal. Acts of bankiuptoy may be committed in lingland in varions ways. Ail acts male previous to adjuilication of liankruptcy are valid, if they are eatered into bond sule on the part of the contracting party. In France, the following acts, made within 10 days preceding the opening of the incolvency, are void: lat. Acts transferriog property'
gratuitousky ; 2d. Payment of debte not due, and of those due aettled otherwise than with commercial offects; 8d. All mortgagen, antlchrese, or security, consented to for anterior debts ; and, lastly, all acts whatever made by the debtor with a third party who was cognizant of his having atopped payment. Articlea 58 to 54 of the Prussian code oontain also aimilar inetructions. The Spanish code fixee 30 daya; the Portuguese code, 40 days; the Dutch code, two months previous to the insolvency as the time during which the insolvent could not alienate his property gratuitously, or endow his children, or transfer or mortgage his real eatate.

The Dutch code declares void the donations made by the insolvent at any time where he knew his affairs embarrassed, although the donatee was boná fide. The Ruseian code prohibits the wife and children of the insolvent to reclaim the donations made to them. By Article 1451, the property engaged by the insolvent, and not yet sold, may be redeemed, and form portions of the assets. As to the administration of the insolvency in England, assignees are chosen by the creditors, under the aupervision of the Court. In Scotland, creditors are to elect an interim factor and a trustee, and also three commiseioners. In France, the agente created by the code 1807 have been auppreseed, and at present there are no more than provisionary assignees, who continne their functions till the confirmation of the settlement, or till the formation of the contract of union. The Tribunal of Commerce of Paris has formert a fixed number of assignees, to whom is confided the management of all bankruptcies.
In Spain, the tribunal designates a commissioner, nominates a trustee for the property of the insolvent, and calls the creditors, who choose some assignees, who are to be taken from among the creditors, or their attorneys. In England, the commissioners of bankruptcy are judges, elected by the Lord Chancellor, one for each district. All legislation provides for the remuneration of the assignees, trustees, or administrators: these remunerations sre fixed by Art. 1078, Spanish code, Portuguese code, Rusbian code, etc., etc., either upon a determined share, or the receipts which they have realized, or by remuneration, valued by the tribunal. Tho Spanieh code prohibte an attorney from representing more than one creditor; and the Jortnguese code prohilita a creditor from representiug another creditor at the meetings.

In order thast an insolvent may obtain a settlement, there need be, in France and in Russia, a majority of the creditors and three fourths of the dehts. In Scotland, a majority and three fifths of the debts. In Spain, one more than the half of creditors and three fifthe of the debts. The wife of the insolvent has no deliberative voice there in the resolutlons relative to the settloment. In Holland, in Portugal, in Wurtemburg, and accurding to the orlinance of Bilboa, the two thirds of ordinary creditors and three fourths of debte, or the tiree fourths of the creditors and two thirds of the debta must be added together. The Prusoian code, which divides the creditors into six classes, exacta the majority on eum and classes; in case of division of clnsses, tho settlement mny be adopted by the one anil rejected by another; but if the division is impracticable, tie declaration of division shall he equivalent then to a refusal. With respect to the contirmation, looth in France and in "pain, it ean only ie pronnunced eight daya after the eottlement has ioen obtained. The diseenting croditors, according to the Spanish code, can not form opposition to it, unless on account of defects in the forme of calling the meetings, on acconnt of collusion, or of want of legitimste rights in the parties voting, or of frandulent exaggeration of their debts; and in Holland, when the assots exceed the sum entered in the settlement. The Dutch code and the Frenoh law render the contirmation obligatory upon all the creditors both absent and
present, and even upon those who have not been callod.
The righta of forelgn creditore are genorally regulated by treaties, Prussla, or by the right of reolproce lity, Anstria. By the French code of civll procedure, two months are granted to ereditors realding in England to prove thelr debts. By the Sardinian code, guch delay is three months.-Com. Lavo of the World, by Leone Levi. London, 1856. 2 vols.

United Stater.-There is not any bankrupt system in existence under the governiment of the United States. An act of Congrees was passed on the anibject in 1841, but it was repealed in 1843. The several States are left free to Institute thelr own bankrupt aystem Insolvent laws prevall throughout the Union. In the Statea of Maine, Now Hampehire; Massachusetts, Virginia, and Kentucky, they are confined to the relief of debtore charged in execution. In New Jersey, Delaware, Maryland, Tenneasee, North and South Carollna, Georgla, Alabama, Misaissippl, and Illinois, the insolvent laws extend to debtors in prison on mesne or final process. In New York, Connecticut, Rhode Island, Pennaylvania, Ohio, Indiana, Missoari, and Louisiana, they are still more extenalve, and reach the debtor whether in or out of prison. The following is an abstract of the lawa of the eeveral States in reference to summary attachment against insolvents:
I. Alabama.-Original attachments, foreign and domestic, are issued by judges of the circuit or county coarts, or justices of the peace. An attachment may lssue, although the debt or demand of the plaintiff be not due ; and shall be a lien on the property attached, untii the debt or demand becomes due, when judgment shall be rendered and execution lasued. A non-resident plaintiff may have an attachment againat the property of a non-resldent defendant; provided he gives good and sufficient resident seenrity in the required bond; making oath that the defendant has not eufficlent property within the State of defendant's residence to satisfy the debt or demand.
II. Arkansas. - An attachment may be lssued against the property of a non-resident; and also against a resident of the State when the latter is about to remove ont of the State; or ls about to remove his goods or effects; or about to secrete himself so that the ordinany process of law can not be served on hím.
111. California.-1. Creditors may proceed by attachment when the defendant has absconder, or is about to alscond from the State; or is concealed therein to the Injury of hia creditors. 2. When the defendant has removed, or ls about to remove, any of his property out of the State, with intent to defraud his creditors. 3. When the defendant frandulently centracted the deist, or incurred the obligation, respeeting which the suit lo brought, 4. When the defendant is a non-resident. 5. When he has fraudulentiy conveyed, disposed of, or concealed his property, or a part of it; or iatends to convey the same to defraud his creditors. In California the real estate shall be bound, and the attachment shali tie a lien thereon, although the delt or demand due the plaintiff the not due-In case the defendant is about to remove himself or his property from the State. The law of attachment applies in California, when the contrnet hus been made in that State, or wehem made payable in that State.
IV. Connecticut.-Attaehment may be granted againat the goods and chattels and land of the defendant; and likewise against his person when not exempted from imprisonment on the execution in the auit. The plaintiff to give tonds to prosecute his clain to effect.
V. Delamare.-A writ of domestio attachment iosues againut an inhabitait of Jelaware when the defendant cas not be found; or han abseconded with intent to dafraud his creditors; and a writ of foreign sttachment When the defendent is not an inhabitent of this State.

This attachment is dissolved by the defendaat's appearing and putting in apecial bail at any time before fudgment.
VI. Florida. -An attachment issues when the amount is actually due, and the defendant is actually removilag out of the State, or absconds or conceals himself.
VII. Gsorgia. - A judge of the superior court, or a juatice of the inferior court, or a justice of the peace, may grant an attachment against a detitor whether the debt be matured or not, when the latter la removing without the llmits of the State, or any county, or conceals himself. The remedy by nt tachment may be rearted to by non-resident as weil as by reuldent creditora. The neceasary affidavit mas be made before any commissioner appolnted by the State to take affidavita. Indorsers of notes, obligations, and all other instruments in writing, are entitied to the same remedy as provided for securities. In all cases the attachment first served shall be firat satisfied. No lien shall be created hy the levylng of an attachment, to the exclusion of any judgment obtained by any creditor, before judgenent ls obtained by the attaching creditor.
VIII. Illinois,-Attschments are lssued by the clerka of the circuit court, when affidavit is filed thet the defendant has deperted, or ls about to depart, out of the State, or conceals himsalf, so that process can not be served upon him.
IX. Indiana.-The property of an lnhabitant of the State mey be attached, whenever he is secretly leaving the State, or shall have left the State with intent to defrand his creditors. The property of a nenresident is liable to attachment as in other States.
X. Jowa.-The plaintiff may cause any property of the defendant, which is not subject to execution, to be attached at the commencement, or during the progress, of the proceedings, whether the claim be matured or not; provided an affidavit is filed to the effect that the defendant la a foroign corporation, or acting as such, or that he is a non-resident of the Stute, or (if a resident) that he is in some manner about to dispose of or remove his property ont of the Stnte.

XI, Kentucly.-1. The plaintiff may have an attaciment agrainat the property of the defendant when the iatter ia a forelgn corporation, or a non-resident of this State; or, 2, who has been absent therefrom four monthe ; ur, 3, has departed from tho State with intent to defraud his creditora; or, 4 , has left the county of hls residence to avoid the service of a summons, or conceals himaelf that a aummons can not reach him; or, 6 , is about to remove his property, or a material part thereof. out of the State; or, 6 , has sold or conveyed bis property with the Intent to defraud his creditors, or is abrout so to sell or convey. Such attachusent is binding upon the defendant'a property in the county from the time of the dulivery of the order to the aheriff.
XII. Lowisiana.-A creditor may obtuin an nttachment against the property of his delitor upon afthlavit: 1, when the iatter is about leaving permanently the State before oltaining or executing judgment against him; 2, when the debtor resides out of the State; 3, when he conceals himeelf to avoid being cited to anawer to a suit, and provided the tern of payment have arrived. In the abacnce of the creditor, the oath may be made hy his agent or attorney, to best of his knowiedge and belief.

Xlil. Maine.-In thls State, an original writ may be framed either to attach the grods or estate of the defendant, or for want thereuf to take his budy. Ali goods and chattela may be attached lyy the reveditor and held as sacurity pending any suit against the delitor. Sach a writ will authurize en attachanent of graxla and eatate of the principal defendant, in his own hands, as well as in the handa of trustees. Real eatate, limble to be taken in exocution, may be attached.

XIV. Maryland.-A creditor may obtain an attachment, whether he be a citizen of Maryland or not, sgsinst his debtor, who is not a citizen of this State, and not residing therein. If any citizen of the Stste, being indebted to another citizen thoreof, shall actually run awsy or abscond, or secretly remove himself from his place of abode, with intent to evade the pasment of his just debts, an attachment may be obtained against him. An attachment may be laid upon debts due the defendant apon judgments or decrees rendered or passed by any court of this Stste, and judgment of condemnstion thereof may be had, as upon other dehts due the defendant.
XV. Massachusetts.-Original writs may be framed, either to attach the goods or estste of the defendant, or for want thereof to take his body; or, there may be an original summons, elther with or without sn order to attach the goods or estate. All real estate, or goods and chattels that are liable to be taken in execution, msy be attached upon the original writ, in any action in which any delit or damages are recoverable, and may be hoid as security to satisfy such judgment as the pinintiff may reeover.
XVI. Michigan.-The grounds of attachment in this State are, 1, that the defendant has absconded, or is about to abscond, or has concealed himself; 2, that he has nssigned, or concealed, or is about to remove, his property with a view to defraud; 3 , that he fraudnlently contracted the debt, or incurred the obligation, about which the suit is brought; 4 , that he is not a resident of the State, or has not resided there three montiss immodiately preceding the suit; 5 , that the defendant is a foreign corporation.
XVII. Mississippi.-An attachmeqt sgainst the eslite, inciuding real estate, slaves, goods, chattels, etc., of a debtor, when it ls shown that he has renoved, or is about removing or absconding from the State, or privately conceals himself. Attachment also lies against the property of nou-reaident decedents. It may be obtained before the debt is due for which it issucs, when the creditor has ground to believe that the deltor wili removo with his offects out of the State, or has romoved.
XVIII. Missouri.-An attachment may be jesued here when the debtor is not a resident of the State; or, if a resident, when he absconds, absents, or conceals himself; or is about to romove his property, or faudulently convey it, with a view to hinder or delay his creditors; or, 2 , where the debt was contracted out of the State, and the deitor has eecretly removed his effects into this State with intent to defraud.
XIX. New Hampshire.-In this State a writ of attaciment may be issued upon the institution of any personal action; and wilt hold real and personai property, shares of stoek in corporations, pews in churches, sad the franchise of any corporation authorized to receive tolls, until the period of thirty days from the time of rendering the judgment.
XX. New Jersey.-An attachment may issue at the instance of a creditor (or in his absence, of his agent of attorney), agalnst the property of a debtor when the latter is about to abscond from the State, or is not a pesident of the State, or is a forcign corporation.
XXI, New York.-Any ereditor to the amount of \& 23 may compel the nssigumont of their estates hy debtors imprisonod on execution in civil eauses for more than 60 vearn. If the dehtor refuses to he examined, and to disclose his affairs, he is liable to he committed to close continement. If he refuses to render an account inventory, and make an assignment, be will not be entitled to his diseharge ; though the officer having jurisdiction in the case is authorized to make the assignment for him. The proceedinga, and the effect of the discharge, when duly obtained, and the duties of the delitor, aud the rights of the credit. ora, are eabentially the bame as in the case of procoenlings with the aesent of two thinds of the creditors.
2. Every insolvent debtor may also petian the proper officere for leave voluntarily to assign his estate for the benefit of his creditors; and the same proceedlags and checks are substantially prescribed as in other casos of Insolvency. His discharge, obtained in auch a case, exempts him from imprisonment, as to debts due at the time of the assignment, or previously contracted; and as to liabilities incurred by making or Indorsing any promissory note or bill of exchange. But the discharge does not affeet or Impair any debt, demand, payment, or decree against the insolvent; and they remain good againat his property acquired after the execntion of the assignment; and the lien of judgment and der- 3 is sot affected by the discharge.
8. The creditic at whose suit the debtor is imprisoned, may require him, after the expiration of three months, to make the assignment, and his refusal will forever bar him from his discharge under this provision.
4. Corporations being creditors, may petition by a director, or other officer, acting onder the corporate seal ; and such director or officer, may mske the reqnisite affidavits. So one joint partner may act as a creditor for the firm; and provision is mada for the accommodation of non-resident ereditors.
5. Delts parchased below the nominal amount entitle the creditor to set to the amount of the sum actnally and boní fide paid; nor is a creditor having a security permitted to bect mo a petitioner unless he relinquishes his security for the common benefit of the creditors. The assignments and discharges in these insolvent cases are to be recorded by the clerk of the county in which they were executed. No debt or duty to the United States is affocted by any such discharge, not even as to the remedy by imprisonment; but debte und duties to the Stato, except taxes, are placed upon the same footing as debts to individuals.
6. The assignment of the insolvent passes all his interest, legal and equitable, existing at the time of exccuting the assigninent in any estate, real or personsl ; but no contingent interest passes unless it shall become vested within three years nfter making the asotgnment, and then it passes. Probabilities coupled with an tuterest are assignable ; hut not bare possibilities, such as the expectancy of an heir. The sasignment does not affect property leeld by the debtor in trust; nor does the assignment by the insolvent husband affiect the property settled to the separate use of the wife free and clear of her husband.
7. The insolvent discharges apply only to debts exiating when the petition, inventury, and schedule of delts are presented, and not so as to cover debts contracted between that time and the time of the discharge.
8. The property assignod is distributed ratabiy anong all the creditors, sulject, nevertheless, to existing legai lians and priorities existing before the asaigminent ; and under the New York insolvent laws, a creditor can not become a petitioning creditor in respect to uny debt secured by a legal lien, unless he previously reiinquishes that licn for the general benefit of the creditors.
9. The attachment-law of New York is a legal mode, by which, a title to property may be aequired by operation of law. When the debtor, who is an inhabitant of New York, absconds, or is concesled, a creditor to whom he owes 100 , or any two, to whom he owes $\$ 150$, or any three, to whom he owes $\$ 300$, may, on npplication to a juilgo or commissioner, and on due proof of the deht, and of the departure or concealment, procure his real and personal estate to bo sttnehed; and on due public notice of the proceeding, If the delitor does not within threo months return and ratisfy the creditor, or appear and offer to contest the fact of having absconded, or offer to appear and contest the validity of the demsnd and give the requisite security, then trustees are to be appeinted who becoma vested with the debtor'a estate ; and they are to eol-
loct and sell it, and settle controveroies, and make dividende among all his creditora, in the mode prescribed.
10. From the time of the notice, all salen and asalgamenta by the debtor are declared to be void. If the debtor resides out of the State, and is indebted on a contract made within the State, or to a creditor residing within the State, although upon a contract made olaawhere, his property is llable to be attached and sold in like masner; but the trustees are not to bo appointed until nine months after public notice of the proceedings.
11. Perishable goods, other than vessels, when ottached under the Absconding Debtor Act, may be immediately sold and converted into money; and if the sheriff, under the attachment, eeizea property claimed by third persona, he is to summon a jury and to ta's their inquiaition as to the title to the property claimed.
12. If any American vessel belonging to the debtor be attached under these proceedinge, it may bo released on the clalmant of the vessel glving seeurity to pay the amount of the valuation of the vessel to the trustees, or to the deltor, as the case may be ; and if it be a foreign vessel claimed by a third person, the attaching creditor must give security to prosecute the attachment, and to pay the damages if it should appear that the vessel belonged to the claimant.
13. A creditor, having an unliquidated demand reeting on contrect, is a creditor within the Absconding Debtor Act, and competent to apply for the attachment. Any creditor may proceed against an absconding or concesled debtor, being an iuhabitant of the Stats, or against any non-resident ifeitor, if the contract was made in Now York; but if the contract was made elsewhere, then the creditor must the a resident of the State.
14. Attachment-lawe ngainst the property, real and personal, of absconding and non-resident debtore prevail throughout the several United States, but those statute laws are not uniform on th' 1 polint.
XXII. North Carolina.-An att chment may isaue on the complaint of a creditor, his agent, attorney or factor, against the property of a debtor when he has removed, or is about to removo, privately from the State, so that the ordinary process of law will not reach him.
XXIII. Ohin,-1. A creditor may procure, before or after the matarity of the cluim, nn intachment against the property of a debtor, where the latter is a foreign corporation or a non-resident ; or, if a resident, when he has absconded, or left the county of his residence, or conceals himself; or is about to remove or convert his property, with a view to defraud his creditors. 2. When the delitor fraudulently contracted the debt, or incurred the obligation.
XXIV. Pemngyleania.-In thin State the writ of domestic attachment issues against any dolitor, being an inhabitant of the Stete, if he has absconded from his usual place of abode ; or shall have remnined absent from the State, or shall have contined himelf in his own houne, or cone9aled himself elsewhere, to defraud his creditors. No second attachment will be issued agrinst the same property, unlean the first be not executed, or be dissolved by the court. A writ of attwehment may be alno isnued agningt the property of a foreiga corporation or a non-resident. In the latter case, the attachment inures to the benefit of the attaching ereditor only. In the former case, it is for the lenefit of creditors at large.
XXV. Rhode Jshand.-In this Sente a writ of attachment is first levied against the body of the defendant ; and if he can not be found, then agninst his goods and chattels. The property of foreign corporations and debtors in also liable to attachment, at the wit of a creditor.
XXVI. Bouth Cardina.-A writ of attachment will issue, at the instance of a creditor wherever residing, againet a debeor when he is a non resident-or
against a citisen who has been absent more than a year and a day; or when he absconds or is removing out of the county; or conceale himself so that tho ordinary procenc of law can not reach him.
XXVII. Tennessec.-When a debtor has removed, or is about to remove out of the cotnty privately, or absconds or conceals himself, an attachment may be obtained against bis property, at the sult of a creditor, or his agent, attoraey, or factor. In the case of nonresident debtors, having any foal or personal property in the State, it is reouired, in order to obtain en at tachment, to file a bili in chancery.
XXVIII. Texas.-Original attachments are :asued against the property of a debtor when he is not to be found in the county; and the property attrehed shall remain $\ln$ custody until final judgment. Attachment will also lie when the defendant is a non-resident ; or When a resident ie about to remove out of the State; and whether the debt be matured or not.
XXIX. Vermont.-Write of attachment may issue against the goods, chattele, or estate of the defendant, or for want thereof, against hls body, before or after the maturity of a claim. Actlons against non-residenta, or when the defendant bas absconded from the State, may be commenced by trustee procoss.
XXX. Viginia. - The property of the defendant, If a non-resident, or a resident who is about to remove himself or effects from the State, is liable to attachment. An attachment in euch cases will hold before the claim is due and payable.
XXXI. IVisconsin.-An attachment will hold against the property of a debtor when he has absconded, or is about to alscond, from tho State; or has fraudulently assigned, disposed of, or concealed his effects; or reinoved his property from the State; or wher the defendant is a non-resident or a foreign corporation.
XXXII. Minneaota.-A warrant of attachment may be issued against the property of a dofendant whan a foreign corporation; or, when not a resideut of tilis Territory; or, 3, has left the Territory with intent to defraud his creditors.
Thus it will be seen that In ell the States the property of non-residenta and forelgn corporations is itiable to attachments at the sult of creditors, before judgmont is rendered; likewise against dumestic debtors when they have absconded from the State, or have fraudulently conveyed, or are ahout to convey, seil, as. sign, or secrete their effects. In nome fow States, however, even this condition is not essential before a writ of attachment will issue.
In the States of Alabnma, Mnssachusetts, Cunner. ticut, Maline, New IIampehire, Vermont, and lhote Island, the creditor may have a writ ef attachment against the property of the debtor at the first institution of a suit ; and without any ground of fraud or frandulent intent-such property being held by the attachment until the termination of the suit, or until judgmer:: ; the phaintiff in such cases giving hond or security to indemnify the defendant for nay loss or damage sustained, should the case ine decided in faror of the latter. Generally, the property is iliatise only when actually levied upon; but in the State of Kentucky only, the property is llabie from the moment of the delivery of the order to the sheriff.
The reater will find the American law on this sabject fally illustrated in "A Trenties on the Law of Suits by Attachnent in the United States. Hy Cuas. 1). Duike, of the St. Louls Mar." Insurance on Shipe and Merchandise,-Suetonius conjecturee that Claudims was the firat contriver of it, A.D. 43. Inaurance was In general use in Italy in 1194, and in England in 1560 . Insurance policies were first used in Florence in 1523. The first lsw relating to insurance was enacted in 1601. Insursace of houses and goods In London began in 1667. This was the year following that of the great fire of Loudon. An office was then set up for ineuring houses and buildings, princlpally contrived by Dr. Barton, one of the first and mont extensive bullders of the city of London. The first regular office eet ap ln London was the Hand-in-Hand, in 1606. A duty was lald on iasurances of 1 s .6 d . per $\mathbf{£ 1 0 0}$ iusured, in 1782: this duty was Increased in 1797, and was variously altered sluce. The date of the first insurance office In the Lnited States has not been ascertalned.-IIAypN.
This article has been divided under the general heads of: I. Insurance (General Principles of). II. Insurance (Marine). III. Ineurance (Fire). IV. lasurance (Llfe).

1. Ingunance (General Principles of).--It is the duty of government to assist, by every means in its power, the efforts of Indlividuals to protect thelr property. Losses do not always arise from accidental circumstances, but are frequently occasioned by the crimes and misconduct of individuals; and there are no means so effectual for thelr prevention, when they arise from this soarce, as the establlshment of a vigilant system of police, and of such an administration of the law as may be calculated to afford those who are injured a ready and cheap methol of olstaining every practicable redress ; and, as far as possible, of lnsuring the punishment of culprite. But, in lespite of all that may be done by government, and of the utmost rigilance on the part of indlviduals, property must always ine exposed to a varicty of casuslties from fire, shipwreck and other anforeseen disasters. And hence the importance of inquiring how such unavoillable losses, when thoy do occur, may be renderod least injurious. The loss of a ship, or the conflagration of a cetton-mill, is a calamity that would press heavlly even on the richest Individual. But were It distribnted smong several individuals, each would feel it proportionally less ; and provided the number of those among whom it was distributed were very considerable, it would hardly occusion any sensible inconvenience to any ene in particular. Hence the advantage of combining to lessen the injury arising from the accidental deatruction of property: and It ls the diffusion of the risk of loss over a wide surface, and its valuation, that forms the employment of those engaged in insurance.

Thongh it be impossible to trace the elrcumatances which occaslon those events that are, on that account, termed accidental, they are, not withstanding, found to obey certain laws. The number of births, marriages, and leaths; the proportions of male to female, and of legitimate to illegithate births; the ships eust away ; the houses burned; and a vast variety of apparently accidental events, are yet, when our experience embraces a sufficiently wide field, found to be nearly equal in equal poriols of time ; and it la easy; from observations mate nion them, to estimate the sum which an individual should pay, either to guaranty his property from risk, or to secure a certaln aum for his heirs at his deatl. It must, however, ie carefully observed, that no confidence can be placed In sueh estimates, unless they are deduced from a very wide Induction. Suppose, for exarnple, It happens that during the pree-
ont year one house is accidentally bnrned, in a town contalning 1,000 houses; thla would afford very little. ground for presuming that the average probability of fire in that town was 1 to 1,000 . For it might be fonnd that not a single house had been burned during the prevlous 10 yeara, or that 10 were burned daring each of these years. But aupposing it were akcertained, that, at an average of 10 years, 1 house had been annually burned, the presumption that 1 to 1000 was the real ratlo of the probability of fire, would be very much strengthened; and if it were found to obtain for 20 or 80 years togethar, it might be held, for all practical purposes at least, as indicating the precise degree of probability.

Besides its belng necessary, in order to obtain the trne measure of the probability of any event, that the series of events, of whlch it is one, ohonld be obeerved for a rather lengthened period, it is necessary, also, that the events ehould be numerous, or of pretty frequent occurrence. Suppose it were found, by observing the birthe snd deaths of $1,000,000$ individusls, taken Indiscriminately from among the whole populatlon, that the mean duration of human life was 40 years; we should have but very slender grounds for concluding that this ratlo would hold in the case of the next 10, 20, or 30 individuals that are bori. Sneh a number is so small as hardly to sdmit of the operation of what is called the law of average. When a large number of lives is taken, those that exceed the medlum term are balanced by those that fall short of it; but when the number is small, there ls comparatively little room for the prinelple of compensation, and the result can not, therefore, be depended upon. It is found, by the experience of all countries in which censases of the population have been taken with considerable accuracy, that the number of male children born la to that of female children in the proportlon nearly of 22 to 21. But unlees the observations be made on a very large scale, this result will not be obtalned. If we look at particular families, they sometimes conaist wholly of boys, and sometimes wholly of girls; and It is not posalble that the boys can be to the girls of a single family in the ratio of 22 to 21 . But when, instead of confining ou: observations to particular families, or even parishes, we extend them e0 as to embrace population of 500,000 , these discrepanciee disappear, and wo find that there is invariably a small excess in the number of msles born ovar the fomales.

The false luferences that have been drawn from the doctrine of chances, have unlformly, almost, procoeded from generalizing too rapidly, or from deducing a rate of probability from such a number of instances as do not givo a fair average. But when the instances on which we found our conclusions sre sufficiently numerous, It is seen that the most snomalous events, such as sulcidus, deaths by accldente, the number of letters put into the post-office without any address, etc., form pretty regular series, and consequently admit of being estimated a priori. The business of insuranco is founded upon the principles thus briefly stated. Suppose it has been remarked that of forty ships, of the ordinary degree of sea-worthiness, employed in a given trade, one is annually cast ayray, the probability of loss will plainly be equal to one fortieth. And if an individual wish to insure a ship, or the cargo on board a ship, engaged in this trade, he ought to pay a promium equal to the 1-40th part of the sum he insures, exclusive of such an aulditional sum as may be required to indemnify the insurer for his trouble, and to leuve him a fair profit. If the preminu exceed this sum, the iusurer is overpald; and If it fall below it, he is underpaid.
Insurances are effected sometimes by societies, and sometimes by individuals, the rlsk being in either case cliffused anong a number of persons. Companies formed for carrying on tho husiness havo generally a large aubecribed capltal, or such a number of propri-
cort, as anablen them to raice, mithout dificulty whatever sums may at any time be required to make good loeses." Socletles of thin sort do not limit their risks to small sums; that is, they do not often refuse to insure a large sum npon a ship, a house, a lifo, ate. The magnitude of their eapitele affords them the means of easily defraying a heavy loss; and their premiami being proportioned to their risks, their prufit is, at an average, independent of auch contingencies.

Individuals, it is plain, could not act in this way unlens they were possensed of very large capitals; and bealdes, the taking of large risks would render the business so havardous, that few would be dlsposed to engage in It. Instead, therefore, of Insuring a large anm, as 20,000 , upon a slngle ship, a private underwriter or insurer may not, probably, in ordinary cases, take a greater riak than $\$ 200$ or $\$ 500$; to that, though his engacements may, when odded together, amount to 820,000 , they will be diffuned over from 40 to 100 ahips; and aupposing one or two ships to be loat, the loss would not impair his capital, and would only lessen his profits. Hence it in, that while nue transaction only may be required in getting a ship insured br a company, 10 or 20 separate tranactions may be required in getting the same thing done at Iloyd's, or by private individuals. When conducted in this cantious manner, the business of inaurance is as safe a line of specuiation as any in which indlviduale can ongage. To establish a policy of insurance on a fair foundation, or in such a way that the premiums paid by the insured shall exactly balance the risks incurred by the insurers, and the varions necessary expenses to which they are put, including, of course, their profit, it is necessary, as previously remarked, that the experience of the rishs should be pretty extensive. It. is not, however, st all necessary, that either party should inquire into the circumstances that lead to those events that are moat commonly made the auhject of inr irance. Such a reaearch would, indeed, be entir ty fruitless: we are, and must necessarlly continge to ve, wholiy ignorant of the causes of thelr occurrence.

It appe , from the accounts glven hy Mr. Scoresby, in hils valuable work on the Aretic Regions, that of 886 ships which sailed from the varions ports of Great Britain for the northern whale fishery, dnring the four years ending with 1817, eight were lost (vol. if., p. 131), being at the rate of one ship out of every 73 of those employed. Now, supposing this to be about the averuge loss, it follows that the premiom required to insure against it should the $1 \cdot 70$ per cent., exclusive, as already olmerved, of the expenses and profits of the insurer. Both the insurer and the insured would galn ly easteriag into n transaction founded on thia fair principle. When the oferntions of the insurer are extensive, and his riaks apread over a considerable number of ships, his profit does not depend upon chance, tuit is as steady, and may be as fairly calculated upon, as that of a manufacturer or a merchant; while, on the other hand, the individuals who have insured their property have exempted It from any chance of loss, and placed it, as it were, in a state of atsonolute security.

It is casy, from the brief sitatement now made, to perceive the immense advantagea reaulting to navigation nnil commerce from the practice of marine insurance. Without the nid that it affords, comparatively few inulividuals would be found disposed to expose their property to the risk of long and hazandoun voyagen; lut lo its means insecurity is changed for aecurity, and the cajital of the morchant, whose ships are dispersed over every sea, and exposed to all the perils of the ocean, in as accure as that of the agrieul. turist. Ne can combine his measures and arrange his plans as If they could no longer be affected by accilent. The chances of shipw reck, or of loss by unforeseen occurrences, enter not into his calculations. 1le has purchased an exemption from the effocts of such
casuaities; and applies himself to the pronecntion of his businese with that confidence and onergy which nothing but a feeling of aecrity can inapire.. "I Lea chances da la navigation entravaient la commerce. Io syateme des assurancea a paru; il a consuite les saisone; il a ports ses regards sur la meri il a interrogo ca terriblo élóment; il on a jugé l'inconstance; il en a preasenti les oragee: il a épié la politique: il a reconnn los ports at lea côtes doa denx mondes; il a tout soumis i dea calcula savans, à des théories approximatives; et il a dit au commercant habile, an navigateur intrópids: certes, il y a des désastres sur leaquels l'humanité ne peut que gómir; mals quant $\$$ votro fortune, aliez franchissez les mera, déployez votre activité et votre Indastrie; jo me charge de voa risquee. Alors, Mes. sieurs, s'll est permis de le dire, les quatre parties du monde se sont rapprochees."-Code de Commerce, Eixposd des Motift, liv., Il.
Besides insuring against the perils of the sea, and losses arising from accidents saused by the operation of natural causea, it is common to insure agaiast enemies, pirstes, thieves, and oven the fraud, or, as it is technically termed, barratry, of the master. The risk arising from these sources of casnalty being ext remely fiuctuating and various, it is not easy to estimate it with any considerabla degree of aecuracy; and nothing more than a rough average can, in most cases, be looked for. In time of war, the flactuation in the rates of insurance is particularly great ; and the intelligence that an enemy's squadron, or even a single privateer, is cruising in the conrse which the ships tound to or returning from any given port usually follow, causes an instantaneous rise in the premium. The appointment of convoys for the protection of trade during war, necessarily tonds, by lessening the chance of enpture, to lessen the premium on insurance. Stilf, however, the risk in such periods is, in mpat cases, very considerable; and as it is linble to change, very suddenly, great caution is required on the part of the underwriters.

Provision may also be made, ly means of insurance, ngainst loss hy fire, and nlmost all the casualtics to which property on land la sulject. But, notwithstanding what has now been stated, it must be udmitted that the advantages derived from the practice of insuring agaiast looses by sea and land are not nltogether unmixed with evil. The security which it affords teads to relax that vigilent attention to the protection of property which the fear of its loss is sure otherwise t. excite. This, however, is not its worst effect. The reconds of our courts, and the experience of all who are largely engaged in the business of insurance, too clearly prove that ships have been repeatedly sunk, and houses burned, in orier to defraud the insurers. In despite, however, of the temptation to inattention and fraud which is thus afforded, there can the no doult that, on the whole, the [ractice in, in a pultic as weli as private point of view, decidedly beneficin!. The frauds that are occasionally committed raise, in some degree, the rate of insurance. Still it is exceedingly moderate ; and it is nost probable that the precautions adopted ty the insurunce offices for the prevention of fire, especially in grent towns, where it is most ilestructive, outweigh the chance of increased conthagration arising from the greater tendency to carclessness and crinie.

The business of lifo insurance has been carried to a far groater extent in Great Britain than in any other country, and has been jrobluctive of the must beneficial effects. Life insurances are of various kinds. Individuals without any very near connertions, and possessing only a limited fortnne, are sometimes desirous, or are sometimes, from the necessity of thair situation, obliged annually to eneroach on their capitals. But should the life of such jersons be extended bryond the ordinary term of existence, tioy might he tutaliy unprovided for in old age; and to secure themselves

agsinst this contingenoy, they pay to an insurance company the whole or a part of their capital, on conditlon of its guarantying them, as long as they liva, a certain annnity, propertioned partly, of course, to the amonnt of the sum paid, and partly to their age when they buy the annuity. But thongh sometimes earvicesble to individuals, it may be questioned whethar insurances of this sort ars, in a publio point of view, really advantageous. So far as their influence extends, its obvious tendency is to weaken the principle of ace cumulation; to atimulate individuals to consume their cspitals during their own life, without thinking or caring about the interest of their anccessors. Were such a practice to become general, it would be productive of the most extensively ruinous conseqnencen. The interest which most men take in the welfars of their fsmilies and friends affords, indead, a pretts atrong eecurity against its becoming injuriously pravalent. There can, howuver, be little doult that this selfish practice may be strengthened hy adventitious means; such, for example, as the opening of government losns in the shape of life annuities, or in the atill more objectlonable form of tontines. But when no extrinsic stimulus of this sort is given to lt, there do not seem to he any very good grounds for thinking that the sale of annaities by private individuals or associstions can materially weaken the principle of aocumulation.

Luckily, however, the specles of insurance now referred to is bat inconsideruble compared with that which has accumulation for its object. All professional persons, or those living on salarios or wages, such sa lawyers, physicians, militsry and naval officers, clerks in public or private offices, otc., whose incomes must of coarse terminate with their lives, and a hoat of others, who are either not posesssed of capital or can not dlspose of their capital at pleasure, most nsturally be desirous of providing, so far as they msy be able, for the comfortable subeistence of their families in the event of their death. Take, for example, a physicion or iawyer, withont fortune, but making, perhaps, $\$ 1000$ or $\$ 2000$ a-year by hia business; and suppose that he marries and has a family ; if this individual attain to the average duration of human life, he may accumulate such a fortune as will provide for the adequata support of his family at his deuth. But who can presume to say that such will be the case ?-that he wiil not be ene of the many exceptions to the general rule? -And suppose that he were hurried into an untimely grave, his family would necessarily be destitute. Now, it is against such calamitous contingencies that life insurance is intended chjeily to provido. An individual possessed of an income terminuting at his death, aцrees to pay a certain sum annually to an lnsurance office; and this office binds itself to pay to his fumily at his death, a sum equivalent, after deduction of the expensef of managoment und the profits of the insurors, to what these annual contributions, accumulated at compound interest, would swount to, supposing the insured to reach the common and average term of human life. Though he were to die the day after the insurance has been effected, his family would be as aniply provided for as it is likely they would be by lis aecumulations wore his life of the ordinary duration. In all cases, indeed, in which those lnsured die before attaining the average age, their gain is obvious. liut even in those cases in which their lives are prolonged beyond the orlinary term, they are not losers-they then merely pay for a security which they must otherwise have been without. During the whole period, from the time when they effect their jnsurances, down to the time when they arrive at the mean duration of human life, they are protectel against the risk of dying without leaving their familien sufficiently provided for; and the stan which they pny after having passed this maan term is nothing inore than a fair compensation for the security they previously onjoyed. Of thoso

Who insure honce against fire, a very small proportion only have occasion to claim an indemnity for losses actually sustained; bat the possesaiop of a necurity aggainst loss, in the event of accident, is sufficient motive to inducs overy prudent individual to insure his property. The case of life inaurance is in this respect difforent. When established on a proper footing, the extra suma which those pay whose Hives exceed the eatimsted duration is but the value of the previous security. In order to adjust the terms of an insurance that the party insuring may neither pay too much nor too little, it is necessary that the probability of his life falling in each subsequent year should be determined with as much accuracy as posslble.

To ascertain this probability, various observations have been made in different countries and periods, showing, out of a given number of pertons born in 2 particular country or place, how msny complete each subsequent year, and how many die in it, till the whole he extinct. The result of such observations, when collected and arranged in a tabular form, are called Tables of Mortality; beling entitled, of course, to more or less confdence, sccording to the number and specles of lives obsery ; the period when, and the care with which, the ohservations were made, etc. But supposing these tables to be formed with sufficient accuracy, the expectation of life at any age, or its mean duration after such age, may be readily learned from them; and hence also the value of an annuity; or the assurance on a life of any age. Thus, in the table of mortallty for Carlisle, framed by Mr. Minne, of the Sun Life Office, and which is believed to represent the average law of mortality in Fagland with very considerable accuracy, out of 10,000 persons, born together, 4000 complete their 56 th year ; and it further appeare, that the number of such persons who die in their 66th year is 124 ; 80 that the probability that a life now 56 yenre of age will terminate in the 10th year hence is 124-4000. Bnt reckoning intorest at 4 per cent., it appears (Tables Ivterest and Anvilies), that the present value of $\$ 100$ to be received 10 years hence is \$67.556; consequently if its receipt be made to depend upon tho probabllity that a life now $\delta 6$ years of age will fuil in the 66th year, its present value will be reduced by that contingency to $\frac{194 \times 497 \cdot 866}{4000}=\$ 2.094$. The present value of $\$ 100$, recelvable upon the life of a party now 56 years of age, terminating in the 57th or any eubsequent year of his life, up to its extreme lim. it (which, according to the Carlisle table, is the 105th year), being calculated in this way, the sum of tho whole will be the present value of $\$ 100$, receivablo whenever the life may fail ; that is, of $\$ 100$ insured upon it, supposing no additions were made to it for the profits and expenses of the insurers.

More compendlous processes are resorted to for calculating tables of insurances at all nges; but tho above statement sufficiently illustrates the principle on which they all depend. In practice, a life insursnce is soldom made by the payment of a single sum when it is effected, but almost always by tho payment of an annual premium during its continuanec, the first being paid down at the commencement of the insurance.* ${ }^{*}$ If the Table of Mortality adopted by the insurers fairly reprosent the law of mortality provniling among the insured, it follows that when a party insured does not attain to the avernge age according to the table, the insurers will either lose by him, or realize less than their ordinary prolit ; and when, on the other hand, the life of an insured party is prolonged beyond the tabular average, the profits of the insurers are proportionally increased. But if their business he so extensive as to eanble the law of avorage fully to npply, whit they lose by premature death will be balanced by the payments received from those who lives aro

- Fer the mothod of calculating theme annual premluma ece Inteabest and Anndities.
prolonged beyond the mean duration of IIfe for the agee at which they were reapectively inoured 100 that the proitte of the society will be whelly independent of chancen.

The rellef from anxiety aftorded by IIf Insnrance very frequently contributes to prolong the life of the Inoured, at the same time that it materially augmenta the comfort and well-boing of thone dopendent on him.' It has also an obvious tendency to atrengthen habits of aceumulatipn. An Individual who has insured a yum on his life, would furfolt all the advantagen of the insurance were he not to contiuue regularly to make his annual paymenta. It is not, therefore, optlonal with him to save a eum from his ordinary expenditure adequate for thla purpose. He la compelled, uniler a heavy penalty, to do 20 ; and having thus leen led to contract a habit of anving to a certaln extent, it is most probable that the hablt will acjulre additlonal strength, and that he will elther insure an additional sum or privately accumulate.
The practice of marine inaurance, ne deubt from the extraordinary hazard to which property at eea ls exposed, seems to have long precedec lasurances against fire and upon llves. We are ignorant of the preclse period when it began to be Introduced; but it appears most probalile that it datas from the end of the 14th or the beginning of the 15th century. It has, however, been contended by Loccenius (De Jure Maritimo, lib., Ii., c. 1), Puffondorff (Droit de la Nature et des Gens, lib. $v_{0}$, c. 9 ), and others, that the practlee of marine insurance is of mach higher antiquify, and that traces of It may be found In the history of the Punic wara. Livy mentions, that dnring the second of these contests, the contractore employed by the Romans to tranaport ammunition and provislona to Spaln, atjpulated that government ahould indemnify them against such lowses as might be occasioned by the enemy, or by tempests, in the course of the voyage.-Impetratum fuit, ut quas navibus imponerentur ad exercitum Miepaniensen deferenda, ab hostixm sempestatioque vi, publico periculo essent.-Ilat., lib. xxili., c. 49. Malynes (Lex Mercatoria, 8 d ed., p. 105), foundling on a passage In Suetonius, ascribes the first introduction of insurance to the emperor Clandlus, who, in a period of acarcity at liome, to encourage the importation of corn, took upor himeelf all the loes or damge that It might sustain Ir, the voyage thither by atorms and tempesta. -Negotiatoribue cortn lucre propnanit, amerepta in as damno, ai gui quid per tempestatea accidisset, et navey mercature comel, fabricantious, magna commoda conoti-twit.-c. 18. It la cusious to ohserve that this stipnlation gave occasion to the commission of acta of fraud, similar to those so frequent In modern times. Shipwrecks were pretended to have happened, that never took place: old ahattered voamela, frelghted with artlcles of little value, were porposely sunk, and the crew saved in boats; large aums being then demanded as a recompense for the loss. Some years after, the fraud wan discovared, and some of the contractore were prosecuted and punished.-Lib. xxv., c. 3. But none of these paseggen, nor a aimilar one, in Cicero's Ietters (Ad Fam., llb. Il., c. 17), warrant the inferences that Loceenias, Malynes, and others have attempted to draw from theni. Insurance is a contract bet ween two parties ; one of whom, on recelving a certain premium (pretinm periculi), agreen to take upon himaelf the risk of any loss that may happen to the property of the other. In ancient, no less than in modern tlmes. every one must have lieen dealrous to be exonerated from the chance of loss ariang from the exposure of property to the perila of the saa. Jint though, in the caaes referred to, the carriers were exempted from this chance, they were not exempted by a contract propler acersionem periculi, or by an Insurance; but hy their empioyera taking the riak upon themselves. And It lis abundantly obvious that the ohject of the latter in doing thin wan not to proft, llke an insurer,
oy dnaling in riaks, but to induce individuals the more readily to andertake the performance of an urgent publie duty.
But wha the exception of the instances now mertioned, nothing bearing the remotent resemblance to an inaurance la to be mot with till a comparativaly recont poriod. If we might roly on a pasage ln ons of the Flamiah chroniolert, quoted by the loarned M. Pardenswo-see his oxcollent work, Collection des Loix Maritimes, tome 1., p. 868 -we ahonld be warranted in coneluding that Inaturance hal been effected at Brugea so early an the ond of the 13ih oentury ; for the chronlelor state" that, In 1811, tho Barl of Flanderg consented, on a requinitlom from the inhailitento, to astabllah a chamber of insurance at Bruges. M. Pardesat. la not, however, Inclined to think that thla atatement should be regariled as decisive. It lis evident from the manner In which the unbject is mentioned, that the chronioler was not a cotemporary ; and no trace can be found, elther in the archives of Brages, or in any authentic publlcation, of any thing like the clreumatance ulluded to. The earlient extant Flomish law as to insurance, is dated $\ln 1527$; and none of the early maritime codes of the North so much as alludes to thia Intereating aubject.

Heckmann seems to have thought that the practice of Insurance originated in Italy, In the latter part of the 15th, or early part of the 16th century,-IIist. of Invent., vol. l., art. Ingurance. But the learned Spanish antlquary, Don Antonio de Capmany, has glven, In his very valuable pablication on the History and Commerce of Barcelona (Memorias Hiatoricas sobre la Marina, etc., de Barcelona, tomo ii., p. 383), an ordinance relative to Insurance, isaued by the magistrates of that elty in 1435 ; wheresa, the earlleat Italian lsw on the subject is nearly a century later, being dated in 1523. It la, however, exceedingly nnlikely, had insurance heen as carly practleed in Italy as in Catalonla, that the former should have been ao much liehind the latter in subjecting it to any fixed rules; and it is still more unlikely that the practice should have escaped, as is the case, all montion by any previous Itallan writer. We, therefore, agree ontirely in Capmany's opinlons, that, nntll some suthentic evidence to the contrary be producod, Barcelona aheuld be segarded as the birth-place of this moet useful and beantiful application of the doctrine of chances.Tom. I., p. 237.

A knowledge of the principles and practice of insur ance was early brought Into England. According to Malynes (Lex Mercat., p. 105), it was first practiced among us by the Lombards, who were eatablished it London from a very remote opoch. It la prabalile it was introduced some tlme about the beginning of the 16th century; for It is mentioned in the statute 43 Fillz., c. 12, in which Ita ntility ls very clearly set forth, that it had been an immemorial usage among merchants, both Finglish and foreign, when they made any great adventure, to procure Insurance to be smade on the ships or goods allventured. From thla it may reasonally be supposed that Ineurance had been in use in England for at least a century previoua. It appears from tho same statute, that it had originally been usual to refer sll disputes that 'aroae with respect to lnsurances to the decision of "grave and discreet" merchants appolnted by the Iord Mayor. Hut abusea having grown out of thia practlee, the atatute authorizel the Iond Chanceller to appoint a commisalon for the trial of insurance cases ; and in the relgn of Charles 11. the powers of the commisslonert wers onlarged. liut this court soon after fell into diause; and, what is singular, no trace can now be discovered of eny of its proceed-Ings.-Marsitalic on Insumance, Prelim. Dinc., p. 26,

able degree formed, the law apon thls anbjeci: H ts judgments were not bottomed on narrow vlewa, or on the manicipal regulatlona of England; but on those great prineiples of publio justlce and convenlence which had been sanctioned and approved by unlvereal experience. His deep and extenalve information was ecquired by conanalting the most intelligent merchants, and the workn of distinguished foreiga jarista; and by carefully atudying the famons French ordinance of 1681, the most sidmirably digeated bedy of maritime law of which any country hat evor had to boast. Hence the comprohensiveneen and excellence of his loriahip's deolsions, and the respeot they have juatly commanded in all coantrien. In his handa the law of insarance became, in a far greater degree than any other part of Englieh law, a branch of that national or public law, of which Cicero has baantifully aaid, "Non erit alia lex Roma, alia Athenis, alia nunc, alia posthac, sed et omnes gentes et ommi tempore una lex et sempiterna, at immortalis continebia, unusque erit communis quasi magister et imperator omaium Deus."-Fragm., lib. Hil., do Republied.
It jurance againgt fire and upon lives lo of mach later origin than inenrance againat perils of the sea. The formar, however, has been known and carried on among as, to mome extent, at least, for nearly a centary and is half. The Amienble Society, for insurance opon lives, was eatablished by charter of Queen Anne, in 1706; the Royal Exchange and Iondon Aesurance Crmpanies began to make ingurances upon lives, in the relgr of George I.; and the Eqnitable Society was established in 1762. But the advantages of life inenrance, and the principles on which the business should be conducted, were then very ill anderatood, and the practice can hardly be asid to have obtained any firm footing among na, till the Equitable Society, by adopting the jadicioun auggestions of Dr. Price, began its carcer of prosperity about 1775. Notwithstanding the example of England, life inaurance hae made comparatively little progreas on the Continent. It was, indeed, expressly forbidden by the French o linance of 1681 (ilv. iij., tit. 6, art. 10) ; by the regul ions as to Insurance tssued at Amsterdam in 1612 (ari.. 24); and it it doubtful whether the practice be not inconsistent with the 334th art. of the Code de Commerce, though it be now extenaively carried on in France. But we are inclined to think that the want of eecurity, more than any positive regulations, has hoen the principal cause of the little progress of life insurance on the Continent.
II. inguancer (Marine).-There are few pergons who are not acquainted, in some degres, with fire and life insmances. The eecurity which they afford to Individuals and families is a luxury which nobody, in tolerahly comfortable elrcumstances, is willing to be without. Hence the grent increase, in our daya, of companies professing to afford thla security; and hances the knowledge, on the part of the public generaliy, of the nature and principles of the engagemente into which these companies enter. But marine insurance is a subject which is of immediate interest onily to merchants and ship owners; unless, indeed, we should refer to that amail portion of the community who have occasion to transport themseives heyond seas with capital and offects for purposes of colonization, or to fill some official situation. Henee the compurative indifference, on the part of the public, as to this subject. The gencrai principles, howaver, of ull insurance are the sama; and in treating of marine insurance, it will be necassary to notice iftele boyond such topics as are peculiar to that branch of the business.

Individual Insurers, or Underveriters.-The firat citcumstance that can not fall to atrike the general inquirer into the practice of marine insurance in this country, is that, while all fire and life insurances aro made at the risk of companies, which include within themselves the denirable requisites of accurity, wealth,

Uuv
and numbera, a large proportion of marine Insurances la made at the risk of Individuale.
Prnhibition of Companies.-Till 1824, in Groat Britaln, all firma and companien, with the exception of the two chartored companiea, the Royal Exchange and London, were prohilited by law from taking marine Inaurances. Toward the latter end of that year, the prohibition was removed, and the busineas of marlne insurance was placed on the same legal footing as other descriptlons of bualness. While the restriction lasted, the two chartered compenies did ao littlo buosness that marine insuranee might in fact, be sald to be wholly in the hande of individuals. These companies were so mach higher in their promiums, and so much more axclusive In the riska they were willing to undertake; than their Individual competitors, that even thoas morchants and ahip owners, who would cheerfully have pald some trifling conelderation to obtain the greater aecurlty of a company, were obliged to evort to Individuals. And it was oniy when the ropeal of this absurd restriction was proposed, that the companies showed, by defending it, that they set any value upon their privilege. The underwriters at Lloyd's joined them In this opposition; and pamphlets were written and apeeches made, to demonatrate how much merchants and shlp owners would anffer, were the law to allow them the free use of their diecration In inauring their property; and how much more conducive to their interests It was, that they should be forced up to Lloyd'e, to pay premiume to Individuals rather than companies. But these pamphlets and apeechas are forgotten; and we should be sorry to wound the feelings of their authors, or to trespase on the patience of our readera, by referring to them more particularly.
Mode of conducting Buainess.-We shall now give an account of the arrangement in England for conducting the busineas of marine inaurance, as well by individuals as the companiee.
Lloyd's. -The indlvidual underwriters meet in a subseription room at Lloyd's. The joint affairs of the aubecribers to thase rooms are managed by a committee chosen by the subscribara. Agents (who are commonly styled Lloyd's agents) are appolnted in all the principal ports of the world, who forward, regularly, to Lloyd's, accounts of the departurea from and arrivala at their ports, as well as of lossea and other casuaities ; and, in genoral, all such information as may be aupposed of importance toward guiding the judgment of the underwriters. These accounts are regularly filed, and are acceasible to all the anbecribers. The p :- cipal arrivala and losses are, besides, posted In two looks, placed in two conspicuous parts of the room; and also in another book, which le placed in an adjoining room, for the use of the public at large. The rooms are open from 10 o'elock in the morning till 5 o'elock in the afternoon, but the most considerable part of the business is tranacted batween 1 and 4. Those merciants and ship owners who manage their own insuranco business, procure blank policias at the government oflice, or of their stationers, which they fill up bo as to meet the particular object in view, and aubmit them to those underwritera with whom they are connected; by whom they are subecri'ted or rejected. Each policy is handed about in this way until the nmount required is complete. The form of the policy and of a subscription is subjoined to this article. The premium is not jaid to the underwriter in roady monoy, but is passed to account. Nor doss the underwriter debit the account of the person to whom he subscrites a policy with the whole amount of the premiun, but with the premium less 5 per cent. Whenaver losses occur which more than absorb the premiums on uny one account, the underwaiter is called upon to pay the balance. But should the underwriter's account be what is called good, that is, should the premiunts exceed tho claims, he sends round, during
the spring and summer, to colleot from his variona dehtors eithar the balance of hia lant year'a account, or monay on account, according to his judgraent; but upon what he receives, he maket an allowance of 12 per cent. An underwriter, If prudent, therefors, before he concents to recelve, will not ouly look to the goodness of hls sceount, hut to the probability of its continuing so.

Imownance Brokers.-Many merchanta ond ahip ownore do not transact thelr own Inaurance basiness. They give their odera for inamance to others, who andertake it for them, and are responsiole for its proper management. These latter persone are called inaurance brokers ; and "ome of them manage the buminese of nnmber of principals. To them, likewise, are transmitted the orders for insurance from the outports and manufactnring tewns. They charge the whole premium to their principals, and their profte conalac in 5 per cent. opon the promium, 12 per cent. upon the money that they pay to the underwriters, and $\frac{1}{3}$ per cent. that they deduct from all the ciaims whlch they recover from the anderwriters. It le proper to remark that thls to the eatabllahed or regular profit ; hot compettion has oceasioned numerous deviatlons from It by the brokers, many of whom consent to divlde this profit with the principals who employ them. The Insurance limkers are not anfrequently anderwriters also; and as some insurances are consldered far moro luerative than others to nnderwriters, and an the brokern have particular facilitles, in some reapects, of judging of the goodness of their own riske, so likewise have they an intucement to play Into one another's hands, and they duso accondingly. See Brow eas.

Payment of losses.-Lonses are paid at all the offices promptly, and without deduction. In Fingland, a month's credit is allowed to the unilerwriters; and another month, and anmetlmes two montha, are glven to the broker, to collect from the underwritere, and pay over to hic principals.

Clubs. - Beaides the individual underwriters and companles above noticed, there are cluba or associations formed by ship ownern, who agree, each entering his ohlpe for a certain amount, to dlvide among themselves one another's lossen. These clubs are institntions of long atanding; but, aince the alteration of the iaw in 182t, appear to he on the decline. Their formatlon originated ln a twofold reason: first, that the underwriters charged premlums more than commensurate with the risk; and secondly, that they did not afford adequate protection. To avoid the first of these two evils, instead of paying a fixel premium, they pay among themselvea the actual lossea of thelr several members as they occur; and to avoid the second, they lay down certain principles of settlement in accordance with their viows of lniemnity. Fach member of one of these clubs gives his power of attorney to the selected manager; and thla manager lssues a pollcy for each ship, which poticy is subscrilied by him as attomey for all the members, the premitm inserted in the policy being understood to be nominal. These clubs are open to the leading objections that apply to individual underwriters; for the members are not collectively, but only indivilually, lable to those of their number who happen to sustain a loss; and the delay of settlement is such, that mory than 12 months have been known to elapse hefore the payment of a losa has been obtained from all the members.

Rate of Premikm.- But little neeil he arill upon the circumatances that influence the rate of premium demanded hy the lnsurera. It must be self-evident that premiums will vary acconllng to the reasons, the quality of the verad, the known character of the eaptaln, the nature of the commodity, and the ntate of our polltical relations. All these, of course, are matters upon which each individual munt exercise his own discretion, partiy from general experience, and partly
from particular information ! exaggeration of rink, and consequent exorbilaney of prominin for any length of time, belng out of the quertion, where so meny indlvidual underwriters, in ad ittion to the companies, are in competition with one as other, and where the mer. chants have the meane at hand of effecting their Insurances abroad. We have slready taken notlce of the Intalilgenee. of which Lloyd'n is the focus, In additlon to thia there is a aubseription register book for shipplog malntained by the principel merchante, shipowners, and underwiters. Thls book profeasea to give an account of the tonnage, bulid, age, repairx, and qualilty of alment aid the vessela that frequent our ports ; and, although exceedingly defective In many respects, is a material asmiatance to the traurers, who have no means of ascertainfag hy thelr own observa. tion the partleulars of one in, hundred of the ships they are called upon to insure.

Contract of Insurance.-Ilaving thus given a general outline of the mode of tranasting buainesa between the insurers and insured, and the means userl to enable both partien to come, as near as possible, to a due eatlmate of the risk to be insured agalnat, our next etep wIII be to explain the nature of the contract, and the bearing of its more important clauses.

It is onvecessary to ntate that the object of those who are engaged in commerce, or in moving articie of merchandise from one part of the world to another, is to bry at such a price that, after paying all the expensen of tranaport, the sale price may leave then a surplus in the shape of profit. If there were no such contrivance ae lasurance, merchante would l, obliged to calcuiate upon the probability of the occasional loss of their property, ant to regulate their transactions accordingly ; but it must be obvious that enterprise, under auch elrcumstances, wouid be very much crip pled. Now, insurance, in as far as it approaches perfectlon in guarantylng the merehant against all losa, except that of the market, substitutea a fixed charge for uncertain and contingent less, and enables him to confine his attention exclusively to price and quality, and to charges of transport ; in which latter, of course, the premium of Insurance is Included. As, however, In practice, insurance is by no means a perfect jrotectlon, either to the merchant or shlp owner, against ali fons that may occur in trassitn, there ls, evc., after inanrance, some contingencies remaining to be taken into conslderation; and we do not know that we can do better, by way of explaining the contract of insurance, than state, as briefly and succinctly as possible, whac are tho losses againat which tho merchant and ship owner are not protected by an insurance effected In this country.

1. Acts of our orn Government,-All losses arising from the acts of our own government. Thus, if an embargo were ludd on vessols about to sail for a particular quarter, and the merchant obliged to unlomd his gowis ; or if his goods wore condemned to be destroyed in quarantine; or purposely destruyed at sea ly some of our cruisers; no part of his logs would be made grow by the Insurer. The insurer it this country, although liable for the acts of foreign powers, is not liable for anch acts directei against the property of their own sulijects. Thus, if French property, in. sured in thls country, were configated by the lrench goverament, the owner would havo no remedy against his lnaurer.
2. Braches of the Revenue Laws.-All lossea arising from $n$ breach of the revenue laws. It may be observed, that If the owner of the chip, by his act, exjuas the goods of the merchant to loss, the merchant so injured, aithough he can not recover from his insurera, may claim from him. It may also be observed, that if the eaptain of the vessel, by his nct, to which neither the owner of the ship nor the merchint is a party, expose the ship and cargo to loss, the insurers, In such ease, are bound to nake good the loss ; the
insurers be gete of the the ahip no saptain an withent the ratry" in ti 8. Hreac ing from port is dee of hiockade our goveras tiffeation, al in the attem It will ofter that the pro flance of th break it, ant minm to 'nat an olject art when effect hower. The writers, to pl ing $\ln$ this et

iasurere being liable for all damage arising from illegal acta of the oaptaln and crew, suppoaing the owner of the ship not to be necessory. The illegal acts of the saptain and crew, contrary to the introctions and wlthont the consent of the owners, are termed "bas patry" in the policy. See Banmativ.
4. Hreaches of the Lave of Natione.-All lossen arise lag from a breach of the lav of nations. Thae, if any port la deciared by a fereign power to be In a atate of blockede, and such blockade Is acknowledged by onr government; and If a oblp, in defiance of that notificatlon, attempt to break the blockade, and is taken in the attempt; the inaurer is not liable for the loss. It will often happen, when a port la ander blockade, that the profte la so great upon goodr Introduced In defance of the blockade, as to tempt adventarera to break it, and to enable them to afford a very bigh preminm to Insure against the risk. But as policies for such an olject are not acknowledged In our conrta of law when effected, they are naderstood to be policien of homor. The same kind of policy is adopted by underwriters, to protect forelgn merchants who prefer insuring in this country agaiest capture by our veasels.
5. Comsequences of Deviation.-All losses aubsequent to any deviation from the terms of the policy. Thus, if a merchant, in a policy on produce from the Weat Indies to london, warrant the ship to sail on or before the 1st of August, and the ship sail after that day and he lont, the insurer is exonerated. Or, if a merchant inaure from london to Lision, and the ship call at Havre and is afterward loat, the insurer is not liable. it will be uederstood, of conree, that the ewner of the ship is liable to the merchant for any breach of contract on hie part, as well as that the hudurer is liable for the barratry of the master; a deviation on the part of the master, not intended for the benefit of the owner, and contiary to his instructions, being considesed harratry. Should the owner of the goods neglect to describe accurately the voyage for which te wlahes to be insured, the loss would be a consequence of his owa negligence.

There is a doctrine connected with barratry which It will here be proper to notice. A captain, owner or part oweet of the shlp in which be asils, can not commit an act of barratry. In other worls, the insurers sre not, in auch a case, llable for an act of his which would otherwise be barratrous. The equity of this doctrine, as far as regards the interests of the captain himself, can not be calied in question; but it is difficalt to understand why the merchant who ships goods on board such a captain's vessel should not be permitted to insure, among other riaks, against the captaln's illegal acts. We have heard that a clanse has occasionally been introduced into policies to protect merchants against captain-owners, and we do not auppose that our courts of law wonld refuse to enforee such a clanse. Indeed, we can not discover any reason why every party, saving the captain, should not have the power of insuring against the consequences of illegal acts of the captain. We belleve, that among the life offices which protect themselves from loss by sulcide and the hands of jastice, there are some which make a distinction in favor of those who merely hold policies on the lives of others as a collateral security. The propriety of such a distinction must strike every body.
b. Unsenworthiness.-All losses arising from unsenworthiness. Unseaworthiness may be callsed in varous ways, such as want of repair, want of stores, want of provisions, want of nautical instrunsents, insufficlency of hands to navigate the veasel, or incompetency of the master. It might be supposed, nt first sight that Insurance affords a much less perfect sceurity fann it really does, seeing on how many pleas it is possible for the insurer to dispute his liability ; but when it is considered that the proof of unseasworthiness is thrown upon the defendant, and that the leaning of the courts is almost alwayr in favor of the Insurod, it
will be easy to mppose shat no respectable Insurera would over plead unceaworthinens unlent they eould make out a ouse of more than ordinary atrength and clearnene. The dogree of utueasinees felt by merchante and ship owners at their liabllity to be involved in lose by crases of unseaworthiness, may be gueseed from the fact that althoegh the Indemaity Iasurance Come pany at one time precluded themselv ea from pleading unseawrorthinese by a special clatue in thelr pulloy, not only did they obtain no additional promiom in consequence thereof, but they did not oven obtain a preferonce over other companies and individuals at the anme promiums. At leant, thil fact must be elther admitted as a proof of the absence of uneasiness on this head, or of that inveteracy of bablt which seem: to lead the great bulk of mankiad alwaye, If posaible, to continue undeviatingly in thove coursen to which they are accuatomed, even whare the benefits to be derived from a deviation are nadeniable.
6. Protraction of the Voyage.-All loss arining from unusual protraction of the voyage. Thus, if a ship meet with an accident in the Baltic, and the repaira detain the vessel till the close of the season, when the passage home la rendered impracticable by the ice till the opening of the ensuing season, no payment is made to the merchant, in mitigation of his losa from interest of money, lowa of market (if the market fall), or deterioration in the quality of his goods (unless arising from actual aea damage); nor to the ship owner, in mitigation of his lose from the extra wages and maintenance of his crew. In most foreign conntriea the ship owner is remunerated by the insurers for the wages and maintensnce of his crew while his ship is detained in consequence of any loss for the making good of which they are liable.
7. Liabivity for doing Damage in other Vessels.-All loss to which the ship owner is liable when his vessel does daruage to others. According to our lawt, the owner of every ship not in charge of a pllot, that doen damage, by neglligence of the master and crew, to any deacription of craft or vessel, is llable to make good the same to the extent of the value of his own ship and freight : for beyond this he is net liable. The common policy in nse among the underwriters at Lloyd's and the companies does not protect the ship owner from this loss. But the clubs or associations before mentloned almost universally take this riak. Indsed, this is one of the purposes which gave rise to their formation. But even they limit their liability to the amount of the policy ; so that If a ship insured with them were to run down another, and to sink herself in the concussion, the owner would only recelve the value of his own vessel from the club, and atill be liable to the owner of the other vessel. The Indemnity and Marine Companies, hy a clause In their policies, make themselves liable for three fourths of the loss which the owner of the vessel jasured with them may sustain from damage dono by his vessel to those of others. If such a case as the one just supposed should oceur under their poliey, the insured wauld receive the value of his own vessel and three fourths of the loss to be made good by him to the owner of the other vessel. The policies of these companies approach in this respect the nearest of any to perfect protection to the ship owner. But the loss from rus ning down other vessels, although serions, nay som. tines ruinous, seidom occurs; and many ship owners trust eo confidently that it will never fall npon them, that they are as well satisfied to be withont as with this protection. The Supreme Court of the United States has confirmed a decision, to the effect, that where a collision takes place without fault in a port where the local law divides the whole lose (thereby opposing the general maritime law), the insurers ware liable for it. This is opposed to the English decisions.
8. Leerage Clause.-Tt. next descripion of loss of which we shall treut, against which the ingured are
not proteoted; is deseribed in the following chanse of the polley: "Corn, fiah, salt, seod, thawr, and frult, art warranted iroe from average, balese general, or the ahp be tranded ; angar, tobaceo, homp, flax, hides, and akina are warranted free from average under 5 per cent., mnleas general, or the ship be stranded; and all other goods, alco the ahip and freight, are warranted tree from avarage under 8 per cent., anlaes general, or the ship be etrandedi" The language employed in this clanse, being technical, requiree explanation to rendor it intelligible to the general reeder. Average is a name applied to certain descriptions of loss, to which the merchant and ablp ownar are liable. There aro two kinds U'average, general and particular. Gemeral A verage comprehends all loss arlsing ont of a volantary sacrifice of a part of either vessel or cargo, made by the captain for the benefit of the whole. Thus, if a captain throw part of his cargo overboard, cut from an anchor and cabio, or cnt avay his masta; the looe to austained, being voluntarily aubmitted to for the $r$ anefit of the whole, is dintributed over the valne of the whole ahip and cargo, and it called'"general average."

Parvicular Average comprehends all lose occasioned to ahip, freigbt, and cargo, which is not of so serious a nature as to debar them from reaching their port of deetination, and when the damage to the ship is not so extenaive as to render her unworthy of repaif. Losacs where the goods are naved, out in such a state as to be unfit to forward to their port of destination, and where the ship is sendered unfit to repair, are called "partial or sulwage loes." The landing diatinction, between particular average and salvage loos is, that, in the firet, the property insured remains the property of the assured-the damage sustained, or part thereof, as the caw may be, and as will hereafter be explained, being made good by the insurer; and in the second, the property insured is abandoned to the insurer, and the value insured cluined from him, he retalning the propurty so abmendoned, or les valne.

Particular Average on Goods:-A fow casen illuetrative of the method of etating a claim for particular average will best explain the nature of this descripalon of loss, and will at the eame time show she reader what the practical distinetion is between particular average and aalvage losa.

The property insured we ahall suppose to be a ton of hemp, the cost of which at Petersburg is 160 , for which aum it is insnred from Now York to London, and that the duty; freight, and charges to which the merchant is subject on landing at london are $¢ 50$. We shali likewise suppose that the hemp, on its arrival, is so danuged as not to be worth more than half what it would have fetehed had it been sound. The hnaurer would then be calied upon to make good to the insural 875 , or 50 per cent., upon the sim insured. But it does not follow that this payment of 675 would indemnify the merchant, or that it would not more than indemnify him, for the ioas austained.

The merchant's lose by the damage ts............ 7500 And be receivee from tha inanrer ats. Upoa the prinetple of a malrage losk he would recelve $\$ 125$,
It wilt be observed that the merchant's loes by the damage of his goods variee with the state of the market. It may also be obeerved, that in general the menchant will not receive from the inaurer the whole amomnt of the loss that he enataing. Whenever his market is a profitabie one (and that it myint uaually he $s 0$ will be obvious to every body), whenever, indeed, his market is not a deciderliy losing one, his policy doee not afford him a complete protection.
The argument in favor of thia mode of eettling claima for particular average-and it ohould be obsarved that the auhject has been discussed, and the prinoiple saknowledged in the conrta of iaw-it, that the insurer's liability is to be guided by the amount apon which he had received s preminm or consideration; that he ts not to be afferted hy the rise or foll of markets ; but that the grass market price of the sound, and the gross market prios of the damaged goods, are to be the teat by which the rate of damage upon the amount insured is to be adjasted; the insurer being liable, besides, for all the extra charges srising out of the damage.

In the first case stated, the merchant's loss by damage is 825 upon 440 , or $62 \frac{1}{2}$ per cent. ; in the second, 810 upon $\$ 10$, or 100 per cent. ; in th. . hird, 818 upon 20, or 75 per eent. If the duty, freight, and charges were diminished in proportion to the diminished value of the goods, the loss in each case would be 50 per cent. upon the uett price, as it is 50 per cent. npon the gross price. As far as the duty is coneerned, govornment, npon many articles, reduces it in proportion to the diminution in the value of the goods; and If the freight were reduced in a similar manner, the merchant would always be indemnified for his loss hy the insurer. But the practice with regard to freight in this country admits of no such arrangement; freight being paid according to the quantity delivered.

To make the prineiple upon which elajms for particular average are adjuated, and its bearing, still clearer, we shall iflustrate it by s few more enses. Suppose two packages to be insured at cost price-a cask of rice and a cask of augar-oneh welghing 10 cwt ; the cost of each at the port of shipment $\% 50$, the freight of each 250 cents per cwt. at the port of delivery, both articles free from duty, and to arrive at a market vhere no more than the cost prieo is realized; assuining that both packages are damaged 50 per cent.-the rice by losa of quality, the sugar hy loss of weightthe statement will be ss follows:

When whole cargoes, or parceis of goods of considerable value, are inoured, the ciause in the policy which protects the insurer from particular average under s certain percentage is often partially set aside. Thus, if a cargo of 500 hogsheads of sugar, valued at $\$ 20,000$, were damaged to the extent of $\$ 460$, the merchant, supposing the protecting clause to remain in foree, would recover nothing from the insurer, the loss aot amounting to 5 per cent. The additionsl written clause, by which it is the practice to modify the printed clsuse, is as foliown: "Particular average, payable upon esch 10 hhds, sugar, 10 casks and 60 luggs coffee, sad 10 bags cotton, following numbers, and apon each package of manufactured goods, chest of indigo, bag of wool or silk, the same as if separately insured." Sach clauses may be, and are, introduced ad libitum by mutual consent of insurer and insured, the premlum or consideration belag arranged accordingly. The protecting clause is considered, on the other hand, by the insurers, axceedingly unsatiafactory in some reapects ; and they, as occasion requires, insist upon additional protection. Thus, saltpetre, hides, cocoa, and tin plates, are generally warranted free from particular average, unless the ship be stranded; and upon tobaceo, it is customary for the insurers to make them. seives lishie ouly to such part of the particular average as exceeds 5 per cont., throwing 5 per cent. upon the merchant.
l'articular Average on Freight.-The clause, as far as it affects "freight," calls for no particular comment. Particular average upon freight can only urise, acconling to provailing practice, from loss of weight ; and whenover the loss of weight amounts to 3 per cent. or upward, the ship owner is entitied to recover from his insurer. The ship owner, upou the arrival of tile ship at its port of destination, is entitied to hold the goods as security until the freight is paid. If the owner of the goods should prove insolvent, and the goods should be entirely spoited by sea damage during the voysge, and the ship owner thus lose his froight, he has no clain upon the insurer; because, although his collateral security la destroyed hy peril of the aell, bia right to receive freight remains unimpaired,
and it is againat the loma or impairing of thio, right that the inaurer protects him.
Partioular dverage on ships.-Partioular Average upon ihipe is a subject somewhat more beset with difficultios. There is ecarcely a ship that makoe a voyage of any longth that doon not austenin some damage. Tha olause in the polioy warranting the ship free from particular ararage under 8 per cent., nnless. stricided, protects the insurer.from the constant recurrence of potty claims; but in addition to this, it is the practice to clase the damage that a ahip suatains in the: prosecution of her voyago under two beada; ordinary damage, or wear and tear ; and extraordinary damage, or particular average. The spitting of, aails, the breaking of anchors and cables, the upsetting of wind. lasees, are losses that come under the first head. The carrying away of masts and bulwarks, damage to the copper sheathing and hull from striking on rocks, come nnder the second. When a ship sustains damage, If she be on her first royage, the whole axpense of the repairs is made good by the lasurers. But if she be not on her firat voyage, it is the established cuetom that the insurer pays no more than two thirds of the repairs, the owner of the vessel having, as it is thought, an equivalent for the one third which falla upon him, in the substitution of new work for old. Where the nature of the damsge ls such as to requirs that the copper should be stripped off the ship's bottom, the insurer paye the difference between the price of the old and the new copper on the weight of the old copper stripped off; the excess in weight of the new over the old copper is pald for by the ship owner; and the labor of stripping and replacing the copper is paid for on the principle already mentioned. In any general rule of thls kind, it must be obvious that the shlp owner will sometimes gain and anmetimes lose by an accident. As soon as the shlp owner, or his carn*in, learns that his vessel hus mot with an seciden., as scon after as possible, he summons regular surveyora to examine his vessel and report all defects, discriminsting between those defects that have arisen from perils of the sea and those from wear and tear. The first only are made good by the insurer, together with all charges, such as survayors' fees, dock dues, etc., caused by the necessity of undergoing repair. It has been already observed, thst when a shlp is obliged, in the progress of her voyage, to put into port for the purpose of repair, although the ownor of the ship be subjocted to great expense for the wages and maintenance of his crew during the detention, he can recover no part of this expense from the insurer; the doctrine being, that the owner of the ship is bound to navigate his vessel, and that the insurer toes not undertake to guaranty that the voyage si...tl be completed within any specific time. Such is the doctrine, at least, in thie country, and the practice is founded upon It; but in all other countries the doctrine and practice are the reverse. For in them allovance is made to the ship owner for the wages and maluienance of the crev during the whole period that the ahlp je under repair. Where a vessel sustains damage and undergoes repair in the progress of her voyage, and is subsequently lost, the insurer is liable both for the partlcular average and a total loss. Or the owner of the ship may, if he please, insure the amount expended in repair ; and then, in the event of subsequent loss, the inaurer is liabie fur the total loss only; but in the event of subsequent safe arrival, the average ia augmented by the chargs of Insurance. The operation of the elause warranting the ship free from average under 3 per cent., noless general, or the ship be stranded, may now be clearly scen. If a ship be innured and valued at $\$ 50,000$, and the repalra of the versel do not, after all the deductions above referred to, amount to 8 per cent., there is no clalm upon the insurer, unlose the vessel shali have been strandel. See Avrbage.
${ }^{5}$ Strawding.-The term stranded is not well chosen, admitting of more than one construction and the clause of which it forms a part is imperfectly eoncelved. And in settiements of accounts, when differencer arise, the parties whe discuse them are mors apt to strive for that interpretatlen of terms and clanses which is favorable to their interests, than for that which is beet adapted for general purposes. It is commonly anderatood that meroly striking the ground and coming off is not a strandling; it beling necessary, in order to fall within that term, that the ship should remain on the ground or rock, as it may happen, and that efforts should be made to float her. Striking on an ancher and leaking dangerously is not a stranding. We shall only adduce two illustrations, for the purpose of showing how ill adapted this clause in as a means to an end. Corn and other succh articles are warranted free from particular average, inless the ship be stranded, because the insurera, considering these articles to be peculiarly eusceptible of damage, will not consent to take that risk, except on some extraordinary occasion. A ship laden with corn, makes a very stormy pasaage from the Baltic to London, and damages the whole of her cargo. Upon arrival off the coast she le stranded, but got off without straining or sustainlng say damage. The insurer is held to be liable for the damage to the corn, under the clause of the policy. On another occasion, after a very favorable passage to the coast, a ship strikes upon a shonl, but is not stranded, sustaining, however, so much damage that ahe arrives at London with 6 feet of water in her hold, and her cargo almoet wholly spoiled. The insurer is held not to be liahle under the clause of the policy.

General Average.-The Insurer is bound to make good all general average without exception, however trifing the amount. General average is trested as though altogether unconnected with particular average; and damage to the goods not amounting to 3 per cent. is not payable by the insurer, altheugh there may be also a general average, and the general and particular average together may amount to more than 3 or 5 per cent. General average is a charge which must in paid by the merchant and ship owner, oven if uninsured; although when insured, he transfers, as it were, in virtus of his insurance, the charge from himself to his insurer. All the elements that can by possibility enter into general average may be classed under four heads:-1. Sacrifice of part of the ship and stores; 2. Sacrifice of part of the cargo and freight; 3. Kemuneration of services required for genoral preservation; 4. Eapense of raising money to replace what has been sacrificed, and to remunerats services.

1. When any part of the ship is sacrificed for the general benefit, the owner in entitled to receive (deducting, of course, his alare of contribution), the amount of his outlay in the replacing of such sacrifice; allowance leing made, on the principle stated mbove, where old warks and materials are replaced with new. The deduction of one third, however, does not invariably apply, For instance, one sixth only is taken of the price of an iron cable that is elipped from for the general henefit, because iron cables are calculated to last for a great number of years ; and no reduction is ever made from the price of anchors. The charge of replacing the loss may amount to considerably mere than the value loet, computing the value at the place where the ship was originally ftted. Thus, the coat of replacing an anchor and cable slipped from in the Dowus, is frequently donble the value of the unchor and cable at Londen. Hut whatevar the chargo may be, such charge for me the basia of settlenent.
2. Sacrifice of the cargo and freight takes place in jetticon, or where part of the cargo in fung overboard to llghten the vessel. Uppon arrival in port, after such jettinon, the owner of the gooda jettisoneal is entitled
to receive (deducting his ahara of contribution), what the goods would have produced nett to him, supposing them to have arrived sound; and the owner of the ship is ontitled to recelve (deducting his share of contribution), the freight to which he would have been entitled upon the same delivery of the goods.
3. Romuneration of sorvices and other charges. When a ohip loses har anchors and cables, very large sums are frequently awarded to boatnien who venture off to her with new ones at the imminent hazard of their lives, A ship disabled at sea is towed into port by another, and remuneration for such service is awsrded accerding to the value saved, the detention occasioned, and the loss sustained. The ship rendering the service may be laden with fish or fruit, that may be totally apoiled by the detention, or may be in ballast. A ship captured by the eneiny may be recaptured by a man of war or armed marchant vessol; here, again, allvage is awarded according to the circumatances of the caes. All these charges are general sverage; that is to say, must be distributed over ship, freight, and cargo. When a ship, with her cargo, is driven on ahore, the expense of attempting to get her off is general average. If she can not be got off without discharging, the expense of dischargiog is general average ; but the expense of getting the ship off after the cargo has heen taken ont falls oxelnsively upon the ship. The warelousing of the cargo, and other expenses incurred for its preservation, are elarges exclusively upon the cargo. The expense of reloading is borne by the freight. When a ship puts into port in distress, the pilotage inward is gencral average ; the pilotage outward lia a charge upon the freight. This distribution of charges has settled into a tolerably well established practice; and upon this principle claims are aettled at the oflices.
4. The money required to meet the alove charges is sometimes attainabis withont expense. If the accident happen near home, and the ship owner ba respectsble, he adrances the meney and recovers from the various parties concerned so soon as the accounts can be made up; or if the accident happen in a foreign port. where the owner of the ship is well known, tho captain's bill upon him will somatimes be received in payment of the charges incnrred. But where such facilities do not exist, tha captain is ampowered to ${ }^{1}$ iledge his ship, freight, and cargo, as eecurity to any ons te may prevaii upon to supply the nacessary funds. This pledge is termed a bottumry bond. By it the captain admits the receipt of the meney; consents to tha payment of a premium (which varies with the distance of the port of deatination, the risk of the voyage, the respectability of the owner, and the necessities of the cuptain); and aasigne the ship, freight, and cargo, as security for the repayment of the nown'y sdvanced and the stipulated premilum. Should the captahn consider the bottonry premium demanded of him exorhitant, or should. he deem it preferable in other respects, he may sell a portion of the cargo for the purpose of raising such money as he may stand in need of towarl the prosecution of his voyuge. The expense of raising the requisite funds, whether by commission, by loottonry premium, or by hoss on the sule of the eargo, is charged to those parties far wiluse interest the money is requirei. Thus, if a ship, havIng struck upon a rock, puts into port in dias ress, and is obiiged to unload to repuir ; supposing the particalar average upon the ship to nnount tu $\$ 501$; ; the general uverage, consinting of ansintance into port and expense of unloading, $\$ 200$; marticuiar charges on freight, consintlug of expense of relauiling and pilutage outwari, *100; and perticular charges on cargo, consisting of warehouse rent and repair of prokages, 4200; and the expense of raising money thonid he 20 per cent.;-these sams would be severaily increased by this addition, and would the raised to wione, fi40, \$120, and 430. See Iotromay, Restonientia.

It still the genera ers of the Almost all port of de cargo are attual atat what is act tain ond er in proporti altogether and should then the $f$ of jettison, ficed for thi same princi what his pr it to have same value contribation average is o if a ship, o from an anc general ave principally adjust it on expenae are at the port tribution. average, do liability; a owner, or $h$ expended in insurer agal the is not abs age funds ar them takes and charges non-arrival such an ocea inearer from custems by sat countrie lishle for th The mercha sign port, port. Fulued
010,000 be

It still remains to be $\operatorname{lnquired} \ln$ what proportion the general average is to be pald by the different owners of the cargo, and the owner of shlp and freight. Almost all general averages are adjusted at the ship's port of destlnation, and the values of the ahip and cargo are taken at what they would produce in thair actual state upon arrival, and the frelght, according to what is actually receivable, leas the wages of the captaln and crew ; the general average being distributed in proportion to these values. Should the cargo be altogether worthless, it can not be made to contrlbute ; and should thi wages of the erew exceed the frelght, then the frelght is not llable to contribute. In case of jettison, the party whose property has been sacrificed for the general benefit recelves indemnlty on the eame principle; the value to which he is entitled being what his property would have produced nett, supposing it to have been sold on the arrival of the vessel-the some value serving for the basla of his propiortion of contribution. Some few cases occur where the general avarage is adjusted at the port of departure. Thus, if a sbip, outward bound to the Britlsh colonies, cut from an anchor and eable in the Downs, or lncur other general average on onr own coast, the insurances being principally effected in this country, it is the custom to adjust it on the spot, by which menns both delay and expense are avolded. On these occasions, the valuee st the port of shlpment are taken as the basis of contribution. A total loss, subsequently to a general average, does not exonerate the inaurer from his prlor liability; and slthough it ls customary with the ship owner, or his agent, specifically to insure the money expended in average, for the purpose of protecting the insurer agalnst any greater llability than 100 per cent. he is not absolutely obliged to do so. When the average fonds are raised hy bottomry, the party advancing them takes the ship, frelght, and cargo, as security, and charges a premlam to cover the risk of the ahip's nen-arrival at her port of destinetlon. And thus, on such an occaslon, a aubsequent total loss relleves the insurer from all liability to average. The law and customs by whleh averages are adjusted vary in different countries ; but the insurer in this country is only lisble for the averages adjusted according to our laws. The merchant, however, whose goods arrive at a forsign port, is obliged to submit to the laws of that port. Ile may thus be a considerable loser; paylng general average according to one law, and recelving from his Insurer according to another. And he never can be a gainer, because, before he is entitled to recover from hls insurer, he must prove that he has paid to the owner of the ship. This is one of the many inconvenlences to which mercantile inen are exposed, which can not be removed without, what it may be hoped will gradually take place, an asshnilation of tha commercial laws of different countries.
Proof of Loss.-The policy of insurance is the instrument under which the merchant and ship owner claim indemnitheation for all lossea that aro not 日pecially excepted. The proof that the less has been sastained must also be exhibited ; such as the title to the veskel and cargo, and the evidence of the captain and crew to establish the circumstances out of which the cham arises. If $\mathbf{A}$ were to insure his vessel for the space of 12 months, and at the explration of 0 months were to sell hls shlp to 13 : A's interest in the vessel having ceased, so also iloen his insurer's liability; and IB, if he wish to be protected, must make n new lmwurance. Proof of ownership, therofore, is an essential preliminary to the recovery of a clalun. In general practice, no difficulty arises from this, because the fact of ownership is sufficiently notorious. The bill of lading is, In most cases, satiafactory proof that the cargo was on board, as well as of the amount of freight.

Ialued and open Policies.-If an Insurance for $\$ 10,000$ be effected upon 100 hhda , of sugar, valued at
$\$ 100$ per hhd., the bill of lading, showing that the ves sel had 100 hhds. on board, establlishes the interest at $\$ 10,000$, and the policy is termed a valued pollcy. But If an insurance for $\$ 10,000$ be effected on 100 hh ds. of sugar, and nothing be expressed as to value, the bill of ladlng only establishes that 100 hhds, are on board, without establishling the amount of interest. The production of the involce, showing the cost of the goods, is necessary to that ond, the pollicy heing termed an open one.
Return of Premium for short Intereat.-In a valned policy, when the whole of the property insured does not appear to have been shipped, the difference between the quantity lnsared and the quantity shipped is termed short interest. Thus, if $\$ 10,000$ be insured npon 100 hhds. of augar, valued at $\$ 100$ per hhd., and 80 hhds. only be shipped; as the insurer's liability does not extend beyond $\$ 8,000$, so hu is obliged to return the premlum upon $\$ 2,000$ to which no risk attaches. Thls return of premium is calied a return for short interest.

For Over-Insurance.--In an open policy, where the value shipped is not equal to the value insured, the difference is termed over-lnsurance. If a merchant insures in London for $£ 5,000$ upon goods, without apecifying any value, from Calcutta to-London, the premium being $£ 3$ and the stamp duty 6 s. per cent., the amount of interest that attaches to the policy is so fixed, that he is neither to gain nor lose by the transaction in the event of the vessel's loss, supposing his insurance to be sufficient. To entitle him to recover a profit, the profit to be insured must be stipulated in the policy. The expense of insurance upon £100 being $\mathbf{8 . 2 5}$, it is clear that every $\boldsymbol{£ 1 0 0}$ insurance covers 96.75 original cost, that is to say, protects the merchant from less to that extent in case of the loss of the vessel. If then, we assume the inveice of the goods shipped to be 40,000 rupees, or, at the exchange of .10 c. per rupee, $£ 4,000$, the Interest attaching to the policy is eacertained as followss :-If 96.75 ,cost ls insured by $£ 100$ insurance, what will $£ 4,000$ cost be Insured by? Answer, £4,135. Under such circumstances, although a policy exists for $\mathbf{£ 5 , 0 0 0}$, the insured is not able to prove interest for more than $\mathbf{£ 4 , 1 3 5}$; and consequently, the insured being entitled to recover no more than that sum in case of loss, the insurer is called upon to make a return of premium for over-insurance upon $£ 865$.

Although we have treated separately of returns for short interest and over-insurance, we should observe that these terms in practice are used indiscriminataly ; and, indeed, we can not say that we perceive much advantage in making the distinction, or preserving the distinctive appellations. It semetimes happens that the property expected In a vessel is not all insured at one time or in one policy. But this makes no difference iu the principle of settlement accordiag to our law : although, according to the laws of most other conntrles, the policies take precedence of one another nccording to their dates, the whole short interest fulling upon the prolicy or policies last effected. The foreign law, in this instance, appears to us the more equitable and reasonable of the two ; and that our reason for thinking oo may be intelliglble, und thus gain asseut or mect with refotation, we shall state a case of short interest upon a number of policies, such as not unfmquently appears. A merchant, $A$, orders lils correspondent at Calcutta to ship for his account a quantity of sugar, not exceeding 1,000 tons, at a price not exceeding $£ 200$ per ton. In due time he recelves a letter from his correspondent ucknowledging the recelpt of his order, and expressing confident hopes of belng able to purchase the quantity, or the greater part of it, at the limits prescribed, and promising to advlse na he procoeds. A, on recelpt of this letter, say on the Ist of Junuary, makes a provisional insurance for $£ 50,000$ upon sugar valued at $£ 200$ per ton.

Continning without further adivices, and fearing lest his correspondent'a letter shonld have miscarried, and that he might have property afiont unineured, on the lat of February, 1at of March, and 1at of April, he offerts similar lnsurances, thus covering the whole 1,000 tons. He subaeqnantly recelven advica that his correspondent had not been able to purchase more than half the cquantity ordered, at his limit, and recovere from his insurers half the premium upon each poilcy. Now, it was not at all improbable that he might have recelved advice from his correspondent, as he expected much sooner. And if he had received advice in the middle of Fobruary, of the shlpment of 500 tona, and chat the slilp which contained them was totally lost in the river IIooghly, the inanrers upon the two firat pollcies would have been liable for a total loss. And it appears to us a defective arrangement, by which a party, who is at one time exposed to a total loss, should at another be compelled to return half his premlum. It is true that the merchant may, if he please, insert in hia policies a clauso by which the polleles shall be made to succeed one another; but we should say that the law, in insurance cases, as in the disposal of the property of deceased persons, onght to be the best general disposition, leaving to individuals the right of modification accerding to particular clrcumstances.

Return for Double Insurance.-Besldes returns for short interest and over-insurance, there are returns for double insurance. They are, in fact, to all intonts and parposes, the same thing. Double insurance exists where the party, throngh forgetfulness, makes an Insmrance upon his property twlee over; or where the shippers and conslgnees of grods, when uncertain of one another's intentions, effect each an insurance upon them; or where the captain of a vesael in foreign parts, fearing leat his advices should not reach hla owner, effecte an insurance upon it, and the owner at the same time, acting with equal caution, effects one also. The observations already made upon raturns for short interest, and upon the difference between our laws and those of other countries, apply with equal force here.

We have now gone over all the prinelpal topics connected with marine assurance. Those who pernse this article with orlinary attentlon will, we hope, gain a tolerably clear insight into the principles and practice of tho business. But a perfoctly familiar acquaintance with it can only he acquired by those who are dally converagnt with its detail.,

A nalysis of the Geweral Law of Inatrance.-The invention of maritime insurance is due to Italy, and it came into ure at the close of the 12 th or the beginning of the 13th century. The term "police" in terlved from the Italian Polizza, which signities any note or memorandum in writing, creating an evidence of a legal obligation. At that time the Italians were the carriers of Europe, and by their means insurance wua introduced into other countries. A colony of Lombarda $\mathbf{v . s}$ settled in London in the 13th century, and conducted for a long time almost exclusively the foreign trade of the kingilom; and it is to them that the tradition of Fingland attributes the introluction of Insurance. In the reign of Elizabeth a court was constituted to treat of caunes relative to policies of insurance in a summary way. The court was formed of the jucige of admiralty, the recorder of London, two doctors of civil law, two commont lawyers, and eight merchants, empowering any five of them to hear and determine all such causes arising in Iamdon. Ilut the court, on aceount of its reatricted character and uther causes, fell into dinuse, and cases of insurance are 1.0 w decided by trial in the cuorta of common law. The contract of insurance is essentially a contract of indemnity against the perile of the sea. The various codea differ in the objects prohibited to be lusured. Thus the French cola, ordinance of Bilboa, Spunlah
coda, Danish, Two Slcilies, Roman States, Ionier. Ielands, Lombardo-Venato, Sardinia, Hayti, and Greece, prohiblt insurance on freight of goods on board, excepted profits, wages of seamen, and maritime laterest on loans on bottomry. While Great Britain, Holland, Portugal, Pruasia, Malta, United SLates, and LIambarg, permit them. Reoinsurance is probibited in Great Britain. In Great Britaln marinars are forbidden to insure their wages ; but a captain of a ship can insure his wages, or any interest as part owner. An insurance on money lont to the captain, payable out of the freight, is illegal. So are wager policies; and it is the same in Massachusetto.

Articie 835 of the French code authorizes the assurance on the whole or on a part of the objects which may be insured; but in Spain and Denmark the goods can not be insured for more than nine tenths of their value, and in Spain, no more than four fifths can be insured on the value of a ship; at Malta the insurance can not exceed seven eighths; in Prussia it may be mada far the cost price, or for the value of the ship but in Molland and in Portugal the entire value may be insured after the vessel has set sail. In Grent Britain no pollcy can be made for a longer time than for 12 calendar inonting.
The duration of risks for a ship continues in Great Britain until 24 hours after sho has moored at anchor in safety. The same in the United States and at Malte.

According to the Prussian code, payinent onght to be effected within two months after the notica of the lamages; after thls time intereet commences to run. The law of Great Britain beling mostly similar to that of America, it has been thought necessary to vary the mode of treating the various eubjects; so illegal insurance, rights of agents, concealment, and reprenentations have been enlarged on in the law of America, while for these, we well as for all others, the reader is partlcularly refarred to the lsw of Great Ilritain. The general spirit of the law of Insurance is beautifully illustrated in the following language of the French jurists at the close of their report to the council of State on the title of insurance in the code of commerce, and rendared by Duer in his work on insurance: "Marine insurunce may justly be deemed ons of the noblest creations of human geulus. From a lofty height it surveye and protocts the commerce of the world. It scans the heavens; it consults the seasons; it interrogates the ocean ; and, regardless of its terrora or caprice, defines its perila and circumscribea its storms. It extends ita carea to every part of the habitable globe; studies the usuge of every nation; explores every coast, sounds every harbor. To the sciance of politics it directs a sleepless attention; it enters the council of monarchs-watches the deliberations of statesmen-welghs their motives, and penetrates their designs. Founding on theso vast materials its akillful calculations, secure of the result, it then auldresses the hesitating merchant : 'Dismiss your anx. lety and fears; these are misfortunes that humanity may deplore, but can not prevent or alleviate. Such are not the diasasters you dread to encountic. 'Trust In me and they shall not reach you. Summon all your resources, put forth all your skill, and, with unfaltering ecurage, pursue your adventures. Suc-coed-ynur riches are enlarged; fuil-thay shandi not be diminished. My wealth shall supply your loss. Rely on mo, and, for your sake, at my bliding, the arm of your enemies shall he paralyzed, and the dangers of the ocean cease to exint.' 'The merchant listens, obeys, and is rewurdel. Thousands, tempted by his auccess, follow his example. Those whem it had long separated, the ocean now unites. The quarters of the world approz ch each other, and are bound by the permanent ties of mutual interest and mutual bencfits."-Levi's Com. Jaw of the World.

We extract from Duer's Marine Insurance the fole lowing Law of Insurance In the United States:
"1. It зu* the perils of the partlee b insurance is pald ; 8d, the bth, the risk period of tim inue in force The anlform considered as ten contract. tlal part of different Stat New York th ent subjects b. (If the Coms tlon of a polic parole eviden detorminatlon court. As a policy is to be ception from strictly again
"1. Itu3urance is a contraot of indemnity against the perils of the sea, 2. A pollcy must specify, lat, the partles between whom, and on whose accoant, the Insurance ls made; 2d, the conelderation or premium paid; $8 d$, the subject insured $; 4$ th, the amount insured ; bth, the risk insured against ; and, lastly, the voyage or period of time during waich the Insurance is to continus in force. 8. Form and execution of the contract. The anlform and general practlce of merchants may be consldered as evidence of the legal necessity of a written contract. A apeolfication of the risks is an essential part of the contract. 4. The policies uasd in the different States of the Unlon differ materially; and In New York the forms of the pollcy ln use for the different subjects of insurance are distinct und eeparate. j. The subscription of the Insurer ls alone sunficient. When the insurance is mads by sn lncorporsted company, the execution of the policy must be attested by the officers designatsd for that purpose by its charters or by lts lawe. 6. When a policy has in fact beon execnteit, and notlce of its execntion has been given to the assured, its actual delivery is not essential to the completion of the contract. 7. The Insurer, whether an Individual or an incorporated company, would not be Hlowed to retract a consent thus confessed to have been given; but would be considered as holding the policy for the benefit of the assured, and bound to deliver it at his request. Should a loss occur, and the policy then be withheld from the assured, he would have s comptete remedy In an action at law. 8. When an applleation for insurance is accepted by the insurer, the rate of premlum and the date inserted, and the writing signed by the partles, it constitutes In equity a valid insurunce, and in law a valid sgreement to insure: it gives to the assured an immediate right, upon the tender of the preminm, or premlum note, to demand from the insarer the executlon and dellivery of the policy. The validity of an agreament to insure may he proved by the correspondence, but the evidence of the assent of both to all tho terms proposed must be clsar and unequivocal. 9. An offer to insure made by letter is a valid undertaking that the party wiil be bound by it, if in due season a fsvorable answer be returned. But although the insured is necessarlly bound by his offer during the lnterval that has been stated, it must not be inferred that the applicant has the right, under all circumstances, to accept the offer when be recelves it. 10. The policy, from the cime of Its execution, constitutes the sole evidence of the agreement of the parties; nor, subject to soms exceptions, can any provious letters or communlcations between them, nor even the written application or agreement, be used to vary or control its Interpretation. 11. When a policy refers to any other docuinent or paper, the contents of the document or paper become a part of the contract as folly as if they were reclted or incorporated in the policy. 12. A policy of insurance, when executed, may not only be cancelled by the consent of the parties, but is subject to any change or modification of its terms that they may choose to adopt. When an slteration is made In the body of the policy ly the assured, without the ussent of the underwriters, if it change the sense, or affect in any degree the sutsatince of the contract, it renders the whole instrunent void. 18. The date is one of the principal requisites in the policy. The date, however, is only presumptive, not conclusive, crifence of the facts that it attents. H. Wager polieics are established and ndmitted to be illegal.

Of the Construction of the Policy. -15 . The constructlon of a policy, wlth the exception of cases in which parole evidence is admitted, is a question of law, the determination of which belongs exelusively to the court. As a contract of indemnity to the assuret, the policy is to be liberaliy construed in hls fuvor. An exception from the risks of the polley ls to be construed atrictly agsinst the iasurer. 16. When a diacrepancy,
apparent or real, is found to exist between a written and a printed clause of the policy, It is the writing that controls the interpretation. 17. Extrinsic proof, by the teatlmony of witnessas or otherwise, is received to control or ald the interpretation, in order, let, to fix the application of general or indetermlnate words; 2 d , to correct an error of description, by showing the identity of the subject to which it relates; 8d, to remove a latent amblgulty ; and, lastly, to explaln the meaning of foreign or technical words. 18. Parole evidence shall never be received to show that the intention of the parties was directly opposite to that which thelr language expresses, or aubstantially differgnt from any maaning that the words they have nsed, upon any construction, will admit or convey. Parole evidence may be admitted to ehow that particular words, upon the construction of which a controversy turns, have acquired, by the known usages of trade, a peculiar mesning, wholly distinct from thelr ordinary and popular sense. 19. When the interpretation of words, or the construction of a clanse in the policy, that may be understood in a sanse more or leas extensive, has not been fixed hy judicial declaions, parole evidence may be admitted to show whether they have obtained, hy use and practice between the assurers and the aesured, any, and what, known and deflite import. The usage, if preved, will govern the construction. 20. If by a general practice, the voyage or trade to which the insurance relates has been pursued in a certain course or manner that the terms of the policy, in their ordinary interpretation, would not embrace parole, evidence may be admitted to prove the existence of the usage. 21. A usage that can alone be allowed to control the interpretation of the policy, or vary the legal rights of the parties, must be general, uniform, notor ions, reasonable, and consistent with the terms of the policy, and, to a certain extent, with the rules of law.
Of Illegal Insurances.-Breach of Municipal Laws.22. The invalidity of an insurance, as an implied violution of the laws of trade, may arise from the character of the goods exported or imported, the nature of the trade, or the breach of some statutory provision relative to the navigation of the ship or conduct of the voyage. 23. When the exportatation or importation of the goods shipped is prohlbited, the Illegality affects not only the policy upon the goods themselves, but equally those upon the shlp and frelght, since the voluntary reception of the goods by the master is as much a violation of law as their shipment by the owner. When the prohiblted act renders the subsequent voyage or trade illegal, it vacates the policy. 24. The illegallty of a voyage, arising from the transportation of prohilited goods, is nsver permitted to affect a distinct policy upon the lawful goods of a different owner. 25. Where the goods insured by one policy are all of them lawful, tho insurance is valld, oven when the assured, as ownor or otherwise, is interested or concerned in the transportation of unlawful goods hy the same vessel, but otherwise when Included in an entire policy. 26. The contract is entire wien the goots insured (whotler the insurance be penerai or specifio) are Included in one gross valuation; but where an insurance is speclifo upon different kinda of goots, and a separate value is affixed to each denomination, the contract is distinct. So where the policy is open upon different kinds of goods. 27. An iusuranco in one policy for the owners of a ship is not devisable; lout the Illugal act of one without the knowledge or privity of the others, has the sume effect in voiding the entire oontract as if all had concurred. But the contract will not be regarded as entire when the insurance is male by a common agent on recount of several persons whoso interests are severul and distlact. 28. When an ontlre voyuge is illegal ut lta inceptlon, the illegality runs throngh and infects every purt of it. 29. When a particular trade is prohibited ly the express terms of a treaty to
which the State within whose Jurisdiction the pollicy is effected is a party, the effect of the prohibition, whether general se to trade or limited to particular commodities, is preciaely the same as if it were by a municipal law, an act of Pariliament, or of Congreas. Every voyage in contravention of the treaty is iliegal, and every inaurance upon auch a voyage, whatever be the subject or terme of the policy, is necesaarily void. 80. The defeat of the voyage by an embarge after the policy has attached, is not considered as a diesolution of the contract, but as a loss by peril inaured againat, entitling the inanred, upon an sbandonment, to a recovery of the whole sum insared. 81. The contingent expectation of the partiea that an existing law will be repealed Interdicting a veyage or trade meant to be covered by the pollicy, la not sufficient to render the insurance valid when the expectation is not reulized, and the voyage is undertaken and prosecuted in defiance of the provisions of the law.

Section II. Einemy's Property.-32. Every insurance upon property liable to confiacation as prize of war by the gevernment of the country to which the insurance belongs, is of decessity invalid. An insurance made in a belligerent country upon the property of the aulijects of an opposite belligerent, is void. 83. Goods in the course of transportation from a nentral country to a belligerent, if they are to be delivered to, and become the property of, a belligerent immediately on their arrival, are considered as his goods during the voyage (in itivere), and as auch are subject to capture and confiecation.

Section III. Linemy's Property-Domicile.-34. A merchant is a political member of the country into which, by his residence and business, be is incorporated; he is a aubject of the government that protects him in his parsuits, that his industry contributes to support, and of whose natural resources his own maans are a constituent part. 85. When the property of a foreiguer whe, at the time of its shipment was living In a hostile country, is seized as that of an enemy, the captors are not bound to prove in the first instance that his piace of residence was his actual domicile. The presumption of iaw is in their favor. The animus manendi, the intention to remain, the law imputes to him, and to redeem his property from the noxious 1 m putation, he must give such evidence of his intention and plane as shall be effectual to destroy it. 86. The national character of persous who reside in a foreign country, in a public or representative capacity, is not changed or affected by their residence, whatever may the its duration, or by whatever circamstances indicative of the intent to reader it permanent it may bo accompanied. Hut if a foreign consul engage in commerce, he is inmedintely stamped, with respect to that commerce, with the national character of the country in which he resides, and from which his trade is conducted. Llis character of consul affords no protection to his mercantile adventures. 37. A native suiject can not ncquire a foreign domicile by an emigration from bis own country luring the existence of hostlilities (flagrante bello) so as to protect his trade during the war, either againat the beiligerent claims of his own country or against those of a hostite power. Ills native character is wholly unchanged by bis change of residence. 38. The nature of the traflic or business in which un individual is engaged, may stamp upon him a national character wholly independent of that which his phace of residence would alone impose.

Section iV. Trade with the Kinemy.-i19. The proporty of a subject is in all cases liable to confireation in a court of price when it is found engaged in an unitaw. ful trade or intercourse with the ports, torritories, or suljects of the publie enemy; and the property of a qulject of a State allied in the war is liable under the like circumstances to the amme foumalty. 40. To render the importation of goods from an enemy's jort an lliegai trading, it ia not requisite that they should he
the fruits of any purchase, barter, centract, or negotiation in the onemy's country, after hostility had commenced. The sailing of the vessel with the goods on board after the party had knowledge of the war, completes the offense, stamps the cargo with as illegal character, and aubjecta it, during its transportation, to a rightful seizure. 41. To render a trade with the enemy unlawful, it is not necessary that the communication with the enemy's conntry ahould be immediate and direct. A circuitoue trade is liable to the eame ebuses, and involvea the same political dangers as a direct one, and therefore equally falls within the interdiction and penalty of the law. 42. If an American vessel, during a war, even when destined to o neutral port, presecutes her voyage under a licensc, from the government of the enemy; both ship and carge, while they remain under the protection of the license, are liable te capture, and If captured, are lawful aubjecta of confiscation. 43. A license granted ly the sovereign power is not aubject to transfer or assignment, but its legitimate uae is confined to those for whose beneflt it was originally granted. A license to an alien enemy, whether by name or general words, removea all his peraonal disabilities. 44. The goods for which the protection of a license is claimed, must correapond with those that the license enumerates or deacribes. When a license suthorizes the importation of goods from an enomy's country in an enemy's ship, the protection intended to be granted, although confined in terms to the gooda, by the juat construction of the law is extended to the veasel. The natlonal character of the ship, as described in the license, $i_{N}$, in most cases, a condition necessary to be fulfilled to secure the protection that is desired.

Section V. Breach of Neutrality.-40. The duties of a aubject or citizen of the neutral State are, 1. To sbstain from every act that tends to the asaistance of either of the belligerents in the prosecution of the war. 2. To abstain from every act that tenda directly to relieve one of the belligerents from the pressure und effect of the opposite hostilitien. 3. To offer no resistance to the full exercise of the belligerents' rights of visitation and rearch, and to resort to no means for eluding and defrauding the righta of capture. 46. From the moment that a ship, with contrahand articles on board, quits her port on a hostile destination, as a general rule the offeuse is complete and the capture legal. Te justify the capture, it is enough that the imnediate object of the voyage is to supply the encury, and that the contraband is certsingy destined to hia immediate use. 47. Articlea of contraliand are all the munitions nud instruments of war; all munufuctured articles that in their actual state ary fitted for military and maval use, and more especlatly for the building and equipping of ships of war. l'itch, zar, and hempare contrahand; liut they enjoy exemptions if directed to a mercantile port. I'rovisions are not contratand, but they may le reudored no by their special destination and intended use. 48. An insurance upen goods liable to confiscation as contrabsend of war-it made in the belligerent comitry whose rightes are $y$ :olated--is wholly void. 49. A blowkade is a uavai circumvallation intended to prevent und cut off all communica. tion with the port that it incluses, und to canse an entire suspension of its commerce. The lireach of a blockade subjects all the property so empleved to contiscation by the belligerent power whose rights are violated.

Of the I'arties to the C'outract-i)f the Legal Competency of the Parties.-50. Alt persons of full wge and otherwise cupable of contracting, have the right to inwure and the insured. 51. In order to render a party capabie of insuring, it is not necessary that he should have any interest in the property insured at the times the insurance is effected, uniess the risks as described in the policy have already commenced. When the contract is jerspective, it is valid and effectual if the
intereat meal attaches, W riaks have c time in the may be eo fra that had in $f$ quired by ins An agent em himself becon

interest meant to be covered exists waen the poliey attaches. When a party effects an insurance after the rlsks have commenced, if he has an interest at the time in the subject-matter of the policy, the contract may be 00 framed as to entitle hlm to recover for a lose that had in fact occurred before hlo own title was acquired by inauring the goods " loat or not lost." 52. An agent employed to procure an insurance can not himself become the lnsurer.

Of the Description of the Parties in the Policy,--53. The names of the immediate parties to the contract, that is, of the individual or company agreeing to assnme the risks, and of the person effecting the insurance, must be mentioned in the policy. 54. When the insurance is made by an agent, the parties really assured may be described by general words; nor is even a general description necessary, if the party effecting the lnsurance describes hlmsslf as "agent" in the policy. Where the person effectlng the insurance describes himself as the agent of a particular person, the policy, by ite necessary constructlon, inures only to protact an interest of the party thus named as the principal. 55. When an agent effecte a policy in his own neme on account of a third pereon, who is named, or describing the assured by general words, an action on the pollcy for the recovery of a loss may be maintalned in the name of the agent, or In that of the party really interested. But where the agent is a naked trustee, having no llen in the policy, and no interest of his own that was meant to be protected, he will not be allewed to maintaln the action in his own name, if it appear that previeus to the cemmencement of the suit his authority as agent had been countermanded or revoked. 56. Although each partner has a right to insure the partazrship property in the name or on account of the firm, yet where the insurance ls expressed to be on his sole sccount, it must be limited in its appllcation to his indivldual share. When the separate interest of a partner, separatsly lnsuring, is equal to the amount insured, he can have no motlve for averring or attempting to prove a partnership property. 57. When the interest of the party in whom the interest is averred is proved, and an suthority from hin to insure, or hls sdoption of the contract la also proved, it to an inference of law from the terms of his policy that the insurance was effected on his account. But when the proof establishes that his interest was not intended te be covered, it furms an insuperable bar to a recovery. 58. The interpretation of every policy that is effected by an agent under previous instructions, must be controlled by the intention of the principal in every case where evidence of the intention can properly be recelved to determine the construction. The general words of a policy describing the assured, have always received a liberal Interpretation. 59. The policy may be so framed that the insurance hall be inseparably attached to the property meant to be covered, so that the successive owners, during the continuance of the risks, shall becoms in turn the parties really assured.
Of the Assignment of the Folicy and of the Rights of the Assignee.-60. Altheugh a pollcy of insurance in its usual form is not assigasble ln law so as to enable the assignee to maintain un sction npon the contract in his own name, it is in all cases asslgnable in equity, and vests in the assignee a beneficial interest, varying in its extent according to the purjose for which the assignusent is made. 61. Although the rights of tho sasignee of a pollicy are equitablo in their nature, it is not in a court of equity, when a less has occurred to which he claims to be entitled, and the underwriters refuse to pay, that he must seek relief. IIe has a full remedy in an actlen at law, in the nsine of the ussurer. 62. The assignment in writing of a polley of insurance does not vest in the asbignee a perfect title, except as against the sseigner, unless it le accompanled In an actual deiivery of the instrument Iteeif. The
policies in use in Boaton contain apecial clauses restricting their assignment.

Of Insurance effected by an Agent.-Of the Authority of an Agent to Insure.- 63 . The neccasity of proving either the orlginal authority of the agent, or the aubsequent adoption of his contract, is expressly affirmed, or necesparily implled, in every case in whlch a question as to the authority of the agent has arisen. A prior authorlty conferring on the agent the right to insure, is elther express or implied. An express anthority may be written or verbal. 64. The suthority of a single partner, and of each partner, to insure the partnership property in the name or by general words on account of the firm, or to direct euch an assurance to be made, is established and nadeubted. 65. The right of a part owner to insure is limited to hle own indivldual share. C6. The master of a shlp has ne general autherity, but bss an implied authority in special cases, 67. When a conelgnee has an interest, he may insure the entire property consigned to him ; but a censignee who has no interest, and. no lien whatever, upon the goods consigned to hlm for sale, has no right to insure them on behalf of the consigner, unlese specially instructed. 68. A general agent may insure on behalf of his princlpal, unless restricted in hls discretion ly the express instruction of hls princlpal. The authority of the agent, exprese or implied, may be revoked by the principal at any tlme before the terme of the insurance havo been settled by en agreement with the underwriters. 69. In the United States a usage prevaile to cover all shlpments by a general standing time polioy on geods, so as to embrace not only all outward and home shipments made on thelr own acconnt, but all shlpments made to them from foreign ports, upon which they are directed to effect insurance. When there is a subsiating policy in the abova form, a direction to insure, once given, is in its nature irrevocable. 70. When an agent accepts an order to inaure, or omple to give notice of hls refusal, he is of course beund to its executlon. When the principal has funds or effects in the hands of his correspondent, the application of which rests in his own discretion, he is justified that they will be applied by his correspondent to procure the insurance that he directs. 71. When the agent has no funds or effecte of hls principal on hand, but, by an astablished course of dealing, has been in the habit of executing the orders of his principal to effect Insurance, and of advanclng the premiam, he is bound to execute all similar orders that he may recelve from him, until he has given him notice that this course of dealing must be discontinued. 72. When a consignee receives a bill of luding, with an order to insure its contents, if he accepte the consignment, he must execute the order. The law regards the transactlon as entire, and the acceptance of the benefit as a tacit promise to discharge the duty. 73. These rules ure subject to exceptions. The agent ean never be bound to effect an insurance that, from circumstances that could not have been known or anticipated when the order was given, instead of securing an indemnity to his principal, would tend to his certaln prejudice and loss. When the ugent, when he receives the order, knows, or has just grounds for believing that his correspondent is insoivent, or is threatened with insolvency, the acceptance of tie trust rests in his own discretion. Yet, should his apprehension prove to be groundless, he should be called to juatify his conduct, by jroving that the information on which he has ucted was credible and trustworthy. The obligation to insure that arises from a prevleus course of dealing, csn only npply to insursnces elmilar to those that the agent had been in the habit of effecting. 74. The contidence reposed in an agent is atrictly persanal ; and ite can not delegate to a third person an authority that, lys the intention of his jrincipal, was meant to be cxecuted by himseif alonc.

8xorton III.-Of Inouranees by voluntary Agents, and their Adoption.-75. Although the adoption of a voluntary inaurance is necessary to render the contract valid againat the principal, and proof of lta adoption to warrant the recovery of a lose againat the insurer, we are not to infer that the agent who effects the policy is at llberty to reacind his own contract, upon proof either of his want of a previous authority, or of the refusal of his intended principals to ratify his act. 76. There are, however, two cases in which, as exceptions from the general rule, the voluntary agent, when hia Inaurance has been rejected, may juatly claim to recover back the premium he has paid: 1st. When he diaclones to the underwritera that the insurance is made without authority, and they agres that it shall be cancelied, if not edopted; and 2dly: Where the insurance is rejected for reasons that would have rendored the contract valid, if ndopted. 77. The contract of the voluntary agent may be ratified and appropriated by the principal, even with knowledge of a loss, unless the power to adopt the insurance under these circumatances, is excluded by the expreas provisions of the pollcy. When an abandonment of the property inaured is necessary to justify a claim for a total losa, an adoption of the contract, with the right to enforce the cla:m, is of necessity limited to the period within which, either by the proviaions of the policy or by the general rule of Inw, the abandonment must be made to render it valid; and a clnim for partial loas is just as liable to be barred hy the lajse of time, an if it erosa under a policy duly anthorized. The party for whom the insorance was intended can have no right to adopt and enforce a contract that would not have been valid if made by his express direction. 78. When the agotit merely excceds a given anthority, the principal is concluded if he fall to give notice of his dianent within a reasonable time after receiving the information.

Of the Duties of Agents in their Relations trith their Principals, and with the Insurers.-79. Every agent who is entitled to receive a compencation for his services, is bound to exercise not oniy the same care and diligence that he ia acenatomed to emplor in tia own private affairs, but all the care, and diligence, nnd sklli that the transaccion of the particniar business with which he is intrusted, accoriling to if nature, may he reasonably construed to require. 80. A person who undertakea to effect an insurance for snother, should make proper inquiries as to the circumstances and standing of the innurers to whom he wiahes to apply, and to be careful to select thone whoae credit is eatablished and undiaputed; int when he acts in good faith in making the nelection, and haa exerciaed the necenpary caution, he is not, generally npeakiag, renponsible for the ultimate molvency of those who antiacribe that policy, unless he receives a del credere comnission. From this rule the voluntary agent is not exempted. 81. When the agent employs a broker to effect the pollicy, an he is alwayn justified in doing, when auch is the asage of the place where the contract is made, it is to the diacretion of the broker that the choice of the insurern is intrusted; and for his fraud or neglect in the exeention of this trust, the agent is not reaponaible where no want of good faikh, or of proper diligence, is justiy imputable to him. 82. An agent who has efferterd in pollicy in conformity to the orders of his principal, han the power when the first insurer becomen insoivent, even of rescinding the contract when the interests of his principal plainly demand the measure, so long us the policy remains in his hands. Hut the agent ought never to cancel a aubsisting policy when the partial security that it affords in preferabie to a return of the premium, uniess with the certainty that he will the abie to pay a new contract fully, to protect the intereat of his principai. The sulsisting polioy being reacinded, if the orier wan special and limited, he will atill be boun'l to follow ita
provisions and obaerve its limits ; but If within its limita, and according to its terms, it in the duty of the agent to effect a aecond lnaurance. 88. Where an inereased premium is demanded, the execution of the order can no longer be regerded as a positive duty, hut will reat in the sound discrotion of the agent. Where, from the lapse of time, or othar circumatances, the alteration of the risk in so material tiset the premium demanded la much larger than the principal when be gave the order to inaure could have contemplated as necessary to be paid, the agent may be partly excused who declines to exercise his authority $\mid$ and, on the other hand, whatever may be the ohange in the riak, and the increase of the premitum, if there are reasonablo grounds to believe that a second insurance will tend to the advantege of the principal, the ugent, proceeding in good faith to effect it, wiil he protected. 84. It ia the duty of every agent to conmunicate to the nnderwritera all the fucts and circumstances of which he has any knowledge or information; to represent truly ail the facta he discloses, and to answer truly all the proper inquiries of the insurer; for the concealment or misrepresentation of the ngent, whether intentional or undeaigned, has the same effect on the validity of the contract as that of the party really assured. 85. Aithough an agent to whom no fraud or neglect is Imputable, is not reaponsible for the conceslment snd misrepresentation of the aub-agent whom he is authorized to employ, yet when he employa a broker to effect the poliey, he la bound to give his all the necessary instructions and all material information that he himself possesses, and this duty attaches even on an agent who acts gratuitously, who may be rendered liable for the damages resuiting from his onisnions. 86. When the omission or act of the agent that vitiates the contract can be justly imputed to hia fraud or his neglect, he is personaily liable for the resuiting dimage ; but where it proceeda from his want of the requisite akill, there aro casea in which equity demands some distinctions. 87. A mercantile agent who was neither authorized to insure nor has effected an insurance, may yet render himself liablo as an insurer, by a false representation, not to the underwriter, but to his principal, if the naturo of the misrepresentation is such as to invalidate a policy founted on it, effected by the primeipal, or on hia hehalf. The most important and responsibie duty of every agent in effecting an insurntice, is to take care that the poicy shall be so framed as effectunliy to cover the property and riaks, which he is directed to iosure, or which, when not acting under a previous order, he believes and represents limself to have insured. 88. When an agent acts under clear and positive instructions, and violates them in the term and form of the insurance that he effects, his negiigence, it is manifest, is still more culpabie and renilers the agent personaliy liable. llut when the order is plain, tho good faith of the agent wili not protect him. 89. Even when an agent acts gratuitousiy, without the hope or expectation of a reward, yet, if ha enters on the execution of an order to insure, he must follow its ternis, and by his omission to cover all the property or risks that he is directed to insure, wili becone responsibie for a $l$ that the insurance of property effected would l, sembraced. The mistake of tife agent where the practice is unsettled and the law uncertain, affords no evidence of the want of reasonalife skiil and ordinary diligence, for whici, alone, he is responoible. 90. The agent is not responsibile if his mistake nrose not from hia want of requisite difigence and akili, but from the imperfect and confused manner in which tha inatructions of hia principal were expressed. 91. All prior verbal communications are superseded by the written inatructions waich constitute the proper and sole ovilence of the intentions of the party ulrecting the lasurancea. 92. If the agent
finda it impr to the terma immedlate $n$ an agent he vorage, and aeveral pere elect to cov he mast be secure to an vity to whic property and onder to ina and when p order la dise or not to ins cretion of the determinea n good falth. it deacribes $t$ rection as to limitation as general the d his obtaining pollcy at the 94. As a genera ed, may be oons solely to the pls atances may do a duty that th Where an age posaersion with cy is continued ights and prot matters arising or total, has on subnit the $n$ amounts, dems onder to sustair loss, an absudo hehalf of his p eriy expressed mast be careful all his transact sponsililo of the collect, receive cur and full dit gence in the o incur a heavy 1 pay all losses, $t$ have been reco to the agent to actual payment of a credit. $\quad 10$ authorized to re credit in lieu of derwriter in auc the trust that is itor of the asen him a lien on th
finds it impracticsble to effect an Insurunce secording to the terms of his Instructions It is his duty to give immediate notlce of his fallure to kile prineipal. When an sgent has separate orders to Insure on the same vojage, and agalnst the same riske, the property of several persons whose intereats are several, should he elect to cover the whole property in one policy, he must be careful so to frame the contrect as to secure to each of his constitrente the same indemalty to which he would bave been entitled had his property and interest alone heen covered. 08. An order to Insare is either diseretlonary or positive, and when positive, is elther genoral or llmited. The order is diseretionsry when the election to Insure or not to Insure, le committed absolntely to the discretlon of the agent $;$ and In such a case If the agent determines not to insure he is responsible oniy for hls good falth. The order when positive is general when It deacribes the property and voyage, but gives no direction as to the rlsks to be covered and imposes no Ilmitation as to the premlum: When the order Is thus general the duty of the agent is fully discharged by his obtsining an Insurance In the usual form of the policy at the place where the insurance is made. 94. When the order to irsure contains no direction or restriction us to the amount of the premlum to be paid, it is the duty of the agent to effect the insurance at all evenis wlthent regard to the premilum; and if by limleing himself to a smaller premium he defeats an insmrance, he is llable, with the exception, however, that where the funds he has or he is to advance should not permilt him to enhance the premlum sufficiently, he would be excised. 95. Special instruetions must be exactly followed by the agent. When an agent is directed to lasure a certain amount, It is hla duty to procure en insurance, if possible, to the full extent of the sam required; but if he can not, he must execute the order as far ss he can. 96. An insurance is not wholly void when the agent exceeds the premium to which he was limited. A contract made by an agent who in its terms exceeds his authority, ls never wholly vold If the excess may be readily ascertained and separated. 97. As a general rule the order unless otherwise expressed, may be construed as intended to refor In its execution solely to the plece of the agent's residence; but circumstances may doubtless create an exception and lmpose s duty that the order does not In terms require. 98. Where an agent who has offected a pollcy retains Its possession with the consent of his princlpal, hls agency is continued. His general duty is to enforce the tights and protect the interests of his princlpal in all matters arising out of the contract. If a loss, partial or total, bas occurred he mast collect, srrange, and submit the necessary proofs, adjust and settle its amounts, demand and recsive Its payment. If in order to sustain the claim of the assured for a total loss, an abandonment is necessary, he must take it on behalf of his principal, must take care that it is properly expressed and is dellivered in due season, and he mast be careful to preserve the requisite evidence of all his transactions. 99. The most important and responsible of the subsequent duties of the agent is to collect, reccive, and pay over the losses that may occur and fall due under the policy, und by his negllgence in the discharge of his duty he may readily incur s heavy liability slace he ls necessarily bound to pay all losses, that but for his neglect and delay might have been recovered from the underwriters. Payment to the agent to discharge the underwriters must be an actual payment made in good faith, not the uliuwunces of a credit. 100. An insurance agent or broker who is suthorized to recelve a loss, has no authority to accept u credit in lieu of a payment In money, nor can the underwriter In such a case allege hla own lignorunce of the trust that is vlolated. When the agent is a creditor of the nasured and the nature of hils deht gives limn a lien on the policy, that lien will attach on all
moneys that he may receive from the underwriter nuder the policy, and he has a perfect right to retain such moneya to hla own use so far as may be necesaary to aatisfy his claima, by giving due credit to the asaured for the amount. The credit glven by the agent extingulehes the debt to the assured, and discharges the insursr. 101. A settlement on account between the underwriter and the agent le conclusive on the agent himself. 102. The agent should transmit to his prinelpal, full and just accounte of all hls transactlons on his hehalf, keep him advised of all ocenrrences connected with the insurance by whleh his interests may be affected, and dellver over to hla princlpal, on request, the poliey effected on his behalf, provided bis own clalms, If euch as give hlm a llen on instrument, are first attlsfied. The polloy is $\ln$ all cases the property. of the party really assured. He may maintaln an action of trover for lts recovery, not only agalnat his agents, but against every person into whose hande it may have passed, and by whom in vlolation of his righta it may be withheld. 103. In the United States it ia not unusual to Insert a provision in the policy by which sll lossea are made payable only to the person in whose name the insurance is effected. 104. If the agent intends by the insertion of the apecial clause to extend hia lien so as to cover advances or a balance of accounts, to which the privilege is not annexed by law, the extension, if not anthorized by the principal, is a fraud upon his rights; and where no such intention existe a provision limiting the payment of a loss to the agent alone may operate to embarrass or delay the remedy of the assured, and should therefore, without his consent, never be Inserted.

Of the Rights of the Agent. -105 . An agent has a lien on the policy; and moreover, has authority to maintain an action in his own name for the recovery of a loss under the polley. 106. An insurance broker has a lien on the policy against his Immediate employer, not only for his commissions and premiums, but fur the general balunce of his insurance atcount If the broker, when he effected the policy knew, or had reusonable ground to believe, that the insurance was on the account of a third person, his lien as against tho party really assured, will be confined to the premilum and lis commlssion in the particular trausaction. 107. A broker who has received moneys under a pollcy that he effected in Ignorance that his employor was an agent, is liable to the party really assured. 108. A mercantile agent has a lien on the policy thut he is directed to effect, not only to the premlum and his commassion in the particular transaction, or extended only to advances male by hlm on account of the property assured, but ilso to the general balunce due to him, or becoming due while the policy is in his hands in his account with his princlpal. The privllege of lien ombrueing claims arising from other dis tinet transactions does not extend to the necessury, the voluntary or the grutuitous agent. A general lien is not limited to moneys actually paid by tho agent or then due to him, but embraces all his outstanding lialilities on behalf of his priucipsl arising out of his agency. 109. But a general lien, unless by u special ugreement, dues not einbrace all the existing demunds and liabilities of the ugent aga.nst his principal, but only such as relate to the business or employment in which the agent is engaged, and have grown out of the relation in that employment between him and his principal. 110. The obligation of the lien attaches ecually on all moneys recelved by him under the policy. The agent waives his lien when he vuluntarily delivers the prolicy to his princlpal or to his order, or when he parts with the possession wrungfully, as by pledging the policy us his own property. So he may waive his lien by an express or implied agreement. When the policy comes aguin into his possession, his lien is revived in ull its original extent. The lien of a mercantile agent attaches on the policy in the possession of the broker
whom he has employed to effect the fasurance. 111. The Revised Statuten of New York Ilmit the right of set-off to a defendant to whom tha demand proposed to be aet off in due in his own right, elther st the origiaal creditor and payee or as the asaignee and owner, and the provialon, If Ilterally and atrictly construed, would oxclude a aet-off by an agent in any case whatever. The courts, however, may adopt as a reasonable conetruetion, that an agent who in hls own name in a party to the contract, and has a lien on the policy and its proceeds, is to be conaldered an an original creditor, er, in judgnient of law, as the ansignee ard owner of the demand. So long as the pro-mlum-nete remaina in the hand of the underwriter, a retnrn premlum on the same policy is Ita neceasary appendage; where the return is entire, it extingulahen the nete; where it is partlal, it operatea protanto as a antlsfaction.
Of the Errtent of the Viability of the Agent.-112. The Hlability of the agent is simply to make good to hls prinelpal the actual damage that the apeclfie breach of duty with which he is charged has directly ocensloned. The llabllity of an agent arising from the inselvency of an underwriter from whom a lose wns due that he might have collected, is probably of the same nature as that of an agent under a del credere commlasion not Immedlate, but secondnry. 113. The first remedy of the principal is againat the eatate of the bankrupt, and the agent is anawerabie enly for the sum that the estate may be deficient to antlafy. And when an agent has recelved the amonnt of a losa, he is not permitted to diapute the title of his principal, his doty is to pay over the monoys he receiven. 114. Te fix the liability of the agent an netnal damage resulting to his principal, mast be proved. Where an agent, from his neglect to lisure, has rendered himself liable as an insurer, he is entitled to avail himself of every defense whleh, had the necensary Insurance been made, inight have been urged by the underwriters themselves, 115. The liability of the agent is not in all cases determined, even where it appears that the princlpai had parted with all his Interest in the subject to be insured prevlons to the happening of the loss. The Ilability of an agent is not in nill cases in lie limited to the amin that his prinelpal would have s.sen entltled to claim as an ludemnity from the underwriters had an insurance heen properly effected. Where the prinelpal has heen defeated in mn action againat the underwriters on the policy, owing to the breach of duty of the agent, the costs and expensen are chargeahle to the agent. 116. An agent acting under a tel credere commission is ilable only as a surety for the ultimate soiveney of the party with whom he contracts for his pritucipal. A del credere agent has no immediate remedy agninst the tinderwriter. When the pollicy ls effected in the name of the del crolere agent, the may maintain an action In his own name on the poliey itself, but not when hla own name is not on the fuce of the policy. A dei eredere commission in not within the statite of frauds. See Drl Chesprar.

Of Insuraaces by an Agent of the Underuriters.117. The anthority of the agent to sign a polidy may be proved by his lubit of snbscribing policies on lie. half of the defendant, although sueh proof is incomplete unless it embraces some jositive act of the defendant amounting to a recognition of the anthority. Whem the agent subserlbes the policy In his own name and omits that of his princlpal, he lireonnes responsible. 118. An agent whose original anthority to sign the policy as auch has been proved or admitted, has an implied authority to perform every sulwequent act on behalf of his princlpal ; and this implied nuthority extends to the alljutment of a loss, the acceptance of an abandomment, and the payment of a loss. An Insurance broker is not the ngent of the underwriter to admit or to bay a losa; and if such a payment is made by him, it is regarded as purely voluntary.
119. Agents of insurance companioe in the United States are rasually intrusted with an authority nut merely to tranamlt appilcetions, but, under certain reatrictlons, to perfoct insurances in the namu and on the behalf of their constituenta. If the restrictions to which the agent is aubject in the oxercise of his authority are private and confidential in tholr nature, their exiatence as between the prinelpal and his agent is not permitted to be alleged. So far as the rights of third persona are concernad, unlesa diselosed, they are inoperative and vold. The ontenaibie or apparent anthority of a general agent is his real autherity ln reapect to all who deal with him in ignoranee and yood faith. It is the custom of the underwriters at Lloyd's and of the principal insurance companies in the United States, to appoint agents in nearly all the ports of the world, but the powers of these agents are circumacribed by very nartow simits. Thay can not bind their employers by any positive net so as to create a llability to the ansured that would not otherwlae exiat, nor are the acta which they are authorized to perform of auch a nature $a^{*}$ to milalead the pulilic as to the real extent of their authority. When a queation arises as to the valldity of their scts, it is aolely by a reference to their written instructions that It must be determined.

Of Concealment,-120. Each is lound to communicate to the other all fucts within his pereonal knowledge that tend to show the true character and value of the risks that are meant to be covered, and each, in hle own communication to the other, le lound to atate the exact and the whole truth in relation to the facts that he represents, or, upon inquiry, diseloses. A mis representation or conceaiment of material facts, whether it resulted from deaign or from ignorance, mlstake or inadvertence, vitlates that mutual consent essentlal to its validity. 121. The materlality of facts cencealed or misrepresented is not to be determined by the ovent, but reaults solely from their probsbio liffuence on the estimated value of the risks at the time thay were assured. The question is not whether the loss that is clalmed is attributable in any degree to the risks that were concealed, but whether, had the facts been known, the underwriter woulh have subscribed the pollicy or would have Ilmited himself to the premium that he received. The obligation of a frank and full discloaure attaches equally upon both the partien, the underwriter ne well as the assured.

Facts that the Assured is bound to disclose.-122. It is the duty of the assured to communicate all fucts that are material te the risks, and which are not known, or presumed to be known, to the underwriter. The assured is bonnd to disclose all the intelligence that ha has received, and all the information that he possesser, that relate to facts whieh are material to the risks, although the information may be of a doultful charucter, nnd may ultmately prove to be untruc. 123. So if the Intelligence received by the assured relates not to a fact, but to mere expectation or helief of the person from whom it was received, if the expectation refors to an event that, had it orcured, weafd the material to the risks, it must be communicated; nor will the aupression he excused by evidence that the expectation, although entertained and expressed in good faith, was not renlized in the event. When it is certain, however, that the assured acted with an entire gool faith, circumstances not disclosed by him axe not to be deemed material simply on the ground that if communieated they might have excited a muspicion of danger in the mind of the insurer. 124. The assured will not he allowed to protect himself against the charge of an unitue concealment by avidence that he had dischosed to the underwriter, in general teras, the information that he possessed. Where his own information is specille, it must be commanicatel in the terms in which it was received. The information possessed by the assured may not be material in itself.

separately considered, yet may be of such a character that it would probably lead to further inquiries on the part of the underwriter 1 and if the reauit of the inquiry would ahow the information to be material, it must be commanicated. Ite conceaiment, whether fraudulent or innocent, will vitiate the insurance. 125. When the Insarance la " on ahip or ehips," omisfion to disclose the name will not aveld the policy unless the concealment was rendered material by other facts. The voluntary ignorance of the assured, whether the result of fraud or of grose negligence, will not be allowed to excuse him, but as evidence of a concealment vitlating the policy, will have the same effect as his actual knowledge. 126. Where the assured employs an agent to effect the policy, it is his duty to communicate through him all the facts that are requisite to be disclosed. The duty of the principal to the same whether the authorlty of the agent be general or special. The concealment of a loas by an agent who is bound to give the intelligence, violates the implied understanding on which the contract is fonnded, as a similar concealment by the principal. Concealment of material facts when the pollicy is altered, renders the pelicy void. 127. Where an underwriter aeeks to protect himself bj a re-assurance, he is bound to communicate not only all the representations made to himself when he auliscribed the pelicy, but ali the knowledge and information he had subsequently acquired. In England and in the United States the knowlelge of the asaured, or of his agent, is never presumed, but mast be estabilshed, in all ceses, by positive evidence. 128. The information usually necessary to be given, may be distributed under the following general heads: 1 . The atate and condition of the ship or property insured. 2. The nature and extent of the interest insured; and, lastly, the extraordinary perilg arising from extrome causes to which the property has been or will probably be exposed. The assured is not bound, in the first instance, to make any representation as to the condition of the ship at the commencement of the risks to which the poilicy relates. 120. Aithough not by the terms of the contract, yet in julgment of the law, stipulates that the vensel was or ahali be seaworthy, and it is on the truth of this inplied atipulation, and not of any representation of the assured, that the underwriter relies, nul the policy is founded. Hence, a policy, where the ship is unseawortly, and the fact is known to, and suppressed by the assared, is conclusive evidence of a meditated fraul. The same disclosures must be male by the s. sured if any fatis are known to him which would justifys reasonable suspicion of the honesty of the naster. As the warranty of senworthiness relates solely to tiecendition of the ship at the commencement of the risks that are covered by the pelicy, if the assured has receivel any advlces relating to the state and condition of the ship since the commencement of the royage insured, he is bound to communieate them. 130. Condition ahl quality of the gools. When no inquiry is made by tin underwriter, the assured is not bound to disciose the state and condition of the goods when shipped, nor where the insurance is on goods generaliy;, is he hound to digelose, in the first instance, the particular character and description of the goods that are meant to be covered. (Goods lushed on deck are not at the risk of the underwriter. Whether they were insured in special or general terms, they are not protected uoiess the fact that they are thus transported is stated in the pelicy, or unless the mole of transportfing is sanctioned by a usage of trade, the existence of which the underwriter is bound to know. When goods iaden, or to be laden, are insured in a time poliey, such a discosure is not necessary to he made. The same when the insurance is on successive cargees on a traling voyage to successive ports, the choice of the jurt at the discretion of the assured.

Tite or Intereat of tho Asoured.-131. The assared If not bound to commnnicate to the underwriters the partienfar mature of his intereat in the property insured ; but in neme cases, as when the insurance is on froight, botton. $\mathbf{y}$, respondentla, etc., the nature of his intereet mast be apecifled in the poiicy, and in others, Ite discloaure to the underwriter io necessary, in order that the torms of the policy may be construed to emhrace it. The deeisions on this subject in the American courts are very conflicting. 182. When lettermarques are intended to be used, altheugh for the limited purpose of ohasing and eapturing vessels that may be met in the coarse of the voyage, it must be disclosed. 183. Information of the fact, or of the day of sailing, although known to the asaured, is not in all cases to be given to the insurer. When the ship is known te have performed a part of the voyage innured, ohe may not be out of time when the policy is effected in reference to the whole voyage, yet may be $s 0$ in reference to the accomplished portion; and, in such a case, it is the duty of the assared to communicate not merely the original time of saillng, but all the information he had received relative to the course and progress of the voyage. 134. However matertai may be the facta known to the assured, it is plainly unnecessary to communicste them to the insurer, if they are in fact already known to him. Proof, therefore, of the actual knowledge of the unterwriter is in all cases a complete answer to a charge of concealment. The assured ia not bound to make any communication in the first Instance respecting facts which the underwriter ought to know, and of which, for this reasen, the law imputes to him the actual knowledge. The presumption of law in the cases comprehended in this rule, is conclusive and absolute. The insurer is bound to know all the general causes that are open to his inquiry, that may by their operation affect either the political or natural perils that are intended to be covered by the policy. 135. The political peris usually covered ty the policy, are the risks of capture, seizure, anll detention; therefore the assurer is bound to know the general and publio facts upon which a loss arising from such risks may occur. 136. The natural perils of a policy are such as wholly anise from physical canses, and in a limited, but not in an unusual sense of the words, are aptly deueminated "perils of the sea," or "sea risks." The underwriter is bound to know all the general causes by which they may be occusioned, increased, or varied. The nsages of trade are equally presumed to be known to the underwriter. In all these casea the presumption of knowledge attaches equally upon both parties. 137. To fix the presumption of knowled ge upon the underwriters, it is the duty of the assured to communicate all the circumstances within his personal knowledge that are necessary to be known to enable the underwriter to apply the presumption to the particnlar riska that are meant to he covered. The assured is not bound to communicate material facts if the underwriter espressly or implicdly waives the information. 138, Where, from the facts communicated to the underwriter, he is bound to infer the existence of other facts not disclosed, his omission to make the inquiry is an implied waiver of a more explicit disclosure. The underwriter, by the nature und terms of the contract, may waive nll spe"lat information as to the actual and probable existence of the particuiar risk that he agrees to assume. When he thas consents to assime the risk in its most aggravated form, he can not justly complain that facts showing that such was its real extent were not disclosed to him. 139. The assured is not bound in the Hirst instance to communicate any facts that are covered hy a warranty express or implied. Ife is not bound in the first inatance to communicate thets that are ouly material. as slowing the existence of a risk which is excepted from the policy. He is not bound to communicato fucts that tend to diminish the risks
as they would atherwise be anderstood by the insurer. 140. The insurer has the right, apon inquiry, to the inf med of all facta within the kaowledgs of the act is .i, that in the exercise of hin own judgment ha may deem material to the risks, or important to be known, an a guide to hin own discretion. ti Where the ineurer is not to be charged with un equal knowiedge, the assured, oither without, or upon inquiry, is bound to communieata all the facta, that his knowledge or information ombraces, that are materiai to the riskn, or may be deened material hy the inonrer, but he is not bound to communicate his own conclusions from the facta that he muat diaclose. 141. The following are casen in which the effect of a concealment is not to vitiate the entlre contract, but merely to exonorate the insurer from a loss resulting from the risk concealed: 1st. National character of the Inaured. 26. Liability of the property insured to capture and detention. 8d. Liability to selaure from breach of foreigr lawa of trade. 4th. Want of neccmary documents. 5th and lastly, the use of false or inmulated pepers.

National Character of ihs Asoured-142. Where the insurance is made in a noutral country, a full dieclonure of the national character of the assured in the firat instance is necesaary, not to give validity to the contract, but to cover the rink, so as to charge the underwriter with a resulting loss. The assured may be the subject of a nentral State, and legal owner of the pi-perty insured, yet, wat equitabie intorent, rendering the property liable to hontile eaptare, may be vested in a belligerent aubject. As ouch an interest creates a risk not contemplated by the parties, it must be disclosed. 143. Even when the policy contalns a warranty of noutrality, and describes the assured by general words, facts not disproving the warranty, yet showing that the property is liable to seizure as enemy'm property, are necessary to be diaclosed. 144. Linbility of property to captare or detention: The voyage or trade to which the Insurance relates may be interilicted by the law of nations, by the apecial provisions of a treaty, or by an najast orilnance or decree of the belligerent power, or by arbitrary rules or decisions that prevail in the courts of prize. 140. Where tho voyage or trade on which the insurance rolates, is prohibited by the municipal laws of the foreign country to which the ship is destined, or where the risks are to conmence, a concealnent of such an oxtraordinary risk discharges the insurer from a consequent loss, without affecting in other respects the validity of the contract. 14 t i. The rules that determine the validity of an insurance, embracing the risks of an illicit trade, or trade in violation of the municinal lawa of a foreign country, are sulestantially the same as in respect to an insurance on goods contrabend of war.

