 A An Influence of War on' Pricesin- The effect of war In obetructing the ontdinaty chatinels of commercial interqourse, land ootasloning extreme floctuations in the supply etad price of commbdities, is well knownis In this respect, however, the letter part of the Frenoh war is, perhaps, cutilled to a proveminemce. Englarid then deait with an onomy who had extended hls sway ovar most part of the Continent $q$ and who endeavored; by every means in his powery to shut us out of the Contineatalimarkets: nMr. Toek has given, in his clabozate andivaluable: work on High and Lou Prices, a 'variaty of details which strikingly illustrata the effect that the regulationa theniadopted by tha belligerent powers had on ptices. "f, "Among the meens," says.Mr. Tooke, "devieed by the ingenuity and enterprise of adventurers to elade or overcome the obstadles presentod by the decras of the enemy, one in particular; whioh was resorted to on an extensiva scale, deserves mention, as illustrating in a striking manndr the degred in which those obstades wore calculated to inarease the cont to the consumer.i Several veoseis laden with uigar, coffee, tobecca, cotton twlet, and other valuable commodities, were diepatched from Eugland, at very high rates of freight and inurance, to Salonice, where the goods were landed, and thenee conveyed on mules and horges through Servia and Hungary to Vionns, for the purpose of being dietributed over Germany, and poesibly inte France.: Thus it might happen that the inhabitsute of thst part of the Continent moat contiguous to this country conld not recuive their aupplies from us without an expense of convayanos equivalent to whst it would be if they were removed to the diatance of a searvoyage twice sound the globes hut not aulject to fiscal andipolltical reguletions.".11 And in consequenco of these, and other causee of tha same sort; Mr. Tooks mentions that the price of sugar in France, add other parts of the Continent, during the latter years of tho War, was as. high as bo, and. 6 s . a pound; that cofice rose to 7s. indigo to 18a, and so on. But the aums charged for frelight and Ineurance were the most ex-
traordinary. Mr. Tooke statea that ho has known inatances in which the license, freight, and other charges on account of a vesisel of about 100 tona burden, making a voyage from Calais to London and back, have amounted to the almost incredible anm of $£ 50,000$ ! $\mathbf{A}$ ship, of which the whole cost and outfit did not amiount to $\$ 4000$, earned during the latter period of the war a grose freight of $\mathbf{\Sigma 8 0 , 0 0 0}$ on a voyage from Bordeaux to London and back! The freight of indigo from London to the Continent doea not at present uxceed 1d. a peund; whereas It amounted, at the period referred to, to about 4a, 6d,-High and Low Prices, 2d ed. p. 212.
6. Intuence of Taxes on Prices.-It is unnecessary to dilate on a topio so familiar to every onc. When a tax is laid on a commodity, its price necessarily rises in a correaponding proportion; for otherwise the producers would not obtain the ordinary rate of profit, and would, of course, withdraw from the business. The rise in the price of several of the articles in the annexed tablo is principally to be ascribed to the increase of taxation. These atatements will probably auffice to give our readers a general idea of the principles which determine the value of commodities. To go deeper into the subject would involvo us in diacussions that belong to political economy, and are aniong the most intricate in that science. The influence of speculation on prices must not, however, be passed over in a work of this sort.
6. Influence of Speculation on Pricen,-It very rarely happens that either the actual supply of any species of produce in oxtenalve demand, or the intenalty of that demand, can be exactly measured. Every transaction in which an individual bnys produce in order to aoll it again, is, in fuct, a speculation. Tho buyer anticipates that the demand for the article he has purchased will be such, at some future period, either more or less distant, that he will be able to dispose of it with a profit; and tho success of the speculation depends, it is evident, on the akill with which he has estimated the circunistances that must deterinino the future price of the commodity. It follows, therefore, that in all highly commercial countries, whore merchants are posaessed of large capitals, and where they are left to be guided in the use of them by their own discretion and foresight, the prices of commodities will frequently be very much influenced, not inerely by the actual oceurrence of changes in the aceuatomed relation of the aupplyand demand, but by the anticipation of such changes. It is the business of the merchant to acquaint, himself with overy circumstance affecting the particular description of commodities in which he deals. Ite endeavors to obtain, by meana of an extonalve corrcapondenco, the cariest and most authentic information with respect to every thing that may affect their supply or deinand, or the cost of their production; and if he learned that the suppiy of an articie had failed, or that, owing to changes of fashion, or to the opening of now channels of commerce, the demand for it had been increased, he would most likely bo ulsposed to become a buyer, in anticipation of profiting by the rise of price, which, under the circumstances of the case, could hardly fall of taking place; or, if he were a holder of the articic, he would refuse to part wit'l it, uniess for a higher price than he would previonaly have aceepted. If the inteliigence received by tho merehant had been of a contrary deacription-if, for oxample, ho had learned that tie article was now produced with greater facili$t y$, or that there was a falling off in the demand for $i t$, caused by a change of fashion, or by the shutting up of some of the markets to which it had previousiy been admitted-he would have acteil differentiy; in thin case he would have anticipated a fall of priees, and would oither have declined parchasing the article, except at a reduced rate, or have endeavored to get rid of it, supposing him to be a holder, by offoring it at a lower price. In consequence of these opurations, the prices of commodities, in different places and perioda, are brought
comparatively near to equality. All abrupt tranaltions, from scarcity to abundance, and from abundance to scarcity, are avolded; an excess in one case is made to balance a deficiency in another, and the supply is distributed with a degree of steadiness and regularity that could hardly have been deemed attainable.

It is obvious, from what has now been atated, that those who Indiscriminately condemn all eorts of speculative engagements have never reflected on the cir cumstances incident to the prosecution of overy undertaking. In truth and reality they are all apeculations. Their undertakers must look forward to periods more or less distant ; and their success depends entirely on the sagacity with which they have estimated the probablity of certain events occurring, and the influence which they have aacribed to them. Speculation is, therefore, really only another name for foreaight; and though fortunea have sometimes been made by a lucky hit, the character of a successful speculator is, in the vast majority of instances, due to him only who has akillfully devised the means of effecting the end he bad in view, and who has outstripped his competitors in the judgment with which he has looked into futurity, and appreciated the operation of causes producing distant effects. Even in the securest busineages, such as agriculture and manufactores, there fa, and must be, a great deal of apeculation. An unlooked-for change of season froquently disappoints the apparently reasonable expectations of those who undertake the former; while the equally capricious variations of fashion have to be encountered by those engaged in tho latter; and each is, besides, liable to be affected by legislative onactments, by new discoveries in tho arts, and by an endless variety of circumstances which it is always very difficult, and sometimes quite imposaible, to foresee. On the whole, indeed, the gains of the undertakers are so adjusted that those wlio carry them on obtain, at an average, the common and ordinary rate of profit. But the inequality in the gains of individuais is most commonly very great ; and while the auperior tact, ludustry, or good fortunc of some enable them to realize large fortunes, the want of discernment, the less vigliant attention, or the bad fortune of others, frequently reduces them from the situation of cepitalists to that of laborers.
The great cotion speculation of 1825 took its rise partly and chiefly from a supposed defieiency in the aupply of cotton, partly from an idea that thers was a greatly increased demand for raw cotton in this country and the Continent, and partly from a belief that tho stocks on hand were unusually low. Now it is obvious that the success of those who embarked in this apeculatiou depended entirely on two circumatances: viz., first, that they wero right in the fundamental supposition on which the whole speculation rested, that the supply of cotton was no longer commensurate wi.ll the deuland; and, second, that their competition did not raise the price so ligh as to diminish the conammption by the mannfacturers in too great a degree to enabte them to take off the quantity to be actually hrought to morket. If tho merchants had been well founded in thoir suppositions, and if their competition had not raised the price of cotton too high, the sieculation would certainly have been muccessfui. But, instead of being well founded, the Jypothesis on which the whole thing restod was periactly visionary. There was no deficiency in the supply of cotton, but, on the contrary, a great anperaboudance; and though there had been such a deficiency, the excess to whicil the price wus carrien must biva checked consumption so much as to ocrasion a serious decline. The failing off in the inporta of cotton from America in 1824 seems to have been tite su urce of the delualon. It was suppoaed that this falling off $n$ is not accidental, but that it was a consequence of the $t$ ice of cotton liaving been for a series of years so low as to be inadequate to defray the expenses of ita cultivation. The result shewed

that this calculation was most erroneous. And besides, in entering on the speculation, no sttention was paid to Egypt and Italy-countries from which only about $1,400,0001 \mathrm{bs}$, of cotton were obtained in 1824 , but from which no less than $23,800,000 \mathrm{lbs}$. were obtained in 1825! This unlooked-for importation was of itself alinost enough to overturn the comblaation of the apecudators; and, coupled with the increased importation from Amorica and other countries, actually occasioned a heavy glut of the market.

The risk to which merchants are exposed when they either aell off any col, modity at a reduced price in anticipation of a fall, or huy at an advanced price in anticipation of a future rise, is a consequenco principally of the extromo difficulty of ascertaining the true state of the fact with respect to the grounds on which an abundant or a deficieat supply, or an increasing or deereasing deniand, may be expected. Rules can here be of no service; every thing depends upon the talent, tact, and knowledge of the party. The queationa to be solvod are all practical ongs, varying in every csso from each other; the skill of the merchant being evincell by the node in which ho conducts his busineas under auch circumstances, or by his sagaelty in discovering coming events, and appreciating their character and the extent of their infinence. Priorlty, hut, above all, accuracy of intelligence, is in such cases of the utmost consequence. Without well-authenticated data to go upoa, every atep taken may only lead to error. The instances, indeed, in which speculations, appareatly contrived with the greateat judgment, have ended in baukruptey and ruin, from a deficiency in this essential requisite, are so very numerous, that every one must he acqualnted with them. Hence the importance of solecting acute and cautlous correspondents; and hence, also, the necessity of maturely weighing their reports, and of endeavoring, by tho aid of information gleaned from every authentic aceessible source, to ascertain how far they may be depended upon. When a few leading merchants purchase in antleipation of an advat: ${ }^{n}$, or sell in anticipation of a fall, the speculation is often pushed beyond all reasonsbla limits by the operations of those who are influenced by imitation only, sud who have never, perhaps, reflected for a moment on the grounde on which a variation of price is anticipated. In speculation, as in most other things, ono individual derives confldence from another. Such an one purchases or selle, not because he has any really accurate information as to tho state of the demand and supply, but because gonie one else has done so hefore him. The original impulse is thus rapidly extended; and even those who are satistied that a speculation, in anticipation of a riso of prices, is unsafe, and that there will be a recoll, nut unfrequently adventure, in the expectstion that they will he ablo to withdraw before the recoil has begun.

It may, we beliove, speaking generally, be laid down as a sound practical rulo to avoin laving any thing to do with a speculation in which many have already engaged. The competition of the speculators seidom fails speedily to render an adventure that might have been originally aafe extremely hazardous, If a commodity happen to be at an unusually reduced price in any particular market, it will rise the moment that lifferent buyers appear in the field; and supposing, on the other hand, that it is fetching an musually high price, it will fall, perhaps, far below the eost of production, as soon as supplies hegin to be joured in by different merchants. Whatever, therefore, may be the success of those who originate a epeculation, those who enter into it at an mivanced period are almost sure to lose. To have been preceded by others ought not, in such matters, to inspire confidence; on the contrary, it ought, unless there be something special in the ease, to induce every conslderate person to deeline interfering with it. T'le maintenance of the freedom of intercourse between different countries, and tho more gen-
eral diffusion of aound instruction, seem to be the only means by which those miscalculations, that are often productive of great national as well as private lose, can be either oby ated or mitigated. The effects coneequent to such improvldent apeculations being alwayo far more injurious to the partica engaged in them than to any other class, the presumption is that they will diminish, both in frequency and force, according as the true principles of commerce come to bo better understood. But, whatever inconvenience may occasionally flow from them, it is abundantly plain that, instead of being lessenod, it would be very much increased, were any restraints imposed on the freedom of adventure. When the attention of many individuals is directed to the same lino of speculation-when they prosecute it aa a business, and are responsiblo in their own private fortunes for any errors they may commit-they acquire a knowledge of the various circumstancea Influencing prices, and give by their combinations a steadiness to them which it is easy to aee could not be attained by any other means. It is material, too, to bear in mind, as was previously stated, that many, perhaps it might be said most, of those who preas so eagerly into the market when any new channel of commerce is opened, or when any considerable rise of price is anticipated, are not merchants, but persons engaged in other busines' s, or living, perhaps, on fixed incomes, who speeulate in the hope of suddenly increasing their fortune. This tendency to gambling seldom fails to break out upon such occasions; but fortunately these are only of comparatively rare occurrence; and in the ordinary course of affairs, mercantile apeculations are left to be conducted hy thuse who are familiar with business, and who, in exerting themselves to equalize the variations of price caused by varistions of climate and of seasons, and to distribute the supply of produce proportionally to tho effective demand, and with so much providence that it may not at any time be wholly exhansted, perform functions that are in the highest degree important and heneficial. They are, it is true, actuated only by a desire to advance their oivn interesta; but the results of their operations ars not less advantageous than those of the agriculturist who gives greater fertility to the soil, or of the mechanist who invents new and more powerful machines.

Those desirous of detailed information as to the prices of commudities in Great Britain, in remoter ages, may consult the elaborate tables in the $3 d$ volume of $\operatorname{Sin} F$. M. Eden's work on the Poor; end the 4th volume of Macibiensox's Annals of Comnerce. Auhutinot's Tables of Ancient Coins, Weights, Measures, Priees, ete., are well known; but the statementa are not much to he depended upon. The Traitd de Métrologie of M. Paucton, 4to, Paris, 1780, is the best work on this curious and diflicult sulyect. See also volumes v. vi. Tоoкк on Prices, Lomion, 1857 ; Huxt's Merchants' Magazine, iii. 305 (IItlonetn); Quarterly Reriew, xxix. 214; American Almanac, 1836, 101; Bankers' Magazine, New York, 1857, 91-9.1.
"Conslderable uncesflucss beging to prevall In Paris at the enormone riae thet hat taken place within the last two years In the prices of food and lodging. It is not only that this stato of things drives away the crowds who a few years ago used to resort to Parta to economize, and rhe spent im. mense sums th that capttal, but, what is of fat more inportance in a sociat and potitical point of vtew, tt ctrates sufferthg, and, consequently, discoutent among the working ciasses. In all the capitala of Europe, there has been of tate a sianiar tendency to an incresse in prteea, partiy caused, no doubt, by the uncertatnty created by the latu war, and by the withdrawal of large numbers of abte-bodied men from the ordinary puraults of agriculturo and industry, to awcit the ranks of 'he standing armisa kept up by the four great nitittary monarohles of France, Russta, Austria, and Prusita. Perhaps, also, the apeculative habits of the preeent generation have had some ehare in producing this resutt."

The above is from a lato London paper. The same remark is pertinent to new circumatances in the Unitod States. The alvanced prices charged for all comnodi-
ties where labor is invelvad in their productlon, and where naw machinery and new appliances can not be used, are unerring reaults of an increased volume of the precious inetals. According to estimates made by statistical writers who have examined the subject critlcally, the increase of the precious matals during the aix yeers, 1851-1856, is fully one-third of that existing in the werld at the end of the year 1850.

The product of gold in California ia thus stated in round numbers:

| Yabrs. | Export. | Marginal Addilion. | Tolal. |
| :---: | :---: | :---: | :---: |
| 1818-49. | \$3,1100,000 | \$806,000 | \$8,866,000 |

At the same time, the rate of interest has increased from an average one of 8 and $8 \frac{1}{f}$ to 6 and 7 per cent.; and the active domand for capital throughout Europe, in aupport of heavy undertaklngs abroad and at hone, will probably malntain the current ratea for saine years to cons. We aee no present indications of a plethore of cupitnl.

We think It will appear that a greater risa, pro rata, has taken place in prices within this short period. In cur own country, the prices of market produce, lahor, and materiala requiring lal.ar for their production, have all increased from thirty to tifty, and in some instances to one hundred per cent. In articles of fool in the London markate, the changes in prices between 18511857 are shown in the following summary, which we take from "Tookk's History of Prices, during the y eara 1848-1856," just published la London:

| Arucles. | January, 1851. | January, 1854. | Fab 1837 |
| :---: | :---: | :---: | :---: |
| Coffec | 63 atsa | $63 \mathrm{a} 6 \mathrm{ls}$. | 68 a 6 ? |

Thene facte are impertant, as demonstrating the progresslve advance of prices according to the increased bulk of precions metals. The apme result occurred in the ceatury following the dlacovery of pold in America ( $1500-1600$ ), altheugh the increased production was far less than it is now. Ients, wages, family supplies, labor generally-all advanced fully one linndred jer
cerit.; and the probability is that an equal (or greates) ratio of increase will talse plece between 1850 and 1860. It is trua that the prowent accumulation of precious metals is diffused among a mneh larger population and over a mere exteaded region of country than in the 16th or 17 th centurias; but similar causes will produce similar results, and labor will secure for Itself a remuneratlon commensurate with the increased expenses of living.

Fluctuations in Prices.-Mr. Tooke, an English writer of some celebrit has lately added two volumes on the pricas of 1848-io56. From these volumes (published in London in 1857) we extract the following suminary view of the changes in prices since the discoverica of gold in California,

Summary of Conclusions with Reference to the Prices of Commodities and State of Trade, 1848-66.-W ithout attempting to Include in a sumimary of concluslons all the inferences which arise froin this survey of the past few years, we present the following statements as setting forth those resulta which are bent establislied and most Impertant, viz.: That as regards thë great articles of import, such as celonlal and tropical produce and cominodities largely employed in thls country as raw materials of manufacture, the course of prices during the nine years, 1848-'56, may be described in general terms, as follows, viz.: During 1848 and 1849 there was a general, and, in suveral important instances, a strong tendency to luwer prices: that in 1850, nartly in consequence of larger consumption and partly in consequence of actual or arprehended failures of supply, pricea sensibly, and, in some cases, matcrlally advanced; that in 1851 thero was again an extensive and severo decline, attributable almost wholly to excess of supply; that in 1852 there wisa a manifrst tendency toward recovery; that in the firat nine months of 1853 the upward tenclancy of the previous year reached its higheat polnt, establishing and maintaining for nine monthe a range of prices considerably ligher than had prevalled for $n$ long period; that from the autumn of 1853 to the cluse of $185-$, there was a sensible reaction from the prevlous high rates, except as regards some of the articles immediately affected by operations, or the commissariat consumptien of the war; and that in 1855 and 1850 the markets were quict and tirm, exhlbitlng only such fluctuations as arese out of ordinary changes in supply and demand. In a future part we shall inquiro how far the fluctuations of frices now referred to were connected with the influx of the new gold.

That the first effecta of the California discoveries of 1848 were felt in England in 1850 and 1851, and nani. fested themselves in the Increased demand for lritioh and foreign artlcles suitable for the export trale to the Unlted States; that the same effect 3 were still mute seusibly felt in the course of 1852; that in 18.3 the consumption of British goods in California and the United States generally had become ao large nud rupid as to counteract almost entitely, as regardy Euglund, any prejudicial eftect upon the balance of trade of the vast imports of grain, rendered secessary l y the serious fallure in these islands of the harvest of ix53; that the same large Ainerican demand for British exjorts continued throngh 1854 and 1855 , and had prevailed through 1856, interrupted lut casually by the extensive failures and discredit which prevailed in the United States and California dtring portions of the years 1854 and 1855 ; and that, as the general result of the trade between Fingland and the V'nited States since 1850, tha abaorptlen of Britisl exports either in Callforma itself or in those regions of the Nurth Ameriean continent to whleh the supplies of C'alifornis gold are chiefly bent in the first instance, has increased so rapidly as to render necessary a constant and large eransmission of tho precions metals from America to England.

Tinat the effects of the Australian discoveriss of the
sammer of 1851 were felt in this conntry in a striking manner varly in the following year ( $\mathbf{1 8 5 \%}$ ), manifeating themeelves in a sudden and large expansion of the atream of emigration from these islands, and in a sud. den and large expanaion in the shipment of nearly all descriptions of columodities; that the demand for ahip hence arising could not, in the then condition of the mercintile marine, be readily supplied; ana the consequence was an enormous increase of the rates of freight, and a demand for new ships so urgent, that conaidershly higher wages were at once conceded in all the ship-building tradea; that the same urgent demands for Australia continned in the early part of 1853, were considerably mioderated in 1854, atiil more reduced in 1855 , but in 1856 were again marked by considerable activity. That the movernent for hlyher wages aaccessfaliy commenced in the autamn of 1852 ; in the ahip-huilding trades became almost universal $\ln$ the first half of $180 \mathbf{8}$; and previous to September, in that year, had led to a very general aildition of from 12 to 20 per cent. to the wages curront in 1851; but that the effect of the bad harvest of 1853 , the war of 1854-'55, and the glut of the Australian msrikets, was to produce a considerable reaction from this advance, especially io. the factory districts. That the firat and immediate affect of tha high prices of colonial and other imported orticles in 1852 and 1853 , and of the high prices and large demand for manufactured goods in the same years, was to occasion vigorous efforts and a largo expenditure of capital, with a view to opening up new fields of aupply, and creatiug extended means of production ; and that it is principally to the operstion of these causes that the steady and frequently declining course of prices since 1853 is to be attributed.

That as far as trustworthy evidence can be obtained, there are no facts in the exparience of the last nine years which justify the conclusion that in England the fluctuation of prices, the course of trade, or the increased demand for goods arising out of the large exports to America and Australia, were immediately preceded by or connected with changea in the amount of the aggregate outstanding circulation of bank-notes. in other worda, all the ovidence available to us points distinctiy and uniformly to the conclusion that the fiuctuations of the bank-note circulation were determined and regulated by the consequences flowing from previous applications of capital and credit in particular motjes. That further, in a great number of specific iastances, it can be shown conclusively that fluctuations of price of the most important kind, and in the lnrgest markets of England, took place either without the occurrence of any change whatever in the bank-note circulation or contemporaneoasly with the occar rence of a change the precise opposite of that which on a priori grounds, or on the grounds on which the currency theory is bailt, would have been expected to precede or accompany the particular alteration in the markets.

That neither is thero any suci coincidence between variations in the rato of interest and variations in the markets hur produce, as to justify the infereace of a direct connection between them in the relation of cause suld effect. That the firat effect of the gold discoveries on the financial condition of England was the remarkable and : 'olonged tepression in the rates of intercst and discount, which prevailed durlng the twelvemonth preceding the spring of 1858; that this effect on the rate of interest was the immediate consequence of an excessive accumulation, principally in the Bank of Engiand, of the early remittances from California and Australia; and that the influence proluced by these accumulatious on opinion and credit was grestly extended and aggravated by tie maintenance at the Bank of England of a rate of discount so low as 2 per cent., from April, 1852, to January, 1858. That the rise of the rate of discount which cominenced in Janusry, 1853, and has been maintained during the subsequent three years, is to be traced in its origin and continu-
ance to extended demand for capital for the purpose of new, distant, and coatly onterprises, directed either to the construction of publie works, to the extenaion of old and introduction of new processes, or to the exploration of new flelds for the aupply of commodities; and that, $\theta 0$ far as we can judge from recent experience, the absorption of capital for these and other objacts becomen more rapid and extenalve wlth every suc. ceeding year.

That the interruption to the trade of England oceasloned by the Russian war of 1854-'55 was comparatively slight, and for four roasons, viz.: 1. Becauae the theatre of war was in a remote part of the east of Europe; 2. Because the enemy had practicaliy no navy that could moleat our commerce; 3. Because the raw materials previoualy obtained from Russia atill continued to arrive through neatral ports or were readily replaced by imports from lndia and eleewhero; and 4, lastly, because tho invention of the telegraph, the existence of steam, and the enormone resources of our mercantile marine and postal aervices, enable us to accompliah in a faw weeks' operations what, at the commancement of the century, would have occupied a long earice of months. That further, in addition to and far more powerful than any of the five causen just enumerated, was the effect of the continued influx of gold during 1854 and 1855 -but eapeciaily during the latter portion of 1855, in averting from England nnd from France the extreme financial pressure and peril which, in the absence of that influx, must inevitably have been preduced by the necessity of providing largo and constant remittances of gold to the seat of war; and must inovitably have placed entireiy out of question the maintenance of the restrintions of the Bank Chart Act of 1844, and perhaps have even imperiled the maintenance of the act of 1819.

That during the years 1848 and 1849, and part of 1850, the losaes and cliacredit which fell with crushing force on a large portion of the middle classea involveil in the railway expenditure, did, heyond question, prodace some important effect in limiting the consumption of commoditios. That, on the other hand, it was a direct consequence of the railway expenditure of the years 1848,1849 , and 1800 , that the working classes wero provided with fair employment during a period of interrupted trade, and it was also a direct consequence of the cheapnesse of food, and the low range of general prices which prevailed to the year 1852, that the working classes were able to command, by means of their wages, a larger amount of sustenance and comfort than had been within their reach probably at any former period of the century.-Tooke's History of Prices, 1857.

Price-current, $n$ list or enumeration of the various articles of merchandise, with their prices, the duties (if any) payable thercon when imported or exported, with the drawbacks occasionaliy allowed upon their exportation, etc. Lists of this description are published periodically, generally once or twice a week, in most great conmercial cities and towns.-For examplea, bee the articles Genoa, Havre, Tineste, etc. in this work.

Pride of China. The Melia azedarach, or Pride of Chinn, is supposed to have been originally a native of I'ersia, where it was known as long ago as the year 980, by Avicenna, an Arabian physician, who noticed the venomous principle which resldes in its fruit; but some otaniats are of the opinion that it is also indigenous to Florida and the United States, or at least has become so from habit; for it is found there growing wild in the forests, aind attains its fullest magnitude. It is propagated for ornament or use in all the warm countries of the civilized world. It is also cultivated in conservatorios in the temperate and colder parts of Europe and Aniorica, and even there it often flowers, and ripens its fruit.

Properties and Uses.-The wood of the azedarach is
of a reddish color, and la organizad in the dietrisation of its fibres similar to those of tha ash. It is sufficiently atrong and durable to be eusployed in eivll archteoture, and ls adapted to varlous unce in the mechanic arts. It has already been empicyed for pullaya, which in Einrope are uaualiy madn of elm, and in america of ash. It is anid to make good fuel. Tho fleshy part of the frult, lika that of the olive, ylelds a fixod oil, which is litter, and is considered as antheimintic, and a narcotic stimulant. The leaves are univerasily used in Indla for poultices, and both the flowers and seeds are atmulnat. The berries, though sald by the Arablan physiclan, Avicenna, to be poisonons, and the pulp of wilch was mixed with grease, for the purpose of killing rats and dogs, ame often eaten by chilidren in the South whithout injurious effects. According to Mr. Royle, however, tho fruit is censidered at polsonous when used in large doses. The bark of the root, when green, has a bitter, nauseous taste, yleiding lis virtues to boilling water, and may be employed an a cathartic or ometle, and la considered as an offielent vermifige, and also may bo used with advantago in Intermittents. In Persia, an olntment la made, for the cure of aome cutancoue eruptlons, by mulling the leaves with lard. It is also said that a kind of toddy is obtalned by fermenting the sap of young and vigorons trece. The nata are often bored by monks, and strung lnto beads. Hence the names of Bead-tree, and /aternostri di San Domenico.-Browns's Trees of Ameriaa.

Primage and Average. Primage la a charge in addition to the frelght. It was originally intended as a gratuity to the captain for his partleular care of the goods, and is sometimes called hat-money ; but it now belongs to the owners or frelghters by charter-party of the vessel, unless by special agreement the whole or portion of it is assigned to the captain. It is collected with the freight. The rate or manner of makling thls charge depende chiefly upon the custom of the department of trade in which the ship is eagaged. Very commonly lt is a rate, as 5,10 , or even 15 per cent., upon the amount of the freight. In some trades it is a rate per hogshead, etc., and in some cases it is not allowed, the word primage being canceled or omitted, and the words in full beling added to the stipulated rate $0^{0}{ }^{0}$ the freight, as has been noticed in speaking of the forms of bllis of lading. The average referred to in the bill of lading is the llability to general contributlon for making good any damage which has been occasioned by any step necessary for general preservation. This forms what is called a "general average," and the notice of it is introduced into the bill of lading to nvoid any doult as to llability on the part of the consignee or elaimant of the goods.-See InburanceShipa, and Suliping.

Prince Edward. Island. Lat. N. $46^{\circ}$ and $47^{\circ}$ $10^{\circ}$; long. W. $62^{\circ}$ and $65^{\circ}$; area, 2181 pquare milies; length alout 135 miles; and lireadth from 4 to 34 mlles.

The island of Prince Edward, formerly calied St. John's, is situated in a recess, on the west side of the Gulf of St. Lawrence, and is aeparated from New Itrunswick and Nove Scotia by tho Strait of Northumberiand, whleh at lis narrowest part is only nine milles wide. Capltal, Charlote-Town. The colony is divided Into three counties: viz., Queen's, 15,425 ; Prince, 15,142; King's, 32,111; and Ite total population in 1848 was 62,678 .
The population at several periode was as follows:

| 1802 | 20,67t |
| :---: | :---: |
| 1920 | 22,600 |
| 1837 | 28,206 |
| 1833 | 39,176 |
| 1841 | 47,033 |
| 1848 | 62,078 |

The quantity of arable land under cuitlivation was 216,389 acren ; and the whole quantity of land oecupied was as foliowa: Held ln fee-simple by occupants, 280,649 acres; under lease, 330,293 acres; by written demise,

31,812 acren; by varbal agreement, 88,786 acrea; and by squatters, 65,434 acres. The crope represented in tha census of the anme year conalated of ; wheat, 219,787 buehela ; barlay, 76,521 busheis; onta, 746,383 bushels; potatoes, 781,575 bushels; turnips, 153,083 buabiels; clover-seed, 14,000 pounds ; and hay, 45,128 tons. The liveatock on the isiand was as followat Ilorses, 12,845; neat cattle, 49,810; aheep, 92,875; and hogn, 19,683. The Induatrial establishmenta were embraced under the following branches: 18 breweries and distilieries, 116 grist-milla, 27 carding-mills, 130 saw-mills, and 246 threshing-machinee. The commerce of the island in 1851 is exhlbted jn the following abatract:
Exporta, including 89 reasele, 15,721 tona, int $\$ 16$ per ton; $1,4,47,2 z 4$ foct, and 6318 plecea, boarda and deale; nlingleen 290,777 M: oath, 800.095 quintola: plekled fish, 8024 barrelof oymern. 4371 buahela, and a varsety of other produetm, an timber, scannliog, knees, otc., valued in aff

The number of seamen inward, In 1850, wes 208:, and in 1851, 2370; outward, in 1800,2801 ; end in 1851, 3631.
The following compares the value of the imports and experts for three years:

|  | 184. | 1839. | 1811. |
| :---: | :---: | :---: | :---: |
| Imports | \$576,040 | *630,476 | \$475 871 |
| Exports . . . . . . . . . . . | :82,775 | 828, 489 | 6117.359 |
| Total.. | \$848,815 | \$.56,404 | \$1.083. 260 |

The exports of 1851 include the value of vessels solld to Great Britaln and Newfoundiand, amounting to $\$ 251,536$, which is not included in eliter 1849 or 3850 . In 1849 there were bullt in the colony 88 vessels, 15,902 tons; and in 1850, 93 vessels, 14,801 tons, valued at $\$ 16$ per ton. The total value of articies, the growth, produce, or manufacture of tho United States, imported in 1853, was 877,858 , the whole of which, oxcept to the value of 83200 , were carried in British bottoms. In 1850 the value of the same description of artieles imported was only 842,113. The wide difference between the two years arlses from the fact that in 1851 the duties on jmporta were greatiy reduced from the rates of the preceding year. With the hlgh rates of duties of 1850 , ouly $\$ 6420$ was received on artleles of American production; whlle in 1851, with diminished rates, the distles were increased to 14,020 . The articles experted to the United States In 1851 were as follows: llarley, 17,929 bushels ; boards and planks, 12,000 fcet ; iron, 60 ewt. ; cattle, 9 head ; firewood, 20 cordz; dry fish, 650. quintals ; plckied fish, 1780 barrels; hard wool, 74 tons ; horses, 3; hackmatack knees, 2215; oats, 222,109 bushels; potatoes, 45,942 bushels; turnips, 6000 thushels; and wool, 1700 pounds. The value of the foregolng, with the value of sundry other articles not enumerated, amounted together to $\$ 119,236$. The value of similar articies exported in 1850 was only ©55,886. On the 31st December, 1850, the number of veasela owned and reglatered in Prince Vidward Island was 310, of the burden of 27,932 tons. On the 31at December, 1851, the vessels owned and registered numbered 823, of tho burden of 81,410 tons. Prince

Edward Island has valuable fisherles in the Gulf of St. Lawrence, and in the Stralt.

Prince Edward Island la ohlefly an agricultnral colony. : Ship-building, however, is carried on to a conslderable extent; and now shipa have already become a prominent article of export. In the yeara 1840, 1850, and 1851, there were built in the lslend, for tale in Great Britain, Nowfoundland, or wherever elae they might find a profitable market, 270 vassels, with en aggregate of 45,948 tons; giving an annual average of 90 veasels, and 15,815 tons.

The difference between the imports from the United States in 1850 and 1851 ( $\$ 36,255$ ) is accounted for by the reduction of the duties on importa by colonial act, the bigh duties up to 1851 affecting, to a large extent, the trade with the United States. This reduction of the tarlff of Prince Edward Island not only augmentel the exports from. the United States, but produced a corresponding increase in the imports from that island. Thus, in 1850, the value of experts from Prince Edward Istand to the United States was 855,385 ; in 1851 it amounted to $\$ 119,286$. The trade between the United States and this ialand being now comparetively free, a etill greater Inorease than that exhibited above may be annually expected.

The revenue, expenditures, and public debt of the colony, in 1851, were as followa:

Revenuc.-Customs and imports, $\mathbf{£ 1 7 , 7 6 9 1 8 s . 7 \$ d . ; ~}$ fines and forfeitures, $£ 110$ bs. $1 d$. ; interest on bonds,
 ments, $£ 21651 \mathrm{~s} .7 \mathrm{~d} . ;$ registers, $£ 159 \mathbf{6 s} 2 \frac{1}{2} d_{\text {. }}$; licenscs, $\mathcal{L 4 5 9} 10 \mathrm{~s}$; seizuras, $£ 4498.8 \mathrm{~d}_{\text {; }}$; and fees from Secrstary's office, $£ 29915 \mathrm{~s} .8 \mathrm{~d}$. Total, $£ 22,53814 \mathrm{~s} .91 \mathrm{~d}$., being an average per head of $7 \mathrm{~s} .2 \not 2 d$., or of the net custoins elone, the everage per heal was $5 s, 8 \frac{1}{} d$.

Total, $£ 24,17310 \mathrm{~s}$. $11 \ddagger d$., showing a surplus rf expen'itures amounting to $£ 163416$ s. 2 l . The public debt amounted, in the year above stated, to $£ 17,938$.-AndaEws's Report on Culonial and Lake Trade (Sen. Doc. 112), 1852-'j3; Mahtin's British Colonies (London odition); Report of a Committes (Canadian) on the Income, Eixpenditure, and Debt of British North America (11th June, 1853); U. S. Cumm. Rel., etc.
Printed Croods. The art of callco-printing is of considersble antiquity, and there exist apecimens of Exyptian cotton dyed by figured blocks inany hundrod years old. A similar process has been resorted to even in the Sandwich Islands, where they uso a large leaf as a substitute for the block.-See art. Corron. The copyright of deaigns aecured in Englaud by 2 Vio., 1839.

Printe, impressions on paper, or aome other substance, of engravinga on copper, steel, wood, atons, etc., representing some particular aubject or composition. Prints, like paintinga, embrace overy varlety of aubject; and differ very widely in the manner in which they are engraved. Their prices vary ancording to the style of the engreving, the fineness of its execution, the goodnesu of the impression, its rarity, etc. The art aeema to have taken its rise in the 15 th centary.

Priage, or Butlerage, was a right of taking two tuns of wine from every ship importing into England twenty tuns or more; which was changed by Edward I. into a duty of 2 s , for every tun imported by merchant strangers, and called butlerage, because paid to the king's butler. The term is now fallen into disuse.Blackbtone.

Privateering. In order to encourage privateering, it la usual to allow the owners of private armed vessels to appropriate to themselves the property, or a large portion of the property, they may capture, and to sfford them and the crew other facilities and rewards for honorable and successful efforta. This depends upon the municipal regulations of each partlcular power; and as a necessary preceution against abuse, the owners of privateers are required, hy the ordlnances of the commercial states; to give adequate security that they will conduct the cruise secording to the laws and usages of war and the instructions of the government. and that they will regard the righte of neutrals, and bring their prizes in for adiudication. These checks aro essential to the cheracter and safety of maritime nations. Priveteering, under all the restrictions which have been adopted, is very liable to abnse. The object is not fame or chivalric warfare, but plunder and profit. The discipline of the crews is not apt to he of the highest order, and privateers are often guilty of enormous excesses, and become the scourge of neutral commorce. They are sometimes manned and officered by foreigners, having no permanent connection with the country or interest in its cause. This was a complaint made by the United States in 1819, in relation to irregularities and acte of atrocity committed by private armed vessels saillag under the flag of Buenos Ayres. Under the best regulations, the business tends strongly to blant the sense of private right, and to nourish a lawless and fierce spirlit of rapacity. Efforts have been made from time to time to abolish the practice. In the tresty of amity and commerce between Russia and the United States in 1785, it was atipulated that in case of war neither party should grant commisslons to any private armed vesseia to attack the commerce of the other. But the spirit end policy of maritine warfare will not permit auch generous provisions to provail. That provision was not renewed with the renewal of the treaty. A similar attempt to put an end to the practice was made in the agreement between Sweden and Holland In 1675, int the agreement was not performed. The French Legislature, aoon after the breaking out of the war with Austria in 1792, passed a decree for the total suppression of privateering, but that was a transitory act, and it was soon swept away in the tempest of the revolutlon. The efforts to atop the practice liave been very feeble and fruitless, notwlthstanding that enlightened and onlarged considerations of national policy have shown it to be for the general henefit of mankind to surrender the licentious practice, and to ohstruct as little as possible the freedom and socurity of commercial intercourse among the nations. -Kent's Commentaries. The reader is referred to the North A mericun Review, x. 166 (J. Gallason); Niles's Register, xiv. 129, xvi. Sup. 29; De Bow's Reciew, i. 516. See also Manitims Law, ante, 1321, et seq.

Ietters of Marque and Reprisal "are grantable hy the law of nationd, whenever the subjects of one state are oppressed and injured by those of another, and jniftice is denled by that state to which the oppressor be-
loggs."-Chitty's Comm. Law, vol. ili. page 604. Before granting lettare of margue, government is directed by the 5 IIen. V. e. 7, to require that satisfaotion be made to the juarty aggrieved; and in the event of anch satisfaction not being made within a reasonable perlod, lettera of marque and reprisal may be issued, authorizing the aggrieved party to attack and seize the property of the aggrassor nation, without hazard of being condeunned as a robber or pirate. Such letters are now only lesued to the owners or captalns of privateers during war, or when war has been determined upon. They may be revoked at the pleasure of the sovereign ; and when hostilitiea terminate, they cease to have any effect: Letters of marque and reprisal were first lasued in England by Edward I., for the seizure of the enemy's vessele, and for reprisal and retaliation upon the enemy on the sea.-Rymen's Fodera. They were first granted in 1995.-Baken'a Chrom. They are asually granied in time of war to private armod shipe, and do great michief to the commerce of belligerent nations,-Pow EL.

Privateers, ships of war fitted out by private individuals, to amoy and plunder the public enemy. But before commencing their operations, it is indispensable that they ohtain letters of marque and reprinal from the government whoee subjects they ars, authorizing them to commit hostilities, and that they conform strictly to the rulea laid down for the regulation of their conduct. All privato Individnals attacking others at aca, unless empowered by letters of marque, are to be considered pirates, and in ay be treated as such either by those they attack or by their own government.

Policy of Privaleering.-The policy of this system is very questionable. It seems to be a remnant of that species of private war excreised by all indivfituals in enrly ages, but which gradualiy disappears as society advances. In wars carried on by land, the property of the peaceable inhablants who take no part in the operations of the armies is uniformly protected; and It is difficult to discover any solid grounila why tho same rule should not be followed at sea. I'rivateers rarely attack ships of war. Their object is merely to plunder and deatroy merchantmen. They causo an infinite deal of mischief to individuals, and aggravato all the miseries of war, without having the slightest influence on the result of the conteat. Experience has also shown that it is not possible, whatever precautions may be adopted, to prevent the greatest abusea from being perpetrated by privateers. The wish to amass plander is the only principle by which they are actuated; and nuch being the case, it would be Idle to suppose that they should be very scrupulous about abstaining from excesses. A system of this sort, if it be ever useful, can be so only to nations who have little trade, and who may expect to enrich themselves during war by fitting ont privateers to plunder the merchant ships of their enemies. In all or. $f$ cases it seems to be productive only of mischief; though it is, of course, most injurious to those states that have the greatest mercantile navy. Instead, therefore, of enconraging the practice of privateering, we think that $n$ due regard to the rights and Interests of humanity would suggest to the great powers the expediency of abolishing it altogether. A fow efforta have, indeed, been alresdy made toward this destrable object. Thus It was stipulated in the treaty between Swedion and the Unit ed Provinces, in 1675, that neither party should, in any futuro war, grant letters of marque againat the other. In 1757 Russia abstained from Jlcensing privateers; and in the treaty loetween the United States and Prussia, in 1785, a atipulation was Inserted as to privateers, similnr to the: in the treaty between Sweden and the United Provinces in 1675. But nothing short of a convention and agreement to that effect among the great powers will be able to effect this desirable object.-Mantrens, Fasai concernant les Armateurf, 1794. See Manitime Law, p. 1822, etc.

Prise. Any thing captured by a belligerent using the right of war: in common language, only shipa thus captured, with the property taken in them, are so called. Prises taken in war are condemned by the proper judicaturs in the courts of the eaptors; such condemnation is held to diveat the title of the proprietor and confer a new ownership. In order to give jurladiction to a court of prize, it is deemed necessary, by the law of nations, that the property coptured should be $3 n$ possession of the captors in their own ports, those of an ally, or of a nentral ; but no beltigerent power has a right to capture in the ports of a neutral country, or within a marine league of her shores; nor does a capture made there render the adjudicatlon valid. Sul. ject to capture is hostile property, i. e., the property of parsons domiciled in a hostlle country, and neutral pro, erty contraband of war.--Sec Contranand.
Prize Money.-The money arising from captures made upon the enemy fa djyided into eight equal parts, and is equally distributed by order of government, thus: Capcain to have three-eighths, unless under the direction of a flag officer, who In that case is to have one of the safd three-eighths; captains of marines and land forces, sea licutenants, oic., one-elghth; Ifeutenants of marines, gunners, admirals'secretarles, etc., one-elghth; indshipmen, captain's clerk, ete., one-elghth; ordinary and able seamen, marines, etc., two-eighths. - See Pivateers anil Letteias of Manque.

Prizes.-The right to ail captures veats primarily in the soverelgn, and no finlividual can have any interest In a prize, whether made by a public or private armed vessel, but what he receivea under the grant of the siate. This is a general principle of public jurisprudence, bello parta cedunt reipublice, and the distrilution of the proceeds of prizes dependa upon the regulatJons of each state; and unless the local laws have otherwise provided, the prizes yest in the sovereign. But the general practice, under the laws and ordinances of the belligerent governments, is to distribute the proceeds of captured property, when duly passed upon and condemned as prize (and whether captured by public or private commissioned vessels), among the captors, as a reward for bravery, and a stimulus to exertlon. When a prize is taken at sea, It must be irought with due care into some convenlent port, for adjudication by a competent court; though, strictly spesking, as between the belligerent parties, the titje passes, and is vested when the capture is complete, and that was fermerly held to le complete and perfect when the losttlo was over, and the spes rectperandi was gone. Grotius and many other writers, antl some marine ordinances, as thoso of Louis XIV., and of Congress durIng the Amertcan war, mado twenty-four hours' quiet possession by tho enemy the test of title by caprure. Bynkershoeck says that auch a rule is repugnant to the laws and customs of Ilolland ; and he insists that a firm posscssion at any time vests the f roperty in the captor, and that ships and goods brought infin prosidic do most clearly change the property. Jiut by the modern uaage of nations, nelther the twatyfour hours' possession, nor the bringling the prize infra presidia, is sufficient to change the property in the case of a maritione capture. A judicial inquiry must pass upon the casc, and the present enlightened practice of commercial nations has suijected all such captures to the scrutlny of judicial tribunals, as the only sure way to furnish due pronf that the aelzare was Jawful. The property is not changed In favor of neutral vendee or recaptor, so as to bar the original owner, until a regular sentence of condemnation has been pronounced by some court of competent jurisdiction belonging to the sovereign of the captor; and the purchaser must be Ablo to show documentary ovidence of that fact to support his title, Untll the capture becomes invested with the character of prize by a sentence of condemins. tion, the right of property is in abeyance, or in a state of legal sequestrailon. It can not be alienated or dis.
posed of, but the possession of it by the government of the captor is a truat for the benefit of those who may the ultimately entitled. This salutary ralo, and ons so necessary to eheck irregular conduct and Individual outrage, has been long establiahed In the Engliah admiralty, and It is now evary where recognized as the law and practice of nations.

The condemation muat be pronounced by a prize court of the government of the captor, sittiag either in tite country of the eaptor or of his ally. The prize court of an ally can not condemn. Prize or no prize, is $n$ question belanging exclualvaly to the , ourts of tha country of the captor. The reason of this ruic is sald to be, that the sovereign of the captore has a right to inspect their behavlor, for he is answerabla to other statee for the acts of the captor. The prize court of the captor may sit in t?.e territory of the ally, but it is not lawful for sach a court to act in a neutral territory. Neutral ports are not intended to be auxiliary to the operations of the power of war; and the law of nations has clearly ordained that a prize court of a belligerent capter can not exercise jurlsdiction in a nentral country. I'his probibition resta not merely on the unfitness and danger of making noutrul ports the theatre of hostile proceedings, bat it atands on the ground of the usage of nations. It was for come time aupposed that w grlze court, though sitting in the country of its own govereign, or of hle ally, had no jurisdiction over prizes lying in a neutral port, because the court wavted that posacssion which was deemed easential to the exereise of a jurisdiction in a proceeding in rem. Tho principlo was admitted to be correct by Sir William Seott, in the case of the IIenrick and Mfaria, and he actod upon it in a prior caso. But he considered that the English adulralty had gone too far in supportiug condemnations in England, of prizes abroad in a neutral port, to permit him to recali the vicious practice of the court to the acknowledged priuelple; and the English rala is now detinitively settlen, agreeably to tio oll usage and the practice of other natlons. The Supreme Court of the United States has followod the Englisil rule, and it has held valid tho condemnations, by a beligereut court, of prizes earried into a neutral port, and remaining there. This was deemed the nost convenient practice for neutrals, as well as for tho partice at war; and though the prize was, in fact, within a neutral jurisdiction, it was still to bo deomod under the control, or anb potestate, of the captor.-Kent's Cunnmentaries, vol. j.

Proa, a narrow canoe abont thirty foet long by three feet wide, used in the Ladrone Islands. The lee side is flat, being the mers longitudinal section of the common form, and tho head and atern exactly alike. A. slight francework projecte several feet to windward, bearing a small block of wood like a canoe; this float supports the vessel from oversetting to that side, ws she would otherwiso do, and the framo-work affords aupport for a weight acting against the pressure of the sail. Tho vessel is steered by the paddle at cither end, and moves with grent velocity either backward or forward, being adapted to a aide wind in running between iwo places. The sail is mat, with a boom, upon one mast. Proa is also the name for large boats usod by the Malays, picpolled both by oara and sails.

Produce, Production. See articles Wheat,

## Fuour, cte.

Promiscory Notes. A pronissory noto may be defined to be a written engagement by one person to pay another person, therein named, absolutely aud unconditionaliy, a certain sum of monay at a time specified therein. The definitlon given by Mr. Justico Blackstono ts, that promissory notes, or notes of hand, are a plain and direct engagemont in writing to pay a sam specified at a time limited therein, to a person therein named, or sometimes to his order, or ofton to the bearer at large. Perhape thils definition may be thought faulty in not statiag that the engageneat is to be ab-
solute and uncorititional. Mr. Justice Bayley more suecinctly utatea, that a promissory note is a writton promiae for the prayment of money at all events. Mr. Chancellor Kent followa the detinition of Mr. Justice Bayley; and perhapa cach is open to the objection that. whilo it seeks brevity, it is Incomplote, as it does not state that the promise is made by one person to pay the money to another person apecitiad. Although a promissory note is, in contemplation of law, entitled to all the privileges belonging to such an lustrument by the Commercial Law, as weil as by the Common Law, without being negotiable, yet it la the latter quality whleh gives it its principal importance and value in modorn times, and makes it a circulating credit, so extenaively useful and so generally resortod to in the commerce of tho worll. Promissory notes are now generally made negotiable, ly being atated thereln to be payable to $A$ or order, or to the order of $A$, or to A or bearer, or to the bearer generally. Perhape tho silent but stcady progress in England, from the simple use of the non-negotlable notea, hefore the reign of Queen Anne, to tha present almost niversal negotiability of such instrumenta in our day, ean not bo better expressed than by referring to the languago of Blackstone, where he advorts to the fact that promissory notes ara payablo "to a person therein nained," and then cautiously adds, or "sometimes to his own ordor, or oftener to the bearer." Tise roversa language might be far inore justly used in tho prosent day; and it might be corroctly statod that promissory notes are 10 w generully nerpstiable by being payable to order, or to the benrer : and that they are rarely limited to be payablo onij; :o a particular person namel thoreln. Wo may add in this connection, that the person who makes the note is called tho maker, and the person to whom it ls payable is called tho payee; and when it is negotiable by indorsement, and is indorsed by the payee, he is called the indorser, and tho person to whom the interest is transferred by the indorsement is calied the indorseo. Every indorses is of course deemed the holder, and so ia every person who, hy a transfer of a noto payable to the bearer, becomea entilled thereto. Tho Scottish law seems procisely coincident with the English law as to promissory notes, except so far as respeets the remedial process thereon; thero being some peculiar privileges ann - yed thereto in Scotland.

It acems scarcely nee ssary to point out the distinction between bills of exchange and prumissory notes in their general structure anl character. In a Lill of exchange thero are ordinarily three original parties, the drawer, the payee, and tho irawee, who, after acceptunce, becomes the acceptor. In a promissory note there are but two original parties, the maker and the payee. In a bili of exchango, the acceptor is the primary debtor in the contemplation of law to tho payee; ant tho drawar is but collaterally liable. In a promissory note, the maker is, in contemplation of law, the primary debtor. If a note be negotiable, and is indorsed ly the payee, then there oceurs a striking re. semblanee In the relations of the parties upon loth instrumeuts, althoagh they are not in all respects identical. The indorser of a noto stands in the same relation to the subsequent partios as the drawer of a bill, and the maker of the note is under the aame liabilities as the accepter of a bill.
The origin of promissory notes is quite as obscure ns that of bills of exchange. Thore is no doult that promissory notes in writling (chirographa) wero well known and in use among the Romaus. Of this we have an instance in the Digest ; ab Aulo Augerio Gaius Seius mutuam quandam quantitatem accepit hoc chirographo: ille scripsit, me accepisse, et accepi ab illo mutuos et numeratos decem; quis ei readom Ralendis illis proximis cum suis usuris placitis internos: Quacro, an ex co instrumento usuraz peti possint, et qual Modestinus respondit, si non appareat de quibus usuris conventio facta sit, peti eas non posse. But this instrument never acems
to have been known as a negotiable inetrument among the Romana, or ma a general mediam uset In purchases and sales, with that superadded quality; bat ite nego tiability seems to be excluaively the invention of modem tiniei. Probably the origin of negotiable promisiory notes is somewhat later than that of bilis of exchange, and grew out of the same general causes as the latter, ria., to facilitete the operations of commerce, and to extend the negotiabllity of debta. Mr. Kyi'a remarky on this subject seom st once weil founded and antiofactory, at leat as conjectures. "As commerce," says he, "advanced in its progreas, the multiplicity of Its concerns required, in many Instances, a less complle cated mode of payment than by bills of exchange. A trader, whose situation and circumstances rendered credit from the merchant or manufacturer, who supplled him with goods, absolutely necesaryy, might have mo limiterl a connection with the commereial world at large that he could not easily furnish his ereditor with a bill of exchange on another man. But his own responaibility might be such that his aimple promise ot payment, reduced to v.riting for tho purpose of evidence, might be accepted with equal contidence at a bll on another trader. IIenes, it may reasonably be conjectured, promissory notes were at tirst introduced." Undoultedly negotiable promissory notes were well known upon the continent of Eurepe long before their introduction into Fingiand. They wero probably first hroaght into use in England about the middle of the 17th century, altho:-gh lord Holt has been thought to assign to thein a somewhat later origin. They grem at first to have been called bilis of debt, or lills of credit, Indifferentiy. Indeed, na Lord Mansticld haa observed, there seems much confasion in the "Reporta" in the times of King William and Queen Anne, so that it is difficult, without consulting the reconds, to ateertain whether the aetion arose upon a bill or note, as the words " bili" and "note" were used promiacuously. There was a long struggle in Weatminster Ilall as to the question whether promissory notes wero negotiable or not at the Common Law, for there could be no doubt that they were by the Law Merchant, at least as recognized npon the continent of Europe. Lord IIolt most strenuousiy, and with a pride of opinion not altogether reconcilable with hita sound aense and generally comprehensive views, maintained the negative. The controversy was finally ended by the atatute of 3 and 4 Anne, ch. 9 (1703), (made perpetal by the atatuto of 7 Anne, ch. 25, sec. 8,) which, after reciting that promissory notes had been held not negrotiable, proceeded to enect, "That all notes in writing, inade and signed by any person or persona, body politic or corporate, or by the servant or agent of any corporation, banker, golijamith, merchant, or trader, who is usuaily intrusted by him, her, or them, to nign auch promissory notes for him, her, or them, whereby auch person or persons, body politie and corporate, his, her, or their servant of agent as aforesaid, doth or shall promise to pay to any other person or persons; body politic and corporate, his, her, or theit order, or nnto hearer, any aum of money mentioned in such note; shall bo taken and construed to be, by virtue thereof, due and payable to any auch person or persolis, body politic and corporate, to whom the same is made payable; and also every auch note payable to any person or persons, body politic and corporate, his, her, or their order, shall be assignable or indorsable over, in the aame manner as inland bills of exchange are or may be, according to the costom of merchants; and that the porson or persons, liociy polltic and corporate, to whom'anch sum of money is or shall be by such note made payable, shall and may maintain an action for the asme, in such manner as ho, she, or they might do upon any inland bilis of oxchange, made or drawn according to tine cuntory of merchants, againat the permon or persons, body politic and corpo rate, who, or whose servant or agent as aforesaid, signed the same; and that any person or persons, body politic
and corporate, to whom anch note, that ia payable to any person or personn, body politlo and corjorate, his, her, or their order, is indorsed or aseigned, or the mon ey therein mantioned ordered to be paid by inilorse. ment thereos, ahall and may malntain his, her, or their action for much aum of money; elther againat the per son or perions, body politic and corporate, who, or whome servant or agent as aforealid, signed such note, or against any of the persons that Indorsed the same, in tike manner an in' caneen of inland blili of exchange." In mort of the Staten of America this statute has been etther expreanly adopted by atatute, or recognized as part of their Common Law. A few only have deetred it Inapplicahie to their situation ; and in some States the cireulation of promissory notes athll remains clogged with poeitive restrictions or practical difliculities, which areatly impede their nse, and valne, and circulation. Moat, if not ell commercial nations, have anhzed er. tain privileges, benefits, and adventages to promissory cotes, as they have to bllls of exchange, in order to promote pubilo confidence in them, and thus to insure their circuintion as a medio.al of pecuniary commercial transactions. in England and America they partake in a very high degree of the character of apecialtien, and are deemed to import prima facie, to be founded upon a valuablo conaideration, and may he generally declared on without apecially atating what the portic ular consideration ja; in which eircumatance shey dif fer from other unaealed contracts, whethep written or unwritten. Iletween the original partles the considieration may indeed, is a matter of defense, be inquired into. But where they are negotiable, and in the posseasion of a bowa fide holder for a valurble comsideration, without any notice of any inherent infirmity or vice in their original concoction, they are hinding upon the antecedent partles, and the consideration is not inquirable Into, and becomes immaterial. In Scotiand they are entitled to all the privileges of bilis of exclange, among which, beaides the common privileges in Fingland and Anterica, is the privilege of a summary process to euforee payment upon their ilishonor, differing trom the ordinary proceas. The like summary process is given hy the French law. [And a similar atatute has recently been enacted in England.] Ilejnecclus, in the panages aiready referred to, atates that they are indorsable like hilis of excliange, and are subjeet to the law of preseription, and, in case of dishonor, are open to the sante process and mode of expeution as bilis of exchange.-Stony on I'romissory Nutes. See Bifa of Exchange and Fxchange.

Promontory (I.atin pro, and mons, a mountain). In Geography, point of land, whether high or low is indifferent, projecting into the sea.-See Cark.

Protection, in Ccmmercial legislaticn, means the protecting or bolatering up of certiain branches of ciomeatic inciustry by prohibiting the importation of the produce of auch branches from abread, or loading it, when linported, with heavy dutles. This policy was at one time pniversally prevalent. Bnt its extremely Injurious Influence having been deinonstrated cver and over again, it has been abandoned by all Intelligent ataleamen. And notwlehtanding the powerfil intereste by which it was supported, it lins neariy disappeared from oar laglalation; and it will, no doubt, eventally disappear front the legislaiton of all countrics.

Providence, city, the principal pert of entry, and semi-capital of Rhode Island; situated in $41^{\circ} 49^{\prime} 22^{\prime \prime}$ N. lat., and $\boldsymbol{I 1}^{\circ} 24^{\prime} 48^{\prime \prime}$ W. long. from Greenwith, and $1^{\circ} 28^{\prime} 24^{\prime \prime}$ E: long. from Washington. It is 30 miles north of Newport, 42 miles sonth-southwest from lioston, 70 milea east of Hartford, 173 miles cast of New York, and 396 from Waahington. Population in 1820, 11,767; in 1830,16,832; in 1840,23,171; In 1850, 41,513; In 1854, 50,000. In point of population and wealth Providetice is the second efty In New England. Its present limito contain about nine square milcs. The
compaes portion of the city is built on both aldes of the I'rovidence River, ovor which are constructed two broad and subsiantial wooden bridges, alove which the river expands into a brosd and beautiful cove.

There are in Pruvidence 26 banka, with an aggrogate capital of $810,410,090$; s savinge-bank; three insurance companies, with a capleal of $\mathbf{8 0 0}, \mathbf{0 0 0}$, beaidee several mutual insurance companies without apecitted capital. The manufactures of Providence are extensive. 'The city also contained $\ln 1857,78$ steau-engines, and within 100 rods of the olty line are 12 or 15 more, that for all practical purposes belong here; 50 jewelry eatabliahments, omploying 1400 hands, and yielding ad annoal product of $\$ 2,771,600$; thrae bleaching and dyeing works, einploying 350 hands, and tiniahing $50,980,000$ yards of goods; 22 manufactories of machinary, steam-enginca, bollars, castinge, atc., amploying 2002 hands; 0480 tons of coal; 11,095 tons of pigiron; 9801 tone of other Iron, and producing annualiy 33,800 stoves, $9,000,000$ pounds of nails and spikea, 80 stesm-engines, 220 bollers, $3,584,000$ pounils of nuts, etc., and other articles to the total value of $\$ 2,561,000$; two screw factorles, that ylelil an annual product of $81,086,000$; two lutt factories, that produco $\$ 2 \% j, 000$, and a great varioty of amaller manufactories, yiclding tegether an annual product of $\$ 17,400,000$.
Providence possesses great commerclal facilities, which have been well improved. The harbor, at tha head of Narraganaet Bay, 83 millea from the ocean, is spacious, and has aufficient depth of water for the largest ahips. Somewhat more than 100 veasels belang to tho port. The reglatered tonnage in 1853 was 10,861 tons. Two lines of packets ply regularly to New York, two to Allisny, one to Philadelphia, and one to Baltimore. A railroad 41 miles loug extends from I'rovidenco to Boston, with which it is connected.
Provisions. Uuder this term, taken In Its most extensive sense, in referonce to man, may bo comprised sll those articles used as food ly the inliabitants of this and other countries; hut commerclaily it is understood to comprise only frosh nnd salted hutchers' mest, hains anel hacon, butter and cheese, egge, and a few other articles.
Value of lafe Stook, agoobdino to the Census of 1850, of the United statre.

Prunes and Prunelloes, a specles of dried plums," of whieh there are many varletles. Tns finest are linportod from Firance, In the south of which this fruit is very abundant. The best prunes are packed in hampers or basketa male of white osiers, welghing from six to ten pounda each; tho second quallty ju quarters, and the third in puncheons.

Prusaia (one of the ZollVerein). The Prusaian territory la not much more than two-fiftha of the size of that of Austria, and the larger portion of it lles within the llimits of the great and comparatively barren plain which extends from tha Bohemian and Carpathian Mountains to tha Baltic Sea. Tho smaller and more fertile part of the Irussian 'orritory, called the Grand Durhy of the Lowar Rhine, lics In the lower part of tho basin of that river, and ls separated from the main bedy $\mathrm{j}_{-}^{-0}$ the kingdom by the Intervention of IIanover, Saxony, and other German states. There are, hesides, several smaller districta scattered in the heart of Germany; and with a territory thus scattered and disjointed, the re. K of Prussia as a great stato has ireen suatained ofly through the superierity of her internal organizncton, and the wary, temperizing, and oven shuffing polley of her government, ferced upon them, indeed, by the defenselosenoss of a kiugdon without natural frontiers, or physical centrality, or a people united ly langnago, aud national feeling, and interest. Agriculture is tho chief occupation of tho people; hut in the Rhenish provinces the cotton, and In Silesia tho linen manufactures, are carried on to a great and increasing extent. Prussia necessarily maintains a larga atanding army, but has no naval power; the king, howover, has recently purchased the port of Jahde from the Frand Duke of Oldenburg for the purpose of a maval station, and haa begun tie formation of a fleet. The kingdom was till recently an abeolute monarchy, but has now raceivad a Constitution.

The first treaty of amity and commerce letween the Uuited States and Prussia was negotiated jı 1785. This was renewed in 1709, and cxpired in 1815. In 1828 a new treaty was coneluded between the two governmeuts, which ts atill in foree. Under the former treatien tho vessels of tho two high contracting parties were rociprocally allowed to import the goods which were of the produce or manufacture of their respective nations. The latter treaty, however, stipulatee entiro reciprocity and freedom of commerce. The vessels of cach nation are allowed to import into the other the productions of their own or of any other country. The direct trade hetwcen the United States and Prussia is, however, very incousiderable. There is acarcely any articlo of American production demanded in Prussia, except tobaceo, rice, and raw cotton; nor is there any bulky article of Prussian preduce wanted in the American marketa.

Vegsels entered and cleqaren.

From the Vnited States the imports into this port are : rice, ashes, rosin and turpentine, and whate-oil; though, owing to its high price within the past few Years, the article last named has almost ceased to be Imported from the United States. Sugar has alme disappeared from the list of Importa, for the reason that the relineries in the Baltic ports chielly use reet-root sugar.

The value of Imposta from the Unlted States Into this port for the years 1851,1852 , and 1853 , and the duties levied thereon, are thas given In l'rusaian oflicial reports :

| 1851. | \$320.8i0 |  | \$26,100 |
| :---: | :---: | :---: | :---: |
| 1854. | t:4,310 | * | 13.27 |
| 1843. | 79,893 | 4 | 5,920 |

The port of Memel is also the eentre of no inconsiderabla share of the direet trade between the United States and Prussia. From 1st July to 31at December, 180., thero entured this port from the United States, in the Hirect troile, five reasels, measuring an aggresate tonnage of $2: 00^{\circ}$ tons, and floating 8171 bales of cetton, valund at $\$ 411,500$. Outward cargoes consisted of hemp, rope, canvar yarn, mate, bags, and leather.

At tho port $\mathrm{c}^{\circ}$.onigsierg thero arrived from the I'nited Stat. urom 1st July, 1854, to 1at January, 1835, sevell American vessels, flonting zargoes in value 4 898,000 -namely, 9680 bales of cotton, 1700 galions of oil, and 3600 boxen of augar. Outward cargoes consisted of hemp, yarn, bristlea, fenthers, raven's-duck, cordage, horve-hair, sonp, and tallow, to the aggregate

The general forelgn trade of this port is consideraHe. Its exprorts consist of grain, wooleus, silkn, soap, atarch, realing-wax, and refined sugar, its imports, however, largely oxeced in value fits exports. The former in 1061 amounted to ahont $6,000,000$ thalers, while the latter only reached a littic over $4,004,000$.

The harbor of K"onigaherg almites amall vessels oniy; large ships lanil at I'llia, which is also the port of Eibling and liraunsherg:
liantzic is the only romaining port of Prussia in which forign trade is condinted. It la situated on the left bank of the Vistula, thrse and a half milea
from its outlet at Weichsolmunde, and is accessible to vessels drawing from ejght to nine feet water. larger vessols lie in the Neufahrwasser, at the mouth of the river, or In the roada, which afford good anchornge for vessels of any burden. Its exports consist of whrut, ryc, barley, oats, peas, flour, linsecd, rape-seed, hiscuit, provisions, ashes, zinc, bones, timber ${ }_{1}$ staves, hemp, tlax, linens, wool, etc. The importa comprise woolen and silken atuffis, and other manufactured goods; coloulal products, dyes, wiuc, oil, spice, frult, salt, and furs.

At Stettin, port dues aro: Tonnage duty, 14 silver groschon per last, laden, and one half only if in billast. Thia would bo about $\mathbf{1 6} \cdot 1$ centa per ton if inden, and 8.05 cents per ton if in ballast. Pilotage dues, 2 , thalers per 25 lasts, and 15 sllver groschen for every 10 lasts upward. This equals $\$ 1721$ per 60 tons, and $34 \frac{1}{2}$ cents per every 20 tuns upward.

Fort Regulations.-The following regulations apply to all the I'ruscian ports: On a ship arriving in the road or port, the nuater must anbmit to the police regulations of the port, which are made known to him or the officer in command; the master is then required to proceed to the custom-house and deliver a complite manifest of the cargo. This manifest or genernideclaration is required to state clearly if the whole carge is to be entered at the port, nul the part, if any, which is to be carried fartherin the ship; that part to te stated under a special head. Tho merchandise, as per liils of lading, is then entered regularly. The slatements for entry are to be drawn up, specifying the description, welght, measure, or quantity, agreenbly to a zell. tariff for the paynient of duties. Excepting variuus artleles imported in an mpacked state, the follewing measures nre to the adopited: For beer in casks, tuns of 100 l'russian quarts; for wines, brandy, and vinegar, in caska (eimers) of 60 l'russian quarts ; for herrings, harrels; for burned chalk, tuns of 4 I'russian hushels; for all other packed articles, centners of 110 peunds gross welght. If there le several packagen of aimitar articlea, and cach package contalns an equal quantiav, they may be entered together, according to their unmber and slzo, and with a general statement of the contents. If the contenth of the packages vary, it will he necessary to specify the contents of each. The lugiage of passengers must be noted as such in the manifest. If it consist of usual traveling luggage, it will be sufficient to state the several boxes or parceis; lut if it incinde goods, these must be stated according to number and description. The jersonal property of the unster, with the exception of provisions, miust the stated like other goods, but omitting the declaration to a conaignee; aul it mast also be stated In the decharation what are the articien which aro not in the ship's hoha. A form is preaentel to tho mester to fill up as his report. It utuat the liljed up exactly according to this form, and written charly In the Girman language. This deciaration is limiling on the master, anil chils error that may be discovered on tho unlading, or on examination, subjects him to a penalty statei in the customs lawa. If the master has not a report with him, ho may have one propared in the port ly a customs officer; In which case he delivers all his papers to the oflicer, who stamps and numbers then, the lust number being marked as such. The naster, at the same time, infirma tho officer of the goods or loggage
belonging to himself or to passengers, if there be no account of the same; the officer makes out a list thereof, which is signud by the master, and returned, In order to be juserted la the report. If the roport has to be prepared on shore, it must be delivered to the customs ollicers within 24 houre after the arrival of the ship in the road; If not, possession will be taken of the ship at the master's expense. Customs officers may take possession of the ship at once, free of expense. It is required of the master to procure the necesaary information for the report, in the arranged manner, on receipt of the cargo. If he does not so prepare himself, the customs ollicers assume the whole direction of landing the cargo, according to the regular instructions in euch cases. Respecting the ship's provisions, If they consist of articles which pay a consumption daty, a separate report is required In duplicate: one is returned to the mestor after revision, in order that ho may tuke on board an equal quantity of similar provisions when he sails. If he falls in this, or if the sailing is delayed boyond a twelvemonti, the consumption duty must be paid on tha provisions renaining on hand. The master is, however, at liberty to doposit the provisions at tha custom-houss until he sails, suljoct to the consumption duty if uot taken away. Articles not properly forming a part of the cargo are so considered if thoy undoubterliy appertain to the ship's lisventory, and are articles for the use of tho voyoge. Articles which are not considered as such, aro to pay duty if they be sulyect to a consumption tax; or thoy may ba landed, ilt order to be deposited in tho customhouse. If a vessel remains in the road, ant cloes not enter the port, anis only diseharges the cargo into lighters, the consumption of provisions in the rosd is duty free. A report of the provisions is sufficient, and no further control ovar the samo is observed, oxerpt is
particular cates when considered necessary. If the master is bound for anothor ilcatination, and only enters the harbor through distress, then a general inspectlon la only made, in order that no part of the cargo may be disposed of. A report, however, is to he made of the cargo. In cases of shipwreek, on the salvagu of the cargo, the kind and quantity is ascertuined, with the assistance of the regular officers, a:d the cargo shall be placed in aceurlty until furihes cirections are issuod. The cargo of vessels which winter in Prussian ports must be declared without unnecessary delay, In as fur as the chip's papers and the knowledge of the master afford information. An inspection of the outer parts and decks of the vessol, and the stores or articles thereon, takes place at once, and the ports or hatchways of the ship's hold are then locked. Untll the declaration, inspection, and locking up of tho veasel take place, it is watehed at the expenso of tho captain; which guarding, in particular cases, may continuo ns long as the eustoms officers may consiter necessary. Shipe which only anchor la tho roada, and do not enter the port, aro not considered within the control of the custorns officers; they must not, however, hold intercourse with the shoro or the port, without delivering a report and their pnpers. If tho ship remain in tho roads longer than $2 t$ hours after the declaration is made, without ontoring or proceediug to unloud, miless tho one or the other be prevented by stress of weather, then an oflleer repairs to tho ship, cxamines the decks, etc., and locks up tho hatches, etc., of tho hold. To the officers who are on service on board tho vessel, proper malutenance ls to be allowed, the samo as is afforded to travelers of the trading elass. The following table exhibits the forcign commerco of the United States with l'russia for 37 yeors, giving tho domestic and foreign exports, tho imports, and tonnago.

[^36]- Nive montin to June 80 , and the fiecal year from thla time begina July 1.