Of Representations, - 147. A representation is $n$ statement of facts, circumstancer, or information tendIng to increase or diminish the risks, an they would otherwise be considered made, prir F to the execution of the policy by the assured or his agent, to the in surer, in order to guide his judgment in forming a junt estimate of the risks he is desired to assumo. It is unually made by parole, or by a writing not inserted in the policy: but when the intention as to the conatruction is anfficiently declared, may be expressed in the policy. 14s. liepresentations relate either, Jat, to facts; 2d, to the information ; or, lastly, to the intentions, expectations, or beliefs of the assured. A reprementation of facts is a positive representation, which is divided into affirmative and prominsory : when affirmative, they assert the jast or present exiatence of the facts to which they relate; when promissory, that the specilled event will happen, or act be performed. 149. The evidence of a posltive reprementation of facta, may properiy be recelved in all canes. The rules of ovidence in respect to the almiesibility of a representaLion, are substantially the same as in respect to a
usage i and, in many casoa, the representation, when proved, becomea, llke the usaçe, a part of the contract. The words of the representation are to be atrictiy and literally construed, but are to be underatood in their plain and obvious meaning, in that whieh It in meat probeble they were suggested to the mind of the inaurer. It will be construed to embrace all the facts the existence of which, from the tetms used, wouli remeonably and probably be lnforred. 150. When a representation is soambiguoun in Ita terms, that it may be understood with equal propriety in two different sensea, it is the duty of the insurer to seek an explunation; and when auch a repreaentation is understovd ly him in a mense different from that intended by the assured if he had omitted to inquire, he will not be permitted to aver its falsity. A representation of future facta, although positive in its terms, may in some cases be justly interpreted, not as an undertaking for the truth of the facta, but as referring solely to the expectation or bellef of the party. When a represent ation of future facts is incensistent with the terms of the policy, it lis not to be rejocted. The policy remains the sole evldence of the agreement; but the repre aentation may be operative, by construlng it to refer to the intentions of the assured at the time of making it. 151. The words of a representation must be constrined in reference to the usages of trado, of in their technical and commercial sense. A representation may supersede a unage and an implied warranty. Where there are aevoral underwriters on the amme policy, a repreaentation to the first is conatrued to extend to all so that each, when it provea to be false, may avai himself of the defense. This rule Is strictly confined to the cases in which the reprementation is made to the unlerwriter whose name stande first on the policy, The terms of the rule are restricted to underwriters on the same policy, and it is confined to cases in which the representation to the first underwriter was favoralle to the risk, and to auch cases the rule exclusively applies. 152. Where the subscription of the first underwriter is obtained under a secret agreeinent that it is not to be binding, and for the sole purpose of decoying others to insure, the exhibition of the policy thus sutacribed is the assertion of a falsebool, and the contract ls void. A representation once made is blinding on the party; unless it la altered or withlrawn liefore the insurance is effected. The completion of the policy is therefure the time to which the representation is construed to refer. 153. A representation, to be binding, must bo material, sui, to discharge the insurer, must be false whelly or partially, and, according to the character of the representation, false in far or in the event. It is not necessary that the facts ref. sianted should be material to the risk, that is, shruld affect or change the value of the risk, considered in themselves. the materiality required is not alosolute, but relative, and its test is the actual or probable influence of the facts represeuted on the unind of the insurer. In julgment of law a representation is false whell it fails to corre apond with the facts that it aflimas or stipulates; and bence its falsity is either intentional or ascidental. 154. When the representation, whether aflirmative or promissory, la made with an intent to deceive, the fraud in all cases vitiates the contract; nor to produce this effect is it repuisite that the falsity meuld be catire: partial falsity, when intentional, is equally a frand ; and an insuiry into the materiality of the charge, as affecting the character and value of the riskn, would never bo allowed. 155. When the falsity of the representation is accidental, its effect upon the contract will depend, ilrat, upon the nature and extent, and next upon the period of time to which it is to be reforred. The falsity of the representation, when cutire, in all cases discharges the insurer; but such is nut its necessary consequence when it is only literal or partial. The substantial falsity of a representation, in cases exempt from fruad, does not always render the con-
tract wholly when made, or Is the necess tached, and th quent event, force, render t the assured ho tesires to repr by a positive a ation by a.klin of others, ur ma tent to the ins furmation in e dile for the act embruces, nor. clasions that t be different if $t$ the assured wl 137. The assur dicel by a false the asaured, or intenis to pur acts favoratile change the inte ation is mude fraul vitiatea ing the insuran of his prinelpal, ing of a fact or juks, the effeet on its just inter resentation of a the character of ject, that such

The righ tual facts at the
tract wholly vold. When the reprementation is false when made, or at the commencement of the riaks, auch is the necessary effect, but when tha policy has attached, and the representation is falslfied by a oubanquent event, the hreach does not, by a retro-active force, reuder the pelley voil in its origin. 156. When the assured has no personal knowlenge of the facts he desires to reprenent, and is unwilling to bind himaelf by a poaitive statement, he may qualify the representation by abling, that it lis made from the information of others, or may nubmit the information in ite whole extent to the insurer. When the assured submitn the informution In extense to the insurers, he is not answershle for the actual or eventual truth of the fuets that it enbraces, nor, in any case, for the accuracy of the conclasions that the insurers may iraw frein it. It would be different if the information proceeds from an agent of the assured whose duty it is to give the intelligence. 137. The assured is responsible when the pollcy in indsced by a false representation of his own agent. Where the assured, or his aggent in his name, dectares that he latends to pursue a certain course, or perform certwin acte favorabie ti: the rlaks, be has entire liberty to change the intentions'so declared ; bat if the representation is made with an actual lntent to decejve, the fraud vitiates the contract. Where the party eeekiag the Inaurance declares hls own expectation, or that of his principal, in regard to the existeuce or happeniag of a fact or event that, if true, would diminish the risks, the effect of the representation must depend upon ite just interpretation. The aane will be tor a representation of a belief of a material fact. It is from the character of the party, and his relation to the subject, that such representation acquiren ntrength.
Of the Right and Duties of the Insured in cate of Loss. Section I.-Of Abandonment,-158. A total lose, within the meaning of the policy, may arise either ly the total dentruction of the thing insured, or, If it specitically remains, by such damage to it as renders it of littha or no value. A loss is anid to be total if the voyage be entirely lost or defeated, or not worth pursuing, and the projected adventure frustratel. It is a conatructive total lows if the thing insured, thongh existing in fact, is lost for any useful purpose to the owner. In such cases the insured may abandon all his interest in the subject insured, and all hla hopes of recovery to the insurer, and call upon him to pay ns for a total loss. 159. In eases of abandonment the insurer stands in place of the insured, and takes the sulyject to hinself, with all the chances of recovery and indemnity. A valid abandonment hua is retrospective effect, and does of itself, and without any deed of cession, transfer the right of property to the insurer, to the extent of the insurance ; and if, after an abandonment duly male and accepted, the ship should be recovered and proceed and make a prosperous voyage, the insurer as owner would reap the protit. 160 . As soon as the insured is informed of the loss be ought (after being allowed a reasonable time to inspect the cargo, and for no other parpose), to determine promptly whether he will or will not abandon; and he can not lie hy and speculate on events. If he elects to abandon, he must to it in a reasonable the, and give notice promptly to the insurer of his determination, otherwise he will he deemed to have waived his right to atoanion, and will be entithed to recover only for a partial loss, unless the loss be in fact absolutely total. If the thing jusured exist in specie, and the insured wishes to go for a total loss, an abandonment is indispensable. The maln general doctrines respecting abandonment being entirely incorporated into the English law, it would be useless to insert them at leagth. 161. An abondonment once rightfully male is bluding and conclusive between the partles, and the rights flowing from it become vested rights, and are not to be divested by subsequent events. The right to abandon is to be tested by the actual facts ut the time of the abondonment, and not up-
on the atate of the information recelved. Upon a valld ahaadonment, the master becomes the agent of the insurer, and the Insured is net bound by hils nubsequent acts, unless he adopts them. 162. It is the same thing with the asaignee of the carge. On an accepted abanilenment of the ahip, the freight eamed previous to the disaster is to be retained by the owner or his representative, the Insarer of the freight, and apportioned pro rata itineria, and the frojght subsequently to be earned goes to the insurer on the shlp.
Section II. Of the Adjustment of Partial Losses.163. In an open polley, the actual or market value of the aubject Insured is to be estimated at the time of the commencement of the riak. 164. There are two kinds of indemnity that may lawfully be obtained under a contruet of insurance. The tirst is to pay what the goode would have sold for if they had reached the place of their destination; and the value there consist of the prime cost and expenses of the outfit, the freight and expenses at the port of delivery, and the proft or loss arising from the state of the market. This puts the insured in the same situntion as if ne loss had happened. The other kind of indemnity is t ay only the first cost of the goods and the expenses incurred; and this places the insured in the sltuation he wan before he undertook the adventure. 163. The actual or market value at the port of departure may frequently be different from the invoice price or prine cost, and when that happens, or can be necertained, it is to be preferred. 166. If goots arrive damaged at the place of destination, the way to ascertain the quantity of damage, either in open or valued policies, is to compare the market price or grose amount at which the same goodn would have sold if sound. There is a material difference between the adjuatment of a partial loss and of a general average, since the former is adjusted according to the value at the time and place of departure of the vessel, and the latter accoriling to the value at the forejgn port. 167. In settling losses under the memoranlum in the policy which declares articles free of average under, say 4 per ceat., if a partial lose to an article be found on survey and sale to have been 5 per eent., the insurer pays the damages and the expenses. If under 5 per cent., he pays nothing, and the insurer bears the expenses. The expenses are like coats of suit, and fall upon the losing party. The expensea are not taken to make up the 5 per cent. 168. With respect to leakage, the rule in canes free from special stlpulations is, that the insurer is not liable for waste occasioned by ordinary leakuge, and only for leakage beyond the orlinary waste and produced by eome extraordinary accident. The practice is to ascertain in each case what amount of leakege is to be attributed to orlinary cases, or the fault of the insured, or bad stowage, and what to the perils of the sea; and, in pursuing his inquiry, the season of the year, the uature of the articles, the ileseription of the vessel, the leagth of the voyage, and the stowage, are all to be considered. 169. An aljustment of a loes ean not be cet aside or opened except on the ground of fruut or mistake of facts not known. In making the adjustment in the case of a partial loss, the rule is to apply the old materials toward the puyment of the new, and a deduction of one third new for old is made whether the vessel be new or old. 170. The insurer is liable for all the labor and expenses attendant upon an accident which forces the vessel into port to be repaired; and in consequence of the general permission in the policy for the insured to labor for the recovery of the property, the insurer may be rendered liathe for the expenses Incurred in the attempt to recover the lost property in addition to the payment of a total loss.
tff the Return of Premium.-171. The preninm paid by the insured is in consideration of the risk which the insurer assumes, and if the contract of insurance be void ab iuitio, or the risk has not been comurnecd,
the insured is entitled te a return of premium，If the Inaurance be maile without any interest whateoever in the thing lisured，and this proceeds through mistake， mialnformation，or any other innocent cuuse，the pre－ mium la to be returned．So if the insurance be made with shert interest，or for mere than the real inter 3 st， there is to be a ratable return of preminm，If the risk has not been rur the premium must be returnod． 172．If the interest hus not heen run，whether it be owing to the fuult，plensure，or will of the insured，or to any other eause，the premium most be return＇for the consideratlon for which it was given faila．173．If the versel never sailed on the voyage insured，or thr poliey became veid hy a failure of the warranty，and without frand，the policy never attaches；but if the risk has once commenced，though the voyago bo ins－ medtately thereafter abandoned，there is no return or apportionment of premium．17．4．Anil if the premiom is to be returned，the insurer retains $\frac{1}{\frac{1}{2}}$ per eent．by way of Indemnity for his trouble and concem in the transuction．175．The Insurer retains the premium in all cases of ectual fraud on the part of the insured or his agent．So if the trade be in ony respoet illegal， the premium can nut be reelaimed．If the voyago be divisible，there may be min apportionment of the pre－ mium，but not unless the risk were divisible and dis－ tinct in the poliey．If the roynge and preminm be entire，there can be no apportionnent．It is requisite that the roynge，liy the usage of trule or the agreo－ ment of the parties，be divisible into distinct risks ； and，in that case，if no risk has heen run as to one part，there may be an spportionment of preminm．－ See Duen on Sifarine lisurance．

Losses of the Boston Stoch Insurance Companies．－ According to the annual report of the heurance com－ missioners，the following were the issues of the verious stock insurance companies of Boaton for the year end－ ing November 1， $1 \times 5 \mathbf{0}$ ：

As the fruit a cubject was brot
casioned by fire in Great Britain, that some means should not have been adopted at an earlier period to render such cnlamities less rulnoas to individuals, particularly whon a plan, which appears oventally to have formed the basls of the present insurance companles, was suggested so carly aa 1609.

In that yenr, a person proposed to Count Antheny Guuther von Oldenhirg, that, as n new species of finance, he sheuld Insure the houses of all his subjects ugainst fire, on their paylng so much per cent. annually, according to their value; but the prospect of gain so tempting to most persons, couli not indtuce the Connt to ndept the plan. He thought it goed if n company was formed of indivituats to insure each others' houses, hot he doubted that it could by him he "honorably, justly, and irreproachfully instituted without tempting Provldence-without incurring; the censure of nelghborf, and without disgracing one's name sul diguity," mhling that "Gol had withont such means proserved and blessed, for many centuries, tho ancient house of Oldenburg, and tie would still be present with him through his nercy, and protect his suhjects from destructive fires." This plan appears not to have bean sgain thought of until the the of 1666 had laid the city of London in ushes.

In consequence of this calamitous event, the citizens began to see tho importance, and indeel necessity, of erecting their buildings of a material less susceptible of fire than hitherto; also of ndopting a regular system of precmation against future necilenta, as woll as of devising some scheme for mutual pecuniary protection and relief. Varlous proposials were accordingly submitted te the Court of Common Council of the elty of Lendon, hetween 1669 and 1680 , for the mutul relief of such as might lave their houses destrovel by tire-the most notatble mad acceptatile of which was by one of their own lualy, Mr. Beputy liewbold. llint if we may julge fron the length of time that elapsed are the worshipful committee mule their report to the eourt, wo whould concluile the adopting of the propoan to lave been attembel with serions diffirulties, and in veritiention of the old proveth that "delays ure dangerous," during the period between the trist presentation of Mr. Newboli's proposals to the lord Mayor, nud the tinal repurt of the committee, to whom the matter was refirred by the Court of Common Council, several private indiviluals assucinted themselves together, and suhmitted to the ghal citizens of Lombon in "leslgn for lusuring houses from liro," and on the Itilh Septeminer, 16isi, a notive of adrertisement was issued from their "other, on the back side of the Royal Eirchatgr," offering to lusure hrick houses agninst tire for sidpenfe, and timber houses for terverpence in the punnd-beling at the rate of 52 lis. preme for the brick houses, anil of Lis per cent. for timber.

Suhserpnitly, on the Iith thetober, 16 N 1 , the Court of Com won Councll did " urrea and resolve to umbertake $y^{e}$ iusuring ull honses within this rity and hibertyes from fire, and exorute yer wan with all exporticom," aul therenfter "resolvel forthwith to elliage a sultivint fumb, ond undoubted seourity by the chamber of lomdow, in lands and gionl gromid rents, tor the performance thereof." Much amosing pamplitetering and advertiving in the riazefte took phato betwern the alroastes of the corperation selieme, unt the "interested" in die sate insurame oflle on tha back site of the loyal Exchemge.

The juurnals of the court of Common tomucil in lisk, 16w, amd 16x:t, pocont the signing of many poticles, and heme amming ovidence of the reat abil pros dence of the tiro insuranco committees in proumigating the benefits of tho vorporation acheme, and combating the untagenistic punphlets lasued by their computitors.

It the frult of this pmiphleteering agitation, the sulgect was brought under tho most acrieus considera-
tion of the court on the 13th November, 1682, as appears by a mhute of that date; when the court evinced a much greuter anxiety to relhnquish than they hat to undertake the design, and directed the discharge of existing contracts, with the prepayment of the woney which hul been advanced.

Notwithstanding this resolutlen, hewever, centaincd in the foregoing minute, we tind several policies subsequently passed the commouseal, on the Gth March and 3d May, 1688.
After this, the city discontinued issuing policies, and having had a quo varranto brought ngainst their clarter, every oxertion was used te olituin as surrender of the existing policies, and thus relense the city lands from the licumbrances thereon.

The last mutter taken into consideration, was the petition of Mr. Newbold, tho author of the design which turned out so unsaccessful for remunerution, for the time, trouble, and expense he had been at, which was referred to a committee whor reported on tho 13th Octoher, 1696, and on the 8th Decembor following it was "resolved to give lim the benefit of making two persons free of this citie by redemp.con, paying to Mr. Chamberl, in to the citie's use of forticsix shillings eight pence a-piece, tho suid persons to bo tirst presented and allowed of lyy this court." This was the fate of' the "City's Dosign and Undertaking for the insuring of Houses from the ovil of Fire." The " interensed" in the rival oflice became, of course, greatly elnted, and their success led to tho formation of several othor companies ar mutual insurance societies, for protection against fire.

In 1696, the Hurul-in-Hand Fire Office was established lyy ubout 100 persons, who ufterwurds formed " deed of settlement, enrolled in Chancery humary $2.1,1698$. This ollico is remarkabio at the present dhy for its afe, and is tho only surviring one of those of that period.

Up to the year 1706, tho protection afforded by fire insurance secicties was limited entirely to houses (buildings), hat in that year the Sun Fire Office was prujected by one Charles l'ovey, for insuring merchamthese and honsehold goods (as well as houses) from tire, and was tho tirst oflice to extend the beneflts of insurance beyond the contines of London. This office has for very many years stood first on the list in amount of binsiness.
'There is also a stamp duty of $1 N_{,}$on each policy.
Ity ar the preater number of the above are jointstock compunies, who hasure at their own risk and for their own protit, and are represented by agents in all the principal towne of the kingilom; the remuinder aro johnt-contribution, or mutuni insurance societiea, in which every insurer purticipates in the profit or loss of the concorn.- $\mathbf{E}, \mathbf{B}$.

Proctice of Pire lustrunce.-The advantages of fire insurance aro too well knowin to require any very elaborato leseription. A manufacturer or privato indivitlwal can, by the payment of an manal sum (premiam) piroportioned to the risk, secure himself agninst loss in the ovent of his manufactery or dwelling-house, or their co .ents, lieimg destroyed by tire.

The latw of Fire Insurance in the C'mited Statest? the usual sulject and firm of this insurumot.-Wo have seen that tire is one of tho perils insured against by tho common marino policies. It is usunl, however, (t) insure building und pramal property which is not to bo whter berne, agninst lire mone ; mid this ls what is comamonly cuthel fire insurunce. The general purproses and principhos of thas kial of insurance are the same an those of the marine insurance; and the law in renpert to it differs only in thoae renpects and in that dogree in which the ditherenco ia mado necessary by the subject-mutter of the contract. It will be proper, themfore, to contine ourselves in this chapter, mainly the the statement of these ilifiorences amil to consider those general principles which have already
been dlscussed，only so far as this may be necessary for the comprebension or illustration of the pecullari－ tles which belong to fire insurance．This kind of in－ surance is sometimes mado to indemnify ngainst loas by tire，of ahipa in port；more often of warehouses， and mercantile property stored in them，still more fre－ quently of personal chattels in stores or factories，in dwelling－houses or barns，as merehandise，furniture， looks，und plate，or pictures，or llve stock．But by far the most common application of thls mode of insur－ ance is to dwellhg－houses．Like marine inourance，it may be effected by any indlividual who is capnilie of making a legal contract．In fact，however，it $f:$ al－ ways or nearly nlways in this country，and we sup－ pose clsewhere，made by companles．There aro stack companies，In which certaln persons own the capitni， and take all the profits ly way of dvidends．Or mu－ tual in which every one who is lnsured，becomes thereby a member，and the nett profts，or a certain proportion of them，are divided among all the meln－ bers in such a manner as the charter or by－laws of the company may direct．Or loth united，in which ease there is a cupital stock provided，as n permanent guar－ anty fund，over and above the premium received，and n certain part or proportion of the nett profits is paid by way of dvidend upon the fund，and the reviduo diviled among the insured．Pansoss on Contracts．
Of late years tho number of mutual fire Insurance compunies has grently ficreased in this country，and prohably hy far the largest monount of insurance ngalnst fire is effected ly them．The principal reason for this is undoubtedly their chenpnoss；the premiums required by them being in general，very much less in fact than In the etock offices．For example，if the in－ surance is effectel for seven years，which js a common period－un amount or percentage is elarged ulout the same as，or a littie more than is charged as the stock conplanies．Only a small part of this is taken in cash；for the rest a premium mate or lowd is given， promising to pay whatever part of the amount may the uceded for logses，which shall occur during the jeriod for which the note is given．More than this， therefore，the insured can not he lxuund to phy，and it frequently happens that no assessment whatever is demanded；and sometimes where the eompany is well estallished，and does a large hasiness upon aound prin－ ciples，a part of the money paid ly him is refunded when the insurance expires，or credited to hime on the renewal of the policy if such be his winh．The dis－ advantage of these mutual companies is，that the pre－ mfums paici，and premium notex，constitute the whole capital or fund，out of which losses are to the paid firs． To make this more secure it is proviled by the charter of sume companien，that they shomld have a lien 川⿲亻丨⿱⿰㇒一乂口灬 the land itself on which any insured buildnges stams to the amomnt of the preminin．Llut sile this adds very minch to the trustworthiness on the promiam notes，and so to the avallability of the enpital，it is， with some persons，an oblection，that their land is thus subjected to a lien ir incumbrance．－ 1 hiorl．
There is another point of difference whish recom－ memuln the ateck rather than the mutual company．It is that the utork company will generally insure very nearly the full value of the property lesured，while the muthal companies are gaperally restrainen hy their charters from insuring more than a moderate jirupor－ tion，wamely，from one half to thrie fourths of the ansessed value of the proverty It would fullaw， therefore，that one insured ly a nutnal compuny can nut lie fubly lademnified agninst lows ly fire：nom may not ine quite so ecrtain of getting the intemulty he largaine for，ay if he were insured ly a stork company． But this last ramen is，pract＇ally，of very little hm－ pwitance，and the lownews of the firemiuns effertmally overcomes the other．The methen and cperation of fire finurance have become quite unlform throughout the couniry，and any company may appeal to the
usage of other companies to anawer questions which have arisen under ite own polley；only，however，with－ in certain rules，and under some well－detined restric－ tiona．In the tirst place，usage may be resorted to fur the purpose of explaining that which needs explana－ tion，but never to contradict that which is clearly expressed in tho contract．And no usage can be ad－ mitted，even to explain a contract，unleas the usage be so well established and so well known，that it may reasonably be supposed that the parties cntered into the contract with reference to it．Thus if under a policy against fire on a vessel in one part of this coun－ try，an inquiry is raised as to the local usage，the policy is not to be affectod by proof of usage upor any particular matter In other parts of the world，or even of the United States．Anil not only the terms of the contract must be duly regarded，bint thoas of the char－ ter；thus if this proviloos that＂all pollcies and other iustruments made and algned lyy the preaident or other ollicer of the company，shall bind the company，＂an agrcement to cancel the policy should be signed：al though it can not be doubted thent a party insured might otherwise give up hls policy，or renounce all clam under it，and that $n$ valid agreement to that effect hetween him and the company vould not be set aside for lis benetit，on the ground of a nercly furmal defect．－Ibid．
In regard to the execution of a fire policy，and what is necessary to constitute such execution－as，for ex－ ample，whether delivery is necessary or a signed mom－ orandum be smbicient，or indeed un oral bargain only， and whether this insurance may be effected toy eorre－ pondence，and if when the proposition and assent ${ }^{2}$（onn－ plete the contract－we are not aware of any material ditierence on any of these points，letween the law of fire insurance and that which has already been pre－ sented as applicable to marine．It has been heli in an uction on a fire pelicy，as doubtless it would le ou a marine poliey，that a memorandum made on the ap－ plication hook of the company by the president，and sigued liy him，was not binding，when the party to he insured wished the policy to be delayed unth a ditfer－ ent aljustment of the terms could be settled，and after wome delay，was notilied by the company to call and settle tho busluens，or the company would not he bound，and he did not call；becune there was here no convummated agreoment．So，tov，a subsequent adop－ tion or ratilleation is equivalent，either in a tire or marine policy，to the making originally of the con－ tract ；with this limitation，however，that mo party can by his adoption，securu to himself tha benetit of a polley，if it had not been litemded that his interest shoolil le embraced withlu it．It is quite commun to desuritue the insured in marine jolicies，by general ex－ pressionsmas，＂for whom it may concern，＂or，＂lor owners＂or the like；but such himghage is selhom if ever used in tire policien，the insured being apectically： named in them，－llid．

It may lee remarked，that the effecting of a tire in－ surance is not so often done through the apurys of a broker，as that of marine insurance；nor in it mo usiall to pay nothing down，lut to ghe a note for the whole preminn．If，howerer，the insurance rompany has an express mile to that effect，it may be waisel；and this walver may lee expresa or implied，from the condurt if oflicers of the company who have the right to at for it ；and their nimisnlons bind the company，－thed．

On the Interest of the Insured．－As to what interest in the hasured is anticient to support an insurance，the principle is the same in lire as in marine insurance． Any logal interest is sulficient；and if it he mpitalle in the mense that in court of equity will recugnize and frotect it，that lasufficient ；but a merely moral or ex． pectant listerest is not enough．Hence，one who has only made an oral hargain with another to purchase his house，can not insure it；but if there be a valid contract ln law，or if by writing，or by part perform－
snce，it is insure．So the breach o terms，If the and enforce property to in it antil th sold．This property wou the assignor； where thia wo there had be nud n new tri Ibid．
Of Reinsur fire policies a governed by insurance，not merely inleal erty originall an insurable with no othe used instead o force．If，for requires n cort circumstances， insured．But the party first transmit the ea that is enough liminary proof， insurer who olt cate（in ndditio one asking insu cerning the chn and a materlal the poliey－Il of thouble In sometimes confo different．By comes again ins insurer is insur iosuret has no ley．If，by n d tect himself ov many Indemnjtl mitted，not only ciples of insura fraud，and make viated in two $n$ fnsurance as ope the property insi then，as soon as the lirst or by a ance has no effi the second insur then only as mu insurances，as o videnl ratably an are considered as： fore，any une ins tion，may claims liahle．－I lid．
in this eonutr and exact proy somewhat ；lut， insurance must on the perlicy ； ollice shall，in th of a less：and it shrance be not shall not recover that Nuch a conti 4 jirior linsurane if subliciont notic Hat lt has been h to the ugent of
ance, it is enforceable in eqnity, the purchsser may insure. So he may, although there the a stipulation, the braach of which has made the contract void by its terms, if the other party might waive the condition nud enforce the contracts. So if a debter assign his property to pay his debts, he has an insurable interest in it until the debts are paid, or until the property be sold. This wns se held where it appeared that the property would pay the delits, and lenve a surplus for the assigner; but wo should expect the same ruling where this was not the ease, although, in this instance, there hat been proviously $n$ verdict for the plaintiff, and a new trial for want of evidence of such surplus.Ibid.
t)f Reinsurance.-Reinsurance is equally lawful in fire policies na in marine polielea, and in general is geverned by the same rules. The reinsurance is an insurance, not of the risk of the insured, for that is n merely ideal thing, but it is an insurance of the property originally insured, in which the first insurers have an insurable interest. If a commen policy be used, with ne other chango than the word reinsurance used instead of insurance, all its requirements are in force. If, for examjle, In ense of loss, this prejerty requires a certifleate from a magistrate, ns to character, citcumstances, etc., that must be furnished by the reinsured. But if a suitable certificate were given by the party first insured to the original insurer, and he transmit the same forthwith to these who insure him, that is enongh; and 80 it would ba with notice, preliminary proof, and all similar requirements. Aud an insurer who obtsins reinsurance, is bound to conmmunicate (in addition to whatever else shomld be stuted by ene naking insurance), all the information he has concerning the character of the party originally insured; and a matcrial concealment on this point would avoid the policy.-Ilid., page 516 .
(ff louble Insurance.-Double insurance, although sometimes confounded with reinsurunce, is essentially different. By this, the party originally lusured becemes agnin insured; but by reinsurnnce, tho original insurer is insured, and, as we have seen, the original insurer has no interest in, and no lien upon, this policy. If, ly a double insurance, the insured ceuld proteet himsclf over and over again, he might recover many indemalties fur ons loss. This can not be permitted, not only becanse it is ojposed to the lirst princifles of insurance, but because it would tempt to fraul, and make it rery ensy. This effect may be obvhated in twe ways: one, by considering the sccond insurance as operating only on so much of the value of the property insured, as is not covered hy the lirat ; and then, as soon as the whole value is covered, whether ing the tirst or by subsequent policies, any further insurance has no effert. A second way is, by considering the second lusurance as maile jointly with the tirst; then only ad much would be paid on any less, on many insurances, as on one muly; hut this payment is divided ratably among all the insurers. All the policies are considered ns making but one policy; and therefore, my one insurer who pays more than his projortion, myy ciaim a contribution from others who were liable,-1bid.

In this comutry tire policies usually contain express and exnct provisions on this nulyect. 'They vary somewinat ; but, generally, they requiro that any other inutance must be atated iy the insured, und indorsed on the pulicy ; und it la a frequent condition, that each ofitee shall, In that cane, pay only a ratable proportion of a lows; and it is often adhed that, if nuch otioer inssufance be not so atated nud indorsed, the insured siall not recover on the poliey; and it has been held that such a condition upplien to a subsequent as weil as a jrior iusurance. Nor will a court of equity relieve If sulliciont notice and indorsmment inave locen male. Hut it has been held that a valid notico might be given to the agent of the company, who whs authorized to
receive applications and survay property proposed for insurance.-Ibid.

Of the Risk incurred by the Insurers.-At the time of the iusurance the property must be in existence, and not on fire, and not at that moment oxposed to a dangerous fire in the immediate neighborhood, because the insurance assumes that no unusual risks exist at that time,-Ibid.

The U. S. Insurance Gazette for March contains the raport of the insurance commissioners, appointed by the comptroller to inquire into the affairs of the fire insurance companies of New York and Brookiyn. The leading features of the report sre contained in the annexed table. The examinations were made from March to December:

| Name af Company. | Value of thoudn and martgagen, | Value of loana un hlock. | Amount of $\underset{\substack{\text { annual } \\ \text { iremluma. }}}{ }$ | Amount of ru-Insurance sal dividend. |
| :---: | :---: | :---: | :---: | :---: |

Of idjustment and Loss.-Insurers against firo are not hell to pry for loss of profits, galns of husiness, or other indirect and remote consequences of a lows by tire; we du not know, however, why profits muy not Le njuecilleally innured ugalust tire, where it is nnt forbidden by, or inconsistent with, the charter of the in-
surers. There is one wide difference between the principle o adjustment of a marine polley, and of a fire polley. In the former, if a proportion only of the value is lnsured, the Insured is considered as his own losurer for the resldue, and only an equal proportion of the loss is pald. Thus, If on a shlp valued at $\$ 10,000$, $\$ 5000$ be insured, there is a loss of one half, the insurers pay only one luilf of the sum they insure, just as if some other party had insured other $\$ 5000$. But in a tire policy, the insurers pay in nll easea the whole amount whlch is loat by the fire, provided only that it does not exceed the smount which they insure. It is said tbat general average clauses or provistons are Inserted In fire policles lu England, but are not known here. Still, in one ense, the princlple of generul nvernge was applied. Blankets were used ly the assured, with the consent of the insurers, to protect the buildlng from a near fire; they did this effectually, but were themselves ninde worthless, and an action hy the insured against the insurers, for this loss, was sustained by the court.-Ibid., p. $\mathbf{0} 37$.

Life Asamance.-It is curious to olserve that life assurance, which has so favorable a bearing on our social and moral welfare, may be sald to have originaded from the study of the laws of chance, as ohserved in the experience of the gamiler. It will he remarked, howover, that the one is the very antithesis of the other. In life assurance, the individual is freed from risk by union for mutual protection with his fellowmen. The gambler takes the single riak upen himself, and his average, if he obtain it, can only arise from the duration of his play. In fart, tho man who hus the apportunlty of assuring his life, und does not do it, ls the gambler, taking the single risk upon himself.
That the one practice took its origin, however, from tho ohservation of the other, there can lo no doubt; the earliest mathematical publicatlon on probabilitles, being a little tract of Christian Huygens, written In Dutch, but afterwand trunslated Into latin, and appearing under the title "De Ratiocinlis in Lulo Alea," in the Exercitationes Geometrice of Frameis Schooten, printed at Leyden, 16:37. Two other mithematiciams, however, who preceded II uygens, rally laid the foundation of the science, although be wrute the tirst systematic treatise on the suliject. We refer to the famous Pascal, and Fermat his friend, a magistrate of the Parliament of Toulouse. llut as the hidory of the general doctrines of probabilities is given under that head, we must confine ollr remarks to the hintory of that doctrine as applied to the duratlon of life, and the progress of life computations.

It has been usual to commence the history of life contingencles with the little velume of "John Graunt, citizen of Loulon," who published observations on the hills of mortality in 1602 ; but Mr. Hendriks has given the means of more remote speculation on the subject.
The practice in the days of Herodutus was to reckon three generations equivalent to a century, and the censns of Vespaslan, as noticed In Illiny, listinguished cases of extreme longevity. Nut we do not find any thing like an observation on the suliject untll we come to the calculatlons of the Prietorian priefect, Uppianus, one of the most eminent commentators on the Justinian Code, who gave a tahle of the extimatel present worth of life annuities, with reference to the requirements of the Falcidian law, which renlered it necessary to put a value on life-rents and other similar provisions. Dlphanus, however, took no account of Interent, wo that his calculations are mora expectations of life than life annulties, and in that view Mr. Ilendriks says, "The ohd Roman jurlapridence gave far more correct views of the comparative value of life at different ages than the mocolerns pusuessed, In a pripular way, until nearly the close of the 1ith century." Ulpianus's calculations (Pandect, 35-2•68), compared with
certain Swedish observations given by Dr. Prlce, are as follows:

| Ages. | Stockholm Ife. Ir, Pitce. |  | Agea. | ExpevtationsAlale nudfemate.Roman lire.Upplat: |

It seems abundontly evident that Ulpianus's estimate must have licen based on actual observations in some form, hut the Romans mast have had a misarable chance of life in old nge.

From that period we bave nothing to attract attention till the 1tith century, when Dr. (or Sir) Thomas Wilson, who died in 1581, pullished hils Discourse upan Usurie, whelh contains illustrations of endowment transactions on the llves of children, but the lifo contingency portion seems merely incidentally introduced with reference to questions as to ustury.

In 1661, M. Cleirne, the author of Les us et Com. tums de la Mer, notices the Guilon, "a French production, formerly complled for the benefit of the merchants tradlng in the nolle city of Rouen." This work is nearly 300 years oll, Its author's name is unknown, hut it is n most curious document, in consequence of the reference It makes to nssurance matters. From Mr. Jendriks we give tho following translation, omitting Cleirac's notes:
" ]. In other countries, where the bodies of people may le eaptured and reduced to bondage, there are various usages for the Insurance of the body and life of men, whether they he of free condition, or slaves, which customs will not be mentioned here, lecause in France, men of whatsoever nation aro of frank mul free condition.
"2. Notice ouly will he taken of what is practicell in thls country liy those who undertake distant woy. nges, ns to the coast of Italy, Constantinople, Alexandrin, or other like voyages in the Mediterranamand Athantic sens, on accoint of the fear which they have of the galleyk, fuztes, and frigates of the army of the Turk, or Corsairs, who make a traffir of the sale of Cliristlans, whom they capture as well on sea as on land; which creates occasion for the masters and captulng of this country, when they antertake such voynges, to stipulato with their marchant freighters, is others, for the restitution of their persons, in case they nre cantured; and thls they can do nven for the peuple of their crew.
"3. In such a case, the master must, In the prilicy, extimate his ransom, and that of his companions, at so muel pur heal; declare the name of the ship, the stay or touchlugs which it will make, the duration of cath stay, and to whon the ransom is payable. The insurer is hound to pay the sum insured for the ramsum 15 daya nfter veritication and certlication of the captivIty, without waithig for the usual two monthe delay; and without other formality of sceing frelghtage, biif of lading, or charter party, It will suffice to proture the attestation of capture and prolicy.
"4. Pilgrims golng to the Ifoly Sepuldire of Jeruwalem, or on other distant voyages, may edibet insurance for their redemption, valued at a given amunt. Deacriptlon shall benlles be made of their pressuns, , names, surnames, country, abole, nge, nul raik; aul,
moreover, lim they undertak the longest $p$ tion whatsoev without admit who undertak periol, or a pa insure for thein
"5. Anothe tions upon the their royage, to itors. Credito debtor remore can be done by case of their de sion or rent as $n$ ulations forhid toms, from whic whence they in prohibit tho sai ited and forbidn
The most rem conlemmation of of assurime in was it assumed Netherlands' ori stitutes of Gem that "securities without the ?!eer pupe, nur ulon t life of kings, ca upen the lifo of dignities, ecelesia be made upon th ships, governme cities, lamls, or I aetion having th or wager (eadimo understoul and a Amsterdam ordin life of any person, or frivolons pur of 1604 and 163 10th article (Tittr namee of Louig the making of an the 11th article f and gurantees th upen the persons perish by uther me thin the 1ith ce ance was regarde there remained a whase work on quarto pagex, de assuramee, and th tacking the eyster

doln de Wit, th mitted to the State tise on the vuluatic that doclument, it for the pmirjose , Ilenuriks characte of any age treatin tion of life manui much intelited to ment, which was Statev of Mollamd and which haul ren In the preparat no cloubt mided $h$
morcover, limit shall be made as to within what time they undertake to make and accomplish the voyage: the longest period shall be of three years inclusive, tion whatsoevor. In imitation of the preceding, those without uduitting excuse of illness, or other dotenwho undertake journeys or vows for a lengthened period, or a passige from ono country to anether, may insure for their ransom.
" 5 . Another kind of insurance is made by other nations upon the lift of men, in case of their decease upon their royage, to pay certain sums to their heirs or creditors. Crediters even may insure their debts, if their debtor remote from one country to another; the same can be done by those having rents or peusions, so as in case of their drease, to continue to their heirs such pension or rent as may be clue to them. Which are all stipulations forbidden, as against geod morals and customs, from which cndless abuses and decepticns arose, whence they have been constrained to abolish and prohibit the stid usages; which is also to be prohibited and forbldlen in this country."
The most remarkable feature of these times was the condemnation of, and legislation against, the practice of assurance in many conatries. Not only in France was it assumed unrecegnizable by law, but in the Nethertands' orlinance of Philip II., and in the civil statutes of Genon (1588), in which last it is declared that "serurities, bonds, or wagers may not be made, without the !:cense of the Sinate, upon the life of the pope, nor nison the life of the emperor, ner upen the life of kings, cardinals, dukes, princes, bishops, nor upen the lifo of other lords or persons, in constituted dignities, ecclesiastical or secular. Neither may they be made upon the aequisition, loss, or change of lordships, governments, hingdome, provinces, duchies, cities, lames, or places $\qquad$ - nor upon any other transaction having the species or form of a bend, security, or wager (vadimonii seeurifutis, seu partit); but all are understood and are forbidden." The 24th article of tho Amsterdam ordinance of 1508 prohitits insurance of the life of any person, and likewise wagers upen any voyage or frivolons purpose; and the Rotteriam orlinances of $160 \cdot 1$ and 1635 repeat the latter injunctions. The IOtin article (Titre 6), of the great French marine ordinance of Louis XIV., dated 16s1, says, "We forbid the making of any insurance on the life of men ;" but the 1 tharticle excepts those who redeem captives, and gurantees the price of the redemption assured upon the persons, if the redcemed on his way back perish by whar means than watural death. "Even later than the 17th century," udds Ilendriks, "life insurance was regarded in lrance as ohnoxious. In 1783, there remained a spirit of opfosition to it. Fmerigon, whose work on assurance comprises more than 1300 quarto pages, devotes one page to the sulject of life assutance, and that short space to the purpose of attacking the system."
lat we minst now pass on to n more literesting petiod, when wo are called on to consider the conflicting chaims of great mames, with reference to the origination and practieal applieation of the doctrine of anmaithes, as derived from the study of the lawe of chance or probahility:
dohn ile Wit, the grand pensionary of Hohand, sutbmitteit to the States-General of ILollanl, in 1671, a treatise on the valuation of iffernnities, and on the linsis of that doemment, it was resolved to grant life annuities for the purpose of raising funds. Thls treatise Mr. Headriks characterizes ns "the first known production of my ape treating in $p$ formal manner of the v-luation of life annuities, ami the scientithe world are mach inubtited to hat for the restoration of this docinment, which was liserted in the resolutions of the Statea of Ilolland and West Frienhand of the year 10it, and wheh had remained as grond as lost for 180 years.

In the preparation of this docmment be Wit was no doutht nided by the preceding labors of l'uscal,

Fermat, and Huygens, and he had no doubt the advantage of observations on the duration of life among persons to whom the States of Holland had previeusly granted annuitles; but, indepenclently of the orlglnality of the design, we must sive limn the entire eredit of having discovered a correct principle on which the value of a life annuity might be calculated.

De Wit's treatise is heac. d, "Value of Llfe Annuities in Proportion to Redeemable Annuities." He commences with pointing out the difference between a " redeemable annuity," as he terms It, nt 4 per cent. that is a perpetuity at 25 years' purchnse, or perpetual investment at 4 per cent., and a life annulty; estimating the value of the latter in the most favorable circumstances us "really, not below, but certalnly above 10 years' purchase." He then glves some preliminary observations on the doctrine of ehances, and afterward applies the principle to the calculation of an nnnuity value at a particular age. Hts calculations are shmplified and explalned as follows by Mr. IIendriks:
"First, Ont of 128 lives, aged say 3 years, 1 is snpposed to die in every half year of the first 100 half years, or 2 per annum for 50 years, leaving 28 nlive, aged $\overline{0} 3$ years, at the end of the term; out of when 1 lies in every 9 months, being 0.66 per half year during the next 20 half years, or 1.33 per annum for 10 years, leaving $15 \cdot 66$ alive, aged 63 years, at the end of the second term; of whem 1 dies in every year tor 10 years, belng 0.5 per half year during the next 20 half years, leaving $5 \cdot 66$ alive, aged 73 years, at the end of the thirl term; of whom 1 dies in every year and a half for 7 yeart, being $0 \cdot 38$ per half year during the next 14 half years, leaving 1 nlive, aged 80 , at the end of the fourth term; which surviver does not live over another half year. Secondly, Out of the 128 lives, those who die in the respective half years between the agee of 3 and 80 , will receive an annuity certain in half-yearly instalments, for a term equal in continuance to the number of completed half years elapsed between age 3 and the date of their death; therefore, the sum of the present values of half-yearly unnuities certain, for the corresponding terms multipljed in the numbers dying within such respective terms, gives the present worth of all the annulties which will be enjoyed by the 128 lives, 1-128 of which represents the present value of the single life annuity at age of, say 3 years."

We have dwolt at some length on the discovery of De Wit, as it has not been available nreviously in any account given of the progress of lifa calculations, our best writers in this country, from the absence of any procise knowledge in regard to lt, having passed it over with a slight notice. On the continent, however, the labors of De Wit have been more highly uppreciated. The Marquls of Condoreet, In his Discours Preliminaire, gave him the credit of being "the first mathematicion who thought of upllying enleulation to pulitical questlons." "It was he rho first essayed to fix the rute of life annuitics according to the mobabilitica of life given by the tables of mortality. Upon politics, upon the true interests of nations, upon the freedom of trade, the hal very superlor ideas to those of his age; and wo may say that bis premature death was a misfortune to Europe as well na tohis country."
We can not condule our notlee of De Wit withent mentloning the name of hls fellow-laberer, If wo may so term him, the Eurgomaster Ifulle. Wo had at one time rather a painfu! lmpression left on our miad, arising ont of the terms of lludde's certitleate to the report of Do Wit to the States-General, and other obsurvatioas by Mr. Hemlriks, but we are glad to flad, from the correspondence subsequently trought forwarl, that they were fellow-lnberers in the same field, and that Iludde limself was a mun of science.

We have now to mention the first publlshed work in whleh an attempt is made to iorm tables of mortality. We allude to the work of John Graunt, whose name has been already mentioned. It was published $\ln 1662$, and is the first hook on the sulbject of life ohservations, as a distinet treatise. It Is entitled, Notural and Political Observations, mentioned in a follouring imlex, and made upon the Billa of Mortolity, by Join Graunt, citizen of Iombon (afterward deseribed in the fifth editien as "Captain John Grannt, F.R.S"). A century previous to the publicution of thls little volume, viz., on 1st Junuary, 1562, the first regiater of hurials was commenced in Iondon, the necessity for the ingulry arising from the great mortulity occasioned ly the plague ot that time. From that time the bills of mortality were kept at irregulur intervals, according tu the appearance and disappearance of the nlagne, but from 1603 the records were continued uninterruptedly. Graunt puid particular attention to these weekly returns, and, with a eagacions appreciation of their value, reduced the results into tables, "in order to the noore ready comparing of one year, season, parish, or other division of the city:". Ile analyzes the blls themselves, and drawa certain conclnsions with great adroltness, giving the first semblance of a table of mortality in the arrangement of deatlis la decades. The work pussed through five editions, the last under the superinten'
of his relative Sir William Petty, who himself pas.. some attention to the sulyjeet, having publlshed Essays on Political A rithmetic concerning the People, Housings, etc., of Iowdon and Paris; Essay concerving the Jfultiplicution of Maukind, and the Grorth of the city of J.ondon; Observations on the Dublin Bills of Mortality, itc.; and Discourse on Duplicate I'roportion, read befure the Royal Societ y, 16: 4.

From this time til: 1693, when the celebrated Ir. Fialley's investigations and calculations appeared, there is little to attract attention. A set of tables was published during this interval, entitled, Tables for Renewing and I'urchasing of the Ieases of Cathedral Churches and Collryes, etc.; ulso Tables fir Renewing and Purchasing of Lires, ete., learing the imposing title of "Sir Isuac Verton's Tables;" but we learn from Mr. Fdwin James I'arren's historical Fsoyy on the Rise and Early Piogress of the Dictrine of life Contingencies in Einglund, that Sir Isaace Newton being then at Cambridge (Lacasian Professor rice lharrow), it uppears to have been thuaght politic to obtain his sancthon or imprimatur as to the correctness of the tables, and "his original cognizance of the work uppears to have lieen to merely confirm the (Q.E.D.) correctness of a single table relatlve tu the established nsage of renewing college leases."

In No. 146 of the Philosophicul Transactions, 169\%, Dr. Halley published the result of his investigations uniler the following title: "An Estimate of the leegrees of Mortality of Mankind, drawn from curious Tables of the llirths and Funerals at the city of Ilreslau, with an attempt to ascertain the prlce of Annuitiea upon lives, hy E. Ilalley, R.S.S."-l:. 11.

Addibional information will also be fund in the Actuarial Tables of W. T. Thomson, F.IR.S.E., 18 sish, and in the very valnuble Tables and Formula for the Computation of life Contingencits, of Mr. Peter Gray, publixhed in 1819 . In conclusion, the mames of Eiswerd Sang, I'cter Ilardy, Samuel Ilrown, Charles Jelliooe, William Woni, William Orelaril, and IB. 11. Todd, may be melected for special notice from the long list of caleulators who have advanced various lejartments of the science dinch valuable hiformation on the nubject will also lie found In the dsaurumee Ifagusine; the lighorts of the Registrur-dientral; and in the E'ridence. . on before the Huste of Commons, in 18.1S, on Joint Stock Companies, and in 1853 , on Assurance $\boldsymbol{A}_{\text {s- }}$ socintions. The evilence on Friendly Socicties will also tee found interenting.-J. D3. See Intehent atyl Anneitige,

The followlig summary of the plan of operation and condition of the Mutual LIfe Insurance Company of Now York, in given to show the state of life insurance In the United States. Thls Company is the largest and one of the lest managed In the country; und its condltion may, therefore, he taken as a fair exponent of the others, and shows clearly to the lusurars the safety of their policlos.

Alutual Life Insurance Co., N. Y.-It will be percelved by the statement following that there have heen issued in the past year (1856) $2,0.11$ policies, anounting to $65,878,457$, being a net incrense in policles of 1,016 , and ln amount of Insured of $\mathbf{\$ 3 , 1 1 9 , 9 0 2 \text { , The cash }}$ recelpts have been $\$ 1,045,23517$; the inerense $11^{\circ} \mathrm{in}$ vestnents on bonds and mort gages lus lison $\$ 505,562$ 1.I, and the entire net Increase $\$ 610,7 \cdot 1994$, irresper tive of the ltems of interest accrued, and deferca premiums, which are not eatluated. Total assets, ©1, $\mathbf{i x}, 94576$, The loans are at 7 per cent. interest. Aggregato amount of loana, May 1, 1856, 83,187,85s 36.

Securities.--Value of lands mortgaged, $\$ 5,009$, , 415 ; value of improvements thercen, $83,513,650$; aggregate value of mortgnged property, $48,521,065$.

Collaterals.-Policies of fire Insurance, assigued or made payaule, In case of coss, to the Company, © $1,702,-$ ( $6368 \mathrm{Sa}^{\text {; personal guaranties to a considerable amont, }}$ say $\$ 200,000$. Total amount of securities, $\$ 10,425,701$, It will thus he seen that the value of the mortgaged property is more than twlee and a half the amount of the loans they are intended to secure. These seeurities are fortified by collateral polleies of fire lusurance to the ninonnt of $\$ 1,70 \pm, 036$. The following schedule of the predteted losses by the tubles, und the actual lossen for the pust 14 years, has heen prepared by the Actuary:
a Comparatifr Table of the pmomable ani diteal
Numieb or Deathis and Lonses, accolbino tio the

| 1560.... | 11838 | 362, 639 | 75 | 26.1 .35 |
| Total | 79818 | 12,471,899 | 6.5 | *1.891915 |

In the above tatile the second colnnin shows the protrable number of deaths, according to the mortality tahes now ured in the I'nited States. The thirl column reprisents the monunt of such losses, whereas the finurth and fifth columns show tho actual results in a husiness of 14 years, la none of these ycars las the Company lost the full amount called for in its tahles.

Hut it must be lorne in mind that life he: urance is only in its lufaney in this country, mul hat full 30 years must elapse before we can calculate rosult, with any degree of certainty.

of Virginia and Kentucky (except witbin 10 mlies of the Misslssippt and Mlesouri Rlvers, between $36^{\circ} 30^{\prime}$ and $40^{\circ}$ north Jatitude); In the interior of North Carolina, fron: he coast ; in Tenneseee, except within 50 miles of the Missieslppi River; and in British North America. All to be east of the 100 th moridian of longitude west from Greenwich.
2. Additional Rates,--Residences withla 10 miles of the Mlssissippl and Missourl Rivers, hetween $36^{\circ} 30^{\circ}$ and $40^{\circ}$ north latitude, $\frac{1}{}$ per cent. The United States, sollth of the southerly line of Virglnia and Kentucky, and north of the 321 degree of north latitude, except on the Missisilppl River (east of the 100th meridlan of west longitude), from 1st July to 1st November, for acclimated persone, $\frac{1}{2}$ per cent.
3. The United States, south of the 32 d degree of north latitude (east of the 100th meridlan west longitulte), from 1st July to 1at November, for ncelimated persons, 2 per cent. Acellmatlon is only deemod complete when the party has had tho yellow fever.
4. Upier California, Oregon (excopt those engnged in mining), Australia (with similar restriction) China, Phllipinine Iaiands, and Sundwich Ielands, for residence, 1 per cent. For South America, West Indics, East lalice, and other purts of the world not mex.tionel, rates will be namell at the office corresponding with the risks, except in places prohiblted.
6. Voyages aud trips to and from California and Oregon, 1 per cent.; round the world, 2 per cent. other voyages subject to special contract at this offiee. Mater mariners and sea-faring men are taken at rates of premimm gradunted to the risk of the particular trude in which they may lee engaged. The conditions as to voyages in auch class are applicalie to time of peace only, un adilitional rate being charged in time of war, if the rlek of war should be taken ly the Co.
Military and naval men are not protected when engaged in nctual warfare; but if regularly called into actual service, and ilying therely, the Company will consider sald denth, under such circumstances, as a tender of their pollcy to the Company, and will pay the sane value therefor as if aurrendered by sale. Persons engaged in military corps aro not held to come under military conditions, except in the event of foreign invasion.
Persoms passing from one class to another.--Persons insured, who pass from a class where the risk is snuller to ene which is greater, must apply at the ofice, und pay the enhanced premilum. Sersons coming from a class where the risk is greater, to where it is less, will commence to pay the reduced premimn when the next renewal preinium hecomos due, should the extria premium he taken off: But where the health aud constitution have hecome impaired by suid residence, the extra premilum will not he taken off. All reductions of the extra premiums charged, must bo made at the ollice.
Acclimation for the 1 mrnose of life lisurance is obtained, 1. By birth and continued residence in the place where insurauce is sought. 2, By long continued sunmer residence, and during the seaan when and where epidemic and endemic diseases prevail. 3. 1ly havin, hal the disease incident to the climute or locality. 4. Acelimation againat yellew fever is not considered complete unless the party das had it, und has continuel since to reside in places where it is epidemic.
Rates for Insurance.-The rates adopted by this Company have been formed on the most correct observations which uow exist, as to the duration of life at the dillerent places where we Insure. We believe that these rates can not he safely reducel, and that any attempt to do lt , with the present limited experience in life insurance in this country, would evince a recklessucse of resulte which would justly cost any Compny wheh should attempt it, the withdrawal of the condidunce of ull who are conversant with the science and principles upon which this business is based.

Life insurance in the Unlted States is as yet in its infancy, as fur as regarda the science, but tho practlee is raptally gaining favor with all classes of the communlty, and the number avalling themaelves of its benotits In this country are daily inereasing* Statiso thes of life and mortalty are the foundation upon which the seience of life insurnnce ls erected, and reliable informatlon regarding the relative value of life in different climates and at each age is of the greatest importance to a life company, in order to prosecute its business anccessfully. In Great Britain this information is obtained from two sources, viz., the experience obtaining each year among the eompunles themselves; and, secondly, from the reperts of the regiatrar-general which are annually made te Parliament. From the comparatbely amall area of the Ilritish lsles, and the excellent system of appointments ly the government of its scientilic men, great advantage is derived. The decennial census of Great Britain la taken in one day, which nt unce eliminates one of the most frultful sources of errur ; and by having a regintrar and corps of assistants in his office regularly educnted nuel trained, a perfeet oystem is adopted; und thus we have in their reports a mass of reliable, interesting, nod valunble infurmation which can nowhere else be obtalned. Unfortumately, in the Vnited Stutes it is ditferent. Froms the immense area of territory, embrabing every variety of soil, climate, and physical contignration, it would the alosost impossible, even if we bat ns perfect a system of registration as they have in lingland, to complete the enumeration of the census in a day, or even a few days.

For the talbies of mortality upon whidh to determine the rates of premiam to be charged for assurances upon lives, the American companies are entirely dependent upen Furopean observations; and it is found hy the experience of companies in this country, that the rate of mortality in Great 13ritaln will very fairly represent that iutho Now England and Middlo States. Ibut luthe Southern States and California it is very diffrent. We have as yet no suflicient data for the determination of the relatlve mortality among residents of the different States in the Union; consequent1 l , when a life company is colled upon to insure the life of a permon resiling in the South or Calitornin, a sum is charged, in ndation to the regular premium, for the increased risk in those climntes, which is entirely arbltary. Yet it has heen shown in the report hy the actuary of the experience of the Mutual Life Insurance Company of New York for ten Years ending February 1, 1853. that the nononl mertaity mong every 10,000 persons insured was as follows:

The experience of the company hat also been computed since 1853 , and will he publishted in 188 s , which will include a period of fifteen gears in the history of that company.

The following table is taken from the report of 1)r. F. Iharton, of New Orleans, to the president of the alove conusiny, on the relative mortality from yellow fever of persons from varions parts of the world who emigrate to New Orlenus. The table ty nn answer to the question, 1 ihat is the relative mortality between nittices and strangras, A me rican and Eumpuems?

Rerly.-The a..swer to this most necensarily le twofold, vil..: 1st, in relation to the accimated, and, $2 d$, the unacclimated. Of the first, the following table, with preche details of each nation and people, foreign and domentic, ant from different latitodes, was made from the data furnishend during the diantrous epinlemic of $1 \times 53$, thim haviug been the most extensive and mailguant yellow fever that ever occorred in Sicw Or-
leans. This table was mest carefully and laboriously compiled by myself, and is, I bellove, the only one annde that can furnish any reply to this most importame question, and should be deemed a fair exponent of the general liabilities, as the greater should embrace the less.

From this table it will appear, 1st, that linbilities to yellow fover exist (In relation to America) pretty much in proportion to inerease of latitude; and, 2dly, hy their cold moisture, so diametrically opposite in its ef. fects on the constitution to sarm noisture; and, above all, their personal habits of crowding into cheap and tilthy dwellings, nnd the immigrants being of a low class, and the predominanco of intemperance. The comparatively anull mortality occurring in those from Great llritain arises from the fact of these immigrants treing of a higher class of subjects.

From these remarks it will be seen that life insur. ance companies in thila country must depend in a great measure upon the results of their own experience.

Something, however, has been ndded to vital statisLics by individual States, particulnrly Masmachnsetts, New York, Maryland, and Kentucky; and there is no reason why these individual States, us well as the Inited States, shoula not havo as complete a syrtetu of registrathon of births, marringes, and denths, as they now have in (ireat Iritain, and thereby tive full and necurate statistics of the life and mortality of the country.

The reports of the six life insurnnce cumpanies of New York, for the year 1857, show that the large sum of 8798,010 has been pald to the representatives of policy holdera, and that their aggregate premiums, loss. es, and assets were aeverally as follow:

Intereat is the lorrower of the lender for 1 preté; ou bien, ices productifs q ii., p. 480, ed. 4 n viously to the $m$ event of all legis of interest being would wholly de sbundance of mo tise as money $\mathbf{t}$ more plentiful. controverted, fir tished in 1750, e Causes of the Ra ter effeet in Hum has been shown communlties is the currency, bu from the emplay frequently hnppe but this is of no substautial diffe 100 bushels of co at the expiratio of 10 O or 105 bu much money, at the corn ar cloth crowds of passe by the snme enr serve to negotin leads to $\mathrm{X} \$ 1000$ sa equivalent an nouse fer the ma produce to $\mathrm{C}, \mathbf{W l}$ is plain that $X$, ties or produce they might have as the noney el Accordieg as th the business it 1 give a greater notes or assigna It is not, howev srticles being $h$ profit which the possession, that paid to the lent may; perhapla, be and jewelers, tl money is increas of their husines not ulwars the e in any degree af ever sent to the graded or deprec weight, or reiati plain that the in of interest for to work up into on the supply o derived from lts wholiy unconne cuin.
It therefore rate of interest $\delta$ by employing e not on the price siste. The latt value of money afficeted by the: proluctiveness protit is unifort of interest. M in the United fland; but the

Intereat is the annual sum or rate per cent. which the borrower of a capltal agrees, or is bound, to pay to the lender for its use. "Interêt; loyer d'un capital preté; ou bien, en termea plus exacts, nehat des services productlfs que pent rendre un capital" (Say, tom. ili, n .480 , ed. 4 me ). It was generally supposed, previously to the middle of the last century, that, in the event of all legislative enactmenta regulating the rate of interest being repealed, its increase or diminution would wholly depend on the comparative acarcity or abundance of money ; or, in other words, that it would rise as money becanie scarce, and fall as it became mere plentlful. But this opinion has been suceesefully controverted, first by Mr. Joseph Massie, in a tract published in 1750, entitled "An Easay on the Governing Causes of the Rate of Interest ;" and, second, with better effect in Hume's Essay on Interest, in 1752. And It has heen shown that the rate of lnterest in alvanced communitles is not determined by tho abundance of the currency, but by the average rate of protit derived from tho employment of eapital. No donbt it most frequently happens that loens are made in currency; bat this is of no consequence. Thero is obviously no substantinl difference between A furnlshing 13 wlth 100 bushels of corn, or 100 yards of eloth, to be repairl at the expiration of a specified period by the delivery of 101 or 105 bushels, or 104 or 105 yards, or with as much money, at $1 /$ or 5 per cent., as would purchase the cern or eloth. And it is engy to perceive that, as crowds of passengers may be successively conveyed by the same enrriage, so the same sum of money may serve to negotiate an infinity of loans. Suppose $\dot{\boldsymbol{A}}$ leads to $X \$ 1000$, with which the latter huys from J sn equivalent amount of commolities; that 13 , laving ne use for the money, lends it to $Y$, who pays it away for produce to $C$, who again lends it to $Z$, and so on. It is plain that $X, Y, Z$ have received lonns of commodities or produce from $\mathbf{A}, \mathbf{B}, \mathbf{C}$ worth three times (and they might have been worth 30 or 300 tlmes) as much as the money employed in settling the transnetions. Accordis:g as the supply of currency, compared with the business it has to perform, is $g$ reater or less, we give a greater or leas number of guineas or livres, netes or assignats, for the article we wish to ohtain. It is not, however, by the fact of the, rice of such articles being high or low, but by the advantage or protit which the borrowers expeet to lerive from their possession, that the interest or compensation to be paid to the lenders for their use is determined. It msy, perhaps, be supposed, in the case o' goldsmiths and jewelers, that when the quantity of metallie meney is incraasel, they will obtain the raw material of their husiness with greater facility. But this is not alwars the case; and though it were, it would not in any degree affect the rato of interest. No coins are ever sent to the melting-pot unless the currency he degraded or depreciated ; that is, unless it le teticient in weight, or relatively redundant in quantly. And it is plain that the inducement to offer a high or a low rate of interest for louns of money, which it is intended to wark up into plate or other articles, wlu not depend on the supply of such money, but on the profit to be derived from its conversion into goods-a cireunstance whilly unconnected with the seareity or abundance of cuin.

It therefore appoars that, apenking generally, the rate of interest depends on the profit that may be male by employing capilal in industrious undertakings, and not on the prive paid for the articles of which it consiats. The latter are affected hy every change in the value of mnney, whereas the formor is iittle, if nt all, affected ly these clianges, and is detern: ined by the prodactiveness of industry. A low or a high rate of profit is uniformly accompunied by a hlgh or low rate of interest. Aloney, as every one knows, is cheaper in the United States and in Australla than in linbland; but the ordinary rate of profit being higher, in-
terest, despite the lower value of money, is also higher. Fxtraordinary as it may seem, it is nevertheless true, that during the half dozen years ending with 1856, the current rate of interest in San Francisco, where bulllon is so very abundant as to be almost a drug, has varied from $1 \frac{1}{1}$ to 2 and 3 per cent. a month, or from 18 to 24 and 36 per cent. per annum. And theugh it were allowed that from a third to a half of thls rate should be viewed as a premium to compensate the insecurity prevalent in Callfornla, still the residue would amount to three, four, or flve tlmes the ordlanary rnte of interest in Eugland. In further corroboration of these statements we may mention, that the low rate of interest in 1Iolland during the greater part of the 17 th and whole of the 18th century, was not owing to any pecullar abundance or cheapness of money, but to the hlgh rate of taxation, and the difficulty of investing capitnl with profit. And to this latter circumstance we owe the low rate of interest in this country toward the middle of last century, and at soveral later periods. It is not, In short, liy the amonnt or value of the currencies of different countries, but by the means which they respectively enjoy for the profitable employment of capital or stock, that their profit and intorest are governed.

That a rise or fall in the value of money can have no direct influence over interest is plain from the fact of the interest being itself paid in the money that has risen or fallen. But, nt the same time, a sualden increase in the supply of money may undoubtedly have a temporary effect in depressing interest. Importers of bullion may not be able to lay it out advantageously in purchases, and may, in consequence, be risposed to have it coined and lent, though at a low rate. We incline, however, to think that the infiuence of cons:derations of this sort is but lnconsiderable. Lenders will not tike less for loans than the borrowers are willing to offer, and the offers of the latter inust be determined not merely hy the amount of money seeking investments, but partly also, and in a still greater degree, by the protit that may he made hy its employment. When there is a rapid intlux of money, loms for short periods are nsually obtainable at low rates. This, however, is not generally the case with loans for lengthened periods. The lenders are willing to accept a reduced interest for a short term, till they can look about for some more protitable means of Investment. But tho interest on loans on mortgages, or for lengchened periods, is always proportioned to tho rate of profit at the time; and, supposing the security to lie unexceptionable, is but little affectell hy any thing else.

The protits made in industrious undertakings are, for the most purt, distributed into gross anil nett profits. Thus, if from the total returns, whether annual or otherwise, obtained in any business or employment, we deduct all sorts of outlays necessarily incurred in earrying it on, including the wages or remuneration the to the undertakers for their skill and trouble in superintending tho business, und a sum to compensate the risks provided against by insurance, the residue is the nett protit of, or return to, the capital employed. And it is on this latter portion that interest lepends, or rather with which it is usually identical. lenders having nothing to do with the employment of capital, nre not entitled to any peenlar advantage that may arise from it. But they are entitled to all that ean fairly he considered as the return to tho capital they have lent, after the risks, salaries, and necessary emoluments of those who undertake its employment are deducted; and this mueh, speaking geurrully, they will get, and no more. Whatever else mus ice realizell hy the eruployment of capital ite inclustrial pursuits belongs to the borrowers, and forms the fund out of whleh they are remunerated. In coming to this conclusion, we are supported hy the anthority of Mr, Tooke. "The rate of lnterest," says he, "is the
measure of the nett profit on capital. All returns beyond this ea the employment of capital are resolvable into compensations, under distinct heads, for rieke, troubles, or akill, or for alvantages of aituation or connection." (Conalderations on the State of the Curreney, p. 12.) Whatever, therefore, may at any time oceasion a audden glut of money or capital may lower the rate of nett protit and interest. But that very circumstance, by increasing the demand for capital, will eventualiy raise the rute to its proper level; and the glut baving disappeared, profita on Interest will depend on the productivenesa of industry.

Besides such variations as are proportioned to variations in the ordinary rate of protit, and which equally affect all loana, the rute of interest varies aecording to the security for the repayment of the principal and the duration of the loan. Hence the powerfal intluence which the character of the borrower, the purpose for which he borrows, and the nature of the business in which he is engaged, have over interest. Careful, skilful, and intelligent purties always borrow, certeris paribus, on lower terms than those of an opposite description. The spendthrift, the idle, and the unskiilful, can with diffleulty obtain loans on any terms; and those who deal with them, and stipulate for a high rate of interest to cever their risk, frequently tind that their guaranty is inadequate, and that they would have better cousulted their own advantage by lending to reapectable parties on the usual terms. The nature of the employment in which borrowers are engaged has ulso, as now stated, a powerful effect in determining the rate of interest. Wherever there is risk, it must be compensated. A sum lent on mortgage over a valualle estate is not exposed to any risk. Hut a anm lent to a manufacturer or a merchant engaged in a hazarduus busineas, is exposed to $n$ high degreo of risk; and the interest payable on the latter, inammach as it must include a premiun to compensate this extra risk, may be twice or three times as much as that paid on the mortgage.

We slould mistake, however, if we aupposed that this circumstance places those who carry on purticuiariy hazardous lusinesses in a comparatively disadrantageous sitution. Competition will not jermit, taking every thing into acceunt, a greater or a leas amount of nett proft to be peramnently obtained in one branch of industry than in another. The produce realized by those who engage in employments of more than orilinary hazurd is generally soll at price that yiell the orilinary rate of profit, with a surplus sufficient to guaranty their stock agaiast the extra risk to which it is exprosed. Were it otherwise, every body would decline placing their property in a state of comparative danger, and undertakings of a hazarious nature woull not be entered into. Ilut it very frefuently happens, that the manager of a bazardous liranch of Induatry, paying from 11 to 12 per cent. for ioans, realizes larger bett jrofits than the purchaser of an extate with money torrowed at 3 or 4 per cent.
Supposing the security to be equai, capital lent for a fixed und considerable perion always fetches a higiser rate of interest than that which in lent for short periods, or which may be delaanded at the pleasure of the lender. There are but frw modes of afely emJloying loans of wisich the duration is so uncertain, so that they are frequently worth very iittle ; and hence the rate of interest is, in the majority of cases, in part at least, letermined by the length of the loan; for, when that is considerable, it may le proxfuctively employed in a variety of lusinesses, in which it would not otherwise be jrudent to inveat it, at the same time that the horrower has time to prepare fur ita repayment. Hat this princiju has only a slight intuence over leans for terms leyond three, or, at nont, five years: for a loan for cither of thece terms, but exjecially the latter, inay be enployed in a great variety of ways, and would bring nenriy as much interest as it
would do ware it for 10 or 12 years. It is further to be observed, that large classes of borrowers prefer the less interest which they get for advances at short dates to tise higber rate which thoy might get were they fer longer terms. Most people wish to have the full command of their eapitnl. Merehants and mannfactarers who lent on mortgage would inso far deprive themsolves of the means of extending their husiness,
and of speculating. And thongh sometimes, perinps, this might be for their sdvantage, yet the thattering opinion which most people entertain of their own sagacity and good fertene, would but seldom permit them to doubt that it was a very aerious disadvintage. Hence the low rates at which banking companes who pay the sums deposited with them on demand, and govornmenta overwhelmed with deht aro able to horrow. A stockholder's mortgage, or claim on the revenve of a country, may be immediately converted inte cashat the current prices. And, however nuch the majority of the ereditors of a deeply indebted country may bs impressed with a conviction of its lobbility to dis. churge the various clains upon it, eacl. individual, confident in his own good fortune and foresight, flatters himself that he, at ali events, will foresee !the coming tempent, and be able to seli out befure a pulific bankroptcy.

It is evklent, from those stataments, that in adition to the security for loans and their churation, the rate of interest will, to a consideralile extent, depend on the facilities atforded for enforcing or carrying out the atipulations in contracts. And hence a milin cause of its reduction as aociety is more and more improved. Generaliy, it may he said that a speedy, cheap, and effectual jrocess for securing the payment of tedts, has a powerful tendency to lower-and a slow, costly, and ineffectual procoss, to raise-the rate of interest In most countrice, extraordinary means are tiken to compel payment of bilis; and this is a principal canse of the low rute at whieh they are commonly discounted. The easy enforcement of contracts constitutes, in truth, an inaportant jortion of the securityfor a deht. By a good security, is not meant a goaranty that a loan will uitimateiy bo made gooi, but that it wiil be punctually paid when due; or, if the loan be of a kind that a littio delay in its payment is usually given, that that delay will not he excerded, and that it will he paid within the custumary teru. A security which should insure the final pryment of a delit, but which shoull not insure its payment when due, or shortly thereafter, is not a good, but a bad sccurity. It is indinjensable to the transacting of lusiness sufely, cheaply, and expeditiously, that thero should the as little doubt us possibio either in regard to the puyment of loms or the term when thary are to he paid. If either of these points toe civabtfui, the lender will insist on an indemnity for the consequint risk. And it thercfore appears that the aummary procedjugs taken to enforce payouent of bills, nid such like dehts, are in truti and reality more for tiee advsutsge of the horrowers than of the lenders. They reduce the rate of interest ; and the hardship, such as it is, which they oceasionally intliet on tho horrouer, fuev not oceur in one case out of tive hundred ; while their powerful intiuence in depressing interest teils in every ciase.
fircect.-in Greece the rate of interest was not regulated by law ; aud it cousequentily varied with all the causes of variation alove aliuded to. Gencraily, however, it was what we should reckon very high, anounting, in most cases, to from 10 to 18 per cent., and upward. This high rate of interest was not eccasioned by a high rate of profit, but by the uncertainty of the laws, and the faciities which they nfforded to framduIent debturs to defeat the just ciaime of their creditors. The finterest on money lent on boftomry, or on the security of the shiji or cargo, or both, was rated at sa much per voynge. It therefore dejended on the place to which the ship was to sail, the season of tike year,
the chance of Usually it wes 60 or 60 per ce Athens, thougl or allens, appes trust worthy, a Hut they were and for no bett of the midille a a writer an lhoe the vulgur pre they drew upon clakses." Another cause for interest grew crmuiation, It I saring of inconse ; indicative of a so tively hurtfti. and perhaps still palitic. llefore $t$ were properly und net be increused that whatever ad must oceasion an ancestors did not
the chance of meeting pirates or enemies' sh!ps, etc. |omy, accumulate atock, add to their own wealth, withUsually it was extremely great, varying from 30 to 50 or 60 per cent. The bankers and money-londers of Athens, though of low origin, belng mostly freedmen or allens, appear to have been considered as eminently trustworthy, and entitled to the publte conficience. llut they were, notwithstanding, quite as unpopular, and for no better reanons, as the dews and Lamlards of the miditite agea. We are surprisel that so learnod a writer as Boeckh should have beell ao imbued with the vulgar prejudice ngulnst them as to stnte that they drew upon themselves "the merlted hatred of all classes." He should have known that it has not been the covetousness of benkers, but that bad laws admin istered by interested juilges, hy making lonne lusecure, and driving parties of the highest rospectability from the lauking business, have been alone to blame for the exorlitant usury of anclent as well as of molern times. Ilad contracts been properly enforced, the protability is that Interest would have been as low in Greece as $\ln$ England.- llokckit's Public Ecomomy of Athens, vol. i., pp. 164-191.

Attempts to limit the rate of interest have raised it.Insteaid, however, of leaving the rate of interest to be adjusted by the free competition of the parties, on the principles thus briefly explained, or endeavoring to redure it ly fucilltating the enforcement of contracts, most governments have Interfered, either entirely to prohibit the taklog of intere:t, or to fix certain ratea which might be legally exactel, while any excess over them was declared to be usury, and prohitited ander the severest peanlties. In tho ages in which these enactments had their origin, the precions metal were the only species of money, and were considered quite peculiar. Being used in a double capacity-as standarls by which to ascertuin the values of different articles, and as the equivalents for which they were most frequently exchanged-thoy acquired a factitions importance in tie estinuation, not merely of the vulgar, bint of persons of the greatest discernment. The fact, that to buy and to sell is merely to barter one commolity for another, to exchange a quantity of corn, or cloth, or beef, for n quantity of gold or silver, and rice rersa, was entirely overlooked. The attention was gralually transferred from the inoney's worth to the money itself. And the wealth of states nad of indiviluals was not moasured ty the ameunt of their disposable produce, or by the quantity or vaiue of the articles with which they could afforl to purchase the precious metala, hut by the quantity or value of these metals actually in their possession. For theso and ether reasons, money has been considered as a merchaydise par excellence. And we need not, therefore, be surprised st the measures to which the prevalence nf such exaggorated opinions ulmost necessarily led; or that vigorous efforts should havo been made to protect those who were unprovided with so powerful an instrument from becoming a prey to their more fortunate neightors. Individuals might treely dispose of their corn, cattle, land, etc. llut it was suppesed that the demand for money might te so great, as to enuble the fenders, unless restrained $\ln$ their exnctions, to ruin the horrowers, and engress the whole property of the country.
Another cause of the prejudice agninst stipulating for interest grew out of the dislike entertained to accamulation. It is a consequence of cennomy, or of a saving of income; and this, in rude agos, is considered adicative of a sordid disposition, and as being positively hurtful. Prolignals and spendthrifts were long and periaps still continue to the, the favorites of the puibic. Before the naturo and ?:anctions of capital were properly understood, it was believed that it could not be increased without injury to individuals, nad that whatever advantage it might give to one party must occasion an equal diaadrantage to others. Our ancestors did not know that those who, liy their econ-
out diminishing that of any one else; nor did thoy know that, when expended, as is aimost alwaye the case, in the support of productive industry, thls atock afferds the means of producing an Increasod income. But reckoning, ns they did, that the savings of indlviduals were su much withirawn frou Income in which the publle would otherwise have participated, it wae natural enough that they should endeavor to limit the advantage derivable from their employment.
Much, also, of the prejudico agaiast bargaining for Intereat, prevalent in tho middle ager, may be truced to the authority of certain texte of Scripture, which were understooi to prohilit its exaction. It is deubtful, however, whether, they will really bear that In terpretation. And supposing that they did, nothing could be more irrationsl than to regard the munkipal regulation of a people placed in such peculiar circumstances as the Jews, as geueral and fixed principles, applieablo in all ages and countries. (Micinablis on the Laves of Moses, vol. ii., 336. Engllah trunslation.) It is a remarkable fact that the famous reformer Calvin was one of the lirst te cmancipate himself from the prejudices formerly so prevalent, especialiy among religious people, uguinst taking interest. Ile comments as follows on the stutement of Aristotle, that as money did not proluce money, no return couid be enuitably elaimed by the lender:-" Pecunla non parit pecunlam. Quil mure? quid lomus, ox cujus locatione pensionem porcipio? An ex tectis et parietibus argentum proprle nascitur? Sed et terra producit, et marl advehitur quod pecuniam deindè producat, et habltatlonis commoditas cum certa peclunia parari commuturive solet. Quod sl igitur nius ex negotiatione lucri perelin possit, yluam ex fundl cujusvis proventu: an feretur qul fundem sterilen fortasse colono locaverit ex quo mercedem vel proventum recipiat sibi, qui ex pecunlà fructum aliquem perecperit, non feretur? et qui jecunia fundum acquirit, annon pecunía illa generat alteram annuan pecuniam? Unde vero mercatores lucrum? Ex lpsius, Inquies, diligentîa atque industrià. Quis dubitet pecuniam vacuam inutilem omnino esse? neque qui id me mutuam rogat, vacuam apud ac habere à me acceptam cogitat. Non erga ex pecunlat illa lucrum accedit, sed ex proventu. Illa igitur rationes subtiles quicem sunt, et epreciem quandam hubent, sed ubi propius expenduntur, seipsa conelitunt. Nunc igitur concludo judicnudum do usuris esse, non ex particulari aliquo Scriptura loco, sed tantum ex equititis regula." Quoted by Dugald Stewurt in his Notes to his I'reliminary Dissertation to the Enyyelopedia Britannica.
But, whatever may have led to the efforts so generally made to limit or suppress interest, it is abundantly certaln that, instead of aucceeding in their object, they hal an opposite effect. If a borrower consider it for his sdvantuge to offer 6, 7, or 8 per cent. for a loan (and etherwise he would not make the offer), why should the legishature prohiblt him from offering, and the lenter from receiviag, more than 3, 4, or 5 per cent.? An interference of this sort, besides belag uncalled for ond unnecessary, is in a high degree prejudicial. Restrictivo laws, instead of reducing, uniformly raise the rate of int "est. They can not he so framed as to prevent borrow iry from engaging undorhand, to pay n higher rate of interest than is tixed by statute. And if the lenders had implicit confidence in the secrecy and solvency of the lorrowers, they might accomnodate then with the sums wanted, without requiring any additional interest, because of the illegality of the trunaction. But cases of this sort are extremely rare. Gratitude, and a senso of henefits received, are but slender securitles for honorable couduct. Numberless unforeseen events occur to weaken and dissolve the best cemented friendships; and a traasaction of this kind would afford an additional aource of jealousics and divisions. In such
nsatters, indeed, men are more than unually sharp- f few in number, aud mostly Jewa and Italians, the obeighted, and are little disposed to trist to noral gnerantees for the security of their property. Hat though neither the threateninge of the law, nor the laducements which it held out to dinhonent deitors to recede from the stipulations inte which they had entered, were able to prevent, or even greatly to leamen, what are termed umrious bargaina, they rendered them more oppreasive. They othiged the lenders to demand, and the lorrowers to andertake to pay a rate of linterest anfllelent to yletd the current rase of nett protit at the time, with a further sum to balance the risk of entering into what the law made an illegal tranation. This latter sum heing, of course, propertloned to the greater or less magnituite of the rink to be provided agalast, it increased or diminishied accordhug an the laws for the prevention of usury were cuiforeed or relaxed. Whenever, under the ofld system, the market rate of interest ruse alowe the statutory rate, the free trannfer of capital wan obstructed. Parties conld no longer look nerely to their own advantage. And lunns which might have been obtained for 6,7 , or 8 per cent., had there been no hazard from anti-usurioua ratutes, were raised, on fits aceount, to $\mathrm{B}, \mathbf{1 0}$, und 12 per tent. It in, therefore, plaia that if the meann taken to put down usury were not wholly respmalble for its existence, they, at all oveuts, added lurgely to its amount.
These conclusions do not reat on theory only, but are supprorted by a wide and uniform experience. In Rome, durlng the reputilic, the ordinary rate of interust was excessively high. The debtors, or pletelana, were every now and then threatening to deprive thair creditors, who were generally of the patrician order, not unly of the interest, but of the principal itself. Rapeated instances necurred to show that these were not mero eapty threats; and the patrichans indemnitied themselven, hy a curresponiling preminm, for the dangers to which they were exposed. "Des continuels changements," says Montesquien, "soit par Jes foix, soit par des plebisciten, naturaliserent a lhome l'usure; car les créanciers, voyant de peuphe leur débiteur, leur luginateur, et Jeur juge, n'eurent pins de conthane dans les contrats. Le jeuple, comme un détitenr decrólitć, ne tentoit à lai préter que par dea gron protits; d'antant phus que, ni les loix ne venoient que de tempres in temps, les paintes du peuple étoient continuelies, ent hatimiderient toujourn les créanciers. Cela ilt que tous lea moyens honnites de priter et d'emprunter furent abolis ì Jome, et qu'une usuro affreuse toujours foudroyce, et toujours renaissante, s'y ctablit. Le mas venoient de ce fue les choses n'avolent pas été ménagés. Leen loix extrimes dana de lien font naitre le mal extréme: il fallut payer pour le prett de l'argent, ot pour le danger des peines do la loi."-Sisprit dea Loiz, liv, xxii., c 21.
In Mohammedan conntries, notwithstandin; the prohilition in the Koran, the orlinary rate of interest is at least three or four times as great as its ordinary rate in Europe. "l'usure augmente dans leo pays Mabometans à proportion de la sévéritú de la defense: le pricteur sändemise du péril de la contravention." Ibid., liv. $x \times$ i., e. 19. Darlag the midale ages, when laterent was excesslvely high, the rate of profit was probalidy littie, if at ali higher thun at preesent. Hut it Nomuld the otmerved that a very great majurity of the lons of these agen were but little inlluenced by its amount. They were not made to bo inverted, bint to be apent. The great larons mad other landed proprictore were the principal tworrowern. Anl in 19 out of every 20 instances, the sums which tbey borrowed were expended in the maintenance of crowids of hate retainers, ill warfare, or in prodigalition of some sort or other. And while the barrowera belonged generally to what we should now call the spendthrift chass, and there were no efficient means of compelling them to abide by their engagements, the lenders were but
jeets of the most unreasonable prejudices. Under such cireumstances, it would be fully to suppose thnt the rate of interest should depend in may conslderabic degree on the zate of profit. The numbers, pusition and eharacter of the borrowere, compared with the fewness, position, und character of the lenders, mind the risk to which the litter were exposed in entering into such tranouctiona, oceasioned the exceenively high rate of intereat. Of the 50 und even 100 per cent. which loorrowers then frequently engaged to pay as interent, not more than 10 or 12 per cent. caa preperiy be suld to have been given for the productive kervices of louns. The rent must be considered as occaniment partly by the extreme acareity of disposable capital and the carelessnean of the borrowers, and partly, and principully, na a bonus to compensate the lenders for the laminent hazand of looing the privelpal.
kingland.-in lingland, as in most other countries, Christlans were, after the Concjuest, aboolutely prehilited, both by the civil and the eeclesiastical law, from bargaining for interest. Hut as Jews, according to the Mosaic law (Deuteronomy, chap. xxili., v. 20), were allowed to lend at an interent to a atranger, its exartion hy them was flrst connived at, and subsequently nuthorized ly law. And the name privilege was afterward extembed to the Italian or Latmbaril merehants. In consequence of this exemption, many Jews early eettied in Engaand, and engrossed a large whare of the trade of the kingulom. Ilat despite their industry und general good conduct, the projudice againat them, and againat the business in which they were mostly engaged, were so very strong that they and their families were regarded as slaves of the crown, by whom they were pluadered, to an extent and un. der pretenses which would now appeur incredible To nuch an extreme, indeed, were these opprewive practices carried, that a particriar otiice, called the eschequer of the Jews, was established, for receiving the sums extorted from them in lines, cuatoms, tailagen, forfuitures, etc. They were, in conhequence, obilged to charge an enormons rate of interest, or, as Madox expresses 1t, "to lleece the suljects of time realun as the king Heeced them." (Manox's history of the Exchequer, vol. 1., pp. 221-261, 4to, litio.) And lunce, while only from 7 to 10 and 12 per cent. interest was paid in conntries where eounder principles prevailed, the rate charged in Eugland was 3, 4, as:d even 5 times as great. At Veroma, in 1228, the interest of money was fixed be law at 123 per cent. Towaril the end of the 14th century, the repmblic of thensa paid only from 7 to 10 per cent to her crediturs; and the average disconnt on gool billa at Barceiona, in 1 tisi, In atated to havo been about 10 per cent. Hat while interest in Italy and Catalonia, where a considetable degree of freedom was allowed to the parties hargainlog for a loan, was thus comparatively molerate, it was, despite Its total prohibition, Incompsably higher In France and Eugland. Nathew Parls meations that, in the reign of lleary III., the dettor paid 10 per cent. every two months. And this, though halioswible as a general practice, may not have been very far from the average interest charged on the few luans that were then contracted for. (1l.aLas:'s. Midule Agres, vei. iii., p. 402.)

Hot in the end the disorders occasioned by this rina ons system hecame no chvious, that, not withstanding the deeply-rexted jrujudices to the contrary, a atatute was pansed In 10.46 (3i lien. VIll., cap. 7), legalizing interest to the extent of 10 per cent. per annum ; thecause, as is recited in the words of the act, the otatuten "prohibiting interest altogether have so liftie force, that little or no punishment hath "nowed to the offenders." In the reign of EIfward VI., the hertor against interest aeems to have revived in full force; for, in 1552, the taking of any was agaln prohilited, " as a vice most odious and detestable," and "contrary

to the word of God." But, in spite of this dewunclation, the rate of interest, instend of being reduced, iunuediately rone to 14 per cent., and continued at this rate untif, in 1571, an act was parsed (13th Eliz., cap. 8), repeailing the net of Edward VI., and reviving the uct of Ilenry VIII., ailowing 10 per cent. interest. In the preamble to thia nct it is atated, "That the prohiliting act of King bilward VI. had not done so utuch good as was hoped for; but that rather the vice of usury hath much more exceedingly abounded, to tho utter undoing of many gentiemen, merchunts, occupiers, and others, and to the impertable hurt of the commonwealth." This salutary statute was opposed, even hy those who should have known better, with all the vielence of superstitious fanaticism. Dr. Jolin Wifon, a man fumous in his day, and celelirated for the extent of his learniog, informed the llouse of Cummons, of which he was a member, that "it was not the amount of the interess taken that constituted the crime; but that all lending for noy gain, be it ever sotittle, was wickedneas before God and mann, nad u dammatile deed in itself, and that there was no mesn in this vice any more than in murder or theft." To quiet the consciences of the bishops, a clanase was inserted, deciaring usury to be forbidden ly the law of Goul, and to be in its nature sin, and detestabie. This statute was limited to $n$ perlod of five years; but, "forasmuch as it was, by proof and experienee, found to be very uecessary and proftable for the commonwealth oi this realm," It was, in the same reign, made perpetual (39th Eilz., eap. 18).
In the 21st of Jumes I., the legal rato of interest was reduced to 8 per cent., by an net to ccntinue for seven years only, but which was mude perpetual in the succeding reign (ik Car. I., cup. 4). During the Commonweaith, the legal rate of interent was reduced to 6 per cent., a reduction which was afterward confirmed by the $12 t h$ Car. II. And, finally, in the reign of Queen Anne, a statute (J\%th Anne, eup. 16) was framed, reducing the rate of interest to 5 per cent., ut which it stwoid tiil 1830. In the preambite to this statute, it is stated that, " whureas, the reducing interent to 10 , and from thence to 8 , and thence to 6 , in the hundred, hath from the to time, by experience, been found very beneficial to the advancement of trade und the improvement of hands, it is beceme absolutely neces ary to reduce the high rate of interest of 6 per ce: b. to a nearer proportion to the intereat nilowed for money in forcign States." it was for these reasons enacted, that all largains or contracts stijulatiog for a hipher rate of interest than 5 per cent, should the utterly void. Aud "that ail persene who should after that time receive, by means of any corrapt barguin, loun, exchange, chevizance, or intereat, of any wares, merchandise, or other thing whatever, or by any deceitful way or means, or ly any covin, engine, or deceitful conveyance for the forbearing or giving day of payment, for one whole year, for their money or other thing, uibove the sum of $£ 5$ for $£ 100$ for a year, should fortitit, for every such offense, the freble value of the moneys or other things no lent, lurgained," ete.

Scolhand and Ireland.-In Scotland previous to the Reformation no interest conld be legally charged. But that great event, by weakening the force of those religious prejudices which had chietly dictaled the probibition of interest, led to tize adoption of more liberai opinions on the subject, und to the enactmeat of the statute of 1587 (IIth Prarl., Jac. VI. cap. $0^{2}$ ), which legalized interest to the extent of 10 per cent. In lia3 the legal rate was reduced to 8 par cent., and in 1661 to 6 per cent. The statute of Anne, reducing the rate of linterest to 5 per cent., extended to buth kingloms. The statutes prohibiting the taking of interest in Irelund wero not repealed until $t 635$, when the statute 10 ti Car. 1., cap. 22 , gave fiberty to stipulate for any rate not exceeding 10 per cent. In liot this rate was reduced to 8 per cent.; in 1722 it
was reduced to $\mathbf{7}$ per cent. ; and in $\mathbf{1 7 3 2}$ it was further reduced to 6 per reat.

France.-In Firance the rate of interest was fixed nt 5 per cent. wo carly ta 1665 ; and this, a fuw short intervals oniy excepted, continued to be the legal rate till the llevolution. Laverdy, in 1;66, reduced it from 5 to 4 per cent. Instead, hewever, of the market rate being proportionally reduced, it wua ruised from 5 to 6 per cent. Prevloualy to the promulgation of the edict, foans might have been obtalned un geod security at 5 per cent.; but an additional per cent, wan afterwurd required to cover the illegailty. Thin caused the npeedy abendonment of the nieasure.* 'The same thing happened In Livonia in 1786, when the Einiress Catherine reduced intesent from 6 to 5 per cent. Ilitherto, suys Storch (in loco cifato), these who had good security to effer were able to berrow at 6 per cent.; but thencaforth they hud to pay 7 per cent. or upward. And such wiil be found to be invurhably the case, when the legal is lese thun the market rate of interest.

It has been observed by Adam Sinith, that the statutory regulations, reducing Interest in England, were mude witil great propricty. Instend of precediuf, they foilowed the fail which was gradually taking place in the market rate of intereat, and, therefore, did not contribute, as they would otherwise have dune, to raise that which th. $y$ were intended to reduce. Sir Josiah Chilid, whose treutise, recomnending a reduction of interest to $t$ per cent., was originaily poblished in 1668, $\dagger$ states, that the goldsmiths of London, who then acted as hunkera, conid obtuin us mueh money us they pleused, upon their servants' notes only, ut If per cent. The supposed insecurity of the revolutionary estahitishent, and the novelty of the practice of funding, occasioned the payment of a high rate of interest for a large portion of the sums borrowad by the public in the reigns of William III, und Anne. But private persons, of andoubted credit, could then borrow at less thin s per cent. During the reign of George I1. the market rute of interent thuctuated irom 3 to 4 and $4 \frac{1}{2}$ per cent. $\ddagger$ Smith mentions that the inereased means of protitably investing capital nequired during the war, terminated iy tho peace of Puris in 17ti3, raised the market rate of interest to u level with the statutory rate, or perhajs higher. Ilut it was not until the subsequent European war that uny very material or feneral inconvenience was fund to result from the linitation of interest to 5 per cent.

It is neccasary, however, to observe, that this remark applies exclusively to loans negotiated by indiviluals who could offer unexceptionable security; for, since the act of 171.t, persons enguged in employments of more than ordinary hazard, or whose character for pradence and punctuality did not stand high, or who could ouly offer inferior security, were amble to borrow at 5 per cent., and were consequentiy compelled to resurt to a variety of schemes for defeating or evading the enuctments in the statute. The most common device was the sale of an anuuity. Thus, supposing an individual whose personal credit was indittirent, and who had only the liferent of un estate to give in necurity, wished to borrow, he sold an manaity to the lemder sufficient to pay the interent stipulated for, which, because of the risks and odium attending auch transactions, was always higher than the market rate, and aiso to piay the promitm necessary to insure payment of the principal at the death of the borrower. It is earious to ohserve, that though the salo of un ir-

- Storeh, Traite d'Economie Iolitique, tom. ili., p. 187.
$\dagger$ A second edition, very greatly entarged, was pubtished ts 1690.
$\ddagger$ On the 18th December, 1752, the 3 per cents. brought the highest priee they have littherto reached, namely, 1063 per cent. On the 201 h of Septeniber, 1797, the day on whilh the fallure of Lord Malmeabory'n altempt to negothate with the Freach repabilic transpired, consols fell to 47 , belag the loweat price at which they have ever beea sotd.
rodeemable life unnulty, at a rate exceoding legal interest, was not reckoned fraudulent or usarions, yet, so late as 1743, Lord Hardwicke held that, in their leas oxceptlonable form, or when they were redeemable, their sale could be looked upon in no other light than as an Invasion of the statute of usury, and a loan of money:* But the extreme fnexpediency of this distinction soon became obvions, and the law was changed. The grent extenolon of the tratio in annuitles; and the advantagn of giving as muoh puhlicity as posslble to auch transactions, led to variour inquiries and regulations reapecting them in the early part of the roign of George III. In coneequence, the sale of irredeemable annuities became nearly unknown ; and it was raled, that the sale of a redeemable annulty conld not be impeached, though it appeared on the face of the deeds that the lender had eecured the principal by offecting an assurance of the borrower's life.
During the greater part of the Frenoh revolationary war, the usury laws operated to the prejudice of all classes of borrowers. The greater extent and high interes "of the public loane, the facility of aelling out of the funds, tha regularity with which the dividends were pald, and the tomptations to speculation arising from the fuctuationa in the price of funted property, diverted so large a portion of the floatlag capital of the country into the coffers of the treasury, thit it was next to imposeible for private individnals to borrow at the legal rate of interest, except from the trustees of pablic companier, or through the influence of circuinstances of a very peculinr nature. . Hence, the proprietors of unencumbered freeholl estates, of which they had the absolnte disposal, were very genorally ohilged, when they had occasion for lonns, to rasort to those dextructive expedient, whleh had formurly been the resource only of opendthrifts and persons in desporate circumatances.

Committre on Uamry Sames.-The evidence annexed to the "Report of the Commlttee of the House of Commons, in 1818, on the Usury Laws," sets their Impolley and pernicioun Inficence in a clear light. Mr. Sugden, now Iord St. Leonarl, stated that when the market rute of Interent was atrove the legsl rate, the landed proprietor was compelled to resort to some shift to evade the usury lawn. He had "known annuitles granted for three liven, nt 10 wer eent., upon fee-s²:ajule estates, nnencumbered, and of great annual value, in a register couity. He had mlso known annuities granted for four lives; and more would have been dided, but for the danger of equity setting aside the transaction on acconnt of the inauequacy of the consideratlon. Jatierly, many ahnuities were granted for a term of yeurs certaln, not depending upon liven." On leing askel whether, were there not lawa limiting the rate of interest, better terms could or conld not have been obtained, he answered, "I am decidedly of opinion that better terma could have heen obtalned : for there in a atigua which nttuches to men who lend money upon annuities, that drive all respectable mien out of the market. Some leading men did latterly embark In such transactions, but $\bar{z}$ never knew a man of reputation in my own profession lend money in anch a mannef, atthough we have the bent meana of ancertainiag the safest mecurities, and of olstaining the bent terms."
"The laws againut noury," nayn Mr. Ifolland, of the honse of Menera. Haring Brotheim and Company, "drive men in distress, or in want uf money, to much more fisastrous modes of raising it than they would adopt if no nsury laws exinted. The man in trade, in want of momay for ma unexpected demand, or dilsupvolnted in his returns, mut fulfill tis engagements, or forfeit his credit. Ile might have borrowed money at © per cent., bint the law aliowe no one to lend it to

[^28]himi and he must sell some of the conumodity he holds, at a reduced prico, In order to meet his engago mente. For example, he holds sugar which is worth 800. ; but he is compelled to sell it immediately for 703. to the man who will give him cash for it, and thu actually borrowe money at 121 per cent., whioh, had the law allowed hlm, ho might have lorrowed from a money dealer at 6 per cent. It is known to every mexhant that cases of this kind are common occur. ennoes in every commercial town, and more especinlly In the i retropolis. ${ }^{l}$ A man in diatress for money paye more Inturest, owing to the voury laws, than he woild If no euch laws existed; because now he is obllged to go to some of the disrepratable money-lendern to bor. row, as he knows the respectable money-lender will not break the laws of his conntry: The disreputalle moner-lender knows that he has the ordinary risk of his dabtor to incur in lending his money, and he has further to encounter the penalty of the law, for toth of which riaks the borrower must pay. "If no usary Iaws existed; in common cases, and where a person is respectable, he might obtain a loan from the mespects. ble money-iender, who would then only have to calculate his ordinary risk, and the compensation for the use of his money."

The committee admitted the force of this evidence by ayreeing to the following resolutions: " lst. That it is the opinion of this committee, that the lawe regolating or reatraining the rate of intereat have been extenoively evadert, and have failed of the effect of impoaling a maximum on such rate; and that, of late yeary, from the constant exce日s of the market rate of interent above the rate limited by law, they hava adisd to the expenne incurred by borrowers on real security, and that auch bormwers have been compeiled to resort to the mode of granting annulties on lives; s morle which has been made a cover for obtaining a higher rate of interest than the rate limited ly low, and has further subjected the borrowers to enormons chargen, or forced them to make very disarivantageons salles cf their eatates. 2d. That it is the oplaion of this committee, that the conntruction of such laws, as npplicable to the traneactions of commerce ns at pres. ent carried on, have been attended with much uncertainty as to the logality of many tranasctions of frequent occurrence, and consequently been product. ive of much emlsarmasment and litigation. 3i. That it is the opinion of this committee, that the present periol, whon the inarket rate of intorest is below the legal rate, affords an opportnnity peculiarly favorabie for the repeal of the sald laws."
In aplte, however, of the recommendistien of the committee, and the cogent evidence on which it was founded, the popular prejudice continued so strong, that it was not till 1839 that a atatute wes pasgel, the 2 di aud 3 Virt., cap. 37, which exempted all hills of exchange and promiseury notes, not having more than twelve montis to run, and all contracta for sums shove $\mathbf{\ell 1 0}$ from the opzration of the uanry laws. It was onpponed, or at all oventa argued, that the repeal of the usury laws would tempt such Individunla as had money to lend, to indulgo in those mean and diseriditable practices which charucterize the lowest class of monevaienlery But it was more reanomully contenied, that in the event of the rate of intarat being left to le adjuatel by the free emppetition of the parties, there woull be little employment for inferior dealers. Kxcept when the market rate of interest was bolow the legal rate, the usary laws prevgnted ali persons, whone crodit was not extremely gooi, from ub taining loans from eapitalists of the highest character and forced them to have recourse to those who were less scrupulous. Supposing the market rate of interest to be 6 or 7 per cent., an indivkitual in ordinarily good eredit may, now that the unury lawe are abol lished, eaplly olvenia a loan at that rute. Hut when the law declared that no more than 5 per cent. ahould be
taken, those le and mo the mar of an in mlum fo tlon, re in such c to attemy position of transe desirable means. they wer ing, they vated the remove.

The outer tallists for tal trious individ that which is of the proild to their chal meeting theid anmed otate capitaliat t vidnais, is, in refuses to len cireumstance th $y$ in good
taken, and, crusequently, affixed a species of stigma to those lenders who bargained for a higher rate, the rich and mere respectabie capitalista boing excluded from the market, borrowers were ebliged to resort to these of an inferior character, whe, in additien to the premium for the risk of eutering into an lllegal transaction, received an indemnification for the odium which, in auch cames, always attachen to the lender. It is idle to attempt to aecure individuals againat the riak of im position in pecuniary more than in any other speoles of transactiess. And, although the object had been dosirable, it could not be obtained by auch inadequate means. The usury laws generatod the very mischief they were intended to auppress. Instead of diminishing, they mrltiplied nsurious transactions, and aggravated the evila they were deaigned to mitigate or remove.

Nething can be more unressonable than the clamor agsinst meney-lenders, because of their exacting ? comparatively high rate of interest from prodigans and spendthrifts. Thia is the most proper and efficient check that can be put upon extravagance. Supposing the security of a prodigal and an industrions man to be nearly equal, and this is but seldem the case, the capitalist who lends to the latter in preference to the former, confere a service on the conmunity. He prevents those funds which ought to be employed in eupporting uasful labor, and in adding to the public weaith, ${ }^{\sim} \mathrm{m}$ being wasted in frivolens or pernicious parsuits.

But perhaps it will be anid that this is mistaking the object of the usury lnws; that they were net intended to fores capitalists to lend to spendthrifts on the same terms as to industrious persons, but to protect the prodigal and unwary from the extortion of uaurers, by making any stipulation between them for more than a given rate of interest null and void. But why nil this solicitude about the least valuabie class of seciety ? Why fetter the circulntion of capital among those who would turn it to the beat account, lest any pertion of it chance to fall into the hands of these whe would eqosnder it away? If the prevention of prodigality be of sufficient importance to justify the interference of the legislature, prodigals should he put under an intendict; for this is the only way in which it is possible to reatrict them. it is not hy horrowing meney at high interest, but iy centrastiaz delits to deaiers, on whose charge thore is no check, that spendthrifts run through their fortunes. Bentham has jnstly observed, that so long as a man is looked upon as one who will pay, he can much more easily get the goouls he wanta than the money to buy them with, though he were content to give for it twice or three times the ordinary rate of irterest. How contradictory, then, to permit provigals to borrow (for it was really borrowing) the iargest supplies of food, clothes, ctc., r $\$, 20,30$, or eveu 100 per cent. Interest, at the same tine that we prohibited them, and every one else, from borrowing money at more than 5 per cent.? Instead of being of any service, this restriction was evidently injurious to the prodignal. It narrewed his choice, and drove him to a market where no diagrace is attached to the exaction of the most exorbitant interest, and where he could searcely escape being ruined.

The cutcry which is sometimes raised against capltalists for taking advantage of the neceasities of indisstrious individuale, in seldom much better founded tisan that which is raised againat them for taking advantage of the prodigal or simple. Partien borrow accorling to their character for sobricty, and punctuality in meeting their ongagemente, and according to the p'esamed etate of their affairs at the time. To may that a capitailist takes advantage of the necessicise of .adividuaie, ie, in most csses, equivalent to saying that he refuses to lend to persons in suapicious or necessitous circumstances or the same terms he would do wero th $y$ in good credit, or were there no doubt of thelr
tolvency. And were he to act otherwise, would he be coneidered fit to be intrusted with the management of his nffaire?

But, as already eegn, whatever may be the extortion of lenders, the usu. y laws did not check'it. On the contrary; they compelled the borrower to pay, over and above the conimon rate of interest, is premium to indemnify the lenders for the risks incurred in breaking them. They attempter to remedy what was not an ovil, and what, consequenily, should not have been interfered with; and in dcing this, they necesearlly croated a real grievance. The wisdom of an nct of Parliament which should compel the underwriter, to insaro a ganpowder magezine and $c$ salt warehouse on the aame terms, would not be very evident. Yet it would not be more absuri than $C$ jnact that the eame rate of intereat shall be charged on capital leat on good, on indifferent, and on bad securities. "It is in vain, therefore," to use the werds of Locke, "to go about effectualiy to reduce the price of interest by law, ond you may aa rationally iope to set a fixed rate upon the hire of houses or ships, as of money. He that wants a vessel rather than lose his market, will not atick to have it at the market rate, and find mear s to do it with security to the owner, though the in ce were limited by lis ; and he that wants moray, ruther than loes his voyage or his trade, wili pay the naturel interest for it, und aubmit to auch whys of conveyance as ahall keep the lender out of reach of the iaw." ("Considerations of the lowering of interest and raising the value of money, 1691," works, vol. il., p. 7, Ito, 1777.) The case of Heliand furnishos a striking proof of the correctness of the theory we have been endeavoring to establish. The rate of intorest has been, tor a very long period, lower in Holinnd then anywhere else in Europe; and yet it is the only country in which usury iaws have been nitogether ur:known, where capitalists are alfowed to demand, and borrowers te pay, any rate of intereat. Strictiy spealing, this appilies only to the staie of Holland previously to the rovoiution in 1795. The enactmenta of the Code Napoleon were se beequently introduced; but it appenra, from the report of the Parliamontary Committee on the usury laws, that they havo net been acted upon. Not withatanding all the violent changes of the government, and the extraordinary disturbance of her financial concerns since 1790 , the rate of intereat in Iolland has continued comparatively steady. Inaring the whole of that period, persona who could offer unexceptionalile security have been able to borrow at from 2 to $5 \frac{1}{2}$ per cent. ; nor has the avorage rate of interest charged on oapitnl advanced on the worst apecies of security ever exceeded 6 or 7 per cent., exoupt when the government was negotiating a forced ioan. But, in this country, where the law declared that no mere than ${ }^{5}$ jer cent. shouid be taken, the rate of interest for money advanced on the beat landed security varied, in the same period, from 5 to 16 or 17 per cent., or above five times as much as in Holland.
In France the usury laws were abolished at tho Revolution; and it is stated that their abolition was not attended by any rise of interest.-STonch, Economie Politipue, tom. ill, pi 187. According to tho Code Napoleon, only 6 per cont. is aliowed to he charged on commercini loans, and 5 per cent. on those made on the security of real property. 'There is, however, no diflicuity in uvading the law. This is usually done by giving a bonus before completing the transaction, or, which is the aame thing, by framing the ohllgation for the debt for a larger sum than is reaily alwanoed by the lender. None of the parties ; artionlarly Interested can be called to pwear to the fact of such bonua being given; so that the transaction is unimpeachable, unless a third party, privy to the aettloment of the affuir, be produced as a witness.-E.B. The reader is referred to M'Collocu's Essay on Interest and Fixchange, pub. in Bankers' Mag., Now York.

In Hamburg the rate of luterest is quite unreatrict－ ed ；or，if there be a written law restraining it，it has become obsolete．The rate，therefore，varies accord－ ing to circumstances．Oceaslonally it has been at 7， 8 ，and even 10 per cent．；and $\ln 1799$ ，a period of great mercantile ombarrassmont and insecurity，it was as high as 14 per cent．Generally，hewever，the rate of disceant on good bills does not exceed 8 or 4 per cent．－Report ow Usury Lawn，p． 40.

In Russia the legal rate of intereat is 6 per cent． But as Ruseis is a conntry capsble of mach Improve－ ment，and where there are very grent facilities for the advantageous employment of capital，the market rate of interest is invariably higher than the statute rate， and the law is constantly and easily evaded．－Report on Usury Lawe，p． 46 ；and Storchi，tom．iito，p． 207.

The previous statements apply only to the cases of Interest arising out of leans made by one party to unother．But there are cases in which interest may become due without being stipulated for，by unneces－ sary or unjustifisble delays in the payment of delts， or by truatees，agents，or other partien coming into posseasion of property belonging tc others，etc．，and in these it is necessary to obviate litigation，that the in－ tereat to be charged should be fixed by law．This legel rate had better be somewhat below the orlinary market rete，and may be adjuited from time to tlme us circumstances may require．Bat，except in cases of this sort，there is no more reason for interfering to regulate the rate of interest，than there is for inter－ fering to regulate premiums of insurance．

Distinction of Simple and Compound Inderest．－When a loan is made，it is usual to stipulate that the interest upon it should be regularly paid at the end of every year，half year，etc．A loan of this sert is said to be at simple interest．It is of the essence of such loan that no part of the interest accruing upon it should be added to the princlpal to form a new principal ；and tbough payment of the interest were not made when it becomes due，the lender would not be entitied to charge interest upon such unpaid interest．Thus，sup－ pose 6100 were lent at simple interest at 5 per cent．， payable at the end of each year；the lender would，at the end of three or four years，supposing him to have received no previous payments，be entitled to $\$ 15$ or 820 ，and no more．

Compound Interest．－Sometimes，however，money or capital is in reated so that the intorest is not puid at the periods when it becones due，but is progressively added to the principal；so that at every term a new priacipal is formed，consisting of the original princi－ pal and the successive aceumulations of intereat upon interest．Money invested in this wsy is asid to be placed at compound interest．It appears only reasona－ ble，when a borrower does not pay the interast he has contracted for at the period when it is due，that he should pay interest upon such Interest．This，how－ ever，is not allowed ly the law of Eagland；nor is it allowed to make a loan at compound interest．But this rule is easily evaded by taking a new ohligation fur the priuctpal with the interest Included，when the latter becomes due．Investments at compound inter－ ent are also very fretileat．Thus，if an individual buy into the funds，and regolarly buy fresh atock with the divilends，the eapital will increase at compound Intercat ；and no in any similar case．

Calculation of Interest．－Interest is estimated at so much per cent．por annum，or by dividing the princi－ pal into 100 equal parta，and specifying how many of these parta are psid yearly for its use．Thus 5 per cent．，or 5 parts out of 100 ，means that \＄5 are puill for the use of $\$ 100$ for a year， 10 for the nie of $\$ 200$ ． 4250 for the use of 450 for the same period，and so on．

Many attempts havo inen made to contrive expedi－ tions processes for calculating interest．The folluw－ ing ls one of the bent：Suppose it were requirell to find the intereat upon 172 for 107 days at 5 per cent．

This forms what in called in arithmeticel books a double rule of chree question，and would be stated as follows：
$\boldsymbol{L}_{0}$ Dayw， $\boldsymbol{L}_{2} \quad \boldsymbol{L}_{\boldsymbol{c}}$ Daya
$100 \times 365: 5:: 172 \times 107=$ the interest required． Hence to find the intareat of any sum for any number of duys at any rate per cent．，multiply the sum by the number of duys，and the product by the rate，and di－ vide by $36,500(365 \times 100)$ ；the quotient is the inter－ ost required．When the rate is 5 per cent．，or 1－20th of the principal，all that is required is te divide the product of the sum multiplled by the day＇s hy 7300 （365，the days in a year，multiplied by 20 ）．Five per cent．interest being found by this extremely simple process，it is usual in practice to calculate 4 per cent． laterest hy deducting 1－5th； 8 per cent．by deducting 2－5ths； 21 per cent．by dividing by $2 ; 2$ per cent．by taking the half of 4 ，and so on．

In calculating interest upon accounts current，it is requisite to state the number of days between each re． celpt or payment，and the date（commonly the 31st of December）to which the acoount current is made np． Thus，$\$ 172$ pald on the 15 th of September，bearing in－ terest to the 31st of December， 107 days．The amonnt of such interest may，then，be calculated as above ex－ plained，or by the aid of tables．
The 30th of June is，after the 31at of December，the most usual dute to which sccounts current are made up ，and interest calculated．It is desirable，in culcu－ lating interest on accounts current，to be able readily to find the number of days from one day in any month to any day in any other month．This may be dono with the greatest ease by means of the following table：
Table mon abcertaining the Nugber or Dayb from any ong Day in tue Year to any othea Day．

parallel line to the column headed Angust, you find 226, the number reqnired. To find the number of days between any other two given days, when thoy sre both after the first of January, the number oppogite the first day must, of course, be deducted from that opposite to the second. Thus, to find the number of days between the 18th of March and the 19th of August, deduct from 281-the number in the table opposits to 19 and ander August-72, the number opposite to 18 and under March, and the remainder, 159, is the number required, last day included. In leap yeurs, one must be added to the number after the 28th of February.
Whea interest, instesd of being simple, is compound, the first year's or term's interest must be found, and being added to the original principal, makes the principal upon which interest is to be caiculsted for the second year or term ; and the second year's or term's interest being added to this last principal, makes that apon which interest is to be calcuiated for tie third jear or term; and no on for any number of years. But when the number of years is conalderable, this process becomes exceedingly cumbersome and tedious, and to faclitate it tables have been constructed, which gre sulijoined to this article.
The first of these tables ( p .1074 ) represents the amount of $\$ 1$ accumulating at compound interest, at 3, 31, 4, 43, np to 10 per cent. evory year, from 1 year to 85 years, in dollars and decimals of a dollar. Now, suppose that we wish to know how much $\$ 500$ will amount to in saven years at 4 per cent. In the column marked 4 pe: cent., and opposite to 7 years, we find $\$ 1 \cdot 31.5931$, which shows that $\$ 1$ will, if invested at 4 per cent., cempound interest, nmonnt to $\% 1.81 .5931$ in 7 years; snd, consequently, $\$ 500$ will, in the same time, and at the same rate, amount to $\$ 500 \times 1 \cdot 31.5931$, or $\$ 657 \cdot 96.6$. For the same purpose of facilitating calculstion, the prasent value of $\$ 1$ due any number of years hence, net exceeding 85 , at $3,34,4,4$, up to 10 per cent., compound interest, is given in the talles, pp. 1074-1077. The use of these tables is precisely similar to the one above. Let it, for exampie, be required to find the present worth of 8500 due 7 years hence, reckoning compound interest at 4 per cent. ; opposite to 7 yenra, and under 4 per cent., $75 \cdot 291781$, the present worih of el due at the end of 7 years; and multiplying this sum by $\$ 500$, the product being $\$ 379 \cdot 95.89$, is the answar required. These talles are in part from Tables of Interest, Discount, and Annuities, by Joun Smant, Gent., 4to., London, 1726. They are carried to eight decimal places, and enjoy the highest charaeter in England and on the Continent, for accuracy and completeness. The original work is now becone scarc.
Ansurties. 1. Annuities certain.-When a sum of money is to be paid yearly for a certain number of years, it is calied an annuity. The annuities usualiy' met with are either for a given number of years, which are calied annuities certain; or they are to he paid so long as one or more individusif shall iive, and are thence called contingent annuities.
By the amount of an annuity at any given time, is meant the sum to whech it will theu amount, supposing it to have leen reguinriy improved at corapound interest during the intervening period.
The present value of an annuity for any given period, is the sum of the present values of ail the payments of that anauity.
Seo Jonks on Aunuities, London, 2 vols., 8 vo; Ency. Brit., 8th ed.; Bankens' Mag., vols. v., vi., vii., New York, 1854-1857; J. R. McCulloch, Essays on Erchange, Interest, cte., New York, 1857; Assurance Magazine, London, 1854-1857; Report to British Parliament on Unury Laves $\operatorname{Srorch}$, Economie Politique, iii.; Madox, ILivisry of the Erchequer; Considerutions on the State of the English Currency; Heme's Easay on Interest; Lssay on the Gorerning Causes of the Rate of Ituterest.

The nees of these tablea are numerous, and they are escily applied. Sappose, for example, it were required to tell the amount of an annuity of 850 a year for 17 years, at 4 per cent., compound interest.
Opposite to 17 (Table, p. 1074) in the column of years, and under 4 per cent., la $23 \cdot 69751,239$, being the amount of an annuity of \$1 for the given time at the given rate per cent. ; and this multiplied by 50 givea \$1184.87.56195, the amount required.
Suppose, now, that it is required what sum onu must pay down to receive an annuity of $\$ 50$, to continue for 17 years, compound luterest at 4 per cent. ?

Opposite to 17 years (Table, p. 1076) and onder 4 per cent., is $12 \cdot 16566,886$, the present value of an annuity of $\$ 1$ for the given time and at the given rste por cent. ; and this multiplied by 50 , gives $\$ 608 \cdot 28.3443$, the present value required.

When it is required to find the time which must elapse, in order that a glven sum, improved at a specified rate of compound interest, may increase to some other given sum, divide the istter sum by the former, and look for the quotient, or the number nesrest to it, in tabie No: I., under the given rate per cent., and the years opposite to tt are the unswer: thns,
In what time will $\$ 523$ amount to $\$ 1087 \cdot 27.94$, at 5 per cent., compound interest ?
Divide 1087.27.94, etc., by 523, and the quotient will be 2.0789 , etc., which under 5 per cent. in table $I$., is opposits to 15 years, the time required.
If it had been required to find the time in which a given annuity, improved at a certsin rate of compound interest, would have increased to some given sum, the question would have been answered by dividing, as above, the given sum by the annulty, and looking for the quotient (not in table No. I., but) in table No. III., under the given rate per cent., it would be found on a line with the time requlred; thus,
A owes $\% 1000$, and resolves to appropriate 10 a year of his income to its discharge ; in what time will the debt be extinguished, reckoning compound interest at 4 per cent.?
1000 divided hy 10 gives 100 , the number in tsble No. III. under 4 per cent, and nearest to this quotient is 00.8265 , etc., opposite to 41 years, the required time. IIad the rate of interest been 5 per cent., the debt would have been discharged in somewhat less than 87 years. This example is given by Dr. Price ( $A n n u$ ities, 6th ed., vol. ii., p. 289); and on this principie the whole fabric of the sinking fund was constructed. Of the abstract truth of the principle there can not, indeed, the $n$ doubt. But every thing depends on the increasing sums annualiy produced being immedintely invested on the same terms; and this, when the sum is large, and the period long, is altogether impracticable.
Let it next be required to find an annuity which, being increased at a given rate of compound interest during a given time, will nmount to a speelliced sum: in this care we divide the specified sum by the anount of $\$ 1$ for the time and rate given, as found in the Table III., and the quotient is the answer.-Thus, What annuity will amount to $\$ 1,087,27,94$ in 15 years nt 5 per cent. compound interest? Opposite to 15 years in Tahle 11I., and under 5 per cent., is 21.5785 , etc., the amount of $\$ 1$ for the given time and rate; and dividing $1087 \cdot 2794$, etc., by this sum, the quotient $50 \cdot 387$, etc., is the annuity required. Deferred annuities are those which do not commence till after a certain number of years; and reversiovary anvuities, such as depend upon the occurrence of some uncertain event, as the denth of an individual, etc. The present value of a deferred annuity is found by deducting, from the value of an annuity for tho whole period, the value of an annuity to the term nt which the reverslonary annuity is to commenee.-Thus, What is the present value of an annuity of $\$ 50$ to continue for $\mathbf{2 5}$ years, commencing at 7 years from the present timo,

Intereat at 4 per cent. ? According to ': able No. IV. the value of an annuity of 61 for 25 y sars at 4 per cent. is $15 \cdot 62207,995$, and that of 81 for 7 years is $0 \cdot 00205,467$, whici being deducted from the other, leaves $9 \cdot 62002,528$, whlch multiplled by 00 gives 8481 , the answer required. Supposing the annuity, Inatead of being for 25 years, had been a perpetuity, it would have been worth $\$ 1,200$, from which deducting $\$ 300$ 10c., the value of an annulty for 7 years at 4 per cent., there remains $\$ 949 \cdot 90$, the value of the reversion. For a selection of problems that may be solved by Table of annuities certain, see 8mant's Tables, pp. 20-109.
2. Lifo Annuitics.-After what has been otated in the article on Ineunance (Geneaai, Principles of), respecting tables of mortality, it will be easy to eee how the value of a life annuity lo calculated. Sup-posing-to revert to the example given before Insurance, that it were required to find the present value of $\$ 1$, the receipt of which is deperdent on the contingency of a person, now 56 years of age, being alive 10 years hence, taking the Carlisle table of mortality, and interest at 4 per cent. Now, according to that taile, of 10,000 perssis horn together, 4000 attain to 56 , and 2894 to 66 years of age. Th.s probabiiity that a person, now 56 yeurs, will bs alive 10 yeasw henre, is, consequently, $2894-4030$; and the present value of el, to be received celtan 10 years hence being \%0.075064, it followa, that. it its receint be mate to depend on $c$ llfe 56 years ot a a ${ }^{\prime}$ e, uttaining to 66 years, Its value wiii be rednced by tlat contingency to $2884 \times \div 0.675564-i 00 \mathrm{~K}=80.43877$. If, then, we had to flod the present value of an annuity of a 1 , sec ured on the life of a person now $\mathbf{b} 6$, we should calculate in this way the present value of each of the 48 payments, which, aceording to the Carlisle table, he might receive, and their sum would, of course, the the present value of the annuity.

This statement is eneugh to show the principle on which all calculations of annuities depend; and this also was, in fact, the raethod aceording to which they were calculated, till Mr. Simpson and M. Ealer invented a shorter and eanier process, deriving form the value of an annuity st any age, that of an annuity at the nex t younger age. There is a considerable discrepancy in the gums af whick different authors, and different insurance offices, estimate the present vilue of life annuities payable to persons of the name age. 'fhis does not arise from any difference in the mode of calculating the annuities, but from differences in the tables of mortality employed. These can only be accurate when they are deduced from multiplied and careful observations made, during a long series of years, on a large body of persons; or when the average numbers of the whole population, and of the deaths at eviry age, for a lengthened period, have been determined with the necensary eare. It is to be regretted, that governments who alone have the neans of ascertaining the rate of mertality by olservitiona made on a sufficlentiy large scale, have been singularly fuattentive to thelr daty in this respect. And until a very fow yeara since, when Mr. Finlayson was employed to calcolata tables of the value of annuitien from the ages of the nominees in putile tontinen, and of individuals on whose livea government had granted anmities, all that had been done in this country to lay a molid fourdation on whifh to construct the vast fabicic of life insurance, had been the work of a few frivate persons, whin had, of cuaree, but a limited namier of obeervations to work upen,

The celebrated mathematicisn, Dr. italiey, was the first whe calcuintad a table of mortality, whieb he dedaced from obmervationz made at Breslau, in Silesia. In 1724 M . de Molvere published the first edition of his tract on Annitiea on liers. Ia order $\div n$ fucilitate the calculation of their vifuew, M. de Moivrs asamed th, asinual decremente of life to be equal ; that is, ha su poded that out of 86 (the utmest limit of life ca his hy.
pothesis) persons bern together one would die every year till the whole were extinct. This assumptien agreed pretty well with the true values between 30 and 70 years of age, as given In Dr. Halley's table; but wan very remote frcm the truth in the earlier and later periodi. Mr. Thomas Slmpson, in his work on Annuities and Reversions, originally published in 1742, gave a table of mortallty deduced from the Lomdan bills, and tables founded upon It of the values of annu. lties, But at the period when this tahle was calculated, the mortality in London was so much higher than in the reat of the country, that the velues of the annuities given in it were far too small for general use. In 1746 M . Deparcieux published, is his Lisai sur les Probabilites de la Durfe de la Vie Humaine-a work distlaguinhed by its persplcuity and neatness-tables of mortality deduced from observationn made on the mortuary registers of several religious houses, and on lists of the nominess in several tontinos. In this work, separate tables were first construeted for malea and females, and the greater longevity of the latter rendered apparent. M. Deparcleux's tables were a very great acquisition to the science, and are decidedly superior to some that are atill extensivaly used. Dr. Drice's fa, none work on Annuities, the first edition of which was published in 1770 , contributcis powerfuliy' to tlirect the public attention to inquiries of this sort, and was, in this reapect, of very great utility. Of the more recent works, the beat are those of Mr. Baily and Mr. Milne, which, indeed, are both excellent. Tha latter, beaides all thut was previously known as to the history, theory, or practice of the science, contaias much new ond viluable watter; and to it we heg to refer such of outr randurs an wish to enter fully into the sulject.

The tailte on whinh Dr. Price laid the greatest stress was calco fated from the burial registers kept in the prisli of All Suinis, in Northampton, containing little inare than half the population of the town. There can lie no doubt, however, as well from original defeets in the construction of the table, as from the improveuent that has since taken place in the healthiness of the public, that the mortality reprosented in the Northamptan table is, and has long been, decidedly above the average rate of mortality in England. Mr. Morgran, i.sdeed, the lato learned actuary of the Equitable Society, rontended chat this is not the case, nnd that the society's expericnee shows that the Northampiton table is still remarkably aceurate. Hut the facts Mr. Morgan discloaed in his "Views of the lise and I'regresa of the Equitable Society," p. 42, jublished in 1828, are quite at variance with this opinion; for he there ratase, that the deaths of persons insured in the Eyitalile Society, from 50 to 60 years of age, luring the 12 years previously to 1808 , were 339 ; whereas, according to the Northampton table, they shotht have been 5-15! And Mr. Milne has endeavored to show (Art. Annuities, new ed. of Eincy. Brit.) that the diserepancy is really much greater.

The ouly other talin used to any atent in Engiand for the calculation of lifs ennuities, is that framed by Mr. Aling, from observations made by Dr. II Py sham on the rate c. mortality at Carlisle. It gives a decidedis lower rite of antality than the Northampton 'rible; anf? there are gool yreuads for ihinking that zhe no. tality which it reprencats is not very different from the actual rate throughout most parts of Finglami; bugh it can not be supjowed that a table fonided on so narrow a basin rhould give a parfectly fair view of the average mortality of the entire kingiom.

In life insurcmee, $t^{t_{1}}$ fizot annual promium is at. ways paid at the comswencement of the assurance, and the others at the lieginging of each year, so long as the party annnred arvives. Ifence, at the !eginuing of the asuurcies, the wnole of tho annual peremiuns payphle for it a:cceed the value of au equal annuity ou lifiv ty one yonio purehase. And, therefore, when the valuc of an assurance in present meney is given,
to find the wh ber of increas life of Carlisl require to thrit lifa jos chase, chase,
che $16.14 \times 1$ be deri the life value ol auties,

Tables $V$ cording t Carlisle Milne. Secoml $R$. on Frieni results of ity, in rel of liff, th between bie and render th the reade admit, w value of ard at 3 , aupton a of the va thu liven cent., He dem, the sort to : the gucst gard to in which tables.
to find the equivalont unnual preminm during the life, the whole present value must be divided by the aumber of years' pnrchase an annuity on the life ia worth, increased by 1. Thus, for all assurance of $\mathbf{\$ 1 0 0}$ on a life of 40 years of age, an office, calculating by the Carlisle table of mortality; and at 4 per cent. Interent, requirss $\$ 53-446$ in present money. Now, according to that table and rate of intereat, an annuity on a llfe just 40 years of age is worth 10.074 years' purchase, so that the equivalent annual premlum is $\frac{05 s^{\prime} \cdot 46}{13014 \mathrm{I}}=13 \cdot 325$. The annual premium may, however, be derived directly from the value of an sanuity on the life, without first caleulatling the total present value of the assurance. She Mr. Milnes Treat. on Annuities, or art. A mnuitiea, in new editlon of Ency. Brit.
"In order to exhlbit the foundation upon which tablea of life annultles and insurance have been founded In this and ether courtries, we have given, In a portion of the preceding tables, the rate of mortallty that has been observed to take place among 1000 children born together, or the numbers allve at the end of each year, tiil the whole becomo extlact, In England, Frince, Sweden, ete., sccording to the most celebrated authoriities. The rate of mortality at Carliale, represented In this table, is less than that observel anywhere else: the ratea which approach nearest to it are those deduced from the obervations already referred to, of M. Deparclenx, and those of in. Kerssebwom, on the nominees of life annuitles in Holland. In order to enlen. late from this tahle the chances whlch a person of any given age has of attalning to any higher age, we have only to divide the number of persons alive st such higher age, given in the column of the table selected 10 decide the question, by the number of persons olive at the glven age, snd the fraction resulting is the chance. We have added, by way of aupplement to thia table, Mr. Finlayson's tablo (No. VI.) of the rate of mortality among 1000 chlldren born together, according to the decrement of lifo observed to take place among the nomlnees in government tontines and llfe annuities in thls country, diatlingulshing mules from females. The rate of mortality which this talle exlibits is decidedly less than that given in the Carlisle table; but the lives $\ln$ the latter are the average of the pepulation, while those in the former are all picked. The uominesa in tontines are uniformly chosen among the healthlest Individuals; and none but those who consider their llvea as good ever luy an annuity. Still, however, the table is very carlons; and it sets the superiority of female llfe in a very striking point of view. Tables VII. und VIII. give the expectation of life, according to the mortality olsserved nt Nortlumpton anil Carlisle; the former by Dr. Price, and the lutter by Mr. Sline. The next table, No. IX., extracted from the Secoml Report of the Comnittee of the Ifouse of Commons on Friendly Societies, gives a comparative vlow of the results of some of the most celebrated tables of inortality, in relation to the rate of mortality, the expectation of life, the value of an annuity, etc. The coincidence between the results doduced from M. Deparcieus's table und that for Carlisle, la very atriking. And to render the information on theas eubjects laid before the reuder ns complete as the nature of thla work will admilt, we have given tables (Nos. X.-XV.) of the value of mis annulty of c1 on a singe lifo, at every age, and at $3,4,5,6,7$ and 8 per cent., accordlug tot he Northanpton und Carlisle tables ; we havo also given tables of the vilue of su annulty of $\pm 1$ on 2 equal livea, and thu lives differing by five years, at $3,:, 5$, and 6 mr cent., according to the same tables. It is but aeldom, therefore, that our renders will require to re. sort to any other work for the menns of soiving the 'questions that usually ocour in pructice with rogard to annuitles; and thore are not many works In which they will find ac good a collection $o^{s}$ the tables. We sulyjoin one or two examples of the mode
of uaing the tables of life annnities. Suppose it wero required, what ought a person aged 45 , to give to seoure an annuity of 850 a year for life, interent at 4 per esnt., according to the Carlisle tuble ? In Tablo No. XI., under 4 per cent., and opposite 45 , is $14 \cdot 104$, the value of an annuity of $\$ 1$, which belng multiplled by 50 givea $705 \cdot 20$, or the value required. According to the Northampton table, the annulty would only have been worth 8614 15. The valne of an annuity on two llves of the same age, or on two lives different by five yeara, vy be found in precisely the sanue way. Some quest.ons in reversionary life annnitles admit of an equally easy solntlon. Thus, suppoee It is required to find the present value of A's intereat in an eatate worth $\$ 100$ a year, falling to hlan at the death of B, aged 40 , Intereat 4 per coni., according to the Carlisle table? The value of the perpetuity of $\$ 100$ a year, interest 4 per cent., is $\$ 2500$; and the value of an annuity of $\$ 100$ on a person aged 40 , interest 4 per cent., is $\$ 1507413$, whlch, deducted from $\$ 2500$, leaves $\$ 99260$, the present value required. A person aged 30 wishes to purchase an annulty of $\$ 50$ for hia wlfe, $2 g e d ~ 25$, provided she survivee him; what ought he to pay for it, interest at 4 per cont, according to the Carlisle table? The value of an annuity of $\$ 1$ on a life aged 30 is 416.852 ; from whieh aubtractling the value of an annuity of $\$ 1$ on two jolnt llvee of 25 and $30,14 \cdot 339$, the difference, $2 \cdot 513 \times 60=125 \cdot 650$, the aum required. Fc: the solution of the more complex casce of survivorship, which do not often occur In practice, recourse mny be had to the directions in Mr. Milne's Treatise on Annuities, and other works of that description. To attempt explainIng them hers would lead us Into details quite Inconsistent with the olject of this work." See Com. Dict.; art. Intehest, by J. R. H'Culloci; Bankers' Mfag., N. Y., 1853-6; the Interest Tsbles now in uee in New York city, are ly Lalisser, Six and Seven per Cent. 4 to 4 ; Phice, 8vo; Oates, 8vo.

Invoice, an account of gools or merchandiae sent by merchants to thair correspondents at home or sbroad, in which the peculiar marks of each package, with other particulars, are set forth.

The revenue laws of the United States require two consular certificates ouly to invoices of foreign merchandise imported into this country (the owners of which reside abroad)-one authenticsting the invoice, the other as to the ralue in Spaniah or American dollars of the currency ${ }^{\prime}$ In which the involee is made out. Where conaular certificutes to involces of goods destined for the United States aro required, they are to be granted only by the consulur offeer within whose consular jurisdletion anch grods have been mannfactured or prepared for expartntion. A practice, it is understood, has extensively prevailed of transmitting invoices to a consular officer at the port of shipment for the usual consular certificates, whose certificate must often nocessarily be given without due knowledge of thoir accuracy or detnils. Thus, invoices of gooda manufactured or prepared for shipment in Switzerlaril have sumetimes heretofore been sworn to at Havre; invoices from Iyons have been verified at Marselles; and those from the Prussian provinces of the Rhine, st the ports of LIolland and Belgium. It is manifest tuut great abuses must opring from such a practice, the meaniag and intent of the law being to require thos's who lisve an accurate knowledgo of the contents of invoices, and the prices of goods comprislng the same, personally to depose to their valuation. All consular oflicers of the United States are strictly enjoineti to conform to this rule, and report to the Treasury Department any violution of it which may come within their knowledge. Under the provisions of the act of Congress of 1st March, 1823, the invoices of nll imported goods subject to ad valoren duty leelonging to yermons not residing in the linited States, unust be sworn to and verified by consular certiticates; the oatl nust be taken by the ewner or manufacturer
of the goods, or a member of the firm owning or manufacturing them, and not by a clork or other anbordinate. In all casea where the oaths to invoices are not taken before the United Statea' conaul, but before some pablle oflicer daly authorized to administer oathy in the country where the goods shall have been purchased, the official certificate of anch officer muat be authenticated by a consalar officer of the United Staten. If there be no consular officar of the United States in the coantry from which the merchandise shall have been imported, the authentication must be executed by a consul of a nation at the time in amity with the Ünited States, If there be any such residing there. If there be no auch consul, the authentication must be mado by two respectable merchants, if any auch there be, residing at the port from which the merchandise shall have been imported.

It ia proper that the oath taken by foreigners should be administered to them, not only in their own language, 80 that they may fully understand the nature and import of it, but also in the form practiced in their own country, which would probably be considered by tham as more solemn and of a more blnding nature than if administered in a form to which they have not been accustomed. The attention of consular officers In alao directed to the 8th and 11th sections of the act of Congress of the 1st March, 1823, in which it will be seen that a consular certificate is required in all cases of involcea of goods exported by the manufacturers thereof, in whole or in part for their account, notwithstanding another ownor in part may reside itt the United States. This provision of the law of 1828, there is ieason to believe, has been hitherto overlooked in many instances. If a conaular officer ascertains and has reliable evidence of the falsity of an oath, administered either by hinself or by a local magistrate whose certificate he has authenticated, he should notify the Treasury Department, which will transmit to him the original invoice and oath, to be used, if deomed expedient, in a prosecution for perjnry.
It is to be remarked that, by the act of $3 d$ March, 1801, invoices of all goods imported into the luited States subjected to a duty ad valorem are required to the " mace out in the currency of the place or country from whence the importation shall be made; and shall contain a true statement of the actual cost of such gooas in such forelgn rurrenoy or currencies, without any respect to the value of the coins of the United States, or foreign coius which now are, or shall be, by law, macie current within the United Statea in wuch forelgn place or country." Ifence, invoicea of free goods are not required to le made out in the currency of the country from whence the coods may be importod; but whenever invoices of auch goodi may be made out in the currency of the country, and said curroncy is depreciated, and ita value not fixed by any law of the Cnited States, a conaular certiltcate of the value of auch currency niust, as before intimated, accompany the same.

There is nothing in the law or instructir ne of the Treanury Department to prohibit invoiot, of free goods from treing made out in the curreccy of the United Staten, or that of any uther country where its value is fixed by our laws. Invoices of ad vaiorem or free gookis, when made out in a foreign depreciated currency, or a currency tha value of which is not fixed by the laws of the United States, whether the inaporter or owner resides in this country or abroud, must in each case lo accompanied by a consular certificate, showing the value of such currency in $S_{j}$ anish or United Statem sijver dollars. Applications are frequentiy muda to the Treasury Department for permilasion to enter merchandise where the invoices are not accompanied by the needifal consular certificates in the casea where auch certificates are by law required. That Department has heretofore acted with great lenteney and indulgence in auch cases, but oxperience has
shown the necessity for a more rigid course in future; and, in all cases whorn such consular certificates should accompany the in voices, any penalty which may be inourred for want of them will be ragularly enferced.
Consuls abroad, by due attention and vigflance, can do much toward checking and preventing the uumerous frauds which are uadoultedly practiced upon the revonue, if they will report to the collectors of the customs of the United States all those invoices where, in their opinions, uniervaluations hava been made, and by otherwise keeping the collectors or this Department generally and fully adrised on this subject ; and they are earneatly requested to do so, and to consider it nne of tha most important carvices which they cuit render in connection with the faithfol collection of the revenue. An erroneous impression exists with many foreign shippers of goods to the United Statee, that the consuls hefore whom the oath to invoices is either taken or verified hove no power to examine the details of such invoices, but eimply to verify the fuct of auch oath being taken before them, or by an officer in authority hnown to them as such. This is not the fact; and consular officers are expected before verifying invoices to satiafy themselves of their correctness.
For the purpose of carrying out a particular syrstem or revenue duties, the govarnment of the United Statea requires that the accuracy of certain invoices should be ascertained and verificd; and a reasonable time for cenauls to accompliah that object, liy an examinatiun of such invoicea, can not be justly denied to them. Consular officers are not aupposed to be practically ucquainted with the market prices or value of all merchandise within their district, or of the precise weights, tares, measures, bounties, etc., included therein ; but inquiry and experience will soon enalule them to render efficient aid to the revenue officers of the United States, ly abcertaining errors or frauda, and promptly informing the Treasury Department, as well as the collector of the port to which tha goods may be destined, of evory inatance where an exporter persists in refuaing to correct his invoice, when apprised of its defects, and that it will be subject to revision at the custom houses of the United States.

CERTIFICATE TO INVOIGE.
Poreign Owner's oath, where goods, vares, or merchandise, have been istually purchused.
I, $\qquad$ do solemily and troly. goods, wares, or merchandise deand troly swoar, that the prodacent and tor merchandise described in the lavolee now my account, oc for aceount of wy wedf actually purchased for prrehane: and that sald lavoles contalue a true and faithful acconnt of the aotual cont thereof, and of all charges thereon; and that no dincounts, bountles, or drawbacke, nre contalned In the mald Involee but auch as have been actuatly allowed on the manc.

- This is equal to $1001 \cdot 8$ English square milios of $60 \cdot 15$ to the degree.

Soil and Climate.-These are very various. Zante is tha most fruitful. It consists principally of an exteasive plain, occupied by plantations of currants, and having an air of luxuriant fertility and richness. Its climate is comparatively equal and fine, but it is very subject to earthquakes. Corfu and Cephalonia are more rugged and less fruitful than Zante; and the former, from its vleinity to the snowy mountains of Epirus, and the latter from the Black Monntaln (the Mount Wnos of antiquity) In ita interior, are exposed in winter to great and sudden variations of temperature; the frost sometimes damaging to a grent extent the oranges and vines of these islands anil those of Santa Maura. The latter is, in the hot season, exceedingly unhealthy-a consequence of the vapors arising from the marshes and the shallow seas to tho north-east. Cerigo is rocky and sterile; it is subject to continued gales, and the current seldom permit its waters to remain unruffled.

These islands have unlorgone many vicissitudes. Corfu, the aneient Corcyra, was famous in antiquity for its naval power, and for the contest between it and Its mother state Corinth, whirh eventually terminuted in the Peloponnesian war. Ithaca, the kingdom of Ulyses; Cephalonin, sometimes called Dulichiun, from the name of one of its eitics; Zante, or Zacynthus; Santa Maura, known to the ancients by the name of leucas or Lencalia, colelisated for its promontory; surmounted ly a temple of Apollo, whenee Sappho precipitated lerself into the ocean; and Corigo, or Cythera, the birth-pluce of llelen, and sacred to Venus;-have all nequired an immortality of renown.

For upward of 400 years those islands remained stuject to Venice, constituting the Venetian Levant. By the treaty of l'aris, 5 th Novomber, 1815, between Englani and Russia, it was agreed that the Ionian Islands should regulate their own internal organization, with the approbation of the proterting power, which should be represented by a lard high commissioner; that the merchant flag of the now States should lee acknowledged as that of a free and independent State; and that Austris should enjoy equal
commercial privileges with Great Britain in ita commerce with the republle. Thls treaty was acceded to by all the representatives of the allied powers, then nogotlating at Paris, and by the Grand Sultan and the King of the Two Slcilies. The ports of the lalands are Corfu, Cephaloni, Zante, Santa Maura, Ithaca, Cerlgo, and Paxo. These are free ports, at which all kinds of merchandise may be stored in designated warehouses, free of any duties or charges, except rent, portage, and other minor expenaea, which are regolated by apecial tariffs. There is no traaty between the United States and the Ionian republle, and the commerclal intercourse between the two conntries ls aubject to the various reatrictions which apply to nonequaliaed veasels. The reatrictions are higher tonnage duties, llght dutiee, port charges, etc.
The following ltems will illustrate these discrininations: Charges for clearance, Inclading hill of health, muster-roll, anchorage, and light dutiea, on an Ionian or equalized voasel of from 250 to 800 tons, $\$ 810$; charges, etc., including as above, for a non-equalized vessel of from 250 to 800 tons, $\$ 1084$.

Other restrictions and discriminations exiat in favor of equalized flags, eapecially in the transhipment of merchandise from one port to another, which confer such advantages on vessels coming under this category, as to preclude all competition on the part of those belonglog to the other class. Merchandise transhipped, as above, in the former, is exempt from every extra charge ; in the latter, three fourtha of the original duty is exseted on all merchandise paying specific dutles, and five per cent. on such as pay ad valorem dutles. These discriminating duties amonnt, in the uggregate, to about 14 per cent. against non-privileged vessels. There entered, in the year 1851, into all the Ionian ports, 1435 vessels, measuring 169,144 tons; and there cleared 1401 vessels, measuring 164,780 tons; making, in all, 2836 vessels, measuring 333,924 tons.

The flags of these vescels represented 14 different nations, smong which the United States is not included. Indeed, it is but seldom that a United States' vessel is found in any of the Ionlar ports, nor can we look for any direet trade between the two countries so long as tho present restrictions exist. Their removal can be effected by treaty or convention only ; and negotiations to this end, under the constitution of the Ionlan ropublic, must originate at London, as all diplomntic questions and cunventions between these islands and foreign States must be conducted by the government of the protecting power.