Prumaian Blue, or Prusalate of.Iron (Ger. Berlinerblau; Fr. Bleu de Pruase, It. A eurro Prustiano, Sp. Azul de Prussia; Russ. Lasor Bexlinekaja), a beautiful deep blue powder, accidentally discovered at Berlin in 1710. It is of considerable importance in the arts, being extenslvely used by painters; it ls mannfactured in this country. Many attempts have been made to render Prussian blue avallabie for the dyeing of broad-cloths, but without much success. The difficulty is to diffuse the color equally over the surface; for, from lis extraordinary vivacity and lastre, the slightest Inequalities atrike and offend the eye. Prussian blue resista the sir and sun extremely well; but It can not be uned in the dyeing of cottons, or any nort of stuff that is to be washed with sonp, as the slkali contained in the soap readily desolven and separates the coloring matter.--Baxoboft on Colors. Blue is a favorite color with the Chinese, and in 1810-11 the imports of Prussian bluo into Canton from England amounted to 1899 piculs, or $253,200 \mathrm{lbs}$. But for some yenra past the Chineso have not imported a single pound welght. The cause of the cessation of the trade deserves to be mentioned. A common Chlnese tailor, who came to England in an East Indiaman, having frequented a manufactory where the drug was prepared, learnel the art of making it; andon his return to China he estublished a similar work there, with such auccesa that tho whole empire is now amply supplied with native Prussian blue! The West has derived many important arts from the East ; but we incline to think that this is the first well-authenticated instance of any art having ever been carried from the Weat to the East by a native of the latter. But $\ln$ all that respecta industry, ingenuity, and fuvention, the Chinese are incomparably superior to every other people to the east of the Indus.
Prussian or German Commercial Union. Next to the efferts of the Irusslan gorernment to diffuse tho blessings of education, their efforts to introduce a free conmercial system Into Germany constltute their best claim to the gratitude and esteem of their own aubjerts, and of the world. Germany, as every one knows, is divided into a vast number of independent, and mostly petty states. Until a very recent period, every one of these states had ita own cus-tom-looses, and its own tariff and revenue laws ; which frequently differed very widely indeed from those of its neightrors. The internal trade of the country was, in consequence, subjected to all those vexstious end muinous restrictions that are usually laid on the intercourse between distant and indepentent states. Each betty state endeavored either to procure a revenne for itself, or to advance its own industry, hy taxing or prohibiting the productions of those by which it was sarrounded; and custons officers and 'ines of customhouses were spread all over the country! Instend of beiag reciprocal and dependent, every thing was separate, independent, and hostile : the conmodites admitted lito Hesse were prohibited in Baden, and these prohilited in Wirtemiterg were almilted into Bavaria. It is admitted that nothing contributes so much to the grow th of induatry and wealth in modern thmes as the perfect freedom of internal industry, and that intimate correspondence among the various parts of the country which reulerg each the best market for the produce of the other. How different would have been our present condition had each county been an Independont state, jealous of those around it, and anxious to exalt itself at their expense! Int, until within these frw years, this was the exact condition of Germany; and, considering the extruordinary ohalacles such a *ate of things opposes to the progress of manufnctures, commeree, and civilizaton, the wouder is, not that they are comparstively back ward in that country, hut that they should be so far advanced as they really are.
lint, thanks to the intelligence sud pemeverance of I'russia, this ami-social systen bas tion 11 well-nigh sup.
pressed; nad the most perfect freedorn of commerce establighed among the great bulk of the Germanle natlons. The disadvantages of tho old system had long been seen and deplored by well-informed men; but so many interests had grown up under Itn protection, and so many deep-rooted prejudices were enlisted in its favor, that its overthrow seemed to be hopeless, or, at all events, exceedingly distant. The address and resolution of the Prussian government, howover, triumphed over every obstacle. Being fully impressed with a strong senae of the many advantages that would result to Pruesia and Germany from the introduction of a free system of internal interconrse, they pursued the measures necessary to bring it about with an earnestness that produced convictlon, and with a determination, coute qui coute, to carry their point.
The first treaties $\ln$ furtherance of thls objeet were negotiated by Prussia with the princlpalitics of Schwarz-burg-Sondershansen and Schwarzhurg-Rudolstadt, in 1818 and 1819, on the principle that there should lie a perfect freedom of commerce between these countries and Prussia; that the dnties on importation, exportation, and transit, in Prassia and the principalities, should be identical; that these should be chargel along the frontler of the dominions of the contracting parties; and that each should particlpate in the produce of such dutios, in proportion to its population. All the treaties subsequently entered Into have been founded on this falr and equitable prineiple: the only exceptions to the perfect freedom of trade in ail the conntries comprlsed within the league or tariff alliance being confined, first, to articles constltuting state incnopoties, as salt and cards, In Prussia; 2d, to articles of native produce, lurdened with a different rate of duty on consampition In one atate from what they pay in another; and, 3d, to articles produced under petents conferring on the patentees certain privileges in the dominions of the states grantling the patents. With theso exceptions, which are not very important, the most perfect frecdom of commerce exists among tho allied states. Since 1818, when the foundationa of the alliance were laid, it lans progressively extended, till it now comprises more than three-fourths of the Germanic states, exclusive of Austria. Ducsi Hesse joined the allianco in 1828, and Electoral Hesse In I831; the kingdomas of Lavaria, Saxony, and Whrtenberg joined it afterwarl, as have Baden, Nassau, and almost all the smaller states thy which it had not been previously joined, with tho exception of Meeklenburg-Schwerin and Meckleularg-Strelitz. But these, with llanover, will he very shortly lucluded in the league. In 1852 tho tarlit alliance comprised-

Throughnut the whole extent of this Immense cometry, from Aix-la-Chapelle, on the confines of the Nitherlands, enstward to Tilsit, on the contines of Russia, and from Stettin and Dantzic, sonthward to Switzarland anil Dlotemia, there is nothing to interrupt the freedom of commerce. A commodity, whether for cunsumption or transit, that has once passed the frontier of tho league, may be subsequently conseyed, withunt let or hiluderance, throughout its whele extent. Insteall of belug confined within the narrow precincty ot their own t"rritories, the products of each separate country of the allance may be sent to every ene else;
so that cach may apply Itself, in preference, to those departments in which it has some natural or acquired advantage; and cach has to depend for its success, not on the miserable resource of customa regulations, but on its sklll and industry. The competition thence arising is most aslutary; and, should the peace of Europe be proserved, we run little risk in saylng that ail sorts of Industry will make more progress among the states comprised within the tariff alliance, during the next ten years, than they dld during the half century prevlous to Its belng organized. An assembly of representstives from tho allied states meets annually, to hear complaints, adjust difficultles, and make such new enactments as may seem to be required. The Prussian tariff has been adopted, with certain moditieations. The duties are received into a common treasury, and are apportioned according to the population of cach of the allied states. In addition to its other advantages, the new system has reduced the cost of cellecting the dutiea to a mero trifle, comparod with its former amount ; and has enabled hundreds of customhouses, and thousands of customs officers, to bs em ployed in the different departments of industry. The existing discrepancy In the weights and measures used in different parts of Germany occasions consilierable inconvenlence; and we are glad to observe that the equalization of weights and measures, and their reluctien to a common standard in all the allied states, is declared to be one of the objects of the league. It is also expressly provided that the tolls, or other charges in licu thereof, shall in all cases, whether they belong to the public or to private individuals, be limited to the sums required to keep the roads in a proper state of repair; and that the tolls existing in Prussia shall be considered as the lighest that are to be levied, and shall not in any case be exceeded.

We are abie to lay before the reader the following extract from a werk printed by order of the House of Representatives, giving an account of the objects to be attained by tho Prussian Commerelal Leugne: "Prussia," it is thero said, "has evidently takon the lead in this wise and important measure, to which the smaller states have gradually acceded. The whole commercial policy of this enilightened power has been distinguished for its Ilberality, being founded on the destre of placing her Intercourse with all nations on the basis of reciprocity. The commoreial league of Germany is intended to carry out this principle, and not to be clirected, as has been sopposed, against any particular nation; as it is well known that I'russia, In her treaties with maritime powers, has invariably adopted tho system of reelprocity, to whatever extent those with whom ahe negotintes are willing to carry it. The estabishment of this community of commercial interests forms n part of the fundamental compact by which the new Germanic Confecieration was created, after the dissolution of the Confederation of the Bhine; to bo subsequently adopted, however, at the option of such of the co-states as should choose to accede to it. Its effects can not fail to promote commorco, and every other branch of industry, as it removes all those vexathous ond endless difliculties which previously obstructed the freedom of intercourse, Navigablo rivers und highways are now opened to tho unfettered use of the German peeple; tho custom and toll houses, with thelr oflicers and barriers, have been withdrawn from the interior, nad the whole intercomunnicntion resembles that of the subjects of any one of the states whthin its own territorles. To these benetits may be adiled the assured prospect of improvement in the thances of the great and smaller sovorehgnties composing the league. This aulvantage will grow out of tho slmpllelty or unlty of the new system, a saving in the cuat of coilection, and from the lncreased consumptlon which renovatel industry and progressivo prosperity so invariably cause."-Ihigest of C'ustoms Laws, vol. III. 1. $\mathbf{2} 27$.

Prussian Duty on C'otons.-T'The duty on cotton goods
being that in which we are most interested, we have taken some pains to ascertain its real influence. This duty amounts to 50 rlx dollars per Prussian quintal on all cotton geods, without respect to quality or price; and, taking the quintal at 118 lbs. avoirdupols, and the rix dollar at 8e., it is equal to $£ 7$ 10s. per 113 lba. Now we have learned from statementa obilgingly furnished to us by a large wholesale house in the city, 1st. That a quintal ( 113 lbs.) of coarse shirting, worth 4d. per yard, contains 497 yards; it consequently costa $\boldsymbol{\Sigma 8}$ 6s., and the Prusaian or tariff alliance duty of $\mathbf{\Sigma 7}$ 10s. on it is, therefore, equivalent to an ad caloram duty of 90 per cent. 2d. That a quintal of superior shirting, worth 1s. a yard, contains $457 \cdot 65$ yards; it consequently costs £22 17s. $\overline{\text { od }}$., making the Prussian duty on such goods 32 h per cent. 8d. That a quintal of printed cottons, worth 1s. 6d. a yard, contains 633 yards; it consequently costs $\mathbf{£ 4 7} \mathbf{0 s}$., making the Prussian dnty on such gooda 153 per cent. 4th. That a quintal of fine printed cottons, worth $2 s .6 d$. a yard, contains 678 yarda; lt consequently costs $\mathcal{1 8 4} \mathbf{1 5 s .}$, making tho Prussign duty on such goosls 83 per cent. It is plain, therefore, that, except on the coarsest and cheapest specles of goods, the Prussian or tariti alliance duty is very far from being oppressive; and, as the value of cosrse goods la principally dependent on the cost of the raw cotton and the wages of labor, being but little influeneed by superiority of machinety, it is not very probable that we should export them largely to Prussia, even wero the duty materially reduced. No doubt, however, it would conduce greatly to the interests of the people comprised within the league, though we do not know that it would sensibly affect ns, wore the dnty assessed on an ad valorem principle, and made 20 or 30 per cent. on all goods; and we should think that this might be done without any material difficulty. The subjoined transiation of the more important clauses of the customs treaty of the $22 d$ of March, 1883, aets the principles on which the alliance is founcled in a clear point of view.

Customs Treaty, concluded the 22d March, 1838, between tha Kings of Bavuria nud Wirtemberg, on the one part ; and the King of Prussla, the l'rince Electoral Co-regent of Ilesse, and the Grand Duke of Hesse on the other part.

1. 'The exlating customs unions between the states above named shall henceforth constitute $n$ general Unlon, unlted by a common system of customs and commeree, embracing all tho countries which are comprised therein.
2. In this general remnion are also comprised the states which have already adhered, either for the whole of their territory, or for a part, to the system of customs and commerce of one or other of the contracting stutes, having regard to their special relations, founded upon the conventions of adhesion concluded with the atatea which have litervened.
III. But there will remain excluded from the general reunion the parts separated from the cuuntries of the contracting states which, becnuse of their sltuation, are not yet inciuded either in the reunion of the Bavarian or Wirtemberg customs, nor in those of Prnssia and IIesse. Nevertheiess, the regulations now in force to facilitate tho commerce of theso territories with the principal country will bo maintained. Other favors of this kind can not he accorded without the unanimous consent of tho contracting stutes.
IV. In the contracting stutes there shali be established unlform laws for the duties of import, of exjurt, and of transit, except sueh modifications as, without hinury to the common ohject, result necessarily from the particular leglslatlon of each contracting state, or from local interests. Thus, exceptions and modidications to the common tariff may take place, as to rates of duties of entry, of export, and of transit (according as the direction of the routes of commorce may require), established upon articles recognized as of minor conse-
quance in extenaive commerce ; provided alwaye, that theso modifications be preferred by separate states, and that they shail not be disadvantageous to tha general interents of the Association. The administration of the duties of import, export, and transit, as well as the organization of the authorities which: are engaged therein, in all the avates of the Ascoclation, ahall be eatablished upon a uniform footing, having regard, bowever, to the particnlar relations existing in those countries. The laws and ordinances which, according to those principles, ought to be uniform in the contract. ing states, and. which are to conatitute tha law of tho tariff and the regulationa of the customs, ahall be consilered as an Integral part of tha present treaty, and shull be publiahed at the same time.
V. There can neither be alterationa, nor additions, nor exceptions, to the acts abova mentioned (Article IV.), but by the unanimons consent of all the contracting parties, and in the form required for the making (confection) of the laws. The preceding appiles equally to all the ordinances which would estalifish, for the adimlnistration of the customs, diapositions entirely different.

V1. Libarty of commerce, and commanity of the receipta of castoms, as regulated by the following articie, will conmence aimultaueously with the operation of the present treaty.
VII. Dating from this apoch, all dutica of import, of export, and of transit ahall cease on tho common fronticr of the Bavaro-Wirteinberg and Prusso-Ilessian customs reunions. All articles of free commerce in one of those territories may be imported freely and withuut duty into all the others, except only as follows:
A. Artleles monopolized by the states (playing-cards anit salt) conformable to Articies IX. and X.
B. Indigenoua articies, now aulject In tive interior of tho contracting states to different dutiea, or excepted from ali duty in one state, and imported into another, and which according to articie II. ought consequentiy to be solject to a duty of compenation.

Finaliy, C. Articles which, without prejudico to patent rithte or conceded privileges in one of the contracting statea, can not be imitated or imported, and ought consequently to be exciuded during the existence of the patents and privileges frum inportation into the atate which has granted thetn.
VIII. Notwithatanding the freedom of commerce, and the exemption from duties, eatablished by Articlo Vil., the transport of articlea of commerce, aubject by the common tariff to dutiea of import or export on the frontiers of tha Association, can not take place between the states of Bavaris and Wirtemberg, and the atates of Prussia, of Electoral Ilesso, or of Grand Ducal Hesse, and reciprocally, except by the public roads, military routes, and navigable rivers. For this purpose there shall be establiahed on the interior fronticrs common bureaus of verification, to which the conductors of merchandiae must, on exhiltiting their licenses, declare what are the articles which they are employed to transport from one territory to another. This disposition will not bo applicalile to retail commerce in raw materials, nor to the petty commerce of tho frontiers or the fairs, nor to the effecte of travelers. I'rocess for the verification of merchandiae will go no fartior than is required for security of the dutiea of compensation,-See Article VII.

XIIf. The contracting parties reclprocally renow their adbesion to the principle that the toils, or other cliarges in licu thereof, shail oniy be sufficient to tiefray the expease of maintenance and rupaira of the ruals, whether the tax be for the state or for private rights. It was thus that has been approved the supplement to the duty of cuatoms, created in Bavaria and Wirtemberg, to replace the sluty of tolla, paving, causeways, bridgea, and generaliy of all unalogous texes. The tolis, etc., now existing in Prussia, accurding to the general tariff of 1828 , shall be consider-
ed as the highest rates, shd ahall not be exceeded in any of the contracting atates.- In accordance with the principle thus announced, the individual'daty for closing the gates of citles shall be abollahed; ss also the duty of paving of causeways, where it still exists; and alt paved roads will be considered as causeways of a deceription liable only to the inty on causeways established ly the general tariff.
XIV. The contractlng governmenta agree to unite their efforts lo introduce into the states a uniform sys. tem of coins, weights, and measures; to commethee immediately the requisite negotiations for this purpose; and, nubsequently, to direct their efforts toward the adoption of uniform custom-house weights. The contracting atates, in the impossibility of establishing this unlformity lefore this treaty goes into operation, agree, for faclitating the forwarding of merchendiae where it had not already been dons, to revise their tariff as to weights and measurea, assuming for a basia the tariffs of the other contracting statea. They will cause such modifications to be published, for the governnent of the public and of their cusiom-houae bureaus. The common tariff (Article IV.) shall be divided into two principal diviaions, according to the system of weights, measures, and moneys of Bavaria, and that of Prussia. The declaration of the weights and measures of articles auliject to duty shall, in Prussia, be according to Prus. aian weights and measures; in Bavaria and Wirtenberg, according to those of Bavaria; and in the two Heases, according to the wefghta and measures there legally eatablished. In expediting cuatom-house acts, tho quantity of merchandise must be expressed acconiing to the two principal divisions of the conmon tari. Until the contracting states agree upon a system of common money, the payment of duties in cach state shall be made in tho asine curreney as in use for pay. ment of its other taxes. But from the present Ilme, the gold and silver coins of all tho contracting states, with the exception of amall money (sheidemunze), shall be received into all the bureaus of receipt of the Association; and for this purpose tables of valuo shail be published.
XV. Tho duties of navigation npon the rivers, comprising therein those which apply to vessels, shall always be mutually acqulted according to the acts of the Congress of Vienna, or of specisi conventions, upon all the rivers to which these regulations apply, unless other determinations be adopted in this resprect. The contracting states agree to enter without delay intonegotiationa for that which particularly regardis the navigation upon the Rhine and the noighboriog stresms, in orier to effect an arrengenent by which the import, export, and transit of the productions of all the states of the Union upon said streams siall be, if not alsolutely free, at least relleved as far as possilite from dutiea of navigation, under the reacrve of charges of r connoisalice. All the advantares granted by one state of the Union to its subjecta, in the exerclse of the mavIgation upon said streama, shall extend equally to the navigation of the other associated atates. Upon the other streams to which neither the acts of the Congress of Vienna, nor any other treaties apply, the duties of navigation shali lie according to the sfeciai regulations of the governmenta interested. Nevertheless, tha subjects of the centracting atatea, their merchandise and vessels, shall throughout be trated on those streans with perfect equailty.
XVI. Dating from the day on which the general eustom-thonse regulations of the Union shall cone into operation, the duties of public stores (fitupes), aud of transiipments (umschlagnechte), which atili exist in the teriftorica heloaging to the Association, shall crase, and no one shall lie liable to forced delay, nor to the dlacharging and storage of his neerchandise, except In cases authurized by the commonn reguiations of the cuatoms or navigation.
XVII. No duties shall be clatued for canala, jocks,
catis
he general
bridgea, ferrlea, cranes, walghlog, and storage; and the establishments destlned to facilitate commerce shall not le allowed rent, except when wotually used. Chargea can not be lucreased; and the subjects of the other contractlig atates ahall be on a perfect equality with the subjects of the countries having those establishments. If the esteblishments for welghing and craues are only used by the custom-houses, no charge shall be made, If the articles have bean previonely welghed at a cus-tom-honse.
XVIII. The contracting atates engage to contlaue their common efforts for the encouragemont cf industry by the adoptlon of uniform rogulations, so the se subjects of esch state may enjoy, as extensively as posslble, the privllege of seeking work and occupation in every other state. From the coming into operatlon of the present treaty, the subjects of any one of the contracting states, trading or seeking employ in the territory of any othar of those states, ahali not bo aubject to any limpost whiol does not oqually affect the nativo similarly employed. Manufacturrera and merehants who are only making purchasea for their trade, or travelers who have no goods with them, but slmply pattorna for the purpose of sollciting commissions, shall not, when thus employed, have any duty to pay in another atate, if autherized to carry on such commores in the state where they have their domilele; or if employed la the sarvice of native manufacturers or merchants. When trading in the merkets and fairs, or when they are selling the produce of the aoil and fabrics, in any one of the states of the Associatlon, tho subjects of the other contracting states shall be treated in all respecta as subjecta of the same states.
XIX. The esa-ports of Prussia shall ho open for commerce to all the subjects of the states of tho Union, on payment of the same dutiea as are pald by Prussian sulijects, and the consuls of the several states in the sea-ports or places of forelga commerce, shall be bound, in cases of need, to assist with their advico and support the subjects of the other contract ${ }^{\text {t.ig }}$ states.
XX. To protect against contrabiand thelr common custom-house system, and to insure the regular payment of the duty of consumption in the luterior, tho contractiog states have coucluded a reciprocal cartel, whicli shall be enforced as soon as possible, but at tho farthest at the same time with the present treaty.
XXI. The community of receipts of the contracting states, stipulated by the present treaty, shall comprehend tho product of duties of entry, of export, and of transit, lo the Prussian states, the kingdoms of Bavaria and Wirtemberg, the Electorate, and tho Grand Duchy of llesse, comprislug thercin thoso countrias which have down to the present time acceded to the custom-houso system of the contracting states. The following are excluded from the community of receipts, and remain reserved for the particular trenetit of the respective governments: 1. The imposts collected in the interior of each state on Indigenous products, comprising therein the compensatory duties reserved in Articie XI. 2. The toll on rivera, to which are appli${ }_{3}$ cable the regulatlons of the acts of the Congress of Vlenna, or spocial conventions.-Article XV. 3. Duties of paving, of causoways, of brldges, of ferrics, of canals, of locks and ports, charges of welghing and atorage, as weli as sinilar receipts, whatover may be their name. 4. 'Ihe fines and contiscations which, bejond the part ullowed to informers, remain the property of each government throughout its territory.
XXII. The prodice of the dutles received into tho common treasury shall be divided anong the states of the Association, in proportion to the population whirh may bo found la the Unlon, suljeet to deduction, 1st. Of the expenses speclfied In Articio XXX.; 2d. Of the restitution of erroneons receipta; 3 d . Of the restoration of dutics and diminutions maile in consequence of apecial common conventions. The pinpulation of overy state which has entered or inay enter Into the

Assoclatlon, by treaty with one or other of the contracting states, under the engagement mada by the latter, to make an aonual contribution for the particlpation of the former to the common revenue of the custema, shall be added to the population of the atatea which nisko thla contributlon. There ahall be made every three yearn, datling from a peribd to be hereafter fixed, an oxact enumeration of the population of the assoclated states: the states shall reciprocally communicate the reaults thereof. ${ }^{\circ}$
XXIII. All restltutions of duties no:, authorized by tho legislation of the customs ahall remain charged to the treasury of tho government which shall have grantod It. Conventlons, hereafter to be concluded, will regulate in what cases almilar restitution may be accorded.
XXIV. In conformity with the object of this associatlon of customs tendlag to facilitate a freer and moro natural commercial Intereourse, the favors accorded for tho payment of custom-houso dutles at ccrtain places in which falrs are held, especially the privileges of nhatement (rabat privilegien), can not be extended to those states of the Association where they do not exlat; on tho contrary, they shall be restricted and abolished as far as possible, regard leing had to tho means of subsistence of tho places heretofore favored, unc to the commercial relation's which they have with foreigners; but others can on no account be granted without the general consent of the contracting parties.
XXXIII. There shall every year, on the 1st day of June, be an assembly of plenipotentiaries of the govermments of tho Union empowered generally to deliberate; and each state may send thither a duly authorized representative. The plenipotentiaries wlll choese from among themselves a president, who, however, shall have no pre-emlnence over tho other members. The first assembly shall bo held at Munich. At the close of each annual assembly, tho place of next meetling will be determined, having reference to the nature of those subjects which will then como under tliscassion.
XXXIV. The assembly of pleripotentiarles will have under its consideration tho following suljects: A. To consider the complaints which may have arisen In any of the states of the Association concerning the execution of the general treaty, of special conventions, of the law, and of custom-house regulations; also of the tariff, when these shail not lave been adjusted during the year hy correspondence between the different ministers. 13. Thic definito reparation among the states of the Union of the total common receipts, hased upon the observations marle by the superior authorities, and verified by the central burcau, as may be rendered necessary by the common interest. ©. To deliberate upon propositions and suggestlons made by the governments for the perfection of the alministration. D. Discusslons upon alterations, demanded by any of the contracting states, in the laws, teriffs, and custom-linuse regulations, as well as in the orgaulzation of the nelministration, and in general upon the development ond perfection of the gencral system of customs and commerce
XXXV. If, $\mathrm{j} \cdot \mathrm{t}$ tho conrse of the Year , when tho plenIpotentiaries aro not in session, extraoriinary incitents shoukl oceur, which require prompt ilecision on the part of the states of the Union, tho contracting parties will consult upon these through their diplomatic agents, or they will order an extra sitting of their plenipotentlarics.

Recent Changes in the German Customs Union.-.Tho discussions in the assomblies of the Leagne have, especlally of late years, heen a good deal Influenced by political considerations. A league, denominated tho Steur-Verein, had been formed in opposition to, or in rivalry with, the Prussian Leagne, by Ilanover, Oldenburg, and Branswick. It was ovident, however, Inasmuch as the interests of these and the other German states were identical, that it would be a great publle ad-

## PYR

vantage were these associatlons merged into one., Bnt owing to political, commercial, and financial jealouslet, this desirable object was of very difficult uttalmment. Happily, however, theas difficulties have been surmounted; and a treaty nogotiatod between Hanover and I'russia, on the 7 th of September, 1851, provided for the incorporation, from the 1st of January, 1854, of tho former kingdom, and the other atates facluded in the Steuer-Verein, with the Prussian Union. Some modificatlons have been introducsd by the treaty inte the basis of the League, but they are of littie importance, except the to partlen immediately interested.

Treuty with Austria.-More recertly a great deal of discussion has taken place between $\gamma$ russia and the subordinate German states on the one hand, and Austria on the other, in regard to the formation of a Customs Association which ehould include the lattor; and in order to pave the way for this deairablo consummation, Auatria issued a new tariff on the 25 th of November, 1851, in which she made many important modifications in the prohilitive aystem on which she had previously acted, at the same tline that she established a free commercial Intercourse between Huagary (which had previously a separate customs establishment) and the other states of tho empire. And though this wise and liberal meas-
ure has not yet led to the incorporation of Austria into the Custons Union, it has led to the conclusion of ant extremely important commercial treaty between Aus. tria and Prussia, dated the 10th of February, 1803. The contracting parties engage to suppress, with a few specified exceptions, all prohibitlons against jmporting the products of the one into the territories of the other; they next establiah a completo fruedom of trade between the two countries in all articles of raw produce; and they further atipulate that the duties to be imposed on manufactured products shall be moderate and rpasonablo. It has a variety of other clanses, all of which have a llheral character. The duration of the treaty is limited to 12 yeara; but we have little doubt, shoulid peace be preserved, that the advantages of which it wili be productive will be oo many and 00 great, that long before the expliration of 12 yeara its provisione will be etill further liberalized, and that it will lay the foundationa of a lasting intercourse, of which we can nelther foresee tho extent nor tho beneficial influence.
In consequence of these and other changes the duties in the tariff of the German Cuatoms Union have undergone many modifications. But except on coarse and heavy goods, they continue, speaking generally, to be moderate. We suljoin

Pumice-ston/ (Gor. Binstein; F'r. Pierre pouce; It. Pidina promice; Sp. Piedra pomez; Lat. Pumex), a light, spongy, vitreous stone, found usually in the neighborhood of voleanoes. It is used for polishing metals and marble, and smoothing the surface of wood and pasteboard. It is said to form a good glazo for pottery. The lighter punice-stones swim oi. water, their speeific gravity not exceeding $\mathbf{~ 0 1 4}$. The island of Lipari, in tho Mediterranean, is chiefly formed of punice-stune, and may be said to le tho magazine whenco ali Europe is supplied with this useful article. There are several species of pumice-stones, but those only that are light and spongy are exported.

Puncheon, a messure of capacity for liquids, containing eighty-four gallons, or one-third of a tum.

Putchook. An articie of this namo is imported in considerable quantities from the uorthwest const of India into China, and is regularly quoted in the Canton price-currents. It is the root of a plant that grows abmilantly in Siude. When burned, it yields a fine smoke, and a grateful and diffusive smell. The Chinese beat it into a fine powder, which they burn as inconse in the temples of their gods.--IIamilton's New $\triangle$ ccount of the Eiast Indies.

Pyroligneous Acid (Gr. тvo; Lat. lignum, mood). This term is generally appied to the acid liquor which passes over slong with tar and gaseous products when wood is suljected to destructive distil-
lation. This acid liquor is an tmpure vinegar, from which necoic scld is olitained as follnws: The pyroligneous acid, freed from tar, is saturated with chslk or puwdered slaked lime, filtered and evaporated, by which an impure acetate of lime is obtained; this is gently heated, so as to destroy part of its empyreumstic matter without decomposing the acetic actid; it is then mixed with sulphate of soda, which yields, by double decomposition, sulphato of line and acetate of soda; the acetate of sods is filtered off the sulphate of lime, ovaporated, heated, and redisaolved and crystailized. In this way a pure crystallized acetate of soda is, by proper mmagement, obtained, which is mixed iti a retort or still with a proper proportion of suiphuric ncid, and a gentlo heat applied, which cnuses the strong acetic acid to distill over, and sulphate of soda remains behind. Thls acetic acid is in a high state of concentration; it is lowered by the addltion of water, and if intended for the table or for domestle use, ss a substitute for other forms of vinegar, it is usually colored with a little Lurned sugar. The charcoal which is the residuc of this distillation of wood is of an excellent quality-that emplayed in the manufacture of gunpowder is thus propared. This mantifacture of vinegar is now earried on upon a very iarge scaic, and the greater part of the vinegar used for d"" estic purposes and in the arts, in many of which it is largely consumed, is derived from this source. of sulphucnuses the ate of soda ch state of of water, c use, as a suaily colcoal which of an ex ffacture of facture of scaic, and extic purIs largely

Quadrana, in English momey, the fourth part of a nenny. Before the rolgn of Edward I., the smallent coin wan a derling, or penny marked wlth a erose, by the guidance of which a penny might be cut into halves for a half-penny, or into quarters, or four parts, for farthinge. But, to avoid the fraud of unequal outtinga, that kling ufterward coined half-pence and farthings in distinct round plecea.
Quadrant, In Geometry, the arch of a circle, containing $90^{\circ}$, or the fourth part of the entire periphery. Quadrant also denotes a mathomatieal instrument, of great use in astronomy and navigation, for taking the altitudes of the sun and atars, as elso for taking anglea in surveying. This Inatrament is varioualy contrived, and furnished with different apparatus, according to the various uses it is intended for; but they all Lave this in common, that they conaist of a quarter of a circle, the limb of which is divided into 90 degrees. Some have a plummet suspended from the centre, and are furniahed with sights to look through. . Tie principal and most useful quadrants are the common aurreying quadrant, astronomical quadrant, Adams'a quadrant, Cole's quadrant, Gunter's quadrant, IIadley's quadrant, hotodictical quadrant, Sutton's or Col:ing's quadrant, and the sinicul quadrant.

Quarantine, a regulation by which all communication with individuals, ships, or goods, arriving from places infected with tho plague, or other contagious disense, or supposed to be peculiarly liable to such infection, is intardictod for a certuin definite period. The term is derived from the Italian quaranta, forty, it being generally supposed that if no infectious disease break out within 40 days, or six weeke, no danger need be apprehended from the froe admlasion of the individuals under quarantine. During this period, ton, all the goods, clothes, etc., that might be oupposed capable of retaining the infection are subjected to a process of purification. Thia last operation, which is a most important part of the quarantine syatem, is performed either on board ship, or in establishments denomigated lazarctos.

Policy of Quarantine.-The regulations as to quarantine are entirely precautionary; they have their origin in the telief that various diseases, but eapocially the plague, are conteglous; and aupposing such to bo the case, the propriety of subjecting those coming from an infected or suspected place to a probation is obvious. Indeed, no government could, until the belief in question be proved to be ill-founded, abotain from enforcing precautionary measures, without rendering Itself liable to the charge of having culpably neglected one of its most inportant duties-that of providing, by every means in its power, for the safety of its subjecte. Latterly, however, it has been contended that the plague is never imported-that it is always indigenous; originating in aome peculiar atate of the atmosplere, or in sonething peculiar in the condition of the peoplo; snd that, consequently, quarantine regulatione merely impose a heavy burdin on commerre, without being of any real utility. But chough thero does not soem to be any reason for doubting that infectlous diseases have originated in the way described, the fact that they have, in innumerable instances, been carried from one placo to another, seems to be established beyond all question. Even if the evidence as to the importation of infectious diseases were less decisive than it is, or the opinions of medical men more divided, It would not warrant the repeal of the reastraints on the Intercourse with suspected ports. This ls not a matter in which innovations ahould be rasbly introduced; wherever there is doubt, it is proper to incline to the side of security. In some cases, perhaps, quaranting regulations have been carried to a needless oxtent; but they have more frequently, we believa, been improperly relaxed.

Instiution of Quarantine.-The notion that the plague was imported from the Easi into Europe seems to pave provailed In all agoe. Bot it would appear that the Vonetians were the firat who endeavored to guard againat ito introduction from abroad, by obliging ahipa and individuals from anapected places to perform quarantlae. The regalations upon this snbject were; it is most probable, lesued for the firat time in 1484.- Breckmanx, Ilidory of Inventions. They have since been gradally adopted in every other conntry. Their introduction into England was comparatively late. Various preventlve regulations had been previously enacted, but quarantine was not aystematically enforced till after the alarm occasioned by the dreadful plaguo at Marveilles in 1720. The regnlations then adopted were made conformably to the auggestions of the celebrated Dr. Mead, In his famoua "Discourse concerning Pestilential Contagion."

Lazarettue or Pesthouses aro establishments constrncted to facilltate the performance of quarantine, and particularly the purification of goods. They havo unually a port in which shipe from a suspected place may anchor; and, when perfect, are provided with lodgings for the crews and passengers, where the sick may be separated from the healthy; and with warehouses, where the goods may be deposited; all intercouree between the lazaretto and the surrounding country being, of course, interdicted, except by permission of the authorities. The lazarettos of Leghorn, Genoa, and Marseilles are the most complete of any in Europe. The facilities they afford to navigation are very great; for, as ships from suspected places may dischargo their cargoes in the lazaretto, they are not detained longer than they would be were there no quarantine regulutions. The goods depoaited in the lazaretto, being inspected by the proper officere, and parified, aro then admitted into the market.

Bills of Heallh.-The period of quarsantlie varies, as respects ohips coming from the same place, according to the nature of their bills of bealth. These are documents, or certlficates, signed by the consul or other competent authority in the place which the ship has left, describing its state of health at the time of her clearing out. A clean bill imports that at the time of her sailing no infectioua disorder wes known to exist. A suspected, or, as it is more commonly called, a touched bill, imports that rumors were afloat of an infections disorder, but that it had not actualiy appeared. A foul blll, or the absence of clean bills, imports that the place was infected when the vessel sailed. The daration of the quarantine is regulated by the nature of these inatruments. They soem to have been first issued in the Mediterrancan ports in 1665, and are obvlously of great importance.
By an act of Congress pansed February- 25, 1799, reapecting quarantinc and health laws, it is provided that the quarantines and other restraints required by the health laws of any State, reapecting any vessel arriving in or bound to any port or district, shall be duly observed by the officers of the revenua of the United States, and by the masters and crews of the revenuo cutters, and by the military officers atathoned upon the sea-const; and al auch officers ci the Uuited States aro required faitifully to aid in tho execution of such laws. The secretary is authorized, when a conformity to the quarantlne and iealth la ws requires it , to prolong the terme limited for the entry of vessels, and the report or eutry of their cargoes, and to vary or dispense with any other regulations appliouble to auch reports or entries, provided that no Stato is thus enabled to collect a duty of tonnage or smport without the consent of Congrosen and provided that no part of the cargo be taken out or unladen otherwiee than as by law la allowed. When, by the health lawe of any State,
any vessel arriving within a collection diatriot is prohibited from coming to the port of entry or delivery for such district, and it is required by auch hee lith laws that the cargo of auch vescol may be unlades at aome othor place, the colloctor, atter due report to him of the whole of such oargo, may grant his apsoial permit for unlading, unden the gare ef the aur veyor, or one or more inspectwre, at acese other place where auch health laws permit, and upon the conditions which shall be directed by the Seervtary of the Treasury; or which such collector may jodge expedient for the security of the publio revenne; provided that all the articlen so uniaden shall be deposited at the, riok of the partion concerned in auch warehouses or inclosuren as the collector shall designate, there to remain under the joint euutody of such collector and of the owner, or person having charge of such vessel, until the asme be entirely discharged, and until the goodo no deposited may be anfely removed, without contravening such health law c . And when auch removal nay be allowed, the collector having charge of such goode may grant pormits to the respective owners or consignees, tbeir factors or agents, to receive all goode which thall be entered, and whereof the duties accruing ohall be secured upon the payment by thein of a reasonable rate of storago, which shall be fixed by the Secretary of the Treasury.

Suitable warehouses, with wharves and inclosures, are provided, where goods may be unladen and deposited for any vessel subject to a quarantine, pursuaut to the health laws. Wben, by the provalence of any contagions or epidemical disease in or near the port of entry for any collection disirict, it slall become dangerous or inconvenient for the officern of the revenue to discharge their respective oflices at such port, the secretary, or, iu his absence, the co troller, may authorize the removal of the collector, i id tho other officera employed in his depurtment, to any other mom convenient place avithin or near to auch coliection district, where such officers may exercise the same authority, and are liable to the eame duties, according to existing circumatances, at in such lawful port or district; and of such removal public notice must be given.-Bluxr's Shipmasters' Aswistont.
The quarantine laws of the different States are too volaminous to givo in detail, and therefore there is hero unnexed only a aynopsis of the quarantine law in force in Now York city.
1 ' is the duty of the pilots to hail all vessels enterlng into the port of New York, and find whether they are subject to quarantine; and if they are, to bring them to anchor In tive quarantine grounds; also, to prevent any violation of the quarantine regulationa while they have charge of a vessel, such as communication between a vessel anbject to quarantine and the shore, rtc., and to report all infringements of regulatlons to the health officer.

Vessels arriving at tbe port of New York are sulject to quarsatine as follows: 1st. All vesecie direct from, or touching at any place where yeliow fever, bilious malignant, or other peatilential or lifectious fever existed at the time of their departure, or on board of which, during the voyage, any case of such fover has occurred, arriwing between the 31st day of May and the 1st day of October, shall remain at quaraintine for at least 30 days after arrival, and at least 20 da;s after cargo has been dischargei, and aball perform such further quarantine as the bealth officer shall prescribe. 2d. Ail vessela arriving between the lat day of April and the 1st day of November, exclusive of the abovespecified; all vessels from a foreign port, on board of which, during the voyage, or while at the port of departure, any person has been oick, or from any place in the ordinary pasage from whioh they pass asuth of Cape Ifenlupen, arriving between the 3iat day of May and the lGth day of October;' and all vesaela from any place (including islands) In Asia, Africa, or the Mediterranean, or from any of the West Indian, Bahana, Ber-
muda, or Weotern Islands, or from any place $\ln$ Amerlea, in the ordinary passago from which thny pass south of Georgia, arriving between the 1at day of April and the lat day of Novembor, are a abject to quarantine and othor segulationa, at the health officer may preseribe. The health officer mast boari overy vessel subject to quarantina or visitation linmediately on her arrival, and make hia examination.
The powere of the Board of Health are amplo to protect the port. The regulations are similar to those generally adopted, and include a fine of $\$ \mathbf{2 0 0 0}$, and imprisonment of twelve months, to any master or crew of a vessel that slall refuse to submit to quarantine, and also a fine of \$60 and imprisonment for any violation of quarantine.'

Quarter, the fonth pert of any thing. . As a term of weight It denotes the fourth of a hundred weight, or 28 pounds ; as a dry measure it signifiea the fourth of a chaldrun.

Quarter, that pert of a alk? p'a side which lles toward the stern, or is compreliendod between the aftmest end of the main chaine and the sides of the stern, where it in terminated by tho quarter piecea.

Quarter of a Point, in Navigation, is the fourtis part of tho diatance between two cardinal pointe, which is $2^{\circ} 48^{\prime}$.

Quarter Daya. The daya uaually regarded in En. gland and most Continental countries (but not in Scotiand) as lieglnning the four quarters of tho year. They are, 1. Lady Day. (20̈th of March); 2. Midaummer Day (June 24th); 8. Michaelman Day (Septeniber 29th); und, 4. Chriatman Day (December 25th).

Quarter Deck. The portion of the uppepmest deek of a ship between the main and mizen masts. This is the "parade" in met-of-war.

Quarter Manter; in the Nary, an inferior officer appointed to aseiat the mates in their several dutiee.

Quarters imply the several stations where the officera and erew of a ship of war are poated in time of action.

Quassia (Ger. Quassicnhole; Fr. Boir de quasie; Sp. Leno de quassia), a beautiful tall tree (Quassia amarg), growing in North and South America and tie West Indies. The wood is of a palo yellow color, and ivodorous: Tasto intensely bitter. It affords to water an intensely bitter decoetion, which is occasionaily used in medicine, and was formeriy substituted by some brewers for hops, hut is now probiblted-under scevere poualties. It affords a safe and efficacious fly-water or poison for files. It is believed that it would succeed well in our Southern States, and form a valuabie addition to our forests.

Quebee, the capital of Canadn, and of the Britith posensions in North America, on the nortimest buak of the River St. Lawrence, alout 840 miles from its inouth, in lat. $46^{\circ} 48^{\prime} 49^{\prime \prime} \mathrm{N}$., long. $71^{\circ} 10^{\prime} 45^{\prime \prime} \mathrm{W}$. Population in 1850, 40,233. Quebec is situnted on a ridge, or promontory, formed by the St. Lawrence on the south and west, and the River St. Chariea on the eust. The extremity of this headland, called Capo Diamond, is about 340 feet alove the ievel of the water, and on it the citadel in built. The town extends from tho citadel, priucipaliy in a northesst direction, down to the water; and is, from the difference of elevation, divided into the upper and lower towns. Tho fortitications, which are very atrong, extend across the peninaula, the circuit within them being about two and three quarter miles. Fram their situation many of the streets aro uneven; they are aleo, for tho most part, narrow; but they are either well paved or Macadamized. The greater number of the houses are built of stone, with ahingle roofs. Some of the public buildings are elegant, and well adapted fur their purioses. The hariser, or basio, dies between the town and tis islaud of Orleans. It is safe and commodious: the water is alout 23 fathoms deep, with a tide rising from 17 to 18 feet; and at springufrom 23 to 25 ditto. Que-
beo was fonnded by the French in 1608. In 1629 it Baltio timber, the Importa into Great Britain from was taken by the Engilsh; hut was restored in 1632. Canada and ether parts of British America of red-pine, It was ngain taken by the English under General and of pine and apruce plankn, eppecially the Intter, Wolfe, who fell in the erigagement, in 2750; and was finally ceded to England by the treaty of Paris in 1768. The rapid increase of population in, and of emigration to, Upper Canada has occanloued a proportional Increase of intercourse between Quobeo and Montreal, and the Canadian ports on Lakes Ontarie, Erie, etc. The frat steamboat that plled en tho St. Lawrence was launched in 1812; but there are now a great many steamars, some of them of large barden, employed in the conveyance of goods and pasmengers between Quebeo and Montrealj and in the trade between Quebec and Ifallfix, in Nova Scotla. And by means of the Rileau and Welland cainals, an uninterrupted line of ateam consmunication is formed hetween the Atlantic and Amhurstbarg; one of the remete settlements of Upper Canada, a distance of more than $\mathbf{1 6 0 0}$ mllea; which is now exterided through Lake Huron to the weatern extremity of Lake Superier,' about 700 milee beyond Ant hurstburg; giving to Quobec a command of internal navigation inferior only to that of New Orleane. The navigation at Quiebec closes at the enid of November or begianing of December, and opene in April. Below Quebec the river is seldem frozen over; Dut the masses of floating ice, kopt in constant agitcition by the flux and reflux of the tide, render navigation Impracticablo. The watere of the St. Lawrence are very pure; and in point of depth and mágniture it is one of the nohieat rivers in the world.-Bovicherre's British Dominions in America. Quabeo is a free warehouning port.

The trade of Quebeo is very extenelve. It engrosses, with Montreal, almost the entire trado of the province with the mother country; tho West Indies, etc. Great numbers of omigrants leave England for Canada; hut the larger number subsequently reemigrate to the United States. It has a regular intercourse, by meana of ateamers, with Montreal and other ports higher up the St. Lawrence, and with Hallfax and other ports on the Atlantic. Still, however, it must not be forgotton that in so far as the United Kingdom le concerned, the trade with Canad $\mathbb{A}$ and Quebec is, in aome degree, forcel and factitions, and has not been a source of proft, but the reverse. In former years it was, in fact, mainly a consequence of the discriminating duties laid in British ports on timber from the north of Europe; and but for this preposterous arrangement, the trade between Great Britain and Quebec would have been extremely unimportant. Now, howe ver, some branches of the trade nppear to have sequired a solid footing ; and notwithstanding the reduction of the diseriminating duties in favor of have of late very largely Increased. Excepting timber, furs and ashea are the most important articlen eent from Canada. A conalilerable part of the corn and flour exported from Quabeo ia the growth of the United States. . The prinelpal articlea of import Inlo Canada condist of corn, cottons, woolena, silk, and other manufuctured goode; glase ware, spirits and wines, iron and hardware, augar and tea, eto. The total value of the Imports into Canads (of which, however, by far the largeat portion goes to Montreal) Ir. 1848 amounted to $£ 2,107,164$ curroney ( 242.42 , currency $=20$ s. ateriing). Declared value of British produce and manufactures exported to Canada in $1851, £ 2,451,534$. It is materini, however, to bear in mind that little more than half the imports are paid for by the exports; they aro, in fact, principally paid for by the Treasury at home, ond are to be regarded as the meana sent out by England to pay the troope and meet the other heavy expenses slie has to incur in the preservation of thia unproftable colony.
Agoount of the Numiner of Vebella and tiriz Tonnage Willen agaively at Tils l'obt of Quenro, includino thobe mound fon Montaral, and feom fea, from 1840 To 1850 INCLUEIVK.

Paper Currency.-There ia no established government bank in the province; but there are several private chartered banke, of which the Quebee Bank is the prineipal.-For a complete necount of the trade of the Provinces, see Canadia and Montrein.

Quercitron Bark. The bark of the Quercus nigra, or American oak: it is a highly valuable dyo-stuff, and is used in the production of some of the most durable yellows.-For a more full account of this dye-stuff, see articles Dybs and Oak.

Oufoladiver, or ITeroury, one of the motals, and so fualble that it oan not be reduced to a aolld atate but at a degree of cold equal to forty below aero of Fahrenheit's thermometer. Its ute in refining sliver was discovered A, D. 1540 . There are mines of It in various parts, the chief of which are at Almadar or Almelda, in Spain, and at Udria, in Caralola, In Germany, discovered by accident in 1497. A mine was diecovered at Ceylon in 1797. Quicksilver was congesled in wintor at St. Potershurg in 1759. It was congealed in England hy a chemical proces, without anow or ice, by Mr. Waiker, In 1787. -Sed Mencuay. For notlces of quicksilver minen, 100 Americam Journal of Science, xxvili. 219; IIUNT' Merchando' Magasine, xvlli, 108.

The exports of quicksilver from California, the production of the Californis mines, for three years, were is follown, allowtng tho flaks to hold 75 pounds at a value of 50 eents a pound:

The exporta of quilekailver of domestic production from the United Statea, for the year 1856, amonnted to $\$ 831,724$, and was solely from the port of San Francisco. The exports of foreign quicksilver amounted to i16,011 of which \$15,589 was from New York. The impor:z of quickallver for the same time amounted to \&3625, of which $\$ 2649$ was into New Orleans, and tie production of the mines of Mexico.

Quickallver is found in tho largest quantities In Spain and California. Almaden, in Spain, has long been famed for ita minea of this metal, which, accordiing to Bowlen, are the richest in their produce. In China quicksilver la chiefly used in the manufacture of vermilion and other articles of comnerec.

The quantity of gulcksilver produced from the New Almaden mines, Santa Clara county, Callforuia, la about 100 bottles per month, or nearly $1,000,000$ pounda per annum. Tho other quicksilvor mines worthy of note are, one at Huaneavelica, in P'eru; in Ilungary, Transylvania, and the distriet of Deux Ponts, in Germany. There ia a mine of elinabar near Allicunte, and another not far from San Felipe, l: Spain. Mereury has alao been found in China end Japan; and though the amonnt of the produce is onknown, it is belioved to be considerable.

According to Dumas, the following minea yield annually as follows: Almaden, io Spain, from 2,700,000 to $3,456,000$ pounds a voirdupeis; Idria, 648,000 to $1,080,000$ pounds; Il ungary and Tranzyly ania, 75,600 to 97,200 pounds; Deux Ponts, 43,200 to 31,000 pounds; Palatine, 19,440 to 21,600 pounda; Huancavelica, 324,000 pounds. The total annual product, inelading Callfornia, can not Le less than from $6,500,000$ to $7,000,000$ pounda.

Quills (Fr. Plumes à écrire; Ger. Posen, F'eder kiel; It. Ienne de scrivere; Russ. Sticoli; Sp. Canones para escribir), tho hard and strong feather of the wings of geese, ostriches, swans, turkeys, crows, ete., used in writing. They are classified according to tho order in which they are fixed in the wing, the second and third quille being the best. Crow quills are chicfly used for drawing. The goodness of quilla ia judged partly by the size of the barrels, but more by the weight ; hence the denomination of quilis of 14,15 , etc., lotha per mille, each millo consisting of 1200 quills. The quilis of tho porcupine are much employed tiy the Indians in North America as personal ornaments; the quilla are dyed, and the colors appear to be durable; they are applied toth to articles of dress asd household furniture.

Quince-tree. The common qoince (Cydonia rulgarif) is a low tres, celdom exceeding fifteon or twenty: foet in beight, with a crooked stem, and tortuous, rum. bling branchoe. The bark hs smooth and brown, approaching to bleck. The loaves are roundish or ovate; duoky green above, and whitioh underneath. The tlowers, which put fort in England by the middle of April, and in the middle and northern parts of the United Staten in May and June, are large, with the petals pale red or white, and the sepals of the same length as the potale. The fowers are suceeeded by large fruit of a globular, ollong, or pear-shaped form, of a rich yellow or arenge color, when ripe, of an auatere taste, and omitting a pecaliar and rather pleasant amell.

Geugraphy and Histery.-The quince ia supposed th have been originally a native of Sidon, a city of ancient Crote, now the island of Candia ; but it is much more probable that it was only firat lirought Into notice in that elty. It la considered at preeent as indigenous to the eonth of France, particalarly on the borders of the Garonne, and to Germany, on the banka of the Danubo. By some the tree is thought to le Indigenous to Britain; and Phillipa atatea; In his Pomariun Britannicum, that quincea grow in auch sbundance in some parts of the Woalds of Sussex, an to encille private familles to make quince wine in quantities oi from one hundrod to two hundred gallone in a season.
The quince was known to the Greeks and Romans, and both nations held it in high estimation. Columeila says, "Quineea not only yleld pleasure, lut heaith." He apeaks of three kinds-the "Strutbian," the "Must Quince," and the "Orange Quince." Pling meutions many kinds, some growing wild in Italy, and othets in cultivation, so large that they, weighed the boughs on which they grow down to the ground. Ho also says that some were of a green, and others of a golden celor, the latter of which were called chrysomela. The oniy kind that wae eaten raw he atates to have been raised by grafting the large quince upon the atock of a mall variety, cailed struthla. "All kinds of this fruit," continues he, "are grown in boxes, and placed within the walting-chamivers of our great personages, in which mon wrait to salute these personages as they coune firth every morning." It appears from the same author that quinces were used to decorate the images of the gods, which wero placed in aleeping-chambers, round the beda; whence it followa that the Komane did net think that there wan any thing either injurious or unjileasant in thelr smell. He gives directiona for preserving the fruit, by excluding the air from them, or boiling them in honey; or by pluaging them in bolling boner, a practice in use with thia and other fruits ia Genoa at the present day. He also writes much ou the neeiicinal qualities of this fruit. "Quinecs," says he, "when eaten raw, if quito ripe, are good for those whe spit blood, or are troubled with hemorrhage." Tic jnice of raw quinces he states to lie a soverelgn reniedy for the awoilen spleen, the dropsy, and difficulty of taking oreath, particularly to those who can not cenvenientiy breathe except when in an upright position. The flowers of the quince, either fresil or dried, he telis us, are good for indlamed eyes. The root of the tree was used, not only as a medicine, Lat as a charm against screfula.
The wool of the quince, when found of sufficient dimensions, is applied to the purposes of turnery; but from its small size thia tree is almost entirely cultivated for its fruit, or as stocks on which to graft the mountain ash and the pear. In France, however, this tree is sometimes grown for hedgen. The fruit is seldons eaton hy itself, but ia generally preserved in sirap, or is made into marmalade, or is mixed with apples in tarts. -Browns's I'res of i merica.

## R.

Ragis (Da, Lompen, Vodden; Fr. Chifor, Chiffow, Irapeaux; Drilles; Gor. Lumpen; It. Strasci, Strazzo; Rusa. Trppie; Sp. Tropoo, Ilarapos), ahreda or fragments of worn linen, woolen, or cotton cloth. Though commonly held in littlo estimation, rage are of great Importance in the arts, being used for various purposen, but especially in the manufaetare of paper, most of which is entirely prepared from them. A0 the mode in which raga are colliected muat be well known to cvery one, the following statements apply only to the trade in forelgn raga.

Woolen Rage.-Woolen and linen rage are imported in conoiderable quantitien from the continent of Europe, particularly froin Italy and Sleliy. Woolen rage are chiefly used for manure in Engian.w, wopecially in the culture of hopa ; but rags of loose texture, and not too mueh worn or decayed, are unraveled and mixed up with fresh wool in the making of yarn-a practice more favorsble to the cheapness than to the etrength and durability of the fabrics into which this old wool is introduced.

Linen Rags are princlpally imported from Rostock, Bremen, Hamburg, leghorn, Great Britain, Ancena, Messina, Palormo, and Trieste. Their export from Hoiland, Belgium, France, Spain, and Portugal, is strictly prohibited. Tho imported rags are coareer and inferlor in appearance to the Englieh; but, belng almost exelualvely linen, they are atronger, and bear a price dieproportioned to the apparent difference in quality : this dieproportion has been materially augmented alinee the introdaetion of the process of boling the rags in ley, and afterward bleaching them with chlorine, has rendered foroign rage it for making fine paper, and indeed, in some reapects, preferable for that purpose, by their affordi' g greater emrength of texture combined with equal whi iness of color. There is considerable variety in the $a$, pearance of rags from difierent ports; but in general thoee from the north of Europe are darker and atronger than those from the Mediterranean fors. The iatter are chiefly the remaine of outer garmente, and bavo become whltened by exposure to the aun and alr; but since the improvements in bleaching, thia does not enhance their valuo.
Impost of Raes moto man Unitgi Grates fon the Yeaz ENDISU JUNE 80, 1857.

Rallroad, or Tramroad, a apecies of road having track: or waya formed of iron, atone, or other aolld material, on which the wheels of the carriages paseing along it run. The ohjeet in constructing such roads in, by diminiching the friction, to make a less amount of power adequate either to impel a carriage with a groator velocity; or to urge furward a greator load. The essential requiates of a raliroad are two or more amooth parallel surfaces for the wheele to run upon, and formed and piaced in auch relation as to glvo tho maximum atrength and affety with the minlmum friction. The frietion on a perfectiy level rallroad, properly conatructod, is eatimated to amonnt to from onetenth to one-seventh only of the friction on an ordinary lovel road; so that, supposing the sanie force to be applied in both cases, it would move a weight from 10 to 7 timen as great on the former as on the latter. But if there be a very moderate aseent, such as one foot in fifty, which in an ordinary road would hardly be perceived, a great increase of power on the raliroad la required to overcome the realatance that is thua ocesoloned. The reason is, that the ordinary load on a lerel rallroad is about seven times as great as on a common turnpike road; so that when the force of gravity is brought into operation by an ascending plane, its opposing powor, being proportioned to the load, is seven times as grest as on a common road. Hence the vast importance of baving rallroads either level or as nearly so as possiblo. It la aleo of great importance that raliroads ahould be atraight or at least free from any abrupt enrves. Carriages being kept on the road hy flanges on the wheels, it is obvioua that, where the curves are quick, the friction on the eides of the rails, and consequent retardation, must be very grest.

The great auccens, rapid extenalon, and present necesoity of railroads, are in consequence of the appreciation of the value of time and saving of lubor, which are the characteriatice of the present age. Distance is nowmeasured by the time coneumed in its passage ; and the saving of cost In the carriage of goods is the aggregate of the saving in time and the saving in labor. We can not in the scope of this article give more than a aummary of the hletory of rallroade, and the statistles necesas ry to show the present condition and progress of railroade.
The alm and advantage of railroads may be stated concisely to be, to obtaln with tho minimum expendlture of power the maximum resnit of speed, draught, and safety in the carriage of passengers and freight. To show how this can be done would be to illustrate the whole science of railiodd englineering, and does not come within the compass of this work. It will be sufficlent to ehow the improvement over the age before railroada, and the progress since.the invention of railrosda, we have made up to this tinio. 1st. Ae to opeed. In 1804 a locomotive was conetructed in Wales, that performed the unprecedented feat of drawing ten tons on a tramroad at the rate of five miles an bour. Wood on railroads, in 1825, eays: "Nothing can do more harm to the adoption of rallroade than the promulgation of such nonsense as that we shall see locomotive engines traveling at the rate of $12,16,18$, and 20 milles per hour." Ritchie on rallways, in 1846, says: "An express train on the Great Weatern Railway, drawing 59 tons, has traveled for three hours at the rate of 63 miles per hour." And wo know that the speed of 100 miles per hour has bery obtained several times in tho past few years. In 1778 a contract was made to eatablish a cosec for passengere between Edinburgh and Glasgow, a distance of 44 miles. The cosch was drawn $\mathrm{b}^{-}$ six horses, and the journey between the two piaces, to and fro, was completed in aix days. Even eo recently as the year 1750, the atage-coach from Edinburgh to Glasgow took 86 hours to make the journey. In the
ycar 18.19 the sane journey was made, by a route three mile longer, in ote hour and a half. In the year 1763 there was but one atage-coach bet ween Edinburgh and London. Thle atarted once a month from each of these citles. It tork a fortnight to perform the journey. At the aame epoch the jeurney between London and York required four days. In 1835 there wers aeven comehea started aally between London and Ediaburgh, wblch performed the journey in 48 hours. In 1849 th.r same journey was performed by railway in twelve hours
24. The great increase of draught, or decrease of frictlon, needs but brlof Illustration. It la stated as a result of experimente on the Massachusetts railroads, that the cost of merchandise tranaportation is 8.095 conte per ton per mile, with an average apeed of ten millea an hour. 'The average cost of tranaportation of heavy merchandiae on the improved Macadamized roade of England is 27 cents per mille, with an average apeed of three milles per hour. We aee, therefore, that the cost of transjortation on railroads has been reduced to 11 per cent. of the coat of tranaportation on improved turnpikes, whlle the apeed has been Increaced 233 per cent. at the amme tline. 8 d . As to the increane of safety. On the l'rench railroade, 212 nilea In length, of $1,889,718$ passengers, who traveled 816,945 millea in the first half of 1843, not ons was either killed or wounded, and oaly three aervants injured. Comparing this with the traveling by horsa coachea in the aame region, we find that in aeven years, from 1834 to 1840, 74 persons wero killed, and 2078 wero wounded. Accordlag to Dr. Lardner, the chances of a passeuger meeting with a fatal accideot la travellng one mile on a railroad are $65,363,733$ to 1. And agaln, the chances of his meeting with bodily jujury In the same distance are $8,512,495$ to 1; and also that $366,036,923$ passengers nust travel one mile in order to cause the death of one railroad employe. On comparing the safety of railroad travellag on the roads of New lurk with those of Ureat Britain, it is found that for the last four years there were a greater number of pasangers killed and a lean number Injured upon the roads of New, York, in proportion to the number carried, than upon those of Great Britain. In New York one passenger was killed out of every $1,262,165$ who traveled, one elther injured or killed out of every 341,125. Ona passenger was killed for every $47,104,426$ miles traveled, and one was either injured or killed for every $12,747,142$ miles traveled. Excluding all the accidents growing out of the imprudence and fault of the passengers theniselves, it appears that one was killed out of every $6,310,828$ who traveled, and one was either injured or killed out of every 664,300 . Exxcludiag the accidents caused by thelr own careleseness or limprudence, there was but one passenger hilled for every $235,822,132$ milea traveled, and but out either Injured or killed for every 24,823,382 miles traveled. A vast number more !!ves would have been lost If the same number of passengers bad been conveyed the samo number of malles in ono-horse wagons or in the old-fashloned four-horse coaches.
"There be three things which nake a nation great and prosperous-a fertile soil, busy work-shops, and easy conveyance of mien and things from one place to another."-Bacor. And we can furm some eatlmate from the foregoing, of what share rallroada have had in giriug ua one of these three alements of prosperity.

History. - Woodea rallwaya wera employed an a aubatitute for cummon roads, in the colonies of England early In the 17th century,-Ritciue on Railucay, p. 19. The eailleat record of their exiatence is in the life of the Lord-kerper North, wherein it appears that about tha year 1670 they were used at Newcastle-on-Tyne, for transporting coal from the minea to the river, and enabled one horse tu draw from four to five chaldrons. Subsequeatly these platea were covered with iron; hut the lncroduction of ralls wholly of Iron seems not to have taken place till 1768., Iloannlower's Report to

House of Co nmone in 1811. A projection or flange on the outer slat of the ralis kept the wheels of tha carrisgee upon them. They were called "Tramroails;" and the oljections to them were the great amount of friction againet the side flange and the wood surface of the plate.

In 1789 was conatructed the first public railway in Englanc, at, Loughborough, by Mr. Wililam Jessop; and he introduced east Iron edge-ralie, and whoela with the tlangen cast upon them inateal of on the rail. Tramroads were, however, in use up to 1808. The Arst rallroad built in the United States was In 18:7, from Quincy to a point on Masachusetta llay, three nilies in length, for the purpose of conveying granite to Boatou from the quarries of Quincy. The ralls used were of wood. The firat passenger railroad was the frat 13 milee of the Haltinora and Ohlo in 1830, from Baltimore to Elkridge.

Mailo.-"In 1803 malleable Iron ralle were firat tried, but uot approved of. In 1808 they were introduced into aome coal works of Cumberland, and used with complete auccess."-Gillesiriz on Railuayt.

Since then they have bean formed of a great variety of ahapes. The princlpal are, lst. The flat rail used en branch coal-roails and on roade where horse-power is used, and where economy is considered essential. 2d. The rall called the "hish-bellled," from the rounded profle of Ita under, aide. The form of this rall lis li. dicated by theory as aluiost perfect for atrength; lut on account of the unsteadiaesa, from requiring a high aupport, it la now generally abandoned...3d. The A rail, or inverted $\mathbf{T}$. This rail la adonirably adapted for atrength and security, but is more complex for rolling than the rail commenly In nee, namely, the $\mathbf{x}$ rall inverted, $t$; and has only been used to a moderate oxtent, and principally in England. 4th. The inverted $\bar{E}$ rall, so called, but more like an I in form. This form was foumal by Irofeasor Barlow to possesa the maximum strength from a given quantity of material. This rail is used in Eagland, but ham been found to be deficient in stability. The Tinverted) rall is the one generally used lu this country; and for the facility in roiling, atrength, and stability, Is decidedly the beat form. The weight commonly used is about Go pounda to the yard; but a heavier rall la more eccuemlcal in the end; and the weight of raila has been in. creasing from $3^{5}$ pounda, the weight first uecd, to that of sixty pounds to the yard.

Ralis were firat laid on stone alcepers or blocks, as giving the most solid support ; but this plan has gradualiy been abandoned, ea the want of elasticity was the cause of a rapid destruction to the rolling stock. Longitudinal alecters of wood were alao tried; but after much practica! experience, the present form of transverse wooden alcepers, lalid on broken atone or gravel bed, was adopted as the best foundation, and is now in common use.
Locomotives.-After a full trial of horse-power and statinnary steam-engines, the plan of an enginc, and whict tles present locomotive is In many respects only an improvenent of, was Invented. 'There has heen some controversy as to who should have the credit of the invention. It appears, huwover, that in 1759 Dr . Rohinson, then a student In the Univorsity of Glasgow, suggested to Watt the applicetion of the stcamengine to wheel-carriages; and in 1782, Murdoch, to whom Trevithick was a pupil, made a model ef a ateam-carriage. In 1784 Watt deacribed such an application In his patent.

In 1801 Ollver Evana, of Philadelphia, moved a steam dredging-machine a mile and a half on wheels turned by ite own engine. In 1802 Richard Trevithick, in conjunction with Andrew Vivian, both Cornwall engineers, built and took out the first patent for a tocomotive; and In 1801 Richard Trevithick buile a second locomotive, which on a road in South Wsics drew ten toms at the rate of five miles an hour. It
was many years, however, befor ,iy improvement took piace, owiag chiefly to the imaginary difficulty of getting the locomotive wheols to "blte," or keep from alipping on the ralia, Great lagenulty was brought to task to remedy this imaginary evili and la 1812 a rail with racke or aockets was laid, and an engine with teeth to fit in the rack was built. In 1818 an engino with hind licge was invented to prevent the slippling. Ali theme contrivancen were, however, shown to be useless by the ulscovery in 1814, by setual experlment, that no friction was needed. And in thla same year the first really anceeasful locomotive was invented by George Stephemaon, which ran six milas an hour, and drew 80 tons. Lietle progress was made from this time until 1829, when Kobert Stephenson construeted the "Jocket" onginn, which on triai ran wlth an average speed of 15 miles an hour, and with a maximuin apeed of $29 \frac{1}{2}$ milies an hourd' Since that time jocomotives have been built to run over one bundred miles an hour, and to draw a train of cars up an inclined plane of 600 feet to the uile. The performances of a modern locomotive, in fact, are smoag the most wonderful of ali mechanisms.

Railroud Management.-Although one of the most powerful clements in our prosprity, and in fact now a necessity, it can not be denled that ralirende generally have heen failures conaldered as profitabio Investments to the stockiolders. The business of our railrosds is ample to make them good investment; and therefore there can be but one cause for so general a fallure; namely, unremunerativs toriffs. Occasional instances of bad managoment have taken place, bat it is obvious that this can not be the cause of so general a fallure. 'The gold diacoveries of Cailfornia sind Austrslia havo sdvanced the prices of labur, fuel, etc., from 80 to 50 per cent., and, consequently, the expenditures of ralirosds in a similar ratio. During this time there has been no corresponding inereasc in the tariths of our railroads. 'This, in conneetion with the fact that the depreciation of the rails, roiling stock, eto., have not been aufficiently allowed for, explain the cause; and make s remedy obvious. To show the authority for this atstement, we give the expenditures, etc., on railroads at different periode since their first practical adoption. These show that there was a gradual decrease to 1845, and ainco that time an increase in oxpenditures.

The annual cost of malntalning in operation a wellmanaged road is almost $1 \frac{1}{2}$ cents for cach ton per mile carried over it, and 44 cents for each mile run by all the engines, besides 500 for each mile of roed. If it be likewise a passenger rond, there is to be added threefourthe of a cent per mille for each passenger carried.Cuanless Elaef, Jun., Civil Engineer, Frankiln Instltute, 1842.

The complete average oxpense per train per mile of running on the prineipal roade was estimated

| In the United Stateg, in 1838,* at. . . . . . . . . . . . . . . 100 cente, |  |  |  |  |  |

It will be seen fromit this statement that the expenses have been stesdily inoreasing eince 1845. To exbibit tiis more plainly, we give a table showing the gross recelpts and expenses, and also the net receipts of the Massachusetts raliroade for ten years.

| Years, | Toter hoeelipis per Milo rys | Total wipemes per milc run | Fet Revipes per MIlo rues. |
| :---: | :---: | :---: | :---: |
| 1846 . . . . . . | ¢ 18 | 646 | Coel4 83 |
| 1847........ | 9.1501. | 76 | 81 |
| 1843........ | 180 | 76 | 74 |
| 1810 ........ | 1 Dt | 76 | 76 |
| 1850........ | 151 | 7.4 | 78 |
| 186t ........ | 150 | 76 | 74 |
| $1859 . . . . . .$. | 14 | 77 | 07 |
| $1883 . . . . . .$. | 151 | 81 | 70 |
| 1854....... | $15 \%$ | 108 | 53 |
| 16V6........ | 160 | 1 (\% | 14 |

From this it will be genn that the grose reeeipte (or tarlfi) increased only 08 per cent. In ten years, while the net receipts decreaned 23 per cent.; and the expenses increased 44 per cent. This comparisoa holds equaliy true with many of our rallioads.
The following facts regarding eight of the princlpal ralirsads of Massachusette are developed by reporta to the Legislature

1. The cont oi passenger transportation is 1.062 cente per passenger per milis. 2. The cost of merchandiso tranaportation is $\mathbf{8 - 0 9 5}$ cents per ton per mile. 3. In passenger trameportation $41 \cdot 98$ per cent. of the recelpts therefrom are absorbed in expenses. 4. In morchsnilse transportatlon $\$ 89 \cdot 52$ per cent. of the recelpts therffrom are zbsorved in expenses. b. The expenses of raliroads are eimost invariably determined by the weight carried over the rsils. For instance-the 工astern road, upon $v$ ihich yrasenger traffio predominatea, Is operated at an expense of $\mathbf{\$ 3 6 7 0}$ per mile of the length of the road; whlle the Jowell, upon which merchandise traffic predominates, is operated at an expense of $\$ 12,478$. 6. The cost of renewals of Iron upon raliroads is an infailibje index of the magnitude of expenses. For the preceding roasons, the cost of that item on the Esstern road is but $\$ 390$ por mille of the length of the road, while upon the Western it is $\$ 1899$. 7. Of the expenses of railrosds; thirty per cent. are absorbed In maintenance of way, or road bed; twenty per cent. In fuel and oll; twenty per cent. in repnir of engines, tenders, and cars; ton per cent. In spevial freight expenses; and the remsinder in passenger, incidental, and miscelisneous expenses. $\quad \boldsymbol{\sigma}$. The weight of the englues, tenders, and cars upon passenger trains la nine-fold greater than the weight of the passengers. 9. The weight of the engines, tendera, and cars upon freight trains, is scarcely one fold greater than the welght of the merchanulise. 10. For cheapness, railroads can not compete with canals, in transportation of heavy descriptions of merchandise; the cost of carry. ing merchandise upon the Erie Canal ranges from two to sixteen millis per ton per mile; while upon sixteen of the prinelpsi rallways of Now York and Msssachusettis the cost of carrying merchandiae ranges from thirteen to sixty-fiva mills per ton per mile.

It being grantea that the present tariffs nre too low, the remedy, or how to make raliroads more pruitable, is the chief point. We extract from a paper writtea by Charies Ellet, Jun. civil engineer, which eiucidatee a good system.
1at. Fivery yoad should form its own tariff of tolls, based upon its own trade.
2d. In arranging the tariff, let the first step be to ascertain the true cost of transportation upon the particular. road for which the tariff is intembed. The actual cost of transportation is cieariy the minimum limit of admlasible reductions in favor of those oljects of transpertation which are deemed, from motives of policy, most worthy of special $r$ 'couragement. There may be, and ought tc be, material discriminations in every tariff; bot no articie oaght to be conveyed for less than the actual cost of its transportation, falrly made out from the proper experience of the line. Having deternined the true cost of transportation, and sdopted that as a minimum charge, below whleh the toll on no articie
shall be suffered to fall, the company wili be aecured againat one frequent source of linmense extravagance -that of carrying freight for mothing, or less than mothing. With this information in hand, it is practlcable to construct a tariff of espenses, whlch should in every case precede the adoption of a tariff of charges.

8t. The mert arep in the process should be to ascertain the highest charge which each article scill bear.

4th. The true charge for each article and each position, it must be apparent, will be found oomewhere betaroen the actual cost of transportation and the prohibitory charge. The next step in the construction of a toll-sheet shouid then be to form a third tariff, by adding together, for each article and each position, the cost of transportation and the prohititory charge, and taking half thelr sum as a near approximatlon to that charge which will yield the greatest net revenue. let there is no fact better susceptible of the strictest mathematical demonstration than this, that the charges which rill yield the maximum wet rerentuc on railroade doing a miscrllaneous business must be from one to tro cents per tow per mile greater than that which will produce the maximum gross recenuc. If, then, a company ainsa to oltain the greateat possible gross revenue, it can only succeed by a great sacrifice of dividends. In fact, the gross revenue may be enornous, and yet be insufficient to pay thair expenses.