Manufactures, etc.-These islands possess few manufactures properly an termed. The wives of the villani, or peasants, spin and weave a coarse kind of woolen cloth, sufficient in great part for the use ef their families. A little soap is mado at Corfu and Zante. The lattor manufnetures a conaiderable quantity of silk gros-de-Naples and handkerchiefs; the art of dyeing is, however, ton little atudied, and the eatablishments are on too small a scule. The peasantry, in general, are lazy, vain, delighting in display, and very superstitious. Those of Zante and Cephalonia are more Industrious than the Corfiotes; in tho first, partieularly, their superior condition is probably to be aseribed, in part at least, to the nobles residing more on their estates in the country, and contrihuting, by their example, to stimulate industry. In Corfu, the taste for the city life, which prevailed in the time of the Venetian governnent, atill operntes to a great degree. The Coriote proprietor reshles but little in hia villa; his lund is neglected, while he continues in the practice of his forefathers, who preferred watching opportunities ut the seat of a corrupt government, to improving thoir fortunes by the more legitimate means of honorable exerticn and attention to their patrimony. In this respect, however, a material change for the better has taken place during the last 20 years.

Iurpurts of Grain, etc.-Grent part of tho land is
held under short tennares, on the melayer ayatem, tha tenant paying half the produce to the landlord. Owing to the natnre of the soil; and the superiar attention given to the culture of olives and currants, the ataple products of the islands, moot part of the grain and cattie required for their consumption is imported. The hard wheat of Odessa is preforred, and Inrgo sums are annually sent to the Black Sea in payment. The ParIlianient, in March, 1883, repeated the duties on the introduction of corn; and the grain monopoly of Corfu, which had been establiahed in favor of government, in order to provide againat the posaibility of a general or partial scarcity, was then alao anffered to expire. These two sourees of revenue, while they exieted, did not probably produce less than $\mathbf{2 2 0 , 0 0 2}$ annually. They are similariy lependent npon Greece and Turkay for supplies of butcher' meat ; a omall namber only of sheep and goats being bred in the islands. Oxen, whether for agricultare or thie slaughter-honse, are principally brought from Turkey. The beeves eaten by the troops are six weeks or two months walking down from the Danube, and the provincea thet akirt ft, to the shores of Fipirus, where they remain in pasture until fit for the table.

Ergorta.-The ataple exports from these ialands are oil, currants, wine, soap, salt, and Valonia. The flrst is produced in great abundance in Corfu and Paxo, and in a leas quantity in Zante, Santa Maura, and Cephaionia. Corfu has, in fact, the appearance of a continuous oilve wood; a consequence, partly, of the extraorlinary encouregement formerly given to the culture of the plant by the Venetians. Although there is a harvest evary year, the great crop in properly biennial; the tree gencrally reposing for a year after its effort. (In France and Pierm wit the period of inactivity is two and three years.) laring five or six month, from October till April, the country, particularly in Corfu, presents an animated appearance, persons of all ages being bualiy employed in picking up the frult. The average price may be abont $\mathcal{E 1} 11 \mathrm{a}$. per barrel. Under the old Venctian syatem, the oil could only be carried to Trieste. It is charged with an ad ealorem duty of 18 per cent., payable on the export. The quality might he much improved by a little more care in the mannfacture, the trees being generally finer than in any other country. Currantr, originally introduced from the Moran, are grown in 7ante, Cephalonia, and Ithaca, hut principaliy in the firat. The plant is a vine of small size and delicate nature, the culti zation of which requires much care. Six or seven years elapse after a plantation has been made before it yields a crop. In the beginning of October, the earth abont the ronts of the plants is loosened, and gathered up in amsll heape, away from the vine, which is pruned in March; after which the ground is again laid down monoth around; the blight called the " brina," and rainy weather in harvest produce great iniechief. The currants are gathered toward Septemier, and after being carefully picked, are thrown aingly upon a stone floor, exposed to the ann in the open air. The drying process may occupy a furtulght or longer, If the weather be not favoralile. A heavy shower or thunder-storm (no unfrequent ocenrrence at that season), not only interrupts it, but sometimes causes fermentation. The fruit is then only fit to be given to animals. Should it escape these risks, it is deposited in magazines called "scraglie," ontil a purchaser casts up.

The exports of theme islands are raisins, olives, ollveoil, honey, soap, silk, and wine ; and the imports are coffee, sugar, wines, brandy, grain, curvd fish, manilfactures of wood, wool, eottion, iron, ete. Curranta and raising constitute the heavient articles of export from these inlands, the annual produce of currants amountIng to some 12,000,000 yritinds; but of late years the producers have had to contend with diseases called "t the bight," for which sulphur has proved to the the
onily efficient remedy. Notwithntanding the partial failure of the crops from this cause, for four consect. tive years, the exports of currants in 1855 ehow an ac tive and remunerating trade. The foliowing oummary for this year will give some idee of the extent of the currant trade of the republio:

Salt may be obtained in conailerable quantities in Corfu, 7ante, and Santa Maura, for exportati:n; the latter ialand alone prodacel it until the iate act of Jarliament, which provided that government should fet the aalt-pans in all the islands to thoae bidders who should offer, by aealed rendera, to supply it at the lowest rate to the consumer, paying at then same time the highest price to government. No export duty is charged upon it. These atatements ahow that heavy duties are levied upon the exportation of the staple producte of the islands-an objectionabie aystem, and one which, if it is to be excused at all, can onily be so by the peculiar circumatances under which tiog are placed. There ia no land-tax or impost on property in the Ionian Ialands, anch ae exists in many other rade countries; and, supposing it were desirable to futroduce auch a tax, the complicated state of property in them, the fendal tenures under which it is held, and the variety of usages with respect to it, oppose alt but invincible obstaclea to its imposition on fair and equal principles. At the same time, too, a large amount of revenue ia required to maet the expensea of the general and local governmenta, to maintain an efficient jolice, and to prevent amuggling and piracy. Ilowever, we can not holp thinking that some very uiateriul retrenchments might be made from the expenditure ; and it is to this source, more, perhaps, than to any other, that the iababitants muat look for any real or offectual relief from tiseir burden.

The Duties on Eirports from the Ionian Irlands are regulated by act dated 8 th June, 1835,25 th $A$ pril, 1837, and 20ti May, 1847. Oil and currants pay 18 per cent. ad rulorem. Wine (oxcepting that of the Cepinalonia Wine Company), 6 per cent. ad valorem. Soap, 8 per cent. ad ralorem. Valunia, 6 jer cent. od valorem. All other articies free. N. I3.-Oil shipped in vessele under Ionima colors for the purpose of being conveyed from one imand to anothor of the States must pay only 7 per cent. ad malorem.

Ports.-The principal ports in the Ionian republic sre Cerfu and Zante, in the islands of the same names, and Argostoii in Cephalenia. The city and pert of Corfu lie on the east aide of the island, on the cnnal
or channel between tt and the opposite centinent, which is here about five milee wide. The eltadel, which projects into the rea, le furniahed with a lighthouse, 240 feet high; the latter beling in lat. $30^{\circ} 37^{\prime}$ N., long. $19^{\circ} 56^{\prime} \mathrm{E}$. The town la but indifferently built. Populatien about 18,000, excluaive of the milltary. The fortificationa are vory etreng, both toward the sea and the land. The canal has deep water throughout ; lie navigation, which ia a little diticult, has been much facilitated by the erection of a lighthoase on the rock of Tignoso in the nerthern entrunce, where the channel to leas than a mile in width; and by the mooring of a floating light eff Polnt Leschine, in the nouthern entrance. Shipa anchor between the small but well-fertified island of Vide and the city, in from 12 te 17 fathoms water. The port, or rather gulf, of Argostoll in Cephalonia, lies on the south-west side of the isiand. Cape Aji, ferming Itr aouth-weatern extrenity, is in lat. $38^{\circ} 8^{\prime} 40^{\prime \prime} \mathrm{N}$., long. $20^{\circ} 93^{\prime} 30^{\prime \prime}$ E. Cape San Nicolo, forming the ether extremity, ia about $4 \frac{1}{4}$ milee from Cape Aji; and between them, within ahout $1 \&$ mile of the latter, is the amall inlet of Guardiani, on which is a light-house. From thie island the gulf stretches N. $\frac{1}{3}$ W., from seven te eight miles inland. The town of Argostoii lies on the weet side of a haven on the east side of the gulf formed by Peint Statura. The situation is lew and rather unhealthy. Population about 8000 . Its appearanee and police, particularly the latter, have been much improved since its occupation by the English. There is deep water and geod anchorage ground in mest parte of the gulf. The best entrance is between Cupe San Nicole and Guardiani, keeping rather more than a mile to the eastward of the jatter, on account of a reef that extends N. E. ond S. W. from it nearly thut distance. The port and city of Zante are situated on the eastern side of the taiand, in lat. $37^{\circ} 27$ N., long. $20^{\circ} 54^{\prime}$ $42^{\prime \prime}$ E. The city, the largest in the Ienian Islands, extends along the shere for nearly $1 \frac{1}{2}$ mile, but it is nowhere aiove 200 yards in breadth, except where it ascends the hill on which the citadel is erected. The stylo of bullding is chiefly Italian ; and the interior of the city displays every where great neatness, and even a certain degree of magnillcence. P'opulation estimated hy Dr. Burgess at about 20,000 . It has a mele or jetty of considerable utility, at the extremity of which a lighthouse is erected; and a lazaretto, situated a little to the south-west. The harbor is capacieus. Ships ant cher opposite the town at from 530 te 1000 yards' distance, in from 12 to 15 futhems, availing themselves of the protection of the mole when the wind is from the north-eust. When the troeps took possession of Zante, in 1810, the fertificatiens were fuund to be in very bad ropair; but immense sums have since been expended upon their imprevement and extensien.
In 1853566,817 tons of shipping entered the ports of the Ionian Islands, of which $27,01 \mathrm{f}$ were English. The others were Ienian, Greek, Turkish, etc.

Money.-Accounts are kept in sterling meney, or in Spanish doliars and oboli, 100 oboli leing $=1$ doll. $=$ 4s. 4d.; a doubloon $=1$ dollar.-l'Ate's Cambist.

Weights.-Engliah weights and measures are sometimes made use of, theugh with Italian denominations; but the following are nost generaily used: The pound peso grosso, or great weight of $12 \mathrm{ez} .=7384$ grains Troy; $948 \mathrm{lbs},=100 \mathrm{lbs}$. avoirlupois. The pound peso sottile, or small weight used fer precious metals and dirugs, is 1-3d lighter than the foregoing; 1292. pese sottile corresponding to $8 \mathbf{o z}$. pese grosso.
The eke, used in the southern islands, weighs about 18,900 grains Troy, er $27 \cdot 10$ llss. avourdupois. The Levant cantar, or quintal, sheuld contain 4t okes. The migliajo ( 1000 lls .), for currants in Zante, is 1 per cent. lighter than fur other articles.

Mensures of Length.-The Venetian foot is 12 onut $=134$ inches English. Passo $=5$ Venctian feet. Braccie, for clotha, etc., $=\mathbf{2 7} \mathbf{3} \cdot 16$ inches English.

Do. for allk, $=208.18$. Land $i z$ measured by the minura or 1.8 of a moggio, or bacile, 400 aquare parai being 1 miaura, or baclio, abont $8-10$ of an acre English. Vineyards are measured by the sappade; 8 zappede (a compnted day'e work) boing 1 miaura. Firewood is measured by the equare passo, usually, however, only 2 feot thick, ilais dopending on the quality of the wood. Stone is measured by the pasao cubo.

Measures of Copacity.-Corn.-Corfu and Paxo: meggio of 8 misure, about $\$$ Winchestur tushela. Cephalonia : bacile ahould contain 80 lbs , peso groaso, best quality wheat. Benta Maura : cado of 8 orivelli, $4=a$ 8 mog.; 1 cado ${ }^{3}$ 3 luahels Engliah. Ithaca: 5 becile $=1$ mogglo. Cerigo: chil6, the measure of Cnastantinople, $=1$ bushel English.

Wine.-Corfu and Paxo ; 82 quartucel $=1$ jar, and 4 jars $=1$ barrel $=118$ Englloh Wine gallons. Cephalonia nod Ithaca: 2 quartucei $=1$ boccale $\&$ boccall $=1$ aecchio ; 6 secchio $m=1$ bartel $=18$ Englioh grallons. Zante: $181 \cdot 8$ quartacel $=1$ lim ; 40 quartucel $=1$ jar; 8 jars $=1$ harrel $=17$ 5.8 English wine gallons. Santa Miaura : 92 quartncai $=1$ stamno $; 6$ atamni $=1$ barrel ver 18 English wine gallons. Cerigo: 2 agosten $=1$ boccia; 90 boccio $=1$ barrel = 18 English wine gallons.
 miltrimel jar ; 4 jare $=1$ inarrel $=18$ English wine gallons. Cephalonia: 9 pagliazal $=1$ barrel $=18$ Kinglish wina gallons. Zante: ? lire, or 3 jars of 46 quartuect each $=1$ berrel $5-8$ Faglish wine gallons. Santa Maura : 7 stamnl $=1$ tarrel $=18$ English wine gallons. Ithaca: 13 pagliazzi $=1$ barrel $=18$ Eugliah wine galloue. Serigo: 24 bozae 1 barrel $=$ 140.5 English wine gallons. Salt.-Centinajo, atrout 4000 lbs. Venetian peso grosso. Lime, - Corfu, measure of 4 English cubic feet.

In compiling this article, we have consulterl, lesides the works referred tu above, the loyage Histarique Pitcoreaque, etc., by Saint Savveur-a diffuse but valuable work. The account of Zante, in the last voluine (tome ill., pp. 101-278), is particulariy good. We have also looked into the Voyage en Grice of ScnoFaxt, 3 tomes, Paris, 1801 ; the Archires du Commerce ; the Pupera laid before the Britiah I'mance Commuttee, cte. See W'estm. Rer., xxxvlii., 41s; Monthly Rev., 1xxxiil., 225, cil, 188 ; Quar. Rec., xxiz., 86 ; Ctrie. Ree., xiv., 625 ; Coms. Reh. U. S., vol. I., 457, vol. iu., 171.

Iovra, onse of the United Stater of North America, lies between north lat. $40^{\circ} 40^{\circ}$ and $43^{\circ} 30^{\prime}$, and weat long. $90^{\circ} 12^{\prime}$ and $96^{\circ} 63^{\circ}$. It is bounded north by Minnesots Territory, east hy the Mississippi 1 II er, which separates it from the States of Illinols and Wisconsin, sonth ly Missouri, snci Fest by the Missouri and the great Slonx Rivers, the former of which separates it from the Indian Territory, and the later from Mi:nesotn. Greatest length from east to west, 207 miles ; greatest lireadth, 196 tuilees area, $\mathbf{6 0 , 9 1 4}$ sppare miles.

The surface of Jowa is somewhat elevated and generally undulating. It las no mountains, nor even hils, of any great beight. Tsble Moand, a conical elevation with a flat aummit, siaree or four miles from Duluque, la perhaps 500 feet ligh. On the lorders of the rivers there are frequent "bluffs" which are geserally from 40 to 180 feet high. ihas highest ground in the State in platean in the north-west, called Cotean dea Prairies, which enters it from Miunewota. The southern part of the State abounils with grasy lawns aud vemlant plaina, intersected by numeroun rivers, the ehlef of which wre the lhes Moines. the Skunk, the Iowa, and the zled Cedar (a lumanch of Iowa) Ilivers which flow in a south-east direction into the Missianippi. The hanks of clmost all of thase rivens are alinted with belts of wood. The distinguishIng featnre, howe ?er, of lowa is tes unique und a luirably diversifled prairien, ecmetiuses oprcading ow :..iw
vast plainc. The entire State is mamed "a rolling pralrie" by the settiors, from the reeomblance its surface bears to the rolling awell of the ocean. From the absence of wood, the acenery becomas wearisome and teme.

The soll of Iows io in goneral fertile. Nesr the confines of the Cotean dee Pralries the country is hilly and desolate ; the high lands being covered with gravel aurport hat a ecanty vegetation, while the low grounds are marehy. It appears, however, from the surveys which have been minde, that no State in the Union has a omaller proportion of inferior land. Dr, Owen, In hia geologleal report, remarks that "she soil of lows Is generally excellent, and of easy cultivation. The valleyz-especially of the Red Cedar, Iowa, and Des Moines Hivers-present a body of arable land, which, taken as a whole, for richneas in organle elements, for amount of saline matter, and due admixture of earthy ailicates, nitionds a comblnation which belonge oniy to the most fertile upland plains." The climate is gen. erally more bealthful than most of the new States. The openness of the country renders it lesp liable than is usual to the influence of malaria, the air on the urland prairiee is buogant, and rendered fiee from all pernicious infuences by the refreshing breezes that olow periodically over them. The rapid tlow of its rivers alse carrles off in the valieys those mismatio influences which otherwise tend to the production of disease. The winter is occasionally severe, but the eeverity is not oo great as lo unual in the same latitudes. The oummer, also, le less oppressively hot.

Iowa is etrictly an asricultural country. Its fine prairiea and rich natural pantures afford peculiar facil. itles for rearing cattio and sheep. Wool-growing has aceoritiagly become one of the staple employments of the settiers. The raisinf; of hogs is an occupation equally common and preftable. The value of live stock in 1857 was estimated at $\$ 3,660,000$, and slaughtered animals at $\$ 810,000$. The ameunt of wool produced was 373,898 pounils. Considerable progres has recently been made in agriculture, as shown by the increase of various pruductions of the State. For Instence, In 1840 there were only 154,693 bushel of uhent grown ; in 1850, there were 1,50,58I; in 1810 , 216.885 bushels onts; in 1850, 1,524,345; in 1840, $1,406,241$ buahela maize ; in $1850,8,656,709$. All the other prodactious common to similar latitudes are grown in lown, and have increased in an equal or grenter jryortion.
Manufuctures have, until recentiy made little progreas in the State. Ilaving only existed for little more than 10 years as an intependent State, time has not been afforjed to develop its manufacturing rosources. l'ossessing within itself abundance of the two grand elemente for manufacturers-cod and water power-there can be no donbt that lowa wil yet te distinguished as a manufacturing State. In 1850 the number of manufacturing estahlishments, producing each to the value of $\mathbf{Q} 500$ annually and upward, wan 48 :. Of theae there wore three for the manuficture of enst iren, $1+$ tanueries, and one woolen factory. The others we chiefly employed in the manufbeture of articles for ordinary and domestis purposes and agricultural inplements. The home-male manufactures In the rear ending lat June 1850 , were valued at (220,000.

The minerala of lowa are nut of grest variety. The vast bituminous coal-field of tho State occupies mont of its centeal and southern portions. For upwards of 200 miles the Itiver Des Mojnes passes through this great leprosit, the aren of which has heen extimated at alout 20,000 equare mileq embracing a country equal In extent to mory thas one half of the State of Iudjana. The beds of coal, which are 100 fect in thick0 sm , liu near the aurface, and may be worked at small expense. The leal miner of Jowa are a contincation of those of Lllinvis and Wisconeln. The workings are
oid and the nor oldest town of Geolyic produce except unboum tric cela lend. 'I in a stal Copper recently abláa qua but as ye verted h State abo and capa miners m aries. It trade witl Guif ls The expe ducts. T sideraible. internal $t$ ant, and b railroad os tween Dul and Keok trade. Ke glso shortl rior. Ilesi State in $\mathbf{v}$ proposed $t$ Council Bl the great Franciseo, a bnanch e roads cont ments of M pleted, both state will given 1,800 Moines Riv made navis there were proposed, fo sted $4,340,0$ River conta as half the a perity may improveme execution 0 Molnes rise weat of Minn eral in a nou nearly equa falis into th the State, al many other rious-sume Skink is m through a fe miles in a Moines. Tl name, has, and after a e itself in the the sides of navigable by 80 iulles fron much furthe (lowa), Is na the Makoqu courses vary are asvigabl
old and have been very productlve. Thay occur in the north-east part of the State, Dabuque, one of the oldest sottloments in North America, boling the ohief town of the laad-mining district.'. Dr. Owen, in his Geol-gical Survey, remarks that the lead-mines of Iowa produce as muoh of that metal as the whole of Europe, oxcept Great Britain, und that their capabllities are unhounded. Zino is found chiefly in the furm of electric calamine, In cellular manses in connection with the lend. This mineral occurs in some "dlgginge" also, in a state of carbuaste, and in others, as a aulphuret. Copper is found in the same localitios as sinc. It has recently been discovered in Cedar connty 'as considerall!s quantities: Iren-ore is abundantly distributed, but as yet, only a small quantity of it has twoen converted luto metal. In the geological eurvey of the State above referred to, it is affirme's that its resources and capabililities are sach that 10,000 laborers and miners might be profitably employed within lts boundarien. Iowa has no direct foreign commerce, but its traide with the ports of the Atlantic and the Mexican Guif is very conalderable, and rapialy incrensing. The exports consiat of agricultural and miaing products. The home traffic of this State la also very considerwile. The facilities which it possesses, both for intemal trade and foreign commerce are very abundant, and in a short time will be greatly incrensed. A railroad of $\mathbf{1 8 0}$ miles in length has beeat projected hetween Dubuque, the capital of the lead-mining elistrict, and Keokuk, the chief port of the State for forelgn traid. Keokuk, Davenpert, Lyons, and Duhuque will aiso shortly be connected by railroads with the interior. Jlesides thene, which will radiate through the State in various directions, the grand trunk line is proposed to be carriod from this city westwarl to Council Blutis on the Mispouri, and will form a part of the groat Pacific 1hiow which ls to terminate at San Prancisco, in Callformia. Through Iowa will also pans a bnuch of the great chain of north and sonth rallroads conrecting St. Louid with the extreme settlementa of Minnepota Territory. When these are completed, woth the home and foreign commerce of the state whil be indefinitoly increased. Congress has given $1,300,000$ acres for the improvement of the Des Moines River, as far an Des Moine City-to bo made navigable for large steantooats. In July, 1856, shere were 108 miles of railrond finlahed, and 1110 proposed, for which Congrees, in May, 1856, appropristed $4,320,000$ acres. The valloy of the Des Moluen River contaits, at present half the population, es weil as haif the agricultural wealth of the State, mud ita prosperity may for some time depend bs much upon the improvement of navigation on thas river, as upon the execution of these projected railroadn. The Des Holace rises in the Cotean des Prairies, in the senthwent of Minnesota, and flowing through the Stato in general in a south southeast direction, divides it into two nearly equal sectinns, nud after a course of 400 miles, falls into the Mississippi at the avuth-east uxtremity of the State, alout fuur miles below Keokuk. lowa has many other inst nur tivers which aro navigable for va-rious-some of them for considerabile-distancen. The Skunk is more than 200 miles in length, and Hows through a fertile country. it parsues a course of 150 miles in a south-east direction nearly parallel to bes Moines. The lowa, from which the State taken it, name, has, in general, a south nonth-east direction, and ster a eourse of upwards of 300 millea, discharges itself in the Misviasippi by two months, forming a dolta, the sides of which are about six milea long. It is navigable by ateamboate nt all seasona, to lown City, 80 miles from its mnuth, and for iwats of light ilranght mach further up. The Ked Cedar (a branch of the lowa), is naviguise for 60 milces. The Wapsipinicon, the Makoquete, Tnrkey, and Upper Iowa Rivers have rourses varying in length from 100 to 200 miles, and are navigatile for distancea of $\mathbf{2 0}$ to 60 milies. They
flow in an east or conth-east direction into the Mitaikalppl. The Great Sioux, an Important tributary of the Missouri, forms the north-west boundary of the State; tts length is eatimated at 800 mlles . The tributaries of the Mliesouri in this State are of minor Importance. The Miseisalippi berdors the State for its whole length on the east, and la navigable in time of bigh water for steamboats, to the mouth of the St. Peters, in Minnosota.
Ipecaouanha (Fr. Ipecacumha; Gor. Americanische brechourzel; It. Ipecoacanna; Port. Cipo de camaras, Ipecacuanha; Sp. Ipecacuana, Raiz ds oro), the root of a parennial piant (Cephallis ipecacuanha), growing in Brazil and other parts of South America. It is from its color usually denominated white, gray, or ash-colored, and brow. Littls of the first variety is found in the shope. The gray and brown varietics are brought to this country in balos from Rio Janeiro. Both are in short, wrinkled, variously bent, and contorted pleces, which break with a resinous fracture. The gray is about the thickness of a small quill, full of knots and doep cirgular fissares, that nearly reach down to a white, woody, vascular cord thet runs through the heart of each piece; the extornal part is coupact, trittle, and looks smooth; the brown is sinaller, more wrinkled, of a blackish-lorown color on the outeide, and whitlah within: the white is woody; and has no wrinklen. The entire root ls inodorous; bat the powder has a faint disagreeable odor. The taste is bitter, sub-acrid, and extremely nazseous: - In choosing ipecacoanha, tho larger roots, whith are compact anil break with a resinous fracture, having a whitish gray, somewhat semi-transparent appearance in the outside cortical part, with a pale straw-colored meduilary fibre, aro to be preferred. When pounded, lpecacuanhs forms the mitidest and safest emetic in the whole materia medica. Though probably employed In Americs from time immemorial, it was not introduced into Europe till the time of Lonis XIV., when one Grenier, a French merchant, biought 180 pounds of it from Spain, with which trials were made at the Hôtel Dieu. Holvetius frest made known its uee in dysentery, for which Louis XIV. muniflcently rewarded him by a douceur of 25,000 francs.-Thomson's Diopensatory ; Tronsos's Chenistry.
Ireland, one of the largest of the Eumpoan islands, Is situsted to the west of Great Britain, from which it la separated by a narrow charnel called the Irish Sea and St. George's Chanael on the enst, and is bounded on Its other sidea by the Atinntic Ocean, through which it can maintain a direct communication with the continents of Europe, Africa, and Amorica. The advantageous position, the fertility of the soil, and the salubrity of the climato, have conforred upon Ireland commercial facilities which aro eapable of being greatly increased. How far these natural advantages have been male nvailable toward the intornal improvoment of the island itaelf, and the general benefit of the empire of which it forins an limportant part, may the thent ascertained from the following details of its history an a statistics.

I reland is riomioidal in shape, and placed at tho eastern extrenity of the Atlantic Ocean, which washes itn northern, western, and southern shores, while its eastern coast is separated from the adjacent island of Great liritain by the Northern Channel, which at one point is only 131 milen wide, the Irish Soa, ahout 130 mifes in width, and St. Georgo's Chanuel, which is 69 miles wife hetween Dubtin and Holyhead, and: somewhat loes at its aoothern extremity. Its goograjiacal position is thet woon N. lat. $51^{\circ} 26^{\prime}$ and $55^{\circ} 21^{\prime}$, and W. Jong. $5^{\circ} 20^{\prime}$ and $10^{\circ} 20^{\prime}$, comprising, therefure, $8^{\circ} 55^{\prime}$ of lat., and $5^{\circ} 6^{\prime}$ of long. $\rightarrow$ the degrees of latituide being the same ns those under which are situated the diselinilar climates of Borlin, Hambarg, Rotterdhom, Leipzig, Warssw, part of liudson's May, the Straita of lielielsle, and l'etropaulowski, in Kumts-
chatke, which latter is nearly under the same parallel of latitude as Wieklow. The largest diagonal line that can be drawn vithin the island, vie., from Tor Head, in Antrim, to Mizen Head, in Cork, measurea 302 miles ; and the ahorter, from Carnsere, in Wexford, to Erris Head, in Mayo, is 210 miles in length. The breadth of the conntry, from Dundalk to Ballyshannon is 85 miles ; from Dublin to the head of Gal-
way Bay, 110 milea; and the indentationa of the coast by harbors, arms of the sea, and mouthe of rivers are so numerous, that scarcely an acre of land in the country is more than 50 miles from the sea or good navigation. The territorial divislons, and the acrealile extent of Ireland, which, next to Great Britain, is the largest island in Europe, appear in the following table :

| Tarritorial Dividione. |  |  | Aecording to the ordmance sarvay aind Ceboun Raport. |  |  |  |  |  | Annanlof Grimbun$V$ Valiastion. |

Several coal-flelds exist in Ireland, reeting on a limestone hasis. In Ulater, the district of Coal Island, in the connty of Tyrone, produces coal of good quality, extensively used in the neighborhood; the small coalfield at Ballycabtle in Antrim, is of no economical importance. The province of Connaught affords beds of coal in Leitrim, Roscommon, and Sligo, but rarely exceeding three or four inches in thickness. The Munster coal-fields are in the countios of Cork, Kerry, and Limerick. The ehlof coaldilstrict, however, is that of Leinster, In Carlow, Kllkenny, anv. the Qucen's County. This coal, as well as that of the Munater district, is anthracitous; that of Connaght is bituminons. The native coal is only used in the districts where it is raised, and neither the quantity nor the quallty has been found such as to interfere with the importation of coal from Great Britain, which probably exceeds $1,000,000$ of tons annually.

More notalile in Ireland are the unstratified igneous rocks, of which many varietics are found. Trap-rocks exist in varions parts of the country, lut more eapeclally in Antrim, where they are found in great variety. The basaltie columns of Fairhead and the Giant's Causewuy form one of the most interesting geological districts in the Hritish empire. The trap-rocks often repose on the indurated chalk of Antrim, enjecialiy in Rathlin Island and at Cushendole. At the latter place leds of trap and the chalk alternate. Of quarta rock, the chief deveiopment In Ireland is In Mayo and Donegal; it appeara, also, in the peninsula of Howth and Dublin, the suinmits of the Sugar-Loaf Mountains, and Bray IIead, in Wicklow, and in the district of Forth, in Wexfurd. No tertiary formation has bcen discovend in lreland, except the clays containing lignite or wood-coal on the southern shore of Lough Neagh.

The elevation of the arrface of ireland in atated in the following table from the Land Tenure Commissionr rs' map:

| Abeve 2000 feet in helght | $82 \%$ |
| Total | 82,5091 |

The higheat jeaks in the chief mountain groups are:

If the posmeasion of numerous fine bays and hariora male a country great as a commercial and maritime power, Irelar. 1 would besecond to none in Europe. I're-eminent even in Ireland is the magnificent harbor of Cork, secarely Land-locked, protected by strong batteries, and used as the only naval station on the Irish conet. Ialtimore IIartor, Sknli, Cape Ciear, Cruokhaven, Dunmanus and Bantry Bay, are all of sufficient
depth and capacity for large vesaels. On the western coast are Berehaven, Kenmare River, Valentia, Ventry, Smerwick, Brandon Bay, the estuary of tho Shannon, Galway Bay, Roundstone Bay, Ardhear or Clifden, Ballynakill and Killery LIarbors, Clew, Blackrod, and Killala Bays, with many others of less importance. On the northern coast are Milroy Ilarbor, and the fine gulfs of Lough Swilly and Lough Foyle. . The eastern coast has been lese favored by nature, and furnishes only one bay, with sufficient depth of water for the largeat vessels, that of Strangford. The Bay of Dublin, which is much exposed, contains the fine artitleial Harbor of Kingstown. Belfast, Newry, Drogheda, Wicklow, Arklow, and Wexford, have all ineen converted into ports, but are naturally deficient in the requisites for good harbors. Between Wexford and Cork is the fine Estuary of Waterford, formed hy the confluence of the Rivers Suir, Nore, and Harrow. Attogether, Ireland possesaes 14 harbors for the li rgesi ships, 17 for frigntes, from 30 to 40 for merchant ves sels, with many good summer roadsteads, and an infinity of small inarbors for fishing-boats. The islands off the coast of Ireland are numerous, but generally of small size; the largest are Rathlin and Tory in the north ; Achill, Clare, the South Arran Iolands, and Valentia, in the west; and Whiddy and Cape Clear iu the south.

Lakes.-The lakes in ireland are numerous, Lough Neagh, in Ulster, is the largest inland lako in the United Kingdom, and is only exceeded in Furope by Lake Ladoga in Rassia, Lake Vener In Sweden, and the Lake of Geneva. According to the Ordnance Survey it covers 98,255 statute acres. The River Bann, passing through it, affords the means of lowering its surface, which is 48 feot alove the eea at low water; but as its deepest part is leneath the level of low water, total drainage would be Impracticable. Tradition atates that it was once dry lend, and that the tops of huildings may at times ine seon in ithen legent which has been made use of by Moore in one of his melulies, Lough Neagh contains lunt one islet, Ram island, remarkable only for a round tower, and as contributing to break the satneness of the surface of the lake, which, being surrouniled by shores almost as level as itself, and generaliy- bare of wood, has little or none of the picturempue beauty whleh rendera Lough Eine and Killarney so clelightful. Its vicinity to the five counties of Ulster, Antrim, Down, Armagh, Tyrone, and Londonderry, each of which its waters tourh, presents breat advantages for internal trade by inland navigut'~. $^{\prime \prime}$; steain versela have been jlaced upou the lake, and, in conjunction with Coal Island, Newry, Litster, and Lagan Canals, lough Neagh, with its 100 miles of coast, promises to increase in importance as a centre of Internal traffic. Lough Erne, the next in size, lies wholly within the county of Fermanagh. Its tutal length is upward of 40 miles, but its greatest breadti in not more than 8. Strictly mpeaking, it consists of two lakes, about 5 miles epart ; the more inlund meas. vring about 14 miles in length, and that nearer the
sea, 25. fino river lower or n division a of the tow covers 92 snds; the 000 statute studded wi ty. Lougl Connaught mas not mo lakes cover 22,219. It a short but town of Ga of the sea, connect the great lakes water comm ther north, a now lake of of Kiliarney their picture pared with th covers 5001 a upper lake on of Donegal, i islet in it, ca been resorted penance by pil This lake is ne Dearg lying o tains 20,570 nc lin to the nor Cavan, aro ale ties. There a most parts of I van, Westmeat Ireland conts the largest rive non, whir', risi Fermasorfh ane and mence in cunnaught froz it turns westwa letween tho Cal miles wide. It erick, and for $\mathbf{v}$ miles of its aour measures 2.10 mi amount of its fia current is very ing its pussago pands into the 1 sad Lough Dea with numerous Charleville, and itself into the $\mathbf{A}$ honadary het wee llefween the litt estuary of the S which have thei the central range after diverging s portion of the pro agnin near the , in the mauntains St. George's Chu mons for its hlat natural ad vantag rated plain of Le falls into the Iris in the Mourne N
Lough Neagh, ar
sea, 25. They are connected with each other by a fine river flowing from the upper or southern, into the lower or northern lake. On tho island formed by the division of this river Into two branches, the cbief part of the town of Enniskiller is built. The upper lake covers 9278 statute acres, and contains abont 90 islanis; the lower and larger lake contains nearly 28,000 statute acres and numerous delets. Itp consta ire studded with numerous seats and villas of nuch beauty. Lough Corrib and Lough Mask, in the west of Comnaught, are separated from each other by an isthmus not more than 8 miles hroad. The formar of these jakes covers an area of 43,484 acres, and the Intter, 29,219. It discharges its watera into Galw's Bay by a short but broad and rapid river, winich skirts the town of Galway. Its level is but 14 fect above that of the sea, and works have long been in progress to connect the navigntion of the bsy witl " of the two great lakes above lt. Means of cons: ang them by water communication has not yet be z . Sected. Further north, and about 8 miles from Ballina, is the narmw lake of Lough Conn, 12 miles long. The lakes of Killarney, in Kerry, have long been celobrated for their picturesque acenery. They are amall as compared with the larger lakes of Ireland; the lower lake covers 5001 acrea, the middle lake 680 acres, and the upper lake only 430 acres. Lough Derg, in the south of Donegal, is amall, but of grent celebrity from an isjet in it, called St. Patrick's Purgatory, which has been resorted to from time innmemorial as a place of penance by pilgrims of the Roman Catholic persuasion. This lake is not to be confounded with the great Lough Dearg lying on the course of the Shannon, which contains 29,570 neres. Lough Gill, in Sligo, Iough Shellia to the north of Menth, and Lough Oughter, in Cavan, are also worthy of notice for their scentc heauties. There are many other lakes of small size in must parts of Ireland, but chiefly in the courties of Cnvan, Westmeath, and Longford.
Irelanil contains not only the largest lake, but alao the largest river in the United Kingdnu-the Shannon, whir', rising in the mountaing on tho conflnes of Ferme:t.gh and Leitrim, flows through Lough Allen, and sence in a south-western dircetion, separating iunnaught from Leinnter, till, arriving at Limerick, it tums westward, and discharges itself into the Atlastic, through a fine estnary; which, at its entrance het ween the Capes of Loophend and Kerrybead, is 8 miles wide. It is navigable for large vessels to Lisnerick, and for vessele of smaller tomnage to within 5 miles of its sonrce in Lough Allen, Its centro length measures 210 miles, and in consequence of the small amount of its fall, which does not exceed 150 feet, its carrent in very slow and often lmperceptible. During its passage from Iough Allen to Linneriek it expands into the largo lakes of Lough Reagh, 15 miles, and Lough Dearg, 21 miles In length, and atudiled with numerous islets. Tho Blackwater rises near Charleville, nnd, flowing south-eantward, discharges itself into the Atlantic at loughal, after forming the houndary between the counties of Cork and Waterford. Between the latter connty and that of Wexford is the estuary of the Suir, the Nore, and the ltarrow, all of which have theit sources not far from each other in the central range of the Slievehloom Mountains; and, after diverging so that their utresme enrich a great portion of the province $n$ of Leinster and Munster, unite again near tho elty of Waterforl. The Slaney rises ia the mnuntalus of Wicklow, and empties itgelf Into St, Genge's Channel at Wexforl. The Boyne, fimous for lts historiend rocoliectiona as well an for its natural advantages, han itn sources in the central elerated pinin of Lelnster, and, flowing north-east ward, falls Into the Irish Sea at Drogheda. The Bann risea in the Mourne Mountains, flows northward throagh Lough Neagh, and, after eeparating the countles of Londenderry and Antrim, flows into the Atlantio at

Coleraine. The Foyle la formed by the union of the streams of the Poe, the Mourne, the Finu, and the Derg, which, flowing from different yarto of the interior of Uister, discharge their comblned waters into lough Foyle near Londonderry. The Erne, which flows from Lough Erne, has a short but rapld course to the Atlantlo westward, and dischargea its great body of watera into Donegal Bay, over a ledge of rocks rising 10 feet abcve the level of the ordinary tides. The other rivers, though numerons, amounting nearly to 100, are small, and mostly confined to the counties that give them blrth. The Liffey, which rises ia the mountain-land of Wlcklow, and, after a circultous course through Kildare, discharges itself into the Irish Sea, is remarkable for nothing except that the metropoliten city of Dublin is seated on its banks.

The extent of country forming the basin from whence esch of the principal rivers derivea its aupply, is as follows:

Ireland was once so thickly covered with timber as to receive the name of the Island of the Woods. DurIng the early periode of its connection with England, its extenslve and impenetrable forests formed a main ohatacle to the progress of the English troops. Weatminster Hall is eald to be roofed with oak cut in the woods of Shillelagh. Numerous trunks of large trees are constantly found in the bogs. Even in mountain tracts, devoted for a long auccesaion of yeare to the pasturage of sheep, timber trees shoot up spontaneously wherever the land is secured from the intrusions of cattle. Many places, where the vestige of a plantation is not to be seen, retain names of which the word "wood" forms a component part; and in localities where the most attentive culture will not suffice to keep any tree or ahrub alive on account of the western llasts, large trees are found imbedded in the bogs. The different kinds of timber found in the bogn of IreIand are confined to oak, fir, yew, holly, pailow, and birch. Two centuries ago, when Ireland was covered with fincests, there were numerous small iron-works, in which wood charcoal was employed, and vast quantitles of wood used until the country was gradually atripped of its eupply, and the working of iron was consequently abandoned. The extension of agricultural improvement, and nore especially the timber act, which gives the tenant at the expiration of his lease, a pecuniary interest in tho trees he has planted, are gralually removing this defect, the consequence of uges of disturbance and desoiation; but trees in large quantities are generally found in Ireland only in the vicinity of tho residences of the gentry, except in some favored spots, which are well wooded.

Minerals.-I reland is reputet to contain much lead, copper, and iron, but notwichstanding many attempt. to work the metallic mines discovered In the country, few have heen found suffleiontly proluctive to repay the necessary outlay of nerital. Toward the close of the last century, gold was diacovered, accidentally, In the streams flowing from the Mouritain of Crophan Kinscla, on the contines of Wicklow and Wexforl. The metal was found In limpos and small pleces down to the minutest araln. Many of the peasants having ruined themselvea by leaving their proper occupations to join the nearch, th: government, to put an end to the fruitlens quest, took up the enterprise, and oniy relinquished it after satiafying the seekers of its worthlessness. "The gold is associated with magnetio ironstone, nometimes in massee of half a hundrod weight ;
also iron pyrites, brown and red hemattte, wolfram, manganese, and fragmants of tinatone in crystals, together with quarts: From the nature of these attendant minerals; of which mont are known to occur In the quartz velns of the adjacent monntain, it was hoped that by tracing ap the rivulete to their sources, and laying bare In various directlons the underlying rock, the tnctalliferous velns might be dlecovered, from the disintegration of which the sand and soil of tho bed of the streatas had been produced. All buch trials proved useless, and the question as to the source from Whence the gold in those streams in Wickldw has been derived, remaina atill unanswered."-Sir R. Kank'e Industrial Resources of Ireland. Copper ores ure distribnted througbont the clay-slate distrlcta in a great number of localities more or less abundanfly. The principal mines are those of Ballynurtagh, Conoree, Cronebane and TIgroney, and Ballygahan, in Wicklow county ; the Knockinahon, Kilduane, Bonmahoa, and Balinasisla, in the Waterford district ; Allihies or Berehaven, Audley, and Coaheen, and Skull, in the gouth-western dintrict; and the mines of Hollyford and Lackamor, in the western distrlct.
The total quantity and value of copper ore from Ireland, sold in Swansea, where it is smelted, were, in

| Tears. | Tons. | Val | Veara, | Tons. | Value. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1886. | 21.819 | s108,865 | 1847.. | 14,857 | C06,330 |
| 1840. | 19,530 | 1:7,911 | 1848. | 12,808 | 82,039 |
| 1849. | 17,509 | 117,625 | 1849. | 10,424 | 68,794 |
| 1844 | 18,50\% | 77,622 | 1850. | 10,121 | 69,094 |
| 1845. | 18,490 | 97.192 | 1851. | 10,577 | 77,718 |
| 1846. | 17,471 | 106,078 | 1852. | 12,171 | 104,822 |

I ead in more extenslvely ditt used through Ireland than copper. The granitle district of Wleklow contains numerous veins; the principal are those of Glendalough, Glenimalur, Glendasane or Luganure, and Ballycorus. The clay-slate districts also yleld numerons indications of this metal, but sew of the mines have proved profitable. Those still worked are at Clonligis, Newtownards, and Rathmulle $\leqslant 5$, in Down county; Bead and Nevry, In Armagh connty ; Castleblayney, In Mon--ghan county; Kenmare, In Kerry ceunty; Kllbricken and Ballyhlekey, In Clare conuty; Shallee, In LimerIck connty ; and IJantry, in Cork ounty'. A vein at Clontarf, near Dublin, was worked until the mine was filled with water bo. the lngress of the sea. At Ilallycorus, where the lead ores from the mines of the Mining Company of Ireiand are manelted, the quantities of ore worked up b: 1851 from Iaganure mines was 674 tons, which froduced 160 tons of lead, equal to nearly 69 per c.at. The proportions of silver to $n$ ton of lead ap genirally found 50 be, from the mine of lagnonure, 8 oz ; Caine 12 oz., Ballyblekey, 15 or. ; Shallee, 25 oz .; Kilbricken, 1.0 oz ; Tollyratty, near Strangford, 10 oz . The ave: ige of sllver extracted from the lead ore raise, by the Miaing Company of Ireland In 1851, was 7 oz . to the ton of lead ; the total quantity 3860 oz. ; producing $£ 102968.8 \mathrm{i}^{\circ}$.

Native silver was found in a lised of lron ochre In

Cronebane, but the, deposit has been long since exhausted. Sulphuret of silver was found in the lead ore at Ballycorus some years sipce, and the Minlng Company of Ireland have rosumed operations to prove this valuable dlacoyery, Tinetone has been found in the auriferoas sell of, Wicklow, but no veins or workabla doposits have been discovered. Other minerals, useful in manufactures and the arts, and found iu quantltes in various parts of the country, are manganese, antimony, sino, nickel, iron pyrites, alunclays of various kinds, building sfone, marble, flags, and roofing slatos, Nineral springs, chaefly, chaly: beate, are numerous ln many parts of the country. Those of chlef note for their medicinal qualitles are ut Mallow, ln Cork, resembling the hot walls of Bristol; Bullynahlnch, In Down; \$wanlinbar, in Cavan; Cas tleconnel, near Limerick ; aud Lucan, near Dublin.

The following is tho result of the differeni estimates and ceasus ingulrics into the nomber of the populatlon of Ireland at various periods :

| Youri 1692 Sir Wulilam Petty | 850,000 |

Hew countries in the world have incrensed in popuIntion so rapidly na Ireland during the first 40 years of the present, and the conclualon of the last century. Arthur Young, In hls Tour through Ireland, in 1766, obscrved that it every where evinces the marks of a rapid lnerease of population. It is generally supposed that the number of tho people increases in the ratho of food and comiforts, und that in Increase of population is a convincing proof of the advancing prosplerity of a nation. The effect of the fallure of the potito crop In depopulating the country would show that the populatlon of Ireland lind outstripped the ;rogress of wealth, and the increase of Industry, and had reduced their wants to the lowest jolnt without procuring an addltion to the comforts of life correaponding to the Increase of the popilation.

The following taible exhlblts the population of each portion of the country, according to the census of 1821, 1831, 1841, and 1851, together with the louse aceommodstion at the latter period:

| Previnees. | 1821. | 1831. | 1841. | \$651. |  |  | Famillet. | Houseat in 1mbl. |  |  |  |

The chief imperliment to improvement in the condition of the people of Ireland during the prenent cen. tury han been the relandancy of the population. In a country almoat wholly dependent on the cultivation of the soll, there were in 1841 an innny as 385 persens to each equare milh of arsble land. Yerhape, with the exception of Chins there was no other coantry In the world so densely peopled, and certainly none where the gopulation was no Illuproportioned to the
meana of employment. 'This great density of population was necesaarily accorpanied by min extreme competition for land and employment, with the ubsence of all inducements to the acquirement of skili, and in consequence of the low rate of remunoration for labor, and high rents, the impossibitity of any accumulation of cajpltal In the hands of the eultivators of the aoil. The foliowing table shows the deusity of the population in 1841, and its semarkahie decrease in 1891:

Ireland is naturally, toth from soil and elimate, $r$ : pastoral country, and it was not untii the commencement of the inst century that efforts were made to introduce an attention to tillage on an extended acnlo. Primate Iloulter, when ond of the Lords Justices, pressed strongly on the British government the necese sity of enforcing a tillage system; and for this purpose proposed a law, in 1727, to compel landlords to tili five acres out of every hundred in their possession, exclusive of meadows and hoge; and also to relase temants to the same extent from the pewal covenants against tillage, inserted in their leases Mr. M'Calloch observes, In his Statistical Account of the British Empire, that the luxuriance of the pastures in Ireland and the heavy crops of oats raised, even with the most wretched cultivation, attest the extraordinary
fertillty of the soil. Strong retentive clay soils, sandy solls, chalky and gravelly soils, and several other descriptions of soil common in England, are seldom or never met with in Ireland, which sffords no great diversity as compared with Great Britain. Mr. Wakefield descrities the soils of Ireland as follows :-" A great portion of the soll of Irelsnd throws out a luxurisnt herbage, springing from s calcareous subsoil without any considerable depth. This is one species of the rich soil or Ireland, and is found throughout Roscommon, in some parts of Galway, Clare, and other districts. Some places exhibit the richest loam I ever asw turned up with a plow; this is the case throughout Meath in particular. Where such soil occurs, its fertility is so conspicuous, that it appesrs as if nature had detormia $: 5$ counteract the bad effects produced by the clumsy system of its cultivators. On the banks of the Fergus and Shannon, the land is of a different kind, but equally productive, though the surface presents the sppearance of marsh. These districts are called caucasses: the substratum is a blue silt deposited by the sea, which seems to partake of tho qualities of the upper stratum, for this land can be injured by no deptis if plowing."

The prevslent soil is a fertile loam, reating on a rocky subatratum, chiefly of imestone. The depth, though in general not great, is in some parts such as to sdmit of a fresh vegetable mold being repestedly thrown up by successive plowings to a greater depth. This occurrence is most striking in Meath, and ln the district of the counties $i=$ Tipperary and Limerick, long distinguished by the name of the Golden Vale, from its extraordinary fertility. In some parts, particule rly in Galway, the rock shows itgelf shove the surface in ridses like waves, the interstices being filled with rich moll, which produces a thick, close sward, extremely grateful to sheep. Large tracts of grazing land aimilar to the Downs in England are unusual; the only tract of sny extent of such description is the Curragh of Kildare, which has been need, time intmeinorial, for s sheep walk. The mountains are capaHe of tillage to a considerable height; and their summits, with the exception of a few of the very highest, aro fit for pasturage in summer.

The quantity of arable land in 1841, acoording to the return of the Censua Commissioners, was 13,464,300 acres, and in 1851, 14,202,581 acres; and the proportion per cent. of cultivated and uncultivated surface, etc., at those two periods was as followe:

Liven.-The same legislative measure which was intended to discourage the woolen manufacturer otated, that "If the Irish turned thelr Industry and akill to the settliag and improving of the linen manufacture, they should recelve all the coantenance, favor, and protection for its encouragement, and promotion to all the adventage and profit they might be capable of deriving froin It." Thls declaration should not lead to the inference that the manufacture had been prevlozsly uaknown or disregarded in Ireland. On the contrary, the use of linen was so prevalent among the higher order, that sumptuary laws wore enacted to check its excesslve use. The unfortunate Farl of Strufford neema also to have anticipated the view's of the British manufacturers on the aulject. Inotead of extingulahing the woolen trude by exclusive duties, he labored to fonter that of linen. He inposted flax seed In large quantitles from Holland, and held out premlums to induce Flemings and Dutchmen acquainted with the manufacture to aettle in Ireland. On these landable objects he spent upward of $\mathbf{~} 30,000$ of his private fortune; and his example was followed by the Duke of Ormond. Stlll, however, the woolen manufacture prevalled, particularly in the south and west, where the climate and extenaive pasturage for sheep insured a copieus and cheap supply of the raw material. In the same oplrit, an act was passed by the English Parliament in 1696, to encourage foreign linen manafacturers to settle in Ireland; and with that view all articlen made of tiax or hemp in this country wers admitted into England duty- free-a privilege which is estlmated to have given that brauch of trade an advantage of 25 per cent. over other nations in the Eigglinh market. The Irish Parllament reaponding to the sentiments and wishes of that of Fingland, proinised that "It would heartily endeavor to entablish the linen and hempen manufacture, so as to render it useful to looth kingdoma;" adding, that "It hoped to tind such a tempercinent in reapect to the woolen trade here, that the same may not be Injurious to Eingland." The "temperament" here announced was evincel mont affectually by laying prohibitory dutlea un the export of Its own woolena, thun accepting the compact on the part of Ireland, and giving the country an la-
controvertible clalm upon England for a perpet ual encouragement of that hranch which was to be nurtured in lieu of tho natural staple of the country. In fir therance of the measures mutnally agreed on between both kingdems, $a$ board of trastees for the encouragement of the linen manufactare was established in 1710, consisting of a number of individuals of :afluence in each province. Under its control a rode of regulations was devised and maintained, which ex. tended to the most inlaute particulars of the processes, and had the effect for many years of securing the fabric a decided preference both in the homo and foreign market. A large oum was anuually grantel to this board for premlums and the supply of wheels and other implements, which was continued till the year 1830, when the grants were discontinued, and the board ceased to act. The flax aced is chicfly inported. Little ls grown in the conntry, as, notwithstanding all the exertions mado ly the grower, the plant raised from it is considered ef inferior quality.

Flas.--The firat fiax-spiming machinery erected in Ireland was at Cork in 1805. About 18:5, English and Scoteh yarns were first inuported into Ireland, and undersold the opun article. The use of machinery gradually lacreased, and the linen manafacture soon became extinguished in the sonth and west, and concentrated in the nortl. In $18: 21$ tho yarns were all made by hand. With one or two trifling exceptions, not a apinuing factory was to be soen. In 1819 there were upward of 70. In 1819, with the existence of bounties on the export of linens, and heary duties on the admission of foreign flax and linen fabries, unly 40 millions of yarua were exported from Ireland. In 1849 those exports had increased to 75 millions. The 'fuestion becaine not as to whether the empleynent of linen-weavers by exteusive manufacturers, anl confining thom to the mere procesy of weaving, was of was not more advantageous than the olif system, where the producer of the raw material, the weaver of the cloth, and the merchant who disposed of it, were the same individual; but whether it would be more protitable to alter the system or luse the trado.

The apparent amount of exports of linen from Ireland is now small, arising from the fact, that nearly all is sent by cross-channel steamers to the English and Scotch ports, whence it is transhipped to forelgn countries. The entire export from Ireland to Grent Britain and all foreign countries reaches about 106 ,000,000 yards; value, $£ 4,400,000$. The following table showa a comparison of the production snd value of the yarns made, and amount of wages paid, in an interval of ten years:

The cotton manufacture was introduced in 1777, and became an object, of attention to the Irish Parliameat, which endeavored to secure a monopoly of the home market by high import dutiea and bounties. The first cotton mills were erected at Prosperons, in the county of Kildare, and in Belfast, about the year 1884. From that period till the Union, it throve, in consequence of the measures adoptad to prevent foreign competition. At the Union it was arranged that the then existing dutles shonld continue for eight yesra, after which they were to be gradually lowered, by eight annual reductions, in such manner that, after the year 1816 , they should atand at 10 per cent. ad ralorem. The progress of the manofacture has been very slow as conipared with that of Great Britsin. The alteration of the acale of dutiea materially affected the home demanil, and he lmmense capital and great superiority of the Brit, sh artist have contributed much to secure to hls mantifacture a preference in the foreign market. In 1822 he quantity of cotton wool imported was $3,755,024 \mathrm{lbs}$., and of cotton yarn, $1,197,294$ liss.; leaving a total quantity of $4,576,816$ liss, of cotton yarn consumed, nfter allowing 10 per cent. for waste, etc., on the cotton imported.
Silk and lace.-The silk manufactnre was introduced into ireland in 1693, by French emigrants after the revocation of the Elict of Nantes. Ita reat war the city of Dublin, where lt was maintained by the aid of protecting duties. Some feeble attempts to fix It in the country parts falled completely. The last of these was so lately as 1825, when a company was formed for the purpose of fixing the trade on a secure basis in the south of I reland, hy earing the silk-worm there, and thus having the bencit of the raw material for the labor of producing it; but after considerable expense had been incurred for the purchapes of ground
linquiahed as hopeleas. One branch of the manufac ture, a fabric of mlxed worated and silk, known by the name of tabblnet, or Irish poplin, is in considerable demand, beth at home and elaewhere, for the richness and beanty of the texture. It ia almost the only branch now flonrishing. The general trade has been nearly annihilated by the removal of the protecting dutles in 1821, after which, in consequence of the combination of the workmen to keep np the rate of wages, the Iriah manufacturer became unable to compete anccessfully with the English trade. The manufacture of lace is carried on to some extent in Llmerick, and of late years a great source of employment for females has been introduced in the working of patterns on maslin with the needle.
Metals.-Manufactures, in metal exlst only to a small extent; and the making of glass, which was once carried on largely, has declined.

Provisions.-The provision trade, together wlth the exportation of the agricultural prodace of the country, has always been, and will probably long remain, the principal commercial husiness carried on in Ireland. This export trade is mainly with Great Britain, to Liverpool, Bristol, and Glasgow, from Belfast, Dundaik, Drogheds, Newry, Waterford, Limerick, and more particularly from Cork and Dublin. In 1825, 181,276 barrels of beef and pork, 362,278 cwt. of bacon and hams, $474,161 \mathrm{cwt}$. of butter, and $35,279 \mathrm{cwt}$. of lard, were exported. Since that period the provision trade has vastly increased; but in consequence of the cessation of the du.ties on the cross-channel trade, there are no means of accurately sscertaining the present extent of the trade.

The following table shows the number of gallons of irish spirits brought to charge since 1840, and the amount of duty :

The principle of extractlng the largest pasalble anount of revenue from the duty on spirits having been adopted, the rate was raised in 1855 to 6 s. 2d. per gallon, when tbe number of gallons brought to charge declined to $6,228,856$, and the maximum rate of duty productive to the rovenue appears to have been attalned, if not oxceeded. There are breweries in most of the large towns in Ireland, the produce of which has superseded tie use of beer imported from Great Britain, and also furnishes a quantity sufficient for a large export trade, whilch has of late yeara much increased.
Tho external trade of Ireland branches out into two great divisions, the cross-channel trade with Great Britain, and the commerce with foreign nations. The reiative importance of each port, as respects its cominercial character, will sppear from the first and second tablea following, which contain a apecification of the number sud tonnage of vessels that entered and cleared out coantwise, from nnd to the British colonles and forelgn countriea in 1853, In each of tho ports of Ireland; while the progress of domeatic navigation will appear from the third and fourth tables, containing a summary, in triennial periods, of the tounage of ahlpe belonging to and registered at the different ports in Ireland, a:d of the number and tonnage of tiose employed in the cross-channel trade.

Recenue. $\rightarrow$ - 3 oform the arrival of the Englisld, the revenues of Ireland ware paid in cattle; and even after that periol the custom prevailed for geveral centaries in the parta less subject to forelgn intlicenco. Traces of it have been met with so late as the relgn of Kliza beth. The new government, under the F inglish, in. trodueed the methin of raising money by sabsidies. Jolin exacted + subeidy from the Irish elergr, nud establishes she court of exchequer for the general mannagement of the revenua. The mame sinethad was continued during the reigns of Lleary 111., and the firet Fiwards; but the income thus extracted from the papple proved so inalequate to meet the expenditure, that recourne wis had to the legalized extortion of coygne and livery, which was the levylng of man's meat and horse's meat for the soldiery in time of sers: ice. The amount of the regular revenae, in the reign si" Edwarl 11I., is stated ly Walsingham and Ioling. shed to have been $£ 30,000$; but Sir John Davis, who collectell his infermation from the piprevols, and other authentic sources, reduces it to $\mathbf{8 1 0 , 0 0 0}$. The most remarkalile financlal neeasure of Hichard II, was a tir upon alsenters. In I/33, the elaventh of lienry Vil. the revenue wae roluced to $£ 2,33918 \mathrm{~s}$. Gu., while the expenses of the government were $\mathcal{C 2}, 8 \cdot 48,16 s$. IUd. thos exreeding the income by E18, 17\%, bith. At the latter ead of the same reign, the Duke of Votk, when sent over as lord-liputenant mith exiraordinary powert, not only ottained the whole revenue, but stipuInted for an addit onal aupply from Enyland of 4,900 markn for the Arst year, and $£ 2,000$ for every year thereafter. Fdward IV, raised noney ly tho ingonsition of daties on all merchandise sold in Ireland ex. cept blies. In the 15th year of Henry VII. a daty of one biblling in the pound was laid on sll merchab. dise inported and exported, except wint and ofl; and
trade, no separate returns have been made out at the custom-house of the quantity and value of the exports and imports.

Fisheries.-The consts of Ireland abound with fish; and Sir William Temnle oliserved, "that the fishery of Ireland, if improved, woild prove a mine under wa. ter, as rich as any under ground." Arthur Young arso remarke, "that there is searcely a part of Irelund bat what is well situated for some fishery of consequence ; and that her consts, of innumerable creeks ant river mouths, are the resort of vast shonls of herrings, cull, mouths, are the resort of
ling, hake, and mackerel.

The circulatin sabject to a grea tering into the d
a tax, by way of subaldy, of 183. 4d. on every hlde of The revenue; from the landing of Schomberg in 1689 lar A. During thin religh the revenue aeldom exceeded L5000. Henry VIII. increased the revente by the arpuremaion of monasteries. The lawe agal ast alisentees were also enforced. During the flrce 15 yeara of Eilzabeth, the revenue was $£ 120,000$, or $£ 8000$ per snnum, while the expensea amounted to $£ 490 ; 779,7 \mathrm{~A}$. $6 \frac{1}{4}$. In 1590, at the close of Ty.one's reber'ion, $\mathbf{8} 600,000$ trese apent In Alx months ; and Slr Robert Cecif affic:a it that freland had cost the queen $\varepsilon 3,40 \%$, 000 in tei. urs' time. In the pacific relgn of James
 done of tais cign ts $£ 9700$. The wridships and other faulal right produced ahout $\sum^{\prime} \cdot 3,000$, notwithstanding which thi" "eome was insdequate to the expenditure. To defra die expols. of the army, an order of baronets $W$. tablished by which $£ 98,500$ ware raised, in additi ${ }^{\circ}$ to whleh $£ 247,433$ were remitted from Eneland to clear off the debts hourrol y Elizabeth. The Irish Pasliament sranteit the samo king a subsidy of $29.8 d$ in $£ 1$ on every personal estate of $£ 3$ annual valae, and 4d. in £1 on every real eatate of £1 value; an act of lilierality with whieh James was no much pleased, that he declared "he would hereafter hold his Irish suljects in equal favor with those of his other kingdoms." In the aucceoding relgn Stratford ralsed the customs to four times their prevlous ninount. In the rame reign the first inention is made of an excise tax. Thurloe, howover, in his state papers, mentions that the revenue for two years ending in 1657, amounted to $£ 137,558$, while the expenditure was $£ 142,509$. When tho Irish Parilament met after the Restoration, it granted, first, an hereditary revenue to the king, his helrs, and successors ; second, an excise for maintalning the army; third, the subsidy of tonmage and poundago for the navy; and, fourth, a tax of 2 e, each on hearths, in litu of the feudal burdens, which were then abollshed. After the lievolution, the inforr ion respecting this important element of national axatistics becomes more precise and satisfactory.
till the ond of the relgn of William, was as follows, the total on the previous milltary expendliture of the war with James having amounted to $£ 3,851,655$ :

| ar. | R | Year. | Revanue. |

During the aarlier part of Anne's raign the income exceeded h $s^{\dagger}$ a million, but in her latter days it was less prodrctive. In the reign of George I. the state of the revenue continned nearly as in the preceding reigr. In that of George II. there was a surplas, which was applled, not always judiciously, to public works. The national deht of Ireland, incurred by an excess of expenditure beyond the income of the country, increaaed with great rapidity toward the close of the last century and till the year 1817, when it ceased to form a separate Item in the puhlle accounts, in consequence of the consolidation of the British and Irish exchequors. Its progressive iacrease since the RevoIution is exhibited in the followirg talle:

> Publio Debt of 1akland.

The cirenlating medium in Ireland was, until lately, miat in Iroland established by the Ostemen or Danes, wahject to a great variety of alteratlons. Without en- the inst eertain account of a mint there fa that estabterlag into the disputed question of the existence of a lished in 1210, by King John, who caused peanies,
halpennies, and farthings to be coined and made onrrent by proclamation. Further colnages were made by Ilerry III. and hy Eiward I., who added the title of Domende Hibenvie to that of Rex Anglif on his Irish colnage. It consieted of groats, halfpence, and furthinge. The first important alteration as to value was in the latter part of the reign of Edwand III. Who caused the ounce of silver to be cut into 26 deniers or pennies, instead of 20 , as befure, which caused the depreciation of 81 per cent. in the Irish, as conupared with the British currency, whlch exiated until the final assimilation of the two currenclen in 1825. Henry VI., or rather the Dake of York, his cieutenant in Ireland, had mints in Dubiln and Trim, in which both silver and copper money were coined.
In the beginning of the subsequent relgn of Edward IV. the valne of silver colns was raised to double their previoue amount. The consequence was an enermous incresse of price in all the necessaries of life; to renedy which, the Irish Parliament enacted, that the master of the mint should atrike, In the Castles of Dublin and Trim, and In the town of Drogheria, five kinda of sllver colns; the gross (or groat), the deml-proes, the denier (or penny), the demi-denier, and quadrant (or farthing); eleven groata to weligh an onnce troy, and each, unelipped, to pasa for fourpence. A few years afterward, the prlce of a lver was again raised so excessively, that the differerce between the Irish and English groat was 50 per cent. in a pound of builion. In the reign of IIenty VII. the difference between the two colnages was one thiri. Soon after the accession of Ilenry VIII. the coin in Ir. Iand was so clipped, defaced, and acarce, that the Earl of Surrey, then lord-lientenant, sued for his recall, in consequence of the want of money to carry on the war against the Iribh. Elizabeth ordered the ounce of allver to be cut inte 60 pernies, so that the coin of that name was reduced in weight from the 20th to the 60th part of an ounce. The cotal value of the meney colned in Ireland by that princess, is said to have beell $\mathbf{C} 94,5 i 7103.6 d$. English, which, at the rate of 16 d. Irish, for a shilling English, amounts to E118,202 8 s . 4 d . Irish. The Irisis olilling, or harp, as it was called, from the impression on its reverse, was worth ninepence English. Hy a proclamation issued in the fifth year of James I. the same proportion of values wad continued. In 1718 linglish money was current int Ireland at an increased valus; the English five-shiliing; crown-plece passing for six shillings and elghtpence, and the other colns in proportion. The exchange lietween Dublin and London was 21s. Itigh for 16 s . Engiath, with 6d. or \&d. per found extra, payable in london. By a proclamation in 1637, the name of Irish money was orderell to be abolished, aml all payments were reduced to English aterling money. Abuut 1672, amsil change was mo scarce in Ireland, that tewns and private dealers wete obliged to issue copper tokens. Jame II., on his artival In Dublin in 1688 , inaued a proclamatien, by which the Faglish guinea was to pass current at El da., the crown-piece at be. Ekl., and ail lesser colns in the sand proportion. In 1690, he depreciated atill further the value of the coln, lyy the insue of pieces of base metal, which were te pass at a neminai value far above their intrinic worth; so that the colnn issued of the nominal value of 4965,3$)^{5}$ necoriling to morne, lut, according to others, of A:1,59t,799, were remlly wurth no more than $\mathbf{C 6 4 9 5}$, estimating the metai at 41. per pound. On the accession of Witliam, this coinage was cried down. In 1725 , the aew gold coin of Portogal was made current in Ireland, the larigest coin, or Portugal piece, being rated at $\mathcal{A 4}$. About the sams tine, in consequence of the ucarvity of anall chasge, Wood obtained his patent for the issue of a copper currency, which was prevented ly the literary oxartions of Dean $S$ wift in his celebrated jubilcations calles the Drapier's Ietters. In 17i00, the acts of Parliamont prohibitiag the carrying of gold or silver into

Ireland were repealed. At that time the value of precieus metais in circulation as apecie, or hoarded, was astimated at $£ 3,000,000$ lrish. No further legieIstive change took place until the assimilation of the Irish and English ourrency in 1825, praviously to which, howaver, the want of a metallic circulation was so severely felt, particularly during some periods of the French war, that pifate bankera and traders is aued noten or tickets for amall sums, from 5a. dewn to twopence-halfpenny ; and alsu copper tekens. The evils of this combined presaure of the acarcity ef legal and the shundanre of cuunterfeit coin, was ultimately remedled by the lasue of stumped dollars estimated at Ga., and by aliver tokena of 10d. and bd., by the bank of Irelaud, which circulated freely until they were teplaced by the lasue of a pure standard coinge of silver from the rayal mint.

The amount of subscriptiens raised in England for the relief of aufferera hy the famine of $182 \%$ having exceeded the expenditure, the surplus was intrusted to a committee in l.ondon, and was retained under the name of the Irish Reproductive Losn Funcl, as a permanent fund for organizing loan societias, yitimately originated the present loan fund system, under which small sums are atvanced to industrious individu: is of the working classes, to be repaid by instalments, with intereat, and which was placed uniler the control of a commission in 1836 by the Act 6th and 7 th Will. IV., chap. 55. The rate of disconat on loans, mate chargeable by it at id. In the pound, has been reluced to $4 d$. In the pound by the Act of Gth and 7th Vict., c. 91, which placed the general control over all charitahle loan societles and charitalle pawn or deposit offices under the saperiatendence of the "Loan Fund Buard." The number of funds, with their capital and circala. tion sines the commencement of the system, has ben

Pawn olficen, ou thin plan and under the name of the Freach Mouts de Piéti, wore opened in several towne of Irelaad in 1811, with the object of ailvancing money" on fiediges at rates more molente than those of the licensed pcwabrokera; but ali have aince been discontinued. Ily ineans of navigalle rivers mad canals, Irelanil possesses extensive inland navgation. For the detaily of the various canals, see Canals. The railway from Dublin to Kingstowa, whiph was opened at the latter end of 1834, was the first, and for several vears the only raliway ia Ireland.
Banks.-The entire banking business of Ireland, until 1583, was in the hands of private inilividuals, who often issued notes to an amount not only far beyond their rewpective capitals, lut exceeding, in a great desree, what the wanta of the country required, orits credil could support. To remedy the evil effects of a system no pernirious, a national bank was eatablished in that year, with similar privileges to those of the lhak ef Engiand in reaject to the restriction of more than six partners in a private bank. The injury that lreiaud has sustained from thre repeated failure of lanks may be nainly attribnted to this injuclicious regulation. The loss that the country has suffered by the fililure of banks may be deacribed in a fow worla. On the ex-
piry of tho continued til 1840., sin new Bankin to the fullow banker of g sequent yea bank. The

Savings-bank The greatest am to the years of d the finctuntions in the annexed

[^29]piry of tho Bank of Ireland's charter in 1888, It wae |under the name rule which has been applled by Parcontinued by act of Parliament from year to year until 1845, since which time it has been regulated by the new Banking Act, 8th and 0th Viet., c. 37, accorling to the following prinelples:-The bank to contlaue the banker of government, which is to pay for the 10 aubsequent years $8 \frac{1}{\text { per cent. on the debt it owen to the }}$ bank. The proceelinge of the eatablishment to be liament to other banking inatitutiona, and to muke weekly returna, alnilar to those of the Bank of England under the new act, containing a full development of Its affairs, the amount of its bullinn, and the variationa in the quantity. The joint-atock banks now doing bueinesa are as followa. Thone marked ( ${ }^{\circ}$ ) do not isaue thelr own notes :

Savings-banka were introduced into Ireland in 1810. The greatest amount deposited was in 1845 , previous to the years of diatress consequent on the famine; and the fuctuations which have since taken place appear in the annexed table:

The internal traffio of the country is carried on ehbefly by wheel-carriage roads. Their condition, both as to llnes of direction and mote of construction, ia excellent. Materlals for the construction and repairs of roada are very generally distributed throughout the whole island, either in quarries, ridgen, and masses of gravel, or in the beds or channels of rivers and streams. The limestone, which is the general substratum of the greater part of the country, is the hest material for their formation; and the system known
nnder the name of mareatamiaing was long and auce cenafully practiced on many of the leading lines of road In Ireland before it wan thought of in Great Britain. ".

The progrese and condition of the Irlah rallway system from 1838 to 1854, Incinalve, may the seen in the following tables; compled from the Board of Trade Returns:

Iris, or Orris-Root Plant (iris gureatia), a perennial, native of Carmloh, and common in the gandens of Europe, the root of which is remarkable for communlcating an odor like that of violete, and proinces the orris of the shops. The thowers, which put forth in opring, are noted for the graceful carve of their petals, as well as for the brilliancy of thelr hnen. It has n thick, tuberous, ereeping stem, nsually ealled its root, which, externally, is lyown and yellowish, if white within, nnd sends out numerous flbres-the true roots -frotn the lower part. When theso are pared off, the stem appiears full of round rpota. Independent of the value which would he derived from the roots of thim plant, it would be highly deslralle to cultivate it for the purpobes of oruanent, In all jarts of the country where it would thrive.
Iron (1)an. Jern; Du. Mzer ; Fr. Fer; Ger. Eiaen; It. Ferro; Lat. Ferrum, Mars; l'ol. Zelaza; Por. Ferro; Kus. Scheleso; Sp. Hierro ; Sw. Jern; Gir. Xidnpos; Sans. Lohit Arah. Ilederd; Pers. Ahun), the most abundant and most useful of all the metals. It is of buish-white color, and when polished has a great deal of lirillaney. It has a styptic taste, and emita n smell when rubijed. Ita hariness exceeds that of most other metals; and it may lee rendered hariler than most bouties liy helng converted Into ateel. Its epectic gravity varien from $7 \cdot 6$ to $\mathbf{7} \cdot 8$. It is attracted by the magnet or loadstone, and in itself the substance which constlutes the loadstone. Itut when Iron is perfectly pure, it retains the magnetic virtue for a very abort time. It is malleatble in every temperature, and its malleability lncreases in proprortion as the temperature angments; but it can not he hamnsered out nearly as thin as goll or silver, or even copper. Its ductility, is, howover, more perfect; for it may te drawn out futo wire as fine at least as a human halr. Its tenacity is кuch, that an iron wire 0.078 of an ineh In diameter is capathle of supporting $540 \cdot 25 \mathrm{lbs}$ avoirdupols withont breaking. Historienl Natice.-Iron, though the most rommon, in the most difilcult of all the metals to obtaln In a state fit for nee; and the discovery of the methol of working it seems to have been praterior to the use of gold, sllver, and copper. We are wholly lgnorant of the ateps by which men wero lead to practlce the process required to fuse it and render It malleable. It is certain, however, that It was prepared In anelent Fsypt, and moine other countries, at a very remote epoch; hut it was very little maed in Greece elll after the Trojmu war. (See the admirable work of M. Goguet on the origin of lawa, Arts, etc.) Iron was fund on Mount Ida by Ihetyles,
owing to the foreste of the mount having heing burnt by lightning; 1432 n. 0.-Arwolelian Mrathles. The (ireeks aserlibe the discovery of Iron to thenselves and referred glass to tha Phoeniviana but Moses reInten that Iron was wrought by Tubal. Cain. Iren farnaces ansong tha Roman\# were unprovided with bellows, bat were placed on eminencei with the grate in the direction of the provalling winde.' Swedish Iron is very celebrated, and Daunemora in the greatest mine of Sweden. British Iron was cast by Ralph Page and Peter Bands, In Sussex, In 1543.-Reymer's Fodern. Iron-milla were first uned for slitting lren inte bara for siniths by Goilfrey Rochs, in 1590. Tluning of Iron was first Introduced from Bohemia In 1681. There are upward of 800,000 toma of Iron procluced annually in Fingland.-Huydn. There are many varietles of Iron, which artists distinguials by particular names; hut all of them may lee reduced under one or other of the three following clanses; caat or pig irvn, ecronght or soft iron, and ateel. 1. Cast or ply Iren is the name given to this metal when tirat extracted from lis ores. The ores from which lron ls usually obtained are cemposed of oxyd of Iron and clay. The objeet of the manufacturer is to reduce the oxyd to the metallic stato, and to reparate all the clay with which it is comhined. This is effected by a pecullar process; and the Iron, belnge exposed to atrong heat in furnaces, and molted, runs out into molds prepared for Its reception, and olituina the name of cast or pilg iron. The cast Iron thun obtained ls distingulahed hy maneufacturers into dlfferent varieties, from Ith color and other qualitles. Of these the following are the most ramarkable:

Whice cast iron, which is extremely hand and brittle, and appenrs to le composed of a congerien of small crystals. It can neither be filen, bored, nor bent, and is very apt to break when auddenfy heated or coolcl.

Gray or mottled east lron, wo called from the inequality of Its color. Its texture is granulated. It is much softer und leas lirittle than tho last variety, ond may the cut, bored, and turned on the lathe. Cannons are made of it.

Black east Iron la the most unequal in its texture, the most finsible, and least colsealve, of the three.

Wrought or soft lron is prepared from cast lron by a process termed a retisement or finery. The wrought Iron manufactured in Sweden is reckoned the finest in the world.

Steel consints of pieces of wrought Iron hardened by a peculiar process. The Swediah lron imported into this conntry is mostly used in the manufacture of steel. ~-Tuomaos'a Chemiatry.

Cavs of lron.-To enumerate the various uses of iton would require a lengthened dissertation. No one whe reflects for a monent on the sulject can doubt that its discovery and a wloyment in the shape of tools and engines has bev, of the utmost importance to man; and has done more, p:rhaps, than any thing else to accelerate lits advance in the career of improvement. Locke has the following striking observatons on this rulject: "Of what consequence the discovery of une natural body and its properties may be to human life, the whole great contlnent of Aluerica is a couvincing instance: whose lgnorance in useful arts, and want of the greatest part of the conveniences of life, in a country that abounda with all sorts of natural plenty, I think tmay the attrlbuted to their ignorance of what was to he found in a very ordinary deapicable atone-1 mean the minerul of iron. And whatever wa think of our parts or improvementes in this part of the world, where knowledge and plenty aeem to vie with each other, yet to any one that will seriously retlect upon It, I suppose it will appear past doubt, that, were the use of Iron lost among us, we should in a few ages be unavoidably reduced to the wants and lignerance of the anclent savage Americana, whose natural endownents and provisione came no way short of those of the most flourishing and polite nations; so that he who first
mode use truly etyle Essay on Iron, on fties, and valuable of pable of be drawn into being exten every dilve softened at oar wants al equally ser ricaltare; al sword, the 1 the needle, carrlage, tho paes, the can mach virtue, frame." In with the ear found in varic formation, an mals and vegi History,-1 known from: and great supe monly used, c tion, caused it dlffienlty of we ployed, greatly antices In IIOTI and forging iro an imperfectly from the ores in Greeks olitalne alcians from the conls. Iron; on'hecount of its'abundance, working qualities, and tenacley; is probably the moat usefo! and valuable of metals. "According to Dr. Ure; "It is capable of beirg cast Into molds of any form, of being drawn intb wire of any desired length of flnenens, of being extencled into plates or wheets, of belng bent in every direction, of being sharpened, or hardiened, or softened at pleannre. Iron accommodates itself to all oar wants and dealren, and even to our capricen. It is equally serviceabie to the arts, the sciences, to agriealture, and war. The same ore fumishes the aword, the plowshare, the acythe, the pruning-hook, the needle, the graver, the apring of a watch or of a carriage, the chisel, the chain; the anchor, the compaen, the cannon, and the bemb. It is a medicine of nuch virtae, and the only metal Miendly to the human frame.". In its primitive position it is commingled with the earth's atrata it pountiful' profusion ; it is found In varions combinations and conditions in every formation, and it is a conetituent element of both animals and vegetubles.

History.-Mallealsle Iron appears to have been known from a remote antiquity. Its olivious utillty and grent superiority over the softer metals, then commenly used, combined with the expense of its reduction, eaused it to be highly prized, though the extreme diffientty of werking it by the rude methods then employed, grently restricted its application. Thero are notices in Homer and Hesiod of the arts of redncing and forging iron; but east-iron waa then unknownan Imperfectly malleable Iron treing produced at once from the ores in the furnace. It is probable that the Greeks obtained mont of their fron through the Phoenleisns from the shores of the tllack Sea, and from laconia. It would be interesting to trace the gradinal advences which have been made in the rednction of iron, from its discovery to the present time; to inquite into the circumstances which led to the successive changes in the processes, and into the principle on which those changen were fonniled; to examine into tbe differences in the products which from time to time ensued, and to notice the influence of these conditions on the extent and progreas of the mnnufacture. Our knowiedge of these changes, however, is scanty and imperfect, and we can only conjecture what wat probably its early progress. The furnaces which were first employed for ameltiug iron were probably aimilar to those now called air-bloomeries. They were probably simple conical ítructures, with amail openings below for the admiasion of air, and a large one nbove for the escape of the prodacts of combustion, and would be erected on high grounds in order that the wind mitght assist combustion. The fire being kindled, successive layers of oro and charceal would be placed in it, and the heat regulated by opeuing or closing the apertures below.
The process of reduction would consist of the deoxydation of the ore and the cementation of the metal by long continued heat. The temperatare would never rise suffientily high to fuse ore, and the product would therefore be an imperfer cly malleable iron, mixed with scorise and unreduced oxyd. It wond then te brought under the hammer, and fashioned into a rude bloom, during which process it would be freed from the greater portion of the earthy impurities. By such a process as this the Romans prohably worked the tron ores of oar own island; scoria, the refuse of ancient bioomeries, occar in varions localities, ia some cases identified with that people by the coincident remains of nitars dedicated to the god who preslded ever tron. Mungo Park aaw a ruile furnace of this kind used by the Africans, and, indeed, with some modifications, It is atill retained In Spain, and along the coasts of the Mediterranean, where rich specular
orea are worked. The advantages of an artifiofal blast wenid soon becotes manifest; and a pair of bellewa, or a cylindar and piston would soon lie applied to the construction mentioned above. Homer represents Hephostus as throwing the materials from which the ahieid of Achillee waa to be forged into a furnace urged by 20 pairs of bellows ( $\phi \tilde{v} \sigma a i$ ). The inhabitante of Madagascar amelt iron In much the same way, theiz blowing apparatus, however, consiating of hollow trunke of trees, with loosely-fitting pistons.

The fin nace corresponds to the blar-bloomery, and has, by anccessive improvements, developed into the blast furnaee, now almest universalily used, and into tha Catalan forge, atlll employed in some distriets. The applleation of the blast would offer conaiderable advantagea; it would obviate the necessity of an elevated aite, place the temperaturo more inmediately under the direction of the smelter, and render the whole procese more regular and certain. The method of reduction remained the same as before, but the product would differ consideraily; for whenever the blast was sufficiently powerful, the Iren would be fused, a partial carburation woald take place, and the resulting metal would be a apecies of steel, utterly useless te the workmen of these days ; hence, it seems necessary to infer, that a rude procoss of refining was invented, the metal being again heated with charcoal, and the blast directed over ita surface, the carbon would be burnt out, and the iron become teagh and maileable. The processes might perhaps form two saccessive stages of one operation, as at present practiced with the Cotalan forge.

The increasing' demand for irm, and the progress of internal communication, would lead the smetter to increase the size and height of his bloomery; and this, probably, would lead to a very unoxpected result. The greater length throngh which the ore had te loscend, would prolong its contact with the charconi, and a higher state of carbaration would enxue, the product being cast-iron-a compound till then perhaps unknown.

From the time that cast-iron became the product of the smelting farnace, the retiaing would be made a separate process, requiring a separate fornace and naehinery. It would soon le found alse that, as the furnace increased in height, the pressure of the superincumbent mass would render the materials so dense as to retard the aseent of the thast, and thus canse it to become seft and inefficient; hence the internal buttresses csited boshes were tirst introluced to support the weight of the charge, relleving the central parts from the pressure, and permitting the free ascent of the blast. While the good quality of the iren and the regularity of the process were thus insured, increase of quantity was the result of improvements in the blowing apparatus, which was now enlarged and worked by water-power. With these moditications, the furnace was the same essentlally as the blast-furnnce now empleyed, though not so large; indeed antil the introduction of coke at a much later period, the Blast-furnace seldom exceeded 15 feet in height by 6 at the widest diameter. The more perfect operation of the blast-furnace allowed the reduction of the heaps of scoria, which had been gradually eccuminiating during the period that the blast-bloomeries had been in operation, and which contained 30 to 40 per cent. of iron. A new species of property was thus created; extensive proprictorshijs of Danish and Koman cinders were formed; large deposits of seoris, which for ages had hin concealed beneath foresta of decayed oak, were dug up, and in Dean Forest it is computol that 20 farnaces, for a periol of upward of 800 years, were supplied chletly with the bloomery cinders as a substitate for iron ore.

At what period the oomplete transformation of the Blast-bloomery into the blast furnace was effected, it is impossible to say. It was probably in the early part
of the 16th century, as we find that In the 17th the art of caating had arrived at a conslderable degree of perfection, and in the relign of Elizabeth thore waa a considerable export trade of cant-iron ordoance to the Continent. In the forest of IDean are the remains of two blast furnaces, which formerly belonged to the kings of England, hut they have been out of blest since the commencement of the atruggle lietween Charles I, and his Parliament. Calculating from the quantly of seoris accumulated In their immediate neighborhood, which appoar to have lain undisturbed for the last two centuries, Mr. Mushet bas attempted to deduce the period of their erectiun, which he conceives to have been about the year 1050, in the time of Edward VI. Lp to this period wood charcoal was the only materlal emploved in amelting oporations, but the wante of a constantly increasing population, not leas than the great consumption of the blast furnaces themsplyes, created a scarcity of this essential material, and gave a check to the manmfacture. To such an extent had the wood iseen destroyed, that the cutting dowa of timber for the use of the iron-works was prohibited by speciul enactments ; and the forests of Sussex ulone appear to have leen exempt from the general terree of conservation. The number of furnaces in blast decreased three fourtha, and the annual production, which but a short tinse hefore is said to have heen $180,0^{\prime} k$ ) tone, was in 1740 redued to vily 10,3*) tons.
Janes I. granted patents to iron-masters in varions parts of the kingrom for using pit-coal in the mannfacture of iron. The obstacles to its introduction, bowever, were nuoserons, and not easily overcome. The conparatively incombustibie nature of coke, and its feehler chemical affinities, readered a more powerful blast und a longer subjection to the heat indispennable to Its successful adoption. Ignorance of the causes of failure operated long and seriounly, but all ditheulties were st length surmounted. An enlargement of the height of the furnace prolonged the contact of the ore and coke, and at last the employment of the steam-engiryand improved blowing apparatus renterel the blast much more powerful and regular, and gave that impetus to the manufacture which has cansed fireat liritain to take the tiret rank in this branch of industry.

The lirst great improve.sent in the blowing apparatus was the abostitution of large eylinders, with closely titting pistons, for the bellows. The earlient of any magnitude were probully those erected ly Smenton at the Carmin lron-Works, in 1760 . In 1783-1. Mr. Cort, of tiosport, introduced the processes of puddling and rolling, two of the most important inrentions connceted with the prolncion of iron since the employment of the $b$ 'st furnace. (See A.!denda, A.) Atrout this time the steam-engine of James Watt came into nae, und along with it commenced a new era in the hiatory of the imu trado and every other liranch of induatry. Its fmuense power, economy, and conrenience of application, brought it at ance into general emphoment. It was soon applisal to puruping, blowing, and wolling; it enabled the mines to be aunk to a greater depth; refractory ores to be reduced with facility, ant the processen of rolling, forging, etc., to the effected with a rapidity previonsly unknown. Uf late years Scontand has matle mondider. able progress in the iron uannfacture. The intrombetion of rallany communication, and the invertion of the hot-llant, have given a stimulna to the trato which las raimed Glasgow into importance as an irou district, and few towns pomaens greater facilities fur tho mule of their produce, than thin eentral dépót of the mineral trensures of the country by which it la nurrultitien.
'The hot-blant procoss, for which a patent was taken out by Mr. Noleon in 182d, ham ellected an entire revolution in the iron induntry of fireat Britain, and
forms the laat era in the history of this material. This simple hut effectlve invention hae given such facilities for the reduction of refractory ores, that between three and four thmes the quantity of Iron can be produced weekly, with an expenditure of little more than one thind the fuel; and, moreover, the coal dees not require to be ooked, or the ores to be calcined. In conclusion, we may add that there appear to have been five distinct epochs in the hiatery of the iron trade.

The firat dating from the empluyment of an artiliciol blast to accolerate combuation. The second marked by the employment of ceke for reduction, about the year 1750. The third datlig from the Introduction of the stean-engine, and on account of the facilitics which that inventlon has glven for raising the ores, pumping the mines, aupplying the furnace with a copions and regular blast, and moving the powerful forge and rollIng muchinery, we may safely attrihute this era to the genius of James Watt. The fourth epoch is indicated by the introduction of the ayatem of puddling and rolling, very soon nfter the employment of the steanengine. The $f i f t h$, and last-nthough net the least important epoch in the history of this manufacture-is marked by the application of the hot-blast-an invention which has Inereaded the production of iron fuurfold, and has enabled the iron-master to amelt otherwise useless and unreducible ores; it has abolished the processes of coking and roastling, and has given ficilities tor a large and rapid production, fur heyond the mont sanguine anticipations of its inventoc: Manufact urers taking advantage of 80 powertul an ugent, ha' e not hesitated to roduce improper materials, nuch as cinder-henps and impure ores, and by umduly hastening the process, and attending to quantity more than to guality, have proluced an inferior doseription of lron, that has brought the invention into unmerite? oblority.

The ores.-The ores of iron are found in profnse ahmodanco in every latitude, embedded in or stratitiod with every formation. They oceur both erystallized, mussive, and arensecons, lying deep in strati of vast extent, filling veins and fanlte in other rucks, and scattered over the surfuce of the grouncl. Sometimes, but rarely, found native; usually as oxyis, wulphurets, or carbonates, more or less mingled with other wilstances. tif thene ores there are perhaps twenty varieties, many of which ore, howerer, rare; others are combined with substances which untit them for the manufacture of iron, so that the remainaler may be classed under the following general heads; their cenposition, however, varies grestly :

1. The maynetic oxyds, in which the inn accurs, an $\mathrm{Fe}_{3} \mathrm{O}_{4}$ or $\mathrm{Fe}_{3} \mathrm{O}_{3}+\mathrm{Fe} \mathrm{O}$. This is the purest ore which is worked: the hest Swedish metal is manufactured from it. 14 is found in primitive rucks, and is widely diffused over the globe. 2. Specular iron ore, peroxyd of iron, Fog tos. This is rich and valuable, and thas luen workel from a remote antiquity in Elioa and Spain. It is fonmet ehietly in primary ame transjtion rowk. 3. lied and lrown hamatites, hyilrated peroxyd of tron. Thene ores oceur in lo y roidal radiat lng maseen, in Cumberlant, Ireland, America, and other places. 4. Carknato of Iron. 'lhis ore orrurs mixed with large quartities of argillareons, carbonaceous, and silicious substances, forming the large depanits of clay-fron-whone and blackbauls, from which most of tho iron of this country is obtainel. These strata ure generally found in close pmoximity th the canl measuren. All the nbove oren are more or less inixed with milica, alumina, oxyd of manganese, ete., amil it may not be uninteresting to glane at their geographical dintribution in Finrugg and Anmerien.

The Linited Kingrlem. - (ireat Britain prossestes pechllar un! remarkahle advantagen ior the manufacture of Iron. The ores are found in exhuastions abundince, usually interstratifled with the coal for their reduction,
and in rlose proximity to the muntain limestoue,
which la $v$ three easen so near tog a large and pally emplo of blackban the coal fiel Sonth Wale: ness in diffe the amount with which $t$ position of tl thire is given

- Corts, and bes ate omitted In this table, but ars allow ed for in the sumalng up.

In Ireland there are vast depmitis of iron ore of great richnewn, though as yot but little worked. Sume of these, such as the oren worked at the Arigua minea, and the Kidney ores of Ralcarry lhay, yinld an much as 70 per cent. of iron. If thess mbines were worked mern extensively, and if peat fucl wern uged in the nometting operations, the Iron would probality be of the very leat qualty, and might rical the famed Swedish charcoal metal. Of this there is now every reaten to hope, an the entablimhment of rallwny commanication, whth a!most every iart if Ireland, will open out the immense peat hogs of that country, and facilitate the Intruluction of vegetabiof fuel for the reduction of the oren, and create a large and unportant uldition to other branches of Irivit induatry:
Frutere posmesses an almadant supply of Iron ore, thet on account if the searcity of cont, the naminacture has lween greatly pestricted in extent. The introduction of railway cembumication in, however, rapidly rembring thin tificuty, and the operations of mmelting are greatly an the incrense. The railroed has enalided the cilench iron-master to nuthititute coal for charcoal in the reduction of the irom oree, and in consequence at lininense increase has inken place in the
probluction of pis and mannfactured iron, The ores are fomal in beds or strata in the Jura rango; aecumulated in kidney-shaped concretions in the lissures of the linestone; or dixpersed over the surface of the ground, and hut nlighally covered with mand or clay: They are found in the lepartments of the Vonne, the Mense, and the Momelle, mad indeed may he traced from the l'us de Calain on the nurth to the dura on the sonth, Indication throughout an alomidant naci manple nuphly. The present increased pronaction of trun in France is chintly due th the introluction of coal in smelting, lut it may aton be tracel th sume mearere to the encouragement given by the governmeat to that branch of industry, end to the whaterprise of a a th men ans M. de Gallois and M. Dufrinow, wha have exerted themanlves to extemel ite maninhature in that country. M. de fialloid reailed in Einghand fir neveral years, immedistely sulosequent to the peace of 1 14ts, and having oltained miminvion into the difleremt iron-workt hern, ha returned to france and established the workn at si. Diteme, now probathy tho largest and mowt extensive in that country. The universal exhilition of hat year (ldobi) fully juntilies the remarke in reference to the great incrense of the irou

trade of France.' Any person in the least conversant with the imperfect inachinery and processes of tho iron manufacture as it exiated in France soma years since, could not have been otherwise than struck with the improved character of those exemplifled in the Parls Exhbibitlon. In no country (prohably not excepting even this) has so great progress been mads in so short a time, In advancling from a state of comparative rudeness to one of conslderable perfection, as in France. The production of crude plg-lion in France is now litthe short of $1,000,000$ tons annually, but the demand for tallways, rolling-stook, bridgos, iron ships, girders, and other constructions is so great that large quantlties of iron are still annuilly imported from this country.
German Iron Manufactures.-The increaso in the proluctlon and manufacture of Iron in Germany, within the last fer years, is remakuble. In Prussian Westphulia alono, no loss than 16 mining and smelting companies have been formed since $1848-12$ of them aince 1854. In 1853, thls province produced hut 603,525 cwt . plg Iron, and $118,064 \mathrm{ewt}$. cast Iron ware; while In 1854 the prodact was $709,110 \mathrm{cwt}$. pig Iron, and 332,061 cast iron ware; showing an increase of 78 per cent. in one jear. In 1855 the saine provlnce produced $1,513,039$ cut. pig iron, and $1,126,025 \mathrm{cwt}$. bar iron. The product of iron ore in all Prussia in 1853, was 1,406,516 tons, and in 1854, 2,1-14,149 tons; increase, 647,633 tone. The prodoct of all the furnaces in the kingdom of ...iony, in 1852, was 168,175 ent. ; in 1808 , 170,637 en 2 . Havaria producer! in 180̄0, $668,167 \mathrm{cwt}$; in 1853, $1,074,817$ cwt. Austria, in 1830, produced $1,487,836$ ewt. pig iron, and 151,637 ewt. cast iron ware in $1854,4,151,505$ ewt. pig iron, and 582,446 ewt. east iron ware. The product of all the furnaces in the States of the Zollverem was: In 1851, $4,612,102$ ewt. ; In $1852,5,137,821 \mathrm{cwl}$. ; in 1853 , $6.126,458$ cwt. : in 1854, 7,501,470 ewt. ; showhyg an increuse from 1851 to 1854 , of 64 per cent. At this rate of increase, the production of iron will soon uxceed its consumption in Germany. But little railroad iron is now imported into Germany. The rollingmills on the lower lhhine, in Berlin, and in Silesia, supply l'russia; the rolllng-mill of Zwickuu meets the demand of Saxony, and that of Burglengentiold supplies lavaria. Austria, too, is supplied by domestic mills. Gernun rails are more expensive then English, but are also said to be more durable.
fa regard to machinery, Gemmany is also making rapid progress, and already outstrips England in tha building of locomotives. Not a single lucumotive is now sent from England to Germany on German account, white numbera of them are sent from Germany to France and Switzerland. Fixtensive iron-founderies and machine-shops are to be found in Herlin, Vienna, Blunich, Augsbarg, Faslingen, Carlaruhe, Aix-laChapelle, Ruhrort, Hanaver, ete. U1 to January 1, 1854, one estaldishment in llerlin had alono turned out 500 locomotives, and $1: 100$ have been built in all in Germany aince $1 \times \cdot 11$, tierman cutlery is likewise beginaing to compete with the langlish, especially in the West Indla and South American markets. The sugse phantations of the West Indies, which formerly obtained their harveating implements from lingland, now import them lirect from tiermany.

Prussic.-Valnahle deposito of the bhackland and clay carhonate ores are found interstratifled with the grest coal-ifeht of luhr ; nul the bog-iron and hematite ores are fund in considerable profushon in Whenish l'russin and other parts. In Upper Silesia, on the Vistula and the Oder, large ileponits of coal and iron are found in juxtaposition, and are worked to a censilerable extent.
The consunption of iron is not so grent as in Frunce, though it is increasing rapldy, us may be seen from returns recently ghen by tho British Chargo d'Atfaires at Borlin. Theso returus show that the anount
of iron are raised in Prusela has increased from 1,495,516 tons in 1853 , to $2,144,509$ tons in 1854 ; this has taken place in nearly all the producing districta, but chlefly on the Rhine, where the demand has lncreased from 719,684 to $1,068,656$ tons; in Westphalle, from 146,820 to 830,014 tons; in Silesin, from 563,730 to 650,369 tons; in lower Saxony and Thuringia, from 51,963 to 70,676 tons ; in Prussian Brandenburg, from $\mathbf{8 , 0 8 4}$ to $\mathbf{1 2 , 7 3 1}$ tons; and in the Upper Zollverein from 6,736 to 12,063 tons.

In I ustria, all the iron is smelted with charcoal or carbonized peat, and is, in consequence, of the finest quality; it may be applied to every description of manufucture, from the inost ductile wire to the harilest steel. The production is, however, small. The eres are found in IIungary, Styria, Moravia, and Epper Silesia.

In Belgium, both coal and iron are found in equal abundance, and are worked at Charleroi, Liege, and at other places. The ores, which are chiefly hematite, are derived from the linestone at the buse of the coal measures.

The auperiority of the Sucedish iron has long been acknowledged, and till recently it has been unrivaled. This arises not only from tho purity of the ore-the magnetic oxyd of iron-but in consequence of its being smelted with charcoal on'y. The quantity is, however, restrieted, as the iron-masters are allowed by law only a cortain number of trees per annum, in order that the forests may not be totally destroyed. Coal does not exist in either Sweden or Norway.

In 1814 some experimental researches were undertaken by Mr. Fuirbairn of Manches'or, at the request of the Sublime Porte, in regard to the properties of iron mate from the ores of Sumakoff in Turkey. The oree were strongly magnetic, and contained, occording to Dumas and others, 62 to 64 per cent, of iron. They conslatel of:

Sumo of theso ores have been smelted with charcoul, and some very fine specimens of iron and steel prodnced. 'The mannfacture is, however, in a langnid state in Turkey, and although smelting furnaces, blowing apparatus, forges, rulling mills, etc., woro propaied and sent out from this country, tasy are to a great oxtent useless anong a peoplo who havo decply rooted prejudices and halitual inactivity to overcarse, and every thing to learn in all those habits of industry which indicato tho rising prosperity of an energetic and an activo people.
America.-lloth the liagnetic, hamatite, and clayironstones abound in the United States. The magnetic ores workel in New lingland, New York, and New Jersey; the hamatite in l'ennsylvania, New York, New Jersey, and other localities; but the greater part of the manhacture must evertuall. establish itself in the valley of the Mississippi, wesi of tho Alleghany range, w here vast deposits of coal and iron exist, thusgh at present but imperfestly known or developed. The ores in mosi of theso districts aro smelted with a misture of eharcoal and anthracite, and the usual limestone flux, and $\rho$ roduce a \%ery excellent quality of iron. la another fortion of this article (*2 p. 11105) a full account of tho iron ores of the L'nited States is given.

In Nuva Scotia some of the richast ores yet discovered oecur in exlanastless abundarace. The iron mannfactured from them is of the vely best quality, and is equal to the tinest Swedish metal. The specular oro of tho Aedian mines, Nova Scotia, is said by Dr. Ere to be a nearly pure peroxyd of irnh, containing 99 per cont. of the peroxyd, und about 70 per cont. of iron. When smetted, 100 parts yield 75 of iron, the increase in weight beias dus to combined carbon. The red
ore Dr. Ure states to be analogous to the kldney ore of Cumberland, and to contain :

| Peroxyd of Iroa. | 858 | 84.4 |
| :---: | :---: | :---: |
| stlien. | 8.9 | 8.0 |
| Water | 6.0 | 7.6 |
|  | 100-0 | 000 |

The Acadian ores are situated in the neighhorhood of large tracts of foresta, capable of aupplying almost any quantity of charcoal for the manufacture of the superior qualities of iron and steel. Several specimens of iron from these mines have been submitted to direct experiment, and the results prove its high powers of resistance to strain, ductility, and adaptation to all those procerses by which the finest deacription of wire and ateel are manufactured. The difficaltles which the government haverhad to encounter, during the last two years, in obtaining a sufficiently strong metal for artiliery; are likely to be removed by the use - the Acadian pig-iron, Large quantities have heen purehased by the War Office, and experiments are now in progress, under the direction of Lien-tenant-Colonel Wilmot, Inspector of Artillery, and of Mr. Fairbairn, which seem calculated to establish the superierity of this metat for casting overy descrlptlon of heavy ordnance. There are also nome very rich ores at the Nhetau mines, as the following analyses by Dr. Jackaon ahow. They cont in lmpressions of Silurian tentacultea, spirifers, etc.:

|  | Browa tre, somewhat 1.4gmeth. | Reil Inon Ore. |

| Alumina.......... | $0 \cdot 60$ | 12) |
| Oxyd of manganese........... | -40 | 4.40 |
| Water............ | 10 | $2 \cdot 40$ |
| - Gain from ourgen. | $\begin{array}{r} 10020 \\ 20^{\circ} \end{array}$ | $\begin{gathered} 100-20 \\ 20+ \end{gathered}$ |
| \$ O, int-run, probmbly carbould arid iromy earbonals of lime. | 10000 | $160 \times 6$ |

As our innits are circumscribed, it will not be necessary to extend thie section further; snffice it therefore to observe, that in all countries nature has, with a beneficent purpose, interinid and interstratilled the whole surface of the globe with this useful and indispeusable material, and it would ill hespeak that bigh intelligence with which man is endowfil if he did not avail himself of, and turn to gool aecount, the immense stores of mineral treasures which are so profusely laid at his feet.
firel.-The inquiry into the properties and composition of the ores of iron, and the processes employed for their reduction and sulsequent conversion int., bars and plates, weuld be incomplete unless accompanied by dercriptive analysea of the fucl by which they are fused. Indeed the results of the operations of smelting, pudiling, etc., are so intimately depend. ent on the quality of the fuel employed, as to render a knax iedge of its constituents essential to the manus. facture of good iron.

Charcoal was at first universally empleyed in the manufacture of iron, and on account of its puri'y conspared with other kinds of furl, and its strong chemical nffinities and consequent high romhuatibility, it is uf rery nuperior value where it cant be ohtuined in large quantitles at a moderate cost. Thim, however, is rareIy the case, and hence its use in restribted within very arrow limits in most cunatries. Charooal is the wint of , verel processes, in earh of which the nls"e is: !nerver in amount of fuel In a given loulk. The will ting et: it to convenient lengths, and piled closel. pco her, in a large lieap, the interatices being $f$ 'led with "te nimalier liranchen, and the whole cove? raik? wet lorer. if powiter, when sis on lire.

auming the carbin. After the whole of the gaseous products have bean separated, and the carbon and salts only are left, the access of air is prevented, and the heap allowed to cool.

Another and bettor process is to throw the wor, into a large close ovan or furnace, heated elther by the combuation within it, or by a separate fire conducted In fluea around it. By this process, not only is the yield greater and of lettor quality, from the slower progrese of the operatio.2, but the products of the distillation may be preservel and omployed for a great variety of purposes. The following reaults of some experiments by Karsten, show the difference in yield of very rapid and very slow processes:

| Wood. | Cbarcoal produeed by quick earbonization. |  |
| :---: | :---: | :---: |
| Young oak | $16 \cdot 54$ | 2569 |
| Old oak | 15.91 | 25.71 |
| Young deal | 14.25 | 25.25 |
| Old deal. | 14.05 | 25.00 |
| Young fir. | 16.22 | 27.7 |
| Old tir.. | $15 \cdot 35$ | 24.75 |
| Mcan.. | 15.88 | 2507 |

These, on the average, give for the quick processes $15 \cdot 3$, and for the s!ow $25 \cdot 6$, being in the ratio ef 1 : $1 \cdot 67$, or 0.67 in favor of the quick process.

Peat-This materiul seems likely to come into use for smelting iron in countries such as Ireland, where neither coat nor wood are found in abundance. It is purer and less oljectionable than coal, and if properly dried, compressed, and carbonized, woull prove a very valuabla fuel for the reduction of such orea as we have already described in the eection on the iron ores of Ireland. It is carbonized in the same way as the charring of wood.

Coke.--Before the introdnction of the hot-blast, this macerial was used to a very great extent in the maufacture of iron; it is prepared from coal in the same way that charcoal is prepared from wool, the uperathen being ealled the coking or deanjphurizing process. The heaps do not require so careful a regulation of the admission of air as those of charcoal, on account of the comparatively incombustible character of the coke. Sometimea the heaps are maile large, with perfurated brick chimnies, to increase the draught through the mounds; at other times they are formed into sanaller heapn, and the conversion takes place withous the intervention of flues. The more usual and economical plan is, however, the emphoyment of close ovens, hy which process a great saving is effected, the yiehd being from 30 to 50 per cent. in the one case, and irom 50 to 75 in the other, accorting to the nuture aod quality of the coul.

The following table of the heating power of various kinds of fuel, trom Knapp's Chemical 'Technology, is not without interest ; in practice, howerer, only a portion of the absulute heating power is male available :

| ir cannel " | $1.275$ | $48 \cdot 362$ | $4.638$ | $47 \cdot 600$ |

And again the analyses, from Overman, of the ash of ceal, may he quoted, us showing the constituents contained in the ashes derived from combustion :

Malleable Iron.-The greatly extended application of wrought iron to every variety of construction renders an inventigation of its propertiea peculiarly interesting. It is now employed more extensively than cast iman and on acconnt of lts ductility and strength nearly two thirda of the weight of material may in many cases be saved by its employment, while great lightness and durability are secured. Its superiority is especially evident in constructions where great stiliness is not required, but on the other hand nuy degree of rigidity may be obtained by the emptoyment of a tahular or cellular structure, ind this may the seen in the construction of wromght iron tubular bridges, heams, and iron shops. The material of malleable iron which is making such vast changes in the forms of constructlon, can not but be interesting and important, and coasidering that the present is far from the limit of its applicatlon, wo shall endeavor to give it that degree of attention which the inportance of the aulject demands. From the forge and the rollingmill we derive two diatlact qualities of iron, known as "red-short" and "coldeshorf." The former is the most ductile, mad is a tough, fibrous materlal. which exhibits considerable strength when cold; the latter is more brittle, und has a highly erystalline fracture almost like eust-iron; but the fact is prohably not generally known, that the brittle worika as well, and is as ductio

## perature.

United States.-Iron was first made in America in the province of Virginia, aloout the rear 1715, and the example was quickly followed by the provinces of Maryland and Pennsylvania. This opening of a new source of wealth was a subject of great satisfaction and importance to those who were interested in the prosperity of the colonies, presenting to their view, at no distant date, a prospect of independence of forelgn countrics for the aupplies of those most essential articles, iron and timber.
Einfohta of Ibon from the Ampaican Plantationg.

In 1810, Mr. Gallatin, the Secretary of the Treasury of the United States, presented to Congress a report on the manufactures, in which, among many other branches, iron, and the manufactures of iron, are mentioned as being firmly established, supplying, in several instances, the greater, and in all, a considerable protion of the consumpition of the United States.

The furnaces, forges, and bloomeries of the United Staces, amount to 630 , of which the State of New York furnlsies 69. The annual value of iron and ita manufactures is estimated at $\$ 12,000,000$ or $\$ 15,000,000$. The average value of imported metal, in lar-iron and wtec., at $\$ 1,000,000$. The Franconia Iron Works, In Nuw llampshire, extablished in 1810, enploy a capital of $\$ 100,000$, The Vergennes lron Works, in Vermont, promise to he very important. The price of bar-iron at this establishment is 8140 per ton, the ore ©il, charcoal $\$ 150$ per 100 hushels; 19,000 muskets are anumally nado at the two public armories of Springliehl and Harper's Ferry. There is now a consile rable surplas of sumall arms."

Some of the ores of iron are found in overy State in the Union; and, nbout the period of Mr. Gallat: :s eport, mines of this metal were worked in New, ". pshiru, Vermont, Hhode Ialand, New York, Coluecti-
ctut, New Jersoy, Pennsylvania, Virginia, and North Carolina.

According to the "Statistical Annals of the United States," by Adam Seybert, founded on official documents, the manufacture of iron in the year 1810 was an follows: 153 furnaces, making 53,908 tons of iron; 330 forges, maklng 24,541 tons of bar-lron; 316 tripbammers; 34 rolling and slitt:ing-milis, which required 6500 tons of tron; 410 nailiries, in which 15,727,914 lbs. of nails had been made. Manufacture of iron, value, $\$ 14,364,526$.

From alstracts of reliable statements it appcars that the whole quantity of iron made in the year 1830, computed $\ln$ pig-iron, amoun $\mathfrak{\gamma d}$ to 191,536 tons, produced from 239 furnaces, two fifths of which were made in Pennsylvania.

The average quantity of lammered iron imported from 1821 to 1830 , was about 26,200 tons, anit of rolled iron about 5600 tona, making together 31,800 tons, valued at $\$ 1,762,000$. The whole quantity of hammered and rolled Iron consumed In the United States in 1830, may be entlmated at about $14,4,666$ tons.

The value of the various forelgn manafactures of iron consumed, on an nverage, from 1821 to 1830, was aloot $4,000,000$, making the whole amount of foreign iron and its manufactures annually consmued, about 85,762,000.

Since the . lron market of
may be reported as much more healthy than it was a month ago. By the last two or three American mails there have been brought speclficatlons which, in thelr number and value, form a striking contrast to these recelved during many months past. These show that the American mills are able to supply only a very amall portion of the demand of the Statea; and are demonstrative that $w^{\prime}$ th bars at $£ 8$ inateaci of $£ 9$, a trade might be carried on with America to an extent that would be restricted by nething else than the powers of production attaching to the Britlal werks. The Persia, whose letters were dellvered on SAturdsy last, was espectally valuable in respect of such npecifieations. In the past fertnight, however, the 'make' of nouth Staffordshire has net been lyy any means so large as under such circumstances might have heen expected. This has been occasloned by the unusual circumstances of large masses of machinery at several works having been atopped by breakages, which have all happenad within a few days of each ether. By the end of this week the preparations that have ensued wlll be completed, and If there should not be a recurrence, the next fortnight will be characterized by the utmost animation at the works of the principal $i$ on-masters of the dlatrict. The large American demand will make the inconvenience greater than is now being felt by most of the makers of malleable iren, from the exceedingly short supply of hematite ore of sample sufficiently fine for the purposes of the puddling furnace. If this deficiency should last much longer, it will cause some little anxiety in cases where those deseriptions of iron are in demand, in the manufacture of which pounded ealeined cinder is not an efficient substitute. There are no complaints of a shortness of supply of those courser samples of red ore used in the blast fur-nace."-Iondon Engineer, Feb.
The supply of the hest quality of iron is decreasing in England, whereas in this country we are but heginning to develop and ticcome acquainted with our hest ores. "Iron Mountain" and "Pilot Ǩnob" in Missouri, contain iron in immense quantities, and of a purity of ore not to be found but in two or three mines, and limited in amount, in Sweden. And Kentucky bas andeveloped iron ores to a great extent, and of uncommon purity. We onght to export rather than import iron; and in less than twenty years we shall do so, unless some womderful mineralogical discoveries are made in the British Isles.
So State in the Union is но vitally intcrested in the fron trade as PennsyIvania. Irom, in all its lifferent varicties, forms one of the chief sources of state wealth. The ore aboumids in several sections of this commonwealth, while furnaces dot the hill-sidea and valleys, piving employment to numerous laborers, and producing thousamels of tons of iron, whichare transported to other States, and serve to enrich all who are interested in ite manufartore. Farh yoar wrience upplies iron to more of the common nses of every-day life. It supplies the muterial for ships ; enters largely into the construction of homses; forms part of all the new and improved agrieultural implements; and thus becomes a rival to timber in the merhanical department of our country. This increasing consumption, of coorse, must increase the demnnel in a parallel degree, and if Congress will but legislate wisely, and in favor of home labor and enpital, as exhibited in the iron trade, it most prosper in the future. It is surely the policy of our country to foster this branch of her prom ductive industry. it is by wise, jublicions legislation, that comparatively young countrics are enabled to compete with okler and more practiced ones, where capital is abundant and labor cheap. Thls is the kin! of legislation demanded by the iron trable of this State and country, and wr hope that much will te extended by our mational legislature.
Since the commencement of the present year, the fron market of this conatry has heen marked ly peen-

Har clrcumstances. East of the Alleghany mountains the production of pig Iren exceeds the quantity manufactured during the same period of any prevlous season. A atill greater increase is also looked for during the remaining menths. There ls now on hand a considerable quantity of the stock of 1855 , accumulated in consequence of the severity of the winter preventIng lron from being dellvered when ordered, But a singular fact ls , that with all these apparent drawbacks, the price stendily and firmly advanced to the highest guotation, and aales have been greater in the early months of this, than in the same months of any other yenr. More than 60,000 tans were contracted for in thle city, in the month of April, to be delivered during the year. This is a very heavy busineas to be perfected so early in the season, and since then the quantity has been swelled to a much higher figure. Importatlons of pig Iren, especially Seotch, have been decreasing for the past year or 18 months. During the six months ending December 31st, 1855, the importation of pig Iron from all foreign ports only reached 29,839 tons. This is leas than one third of the ameunt imported during the previous 12 months. This is a cheering indication, and the decrense in the importation of foreign pig iron will give a fresh impetus to our home manufacture, which is much needed in many sections of the Union.

The long and severe winter prevented shipments of har iron from Pittsburg in the usual quantities, consequently there has been a heavy accumulation of that particular stock at that place. It was estimated that in the month of April, there were 35,000 tons of Lar iron waiting sale and transportation at Pittsburg. In despint of these facts, however, the various mills are in full operution, leprending upon the heavy trade to carry them through the sensen. The general presperity of all the weatern interests must keep up the demand for iren, and if so the stons. will not be too heary. It is computed that $280^{1} \mathrm{~ms}$ s is of pig iron will he produced in the West dui roin $1 /$ rresent year -this, of ceurse, includes wesi i ansylyanin. From tha districts of Alleghany, llanging Roek, and Clarksville, about 200,000 tons will be sent to market. There will he a decrease of charcoal pigg iren in the present year, when compared with the production of $1 \times 55$, of $5 \mathrm{E}, 000$ tons. The product of new ceke and raw bituminous ceal furnaces will, however, make gool at least 15,000 tons of this deficit. The amount of anthracite pig iron consumed in the West in 1855 , was 33,000 tons. There will be an increased amount needed during the present year, If we may julge from the contracts nade for supplies from Susquehanna. We tive below an interesting article from the "Iron Masters' Review, " showing the amennt of pig iron consumed in the places named in the West; and also the quantity und value of railroad iron imported inte the Initud States, from the :10th June, 1839, to the 30th June, 1855 . It is well worthy in attentive perusal by all those who are interestes in the iron trade of the United istates.

In the lower part of tho Surquehanna district, the furnaces have mostly produced for the western market. There has been considerable irregularit:" in their operations, partly on aceount of deficiency of coal and the lato opening of navigation. The new furnaces-Dulley, Keystone, No. 2 Cornwall-anl several furmaces which worked little, if any, in 1855 , will prohmbly increase the product of the district this vear liy 25,100 tons. Cireumstances do not admit of a comprehensive survey of the produrt of this district, nor of the demands that may come from the West.

In the Ieehigh district, at this date, the stock of pigi iron, which is nearly all No. 1, smounts to 34,250 tons. The contrnets nilready nade, for iron of this district, for thin year's delivery, approximate to $37,6 \mathrm{fl}$ tons. There are 17 furnaces now in blast, whe to be put in hast hy the middle of May, and one in July

The 17 furnaces are prolucing weekly an iverage of 2100 tona, making for the remaining $37 \frac{1}{\text { s }}$ weeks of 1866 , 78,750 tonm, whieh, added to the present eto 2 -, rives an aggregate of $\mathbf{1 1 2 , 9 0 0}$ tona. In this eathnate we omit the produet of the twe furmsees soon going into blast, to make up for tho ponalble deficienclea that may raralt from accidenls. If we allo "for next yeur'a market the production in four weeks of December, daring which the product may be closed la by winter, we hnve 104,500 tons for the market for thia year, leas thunalreaity contrac sa, 37,600 tons ; leaving ansold for this year's delivery 66,900 tons. In tisese eatimates no acconat la taken of the amall nalea in the diatrict, nor of a fow small shipments by railroad, made in 1856 prior to this date. The sales of Iron from this diatrict in $18: 5$, npproximnteil to 105,000 tons-equal to a reduction of stocks, of 19,000 tona. Tha ntocks on the lat of Jannary lant approximated to 20,700 tona, and on the 1at of January, 1855, to 39,000 . The total production in this distriet in the year 1856, will approximate to 106,000 tons; ansuming as a basis the dsta above given, which will prove reliable, save as It may be affectod by accidents in manofacturing, or by a change in the market. The production in the 14 weeks pant has noi averaged 2100 tons-several furnaces laving liut recently been put in hast.

Tha consumptiont of rals within the past aiaf months has greatly inereased over the overage of the provions year. The impurtation in the six months enrling December 81, 1855, amonated to $89,8 \mathrm{c} 4$ tons ; or 50 per cent. more than in the avarage of the previous 12 montha. In the six montha named, Anerican mills produced about 70,000 tons. As the returns of last year's harveat are now exerting their grealest Intuanoe upon the general proaperity of the interior, railroad enterprises are much encouraged. If the promised peace of Europe is fally re-inaugurated, there is no doubt that with un averagu harvest the present jear, our rallroad oxtensions will be greater than in any prorion heletofore. In addition to the reguirements for new roadn and exteasions, the older roads are jringreasively needing a greater amount of ralla for renewals, where In most inftancea heavier ruils are pat dewn. It is worthy of uote, that a harge çortion of the oid rails taken up is used in other manufactures, to whieh thia ilescription of iron is rogarded hy many as being better ulapted. The increasing amonnt of this stock, which comes in competitlon with pig lron, is worthy of special consid. eration. Capital la wanted in I'ennaylvunia, Marylani, Virvinia, Dissouri, Tennessee, and other States, for the more vigorous and inore profitable workiugs of the extensive iron orea of those States.

Paonection or Pio laon in ties United Statioh, acconoino to tire Crnber or 1850.

I'godection of Whought Ibon in the Liniteid Statks, buo.

Produotion or Inon Cabtinoe in the Unithd Statra, 1850.

Appearances indicate that iron will grow moro and more into request-in architecture, ships, and rigging. Wire ropes are now used at mun; of the mines in the midland and northern counties; and an attempt is being made to introduce them in Devon and Cornwall. At equal strength, a wire rope is lighter by one third than a hemp nupe, and by two thirds than a chain; an important fact, eariceinlly where mines are deepest. Then we are to linve metallic life-bonts, pontocns, anny-wagons, if the reeult of experiments made at Wootwich and Roclsester may be trusted. The boats, we hear, can not be broken or overset, let them be used ever co roughly; and the pontoons are models of lightness. And again-tho United States' Congress have recommended three lines of rallway to California: northern, central, and southern, each about 2000 miles in length. The landa grantel to the three comprise [ $31,865 \hat{5},(000$ acres-a truly gignntic encouragement! What a demand there will be fur rails! Then we are to have the often-talked-of railway to India by the Euphrstes valley; the route is to be forthwith surreyed. And there is talk of a railway from IIonduras across to the Pacific-161 miles, the estimuted cost
$\$ 7,000,000$, and the expectations of a profitable traflic, fair. To say nothing of the trade from ocean to ocean, there are forests of mahogany and other woods to supply timber-freight for centuries. Accurding to a report in the Journal of the Society of Arts, the Honduras government " agrees to give a bounty of 50 acres of land to unmarried, and 75 acres to married laborers who shall go to the concity to work on the road, and who shall declare their intention to become citizens."-Chambers' Journol. We now subjoin an official sunmary of the exprort trade of the United Stntes from 1847 to 1856:
Foarinn Iron Trade or Cinited States foa ten Yraeg.

Iron Mountain.-Iron Mountain is situated in St. Francis county, Mo. The land on which it lies was a grant by the Spaninh government, when this portion of the south-west was in possession of that goverainent. The grant was conilrmed by the Congress of the United States in 1836; but of arcount of the dillterlty of transportation, and of the impression that tho ors coud not be amelted, this luexhamatible supply was permitted to remain unproductive until 1851, when the Iron Dlenntain Company was formed and proceeded to the erection of furmaces. The mountain is a flattened, conical shaped hill, with an uverage elevation alove the surrounding valleys of 228 feet, the hase of which envera an area of about $\overline{\mathrm{t}} \mathrm{f}$ acres. Tife ore is the specular iron ore, and is remarkably pure; its average yield, In the furnace, being 56 per cent. From surface indications, and from ail explorations made, the whole Iron Mountain acema to be mate of iron ore. Almost the entire aurface of tise mountain is covered with irou ure, the particlea : ecreasing in size as you aseend toward the top, until on its aummit are found disconnected masses, many tons in weigit,
and often six or elght feet in diameter. To what depth the iron ore extends below the base of the mountain, has never yet been ascertained. An artesinn well was attempted to be bored by the compnny, at the base of the mountain, and after attaining the depth of 180 feet, most of the way through iron ore, the work was abandoned. When the bering ceased, the: 'ger rested In a solid mass of ore; so that there is ore under the ground, as well as ahove it.

Imports of Iron into the Unitec' States.-The United States, pext to England, may the considered among the leadiug Iron produciug countries in the world-Fingiand prolucing $3,600,000$, and the United States $1,000,000$ tons fer nnnum. Ansuming the average price of iron to he 847 , or even 830 , we produce annually to the value of $\$ 27,000,000$ or $\$ 30,000,000$. From the foliowing table it will be seen that our imports of iron and steel manufuetures lave gradually reached nearly the same sum. The imports were in

Iron-Wood (Ger. Eisenholx; Du, Yrerhout; Fr. Bois de fer; It. Legno di ferro; Sp. Plo hierro; Lat. Sideroxylon, Lignum ferreum), a species of wood of a reddish cast, so called on account of its corroding ao that metal doee, and its being remarkably hard and ponderous-even more se than ebony, The tree which produces it grows princlpally in the West India Islands, and is likewise very common in South America, and in some parts of Asia, especially about Slam.
Irrawadi (Erivati, "the great river"), one of the groat rivers of south-eastern Asia, is supposed to rise in Tibet, near lat. $28^{\circ}$ north, long. $97^{\circ} 30^{\prime}$ east, flows generelly southward, traversing the Burmese Empire throughout, and enters the Indian Ocean (Bay of Bengal) by numerous mouths, east of Cape Negrais, in Lat. $16^{\circ} 20^{\prime}$ north, long. $96^{\circ}$ east. Principal affluents, the Ning-thee, Mogouny, Bhamo, and Langcchuen Rivars. In lat. $17^{\circ}$ north, it separates into numerous arms, which cover the whole kingdom of Pegu with net-work of ramifications, and the Rangoon and Baasein branches form the east and weat boundaries of ita delta, a region comprising upward of 10,000 aquare miles, covered with teak forests and grass jungles, interapersed with some rice-grounds. The main atream from the bead of the delta to Yedan, above Ava, varies from one to four miles in brealth, and may always be ascended to Ava from the sea by vessela of 200 tona, which, during the rains, ean reach the influx of the Mogouny RIver, 800 milies from the ocean. It is
usnally navigable for canoes as high as Bhat.o, besides which town and Ava, Amarapura, Sakalig, Yandabo, Pagahm Mew, Prome, Henthada, Baseein, and Rangoon, are the principal places on Ita banks.
Ininglass (Ger. Hausenblase, Hausbluse; Fr. Colle de poisson, Carlock; It. Cola di pesce; Rus. Klei rübūi, Karluk), one of the purest and finest of the animal glues. A variety of gelatine, sometimea called ichthyocolla, or fish-glue (from lx $\chi$ ús, a fóah, and кúd $\lambda a$, glue), prepared from the alr-bag, awimming-bladder, or sound of various fishes. The Rasaian and Siberian isinglass is most esteemed; it is cliiefiy obtained from sturgeons, a family of cartllaginous flaten of the genus Atcipener. The awimming-bladder is cut up, washed, and then exposed to the nir, with the luner silvery membrane upward. When dry, this membrane is remevel ly beating and rubbing ; the sound is then prepured in various wnys. For forming what is calied leaj' 'singlans, it ia marely dried; for lomg and ahort staple, it is twisted between three pegs, lato the shape of a horseshoe, harp, or lyre; for book isinglass, it is folded like the sheeta of a book; for ribbon isinglass, it is rolled eut. The awimming-Hladder of A, sturio of the Casplan Seen furnishes leaf isinglass of three qualities, known as fine-firsta, firsts; and seconds. A. güldenatadiii of the Casplan and Biack Seas and their tributary rivers, furnishee caviare from its roe or ovary while the ewimming-bledder ylelds staple nud leaf isinglass. The varieties of staple are Patriurch Astrac

Lhan, and Astrakhass Arets, reconde, and thirdes, The may be imported under any flag. This island is situ varieties of leaf are also firsts, secoinds, and thindowthe firsts forming the fineot leaf known in commierce. A. rufinus and A. otellatus also yleld isinglase. .There io a kind known as Edmovey leaf, from 'Tanganiod,' hut this is inferior , there is also thio sisane leaff sald to be obtained from a small fish, and krobki ininglass; which is made Into emsill membrenous diske." Isluglass is also procured from siluris glanis. For purre, pips, and lump isinglass, the swimming-bladder is dried unopened, and the variety known as siberian purte, of moderately good quality, is greatly in demand.
Brazilian ftinglase is obtained from 'Para and Maranham, but the fishes which produce it have not been named. For the variety known as pipe-Brazil, the swimming-bladders are dried unopened, and made into pipes 10 or 12 luches long, and from 2 to $2 f$ inches brosd, snd are sometimes distended with air. Lump islinglasa is formed by placing two swimming-bladdere side by iide, and for hioney-comb istinglass, the largest lump ialuglass is aplit open. "There are also varietles of lsinglass from Now York, from Hudson's Bay, and from the East Indles. In Moldavia as variety is prepared from the skin, stomach, intestines, and swim-ming-bladder of the sturgeon. These are eut small, steeped in cold water, and alimmered. The jelly thus produced is spread out into thin layers, and dried into a kind of parchment, whieh,' on being softened witth wster, is rolled into cylinders, or extended into plates, and forma an infericr islaglass. Cod sounds are also nsed for a similar parpose. The patent gelatin propared from glue-pleces or cuttings of hides, etc., after the manner of glue, it also uned as a subetitute for ielnglass. A sold gelatin in thin plates and strings is prepared from bones, and is chlefly' of French manufacture:
Isinglass is propared for sale by being picked and eut. Thls was formerly' done by hand, bnt is now effected by steam machinery; the thin filaments thus produced should be whitish in color, dry, semi-transparent, nearly tasteless, anid quite devold of amell. Islngiass differs from glue in being tongh, filhrous, and elastic, Instead of brittle. On boiling, it shiould completely dissolve, and on cooling, should form a whita Jelly, soluble In weak aelds, but saparable from them by alksies. With millk and sugar it ls used as a dieî for invalids, and it is slso used in the preparation of blanc-mange, jellies snd creams, snd for enriching soups and sauces. Isinglass is no longer considered to he highly nutritive; it is even less digestible than the flesh or muscular part of animals. The great consumer of isinglass is the brewer, who uses it as a finlng mstcrial, for which purpose lump islnglass is chiefly used. This is deeper in color, and inferior in solubility to the better varieties. On mixing it with the liquor to be fined, It partly combines with some of those mstters which render the liquor cloudy, and entangles in its meshes those whith sre mechanically suspended, tha vhole then rising to the snrifice can be removed; and the liquer be left olear. Wine, ceffee, and other Hiquids are slso clarifled by Islnglass, but solesklus und hartshorn shavings ams often used as substitutes for it. Isinglass forms the adhesive materlal in court-plaster, for which purpose a solution of Lsinglisss, mixed with tlincture of bensoin, is brushed over bleck saresenet.' Isinglass dissolved in spirits of wine or common gin, and gently simmered by placing the bottle in a vessel of bolling water for sbout an hour, forms diamond cement, or whits fieh-glus ; gum anmonise is sometimes added. Panes of lisinglass, Instead of glue, are used ir. France instead of horn, for lanterns, and alao for lamp-shades, ete.-E. B.
Isle of Bourbon. Merchandise from Enrope, or sny country facing the Mediterranesen, is inaimissible to the estabilisied entrepot of thlis leland, unless directly lmported from French entrepots, or the place of production; but merchandise of any other origin
ated in the Indinu Ocean, between latitude $20^{\circ} 50^{\circ}$ and $21^{\circ} 24^{\prime}$ S., 410 miles eant of Madagascar. It is of ani oval shape, greatest longth 40 millen, grestost breadth 27 millos. Popalation about 109,000. Area, 900 square miles. It is intereected by two mountain ridges, with volcanoes. Thare are many small rivers, bua noue navigable. The vallays of any considerable size are not numerous." It has no safe harbor. The cllmate la healthy and pleasant. From December to May is the hot and rainy season. The soil is very fertile. In 1836 the surface was distributed into about 65 parts of cultivated land, 14 parts of pasturage, 55 parts of wood, and 97 parts of waste lands. The cultivated parts enicircle the island, and press np the eldes of the interior mountaling. The articles produced ere the sugar-cane, coffee, cloven, cocoa, tobacco, and grain ; of these, the sugaresane, grain, and coffee aro most largely produced. The fisheries are excellent. They omploy about 500 peraona. The fish taken sell in the Ialand for about $\$ 80,000$ per annum. In 1848 the population consisted of 108,000 souls. They have numerous brick and lime kilna, tanneries, forges, founderies, thu-ware factories, brewaries, and manufactures of palm-lesf bagglag. The principal articles of export are raw angar, coffee, clovab, dyewoods, csbinet-wood, and asltpetre. The staplea are onumerated in the order of their importance, and are of the annual value of shout $\$ 5,000,000$. The chlef imports are rice, whest, oll, wines, cattle, timber, salt, glass, percelain, and cottons and other manufactured goods.: The total value of the - imports is about $\$ 2,800,000$.
Isothermal (Gr. coos and $\theta \in ́ \rho \mu \eta$, heat). In physical geography, ivothermal lines are those whlch pass through thase points on the surface of the earth at which the mean annual temperature is the same. Isothermal zones are apaces on opposilte aldes of the equator, having the same mean temperature, and bounded by corresponding isothermal lines. ${ }^{3}$ On account of the irregular form and dispositien of the continental masses, by which the climate of different places is greatly infinenced, the leothermal curvea are not parallel to the equator, excepting in the very low latitudes. Accordicg to Humboldt; the isothermal line, which corresponds to the tempersture of $32^{\circ}$ Fahrenheif, passes between Ulea, in Lapland, lat. $56^{\circ}$, and Table Bay, on the coast of Labrador, lat. $54^{\circ}$. The isothermal line of $41^{\circ}$ panses near Stockholm, lat. $591^{\circ}$, and St. George's Bay, Newfoundiand, lat. $48^{\circ}$. The line of $50^{\circ}$ passes through the Netherlands, lat. $510^{\circ}$, and near Boston, in the United States, lat. $421^{\circ}$; that of $59^{\circ}$ between Rome and Florence, lat. $43^{\circ}$, and Raleigh, in North Carolina, lat. $36^{\circ}$. In all these cases we see that the isothermal Innes, in passing from the western side of the continent of Europe to the eastern coast of America, deviste very considerably toward the outh; the deviation in one case amounting to $111^{\circ}$ of latitude., In passing over the Ameriean continent they again recede to the northward ; and in Californis, and to the north of that peninsula, aleng the weatern alde of the continent, the annual temperature is nearly the same as under similar latitudes in the west of Europe. From the western to the anstern side of the old continent the flexure of the lsothermal curves and the diminutlon of the mean annuil tomperature under the aame parallels, are not less conspicuous. The lisothermal line of $55^{\circ}$ passes through Nantes, lat. $47^{\circ}$, and Pokln, lat. $891^{\circ}$. EdInburg, and Kasan, in the enst of Russia, have the bame latitude; but the mean annual temporature' of the former is $48^{\circ}$, while that of the ascond is below $88^{\circ}$. For the different eauses which affect the parsllellsm of the isothermal lines, or which produce the differences of the mean snnual tomperature of the places nnder the sume parallel of latitude.
IIumboldt gives the name of iootheral lines (ioos, and $\theta$ epos, oummer) to the curves passing through those
places at which the mean aummer hat is the same; and of isochimenal ( $1 \sigma 0 \varsigma$, and $\chi e t u \omega y$, winter) to those which pass through the placea at which the mean temperature of winter is the same. The isotheral and isochimenal curvea deviste much more from the parallela of lat'tude than the iaothermal. The latitudes of places having the same winter temperature sometimes differ so much as $18^{\circ}$ or $20^{\circ}$. The winter of Scotland is as mild as that of Milan. The mean temperature of the winter months at Edinhurg is about $881^{\circ}$; of Kasan, uader the same parallel, only $2^{\circ}$. The winter of Pekin ia as rigorous as that of Stockholm.-Humsoldr's Fragmens Asiatiques.

Inthmus, a narrow neck or alip of land which connecte two continents ; or joins a peninaula to the terra firma, and separates two seas. The most celebrated isthmuses are, that of Panams or Darien, which joins North and Sonth America; that of Suez, which connecta Asia and Africa; that of Corinth, which unites the Morea with wastern Greece; that of Crim Tartary, otherwise called Tauricu Chersonesus; and that of the Peninaula Romania, and Erisso, or the isthmus of the Thracian Chersoneaus, twelve furlongs broad, being that which Xerxea undertook to cut through.

Italy. The name Italia was originally applied to the extreme end of the peninauls, south of a line drawn from the Galf of Squillace, Sinus Scylaceus, to that of Sta. Eufemia, Sinur Terinous. By the time of Thucydides, in the' 5 th century B.c., the appellation had already extended to Metapontum on the east, and the Posidonian Gulf on the weat coast, thua including the whole of modern Calabris, and great part of the provinces of Basilicata and Salerno. The further extension of the name was cotemporary with the progress of the Roman power, and at the time of Pyrrhus it included apparently the whole peninsula, except Liguria and Cisalpine Gaul. In the 7th century of Rome. though loth Ligurin and Cisalpine Gaul were stili, in offleial usage, distinct from Italia, yet the latter name, as we gather from many passages in the clasaics, was already employed, in common acceptation, to designate the whole country from the Ajps to the Sicilian Straits. The official acceptation was dropped as soon as Augustus, in his division of Italy, incorporated Liguria, Cisalpine Gaul, Venetis, and Istria.
The origin of the name has been referred to vurious sources, all equally uncertain. Greek and Roman tradition deduced it from the eponymons hero Italus, a anpposed (Enotrian or Pelasgic chief; while Timens, followed ly Varro and Geilius, derived it from Italos, which in old Greek signified an or, from the quantity of cattla bred in the country. Greria, enim antiqua, ut scribit Timeus, tauros vocabat 'Iraגoig, a quorsm multitudine et pulchritudine et fietu vitulorum, Italiam dixerunt.* Thn word litulus (calf) and Italus were, according to Festus, synonymous; and on the denarii struck by the Sabellian nations daring the Social War, n.c. $90-88$, there wecurs the word :itelu for Itaiy.

In early times Italy was also calied Snturnia from the Iatin god Saturnus, Qinotria from an ancjent chie? (Enotrus, and Arania from the Ausones, the Auruwici of the llomans, who occupied the centre of the peninsula. All these names, however, seem to have belonged to particular districte, and to hava been applied to the whoie country only ly the Latin and later Greek poets; indeed (Enotria would appear from Antiochus to have been synonymous with Italia in Its original acceptation. The Gireek poets apilied to it sometimes the name Hesperic, on aecount of ita being to the westward of their country. 'The (lermans called it Woelshland, because the parts nearest to them were Inhabited by the Galles or Wallea; and in their pres-

- Varro, De He Mustied, It. 6.
ent language the name of Waelshland is still retained by the common people.
The loftioat range of mountains in Europe on the north-east, north, and north-weat, and the sea on every othar side, form the natural boundaries of Italy. The Alpine chain, oxtending in a semicir. cular form from the Julian Alpa at the head of the Adriatio to the Meritime Alps on the Gulf of Genoa, dividea it on the north-east from Illyria and the Tyrol, on the north and north-west from Switzerland, and on the west from France, where the liver Var (Varus) forma its boundary. From this Alpine range, which may be called its basis, Italy prcjects south-oast in a peninsulsr form, and nearly in the shspe of a boot, far into the Mediterranean Sea, which takea the different namea of-Adriatie, Afare Superum, on the east coast-Ionian, Mare Ionium, on the southeast coast, from the Cape of Sta. Msria di Leuca to the Straits of Messina-and of Tyrrhenian, Mare Inferum vel Tyrrhenum, on the west coast. According to these
physical barriers, Trieste and the province of Istria on physical barriers, Trieste and the province of Istria on the east, and Nice on the west, would be excluded from Italy; but ever eince Augastue extended its limits to the Var on the west, and the Gulf of Quarnero (Sinus Flanaticus) on the east, they have been reckoned as part of ltaly. In the present politicai division of the Austrian empire, however, neither Istria nor Trieste la included in the Lombardo-Venetian kingdom, the limits of which are at the Isonzo, north-east of Aquilein. Along the north snd northweat frontier the limits of Itsly have at different times undergone various, though lnsignillcant ehanges; for the Alps, though presenting an unbroken line in a distant viow, are so deeply indented with valleys a 3 to make a natural boundary possible only by foliowing the watershed, a course never or eeldoin adopted in political arrangements. But oven the watershed would not mark the limita of different nationalities, as valleys which, by this criterion, should not belong to Italy, are inhabited by an Italian race; and German or French is apoken in districts which should be included in Italy.

The Italian peainsula is situated between the parallels of N. lat. $46^{\circ} 30^{\prime}$ and $37^{\circ} 54^{\prime}$, and E. long. $6^{\circ} 38^{\prime}$ and $18^{\circ} 32^{\prime}$; if the islands are included, the southernmoat parallel of lat. is $35^{\circ} 40^{\prime}$. Its length in a direct line from the foot of the Alps near Aosta to the Capo di Sta. Maria di Leuca (Iapygium Promontorium) is about 609 miles, and to the Cspo dell' Armi (Leucopetra) a little moro than 660. Ite breadth varies greatly. From the mouth of the Var to the head of the Adriatic, near the Isonzo, it is 300 miles; and if the line be carried te the head of the Gulf of Quarnero, near liume, it is more than 850. It narrows rapidly as it descends south; and from Viaroggio to Cervia is only 95 miles. Further south it expands a little; and from liomhino to Ancona the breadth is 138 miles, and 150 from Capo di Licosa to Brindisi. From Diamante to the mouth of the Crati, in Calabria, it ia 29 miles, ani oniy 18 between the Gulfs of Sta. Eufemia ant: Squiliace. It is surrounded by many islande, the princlpal of which are: on the east coast the group of the Tremiti, north of Monte Gargano, and S. Pictro and S. l'aolo in the Gulf of Taranto; on the south, Sicily, the largest of all, the Lipari group, Pantelleria, Malta, nnd Giozo, 58 miles from Sleliy; on the west, Capri, Procida, anit Ischia, at the two extremities of the Gulf of Nuples; the l'onza group opposite Gacata, Giglio near Monte Argentaro, the two large Jslands of Sardinia and Corsiea; and between the latter one and the const of Tuacany are l'ianosa, Elba, and Capraia. The most important of these ure noticed under their respeetive heads in thla work.
The sea coasts of the peninsula, on the Tyrrhenian side, are, for tha most part, protected by lofty acclivitien, but on the Adriatic and the Ionian they are genersily flat. The moat remarkable capes and promontorles of the jeninsula are: Delio Nielle, Manara,

Pioml
Licoas
Sparti
Gargs
The

Piombino, Argentaro, Circelio, Miseno, Campanelia, Licosa, Vaticano, Delie Armi, on the west shore; Spartivento, Rizzuto, Nau or Colonne, Alice, Leuca, Gargeno, on the south-east and east shore.
The extent and population of Italy, including ita jsiands, are shown by the following table, which is to
be considered as merely approximative. In some of the States, the returna of population are not mach attended to; and, with regard to their area, there is great discrepancy between the varions authorities. This table, however, has beta compilod from the moat authentic data.

The most densely inhabited State is that of Lncea, which contuine 525 individuals for every square mile ; next to it come the Lombard provinces. The most thiniy inhabited parts are the Campagna of Rome and the Island of Sardinia. Itsiy has more populous towns than any other State of Europe of the same extent. Naples has more than 400,000 inhsbitants; Milan, Turin, Rome, and Palermo, each more than 150,000 ; Ficrence, Venice, and Genos, more than 100,000; Leghorn, Messina, Verons, and Bologna, more thsn 60,000; Purma, Padus, and Catania, more than 40,000; Mantua, Bergamo, Brescia, Ferrara, Modens, Piacenza, Ancons, and Bari, more than 30,000 , etc.

The division of Italy into northern, central, and southa* ., is neither political nor etrictly geographical, but is adopted sometimes as a convenient designation of some parts of the country. According to the general acceptation in the peninsuia, northern Italy is understood to include Piedmont und the Riviera, Lombardy, the Venctian, Parma, Modena, and the States of the Church, as far as an imaginary line from the Gulf of Spezia to Ravenna; central Italy inciudes Tuscany and the rest of the States of the Church; sind southern Itaiy the kingdom of Napies. Tho division in more common use among natives is into upper and lower Italy, the former applying to the portion north of the Apennines and to the Riviera, the istter to sili the rest of the peninsula.

The face of the country is much diversified by mountsins, of which thoso forming its northern und northwestern boundary have been described in this work under the article Anss. A second range of mountsina, running through its whole length, determines its contigurstion and its phyeical churacter. From the earliest historical times they wero called Apennines-a name supposed to be of Ceitic origin, from its containing the root Pen, which in Celtie dialects signiflea height or head.

The Apennines may be regarded as a great offyhoot of the $A \mathrm{lps}$, from winch they branch off near tho Guif of Genoa; but as there is no regular break in the chain, much difference of opinion has prevailed as to the point of their real commencement. Poiybius extends the Apennines neariy as far as Marseilios; Stralo, on the contrary, extends the Maritime Alpa to Vado, and states that the Apennines begin near Genoa, The latter opinion has heen adopted by tho best modern geographers, who fix the junction of the Maritimo Aips and tho Apenuines in the valley of the Bormida, west of Savona, where the range, which does not exceed the height of 1300 fect, prosents the nearest approach to a break.

All the rivers of Itsly are subject to audden and
very heavy floods, and with the exception of the Po, the Adige, and the Tiber, have their volume of water groatly reduced in summer. The insignificant amount of tide in the Mediterranean renders most of them useless for navigatior
In a country extending throngh 10 degrees of iatiwude there must be great differences of climate, and consequentiy of vegetation and agriculture, from position alone. Besides that, however, the climate of Italy is modified to such a degree by the ranges of the Aips and Apennines, and by the sir of the sea along its coasts, as to render useless any division into regions according to the classification of Saursure. In the plains of Lombardy and Pledmont, and the other territories to tho north of the Apennines, which are inclosed by mountains on every side but the east, Fahrenheit's thermometer in winter descends to $10^{\circ}$; snow lies sometimes a fortnight on the ground, the lagoons at the mouths of the rivers are frozen, and slight night frests appesr early in Nuvember, and some years as late as Aprit. Delicate plants do not thrive except in sheitered situations, but the mul-berry-trees flourish, rice is grown, and the pastures are rich. South of the Apennines, that part of Tuscany and the States of the Church which is near their main range is subjoct to great cold, but westward, and aiong the Riviern, the temperature grows mildor, snow soidon lies long on the flelds, and the climate is suitable to the growth of the olive and the orange. But it is when wo reach the cential range of the Apennines that we find the coldest districts of Itaiy. In all the upiar d valleys of the Abruzzi and of Sannio, snow begins to fali eariy in November, and heavy storms occur often as lite as May; whole communities aro ahut out for monthe from any intercourse with their neighhors, nnd some vilinges are so long buried in snow that regular passuges are made between the different houses for the sake of communication among the inhabitants. The district extending from the south-east of Inke Fucinus to the Piano di Cinquemiglia, and laclosing the upper basin of the Sangro and the smail lake of Scanno, is the coldest and most bieat. part of Itaiy south of tho Alps. IIeavy fails of snow in June are not uncommon, ond it is oniy for a short time toward the end of Juiy that the nights are totaliy exoupt from light frosts. Yet, loss that 40 miles east of this district, and even more to the north, we find tho olive, the flg-tree, and the orange, thriving luxuriantly on the elsores of the Adriatic from Ortona to Vasto. In the samo way, while in the plains and hills round Naples snow is rarely seen, and never remains long, and the themometer aeldom descends to the freezing point, 20 miles eust from it in the fertile valley of Avellino, of no great elevation, but encircled by bigh
mountains, light frosts are not uncommon as late as June ; and 18 miles further east; in thio elovated region of S. Angelo do' Lombardi and Bisacela, the Inhabitants are always warmly clad, and vines grow with difficulty and only in sheltered places.' But nowhere are these contrasts so striking as In Calabria. The shores, especially on the Tyrrhenian Sea, present almost a continued grove of olive, orange, lemen, and citrontrees, which attain a size unknown lu the north of Italy. The sugar-cane flourishes, the cotton-plant ripens to perfection, the date-trees are seen in the gardens, the rocks are clothed with the prickly-peur or Indian-fig, the inclosures of the fields. are formed by aloes and sometimes pomegranates, the liquorice-root grows wild, and the mastich, the rosemary, the myrtle, and many varietiea of oleander and cistus, form the underwood of the natural forests of arbutus and overgreen oak. If wa turn inland but five or six miles from the shore, and often even less, the scene changes. IIIgh districts covered with oaks and chestnuts succeed to this almost tropical vegetation; a little higher up, and we reach the elevited table-lands of the Pollino and the Sila, covered with firs and pines, and affording rich pastures even in the midst of eummer, when heavy dews and light frosts succeed each other in July and August, and onow beging to appear at the end of September or early in October.

The cerealia form, as elsewhere in Furope, the chief aliment of the inhubitants; in Italy, however, the lower classes, who are the most numerous, subsist much on maize and beans, which require little prepamtion to render them fit for food. In some of the southern parts wheat is made use of by the same clasa, both in the form of bread and in that of macaroni, which is manipulated with great facility. Wheat and maize are, on the ivcrage of years, about equal to the consumption, hut little can be spared for exportation; and in many of the ports are dépots of foreign wheat kept to meet the variations of seasons, or to be used as articles of commerce with other countries.

Aa Italy produces abundance of wine, and consequently nceda neither beer ner corn-spirits, no barley is needed for these drinka, and scarcely any is cultivated. Oats are but little grown, bat abundance of leans of various kinde are prodaced. Rye, the common bread-corn of the far greater portion of Europe, is ouly raised in a few spots in the very northernmest parts of Italy, where it is made into bread for the poor ; while those of the higher classes there, as well as throughout the whole peninsuls in the citien, make use of wheaten bread. Rice grows in many parts, in fact wherever there is a sufficiency of water to insure a good produce, ut such diatance from towns as not to be injurieus to the health of the inhuhitants. It in a part of almost every meal in families in eany circumatances, hut is scarcely uned by families who are in circumstances that requlre the practice of great parsimony. A great variety of lupines are used as food, especially in the soups. In some parts of the mountainous repions, cheatnuts are a substitute for corn as long as they last. Fruitn are plentifully used, particularly fige, grapes, and melons, se food; while the cheapness of onions, garlic, tomatoes or love-apples, and capsicums, render them valuable as condiments. The potato, which in the other parts of Europe has theen mo mach oxtended of late years, has been hut partially introduced into Italy; and, where it is caltivaterf, it occupics a very small proportion of the soil. lettucen, asparagas, endivo, artichokes, and several kinds of tumips and of earrots, are everywhere grown.

Animal food is far from being extenively used. The oxen yield in some parta excellent, in other very indifferent meat. " The mutton is noither good nor abundant, hut has been much linproved of late years. Swine farnish a plentifal supply daring the winter months: they are also propared as bacon ur hams, and above all as sansagen, the fame of which latter has
reached unto England under the name of the city of Bologna, whare they wore early and extenvively prepared. The large dairy farme in Lombardy, in which the cheese known by the name of Parmessan is made, and the oak and ehostnut forests of Calabris, furniah the mast and best swine's fonh.
:The 'fisheries contrihute largely to the supply of food in Italy, thengh from the number of fasts still countenanced by the Catholio church, net sufficient for the consumption; and the deflciency is procured by commerce with the English, French, and Americans, who convey to the sea-ports the salted cod-fish from the banks of Newfoundland. Their own fisheries on the coast give much occupation; the most considerable are these for the tunny, a very large fish, and for the anchovy, a very small one. Thees are conducted upon a large scale by joint-stock companies. The lakes and the rivers also yield some, though not a great proportion, of that kind of food which accleciastical restric. tions render indispensable. The sugar-cane is not cultivated in the sonth of Italy, as it is foum, that in point of etrength, as well as of cost, the yugar made from it dees not aucceed in a competition with that substance when imported from the West Indies. The products of agricultare are sufficient for the clothing of all the inhahitents; for though wool is neither good nor plentiful, yet hemp and fiax are grown everywhere, are manufactured at home, and, from the nature of the climate, linen can be substituted for woolen dress during most of the montha of the year. Some raw wool is, however, imported to supply the manufactures, and some cloths, both from England and France, together with (in Iombardy) those from the other 'Austrian provinces, especlally from Bohemia. Some cotton is grown in the southern divisions of Italy, but not sufficient to furnish matorials for their very insignlficant manufactures of that nrticle.

The chief product of Italian agriculture is the silk. It is produced from every part, and much of it is converted into articles of dress or of farniture where it is collected; but the chief production of it is in Sardinin, Naples, and Lombardy, whence the looms of England, Prussia, Austria, Russia, and Gerınany are supplied. The valne of this commodity exceeds that of all the other productions of Italy which are exported to foreign countried. The manufuoture lise of late years made grent progress, wnich it in still steadily maintaining. The great increase which has taken place in the propagation of the mulberry-tree has, within the last 30 years, incressed the quantity of raw silk to an extent that had never before been droamed of.

Another very important Italian product, which is used partly as foon, partly employed in home manu. factures, and extensively experted as an articie of foreign commerce, is the oil of the olive-tree. It is used as in substitute for bitter in the south, is much appropriated to the manufacture of many kinds of soap, and is experted to Fingisnd for the use of our various falries, chiefly those of trool, and as a lirxury at our tables. The planting and watching cost but littie labor or expense, and in a fow years the income more than recompenses the labor. The best olive oil is proluced near Genon, in Iucea, in Tuacany, and in Calahria ; but it is plentiful thranghout the whole of Italy, oxcopt in Lombardy and in P'ledmont.

The wines of ltaly are not very highly valoed in other countries, and almest the whele that is protuced is consumed at home. Those of the nerth are for the mont part disagreeably nekd, and scarcely nuy of them are or can the preserved beyond one yeur. The vines are net to much grown in vineyarils an in tho hedgerown ; a system which deubtless injures the quaity of the wine. In the southern parts, however, where the vines are grown in low vineyards an in France, the wines are of a more flery quality, and though prejured with little care, they only require to be better known to $i$ es esteemed by fureigners.

The minerals of Italy are of amall value; and of cotton exported to Sicily, Sardinia, and Tuscany, though minee of gold, sillver, and copper were once wrought, the veine have long been oxbausted... Some alum is found in the Papal dominions and the Neapolltan territory, some vitriol and antimony in Parma, and sulphar in the island of Siclly. In many places there are exceilent marble, quarries, the best near Verona and Carrara. Alebaster is found in many of the monutains. The salt manufactured on the seomshore, and from aaline springs, is more than is required for the home consamption, and a large quantity milght be exportod.

Direct tradeq between the United States and Italy is conducted through the porte of Leghoin, Genoa, and Palermo, to which may be added the Austrian port of Trieste. Exports to Sicily, Ssrdinia, and Tuscany, in 1854, amounted to $\$ 469,148$; while to Trieste they reached, during the same your, $81,751,766$. The value
during the same year, was 179,098 ; to Trieste, it reached $\$ 1,370,402$, The valne of tohacco exported to Sicily, Sardinla, apd Tuscany, in 1854, was ${ }^{\circ} 144$,082 ; to Trleste, It resched the sum of $\$ 259,262$. A large portion of the exports to Trieste, however, are purchased there for the German markets, that port possemaing unusual facilities as a leading entrepot for many of the States of Germany. Many American vessele clear from the ports of the United States with cargoes destined for the markets of "Italy generally i", at least such would seem to be their mode of clearance, from the cnstom-house returns; and the average annual value of cargoes thus deatined, exceeds the whole amount of cargoes for designated points in the Italian peninsula, except Trieste. The following tahle exhibite the value of this triangular trade for a period of $\mathbf{8 6}$ suocessive years:

Commreck of the Unitid Btates wita Italt (inoludino Malta to Ootorir 1, 1888), fhom Ootorir 1, 1820, to July 1, 1856.

The mercantile marine numbered at the close of the year 1854, 1,893 vessels (of whlch 210 were veasels of wnr), having a total tonnage of 31,637 with 9711 men.-Foreign Com. U. S.

Ivory, the name given to the tecth or tusks of the elephant, and of the walrus or sen-horse. Each male elephant come to maturity has two tusks. These are hollow at the root, tapering, and of varioue eizes, depending principally on the nge of the animal. Color externally, yellowish, brownish, and sometimes dark ; internally, whe e. The best are large, etraight, und light-colored, without flaws; not very hollow in the stump, but solld and thick. The most esteemed come from Africa, being of a closer texture, and less linhle to turn yellow, than those from the East Indies. The trade in Iondon thus divide them:-First sort, weighing 70 pounds or upward; second sort, weighlng 56 lbs. to 60 lhs.; third sort, weighing 38 lbs. to 56 lbe. ; fourth eort, weighing 28 ibs, to 87 Ibe. ; fifth eort,
wolghing 18 lbs. to 27 lbe. All under 18 lbs are called serivelloes, and are of the least value. In parchasiag elephanas' teeth, those that are very crooked, hollow, and broken at the onde, or cracked and decayed In the inaide, ahould be rejected; and care taken that lead or any other aubstance bas not been poured into the hollow. The freight is rated at 16 cwt . to the ton. -Mrlburn's Orient. Com.
Supply of Ivory.-The imports of elephaats' teeth, in 1840 and 1841, were, at an average, 5556 cwt ., ef which 4620 cwt . were retained for consumption. The medium weight of a tusk may be taken at about 60 lbs.; so that the yearly imports of 1840 and 1841 may be taken at 10,372 tusks; a fact whlch supposes the destruction of at least 8186 male elephants 1 But, supposing the tusks could only be obtained by killing the animal, the destruction would really be a good deal greater, and would, most probably, indeed, amount to about $\mathbf{7 0 0 0}$ elephsnts. Occasionally, however, tueks are accidentally broken, one loat ln this way being replaced ly a new one; and a good many are also obtained from elephants that have died in the natural way. Still it is sufficiently obvious, that the supply from the sources now alladed to can not be very large; and if to the quantity of ivory required for Great Britaln, we add that required for the other countries of Europe, America, and Asia, the slaughter of elephants must, after every reasonable deduction is mnde, appear immense; and it may well excite surprise, that the breed of this noble animal has not been more diminished. The western and eastern cnants of Africa, the Cape of Good Ilope, Ceylon, Inwa, and the countries to the eastward of the Struits of Malacca, are the great marts whence supplies of ivory are derived. Tho lmports from westera Africa into Great Britain, In 1810, amounted to 1933 cwt .; the Cape furuished only 97 cwt . The imports during the same year from India, Ceylon, and other eastern countries, were 2418 cwt . The Chinese market is principnily sapplied with ivory from Malncea, Siam, and Sumatra.
The chiof consumption of ivory is in the manufacture of handles for knives; but it is also extensively used in the manufacture of musical and mathematical Instruments, chess-men, blliard-balls, piates for minlatures, toya, etc. Ivory articles are sall to be manafactured to a grenter extent, and with better success at Dieppe, than in any other place in Earope. But the preparation of this beautiful material is much better understood by the Chinese than ly any other peoplo. No European artist has hitherto succeedod in cutting concentric balls after the manner of thic Chinese; and their loxes, chess-men, and other ivory articles, are all far superior to any that are to be met with any where else.

llistorical Notice.-It is a curioun fact, that the peo ple of all Aolatio countrien in which the elephant is found, have al waya had the art of taming the animal and applying it to useful purposee, but that no such art han over boen possessed by any natlve African natlon. Is this owing to any difference between the Asiatio and African elephants, or to the inferior sagacity; of the African people? We incline to think that the latter is the true hypothesif. Aloxander the Great is belleved to have been the Brst Eurupean who employed elephants in war. It appears pretty certain that the elephants made use of by the Carthaginians were mostly, if not wholly, brought from India; and that they were managed by Indlan leadera. Some of the lutter were captured by the Romans, in the great victory galaed by Metellus over Asdrubal. See, on this curious suthject, two very learned and valuable notes in the Ancient Universal History. Burfon's Article on the Elephant is a splendid plece of compoaition.

Rendering Irory Soft.-The various mechanical and chemical processes connected with the manipulation of ivory; are among the most interesting peculiarities of art. In rendering it soft and transparent, small pieces of the article are laid in strong phosphoric acid untll they become transparent, then rinsed in water and dried in pure linen. When dry it is translucent and harl, but softens as often as it is dipped in warm water or millk. The time of immersion in the acil differs with different pleces of ivory. If certain parts are to retain their original character, they are covered with a varnigh before immersion. The acit probably acts by forming an acid phosphate of lime out of the buric phosphate which constitutes three four hs of Ivory. The process of hardening lvory, which has become pllable by age, consiste in bolling it for seme time in a solution of gelatin.

Vegetable Irory is now imported chie日y from the River Magdalen into Europe and the United States of America; in some years no less than 150 tons of it have been imported into England. The " nuts" may be purchased in the toy-shops of the British metropolis for a few pence ench, but when bought in large quantities, they are obtalned at a much cheaper rats. In August, 1854, 1000 "nuts" were sold in Iondon for in. Gd. The ivory plant is conflned to the continent of South America, where it grows hetween the 9th degree of north, and the 8th degree of south lstitude, and the 70th and 79th of west longitade. It inhabits damp localities, such as confined valleys, banks of rivers and rivolets, and is found not only on the lower coast region, as in Darien, but also on mountains at an elevation of more than 3000 feet nlove tha sea, as in Ocana. Among the Spaniards and their descendants, it is known by the name of Palme de Marfl (Ivory palm); while its fruit is called by them Cabeaa de Negro (Negro's head); and its seed, Marfil regetal (vegetable ivory). The Indlans on the banks of the Magdalenn term the piant 7agua, those on the coast of Darien Anta, and those of leru, Pullipunta and Homero. It is generally found in separste groves, seldom intermixed with other trees cr shruls, and where herbe are rarely met with.-Botanical Magazine, May, 1856.
Ivory Black. The mixture of charceal and phosphate of lime obtained by burning bone, is moid under this name, and, like other forms of animal charcoal, is very effective in depriving certain substances of their color.

Jaok, in nautical language, is a fiag of colors used in making signals. See Flags.
Jacmel, a sea-port of Hayti. Thia port, conslderIng the scantinesa of its supplies for foreign export, enjoya a conaiderable share of the navigation of Hayti. It forwards to Port-au-Prince most of the merchandise it importa, especially the large quantities of flax and silk textiles which it receives by the Britiah ateampacketa. The first rank in the commerce of thin port, formerily held by the British, is now transferred to the United Statea. In the movements of 1850 there were under the American flag 60 vessela, out of a total of 151 ; under the Engliah flag, 45 (including their r:gular royal mali steamers); and under the French flag oniy 5. The trade and navigation between the United Statea and the port of Jacmel during the last six months of 1854 ia given as follows:-Number of vessels, 30 ; average tonnage of each, 140 tona; value of cargoes Inward, $\$ 661,59932$; valoe of cargoes ont ward, not given in official returna. Cargoes inward consisted of provlsiona, lumber, ahingles, and asaorted goods. Csrgoes outward of coffee, logwood, lignumvite, fustic, braziletto.
Jacobus, a gold coin, worih 25 s., and so called from King Jamea I. of England, in whose reign it was gtruck. There are two kinds of Jacobus, the old and new; the former valued at 26s., weighligg six pennyweighta ten graina; the latter, called also Carolus, ralued at 23a., and in welght five penny weights twenty grains.
Jacquard, a pecular and most ingenious mechanism, invented by M. Jacquart of Lyona, to be adapted to a ailk or muslin loom for supereeding the employment of draw-boys, in weaving figured goods. Independentiy of the ordinary play of the warp threads, for the formation of the ground of auch a web, all thase threads which should rise simnitaneougly to produce the figure have their appropriata healds, which a child formerly raised by meana of cords, that grouped them together into a system, in the order, and at the time deaired by the weaver. Thia pian evidently occasioned no little complication in the machine, when the design was richly figured; but tho apparatus of Jacquart, which subjects this mancurre to a regular mechanical operation, and derives its motion from a aimple pedal put in action by the weaver's feet, was generally adopted aoon after its invention in 1800. Every common loom is susceptible of receiving this beautiful appendage. It costs in France 200 francs, or Q 40 in this country.
Jade, an ornamental stone, of which there appear to be two varieties, common jade or nephrite, and saussurite or jade tenace. Common jade is a silicato of magnesia, oxyd of iron, alumina. Its specific gravity varies froin 2.9 to 3.0 ; hardness 7.0 . Its coior is leek green, passing into gray. It is very tough, und scarcly fusible beforo the blow-pipe. Nephrite was formerly worn as a chatm, and was supposed to be a cure for disease of the kilney, whence the name fren vépoos, kidney. From its toughness it has been used for the Mades of hatcheta by the New Zcalanders, and other savage nations. II umboldt speaks of jade stones being an article of trade among ths natives of the north and south sides of the Orinceo. Jade is muci used in Turkey and Poland for the handics of knives, daggers, sworda, etc.; and in India, ornamenta and trinkets, delicatoly worked, are mado of it. In China, the jade is of a whitish color, and is called $y n$. It is formed into vases, ringa, and other articles. A great variety of jade ornaments from India and China appeared at the Great Exhilition of 1851. Such articles are very costly, on account of the extreme difflculty
of working this refractory substance, but it has been auggested that mortara, peatlea, and some other objects required by chemista, could be manufactured of jade of larger siza than can now be made of agate, and, from the simplicity of the forma, at moderate cost. Jade is poliahed by carnelian, but it takea only a greasy, not a brilliant polish.
Saussurite ia a donble allicate of magnssia, lime, and oxyd of iron, with silicate of alumina ; specific gravity $8 \cdot 2$ to $8 \cdot 4$, hardness $5 \cdot 5$. Its color is greenishwhite, or ash-gray; ita cleavage is in two directions, meeting at an angle of nearly $120^{\circ}$. Ita luatre ia pearly, resinous, or vitreous; it ls extremely tough, and in fusible before the blow-pipe.-E. B.

Jaffa, or Yaffa (the ancient Joppa), is a sea-port town of Palestine, in north lat. $32^{\circ} 8^{\prime}$, esat long. $34^{\circ}$ 45 . It ia aituate on an emirance projecting into the gea, about 40 miles north-west of Jerusalem. It is mentioned in the Old Teatament as the port at which the timber for Solcmon'a Temple was unshipped. DurIng the wars of the Maccabees, its shipping was set on fire by Jonathan ; and it waa again pillaged during the wars between the Romans and the Jews, $\mathbf{8 4 0 0}$ of its inhabitants being put to the aword, and the town burned. Having aubsequently become the refuge of plrates, the place was ntterly destroyed. Gradually, however, it seems again to have risen to importance, for, during the reign of the Christian emperors, it was made the seat of a biahopric. In A. D. 636 it was taken by Omar. In the crusades it was taken by Baidwin I., and in 1186 retaken bj Saladin. In more recent times it was stormed by Napoleon in 1797, when 500 Tarkish prisonera wers put to death. The harber of Joppa haa alwaya been dangerous, owing to its exposure to the sea, and, being now nearly choked up with sand, vessels are obliged to keep at a distance from the shore. Notwithstanding all the langer and difficulty of landing, Joppa has for many centuries been the resort of pilgrims on their wuy to Jerusalem. The town chiefly faces the north. The buildings are surmounted by flattened domes, which rise in rows above one another like terraces, on the steep face of the eminence on which the town is built. The anmmit of the height is crowned with a castle; but though the generul situation of the town is thus somawhat picturesque, its appearance on closer inspection is mean and comfortiess. A wall 12 feet high defends the town on the lundward side, and two forta protect the harbor. Joppa carries on trade in cotton, goap, fruit, coral, etc. The frults, consisting of watermelons, oranges, lemons, etc., grow well in the sandy soil of the numerous neighboring gardens. It importa rice from lgypt. The inhabitants consist of Turks and Arals, Romanists and Greeks, with some Armenians, ss may be inferred from the threo mosques, thres churches, and three Armenian convents to be seen in the town. A British consul resides here. Population 4000 .-E. B.

Jrfna, the eapital of the district of Jafnapatam. It stands at some distance from the sea, but communicates with it ly a river navigable for large boats, and which falls into the sea near Point Pedro. The town is fortified and possesses a good citadel, which, though small, is exceedingly well built ; but it was given up in 1795, after a slort resistance, to the Britiah troops. The situation is salubrious, and living is cheap; on which account many families have removed to this place from Columbo. 'Tho greater part of the inhabitants are of Mohammedan extraction, and are divided into several tribes, known by the names of Lububuhs, Moplays, Chitteea, and Cholias. The foreign settlers are nore numerous than the native inhabitauts. There are
manufactures of coarse cotion cloths, chsicoes, handkerchlefs, shawls, atockings, ete., and there are also many artificers, auch as goldsmitha, jewelers, jolnera, and cabinet-makers,-E. B.

Jalap, or Jalop (Ger. Jalapp; Fr. Jalap; It. Sciarappe; Sp. Jalapa), the root of a certain convelvulus, so named from Xalapa, in Mexico, whence we chiefly import it. The root, when lirought to this country, is in thin transverse slicea, solid, hard, woighty, of a blackish color on the outside, and internally of a dark gray, with black clecniar atria. The hardeat and darkest colored if the best, that which is light, apongy, and pale colored, ahould be rejocted. The odor of jalap, especially when in powder, fo very characteriatlc. Ita taste is exceedingly nauseous, accompanied hy a aweotish bltterness.-LImwis's Mat. Med. ; Branns's Phamacy.

In Mexico, from 4000 to 6000 feet above the sea level, grows the plant which ylolds true jalap, and which has been called by botaniata Convolvulus purga, and Ipomea purge, the latter name belag adopted by De Candolle. It has aince, howevar, been placed in the genus Exogonium. The trae jalap (Kxogonium purga) hat a tuberous perenulal root, a amooth, twining, annual atem, a salver-ahaped corolla, with long cylindicical tube, a calyx of five small, unequal sepals, and herbaceous stems. Its leaves resemble the ivy, and its beautiful red flowers open only at night. The dried tabers of this plant supply the drug jalap; these, as found In commerce, rarely exceed 1 lb . in weight I thay are oval in form, and covered with n dark akin or cuticle. Internally they are yellowish gray, with deep brown enncentric circles, and ars hard and difficult to powder. Inferior sorts are more irregular in form, and aro called opurious jalop, or, from their ahape, cocked-hat jalap. Some roots are mneh morm-eaten, and are so called, but as the Insecta do not touch the resinous portions, such roots are available for extructs. Four kinds of Jalap are known In commerce, two genuine and two epurious; first, dark, heavy, reainous tubers 1 secondly, lighter oolored and leas resinous; thlodly, whice or false jalap, pieces of which are occaslonally mixed with the true; and, fourthly, jalap-stalk or woody jalap, the sllees of which are more tibrous and woody than the genuine. There are about $200,000 \mathrm{lbe}$. of the pure jalap ennually exported from Vera Cruz on the Gulf of Mexico, the sea-port of Jalapa.

Jalapa, or Kalapa, a town of Mexico; capital of a cognominal department, in the State of Vera Cruz. It is situated on a amall plain at the foot of a range of hills 65 milea north-went of the town of Vern Crux, and about 4500 feet above the ses level. On account of its exhilarating climate it is a fuvorite remort of the lnhabitanta of Vors Crus when the vomito prieto is prevalent there. The only building of importance is an old church, which is belleved by the people to have been founded by Cortez. Cotton is manufactared, hut ita trade has greatiy diminished. In the neighlorhood grows the creeping-plant, Brogonium puryn, or, as it is called from thia town, Jalap. The population of the department In. eatimated at 45,000 , and the town at 16,000 perwens.
Jamaifon, an Island lying off tho Bay of IIonduras, between the Carilitean Siea and tiulf of Mexico, within N. lat. $17^{\circ} 40^{\circ}$ and $18^{\circ} 80^{\prime}$, and W. long. $76^{\circ} 10^{\prime}$ and $78^{\circ} 80^{\prime}$, about 4000 miles S.W. of Fng 'and, 80 S . of Cuba, 90 W. of St. Domingo, and 515 miles N. of Chagres, the Atiantic port of the Isthmus of Panama. It is the most southern of that group, which ls eailed by some the Greater Antilles, by othern the Leeward Iaiands. The latter name, however, is now generally appitins to the amaller islands on the north-east, snd sometimes to those on the south of the Carlbbean Sea. It is the largest, and was formerly the most valuaitle of the Britioh West Indles, belng 140 geographical milet in length, by 50 in extreme breadth, and con-
talning about $4,080,000$ acres, or 6400 square milea Within it government are comprised, besldes the three amall islands called the Caymanas, Belize, or British IIondura, on the main land of Central AmerIca, with Ruatan and other lalande in the Bay of IIonduras. Thene places, though dintant respectively 600 and 460 miles, have been called the dependencles of Jamalea, and are ruled by auperintandente appointed by the govemor. The title of Britala was disputed by Spain in the early part of tho-last century, and the Bay Islands were given up to that power by the treaty of London in 1786, but were re-occupled by the Britlsh during the aubsequent war. IIaving, with the Mosquito Territory, formed the sulject of dispute between Great Britaln and the United States, arising out of the Clayton-Bulwer Treaty, they bave (1886) been constituted as free territory under the republio of Honduras, with provisos agalnst alienation, the ereetion of forts, and the introx cetion of elavery.
Jamaica was diacovered by Columbus on the 34 of May, 1494, while coanting along the wouth of Cuba, duriag his second voyage. He called it St. Jago, after the patron saint of Spain, but it is now generally known by Its Indian name Jamaica, a word sjenifyiag the Isle of Springe, according to the beat autherities, though Long derives it from a kind of fruit. It is sometlmes written Xaymaca hy the Spaniards. On approaching the shore, Columbus called the naarest land after his firat ship, Santa Maria, a name atill preserved in Port Maria. He effected a landing a little to the westward, at Ora Cabesna, where, after a slight opposition from the natives, he took possession of the ceuntry, with the weual formalities, for the king of S ainThe inhebitants were the ame mild, inoffensive race as those of Cuba and IIaytl. Like the Arowaks of Trinidad and Guiara, they were probubly offishoots of the great Mexiean stock, and very different from the flerce Caribs of the Windward Islands. After a short stay, Columbua quitted Jamaica, which remained ua. disturised for nine years. In Juno, 1503, on his fourth and last voyage, he was driven by a terapest, in which he loat two shipe, to a bay on the north side of the island, which he named Sta, Gloria (now St. Anu's liay), where he ran hls remaining vessels ashore in a omsil inlet still called Don Christopher's Cove. The shipwrecked mariners were received with the grestest kindness by the Indians, and here Colvmbus remained upward of a year a waiting the return of messengers he had dispatched to Ovando, governor of IIispaniola, as Cuba was then called. Daring this time he suffered much from disease, as well from the mutiny of his followers, whose gross misconduct alienated the 1ndians, and provoked them to withhold tixeir accustomed supplies, until he dexterously worked upon their superstition by prognosticating an eclipse.

By Esquivel the natives were treated, according to IIerrera, with unusual humanity. That his successors did not imitate him in this respect is proved by the stounding fuet that of the Indian popuintion, at this ..ane estimated at from $\mathbf{6 0 , 0 0 0}$ to $\mathbf{1 0 0}, 000 \mathrm{souls}$, not a descendant of either sex existed in 1655, when the island fell into the hands of the Euglish, nor, is it supposed, for neariy a century lefore. Aiter a short sway, Esquivel died in Sevilla d'Oro, a towa founded by himself on St. Ann's Ray, which is supposed by some to have been deserted on account of the ravages of ants, by others to have been destroyed during on insurrection of the Indians. Its premature fall was, however, most probably owing to the attacks of French filbustiers, or plrates, who for a long perlod infested these coasts. The site of the town may atill be traced by mounuls of earth, as well as in the names of certain flelds belonging to the Seville sugar plantation. Melilla, near Port Maria, or, according to another opinion, at Martha Brae, near Falmoth, shared tiee same fate.

Inland to the south of the monntaln range, St. Jago de la Voga, St. Jaman of the Plain, which gave the title of marquis to hia deacendanta, and is atill the officlal capital, under the name of Spanish Town. At some distance weatward, on the const, was built Oristen, which is now calied Bluefields. Down to 1598 the bistory of Jamaica is only a record of the rapid disappearance of the Indiana, under the Spaniah yoke, and of intrigues at the court of Spain, heving for their object the disposseasion of the deacendants of Columbus, whose rights were, however, succeasfully defonided, and eventually centred In an heirees, through whom thay passed by marriago to the house of Braganza, reverting afterward to the Spanish orown, in consequence of the revolution of $\mathbf{1 6 4 0}$, which piaced John, duke of Braganza, on the throne of Portugal. Long anterior tu this last event, the unior of the crowns of Spuin and Portugal, wnder Philip ${ }^{\prime}$ r., in 1580, occasioned an inflax of Portuguese colonists into Jamaica, whe contribated much to its strength and prosperity, but were usually on indifferent terms with Spanish settiers. - ontion had at an early period been paid to agriculture, the cotton-plant zeas extensively cultirated, and the sugar-cane, vlne, and various kinde of corn and grass had been introduced; and wheress a emall epeciee of dog, called the alco, was the only domestic quadruped known to the aborigines, horses, horned csttle, and -Flne had been imported from IIispaniola, which multipiled amazingly, and a flourishing trade sprang up in lard and hides, as well as tobacco, sugar, and ginger.
The popnlation, according to the return of 1855 , consists of 181,033 malee, and 105,800 females; hut this is hased upon the last census, that of 1844 , when the population was returned at 380,000 , of whom 16,000 were white, 68,000 colored, and the rest black, of whom about 1200 were maroons. Since then upward of 40,000 peopis have died from cholera and small-pox, and about 2000 bave emigrated to Navy Bay to work on the rallway nver the Iethmus of Panama, a portion of whom only have returned. The careless treatment of children ly the negroes, and thelr almost Invincible repugnance to pay doctors' fees, which has necessarily reduced the number of medleal practitioners, prevent the natural rate of increase; and the waste of public money daring the protracted dispnte between the Conncil and IIouse of Assembly, has cansed the number of immigrants imported to fall very short of other colonies. We find, in consequence, that whlle 40,000 arrived in British Gulana between the years 1840 and 1852 only 14,000 were brought to Jamaics. The following returns have been msde by the Emlgration Comnissloners of Immigrante introduced into Jamaica frem 1848 to 1855, both inclusive:

$$

Besides which there were still in the island 1684 coolies who had arrived before 1847, and a considerable numher of recsptured Africans. The criminal returns of this population are reioarkally favorable; the number in prison throughont the island on tho 31at December, 1850, was only 583 ; and Sir II. Barkly reports that the numbers convicted of crimes in Jamaica when compared with British Guiana wore as 18 to 33.

The revenue of Junaica was estimated, in a calculation made in 1830, on an average of ten yeers, at $£ 490,000$ urrency; or about $\pm 327,000$ sterling. This was independent of that raised by the vestries for parochial purposes, whlch anounted to about $\mathbf{£ 3 0 0 , 0 0 0}$ currency, or $£ 200,000$ sterling. The public revenue of 1841 Wha $£ 226,959,18 \mathrm{~s}$. Bd.; the parochial, $£ 177$,401, 12 H . 10d. sterling. The publio expenditure, £291,-
$415,108,0 d . ;$ the parochial, $\mathbf{E 1 5 0 , 8 5 7 , 1 6 4 . 8 d . ~ I n ~ t h e ~}$ yoar 1854, owing to the auapesaion of the Import and ram duties, and consequent large secumulation of taxable articies which had pald nothing to the treasury, the revenue fell to $\pm 96,624$ sterling, while the expenditura was $£ 197,688$. In 1855 the following return was made : Incor e, -Ordinary revenue, $£ 190,047$; casual revenue, $£ 26,771$; total, $£ 226,419$. Expenditu res. Ordinary expenditure, $£ 198,461$; casual expendi.ure, $\mathbf{£ 4 9 , 6 4 8 ;}$ total, $£ 248,105$. In the name year the local or parochisl taxes amounted to about $\mathbf{8 8 0 , 0 0 0}$. In the budget for 1856, the following eatimates of the rev. enue and expenditure for the current year were presented to the Jamaica Jegialature:

By an act of the Assembly in 1854, the Councll fund of $£ 6000$ a year, originally granted in 1728, ceased, and it was provided that $£ 25,000$ should be raleed annually as a permanent civil list, for the purposes of the government of the island, ard a further sum of $£ 30,000$ for the Interest on, and repayment of the guaranteed debt.
It is difficult te fix the value of the movable and immovable property in Jamalica, once eatimated at $£ 80,000,000$. The latter, bowever, that is, the lana: with the buildings on it, is periodically val:ed for taxation, and the hereditament tax is raised upnn a sum equal to 6 per cent. on auch valuation-that being, according to an arbitrary assumption, the nett revenue of the land. Though the tax is puid upon many properties on which the cultivation has been given up, and which produce no revenue at all, this sum was fixed in 1850 ut $\pm 693,382,4 \mathrm{~s} .3 \mathrm{~d}$., on an estimated value of about $£ 11,500,000$. Since then the decline has been rapid; and when it is remembered that the fall in ratable property in the next year exceeded $£ 2,000,000$, there can be little dnubt that the difference in valus since the prosperous days of Jamsica amounts to at least 80 per cent. For many once valuable estates no purchaser could now be found on any terms. It is on record that 231 sugar estates have been abandoned, bealdes 243 coffee plantations, and 132 grass pens. It is notorious tist the paper circulation, which amounted to $£ 258,816$ in 1844 , has dwindied to $£ 70,000$ in 1855. It is clear, therefore, that though the public and parochial taxation has been reduced from sbout $\mathbf{£ 8 0 0 , 0 0 0}$ currency to less than $£ 300,000$ aterling, it is much more burdensome to the tax psyer now. Indeed, when it is considered that the value of artioles expurted, expensive as they are to produce, does not reacs $£ 1,000,000$, it is evident that the estates in the

## JAM

aggregate yield no rontal at ell, but are maintalned by mon-reeldent proprietors posessed of other meana, who are unwilling to abandon the hope of future improvement. Even auppoalng the whole money expended is. raising thase articlen of export amounted to little more than double the publie revenue of the country, a proportlon, highly taxed as the foland la admitted to be, quite beyond bellef, it would follow that after pay. ment of production, expenmen, and taxes, little or no sarplas would remain for the proprictor; hut such sxpensas must in reality far exeeed $\mathbf{8} 600,000$, and can only be provided, as before observed, by those proprietors who have other funda at thelr diaposal.

It is necessary to explain the two forms of calculation to which refarence has lieen made-currency and sterling. The former was an arbiltrary mode of reckoning, unrepresented by myy colnage, omployed until the year 1840, hy which $\mathbf{2} 140$ currency equalled nominally $\mathbf{2 1 0 0}$ sterling; but a premium of about 18 per cent. was pald in adalition to place this aum In Eirgland, so that upwarl of $\mathbf{\alpha 1 6 6} \ln$ Jamaica wern needed to pay efloo in Eingland. In 1840 an act parsed establiahing the Engliah computation, fixing the pound aterling at $\hat{⿻}$ linglish money the legal tender. Spanish and l'ortuguese coins are atill current, the highent being the doubloon, or ounce, worth about $\mathbf{4 3}, 6,8 \mathrm{Bd}$. Hefore this date, a "fivepenny;" worth 8d, sterling, was the lowest coin. There is atill no coppar, and the lowewt coin is the silver three-halipence, colned eapecially for Jamalea, and called a pradial, as Intended for the payment of agricultural iaborern. In former dayo, the only paper currency consiated os' ialand checks isutied by the treasury. There are now two banks of ianue, a branch of the Colonial tiank, and the llank of Jamalica. A thlrd, the l'lanters' Dank, has been glven up sinco the trude of the colony declined. The present inasue in usually from $\mathbb{E} \mathbf{0 , 0 0 0}$ to $\mathbf{8 8 0 . 0 0 0}$. Savings banks have also been eatablished in the inland.
The commerce of Jamaica dejends almont entirely on Its agriculture. It bas gradually lost the greater portion of the tranait trade in consequatice of the revolt, and aubsequent disorganization of the Spanish colonies on the mualniand, the eatulilishment of St. Thomas an a free port, and the rapility of ateam communication bet ween Eamope and the American coant, which diminished the advantages of an emporiam In the Weat Indles. its agricultural promperity has declined in equal proportion, though, from different causon, the value of its ataple having been deprecinted by successive acts of the Imperial Govermment, whereby the differential duties, under the protection of which
the scheme of emancipation wat originally intended to be oarried olut, were discontinued. In 1840 Eant Inclia sugar was admitted on equal torma Into the Britlah market. Four yaara afterward the same edvantage was cunceded to forelgn augar, the produce of free labor; and in 1846 to alavo-grown augar. Protection has also been removed from molasees, coffee, and cocos. Under thes clreumatances, the want of ale. quate labor has prevented Jamalea competing with those countries in which, from slavery and other causen, there is a sufficient sapply.

The following tables Hlustrute these observations:

The exporta consist of her own products only, the Imports Include those intended for re-expertation, as well as those taken for home consumption, whicn explalns why, In the flourinhing era of the transle trade, the balance should be apparently no unuch against Jamalca. The exports, too, are entered at their value In the place of growth, whlle to hupor's are added chargee for freight, etc. Tho amall imports of 185 t were partly owing w the goods imported in anticipation the year befure, when the duties were not luvied. The same cause accounta for the amall quantity of rum exported in 1853, and the excess of the two fol. lowing yeara, enough for two yeara' home consumption huving been entered in the same year duty frec. The following talle gives the trade and navigation report for 1855:

The largent sugar crop was in 1805, which exceeded lle and Bardowie, in St. Andrew; the Portland Min160,060 hhds. ; that of 1855 dill not reach 80,000 hhuls. ; that of $18: 6$ had fallen to $20,(000$ hbin. The largest coffee crop was In 1814, and exceeded $34,000,000$ lbs. The grest increase of phaento is unfortunately accounted for hy the rapid apread of the tree, which growe wild in Jamaica, over landa formerly nnder cultivation. Since 1852 a amall quantity of copper ore has leeen exported, amounting in 1854 to 37 tuns. Ilesidea these principal articlen, there in exported a small quantity of tamarinds, cocon-nuta, muccades, shruh, ebony, ligaum vitre, and lancewood. There are five mining companies in Jamaica, all in their infuncythe Clarendon Consols, and Wheal Jamalea, In Clarandon ; the Port-Royal and Se. Andrewa, and the Ellers-

Ing Company in lortland. Of these the first two are at jresent the mont promising. The principul impurts, Into Jamalca are malt pork and beef, nuit fiah and oil, hutter, lard, cheese, corn, corn-meal, oatmeal, fiour, bisculta, rice, tobacco, wine ard beer; hardware, cutlery and Ironmongery ; ready-made clothes, buita and ahoes, and iry goodm of ali sorts; soap, caobles saddiery, and harness; shingles, lumber, wood-jwops. and rouls.

Imports into the Jaland of Jamoica from the linited States in 1854.-Flour, 13,82s barrela; pandlea, 7911

There is a steam communication between England ad Jamaica, and eice veraa, twice a month, in 10 days. The Rayal Mail Steam-pucket Company's ohipa leave Southampton on the 2d and 17 th of each month, calling at St. Thomas, Porto Rico, and Jacmel, in Haytt, and reuch Kingston on the 21st and 6th. They leave again for England on the 27th and 12th. making the conrse of post about 44 days. They also anil once a month between Jamaica and Honduras; courao of post 10 days. There sre frequent opportunities hetween Jamaica and LIavana, and the United States. In the island there ls a post twice a day betu 'an Kingaton sad Spanish Town, and a communication twice a week between these capitala and the country districts; besides expresses, on the arrival and depurtare of the msil packets. Jumaica being on the direct route from Englund to Nicaragua, can scarcely fail to share in the growing importance of the States of Central Anerica. Emaacipation,-IItherto ite history, since emancipation, has been discouraging to the friends of liherty. The negro on whom the cultivation of the island depends, has grudually retired from labor, nad retrograded in the social scale. This does not arise from any hostile feeling toward the whites, with whom be usually lives on the most amicable terms; it ia the ustaral result of removing all restraint from a people low in civilization, and consequently with fow artificial wants, in a country where land is superabundant. The Jamaica negro can earn enough on a sugar plantation in a few weeks to huy a mmall pateh of frechold land. The wood upon it forms his cottage; the vegetalles which grow almost spontanesusly support him in tolerable comfort. When hila little property does not require his care, he works from tims to time for hire ; bat as plantation after plentation is abandoned, and the country returns to itc primeval forest, he is confined inore and more to the society of his own race; and though not more addicted to crime, ts rapidly receding into a savage atate. During slavery; the disseating ministers possessed great Infinence over him;
he naw prefors the eetabliahed chnroh, becanie it conts him nothing, but he oares little for olther. Not foeling the want of educatlon, ha doen not reak it for his children, whom he profors amploying in hia own sarvice. Hence, noither charches nor achools are wanted In Jamaica, but congregaticas and scholars. These observations are confirmed by the last roturna, which fix the diminution of children in the achoola in 1854, at compared with the prevloue year, at 2000, and show this decrease to be lesa conspleuous in those belonging to the entablished church of Eagland and Scetiand, than in those of the Baptists and Independents. We cen acarcely blame the negro for following the beut of his laclination; but it is evident that under these circumstances, unless there ls large and immediate oupply of limmigrants, to meet the expense of whose Introiluctlon, averaging at least $£: 10$ per head, there are no avallable fund, all soclety will come to a epeedy end, and the tsland become a second Haytl. Already the enermous depreciation of property has caueed the ruin of no many, that the name of Jamaica Fiuprietor, once naed proverbl: ! y to Indicate wealth, is now associated with pove - and distress.

Ianalica is of a long ovm snese, and has been compared to is seal with the huad pointed to the west. Its surface ls beautifully diversified with hills and valloya. An elevated range, called, in the eastern or highest part, the llue Mountains, and terninating in Dotphin IIead, to the west, runs longitudinally through the island, and other high ridges insersect this chain. On the south the mountains are genorally steep, with gigantic apines or buttressed rising from the plain at an everage distance of 12 miles from the sea. Though difficult of access they are traversed by bridle-roads in various directions to the height of nearly 6000 feet ; and several passes, or gaps, as they are called, of great altitude, colsrect the two sides of the island. On these olevated ranges the coffee attains the greatest perfection, and above, denso foresta ascend to the highest peak, composed chiefly of beef-wood, as it is called from its color, and astin-wood. Under their shade the tree-fern grows to the helght of 15 feet, and the flute-like note is heard of the solitaire, a bird only found in these wildernesses. On the north side tho mountains approach the sen closely, but more gradually, their conical furms are gently rounded, and in St. Ann and Trolawny the lower slopes are shaded by pimento woods, the indigenous growth of the ialand, and elsewhere by orsnge groven, mango, and cedar forests, ahove which frequently towers the grigantic silk-cotton tree. The shady valleys between were once occupled hy cacso walks, now destroyed; and on the lowlunds, near the sea, were formerly the indigo-works, long sinco abandoned. Here are now the augar eatates, in which the dark green of the cane is varied by the golien tint of the guinea grass, and the cabbage and cocoa-nut palins shoot up in long lines close to the water's edge, from which they are separated by a fringe of manyroves, growing below high-water mark, and tho heautifui lut poisonons manchineel. The waving field of canes is broken at Intervals by the white clnster of huillings composing the sugar-works. The mill, the boiliug-house, with its tall chlmneys, and the stablea, stores, and bookkeopers' houses snrround a large court-yard. Above, on an eminence, is usually the proprietor's mansion, and close by, though completoly buried in the broad follage of the plantain and bunama, the negro village. On these plantations during erop the scene is most animated. Bands of negroes, with cutlases, attack the rows of canee which tower above their heads; wagons, drawn by oxen or mules, in endless auccession, carry the canes to the mill; women and children hurry with the dry' stalks to feed the fires; and the shouta, without which a negro seldom dow any thing. announce afar off, is this clear atmosphere, the neighborbood of a sugar eatate. It is here, too, that the traveler sees most clearly the
decline of the country. At ench end of the island, in the pariobes of Hanover and Portland, he may Journey for miles through deserted plantationa. Ridges, overgrown with guava bushes, mark the alte of the corn fieldn ; rank vegotation filis the court-yard, and oven burets through the ence hospitable roof. A curse aeems to have fallen upon the land, as if this generation were atoning for the sins of the paet. For whlle we lament the ruin of the present proprietors, we can not forgot the uurequited toll which in times gone ly created the wealth they have lont, nor that haplens race, the orlginal owners of the soll, whose fate saddena the darkest page of hiatory.

The sugar estates resemble generally those of the other Inlunds, but Jamuica has a feature peculiar to Itself. In the centre of the lsland, and toward the south and west, are large plains, or table-lands, at an olevation of about 1000 feet, coverad with a luxuriant growth of guinea grama, dotted with groven of tall trees, and, at greater intervala, whth white housea and villages. From an eminence the whole country resembles a series of Engllsh parks. These are the pens, or grazing farms, where horses and cattle of most excellent quality are bred. They are chlefly In St. Ann, Mancheater, St. Flizabeth, St. Jamen, and Hanover. The climate, at this elevation, is well nulted to $n$ Enrepean population, who can not work on the augar plantutions, hut may with aafety be employed on the light and healthy dutles of the farm. From one of the many points of view on the mountaln range the country presents an aspect of heanty and grandeur searcely to be surpassed. Above tower the lofty peakp, with clouds on their summits-aronnd are magnificent for-eat-beneath are the pecullar hollow basins, called cock-plts-below them deep ravinen, or wider valleys; through these flow river or mountaln torrenta, ocensionally falling from the rocky ledges In eascades which would attraet notice in any part of the world. At a greater distnnce the wide plains are apread out Hke a map, checkered whith towne and villeges ; and the deeply indented coast, terminating to the easi In lofty ellffa, in washed by the glittering waters of the Carilibean Sea. The vlew of the island from the sea has long teen colebrated. Soon after leaving Cape Tiburon, the western polnt of Hastl, the Mlue Mountains are in alght, and along the south coast of Jamalca, from Polnt Morant to Kingston, the Inhabited plains, sloping gradually up, til cultivation terminates in forest, present an anpect of no common beanty. From Fort Nugent, which is conspicuous uniler a nteep hill, to Port Royal, runs a narrow sandy promontory, called the Pallsades. Here is the great cemetery where no many vietims to yellow fever lio buried that the name has become proverbial; and this neek of land Incloses the harbor of Kingston, which is entered by a mont Intricate channel lotween Port Royal and Port IIenderson, and beyond which the capital Is meen atretehing northward toward the amphithe tre of the Ligunna HIIIs, and protected liy the. deat range of the Illue Moontains. The helghts of the principal peaks have been computed ne follows: Hlue Mountain Peah, 7770 feet; the Portlund Gap rilge, G501 feet; Phrtland Gap, 5040 feet ; and St. Catherise's Peak, 4970 feet. It is stated, however, hy nome authoritles, that the three higheat peaks on tho grand rifige of the Illue Mountalas, called Coldridge, have their respective summits 8184, 7656, and 7576 feet aloove the level of the nea.

The moll is In mont places deep and fertile, and for the growth of sugar, pimento, and ginger, and, as some think, of coffee, has never heen aurpassen. On the north there is a reddiah yellow noll. The brick mold, reckoned the best in the West Indlien for the cane. la a deep warm hazel mold, casily labored, and requiriug little manure. The black shell mold owes lte fertility to the mineral malts and exuvine which it contains. On the south side are large natural salt
ponds, which of late years have been neglected. The prinolpal solls in the laterior are a red clay, a yellowish clay, a red grit, a loose conchaceous mold, a bleck mold or clay or marl, a loose vegetable mold on rock, a fine sand. The red sandstone of the lower monntalna resembles much the porphyrite conglomerate of the higher, and both produce coffee; but while that grown on the former has been driven out of the market hy the cheaply grown coffee of Ceylon, the latter reteins its value, belng condidered by many superlor to the Mocha which aprings from a slmilar soll. Among minerale are-argillaceoue dark purplo schist; gneiss ; steatite, and oven serpentine; sienltea, highiy micuceous; and the hard Jamellated amlanthus, resembling petrified wood; white freeatone; quartz of different kinds; llmestone, and a kind of murble. Rlch lend ore, impregnated with silver is found in St. Andrew; radlated antimony and rlch copper ores, abounding lit mulachite, are found chlefly In Clareudon, Portland, and St. Geerge; magnetio iron and cobalt in St, George and Metcalf; anthracite coal In Portland and St. George 1 but neither gold nor pure silver have been found, though the Indians porreased ornaments of both when discovered by the Spaniards. A species of marl, common In Jamalca, was eaten by the negroes during slavery, so much to the detriment of their heaith and value that the practice was mads penal. The honeycomb llmestone rock, of which a great part of the fsland ia composed, contalns no mineruls, but is hollowed Into Innumerabie caverns and fiswures. Many of these are beautlfully ormamented with stalactites, particularly one on the Roaring River estate, near Savana la Mir. In some of these fissurps called "slnks," rivery anddenly dixappear to rise again ni a considarable distance. On the Sweet lijiver estato several apring" rise like fountalns with great force in one field. On the rosd from Falmouth to Maroon Town, a conslderable atream pours from an opening in the solld rock neveral fect above the ground, anil the Rio llueno streams at once from the foot of a perpendieular rock in St. Ann. There are fever trices of fi, in Jamuica than In the other ishands; but the llurnt Ilill, near Hope Bay, arems to be nn extinct volcano. 'There is great varioty of wimate; the wedium heat at Kingston is about $80^{\circ}$, and the minimum $70^{\circ}$ Fulirenheit, throughout the year. At an elevation of from 4000 to 5000 feet, the average range $i_{s}$ from $55^{\circ}$ to $05^{\circ}$; the minimum in winter teing $44^{\circ}$. On the Blue Mountain I'eak, In Augunt, the writer found the temperature $44^{\circ}$ at sunrlae, and lee of aome thicknees has been formed there In March. Snow has never leen known to fall. The niternation of temperature Is froms $8^{\circ}$ to $10^{\circ}$ on the south side, and more on the north, but the transitions are not so suldeu and detrlmentul us in many parta of the continent of North America. The grand compensation for excess of temperature is afforded by the breezes whith regularl every morning sent in from the sea to tho land, and every evening from the land to the sen, to preserve the equilibrium which the noonday aun has distnrled; when these are nometimes Intorrupted tho heut is intense, the thermometer rislngt to $100^{\circ}$ Fabrenheit, and the island becomes unheathy. There is no striking variety In the length of the duy, or in the samsons, except the alternations of wet and dry. Storns of thunder and lightning are prevalent, and aometimes very mischievous in autumn. The hurricane season rangen from July to October The periodical ralus, which last ordinarily forman weeks, are called the May ans: Oetober seanons, hut there is great irregularity in the time of thelr falling. The north side usually anffers less from drought than the south, hut even there the rains are sometlines very capricions, following the course of a river, or being stopped ly a ridgo of hills. The parishes of Vere and St. I lorothy, on the sonth akle, have aonsetlmes been moro than a year without rain, to the deatructlon of vegetation and cattle.

Some parts of Jamalea, psticularly near morasses, are extremely unhealthy, and there fow escape intermittont fevere, or "fever and ague," as it is called; but in general the clinate is favorable to those who live carefully, theugh when the yellow faver comes as an epidemle, which happens every teven or elght years, It carrles off all ulike. It lis, however, rarely knewn at an elevstion of 1000 feet, and in aome of the hilly dlatricts, especlally the Santa Craz Moantalna and Pedro Plains, there are remarkmble instances of longevily aineng the linglah settlers. The annnal mortality among the white troops for twenty years ending 1887 was $130 \ln$ the 1000, or a seventh of the entire force. Since they have been fed on fresh provisions, and more eapeclaly alnce they have been encamped on high ground, thls has been reduced to 34 per 1000. Of late years the cholera has made lts appearance, and committed oxtraordlnary havoc; and aince emanclpation, small pox has been more prevalent, on account of the negroes neglecting the vacelnation of thelr children. The vegetable productions of Jamalca are far too numerous to be deserlbed. There are forest trees fit for every purpone, from ohlp-bullding to cablnet-making, among which the hallata, rose worl, satinweod, mahegany, Ilgnum vite, lancerrood, and ebony, are conspleuous; but the ecarcity of latior makes it cheaper to import planke ready sawn from Anoriea. The logwood, the trunk of which resambles the eluatered columns of Gothic architecture, and the fustic, are largely exported for dyelng. The Jamaica cedar (Cedrela odorata), with ash-like leaves, is valuable for the interlor of houses, as its scented wood keeps off Inseets. The sllk-cotton tree (Ceiba Bombax or Eiriodendron) is one of the largent in Jamaica; its silky poils are used to stuff pillows, but, from want of alhesion in the tlbres, is useless for manufacture. The pimerto ia iniligenous, and furnlshes the allspice. The bumboo, the coffee, the cacao or ehocolate tree, are well known productlons; the last, however, is disappearing, and the oxport hiss ceased. Several species of paim nbound, the macea, the fan pulm, and screw pulim, but the noblest is the palmetto royal (Areca oleracea), the green top of which is callod the mountsin cubbage, and eaten as a vegetathle. The cocos-nut is the most valuable of all this trilve. The mango, which overspreads the laland, forming a oplendid forest tree, and affording food for man and heast, was introduced by Rodney, who took it from a French ship; the bread-frult by the famous Bligh in 1793. The papaw has the peeculiar property of rendering ment tender. The lace-lark tree, found near Maroon Town, has an lnner bark of so delleate a texture that ladies' dresnes have been made of it. The guava, from which the delicions preserve is made, is a weed of the country, and the fruit when raw ecarcely eatabie. The palua chisisti, from which castor oil is made, is a very ubundant annual. A new epecies of silkwerm (the Bondyy C'ynthia), which feeds on its leaf, bas lately leen introduced from India, by the slamales Society of Arte, founded by Sir C. Grey, 'The aunflower is sometimen cultivated for oil. A variety of the Coctus Opuntif, en whlch the cochineal feeils, is coinmon, and from which, as well as from the lnaces, recent experiments have proved that a dye may be olitained. Linglash vegetables graw in the hilln; while the plains produce the plantain, coeoa, yam, cassava, oclara, beans and pema of various sorts, ginger, and arrownot. Malze and guinea corn are getserally cultivated, nud the gulnea grass, nceidentally latroduced in 1760, has overspreal the whole islanil, and forms the most whelesome and atrongthenting firal for horsed and eattle. The princlpal frults are the orange, the shallock, the lime, the grape or cluster fruit, the pineupple, noseberry, granudilia, star-apple, custard-apple, mainuee ampota, mange, banans, grapes, meions, the a vocalo pear, the liread-fruit, and timarind, thuugh the last three would be more correctly runked
among vegetables. There la a botanle garden near Kiugaton, and a finer one at Bath, where many now anturaliaed exotlies were flrst planted. The sar uparilla la erroneously aupposed to grow In Jamale. though it is classed in the customs' returns there among the lmports. It is brought from the Spanish main, and re-exported by the Jamaiea Jews, In whose hands the trade is; hence it lo called Jumalce sarsaparilla. The sugar-cane was cultlvated at an early perlod in Jamalea by the Spaniards, and was so mueli extended by the English that, In 1671, we read of sugar worke ecattered over the whole loland. There are several varletlas, the mest valuable being the one brought from llourbon In 1799 , which lo of a bright yellow; and the Mont Blanc, of three sorts, white, vlolet, and blue. Beslder which is the ribbon-cane, beautifully striped with varleus colers, which is coarsa and dry, but more harily than the othar eorta. Tha statistics of the sugar and coffee cultivation have been given elsewhere. There are many lesautiful flowers in the island, the most remarkable of which are the aloe, the yuecn, the dutura, the mountain prlde, the portlandia; the cactus and cereus tribe, the various klnds of convolvulus and lpomeen, and two beautiful descriptions of plumeria, called the tree jasmine. Innumerable varietic3 of ferns grow In the mountains, and orehids in the woode. The pastures are Infested by that interesting minosa, the seasitlve plunt. It is oaten by sheep, but is armel with minute thorns, which make troublesome wounds In thelr feet. Thero are many henutiful insects, among whleh the fire-files are most remarkalile. There are fourteen sorts of Lampyridas or tlre-fles, besides the Elateridee or lantern beetles, which aro larger and more luninous; but neither lin flowers nor Insects is Jumaica so rich as more southern islanis. To compenate for thls it has no venomous oerpents, though abounding In harmlesa sankes and lizarile, A large lizard, the iguana, is considered a delicacy, as are the land-crab and tortoise. Tha scorpion und centipede are poisunous, but not very common or dangerous. Ants, mosquitoes, and sandtlies swarm in the lowlanda. Bees, unong whleh is a atimgless variety, uro numerous in the wools, and produce excellent honey. It is a popular error that in the tropics flowers have no scent and birls no song. The datura amb orange are aniong many Instances to the contrary In the former case; and as to the latter, Goss cnumerates some twenty different song blrde in Jamaica, among which may be mentloned the Jumaica nightingale, a kind of mocking-blrd (Merula Jamaicemis), und a species of humming-hilrd (Mellisega humilis). Darrots and pigeons are common, and the wild guinea fowl ; also a specles of goatsueker, called tho moscjuito lawk, mal in great variety of waterlifids, amongs which is the pelican and a sort of albutross. The crane, heron, plover, sulpe, ortolan (or rice-birl of Curolina), und quail, are migrutory. The atura vulture, or turkey buzzard, called the Jolin Crow, Is numerous, und valuble as a ecavenger. By ita lustinct the coucealed booly of a murdered man has more than once been traced lin Jumaica. The seu and rivers swarm with llah; umong the larger ones are the shark, the nurse shark, the bonito, the eword and suw-llah; besiles the snapper, mullet, klng-llsh, Spaniah mackerol, the flying-lish, cte. The cachalot is found. Turtles abomul ; and the neal and manatee, or river cew, aro sometimes found, and the crocodlle (callel errmeously alligator). Jamaien, when tiscovered, coutained but few species of unimuls. Hesides the alco, there was the ntin or Indian cony, the musk rat, the armadillo, monkey, ugoitl, peccary, oporamm, ant raccoon. At present the ouly will animala are the wild hog (nn Afrlcan variety, hitroduced from the Canarics), a kind of deer (the carlacou), goats, rats, and mice. The rats commit serioun ravages among the canes, and those which feed only in the camo-liehle are ly anme asteomed a delicacy. Thia spocies, called the

Charles Price rat, was introduced to destroy a smaller kind; but the remedy seems to have proved worse than the evll. The breed of oxen has been much improved by judlclons crossing, and can scarcely be ourpassed. The horsos have much of the Arab blood. They are small bnt fleet, and at the island races have often beaten English racers, particularly somo taken out by the Marquis of Normanby, when governor. The Cleveland bay has lately been introduced from England, with a viow to slze and bone. The mules are large, hardy, and sagacions, and much nsed for mountain-riding, as well as for carrying baggage and working on the estates. The sheep and pigs are of excellent quality, and the pork of Jamalca is conaidered much more wholeame than that of England, being frequently recommended to invalids. Goats are mnch reared liy the negroes, hut they are very mlschievons In angar and coffee plantations. The Cuba bloodhound is used as a watch-iog, being the species whlch thrives beet In a hot elimate; the Fnglish hound and terrier, which have frequently been Introduced, soon degenerate and dle. Poultry sueceeds well, particularly the turkey, the Guinea fowl, and Muscovy duck.
Tho principal publleatlons relating to Jamaica are : Luno's History, 1774; Bnyon Enwanns' History, 1809, wlth an Appendix, 1819 ; Ressv's History, 1807 ; Mathison, 1811 ; Ilowarn's Iare gf Jamaira, 1827; Inck fonn's Hisfory; Daltas' Miroun War; Stewaut's Jomaica; Monk Lewis' Tour: Mandex'a Jumaicn; Montoomeay Martin, 1836 ; PurLirPu's Past and Pretent State of Jamnica, 1843. The earlier historles are acarcely applleable to the present day, while many of the later pullications are mere vehicles for convering the authors' views for or against slavery. Hy far the beat and most rellable information is contained in the dispatches of succeasive governors, publlshed in the Parliamentary Blae Books; many of whlch, and particularly those of Slr Charlea Grey, contain admirable expositions of the state of the country, and causes of its decline. The natural history of Jamaica has also been the theme of many writer*-Sloane, in 1692; Brown, 1754; Barham, 1794 ; Lunьn, 1814. These authors lave a most able and enthnsiastic suecessor in Gosse, whose Journal of a .Vnturalist in Jamaica, 1851, and Birvis of Jamaira, 1847, are dellghtful lroks. For vivld pietures of senery aud Jfe In Jamalea, Tom Cringle's Log, and The Cruise of the Midge, by Michaet. Scotr, a Kingston merchant, are unrivaled.

The Caymanas, or Cayman Isles, are tiree amall coral ialands or keys, $\ln \dot{N}$. lat. $10^{\circ}$ th $19^{\circ} 20^{\prime}$, and 30 to 40 leagues west north-west from Point Negril, Jamalca, and sbout the same distance nouth of Cuba. Grand Cayman lles off tha centre of the Yucatan l'assage ; Cayman-liraque or Hrae, and lilttle Csyman, are near each other, and slout 34 miles northoant from Grand Cayman. They were dlseovered by Culumbus, hut no settlenent was over made by the Spaniards. Grand Cayman, the only one occupienl, is about a mile and a half long by i mile broad, and colitains about 1000 acres. It is very low, entlrely withnut mirings, and overgrown wleh low atunted shruts. These islands are favorite lireeding-places for turtles, iumence shoals of which anlmals frequent the low sanily shore for the purpose of depositing thelr egg ${ }^{\circ}$.

James, Capt. Thomas. This Engllsh navigstor was employed by a conipany of merchants of Hristol, In connection with one luke Fox, in 1631, on a woyage of exploration for the discovery of a north-west pasage. Slr Thomas Kie presented him to Charles 1., who greatly encouraged the enterprise. He suiled from the port of Brtatol on Bd May, and wintered on an Island In Hindson's Bay, In latitude about $52^{\circ}$, from whence he proceeded northward as far as $60^{\circ} j^{\circ}$,
when his further progress was provanted by the great accumulation of lee, aud he returned to England, Whera he arrived 22d October, 1632. During the enaning year, he published his "Strange and Dangerous Voyage for the Discovery of a North-west Passage to the Sonth Sea." He made some discoveries on the coast of Hudson's Bay, to the western slde of which country he gave the name of New Wales, in honor of the prince, afterwand Charles II. His journal contains much curious and interesting matter connected with tha sufferrings of himself and his companions doring their sojourn on the Isle of Charlton.
Japan. The emplre of Japan consiata of a chain of ialands lying off the eastern conat of continental Adia, and extending south-east and north-west bet ween north lat. $31^{\circ}$ and $48^{\circ}$, and east long. $129^{\circ}$ and $150^{\circ}$. Inclowed between thie chaln of lislands and the oppoaite coasts of Corea and Manchu Tartary; is the Ser, of Japan, which communicates by means of strsits with tha Chlness Sea on the south, the Pacific Ocean on the east, and the Sea of Okhotak on the north. To the esst, Japan has no nearer land than Califernin, 5000 millos off; the nearest part of China is about 420 miles, and of Kansschatica 270 miles diatant. The term Japan is probably a corruption of the Chinese name, Ji-pun-quo-i, e., Klngdom of the Source of the Sun, or Eastern Kingdom. Marco Polo, who was the first to bring Intelligence of thls country to Europe, and who açuired hle Information in China, calls it Zipangu. The Japanese name is Nipon, or Nifon-i. e., Sun-source.

The empire is divlded into Japan proper-consisting of the three large islands of Nlpon, Kiu-aiu, and Sitkokf, and the numeroue small islands, Nipon, the largegt and most important of the group, and that which gives name to the whole empire, has an estimated area of 100,000 square miles; its length being more than 900 miles, while its average breadth exceeds 100 . It is thus about one fifth largor than Great Britain. Its form is that of a curve or crescent, with the concave side toward the main lund. South of Nipon, and separated from it by a narrow ehannel, is the island of Kiu-slu, or Xinso, about 200 mlles $\ln$ leugth snil ahout 80 in average breadth, thus containing an area of about 16,000 square milee. Lyligh north-east of Kiusiu, and eastwaril of the southern extremity of Nipon, is the islanil of Sitkokf, or Sikoka, about 150 miles in leugth thy 70 ln average breadth. It is separated from Nipon by a long strait in aome parts not more than a mile In width; and from Klu-siu by Bungo Channel, which is about 30 miles broad. North of Nigon, and separated from it loy the Sangar Straits, is the large Island of Yesso, a conquest and colony of the empire. Its form ia that of an irregular triangle, and its area is computed at 30,000 n $\quad$ quare miles. Tho southern portion of the islund of Krafto, or Sagallen, which is separatell from Yexso by the Strait of Perouse, and the three southernmost of the Kurile Islands-Kunashir, Itarup, and Ourop-belong to Japan.

The small islands which surround these are generally rocky and barren, but occaaionally rich and fruitfinl. The entire number of lalands consposing the empire of dapan is estimated at alove 1000 , and the area of the whole einpire at not less than 170,1 kio squaro miles. The coasts are difilcult of arcess, not only from the multitude of roeks and lslets which beset the passages, but also from the severn gales which, more than any other part of the ocean, agitate theee narrow seas. Several dangencua whirlpools also occur manong the rocks. Kmonpfer renarks, that natare seems to have tlenigned theme islands to lie a sort of little world, secluded anil independent fron the rest, as well by rendering it langerous to approach their shores, ss by endowing them plentifully with evary thing necessary for luxury and comfort, and thus enabling them to aubsiat wlthout any commerco with other natlons. 'The Japausse policy, whleh rigidly
forbids all stances im the interpo Climate. ably betwe bit, except formation empire, it Finghand. $33^{\circ}$, the avi was $35^{\circ}$, ar the weather all seasons of July and ground is c with anow, the land is c the south dt At Simodn, $39^{\prime} 49^{\prime \prime}$, eas account of $t$ "the climate spring. forblds all intercourse with strangers, in other ciroumstances impracticable, has been greatly facilitated by the interposition of these natural bartiera.

Climate.-The climate of Japan must vary consider ably between its northern and southern extremities; hat, except at a few points, we possess very little Information on the enbject. In the sonthern part of the empire, it is said In many respects to resemble that of Enghand. At Nagasaki; in the island of Kin-siu, lat. $33^{\circ}$, the average temperature in the menth of January was $85^{\circ}$, and in Auguat $98^{\circ}$ of Fainr. At this point the weather is very changenble. Rain is frequent at ail scasons of the year, but enpecially in the months of July and August. In December and January the ground is covered with hoar frost, and occasionality with snow, oxcept in very mild winters. In summer the land is cooied by the sea-breeze, which blows from the south during the dar, and from the east at night. At Simoda, on the island of Nipon, in north lat. $34^{\circ}$ $39^{\prime} 49^{\prime \prime}$, esat long. $188^{\circ} 57^{\prime} 50^{\prime \prime}$, we learn, from the account of the American expedition (1852-64), that "the climate is more or less varinble in the winter and apring. The presence of anow upon the lofty peaks, although there is seldom froat or anow at Simoia itself, and the not unfrequent rains, with the ever necessary fogs, give nn ocessional humidity and rareneas to the atmosphere, which are chilling to the nenses, and nust be productive of occasional inflammatory discases, such as are frequont in the spring and winter with 11s. The change of wind alternates of ten between tha warm sea-breezes from the south, and the cold Wasts from the anow-capped mountaine inlarid, and prodaces the usunl effects, doubtless, of such variations. In sammer it is occasionally very hot in the daytime, hut the nights are refreahed by the sea-breezes. Fron April 19 to May 18, a record of the thermometer gives $72^{\circ}$ ns the highest, and $58^{\circ}$ as the lowest point ; and of the harometer, $29^{\circ} 88^{\prime}$ and $30^{\circ}$. As the senson adrances the mercury rises, no doubt, much higher, renching probably $85^{\circ}$ of Fahr., or more." Goiownin, a Russinn naval officer, who was for two years a prisoner at Hakodadi in Yeaso (north lat. $41^{\circ} 49^{\prime}$, east long. $140^{\circ} 47^{\prime}$ ), deseribes its climate as foliows :-" The ponds and lakes freeze, snow lies in the valleys and plains from November till April, and falis in as great nhundance as at St. l'etersburg. Severe frosts are indeed nneommon, yet the temperature is often two degrees below the freezing point. In summer the rain pours in torrents at leant twice a week, the horizon is obseured by dark clonds, violent winde blow, and the fog is scarcely ever dispersed. Applea, pears, and paches hardly attain ripenese, and the orange and lemin will not bear fruit." Of the cllmate of the still more northern part of the ompire we have no precise account; hut the same writer informs as that on the coast of Sagalien which is but littie further north than Paris, the sen is not clear of ice so eariy af the Guif of Finiand. Foge are aiso, as might be expected, very prevalent in Japan, and thunderstorms are frequent.

Surfare.-The surface of the principsl islands is in general very irregular, though in the interior some piains of considerable extent occar. In many places hills descend close to the sea-shore, or lenve oniy s narrow strip of land between the water and their bseses. The highent mountain is said to be Fuai, an extinet unlesno, on the island of Nipon, westward of the llay of Yeddo. Its sammit is cind in perpetual snow, thas indicating a helght of not lass than 12,000 feet alove the level of the sees. Several mountains of consilieratile elevation are seen to rise in the northem part of Nipon, in Yeaso, and In Sagailion, and neme of them are aetive volcances. llenides the outbursts of frequent volcanic eruptions, no country is more frequentiy visited by deatructive earthpuakea. Krempfer enumerates six active voleanle mountains. "Earthquakes," anys be, "are so frequent that the natives
regard them no more than Europeans do ordinary storms." In 1586 a auccession of carthquakea took place and lasted for 40 days, causing the dastruction of the best part of the elty of Yeddo, and the desth, it is alloged, of 200,000 of its inhabitants. In 1783 the eruption of a volcano in the island of Kiu-slu, accompanied by vielent oarthquakea, lestroyod in a single province 27. villagea. Another volcanic aruption took place in the same island in 1793, accompanied by earthquakes which continued from March to June, and cansed, according to official returns, the death of 58,000 persone, with a proportional destruction of property... On 23d December, 1854, an earthquake occurreả which was felt on the whole coast. Of the town of Simoda only a few temples and private edifices, that stood on elevated spots, eacaped destruction. The fine city of Oasca, on the couth-eastern side of Nipon, was completely deatroyed, and the capital Yeddo did not escape without injury. On 10th November, 1855, an earthquake at Yedilo is said to have cansed the destruction of 100,000 dwelliaga and 54 tomples, and the death of 30,000 persona.

Rivers. $\rightarrow$ The rivers are numerous, but ahort, ahallow, and rapid. They are not navigable for veasels of burden, but some of them may be ascended by amall beats for some miles from the вea. The priacipal lake of Japan ia that of Oitz, in the eouthern part of the island of Nipon. It ia about 60 miles in length, but of inconsiderable breadth.

Geology.-Little is at present known of the geological formation of the Japanese islands. The voleanic formation appears to prevail, but by no means to the exclusion of the plutonic and sedimentary. The useful mineral products, so far as yet known, are gold, silver, copper, quickailver, tin, lead, iron, coal, aulphar, and aalt. With the exception of tin and iron, these seem to be all very abuadant. The gold ia found in many parts of the empire, sometimes as ore, and sometimes from the washings of the earth or sand. Siiver is equally plentiful with gold, and it is probable that the quantity of these metals annually exported from the country, when the trade was open, amounted in value to a million and a half storling. Copper abounds through the whole group, and sometimes of a quality not to be surpassed by any in tise world. The natives refine it, und cust it into cylinders about a foot long and an inch thick. A specimen annlyzed by Dr. Percy gave $0 \cdot 13$ per cent, of niekel, 0.03 per cent. of iron, and extremely minute traces of tin and geld. The coarser kinds they cast Into round lumpe or cakes. Iron ore rich encugh for the purpose of smelting appears to be contined to three provinces, and the metal is consequently dear. "Iron," says Kampfer, " is much of a price with copper, iron tools belng full as dear, or rather dearer, than those of copper or brasa." The same is stated with respect to the proportional value of iron and copper by Golownin. Lead and quicksiliver are said to be abundant, but they have never been articles of export. Tin has been discovered in smail quantities, and of a quality so fine and white that it ainost equals siliver ; but of the extent to which it may be procnred little is known, as the Japanese do not attuch mach value to it. Zine, according to Kimmpfer, is not produced In Japan, and in his time calamine used to be imported from Tonquin for the manufacture of trass wares. Zhe, however, is expressly statel by the governor-general llaron Van Imhoff to bo an articie of export as well as brass. This was 60 years after Krempfer's time. Sulphur, as might be expected iu a region so volcanic, is very abundant. In some places it lies in broad deep beds, and may be dug up and removed with aa much caso as sand. A considerahie revenue la darived by the government from thia aource. Coal appears to be found In many parts of the country, and is used for fuel. Sietrold speaks of it as boling la common use throughout the country, and on visiting one of the mines he

## JAP

saw enough to convince hlm that it was skilfally worked. Baing bitnminons, it is, for domestie purposes, generally converted into coks. Rock-salt aeems to exist in aome parts of the conntry, bnt does not appear to be much used, the cnlinery salt in use belng made frum sea-water by an unakillful and expensive process. By saturating massea of and with see-water in the sun, a strong lye is obtained, which fa afterward bolled In earthen vessels, and ylelda an expenalve and impure muriate of soda. No dlamonds have been fonnd, but agates, carnolians, and jaspers are met with, some of them of grest beanty. Pearls, frequently of great slee and beauty, are fished up on nearly all parts of the coast.

Vegetabis Productions.-The vegetable productions of Japan are, for the most part, thoae common to temperate reglons. Timber f , however, no acarce, that no one ls permitted to cut down a tree without permisslon from the maglatrate, and only on condition of plantlng a young one in lts atead. The most common forest trees are the fir and cedar-the latter growing Whan immense size, being sometimes more than 18 feet in diameter. In the northern parts of the empire two species of oak are found which dlfer from those of Europe. The acorus of one kind are boiled and eaten for food, and are said to be both palatable and nutritlous. The malberry growa wild in great ntuadance, and the varnish-tree (rhus rermir) abounds in many districts. In the south, the bamboo cane, though a tropical plant, is found elther in the wild or cultivated state, and is largely used in the manufactories. The camphor-tree is of great value here, and lives to a great age. Slelold visited one which Kxmpfer hall described as having been seen hy hlm 185 years before. It was healthy, and covered with folinge, and had a circumference of 50 feet. The country people make the camphor from a decoctlon of the root and stems rot into small pleces. Chestnut and walnut trees ars both found. Among the fruit trees are the orange, lemon, fig, plum, cherry, and spricot.

A aimals.-Wxtenslve cultivation leaves no room for wild animals ; and tame anlmals, not being lued for food, are nat multjpliad beyond the falt necessity for their use. The horses are emall, hut hardy, active, and of grool hottom. William Adama, an Eliglish mariner of the time of James I., describes them aa " not tall, but of the slze of our middlling nags, short and well trust, small headed and very full of mettle, in my opinion far excelling the Spanish jennet In pride and atomach." Oxen and cows are only used in plowing and carriage, milk and butter not being used as articles of food. lluffaloes of an extraorlinary size, with hunchem on their backs, likn camels, are used to draw earts and carry heavy govis on their backs. Sheep and goats were formerly kept at Firardo by the Dntch and Portuguese, and might be brel in the country to great advantage if the natlves wern permitted to eat their fleah. or knew how to manufacture their wool. They have a few awine, kept chiefly for trading with the Chlnese, among whom they are in great demand. Dogs are to the found in large numisers In the half domesticated state in which they generally exist in the Fast. Thin in not true, however, of one species, re. nembling aomewhat an Engilsh apaniel, which is conslidered so valuable as to form part of every reyal Jupanese present. It is conjectured that the Fingliall variety may have aprung from some presented hy the emperor to the king of Eingland. The wild animals are liears, wild brars, foxes, monkeys, Heer and haren. Kats and mice are very common, as well as two small npecies of wearel or ichnemmon, which live, half tame, under the eaves of houses.

Wild fowl are very abundant, eonsiating chlefly of geene and ducks, which migrate in great numbers to the shores of Japan in wlater. Numeruus specles of pigeons are to le found, and woodcocks, pheasants, snipes, larks, etc., are commion. There are two spe-
cies of pheasant, and one of peacock, pecullar to Japan Domentic poultry are kept by the nativea almost solely for ornament or amusement. Soms of the reptilia aze of large size, and, along with the inasct tribes, are dreaded for their deadly; and deatructive powers.

The shallow bays and creeks around the islenda swarm with ehoals of fish, which, indeed, constitute nearly the whole animal food of the Japaness, and furnish them plentifully with oil for domeatic parposes. In their coarso taste, the inteatines of the whale, and even the refuse of blubber, are consldered good enough for food. The Japanese are the boldest and moat expert of all Aalatic fishermen. Their fishing voyrges extend to the rigorous aema of Sagailen and Kurilea in pursuit of herring, with which they manure their cotton fields. They are the only Asiatic peaple that pursue the whale. The women are said to be expert divers for shell-flah, with which the shores of Japun abound.

Nutives.-The Japanese are described as an active, vlgorous people, of the middling size, and their bodily and mental powsrs more closely asoimilated to Europeana than Aslatics. The common people, according to Thunberg, are of a yellow color, which ametimes borders on brown, and sometimes on white. The laboring classes, from the exposure of the upper parts of their todies in summer, have their nuturaily fuir cemplexion deepened into brown. Their durk brown cyes are otalong, small, and sunk deep in the head. The eyelids forming a deap farrow givea them the appearance of belng keen-siglited. Their heads are lurge, and their necke short, their hair black and glossy witit oil. 'iheir noses, without being flat, are yet rather thick and short. Dr. Ainslie gives a aomewhat difterent account of their complexion. Ile represents thein as perfectly falr, and indeed blooming, though this seems to apply chistly to the women. Thunberg ulso mentlons that the descendunts of the oldost and noblest families of the princes and lords of the empire are somewhat majestle in their shape and countenance, being more like Europeans; and the ladies of distinction, who seldem go out in the open air without being covered, are perfectiy white. Siebold, apeaking of the inhubitants of Klu-siu, corroboraten this view, and says that "the wonsen who proteeted themeeives frum the influence of the atmosphere have generally a ling and white skin, and the cheeks of the young girls display a hoominy carnation." The married women of Japan dye thelr teeth black, by means of a cortosive conposition, so powerful that by nere tonch it hums the tlesh into a purple gangrenous spot, and in spite of the utnoat care in Its application, Invariahly taints the gums, destroying their ruddy color and vitality. "The Japunese women, slways excepting the disgust. Ing black teeth of thoae who are married, are not ililooking. The young girls are well formed, anil rather pretty, and have much of that vivacity and self-reliance In manners which come from a censciousness of dignity, derived from the comparative! high regard In which they are held. In the ordinary mutual in tercourse of friends and families the women have their share, and rounds of visiting and tea-parties are kept up as Lriskly in Japan us In the United States."A merican Eispedition.

Language.-Superticial observation led to the belief that Japan was colonized by the Chinese ; but a mure accurate knowledge of the physical characteristies and language of the people has ranifered this opinion artcuable. Indeed, the Japaneso themselves consider it a high disgrace to be compared with the Chinese. Ir. Ainalie states that the only ocrasion on which he suw a Japanese anrprised into a pasaion, and, forgetting his babitual politenexn, lay his hand on his sword, was on a comparimon being mada between the two nutions. The structure of the languiges of the two conntries is essentially different, that of Japan being polysy'labic, while all the dlalecta of the Chinese are monosylahic

It lo true that, llke tha Latin in Europe doring tho middle agen, the mandarin dialect of the Chinese is in use among the learned here, as In Corea, Tonquin, and elsewhere; and hence many Chinese words have been introduced into the Japanese; but the introduction of these only makes the structural difference the more strikingly apparent. Tha Yomi, or primitive language of Jupan, is used In poetry and worka of IIght literature. The Koye, or Chinese language, allghtly varied in pronunclation, is employed by tha bonzes or priests in their religious books. The vulgar language of the country is a mixture of the two. Close affinities have not been traced between the Yomi of Japan and any other Asiatle language. Hy some, at least, it is thought to be moat analogous to the languages of the Tartar race, to which, in spite of diversity In physical charscteriatlea, it ls now inost commonly believed that the Japanese belong.

Population.-In regard to the populstion of Japan, all eur Information rests merely on conjecture. Some authoritica estlmste- It at more than $10,000,000$, while others make It mere than four or five times that amount. All travelers who have visited the country bear testimony to the populousness of the parts vialtod by them. Thus, Kampfer, who passed four times over that part of the country between Nagasakl and Yeddo, says-" The country la populous beyond expression, and one would scarce think it possible that, being not greater than it is, it should nevertheless maintala snd aupport such a vast number of Inhabitunts, The highwaya are an almost continued row of villages und burghs. You searce come out of one but you enter another; and you may travel many miles, as it were, in one street without knowing it to be composed of different villages but by the different names that were formerly given them, and which they afterward retain though joined to one another. It has many towns, the chief whereof may vie with the most condideralle in the word for largeness, magnificence, and the number of inhabitants."
The men of all classes are exceedingly courteou", und although inquinitive about strangers, never become offeasively Intrusive. The lower people are evidently ia great dread of their superiors, and are more reserved in thelr presence than they would be If they were left to thelr natural inatinctas. The rigid exclusiveness in regard to forelgnera is a law merely enacted by the guveroment from motives of pollcy, and not a sentiwent of the Japancse penple. Their hablts are sochal ming themselves, and they frequently intermingle in friendly intercourse. "The Japaneae," says Kampfer, "are very industrious and inured to hardships. Very little will satisfy thens. They generally live on plants and roota, tortcizes, shell-fish, sea-weeds, and the like. Water ts their common drink. They go bare-headed and bare-legged. They wear no ahirts; they have no soft pillows to lay their heads on, but sleep on the ground, laying their hends, instead of a piliow, on a piece of wood, or $n$ wooden box somewhat depressed in the middle. They esn pass whole nights without sleeping, and suffer all manuer of hardships." The following appurently very correct pieture of this people is given by an anonymous writer of the relgn of Elleabeth: "'The Inhabitants slow a notable wit and an Incredible patiance In sutfering, labor, nul norrows. They take grent and diligent care lest either in word or deed they should show their fear or dullness of mind, and leat they should make any man (whosoever he be) partaker of thelr tronblea and wants. Ther covet exeeedingly honor and pralse; and poverty with them bringeth no damage to nobility of Wrth. They suffer nat the least injury in the world to pass unrevenged. For gravity and caurteny they give not place to the Spanlarda. They are generaliy affable and full of compliments. They are very punctual in the entertalument of atrangers, of whom they will curiously lnquire even triflea of forelgn people, as
of their manners, and such like things. They will as soon lose a limb as omit one ceremony in welcoming a friend. They used to give and recelva the cup at one and the other's hands, and before the master of the house begins to drink, he will proffer the cup to every one of his guesta, making ahow to have them begin. Fish, roots, and rice are their commen junketa ; and If they chance to kill s hen, duck, or plg, which is hut seldom, they will not, like churla, eat it alone, hut their friends will be partakera of it. Althongh essentially an abstemious and sober people, they are not averse occasionally to strong potations."
The Japan -as laws are very ahort and intelligible, and the pro sedings under them are as simple as the lawa themselves. There are no profecsional lswyers, every man belag deemed competent to plead his own cause. If a party is aggrieved, he appeals to the magistrate, who summons the other party before blin. The case is then stated by the complainant in hle own way, and the accused is heard in reply. The magistrate examines witnesses, and is sald frequently to cisplay great acuteness in the detection of falsehood. IIe passes sentence, from whlch there is no appeal, and it is carried Into execution instanter. If the matter In dispute he of great Importance, the magistrate may refer it to the emperor in council. Sometimes in trifling cases he orders tho partles to go and settle the matter privately with the aid of their friends, and it is. well understood that the matter must be settled, or unpleasant consequences will result. See Eincy. Brit., 1856; De l3ow's Review, Ix.

Revenue.-The great source of revenue in Japan is the rent of land, with an impost on houses, in the manner of a ground rent. There appenrs to be no tax on articles of conaumption, no capitation tax, and no transit duties. The cultivators of the soil appear to be mere villeins, simply occupants cultivating as metayers. In lands belonging to the crown, the proportion of the crop considered rent is four parts in teu, and in the rest six In ten, most commouly the latter. These proportions apply to every kind of crop-corn, pulsea, and cotton. The land, in order to determine the rent, is surveyed by sworn nppraisers twice a year, once before the seed is sown, and again iminediately before harveat. Those that cultivate untilled ground have the whole crop for two or three years. Among their many excellent laws relating to agriculture, ne is, that whosoever does not cultivate his ground for the term of one year forfeits his possession. It would appenr, from the proportion of crop taken as rent, that the limpost on the land does not materially differ from that assumed as land-tax under the Mohammedan government of llindoostan, and continned in some places by oursel ves. This will emahle us to maxe an approximate estimate of the rental of Jrpan-that is, of the principal source of its public income. This, of course, will suppose a similar condition of society and rate of population in Japan and the country with which it is compared. Let us take, therefore, the same Indian territories by which we have sttempted to estimate the population. These have, in reund numbers, a population of $46,000,000$, and yielil a land-tax of $\pm 10,000,000$. This proportion would give to dapan, with its estimated population of $40,000,000$, a rental of nearly ( $8,700,000$ to le divided between the Imperial governments, feudatory princes, hereditary nobles, und the soldiery.

To the rent of lanils ia to be added the ground-rent of the houses, which is said to he at the rate of 1 s .8 d . for each fathom of frontage, without regard to depth, inless it exceed 15 fathoms, when the rate ls doubled. Whether the lmpost applies to all houses, wherever situated, or ouly tu thoso in towns, is not stated; but if the former be the case, estlmating each honse to hare an average of tive inhnbitanta, and also tivo fathoms of frontage, would give the Income from this source st more than $\pm 3,300,000$, or, adding this to the land-reut,
would make the annual revenue of the empire about ع12,000,(000.
"The Japanses beligg chiefly dopendent on the soll for subaletence, have arrived at a high atate of perfection in the arts of agriculture. Thoigh a great part of the country fo hilijy or mountainous, and the soll in general rather poor, yet almost every available foot nf land is caltivated, and very abundant orope are raised. Where the land is inaccensible to the plow it is cultivated hy manual labor. Like the Chinese, they pay great attention to manuring and irrigation. Aa animal food conatlutes handly any part of thelr culvelstence, no pastures or meadown ary to be seen. Rice conatitutea the main object of agriculture, as it fnrms the bread corn of the peopie from one end of the empire to the other. Its cultivation extenda to the faland fir Yasen, and as far north as 45 degrees of latitude. The rice of Japan is known to excel every other in Asia, and this may not be owing exclusively to Its akillful cultivation, but partiy to the climata and the distance of Japan from the tropics. From it the inhabltanta diatil a drink cailed saki (a kind of rice leeer), in very general nse. Whent and barley are grown, but the former is not. in much nae, and the latter la the chief procender of cattle. Rye, maize, panic, miliet, and the Cymosmrwe cororawhs are aleo raised. Beans and peas of different kinds are cultivated in great abundance, particulariy the bean Dolichos anja, from which any, a kind of sauce, prepared by boliting and fermentation, Is made. Among esculent roots and pot-herbs the following are sucreasfuily cultivated : the hata, the potato, carrot, tumip, cabbage, malish, lettuce, gonnd, melon, and cucamber. The frults are generily those of Earope, as the nrange, lemon, peach, flg, pear, chestnut, walnut, and cherry.

The tea-piant in Japan, in in China, takes the place of the vine in the temperate regions of the west, and of the coffee in tropical conntries. "The tea shrub," eays Ksempfer, "is one whe moat nseful plants growing in Japan, and yet it in allowel no other room but round the iorders of rice and corn flelds, and in other barren places anfit for the culture of nther things." In a few places the plant, accorling to Slebold, receives more attention; generally, however, hardly an much as our hawthom hedges, and thus the leaves are anfit for the consumption of strangers. It use, however, la unlveral among the natives. It was Introdaced into this country from China in the ninth century. Tohaceo was first Introdnced by the Portis. guese in the early part of the 16 th rentury, about the aame time that it was introdnced Into England, and it is remarkable that the Japanese emperor irstituterl n perneention against its growers and amokers at the asme time that King James issuet his Coviter Blast, and with an littlo effect in arresting its use. The plants eultivated in Japan for textile parposex are cotton and hemp in the northern istands. The mulberry is grown for the silk.worm. In hushaniry cotton ranks next in import ace to rice, and furnishes materials fir clothing the great mase of the people.

Manyfactures.- In the manufacture of cotton fabries the Japanese diaplay considerabis akll, but in this respect they do not equal the 11 indions. Their beat sllk is sabl to be superior to that of Chins. In the manufacture of porcelain, too, they are alit hy some to excel the Chincse. Specimens of great heanity and delicacy, at lenst, have been produced, though some ascert that, owing to the exhaustion of the liest clay; such articien can no longer ive manufactnreil. Llke the Chinese tho Japanease have long precticed the manufact ure of paper and gians. Formeriy they did not know how to make the fiat pane for window glase, and probably what they do make is of an Inferior quality, as they stll! purchase thick mirror glass from the Duteh, to grind Intn lenaes. Paper they manufarture lo great abunlance, as well for writing and printing as for tapentry, handkerchiefs, otc. It is made of very
various qualitios, and some of it in as soft and flexibls as cotton cloth. Indeed, that used for handkerchiaf: might be mistaken for cloth, co far as toughnass and flexibility are concerned. Thla peper in made of tha bark of the mulberry (Morwa papyrifera) by means of the following process: In December after the tree has shed its leavse, they cut off the young ahoots, about three feet in length, and tie thom up in bundiee. They are then boiled in alys of aahoe In a covered kettle, tili the bark is so shrunk that half an lnch of the wood may, be seen projecting at sither enil of the branch. When eool the bark is atripped aff, and soaked in water for three or four hours until it becomes soft, when the extorior black cuticle in serapod off with a knife. The coarse hark, which is full a yoar old, is then separated from the fine, which covered the younger brancher, and which maken the best paper. The bark is then loiled agaln in clear lye, continually stirred with a atick, and fresh lys from time to thme added, to make up for the aveporation. It is then carefuliy washed ut a running stroam, by means of a sieve, and ineeasantly atirrad until it becomes a fiac puip. For the finer kinds of paper this process is repeated, a pivee of liaen being aubatituted for the sieve. After being washed, It is beaten with aticks of hard wood on a wooden $\boldsymbol{t}$ table, till it is brought to a pulp, whirh is put into water and dissolved and dispersed like meal. This is put into a smail vessel with a decoction of rice and a epecies of Mibiscus, and stirred until it has attalned a toierable consistence. It is then poured into a larger vessel, whence it is taken out, and put in the form of eheets in mats or layers of grass straw. These shsets are laid one upon anothar, with straw between, and pressure is applied to fore the water out. After thia chey are spremi upon bos ds in the sun, dried, cut, and gathered into bundiea for sale and use. The well-known lacquer ware to which Japen has given name, is mnequaled for beauty and durability by that of any other nution. We have ourselves of late years imitated, but certalniy not equaled it. They diapiay considerabie skili in working the metals, In wood work, caskete, cabinets, and the like, they are unsurpassed. Some of their awords are sald to be equal to the tineat Damascus biades; end Golownin stated that their carpenters' and cabinet-makers' tools are equal in temper to those of a simitar kind in Eingland. Thay are exceeding quick in observing any improvement brought in among them by foreiguers, and cops it with great ekill and exactness. Clocks, watches, and astronomical instruments are made by them, copied from kuropean modela.

Ares.-In certain 'ranches of the fine arts the Japanese have attained no smail skilh. They are isnorant of anatomy and perspective, and therefore harbsrous In their aculptures and landacapes; bat in tha representation of a single objert they manifest great necaracy of detail, and a truthful alharence to ature. Architecture, as an art, can hardly be said to hava an existence-their tempies, palaces, ani private houses being all low and temporary structures, generally of wood; and the frequency of sarthquakes leails them to bestow less care on their buildings than in other circunistances they might do.

Trade.-The dapanese carry on $n$ large internal tratic, which, from the peculiar characteristics of their country, is in a great measure by coasting. Tha numerons straits and creeks, with their shalliow waters, though generally unfit for shit, of burden, are aufticiently commodions for the smali craft of the Japanese, which rarely exceed 60 tons burlea. Tha iniand tranaport la by horses, oxen, and porters, there being very jittle river or canail navigation. Kicmpfer, who, however, refern to the busieat parta of the conntry, that letween the chilef port Oasco and the two capitals, apeaks of its commercial activity as follows: " Ilow much is carried on between the several provinees of the empirel How busy and Industrious the

merchants are everywherel How fall their ports of ahips I How many rieh and mercantile towns up and down the country ${ }^{\prime}$ There are ench multitudes of people along the comste and near the sea-l ots; such a noise of oars and mails and numbers of ships and beats, both for nee and pleasure, that one woold be apt to imagine the whote nation had settled there, and all the inland parts were left quite desert and empty." This was sald 160 years ago, and it may be safely assunied that the uninterrupeed peace which the country has since onjoyed has not impaired its commercial prosperity. That the Japanese are a commercial people may be inferred from the order, neatness, and propriety with which every thing connected with their tride is conducted. "They bave gold, allver; and copper money; as well as bllis of oxchange. "Their shops have aigns, sid thele goods are packed and labeled with a truly mercantile cere and neatness.

The foreign interconrse of Japan was, more than two centuries, and till within the Inst fow years, solely confined to the Dutch and Chinese. Even with these the trade wan limited, belng with the Dutch for a considerable time restricted to a aingle shlp annually, and with the Chinese to ten junks, The exports and imports were even limited as to value, and the aales and porehases fixed by a tariff of the Japanese government. The Dutch were confined to the mmall island of Dexima, in the harbor of Nagasaki, which is only about 640 feet In length by 240 in extreme breadth. A small stone bridge connecte the laland with the town of Nagasakl, and a atrong Japanese guard was always stationed here, no one being allowed to pass either to or from the Ialand without license. The whole island is surrounded with a ligh fence, on the top of which are placed iron spikes. On the north side are two water-gates, which were kept always shat, except to sidmit or let out the Iuteh vessels, When a ship arrived her guns and ammunition were first taken out, and she was afterward searched In every part, and nn exset liat made of every thing; on board. The crow were then permitted to land on the island, where they were kept, as long as the ship remained, under the inspection of guerds. Every Japanese official at tho Dutch factory was bound twlice or thrice a year to take a solamn oath of renuncintion and hatred of the Chriation religion, and was made to trample croase and eruclifixa under his feet. The Duteh were at all times surrounded by Japanese apies, whom they were obliged to employ as interpreters, clerk, servants, ete.

As the emplre is ngain in some measure thrown open to foreign Intercourse, it may not be unprofitable to speculate on the nature and value of a trade with it. The commoditien which have been chiefly in demand in Japen, are iron, steel, load, tin, quicksilver, cinnsbar, sapan-woon, black pepper, cloves, nutinegs, angar, putchak, deer-skins, ivory, Chinese nnd Tonquin raw silk, Indian cotton goods, entton yarn, mirrors and other glass ware, and Engliah woolens. At one tine or another all these articles found n market in Jspan, and mont of them are Imperted by the Duteh and Cbinese at the present time. In a free trade, or any approsch to lt, with Japan, wo may suppose that iton and ateel, high-priced commodities there, would become staple imports. The climate would give rise to a conamuption of woolens; and although the Japanese are elothed in their own cotton, fudging from What has taken place in India, where both the raw and wrought artleles are cheaper than in Jnpan, we may infer that cotton fabries might be imported with advantage. Cotton yarn or twiat has long heen one of the regulse articles of import, although it was long the high-priced manufucture of Java spinn with the diataff that was imported. Mirrors and glaes ware would, no doubt, find a ready mart. Sugar would certalnly be In demand, ne Jnpan producen none; and the same may be said of nearly all klude of apiceries and dye-
woods. Even cotton wool and rice might be occa: olonally lmported, sa they are regularly into China. According to M. Caren, whoas. Information' refers to 1636 , or the period preceding the last persecu, thon, the European nations imported annually. into Japen from 640,000 to 675,000 lhs. of Chinese rav silk, 200,000 deer-akins, and 100,000 other kind of peltry. :".
With reapect to the exchangeable products from Japan, gold, silver, and copper were largely exported when the trade was open. While the Dutch were carrying on their trade at Firando, and atill unreatricted, they exported annually gold to the value of $\mathbf{£ 4 0 , 0 0 0}$, and silver to from $\mathbf{£ 8 3 0 , 0 0 0}$ to $\mathbf{£ 8 8 5 , 0 0 0 .}$ But the Spanish and Portuguese trada was free at the same time, and these nations are atated to have exported more largely, so that we may conclude that a inillion and a half of the precions metals were, from near the beginning to near the middle of the 17 th century, exported from Japan. Of copper, the Datch exported in some years as much as 1800 tons. Most important, however, in this part of the world will be the supply of eoal; whioh the islande are eald to furnish abundantly. It will also be seen from what we have already alald of the productions of the country, that there ere many things among them that may become valuable as exports, while a demand for other articles will no doubt lead to their introduction an subjects of trade.

After the expulsion of the Portuguese in 1639, and before the restrictions were so stringent as they afterward hecame, the entire value of the foreign trade was extimated by the Duteh governor-general, the Baron Van Inihoff, at $\mathbf{£ 8 3 8 , 0 0 0 ; ~ w h i l e ~ i n ~ b l e ~ o w n ~}$ time (1744) it had declined to $£ 264,588$, of which one thind only was Duteh, the rest baing Chinese. In 1805 the cargoes of two ships laid in at Batavia, were sold in Japan for £ $\mathbf{8 5}, 416$, with whieh, or rather with the balance after deducting heavy local charges, copper and camphor were purchaeed, which in Batavia sold for $£ 195,733$. The adventure of next year was noither so large nor oo prosperous, for the outward cargo brougut in Japan only $£ 24,325$, and the return cargo of copper and eamphor produced when sold in
 however, arose entirely from the enormous war prices for copper and camphor. Since then the trada has become still smaller, and, as already atated, is confined to a single ship. In the earlier period of ite trade Japan was not only freo to all the world, but was not even burdened with imposte on eithar ship or cargo; presents, however, required to be made to the emperor, the provincial governors, and one or two other partien. - W. E . 3.

Afoney. -Accounts are kept in teels, mace, and candarines; 10 candarines make 1 mace, and 10 maces 1 tael. The Dutch reckon the Nangasaki tael at $3 \frac{1}{2}$ florins, equal to alout 6s. 2d. The gold coins current aro the now and old itjih and cobsnge, or eopangs ; the silver coins are, the nandiogin, itaganne, and kodama. They are in general very simpie, struek plain and unadorned, the greatest part of them withont any rim round the margin, and most of them without any determined value. For this reason they are always weighed by the merchants, who put thoir chop or stamp upon them, to aignify that the coln is atandard weight and unadulterated. The new cobangs are oblong, rounded at the ende and flat, about 2 inebee broad, scarcely thieker than an English farthing, of a pale yellow color; the die on one side consiats of sevoral cross lines stamped; and at both ends there is a rectangular figure, with raised letters on it, and, hesilen, a moonlike figure, with a fiower on it in relief. On the other side is a circular stamp, with raised letters on it ; and within the margin, toward one end, two smaller sunk stamps with raised letters, which are differeut on each colong ; they are valued at $\mathbf{6 0}$ mace.

There are old cobangs oecasionally met with, which are of fine gold, somewhat broader than the new. The old cobang weigh 371 Dutch asen, or 275 English grains, and the gold is said to be 22 carata fine, which would give 44s. 7d. for the valus of the old cohang. Bat the Japanese colpa are reckoned at Madras oniy 87 touch, which is $20,22,25$ carats, this reduces the old cobming to 41 s .10 d . The now cobang weigh 180 grains; the gold is about 16 carats fine, and the value 219. 8d. The oban is thrice the value of the cohang. The itjib is called by the Dutch golden bean, and is made of pale goid, of a paralielogramical figure, and flut, rather thlcker than a farthing, with many raised letters on one side, and two figures or flowers in rellef on the other; the value of this is half of a cobang. There are old itjibe also to be met with; these are thicker than the new ones, and in value 22 mace 5 candarines. Nandiogin ls a parallelogramleal flat silver coin, of twice the thicknees of a halfpenny, 1 inch long and inch broad, and formed of fine silver. The edge is stamped with stars, and within the edgea are ruised dots. One side is marked all over with raised lettere ; and the other on its lower and larger moiety, la filled with raised letters, and at the same time exbibits a doubie moonlike figure. Its value is $\mathbf{7}$ mace 5 candarines.

Itaganne and kodama are denominations by which various lumpa of ailver, without form or fashion, are known, winch are neither of the same size, shape, nor value. The former of these, however, are ollong, and the latter roundish, for the most purt thlek, but aometimes, though seldom, flat. These pass in trade, but are always weighed in payment from one individual to another, and have a dull leaden appearanc?. Senl is a demonination applied to pieces of copper, brass, and iron coin, which bear a near reaemblance to our old farthings. They differ in size, value, and e ternal appearance, but wre alvay's cast, and have a quare hole in the middie, by means of which they may be strun- together; and likewise liave always broad edges. Of these are current, sjumon sent, of the value of 4 common seni, made of braes, and almost as broud as a halfueany, lut thin. The common seni are the size of a farthing, and made of red copper; 60 of them $=1$ mace. Duosa seni is a cast iron coin, in appearance like the last, of the same size and value, bot is so brittie that it is easily broken by the hand, or breaks in pieces when let fali on the ground. The aeni are strung $\mathbf{1 0 0}$ at a time, or as is most commonly the case, 96 on . rush. The coins in one of these parcels are seldom ali of one sort, but generaliy consist of 2, 3, or more different kinds; in this case, the larger ones are strung on firnt, and then foilow the smaller; the number diminishing in proportion to the number of large pieces in the parcel, which are of greater value than the smaller. The sehuit is a silver piece of 4 oz .18 dwte .16 gr . Truy, and is 11 oz . fine, which gives its value 21 bs. 3d. The name is 1 )uteh, referring, probably, to its shapo, like a lroat.

Weights.-These are the candarine, nuace, tael, catty, and picul, thus divided:

| 10 candariaes | $=1$ mace. |
| ---: | :--- |
|  | $=1$ tael, |
| 10 manee | $\equiv 1$ cativ. |
| 100 cattics | $\equiv 1$ pleuil. |

The picul $=2125$ I uteh lise, or $1331 /$ ilss. avoirdupois. It is, however, said to weigh only $1: 30 \mathrm{lbs}$.

Measures,-The revenues of Japan are eatimated by $t$ wo measures of rice, the man and koif; the Cormer contains 10,000 koifs, each 3000 lmales or bage of rice. The long measure is the inc, which ls about 4 Chinese cubits, or 67 feet English nearly ; and 21 Japanese leaguea are computed to be about I Duteh league.Milbuas'a Orient. Com.

The principai, or more insportant towne of the empire, are Yelo (or Jeddo), Mijako (or Kio), etc. ; Nangaeki, Saga, Kokura, etc. ; Sinocla, Kotsi, Takamutsl, etc. ; Hakodade, Matsumae, etc.

Commercial Intercourse.-At an early period the Portuguese founded a suttlement, and established trade with the Japanese, having aucceeded in winning the favor of several of the native prinees, through the Instrumentality mainly of Christian misoionaries. In 1642, Fernando Mendea Pinto, a Portugueso, embarked in a Junk from Macao to Lew-Chew; but encountering adveree winds, he was driven to one of the western islanda of the Japanese archipelago. About the eame period, the celebrated Xavler arrived at Goa, anil, proceeding soon after to Koyositna, mede so fa vorabie an impreasion on the Prince of Satsuna that an active and profitable intercourse at once apruag up hetween the western ports of Japan and Macao. This Intercourse continued unlnterrupted during a period of neariy 40 years, when un edict was laeued permitting the Portuguese to continue their trade as before, but forbliding them to bring any more misuionaries, or even to speak on rellyious subjects. In 1635 , under the reign of Yeyo Mitson, a prison was constructed off Nunguakki, and ali the Portuguese found in the country were there confined, and the commercial privileges which they had so long enjoyed were tranaferred to the Dutch, who were generaliy helieved to the the instigators of the severe mensures put in force against the Portuguese. A anguinary buttle between the Portuguese and native Christians, amounting to 38,000 men, on the one side, and tile Dutch, and such of the natives as aymputhized with them in their hostility to the Portugueae, on the other, was the reault of these rigorous measures. The former fortilled themselves in Slmabara, and the latter mado their utack under the comanand of the Dutch director Kockebecker. The fortreas was soon reducel, and the l'ortuguese, rither than subuit to their rivals, to whom they attributed all the misfortunes that had befalien them, perished to a man. An edict was lmuediately published, forbidding the Portuguese to enter the country. The intelligence of these procecilings soon reached Macao, and four of the most distinguiahed citizens were sent to conciliate the favor of the gavernment of Sapan. They arrived at Nangrasaki In 16-10, and were inmediately put under arrest, and condemned to death for entering the country in violation of tho edict. The following inseription, written, it is said, by the butch director, Koekelecker, was placed on their grave: "So long as the sun shall warm the earth, let no Christlans be su bold as to come to Japan ; sul let ail know, that the King of Spain himself, or the Christian God, or the Great Saca, if he violate this command, shall pay for it with his head." The Portuguese have never nince been permitted to renew their intercourse with Japan.
The first formal edict in favor of tho Dateh was issued in 1611, and the priviloges of trade which were then conceded have continued, modified at various tiuses, to thas present day, In the earlier period of this trade, return cargoes consisted chieliy of siiver and goid, Japunese copper lreiug then but hittle known in Europe. This latter article, however, soon became one of the leating staples of Japanese export trade. In a work, entitled " Notes of the Voyage of the Morrison from Canton to Japan," pulilished in 1833 , the following reference to the Dutel truice at this perind is made: "The Dutch were now left in sule possession of tho trade with Jepran ; and, since that time, it is well suown, their monopoly has never been disturlied. Their subsequent political intercourse has been limited to an occasional mission from Batavia, and the visits of the Dutch chief of the factory to Yedo, fomerly made annualiy but now once in four years. Charlevoix mentions embassies in $166{ }^{6} 4,1656$, and 1635 . It was while tife second of those misgions was at Yedo, that two thirds of that city and 100,000 of its 1 ppuiation were ciestroyed liy fire. It remalns to trace, briefly, the use the Dutch have made of the monopoly to which ties liave so long asplred. Of the assurtment

and value of their import cargoes, in the $\mathbf{1 7}$ th century, we have little or no account. Their returns had been In silver, chlefiy, untll 1641, when the directors of the Company suggested returna in gold. Japanese copper was at this time in little estimation in Europe, becanse little known; but afterward, on a rise in value, it hecane an important return. The first order for $\mathbf{2 0 , 0 0 0}$ piculs was sent out in 1655."

Various reatrictlons and prohibitlons have been, from time to time, imposed npnn Dutch commerce by the Japanese authorities. The imports and exports were limited, and the number of vessels was finally restricted to four, three, and two, as before the late treaty. The profts realized by the Dutch from thls trade have never been accurately aseertalned. The author already elted, referring to the restrictions imposed by the Japanese government, remarks: "Under these circumatances, the trade, which had yielded an annual profit of 500,000 to $\mathbf{0 0 0}, 000$ floring for the 80 years previous [to 1714], wonld no longer pay the charges." Efforts have heen made, at different periods, by the Engllsh and French governments, as well as by that of the United States, to open commercial intercourse with Japan; but, with the exception of the very limited concessions granted by the treaty of 81st March, 1854, between the United States and Japan, and concesslons nearly similar allowed to the British, by treaty, subsequently ratified, and the privileges granted to the Dutch by the treaty of 1855 , without success. Some years since, Russia endenvored to establish commercial relations with Japan; but the proposal was declined, and the envoys were ordered aot to return again on pain of death.

The treaty, already referred to, between the United States snd Japan, which was concluded March 31, 1854, ratified August 7, 1854, exchanged February 21, 1855, and proclaimed June 22, 1855, is as follows: "The United States of America nnd the empire of Japan, desiring to establish firm, lasting, and sincere friendship between the two nations, have resolved to fix, in a manner clear and positive, by means of a treaty or general convention of peace and amity, the rules which shall in future be mutually observed in the intercourse of their respective countries ; for whlch most desirable object the President of the United States has conferred full powers on his commissioner, Natthew Galbralth Perry, special embassador of the United States to Japan, and the august Soveroign of Japan has given similar full powers to his commissioners, Ilayashl, Daigaku-no-knml, ldo, prince of Tals-Sima, Izawn, prince of Mima-sakl, and Udono, nember of the board of revense. And the said commissioners, after having exchnnged their sald full powers, snd duly considered the premises, have agreed to the following articles: Article I. There shall be a perfect, perinanent, nad unlversal peace and a sincere and cordial amity between the United States of Amerlea on the one part, and the einpire of Japan on the other part, and between their peoplo respectively, without exception of persons of places. Article 11. The port of Simoda, In the principality of Idzu, and the port of Hakodale, in the principality of Matsmai, are granted lyy the Japanese as ports for the reception of American ships, where they can be supplled witi wood, water, provisions, and coal, and other artleles their necessities may requiro, as far as the Japanese have them. The time for opening the first-named jort is inmediately on slgning thls treaty; the lastnamed port is to the opened immedintely after the same day in the ensuing Japanese year. [Note.-A tariff of prices shall be given by the Japanese officers of the things which they can furnish, payment for which shall be made in gold and sllver coln.] Article III. - Whenever slips of the United States are thrown or wrecked on the coast of Japan, the Japanese vessels will assist them, and carry their crews to Simoda, or Hakodade, and hand them over to their coan-
trymen appointed to receive them; whaterer artieles the ahipwrecked men mey' have preserved shall likewise be reatored, and the expenses incurred in the rescue and support of Americans and Japanese who may be thus thrown upon the shores of either nation, are not to be refunded. Article 1V.-Those shipwrecked persons and other citizens of the United Stutes shall be free as in other countries, and not subjocted to confinement, but shall be amennble to just laws. Article V.-Shipwrecked men and other citizens of the United States, temporarily li..ng at Slmods and Hakodade, shall not be subject to anch restrictlons and confinement as the Datch and Chinese are at Nangasaki, but shall be free at Simoda to go where they please within the llmits of seven Japanese miles (or ri) from a small island in the harber of Simoda, marked on the accompanying chart hereto appended; and shall in like manner be free to go where they please at Hakodade, withln the limits to be defined after the vlsit of the United States' squadron at that place. Article VI.-If there be any other kind of goods wanted, or any bisiness wbich shall - quire to be arranged, there shall he careful dellbusatinn between the parties in order to settle such matters. Article VII.-It is agreed that ships of the Unlted States resorting to the ports open to them shall be permitted to exchange gold and silver coin and articles of goods for other articles of goods, under such regulations ns shall be temporarily eatablished by the Japanese government for that purpose. It is atipulated, however, that the ahips of the United States ahall be jermitted to carry away whatever artlcles they are unwilling to exchange. Article VIII, Wood, water, provislons, coal, and goods require $i$, shall only be procured through the agency of Jnpav:ese officers appointed for that purpose, and in no other manner. Article IX.-It is agreed that If at any future day the government of Japan shall grant to any other nation or nations, privileges and advantages which are not herein granted to the United States and the citizens thereof, that these same privileges and advantages shall be granted likewise to the United States and to the citizens thereof, without any consultation or delay. Artlcle X.-Shlpe of the United States shall be permitted to resort to no other ports in Jupan bat Simoda and Hakodade, unless in distress or forced hy stress of weather. Article XI.-There shall be appointed by the government of the United States consuls or ngents to reside in Simoda, at any time after the expiration of 18 months from the date of the signing of this trenty: provided that either of the two governments deem such arrangment necessary."

The harbor of Simoda is near the south-eastern extremity of the peninsula of Idza, and affords a safo and capacions anchorage. Hakodade lies on a spacious and beautiful bny of that name, and, for accessibility and safety, is one of the finest in the world-capatie, says the Ifong Kong Register, of holding all the fleets of the Paclicic in security.

Port Regulutions of Simoda.-Three natives havo been appointed pilots for American vessels entering or departing from the port of Simodn, and the follewing rates of pilotage linve been established by the pi p.r authorities, viz.: Vessels drawing over 18 feet, pay \$15; over 13 feet, and less than 18 feet, 10 ; under 13 feet, $\$ 5$.
"These rutes shall be paid in gold or silver coin, or their equivalent in goods; and the snme slalil be paid for piloting vessels out, as well as into port. When vessels anchor in the outer roads, and do nct onter the inner harbor, only half the above compenation shall be paid to pilots. A look-out place shall be established at some convonient point, from which vessels nppearing in the offing can be seen and reported; and when ono is iliscovered, making apparently for the harbor, a boat shall be sent to her with n pilot. And in order to carry this regulution into full effect, boats of suituble size and quality shall ulways bo kept in
readinesa by the harbor-maater, which, if neceseary, shall proceed beyond Rock Island, to ancertain whether the veseel in alght Intends entering the harbor or not. If it may be the denlre of the master of the sald vaseal tn anter the port, the pilot shall conduot her to safe amehorage, and, during her stay, bhall render every adolutance in hia power In faclitating the procaroment of all the suppliee, he may require. The prices fur anpplying water to American vessoln at Simoda - hall be 1400 eashe per boat-loed (the caaks being furnished by the vessel). And for wood delivered nn boand, ahout 7200 cash per cube of 5 Americsn feet."
is The foregoing In a full mmmmary of the concesalons granted to American Intercourse by the treaty with Japan of March 31at, 1854.' As a means of opening commerclal relations with that empire, its provisions have proved Ineffielent; bat, befo enubmitting any nocice of facts that have come to knowiedge of the Department relative to thla auhject, it is deemed appropriate to glve the leading provisions of the treaty entered into by Great Britain with Japan. The flrst articie of this treaty opens the ports of Nanfresaki and IIakoulade to British vessels to repalr and oistain aupplies only: It opena all parts of these ports; hut, an reapeets anchorage, vessels must conform to the instraetions of the iocal government. Safe and commodious piaces are to the dealgnated for the repair of vensela. Workmen, material, nind other necessary supplies to be furnished by the local government, in accordance with a tariff to be agreed npon, which shall regulate the manner of payment. All officieial communteation to the condueted In the Engtish language, as moon as the Japanene shnll have acquired a knowledge of that language. A place to be reeerved as a burial-ground for the Einglish at Medsuma Sitna, which will be Inelosed hy a stone wall and sultally protected. The second article stipulates that at each of the ports of Nangasaki and of Hakodude, the regalations of the port shall lee ohserved; but the Japaneso government wili ace that theso regulations ahall be sueh an to create no diffieulties and interpose no olstacle whatever to the general olject of the treaty, which is essentinlly designed to facilitate amirable relatlona letween freat liritain and Japan.
'ihe third artiele declares that only veasela in distreas or dismantled can enter other ports than Nangnsaki and IIskodade, without peraission of tho Japanese government; but shlpa of war possea, as a necesaary attribate of their public character, tho general rigit to enter all the ports of frienily powers; while, however, this right shall suffer no prejudice or restrietion, the vessela of war of her Hritanic majeaty will not enter any other than open ports, without necesnity, nor without offering proper explanations to the imperial anthorities. The fourth article provides that liritish ships and subjects in Japanese porta slasll conform to the laws of Japan; and that if any subordinate liritisit nuljects comonit offenses against tho laws, they shali le delivered to their own officers for punishment ; ani that if auperior officers, or commanders of shipa, siatait break the lawn, it will lead to the closing of the ports apecified: bat it is not intended liy this article that any acts of individuals, whether high or low, previonsiy unauthorized or sobsequently disspproved of by her majeaty the Queen of (ireat İritain, can set asife the convention eutered into with her majesty aione by his inperial highness the Emperor of Japan. The fifth article secures, in the fullent sense, to Hiritish shipsand anbjecta, in every port of Japan, eiticer now open or hereafter to be opened, an equaity, in point of advantage and accommodation, with the ships and aubijects or citizens of any other nation, witibut prejudice, however, to any peculiar privilegen hitherto conceded to the Dutch and Chinese in the port of Nangasaki.

- C00 oopper eash are equal to 43 centa (arbitrary value). The curreacy of Japaa is uimilar to ihat of China, to which 1 tanl -10 mace $=100$ eandareens -1000 cash $-3148 \mathrm{U} . \mathrm{S}$. eurrency.

If, therefore, any other mation or people be now, or hereafter, permitted to enter other perts thon Nangasakl and Hakodade, or to appoint conaula, or to open trade, or to anjoy any advantage or privilege whatever, Hritish ahlps and anhjects shall, as of right, enter apon, the enjoyment of the name. The alxth article declarea that the conventlon shall lie axchanged at Nangasakl, on behalf of her majesty the Queen of Great ifritiln, and on behaif of his highness the Eimperor of Japan, within 12 months from the 14th day of October, 1804 .

The governor of Nangaakil communleated, In Oetober, 1804 , to Sir dames Sterling, the following atanding port ragalations: Anriclis 1. Shipe ahall anchor within two sima, and there await the direction of the governor. 2. No tire-arms are to the diechargeit. 3. No permon to land on any of the lalands. 4. No moundings to be taken, nor boate to be puiling about. B. Nhould any communications be desired, a loat of the upper oficers shall be called; hut no communleation shail be beld with meprhant boata, and no exchange of articles take place, or trading of any sort.
The above being, according to the law of Great Japan, all commanders and other officers shall obey the same, and oridera shall be given to the erow that the aforesald law shall not le broken.

An arrangement, maile aubsequently to the conventhon with (ireat Britsin, requires that liritish ahipa, intending to visit Japan, shall be provided with a document in proof of their nationality, and as a eheck upin the conduct of vessels in Japanese ports; end her majesty'e guvernment hus directed a form of certiticate of registrution to be adopted, which han treen accepted as antisfactory liy the Japnnese authoritien; nnd merchant ahips arriving in Japanese ports are to al himit their certilicate of registration to the officers to be appointed by the Japanese authoritien, and to permit theur to make sueh extracts from it as may seem grod to them, lefore such alips can be admitted to olitain repairs and supplies. Iler inajesty's ships of war are not to be provided with such doenments; but the ofticers in cominand, npon proper apptication, will afford all reanonable information regaroing their ships.

Holland has also recently formed a provisionai treaty with Jupan, but it is a+ated that tho Duteh government withholds it from publication. The singapore papers give tho following summary of its provisions: "The Dutch are no longer linited to Decima, but may freeiy remort to Nangasaki nod the immediate neighborhood. The inland of Decima is plaeed at the disposal of the Dutch, and tho buidings thereon sold to Ilolland. This island will serve as an entrepit for the Buteh, where they can land their goods without payment of daties or aearci. The keys of the watergates and of the entrepot warehouses will remain with tho Dutch chief factor. The usunl duties will not be exacted until goods are brought to Nangasaki. The trade with the Datef government remains on the former footing. Free exercise of religion and right of burial is canceded to tho Dutch. There shall exist, henceforward, freelons of communication with other ships entering or depurting from the roads. A detinitive treaty is to ho hereafter concluded; hut, until that takes jplace, the jresent agreement is to beconsitered in furce."

The atove in, in substance, all that has been published relative to the conveotion bet ween Iinitund and Japan; but, until the definitive treuty, uiluded to in the last paragraph, shall have been entered into, the ir.tercourse lietween the two countrien will be of the same limited character that has hitherto existed. Indeed, the Japaneso evince an almost invincilite repagnance to opening their ports to foreign commerce, and, In their interpretation of treaties, concede nuthing theyoud what is aprecilicaily granted. Thus, the term "temporary residence" in the treaty with the United Statef, is so strietly interpreted that citizens of this country, who desired to land at one of the open ports,
were requ atato how tions wow sutilielent case, the been to ro for the pu of whalee the exact shore for permitted On the W'iluningto nectleut, a misceilane at that por 20 ottieors husiness tl formed the modities, w for goods irmed the people at la that the em cial interco ers. To Amerie iug been the with Japan. world, partica wentern Alue fishery in the airable to hav of Japan. gland, Russi success, when resolveif 10 m aceordingly ti mand of Com sailed from N thu 24th of N possible by th arrived in the with four vens war, and after ter of the Pres in the spring. Choo and Chi
were required, before being permitted to go ashore, to atata how long they intended so to reside I and intimatione ware given that "four or five days" would be sulticisnt to satiafy the words of the treaty. . In one case, the applicants, whose olject appeare to have been to reaide permanantly at one of the open ports, for the purpose of establishing a dépit for the aupply of whaleships, were informed that, until they atated the exaet number of days they intended to stuy on ahore for "temporury residence," they would not be permitted to aleep one night from their veasel.
On the 17th Auguat, 1855, the Ameriean achooner Wilmingtom, Brovn manter, of New London, Connecticut, arrived at Simoda from Hong Knng, with a misceilaneous cargo, anpposed to be auitable for trade at that port. Shortly after emating anchor, some 15 or 20 oflicers came on board, and desired to know on what business the vessel came inte port.. They were informed that she brought a cargo of Americun co moditiea, which the captain wiahed to sell or exchange for gooda of Japanese manufucture. . They then ininrmed the eaptain that they could net trade thut the peopie at large would be much pleased to do so, hat that the omperor had pesitively prohibited all commerciai intercourse, under penalty of death to the offiendsca. A letter was addressed to the governor of the eity of Slmoda, which way returned tin the aane onveiope, with is verbal message to the effect that he would not be permitted to land a single article for trade, nor could he prosent any for trade on shiplourd. Wood and water (the former at $\$ 5$ per cord) were offered; but fresh provislons, It is stated liy the captuin, were refused. The veasel was, night and day; surruunded by guard-hoats until she cleared from the bay. The Wilmington then proceeded to Hakodnde, where sha met with more liberal treatinent, inut permission to trude was refused, as at Simoda. The only provisions to be parchased consiated of heana, turnips, scallions, and such vegetables. T'to catcie the Japanese look upon as sucred, and will $n$ ither sell nor kili theu. The captain and crew were pr initted to go ashore and visit wherever they pieased. They were slos excmptad from the vigilunce of guard-trouts, as well as from the constant attendance of g uards, us at Simoda.
It seems evident, therefore, so far as appears, that, uader the present treaty, the Japunese government wiii not permit any trade to be carried on; nor is there much probability of the treaty receiving any nore fiberal interpretation than that siven to it hy the oficinis at Simoia. It is, as tho dupanese aver, s treaty of peace and amity only, strictily guarded against any concesaion or ciuuse under which American citizens could claim the privileges of general trade.-Com. Bel. U. S.

To America andoubtedly lelonga the eredit of haviug been the first to re-establish commercial relations with Japan. The increased traffec in this part of the world, particulariy between eastern Asia alld northwestern America, and the importance of the whalofiahery in the Jupanese seas, hud rendered it very desirubie to have free access to at least some of the ports of Japan. Repented attempts had been male by En. giand, Russha, and the United States, but without success, whell ut iength the United States' government resolved to make an effort worthy of the oliject, and accordingly titted out an expedition under the command of Commedore M. C. Perry. The commodore saited from Norfolk in the Mississtppi war-atenmer, on the 24 th of November, 1852 , to be followed ne soon as possible by the other vessels of the experlition. He arrived in the Bay of Yeido on the 8th of Juiy, 1853, with four vessele, two war-steaners, and two sicops of war, and after some negotiutions he deliverod the lotter of the l'resident, promising to return for an answer in the spring. The rest of the year was apent at Loo Choo and China, and on the 12th of February, 1854,
the squadron reappeared in the Bay of Yoddo, having ty this time been Inereased to nine vessele, three steanc-frigatea, four sloops of war, and two store-ahipe. A treaty. was concluded on the 81at of March, in terna of whleh the porta of Simoda in the island of Nipon, and liakedada in Yeaso, are opened for the reception of Amariomn ahipe, where they will be aupplied with wood, water, provisions, coal, and other articies, so fur as the Japanese possees them. Ships in distress, or from stre 18 of weather, may onter other, porte ; and ueamen shipwrecked on any purt of the coast aro to be alded and carried to either Simola or Hakodade. Shipwrecked seamen and othera temporarily residing at these ports, are, at Simods, free to go any where within the linits of 17 Engliah miles from a amail Islund in the harbor, and in like insnner at Hakodade within 12 milies. Ships of the United States are also permitted to trade under such reguiations as shali be temporarily eatublished by tine Jupanese government for that purpose. All the privilegea that may hereafter be granted to ally other nation are to be accorded to the United States. On the 7th of September foliowing, an English aquadron, consivting of a frigute and three steamers, under the command of Rear-Adinirul Sir James Sterling, entered the hurbor of Namyasaki. The primary object of this vieit to Japan was to seurch for Russian vesseis, but it was aiso intendod to attempt to establiuh friendiy relations between the two nations. $A$ treaty was entered into, the effect of which is to open absoiuteiy and at once to British ships of every description, for effectlng ropuirs and obtuining fresh water, provisions, and other suppliea, two of the most convenlent harbors In Japun-Nangasaki and Hakodude; to open inferentially to Britiah ahipa in diatress any other port in Japan it may be expedient for them to seek ahelter in; to secure eventually to British ships and aubjects in every port of Japan which may hercufter be open to foreigners, equal advantages with the ahips and sulijects of the most favored nation, excepting only the advuntsges at present accorded to the Dutch and Chinese. It imposes In return for these concessions, no other obijgation on Britisis ships and sulijecta than that of respectiog the luws and ordinances of the ports they visit. More recently the Russiuns have succeeder in obtaloing a similar footing in Japan. See Eincy. Brit., 8th. edition; Ifuxr' M Mer. Mug., i., 208, xxxi., 234, 6:6, xxxiv., 120, 742 \& Nor. Am. Rev., x., 83 (by N. Hales); Quar. Rev., xxii., 107, iii., 159, vi., 357 ; l'euny's Japan Esped., 180 H ; Living 1 ge , x., xiv., xxlil.; De Bow's Rev. ix., 44 .

Japanned Wares (der, Japanische vare; Du. Japanach lukwerk; l'r. Marchandises de Japan), articles of evary description, such us toa-trays, clockdials, candiesticks, suuff-boxes, etc., covered with conts of Jupun, whether pluin, or embellished with painting or gitding.

Japanning, aspecies of lac-varnishing, in imitation of the hacquered waro of Japan, whleh, with that of China, is esteemed the best iu the worid. The ware muy be lacquered upon wool, metal, or papier-maché grounds. A description of the procoss as practiced in China may serve to expluin tise nources of eupeciority. The urticle, if of weod, being inade very dry, light, and smooth, is primed with a mixture of ox gall med rottenatone, which is rubbed stnooth before the varnish is appied. The varnish in composed of 605 gruins of gumblue in 1200 grains of water, to which are sided is grains of oil of Camellic sasnnqua, pig's gali, and is grains of rice vinegar. The ingredients are weli mixed in full daylight, when the varnish graduaily doepens into a brilliant bhack. A very thin cout of this varnish is ar, cied witin a hat hair brush. The article is ieft in a steamy heat, und is then rubbed down in water with very fine pumice. A second coat of lac-varnish is next nppilied, and the polishing is repeuted, which two operations are continued until a perfectly oven and brilliunt surface is
attained, a finar quality of lac being uned for the later coats, of which thera are never lean than three; nor more than 18. The object is ornamented by an artist, who drawa the design in white lead, engraves it, and Alis up the details, The article is next painted with the camphorated lac of Kouangenl, which servea an a bagis for the gilding. It in eompleted by vurninhing.

In our method of japanning, the "ood intended for the loest works ia thoroughig dried, since any warping or ahrinking would be fatal to the finislied aurface ; for which purpose well-seasoned wood is cut nearly Into the required forma, and exposed for eeveral daye to a gradually increaning 7.ent in the japanner's stove. The articien are then finished as to form, and are again stoved, after which the cracks are atopped with putty or white lead. For black japanned works, a ground of ivory-black mixed with dark colored animè varniah is applled. This in dried in the stove, and conted with varnlah three or four times, the work being stoved between every two conta. For colored grounds, the varnish mised with the proper color is lald on in one or two coats, and the work in completed by several succeasive varnishinga and dryinga. Ordinary painters' colors ground with linseed oil or turpentine and mixed with anime varniah are employed for various black op brown anrfaces with gilt edges, imitationa of marble, fiae-grained woods, tortolse-shell, etc. The colors mostly used are flake-white or white lead, I'russianhise, vermillion, Indian-rell, king's yellow, veriligris, lamp-black, and the various tints prowluced by their almixture. Tha varnishes used are copnl, seed-lac, anime, and mastic. The lac varulsh is the best for hardnese, but its color prevents its use for delicate grounds, so that for such parposes it is either mixed with gum varniah, ar enpal varniah is insed inatead. Copal or animè sarnish made withont cirlers is applied, in from two to aix coats, after the color has been laid on. See Vanmint.
Japanners sometimes use a priming of sise and whiting, which is laid on with a brush, and left for a day or two to dry; it is then mades smouth by rubbing with rushes and a wet cloth. When this is quile dry; the grounds are laid on, and finished by varnishing and polishing with rottenstone, or in the case of a white groand, with putty or starch, and oill. It muxt, however, be remarked, that a priming, or artificially perpared gronnd, la oljectionable, the japunning leling uore liable to crack than when executed on the actual surface of the object itself. A gold ground is formed ly varnishing the work with Japanner's gold slze, and when nearly dry, lint still clammy, covering it with gold duat applied on a piece of wasio-leather ; the effert of auch a ground when bighly varnished lis very brilliant. dapan work is ornamented with drawinga of engravings, on the princijle of tranafer, for whleh purpose the engraving is printed, or the drawing executed on fine paper previously prepared with a cunt of isinglasa or gum-water. When this is dry it in placed face down ward upon the japan ground, which is covered with a thin coat of copai yaruish. A pponge dipped In warme water ta then applied to the back of the paper, which dissolves the isinglass, loosena the paper, and leaves the print on the work. Ancther method is to execute the print on an elastic composition of gluc, etc., wbich receives the impression well, and can te luld down at once on the japanned surface. The whole of the processes require so much drying, that ntoves are requiwite to hasten the work.

The great demand for japanning is for works in papier machs, to which article we must refer for further information on the subject. ('ommon articles of furniture are sometimes suid to be japanasel, therely lmplying that they are more duratile than common painted articles. The term as thus used is, howover, incorrect, since the eolors employed on such common wouks are only mixed with turpentine instead of oll. For japanning works in metal, they are cleaned with
turpentime to get rid of greane or oll, unlers the oll whonld be linseed, in v hich case the articlem are stoved until the oil hecomes quite hard. Japanning is then performed in the mala manner.-F. B,

Jagper ((Jar. Jaapi: ; Du. Jasin; Yr. Jnope; It. Diacpro; Sp. Jaspe; Rus. Jushma). This atone is an ingredient in the comprosition of many mountains, It occors uenally in large amorphona masaes, nome. timen in round or angular pieces; its fracture in conch. oldal ; specitle gravity from 2 to 27. Its colors are various; when heated it does not decrepitate; It is usnally divided into fonr apecies, denominuted Egyptian jaspar, strjped jasper, porcelain janjuer, and com. mon jasper. It la sometimes employed by jewele ra in the formation of seals.
Java, the firat in importance, although only the third in magnitude of the lalands in the Indian Archi. jelago, tlea bet ween east long, $105^{\circ} 12^{\prime}$ and $114^{\circ} 4^{\prime}$, and south lat. $5^{\circ} 52^{\prime}$ and $80^{\circ} 40^{\circ}$. In form it is long and narrow, being 666 miles $\ln$ length from east to west, by from 56 to 136 miles in breadth. Aren 60,260 square miles. To the north-west it is parted from Sumatra hy a strait, at its uarroweat part only 14 milies wide, and with islands between ; and to the east from Ball, by a strait of no mow than two mllea broad. On its low, and in mome measure sheltered north coast, Java has a good masny islanda, by far the largest and mont impertant of which ia Madura, sepa. rate from it by atralt at one part only aboat a mile wisle. On the bold preeipitous south coast there are very fow islands, and only $t$ wo of a conaifleralile size, Ihanon and Kambanagan. The coast line of Java, which is about 1400 English miles in extent, has muny bays on its northern const, but it is not deeply, renetrated by any one of them, so that it has properly no harbor hut one, that of Surabaya, formed bet ween the nain island anil Madura, where the atrait that dividen them lis still narrow. The acuthern coast is atill less indented. Here there are two harlors only, Pachitan -inconvenient and unsafe-and Chalachap, formed bet ween the main island and Kambangan, both out of the way of intercourse, and little frequented. On other parts of the sontis coast there is no sufe anchorage, while dangerons surge rolls in on the shore in ail seasons. With the ningle exception named, the prorts of the nothern eoast are but open rondsteads, with good anchoring ground; lut the want of land-locked harbora in not felt an near the equator, where hurricanes are never experienced, and where the weather is only eccensionally tempestuous at the change of the monsoons.
The physical outline of Jaya may he divided into five different sections of varions breadtha. lleginning from the western ond and following the line of the northern coust, the first section ends with the eastem side of the bay of Bataria. This la alout 75 miles in average treadth. The recond extenda enst as faras Cheribon, in long. $108^{\circ} 36^{\prime}$, and is abont 93 aniles broad. Both these divisions are mountainons, the mountains heing of leas elevation than in the other parts of the islund, but loore crowiled, and with narrower valleys. 'They conatitute the proper country nf the Sundas, who speak a distinct language, and are less adranced in civilization than the Javanese, the nation which occupies all the rest of the inlind. The thinl section extenda from Cheritoon to the western sile of the promontory of Japara, in aloout long. $110^{\circ}$ $30^{\prime}$, und its breadth does not exceed 50 miles, the ialand belng greatly narrowed by the bay which ex. tetrds for 140 inlles from the point of Indramaya to that of sapara. 'The fourth section exteads from the promontory of Japara to that prortion of the ishand which is opposite to the western end of Madura, sad this has an average breadtls of $\mathbf{1 0 0}$ miles. The fifth gection embraces the remainder of the island, and is no more than 50 miled in breadth. In the three last sections, the mountains are of greater elevation, the

pisina more speciout, and aiong their northern coanta there runa generally a belt of ailuvial land varying from 5 to 15 milas $\ln$ depth.

The geological formation of Java in eminently, olcanic. A range of mountains runs in a longitudinal direction through the centre of Java, the peakn of which vary from the height of near 4000 to near 12,000 feet abova the level of the sea. No fewer than 46 of those peaks are volcanoen, 20 of which are in a state of greater or lene activity. The craters are pumetimes of great extent, and their walls illuatrate the structore of the mountains, which in either vertical and irregulariy columnar, ar disposed in oblique or horizontal atrata.

Java has no extensive collection of water, alt or freah, and no large lagoons connected with the sen. Thers exist, however, a few heautiful mountain Iakes. One of those lies within the mountain WIlls (" the green"), which parts the plains of Madiyun and Kadiri, and is known by the name of GAbal. There is a secoad in the proviace of Cheribon, known hy the Sanserit name of Talaga, or the reservoir 1 and a third in In the province of Paouruhan and called Banunila, or the blua water. In Java, however, there are aeveral extensive marshes, which, in the season of the rains, become lakea, are navigated, and have fisheriea. The rivers of Java, especially on its northern aide, are numerous; but from the form of the island, they are of small size. None of them are navigable for veasels of burien, and few even far boats beyond the rench of the tide. They are all, more or less, obstructed hy mud or sand-hars at their mouthe. Though of Ittle utility for trade, they are oxcellentis adapted for irrigation. Few of the rivers of Java have specifie names, but take their appellations generally from the places they pass by, and change thein with every new one, a circumstance which may, perhaps, be owing to their small size and great number. There are, however, a few exceptions, in nome of the larger, ne the Saraya, a river of the province of Banumna nnd the Praga, with its tributarien the Elos Rivers of Kadu, all debouching on the southern coast.

Climate. -The cllmate of Java is what may he expected in a natrow sea-girt conntry between five and eight degrees sonth of the equator, having plains almost on a level with the sea, and inhabited land 5000 feet above it. The wet season begins with Octoher and ends with March, and the dry with April and ends with September. The monsoons are those of the southem hemisphere, the north-western corresponding with the wet season, and the south-eastern with the dry. The setting in of these monscons is irregular, and, even during their prevalence, there is aome try weather in the wet, and not unfrequently rain in the dry. At the equinoxes, when the monsoons change, the weather is very unsettled, and most tempestuous at the commencement of the winter solstice in September and October. Thunder-storms are then frequent, and often destructive to lifo. Jand and sen-breezer are experienced within 15 miles of the northern and southern coasts, and in particular loenlities of its eastern and narrowest extremity the aouth-eastern monsoon blows with great force across the whole islind. The temperature, so far as the scasons are concernei, is equable, Near the ievel of the sea, which is that of the great alluvisi baud, which runs along the northern side of the island, and of the wide plains of the interior, Fahrenheit's thermometer selloun falls below $90^{\circ}$, and seldom rises above $90^{\circ}$. According to the elevation of the land, every variety of temperature is experienced from this last to $5^{\circ}$ below the frec.ing polnt. Snow never falls, even on the highest pesks; but on these at the height of winter, in July and August, ice a few lines thick is formed, and hoar frost is seen every morning, calied hy the nativee, poison-dew (àmbun-upas), irom its pernicious effect on regetation. In the Inhabited mountain valleys, at
the height of 4000 feet, the thermometer is meally about $20^{\circ}$ below what it it at the leval of the sea. Here is axperienced a climath agreeable and congenial to the European conatitution $;$ and here, the come, fruits, flowers, and esculent vegetables of temperate regions, hava long been acelimated. In point of salubrity, tha climate of the high lande of Java is unexcoptionable, and that of the low, containing the maas of the population, in generaliy equal to that of any other tropioal country. In a fow apota of the alluvial band of the northern coast, auch as Batavia and Cheribon, deleterioua malaria have oceasionally provalled, ariaing from tha naglect of canals and water-cournen, or from these being obstructed by voleanie dobbris; but these are exceptiona, as are aiso in fow forest tracts of the interior of the isiand. The extenaive cultivation of rice by Irrigation might have been expected to genererate inaiaria, but such is not the case, nor has it ever been alleged to have done so in the country italf.

The elephant is not found lu Java, nor does there exist any evidence of its ever having heen indigenous, and thia is the more remarkable as it in abundant in Sumatra. The anlmal, however, wan known to the Javanese for ages, and was probably lmported ocensionaily for the use of its princes. Java has one rhinoceros peculiar to itself, and differing even from those of Sumatra. It is an animal easily tamerl, and when so, gentle in lis hahits. Desides the domesticated hog, Java has two wild species, the Sus verrucosun and Sus vittatus. Bith are very numerous, and their depredatlons are a serioun impediment to agricuiture.

A wild ox is found in the forests of Java, the same as that found in the peninsula and Borneo, but which is wanting in Sumatra. It is the Bon aondaicus of naturaliste. The Dutch naturalists inform us that all attempts to tame it have been vain, as in the case of the buffalo of the American prairies. According to the Javanese, however, it will pair with the domestlcated cattie, producing a fertile offapring, to which they attribute the largest breed of their oxen. The buffalo, Bos bubalus, is found will in many of the foreats of Java, but considered by naturalists to be derived from individuals in the domestic state that had escaped from servitude. The horse nowhere existe in Java in the will state, but the numbers of this animal and of horned cattio in the domestic state throughout the island are very large, the Dutch returns reckoning the first at 320,000 , and the last at about $2,000,000$.