Roiltray Legialation.-Nothwithatanding the vast advantages which the opening of so many new and improved innea of communlcation have conferred on the country, we can not help thinking that these advantagee might have been much greater, and that, in the instance of railway-legislation, the public interests have been overlooked to a degree that is not very exensable. It is, we admit, no easy matter to decide how far the interierence of government ahould be carried In matters of this sort. But, at all events, this much is obvious, that when government la called upon to pass an act authorizing privato partles to excente a railway or other publle work, It is bound to crovide, In as far as practicable, that the publicinterests shail not be prejudiced by such act, and that it should be framed so that it should not, either when passed, or at any futnre period, stand in the way of the public advantage. We believe, however, that a little consideration will serve to satisfy most persons that this Important principle han, in the case of rallways, and indeed of most descriptiona of public works, been, in this country, ail Lut wholly neglected.

Within a few yenrs past the rallway lytereat has besome one of the most important In this country, not only on nccount of the large pecuniary inveatments which have been made therein, but also on account of the effeet which its developinent has had In Increasing the value and changing the relations of property, trade, and commeree, and in modifing the cocial conditions of our people. Thene varied interesta, and the new circumatancea whleh have leen called Into exiatence by the vaet and rapid expansion of the railway syatem, have required additional legal enactorent from time to time, but the same aupervision and restraints of law which are considered neceasary to guard and protect other public intereats have not been imposed upon thia one to an extent commenaurate with lis increasing importance. The railrond corporations, in whleh there is a larger inveatment than in the banke, over which the law exercises supervision, are permitted to control an immense amount of caplial, and intereats of the greateat magnitude, with no other check than ia afforded by an annual atatement of their afthire, notoriously Incorrect, and in many cases made so systemntically, for the purpose of concealling from the stockholders and the pablic violations of law and want cf fidelity to their truate.

One of the best guarantees for the falthful performance of duty that can be given to the public and the atockholders by railirond managers la to render, int fre-
queat intervals, full and accurate atatements of the results of the operations of the worka, and the manner in which these officers have discharged their trusts. It is not difficult to demonstrate that the publication of such ample etatements doee not, in the long run, injure the interests of any corporation, and that it is the most certain security againat malversation in the administration of lts affirs.

Under the General Railroad Act of 1850 each of tice rallroad corporationa In the State of New York is re. quired to make an annnal report to the Stste Enginecr and Surveyor in the form preseribed, showing its finnncial condition and coat, its length, and other characterlatics; the business done during the year and the expense thereof, a atatement of the recelpts and payments, and a llat of aecidenta which have occurred involving injury to life or limb; and this officer is re. quired to arrange the information thus furnished, and submit It, together with the reporte, to the Legislature. -Report of the New York State Eingineer, 1855.
Auatrian Railroade. - The goveriment of Austria has at length conceded to a public company ail the railwaya that have been completed, and those which are to be censtructed, in the Lombardo-Venetian territories, and the Central Italian Rallway. Tha lines alrearly completed by the atate are as follows:

The railways to be conetructed are an follows:

The length of rallwaye completed is equal to 373 Fn gliah milea, and the length of those to he constructed is equal to about 223 Fnglish miles. The Centrai italian Raiiway concession ia for $\mathbf{2 8 0}$ kilometres, so that the entire concession, when complete, wili comprise about 680 English miles of rallway: The atate grauts to the cosapany the free use of the line frem Nebresina to Trieste, with the joint uee of the terminus at Tricste. The company is to pay to the atate for the finished railwaya $30,000,000$ francs, or $£ 2,400,000$; this sum is to he paid in six Installments within a period of six years, or at the rate of about $£ \$ 00,000$ per onnum. Sisoulid the net profits at the end of this term exceed $\bar{i}$ per cent., the company will have to pay an additional sum to the Austrian govermment of $16,500,000$ frames, or e660,000. The Austrian government guarantees 5 per cent. on the whole cap̧ital required, which is estimated at about $250,000,000$ francs, or $\mathbf{2 1 0 , 0 0 0 , 0 0 0}$. For the Central Italian liailroad, the company has a guarantec of $6,500,000$ franca per annum, or more than $6 \frac{1}{\text { pet }}$ cent. on the cajital.
Or the railways in operntion, in progresa, and contemplated in Finstem Europe, a brief notice will suttice.

Russia, carried along ly the tide of iubilic opinion in Europe, found herself compeiled, hy a due regard to the interests of her people, to consecrate a part of her exertions and her capital to tha construction of the new lines of conmunication. An attempt was tirst made to attract private capitalists to these projects, and apecial ailvantages wero otlered to compnities who might be diaposed to undertake the construction of the Ilnes of railway contemplated in Russia. The enuerur, bealdea guaranteeing to the sharcholilers a mininum profit of 4 per cent., proposed to give them gratuitously all the lands of the state through which the rail-
ways should pass, and to place at their diaposal, also, gratuiteusly, the timber and raw materiala necessary for the way and works which might be found upon the spot. It was further propused to permit the importation of rulls and the rolling atock free of duty. Russian proprictors aiso spontaneously came forward, and not only agreed to grant auch portion of tholr land as the railwaye might paas through gratuitoasly, but further to dispossess themselvestemporarily of thelr serfe, and surrendor them to the use of the companios on the sole condition that they should be properiy supported while employed.

13y a apecial ukese, dated February 18, 1842, it was decreed that the rallway which was to unite tho two capitals of St. Petersburg and Moscow should be constructed oxclusively af the expense of the state, in order to retain in the hands of the government, and in the general listerest of the people, a line of communication so Important to the industry and the internal commerce of the empire. The local proprietors equally agreed to surrender to gevernment gratuitously the lands necessary for the works of this line.

The system of railways contenplated in Russin la composed of five principal trunk liaes, one of which, contecting Warsaw whth Cracow, ie completed andi in operation: the langth of thle line is 168 miles. The second will connect Warsaw with St. leteratirg : the extent of this would be, when executel, 683 miles. The third will connect St. Petersiburg with Moscow; this line is in active progress: Its length will be about 400 miles. Besides these, antherization was given to $n$ company, by a ukase dated July, 18.13, to construct a railway for the transport of goods between the Wolga sud the Don, the length of which would toe 105 miles. In the actual excention of this magalficent system of railway commnnieation, tho considerable progresa has been ret made, with the exception of the line nilready mentioned between Waraaw and Cracow.

A short llue of railway connectling St. Peterahurg with Tsarkod-soola, having an analogy to the Greenwheh and Richmond lines, which diverge from London, and the Versailles and St. Germaln lines from Paris, was completed and opened for traffie in April, 1838. The traffic on this Ilne has hitherto amounted to about seven humired passangers per day.

The rallway connecting the Don and tha Wolga was openad for traffie in 1846; but thls line is excluaively for merchandise, and is worked by heras.

In southern Russia a lina of railway la projected between Klef and Odessa, the surveys of which have been made by lelglan englneers; but no progreas in its construction han yet been effected. A railway has been projected also between St. 'eteraburg and Cronstadt, and anether between St. Petersburg and Baltishifort, In Esthonia, to be constructed and worked ly a company wlth a guarautee of $\pm$ per cent. by the government.

In Italy a few short lines of railway only have been executed, connecting the chief atates with neighbering places. They are as follows:

|  |  |
| :---: | :---: |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |
|  |  |

|  |  |
|  |  |

In the kingdom of Sardinin railways exist as yet only In prospect. It is intended to carry two lines from Turin, one directed on Genon by Alexandria, and the other on Milan by Vereelli and Novara. The political distractions, however, of tho last two years havo suspended theac projects.

Railroads in Spain.-From returns Intoly mado In Spain to the govermment conecruing the railwaye conceded and at work in that country in 1856, it appeare that the whola of the lines open to the public, including that from Madrid '. Taragossa, conceded to tho Spanish Crédit Mobilier, give a length of 1955 kilomotres (1222 miies). In the concassion granted to that company, of the twe sections of the railroal from Madrid to Valladolld, and from Burgos to tha frontier of France, the first sectlen will leave Madrid, pass by Avila, Arevolo and Medina del Campo, and will stop at Valladolld, whero It will join the aection already traced out from Vallatolid to llurgos.

Railroada in Prussia.-Thu subjoined ls an necount of the progress of railroads in I'russia since 1840 .

The number of passengers has remainel atutionary since 1819, while the receipts for passenger trade have lacreased only in proportion to the length of road. The amount of merchandise transported has, on the contrary, increased three-and-a-half fold; and while in 1819 the reecipts on marchandisu did not equal the receipts from passengers, they amounted in 1855 to more than double the receipts from passenger transport. In $1 \times 49,381,788,585$ hundred pounds were transported over every mile of road; in $\mathbf{1 8 5 5}$ were transported $1, i 42,066,152$ hundred pounds. While the roads have scarcely lnereased one-third in aggregate length, tho transport of merchandise haa Increased live-fold.

The lengthe above attributed to Jrussian ronis extend in some cases heyond the Irussian borders. At the end of 1854 there wore 2230 miles of rallroad in l'russia. At the end of 1855 there were $231: 1$ miles. During the year 1856 about 270 miles of road were ojened in l'russia, so that at present in tho whole I'russian atate there is one milo of railroad to every uine and two thirds equare milles. This, howover, varies in dilfurent provinces-amounting la Rhincland and Weatphalla to $5 \cdot 5$; It Silesia to 7.2 ; in 1lrnudon-
burg and Saxony to $7 \cdot 5$; in Pemeranla, Prussia, and Polund, to $22 \cdot 5$ square mile for every mile of railroad. There are already commencod, and to be completed in 12 ycars, 2600 miles, so that in 12 years Prubsin will contain at loast 5280 miles of railroad, or one mile fr.r every $4 \cdot 3$ square miles. Thore will then be one mille of railrond to every $2 \cdot 3$ square miles in Rhineland and Weatphalia, to every 4 square miles in Silesia, to every 4 square miles in Braudonburg and Saxony, and to every 10 byuare miles in Pomerania, l'osen, nud l'russia. The cost of building these new romis is estimated at about $\$ 168,000,000$, or $\$ 14,000,000$ yearly.

Railronds in France. We extraet the following report on the conditlon and progress of railroads in France during the year 1856, submitted to the Emperor by M. A. Roulier, chief of the Department of Agrieulture, Commeree, and l'ublic Works:
"A resumé of theso figures, whleh Indlente the great Incroase of public contldence, also oxhibits the fact that the cunstruction of the net-work of railroads in France has cost, to thls period, $8,080,000,000$ franes, " of whilch

[^37]2,419,000,000 fell upon the companies, and $661,000,000$ was contributed liy the state. Of this aggregate amount there appears for the yeara 1855 and 1856 the enormeus sum of $919,000,000$ france.
"The net receipts, which in 1847 were ralsed to 22,000 france per kilometre,* suddenly fell in 1848 to 13,600 francs; but since 185̈2, notwithatanding doulle tracks were lati, their marked laerease la showa by the following ligures:
In 185? $\qquad$ 21,000 franca per kilomstre.

* 1854. 

"These returns experienced ln 1885 an exceptional angmenntion, owing to the Liniveral Exhiblion or World's Fair. They reached 30,300 francs ; and if tho amount did not reach that figure the present year (1856), the increase over 1854 is not the less progressive; for the returns for the first three quarters show the net amount of 28,000 franes, at the very lowest, per kilometre.
 feom 1823 ro 1853 .

"It may be interesting and instructive to show as well the propertions in which thu expenses are distributed between the principal periods into which the past, thirty-four years have been divided, as the shure contributed by tho atate during the same periods. The yeare which elapsed between 1823 and $1 \times 30$ were, as respects railroady, an epoch of experhments and trials, to which the companies develed an annual average of 470,000 frances, the atate furnishing no contribution.
"During the twelvo years which aucceeded tho revolution of July, the indecision In regard to the system Hion which railroads were to he constructed, and the smatl share of contidence which these new apeculations Inspired, paralyzed the progress of developunent. This the expenses on the psit of the companies did not esceed an annual average of over $11,330,000$ frunes, while the amount which fell upon the state on a sinilar average was but 270,000 francs. The law of June 11, 1si:, gave the tirst impetus to railroad enterprises. From $1 \times 12$ to $1 \times 17$ the anuual nverage expense wus $85,800,(600$ franes for the companies, and $46,400,000$ for the state. From $184 A_{\text {to }}$ the month of December, 1851, owing to the politioal disturbances, which raached even the sources of credit, the annual average expenses of the company sunk to $30,000,000$ frances, while the mount which fell upon the atate wes raised to $55,000,000$ ench year. Since 18j2, however, when legilimate conlidenee was again restored, and new institutions had inspired in France securlty and hope in the future, a new order of thinge commenced. The annual exprenses of the company auginented in a remarkatile degree, havInge risen to the average of 21 ti, 000,000 francs. The demands upon the treasury dhminiohet no less rapidly, having been reduced by recejpts and relmbursements to the annual sum of $17,000,000$ franes.
"Finally, under the healthy fntinence of the general prosprity and credit, the expenses of the companles reached, in the year $18: 5,430,000,000$ franes, and in $1856,408,000,000$ francs; while those of the state were

[^38]reduced by relmbursements to not more then $80,000,000$ for both years. The résumé of these figurea, whleh are themselves the indlees of tha publle confidence, shows that the net-work of ralifroads in France has cost, up to the present period, $8,080,000,000$ francs, of which the rtate paid $661,000,000$ francs, and the companies $2,419,000,000$. To this aggregate amount the years 1855 and 1856 alone contribated tha onormous amont of $919,000,000$ france.
"The entire length of thls net-work of raliroads nt the commencement of 1857 is 11,250 kilumalres; or opened, 6500 ; in progress of completion, 4750 .
"Length to be comploted in the next ten years:

| 1854.......... | T1 | 482 | 9,211,602 |
| 1855.......... | 10 | 363 | 9,192,038 |

Of the 73 acts passed in 1855,53 had reference to the construction of works; the length of new lines authorized by these 53 acts was as follows: viz., 196 miles in England and Walcs, 76 milea in Scotland, and 9 9 miles in Ireland.

The lines anthorized in England and Wales were chielly extensions or hranches connceted with railways alrendy authorized. Tho most inportant were tho following :

The extenaion of the East Kent Railway, from Can-
terbury to Dover. By this line direct rallway communication will be afforded between Dover and the naval and milltary arsenals in North Kent, as also a shorter line between Dover and the metropolia, than is afforded by the Southeastern Railway: The Newtown and Oswestry Kailway deasrves notlce, as forming a link in a llne of railway communication which will probably eventually consect the manufacturing districts with Milford Haven. The Carliale and Silloth Bay Railway ia an extension of the Port Carlisle Railway to a new harbor on the Solway Frith.

Among the llaes authorized in Scotland may he noticed the Glasgow, Dumbarton, and Heleuaburg Rallwuy, proposed to be constructed along the north hank of the Clyde from Glaagow to Helenaburg, and the Bauif, Macduff, and Turiff liailway. The remaining lines were merely ahort branch lines in connection with exlating rallways.

In ireland were authorized an extension of the Dundalk and Ennlakillen Railway to Cavan, and of tho Ulater Railway to Dlonaghan. The Belfast and County Down Railway Company wag authorized to make a line to connect Downpatrick with llelfast. A few other ahort branch lines were also authorized.

Development of Railucay Communication.-The total length of line authorized hy Parlianent down to the end of 1855 amounted to 14,346 miles; hut of this 1495 miles have been abandoncd by subscquent acta or by warrant under the authority of the commissioners of railwaj:s, and conaequently there remain $15, i^{5} 1$ miles for which the parliamentary powers which were obtained have not been repealed. Of these 8280 milea were open nt the end of $180^{5}$; 4571 miles, having reecived the authority of l'arliament, remain unopened.

The following talle exhibits for each year since 1843 the proportions of rallways authorized, opened, and abandoned under the authority of Parliament :

 tie total lenoth of llailway opened for 'ldayfio in facif Seab binof 1843.

From the foregoing tahle we see that there was a general lnerease in the number of miles opened from the year 1844 to the year 1818, when the number reached the maximum. From the year 1818 there was a decreaso, which, though not regular, is aufficiently so to show that Great Iritaln was approxlmating townri a completed systom. The average numberof inlles opened in the twelve yeara from 1844 to 1855 Inclusive, was 690, which la much leas than the average number hullt in the Uniter Statea during the same period.
This length of line lis distributed throughout the United Kingion as follows:

With respect to 2284 miles out of the 4571 miles | been applied to those portione of railway, and that it for which parliamentary powers have been obtained, and which have not yet been opened, the powera for the compulsory purchase of the land and the completion of the works have expired. The proportion in which this is distributed through the several yoars is shown in tho following table:
Table emowing rit Proportion of Rathwat mot open YOK TRAFFIO, AUTIOAIZRD PREVIOUS TO THE END OF 1843 AND IN EACH SGABEGUENT YEAE, AKD WHIOL HAVE NOT HEEN ALAANDONET HY gUBEgquENT AOTE; AND TIE PROPORTION AB TO WHIOI THE TIME ALLOW ED FOB TIIE OOM-

Cpon 213 miles out of the 2287 miles for tho construction of which parliamentary powers exist, the powers for the compultery purchase of the land havo been allowed to expire without having been exerciecd; nnd this increases, therefore, the numbier of miles which it is not probable will ever be made to 2497 miles.
The tatal amount of money authorized to bo raised by roilway companies, by shares and on loan, to the end of 1855 , amounted to $\mathbf{5 3 7 4 , 9 7 1 , 9 6 6 \text { , of which }}$ $£ 297,583,284$ had been raieed, leaving $£: 5,388,682$ to be raised. There are no meana of ascertaining how much of this sum is apportioned to the miles of railway for which parliamentary powers have expirct, but it may bo assumed approximately that from $£ 30,000,000$ to $£ 40,000,000$ of this amount would have
been applied to those portions of
will not, therefore, be now ralsed.
Of the 8297 mlles open for traffic on the 31st of DC. comber. 1855, the proportion constructed on the narrow gauge, broad gauge, mixed gauge, and Irish gauge, is as followa:

|  | Natrow | ${ }_{\text {Prend }}^{\text {Browd }}$ | Mired |  | tal |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 12 Englind | ${ }_{\text {Mileat }}^{\text {Mis }}$ |  | ${ }_{\text {Miober }}^{\text {Milo. }}$ | पller. | Sillea |

| In geutiand | 20 | 5.54 | $\ldots$ |  |  | ist |
| In Ireland. | 21 | 2 | $\ldots$ | $\ldots$ | 569 | 870 |
| Total. | 126 | 13011 | 209 | 72 |  | 2163 |

- Thirty-alne milles of thils length is laid with a second line on a narrow gauge.

From the abovo details it appears that the length of now lines opencd for traffic during the year 1855, ineluding 17 miles of lino lelonging to private individuals, amounted to 243 miles; of these, 235 miles were laid with only one line of rails.

Of the lines opened in 1855, the following arc those which appear to be the most important, viz. :
Tho Hereford, Ross, and Gloncester Railway, a hroadgauge line, which affords to Hereford a more direct communication with the metropolis than it previeusiy possessed.
The Wimbledon and Croydon Rnilway, which affords a commanication to the south of London, between the London and Southwestern and the Southeastern Maiiways, and provides another link in the line of railway communication which encireles the metropolis.

The length of new lino ryported to be in course of construction on the 30th of June, 1855, was 480 niles; of these about 170 miles wero opened beforo the 31 st of December, 1855.
With the view of affording some measure of the comparative progress of railway enterprise, the following table has been prepared, showing the number of mites of railway in course of construction in each year sinco 1848, and the number of persons employed thereon, together with the amnunt of money received, suld the number of miles of railway opened during the year:

| Years. | Lines in ecorme of Construellin. |  |  | $\begin{gathered} \text { During } \\ \text { the } \\ \text { titer. } \end{gathered}$ | Money raised by Nharat and Leend. | Miles of Railuas oppened during: the 3 rat. |

The number of erana employed on the 30th of $\mid$ Tho increase in the number of miles for the whle pe. June, 1855, upon the railways in course of construction aunnunted to 38,516 , being on the average 43.8 per mile. It will be seen from this tablo that the average number of persons emplnyed per mile has gradually decreased sineo 1849. This may be ascriberl to improvements and the employment of ateam-powor in railway construction.
The length of line open for traffic in the Unitod Kingdom on the 30th of June, 1855, was 8116 miles, and the number of persona employed thereon amounted to 97,952 personk, or 12.07 per mile. This, ns apparara from the following table, is a larger number per mile than has been employed In any year since 1 k 48 .

Tho increase in the numbier of miles for the whole perod of elght years, is 98 per cent.

RAI
Emeliah Railway Trafito

|  | 1965, | 1868. | locreme, |
| :---: | :---: | :---: | :---: |
| Total recelpta for goods, passeagera, malls, etc. . . ....... | 2 $21.128,816$ | ,222,9C5,500 | 21,872,185 |
| Length of ratiways open fer traffic, mites............. | 8,240 | 8,760 | 6:30 |
| Average recelpt per) mille open during the yoar .......... | c2,068 | ¢2,750 | 291 |

There is thus aeen to be an increase, not only In the nmount received, but also in the length of railway, and this has been to auch an extent that the receipts per mile are likewise greater; and although the later week3) returns for 1858 did not show ao large an Increase over those of 1855 as those of the earlier portion of the year exhibited, there is still reason to hopo that railway property has now overcoma many of the difficulties by which It was besct, and that it will henceforth yield a return more commensutato wlth the advantagea it has conferred upon the public than has liltherto been the case.

Among the benefits derived from rallways London may reckon the increased importation and diminlshed price of fuel, which lave been the consequence of the better development, as shown by the following return of railway coal traffic:

| 1855. | 1854. |  |
| :---: | :---: | :---: |
|  |  |  |
| $\text { Toon. } 137,635$ | $\begin{gathered} \text { Tone. } \\ 1,240,209 \end{gathered}$ | 108,4 |

But the value of railways in this respect will be better appreciated if the quantities brought in that way aro contrasted with thoas brought by other means of conveyance, for during the same period we find that the canal coal traffic only amounted to

| 1886. | 1858. | e |
| :---: | :---: | :---: |
| Tono. | Tous. | . |
| 24,051 | 25,401 | 750 |

And that the whole amount of gea-borne coals breught into Lonilon in those years did not axceed

| 1888. | 185s. | . |
| :---: | :---: | :---: |
| Tons. <br> 3,016,808 | 8, Tona | 83 4 T,454 |

From which it appeara that the railway coal traffic now benrs a very large proportion to the limportation by sea, and that during 1856 the increase by rail was greater than in 1855, although there was not then the competitlon, for purposes of war, in freights whleh had previously existed; whila the canal traffic is 80 small as scarcely to deserve notice.

The reault, as shown by the following tablo, is that passengers and goolls have changed places as the chief clements in the gross earnings. The early railway managers expected-nnd with reason-that with the railwnys, as with the conches, the pnssengers woull be the main reseurce, and so they were for a few years.

But for the last four years, and the more rapldly as the lines open have extended, the goods traffic has ahot ahead, and year by year bas left the passenger traffic behinil.

ENGLAND AND WALES.
Elont Yeara, 1840-'66. -Grose Reozipts, per Mile open, from faci Clabs of Pabsinorib, and albo tib Receipte per Mtle yo: Goods.

Thene tablea incinde the years 1840 and 1850.

But this is not all; for when we come to look closely into the passenger traffic itself, we find tha same continuous and confirmed tendency in the common to supersede in importanca the dear kinds of service. Tho receipts from first-class fares hava barely maintained the level at which they stood elght years ago. The reccipta from aecond-class fares have acriously fallen off; namely, from $\mathbf{£ 5 1 8}$ per milo in 1849 in tha 4355 mlles open, to $\mathbf{£ 4} \mathbf{6} 6$ per milo in 1856, with 6332 miles open. But with the third-class fares a precisely opposite class of changes has taken place. With scarcely a ainglo exception of consequence during the eight years, the receipt per mila from third-class fares has gone on increasing, until, in 1856, the receipt of $£ 448$ per mila is quite 83 per cent. above receipt of $£ 331$ per mile in 1849. The percentage proportions to the total passenger traffic $\ln 1840$ and 1856 of the receipts per mile of the three classes of fares, were ns follows, viz. :

While, thereforo, in 1849 the common kinds of passenger service contributeii a little more than a fourth part of the total passenger reccipts, that proportion had been raised to quite a third part in 1856 ; tha firstciass proportion remaining the same, hut the secondclass proportion falling from 41 to 35 per cent.

But there la mure evldence to be adduced.
Wa have seen in the foregoing table tha gross results per mile of railway open. Let us now examine somewhat mora in detail tha relation between those larger results and the rato of fares and average phyment by each person conveyed, and these further details will be found in the following table, but extending to the five years 1852-56:

Five Yeare, 1S52-'60.-Detaile of the ayeqdoe ledelipts fon l'ashenoza Teafyio.

| Yoara | Firat Class. |  | second class. |  | Third clos. |  | Total. |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{aligned} & \text { Averngy } \\ & \text { Payment. } \end{aligned}$ | Averrigo par Mile. | Averago Payment. | $\begin{aligned} & \text { Avergeg } \\ & \text { per Milo. } \end{aligned}$ | $\begin{aligned} & \text { Average } \\ & \text { Paymeat. } \end{aligned}$ | Average per Mile. | $\begin{aligned} & \text { Avergat } \\ & \text { Paymant. } \end{aligned}$ | $\begin{array}{\|l\|} \hline \text { Avorage } \\ \text { per Mile. } \end{array}$ |
| 1859 | ${ }_{54.90}$ | ${ }_{2}^{\text {d }}$. 11 | ${ }_{22}{ }^{\text {d }}$ - 32 | d. ${ }^{\text {d }}$ | $12 \cdot{ }^{\text {d }}$ | d. <br> 0.8 <br>  | 21:30 | ${ }_{1}{ }^{\text {d. }}$. ${ }^{\text {c }}$ |
| 1833 | 51.80 | 2.13 | 20.4) | 1.44 | 12.43 | $0 \cdot 86$ | 20.40 | 132 |
| 1854. | 47~28 | $2 \cdot 10$ | 2088 | 1.42 | $12 \cdot 48$ | $0 \cdot 55$ | 19.92 | 1.29 |
| 185). | 4388 | 2.09 | $20 \cdot 16$ | 1.43 | 12.00 | 088 | 19.20 | $1 * 28$ |
| 186. | 43.30 | 245 | 20.45 | 1.44 | 11.68 | 0.88 | 18.74 | $1 \cdot 22$ |

Nots. - In tha nobve table the columma of "Avemge Payment per Pasaenger" represent the total average aumin paid in each year by each of the paseengers eonveyod. The colnmas of "Avergge Farv per Atile per Passenger" reduee the larger columus to a mere convenient infteagement.

We find here thant the first-class fares have fallen from 2-11d. per mille $\ln 1852$ to $2 \cdot 07 \mathrm{~d}$. per mile in 1856, and average payments of each passenger convoyed from $54 \cdot 96 \mathrm{~d}$. $\ln 1852$ to $43 \cdot 30 \mathrm{~d}$. In 1856 ; but in connection with these reduced fares and amaller individund phyments, we have already geen that the earnings per mile open have somewhet riaen, comparing 1856 with 1852.

In the second class the farea have riaen slightlythat is, from $1 \cdot 43 \mathrm{~d}$. in 1852 to $1 \cdot 44 d$. in 1856 ; and the nveraga paymenta have alightly fallon from $22 \cdot 82 \mathrm{~d}$. to $20 \div 45 d$, but the average earnings per milo have remalned almost unchanged.
In the thlrd class the fares have fallen, and so have the individual payments; but the earninga, as we have already seen, have increased largeiy.

## RAI

Wo may venture, then, to infer that, so far as the evidence before us applies, three general conclusions seem to be justitied at this scage of the inquiry, and these conclusiona aro:

1st. That the revenue of railwaya during the last eight years-that is, during the period since the railway system had arrived at maturity in England and Waies-has been derived year by year in a larger proportion from common as distlnguished from dearer kinds of aervice, and especialiy in the rapid relative growth of goods traffle.
2d. That during the anme period a precisely aimilar result has taken place $\ln$ the passenger traffic by increase of receipta from third-elass passengers, and the decline or non-increase of recelpts from tirat and second class passengers.
31. That as regards nearly all classes of passengers, the increaso of passénger traffic per mile of railway has been accompanled by a recluction in the rates of fares, ind also by a reduction in the average payments of ench person conveyed; in other words, a larger revenue has been obtajued by meana of smaller individual contributions.

Railonads in Canada.-The gigantic railway enterprises now in progress in Canada nre intended to ennbrace a railway system traversing neariy the entire length of the province from east to west, with branch feeders running inte the main-trunk line, and carrying ofl traftic to the leading American citios and Atlantie sea-board.

Besides the government aid to thia complete railway system through Canada, theso undertakings are understood to receive substantial support from L'nited States interesta, the great Western country, as well aa the northeastern States of the Union, being directly interested in the suceess of these Canadian lines; more expeditious routes between tha agriculturai districts of the West and their centres of trade being opened up) by them. One of the mest valuable features of these railways to Canada will be their affording the provineo increased facilities of trade during winter, and uninterrupted communication with ocean traffic when inland navigation is closed.
The most important line of this comprehensice railway aystem is the Grand Trunk railway. The entire length of this line, when completed, will be 1112 inlies. Its eastern terminus is at Trols l'istoles, In lower Canada. Thence upwarl it proceeds along the south shore of the St. Lawrerice, passing opposite to Quebec, and, continuing thus west ward, reaches Montreal. Ilefore reaching Montreal, the line effeets a junction at Itichmond, in the eastern townships, with a line of railway to l'ortland, on the Adlantic, in the State of Maine. The part of the tine hetween Montreal and loriland, a distance of 292 miles, is now open. The communication between P'ortland and Quebee was opened in 1854.

At Montreal, one of the mast atupendous atructures of moiern !imes will carry the railway across the fiver St. Lawrence, which is here two miles in width. This glgantic undertaking is now in courso of construction, under the superintendence of Mr. Rohert Stepliensen, whose name is associatein with the well-known Britansnia tnbular bridge. The Vietoria tubuiar bridge of Canain will, however, far surpass Mr. Stejhenson's carlier work. The total span of the arches will he 61 is8 feet, besides piers on cidier side, runnlug into the river, ench about half a mile long. The apan of the centre arch is 360 fect. The number of arches is 25 , and, with the exerption of the centre one, wach has a span of 242 feet. The tule, which is of iron, is 25 feet hilgh and 18 feet wide. The other parts of the work, including the half mile of jiers on either side, are wholly of solid masonry. The height from the water level of the river to the floor of the iron tube will be 60 fect. In order to imjart some illea of the strength of this stupendous work, it may te mentioned that
each buttress is calculated to resist the pressure of 70,000 tons of lee. Tho estimated cost of the Victoria tuhular bridge is atated to be $\$ 7,000,000$.
From Montreal the Grand Trunk line follows the north bank of the St. Lawrence, touching the towns of Cornwall, Prescott, and Brockvilie, to the city of Kingston, on Lake Ontario. Thia distance from Dontreal to Kingston is about 180 miles, about 120 of which, from Montreal to l'rescott, was opened in October, 1855.

A branch dine of 55 miles, connected with this part of the main trunk, was fully completed during 185., from Bytown to Prescott, opposite to the Anerican port of Ogdensburg, where an important contrection has been formed with United States lines of rail. way. Anether line of abont 80 miles was also constructed in connection with this section of the Grand Trunk from Montreal to Kingston. This is ane from Ily town to Montreal, following the course of the Ottawa, and jolning the Grand Trunk at Vauilreil, close to the Ottawa, and to the junctlon of that river with the St. Lawrence.

The Grand Trunk line, procecding westward from Kingston, skirta the shores of lake Ontarlo, passing the Llay of Quinte, through the towns of Belleville, Cobourg, and lort llope to Toronto, the capitai of Upper Canaila. The length of this section of the line, from Kingston to Toronto, is about 200 miles; the lengtr of tha line from Moutreal to Toronto being $3 \times 0$ milcs.

A branch of thila section of the Grand Trunk from Kingston to Toronto, extending to 30 miles from $\mathrm{C}_{0}$ bourg to the town of l'eterborough, on the liver 'Sta abee, was ojened during the year 1856. Another line is also in construction from Bellevilie to l'eterborough. The most important line branching from this maia section of the Grand Trunk, 45 miles of which are al. ready open, is that from Toronto northward, passing Lake Simcoe, and thence continuing to the great Georgian Bay, on Lake Huron. From Toronto the Grand Trunk railway proceeds directly westward through the fertile peninsuia of Upuer Canada, passing the towns of Guelph and Stratford, and terminating at the flourishing town of Sarnia, at the liead of the River St. Clair and southenstern extremity of Lake lluron. The entire length of the Grand Trunk ine, which is now being pushed toward completion, numely, that from St. Thomas, 40 miles beiow Quebec, to Guejpl, ia Upper Canada, was completed in September, $1 \times 56$. The remaining portions of the system will not be so actlvely proceded with. The direct diatance from 'Trus Pistoles to Sarnia is $8: 0$ miles.

At Toronte another important railway system conmences, known as the Great Western. This rallway commences from a joint station at Toronto in comection with the Grand Trank railway, and skirts the hrad of Lake Ontario to Hamilon, a distame of to miles. It thence proceeds west ward through the heart of the settled parts of the great peninsula, sitnated leetween the lakes Ontario, Lirie, atid Inaron, passing through I?rantford, London, and Chatham, nud terminates at Windsor, on the Itiver Detroit, dirertiy opposite to the American rity of Detroit, in the itate of Michigan. At this point an lmportant connection takes place with linited States raliways.
'Ihe Great Western ine, besides its terminus at Ilamilton, dlverges to the Falls of Niagara. The Grent Western rallway is now open from Windsor to !lamilton and Niagara Fulls, a distance of $2: 0$ miles. That jortion of it from Hamilton to Torento, 15 miles in length, was oprned in the vear 1851.

We have now (returning to Lower Canada) to mention the St. Lawrence and Champlaln railway, which conneets the south lank of the St. Lawrence, opposite to Montreal, with the head of Lake Champlain, at Ronse's Peint, a distance of 45 miles. At Ronse's loint this railway comects with the system of railways

## RAI

to Albany, Boston, New York, and other parts of tho Unlied States. The Plattsburg railway commences at Cauglinawaga, on the south shore of the St. Lawrence, opposite to Lachine, and runs to the town of Platisburg, on Lake Champlain, a distance of 28 miles. The Nontreal and Lachine rallway, a short line of 9 miles, connects the city of Montreal with the upper pert of the island at the village of Lachine. This rallway, as also a portion of the St. Lawrence and Champlain line, have been in activo operation for soveral years.

The average cost of the construction of rallways in Canada will be about $\$ 17,500$ per milo. The average fares are from two to three cents per mile, according to distanco of journoy. The electric telegraphs in Canada convey messages at much nore moderate charges than in England.
The control of the Post-office of Canada was transferred from imperial to colonial authorities in 1851.
er. The first locomotive engine used weighed but aix tous, and these have been suecessively increased to ten, sixteen, twent $\%$, and twenty-slx tons, whille on some of the frelghting roads engines of furty tors weight (Including the tenders) have been introduced. I'he foregoing llst of changes shows how imperfect a inachine the railread was when many of thein in thla country were first commenced, and how many radical changes have been necessary in the construction of their ways and works. The preaent atate of perfection in the machine renders it probable that new substitutions of lte important and expensive parts will annually become more rare, but yet it may be safely assumed that some expenses of this character will contlnue to accrue and must be provided for in estimating the cost of our railroade or their value as an investment.-Report of the New lork State Einginecr, 1855.

In the conception and construction of our system of railroads there was no well-digested plan in regard to the position of the prinelpal terminl, or the route for the trunk lines, or the mitual relation of the main llnes to each other. Tho result is that tho syatem is imperfect as a whole, though admirablo in many of Its parts. We have many roads huilt only in rivalry to others; some parallel, others having the samo termini. The same expenditnre properly directed would have given us a complete system, with fewer miles constructed, but of a more durable character. The want of plan ls in consequence of our system having been built by States not separated by topographical divisions, and by private eompanies having a vlow more to immedlate prefit than to the future success of and connection with the system. One of the greatest resulting evils is the conatant break of gauge, which makes necessary the frequent transhlpment of both passengors and freight; thereby increasing cost and delay. The gauges ith common use comprise from 4 fect $8 \frac{1}{2}$ inches, the chance width of the first " tram wagon," which the tirst " tramroads" were made to fit ; to 4 fect 10,5 and 6 feet, all empirlcal gauges; and each having respective merits which vere advocated by their introducers. Whatever may have been these claims, it is untortunate that ono was not universally agreed upon; and there is no risk in asserting that even at this dato date the saving in time to passengers and in Injury to frelght during five years would be more than an equivalent for the cost of all necessary changes in the rolling stock, and superstruclure consequent on the adoption of a common gauge. Our railroads have been so much indebted to fortultous circumstances for their position and relation to each other, that the prinelpal claim to a aystem that wo can advance is liased on topographieal divisions. And having this division in view, wo will proceed to describe briefly our railreads as a system.

The oljjects to he gained by our first railroads were to open an ontlet from the ferlile regions of the West, and to get access to the interior as a market for the manufactures of the sea-board. The principal results are the four great trunk lines, which are the boast of the country, and which have done more to develop tho West and enrich the East than wac dreamed by the "enthusiusts" who were followers of Do Witt Clinton. Two of the four trimk lines, the New York ond Erie, and the New York Central railreads, clirected their first slow course to the great American chain of lakes, expecting to be content to end there, and not to cuter into a contest with an inland sea. But with the nid of the frosts of winter, they found thenselves fit rivals, and have extended their lines with such vigor, that the branches of these trunk lines have tapped the Mississippl, and are hastening on to the Pacitic. Their connection with every town and hanlet in the Mississipni valley is the best fourdation for a contlnuation of the progressive prosperity of New York. The other two lines, the lemsylvania Central and the Baltimore and Ohio railroads, had no further aim than to pass the barrier of the Alleghanies, and then receive their pros-
parity from the Ohio River. But a rivor that, accordligg to John Randolphy "was dry half the yoar, and frozen the other hulf," was not a dopendence; and now even the Misaisalppi liver is not a satlefying end. Wo can brietly nay that thene four trunk linem, with their direct connections, constitute the Northern hale of the system. The other aingle roadn, not connections, north of a line of the Ohio valley, however important in themselves, are only local roads.. Seath of the line of the Ohio valley, the Virginia Central and the Charleston and Memphis rallroads, with their direct connectlons, constitute a similar portion of the Southorn half of the railroad aystem. The remaining East and Weat trunk line to be deacribed in the one from Now York eity, in 4 direct line west. This railront, now nearly comploted, is almost a necessity to the passengor truffic, being the shortest route weat from New York city. These roads, in conveying the produce of the Interior to the sea-board, and in opening the Weat for settement, form a much more important part of the aystem than the roads running north and south, and having as their principal business the interchange of the producta of the North and South. The roada, running north and south, are divided by the Alleghany Mountains. The castern half is made up of a trunk road and its branches, running piralles to the sea-coast from Bangor to Mobile, having at prenent but one ahert break in Alabama. The treight business of these roata is necessarily linnited, and condned prineipally to costly freight, as tho co.sting trade in the untural carrier of heavy freight. The passenger businesa is the principal eource of profit; and as theac ronde ran through the noot populous sections of the country, they have umpio eumployment. The trunk road west of the Alleghany Mountains is made up of the Illinois Contral and other roada In the Miesisbippi valley, converging to the mouth of tho Ohio River, added to the yet unthished trunk road from the mouth of the Ohio to Mobile and New Orieans. There roade until ?ately have not been necessary, as the Misalsalppi and Lranches have generally affirded ali the internai communication necessary. Th: interchange of the productiors of tho South nud Weat, and gling rapid communication over the West, mak s thene roads now a necesaity. We can see then, that, netwhestanding the want of unity of action from the first, the aystem ie gradually becomIng more perfect, and that the completion of the trunk lines runuiug weat to the l'acific will not lot ue lose the proud boast that we can now truly make of having the noblest system of internal improvement in the world.

New lork Shate.-The fullowing exhibit of the condition of the railroade in Now York State in in part a synopsis of the roport made to tho New York Legisiaiure in 1855 by the state engineer, and contains many important suggentiona in regard to the future managemeut of our raliroads, coupled with such valuable information as to the condition of the atate aystom.

The returns of the railroud corporations of New York State do not comply with the law in stating the nmount of dejrecistion of the works and rolling stock. The returus of the railronds of Masachusetts, in mont cases, show a small allowance made for the depreciation of tho iron rails, engines, and cars. It is contended by many skiliful managers that if the works and roling stock are kept in thorough repair, they are in as good condition at the end of each ywar as they were at the end of the preceding year, and therefore that there can be no depreciation. The diticulty lies in determining the fuct whether the repairs have been kept up lon this thorough manner. The expense for repairs of tron ralls, nfter allowing for the value of the old material, is equal to the cost of an entire renewal once in fourteen years; that for cross-ties to a renewal once in elght years; for wooden bridges once in ten years; and for wooden stations once in thirty years. This deterioration may be reprosented in antiother form, by atating it as egual to from 2 to $\&$ per cent. andualiy on the whole cost of the road.

Railinosde are also subject to one item of expense which is rarely directly itated; via., the necesanry aubatitucion of improvementa in the way and works before the original ones have been worn out by use. The railroad, considered as a machine, is of recent invention. Its power, eapacity, and endurance have not even yet been fully ascortnined. As the two former are doveloped, the sabstitution of improved forms for increanalng its efficionoy, either in capacity, speed, or economy, becomen necessary, and these subatitutions are more extensive than they are in other machines of older date or use.
The returns of the railrond eorporations show continued large additions every year to the conatruction account of even our oldent and beat built ronds. The reported increase of cont during the year 1855 was chleflyIn consequence of an axtension of the double track, a larger equipment, and atation facillties for the accommodation of the incressed freight traftic. The increaso of the cost of the road on the New York and Erie waa 20 per cent. during the yenrs 1854,1855 , and ou the Central it waa greator than 25 per cent. durIng the same period. The reported carnings and net earnings of these ronds have increased by a much larger percentage than the cost of the roada as above stated, white the reported expenses of operating have increased by about the same percontage as the earnings. The freight earnings have increased more than the passenger earnings ; bu: the nverage receipts per ton per mllo wero less in the year 1855 than the preceding one, eapecially on the Central roud, although the rates of chargos have been increased on both roails, The average receipts per ton per mile for the jear $185 \tilde{H}_{i}$, wero two and a half rents on the Erio, and a littio more than three cenis on the Central, whilo the arerage the preceding yoar on tho latter was nearly three and a half centa. The frelght tariff has been nearly alike on ench of these moads for the last two yenrs; it ia, therefore, ovident that the business of the Eric rond embracea a larger portion than that of the Central of those articles which pay the least rates, and that the latter road has been performing a much larger propartion of ita businese at low rates thia year than fonmerly. On comparing the reported receipts, expenses, and businese of our three princlpal froighting ronds, it will be seen that the paseenger bualuess on the Erie is reported as giving a net proft of 47 per cent., with an avernge charge of one and seven-tentha cents per pas: senpor per mille; on the Central, a net profit of ti per cent., and a charge of one and nine-tenths cents, and on the Northern Railroud a net profit of two per cent., with an average charge of two and eeven-cighths cents per passenger per mile; and that the freight business on the tirst is reported as giving a net profit of 51 per cent., with an arerage charge of tro and six-tenths cents per ton per mille; on the second a net profit of 48 per cent., with nn average charge of three and seventenths cents; and on the third a net profit of 34 per cent., with an average clarge of two and one-fourth cents per ton par mile. The character of the husiness, ths grailea, and other circumbtances of these several ondn, to not furnish nny sufficient renson for these iscrepnncies. The aetunl cost of transportation upun raltroada will prohahly never be accurately determined from their reports, until they have been run a few years with the construction account elosed, and no money borrowed. The expenses of operating the road, as atated in the reports, aro about one and $n$ quarter cents per ton per milto on tho Erie, and one und sixtenths cents on tho Central; but, ss before stated, these reperts cio not show accurately the cost of this service. More reliab, testimony on this sulject is afferded by the recent action of the railroad conventions. At the one held at New York, embracing the officers of the four great lince between the Atlantlc and the Weat, a joint report was submitted ty the superintendents of the several roada, in which they state

that "experience has proved that the lovest rates at and expenses will sverage about two cents per ton per mile for heavy agricultural producta, three centa for groceries, and four cents for dry goods." At a subscquent convention of the railroad companies of Ohio and Indiaina, simllar rates wero adopted. Tho above charges applied to the business of our two great lines would yield an average of a little less than three cents por ton par mile, and would serve to show that some of the business dono on each of theae roads does not even pny "interest and expenses." Sufficient informıation bias been elicited from the railroads of this and other States, from the setions of the conventions, and from other sources of information, to warrant the belief that a considerabito portiout of the freighting business now dọne by our railroads ylelds no profit st tho present rates, when duc allowance is made for tho increase of espital which it requires for the increased wear and depreciation of tho works, and for the ocenpation of the track to the Injury of tho other business.

The reports of tho yenr 1855 show an increased expense in operating the roads, over that of the precening year. An examination of the reports of a number of railroads in New England and elsewhere, ahows, for the last five years, an annual increaso In their cost of from 2 to 5 per cent. per annum; an Increase in their receipts of from 12 to 20 per cent. ; and an incroaso in their exponses of from 20 to 40 per cent. per annum.

Deductions from the reports of the railroads in the State of New York, 1855, have been made, ahowing the comparativo cost of construction, of maintenance, and of operating each of the roads of the State, and have been arranged as follows :
The total length of road known to be In opera-
tion In New York in 1855 was.................... 27881 miles. If additlon to which there is of aecond track in
operution . . . . . . ...................................... 808 Making a total lengtis of track In operation .... 85264 The wholo length of completod and prujected roadn.

The nverage receipts per mile of road were :

From this we see that the expenses were 50 per cent. of the gross receipts, which is below the average throughout the country.
The expenses of operating the road were 57 per cent. of the whote receipta.

The average receipts per mile run by the trains were as follows :

From passengera
$\$ 182$
frelght ....
48

tha 10 roands, 22525 mile'e tong, the number of passengers carried, as reported, was........... 12,206,71t The actual number of travelers was probably

Comparion of the Returns of several Railroade.-Frons | expenses per mile run ; thereby making it evident that, the atatiatics of the net income and general ect omy of the principal raliroads in New York and Massachusette, we can olucidate many facta of tha greatest importance in railiond manageinent. Among theas may be noticed tise following: The average number of passengers and the number of tons of freight carried each mile run is the same; that is, on an a verage there are delly carried an equal number of pussengers and freight an equal distance on the road. The largest number of passengers carrled each millo run la by the Hudson Hiver Railroad, which has as a rival the best navigabie river in the world. The largest number of tons carried per millo run ls hy the New York and Erle Railroad, which is the principal through freight road for the producte of the West; and this road also ahows the largeat net income per mille. The ratio between the total receipts per mile and tho net income per mila is far from being conatant, or the last from belog dependent on the first. There is, however, a relation between the net income per mille of a road and the expenses per mile; that is, the net income per mile of a railroad bears a very nearly constant ratio to an inverse of the
ceteribus paribus, the interests of the stockholder are advanced more by reducing the expentes per mile run, than hy increasing the business of the road. The receipts for passengers or freight carried per mile le given by adding the expensea and tha net income carriod per mile. It is shown from this comparison that on an average the net Income from passengers carriod per wilie is 50 per cent. of the recelpts, or equal to the expenses; while the net income from freight is only 34 per cent.' of the expeases. From this we see that the tariff of freight aloould be increased 16 per cent., that it slsall be in a just proportion to the passenger tariff.

The tables also show that the net income from paesengera and malls per millo sun is generally greater on the Massachusetta reilroads than on the New York railroadk, and that tho net income from freight per ton per mille is greater on tho New York railroads. The general tarifis are not materlally different in the two States, but the expenses of frelght are fully 50 per cent. greater In Massachusetts than in Now York. The net Income per mile is the greatest on the New York and Erio Railroad, which is a freight road.
gtatistiog of tha Ingoma and Egonomy of the prinoizal Italcroadg in New York and Mabsacidegtta.

The above table, condensef, presents the following polints:
Mlles opened in five jears ending 18

The greateat progress has lieen made by the elight Western States ; next by the Southern States; while the Northeastorn States have made but trifling addltlons to their pubilic works.

The Secretary of the Treasury has prepared a statement showlng the cost of raliroads in the United Sintes In 1855, from which we make the following summary. IReturns not linving been received from a number of contpanles, these figures nro only approximative.

| Capltaj pald in. | \$433,286,046 |
| :---: | :---: |
| Finded debt. | 203,187,973 |
| Floutlog debt | 40,120,958 |
| Expended in 1855 | \$770,651,877 |
| Required to finish the r | 813, 599.237 |
| Total csitmated eost. | \$1,090,381,114 |
| Mlies fintshed | 19,036 |
| Miles unfialshed | 16,06) |
| Total length | 36,006 |
| leceipts for the year. | .. \$91,182,083 |

According to theso figures, the averago cost per mile would only amount to $\$ 30,000$, whereas experience proves that $\$ 35,000$ is nearer the truth. Assumiug this estimate, the total cost of the 36,000 miles, when finished, would amount to $\$ 1,260,000,000$.

The average cost of a portion of our railroad system has been as follows:

|  | Costing. | Per Mile. |
| :---: | :---: | :---: |
| 30 roads in New York | \$ $\$ 80,000,600)$ | \$16.314 |
| 38 " " Masachusotts. ....... | 60,000,000 | 4.482 |
| 12 " " the south and West . . | 50,000,000 | 45,653 |

It is estimated that at least threc-fourths of the money which has been expended upon railroads in this country has been furnished by our own citizens, and the rewainder (chiefly for bonds) has been obtained from foreign investments.

In conclusion, we may adel, that, in reviewing the progress of rallroads in the United States, their cffect upon the prosperity of tho country, and their future prospects, are much beyond the wildest dreams of the originators of the system. The number of miles built in the first ten years of our railroal history, heginning in the year 1828, was 18.13, of which New York Stato built 18 per cent. The number of miles built in the second ton years, or from 1838 to 1848 , was 3839 , of which New York built 15 per cent. From 1848 to 185t tho number built was 18,794 , of which Now lork buitt 9 per cent. At the present time New York has over 11 per cent of the total length of railroads, and ranks next to Illinois in number of miles. Our railrcall history has had two eras-tho first from 1828 to 18.18, when there was in the number of miles built an average increaso of 268 miles per year; and the second froin 18.18 to 1856 , having an average in aso of 2450 miles per year. In many of tho States the development of the rallroad system is quile equal to the wants of the people; but in many others, Kentucky being the mot notable instanec, it is much less.

The cost of these 26,000 miles of railroad built at the end of the year 1857 is estimated at $\$ 920,000,000$, or an average of $\$ 35,000$ ( $\$ 36,000$ jer mile; and, if the rails had been laid with American Iron, produced hy domestic labor, it would havo been the most produetivo investment tho country over made.

The Raiload Systems of Europe and the United States. -Among the greatest achicvenients are the opening up of new fields of supply, $s$,d the teepening $\overbrace{\text { * ohl chan- }}$ nels of consumption. They have brought into profitable use mines, forests, quarries, arable and grazing tistricts, fisherles, harbors, and rivers, previously inaceessible.

But still greater even than these achlevements are the advantages arising from the cheap and rapid conve;anee of passengers over long tistances. Every enterp.tso ls now carried on with nerhaps ten times as much dispateh, and with ten times less trouble than forty years ago; and the facllity of personal supertntenilence is certainly twonty times greater than it was then. It is not diflicult, therefore, to comprehend that to accelerate oven by a few yoars tho completion in a country of an extensivo system of rallways, is to confer upon te allvantages the real value of which it is Impossible to represent in terms of money; and we shall find, In the considerations connected with this mode of vewing the facts, a correction of many prevalent errors relatlvo to the cost of Engllsh rallways.

Lot us see what was the comparatlve progress whlch,
at the end of 1854 , hat been mado by the countries of Central and Western Europe, and by the United States, In providing themselves with rallways.

Railways.-General summary of the comparativo extent of rallway open at the elose of 1854, in different countries:

| Canatriea. | Aren in English squaro Milen. | No, of Miles of Railwny open la 1854. | Miles of Hail open to each 100 square miles of Area. |

|  | 129,200 | 7,800 | 56 |
| Twenty-t wo other States of the Enion | 1.251,000 | 8,200 | 00 |
| Totals. | 2,18 , 0.41 | 32,88) | 1.5 |

It appears by these figures that the only country or State possessing a greater extent of railway (compared with territorial area) than England and Wales was the Stato of Massachusetts; but the area of Massachusetts is only an eighth part the aren of England and Wales.

In I'rance and Germany the progress has been less than a seventh of our own. Even in Belgium, and New York, and Pennsylvanla, the progress has been barely a third of ours. In Scotland the progress has been twice as rapid as in Germany; and if fair allowanco be made for the lake and mountain surface of Seotland, the progress in it will execed the progress of Belglum, and of those Western States of the Union where railways are made with a cheapness and facility unknown any where else.

We may now racapitulate the conelusions which seem to be established by the faets and statements before us, viz.:

1. That of the three hundred millions sterling aetually expended In railways to the close of 1855 , in the United Kingdom, fully oue half, or one humdred and fifty millions sterling, were expented turing the five years, 1816, '47, '48, '49, and '50, and that of the 8300 iniles of railway open and at work at the close of 1855 , fully one half, or 4150 miles, were completed and brought into operation for the first tlme during the tivo years now enumerated.
2. That the consequence of so prodlgious an ontlay in so small a space of the has teen to place tho United Kingiom, but especially England, so fur in advance of other countrles in the possession of an extensive rallway system, that, ailopting the fair test of comparing territorial area with rallway mileage, England has a comparative mileage threo times greater than Belgium, New York, and Pennsylvania, and seven thes greater than France and Germany.
3. That the Introduction on the iargest scale into this country, and in degrees moro limited into other countries, of a change so extensive, ahsolute, and fur.damental in the means of translt, has already led, nod In a short thmo will lead still further, to important modifications in the conditions affecting the supply of and the demand for large classes of commodities-theso modifications tending gencrally to rehuctlons of price, as a consequenco of diminished cost of production or reduced expenses in conyeyance to market.
4. That as regards the 150 milllons sterling oxpended in this country in the five years, $i 8.10$-'in, its opration was to give employment, during periods,
first, of dear food ( $1846-147$ ), and second, of extreme commercial difficulty (1847-48-49), to a body of artisans and others, varyling from upward of a million to half a million of persons.
b. That on the other hand, the calls by the process of which the 150 millions were gradually raised from the middle and wealthier elasses, who were the holders of rallway shares, operated like an income tax, nearly the whole amount of which was provided by the resort to severe economy, or by additional exertions to produce augmented resources.
5. That the retrenchuents and increased exertiona of the contributors of calls, taken in the aggregate, more than counterbalaoced the consumption of the army of laborera employed in railway works, and also tho expenditure for the purpose of those works on imported materials; and hence that even during the five years, 1846-'j0, of an average annual expenditure of thirty millions sterling, the balance of trade was, as a general result, constantly in our favor.
6. That during the five years in question the average annual return yielded by the (say) 200 millions actually oxpended in rallway undertakings was less than 2 per cent. per annum; that beyond the failure of annual return there was a depreciation of market price equal to about 50 per cent. below par value; and that while the ultimate recovery of the country; with comparativo ense, from the effects of so severe a strain, abundantly indicates its resources; still the depression and losses experienced by so large a portion of the middle class during 184t-'50, and even later, may be considered to have been, to some extent, a cause of the dullness of trade and the low range of prices which prevailed during the two or three last years of the peried.
7. That, on the other hand, the cessation after 1850 of an annual heavy demand for calls, the rapict increase of dividends on the capital previously expended, the still more rapid advanco of the narket price of railway stock, abll, more powerful still, the effect upon production and consumption of several thonsand miles of railway communlcation, may be regarded as explaining in some important degree the comparative prosperity and ease which have prevailed since 1851.
8. That tinally, while it is quite true that the railway excitement of 1841 '. 15 was in many respects irrational and disgraceful, and in numerous individual cases the source of crime and ruin, still it enabled this country to pass, almost at one step, and ly a single sharp and effectual effort of self-denial on the part of the middle classes, Intc he possession of the most complete system of railwa, d possessed by any country; that while these railways have cost more to their projoctors than would have been expendeal by less precipitate adventurers, there is no sufficient reason to believe that the inordinate cost falls as a perpetual burden upon the frequenters of the lines; in other worls, that the cost of the line and the rates of toll, which can alone attract customers, have no necessary or close dependence on each other. And hence, that, eccentric and exceptional as may have been, In many cases, the efforts of privato enterprise, as displsyed in the formstion of rallways it. this country, no denial can be given to the broad and beneficisl result. That to private enterprise we are iudelited for being a generation in advance of the rest of Furope as regards cha new means of internal transit.--Tooke's Mistory of Prices.

We glve a syminary slowing the nunher of miles and cost of the railroads of the worh. This summa. ry is of later date than the separste statements given before, und of course shows an increase. There is a discrepancy between the number of mites in operation In Germany, according to the authority of Tooke, and the following. This is explained by the fact that many of the railroads statel by Tooke as leclonging to Germany should be placed in the column of Frenoh and Belgio rallroads.

Tha following table also exhibita the low cost of American rallroads comparod to those of Europe.
Comparative taile of Railiboadg in Opraation,

Raisins (Fr. Raisins secs, ou passes; Ger. Rovinen; It. Uve passe ; Port. I'assas ; Russ. Issum ; Sp. Dasas), the tricd fruit of tha vine. They are produced from varlous species of vines; deriving their names partly from the place where they grow, as Smyrnas, Valencias, ete.; and partly from the speciea of grape of which they are made, as muscatels, blooms, sultanas, ete. Their quality appears, however, to depend nore on the method of their cure than on any thing else. The finest raisins are cured in two methods; either by cutting the stalk of the bunches half through, when the grapes are nearly ripe, and leaving then suspenden on tho vine till the watery part be evaporated, and the sm drics and candies them; or by gathering the grapes when they are fully ripe, and dipping them in a ley made of the ashes of the burned tenirils; after which they are exposed to the sum to dry. Those cured in the tirst way are most estemed, and are denominated ralsins of the sun. The inferior sorts are very often dried in ovens.-Thoman's Disp.

Ruisins are imported in casks, barrels, boxes, and jurs. The finest come in jars and quarter thoxes weighing about 25 lbs . Some of the inferior sorts aro brought to us in mats. Malaga raisins are in the highest estimation. The muscatels from Malaga fetch fully a third more than any other description of raisins.

Tho value of raisins imported Into the United States for the fiscal year $1850-67$ was $\$ 937,460$, viz:

| Whence Imported | Pounda. | Value. |

Rake, to. The sea term for incline, and applies to the masts, stem, and stern- $\mu$ ost, ete.; the bowsprit, instead of raking, is said to stecre. Masts generally rake aft, mus in peculiar rigs only forward. The rake of the mast has an influence on the suiling of the vissel, and the masts of seme schooners ruke excessively. The principal effect seema to be to diminish the effect common to all the sails, of depressing the ship's head. To rake a ahip, is to fire into her head or stern in the direction of her lengith, or along her decks. It is similar to what engineera term entilading.

Rake of a Ship, is all that part of her hull which hangs over both ends of her keel. That which is lefore is called the fore-rake or rake forward, and that part which is at the setting on of the stern-post is called the rakeaf or afierward.

Rangoon, a commerclal port and town of the burmese dominions, ahout 26 mites from the sea, on the left bank of the easturn branch of the River Ircawadily, in lat. $16^{\circ} 42^{\prime}$ N., long. $96^{\circ} 20^{\prime} \mathrm{J}$. Tha town and suburbs extend lengthwise about one pile sloug the
bank of tha river, belog about three-fourths of a mile in depth; but the houses are very unequally scattered over this area. The fort, or rather wooden stockade, which contalus the town, properly se celled, is a regular aquare about 14 feet high, composed of heavy beams of teak timber. It appears, from a census taken a short time previously to the commencement of the war in 1824, that tho pepulation was 18,000 , which probably is not far frem ite present amount, though it has heen stated considerably higher. The foreign trade is principally regulated by the treaty between Great Britain and the Court of Ava, 1826.

Kangoon is the chief, and indeed almest the only port of forcign trade in the Burmese dominions, which extend from between the 16 th and 16 th, up to the 26 th and 27 th degrees of N. Iat., and from the 98d to the 98th degrce of E. leng., containing an area of aboot 184,000 square miles, with a pepulation of about $4,000,000$. Its situation is extremely cenveniont for commercial purposes, being situated so near the sea, anl commanding the navigation of the Irrawaddy, which extends to Ava, the capltal, a clistance of nearly 500 niles. Rangoon is accessible to ships of even 1200 tous burden; the navigation, although somewhat intricate, being safe and practicable with the assistance of the ordinary native pilots.

The town has many advantages for ship-building. At neaps the tide rises and falls about 18 feet; and at springs from 25 to 30 feet. The principal teak forests are, at the sane time, at a cemparatively short distance, and thers is a water conveyance for the timber nearly tho whole way. Ship-building has, in fact, been carried on at Rangoen sinve 1786, and in the 38 years before the British captured it thero had been built 111 square-rigged vessels of European constructian, the total burden of which amounted to above 35,000 tons. Several ef these wero of from 800 to 1000 tons. Under the direction of European masters, the Burmese were found to make dexterous and laborious artisuns; in this respect greatly surpassing the uatives of British Indian provinces. There are two consilterable markets, where the ordinary necessarles of life, according to Burmese usage, are cheap and aboudant: these are rice, excellent fish, and poultry.

Joney.-The Burmese currency consists, for small payments, of lead; for larger ones, of gold end silver, Lut chiefly of tho latter. There aro no coins. At every payment the metal must he weighed, and very generally assayed-a rude and very inconvenient state of things. The welghta used in the weighling of money are the same as thoso used on ordinary occasions; tho kyat or tical, and the paiktha or vis, being by far the most frequent. Silver may be considered us the standsrd. Gold is generally held to be about 17 times more valuable than sllver. Tho weighing and assaying of the metals used as currency gives employmont to a class of persons as brokers, money-changers, and assayers. Every new assay costs the owner, if the metal be silver, $2 f$ por cent. $-1 \frac{1}{2}$ jer cent. being the establishod commisslon of the assayers, whlle 1 per cent. is lost, or supposed to le lost, in the operation. If it be ropeated 40 times, it follows that the original amount is wholly absorbel-a fact whleh shows tho enormous waste of metal arlsing out of this rudo substitute for coin.

All grains, pulses, certaln fruits, natron, salt, and lime, are bought and soid by measura: other comnodities by woight.-For an account of the weighta and measures, see article Buam.ah.

Commerce.-A considerable intercourse is carried on between the Burmese and Chinese dovininions by an annual caravan, of which the merchants are all Chinese. The inports from Chins consist of manufactured articles, the chisf export from Burma being cotton wool. The trade with foreign countries seaws is is cerried on with the ports of Chittegeng, Dacca, and Calcutta, in llengal; Madras and Masuilpatam, on the Coromandel
coast; the Nicobar Islands, in the Bay of Bengal; Penang, in the Straits of Malacca; and oceasionally with the Persian and Arabian Gulfs. . The largest trade is with Calcutta, owing te the great consumption of teak timber in the latter, and the facility with whleh she supplles the demand of the Burmese for Indian and British eotton gooda. The articles exported to forelgn conntries from Rangoon are the following: Teak wood, terra Japonlea, or catechu, stick-lac, beeswax, elophants' tecth, raw cetton, orpiment, commonly called in India hurtal, gold, siliver, rubies, sapphires, and horses, or rather the small, hardy pony of the country, which is much estcemed, particnlarly at Madras. By far the most important of these commoditiea is teak tiniber; the quantlty of this wood annually experted is asid to be equal to 7500 full-sized trees, which for the most part consist of what India ship-builders call shinbin, which are planks hewn eut of the log with the adze at an inmenso waste. Tho teak ferests of l'egu are by far the most abundant in Indla. The teak is nowhere to be found in the low alluvial lands to which the tide reaches, but abounds in the high lands beyend its influence. It seems to be very generally disseminated throughout the Burmese dominions. In the territery ceded to the British in Martalan, there are some fine forests, the timbor of which is cat dewn for exportation, and where it is believed that saw-mills have very recontly been established by some Earepean settlers. The most accessible and extensive forests of teak in the Burmese dominions aro in the province of Sarawadi, abeut 150 miles to tho nerth of Rangoon, with which there is a water communication. The principal imports into Burms nre cotton pieco goods from India and Britain, British woolens, iron, steel, quicksilver, copper, cordage, borax, sulphur, gunpowder, saltpetre, fire-arms, coarse percelain, English glasswaro, opium, tobacco, cocos and areca nuts, sugar, and spirits. Of these by far the most important is cotton piece goods. Tho Burmese have few cotton manufactures of their own, and appear, from very early times, to have been furnished with the principal part of their supply from the Coromandel coast. To theso were afterward added the cheaper fabrics of Bengal; and both are now, in a great messure, superseded by British manufactures, the nge of which has spread very rapidly since the opening of the trade in 1814.

Rape, a bienuial plant of the turnip kind (Brassica napus, Linn.), but with a woody fusiform roet scarcely fit to be caton. It is indigenous, flowers In May, and ripens its oceds in July. It is cultivated in many parts of Englanil, partly on account of its seod, which is crushed for oil, and partly for its lenves as food for sheep. The culturo of rape for seed has been mueh oljected to by some, on account of its supposed great exhaustion of the land; lout Mr. Loudon says that, where the seil and preparation are sultable, the afterculture properly attended to, and the straw and offal, instead of being burned, as is the common practice, converted to the purposes of feoling and littering cattlo, it may, in many lastances, be the most proper and advantageous crop that can be employed by tho farmer. The produce, when the plant succeeds well, and the season is favorable for securing the soed, amounts to from 40 to 50 bushels an acre. The seed is crushed in milly construeted for that purpose.-Lounon's Eincyc. of ' Agriculture. See Oni, and Linseen.

Tho value of rape-seed and hemp-seed oil imported into tho United States for the fiseal year 1856-'57 was \$11,601, viz. :

Ratans, or Canes, the long slenter shoots of a prickly bush (Culamus rotang, Linn.), ono of the most.

## RED

neeful planta of the Malay penineula and the Eastern islands. They are exported to Bengal, to Europe, and, above all, to China, where they are consamed in Immense quantities. For cane work they should be chosen long, of a bright pala-yellow color, well glazed, and of a amall size; not brittle, or subject to break. They are purchased by the bundlo, which ought to contain 100 ratana, having their onda bent together, and tiod in the middio. In China they are sold by tho picul; which contains from 0 to 12 iundles. Such as are black or dark colored, snap ahort, or from which the glazing flles off on their being hent, should be rejected. When stowed as dounage, they are generaliy allowed to pase free of frelght.-Milnumn's Oriental Commerce, oto. "The ratan," says Mr, Crawfurd, "is the spontancous product of ali the forests of the Archipelago; but exiets in great porfection in those of the lislands of Borneo, Sumatra, and of the Malayan peninsula. Tho finest are produced in the country of the Botaks of Sumatra. The woor-cutter who is inclined to deal in this article proceeds into the forest withont any other instrument than his parang or cleaver, and cuta as much as he is alilo to carry away. The mode of performing the operation is this: he makes a noteh in tho tree at the root of which the ratai is growing, and cutting the latter, atrips off a small portion of the outer bark, and inserta the part that is peeled into the noteh. The ratan now beling pulled through as long as it continues of an cqual slzo, la by this operation neatly and readily freed from its epilermis. When the wood-cutter has obtained by this means frem 300 to 400 ratans-beling as many as an Individual can conveniently carry in their noist and undried statehe sits down, and ties them up in hundies of 100 , each ratan being doubled before belng thus tied up. After drying, they are fit for the market withont further preparation. From this necount of tha small labor expended in bringing them to market, they can be nold at a very cheap ras ${ }^{*}$. The Chinese junks obtain them in Bornco at the low rate of 5 Spanish dollars per 100 bondles, or 5 centa for each 100 ratank, or 27 for $1 d$. The nativea always yond them by Lale; but the European reildents and the Chinese sell them by weight, counting ly piculs. According to their quantity, and the relative atate of supply and demand, the European merchants dispose of them at from $1 \frac{1}{2}$ to $2 \frac{1}{2}$ dollars the picul. In China the price ia usualty abont $3 \frac{1}{2}$ dollara per picul, or 75 per cent. above the avorage prime cost. In Ilengal they are solld by tale, each bundle of about 100 ratans bringing about $20 \frac{1}{2} d$."-Indian A rchipelago, vol. iii. p. 423.
Ratlines, amall lines which traverse the shrouds of a ship horizontally, at regular distances, from the deck upward, forming a variety of ladders whereby to ciinul or to descend from any of the mast-heails.
Razee, a ship of war cut down to a smaller size.
Real, in the Spanish monetary aystem, is of two sorta ; viz., a real of plate, and a real rellow. The former ia a silver coln, varying in valuo from 10 to $12 \frac{1}{2}$ cents. - See Conss. A real vellon is a money of accomint, worth about 5 cents. Formerly, ly authority of Congress, the value of a real of plato was put at 10 cents, and a reai vellon of S pain at 5 cents.
Realejo. The port of Realejo, on the Pacific, Iat. $12^{\circ} 84^{\prime}$ N., long. $80^{\circ} 4^{\prime}$ W., to which it la proposed to bring the cnnal from Lake Leon, is suid to be one of the best that is any where to be met with. The port of Realojo conaists chiefly of a alt-water creck, into which several smali streams of water empty themselves. The entrance is protected ly ant injand about two miles long, which loaves at each end a channel where shipa can enter the harbor, but extending opposite the main land, forming the port in such a manner as to protect it entirely from any wind that could possilily blow, and aleo pntirely breaking the swell whlech entors the onter bay of Couchagua from the ocean. The north eutranco is about a quarter of a mile wide, and that at the mouth
of the island rather narrower, both being entirely free from rocks or hidden dangera, and having in no part lese than five fathome depth of water. At one of these openinge vessels can at ali times enter with a leading wind, from whatever quarter it may blow. The inside consiats of a noble basin of water, nowhere less than four fathoms deep, with a bottom of mud, where two hundred shlps of the line might tio at alt times in the most perfect security. One of the branches of the creek extends inland to within three leagues of the Lake of Leon or Managua. Tho intermediate country is a gentlo slope, whero undoubtedly should enter one of the ends of the canal to connect the Pacific and A Iantic oceans. The ditficultiea to be encountered in crossing the chain of hills between the Lake of Nicaragua and San Juan del Sud wonld he entirely avoided ly bringing the cnnal through the Lake of Leon (conneeted as it is with that of Nicaragua by a river that might be rendered navigable at a moderato cost) into the above-named lranch of the Realejo harbor, thus securing the great advantage of an exceilent harhor at each end of the canal, bealicis many othera which are certainly not to be met with cither at Panama, Tehanatepee, or any other placo. The town of Renlejo is alont two leaguee distent from the part of the cr 'k where vessels lie ; but there is aufficient depth for annail vessels to como within a mile of tho town, and a very little labor would make it nccessible to large alinin: but an enlightened government would probalily prefer moving the town to tho opposite side of the resch, where vessele lie, where there is a site extremely stit'able for the purpose, and where a quay might easily b: erecterl capuble of accommodating any number of ships. In the time of tho Spanish goverument scyeral ves. sels, somo of 300 to 400 tons, were bullt at Reaipjo, where tho wood is very auperior and durable. The port of San Juan del Sud, to which place it was proposed to bring the cenal, reems inferior to Realejo in most respects. The Gulf of Papagayo, where the port is situated, is very difficult to enter for a sailing vessel for five months in the year.-See Ntcabagua and Pasama.

Ream, o quantity of paper. The ream of writingpaper consists of twenty quires, each of twenty-four shects $\boldsymbol{p}$ usually cousistling of elghteen quires of twen$t y$-four sheots cach, and the two outside (or broken) quires of aixteen to twenty sheets each; but the ream of printing-paper, or, as it is sometimes called, the printer's ream, extends to twenty-one and a half quires, or 516 sheets. Two reama of paper mako a bundle.

Recoipt is an acknowledgment in writing of harling received a sum of money, or other valuable consideration. It is a voncher either of an obligation or debt diacharged, or of ono incurred.
Reckoning, in Narigation, the estimated place of a ship, calculated from the rato as determined ly the $\log$, and the courso as determined by thd compass, the place from whleh the vessel started being known. Dend reckoning means tho same as reckoning, due silowance being made for drift, lec-way, currenta, etc.
Red River is the first large river which enters the Mlasiarsippi, 3.11 miles ahovo tis mouth, and risea at about lat. $34^{\circ} \mathrm{N}$. in the Llana Fistacuda, or Grest Staked Hiain. It is formed by several head lranches, and receives several trilntaries, the largest of which are Bine liser and Falso Washita. A greater part of its course is through rich prairies of a red soil, which colora the water of the river, and henee the origin of ita name. Its shorea are covered with grass, and abound with grape-vines, which proluce an excellent fruit. Alout one hundred milea alova Natclitoclies commences what is denominated the Raf, whilliconsiats of a awampy expanaion of the river to the widtin of twenty or thirty milea, and hisa a length of aixty or seventy milles. Tho river divides into a great number of channels, many of which are shaliow, and these channeis have been obstructed by falien trees, brought
down by floods from its upper parts. At a great expense, this raft has been so far removed by the United States government that ateamboate pass through It. Boats sometimes pass the raft by leaving the river above it, In a channel which flowa out of it into some neighboring lake, and following the outlet of this lake until it joins the river below the raff. This raft has been a scrious obstruction, as the river would otherwise be navigable for steambonts four hundred mllea, and the lands on its bordera are highly fertile, and desirable for cultivation for a great distance above the raft. Below the raft, snd four miles above Natchitoches, the whole volume of the river la again united, but very soon divides into many channela, and filis an immense number of bayous and laker that lie parallel to it. In ita lower parts the main channel of the river is narrower than above the raft.

Sed Bea, or Arablan Gulf, an inland sea between Africa and Asia (Arabia), lat. $12^{\circ} 40^{\prime}$ to $30^{\circ} \mathrm{N}$., long. $32^{\circ} 30^{\circ}$ to $43^{\circ} 39^{\prime}$ E. 'Length, northwest to southeast, upward of 1400 miles; breadth varies to nearly 200 miles. At its southern extremity lt communicates with the Indian Ocean by the atrait Bab-al-Mandob. In its northern part it bifurcates into the Gulfs of Suez and Akabah, which inclose the peninsula of Sinai. Depth varies; average about 100 fathons. It abounde with island ond coral reefs, and is supposed by somo to have derived its name from the large quantities of red coral and pink-colored fuci which it vields; while it is more probably derived from the aneient Iduma, "Ses of Edom," or "Red Sca." The country almost every where arcund it is mountainous. The sontheast monsoon blows constantly for eight months of the year, and during the remainder the northwost monsoon. From October to May, whon south wlads prevail, the water rises in the northern part of the sea, which then attains an elevation much higher than the Mediterranean. The navigation is difficuit, owing to budden changes of wind and heavy gales. Principal ports are Mocha, IIodelda, Loheia, Jiddah, anil Yembo on the Arabian side, and Sinez, Kosseir, Suakin, and Massowah on the Egyptian, Nulian, and Danakil coasts.
Reef, a term in navigation. When there is a heavy gale of wind the geamen commionly roll up part of the ssil below, thest by this means it may beconie the narrower, and not draw so much wind; and this contracting or taking up the sall they call a reef, or reefing a sail; so also when a top-mast is sprung, as they call it, that is, when it is cracked, or almost broken in the cap, thay cut off the lower piece that was nearly broken off, and satting the other part, now much shorter, in the step again, they call it a reefed top-mast.
Regatta, a word used originally by the Venctians to signify a grand fete in which the gonduliers contested for superiority in rowing their gondolas; but the term has been adopted into all the modern languages, in which It signlfice a briliiant species of boatrace.

Regiatry, in Commercial narigation, the reglatration or cliroliment of ships at the custom-house, so as to entitlo them to be classed among, and to cryjoy the privileges of national ships.-See Sinps.

Tho United States have initated the pollcy of othor commercial nations in conferring peculiar privilegea upon Anserican-built ships, and owned ly citizons. The clject of the Registry Act ? 3 to encourage our own trade, navigation, and ship-bullding, by granting unusual and excluaive privileges of trade to the fiag of the United States, and by prohlbiting the commonication of those lmmunities to the shipping and mariners of other countries. The provlsions are well calculsted to prevent the commission of fraud upon individuals, as well as to advance the national policy. The registry of vessels at the custom-house, and the memorandums of the transfors, add great security to titlo, and bring the existing state of our navigation and marine
under the vlew of the general government. By these regulations the title can be correctly traced back to Its origin. The acts of Congress of 31st of December, 1792, and 18th February, 1793, constltute the basis of the regulations in this country for the foreign and coasting rade, and for the fisherles of the United States ; and they correspond vary nearly to the provisions of the British statutes in the reign of George III.

Theso acts relate to all shipa employed st sea, which may be divided into five classea : 1. Ships of the United States employed in foreign trade, which are entitled to be registered. 2. Ships of the United States employed in the coasting trade or fiaheriea, which are entitled to be earolled and licensed. 3. Shipe built ont of the United States, but owned by citizens, which are entitled to a ccrtificate of ownership; but if wrecked in the United States and repaired to the extent of threequarters of their value, they may be registered. 4. Ships built in the United States, but owned wholly or partly by foreigners, which are entitled to be recorded. 5. Ships built out of the United States, and owned by foreigners, which are considered allen vessels to ail intents and purposes.-See Kent's Comm., vol. iii.

Vessels actually registered, and vessels duly qualified for carrying on the coasting trade and fisheries, or one of them, are alone denominated and deemed ships or vessels of the United States, entitlod to the benefits and privileges appertaining to such vessels; and they continue to enjoy the anme no longer than they continue to be wholly owned and commanded by a citizen or citizens of the United States. Vessels built within the United States, and vessels captured by citizens in war, and condemned as prizes, or seized and condemned for a breach of revenue lawe, and wholly belonging to citizens, may be registered. No citizen who usually resides in a foreign country can, during such residence, ontitle himself to have registered a ship ownod in whole or in part by him, unless he be a consul, or an agent or partner in asme house of trade or partnership, consisting of citizens actually carrying on trade with the United States. An American vessel, transferred by parcl while at sea to an American citizen, and resold to her original owners on her retnen to port, does not lose her privileges as an American vessel.

If one of two partners obtaln a registry of a vessel by awearing that he and his partner, of the city of New York, are the owners, when in fact his partner is domiciliated abroad, tho vessel is liable to forfelture.

No ships can be registered, or lf reglatered, can bo entitled to the benefit thereof, If owned, in whole or in part, by a naturalized citizen, residing for more than one year in the country from which he originated, or for more than two years in any foreign country, unless he is a consul or public agent. But such ships may be registered ar 3w on a bona fide sale to any citizen resident within the United States.

No registered alifip, which has been seized or captured and condemned by a foreign power, can be registered anew, except regained by the original owner at the time of capture or seizure, or by his executors or ndministrators; but such a ship is deemed a foreign ressel, though purchased or owned by any other citizen. Shipa entitled to be recorded and entitled to the benefits of recorded ships in the United States are ships built In the United States, and belonging wholly or in part to foreigners. Vessels entitled to be enrolled aro vessels of twenty tons or upward, possessing the same quallications and requisites as are made neceasary for registering ships, i, e., they must be built within the United States, and be owned wholly by citizens. If under twenty tons, they are entitied to a license. No ships, unless enrelled and licensed, are deemed entitled to the privileges of American vessela employed in the coasting trade or fisheries; and if any not enrolled or licensed be found engaged in the consting trade or fisheries, having on board any foreign articles or distilled apirits other than sea stores, they are eubject to forfelt-
ure, muless the veasel be at sea at the expiration of the time for which the license was granted; in which case the forfeiture is not incurred, provided the master prove the fact, and deliver his license to the collector of the dlstrict in which he shall first arrive, within forty-elght hours after his arrival:
In the United States no vessels are required to be registered. But to entlitio them to the privilegea of the United States they must be registered; otherwlse they are deemed alien ships. As is before stated, voesels engaged in the coasting trade or fisherles are liable to forfeiture if they have foreign goods on board, unless they are enrolled or licensed.-BLUNT's Shipmasters' Asistant.
It is furthor provided by the act of March 2, 1797, that whenever any vessel is transferred by process of lave, and the register, or cortificate of enroliment or ilcense, is retained by the former owner, a new one miay be oltained upon the usual terms, without the return of the outstanding paper. Vesseis captured and condemned by a foreign powar, or by sale to a foreiguer, whereby there becomes an actual divesture of the title of the American citizen, are to be considered as joreign vessels, and not entitlod to a new register, even though they should afterward become American property, unless the former owner regain his titie, by purchase or otherwise, and then the law allows of the restoration of her American character by a sort of jus postliminii. Every registered or unregistered veseel owned by a citizen of tho United States, and going to a foreign country, and an unregistered vessel, sailing with a gealetter, is entitled to a passport, to be furnished by the collector of the dietrict. But no sea-letter, certifying any vessel to be the property of a citizen of the United States, can be issued, except to ships duly registered, or earolled and licensed, or to vessels wholly owned hy citizens of the United States, and furnished with or entitled to sea-lettors, or other custom-house documents.

The English reglstry acts of 26 Geo. III, and 84 Geo. III. c. 68, required the certificate of regiatry to be truly recited at length in every bill of salo of a British ship to a British subject; otherwlse such bill of sale was declared to be utterly null and vold, to all intents and purposes; and this was held to be necessary, even though the ship was at sea at the time, and the vendee took the grand bill of sale and ponsession of the ship immediately on her arrival in port. The laws of the United States do not go to that rigorous extent; and the ouly consequence of a transfer without a writing containing a recital at length of the certificate of registry is, that the vessel can not le rogistered anew, and sho loses ber privilege as an Ainerican vessel, end becomes sulject to the disabilitics incident to vessels not registered, enrolled, or licensed as the atatote prescribes. But where an American registered vessel was in part sold, by parol, while at spa, to an American citizen, and again resold, by parol, to her original owner on her return into port and befors entry, that transaction was held not to deprive the vessel of her American privileges, or anhject her to foreign daties, for In that case no new register was requisite, It would havo been, except in date, a duplicate of the old one, and perfectly useless.

If a ship be owned by American citizens, and be not documented according to the provisions of be registry acts, is is not liable to any forfeitures or disabilities which are not specially prescribed. The want of a register ls not a ground of forfelture, but the cause only of loss of American privileges. Every veseel, wherev. er bulit, and owned by an American citizen, is entitied to a custom-house document for protection, termed a passport, under the act of June 1, 1706 ; for It applies to "every ship or veasel of the Vnited States going to a.'y foreign country.". As our registry acts do not decl ine void the ale or transfor, and every contract or ac reement for transfer of property in any ship, without an instrument in writing, reciting at large the certif.
cate of registry ; and as they have not prescribed any precise form of indorsement on the certificsto of registry, and rendered it indispensable in every sale, ss was the case ubder the Hritish statutes of 20 Geo. ItI. c. 60, and 84 Geo. III. c. 68, we are happily relleved from many embarrasoing questions which have arisen In the English courts relative to the sale and mortgage of chlps.

There have been great difficulty and some alterna. tion of 'opinion in the English courts In the endeavor to reconcile the strict and positivo provisions of the statute with the princlples of equity, and the good faith and intention of the contracting parties. It has even been a question of much discussion whether the statutes of 26 and 84 Geo. III, had not destroyed the cem-mon-law right of conveying a ship by way of mortgage, like other personal property ; and whether the mortgagee had not a complete titlo leyond the power of redemption after the transfer of the legal title according to the prescribed form of the. Indorsement an the certificate cf registry. The language, in many of the cases, was in favor of the conclusion that there couid be no eqnitable ownership of a ship distinct from the legal title, and that upon a tranafer under the forms of the registry acts the ship becomes the absolute property of the intended mortgagee, and that the termas and the policy of the registry acts were incompatlble with the existence of any equity of redemption. But these opinions or dicta have been met by a series of adjadications which assume the lawa to be otherwise, and that tho registry acts related only to transactlons between vendor and vendee, and to cases of real ownorship; and that an equitable Interest in a ship might exist by operation of law, and by the contrsct of the parties, distinct from the legal eatate; and that, notwithstanding the positive and absolute terms of the indorsoment upon the certificate of register, a mortgsge of a ship is good end valid, according to the law as it existed before the registry acts, provided the rcquisites of the atatutes be complied with. The opinion of Sir Thomsa Plumer, in Thompson va. Smith, contained a very clear and masterly vindication of the validity of the mortgage of a ship consistently with the prescrvation of the forms of the regiatry acts. He effectuaily put to flight the alarming proposition that, since the registry acts, there could be no valld mortgage of a ship; and he insisted that the defeasance annexed to the bill of sale ought to bo fully indorsed as part of the instrument on the certificate of registry, if tho ship be mortgaged in port ; or, if mortgaged while at ses, a copy of the whole transmitted to the custom-house; and that though the defeasance ahould not be noticed in any of the forms adhered to at the office of the customs, and the inatrument should be registered as as absolute blll of ssle, the mortgager's right of redemp. tion wonld not suffer by the omission. But as no such questions can possibly arlse noder the registry acts of Congreas, these diacussiona in tho English courts are noticed only as a curious branch of the Engiish jurisprodence on this subject.

The registry is not a document required by the law of nations as expressive of a ship's national character. The registry acta are to be conaldered as forms of local or munieipal lnatltutions for purposes of pubiic policy. They are imperative only upon the voluntary transfer of parties, and do not apply to transfers by act or operation of law. They are said to be peculiar to Engiand and to tho United States, whose maritimo end uavigation system fs formed upon the molel of tinat of Grest Britain. Bot by various French grainances, betweea 1681 and the era of the new code, it was requisite that all vessels, in order to be entitled to the privileges of Freach vessels, should be built in France, under some vecessary exceptlons, and should beowned ex elusively by Frenclimen, and foreigners were prohlbited from nsvigating under the French flag; and a Frenchman forfeited his privilegen as such owner by anarrying a foreign wife, stom-house; t be notieed e of the castered as an of redempt as no such btry acts of I courts are uglish juriz-

## by the law

 al character. prms of local ublic policy. tary transfer act or operto England and nariga. hat of Great ces, between aisite that all res of French me necessary 5 by Frenchnavigating forfelted his Coreign wife,or residing abroad, unless in connection with a French house. The regiater ls not of iteelf evidence of property, unless it be confirmed by some auxillary circumstance to show that it was made by the nuthority or assent of the person named in it, and who ls sought to be charged as owner. Without prcof to connect the party with the register as being hia direct or adopted act, the register has been held not to be even prima facie evidence to charge a person as owner; and cven then it is not conclusive evideace of ownership. The cases of the Mohawk Insurance Company vs.' Ecifford, decided in the New York Court of Cominon Pleas in 1828, and Ring vs. Franklin, in the Superlor Court of that clty $\ln 1820$, went upen the same ground that the register, atandling in the name of a peraon, did not dotermine the ownership of a vessel, though it might perhaps, be prosumptive evidence In the first instance. An equitable titio in one person might legally exlat consiatently with the docume atary title at the customhouse in another.-Kent's Comm., vol. Ili. p. 196. See articles Tonvage, Sitipeina, etc.

Relleving Tackles. Temporary tackles attached to the end of the tiller In bad weather to assiat the helmsman; and In case of accillent happening to the tiller ropes. Thay are also strong tacklea from the wharf to which the shlp is hove down, pasaed under her bottom and intached to the opposite side, to asaist in righting hor ofterward, as well as to prevent her from oversetting entirely.

Report. In Commercial navigation, a paper delivered by the maters of all ahipe arriving from parta beyond seas to the custom-houae, contaiuing an account of the cargo on board, ete.

Repousse, or Chasing. The repousse work of French silver-emithe, which is equivalent to chasing, is a very remarkable mode of decorating gold aod ailver plate. It is effected entirely by the hammer. The workman has a plain flat sheet of silver to work upon, and before him ts a carefully executed wax model of the article to be produced; the silver plate rests upon a soft bed of pltch or other composition, and with a small hoinmer the workman produces indentations over the surface corresponding with the deviee to be pro duced. A small atecl punch ia employed occaslonally ; and if any of the Indentationa are carried too far, the plate is reversed, and a little counter-hammering applied. Many of the shields, aalvers, diahos, and other articles in the Great Exbibltion, diapluyed fine examples of this kind of work; and there was an equestrian statue of Queen Elizaboth produced almost entirely by thia remarkable procees.

Reprisals. Where the people of one nation have unlawfolly acized and detalned property belonging to another state, the subjects of the latter are authorized, by the law of natione, to indemnify themselves by seizing the property of the subjects of the state aggressing. This is termed making reprisals ; and conımissiona to this effect are issued from the Admiralty.See Phivateeles.

Resin (Gr. $\dot{\text { R }}$ tu $\nu \eta$; from $\beta c \omega$, Iflow). A proximate principle common in tho vegetablo klogdom, the ultimate compor enta of which aro carbon, oxygen, and hydrogen. Therearemany varieties of resln. Their general characters are fuability and inflammability; aslubility In alcohol, lusolubility in water. They are generally separable into two diathet portions by the action of cold and of hot alcohol. They are valuable as ingredients in varnishes, and eeveral of them are uaed in meallcine. They are often naturally blended with modifications of gum, in which case they constitnte the series of gum resins. The specifle gravity of the reains varies between 1.0 and 14 . They become negatively electric by friction. The commoncat resin in ase, usually called rosin, is olbtained by diatllling turpentine: the volutile oll passes over, and the resin remalue in the still.-See Gums and Oris.

Rempondentia, in Commercial luw, significe the
hypothecation of the oargo of a ship, on conditions slmilar to those npon whish the ship and treight may be pledged-the latter belng called a bottomry bond. The security of the carge may, indeed, oe given by the maater of the vessel, in addition to that of the ship and frelght, should the last two be dcemed sufficient security by the lender of tha money ; but, notwithatanding the cargo may in this case form the principal part of the securlty, stlll such loan will be commonly sald to be bottomry; hut is more atrictly on bottomry and respondentia. The right which a master poasesees of thus pledging the cargo is undoubted, and is a natural consequence of the power which la lavested in him of disposing of part of the cargo in case of extreme necesrity, and whieh la to be oxercised by hlm for the benefit, to the beat of his judgment, of all concerned. The master of the ship is not, however, juatlfied in selling the whole of the cargo, for that would defeat the object of the voyage which the repairs are intended to carry into effect; nor is he permitted to hypothecate the cargo without the ship, or without the ship and freight. A hottomry bond may include a respondentia bond, or they may be given aeparately. - Generally all laws applicable to respondentia are equally ao upon bottomry, but the reverae is not in all countries the case. By custom, the holder of the bottomry and reapondentia bond after judgment first recelves the freight and sells the ship, and, if these do not satisfy his claim and the expenses of legal proceedinga, then to have recourse upon the cargo; but this course is not always imperative; he may sell the carge, and leave the shlp and frelght. In ouch case the owners of the veasel are reaponsible for any loss whleh the owners of the cargo may austalo, over and above the proportion of general average cherges on the cargo and tho bottomry promium thereon.

A reapondeatia or bottomry bond ia an assignable instrument, and is usually transmitted to an agent in tha place named as the termination of the voyage, with legal authority for him to receive the money, or institute legal proceedings for enforcing payment. The general sule is, that the power of the master to give bottonry or respondentia bonds exists only after the voyage has commenced, and ia to be exerclsed in aome port where the owner does not regide. Bet it is not indispensable to tho validity of a hypotheoation that the ahip and cargo be in a foreign port. The law looks more to the difficulty of communleation between the master and owner. And a hypothecation may be made In another port of the same country, if communication with the owner is subject to great difficulty and delay. The bottomry or reapondentia hond is to be paid before any prior insurance, and it superseâce a provious mortgage on the ship. If there is more that one bottomry Lond, they take precedence in an inverse order to their dates. The last bond given is entitled to priority of paymeat over all others.

The position taken by Lord Manafield, that the lender on bottomry or respondentia is not liable to contribution in case of general average, has been much and justly questioned. It ia contrary to the maritime law of France, and of other parta of Europe, and in Louisiana there is a decision againat it. It seeme conclusivo that if the lender on bottomry owes the preservation of the socurity of his moncy to any aacrifice of ship or cargo, he should contrlbute to a general average or jetsam. -See Botromry and Respondentia, and Manitime Loans. See also Kext'g Comm. vol. iii. ; Pansona's Maritime Lav.

Revenue nad Dxpenditure. Though not properly velonging to a work of thie sort, we belicva we shall do an acceptable service to our readers by laying before them the following comprehensive Table of the revenue and expenditure of the world, which we have compiled from Leone Levi's Commercial Law... For als exhibit of the revenue and expendlture of the Unitod Stntea from 1789-1857, aee article United States.

## RHO

Rhode Imland, one of the United States of America, and the smallest State in the Union, being about 49 mlies long and 28 broad, contalning 1200 square milea, of which 130 la included in Narraganset Bay. Population In 1790 was 88,825 ; in 1800, 69,122 ; in 1810, 76,981; in 1820, 88,059; in 1880, 97,212; $\ln 1840$, 108,830; and ln 1850, 147,545.

Early History.-The country ronnd the Narraganset Bay and to the wost of it is in the first old vorks and mapa generslly named Narragansets, or the Narrayimsett Country. The colonists at Plymouth discovered and entered this oountry alrendy in the firsi years of the existence of their town. Roger Williams was the first aettler in this territory. He and some other dissenters and refugees from Massachusetts founded here the towns of Providence, Newport, and Portsmouth. They nited all in one government in tha year 1648, under the name "Incorporation of Providence Plantations;" or, as they are styled in King Charles First's patent of that year, "Incorporations of Providence Plantations in our Naragansetts Bay, in New England." In the year 1655 Crompell writes to this celony undor the following addreas or title: "To our vell-beloved inhabitants of Rhode Island, together with the rest of the Providence Plantations $;$ " and this, I believe, is the first time that the name Rhode Island is applied to a greater axtent of the territory of a province. As the name of an island it was, however, already for some time in existence.

Origin of the Name.-This isiand, the largest In Narraganaet Bay, was called by the Indluns Aquiday, or Aqueduet, or Aquetneck, which ls said to signify Garden lsland. In the first volume of the Colonial Records, p. 120, in the proceodings of the Generul Court of Dilection, or General Assembly, March, 1644, ts tho following: "It la ordered by this Court, that the Yaland commenly called Aquethneck, shall be from henceforth called the Iale of Rhodes, or Rhode Island." Some ancient authors write the name "Island of Rhodes," and it has been suggested that the name was derived of the old Grecien island of thls namo. It is in this respect a curious fact that already the oid French navigator Verrazano, tho firat modern explorer who touched thls part of the American coast, pronounced the name of Rhodes in connection with this hay. Ho discuvered in these waters an island (aupposed by some to be the island now know.s as Martha's Vineyard), which be compares, in respect to size and appearanco, to tho island of Rhodes, In the Mediterraneun. This was read in Hecklyt, and it is possihle that John Clark and his companions (tho first settlers on Aquetneck) took occasion from this circumatance to name their island. The name was afterward given to the whole country round Narraganaet Bay, which also was sometimes called Rhode Island Buy. In the year 1663 the colonists of that country obtained from Charles I. a charter which incorporated their community under the name of the "Colony of Rho ve Island and Providence Plantations." Tho Narraganaet country, lying south of Wurwick, was also sometimes called The King's Province. The present legral und official namo is stil! Rhode Island and Providence Plantations, but commonly the name is made shorter, State of Rhode Islamd.-J. G. Konl.

Physical Features, ctc.-This Stato on the north and west is hilly and broken, but becomes gradually level toward the sea. The lslands in Narraganset Bay are distinguished by their pleasing and diversified scenery and fertile soil. The c!!mate is healthy, particularly un the islands, whero the sea-breeses have the effect not only of mitlgating tho heat in sumnier, but moderating the cold in whter, and randering the cllmate truiy delightfu!. The rivars, though not large, furnish many fine mill aeats, which are extenaively used for manufacturing purposes. The principal are Pawtucket, Provldence, Pawtuxet, Pawcatuck, and Wood Rivers. Narraganset Bay is a fine body of water,
and contains a number of beautiful and fertile islands. Among them is Rhode Island, which glves name to the State. Iron ore and anthracite coal ara found to some extent; marble, limastone, freestone, and other bullding stone. There were in this State in 1850 , 356,487 acres of land Improved, and 107, 451 of unlmproved land in farms; cash value of farms $817,070,802$, and the value of implements and machinery $8497,201$. Live Stock.-Horses, 6168; milch cows, 28,098 ; working oxen, 8189 ; other cattle, 0375 ; sheep, 44,296 ; swine, 19,500; value of live stock, $91,582,687$.

Agricultural Products, etc.-Wheat, 49 bushels ; ryo, 28,409 ; Indlan corn, 589,201; oats, 215,282; barley, 18,875 ; buck wheat, 1245 ; peas and beana, 0840 ; potatoees, 651,029; value of products of the orchard, $\$ 08,994$; produce of market gardens, 898,298 ; pounds of batter made, 095,070 ; of cheese, 816,508 ; maple sugar, 28 pounds; molasses, 4 gallons; beeswax and honey, 6847 pounde; wool, ponnds produced, 129,692 ; flax, 85 ; hops, 277 ; hay, tons of, 74,818; clover seeds, 1828 bushels; othor grass seeds, 3708 bushels; and were made 1018 gallons of wlne; value of homemade manufactures, $\$ 26,495$; of slaughtered animals, $\$ 667,486$.

Manufactures, etc. - Thera were in the Stato in 1850, 158 cotton factorles, with a capital invested of $\$ 6,675,000$, omploying 4950 malcs aud 5916 females, produclng $96,725,612$ yarls of sheetings, etc., and $1,902,080$ pounds of thread and yurn, valued at $\$ 6,447,120 ; 45$ woolen fuctorles, with a capital of $\$ 1,013,000$, employing 987 males and 771 females, manufacturing $8,612,400$ yards of cloth and 46,000 pounds of yarn, valued at $\$ 2,381,825$; 20 establishments, with a capital of $\$ 428,800$, employing 800 persons, and maklag 8558 tons of castings, otc., valued at $\$ 728,705$; 1 eatablishment, with a capltal of $\$ 208,000$, employing 220 persona, manufacturing 2650 tons of wrought iron, valued at $\$ 222,400 ; 29$ flouring and grist mills, 51 sawmills, 8 tanncries, 20 printing-offices, 5 daily, 2 semiweekly, and 12 weekly publications. Capital invested in munufactures, $\$ 12,923,178$; valuo of manufactured articlea, $\$ 20,000,000$.

The principal places in the State are Providence, city, Newport, each of which is alternately used us the capital, and Bristol. There were ln September, 18557, 100 banks in the State, with a paid capital of $\$ 21,000,000$. There were built and in operation January, 1856, 145 miles of railroads ; tonnage, $1853,41,1$ ä 6 tona.

Principal $y^{\prime}$ orts.- Newport is sltuated on tho sonthwest shore of Khodo Island, twenty-elght miles sonth from Providence, and five miles from the ocean. Tho harbor is one of tho best in the United States, and is well defended. Its aite is beautiful, and of late years it has been much resorted to in the aummer season. Its shlpping is mainly employed in the whaie fieleries and coasting trade: its manufactures are various, and of considerablo extent. The tonnage of Newport in 1856 was 11,646 tons, and in 1857, 12,308 tous.

Providence, a city, and principal port of entry in Rhode Island, situated in lat. $41^{\circ} 49^{\prime} 22^{\prime \prime}$ N., long. $71^{\circ} 24^{\prime} 28^{\prime \prime} \mathrm{W}$. Providenco has great commercial facilitiea, which have been well improved. The harbor is at the head of Narraganset Bay, thirty-threa miles from tho ocean, is spacious, and has safficient depth of water for the largest ships. Tho tounage of Providence was 19,305 tons in 1856, and in 1857, 22,343 tons.

Bristol, between Mount IIepo Bay and Narraganset Bay, has a good harhor, and great facilities for navigation. The tonnage in 1856 was 2902 tons, and in' $1857,15,152$ iens.
The public revenue of Rhode Island for the fiecal yeer ending Aprll 80, 1857, was $\$ 206,400$; viz., direct tax, $\$ 52,407$; tax on banke, $\$ 83,604$; Hicenses of peddlers and auctloneers, $\$ 5221$; insurance companies, $\$ 4320$; from courta, $\$ 10,118$; Interest, $\$ 36,100$; miscellaneous, \$14,634.

Nine months to Juee B0, and the flecal year from this time begina July 1.

Rhodes, a sea-port of Anlatic Turkey, eapital of the island of Rhodes, at its northeast extremity, thirteen milen southeast the nearest promontory of Ania Minor. Lat. of mole $86^{\circ} 26^{\prime} 9^{\prime \prime}$ N., long. $28^{\circ} 18^{\prime}$ E. Population about 15,000 , of whom 8000 are Turks, and 8000 Jews. On the nerthenet side two piers project to inclose a harbor, having in its centre from sixteen to cighiteen feet water, and on itn north side is another port of nearly equal depth.
(Rhubarb (Du. Rhubarber ; Fr. Rhubarbe, Rubawb; 1t. Rabarbaro, Reobarbme; Sp. Rwibarbo; Russ. Reren ; 'Arab. Raveend; Chin. Ta-heang), the root of a plant, a native of China and Tartary. Three varieties of rhutharl are known in the shops; viz.; Ruacian, Turkey, and East Indian or Chinese rhabarb. The first two resemble each other in overy renpect. They are, in fact, the same article, being both derived from Tartary. The portion deatined for the Peteraburg market being selected and sorted at Kiachta, acquires the name of Russian rhubnrb; while the portion that is sent from Tartary to Smyrna and other places in Tarkey is called Turkey rhubarb. The best pleces only are sent to Petersbarg; and according to the contrset with the government, on whose accounk it is bought, nll that is rejected must tre burned; and that which is approved undergnessa necond cleaning before being finally packed up for l'etersburg. The best pieces of Rusaian and Tarkey rhubart are roundish; and perforated with $n$ large hole, of a reddiah or yeilow color on the outside, and when cat or broken exhibit a mottled texture, and alternate streaks of red and gray. Its odor is peculiar, and its tanto nisuseons, bitter, and antringent. It should not lie porous, but rather compact aid heavy. East Indian or Chinese rhuharh is in oblong flat pleces, weldom perforited; has a stronger odor, and is more nauseous to the taste than the other; it is heavier, more compact, breaks emoother, and affords a powder of a
| redider ahade. - Thoman's Dispensatory; Aisslie's Mat. Indina, etc.
Tha palmated rhaharh (Rheum palmatum) is a perennial, native of Rusnla and some parts of Asia, whence the dried root is imported into this country for medicinal purposes. Large quantities of the roots sre also sanually collected for exportation in the Chinese provinces, within the lofty range of the Himalnyas. The best is that which comes ty the wry of Russis, as greater care is taken in the selaction; and, on liss arrival at Kiachta, within the Russlan frontiers, the roots are all curefuliy examined, and the damaged pieces destroyed. This is the fine article of the shops, improporly called "Turkey" rhuberb. That of the best quality occura in small pieces, with a hole in the middle of each, made in the fresh rool, to facilitate the operation of drying. The color ts a lively yellow, streaked with white and red. Its texture is dense, and, when redaced to powder, it is entirely yellow. The Chinese rhabart, called by the natives Ta I/roangor Ilaihoung, ia cultivated chiefly iu the province of Chersec. As imported, it is known hy the name of "Fast Indian" rhubarb, and comes in larger masses, more compact and hard, heavier, less friable, and not so fane in the grain as the othef, and having less of an aromatic flavor. This species has been introduced into England, where it has been extensively cuiltivated; snd there is ilttle doabt, therefore, of its proving perfectly: hardy in many parts of our own country. Large quantities nre onnnally imported, the coat of which might be saved if its cuiture were successfully prosected here, and we might thus add to our productive resources. In the middle and cooler parts of tise C'nited States, the secinn may be nown in March, in a gentle hot-bed, and, when the roots are about an elghth of an Inch in diameter, they may be carefully drawn up, preserving the tap-root, and planted in a flae, rich, sud
give
the
The
deep aoil, but not too mach so, leat the roota : ecome too tlbrous. The largest apecimens of this drug have generally been allowed to grow alx or soven years; the roots are then very large, sometimes weighing from thirty to fifty pounds. The Chinese take up their rhubarb in wintar. Pallina asya that the Tartars take up theirs In April and May; but Forster, in his History of Voyages in the North, with more reason, affirms that the roota are lag up in winter, because they then contain the entire juice and virtue of the plant, as thone taken up in aummer are of a light, spongy texture, and unft for uae. In Tartary, after being thoroughly cleansed, and the amall radiclea cut off, the roots are cut tranaversely into pleces of a moderate size; these are then placed on long tables or boards, and turned three or four times a day, $\ln$ order that the yellow, viscid juice may incorporate with the substance of the root. If this juice be suffered to run uut, the roots hecome light, and of but little value ; and if they are not cut within five or six days after they are dug up, they hecome soft, and rapidly dscay. Four or five days after they aro cut, holes are made through them, and they are hung up to dry, exposed to the air and wind, but sheltered from the sun. Thus in ahout two months the roota are complately cured. The loss of weight in drying is very considerable, seven parta in welght of the green root ylelding only one part of that which Is perfectly dry. The Chinese metliod is somewhat different. They peel the roots, cut them into slices, and dry them on atone slabis, under which fires are kindled; but as this process is not eufficient to dry them perfectly, they make a hole throngh each of the pieces, and suspend them on strings-some say exposed to the sun, while others assert that they are hung in the shade.
Rhumb, a circle on the earth's surface, making a given angle with the meridlan of the place, marking the direction of any object through which it passes. The divisions of the compass card are called rhumbs. -See Mercator's Chabt.
Rhumb Line. In Naval affairs, the track of a ship which cuts all the meridians at the geme angle; called also the loxodromic curre. This being the simplest curve, is the routo unlversally pursued; but a ship sailing on this curve never looks difect for her port until it comes in eight. A great meridian circlo would be the ehortest distance between any two points ; but in order to follow such a circle, the course of the ship would have to be constantly changing, and with such variations as to make it practically impossilile.

Ribbons, or Ribands (Fr. Ruben de Soie; Ger. Rand; It. Nastro di Seta; Sp. Cinta de Seda), a namo given to siliken bands of varioue widths and colors, much used by females for head-dressea and other purposes. They are both plain and figured, and aro sometimes distinguished into sarcenet, satin, etc., according to the manner In which they are made. They are also frequently ornamented by having what is called a pearl edge given to them. Ribbons are woven in pieces, each 35 yards in length. The finest are made entirely of Italian ailk; tho next lo quality, of a mixture of Italiau and Bergal silk; and the commoner sorts, altogether of Bengal silk. The great seat of the manufacture of ribions is Coventry; where they are now made of quality equal to the finest of tho productions of the lyonese weavers: they aro also made at Coagleton, Derby; Macciesfield, Leeh, and other places.-See Siluk.
Rice (Fr. Riz; It. Riso; Arab. Aruz; IInd. Chavel), one of the most valuable of the cereal grasses, the Oryza sutiva of botanists. It is cisised in immense quantities in India, China, and most Eastern countrics; in the West Indies, Central America, and the United States; and in some of the southern countries of Europe. It, in fact, occupies the same place in most intertropical regions as what in the warmee parts of Europe, and oats nnd rye in those more to the nurth.

Yorming, as it does, tha prineipal part of the food of the most civilized and populoua Eastern nationa, it is more extensively consumed than any other apecien of grain. It li light and wholssome, but is aaid to contain lesa of the nutritive priaciple than wheat. When rough, or in ita natural otate in the husk, it is called paddy. There is an immense variety in the quallitiea of rice. That which is prinoipally exported from Bengal has received the namte of cargo rice. It is of a coaree reddish cast, but ta aweet and large grained, and is preferred by the natives to every other sort. It is not kiln-dried, but In parbolled in earthern pots or caldrons, partly to destroy the vegetative principle, so that it mey keep bettor, and partly to facilitate the process of hisking. Patna rics is more ssteemed in Europe tiana any other sort of rice imported from the East. It is small-grained, rather long and wiry, snd remarkably white. But the rice ralsed on the low marshy grounds of South Carolina is unquestionebly very superior to nny brought from any part of ir lia. It mas, perhaps, be werth mentloning that rice, like wheat, oats, and barloy, is not Indigenous to America. It was first ralsed in South Carolina from seeds brought from Madagascar, near the end of the 17th century. Its culture increased so rapidly that in 1724 no fewer than 18,000 tiereen, or berrels, were exported.-Pitkin's Statistice, 1835. According to the returna under the census of 1840, the total annual produce of rice in the United Statea was estimated at $80,841,422$ lbs., whereas under the census of 1850 it was estimated at $215,812,000 \mathrm{llbs}$, or above 06,000 tons, of which 159,030,613 lbs. were raised in Soath Carolina ; and in $1850,213,540,000 \mathrm{llss}$.
The produce of lands naturally or artificlally irrigated li, as far as rice is cuncerned, from five to ten times greater than that of dry land having no command of water ; and hence the vast Importance of irrigation in all countries where this grain is cultivated. But it is worthy of remark that, owing to the not unfrequent occurrence of severe droughts, there is a greater varintion in the crops of rice than in thoee of any other species of grain. Those who, like the Hindoos, depend almost entirely on It for subsistence, are consequently placed in a very precarious situation. There can bo no doubt that famines are at oace more frequent an! severe in Ilindostan than in any other country, Ireland excepted.

Cultivation in the United States.-Kice is the chief food, perhaps, of one-third of the human race; possesses the advantage attending wheat, maize, and other grains, of preserving plenty during the fluctuations of trado; and is also susceptible of cultivation on land too low and molst for the productlon of mest other useful plants. Although cultivated principally within the tropics, it fourishes well beyond, producing even heavier and better filled grain. Like many other plants In common nee, it is never found wild (it is to be understood that tho wild rice, or water oat, Zizanis aquatica, which grows alung the muddy shores of our tide-wat is, is a distinct plant from the common rice, and shonid not be confounded with it), nor is its nativo country known. Linnæus considers it as a native of Ethiopla, while others regard it of Asiatic origin. At the Industrial Exhibition in Londen there were displayed many curioue samples and varieties of rice, grown without irrlgation, at elevations of 3000 to 6000 feet on the Himalayas, where the dampness of the summer months compensates for tho want of artlficial moisture. At the exhibition above alluded to, Americen rice recelved not only honorable mention for its very euperior quality, but tho Carolina rice, exhihited by E. J. Ileriot, was pronounced by the jury "magnificent In eize, color, and clearness," and to it was awarded a prize medal. The jury were free to admit that the American rice, though orlginally brought from the old World, is now much the finest in quality. Tho common variety is cultivated throughout
the torrid sona, whorever there le a plontirul supply of water, and will mature, undor favorable oircumstances, in the Eeatern Continont, as high as the forty-fifth jwrullel of nerth latitude, and as far south as the thirtyujgith. On the Athantic alle of the Wastern Couthnent it will flourish as far north as latisule thirtyeight degrees, and to a rorroesponding parallel south. On tha weatern cosat of America it will grow as far north an forty or more degrees. Ito culture is prinelpally confined to Indla, China, Japan, Ceylon, Madagnsear, Eastern Africa, the nouth of Europe, the south"rn prortiona of the United Stetek, the Spanish Main, Brazil, and the Valisy of Parana and Uruguay.

IBce wan frst Introduced Into Virginia by sir Willlaun Berkeley In 16H7, who recelved half a luahel of seed, from which he ralsed oixteen bushela of excellent rice, most or all of which was nown the following year. It is also atated that a Dutch brig from Madeguacar came to Charleston in 1604, and left about a peek of paddy (rice in the huak) with Governor Thomas Smith, who distributed it atnong his friende for cultivation. Another accouat of its introduction into Carolina is, that Ashiby was encouraged to send a bag of seed ricu to that province, from the crops of which sixty tons were shlpped to Eingiund in 1698. It soon after became the chief staple of the colony. Its culture was introduced into Iouisiana in 1i18, by the "Compaay of the West."

The present culture of rice in the Unlted States is chiefly confined to South Carolina, Georgia, Florida, Alabama, Mississippi, Lauiaiana, and Texas. The yield per aere varies from twenty to sixty buehels, weighing from forty-five to forty-eight pounds when cleaned. Under favorable circumatances, at many a níncty liukhels to an acre have wea raised. Anether variety is cultivated in this country, to a limited extent, calied Cochin-China, dry or monntain rice, from lts adaptation to a dry soil without lrrigation. It will grow reveral degrees further north or south than the Carolina rice, and has been cultivated with success in the northern provinces of China, Ilungary, Westjphalis, Virginia, and Maryland; but the yield is much less than that of the preceding, being only fifteen to twenIy buahels to an acro. It was first litroducel lato Clarieston from Canton, ly John Bradloy Bhake, in 17i2. The amount of rice exported from South Carolina in 1724 was 18,000 Larrela; in 1731, $\mathbf{4 1 , 0 5 7}$ barrels; in 1740, 90,110 barrels; In 1747-'48, sú, 000 barrels; in 1764, 104,682 barrels; in 1760-61, 100,000 barrels; from Savannuh in 1750, 2299 barrela, betides 237 hushels of paddy, or rough rice; in 1760, 3283 harrels, heaides 208 Lushels of padty ; in 1770, 22,120 Larrels, besides 7004 bubhels of paddy; from Philadelphia in 1771, 258,375 pounds. The amount exported from the United States in 1770 was 150,529 luarrela; in 1701, 96,980 tispes; in 1800, 112,036 tierces; in 1810, 131,311 tierces ; in 1820-21, 88,221 tierces; in 1830-31, 116,517 tierces ; in 1840-41, 101,617 tierces ; in 1815-'46, 124,007 tierces; in 184G-'47, 144,127 tien res; in 1850-51, 105,690 ticrees.

Of these exports, 1856-'57, there was exportud from the following ports,

Rice Paper. This sutstance ls sald to be a memfrane of the Arfocargus incisa, or breal-fruit tree. It is brought from Chins in smull pleces, dyod of various eolors, and is used an a muteriai for painting upon, and for the manufucture of several fancy and ornamental articles. It is sometluen erroneously stated to be prepurel from rice.-See Papten.

Richmond, city and port of entry, and capital of Henrico county, and of the State of Virginia, is situated on James IRiver, at the fulls, at the head of tidewater, nnd is in $37^{\circ} 30^{\circ}$ N. lat., and $77^{\circ} 81^{\prime}$ W. long. from Greenwich, and $0^{\circ} 27^{\prime}$ W. long. from Washington. It is 23 uilles north from Petersburg, and 117 south ly weat from Washington. The population in 1800 was 8727 ; in 1810, 0785 ; in 1820, 12,067; in 1830,10,060; in 18.10, 20,153; la 1850, 27,670; and in 185., 80,000. It is beautifully located on the west side of the river, Vetween 50 and 60 miles above City Point, and 150 miles above the month of the river.

Four lines of raliroad here connect, viz., Bichmond, Fredericksburg, and Potomae; Richniond and Petorsburg; the Central Railroall of Virginia; and the Danville Ruilrosd; and here terminatea the James River and Kanawhi Canal. Vesseis drawing 10 feet of water come to Ilockets, about a mile below the centro of the eity; and those drawing 15 feet, to Warwiek, three miles helow the city. The fulls in James Hiver nro obviated by the cansl, and above them it is nuvigablo for boats 220 miles. Reguiar ilnes of packets connect the city with New York and other places, und it is connected by steamboats to Norfolk. The prinelpal articles of exportation are wheat, flour, and tolsacco. The exports amount to aloout $\$ 3,000,000$ annuully. The tomiage of the port in 1853 was 11,460 tons. The manufactures of Richnmond are also extensive.

Riding, in Nacal affairs, is the state of a ship's being retained in a partieular stution by means of one or more cables with their snehors, which for this purpose are sunk into the bottom of tise soa, etc., in order to provent the vessel from being driven at the merey of the wind or current. A rope is sald to ride when one of the turns by which it is wound about the capstan or windlass lies over another, ao as to interrupt the operatlon of wearing.

Riding Athwart, the position of a ship which lies aeross the direction of wind and tlde, when the former is so strong as to prevent her from falling into the current of the iatter.

Riding between the Wind and the Tide, tho gitustion of a vessel at anchor when the wind and tide act upon her in direct opposition, In such a manner as to destroy the effort of each other upon her hall; so that she is in a manner balanced between their reciprocal force, and rides without the least strain on her cables. When a ship does not fabor heavily, or feel a great strain when anchorcd in an open road or bay, she la said to ride essy. On the contrary, when ahe pitches violently into the sen, so ne to strain her csbios, maste, or hull, it is called riding hard, and the vessel is termed a bail roader.

Riga, s city of European Russia, the capital of Livonia, on the Dunu, about 9 miles from the sea, Int. $56^{\circ}$ $56^{\prime} 5^{\prime \prime} \mathrm{N}$. , long. $24^{\circ} 0^{\prime} 4^{\prime \prime} \mathrm{E}$. l'opulation in 1842 , excluding garrison, 60,000 . A light-house has been ereeted on Fort Comet, on the western side of the nouth of the river. It has two lights: the first, eiovuted about 104 feet (English) above the level of the sea, may be seen, under favorable clrcumatances, at the distance of 4 leagues; and the eecond, elevated abont $24 \frac{1}{2}$ feet, may be seen at the distance of 21 leagues.

Tha bar at the meuth of the riveeshas usually frose 12 to 13 feet water; and vesmols drawing more than this frequently load and unload part of thair cargoea by mesuy of ilghters at Holderas, a smali town on the went side of the river, noar ita mouth. There is a fair-way beacon without the bar, in $\overline{5}$ fathoms water; and withIn, the channel is buoyed with black and white buoya I the biack being feft on the right or starboard side when entering, and the white on the larboard. Vessels bound for liges take pilots at Bolderam, who carry them to their anchorage. No ballast is allow ed to be discharged, except at Poderague. Reguiations an to clearing, etc., similar to those at I'eterabarg,-Cowlier zur les Phares, 2d odlt. I and Regulatione published by the Rusian Authoritices.

Trade, - Owing to its advuntageous aitnation near the mouth of a great navigabie river, the trade of ligga is very extensive; being, of the Russian towns on the Baitie, in this respect second only to Petersburg. - The trade is ehiefly carried on by foreign merchante, partleuiarly by the Engliah. The principal exports are flux and hemp, linseed and hemp seed, timber, corn, tohacco, hides, wool, tallow, etc.; the inportes are salt, mugar, cotfee, and groceries of all sorta, herrings, indigo, dye-woods, cotton and cotton twist, silks, wines, ete. The must trade is extenaive. The burghers of Riga send persons who are called mast brokers into the provinces to mark the trees, which are purchased atanding. They grow mostly in the districts which border on the Dnieper, are sent up that river to a lendingplace, transported 80 versts to the Duna, when, being formed into rafts of frum 50 to 200 pieces, they descend the stream to High. The tree which prodnces the largest masts is the Scotch fir. Those pleces which are from 18 to 25 inches in diameter sre called musts; nuder those dimensions, spars, or, in England, Norway masts, because Norway exports no trees more than 18 inches in diameter. Grest skill is required in distlnguishing those masta that are sound from those which are in the least internally decnyed. They are usually from 70 to 80 feet in length. The hest kind of fiax ohipped from Riga is grown in White Russin, and is called Drıana rakitzer; its color is very white, and the threade long, fine, and loose, but it has sometimes thack spots ; the next quality, coming from the province of Trockic, in Lithuania, is called Lithuanian rakitzer, and is very little inferior to Drusna, but its color is a little brown; of this kind the best sort is Thlesenhausen. The best kind of Courland flax shipped from liga is Marienburg; that grown in Livonia is inferior. Thero are two klnds of lineced; that of the last crop, which is ueed for sowing; and that of former yeara, for crushing. To prevent deceptlon, the year of its growth is stamped on the barrel by sworn inspectors (brackers). Hemp seed is mostly shipped for Ilolland.

Afoney.-For the money's of Riga, see Petensnutig.
Weights and Mensures.-The commercisl pound is divided into 2 marks, or 32 loths ; and also into halves, quarters, ete. It contuins 6452 English grains. Hence 100 ibs , of Riga $=92 \cdot 17 \mathrm{lbs}$ avoirlupois $=41 \cdot 8 \mathrm{kilog}$. $=$ 86.32 lbs of llamburg $=84 \cdot 64 \mathrm{ils}$, of Amsterdam. The lisponnd $=20 \mathrm{lbs}$. the sinippound $=20$ lispounds. The loof is the messure for grain : 48 Joofs $=1$ last of wheat, barley, or linsecd ; 45 loofs $=1$ last of rye ; and 60 lonfs $=1$ last of osts, mait, and beans. Aecording to Kelly, the loof $=1.9375$ Winehester bushel ; and, consequently, the last of wheat $=11.625$ quarters. Nelkenbrecher does net value the loof quito so high as Kelly. The fuder, the messure for liquids, is divided into 6 ahms, 24 ankers, 120 quarts, or 720 stoofs. The anker $=10$ English wine gallons. The foot of Riga $=10.79 \mathrm{Ea}-$ glish inches. The ell $=2$ feet ; the clafter $=6$ feet.

Like most of the rivers falling into the Baltic, the Duns has a bar, varying, sceording to eeasons, from 12 to 15 feet of water. Large vessels usually discharge and take in their cargoes either at the roads or in the Bolderaa harbor, near the month of the river,
by means of well-ceered lighters. The linseed, flax, hemp, and wool of this port have always been held In higher repute than those exported from any other port In Rusila. The graln shipped from Riga is the prodnee of White Russia, the Ukraine, Poland, Coarland, Livonia, Esthonia, Sunolensk, Minsk, Lithuania, cic. The navigation of Riga may be seen from the follow. ing returns for a series of years:

Total amount of exports from England to this port in 1850, 4,984,000 franca, or $\$ 927,000$.

Total amount of exporta from Kiga to England, ©6,578,054.

The merchandlse imported into England from Ruaaia la such, chiefly, as Kussla only can aupply-at least in euch quantitles as to meet the oxtenslve demande of the mannfacturers of Great Britaln. It consiste princlpally of articies of firat necessity in manufactures, auch an hemp and flax seed for oil and calture, The merchandise supplled to Kuenia (at the port of Riga) from othor countries conaiets chlefly of augar, coffee, sult, wines, apirituous liquors, tobaceo, and cotton tiysuen. In reforence to the latter article, such ls the extraordinary actlvity of Ruasian manufacturing industry, supported as it is by a high tariff on manufactured articles, that, had not the war intervened, she woutd probably be now independent of other natiuns ay reBpects cotton yarns.

The total tonnage which entered and cleared at the port of Riga in 1850, as already shown, was 397,895 tons. Of this total, 180,004 tons were under the English flag, or within a figure of 50 per cent. on the whole; while the Russian flag covered only 61,894 tuns, or 15 per cent. on the whule. The value of flax-secd for cul. ture, exported from this port from 1840 to 1850 , was $\$ 7,000,000$; of which England recelved, in the aggregate, one-third. The remuining two-thlrde were sent to Helglum, Pruasia, Hanse Towne, Sweden and Norway, France, and the Unlted Statea. The nuvigation movements at thia port fur 1858 were as follows:

The oflicial paper, from which the preceding talle is oxtracted, furnishes ulno interesting fucte retative to the hemptrade of this port. Tho following extract is Iranklated from this document:
"Hemp is usually sold by the producers in the interior to morchants who visit their eatatea for the jurpese of ajeculation. 'They make their contracts generuily let ween April and October. The time of dilivery is atipulated for, and from 5 to 10 per cent. on 'fie pur-chase-nuncy is palil down in cosh. The unr and aver. ape quantity of hemp thus brought to the sarket of Liga amounts to about seven millions 'f fírucs. At Riga there are aurvegurn' uffices entul)lished, wate the hemp brought for aale is aubjected to the atrintest exami ation, and is ranked, according to quality, Nos. I, 2, or 3. Should the problineers he dikentinfied with the actlon of the survey ors at liga, they have the right of appeal to St. Peternburg." - Nee articlen Itrasp and liuseia for particular information.

Rigging of a Ehip, a general nmme given to all the ropes employed to support the mats, aul to extind or reduce the salla, or arrange them to the dingwition of the wind. The former, whleh are usel tumatain the masta, remaln uaually in a fixel ponition, nual are called starding rigging; such are thon mirouls, stny н, und haketays. The latter, whose offlec is to manage the s.ils, by communlenting with varlens blocke or pulliva, situated in different partn of the thaste, yarila, hiromis, ete., are comprehended ln the genvral terni rumuing rigging; such are the braces, slicets, halliards, clew-lines, and brails.

Ring, an ornament of gold and silver, of a circular | patents and orders of princes were sealed with their figure, and usurlly worn on the finger. The antiquity. of rings is known from Scripture and profane authora. Judah left his ring or signet with Tamar. When Pharaoh committed the governuent of all Egypt to Joseph, he took his ring from his finger and gave it to Joseph. After the victory which the Isruelites obtalned over the Mldianitee, they offered to the Lord the rings, the bracelete, and the golden necklaces, and the goiden aur-ringe, that they had taken from the enemy. The Iareelitish women wore rings, not only on their fingers, but also in thoir nostrils and their ears. St. James diatinguishes a man of dignity by the ring of gold which ha wore on his finger. At the return of the prodigal son, his father orders him to be dressed in a new suit of clothee, and to have a ring put upon hie finger. The ring ohiefly nas usod to seal with. The
inge or aignets ; and it was this that secured to them their authority and reapect. The eplscopal ring, which makes a part of the pontifical apparatua, and is esteemed a pledge of the spiritual marriage between the bishop and hile Church, was used at a remate period. The fourth counoil of Toledo, held in 633, appointe that a bishop condemned by one council, und found afterward innocent by a second, shall be restored by giving him the ring, staff, etc.
Rio de Jaiaoiro, the capital of Brazil, on the Atlantic, in lat. $22^{\circ} 54^{\prime} 15^{\prime \prime} \mathrm{S}$., long. $48^{\circ} 15^{\prime} 50^{\prime \prime} \mathrm{W}$. Population, : , 000. The harbor of Rio is one of the finest in the world, both as ryepecta capaciousness and security for all sorts of veseels. In coning from the northeast it is usual to make Cape Frio, in lit. $23^{\circ} 1^{\prime}$ $18^{\prime \prime}$ S., long. $42^{\circ} 3^{\prime} 19^{\prime \prime} \mathrm{W}$., being nbout 4 leagues

Reforences to Pan,-A. Tha do Catunduba. 11. Fort de Bt. Jono. C. Morro do Flamongo. D. Pontn do Calhabouco. E. Fort da tha das Cobras. F. tha doe tation, O, Fort da Boa Viagom.
nearly east of Rio. The entrance to the harbor is marked by a remarkable hill in the form of a sugarloaf, 900 feet high, close to ite weat side ; whlle on the east, or oppdaite side of the bay, at the distance of about $1 \frac{\mathrm{milfe}}{\mathrm{i}}$, s the fort of Santa Cruz. But the woodcut in the preceding page, taken from a chart pnbliahed by order of the Brazilian authorities, gives a mach better idea of thls noble hartor than comld be obtained from any description.

Harbor.-Vessels bonnd for Rio, coming from the north, should, after rounding Cape Frio, steer due west, keeping about 8 leaguea from the coast, until they come withln 5 or 6 miles of the Iha Raza, or Flat Island, lying aimost'due south from the mouth of the harbor, at the distance of about 3 leagues. A light-bouse, the lantern of which is aaid to be elevated nearly 800 feet above the level of the sea, was erected on this island in 1829. The light is a revolving one, finiahing its revolutlon in 3 minutes, and exhibiting alternately a white and $\pi$ red light. There is also a llght-house in the fort of Santa Cruz, the light of whlch ta fixed, and elevated about 50 feet above the level of the sea. -Coulier sur les Phares, $3 d$ ed. Having got within 5 or 6 miles of the llha Raza, ahipa may enter by day or by night, the doted line in the cut markiag the fair-way into the harbor. There are no pilots to be met with; and as there are no hidden dangere of any kind, their services are not wanted. On entering, vesseis murt pass within hail of Fort Santa Cruz, to be ready to enswer any questions that may be pat to tham. They ti:en proceed to Fort Viiganhon, below or opposite to which they must bring to, or come to anchor, allowing no boata to come along side but those of the government until ihey have received pratique, when they will be permitted to proceed to the usuai place of anchorage for the merchant shipping. The sea-breeze generally sets in about 11 A.m., and lasta till about sunset. It is atrong enough to enable ships to cevercome the elb. High water at full, and change at 2 in the afternoon.

Anchorage Dues.-1. From and aftar 1st July, 1852, the anchorage duty npon vessela trading bet ween foreign ports and tho ports of Brazil will be reduced to 300 reis the ton ; and the same clasis of duty now levied upon coasting vessela shall be aloolished. 2. That part of the provialons of April 20, July 20, and November 15,1844 , which has not been altered by this decree will continue in force.

Money; Weights, and Measures.-All payments are made in paper money, which has been over-issued, and is excessively depreciated. But In ordinary casas tie par of exchange may now be assumed at about 31d. aierling per patriotic doller, of 1620 reis paper. Weights and long measures are the same ns those of Lisbon, the arroha being $32 t$ lbs. avolrdupois; but measures of capacity are difterent, a medida being equal to -5954 imperiul gallon, and an alqulere to $1 \cdot 11$ ditto.

Trade.-The trade of Rio is extensive, and has $\ln$ creased rapldly of late years. It is now by far tho greatest mart for the export of coffec. The shipments of this important article, which in 1830 amounted to 896,785 bags, have increased with sach unexumpled rapidity, that in 1848 they amounted to $1,710,707$ bags, that is (taking the bag at 160 lbs .), to $278,713,120$ lbs., or 122,193 tons; belng about equal to all the exporta of coffee from ail the other porta $\ln$ the world. It has not, however, heen so large since. Sugar was formerly an important artlcle of export from Kio, bot latterly it has repldy decreased, and oply tenornted to 5979 cases ( 13 ewt . each) in 1849 . It ${ }^{\circ} \mathrm{proms}$ ? , however, that here, as in Cuba and other places, the late low prices of coffee may have produced a reaction in favor of sugar, the exports of the latter having risen in 1850 to 13,047 cases. The other great articles of export from Rio are hides, rice, tobecco, rum, tapivea, ipecacuan'sa, manloc or manihot, flour, and other inferior articles. The export of cotton has entirely ceased; and that of gold, diamonils, etc., is "notly elandestlne. Diamonda are principally export : 1 in Bahla. We sabjoin an

The principal article of import consists of cotton goods, the value of which amounts to full one-third of the total value of the imports. Next to cottons are woolen, linen, and silk manofactures; wines, jowelry, and lron-mongery; flour, meat, fish, butter, and other articles of provision ; spirita, salt, enrthen-ware, paper, and a host of articles. The importation of readymade furniture from tha Unitel States is alsu extersive
About 56 per cent. of the entlre commerce of Brazll passea through the port of Rio de Janeiro. Hi'her is conveyed, from all the ports on the coast, from Bahln almost to the frontiers of the Argentine Repubiic, all the irroduce intended for exportation or home consumptlon. Farina, leans, becon, dried and salt meat, hides, horns, tallow, rice, tobacco, sugar, coffee, cotton-in a word, all the proluce and manafuctires of the different provinces are made tributary, either by land or water conveyance, to the weulth and cominercial greatness of the Brazitian metropolis. A numervas fleet of vesacla la employed in the coasting trade, in supipiying the d:ferent ports along the const with the various productions of the will and industry of Ameriea and Euroie. The chief forelgn exports from Rio do Janeiro are-coffee (mure than half of the whole golng to the Cinitell States), sugar, cotton, hiden, tobacco, otter ${ }^{*} k i n g$, otc.
Tonnage employed in the trade of 1841 : Total vesselc, 1i05, of 416,000 tens-of which, from and to the

United States, there were 289 vessels, of 77,000 tons. Tounage, etc., of 18.41, compared with that of 18.10:

The increuse of the foreign commarce of Rio de Janelro is better illuatrated by the following returns:

All foreign nations shared equally in the large angmentation which the returna of 1846 exhibit over thoge of 1845. Some of the causes that contributed to this increase have been already adverted to. The true cause, however, to which all others are but anxiliary, is the admitted capacity of Brazil to multiply her staple productions, particularly coffee, to the fullest extent of the foreign demand, if she will only avail herself of the abnndant reaources with which nature has so bountifully supplled' her.
The quantity of coffee exported increased $23,764,000$ kilogrammes (of $2 \cdot 20$ lbs. avoirdupois). Sugar, on the other hand, diminished $8,098,000$ kilogrammee. The exports of coffee during the year 1846 were:

| Total in 1850 . . . . . . . . . . . . . . . . . . . , | 1080 | 264,616 |

The leading articles lmported in 1851 were as follows: Cottons, 42,560 , woolens, 5488 , linens, 5695 , silks, 1088, and mixed goods, 1263 packages; codfish, 54,602 quintals ; coals, 42,007 tons ; ale and porter, 23,704 barrels ; flour, 283,893 burrels ; candlea, sperm, 90, composition, 6052, and tallow, 25,561 boxea; wines, Portugal, 14,033, Mediterranean, 7644, and Bordeaux, 4421 pipes ; butter, 25,561 firkins ; cordage 5480 coils, etc. The produce of the country exported in the aame year consisted of : Coffee, 2,033,743 lagg; hides, 147,296; sugar, 7824 casee; rum, 3892 pipes; rice, 8229 bags ; horns, 256,949 ; tohacco, 28,755 rolls (of 96 Ibs. each) ; rosewood, 36,547 pieces ; half-tanned , hides, 12,744 ; tapioca, 17,737 barrels, etc. The arrivals coastwieg in 1851 were 1935 ssil vessels, and 309 steamers, with an aggregate of 221,647 tons; and the departures were 1863 sail vessele, and 880 steamers, with an aggregate of 225,002 tons. The total imports and exports of the empire in 1851 exhibit an increase of 33 per cent. over the average of the four preceding years. Could Brazil be induced to abolish the heavy export duties which sho levles on her staple productions, the increase would largely exceed this figure. The article of coffee alone would in a short perior fully make up for any deficiency in her reveuue caused by the abolition of these duties, in the increased demand for that article for foreign marketa. Besides, the stimulus which would in consequence be imparted to that branch of agricultural labor would present sin incldental benefit which could hardly escape the observation of a sagaclous legialator.

The subjuined figures show the amount of export duties levied at Rio de Janeiro from 1846 to 1851. [Milres $=55$ to 56 cents United States currency.]

The total value of the commercial movementa at the port of Rio de Jsneiro in 1852 was 353,000,000 france -equal to $067,070,000$; showing a large increase over the trade of the preceding year. Of the above total there was for imports $\mathbf{1 8 0}, 000,000$ francs, and for exporte 173,000,000 frsncs. The following condensed sumnary shows the trade of the priacipal commercial countriea with Rio daring this year: Great Brituin und possessions, $74,000,000$ francs; imports consisted chiefly of cottons, woolens, provisions, hardware, coal, etc. France, $34,000,0$ : 0 francs ; imports-liquors, tissues, cutlery, articles of fashion, etc. United States, $23,000,000$ francs ; imports - provisiona, stores, etc. Portugal, $14,500,000$ france; linports - wines, provislons, etc. LIanse Tcwns, $11,0 \% 0,000$ franes ; importe -syeneral cargoes. Buenos Ayrea and Montevideo, $5,000,000$ francs ; imports-provisions, skins, etc. The exports of Rio de Janelro this year were in value :

According to the official report of the custom-houas of Rio de Janeiro, there was exported from that port to the United Statea, up to 30th June of this year (1852), 952,489 hagn of coffee, of 160 lbs . each-making in all $152,398,240$ ibs. The total qusntity of coffee exported the oame year is atated to have been $1,896,600$ baga,
or 303,457,440 lus. The quantity sent to the United States was thus distributed:

| Now Orleans | 846,202 bege. |  |

| 1840 | ${ }^{290,123}$ |
| 1850 | 229, 113 |
| 1352 | 346,262 |

It is staterl that the first importation of coffeo into New Orleans direct from Brazil took pluce in 1835; and that from that year to 1840, or during a period of six years, the quantity thus directly imported from Brazil did not exceed 44,000 bags; while in the year 1840 alone there were received at that pert from cula 91,000 bags. Cuba, however, has now almost enlirely ceased to export coffee-has ceased, at leust, to any conaiderable extent.
Compalativa Statement altowina thit Quaktitike of top-
 mitit inchisive.

These returns show great uniformity, and go toprove that the trade of Ria Janeiro in the grest staple of Brazil has attained for the tine ita maxiumm. The exports to New Orleans for the same period, however, show in progressive increuse.

From official publications received as these pages go to press, it appears that the general forcign comainere of Brazil in 1854 was unusually prosperous. The agricultural productions of the empine, the chief husis of Its foreign trade, exceeded those of the preceding year, the returna for the port of Rio de Janeiro reaching as high as $338,000,000$ france; showing an excety over those of the preceding year of $13,000,000$ francs. The total numher of veasela that entered the port of hio de Janeiro in 1854 was 1064, and in 1855, 1285 ; whille in 1853 there enterell only 1054 vessels; showing an incrense for 1854 of 10 , and for 1855 of 231 vessels aver 1853. The following stutement shows how the navigation of this port was distributed in $1 \times 53$ und 1854:

| Nallonatuy. | No. of Vemels. |  |
| :---: | :---: | :---: |
|  | 1888. | 1854. |

For many years the United Ststes occupied the first rank in tha usvigation of Rio de Jsneiro. It will be perceived from the preceding table that England claims the precedence in 1854, a fact which is sttributed to the falling off in that year in the importation of fluur from the United Stntes. The new line of steamers, established in $\mathbf{1 8 5 3}$ between Liverpool and Ria de Janeiro, touching at the same places as the Southampten line-namely, Lisbon, Madeira, Teneriffe, St. Vincent, Pernambuco, and Babia - netwithgtandin ${ }_{6}$ the fosrs as to its success, continued, $\ln 1854$, its monthly service with activity and profit. Besides these two lines of steamers, a company, composed of Brazilian and Portfiguese merchants, has established a line between Lisbon and Rio, touching at the same points; but this line had in 1854 but oue steamer in service, the voyages of which, however, proved very successful.
The port of Rio de Janeiro is becoming yearly mere important as the contre of South Atlantic commerce. The number and toanage of vessels which entered in 1855 were augmented a third when comparel with 1845, and more than a half ever the numher and tonnage of vessels in 1835. From 1850 to 1854 the average increase during the five years was nearly a lifth. The following statement exhibits this progressive movement:

Thes figures exhibit the results of foreign navigation only. The coasting trade is shown as follows:

| Yeasu. | Yessels. | Tons, |
| :---: | :---: | :---: |
| 1885................................... | 1929 | 115,117 |
| 1St5..................................... | $26: 12$ | 168,872 |
| Average 1850-64 . . . . . . . . . . . . . . . . . . . | 2390 | 230,228 |
| 1855......... | 31168 | 318.229 |

- The eniployment of etcambeats in the navigation of Rio de Janeiro is yearly extending. In 1845 the number of steambonts engared in the trade of the port of Rio was 239. In 1855 the number reached 431. Fourteen compunies, owning thirty-nine steambonts, with in aggregate of 2428 horse power, kee, up the communlcations between Rlo de Janeiro and the other maritime towns of the emplre. There are also four towboats, with un aggregate of 187 horse power. The following tabular statenent exhibite the value of leading importations lnto Rio de Janciro in 1805:

| 1st.-Mmbeninninge |  |  |
| :---: | :---: | :---: |
| Liquors, wines, tea, etc. . . . . . . . . . . . . . . 17,000, 000 franes, |  |  |

As regards tho export trado of Rio de Janeiro in 1854, the returns it hand are not so minute. Of coffee, hicwever, the chief article of export from the Brazillian market, there were exported this year 1,987,632 bags, weighing an nggregate of $318,021,120$ lus., of which 899,900 bags, or $143,984,000 \mathrm{lbs}$., were sent to the United Ststes. The quantity exported the previous year wss $1,687,663$ bags, or $262,026,080 \mathrm{lhs}$. The quantity of sugar exported was less than that of 1805 -nmmely, 5905 hhds. and 1739 barrels.

The following resume exhibits the total results of 1854:

|  | Iniporta. | Exports, | Totnl. |
| :---: | :---: | :---: | :---: |
| Vaine ln 185 | $\begin{aligned} & \text { Frances. } \\ & 171,000,1000 \end{aligned}$ | $\begin{gathered} \text { Franes } \\ 167,100: 1,000 \end{gathered}$ | $\begin{aligned} & \text { Frene. } \\ & 335,(H), 0.00 \end{aligned}$ |
| Value ln 1853. | 104,0010, 060 | 161,000,060 | 325,000,0\% |
| Inerease In 180 | 7,0100,600 | 6, 1900, 060 | 13,900,00) |

The total flour imports at Rio for 1856 were 317,404 barrels, of which 301,729 barrels were frem the United States. Of this amount 101,716 barrels were shipped coastwise or re-exported after reaching Rio.
Totat import, 1557
Stock in all hands jannary $i, \dddot{18} \mathbf{1 8 6} \ldots \ldots . .$.
Sllpped constrife and re-experted, 1850.
$\frac{80,1000}{\substack{151,7161 \\ 03,000}} 307,474$
Conkumption of $15 \% 0$. $\qquad$
The imports of flour from nll sources last year exceed those of the preceding year 16,536 barrels, while the imports from the United States show an increase for the same period of 74,423 barrels. In fact, tho talies for ten years show a somewhat irregular but decisive transfer of the flour trade almost entirely to tho hunds of the United States.
The total exports of ceffeu from Rio for the year 1856 show as follows :

| To the lintted States. | 1,109,131 bag. |
| :---: | :---: |
| To Fiurope | 839,885 |
| To other peints, | 47,120 |
| Total. | 2,000,136 |
| Exp |  |
| To the Cnited States. | 1,100,135 bugst |
| To liurope | 1,242,326 ${ }^{\text {a }}$ |
| bilewi | 24,849 |
| Total. | 2,490,809 |
| Lar |  |
| To the United Stater. | 801,706 lings. |
| To dinrope | 1,064,189 * |
| Elsewher | 37,3I9 " |
| 'Total. | 1,903,706 |

The totsl exports of sugar for 1856 were: Cnses, 2364; harrels, 25,581; showing a decrease from the preceding year of $2: 181$ cases and 12,155 barrols. The export of hides fer 1856 was 64,861 pieces, showing a large decline from the two preceiling years.