Fish are plentiful along the whole northern coast of Java, and a few species are of excellent quality, but, upon the whele, the abundance and the quality are not equal to those of the shores of the Stralts of Malacea. The frosh water fish are all of very inferior qually and no migratory species frequent the rivers for spawning as they do on the rivers of the eastern side of Sumatra. Shell-fish are very abundant on the northerr coast, especialty oysters of excellent quality, unt prawns, the last being much used by the people in the shape of the coudiment called by the Javancese trasi. The fisheries of the exposed southern coast of the island are unimportant.

Java, whether the Inhabitants be of the Javanese or Sunia nation, is peopled by the same race, the Malayan. This is characterized by a short and squat person, the stature being about two inches less than that of the European, the Chinese, the Hindoo, the l'ersian, or Arubiun. The face is rouad, the mouth whie, the cheek-bones high, the nose short, small, never prominent as with the luropean, and never flat as with the African negro. The eyes are always back, small, and deep-seated. The complexion is brown, with a shade of yellow, not so dark as with the majority of IIlidocos, and rever blacn as with some of them. Fairness is, indee c , in estimation with the Javanese and others of the same race. The hair of the head is abundant, always black, lank, and harsh, or at.
least never soft or silky. The halr on other parts of the body is either acanty or altogether wanting. The beard consista only of a few ehort straggling hairs, and there la none at all on the breast or limbs. The Javanese, personally, are not an agile people, and make very indifferent ruaners or wrestlers. As to moral character, the Javanese of the present day may be described as a peaceable, llocile, sober, simple, and industricus people. The practice of running a muck, so frequent with the other cultivated nations of the Archlpelago, is of very rare occurrence with them. Java was populous, nad to a considerable degree civilized for many ages before it was known to Europeans. De Barros describes the Javaness, at tha arrival of the Portuguese, as what they still are, "the most civilizel people of these parts" (gentes de mais policia). They were then found carrying on trade from Sumatra to the Moluccas; they furnished breadcorn and manufucturea to the less advanced nations in return for their rude proluctions, and they hat effected conquests or settlements in Malacea, palembang in Sumatra, and in the two fertile islands of Bali and Lomboe. In fact, it is cortain that the Javanese were, at this time, a far more civilized, probatly even a more numerous people than either the Mexicans or Peruvians, who became known to Europe nearly at the same thene. The essential part of Javanese cirilization seems to be of native origin and to have eprung up in the island itself, although it sulisequently received considerable accessions ly interceurse with Hindooxtan.
With the exception of the preple of BaSi and Lomboc, the Javanese are the only nation of the Archipelago that can be said to io almost exclusively agricultural. With the exception of the fishermen of the northern coast, and a snull proportion of artisann, the computed ten millions of the population of the island is directly or indirectly engagal lu agriculture, and have made a respectable progress in it. To reguInte the jrocessen of agricultare, the Javanese have a rural calendar atill in use. This consists of a year of 360 days, beginning with the winter solstice of the southern hemispliere in the end of , lune, and divided Into twelve seanons of uneyual length, varying from 23 to 41 daya cach. It detalls the times for clearing and preparing the land, for sowing, for transplanting, and for reaping the diftierent crops. The native terms by which the seasens are uamed, are, for the most part, the ordinal numbers of the vernacular hampuage, while the alaptation of the seasons to the latitude of Java sufficiently show that this calendar ia a Javanexe invention, and not borrowed from straugers. I rrigation, in to far as the rice crop is conconned, multiplies the pre luctive jowers of the soil from tive to tenfold, accorling to the abundance of water, and the facility of uxing it, and has been carried to such an extent in Java that the majority of the armble land of the ishand consists of rice tields. The perennhal streams and rivers, as they descemel frum the monntains, are, by moans of enilankmente and trenches, diverten into small tielids surrounded ty low dikes, wheth man le flocked or itruined at pilanure. The pirneess of forming such lands is expunsive amd haterions, hut when once formell, they are casily presersel. When the water for irrigated lands is sum sently ahoundant and comtinuons, two crope of rice are riiseld within the year, and in some cases even three within lifteen monthe, the sunt being hot rnough to ripen rive in every meason. The hustmmiman may follow his convenience as to the time of sowing, and in contignons fields may be seen at once sowing and reaphis rice, with every inturnediate ntage of the gresth of the phant. When the water is not sufficently copisus for t..0) crops, the rice is sown in the wet ur het sersum; and in the dry, or colit, erops consilerind of kecumbary value are prouluced, nuth an pulsen, vilogiving plant, and cotton. No manure is over applied to irrigated lauds, wor are fallows practiced.

Dry or upland arable is of small value compared to irrigated land. On the best dry lands rice is occasionally grown, but more generally these lands are used for such crops as pulses, oil-giving plants, cotton, sugar-cane, and tobacco, and on the mountain-slopes, at an elevation of 2000 and 3000 feet, for coffec. In the moat fertlle parts of Java, which, from the neighborhood of the high mountains, are usually also the moat picturesquo, the scenery is at once agreeable and magnificent, and certainly fer grandeur and beauty excels all that may be seen, even in italy, that country which in aummer hears the nearest resemblance to Java. In such aituations we have movntains 10,000 fect high, cultivated to half their height, the valleys below having all the appearance of a well-watered garden.
When Java frst became known to Europeans, its prineipal agricultural prolucts were rice, pulses, sesame, ground-pea, und other oil-giving plants, indigo nad cotton, with palins and indigenous fruits. European intercourse has added to these, maize, tolnceo, and coffec. The quantity of its great stinple, rice, which it produces, can only be estimatel. With the exception of $n$ small quantity of maize, rice is the only bread-corn of the davanese; and, therefore, if we take the consumpticn per heal at a quarter, or 418 lhs., this, on a computed population of 10,000, (HM) , will make the total annual produce the same number of quarters. The export is, at present, too incensiderable materially to affect this computation, for in 1818 it amounted to no more than 217,000 quarters. Firem the first appearance of Europeans, and no doult for many ages before, Java was the greatest gramary of the other countrics of the Arclipoligno. Reeently the extensive culture by corvece labor ca such prod cets as sugar, coffee, and indigo, under an ille and permicius hypothesis that some peculiar commereial adsautisg to the State belonged to their culture, has greatly iaterfered with the production of corn. The expert of it has consequently diminished, mol the price materiully risen; the consequance of which has heen, that countrics immemorially supplied ly Jawa, now draw their corn from other phaces, such as Hali, Lematoe, Siam, and Arracan.

Mechanic .1rts.--The state of the mechanic arts among the Javanese is far bolow that of their agrienlture, but still in advance of that of the other nations of the Arehipelago; mul with the exceptiva of textile falrices, not helow that of the llindoos. Atwit thity dillerent crufts may be enumerated as practiced mung: them, the most important of which are the hiseksmith or cutler, the carpenter, the kris-shoath maker, the coppersmith, tho golelsmith, and the putter. Buth bricks and tiles are, at present, largely made; and excellent bricks ure found in the remains of amy ancient temples, proving that the art of mandaturing them has been known for many ages. Coarse unhlazed pottery, similar to that if Ifindeontin, is aloo made ; and the names of the different surts all humg to the vermacular language. Heyon the manufueture of this coarene article, the davanese have me ahanced -all tha ir hetter pottery having been for ager feccived from C'hinal. Their skill In earpentry is displayed in bonse and boat building, in the falirication of agricultural lmphements, and of the hilts, shaft, and Renh hards of warlike we ponas. The urdinary ducll. ings of the peasantry consist of a rough frame of timleer, thateched on the coast with the leaven of the nipa palm, and in the luteriar with grias; having walls and partitions of split, flattened, and phated hambure work. They are always l, nitt on the kromut. The duelling of the upper chasess differ, chicels, in their greater rize, with the exception of ole patacen of the princes and higher notility. Muat-buiding in an art extensively practiced all along the northern const of hava. Their loats vary in form now ala, from mete fishing canoes to vesuels of tifye tons. The buildin'
of shlpe of Eurol Javanese. with the large size agricultur those of n rule.
The Jav ture that ples of the kiml of don or of embar country of ahle edifice abundant; tecture ceas medan struc constructed religion tow

The only text ton, rather a coa made from it is a other tine textul known as manut and preparing tl Iyring, are all e domentic operati, nutions of the Ar variety of colors consisting la weal stripes, cheerkere with the other to Javanese, Anotl dists la covering cloth not fintening
of ships is, at present, carried on under the dlrection of Europeans, the workmen, however, being all fivanese. When Furopeans became first acquainted with the Jsvancse, they were possessed of vessels of large size, well entitled to the name or bhips. The agricultural implement of the Javanese are, like those of nearly every other Asiatle people, simplo and rude.

The Javanese of the present day have no architecture that deserves the name, and apart from the temples of their anclent worship, no relics remain of any kind of domestic architectore, of bridges, of reservolrs, er of embankments of rivers, such as are found in the country of the II indoos. The remains of the remarkable editices connected with the IIindoo religion nre abundant ; but it is singular that an improved archltecture eensed with that rellgien, and that ne Mohammedan structure of solid materials or benuty has heen constructed sloce the adoption of the Mohammedun religion to ward the end of the 15 th: eentury.

It is in working the metals, however, that the Javanese have mest excelled, and as they acquired this comparative excellence withont possessing any of the metals themselves, but having all of them 1 m ported, the faet may be censidered as evidence of comparatively nulvanced eivllization, Aceording to the Javanese, the first rank among artisans to to be ascribed to the hlaeksmith, or at lenst te the cutler. The most estcemed preduet of his skill is the dagger, the well known kris. Every man, and boy of 11, wears at least one kris as part of his ordinary dress, and men of rank two, and sometimes four. Even ladies of high rank oceusionally wear one. Swords are used only in native warfare, and are much less esteemed than the kris, the natienal weapon. The Javnnese spear, $n$ plain pike with an lron head, is a formidable weapon, from its long shaft of from 12 to 11 feet. Some of the Javanese krises, from their antiquity, nro highly nppreiated, and when sold bring enormeus prices. The Javanese had also, before the arrival of the Pertuguese, a knewledge of gunpowder nad artillery De Barros, in describing an expedition which invaded Malace in 1513, says, "that it was furnished with much artillery, made in Java, for," ndlds he, "the Jaranese aro skilled in founding or easting, and in all Fork in iron, hesides what they lave from India."
The davanese, although they manufneture pold and silver ornaments of considerable heauty, execute nothing equal to the tiligree work of Sumatrit. In works in brass, their chief excellence consists in the fabrication of musieal instruments, a full band of which is known thronghout the Archipelago by the Javanese name of gamilan. The instrmments consist chiefly of hars, constructed after the manner of the stancatia, or of the gong, a word which has found its way into our dictionaries and is gemuine bavanese. Some of these gongs have been maile three feet in dimmeter. Musieal instrmments of this descriptimare still manufactured in , hava, antl form no artide of exportation, as, indeed, they are sald to have done on the first arrival of the l'ortuguese.
The only textile material of native produce is rotton, rather a coarse article, and the only kind of eloth made from it is a stout durable calico, the muslins and other fine textures of continental Intia being unknown as manufictures. The processes of chaning and preparing the cutton, of spiming, weaving, and dyring, are all carried on hy women, and aro purely domentic operations, as is the case with all tho other nutions of the Archipelago. The usual mode of givinis rariety of colors to the web is the simplest possihise, conslsting in weaving the previonsly colored garm in stripes, checkeres or tartan patterms, su frequent with the other tribes, heing ngainst the taste of the davanese. Another mode pecculiar to this people consists in covering with melted wax the part of the eloth not intunled to be dyed beforo putting it in the
rat, the process necessarily requiring repetltion in proportion to the number of colors intended to be given. The only material, besides cotton, from which cloth is made by the Javanese is silk, and as the art of rearing the silk-worm has never been suecessfully introduced into Java, the raw material has always been imported. At present it is imported from Chins, an Inferi w allk, from which a coarse cloth is wrought with the same implements as that of cetton. Paper is a minufacture peculiar to the Javanese. It is of the nature of the papyrus of the ancients, and not of the beautiful and ingenious fabric which the nations of Europe acquired from the Arabs of Spain, and so long known to the Chinese.

Twe langunges are spoken in Java, of the same general strueture, belonging to the same elass of tongues, ad having many words In common, yet essentinlly differing from each other. These are the Invanese and Sunda. The Javanese has been immemorinlly a writton language, and ita nlphubet has extended to the Sunila language. Inseriptions on stone and brass enrry us back in its history to the 12th century. The written charneter is of twe descriptions, that found in ancient inscriptions, nnd that at present current. They seem, however, to be essentially the same, nnil not to differ more than black letter from modern manuscript.

Ifistmy. -Iava was unknown even by name to the eivilized nations of ancient Lurope, nnd even to those of the midille ages. It is first named by Marco Pele, who, in his junk voyage from China to the Persian Gulf, [assed through the northern part of the Archipelage about the close of the 13th century. Ile gives the name as Ciaua or Java, but his infermation being mere hearsay, is in other respeets erroneous Thus, mistaking prohably the products of its con. ce for its indigenous productions, he enumerates mong the latter eloves and nutmegs, nnd gold in quantity "exeeding all ealeulation und belief," nlthough it produces none at nll. No semuer had the l'ortuguese rearhed India by the Cape of Good Ilope than the name heenme familiar enough to Europeans. I. Barthema visited the island and remained fourteen days in it, hut his account is obvionsly fulse or worthless, for he deseribes parents as selling their children to be eaten by the purchasers, nid himself as puitting the island in haste for fear of beiniz made a meal of. Eiloarila ltarbosn, althougi ie ...d net visited lt, describes its productions, its trable, its manufactures of arms, and the prosons, dress, and manners of its Inhabitants, with mueh aceurner: ligafatta, although his information respecting it was leriv, ', as he tells us, himself, from the old pilot whe aecompanied him from the Moluccas, is even more correct than Barbosa. Hlow very little, however, was really known of Java hy the early Portugnese of Indin, is to be seen from what De Harros, master of all the Indian urehlives, says of it in lus Third lleade, published in 1668, no less than 52 years after the conguest of Malacea, and reveral years after his countrymen had visited China, dispovered dava, and traded with both. He makes it ronsist of two islands, Java and Suntla; and his work contains a ruile map, in whieh a great river, or ruther a strait of the sea, is represented as diviling them. This he calls the Niver Chiamo, which may pessibly bee the Chitambo of the Sumbas, 1 consideralile atream nt the eastern boundary of their conntry, a ond which, in their language, signitios, "bomblary water op river."

It was in the reign of the second prince of this dymasty, that the Dutch made their first appearanco in Java, umder lloutman, in 1595. In 1610 they ohtained permission from the Sunda prince of Jacntra, to build a fort near the spot on which now stands the eity of liatavia. In $16 i 9$ this fort was besieged ly the joint forces of the primers of Jacutra and Bantam, aided and nontted by the Bimglish. It was relievd by a Dutch tient under admiral Koen, and the assaliants defeated
and driven eff. It was after this event that the name of Batavia first given to the fortress was bestowed on the town. In 1628 Batavia was bealeged by a numerous army sent againat it by the reigning prince of Mataram, with the hepe of expelling the Dutch from tho island; but by the akill and courage ef the European garriaon, the rude and diaorderly host was baffled and routed. From this time the hlatory of Java is properly that of Its European conquerors. No consideralile territorial acquisition, hewever, was made until 1677, when the Dutch oltained a cession of the princlpality of Jecatra. From that time up to the year 1830, every war carifed on hy them with the native princes, whether as principals or auxiliaries, invariably ended in a cession of territory to the former; 80 that, at present, hardly one fourteenth part of the island is in possession of native rulers, and even that is entirely tributary and dependent. From the year 1674 to 1830 , the Juteh, as principals or auxiliaries, bave lieen engaged in no fewer than four great wers, all of long duration; nne of which, begun in 1674, lasted for 34 years; nne in 1718 , lasted for 5 yenrs; one in 1740, for 15 years; and one in 1825 , for 5 yeers; so that, of one thirl part, at least, of a period of 151 ; yeara, eivil war ragel in the island. The Duteh have divided their possessions in Java into 20 provinces or residences, each of whilh is administered ly a resident or prefect. Six of these belong to the country of the Sundas, and 14 to that of the Javanese. The two remaining native States, although ahministered by their own princes, are virtuall: Duteh provinces, and placed under the control of an officer, with the same title as those of the provinces under direct Dutch rule.

Population.-Attempts have heen made at various tlmes to estimate the tetal population of lava. The tirst of these was by the historian Valentyn, who estimates the population in his time (1726) nt $\mathbf{3}, 194,7501$; and including Madura, 3,591,500. This estimate was made shortly'after a civil war of five years' duration. In 1755, immediately after the finest parts of the island had been the theatre of a civil war of $15 y$ ears, an estimate was made which gave dava only $1,9.91,911$, or including Mailura, 2,001,911. This would neem to show that In less than 30 yeurs a der reawe had taken place exceeding a inillion abil a quarter. At the close of the last cencury, estimates of the population were made, which raised the joint population of Java and Madura to $3,559,611$. This was after a continued peace of 45 years; and whows, compared to the last estimate, an increase excoeding a million and a hulf. In 180 s another estimate was made, and by this, the number was maile $\mathbf{1 , 7 3 0 , 0 0 0}$. In $1 \times 15$ a crnsus was attempted during the temporary ocenpation of the linchlish, which raised the population of Java to 4,390, , $6 ; 11$, or ibrluding Madura, to $4,615,2 \% 0$. In Ised a rennus was taken which gave the pepulation at $\bar{\delta} 40: 1,7 \times 6$. 10 years later, another was taken, nal this raised the number to $7, \times 61,551$; and consequently gave a derennial incrosas at the rate of about it per cont. The census of $1 \times 15$ mate the joint prpulation of dava and Badura $9,5 \%,-81$, or of la va alone, $9,2: 5,0,03: 4$. The last census is that of 1862 , and this male the joint propulation of dava and Malura 9,9-13,075. The pepulation wawestimated as heing, on 11 st I lecember, $1 \times 5: t, 10,24,1,1000$.

Rrcentr.-The revenue of the Eurnipan governmont of Java is that of the whole island, inclurling Malura; excepting an to anme taxpa on consumptim, the terrlturies are subject to the two remuining nativen princes, embracing an area of $2 x 29$ mpare milow, and a reputed population of 850,000 . It is derlved from multifarions wources, and may be brietly desiribed, taking the thigures from the public necounts of $1 \times 49$, an given by Mr. Temminck. These may be sutlicient for a general view, as no material clinge has slace becon made in the fiscal nystem.
During the five yoars' temporary orcupation of Java ly the British government, from lxil to lelf, nearly
the whole ancient aystem of monepolies, forced deliverica, and corvée labor was overthrown, and free eulture, open trade, and free laber substituted for them. The merit of thls great revelution in the administration of the Jsland belongs to the late Sir Stamford Raffles, the British lieutenant-governor of Juva, under the supreme gevernment of India; and be carried his
bold ond valuable innovations into effect with a courage, industry, and perseverance entitled to the greatest praise. The finaneial aystem which he alopted, however, was not so happy, in so far as the land-tax was concerued, for it proceeded on the principle of the States entering directly into an arrangement with each individual occupant of a few acres, in the case of Java probably not fewer than half a million. Under this aystem, the tax was puid either in money or in kind, at the option of the occupunt; and being generathy paid in the later, it followed that the government was converted at once inte warehense-keepers, and cornmerchants. As in other territories on the concinent of Indin, the new nystem was found mischievons and impracticable. The land was over-assessed, and the hypotheticul fund-tax could not be realized.

After two years' trial, the Dutch commissioners who receivel charge of the island, judiciously abandoned the Ryotwarrie system of 1814, and arranged with the lumbs of the village corporations for the lamb-tas, leaving its distribution among the occupants to these corporations themselves. This natural and simple system, the only one suited to such a state of rociety as that of Java, after heing in operation for It years, was partially relinquished in 1832, and the old system of forced teliveries of certain agricultural product., and of corvíe labor in raising them, was, to slarge extent, rextored. The pretext for this was the hope of greater gain, and the assumption that, by the immemorial usage of the country, the State was entinled to take, at its option, its tax in noor. $y$, in kinl, or in corvé labor. U'uder this system, a ronsiderable portion of the tax on rent is remitted, and some of the best lamd with the labor of its peasantry las licen ap. propriated to the cultivation of products deemed jeculiarly fitted for the markets of Burope, sueli as coffece, angar, and indifo, with tea, cinnamon, and enchineal, and the lant three expressly introduced into the inland for this special purpose. By this impolitic measure, the Duteh govermment has become, once more, a cultivator, a trader, und necessarily, from its positinn, to a certain extent, a monopolist trader. The evil elfects of such a system on that wealth, which is the only sourre of pullic resinue, must be obsions th every enlightened ntatesman.
The actual monnt of the tax on rent or lamp-tax remainlag to the butch goverument. attor leductin: expmptions, was, in $1 \times 13$, allowing etot. to the thorin, Ex:L5,551. To this, however, is to bumbisi a sum of ceti,215 for the quit-ronts of land sold at varions times in fee-simple to buropems, with cother items of the mature of a land-tax, as the rents of certain tish-joms, or stews, amounting to $\boldsymbol{x}^{2} 2,30^{2}$, mar ing the tital limitax realizenl $\mathbf{E} \times 89,12 \times$. No acconnt is rableted of remissions on account of land appropriated to the cultur of proklace for government, but a fow farts are shated which will give a tolerable nution of the "atent to which this very barbarous system is carriol. The number of lavanese families fruna whith corvio lahw was exacted for the culture of collice, in In II, was sas, $2 x!$, and for that of sugar, intign, ant thoamum, itate,95is, making the total jumbine, exclusive of those employed in the cultivation of tea and cochineal, which is not atated, $701,2 \operatorname{ll}$ families, eguivalent to a papulation exceeding three millions and a hatf, or 10 patts in 100 of the entire population of the luroman protion of the ishand. 'The quantity of land sot anite for the cultivation of sugar, indligo, and cinuanon, amomed In 18.11 to 117.435 acres, abd this consisted of the rirhest irrigatel lands of the island, unally firling twa

yearly harvests, and equal in value to 10 times that of the average of all dry lands. The quantity of land, of an infarior deseription, appropriated to the culture of coffee and tea, all peculiarly fitted for the growth of maize, is not stated, but some notion of it may be firmed from the number of faniliss employed, as above given, and from the number of trees, which amounted in 1841 to $336,922,460$.
The taxes on consumption are multifarious, consisting of monopolies, excises, customa, transit and market duties, $t$ "xes on fisheries, and on the slaugliter of cattle. The chief monopolles are those of the vend of opium and salt. In 1843 the first of these smounted to $£ \mathbf{8} 96,630$, and the last to $£ 381,150$. The monopoly of opium is at once proluctive and unexceptionable in principle. That on salt is, of course, a poll-tax, which amonits to about 4s. on eneli family, and is only less onerous than our own in Bengal, from the salt of Java, the produce, chiefly by solar evaporntion, of its northern coast, being better, cheaper, and more economically distributed to the consumers than that of Bengal. Another monopoly is that exareised in certain caves producing the esculent swallow-nests, and this, as the birds ara the chief manufacturers, and strangera the chicf consumers, is an unexceptionable souree of revenue. In 1843 its amount was $£ 24,271$. The sale of timber from the teak forests, which are the exclusive property of the gavermment, constitutes another monopoly, of which the produce in the same yenr was $\mathbf{f}+2,141$. Theso difforent items make the total revenues arising from monopolies $£ 1,247,201$. In the publie accuants the monopoly of the tin of hanca is get down as Javanese revenue, and stated at the sum of $£ 250$,000 . As the revenue of Java nlone supplies the funds with which the mining and smelting is carried on, this branch is therefore correctly enongh incluled in the financiul resources of that island.
The export and import duties of Java $\ln 1813$, $\ln$ clading port charges, nmounted to E. $60,8 \cdot 10$; and the market, transit, null ferry dues, cane to £262,672. The tax on the slaughter of cattle was $£ 39,341$, and that on fiwh and fisheries $£ 27,911$. It is not necessary to add that the two last, as taxes on necessaries of life, are injurious imposts. A strange want of nttention to an obvious principle is evinced by the European goverament of Java, connected with the slaughter of catthe. The slaughter of the buflite is expressly prohitited, with the avowed olject of increasing the number of this animal for the tienefit of agriculture. The certain effect of the prohilition, however, must of course the the very reverse of what is intencled, for the rearing of these animals, is surely discournged, not pronoted, hy depriving the owners of a markec for the old, imperfeet, or superduous ones.
The expenses of the govermment of Java in 18.13, were given at tho sum of $\mathbf{E} 6,291,606$. Thus, then, the expenditure excreded the nmount of the taxes by the enomous shm of $\mathrm{EA}, 082,249$, to be made good hy the contingency of profits on proluce remitted to Jiuroper. The civil charges eame to $\mathbf{E 8 2} \times 7,825$, the military to fiso,310, the naval to $\mathrm{fl} 1 \mathrm{k}, \mathrm{k} 56$, and the extraorlinary expenditure, on necount of Sumatra, to $£ 920,0$ od The expeuse of dispatching government prombuce, exclusive of frelght nod charges, nmounted to f75,212, while the interest of the public debt, nearly all incurred in 27 years' time, eame to $£ 1,018,16: 1$, or about half of that of Iritish India, with $120,060,000$ of inhabitants, and which it has taken a century to incur.

Trude. - The intermal trale of Java embraces that of all the Netherland possessions in Indla, as it is the entrepit for the whole of it. It includes also a large remittance fur the public revenue in the sliape of prodace, as coffec, sugar, indigo, tin, and spices. Java and the other 1)utch possessions were delivered over by the Binglish in 1816, with a conshlerally Improved commerce, and cortainly, at all events, wioh a clear fied for the establishment of a liberal aystem. The
opportunity has assuredly not been taken advantage of. Double dutlas have been imposed on all gooda importad under a foreign flag, and other contrivancaa of the exploded mercantile aystem have been had recourse to, in ordar to give trade a direction to Holland, a costly expedient, injurious to the colony, and of no substantial valus to the mother country. In 1824, and within eight years after the restoration, a new East India Company was set ap as ons of these contrivances, the Handel Mantschapij or trading association. This association is merchant, shipownar, agent, for the sale of the government produce in Europe, carrier of this produce, and farmer of some branches of the public ravenue of Java. Originally, there was guaranteed to it a fixed and certain intersat on its capital stock, and even the sovereign of the Netherlands was a slaeping partner of it. The fulse hypothesis on which this retrograds policy was adopted, was a supposed nacessity for encountering what was called the overgrown capitala nnd enterprise of England and America, ns if the free capital and enterprise of IIolland, which, nnder greater difficulties had achievel much graater things, was unequal to carry on the trads of its own colony' without pillowing and bolstering.

The values of the exports from Java, and their destination, in 1816, 1836, and 1826, were as follows:

The previous statements show that the produce and trade of Javn have lncreased during the last 12 years with a rapidity unknown in any other colony, Cuba, perhaps, excepted; nnd if the resources and capabilities of this noble islnnd ba fully developed, it is quito impossible to say how much further her trade may be exteniled nnd her resources developed.

Principal Port.-Batavin, a city of the island of Inva, the capital of the Dutch possessions in the Fast Indies, and the principal trading port of the Oriental lslunds, lat. $6^{\circ} 8^{\prime}$ south, long, $106^{\circ} 50^{\prime}$ enst, on the north-west coast of the island, at the mouth of the Jacatra liver, on an extensive lay. The harbor lies between the main land and several sundl uninhabited islands, which, during the north-western monsoon, attord sufficient shelter and good anchorage. Population in 1842, 53,8t0, including about 3000 Europeans; the rest are Chinese, Javanese, Malays, etc. It is built on marsly ground, and intersected by canals in the Dutch style. It is defended hy a citadel and several batteries, and has a considerable garrison and marine arseual. Other authorities represent the population of latavia, in 1832, at 118,000 ; viz., Europeans, 3000 ; Chinese, 25,000; Aborigines, 80,000 ; Moors, 1000 ; Arabs, 9000 . Batnvia has n bank, with bramehes at Samarano nnd Smabnyo. This place was long considered very unhealthy, but has beon mueh improved hy ilruinage, Mean temperature of year, $78^{\circ}$.

The Jaratra is naviguble by vessels of 40 tons two miles inl-.$d$; ships of from 300 to 400 tons anchor in the hay, 1f miles from shore. lhatavin is the great commercial emporium of the Asiatic Archipelago, and atisorbs by far the greatest proportion of the trade of Java and Madura; the nunnal exports of whieh islands amount to $60,300,000$ tlorins $(\$ 25,123,000)$, and the imports to $30,000,000$ florins ( $12,000,000$ ).-E. 1 .

See Quar. Rec., vi., 487, xvii., 72; Munt's Mer. Mag., il., 328 , xxxili., 369; Eil. Rev., xxxi., 395.

In 1853 the foreign commerce of Java and Madura amonnted to $817,712,241$ for general imports, and to $28,677,183$ for exports. Tho imports and ex-
ports during this year exceeded those of the preceding year-the former $\$ 1,596,164$, or 9.9 per cent.; the latter $\$ 6,294,489$, or 21.83 per cent. ; thua exhiblting the most practical illuatration of the increasing trade of these rich and fertile ialands. The share assigned to
the Netherlands In the general trade of 1853 represented, for imports, 42.23 per cent of the whole; and for exports, 76.09 per cent. The trade with the United Statea with these lalands, during the same jear, was 1.89 of the whole.

Tariff.-The tariff regulations of Java nre ilvided into slx different classes, vlz. ; Class I relatee to dutien on wines and apirita, etr. ; clase 2 relates to duties on cotton and woolen goods; clabs 3 relates to aundry Imports from Europe, Anmerica, and the Cape of Grox Hope: class 4 prescrilees the dutien on the products of tho Indian Archipelago; clase 5 relates to merchandise lueing the proiluce of countries east of the Cape of Good llope, not Included In any of the foregoing clarspa; clans $f$ prescribes the export dutien lovied on the prolucts of Java. All these classes recognize a diserisination In favor of the luteh flag; but, nuder the treaty of Auguat 26, 1852, between the United states and llolland, these discriminatious ilo not spily io the Ameriean thag when importing or exporting from or to the ame places an the nuthunal flug. 'lise article, by virtue of which the vesnels of the I'nited Statea are equalizod with those of llolland, reads thas: Art. 11. "The alove reclpucal equality in relation to the flapg of the two conntries in understoenl to extenil also to the parts of the colonies and dominlons of the Netherlands beyond the sean, In which gooda aud merchandise, whatever their origin may be, imported or expurted from and to any other country in veasela of the Vinited states, shall pay no higher or other dutien than shall be levied on the like goods and merchandine imported or exported from and to the sume placen in veasels of the Netherlands. The lounties, drawhacks, or other privileges of similar denomination, which muy be there granteal on goodn and merohandise imported or exported In vensels of the Netherlanils, shallalso, and in like manner, loe granted on grools and merchandise imported or exported lu vessels of the United States."

From tho precerding table it appears that in 1 sins the Lnited itates just trebled in one year the number of versels bearing their llag in that renoto corner of the gholes. This in to he asirilied to the liberal conmercial treaty of 1802, equalizing the U'altenl States' ant the lutch llags in tho colonial trade. The aubjeined turifl of iluties of the laland of Java has been prepared from a copy printed nt Inatavia in 1844, with monlifications and changes down to dune, I85is, transmitfed from the United States' conmulat at that furt:
fort Chargea ut Joma.-The larion dues are one half a rupee per ton; lut a ship having once pali this charge can touch either at Samarang, Soerabaya, or go to a foreign port and roturn, if within six monthe from date of payment, withuut further expense. Ships can
anchor an with the s charge of line drawn All letters tom-house, be intenile no pilots pilots can west, and terell wate with a fore

anchor and remain in the roads, and can communleate with the shere, recelve provisions, water, ete., without charge of anchorage fees. The roads are south of a line drawn from tha Rhoneland to the Neptune shoal. Ali ietters must be lnmediately delivered at the cus-tom-house, except consignees' letters, and such as may be inteuded for the captain or snpercargo. There are no pilots for Batavia or Samarang. For Soerayaba pilots can be had at Point lauka coming from the west, and nt Passaroeng coming from the east. Filterel water is sent alonggide in government tanka, with a force-pump and hose, et a charge of 57 cents
per hogshead, and in the outer roada at 66 cents. When a blue flag ia flying at the maln-mast bead of the guard-ahip, or at the aignal ataff of the lookoat-house at the head of the canal, it is unsafe to attempt entering the river.

Tariff' of Duties for the Island of Java.-By Dutch vesseis aro meant vessels belonging to Holland, and no others. Under the Dutch flag are comprehended the flags of Asintic princes which are placed on the arme footing as the Dutch flag. The pound in this tariff is the old Amsterdam pound. To the duties in the tariff, 5 por cent. is added for breakwater.

Jeddo, Jedo, or Yedo, the capital of Japan, nid the largent eity in that empire, is situate on a gilf, on the weatern side of the island of Nipon, lin N. lat. $35^{\circ} 32^{\prime}$, li. long. $110^{\circ}$. It atands on a large plain at the heal of the gralf, which is here at ahallow that vessels gencrally discharge their cargoea a league or two below the city. Jeddo is suid to be 7 miles in length by 5 in breadth, and to have a circumference of 20 miles. It is not inclosed liy walls, but is intersected hy numerous broad canals and ditches, having on each side high embankments, on the tup of which are planted rows of trees. A river of considerable size tlows through the town into the harisor. The hauses are small and low on account of the frequency of earthquaken. They are built of wool with thin clay walla, and are divided into rooma by paper screens. The thoors are covered with mats, and the roofs with shavings of wool. Being thus entirely compsed of combustible materialn, fires are frequent and destructive. As the familles of princes, lords, and nobility of the empire are obliged to rewide continnally at Jedilo, zhere are uumerons housea of a sisperior class. These, lowever, are only one story in height, and have no towers. They ary distinguivhed from the ohher louses ty large court-yaris, stately gntes, and tho varnished nteps leading up to the door. There are besides numeruas temples, monasteries, and other religious boillings, The imperial palace is near the midlle of the town, and is salil to be more than cipht miles in circminference. It comsists of several palacen or caatlen, with large gardena and orcharila. Benides leing the residence of the court, Jodhlo contains loori-hing mannfactures, anl carries on nu extenslve commerce. The population is varionsly extimated from 700,060 to $1,500,060$, and even more. See Japan.

Jeremie. This is the km dlest pert in the island of Ilaytl apen to foreign commerce. The anchorage at Jeremie in so dangerons that scarcely a year panses without one or more mbipwrecks, or other seriuua casnaltiea, being recorded. In 1819 there entered and
cleared 76 vessels, with an aggregate of E 200 tons; und in 1850 there entered and cleared 91 vessels, measuring $11,5: 16$ tons. The following summary exhilits the general trade of this port for 1850:

| Countrie. | Value of litipurts. | Arcicles and quan'ilies uf exports In leson. |  |

Jersey, the largest and most important of the Enlish Chamel Islands, is situate in the Bhy of st. Nichael, 13 miles weat of the nearent coast of France, and 85 miles from the nearent point on the linglish coast ; N. hat. (St. Helier's) $49^{\circ} 11^{\prime} 3^{\prime \prime}$, W. long. $2^{\circ}$ $7^{\prime}$. It ia 12 miles in lungth, from east to west, and 7 in breadth from north to south, and has an area of alant 40,000 acres. The north const of the inlanl is rorky, bold, and precipitous, rising sometines to the hoight of more than 200 fect above the sea. The t'hamel Islanto are considered an belonging to the crown, but ay forming no purt of the reahm, so that they are not represented in P'arliament ; and Acts of l'aribament, as such, have no legal force as regads them, unkess they are therein specinlly namod, or unless the actu, in virtue of an order of council, are rentistered on the records of the ishands. In their institutionn, customs, and lawn, the people at'll retain much that is Norman; and, in this reapect, dersey has cetained considerably more of the ohl institations and of their free efirit than the fiter island of liucrneys. The people appear to have at all thes onjoyed muith freedom and great privilegen.- C . It.

Jetty-head, a name usually given in the royal dockyards to that part of a wharf which projecta beyond the rest; lut more particulariy the front of a wharf, the side of which forms one of the cheeks of a Whary or wet dock.
Jewelry. Worn by most of the early nationa. So prodigious was the extravagnace of the IRominn ladies, that Pliny the eiler says he aaw Loliia l'sulina wearing ornaments which were valued at $\$ 1,605,000$. Jeweis wore worn in France by Agnes Sorel, in 1434. The manufacture was extensively encouraged in Enghand in 1685 . See Gold.
Jib, a large triangular sail, between the fore-topmast head and the boom (thence called jib-ioom), which projecte beyend the bowsprit.
Jidda, or Djidda, a sen-port town of Arabin on the led Sea, 64 milea west from Mecea, of which it is the port; N. lat. $21^{\circ} 29^{\prime}, \mathbf{E}$. long. $39^{\circ} 15^{\prime}$. It stands on a gentle elevation, rising from the sen, while the surrounding country is a bare desert. Jidin, as respects cieanliness and regularity of pian, is superior to most eastern towns. The strects, though unpaved, are comparntively well Inid out and wide. I'he houses are buit of coralline stone, from the shores of the Red Sea, and from the perishing nature of this material, are not very durable. In the suburbs, the louses are mere huts constructed of reeds and bushwooi.
didda las long been famous as tho commercinl emporium of Aratia, and indeed is solely dependent for its existence upon its trade. Situate atoout the midule of the east const of the Rel Sea, only nbont $1: 0$ miles distant from the opposite shore of Nuhia, and within two days' journey of Mecea, it is peculiarly fitted for the importation of foreign goods as well as for the exportation of home produce. The luarber, bowever, like moat of the other jorts on the Ked Sen, is inconveninnt, and the entrance rather intricate. On account of tife shallowness of the harbor, inrge ships are obtiged to dischago their cargoes in the offing about two miles from the ohore. The inports from Efypt aud Abyssinia comprise corn, rice, hutter, sugnr, cluthing, oil, tobacco, musk, and incense ; from Indin, musins, rinawls, spices, and cocon-nuts; while the Malay islands and the Mozambigte coast send hither slaves. The imports are conveyed by ships to Suez, whence they tind their way to the Mediterranean purts, or by caruvans to Mecea and Medima, from which cities they are dispersed to Syria, Asia Miner, and Turkey. Dates, nad the ectebrated haim of Mecea, are brought from the interior for whipment. Sext to prain, tho most important nrticle of trade is perhaps colfie, which is obtained in large guantities frou Mocha. The number of vessels thelonging to the port is estimated at ulout 250 . The government of Jihla is in the hands of the $l^{\text {ashen }}$ of bigypt, and the town is garrisoned by I;iyptian troops, anownting ustaliy to ntout f 16 . The poputintion is very Hactuating; the jermanent pepulation dioes not probably exceed $10,0 \% \%$, while, on the arrival of the merchant flects, and during the feast of Rumadthan, there miny be as many ns 20,000 strangers within its walls.-E. 16 .
Jobber, n person who undertakes jobs, or sunnil pieces of work. In some sitatutes, jubier is used to signify a person who buys and selis for others. See Bиoker.
Jobbing is the business of a jobber.

Stock-jobbing denotes the practice of trafficking in the publie funds, or of buying and selling stock, with a vlew to its rise or fall. The term is commoniy applied to the practlce of buying and aelling stock for time, or of accounting for the differences in the rise or fail of any particular stock for a stipulated time, whether the buyer or seller be possessed of any such real atock or not.

Joint-stock Companies are, in Fingland, a speciea of partnership in which a number of persons contribute funds or "stock" for the accomplishment of some trading or other profitable object. The peculisrity from whicin the term is derived is the contribntion of atock apart from joint management. In an ordinary partnership the membera loring more or less of their own personal management into the affairs of the company; and although, in peculiar circumstances, a partner may abstain from any interference, such a person, called in the trading world "a sleeping purtner," is treated by the law in all respects as if he proticipated in the privileges and responsibilities of his working bretiren. The distinctive peculiarity of the jeint-stock company is, that their members throw their stock into the venture without directly participating in the management, which may be either in the inunds of a selected number of the eliareholders, or in that of persens whe do not contribute at all to the undertaking. 'The subject thus presents considerations stretching far heyond the boundary of the mere lawe affeeting the rights nad obligations of individual partners into the tleld of politics and history. It is at once obvious that these arrangements, by which the wealth of indelinite numbers can lo concentrated in the hands of a few, are capable of creating a political influence which will have more or less the character of a ruling or governing power, according to the strength of the etherwise constituted authorities with which it may come in contact. It was by tinis sort of concentration of the wealth of many in the hands of a few that aome of the reigious societies of the middle uges lecame furmidable rivals of the monarchies; the Society of the Knights Templars rising conspicuously above nll others, and threatening to establisi a sort of corporato empire, presiting over the Jirropean monarchies. Subsequently the Jesuits, in their government of laragnny, afforded evidence of the power at the command of elever men regulating a common fund, which alarmed crowned heads no less than the usurping tenor of their loctrines. The great union of the Hanse Towns, before which the robber monarchies und aristoeracies of central Lurope fell, was again an instance of the power of concentrated weaith when mensured agninst pure monarehical mod aristocratic authority; ant the expanding resources of the republic of Venice, and of other wenltily oligarchies, seemed to be raising a new ruling power which would gradually nbsori) and supersede the old dynasties, whether autocratic or nristocratic, by which nations were ruled. The expansion of trade by the discovery of America and a new passage to lndin, and still more jerhaps the recasting of the political state of liurope by the Reformation, ioroke up these great concentratel musses, and distributed tho power of collective wealth into amalier groups. Stili the influence of joint-stock associations has ever, from time to time, arisen in formidable rivairy with other forms of political power, sometimes crenting an effectual barrier to jolitical oppression, hut nt others threatening the liberties and just righte of communities by a apirit of aggrandizement and rapneity. D'erhaps the most curious single instance of a atruggle between concentrated wealth und a ruling dynasty will be found in the history of Russin. The merchants of Novegorod increased in wenlti ami influence until they becamo a virtuai repubilican government. gradually absorbing under their influence the surrounding territory. "Who can resist God and the great Novogorod ?" became a saying of
the 15th century. The Grand Dukea of Mascovy commenced a aystematic war againat the royal company of merchants, and it seemed for some time a question whether luasia should be ruled by a commercial company or an autocracy. After many acenes of cruelty and rapacity, the latter prevalled. Hut the Influence of Novogorod was not eutirely extingulahed until the foundation of St. Petershurg drew the northern trude of Russia into a new channel, where it came effectuaily under imperial control.

IIritinh history afforis many memorable instances of the intluence of joint-xtock operations. It becune the policy of the crown, from Qneen Elizabeth's reign lownward, to cherish commercial combinations, as a balance against the power of the aristucracy, and nounetimes the body thus started with a stock of exclualve prlvilegen acquired an intiuence langerous alike to the anthority of the crown and to the rights of the suliject. The Russian Compnny, whileh had been licensed just hefore the accession of Ehizabeth, açuired so mach induence under her fostering care as to npread its transactions inte Persia on the one hand, and embark in the whale fishery of Spitzbergen on the other. This potent bocly was in une to nend ombasadors to the tirand Duke of Muncovy. But his successors, the carars, were net is slinel to encournge such fellowship, and gradually. enfeebled the haughty corporation by restricting itis foreign privilegen, anil encouraging the rival company of lloliand. The celohrated turkey or levant Compuny was elartered in 1581. Just is years afterward was formed, under far lens pompoun auspicee, that East Iudia Company which has lueen deatined to rule over a greater empire than that of Juliun Casar or Charlemagne. See INims. Many African and American companies wero formed in the Sth century, and created much exeitoment ly their agiressions and rivairios. The Sents, excited iy wits nessing the enterprise and pronperity of England, in which the invilituus navigation law of Charles 11. prohibited them from participuting, resolvell to eatatilish a great national joint-atock company for themselven, In 1695 they formed the "African Compans," hetter known an the Darien project, sulscribing a capital of four millions, the rreater portion $0^{\prime}$ which waf paid up. This was helid in its day to te a marvelous pecuniary effort fir a portion of the empire which, a century and a half later, entered on railway projects lnvolving in one year an ontlay of sixteen millions. The company oftained from the Seottish l'arliament more alseinte power than even the great corporations of Eingland; being authorizel to hold a monopmly of certain trades, to occupy and govern torritories, and to make pence and war. It commenced the execution of a varicty of projects on a grand scale, and their tisastrous result was a signal instance of that unserupulous spirit of aggraudizement and op, reessien to which trading curpuratione are so linble. The Seotish connpany, prohably, like many of the other boolies of aidventurers, csumitted mome queationable aetn, lut none muticient to justify the rancoroua hatred of the Euglish rival companies, which, while the Scots were prevented, as an alien nation, from having their ahare in the Finglish companien, denounced the corporstion set up loy the nation, which they thus counteal meparate nni indeprendent, for an lifringcument of a monopoly purely Banglish. King Willam was too deprendent on the noneyed power in Finglanl to hold an even latance of justice between opponents on unequally ustelid, and the scottish colony was ruinem.

Among the English companias of that age, neveral were nuccessively estalilished for trading with Africa and Anerica. Their chief object and nuturee of gain wan one that wonld be fortunately held in detestation lig the greatur portion of British appeculaturs at the present day-the supply of capturesl negroes to the plantationa, foreign an well as Britinh. The culminathou of these projects in the greut South Sea acheme
of 1719 is a well-known chapter in English history. The names of the many prepoeterous antellite achernes by which it waf aurrounded have often been cited an instancess of folly" calculated to tax the credulity of aniberer periods, as projocta in which the iahabitants of the winest of natlons aotually embarked. If it were any consolation to tind their neightors guilty of greater follies than their own, the British of that age might find aucle consolation in a view of the Freach Missinnippi schene. The corporate power thus created not ouly professed to absorh the trade, linanco, and banking of France, but projectod tha creation of a transatlantie empire, which, from ita centre in louisiana, should gradually absorb the American centinent.
Since the passing of the Puteuta Act in the reigh of James I., the crown alone was preciaded from grint. ing powers of traling monopoly in royal charters, and the companies which, since that periori, have obtuined uny monepolies in England heyond those created hy the slimpte instance of their large capitai, have lield their powers froin I'arliament. The crown continued to grant monoprilies in foreign tructe till 1693, when, in the celelirated question of the old East Indial Conppany; the practice was condemned by a vote of the liouse of Conumons. A remaricable Instance lately occurred of an attempt ly some enterprising men to carry out a project momething like that of the Last ludia Company, Inilependently of authority either from the erown or Parliament. It was repreenented that the islands of New Zealanil were admirabiy guited for culmization, and shouid be innmediately attached to the IIritish eolonial emplre by the right of eceupancy. There wan, however, a atrong disinclination on the part of Iritish statesmen at that period to encumber the imperial government with tise management of additional colonles. The adventurers conceived the idea of oecupying the inlands with independent British eaingrants. The novelty of their viows, and the energy and eloquence with which these were euforced, intracted a number of arient apirits around them, who were tulght that in these hapiy islands, pussessed of alf the advantages of our liritish climate without its drawhacks, they were to found that empire of Angho Saxon origin, by which the asouthera purtion of the world was to te eventually ruled. It seomed bard that the government, deelining to cecupy the colmies, should discourage this project; hut there were many groumis for drealing from it evil conseguences, smong which the mont ohyious and immediute was, that when the colony began slightity to prosper, it would uttract the cupidity of ame cither liamopean 1 mwer, from which it coild not lee protected without an interference which might involve the British government in furmidable disputen. Hence, in the year $1 \times 10$, the lritish flag was luisted in New Zesianic, and although "'The New Zeainad Company" was incorporatell, and nfter. wanl hecame the medinm for the disposal ot large tracts of lamil, its position was 40 humble in contparison with the spleudid virions cutertained by its promoters, that after a long neries of litricate disputes, they resigned their charter to thr government in 1x.00.--1., 11 .
Tho chics objects for which joint-stork compmies have lat ' $y$ been constituted are haukinge, insuramce. works the supply of cities with watter and kat camais, shijping, and harbors, and, at the head of all, railways. The railway syatem, inteet, is the forn in which hoth the government and the proplo have of hate feit the preasure of joint-stock power, nal huown the intluence of which it in suaceptible. Tha hixtury and effect of the rallway system will the found underits proper heal.
Jonk, Jonque, or Junk, in naval siffirs, in a kind of smail ship, very common In the Fant laties. Thene venseltare of varimes timensions; and dititr in the form of their building, neeording to the differant

Jute. Jute is " silky; ant pasily of tages were addend ti wouth probably sup lhat it is as riphid in in reality, the most period of its lirst duwly, aud of ite ow the leautiful peariy it, and sssuming su
methods of naval archltecture used by the nations to which they belong. Their aalls are frequently made of muts, and their anchors of wood.
Journal, a day-book, reglater, or account of what panses dally. Jourmal, in merchants' accounts, is a book in which every particalar article is ponted aut of the waste-book, and made debtor. This is to be very clearly worded and falrly engrossed. Journal, la navigatiom, a sort of dlary or dally reglater of the ship's course, winds and weather, together with a general necount of whatever is material to be remarked in the periol of a sen voyagg. In all such journals, the day, or what is called the 24 hours, terminates at noon, becanse the errors of the dead-reckoning are at that period generally corrected by a solar observatlon. The dally compact usually contains the state of the weather; the varlation, Increase, or diminution of the wiad; and the suitable shifting, reduclng, or enlarging the quantity of anll extended; as alao the most material incidents of the voyage, and the coniltion of the ship and her crew ; together with the dlacovery of other ships or fleeta, lanil-shoals, broakers, soundings, and the like.
Juan Fernandez, or Mas-a-tierra, a rocky island in the Paolfio Ocean, about 400 miles off tho chast of Chill, of which it it is a dependency. Lat. $33^{\circ} 45^{\prime} \mathrm{S}$., long. $79^{\circ} 2^{\prime} \mathrm{W}$, It is 18 miles long and 6 mils broad, risea to 3,000 feet aiove the ocean, has ateep shores, and a desolate appearance from the sea; but in ita nerth half, in which ls Cumberland Ilay, are some fertile valleys, producing tigs, grapes, and eandal wood, cork, and other timber trees, and it is leasel from the c"illan government by settlers from the Vaited States and Tabitl. The solitary resilence here for four years of a Scotchman, named Alexander Selkirk, is supposed to have formed the basis of Defoe's well-known tale of " Robinson C'risoe." Nas-afuera ls another rocky and precipitous Ialand, lying to the west. Lat. $83^{\circ}: 19^{\prime}$ S., long. $80^{\circ} 27^{\prime} \mathrm{W}$.
Juniper. The juniper-treo belonge to the natural orier Conifere, and is usoful both for its wool and its berries. The Virginian specles, which is called red ceder, uffords a light and durable material valuable in ship-building. It attains tho heipht of about 30 feet, and gows well in barren soid. The berries used for flavoring ghare oltalned from the Juniperus commuwis, and about 200 tons of them are annually imported to this conntry. They are also used for imparting pungency to lieer. When roasted and ground, they afion s sulstitute for cottee. The oll of juniper is unt importunt ingredient la varniah for pictures, woodwork, etc. The berries have ulso a diuretic property, and are used in medieine. The heavy duty to which they were subject in England was abolished in 1845.
Junk, in nautical language, a name given to any remant or piece of old cable, which is usially cut into monall portions, for the purpose of making points, mats, gasketa, sennets, and the like. Nee Jonk.
Jute. Jute is a remarkably beatiful titro-soft, silky, amd essily spun; and If to lts other alvantages were added those of strength and churabilty, it woull prohatly supessede all othar tibrous natorials. Hut it is as rapid in its decay as in its growth, and is, in reality, the most perishable of tibres. lirom the period of its first production in the dear state, it slowly, and of its own accorl, changes its color, losing the beautiful pearly white, which at tirst distinguishes it, and assaming succesaive sliudes of fuwn-color and brown. At the same tiue, its strength proportion-
ately diminishes. Circumstances hasten ar retard thils decay; and molature is particularly Injurlous to It. Iligh-preasure steam almost melts it away, so that when suil-cloth, adulterated with jute, is submittel to high-pressure steam (of only 30 lbs. pressure), for four hours, mere wathing afterward removes the jute. It is belleved that an improvement in the process of setting would herease both its atrength and durability but it is very doubtful if it can ever be rendered equal in theno respects to either hemp or flax.

The extent of the foreign traffic which bas already been established in this tibre, notwithstanding its linperfections, may be juiged of from the fact, that in the yoars 1850 and 1851 , the quantity of jute exported from Calcutta alone was valued at $2,000,000$ rupees, or $£ 200,000$, and the jute or gunay-cloth at an equal sum, and that it has already obtained a considerable place among the raw materials employed in manufacturen.P. J. of T. See IIeshr.

According to Braithwaite's "Commerce of Liverpool," 100,000 bales of jute are used annually in England, valued at $£ 20$ per bale. The grass is sent to Dundee aud other places, and the fibre so resembles caterpillar's throad, that it is used to adulterste silk. It is made into coverings, called " baggings," for cotton bales; and, after varions uses, finds its way to the paper-mill, for the manufacture of coarse wrapping-papers.-llemepati's Journal.

This article is now largely introduced in the manufactures of lingland. It much resembles a coarse hax, having a loug thry texture, and when dyed has a very woolly appearance. In and around Dundee, Scotland, there are no fewer than 76 mills, all engaged, spinning this jute and thax-the principal of whichis eaid to to the largest mill in Scutland. There are in this mill some 2000 hands, all wholly employed apinning jute, which is used to a large extent in the manufacture of carpets and rugs. Some three hauses in that quarter dye for this branch of trade alone alout soven tons a day. The carpets are sold as low as from 7d. to 11d. per yard; the rugs again as low as 3s. sterling. Jute can be spun to a very fine thread. It might be turned to a good account in the shawl trable, as a substitute for cetton. In its unmanufactured atato it is eaid only to cost 11 s . per ewt.; a very great contrast to the very coarsent wool-at least 1s. per pround in its oily state.

Jury-mast. In haval affairs, a temporary mast erected in a ship in the room of one that has been carried away by tempest or any other accident. Iurynusts are nometimes erected in a new slip to navigate ber down a river, or to a neighboring port, where her proper masts are prepared for her.

Jury Trial, the most thoroughly expressive feature in the administration of modern justice, is, in its essential prlnciplo, nothing more than the citizen's right to lavo the judgment of an impartial committee of his fellow-citizens on any question of tact tending to affect his life, lis liberty, or some important pat rimonial interest. The origin of the practice hay been traced by juridical antiquaries into many and far diverging sourcen, but they havo all been fuund converging in one direction, by the intluence of a commun determination, which seems to have over guided the purpose of the Anglo-siaxons and some other northern races in the practical application of such existing institutions as could be intluenced to tho end in view. See North Srit. Rer., viii., 44; Quar. Rer., Ivii., 177 ; Dem. Rer., vi., HiBi ; Blackwoon, xxvii., 736; Ḱnick., xv., 478, x viii., 217 ; Nuses's Reg., xiii., 139.

Kaleidosoope. Thls optical instrument, which combines milrors, and produces a symmetrical reflection of lseautiful Imagen, was invented by Dr. Brewster of bilinburg; it wan frat auggeated In 1814, and the Instrument perfected in 18.7, after whleh large numbera were manufactured. It la intended to asalat jewelers, glass-palnters, and ether ornamental artists, in the formation of patterns, of which it produces an inflnite number. See lirackwoob, Ill.
Kane, Dlisha Kent, the Aretic explorer, was born in I'hiladelphla on the 3d of Fetruary, 1822, and graduated at the University of Pennsylvania in 18.43, first $\ln$ the college and aubsequently $\ln$ the medical department; and when he started upon his actlve career of adventure, he was esteemed a cood clasalcal scholar, and a good chemist, mineralogist, astronomer, and surgeon. Llis frame, even in boyhood, was delleate, and. with a view of atrengthening his constitutien, he solicited an appointment in the navy as aurgeon, ond obtalned it, and was attached to the IIrst Ameriean embassy to China. This position gave him nn opportunity to explore the lhilippine Islands, which he etrected mainly on foot. He was the flrst man who deaceniled Into the crater of Tael, lowered more than 100 feet by a bmaboo rope from the overhanging cliff, and clambering down some 700 more through the scorias, he made a topograpical sketch of the interior of this grent velcano, collected a bottle of anlphurous ach from the very mouth of the crater, nad, although he was drawn up almost senselusa, he brought with him a sketch of this bidoous eavern and the specimens which it afforded. Before returning home from this expedition he had ascender the Illmalayas, visited Ceylon, the upper Nile, and all the mytholugical regions of Egypt-traversing the route and making the acquaintance of the learnel lepslus who was then pronseuting hia archaological researches. He nlso trinversen tireece on foot, and returned to the Duited Statea throagh Furope. S: after hla arrlval he was again ordered on duty-this time to the western conat of Africa. Ile now attempted to visit the shave murts of Whydah, but haviag taken the African fever, he was nent home in a precarious state of health. He recovered, however, and we next tind him a volunteer In the Mexican war. Ilis adventures in Mexice proved him to be the possessor of lion-like courage, and of a mont generobs and noble heart ; lut he fell a virtim to one of the fevers of the country, and was very near dying. When he recovered and returnent, he was employed in the Const Survey depurtment, from which be was transferred ly the secretary of the Navy to the pant of aurgeon on the tirinnell Arctic expelition. Hlis history of that experlition gave him a high position as an muthor. Not yet satisfled, however, he acarcely gave himself time to recover from the hariships of that cruise, hefore lie set on font tho second Grimnell or Kane expedition, the reaults of which have been pronounced ly the highest European mathoritles as among the wonlern of the present century. Dr. Kane died of consmmption, at llavana, Fehrary 16th, 165\%. See Irctic Eirpharutions and Lafe of Kane.

Kansas Territory extends from the 37 th degren of north latitucle to 40 degrees north, and from the went lnoundary of Missouri to the crest of the liocky Mountains. Area, $122,0(4)$ square miles. Drainet by the main branch of the Arkansas, by the Kanmas, and lig heall liranches of the south fork of l'atto or Nebranka liver. Surface level, consinting of an immense plain, with a gentle nlope from the base of the Rocky Montains to the Mismuri Exoriler, and the abrapt descent from the mountain ridge to the bave of about 75 milee in width. 'The soll is various, rich alluvial bot-
tom landa bondering the streams, nome fertile prairia lands and extensive sandy plaina, but these are of sufficlent fertility to furnish nourialiment to immense herda of the American blson. It was formed into a Territory by the act of Congreas of May, 185:t, together with the Territory of Nehraska.

Kedge, a mall anchor used to keep a ship rtedy while ahe rides In a harbor or river, particularly at the turn of the tide, when she mlght otherwise Irive over her principal anchor, and entangle the stock or thukes with hor atack cable, so as to loosen it from the ground. This la accordingly prevented by' a kedpe roje that hinders her from approsching it. The ked tes are pare tleularly useful in transporting a slip; that is, remorlng her from one part of the harbor to another, by means of ropes, which are fastened to these nochors. They are generally fun ishel with an iron stork, which is easily displaced for the convenience of stewing them.

Keel, the jrinclpal piece of timber in as ship, which is usually thrst laid on the blocks in builting. liy comparing the carenss of a shlp with the skeleton of the human booly, the keel appenrs as the hack-trme, and the thmbers as the ribs. The keel supports and unites the whole fabric, nince the stem and stern pesty, which are elevated on its enda, ure, la some measure, a continuation of the keel, and serve to connect nad inclose the extremities of the sides by transoms, as the keel forms and unites the bottom by timhers. 'Th' herl is generally composed of several thick pieces placed lengthways, which, after behg scarfed together, are bolted and clinched upon the upper side.

Fiblse Kerel, a strong thick piece of timber, Isilecil to the linttom of the keel, which is very useful in preserving ite lower side. The false keel is provided when the thick pieces whicli form the keel can not be procured large enough to give a suthicient depti thereto. In large ships of war the false keel is composed of two jieces, called the upper and lourer false keels, The lowest phank in a ship's botton, called the gurbenard streak, has its inner edge let intor a growse or chamel, cut longitudinally on the side of the ked. The depth of this chamel is therefore regulatel by the thickness of the garionmil streak, - Li. A.

Eeel-hauling, a jumishment inticterl for varions uffenses in the luteh hivy. It is performed lyy suc. pending the culprit by a rope from one yarlarm, with a weight of lead or iron upon his lege, and baving another rope fastencel to him, lealing under the mip's bottom, and through a blowk at its opposite yari-arm, He is then amblenly let fall from the one yard ann Into the sea, where, passing under the shipis hetton, he is hoisted up on the opposite side uf the vessel to the other. This punishment is rot altogether unknown in llritish ships; thet, as it is dangermas, it is very rarely, or, indeed, nearcely ever, now frat tiocel.
Keelson, or Kelson, " piece oi timhr forming, the interior or connterpart of the keel, bing hilt unin the midulle of the fore-timbers imberiately wor the keel, nid sarving to bind and unite the former the the latter, by means of long Isilts driven frum withat, and cinched on the upper sile of then kedsem. The keelson, lihe the keel, is comamsed of sebral pieces acarfol together ; and, in order to fit with murre secusity upon the floor-timbers and erotehets, it is intemem about an inch ams a half derf ormasite to each of thoie pieces, theroby acored down "jon them to that depth, where it is mecared upen them by apikenaits. The pieces of which it is formed aris of only hali the lorealth and thickness of those of the kerd,--V. . A.

This result, thon kelp shores, and po the laborers amploy regrettent. It could keeping up the pri necessaries of life a The hish price of $k$ cies of the late was supply of harilla, $f$ ties on it and on restige of a 4 round things would the pert by it while it lasted government was to to some of the neve war, merely that the cidental advantage.
xelp is chiefly us
monly termed, noda, is the chlef. Thil ingredient renulers it usaful in the composition of soap, in the manaficture of alum, and in the formation of crown anit toittle glasa. It in formed of marine planta, which, leing cut from the rock with a hook, are collected and dried on the beach to a certain extent; thay are afterward put into kilns prepared for the purpose, the heat of which is aufficient to bring the pinnta into a state of aemi-fusion. They are then atrongly atirred with iron rakes ; and when cool, condanae inte a dark Hue or whitish masa, very haril and molld. Ilanta about three years old yleld the largeat quantity of kelp. The beat kelp has an acril caustic taste, a amlpharous odor, is compact, and of a dark-blue greenish chlur. It yields ahout 6 per cent. of its welght of sola.-Bannv's Orkney Islunds ; Tuomson's Dispensatory. The manufacture of kclp in Great Ililtain, in, or rather wns, princlpally carried on in the Weatern ldatals, anil on the western shores of Scotland, where It wis introduced from Ireland, about the middle of last eentury. Toward the ent of the year 1815, the kelp shores of the island of North Ulat let for $\mathbf{E 7 0 0 0}$ a year. It las lieen ealculated that the quantlty of kelp annuslly manufatured in the llebrides only, exdusive of the mainland, and of the Orkney and Shetiand intes, nmounted, at the period referred to, to about b000 tons a year, and that the total quantity male in Scotland and Its adjacent Islea, amounted to abuit $: 9,000$ tons. At some periokls during the war, it sollifor $\mathrm{f}^{20}$ a ton; but at an average of the 22 years endin, with $18: 2$, the price was $£ 10$.-Art. Scotland, Bilinburg Encyclopredia. Unlucklly, however, the fundations on which this manufacturs rested were altogether factitious. Its existence depended on the maintemance of the high duties on barilla and aalt. Insaumeh, however, as kelp eould not be substituted, without undergoing a very expensive process, for marilla, in a great many departments of industry In which the use of mineral alkali is indlspensable, It became necessary maserially to reduce the high duty in (irent Britain on harilla during tho war. The ruin of the kelp manufacture has been nseribel to this reduction; but thetgh harilla had ieen altogether excluded from the markets which conll not have been done without great injury to many most linportant manufactures, the result would have heen perfectly tho same, in so far as kelp is concerned, unless the high duty on salt had alo lieen mantained. It was the repend of the latter that gave the kelp manufacture the comp de grace. The purithation of kelp, so an to reniler it fit for soapmaking, is a muth more troublesome and expensive proress that the arcomposition of sult ; and the greatpos quantity of alkali used, is now olitained by the lattet methoil. 'The manufarture ja now almost ex. tinct. Shores that formerly ylelibil the proprictors a reat of $£=00$ to $£ 500$ n year, are now worth next to nothing. The price of kelp since 1 de: has not been, at an avarage, alove £4 a tom; and the articto will, most probalily, som cense to be produred.
This result, though injurious to the proprietors of kelp shirea, and prombertive of temporary distress to the latorere empored in the manufacture, is not to be regrettel. It could not have been obvinten, without keepiat, up the price of some of the mest important necessaries of lifo at a forced and unnatural elevation, The high price of kel p was oceasimed by the exigencies of the late war, whilh, hesides ohstructing the supply of harilla, forced government to lay high duties on it and on aalt. The proprietors had not the restige of a ground for cemsidering that surh a state of things wouht lee permanent ; they illd right in protiting by it while it lasted; but they could not expect that government was to subject the conntry, during jeace, to some of the severest privations occasioned ly the war, merely that they might continue to enjoy an accidental advantage.
Kelp is chiefly used in the United States as a ma-
nure, and for this purpose is very valuable. Large quantitles are thrown on the besches after a storm, and the Gulf Stream constantly brings it to our ahorea, from whence 't ls carted by our farmers to their fields, and allowed to decompose.

Kentledge, the name aometimea given to the Iron piga cast in a partleular form for ballasting ships, and employed for that purpose.

Sentucky, one of the central United Statea, is aituated between $36^{\circ} 30^{\prime}$ and $39^{\circ} 10^{\prime}$ north lat, and between $82^{\circ}$ and $89^{\circ} 40^{\circ}$ west leng. Its length is about 400 miles, and its breadth 170 inlles, containing 37,680 aquare milles. Yopulation ln 1790 was 73,607; In 1800, 220,959; in 1810, 406,511; $\ln 1820,564,317$; in $1830,688,814 ; \ln 1840,779,828$, and $\ln 1850,082,-$ 405 . The State is divided into 100 counties.

Surface, Soil, etc.-A tract from 5 to 20 milee whle nlong the Ohlo River, through the whele length of the State, is hilly and broken, but has a fertile sell. The margin of the Ohio for about a mile in width, consists of bottom lands, which are overfiowed when the river is high. Hetween this tract of hilly country the more mountainous eastern counties and Green Liver is a fertile tract, frequently denomlnated the garden of the State. It ts about 150 miles long, and from 50 to 100 wide. The soil is excellent, the surface gently undulating, and the forest-growth, hack-walnut, blackcherry, buckeye, paw-paw, sugar-maple, mulherry, elm, ash, cotton-wood, white thorn, and an abundance of grape-vines. The country in the south-west part of the State, between Green aml Cumberland Rivers, is called the "barrens." In 1800 the legislature of the State made a gratuiteus grant of this tract to actual eettlers, under the impression that lt was of little value, but it proves to he excellent grain-land, and also adapted to the raising of cattle and swinc. The whole State below the mountains, has, at the usual depth of elght feet, a bed of limestone which has froquent aperturea through which the waters of the rivers sink into the earth, causing some of them to disappear for a tlme, and others to be greatly diminished in the summer seasou. The rivers have generally worn deep channels in the calcareous rocks over which they flow. The preciplces formed by the Kentucky are in many places stupendous, presenting perpendicular banks of solid limestone 300 feet high, above which is a steep and difficult ascent several times ns high. In the south-west part of the State, between Green and Cumherland livers, are several remarkable caves. One called the Mammoth Cave, $1: 30$ miles from Lexington, on the rond to Nasliville, has been explored for a distance of elght or ten miles. Iron ore and coal, are widely ditfuset, coal especially occupies an extensive field. Salt springs are numerous, and minaral springs are found in many locnlities. There were in this State in $1850,5,968,270$ acres of land improved, and $10,981,-$ Ti8 of anluiproved land in farms; cash value of farms, $\hat{6} 15,031,26_{2}$, and the value of implements and machinery, $\frac{75}{5}, 169,0: 17$; live stock-horses, 315,682 ; nsses and mules, 6in,ti09; mikch cows, 247,475; working oxen, $62,27.1$; other cattle, 442,763 ; shes?, $1,102,091$; swine, $2,891,163$; value of live stock, $\mathfrak{z} 29$, ti61,4it

A! mictultural froducts, etc.-Wheat, 2,1.12,822 bushels; rye, 115,073 ; Indian corn, $5 \mathbb{2}, 672,591$; outs, 8,2111,311; barley, 95,343 ; buckwheat, 16,097 ; peas and beans, 202,574 ; potitoes, $1,492,4 k 7$; sweet potatoes, 998,179 ; value of products of the orchard, $\$ 106$,$2: 10$; produce of market garilens, $\$ 303,120$; pounds of butter mide, $9,9 \cdot 7,523$; of cheese, 213,95.1; sugar, 284 hhils. : maphe sugar, $43 \overline{7}, 405$ pounds ; molansea, 30,079 gallons; beeswax and honey, $1,158,019$ pounds; wool, pounds produced, 2,597,433; cotton, 758; thax, 2,100,116; wilk cocoons, 1201; hops, 13019 pourids; tobacco, $55,001,196$; hay, tons of, 113,747; hemp, 16,4:12 tous; clover seed, 3230 bushels; other grass seeds, 21,481 ; thax seed, 75,801 bushels; and were made 8093 gallone of wine; value of slauglitered anlmals, $86,46^{2}, 598$.

The Ohio River, hy ita varlous windinge, bordera this State on the north fer 637 milen. Cumlierlend and Tennennese Bivere paas through lta weatern part an thay appreach their entrance Into the Ohlo. Cumberland rises In the eastern part of this State. The Blig Sanily ls 250 miles long, and for a considerable ilintance forman the houndary between thls State and Virginia, It la nave igable 50 miles for honts. The Kentucky Illver rises in the Cumberiand Mountains, and after a couran generally through a deep rocky hed, falis Into the Ohio 77 milea alove Lonlavilte. It In navighle for stenmionats 60 miles to Frankfort. Ileklng, Grmen, and Salt, are other considerahie rivers. The Misainalpul runs on the weatern lorilor. Tonnage of the State, January, 1853, 12, 166 , composed entirely of ateamicoata.
fanufuctures, efc.-These were in this State in 18B0, 8 cotton faetorles, with a eapital lnveated of 8511,000 , employing 206 mules and 307 femalen, producing $1,078,081$ yarils of sheeting, ete., and $725,00,0$ pounds of yarm, valued at $\mathbf{6} 440,095$; 27 woolen factories, with a enpltal of sego, 820 , employing 289 males and 81 fomales, manufneturing 878,03. 5anla of coth, valued at © 8424,544 ; 2.1 eatahilishmenta making pig Iron, with a eapital of $1,027,5 \mathrm{th}$, employing 1922 persons, producing 28,609 tons of pig iron, etc., the entire value of products, 4699,937 ; 20 estubliblimentn, with a capital of © 512,200 , emploring 578 persons, and making 5 ands tona of eastingon etc., valued at 9741,$316 ; 4$ eatatillahments, with a conpleal of 6176,000 , employing 183 persons in mannfacturing 3070 tons of wrought lron, valned at $\mathbf{H} 299,700 ; 820$ thovring and grist-milla 862 saw-milla, and 380 tanneries; 51 printing officen, 9 daily, 5 tri-weekly, 2 seml-weekly, 34 weekly, 1 semimonthty, and 7 monthly pullicatlons ; cotal coples printed annutlly, $6,882,8: M_{M}$.

There were in this State Janunry 18\%7, 83 bankn, with a eapital of alout $\$ 12,000,000$. There were in operation Jnnuary, 1856,238 mile of railroad, and 452 miles in course of construction.

The foreign commerce of Kentucky la very amall. Effort in beling made to inerense it, and also the forelgn eomnserce of some of the other wentern Staten, lyg glving facllities for the direct importation of gowls. At several of the western cities, fine eustom-houses have been luilt ; at St. Inuls and ('incinnati, and at uthers, Lavilavilie and Dhouque, it is projmued to ereet them. There are no recorils of the foreign eommorce of Kenturky pron to $1 \times 35$. Since that the it has beens an follows:

Kepler, John. This eminent man, known In the ennals of astronomical sifintes an diseoverer of the lawn of motion of the planetary bodics which composen the solar circle, was the son of a military officer, and was lom at Wiel, luchy of Wirtemblure, 27th Ite. ceminer, 1ati. In 1 ind be liectame the pupil of Mchat Minatlina, under whom he made great progreas as a mathematician. Ilaving added divinlty to his atullen, he acipulem considerable celebirlty an a jireacher; but, relinguiahing the elorical gown, he anccueded, In 1594, in ehituininif the mithematieal chair In the nulvernity of diratz, in styrias. In liges, huving profesaed the I'rotestant falth, he was removed from his office. hut was moon recalled apain by the Statea. In lews he accepted nn livitation from Tralog, loging him to wattle at l'ragne, nol nevist him in the prospeution of astronomical researeloca, unilor the patronage of the I'mperor Rodelyh. The duath of TYeho, and Kepler'A own llinean almont immediately on hisarrival in l'rague, prevented the lesired co-operation; bit on bis introduc-

Ion to the emperor, he was requested to complete the tablen hia late frient hal begrin, which were to lie ealled the Rorlolphine Tables, This work, which oceupied him during the greater part of the remalailer of his life, he earried on and ecmpletel in 1627, amid the inconvenlences and difficultien which arose trom the irregalar payment of hia pension, and the other expenaes attending the unilertaking. Illa health now again failed, and as a meana of rentoratlon, together with the desire of ohtaining the arreara due him by the emperor he went to Ratiabion; but the fitligue of traveling and mentai uneasinenn threw him luto a sickness whlich closed hin life, soons after his arrival in that rity, In November, 1630, Ills publizhad works on astrunomi. enl sulijects are nimeroun, liealilea whlch he wrote on chronology, geometry of anlida, trigonometry, loga. rithme, and dloptrics. To this great philonopitier the world is indebted for the diseovery of the true tigure of the orlits of the planeta, whiels he demonatratel to be ellipaen, together with those princlples of planetary motlon genernily denominated "the lawn of Kepler."

Kermes (Ger. Ncharlachbeeren; 1)u. Girein Schar. Lulicubesern; lt. (Iruna, Chermes, Cremese, thechi; sp. Gimana Kermes, Grama de la eosoyja), an lusect (Circus illicis Lin.) of tho same npecies as the true Mexican cochineal, foumd upon the quercus ilex, a arecles of oak growing in Spain, France, the Levant, etc. Ilefore the dincovery of America, kerines was the mont exteemed drug for dychig scarlet, and had been uset for that purpose from a very remote period. Berkmann heclincs to think that it was employed by the l'henicians, and that it excelled even the famons Tyrian purple. (list. of Inceat., vol. ii., p. 197, Eng. el.) From the name of enceum or coecus, cloth dyed with kermes was ealled corcinmm, and persons wearing thla cloth wer. suid by the limmans to be concinati. (1/art., lib. l., epig. $9 i^{\circ}$ lin. 6.) It is singular, however, notwithatandiag its extenaive use in antiquity, that the ancients had the most incorreat nuthons with respect to the nature of kermes; many of them supposing that it was the grainn (gramb) or fruit of the ilex. Thin was l'liny' opinion; othera, after him, considered it in the wine light, or as an excreacence formed by the puncture of a particulier kind of lly, like the gall-nut. It was not till the early part of last century that it was finally and aatiafactorily eatahliahed that the kermes lo really nothing but an insect, ussuming the njpeurance of d berry In the process of drying. -Tho term kermes it of l'ersian origin. The Arubians had heen wecpainted with this prominction from the earliest perioris in africa; and having found it in Spain, they cultivatel it extensivaly as an artic* of commerce, as well ns a dye drug for their own use. sont since the introduction of cochingeal, it las become an oljoct of compuratively trifling importance. It is atill, however, preparel in mome parts of simin. I'lothes dyed with kermes are of a leep red color: and though mach inferine in tritHancy to the acarket rloths dyed with real Mexican cochineal, they rotain the color better, and are less liable to stain. The ohd tapestries of Bruselels, and other places in Flandera, which have scarcely lost any thing of their orlginal vivacity, though ewo years old, were all dyed with kermes, The history of this production has been treated with great learning in leekmann (Hinf. of Inernt., vol. I., pp. 1:1-14n, Int ed. trana.) ; and by Dr. Jancroft (I'ermament iolors, vol. i., plo 28:3-409).

Keraey (probatily a corruption of Jersey, whence it originally came), nkind uf coarse cloth, usually ribo thed, and woven from long wos). It is chiclly mana. factured in the north of lingland. Kerseymere, on the other hund, in a thin atuti, generally woven plain from the tinent wools; and hence it has been inforred that these two terms, whose meaning is no distinct, can not the reforced to the same orkin. Kerveymore is waid to linve derived its apmellation from ( iashmir, a country which probluces the finest wool, and is consequently
most colalirat gland it ls $p$ nistrict.

most celabrated for the works of its looms. In England it is prineipally manufuctured in the western ilastriet.

Kotoh (It. caicehio), an old English term applied to a veasel equipped with two mata, and from 100 to 250 tons burden. It wae nearly gyonymoua with the modern term yrieht, lielng used chielly by embasadora or ether diatinguished personagen In veyages from ane place to another; and was furniahed with all the onparatus necesmary for defenas or aggreandon.
Keys. The lnvention of them faseribed to Theodere, of Samon, by Illiny, about 780 nc . . Hut this in an ertor, as keys are mentloned In the aiege of 'Troy, 1103 s.c. Keys were orighally mude of wood, and the carlient form was a mimple crook similar to the comnon pieklock now in use. The anelent keys now to he fonnd In the cabinets of the curlous are mostly of bronna. The late Francla Jonce, liaq., had nome of remarkabla shaper, the shaft terminating on one side by the workn, on the other by a ring. Keya of thia description ware presented by husbanis $t_{1}$; wilvea, and wers relurned again upon divorce or separatlon.

Keys are ce:tioln sunken rocks lying near the aurfuce of the water, particularly in the West Indlen, from the Spanirh cayo (an Inlet rock). The keys, so called, off the Florda coast, are prolifio ln wreckn of the larger chass of vesseln. For an account of thene wreckn, ree articlen Kicy West, Fhorida, and Wrecks.
Key-West, a anall island from four to tive miles in leaght, hy one in wheth; 56 miles sonth-west from Cape Sable, In Florida. It in one of the Florida keya, or of that extensive circular range of low lalnnile, bank, and reefn, which fences the coant of blorida, and forms the nerthern boundary of the (inlf Stream, from the Tortugas lslands on the west round to Cape Horida on the north. A Hight-house erectell on the gouth-west point of the ksland, lat. $24^{\circ} 32^{\prime}$ 'tiz' N., long. $81^{\circ} 48^{\prime} 30^{\prime \prime}$ W., has a fixed light elevated 67 feet alove the level of the water. The town of KeyWest, near the north-west part of the lalanil, has about 1600 inhahitanta, and has an excellent harhor, with about 25 fert of water. A safe passage, ubout iix miles in length, loads hy Key-West from the Galf Siream to the (inlf of Mexico. It has 12 feet of witer at ebb tide, and vessels from the north lound for Sew Orlenns, Mobile, ete., or Prom the latter for the fonner, by passling throughilt, avoid the delay and danger of the more westerly passage round the 'l'ort ugas. Owing to the frequent accidents to shipping from coming in contact with the banks and reefs in this dangerom vicinity, the American government has urganized an eatablishment at Key-West for the asistance of ships in distress, and made it the seat of an edminalty eourt for the miljutication of elaims for malrage. The former consints of above 20 licensed ressels, with crews of ubout 10 men ench. These are kept cunstantly craising about on the look-out for ship in distress or wanting pilots; and as their emolument priacipally depends on the fees they oltain for their ascintance, it may be fairly assumed that it will be readered with the greatest nlaerity, Hut the desirable thing is to hinder vessels from gettlag on shore, the assisting them when in that predicament being, though an impertant, a secondary conalderation. The latter, howerer, and not the former, is the moln object which the licensel cruixers of Key-West have in view ; and it would he preforable, conld means the devised for making their remmeration depend rather on thelr sucecss in preventing disasters, than, as at present, in mitlgating their intluence. This, however, is by no means easily done. Shipwrecks will, perhaps, the inore effertually prevented by increasing the number of lighthonses, light-vessels, and sea-marks along the edges of the islands ant reefs, than in any other way. Wo subhoin an account of the sums awarded as ailvages br the court of Key-West, in each of the 16 years eading with $1 \times 501$. These, though of small amount,
bhow a general uniformity, making it probaible that they are from local canses.

See Illuyr's Americun Pilot; Delkow's Imhutrial Reanurces ; Acrount of Light-hounen, U. S., in 1850.

Kiakhta, a Kusslan settlement of more than $n$ century olle, a little to the aouth of Lake Baikal, and constitutea, wlth the Cbinene frontier town Malmachen (which is in immediate juxtapoaition), the emporium through which the whole of the overland tea for Kussia passes, and it is from this fact that this place nequirea ita present importance. It la liy thia channel that the artlele originally reached western Europe; and If all Intercourse with the Chinese seaboard were atopped, by this channel only would all consumers, not only in Firrope, but In Amerlca also, be able to obtain lt. The whel "ea-drinking worlil would have to content itaelf wlth viltalning from St. Petersburg what supplies it conld, after It had been bronght a distance of nearly sin00 mites by land transport and rlver navlgatlon. The cost of tranait is auch that before the late war with Iluasia scarcely any thing was ilrunk throughout the whole kingdom of J'oland but smuggled Canton tea, which was every year penetrating further and further Into the Interior of Russia, as will be bellezed, when it is stated that the average whilesale price of the common tea was 270 copecks ( 9210 ) and of the beat 410 copecks ( $612 \times$ ) at Moscow in the year 185\%. To what price it would reach, were the demand suddenly inincrensed to anv great extent, is mere conjecture. One thing ls phain-it would dejprive not merely the common people, but the great bulk of the middle clase, of all purticipation whatever in this great necessity.

The dutica on this overland tea form on Impertant item In Russlan finance. A most serious diminution In them was oceasioned by the treaty with China which threw open the northern ports. In 1842 no leas than 467,679 poois of Chinese merchandise, the far greater part of it being tea, left Kiakhtin in 185.l little more than lulf as much. If a perfectly free Intercourse with the Interior of China were allowed, the Kiaklita trade would he proportionably diminished; and it is fuite eonceivahle that it would even be superseded nltogether, except as regarils the no-called "brick-tea"-a compost of tea-lenves and sheep's blood, in which the Mongul palate exelusively delights. This inference is Irawn confidently from the prositive statement of the Russian stutist, M. Tengoloraski, that the Kiakhta teat costs 20 copecks the poind in tramspurt before it even reaches the emporium; whereas the same article from the name depiot may he taken to Shanghal for only 8 copecks, and ull the way to London for 10. It is plain, therefore, that the question of open or closed jorts in China is the question het ween the annihilation of the linssian rovenue from tea, and the compelling of the consumers of the commodity throughout the world to enrieh the liussian treasury by purchasing a tithe of their requirements ut tenfold the price they need pay for an ample suppro

The only country which has an Interest in mealing the 1 hinese seaboard is likewise the only one which enjoys, and has long enjoyed, the privilege of heing represented at lekin. Wer since the year 1727 the Itasaian goverament has maintained un establishment in that capital, the members of which are changed regularly every 10 years. It originally professed to be for the spiritual behoof of the dencendants of some Siberitm settlers who had been carried ofl about half a century before from the uper valley of the Amoor,
but the mission still continues, although the necessity has ceased; and, while authentio information relative to the reeonrces and the administration of the Celestial Erupire is derived through this channol by the foreign effice at St. Peteraburg, no douht whatever opinlons are curreat at Pekin of the powers of western Europe owe thelr shape and culor to the same agency.-Le xdon Times.

Kiddermingter, a manufacturing town of Enngland, county Worcester, on the Oxford, Worcester and Wolverhampton rallroad, and on bu. ©ides of the Stour, near its contluence with the Severn, 15 miles north of Worcester. Population, 18,462. |" lilderminuter was noted for its woolen manufactures in the reign of Ilenry VIII. The fabrics now male are carpets and finger ruga, with eome bumbazinge, button coverings and waiatcoat pieces. The carpets are nnrivaled for excellence of workmrnehip at the low prices charged. In 1838, upward of 2000 looma, and 4000 hands, were employed in this manufucture. The Stafford and Worcenter canal paenes the town, and opens a communication with Liverpool, Hull, and Bristol. The Kidderminster and Scotch carpets are woven on the principle of damask patterne, all being wool, and the patterna being effected by arranging and interehanging two coters, so that white one prodominates on one side, the other pattern shows itself on the other side. They have littie substance, and soon wear out; their low price being their only advintage. They are made in widths of a yard, and are aohl at ahout Ba, eterling per yard, or nometines even beluw that price.

Eidney Beans, or French Beans, were introduced into England about A.b. 1633 . The kidney bean-tree (Gilycine frutescens) was brought to that country from Sonth Carolina about the year 17\%4, though some anthorities say earlier. Kithey benns are a summer puise, and ara of peculiar dellesacy earty in the season. They are much estcemed, both in this country and in Englund.

Eilogramme. In France, the unit used in weighing is the gramme, which hue been tixed by law, and is equal to the specilic weight of the distilled water contalned in one cubio centimetre. The gramme thas fixed weighe $15 \cdot 433$ graina Troy and $16 \cdot 9: 4$ grains avoirdupoia, while the kilogramme, which consists of 1000 grammea, is found to be equal to 2 livres (pounds) 5 gros, 35 grains- 16 -100ths joitls de tuarkand to 2 pounds, 8 ounces, 3 pennyweights, $6 \cdot 355$ grains 'Proy, or 2 pounds, 3 ounces, 4 itranchans, 16 grains avoirdupois weight Einghish. An the moat common thlugs of daily consmmption are autd by weights in smail quantities, a great dilliculty urose in introducing thin part of the syatem; und the old denominations of welghts have therefore been allowed to remain, with some modification in their actual value, taking the kilogramme as the banis. The kilogramme is divided into 2 livres, the liver is subdirided into 16 ounces, the ounce into 8 gros, and the grow into 72 gralns. The new Uyre, therefore, exceeds the ofd one (poids de mare) by $2-1$ Cothe ; so, to reduce kilogrammen into old measure, it is necessary to nuitipity by 2 and add 2-100tha. In the decimal syatem adopted In 'rance, the pretixes for multiplying are tireek, and for diriding are latin, Thus:

| Deca means | 10 ttmes. | Deel | incans | 1 mb | uart. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Heeto | (11) " | Cent | " | 16以 |  |
| Kilo | 1,1100 | Milil | * 1 | 1,090th | ${ }^{*}$ |
| Myrla | 10,000 |  |  |  |  |

We have, therefore, the milligramme, centigramme, dseigramise, Gमamмr, decagramme, hectigramme, kilogramme, and myriagramme, as the namen of the various weights.

Eino (Fir. Gomme de Kino; Gisr. Kimoharz; It. (Chino), a gum, the promluce of trees that grow in the Lant and Weat Indien, Africa, Bocany llay; etc. The kino now found la the abops is aaid by Dr. A. T.

Thomson to come from Indla, and to be the producs of the nauclea gambir. The brancheo and twigs are brulsed and bolled in water. The decoction is then evaporated until it acquiree the consiatence of an extract, which is kino. It is importen in ehests containing from 1 to 2 cwt .1 and on the inside of the hid of each chast is a paper, inscribed with the name of John llrown, the month and year of its importation, sind atating that It is the produce of Ambryns. It is hodorous, very rough, and elightly bitter when lirst taken Into the mouth; but it afterward impresses a degree of eweetness on the pralate. It is in small, uniform, deep brown, shining, brittle fragnents, which appear llke portions of a dried extract broken down; being perfectly unlform in their appearance. It fe eablly pulverized, affording a powdor of a lighter brown color than the fragments. Ilut it may be doubted whether the insplesated juice of the nauclea gambir ought to be coasidered as kino. Dr. Ainslie says that Botany Bay kino is the only kiud he had seen in an Indian hazaar. The tree which yiedds it grows to a grent helght: it flows from incisions made into the wood of the trunk.-Titomsos's /ispensatory; Ainhlie's Mfateria Indica.
Knee, in a ship, a crooked piece of timber, having t wo liranches or arms, and generaily used to connect the beums of a ship with her oldee or timbers. The branches of the knees form an angle of greater or amaller extent, according to the mutual situation of tha pieces which they are designed to unite.
Kinee of the Ilead, a large, that piece of timber, fixed olgowise upon the fore part of a ship's stem, and supporting the ornamental figure or hauge placed under the howsiprit. I'he $h$ wee of the head is a phrase peculiar to ahipwrights, as this piece ls always called the cutvater by seamen, if we excent a tuw, who, allecting to he wiser than their brethren, have adopted this expression, prolucbly on the prosumption that the other is a cant phrase or vulgarism.

Curling-Knees, in a nilp, those timbers which ex. tend from the ship to the hatchwny, and bear up the deck on both sides.
Kniven (Ger, Mfesser; Dn. Messen ; Fr. Couleaus; 1t. Coltelli; Sp. Cuchillos; Rus. Noohi) well known utenaila made of iron and steel, and enıployed to cut with: they are principully manufnctured in lomaton and Strellichl. Knives are made for a varicty of purposes, as their different denominations imply ; such as tahle-knivea, pen-knives, oyster-knives, pruningknives, cte. Although England at [resent excels every part of the world in the manufacture of knives, as in most branches of enthery, the ther kinls were imported antil the reign of Elizalieth. It is stated ly Mr. Mncpherson (Anmals of Com.: A.11. lithit), that kniven were not mate for use in lingiand till listis; but there can be no doubt that this is an urror. They had leeve made, though protably of a rude and elumso pattern, for centurien before, in the district ealle! Italfamshire, of which Sheftield is the centre; the cutlers of London were formed into a cerporation in 1117.Manufictur - in Metol, in Lamonsin's C'ychopedias. See llantowauk and Cutheny. Forke were In lise on the Continent in the $\mathbf{1 3}$ th and 1 dth centuries. - Foltathe. This in reasonalily disputed, as heing tou earty, In Fixise Monymon's linerary, reign of Nilizubeth, le says: "At Yenice each parsum was served (besiden his knife mili apooni) with a firk to lold the meat while he cuts it, fer there they deen it ill manners thar one should touch it with his hand." Thomas Coryate describes, with mush minmaty, the manner of using furks in Italy, and adds, " 1 uyself have thought it gorel to limitate the italian fashion since I came home to kingtend," A.t. than.

Konigeberg, the capital of enst I'rusxia, in las. $54^{\circ} 42^{\prime} 11^{\prime \prime} \mathrm{N}_{+1}$ long. $20^{\circ} 29^{\prime} 15^{\prime \prime}$ E. $l^{\prime \prime \prime}$ pulation, in 1846, 75,234 . Ariteles.

[^30]- tog ituperial qu
ake having from 10 to 14 feet water. The bur at the mouth of the Pregel has only from 10 to 11 feet water, eo that vessels of more than that draught of witer requiro to be lightered to come up to Konigaberg. Pillau, in lat. $54^{\circ} 33^{\prime} 39^{\prime \prime} \mathrm{N} .$, long. $10^{\circ} 52^{\prime} 30^{\prime \prime} \mathrm{IE}$. on the north side of the entranca from the Baltio to the Frisehe Ilaff, is properly the port of the town. Within these fow years, a light-houas has been erected on a rising ground, a little to the aouth of lllleu, the lantan of which la elevated 90 feet above the level of ths sea. The light is fixed and brilliant. The entrance to the harbor is markel by buoys; those on the larboard side heing aurmounted by amall flags. A Gothic building, 120 fect abrove the level of the sea, has been erectell te serve for a land-mark; nt a distance it looks like a three-nrasted ship under sail. There is usually from 15 to 16 feet water between the hueys on entering the harlor; but particular winds occaslon material differences in this reapect. Being aituated on a navigable niver of ennsiderable lmportance, Könlgsberg has a large commund of lnternal navlgation, and is the prinedpal emprium of a large extent of country. Wheat, rye, und other species of grain are tho chief artleles of export. The wheat la somewhat similar to that of pantaic, but of inferior quality, belng larger in the herry, und thicker skinned. The rye is of good quality, hut barley, with fow exceptions, is thin and light. $A$ few remarkable large and fine peas nre exported; but the luik are of small slze, ant inferior. Onts aro commun feed, with a sllght admixture of tures, but as these hast answer in some dogree the purpose of heans, the value of the oats is rathar enhaticed than otherwise by the circmustance. Morc tures are ahipued here than from any other port in the llaltic. The price of all aorts of grain ls uatally lower at Könlgsberg than at the nelghboring Prusalun ports. Linseed and rapeseed, hemp, llax, linens, oil-cake, vil, bristlee, refinel sugar, etc., are largely exported.

Money, Weights, and Measures, same as at Dantzic ; sce Dantzic.

Kurk - see, or Karachee, the ,rincipal sem-jort town of Scimin, on an inlet of the Indian Ocean, 18 miles from the west branch of the Indus. Lat, $24^{\circ}$ $17^{\prime} 3^{\prime \prime}$ N., long. $65^{\circ} \mathrm{bti}^{\prime} 2^{\prime \prime} \mathrm{E}$. It stanils on a low, sandy whore, and a fow yeurs ugo consisted, with ita extensive suburbs, mosily of straggling linte; but the latest accounta state that it has been almost reluiit, and greatly limproved since it has become a liritish ;ossession. Its trade and conserpuenco are rupidly augmenting. The harbor is the only port along thia const for vessels drawling more than 10 feet water, and Is sleeltered by Cape Munorah, four miles south-weet.

Iaboring of a ship, Implles pitching or rolling heavily in aturbulent sea, an effect by which the masts and hull are greatly endangered; because by the rolling motion the masta strain npon thelr shrouds with an eflort which Increuses as the sine of their obliqulty; and the continual agitation of the vessel often loosens her joints and makes her oxtremely leaky.

Labrador, a large peninsula of North America, nearly of a trlungular shape, extending from N. lat. $50^{\circ}$ to $63^{\circ}$, and from W. long. $56^{\circ}$ to $79^{\circ}$. It is bounded on the south by Canada and the Gulf of St. Lawrence, east by the Atlantic Ooean, north by IIudson's Strnits, and weat by Hudson's 13ay. Lahrador is thus detached from the arctie lande, but is nevertheleas a country as frozen, desolate, and barren, un those on the west of IIudson's Bay. The const along that apacious Inland nea is called liant Maio, and the elimate there is peculiarly rigorons. The whele surface of Labrador, indeed, is as storile and naked as any part of the globe. The prevailieg features are rocka, awamps, and water; and vegetation uppears as the last effort of expiring nature. Snell, seraggy poplars, stunted firs, ereeping birch, and dwarf willowa, thidy neattered in the sonthern parts, constitute the whole of the treen. Herbs and grana are also in aheltered places to be met with, but in the nost northerly parts only varieties of moss and lichens are to he found. The whole of the interior, from the aspect of what has heen explored, and from the reports of the Fsquimaux and other Indiana, seems to he broken up with rivers, lakes, and rocks. The prevailing rock continuons to the sea-shore of Iabrador, is gnelss. On this, at l'Anse a I.oup, the mout fertile jart of the coantry, a bed of old red sand-stone, abut 200 feet thick, is superimposed, and extends about half a mile Inland. Ilere, also, as on other parts of the const, the appearances of the cliffe and of the land near them, and the rolied masses inland, which bave evidently lieen exposed to the action of the sea, secm to prove that the latter has consherihly receded.

On the coast of Jabrador the winter is extremely severe, the thermometer often falling 30 degrees beJow the freezling point ; and although the houses of the Noravian misslonaries are heated by large castfron stoves, the windows and watis are all the winter covered with ice, sad the hed-clothen freeze to the walls. linm is frozen ln the air as rapidly as water, and rectified apirits soon become thirk like oil. From Decemiser to dune, the see: ompletely frozen over, and an intense is the cold during the winter montins, that traveling is ametimes attended with the most palnful consequences. The summer months, again, are extremly hot along the const, the thermometer rising to $8 f$ degreen of Fahrenheit, when awarms of musquitoen Infont the alr.

The elimate is not insululrious; and, notwithatunding all its disadvantagea, Jabrator in of considerable Importance to Grent llitalı. No country is better provided with large, convenlent, and afe harioors, or aupplied with lietter water; and vast multituiles of all those kinds of fish cormwn to the aretic neas abound on the coant. Ilerringsare very fine and plentiful in August, bat there is no weather to cure any kind of fish after the loth of Septeminer. The rivers are frequented liy aalmon and aea trout ; and phke, barliel, eels, river tront, and the like, are likewise found in them. On the numeruas blands whidh are acatered along the east const, maltitules of ehler-ducka and other water-fowl breed. Those of large size have dever, fuxen, and hares upon them. On the continent the wild animals ure principally bears, wolven, foxes,
and otters; beavers and deer are not numerous, but their furs are remarkably close and beautiful. The birde of the country are the white-tailed engle, falcons, hawks, and owls of varlous kinds ; raven, white grouse, ptarmigan, spruce-game, whistling-curlew, gray plover, varioua kinds of sand-plpers and ether wroders; geese, ducks of various sorts, shags, gulla, divers, and some fow apecles of small biris. During the ahort aummer insects are very numorous, eapecially in swampy places. In winter they exist in a state of torpidity, from which they are areused by the solar heat or artificial warmth. The phenomemon of the anmora borealis is uncommonly brilliant in this region, and exarcleses a very marked Influence over the compnes.
No accurate accoant of the truie of Labrader ean he olitained, as there are no cuatom-honses or public officers in the country; but the following estimate is probably as clese an approximation as can be made to the annual value of the experts :

| In Nowfonndland vern | £240,400 |
| :---: | :---: |
| " Nova Seotia | 96,000 |
| "Amortean " | 90, 010 |
| "Canadlan " | 29,400 |
| " Vessels owned or chart or Jersey honses. | 96, 040 |

Some, however, extimnte the total exports it $£ 800$, 000.-E. 13.

The oxports of Lal,rader are cod, herring, pickied salmon, fresh salmon (preserved in tin cases), sealskIns, coll and senl oil, furs, and festhers.
Fishories of Inbrador.-An lnte as 1761, it is not probahle that fishermen of any flag had visited the waters of Labrador. The English whale and sea fisheries were the first, and employed upward of j00 ves. aels, at times, pror to the yenr 1775. The earliest ad. ventures were near 1763 ; is at that time the jabradur country was palitically separnted from Cansia, and annexed to the govermment of Newfoundland ly, royal proclamation, to the end that the "open anil free fishery of our subjects may he extended." The pursuit of the eod and salmon followel. Menntine the $\mathrm{B}_{0}$. raviuns, whone principal settlement is nt Nuin, who have ever led a quict and aimple life, and who now annually ship furs, oids, and other productions of that region to England, in payment for the manabactured commoditles which they require, hath fotunded a colony. The lslands aro so numerous, und so near cach other, as to resemble, and often to be mistaken for, the moln land. llack from the coast, the comutry is still unknown. Labrador atill forms a part of the calony of Newfoundland. The natives hear the general name of Eanquimaux. The realdent indabitants of Eurogesn orisin are English, Irish, Jerseymen, and tamatian, who are employed vither on thelr own acconnt, or as servants of others, as furriers, scal-catchers, and col and walmun-fishers.

The Camulian fisheries are mall. They semp 8 or 10 wessels to the coust, with 80 or 100 men. They thah for cod ant? aultoon. They carry a part of what they caluli to Quebee, nud nend a jart to Durope. The colonlsta of Nova Scotla and New Brunswick adventure at labirculor to a comiderahle extent; but they do not pursme the husinesan as ragularly and with ua much systiom an do those of Nevfoundiand. Sume. times they send uore than 100 vessels in a year; at others the number ts moch les. They angage princtpally In the cod-tishery, making a singig fire and cur. inge their fish at home. The latirador tisheries have "Increased moro than aixfoli," nays Macgregn, "principally in consequence of our tishermen (tho

The fishing establiahments of the English and Jersey merchants are extensive and well conducted. They are engaged in the cod and salmon flsheries, and in the taking of seals. In the yaar 1831, the value of their shipments to Europe was npward of 8200,000 . The number of these commercial houaes is from 10 to 12, who mansge their business at Newfoundland, elther thy the temporary presence of junior partnera or derks, or by realdent agents. The people of Newfeundland, averring that the French and Americans have driven them from their own "bank-flahery," resort to Labrader. They employ 200 or 300 vessels. A part make two voyages in a season. The tirst fare is commenly eured on the coust ; but the socond is earried home without drying. Some of the merchanta of Newfourdland ship both cod and salmon directly to cerrespondents in Europe; while others oriler their captains to return to the laland and unlade their flsh and eil at their own warehouses.-Sanink's Anerican Fisheries.

Labuan, a small Island off the north-west coast of Hornee, a dependency on the British crown, about six miles distant from the nearest point of the mninland, and 30 miles north from the city of Borneo or Brunt, lat. $50^{\circ} 12^{\prime} \mathrm{N}$., long. $115^{\circ} 19^{\prime} 36^{\prime \prime} \mathrm{E}$. It is from 25 1030 miles in circumference, flat, and covered with wood. The nuchorage on the eonth side of the island is protected by agrenter and three amaller ishands; and the town of Victorin has been commenced at the embonchure of a rivulet $\ln$ a small bay, at the head of the ancherage:' Coal of good quality is found on the island, and it is well supplled with fresh water. It was ceded ly the Sultan of Iorneo to Great Britain in 1844 ; and Sir Jamas Brooke, who negotiated its cession, was afterward appointed lis governor. When it cameinte posse sion of the English it wus uninhabited; but lis aituation ls such that, proviled it be moleratefy healthy, it can lurdly fuil to become an important emporium. It lies near the liest ronte for shipping from the Stralts of Singspore to China, and, while it is extremely well aituated for carrying on trale with the west anil north consts of Bomeo and the Phillppine Iflanda, it will serve as a harbor of refuge, and as a convenient atation for the steuners and other ships of war required to put down the piracy that has been, to the great injury of cominerce, carried to ao great extent from the ports and rivers of $\mathrm{B}_{\text {boneo, and of }}$ sone of the adjacent ishunds. In this respect, its abundant supply of coal will the of the greatest service. If war, the passesslon of Labonn will give to the English entire command of the Chlnese Sen.- Brooke's Jourmal.
Horneo, ar Branl, on the adjacent shore of the mainland, and the resilence of tho Saltin of lSorneo proper, has heen termed the Venice of the Bast. It contuins frome 80,010 to 40,100 inlubitants, moatly Malays, and rally seems as if it tlonted on the waves. It is situalel on an estury, anl thomgl lmilt with little regard to regularity, it is internectel erosswlase by two main streets, which divile it into tour jortlons, one only of which stands on dry land. The housen in the other three parts nre of wood, huilt on piles, which enpport them nhove the water, with atreetix, if so they may be eslled, to admit the passage of eanoes. The steamer
whleh convejed Sir James Brooke to Borneo, when Lahuan was ceded, anchored in the main atreet, in the centre of the town ! "The greatest novelty at Brunl," says Mr. Marryat, from whom we have borrowed thase detalla, "is the floating bazaar. There are no ahops in the city, and the market is held every day in canoes. These come in at aunrise avery morning from every part of the river, laden with freeh fruit, tobacco, pepper, and avery other article which is produced in the vlcinity; a few European productiona, such aa handkerchiefs, check-cotton printe, etc., alao make thair appearance. Congregated in the malu atreet, the canoes are tacked together, forming lanes, through which the purchasere, in their own canoes, paddle, selecting and bargaining for gooda with as much convenience as if the whols were tranaacted on terra firman Iron is here so valuable that it ia uaed aa money. 100 flat pieces, an inch aquare, ara valued at a dollar; and among the lower classes these iron pieces form the aole coin. They are unstamped, so that any person appears to be at liberty to cut his own iron into money; but whether such is really the case, I can not vonch."-Marmyat's Borneo.

But thougly deficient in iron, the gold minea of Borneo are salil to be of the richeat deseription. Sir Stamford Rafflos estimated that in his time about 32,000 Chinese laborera were employed in these minea on the west coast of Borneo ; and it ia not eusy to asy how productive they might become ware the miners in a condition to prosecute their undertaklaga in eafety, and to bring the resources of science and of eapital to their ald. Antimony is slao found in abundance in Borneo, eapecially in the district of Sarawak, of which Sir Janea Brooke is rajah; and the diamonds of Borneo rival those of India and Brazil. But independently of its coal, and of its precious and other metsls, its vegetable products might alone furnish the materiala of an extensiva commeres. The sago-palm grows in great perfection in many parts of the islund, and sago is largely exported in it rough state to Singapore. The areca nut, rattan, gutta-pereha, gum-benjamin, camphor, hirds' nests, etc., are also considerable articles of export; und sugar, pepper, anel all the products of tropienl regions, might, with a little care, be raised to any extent in most parts of thia vast island. The numbers and ferocity of the aavages by whom it ia occupied present, indeed, formblable obstnclea to its improvement. Ilat civilization la beginning to make its way smong them ; und, though probably slow, its progress can not well be arrested.
Lac or Gum Lao (Ger. Lack, Gummilaek; Fr. Laeque, Gomme lacque; It. Lacca, Gommalacca; Sp. Goma laca; las. Laka, Gummilak; Arab. Laak; IIind. Lak' $h$; Nans. $L_{i} k^{\prime} s h i \bar{i}$, a substamee whleh has been improperly called a gum, proluced in Bengal, Assum, l'agu, Siam, etc., on the leaves und branchea of certaill trees, by in insect (chermes hucea). The troes selected hy the insect on which to deposit its eggs aro known by the names of the bihar-tree (Croton lacciferum Lin.), the perpel (Butea firmilosa), bott and coosimtrees, ete. After being deposited, the egg is covered by the inkect with a quantity of this peculiar sat)stance, or lac, evilently intended to acrve, in the economy of nuture, as a nidus and protection to the ovum and insect in its flrst stage, and as food for the maggot in its more alvanced atage. It is formed into cells, finished with us much art as a honeycomb, but differently arranged. Lat yieds a tine red dye, which, though not 80 bright as the truo Mexlean cochineal, is said to te more permanent; and the resluous part bextensively used in the manufacture of sealing-wax and hats, and as a varnish. Lac, when in its nutural state, incrusting leaves and twigs, is called atick luc. It is collected twice a year; and the only trouble in procuriug it is in breaking down the leaves and brunches, and carrying thom to markot. When the twigs and sticks uro large, or only partially cov-
ered, the lac is frequently separated from them, as It alwa's ought to be when ehipped for inarket, to lessen the expense of frelght. The best atlek lac is of a deep red color. Whon held against the light it ohould look bright, and when broken should nppear in din-mond-like points. If it be not gathered till the $\ln$ sects have left thelr cells, it beconies pule, and pierced at the top; and it is of little use as a dye, though probably better for a varnish.

Iac dye, lac lake, or cake lac, consists of the coloring matter extracted from the atick lac. Varjous processes have been adopted for this purpose. It is formed into amall square cakea or pleces, like those of Indigo. It should, when broken, look dark-colored, shlning, smooth, end compaet; when scraped or powdered, it should be of a bright red color, approaching to that of carmine. That which is sandy, light-colored, and epongy, and which, when seruped, is of a dull brickdust color, should be rejected. Notwithstanding the continued full in the price of cochinenl, the nse of lac dye has been extending. The annual consumption in 1853 was estimated nt nowot $1,200,00013 \mathrm{n}$., having more than quiutupled since 1818. The finest qualities of lac dye are seldom met with for sule In Calcutta, being generally manufactured umber contract for the European market. When stisk lac has been separated from the twigs to which it naturally adheres; and coarsely pounded, the native silk and cotton lyers extract the color as far as it conveniently can be done by water. The yellowiwh, hard, resinous powder which remains, haviug somewhat of the appearance of mustard-seed, is called seed lac. When liqueticd by fire, it is formed Into cakes, and denominated lump lac. The natives use the latter in making bangles, or ormaments In the form of rings, for the arms of the lower class of femates: the hest shellac being used in manufacturing these ormaments for the siperior class.
Shellac is produced from seed lac, by putting the latter into bags of cotton eloth, and holding it over a chareoal fire, when the lae melts, and being strained through the bag, the resinous part, which is the most liquefiathe, is obtained in a conviderable alegree of purity ; It is formed into thin sheets or plates. Thin, transparant, or nmber-colored shellar is best. A volid that whleh is thiek, dark, and speckled. It should a)ways, when broken, be amber-colored on the elke. That which has dark-brown fracture, however thin, should le rejected. When latid on a hot Irom, shellac, if pure, will instantly catch tire, and hum with a atrong but not disagreable smell. It used to be prineipally employed in this country in the manufacture of sealing-wax and us a varnish, hut it is now very extensively ueed in the manufacture of hats. In Hengal lae is chlefly profluced in the forents of Sylhet and Ilurdwan. The finest dye is sulat to be obtained from the stick lac of Siam and l'eg'u ; but the nhellae or resinous part obtalned from the latter is luferior to that produced from Sythet stlick lac. It may lie olstained in almost any quantity.-llanisort on /'rmanent Colors; Aisslar's Mut. Sfed.; Ma.aurn's Orient. Com.

Lac of Rupees, is 100,000 rupees, which, suppresIng them standard or siccas, at 2n. 60. each, amounts to $£ 12,500$ sterling.

Laccadiven, an archipelagn of low inlanda lyinfe off the wextern const of Indha, hetween $8^{\circ}$ nnd $13^{\circ}$ $N$. lat. There are 19 conslderalice ones; but ns most of them are surrounded with reefs and steep rocks, with a great depth of water cleap to them, the approach to them is very dangerous. Ihetween these inlands there are many channels, through which ships from India. bound to I'ersla or Arabin, frequently asil. The afest of these is called Mamale, or the Nineale. gree Channel, which runn letween the Inlandi of Seuhilipar and Kalpenny. The largent of these ixlands is atosut 7 mllem in length and $2 f$ in breath. Most of tinem are inbabled by a race of Mohammedans called

Moplnys. They do not yleld graln, but produce an infinite quantity of cocoa-nuts, from the huska of which they form the coir cablea, which are more elasthe and durable than hemp, as the sea-water, histead of rotting, preeerves them. These lslands are well supbled with fish, and carry on a trade with the small shells called cotorica, which pass as coin all over India and most of Africa. Most of these islands are under the uncontrolled management of the beebee of Cannanore, sulject to the payment of an annual tribute to the British government. A proposal has been made to the beebee to transfer them to the Britlsh, la consideration of a pecuniary equivalent. The $y$ were dis. covered by Vaaco de Gama In 1499, but have sine been little frepuented by Europeana.
Lace (I).. Kanten; Fr. Dentelle; Ger, Spizen It. Merletti, Jizzi; Rus. Krushero; Sp. Encajes), a plain or ornamented net-work, tastefully composed of many fine threads of gold, silver, silk, flax, or cotton, interwoven, from Lacinia (Lat.), the gunrd hem or fringe of a garment. This dellcate fabric appears to have clains to high antiquity, but its origin is involved in considerable obsenrity. That it was worn by Grecian femules is certain, and the derivation of the word lace afforls preaumptive evidence that it was also in use among the liomans. In Venice, and the neighioring States of Italy, it was very early worn ; and Mary of Medleis is supposed to have been the tirst who introduced ite use into France; but as early as 1.183 it was lecluled in a list of artlcles prohibited from importis tion into England. Hence it had been made in this country piore to the period above mentioned; and this prohibition, like many other subsegtuent nets, was for the protection and encouragement of home munufuctures. llut pins, which are indiepensable in the process of fine lace-making, were unknown till long afterwarl ; so that it is probuble the fabric made was neither very fine in texture nor produced to any great extent. It is uncertuin by whom the manufueture of lace was originally introduced Into this country. Alsut the middle of the 17 ith century the lace trade was touriahing in Buckinghamshira; and so greatly. had it advanced in England, that, by a royal ordunnance in France, passed in 1600, a mark was estallished upon the thread lace inported from this country and from Flanders, and upon point lace from Genoi, Venice, and other countrics.
fillou, or Threais Iace, is made by placing a perfornted puttern on a hard stufled pillow, and the thread recuired in wonnd upon hobhins with a grove in the upper part for retaining the threal ; while, to form the meshes, pine are stuck in the cushions, and threals woven or twhated round them, the pattern showing the polats of insertion for the pins, and also the direction for the gimp, which is interwoven with the tine threals of the faliric to form the pattern. At the commencement of the work the bobbins are arranged on one side of the cushion, and are lirought to the froit side, two puirs at a time, and twisted together. The woman holds one pilr of hobbins in cacl hund, and twists them three thes over eachother to form the sides of the mexh, the adjacent bobbins of einh puir are next interchnnged, so as to cross thene threals over one another to form the lootum of the next. Supposing the four bobling to be marked $1,2,3,1,-\mathrm{Ko}, 1$ is twintell round 2 , nud No. $i \frac{1}{}$ round 1 ; thene, in onler to crove 2 and 3, are interchauged, so that 1 and 3 and 2 nnil 4 come together, aud at the next $t w i s t$ those pairs of threads will be combined. As the meshes or half-ilmashen are furmed, they are secured by pins. These four bobhins are now put on one nide of the cushion; two nore pairs are brought forward, twisted and crussed as before, and these operations ate repenated until a row of meshea is formed of the required breadth, when the bobbins are worked over again to form another row. From 48 to 60 bobbins are required fur every inch of bremith. l'illow or threal

Flowers aro tremely fins net
lace, formerly employed a large number of women and children in the counties of Bedford, Buckingham, Northampton, and Oxford, but the demand for this kind of white thread laco failed, and llack lace took its place. Lloniton lace ditfers from plllow lace in having the pattern made aeparately. The ornaments were formerly confined to almple aprigs and borders; but the fabri s now produced show extreme delieacy of execution, with beauty and taste in design : flouncings, shawls, scarfs, handkerchiefs, berthos, etc., now vary in price tiom 10 to 200 guineas. The Honiton lace district extends alout 80 miles along the cosst of Devonshire, and about 12 miles inland. In 1851 from 7000 to 8000 persons were employed in the manufacture.

British point, tambour, and Limerick laces are chiefly imitation, and are produced in shawls, scarfs, dresses, court trains, flouncings, lappets, etc. British point is made chiefly in the nelighborhood of London, tambour chiefly at Islington, Coggleshall, and Nottingham, while Limerick lace is peculiar to Ireland. Black laces now occupy a considerable portion of the attention of the trade. The most celobrated laces have been elassed as-1. Brussels, the most valuable. There are two kinds: Brussels gronnd, having a hexagon mesh, formed by plutting and twisting four threads of flax to a perpendicular line of mesh; Bovssels wine ground, made of silk ; meshes partly straight and partly arehed. The pattern is worked separately, and set on by the neerite. 2. Nechlin: a hoxagonal thesh, formed of three flax ihreads twlated and platted to a perpendicular line or pillar. The pattern is worked in the net. 3. Valenciennes: an irregular hexagon, formed of two threads, partly twisted and platted at the top of the mesh. Tbe pattern is worked in the net similar to Mechlin lace, 4, Lisle: n diamond mesh, formed of two threads platted to a pillar. 5. Alencon, called blonit: hexagon, of two threads, twisted similar to Buckingham lace; considered the most inferior of any made on the cushion. 6. Alengon point: formed of two threads to a pillar, with octagonal and aquars moshes alternutely.
In the munufacture of lace, France takes the lead; and it is calculated that the production of lace by band gives employment in that country to upward of 200,000 females of all ages. It is all made with loobhing upon s amall pillow, except at Alencon, where the needle only is employed. The materials used are hand-spun linen thread, cotton, wool, silk, and gold sud silver thread. Point $d^{\prime}$ Alencon is the only lice made with pure linen hand-spon thrend; this threati is worth from 8500 to 600 per pound. White lace is now chiefly made with cotton thread, Nos. 120 to 320. The principal scats of the manufacture are-Caen and Bayeux, Chantilly and its neighborhood, Lille, Arras, Mirecourt, Pay, Bailloul, and Alençon. Each of these districts has ite own peculiar style; and although the lace may be made in the same way, and with the same material, ia nil thene districts except the last, yet each is easily recognized. Silk blond originated at Caen, and was so called from belng made of nndyed silk of a aankeen color: the finest white or the finest bluck silk is now emploged. Caen and bayenx excel all other places in the production of piece goods, and manufacture shawls, roles, mantles, etc., more extensively than nny other distriets in the world. lly means of a stitch called rucroe, the wonien of the department of Culvados join several parts into one piece so cleverly as to defy detection, even with a magnifying glass. Mest of the improvements ani noveities in lace-making origin - o at Mirecourt ; it prodnces the ssme kind of lace ia Lille and Arras, via., clear foundation, fonds clair, and also fonds de champs, in white thread, slso a lace resembling the IIoniton called guipure.

Howers are also made, and sewed upon the extrenely fina net called lirussels net, closely resem-
bling the Belgian fubrlc. The whiteat and cheapeat Freach lace is produced at Ilayeux.
Belgium is the grest rlval of France in the manufacture of laces, the chief varieties of which are known as Brussels, Dfechlin, Valenciennes, and Grammont. Brussels produces two descriptions of lace, known as point à l'aiguille, snd Brussels plait, the one made entirely with the needle, and the other on the pillow. The finest kind is mad of very fine flax thread, and some of cotton. It is remarkably soft and clear, but very costly. Mechlin laces are made at Malines, Aatwerp, etc. They are mado in one plece on the pillow, and the flowere are sarrounded by a plait thread, which designs tle outline, and has the effect of embroidery. Valensiennes laces are made chiefly at Ypres, Menin, Courtrai, Bruges, Ghent, Alost, and their respective neighborhoods, each town having its characteristic peculiarities by which its productions aro identified. Ypres produces laces of tho finest square grounds, varying in price from 12 cents to $\$ 250$ the English yard.

It is natural to suppose that attempts would be made to lessen the cost of production of so beavtiful and costly an article as lace. It was not, however, until machinery had been largely intioduced for the purpose of manufacturing textile fabrics that lace machinery can the said to have been successfully employed. About the year 1768 a frame-work knitter of Nottingham employed the common stocking-frame In the manufacturo of luce, and about the same time another person of the sume pluce introduced a pin machine for making single-press point-net in imitation of the Brussels ground. Varions machines wore from time to time introduced, all of which, except the varp machine, have been superseded by the bobbin-net machine, so called from the circumstance that the thread that makes the lace is partly supplied from bobbins and partly from a warp. The first successful machine of this kind was mudo and patented by John Heathcote in 1809, the principle of which was to pass the boblins from front to back, and from back to front, while n lateral inotion was imparted to the warp-threads, thas causing one series of threuds to wrap round the uther. The first machine was so complicated, that 60 motions wero required to complete one hole-an effect that cau now be produced with six. The cost of production hus also moro thun proportionally decreased; for in 1815 one square yurd of tho produce was worth $\$ 7$, and can now bo purchused for eight to tea cents. Up to the year 1831 plain net and quillings woro the chief produce of the boblin-net machine; lut sbout this time methods were introluced to purl and bullet-hole the edges of narrow laces, finishing them afterwarl, with a gimp thread, with the needle. The machines used wero known as the Leaver's, named after the original constructor; the pusher machine, so called from having independent pushers to propel the bobbins and carringes from front to back, insteal of pulling or loooking them; the circular mac'dine, so called from the bolts or combs on which the carriagea pass beiog made circular instead of straight ; the traverse-varp] machine, so called from tho warp traveraing, instend of the carriages. Ahont the year 1839 the Jacquard apparatus was successfully applied to a pusher machine; and since 1841 , when a plan was discoverd for applying the Jacquard to the guide-bars, acurcely a machine has been worked without the ornaments being applied by means of cards. New sources of manufncture soon developed themselves, such as flounces, scarfs, ahawls, window-curtains, etc.

Bobbin-net luce owes mach of its beauty to the quality of the threude, and the correct shape of the meshes. liy increasing the umber of warp-thrends within a given spnee the meshes ure reduced in eize, und finer lace is formed. There may be from 700 to 1200 und upwarl of warp-throads in a piece one yurd wille. The flneness, or gnage or points, ss it ta culled, depends
on the number of sifte in the combs, and hence on the number of bobbins in an inch; thus grage nine points indicates nine openings in one inch of the comb. The leugth of work counted vertically, and containing 240 holes or meehes, is called a rack. A circular-bolt machine may produce about 360 rucks per weak. Bobbln-net is made up in pleces of from 20 to 30, or more yards in length, and of varialle breadth. Nar row quillings are worked together in a numbor of breadths, united by threads, which are afterward drawn out. In well-mude lace the meshes are alightly elongated in the direction of the selvage. Ornaments, consisting of soparate flowers, sprigs, etc., are worked in by a Jacquard apparatus attached to the frame; but as the ornaments are all necessarily connected by the thread of glinp which forms them, the connected thread is afterward cut out with acissors, by children employed for the purpose. Where the inachine produces only one plain net, the pattern ls workod in by hand, the lace-runner being gulded by a lithographic pattern placol under the net. When the embroidery is complete, It is examined, defective parts are murked by tying the lace in a knet, and thene are restorad hy a distinet met of women called lace-menilere.

In addition to the bobbin-ruet machine for making lace, there is almo the varg machine, invented alout the year 1775. It was suggested by the stockingframe, thich only one thread is reyuired, while in the warp-frame there is a thread to each needle. The first articles mude by it were ailk stockings, with blue and white zif-zag stripes, or mandykes, as they were ealled, from the name of one of the four claimants to the inventlon of the warp-frame, the uther three leing Engllshmen. Alout 1784 a Nottingham mecinaic greatly improved the warp-frame by the applicution of the rotatory motion, and the cam-whicels to move the guide-bars, still known as Dawron's whech. The improved framen produced officers' sashes, purses, liracen, and other elastic textile fabries, the manufacture of some of which still continues. In 1796 s new falric was produced from the warp, and employed for mailora' jacketa, pantaloons, and the article known an Jerlin, so much used for making gloven. Warp machines were the first to produce ornamental patterns on lace, such as apots, bullet-holea, etc., which had been previously embroidered or tamboured liy hanil. The bohbin-net machine, invented in 1809, soon liecame a formidalle rival of the warp, and inthenced its fortunes in various ways, until 1899, when the Jaequard apparatus was applied to it, and so much increased its eapiabillies as to intromuce into the warp-lace trade of Nottingham a new clase of products of elaborate design, such as shawls, scarfs, mith, fall A , luces, etc. Of late years the tacist machine has been employed on aimliar goorls, and has to a great extent superseded the warp. Great improvements have also been introduced in the Finglish methods of dressing lace, especially in silk goods. Many new kinds of elastic fabricn, in gloves, in ailk, and other materlala, have been introduced. Velvet, and velvet in combinatien with luce, have also leen produced nt the warp-frame. At the the of the Great Exhibition there were alout 1400 warp-frames in operation, namely about 600 in Iejcentershife, about 400 in Ilerlychire, and about the name number in Nottinghamshire. The employment in the varlous liranches wan eatimated as followa: $150 \mathrm{ma}-$ chines engaged in the production of hioml, and other silk lacea; 150 in cotton tatting $\mathrm{A}_{\text {, }} \mathbf{5 5 0}$ in lecicester hosiery, etc. 100 in lace gloven and mita, 150 in woolen cloth, lumiery, purses, and varionk faliries for gloven, etc. The flrst machinen were about 16 inches in vidth; they are now, in the Nottingham trale, fr. a 90 to 150 inchen in willth, and in the leiceater hralery trade, from 44 to 72 inches. The number of penons employed in the warp trade in (ireat Iritain, in 1851, was estimated at 10,000 , and the capital invested at $\$ 1,800,000$, making a return par annum of
$\$ 3,500,000$. In the Great lixhibition was exhibited a power machine, capable of producing (working 12 hours per day) 800 racks per week, which, when dressed, would be equal to about 1200 square yards. A yurd of d-quarter white silk blond, whteh in 1830 cost 50 centa, can now be had for 12 cente.

Gold and Silver Lace.-The textile fubric known es gold or ailver lace censlets of warp threads of silk, or of a mixture of silk and cotton, while the weft or shont is a silk thread covered with silver, or with sllver gilt, as the ense muy be. The production of thls thread is, a remarkable illustration of the extensilililty of golis and of the ductility of nilver. The silver preferred by the wire-drawers is that which bas been meparated from argentiferous galena, this boing less brittlo than the silver oltalned from purer souries. Fron 400 to $\mathbf{j} 00$ ounces are cant into in ingot slout 2 inches in diameter, and from 20 to 24 inches in length. This is male red-hot in a charcoal tlre, and hanmered until sufficiently reduced to pass through the first hole of the draw-jlate, the hammering increasing the tenacity and elasticity of the metal. After the thar has been reduced by pnssing throngh 10 or 12 holen, it is planell, in order to remove iny imperfections from the surface which would interfere with the perfect gilding; the blemishes are readily detected by the retlection of a oheet of foolscap puper slightly arched, and placed over the bar. The bar is now gllt, by placing on it a number of gold leaves, varying from 10 to 30 , nceanding to the richness of the wlre required, the higher qualities being used fer milltary purposen, and pearls and bulliens for embrodering, while the lower qualities are used for liveries, the ends of muslins, and for skein threads exported to India and China. The gold leaves are placed in a row, side liy side, neariy the length of the bar, on a piece of cartridge paper: the bar is then gently placed on the leaves, prossed clices, and the edges of the leaves raised up until the silver $i$ : entirely covered. Tho bar is next enveloped in paper tied tightly round with cord, and placed in a charcoal fire, where it is left until it becomes of a bright rel heat, the paper not burning, but becoming red with the metal, when it alowly consumen, after which the bar is withulawn. While atill red-hot it is humished with a blool-stone ar with South Sea ax-stone, for the purpose of uniting the gold and the allver perfectly. When cold the aurface is covered with wax, and the bar is drawn into wire through graduated steed dies, and, after ene or twe annealings, finishod by drawing through perforated rulises, so fine that from an eunce of metal a wire a mile and a quarter in length is produced. At this point the wire has not so rich and deep a shade of yeilow ns is required, but this is given by winding the wire round a copper crlinder, with the addition of a small portion of wax, and tilling the casity of the cylluder with red-hot clarcoal made from birch-wood, the effect of which is to decpen the color, and render it permanent. The next prueess is to flatten the wire by passing it between in comple of steci rollers, one of ten, and the other of four lnches in diameter, made of the finest ateel, and of exiquisite polish. They are manufactured in Khenish Prussia, ut a cost of $\$ 600$ for a single pair of rollers. The flattened wire is wound on snall bobblas, which are phaced in the centre of circular ringe, attached to s luar over a apinning frame. On the front of the frame are tulblins of wilk, the threads of which pass through the centre of the ring to whieh the reul of wire is fixed. The whole is aet in motion, and while the threal is bolng $t$ wisted, the ring with the wire revolves ronnd the thread in the opposite illroction. In this way from 30 to 49 threadn are covered at once, the rerult being s resplendent flexible goll thread, adaptel to the jurposes of lace-making, embroidery, etc. Of thls thread, although gold only appears, probathy 9-10tis of its bulk is silk, whila of tha remaining 1-10th only 1.50 th part is gold. See details on this subject in the Journal
of the Socie Ilennoch's E. $B$. The expc year 1856,

Lacquer, or Lacker, a yellow varnish, consisting of a solution of shellac in alcohol, colored by gaaboge, saffron, annotto, or other yellow, orange, or red coloring matters. Lacquers are chiefly used for rarnishing brass and some other metals, in order to give them a golden color and preserve their lustre.

Lacquer Ware, is derived from the Hindoo name lac, which is the resin seereted together with lae-dye by the lac insect. The lacquer ware has a covering or coating of lac; but two different processes are often confounded in India under this name-the one prevailing in the sonthern yarts of India and in Burmah; the other in Cashmere and Lahore. The former of these wares, comprising lacquered cablnets, loxes, etc., was much appreciated in the last century ; part being brought from Bnrmah and Indin, and part from China; lut the lacquered or japanned work of Japan, seems to have been superior to either; many fine specimeas of it may still be seen in the forms of large folding screens, ete. The chief expease of the manufacture arlses from the care with which successive layers of varnish must be laid on. Boxes have been gent to this country in various stages of progress, which show the gradual production of the desired effect. The other kind of lacquered ware partakes somewhat of the nature of pajier-mache, covered with one or more layers of lac varnish. Many of the luequered boxes beionging to this class, from Cashmere and Labore, are remarkabie for the clegance of their patterns.

Lading, bill of. See Bitic of Lamina.
Laden, in nantical langaage, the state of a ship when she is charged with a weight or quantity of any sort of merchandise or other materials equal to her tonnage or burden. If the carge with which she is laden be extremely heavy, her burden is determined by the weight of the goois; if it be light she carries as much as she can stow, that slie may be fit for the puiposes of navigation. As a ton in measure is generully cstimuted at 2000 pounds in weight, a vessel of 200 tons ought, accordingiy, to carry a welght equa to 400,090 pounds, when the matter of which the cargo is composed is specificaliy heavier than the water in which she flaats; or, in other words, when the cargo is so heavy that she can not float high enongh with so great a quantity of it aa her hold wili contain.

Iaden in bulk, the state of being freighted with a cargo which is nelther in casks, boxes, bales, nor cases, but llea loose in tha hold, being defended from the moisture or wet of the hold by a number of mats, and a quantlty of dunnage. Such are uaually the carg;oes of graln, salt, or snch materials,

Ladoga, a lake in Ruasin, the largeat in Europe, lies between the governments of Viborg on the north and west, Petersburg on the soath, and Olonetz on the east. Ita greatest length is about 180 miles, breadth above 70. The coast is generally low, much indented, and abounding in dangerena reefs. The depth in aome placea reaches alout 150 fathoms, in others it is insufficient for safe navigation. Storms are frequent, and the infiux of many considerable atreams produces strong currents. The chief rivers entering the lake are the Swir (or Sveer) from the east, bearing the waters of Lake Onega; the Volkhoff on the south ; those of Lake Ilmen and the Saima on the north, draining the retlculation of waters of that name. It empties itself on the south-west by the Neva, into the Gulf of Finland. There are numerous islands scattered aleng the north-weatern shore, several of them inhnbited. The princlpal towns on the coast are Kexholm, Schlusaelburg, and Novala Ladoga. A canal execated in the reign of Peter the Great connects the two latter, forming a direct communicatlon hetween the Neva and Volkhoff.

Ladrone, or Marianne Islands (so called reapectively from the thlevish habits of the natives, and in honor of Queen Mary Anne of Spain), a group in the North Pacific Ocenn, between lat. $13^{\circ}$ and $21^{\circ}$, long. $144^{\circ}$ and $146^{\circ}$. They are about 20 in number, of volcanle origin, irregular and pieturesque in outline, and clothed with luxuriant vegetation. The iatervening straits abound in shoals and currents, and there are few good harbors. The heat of the climate is somewhat tempered by the trade-winds. Among the vegetable products are sugar, rice, Indian corn, tobacco, cotton, indlgo, etc. Of wild animals, the most numerous are swine, sometimes of large size; cattle, horses, asses, mules, and Ilamas, have been introduced liy the Spaniards. The principal island is Guajtan, or St. John, the most southerly of the group. It is about 80 miles in circumference, and has a good fortifled hurbor, some milies to the south of St. Ygnacio de Agana, the seat of government. The aboriginal inhabltants, an active and athletic race, have gradualiy given place to a mixel pepulation, descended of colonists from Mexico and the Plitippine Isles. This group was discovered in 1521 by Magellan; but no settlement was made in them for about 150 years, when the widow of Philip IV. sent out a body of missienaries to convert the nat! ;es. They were visited in 1742 by Anson, who spent some time on the island of Tinain, where he discovered architectural remains, indicating a considerable progress in the arts of civilization. There are two other amall island groups of this name, the one on the coast of China, at the mouth of the bay of Canton, a groat stronghold of pirates, the other off the coast of Guatemala.

Lager-Bier was introduced into this country; generaily, about nine years ago. The process of manufacturing the peculiar and popular beer under consideration, differs very much from that in makiag common beer, or ale. The only materials used are malt, heps, aud water, and an inspection of the breweries is cenvheing that much care and cieanliness are exercised in ali the ojerations. Lager-bier ferments dewnward. Common beer can be unade fit to drink in four or five days, according to the heat of the weather; but it requires as many weeks before tager-hier can he drank, and it is thought to improve constantly if it lo given years of probation.

Fireweries, etc.-The art of fermenting grain was early known to the ancients, who employed it ndvantageously in fattoning animals. Urquiart ims noticed

## LAG

that Penelope steeped the grain with which she fed her geese. The eariest mention of beer is found in the history of the Egyptians, who are sald to have invented it more than 12 centaries befou 3 the Cbriatian advent. They called it, however, not beer, but Pelnsian liquid, from Pelusinm, a city near the mouth of the Nile, where It was first made. Hops were first used in England, A. D. 1624, where, it appeare, they were for a time prohibited as a "polsonous drug." The famons white beer was made from wheat, at Nuremberg, In Germany, alout A. D. 1541. Ale was brewed by the English Saxons as early as A. D. 728, and their " tharley-wine" was celebrated for its exhilarating qualities. Porter was originally a mixture of different draught lears, first compounded in 1730 for the latoring classes in London, who required a beverage of more nutritive qualities than had been prolineed by the mixture of ales of two, three or four "threads" or draighta. The ceiebrated Germuan mumm was first hrewed at l3runswick, A. n. 1492, by Charies Mumm, who gave his name to his invention. lingland las, however, till recently, been the great " beer conntry." Official returns ahow that in $\mathbf{1 8 5 0}$ the licensed brewers In the United Kingiom were:

In England, 5631 ; malt consumed, 24,055,202 hush.; Scotland, $1510 ; 950,105$; Ireland, 951 ; 164,702.

Of this last quantity; the greater portion was doubtless used in distillation! The licensed tavern-keepers In Scotland are shown by these returns to have numbered 14,971 , and the number in lroland to have been 13,793, many of whom were also licensed to brew or distill.

The quantity of ale and heer brewed in the United States, In 1450 , was $1,177,924$ barrels; of whisky and high winea, $42,188,955$ gallons ; of rum, $6,500,500$.

The amount of capital inverted in the United Statea' broweries averaged $48,334,254$; and the number of persons emptoyed in thia branch of commerce, 5487. The breweries in our American States have been greatly increaned of late years by the adilition of German capital, amounting nearly to $\$ 7,500,000$, distributed among upward of 590 entablishmenta. In 1847, the German breweries first introduced into this country the heverage known as lager-bier; perhaps the drink more extenslvely used than any other theer compound in the present day: The process of brewing thls peculiar and popular bier differs, we are told, very much from that employed in making common ale or beer. The only materiala, we learn, are malt, hops, and water, lut the quantities employed, aod the mean temperature observed, are a secret to all but the initiated. An inspection of the different breweries, wiii show that a studied care and cleanlineas are exercised In alt the operations. Fermentation, which in common beer is upwand, we are told, in the instance of lagerbier, is the reverse, or downward; lunt as it is the nsture of all fermentation procenses for the "workinga," as they are termed, to ascemd for a certain perion thefore they finally settie, we are liscined to beiieve this "downward fermentation" an ingenious juke, in order to stifle further inquiry. The word lager, in tierman language, means "rest, repose," an attention this jeculfar drink requires in orler to secure a ripening or maturity of perfectness ; and from this word the bier derives its prefix, hagre.

The iager-bier annually macie in New York eity and suburtha la estimated at $\mathrm{NS}, 000$ barreis, a number we are inclined to beileve beneatit the actual average. The entire city conaumption, however, of thin tier from ail parts, In computed to be not less than 8,075, 000 barrels! The city retailera number about 2000 , exclinive of the large hotels and restaurants, which alone consume from 85000 to 66000 worth nnnuality. In the eity of St. Lonin, Missouri, there were drank, from Int March to September 17, 1854 , more than 17,B00, 000 glassee of lager and common heer, and the entire stock of 24 breweries of that district wus com-
pletely exhausted. Philadelphla has 22 breweries of iager-hier, and the stock accumulated during the fali and whintar of 1855 , was valued at $\$ 600,000$ wholesaie ! The clty of Cincinnati has 7 first-class and 22 secondclass breweries; the value of the "plant" (machinery, tulss, etc., etc.) of the former lo estimated at $\$ 150,000$ each. The first-clase breweries average each about 4000 barrela per year. Most of them have large excavated vaults for atocking or lagering this bier. M. Yon Beck's store-ceilar, in the rocks at Rondout, Naw York, which will contaln 30,000 casks, cost $\$ 15$, 000 for excavations, etc.
The brewing of luger-bier usually commences about Octotser, and is then deposited thll the succeeding April
or May, when it is consldered to be in " tine or May, when it is consldered to be in "the condl. tion." The. Cincinnat! lager-bier brewerian empioy abeut 250 brewera, and as many others as assistants, etc., etc. The salary of a good foreman is $\$ 1000$ per annum and house-rent ; his assistants receive from $\$ 30$ to ${ }_{6} 50$ per month. They commence operations at four A. M., and get through in from 9 to 10 hours. These men are remarkatile for good health. Some of these establishments make 0 brewings a week. The fali stock of Milwankie lager-bier, in 1856, was fuljy 60,000 harrels. The weatern lager requires to the of a stronger quulity than that made in the northern breweries. Of the benefical qualities of this hier, apinions are far from unaninous; the jartisans in favor of the beverage profess that from 10 to 60 glasses per day may the drank with impunity! While the editor of the New Furk Scalpel, in his issue for October, 1856 , asserts that its continued use produces the most injurious effects on the human constltution, and which, if persisted in, induces disease and gradual decay; wentaily and physically.

Lugoon, from the Latin lacuna, a ditch, means a morans. Tho name is given paiticulariy to thoss erecks which extend aiong tie coast of the Airiatic, in the present government of Venice, and which are formed by water running ui in the land. They contaln many islands. Venice, for instance, is buitit on 60 of them. in some placen they are deep; in others so whallow that their exialations are offensive and dangerous. The Austrian government does less toward clearing them out than tho former Venetinn government did; and Venice in consequence is considerabiy. less healthy than it was. Toward the sen the islets are secured by dama, natural or artificial.
La Cuayra, the principal sea-port of the repubtic of Venezuela, in the province of Caraccas, on the Caribhean Sea, lat. $10^{\circ} 36^{\prime} 19^{\prime \prime} \mathrm{N}$., lon. $66^{\circ} 6^{\prime} 45^{\prime \prime}$ W. Population 8000? In 1810, the population is believed to have amounted to 13,000 ; the reduction leing a consequence of the loss of life caused by the tremeadoun varthquake of 1812, and the massacres und pioserijtions incident to the revolutionary war. The population of the city of Caraccas, of which La Guayra may be considered as the port, feil off, from the same causes, from 43,000 is 1810 , to 221,000 in 1830; but they are now both increasing. There is neither quay nor mole at la Guayra. Ships moor E. N. E. and W. S. W., with their heads to the north, at from $\ddagger$ to $\frac{!}{\text { of }}$ a wile from the land, in from 9 to 18 fathoms. The holding groumd is good; and notwithstanding the openness of the road, vessels projerly found in anchors and cables run very llttle risk of heing driven from their moorings. The principal articles of export are coifee, cocoa, indlgo, hiles, sarsaparilia, etc. La Guayra shares the trude of Venezuela with the ports of Cumana, l'uerto Cabello, Maracaybo, etc., having about a haif of its entire amount.

Port Reguhations.-Dn canting anchor, a visit is paid hy the collector of customs, or his agent, accompanied by otier officers, who take from the master hi. register, manifest, and muster-roll, and an officer is left on board untll the cargo is discharged. A ship introducing a cargo, and asiling in ballast, would lee liable to all tho above charges, with the
exception of the last two. The charge for water is levied without regard to tonnage; viz., sloops and schooners, $\$ 20$ each, brige, $\$ 30$, and ohips, $\$ 40$. Tonnage employed in the foreign commerce of La Guayra, for six monthe of $1856,30,417$ tons. Sea Venezuela,

Laguna di T'erminos, or Laguna di Carmen, a sea-port on the south sbore of the Gulf of Maxico, State of Yucatan, lat. $18^{\circ} 38^{\prime} 44^{\prime \prime}$ N., long. $91^{\circ} 51^{\prime} 22^{\prime \prime}$ W. It dorives its numes from being situated about 1 mile within the south-west extremity of Carmen islund, on the moat westerly of the strults or entrances loading into the basin or lagoon of Terminos. Pepulation about 8000 . The port, which is secure and one of the best on the gulf, bas from 12 to 14 feet water over the bar at the entrance to the lagoon. Veasel:, of greater draught load and unload by yueane of lighters, outaide the bar, In from 3 to 4 fathoma, with gool holding ground.

70 Euter the Port.-Kun in over the bar with Xicalango Polnt, bearing by compass S. $\frac{8}{4}$ li., till Point Sacatal bears S. E. $\frac{1}{}$ S., and then ateer for it ; and when the north eide of the jeland begins to shut in haul up for the anchorage off the town. Tha lead is a safe ginde on the weat side of the channol, but not on the east. The chlaf trade of the town conslsts in the shipllng of logwood, known in foreign markets ly the name of Campeachy wood, from its laving been origInally cut down In the vicinity of that port and shipped from it. But Cumpeachy has censed to be an entrepôt for logwood. It ia now principally cut down on the mainland adjoining the lagoon of Terminos; and being thence conveyed to Laguna in coasting schooners, Is sent from it to all party of the world. Vesaels arriving with cargoes muat bring a general manifest and involce in triplicate, certitied by the Mexican consul at the port of departure. Those arriving from a forelgn port ln ballaat, must produce s clearanco aither from the Mexican consul or the authorities of the place frem whence they came, showing that they bring no cargo. Pilotuge $\$ 1.75$ per foot, other port charges, auch as harbor-naster's fees, anchorage, bonrd of health, etc., about $\$ 25$ each veasel. Ships arriving direct from a forelgn port pay $\$ 1.50$ per ton for tonnage dues. See Mexico.

Siatfgent of tie Exportation of Diewoole from the Pont of Lagena di Traminos nerino the Yeans 1850, lish, and 1859, bpecifyino also the Vessris in when they wear bitpped and tho loats to which thay AElositid.

Lahore, in extensive province of I!indonstan, sit- the Indus. The principal geographical and territorina uated hetween the thirtieth and thirty-fourth degreen of north latitude. It has been estimsted at 340 miles in length hy 200 In average breadth. It is lounded on the nurth ly Cashmere and the conrse of the Indus; on the south ly Delhl, Ajeueer, and Moultan ; on the east by the mountalns of northern Hindoostan; and on the west it it separated from Afghanistan by
sublivisiona are the Puajal, comprehending other minor subdivisions, and the Kohistan of I.nhere. kice is cultivated in the narrow valleys, hut the inhabitants sulaist chiefly on what bread, and peas made lato a thick soup. Pines and willow-trees grow on the aurface of the monntains. The resinnus part of the fir is cut into slipa, and supplics the place of a
lamp. The climate in not favorable to frults and vegr stables. Fossil salt in found in many partn, and the mountaln tracts are apposed to be rieh in minerals.

The coinmerce of thls country was formerly much obatructed by the havy dutiea levied on all the gooda as they passed through the different territoriee of the petty Sikhs. It wan In consequence earried to IIIs. doostan l'roper by the difficult and mountninous route of Jamboe, Nadone, and Serinagen. The Slkh chlefs, bowever, diacovered thele error, and many of these heavy and vexatlous duties have been reducel; and by a mero strict aiminiatration of justice, cenfidence has been rentored to the merchants. The exports of Lahere to the countries weat of the Indus are, augar, rice, Indigo, wheat, and cotton eloths. 'the importe from these countries are, sworda, horsea, fruit, lond, and apices. The exports to Carlmere nre nearly the suine us to l'ersia, the imports beling shawle, a variety of cloths, mafiton, and frults. With Kohiatan the mountainous district of Lahore, the inhatitants of Punjah exchange cloth, matchlocks, and horses, for Iron and other small commoditles. from the south are lmported sulphur, indlyo, nalt, lead, Iran, European coarse broadeloth, anil apices. The exports to the south are, horses, carnela, sugar, rice, white cloth, mutchlocks, sworls, und bows and arrowa.

Iahore, tho capital city of the Punjab, lliltish India, on min aftinent of the Ravee, In lat. $31^{\circ} 83^{\prime} \mathrm{N}$., long. $74^{\circ} 18^{\prime} \mathrm{F}$. I'opulation estimated at from 100 , 000 to 120,000 . It is inclesed by a donble line of ilefenses, the outer heing ubout 7 miles in circult. Streets narrow, filthy, and excessively crowded; hounes of lrick, and lofty. It has many large and bandsome mosques, and around it for many miles aro extensive Mohnmmedan ruins, with the fine tomb of the Emperor dehangire, and the garien of Shat Jehan. Here nre also many llindoo temples, well-supplied markets, und a citadel, contalning the palace of the Sikh sovereigna. Under the Mogal emperora, the city was of much greater extent. In 1748 , it fell into the hands of Ahneed Shali; In 17 an Runjeet Singh was invested governor and rayuh. After the tinal defeat of the Sikhs, $\ln 1849$, Lahore wus taken possessiun of by the liritish.

Lake, an extensive accumulation of water wholly surrounded ly land, und having no direct nor limmediate communication with the ocean, or with any neam, or having so only ly means of rivers. Lakes are of varlous kibln, and have been divided into two classen, aceording to their situation and causes of production. Those which are formed in deep hollows between the ridges or ut the basen of the moontain, and which are supplied with water by aprings or turrents, are classed together, and those which are formed in low and level countries ly the surplus water of rlvers, or from a want of sutficient declivity in the ground to allow the waters to cotinue their conree, constitute a second class. Sometimer a chain of lakes is connected with one nother and with the oceun by a series of rivers. Thim in the case with the great lakes on the northern frontier of North America, where basin aucceeda basin, on a lower level, like ne many lucks on a cana!. A fourth clase of lakes are those which recelve at reams of water and often great rivers without haring apparently any outlet. These lakes are in gencral condhed to wurm climates; but the Caspian Sea, the largest of all laken, belongs to thin clans. There are a great many of hery Lienide In Asia; and South Amerina contains Lake 'Titicaca which has no efllux, although it recelves very onsiderable riven into it. Surh laken appear to belong to the interior of great contineate ; they are pluced on elevated plains which have no senaible deellity towaril the sea, and which do not allow the water opening for itself a passage through which to flow out.

It was long conjectured that ly some nuliterraneous channel laker of this description communieated with
the sea; but the faet that the surfaces of sonse of the mest remarkable of them, such as the Caaphan and the Dead Sen, are depressed below the level of the ecean, In quite sufficient to explode this bypothesia. For were there any communication, howover amall, the ocean would flow into the lake tIll it brought it to a lavel with Itself. The true explanation meems to be that a quantity of water equal to that which runs in is carried off by evaporation. The absorption of liquid by the contlguous land, may ulso materially assint in carrying off the surplus fluld.
Dlathet from any of the oharncteriaties of lakes yet alluded to, in the chemical nuture of their waters. Lakes in reapect to the quallty of the waters are dis. tinguished Into frenh, naline, ond alkuline. Those which receive and diachurge conviderable gantitiea of fresh water are almost always kepit ln a state of perfect freslmess; but those which have no eutlet are in variably waline. Thus the Deal Sea, whose waters have no eftlux, and lnto whleh the river dordan continually flows, contalns about elght itmes as much salt as common sea-water. The waters of the Iorian are brackish, and the nelghboring soll is much impreg. nated with sult, so that the accumulation of such a quantity of saline matter in the lake during a serics of ages is by no means surprising, for none of lt ever pasmes off by evnporation. Salt muat likewise lie accunsulating in beds ut itn bottom; for as moon as water in perfectly saturated, und can hold no more salt in molution, the latter must fall to the bottom. Some of the large Aslatic lakes are dried up during summer, and their heds appear lined with an incrustation of salt. All the grent American lakes consist of fresh wnter; those of Furope are either fresh or slightly saline; but the Caspinn sea, and various others which are situated in plains full of salt, or In tracts of conntry whero nait spriugs abound, are almost invariably impregnated with that anbstance. Some lakes are both maline and alkaline, us is the case with the Natroa Laken in Lower Eyypt. They derive their appel. lation from thelr shounding in seda which is there called trona, and natron, the nitre of the Seriptures. Some laken produce a pitehy nubstance. In the island of Trinilad there is one on the surface of which an enormous quantiny of hitumen, fit for naval purposes, is collected. Jeposits of varioun kinda besiles those enumerated seem to owe their origin to lakes. Ibg iron ore, or hyilro-phosphate of Iron, is often found in such situations as to nhow that it lins been deposited from the watera of taken ; and in nome conntries it is collected from the siles and bottoms of lakes once in a certain number of years. Calcareous springs are numerous, and when the waters of these collect in hollow place so an to form a hata, quantitios of faleareous sinters and tuffus are depositen, so that the lakes when emptied preaent extensive dejosit of that mineral. The trnvertine ennployed at lome for luilding, Is a lake or spring calcareoua deposit of sinter and tuffa.

Iaices, Great American. The following are the principul lakes forming the great chain of inland uavigatlon, extending from the St. Lawrence River to the head of lake Superior:
T.ake Ontario, In shape, appronches to a long and narrow elllpse, belng atout 190 miles long und 55 wide, with a coast line of about 480 miles. Its surface is 331 feet alowe tide water, and 330 feet lelow the surfice of lake Dirie. It is in many places over boof feet deep, so that its lottom is below the level of the diluntic. In every part it has suticient depth for the largest vessels, und is rarely frozen, exrept near the shore. There are many good harbors on the lake. It receives the water of Niagara Iliver, the oullet of the other American Laken; also the Genesee, Obwrgo, and Illack Kivers. It is connected with the Eris Canal by the Oawego Canal, und has by this means a direct wutor comnanication with New York city.

Lake Erie, which is situated fots feet above the sea,

380 feet abov miles in leny between 600; depth la 120 lakes, and mo account of it storms, caun] dangerous dns log large loss quant occurre navigation, lie atop to all acti present feata tario; the han and move elay sund. The $n$ from the ban table-land bey harbors along of dsep creeks tion of storms jecting piers.
Among the Port Collorne, Canal, at the $f$ conmencement up is the harl the Grand Riv atresm, naviga tance, and pos scenery along some way abo sents maty del the harbors fur well, and Stan flourishing of $t$ the most propu part of Canada great fertile pe here high, and mediate bank, extensive tract Lake IIuron, a best quality, be beech, maple, cherry, and oth of soil. The v appearance, an upper part of beautiful islanil there is a light along the upper mouth of the 1 riant aspect. shore, and the clustering amon tall shrubs alo here covered w

Lake st, Cll country, we pa: St. Chair, then Into the liroad head of Lake : tance of hetwe of unsurpassed ling many deli, about 27 milles islands, several Frie, are beauti burg and Sand sor, aro situate Opposite Wind and where the of a mile, is the of Michigan. necting link, $h$ Rivere, betwee!

390 feet above the lovel of Lake Ontario, la about 265 miles in length, fron: 80 to 00 mlles in breadth, and betwoen 600 and 700 mlles in clreumference. Its mean depth is 120 feet, beling the shallewest of all the great lakes, and most easily frozen. Its waters are alac, on accaunt of its shallowneas, mere readlly agitated by gtorms, causing ita navigation to be therefore more dancerous dnring atormy weather. Dinasters, Involvlng large loas of life and property, are not of unfrequent occurrence on the lake, toward the cloae of navigation, liefore the rigore of winter have put a final stop to all active lake traffic. The siones of this lake present featares very aimilar to those of Lake Ontarlo; the banks of lake lifie being generally bolder and more elevated, and composed chlefly of clay and sand. The more fertle parts are at seme diatance from the banks, througheut the extenaive plain of table-land beyond. There are several good natural harlars along the whore, formed chlefly by the mouth of deep ereeks or atreams, and protected from the action of storms and current of the lake by streng pro jecting piers.

Among the harbors of Lako Frie may be mentloned Port Collorne, altuated at the entrance to the Wellind Canal, at the foot of Lake Frle, and a little above the conmencement of the Niagara Rivor. A little further up is the harbor of Pert Maltland, at the mouth of the Grand Kiver. This is a very fine and capacions atresm, navigable for small veswels a considerable distance, and possessing much fertlie land and pleasing scenery slong its banks. The shore of the lake for some way above the mouth of the Grand Rlver presents many dellghtful and fertile gettlements. Among the harbors further up the lake are l'orts Dover, luarwell, and Stanley. Port Stanley is perhaps tho most flurishing of these harbors, belng the port of one of the most propulens and enterprising districts of this part of Canadn, and aituated neur the centre of the great fertile penlasuia. The banks of Lake lirie are here high, and of a asandy character; but off the itnmediate lank, and extendlng all the way through tha extensive tract of country to $t^{\prime}$ e town of Goderich, on Laka Iluron, a distance of 85 miles, the soil is of the best quality, being for the most part timbered with beech, maple, black and white walnut, oak, ash, cherry, and other trees, Indicating the first qualities of soll. The whole tract ls greatly undulating in its appearance, and is everywhere well watered. The upper part of Lake Erie is distinguished by many besutiful islands, the largeat of which is Pele, on which there is a light-house, and several fares. The shores along the upper part of the lake, espeeialiy toward the mouth of the Detroit River, have a amiling and inxuriant aspect. Trees of the finest growth rise from the shore, and the wild vine may be seen twining and clustering among the branches of the lesser trees and tall shrubs slong the sioping banks. The shore is here eovered with fine white sand.

Lake St. Chir.-In our further progress up this country, we pass the Detrolt River, thence inte Laks St. Clair, then the River St. Ciair, which last opens into the broad expanse of Lake Huren. From the head of Lake Erie to the foot of Lake lluron, is a distance of between 80 and 90 nilea, through a country of unsurpassed fertilty and loxuriance, and possessing many delightful fentures. The Detrolt River, about 27 miles in length, is interspersed with many inlands, several of whiel, near its entrance into Lake Erie, are beautifully wooled. The towns of Amherstburg and Sandwich, and the smali village of Windsor, are situated alorg the Canada side of this river. Opposite Windsor, toward the upper part of the river, and where the banks narrow to about three quarters of a mite, is the American city of Detrelt, in the State of Michigan. Lake St. Clalr, which forns the connecting link, by meana of the St. Clair and Detroit Rivors, hetween Lakes Iluron, Mlehigan, and Erio, Is
the smallest of all the lakea, and exceedingly shallow for the larger ciass of veasela passing through it. It la from 20 to 30 milies in length, and about the same ln brealtt: Its average depth is about 20 faet, but the principal channei used by veasels parsing through it in much shallower, especially in dry seasons, when the mud of ith flats is atirred to the surface not unfrequently hy large veanels. The ehief stream which it receives from the Canadiun shere is the IRlver Thames, which is pavigable for lake vessels 22 miles from ita mouth, and the banka of which are exceedingly fertile, and moatly well settled. Much of the lend bordering on the lake is low and marshy. In the upper part of the lake are several islands, the prinelpal of which is Walpole Island, about 10 mlles long, and from 3 to 4 milies wide. This laland is inhabited by a stray portlon of the remnant of Indians still exlstling In smail and decreasing numbere in Canada. We are now at the entrance to the River St. Clalr, in langth abont 30 mlies. There are several thriving settlements aleng the fertile and beautiful banks of this river. Toward the lowar part, amid a cluster of wooded islands, the banks, with somewhat of a flat appearance, are covered with lnxuriant timber. Further up, the land risee, with finely aloping banks and cultivated farms. Nenr the heal of the river, and picasantly eituated, is the fourishing town of Sarnis.

Lake Iluron.-The River St. Clalr now opens te the wide expanse of Lake Iluron, of about 1000 milea in elteumierence. This vat sheet of inland aes is the second In point of size of the great lakes, yicldinct only in this respect to Lake Superior. The surfuce of Lake Huron Is about 30 feet above the lovei of Lake Eric, and 505 feet above the level of the Atlantic. The length may be estimated at 250 miles, and its breadth 160 miles, inclusive of the Georgian Bay, a large wing of the lake, extending along the nerth-eaatern shore for a distance of about 100 miles. The mean lepth of Lake lluron is 900 feet, and lts greaiest depth 1000 feet near the west shore. This lake is suid to contuin the almost incrodible number of 32,000 islunds, principally ulong the northern ahore and at the north-western end, varying in size from mere rocky reefs and pinnaclea to iarge and cultivable islands. The Great Manitoulin, the longest of the islands, is upward of 75 mlles in length, and varies in width from 3 to 23 miles. Tho waters of the lake are remarkably pure, clear, and cold; in these respects reaembling the great upper Lake Superior. The surface of Lake lluron is about 82 feet lower than that of Lake Superior, and it is very nearly us deep as that lake. The nature of the banks of Lake Iluren vary very much. In parts they ure low and sundy, in others formed of clay; they rise to a height of about 120 feet, while again the shore of this inland sea presents a bold, rocky, iron-bound coast, having great depth of water to the base. Numerous streams descand on nil sides into the lake; and among its rivers may be mentioned the Maltland, Sovern, and liver Français. Tho lake, which is rather aubject to storme, is detdcient in good and natural harbors, the prineipal of which, along the eastern coast, are Goderich, it the mouth of the Maitlanil, Baugeen, and I'enctanguishene; and in the western alore the best places of shelter in h ivy weather are Thunder Bay and Saginaw llay.

Lake Iluron possesses the advantage of heing reremarkally centrally situated with respect to the other great lakes. With Lake Erie, as we have seen, it is conneeted by the Straits or Rivers St. Clair and Detroit, and the small Lake St. Clair. Lake Ontario, tho lower of the lakes, is even open to it by the River Severn, Lake simcoe, then by a ahort portago, a chain of lakes, und Trent Itiver. Lake Simucoe, thus situated between Lake Huron and Lake Ontario, is a very beantiful lake, about 30 miles in length and 20 in broadth. The nock of land south of lake Slucoe from IIoliand River leading to Toronto is, it will be
remembered, aisut $s$ milea; and again, north of Take Slineoe, from the narrows of this Jake to Lake Huron, the portage in only about 14 inlles. The new railway now eutting through thla neek of the penin aula weat ward, situated between the Lakes Fria, Ontario, and lluron, will greatly facilitate the growing Intercourse lietween the nhores of Ontario, an well as all the country lower down along the banka of the St. Lawrence, aul also great part of the United Staten, with the reglons of the grea. upper lakes, Huron and Superior. This direct course will no doubt be much preferred to the elreultous ronte through Lakes Erie and St. Clair, and the connecting rivers.
Lake Iuron, besiden, communicatea with the Ottawa, and thence wlth the St. Jawrence above Montreal, hy means of French Iflver, Lake Niplasing, and the Eiver Mattawa, into the Ottawa. This is the route adopted generaliy by the north-west traders in proceevilig to the remote parts of the country; and It is also the one by which Rumpeans first penetrated the Weat, The distance from Montreal by this route to Iake Iluron la fully more than one half sherter than that ly the St. Jawrence. From Montreal to the Georgi:an liay, the diatance is extlinated at 100 mliea, while ly the St. Iawrence the ciatance is upwarl of 1600 milen, Again, lake Iluron comminaicates with the great upper Jake Superior by means of the River St. Mary, aheut 40 miles in length. Jantly, we have this centraily situated lake communienting by the atraits of Mackinae with Jake Michlgan, and thenco by the Illinois Rlver and Canal with the Misalaslppl and tiulf of Mexleo. The shorea of Jake lluron have of late revealed important mineral treasuren. The Iruce eopper minea promise to the of great value. Theae minen are situated upon the northern ahore of the lake under the Cloche Mountains, a bold range of hilis extending alout 40 mites along the coast. Along the aontb-eastern sheres of the lake, extending beyond the town and harbor of Goderich, on the Kiver Maithad, are many highly prosperous settlements. The Jands in this direction, and through the large and tine diatrict inland, are belleved to he the most fertlle in Cansia. The eountry is every where well watered, and enjoys much delightful scenery, inoth along the elevated lanks of the lake and the beautiful rivera whleh liversify it. The town of foilerich, on the liver Maitlani, is very agreeatly situated, mul possesses an excellent liarbor. The high banks of the Maitiand are exceedingly picturenque.

Inke superior.-We now approach the uppermost of these vast coilections of water, not lmuppropriately named iuland seas. The River or Strait of St. Mary, connecting Iake Ifuron with Jake Superior, is between 30 and 40 miles in length. The character of the scenery, on entering St. Mary's Channel, is the most delightfol that can lie imagined. The ehannel throughout, with the exception of soveral sunall lakes, neems to he alnost packed with Islands ; and while perplexing the navigator by its Intricacy; it is every now and then reveailng now and atriking lieantien of woodes helghts and steep banks clothed with verdure, and spots of fiat, fertile meadows, and, at times, bare, rocky, fantantic crags. The sldes of the ridiges of table-bands that ahirt the country, aromal the bordera of Jake Superior, afpear in the distance ciothed with one mass of lively green. The foot of the Falls, or, mure jroperiy speaking, Ihapids of St, Mary, mpproach within alout Is miles of Lake Snperior. The region in this direction seems much less fertile; the trees along the shoro of the broad atrait appearing to be chiefly of the pine species, and the mil in many parts light and andy, while the lands clowe upon the banka lie for the noat part low and flat. We now approach the chicf seat of the great copper district of Ameriea, where the barrenness of a large portion of the country is richly compensated ly the value of the metala with which it abounds. The copper minea of Canada, along
the ahorea of Iakes Iluron and Superior, are perhapa ontilled to rank among the moat valuable reaurcen of this great country.

As we approach the great queen lake or inland sea, upward of $\mathbf{4 0 0}$ miles In longth anil 180 in bresith, dark blue masaes of hills uprise, somewhat reminding the veyager of the haproaches to the St. Lawrence fin the forma of the headlanda of Cape Itoalere and others, yet belng neither an high nor no bold as thene. Tha nain entrance to the lake is marked by two such rocky lreallands, one upon either shore aeveral millos apurt. From the heighta of the one on the other aloore, named Grun Cap, consposed of the roek of the old red mandstone, the aidea of whileh are partially covered with junipera, blue bella, wild briars, and other vegetation, reminiling one of the Scottlah bills, we overlosk a seene of the moat imporing and atill grandeur possible to lise imaginad. The dim diatance linto the lake is botmded by vast islands, and along both ahores iold uneven loanks uprise, apparently covered with dark deane follage, and atretch themselves in Irreguiar conrae, as far an the eye can reach, along the wide ex. panse of water that scarcely as yet presenta any speck of mulgation. The alores of lake Superior, which are even now lmperfectly explored, already prove to be abundant in mineral reaources. Many of the enterprising luhabitants of Canada, having formed theuraelvea into associations, are now engaged in mining the seemingly inexhaustlble treasures of virgin copier which are found along the shores of this like as well as Iake IIuron. Thls source of wealth to the colony ls likely to prove of considerable import. ance.

Lake Superior, which ia the largest sheet of fresh water on the face of the globe, is the inost remarkabite of the great American Iakes, not only from its mugnitude, but also from the picturesque accnery of its borders, and the intereat und value attaching to its geologleal foatures. "As a mining region," continues Dr. Jackson, who, as Unitel States' geologist, was intrusted by his government to survey the territory, "it is one of the noost Important to this country, and is rich in veins of matallic eopper and silver, as weil ss in the orea of those metals. At the prenent moment it may be regarded as the most valuabie mining district in North Amprlea, witil the exception only of the gold deponita of California. The whole coast of Jake Superlor ls rock-lound. Mountain manses of considecable clevation in some places rear themeslves from the linmediate shore, while steep precipicen and frightful crags oppose themselves to the surges of the mighty lake, and threaten the unfortunate marlner who may he caupht In a atorm upon a lee shore with almost inevitable destruction, The northern or Canadian ahore of the lake is the most precipltous, and eonsequently most dangerous to the navigator. Good harlora for vessela of moierata capacity ara comparatively few, hut there are almindance of coven or hout-harbors formed by the countlens indentations of the rocky coant. In reutarkablio contrast to lake lluron, which is thickly stuldeil with itsands, there are very few islands in lake Superier.

Agrienlture may be truly sald to have not yet commenced to tame the great and comparatively unexplored wilterness around the shores of Lake Superior. The forests of stunted apruce and tir-trees aiong the immerliate coast of the lake are auid to atiord a very inadequate idea of the agricultural resourecs of the whores of the great queen lake. The ecld air from the lake, auy, Dr, Jackaon, affects only the vegetation nasr its ahores, while further inland the temperature more resembles that of the settled parts of Camada. The native forent trees, anil also the dowering plants, as well as the agricultural produce where clearings have been made, are believed to afficd very satisfactory evidence on thin polut. The forests are tilied with excellent timber for bullding purposes; the
white and dimensions. are numerol interesting : bringing dow abundant w extensive In dencenta and nevar be rent above their is Jake Mleh America, lie and liet ween aorthern pari Struits of Mi miles in widtl Ite northern Dlichigan. B lies whelly wi long, andi, on 16,981 square Bay, a large east, Grsnd 'I It is estimated is elevated ab few good harb cago, Milwaul are Dlichigan Jeseph River Gruad liver. and eeveral

## LAK

white and yellow pinem，particularly，belng of large dimenaions．＂The trilutary rivers of Jake Superior are numerous，＂says Mr．I．1）．Andrews，in his very latereating report to the United States＂Senute，＂auil， bringing down a large volume of water，afford super－ abundant water－power for manufactories the most extenaive in the werld，though，from the precipitous descenta and numerous fallis and chutes，they can never be rendered navigabla for more than a fow millea above their moutha，except for canoes．＂

Lake Michlgan，ona of the five great lakes of North America，lies between $41^{\circ} 38^{\prime} 68^{\prime \prime}$ und $46^{\circ} \mathrm{N}$ ．lat．， and leetween $84^{\circ} 41^{\prime}$ and $87^{\circ} 8^{\prime} \mathrm{W}$ ．long．In the northern parta it communicstes with Iluron by the Straits of Michillmackinne or Mackinac，about four miles in width in its narrowent part，and lyy which and its northern part it separates the two peninaulas of Michigan．Michigan Laka is the largeat lake that lies wholly within the United Statea，being 330 miles long，und，on an average， 60 milea broad，containing 16,981 rquare milea，or $10,868,000$ acres．It has Green Bay，a large branch on the north－west ；and on the enat，Grand Traverse May and Littla Traverae Bay． It is eatimsted to be on an average 000 feet deep；and is elevated about 800 feet sbove tide－water．It hss few good harbors．On the west slde are thoee of Chi－ cage，Milwaukie，and Green Bay．On the east side are Mlichigan City；St．Joseph，at the mouth of St． Joseph River，and Grand Ilsven，near the mouth of Grand liver．It is navigated by many inrge vessels and several stemboats，which fly from Buffulo to

Lake Frie and Chicago，atopping at the intermediate places．It affords great facilities for tranaportation． The lake has jure and clear water，and abounda with excellent flah．There are aeveral lislunds on ith north－ ern part．It has 23 light－honses and 4 beacons on Ita Islands and coante．The Illinols and Michlgan Canal conneets the navigable waters of the Ihlinola Itiver with Lake Michigan．

Commerce of the Lakes．－These lakes are eatimated to druin an entlre area of 335,515 square miles，and dissharge their waters into the ocean through the River St．Lawrence，which is rendered navigabie from Lake Frie dowrward to all veasela not exceeding 130 feet keel， 26 beam，anl 10 feet draught，and the free navigation of which fur American bottoms was recently＊ acquired by the concession of reciprocity of trade to the Canadian government．The whole traffic of these great waters may be now unhesitatingly stated st $\$ 326,000,-$ 000 ，employing 74,000 tons of stenm，snil 138,000 tons of aail，for the year 1851，of 215,000 tona burden．

The entire number of veasels and crews of the in． terior trade amounta to 140 bottoma，and $\mathbf{0 , 8 3 7}$ men，in excess of the whole ocesn and coast navy，though the tonnage emploved in the Jutter is smaller by ${ }^{\prime}, 775$ tons．

Llowever r6．．．ote the period of the diacovery，ex－ ploration，and partlal colonization of these wilds and waters，any thing like pructical navigation of them for commarclal purposes was unattempted until after the commencement of this century．In 1679 a French craft indeed was launched at Erie，Pennsylvania，for the expedition of the celebrated and unfortunate La Salle．

Tonnare of the Lake Poats， 1856.

The great lakea are about 1－25th of the area of the

Atlantic Ocean；but in proportion affurd much greater facilities fur commerce，in consec，uence of the advan－ tage of great length with less width，sud of greater proportion of shore line．The country furming the shores of the lakes can not be surpassed in general productiveness by any section of the Union，either in variety of important commodities，or in quantity pro－ luced per square mile．The extent of the commerce of the lakes may be catimated b ，the commerce of the lake ports．During the past 15 years the value of the trade of the lakes has awelied from $\$ 65,000,000$ ，in 1841，to $\$ 608,310,320$ ，in 1856；and the whole of this granil aggregate，with the exception of $\$ 42,260,060$ ， set down fur Sackett＇s llarbor，Cape Vincent，Oswe－ gatelife，Genesee，and Niagara，came through the fol－ low：ug ports ：

| Buffalo． | \＄303，023，000 | Milwaukte．．835，000，000 |
| :---: | :---: | :---: |
| Chicago | 228，59x，0000 | Maumee．．．．94，107，000 |
| Clevolaud | 162，155，000 | Sandusky ．．$\quad 59,906,000$ |
| Detrett | 140，000，000 | Oswego．．．．．146，235，000 |

With the exception of Buffalo and Oswego，these are all ports of the north－west，whose trado has been the result of its development during a very brief period； and the great bulk of the trade of Buffalo and Oswego is derived from the same cause．

The tonnage employed on the great lakes is shown
in the following table, and does not include any ocean or river tonnage:

|  | Tone. | Ton |
| :---: | :---: | :---: |
| Illinole. | 1,742 | Ohln (take tonoage) 11,856 |
| Wiseon | 1,451 | New York . . . . . . . . . 88,504 |
| Mehiga | 7,548 | Total........ ${ }^{\text {a }}$ 45,42 |

This la $1-12$ th of the total tonnage owned by the United States, and ahout $1-5$ th of the total amount omployed in the coasting trade. The ilrst stemmer launched on Lake Ontario was in 1816, while on Lake Erie ateam navigation rommenced in 1814. In 1851 the proportion of steam craft to sailing craft was ns 74,000 to 138,000 tons. The number of Camadian
steamers and schconers now trading on Lake Ontario is 234 , of which 48 are ateamers, 17 propellers, and 169 schooners, the tonnage of which amounts to atout 42,000 tona, and their value la about $\mathcal{C 3 7 8 , 0 0 0}$. 'The whole tonnage owned on the lakes in 1820 unounted to but 5,500 tona, in 1840 to 70,000 tons, in $18 i 0$ to 215,787 tons, and in 1855 to 345,000 tons. hiut even this rapil increase hardly conveys an Idon of the vast commerce of which theso great Inlund eens are destined to becemo the scene even before the close of the curret it century. The lihoral provisions of existing truaties vith England and her American colonies, will rapialy develop tha resources of Canada and the N. Slates.

becoming the eutrepot of trade. Hitherto, however, these negotlations have proved abortive, so that, as already statod, Lamar at present engrosses most part of the forelign trade of the State. We suljoin the decree constitnting Lamar a free port:

1. Frem and after tho lat of Joly of this present year, 1833, port lamar shall be absolutely free and open, 2, Vomela of crery nation may enter thls pert, and remaln as long as they please, without belog suljected to any tax whatever, elther on entrance, or during their stay, or on their departure. 3. They shall be firee from nill dntles of anchorage, tounge, shilfing, unlosding, or relonding of cargo, deposit, atorage, or any other of whatever denomination. ' 4 . Goode masy be depooficel in private warehoused, wilhout any intervention on tha part of the government. 5. The cuntom-house of Port latuar is duppressed. In lis atead will be a commassioner's offee, for the purpose of distrithuting permits for the transportation ci goods into the Interior. 6. Whenever gooits are to be sent lote the interior, they must first be suhmitted to the comaisuloner, together whit the luvolee correaponding. t. The commissiener will regiater then in a mooi. together with their vuluation, inade by two merchants of the place, and the anme of thelr owners, of the pereon to whom and the place whero they are to be sent. This is to be slgned by the person ontering the goods, who, at the same thac, binda himenelf to have them transported direet to the cusiomhonse fir which they are destlied, witheut opening any of the cases, bage, or other envelops, each of which shall be sented, marked, and numbered before drparture. These poluts are to be expressed in the permit. 8. The comminsluare thall by the earliest post send a netice to the cultector of the chatem-houne for which nuy merchandlse la destined, muedfying the numbers, characters, qumbtitles, aud qualltes of the several articles. 0. The goode must not be carried by suy unaccustomed ronds, but only through Calanaa and the publio thereughfares; and whenever they pans through nay phace at which a guard or commlsslouer in statloned, the permita muat be exhiblted, in order that their arrivas with their meals mbiroken may be atcertalaed. 10. Merchante, olther to person or by a represeitative, mat produre to the commlssioner of the port a certlifato of the dellivery of the ge eds at the custon-honse for which they are deathed within aix nonthe frou the day of thelr entry ; In ease they do not, they mast at the end of that period pay the whele of the dutlen on them. 11. From and aftec the lat of, July, 1838, all goods entered at lort lamar nhall pay a duty of obsy 5 per cent. over and above that of half per cent, to the consulado. 12. The duty of 5 per eent, shall be pald thus: nt the port, 2 par cent. on the valuatlon male as aforesald ; and tho other k at the cun-tom-house in the luterler for which the goode are deatined, In each rase, whe half at the end of 3 , the other haif at the end of 5 monthes. 12. All geeds carrled from lort Lamar hy land to any of the adjucent repubiles shall only pay a tranade duty of 2 pur cent. 14. A duty of 2 per cerit. ghall be pald on three fourths of all gold and allver mency entered at any of the castom-houden In the interlor for exportation throngh Port hamar. 15. It is abselutely prohiblted to export gold er sllver ln bullon or plate, except In small quantiles for the une of the presson carrylng it out. It wlll be aiked wherever It is fonmel on thita alde the diatricta of San Antenlo, San Viacente, Atoca, Axua, de Castllia, Lequapite, or the llae of the canal. 16. All hardware for agriculture and mintug machluery, Instruments of uclence or the arta, Iron, sheel, qualeksliver, and moral booka, may be introducel free of duty lnto the repulitic, and preductiona ef liolivia may bo oxported likewhe free. 17. A promilum of 2 per cent on their value shath be allowed on the expertatlon through Port lamar, of easenrilla, woot, tin, cocor, and coffec, In the ahape of remisaton from dulles to the amman on goods rarrind lnto thy interlor from the same pert. The remaining articlea of the the eree ara of a purdly loeal nature. Noct homivis and leme.
Lamb-skins (Gier. Lammsfelle; Fr. Prounc d'ugeneater; lt. Ielli agnelline; Sp. Pielle de camperow). The valuo of lamb-akins varies according to the lineness, briltisney and color of tho wool. Hhek lambskins are more generally estomed than those of uny other mon. Vaglish lambeklins are soldom to the met with perfectly hack; but since the introduction of Murioo sheep into this country, many of the white deeces have, in point of quality, nerived at ; zituch of perfection which justly eutitles them to be rannad with sonie of the best tleeces in Spain. The limportation of lamb-skins is immetse. Hight tenths of the whole quantily aro aupplied by Italy. They are montly unel In the glove manufucture.

Lamp (Ger. Lamps; Fr. Lampe; It. Lucerna; Sp Lampara; Rus. Lampadu), an Instrument used for tho combustion of liquid inflammable bodies, for the purpose of producir; artificial light. Lamps are mentionod in oll the early ages: they were in use in Eigypt, Greece, and Rome. The earthen lamp which Epictetus the philosophor had In his study sold after his death for 3000 drachmas, A. D. 161. Lamps with horm sides were the invelition of Alfrod. Lamps were in general use through the streets of L.ondon up to the close of the 18th century, as were flambeanx, which were carried by link-boys. London strects were tirst lighted by oil-lamps in 1681, and with gas-ic.aps in 181.4. The domestle lamp is now of elegant manufacture ; of this kind is the Arpund lamp, brought Into general ase in Fingland in 170.--Haydn.

It la nunecess:ry to givo any lescription of instrumenis that are so well known. We may, however, remark that the discovery of Sir II. Davy, who, by covering the flame with wire ganzo, ancceeded In producing a lump that may lie securely used in coal minep chargeil with inflammalslo gas, ts one of the most $i \cdot-$ genious and vuluable that has ever been mude. "he following extracts from a communication of the late Mr. linddle, an able and well-Informed coal enancer, evinces the grot importance of Sir Humphrey inavy's invention: "llesides the facilitles alforded by this invention to the working of conl mines abounding in firedamp, it hus enabled the directors and auperintendent to ascertain, with the utinost prectsion and expedition both the presence, the quantity, and correct aituation of the gur. lustead of creeping inch by inch with s candle, as is usunl, along the galleries of the mine suspected to contain fire-danip, in order to ascertain its presence, wo walk firmly on whth the safe lamps, and, with the utmost comidence, prove the netual state of the mine. liy olserving attentively the several appearances upon the flane of the lamp, f:s an examination of this kiml, the canse of accidents which happened to tho most experienced and cautious miners is completely developed; and this has hitherto boen in a great measure mattor of mere conjecture. It is not necessary that I wonk enlargo upon the natural advantuges which must necessarily result from nul hivention calculatel to prolong our supply of mineral conl, hecause I think them ohvious to every reflecting mind; but I can not eonctude without expressing my highest sentiments of ndmirution for thuse talents which have developed tho projerties and centrolled the power of one of the most dangerons clements which luman enterprise has hitherto land to encounter."
'The lamps now used for light-houses are highly ingenious, anl benutiful. In the first place, it is necessary to distinguish hol ween two systems-the catoptric mul the dioptris-tho formor depending on the retlectimn of lipht from a mitror, and tha latter on the trammission of light through a lens. If a large lamp were placed ofl the cop of a lifht-house, with glass roof and windows all around it, the light would shine in every direction, hosing ifs lutenaity ly heing on much diliused; lint by the nse either of mirrors or of lenses, all the light is conventrated tu one clotinito dimotion; its energy is incrensed by being circumserited in range. In the catoptric system, numerous concave rellectors are placod ut detinito miglea round a central lamp: they ure of kilvered eopper, und ure kopl exquisitely bright; und they all contrive to reflect the rays out neawark, without allowing any to waste their puwer handward. 'I he dioptrio syitem involves the use of powerful cunvex lenses, through which the rays are focalized in a detinite diration. If very large, these leuses would bo diffleult to make und costly to purchase; hut it has been ahown by lirewater nul liresnel, that a compound lens may be huilt up of a number of pieces, provided tho curvitures uro wenl ndjusted. Around thousands of iniles of coast,
where the annual wrecks are from 700 to 800 , and the property lost amounts to inllions sterling, the lighthonses havo passed through many stages of efficioney. First there was the large coal fire used on the summits of open buildings, then the old-fashioned oil lamps, or sometimes wax candles, with a looking-glass reflector behind; thon the more brightly-hurning Argand lamp, with concave metallic refiectors belind; then the convex lens, to focallze the rays by transmission; and then the lens built up plecemeal, so that the light may appear almost as one vast luminous pillar. See Ligartllovasas.

Jamp-black (Ger. Kienruss ; Fr. Noir de fumde, Nero difumo, Negro-fume, Negro de huno). Tho finest lamp-bliak is produced by collecting the amoko from a lamb with a long wick, which supplies more oil than can be perfectly consumed, or hy suffering the flame to play agoinst a metalline cover, which impedes the combastion, not only by conducting off parts of the hrat, but by obstructing the current of alr. Jampblack, however, is prepared in a much cheaper way for the demands of trade. The drege which remnin after the eliquation of piteh, or elae small pleces of flr-wood, are burnod in furnaces of a peculiar construction, the smoke of which is made to pass through a long horizontal flue, terminating in a cloae boarded chamber. The roof of this chamber is naile of conrse cloth, through which the current of air eacapes, while the sont remains.-Une's Dictionary.

Land, in sea language, makes part of several compound terms: thus, laying the land, denotes that notion of a shlp which inerenaes its distance from tine coast, so as to make it appear lower or sm-ller on account of the intermediate convexity of the mon. Rusing the lankl, ls produced hy the motion of the vesmel toward it. Land is shut in, signilies that another part of the land hinders the sight of that the whip came from. Iand to, or so far from shore that it can only he just diseerned. Land turn, a wind that in slinost all hot countrien blows at certain tises from the ahore in the night. To set the land; that lis, to see liy the compress how it lears. Iand-breeze, a curreat of air, which in many parta within the tropica, particularly in the Weat Indies, regularly sets from the land towand the kea lurIng the night, and this even on opposito points of the coast. Iaud-locked, is aaid of a liarbor which in environed liy land on all silles, 80 es to exclude the prospect of the sea, unleas over soms Intervening lunil. If a ship is at anchor in auch: place, she is said to ride landlocke, and is therefure considered th the anfo from the violence of winds anil tinlen. To mule the land, js to discover it after having leen out of sight of it for nome tlave. Land-mark; any mountain, rock, steeple, or the like, near the sea-sille, which servea to direct ahips passing ly how to nteer an as to avoid certain dangeroun rocks, shoals, whirlpools, etc.

Lands, Publio. Dirants of public land tocertain Staten for railroaln, mate at the last gesaion of the
 ternate woctiuns deabroated hy od 1 nombers, for aix mallen in width on each wide of certain railroade named in the a-t ; and, in ease any of such sectiona shall have heen meld, or become subject to gre-emption, then the limit of melection is exteuded to fiftecn milex on each rile, to make up the deticiency so caumed. "The alfor. nate sections remaining to the Cnited States within ais milez on rach phle not to lie woll for lews than sonhle the minimun prine of other pmblic lamdaE1 25 leer acre. Iroopen and wher property of the Linited States for lie transperted free upon the rail-roals-mails to be carriesl at auch rateman t'ongrosa may; prescribe, and, until so lixed, at such potes as 'ie l'entnanter-tieneral may allow.
At the second session of the amme Congrean, IXifi- 7 , a like graut was made to Minnesota ami to ilabama. The quantity of land granted in each case is over 8000 screw per mile of railway.

In the first grant mada to Alabama, there does not seem to le any Increase of the price of the sections retained by the United States, that provision of the law not being fairly construable as onc of the terms or conditions of the grant. In all these grants, it will he observed, the States are authorised to make the! r selections as far as fifteen miles on ench side of every railrosd, while the increase in the minimum government price of the retained lands Is contined to the six mile limit. The public landa, in all the shovenamed States, particularly in lowa, Alabama, Mississippi, Louislana, Wisconein, and Michigan, having been eold or pre-empted to a great extent, it is manifest that the selectlons for all the named railroads will range, more or leks, to the maximum limit of 15 miles on each side of them. The increase in the minimum prace, therefore, does not apply in a width of nine miles on each side. This seems to give up the argument that the only consideration which moved Congress to mal.c these grants was such as would actunte any large holder of noccupied land to give away part to enhance the value of the residue; for if the land is not Improved in value for the full extent of the 15 miles, what right have Congress to make such a grait for such s reason?
The immenso donations of public land made of late years by Congress to corporations within the new States, have awakened the attention of the people of the old Staten to the subject, and of Virginia, espectally; where the burlen of taxation for internal improvementa has heen greatiy increased. It strikes us, therefore, that a brief recurrence to the history $n \cdot\}$ conditions of the tenure of the public domain ri.. it of general juterest at this time.

At the commencement of the Revolutionay $\mathrm{War}_{\text {, }}$ there belonged to some of the States large tracts of w!d und unappropriated lands, while in others none such existed; the States possessing no such lands, chimed that as the war was waged with united means and erdal sacritices, the waste lands which might be confuered from the enemy should become common property, and, under the recommendations of Cor gress, loth Betolier, 1780 , "that the unapiropriaten lands which might he reded to the Inited States, ly any particular State, pursuant the the recommendation of tongreas of the 5 th of September last, shall be thisposel of for the common benefit of the l'nited States."

Virginia promptly made a ression of her vast domain north of the liver Ohio, out of which six States ha e since been formed. The condition of har epesion (adopted substantlally by other states) was, that atl the lands conveyed "shall be considered as a common fond for the use and benefit of such of the l'nited States as have hecome or shall become members of the confederacy or federal alliance of the said States, Virghinia inclusive, according to their usual respective propsortions in the gencral charge and expmotiture, and shall be faithfully and bond fill disjosmod of for that purquse, and for no ether use or purpese whaterer." Thua were thw lands ceded, acceptord, and hield in trast. How they have nince been disjosed of, in tutal diapegurd of the combitions of the trunt, the himory of the comintry tel! in tho ammala of Congressional legidhation.

In dinregaril of the phain obligathons of the truse, I'renident lackann, in the early days of his mhinistration, proposed tor cede the lands thus aryuiresl, and all snbsequently purchased, to the states in which they Hon, gratuitonaly, or for a mominal price.

Tis counternct tha movempot, whidh at that time mot wit!: no favor in Congress, hut which has nitree teen subatantially adopted in the syatem of partiad granta, Mr. Clay butroluced hia well-knoun listrilution bill, nhich was panaed by Congrows on the 影dyy of March, 18:3, by a vite of 24 to : 6 in the senaki and 96 to 40 in the Jlouse of Representatives. This liill I'roshlent Jacknon rofused to aly,
not become the vote of $t$ ing. Some to avow the the States in one of the $m$ the census of sistible. The plete, and afte be utterly po their common
The whole gone into the visions of $\mathbf{M r}$ periol of seve for each year,

not become a law, the popular will, as Indicated by the yote of the Mouse, to the contrary notwithstanding. Some of the westurn members did not hesitate to svow the purpose of eventually appropriating to the States in which they lie all the public lands, and ene of the most eminent of them declared that, after the census of 182 , the power to do so would be irresistible. The fulfilment of this menaco is almost compiete, and after the census of 1860 the old States wilt be utterly powerless unless they unite cordially for their common protection.
The whole amount of monay which would bave gone into the Treasury of Virginia, under the provisiuns of Mr. Clay's land bill from 1892 to 1839, a period of soven years, would have been $\$ 4,369,169$, or for ench year, $\$ 728,194$.

On September 4, 1841, an act was paesed to appropriate the proceeds of the sales of the public lands among the savaral States. The first section provided that from and after the 81st of December, 1841, there should " he allowed and paid to each of the States of Ohio, Indiuna, Illinois, Alabama, Missouri, Missiasippi, Louisiana, Ary ınsas, and Michigan, over and above what each of the enid States is entitled to by the terins of the compacts entared into between them and the United Stateg, upon their admission into the Union, the sum of ten per centum upon the nett proceeds of the sales of the public lands, which, subsequent to the day aforessid, shall be msde within the limits of each of said States respectively." Wa give below a atatement, showing the quantities of public land disposed of, and slso the quantities vacant.
gtatbeent of tif ageas of tie sbveral Pudlio Land, States and Temitorikg of tife U. b., the Quantity of Land diafosid or, and tife quantity aenainine vacant, on the botil of June, isfe.

[^31]Land-watter, an oflicer of the thglish customheuse, whose duty it is, upon Imaling nny merchandise, to tasle, weigh, measure, or otherwisa examine the various artiches, ete, and to take an account of the same. 'they are likewise slyfed searchers, nudi are to attund, and join with, the patent neurchers, in exectution of aii coekets for the mhipping of goobs to be exporteil to foreign parts ; and, in carea where ciraw. backs or bounties are to be paid to the merchant on
the exjortation of my goods, they, as well as the patont senrehers, are to certify the shipping thereof on the tehentures.

Lantard, or Lanyard (frow: Lamier, Fr.), a whort piece of cord or tine fastened to several machines in a sthip, nmi serving to secure them in a partientar piace, or to munnge them more convenientiy. Such nre the lunyuris of the gun-pert, the lanyard of tho buoy, the lanyarl of the eat-hook, and others. The principal 1 lu
lanyaria used in a ship, however, are those employed to extend the sbrouds and stays of the masts by their communicatlon with the-dead eyes, so as to form a sort of mechanical power resembling that of a tackle. These lanyards are fixed tu the dead-eyes as follown: one end of the lanyards ia thrust through one of the holea of the upper deadeye, and then knottell to prevent it from drawing out; the other is then passed through one of the holes in the lower dead-aye, whence returning upward, it is inserted through the second hole in the upper dead-eye, and next through the second hole In the lower dead-eje, and finally through the third hole of both dead-eyes. The end of the lanyard being then directed upwand from the lowest dead-eye, is atretehed as stlff un possible ly the appllention of taekles; and that the several parts of it may alide whith more facility through the holes of the deat-eyes, it is well smeared with hog's-lard or tallow, so that the straln is inmednately communicated to all the turns at once.

Ia Perouse, a celebrated French navigator. IIs first voyage was commenced in 1785, whee Perouse sailed from France for the l'acific with the Roussole and Aafrolabe under his command. The last direct latelligence received from him was from Batany liay; In March, 1788. Several expeditions were sulseequently dispatched inseareh of l'erouse, hut no certain information was hat until Captain Dillon, of the Finnt India ship Research, ascertained that the lirench ships had been cast away on two different islands of the New IIeliriles-a fate authentieated by various articloz of the wreck of these vessels, which Craptain Dillon broughit with him to Calcutta, April 9, 1828, 10 years afterward.
Lapldary, a nume given to the artist or artinan whose husiness it is to cut, grind, and polish gems. amall stones, etc., for the purquses of jewelry, and atso for mineralogical specimens. The name, derived from lapidarius, pertaining to stones (fros lapia, astone), would seem to include the varions modes of working or finishing stones in general ; the technical use of the worl, however, is limited as above noticel.

LapIs Lazuli. See Uithamaitine.
Lapland, the most northerly eomitry of Finrope, is bouniled north liv the Arctic Ocean, south by Nweden, east hy the White Sea, and west hy Norway and the Atlantic Ocenn. Its limits nre not :ury areurately la!. down ly peographurs; hat it seems to be dividel from the rett of Scamimavia ly a line umarly corremponding with the polar vircle, in latitule $66^{\circ}$ 32', and is conmequently alnost entirely an arotic region. North Cape, its most northerly point, is situated in N. lat, $31^{\circ} 10^{\prime} 15^{\prime \prime}$, consequently its lengit from north to south, is alout aso miles, ami nut ban, ns is usually statel. From Cape Orlov, on the White Sel, to the Atlantic on the west, it extemis almint 700 miles; but besides this eontinental territory, threre are a vast number of i-lands, whiels are incluidel in the general name of laptand. The whole country it divided into three part*, calted lius-inn, Swedinh, and Norwegtan lapiani or Finmark, and is rerompizeal hy the Swedes and Norwerians loy tha name of Lapmark, mark aignifyius, leth in Sweilish amd Nurse, land or trat of conatry. The veis eariy writera, however, dos nu: notice any country uniler the name of laphark, while Finmark is alluted to, though not with alsibs chearnees as would almit of our detining the exart extel.t uf contistry whish went tive that appeltation. It hat been conjectured thit, in former ngen, the girt a the porth now hoown by the manes of Swellish and Ruasian Inplame were diatinguiahed as linsaion ani Swodidh Fimmark pire lutsty to the perioni when the Fimus obtained the namo of lapper, "I laphanders.

Fimmark, which forms the mast morthern part of thin wild and extemalve territory, constitutes obe extremity of tha kinulom of Norway, to which it now belongs, though doulitless in ambient times it was a oegrazate hioggom, governed ly its onn noverelgits.

Its present boundary on the west is Loppen, the first ieland in Finmark, and whleh forms a line between it and the Nardlands, a part of Norway sometimes erroneously confounded with Lapland. On the northwest and north-east it is washed by the Polar Ocean, while to the east it is bordered by lussian Lapland, which also, with Nordland, bounds it to the souththe boundary line between the two countries being tha River Tana. Its extent from north to south-that is, from the borters of Russian Lapland to the North Cape--ls neurly three degrees of latitude; its greatest brealth heing from west to east, namely, from the western side of Faroe to the coast above Waranger, near the liorders of Russian Lapland. At the eastern extremity of I'Inmark there is a considerable tract, to which both Norway and lussia lay claim. It lies between the nek nowledged boundaries of each of theso powers, and leing now cousilered as neutral ground, Is free to the Laplander of both countries to hunt and tish in. This district extends a little to the westward of Bugefiord, stretehing nearly sonth to the linara Lake, where it liends to the enst, and afterward to the N.E., where it joins the coast. Russian Laphand lies to the south and east of the delatalle groumi aluse mentioned. The river Muonio, which for a consilerable portion of its early course receives the name of the Konghirnalelf, constitutes the boundary between Sweden and Russia. The cirele of V : la, and the northern part of eastern Kemi, constitutal at one time Lussian Laplanul; but, ly subsequent treatics, two extensive districts, all the lapmark of western Kemi, and the greater part of the lapmark of Tornen, have been ceded to lussia. Thus nearly two thirds of the regiona inhabitel by the laphanders are included in the dominions of the Emperor of liussia. Swellid Lapland, the most southerly division, ocenpies the interior purt of the country to the west of the River Torneo-the maritime district of Nordlanil, a portion of Norway, being aituated letween it and the North sen. Jow much of the northern purt of Swelen is entitied to be enlled Swedlsh lapland, it is imperssible to ssy. If the arctic circle be taken as the homadary lime, only that portion of Sweden called North loth. nla can he eonsldered ns belonging to lapiamd; but l'itan lapmark and V'mea Lapmark are sonetimes mentioned as forming part of the latter comatry, and these are situatell in West llothnia. The cuuse of error may he traced to the circumstane of these nomadic tribes frequently inimbiting, at least for a porthen of the year, districts of country far down in the interior of sweden and Norway. Thus, in the latter countiy, the Kormas Mountaine, situated hetween Cloristiasia and Drontheim, are inhabite il, during: sumbure ut least, by a fanily of laphanders, with the never-failing lierd of reincleer llut the exat buydary line is not very material, as it has reforeme only to diffrent purtions of a tract of country which is under one government.
Thure are numerons lakes and rivers in lapham. Of the hater, soveral take their rise is the Koulin Mountains, and tow in various directions inte the Ithatic Wrean or the tinlf of thothia. The promeipal rivers of the country are the Tama or 'arma, which tahes a mertho eastern courne through Flamark, and emption italf into a bay or somot of the amme mame ; the Alten or . Nata, which is vory rapid, forcing its way through the nountalne of Fimmark in a northewenterly direction, "mpene it-rifluton lay of the same mame; the Tonnen, which issues from a lake so natned, ami, after bein! rolarged by a number of streams uniting in one channel and running nearly due month through a long coorme, falls into the merthorn extremity of the lhothnlan Gulf at Turneo; ani the Mmolio, which rives from the Killpis Iatre, at the font of the appine chain of Sorway, is a consinerable atrean, ani eometitutes the Inundary line inetwern siweden and ithosha, till it unites with the liver Tumeo, when the latter marks the

Ilmits of elther country In this quarter. There are also other rivers which take their rise in Lapland, and fnll Into the Gulf of Bothnia, anch as the Lulea, Pitea, Kalix, and others. In Russinn Lapland there are severa: considerable streams, but these have not been so well detined, nor has thls part of Lapland been so ally de ribed as the others. The Kep̣i takes Ita rino mong the Kemi Mountalns, altuated near the centre of the cenntry, and flows into the Gulf of Bothnia. it has many imposing cataracts, of whleh the Tairal Konki, or the full of the heavens, is the only one whieh the adventurous boatmen never attempt to cross. The Passe, or holy atream, is the outlet of the great lake Enara, flowing thence to the Arctic Ocean. The eastem declivities of Russian Lapland are watered by the Panol, which discharges itself into the White Sea, The Tuloms falls from a great helght, enters the Lake Kola, which name it afterward takes, and falls Inte Kola liay, on the Aretlc Ocean, Beside these, there are numenous other rlvers which traverse the country in varions directions, and elther give rise at lakes, or issue from them.
Fishery.-The const Laplunders support themselves entirely by the fishery; which is natonishingly productive, 2000 pounds' weight of cod-fish leing caught in a day hy means of lines alone. From the great aamber of small Russian vessels which frequent the coast at certaln seasons, they find a ready sale for the fruits of thelr lnduatry, receiving in exchange ehlefly meal, brandy, tobacco, and the like. Whales are abundant. particularly what is enlled the fin whale, which is iong, active, swimming with grent strength and speet, and consequently difficult to enpture.
Manufactures.- In tiselr innnual arta and manufactures, that la, making the various utensils which their mode of life requires, the Iaps displsy some ingenuity. Their aledges and canoes are very strongly and closely put together, so ss to he entirely impervions to water. They tan hldes with the first inner bark of the birch, make strong cordage and thread of the sinews of the rindeer, weave coverings for their tenta, knit gloves, fashion wooten utensils for domestic purposes; and the women prepare the skins of foxes, fawns, otters, and other animals for anle, ty stripping off the membraneous parts, and curing them with tish-oll.

Russian Lapland hegins st the Warnuger Fionl, undet N. lat. 70, and oxtends as far ne the White Sea. Admiral litke, in anrv ying its northern const, in the years $182-3$, has noted down many interesting partheulars, from which we derive the following notes:

It may appear surprising, hut it is nevertheless true, that this coast, nuvigated for thren centuries by the first maritime natlons, was, hefore Almiral litke's survey, less known to us than many of the moat distant and uninhabited purts of the globe. Vessels trading to Arebangel had, for a long tlme, only the Zeefokel of the Duteh forn gulde. Litke, June, $18: 2 y$, hegan his survey of the Laphand const at Cape Orlov, in alout N. lat. $67^{\circ}$. This, the enstern extremity of Mussian Lapland, consista of hlfh, sterp, and lare rocks. Near Sviatol Nos (in N. lat. tis ${ }^{\circ}$ ) the const has an insiting appearanee; the south side of the inlands, or lndentations, being covered with beantiful turf, wild leek, and a number of strawherries, hat there were no bushes. thi the main shore, however, were seen low dwarf hirch and junjuer bushes, and numerous tracks of reindeer. Juring simmer, as Admiral Litke was here inforned, there is no laril route throurh Lapland; and all who are then need sitnted to travel -an, for exmmple, elergymen, the judges, or oblicers of Jullicial courts, etc.--poss by showites hlong the shere, ly stations, from Kolu, roind the whole peninsula, as far as Kandalakolua, In the extremo northeastern puint of the White Sea. Ietween Kanclahaksha, however, and Koln, they manage to traval in the usual manner. A little to the west of svatol Nos is the mouth of the Yukanka River, whilh is navigalide
for three to four ses miles up, when rapida commence, and prevent navigation, even for small boats. On the left bank of this river lies a Lopar village, callad the Yukanka Lodge: for all places of the Lopares, both for summer and winter residence, are called by the Russians pagosti (lodges).

About 30 miles north-west from Yukanka is Cherni wos, or Black Cape; and near it, Noknev Itand-in earlier charts, called Nagel, or Nagol. Here Admiral Litke found that the needle showed no variation. On the main shore, near Noknev Island, the prinelpal fishes caught aresalmon, bib, paltus, and piksha. The peshehanka (sand-eel) is caught in a remarkable manner. Some time hefore ebb, the Lopares set abont digging up the wet sand close above the etrand line; with slmost every atep they dig out such a fish, to which, however, they must not allow a seennd's tlme, as otherwlse it would be sure to dig itself in again, and esenpe. As soon as they perceive it, therefore, they selze it with a handful of sand, and throw lt violently on the ground. The fish, thus stunned, are collected in baskets or casks. It is strange that this fish is found only nt ebly during the dny, and never at night. The people of thls place had also some shaep, which had ahuudant food in the adjoining pastures.

The chief ivlnnd on the const ef Rnssian Iapland is Kildin-not Kilduin, as the Duteh enll it-and lies 11 miles enst from the mouth of the Kela Bay. It is 9 miles long, and $I \frac{1}{2}$ to $3 \frac{1}{2}$ miles broad. Its shores are high and precipituus on the north side, and terminate abruptly in a perpendicular rook on the west, while on the south-cast side it slopes down gently to the sea. The appearance of the south coast is most pecullar, rising as it does in four most regular terraces, forming an amphitheatre of 500 feet in hoight, with a flat, talle-like top. This coast is everywhers clothed with the richest verdure, forming a most atriking contrast with the bare granite erags on the main shore. The island consists of prlmary slate, and thus differs from lonth the islamis nul the main shore to the south-eastward, which show only grnuite.
Kola, the capital of Itussian Lapland, is situate nt the conflnence of the Rivers Kola nad Tuloma, about 30 miles from the sen. As determined by Mr. Rasnnowski, who, in the lnst century, obeerved in this place the transit of Venus over the sun, the latitude of the city is $68^{\circ} 62^{\prime}$, the longltude $33^{\circ} 1^{\prime}$ enst from (ireenwleli. It appears that Kola was founded long before 1553, ns linglisli and other mariners traded nlready nhout the midille of the 16 th century to Kola na to a well-known place. It was at first only a reolish (capltal of a ilistriet), heeame nuder Peter the Grent un ostrog (fortlifind place), and since the foundation of the stadtholdership, the capital of a government. The place extends 630 fathoms nlong the liver Kola, and $\mathbf{j}_{7} \mathrm{~F}$ futhoms along tho Rlver Tulema. Except at chard binitt of stone, all the houses ave of wincl. The streets are paved with planks. On the bank of the Kola, near tho centre of the town, lles a wooten fort, being a square with five towers: since the rupture with lingland, in the year 1800, the cannon of this fort were removed to the priory of Solowez, in order to put the latter in a state of defense; and sinee then, the walls of the fort serve only as a fence for the eathedral, and the towers are transformed into starelumses. I'he number of inhahitants of both sexes was extimated by litke, $\ln 1822$, at nhout 800 , hut recent oflleial datis show that it was, in 1849, only (i.te. The otlleling and merchants oi Koln live in in style varying litele from that of the eapital. In extemal mpearanee, Kola is that of a rlean town; nud the lonses, comainting frequently of two thoors, are neat. The view of the town from the north-eant la most churming ; it stands on n high and abrupt bank, from which in wide mhin extends, tordered on three sldes by high hills. "The principal trate of Kola is in tish, partienlarly In bib (triskin) und paltus. 'The Ko-
laers are net themselves engaged in flshing. but obtain the fish by barter, mostly from the Ruseian fishers tredlag on the Lapland coast, partly from the Norwsy ports of Wadsö, Wardhuns, IIammerfest, end oven from Tromsö, to which porta the Kolaers are permilted to export about 2000 tchetcert of rye flour every year.

Kola lodji go to Archangel to barter their cargo of fiah for the various merchendise they require, and some of them venture to set out from the latter place on their return home as late as October. While the men of Kola are thus occupied, their wives and daughters do not remain idle. They croas in little loats to the istands to gnther maroshlia, the berries of Rubus chamemorus. A boat contalins usually but one young and able man, and from 12 to 20 women. Among the islands near the Bay of Kola, the Korellne Islands are considered to give the hest produce of moroshka; thoy lie five miles west from the month of the biy. The Koln women, however, will go atill further, to Metov Bay, and even to the Alnova Islen, at least 100 miles from Kola, in a boat. The moroshka from theae isles are said to surpass in size and flavor all others, ned are montly destined for the imporial court. The Hay of Kola, gear the town, is so shallow that even the smallest vessels can approsch it only at high water. The River Kola ceases altogether to be navigable nt the town; but the Tulome is navigable for about 40 miles, namely, to its origin frum the lake. Its hanks arg densely rooded with splendid fir. There is a small and bare lstand in the middle of the Bay of Kola, called Solnei Ostrov (Tallow Island), from the immense number of senla which formerly used to come ashore here, but which entirely disappeared atont the end of the last century.

The lay hut la formed interiorly of wool, ly means of curved ribs, which unite near the centre in a ring, which is open, and alluws free escape for the smoke, the fire being lighted in the centre of the floor. the exteriur is covered with turf. The duor is wool on one side. The inmates recline on skins on the thoor, with their feet toward the fire; and behind them, on a row of stonea near the wall of the hut, are their various ntensils. Their clothing-hiefly of tanned skins and woolen stuffs-looked very dirty. 'Iheir whole wealth consints in reindeer. The two families who frequent this valley possens alout tocideer. We asw, perhajns, nhout one fourth of that number. A few of them were driven, for our inspection, into a circular melosure of wooten praling, where they are halitually milked. One of the men dexteronsly caught them ly the horns with in luaso, or noose. The deer are small; but nome of them carry immense branching horns, the weight of which they seem almost unable to sujport. At this meason their long winter cont of hair eame off ly hundfulls. They make a low gronting noine, almost like a pig. The milk is very amall in quantity, and excessively rich.

The whole population of Finumark dies not exeed 45,000 . The degraling superstition in which they were formerly aunk has now in a great monature disurpeared, along with those numerons deities which they worshiped : the wild creations of unenlightenel nature have been superseded by Christianity, and a knowledge of the true Goh. Itpgular elergymen are astatilished in the country by the different governments, and the laps exhibit much reverome and devotional feeling cluring dlvine eervice, although its purport ia only known to them through an interpreter. Finmark, in regard to ecelesiastical regulations, is under the juriadiction of the llinhop of Norland and kinmark, both of which form one dioeene. Swedinh lajland has a population of only slout 12, (MM).-lia. It.

La Plata. The Argentine Repulilic, or " La tonfederacion Argentina," comprisen the provincea which, with Pareguay and Vruguay, now Independent States, conatituted, under Spaninh rula, the vlce-royalty of Buenow Ayres. Ita area is the largest of the South Amer-
ican republics, and its pepulation to the square mile the smallest. It consista of 18 provinces, comprising an area eatimated at 786,000 square inlles, and contains a population of about 764,000 souls. Other estimates reduce this number to 596,000 , while the " Almanach de Gotha" for 1855 gives a total number of about $2,600,000$, of whom $1,200,000$ are creoles, Spaniards, and mestizos, 200,000 subjugated Indians, anl 25,000 negroes. Within a fow years, Buenos Ayrea has withdrawn from the confederacy. With the exception of a portion of the extenslve plains, called pampas, watered by the rlvers Rlo Negro, Colorado, und Desaguadero, nearly all the country belonga to the hasin of the Ia Plata, the great estuary of which is between the State of Buenos Ayres and the Uruguayan port of Montevideo. The most important product of the republie is cattle. Immense droves of oxen roan at large over the pampas, and vast herils are scattered throughout the extensive breeding estates of private individuals. Horses and mules constitute a prominent article of commerce with the Peruvian and other traders; and sheep ind hogs, and the small quadrufeds which furnish the nutria and chinchilha-shins, are muong the valuable native snimals, Cotton, tolaceo, rice, cocoa, sugar-cane, indigo, maize, wheat, und other grains, constitute leuding productions; but the stuplea of export are hiden, skins, horne, hones, hursehair, wool, tallow, ostrich feathers, salted meats, crude naltpetre, and cocoa. The export trade reaches, annually. a value of about $\$ 10,000,000$.

Commercial relations letween the United States and the Argentine Repulilie are regulated by treaties of July 10th and gith, 1853 . The former treaty relates chiefly to the narigation of the rivers latana and Uruguay : that of July 2ith was designed to acknowl. edge and contirm the relations aubsiating bet ween the two governments by the signing of a treaty of friend. slip, commerce, and navigation, as well for the good security as for the encouragement of the commercial intercourse niready subsisting hetween them, This latter treaty stipulates that perpetual maity shall exist letween the two couatries and their respective citizens; that there shall be reciprocal freedom uf commerce : that the citizens, ships, etc., of cach shall be protected in the territuries of the other, to which other forcigners, or the ships or cargoes of any other foreign nation or state ary or may be, peranitted to come ; that the rexpective ships of war, and post-office or passen. ger packets of the two countries shall have literty freely and securely to come to all harlors, rivers, and places to which other foreign shipa of war und packets are, or may be, permitted to come; to enter into the same; to anchor and remain there, and retit, subject always to the laws and usages of the two contries rempectively; that any favor, exemption, privile ${ }^{\circ} e$, or humunity whitever, in mutters of commerce or mavigation, which either of the two nations hes actually granted, or may hercufter grant, to the citizens of soliject of any other govornment, nation, or state, shall extend, in tike eaxes and circumstances, to the citizens of the other; that no high or discriminating duties shall be imponed, in the territories uf either of the contracting parties, on uny article of the growth. produce, or manntacture of the territorias of the ather, than are, or shall he, paynble on tho like article of any wher forebsn conntry ; that export duties on all articlen exported from the territorica of either party to those of the other, ahall be the same as when the expurtation ia made to any other foreign country; and that all prohibitions as to imperts and exports, into or from either country, shal! lee such as extend to tho like articlen of any other forelgn country. The traty further providea that no other or higher duties or charges, on ncconnt of tonnage, light or harbor dues, pilotage, salvoge in ease of average or shipwreck, or any ether bocal charges, shall be limposed in the perts of either of the two contracting parties, on the vessels of the
other, than th veasels; that equality with both nis respec passport, or se ity, shall be the versel ; th and all other c tices, shall enjo the territories rights, in all $r$ under the law: try ; that, in e ment, of any c ties, in the terr or consul of the or the reprezent la his alisence, possession, adm the estate of th of the country, heirs. In the capital of th In Corrientes, th Gerga. Art. 4. ging article sh trado; and those Salta, San Juan houses for inlan tariffs be fully ar trade on the rive rorling to exlati cent. upon the va consumption into leeted us the rol tom-houses for it valuation shall be as a national tax. fureign trade, an rior, Ahall permit for the provinces tom-house dispate five per ceut. upo whole of the na merchandise of $f$ foreign places, an tures or lndustry duced by land inte shalt pay, for the lected in the cus the ame cnstom-
other, than those payable in the same ports on its own vessels; that the vessels of each shall enjoy entlre equality with natlonal vessels in the ports of the other, both as respects imports and exports; thst a regular passport, or ssa-letter, furnished by competent authority, shall be sufficient evldence of the natlonality of the vessel ; that the merchants, commanders of ships, and all other citlzens of either of the contracting partice, shall enjoy, in the management of their affairs in the territcries of the nther, the aame privileges and rightr, in all respects, that belong to its own eltizens under the laws and eatablished eustoms of the country; that, in case of the death, without will or testement, of any citizen of elther of the contracting parties, in the territories of the other, the consnl-genarsl or consul of the nation to which the deceased belonged, or the reprezentatlve of such consul-general or consul In his abeence, shall have the right to intervene in the possession, administration, and judicin! liquidation of the pstate of the deceased, conformally with the laws of the country, for the henefit of creditore and legal heirs. The treaty concludes with placlng the diplomatic agents and consuls of the United States on tho same footing as slmilar represertatlves of the most fapored nution, and makes anıplo provision respecting religious privileges, rites of hurinl, etc. This treaty contains no limitation as to its duration, but provides that the amity which it estathlishes between the cithzens of the two republics shall be perpetual. The forcign trale of the Argentine Republic was formerly monopolized by Buenos Ayres; but, in 1852, new cimunels of commerce were opened, the Paranu and Uruguay Rivers heing declared free to the commercial traffic and navigation of all nations by a decred officially promulgated October 80 , of which a translation is suljoined:
Article 1. The navigation of the Rivers Parana and Uruguay is allowed to every deseription of merchait ressels, whatever may bo their nation, place of departure, or tonnage. Art. 2. All merchant vessels may enter the ports established on the Rivers Parana and Uruguay. Art. 3. The established ports are: 1. In the province of Entro Rios, that of the city of Parana, the capital of asil province, and those of Diamanti, Victori, Gualegrai, and Ia Paz, on the Rlver Parana; and those of Gualeguaichu, Concepcion del liruguay, Concordin, and Federacion, on the River Iruguay. 2. In the province of Santa FC , that of the eapital of the province and that of Rosario. 3. In Corrientes, the capital of the same, Belle, Vista, and Gorga. Art. 4. All those ports designated in the foregoing article shall have custom-houses for foreign trade; and those established in the provinces of Jujul, Salta, San duan, and Mendoza shall have customhouses for inland triale. Art. $\overline{1}$. Until the national tariffs be fully arranged, the custonn-houses for forelgn trade on the river shall continue to collect duties, neroding to existing regulatlons. Art. 6. Seven per cent. upon the valustion of the artheles imported for consumption into the litoral provinees shall to collected as the sole national tax. Art. 7 . In the cus-tom-houses for inland trade, six per cent. upon the valuation shall be collected on all articles introduced, as a national tax. Art.8. All the chatom-houses for foreign trade, as well on the rlvers as in the interior, shall permit the transit of forelgn merehandise for the provinces of the confederation; but the cus-tom-house dispatching them shall collect and retain five per cent. upon the valuntion of the goods, as the whole of the national tax. Art.9. All grools and merchandise of forelign production, or shlpped from foreign places, and all the productions of the manufactures or industry of Buenos iyres, which are hitroduced by land lato nny oi the prorinces of the lnterior, shall pay, for the present, the same dutios as are collected In the custom-house of Rosario. Art. 10. In the same custom-louse, the same duties on exporta-
tlon as on Importation shall be pald on whatever articles interior provinces may introduce into the province of Buenos Ayres. Art. 11. In all the custom-honses In which doposit is allowed, the same shall be conthued subject to the exlsting regalstions. Art. 12. Within the territories of the $\mathbf{1 3}$ confedersted provinces, the passage of their own product or msnufacture shall be free of all duties of transit or on consumption. Art. 13. The present decree shall have effect only nntll the natlonal congress shall establlsh permanent regulations on the subject it embraces.

The sbove decree, pulllshed by the provisional dlrector of the republic, was followed by the publicstion, on the 18th of the same month, of tbe following resolutlon of the representatives of the province of Buenos Ayres :-" The province of Buenos Ayres, recognizing as a princlple of general convenience the opening of the River Parana to the traffic and navigation of all nations, from this present date declares and authorizes the same on its part.'
Buenos Ayres must always be a point of groat commercial importance, as it is the principal outlet through which the produce aid industry of the immense regions lying behind can have an egress to a foicign market ; and it is only through this part and Montevideo that those countries can receive, by the La Plata and its tributaries, unless in the direct trade, their supplies of foreign merchandise. Indeed, these two ports form the only channels through which the productlons of the countries lying between the Cordilleras and the La Plata will find their way to forelgn markets. By late advices to the Stute Department, notice is received of a law which passed both houses of the Argentine legislature, and was approved by the President July 10, 1856, establishing differential duties on all foreign merchandise Introduced lnto the ports of the confederation, in the indlirect trade from Buenos Ayres. These duties are almost equivalent to prohibition, and will divert from the port of Buenos Ayres that portion of the foreign trade destined for the fluvial provinces. The chief reason assigned for the adoption of this measure, as announced during the debate which it elicited in toth lranches of the legislatue, was, that it would be the most effective moans that could he adopted to forco Buenos Ayres from its secession movements, and thus restore tranquillity to the republic. Already the goverment buiget of Buenos Ayres shows a deficiency of $\$ 9,000,000$. Thls act of the confederation, in driving from its ports the foreign trade of the other provinces-hitherto a sonrce of immense profit to its treasury-muy lesd to a commercial, perhaps a political, crisis.

The navigation of the La Plata and its trihutaries is represented to be at this time active, emplnying a heavy tonnage both of steamers and sailing vessels. The trade between Buenos Ayres and Montevideo consists in the transhipment, to and from either port, of articles the grewth or manufacture of Europe and the Vnited States, and the conveyance of passengers. lirom Iltenos Ayres to the interior, the trade consists in the interchange of forcign merchandise for the various proluctions of the la llata provinces. South of lluenos Ayres, and from l'atagonla, in exchange for dry goods, spirits, wines, and sundries, are imported hides, akins, tallow, hair, and, occasionally, whent and salt, especially from latagonia. The principal ports in the provinces open to this trade are San Farnando, San Pedro, and San Nicolas, in the province of lluenos Ayres; lossario and Santa Fé, in Santa Fé; Gualoguaigelun, Parana, and Concordia, in Entre Rion ; Gorga, Bella Vista, and Corrientes, In the province of Corrientes, From all these ports, as from those in Paraguay and Uruguay, the imports consist chiefly of yerba maté (Puraguay tea), and tobaceo, hides, lumber, nutria, wool, candles, soap, ashes, peunuts, and varions manufictures of wood.

The stean-vessels, exclusive of those of the Ilritish

| Norway.. | 95,450 | Total dollars. | 19,744,548 |

From statements published by the minister of finance of the State of Buenos Ayres to the legislative chambers, on the revenues of the customs, it appears that there was imported in 1854, of merchandise of every description, in value, as follows:

| Sundry artleles, paylag 5 per énnt. duty. | aper plantres. 16,677,540 |
| :---: | :---: |
| gandry articles, paytng 10 per cont. dnty | 1,437,947 |
| sllks, payiag is per cent. duty | 41 |
| Sundry artheles, pas luit 15 por cent. duty....... | 184,494,583 |
| Artches made up, and provislons, payling 20 per cent. daty. | 44,800,880 |
| Liquers, paying 25 fer reat. duty | 39,424, 824 |
| Articles free of duty, or entered in contraband. | 57,853,245 |
| Total. | $800,000,000$ |
| Value in U. B, eurrency. | -15,000,090 |
| Total exports of Buenos Ayres in th4....... Tolal limports of thenes Ayres tu 1s\%4...... | 99,74,548 $15,000,000$ |

The large balance of trade, however, which appears against this jort (as is the case also with the port of Nontevideo), is accounted for by the fact that the wants of the interior provinces of laraguay, and even of many places in lolivia, are supplied from these two points.
Wool constitutes upward of 25 per cent. in value of all the imports into the United States from the Argentine Regulilic. 'This is shown by the following tabular statement made $u_{i}$ from annual reports of the Treasury Departmunt on commerce and mavigation for the years na:aed, exhibiting the total values of imports fato the Cuited States from the Argentine Rejublie, from $1 \mathrm{~s}_{\mathrm{i}} 1$ to 1855 , to $\mathrm{G}^{-2}$ her with the values of wool imported from the same country during the same periorl:

| Yeart. | Tutal saluen of tropiorts. | Valups of wout. |
| :---: | :---: | :---: |
| 181. | \$8,265, $2 \times 2$ | \$1,324,887 |
| 1 k 2. | 2.061,027 | 714, 184 |
| 1 N2il. | $8.188,641$ |  |
| $15 \%$. | 2,144,971 | 854.232 |
| $185 \%$ | 2,5-4, 00.7 | 627,714 |

Of the total quantity of wool inported into the Conited States from alf countrics, nhout one third, or nearly 64 , is received from the Argentine liepublic. This is shown by the following tabular statement, derived from the same sources as the former, exhiliting the 'quantitice of nool imported into the United' "tates frum all countrics, from 1851 to 1855 , togethor with
the quantities imported from the Argentine Republic during the same period:

| Yeara. | Alt connirles. | Argentine Republle. |
| :---: | :---: | :---: |
| 1451. | 82,5-48,491 | 12,108,036 |
| 1859. | 18,941,298 | 7,084,748 |
| 1858. | 21,696,079 | 5,745,857 |
| 1854. | 20,200,110 | 6,250,098 . |
| 1855. | 18, 884,415 | 6,966,969 |

The preceding table oxhibits an aggregate of 111, 219,393 pounds of wool imported frum all countrlas, and of $\mathbf{3 7}, 159,802$ pounde from the Argentine Republic, or an annual average of $22,243,878$ of the former, and of $7,481,060$ of the latter; being a fraction over one thind of the whole.

Regulations of the Port of Buenos Ayres,-Article 1. -All versels at anchor in the port, whether national or foreign, shall render every assistance in case of a vessel breaking adrift, or of any other acchdent; or, in default, shall suffer the penalties established by law, and in proportion to the gravity of the case. 2. All vessels at anchor in the roads must have their anchora buoyed, on account of the shallow water; or pary all damages which may occur to any vessel or boat, from thila precaution having been neglected. 3. Any vessel losing a bnoy from ber anchors shall report it immediately to the captain of the port, who whll send off a pilot to replace it. No auchor can be weighed without permission of the eaptain of the port. 4. Pilots on bringing vessels up ln the roads are to laform the captain what articles are necessary for their perfect safety, and in case of there being any wanting, report it to the captain of the port. Pilots neglecting to do so will be punished with the rigor of the law. 5 . If, In a gale, the anchor of any vessel should happen to drag, or the cable part, either on account of said cablo not corresponding with the size of tho vessel or the anchor, or from rottenness, said vessel will be reaponsiblo for all the damages occasioned thereby. 6. Any vessel from sea, that may unchor in this port without applying to a pilot, will be liable to pay all damages that may occur, and can not clain redress if she, in any way, austains damage. 7. Any vessel nt anchor with her boats astern, and not hauling them alongside upon deeing another under sail, so as to givo a free passage, ean not claim for the damages she may suffer, and ahall be ohliged to pay fur those occasioned. 8. No vessel at anchor in the roads can heave ballost, or any thing that does not float, overbonrd; and if such he proved to have heen dune, the act wiil be punished according to law. 9. No vossel, excepting on her arrival, can salute in the inner roads without ubtaining permission of the captain of tho port. Those which du so will suffer the penalties the government may determine on. 10. All bosts, belonging to merchant vessols at anchor in either roads, slall put off from shore one hour after sunset. 11. All boats that nuay be found on the beach, from the time of firing the evening gun until daybreak, will be seized, and the crew punished according to the gravity of the case.
f'hot Duks of tirk l'ont of lurnos Atres.

All veesels, excepting packets, requiring a pilot to enter the inuer roads, pay $\$ 200$ eurrency (equal to $\$ 10$ Ithited States' coin-the eurrency dollar heing, at present, equal to 5 cents, United States). When leaving port, whether taking a pilut or not, thoy pay $\$ 200$ currency ( $\$ 10$ United States). Any vessel that may enter the inner rouds without a pilot, wishing to be moered or to change anchorage, jays $\& 100$ currency ( 55 United States).

Port Charges.-'Tonnage dues per ton, entering (eurreney) $\frac{* 11}{}=400.1$ centa, United States; visit and regulation, $87=\$ 035$; stamps for opening register,

## LAU

otc., $169=4845$. Tonnage dues, clearing, $11=$ 0071 ; crew list, $12=0060$; blll of health, $6=$ 1030.

By the following law, passed by the Senate and Chamber of Representativen of Buenos Ayres, and officially announced under date of September 6, 1804, It will be seen that vessels of friendly nations enjoy the same privllegen, and are subject to the ame restrictlona, as natlonal vessela :-"From the date of the present law, there will not be charged In the
ports of the State of Buenon Ayres, to the vesseld, of friendly nations of more than 120 tons, for tonnage dues, port dues, pllotage, salvage in case of damage or ahlpwreck, more than will be charged to Argentine vessels."

Thls law places the vessels of the United States on an equality with those of Buenos Ayres; while, under an old law, the ship's register la taken as evillence of bet measurement. For a more extended account of the commerce of La Plata, see article Buenos Ayufs,

By a recent treaty with Brazil, the free navigntion of the l'arana and Paraguay ls secured. The tariff of import duties adopted by the Argentlno Repullie is based on the per cent. ad valorem princlple, breadstuff: excepted; while export dutles are chlefly spectic.Con. Relations, U. S.

Larboard, among seamen, the left hand side of the ship when you stand with your face toward the head.

Earch. In the catalogue of aft timier used in shlp-building, the larch or hacmatark is not the leost useful-the latter name lo the aboriginal. It sometimes attaius an altitude of 70 feet, but is usually found from 10 to 50 feet. It is generally of struight gowth, but quite tapering. It grows rajidly, and is of great atrength; and its durability exceeds that of the oak. It is distingulshed for the closeness of its grain, is very compact, and of redtish color; and ior knees and top-ifinbers of vessela, particularly stenmvessels, is unequaled. This fact should, however, be retained, that its strength is quite out of proportion to its density; hence, we say, that it should aiwaye be fastened with muare Iron; under such circumstances it is superior to oak. This inmer is extensively cultivated in Europe, and ls not a rare specimen of segetation in the New England States,-Gitupitis's Shipbrilders' Munual, V. 1', 1856.

Lascars, native Indian sailors, many of whom are in the service of the East Indiz Company.
Last, an uncertain quantity, varying in different countries, and with respect to differebl articles. Generally, however, a lasi ly extimated at 4000 pounds; but there are great discrepancies.
The following guantitice of different articles mako a last, viz. :- 14 harrels of pitch, tar, or ashes; 12 duzen of hides or akins; 12 barreis of codish, potash, or meal; 20 cades, cach of 1000 hurrings, every 1000 , 10 hundred, and every 100 llve score; $10 \frac{1}{2}$ quarters of cole-seed; 10 quarters of coan or rajo-sect. In some parts of lingland, 21 quarters of corn go to a last ; 12 sacks of wool ; 20 dickers (wary dleker 12 skins) of leather; 18 barrels of unpacked herrings; 10,000 pilcharis ; yat barrels (each harrel containing low lhas.) of gunjowiler; $\mathbf{1 7} 00$ lber of feathers or thax. J.ast is sometimes used to nignify the burden of a ship.

Lateen Sail, a long triangular mail, extended by a lateen yard, and frequently used in Xiebecs, Jolucres, Setees, and other vexsels which mavignte in the Mediterranean Sea.

Lath, Laths (Fr. Lattes; Ger. Lattet; It. Correnti; Kus. Slegis), long, thin, and narrow alips of
wood, nailed to the ralters of a roof or ceiling in orter tustastain the covering. Laths are distinguighed into varlous sorts, according to the different kinds of wood of which they are male, and the different purposes to which they are to be applted. They are also distin. guished, according to their length, Into five, four, snd three feet laths. Their ordinury brealth is about an inch, and their thickness a quarter of an inch. Laths are sold by the bundle, which is genetally called a hundred; bit seven score, or 1.10 , are computed in the hundred for three feet Inths; wix neore, or $1: 0$, in such as are four feet; and for those which are denominated five feet the common hundred, or five score.

Latitude. First determined by Ilipparehus of Nice, alont $170 \mathrm{n} . \mathrm{c}$. It is the extent of the earth or of the hervens, reckoned from the oquator to cither pole. Maupertuis, in latitule 66:20 measureal $1^{\circ}$ of latitude, und malo it 69.196; he menarared it in 1737. Swanherg, in 160:1, male it $68 \cdot 292$. At the equator, in 1714, four astronmmers mute it 68.732 ; and lampton, in latitude $12^{c}$, made it 68-73. Mudge, in linglant, mate it til 148. Casuini, in france, in 1718 and 17.41 , noade it $69 \cdot 12$, nud lhot 68.769 ; while a recent measurer in Spain makes it hut 68-6:I, less than at the eqator; and contradicte all the others, proving the earth ta be a prolate spheroid, which was the opinion of Cussint, Dider, and others, while it has more gencrally been regarded as an oblate spheroial. See l.ovititime.

Latten, a name sometimes given to tin pates; that is, to thin plates of Iron, tinned over. See Tis.

Launch, in sea lauguage, signitles to put out; as, launch the shlp; that is, puther out of dock. Latuch aft or forwarl, speaking of thinge that are stowed in the bold, is, put them mure forwarl. Laumh, ho! is a term nsed when a yard is hoisted high enough, and signifies, hoist no more.

Laurel-tree. The Kalmin latifolia, or laures, is a larbe evectreen khrub or low tree, growing to a helight of 15 or 20 feet, in favorable nituations, with a stem three or four inches in thameter ; but ordinarily it does not attain more than one half of these dimenwions. Its leaves are of a coriaceona texture, obalnemminate, entice, nul aloot three inches long. The tleners, which jut forth from May to July, are rome. times of a jure white, timed with jale pink, delicately apotted; hut, in general, they are a beantiful rosecolor, and are destitute of islor. They are disposed in corymas at the extremity of the branches; and, as they are always numerons, their lirilliant effect is belghtened by the richness of tho nurrounding foliage.

The seeds a globular ca The Kalr lea, from C ever, north and is but ern Tenuess States wher where the paratively a southern St multiplied, $r$ riant vegetat parts of the tracte, and for a third are rendered unyielding tr As the shrub of the same foliage, they verdant mead

The seeds are very minute, and are contaiped in small, globular capaules.

The Kalmia latifolla ia indigenona to North AmerIca, from Cansds to Carolina. It rarely occura, however, north of the 42 d or 43 d degrees of north latitude, and is but sparingly produced in Kentucky and weatern Tennessee, and clisappears entirely in the aouthern States wherever the rivers enter the low country, or where the pine-barrens begin. Although it la comparatively sbundant along the rivers of the middle and southern States, it is nowhere seen more profusely multiplied, nor of a greater helght, and of more luxuriant vegetation, than In North Carolina, on the loíciest parts of the Aileghmiles. It there occupies large tracta, and forma thickets upon their aumimits, and for a third of their distance down their alles, which are readered almost impenetrable hy the crooked and unyiclding trunks, crossed and locked with each other. As the shruba which compose these copaes are nearly of the samo height, and richly leten with evergreen foliage, they present, at a distance, the appearance of verdunt meadows, surrounded by tall trees.
The wood of the Kalmia latlfolia, particularly that of the roots, is very compact, fine-grained, and marked with red lines. When green, it la of a soft texture, and is easily wrought ; but, when well scasoned, it is yery hard, and more nearjy reambles the European box (Buxus eempervirens), than any other American wood. Consequently it is worthy of the attention of mathematical inatrument-mnkera, and of engravers on wood. It is sometimes employed In the United States for the handles of light tools, for scrows, boxes, etc.; and it is sald, also, to make good clarionets. It is used by the American Indians for making small dishes, spoons, and other domestic utensils. The whole plant is regarled as polsonous to young catt'-, and sheep, but not to gonts and deer. A decoction of the leaves of this tree was formeriy tnken by those miserable natives who had determined on self-destruction. llut modern enterprise has succeasfully enlisted it in tha service of medicine, and it is epplied, in a pulverized form, internally, in fevers, or topicaliy, for the relisf of cutancous affections, A few drops of the tincture poured upon the boly of a large and vigorons rattlesnake, killed the reptile in a short tinte. The powder which covers the leaves is popularly enployed in some purts of the country where it grows, for snuff. The honey collected from the flowera ly bees, is nerounted deleterious, wilch, with other noxious qualities of this elegant shrul, lessens that esteem which its beauty elaims.

The Laurus pobilis is a native of the south of Euroge, and northern Africa; and, accomling to St. Pierre, remarkahly fine trees of it were found on the lonnks of the river Penens, in Thessaly, which, probably, might have given rise to the fable of the nymph Daphne (supposing the Greek daphns to he this tree), the daughter of that river. The exact date of the lntroduction of this species into Ilritain is unknown, but it must have heen previous to listis, ns it is mentioned hy Tumer, in his " llerhal," published in that year; nod we find that, in the reigin of Bilizabeth, the floors of tho houses of dixtinguished persons wore strewed with its leaves. The liargest recoriled tree of thits apecies in Britain, is at Margram, in Glamorgansiare, at the seat of C:. D. T'albot, M. 1', ahout 1 ? miles from Swansea. It is upwari of $\mathbf{6 0}$ feet in height, with a naggnificeot hell-shaped summit, ahent 60 feet in diameter. At Cypress Grove, near Inblin, in Ireland, there is a laure 50 feet in helght, with a trank two feet in dianeter, and an umbitus or spread of branches of 25 feet. Througheut tiermany, the Laurus nobilis is a green. house plant. In Russia, in the Crimen, it requires protection during winter. In italy and Spain it attaina a larger elze than in any other part of Europe, forming immense bushes, from 50 to 70 feet in height. in the northern parts of the United States it is only
cnltivated as a green-house plant ; but in the sonthern sections of the Unlon, where the climate la more mild, it grows in'great perfection In the open air. The wood of this tree, from its Inferior size, is not much used In construction, nor in the arts. The young branches are sometimes employed for the hoops of amall canks. Both the leavea and berries were formerly conaldered medicinal, belng highly aromatic and stomachic; they are also astringent and carminative. An infuaion of them was not only conaldered beneficial, when taken lnternally, but it was used in fomentatlons, etc. From the berries there is extracted a particular princlple, called laurine. The kernela of the fruit yield an emollient and resolative oll, called oil of laurel, whlch is employed as an embrocation in materia medlca, and in the veterinary art. The essential oil is used In perfunery, and for acrubbing wainscota in chambers, in order to drive away flies. The leaves impert a yellow color to wool. The princlpal use of this tree, however, lo for hedgen, and other purposes of ornament, though the icavea are much einployed for flavoring custarils, blanc-mange, etc. The flowers afforl the beat kind of honey, and are nuineronely frequented by bees.

The Laurns carolinensia is indigenous to the lower part of Virginia, end is found more or less abundantly throughout the maritime districts of the Carolinas, Georgia, Floridn, nnd of Louisiana. It occurs in the brond swamps whleh intersect the pine-barrens, and is there assoclated with the tupelo (Nysa biflora), red maple. (Acer rubrum), and the water oak (Quercus aquatica). A cool and humid soil appears to be essential to lts growth; and it is remarked, that the further south it grows, the more vigorous and beautiful is its. vegetation. 'I'he wood of the Laurus carolinensis is very strong, and of a benutiful roas-color, with a tine, compact grain, and is susceptible of a brilliant poliah, having the appearance of watered satin. Before mahogany became in general use In cabinet-making, in the United States, the wood of this tree was much omployed Ir, the regions where it abounds, in the manufacture of artleles of furniture of the highest degree of beanty. It might also be employed in ship-building, and tor other purposes of construction, as it unites the propertics of etrength and durability; but its trunks are rarely found, of lite, of sufficient dinensions to render it available for these purposea. When bruised, the leaves diffuse a strong olor, resembling that of the sweet bay (Laurus nobilis), and may, like them, be employed in cookery.-Brome's Trees of America.

Law, John. Law's Bubble was the most ruinous speculation of modern times. The projector, John law, of Fdinburg, raised himself to the dignity of comptroller-general of the finances of Europe, upon the strength of a scheme for establishing a bank, an Fust India ande Mississippi Company, by the protits of which the national delit of France way to be paid off. He first offered his plan to Victor Amadeus, King of Sardinia, who told him he was not powerful enough to ruin himself. The French ministry accepted of it in 1:10; snd in 1716 he opened a bank in his own name, under the ןrotection of the Duke of Orleans, regent of France; and most of the people of property of every rank in that kiugdom, sednced by the prospects of immense fains, subscribed both in the bank and the rompanies. In 1718, law's was dechared a royal hank, and the shures rose to upward of twenty-foll the original value, so that in 1719 they were worth more than 80 times the amount of all the current specie in France. flit the following year this great fabrio of false credit feil to the grombi, ant aimest overthrew the French government, ruining tens of thousund of families. It is remarkahie that the rame desperate game was played by the Sosth Sen directors in Engiand in the same fital year, 1780.-Mist. of France, Nouv. Dict.

Law was the eldest son of Wiltiam Law, and was
born at Ellinburg in the month of April, 1671. IIf father followed the profession of goldamith or banker, with so much succesw, that he was onableil to purchase the landa of Lauriston and Iandleaton, which afterwand descended to his son. The latter was educated at Edlinburg, where he In asid to hava made some progrons in literature; but the lient of his genius havigg led him to study arithmetio and goometry, he attained such proticiency in theme branches as to be able to solve with facility the most intrieate problems $;$ and he likewise made bimself manter of algebra. Law resided for several years abroud; first at l'urle whore ha acquirod great dexterity in all gumes of chanee, and afterward at Genoa and Venice. One cause ansigned for hila leaving l’arin, was hle eloping with Lady Catharine, third danghter of Nicholas, Lond Banbury, and wifv of Mr. Senor, or Semour. Ilis success in play was so great, that he is sald to lasve nequired $\mathbf{£ 2 0 , 0 0 0}$. The favorite maxim inculeated by Law, and upon whels hia whole fulric of the Minsissippl system wan reared; namely, that the power and prosperity of a nation increase in proportion to the quantity of money circulating therein, and that, su the richest nutions have not speciesuftieient to atforil full employment to their lnhabitants, this defect may he supplied liy paper credit; Involvea a dangerous fallacy, even in the most reatrieted view that can be taken of ita application, inasmuch as it implies that paper muney may be lasued with advantage to an almost unlimited extent, upon general security ; and that its credit, or, in other words, its. value, may thus le maintained without its being renderd convertible at pleasure into cash. But all expe-
 There is much truch in an olowervasion of Mr. Harke, In his Refilctions on the fronch Recolution. "It is not true," ayys he, "that law built solely on a sjeceulation concerning the Mississippi; he added the Fast Iudia trade, he adiled the African trade, he allded tho farms of all the farmed revenue of France; all these unqueationably could not support the atructure which the pablic enthualaam, not he, chose to builil on these banes. He laid the best foundation that he could, perhapa the beat which, In the cirenmatances, it was posaithle to lay; but the nation went audidenly mad, an event which he could searcely have foreseen: the Company was hurried onwarl by the general frenzy : and when the deliriam hal reached its height, the resent was allvised to issue the fatal ediet, which leveled the whole faliric the the duas. (Nee E. H., 185th.) Gueres de lanc, jansim; Histoire du Syatome deatio nances, tom. i.t Jollnitz, Jemaires; Mawallon, J/imoirra de la Minorite de Sanis XV.; Mimoires de te Regence do S. te the d'Orleans, tom. Leawn (ijer. and Fr. Linon; It. Linone, Jiwsu; Sp. Cambroy clarin), a sort of clear or open-worked camliric, which, till of late years, wan exclusively manufartured in France abd FInndera. At present, the lawn manufarture in entablinhed in Scotland and in the north of Ireland, where articles of this kind are lirought to such a dogree of perfection as nearly to rival the productions of the French and Fleminh manufartories. In the manufacture of lawna, ther flaxen threall is used than in that of rambric.

Lavrence, a manufacturing town of the laited Statef of North America, Hineex county, Massablhusetten, Is situated on the lefl bank of the Merrinace, 2ti miles north of lsoxton, and forms the centes of a nelwork of railronds communicathis with lowell, Newlouryport, Hoaton, and other placen of importance. Although founded but recently, lawrence has leconie one of the chlef manufacturimg towns in New England, in conmequence of the great water-power it derives from the Merrimae. In 1etio, the Fismex Commercial Company conatructed a dam of manonry acrons the stream, hy whicha
fall of 28 feet was obtained for the whole river. From thia dam a canal, from 60 to 100 feet broad, 12 feel deen, and more than a mile long, conducts the water to the varluas fuctories situate hetween It and the Merrimac. The town proper, which is lald out bet ween the latter and a small tributary called tha Spleket, has in its centre an open common of $17 \frac{1}{2}$ acrea in exteat, and contains a town-house, jail, several churches and schoola, anil a ilterary institute. The inbabitant, are almoat all employed In the varioua factories in the town, sume of which are of great slze, and one, the I'uclile, la auid to le the largeat in the world. The building has seven atorien, and ita flooring covers 16 acres, while the consumption of cotton within lts walls amounta to $1,500,000$ llis. yeurly, and of wool to the third of that amount. It gives employment to nibout 2000 persons. The manufactures of the town comprise woolen, Jinen, and cotton graila of various kimils. Incorporated 18.7. I'opulation in 1848, 6000 ; in 1800 , 8283 ; lu 1855, abont 14,000.

Invience, Bt., an important river of North Americi, forming part of the north houndary uf the United States, and watering the theat portion of llitish Amerlen, rises, undur tho name of the St. Louis, in lat. $47^{\circ} 45^{\prime}$ N., lung. $98^{\circ}$ W., Hows east, und enters the south-weat extremity of Lake Saperior. Lasving through the ehain of great lakes, it juits Lake Ontariont Kingaton. llere it takes the name ut the lrofuolx, and thowing north-east forms the while expauses called Lakes St. Francis, St. Louin, and St. I'uter. It Is flrat called St. Jawrence after passing Montreal. Below Quelvec it forms a broad extuary; nut it enters the Gulf of St. Jaw renco at Giaspue 1roint lyy a moath 100 miles wide. J.ength, from Juke Ontarin, to the Gulf, G50 miles ; entire length, 1800 mites. Ti e basin of the St. latwrence lo estimated to eomatain 497,000 wquare miles, of whilh 91,000 are rovered with the waters of the great lakes. The river receives many important tributaries from the north, but none of any sizu from the south. The tided rise to the dis. trict of 'Three livers, Ships of the line ascend to tyineTher, and vessels of tinotons to Montreal. The navigation is continned hence by canals to Kingeton ani lake thatario. See Cianain lakes, Commbine or.
Lawrence, 8t., Gulf, an inlet of the Atlantic Dean, Ilritish Nurth America, having Nen fombland on the east, Labrador, lower Canala, and New Ilrunswick on the north end west, and Nova Scutis and Cape Breton on the south; extending from S . lat. $46^{\circ}$ to $\left.\overline{51}{ }^{\circ} \cdot\right)^{\prime}$, and W. long. $58^{\circ}$ to tisio . It comminicates with the ocean by three channels, the princijal of which is Letween Cupe Ilreton and New fundland, 4 N miles in wilth at its narrowent purt. The ither two chanuil/ are much marrower; the straits of Itelle Inle, hetween the north extremity of New. foundlanil and Sabrador, belog 10 miles, sul the Gut of C'anso, lee wixt t'ape lireton and the main tand, being only about lalf a mile in wilth at the narrowest purt. The tialf is about "00 miles in lengeth, from north to south, ly $240 \mathrm{mi}^{3}$ in br dadth, and imeloses nomerous isfands. the chiet of which are-.. Inticusti, in the north, the Magdalen group in the centre, and I'rince Fidward's Ishand in the south. The astuary of the St. Law rence liiver deloucters into the diulf at the weateri extremity of Auticosti; although, properly Nacaking, this tirth is an intet of the liolf as far ap as the River Saguenay. Navigation is suspentenl here during winter and early spring, from the prevalence of bee, which is especiall: dangerous in the entrance to the tinlf. Fongs aho are very frefucnt during the prevalence of the east winds in spring. In submer, however, the weat and south-west wimder racier navigetion comparatively eafe. The tisheries, which are very valuahle, are prosecuted with assiduity by the colonies as well as hy United States' compnoies. Herring, coil, and mackerel abound. Site Ciasion and l.AKim,

Invis of Commeroe. The following artlele contains a condensed summare of the present state of commerclal lan In thoes $c$ intrien with which the United Staten have commercial Intercourse. For this valuable sketch, wa are indebted to "The Commercial /aves of the World," by Inone Lkvi, Lonilon, INSH, 2 voln., tho.

1. A nhalt-llernbourg, Anhalt-Coethen, A nhalt-Desean, Duchirs of.-The I)uchlee of Anhalt-llernboarg, An-halt-Coethen, and Anhalt-Dessau, each forming on jadependent State, are unler laws peculiar to themselvea. One may eally percelve, however, that In provinces of an llinited extent, and where cenmmercial relations are very partially developed, legisiation munt have remainel imperfect. Thus, in their tribunals, they bave to refer etther to lawa which are rather civil than commercial, to forelgn legislation, or to the common law of Germany. Two orlinanees of 31st Aupast, 1802 and 1832, on hills of exchange, were replaced br the law recently enncted for all Germany. There exists in the Duchy of Anhalt-Dessau an ordinance in regaril to brokern, of the 19th April, 1803, and a law relating to bankruptcy, of the 12th July, 1818; but these contain only a amall number of animportant arrangements, which it is unnecessary to specify; with only one exception, namely, that in the law regarling brokers, every contract concluded ty such persona is null if not drawn up in writing, and is complete only when the deed has appended to it the signatures of the parties interested. There is no special jurisdiction in the three Duchies for the determination of commercial suits. They are decided hy the ordinary tribundis. It would be ilfficult te enter into the detail of the organization of these courta, the powery of whlch are of a very complicated character, and whose competency raries accorling to the persons or mutters brought tiefore them. It is sufficient te remark that the princes of the three Duchies of Anhalt joined with the princes of Schwartzhurg In estathlishing, 14th October, 1807, a supreme court of appeal, before which all affalrs, civil and criminal, of their reapective States, are, or may be, finally carriod.
2. Austrian Empire.-The commercial legislation of Austria, at present in force, is tracel to the time of Maris Therean, who, $\ln 1756$, published an ortinance of considerable length on matters connected with cemmerce. She at the same time catusel a revision of the former law of exchange of 1717, and ty lotters patent of 1at October, 1763 , dechared the same to be limperative in almost all the provinces of the Austrian monurchy. This, consinting of 54 articles, contains direetions relative to bills of exchange and to other points of commercial law. Various molifleations, however, of later date, have passed on it. The law of lonnkruptcy is equally due to the carn of Marin Theress, althaugh not promulgated lefore the reign of Ioseph II. This law, not leas limportime on arcount of the wisilem of its provislons than from lts general extension throughout all the Austrian States, was to have come in force on the lat of January, 1782 , but in consequence of seme accompanying difticulties, was not scted upon till the 1st of Miny following. It repeals all the pre-existing statutes in relation to bank ruptey. It presents at the aame time certain undetermined points afterwasd providel for by later statutes, mostly inserted in the judiclary ordinances of Gallicia. As all the provisions of this law were repeated in a new edition of the lombario-Venetian cole, the most important points will he exhibited In that division under the title " lhankruptey." The maritime legislation of Austria is the work of the aame empress. It dates 2ith April, 174. She publiahen the orlinance known under the titte, "Editto l'olitico ill Navigazione Mercantile Austriaca," attended thereafter by nome other orlinances. The whole, however, is far frum being a perfect syatem of commercial legisiation. The " linitite Dolltlico," whi h embrace the most extensive and the whest
provislona in regard to captains and seamen, contalna nothing on the anbject of frelght-contracts, of bot-tomry-bond, and insurances. In the abmence, tharefore, of legislative decision, reference la at present made, on the shores of the Adriatic, to the French "Ordonnance de la Marine" of 1082. Theme different lawn are already of aomewhat ancient date, and are by no means adequate to the new wanta of commerce. We are led to this conclusion by the fact that of late there were leing prepared $\ln$ Austria two projects of law, the object of whleh was to emtirace in the one the Intereats of Inland commerce on which a great part of the new code of IIungary has been bamed; In the other, all the maritime leginlation. Neither the one nor the other has raceived the legislative sanction.
3. Builen, Grand Duehy of.-From the 1st July, 1809, the French cole has heen In force withln the Grand Dachy of Baten. Though the text of this has not been altered, and the same order of articlea has been malntalned as far as article 206, numerous additions, under the form of articles supplementary, have heen introducnd, particularly in what relates to commission, carrying-trade, and bils of exchange. We have innerted only these additional regulations. The clvil code of the Grand Duchy of Itaden, under the head of "Iroperty;" contalus important provisions in regard to literary property. The eecond book on maritime commerce was necensarily retrenched. The fourth, on commerclal jurisilction, slso has not been reprofluced.
4. Bavaria.-Davaria has an commercial code, nor even a commerclal legislatlon, applleable to the whule extent of lts territory. In the provinces where the Code Napoleon has been maintained, that is, In Khenish Itavaria, the Code de Commerce is cqually in force. In a aimilar manner, the distriets which formeriy belonged to I'russia, such as the principalitles of Anspach and Balrenth, Incorporated into Bavaria in 1803, have preserved the Jrussian legislation. There are, therefore, none but the ancient provinces of llavaria which are governed by npecial laws. 'This legislation, in what concerns commercial right, is extremely imperfect. In most cases, it is true, the defect le supplied by the common law of Germany and ly the clvil law, but the documents most important and complete, are three statutes: the first known under the name of the statute for Bavaria of 24th November, 1780, extending to all the provinces of the kingdom by the laws of 11th of September, 1825. The two others, that of 1778 , for the city of Augsburg, and that of the 16th February, 1722, for the city of Nuremberg. We find in these three enactments regulatione not only in regard to bills of exchange, but respecting inerchants, brokers, partnership, and factorage.
5. Belgium, Kingdom of:-The commercial code of Framce, without any moilitication, has continued to regulate affairs of commerce in lielgium ever since the year 1811 , the period at which a political separation between the two countries took place. The same judleiary organization has been in like manner continued. The single exception is, that a law has been enacted in Ilelgium ( 25 th March, 1841) ordering that the trlounals of commerce shall give tinal judgment in causea that may ceme before them to the ameunt of 2000 francs, whereas in France the law of the 25th May, 1838, fixcs the competeney of the tribnnals in the first instance at 1500 france. Royal edicts have named comminsions charged to prepara projects of law for the rovision of the legislation in regard to bankruptey, ниspension of paymont, partnership, civil or conmercial insurances, writs of captim, mortgage seizure of real estate, accounts of law, expenses, marriage contract, possession and division of property. A law has been in progress on the proper interpretation of article 4.12 of the Code of Commeree. It was discussed in the Chamier of IRepresentatives in the session of 1842, but was rejected hy the Senate.
6. Brazil, Empire of.-A commerclal codo to which that of Spain has aerved as a basis, has lately been laetued, but not being yet in our possession, we refer cur readers to article Brazit.
7. Bremen.-Theugh the city of Bremen was one of the first in the anc!, nnt Hansestle League, and is atill among the most important sea-ports in Germany, Ite commercial legislation is extremely defective and Incomplete. Statutes and legislative enactments hearing a very remote date, have fullen entlirely into desuetude, and causes are determined either by the common law of Gernuny or hy that of neighboring legislations, Hamburg, ete. Commerclal disputes are determined by the tribunal of commerce, as In Inmburg. Bremen names tipo deputies to the Supreme Court establishad at Lubec for the four Hanseatic Towns.
8. Rrunswick, Duchy of.-The city of Bronswick had formerly celelirated fairs. Shs obtained at an early period a special ordonnance in regard to exchange, which, renewed on 1st Aug ${ }^{-}$, $\mathbf{1 7 1 5}$, and afterward extended to the Duchies of Brunswick and Brandc? bourg, was still the law of tr, State untib the law for bills of exchange for all $\qquad$ 'ony came Inte force. Another ordinance releting ow asakruptcy, of date 26 th March, 1823, is alrost the only document of a commercial character to be tound in the duel $y$; for wlth the exception of some recenc decisions in the Court of Appeal of Wolfenhottel in regari to mercantile acconnta and fuctorsge, and whose simple olject was to give the force of law to usages alresdy established, other enactments lave been of a deacription so purely of detail, without bearing directiy on commercial legislation, properly so called, that it has been thought unnecensary to to more than refer to them. In the Duchy of Irunswick commercial causes are determined hy the ordinary tribunals.
9. Cracove,-The conmercial code of France, of which an almoet literal transintion was made for the use of Warsaw, has not been officially reparied in the new kingdom of loland. It mppears unlikely, however, that legislation of French origin will be permacent in thia country. In the city of Cracow the cole just mentioned atiil maintains its authorjty. It in also in fore throughont the Grand Duchy of Warsaw, having been introdnced in 1808; Cracow at that thme forming a part of tho ducliy. Only one alteration has lueen male in the colle, namely, that wich authorizes the notaries and the juiges of the court to affix their seals to the piroperty renl or movabid of a bankrupt, and to deternine the dividend paybhio to the respective ereditors. Commerelal affairs have no apecin] trilinnal. They aro darried before the orllinary conrts as well in first instance as in cases of appeal. Three lawg, the one of 15 th Octolser, 1818 , relative to the puille exchange (la llourne), and the eorporation of merchants, and the other two of the 1 ot March, 1821, and 19th May, 1833, on the frcedom of commercial tranametions, and on the reatriction to which in certain cases they may be lindle, are not of sufficiently general interent to have a juse given them here. There are certain articles of prosiuce anljected by the Senate to a tarifi, in which trading in not considered as a part of commerce, and only legal process of a civil character in allowed.
10. Inmmark.-The enactments relating to commerclal Jnriapruience in Denmark are not ut all numerous. In matters of exchange the ancient ordommance of 1768 , has beet replaced by a later net of laginfature of 18th May, 1895 , which mopeala all preceding deeds with the execpution of that of s6th dume, 1824, relative to some partieular branches of the law on hille of exchange, the reseript of 22d March, 17 tib, and the proclamiation of 8th Nuvember, 1799, In whiteh are found reycitationa for billa upon the Weat Indles. The marit'me law of INenmark constaine $\ln a^{\prime \prime}$ = sude of Chríclan $V_{\text {., }}$ l6ss, contlanes atlll in force. We
should have confined ourselves to an analyois of these regulations which possess only a historical Interest; but we have folt the propriety of joining with them ara analytio view of all the later enactmenta and laws which have served to complete, at this day; this anclent monument of maritime jurisprudence, and which wa are enabled to present by the ansistance of the excellent abstract of M. Poehis. As to bankruptcy, there exista no law which gives precise and fixed rules. Ordonnances of very anclent date, the meaning of which long custom has determined, constitute, on this mobject, the legislation of the country. It would have been a matter of great difficulty to give a copy of these had not a valuable document, due to the labors of M. Orstedt, Attorney-General in the High Court of Copenhagen, and generally intended for the use of the French Consell d'Etat at the time of the iliscuasions on the profot de lol on bankruptey (published 28th May, 1838), easbled us to present an sbstract which wili be found as exact as it is substantial and well arranged.
11. France.-France had, under the admiaistration of Colbert, united, or rathor codified, ber commercial legialation, anil coliected in the two ordinances of comrerce and navigation of 1673 and 1681 , their principlea, uanges, and customs. Yet the want of a general code of lawa was seriously felt untll, with the entire reconstruction of her political institutions, Napoleon ordered the compilation of codes which, within a ahort period, were jresented and adopted. With seme unimportant modifications, they are still the basis of French juriaprudence. With regarl to the alministration of commerchal law, the following is a summary of the report of the Minister of Juntice for the 3 ear 1846, which deserves detentive conslderation :- ? ? ribunals of Commerve.-Conmercial affairs ure ndjullicsted by 220 apecial tribunals of commerce, established in the most commercial departments, and by 170 civil tri. bunals, which are charged to take cognizance of the asme in the other departmonts. In 18.16 there were Introincel 207,279 new cases before these 8100 c.ibunals; 177,446 have been brought before the 220 special tribunals, and 29,833 only before the civil tribunala, tuilging commerciaily. In 1845 only 191,687 cases wero enrolled in the 890 tribunals; since $18: 15$ the number has incrensed 38 per cent. On 31at Decenbe:, 1845, there remained 7,932 cabes to be adjudicated; ;, 864 cases which ware conshderel as terninated by compromise or abmaionnent, were brought before the court in 1846. These, united to the 207,279 new caspa, form a total of 219,039 camen to lee aljulicated. Of this number 59,323 have been adjudicateil contradietorily, and 115,308 by non-appearance; 4009 have lieen allimitted by the tribnnal_ to arlitration, and 32,705 have been erased from the register as terminated hy compromise or abanionment: 7678 only were left unsettled on the 81st lecember, 1846 , or harily 34 per cent., while the civil trihumats left unsettlod at the same apoch 26 ner cent. of the divil casec lirought before them. Of the 174,641 adjudiations rendered in 1816 by the trilsunain of commerce 34,669 only, harily one fifth, were susceptible of appeal. The npecial tritunals of commerce have 1 court and I president only। the number of juljea variea from 1 to 10, and that of the surrugates from: 2 to 16 . The tribunals of l'aris and lyons have eath 10 judgen, and of anrrogates the first 16 , the secomd 6 ; 8 tribumals heve 6 julgon and 4 to 6 surrugates; 1 only has 5 jadgee and 8 surrogates; 96 have 1 jodges and 2 to i surrogntes; 106 hayo 3 juiger and 2 to 4 surrogatea! lartly, 7 have 2 juigen and 2 surrugates. In 1810 the tritunals of connueree of l'arlm had disjutched 66,276 casen, or more than one fourth of the gotal number. The tribunals of conmerve which have dinpatchad most eases after that of Paris, are thowe of I.yor, 0811 ; IRouen, 4914 ; Marseilles, 4296 ; Boreaux, 4137; Toulouse, 8728 ; thut of Liungen,

2307 ;
$2307 ; 21$ othor tribrunals have adjudicated upon 1000
to 2000 cases; 11 triburals composed of 3 to 4 judges have diapatched csch 50 per year, and 16 others have terminated from 50 to 100 only. There were renilered, in 1846, $\% 40$ sentences by arbitration in disputes between partners, 169 of which with the esalstance of $n$ third. The greffiere of the tribunals of commeice have received the deposit of 2724 partnershlp duds, of which 1980 in colleetive names, 450 in commandite, 235 by shares to mominated persons, and 41 by shares to the bearer, 89 anonymous partnerahipe, have been beaidea authoriaed by regulations of pablio ariministration; in all, 2747 partnerships of every kind. The greffer of the tribunal of the Selne alune has raceived 869 partnership deeds, almost the third of the total nurmber. On 81st December, 1845, there remsined 5964 bankruptclee to be liquidated. In 1840, 8795 new ones were openel; 3606 only have heen terminated, and 6153, or almost two thirds of them were left unsettled at the ond of the year; 1612 bankruptdea havo been tarminated by compromise; 1031 by liquidations; 820 have leen closed by insufficiency of capital; lastly, there have been declared 134 judgnents of bankrupteies. The tribunal of commerce of the Seine has terminated 896 bankruptcles $\ln 1840$, that of Reuen 193, of Lyons 181, of Bordealix 60, of Marseilles 51. The passive debt of 356 bankruptcies which terminated in 1846, by agrecment or liquidation, did not exceed 5000 francs; it varied from 5000 to 10,000 in 441 bankrupteles ; from 10,000 to 50,060 in 1269 ; from 50,000 to 100,000 francs in 270 ; lastly, it exceeded 100,000 franca in 307 . The amount of the active debt of 2948 bankruptcies liquiduted was $51,-$ 819,891 francs ; namely, in estates, $19,855,111$ francs ; and movables, $81,964,280$ francs. The totni amount of the pasaive debt weas 143,544,671 franeq; murtgagod debt, $19,257,540$; privlleged, $3,901,637$; and ordinary; $120,385,404$ france. The loss borne by the ordinary creditors was, on an average, 76 per cent. The dividend obtalned has been more than 75 per cent.; in 84 baukruptcies 51 to 75 per cent. ; in 62 from 26 to 50 per cent. ; in 59410 to 25 in 1228 ; and 1 per cent. in 412. In 185 hankrupteles the ordinary creditors have reseived nothing; the assets having seen absorbed ly mortgaged and privileged cred?ors. Laatly, the dividends of 78 bankruptcies temminated by compromise have net been, inclicated, an tho assets could not be reailzed immediately. Court of Appeal.-In commercial matters the number of judgneuts susecptible of appeal have been in $3840,34,569$. 2511 appeals were made, namely; 7 appesls for 100 judigments less than in civil matters; 1777 appenls only were adjucilcated upon, 1212 judgments ( 68 per cent.) have been confirmed; 1565 ( 82 per cent.) modlfied in whole or in part; 602 appeals have been negativerl. Connt if of Prudhommes.--68 cuuncils existed, 4 of which did nat sit in 18i6. The 64 councils have had on hand $21,25 i$ caves. The parties have withdrawn 3153 easca lefore they were settied; 16,140 have been conciliated; 1:62 remitted to tha bureaux-general, and 196 to the julge of pesce.
12. Fromlfort.-The anclent ordinance of Framkfort (26 May, 1739) relative to varlous points of cammercial law, such as partnership, commission, and brokerage, has always continued in force. 'The Netuato haid in 1811 propared a proloet ahmilar in groat part of its provisions to the French collo, hut wilich, from national feellige, was not ailoptel in 1814. In 1827, a new project of a code of commercial law was published, for the purpose of belng aulmitted to jurists and to merchants. This project, however, has not hitherto received any legiaiative aanction; so that the ordinance of 1790 still remains as law. There exists in Frankfort no special juriadiction for commerelal matters: they are brought befure the ordinary tritunals. There la a court of appeal, a munleipal court, and a municipal or teritorial balliwlek. The aupreme
court of appeal sits at Lubeo. Its jurisdictlon extende to all the free cities of Germany.
18. Great Britain.-The mercantile law of England Is ahnost entiroly fouruded on what has been experienced to be most conducive to the welfare of soclety. Its origin is derived from many sources, while ancient commerclal enactmente were the basis of our maritime law. With the increase of commerce and general aivancement of the natlon, mercantile law grew in importance. Promisaory-notea and the banking aystem were placed in their present state during the reign of William and Anne. Numbers of judges fullowed, whose commanding intelligence formed an epoch in the annals of Jurisprudence. The names uf Juatlee Ifale, Lord Mansfield, and Lord Stowell, are rendered fumiliar from their being constantly referred to in the adjudication of the moat subtle arguments on commercial law. Most of the cominercial law of Great Britain is included in the cominon law; jut lately various enactments have passed consolidating the bankruptey law, jolnt-stock companies, etc. The law of Scotland differs materially from that or England in cuntracts and bankruptcy. The mercantile law of this country is entirdy included in the civil law, of which Erskine, Stalr, etc., are the leading writers.
14. Greece.-Since the erection of Greece into a sovereign and independent State, its government has been engaged in fixing its laws and digeating the various codes. The civil law is atill determined by the manual of Hermunapol, the lateat compilation of the Byzantine emperors. The commercial code, which is but a textual repctition of that of France, with a few unimportant alterations, has heen In force since 1st May, 1835. These altevations consist only in the suppression of Artleles 615 to 630, relating to the organization of tribunals of commerce, in place of which there is the law of 1834. To complete the documents relative to the commercial code, we shall say that the law of 14th May, 1835, re-established tios regulations of Arts. 631 and 641 of the French code, which at flirst had been supprossed. It is interesting to remark that the adoption of the lirench code was anterior to the Greek revolution; Inasunch as $\ln 1821$ it had been twice translated, and the merchants of Greece had unanimously adepted it. It was for the purpose of coufirming this volutnary preference that his majesty Otho, by a royal declaration of May, 1835, gave the force of law to a translation executed by his command, and now acknowledged as the nole official nuthority. As to the judleial organlzation, it is simllar to tinat of France. There is nn innovation, however, wheh is of some practical utility; thls is the being obliged to choose a jurist as president of the tribunal of comnierce. All the articles of the commercial code are the same as the regulations of that of France, with the exceptlons of the modifieations duly noticed.
15. Hamburg.-Though the commerclal laws of linmburg are now of old date, and have frequently, particulaily in later years, been sought to the suimitted to revicion, yet going back, as they do, to the statutea of 1603 , and supplied, when defective, by enactments of greatly more recent date, they demand our notice; and the moze so that they regulate matters not only in Ilamburg fint in the neighboring eities, such as Bremen and Lubec, where, properly speaking, there exlat no commercial laws whatever. Thu emetments most recemily nuade in regard to points embrace $i$ in the commercial codo of France are the fullowing : sucrnetment on the subject of brokerage, of 15 th December, 1824 , and another on partucrshij, of 28th December, 1835 , the lattor, however, lasving only for its ohject the deposit and pulilication of partnership deeda. The statutes of 1603 , relative to mercantile books, have not been repealed hy any later enactment. The law on bills of exchange la now similar to that of I'russia. The regulations in regard to maritime conmerce
are atill chiefly borrowed from the atatutes of 1603, As they have been modified, however, by several more recent enactments, we have a siled ourselves of the work of M. Poehls apon this subject. These wilt be found also In the proper place-the regulation in regard to maritime insurunce of 10th September, 1731of great importance to one wishing Information, and remarkable for the completeness of its details, IVankruptcles, befote the trilunals of commerce (a procedure which does not exist generaity in Germany, where in cases of failure the process for a settlement between the partiea is carried to the civil courts), have been regulated by an ordinance of 31at At; uet, 1752. The commerclal jurisdiction and competency of tribunals of commerce had been fixed by the law of 15 th December, 1815 , which appointed a tribunal of commerce at llamburg for all conmercial nffairs. Prior to 1810 thene wure carried before the administrative authority, or before the Court of Almiralty when the affinir was of a maritime character.
16. Hanocer.-There extsted, accurately speaking, no commercial legislation in llanover till the period of the Prussian occupation in 1801. Immediately after this the Prossian code was introduced into the Laniliages of Ileldesheim, Verden, Ifaya, Diepholtz, Osnaliruch, and Lenjar. A royni obdinance of George IV., dated 23d July, 1822, contirmed it. It is still the existing law. In the other parts of tho kingdom there existr, with the exception of the repulation in biils of exchange, of the ame date ( 233 d duly, 1822), no law whatever, learing on commerce. Actions are determined by ueage and common law. The new pena: code adopted in Hanover, 1810 , flxes the penalties extablished in cases of bankruptey. All commercial differences are brought before the ordinary tribunabs. In most instances, however, they are terminated ninienbiy by arbitrament, or they are decided by the municiphl court which onduins nccording to common law, or, otherwise, acts in the capacity of a court of equity.
17. Hayti, Republic of.-The republle of IIayti has had, since 1828, its coles in nniformity with those of France. The commercial code is throughout the same as that of France, It was pubished on exth March, 1826, and has been urted upon since 1st July, 1827. The other codes, those relatiog to civil and commercin! procedure, penal and rural, form tagether, with the civtl and commerciai corter, one thedy of law, dated the 25th year of Independence, und priduced by the labors of M. Hianchet, a distinguished member of the Parisian bar.
18. Hesse, firamd Juchy if:-The lirench code has been maintained where it had been introduced at the time of the French occupation in the Ihenish provinces. With regani to the other provinces such as Starkenburg and IIesse-Superieure, commerciat legfalation is regulated as much as possible in conformity with the Fremels faw, with the exception of the town of Offentach, which had a apecial ordinancen on the exchange, of date fth March, 1829 , the same as that of Frankfort. There are me trilomals of commerce in the firand llus!y; commerchal disputes are atbuitted, as in most parts of Cermany, to ordioary triburala.
19. Hesse Electurate. - Three ordinances only, and of very oid date, exint in this sitato on commercial matters; the firnt, of lith May, 17 ti, , ha hankruptien; the recondi, of 21st Novemier, 17Ns, on part nershijus ; the thiri, of 1 tth lecember, $1: 36$, rorcerning commercial twok Although these three ordimancen merve oniy to estatilsh primejples siready recognized, and contain onily a very limitei number of jrovicions, yet we have thought it necessary to ruprotuce them. indejendent; of these ordinames, which wre fir from forming a aufficient lonty of commercial law, they generaliy refer either to the Fronch conde which has heen in force for mome thue in this rountry, or to the common law of Germany.
20. Holland.-The code of Itolinnd came into oper-
ation the 1st October, 1838. It passed under a sevese ordeal, and it was delayed through the revolution which caused her separation from Belgium.
21. Hohenzollern-Hechingen.- (Principalities of Siegmaringer and Llchtenstein.) These States have no general procedure for commercial matters ; the diaputes arising on them are adjudicated by the ordinary tribunals. The principality of Llehtenstein la governed, for commercial mattern especially, by the laws and ordinances of Auéria.
22. Ionian Islands,-The French code of commerce with n small number of modifications, most of which have been borrowed from the code of commerce of T'wo Sicilies, has recently been introduced In the United States of the seven lonian Islands, which form an aristocratic repreaentative republic under the perpetual protectorate of England. A decree of 16 th March (26th February), 1841, abrogated ail the laws, statutes, regulutions, general or local customs, the requirementa of which are cuntrary to the present code which cane in force on the lat May, 1841. At the sume epoch of 1et Msy, 1841, the other codes of civil and criminal procedure, and the penal codes, had been promulgated; they are drawn up almust in the samo spirit and system as the French corles.
23. Lombardo- Veretian Kinjdom.-The French code of commerce has been almost entirely preserved in the Lombardo-Venetian Kingdom; only with regaril to bankruptcies they refer to the Austrian legisJation ; numely, to the ordinance of 1st January, 1782 , and to the more recent ordinances inserted mostly ia the ordinance for Western Gullicia, and lnter on in the judicial ordinance, for the Italian States of the Austrian monarchy. A transiation in Italian of the French code of cominerco has been recently pablished at MiInn, where thone provieions whicia havo remained in visor, and have the force of law have heen repreduced; these provisions have repiaced the lirench code, especially on bankruptcies. We have made use of this work is the most authentic compiation we couid adopt; and have aimply indicated the direct correspondence hetween them and the ancient ordinances or law of 1782 , and the ordinance of Gadicia, deeming this suffecient to show the various cbanges which have beeu made. Trieste follows entirely the Austrian legisintion, namely, the ordinance of 1760 on bills of exchange; that on hankrupteie of 1782 moditied by more recent inws, such as thint of Gallicia and others, and the pritical procimmation of Maria Theresa of 1tis3, on maritine conmerce.
O.f. Lubec (F'ree Toun of ).-Lubec, although a truly commercial city, does not, properly speaking, possess any hody of commerciat law. She borrows provisions relative to this matter either from the conmon law of (iermany from foreign leginlation, or from ancient statutee. The Stadtrecht, which is the foundation of the law of lubec, is not sutheient for the wants of commerce. Yet, with all the imperfections of the law, uttempts to fimprove it have proved nhortive. The political constitution of Lubec, which goes an far hack as thou midille ages, demamis, for the compilation or revinion of the daw, such minute ami complicated formalities that even the most indispensa bhe improvaments are intinitely long delayed. IVery project, in fact, after inving been elaborated hy a commisrion, and sulbected to the examination of the Senate, must to woccessively diacusarl anil approved by 4. $\boldsymbol{y}$ cieven coileges of tho llurgens. This mude of deUnerathing, isolated and multipiied, carries with it lengtisened anil incaloulabion didieulties, l'ractice very imperfectiy napplies lefects of the written law; because no regular jarispruclence can be extabilisited in a country where the infabitants terminate their differences chiefly ly arbitrathon. This is so true that in $1 \times 30$ the saprome court estalidished at lubec, for the 4 free town of (iermany, had to adjudicate only upon 4 appenta made by the citizens of Lubec. Nev-
erthelese, transmitte France, a of Lubec, from it. are furnlal chants, als there exist on commes time comm 90 method on bills of November, gust, 1823 , dure. ertheless, M. Herbert, the French consul there, in 1841, transmitted to the Minister of Foreign Affairs la France, a remarkahle work on such legislation as that of Lubec, that we think proper to give some extracts from it. Through his care and enlightened zeal, we sre furnished with some valuable documents on merchants, also, on commercial books, brokers, on whom there exista a regulation of the 26th Jme, 18z2, and on commerclal jurisdiction. With reterence to maritime commeree we have followed the irestise of Poohls, so methotic and complete. The St. odtrecht is silent on bills of exchange. Tho tnree ordinances of 14 th November, 1669, of 5th March, 1738, and of 20th August, 1823, contain only provisions of simple procedure. The first prescribes some measure for prompt exceution in matters of exchange; the second declares the rifht of appeai, but nor its suspe: an powers; and the third leaves to the tribunais $t$. sculty to examine whether a permission may ${ }^{\text {' }}+$ ! $\cdot$ ven to tho natives of taking proceedings in matter's of exchange. The reproduction of these texts did not appear to us necesasiry. Title IX, of the Third Book of the Stadtrecht is devoted to commercial partnerships; but their provisions are not in conformity with the dovelopments that have taken place which ancient law could neither foresee nor regulate. Thus while expecting the enactment of a law on bankruptcy, and bearing on this subject, they are guided by the regulation of IIamburg. As for bankruptcies, the subject is so obscure and uncertain that it is now fiity years since merchants demanded somo regulations; but difficultics, spparently lusurmountable, have hitherto prevented sny improvement. Still there exists a project prepared in the name of a commission by tho Syndic Buecholz, a llistinguished jurist. This project is to be subnitted to the Senate. It seems that it is composed of more than $\mathbf{1 5 0}$ Arts. and that it approaches the French cole in its spirit and as a whole. Tise titlo I. of the Thirl Book of the Stadtrecht contains some provisious still in force (the rights of creditors privilegenl, creditors listraint, ete., etc.), lut which have reference more to individuals in general than to merchants. The "Dourse" of labec is reguiated entirely by that of lLatuburg, for the course of exchangs, money and public funds. With respect to jurisiliction, commercial affairs are sulmitted to the civil tribumals of three different degrees, of which we will givo some details.
25. Lueca, Duchy of:-An ordinance of 6th May, 1840, declares that the French code of commerce shall continue in force in the Dnchy of lucce.
26. Luremburg, Grand Duchy of $f$.-The French code of commerce has not ceasel in the Grand Duchy of Luxemburg. Simply a decree of King William, of 3d April, 1817, modifies the articles 615, 640, nud 641. it suppresses the triburials of commerce, and it orders that commercial disputes shall be aljulicated ly the ordinary tribunal.s.
27. Ifalta.-Much confusion exists in Malta, in the appication of the laws in regard to commerce; a want of firity, which gives occasion to constant complaints. Their oniy guides are the "Ortonnance of French .Marine," of I681, and other old authorities, such as the Code, or "Pragmatique," of the Grand Master Manoel (which is only subsilharily in force), or the code of li8t, of the liramd Master de Rohan, which hears the anme of "Manicipal Law," and is st present a very gencral autioring. Subsequently to the date last given, irocianations emanating from the different governments which havo atucrecded each other in Mafla, and in partleuiar that of Britain, since 1800 , have introduced or remodeled certain rules of jurisprudence in regard to varibus poiats of commercial equily. The result has been a sort of common law, generally adopited in praclice, and auted upin ly the tribunals. To promote tits olject, a coliection of alt commercial usuges in the form of a manual, has lieen jublished by gentlemen of the legal professlon; it
bears the title of "Compendio ii Diritto Commercials Mallese (Malta, 1841)"-Compendium of the Commercial Law of Malta. This collection presenta an abridged view of the principles of Maltese leglslation and jurisprudence, in the absence of any thing like a regular syatem of commercial law. It is a subject of regret that the English government has not followed up its plan in giving a code to the Ionian Repablic by promnlgating a olmilar one in Malta. (We understand that the civil code for Malta is already prepared and printed.) On the subject of bitls of exchange, the want of legal arrangements has been pecularly felt. In the mean time, the regulations in regard to haritime commerce, borrowed chiefly from the French shipping law, enter much into the necessury detaila, and form the principal part of the commercial law of the island. In the matter of bankruptcy, the ordinances of 1815 have established certain principles which, in the form of procedure especially, have been only imperceptibly modified by later enactments. These regulations trent hankruptcy as in England-Chap. XVI.-in which it is stated, that ahonld eny difficu]lies occur in regard to procedare, reference should be had to the luw of England. The judiciary organization, which dates from 1679, was terminated by the constitution of 1814. The maritime consulship was then reformed, and the name of tribunal of commerce linposed. Regulations were at the same time enacted for its auitable efficiency. The commercial code so many years under consideration, was revised by the council in 1847, on the recommendation contained in the ahle Report of Androw Jameson, Esq., Advocate, Sherifflepute of the county of Edinburg. A commission was nlso named to revise the code of civil procedure, intended to remove many obstructions and delays in the administration of justice.-Parliamentary Report, 1849.
28. Mecklenburg-Schverin, and Mecklenburg-Strelitz, Duchies of.-There exists in theso Duchies no peculiar law relnting to commerce. The ouly authority throughout their respective provinces is the common faw of Germany. Rostock, however, has a municipal law peculiar to itself. A decree of this city wns passed, 19th December, $18: 27$, relative to bills of exchange.
99. Molena, Duchy of:-The duchy of Modena has no codo of commerce. Heference is made to the opinions of the most celebrated writers, sucl: as Casaregi and Ansalito, und still more to Azuni, lhaldasseronl, and Cassiani. In the absence of legislative cnactment, in regaril to commerce, the civil code is alao most frequently appealed to, which in commercial differences alone permits to net by exccutory process.
30. Nassau, Duchy of.-Till the present period there existed in the Duchy no baw relating to commercial rights, anil the ordinance of Frankfort on bills of exchange was the sole antiority. The government has, thowever, recently promulgated the project of a commercial code, extending to every subject that might lie contemplated by it. This project, which has been aided liy the valuabie co-operation of Messrs. Yolpracht ind llertram, is in a great measure a repetilion (as to the text nlmost always so) of the regulations of tho conlo of Wurtemburg, of those of the ordomnance of Staxe-Wrimar (20th April, 1819) on bilis of exchange. Though the above $p$ yjet has not yet been discussed at an assembily of the States, there is every probahility of its being notopted in its present form, at lenst without any whterial alteration. We have accordingry inserted it in dine orler.
31. Nomus.-Civii und commercial legisiation remain in this country the same as ln Ibenmark. Ita union with Sweden, in 1814, pruluced no nlteration. T'wu laws ouly were carriel in the last Storthing (Darliament) in 1842. The tirst, of date th Atigust, on hifls of exchange, given in its pioper place, tirg second, of 99 th June, and which has received the royal assent. This law, however, belug merely a rep "tion on the right of engaging in commerce, which it limits, with
very few exceptions, to the citizens of commerclal towns, we regard as net coming within the legal department we had assigned ourselves; we therefore omit it. There was recently in force a regulation in regard to exchange of Copenhagen, 16th April, 1681, as presented hy M. Nonguler. Thls regulation has been replaced in Denmark by the law of 28th May, 1825. In Norway it has hitherto undergone ne alteratiun except those of the recent law of 4th August, 1842.

The maritime law of Norway is the same with that of Denmark. The code of Christisn, promulgated in 1683 in Denmark, and in 1657 In Norway, is stlll in force.
32. Parma, Placentia, and Guastalla, Duchirs of.-The commercial code of France, which had been introducel Into these duchles, still continues in force. Only the clvll code of Parma contains regulntions in regari to bills of exchange. These remain the sole distinguishing documents of commercial clisracter.
33. Portugal.-On the 18th September, 1833, an ordinance of the King Don Pedro sanctloned a code drawn out by a jurist alone, and which, derived in great part from the Spanish ond Dutch codes, has taken from them the most enlightened provisions, and added others, especially on the institntion of the jury, for commercial matters.
3I. Roman states.-The commercial code of France, suppressed in 1814, when the French ceasel to oceupy the Roman territory, has, notwithstanding, atill continued in force in some of its provinces, and in 1821 was furmally re-estahlishel thruughout all the Papal States, by all edict of liv. VIl., under the title of Provisional Law of Comnerce. Certain moditicationa, however, of minor importance, and which were to remain only until the completion of n new code, were introduced. This cole has not yet uppearel. The edict of 1st June, $18 \% 1$, contains, moreover, several enactiments whical have for their oliject the leetter organization of tribunals of commerce. In regarl to this point, however, "a legislative and judicinry regulations of 10th November, 1834, contalns, in sections "hree and four, new provisions. The declsions of the tribunals of comnerce may be carried before the ordlnary courts of appeals. The net law, however, has not revoked a papal statute of date 27th February, 1830, reetentablirhing a court of appeal at Ancona, anil of which wo have alsn given a transtation. The edict of 1nt Iune, 1821, contains, tuesidew, different juliciary enactments, several of which have been borrowed from the knglisla corle of civll procelure. Into the examinatua, thase we felt it unnecessary to enter, the grater part incing presented in the new legislative nuo judiclary law.
35. Russiu.-As eady an in 1700, Peter the (ireat conceived tha hea of collecting all the ukases pulslished siace :'se culd of 1649 , but co-operation was wauting to carry it into practice. Neholus completed this inipurant undertakhig. 'tbe sorod was pubilished with the ulame of 31st January, 1826. It is a complete digest where the old Jaws ara inserted, yet conforming them to the r rogress of lagislution ant Furopean civilization. The commarcial part, forming the 11th volume, occupios an important place; it includes more than cow articlen, and it contahis very remarknbe provisions, such as demonstrate the customs and usage of the lahabitants of this vast empire.
86. Nerdenia.-Ifter the events of 181., which placell upin the throne the present family, the anclent laws puthlished in 1703, an impresmion of which, with numerous additional provisions, had beent published hy King Charles Finmanuel Ill., the Tth April, 1770 , were re-established in Sardlnia, Savoy, and l"iedinont. They remalned in force as to commerciul matters until the jronsulgation of the now comle of commerce, which came into operation the Int Jaly, INAS. The city of Genoa slone has contlnued to be regulated by the French code sizee the liestoration, the exligencles of
this commercial port requiring the application of a more modern legislation, and one which weuld be in harmony with the la we and custome of other nations. The same motive has arged the enlightened governments of Sardlnia to endow their country with new and more uniform provisions by publishing a code of commerce, The new code of 1843 follows entirely the French code, taking into careful consideratlon the laws voted for Its amelloration by the French Chambers in 1817, 1833, 1838, and 18.11. It has done nore; It has almost slways resolved any dificulties that have arisen in the practice according to the sense and juidgment of the Court of Cassation, and often made reforms which experience had proved to be necessary. Among the various innovations introducel, it is neeessary to mention that minors and females whan the clvil Sarillinian code-the same as tho Macedonian and Velleine stutus consultus-considered as incapteitated to act for themselves, are, as regards the exercase of commercial profession, Independent ; which modificstion was certainly Indlspensable; adding also to the No. 6 of the French law in conformity with their ju-
risprudence, a presumption of the consert of the husband when the married female is engaged in trade. The code intrusts to the tribunals of commerce the in upection of books of commerce; it prescribes precautions already specified in the projects of law presented by the Garile-des-scealux, bufore the Chanher of Deputies, the 15th Februnry, 1838, with a view to put an end to the scandalous speculations of partnerships in commandite; it relieves partners from foreed urbitration, and makes it optional, as in several momern codes ; it dedicates a fourth book to this important matter, under a spechal title, in conformity with the provislons of our cokle of procedure; and it replac ss the entire section of the French colle whleh treats of disputes between partners, with most valuable provislons in the functions of the llyuldators of partnerships. The exchange agents nre, as the notaries in France, reaponsible for the slgnarures to bills which they negothate when signed in their presence; their books, and those of brokers, furm evidence of agreentents among parties. With reference to bllts of exchange, those drawn by the States of the king In a forelgn country; may be signed liy any person who may lie subjectel to imprisomment for non-payment, without distinction of rank, but, for inland bills, merchants alone may be prosecuted commercially; and it is further necessary that the bill shall not lie drawn by order and on account of a third, in which case they are only deemed as simpla promises The endorsement, after the bill trecomes due, and the security giver, by a person not engaged in trade, do not constitute procuration. It is worthynf remark that Sarillnis has adopitell the same metrienl aystem for distances and mensurement as in France. The secund book relatlve to maritime comancree contains only regulations amalogous to the French code, with the exception in reference to the sale of rhips, which must be made by puthice act, under penalty of nullity- it prescribes alsa to the capain, express duty of ascertaining the good state of tho ship liffore going to nea; It enjoins on him to wateh with great care over the interests of seamen. lastly, hy the Art. 343 , § 1 , the negotiation of a loottomry-bond between persons not engaged in trade, produces the same effret as hills to order, and by the Xrt. 3to, any ronsention which should have for it object to discliarge the lender on lottoniry bond from the contribution to the rommon averugen, is uull. The regulations of the thirit hook on banakrupteles nre the sume as these of the Firnch law of 20th May, 1838. Simply they have aupressed the Art. 4.18 of the Frencll coile which declares null the inscriptlons of mortgages taken within 10 dava prereding the suspension of payment; unt, slas), they order the exposition of the names of all persons who fail at the hall of the tribunal of commerce daring the whole of their livea unless thay obtained a licease.