Of the coffee exports to the United States in 1856,

Baltimore received 188,011 bngs; New York, 362,248; who are employed in the mechanic trades, in commer. Phitadeiphia, 01,985; Boston, 5001 ; und New Orieans, $404,502$.
The foreign commercial arrivals in 1856 number 1050 vessels, of 335,886 tons, of which thirty-two waro from Bultimore, thirty from Now York, twenty-eight from Richmond, fifteen from New Orleans, fourteen from Boston, oleven from Philadelphia, two from Charieston, two from the Rio Grande, and one from Wilmington. The number of foreign departures in 1856 was 906 vesseis, of 426,908 tons, of which 640 wero with produce, 34 with foreign merclannilise, 140 with their inward cargoes, and 182 in ballust proceeded to other ports of the empire. The coanting trado out ward was conducted, exclusively of 303 steamboata, by 2226 vessels, of 253,736 tons burlen. The coasting trade invard was conducted by 2222 aailing veasela and 305 steumboats, of 276,967 tons.
The revenue collected at the custom-house of Bio exhilits an increase corresponding with that of the import trado of this port. This is shown by the following comparative statement of receipts :
1835. $\qquad$ 3,583,000 miltreas.
180. $\qquad$ $8,1+9,1000$
The last year (1855) does not exhibit the maximum. This wre roached in 1852, the amount that year exceeding $14,775,600$ milrens, or over $\$ 7,000,000$.
Immigration.-The immigration returns of Rio furnish the following statistics:

| Yeans. | tinterest. | İeparted. |

cial pursuits, as domestics, etc. Some hundreds ars aent to the new colonies, where thay constitute almost the only aid which Brazilian agriculture receives annually from foreigners. There arrived in 1851 and in 1852 a large number of German settlers, engaged in Europe by the agents of the colonial directora. On their arrival those colonists became dissatisfied, and hence German immigration has nimost entirely ceased. In 1851, there arrived of this class of immigrants 2958 persons; in 1852, 1347 persona; in 1853, 349 persons; and in 1854 , only 295.

General Remarks.-On the 80th of April, 1854, the first railroad in Brazil was thrown open to the public, the inauguration taking place in the presence of their Imperial Majesties, and an inmense concourse of the leading personages of the empire. The general navigation and commereo of the southern provinces, as weil ns the gencial trade batween them and tho United Statea, are decreasing; owing, it in alieged, to the settlement of the difficuities that exieted on the River Plata. The more liberai tariff, buth on importe and axports, attracte a large buik of the trade of these provinces to that quarter. A treaty betwcen the Coited States andi Brazil is regarded as the only meana of pronoting the general commerce and navigation between the two countries. There exists no commercial treaty between the United States and Brazil; but Brazilian vessels, with their cargoes, are admitted on an equal footing with vessels of tie Vnited States as respects tonnage and import duties, nud nil other charges.

The ports of Brazil open to direct foreign trade are: Para, Maranham, Parnahila, Fortaleza (Ceara), Amcaty (Ceara), Rio Grande North, Parahiba, Permambuco, Maceyo (Alagoas), Lnnangeiras (Sergipe), Bahia, Fspirito Santo, Rio de Janeiro, Santoa, Paranagua, St. Catherine, Rio Grande, Siso Borga (R. G. South), Porto Alegro (R. G. Sonth).

Anchomage Dues.- $\mathbf{0 0 0}$ reas (about $16 \boldsymbol{f}$ cents) per ton of Brazilian measurement. Vessels arriving und departing in ballast pay only half anchorage; and those calling merely for supplies cre exempt from anchorage duty. Vessela which make more than two voyages to ports of Brazil during a $t$ welvemonth are exempt from the payment of anchorage dues on nll voyages over that number within the same year; veasels, therefore, pay no more than 600 reas annually ( 384 cents), be the number of voyages what it may. For passpoits to loave, from 4 to 8 milreas (from $\$ 222$ to $\$ 44$ ); for pilotage inward 80 milrcas ( $\$ 1667$ ), but no obligation to take pillots inward; for pilotage outward 70 milreas ( $\$ 3888$ ), and for canoe-hire, 6 milreas ( 83 38). No vessel is allowed to lesve port without a pllot, nor to get under weigh aftor aunset, or before sunrise. Hospital money, 4 milreas on the vessel (say $\$ 222$ ), and 640 reas (or about 36 cents) for eich of the crew. The chargo for stamps varies, being not less than \$1. A consular return irom Pernambuce, ender date of Jnnuary, 1865, gives each specific item of charges upon an American bark of 200 tons burden which entered that port laden with flour, and leaving with a carge of sugar. The total, inward and outward, including the charges for lighterage, labor, cranenge, etc., which are uot on government account, amounted to $\overline{\boldsymbol{\phi}} 57145$. Of this there was piid on government account $\$ 19245-$ the remainder belenging to the other class of charges.

Tariff:-The market prices in Brazil are taken ns the besia for the duties finfosed by the present tariff. The dispatch by inveice will take placa when the goods imported have no fixed duties in the tariff, or when they are aubject only to a tax for warehousing and clearing out.

For the diapateh of goods subject to ad ralorem duties the merchant or consignee is obliged to show a declaration stating the prices of his goods, and the original invoice duly certified. In want of the original invoice may be presented two certificates by two brokers, or, in the absence of brokers, of two merchants of the place, ahowing the current pricea of tha goods.
The value of the goods subject to ad colorem duties will be that of the Irazilian market, ns before asid; deductions made of the respiective chities, or the valuo of the original invoice, with the addition of 10 per cent. -United States Cum. Relations.

Remarks on the Trade of Brazil.-This vast empira comprehends the great enstern section of South America. Its length from north to suuth is computed at about 2600 miles, and its greatest breadth at 2540 miles. The entire area comprises about $2,973,400$ square miles, or over ten times the aren of Texns, and alout seventy times that of Portugal. The climata is generally favorable to agricultural pursuits, the soil being fertile, and in many parts of the enplire, particularly in the provinees, abrunding with valmable mineral resourcea. The ataple productions of Brazil are such as must necessurily attract an extenslve fureign trale; though it is stated that anterior to 1809 she lad no direct interconrse with other nations-the mother comitry, under the policy which dictated her colonial system, exciuding from the ports of her extensive colony all foreign flaga. The dangers which menaced, and the domestic troubles which ngitated Portugal at this period, rosulted in the flight of the royal family to Brazil. With the court were introduced new tastes, now idens, nud a more litieral poliey in regard to foreign interceurse. Tho ports of Brazil were at once opened to foreign commerce, and since that period the culture of the staple productions has kept pace with the increased demands of foreign markets. The grent staple of lirazil is coffeo, though vegetnbles, fruits, wheat, barloy, rieo, maize, and tohaceo are extensively producel in the southern or temperuto provinces; whiiie within the tropies the chief produstions are mandioca, rice, hannanas, plantains, beans, sweet potathes, ceffee, augar, cotton, and cocon-the last four for
exportation. The forests supply the very best timber for ship-building, and almost every variety of wood for cabinet-work and dyeing purposes; among the latter, Brazil-wood, ronewood, and Campeachy-wood are important articles of commerce. Travelera who have minately explored tha interior of Brazil deacribe no less than 219 varieties of timber, and many of them largely enter into the commercial resources and domestie wealth of thot empire. Since the acknowledgment of its independence, the cominercial regulations of Brazil have been marked by e spirit of liborality and of freedom from unnocesanry and exclusive restrictions. The duties on imports and exports are bnsed upon the valuation pirinciple, and are designed solely with a view to supply the necessary revenues for the support of the government ; and the port, pilot, and other navigation charges aeldon exceed the actual requirements of a just and liberal intercourse with foreign notions. Indeed, the cammercial policy of Brazil seems eminently adapted to a conntry of auch boundless extent and so spausaly populated, fis labor is suro to find a remunerative reward, in whatever modo it may seek tc develop the oxhnustless rasources of tho empire, In the free competition to which it invites the enterprise and exchanges of forelgn nations. The entire population amounts to alout six millions-being two persons to the square mile; of which at least three-ffiths are blacks. Tha commercial treaties negotiated by the government of lrazil with forcign countries are generally bnaed upon the principle of reciprocity. That with the United Stntes was concluded December 12, 1828, and established between the two countries freedom of commerce and entire reciprocity of trade und navigation-certnin specinl favors being reserved to Portugal, owing to the former relations between that country and Brazil. This treaty contained the usual stipulation requiring twelve months' natice to he given by either party desiring to terminute the same; and such notice having been given by the government of Brazil, and the twolva nontha having expired, tho treaty is no longer of force. The commercial relations between the two countries were, however, placed upon n footing of similar reciprocity to that guaranteed by the treaty, by virtue of tire proclamation of the l'resident of the United States, bearing dute November 4, 1847, issued conformably to the provisions of an act of Congress passed on tho 2th duy of May, 1828.

As the trule letween the two countries is placed much on the same footing of reciprocity as that guaranteed by the treaty, it is deemed not irrelevant to present a aynopsis of the provisions of that treaty, so far as thoy relate to commerce.
The contracting paties are plaeed on the footing of the most favored nation in rexpect to commerce and navigntion, tho relatiens between Portugal and Brazil excepted. Free commercial intercourse, on the linsis of perfect equality aud reelproelty het ween the citizens and sulyjects of the two countries, is estallished, the coasting trado being reserved by ench govermment to its own flag. The vessels of both countries nre placed on the same footing in the ports of each, as to the importation, exportntion, or re-exportation of foreign goods, from or to any foreign country; the United States agreeing to consider a vessel ns brazilian when the proprietor nod enptain nro subjects of Brazil and tho papers are in legal form. The contracting parties agree that no higher or ether duties shall be iniposed on the importation of any articles, the produce or manupactures of either country, into the ports of the other, than are or shall be payable on the like artleles, being the produce or manufactures of nny other foreign country; and export duties shall be the same in each to the ports of the other as when the nrtieles are experted to any other foreign country'. It is ngreed that it shall be wholly free for all nerehants, commanders of ships, and other citizens or subjects of both countries, to managa themselves thelr own business in all the prorts
and places subject to the jurisdiction of each other, as well with respect to the consignment and sale of their goods and merchandise by wholesale or retail, as with respect to the loading, unloading, and sending off thitr ships; they being in all these cases to be treated ae citizens or subjects of the country in which they reside, or, at least, to be placed on a footing with the subjecta or eltizens of the most favored nation. Vessels in distreas, pursued by pirates or enemles, etc., belonging to either of the contracting parties, to be received and protected in the ports, rivera, bays, etc., of the other.
Foreign Commerce of Brazil.-From official documents, it appeara that of the whole commerce of Brazil, Rio de Janelro holds 56 per cent. ; Bahia 12 per cent.; Pernambuco 12 per cent.; Alagoas, Santo I'aulo, and Santo Pedro do Sul, 8 per cent.; Para, Nuranham, and Sunta Catarina, eachl 4 per cent. The species of merchandise which constitutes the leading imports Irto Drizil are cottuns; of which Rio de Janeiro, Balia, and l'ernambuco usually recelve in value abont $\$ 7,000,(16)$; woolens about $\$ 1 \rho 0 C 0, M_{1}, n ;$ silks, $88,0 \% 0,000$. Aftes theno rank next :a commercial importance provisiens, toor (the great buik of whleh cones from tha United States); wines and other liquors; metals, cruce and manufactured; watcher, jewelry, arme, s.smuaition, etc. etc. The principal oxports are coffee (which is shipleed from Riv) nud suggr, (princlpally from datia and P'ernambuco). Fill a moiety of the former goes to the United State3, and the latter chiefly to England, Trieste, and the H.nno Towns. The precioua metals next follow in the mand of exports ; then dlamonds, skins (utter), hide s, estion, and tobacco. The two last, ss well an sugar, though not to so great an extent, are either stationary or de eliuing, as respects the quantities annually cxported.

The fcllowing comparative statements give tie figures for two ycars, 1801 and 1852:

|  | 1851. | 1852. |
| :---: | :---: | :---: |
| Injuorta | \$42,300,000 | \$ $434,200,000$ |

Coffe..-Coffeo is the leqding staple of Brazil. For merly, ald fur many years, Sau Domingo was the souree from which Europe slerived lts supplies of this article-the quantity exported frum that inland at unf tize having reached as high as $\mathbf{i 7}, 000,000 \mathrm{lbs}$; sud hail not the revolution broken out in 1792, it was es ${ }^{+1}$ mated that thero wonld havo been exported chat year nbout $84,000,000 \mathrm{lbs}$. That event, comil ned with uther olvious causpa, proluced a toal ceasation in the sup plies from thls source. Being driven fron: St. Demin$\mathrm{p}^{\text {on }}$, the culture of coffee at once bryme a leading branch of indastry in Cuba, Jansiea, Surinam, and Java, and war at a subsequent perion lutroduced viit: ?nuch success into Drazil. After the filght of John VI. isom Portugal to Brazil, in 1808-'9, the port of lito de Juneino was giened to forelgn trade, ond coffee enon became one of the leading staples of export. At that period the anmal erop dim not eaceed 30,000 , bage, of $4,800,000 \mathrm{lba}$. In 1820 it r cheà as algh as 1001,000 latgs, or $16,000,00 \mathrm{c} 1 \mathrm{bs}$. In 1817 and 1391 the sup, ly was so mnull, that in the market ©f lamion it ruse as ligh as $37 \frac{1}{3}$ centa per lb . This of course stlmulated its cultivation in Brazil. The rain of San

Domingo transferred, alao, the cultare of indigo to Mritish India, and it. roltare was at the same period abandoned in Brazil. Previously to the revolution in llayti there was exported from that island $76 \times 33,319$ lise.; in 1818 the $\cdot x$ ports fell to alvout $26,00 \mathrm{r}$ in lis.s. and now they do,$\cdots+$ exceed thisty-flive in furty milllons. Hix 1834, the year in which the enaancipation act went lato effect, Jamulca exportel to linghud $18,268,888$ lhs. of coffee; five yarrs later, the ruatityhad fallen to $9,423,197 \mathrm{lbs}$. The decline in thu cultivatior of coffee in thls istand, and the unrestrictel suppl: of African olave labor in Brazil, combined to glive a pewerful impulse to its cu'ture in ihat enipire. Hence, in 1830, the erop reacher ne high us 404,1000 Lags, or $\$ 1,000,000 \mathrm{llis}$. The coffee-growing districts in Hra"il are divlect into Serra Abaxo (beluw the mbuntaius) and Serra Acima (above the mountainy). Tife cost of transporing the coflee from the phatation to mariet is about 2 cents per It.; and the actual cost of production is stated to be about $4 \frac{1}{5}$ ceats per ib. The quantity producel in che eupire, year hy year, is nos officially ascertained; I ut it has been approximated witit sullicient exactuess fur pructieal jurposes.

Coffee was first Imported into the Inited States perted Into the United Stutes from Brazll, ard the from Brazil In 1800, the first Importation consisting of 1809 bagr. From 1809 to 1849 the lmports of coffee Into the Unlted Ststes had Incressed from 1809 bags to over $100,000,000$ libs.; and in 1855 It renchod as high as $135,369,388 \mathrm{lbs}$. The following comparative tabular statement shows the quantiti of ceffee im-
quantitles of flour exported from the United States to Brazil, with the totul annual values of each respectIvely' and the current price of flour per barrel, and of coffee per lb., for each yeur, for a period of eleven years - from 18.44 to 1854 , both lncluslve, showing a greater rate of lincroase in coffee over flour:

| Years, | Coffee to V . S . from Brasil. | Values. | Flour from V . 8 . to Bramil. | Valuea. | Vatue of Coflee per lb. | Value of Flour perbbl. |

| 1854. | 116,794,773 | 10,329,092 | 315,319 | 2,417,685 | $8 \frac{3}{4}$ | 7664 |

Sugar.-A glance at the preceding tables will show in Brazil in respect to tho slave-trade is seen in the that ceffee is the great ataple export of Brazil to the following table, compiled from an American authority : United States, the produce of which is most steadily and rapidy advancing. The aupply will doubtless always be equal to the demand, owing, in a great measure, to the facility and comparatively small expeyse attending its production; while the culture of sugar and cotton depends on contingencles, both temporary and permanent, which nust materiully affect the quantities annually produced. These contlngencies may be briefly stated. The culture of sugar depends as much on the sclence of the manufacturer as on the capital and labor of the planter. Before it can reach the market of Rio, or of any of the other ports of the empire, It requires a vast expenditure of labor, the most assiduous attention, and an outlay of cupital that absorlss fully one half, if not more, of the gross yield. llesides, the abolition of the slave-trade, and the sevelity with which the present laws of Brazil punish those detected in that traffic, must produce deelded effects upon the production of those staples in tho culture of which slave labor is indispensable.
A French work on statistics, recently published, furnlshes the following data relative to the present number of slaves in Brazil: From a publication mado in 1843 by Mr. Saturnino de Souza e Olivelra, chief officer of the customs in Brazil, the number of slaves has been computed at threo millions, who are thus divided as to empleyment :

Slafre in Brazil.
Employed on the estates.
2,500,000
Donsentics .................................. 100,0000
Illred out, and others......................... Y . $^{\prime} 0,000$
Total. $\qquad$ $\overline{3,000,000}$
The operation of the presents rigid measures in foreo

The figures for 1851 evidence the vigilance of tis government in the detection of those engaged in this traffic. It may be remarked, that of the 8287 given for 1851,1006 were recaptured by tho Brazilian cruis. ers, and dectared free.
llow long, under thoso circunistances, sugar and cotton shall continue to lie classed among the staples of Irazil, is scarcely left to conjecture.
Quaxtities and Valezs of Suoar imported into the L'niter states yron Brazil.

Cotton.-As regards the cultivation of cotton, it is well known that several inguperable drawbacke to its extension exist in Brazil. Among these may be named tho ravages of insects, the peculiarities of the climate, and the expense and difficulties attendant upon it transportation from the interior to the coast. Miny years ago, it was abcertained in Brazil that the cotton-plant will not flourish near to the sen, and the plantations have, in consequence, receded further inland, ns well to avold this difficulty as to beek new and fresher lands.

The exportationa of cotton from Braaii in 1843-'44 and 1858-'54 are atated b.- Brazilian official authorities as followa:

| In 1858--64. . . . . . . . . . . . . . . . . . . . | 88,420,820 pounds. |
| :---: | :---: |
| 1n 1843-44. . . . . . . . . . . . . . . . . . . | 26,065,160 |
| tnerease in ten yearn ......... | 2,304,160 |

In 1851-'52 the exportation amounted to $31,983,050$ Lhis., of which quantity Great Britain received 26,881,201 Ibs., Spain 2,291,578 lbs., Portugal 1,896,286 lbs., and France 889,048 libs. Of the total exportations in 1852 -'b3, Great Britain received, as appenrs from the same nuthoritles, 22,5i5,122 lbs., Spain 2,351,279 lhnsa Portugal 2,673,766 lbs., and France 543,611 lhs. The exports to Great Britain from Brazil began in 1781; and from that period to the preaent time the large bulkat leant four-ffths-of Brazillan grown cotton goes to that kingdom,-Comm. Rel. U. S.

The conmerce of Brazil has sustained grent injury from the. wretched state of the currency und of the finances; the vaiue of the former, which consist almont wholly of paper, being excenalvely depreciated and liabie to extreme fluctuations, and the ravenue being inadequate to meet the expendituro. latteriy, however, vigorous efforts have been made to increase the revenue; and it is hoped that in the event of the Innnces being placed on a better footing, measures may also be taken to improve the currency. We subjoin an account of the debt, etc., of the emplre in 1851 : Forefign delht. $\qquad$ harat funded debt, $02,370,000,000$ reir, at exchange Treasury bilin sflust, about $\mathbf{2}, \ldots, 000,000,000$ rels, at exchnago 23d.

6,187,000 exchace 2 ad .

7,540,000 Entimatert amouot of noted in cliculation (mperer money) throughout the empire, $50,010,000,000$ rels

240,000 6,700,000 E2i $\overline{21}, \mathbf{6 0 7},(0+1)$
or, in round numbers, the debts and liabilities of Brazil may lie stated at $£ 20,500,000$ sterimg. The for rign capitai in tho empire is computed to le about s10, 000,000 ateriing.
"The duantity of precious atones shipped la no: very consideratile. In most cases they, se sent to a fosing narket $\mid$ being, in fact, moro valuable in Brazli than in London or Paris. Aquamarines (see Jenyr.) of a very large nizo have been found. In January, 1811, one was found in tho Riberao das Americanas, near the diamond district, which weighen 15 lbs ; nnd in the same place, in the October following, one was discovered weighing 4 lios. Topazes of fine quality, but seldom largo, amethysts and chrysolites, are also articles of exportation; and at times nome tine njecimens of these gems are to be met with in tho jewelers' shops. Ccrrectiy epeaking, there are no trading ecmpanies in Lio do Janeiro; there is a society for etfectIng maritime assurances, hut no other. The Bank of Brazil has hud very extunsive concessiona made in its favor, and ought to be in a $f$ riwhing etate. It has power of issuing notes; and uli iisputed moneys and property of the ileceased sind alsent (mortese anzentes) must be piaced in its hands, and 2 per cent. jer annum charged for thy care and trouble. This, in addition to the interest which migit be olstained for the doposit, would alone, in an active uercantile country, form no inconsiderable sevenue. Specie is prohitited from heing carried coantwise; merchants who wish to deposit cash in one of tho northern ports, where the lurgest purchases are mado, are therefore forced to tako hand biils, and pey a premium for them, varying from 3 to 5 jeer cent. Somo enormous capitais have theen amassed; but generaliy the sieculations of the native unerchants are comfucted on a very linited acale. The legal rate of interest is 6 per cent.; but money can seldom be olstained under 12."-Caznctevugtis Trarrla in South A merica, vol. i. p. 58-59.

River. A river is a current of fresh water flowing in a bed or channel from its monrce to the sea. The term is appropi ted to a conslderabie collection of
waters formed ly the conflux of two or more brooks, which deliver into its channel the anited streams of several vivulets, which have coliected the supplles of several rills trickling down from numberless springs, and the torrents which carry off from the sloping grounds the surplus of every shower.

Rivers form one of the chief features of the surface of this globe, serving us voiders of all that is immediately redundant in our rains and springa, und also as boundaries and barriern, and even as highwaya, and in many countries as plentiful store-houses. They also fertilize our soll by laying ujon our warm banks the richest mould, brought from the high mountaina, where it would have remained uselcsa for want of genial heat.

Riz Dollax ( $n$ corruption of German rrichsthaler, or dollar of the empire). A sllver coin of different values in tifferent countries.-See Coins. By authority of Congress, the value of a rix dollar of Denimark is iut at 100 cente, and the rix dollar of Bremen at ift cents.

Road, in Narigation, a hay or place of anchorage, at some distance from the shore, whither vessels occasionally repair to receive inteiligence, orders, or nec ensary supplies, or to walt for a fair wind. The excellence of a road consists in its being protected from the reigning winds and the aweil of the sea, in having a good anchoring-ground, and being at a competent distance from the shore. Those whieh are not sufficiently protected are termed open roads.

Roads, pathways formed through the country with more or less art and care, for facilitating the transit of individuals, carriages, etc., between different piluces. They are of every variety of form-from rude, narrow, rugged, and unformed paths, carried over mountuis, interrupted ly every petty rlvulet, and almost imprac. ticablo to any but foot-passengers, to smooth, broad, nnd lovel ways, formed of solld materials, winding round or cut throngh momutains, and carried ever swanps and rivers at an imumense expense, and ndnitting of the oasy passage of carriages and of all sorts of gools. The laying out of improved roads, and their construction, forms an linportant part of what is denominated the acience of civil engineering. But us it would be quite foreign to our purpose to enter into any details as to the formation of roads, we shall sutisfy ourselves witi laying liefore the reader the following stntements as to their importunce in a commercial joint of view.

Importance and L'tility of improred Roads.-Next to tho introduction of monoy, and weights and measures, the formation ef good roads and bridges gives the greatest facility to commerce, nnd contributes more 10 werfully, perhap, than nny tiling else to the progress of ..provement. They havo been denominated national veins and arteries; and the latter are not more indispensable to the existence of Individmals than inproved commanicutions are to a hoalthy state of the public economy. It wero vain to uttempt to point out in detail tive various udvantages derived from the easy means of communication. There is not a single district that is nut indebted to othera for a jurgo part of its supplies, evell of some of the bulkient commorlities. Hesides the coals, metuls, minerais, timber, corn, etc., conveyed from one part of the empire to another by sea, inmense quantities are conveyed from place to placo in the laterior ly roads and cminals; and overy improvement edfected in the means of conveyance has obviously the sane effect upon the cost of commoditien that have to be couvryed, as an inprovement in the methods hy which they are raised or manufactured. Wherever the means of internal commanication ure deficient in a country, the inhabitants must unavoidably disperse themseives over the surfaco. Cities wero originuily founded by individuais congregating nore, perhajis, for the snke of mutual defense and protection than for any ether cause. But in countries whore goal government is estabiished, and property is secure, men reart to cities uniy from a sense of tie advantages they afford. The

acaie on which butiness is conducted in them presents facilities that can not be elsewhere afforded for making a fortune; and the extent to which the aubdivision of empioymenta is carried opena a field for the exercise of all sorta of talent; at the same time that it improves and perfecta ail aorts of arta, whether aubaervient to industrious or acientifio pursuits, or to those of pleasure and dissipation. It is this that attracta the aapiring, the induatrious, the gay, and the profligate, to citiesthat fills them with the best and the worat part of the species. The compotition that takea place in a great tuwn, the excitement that is constantily kept up, the collision of so many minds brought into immediate contact, and all endeavoring to outsirip oach other in their respective departmenta, develops all the resources of the human mind, and renders a great clty a perpetually radiating focus of intelligence and invention. There are, however, conaiderable clogs upon the continued increase of cities. The food and fuel made use of by the inhabitants, nud the raw products on which their industry is to be exerted, must all como from the country; and according as the size of a city increases, the distances from which its supplios have to be brought hecome so much the greater, that uitimately the cost of their conveyiance may be so great as to halance or exced the peculiar advantages resulting from a resldence in town. Ilence the impossibility of a large or even a considerable city existing any where without possessing extenaive meana of communication either with the aurrcunding country or with other countries; and hence, too, the expianation of the apparently singular fact, of almost all large cities having been founded on or near the sea, or a navigable river.

The influence that the growth of a large town has upon agricuiture is great and ath cking. "In the neighborhood," saya Paloy, " of trading towns, and in those districts which carry on a communicution with tho markets of trading towns, the husbandmen are busy and skiliful, the peasantry laborious; the land is munuged to the best advantage, and double the quanticy of corn or herbage (articles which are uitimately converted into human provision) raised from it, of whut the same soil yields in remoter and more neglected parts of the country. Wherever a thriving sanufactory finds means to establish itself, a now vegetation springs up around it. I belleve it is true that agriculture never arrives at any considerabie, much less at its highest, degree of perfection, when it is not connected with trade; that is, when the demand for the produce is not increaged by the consumption of trading cities."-Moral Philosophy, hook vi, c. 11. But the fact of their being mainly conducive to the growth of cities is not the oniy advantage which improved roads confer upon agricuiture. Without their aid it would be impossible to carry to distant piaces sufficient auprplies of such buiky and heavy articles as lime, mari, sheils, and other manures necessary to give fuxurianco to the crups of rich soils, and to render those tiat are pour productive. Not only, too, would inferior roads lessen the market fur furm produce, and consequently the quantity ruised, fut a larger proportional number of inorses or other cattle would be required to convey the diminished produce to market. It is plain, therefore, that good roads are boti directly and indirectly a jrime source of agricuitural improvement; directiy; by increasing the quantity and reducing the cost of manure, aud by increasing the quantity and reducing the cost of conveying farm produce to market; and indirectiy, by providing for the growth and indefinite extension of cities and towns, that is, of the marketa for agricuitural prodnce. Increased speed of conveyance is one of the principal advantages that have resulted from the formation of good roads, the invention of steam-packets, etc. Suppose that it takes two days to travel by an uneven, ili-made road between any two places, and that, by improving tho road, tho journey may be nccomplished in one day ; the effect is the same
as if the distance ware reduced one half; and there is not only a great saving of time to travelers, but also a great saving of coat, from the more apeedy conveyance of commodities. This latter is a point of much more imporiance than is commonly supposed. It is not posaible to form any correct entimate of the value of the products that are constantly in the act of being carried from place to place. It is certain, however, that it is very great; and every addltional facility of conveyance, by bringing auch products more rapidly to their deatination, and enabling them to be sooner applied to the purposen for which they ara intended, renders large quantities of capital availabie for induatrious purposea that would otherwise be locked up.--See articles IAilroads and Canals.

Rolling. In Naral language, the lateral osciliation of a vessel. This motion, whieh is often very great when the vessel is running before the sea, endangers the masts, strains the sidea, and loosens the decks at the water-ways; it is aiso liabie to cause the guns to break adrift. When the contre of gravity is too low, the oscillations begin and end violentiy. The changes in the stowage necessury to modify the nature or extent of the roll are made by seamen from experimontal knowiedge.

Rolling Taokle. A tackle or puliey hooked to the weather quarter of a yard, and to a lashing or strap round the mast near the alings or parrel of the yard. The object of it is to keep the yard constantiy o cer to leeward, thereby depriving it of play and friction when the ship roils to windward.

Rope consists of hemp, hair, etc., spun into thick yarn, of which several strings aro twisted together by means of $a$ wheel. When mado very smali, it is calied a cord; and when very thick, a cable. Ali the different kinds of this manufacture, from a fishing-line or whip-cord to the cable of a first-rutn ship of war, go by the geaeral name of cordage.-Siee Cable.

Roses (Oil, Esaence, or Attar of), an oil obtoined by distilling tho leaves of damask roses. It is limpid, of a light orange coior, and has an extremely grateful and jowerful perfume. This, which is tho most expensive article of Oriental luxury, used to be principally made at Tunis and Ghazipore, in India. But though it be still very extensively produced at theso piaces, and more especinily at tho latter, what may be calied the foreign demand for the oil is now almost wholiy supplied by the districts of Eski Zara and Ilassansik, in liulgaria. There tho culture of roses is carried on upon a very large scale. Inasmuch, howover, us it is said to require about 300,000 roses to yieid an ounce of oil, tho quantity produced does not exceed 4500 lbs . in a good, and 3000 lbs . in an ordinary year. The genuine article fetches an enormous price; and is in consequenco very generally, or rather, we shouid say, uniformiy aduiterated. When the aduiteration is effected by means of the oil of geraniums and other fine volutile oils, tho fraud is not easiiy detected oxcept by connwisseurs, unless the foreign matter be in excess. Sometimes it is alioged that attar of roses inas been sold as genuino when above 80 per cent. of other oils was mixed up with it. That which is hawked about tho streets of Constantinopio and Smyrua is sejdom any thing letter than oiive oii scented with roses. Some of the more expert dealers in the article will tell within 2 per cent. the foreign oil in any parcel given them to examine. The valuo of the exports of this curious product from Turkey bas been estimated at from $\$ 400,000$ to $\$ 500,000$ a year,-Blangui, Voyage en Julgarie; II unt's Merch. Mag.

Rose-wood (Ger. Rosenholz; Fr. Bois du rose, de Rhode; It. Legno rodie; Sp. Leno de rosa; Port. Páo de rosado) is produced in Brazil; the Canary Islands; in Siam, whence it is protty largely exported by the Chinese ; and in other places. It is in the highest esteem as a fancy wood. The width of the log imported into thia country averages about 22 inches, 80 that

It must be the proince of a large troe. Rose-wood has alightly Wtterish, somewhat puigent, balsamile taste, and fragrant amell, whence ita name. It ahould be chosen sound, heary, of the deepest color, In tha largent piecen that can loe procured, and of the most Irregelar, knotty grain. The small, Hght-colored, and large ahivered plecen should be rejected. The more diatluct the darker parte are from the purple red, whleh forms the ground, the mone is the wood esteemed. I la uaually cut Into veneers of nine to an inch.-min nunx's Orient. Comwn., ete,

Rosin. This aubotance is olitained from different peclew of fir; as the Pinua abies, aydvestric, Larix, balsamea. It ia well known that a realnoua juice exudea from the I'inus sylreatris, or cummon Scotch fir, whleh hardens Inte tears. The same exudatlon appears in the Pinus abies, or apruce fir. These teare conatitute the antistance called thus, or frankincense. When a portion of the bark la atripped of these trees, a liquid juice flows out, which gradually hardens. The juice has ohtalned different names, according to the plant from which it comes. The Pinus sylvestris ylelds common turpentine; the larix, Venlce turpentine (mee Tunirentise); the baloamea, bulaam of Canada. All these julees, which are commonly distinguished by the name of turpentine, are considered as composed of two ingredients ; namely, oll of turpentine and rosln. When the turpentine ia diatilled, the oll comes over, and the roaln remains belind. When the distllation is contlaued to dryness, the residuum is known by the name of common rosin, or colophonium ; but when water is mlxed with it while yet tuld ind incorporated by viokent agitatlon, the mass in call ad yellow rosin. During winter, the wounde made in the fir-trees become incrusted with a white, brittle subatance, called barras or calipot, conslating of roain united to a amall portion of oil. The yellow rosin, made by melting and agitating thls aulsstance In water, is preferred for most purposes, becsuse It is more ductile, owlng, probably, to its still containIng some oil. The uses of rosin are numerous and well known.-Tnomaon's Chemindry. See Naval Stores.

Rostock, the prinelpal elty of the (irand Duchy of Mecklenburg Schwerin, on the Warnow, about 9 miles above where it falls into the Baltle, lat. $51^{\circ} \mathrm{N}$., long. $12^{\circ} 12^{\prime}$ E. I'opulation In 1837, 18,067. A large falr for merchandise la annually held at Whitsuntide; and there are wool falra at other scasons of the year. Ite outport of Hostock ls at Warnemunde, at the mouth of the Warnow. The depth of water at the latter varies from 101 to 12 feet; lut when the west pier, now in the courae of being constructed, has been completed, It is expected that the depth of wates will be from 12 to 14 feet. The depth of water In the river from Warnemunde up to Roatock is usually from 8 to 0 feet ; so that vessels drawlig more than this muat lie lightened to get up to the latter. Rostock has a grood harbor and commodious quays.

Imports.-The princlpal articles of import are sugar, coffie, and other colonial prolucts; cottons, woolens, and harlware, with conl, earthen-ware, salt, Iron, horsea, etc., from England; hemp, flax, tallow, oll, sail-cloth, etc., from Russia; alum, deals, timber, lime, tar, etc., from Sweden ; herrings and fieh oll from Norway ; wins, brandy, molassen, Ilruga, etc., from France; with rice, rrm, grocerien, etc., from Copenhagen and IIamburg. The total value of the Imports by sea may be estimated at abont $\mathbf{~} 250,000$.

Erporta.-'These consist chiefly of very good red wheat, barley, peas, rapeoseed, and a few oats; with wool, rags of a very superior quallty, oil-cake, rapeooll, bones, etc. The erports of wheat amounted In 1840 to 97.660 quartern, and in 1841 to 124,267 . In 1840, the exporta of peas from Hostock only were 9503 quarters ; but from the duchy they amounted to 48,013 quarters ; but at an average thelr export does not exceed from 20,000 to 25,000 quarters. The export of bonce amounted during the sanne year to $1,500,000 \mathrm{los}$.

At an average, the value of the arports may be eatl mated at $\mathbf{2 3 0 0}, 000$.
Shipping.-The port of Roatock In 1840 had- 230 shlpe, of the burden of 86,882 tons, which trade with mont European natlons, the United Statea, and Brazll. In 1885 there entered the port 540 shipm (burden not atated), of whleh 215 belonged to Macklenhurg, 152 (montly mmall eraft) to Denmark, 83 to Swedon, 27 to Ilanover, 18 to Prustia, 12 to Ruesia, 19 to Itolland, 10 to Labeek, 2 to Hamburg, and 1 aach to France and Euglund. It fe only, in fact, when our portn are open to the Importation of foreign corn that IIritiah ahipa are met with in conalderable numbers in the ports of Mlecklenburg.

Port Charyes.-These are the mame on native and privlleged ships, among which are Incloded those of England, France, Amarien, Prusala, Norwsy, etc. The port chargen on a veasel of $\mathbf{1 0 0}$ tons burden are as follow, viz.:

|  | Priviloged. | Not privilegent |
| :---: | :---: | :---: |
|  | Mix libl. Beh. | Mix Doi. Beh. |
| limward with cargo ........... | 10 g | 10 y |
| Gutward ditto . . . . . . . . . . . . | 23 44 | 32 |
| laward in ballant | 12.6 | 19 |
| Ontward ditto | 1936 | 3110 |
| Dito wlthont either. . | 17 32 | 25 42 |

Duties.-These are extremely moderate, On most Imported artlelea they amount to only 3 per cent. ad ralorem. An export duty of about 5 d. per quarter is charged on corn, and of about $4 a, 8 l$. per hhd. on wlue. Wool la not autiject to any daty on export. Gosods imported in vessels not privileged pay 60 per cent. additional on the uliove dutien that ln, they pay $4 \frac{1}{2}$ instead of 3 per cent. ad ealorem.

Wismar, the second sea-port town of Mecklenlurg, at the confluence of the Wiver Stor with the aca, in lat. $53^{\circ} 49^{\prime} 25^{\prime \prime}$ N., long. $11^{\circ} 36^{\prime} 15^{\prime \prime} \mathrm{E}$. Population 11,000. The harbor of Wismar ls commodious and nafe, belng nearly land-locked by the islands of I'uel and Waliseh. Close to the town there is from 8 to kt feet water: in the inner roaila there ia from $12 t_{0} 13$ feet; and in the outer from 16 to 20 feet water. The port charges on a native or privileged veasel of 100 tons amount to about 80 rix dollars. The artleles of import and export are the sume at Wlamar as at Itostork; but owing te the proxlmalty of Labeck, from which Wismar is not mere than 27 miles distant, her foreign trade is comparatively limited. About 35 ships, of the burilen of 4800 tona, belong to thla port. There eleared from It in 1885227 shljse, of which 11 were Inglish. The dutles at Wismar are some what higher than at lostuck, being $4 \frac{1}{1}$ per cent. ad ralorem on colonial products, snd from $4 d$. to $8 d$. per quarter on corn exported. It is belleved, however, that they will shortly be reduced to the Kostock level.

Trade of the Juchies.-Meeklenhurg ls essentialiy an agricultural, wool-growing, grazing, and breeding country. In son places it is aundy and barren; but It is for the mos. art very fertlle, and the erojis and pastures are both luxuriont. IIaving few manufactures, her imports necessarily conslst principally, as already atated, of manufactured giods, and her exports of raw proluce. Owing, however, to the circumstance of the southwestern part of the province being tounded by the Fille, and approaching to within about 80 miles of Hamburg, almoet all the manufactured goois, as well as a very large proportion of the colonial 1 polucts used liy the population ( 550,000 ), are lingorted by way of Hamburg. Hence, in Mecklenhurg, as in I'russia, the direct forelgn trade carried on by the sea frontier forms but a very small part of the entire trade of the country. It is limposslble, however, to form any preclse eatimate of what the latter may amount to. J'robably there is no Furopean country so little fettered by customs regulations as Mecklenburg. The duties on articles hnported hy sea amount only, as ulready atated, to about 3 per cent. ad ralorem; and those entering by the land frontler aro subject merely to a tri-
filigg charge， 1 ，account of toll，of which wa have not zeen any account．It is imposalbie，indeed，that any commercial syatem ean be bottomed on more liberal principles ；and this enlightened policy，and her situa－ tion nuar the mouth of the Eibe，and on the weatern frontier of tha Pruasian league，give to Mecklenburg fur greater importance，an a commerclal state，than is insilicated by the amount of her population or har in－ ternal consumption．
Rotterdam，on the north bank of the Maeae，in lat． $81^{\circ} 85^{\prime} 19^{\prime \prime}$ N．，long． $4^{\circ} 29^{\prime} 14^{\prime \prime}$ E．Population in $1850,82,000$ ？Rotterdam is the ancond commerclal city of liolland．It is more advantageously situated than Austerdum，belng nearer the see $;$ and the canala
，Liverpool，IIull，Leith，Havre，Hamburg，ete．

Rouble，a Russian coin．（For the silver roullo， see Conss，division Russian；the value of the paper roulile is variable．）Ily the official valuation of tho paper rouble，in the puyment of taxes，a few years since，one silver rouble was equal to three roubles six－ ty copecks paper．Ily authority of Congress，the value of the Russian ronble formerly was fixed at 75 cents．

Rouge（Fr．Fard）．The only cosmetic which can he applied without injury to brighten n lady＇s conn－ plexion is that preparefl，by the following process， from safflower（Carthamus tinctorius）．The flowers， ufter being washed with pure water till it comes off colorless，are dried，pulverized，and digestel with a weak solution of cryatals of soda，which assumes there－ by a yellow color．Into this liquor a quantity of finely－ carded white cotton wool is planged，und then sa much lemen juice or pure vinegar is added as to supersaturate
the sola．The coloring matter is disengaged，and fulls down in an impalpable powder upon tho cotton fila－ ments．The cottun，after being washed in cold water， to remove some yellow coloring partinles，is to be treat－ ed with a fresh solution of carbonate of soda，which takes up the red coloring matter in a stute of purity： Hefore precipitating this pigment a second time by the acid of lemons，some soft powdered tale should be laid in the bottom of the vessel，for the purpose of alsorb－ ing tho fine ronge，in proportion as it is separated from the earbonate of soda，which now holds it dissolved． The colored mixture must be finally triturated with a few drops of olive oil，in order to make it smooth and marrowy．Upon the fineness of the tale，and the pro－ portion of the safflower preclpitate which it contains， depend the beauty and value of the cosmetic．The rouge of the above second precipitation is received
sometimes upon bits of fine-twisted woolen stuff, called crepons, which ladiee rub upon their cheeks.

Row', to propel a boat by oars. Rowing is reckoned the most favorabie application of human strength ; the whole force is, however, not effective on the oar, us the part inside the actual fulerum, which is in the water, acts as a back water. Some nations take short strokes, which they rise up in making; a long stroke sitting, to sny the least, auves much exertion. As the theory of rowing involves the resistance of fulds, It is necessarily defective.

Royal, in Naval affairs, the sail above the top-gallant sail. The term royrd is also applied, in artillery, to a kind of small mortar.

Royal Exchange, London. The foundation of the original editice was laid by Sir Thomas Gresham, June $\mathrm{T}, 1566$, en the site of the ancient Tun prison. Queen Elizabett isited this Exchange in January, 1571, abll by the sound of trumpets her h wald named it the Royal Exchanon.-Hume. This grard fabric was totally destroyeod : The great fire $\ln 1660$, jurecleely a century after its .an icana. Charles Il. laid the foundatlon of the next edifice, October 23, 1667, which was completed by Mr. IItw kesmoo, a pupil of Sir Christopher Wren, in slout three years; and it was repuired and beatatified in 1769. This last also became a prey to a destructive fire, January 10,1838 , and was burned to the ground, with a number of public oftices and adjolning houses. The new Royal Exchange, commenced in 1840, under the direction of Mr. Tite, was opened by the queen in state, accompanled by lier ministers and a grand civic processlon, October 28, 1844.

Ruby, a precious stone, verjं highly esteemed; but under this name a variety of minerals have not unfrequently been sold, whlch differ casentially in their characters. The Oriental ruby is, in fact, a red variety of the sapphire. When perfect, its coior is a cochlneal red, presenting a richness of hue the most exquisito sud aurivaled: it is, however, in general more or less pale, and often mired with blue: hence it occurs rose red, peach-blossom red, and lilse blue, pasuing Into the amethyst. It is harder than any sther minciral, except the diamond. Easily frangitle. Specific gravity from 3.916 to 4.283. Infosible befors the blowpipe. Oriental rubies of 10 carats are extremely 1 are aind valuable. One of 22 grains was sold for $£ 1 \mathrm{c} 0$. Rubies in lots, Indian cut, or sinail sizud, and of different qualities, are at all times to ix hau, and sell at from 15s. to 65s. a carat; lut a perfect atono of a carat, or 6 grains, may be leemed rare, and falls little short of the value of the diamond: nay, in some cases, rubies ef 2,3, n' 4 carsts, If rery fine, are moch searcer, and even mors valuable than diamonds of equal welght. The finest ruby In Engiund, or peohaps in Europe, is in the collection of the late Mr. Hope, the author of "Anastasius." There are two other species of ruby, the spinelle and Baiais. When perfect, the spiaelle Is a gem of great value and scarcity. Its color is a fine full carmine or ruse red, but it never presents that rici, mellow thige that attends the Oriental ruhy. It is also inferior to the latter in hardness and speclfic gravity. Stones of 3 carats snd upwsed are very rare and valuable.

The hichis ruby is a pale variety of the spinelle. It varies in color from light red to yellowish red. Though not bo rare as the spinelle, it la by no means common. It is much admired for its agreeable tinge of color; und, when pure and perfect, fetches a very high price, though considerably less than the other varieties. Rulilea are not found in suy considerable quantity except in Ava.-Mane on Diamond; Thox son'z Chrmisry.

Rudder. A necvy flat plecu or frame of wood, hung upon the stern-post by means of pint es and gucgreons, for the gurpoes of steering the shif. The rudder is turned round the aterm-post as an axla, bjo the tiller, which enter the rudder-hesd. In vessels
drawing much water the rudder in aeep and narrow; in fiat-bottomed veasels it is shallow and broad. Wher carrled to a conskderable breadth, as in the Chinese vessela, it is pierced with holes, which preserves an increased leverage with a diminished direct resiatance from the water. When the rudder is broken off by the alip getting aground, or by a heavy sea, a temporary one is made lyy a topmast and other apers placed paraliel, and loaded at the bottom with plgs and ballast, and confined to the atern-post by hawsers leading on each side of the keel.

Rudder Coat.-A covering of tarred canvas loosely put round the rudder-head to keep the water from entering by the aperture, while it admits of the rudder being turned freely round.

Rudder Pendents,-Strong pleces of rope ending in chains, by which the rudder, if unshipped, is held to the ship's quarter.

Ruclder Shock.-A piece of wood fitting between the head of the rudder and tho rudder-bole, to prevent the play of the rudder in case of the tiller belng removed.

Rum, a well-known and highly eateemed spirituous liquor imported from ths West Indles, of which it forms one of the staple products. It is obtained by means of fermentation and distillation from molasses, the refuse of the cane juice, and portions of the cane, afier the sugar liss been extracted. The flavor and taste peculiar to rum are desived from the easentlal oils carried over in distiilation. When the distillatlon has been carelessly performed, the spirit contalins so large a quantity of the grosser and less volatile part of the oil ae to te unfit for use till it hes attained a considersble age. When it is well rectlied, it mellows turach sooner. Rum of a brownish transparent color, smooth olly taste, strong body and consistence, good age, and well kept, is the best. That which is clear and limpid, and hes a hot pungent taste, is either too new, sixed with other spirits. Jamalca run is the first in joint of quality; the Leeward Island $r \cdot m$, as it is cailed, being always inferior to it, both in flavor, strength, and value. The price of the latter is usually 20 per cent. below that of the former. It is customary, in some of the West Indis Islands, to put slleed jineapples in puncheons of rum: thls gives the spirit the flavor of the fruit; and hence the deaignation pineapple rum. Kum is also proluced $\ln$ snd imported from the Mauritius and the liast Indles; but tiat of the latter Is riore nearly allied to errack than to getuine rum.

We know nothing about the origin of the word rum. or the time at whlch the manufacture of the splrit commenced. At present the manufacture is chietiy carried on In the islands belonging to Great Britain. Ir. Ure states that in Jamaica tite wort ls made by adding together 120 gallond of molasses, 1000 gailons of the spent wash of a former distillatlou, 720 gallons of the skimmings of the sugar toilers, and 160 gallons of water; so that there is in the wort nearly 12 per cent. of solid saccharins matter. Other proportions, however, are used, bringing the proportion of anccharine matter up to nearly 15 per cent. ; as, for instance, 100 gallons of mola-ses, 300 gallons of akimuings, 200 gal . lons of spent wash, and 400 gallons of water. The proportions vary in almost every estate, so that ay certain rule can be laid down. The fermentation is in general conductad very slowly (ajparently very unnecersarily so), occupying from nine to fourteen days. The asccharine matter is, thoreforo, very inaperfectly converted into alcohol, and the yield of spirit is usually so low as 116 gallons of proof-spirit for every $1: 00 \mathrm{gai}$. lens of wash. On some eatatea, and depending on the price of sugar in the market, the greater proportion of the sugar is converted tinto rum; and the sane imperfect fermentation being followed, the average yield is said to be only 240 galluns of rum for every three hogsheads of augar, whereas the proportion ought to be very nearly duuble. It ly from the skimmings, which
are rich in aroma, that the pecnliar flavor of rum is de- | foreign wares, than to native enterprise, for their origin rived; for it is a curioos fact that augar and molasses distilled in this country yield a spirit entirely deatitute of all rum flavor, and in nothing distinguishable from the ordinary apirit derived from graln. Any depth of color may be given to the rum by the addition of molasses or caromel, though it is commonly but ermneously stated that the color of the rum is derived from the oak casks.-See Spinita and Wine.

The manufacture of rum entirely of sugar or molasses is not carried on in Great Britain. The number of gallons of rum manufactured in Great Britain during the year ending January 5, 1854, of a mixture of sugar or molasses with unmalted grain, was as follows:

Expobth of Rum fron the Unejed States for the Yeas endino Jung 80, 185 T .

Rupee, a silver coin current in the East Indies, equal to from 50 to 60 cents. liy anthority of Congress, the value of tho rupee of British India was fixed at $44 \frac{1}{2}$ cents, and the sicca rupes of Bengal and the rupee of Bombay at 50 cents.
Russia. Thls extensive empire comprises the whelo northern portion of the esstern hemisphere, from the froutiers of Posen and the Gulf of Bothula on the west, to tho Pacific Ocean and Behring's Straits on che casi, It inchudes the greater part of the ancient 'ingilom of loland, Finland, Astrakhan, and Kazan, conquered from the Tartars; the Crimea, Iittlo Tartary, Bessarabia, and a portion of Moldavia, taken from t'urkey.

The lusslan empiro embraces nearly one-half cf the surface of Burope. It chiefly consists of an enormous plain, boing littic divorsified by rising ground, except toward the Urals and the Caucasus in the south and east, and in the province of Finland in he northwest. The northern part of the country is a coll and barren region of heatha and marahes ; the ceutral provinces aro rich and fertile; the southern, ware steppea, or brassy, sandy, and salt plains, which afford, however, in their hollows, along tho river-courses, phundatee of "xcellent pasturage for enttle and horsea. The population is chiefly agricultural or nomadio; anil the manafactures that aro to bo foind in some places nre inure indehted to the fostering care of the government, und the high import dutie*, or absolute prohibition of
and continuance. Russia is an immense military power, so far as that depends on the numbers of her armies; but the want of national wealth is such \& drawback on military enterprise as sho has not yet becn able to overcome.
The origin of the Rassians as a distinct branch of the Slavonians is a moot point among archæologista. They scem to have borne at one time the name of Antes, consisting of several tribes that formed a sort of confederation. In the 9th century, Ruric the Varangian established himself in Novgorod the Great; and his successors, extending their dominion by conquest, cstuhlished their capital at Kieff, where the dynasty reached the zenith of its power under Vladimir the Great, who introduced Christianity among his subjects, according to the creed and ritual of the Greek Church, A.D. 983 . His empire was subsequently overthrown by the Poles and Lithuanians, and the greater part of it remained eubject to Poland till the accession of the house of Romanoff. The eastern provinces beyond the Unieper were conquered by Tartars, and remained under their dominion till the 16th century. The city of Moscow was founded by Andrey I. in A.D. 1156. In the middle of the 15 th century, Ivan Vassiliwitz, Duke of Moscovy, recovered his independence, and having subdued a number of petty chieftains, and added the duchles of Tver and Novgorod to his dominions, assumed the title of Grand Duke. His grandson, of the same name, subdued the Tartar kingdoms of Kazan and Astrakhan, and assumed the title of Czar ar Great King.

During the last three centaries the successive dakes and czars of Moscovy and emperors of all the Russias have foliowed the same policy of extending their dominions hy every possible means, fair or foul. They have now declured themselves the heads and protectors of all the Slavonic races, and of the orthodox Greek Church, and seem to make no secret of their deep-laid project of unscrupulous aggrandizement. Their vaat dominlon now extends in length through $202^{\circ}$ of longitude, and in breadth through $38^{\circ}$ of latitudo, and is supposed to contain about $65,000,000$ of inhabitants, of whom five-sixths are in Europe.

The following is believed to be a correct estimate of the extent and population of this vast empiro:

| Natural Divisions. | Area in Engllsh square milen. | Population in 1S52. |
| :---: | :---: | :---: |

Tho rivers of Russia are ucreliy divided into tive groups or systems, correspond:ng to the seas in which they havo their embeuchures; viz., the Arctic Ocean, the Baitic Sen, tho Black Sen, the Caspian Sea, and the Paciffc Ocean. The first division comprises the Dwina, Mezen, nud Petchora, in Lurope; the Oli, Jenisoi, ant Lena, with nunerous other small rivers, in Asia: the three last have n courso of from 2000 to 2500 miles. The rivers which fall into the Baltic, though possesslng much inore commercial importance to lussia, are of inferior magnitude. The princlpal are-tho Neva, which has St. Petershurg at its mouth, the Dana, and the Nicmen. Tho rivers which fall juto the Black Sen aro of
equal importance with thosa just named, and exceed them in length of course and velume of water. The princlpal among these aro the Dnlester, Dnieper, Bug, Don, and Kuban. The Velgs, in the basin of' the Caspian Sea, is the largest and mest important of the rivers of Russia. This extensive river has its sources in the government of Twer, about 180 miles south by east frem St. Petersburg. Its course is about 1000 leagues, while that of the Danuie is only about 450 . It is of vaet importance to the intel :al commerce of Russia. Its affluents, which are connected by aeveral canals with the Neva, establish a communication between the Caspian and the Baltic, White, and Black seas. Twe other rivers-the Ural and the Emba-have their embouchures in the Casplan Sea.

Sfaples.-The producta of Ruasia vary with the difference of soil and climate. Cereals of every kind are raised in great abunciance; but rye, being the cemmen food of the peasantry, is produced in much greater quuntities than any other sort of grain. The most productive provinces are Orel, Kasan, Nijnl Novgorod, Penza, Tambov, and Kursk. The total annual production of grains in European Russia (including P'oland) may be estirated in ordins y years at $1,495,000,000$ bushels, at a value of about si20,416,665. Flax and hemp are also extensively cultivated, and constitute a leading export of Russia. Tobacco is cultivated in the southern provinces, aud of late yeara much attention has been given to the cultivatien of beet-root. In 1848, the quantity of sugar manufactured from this article was estimated at $82,240,000 \mathrm{lbs}$. Tallow and wool are alse important articles in the export trade of Russia; of the latter, tre exports amount aunually to about $18,000,000$ lbs. The climate of Russia is not, however, well adapted to the productien of fine wool; and allbough much attention has been given to the improvement of the breed of abeep, Russia can net enter into competition with Australia in supplying fereign markets with thls article. The quantity of wool furnished by the Cape of Good Hepe colony, from 1840 to 1852 inclusive, was $48,859,748$ lbs. ; furnished by Australia in same period, $256,008,415 \mathrm{llm}$; hy Cape colony, in 1852, 7,772,505 lbe. ; by Austrulia, in 180̆2,

82,500,000 libs.; namber of sheep In Cape colony, 4,496,000; number of goats in Caye celony, $1,093,000$; number of sheep in Russia in Europe, 35,666,698; number of goats in Rusia In Europe, 1,188,173.
Manufactures.-The manufactures of Russia are not generally in a very advanced condition. In some departments of manufacturing industry, however, Russil oxcels all other countries. Every attempt $f$ initste her leathor, especlally such as is used for book sunding purposes, has proved a failure ; and Russin sill continues to onjny, as sho doubtless ever will, an undisputed monopoly' in supplying foreign markets with this valuable production. Her glase manufactures are also highly eeteemed. Single plates have beon manufuctured at the St. Petersburg glass-works which have readily sold for $\$ 3000$. Her other manufactures are sail-cleth, cerdage and canvas, tick, felt, mats, potaehen, sonp, candles, caviar, isingluss, spirits, and some miner articles for demestic consumption. The colton manufactures of Russia have made rapid progress during the past twenty years; and, instead of the vust quantities of cotton yarne formerly imported, she now imports largely of the raw material. In 1832 the quantity of raw cntton - Imported was 116,000 poods ( $4,176,000 \mathrm{lba}$.) ; in 1852 it agcended to $1,748,000$ poods ( $62,928,000 \mathrm{lbs}$.), of which she received from the United States $\mathbf{1 0 , 4 7 5 , 1 6 8} \mathrm{ibs}$. The total manufactures of Russla empley $6,1064,700$ pernons, of which number $4,500,000$ are engaged in the manufacture of flax and lemp. The totul annual value of Kussian manufactures is estimated at about $486,000,000$ silver roubies ( $\$ 364,000,000$ ). Moscow is the grand centre of this branch of industrial pursuits, and is inhabited almost exclusively by manufacturers and artisane.
The following tahle, translated from Russian official returns, will exhihit tho number and character of ma:ufacteries $\ln$ Russia, the number of werknen eminioyed, and the quantity and value of their productions, in the year 1852. It is proper to remark, thast the tuble gives enly the principal manufuctures which enter into the export trade of Russia. Those consumed in tie country, and numeroun miner masufactures, are omitted in tho following sumnary:

The large manufacturing establishments are located iu the government of Moscow. The 1244 factories of this government give employment to 114,628 workmen, the annunl value of whose productions amounts to $\& 33,148,606$. In the gevernment of St. Petersburg there are 477 fuctories, mploying 24,681 workmen; annual value of productions, $\$ 24,728,565$. Before the commencement of the late European war, the foreign commerce of tils vast empire was very extensive. In 1852 the imports reached the sum of $114,778,829$ ailver roubles, and the exprorta amounted to $100,864,052$ siiver roubles. This trads gave employment to 17,162 vessels, measuring an aggregate of $1,659,200$ lasts.* Previous to the war, tha exports of Ruasia from the ports of th: Alach Ione amonuted to $80,000,000$ busheis of grain ar- ..._ly. There is no official or reliable information. ut iand which would indicate the diminution which Russian trade has experienced from the blockading measures of the allied powera. It is certain that not half the usual quantity of hemp, flax, and tallow can pass from the territories of Ruesia. There is at all times a considerable overland trade bcrose Prussia, but the heavy expenses attending the trunsportation of merchandise over this route muet necessarily confine its consmmption to the wealthier classes. The value of coffee, salt, sugar, stc., has been augmented to the most exorhitant figure; and these enhanced prices, with the expenses of land transportation superadded, must, in the event c: prolonged hostilities, $\dagger$ drive these articles out of general use altogether. These are, however, but the nuavoidable effecta of war; and as the phiianthropist must hope that peace ehall soon return, and the channels of commerce be again reopened, so the commerciai statistician must regard these interraptions to the peacefu' 'rade of the world as bat temporary and unflxed, and treat only of the permanent commercial regulations, and relations with foreign nations, of such countries as may come within the scope of his official duties. The commercial relations of the United States with Russia are regulated by the treaty of October 6 [18], 1832. Its stipulations provide for entire reciprocity and perfect commercial equality between the two couniries. It has been observed in good faith by both governments, and lta provisions and spirit fuithfully adhered to. The principal articles of export from Russia are tallow, grain, hemp, and flax ; timber; potashes; lesther ; fox, hare, and squirrel skins; canvas and coarse linen ; cordage, caviare, wax, leinglass; furs, tar, etc. The principal imports are sugar, cotton, cotton stuffs and yarns ; machinery for mllls, factories, etc.; hardwares and iron; coffee, Indigo, and other dye-stuffs ; woolens, oils, spices, wine, tea, lead, tin, cosi, and salt; linens, siiks, etc. The principul porta for foreign commerce are St. Petersburg and Riga, on the Baltic; Archangel, on the White Sea; Ketch and Taganrog, on the Ses of Azof; and Aetrukhan and Bnku, on the Caepian. The interior commerce of the empire has its principal entrepôt at Moscow ; and Kiachta is the centre of the trade with China. This trade with Chins is strictiy one of barter. The interchange takes place at the town named above, lying on the Sulenga, and at some distance from the great lako Haikal. The Russian merchandise and wares are here ior osited In warehouses, which are visited by the Chinese merchanta, with whom the interchange is effected.
None (anys McCulioch, in a work pubiighed in 1854) but native Ruseians are allowed to engage in the internal trade of the country; and hence a foreigner who imports goods into Ruesis must sell them to Russians only, and at the port where they arrive. The merchants engaged in the foreign trade are mostly foreigners, of whom the Engilsh are the princlpal. Every Ruselan carrying on trade muet be a burgher, and have hie name registered in the Burghers' Book. These

[^39]burghers aro diviced inte three gailds. Foreign merchants or gueste are permitted to enroli their nsmes in the city register, on the payment of from $\$ 900$ to $\$ 950$ per annum. The Journal of the Manufactures of the Empire, 1846, publiehed in Ruesia, gives the following information relative to these guilds:

Declared capital of those engaged in cummerce:

| Firsi guild. | \$0,675,000 |
| :---: | :---: |
| Second gulld | 10,273,500 |
| Third gulld. . . . . . . . . . . . . . . . . . . . . . . | 66,691,800 |
| Declared capltal of forelgn merehants . . | 382,500 |
| Total capital Inveated in trado | \$87,022,800 |

In the whois of European Russia nbout $7,000,000$ tchetwerts of grain are employed in the distillation of $64,000,000$ vedros ( $208,000,000$ imperial gallone) of brandy, nearly all for home consumption.
The tarlff regulations of Ruseia have during the past few years undergone several modifications. Under the tariff of 1841, the duties on most kinds of manufactures were equivalent to a prohibition. This tariff was entireiy remodeled in 1850; and In June, 1854, various other alterations and changes wero made, reducing still lower the duties prescribed by the tariff of 1800. These alterations and reductions are given down to the 23d June, 1854, the date of the last change in the Rusalan tariff; for which see Tariffs of Northern Europe, "Russia," Purt II. Prior to the year 1850, there was a separate tariff for Poland; but the imperial ukase, promulgating the tariff of 1850 , observes, in referenco to this kingdom: "In our constant solicitude for tho promotion of commerce and industry, we have jndged it expedient, with a vew to facilitate the interior, as well ns the exterior, relations between our faithful subjects of the emplre of Russia and the kingdom of Poland, to establish a uniform tariff of customa applicablo to the empire and kingdom alike, and to anppress the customs-line which has heretofore separated them." The only other separate turiff now in force in Ruasis is that which appiies to tho ports of the Biack Sea. For the purpose of comparison with subsequent tables, giving the commercial movements of Russia for lacer periods, the following table is annexed, exhibiting tho total commerce of tho empire with foreign countries, by land and sea, from 1832 to 1842, both Inclusive:

| Yonts. | lapports. | Exporta. | Total. |
| :---: | :---: | :---: | :---: |
|  | Franca. | Franca. | Franea |
| 1839. . . . . | 110,387,000 | 255,0,14, 000 | 446,08t,000 |
| 1833..... | 211,984,000 | 285,153,000 | 477,187,000 |
| 1834. | 240, $0.44,000$ | 243,491, 000 | 483,445,000 |
| 1835...... | 245,5-42,000 | $23,720,000$ | 485,2841,000 |
| 1836 | 261,87!, 000 | 804.003, 000 | 605,888,000 |
| 1837 ..... | 277,062,000 | 280,85\%,000 | 657,217,000 |
| 1838.. ... | $273,2100,000$ | 810,018,000 | 00, $, 918,000$ |
| 1831...... | 274,375,000 | 871,843,000 | 643,218,900 |
| 1949...... | 300,706,000 | 324,307,000 | 625,078, 000 |
| 1841...... | 317,7t8,000 | 845,529,000 | 603,247,000 |
| 1849..... | 838,000,000 | 881,100,000 | 06, 01000,000 |

If to the total for 1841 we add for specie inported, and the commerce of Poland and Finland, neither of which is included In the above table-about $100,000,000$ francs in ali - we shali have for that year a general total of neariy $\mathbf{7 6 0 , 0 0 0 , 0 0 0}$ of francs, or $\$ 141,860,000$. A comparison of the Russiat official reports from 1832-'83 (annual average) to 1842 , ne above condensed, shows that the general commerce of Russia has increased; viz., imports $4 f$ _ $z$ cent., exports 22 per cent.
Revenue from cuatoms and other sources is $1839,105,400,000$ $\because \quad " \quad 4 \quad 4 \quad 1840,161,420,000$

The amounts drrived from the diffarent branches of customs in 1841 were,

The following table exhibits in detail the principal fureign merchandise entering into the lmport trade of Russia, and also the value or quantities imported, in the years 1849, 1850, and 1851:

| Deac | 1849. | Inso. | 1861 |

| Machlne | 9,587,271 | 2.074,805 | 2,888,110 |

The augmentation which the official returns of Russia exhibis in cottons, dye-stuffe, wool, machinery, and tools, evince the progressive condition of Russian manufactures. It has already been shown that in 1832 the quantity of raw cotton imported into Russis was only 116,600 poods ; ln 1851 it reached 1,312,356 poods ; and in 1852 it ascended to $1,-48,000$ poods of 36 lbs . aach. In 1845 the importation of cotton yarma (chiefly from Englaud) reached 606,045 poods ; in 1851 this amount fell to 138,065 poods, making a difference of 467,080 poods, or $16,847,280$ lbs. The activity and progress of the cotton manufactures of Russin explain this great Calling off ir the quantity of cotton yarns imported, as the amnual diminution of the letter will be found to be proportionatr to the annual augmentation in the quantity af the former. An analysis of the returns of trade between Ruseia and the United States will also ahow an increase in this quantities of raw cotton imported by the forner, corresponding with the diminished importation of colton yame; our raw cotton suppiying to a great extent the different faciories in Russia. The following table, compied from the United Statee offirial authorities, exhibits tha cuantities and value of this atapie exported to Rusvia diryet from the United States:

| Yoars. | Cotton espurted to Rueda frum United Btaten. | Velan. |
| :---: | :---: | :---: |

In the kingdom of Poland the custom-house receipts amounted to $\$ 993,978$.

The Asiatic commerce of Russin centres at three principal points. Kiachta, at which place the operitions with Clina are conducted, is the most limportant of these. Considerable trade la also proseeuted with the Tartars in Central Asia. Astrukhen, on the Caspian Sen, is the entrepot for thla trade. The land route is from Astrakhan, through a barren and desert country, to Khiva. Stam vessels are now establighed between Novgorod, Astrukhan, the Caucaaian provinces, and Persia,

In 1854 a a steam navigation company was organizel at Astrakhen for the purpose of opening a regular steam communleation between the ports of the Caspinn Sea. Up to 1852 there were but $a$ few small gevernment steamers employed on the waters of the Casplan. The steamers of this new company will offer abundant facilities for commercial movements. Not being obliged to wintor at Astrukhan, they can be kept aflout the entiro year, and thus maintain rogular communications, not only with the trans-Caucasian ports of Russia and the eastern ports of the Caspian, but also with the l'ersian coast.

- This trade in exelusively a trade of barter with the chit-

In 1848 the entire commerce of Russia with Asla is thus aummed up in official returns :

If to the above we add the Enropean commerce of Ruasla, we shall have for that year nearly $710,000,000$ francs, or $\$ 132,060,000$.

The general navigation of Rusaia, for a aeries of years, is found in official returns, as followa:

| Ports of | Veweli eatered. |  |  |  | Femels oloared. |  |  |  |

Tho preceding figurea demonstrate the lnereasing actlvity of Russian maritime commerce. It is proper to observe, however, that the years of 1846 and 1847 are exceptlonal, as the commerce of these years was simulated by circumatances which were, happily, of a tranalent character; and they can not, therefore, form a basis for legitimate comparison. The movements in grain alone, In 1847, augmented Ruaslan exports upward of $\mathbf{6 4 0 , 0 0 0}$ tons, equivalent to an Increase of 50 per cer

The greatest number of ships were English and Rus. sian, viz. : of the former thero arrived 1875 ; and of the latter, 1019. Of ships arrived inder other flags were. Turkish, 978; Dutch, 586; Greek, 444 ; Swedish, 866 ; Mecklenburg, 329 ; Russian, 299 ; Danish, 223; Sardiniun, 210 ; Austrisn, 191 ; a.id of otier nations, 80 ?.

These arrivals and departures were thus distributed in 1852:

Steam Vavigation.-The steam navigation of Russia has largely increased since 1850. In that year there visited the port of Cronatadt 82 eteamers, viz.: From L.ondon, 8 ; IIull, 13 ; Dunkjrk, 7 ; Lăbeek, 26 ; Stettin, 24; Kiel, 2; Havre, 2 ; Total, 82. Two steamers maintain a regular communleation between Riga, Ilull, and Stettin, maki.s monthly, sometines somi-month ly, trips. The frigate-built steamers the Odessa, the Crimea, and the Odessa and Kherson, make annually 33 trips between Odesss and Constantinople, and tine steamer Peter the Great 19 between Odessa and Galatz. Regulsr communication is also kept up between St. Peteraburg and the ports of Finland and of the Baltic; also between Odessa, Kherson, Nicolaief, and other ports in the sonth of Russia. These steamers usually make 104 voyages yearly. Two steamers connect the ports of the Sea of Azof; and commnnication lietween the ports of Russia and those of Persia is regularly maintained by national ateamers. The prospectus of the new Russian Steam Navigation and Trafic Company, the statuten of which received the emperor's sanction on the $3 d$ of August, is puhlished very conspicuously in the Journal de St. Petersburg. This company; which, by the extent of its resources, and by its importance to "the regeneration of the internal and foreign trade of Southern Russin," is regarded as one likely to take rank above all other existing Kusslan companies, will have a capital of six millions of roables to begin with, divided into 20,000 shares of 300 roubles cach. At a future period this capital may be raised to nine millions, by the creation of 10,000 new shares, if agreed to liy a get.eral meeting of shareholders. By the 25 th statute of the company, none but Kussian suljects are capable of holding shares, the laws of the empire prohibiting any foreig iers from taking part in the coasting trade between the Sen of Azof and the Russian Black Ses ports, which is an essential part of the company's undertaking. Like the Russian American Company, it is to be placed under the apecial protection of the imperial government. The objecta of its eatabilishment are defined as being " the development of the trade of Southern Russia, and of the commercial an well as the postal communicatious by steambrats between that part of the eupire and foreign countries."

The company is bound to keep up certain lines of communication. Het ween Odessa sud Constantinople, Athos, Sinyrna, Mhodes, Beyrout, Jaffa, and Alexamdria, ita steamboats are to ply three timea a month, as will as between Odessa, the Sea of Azof, and the C:cassian coast. If it slould bo deemed advisable, boats from Odessa may toueh at the ports of the Crimen, and also at those of the Anstolian coant, befure proceeding to Const intinople, or a line may be established from Odessa, taking in Galatz sud the ports of tho l'rincipalities, and ending at Constantinople.

The company sre bound, moreover, to provide for eighteen voyages in the year from Odessa to Trieate, calling at Constantinople, Syria, the Ionian Islea, and Ancona, as well as for elghteen voyages in the year from Odessa to Marselles, stopping at Constantinopie, the L'iraus, Mesaina, Naples, Leghorn, und Genoa.

The goverpment will cede to the company, at a price to be fixed by valuation, all the ateamboats belonging to the department which has conducted hitherto tha postal and commercial intercourse between the difieront porta of Now Russia, together with the wharves, warehouses, and stores belonging to that department.

The company is to be aided by the government with a subvention, calculated at 60 much per mile, allowed upon the voyage actually made by the compans's vessels. This allowance during the first ten yesrs will be at the rate of 5 roubles 22 kopecks for the levant voyages, 3 roublea 404 kopecks for the Marseilles, and 4 ronbles $7 t$ kopecks for the Trieste voyages; the ullowance for the Black Sea trips will be somewhat lower. After the first ten years the subsidy will decrease reguiarly in each year. Above thia mileage, an annual grant of 64,000 roubles is secured during twenty years.
Commerce with the trans-Caucasian Provinces and on the Caspian Sen.-The trade with the trans-Caucasian countries consists in the importation of Asiatic produce, for which European and colonial merchandise is sent in return. Silk is the principal article of import from this region, and is chiefly deatined for European markets. The transit through Persia, of merchandise destined for the trans-Caucasian countries, is becoming more active each aucceeding year. The establishment of regular steam packets on the Black Sea, ss well as the steamboats belonging to the Volga Steamboat Company, have contributed to make Astrakhan a place of considerable inportance to Russian commerce. The yearly increasing commerce of this port attests the importance of these lines of communication. In $1 \times 56$ tizere was received from trans-Caucasian countries merchandise valued at 954,625 silver ronbles, showing an increase over the imports of the precieding year of 290,432 roubles. This sugmentation is 40 be attributed to the incrensed demand for the silk 0 ! these countries. In 1850 this artiele alone covered 232,$1 ; 0$ ruibles, while the quantity in market in 1849 mached only 69,840. The imports into Astrakhan in 1850 amounted to 453,039 roubles, against 139,094 roublea in 1849 .
From Russian official statistics for 1853, the following extracts are translated :
"The josition of Astrakhan on the Volga, the convenience of its port, and its proximity to the Caspian Sea, are the chief founclations of its commercial importance. The advantage of water transpertation of merchandise over land conveyance, draws to this market the larger bulk of all the trade of the neightoring territury. The imports and exports of Astrakan are thus given for 1853:

> Exportn. ..........................1,190,149 stiver roubtes.
> Exports.
> Total. $\frac{1,478,637}{1,515}$
"This sum is, however, largely angmented, if we add the amonnt of the internal trade, or trade with the neighboring provinces of Astrakhan. Official returns show this trade to inave been in $1853,28,666,732$ fruncs or $\mathbf{8 , 4 4 6 , 7 9 0}$ dellars. The imports at Astrakhan are silk, cottons, dry fruits, and sundries. The exjorts are cutton tissucs, fron, gruins, copper, sugar, tea, ond hides."

Commerce by the Lines of Orenburg and Siberia.The commercin) rovements of Rusaia with ('entral Asia are prosecuted with much ectivity. The value of merchandise exchanged with the Tartars of this por tion of Asia in 1850 reached nearly $6,000,000$ roubles, showing an increase over the total trade of 18.19 of 600,000 roubles. The prineipal injports were ten ( 19,070 joods), which passed through the westeru frontiers of China, smounting in value to 512,482 nubles (equal to b0 cents grer pound nearly). In 185 I this trade maintained still greater sctivity. The value of merchandise imported across the lines of Orenlourg and Siberia reached 31 millions of ruables; and the exchangea, consisting of cotton and woolen cluths, louf.
sugar, raw and tanned hides, amounted to 2,746,822 roubles. This exhibite an increase over 1850, viz.:

| Imports from ('hina by the Prontterd of Oren- | Sliver Roubles. |
| :---: | :---: |
| burg and slberia .. | 210,404 |
| Exports to Chlaa by the frontiers of Orenburg and Silberia. | 3,602,602 |

The principal imports were black and other tens ( $755,830 \mathrm{lbs}$. , valued at $\$ 437,891$, or nearly 58 cents per pound), raw and spun cotton, etc.

Commerce with China at Kiachta in 1851.-This trade, as already remarked, is atrictly a barter of nerchandise. It takes place from the 6th of Fehruary to the Gth of April each year. In 1851 the export trade consisted of woolen clotha, value $3,267,053$ silver roubles ; cotton cloths, value $1,193,713$ silver roubles; Russian leather, 240,933 silver roubles; corals, 259,527 silver mubles; making a total of $4,901,226$ roubles, or $83,720,920$. The imports (merchandise received in barter) were teas ( 122,839 cheats and 26,289 amall packages). For the Interior of Ruseia there were Juported at Kiachta 121,249 half cheats, and 30,849 small packages of tea. The duties levied on theso imports at tise Kiatcha custom-house amounted to $4,685,433$ roubles, or $\$ 3,504,076$; an excess of $\$ 280,560$ over the receints of 1850 , and of $\$ 615,225$ over those of 1849 . The duties, cost of transportntion, and other incidental expenses between Kiachta and Moscow, nmount to about 100 per cent. on the original cost. This would nake the cost price of tea in Moscow 81 per pound. The profit, however, is realized on the merchandise bartered, on which high and arhitrary prices are usually fixed. The tea in small packages is consumed in Siberia.

Offichal returns, received since the aioove was prepared, afford materials for bringing down a report of trade at this important point to a later period. From these it appears that the number of chests of tea (black and green) deposited by the Chineso merchants at Kiatcha during the trading senson of 1852 reached 100,000 . There also arrived 1000 packages for consumption in Siberin. The number of pounds per chest varies; they average, however, ubout 60 lbs . to a chest of llack tea, and about 90 lbs . to the chest of family tea. Besides tea, the Chinese nlso exchange sugar and sugar-candy; hut those articles are usually consumed ir the vicinity of Kiachta.

Of lnte years the Russian tradera have derived immense profits from the barter of velvets and velveteens, which are in great demand among the Chinese.

Tho trade of 1853 prosented some novel festures. The announcement that 180,000 chests of tea wero in transitu for Klachta throw the market, at this point, into the greatest confusion. The merchants received wcekly adrjces as to the state of the market at Moscow, and the great decline which teas had experienced at that time left no alternative to tho merchants, in view of the heavy arrivals of teas daily expocted, than to raise the prices of Russinn merchandise 50 per cent. Any other course would have anniliilated the profitable trade se long carried on at this place. The arrivnls, however, did not exceed 67,000 chests, and tho market maintained its usual tranquillity.

General Summary.-The following summary of the navigation of the different ports of Russia, In 1851 and 1852, is alstracted from official returns:

| 18\%\%.-V'easets arrived. | 7,325 |
| :---: | :---: |
| * 4 cleared. | 7,848 |
| Total tonnage, fast | 700,300 |
| 1852.-Veanels arrived | 8,05\% |
| $4{ }^{4}$ cleared. | 8,507 |
| Totat tonnage, fast | 708,900 |

Navigation of the Volga in 1852.-The importations at Rybinak, hy the Volga, in 1852, reached in value $875,449,000$ francs, and the exportations $101,621,000$ francs. The excess of exports over imports is explained by the faot that Rybingk exports by watar only, and imports by land ns well as by water. The returns of imports by land are inaccersible to the etat-
istician; but it la supposed that they would equalize the values of the imports and exports of this inarket. Rybinok la one of the most important markete in the interior of Russia. In the import trade there are employed 32 ateamboata belonging to the Volga-Kama Steamboat Company ; 681 canal-hoats ; and 3141 barks, flat-boats, etc., propelled by sails and oars.
The export trade of Rybinsk (i.e., the re-exportation of merchandise) employs: By the Volga, 3765 vessols of - 11 kintla; Mologa, 1ä7y; Sheksna, 2221; total, 765.

Steam Company of the Volga.-Frmm the report of the general meoting of this company, held 2ith February [11th Ma mh ], 1852, the information is gleaned, that the company was organlzed in 1843 with a capital of $1,300,000$ raubles ( $\$ 975,000$ ), divided into $620{ }^{\prime}$ shares of 2.50 roubles ( 818780 ) each; that it now owns (in 1852) five iron steamers, which navigate the Volga; namely, the Sampson and the Herculec, each of 77; the Kama, of 50 ; the Volga, of 42 ; and the Oka, of 17 horse-power. Besides these, the company owns ninoteen barks and threo large bateaux. The capital invested In property (vegacls, etc.) amounts to $1,200,000$ roubles ( $\$ 900,000$ ). In 1852 the company received for freights 334,805 mubles 90 kopecks ( 6251,104421 ), besides 3215 roubles 60 kopecks ( $\$ 241170$ ) interest on capital invested, which brings up their total receipts to 338,021 roubles 50 kopecks ( $\$ 253,516121$ ).

 Net recelpts duriog the ycur ... $155, \stackrel{153}{ } \quad 05=110,237$ 2si This net amount was thus distributed:
To stockholdera, at 20 roubles per Roubloe. Kopecks. nollars. Cis.

Extra Duties.-In addition to the rates given in the tariff, special duties are levied for tho benefit of citios, etc., as follows:

At the I'ort of Archangel.-For the benefit of the town, $\frac{1}{2}$ per cent. on the value of all imports and exports.

At Odessa.-For the lencfit of the town: On wheat exported hy sea, 1 cent per 53 bushels. For the benefit of the lyceum, 1 名 cent per 59 buahele, on all kinds of corn exported.

At the Port of Taganrog.-For tho bencfit of the city : On all merchundise passing through the scales, imported, $\frac{1}{6}$ cent per 36 lbs . Exported, $\frac{3}{16}$ cent per 36 libs. On wines imported, ${ }^{3}$ cent per 24 gullens.
At the Port of Mariopol.-For the benefit of the city : Imports, \& cent per pood, dry messure; it cent per pood, liquid measure.

St. Petersburg.-lor the bridge on the Neva: On all imports, 2 per cent. on amount of duties.

Moscow.-For a sinnilar purpose to the foregoing: Ou oll imports via St. Petersburg, 2 per cent. on amount of duties.

Tho custom-houses of St. Petershurg, Archangel, and Riga nliow foreign goods, imported by privileged merchants, to remain in hond without paying duty, or to be re-exported, during twelve months; if imported by others, six months.

Progress of Cotton Manufactures in Russia.-It has already been remurked, that the manufacture of cotton in the Russian empire is progressing with extraordinary activity. Tho nunber of spindles in Russia excecils 850,000 , producing annually upwurd of $10,800,000 \mathrm{lbs}$. of cotton ynrns. The manufacture of cotton velvets, especially, is becoming highly import-

[^40]ant $t_{0}$ the direct trade between the Uniter, States and Rusnia, the raw material being almost exclusively supfiled, either in the direct or indirect trade, by the former couniry. Formerly eotton velveta were supplied to the Chineae oxcinsirely by the British. The Chiseae now prefer the Ruasian manufncture; hence it has become a leading staple of barter at the Russiofrontier markets of China.

No foreign nation is allowed to particlpate in tho cossting or Internal trade of Russia-Ordinance, September 9,1845 . The treaties between liassa and other maritime statea all contain the same terms as that botween Russia and the United Stat 3 of December 18, 1832 ; viz., the veasels of friendly nationa, with cargoes In liallast, are to be regaried quite $2 a$ the domentic, as to export or inport, Ex, to port of sile dutles, or

 from the United Stat- a $6,1+1$, tageously imported cc on, ins:+4, $a^{\prime} n^{2}$ ice.

The following table exhltits the quentitios of raw and spun cotton Imported into Rubsia during the years designnted:

Russia
It. Cuojo , Sp. Nhuscou denaminat mation said manufnetur ried ou in Moscaw an a strongly a powerful
this region. The settlemen's originated with an association of merchauts, formied at Irkutak, who obtained from the Emperor Proul the exclusive privilege of treding for peltries in the Aleutian Islands and adjacent coasts. This rivilege was extende. by the Emperor Alexander over all Hassian Ame, ica, and the charter was repewed 'y Nicholss w 1849. The cap!tal and priscipul factory was irst tatablished at Kow a'ik, but the increasin scarcity of sea otters led the thon governur to lay the foundation of New Archat. gel, which has a .Jw become the chlef deput. The Fris. sian dnminion over the vast solitudes of the interfor is only t. minal: the interior, indeed, is a terra stoogni'a, und inhabited by tribes who scarcely kusw the name of their lords. At the present day the Russians occupy oniy the isla is on hib coast. New Archangel, the cupital, is siluated on the island of Sitka, in lat. $57^{\circ} 30^{\prime}$ N., and long. $135^{\circ} 13^{\prime} \mathrm{W}$. It is a town of some 1000 inhabitante, and contalns the Boarda and warehouses of the company. The whole country is nuder the surveillance of a governor, who derives his anthority from the company at Irkutsk. The total popuistion of Russian America is catimated at 60,001$)$ or 70,000 , including aborigines. The commerce of this country is chiefly confined to the exportation of furs to Canton, and the import of provisions and agrioultural supplies from the Puget's Sound Agricultural Company. It is of little value, being less than $\$ 300,000$ a year, and is constantly declining, consequent on the decline of the seal and otter. Bodega, on the coast of California, was formerly a Russian settlement. The British lease the continental part of Russian America for hunting purposes.
Shipping and ship-huilding are considerably increasing in Finiand. The causes are to be sought in the increasing commerce and the general prosperity of the country, in the high prices which have been puid in the last years for the principal exports-wood articlesespecially in Southern Europe, and in the high freights paid by foreigners for the employment of Finnish vessels. To encourage shipping and ship-building in Finland, the Russian government has allowed that all materiala and articles which are used in ship-builthing, and are to be had cheaper in foreign countries, may be inported into Finland freo of duty. Ancrican improvements in ship-building have, in part, already been introduced, and will probably be more generally adopted.-Comm, Rel. U. S.

Russia Company, a reguluted company in Great Britain fur conducting the trade with Russia. It was firat incorporated by clarter of Philip and Mary, sanctioned by act of Parliament in 1566 . The statute 10 and 11 Wiiliam III., oh. G, enacts, that every British subject desiring admission into ' e Russie Company shall be admitted on paying $£ 5$; and every individual admitted into the company conducts his business entirely as a privata adventurer, or as he would do were the company abolished.
Russia Jeather (Fr. Cuir de Russie; Ger. Juften; lt. Cnojo di Russia; Pol. Jachta; Russ. Juft, Youft; Sp. Wuscovia), the tanned hides of oxen and other kine, denominated by the Russians youfts, or $j u f f s-a$ desig. nation said to be derived from their being generaliy manufactured in pairs. The business of tanning is carried on in most towns of the empire, but principally at Moscow and St. Petersburg. Russia leather is seft, has a strongly prominent grain, \& great deul of lustre, and a powerful and peculiar odor. It is principally either
red or Msck: the former is the best, and is largely used in this and other countries in took-binding ; for which parpose it is euperior to overy other material. The black is, however, in very extensive demand in Rnssia, large quantities being mude up into boots and shees. The process followed by the Russians in the preperation of this valuable conmedity has been frequently described; but notwithatanding this circumstance, and the fact that foreigners have repeatediy engaged in the business in Russia, with the intention of making themaelves masters of its details, and undertaking it at home, the efforts made to iutroduce the manufacture into other countries have hitherto entirely fuiled. One of the best tests of genuine Bussia loather is its throwing out a strong odor of burned hide upon being rubhed a little.-Ricand, Traite Général du Commerco, tome i. p. 275, ed, 1781.
We extract from Mr. Borrisow's work on the Commerce of St. Petersburg the following details with respect to this article: Russia leather forms one of the priacipal export commodities of St. Petersburg. But since the ports of the Black Sea have heen opened, the exports of leather from this port have considerably de reased; Italy, the principal consumer, supplyin $\because$ it 0 , ants from Odessa and Taganrog more easily, r. ... $\%$ ar expeditiously than from St. Petersburg. ich eport:ttion from the latter is to Irussia. 's. 196 F :- ${ }^{\text {d }}$ Englana. Frankfort-on-the-Maine ar juic:, igreat
 account of the fairs held in they: al $1, \frac{3}{6}$ ara never bought on contract, but alwo: un $2 l_{\text {a }}$ pos at cash prices. It nevertheiess often brinea sat gents-in order to secure a lot of juffe, in : a ce. . .ins sam in advance, and settle for the an: $\cdots$, at ine first market prices ; no prices beitrg tixed io s. in as of Jannary, February, Diarch, and sometin. - vrit A pril. Juffs are assorted or bracked when recciv 1 , according to their diferent qualities, into Gave, Rusval, Malja, and Domashna. The three first aorts are again divided into heary and light Gave, heary and light Rosval, etc. Domashna is the worst, and censequently the oheapest cort. It often happens that jufts are bought unassorted, and then the prices are regulated according as the quantity of Domashna cortainod in the lot is greater or less. Persons well acquainted with the nature of Russia leather prefer purchasing it in this state. Juffs are sold by the pood, which consists, as it is commonly expressed, of $4,4 \frac{1}{4}, 4 \frac{1}{3}, 5 \frac{1}{4}$, and $5 \frac{1}{3}$ hides. By this is understood, that so many hides make a pood, cnlculated upon the whele lot; and it is to be observed that the lightest juffs are esteemed the best in quality. Heavy juffs, or those of 4 and $4 \frac{1}{2}$ hides, are shipped for 1taly: the Germans, on the contrary, profer tho lighter sort. Juffs are packed in rolis, each containing 10 hides; and from 10 to 15 of those rolls are packed together in a bundlic, which is well socured by thick mutting. There are red, white, and black juffs; but the red are uost in demand. Their goolness is determined by their being of a high red color, of equal size, and unmixed with emnll hides: they must also be free from holes, well stretched, and equally thin. In a wellfinished iot no thick head or feet parts should be found. If spots resembling flowers are seen on the red hides, it is an additional sign of their good quality, and they are then called bloomed juffs. The inside should be clean, soft, and winte, and, when taken in the hand, shonld feel clastic. The best connoisseura of Russia leather can nearly determine the quality by the smell alone. Great attention must be paid, in shipping juffe, to secure them from being wetted, as damp air alone is sufficient to injure them. Sixty rolls of jufts make a last; 88 peods net weight, when shipped for Italy, make a last; and 44 noods a ton. The exports of juffs from Russia in 18.41 amounted to 177,838 poods, and 150,951 pleces, worth together $1,538,191$ silver roubles.

Rye (Ger. Rogken, Rocken; Du. Rog, Rogge; Fr.

Seigle; It. Segale, Segaln; Sp. Centeno; Russ. Roseh, Sel, Jar; Lat. Secalo), according to some, is a native of Crete; but it is very doultful if it can now be found wild in any country. It has leen cuitivated from time innemorial, and is considered as coming nearer in its properties to wheat than any other grain. It is more common than wheat in many parts of kurope, leing ab more certain crop, and requiring lest culture and manure. It is the bread cerm of Germany and Kusein.Lounon's Eincye. of Agriculture.
lye is supposed by mome authoritien to be a nativo of the Caapian Cnucasian desert $\mid$ and has been cuitivated in the north of Europe and Asia from time intmemorial, where it constitutes an importunt articie of human subaiatence, heing generally mixed with Lariey or wheat. Ita introduction into western Europe is of comparatively recent date, as no mention in made of it In the Oriue Sanitatis, puliisked nt Augaburg in 1485, which treats at leagth of barley, millet, oats, and wheat.

The production of rye has decreased $4,457,000$ bushels in the uggregate; but in New lork it is greater than in 18.10 by about 40 per cent. Pennsyjvania, which is the largest prollicer, has falien off from $6,613,373$ to $4,805,160$ buthels. Perhaps the generul diminution in the guantity of this grain now produced may be accommed for by iupposing a corresponding decline in the demand for distilling purposes, to which a large part of the crop is epplied
Expoeta op Rtk anginall Gainn pmon that ivitmb Stateb jor tifr 'iear endino dexf Mo, 1SK6.

Wye was cultivated in the North American culonies mon after their nettlement by the Englinh. Gorges speales of it as growing in Nova Scotia in 1622, as well ta of bariey und wheat. Plantagenet enumerates it among the productions of North Virginia (New England) in 1 G18, and nlludes to the mixing of it with
maize in the formation of bread. It wha also cultivated in South Virginia by Sir William Berkeley previoua to that year.

Geogruphically, rye and barley associate with one another, and grow upon soils the mont analogous, and in aituations alike exposed. It is cultivaiad for lrend in corthern Asia, and all over the continent of Eurpe, partioulariy in Ruable, Norway, Donmark, Sweden, Germany, anil Joliand; in the latter of which it is much eniployed in the manufacture of gin. It in alao grown to some extent in England, Scotiand, and Wales. In this country it ia principaliy restricted to the Middle and Eiatern States, but ite culture is giving jiface to more profitable erops.

The threa leading varietlea cuitivnted in the United States are the Spring, Winter, and Southern, the latter differing fron the others only from diagimilirity of cij mate. The yicid varies from 10 to 30 , or more, bushels per acre, weighing from 48 to 56 liss, to the bushel.

This grain has never entered largely into our foreign commerce, as tio home consumption for a long perioi nenriy kejt pace with the aupply. The amount exported from the United States in 1801 was 392,276 bushels; in 1812, 82,705 buahele; in 1813, 140,136 busheis. In 1820-'21 there were exported 23,523 bar reis of rye flaur ; in 1830-'31, 19,100 barrela ; in 1810 ' $41,44,031$ barreis; in 1846 -' $16,88,530$ barreis; in 1846-'47, 48,892 barrols; in 1850-'51, 44,152 barrels.

During the year ending June 1. 1850 , there were consumed, of rye, alout $2,144,000$ buabeis in the manufacture of mait and spirituous liquors.

According to the census returne of 1840 , the product of the country was $18,6 \cdot 15,567$ bushels; in 1850 , $14,188,637$ bublels. Of this amount there was exportted from New lork $\$ 2,022,383$.

Gable (Ger. Zobel; Fr. Zibelline; 1t. Zibellino; Kuks. Sohol), an animal of the weanel tribe, found in the northern parta of Aslatle Rusia and Ainerlea, hunted for the sake of lta fur. Ita color la generally of a deep glossy brown, and sometimes of a lino glossy black, which is most esteemed. Sable sking have sometimes, though very rarely, been found yellow, and white. The fluer norts of the fur of sables aro very acarce and dear. A single skin of the darker color, though not abovo four inches broat, has been valued as high as 60 . The sabio (Mustela zibellina, Llnn.) is principally a nativo of the northern regions of Asial it is hunted and klllod for the Russian markst, either by a single ball, a blunt arrow, or traps, by exiles or soldlers sent for that purpose, in the deserts of Siboria. The skin is in the highest peefection froun Nevember to Fobruary, A nearly allied animal, called the "fisher," Inhabits North Amerlea, and is similarly sought after and destroyed for Its fur.-Sec Fun Tbadi.

Gaddles (Fr. Selles; Ger. Sattel; It. Selle; Russ. Sülla; Sp. Selles), seats adapted to horses' backa, for the convenience of the riter.

Bafllower, or Bastard Eaffron (Ger. Saffor; Du, Safther, Basterd Saffran; Fr. Cartame, Saffran baturd; 1t. Zaffrone; Sp. Aluzor, Azafian bastardo; liuss. Polr rooi, Prostoi schafran), the flower of an annoal plant (Carthamus tinctorius, Linn.) growing in India, Egypt, Anerica, and some of the warmser parts of Europe. It is not easily ilistinguished from saffron by tho eye, but it has nothing uf its smell or taste Tho tlowers, which are sometimes sold under the name of saffranon, are the only parts employed in dyelng. They yield two sorts of coloring matter: uno soluble in water, and producing a yellow of tut littlo beauty; the other is resinous, and best dissolved by the fixed alknlies: it is this last which alone renders safilower so valuable in dyeing; as it aflords a red color excectlug in delicacy and beauty, as lt does in costliness, any which can be obtained even from cochincal, thuugh much infcrior to the lattor in durnbllty. Tho color of saftlower will not bear the action uf soap, nor even that of the sun and alr for a long tlme; and being very costly, it is principally einployed for imitating upon silk the fino scarlet (ponccau of the French) and rose colors dyed with cochincal upon woolen cloth.

The fine rose color of safllower, extracted by erystallized sola, precipltated by cltric acd, then slowly dried, and ground with the purest tale, produces the beautiful rouge known by the name of rouge régetale. Saffiower should be chosen in fiakes of a bright plink color, and of a smell somowhat resembling tobacco. That which is in powder, dark-colored, or oily, ought to be rejected.-llasscicuulst's Voyages, Engl. ed. p. 352; Bancrort's Permanent Colors, vol. i. p. 280-289; MituUns's Orient. Commerce.

Bafiron (Gor. Saffran; Du. Safran; It. Zafferano; Sp. Saffron; Fr. Azafian; Russ. Sckafran), a sort of cake prejared from tho stiguas, with a proportlon of tho style, of a perennial bulbous plant (Crocus sativus, Linn.). When good, saffron lias a sweetish, penctrating, diffusivo odor; a warm, pungent, bitterish tasto; and a rich, deep orange-red color. It should be chosen fresh, in elose, tough, compact cakes, moderately moist, and possessing in an obvlous degreo all the above-mentioned qunlities. Tho not staining the fingors, the making them oily, und its being of a whltish ycllow or blackisli color, indicate that it is ball, or too old. Snffron is used in medicine and in tho arts; but in England the consumption seems to be diminishing. It is employed to color butter and cheese, and also ly painters and dyers.-Tromson's Ihepensatory; Lovnox's Eincyclopedia of Agriculture.

Bagapenum (Arab. Sugbenu), a conereto gumresin, the produce of als unknown Perslan plant. It

Is Imported from Alexandria, Smyma, etc. It has an odor of garlle, and a hot, acrld, bittorish tasto. It is in agglutlnatud a pe or inasses, of an olive or brownlah yellow coler, sllghtly translucent, and hreaking with a horny fracture. It softens and la tenacleus between the fingers, melta at a low heat, and burns with a crackliag nolse and white flame, giving ont abundanco of sinoke, and leaving behind a llght spongy charcoal. It ls used only In meillelne.-'Tr:omson's Diepensatory.

Eago (Malay Sagn; Jav, Sagu), a speclea of meal, the produce oi' a palin (Metroxylon Sayu) indigenous to and abundant In such of the Eastern Islande as produce splees, where it supplies a princlpal part of the furinaceous food of tha inhabltants. It ie produced in China, Japan, Molucea, and the South Sea Islands. The tree, when at maturity, is about 30 feet high, and from 18 to 22 Inches fu dlameter. Before the formation of the fruit, the stem conslsta of an external wall about two inches thlek, the whole interlor belng fillod up with a sort of spongy medullary matter. When the tree attalns to maturlty, and the frult la formed, the stem ls quite hollow. Being cut down at a proper period, tho medullary part ls extracted from the trunk, and reduced to a powder like saw-that. The filmments are next separated by washlng. The meal is then laid to dry ; and, belng made Into cakes and baked, is eaten by tho lalanders. For exportation, tho finest sago meal is mixed with winter, and the paste rubbel into smal grains of tho size and form ot coriander seeds. Thls la the species principally bronght to England, for whleh market it shonld be chosen of a redilish hue, and readily dissolving In hot water Into a fine jelly. Within these faw years, however, a process has been invented by the Chluese for rellining asgo, so as to give it a fine pearly lustre; and the sago so cured is in tho highest estimation in all tho markets. It is a light, wholesome, nutritlous food. It is sent from the Islands whore it is grown to Singapore, where it is granulated and bleached by the Chinese. The export trade to Elurope and India fs now principally confined to that set-tlement.-Ainslik'a Mat. Indica; Crawford'a East. Archipelago; Bell's Review of the Commerce of Bengal.

Gahara, or the Great Desert (Arab, Zahra), a vast reglon of norihern Afrlca, extending between lat. $16^{\circ}$ and $33^{\circ} \mathrm{N}$., and long. $17^{\circ} \mathrm{W}$., and $23^{\circ} 10^{\prime} \mathrm{E}$. Bounded east by Egypt and Nubla, south by Senegambia and Nigrltia, west by tho Atlantic, and north by Barbary. It consists of an elevated table-land, covered with large block sof stone, hard-baked carth, gravel, and loose sanil; and in many places it is incrusted with salt. It is the grentest desert on tho glohe, but numereus oases and habitablo spots are scattered over its surface, the largest of which are Gadames and Tuat. It is trnversed in many directlons liy caravan rontes; travelers on which undergo the most intense suflerings from thlist, and from exposuro to the simoom, or hot, dry wind from the south and east, which usually lasts 10 or 12 hours: during its continuance the uir ls impregnated with finu snnd, nut tho sun is bnrely perceptible. Kain appears to fall in torrents at intervals of 5,10 , or 20 yenrs, and many places of tho desert bear evidence of lts action even for a much longer period. The heat is excessivo turing the summer, but in whinter the evenings are cool, nad durligg night frequently cold. Palm-trees grow on the borders of the Sahara, and the chicf products of its oases are dates and gums.

Bail, in Narigation, an assemblage of severnl breadths of eanvas sewed togother by the lists, and edged round with cord, fastened to the yarils of a ship to make it drive before the wlnd. Tho edges of the cloths or pieces of which a sail is composed are gencrally sewed togethew with a doulle scam, and the whole is skirted round the edges with a cord, called the bolt-repe. Although the form of sails is extremely different, they
are all, nevertheless, trianguiar or quadrilateral ifgures ; or, in other words, their surfaces are contained either between three or four sides. The former of these are somstimee spread by a yard, as lateen sails, and otherwise by a atay, as atay-aaila, or by a mant, as shoniler-uf-mution aails; in ail which casea the foremost loech or edgo is attached to the sald yard, mast, or stay, tirroughout Its whole length. The latter, or these whicin are fonr-sided, are either extended by yards, as the principal yards of a ship; or by yards and booma, as the studding-sails, drivers, ring-tails, and ail thome saila which are set occasionaliy; or by gafis and booma, us the mainsails of sloops and brigantines.

Sail is almo a name applied to any vessel seen at a distance under sail, and is equivalont to ship.

To set sail, is to unfurl aud expand the saila upon their respective yarda and atays, in order to begln the aetion of salling.

To make aail, is to spread an additlonal quartity of sail, so as to increase the ship's velocity.

To shorten sail, is to reduce or take in part oi the sails, with an intention to diminish the ahjp's velocity.

To strike aail, is to lower it suddenly. This is partieularly used in saluting or doing homage to a superior furce, or to one whom the law of nations acknowieriges as superior in certuin regions.-See Bluxt's Coast JiLut; Illest's Ship-mastor's Assistant, New York, 1807 ; Bow pitch's Narigution.

Bailing, tho movernent by which a vessel ia wafted aloug the surface of the water by the action of the wind upon her salls. When a ship changes her state of reat to that of ravtion, as in advaucing out of a harbor, or from her station at anchor, she acquires motion very gradualiy, as a body which arriven not at a certain velocity till after an intinito repetition of the action of lts woigit. The first impression of the wind greatiy affects its velocity, because the reaistance of the water might destroy it: since the velocity being but amall at first, the reastance of water which depende upon it will be very feebie. But as the ship increases ber motion, the force of the wind on the sails wili le dininished; and, on the contrary, the reaistance of the water on the bow will accumniate in proportion to the veiocity with which the vessel advances. Thus the repetition of the degrees of forco, which tho action of tho sall adds to the motion of tho ship, is perpetuaily decreasing; while the new degrees added to the effort of resistance on the bow are always angmenting. The velocity is then accelerated in proportlon as the quantily added is greater than that which is sultracted; but when the two powers become equal, when the impression of tho wiad on tho sails has lost so much of its force as only to act in proportion to tido upposite impulse of resistance on the bow, the ship will then aequire no adilitional velocity, but continne to saij with a constant, uniform motion. The great weight of the ship may, indeed, prevent her from acquiring the greatest velocity; but when abo has attained it, she will advance by her own intrinsic motion, wil hout gaining any new degree of velocity, or lessening what ahe has acquired. She moves then by her own pmper force in racuo, without being afterward aubject either to the effort of the wind on tho sails, or to the resistance of the water on tho bow. If at any time the inspulsion of the water on the bow should deatroy any part of the velocity, the efliort of the wind on the sails wili revive it so that the motion wili continuo the eame. It must, however, be observed, that this state will only subsist when these two powers act upon each other in direct opposition, otherwise they will mutualiy destroy one another. The whole theory of working shipe depends upon this countor action, and the perfect equality which should subsist between the effort of the wind and the Impulaion of the water.
The effect of asilling is produced by a judicious arrangement of the sails in tho direction of tho wind. Accordingly, the various model of eailing are derived
from the different tegrees and situations of the wind with regard to the course of the vessei.

Satiling niso implies a particular mode of navigation, which is formed on the prineiples and regniated by the Jaws of trigonometry. Hence we any, Plaln Saliing, Mereator's, Midille-iatituile, I'arallei, and Great-circio Sailing.

Baint Ohriatopher, or Baint Eitt's, one of the Hritish. Weat Indla Isiandin, leeward group; Int. (Fort Smith) $17^{\prime \prime} 18^{\prime} 7^{\prime \prime}$ N., long. $60^{\circ} 42^{\prime} 9^{\prime \prime} \mathrm{W}$. length, northwest to southeast, 20 miles; breadth, 5 miles. Area, 68 square milies. Popniation about 25,000 . The soil is partleuiariy adapted to sugar.

Staple Productions.-Sugar, rum, molassea, nrrowroot, fruits, and vegetabies. The Unlted Stater export to thls isiand, and the other iaiands which compose this conaular diatriet, flour, grain, lumber (prinel. pally piteh-pine), and provision of ali kinds. American tonnage employed in the trade with this island in 1853: ${ }^{11}$ vessels, with an aggregate tonnage of 5070 . There are no lritish vessels regularly engaged cither in the foreign or consting trade of this jaland. Hence American ships are frequently chartared to convey sugar, molasees, and other products to England, where, by reason of a protective duty on foreign similar profweta, they find the lest market. In addition to the staples of this island, United States vessels export large quantitiea of old motais (as brass, iron, copper, lead) and hides. A large portion of the revenue of this inland is derived from en export duty on its ataple jrminctious.

Fort Kegulations.-All vessels on entering pay a tonnage duty of 36 cents per ton, and a fee of $i+$ to the colonial seeretary. There is no pllotago tax, as the port of St. Christopher is open and free from ali olstacles, such as reeff, cte. The official returns for six monthn, from 1st July to 81si December, 1854, wlil suffleiently exhitht the extent of trade between the United Staten and St. Chrintopher.

Gaint Croix, the southernmost and largest of the Virgin Islands, andi the most important of the Dacish possessions. Areu, 100 square milics. P'opulation (1845), $25,600$.

Tho commereial intercourse between thia isiand and tho United States depends partly on the mother country, and parily on local legialation fixed for the time. There aro 110 privileges allowed other countries which are no. allowed the United States. Goods may be reohipre. in American vessels. The money currenty passiag, heor is dollars anil cents. Danish weight is about 10 per cent. beavier than liuglish. The trade to this island is now leas than one-third of what it was lefore the emancipation. Oftentimes iliere is not on American vessel in port for monthe together. The supplics como generally through St. Themas, which is a freo port, and yet under the same government.-For Geology of St. Croix, ace Silliman's Journ. xxxv. 64. Amgaioan l'modece impertid bigeot into the laland of

Saint Efelena, an ialand in the sonth Atiantic Ocean, belonging to Great Britain, aboat 800 milea southeast from Ascenaion, and nearly 1200 iniles from the coast of Lower Guinea. Lat. of obeervatory, $15^{\circ} 65^{\prime}$ S., iong. $5^{\circ} 44^{\prime}$ E. Area, 30,300 acrea. Population in 1850,7000 , of whom nearly one-half were whites. It is of volcanio origin, and conaista of rugged mountaina, interspersed with numerous ravines, in one of which, on its northwest abore, is Janiss Town, the residence of the principal suthoritiea. Its centre is a table-land, with an sievation of 1500 feet, but from which esveral mountain sise to a greater elevation, Dlann'a Peak being 2700 feet. Climate mild. Mean temperaturn of year, $61^{\circ} \cdot 3$; winter, $58^{\circ} \cdot 4$; summer, $03^{\circ} \cdot 8$. The island is watered by nunerons brooke, and about a fift part of its surface is fertile, yielding the products beth of European anil troplcul countriss. Goats are plentiful in the uplands; but supplies of provisions are mostly procured from abrend, the island tying in the homeward track of ahlpa returning from India. St. Helena is chiefly noted as the place of exile of Napoloon Bonaparte, whose rosidence, Longwood, was on the elevated plateau of the interior. He lived there from 1816 till his decease, May 5th, 1821.
The Unitad States have a consul resident at this isiand, which is frequently visited by our ships to and from Asia, Iudia, Cape of Good Ilope, ete. By act of 3 and 4 Willism IV. the island of St. Holena, and all forts, facteries, and publle edlfices, were vested in His Majesty, and the island shall bo governed hy orders in council.
The average aggregate values of imports at thits island from the United States are: For the jear 1851, 86420 ; for the year 1852, 88377; for the ycar 1853, 830,809 ; for the six months ending B0th June, 1854, \$12,25t. Value of oil and whalebone transhipped by Anierican vessels to the United States, \$16,525. There are no privileges permitted to the comuncree of other nations which are denied to the United States; but, on the other hand, thero aro privileges granted solely to vessels of tho United States, such as the reduction of custom charges on the transhipment of oil, whalelone, and cupty oil casks, as por proclamation of September, 1853, and the remission of port charges to whaling veseels calling here withis three months after their first arrival, as per notice of July, 1854, which accommodations have had their effect in the incrense of the Ansorican fleet at this port. The port charges are levied alike on all foreign vessels as on British. There are no charges on national vessels, elther British or foreign, and all are alike furnished with water freo of charge. There is no Chamber of Cominerce, and tho rates of exchango depend on the parties egreelng; generally, howover, they ane private bills, and are taken at par ; the commisaariat, however, charges $1 \frac{1}{2}$ por cent. There are no duties oxcept on wines, spirits, and beer; only a wharfage tax on all gooda landed from Great Britain or any forelgn country. There are no pricc-current sheets issued, the market boing unstable; and the supplies from abread (almost entirely from England) being irregular, ovory thing, as a general thing, bears a high valuc. The American whaling flect, after once entering this port and paying the custom fees, may return to the island at any timo within three months, for veater or any other supplies whatsocter, without being subject to the payment a accond time of the tonnage or other custom fees; and that every facility will be given for the accommodation of the fleet.
Baint Johns, a sea-port, and capltal of the island and British colony of Nowfoundland, North America, near the extrenity of the mosteastern of the numerous
peninsulas whleh project from the eastern portion of the isiand; lat. $47^{\circ} 33^{\prime} 6^{\prime \prime}$ N.; long. $32^{\circ} 43^{\prime} \mathrm{W}$. Population in 1850, 19,000; In 1852, 21,000 (renident), 6000 fishermen. T'he trade ce St. Johns consiate chicfly in supplying the fishermen, most of whom are Roman Catholien, with clothing, provisiona, and flahlug and hunting gear. The harber of St. Johns is excellent, although narrow at the entranco; the channel, from point to polat, being only 300 fathoms wide. Tho tide rises 5 fest, neap-tides $8 \frac{2}{2}$ feet, but very irreguiarly, being much infiuenced by the winds. Goods may be transhipped in United States vessels to amy place out of this colony without restriction of any sort. The weights and measures are the same as in England. The monays are in a great degree the same, nemely; soverelgns, with Spanish and Mexican dollars, which, however, aro now fust disappearing. The currrent value of the sovercign is 24 shillinga, equal to 8480 , and of the doliar 5 shillings, or 100 cents.
The nvorage wholesale prices of the exports to the United States since July 1, 1853, have heen as follows: Seal oil, 60 cents per gallon; cod oil, 65 cents per gnllon; codifsh, 8260 per quintal; herrings, 8240 per harrel. Salmon, not quoted above, varies from 182 to 820 generally for the tierce of 310 pounds. These articies are rarely sold at retail in thls market. Tho nverago raio of exchange was 4 to 5 per cent. discount from this colony to the United States. The true par of exchange is 2 per cent. Tho duatea nre on imports from all countrles allke, as follows : Bread, 6 cents per bag of 112 lbs.; flour, 35 cents per barrel; pork, 72 cents per barrel; beef, 48 cents per barrel; butter, 48 conts por cwt. ; manufactured tobacco, 4 cents per lb . ; tea, 0 cents per ib . On all unenumerated goods 5 pier cent. ad ralorem; and in this port an additional duty is levied of 10 per cent. on the duties above.

Baint Lawrence river, UnIted States and Canalla, forms the outtct of the great lakes Superior, Huron, Michigan, Eric, and Ontario, and, after a course of mere than 2000 mlles, flows inte the Gulf of St. Lawrence. It forms the bonndary, with tho nilddlo of the lakes through which it passes, between the United States and Canada, until it arrives at tho 45th degres of north lat. It has different names in different parts of its course. From its mouth to Lake Ontario it is cailed the St. Lawrence; between Lakes Ontario and Erio, Nlagnra River ; between Lakes Erio and St. Clair, Detroit River; between Lakes St. Clair and Huren, St. Clalr River; and betwcen Lakes Huren and Superior, St. Mary's River. It is navignblo for ships of the line $\mathbf{4 0 0} \mathrm{mlles}$, to Qucbec; and for sh es of 600 tons to Montreal. The distance from Montreal to Lako Ontario is uearly 200 miles. From Quebec to Montreal it has an nverage brendth of two milcs. At its mouth, tho Gulf, from Capo Rosier to Mingau settieinent, in Labrador, is 105 uiles in length. The cievation from thto-water to Lake Ontario (exceeding two hundred feet) is overcome by seven canals of varieus leagthe, from 12 miles to one inlie (but in the aggregate only forty-one miles of canal), haviag lecks two hundred feet in length between the gates, and forty-five feet in width, with an exenvated trunk fron. ons handred to one hundred and forty wido on the wate-siarface, and a depth of ten feet water. From Lake Ontario to Lake Erie an elevation of three hundred and thirty feet is surmounted by a cannl twenty-eight miles in length, with about thirty eat stone locks one \%me: dred and fifty foet long, by twenty-six and a laif ieet wide, designed for propeliers and sail cra! Theso locks will pass a craft of abont fivo hundreet tous surden, while those on the St. Lawrenco have a cepacity doublo thls amount. The total cost of thi, uat igation may be set down at $812,000,000$. The \$it. Iswrence Conal was designed for paddic-steamers, which aro required as tugs, or to ascend ngainst tho chirrent; but from the magnitudo of tho rnplis, and their regular inclination, tho ald of the locks is not required in de-
scending the river. At some of the rapids there are olstacles preventing the descent of deeply-laden craft, but the govermment are about to givo the main channel In all the raptils $n$ depth of ten feet water, when the whole descending trado by steam will keep the river, leaving the cmuals to the useending craft.-Nee Cumada and Montheial.

The relative position of the Unlted States and Great Britaln in ruspect to the navigation of the great northem lakes and tho River St. Lawrence, nppears to he similar to that of the United States and Spain, proviously to the cessation of Louisiana and liorida, in respect to the Missisalpyi; the United States being in possession of the southern shores of the lakes, and the River St. Lawrence to the point where tho northern houndary line strikes the river; and Great Brituin of the northern shores of the takes, and the river in its whole extent to the sen, as well as of the southern banks of the river, from the latitude of $45^{\circ}$ to its mouth. The claim of the prople of the United States of a right to navigate the St. Lawrence to and from the sen was, in 1826, the sulject of diseussion between the American and British govermments.
The navigation of the continuous waters of the United States and Canala is provided for int the following artictes of the treaty of June $\overline{5}, 1854$ : The third article, whose operation miny be affected at the will of the Americun government, by a suspension of this privllege, as atipulated for in the fourth article, on tho part of Grent Ilritaln, provides for 5 rechprocal trade, free of duty, between the United States and the British colonies, in the articles of their respective growth and proluce, as enumerated in the schedule thereto anmexed.
"It is agreed that the citizens and inhabitants of the Inited States shall have the right to navigate the Rlver St. Lawrence and the canals in Canada, used as the urrans of communication between the great lakes and the Atlantic Ocenn, with their vessels, boats, and crafts, as fully and frecly as the subjects of lher Mritannic Majesty, subject only to the same tolls and other nssassments as now aro or may hereafter be exacted of Iler Majesty's said suhjeets; it being understool, however, that the British government retains the rlght of suspending this privilege, on giving tho notice thereof to the government of the Cnited States.
"It is further agreed, that if at any time the llritish government dould exerclse the said reserved right, the government of the Conited States shall have the right of suspendi'g, if it think fit, the operation of $\mathbf{A r t i c l o} 3$, of the present trenty, in so fur as the provines of Canalla Is affected therely, for so long as the suspension of the free navigation of the liver St. Lawrence or the canals may continue.
"It is further agreed, that British suljects shall have the right freely to navigate Lake Michigan with their ressels, boats, and crafts, to long as the privilege of navigating the River St. Lawrence, seeured to the Americaus hy the above clause of tho present article shall continie; nad the government of the linited States furiler cagages to urge ujon the State governments to secure to the subjects of Jler liritamic Majesty the use of the several State canals on terms of etpunlity with ihe inhonbitants of the Luited States,"Wusntws's International Lau', For correspondenee on unvigntion of St, Lawrince, seo Americun Amual Registor, i1. 1.7; ; Nuses's Register, xxxiii. 111.

Saint Louis, city, Missouri, cupital of St, Louis county, is sitated on the right bank of the Mississippi, in lat. $3 x^{\prime}{ }^{\prime \prime} 5^{\prime} 28^{\prime \prime}$ N., und long. $90^{\circ} 15^{\prime} 10^{\prime \prime}$ W. from Greenwith, nut is one of the largest and nost flourishing cities in the great valley of the Misslssiphi. It is 1290 inites above New Orleans, and 1350 miles above the mouth of the river, About 180 mikes aouth of the clty the Ohio comes in to the Great Father of Waters, from its castern sources in the Alleghanies, after a course of 1000 miles, while a short dintance above its mou'h the Cumberland and the Tennesse pour their
streams iato Ia Belle Itivlere. To the northward, 17 miles, the Misaourl pours out lts turbid stresm into the Mississlippl, and the waters flow down to the very front of. the city, before the elear waters of the Mississippi yield themselves to the embraces of the great rivers of the West, coming down from the anows of the Rocky Mountaius 2000 milea away. At a distanea of 33 miles to the northward, the Iltinoig-now conneeted with the takes by tho Illinois and Dlichigan Canal-comes in from the northeast, and is navigated by St. Louis hoats as far as the junction of the canal and river at La Snile, 290 miles from St. Louis. St. Louis is the centre of a great railroad system, radiating to all parts of the Union. The system, as at preaent planned, may be stated as followa: The Paelfle Road with Its branches. This road runs froms St. louis to the Nerrimae River; tho main line then crosses the dlvide between the Merriinac nud the Missouri to Jefferson City, the eapital of the Stato; thonce leaving the river, It runs direetly to the mouth: of the Kansas River, to be extended to the Pacilic, through the great chain of the Roeky Mountains. This road is 311.60 milles in length, and is finished to Jefferaon City. The Ohio and Mississippi Railroail, from Cincianati to St. Loule, was opened in 1857, 336 miles in length.

The steamboat tonnage of this city will appear from tho following table. For the year ending June 30 , 1853, the following cities stood entered on the hooks of tho custond-house, as fullowa :

| Citien. | 1830. | 1851. | 1853. |
| :---: | :---: | :---: | :---: |
| Nt. Ionis. . . . . . . . . . . . | 24,965 | 8.4,04\% | $45,6 \pm$ |
| Ctucinnati | 16,906 | 14,187 | [11, ! $!1$ |
| Nasliville . . . . . . . . . . . . | 3,70 | 3,667 | 8.414 |
| L.oulsville. . . . . . . . . . . | 14,8:0 | 12,90\% | $14,160^{\circ}$ |

thus ahowing an inerease at the rate of 11,000 tons per year. For tho yunr ending December 31, 1853, the sugne landed at St. Louis was 50,774 hhds., 15,993 bbls., $\mathbf{4 6}, 257$ boxes and bags; molasses, 51,0933 bhls. and hheds. For this artielo St. Louls is the great central supply mart. Hy the government returns, nll the sugar shipped from New Orteans for $\mathbf{1 8 5 \%}$ was 60,793 hhils., and $6 \mathrm{ha}^{3}$ tbls., while St. Louis imported $50,7 \mathrm{ta}$ hhlas., and $13,993 \mathrm{bbls}$. The whole limports of coffec into the Unlted States in 1853 were $199,089,823$ lis., nud of this St. Louia imported $16,714,720$, or abunt onetwelfth. To show the business of the yeurs 185:-1857, we give the receipts of eertain articles:

Baint Petersburg, the modern metropolls of the Russian empire, situated at the confluence of the River Neva with the eatern extremity of the Gulf of Finlend, in lat. $59^{\circ} 56^{\prime} 25^{\prime \prime}$ N., long. $50^{\circ} 18 z^{\prime}$ E. Population, 480,000 . Thls flourishing elluporlum was founded by Peter the Great, whose nume it bears, $\ln 1703$. In the same year, the flrst merchant ship that ever appuared on the Neva arrived from Molisnd; and the czar, to mark his sense of tho valuc of such visitors, treated the eaptain and crew with the greatcst hospitallty, and leaded them with presents. In 1714, 16 ships arrlvod at St. Petersburg; In 1730 the number had increased to 180; and so rapid has been the progreas of commerce and civilization In Ruseia sis ce that period, that at present from 1200 to 1500 sh ps annually enter and clear out from St. Petershurg! It is much to be regretted that, although favorable to commerce, the situation of St. Petersburg is in other respects far from good. The ground on which lt etands is very low and swampy; it has on ditferont ocessions sustained great injury from Inundations; and the country round is, gencrally speaking, a morsss and forest, so that almost every thing required for the culsistence of the inhashitants must bo brought from a distance. No one less bold and daring than Peter the Great would have thought of selecting such a situation for the metropolis of his empire; and none possessed of less power and resolution could have succeeded in overcoming the all but iusuperabie olistueles which the nature of the conntry opposed to the completion of his gigantic schemes.

Cronstadt, situated on a small island about 20 miles west of St. Petersburg, may, in some measure, be considered as the port of the latter. Almost all vessels bound for St. l'etersburr touch there; and those drawing alove 8 feet water load and unload at Cronstadt; the goods being conveyed from and to tho city in lighters, the charges of which vary aecording to the demand at the time. 'The merchants' harbor at Cronstalt is fitted to contain about 600 ships; but it is exposed to the westerly winds. Cronstadt is strongly fortitied, and is the principal station of the Rassian fleet. Vessels bound for St. Petersburg must pass by the narrow channel to the south of the island, commanded by the fortilleations of Cronstadt on the ono side, ant of Cronslot on the other.

Money.-Accomits are kept at St. Petersburg, and throughout Russia, in soubles of 100 copecks.

The only gold coin nt present struck is tho $\frac{1}{8} \mathrm{im}$ perial, or 3 -rouble pieca, $=16$ s. sterling very nearly. The silver rouble, worth 3 s .23 l . sterling very nearly, was deelared, by a ukase issued in 1839 , to be worth 34 paper roubles.

But another ukase, issued on the 14th June, 1843, directs that the old bank-note roubles in circulation, amounting to the sum of $595,766,310$, being equal, at the exchange of $3 \frac{1}{2}$, to $170,221,803$ silver ronbles, should be called in, and replaced by an iseuo of $170,221,000$ billets du credit, to bo exehangeable at tho pleasure of the holder for silver roubles. This is a most important regulation, and if it be fully carried out, the distinction between silver and paper roubles will dismppear; at the same time that additional security will be given to all sorts of industrious undertakiugs, and to tho eredit of the govermment.

Weights and Measures.-Tho Russian weights are the same for rold, silver, and merehmulise : viz., 3 Soltnicks $=1$ Loth. $\quad 41$ Pounds $=1$ Pood.
3! Loths =1 P'onnd. 10 P'euds $=1$ Uorkovitz.
The Russian pound contains, aecording to Kelly, $6318 \cdot 5$ Euglish grains. Hence 100 Hbs . Linssian $=$ $90 \cdot 26$ 16s. avoirdupois $=40.93 \mathrm{kileg}$. The pood $=36$ Ibs. $10 \% .11$ Irs., but amongr merchants it is reekoned $=36 \mathrm{lbs}$. Aecording to Nelken'brecher, 100 lbs . liussian $=90.19 \mathrm{lbs}$, avoirdupols $=40.9 \mathrm{kilog} .=82.8 \mathrm{lbs}$. of Amsterdam $=8 \cdot 4 \cdot 4$ of Ilamburg.

The principal measure for cora is tha chetwert, diviled luto 2 osains, 4 pojocks, 8 chetwericks, or 6.1 ger-
nltz. The chetwert $=5.75$ imperial bushels. Henco 100 chetwerts $=72 \cdot 12$ lmperial quarters.

| In liquid measure, | 8 Wedros $=1$ Anker. |
| :---: | :---: |
| 11 T'sharky = 1 Krashka. | ${ }_{2} 0$ Ankery $=1$ Oxioft $=1$ Oxhoft. |
| 8 Krashka $=1$ Wedro. | ${ }^{2}$ Oxinoft $=1$ Pipe. |
| 40 Wodros $=1$ Sorokovy. | In long measure, |
| The Wedro $=8!$ Englieh | 16 Wershok $=1$ Areheen. |
| 18t Bottles $=1$ Wodr | $\begin{aligned} & 3 \text { Arsheen } \equiv 1 \text { Sushe0. } \\ & \text { 500 Sashen } 1 \text { Vornt. } \end{aligned}$ |

1 sashen $=7$ English feet. 1 arsheen $=28$ English inches. 100 Russian feet $=114 \frac{1}{2}$ English feet. The verst, or Russian mile, $=5$ furlongs 12 poles. The English inch and foot aro used throughout Russia, chlefly, however, in the measuring of timber. - li L ly's Cambist, art. Russia; Nelkenanecien, trcibiel Unitersel.

The following regulations for the importation of foreign goods are strletly enforced. All goods imported must be accompanled by the fellowing documents:

1. The declaration of the captain, aecording to the form ordered by the custom-hoaso.
2. An attestation from the Russian consul, and, where there is no consul, from the custom-house of the place, of the quantity and quality of the goods, and a declaration that they are not the produce, manufacture, or property of an enemy's country.
3. Bills of lading of all goods, in which the weight, measure, or quantity of each package must be specified. In caso the bills of lading are not exactly after this regulation, the goods pay double duty as a fine. In ease more is found than specified in tho bill of lading, the surplus is confiseated: if less is found, the duty must be paid on the quantity specilled. Of winc, it is not sufficient to specity the number of pipes or hogsheads only, but also their contents in gallons, etc. Of lemons, the number in eaeh box must be specified. Of manufnetured groods, the measure of each pieco must be speeified, and the number of pieces in each bale. It is indifferent whother the gross or the net weight be specilied. If the packages be all of tho same weight, measure, or contents, a general specification will do; ns , for example, 100 easks alum, of 17 lispound each. Of dye-woods the weight of the whole need only be mentioned. Of goods of sinall bulk, ns pepper, etc., it is sufficient to state the weight of every fire or ten bales, but with specification of the numbers. There must not beany erasures or llots in the bill of lading. All goods not aceompanied by these dlocuments, or where tue doeuments are not aceording to the n'ove regulations, will be sent baek. Bills of lading may be mado out either to some house or to order.

Tha following charges have been fixed by the merchants of St. Petersburg:
Commalssion on sales and porehgses
Per Ct.
lixtra charges on alt goois.

Brokerage en sales and purehases.
Dite on bilis. . ..................... .
D) tito on frelght, juer ton, 60 copecss.

Trade，etc．－St．l＇etersturg has the most extensivo furcign trate of any city in the north of Europe．This arises from its lowing the only great maritime ontlet on the solf of lumanal，and from tis vast aul various conmmitications with the interior of the conntry．Few comutriea have such an extent of intermal navigation aa Lessia．The irom and furs of Sileria，and the tess of thima，are received at St．I＇etershurg ly rivers and canals ria the Caspian；liut owing to the great ills． tance of those comtries，and the short period of the year during whic the rivers anel canals are navigalide， they tuke three years in theirt nusit．Immense quan－ tifles of georls are also conveged durlug winter opon the ice，ins sledgen，to the dilfirent ports，and to the neareat pristans，or phaces in the hiterior where barka are buith for rhar or ranal navigaton，They nre put on board in an：belpation of the poriend of sailing，that the harks may be ready to take atlvantage of the hith water，hy toathg down with the current an soou as the anow anll hee beghin to melt．The cargoes carried up the river itto the interior during summer are princh－
pally conveyed to thelr ultinata destinatlons by the sledge roads during winter．The convegance by the latter is generally the most expedtilious；and lt ，as well as the internal conveyance by water，la performed at a very moderate oxpense．Tha barka that come from the interior are mostly of a very rude construction， llat－botomed，and seldoin drawing mora than 20 or 30 inchos wator．When they arrlve at their destination， they are sold or broken up for fire－wood．Theso that leave the ports for the interior are of a superior descrip－ tion，nud nre comparatlvely few in number；the com－ moditles imported heing at an avernge，of much greater value relativoly to their bulk and welght than those that are exported．

Principal Articles of Export．－The prinelpal articles of export are tallow，hemp，and fax；gralu，particu－ larly wheat；linseed，timber，copper；hldes，potashes， bristlee，hemp－seed oil，furs，leather；fox，hare，and squirrel skins；canvas and coaroo linen，cordage，cav－ iare，wax，isinglass，quills，tar，etc．Tallow，both for eandlea and sonp，is more largely exported from this than from any other port in the Baltic or elsewhere， and is an artlele of great commercinal importance．－See Tais．ow．llemp is of good quality，though inferior to that of Riga：it is assorted，aceording to its quality， into clean，or firsta；outshot，or seconda；and half－clean， or thirds．The first sort should he quite clean，anil freo from spills；the second la less so；and the third or half－clean，eontnins a still greater portion of spilks， and is，besides，of mixed qualities and colors．Thusian Hax is much estecmed for the length of its fitire；it is maturally brownish，lout hecomes very white after the tirst bleaching．Threo qualities are distinguished：iz．， 12 head， 9 head，and 6 head．Iron of gool qualty， and preferable to that from the other Russian ports，is of two kinds，old and new sables，the former heing the best．It used to be exported in conaiderable q⿴囗十⺝刂土ti－ ties；but the shipments are now much reduced．
Commerce．－The total value of the exports of st．
 A considerable nugmentation was experienced in cer－ tain deseriptions of merehandise．The quantities of woel and copper more than tripled，and of wheat and thax－seed oil more than doubled the quantities exported during the year 18010．J＇otashes increased 50 per cent．： on the other hamil，oats terreasell $\frac{8}{3}$ ．peltries $\frac{3}{3}$ ，iron $\frac{1}{2}$ ． tallow 25，per cent．；thas－sced，hemp，and woven goods more than 10 per cent．Sugar，tolacco，salt，wines， silk，and cotton yarns also fell much helow the usual importstions．An nugmentation，however，was noted in the lmportation of fruits，rice，raw cotton，and（ham－ pagne wine．
Notwithstanding a beary expenditure was appliwd ly the Russinn government to the improvement of st． betersturg as the commercial emporium of hinssia． atill，owing to the namerons dilliculties ancountrent． and the severity of the climate allowing the six mombe in the year for the contimanee of these work，the re－ sult ly no means realizell the expectations of the gon－ erument．The consergience was，that the low water－ in the rivers，ami the almost total ahseace of water in tho canals，kept lack the produce namally foruaried from the literior．It was net notil towaril the cult of duly that the trate of is．lefershurg exhilited any briskness．Luring the momth of May，several liritid vesels arrived and cleared in hallasi；lime in the lat－ ter part of Jitly and Angust frelght oflered in great nhmblane，althongh the nerivals were numbons．From thia pieriod the trade continued unusmally hriok，mutil early in November，when the navigation closed．

Suljoined is a statement of the prineipal exports from st．l＇ctershurg in 1N52：
Tallow．To Eugtand
．．1，86，1，909 jumla．

31 rouldea 71 kopecka per berkuwitz $=7$ centa per lb．，oearly．

Pricea ranged at 0,10 , and 12 roublea per pood $=\$ 075$, $\$ 750$, and $\$ 9$ per 36 pounds, or $18 \mathrm{k}, 20 \frac{5}{6}$, and 25 cents per pound.
The foregolng were the princlpal exports from St. Petersburg in 1852, and they aro given $\ln$ detail, inasmuch as they constitute, together with iron, copper, timber grains, Russlan leather, quills, etc., tho leading ataples of this great commerctal emporium.

Narigation of the Nera in 1852.-The following table exhibits the navigation of the Neva (i. e. of St. P'elersburg and Cronstadt) In 1852:

-C. D. For further information seo Liring Age, ii. 317 ; South. Lit. Messengcr, xv. 427; Democratic Review, xi. 151 ; Brilish aml Foreign Reries, viii. 33; BlackWool's Mayazine, $1 \times x$. 151 ; Foveign Qurterly, xxviii. 39s. For an account of the commercial poliey of Russia and the general statisties of trade, see Ressin.

Gaint Thomas, a Danish West india Island, Virgin group, threo miles west of St. Johns. Lalitude of west extremity, $18^{\circ} 20^{\prime} \mathrm{N}$., long. $64^{\circ} 5 j^{\prime} \mathrm{W}$. Area, 13 syuare miles. Population (1847), 12,800. Soil poor. The prineipal products are sugar and cotton.

The commerchal intercourse of the Vinited States with this island is depentont parly on the action of Demmark, and partly on tho celonial government. The present commercial regutations aro not fixed for a detinite period, but may be changet at any timo by the recommendation of tho colonial council, approved by the Ministry anl: King of Denmark. There is, however, no chango emtemplanal. By the existing laws and regulations, all nations, including tho mother country, are placed on the same footing in their commerciat intercousso with this island, except as to the tonage duties oa vessels enturing and clearing at this purt, which ati: : on all European veseels, 45 cents per ton; un all uthers, ineluding American, 19 cents. The distinction is probably mate to enconrage the introduction of provisions, rather than the dry goods, farey urticles, and licquors imported from Europe. Tho translipment In vessels of the United States of goods to ports in Denmurk, tho Danish colouies, or to a foreign port, is permitted withont any privileges or restrletions not granted to or imposel on Damish vessels, or tho vessols of any other nations. The moneys, weighta,
and measures known and in common use in thim island are the same aa those establlahed by the supreme law of the mother country, yet the geld and silver coins of the United States and the denbleens of Mexico are also in common use; the latter is worth 616 . The notes of the "Dank of St. Thomas" (a private institution not incorporated) and the netes of the Colonial Bank, lasued in $\$ 5, \mathbf{9} 10, \$ 50$, and $\$ 100$, redeemable in gold and silver, according to the standard value of the currency of the United Stutes, form also a considerc. be part of the colonial cireulation.

The navigation between the United Statea and St. Thomas, as ahown by Consular Retorns, was: entered in 1851, 375 vessels, 71,410 tons; cleared, 366 vessels, 69,847 tons; tetal, 741 vessels, 141,257 tons. Entered in 185:, 368 vessels, 69,490 tons ; cleared, 361 vessels, 68,451 tons; to:al, 829 vessels, 137,941 tons.
Fogeion Impohtationi at Et. Thomas, from Aphil 1, 1853, To Maroll 31, 18 H

St. Thomas is the central station for packets lu generat, and for the steam communication between Southampton and the West Inlies.

Bal Ammoniac. The manufacture of this salt may be traced to the remotest era. Its name la derived from Anmonia, or the temple of Jupiter Ammon, In Figy pt, near to which the salt was originally made. Sal ammoninc exists ready formed in several animal products. The dung and urine of camels contain a suflicient quantity to have rendered its extraction from them a protitable Egyptian art in former times, in oriter to supply Euroje with the article. In that part of Africa, fuel thetige very scarce, recourse is had to the dung of theac animats, which is dricd for that purpose by piastering it upen the walls.

Balep, a spacies of jowier prejured from the dried roots of a plant of the orrhis kind (Orehis maseuld, Linn). That whtch is inported from India is in white wai pleces, hard, clear, and pelluchd, without smeli, nud ansting like tragaranth. As mu article of diet, it is said to be light, himed. and untritious.- Ansume's Mat. Indica; Mnhtns's Oriantal Commerce.

Galmon (lier. Lacke, Sulm; Fr. Nouncm; II. Sermone, Nalnmone; Sp. Salmon; linss. Lemgot. Jhivexrellent fish is too well khown to repuire any description. It is found only in northern seas, Ielng inknown in the Mediterranean and cher warm regions. In this conntry it is an article of muli value and importance. It is said to be exccedimply abumbant fin Jajan nut K, metachitha.

Mot Mritain.-Sulh salmon as are taken in estuarles or ri et are, of course, the property of these to whom the whaties or rivers belong, the tisheries in them freamently letting for very large sums; but of late very -a 10!lon aide quantitien of sol ton have bern taken in

 natle" where the consumption is immense, has hern Whane 700 mrineij ally then lied from the Sonth rivers. The Tweed fistsery is the tirst, in point of magnitude, - st." in th. klugion; the take is sometimes quite

taken by a alngle sweep of the net! Salmon aredispatched l:s ateamers or fast-salling vessels from the Spey, the Tay, the Tweed, and other Scotch rivers, ior Lomion, p.icked in ice, by which means they are preserved quite fresh. When the aeason is at lis height, and the catc.' greater than can lee taken off freah, it is salted, pleklec., or drled, for winter censumption at heme, and for fo.eign markets. Formerly, auch part of the Scotch salmon as was not consumed at heme was plekled and kitted after leejng bolled, and was in tihis state sent up to london under the naine of Neweastie salmen ; but the present method of disposing of the tish has so ralsed its value, as to have nearly deprived ali but the richer inhabltants in the envirous of the fishery of the use of solmen. There are considerable fisherics in some of the Irish and Engliah rivera, but Inferier to these of Scotland. The Scotch salmon fisheries seem to have nttained their maximum value toward the end of the last war, when the fisherles in the T'weed were let for from $£ 15,000$ to $£ 18,000$ a y ear! and those of tite Tay, Dee, Spey; etc., were proportionally valuable. But the value of the Scotch salmoin fisheries has, sicaking generally, declinea greatly of late years; in conse. quence, partly and principally, of a diminished supply of fish in the rivers, but In some degree, also, from tho greater facility of the communication hetwer'n lunton and Liverpool, and the consequent importation of irish salmen into the Jondon marketa, - Gencral Riport if Scotland, vol. III. p. 327.

This tishery in Canada, at the present tims, is very smail. In 1786, however, the export was censilerable. In parts of the country where, in former years, life eatch was large, a fow barrele of pickled animon mily were shipped In 18.48. In the Gulf of St. lawrence there were once extensive eatablishments for the jrosecution of this business; but some have been l,roken up, and etherd have become unprofitalile. Streams that half a century ngo afforded suffictent for domestic consumption, sind thousands of barrels for export, now yield only hundreds of harrels, and the quantity is rapLily dlminishting.
Nora Scotia.-The loynlists, who went to this colony at the preace of 1783 , depended very much upon this tishery, and carricd it on to nivantage. The quantity of salmon experted for some yeara was sumficient to purchinse many ariticles of comfors, and to save them at times from the miseries of pressing want. The sabuon has entirely disappeared in some parts of the celony, and has censed to be plentiful In all of its rivers aid streans. The export of salmon canght in the culeny is not latge. The whole protuce of the fishery in laj appears to have been liut 1669 barrels.

Nerfoundlund.-The fishery is still worlhy of attentien, an reference to the nccompanying statisties will sjow. The export in $1 \times 43$ was even largur than in 181.
 mude a vogage to Havis's Straits in the ship 11 held in 1:29, and who visited the const a second time in liox, found sabuon very abundant. In Salmon livor loth he and his men caught many while wailigg, and with their hands. 'fing took all they fiad salt to cure, and one that measured four feet ten indies in length. Atkins's accomm, afler his retors, beems to have insciuced no attention to the fishery on the part of his lasmamen. In $1 \times 11$ the exports amombed to 230 tierces of the pickled fish, of the value of eith, tiont.

New Mrunsteick:-The logalista and other enrly setthers fo:m the nal.non in almost every river ani ntream in the colony. At present it is never suen in sone, is becoming scarce in mont, and is of immortuncs as an articlo of export in the St, dotms alont.

Tho satch at Salmon Palls, in the Si. troix, thirty years ago, was cwo hundrui in a day, on the ascrage for threm montis in a ycar. A person standing on a "jam of logs" caught there at one limu ome bundred and righteen with a dijerme ; onl a boy tiften years

oll took about five hundred in a seacon. But such has been tha daclino, that it is sald only two hendred were taken during the entire year of 1850 by all who engaged in the bualueas on the river. It is stated that the dams erected across tha river have producel this change in tha fishory, and faets appear to suetain the position. The fow aalmon that now appear in thu Orumocto, the Nashwaak, the Maduxnakeag, and the Mispech, aa well as in Emerson's and Garlner's creeks, in Great Sahmon River and Goose Creek, la attributed to tho samo cause. In two or three of the streams of minor siza, whera no obstructions oxist, and where the water is not muddy, the pursuit is still attended with some success and jrolit.

In some othor places, the fishery, but for tho wanton and lawless destruction of the fish, without reference to its condition or tha seasen of the year, might be carried on advantageously.
To the people of the city of St. Johna the annmal cateh of salmon is a source of galn. The tisheries of the harbor, by a provision in the city charter, belong to tho citizens, or "freemen." The fishing grounils or stations aro lotted out, and sold at auctlon every year for the benefit of those who are entitlod to them uider the charter. The practical tishermen are the purchasers. The lots are of unequal value. and some merely nominal. The number of salmen taken at St. Johns in 18.0 was estimatod at 32,000 , which sold, whether large or small, at the contract price of one dollar each-except a small part for city consumption-to bo packed in ice and sent to Jloston. Drift-nets and weirs are usel in the fishery, though the former aro prohibited by law. Fishormen deprocate tho nse of toreh and spear; but both are sometimes seen in the hands of lumberers and gentlemen sporters. I'ho salmon is found on the Eit. delus, two hundred miles from the sea, and on several of its tributaries nearer to the ocean. On the Nerepis, one of its branches, on which no mill-tams have been erected, there is a fishery of note-from 1500 to 2000 being taken annually.

It will be seen that the exportation of cured salmon from New Branswick ceased entirely in 1818-ilhe whole cateh, not required for consumption, having been packed in ice, and shipped fresl.

## --Sniness' American Fisheries

Ealonica, a largo city and sea-port of European Turkey, at tho northesst extremity of the gulf of the sume name, lat. $40^{\circ} 38^{\prime} 47^{\prime \prime}$ N., long. $22^{\circ} 57^{\prime} 13^{\prime \prime}$ E. l'opulation estimated at 60,000 to $7 j^{j} v i .0$.
'lhis eity, originally called 'Therma, anil afterward Thessalonica, is celebrated both in sacred and profane history: It was visited by St. l'aul, who has adilressed two of his epistles to the Thessaloninns. In the days of its prosperity it had an amphitheatre, an extensive hippodrome, numerous temples and trinmphal arches, tho ruins of which sufficiently attest its ancient aplen-der.-Clahike's Travels, vii. 441-478, 8vo ed.

Jeing the principal emporium of Macedonia, Salonica has nlways had a considerable trade; and to this circumstanco may be ascribed lts continued and comparatively prosperous oxistence, notwithstanding the many vicissitudes it has mudergone.

Thero ls $n o$ port at Salonica, but there is excellent anchorage in the roals opposite to the town. The access to then is by 10 means difficult, and pilots aro seldom empluyed. Vessels anchor very near the walls of the town, though it is pradent not to come too cleso in, owing to the number of small craft at anchor. The dejth of water a cable's length from the shore varies from $3 \frac{1}{2}$ to $d$, and at two eubles' length from 7 to 8 fathoms, whence to Cape Carabourum it varies from 12 to 17 fathoms. Thero is very little rise. Owing to thu rivers which empty themselves into tho Gulf, tho currents setting out are at times atrong, and In light whits suflicient to imperle the way of tho vessel. Next to Constantinople, Salunica is the most inportant port of Turkey in Europe. In 1850 its maritime commerco renched upward of $\$ 3,500,000$; viz., about $\$ 2,000,000$ for imports, and $\$ 1,500,000$ for exports.

The foreign trade of this port is chiefly engrossed by the Jritich and French llags 'The imports consisi chiefty of chenp cottons and $w$ :r'e ${ }^{\prime}$ cloths, and varlous other manufactures. Its exp aro wheat, barley, maize, timber, wool, aponge, raw silk, wins, sesamam seed, tobacco, and staves. Colonial produco and manufactured goods are aupplied to this port-the former
from second and third hands-by England and Austria. Thero is nothing to prevent the Cnited States from participating in the trade in this species of merehnndlso. Neither Austrla nor Eingland could competo with this country in supplying the vast guantities of colonial produce, and the cheap white and printed cottons, which are requirod for consumption in this market. In niddltion to the suppllea needed for the tinily wants of 60,000 to $\mathbf{7 5 , 0 0 0}$ Inhalitante, Saloniea furnishes largo quaritities of colonial and manufaetured goods for tho yearly fairs of Parlepi, I. 'cen, and Seres, where the antes aro always made for cash. The high priec of Frencb cotton and woolen cloths will nlways preclude tho merchants of Franee from succeseful competition in this branch of trade; and the heavy oxpenser attending the circuitous trado through Marseilles, Smyrun, Constantinople, Trieste, and Venice, would necessarily favor direct exportation from the United States. The prices at Snlonicn are alwnys from 10 to 18 per cent. higher than nt Constantinople or Smyria.

The gross retarns of trade at the port of Salonien for the year ending December 31, 185 h, show a considernble increase in the import trade, viz. :

$$
\begin{aligned}
& \text { Velue of importa in } 1854 . \ldots . . . . . . . . . . \\
& { }^{7} \mathrm{n} \text { IS53. } \\
& 2,856.36 \\
& \text { Inerease. . . . . . . . . . . . . . . . . . . . . . . . \$12, } 470
\end{aligned}
$$

Ibut the returise ox ibibit a still more consilerable in crease in the value of the outward trade, viz. ;

This large incrense, boih in the inward and outward trade with tho port of Sale nica, may te erarded as an avidence of the limproving tate of the conntry.

The navigation returns for the same jeriods exhibit the following resul'

A British authority, reforring to thia trnde, says: "A demand fur llritish cotton manufneturea of all descriptions daily increases, and overy year there is some new outlet of sufllicient importance for the establishmest of agenciea in the interior by the importers at Salunica; hence the prospect of an increase of the ithpurt trade in proportion to the increasing value of the export trade. The Austrian ant Suxon manufacturers have again turned their attention to this part of 'Iurkey, and are sending larger parcols of tow cotton goods."

The above extract is worthy the attencion of those engrged in trade with Turkisli perts.
firpors.-Owing mainly to the Hellenic inrasion, considerable delay was ocrasioned in getting in the crops in 1 A 51 , and, consequently, the supply of grain at sialonica was not equal to tho demand. Little was tone in wools and cottons, the prices having averaged too high a rate for European markets. The trate in silk was considerablo; hut, owing to the rive in tho price for labor and fire-wood, several of the silk factors preferred rending the silk-perds to France and to the Italian perts, to Irawing the raw silk at salonjca.-L'. S, Cum, llelations.

Balt (Ger. Salz; Du. Zout ; Fr. Sel; It. Sale; Sp. Snl; 1tuss. Sol; Lat. Ainl; Arab. Jelh; Chin. I'en; lliml. Nimmuck; l'er. Nun), the chlorib of adiu, of modern chemists, has leen known and ln wommon use as a seamoner and preserver of food from the carlieat ages. Immense massers of it are found in thim and many other countries, which reguire only to be dug
ont and reduced to powider In thint atate it is called rock-salt. The water of the oe an also contains a great deal of salt; to which, indeed, it owes its tasto, anil the power which it possesses of re lating freezing till cooled down to $28^{\circ} \cdot 5$. When thlo 'vater is suffecently ovapornted, tho salt precipitates in crystals. This is the common process by which it is obtained in many countries. There aro various processes by whic'. it may be obtainod quite pure. Common salt usually erystajlizea in culve. Its taste is nniversally known, and is what is strictly denorilinated salt. Its apeclfic gravity fa $2 \cdot 125$. It is soluhitu in $8 \cdot 82$ timea its weight of colid water, nod in $2 \cdot 76$ tlmea fta welght of boiling water.Tuomson's Chemistry.
llesides fts vast utility in seasoning food, and preser fing meat both for domestic consumption and during the longest royages, and in furnishing muriatic acid aid soda, salt forms a glaze for coarso pottery, by heing throw' finto the oven where it is baked; it inprovea the witieness nad clearness of glass; it gives hardness to ava;'; in melting metals it preserves their surface from calcination, hy defending them from the air, and is employed with advantage in some nssays; It is used ne a mordant, and for improving certain colurs; aud enters more or less into many other processes of the arts. Many contradictory atntements have been mate ns to the use of snlt as a manure. Prolinbly it may loe advantageous in aome situations, nud not in others.

Nalt , Nines, Springs, etc,-The principal salt-mines are at W'elitska in l'olami, Catalonín in Spain, Altemonte in Calalria, Loowur in Ilungary, in many pluces in Asin and Africa, and in Cheshire in England. The mhes at Wielitska nre upon n very large scale; but the statements that lave frequently heen jublished, of their containing villages ibhnbited by colonics of minere who never saw the light, are altogether without foumdation. These mines have been wrompht for more than 610 yenrs.-Coxe's Tiracels in the. Forth of Aurope, vil. i. 149, svo ed.
The salt-mines in the nelghtorhoorl of Northwich, in Cheshire, England, ure very extensive. They have been wrought since 1650 ; nid the guantity of salt obtaincel from them is greater, proliably, than is ohtained from any other salt-mines in the world. In its solit form, when duk from the mine, Cheshire salt is net sutheiently pure for use. To purify it, it is dissolvel in sea-water, from which it is nfternarl sepurated by evaporation nud crystallization. The greater part of this salt is exported. Salt oprings ore met with in aeveral countrics. Those in Cheshire and Worester. shire furuish a large projertion of the sale mate usc of in (ireat Itritain. The brine, being fimmed up from very deep wella, is evapornted in wrought-iron pats frotil 90 to :to fect square and 10 or 12 inches deç. placed over $n$ furnace. Most of the salt used in Suotland, prevlous to the rupent of the duty, was obtained by the evaporation of sen-water nearly in the way now mentioned: lnt moat purt of the Scotch salt-w orks have since been relinguished.

In wamm countries, salt is oltained ly the eraperation of aca-nater ly the hent of the am; num the cryse tuls of salt mave in this way are bors purfert and phrer, from the greater alowness of tha process. French salt is manufactured in this mote, and it has always treen fa considerable damand.

Thaties on Salt. - In atrient Rome, sale wns stiljected to a ilnty (rectigul sulinarum; are licasan, Jissertatio de lectiynlibus /(p. Rum. c. 6); and it has been heavily taxed in most modern states. The gabelle, or code of salt laws, formerly established in lrasee, was most oppressive. Frem 4000 to 8000 persons are calculated to have been seltt ammally to prison aml the galleys for othenses connected with thees laws, the severity of which lad no ineonsideraile share in bringing alsmet the levo-lution.-Yor vi's Trarela in firunce, vol. i. p. 598, In lingland duties upon salt were impused in the reign of

Willam III. In 1798 they amounted to $5 a$. a bushel; but were subsequently increased to 15s, a bushel, or about thirty times the cost of the salt! So exorbitant a duty was productive of the worst effects; and occasioned, by its magnitute, and the regulations for allowing sult cluty free to the fisheries a vast deal of smuggling. The opinion of the public and of the House of Commons having been strongly pronounced against the tax, it was inally repenled in 1823.

The duty on salt imported into the United States is 15 per cent. by the act of March 3,1857.

United States.--The following eompreheusive account of the manufacture and consumption of salt In this country was written in answer to a request for the statistical infermation it contains, for the use of a committee of the British Purlinment. Its auther is a prombnent salt merchant of New York, and thoroughly conversant with the subject :

New Yonk, April 28, 1857.
Deati Sin,-1 have recelved your letter of the 20th instant, in which yeu selirit infermation respecting the manufacture of salt, the quantity mude in the United States at each of the works, the rate of freight to the principul perts, the toll paid on domestic and also on foreigu salt on oor State canals, etc.
'The interest I feel in the sult trade of this country prompts $m e$ to take some pains to give you the required information. Yet the short time I have had since the receipt of your letter precludes me from answering your several inquiries with perfect satisfaction to myself in regard to their accuracy.

1 will, bowever, venture to give you the following statistics, which, from the lest information I have been able to oltain, I believe to be mainly correct:

Estimated Quantity of Salit manufactureid in tue
United States tea Annum.

In the Stato of Massachusettr (mortly in vata buitt atong the nea-shore).

Bushel.

In the Stato of New lork (Onondaga County),

In the state of VIrglaia Kanawha and Kings

here are salt lakes in the United States territeries -one in the southwesterly part of Texas and one or more in Utah-where salt of good quality is foond in great abundance. Nearly nll of the salt manufactured in the United States is made by bolling, oxcepting what is made in Massachusetts, Filorida, and the Solar Works nt Onendaga. The amount of salt munnfactured at the Solar Works of Onondaga in 1856 was 709,391 bushels. The amount of salt manafactured in kettles in Onondlaga in 1855 was $5,258,419$ bughels. When the works (ut Onondagn) are generally running, they require $3,000,000$ gatlons of brine daily, and the supply is not less than $2,000,000$ rallens per day for six months. The annual report of V. W. Simitl, Eiser, the State Superintendent of the Onondaga salt sprimgs, which I hurewith hand you, furnishes valanble information iu regard to the manafacture of salt, the sallne deposits within our State, and such other general information pertaining to this necessary articlo of animnl subsistence, as to render it one of the most accurnte and interesting public docaments publlshed in our cemntry.

The wells in the Virglnia aalt springe are about 900 feet tleep. The wells at Pomeroy and West Columbin are from 1000 to 1200 feet deop. The estimated quantity eiforeifn salt consumed in the Unitod States and territories is abeat $13,500,000$ bushels per annum. The amovit of salt consumed in tho United States (for va-
rlous uses) is about sixty pounds to each inhabitant. The consumption in France ls estlmated at 21 各 pounds; in Great Britain at 25 pounds for each inhabitant. The cost of manufacturing salt by bolling in Onondaga, as per estimate, during five consecutive yesrs, sverages abeut $\$ 1$ per barrel of 280 poonds. The freight charged on our canals on domestic salt, in barrels of 280 poumde ench, from Onondaga to Buffalo, 198 miles, is about 15 cents per barrel over the toll pald to the State, which is one mill on 1000 pounds per mile in the canals. To Oswego, 35 miles, the freight is about six cents per barrel over the toll.

The freight on foreign and domestic salt from Albeny to Buffale, 364 miles, is about $\$ 3$ per ton (of 2000 pounds) over the tell. Frelght from Albany to Oswego, about 209 miles, is 82 per ton over toll. The freight from Naw York city to Oswego and Butfale eia Albany is precisely the same as though shipped at Abbany, although 148 miles farther.

The toll on foreign salt on our State canals is five mills on 1000 pounds per mile. The freight on a barrel of salt from Oswego to the principal ports on Lake Erlc (average distance about 450 miles) is 12 cents per barrel. The freight to the principal ports on Lake Michigan, distance about 1000 miles, is 95 cents per harrel. The freight from ports on lake lirie (aay Cleveland and Toledo) to the Ohio Hiver and Cincinnati is 50 cents per barrel. The freight from Chicago to the Mississippi River and St. Lonis is 50 cents per barrel. The minimum price of salt at the Ononlagn werks in 1849, '50, and '51 was from 70 to 90 cents per barrel ; in 1852 , $\$ 1$ per harrel ; in 1853, $\$ 112$; in 1854, 8125 ; ln 1855, 8130 ; anc'. in 1856, $\$ 140$ per barrul. The solar salt cests about the same price to manufacturers as toiled salt. The solar salt weighs nbout 70 pounts to the 1 ks I (mensure). The hoilet salt welghs about 56 "'re.fy io the hushel, varying, however, necording te :... 'on of the kettles, to a weight consitlerably alove ...tu aso considerably below this stuudari. The duty paid to the State of New York on salt mannfactured at Onondaga is always reckoned on 56 peunds (the statute bushel), and covers the expense incurred by the State for pomping up the water and delivering it to the premises of the munufacturers.

A salt block at Onondaga, of the largest size, is made of brick about 12 to 15 feet wide, foor to five feet high, and ferming two parallel arches, extending the whole length of the block. Over and within the top of theso arches are placed common cast-iron kettles, helding about 50 to $\% 0$ gallons of brine, placed elose together in two rows the whole length of the arehes. A fire luilt in the menth of the arches passes under each kettle lnto a chimney, luilt generally 50 to 150 feet high, averaging from 50 to 70 kettles in each hlock. A siugle block with one row of kettles is about half of this widlh. The quantity of salt made in one of these double blocks in the year (say elght months) averages 20,000 to 25,000 buslicls of 56 pounds. The cost of a bushel of sult produced at Kanawha is about $17 \frac{1}{2}$ cents. The price of freight on a sack $0^{*}$ Liverpool salt from New Orleans to Lonisville ayerges about 35 cents per sack. A good portion of the coarse, hard salt imported into the United States from the most southerly islands of the West India greap is kiln-dried, elcansed, gronnel very finc, and put in small phekages for collnary or dairy use. The nmount of coarse and fine salt imported into the United States from forelgn countries for the year ending June 30, 1850 , was $15,405,864$ bushiels. The amount of domestic salt exported during the year ending Junc 30, 1850, was $688,40 \%$ hushels. The amount of foreign salt exported cluting the year ending June 30, 1856, was 126,427 bushels.

Yours, truly, Samuei. Hotading.
Patents were issued by the United States Patent Office in 1850-1. For improvement in nppuratus for evaporsting salt. 2. Improvement in apparatus for solar salt evaporation. B. Improvement in salt evaporators.

The whola amount of ralt inspected on the Onondaga nalt aprings during the yenr lxbit was $5,9 t \mathrm{~s}, \mathrm{x} 10$ bundels. Thin is about $1: 20,000$ bunheln nhort of the fin*pection of 1855 , but excecdn, however, that of any jre. vous year, leing lim, 000 more bunbels than were returned in : whis. In the ordinary course of evente, considering the increase of population in the Wentern mark. cts "r Unominga malt, and the addithonal facilitien of
trampportation constantly brought linto use, the inspection for 1856, according to the offieinl lieporta, ought to bave reached $6,500,00: 1$ binshels. Tho two prifui, al causes prolucing the deflecency uay be found in a more stringrate atate of the money inarket during the whole season, and in the enhancement of the price of salt at the works. $\$ 140$ per harsel in 1856 against 4120 in 1850. The amount of malt actually manufacturel in 18its, and either sold and shipped or remalning in oriplnal hands, Is considerably in excess of the mamfacture of any former year. The inspection Indicates very accurately the amount of alea, as no more is inspected during the manufacturing season than what is required to lill orders. The arrivals of Ononduga nult at towe. ge in 1xiti wero 3,483,967 bushels, agmiest $5,0,39,593$ in 18:5)-an increano of 411,344 bushels. The arrivals at Buflalo in 18.06 wero $1,0 \mathrm{k} 1,767$ busheds, ngalnst
 arrivals at all the lake porta 19 I 450 , compared with those in $1 \times 50$, whow a decrease oi 211 , it in hushels.

Baltjetre, or Nitrate of Potash (Ger. Saltpeter: Fr. Nitre, Nelpelre; It. Nitm, Nalnitro; Sy. Nitr, SuLiare; Rusa. sienitra; Iat. Nitrum; Arah, L'blir; llind. Showh ), a ault well known in commerce, nud nf great lmportanco. It may be regarded hoth as a natural and an artilicial production; being found on the surfuce of the moll in many parta of Indin, Egypt, Italy, cte.; but in theae and other placen all that is known in commerce ln oltalned by an artiticial process, ir by lixiviating earth that has heen furmed into nitre beels. The saltpetre conaumed in Foggland is brooght from letugal In an impure state, but erystallized, in bapy, each containing litit tha. Saltpetre furms the princtpal ingredient in the manufncture of gunpowider, and is used in varloun arta. It is almo uf great utility in the commeree of India, from its furnisting $n$ linte amount of tead weight for the shipplng engitged in it. Snltpet re proseases considerable antiargitic pawir. That wheh in of the leent quality and well relined is in long, transparent cryataln; its tante in sharp, hitterish, and coolhig; it thames much when thrown upon burning coala : it is very trittle ; specific gravity, 196 B . It is not altered by exposure to the air.
lseckmann contenda, in a long and claborate dissertaion (Hist, of /nvent.), that the rncients were mac* quainted with maltpetre, and that their wirmm was really an alkaline salt. Bu* as saltpetre is proluced
nuturally in considerabis quentities in Egypt, it is diflicult to suppose that they could be entirely lignerant of it, though it would appear that they had contonnded it with other things. It has been known in the East from a very emily period. Heck:tann concurs in opinlen with those who believe that gunpowder was Invented in India, and brought by the Saracens from Africa to the Eurepeans, who improved its manufacture, and made it avallable for warlike purposes.

The Mammoth Cave In Kentucky was used as a placo fer the manufacture of saltpetre daring the war of 1812. The soil in the cave is thoroughly impregnated with saltpetre; but in consequence of the difficulty of transportation, the manafacture has been abandoned.

Salvage, as the term is now understood, is an allowance or compensation made to those by whose exertions shlps or gools have been savod from the dangers of the seas, fire, pirates, or enemies.

The propriety and justice of making euch an allowance cuust be obvious to every ons. It was allowed by the litws of Rholes, Oleron, and Wisby ; and in this respect they have been followed by all modem maritime states. At common law, the party who has aaved the geods of another from loss or any imminent peril has a lien upon them, and may retain them in his possession tal payment of a reasonable salvage.

Salrage upon Losses by Perils of the S'ea.-In fixing the rats of salvage, regard is usually had, not only to the labor and peril ineurred by the salvors, but also to the situation in which they may huppen to stand in respect of the property saved, to the promptitule and alacrity manifested by them, and to the value of the ship and cargo, as well as the dagree of danger irom which they wero reseued. Sometimes as largo a proportion as a half of the property saved has been allowed as salvage; and in others not more than a tenth.

J'arties entitled to salvage are all those who have contributed to the safety, cither by personal exertions or by sammary sacrifice, provided it did not fall within the course of thelr regular duty to make the exertions or saerifice. Thus neither the master nor seamen of the ship in danger have any title to it ; nor have any passengers for any ordinary assistance they may give; but it is not the duty of passengers to remuin on hearil in time of danger, nor to lnear any responsibility by undertaking the management of the slip; and if by doing the one or the other they contribute to the safety of the ship, they may be entitled to salvage.

If, before the service is rendered, a bargain is made for the amoent to be paid for the assistance, this amount settles the cinim for salvage; so if $t$ wo ships enil as consorts, as is customary with whaling ships, on the terms of rendering each other mutual assistance, nuither can claim salvage for assistance rendered to the other.

All the officers and crew of a British ship are under
obligations to asalat ships in distress; they are, nevertheless, to recelve salvage for their aerv ces, sulyjet to the condlitions expressed $\ln$ the Britho statutes. The owners, also, of a ship which has sroved another are, besides being remunerated for stores or other matters contributed, or injury done to their ship, entitled to salvage for the detention of theit ship, the risk of vaeating their insui nee, etc.-See Suipriva.

The salvage is to be paid by those who would have borne the loss had there been no assistance, in the propertion to the henetit they have received. If the ship was in the course of earning freight, the freight must contribute. The wearing apparel, etc., of the master and crew are nut liable for salvage.

The aubject of salvage was largely discussed in our courts in a case of recapture. The 1istrict Court of New York allowed as salvage ons half the valus of the ship. The Circuit Court reversed the deeree, and denied all aalvage, The Supreme Court of the United States corrscted both decrees, and allowed one sixth part of the net value, after deducting the charges. The court in that case admitted the rule to be, that a neutral vessel, captured by a belligerent, was entitled to be dlscharged without paying sulvage, on the ground that no beneticial service was thereby rendered, as the neutral, acting properly, would of course be discharged by the courts of the novereign of the captor; and they adnitted Jikewise the exeeption to the rule when belligerent eaptors and courts were notorious for their unprinclpled rapacity. This rule and the exception have been frequently dechared in the English admiralty. The rule of British jurisprudence in respect to recaptored property of British subjects to allies, until it appears that they act upon a less liberal principle, and then the allies are treated according to their own measure of jastice. 'i he same rule has been adopted by statute in this country, and is founded on the immovable busis of reciprocal justice. Though the contract of seamen be not dissolved hy shipwreck, and it bo their duty to remain und lator to preserve the wreek and fragments of the ship and eargo, yet they may bo entitleil to recompense, by way of salvage, for their peculiur services. Tho wages recovered in the case of shipwreck are in the nature of salvage, and form a lien on the property saved. The character of seumen creates no incapacity to assumse that of salvors; and were it otherwise, it would be mischievons to the interests of commerce, inconsistent with natural equity, and would be tempting the unfort unate mariner to ohtain ly plunder and embezzieuent, in a common calamity, what ho ought to possess upon principles of justice. Tho allowance of salrage in such cases is and ought to be liie ral; not less, in any case, than the wages would have amounted to; and even an additional recompense should be made in cases of extraordinary dunger and distinguished gallantry, when the servies was mueh enhanced by the preservation of life, and the great value of the property at stake.-Kens's Commentaries, vol. iii.-Siee Insinance.

Sample, small quantity of a commodity exhibited at public or privite sales, as a specimen. Sugars, wool, spirits, wino, coffee, and indeed most apecies of merchandise, are sold hy sample. If an article be not, at an average, equal to the smmple hy which it is sold, the buyer nay cancel the enntract, and return the artiele to the seller,

Sandal-wood, the wood of a treo (Santalum allum, Linn.) laving somewhat the appearance of a large myrtle. It is of a deep yellow celor, and yields an agreeable perfume. The tree, when cut down, is usually about nine inches in diameter at the root, but sometimes considerully more. After being felled, it is barked, cut into billets, and buried in a diy place for about a couple of months, during which time the white ants eat off the outer wood, without touching the heart, which is the sandal. It is then taken up and sorted, according to the size of the billets. 'ibe teeper the
color, and the nearer the root, the higher in the perfrume. Reject aueh pieces as are of a pale color, small, decayed, or have white wood about them; and take enpecinl care that it be not mixed with wood renembling mandal, but withsut its perfume. - Milacus's Orient. Commerce.

Sandal-woat is extensively empioyed F , the Hindoos as a perfume in their funeral cerer \%1. © but the Cbinese are its princtpal consumers. nanufacture it into fans, and small artieles of furnuture, and use it, when ground into powder, as a cosmetic. During the year ending the 3int of December, 1848, there were importel by British vensels into Canton 20,732 plenls of sanilai-wood, valued at ${ }_{\psi} 207,400$; and the Imports in some years nee more than twiee this amount. The average importation into Caleutta is about 200 tons a year. It grows principally in Malabar, in the mounthir.ous country nt a little distanse from the low aenaconst ; in Timor; and in the Fejee Islands in the South Sea. Calcut ta is princlpaliy eupplied frem Malalar, while China derives the larger portion of her supplies frum 'limer and the other isiands. It is seldem lurought to Europe, except by individuals for their own use, or as presents for their friends.- Bena.'s Eirtemal Cimmen of Bengal; Cenwyons'a /adian Archipelago.
Sandals, a niecies of slippers worn by the ancient Jews, (irecks, and Lomans. 'They consisted of a solo with a hollow part at one extreme, to emilrace the ankle ami leave the upper part of the foot lure. Origmally amulais wero mato of leather; the they afterward lrecame articlea of great luxury, helng made of gohi, silver, or other preclons stuff, und most heauthfully ornamented.
Siudarach, a resinous aubatence, commenly inet with in lonse granules a littic larger than a pea, of a whitinh yellow color, brittle, intamminde, of a resinous smell, and aerid, aromatie taste. It exubes, it in wnid, in warm ellmates, from erack a and iacisions in the common Juniper loush, It la used as n varniph, dissolved in spirits of wine.-Arsm.ıe's Mat. Indicu.
San Domingo. The ohl Spanish part of the baland of San Domingo, or the Lominican Republic, embiracos the territory as seltied by the treaty of linits between Spmin and I ranee in 1777. Aceording to thoso limits. its area would comprise nhout two-thirds of the whoh inland, or over $18,(x) 0$ square miles. The popuintions of the republic reaches nhout 120,500 sonta, compused of Spaniards, creoles, and hlacks. The population, however, is stated hy some authoritien ta exeecd 250,000 ; hut this is prohally ton larige. The nutural productions of the repulite are ull kinds of valuable wood, copper, iron, salt, eonl, etc. Its moil is very fertile, but its climate is unhealliy, and ot certain seasons exceedingly fatal to foreif: .ers. The chief staples of the repablic nre mahogany, lignum-vites, dye-woots, tobacco, honey, and hides. The iniports from the l'nited Statem consist of ansorte! cargoes, thour, ete.; liut most nsualiy our vessels enter the ports of the repmbiie in ballast.
The tariff of dutien is based upon a fixed value aselgneil to each class of merchandise, on which a duty of 25 per cent. in leviel. The gen ral seope of these dutien may te illustrated by selecthog from the latest tariff the article of flour. The tariff valuation of this article fa 85 per barrel of from 175 to 200 lis. ; the tuty on which, at 25 per cent., would he $\S 1 \pm 5$. These dutien are permanent (so long as the tariff continnes unaltercel), and are in no manner dependent on the luctuation of prices. The tonnage duty on American vessels is 81 per tory in port, and so centa ${ }^{\circ} \times \mathrm{r}$ ton for tha cuast, heing 50 per cent, more than in charged on the vesseis of such nations an have recognized the independence of the repubile, or have entered Into treaties with its government. The effect of this, as well as of other discriminations against the Annerican flag, ham been to give to the flagn of treaty nations, especialiy to that of (ireat liritain, a large share of the carrying
trade hetween the United Statea and tho Deminican Lepublic. In 1804 a treaty of amity, commerce, an: navigation was agreed mpon and executed liy plenipotentlaries of the two governments duly appointed for that purpose; but, oljectlons being made to some of Ita stipulations ty the Iominican legislature, it was not contirmed. An amendinent, defning the rights of Irominican eitizens in the United Stater, was propused, to which the commissioner of the Unlted States ohjected, and thus the matter is understood to stand at the present time. The following tabular statements exhibit the trade and navigation of the Dominican Republic during a period of four years, ending with 1852 , tugeth or with an analy:is of the trade and navigation of each of the ports, Sun Domingo and Porto Plata, dr" - the year last designated:
Tgain and Navigation of the tominican Retebile.

The following is n summary of the trade het ween the Enited States und the port of San Domingoduring the last six months of 18ist, viz.:

Number of veaseis entered and cleared 28 , with at
aggregate of 2520 tons ; of these, four entered in ballast, and ten with assorted cargoes. The homeward cargoen consiated of mahogany, lignum-vitee, hides, and heney, and amounted in value to $\mathbf{6 6 , 2 7 0}$. During the same period there entered six vessels under liritish colors, measuring in all 518 tons: one French vessel of 139 tons; one Danish of 125 tons, and one Dominican of 68 tons; total number of forelgn vessels (exclusive of Amerlcan) nine, with an nggregate tonnage of 850 tons. During the first six months of 1855 there entered and cleared 40 vessels from the United States (under the Aunerican flag), measuring in the aggregate 3375 tons; of these, 13 entered in ballast, and 7 with assorted cargoes, Including one laden in part with fiour. Value of cargoes, inwarl, $\$ 27,650$; value of cargoes, homeward, 84, fiGt. Llomeward cargoes consisted of mahngany, lignum-viter, satin-wood, fustic, hildes, and honey.

The commerce of San Domingo with the United States for the year 1857 was as follows:

The latest revision of the Dominican tariff bears date 18 th June, 1853. The valuation of several articles, including domestlc cottons, boys' slooes, ete., lins heen reduced; while in a few others, including woinen's shoes, there is an incrense-on the latter article from ${ }^{57}$ to $\$ 8$ per dozen, which will ralse the duty from $\$ 175$ to $\$ 2$ per dozen. The finnncial and politicul difficulties now experienced in the Dominican Republic can hardly fail to he felt in the general move:nents of its forelgn commerce.
The reader is referred to the article Ilarti for the comparative statement of the cominerce of the Lnited States with the island of San Domingo-embracing the empire of IIayti and the Dominienn lepullic-exhibiting the value of exports to aul imports from each country, und the tonnage of Amerlcan and forelgn vessels arriving from and leparting to each country, durlng the years designated.

A Dominican vessel arriving in the United States from a port in the Dominican Republic is liable to a tonnage duty of $\$ 1$ per ton, that being the rluty imposed on the tonnage of vessels of the Unitel Stntes arriving in sald republic; hut the cargo is not liable to a discriminating duty of 10 per cent., no such duty leeIng levied by the Dominican Republic on the cargocs of United States vessels arriving in the ports of that republic. - See IIayti. For Political lelations of England with San Domingo, see Fuaseis's Mag. xlii. 133 ; same artlcle, Living Age, xxvii. 126; Edinburgh Review, xvii. 372.

Bandwich Islands. A group of eleven islands In the l'acific Occan. They were discovered ly Captain Cook in 1778. Many voyagers report that the natural enpacity of the natives seems in no respect below the common standard of mankind. It was in one of these islands that this illustrious circummavigator fell a victim to the sudden rceentiment of the natives, Feb. 14, 1779. Tamehamcha, chief of Itawnii, becomes king of the group, 1800. Nihoriho, his son, sueceeds him, 1819. Idolatry abolished, 1819. Jihoriho and his queen died In England, 1824. Knnikenouli, 20 years of age, king, 1824. Nission estnbllished by the American Ilourl, 1820 . In 1832 there were 900 schools and 50,000 pupils in the islands. Trenty with the French, made with admiral Dupetit-Thouars, 1837. Another, cuforcing the introduction of Cutholic missionaries, etc., 1839. Tamehameha III. becomes king, Dr. G. P'. Judd, an Anserican, prime minister. In 1831 there were 14 ships, 2630 tons, belonging to the is!-sinds-which are Important to the United States ns a whaling station.

This remote but interesting group is situated in the
midint of the Pacific Ocean, in about lat. $21^{\circ} \mathrm{N}$., and long. $157^{\circ} \mathrm{W}$. It comprises elght Inhabited and four uninhabited Islands, Owhyhee, where Captain Cook was kllled, belng the most considerable. They are of volcanle formation, and mountainous, som of the peaks rising in Owhybee to thetween 13,000 and 14,000 feet in height ! The population in 1847 is sald to have ainounted to above 112,000 , of which nenrly 40,000 belongel to Owhyhee. Hut it is a curious fact that the native population has been rapldly decreasing for some years past, and does not now probably exceed a third part of lts amount at the epoch of their discovery. The Islanders are honorably distinguished among tho Polynevian nations ly the advancea thet have made lis civlllzation; and partlcularly by thelr progress in manufactures, navigation, and commerce. Christinnlty was introduced by the American missionaries in 1820, and ls now the religion of the state; schools lave heen established, churches have been built, and the forms of religion are pretty well ohserved. Enropean usages have become fastionable; and the costume of the better classes, women as well as nien, closely resembles that of the Americans.

The following table exhibits the population of the princlpal islands, according to the census of December, 1853:

| Lelanda. | Nativer. | Foroiknera | Putn! |
| :---: | :---: | :---: | :---: |
| llawall ................ | 44,193 | 259 | 24.401 |
| Manl . . . . . . . . . . . . . . . | 17.420 | 24 | 15,4it |
| Molokal. . . . . . . . . . . . . | 3,605 | 42 | 3,6)7 |
| l.anai. ................. | 809 |  | 599 |
| Gath................... | 17,915 | 1311 | 19,120 |
| Katal . . . . . . . . . . . . . . | 6,726 | 20. | 6,090 |
| S ${ }^{\text {Lhhan................ }}$ | 796 | ... | 790 |
| Tntal............... | 71,118 | 2120 | 73.229 |

The staple exports of the islands are: Sugar, molusses, sirup, coffee, goat-skins, sweet potatoes, wool, hides, salt, tallow, beef, pulu,* and arrow-root. Agriculture has made but little progress, anil will never, probably, occupy the natives to any great extent. There nre many excellent tracts suitable for the production of coffee, wheat, vines, etc. ; but the means of subsiatence are so easily procured, that the inhabitants liave but few Inducements, even did they not lack the Industry and enterprise, to become extensive agrienlturists.

There are large tracts of good grazing land scattered throughout the island, and the growth of cattle is a leading. perhaps the most profitnble, branch of agricultural industry. There are also mumerous sheep runges, on which are tended nbout 12,000 sheep; but the hisiness is not encouraging.

The eminently alvantageous position of the Sundwheh Ishnids, lying on the great route letween Americn and China, invited nt an early period the cuterprise and cnpital of several European and American settlers, and led to the establishment of a gomowhat active trade. They constitute a common centre between the three principal whaling grounds of the Northern Pacific-one on the equator, the other near Jupan, nud the third toward the Behring Sea.

The principal port is Honolulu, on the south side of the island of Woahoo, in lnt. $21^{\circ} 18^{\prime} 8^{\prime \prime}$ N., long. $157^{\circ} 55^{\prime} \mathrm{W}$. l'opulation about 8500 , of whom alout $1: 00$ are Englishmen, Amerleans, and other foreigners. The harhor, to which the place owes nll its importance, has a narrow entrance, but it is ansy of access at all times of the tide to vessels not drawing more than 18 feet water. The har at its month leing narrow, and composed of soft eoral, it might casil! be made nccesslble even for line-of-bsttle ships.

Commercial relations between the United States and the Sandwich Islands had existed for many years before the treaty of 1849. As far back as 1832, when the native populntion of the islands nmounted to 130,315 (nearly double its present number), it appeare that the

Photographic Sciences Corporation

soon after introduced into Europe, hat it is doubtful whether this were done by the Arabians or Greeks. The mode of fabricmting paper from cotion and other vegetahle materials belng once discovered, lts fahrication from linen rage waa a comparatively easy, and in Europe, where cotton was then extremely scarce, an all but necessary step. It is singular, however, that we have no poaltive information eicher as to the country where, or the epoch when, paper from rags began to be msnufactured in Europe. Mais on ne peut reculer son invention plus tard, qu'au Treizieme siccle, ni son usage ordinaire au-delis du Quatorzieme. - Nouveau Trait, etc., i. 524. In fact, Egyptian psper, or paper made of papyrus in the manner described above, continued to be partially employed down to the middle of the eleventh century, though parchment was then the principal material used in writing. It is curious to observe how very shartly the introduction of paper preceded the invention of printing, to which, indeed, as already seen, it was an indispensahle preIlminary. Muratorl attributes the ignorance of the barbarous ages principelly to the scarcity and high price of paper, and the superior intelligence of modern times to its abundance and cheapness. - Andmes, $i$. 200. And whatever opinion may be entertained as to the first part of this statement, there can be no question that the latter is perfectly well founded.

Not only are we in the dark as to the history of modern paper, but we are unable to make any very satisfectory conjectural estlmate of the mode In which it was invented. It is all but certaln that tho invention must have been suggested by accident, or by ohserving the effects produced by the accidental drying of triturated vegetable maiter, or $\ln$ some such way; and that the hint thus afforded was gradual!y improved upon, It is not posstble to Imagine that the invention should heve been wholly the result of design; for we can not conceive how any one without any previous knowledge should have proposed to himself to produce paper by pounding rage, or other vegetable matter, mixing the mass in water, and then pressing and drying the deposit. But, without indulging in unprofitable conjectures, it is at all events certain that, however and by whomsoever discovered, no invention has been of groater importance. Chartas usu maxime humanitas vita constet et memoria.- Pliny, Mist. Nat. lib. xlil. cap. 11. The proceases by which the most worthlees and vilest materiele are converted into auch admirable substances as paper and glass are probably the greatest triamphs of haman talent and ingenulty. They have more than realized the dreams of the alchemists, and have heen incomparably more advautageous than if we had become acquainted with a means of transmating the inferior metals into gold.

In 1813, Dr. Colquhoun estimated the valne of psper annually produced in Great Britain at $£ 2,000,000$; bat Mr. Stevenson, an Incomparahly better authority upon such eubjects, estlmated It at only half thls sum. From information obtained from those engaged in the trade, we incllne to think that the total annual value of the paper manufactured in the United Kingdom, exclusive of the daty, may at present amount to about $£ 1,600,010$ or $£ 1,700,000$. There are about 700 papermills In Engiand, and from 70 to 80 in Seotland. The number in lreland is but inconsiderable. Of these mills, we believe, very few have iately been unemployed. It was formerly customary to collect the rage used in the manafacture into large heaps, in order that, by their heating and fementation, they mlght be the more easily reduced to filaments. But this injured tho rage; and it is now the practice to teer thein to pleces, without any such preparation, by poworful machines constructed for the purpose. Daring the present centary this manufactare las been algnally promoted by the combined Influence of science, ingenulty, and mechanical skill. These heve been nuccessfully exerted In the preparation of the pulp; the converalon of the pulp

Into paper, and the proviaion of materials; and in none has their influence been more remarkable than In the last. This ds evident from the fact that, while the munufacture has been more than doubled since 1820 , the demand for Continental rags and other foreign materials has actually been rednced withln that time, in consequence of the immense home supply we derive from substances prevlously regarded as worthless, and treated as refuse. The oweepings of cotton and flax mills, owing to the gresse and dirt with which they are mlxed up, were, until wlthin these few years, of no value whatever, except as manure. The chemical and mechanical processes by which these materials are purlfied, whitened, and made svailable for the production of paper, without their strength being impalred, are not only exceedingly interesting in themselves, but are of great nationallmportance; and, by reduclng the cost of paper, havs done ten times more to lower the price of books, and diffase literature, than all the efforts of all the socleties that ever existed.

The first idea of a machine for converting pulp into paper originated in France, the inventor being un ingenious workman of the name of Louis Robert. A model of thls machine was brought to England by M. Leger Dldot; and though at first it was far from givIng an asearsnce of success, it sufficed to induce Eaglish capitalists and engincers, particularly Mr. Donkin, to follow up the scheme; and In the course of a fow years they brought it to a blgh degree of perfection.

The following tabular statement exhiblte the aggregate quantities, values, and prices per pound of raga imported into the United States from all countries, distinguishing in a separate column the quantities received frem Italy during a period of ten consecutive years, from 1846 to 1855:

| Years. | $\begin{array}{\|c\|} \hline \text { Ragn imporit } \\ \text { ed from on } \\ \text { E'ountries } \\ \hline \end{array}$ | $\begin{aligned} & \text { Ragn } \\ & \text { imported } \\ & \text { from Itoly. } \end{aligned}$ | Aggrogate | $\left\|\begin{array}{c} \text { Priec } \\ \text { per } \\ \text { pound. } \end{array}\right\|$ |

| Ann, average. | 20,488,871 | 14,830,015i | 732,87: |  |

From the preceding table it will bo seen that during the decennial period ending with 1855 the aggregato quantity of rags imported into tho United States from all parts was $200,631,954$ lhs., while the aggregate quantity received from Italy reached as hlgh as $148,300,15 \mathrm{ja}$ lhs. The annual average for the perlod designeted will, however, furnish a more statistical basis for ascertainIng tho relative Importance of Italy compared with ali other conutries as tise principal source of supply upen which tho United States must rely, with any degree of cortainty, for an article the consumption of which Is so rapldy increasing thero; oven during the past year, an alarming deficlency of the manufactured material was seriously approhended by the conductors of our periodical and nowspnper journals. The average annual quantity imported into tiie United States from all countrios during the period designated was $20,988,871 \mathrm{lbs}$; the average anmual quantlity receiced. from Italy was $14,880,015 \mathrm{lbs}$. Thus It is siown that instead of one-fifth Italy uctually furnishes nearly two-thirds of all the raga limported linto the United States.-Ses Raga.

The consumption of paper in the United States is equal to that of France and England combined. In other words, the $28,000,000$ inhabitants of the United States consame as much paper as the $64,000,000 \mathrm{in}$ hahitante of France and England. This is very near- than in sile the e 1820, gama ime, in derive :ss, and nd flax hèy are no valcal and are puduction red, are but are the cost he price fiorts of rert. A d by M. om givluce En[r. Donrrse of a p perfec
ly correct. The atstistics, however, will prove intereating. The number of paper - mills in operation in England in 1885 was 750, and the annusi value of the paper manufactured reachad as high as $\$ 8,000,000$. At that period, however, the manufacture of paper was burdened with an excise duty amounting to more than thres times as much as the total wages of the hands employed in making it, and the qnantity annually produced did not exceed $50,000,000 \mathrm{lbs}$. of first-class and $16,000,000 \mathrm{lba}$ of second-class paper, requiring a supply of about $100,000,000 \mathrm{liss}$. of rags.

Improvements in machinery and mode of manufisoture, and the appllcation of steam, have reduced the number of mille in Great Britain and Ireland to 380, according to the latest statietical returns; while the quantity of rags annually consumed has risen to $201,600,000 \mathrm{lhs}$., or over 100 per cent. We have compiled from a recent, though in this country a rare Dabiin publication on atatiatles, the following tabular statement, showing the quantity of paper manufactured, consumed, and exported In Great Britain for a period of nine years, ending with 1854:
Comparativa Statenent erowing the Quantities oy
Pafri manticotured, coneunid, and exportid in

| Yeam. | Poundr of Papar manntictured a Gresl Britala | Ponadi of Paper retnined for Conginmplion In Great Hritaln. | Founds of Paper esported from Groal Eritaln |
| :---: | :---: | :---: | :---: |
| 1846 | 127,400,000 | 128,600,000 | 4,888,000 |
| 1847 | 121,900,000 ' | 116,100,000 | 5,852,030 |
| 1843 | 121,800,000 | 116,600,000 | $\therefore 5,180,000$ |
| 1841 | 182,100,000 | 189,100,000 | 6,068,000 |
| 1850 | 141,000,000 | 188200.000 | 7,762,000 |
| 1851 | 160,900,010 | 148.5]0,000 | 8,305,000 |
| 1859 | 154,470,000 | 147, 100,000 | 7,328,900 |
| 1858 | 177,600,000 | 164,300,000 | 13,290,400 |
| 1354 | 177,800,000 | 161,700,000 | 16,112,000 |

France turns into paper annually about $235,200,000$ lbs. of rags, producing about $156,800,000 \mathrm{lbs}$. of paper. In the United States there are 750 paper-mills, which work up each year about $405,000,000$ lbs. of rags. Assuming (the asual estimate) that $1 \frac{1}{} \mathbf{l b}$. of raga yields 1 lb. of paper, we have the foliowing comparative statement for the United Statos, and France and Great Britain combined:

|  | $\begin{gathered} \text { Ponode of } \\ \text { Bago natually } \\ \text { consomed } \end{gathered}$ | $\begin{gathered} \text { Pooonds of } \\ \text { Papor Annoaly } \\ \text { manufaclared. } \end{gathered}$ |  |
| :---: | :---: | :---: | :---: |
| Itted 8 | 400,000,010 | 970,000,000 | 10.80 |
| Greal Britain and France combined) | 436,800,000 | 291,200,000 | $4 \cdot 5$ |

From this statement it appcars that the United States consumes $31,800,000 \mathrm{lbs}$. of rage, and manufactares $21,200,000 \mathrm{lbs}$. of paper, lese than Great Britain and France combined, while the quantity of paper msaufactured per capita of the population of the former is mure than doublo thnt assigned to the combined population of the two latter. The quantity of paper imported in Great Britain and France and addod to
the stock for consamptlori might vary alightly, bat not materialiy, the above reaults. The preceding statement, however, omits the quantities annually imported and exported by each of the countriea respectively, items without which no calculation as to consumption can be accurately made. The importation of paper of all klnds fnto France in 1858 did not exceed 837,104 lba., while the experts amounted to $17,053,657$ lbs. This gives an excess of exports over imports to be supplied from the stock of demestic manufacture, of $16,716,553 \mathrm{lbs}$. Deduct this from $166,800,000 \mathrm{lbs}$., the quantity manufactured, and we have left for consumption $140,088,447 \mathrm{lbs}$., or $3 \cdot 89 \mathrm{lbs}$. per capita of the popolation.
During the same year there were imported into England, according to the Report on Trade and Navigation, $909,250 \mathrm{lbs}$. of paper. The report gives this quantity for the last six moaths of the year only; assuming that the importation during the first six montha was equal to that for the last as above given, and the total importation would reach, say 200,000 lbs. The quantity exported, we havo seen, was $13,296,874$ lbs., leaving an excess of exports over imports of $13,696,874$ lbs. Recent and important improvements have been made, by the use of refuse tanned leather, bark of the cottonstaik, pulp from the fibres of endogenoua plante, as raw materials for the manufacture of paper.--Scientific $A \mathrm{nn}$. Exports of Papar and Stationert of Domigtio ManuFAOTURE FHOM THE UMHED STATEA YOE THR YEAR ENDING J tre $=80,1556$.

Importe or Pafea and Mantyaotuaeg of Pafei into tag United Btateg for tife Yeag endino June 30, 1856.

Paper Boxes.-The manufacture of boxes from paper, or rather pasteboard, han become a very large one, from the custom of so many manufacturera selling their goods in these boxes. It is said that in Paria four thousand pernona are employed in this trade alone. The trade is divided into six branches.. The first comprises the most elaborately-finished and ornamented boxet, for the display of artificlal flowera, rich velveta, ribbona, allks, trimmings, modale, miniatures, and corbeilles for weding presents. The second class conalate of boxes and small ornaments for confectionera. The third kind are used for packing toye and trinkets of small aize. The fourth klod are for perfumery, fans, glovea, etc. The fift comprises large boxea for shawle and ribbons for exportation. The aixth are pill-boxes, wafer-boxes, and others of the smallest kind. The French productione in this department of manufacturee are superior to any other In neatnese of execution and taste of ornameutation.

- Chinese Paper.-The Chinese make a filamentoua kind of paper much maperior to ancient papyrua; it obtains In England the name of rice-paper; but sufficlent is now known of it to show that this is by no meana a correct deaigaation. Dr. Livingstone introduced Chinese rice-paper in England about half a century ago; it had great favor as a material for artlficial fiowers. It was many yases afterward that information was obtained concerning the mode adopted by the Chineae ln making these small but very expenelve sheets of paper. 'There is a leguminous plant growing in China and Iodia, the stem of which is cut into pieces eight or ten Inches lo length; and these are cut by tho Chinese into one continuous spiral film, on the same principle as the modern mole of vencer cutting, but by the dexterous use of hand-tools. These lamlam, being apread out and pressed flat, form thin sheets, which, after being dyed and otherwise prepared, constitute the rice-paper of the Chinese.

The same ingenlous people make paper of bamboo. The bemboo atoma, when about three or four fnehes thlek, are cut into pieces four or five inches long. Thesc, when softened In water, are washed, cut into filaments, dried and bleached In the sun, boiled, beaten to a pulp, and made into thln sheets of paper. This is truly paper, which the former examples are not; and tho art must have made a considerable adrance before such a methol could have suggested itself.

Paper-hangings.-Stamped paper for this purpose was first made in Spain and llolland about A.b. 1555. Made of veivet and fioss for hauging apartments, about 1620. The manufacture of thls kind of paper rapidly improved in Great Britsin from early ln tho eighteenth century; and it has now been brought to great perfection. Since this important and elegant substitute for the anclent "bangings" of tapeatry or cloth came into uee about 200 years ago, the manufacture hes undergone a gradual succession of Improvements, and has now resched a aigh state of beanty and perfection. The patterns on these papers are sometimes produced by stencil plates, but more commonly by blocke, each color leing laid on by a separato block cut ln wood or metal upon a plain or tinted ground. Tho patterns aro sometimes printed in varnish or size, and gilt or copper leaf applied; or bisulphuret of tin (aurum musinum) is dusted over so as to adhere to the pattern; and In what are called flock papers, dyed wools minced into powder are atmilarly applied. Powdered steatite, or French chalk, is used to produco the peculiar glosa known under the name of satin. Striped papers are sometimes made by passing tho paper rapidly under a trough, which has parallel slits in its bottoun through which the color is delivered; and a number of other very Ingenious and beautiful contrivances have lately been applied in this fraportant tranch of art. Tho inventlon of the paper machlne, by which any length of paper may be obtained, effected a great change in paper-hangings, which could formeriy only be printed
upon separate sheets, and were much more luconven. lent to priat as well as to apply to the wallos.
Prapior-maohe, anme given to articles manafactured of the pulp of paper, or of old paper ground up into a pulp, bleached, if necessary, and moulded into various forma. This artlole has lately been uesd upan an extensive acale. for the mapufacture of mouldings, rosette4, and other architectural ormaments; pilasters, capitals, and even figures as large as life, have also been made of it. It is 1 lghter , more durable, and leas brittle and liable to damage than placter, and admits of being colured, gllt, or otherwlee ornamented. Another article sometimes goes under the came name which is more like pastelionrd, conaisting of aheets of paper pasted or glued and powerfully pressed together, so an to aequlre, when dry, the hardnesa of Loard, and yet to admit, while moist, of curvature and flexure: tertraye, waiters, miffl-boxeq, and simillar articles are thus propared, and afterward;carefully covered by Japan or other varnishes, andioften beantifully ornamented by figures or landscapes and other dovices, etc., occaaionally inlaid with mother of pearl. A mlxture of sulphate of Iron, quickllme, and glue, or white of egg, with the pulp for papler-mache, rendera it to a greater extent water-proof $\}$ and the further addition of berax and phosphato of sode contributes to make it almest fre-proof. The chief papier-mache manufactory in England is that of Bielefeld, in. Wellington Strect, Strend, who has recently publlshed a concise histery of tho manufacture; embelished with numerous Illustrations. : There are manufactories of papier-macho goods now establlshed In Massachnsetts, For theim. ports of artleles of papier-mache, see Papen.
Para, or Belem, a gea-port city of Brazil, capital of the province, 70 miles from the Atlantle, latitude of Fort St. Pedro $1^{\circ} 28^{\prime} \mathrm{S}$., long. $48^{\circ} 80^{\prime} 5^{\prime \prime} \mathrm{W}$. Populat' $\Omega$ catlmated at 10,000 , mostly of European descent. It stands on elevated greund, on the south shore of the Bsy of Guajuara, on the right bank of the Para, or Tacailtins, and has a fine appearance from the river. Chicf edifices, the governor's palace, cathedral, several other charches, convents, barracks, arsensl, eplscopal palace and seminary, formerly a Jesulta' college; a prisen, and an unfinished theatre. Vessels of large draft can lle near tho eity, and the cocos, caoutchoue, isinglass, rice, and drugs, exported from Brazll aro chicfly from Para. It has also a trade in cotton, vanills, annatte, dyenwoods, honey, wax, and a great variety of other vegetable and animal products. The trade is mestiy with Llverpool, London, Barbedoes, Cayenne, and the North American and other Braziliau ports. The Eirer Para, bounding the islapd of Marajo southward, extends between long. $48^{\circ} 10^{\prime}$ and $50^{\circ} 40^{\prime} \mathrm{W}$., receives the $\mathrm{T}_{0}$ cantins and Annapu from the south, and is connected northwestward with tho Amazon.

Para enjoys an advantago possessed by no other seaport town in Brazil-that of an unobstructed intercourse by water wleh the interior. The commerclal reseurces of this province, and the admirable trading position of the eity, are unsurpassed; but inhahitants are wautIng to develop these elements of commerce and civilization. In 1840, some American eltizens estublished several saw-mills at Maguery, In the viclnity of Para; but whother they met with better success than did the Glasgow merchants, whose property to the amount of $\$ 350,000$ was pillaged in the same place during s revolt in 1835, has not been aseertained. The cotten of Para has been higlily prized. Caoutchouc, the use of which was first discovered In 1735 by French academiciaus sent to Brazil to mako aatronomical observations, is abundant, and is sxtenslvely manufactured Into shoes, etc. Wero this articlo admitted inte the United States, as in England, free of duty, it would become one of the staplo exports to thie country. A well-infornied American merchant, reslding nt Para, addressed a ietter on this subject to ono of the officers
of Lleutennnt LIerndon's expeditlon to tho Anuzon, and admits ated. Aname nanie of sheets of id together, board, and exure: teales are thus l by Japan srnamented , etc., accemlxture of hite of egg, to a greater on of borax e It almost ufactory in ton Strect, cise history cerous tilus-apicr-mache For theim. , latitude of Popular in

of the officers the Amazoa,
urging the dlasdvantages under which American commerce labors, an compared with that of Great Britain, in the caoutchouc trade.-Sec "Letter from the Secretary of the Treasury, transmitting copy of circular let. ter end replies thereto, in reference to the Tariff, March 8, 1854.n ${ }^{\text {n }}$ This article is now becoming the chlef etaple of the province of Para'; and so various and multiform are the uses to which it is applicable, both in the arte and in domestio economy -80 important as an article of commerce hap it alresily become, that, even agsinst the import duty of 10 per cent. in the United States, It constitutea almost 50 per cent. of our trade with Para, The following statement exhibite the quantities of Indie-rabber Imported from Para into the Uaited States during the years deslgnated:

The exports from Pars to foreign countries consist of caoutchouc, cotton, rice, castor-oll, copaiva, anisesced oll, cocos, clovee, cinnamon, hides, horns, isinglass, Peruvian bark, etc. From 1816 to 1827, the exports from this, province averaged sinually $\$ 850,131$. The following summary exhilits the total tra, ${ }^{\prime}$, of Para for 1845: Inward-Vessels, 69; tonnage, 11,136; value of cargoes, $\$ 95,040 ;$ of which there entered from the United Statos: Vessels; 28; tonnage, 8920 ; value of cargoes, $\$ 236,200$. Cleared to all countriesFessels, 70 ; tonnage, 11,445 ; value of cargoes, $\$ 737$,52j. To the United States-Vesscls, 27; Conouge, 3628 ; value of cargoes; $\$ 261,620$. In this province, the sugar and coffce plantatione do not produce sufficlent for home consumption, and supplics are usually imported from the nelgbboring provinces. The innports from foreign countries consist of cotton goods, sllks, hardware, wines, spirits, salt, flour, salt prov:sions, gunpowder, etc. The only manufactures are ordinary cotton cloths for sacks and hammocks, and Indis-ruhber shoes; but these manufactures seem not to thrive, from a want of skill to direct them.
Total Number or Veasela, with this Tonncaom, enoaged in tha Teade between Para and Fobigon Countriss, and Value or Exports and Importg, eto. IN 1848 AND 1850.

Staple Productione of Para, aelatively coneidrmed, hith rebpect to the quantities anneahiy ixpoetid:

The above are the leading exports from Para; but, besides these, the province produces varions kinds of timber admirabiy adapted for ship-building purposes, and a great variety of textile plants, medicinal drugs, and dye-woods of the richest qualities. The present population of Para is about 205,000, though the provInce is said to be capable of maintaining some mifitions of inhabitants. With such a population, its natural resources might be more fully doveloped, and Para thus placed, in point of position and commercial importance, in the very first rank of Brazilian ports.Commercial Relations with the United States.
Paraguay, a repablic or consulahip of South America, extends from lat. $21^{\circ}$ to $27^{\circ} 20^{\prime}$ S., and long. $64^{\circ}$ to $58^{\circ} 40^{\prime} \mathrm{W}$. The space thus inclosed forms a very compact territory, nearly in the ehape of a parallelogram, about 430 milies long, north to south, with an average
breadth of about 200 miles, and contains an area of abr'it 86,000 square miles. . Population 300,000 . Capltal, Asuncion. The name Parageay at one time was used in a very extensive sense, 80 as to include the whole of the immense regions of South Americe, between 1at. $16^{\circ}$ S., and the Strait of Magellan, and between Cbill and Poru on'the west, sind Brazil on the esat, riow confined to the republic properly so called. On the north the limits of this state with Brazil are not definitely settled, but in other directions it hse the advantage of great natural boundaries; the Paraua on the eact and south, and its tribitary the Paraguay on the west. ${ }^{\prime \prime}$ The whole surface thius belongs to the busins of these two rivers, a mountaln range of conelder. able elevatlon atretchling between them north to south, so as to form their water-shed; and eend the draiuage In opposite directions, but nesrly in equal portions. The dietance of the water-shed from the river scarcely any where exiceeds 100 miles, and bence the tribntaries by which the drainage is conveyed are more remarkable for their number than their magnitude. By far the largest is the Tibimari, which, owing to an eastern bend in the water-shed, has its couree considerably prelonged, and being angmented by several large afflu ents from the north, becomes a noble atream before it reaches the Paraguay. The surface is mountainous in the centre, and also in the northegst, where a ramiflcation, known by the name of the Sierra de Maracay, or Cordillers de Maracara, breaks off from the central chaln, and proceeding east to the banks of the Parsna, interrupts the navigation of that river, and forme one of the most remarksble cataracts in the world.
Paragusy is one of the fincet countries in the world. It is aimost inclosed by rivers, and the interior is also bountifully watered. The exterlor waters are navigable, and constitute the great avenues which are destince to besome the highwaye of the commerce of a magnificent interior country. Unlike the open countries aurrounding it, Paraguay is well wooded, and smong its treer are many valuabie in the arts and manufactures. It also abounds in medicinal producta, as rhubarb, sarsaparilia, jalsp, sassafras, dragon'e blood, copaive, nux vomica, liquorice, ginger, etc., all of the finest quaiity. Of dye-stuffi, too, there is an immense variety; as cochineal, indigo, vegetable vermilion, saffron, etc. Many of the forest trees yield vaiuable gums, and they comprise some of the most dellcions perfumes and Incense that can be imagined. Othere, again, are like amber, hard, brittle, and insolvble in water. The seringa, or rubber-tree, the prodnct of which is now almost a monopoly with Para, and also the palosanto, which produces the gum guiacum, crowd the forests, and the eweet-flavored vanilia is abundant. Upon the hilla the celebrated yerba maté flourishes luxiuriantly. The cultivated producte are sugar-csie, cotton, tobacco, rice, mandioca, Indian corn, eto. On the piains thousends of cattie range, sand large quantities of hides, hair, horns, bones, tallow, etc., sre iost for want of transportation. The country is not celebrated for ite minerals; but in ail that constitutes an agricultural country, rich lands, a fine climate, and abundance of water, it has no equal. Hitbrito, however, it has been shut out from the woild by the arbitrary will of despotiam; and its future commerce can only be measured from its resources and facilities. The recent revofutions in the states of the Plata have opened the nagnificent rivers of this country, and there is certainty no further impediment to commercial enterprise.

This etate, formerly a proviuce of Buenos Ayres, withdrew from the connection in 1811, and the Span-ish-A merican revolution breaking out about that date secured it from molestation. 'The policy of its rulers has been the excluslon of foreigners from the country, and under Dr. Francia, so ceiebrated in connection with lits annsla, the utmost despotism was exercised. The tyrant dying in 1840 the government was changed in its character, and a mere liberal policy obtained,
and uitimately it has becone in form an elective ropublic. As oarly as 1842, Paraguay acceded to the opening of its rivers to foreign commerce; but until the overthrow of Roass, the tyrant of Buenos Ayres, who axercised authority ovar the estuary of the Plata, the concession, was of no value. The successors of Rosas have now fully conceded free ingreas and egresa with the ees. These important revolutions in the policy of the two conntries will eventpate in the dee velopment of the vast resourcea of the southeastern and middle portions of South America-countries which are unsurpassed in agrioultural wealth and valuable commercial ataples. For further information, see American Statiatical A mnual; American Whig Review, vi. 245 (U.S. Conaul Hophina); North A merican Review, xxyl. 444 (A. H. Evesert) ; Dublin Univeraity, xii. 474 ; Quarterly Review, $x \times$ vi. 277.

The commercial policy of Paraguay, however, is not of that liberal character to attract foreign merchanta to its ports. In addition to the expense of purchasing atamped paper, by means of which every official transaction in the republic is conducted, and without which foreign merchants can not enter the markets, the internal taxes are such as to discourage efforts to develop the resources of the country, and, aa a consequence, to oppress its commercial industry. The aggregate of these taxes bearing apecially upon commerce is atated to amount to 26 per cent. on the value of every article sent to market. They consial of diezmos (tithea), 10 per cent. ; export duty, 10 per cent. ; and on rent of lande (almost whelly owned by the atate, and fixed at a high valuation) 6 per cent. If to this be added an import duty of 20 per cent. on almost every article which the United States could send to the markets of Paraguay, it can be readily consprehended why the name of this republic does not appear among those of other foreign nations the detaile of whose commerce are ininutely set forth in the annual Report on Cominerce and Navigation, prepared by the Department of the Treasury of the United States. The " atampa," to which alluaion has been made, ara djvided into cight classes: those of the first clase cost 25 cents; of the second, $87 \frac{1}{2}$ cents; of the third, 1 ; of the fourth; 82 ; of the fith, 86 ; of the sixth, 88 ; of the seventh, 16; of the eighth, 826. Permission to discharge or to losd a vessel of 21 tons, or 2000 tons, can only be obtained on a stamp of this last description; so that to unload a cargo valued at $\$ 100$ will coat $\$ 26$ all the same as if it were worth 100,000 ; and in like manner as to taking cargo on board. The forelgn trade of Paraguay is conducted chiefly through the ports of the Argentine Confederation, eapecialiy that of Buenos Ayres, and those of the Republic of Uruguay. The exports consist of yerbs mate (with which the hills of the country are literally covered), tobaceo, cigare, wooda, hides, hair, leather, molasses, rum, white starch, mandioca, peanuts, beans, and oranges ; of which latter article not lese than 30,000 bushels are said to be exported per month. The exporte from the United Statea which would moat readily find a market in Paraguay are cotton domestica, calicoes, plain cloth, clocks, boota and shoes, gunpowder and shot, aaddlery, and agricultural implements.

If the navigation of the River Vermejo, an affluent of the Paraguay, were opened to forcign commerce, or were even permitted to the Argentine flag, the United States would, it is belleved, soon enjoy the entire foreign trade of the upper provincea of the Argentine Confcderation. This privilege, however, If refused by the government of Paragusy, notwithatanding the River Yermejo, In its entire course, liee within the territories of the sister republic. Hitherto a selfish and illiberal policy excluded foreign vessela from the port of Alluuquerque, a place 1600 miles above Asuncion, the capital of Yaraguay, in the Brazilian province of Matto Grosso, which the government of that empire has declared open to the comumerce of the world. Brazilian vessels were not permitted to dencend the Rlver Paraguay, which
takea its rise in thia province, nor are foreign vessela allowed to ascend higher than the city of Asuncion; thua cutting off all trade wlth the richest portions of Bolivia and the fertlle province of Matto Groseo, in Brasil. The claim of Paraguay to exercise juriadiction over both banks of this river, by prohibiting ite navigation above Asuncion, and by closing the navigation of the Vermajo, both to the citizens of the Argentine Republic and to forejgners, has never been admitted.

A treaty between Paraguay and Brazil was duly aigned and ratified Jnne 14, 1858, by which it is stipulated that the watere of the Upper Paraguay shall henceforth be open to general mavigation and commerce. This will bring not only the produce of the Brazilian province of Matto Grosso, but alac the agricultural anć mineral wealth of Bolivia, to an Atlantic market The value of these mineral resources may be inferred from the fact that there ars atated to exiat in thla reglon opward of a thousand valuable mines unworked, it having been found impossible hitherte to conver machinery thither, across the mountains, from the Pacific cosst. A highway to the spot is now opened from the Atlantlc, as broad as the Minsisaippi, end equally accesaible. The rich province of Matto Grosso, with its diamonds, gold, silver, and copper, le also brought In connection $v$ 'th the good and nontiguoas sea-ports, Buenos Ayres and Montevideo, by vie Paraguay River ; and Cujaha, Its copltal; in the centre of the mining diatricts, can easily be reached from Asurcion. Dianantino, alout two handred miles from Cajaba, sends its produce to Santarem, on the Amazon, and thence to Para. This tedious and circuitous rdute is now superseded, as tho Paragnay connects theso markets with the eatuary of the Plata. A Paraguayan journal, "La Nacional," of Auguat 11, 1856, publishes the subjoined regulations: "All vessels froms foreign ports to the Brazilias ports above shall take pilots at Aaunclon, Concepcion, the junction of the Apa, and Olimpo. The vessela that descend that river fron the upper Pa raguay are obliged to take pilota from Olimpo, the junction of the Apa, and Concepcion; and the wagea of the said pilots are to be agreed upon at the captain of the port's bureen in Asuncion."

In 1858, the United States ateamer Water Witch, of 400 tons burden, and nine feet draught, was dispatched, under the command of Lieutenant Thomas J . Fage, to make an exploration and survey of the tributariee of the River La Plata. The results of this expedition will, doubtless, contribute in an eminent degree to the advancement of commerce and the promotion of science. The navigation of the Paraguay River, whlch empties into the Parana at the distance from Buenoa Ayres of 800 miles, was extended to the parallel of $18^{\circ}$ south latitude; making the eutire distance of the rivers Parana and Paragusy, through which this small sea-steamer had passed from Buenos Ayres to Corumlus (an interior military post of Brazil), equal to about 1700 miles. There is no doubt that the navigation of the Paraguay, during the sesson of high water, could have been carried by the Water IF'itch to a still greater extent; but at the time of this explorstion sny further ascent was prohibited by Brazil. Permission was, however, subaequently granted by the imperial government, but refused by that of Paraguey; The expedition was thue restricted to a more limited exploration of the upper waters of thie river than had been anticipated. It is to be hoped that the time is not far diatent when ail such prohibitions will be removed, and this interesting region of unknown country brought to the knowledge of the world.

The navigation of the Paraguay has thus been extended beyond Aauncion, to the distance of 650 mlies . This fact has induced the Brazilian government to avail itself of thia Important chananal of communication, by ateam, with her north western privince, Matto Grasso, in which is found the most valua ble diamond reglon of the ompire.

An expedition was dlspatched by the French govcrnment, a few years alnce, for the exploration of the Parana and Paraguay rivers; and the followlng passage In translated from a report made in March, 1865 , by Captain Picard, to whose charge it had been committed:" When we consider the excellent means of communication which nature bas opened to the provincee of the Argentine Confederation and the Republic of Paraguay, we can not but regret to see them unemployed and deserted. The absence of population, continual civll war, and the administratlve policy of Para gusy, have, so far, been the chief obstacles to progress. Let us Indulge the hope that tho day ls not diatant when the aspect of things will change, and these magnlficent countries will flourish under the bleasings of a more advanced civllization."
Parsguay can hardly be aald to possess a merchant marine. In 1851 there were distrihuted, between the two ports of Asuncion and Villa del Pilar, 12 vessele, averaginge each abont 42 tons. In 1852 there were 11 of the same description, and In 1853 only 9 . Beaides thees, there lo one brig belongling to the government, which is sald to monopolize almost excluaively the ccmmerce of the state. The forelgn veseels engeged fia the trade of Paragasy In 1852 were 81, with an uggregste of 4582 tona, from the Argentine provinces :outh, below the Paraguay River, and three American vissels, tonnage not known. All theas vessels trade with the ports of Aeuncion and Villa del Pller, which, with the port of Encarnaclon, on the Parana, were alone open to forelgn commerce. There is no treaty between the United States and Paraguay. With England a treaty was ratified November 2, 1853, by the eecond srticle of whlch the Republic of Paraguay concedes to the merchant flag of Great Britain the free navigation of the River Paraguay as far as Aeuncion, the capital of the republic, and of the right side of the Parana, from where it belonge to her, as far as the city of Encaroscion. It stipulates, also, that British subjects shall be at liberty, with their ahipe and cargoes, freely and securely to come to, and to leave, all the places and ports of the sald territoriea; hlre houses and warehouses; and trade In all kInds of produce, manufactures, and merchandise of lawful commerce, subject to the usages and establlshed customs of the country: also, that they may dlscharge the whole or part of their cargo at the ports of Pilar and where commerce with other nations may be permitted, or proceed with the whole or part of their cargo to the port of Asuncion, sccording sa the captain, owner, or other duly authorized person shall deem expedlent; and that, In the same manner, shall be treated and considered auch Paraguayan citizens se shall arrive at the ports of Great Britain with cargoes in Paraguayan or Britlah veesels.

There is an American company established In Paraguay, under a charter from the State of Rhode Island, which has been engaged In commercisl operations for soms time, under the title of "The United States and Paraguay Navigation Company." The chief object of this compsny is to lntroduce steam navigation on the rivers of Paraguay; but how far it has progressed in the accomplishment of thla olject, information is not it hand. The only direct trade, however, yet opened between the United Statea and this republic consists of some shipments of clgars and samples of wood made by this company. All othor artlcles of Paraguayan produco which reach the United States come throu, h the ports of Buenos Ayres or Montevideo, and are Included in the custom-house returne to the Treasury Department of exports from the republics to which these places respectlvely belong.

The government of Paraguay pute forth no atatistics relstive to the commerclal movemente of tho republic, and it ls said to be quite Impossible to obtaln Information on the subject from its adminlstrative officlals. Complete commercial statistics, which may be viowed as strictly acourate, can not, therefore, be looked for in
this DIgest ; but the subjoined statements, derived from a Memolr prepared In 1858 by M. L. Geofroy, an attach6 of the miesion extraordinary sent by France to the Plata and Paraguay, are, no doubt, reliable, so far as they extend.
 1852.

Tobaco0-299,000 arrobec, at 12 reala (or \$t 80 ) yer arrobe of 25 poanda ......................... \$343,000 437,000 Hides-Dry, 140,000, at 10 reals each. . . . . . . . . . . . " Tanned, 85,000 at $\$ 3$ enoh.. 125,000 Wood-Cedar, 60,000 yerde, at 4 reale 105,000 "1 Cabinet, alloop-10ed of 7000 to 8000 arrobea
 Cigare 0000000 arrobas, at 6 reale per arroba. Cigars-2,0 25,000
6,000 6,000
4,800 4,800
15,000 4,000 1,250 Sundry product, Wh per 1000 (a boxea of 100).. aril cargoes), common wood (Urander and I pacho), eto. cottory cargoon of oraoges, maize, pulse, 82 each in, 1,00 arrobais tiger-akins, 000, at $\$_{2}^{2}$ each; ladis rubber, otter-iking, hammocks, beaketr, eto 1 fringed napkina, lace, eto. . . . . . . Total.
that the above total might be Increased at least one-third, could exact statements be obtalned. If we add the export dutles of 10 and 6 per cent. on the articles exported-yerba and wood, which are government monopolies, and are exempt from duty, being excepted, and whlch would amount to abont 870,000 -and $\$ 20,000$ in sllver, exported in contraband, and $\$ 10,000$ for sundry charges-we have $1,500,000$, or an amount equal to the value of imports during the same period. Indeed, ouch is the scarcity of money in circulation, that the trade is necesearily one of barter; so that the flgures whlch represent the value of imports may also, generally, give the value of exports.

Measures.- The arrobs equals 25 lbs.; the cubic vara about $20 \frac{1}{2}$ cuble feet; the pesada 36 lbs ; the almude about three-fourths of a bushel; the asumbre about one quart ; the frasco about half a gallon; the fanega about four bushels. It may be observed, that these donominatlons of weight and measure represent different quantities in different countries, and even in the aame countries, as regards different articles.
Imports and Expouts of Abungion prom 1851 to 1854.

| Y ${ }_{\text {sinat }}$ | tmports. | Exports. | Total. | Duties patd. |
| :---: | :---: | :---: | :---: | :---: |
| 1851 | No data. | \$341,380 | No dnta. | No data. |
| 1852 | \$549,153 | 474,409 | \$1,014,649 | \$123,276 |
| 1863 | 496,658 | 691,982 | 1,008.640 | 56,564 |
| 1854 | 885,623 | 777,467 | 1,362,980 | 123,289 |

Among tho Importations of 1854, tisenes and wines hold the first rank, or, rather, they constitute fourfifths of the total value of imports.
Navigation.-Transportation by land being extremely difficult, the commercial movements already anslyzed were effected by water-by the Paraguay, an affluent of the Parana. From the opening of the port of Asuncion In July, 1851, to December, 1852, there arrived about 120 sloops, of 6000 arrobas, on an average, for each. A cargo of 7000 arrobes equals 60 tons, which would give an average of from 40 to 80 tons for each vessel. From January 1, to Fehruary 28, 1853, there arrived at Asuncion 80 Sardinian vessels. These vessels, the owners of which, or the grester part of them, were Sardinlans, sailed under the Uruguayan or Paraguayan flag. There arrived also, up to March 10, 1853, at this port, 19 sloops. In 1854 there arrived 160 merchant vessele, averaglng each 50 tons burden. Of these, 2 were Britioh, 81 were under the flag of the republic, 116 belonged to the Argentine Confederation, and 11 to Uruguay.
The customs tariff of Paraguay, now in force in that republic, is that promulgated by n decree given at Asunclon, Jsnuary 2, 1846.-Commercial Relations of the United States.

Parallels of Latitude, on tho Terrestrial Sphere, are small circles parallel to the equator; bnt ln the Celeatlal Sphere they are parallel to the enllptlc.