The treas the proced only be gi the accom nals have t judges oleo king. 40. Sarony, K ony are at prese cient legislation, As yet, however oven in the for

The treasury edvancer the prellminary expenses of the procedure. With reference to the lleenae, It can only be given by the Senate (court of appeal) after the accomplishment of many formalitiea. The tribunals have the same organization as in France; but the judges elected hy the merchants are nominated $1 \mathrm{y} y$ the king. An important modification has been introduced in Surdinia; es In Mexico, and in Spain; a lawyer (consulente quidiziale) is appointed to each tribunal as a counselor, but without a deliberative vote. This institution has doultless great advantages, yet it is subject to great inconvenlences, as If, for example, the consultore, through the influence of his acquaintances, should predominate In nill the deliberations, and overrule the judges. Another innovation consists in the creation of a judge, delegated eversj week by the trlbunals, who decides by himself all disputes below 300 francs, and judges without appeal all thiose which do not exceed 100 niunce. The appeal is admissible only in disputes above $\mathbf{1 2 0 0}$ franes, as before the enactment of the French law of 11th April, 1838. An article on imprisonment for delit has been added to the code; It fixes its duration in proportion to the sums due, and submits to it persons not engaged in trade for bills of exchange, drawn from or on foreign countries, when it results from maritime operations; nnd in consequence of frauls, or presumption of flight, and insolvency. There is net yet any regulation on the procedure befere the tribunals of commerce. The publication of the celle of procedure is shortly expected, the ministry having been oceupied with it for severnl years past. A diplomatle treaty of $24 t h$ March, 1760 , scems to place Sardinia, wlth respect to France, in a very exceptional position relative to the execution of judsments rendered by the Sardinian iribunals, and the payment of the security judicatum solvi.
37. Saxe-Attenburg, Sare-Coburg Gotha, and Saxe-Meiningen.-In these duchies there exists, in regard to commerce, only a very small numier of regulations. Commercial differences are declded hefore the ordinary tribunals, and, in general, by a reference to common law and usage much more than to particular statutes. Thur, for example, the practice of Leipsic is the principal guide to that of the two duchies of Saxe-Attenburg and Saxe-Meiniugen.
38. Saxe-Moldburghausen, Duchy of.-The ordinance of Leipsic, which was introduced into this duchy in virtue of a rescript of 11 th June, 1714, still continues in force.
39. Saxe-Weimar.-A number of laws, entering into considerable detail, on the sulject of mortgages, and the proper distribution and precedeney of creditors in cases of bankruptey, were promulgated by the government in 1839 and 1841. Their ohject, however, is only to establish, in regard to the intter subject, a uniformity of rule, such as is reculired in any other civil arrangement. For books of merchunts, partnership, brokerage, fallnres, there exist no other apecial reguiatiens. The Prussinn code ls foltowed, or, ns in other parts of Germany, actions are deciled by uage nod common law. There is no special tribunal of commeree in the firand Duchy. It is proper, however, to remark, that, during the contlnuance of the woolfair, which is annually held In Weimar, in the month of dune, a commission is named by the burgomaster, compesed of two members of the municipality and several merchants, for the parjose of dechiling upon differencer that inay occusionaily nrise. There being no commercial town in the Grand 1)uchy, no lourse (place of exchange) has been regularly estabilished. Each city has its particular regulations in regard to fairs hell in it.
40. Saxony, Kingdom of.-The government of Saxony are at present occupled in the revision of the ancient legisiation, and in completing it by new laws. As yet, however, there exlats no commercial code, not even in the form of a "projet." The tribunals are

## 4 F

guided by anclent statutes and ordinances, whieh, where no enactments exist, are considered as poss $3 s s i n g$ unlform authority. Varlons regulations have passed In regard to brokarage. Thelr respective dates are 7th March, 1818, 21st Septemler, 1883, and 14th April, 1832. In regard to payments and bankraptcy, the only legal authority is the ordinance of 20th December, 1766, promnlgated in Insatia in 1783 ; this anawers, however, very insufficiently for the presant reqnirements of commerce, and government are preparing to replace It by new enaetmenta. The ancient tribnnal of commarce established at Lelpatc, by an ordinance of date 21st December, 1682, still exists, hut sirnply as a local court, and without any effort beling made to estnblish other trilunals upon a enmmon principle of judiciary organlzation. Such ls the present state of commercinl law in Saxony, to which the government are now endeavoring to apply a remedy. In addition to other means for this purpose, M. Einert, one of the most distingulshed jurisconsults of the country, has lately received an order to review the rocent laws, 80 aa to bring them still more into unison with the inereasing demands of commerce and industry.
41. Schtcartzburg, Rudolstadt and Schwartzburg-Sondershausen, Principalities of.-A" in the greate، number of the minor Stwe: of Germany, so in the above principalities, conmercial differences are brought hefore the ordinary tribunnls, and are decided upon according to common law usage, or even the laws of the neighboring States, Saxony, etc. The former ordlnunce of 1 st September, 1787, respecting failures, has been replaced by another of 1st December, 1885, on the same subject.
42. Nicilies, Kingdom of the Tuo.-The French commercial code was introduced into Naples the 28th May, 1808, when the throne was occupied by King Joseph Napoleon Bonapurie. The laws, having undergone a general revision at the time of the Restoration, a new code of commerce for the Two Sicilies was made public 26th Mareh, 1819. It forms one of the parts of a body of general law, arranged under the flve heads of civil, penal, and commercial law, and civil and criminal procelure. This cotle of commerce contains nearly the same ragulations as that of France, on the busis of which it has obvionsly been founded, and which long practice besides has sanctioned.
43. Spain.-In 1827 King Ferdinand VII, nomlnated a commission charged to frame a cede of commerce; and on the 30th May. 1829, a royal ordinance sanctioned the new code, which was to come into force the lat January, 1830.
41. Suceden.-lor hills of exchange in Sweden there ure two orilinunces, of 1st February, 1748, and 13th June, 1816. The text of them has heen given by M. Nonguier in his treatise. It appears, however, that these onlinances have been insufficient for the wants of commerce. Accordingly, on 20th May, 1835, there nppeared a new law regulating inland bills. This law, which in perfect in itself, and may be considered as the common law of exchange in Sweder, forms, with the orlinances nlready mentioned, an extremely remarkable borly of laws. In relation to inaritimo taw, a complete nccount of it, as it formeriy stood, msy he found in the celiection of M. Pardessus. 1le has given there the ordinance of 1667 , being an abstract of the Hanseatic Reces Marltime Consulate, etc. Numerous changes, however, have aince been made in this ordinance, certain articles havlng been retained, while others liave been supressed or modified. On the present state of the muritime law of the north, the work of M. Poehls may he regurded as of the highest authority. A law, very minute in detail, was is. sued in regard to fuliures, in 1818. This has been mere recently replaced by a new law of date 12th March, 1830, laving regard to some molifications made in it in 1835. In regnrel to justiclary organiza.
tions, it is sufficient to note that, generally, the settlement of commercial disputes devolves on the clvil tribunals. The only exceptions are proceeding rolstive to billa, or ariaing from disputea which may have arisen between ahlp-owners and the proprietors of the cargo, or the captalna, or between captalns and their meamen. Actlons in regard to these are within the competency of the munlcipal conrta. The same tribunala take cognizance of ordinary failures, If the bankrupt is noble, the case la brought before the courts of justice. To these also an appeal lies from the declsions of the munlelpal tribunals. When there Is room for appeal from an inferior dlatrlet court, it may be carried in the second Instance before a ouperior one; and in the third (finally) lefore one of the three high courts of the realm.
45. Suvizerland.-Each of the twenty-two Swies cantons is soverelgn and Independent, ruled by lts own laws. There exists, however, in the greater part of them, nu commerclal law whatever. Matters of commerce are treated as other affaire of civil life, with all the restrictlous and limpediments whlch have been the frult of muleipal legielation. In the Canton of Geneva, the French code, introduced provialonally after the cvents of 1814, seems nuw to poosess the mithority of definitive law. No chango has been made in It, except ia what regards the mode of legal procedure, delineated in the "Cods de Procedure," arranged hy M. Bellot, and promulgated 1st January, 1821. A law of 12th May, 1817, glving a new aanction to the Prench code of commerce, established those changes already adopted in France, and introduced into the art. 160 a provision having special reference to Geneva, namely: "The loss of right mentioned In the art. 160, shisll take place agalnst the hearor of a bill of exchange, at one or more duys after aight, or montis or usances after sight, drawn from the Cunton of Geneva, payable in foreign countrice, who shall not exact the payment or acceptance withiu the time preseribed by each of the prefixed dates." In the other French Cantons of Switzerland, the eame French code, though not expresaly enacted, is frequently, lu the absence of owher legislative authority, the guide, or is at least apprealed to as a rule of equilty. The Canten of Vaud has published a law on hills of exchange, the th Jume, 1819, which is chicfly extracted from the French code, und whiels has leen also
 Council d'Etat of the Canton of Vaud had prepared a report of a code of comnierce to be aulmitted to discussion, but it was rejected in 18.13, by the (irand Council. The Canton of Frithurg, in $1 \times .10$, prewented the projet of the first look of the "Cuhe de Commerce "" it has not yet, however, undergone disenssion. Lastly, Neufchatel has recently published some commerifil laws. The legislation in the German Cuntous is extremely imperfect. The least defective aystem of mercantilo law is that of Dasle, in which, in adlition to an ord nance on exchange, of 14 th Derember, 180 s , there are to tre found various rugulations in regarl to mercantile bookk, lirokerage (Etid llec., 18*2; "rill, JK0.\% and JN17) as well as mone old regulations (i:19) relative to the ranking of creditors in a cane of hankruptey. Tho latter also still retalif some degree of authority, und are therefore not without inijortanue, liecently, in the Canton of lierne, the discosmion as to the propriety of maintaining the codes of France in the Freuch jertion of tho Canton, seems to have fed the way to important reforms, having for their oljfect the revision, not only of these coles in certain articies, but of the cutira leglasution of the country. This içislation is composed of very anclent haw w, which conld net he lincluded in this work. The law on lankruptey, of 221 Derember, 1820 , contains aome very rencrkable provisions. The new civil code of Lucerne einliraces various reguiatlons on consmercial matters. Zurich ponsesses an ordlanance on
villa of exchange, of date 16th May, 1805. St. Gall, an ordlanace on the oume of 18 th July, 1784 , and a law of 11th October, 1832, on commercial accounts. Lucerne followa the ordinance on bilia of exchange of St. Gsill; Soleurs, that of Basle; and Eribury has the same law as Vand on billa of exchange, of date 24th June, 1829. In the German Cantons the defects of commercial law are auppled partly from the civil luw, but chiefly by usage. Commerclal disputca are determined before the ordinary tribunale. A law on bunkruptoy, of 18th May, 1818, for the Canton of Zug, contains some curious regulations in regard to religious eatablighmente, in faver of the bankrupt himself, who preserves the right of redemption over the sale of his real estate, und against his family in certuin cases. Thore etill exista at Bchoffenhausen a committee of commerce which traces ite origin to the year 1703; aimilar ones were to be found in several citics in Switzerland. Its memivers were elected from the inercantile body, and wero appointed to wateh over every thing that concerned the commerce of the eity. In 1805 it was erected into a tribunal of commerce for the declaion of all morcantile differences, It is much to be wished that Switzerland, especially in regard to commerchal affulra, were possessed of a common legislation applicable throughout the whole extent of the confederations. It is possible that the late reforms in the civil and the criminal codes of the Cantons individually, may lead eventually to this result. In certain cases, indeed, the Cantons have slready felt it necessary, minld the multiplicity of statutes and usages, to adopt certain nieasures of a general character, by federal conventions or concordats. Thas, in a case of bankruptcy, by the concordat of 15th. Iane, 1804, contirmed Xth iluly, 1818, every Swiss thioughout all the Cantens, enjoys, on ranking as creditor, the same rights with the inhalitiant of the Canton in whose juriadiction the bankruptey has been dedared, loth in regard to preferable and to ordinary claims, No seizure can take place of the movable proterty of the hunkrupt, except for the cominon interost. Thrae Cantons only-Schwltz, Claris, and Appenzell-n. fused their adhorence to this feteral ngreemen: their particular legislation seoms to oppose it. liy another concordat, ith June, 1810 , contimed Sth July, 1818, the Cantons have mutually decreed that all the effects of the bankrupt, whereser found, mist go into the general mass, without prejudice, meanwhile, to the clalus of the present holder. In the case, however, of the body of the creditors conteat ing either the property of deposits, or a mertgage or ownership aecurity situsted in a different Caston from that in which the hankrupt was domiciled, the claim must be carried before tho competent judge in that Canton, where the said effects, mort sike, or security, were foond. Ily virtue of art. 1t of the treaty of alliance between France and Switzorland, Frenchmen and Siwisa are respectively exempted, in pleading vefore the courts of aach other's country, from the obiigation to furnish a " judirntum anlci." The Court of Cassathon, !h April, 1807, and the Court of Colmar, 2sth March, 1410, have spechally determined to this effect; and the law may be considered as tixed.
46. Tunis.-There is no commerci.al law in Tunis, Ihage and particular articles of agreement direct the decision in those cases of dispute that may oceur hetween native traders. Bivery trader kneps a book in which he registera lis purchames and his sades. Tha native Musabluen and dows know no higher form of mercisntile look-keeping. Thory ars sew countries, however, where commercial probity is fombd moro prevalent. And though cases may weeur, in which the condidence of the creditor or the cquity of the judge are attempted to he worked upon, yet such are proportionably rare, whell compured with smilar instances smony nations where the written laws of commerce ara of a more definito and extended character.
47. The
47. Turkey.-The geographical position of Tarkey was destined to form this rich country into an essenthally commercial power. But the natural indelence of its Inhabltants has prevented it from reaping the advantages which nature had laviahed on it. Their foreign trade is almost exclusively carried on by atrangern, who enjoy, by virtne of diplonatlc treaties, the privilege of paying dues of customs of amaller amount than those which are exacted from the Mussulmen and Rajpas, and possess the right, in cases of u'fferences with other foreigners, of appealing to their own internatlonal laws. The Koran is the commen law according to which canses among natives are almost always declded. It is no matter of surprise, therefore, that there exists no special law spplicable to matters of commerce. Those enactments which seem to bear the nearest resemblance to such, are acattered throaghont the general code-a collection of all sorts of laws; to which, moreover, the ldea of religions sanctity is attached, and which have been brought together by varions doctors for the purpone of regulating religioga services and pabllc administrations. The collection of highest authority is that which wan compiled by order of Solymen II., from 1520 to 1566, entitled Multeka Fhbar. This code has been translated by Chevaller Monrudja dI Hoasen, s native of Constantinople, of honorable Armenlan famlly, and dragomsn (Interpreter) to the embassy of the King of Sweden. The work appeared in France, the first two volumes in 1798, and the third in 1824, under the title of "Tableau General de l'Empire Ottoman," and presents an accurate exldbition of the laws which govern that vast empire. This cede centains a book on commercisl inatters, hut the laws embraced in it refer rather to principles bearing upon civil contracts, and sdapted to Musaulman manners, than to commercial right, properly ae called. Under the adminjatration of Ahmed-Fetchi-Pacha, In 18:39, a project of a commercial code was prepared on the model of that of France. The fall of that minlster, however, has indefinitely deferred lts putilication. As to commercial Jurisdietion not falling under the rule of common law, actions in regard to it were deterinined at Constantlnople and in the princfpal sea-ports of the Levant, by the chief officer of the custom-house (chef tle la dooane), alded by several assessorn chosen from the leading merchants of the place, Mussulmen, Rayns, and freemen. This court, however, had heen suppressed in the capltal, and the Ministers of Commerce, almilarly alded by assessors from the same class of merchants, have for some time taken cogniaance of sil comarercial affairs. It was the wish of the l'orte that disputes between Ottoman suljects and Europeans, shuuld be carried by petition hefore this tribunal withont the presence of any Furopean asscssor, and subject only to the interposition of the Interpreter of the embassador of the respective country. The entire diplomatic body' were opposed to this, and the ministry of commerce has been abolishel. The former order of things has now been reestablisleed, and the (irand Dounainr (the officer already mentioneti) presides as formerly in the tribunals. Its decisions are final. "A cause," says the religious code, " legally examined, discussed, and determined, can not again be brought into court, the law having pronounced agalnat all appreal." The judgments which it pronounces are not founded on any well-defined usages. The coule of France in generally the rule to which, in their private transactions, the Rayas, who hold a seat in the tribunal, are accustomed to defer. The tribunal of commetce ls not the only tribunal existing in Conatintinople. There are other three, uamely: 1. The Arz thdabsez, a supreme tribunal where formerly the Grand Visir presided, now the Chelk-ul-lslain (mufti), before whom, without appual, differences of every kind ara determined, save on cormmercial and maritime subjects. 2. The tribunal of the Cadlz; the Melikelim, a
sort of coart of paace or conciliation. 8. The court of the commandant du pert (governor of the harbor), Leiman-Odaasy, who, assisted by everal captaina, judges of all marlitime quentlona, Insurances, shlpwrecks, jettisons, etc. Commercial differences between the subjects of the Gravad Selgnlor and these of foreign powers whe are residents in the Ottoman empire, are determined aummarily in presence of an interproter of the legation, or of the consul of the natlon to which the foreign subject belongs, aometimes by the decision of the custom-house suthority, sometimes by that of the Pacha. In consequeace of forelgn treatles, every process involving a subject eaziveding 4000 aspres (about 8 francs each) may be foreed before the divan in Constantinople. This privilege, however, ls seldom made nse of. In cases of dispute between the subjecta of forelgn puwers, a decision is given by the censuls of the respective parties, assisted by merchants of both nations. The Turklsh tribunals decide on actions brought before them by the commentaries of the Koran, of which there are four in number, namely, as follows: the Hanafi, the Maleki, the Chafiy, and the Hambuli. These have never been translated from the original language. The Hanafi is followed at Constanthople and throughout Furopean and Asiatic Turkey; the Maleki, in Barbary ; the Chafiy, in Egypt ; the Hambuli is no longer used; the collection entitled Multeka Ehbar is known over the whole empire.
48. Tuscany.- The "Code de Commerce" has always, since it was introduced into the Grand Duchy; held its position as law ; and with the exception of the suppression of the tribunals of commerce, which, notwithatanding, have been continued in Florence itself, it has undergone no adteration of any importance. The article 117, however, of the judiciary reform of 1838, has annulled the regulations of article 51 of the French code, relative to ebligatory arbitration in matters of copartnery. An ordinance of 5th September, 1814, with a view to prevent the facility with which persons not engaged, in trade aign bills of exchange, suthorizes oaly bankers, merchants, snd traders, to draw bills of exchange. In cases when on such bills there should be the signatures of ethers chan merchants, the ordinance grants only a recourse against them through the civil procedure. Another erdinance of 23 d November, 1818 , prescribea certain measures proper to shorten the procedure in matters of bills of exchange. Lastly, a thlrd ordinance, of 20th December, 1824, declares that the words value exchanged, in bills of exchange, shall be considered as a true cause. We may also announce an important reaolution of the jurisprudence of the court of Tuscany, by which a failurn dees not destruy the provision of funds for a bill of exchange: a question much disputed in France, and which the Court of Cassation has adjudicated upon in a manner contrary to the juliciary decisions of the tribunals of Florence, by decrees of 7th February, 1816, 30th July, 1832, ant 20th March, 1841. We may add that the article 130, of the new Sardiniun code of commerce, contains a regulation in conformity to the jurisprudence of Tuscany. An ordinance of 6th August, 1827 , has made alterations in regard to insolvency and baukruptcy. It confers on the Advocate Fiscal (public prosecutor), or his substitute, the same powers with those of the public uinister of France. The eame ondinance proceeds thereafter to abrogate the enactments of article 587, of the lirench code of 1807, relative to those cases in which proceedlings might be taken against a simple bankrupt: The court above mentloned in F'lorence consists of two merchunts who are judges, two surrogates, one judge, a professional lawyer, and a "greftier." The judges-consular are chosen by the principul merchants; the list of nominals is laid before the Grand Duke for approval. The judgments awarded by this tribunal may be carricd by appeal hefore the tri',unal "de la vote," and finally before the council of justice. All maritime casea are

## LAW

under the jurisdiction of the "bnrean de la Marine," at Leghorn. In the other provinces of Tuscany the tribonale of comaierce have been suppressed, and the cognizance of commercial affuirs transferred to ills civil judgea, whose juriadiction ia uniimited.
49. Unit-d Stafes, - The commercial law of the United Statee is, in general, the same with that of England. The principles connestad with it are almost alwaya traceable to the latter source; modified, however, by the legialation of individual States, an well as by the decisions of tha federal court of the Unlon, and other inferior tribunals. Fingliah laws are not valid as auch. They must be anctioned by legialative enactmont, or int roduced by a court, as an erpoaitlos of principles common to the two natiens. Jach State has a neparate commercial legislation. This is founded either on exprees statute, or on der isiona of court. But as the flecrees of the different courts ha's a sort of anthority of thomselvea and ong in a...bision: to this, egastions in relation to anmerie, sitnate
 the proper interpretal $\because \in$ of tho ram. . . nerost law may be said to be the samie $w_{i}$ very inconsiderably throughou' 'he $\qquad$ ous queetlons on ecmmercial affairs ars tishted hy ine
 held for tho purpore of taking cognizunce cf civll de. putes between inhatitants of different States, and of all cases of admiralty and maritime jurisdietion. The final revision of the decisions of these courts ingenerally competent to the Supreme Court of the United States, which, differing frum the Court of Cuasation in France, judgeas buth in regard to fact and law ; and the decrees of which, whife not considered as determining the principles of legisiation or jurisprudence, have, ind..ectiy, great inflenee in giving uniformity to the decisions of inferiur courts in the aeveral States of the republic. Though each State is in itself independent, yet lawn of a, general and uniform character may be enactod by Congress. For example, articie 1at of section 8 wibd section of the fonstitution of 1783, prevides, that Congrowa shall have the power, in the matter of hankruptey-a suthject of wo grave interest in Ancrica, and affecting so deeply public credit -to enact laws that shail be ohligatory on ail the States, and take place of local enactucnts, whatever these may be, Uuker a general view, the eribunaia must forin their decisions on the basis of four suffciently defined eloments: lat. The common or imperfeetly written law. 2d. Tin ntatutes of the particuIsr States. Sd. The legisfative acts of Congreas ; and 4th. The decisiuns oi English courty and treatised on Einglish jurisprudence to which fiwyers are permitted to appreal, an maison icrit, profesionti decinion reduced to writing. There are no tribunalis of commerce in the United States. Commorciai or marltime ques. thens are determined in th" tirst lnatance hy the orlinary coursa appointed in. sh State. There are many exceptinns, however, viz.: 1at. If inaritime civil canses such an seamsn's wagen, mortgages, salvage, engagenents of ressels, cte., in general, of every reai acticil agsinnt the vessel, or even in certain cuses afginat the cargo. 2d. In the came of neianre of the alip or cargo. 3 k . In regard to patents for diseovery; rights of authorship, etc.; sul th. In an action intended by a citizen of onn State agalust a citizen of another, In all theae camen the jurisuliction devolvea on the federal extirt of cireuit or of district. Though the juikes have no pollitical privilegen, they posseas each in his own ephera, great fower; inasinuch as they may refuan to apily the law on the ground of unconstitutional inprupriety in particuiar casen brought thefore them-an ingenioun but sure method of fixing the character of imperfection on a particular law. In onder ti place in one view the decuments secessary to give the moat perfect view of Ainerlcan ingiatation on the varions matters contained in a com.
mercill code, it was nacessary to have recourse to the beat accredited exposidions and commentariea, und to which the Ancericans thomselver attach the highesi nuthority. The nuthor generally followed, as the most accurate, is Chancelior Kent, whose Commentarifs on A merican Law, presenta an admirable and general view of commercial legislatlon. With reference to bankruptcies, the Congress having made use of the power granted to it lyy the Constitution, votid 19th June, 1841, a general law for all the States of the Uuion, which eame in ferco lat February, 1842. See Inaolvenoy.
50. H'alluchia and Moldavia-Theae pincip.lites are tuled by lawa, originally a mixture of Roman law, and uacke. More recentiy the laws of the Lower Fimpire came into force, and retained their autherity to a pee riod nut yet remote. The position of the two countriea, pressed by the great powera which surround them, has led them to feel the importanc, of stibility in civil legist ation. For this purpoes taere have been Astablished igganic resu: tiuns, with a view to protect The eitizous against the usurpations of the governing wathoritiea, aa well as to render secure the rights of the principalities against their powerful prutectors. $A$ lesire has been felt also to preserve the traditionary agea which are the expression of aational hahits, olu righ soncetimes these usarea are not perfectly in Iuranony with the French legislation, which has been adopted as the leading authority: The arintocratic principle is maintained in all its rigor in their laws, As the primary element in that principie is the preservation of the great estates, the luw confers on parents, according to their rank, and, fuiling these, ou iahulitants of the loculity, a proference in the right of purchase, and also a power of reliemption on the sale of immovable property. In the case of encroachmenta on contignous property, prescription is not mamitted. So jealons indeed are the inhabitants ia preserving their estatee intact that the pruperty coureyed in dowry by the wife (such is the rigor with $w$ hich the dotai eyatem is carried into exceution), is freed from obiligation to a leasehold hy the simple fact of macriage, if the husband refuses to contirm the lease ; a regulation greatly tending to shuckle and discouragn the lubora of the agriculturist. In 1810 a commercial conte was laid before the General Aisentily, conthining, with a few alterations, the anne regulatiuns vith that of Framee. It has 595 articles, After having lieen aduptei by the General Assembly it roceived the sanction of the prince, June, Into, Bin? was to come into force lat Jamuary, 1841.

Lead (Ger. Bley, Bles; Du. Lood, Ioof; Fr. Plomb; It. Piombo; Sp. Plomo; Run. Sveinetz ; P'ol. Ohom ; Lat. Plumbum ; Aral. A nuk; Illod. Sisa; l'ern. Surb), one of the most useful metala. It is of a hiluish white color, and when newly melted is very bright, but it soon becomea tarnished by exposure to the air. It has scarcely any taxte, but emitn, on friction, a peculiar smell. It stains paper, or the fingers, of a lloikh color. When taken Internally, it acts as a poison. It is one of the softest of the metals ; its specific gravity is $1 \mathbf{1} \cdot 35$. It is very malleable, and may be reduced to thin plates by the hammer ; it may also be drawn out into wire, bat its ductility is not very great. Its tenacity is so small, that a lead wire 1-126 lach diometer in capable of supporting only $18 \cdot 4$ lbs. without breaking. It melta at $612^{\circ}$.-Tvossox's Chemistry. Lead is a metal of much importance in the arts. Its duralitity and malleability make it very auitalise for the roofing of luildingn, the construction of guttern, and such like parposen. It used to be very extenaivaly employed in the formation of water-pipee and
cintorns. But though watar has no direct action on jead, it facilitaten the action of the external air; and hence the load of cisterna and of plpes from which the alr in not entirely excludad becomes oxydized, und ia covered with a white cruat at the point where the aurface of the water comes Into contact with the air. In. asmuch, however, an thla oxyd ls extremely teleterous, lead plpes and cisterns are now very generally auperseded by those of cast Iron. At present, perhape, lead in more extenelvely used in the nunufacture of amall ahot than in any other way. Its salts, though poleonous, are used in medicine to form seilative external applleationa; and frequently unt a little, by the diareputable wine merchant, to atop the progrese of acetous fermentation. Wine thus poisoned may, however, be readily dintingulahed; a smull quantity of the blcartonate of potass producing a white precipitate, and aulphureted hydrogen a black one. Pure wine wlll not be affected by elther of theme testa. "The oxyd of lead enters linto the composition of white glass, which it renders clearer and more fusible; It in alro need In glazing common earthen veseels; hence the reason that pleklee kept in common reij pana becume poisonous. Lead, wlth tin, and a amall quantity of some of the other metals, forms pewter; with antimony, it forms the alloy of which printing typen are made," Joyce's Chemistry. Mines of this vaiu. able mineral havo been wrought in England from the ara of the Romans. It does not, however, ajpiear that it was obinined any where except in lertiywhire, tiil 1289, when it was discovered in Wules; and the fact that silver was found intermixed with the Weish urea having transpired, gave a new atimulus to the business ; but In other respects the discovery of silver was of no use; the quantity obtained being insuffcient to defray the cost of lts separation from the iead. At present, the most productive Englinh lead mines are situated in Northamberiand; in Cumberland; in the western parts of Durhans; in Yorkshire; in Derbyshire, and in Cornwall. The Welsh minee are principally aituated in tho countied of Flint, Cardigan, and Montgomery; those of Scutlan.d in Ayr, KirkcudWright, and Lanark; and those of Ireland, in Wicklow, Down, Limerick. Leal mines are aiso wrought to consilerable advantage in the Jule of Man. We aubjoin an aliatract deduced from the accounta fur nished by the Museum of Practical Ceology, of the
quantitiza of Lead Oar and Iefab producen in Great

"In 1852, 14, 124 tons of lead were Imported, and 2f,548 tons (including 2,967 tons foreign), were exported. It consequently follown that the produce of IIritish mines is sufficient not only to suiply tho home demand, lut to furnish a surpulus of 9,457 tons for exportation. $\mathrm{I}_{\mathrm{g}}$ lead was worth, In the London market, in Septem. ber, 1883, f\%2 10s, 6l. a ton. In 1832 it was ouly worth $\mathrm{Cl3} 10 \mathrm{~s}$. a ton.
"Lead, when firnt extracted from ite ore, alwayscentalns a certaln portion of ailver, varying from a few graine to 45 oz . or more In the ton. When the silver mixed up with the lead ts sufficient to repay tine expense, it is usual to separate it, whlch is effected hy the procesn termed refining. The lead of anme if the Fingllah mines, especially those of Cornwall, and, nlso, of the Isle of Man, containa very considernije qusntities of silver, and our readers will, perhajw, be surprised to learn that It has been estimated by the highest authority that, In 1852, the United Kingdum furnished no fewer than $818,325 \mathrm{cz}$. of silver, worth, at 58 an oz., ${ }^{\prime \prime 2}: 05,080$, obtained from lead."

Estimating the American lead to welgh 70 pounds each pig, and the foreign 140 pounds each, which is deemed alout the average of both.

Lxad axexivid at St. Louls paon Weatzan Minis.

In 1844 the Galena mines produced $51,494,860$ pounds of lead, and the price at St. Louts was about i centa per pound. In 1856 they landed at St. Louls $14,325,920$ pounils-less than one fourth the aupply of 12 years previous, and the price was about $6 t$ cents per pound, thus being more than doubled. In 1854 there was imported into the single port of New York $55,945,900$ pounds of foreign lead-inore than the Galena mines ever produced in any one year. Doubling the price, doubling the demand, has reduced the prolluction to one quarter, and it is certaln that in 1857 the western manufucturers of lead will have to procure a portion of their staple from imported foreign lead $\ln$ the Atiantic cities.
Statement eximeitina the Foneion Inpogtations and Expogrationg, Dumeatic Exports and llowe Consumption of Forehan lmpoktations of Lead, and tha Mantitacturgs turkrof; alao Itomr Consumption of fuxgion Impoxtations, lesb Domestio Exporta, of Leab, and the Manufactibes of Lead, and Donystio Expohth, less llona Conecmition or Fongion Inpoatationg of Lzad, and the Manufactebes thereon, yor the labt seventagn Yikabs, and the Annval Avzaage thebrop.

The proluction of lead at the Galena inines, of late yeara, has heen materially reduced by the discovery of gold in California

White Lead.--The manufacturers of white lead, shot, Jead plpe, etc., have putitioned Congress to place the raw material, ply leal, on the free list, and the committee reported favorulily on the subjest. The prition wan slgned ly all the leating hensea engaged in the trade, and the fact. presentel in favor of the ir request aro numerous and conclusive. They say that for a loug thme previons to laty the domestie supply of pha lead was more than adequate to the entire domestic demand. Up to 1817 the © ialena mines steadily increased in productiveness, and kept pace with the Increame in condumption. Since that year the con numption has heen in alvance of the tome supply, and the manufacturern on the seaboarl bave had to pay comparatively high priven fir the raw material, the wetern states now manufacturing nearly all the phig lead they prolure. Ont of $150,000,(600$ pobinth of pig leall inymorted lato Naw York in 185t, enly about $2,500,000$ poumils were American. The dity on pigg lead, ly the tariff of 1 RAB, was 20 jeer cent. ad ralurem, and at the time that eet was passed, it protected all donentio interente, for we proluced an much lead an the country consumed. Slnee 1818 we havn been obilged to lmport the bulk of our cenaumption, and all connumera and manufacturern are therefore hinjured, while foreign manutacturery are lestefted ly the du!y now imponed on the article. (lur manufacturars are ahut eut of all foreisn markets by the enhanced price
whieh the duty of 20 per cent. puts upon their gools The mamufucturers ask only that jig lead shomid he put in the free list. It is their wish that all artides manufactured from pig lead slould remain as at prow. ent, under a duty of 3 per cent. The manufurturess of articlea from pig lead ank no more than the secretary of the 'Ireasury han repeatedly suggested in his munual reports-" that the raw materlils used in our manufactures should be almitted free of dutr." lif the tarilf of 1837, passell 3d March, tho duty on leid imanufactures generally was reducell from 30 per cent. ti) 21; Inad In pig and bars from 20 to 15 per cent. Uro from 20 to 15 per cent.

Lead, for sounding. The emmon hand lead weighs 11 lbs. with alont 20 fathams of line. Thi lealsman stands somewhere on the side of the vessel, leaning against a band fer the purpose; leta the lead descend suar the water; then, swinging it wer his head once, or trice, if the shifp is poing fast, throws it formard. The line is marked at $5,7,70,1: 1,17$, and 20 fatherna. The numbers betwern aro called depms: thus, "hy the mark 7," "lyy the deep! !!," indientes 7 and 9 fathoma. When the depth is great, the teep-sea leal of $2 \times$ lins, is used. The tead is dropmed from the fore part of the vessel, the line heing pussed outsile all. It in gonerally necessary to licave the ship to. See Soumbinas.

League, a measure of length, usell in reckoning distanses by sea. The sea league is three nantical or geographical miles, or the 1-20th of a tegree, and colssequently about 3.45 Engllish miles. Tho comerna
land league continent of hewever, hin league (lieue equal to $2 \cdot 42$ degree (anele 2.76 English be regarded $n$ Revolution provinces. 1 Celtel louch, by stones $\ln$ t thuse provine by leagues as considered ly half of their man paces. was introduced an early period to 2 milos of th tern lev. $n$ is u. ef the old Eny the limit from tion of a count the limit of ne wafe. L'arietira.--Len three kinds, num yield diffirent va hacke, which ure bilice. When hat
land leagre is a well-known itherary measure on the continent of Europe, chlefly in France. The Fronch, hew over, have two distlnct leaguss : the legal posting league (lieue de paste), contalalng 2000 toises, and equil to $2-42$ English miles; and u league of 25 to the degree (anelently the lieue moyenne), or equal to about 2.76 Engllsh miles. Thla last, however, can searcely be regarded as a definite measire $;$ and previons to the Kevolution the leagne was different in the different provinces. The word ls sald to be derived from tho Celtic loach, afone; the diatances having heen marked by stones in the Roman provinces. In Gaul alone of thuse provinces, they were marked In some instanees by leagues as well as miles. The Gaulish leugue was considered by the Romsne as equa: to a mile and a half uf thelr own measure, or as centaining 1500 Roman puces. It is supposed thut the league, or leura, was introduced into England liy the Normana, wherf at an early period, it came to be reckoned as an equiv'sent to 2 milus of the time; this being the sense in whach the tern lev a is used by the oldest law writers, und in most of the old English charters. A league, or 3 mlles, is the timit from shore generally allowed fur the jurisdiction of a country to extend ln fisheries, etc.; und also the limit of neutral water, in which a fugitive ship is safe. Seo Fisuentes and Neurnibis. Suo Milz.
Lealc, at seu, is a lute in the ship, through which the water evmes in. A ship is maid to spring ol leak, when she liggins to leak or let in the water. The maner of stopping a leak ls to put into it a pligg wrapped in oakum und well turrel, or to insert a tarpauling clout which keeps out the water, ur to mail a piece of sheet-leurl on the place. Seamen sometimes stop a leak by thrustlug a piece of sult beef lnto it. The sea-water, salys Mlr. Boyle, being frosher than the brine imblied by the beef penetrates into its budy and canses it to swell su as to beur strongly ngainst the edges of the broken plank, and thereby stops the itHax of the water. A ready way to thad a leak in $n$ whip is to apply tho narrower jart of a speakingtrumpet to the eur and the other to the side of tho ship where the leak Is supposed to be; then the noise of the water rushing in it the leak will he distinctly hearl, ans thereliy discovered.
Leakage, in commerce, an alluwaneo in tho eustoms, granted to importers of wine for the wasto and damage the gools are supposel to rocelve liy kerping.
Leather. The sklas of various anlmais, in their fresh state, are flexible, tough, anl elastic, and appear to he ndmirably adspted to the purposes of clothing. Bat in drydug, they become hard and horny, and. on expesure to molsture, putrid. Tho art of restoring the supple gualities to akins, and rendering them durnble, appears to have been discovered at an early period of man's history; and the worl leather, from the suxom liah, lithe, or lither, indicates the quality of suppleness. Leather ls formed by the chemienl union of the dermis, rorium, cutis, or true skln of an anlmal, with an astringent vegetable priuciple, known as tannin, or tanaic acid. The worl tan, from the French tanner, to tan, appears to be derived from the low latin tanare. leather may, however, he prepured by imprognating the akin with alum, oll, or grease. In the aninial hide or skln, the outer part, which is novered with hair wr wool, is called the epidermis or anticle, belew which is the reticulated tisaue, and then, in contact with the llesh, is the dermis, or true skln, which is the ouly part which mbinits of leeligg tanned. It saries in thickness In diferent purts: the mune, the lask sul the rump, belng thicker than the leelly. 'Ihow shin is converted into gelatio, or glur, hy the artion of builing water.

Variefies,-Leather tanned is generally divided into three kinils, numely, hiles, kips, and shime; and these yiekd dlfierent varieties of leather, such as butts and buche, which are male of the stonteat and heaviest oxbiaca Wheu hides aro tanned whole fur sole lenther,
they are called crop hides. Skins produce tha lighter varieties of leather. Large quantlites of hlden, dry salted, are Imported Into the United Klngdom from South America and different parts of Eurepe, from the Cape of Good Hope, Morocco, etc. Calf sklna are imported from the Baltic, and the calves bolng killed, younger than in England, the leather prepured from thein is used for hook-binding, gloves, and ladies' ahoes.

The stoutest leather is made from butts or backs. Buf leather was formerly made from the hide of the buffalo, bitit it now surnished by the cow-hlile, and ls used chiefly fur soldiers' belts. Bull-hlde ls thleker than cow-hide, while that of the bullock is intermediate. Calf-skin supplies the greut demand for the upper part of boots and shoes. Sineop-skins furm a thin, cheap leather; lamb-skins are used for gloves; goat and kid-skins form a light leather of tine quality; deer and antulope aro usually shamoyed, or dressed in oil ; horse-lide is prepared for harness-work, etc., and this, with senl-skin, is used for making enumeled lauther; dog-skin makes a thin tough leather, but most of the gloves sold ue dog-skln are made of lamb-akin. llog-skin mukes a thin, porons lenther, and is used for covering the seats of suddles. There is a large lmport trade in skins. The great demand for leathor for the best gloves is supplied by lambskine from Italy, Spsin, the suuth of Framce, und other parts, wisero, in consequenes of the lumb beling killed earlier than with us, the skin is smull, fine, und thln, nuil is used instead of kld; but it is neither so strong nor so glessy. The skin of lambs that die soon after their lirth sre somethmes dressed with the wool, and are used for lining fleves und shoes. The hent kid-skins ure from the south of lirance; they are also imported from Germany, Switzerland, Italy, and Ireland. It is sald that as soun as the kid begins to fevd on herbage, the skin sulfirs in tineness and delicacy, and is no longer muituble for thu best gioves. The best muroceo leather is male from Swlss goat-skins, unother kind is from Mogador und Bast Indiun gont-skins, which are often made into hlack moroceo, known as "black Spunish leather," from the circumstance of the first supplies laving been obtained from Spain. The leather from the Cape sheep-skin is noarly equal to meroceo. 1lippopotamus hides are Importel from suath Africa, and when tannod with oak burk, they make an extromely thick und eompuct leuther.

Tanning Materials,-The vegetable substances used in tanning have of late years become almost us numerous us the varieties of hides und akins on which thoy are employed. The netive vegetuble principle, tannin, varies sumewhat ncevrling to the aource from which it is derived; but it ls alvaya marked by an astringent tuste, a bluish-black, or dark-green precipitate, in aqueuns sulutions, by almixture with a solution of one of the eults of poruxyl of Iron; twbile, with a solution of gelatin, it gives a dirty white or brown precipitute. A cold aqueous exalution of tunnin, mixed in certain proportions with one of gelatin in the form of glue, size, or isinglasa, forms a sulstance wheh is known as tumo-grlatin, which may be formed liy the application of heat into a vlseld elastic muss, resemt:'ug Indiarubber. lly tho action of ether, contalning a little water, on gull-nuts, pure tannin may be proeured. The etherial solution separates by repose into twa layers, the lower one, which is of an amber culor, belng a solution of : mutili In water; whlle the upper layer contuins gullic urid, mlxed with other subetances. On gently evaporating the afueons molution, nearly pure tamnin is procured, to the extont of from as to 40 per cent. frum galls. Ohtained in this way, it is a shinling, promus, unerystulizuble mass: it ls soluble in water, and then exerts the properties of an achd. By ex:posuro to air it absorbs oxygra, nod gives off a curbonic achl ; two new products, gallion neid and rliaghe acid, leing formed at the expense of the tannin, the luttor being inseluble. Tannin may be precigitated from lts
solntions by sulphuric and some other acids ; by boiling the precipitate with sulphnric acid for a few min. otes in a dilute solution of the aame acid, gallic ncid in formed, and cryatallizes in cooling. Gallic acid exlats in gall-nuts, anmach, vallonea, tea, and other subatances, and probably arises from the decomposition of tannin. It dees not combine with gelntin, and is, therefore, useless in tanning. Some tanners, however, imagine the gallic acid of the wante liquar to be useful in swelling or raising the hides, preparatory to removing them to a stronger liquor. it is important to the tanner to understand the circumstances under which tannin is converted into gallic acid; they are numerons and somewhat complicated, and their investigation belongs to the scientific chemist, to whom the msnufacturer already owes so many obliggations.

During a long period the principal tanning material has been oak bark. That which in stripped in the spring is the most esteemen, for it then contains a larger quantity of tannin than that stripped in autumn, and this more than the bark stripped in winter. The best bark is obtained in a warm spring, from cop-pien-trees about 12 years of age. Oak bark contains from $5 \cdot 6$ to 6.0 of tannin, which is contained in the Inner white layers next the alburnnm, as in the cnse of nther astringent barks. The tannin of bark is probably not Identical with that of galla, as it dnea not yield pyrogallic acid when suhjected to destructive distillaton. From four to six pounds of oak bark are required for every pound of leather. After the stripping, the bark is stacked to dry. Should the season bo rainy n portion of the tannin nayy be washed out, and tho bark be thins deterinrated. There is un dnulit that the peculiar excellence of the sole lenther of Eingland is due in grent measure to the superior oak bark which is possessed. Oak burk imparts firmness and solitity to leather, while other sorts give softness; thus the pecultar softness of French curried feather in referred to the bark of the evergrean oak, with which the lietter kinds are tanned, while the other tanning materials next to be named give each its peculiar quaity with resject to color, scent, toughness, or the power of resixting moisture and decay.

The other tanning naterials, used chiefly for fancy leathers, are as follows:-Sumach, consisting of the young branches and powiler of the leaven of hhus fofinus, Jenus sumarh, or the wild olire, and Rhus Coriaria. Sumach varies in its amount of tannin from 16.4 per cent. in Malaga and Sicilian sprecin. 2ns, to 10 and 5 in Virginia and Cesrolina sumsch. The solution is liable to fermentation. Dici, or diri-dici, is the pod of a South American whill, Corsalpinia Coriaria, The pod is dark-lirown, shout three inches long, and curled $n_{i j} s^{3 s}$ if lyg heat. It in rich in tannin, the whole of which is found in the rind beluw the epidermia. Vallonen, conaisting of the acorn cujs of Querces .Fgilops, ur prickly-cupped osk, growing in tho Morea. A smaller kind, called cornata, containing a larger proportion of tannin, is for the most part used by the aijk dyers. Alout two pounds of vallonea are required for making one jound of leather. Vallunea and oak hark mar be mixed together with gool eifect. Citechu, rutioh, Terin joponict, or terma, are the inspisasted aqueows pxtracts ci the bark, wood, and leavea of the . 1 raciut tutechu, and i'necria rumbier. The twu varieties are known in commerce as catechn, or gambier, and cutch; that from Iloming is richer in tannin than that from Ibengal. Myrobalian is a mane ofiven to the fruit of several Fast India trees; the husk, leing the portion valuahle to the tanner, is separated liy bruise ing the nut which it inclosea. Minnart ce W'atlehark In furnished ly differeut ajecies of Jimose growing in Auntraila and New Zeainad. Cork-tree bark is the inner thark of the cork nak, the outer, or dead hark being the welt-known sulstance, cork. It is ottained from Corsira, Spain, and a few other countries, and contains $t$ w're an much tannin as asarage oak bark. larch bark is sometimes used for tannings sheep-skins,
and Willow bark for kid and lamb-sking. The lastnsmed bark is used in making Russia leather, but its pecullar odor is given by means of the oil of birch-tree bark. In addition to the tannin contained in the above substances, there are mucilaginons, coloring and other matters which have an influence on the kind of leather produced. The tannin itself may also vary in different materials; thus cateehu and divl give a more porous leather than oak bark or vallonea, while larch bark gives a very inferior leather to that prepared from oak bark. The celoring mstter in some excellent tanning materiala proventa their use; sinco it is the custom to sell both upper and role leathers of a yej-lowiah-fawn color, and any thing which interfered with the production of this tint would be oljected to thus, catechn and cutch would be among the cheapest of tanning materials, were it not that they impart to the leather a reddish-brown color, whith would in no way interfere with the dressing or currying.

producea an ink dye; atale urine is then applied to the skin, and when dry, the stuffing is applied. The grain is raised, and when dry the akin is whitened, bruised, aad ugaln grained; after which a mixture of oil and tuliow applied to the gruin side, completes the proceas.

Varnished and Einameled Leather.-For many years it was found difficuit to canse a bright varnich to arkhere to leather without cracking, an effect which is now producer by means of beilied linseed oil, mixed
with vegetable black and Prussian blue. This composition, of the consistence of a thick paste, la rubbed upon the surface of the leather, and then dried at a temperature of from $150^{\circ}$ to $170^{\circ}$ Fahr. The proceas is repeated from 3 to 7 timea, and when quite dry, the varnish adheres very firmiy, and will bear considerable flexure and tension without cracking. By mixing colored pigments with the varnish, enameled leather colored pigments with the varnish,
of various colora may be produced.

Monocro.-Muroceo leather is prepared by tanning goat-skIns with mumech, and dyeing on the grain mitle. Inferior moroceoes are prepared from sheep-skins whiilarly treated, for which purpose each akin of pelt is sewed up into a bag, the grain olde outermost, distended with alr, and placre] in a mordant of tin or alum. They are next placed in a warm eochineal thath for red, Indigo for blue, urehil for purple, and are worked by hand untll the dye has properly situek. For certain colors the tunning precedon the dycing. The tanning or mumaching is carried on in "large tuh, containing a weak solution of numach In warm water; another and, reronger solution is contained in an udjolnigg voratel, portion uf which, together with aome numach leaves, in pured into the bas; mome of the wosak solution is then adifed, the tag is then distemied with air, and the akin thrown inte the vat. In this way alwat 60 skine are treatel, and are kep in motion a few hours in the kumach tuls ly means of paddles worked by hand or ly machlnery. The skins are then taken out and heapeal up on a shelf at the shle of the tha, the preasure thas prondiced cansing the higoor to escape slowly thrungh the pores of the mkin, the bage being alifted abolit from time tu time. The batgu at ne, iown! Intoa arecud vat containiuga str nger

 Fian theij trevo, borny, und are ion the crust, an It la
called. They next gass through much laborions friction with the pommel, and with a glass-lall; while the peculiar ribibed appearance of morocco is riven by means of a bell of bax-wood, on which is a number of narrow ridges. Sheep-skin moroceo is premad from whlit sklus ; the skin-spititinte madio e rasembles in principle that alreaty describul, only as the membrane ls thinnor certaln variations are reguired. Instead of saretching the vkin on a drum, it iv passed loneween two rollerx, the lower one of gun-lu"til, and sulit, and the upper made of gon-metal rings; while lietwren the two rollers, and nearly in cratat, is the elgee of the alasp knife, which is nowed ly a a rank, an already mentioncel. When a akin is introluced Inetween the two rallera, it is dragged through ugainst thw knife edge and diviled, the nulill lower raller suppurting the membrane, while tho mper une, being capabile of moving through a small powe by means of itn ringe, ubljants leself to inequalitios in the menlonane; where this is thin the ringe beecme depresed, and where it is thick they rise "I, so that no part es. capers the uction of the kulfe. The divided hins are mit wewol up int, bags, as from their thinnees they can be ammached quickly'.

In proparhys white leather ber tawing, the pelt is made an puro as possible; the loset kind of hesther laing preparal from hid-skins, while theep or laminskias make the inferlor kinda. They are tirst ficl withalnm and nate in a dram or tumbler made like a luge charn; aborit: llos. of altim, and iths, of salt heing ued to 1:20 minn of mediam nize. Tive alamina wh the alam probably forms sos:w delinite compond with the gethtin of the akins, while the walt ocrves to whiten them

When taken out, the akins are washed in water, then allowed to ferment in bran and water, to remove the surplus alum and salt, and to reduce the thickness. They are next drled in a loft, and become tough and brittle, but they are made soft and glossy by means of a dressiag of 20 lbs , of wheat flour, and yolks of 8 dozen egge. By rotating the skins in the drums for sonte time the dressing is absorbed, and scurcely any thing but water remalns. Thls dressing is nsually repeuted, and the aklas are hung up to dry. The beautiful softness and elasticlty of this leather is now given by munlpulation. The ekins are first dipped in clean water, worked upon a board, and staked upon a stretehing, or softening iron, conslsting of a rounded iron plate flxed to the top of an upright beam, by which the skins become extended and made smooth. They are finlshed by being passed over a hot fron.

Ledger, the principul book of accounts kept by merchants and tradesmen, wherein every person's nccount is placed ly itself, after lioing extracted from the Joumal. For an extended summary of the laws of different countrics regulating the keeping of accounts, see lane hayt's Commercial law of the World.

Lee, an epithet used by seamen to distingnish that part of the hemisphere to which the wind is directed from the other part whence it blows, and whlch is ac-co-dingly called to windivard. This expression is chlefly used when the wind crosses the line of a shlp's course, so that all on ons eide of hev is called to windward, and all on the other side to leeward. Hence, under the lee, Implles further to the leeward, or further from that part of the horizon whence tha wind blows. Under the lee of the shore, means a short distance from the shoro which lles to windward. Thls phrase is commonly understood to express the situation of a vessel anchered, or suillig under the weather-shore, whers there is always smoother water and less danger of hasvy seas than at a great distance from it. Lee lurches, the sudden and v!olent rolls whlch a ship often makes to the leeward in a high sea particularly when a large wave strikes her on the weather-slde. Lee side, ell that part of a ship or boat that lies hetween the mast and the side furthest from the direction of the wind; or, otherwise, that part of a ship which is pressed down toward the water by the effort of the sails, as separated from the other half by a line drawn throngh the middle of her length. That part of the shlp which lles to windward of thls line is accordingly called the weather side. Thus, admlt a ship to be sulling southward with the wind fit east, then is her starbourd or right side the lee side, and the larmourd or left the weather side.

Leeward Ship, signifies a versel that fulls much to leeward of her cotrse when suiling close-hauled and consequently loses much ground. To leeward, toward that part of the horizon whieh lies under the lee, or whither the wind blows. Thus, "We saw a fleet under the lee," and "we saw a fleet to leeward," ars synonymous expressious.

Lee-ray, in navigation, is the deviatlon of the course actually rin by a ship from the course stecred upon; or it is the angle formed lietween the line of the ship's keel and the line which she actually describes through the wuter. Ju consequence of the action of the wha or currents, a ship is generaily inspelled sideways as well us forward, whence the direction of her motion is ditierent from that of the keel.

Leeward Islands, a name frequently appllenl to those of the West India Islands lylng between $N$. Int. $15^{\circ}$ and $19^{\circ}$, and W. long. $60^{\circ} 30^{\prime}$ and $65^{\circ} 40^{\prime}$. The group comprises the llitish posacssions of Antlyan, Deminica, Montserrat, Nevis, St. Christopher's, Anguilla, Baroula, and the Virgin Islands, which are all included under one governinent. The French, Dutch, Danen, ete., lative also possessions to the group. There are $2: 3$ islands, hesides numerous lslets, haviort in ull an area of about 1700 square miles, and a population of about 321,000.

Leech-Fishery. The denand for the medieinal leech (Hirudo medicinalis) is so great as to athord employment to a eomsideruble number of persons in catching und selling the aninul. It is commen throughout limrope, America, and India, inhabiting lakes and poris. Norfulk supplies the greater purt of the leeches bronght to the london market; but some are taken ia Kent, Sultolk, lissex, and Wules; und large quantities are tmported trom lhordeaux and lidshon, They are caught in spring und nutumn by people who wade into tho pools and allow them to fasten on their limb; or more generally the eatchers bent, as they wate in the surface of the water with pules, which sets the leeches in inotion, and lorings them to the aurface; when they are taken with the haud, and put into bags. As they come to the surface just before a thunder starm, this is rugatiod a good time for collecting them.- 'linonnos. We extract from the Gazette des Hopitaux the following interesting necouat of the lishery of leoches ut La Hrenne, in France:
"The eonntry abont Ia lirenne la, perhaps, the not tatatereating in France. The peopte are miserable-lookling, the
eattie wretched, the fish junt sa bad-but the leechen are admirahia. If ever yon pene through La Brenne, you will nee n man, pole and atreight-haired, with a woolen cap on hia head, and hita legs and arma naked; he walkn along the bordern of a marah, ameog the apota left dry by the aurrounding waters, but particularly wherever the vegetatien aeemin to proserve the autijacent solt undistarbed; thle man ia a leech-fiaher. To aee him from a diatance-bla woe-begone aspect-hia hoilow eyea-hhia livid lipo-hia aingular gentares-yen weald take hin for a patient whe had left hia aick bed in a at eif delirlum. If yon ebmerve hias evary now and then ratatog his legt, and examiniag thein one after the other, you might suppose him a foolt but he is an intelligent leech-fater. The leechen attich themseiven to hia lega and feet as he movea among their haunta; he fecta licelr prosence from their bite, and gathers them as they cluster abont the roots of the bullruchee and asa-weeds, or beneath the stoned covered with green and giuey mose. Bome repoet on the mud, while othera awim about, hut mo alowly that they are eanily gathered with the haod. In in favorable season, it is poustibe, io the ceurse of three or four hours, to stow ten or tweive dozen of them It the ittle hag which the gatherer carries on his ahoulder. Sometmes you will see the leech-fiaher armed with n kind of spear or harpoont with thia he deposita pieces of decayed anImal matter in placea frequentod by the leechea; they soon gather round the prey, and are prosently themnoires gathered Into a litile vensel half full of water. Such in the leech-huhery In apring. In aummer the leeeh retires into deep water; and the fahera have then to atrip nesed, and walk immersed up to the ehtn. Some of them have little rafls to go upon; these rafta are made of twige nud rnalies, and it ta ne casy matter to propel them among the weeds a nd riqualic piants At thts season, ies, the aupply in the pool ita aennty ; the fisier can only take the few that awim withil his reach, or these that get entangled in the ntrueture of hia , aft. It is a horrid trade, io whatever way ti ia earried on. Ti eleech-gathorer If conatantify more or leas in the water, brea hing fog and miat and fetid odore from the marah; be ia oft 3 attacked with ague, catarrha, and rieumatism. Some indc'ge in atrong liguors to keep off the noxtons influenee, but they pay for it in the end by itsorders of other kinds. But, w th all ita forisüuling pecuilaritles, the leech-fiahery given em, voyment t.) many handa: If it be peroicioue, it in also lueraive. Besides supplying all the neighboring pharm' ens, great quantilea are exported, and t'rie are reculer era congaged for the purpose. llent E"sartier la de of those persona; and an ímportant personage he is when be cemes to Meobecq, or Ita viefnity ; hia arrival makes quite a fite--ill are eager to greet him. Among the fateresting particulara which 1 kathered in La Brenne rulative to the teceh-trade, 1 mar mention the fotlewing: (me of the tradern-what with hie own flahing and that of his children, and what with his acquialtiona from the cartiers, whe sell quantitien second-hand-was cuabled to hoard up 17,500 leeches in the course of a few montha; he kept them deposited in a place where, in one nifit, they all became frozen en masse. Hut the front does not iminicilately fill then: they may generally be thawed futo life agrin. They easlly, indeed, bear very hard usage. I ani told by one of the carriera, that he can phek them as closely as he pilen res io the moist mack which be tiea belind his waddle: and sometimen he atowa bis ctoak and boots on top of the anck. The treter buys his tecerhes pille mile, hig and little, green and black-alt the amme; but he atterwaris morts them for the market. Those are generaily accoonted the best which are of a green gronod, with yelluw atripee along the body."

A tract puldished at Paris in 1845, hy M. Jorepls Martin, Jeech-merchant, contalns a great $\quad$ arlety of curious and instructive detalls in regard to the natural Mistory of leerhes, the trade carride on In them, and the frauds of the dealers. They are, we telleve, muth mere extenalvely uned In medlioal practive in France than in Fingland; and, at all eventr, their conaumption in the former seens to be quite immense. Nowithstanding the exhaustion of some of the marahes and ponda in dlfferent parts of the eountry, whence sup)jolien of leechen were formerly prowired, great numbern are utill obtained at home. Jhy far the largur jortion of the necensary rupplies is, however, brought frous abroal ; princlpally from Germany, Spain, Sarillnia, Turkey in Jiarope, Aggern, Asia Ilinor, ute. In tie French custom-house the 1 mport a ere eatimated at 500 leechee per kllog.; but M. Martin affirins that 1000 leeches do not, at an average, wolgh more than a kilog. Hence the nombers and values of the loeches importod
into France during each of the five yeare ending with 1847, will be:

| Yearm. | Numbers aceording to officlal Relurns. | Number corres'tid. ${ }^{*}$ | Offichal <br> Yalue. |

Leghorn, acity and sea-port of Italy, in Trucany, lat. $43^{\circ} 33^{\prime} 5^{\prime \prime}$ N., long. $10^{\circ} 16^{\prime} 45^{\prime \prime} \mathrm{E}$. Population, in 1851, 84,000. Leghom has an outer harbar, pro tected by a fine mole, running in a north north-west direction upward of half a mile into the sen, enil a amall Inner harbor or basin. The water in the harbor is rather shallow, varying from 8 feet In the inter basin to 18 or 19 feet at the end of tho mole. The rise of the tides ?" about 14 inches. Ships lle within the mole with their sterns made fast to it by a cable, and an anchor out ahead. The light-house is built on a rock a little to the sour a-west of the mole. It is a consplcuous object, being rimut 170 feet above the level of the aea. The roadstead lies west north-west of the harbor, between It and the Melora bank. The latter is sunily, lying north and south, 4 miles in length hy 2 in hreadth, the side nearcst the shore being almut 4 milea from it. It consista, for the most part, of sand and mud, and has from 3 to $8 \frac{1}{2}$ fathoms water over it; lut toward his southern extremlty it is rocky ; snd there, on some of the points which project above the water, the Melora tower has been constructed to serve as a sen-mink; it benra from the llght-house west one half north, distant alout 4 miles. The best courve for entering the roads in to keep to the northward of the Melora bank at alout a mile from it, and then, having doubied it, to stand on for the light-hnose alnat $2 \frac{1}{2}$ miles, anchoring in from 7 to 9 fathoms, the light-house frearing south mouth-east one half east 4 miles off. The entrance by the channcl to the south of the Melora hank is nlso quite safe; bat it is not so suitable for large ships as that by the north. During southerly winds there is sonsetimes a heavy sen in the roads, the the holding-ground is good; and with sufficient anchors and cables, and orlinary precaution, there is ne danger. The lazaretto lies to the sonth, atout one mile from the tower, anil lss said to be one of the best In Fiurope.

Trade, etc.-The compurative security and freedem which forelguers have long enjoyed in Tuscany, still more than its advantageous sithatlon, render lechiorn the greatest cominercial city of Italy. Its exports are slailar to those from the other Itallinn ports ; consisting prinelpally of raw and manufactured silks, olive oil, borax, fruits, shumac, Valonla, wines, rags, hrimatone, cheese, marhle, argol, anchovies, muna, juniper herries, hemp, sklus, cork, etc. Leghorn platting for straw hats is the tinest lin the wordd; aull latge quantitien are imported into liritals. See llits, Straw. Hesiden the above, all sort: of articles, the produce of the levant, may be had at Jeghora. Jecently, how. over, this trade has fallen off; tho linglishand otbernations who used to import Levant jrodece at serond hand from Italy, preferring now, at least for the must mort, to bring it direct from Suyma, Alexamition, etc. The imports are exceedingly numerous ant salualile, com. prlsing all sorts of comnsalities, with the exception of those produred by Italy. Sugar, coffec, and afl serts of colonial produce; cotton stulfs, yarn, and wonl; enrn, woulen stuff, splees, dried fish, limigo, dyewooln, rice, Iron, tin, hilea, ete; are among the most prominent artlclea. Shlps with corn on luard may unload within the limits of tho lazaretto, without being detalned to jerform quarantine ; a clreumstance which has contributed to make Jeghorn one of the principal dipher. for the wheat of the lilack Sea. llurl wheat, partieularly from Taganrog, 1 s in high eatimation leve and in the other Itallan ports. It is particularly we!]
fitted for m ernment do ports of Leg have been f deficlency.
Money.kept in pezz pezza beling money has b accounts are centesimi is with London in 20 soldi d bist, p. 37.

English grain lbs, avoirilupe usual to recko pois : this, pe and other allo of uncertalnty English cwt. at leghorn, th of logwoed, to der more than 100 lbs . The taro of sugar brandy $=120$ cles $=160 \mathrm{Jbs}$ the sacco or 8 4 sach:s $=1 \mathrm{in}$ measures are:

2 Mezzett
2 Boceato
20 F'lasehi
The barile of 8.83 wine gallor A large jar of o and a box with
The long me into 20 soldi, 6 22.08 Enylish yards. The car
Credit, Charg and sold for sil money in which a difference of \$107 in silver lought or sold there is no dis discount of 3 pe per cent. Charg generally from ceat. Tares, Mocha caffee, 5 30 to 40 per se crushed, fe per package, and 4 p if per cent. upwa rosia, 12 per cent the price current Three Montha' Da ish dollurs, it 11 loons, flo1; tien wher 196 C. Flo
In $18: 16$ n join horn, with a mapit taking the lira at whole of the eu bility is limited t the power of issu 6,000,000 lire. government, are the bank ars conf
fitted for making vermicelli, macesroni, ete. The government do not publish sny official account of the imports of Leghorn ; and no mercsntile circulars that we have been fortunate enough to fall In with supply the deficiency.

Money.-Down to 1887 accounts were principaliy kept in pezze da stto reali (or dollars of 8 reall), the pezzu bcing divided into 20 soli or 240 denari; but this money has been discontinued since the above date, and accounts are now kept in lire Toscane. The lire of 100 centesimi is worth 7.82 d ; ; so that the par of exchange with London is $80 \cdot 69$ lire per £1. The lire is divided in 20 soldi di lira each of 5 centesimi.-Tate'a Cambist, p. 37.

Weights and Measures.-The pound by which gold and silver and all sorts of merchandise are weighed is divided into 12 ounces, 96 drachma, 288 denari, and $691 \%$ grani. It $\mathrm{ls}=339 \cdot 542$ French grammee, or 5240 Engish grains. IIence 100 tbs . of Leghorn $=74.864$ lbs, avoirdupois; but in mercantile calcuistions it is usual to reckon 100 lbe . of Leghorn $=77 \mathrm{lbs}$. avoirdupois: this, perhaps, has arisen from taking the tares and other aliowances, as to which there is is good deal of uncertainty, into account. Thus it is found that tho lingish cwt. seldom renders more than 140 or 142 lba . st Leghorn, though it is $=150 \mathrm{Ibs}$; in the instances of logwood, tobacco, and a few others, it does not render more than 135 libs. The quintal, or centinago $=$ 100 fls . The centuro is generally 150 lbs . ; but a centaro of sugar $=151 \mathrm{lbs}$; that of oil $=88 \mathrm{lbs}$; of brandy $=120 \mathrm{lbs}$. ; of stock-fish, and some other artjcies $=160 \mathrm{lbs}$. The rotolo $=3 \mathrm{lbs}$. Corn is sold by the saceu or sack $=2.0739$ Winch. bushels; hence 4 sacl: $=1$ imperial quarter, very nearly. The liquid measures are:

## ${ }_{2}^{2}$ Mezzette $=1$ Boccale

20 Flaselit $=1$ Bartlo $=12$ English wino gallons.
The lurile of oil is 16 fiaschi, of two boccali esch $=$ 8.83 wine gallons; it weighs about 66 Ths. avoirdupois. A large jar of oil contains 30 gallons; a small one 15 ; gnd a box with 30 bottles $=4$ gallons.

The long measure is the braccio, which is ciivided into 20 soldi, 60 quattrini, or 210 denari; it contains 22.98 English inches. 155 bracei $=100$ English yards. The canna of 4 bracei $=92$ English incies.

Credit, Charges, etc.-Goods in general are bought and sold for silver money; between which, and the money in which bills of exchange are bought, there is $a$ difterence of 7 per cent. (agio) against gitver; i.e., \& 107 in siliver are equai to $\$ 100$ in goil. On goonls bought or soll (unless it be in effective money, where there is no discount) there is, generaliy speaking, a discount of 3 per cent. ; on all cotton manafactures, 4 per cent. Charges on sales, incinding commission, are generaily from 6 to 8 jer cent.; on tish, 8 or 10 per ceat. Tares.-Cinnamon 1 b .12 to 1 i per half buie ; Socha coffec, 5 to 7 per cent. ; indigo seroons, $\mathbf{i b}$. 20 , 30 to 40 per seroon; sugar Ilavana, 14 per cent.; crushed, 42 per cent. or real tare of package; loaf package, ani 4 per cent. for paper; lirazil of 19 inches, js per cent. upward 20 per cent. ; tobacco, 10 per cent. ; rosin, 12 per cent. For most other articles specilici in the price current the real tare is sliowed. Eirchanges, Three Mowths' Date.-L.onion, liv, (it) per $\boldsymbol{E}$ stg.; Spanish dollurs, 6611 s ; Paris, liv. (at per 100 franes; doulsloons, £101; Genea, liv, @ per 100 Ln ; ; Trieste, Jiv. at per low C. Hior.
in 1830 a joint-8tock bank was established in Leg. hom, with a rapital of $2,000,000$ lire ( $\mathbf{£ 6 6 , 6 6 6}$ sterling, taking the lira at 84.) In sharee of 1000 lire each. The whole of the capital le paid uph, and the reaponsihility is limited to the capital. The munugers have the power of issaing prom ssory notes to tife extent of $6,000,000$ lire. These notes, though recuivel liy the goveinment, are not lega? tender. The operations of the bank are confined to the disconnting bills of ex-
change not having more than four months to ran, and to the purchase and sale of foreign coins. The rate of discount is fixed at $\overline{6}$ per cent. The superintendence is veated in a director and eight regents, nominated by the shareholders; and the government appoints a com. missary and three censors (from among the share holders), who exercise the highest authority, to secure obedience to the statutes. An annual report and hal-ance-sheet ia produced, and is accessible to all shareholders. The maximum amount for which notes are issued is 2000 lire $=£ 60$ 13s. 4d. sterling; the lowest, 200 lire $=\mathbf{f 0 1 3 s , 4 d . ~ s t e r l i n g . ~ I t ~ i s ~ a ~ p r o t i t a b l e ~ e s t a b - ~}$ lishment ; its shares are st a considerable premium, and it hus every prospect of success.

Leipsic, or more correctly Leipzig, one of the four circles into. which Saxony is divided, comprises the north-west part of that kingdom, and is bounded on the north and west by Prassia, south by Saxe-Altenburg and the circle of Zwickau, and east by the circie of Dresden. Area, 1336 square miles. The country is generaliy level, and lies lower than any other part of Saxony. It is most elevsted in the south, where soine offisets of tho Eragebinge sppear, but do not attain any great height. Leipsic belongs to the basin of the Eibe, and is principally drained by its tributaries the Eister and Mulda. The soil ls fertile, und in general weil cultivated. The principal crop is corn. The rearing of catt!e, and especially of shee $j$ of a superior breed, is much attended to. Tobacco i extensively grown. There are no metals; but limestone, marble, potters' cluy, fullers' earth, and peat are shundant in various parts. The manufuctures in th.y circie are tiourishing, and include woolen cutton, and linen goods, and carthenware. Population (1855) $454,2162$.

Leipsic, or leipzig, the capital of the above circle, und the second city in the kingdom, is situate on an extensive and fertile pisin, on the White Fister, here joinet by the l'ieisse and I'unte, 72 miles W.N.W". of Dresden by ruilway. The fortilicutions which furmeriy surrounded the town have heen converted into beuntiful wulks and gariens. The houses are chiefiy old-fashioned stately buildings, frequently six stories in height, besides three or four additional ones in the pyramidial roof, and exhlbiting much carved masonry. The streets are narrow, and from the height of the houses, have rather a dingy appearance, but are well
paved anu clean. The suburbs, horcver, of which thery are four, are of recent date, and more regularly built.

Lelpale io connected hy railwaya with Dreaden, Magdeburg, Berlin, and Altenburg, and is the centre of a very extensive traie. The celehrated Leipsic fairs are held thrlce a year-on the lat of January; at Easter, und at Michuelmas. They nsualiy last for threa weeks, and are attended by merchants from all parta of Germany, Fingland, France, America, Russir, Italy, Greecen 'T' rkey, Persia, etc. The grods contprise all kinds of woolen, linen, and cotton stuff, silks, lace, hardware, Jewelry, watchea, toys, puper, books, lenther, etc. The value ot the goorls brought to these fains in 1855 was entimuted at about $\$ 55,000$,000. On these occustons the town j , mesants the greatest bustle and confusion; the streets and pquares are orcupled by temporary bootha, in adidition to the ordi. nary ehopa, while the population of the town is nearly dotbled. The Easter and Michaclmas fairs, particularly the fomuer, are famous for the vast numier of new publications brought there for sale. The Easter fair is attonded hy bookseliers from all parts of Germany, and even from other countries, sometimes to tbe number of 600. Prospectuses and specimens of new pubilications are brought bere for circulation, annual accounta are settled, and purchases made. In the Easter fair catalogne for 1856 the number of new works announcel'as published In Germany during the preceding year was 9540 , as forthcoming, 1171, Lei,sic ia also of considernble importance as a manofacturing town. It has large type-founderies, oil-milln, paper-milis, and manufactories of ailken goods, stockIngs, leather, hats, hardware, musical, oftical, and mathematical instruments. There are about 100 puls lishing eatablishments io the town; and in 180 sis there were 36 printing-offices, with 58 steam, and 164 hamd presser. Lelpsic was the acene of a trensendoun conflict on the 166 h, 17 th, and 1 tuth of Oetoler, 1813, between the allies under Prince Schwartzenberg, and the French, under Napolcon, in which the iatter were totally defented. See IIstony of France. IopaIation (1855), 69.986.-EE. B.

Leith, although an independent burgh, may in considered the sed-port of Filinburg, from which it is only about a $i$ le and a haif diatant. The Water of Leith, at its r al luence with the Firtin of Forth, divides the town ito two jarty, ealied, rempectivily, Nortit and Kouth ietts. The tirst mention male of Leith is in the charter of erection of liolyroorl Abley, founded by Davi!! I. in 1128 , where it is at $y$ led Inverleith. The magistrates of Filinhorg obsained a grant of the harbor and milis from Rolert I. in 1929, and they aulsequently purchased, from loggan of lestalrig, ail the other rlghts and priviinges.

The chief manufactures of faith are ropes, saililoth, locomotive engines and machinery, glass, soap, ale, refined sugar, and ollweed conkes. Iron and timber ship-binilding is also carried on to a conaiderabie extent. Varioun efforts have frim time to the hean made to wercome the uatural onstacles timat lay in the why of Leith as a shipping purt. In 1720 a dock was formed on the eant side of the river, and in 1777 a smail quay caljed the cinstom-house quay wan built. Betwecn iwn and $1 \times 5 t \overline{7}$, two wat docks wire consstructed, cach mensuring ofy fevt in length by now in width, and haviog a united area of about 10 acres. In 18:11 two great additional works were uniertaken, viz., an addition to the oldor eant pier of 500 yards, and the formution of a covering hulwark, by means of which the wator in the chammel was deepened about two feet. There were still, however, only. 17 feet of water over the lour at it mooths at high-water apring then, and no vessel of alove 400 tons could enter the harbor without lightuulug. Further inpirovements were rommenced in $1 \times 18$, and rompleted in 1855. These included the formation of the Victorin llock,
equal in extent to either of the others ; the new west. ern pler and low-water landling allp; the extension of the eastern pier 1000 feut seaward. The length of the east pler is now 3530 feet, and of the went, 8123 feet. They are uneurpassed ly may in tite kingdom; nuti, in addition to other important purposes, afliurd the means of a healthful and pleasant promenale. By meaos of these improvements, a depth of 26 feet water has been obtained in the new harbor at high-water opring, and of 21 feet at neap, tides. The Vletoria Dock hat 25 feet water at spring, and 20 feet at neap, tides, upon the gate $\varepsilon \pi^{\prime}$ and two feet nore within the dock; and the two ond docks have 18 fcet at upring, and 13 fect ut neap, tides. Vessels of upward of 2000 tons burden, of 320 feet in length, and 58 fect in breadih, can he accommodated in the Vietoria Dock. There are ulso five dry or graviag lueks at Leith, of the folowiag dimenalone:

 beell conceiv, of money, wi ered that at a a mann could ous nor so pri therefore, wit diate necessit$£ 453,403 ; 1855, £ 162,917$ ；und $1856, £ 498,172$ ．The vesseis registored as belonging to the port on 31st De－ rember，1855，were：wailing vessels，of and under 50 tons， 71 ；tomage， 2218 ；above 50 tons， 80 ；tonnage， 17,038 ；aterm vesyela of and under 50 tons，i ；ton－ na；e，289；above 50 tone， 23 ；tonnage，66ib？．The recent war with Rusaia has cheeked the increass in the trule that would otherwise have resulted from the greatly enlarged accommodation．－E．II．

Lemons（Ger．Limonen；Dı．Linoenen；Fr．Li－ mens，Citrons ；It．Limoni；Sp．Limenes；Port．Limbes； Rus，Limoni；Arab．Limin），tho frult of the lemon tree（Citrus medica，var．$\beta$, C．）．It is a native of Aso syria and Pergla，whence it was brought into Europe： first to Greece，and afterward to Italy．It is now cul－ tivated in Spain，Portugal，and France，and is not uncommon in our green－louses．Lemons are brougit to Fingland from Spisin，Portugal，and the Azores． packed in cheats，each lemon being acparately rolled in paper．The Spanish iemons are most esteemed． i．ike most of its tribe，the lemon produces noter cuiti－ vation a great number of varletics．Several are known in commerce．The principal are：the Wax Lemon（Citrus Limonum reviescum of Risso）；this is tho smeoth－pepled one，most generally found in the markets； jts rind is thick．The Bignette Lemon（Citrus J．i－ monum Bigneita of Risso）is a thinner－feeled fruit that the wax lemon，less oval in mhape，and more blunt at the point；the color of the rind is less clear，and is asually tinged with green．It is cultivated more largely than any other variety，as it yields a larger quatity of juice，and is a most abw diant licarer．The Custered Lemon（Citrus Limonur racemosum of Risso） is the leat oval of the imported lemons，lint the nipple－ like point is fully developed．The rind is thick，and bas a brigit yellow color．The pulp is less agreeahle than the varieties proviously mentloned．One or two other varietico，as the ：imperial and Gaeta lemons，are occasionally brought to this country；but not in any consiferabie quantities．
Lemon Juice，or Citric Acld（Ger．Zitzronen－ saft；Fr．Jus de limon；It．Agroo Sugo de limone；Sp． Jugo de limon），the liquor containei in the lemon．It may be preserved in botien for a considerable time by covering it with a thin stratum of nil：thus secured， great quantities of the juice are exported from Italy to differeat parts of the worhl ；from Turkey，alsu，where abondance of lemons are grown，it is n comsiterable article of exprort，particnlarly to Odessa．The diseos－ cry of the antiscorhutic intuence of iemon juice is one of the most valuable that has ever been mado． The scurvy，formerly oo fatal in ships making long vogages，in now almost wholly unknown：a result that is entirely to be ascribed to the regnar allowance of lemon juiee aerved out to the men．The juice is also frequently administered as a medicine，and is ex－ tensively used in the manufacture of punch．
Lemor Peel（Ger．Zitronenshalen，Limonschelles； Yr．Lames d＇cirorce de citron；It．Scorse de limome； $\mathrm{S}_{\mathrm{i}}$ ． Courtezas de rifra）．The outwarl rind of lemons is warm，aromatic，mad slightly bitter－qualities depend－ ing on the essentill oil it contains．It is turned to many usen，and，when well candied，constitutes a very good preserve．in llarinuloes，a liguenr，known under the ame of Ean de Barbale，is manufactured from lemon peel，which the inhahitants havo tho art of quesersing ia a manner peouliar to themselves．lhoth the liqueur and the conserve ueed to be in bigh repute，especially in France．
Lending－houges．That it should have once been conceived unlawful to exact interest for the loan of money，will not appear surprising when it is consid－ ered that at an early periol the occupations hy which a man could support his family were neithor so mumer－ ous nor so productive as in modern times．Aa money， therefore，was at that timo suaght to remove imme． diate necessity，those whomdanced it were influened
by benevolence and friendship．But on the extension of trade，arts，and manufaciures，money lent prodncer： much more than what waa adequate to the borrower＇s daily support，and therefore the lender might reason－ ably expect from him sume remuneration．Ts the Iending of money upon interest，according to th，earil ost accounts，succeoded the practice of estaluishing fands for tie relief of the needy；on condition that they could deposit any thing equal in value to double the enm borrowed，for which they were to pay no interest． But，as upon the one hand，the idea of exacting in－ terest for the loin of money was olious to the mem－ bers of the Catholic church in general，while，on the other，it appearod proper，and even neceesary，to pay interest for money to be employed in commerce，the pontiff themseives at length allowed the lending－ houses to take a moderate interest；and，in order not to alarm the prejulices of those to whom the measure whs obnoxinus，it was concealed under the name of being paid pro indemnitste，tho expression made use of in the papal bull．

It eppears that lending－houses，which gave money on receipit of pledges at a certain interest，are by no means of recent date；for many houses of this de－ acription，in Italy at least，were established in the 15th century，ly Marcus Ilononiensis，Michel a Carcano， Cherulinus Spoletanus，Antonins Vercellensis，Ber－ nardinus Tomitano and others．The lending－house at Perngia established hy Ibarnabs interamnensis was inspected in 1485 ly llernardinus，who angmented its capital，and in the sane year estallished one at Assisi， which was contirmed by Pope Innocent，and visited and improved by its founder in the year 1487．Ile likewise estabiished ono at Mantua after formidable opposition，having procurad for it the sanction of the Pope．The name percom niso fornded lending－houses at Florence，Parma，Chieli，and Piacenza，in doing which he was sometimes well received，while at others he frequently met with grent opposition．A house of this kind was established nt Padua in tho year 1491， and anotier at Ravenna，which were approved of and confirmed by Pope Alexander VI．

Long after the jeriod here referred to，lending－houses wore extablished at Liome anl Naples；that of the former city luving been opened in 1539，and that of the latter probaliy in the following year，A lending－ house was extublished at Nuremberg，in Germany， uhout 1618，tho inhabitants having ohtained from Italy the reguistions of different houses In order to select the best．In France，liugiand，and the Netheriands， lending－touses were lirst known under the denomina－ tion of lombards．Similar institutions were formed at Rrussels in 1619，at Antwerp in 1620，and at Ghent in 1622．Although su $h$ irouses must lie allowed to be of very con iderable utility under certain circumstances， especially when interest is not allowed to ho exorbitant， yet they were always odions in France．One was， however，estahlished at laris in 1626 in the reign of houlm Xill．，which the managers next year wero obliged to abundon．The mont de pieto in that city， wilich has sometimes fund in its possession forty caske fill uf gold wateles which hat been pledged，was ps． tablished ly royal authority in the year，1777，as wa learn from the Tibleau de Paris，publisised at Iianhuag in the year 1781．－Fi．A

Lengthening，in shif，building，the operation if cutting a mhijutown across the middle and adding a cec－ tain portion to her length．It is jerformed by sawing her jlanks asunder in different places of her lengtin on ench side of the midiship frame to prevent her from being too mucin weakened in one place．The two ends are then drawn apart to a limited distance，which must lee equal to the proposed addition of lengtit．An in－ termediate piece of timber is next udded to the keed， nfom which a sufficient number of timbers are erectel to till $u_{j}$ the vacaney produced by the separation．The two jarts of the kelson are afterward united ly an ad．
ditional piece, which is scored down upon the floor timbera, and as many beams as may lie neceaanry are fixed across the alilp in the new Interval. Finally, the planks of the sidn are prolonged so as to unite with each other, and those of the ceiling are rofitted in the same manner, by wilch the whole process is comploted.

Lentil, the seeda of Ervum leva (natural order l.e* gummone). The lentil la closely allied to the tare, and is probably the mont ancient of ull the food pro $u$. which man deriven from the pea-tribe. The re citt. tage in Gen, $\operatorname{mxv} .34$, is the anall lentil decortion 4 as it is sold at the preaent day in the bazasars of Indla. Pliny mentions two kinds of lentlls grown in Eigypt, one ronader and blacker than the other. These were, probably, only varistiea reaulting from cultivation. Three such are cultivated in France, where, as in most Roman Catholle couratries, this kind of pulee la extenslvely nsed during Lent ; to which season, as some ouppone, It givee ita narne. The lentil is a native of Europe, Asis, and northern Africs; or, at all evente, ic ls natnralized in those parts of the world. It is cultivated occuslonally in some parts of Fingland, but chlefly as a fodler plant. The ripe seeds are very nutritious, and contuin a large proportion of gluten. They are frequently imported from Alexandria for cattle-feeding; while, for culinary parposes, the larger und lightercolored varietien are linported from France und Germany, where considerable attention is paid to their cultivation and harvesting. In Euypt the lentil forms a large proportion of the general food of the inhalitants, and the haulm is used for packing purposes. The empirical preparation called lievalenta Arabica, has been proved to be nothing but the meal of decorticated lentiln; fool hy no meaus well adapted to nll constitutionk, especialiy those of infants. The quantity of starch in the lentil is very cousiderable; and, in addition to the gluten, renders this pulse one of the most nutritive of vegetahle food products. Lentils are, Lowever, heating if used much. The starch, according to Einhoff, is nearly one third lts weight.

Jetters of Credit. A letter of credit is an open letter of request, whereby one person requests some
othor person or persons to advance money or to give credit to a third person, named therein, for a certaln amount, and promieea that he will repay the mane to the person advancing the same, or accept lills ifawn upon himself for the like amount. It is called a gen. oral Jetter of credit when lt is addreased to all mer chants, or other persons in general, requesting such advance to athird person, and a apecial letter of credit when It Ia aullressed to a partlcular peraon by name, requenting him to make such advance to a third persun. If the letter of credit he of the latter sort, there doea not seem to be any doube that it la un svailable promisa in favor of the person to whom it ls addressed, and who makes the advance upon the faith thereof. But if the letter of credit lie general, it is a matter of some doult whether the writer ls lound to the jeraon maklng advance upon the atrength of the letter. The questlon does not appear to have been ever decideci in England, bat lt has aereral times been thoroughly discussed in the Suprame Conrt of the United Stites (Lauerason vs. Mason, 3 Cranch, 492 ; Adams vr. Jones, 12 Peters, 207). The doctrine wus maintained in these cares that the letter writer in bound positively and directly to any party making the advance upon the failth of the letter, not only where the letter purporta, on its face, to be addressed generally to any person or jersone whatsoever who should make the advance, but also in cases whery the letter is ad. dressed solely to the person to whom the adrance is to be made, and merely atates that the person signing the same will become his aurety for a certain amonnt, without naming any person to whom he will hecome security, if it is obviously to be used to procure credit froin aome thinl person, and the alvance is mude upon the falth of the letter by such thiril person.

Formerly, and up to the years $1825-1830$, remittances to India and China, for importations into the Inited States, were made almost exclusively in SpanIsh doliars. After that perion letters of credit were liberally issued by the Ibank of the Uolted States, on their Vurojean correspondents, in favor of Amprican merchants. This mode of remittance is made universully from the United States.

in New York it has been held (IIil's Rep., vol. v., 634 ) that letters of credit and commercial guaranties are not negotiable Instruments. In Cnmpbell' Rep., iv, 393, It was decided that a letter of credit, addrensed to any person who should make an advance upon the faith of the letter, is an available promise in faver of the person making the advance; and it is considered as available if it he a general letter of credit, in favor of any pereon who makes the advancement the faith of it. See articlea Banks, Bills of Exchiange, and Exchaxoe.

Levant, a name derived from the Italian word for the south-east, and applied in the middle ages to thint quarter of the Mediterranenn east of Cape Matapan, now generally applied to the coasts of Asia Minor, Syrla, etc. Levant, in geography, signifies any countfy to the eastward of us, or in the eastern part of any continent or country, or in that quarter where the sun nises.
Levee, an embankment on the margin of a river to confine it within its natural channel. The lower part of Louisiana, which has heen formed by encroack. ments upon the sen, is suljected to be inundated by the Mirsiseippl and its various branches for $n$ distance of mere than 800 miles. In order to protect the rich lamds en these rivers, mounds are thrown up of clay, eypress-logs, and green turf, sometimes to the height of 15 fect, with a breadth of 30 feet at the base. These, in the langunge of that part of the country, are ralled lerefs. They extend for hundreds of miles; and when the rivers are full, enltivated fields covered with rich crops, and studded with villnges, nre seen several feet below the river courses. The giving why of these levees, sometimes ocensioned by a auditen and violent pressure of the water, and sometimes by accidental perforations, ls called a rrecasse; French, a disruption.

Lew-Chew Islands. See Loo-Choo Imbavas.
Liberla, an independent Negro republic of west Africa, established 1823, extends nlong the const of Gainen, between Sierra Leone and Cape Mensurado, from the Sbebar Rlver en the north, to the Garawny on the south, a distance of 350 miles, with an average breadth of 80 miles. Population 1850, 250,000, of whem 10,000 are free blacks from the linited States, and the remainder aborigines, or captives roleased from slavers. The country has been nil purchased from time to time by the American Colonization Society, and its climate has inproved greatly by n systematic drainage, and clearance of woods. It is estimated that $2,000,000$ inhabitants of the interior now obtain suppilies of luropean goods from this republic and Cape i'nlmas. Lilieria, formerly a depentency of the United States of Amsrica, was recognized ns an independent republic in July, 1848. Cioverument vested in a preaident, vice-president, and a senato of 6 memiers, and $n$ house of representatives of 28 membert, clected by nll possessors of a renl estate to the value of 830 . About $\$ 0,000$ of the popuintion nre and to nase the English languago, and children are sent from the surrounding countries, 400 or 500 miles distant, to attend the schools of this State, which also supprorts two pulbic journals. The rea-port and capital, Monrovia, has a population of 9,000 .

The treaty concluded in 1852 between France and the repablic of Liberia was finally ratified in the year 1858. The independence of the republio was recognizod anccessively by the United Statea, England, Belgium, Prussia, and Braxil, from 1847 to 1854. To this list France has at last added her name by the late treaty. The original colony of Llberia was founded by the American Colonization Soclety, under the direction of its first President, Mr. Finley. It is situated at the northern extremity of the coast of Guinea, and is about 370 miles in length. Its capital, Monrovia, is on the former site of the principal slnve-market on this part of the African coast, and stands as a living protest against the slave-trade, in the abolition of which the colony has been largely instrumental. In Feliruary, 1820, the firat ship-load of emigrante left New York for the coast of Guines. They were 80 in number-forming 25 familieg-under the care of 8 citizens of the United States, a clergyman, a lawyer, and a physician. In 1847 Liberia emerged from its dependent colonlal condition, and became an independent State. In 1854 it contained a population of about 12,000 black colonlsts, chlefly Americans, and from 140,000 to 150,000 natlves, whose social and religioun condition is fsr in advance of that of their blood-thirsty and idolatrous ancestors.

The cnpital ls now a fourishing maritime city, hering a fort, a light-house, a commercial market, a amsll marine, and schools, churches, newspapers, charitable associations, and other institutions similar to those in the United States. The 6 th article of the constitution of the repnblic deciares that, Inasmuch as the essuntial object of its foundation was to open an asylum for the scattered and oppressed children of Africa, and, at the snme time, to regenerate the people of the vast continent of Africa, yet enveloped in the darkness of ignorance, noue hut persons of coler will be allowed to become citizens of the republlc.

Tho exports of Liberia, consisting chiefly of palmoil, logwood, and other dye-woods, which are transported to Eagland and the United States, amonnt to ahont $\$ 1,000,000$ nnnually. Hesides all the usual tropical productinns, it proluces Indina corn, rice, the potato, sugar, coffee, and cotton. Gold ls also found in considerable quantities. The cotton of Liberia, which has been highly approved in the Manchester market, has latoly attracted much attention, sad its probable auccessful cultivation promises to exert a most important influence on the futnre of the republic. A communleation from a highly reapectnhle and relinble source recently appeared in the National Intelligencer, the writer of winch gave a decided preference to the cotton of Literia over that of Brazil, in point of quality, chonpness of production, and facility of transportation to market. The subject deserves further and full investigntion. Cousidered simply as an experiment in practical benevolence, Llberia deserves und will recelve the protection of the great powers of the world. Whether or not it be destined, na sume have thought, to work out the solution of the vexed queation of slavery in the United States, it will yet gain the great glory of rodeeming from barbarism and idnatry many millions of the human raco.

Trade is the chosen employment of the great mass

Corporation
of the Liberians, and some of them have been decidedly auccessful in this vocation. It consists in the exchange of articles of Amerlcan or European manufacture for the natural products of the country, of which palm-oil, cam-wood, and ivory, are the principal artlcles. Cam-wood is a rich dye-wood, and It is brought to Monrovia on the shoulders of the natives from a great distance. It is worth, in the European and American markets, from $\$ 60$ to $\$ 80$ per ton. The ivory of this region does net form an important ltem of commerce. The Liberian merchants own a number of small vessels, bullt by themselves, and varying in eize from 10 or 15 to 40 or 50 tona. These are navigated by the Liberian sailers, and are constently engaged in bringing palm-oil to Monrovia, from whence it is again ahlpped in foreign vesseis for Liverpool or New York.

Under the general name of Liberia are comprehended the territories of the republic and of the Maryland colony, founded at Cape Palmas. The political jurisdiction of the republic extends from Sheivar, a point immedistely north of Gallenas, to Grand Sesters, giving a coast frontiar of 350 miles, or, including the Maryland colony, of 4.0 miles, running Into the interlor an average of 40 mileo ; the whole territory embracing an ares of upward of 14,000 equare miles. The jurisdiction of the Maryland celony extends from Grand Seaters to the River San Pedro, opening a cuast frontier of 120 milos. These territories have, of late years, been considerably extended by means of purchase, the most important addltion being the annexation of Gallense, formerly the point ut which the siave-trade was moet exteneively conducted. The Now Jersey Colonization Soclety, establighed in 1825, is said to have recently purchased from the natives 150,000 acres in the interior of Bussa conntry. The population in 1850, as estimated by the Rev. R. R. Gurley, who was sent out by goverament to olituia informativn in respect to Liberia, was, in the repnblic, emigrants, 6,000 ; natives, 140,000 to 200,000 . In the Maryland colony, emigrants, 9000 ; natives, 100 , 000. The independence of the repnblic of Liberia has heen recognized by France, Belgium, Pruasia, the Hanse Towns, and England; and, with the latter country, a treaty of peace, friendahip, and commerce, was concluded, Auguat 1, 1849. Treaties of friendehip, etc., have also been entered into with several tribes of the interior, containing atipulations for the abolition of the alave-trade, and including new territory within the political and judicial jarisdiction of the republic. The soll of the republic ls capable of Fielding, in the greatent abundance, the most valuable productlons of the tropics. Rice, cetton, the sugar-cane, and coffiee are classed among the staples of Liberia; and corn, cassada, yains, aweet potatoes, arrow-root, vegetables, and beans, of every variety, are among the productions of this region.

It is stated, on the suthority of persons thoroughly scquainted with the resourcea of this region of Africa, that no clirie or country In the world will bring coffee to higher perfection than Africa; and, whether introduced at an early period by the Portuguese and Spanlards, or whether it is a native of the country, it has propagated itseif aleag a great extent of the African cosst, without culture, for many ages. The convmerce of the republic with forelgn countries censista chlefly in the exportation of articles supplled by the native population, from the spontanaous growth of the country, auch as palm-oil, cam-wood, ivory, tortoleeshell, and gold, wheh are bartered for tobaceo, powder, muskets, runi, cotton goods, salt, soap, crockery, and iron wares, copper und lron rode, and American provisions. This commerce must necescarily expand with the growing development of the agricultural resources of the country, and the extenaion of the arta of civilization and industry, in a region so highly favored in soll and climate, and so eminentiy adapted
to the production of ao grest a variety of valusblo ataplea.

In a letter from the Secretary of the Treasury of Llberia, in Novamber, 1849, that gentiaman says, "The committee whase duty it was to furnish you with a report, have, I think, considerably underrated the annual exports from Liberia. It may be fairly atated at $\$ 500,000$, in Arrican commoditles (one fifth of which is $\$ 100,000$, , and our importa from the United States may be estimated at $\$ 150,000$. It is worthy of remark that, at present, it is only from the United States that our merchants import goods; and, further, that the kinds of goods most au. ${ }^{-1}$ ble for the African trade come from Enrope. The commerce of Llieriu is in its Infancy, but it advances rapidly. The two priucipal articles of trade are tobacco and powder; und no country can compete with the United Statee in these Items. Provielons, also, will eoon find an extensive market in Liberia; already the natives have commenced purchasing them, partlculariy bcef, pork, and aalt fish. I am not exaggerating when I asy thai the trade advances at least 50 per cent. annually. The Amerlcan cotton goods are, in quality, auperior to those brought from Europe; but there is a material difference in price. The European is the cheapest, and hence the inability of the American to compete with the European. In Liberla we attribute the difference la price to the low price of labor in Europe." Changes have occurred in the commercial movements of Liberia since the date of Mr. Gurley's report. Then, Liberia imported Engliah goods, though not directly from Engiand; but now, Importatione from England are very larga, while from the United States they are annually dlminiahing. It is estimuted that there are not lesa than 100 ahips, somo of them of 1000 tons' burden, regularly trading between Mritish ports und the coaat of Africa, while a regular line of steamers plies monthly between England and Liberia. Most of the supplies of every description are derived from Eagland; while the only artlcies going from the United Statea are powder, rum, flour, beef, pork, tebaceo, herringa, mackerel, and some few cotton goods; the latter article constantly diminishing. A rellalie statement, recently put forth, estinates the value of the average annual exports from all this region of western central Africa, to the European States, it some sis., 000,000 , and at a commercial excbange in faver of the European merchants of about 500 per cent. The commerce has been carrled on chiefly by natlve and Lilie rian traders from Liberian ports and ethers on th Gulf of Guinea, in European vesaels. France, Spain, Denmark, Pertugal, and Germany, have participated in this commerclul intercourse; but they are all surpassed by Great l3ritain.

From the "Annual Statements of the Trade and Navigation of the United Kingdom," it appears that the importa Into Groat Britain from the western cosst of Africa-the limits of which are not purticularly designated, theugh estimated to contain some 50,600 ,000 inhabitunts-conslat ehiefly of har-wood, cam-wood, ebony, guano, gum-animi, gum-copal, untauned hide, palen-oil, orchal, elephants' tecth, und bees'-wax-the heaviest item, by far, being palm-oil, which averaged nome $450,000 \mathrm{cwt}$. each of the five years cndiug with 1853 ; and amounted to $633,508 \mathrm{cwt}$., ut a "computed real value" of $£ 1,457,068$, in 1854. The aggregate value of inporta in 1854 is given efticially at $£ 1,528$, . 896. The exports, durlng the same year, the produce and manufactures of the United Kingloun, or of other countries, consisted of arnos and anmunition, wearing apparel, manufuctures of cotton, wool, silk, iron, brase, copper, steel, and glasa; salt, soaj, epirits, ataves, coala, hauda, unmunufuctured tobacco, carthenwara, und porcolain ; of which the heaviest items were cottons, gunpowder, guns, staves, and tubacto. Theaverage "declured value" of cottons thus expurted, during the six years ending 18004 , was $£ 18 \pi, 000 ;$ and
of tobacco, the average quantity was 2,$150 ; 000$ pounds. The computed real value of the $1,816,827$ pounds of tobacco exported in $\mathbf{1 8 5 4}$ is given at $£ 58,700$. The computed real vaiue of all forelgn exports to western Africa for the amme year was $£ 174,078$; and of all domeatlc exports, $£ 640,868$; belng more than that of 1858, snd donble that of 1852-the average value of each of the slx years ending with 1854, being ppward of $£ 460,000$.

It is thns seen that the trade of Great Britain with western Africa is rapidly incressing-amounting, in value, in 1854, to : $\mathbf{E 1}, 528,896$ imports: doniestle ex-
 (lmports and exports) $£ 2,849,887=\$ 11,749,185$. And this, Independently of the Britlsh colony of Slerra Leone, the trade of which amounted in 1854 to $\$ 1,421$,865 ; and of the Britleh posnessione on the Gold Coast and the River Gambla, smounting to $\$ 1,547,285$ more ; and of those at the Cape of Good Hope and south Africa, swelling the amount $\$ 8,383,090$ more ; mnking, in all, an nggregate of over $\$ 23,000,000$ In 1854 , for the western coast of Africa entire. The trade of the United States with west Africa, there are no means of determining-the values of Imports and exports being given in Commerce and Navigation for "Africa Generally." "Liberia," it is true, appears in the reports from 1849 to 1854 , incluaive, but with no figures to indicate trade, and but few to lndleate navigation; giving, it is inferred, the tonnage of colonization vessels only $\rightarrow$ none others, perhaps, taing engaged in the direct intercourse with Llberia. The following table showa the trade of the Unlted States with Africa during the seven years ending June 80, 1855 :

| Yasrs. | Exporth. | Imports. | Total. |
| :---: | :---: | :---: | :---: |
| 1849.............. | *708,411 | \%495,742 | 1,204,158 |
| 1850............... | 750,266 | 524,722 | 1,288,988 |
| 185t................ | 1,840,644 | 1,163,176 | 2,508,820 |
| 1852.............. | 1,246,141 | 1,057,657 | 2,308,798 |
| 1888............... | 1,610,839 | 1,202,956 | 2,818,819 |
| 1854............... | 1,804,972 | 1,386,564 | 3,191,582 |
| 1565. | 1,375,915 | 1,987,527 | 2,713,482 |

From this statement, it will be percelved that, although the figures for 1855 show a falllng off in that year, as compared with 1854 and 1853, yet that there is a regular and very rapld advance from 1849. Hut, whlle the average value of the trade of the United States wilth all Africa, during the six years ending 1854 , is found to be only $\$ 2,200,000$; that of Great Britian with west Africa, alone, for the same perlod, averaged $\$ 2,800,000$; and, Including all of her African colonles and possessions, together with the estimated value of her trade on the eastern cosst, it could not have averaged much lese than $\$ 20,000,000$.

In 1854, the trade of the Unlted States with "Arrica Generally" rose to $83,191,582$-a hlgher figure than before or since; at the same time, the trade of Great Britaln with weat Africa, only, amountert to $\$ 11,749,180$. The valne of the unmunufactured tobucco ulone-ilerived mostly from the Unlted Stutosnumounted to nearly $\$ 300,000$ of that totai ; and tine value of liritiah trade with "Afrlca Generally" was, as has heen seen, more than $\$ 28,000,000$, or nearly 8 times that of the United Stster,

The establishment of a llne of commercinl ateamers between the United Statea and the weatern coast of Africa has been urged, as tending greatly to the angmentution of our commerce with that country. The uses which such steamers might subserve have heen stated thun:-1. The transportation of free negroes from the United States to liheria, 2. The carrying of the mails. 3. The tranaportation of merchandize. 4. The carrying of pilgrims on their way to Mecea. 5. The carrying, on the return voyage, of the pllgrims, who now aseume the name of Hadjla; the certsin and expeditious transportation of the fruit and ether products of the Mediterranean; and the greater facility afforded to passengers from contrul Europe
to America, whose expense of travel will be greatly diminished by embarking at the south of France instead of at the usual western portis.

Palm-oll has become, withln a few years, a staple of export from Liberia. More than 80 vessels were frelghted with the article at her ports, in 1855 ; while three yerrs before, the quantity exported did not exceed 1000 gallons, at a cost of $\$ 1$ per gallon. The quantlity exported at the present time is, at least, 700,000 gallons; hut the price has fallen to 83 cents per gallon. The trade In ground-nuts, chiefly carried on with France, is becoming of grest importance. They are shipped in bags, and, when ground, supply a wholesome subatitute for olive-oil. Sugar, cotton, and coffee are, however, viewed as the grest natural staples of product for the coll and climate of Liberia. The import duties in the republic of Liberta are 6 per cent. ad calorem.

From recent intimations, it is not improbsble that the country east of Liberia may shortly be more extensively explored, with a view of plantligg new eettlements in the interior of the present coast line, whlch it is hoped will be beyond the reach of malaria. Should such an enterprise be successfully carried out, the imunense natural resources of that fertile region would soon attract forelgn commerce, and thne the philanthropic labors of those engnged in the movement would be greatly facllitated.-Com. Rel., U. S.

There can be no question that vast commerclal advantages would accrue to the commerce of western Africa, If the Niger and Tachadda, the natural highways Into the interior to Timbuctoo and other large cities of the continent, were effectually opened and maintained so for a few years. The last expedition is a proof that, under judlclous management, and at the proper eeason, there is no greater danger to health in a navigation of those streams, than of other rivers in Brszil and our sonthern Statee. While the British export trade with different parts of the world has only increased in the last 20 years 50 per cent., the export trade of western Africa has more than doubled. Britieh manufuctures are malnly dependent on that quarter for eeveral artlcles, especially vegetable oils and ivory. The yearly export of palm-oll has risen to the value of nearly $\mathbf{£ 2 , 0 0 0 , 0 0 0}$ sterling, or $\$ 10,000,000$. Ground-nuts, for oil, are a leading artlcle of production. Dyewoods are important. Of the whole imports of ivory into Great Britain, Africa supplies one half. When it is noticed what has been done in stimulating the cultivation of coffee, sugar, spices, and other staples in Liberin, there is no reason why a great stlmnlus may not be given also to the countries bordering on the rivere of the interior.

The following returns to Parllament illustrate the increase of British exports to the west coast of Africa, and of Imports from the ame region :

| Yentr. | Expmoris. | Impors. | Total. |
| :---: | :---: | :---: | :---: |
| 1851. | £680,429 | (1005,958 | E1,24, 857 |
| 1851... | 6,54,548 | 794,8t0 | 1,440,353 |
| 1552.. | 543,725 | 707,024 | 1,241,349 |
| 1853. | 901,402 | 749,873 | 1,059,775 |
| 1854. | 958,409 | 905,634 | 1,981,449 |

This is indepondent of the British colonies of Sierra Leone, the trade of which amounted $\ln 1854$ to 61,421 ,865 , and of the 13ritish posseasiona on the Gold Coast and the River Gambia, amounting to $\$ 1,5 \cdot 17,285$ more, rid of those at the Cape of Good Hope and in aouth Africa, swelling the amonnt $48,888,090$ more; making In all an aggregnte of over $\$ 28,000,000 \ln 1851$, for the western coast of Africa ontire.

An American steam line to Africa would be a pioneer of civilination. It wouid afford a rapid cominunication with the interesting republic of Liseria, whioh Is proving the capacity of the Christianized and Americanized African for relf-government, accordling to An-glo-Saxon idear and institutions. It could not fail to promote powerfnlly tho prosperity of that young com-
monwealth. It would practically bridge the Atlantio in a new direction, and connect together the most progreasive and the most atationary of the continenta. It would aoon be an effectual ald in that African exodus from the eoil of the new world to the ancient fatherland of the race, of which we now see the falnt beginninga. Ite realization wowld involve more widereaching and beneficial reaults than even its warment friende have ever hoped.
Libraries. In a volume on Public Llbrarios of the United States, pablished by the Smithsonian Institution, the following atatistice appear, obtalned for a large part from repliea to circulars, and therefore less full than those of the censua:

Life-Premervers. Although it too frequently happens that an accident which materially endangers the life of an individual, deprives him, in the meantime, of that prevence of mind which alone would onable him to take proper measures for his safety ; yet to have meditated, in an interval of leisure, upon the best method of proceeding in case of emergency, must teand groatly to diminioh the embarrasement and confuslon that commonly accompany the accident, even If it ahould not be thought necessary to provide any particular apparatue for the purpose of eacaping the dangor. There aro also many waye in whlch those who are not immediately $\ln$ volved in the disattar may contribute to the preservation of life, whether actuated by intereat, or by humanity only ; and the modea of rolief will therefore be naturally divided into the internal and the external, whether relating to fires or to shipurecks.
Internal Fire-Escapes.-Whenever a family establishes itaelf in a residence not detached from others, it becomes of importance to ascertain what facilities the houes afforde for asceading to the roof, and for passing to those of the neighboring houses. It is scarcely possible that a conflagration ohould extend at once to the contiguous honses on each side, before the Inhabltants of the house in question have had time to eacape. But in a detached house, if there are not two or more atair-cases remote from each other, and even in a house contignous to othera, when there is no facility of communjeating by the roof, it becomes highly ex. pedient to provide some internal meana of escaping through the windows, in case of fire, and to have on every floor a atrong rope, with a hook or a loop at the end, by which it may be fustened to a bed-post, so us to enablo an active person to descend by its help out of the window, finding from time to time a partial footing in tho inequullities of the wall. This process will be greatly facilitated by having the rope knotted at intervala of about a fort throughout its length; the knots being neariy as convenient as the blocks or clips, that are sometimes made for the purpose of retarding the deacent, by holding them, and regulating the friction by the preasure of the hand; unless the clip be attached to a strong cross-bar, on which a person may ait, while he reguiates the position of the ciip by its handles, aliows himself to descond with more or less velocity at pleasure.-Emerson's Mechanics, flys. 228, 229 ; Levrolin's Thaatrum Muchinarium, plate liv.

External Means of Escape from Fire,-The external means to be employed in cases of conflagration must be provided ly the managers of fire-ofices, wr by other puhlic officers; and every ingenious workman whom they may employ will be able at his leisure, to deviso such apparatus as he can the most convenientiy execute, and to give it a fuli trial in tho alsence of all danger; it will therefore only be advisabio that he should comparo for hinnelf the particalar inventions which have been auggented for this purpose, and tint he ahould choose from among them such as he thinks most iikely to do hiin credit; and he may, indeed, very passibl. find means of improving on any of tien. In Lellpold's Theatrum Machinarium (piates Siv. iv.), we find the representation of a cimir calcuinted to be drawn up or down ly mouns of puileys. Mr. Varcourt oltainel, In 1761, the approbation of the Parisian Acaleny of Sciences for hia invention of a holiow mast, fixed in a wagon, and supporting a atnge, with the means of ass conding and dencending.-Ilist., i. 158. In the beginning of the present centary, a lireescupe of Mr. Aulibert was approved iy the larisian Institute.-Mem. Inet., iv. A committee was also appointed for examining soveral similar inventions at the Lyceum of Arts, and a nedal was awarded ly it to Mr. Daujan, for his apparatus, whish consinta of a phatform carried on wheels, sujported by threo frumes, with brass wires, on which boxes are mado to sildo up and down for the conveyance of persous or furniture.-Annalea des Arls.

Repertory, li., vol. i., p. 489. Mr. Colling's invention of plpes roised by ropes, and affording a centre to a long lever, is described in the fourth volume of the American Transactions, and in the Repertory, vol. xv., p. 85. In the 81st volnme of the Transactions of the Society of Arta for 1818, p. 244, wo have an acconnt of a fire-escape Invented by Mr. Adam Young, for which he recelved a medal from the society. It appears to constitute by far the most portable of ladders, consisting of cross bars or rounds connected by ropes, snd bsving their enda fitted together, at as to form a pole, which is readily olevated to the window; and the rounds being separated, and the hooks at the end properly fixed to the window-frame, the whole forms itself into a very convenient Isdder of a mixed atructure. The 34th volume, for 1816, p. 227, contains a descripthon of Mr. Braby'a fire-escape, conslating of a cis made to slide on a strip of plank fixed to a pule, and governed by a rope, which is cased with Iron, to protect lt in cas. of necessity, from the effect of the fire.

A great many other forms of fre-escapes might be noticed, for it is one of those subjecte which readily appeal to the ingenious mechanic in a large city where firos are numerous; and every form of fire-escape must at times fail. Hence, there has been a sort of competition among the uneducated inventora, who have displayed aome mechanical ingenulty, but have not, so far as we are aware, developed any new principle.

Internal Means of Escape from Shipwreck,-The means of escaping from shipwreck may be similarly divided into internal and external, or Into the precauthens to be taken by the ship's company, and the measures to be adopted by persons on shore. The Internal means depend elther on enabling the Individuals to swim or fiost, or establlshing a connection with the shore by ropes • and of the former, we may firet consider those $w^{\prime}$.ch require no particular proparation before the occurrence of the accident thst calls them into action, and which are, therefure, the most nulversally spplicable. Of such expedients, the most effectual sppear to be thoee which depend on the employment of empty water-caska for assisting the ship's company to drift on ahore. 1. A peper on tho arrangement of water-casks, to aerve as floats in case of shipwreck, appears in the publlcations of the Soclety for the itmprovement of Naval Architecture, dated in 1796 (vol. li., p. 51). 2. In 1818, Mr. Grunt of 11ideford oltained a gold medal from the Soclety of Arts, for the invention of a life-preserver, consisting of a 36 gallon cask, with some iron ballast fixed on a wooden bed, and lashed to the cask, und with ropes round it for the men to hold; and it was found tiat 10 men were supported by it with convenience in tolerably smooth water, the bung of the cask being well sccured by cork (vol. xxxvl., p. 6i3). The ballast cuuld be of very little use, and a cask simply tied round with a rope, like a common parcel, would probably answer the purpose equaliy well. It would, indeed, be prudent for every ship in a storm, on a lee shore, to have a few of her casks well einptied and stopped, and tied in this manner, before the setual occurrence of imminent danger. 3. In 37th volume of the Trousactions of the Society (p. 110), there is an account of Mr. Cook's life-raft, conalsting of a square frame with canves nalled across it, nupported by a cask at each corner, for which the gold medal whis voted to him. 4. It is followed by a description of Lieutenant Roliser's life-raft (p. 11i), which obtuined a similar compilment. This raft has the advantage of requiring only ouch materials as are usually found on board of every ship; capstan-hars, boat-masts, yards, or any other spars of moderate dimensions, which are tied together mo as tn make a sort of wagon Prume, with a large cusk fixed on esch side; it ,upears to affurl a very convenient eupport to the men, bat it can scarcely
poseess any great atrength for resleting the force of the breakers.

Mr. J. Bremer, a clergyman in the Orkneys, had recelved a medal from the Society in 1810; for hia method of converting any shlp's bost into a llfe-boat by putting into it 3 or 4 casks lashed to the keel, which is to have ring-bolts fixed in it for recelving the ropea by which the casks are fantened; he gives partlcular directions for making sll the necessary arrangements, in the 28th volume of the Transactions ( p .184 ); he partlcularly adviees that no use should be made of the natural buoyancy of the cavity of the boat, but that the bottom shonld be perforsted without heaitatlon; wherever the hole would afford any additional facllity for fixing a rope. Captain Manby's jolly-boat, fitted es a life-boet, "at the expense of $\pm 3$, " seems to be comprehended among those preparatione which are to be made previously to the voyage. The buckling a soldier's canteen on his breast as an asslatance to ensble him to float, belonge to those temporary expedlents which may occasionally be employed with advantage. Tying a hat $\ln$ a pocket-handkerchief, and holding it as a float, has been recommended by Mr. Dawson In the Philosophical Magazine (rol. xx., p. 362); he advises that the crown of the hat should be held downward, and observes that a stick may be employed, to enable us to use 2 or 4 hats at once; but this method can only be a.oopted when the accident occurs in very still water.

In China, a frame of bamboo surrounding the person is used for a float, and the lightness and strength of this substance must well sdapt it for the purpose ; sometimes also a gourd is tied to a child, to secure its floating in case of accident. The inflated goat-skins used from time immemorial by the Arabs, or the aealskins employed by the Chillans, have the disadvantage of being easily rent or torn by a rock or a spar; an oljection which ls also more or less applicable to all substances containing sir; for example, to the sirjackots described in Leupold's Theatrum Pontificum, published about 1724. A flout of a semlcirculur form was recommended by Ozanem, the author of the i.ecreations; and Bachstrom, in his Art of Suimming, proposed to float a troop of cavalry, by tixing cork to the saddles. The cork jucket of Gelacy is described in the History of the Parisian Academy of Sciences for 1757, and Lachupelie's Scaphander, which is considered an improvement on it, in the volume for 1765. In the year 1764 the attention of the British public was particularly called to the flosting powers of cork, by some experiments which were made with cork jackets on the Thanes, together with some comparative cxperiments on sir-jackets ; and Dr. Wilkinsen, in the Philusophical Transactions for 1765 , describes some experiments by which he asc rtulned that about a pound of cork was amply aufficient to enable a man of ordinary slze and make to tloat without effort. It is alinost superHuous to enumerate the multitude of trifling variatione that have been made in the arrangements of cork jackets and air-jackets, apparently for the purpose of exciting a momentary interest, though possibly from the best motives. Mr. Ilosquet advised a hug of cork shaviugs to be kept in readiness by each person; the Seaman's f'riend was composed of two pieces of cork, united by straps; the Collinetta was a hollow vessel of copper, divided into cells; п " marine spencer" has been deseribed by Mr. Spencer, in the 16 th volume of the Philosophical Mugusiue, conslsting of a number of old corks, arrunged so as to form a girdle ; und in 2806, Mr. T. C. Daniel olitained a gold medal from the Society of Arts, for the invention of an apparatus of waterproof leather, surrounting the body, which, according to the testiinonials ho produced, had naved the lives of some permons who had been suiling in a pleasure-bout on a river. In smooth water, it has been suggested that throwing a foot-bali, with a emall weight tied to it, to the person inmersed, would often afford sudicient asslistance;
and, with reapect to floating, there is no donbt that any of the aseistances which have been proposed would be sufficlent if thoy were at hend; but there is another object, to which it is necossary to attend, in cold, and even in temperate climaten, that of supporting a temperature compatible with life and health, if the immersion is likely to be of long duration ; and an additional provision of worntel etockings, jackets, and trowsers, will be almost as eseentlial, in euch cases, as the means of obtaining buoyancy.

The Invention of Indin rubler cloth led to the introluction of infated belts, the advantagee of which, compared with cork, and other forms of belt, are their greater buoyancy compared with their hulk, and their greater portability, for, when emptied of air, they can be folded up, and packed into a small apace. The objections to thom are their liability to get panctured or torn, and to decay, from being put away damp; the metal valves by which ther are inflated mny also get out of order; daring the hurry and confusion of a wreck they are liable to be only partially inflated, and the valves to be oniy half ecrewed up, eo as to allow of the eacape of the inclosed air. Commander J. R. Ward, R.N., inepector of life-boats to the Natlonal Life-Boat Institution, has invented a lelt with 4 compartments, which admit of being separately inflated, thus mitigating the danger arising from puncture or Injury to the infating valves; it has a buoyancy equal to 30 lbs ., and should two of its compartments be diaabled, the remaining two would be sufficient to tiont the wentor.

For the rough purposes of ordinary boat-work, Commander Ward insists on the advantages of cork as a material for life-belts, and he has invented a form of belt, which has been selected by the National Li'sBoat Institution for the use of its life-boats' crews. The buoyant power of each belt is from 20 to 24 lbs., tho cork is uncovered, so thint its quality can be seen, and it is divided into numerous narrow piecen, each of which is sewed separately to a strong linen or duck beit, which covers the body from the arm-jits to helow the hips. The pieces of cork are distributed in two rows, one alove, the other below the waist, and the belt is secured closely about the booly hy means of strings passed round the waist, hetween the two row's of cork. It is further secured thy other striags, crusped over the shouiders. By this arrangement the trank of the borly is enveioped in cork, attached so as to be quite liexible, and to allow of the usual movements of the lody without inconvenience, while it protects the body against injury from blowa, and is a warin covering $\ln$ cold weather.
Various forms of buoyant mintresses have been contrived by Mr. Laurie and others. As mannfactared by Mr. Silver, numerous waterproof tabes are partly diatended with horse-bnir, woolen flocks, or cocon-nut filbes, mo that, should one or more of the tulies fail, the others may suffice to sustain the required weight on the water. The tules are made up into mattresses, pilluws, and floats-the last to be placed under the thwarts of boats. A mattress weighing 17 lbs , sustains in the water 2 kr 4 lhs . A piliow eustaina 28 lbs. A mattress for enigrunt vessela, sold at 9s., was proved at the (ireat Exxiilition. It sustained 961 lbs . in the water during 5 days, without being injured. Floating mattreases are alwo male, fllied with cork niavings. In the Great Exinitition, Mr. Khind had various modeis of deck neats and lienches for stonmere, so constructed as to be readily formenl into rufts, each of which was capable of sustaining 8 jpersons.

For the second olject which in desirable to a ship in distress, that of oittaining a sufe comununkeation with the nhore, it has been nauai of late years to rely principaliy on the humano excrtions of persons who may be on the coast, and who may have made preparationa for thin purpose; and with this view, some instructions for properly co-operating in the mec.sures to be
adopted with Captain Manby's apparatus have been liberally distributed to all ohipe when they received thelr papers from eome of the British cnatom-honsee. Thore are, bowever, some elmple expedients which may be adopted for this parpose by persons on board of the ohip; for example, the making a kite with a pocket-handkerchlef atretched over a hoop, and caua ing it to carry a cord to the lee shore, by means of whioh a stronger line, and at lagt a hawser, muy be drawn by persons standing on the teach. A line may also sometimes be carried on shore by a caak, aliowed to drift before the wind; and a bag has been recommended to be attached to such a cask, or to a buoy, in orler to act as a esil, and to insure its crossing the surf. Mr. Cleghorn was also rewarded, in 1814, by the Society of Arts, for tho invention of a buoyant line, having a heart of cork, to obviate the inconvenience which would arise from Its sinking and being dragged on the stones under the breakers; but he e'rserves, that in heavy storms there is generally a current along shore which renders the method ulmost impractlcable. (Transactions, xxxii., p. 181.) A Mr. Wheatley assures us, in Captain Mnnhy's Essoy, that hie own life, and those of 8 other persons, were saved, in 1701, by a lead line, which was carried on ahore by a Newfoundland dog that be happened to have on board, when two good swimmers had been drowned in the attempt to swim on ehore. It had occurred to Lieutenant Bell, in 1791, that a rope might be thrown from a ahip which had atruck, by meana of a mortar carrying a heavy ahot, and upon the principle of the gun harpoon; and he showed the practicaLility of the suggestion by an actual oxperiment, in which a deep-aen line was carried to a distance of about 400 yarls. (Trans. Soc. Arts, xxv., p. 136.) He recommended that every ship should be provided with a mortar capable of carrying euch a shot, and oliserved that it might be placed on a coil of rope to be fired, instend of a carriage. The line was to be coiled on handspikes, which were to be drawn out hefore the mortar was fred. In 1792 he received a premiuna of 50 guineas from the Society of Arts (Transactiom, x., p. 204); and he olitained his promotion in the Ordnance as an acknowledgment of his merits. The shot was to weigh about 60 ibs . or more, and the mortar 5 or 6 cwt . The experiments of the French artiilery at Lafere werv subequent to thees of Mi. lieil, though they hive sometimes been quoted as the first of the kind.

It has, however, generaily been thougit impracticable to manage $n$ mortar with effect under the circumatances of actual shipwreck; and Mr. Trengrouse has preferred $n$ rocket, as more eas!! fred, and ns having a sinaller Initial velocity than a ahot, ao that the rope wouid be jess in dinnger of being broken by the inpulse. He found that a rocket of 8 oz , carried a mackerel line 180) yards, and a 1 lb . rocket 212; and in mome experiments made under the inspection of the Society of Arts, a rocket $1+$ inch in diameter carried a cord acroas the Serpentine Miver in Hiyie Park. Tho masket is provided with a valve, to prevent the escape of the materials of the rocket; and it is to lefired with a little powder, without wadding. The whole apparstus is packed in in chost, containing from 8 to 12 rockcta, the muaket, is life-spencer, a chair to traverse on a rope, in ennvas bag, and a ball of wood to throw to a person swimming. Mr. Trengrouse was complimented with a medal from tise Society of Arts in 1820. (Vol. xxxviii., p. 161.)
birternal Means of kirape from Shipertck.-The means to the employed by pereons on sthore, in cases of shipwreck, depend either in projecting $n$ iine over the elilip, or on the nese of a life-loont. Mr. Hell ind curmorily obenerved that a ilne might the curried over a ship from the abore by meane of his mortar; but for the artuai execution of this proposal, in n variety of casen, we are indebted to the meritorious excrtions of

Captain G. W. Manby, whose apparatus, according to the report of a committee of the Hones of Commons, dated in Mareh 1810, appears " to be admirably adapted to lta parpose, and to have been attended wlth the fullest success in almost every Instance." In consequence of this report, Captaln Manby was thought worthy of a parliamentary reward; and he afterward published a description of hls inventions, under the title of "An Eseay on the Preservation of Shipwrecked Persons," 8vo, London, 1812. He had prevlously received a gold medal from the Society of Arts in 1808 (Transactions, xxvi., p. 209). Hla auccess makea lt expedient to extract from hla esazy a detailed deacription of the apparatne; and It wIll be easy to make It somewhat more intelligible by a sllght alteration of the order of arrangement: "The method of affixing a rope to a shot, for the purpose of affecting communication, when projected from a plece of ordnance over a atranded veasel, was at length sacceeded in, by Introducing a jaggel plece of Iron, with an eye at the top, into a sheil, sud securing it by filling the hollow ephere with boiiing lead; and In another way, by drilling a hole through a solld ball, and passing a plece of iron with an eyo to It, as before described, to the bottom, where It shouid be well secured by riveting. To produce the means of connecting a rope to a shot, and prevent its being hurnt, and rendering It 'irresistible' to the powerful inflammation of gunpowder, was the labor of infinite time, and the number of experiments to accomplish it are numerous. Chains in every variety of form, and great strength, breakling, proved that it required not only an elastic, but a closer connected body. At length, some stoot platted hide (lig. 2), woven extromely close to the eye of the shot, about two feet in longth beyond the muzzle of the piece, and with a loop at the end fo recelve the rope, happily effected it.

"This method is certainly desirable, as a rope may immediatcly [as] it is required, be affixed to the loop, and applied in eervice. The form of the phatted hide may likewise be woven by twisting it in the manner that the lashes of whips or rope are spun. There is another method, by passlng the rope through a case of leather, taking the greatest care that it is so well secured at the eye of the shot as to leave no room for the slightest play, as is represented by the annexed barbed shot (fig. 2).

FIg. 9.
When the crew of the distressed vessel are incapable of availing themsoives of the benefits arising from communication, they having previously lashed themselves in the rigging to prevent being ewept away by the sea, which is repeatedly breaking over them, and when, from long fatigue and the eeverity of the storm (on which occasions it too frequently occ rs), they totally lose the use of thelr limbs, and are rendered fincapable of assisting themselves in the alightest degree--the sdvantages of this ahot are, that, on its belng projected over the vessel, and the people of the shore hauling it in; it firmly eecures ltself on some part of the wreck or rigging, by which a boat can le hauled to the rollef of the distreased objects; and by the counterbarbs it is rendered impossilile [that it should] give up its hoid, or alip, while that part of the wreck romains to which it has secured ituelf.
"Among the many that have been asaved by this shot, the following are teatimonials of a few of the cases: 'Wo, the crew of the brig Nancy of Sunderland, do bereby certify that we were on board the sald vesael when ehe was stranded on the beach of Yarmonth, on Friday mornlng, the 15 th of December, 1809, and compelled to secure ourselves in the rigging to prevent being swopt away, the esa running so high over the veesel. And we do further declare and certlfy that Captaln Manby, firing a rope with a hooked ahot, ascurely holding on to the wreok, enabled a boat to be hauled from the shore over the surf to our rellef, otherwise we must inevitsbly have perished.' This certlficate is atteated by six signaturee.
"Facilitating communicatlon is at all timea of lmportance; but when the stranded vessel is in momentary danger of going to pleces, this point becomes a consideration of extreme urgency. I feel a persuasion that this particular service can only be carried Into effect by a emall and light plece of ordnance, the range of which is consequently very inconsidorsble, when compared with that of a large and heavior piece, as it is weight alone that conveys the rope. In order, therefore, to lncrease the powers of shot projected from a emall mortar, its natural form must be varied, so as to give it additlonai 'preponderane.' The annexed ehape, in the form of a pear (fig. 3), has been used with the greatest euccess; for, by
 the increased weight, the shot's momentum and power
over the line ls in consequence considerably augmented In its range; and whon made to fit the piece as close as possible, a great increase of velocity is likewise produced from the decrease of windage.
"Portability in the construction of a piace or ordnance (as just described) la the very ossence of this service; and communlcation with the stranded vossel or wreck may be effeeted wlth a cord, by which cord a rope can be conveyed, and by that rope a hawser or cable sent to the distressed vessel; for this purpose the annexed was constructed (fig. 4). A person completely equipped with every necessary apparatus to effect communication with a vessol driven on a lee-shore * *

Fig. 4.
the horseman, fully equipped, traveled a mile and a hulf, the howitacr was dismounted, and the line projected 153 yards, in six minutes.
"Tho application of a sinall piece of ordnance likewise offers particular advantages, capable of being employed from a lost to go to the assiatance of a vessel grounded on a bar when running for a harbor, the necessity of which repeatedly oceurs, and was twico witnessed at Blakeney, on the 10th of Novomber, 1810, when boats endeavored to go to their relief, and were enabled to get out of the harior on tho ebb tido, within 20 yards of the vessel; but It was found impossible to approsch them nearor. Ilad auch boats been provided with a piece of this doseriptlon, and tho same firmly secured on a atoat piece of plank, by the holes left at each corner of the iron bed, they' might have projected a small rope, coiled in a crate or hasket, made to the form of the bow of the boat; and the persons in the boat, so provided, would not have remuined the distressod apectators of the untimely end of their fellowcreatures, without being ablo to afforl them the smallost relief, although so little was lien wanting for that desirable parpose.
"Although alvantages have been pointed out in the use of those small mortars, it is necessary to be kept in remembrance that they are produced for particular eervices ; as the nature of the coust, nud circumstances attending the distreased vessels, will direct what pieco lo best adapted to the undertaking. To onailo
the mind to form a judgment of what can be effected by other pieces, the following are the minutes of ex. periments made with a 5 -inch brass mortar, stating the quantity of powder used, and distance the ropes were projected against a strong wiad, at the angle of $17^{\circ}$ (elevation): wright of the mortar and bed about 800 lbas:

| Ounces or powder. | Tarde of Ineh and half rope, |  |  | Yarda of deepees line. 148 |
| :---: | :---: | :---: | :---: | :---: |
| ${ }_{4}$ |  | 184 | . |  |
| 6 |  | 150 |  | 182 |
| 8 | ......... | 184 | ......... | 915 |

| 898 | 479 | 838 |

" Directions for using the Apparatus.- When the rope (which should be pliunt and well atretched) is brought on the beach or cliff opposite to the atranded vessel, the most oven spot, and free from projecting stones, should be selected to lay it on, and great care be taken that no two parts of it whatever overlay or even touch each other; nor nust it be laid in longer lengths than of two yards. But to project $n$ small line or cord, it will be necessary, If it is reqnired to contract the faker to half a yard at moat, to evoid the jerk received at the end of each right line. The best method, with such a description of cord, is to lay it on the ground in the most short and irregular winding, to relieve it from the powerful impuise. To prove the eflivet of tise impulso on a rope, if it is faked in lengthe of $\mathbf{1 0}$ or 15 yerds, it will break each time, as it then becomes a most powerful pendulum. These precautions aro absolutely necessary to the enccess of the service.
"The following has, after various trials, been found a
 certain method of laying the rope, and placiag it into compart. ments." ( 'rench Faking, fig. 5 ) "A particular attention to this mode wiil never fuil, with a good rope, when the impedimentsare removed that might otherwise obstruct its rapid fight. Its advantages are, that it will allow the eye rapidly (yst correctly, just before firing, which is absolutely necessary) to jasa over the different compartments, and at once discover if any fake has been displaced by the atorm, or by any other casuaity or accident come in contact with another part, which would deatroy its application by the ropo breaking.
"It may likewise be coiled in the manner used in the whale fishery, whale lair (fig. 6); and in the method called chain fuling (fig. 7).

Fig. a.

Fig. 7.
place 1 , but from the great anxiety of mind natural en these occasicna, where the liven of follow-creatures are Ilterally dependent on the correctness with which the rope la laid; it is therefore extremely difficult, in a moment of agitation, to determine whether any overlay has taken place, an error that would infuliibly deatroy avery endeavor, and occaalon even the fatea of those whof lives we might be exerting ouraelves to prenerve. Could permons in the perfurmance of th ${ }^{t_{3}}$ service bo alwaye collected, the two latter methods would have a decided advantage over the firat mode of faking, they being laid in a much less space of time.
"As all these methods of laylag the rope occupy time to place it with the care necessary ; and as it has repeatediy happened that a vessel very soon after grounding, has gone to piecen, and all hands perished; it was necessary to produce a method of arranging the rope, so that it couid be immediately projected as soon as it arrived at the apot ; and none proved so effectual as when brought ready in a basket (fg. 8.) In this

Fig. 8.
case, the rope should be most carefully haid in alternate tiers or fakes, no part of it overiaying; and it shon: be well secured down, that in traveling it be not displaced; lint, above all, no mistake must happen in placing the basket properly. For example, that the end of the basket, from which the shot hange in the above figure, should be previously marked, and mast be placed toward the sea or wreck, that the rope be delivered freely, aud without any chance of entangiement. It will be scurcely necessary to add, there wil! be several tiers of the rope when laid. The utmost care and attention are required in lnying the rope in tiera with strict regularity, to prevent entangiement.
"The next is the application of the mortar. If the wind is sideways to the shore, it nust be pointed sufficiently to windward to allow for the slack of the rope ligitting on the olsject, as the rope wili, of course, be considerably borne to leeward by the effect of a strong wind, and by its being luid at a low elevation insures the ropo falling against the weathermost jart of the rigging. While this service is performing, great care should be taken to keep the mortar dry ; nor should it he loaded until every thing is ready ; when that is done, it shouli be primed; but as it would be impossible to do it with loose powder in a storm, a tube is constructed in the simpiest manner of common writing paper (the onter edge being cemented with a littic gum) in this form (fig. 9). It is filied with meai gunpowider, made into paste with spirit of wine; when in a stute of drying, ran a needle through the centre, and take care the hole is left open, for, on the tuie leing inflamed, a strenm of fire darts through the aperture with such force as to perforate the cartridge. The mortar should then instantly be fired; Fig. 9. and in order to lessen a difficuity that has often occurred in performing this service, a pistol may be usel, having a tin box over the lock, to exclude the effect of wind or rain on tise priming; und the muzzie ieing cut [obliquily], dilates tha infummation, so as to require but ittie exactness in the direc-
It is, however, necessary to add, that great atten- |tion of the alu. tion is required in laying it agreeabiy to the two latter methodn, arising not oniy from the arm being liable to get uniler certain parts of the rope, and thoreby dis.
"Wo will suppose the communication to be secured, although it is nenrcely necessary to offer any other assiatance than that of a rope, as the inventivo genins
of a sail expect meeting prompte as the $\mathbf{n}$ her off $w$ to the wo the surg rope atta fired over those on 1 rigging ol but sboul by the pro throogh rope be m and the to block a litt have heen fast to the this ls don cot, hamm numerous larger rope If a cot be to it as to then be brc fect safety.
"While
be driven $\mathrm{i}_{1}$ as to meet e As soon as crew of the sttached to crew will ha block, thront ends of whi ohore, Whe the larger ro tackle purch to the atake larger rope $m$ if care be ta roils ont to se will be guard purchase be shore, the ala the cot (fig. piunge it in t wili he arold
"Supposin first cast off $t$ - close hitch, ders of the pe

ench arm, draw knot is on the $t$ that position, o person from th back, conseque
of a sailor will aupply evory thing olse; yet I could expect the people on ohore to get a boat ready for mseting the vessel when driven on a heach: it ia tha promptest ind most cortain method of rellef, as woll as the most easy to be accomplishod; for by hauling her off with the rope projected, the boat's head is kept to the waves, and not only insures safety by rising to the aurgo, hut provente her upsetting. When the rope attached to the shot (not having barbs to it), ls fired over the vessel and lodgen, let it be secured by thoee on board, and made fast to some firm part of the rigging or wreck, that they may haul off a boat by it but should there not ba any boat, then haul on board by the projected rope a larger one and a talled block, throngh which a smallor rope is rove. Let the large rope be made fatt at the matt-head, betwreen the cap and the top of one of the lower masts, and the tailed block a little distance below it ; but, if the mast should have been cut or carrled away, then it must be made fast to the loftlest remalning part of the wreck. When thia is done, there will be aupplied from the shore a cot, hammock, netting, basket; hoop, or any of the numerous resoarces of seamen, which will run on the larger rope, and be worked by the people on shore. If a cot be used, the men may be so securely fastened to It as to preclude all possibility of falling out, and then be brought from the wreck, one by one, in perfect safety.
"While communication la gaining, 3 atakss should be driven into the gronnd in a triangular position, so sa to meet close at the heads to support each other. As soon as communication has been effected hy the crew of the vessel, and they have socured the line attached to the shot, made fatt to these stakes, the crew will haul on board by it a large rope and a tailed block, through which a maller rope is to be rove, both eads of which (the smaller rope) are to be kept on shore. When they have secured these on board, and the larger rope is rove through the rollers, let a guntackle purchase be lashed to it, then lash the purchase to the stakes. By the meens of the purchase the larger rope may be kept at a fit degree of tenaion ; for, If cere be taken to slacken the purchase ns the ship rolls out to sea, the danger of the rope being broken will be guarded agninst; and on the other hnnd, if the purchase le gathered in as the ship rolls toward the shore, the slackneas of the rope, whlch would prevent the cot (fig. 10) traversing as it ought to do, and plunge it in the water mora than it otherwise would, will be avoided.
"Supposing neither boat nor cot apparatus at hand, first cast off the shot from the projected rope, and with a close hitch, let it be put over the head and shoulders of the person to be saved, bringing it close under

Fig. 10.
each arm, drawing it tight, obserring particularly the knot in on the breatbone; for, ly having the knot in that position, on the people of the shore hauling the person from the wreck, he wlll naturally be on his back, consequently, the face wlll be uppermost to
selze every moment for respiration, after oach surf has passed over the body. If eircumatances compel rocourse to thin method, care mant be takon to free the rope from any part of the wreck, and to jump clear away ; but should there be more than one on board, each man should make himself fast in the same way; abont 4 four feet from the other, and join hands, all attending to the same directions.
"For giving Relief to Vesela stranded on a Lee Shore in a Dark and Tempeatuous Night.-It will be requisite, first, to devise the meane of discovering preclasly where the distreseed vessel lien, when the crew are not able to make their sltuation knowa by luminous oignale; secondly, to produce a mathod of laying the mortar for the object, with as much accuracy as in the light ; thirdly, to render the flight of the rope perfectly distinguishable to those who project it, and to the crw on board of the vessel, so that they cen not fall or seelng on what part of the rigging it lodges, and consequently have no difficulty in oecuring it. To attuin the first objeet, a hollow ball was made to the size of the piece, composed of layers of pasted cartridge paper of the thickness of half an lach, having a lid on the top to contain a fuse (fig. 11), and It was then filled with about 50 luminous balls of star composition, and a sufficient quantity of gunpowder to burst the ball and inflame the stars. The fuas fixed in the ball was graduated, to set fire to the burnting powder at the hoight of 300
 yaric. Throngh the head of the fuse were Fig. 11. drilied holes, at equal [distances], to pass through them strands of quick match, to prevent the possibil. ity of any necident from the match falling out, or from its not fring the fuse. On the stars being released, they contlinned their aplendor, while falling, for near one minute, which allowa ample time to discover the situation of the diatressed vessel. During the period of the light, a stand, with two upright sticks (fig. 1: ) , (painted white to render them more discerntble in the dark), was ready at band, and pointed in adirect line to the vessel.
" A shell
affixed to the rope, having four holes in it to receive a tike numher of fuses (headed as hefore described), and filled with the fiercest and most glaring composition, which, when Inflamed at the discharge of the piece, displayed so splendia an Illumination of the rope, that its flight could not be mistaken.
"To yet a Boat from a Beach over the Surf. -The importance of going to the relief of ships in distress at a distance from the land, or fur taking off pilots, was viewed as of the bighest consequence by the elder brethren of the Trinity llouse, and offered to my particuiar atteution by several distingulahed characters. After numerous experiments to accomplish it in various ways, the mode fullowing was most approved :-About 40 fathoms of $2+$-inch rope, made fast to 2 moving anchors, was luid out parallel with the shoro, et a distance beyond the sweep of the surf; to the centre of this rope was made fast a buoy, of sufficient power to suspend the great rope, and prevent it from chafing on the sand, rock, or atenes, as well as embedding, a circumstance that has rendered it lupossible, on a sandy or ahingly coast, to heave out an anchor with a
rope to it from the ahore. As this earrise should be performed in fair weather (to be prepared for the atorm), it may be regulated with the greateat exactnema, and should take piace at the top of high-water, that the upper part of the buoy may be at the fuli strotch of lis power, and only oeen at that time. Should the ahore be oxtremely flat, it will be deairsble to place another set at a suffielent diotance beyond the firat, to inaure the operation of thle mathod in any atate of the tide.
"The royal mortar being brought to the apot, le to be pointed in the direction for the buoy, and should be laid at a very low elevation, but anch an to inaure the range ; for the more it is depreased, the lean slack of rope there will be from the parabola formed in tha ahot's filght; the basket with the rope ready laid (having a barbed ahot to it) is to be placed in the front of the mertar; on les being fixed, Instantly haul the slack of the rope in , to prevent the effect produced on it ly a strong tide; which being done, let the remainder be gentiy' hauled In , to insure the ahot's grappling with the great rope ; when that is canght and hooked, a power will be acquired filly mdequate to the service.

Fig. 18.
"As a cast-iron anchor appears particnlarly adapted to this method, and would be much cheaper than hammered, flg. 13 is a plan of one which the British Navy Boarl approved, and allowed me to cast at their expense, for the porpose of making the experiment. When a vessel is in that extreme and perilous situation, triven under a rugged and innccesaible cliff, and in danger of going soon to piecen, the most prompt method I should suggest is, by lowering to the crew a rope with stiff loope apliced into it (fig. 14), at the distance of a foot and a half from each loop, of sufticient size to contain the foot, ly which they can ascend as a ladder. This rope-ladder ls capable of being projected; and one of an inch and a balf rope was thrown from a niortar 194 yards. It might also, from the aimplicity of ita structure, be extremely useful in escaping from a house or fire. By making one end fast to the leg of a bed or a table, the jerson would come down from the window in safety, and with much leas difficulty, and quicker, Ftg. 14 than with the common rope-ladder, which is heavier and more nn wieldy. It has great advantages when employed in maving ohlpwrecked men in aitua tions just descritied, when, from extreme cold, and almost benumbed limbe, it would be imposaible for them to climb up a rock, or ascend it even by the aid of a common rope. The holds, thus apliced in, will support both hands and feet. ${ }^{\text {" }}$,

The Report of a Committee of the liouse of Commons contains also a $r$ aper of inntructions for the managers of Captalis Bianby's apparatus on ahore, which are somewhat more minute than the directions published in his Esasay. For example:-" If the wind be sideways to the shore, the mortar must be pointed eufictently to windward to allow for the alack of the
rope lighting on the objeet, as the rope will, of courne, be berne conaiderably to leeward by the ffeet of a strong wind. The distance your judyment deciden the veasel to be from the ahose ahould regulate the charge of powder at stated in the acale, taking just a unfficient quantity to clear the object 1 an attention to this will be more certain of your effecting communi cation, and guarding against the danger of the rope breaking, or any other circumstance that might provent the anccesaful porformance of the service. The elevation of $15^{\circ}$ is to be preforred, partioularly if the wind is aidowaya, pointing the mortar aufficiently to windward, at the ropo would then fall againat the weather-most part of the rigging of ths atruaded vessol. I Whan a veacel is driven on ahore in the night, you will flash gunpowder at often as convenient on your way; thia will animate the crew, and denote to them you are coming to thoir asaistance. . On getting to the apot where you bar. reason to suspect the vessel lies, as you are not able to discover har from the oxtreme darkness, and if the people on board can not [make known] their aituation by luminous signala, or noises (which they will be directed to make if posajible), you will lay the mortar at a very high elevation, and fire a light ball. Just before you fire (the rope) it would be advisable to lot off a blue light to put the crow on their guard, to look out, and be ready to secure the rope. The service can be performed with a carronade."

In the repert we have a copy of directions to jereons on board vessels stranded on a lee-shore, propused to bedellvered to the masters at the custom-house. It is observed, that even anspping a piatol, when the powder in wet, may cometimes afford a aignal viaible on ahore, from the aparks of the ateel alone. The other parts of the directions will be supplied by thene who understand the princijles of the pruposed nuode of rellef.