Parmmaribo, the capital town of Dutch Gulana, on the west bank of the Surinam, five milles from its mouth in the Aclantic, lat. $5^{\circ} 40^{\prime}$ N., long. $50^{\circ} 22^{\prime}$ W. Estimated population, $2 n 000$, mostly blacks. It is regularly and wéil bailt; streets unpaved, but ornamented with rows of tamarind and orange trees ; and It has Lutheran, Calvinistic, Roman Cathelic, and English churches, Portuguese and German.Jowish synagoguea, and is the centre of the trade of the colony. Fort Zeelandia, north of the town, is the residence of the governor. In a hospital for lepers, on the right bank of the Coppename, 450 patients are maintalned at the expenie of the colony. The Kwatta Canal, began in 1846, is the firet pabllo work executed by free laborers.

Paramo (sometimes rendered, though, incorreetly, by decert or heath). The name given in South America to a meuntainous district covered with'stunted trees, exposed to the winds, and in which a damp cold perpetually prevails. Uadr $r$ the torrid sone the Paramos are generally from 10,000 to 12,000 feet in height. Snow often falls on them, but remaine only a few hours ; in;which respect they are distinguislied from the Nerados, which enter the limits of perpetaal snow. The Paramos are almost constantly enveloped in a cold, thick fog 1 so that when a thick, mall ruin falls, accompanied with a depression of the temperature, they say at B. oota, or at Mexice, cas un paramito. Hence has been formed the provincial word am-paramarae-to be as cold as if one were on a paramo. -Hemioldt's Pers: Nar. 11. p. 262.
Paraange, a Persian measure of length; according to Herodotus, equal to $\mathbf{8 0}$ stadia, and (reekoning elght stadia to the English mille) equal to at English miles. The length of the parasang was reckoned differently by different authors; and auch are the discrepant estimates of the ancients that some have assigued it the length of 60 stadia. The word is supposed to be derived from the Persian seng, algnifying a stone.
Parcel, a term indifferently applied to amall packages of wares, and to large lots of goods. In this latter sense, 20 hogoheads of sugar or tuore, if bought at one price, or in a single lot, are denominated "a parcel of sugar."
Parcels, Bill of, an account of the Items compos: ing a parcel.
Parohment and Vellum. The former consista of the skins of sheep and goats, and the latter of those of calves, prepared in such a mainer as to render them suitable for being written upon, for covering books, and other purpasee. The consumption of theso articles is very considerable. In this and most other countrios it is customary to use thom instead of paper in the drawing op of a great variety of deeds and other logat instruments. They are also extensively used, especially in Italy, in the binding of books. The finest coples of the magnificent classics. which issued from the Dutch presses in the 17th century, and the early part of the 18th, were all bound in vellum. Parchment is coarser than vellum, and not so well adapted for writing upon. The qualities of both articles differ very widely ; so much so that tho best parchment is preferable to inferior or even middlling vellum. The goodness of oach depends partly on tho quallity of the gling of whleh they are made, and partly, and indeed in a very high degree, on the care and sklli wifh which they are manufactured.
The history of these articlee is Involved in some obscurity. Varro and Pliny (Hist, Nat. lib: xili. cap. 11), who have been generally followed, state that they were originally manufactured at Pergamus, in Abia Minor, the capital city of Eumenes II., one of Alexander's successors, during the reign of that prince; and that parchment owes to this circumstance its classical name of charta Pergumena. But thera seems to be littie if any foundation for this statement. We have seen, in the preceding article on paper, that Herodotas,
who flourished rather inore than a century befory Alexander the Great, states distinctly that, prevlouoly to his era, when paper (charta; Egypricoa) was scarce, the Ionians were accustomed to write on the skins of sheep and poats, and that' that practice was then followed (viz.y in his time) by several barbarous nations. -Lib. v. cap. 58. And it is all bat certain, seeing that the practice of writing on skins had beep in use for at least 21 centurios, and probabiy much more, proviously to the era of Eumenes, that their' preparation would, in the course of that lengthened period, be so much improvad as to render them littio difforent from parchment. It is probable, ladoed, that their manufucture may have been improved in. Pergamus; but wn incline to think that parchment owea its name rather to the extensive demand for it in that city, in consequence of Eumenea having amessed a large and valuable library, than to any thing elee.? He was, in fact, compelled to uso parchmeyt and vellum in the copying of books, as bls contemporary Ptolemy Philadelphus had prohibited the exportation of paper.--Pisyy, ubi supra. The scarclty of parchment during the Middie Ages, and in antecedient times, led to the practice of obliterating the writing on old parchments; by rubbing them with pumice-stone, immersing them in boiling water, and such like devices ; and there can be no menner of doubt that the prevalence of this pratice hes been most injurious to literature; and that it hes most probably occesioned the total destruotion of somo of the noblest chefodicurre of antiquity. In the Middle Ages, these were erased that room might be madef for some worthlese treatise on scholestic theology or logic! Sometimes, however, it happens that the ancient writing la not so much obliterated but that it may still be read; and to that circumatance the receat diacovery of a portion of Cicero's treatise $D_{0}$ Republica le to be ascribed. It bsd been efficed to make room for a commentary of St. Augnetine on the Paalms. Parchments that have been erased in this way are celled Palimpsesta (from $\pi a \lambda_{1 \nu}$, again, and $\psi a \omega$, to efface or clean), or repeatedly cleaned parchmento $;$ bocause they have been repeatedly cleaned, renewed, or prepared for writhg upon. If the learned world is ever to be gratified by the recovery of the lost cemedies of Mensander, or the lost booke of Polybius, Livy, and Tacitus, it will most probally be by finding them under some homily or such like trash--Nouveau Traite de Diplomatique; Dim de Vaines.
Parls (anc. Lutetia Parisioram), the capital of France, and, after London, the largeet and $m$ s.st populous city in Europe; lat. (observatory) $48^{\circ} 50^{\prime} 122^{\prime \prime}$ N., long. $79^{\circ} 23^{\prime} 02^{\prime \prime}$ E. from the national observatory, Washington, and long. $2^{\circ} 20^{\prime} 30^{\prime \prime}$ E. from London. Population in 1851, 1,021,580. Situatcd 193 feet above the level of the sea, on both bides and on two isiands of the Seine; 111 miles from ite mouth. It has rceently , and at the expense of about $\$ 100,000,000$, been surrounded with fortifications, consisting of a wall 33 feet In height, bastioned and terraced, lined with a fosse about 20 feet deep, and embracing both banks of the Seine, with a continuons inclosure, and of outworks composed of 14 detached forts. These fortificationa take in much of the aubarbs, and even of the surrounding country; but the proper limits of the town are traced by an intorior wall, erected at a much earlis date, for fiscal purposes. - In thin, wall are 50 gates or barriers, which form the proper entrances of Paris, and at which the octroi, or daties on goods brought into it, are levied. Many of these barriers are magnificent stracturea. Among others may be epecified the Barrlère de Neuilly, conelsting of two pavilions, and having in front the eplendid triumphal arch De l'Etoile; the Barriores तe Vincennee, de St, Martin, de F'ontainebleau, do Reully, de Chartres, and do Passy. Ontaide the barriers and their connectiag wall is a large zove, finely planted; which nearly makes the circuit of the town, and forms an excelient, though not very

It recelves the name of Outer Boulovards, to distinguinh tliem from the Inner Boulavardo, which form a aimilar internal aoine, consisting, in their fiaest parts, of a magnifiomt ceatral thoroughfare, bounded on either aide with a doable row of trees, under which a broad and olevated pathway has been formed, and lined by elegant shops and mansions, tie whole forming a icene of animated gnyety sad splendor which no other capital in Lurope can equal. Whang an a selne travernes the eity in a weat-northweat direction, and has a modiam breadth of aboat 450 feet, pearly one-thled less than that of the Thames at London. It is shallow, and navigable only by barges and small steamers. Its quany sre built of solld macoary; and form large terracee; with a roadway in the centre, and a footpath on el ther side, gemerally planted. Thay extend about 11 mlles, and, in addition to the aplendid walks which they afford, serve the limportant pturpose of protecting the lower parts of the city from inuindetions, from which, previounly to these erectlons, it uften suffiered. The number of bridges is twenty-seven, all of stone, with the exception of seven suapension bridges, three of a combination of atone and iron; and one of wood.
Manufactures and Trade.-The government possesses only two properly manufacturing establishmentsthat known by the name of the Gobelina, celobrated for its tapestry and carpets, madej however, not for sale, but the supply of the palaces, and for presenta ; and that of tobaceo, which the government holds as a monopoly, and carries on in a vast entallishment on the south side of the Seine, producing about a fifth of all the enuff used in the kingdom, and yielding an annual proft eatimated at $\$ 14,000,000$. In the other branches, whioh are fiee, the most important manufactures are articles of jewelry and precious metala; ebony and ivory trinkets, fine hardware, paper-hangings, aaddlery, and other articles in leather; cablnet-work, carriages, various articles of dress, silk and woolen tissaes, particulerly shawls and cerpets; lace, embroldery, artificial fiowors, combs, mechines, mathematieal and optical instruments, types, books, engravings, refined sugar, ohemical producte, etc. The value of all tha induatrial products of Paris in 1847 was, after a very careful investlgation, estimated at $\$ 292,725,070$. In 1848, during the turmoil of the last revolution, they fell to less than one half of what they were before. The value of the exports, composed almont entirely of the above artioles of manufacture, was declared at the cinstom-house of Paris to amount in valne, in 1850 , to $\$ 11,095,945$. The estimated revenue of the city for 1852 was $\$ 0,308,680$; and the expenditure $\$ 9,703,630$--Ses artiels France: For commerce, etc., of Paris; see Hunt'a Merchants' Magazine, xviil. 60; Quartorly Reciev, Ixxviii. 146; Living Age, ii. 404, xiii. 219; Foreign Quarterly, xxxi. 182; Edinburgh Review, lxxxv. 89; Comm. Rel. U. S.
The commercial intercoure between the Unlted States and this consular district depends on the regulations of the custom laws of the empire, and on the local legislation of the elty of Paris, by which octroi duties are levied on many articles brought into the city, whether fereign or domestic, but cepecially on spirits and articles of subsistence. These regulations sre fixed, and reat only on the contingency of alteration by legislative enaetment. There are some privileges accorded to Spaln by aneient treaties which will be found set forth in the Code des Douanes, Code MFaritime, and the Tarif des Droits. We are not a ware of any privileges accorded to the commerce of othor nations and denied to the. United States, or of any important restrictions.' The books referred to above give full information, in tabular atatements, on this question. The transhipment-of goods belongs to the coasting trade, and, by law, only French vessels are entitled to engage in this tredo. Fuli information will be found upon this point in the Code Maritime.
 Sales of goods are made npon cash or upon orders,
with credits from thirty days to six months: Commission housea are in the hablit of advancing for many of their customers.-Seo Tarif des Droits, Regulations des Dovanes, and Statistique Induatriel.
Parrel. In Naval language, the collar of greased rope, or tracks, by which the yard is confined to the mast, while it slides up and down lt.
Partnerthip. A partnershlp is an agreement between two or more to share in the proflt and loss of the use and appllcation of their capital, labor, and skill, in some lawful business, whether one supplles capital, and another zkill and labor, or each both labor and capltal. The benefits of a nnion of the mpana and advantages of different persons for the conduct of a brench of bueiness, in many instances, are too obvious and common to need illustration. A partnershlp is not constituted merely by an interest of different parties in the same thing, but it depends on a participation of profits and joint liability to loss. And yet there are some exceptions to thle rule, for it has been held that seamel shlpping on shares in' a shipping voyage are not copartners with the owners. And so, where a certain share or commisslon is allowed to a elerk or agent, depending on the success of the businees or amount of prefits, in addition to his other compensatlon; It has been held, in many cases, not to make hlm a copartier. It is difficuli to point out the criterion by which cascs of this description are distinguiehed from those of copartnership; and same of them look more like an exception of cases whlch strictly come within the deflintion of copartnership. A question has been made whether joint owners of a shlp are copartners, and the general doctrine is that they are not so; and yet it is generally held that each one is liahle for the whole amount of repalrs and expenditures In the navigation of the ship; but atill the ownership is not joint, for, in the case of the decease of one, the property in the whole shlp does not survive to the others, as would be the case if it were partnershlp properts; but the property is held in common, each part-owner having a distinct title to his share; and one part-owner can not, merely as such, convey a title to the whole ship, or to any share except his own. As to the share of each partner in the profits, or his liability for losses, if there is no agreement on this subject, all the partners stand upon an eqnal footing.

As to the objects of copartnership, they are not confined to commerce, though most frequent in that branch of Indastry, but may embrace manufncturing, the carrying on of any mechanic art, agriculture, the practice of law or medicine, and, in short, every lawful branch of business. . Copartnership is more usnally formed by a written agreement; and by some codes and in regard to certain copartnerships, formal atipulations are required by law in order to constitute a copartnership. This is not a general rule, however, forlin many branches of business parties may agree orelly for a participation In profit and loss. These associations are divided into different classes, distlnguished by their objeets, and the extent of the linbility of each particr. The Roman law allowed of general copartnerships, extending the communlty of property, and joint pront and loss, not only to the business puraned, but elso to all acquisitions by either party, whether by legacy, inhertance, gift, or as the fruits of industry. By that law, and so by the laws of France, Spaln, Lonisiana, and other codes derived from the Roman law, a man and his wife may
be eopartnere ; and, in making the marriage contrict, the kind and extent of copartnership is as rued upon the form of the atipulation for this purpose being particularly polnted out by the Irench code. It was betweion the partien to the marriago contract that the general copartnerahipa above-mentioned were moot frequentiy formed. In thia respect, however, the Romen law, and those codes derived principally from it, leave the parties at liberty to agree npon a univeral copartaership or a limited one, or a saparate property.

Copartnershipa ase usually oonfined to the prosecution of a particular braneh of buainess, and it very oftea happens that each copartner is concerned in other branches: The term general copartnerahiy is also applled to one formed for trade generaliy; or businesa generally, withont limitations; but where t-ajoint interest extenda only to a particular concern, as, for inalance, the froighting of a ship, it is called a apecial copartnership. And so a partnership is, calied ypecial Then the parties enter into atipulations modifying and restraining the right and powere of the members, inutead of leaving them to the operation of the lawa genorally appilicable to auch astociationa; and this is the tuan meaning of anch copartnerthips. Another doecription in that of limited copartnerships, $m$ which one or more partners put in a certsin amount of capital, which is liable for the contracts of the tim; but beyond thla the party or partiea are not liable. This cort of partnership is particulariy provided for in the Freach code, and is not nnfrequent in France. It it a very usefnl provision of the law that allows of such associations, for it enables persona of fortune, anil retired from buaineas, to put a part of their capital at riak in trade, without riskiag their whole property; and it accordingly operatea very favorably upon the enterprise of the community; for a young man who has only his talents and indusiry to put into a concern can thus more easily obtain the capical necessary to give bie activity and caterprise scope, and every community ought to open all practicabic channela for the intellectual and phyrical exertions of its members. This apecies of copartnership has accordingly been partially introduced into the United States, being provided for in the code of Louisiana, which is modeled on the French code, and having been introduced also into the lews of New, York by a statate, the provisions of which were clotely copied from the French code-the first instance (as Chancelior Kent remarka in his Commentaries) in which any other forelgn law than the English had been adopted in the particular atructure and provisions of an American atatute, in those States of whose codes the English law is the basis. This species of partnerships has also been anthorized by atatute in Massachusetts, Rhode Isiand, Connecticut, Vermont, How Jersey, Pennsylvala, Maryland, South Carolina, Georgla, AJabema, Florido Mississippi, Indiana, and Michigan. We will now pruseed to a more extended account of limited partnershipa.
The condition of a limited partnership is that the name of the perion whose liublity is thue llinited must be used in the firm, and particular provisions are made as to paying in the amount of capital stipilated; and snother suitable provision in such case is the provision for some registry by which it may appear to those who wish to make the Inquiry what amount auch partner pays in. Some partnerahipe are secret ; that is, some one agrees, upon terms, to share profits with osteasible partners without any notice to the public of hie being a mumber of the firm. Each partner has a joint interest in the whole personal property, and, unless the articiés atipulate otherwise, may trapafer lic.

Each portner may also bind the whole firm by his contract made in the course of the business of the firm, unless it be otherwise agreed between them; and even when it is otherwise agreed, still, if a party with whoni s partner contracto has a legal right, from the manner in which the joint affaira are managed, to prosume that
e partaer is suthorised to oontrect for and to blad his cepartnars in regard to the anldeat of any contrect, the firm will be buend by arch contract. Bue if the party coatracted with has notice that, by the articies of oo. pertnarahip, a partner has not anthority to make a contract, the company will set be bound by it, so if a partnor contracta, in the partaorthip name, ia a manner Which the party contracted with knowe is not within the bualnesa of the firm-ase if he makes a negotinbie note in the name of the firm for hio own separate dsbe -the contract will not biad the firm to the party thus contracted with; beat atill, if thie coatract, being traseferable in its nature, and holding oot on the face of it the responsibillity of the whole firm, is negotiated to these who have so notice that the paper was made for the private accommodation of the partner who signed the partnerahip name, the company will be bound in respect to such asaignee; that is, the firm having given notice to the world that they are copartnera in a certain branch of husiness, every one has a right to presume that all acte done by each of them in regard to it are authorized by the terma of their contract, or the circumatances of the case, pnleas he has notica to the contrary. But certain acts are not anthorized by the genaral powers of copartuers, and those no one partuer can be preaumed to have power to do; at, for intisnee, one partaor is not merely, as ouch, anthorised to make a deed in the name of the other, or to act as his attorney; and he can not, accordingly, convey land helonging to the members of the company ; for, though it may have been acquired and paid for with the property of the frm, yet whan acquired, it holongs to the mombers in common, if the titio be in them ail, and anch member can himself convey oniy hla ahare; and in order to the conveyence of that of another, he muat bespecially empowered. But a partner may release a delht due to the firm if it be done fairiy, and without collusion between him and the dobtor. It has been heid, however, that one partaer can not by deed aubmit a question to arbitration. A partnership may be dissolved by its own limitation, the death, bankruptey, or insanity of a member, or by the breaking out of a war between the countries to which the members belong.

A question is also made whether a member may dis solve the copartnership voluntarily. before the time for which it was formed expires, and the opinion seems to be that he may do so by giving sufficient notice to thin effect; and this seems to be necessarily incidient to new associetions; for, though he would, in such cese, bo answerable to bis copartuers for the breach of his agreement, yet it would be exceedingly ineonvenient if a partner were irrevocably bound to give his copartnen the right of hie credit, and of disposing of his property, after all hie confidence in them had ceased. In case of mismanagement by any partner having chsrge of the partnership effecte, to that the other partners are lisblo to be materialiy injured, they may make application to a Court of Chancery to appoint a receiver to take charge of the concerns of the company, and wind up its affairs, in case the partnership has already besn dissolved, or in case there appears sufficient reason to dissolve it. But where there is no ground for such application to a Court of Chancory, and the company is dissolved liy the death of one partmer, the joint propcrty will aurvive to the other partner, who mey disposs of it, and collect and pay the delits of the concern, snd will be liable to account to the personal representatives of the decensed partner for his proportion of the surpius property. In case of the decease of a partner, his personal representative do not become copartncrs with the curviving partaers, but the affairs of the concern must le settied with reference to the time of the desth of the deceased partner:-E. A.

Limited Partnerahip in New York.-1. According to the Revised Statutes of the State of New York, limited partnership for transaction of any mercantilo, mechanical, or manufacturing huiness within the State may

be formed of two or more pertena; but the provisions of the act will not authorize any awch partaerahip for the parpose of banking or making insurance. 2. Such parinerahips may conalat of ons or more parsons, who shall be called goneral partners, and who ahall be joint ly and asveraliy reuponalblo, as general partnert now ara by law; and one or more persons who ahall contribute, in actual cash payments, a apecifio aum as capltal to the common atock, who shall be celled apecial partners, and who shall not be Hiable for the debte of the partnarship beyond the fund ee contributed by him or them to the capi'al. 8. The ganeral partaern only thall be authoriaed to transact businean and aign for the partnership, and to biad the same. 4. The percous desirous of iorming auch partnerahip ahall make, and eoveraliy sign, a certificate, which shall contain: I. The name or flrm under which auch partnerahip ia to be condacted. II. The general nature of the buainess to be transacted. III. The names of all the general and apecial partnersinterested therein, diatiagniahling which are general and which are apecial partners, and their respective places of realdence. IV. The amount of capital which each apecial partner shall have contribnted to the common atock. V. The period at which the partnership is to commence, and the period at which it shall terminate, 5 . The certificate shall be acknowledged by the several persons aigning the ame, before the Chancellor, a Justice of the Supreme Court, a Circuit Judge, or a Judge of the County Courta; and auch acknowledgment shall be made and cartified in the same manner as the acknowledgment of conveyance it land. 6. The certilicate so acknowjedgad and certified shall be flled ln the office of the clerk of the county in which the principal place of business of the partnership shall be aituated, and thali also be recorded by him at large in a book to be kept for the purpoee, open to publie inspection. If the partnership shall have places of buainess altuated in different countiea, a tranacript of the certificate, and of the acknowledgment thereof, duly certified by the clerk in whose office it shall be filed, under his official eeal, whall be flled and recorded in like manner in the office of the clerk of every auch county. 7. At the time of fling the original certificate, with the ovideuce of the acknowledgment thereof, as before deacribed, an affidavit of one or more of the general partners ahall also bo fled in the ame office, stating that the sums apecified in the certificate to have been contributed by each of the apecial partmers to the common stock have been actually and in good falth paid ln cash. 8. No auch partnership shall be deemed to have been formed until a certificate shall have been made, acknowledged, filed, and recorded, nor until an affidavit shall have been filed, as above directed ; and if any false atatement be made in such certlficate or affldavit, all the persona interestedi in auch partnership shall be llable for all the ongagements thereof as general partners. 9. The partners ehall publish tho terms of the partnerehip, when registered, for at least six weeka immediately after such registry, in two newspapers, to be dealgnated by the clerk of the county in which such registry ahall be mado, and to be published in the senate district In which their businesss shall Le carried on; and if auch publication bo not made, the partnership shall be deenied general. 10. Affidavits of the publication of such notice, by the printers of the newapapers in which the same shall be publisheed, may be filed with the clerk directing the same, and shall ho evidence of the facts therein contalned. 11. Every renewal or continuance of such partnership beyond the time originally fixed for ite duration shall be certified, acknowledged, and recorded, and an affidavit of a general partner be made aud filed, and notice be given in the manner herein required for jts original formation; and every such partnership which olisil be otherwise renowed or continued shall be deemed a general partnerthip.: 12. Every altaration which shall be made in the names of the partners, in the nature of
the businese, or in the eapital or aharas thereof, or in any other matter apecified in the ortginal certifleato, shall be deemed a dissolution of the partnership; and every auch partaerahlp whioh ohall is any manner be carried on after any auch alteration shail have beea made, shall be deemed $n$ gemeral partnemhip; misess renowed as a apecial partierahip, according to the prorisions of last section. 18. Thy busiaws of the partnerehip shall be conducted under a firm, in which the names of the genoral partners only shall be inserted, without the addition of the word "Company," or any other genaral term; and if the name of any apecial partner ahall be uned in auch firm, with hls privity, he shell be deemed a general partnar. $\dot{2}$ 14. Suits in relation to the buainess of the partnaruhip. may bo brought and condueted by and againat the genoral partnern, in tho tame maninsr as is there ware no apecial partneru. 15. No part of the aum which any opecial partner ahall have contributed to the capital took ahall be withdrawn by him, or paid and transferred to him, in the shape of dividenda, profit, or otherwise, at any time during the continuance of the partnership; bnt any partner may annually receive lawful interent on the aum so contributed by hind, if the payment of auch interest shall not reduce the original amount of auch capital; and If, after the payment of ouch Intereat, any profits thall reramin to be divided, he may also receiva his portion of auch profits. 16. If it whali appear that, $r_{y}$ the payment of interest or $p$ ofita to any special partner, the original capital has been reducsd, the partnor reselving the tame ahall be bound to restore the amount neceseary to make good his ahare of capltal with intereat. 17. A apecial partner may, from time to time, examine into the atate and progress of the partnership concerns, and may advise as to their management; hut he ahall not transact any businees on account of the partnershlp, nor be employed for that purpose as agent, attorney, or othervise. If he shall interfere contrary to these provisione, he shall be deemed a general partner. 18. The general partners ahall be llable to account to each other, and to the opecial partners, for thelr management of the concern, both in law and equity, as other partners now are by law. 19. Every partner who ahall ba guilty of any fraud in the affairs of ti partnership shall be liable civilly to the party injurtu to the extent of the daminge, and shall also be liable to an indictment for a misdenceanor, punishable by fine or imprisomment, or both, in the discretion of the court by which te whall be tried. 20. Every sale, assignn. ant, or transfer of nny of the property or effecta of euch partnership, made by euch partnarthip when ineol vent, or in contemplation of insolvency, or after, or in contemplation of the insolvency of any partner, with the intent of giving a prefert:ce to any ereditor of such partnerahlp or insulvent partner, over other creditors of such partnership, and every judgment conferred, lien created, or security given by auch partnerahip under the like circumstances, and with the like intent, shall be void, as against the creditors of such partuership. 21. Every such sale, assignment, or transfer of any of the pruperty or effects of a gener. al or special partner, made by auch general or apecial partner when insolvent, or in contemplation of insolyency, or after, or in contemplation of the inavivency of the partnership, with the intent of giving to any creditor of his own, or of the parnership, a preference over creditors of the partnership, and every judgment conferred, lien created, or aecurity glven by any such partner under the like ciroumstancen, and with the like intent, ohall be void, as againat the creditors of the partnersiip. 22. Every epecial partner who shali rlolate any provision of the two last precedlng aections, and who shall concur in end asaent to any such violstion by the partnership, or by any individual partner, shall be liable as a general partner. 93. In case of the incolvency or bankruptoy of the partnerahip, no special partner shall, under any circumatancea, be allowed to
claim, wa creditor wats the olalime of all the other croditors of the pertmorohip shall bo astiofled. 24. No diceolution of nuch partinarohlp by the sote of the parties abali take place provious to the time apoeifiod in the certificate of fin formstion, or ta the certilicite of its ronewal, natil a pettoe ol such diecolution shall have been fited and recorded in the clork'h offiee in which the original certiticato was recorded, and published once in ench week for four. weoke is a mowopapor priated in each of tie counties where the partnemhip may hove places of buelocea, and in the state papera-Lzoive Lzvi's Commercial Lave of the World.
Analyuie of the gonernl Law of Partwerohidod-Partnermhip in Groat Britaln is a cortreet antirely free, and subject to no furmalitios; it belongs to the partios themeives to reguiate the conditions; the law is mieseIy circumacribed in protecting the righte of third parties, and to spe themp reapected /" Partnership in common law is divided into thrwo clewes-aniversal, genonal, and limited oc apecial. They are also divided into privato partnershipa and publio companiet, 'I Publio companien are dividel into molncorporated companioi or associationa, and incorporated compenies, and corporatione chartarod by goverument. By the law of Seotland partnorolipe are divided idto ordinaty partnerohipa, jointrotock companies, and publio companien. In the first the firm is a distince pernon at law; and the partners, altuough jointly and severally liabjo for all the defits and contracto of the firm, aro so ac guarantors of the frm: This ia general paitnerahip. Special partnership is one contracted for a partleular brapeh of businesa.
There are principles connected with the law which are identical in every conntry; namely, that all members of an ostenuible partnerobip, or in colleetive name; are responr'hise in solidum; but diferevices appear in pointa regarding the continuation or ceseation of partnership affur the deceace of one of the partaers. Thua in Pruscia or Frankfort, the hairs continue the partnership until the end of the year, and If they do not give potice of their retirement, or if thay are not excluded by the other partnera, they do not cease to form part of t .
In France partnerabip ends of full right at tho inatant of the death of a partuer, unlese by contrary agreament this last regulation has been generaliy adopted. It is the same for that hy: which the profte distributod among partners are not to be returued to the partnership fund, whatever may happen afterwari, unless there be fraud, and the provision is added, that a partner who brings in only his labor can not, in any case, return the dividenda which te has received.
$y$ Almost overy lagilation exicept that of Great Britain recognizee the existence of three kinds of commercial partnerahipe. 1at. Oatensible partnersinips (in coliectivo name); 2d. Partnershlps in con:mandids; Bd. Anonymons partnerahipu, tiv :

The Portuguese code speoifiea each kind of partnership, indicatiug their rules at some length. In effect, besides the pertnership anonymous, dornant, or secrot, and in collectivo name, that of capital and labor is made prominent $;$ in this case the partner with capital alone ia responsible beyond hia investment, in consequence of which the law characterizes this aseociation as inregular. Then come partnerships in participation, with limitod or unlimited capital, called Pareeria, either for an indivisible object, or for a determinate end; but in all casea it is necessary that it should refer to $a$ commercial operation, and that there be at least one merchant either dormant or ostensible. There are in this code some regulationa worthy of being noted; pamely, that a contract which woold free the provider of funds from all obligations, when be has a share in the profits, ia nuli, buit then he becomos an intereated, party, and nol a partmer. A contraot is deelared asurious which shouid allow to a lender of money the profits besides the interests, withoat subjocting him to the lossen,
which is rery proper and just I becauee the principlo of equality ough to govern, above all, matters of part. nerobipi conecquencily this last elause ought to bo annulled if it exioted. In general, a minor, even not a trader, may not be a partnery ibat he hes power to make une of the privilege of restitution in case of lose. If, at hie coming of age, ha has not declared that he wiohes to retire, he becomes reaponalble for all further aeto of the partnership.
It in mone escontial in partnership in collective hame that the partnore should all be repponailibe in colidum. In this the Datch code Is equal in all pointe to the French codes but the former code contains a derogation from this rule aspprising at first, becanse It enya that a colleotive partner, who has become commandi. tairv is not responsiole in colidmn. $r$ ye resson of this extraordinary regalation is founded upon the ussge which parmites the contimuation of ancient commercial housee, known under the namen of thelr founders, although thase have otlll their capital inveisted in them; true it is thas third parties ought to have heen acguainted with it hy the liquidation of the preceding hoses, or by the publieation of the diesolution.
In the Spanloh code there is a reguiation different from any othar legialation in matter of conatitation of anonymous partsershipa, by inuljecting the artieles, nof to the exemination of the government, but of the tribtunale of commerce. The spanieh code and that of Portugal preserfbe a measure the eame is that of the Code Napoleon, which consista in making interests to run in fall right, on the investmenta of the partners, from the day in which they ought to be made. With rogard to the nomination of managers of partnership, in Franes the lav hat no provision for It. In Wortemberg and in Spain, when the manager is nominated by the articlea, ft is allowed, should his action he injurious to the interests of the company, to add snothor member. In Rnssia it is prohibltec' to confer hy the articlea the mansgement of the partnership on certain partiec for all its daration and without a renewal. Ail legiaintion is silent upon the intereats of the capital invested by the shareholders. It is, in fact, clear that an inveatment of funds in a partnerahip is not an employment, but a sum beatowed for mere operations, and which can only allow to raise sums on the realised profite, either every year, or at the time when balance-sheata are drawn op according to law, or at any other time, periodieal or not. But in Hungary the "commanditaires," Improperly called partners, because they are then only consldered as lenders of money, may stipulate for interests beyond the legal rate which the other partners ought to pay, even if they ahoold suffer losses. It is the same in Prussia.
With regard to the emission of shares and thelt transforenco, the Hungarian codo cortalns very Im. portant regulationa. It says that all persons may buy sharea, but it proscribes shares to the bearer-a regulation which was reproduced in the Rossian code snd in the Wortemberg code. It saya also that no linvest. ment of capital can be made nor interests claimed before the constitution of tho pertnership, and that only when all ohares are aileposed of the thareholders may establish the articies." Lastly, there is the remarkable regulation, that when the majority of sharcholders have voted for a change or modification in the articles, of a nature to alter the object of the partncrship, the minority have power to retire.
The Rueslan code prescribee several very curlous messures. The sale of shares, or premises of shares on credit, is prohilited. A portion of the profits must be taken to constitute a reservo fund; the unrecluimed dividend, after ten years, is innted to the social fund, or may be divided among the other shareholdcrs. Lastly, if the directora are divlded in their deliberstions, the dissenting minority may exact that mention be made of their opinion in the verbal process. The same code indicates the mode of terminating diaputes:
betwee conimen blerato alway foreed equall errted Warte Hungs shali b if it re they al nals. . duce tl among dinia In Eot determ partice the for ed by decree

The law of merchants differs fromy the commen law in the power of binding a partner by deed.
Lord Kenyon sald, in Harrison v. Vackson, 7. 8. B. 210: "The law on merchante is part of the law of the land, and in morcantile transactions it nevar was doubted but that one pariner might bind the rest. But the power of binding each other by deed is now for the flrat time insiated on. A general partnership agreement, though under seal, does not anthorize the partners to execute deeds for emoh other, unlesin a particular power be given for that purpose. Xet in common law a partner hes power to bind his zopartner by deed."
Alchough, in the worde of Hobart, C. J., "The custem of merchants le part of the common law of the United Kingdom, of whioh the judges ought to take notice ; and If any doubt arise to them about their custom, they may aend for the merchanta to know their custom, as they may send for the citizens to know their jaw ;" yet, on the other band, Lord Ifolt saye; "Wo take notice of the laws of merchants that are general, not of those that are particular usagos."-Seo Weatminster Review, xx. 68 ; American Quarterly Review, xix. 48; HuNT'a M, "vhanta' Magasine, xxiv. 66, xxxill. 457, xxxv. 720. See also Leons Levi's Commercial Law of the World, 4to; London, 1861 ; and Krat's Commenturies, vol. ilil:
Partners of the Mants, the wood-work round the mast at the deck, to strengthen and support the dock agninat the pressure of the mast. The term is also appiled to the simillar supports round the capetan and pumps.
Partridge Wood, a variegated wood imported from Martinityue; It is said to be the produce of the Ueitteria coccinea.
Pamsengers, in Commercial narigation, are Individuals conveyed for hire from one place to snother on board ship. Passage ships are thoso peoullariy appropriated to the conveyance of passengers. Passage ships are generally placed under certain regulations; and the extent to which emigration is now carried renders it of the utmost limportance that these regulations shouid be carefuliy compiled. The greater number of emigrants are in humble plfer fow among them know any thing of ships, or of the precautions necessary to insure a safe and comfortable voyage; they aro aloo, for the most part, poor, and exceedlagiy anxious to economize, so that they seldom hesitate to embark in any ship, however unfit for the conveyance of passengers, or inadequately farnished with provisions, if it be cheap. Uaprinoipled masters and owners have not been slow to take advantage of this ; and in ordet to preveat the fraude that would otherwies be practioed on the unwary; It has been found indiepenabble to lay down some general regulations as to the number of
pasaengars to be taken on buerd ohips sif comparsed with tholr tonnage; the quantity of water and provi. slons as compared with tho passengera, oto. But thsa is no very maay tank. If the limitations be too strict, that is, if comparativoly fow pascongers may be oarried, ox $\Psi$ the stock of provislons to be put on board be elther unnecassarily large or expensive, the cost of eme igration is proportlonally onhancod, and an artificin! and ceilous impedimint is thrown in the way of what ahould be made as essy as pooulbls, consiatent with seo ourity. But, on the other hand, if too many passengers be allowed, their health is Jiable to suffer ; and shoulis the supply of provialona be inadequate, or the quality bad, the mest sorious consequences may onsue.
In conie raspects passengers may be considered as a portion of the crew. Thay may be called on by the master or commander of the ship, in ease of finminent dnager either from teunpest or enemies, to lend their analatp ace for the general mafely; and in the event of thr'. Ueclining, rasy be punished for disobedience.
principle has been recognized in : esveral cases; but an the autherity arises out of the neceasity of the cave, it muat be exercised atrictiy within the limits of that necessity,-Boyce $\dot{\mathbf{v}}$. Badoliffe, 1 Campbell, bs: A passenger is not, horever, bound to remain on board the ship in the hour of danger, but may quit it if he lave an epportunity; and he is not required to take upon himself any respontibility as to the conduct of the ship. If ho Ineur any responalbility, and perform eise traordinary services in relleving a veesel in distreas, he is entitled to a corresponding reward. The goods of. passengers contribute to general average.-AnBort on 4, Lave of Shipping.
Passenger Act of tise United States.-It is made the duty of the Secretary of State, by the second paragraph of the 18th seetion of the act approved 3d of Merch, 1855, to give: notiee, In the ports of Europe and eleewhere, of the provisicns of the act to regulate the oarriage of passengers in steamships and other vetsels.
The specinl sttention of United States consular offcere is callod to this act, end aliao to the insiructions which have been issued by the Treasury Department in reference to it. It will be observed that, while this act prescribes spacas of cortain oiear super8cial feet of deck to each passenger (other than cabin passengers), it morcover fixes a maximm, by restricting the number of such passengers allowed to be carried in any such vessel in the proportion of one to every two tons of said vessel's tonnage measurement, excluding childron under the ago of one year in the compatation, and computing two children over one and uncier elght years of ago as one passenger. It fnilows; that though a vessel might afford elear apaces of the dimensions ludiested for a greater number of passengers than one to evory two tons of her tonnago, meseurement, yet if the number shall exceed that aliowed by her tonnago messurement the penalties imposed by the law would attach; or if her tonnage mensurement should aliow a greater number of passengers than according to the ciear spaces prescribed by law the could carry, yet if the number ehall exceed that allowed by the clear spaces prescribed by law the penaities imposed by the law wouid equally attach. In other words, the one ralo, as to the number of passengers a vessel is entitied to carry, is a limitation upon the other. The tonnage of each vessel, according to custom-house measurement, must, therefore, be ascertained; as well as the measurement of tha spaces allotted to pasisengers, in order to determine tho number of passengers sbe is entitled to carry.
In order to determine the number of passengers a vessel is entitited to carry in accordance with the spaces prescribed by this atot, the height between decks must be measured, not from the bottom edge of the carlines or deck beams, but from the under surfice of the upper deck to tho top fioor below; and no space bhall be con-
aidered available for passengers that has not, when meacured in this manner, the height called for by the law, as the case may be; nor shall any opace in the vessel of a less width than four feet be messured; provided, however, If the vessel shail, in accordance with the provisions of the first section of this act, carry any portion of her cargo, or any other article or articies, on any of the decks, cabias, or other places appropriated for the use of passengers, in lockere or inciosares prepared for the purpose, the height between decks shall be measured from the bottom edge of the carifines; or deck beams, to the upper surface of said lockers or inclosed spaces, which shall be deemed and taken to be the deck or platform from which measurement shall be made for all the parposes of thic aot, and the apaces occupled by said lockere or inclosed spaces shail be deducted from the spaces allowable for the use of passengers. For example : the spacea in the maln and poop decks, or platforme, and in the deck houses, if any there be, will be $16 \times 6=96$ feet; lower deck, $18 \times 6=108$ feet; two-deck vessels, $14 \times 7 \frac{1}{2}=105$ feet. The oncumbering by merehandise or storea, not the personal baggage of the passengers, except in lockers or inclosures prepared for the purpose, of any part of the apace occupied by the passeagers, will vitiate the whole space, unless the part so encumbered be et, arated from that so occupied by a substantial bulkhead. The deck or piatform inust be of a permanent nature, fiush, and impervious to the water.

Pagsport, a warrant of protection and authority to travel, granted to persons moving from place to place by the competent officer. The word appears to be derived from the maritime usage of some Continent: al countries of giving similar authorities from the admiral of a neval station to vessels leaving harbors within his jurisdictlon, As passports are not required in our own coantry, the only spreies known to our travelers is that of foreign passports, which, for traveling on the continent of Europe, are usually made out by the resident minister or consul of the country he intends first to viait, or by the State Department. They are subject to eisa, or inspection; by the proper authorities at the place where the traveler disembarks, and also at other places where he may reach, according to the police regulatione of each particular country, and on pasaing the frontiers of states. Austria is, we believe, the oniy European state which at thia time requires absolutely the visa of an embassador or minister of her own for travelers entering her domains by land. In France, and in many Continental countries, home passports are necessary for the native traveler. According to the letter of the French law (since 1796), $n$ Fronchman can not pass the limits of the canton in w+". he is domiciled without a juseport ; but in prac..e it is not required within the extent of the department. Legaliy spaaking, the strict formalities of an internel passport in Irance require the direction of a journey to be specified, and its exact execution attested by the visas and aignatures of the police anthorities at every place mentioned in it; and these laws are, from their severity, so incapabie of complete execution, that it is a common saying that no man but a rogue is ever entirely en regle with respect to his passport, suspiclous characters being usnally the most particular in their attention to formalities, for fear of detention. A Frenchman traveling without a properly-authenticated paseport is liable to arrest and datention for a period not exceeding a month. The fees fixed in France are two francs for a passport to travel at home, and ten to go abroad.

By the twenty-first section of the act of August 18, 1856, the Secretary of State of the United States is authorized to grant and issue passporta, and cause passports to be granted, issued, and verified in foreign oountries by auch diplomatie or consuiar officers of the United States, and ander anch rules at the Preaident ahail designate and prescribe, for and on hehalf of the Unit.
ed States, and no other pernon shall grant, iasue, or verify any such passport ; hor shall any pasaport be granted or inaued to or verifled for any other persons than citicens of the United States; nor shall any charge be made for granting, isauing, or verifying any passport, except in a foreiga country; and in any case the fee allowed therefor shall not exceed the sum of one dollar, nor shall any such charge be made for more than one such verification in any foreign country ; and if any person acting or cialming to act in any office or capacity under the United States, or any of the States of the United States, who shalf not be lawfully authorized so to do, shall grant, iseiue, or verify 'any passport, or othor instrument in the nature of a pasaport, to or for any citizen of the United States, or to or for any person olaiming to be or designated as such in such paseport or verification; or if any coneviar officer who shali be authorized to grant, fesue, or verify passports, shall knowingly and willingly grant, ieeue, or verify any such pasaport to or for any person not a citizen of the United Citates, the person so offending shall be deemed and taken to be guilty of a misdemeanor, and on conviction thereof shall be imprisoned not exceeding one year, or fined in a sum not to exceed five hundred dollars, or both ; and may be charged, proceeded againat, tried, convicted, and dealt with therafor in the district where he may be arrested or in cnstody. It is likewise made the duty of all persons who shall be authorized, pureuant to the provisions of the act, to grant, issue, or verify passports, to make return of the same to the Secretary of State $;$ and such returns shall speeify the names and all other particulari of the persons to whom the same shall be granted, issued, or verified, at embraced in such passport.

From the foregoing provisions of the act it will be seen that passports can only be issuea by the Secretary of Sta:e, and such diplomatic and consuiar officers of the Unlted States in foreign countries as he may expressly authorise, and they can be granted to citizens of the United States only. Passporte will be grsuted by the Secretary of State, and by the diplomatic representatives of the United States in foreign countries, free of charge; but when issued by a consul generai or consul, the fee of one dollar, as preseribed in these instructions, is to be collected in overy case. As passports granted by the Secretary of State secure to the bearera facilitiea from foraign governments not accorded to those iasued by dipiomatic officers, consuls general, or consuls, it will always be to the interest of travelers to procure their passports before leaving the United States, and this course is earnestly recommended by the Department of State. In any country where thero is a dipiomatic representative of the United States, no consul general or consul is authorized to issue passports, except in the absence of such representative from the place of his legation." Whenever ha may be so ahsent, authority is given to consuls general and consuls only to issue passports; but in all cases the said consule general or consuls, as the case msy be, wili report to the Department of State the names of the persons to whoin passports have been issued by them, together with the evidence of thielr being eitizent of the United States, and a copy of the same report will be forwarded to the legation of the United States, if there be any in the country. In case there should be no diplomatio representative accredited to the country in which a conaul general or consul may reside, then these officore are authorized to grant paesporta, having regard to the general instructiona to conauiar officers in referenco thereto; they will transmit, in ail cases, to the Department of State the Information in regard to citizenship required by this section.

Whenever a foreign government shall require the visa of a pasport of any citieon of the United States, it ahali be given by the consular officer of the United States at the place where it is demanded, and he ahail, for each paseport so risaed, eollect and account for the

fee prescribed in these instructions, noting on the passport that this has been done; and no charge shall thereafter be made by any officer of the United States for any visa of that pasport in the same conntry. Passports are granted upon the ground of international courtesy, and as affording avidence to the diplomatic and other agents in foreign countries that the bearer thereof is a citizen of the United States, and entitled to full protection as such. A passport, in proper form, must contain a description of the bearer, with his signatare; it must also request all whom it may concern to permit the bearer thereof, being a citizep of the United States, anfely and freely to pase, and, in' cape of need, to give him all lawful ald and protection while so doing. It must be aigned by the diplomatic representative, consul general, or consul, and sealed with the sanl of the legation or copsulata. Consuls general and consuls are expressly Instructed that when an application is made for' a passport by a native citizen of the United States, before granting it, the applicant must file in the consulate an affidavit stating that fact, and slso his age and place of birth; this must be signed and aworn to by himself and one other citizen of the United States named therein, to whoin he is personally known, and to the beat of whose knowledge and belief the declaration made by him is true. If the appllcant be a naturalized citizen, a passport can only be granted upon his exhibiting a certificate of naturalization, or a certified copy thereof; an authenticated copy of which must be transmitted by the consul general or consul to the Department of State. When the appllcant is accompanied by his wife, children, or servants, or by femalce under his protection, it will be sufficient to state the names and ages of auch persons and their reintionship to the appllcant.

Pante (Fr. patte). In Gcm Sculpture, a prepsration of giass, calcined cryatal, lead, and other iagredients, for imitsting gems. This art was well known to the ancients, and, after being long lost, was restored, at the end of the fifteenth century, by a Mllaneee painter. Some modern artists heve sacceeded in obtelning a composition possossing a hard, fine, and brilliant lustre or appesrance ; but pastes, or mock diamonds, as they are called, depend most for brilisisncy on the art dispisyed in setting the foil or tinsel bohind them. Soveral recipee have beon given by M. Fontanlen; hut the most useful, and that generally employed for the production of artiffisil diamonds, is the following: Take of litharge 20 parts, of silex 12, of nitre 4, of borax 4, and of wilte sreenic 2 parts. Theae ingredients are to be woll mixed together in a cruciblo and melted; the fused metal is thrown into water; and should any of the lead employed be reduced to the metalic state, it hecomes separated by this process, and the glass is remeltod for use. For the finer kinds, rock crystai is ased instead of fint or sand, as it occurs in a much purer state; $i$. o., more free from the sdmixture of metallic oxyds, which give to vitreous compounda their different colore. In place of the above,

Loynel recommends the following ingredients to form a compound having the same, apecifio gravity at the Oriental diamond, and on this account considered, anperior, as it more aearly approachen the gem with rogard to lita refraotiye and disperalve powera; but, like the former, it requires to be kept fac oome two or three days in a fused state, in order to expel the superaband. ant alkall and to perfoct the refining. A moderate de gree of heat fuses it. . The following is ite composition: Take of white sand purified by belng washed, firat ln muriatio acid and afterward in pure water until all traces of acid ara removed, 100 parts; red oxyd of lead (minium) 150 parta; calcined potach 80 to 85 parts; calcined borax 10 ; and oxyd of arsenic 1 part.-Ssee the Polytechnic Journal for July, 1841. . The term paste is also applied to the earthy.mixture for pottery and porcelain; also to dough, and to the solution of starch or wheat flour, made by first mixing it with a proper portlon of cold water, and then adding boiling water under constant atirring, so as to form an even solution. Alum is often added to paste to etrengthen it.-Brande's Dictionary.
Pantel (Lat. pastillus). In painting a crayon formed with any color and gum water, for painting on paper or parchment. The great defect of this mode of painting is its want of durability
Patents. A patent, according to the definition of Mr. Philps, is a grant by the State of the exclusive privilege of making, ueing, and vending, and authorizing othere to make, use, and vend, an invention. $\tau y$.
The firat act of Congress on thie subject was passed April 10th, 1790, and it aathorized the Secretary of State, the Secretary of War, and the Attorney General, or any two of them, to grant patents for such new inventions and discoveries as they siould deem aufficiontly neefol and important. That act extended equally to aliens, and the board exercisod the power of refusing patents for want of novelty or utility. This act wae repealed, and a new act passed on the 21at February 1798. It confined patents to the citizens of the United States, and they were to bo granted by the Secrotary of State, subject to the revision of tho Attornoy General. Tho act gave no power to the Secretery of State to refuse a patent for want of novelty or uscfulnesa, and the granting of the patent bezame a mere ministerial duty. The priviloge of suing out a patent was, by the act of 17th April, 1800, extended to alicne of two yeare' realdence in the Unitrd States. The act of July 13th, 1832, only required the alien to be a resident at the time of the application, and to have declared his intention, according to law, to become a citizen.

But as every person was entitled to take ont a patent, onsomplying with the prescribed terms, without any material inquiry, at least at the Patent Office, respecting the usefulness and importance of the inveution or improvement, a great many worthless and frsudulent patente were issued, and the value of the privilege was degraded, and in a great degree deatroyed. It became necessary to give a new organization to the Patent Office, and to elevate its character, and confer upon It more efficient $p$ swer. This was done by the act of Congress of July 4th, 1836, which repealed all former lavs on the aubject, and re-cnacted the patent aystom with essentiol improvements. A Pstent Office is now attached to the Interior Department, and a commissioner of petents appointed. Applicetione for patenta are to be made in writing to the commissioner, by any persons haring discovered or invented any new snd useful art, machine, manufacture, or composition of matter, or any new and useful improvement on any art, machine, manufacture, or composition of matter, not known or used by others before his diecovery or Invention thereof, and not at the time of his applicstion for a patent tn public use or on sale, with his consent or allowance, as the ioventor or diacoverer. The applicant muat dellver a written dencription of his invention
or discovery, and of the mannor and process of making, constructing, using and compocinding the iame, in foll, clear, and oxact terms, avolding tunecessary prolixity, so as to enable hay porson skilied in the art or acience to which it sppetraina, or la moot nearly conuected, to make; construct, compound, and une the same; and he mast, in the case of a machine; fuliy oxplain the principle and the application of it, by which it may be distinguished from other Inventions; and he must particuluriy apeoify the part, improvement, or comblation which he oluims as his own invention or discovery. He must accompany the same with drawings ind written references, where the nature of the case admitio of drawings of apecimena of ingredients, and of the comporition of matter aufficient in quamtity for the purpose of experiment, where the invention or discovery is of a composition of matter. He nuist likewise furriish a model of his livention, in cases which admit of reprosentation by model. Ttie applicant also must make onth or affirmation that ho believes he is the original and firut inventor: or discoverer of the art, machine, composition, or improvement for which he sollicits a patent, and that he does not know or believe that the same was over before knewn or insed, and he must further state of what country he is a eitizen.

If the applicant be a citisen, or an alien of one year'a residence, he fa to pay to the Treasury of the United States $\$ 30$; and if a British subject; 500 ; and all other appicicants, 8300 . The original and true inventor is not to be deprived of the right to a patent for bis invention, by reason of his having proviously taken ont letters patent therefor in a foreign coontry, and the same having been published at any time within six months next preceding the filing of his specification and drawiug. The executors and administraters of persons dying before a patent is taken out, reay apply and take it out in trust for the heirs or devisees, on due complinnce with the terms of the statute. Patents are assignable, and may be granted in whole or in part by writing, to be recorded in the Patent Office. If invalid by reason of defective opecifications, or by claiming too much, the patent may be surrendered, and a new patent taken out for the noexpired period, provided the error did not arise froin any fraudulent intention. If the patentee be an alien, he forfeits his exelusive right, If he fails for elghteen montha from the date of the phtent to continue on sale to the public on reasonable terms the invention or discovery covered by the patent. The patentee does not lose his patent if it satisfactorily appears to the court, that at the time of his application he believed himself to be the first inventor or discoverer of the thing patented, thongh the invention or discovery, or any part thereof, had been before known or ased in a forelgn country; provided it doee not appear that the same, or any substantis] part thereof, bad before been patented or described in any printed publication.

These are the principul existing statute provisions on the satject, and though the act of Congress of 1836 has made considerable alterations in the pre-existing iswe reapeeting the erganization of the Patent Office, and the limitations on the granting of patents, yet the eseential and established doctrines concerning pntents heretofore declared in the decisions of the courts remain unaffected. The aet of 1793 declared that ilmply ehanging the form or the proportions of any machine or compooition of matter in any degree was not a discovery. And also, that the person who had discovered an impmeinent in the principle of any machine, or in the process of any composition of matter, might oltain a patent for such improvement, but that he could not therely make, use, or vend the original discovery, nor could the firet inventor use the improvement. These declaratory provisions are omitted in the lav of 1836, e.d I presume the construction was considered to be necensarily the same without the provision. In an age distinguished for an active and ar-
dent spirit of improvement in the arts of agriculture and manufuctures, and in the matchinety of every kind applied to their use, the doctrine of putent rights has attracted much discassion, and become a suibject of deep interiet both here and in Ebiope:-Kent's Commentarite, vol. it p. 488 ; DuNiAr's Digent Lavor U. S.
Patreas, or Patritise, a sea-port In the northwest corner of the Morea, near thie entrance of the Gulf of Lepanto, lat. $88^{\circ} 14^{\prime} 25^{\prime \prime} \mathrm{N}$, long, $21^{\circ} 40^{\prime} 20^{\prime \prime} \mathrm{E}$. Population" varionsly estimated from" 7000 to 8000 . The port lies a little to the northward of the town; but the part fionting it is unsafe, and exposied to heary seas, particulurly in winter. Vessele, therefore, go a Hittie farther up the galf, where there is a mole or quay, and where they can lie clone to the wharf. Patras has - more extensive trade than any other port of Greece. The principal exports are currante, oil, valonia, vine, raw silk, raw cotion, wool, skins, wax, etc. Of these, enrrants are by far the most important. ${ }^{\text {:3 }}$ The fruit is larger, and freer from sund and gravel, than that of the Ionian Islands. They are shipped in caskis of various sizes; but as the weight of the cask is included in thast of the fruit, it is said to be, for the moit' part, heavier and stranger than nccessary. "Morea currants are preferrid in most countries, except England; but'there the currants of Zante sre hald in equal, or perheps greater, estimstion. The export of currants from Ps. tras may average from 70,000 to $80,000 \mathrm{cw}$ ts. a year; but the produce of the crop rairies extremely in different seasons. Latterly the culture of currants in the Morea hine heen very greatly extended. Owing to the increase of their quantity, their prico has been nuch reduced: But their coltivation weold notwithstandIng be extremely profitable were it not for the extraordinary risks by which it to sttended. It is seldom, indeed, that the entire crop can to housed without serious damage ; and very frequently it in all bot entirely loat. Thie was the case with the crop of 1852, the loss of which occasioned mach distress. The erops of oil, the next great article of export from Patras, are, if possible, still more fluctuating than those of currants. The importe at Patras, an at the other Greek ports, coneist principally of sugar, coffee, and other coloniai products; plain and printed cotton staffe, woolen goods, salted fish, iron, tin plates, hardware, cosl, cordage, hemp, deals, etc. Imported articles are brought principaily from the Ionian Islands, Malta, Venice, Ieg. horn, Marseillee, and Trlaste; but, from the want if authentic details, it is quite imposilible to form any securato estimate of their amount either as respects $\mathrm{P}_{6}$ tras or any other Greek port.
Conmerce.-The Greeks have particularly distin. guisiced themselves ly the spirit, and success with whloh thoy have engaged in naval and mercuntile ellterprises. Their commerce, next to their freedom, was the grand source of the prosperity of Athens, Corinti, and other Greek cities of antiquity. Apd in this reopect the modern Greeks have been no unsuccessful imitators of their illustrious progenltors. The great articles of expert from Greece consist of currants, silk, fign, wool, ollve oil, valonia, wine, sponge, wax, tobacco, etc.; the prineipal Imports being manufactured cotton and woolen goods, corn, with a great variety of subordinsto articlen, principaily from England, but partly also from France and Germany. The mercastiie navy of Gresce was estimated In 1850 at 4000 vessels, of the aggregate birden of 150,000 tous, emploging about 30,000 seamen. Tho Greeks have, in fact, attained to the distinetion of being the carriere, factors, and traders of the Levant.

The advantage resulting to Greece from her being the aeat of extensive trade is not so great as might have been antieipsted. The import and export trade of the country is subjected to many troublesome reguIatlons; there are no reads, which, however, are less wanted here than in most other countries. Slanufactures on a large scale can not hies enid to exist, the bulk

of the populet'on, but little removed from barbariom, using only those made at home; agriculture ia also in the moat backward condition, and is almont wholly curried on under the metayep syatem, 1 Still, however, some improvements are taking place, especiaily in the islands 1 and it is probable that the progress toward a better atate of thingaivili be gradublly accelerated. It is deeply to be regretted that Candie, or Crete, was not either added to the naw kingdom of Greece, or made independent, We can not heip connidering it as disyraceful to the Christian nations of Europe; that this famous island, where Enropean civilization first struck its roots, should be conaigned to the barbarians by whom it is now' iaid wasta. It is as well entitied to the favorable consideration of England, France, and Russia, as any part of Continontal Greece; and we hope that measuree may yet be devised for reacuing it from the atrocious deapotism by which it has been so loag weighed down.-Dee Grimecs. For Commerce, etc., of Modern Greace, see Living Age, ii. 657; Nrtes'a Reginter, xxiv: 842 (Danial Webstere'a Epeech); Hust'a Merchaints' Magazine, vii. 109; De Bow'a Reciev, xili. 134 ; Demooratic Review, viii. 204 (Grorger Sumner):
Patterns are speeimena oreamples of commodities, transunitted by manufacturers to their correapondents, or cerried from town to town by travelera, in search of orders.
Pawnbrokers and Pawnbroking. A pawnbroker is a specien of bainker, who advances money, at a certain rate of interest, upon aecurity of gooda deposited in his hends; having power to sell the goods, if the prinuipal sum and the interest thereon be not paid within apecified time. The origin of berrowing money by means of pledges deposited with lenders is referred, as a regular trade, to Peronsa, in Italy, abont A.d. 1458 ; and aoon afterward in England. The business of pawnirokers was regulated 80 Geo. II., 1756. Licenses were issued 24 Geo. III., 1783. In London there are 334 pawnbrokers; and in Engiand, exelnsively of London, 1127.

Advantagea and Disudeantages of Pawobroking.-The pratice of impledging or pawaing goods, in order to raise iogns, is one that must necessarily.always exist in civilized societies, and is in many cases productive of advantage to the parties. But it la a practice that is axtremeiy liable to abuse. By far the largest proportion of the bona fide borrowera of money on pawn consist of the lowest and most indigent classes; and ware the lendere not subjected to any species of regulation, adventage might be taken (as, indeed, $1 t$ is frequently taken, in despite of every precantion) of their necessities, to suijject them to the most grievous extortion. But, besides those whoge wanta compel them to resort to pawnbrokers, there is another class, who have recourse to them in order to get rid of the property they have unlawfully acquired. Not only, therefore, are pawnbrokers instrumental in relieviag the presaing and urgent necessities of the poor, but they may also, even witaout intendiag it, become the moat efficient allies of thicver and swindiers, by affording them ready and convenient outlets for the disposal of their ill-gotten gaios. The polioy of giving legislative protection to a business soliable to abuse has been doubted by meny. But thongh it were ouppressed by lew, it wonld al waye realiy exist. An individuai ponsessed of property which he may neither be abie nor willing to dispose of, may be reduced to a state of extreme difficuity ; and in such case, what can be more convenient or advantagcous for him than to get a loan upon a deposit of such property, under coudition that if lie repay the loan and the interest upon it within a certain period, the preperty will be roturned? it It is said, indeed, that the facilities of raising money in thia way foster habits of imprudence; that the firat resort for aid to s pawnbroker alinost always lesde to a second; and that it is
impossible so to reguiste the business as to provent
the ignorant and the necessitous from being piundered. That this atatement, though axaggerated, is to a certain extent true, no one can deny. : On the other hand, howered, the capacity of ohtaining auppliea on aeposita of goods; by affording the means of meeting preacing oxigencies, in eofar fonds to prevent crime, and to promote the security of property; and it would seem as If the desire to redeem property in pawn would be one of the most powerfal motivea to industry and economy. At the same timic, too, it must be borne in mind that it is not possible; do what you will, to :prevent those who are poor and uniastruoted from borrowiag ; and that they mhat in all case obtalif loans at a great sacrifice, and be lisble to be imposed upon. But the fair presumption is, that there is fesal ahance of any itmproper advantage being taken of thers by a livensed pawnbroker than by a private and irresponsible individual: Although, however, the businesi had all the inconveniencea, without any portion whatever of thie good which really beiongs to it, it would be to no purpose to attempt ite suppression. It is visionary to imagite that those who have property will submit to be reduced to the extremity of want, without endeavoring to raise money upon it. : Any attempt to put down pawnbroking wouid merely drive respectable persons from the trade, and throw :ic entirely into the handa of those who have neither property nor'character to fose. And hence the object of a wise Legislature ought not to be to aboilah what muet always exist, but to endeavor, so far at least as is possible, to free it from abuse, by enacting such regulationa as may appear to be best calcuiated to prevent the ignorant and the unwary from becoming the prey of swindlera, and to facilitate the discnvery of stolen property.

Obligations under which Pawnbrokers should be placed. - For thls purpose it aeems indispensable that the interest charged by pawnbrokera should lie linnited; that they ahonld be obliged to give a receipt for the articlea pledged, and to retain them for a reasonable time before selling them; that the snle; when it does take placo, should be by public anction, or in such a way as may give the artleles the best chance for being sold at a fair price; and that the excess of price, if there be any, after deducting the amonnt advenced, and the interest and expenses of sale; should be paid over to the original owner of the goods. To prevent pawnbrokers from becoming the rocaivera of stolen goods, they should bo liable to penalties for making sdvances to any indi vidual unable to give a satisfactory account of the mode in which he became possessed of the property be is desirous to pewn ; the officers of police shonld at all times have free access to their premises; and they should be obliged earefully to deseribe and advertise the property they offer for sale.
Law as to Paunbrokers.--It may appesr slingalar that pawnbrokers sliould bardly have been named in any legislntive anactment till after the middle of last century: It was enacted by the 30 Geo . II. that a duplicate or receipt should be given for goods pawned, and that such as were pawned for any sum less than $£ 10$ might be recovered any time within two years on payment of the principal and interest; but the rate of intorest was not fixed.

Of the pledgs of Mortgags and Chattels.-There is a material diatinction to be noticed between a pledge and a mortgage. A pledge, or pawn, is a deposit of goods redeemablo on certsin torms, and either with or with ont a fixed period of redemption. Delivery accompanies a pledge, and is essentiai to its validity. The geaeral property does not pass, as in the case of a mortgage, and the pawnoe has oniy a apecial property. If no time of redemption be fixed by the contract, the pawner may redeem at any tima; und thongh a day of payment be fixed, ho may redeam after the day. He has hia whole lifetime to rednem, provided the pawnoe doea not cali upon him to redeem, as he has a right to do at any time, in his diserction, if no time for redemption
be flxed; and if no such call be made; the reprenentativee of the pawner may sedeem after his'death. A early. as the time of Glanville, these just and plaim principloe of the law of pledget ware esmentially recognised, and it was declared, that if the pledge wae not redeemed hy the time appointed; the creditor might have recoure to the law; and compel the pawner to redeam by a given day; or be forever foreclosed wad berred of his right.! And if no time of redomption was fixed; the creditor might call upon. the debtor at any time, by legal procese; to redeem or lose hls pledge. The distinction between a pawn and mortgage of chattels is equally well sattied in the English and Amorican law; end a mortgage of goode differs from a plodge and pawn in this, that the former is a coaveyancs of the title upon conditiony and it ibecome an absolinte interast at law, if not redeomod by a given time, and it migy be valid in certain cases withont actoal delivery. According to the civil law; a pledge conld not be sold without judicial sanction, unlese there was apecial agreement to this effect; and this is, doabtless, the law at this day in most parts of Europe. The French Civil Code has adopted the law of Constantino, by which even an agreement at the time of the original contract of loan, that if the dehtor did not pay at the day, the pledge should be absolntely forfoited; and become the property of the ereditor, was declared to be void. While on this aubject of pledges, it may be proper further to observe, that the pawnee, by bill in chancery, may bar the dobtor's right of redemption and have the chattels sold. This has been done frequently in the case of stock bonds, piato, or other personal property pledged for the payment of debt. But wiehont any bill to redeem, the creditor, on a pledge or mortgage of chattels, may sell at anction, on giving reasonable opportunity to the debtor to redeem, and apprising him of the time and place of ealo; and this is the mose convenient and amal practice. ㅇ.. While the dobtor's tight in the pledge remains unextinguished, his interest is liable to be sold on execntion; and the purchaser, like any other purchaser or aseigued of the intorest of the pawner, succoeds to all his rights, and becomes ontitled to redeem. -iSes Kexr's Commentaries, vol. iv.
r. Ilaly, France, efe. -The practice of advancing money to the poor, either with or withont interest, seeme to have bean occasionally followed in antlquity.- Becxmanx, vol. iil. Bat the first public establighments of this port were founded in Italy, under the name of Monti di Piete, in the 14th and 15th conturies. As it was $t o o n$ found to be impossible to procure the means of aupporting auch establishraents from voluntary contribntions, a bull for allowing intereat to be charged upon the losns made to the poor was issued by Leo X. in 1521. These eatablishments, though differing in many respects, have universally for their object to prolect the needy from the risk of being plundered by tho irrespensible individuala to whom their necessities might oblige them to resort, by accommodating them with loans on comparatively reasonable torms. And though their practice has not, in all instances, correaponded with the professions they have made, there seerus no reason to doubt that they have been, speaking generally, of essential nervice to the poor. From Italy these, ostablishments have gradually spread over the Continent. The Mont de Rield, in Paris, was eatablished by a royal ordinance in 1777 ; and after being deatroyed by the Revolation, was again opened in 1797. In 1804 it olbtained a monopoly of the hasineas of pawnbroking in the capital. Losin are made by this establishment upon deposits of anch grode es can be preserved, to the amount of two-thirde of the estimated value of ali goods other than gold and silver, and to four-fifths of the value of the latter. No loan is for less than 8 franca. The advances are made for a year, but the borrower may renew the ongegement. Interent is fixed at the rate of one per cent. per month.

The Mont de Pidd has genorally in depoeits from

600,000 to 650,000 articiet, worth from twolve million to thirteen million frances The expense of managbment amoante to from 60 to 66 rentimes tor oach articie; $\mathbf{0}$ that a loan of 8 franca never defraye the oxpenses it adcmione, and the profits are wholly dorived from those that exceed 6 friment At an average the profte amount to sbont 280,000 irance; of which only about 166,009 are derived fronts loand upon deposif, about 126,000 being the prodece of other funde at the diaposal of the company. In tome reipecte, yarticuJarly the lownems of interest apon omall loaing, and the greater vigliance exercieed with respect to the reception of etolen geods; the Mont de Plied has an advantage over the pawnbroking sutabliebments in this country. Is. It may bu donbted, however, whather it is; on the whole, 80 well fitted to attaln its objocts: The litnitation of the loans to 8 francs would be folt to be a merions grievance here, and it can hardly be otherwise in France; nor is it to be supposed that the mervante of a great public establishment will be no ready to asaist poor persona, having none but inferior articles to offer in security, al private individnals anxious to get business. And such, in point of fact, is found to be the case, not in Paria only, but in all those parte of the Continent where the businees of pawnbroking is confned to a fow establishmental And hence; though the question be not free from difficulty, it would seem that, were the modifications already suggeeted adopted, oar syatem would be the best of any. "For further information with respeot to this curions and it terosting subject, the reader is referred to the Traith es. la Bienfaiaamee Publique of Degerando, ifi. 1-65; besides givo ing a anceinct hiatorical notice of Monts do Pithet the learned anther han discussed most part of the knotty questions connected with the proper organization of these eetablishments, and with their influence on socioty, with equal angacity and ability. - See Bankers' Magazine, New : York, Auguet, 1850, p. 170 ; August, 1852, p. 124 (Sir F. Hrad); Standard Lih. Cy. London, 1848.

Peach-tree (Amypdalus perrica). It is not certain in what part of the globe the peach-tree was originaliy produced; for although we have eariy acconnts of fts baing brought to Europe from Perata, it does net follow from thence that it was one of the natural productions of that country. Pliny relates that it had been atated to have possessed vonomous qualities, and that its fruit was cent into Egypt by the kinga of Porvia, by way of revenge, to poison the natives; bnt he treats this stery as a mere fable, and considers it the moat harmless fruit in the world; that it had the most juice, and the least amell of any fruit; and yot caused thirat to those who ate of it. He expresely atates that it was imported by the Romana from Persia; but whether it was indigenous to that country, or cent thither from a region still nearer to the equator, we have no information. He sdde that it was not long siuce peaches werv known in Rome, and that there was great diffienlty in rearing them. . He also informs us that this tree was brought from Egypt to the Isle of Rhodes, where it could never be made to produce fruit; and from thence to Italy. He sayk, moreover, that it was not a common fruit either in Gresce or Natolia. : No mention; however, is made of it by Cato. Pownall, in hie Roman Prooinces, makes it a Phocean importation to Marseilles; and evidently it was cultivated in France at an carly period, as Oolumella, in his account of this fruit, asys:
"Those of mall wise to ripen make great haste; Bach as great Gaul bestows, oboervis due time and senson, not toe esriy, mer too tata."
The peach is acid to have been. first cultivated in Britain about tha midile of the 16 th century. Gerard deseribes several varieties of it as growing in his garden, in 1597. Tueser montions it in his list of fraits in 1572 ; and in all probability it wall introduced when the lomane had possecsion of that conntry.

The peach was introdiced into North America by
the first of the 16 cultivate with sue trees, In land, Vir tion is pa lent qual planter to and or n dle Staten greatest ; in the op Vermont so delicio it is also to, in Ca quality is Florida, if well cul to a large Mississip same Iatit indigenou of foreign before the vicinity and othe pesch is numerous fine quali American abundane speaks in fruit, whi neighborh dea; and as an art those mo ried from la Plata, seen peac eat perfect siderabln they grew quantities use, and by cattle,
The wo roseate h owing to is but litt! tries whe tained, ho ployed fo color may Its leaves low color, soms, and poisonous sugar con tritious, a preserved it is slight tities it is taken tou When ate relaxatíve for the 8 The lave liquorist, have also fatal conse they shou prescrvat! other kind in the ind
the first European settlers, probably toward the close of the 16th or eariy in the 17 th century, where it is cultivated in extensive plancations, which often grow with such lusturiance as to resemble forente of other trees. In New Jereey, Pennsyivania, Delaware, MaryJand, Virginia, and several other States, much attention is paid to its eultare, and the fruit is of an.excelleat quality. It is no uncommon circumstance for a planter to posesese a pesch orchard containing one thonsand or more of standard trees. It is ouly ir the Middie States of the. Union where this fruit ary ses at the greatest perfection." In favoralile eemsons, it matures in the open alr as far north aa Maine, Now Hampohire, Vermont, and the Falls of Niagara; but ite puip te not so delicious as when grown some degrees farther south; it is also trained against walls at Montreal and Toronto, in Canade, where, in some reasons, fruit of a fine quality is obtained. In the Carollnas, Georgia, and Fiorida, the trees make much foliage and wood; still, if well cultivated and properly pruned, tho fruit growa to s large size, and is julcy and well flavored. On the Mississippi, particularly in Louiaiana, which lies in the game intitade as that part of Aais where this species is indigenoue, it grows apontaneously, but is regarded as of foreign origin, having been introdaced from Spain before that river was explored by the French. 4 In the vjeinity of Boston, Salem, New York, Philsdelphia, and other populous cities of the United. States, the pesch is reared againat walls and in hot-houses by numerous opulent citizens, and fruit of a large size and fine quality is produced. In some other parts of the American continent It also readily grows, and in great sbundance. Sir Francis Head, in his Rough Nctes, speake in raptures of the bearty and luxuriance of this fruit; which was ecattered over the corn-fields in the neighborhood of Mendoza, on the east side of the Andes; and the same traveler noticed dried peaches used as an article of food on che more eiovated parts of those mountains, to which they must have been carried from the plains below. On the banks of Rio de ls Piata, from