Rockets have of late years been much employed inatead of the mortar, In Manby's apparatus for thmw. ing a line to a ship in distress. "Dennett's Rocket Apparatus" is supplied to many atations aiong the coast. The only advantage which the rocket has over the mortar in ita greater portability; for, being much lighter, it can be used with greater facility among rocky eliffe, and in positions difficult of access. The disadvantages of rockets are, that they are somewhat uncertain, sometimes exploding es eoon as ignited, to the danger of the byatandera; and they are alao liable to deteriorate from the effects of damp or of age. Moreover, being expensive, they can not be often employed in trials, so as to keep up the practice of the people employed in using them. The range of a shot from a 24-1h. mortar, which is the ordinary size, is about the same as that of a $12-\mathrm{ib}$. rocket, which is the largest in use. As the management of the mortar and moket apparatus is much better understood by the officere and men of the coast-guard service than by ordinary boatmen and fiehermen, it has been almost entiroly le in their hands, and is provided by the Roard of Customs. There are in England 132 mortar and rocket atations; in Scotland, 15 ; in Ireland, 22. Several inventions, or variatione, in the Manby apparatus may be just glanced at. M. G. Delvigne nsee a howitzer luateal of a mortar, while a pertion of the line to be carried is contained in the projectile. Mr. Greener has a method of discharging a rocket, with a line atteched, from a tight harpoon gun. When discharged, the rocket Ignites, and is said ts prolong the range to a greater distance than if the gun or the rocket were alone employed. Captain Jerningham, R.N., has an anchor of a particuiar form, which he proposes to fire from a Manhy's mortar, in aufficient numbers to afforl the means of hauling a life-boat throug's the surf. Mr. A. G. C'arte employs a warrocket instead of a Dennett's rocket.

to be considered, with regard to the preser ration of iven in casee of shipwreek, is that of liff-bonts, whic: are of anch a conatruction as to be incapable of aink. ing, aven when flled with wator. The occasional adaptation of the common beata of the ahip to sucil purposes, by means of empty caaka, has been already aoticed. But the boata now in question are aupposed to be kept on ahore at proper aiations, and manned by active persone, who are is the hablt of exerting themseivea for tha rellef of eamen in diatreas. Mr. Henry Greathead of South Shiolds, recelved a gold medal and fifty guineas from the Society of Arts, in 1802, and a pariamentary seward of $\mathbf{2 1 8 0 0}$, beniden further remuaerationa from the Trinity House and from Lloyd'a Coffee-house, for his invention of a llfe-boat, which is dascribed in the Transactione of the Society, vol. xx., p. 283. The length of thin boat in 80 feet, lta broadth, 10, and ita greatest depth about 8, besides a igneral curvature, which nearly doublen the depth, ad reckoaed from the onda; the convexity beiow being in tended to give it a greater fueility of tarning, and a greater power of mour $\mathbf{i g}$ on the waves without submarsion of the bow, whach would increase the reaistance, though it would not sink the boat ; the breadth is also continued further than maual fore and aft, in order to contribute to the same property. The ganwale projecte some inches, and the aides below lt are cased with pieces of eork, amonnting in the whole to seven cwt., which are secured by plates of, copper. There are ten short oars of fir, fixed on pin's to the gunwalea, and a longer oar for steering at each end, both ends of the boat being alike. It is painted white, in order to be more conspicuous; and a carriage la provided, for conveying it overland when required. The description in accompanied hy documents of the preservation of 200 or 300 men by the bosts of South Shields and North Shiclds, which were built in 1789 and 1798 reapectively.

Mr, Christopher Wilson received a gold medal in 1807, for a life-boat with air gunwales, which waa tried at Ncwhaven, and was said to be lighter and more manageable than Mr. Greathead's. (Transactions, xxv, 55.) "Littie is required," says Captsin Manby, "to establish the importance and advantagea that will resuit from giving avery boat the properties of a lifoboat, particularly when taken into consideration that it can be prodaced at a very trifiling expense." To ulustrute the method of giving the properties of pres. arvation to any boat-a man-of-war's jolly-boat, for example-we quate the description of the one which was fitted up to make experiments thereon, by permiesion of the IIonorable Commisaloners of the Navy Board. "To glve it buoyancy, empty casks were well lashed and secured in it. For the advantage of keeping It in an upright position, launching from a fiat shore, beaching, and to resist upsetting, it had billago boarda of equal depth with the keel, and when a good sized piece of iron or lead was let into or made fast to the keel, if any accident did upset the boat, it immediately regainedi its original posture. A stout projecting rope, with swelings upion it to increase its elasticity, sarrounded the gunwale, served as a fender, and provented it being stove in lowering down, or when driven in contact with the vessel it nilght bo going to relleve. The bont thus deacribed had the plug out, and was filled with water until it ran over the gunwale, when a crew of four, with myself, tried it in every way, and found from the buoyant proporty of the caske, it kept the boat so mach above the water's edge, that it was rowed with the greatest enae, and was capalile of performing any service required."

Mr. J. loyes, in 1814, obtained a medal for his lifeboat and safety-buoy, consisting of hollow pylinder made of cunvaa, painted and varnished, and connected with esch other. It was tried on a river, and carried a man with safety (Trans., $x \times x i 1 ., 177$ ); but surely it could not le trusted among broakers on a lee shore.

In 1818 Mr , Gabriel Bray obtained a ailver medal for hla invention of a boat filied with air-boxca under the seate and along the aides. (Vol. xxxv., p. 172.)
Of late years the anbject of life-bonta has attracted considerable attention, from the circumstance of the mereasing number of wrecks, consequent on the rocky nature of many ahorea, and the rant and increacing umount of our commerce. The exertions, too, of the National Lifo-Boat Institution have had a powerful influence in directing attention to this subject. This aoclety, founded in 1824, is ander the patronage of her majeaty, and the proaidency of his grace the Duke of Northumberland. The olject is to aasiat every wrecked person in the kingdom, by auch meana as the astabitahment of lifo-boats and rooket-monars at all the dangeroua parts of the coast ; to sasist in the formation of local committees at the chief ports; to confer rewarda in the form of meduls, votes of thanka, or pecunlary remuneration to all persona riaking their lives for the aske of others; and also to encourage the invention of new or improved life-boats, belta, rocket apparatas, buoys, and other means of asving life. This admirable society is dependent on voluntary aubscriptions for its existence and aupport. That the society has worked with some succeas, may be Judged of from the fact, that slnce its establishment it has been instrumenal in saving the lives of 9682 persons; it has granted 79 gold medallions, and 556 aliver medals, besidea peenniary rewards, amounting to $£ 9631$. The attention of the public ls also kept alive by the publication of a journal entitled The Life-Boat, which, In addition to atatlstical returna of shis,wrecks, contains information on every sulject convacted wlth the preservation of life from shipwreck. One of the publicationa of the seclety is a Wreek Chart of the British Islands, originally phblished by the Admiralty. A vesacl wrecked on their coast is indicated by a black spot , while a vessel so aeriously damaged as to require to discharge her cargo is indicated by t; and the number of such marks at any one spot indicates tho annual average of wrecks, which may be large because the coast is dangerous, or because the traffic is great. Thus, the mouth of tho Tyne shows a larger number of black dots and crosses than any other place ; the mouth of the Ters and the mouth of the Weir occupy the next placea of distinction in this dismal chart: these three rivere belng the outlets of the district by which London is supplied by sea , th $3,000,000$ tons of coal every year, giving employment to several thousand collier ahips, which sail to and fro and greatly add to the otherwise large trade of tha Northumberland and Durham porta. The const of these two counties indicates per annum 180 wrecks, ainkings, and serious collialons. The mouth of the Humber, the const of Suffolk between Yarmonth and Southwold, the sandy shoals off the mouth of the Thames, the Goodwin Sands, the Scilly Isles, Barnatable Bay, and Liverpool, rank as the next dangerous portions of the English coast. The Welsh coast is also dangerous, especially Glamorgan, Pembroke, and Anglesea. Scotland, oxcept near the Firth of Forth, is comparatively free from wrecks, the western coas romarkably so, probably from being less exponed to the winds, which tend to drive shlps ashore on the enstern cosst. In Ireland, the east and south coasts present ubout an equal number of wrecks, the amallor number being on the northern and western. In the year 1855 no less than 1141 wrecks occurred on the coasts of the United Kingdom-about one half of that number belonging to the east cosste of Great Brita'n. The loss of life from shipwreck during that year was comparatively small, heing only 469, or lass than one third of the lose of the proceding year, the average loss per annum being between 600 and 700 lives.

Passing over a great variety of proposals for lifeboats, we proveed to notice the bont which the Lifeboat Institutio: recommends and smpplies to its sta-
tions. Its hlatory is intere ting. A fow yasre ago, a Jamentable secidont occurr do to south Shields lifoboat, whereby twanty pliota were drowned. This m dueed the Duke of Northumberiand to offer a reward for the beat model of a life-boat. This effer was reaponded to by boat-buildore and others from various parts of the kingiom, as well as from Hrance, Hollund, Germany, and Amuerica, $e$ that 280 models and plans wers sent in. A bout 50 of the best of these were exhibited by his Grace In the Great Exhibition of 1851; and he expressed the Intention of placing the best lifo-boata, with their subeldiary apparatua, on all the expesed polnts of the cosst of Northomberland. Ife aleo caused a report to be prepared, accompanied by plane and drawlags, with a viow to elicit the beat form of life-boat ; for although tiso prise of $£ 100$ was assigned to Mr, Beeching: of Great Yarmouth, it was considered that a bettar boat might atill be produced. Accerdingly, Mr. James Peake, asaistant master-shipwright in her majasty'a dockyard at Woolwleh, and a member of the Life-boat Committoe appointed by the Duke of Northumberland, was requeated to furnish a design for a life-boat which might combine as many as possible of the advantagen, and have an few as possible of the defecte, of the beat of the modela examined by the committee. A bont was accordingly designed by Mr. Peake, and built at the patilic expense in Woawich dockyard. Some modifications were from time to time mads in her, in consequance of varieus experi-
ments, and a trial of her capabilitlean $n$. de $\ln$ a gale of wind at Brighton. The boat, with othere of the mame dealgr, ballt at the cons of the Duke of Northumberland, was pliced on the Northumberland coast in the antumn of 1852. In the course of the following winter, theme boats were taken afloat on trial hy the Socl. ety' inapector of Ilfe-boats, wome of them in beavy seas and gales of wind, and the reault of the triala was considered to be highly antiofactory. Other boate were therefore built on the aame plan, and we may therefore conalder this as the model life-bont. These boats have been, for the moat part, of two sisen, vis., 27 and 80 feet In length, with 7 to to 8 foat bram, and rowing from 8 to 12 oars, donble-banked-their weight averagiag iwo tona. But as such boata have been found too hesvy to fie managed in sonse localitien, where boatmen are few, boata of leas beam and woight, rowiag alx oars siagle-banked, but on the same deaign in other respects, have been built under the denomination of second-lase life-boats. The forner clase of inosts has also been somewhat modified aince the deneription of the boat was firat published, so an to be reduced somewhat in bearn, and to have leas height, and greaiar sharpness of bow and stern, to onable them to $\mathbf{b}$ rowed with greater speed againat a head gale and a heavy sea. They are also built of fir, upon the diagonal principle of douole planking without timbers, wheress the earlier bouts were of olm, and clenched, or clinker-built.

FIs. 16

Fig. 16.

The accompanying figures show the general form and the nature of the fitting of the air-chambers of one of these boats, 80 feet in length, and 7 feet 6 inchey in breadth. In Ags. 15 and 16, corresponding to the elevation and deck-plans, the general exterior form of the boat is seen, showing the sheer of gun wale, length of keel, and rake, or slope of stem and stern posts. The dotted lines of fig. 15 show the position and dimensions of the air-chambera within the board, and of the relieving tubes. A representa the deck, 13 the relieving tules,

The chiof peculiarity of a lifo-boat is its incapability of being sunk, in consequence of its being fitted with water-tight aifr-cases, or compartments. One of the diffeculties of lifo-bonts has been to decide as to tho amount and distribution of such air-caneen. The necessary space for rowing and working the boat, and for the stowage of ahipwrecked persona lveing eccured, the opace along the aiden within-board should be entirely oceupied by buoyant cases, or compartmenta, because, on the boich shipping a nea, the water, until got rid of, is confined to tha midehip parts of the boat, where it serves to a great extent as bellast, Instead of falling over to the lee-aide, and destroying the equilibrium of the nat. Hence, berrels or caske, which do not conform in shape to the siden of the boat, are not well adapted to verve as air-cases. In Mr. Penke's lifobost thers is a water-tight deck at the load-water-line, and detached air-boxen along the sides, closely conforming to their shape from the thwarts to the deck. Extra booyanoy io also derived from largo alr-cases, huilt acrosa the how and atern, and occupying from 3 feet to $1 \ddagger$ feet in longth, from the atem and stern posta to the gunwale height. Thene cases are chiefly intended to provide self-righting power; but in the event of the boat being atove in, and the apace below the deck belag filled with water, these sir-casee alone have sufficient bnoyancy to float the boat.
The second pecultarity of a life-bont is its power of diacherging, in a few seconds, any water which may be shipped by the breaking over of the sea, or by the boat being suddenly thrown on her beam-ends. This property does not belong to all life-bonts, for, in certain cases (the Norfolk life-boato, for example) the plugs which stop certain holes in the floora are taken out during a gale of wind, or a heavy sea, so as to let the water 'nto them until it is at the level of the sea. The water thua let in is confined by the wide sea-cases to the midships of the boat, where it serves as a loose baliast, snd the boatmen conslder that it is safest to go off under suil with the boat deeply Iminersed. The Liverpool life-bosta have no relieving holes, so that when filled by a sea, the water must be got rid of by baiiing. In Mr. Peake's boat there is a water-tight deck at the load-water-line, and a number of large open tubes, opening at the nurface of the deck, and passing through the apace between the deck and the floor; the bottom orifices being furnished with selfacting valves opening downward, so as to allow any water shipped to escape through them. The deck being plased at or above the load-water-line, any water which in above it will be above the ontside level of the sea, so that the water escapes from the deck by its own weight, and disappeara in a few seconds. Ae a lifeloat has very great buoyant power, it is important to her stability and safety to attend to the bailaating. The Greathead life-boats have uanally no bailast, their great lwoadth of beam being relied on for stability; t't some of them have a tank in the midships beneath the deck, which can be filled with water. Bneching's life-boats are similarly ballasted; but accidents, with loss of life, have arisen from a difficalty in filing the tanks, and preventing the eacape of the water when full ; hence solid belliat is to be preferred. Mr. Peake's life-hoats are ballasted with heavy iron keels, and with solid wood and cork ballant, atowed under the decks; and should these be atove in, and the space beneath be filled with water, the wood and the cork would supply extra buoyancy.
A life-loat ought to be aelf-righting if npeet, a propenty which, however, belonge only to Mr. Penke's and Mr. Beeching'a boate, some boat-builders considering
 that the meane capployod to prodace solf-righting add to the atability of a boat, und improve har in other reapocta. The molf-righting powor is thus attained: , 1. The boat is bullt with comadiorable ahoor of gun wale, tha bow and atora being from 1 foot 6 tocheo to $\frac{1}{\text { foot }}$ highor thas the aldes of the boat at her centre, and the apace within the boat at oithor oxtronity, to the distance of from 8 to $4 \frac{1}{3}$ foot from the stom and atorn posts to gunwalo height, is then inclusod by a seotional bulk-head and a celling, and so convortod into a watertight air-chambor, the oubical contente of which, from the thwarte upward, are sufficient to bear the whole weight of the boat when ohe is placed in the water in an invarted ponitlon, or keol upward. 2. A heavy Iron keel (from itw 8 owt.) is astached, and a nearly equal woight of light wood or cork ballinot is stowed between the boat's floor on the deck. No nthar measores ane neceseary to be taken in order to affect the self-righting power. Whon the boat is forelibly placod in the water with her heol upward, she is $f$ sated unateadily on tie two alr-chambera al bow..ad stern; while the heavy iron keel and other bali belag then carided above the centre of gravity, an unatable equilibrium is at once effected, and the weight of the iron keel falling over on one aide, immediately rentores the boat to her proper poaltion; in other words, ahe self-rights."-The Life-boat, No. 22. Lateral stability or stiffinena, being the tendency to proeerve an upright position in the water, with proportionate resistance to upsetting, is obtained by breadth of beam or by bal-laet-as in Mr. Peake's boats, by an iron keel and other solid ballaet, and by flatness and length of floor, with moderate beam only. The other qualities to be required in a good lifo-boat are apoer atrongth, and stowage-room, all of which eeem to have been well considered in Mr. Peake's ionats.
A new description of life-boat, favented by the Rev. E. L. Berthon, M.A., of Fareham, and known as the Fareham Life-boat, hes been made the subject of a patent. Its novel feature is, that it is collapsible, so that it combines the property of the lifo-boat, with facility of atowage in a small apace. Hence, it la well whapted for the use of ebips, especially large eteamera, omigrant vesseia, and troop-ships. Its framo-work is of wood, all the timbers extending the whole length of the boat, there being no tranaverse timbera or ribe. The timbers, four on each side of the stem and keelF ce, are thin, flat, and deep, comething like a thin alice of melon; they are made without scarfing, by beading plank over plank till the required thickneas is attained. They are fointed together at their onda, and to the tops of the atem and stern posts by a kind of chuin hinge. When the boat is collapsed, these timbera atand side by side in vertical planes, like the leaves of a closed book; but when expanded, they stand apart in radial planes, somewhat like the aegments of an orange. Attached to the edgee of all the timbers are water-proof coverings, of which there are two, the outer akin being secured to the outer edgea, and the inner skin to the inner edges of the timbera, by which means the whole body of the boat is divided into eight separate longitudinal cells or compartments, which become filled with sir on expanding the boat. This is effected and maintained by the bottom boards and thwarts, which being jointed along the middle line, are made to stand up at an acuta angle when the boat is collapsed, and fall down to straight lines when open. The inventor comparea the principle of extension to that of a carriage-head, the frame of which maj be compared to the boat's timbera, and the joints to the thwarts and stretohere of the bottom boards; and as the leathern covering of the carriage shuts in when the head in down, so the coverings of the boat shut in between the timbers. The boat has rather a deep keel, berides two bilge picces on each side, and
in ave $y$ other salient point the covering is protected by wood or copper. The toat in lowernd by the following eontrivance: Inside the bulwarks ia a large, fint, deeply-grooved sheave abont 2 feet 8 inches in diameter; it has two deep, narrow grooves cut nearly to ita axis, and in these are wound eeparately the ends of the two falls. From this sheave is a projection on which a friction-strap with a powerful lever is made to work. This being placed flat agalnat the bulwarks, the falls are trought to lt fore and aft by amall sheaves set in the top-rall; thun the friction of the strap, when the boat is up, is enough to prevent motion; but by slacking the lanyard by which the leather la secured, it may bo allowed to descend rapidly or slowly, according to the pressure applied to the break. IRlslng and falling derricks are snbstituted for davits. The average size of the Fareham life-boat is 12 by 10 feet; It has 8 thwarts, beslles senta roumil the atem, and will pull, if required, 12 oars, doulble-banked.

Captain Manty's proposal for throwing ropes from whip to ship in cuses of arcidenta may ensily be understood from the methois $w$ hich he employs for saving lives in ahipwreckn. The life-bnoy by Lloutensnt Cook, R.N, F.3R.S., Profensor of Fortitication at Addiscombe Colloge, is relsted to the same elass of inventions; its otjeet in to preserve the life of a person falling overbeard in the night, by means of a floating light; and it obtained him a gold medal from the Soclety of Arta, in 1818.-Transactions, xxavi. lle observes that a ship way uften have to ron half a mile before she can get about and lower a twat, no that it lecomes highly deslrable to afforl a temporary nupport to the sufferer. The machine consisi s of $t$ wo copper apherical air-veswels, with a aquare tapering tube through each, made water-tight, and united together by a cross-pliece of wood, in which are two brass conducting tubes through which is fixed a perpendicular tulular-stalf, with a brasa forule at ench end, and a copper aliding-rod, nearly its own length, within it. Attached to the lower end of the rod is a fiat circular balance-weight, hearing a chain by which the life-buoy ts suspended, and a link which, when hooked to $n$ stad in the lower ferule, bears up tho rod and the balance-weight, but which, when unhouked, allows the weight to draw the rod nhont two thirde out of the seafi. To tho heal of the perpendienlar staff is attached at nipht a fuse, on a brass fuso-plate, the shank of which is wecured in a socket by a thumts screw. The buoy ls necured to the shlp liy the chain only, the ring of which hange on the hook of the wheave of the trigyer-plate. Attached to the stem of the vess.! are two iron rods cased with copper tubling, together with the nerew-bolls, from which they are manjended; just above the forked stay which keeps tho mond parallel, at a proper distance from the atern, in the trigger-plate, and the lirasy fince-case which covers ant proterts the fise on the head of the staff. There is alus a lirass case for the lort, or percussionhammer, placed no an to combr.. acte with the firsecase, by meank of the horizontal tutre ; all these, together with the fulleys and guand-iron, are tirmly attachert to the atern of the versel, inside of which, immediat ely opoosite to the pullies, are tixed the cups and bandles, the une for firimg the lock and lighthig the fuse, the other for raining the trigher-iwite and disengaging the buy from the ship. As noon as the trigiger-tool: is raised, the whenve revolves, the ntop turns round, sut the life-bnoy slides off the roks into the water, bearing on the head of the staff a brillinat fiame. The balance-wright, when no longer held uis by the chain, drops apward of three feet telow the cros-piece, prevents the hooy from upaetting. and affords aphere for the masin toniand an. This appuratus admita of being lighted and let down into the water in the short apace of tive neconds. Lleatenant Cook liw alao the inventor of a plan for converting beats used for ordinary purposen into life-tonats at pleanure.

Mr. Miller'n safety-polea for skutera, and Mr. Prior's mode of prevuntiog aecidenta in descending minos, are mentionod in the Transactione of the Society of $f^{\prime}$ Arfa (vols. xxxil., xxxvi.) Apparatus of the latter kind has been introduced at different tlmes with varlous modificatlons. In coal-pits, or coal and fron pits, where the mon are raised and lowered in a rectangular iron frame, called a cage, the rope or chain may break, or tho cage may be overwound by drawlug it over the framing ut the pit's mouth. Mr. Robert Blee of Reilruth, has intriduced what he calls a aafety-bucket, and Messrs. White and Grant of Glargow, have a snfety-eage. These inventions depend upon somo auch urrangements as the following : 'Two puirs of rccentrice are attached to the ends of two parallel shufts, which extend ncross the top of the cage; the edges of the eccentrice rre toothed, and when the cage is in motion they are free of the vertical wouden ratils which
ateady the cage in its motion ap and down the pit ateady the cage in its motion up and down the pit. Should the rope lireak, two volute spriags liring round the thick sides of the eccentrics to bear against the guldes, and hold the cago securely. To provent oyerwinding, the holdfast which comnects the rope to the cage is necured by a curved bolt, kejit in place by a strong apring ; this bolt inoves on a fulcram, and is continued as $n$ lever beyond the holdfast; across the framing at the month of the pit Is a bur so arramged that, when the lever comes in contact with it, the bolt becomes disengaged, the cage, by the action of the accontrics, liceomes fixed, and tho rope only is drawn upover the pulleg. In Mr. Hlee's sufety-cuge the catches allow it to move freely molong as chere is a vertion strain on them; but shuald this cease by the breaking: of the rope, the catches lecome liseritem, and attached to the iron staves of the lndders placed on either side of the shaft.

A sketeh of the expedients which have been recommended for the preservation of mariners, published in a work entitled shipurechs and Disusters at Sea (vol. iii., lilinlurg, 1822), contains a fow further historieal details relating to some of the inventions which have heen des, rihed.-Li, II,

Francis's lifo-lwats aro vory pencrally usel on our American const. and helow wo give a short description of them. Many of them are also used in Great llritnin. The atructure of the lioate, and of the wagons may be briefly described. A sheet of salvanizd irm or copper of the full sizo of ono half of the bost, from stem to sforn, but not thicier than a sixpeuce, is placed inetween two dies of the requirite form, and then oubjected to enormous hydraulic pressure. The diles regnire great care, labor, and expense, in their preparation, two being required for each form und size of lemat-one for the starloorrl, and ono fir the darboard section. The plate of metal is thus pressed iut) the shape of the half boat, receiving at the same time certain longitulinal, or foremath-aft corragations of a pecaliar character. The two halves are then riveted together, and the lwat is complete.

It is to the corrugations that the bont owes it anormons strongth, for it has no frume-work, no ribs, min timbers. A plate of plain mutal was exhibited; it was taid on two blocks of wool a yurd mint, and was too weak even to bear its own weight. Aasther phat" of metat of the samo thickneas, hat corrurgited, was placed on the book, and fore the weight of a man without bonding; and wonld have borne four men. Honts of all nizes may he thas construtel, from the smallent gig to the largest man-ofowar's cutcer or hunch. The grent majority of che Amorican steamers have, fur mome years, earried francin's beates. In at experiment to tent the atrength of theno lants, ane of them was aubjected to moat vholent treatment. It was pitched from a height on atone pavement ; it was rolld and bruised upon it, and several men used thoir utwast endenvora, with heury hammora, to damage it, but all in viin. It wan then set alloat, and four ktrong wen,
pulling aperl4, doere of annihilh fered no which $n$
pulling with mint and main, ran It, atem on, at full
 done of the meriments, whleh would linvo utterly aunihiluted a wooden boat, it was found to have sufferd no damage beyond a few dents and bruisea, which a hammar set to rights in five minutes.

The wagons were also experimented upon. The whyon was dirst placed in the water, with the whole of lts runuing gear attached, including the pole, the welght, 18 ewt .16 men then got in, their weight amounting to wis ewt., and brought the wagon to about one foet from the top. Attempts ware then made to upset it in the water, by the whole of the men bearing down, first on nue side, and then on the other, but all in vain; the upper edje of the wagon could net he lirought tielow the water. Many other severe experiments were tried. The advantages posseased by an army marching with these wagons, are numifold and self-evident. The cumbrous pontoon and brilge train may he dispensed with, the ordinary wagons which must acrompany an army supplying their place. On approaching a river, these wagens, full of men, may at once to driven across the water; or if the stream be full and rapid, the wagon-bodies mny be taken off their running-gear, and used as boats, propelled hy onrs, or dragged by repes from the oppesite lank. Two wagen-lodies put together will flout a field-piece, with its limher and ammunition reudy for Instant action. Four of the holies maku a valuable raft. A succession of them may be unchored arross the river, [lanka laid over them, and a brilge tor all arms is at once established. For a more extended account of the losses on tho coast of the l'nited States, see Warcess.
Lighter, a large open tlat-hottomelt vessel, generally managed with ears, and employed to carry goorls to, or itom a ship, when she is to lo laden or delivered. There are alse some lighters furnished with a deck throughout their whole length, in order to inclose such merdimatise as would be damaged by rainy weather. These are usually called close lightera.

Light-houses. Light-louso, anil sea-light, are terms which, although not etrictly syunymous, are indifferently employed to denote the same thing. A Suatight may be detined as a light so modified and directed as to present to the mariner an appearance which shall at once enable him to judge of his position during the night, in the same manner as the sight yt' a lumblmari ronld do during the lay. The early history of lighthenses is very uncertian; and many ingenious mutigiaries, tinding the want of authentie recerds, have endeavored to suphly the deticiency by conjectures founded on casual and obseuro allusions in ancient writers, and have invented many vague and unsatistatery hypotheses on the subject, drawn from the beathen mythology. Some writers have gone so far as to imagine that the cychops were tho keepers of lighthenses; while others have actually maintained that Cychops was intended, by a bold prosopepeia, to teprevent a light-house it self. A notion bo tanciful des serves little consideration; and in order to show how ill it nceords with that mythology of which it is intended to bu an exposition, it seems enough to quote the lines from the ninth Odysses, where llomer, atter describing the darkness of the night, informs us that the theci of Ulysses actually struck the shore of the Cyclopean island hefore it could be seen.

Odyss., Ix., 116.
Thero does not appear any helter reason for supproing, that uader the history of Tithonus, Chiron, or any other bersemuge of antiguity, the hem of a lighthouse was conreyed; for sueh suppositions, however reconcilatile they may uprear with nome parts of the mythology, involve obvious inconsistencies with
others. Nor does It seem nt all probable, that In those eurly times, when navigation was so little practleed, the advantagea of beacon-lighta were ao generally known and acknowledged as to render them the objects of mythologleal allegory.

Colossis of Rhoies,-About 300 yeare liefore the Chistlinn era, Chares, the ilisclple of Lysippus, constructell the celebrated brazen statue, called the Colossus of Rhodes, whose height was upward of 100 feet, which stood at the entrance to the harior. There is considerable probabillty in the Idea that thla figure served the parposes of a llght-house; but we do not romomber any passage in ancient writera, where thla use of the Colossus is expressly mentloned. There is much Inconsistency in the account of this fabric by early writers, who, la describing dlatant objecta which conld be seen from It, oppear to have forgotten the height which thoy assign to the figure. It was partly demolished by na earthquake, about 80 years after lts completion; and eo late as the year 672 of our era, the brass of which it was composed was sold by the Saracens to a Jowioh merchant of Eleasa, for $\mathfrak{n}$ sum, it ls sald, equal to $\$ 180,000$.

Tharos.-Littlo is known with ecrtainty regarding the l'hares of Alexandrla, which was regaried by the anclents as one of the seven wonders of the world. It was hilt by l'telemy Philadelphus, about 300 years before Christ; anil it is recerded by Strabo, that the architect Sostratus, the son of Dexiphanes, having first socretly cut his own name on the solid walls of tho building, covered the words with plaster, and, In ohedience to I'tolemy's command made the following inscription on the plaster-" King l'tolemy to the gods, the savlours, for the benetit of sallors." What truth there may be in this nceount of the fraud of Sostratus there ls now no mouns of letermining; and the story ls only now interesting, In so far as it shows the object of the royal founder and the use of the tower. The accounts which have reached us of the dimensions of thls remarkable edifice are exceodingly various; mul many of the otatoments regarding the distance at which it could be scen are clenrly fithulous. Josephus appronches nearest to probabillty, and informs us, that the tire which was kept constantly burning on the top, was visible ly seamen at a distance of niout 10 miles. It the reports of some writers are to be believed, this tower must have far exceeded in slze the great pyrnmid itself; but the fact that a binlding of comparatively so late a date should have so cempletely ilisapprarel, while the pyramid remnins almost unchanged, is a sufficient reason for rojecting, as erroneous, the dimensious which have been assigned by most writers to the l'haros of Alexandrin. Some have pretended that large mirrors were employed to direct the rays of the bencon-light on its top, in thu most advantageous direction; but there is nothing like respectable evidence in faver of this supposition. Others, with grenter prohahility, have imugined that this colehruted hencon was known to mariners, slmply by the uncertaln and rude light afforded hy a common tlre. In speaking of the l'haros, the poet Lucan, on mest ocenslons sudliciently fond of the marvelons, takes no notico of the gigantic mirrors which it is anid to have contained.

Soptha nox, Zepthyro nunquam faxaute rudentes,
Ostentit tharlis. Asgyilu littora flammis.
Sud prius orta dites yocturnam dampaita lextt,
Quan tutus tutraret nquas. Pharsat., ix., 1004.
It is true that, by using the word "lempada," whiel can only with prooriety he applied to a more perfuct mode of lliminuthon than an open tira, he appears to halicate that the "Aamme" of which he speaks, were not so prodesed. 'The word kampuda may, however, ho used metaphorically; and thomanis would, in this ense, not improperly describe the lrregular apicarance of a common fire. Thowe who aro desirous of knowing all that occurs in ancient anthors on the subject of the

Pharos of Alexandria, may consult Pliny, l. xxxvi., c. 12 ; 1. v., c. 18, and i. xili., c. 11. Strabo, 1. xvil., p. 791, ef seq. Cassar, Comment, de Bell. Ciril., l. ili., Pompon. Mela, l. if., e. 7. Ammian. Mancellix, 1. xxii., c. 16. Josepr. de Bell. Judiac., 1. vi. Nicholas Lloyd'e Lexicon Geographicum, and the Notitia Orbis Antigui, of Celarius, 1. iv., c. 1, p. 13.

Coruma.-Mr. Moore, in his History of Ireland (vol. 1., p. 16), speaks of the Tower of Corufia, which, be says, is mentioned in the traditionary history of that country as a light-house erected for the use of the Iriab in their frequent eariy intercourse with Spain. In confirmation of this opinion, he cites a somewhat obscure passage from Ethicus, the cosmographer. This in all probahility is the towor which Humboldt mentions in his Narrative under the name of the Iron Tover, which was built as a light-house by Caius Seevlus Lupus, an architect of the city of Aqua Flavia, the modern Chaves. A light-house has lately been eatablished on this headiand, for which dioptric apparatus was supplied from the workhop of M. Iétournean of Paria. See also a curioun account of the traditions about this tower in Sootiricr's Letters from Spain and Portugal, p. 17. There is also a record in Strabo, of a magnificent light-house of stone at Capio, or Apio, near the harbor of Mfeneatheus (the modern Mesa Aeta, or Puerto de Sta. Maria), built on a rock nearly surrounded by the sea, as a guide for the shatlows at the mouth of the Gurdaiquiver, which he deacribea in torms almost identical with those used by him in speaking of the Pharos of Aiexandria. I am not aware of any other notice of this great work, for such it seems to have been, to have deaerved the praises of Strabo. In Camden's Britannia a passing notice is taken of the ruins called Casar's Allar, at Dover, and of the Tour d'Ordre, at Boulogne, on the opposite coast ; both of which are conjectured, on somewhat doultful grounds, to have been ancient light-houses. Pennant deacribes the remaina of a Romsn Pharos near Ilolyweli, hut eites no authorities for his opinion as to its use. Thers were likewise remains of a similar atructure at Flamboroughhead. A very meagre and unintelit, ible account is siso given of a light-house at St. Fdmund's Chapel, on the coast of Norfoik, in (jough's additions to Camien, by which it might seem that the light-house was erected in 12\%2.-Govon's Camber's Britannia, voi. i., p. 318, and vol. ii., p. 198. Jatcheller, in his Jhover Guile ( $1 \times 45$, p. 111), says, that the Iover Pharos was built "during the lieutenaney of Aufius Piantias and Oatorius Scapula, the latter of whom ieft Britain a. 1, $53^{\prime \prime}$ (I'ennant'a History of Whiteford and Holywell, p. 112).

Moilern History.-Such seems to be the sum of our knowledge of the ancient history of light-housen, which, it must be admitted, is neither accurate nor extensive. Our information regarling molern light-houses is of course more minute in its details, and more worthy of eredit, an the greater part of it is drawn from authentic sources, or is the reauft of the actual ohnarvation of the writer of this article, who has visited the most important thght-houses of Europe. It secma sufficient here to notice briefly the mont remarkable establinhments of the kind now in existence: reserving, for the latter part of the article, the nore ajpropriate and important topica of the methois of iliumination, and the systems of management. The first iight-honse of modern disys whinh morits attention is the Tour ife Corduan, which, ill joint of architecturai grandeur, is unquestionably the noblest edinice of the kind in the worid. It in situate on an extensive reef at the mouth of the Kiver Garonne, and serven as a guide to the shipping of Iborleaux and the Languedoc Canal, and, indeed, of ali that part of the Ilay of Iliseay, It was founded in the year 1584 , and was not completed tiii 1610, under Itenri IV. It is minuteiy described in Beldor'a Arehilecture Hydromligue. The building is

107 feet in height, and is ohown in the accompanying woodent, fig. 1. Round the base is a wall of circum. vallation, 184 foet in diameter, in which the light.
ber, 1703 and Mr. went to $t$ but the st the whoie sistants ul
The wat fatal accid Mr. Winst war was w her crew after this n before the new act to month of $J$ iight-house Rudyerd of new light w lariy exhibi ne was dest years. But how long the hasve insted, his task wit architectural ation, and dt tower which waves. The cular form, a the lantern, which was a 23.

The advantal been so long knI time was permi were taken for whem applicatic recommended th which, both fro considereli most Sth of April, 17 rock, and matio tístune, and p
bet, 1703, some considerable repalrs were reqnired, snd Mr. Winstanley, necompanied by his workmen, went to the llght-house to attend to their execution; but the atorm of the 26th of that month carried awuy the whole erection, when the englncer and all his assistants unhappily perished.

The want of a light on the Eddystone soon led to a fatal accident; for, not long after the destruction of Mr. Winstanley's light-house, the Winchilsea man-ofwar was wrecked on the Eddystone rocks, and most of her crew were lost. Three yeara, however, elspaed after this melancholy proof of the necessity of a light before the Trinity IIouse of London could obtain a new act to extend their powers; and lt was not till the month of July, 1706, that the construction of a new light-house was begun, under the directlon of Mr. John Rudyerd of London. On the 28th of July, 1708, the new light was first shown, and contlnued to be regularly exhibited till the year 1755, when the whole fabric was destroyed by accidental fire, sfter standing 47 years. But for this circumstance, it is impossble to tell how long the light-house might, with occasional repair, have lasted, as Mr. Rudyerd seems to have executed his task with much judgment, carefully rejecting all architectural decoration, as unsuitable for auch a situation, and directing his attention to the formation of a tower which should offer the lesst resistance to the waves. The height of the tower, which was of a circular form, and constructed of timber, was, including the lantern, 92 feet, and the diameter at the base, which was a little above the level of high water, was 23.

Fig, 2. EDDYBtONs ligit, COBswall.
The alvantages of a light on the Eddyatono having been so long known and acknowledged by seamen, no time was permitted to elapse before active measures were taken for its restoration ; and Mr. Smeston, to whom application was made for advice on the sulject, recommended the excluslve uae of atone as the material, which, both from its welgnt and otier qualities, ise comsidered most sultable for the altuation. On the Sth of April, 1756, Mr. Smositon first landed on the rock, and made arrangements for erecting a light-house (f stone, sul preparing tise foumdatlons, by cutting
the surface of the rock into regular horizontal benches, into which the stones were carefully dovetailed or notched. The first stone was laid on 12th June, 1757, and the last on the 24th of August, 1759. The tower measures 68 feet in height, and 26 feet in diameter at the level of the first entire course, and the diameter under the cornlce is 18 feet. The first 12 feet of the tower form a solid mass of masonry, and the stones are united by means of stone joggles, dovatailed joints, and osk treenalls. It la remarkable that Mr. Smeaton should have adopted an arched form for the floors of his building, lnstead of employing these floors as tiewalla formed of dovetalled atones. To counteract the injurious tendency of the outward thrust of the arched floors, Mr. Smeaton had recourse to the ingenlous expedient of laying, in circular trenches or beds in the stones which form the outside casing, seta of chaine, which were heated by means of an spplication of hot lead, and became tight in cooling. The light was exhlbited on the 16th October, 1759 ; hut such was the state of the light-room apparstas in Britain at this period, that a feable light from tallow candlea was all that decorated this noble structure. In 1807, when the property of this light-house again came into the hands of the Trinity House, on the expiry of a long lease, Argand burners, and parabolic reflectors of silvered copper, were substituted for the chandelier of candles. Figure 2 shows a section of the Eddystone light-house, as executed according to Mr. Smeaton's design.

Beil-Rock.-The dangerous reef called the Inch Cape, or Bell-Rock, so long a terror to mariners, was well known to the earliest navigators of Scotland. Its dangers were so generally acknowledged, that the Ablots of Aberbrothick, from which the rock is distant sbout 12 miles, caused s float to be fixed upon the rock, with a bell attached to it, which, being swung by the motion of the waves, served hy its tolling to warn the mariner of tis approsch to the reef. Ainong the many losses which occurred on the Bell-Rock in modern times, one of the most remarkable is that of the l'ork, 74, with all her crew, part of the wreck having been afterward found on the rock, and part having come sahoro on the neighboring coast. During the survey of the rock also, many instances were discovcred of the extent of loss which thia recf had occasioned, and many articles of ships' furnishings were picked up on it, as well as various coins, a bayonet, s silver shoe-buckle, and many other small objects. lmpressed with the grest importance of some guide for the Bell-Rock, Captain IBrodie, R.N., set s sinall subscription on foot, and erected a beacon on apars on the rock, which, however, was soon destroyed by the sea. Ilo atterwnrd constructed a second beacon, which soon shared the same fate. It was not, however, until 1802, wien the Commissioners of Northern Lights brought a biil into Parliament for power to erect a light-house on it, that any efficiont measures were contemplated for the protection of seamen from this rock, which, being covered at overy spring-tide to the depth of 12 feet, and lying right in the farewny to the Firtis of Forti and Tay, had been the occasion of much loss both of property and life. In 1806 the bill passed into a law, and various ingenlous plans were suggested fer overcoming the tlifiticultes which were apprehended, in erecting a light-house on a rock 12 miles from land, and covered to the depth of 12 feet by the tlde. But the suggeation of Mr. Robert Stevenson, the enginear to the Light-house Board, after being submitted to the late Mr. liennie, was at length molopted; and it was determined to construct a tower of masonry, on the principle of the Eddyatone. On the 17th of August, 1807, Mr. Stevenson accordingly landed with his workmen, and commenced the work by prepuring tie rock to recelve the supports of a temporary wooden prramid, on which a barrack-house, for the reception of the workmen, was to bo placed; and during
this operation much hazard was often incurred in transporting the men from the rock, which was only dry for a few honrs at apring-tldes, to the vessel which lay moored off it. The lowest floor of thin temporary erection, in which the mortar for the bullding was prepared, was often broken up and removed by the force of the sea. The foundation having been excavated, the first utone wss laid on the 10th July, 1808, at the depth of 16 feet below the high-water of spring-tides, and at the end of the second season, the building was 5 feet 6 inches above. the lowest part of the foundation. The third season's operations terminated by flnishing the solid part of the etructure, which is 30 feet in height; and the whole of the masonry was completed in October, 1810. The light was first exhibited to the public on the night of the 1st of February, 1811. The difficulties and hazaris of this work were chicfly caused by the short time during which the rock was accessible between the obbing and flowing tides; and among the muny eventful incilents whlch rendered the bistory of this work interesting, was the narrow escape which the engineer and 31 persons made from being drowned, by the rising of the tide upon the rock, before a boat came to their as:, stance, the attending vessel having broken adrift. This circumstance occarred before the barrack-house was erected, and is aarrated by Mr. Stevenson in his account of the work, published at the expense of the Light-house Board in 1824, to which we may refer for more minnte information on the subject of this work, and the other lights of the coast of Scotland.

10 द
Fig. 8. hell.-BOCK LiOnt, BCOTLAXD.
The Bell-Rock tower 1900 feet $\ln$ hoight, 42 feet In diameter at the base, and 15 at the top. The door is 30 feet from the base, and the ascent is by a massive copper ladder. The apartments, including tho ligitroom, are six in number. The light ls a revolving
red and white light, and is produced by the rovolntion of a frame containing 20 Argand lamps, placed in the foci of parabolic mirrors, arranged on a qualrangular frame, whose alternate faces have shades of red giuss placed before the reflectors, 80 that a red and white Ilglt is shown suceesslvely. The machinery, which casues the revolution of tho frame contahing the lamps, is also applicd to tolling two large bells, to give warnling to the mariner of his approach to the rock in foggy wosther. Vlg. 3 shows a section of tho lheliRock Light-house, and of the temporary barrack-house, whlch was removed on tho completion of the werk The entire cost of the light-honse was over f.61,3:3 The great inorit of Mr. Stevenson, as architect of the Bell-Rock Light-house, lies in his bold coneeption and unshakon belief in the possibllity of erecting a tower of masonry on a reef 12 miles from the nearest land and covered hy every tide-a situation, undoubtelly, much more difficult than that of the Eddystone. llut bis mechanical akill in carrying on the work is also deserving of high praise. Not only did he conceive the plan of the movable jib and balance cranes, which he afterward used with much advantage in buidding the tower; but his zenl, ever alive to the possibitity of improving on tho conceptions of his great master Smeaton, led him to introduce several benelicial changes into the arrangements of the masonry. In particular, he converted the etone floors of the bpart ments, which In the Edilystone exert an outward, and in its tendency disruptive, throst, into bonds of union and efficieut sources of stability. Thls thrust was hy Sueaton himgelf considered so disalvantageous, that he thought fit 10 counteract it, as alrealy noticel, ly means of metailic girders, concealed in the stone-work, and most ingeniously applled. The light-house llonrl placel in the upper apartment of the tower a lonst of Mr. Stevenson, "in testimony," as the minutes record, " of the sense entertalned by the Commissiemers of his distinguished talent and indefatigable zeal in the erection of the llyht-house."
The most remurkalile light-hows on the ceast of fro land is that of Carlingford, near Crminieh loint, at the entrance of Carlingford Lough. It was built aco eording to the design of Mr. George Ifalpin, the laspector of the Irish Liglits; and was a work of an arduous nature, being founded 12 feet below the level of high-water on the Hawibowline Rock, which lips about two miles off Cranfleld Point. The tigure is that of a frustum of a cone, 111 feet in height, and 48 feet in diamuter at the base. The light, which is fived, is from oil barned in Argand lamps pared in the foei of parabolie mirrors. It wafirst exhilited on the night of the 20 h December, 1830 .

Skervirore Rocks,-The Skerryvore lRocks, which lie about 12 miles W.N.W. of the seaward point of the lale of Tyree, in Argyleshire, were long known as a terror to mariners, owing to the numerous shipwrecks, fatai alike to the vessels and the crews, whieh hat orecurred in the neighborhood. A list, confessedly incomplete, enumerntes a vessels lost in the 40 years preceding 1844; but how many others, whin during that perion had been rejorted as "funntered at sea," or as to whose fate not even an opinion has heen had. arded, may have been wreeked on thi, dangerons reef, which lies so much in the track of the shipging of liverpool and the Clyde, It would be vain to conjecture. The Comnussiciers of the Northern Light-lonsen had for many years entertained the project of erecting a light-inowse on the Skerryvore ; and with this olject hall visited It, more oxpecially in tho year 181., in company with

Sir Walter description culty of lan the contlnus undiminlshe out no chee year 1834, dered by the formidable

The reef is over a surface I.N.E. The cient surface three miles fr composed of giass by the small that ut of the tower and some rugt through whel

Sir Walter Scott, who, in hls dlary, glives a graphic |cutting of the fonndation for the tower in this irregudescriptlon of lts Inhospltable sapect. The grent difficulty of landing on the rock, which is worn amooth by the continual bent of Atlantie waves, which rlse with undiminished power from the deep water near it, held out no cheering prospect; snd it was not until the year 1834, when a minute survey of the reef was ordered by the Board, that the idea of commencing this formidablo work was seriously embraced.
 lar ilinty mass occupled nearly two enmmers; and the binating of the rock, in so narrow a space, without any shelter from the risk of flylag splinters, was attended wlth much hazard.
The deslgn for the Skerryvore Light-house was glven by Mr. Alan Stevenson, and is an adaptation of Smeaton's Eddystone Tower to the peouliar situatlon and the circumstancen of the case at the Skerryvore, with ouch modifications In the generel arrangements ond dimenslons of the bailding as the enlarged views of the Importance of light-houses which prevail in the present day seemed to call for.

The tower is 188 for 3 inches high, and 42 feet in diameter at the base, and 16 feet nt the top. It contalns a mass of stone-work of about 58,580 cuble feet, or mors than double that of the Bell-Rock, and not much less than five times that of the Eddystone. The lower part of the tower was built hy means of jib-cranes, and the upper part with shear-poles, needles, and a balancecrane. The shear-polea were slmilar to those used by Smeaton at the Eddystone; and the $j$ jb cranes and balance-crane were the same as those whlch were designed and first employed by Mr. Robert Stevenson in the erection of the BellRock LIght-house. The mortar used was compounded of equal parts rf limestone (from the IIalkin Mountaln, near Holywell, in North Wales), burnt and ground at the works, und of Pozzolnno earth. The light of Skerryvere Is revolving, and resches its brightest state onco every minute. It is produced by the revolution of eight great annular lenses around a central lump with four wicks, and belonge to the first onler of dioptrle lights in the system of Fresnel The light may be seen from a vessel's deck at the distance of 18 miles. The entire cest of the light-house, including the purchase of the steanvessel, and the building of the harbor at Hynlsh for the reception of the small vessel which now attends the light-house, was $£ 86,977,17 \mathrm{~s}, 7 \mathrm{~d}$.
"In such $n$ situation as the Skerryvore," snys the engineer, "innumerable delays and disappointinents were to be expected by those engaged In the work; and the entire loss of the frult of the first season's laber in the course of a fow hours was a good lesson in the school of patience, and of trust in something better than an arm of tlesh. During our progress, also, cranes and other materials were swept away by the waves; vessels were driven by sudden gales to seek shelter at a distance from the rocky shores of Mnll and Tyree; and the workmen were left on the rock desponding and idle, and destitute of many of the comforts with which a more roomy and sheltered dwelling, and the neighhorhood of friends, are generally connented. Daily risks were run in landing on the rock in a heavy surf, in blasting the splintery gneiss, or by the falling of heavy hodies from the tower on the narrow space below, to which so many persons were necessarily coníned. Yet had we not any loss of either life orlinh and although our labors were prolonged

The reef is composed of numerous rocks, stretchlng over a surface of nearly elght miles from W.S.W. to E.N.E. The main nuclens, which alone presents auffcient surface for the bane of a light-house, is neurly three miles from the seaward end of the elunter. It is composed of a very enmpnet gneiss worn amooth ns glass by the Incessant play of the waters, and is an small that at high-water little remalns around the buse of the tower lout n narrow band of $n$ few feet $\ln$ whilth, and some rugged humps of rock, separated by gullies, through which the sea plays nlmost lncessautly. The
from dawn to night, and our provisions were chiefly salt, the health of the people, with the exception of a few alight enses of dysentery, was generally good throughont the six auccessive nummers of our sojourn on the mock. The close of the work was welcomed with thankfulness by all ongnged In It ; and our remarkable preservation was viewed, even by muny of the mont thoughtiess, as, in a peculiar manner, the gracions work of IIlm by whom 'the very hairs of our heads are all numberod.' "
There can be little doubt that, down to $n$ very late pe-
riod, the ouly mode of lllumination edopted in the lightbouses, even of the most civilined nations of Europes wes the combustion of wood or coal in a chauffor on the top of a high tower. It is needless to ealarye upon the evils of such a method; they need only be named to be anderstood; for it is dificult to concolve how an efficiont ayotem of lighting a count conld be managed under auch diegdvantages. The nucertainty cauned by the effects of wind and rala, and the imposilhility of rendering one light ditetinguishable from another, must have at all times renderod the early lighthousoa In a great measure usolens to the mariner.
Catoptrio Syatem.-M. Touldre, a member of the Eoyal Corpe of Engineers of Bridgen and Roads in France, is, by some, considered the first who hinted at the advantages of parabolio reflectore; and he le sald, in a momolr dated the 26th June, 1783, to have proposed their combinution with Argand lamps, ranged on a revolving frame, for the Corduan Light-house. Whatever foundation there may be for the claim of M. Tenldre, cestain it is, that this plan was actually carried into effoot at Corduan under tho directions of the Chevalior Borda, and to him lo generally awaried the merit of baving concelved the ldea of applying perabolio mirnors to ligbt-houses. Those were prodigions steps in the improvement of light-houses, as nat only the power of the lights was thus greatly increased, but the introduction of a revolving frame proved a valuable aource of dietinction among the lights, and has since been the means of greatly extonding their atility. The exact date of the change on the light of the Corduan is not known; but as it was made by Lenoir, the eane young artist to whom Borda, about the year 1780, intrusted the construction of his reflecting circle, it has been conjectured by some that the improvement was made abx it the same time. If this conjectare be correct, the ciaim of M. Teuldre must of coume fall to the ground. The refisctors wern formed of sheet copper, plated with silvor, and had a double ordinate of 31 French inchea. It wat not long before these improvementa were adopted in Englend by the Trinity Heuse of Londen, who sent a deputation to France to inquire into their nature. In Scotland, one of the first acts of the Northern Lights Board, in 1786, wae to subatitute reflectora in the room of conl lighte, then in uee ut the Isle of May in the Firth of Forth, and the Cumbrae Iale in the Firth of Clyde, which bad, till that period, been the only beacona on the Scotch coast. The refiectore omployed were formed of facets of mirror glass, placed in holiow parabolical molde of plester, according to the deslgns of the late Mr. Thomas Smith, the Engineer of the Board, who, as appesra from the irticle - eflecotor in the Supplement to the Bd edition of th. Encyelopadia Britamica, was not aware of what had been done in France, and had himself concelved the iden of this combination. The system of Borda was also alopted in Ireiand; and, in time, variously modifed, it bocame general wherever light-houses were known.
Paraboloidal Mirroro.-The property of the parabola, by which all linee incident on its surface from the focus make with normals to the carva at the points of incidence, angles equal to the inclination of these same normals respectively to lines drawn parallel to the axis of the carve, is that whleh fits it for the purposes of a light-bouse. A holiow mirror, fermed by the revolution of a portion of a parmbola about ite axis, hat, in consequence of thls property, the power of projectiag the repested imagos of a lumincus polat placed in ite focus, in directions paraliel to the axis of the generatligg curve; so that, when the mirror is placed with its axis parallol to the horizon, a cylindrical beam of light ha thereby sent forward in a horizental direction. When such mirrors aro placed aide by side, with thoir axis parallel on the faces of a quadrangular frame which rovolves about a vertical axis, a dirtant ob-
server receives the succousive impressions which result from the passage of each fuce of the frame, over a line drawn between the observer's oye and thi centre of the revolving frame." This arrangement conetitates what is callod a revolving light. A fixed light Is produced by placing, alde hy side, round a circular frame, a number of refloctors, with their axes inclined to each other, so as to be rad! containing equal arce of the frame on which they are placed. It is obvious Shat a perfect parabolle figure, and a luminous point mathematically true, would render the illumination of the whole horizon by meana of a flied light impossible; nd it io ouly from the aberration caused by the size of the flame which is substituted for the point, that we are enabled to render even revoiving lights practically useful. But fer this sberration, even the slowest revolntion in a revolving light, which would be consistont with is continued observable series, such as the practical seaman could follow, would render the fiashes of a revolving light greatiy too transient for any useful parpose ; while fixed lighte, being visible In the azimuths only in whlch the mirrors are placed, would, over the greater part of the distant horizon, be altugether invisible. The slze of the flame, therefore, which is placed in the focus of a parabolic mirror, when taken in conhection with the form of the mirror itself, leads to those important modifications in the paths of the rays, and the form of the resultant beam of light, which have rendered the catoprio system of lights so great a benefit to the benighted seaman. It is ebvicus, from a consideration of the nature of the action which takes place in this combinaticn of the parabololdal milrrors with Argand lamps, that the revoiving light is not only mere porfect in its nature than the fixed light, but that it possesses the advantage of being susceptible of an increase of its power, by increasing the number of reflectors, which have their axes porallel to each other, so as to concentrate the effect of aeveral mirrors in one direction. The perfect paralleilism of the axes of separate mirrore, it is true, is unattainable, but approsches may be made sufficiently near for practical results; and in crder to prolong the duration of the flash, the reflectors are sometimes placed on a frame, having each of its sides sligbtly convex, by whleh arrangement the outer reflectors of each face of the frame have thelr axes less inclined inwarde from the radii of the revolving frame which pass through their foci.

Proportions and Dinergence of Paraboloidal Mirrors. -The best proportions for the parai, loidal mirrors depend upon the abject to which they are to be applied; as mirrora which are intended to produce great divergence in the form of the resultant beem should have one form ; while those which are designed to cause a near appronch to paralleiliam of the raya will have another form. These objects may also be attained by variations of the size of the flame applied in the same mirror; but it is much more advantageous to produce the effect by a change in the form of the mirror, as any increase of the flame beyond the aize which is found to be most advantageous in cther respects can not be regarded otherwise than as a wasteful expenditure of light. The details into which a full investigation of this matter would lead us are quite beyond the ecope of this article, and it therefore seems sufficiont to give the formule which express the relations which exist betweon the size of the flame, the reflecting surfuce, and the corresponding divergence of the reflected ray. If $\Delta$ represent the lnclination of any reflected ray to the axis of a paraboloidal mirror, e the distence of the focus from the point of reflection, and $d$ the distance from the edge of the flame to the focus in the plane of reflection, we shall have sine $\Delta=-$; and whea
the flame in the given plane of reflection is circulsr, or has ite opposite sidea equidistant from the focus of
the mirror, wo shall, by putting $\Delta^{\prime}$ for the effective divergence of the mirror have in the given plane, $\Delta^{\prime}=2 \Delta$. When, therefore, great divergonoe, as in the case of the fixed lights, in required, the prolate form of the curve is to be preferred; and the oblate is conversoly more suited to rovolving lighto.
Power of Paraboloidal Mirrors. The power of the reflectors ordinarily employed in light-houves is genorally equal to about 860 times the effect of the rasesisted flame whioh is placed in the focus. This value, however, is strictly applieable only at the dintances at which the observations have been made, as the proportional value of the reflected beam must necessarily vory with the distance of the obeervor, agreeably to some lav dependent apon the nnequal distribution of the light in the luminous cone which proceeds from it. The ordinsry burners used in light-houses are one inch in diameter, and the focal distance generally adoptod is 4 inches, so that the effective divergence of the mirror in the horisontal plane may be estimated at sbout $14^{\circ} 22^{\prime}$. In arranging refiectors on the frame of a fised light, however, it would be advisabio to calculate upon less offective divergence, fur beyond $11^{\circ}$ the iight is feeble; but the difficulty of placing meny mirrors on one frame, and the great expense of oil required for so many lampo, have generally led to the adoption of the firat valuation of the divergence.
Manyfacture and teating of Reflectors.-'The reflectors used in the best light-houses are made of sheet copper pisted, in the proportion of 6 oz. of oilver to 16 os. of copper. They are molded to the paraboloidal form by a delicate and laborious process of beating with mallets and hammers, of various forms and miterials, and are frequently teoted daring the operation by the appilication of a carefully-formed mold. After being brought to the curve, they are stiffened by means of a atrong beasle, and a strap of brasa, which is atteched to it for the purpose of preventing any accidental alteration of its figure. Polishing powders are thea applied, and the inatrument roceives ite last finish. Two guayes of bruss are applied to toet the form of the refector. One is for the back, and is used by the workmen during the process of hammoring, and the other is applied to the concave face as a test, while the mirror is recelving its final polish. It is then tested, by trying a burner in the focus, and measuring the intenstity of the light at various points of the roflected conical beam. Another test may also be applied successively to various points in the surfuce, by masking the rest of the mirror. Having placed a screen in the line of the axis of the mirror st some given distance from it, it is easy to find whether the image of a very small object plsced in the conjugate focme, which is due to the diatance of the screen, be roflected st any distance from that point on the centre of the screen through which the prolongation of the sxis of the mirror would pass, and thus to obtain s measure of the error of the instrumert. For this purpose it in necessary to find the ponition of the conjugate focus, which corresponds to the distance of the screen. If $b$ be the distance which the object should be removed outward from the principal focus of the mirror, $d$ the diatance from the focus to the ecreen, and $r$ the distance from the focus to the point of the mirror which is to be tested, we thall have $b=\frac{r^{2}}{d}$ as the distance whioh the object must be removed outwand from the true focus on the line of the axis.
Argand Lampe.-The flame generally nsed in reflectors is from an Argand fountaln-lamp, whose wick is an inch in diameter. Much care is bestowed upon the manufacture of these lamps for the Northern Light-houses, which have their burners tipped with silver, to prevent wasting by the great heat which is evolved. These burners are aliso fittod with a alide apparatus, accuratoly formed, by which the burner
wy be removed from the interior of the mirror, at the thue of cieaning it, and returned exactly to the same. place, and locked by means of a koy. Thie arrangement, which is shown in figures 5,6 , and 7 , is very important, as it inanres the hurner always. boing in the focus, and does not require the roflector to be lifted out of its place every time it is cleaned; so that, when once carefully mot and scraved down to the frame, it is never altered. In these fige. aac represents one of the reflectors, $b$ is the lamp, o is a cylindrio fountain, which contains 24 oz. of oil. The oil-pipe and fountain of the former is connected with

Fis. 8. the rectangular framo $d$, and is movable in a vertical direction upon the gulde-rods o and $f$, by which it can be let down and taken out of the reflector by simply turning the handle $g$, as will be more fully understood by examining fig. 6 . An aperture of an elliptical form, measuring about 2 inchos by 8 , is cut in the npper and lower part of the roflector, the lower serving for the free egress and ingress of the lamp, and the upper, to which the copper tube $h$ is attached, serving for ventilation: if shows a cross section of the main bar of the chandelier or frame, on which tto reflectors are ranged, each being made to rest on knobs of brass, one of watch is seen st $k k$, and which are soldored on the brase band $l$, that clasps the oxterior of the reflector. Fig. 5 is a section of the rofloctor aa, ehowing the posltion of the burner $b$, with the glase chimney $b^{\prime}$, and oill-cup

Fig. 6. l, whioh receives any oil thst may drop from the lamp. Fig. 6 shows the spparatus for moving the lamp up and down, so as to remove it from the reffactor at the time of cleaning it. In the disgram, c , the fountain is moved partly down; dd

Arrangement of Refectors on the srame.-The modes of arranging the retlectors in the frames are shown in figs. 8, 9 , and 10. It soems quite unneceasary, after what is aald on the aubjoct of divergence, to do more than remark, that in rovolving lights the reflectors are placed with their axes parallol to each other, so as to concentrate thelr power in nno direction; whlle in fixed lights It is necessary, in order to effect as equal a diatribution of the light over the horizun as possible, to place the reflectors, with their axes inclined to each other at an angle somewhat less than that of tho divergence of the reflected cone. For this purpose a brass guage, composed of two long arms, sonewhat in the form of a pair of common dividera, connected by meane of a graduated limb, la employet. The arms baving been first placed at the angle, which is supplementel to that of the Inclination of the axes of the two adjacent mirrors, are made to span the fuces of the reflectors, one of which is moved about till its elgea are in close contact with the fat surface of one of the arme of the guage. The different arrangements of the refiectors willi be more fully understood by referring to the figurea.

FIg. 8.
Fig. 8 shows an elevation of a revolving apparatus on the catoptric principle. in thene figures, $n n$, shows the reflector frame or chandelier; $o$, $o$, the refiectors $w$ ith their uil-fountuins, $p, p$. The whole is attuched to the revolving axis or shaft $q$. Tho copper tuisen, $r, r$, convey the smuke from the lamis; $s$, are crows bars which support the nliaft at $u$; uu is a copper pan for receiving any moisturo which may accidentally enter at the centrai ventilator in the roof of the lightroom; $l$ is a cast-iron bracket, which supports the pivot on the shaft; $m, m$ are leveled wheels, which convey motion from the machine to the shaft. Fig. 9 shows a plan of one tler of reflectors arranged in the nanner employed in a fixed catoptric light; nn alowa the
chandelier, $q$ the fixed shatf in the centre, which napports the wholo, $o$, o the reflectorr, and $p, p$ the fount-
ains if their lamps. ains of tholr lamps.

To the Dutch beionge the honor of having first, after the Fronch, enibraced the systam of Fresnei in their lights. The Comminaionars of the N. British Lights followed in the train of improvement, anil, in 1834, eent Mr. Alan Stevenson on a mission to Paris, with full power to take such steps for acquiring a perfect know ledge of the dioptric ayatem, and formini; an opinion on its merita, as he should find necessary. The s igular liberality with which he was received by M. I , nor Fresnel, brother of the late illustrious inventur of the syatem, and his successor as the Secretary of the Light-honse Commission of France, afforded Mr. A. Stevenen the meane of making such a zeport on his return as induced the Commissioners to anthorize
him to remore the refiecting apparatua of the revolvo him to remare the refiecting apparatus of the revolving light at Inchkeith, and subatitute dioptric instruments in its place. This change was completed, and the light explibited on the ovening of 1st Octoler, 1835 ; and no great wae the satisfaction which the change produced, that the Commiasionera immedistely instructed Mr. Stevenson to make a aimilar change at the fixed light of the Isle of May, where the new light was exhiblted on the 22d Septemiver, 1836. The Trinity liouse of London followed next in adopting the improved system, and employed Mr. A. Stevenson to superiatend the construction of a revaiving dioptric light of the first order, which was afterward erected at Start Poiat in Devonshire. Other countries isiolowed, and the Rep of the Lighthouse Board of America, published in 1852, which recommendx (see page 1229 of this article) the adoption of Fresnei's dioptrie system, and the holophotal improventonts, is a very fuli body of information on light-house sutjects, extending over about 750 pagea. Even Tarkey ins followed in the train of improvement, and we helizve that a light on the dioptric principle will ehortly be exhihited (if it he not alreaily completed) from the Isie of Serpents. Fresnel, who is alrealy classed with the grea'eat of those inventiva ninds which extend the boundaries of human knowledge, wili thus, at the same time, receive a place anong those benefactors of the species who have consecrated thir gonius to the common good of mankind; and, wherever maritius intercourse prevails, the solid advantages whieh his latora have procured will be felt and acknowielged.

When, however, this system was in its infancy, there were several objections raised to it adeption, wilich appeared to be of very oonsideralicie importance, though the experience of years has proved that they ore not inaurmountable. The first, and probaliy the
mest is tinguis oil-pum there b tinction have be and an houses pcse ; fi has, on spare la totally $e$ the keep The o short du to the as This has or holopl lenses, as the princi cut the $w$ throngh t in advance dvantage nearly of Spherice over, suggs evil, hy co vertical pis plane may In the apI the annulus aal aurface be a portio Thus ench a plano-con the ruye ac would be of the excess Thus, ly 8 amount of $h$ this witiou glass, at leas curve of 1 Fiuel of 1 1 generaliy en Kingdem, w obtained fro cephalus). from the se oleracen colad a ajecies of troduced intd of the colza Scottis'l Ligi carefoi photo that the ligh intensity, s opermaceti colzs oil burn Argand bant without requ justment of $t$ more steady frotn sperma owing to the less hrenkag with the ape seems in the for apermace consuapition spermaceti; numbers, 515 representing and if the pri maceti is 6 s , saving in the
most important, wat the liability of the lamp to be extingulahed from the failare of the leather work of the oil-pumps-a most serious objection, inasmuch an, from there being only ona lamp, ita failare impliea the extinction of the light. The meane adoptel to romedy thls have been alroady doscribed (vide "mechanical lnnpp"), and an experience of 21 years in the Northern Lighthouses has proved them to be aufficiont for the purpcse ; for during the whole of that time (although it has, on several occasions been necessary to light the spare lamp), the light has only on one occasinn been totaily oxting uiabed, a casualty whleh was caused by the keeper oleeping on his watch.
The only other objection worthy of mention is tha sliort duration of the flash in revolving lights, owing to the small divergence ( $5^{\circ} 9^{\prime}$ ) of the annular lene. This hus been eorrected by aettlig tha inclined mirrora, or holophotal prisma, a littlo in advance of the great itases, so that they precedo, and consequently prolong, the principal flash. M. Degrand has also proposed to cut the whole apparatas by a horizontal plane passing throagh the focus, and to eet one portion a few dogreea in advance of the other, a plan which has conaiderahle adrantages, as all the portions of the beam are more nearly of equal intersity.
Spherico-Cylindric Lenses.-Mr. T. Stevenson, moroover, euggesta an ingenious method of remedying thia evii, by conatructing lensea whose nberration in the vertical plane is corrected, while that in the horizontnl pians may be aljuated to any determinate amount. in the application of this mothod of construction to the annular lenses they would be gronnd on the extornal surface as hefore; but the internal aurface would be a portion of a vertical cylinder of suitalle radlus. Thus each vertical section would be similar to that of a piano-convex lena as at present, and would refract the rays accordingly, while the horizontal sections would be of a meniscal form, and would act only by the excess of their convexity" over their coneavity. Thus, ly varying the radius of the cylinder, any amount of horizontal divergence may be obtained, and this without much increasing the thickness of the glase, at least in the case of revolving lighta, in which a curve of long radius might be applied.
Fuel of Light-houses.-The oil, until lately, moot 1 generally employed in the light-housos of the United Kingdom, was the sperm oil of commerce, which is obtained from the South Sea whale (Physeter macrocephalus). In France, the colza oil, which is expressed from the seed of a species of wild calhago (Brassice oleracen colza), and the oliva oil, nre chiefly used; and a species of the former has now heen succossfully introduced into the Britiyh light-houses. The advantages of the coiza oif are thus stated ly the engineer of the Scottish Light-house Board :-"İt appears from pretty eareful photometrical menaurements of various kinds, that the light derived from the colan oil is, in point of intensity, a iittle superior to that derived from the spernaceti oil, being in the ratin of $1 \cdot 056$ to 1 . Tho coizs oif burns beth in the Fresnel limup and the single Argand barner with a thick wick during 17 hours, without requiring any coaling of the wiek or any adjustment of the damper; and the flumo seems to be more steady and freer from fickering than that derived froin spermaceti oil. There seems (most probably owing to the greater ateadiness of tho fisme), to to less breakage of glass chimneys with the colza than with the spermaceti oil. The cousumption of oil seemin in the Fresncl lampi to be 121 for colza, and 114 for spermaceti; while in the coonmon Argand, the consuapition appears to be 910 for coiza, and 902 for spermaceti; and if we assume the means of these numbers, 515 for colza, and 508 for spermaceti, as representing the relative expenditare of these oils; and if the price of colza in 38. 9 d ., while that of spermaceti is 6s. 9d. per imperial gallon; we ahull have a saving in the ratio of 1 to $1 \cdot \frac{55}{}$, which, at the present
rate of apply for the Northern Light2; would give a saving of about $£ 3266$ por annum."

Gas.-In a fow light-houses which are near towna, the gas of pit coal has heen used, and thore are certaln advantages, more espectally in dioptric lights, where there is only one large central flame, which would render the use of gas desirable.' Tha form of the Hame, which is an object of considerahle importance, would thas be rendered lese variable, and could be more easily regalated, and the inconvenience of the elock-work of the lamp would be wholis avoided. But it is ohvious that gas is by no meane enitable for the majority of light-housen, their distant situation, and generally difficalt accesa, rendering the transport of large quantities of coal expensive and uncertain; while in many of them there is no means of orecting tho apparatus neceseary for manufactaring gas. There are other considerationa which must induce us to panse before adopting gas as the fuel of llght-honees; for, however much the risk of accident may be diminished in the present day, it atill forma a queation which ought not to be hastily $d$ ted, how fur wa should be justifled in running oven the moot remote risk of explosion in ectablishments auch aa light-houses, tho sudden failure of whieh might involve consequences of the most fatal description, and the situation of which is often such that their re-establishment must be a work of gieat expense and time.

Drummond and Voltaie Liphts.-Tha application of the Drummond and Voltaic lights to light-house purposes is, owing to their prodigious intensity, a vory desiruble consummation; but it is surrounded by so many practical difficulties, that it may, in tho present state of our knowledge, be pronounced unattalnable. Tho uncertainty which attende the exhibition of both these lights is of itself a sufficient reason for coming to thia conclusion. But other reasons, unhinppily, aro not wanting. The smalinees of the fiama renders those lights wholly inapplicable to dioptrie instruments, which require a grent body of flame, in order to produce a degroe of divergence sufficient to rendor tho durntion of the flash in revolving lights long enough to answer the parpose of the marinor. M. Fresnel made some experiments on the application of the Drummond light to dioptric instruments, which completely domonstrate their unfitness for this combination. He found that the light obtained by placing it in the focus of a great annolar lens was much more intense than that produced by the great lamp and lene of Corduan; but tha divergence did not exceed $30^{\prime}$; so that, in a revolution liko that of Cordmun, the flashes would last only 1 f second, and would not, therefore, be seen in aueh a manner as to suit the practicnl purposes of a revolving light. The grent cyilndric refractor, used in fixed lights of the first order, wns also tried with the Drummond light in its focus; but it gave colored apectra at the top and bottom, and only a small bar of white light was transmitted from tho centre of the instrument. The same deffeiency of divergenco completoly unfte the combination of the Drummond light with the refector for the purposes of a fixed light, and even If this cause did not operato ngainst its application in revolving lights on the catoptric plan, the supply of tha gases, which is attenderl with almost insurmountnble difficulties, would, in any case, render the maintenance of tho light precarious and uncertain in tha last degree.
There are many questions of much interest regarding light-houses which appear to open an extensiva fleld of inquiry; and it may he doulted whother soma of tham have recoived that degree of considerution to which their inportance entitles thom. Anong theso wo may rank the numorous questlons which may be raised regarding the most effoctivo kind of distinctions for lights. Those distinctions may be naturnliy expected to be of the most effectiva kind which etrike an obsorver by thoir appearance niono. Thus a red and
white light, a revolving and a fixed light, ofer appearancea which are calculated to produce upon the obasrver a atronger sonse of thoir difference than the same observer would recelve from lighta the sole difference of which Jies in their revolutions being performed in greater or less intervala of timo. On the other hand, the distiactions derived from time, if the intervale on which they depend do not approach too closely to each other, appear to afford very anitable means for characterialng lights ; and the number of diatlinctlons whlch may be founded upon time alone are pretty numerous. Colored media have the great disadvantage of absorbing llght, anil the only color whlch has hitherto been found useful In practice in red, all othera at even moderate distances, serving merely to enfeeble, wlthout characteriaing lights. In the system of Fresnel, as already explalneri, all the distinctiona are based upon tlme alone. Mr. Robert Stevenson, the engineer of the Northern LIght-housee, has inventel two diatinctions, which, although they are produced hy variatlona of the time, possess characteristlc appearances, sufflclently marked to enable an observer to distinguish a light withont counting time. The one is called a fashing light, In which the flashes and eclipses succeed each other so rapldly na to give the appearance of a succesaion of brilliant selntilintions; and the other has been called inermittent, from its consisting of a fixed light, which is suddenly and totaliy eclipsed, and agaln aa suddenly revealed to vlew. The effect of this light is entirely different from that of any revolving light, both from the great Inequality of the intervals of light and darkness, and aleo from the contrast which is produced by Ita sudden disappearance and reappearance, whleh is completely different from the grudeal diminution and increase of the light in revolving ilghts, more especlally in those on the catoptric principle. The great and still increasing number of likhts rendera the means of distinguishing then one of the most Important considerations connectel with light-houses.
Lights on the Coust.-Not lens important, and very nearly allied to the aubject of distinetion, is that of the arrangement of lights on a line of coast. The cholce of the most auita'ile places, snd the assigning to each the characteristic 1 ppearances which are most likely to diatinguish it from all the neighbering lighta, are points requiring tanch consideration ; and It ought never to be forgotten, that the Indiseriminate erection of light-houses soon leads to confusion, and that the needless exhibition of a light, by Involving the loss of a distinction, may afterward prove inconvenient in the case of some future light, which time and the growing wants of trade may call for on the same line of coast. To enter at length upon this topic, or even to lay down the general principles which ought to regulate the distribution of lights, would exceed the limits of this article ; but in connection with this it may be observed, that the aperinteadence of light-houses ahould be comniltted to one general body, and ought not to be jeft to local trusts, whose operations are too often conducted on narrow principlen, withont reference to general interests. The inconveniences arising from interference between the distinctions of the Jights under one trust, and those of the lights under another, are thereby avolded; and the full advantage is otitained of the meane of distinction at the disposal of loth.

The consideratlons which enter into the choice of the position and character of the lights on a line of coast are either, on the one hand, so simple and selfevident as scarcely to admit of being atated in a geasral form, without becoming mere truinms; or are, on the other hand, so very numerons, and often so compllcated, as scarcely to be suseeptible of compression into any general lawn. We ahall not, therefore, do mure than very briefly nutice, in the form of distinct propositions, a few of the chief considerations which should guide us in the selection of the sites and characteristic sppearance of the light-houses to be placed
on a line of coast. For further Information on this aubject, woe works mentioned at the ond of this article. 1. The most prominent points of a line of coast, or those first made on overvea voyages, should firat bo Iighted; and the meat powerfal lights shoald be adapted to them, at that they may bo dlacovered by the mariner as long as posisible before his resching land. 2, 80 far as la conaistent with a due attentlong to diatinctlon, revolving lights of some duncription, which are necensarily more powerful than fixed lights, should be employed at the outpoats on a line of coast. 3. Lights of procinely identical character and appearance should not, if posilibo, occur within a less dimtance than 100 milfes of ench other on the same line of coast, which in made by ovor nea veasels. 4. In all cases, the distinction of color should never be adopted except from absolute necesalty. b. Fixed lighta, and others of less power, may be moro readily adopted in narrow seas, because the range of the lights in auch aituatlons is generally leas than that of open eea-lighta. 6. In narrow seas, also, the diatance between lights of the same appearance may often be safely reluced within much lower limita than la desirabie for the greater sea-llghts. Thus there are many instances in which the diatance separating lights of the same character need not exceed 50 miles ; and pecullar cases occur in which even a much leas neparation between eimilar IIghts may be snfficient. 7. Lighta intended to guard vessela from reefs, ahoala, or other dangers, should, in every case where it is pructicable, be placed senicard of the danger ltaelf, as it is desiruble that seamen be enabled to make the lights with confidence. 8. Vlewa of economy in the first cost of a light-houme should never be permitted to interfere with placing it In the best pusibible position ; and, when funds are deficient, It will generally be found that the wise course is to delay the work until a sum shall have been oljtained sufficient for the erection of the light-house on the beat alte. 9. The elevation of the lantern alove the ses should not, If possible, for sea-lights, exceed 200 feet ; and alout 150 feet is sufficlent, under almost any circumatances, to glve the range which is rsquired. Lights placed on high headlands are suliject to be frequently wrapped in fog, and are oficn thereby rendered useless at times when lights on a luwer level might le perfectly efficient. Nut this rule must not, and Indeed can not, le strictly followed, eapecially on a const where there are many projectlng clifis, which, while they suliject the lighta placed on them to occaslonal obscaration ly fog, would also entirely and permanently hide from vlew iiglits placed on the luwcr land adjoining them. In anch casen, all that can be done is carefully to welgh all the circumstances of tio locality, snd choose that aite for the light-house wiich seems to afford the greatost balance of advantuge to navigation. As might be expected, in questions of thls kind, the opinions of the most experienced persons are often very conficting, nccording to the value which is set on the various elements which enter into the lnquiry. 10. The beat positlon for a neu-light ought rarely to be neglec.ed for the aake of the mere immediate thenefit of some neighboring port, hewever Important or influential; and the interests of navigation, as well as the true welfare of the port itself, will generally be much better served by placing the sealight where it ought to be, and adding, on a smaller scaie, such stibsidiary lights an the channel leading to the entrance of the port masy require. 11. It may be held as a geueral maxim, that the fever lights that can te employed in the illumination of a coast the better, not only on the score of economy, but also of real efficlency. Fvery light needlessiy erected may, in certain circumstances, become a source of confusion th the mariner ; and, in the event of another light being required In the neighborhood, it becomes a deduction from the meane of distinguishing it from the lights which existed previous to its eatabilishment. By the
needleas erection of a now light-house, tharefore, we not only expend publis treasure, but wante the means of distinction among the neighburing lights. 12. Distincciens of lighta, founded upon the minute estimation of intervals of time between flashes, and eapecially on the measurement of the duration of light and dark perlods, are lean antiafactory to the great majority of coasting seamen, and more liable to derangement by atmospherio changes, than those distinctions which are founded on what may more properly be called the characteristic appearancs of the lights, in which the times for the recurrence of cortain appearances differ so widely from each other as not to require for their detection any very minute obeervation in a atormy night. Thus, for example, flashing lighta of five seconds' interval, and revolving lighte of half a minute, one minute, and two minutes, are much mora characteristic than those which are distinguished from eact. other by intervale varying according to a slower serien of $5^{\prime \prime}, 10^{\prime \prime}, 20^{\prime \prime}, 40^{\prime \prime}$, etc. 13. Harbor and local Ilghta, which have a circamascribed range, ahould generally be fixec, instead of revolving ; and may often, for the asme reason, be safely diatinguiahed by colered media. In many cases, also, where they are to serve as guides into a narrow channel, the leading IIghta which are used should, at the same time, be so arranged as to eerve for a distinction from any neighboring lights. 14. Flosting lights, which are very expensive, and more or less uncertain, from thsir liability to drift from their moorings, as well as defective in power, should never be omployed to indicate a turning-point In navigation in any situation where the conjunction of lights on the shore can be applied at a reasonahle expenas.

British and Irioh Iights.-Engliah IIghts are placed under the Corporation of Trinity House of Deptferd, Stroud; the Scottish lights are under the management of the Commissioners of Northern Lights ; and the Irish lighte are under the care of the corporation for preserving and improving the port of Dablin, com monly called the Ballast Board.

The last act of Parliament on the subject of ligh. houses forms part of one the general title of which is, "An act to amend varioun laws relating to merchant shipping." It passed 20th Angust, 1853. The chief provisiona which affect light-housea are the following: 1. Tha light dues of the United Kingdom are to form one imperial fund, under the control of the Board of Trade. 2. From this fund all expenses of erecting and maintaining the lights of the United Kingdom are to be defrayed. 3. The three boarda which manage the light-housea in England, Scotiand, and Ireland, are to render account of thair expenditure to the Board of Trade. 4. The Trinity House, or English board, is to exercise a certain control over the boards in Scotland and Ireland, and is to judge of all their proposals to crect Lew lighta, or to change existing ones; but In every case the sanction of the Board of Trade must precede the acts of each of the three boards,-E. B.

Comparison of the Systems of Lighting in the United States, Fronce, Great Lritain, etc.-To nakke this comparison intelligible, will require a briaf notice of the light-heuse systems of France and Great Britain, with some remarks on the aystems of other countries, before giving an extended netice of the aystems of the United States' light-heuses.
France.-The administrative maiters relating to light-houses, theagh hardly such as it would be possible for us to follow, are, nevertheless, regulated with a system of order worthy of all commendation. As with us, no light dues are exacted from shipping, hut the light-houses are a direct charge upon the treasury, and aupported by annual appropriations. The question, shall there be a light-house at a particular point, is decided by a board consisting of naval officers, govemment engineers, and acientific civillans. The firt decision setties that inquiry is desirablo. The
civil engineer of the Department where the work is to be placed, reporta his viows, with plana and ostimates for it, which are laid before the board by their neeretary. If jt now appeare that the work ohould go on in the manner propesed, the detalls of constructlon and the eatimates pans to the genorel councll of govornment ongineers (Bridges and Roads-" Ponta of Chausedes'), and whon approved are conatructed by contract, under the aupervision of the government engineers of the Department. These ongineors also anperintend all repairs of light-houses. In some canes local boards are required, first, to oxamine and report npon the necesalty for a proposed light, before the sulject is examined by the light-honse board. The adminiatrative detalls are in the Department of State, ministry of public worke, nuder which the difierent persens referred to, serve. The general arrangement of seacoast liphts, adopted on the report of Rear Admiral Roseel ', ne light-house board in 1825, is hased npon two princlples : that one Ilght of the brightest clasa shall not be lost algint of until another is vialhle: and that such diatifnction shall be presented hy the light, that a veasel on nearing the coast, without very gross errur in the knowledge of her position, can not mistake one light for another. 21 nautical miles was adopted as the diatance of viaiblilty of the brightest lights, and three classes of distinction were admitted, via.: fixed lighte, revolving lights showing a bright light, and an eclipee at intervals of a minute and et half a minute. By placing the fixed light midway between the two revoiving ones, of the different kinds, and at a distance of 42 nantical miles from each other, the essential conditions of the syatem would be fulfilled. In applying this practically, it was, of course, so modified as to conform to the general features of the coast, and to the wants of navigation. Between these brightest seacoast lights, others of inferior power were arranged as required.

Every light is placed under the inspection of a person called a conductor, who visits it ot least once a month, by night as well as by day, and is provided with keys of the building and of the watch-room, so that be can enter at all times, without summoning a keeper. The resident eagineer of the Department inspects all the lights in his Department at least once a quarter, and the chief engineer of the Department once a year, and the secretary of the Departrrent makes an inspection at least once in three years. The light-house keepers are furniahed with books, ruled, and with appropriate headinge to the columns, to record the oheervations required of asem. Detalled Inatractions for Ilghthouses and beacons are distributed, which direct minutely their duty.

Prior to 1822, Argand lamps with refiectors were nsed in the French light-houes. In that year, Augastine Fresnel put up the first lans Ilight of his invention, in the tower of Cordouan, at the mouth of the Gironde. In 1825 the general adoption of the lans aystem was deterinined upon. In 1845 thare wore on the coast of France, not. including the colonisa, 151 lens lights and 47 reflector lights; and nearly all of the latter were merely beacon-lights.

According to Mr. Reynaud's statement, not ono reflector light will be left in 1852, in the class of lights of the first and second order. Experience, then, has led to the sulistitution of lens lights for the others, except as amail hurbor beacon-lights, requiring n amall arc of the horizon to be Illuminated. The mechanical lamp used with the lens light was the joint Invention of Arago and Freanel, combining the Idea of Rumford, of a number of concentric wicks, accorling to the intensity and volume required for an flame, and the idea of Carcel of keeping the wick from hurning rapidly, by making the oil overflow about it, by raising it with a pump, moved by clock-work. Several kinds of mechanical lamps have, from time to time, been preaented for examination and trial, an-
awering, gonerally, matiefactorily; those used in mome of the recent lights ase called the " moderator lamp." The ropuie of 28 lampe of the Arst onler lights, 4 of the accoull, and 18 of the third, amountel, in 1860, only to 418356.

Mr. Yresnel suggests that if it be approheniled, that, on account of the dintanee of $w$ light-house from the workshope, there maj be dimiteultien in regard to the repaire of the mechanical tamp, the appolitment of a meehanio an lighthouse keeper, and the supplying him with the necesmary tools, will be a very wimple remedy. In the refracting light the diverging rays from the lamp are rendered nearly varallel, ly passing through a glass lens. Several ineh lenses, forming the sides of a prism, eurround the lamp, the light from which is thun refracted Into a number of beama corresponding to the number of the faces of the prism, separated by dark angles. If this prism be mado to revolve slowly shent a vertical axis, there will be aiternations of light and darkness, as the beam from the fuce of the prism reaches the eye, or it is in the dark angle between the beame. The linereses of the light to its greatent brightnees, and the decrease agnin, will te gradual. A prisu of ejght niden, thus revolving in eight minntes, would show bright flathes at intervals of a miaute, and eelipaen at the eame interval.

The lens is made of a number of piecen of glase, around to the aman curve, and fitted elosely together. The buliding up of a lens in this way, of separate phocer, has been carried to very great perfertion, and the sepurate pleces composing it are of lenutiful clearnene, polish, and precision of form. A druun of glass, cylindrical in its horizontal sectione, and lena-shapeod in the vertical direction, placed about a lamp which occupies Its centre, will diffuse all arourd the horizon the raya falling borizontally upon it, bending toward the horizon those coming above or below the horizontal line from the lamp, furnishing a fixed light of equal brilliancy in every direction. A panel of glass, lensshaped in the borizental diroction, being made to revolve ntrout this, woull give a tiright flueh as the axis of the lens passed any particuiar point; and several of these thus made to revolve, constitate a fixed light, varied by fashes.

When the whole of the horizon is not to be Illuminated, s reflector is sulatituted for tho lens belind the lamp, so as to throw to the front the light which would otherwise he lont. Nit to lose the light thrown upward by the lamj, a series of glass prisms is so arranged an to receive the rays at the nugle at which they are reflectel, to throw them downward to the horison. Similar prisme below the lamp, serve to prevent the waste of the light which falls below the jens. This application of totally refiecting prisms, is claimed ly Mir. Alan Stevenson, of Edilnhurg. There are four ordere of likhts, according to the range of viathlity, determined by the rolume and brililancy of the flame ; the first order correaponding to the grentest range. The number of wicke of the lamps, nad the dimensions of the whole apparatur, vary, accordingiy, in the different onlers. The thind und fourth onders are subulivided into two classen, correnponiling to the larger and smalier size of the apparatus. The dimensions of the lantern of the several orders, the number of wicks of the lamps, and other detalis, will be fonnd in the talle annexed.

Flsed and revniving white lighta are used to give six characteristic combinations: the simple fixed light; the fixed light, varied hy bright flanhes every four, three, or two minutes; the revolving light, with intervaln between the flamher, or bet ween the eclipsens, of a minute or balf a minute. lly introducing a red fixed light, alternate red and white flashes, and a fixed white lifhe with red flashes, tivese combinations are extended to oight. Two filxed white lights, in sefarate towers, are used in a few cases for the sake of dintinction.

Tha losa of light by a deep-red plase, in atated by Mr. Stavenson to be as high as 80 per cent. of the whole. A pink French glase al orived but 57 per ceft.., but the color of the buraer wa not very decided. All parts of the illuminuting appara ye for light-houses are supplied from a depues and workahopm under the Immedlate direetion of tias secrotary of the lighlit-lwuse board. The distaince to which a light may be seen, lis range of visitility (callied mometimen simply its range), depends upon the brightness (intensity) of the light, its elovation above tha genoral surface, and the greater or leas transparenoy of thy otmonphere. Some peraons, too, can distinguish lights at a much greater distance than othera. The range of a light, then, is not a sure tent for comparing it with ather lights.
The value (useful effect) of a light depends on its brightnoun unil the extent of the horison which it will Hiluminato. The brightneas can be ancortained by experiment with the photometor, in terms of the light of a standaril hamp as a unit; the extent of horizun illuminated, by simple measurement in chegrees, minutes, and fractions. Hence tha value of a lightt can be expressed in numbers: ao many units of the standarit lamp, muitipilied by so many degrees on the horizon. If the light is nut apread uniformly ovor the horizon, it in necessary to estimato its brightness at different parte, and the apace over which it oxtends. The value for each portion beling thus found, the whole value is easily deduced.
Theory will show how much of a light from a lamp can be thrown by a given lens, or mirror, in a particular direction ; but as the degree of perfection of these instruments would vary the result cunsideralily, recourse is to be had to exjeriment in comparing differ. ent kinds of illuminating npparutus. Very careful and often-repeated experiments have heen made ly M. Leonor Fresnel, late secretary of tho $\mathrm{light}^{2} \mathrm{~h}$ house boart of Frauce, for the parpose of comparing the reflector and lens Ughts used in France. To appreciate them fully, it in neeessary to follow the very minute details entered into, by measuriug the lrililiancy of the light in the various divialons of the horizun, and inding its total value (useful effect) in estimating the value from different parts of the apparatus, and the allowance to be made for loss of light frum the construction of the lantern, etc. Without anch a scrutiny, however, the elaracter of their nuthor, as an oxperimentalist, is a guaranty for the accuracy of the rewults. They show the following comparison for lens lights of the different orders, and equivalent systems of retiector lights:
4th order, $2 d$ class; economy $2 \pm$ to 1 in favor of the lens light.
3d orler, Int class ; cconomy 34 to 1 in fuvor of the lens light.
2 al order, fxed ; economy 31 to 1 in fusor of the lens $\mathrm{ll}_{\mathrm{ght}}$.
21 onder, rovulving। economy 4 to 1 in favor of the lens light.
1st oriler, fixed, economy 4 to 1 in favor of the lens light.

The rombination of reflectors, to be equivaleat to the trat order lens, is such ohs never been male. The average econony of the light itself is about 3$\}$ to 1 in fiswor of the lens syatem.
To render these delluctions strictly upphicalide to practice, they should toe mado under the precise circumstancen in which tho apparatus is used; but as they would then be made in conditions unfavoralde tu accurncy, it is ususl to assume that, in practice, the lamp is burning in the hest way, and thus to muke the comparisons. To render them strictly applicalide to the Uginte of the United Statee, the vil, too, shootid be the same, and the manner of burning it the same; or, if different oils were used, each cil should be burned under the most favoralie circumstinces for it. These remarks, however, touch only the reline-
menta of the ence, and show the dealmbleneen of exporimenta made with the aetual rofisctors, lampe, and oil in une in the United Staten, with the lensen and their lampe, the eil boling the same.
The question of the relative eonsomy of tha lenn and refleetor lighte, depends upon the relative eost of the light-house adapted to them 1 of the illuminating apparatas; of the 'repalre of the building and apparatus; and.rien of the keepers; eost of the oil, and incldental expensen. In France two keepers have alwayn been employed for the larger lighta; ige or the other being required to be conetantly on duty, mo an novor to leave the lighta without attendance in the lantern or witch-mom. With the now apparatus foe tha firat onler lighta, in ordinary casen, three keapere are ullowel, fier anaing the expense for salarien about ene foarth. With those of the other orders, there han been no increase-two keepers tring allowed to thone of the seconil order, and thind order, firnt elame, unling the mechanical lamp; and onn to the thind order, nec. onil clume, and to the fourth opler lights, neligg the ordinary fountain lamps with Argand burners. "The light-houne buildinge are of the anme coest, except that an adilitional roum must be provided for the third keeper of the lens lighits of the firat order. The first cost of the lens apparatua to somewhat greator than that of the mirrors ; but the great economy in consumption of oll, turns the scale entirnly in favor of the leus lights-giving, aecording to the caleulatione of M. Prosnol, made upon the prices in France, for a smali light, an economy of nearly 2 to 1 in favor of the lens ; and for a large light (revolving light, eecoud orier), an economy of more than $1 \frac{1}{2}$ to 1 . The interest on the firat cost of apparetue, and the additional salaries, must make a large incrense to counterbalance the large economy in the consumptien of ell, which, in France, we have seen to be mere than 3 to 1 in favor of the lens lights. The aame grade of intelilgence and education is stated by M. Freenel to be required in the keepers of the two kinde of lights. The care of the mechinical lamp, however, reguires more mechanical tact than that of a common lamp; while the cleansing of the lens apparatue requires lems tlme sind care than the others.
The sdditlonal heeper of the large lights, and the providing of a eecond lamp in case of aceident, is supposed to graard sigalnot the danger of the total oxtinguishment, for any roneldershle time, of the single lights, which is the wesk point of the lens system. A very almple alarum is also provided, whleh, as soon as the overtow in the lamp ceases, rings a bell, giving potice of any derangement in the machlnery, etc., for faising the oil. Mr. Stevenson causes this apparatus to keep a bell constantly sonnding, and to atop whea the machinery becomes deranged; believing that he better seeures the watchfuluess of the keoper thereby. On this question M. Fresnel gives this very decided opinion-after an experiunce of 22 years, sustained ly the daliy results of more than 100 lenticular lights of the firat 3 oniers-" that they have been distinguished by the regularity of their service." The metsilic parts of the lantern are made of geu-metal (broose), the astraguls being laclinet to the vortical. The ventilition of the tanterua is carofully attended to. 'The tomes are of copper, painted white laside. There is a liglitning-conductor, of copper wire atrends, twisted like a rope, to each tower. Tho koeper's house, and the ceilarn for oil, are generally detached from the light-house, when practicable. The construction of light-house towers offers nothling for apecial remark, escept that, ns might le expectec from the care used 'a obtaining plane for them, they are sobstantial and convenient, dry and well ventilated.
Oil of colza (rape-seel), expressed from the seevts of a kind of will calbage (brassica olerasea), is the only oil used in the Preneh light-huitses. The colza gives a very white light, and the oil doee not readily
thicken by coll. M. Roynaud, secretary to the lightbotes bonrd of lirance, speake of the renulte of comparat - experiments on ollve oll, mineral oll from bitum , , uas achiste, hydrogen, and mixtures of oxygea and hydrogoy, as having been unfavorable. The oil is tented buforg beling recoived, hy hurniag for 15 or 16 consecutive houre in a mechanloal lamp, when, if It burpe clearly, and makes little or no crust on the wlek, it in received. The oliometer is also uned in the laspection. At the primilpal. porta a book in kept, in which mestars of vesaoin may register their complalata In reforenoe te the lighta on the coast. Their remarks are examined, and inquiry made by the inapecting ensinears.

For a list of the principal French, Danish, Rassian, and uther Continental Light, showing the heights of power and elevation above the level, neo the last part of this article.

Great Britain.-The administrative part of the British light-house syotom is so peculiar, having gruwn ap liregularly with the expaneion of conmerce, that It does nut require to be described in detail. The chlef Eagilsh lighita are under the direction of the corporation of Trinity Ifouse, Deptford Stroud, London; and the Scottigh and Irish lights under commiyoloners. The expense of the lighta is paid by dues collected from vessela of ail natione, iucluding England berseif.

The Britiah lights are divided, according to their power and position, into three classes-sea-coast, secondary, and harbor lights.

Each tistrict in Enyland has a local Inapector, and the members of the Trinity House corporation also inspect from time to time. In Scotland, the engineer of the commiseloners has the general superintendence of the lights. Notices in regard to lights are given in eeveral of the duily metropolitan papers, in periodleala perused by nautical men, and are posted at the custom-houses.

The lights of Great Britain are principally still retlecting lighth, hut the Iens light has been introduced in many of the most important positions, and is gradually taking the place of the other.
I'rinity Ilouse lenses, 1st order, 15; 2 d order, 5 ; sth order, number not known.

In Scotland, the proportion of lenses to reflectors is greater than uader the Trinity Iloase corporation. Mr. Stevenson rays: "The Board of Northern Lighthouses are, oxcepting in a few cases, giving up the use of reflectors, and substituting either F'resael or holophotal lights." (See letter of October 15, 1851.) Quite reccutly throe new leus lights have been established in Eugland, by the Trinity ILouse loard; threo others, of the itrst, second, and fourth orders, reepectively, have taken the place of refiector lighte, and fourth order lenses have been litroduced for harbor lights.

The first lens light in Great Iritain wag established in 1835, at Inchkeith, near Edinburg, under the charge of Mr. Alan Stevenson; the next at the Isle of May; and now the Seottisin lights of the larger classes are graduaily being converted into leas lighte. The Trinity House, of Deptford Stroud, introduced tha first lens light in Eagland, in 1837, at St. tl'oint, in Devonshire. Mr. Herbert says: "The Lydraulic lamp is universally in use in the dioptrio lights of the corpo-
ration of Trinity IIouse, with one exceptiou (the South Forelaod light), where the light is shown from a Carcel lamp, the disailvantage ariaing from the use of which to the occasional derangement of the machinory:" In Scotland, the mechantcal lamp is used with the lens lights. When the ventilation of the towers la not complete, the introduction of Professor Farraday's ventiliting tubes over the chimneys of the lampe has been found very uneful. The consumption of oil Is increased, but the light in also increazed, and no filckering of the lainp can occur in the highest wlud. These tubes are used in alt the English light-houses under the Trintiy llouse loord. The oll of colza la now exelusively used in all the lights under the Trinity Houre board. According to Mr. Stevenson, its light is a little more intense than that of spermacetl oil; the consumption for a given quantity of light about the sane, whether the cwo be compared in a mechanical lamp or a common Argand lanap; it remalns fluid at tomperatures which would thicken spermaceti oil; the flame appears more steady, and bence the brenknge of lamp-glsseses is less than with spermacet! oil. It is furnished in England at 89 cents per gallon, which is 40 per cent. less than the cost of spermaceti oil there. The supplies of oll, wickn, glasses, etc., are dellvered once a year by a vessel helonging to the corporation. There are two distinctlve characters given to the refector lights on the Scotel const, differing from those already adverted to; in one, by placing the rims of all the mirrors on one alde of a revolving light, In one vertical plane, and inclining theis axes slightly to the horizon, and eausing a raplid rotation of the frame, $\boldsymbol{n}$ flash is produced every 5 seconds, which appears to rise and fall; the bright and dark intervals follow each other rapidly. In the other, an Intermittent light is produced by the vertical motion of etreular discs in front of the reflectors, eclipsing the light fir half a minute, nad then permitting it suddenly $t=$ sh $\mathbf{y}$ wout.

In England, the cost of the lens apparatus for a seacoast light, lantern, and pedestal, exceeds that of the refector apparatus nearly one fourth; but this disuppeara in the cost of towers and apparatas, and the adventage is on the other side when the charge for conatruction is turued into an annual interest, and the cost of illuminution is considered.

No difference la made in the number or salariee of the keepers of the lens lights in England. Two keepers are ellowed to all large lights, because one is required always to le on doty in the watch-room.

Comparing the value (useful effect) of the revolving lens light at Ske $\quad$ yore, Scotland, with the old reflector light at Incikeith, Mr. Stovenson makes it in the ratio of nearly 81 to 1 , and the ecenomy (economIfal efferi) $\ln$ the proportion of $3 f$ to 1 . Spermaceti oil was used in these comparisona, the result of which, as to economy, is the name as wan obtained in France. In the conparison of fixed llghta, Mr. Stevenson makes the economy of the lens light rise to four times that of the refiector. Taking the interent on firat cont of erection as an annual charge, ami conbining it with the cost of maintaining the two kindia of lights, Mr. Sterenson makes the economy of the lens system, for recolring lights of the first order, to be as $1 \cdot 2$ to 1 , and for large fixed lights an 1f to 1 .

Argand turners and paralwilic reflectors are used in the I?ritish light-vensels, Inth for fixed and revolving lights. The lanterns are of copper, or of guin-metal.

There are from 3 to 11 ilght-veseels in each of the dintrints under the charge of the Trinity lionse board, and in each ingtrict a relief light veasel is atationed. A gong is usen as a fog-alarm, in the Trinity House corporation light-vessels.
The lens system was early introduced into Hollandi, where is has been entirely approved; it has also leeen introduced into Sweden, Denmark, l'russla, and Ruasia. The colta oil is also in conmon use. There is
o cane where the lens ilghts have been introduced, in which recurrence has been made to the reflector systom.
From thene data, we are propared to make the cum. purison required by the instructions of the Depurtment, under the heads which it has pointed out, as far as it can be done withont further experiments.
The ase of these data will be entively safe, since the aystems of refiecting and refracting are compared undor the mont favorable eirenmstances for eneh class.

1. Ueeful Effect.-We have just shown that, hy the experiments of Freanel and Stevenson, the nseful effee: of a lens light is to that of a reflector light of tho same class, on the averuge, as 8f to 1 ; of course, the holo. photal system of asving some of the loat light in the various arrangementa, increanes thle disparity.
2. Eeonomy-Firat Coat-Repaira-Durability-Fifjciency. - This branch of the subject has been so elabio. rated elsewhere in this report, that it is considereel only necessary to remark briefly upon it in this phace.
Asanming that the lights in the two systems are the best of their kind:
The economy of the third orier lens light, in comparinon to the reflector light, as nearly equal to it as ponalile, is as 1 to $2 \cdot 6$. That in, it requires more than iwo and a half times as much oil, ete., for the reflector light, which is less than one thirl as useful, as for the lens light.
The economy of the second order lens light, In comparison to the refiector light, as nearly equal to it as it is possilile to be made, is as 1 to 407 . That is, the lens apparatus is four times as adventageous as the refiector light.
The economy of the first onder lens light, compared to that of the reffector, in $4 \cdot 04$ to 1 ; or that the refiector in four times as expensive as the lens, or that the lens is four times an aulvantageons as the reflector light.
"That if we take into account the first cost of conatruction and the expense of their maintenance, we will find, in renpect to the effect produced, the new ysatem (dioptric) lo still from one and a half to twice an advantageous as the old."
The repairs to the mechanical lampa employed in lens lights, amount to a mere nominal sum.

No dlfficulty can be anticipated in getting pruper keepers to attend to the lens lights. Nen belouging: to the clans of ordinary mechnnies or iaborers, are apppointed to take charge of the lamps in Fraice. Eight or ten days will suffiee to instruct a light-keeper in the morí essential parts of hila duty, receiving leamonn froma an Instructor conversant with ail the details of the service.

The attendance mpon the lamps can no longer be regnaded with fear of itt consequences. They havo been greatly improved, and are now belleved to tio nearly perfect.
There la mothing belonging to a mechanienl lamp which could not tee repmired by a watch-maker, and any peraon capaille of taking charge of n rovable light is equally competent to manage a fevs light.
While experience has fully proved that the fears which were entertalinel of the extinction of the single lamp nsed in the lens lights are llusory, yet, should they stlil exist in any mind, any greater guaranty tue absolintely requiral than experience given, it would lie easily a fioried by furnishing eath of the thres or four wicks of the mechanicai lamp with a separate pump, nendering them thas, in effect, threc or four lamps. Ity sululiviling the wick, this might, if desirest, luo carried stilil further, and the expense of the wdiditional pamps would not adid two doliars per annum to thin enst of esch firat-elass light. The experience in relavion to lenses has not lwen conflned to any one country; even In our own, with but three stations, the results are most anclusive in their finvor. livery fret-class light should have two keepers, as in Great

 cosst light sulticient t ers, timely up lights t extenting miles, is as The marine free from al ppinions. The olject hididen dan him clenr tined port. nate the pou enea to thes a " clear cos proach or pr runaing his must be gir lar sounding tended to so or shoal, the range as wi these dange exauple, us ing on shoreThere are States, with from them. lights of the Me, Tako leturen llar thase ofl ' 'ay, The showals of the present I alle circumst tirst orler lig requirel, is 1 named above mariner in F the hathama Florida coust. the haze, mis of our sonthe erroneons.

Britain, etc. Such, however, is not the case in the United States ; and In inaking the comparison of cost, they have deemed it beat to allow the salary of an asslstant keeper, and the additional cost of hia dwallingrooms, in making comparative estimates of the expense of the lens and reflector lights; but in comparling the actual annual expense of ilghts per lamp in this and ln forelgn countries, no credit was given to the forelgn light for having addltional keepere, and no charge made to our lights for deficlency of keepers. The Congressloual Committee on Commerce say :
" It la not beileved that dioptrlo lights of the first onler can be required at any points except i few, and these the most important outer sea-stations. The renuarks hereinafter made in regard to the comparative efliciency and economy of French and American lights, suil the letter of the Aulitor, may auggest donbta of the prepriety of using any of the first order."
first orier llghts are, if possible, more mecessary on our coast than on that of any other country, and the Bowd com not, therefore, conceies what good reason could be giren for not introducing them. It Is true, we have to first order lights at present, out many are claimed to be of that class, while thay are wo better than thirch dass owce. It is demonstrated elsewhere in this report, that the firat onder lenses are abrolutely necessary; and it is beyond question true, that no combination of the replectors can produce a first order light equal in potcer to a jirst orler lens.
Again, the committee say:
" ha arranging lights, "seful effect and expense ahould be looked at in one vlew. An outer or senensst light should have a 'pertee' or reach of light quithcient to give the npproaching vessel, in all weathers, timely notice of danger. Any expense in fitting up lights to produce more effect is useless. A light extending its limit of visibility to the distance of 25 miles, is as eflicient and useful as une of greater range. The mariuer sees It in ample time to shape his course free from all dllficulty." The lloard concur in these apinions. But cur lights are not of thot character. The ebject of a light is to warn the navigator of some hidden danger, or of hia nppronch to land, and to guide him elear of that danger on his way, or into his deatined port. It therefore becomies neeessary to regalate the power and range of a light, solely with reference to these primary objects. If a light is placed on s" clear cosst" merely to warn the mariner of his approsch er proximity to a lee-shore, or of hits danger of ruaning his vessel on it at night, a power ant range must be given with reference to the grailunl or Irregular senndings in approaching the danger. If it is lntended to eerve as a guide around a dangerous point or shoal, then it hecomes necessary to givo it such a range as will insure sufety to the vessel outsile of these dangers under every cireumstance; such, for example, as a suiden storm, or a contluued gale blowing en shore for many days.

There are many points along the coast of the linited States, with dangerous shouls extemding many miles from them. Toguido vensels clear of these dangera, lighes of the greatest power and range are indispensabe. Tako as example the Nantucket Shoals, these hetwees llarnegat and Capo May, off Alsecum, and these ofl Capes Ilattoras, Lookoni, Vear, Itomain, etc. The shosls of Cape bear extem t0 nautical miles from the present light, which can only be seen under favorahle circumstances about 12 miles. 'The necessity for linst order lights at all points where nea-eowat liglits are requited, is therefore limisputahle. None of the lights named above have a sumbient range to warrant the mariner in ruming boldly for thous. The lighta on the liahana banks are vastly superior to those on the Florida coant. 'The ilea that our lights are injured by the haze, mists, ete., ete., arising from the proximity of our soathern coast to tho Ginlf Stream, is therefore erroneons. That there is nothing la the atmospitiere
along our coast calculated to affect the brillancy and power of good lights, which doea not exist on the coaste of England, Ireland, Scotland, France, Molland, Denmark, Norway; Sweden, otc., ete., ls abundantly proved hy the ohservations of intelligent individuals, who are acute observers of meteorological phenomeua, and who have had their atteation drawn to this porticular subject in consequence of the great inferiority of our lights, compared to those of the reat of the maritime world.

The proper elevatlon to be given to firat-clase Ilghts, is a aubject elosely allied to, and In some degree dopendent upon, the general state of the atmosphere in the viclnity of the partlcular lighte.

Observation by Intelligent professional persons, will always enable the light-bouse engineer to act underatandingly and decide correctly in all special cases of thls kind.

As a general rule, it is consldered by able llghthouse englneers in Enrope, that on cossts where fogs prevail, a light should not have a greater elevation than 200 feet above the mean en-level; but under other circumstances any elevation, If desirable to afford a greater range to the light, may be given, which is not alove the region of clouls.

For a list of the principal llritish lighti, showing the height of tower and clevation above sea-level, see the last part of this article.

No light dues are charged upon shipping in France, as in Great liritain, Ilolland, Deaniark, Norway, and Sweden, etc., but the whole establishment is provided for as in the United States and Russia. The maintenance of the light-house luildings in confided to the departmental or local engineers, and the expenses are defrayed from funcle appropriatod for the serviee of the department of pulilic works.
Enited Sfates, Light-house System in the.-The followng account of the condition of the light-houses in the United States, and the proposed changes to be made in the light-house system, is extracted from the Report of the LIght-honse Iloard, made in 1851.
"The suliject of light-house illumination and improvement, although one of occasioual discussion in Congreas anil in certain circles within the last 12 or 15 yenrs, has not occupied the public miud to any great extent in this country, while in liurope generally, but more especiully in France, lingland, Scotla: and I reland, the ablest and most ilistinguished statesmen, philesopihers, and philanthropista have devoted themaelves for the last 25 or 30 years to this suly. , a enaleavoring to upply practically the aids which sciance nud the mechanic arts have tevelyed. Experin nts to ancertain the truthfol practleal tests of the relative useful and economieal values of illaminating apparatus, combustibles, and their necessorles, In the most minute detail, have heen mule by l'resnel, liaraday; Stevenson, hind other dintinguished indivituals; the results of their inveatigations hevo been published to the word, and their conclusions have served for the formation of a system for light-house illumination, approximating to perfection. Legislation, too, has taken a prominent part in this inportant branch of the public service in liurope, In 1825 the french goverament mopted definitely the Fresnal system of Ilhmination on the consts of lirance, anil took, ns the basls of thelr futnre light-house establishment, the programme proposed by tho lloard organized for tho purpose, at the heal of which was Almiral Rossel of the Firench havy.
"Ahout this tine the subject, which Sir David Ilrewster had forcoladowed in 1811, was revived in Bughand and Scotland, through Colonel Colby of the Royal lingheers, and Mr. Stevenson the enginear to tife Nertherv tioghte, nud the alistinguished architect of the liell-Reck tower. Ilowever, no important step was taken on the Einglish side of the Chamel to introduce the Vresnel upparatus until after a more careful and rigil
examination had been made by the light-house ongineer of Scotland, and after trials of comparative usefulneas and economy with that and the reflector apparatus at the Inchkeith station. In 1834, a new impulse was given to the subject of improvement in light-house illumination by lettera from Sir David Brewster, and from the action of the Honse of Commons' eelect committee. The light-house boards of Europe seemed to exert themselvea to satisfy publle opinion by the introduction of the Fresnel lens at a few of the most important points for land lights, and of Improved apparatus for floating lights, consisting of the Argand lamps and parabolic reffectors, in general use for land lights prior to the introdaction of the Fresuel lens, and movable machlnery for converting such fixed floating lights as were necossary into revolving ones.
"Although the lens met with much favor in England, and has been gradually getting into use, until nearly one half the sea-coast lights have been changed since $\mathbf{1 8 3 7}$, stili Scotland has introduced a larger namber, in proportion to extent of coast, than the Trinity House corporation. Notwithstanding these decided Improvements in the lights of Great Britain, another select committce on light-houses was raised by the House of Commons in 1845 ; and of the benefits arising from this last report have ireen the introluction of a large number of lens apparatios, not only in Great Britain but also into many of the colonies, and the eubstitution of the colza or rape-seed oii in nearly every light-house in the kingdom, in consequence of its superiority and economy compared to the best sperm oil. Improvements in illuminating apparatus and constrnction, ventilation, combustibies, etc., have made rapid progress in light-honse engineering in Europe; while in this country no attempt has been made to improve the lights, with the exception of the act of Congress approved July 7,1838 , and which was the result of the recomniendation of the committee on commerce in the Senate, as follows :
' Secc. 2. And bo it further enaeted, That the Secretary of the Treasury be, and he is hereby directed to cause two sets of dioptric or ienticular appararnsone of the first, the other of the second class-anil also one set, if he deem it expedient, of the reflector appnratun, all of the moat improved kinds, to be imported, and cause the said several sets to be set up, nud their merits as compared with the apparatus in use, to be tested by full and satisfactory experiments.' Under this authority, a lens apparatus wan placed in each of the towers at the highlands of Navesink, and 14 out of the $\mathbf{1 5}$ reflectors were placel in the Boston Hight-house. If 'the said several sets' were 'set up' and 'their mer. its, as compared with the apparatus in use, tenterl by fuil and satisfactory experiment,' in confomity to the act, the results of those experiments have not been made known. With this exception, and the authority of Congress 'to test Mr. Inherwood's plan of discriminating one light from another, and of determining the distance of a versel from a iight,' which resulted in placing a second orier lens in the tower at Sankaty Ifead, Nantueket, and the fights authorized by law to be constructed under the direction of the Toprographical Bureau (Brandywine Shoal, taryofurd Reef, and Sand Key'), no ateps have lieen taken to keep pace in thghtloouse improvements in this country with those of France and Great IHritain.
"The loord, nfter examining with a patience and a geal which they believe this important branch of the publie aervice to demand, the different quints to which their attention was-apecially calied liy the inmeructions of the lepartment, have arrived at the foliowing conclusions, which they feel assured will be found to twe fuily suntained by the detailed data in this report, and its appendix, upon which they are chiefly hased:
"Jluat the light bouses, light-vessels, bencons, and thoy, and their accessoriea in the United Staten, are
not as efficient as the interests of commerce, navigation, and hnmanity demand; and that they do not compare favorably with aimilar, aids to navigotion in Europe in general, but expeolally with those of Erance and Great Britain, and their dependencies, That the light-house eatablishment of the United States does not compare favorably in economy with those of Great Britain and France. * That white the superiority of European lights to those of tho United States (arising from the greater care and attention bestowed upon them, the better and more expensive apparatus employed in them, the larger number of keepers to the lighte, the more rigid superintendence snd frequent visitations for inspection and for delivery of supplies), render any just comparison of them in annual expense in money inpossible, it is shown that the difference for maintenance per lamp per annum is very small, fitted with lens apparatus of equal power to the reand that not invariably in favor of those of this country. * * if all our present iights were flectors now in use, the annual expense for supplies of oil and cleaning materials would coat little more than one fourth as much ns is now expended for these articles of supply annually; that is, that the supplies now costing upward of $\$ 152,000$, would not exceed $\$ 38,000$ to $\$ 42,000$, making an annual saving of $\$ 110,000$ to $\$ 115,000$. That in addition to the great superiority in brillianey, power, and veonomy of the lenses, compared to the reflectors, they porsess the great advantage of durability to the extent of never requiring to be renowed.
"The light-honse system of the United States has grown up from small beginninge-only 8 lights in 1789 , and 65 lights in 1820 -to the eniarged condition of 331 lights in 1851, and withont those helps from organization of which some other countries have hatd the udvantage. Great credit is due to the zeal and faithful. neas of the present general superintendent, and to the spirit of economy which he has shown. The systems of lighting, however, which 25 years ago were in general use, have gradually given way to more improred ones-more efficient and more economical. The generat condition of our lights is not such as our conmmerce now requires, and not suef as the improvements of the day ean suppiy. In considering the condition of the different parts of the aystem in their order, these facts will atrongiy appear, viz. : that waste of light, by imperfect appratus, is waste of oil, and muat te jaidi for in muney. The navigator would be aore benefited by a few good and reiiable lights than by many imperfect ones ; indeel, he would prefer no light at ail to a bad one.
"Classificution of Lights.-A proper classibication of lights has many and obvious milvantages; in fact, it forms the basis of the arrangement of tighty in a system. In lingland the shore-iights are classed ns sesconst, secondary, river, and hartor-iighte. In liranee they are divided into six orders, aceording to the slze of the iltuminating apparator. The name of the order of the light in the French aystem suggests its puirose, the range, the relative britiancy, the nize and ebaracter of the parts of the illuminating apparatus, and tho particulars of detail. That our own lights have not been elassed, wili explain the many momatiea in the number of iampa, the formo of the reftectors, and the like. It in an mbaitted prineipie, that the degreo of divergency given to a light hy a rofleetor for lighthouse purjosen, shonsi depend upon its intended objects, incluiling ranke, etc., etc. ; and yet no such prineiple has been applied in our tight-houses, ani a waste of light has treen the consequence. Classifleation is ef litte avail without other and nore important quatition; hut it in novertheleas an ossential of a system. The following is an assumed ciassifieation of the lights of the Innited Staten, accoriltng to their present value and useful effect, as comparell to the lens:
I. One at ation with a first order fixed and a second
order $x$ the lig One at This 1 constro of the 3. One light, c station nearest the coas. Three a not bet! dioptric ers (two order ea el). 7. equal to stations order len 21-inch r 10. Eigh third ord inch do. stations, inch do. station, 1 do. 18. stations, do. 21. stations, 1 inch da.

"Iens Lights.-One statiou equal to second order lens light. One station not equal to second order lens light. One station with third order (larger model) lens light.
"Reffector Lights.-12 lights nut equal to second order tens light. 61 lights not equal to third order lens light (large size). 35 do . (mmall size). 121 lights not hetter than fourth order lens light. 8.1 lights luferior to the fifth and sixth order lens light.
"It is apparent from this stutement that there is not a first-diss light of any deseription on the whole coist of the Cnited States. The nearest approximations are at the Iligilands of Naverink, composed of a tirst and secoul order light, and the revolving retlector light at Metike loint, of 21 reflectors. The three next in order sre Sandy' 11 ook, Cape ILenlopen, und Cape Heury, each fittel with 1821 -inch reflectors, and in towers of a good elevation. The Boston harbor light, fitted with 14 2l-inch Engilsh reflectors, probahly nour etands next on this list, although the apparatus is much worn and has not had the care and attontion it deserved. There are 236 fixel lights, 30 revolving ligits, 2 fixed anl revolving lights, 18 double lights, 2 triple lights.
"Average number of lamps per light-honse, in tho I'nited States, is now 91; In England (general const), 13; in Scothand (do.), 171; in Ireland (do.), 20; in Ireland harior, 7is The 41 light-vessels of the United

States are fitted without lamps (in the ordinary acceptation of the term), sind without reflectors. The llghta are consequently seen at very short distances, and do not fully subserve the objects for which they were authorized by Congress." Argand lamps, with large parabolle reflectors, are employed ln Grest Britain in light-vessels. The Admiralty list of Trinity House lights for 1849, shows that there were at that tino aeven floating lights fitted with revolving apparatus, belonging to that corporation.
" Distinctive Characters.-The distinctive characters of the lights of the United States, are:-1st, fixed lighta ; 2d, revolving lights ; 3d, double lights, or lights in two towers; 4 th, lights in three towers; 5th, colored lights. Distinctions have heen employed at 10 stations from two fixed lights, and from one fixed ltght , and ono revolving light; and In three towers with two lights, one above the other. There is but one friple light on the cosst of the United States. The beacons for ranges are not, of course, included in these numbers. Double and triple lights are among the most wasteful modes of distinction, and, it may be added, the least effective. Very little attention has been pald to distinguishing lights in the United States. At points nlong the eastern coast, many fixed lights are seen at the same moment, without the means of knowing any of them. The proportion of revolving to flxed lights on the entirc coast, ls $\mathbf{1}$ to 9.2 . Tho proportion of all modes of distinction, including multiple and colored lights, is 1 to $5 \cdot 2$.
"On the const of Naine there aro 34 light-stations; of which number, 3 are revolving, 1 two-towers fixed and revolving, 1 two-towers fixed lights, and the remalning 29 are oll nixed lights. In New IIampshire thore are 3 light-stntions: 1 fixed, 1 rovolving red und white, and 1 fixed, with 2 lights in 1 tower. In Massachusetts there are 42 light-stations ; of which 5 are revolving, 11 fixed and revolving, 1 leas, flashing, 8 double fixed, 1 triplo, and the remalning 26 are fixed white lights. In Rhode Island thero aro 9 stations ; 2 aro revolving, and 7 aro tixed lights. In Connecticut there are 11 stations; 2 aro revolving, and 9 fixed lights. In New York thero are 41 light-stations; 4 aro rovolving, and 37 fixed lights. In New Jersey there are 10 light stations; 1 rovolving, 1 fixed and revolving, 1 red, nud 7 fixed lights. In Pennsylvania thero are 4 light-stations, and all fixed lights. In Delawnre there are 8 light-stations, and nll the lights nre fixed. Tho one on the brenk water is called a red and white light, by the kecper; but as the light ean not bo seen through the dark red shleld-like shades, the white part only is seen. In Maryland there are $1+$ light-stations; 1 double fixed, and 13 single fixed lights. In Virginia there are 8 light-stathons; 2 are revolving, und 6 are fixed lights. In North Carolina there are 11 light stations: 2 aro revolving, 2 double fixed lights, und 7 fixed lights. In South Carolina there are 5 light-stations; 1 revolving, 2 douhlo fixed light-feacous, nad 2 fixed lights. In Georglat there are 9 light-stations; 2 revolving, 1 two fixed heacons, and 6 tixed lights. In Floridit there are 12 light-stations; 6 revolving, and 6 fixed; one of the hatter with rell shades. In Alabama thero nre 3 light-stations; 1 revolving, and 2 fixed lights. In Mississippi there aro I light-stations, and all fixcil lights. In loniskana there are 14 light-stations; 3 revolving, 1 with two lights in one tower, 1 red light, and the remaining 9 are all fixed lights. Of the remainhg 49 lights, on'y tuo are revolving.
"The foregoing lights are exclusive of the 12 lightversels distributed along the coast, forming un lmportint part of the light system, all of which are fixed lights. From tho Ilighlands of Navesink to the dixed light on Dry Tortugas, a distance of upward of 1300 miles by the coast, thero aro only is prominent revols ling lighta; all the rest being single tixed lights. The rovolving lights at Cape Charles, at Oeracoke, Sapel.
and Amellia island, are not included in thla estimate, becanse they are minor lights, and not aeen, oxcept by vessela bound into ports near their tocution. Body's ialand is co badly placed, and so low, that it ia of very litelo use to nuvigators. From Dry Tortugas to Cape Canaverul, alatance of nearly 400 milea, there is not a aingle revolving or other than fixed lights. From Charleaton to Cape Canaveral, a distance of 300 miles , all the prominent lights are flxed, with only two minor revolving lights. From Charleston to Naveaink, there is but one revelving light which can be of any use to the mariner boand to New York.
"In England the lights are diatingulshed by fixed, revolving, tlashlag, colored (red only being used), with combinations of double fixed, fixed and revolving, etc., etc. The Engllsh TriDity House corporation have 7 revolving lights on board of light-vessels, out of 25 ; and the proportion of revolving to fixed lights is 1 to 4.2. Of 40 sem-coast lights, 19 are fixed white, 10 revolving, 4 revolving and $t i x e d, 3$ red fixed, and 1 double fixed light; that js , one half are fixed, and the remaining half are revolving, etc. The Scotch have 11 fixed white; 2 revolving red and white; 4 revolving, showing brightest every minute; 4 revolving, and showing white ilghts every two minutes; 2 double fixed lights; 2 flushing once in every five seconds; 4 intermittent Ilghts, brightest state once in two minutea; 2 fixed und red; 1 double, revolving at the same instant; making only 11 fixed lights, out of 33 , on the entire coast of Scotland. In Ireland thers are five distinctions employed : fixed white, fixed red, revolvIng white, revolving red and white, and intermittent lights. Of 23 rea-coast lights, II are fixed white, 7 revolving, I fixed red, and ifixed and revolving.
"In France there are nine principal combinationa of lights, posseasing distinctive characteristlcs, via.: 1. Flashes which ancceed each other overy minute. 2. Flashes which succeed each other every half minute. 8. Flashes alternate red and white. 4. Fixed lights, varied ly flashes every 4 minutes. 5. Flxed llghes, varied ly flashes every 3 minutes.
6. Fixed llights, varied by thashes every 2 minutes. T. Fixed white Hghts, varied by red flashes more or leas froquentiy. 8. Fixed lights. 0 . Double fixed lighta, To which might lee atded tlxed and revolving, in two towers, as at Nuvesink. There are, however, very few double lights in France, and are only employed to give a very decided churacter to a locality, in contradistinction to those nearent. Hy adopting the principle of lear Admiral liossel, as set forth in the programme reported by him for lighting the coasts of France, in 1822, finally adopted ly the French administration in 1825, and whleh has lieen steadily adhered to rince, of placing first order sea-coast lights within the distance of 42 nautical miles of ench other, there can be no great difficulty in obtaining a suthicient number of very marked distinctions for sea-cosst Hights. The present advanced and progressive state of nantical science is also brought in to the ald of the light-honse engineer, as it will now seldom happen that a navigator will be 84 miles out of hid reckoning. lly commencing at one line of the boundary of a country, oll a sea-coast where a tirst oriler light is reguired, with a revolving light ; then, at the distance of 42 natitical miles, a fixed light; and at the distance of 42 nautleal milles forther, in thakhing light; then an Intermittent liright, then a fixed light ; then a revolv-ing-ani so on along the entire coast-the mariner will find no diffienlty in recogniaing any well-kept Ilght that he may see. Should it teconse necessury to employ thme as one of the elenents, then there can be no better aystem than that employed in France. An oceasional deviation may he found to be necessary, such as the erection of $t$ wo towers for fixed, revoiving, or fixed and reveiving lights. This is one of the iranches of light-house service which ean only the executed jroperly hy competent persons, who have thor-
oughly investigated and studied tho subject, both in general and for apecial cases. Sheuld the very lngenions plan of diatingulahing lights by occultations, as proposed hy Mr. Charles Babhage, prove, upon experiment, to be practicable, the whole aystem of characteristic distinctions will be entirely changed and greutly simplified.
"The flosting lights of the United States are all fixed, and firted with common torch lamps, without Argand hurners and reflectors. The light-veasels are too small for exposed positions, and the models are not the best for the purposes for which they are designed. They are not provided with moorings such as they require, and there is not aufficient attention pald to placing them in their proper positlons. The lights, In consequence of the inferior lamps without reflectors, are of very little use to the navigntor. 'The uncertainty of finding the light-vesaela in their proper positions, by navigators who have heen eeveral months absent from the country, produces a general distrust, which destroys all reliance on them.
"The floating lights of England and Ireland are built upon the best models; are of sufficient tonnage to be safe at the points for which they were buift; are constructed in the most substantial manner-of wood generally, but ln some cases of Iron; are moored with heavy unchors and chains, and long scopes. Those placed to mark channels, as the North-West light-veasel at Liverpool, are moored with long scopes of cable to a awivel, snd hove in, so that in swinging they do not change their positions perceptibly. These flosting lights are placed in the most exposed pesitions in the Irish nr St. George's Channel, in the llitish Cbannel, North Sea, and in the most exposed positions of the English and Irish coasts. It very seldom happens that they break from their mooringe, nud are never tuken away without previously placing a dupiticate in the poaition. The system of relief to the keepers and crews is an sdinirable one; nue that insures a faithful performance of the duties intrusted to them, to the great advantage of navigators.
"The lingliah floating lights are fitted with Argud lamps and parabolic reflectors-lixed, revolvhig, and double lights. They are distinguished ly day by cages of hoop-iron, balls, conen, flugs, etc., etc. The name and number of each light-vessel are painted in large letters and flgures conspleuously on the sides and stern. These lights from the superier apparatus emplayed in them, and the great care and attention of Inspections and superintenilence, nnder the nost rigid instructions in detall (which are printed in large type, und hung in frames in the apartments), are very little inferior to the same class of reflector lights, with equal elevations, on shore. Many of them can be seen from the deck of a merchant vessel $1: 2$ to 14 miles, while those in this country cun only be seen from 3 to 7 miles. Refractora have been made ly Mr. Bestourneau, of Paris, for light-vessels, which can not fial to be profuctive of much benefit, and which are, no donlit, destined to render floating IIghts mach aure nseful to the navigator then they have hitherto twen, even la lingland, where the hest reflecting apparatus has been employed for many years.
"Mode of ascertaiaing l"taces of Light-IVousps.-No aystematic mode of determining where there should be 4 light-house, or loost, seems to have been followed for nny period of yeurs, and hence the lights nre se mumerouk on some parts of the coast as to be inconcenimen, und on other parts are no few as mot ts auply, ertit moslerately, the demands of uavigation. The princido adopted by the French rommissioner of lightlionses for placing lights on the coast of France, will le found ntated in another part of this report : steadily adhered to, it has prevented the wasteful multiphication of lighta, and has provided, gradually, those really necessary for faclitating nayigation.

tematle methods appear to have heen reaorted to to secure plans for light-houses, light-boats, llghtling apparatus and other accessories, In the United States. The preparation of plans for light-houses, llghting apparatus, and other accessories, is the husinese of an engineer. Occasionally architects have been consulted, und the Treasury Department and Congress have sometimes devolved the preparation of plans, etc., upen the officers of the corps of topegraphleal engineers. The unculled-for variety and the Inconvenience and Illaduptation of the etructures vialted by the Board, show how much the intervention of knowleige is required. Ia discussing the detaile of thene works, this fact will constantly appear. Professlonal skill lis essential to efficiency and economy. Ill-contrlved light-houses require numerous additions, and do not then answer their purpose. Badly-constructod ones are expenalve in repairs, besides lnjuring the apparatus and stores contained in them. Badty-contrived lamps waste the oil, and anawer imperfectly the purpose of llghting. Mirrors badly made, uuskillfully arranged, unseientlic in their forms and adjustments, cause a loss of light which is paid for in oil. Imporfect ventilation canses s bad light. Unscientific arrangements of the lantern in regard to glazing, painting, ete., cause a waste of light. The proper arrangement of these matters is the study and ocenpation of a professlon. The negloct of the proper conditions is wasteful. Plans of lighthouses of different classes, with modifications adapted to differeat localities, would promote economy by the frequent repetition of the aame pleces, which in stonework, brick-work, Iron-casting, carpenter's-work, gla-zier's-work, and the like, is productive always of a decided economy. The limportant subject of alarm signals has not received the attention which it deserves. In the English light-houses the gong is used instead of the bell, to give slgnals in case of fogr, and no attempt appesrs to have been made in this country to compare the value of the two kinds of alarm signals. The fog-whlstle, introduced by Mr. Daboll and recommended by the loard, has been found to be far more efficient than the bell. The Board had ample means of forming correct conclusions as to the relative merits of the two modes of wnening the mariner in fogs, and found no difficulty in deciding In fuvor of the whistle for positions where it can be put up.
"Mr. Alexander Gordon, civil engineer, of London, proposed to the select committee of the llouse of Commons on light.houses, $\ln 1845$, that the gong employed on board of light-vessels should be superseded by the use of a shrill scream or whistle, auch as the railway whistle, giving it sound by a bellows, and having the sound directed around the horizon hy reffectors, similar to these of Bordier Marcet for retlecting light. The reffection of the sound of the alr-whistle of Mr. Daboll is helieved to be practicable hy the meuns suggented by Mr, Gordon; at any rate, the importance of the subject warrants the small expenditure which would be required to test it experimentally. The discharge of heavy guas has theen recommended, and would be effective if there were sufficient furco at the lighthouses to load and fire them. They would alwaye ho expensive, however, every discharge of a $2 \cdot 1$-poumiler gun costing atout $\$ 1$. The fog-belle exnmined thy the United States' Board were not placel so as to produce the best elfect. That at lloston farbor was lnclosed in a frime huilding, the sides of which effectually deadened the sound in two directions. It is time that this sutiject recelved full and eareful investigation thy experiments under the direction of ecientific men, Hesides this class of signals, those intemded to guide vessels eatering luto barred harbors, when (from heavy weather or other eanses) pllots can not be hall, should the carefully syatematized. The systom should be adepted of Captain Fenoux, of the French navy, depending upon the positions of a movable triangle fixed to a pole or mast, or to a light-house; und that of Lieutenunt John

Rodgers, United States' navy, by a flag, to be used in a boat or on shore. Surf-boats and life-boats should be furnished to certain llght-house stations, and the means of readily providing crews for them in time of need, be furnished. They ehould be planned by, and constructed under the directlon of, competent persons, who would study all the detalls of their use, and make It certaln that when required they could be launched and effectlvely manned. The truatees of the Liverpool Doek Company (England) have, under the admirable management of thelr very able marine surveyor of that port, a most perfect aystem for the rellef of the shlpwrecked.
"There are nina life-boats stationed at different polnts sround the bay and port of Liverpool. The boats are constructed on the most approved principles; kept on carrlages In the boat-houses near the shore, and horses provided to enable them to proceed to the most advantageous spot for launching. A gun is placed at each station to summon the crew, besides dlatress flags placed at each light-house, light-ship, and telegraph station. The srrangements are so perfect that in many linstances the life-hoat has been manned, launched, and on her way to the wreek in 17 or 18 minutes from the time the distress slgnal was made. The life-boats are manned by picked boatmen of Liverpool and pleked fishermen along the coast, who reside near the boat atations, and who are familiar with the banks, swashwaye, tides and currents, in Llverpool Buy. The whole of the boatmen are kept on constant and permunent pay, and are regularly mustered and exerelsed once a month, and no expense has been spared in rendering the bouts, their equipments and crews, as perfect as possible. The Liverpool arrangements ure well worthy of imitation for many parts of our dangerous coast (especiully dnring the winter months). The necessity can not too strongly he urged for the employment of more efficient mesns than now exlst at the polnts where life-boats have heen authorized by law to be placed.
"Light-Boats and their Accessories.-The first cost, large annual expense for maintenance and repairs, and the rapid decay of light-vessels, render this mode of lighting very objectiontible, Independently of the ineffectual manner In which they subserve the purposes of warning the mariner of danger. That thls description of lights has not recelved the attention in this country due to its importance as a necessary adjunct to a proper aystem of sea-coast illumination, is very evident to the Board.
"That there are many points on our extended seacoast requiring to be lighted, which will not admit of any other means, ls also evident. It therefore becomes necessary to eelect those means least objectionable, in an economleal polnt of vlew, and best adapted to the desired end. The rapld deeny of timbers, especially on our southern coast, would seem to snggest the propriety of employing more durable materials. It is stuted by the general superintendent of lights that these vessels last from 5 to 10 years. To obvlate the necossity for renewing them at such short periods iron vessels might, with great propriety, be substituted. The experiment has heen tried in Europe with perfect success. The advantages of iron over wood for the constructlon of light-vessels are self-evldent. Durahility, hoyancy, and economy of first cost, are the advantages, without any conceivatile ilisndvantages that could arise from their introduction.
"The inferiority of those vessele seen by the Board, the large sums approprlated annually for their support and rupalr, and the small amount of usefulness arising from their employment, warrant the Board In recommending a better elass of vessels; to be built of iron, and filled with the hest parabolic reflectors and Argand lamps, similar to the north-weat light-shlp at Liverpool and those generally employed by the Trinity Llouse Board und Irish Board. Proper distinguiahing
marks by day, as well as the distinctlona of the lights at night, should not be neglected, and the Board can not do better than recommend the Liverpool and other English light-vessela as proper models, in every respect worthy of imitatlon. There are many polnts on our aouthern coast, especially in the sounds and haya, where amall light-vessels are now placed, at which screw-pile foundationa might be anvetiluted with great advantage to the navigator, and in an economical polnt of view. Structuren on screw-pilae costing in the aggregate much less than the light-loata, and affordlng a more powerful and efficient llght , would conduce greatly to the efliciency and economy of this lranch of the lighting service of the United States. The apparatus of the light-vessels of this country is so far inferior that most intelligent and disinterested persons engaged in commerce snd navigation pronounce them useleas. The example of the Trinity llouse corporation, Liverpool lights astallishments, etc., etc., in fitting up their light-ships with 21 -inch parabolic roflectors und Argund lsmps and burners, has not been followed in this country. While the light-vessels of this country are comparatively useless, those of Great Britain are In many instances equal, and in all nearly so, to thoso placed in towers on the shore. The introduction of movable machinery, with the view to distingulshing these lifhts, is not of very recent date in liurope, though not known here.
"The remevul of light-vessels from dangerous and important pointa on the const, without due notice (a nource of almost universal complaint by masters of yessels), is an evil that can not be remedied too aoon. It has not been many days since the finest steam-frigato in the navy struck on a dangerous shoal, properily laid down on the coast-survey chart, in consequence of the absence of the lightwessel froun her position. Lightvessela stldon break away from their moorings in England, and are never taken away from their positiona without previously placing a substitute. This branch of the lighting service of the country is probably the most defective. Properly modeled, built, and moored, light-vessels, fitted with the hest apparatus, and phaeed under the charge of competent masters, with ample crews, governed by the must rigid rules and regulations, and subjected to frequent visitation and inspection, can alone aulserve the great interests of navigation, in this branch of the lighting service.
"Manner and Frequency of Inspection-Persous by whom made.-All experience shows that frequent inapections of light-houses are essential to maintaining an efficient ayatem. These inspections, by competent persons (engineers of the corps of Ponts et Chansien) are carefully provided for in France, by members of the Triuity Board in England, and by the engineers of local estabishments, such as that of the Port and liay of Liverpoal, and by the engineers and their assistant. of the eatablishmenta of Scotland and Irelanil. The vigilauce which is sucured by inspections at irregular intervals is of greater value than even the direct results of an examization. Our system, at present is quite deficient in this respect; a single annual vixit from the collectors, who are superintendents of lights, and the visit of the employee who delivers supplies to the lighthoune, etc. (the latter, fil rome districts, being the oniy' inspection), is obriously insufficent. (See Senate Duc, No. 428, 1st session, 20th Congress.) The evident state of preparation in the light-heuses at which the vixits of the board were expectel, showod that grod effects would flow from a syatem of inspection. Such a syatem could be organized with very littie, if any, additional expense to the g overnment; which will be discussed in detail in another part of thits report. The efficiency which would be gained by thorough inapection would justify additional expenditure, if it couid not we reached without it ; but it is Leiieved to be clearly demonatrated eisewhere in this report, that the present annual expenditure for com-
mission on purchasen, distribatlog supplise, and nominal Inopectiona, trould be ample, under the system proposed by the Board, to produce these desirable sod beneficial resulta. Metter havo feover lights and effective, than many without efficiency. In the district of New York the collector employs an asslatant, who is charged with the care of the llghts, beacons, buoyn, etc., and who has under his charge a small vessel for furnighing supplies, vistting the lights, roplacing buoys when diaplaced, and the like. The zeal of thls gentleman has been servicable in the management of this district ; and were it guided by good instructions, and sustained by occasional vialts of a competent general inspactor, would produce still bettor resulto.
"Positions of Beacons, Buoys, etc.-As a general rule, only seamen familiar wlth hydrography, and pilota, know what beacons, buoys, and sea-marks are required, and where and how they should be placed. The bescons, buoys, and sea-murks which would anfice for pilots, with their accurate knowledge of natural and artificial oljects available for affe navigation, are not always sufficient for mariners generally. Their object is net to dispense with the services of the pilot, but to furnish him with marks, etc., to provido for cases of eniergency, when the vessel must enter, and may not be provided with a pllot. Small coasting vessels, carrylug freights whleh do not pay well, can not afford to pay pilotage. The necessity for the beacons, buoys, and sea-inarks recently and at present provided for ty law, is inquirsd into and reported upon by the superintendent of the coast survey, on the examinatien of officers of the work, and by the chiof of the Topographieal Burenu. They are then usuilly placed by pilots or seainen, but sometimes by the officers of the coast survey. When required to be removed on account of ice, or for repairs, or when Ilisplaced, they are replaced by contract by the year, under the suthority of the local superintendent. The duty of replacing bunys driven from their moorings is nelther superiutended ner executed in a proper manner. The buoys are usually placed by pilots (who contract to perforn the service) by compass bearings, ranges, or by guess ; end it has been remarked by the surveyors, that li many cases their places are so much ehangel in diffetent years us to proluce crror, and oven danger. The cosst survey officers place them by the known positions of three suitable oljjects on shore-a method known as the three-point problem, measaring tho angles with a sextant. This is the true mode of placling them; and no person should be permitted to put them down who is not conpetent to use that Instrument. When placed, it is indispensable that their position should be verlfied by a conpleteat officer, that he should report In relation to them to the local or general superintendent, and that he should ingpect their positions from time to timo, und always when, by aceldent or design, they have been moved.
"Coloring nnd Numbering Buoys.-- Vntll the passage of the recent law (1850), in regard to coloring broys, the locul superintendeuts changeil tho colors at pleasure, often introducing the utmost confusion. No notice of such change being given to the general superintendent, no changes could be made in the elarts of the coast, and the wurst consequence might have reanled. Wine legisiation has checked this; hat it is still true, that the examination of positions, colors, and numhers, shoukd be mada ty compretent inspectors, and reported to the Department. Plain as are tho directhons of the law in segand to coloring and numbering buoys, there is known one importunt port in which the provixions of the law have been completely misunderatood, so that a navigator running hy the buoys must put his vessel, if of considerable drunght, on the bar.
"Sufficient care has not boen bestowed upon the huoyn generally; under the law of $\mathbf{1 8 0 0}$. The paint used for erioring has not been, in any single instance that the lbond has seen, of the best quality. 'lo carry
oat the design of the act of Cengress, the red espeelally should he of the beat quality of red lead, the black of the glosslest, and the white of the purest white. Spanish brown and dirty black are difficalt to diatinguish from each other. Sach may be seen almost everywhere along our entire coast. The apar-bueys, being the mest common in this ceantry, are insfficlent difficult to give easily distingaished marks or numbera, and from their peculiar shape, size, and Improper mooring, are too ofteri at'such an angle with the surface of the water as to render them exceedingly difflcult to be soen." Can and nun'buoys are empleyed, but not to a great extent, and those used are mach two small. The boat-bueys, ised chlefly on the eastern cosast are very inieficient. In aome of the rivers, barrel-buoys, equal In capacity to about $n$ sixty-gallon cask, are employed. Iron haoys have been authorized, by special act of Congress, for the Columbia River, rivers in Texae; Hatteras Shnals, etc. The mooring of buoys in the United States are, as a general rule, very defective. The welght of the blacka of granite, or sinkers of lron, and size of chains, are not sufficient. For want of proper inspection, buoys frequently sink st their mooringe, and part their chalns. Too much care can not be taken to gonril against those casualties, especially In Important channels: in rivers and on sind-bars, lodgments of thls kind may destroy n valuable channel. The important duty of raising and replacing buoys shonld not be left to the discretion of contractors. The kind of bunys required, their material, etc., shoald all he proviled for by competent persons. In regard to distingniahing them, the Bonrd will elsewhere make further remarks. The numbers, as now placed upon the buoys, are very ineffective. The law in regard to coloring and numbering them, however, is deemed all-sufficlent.
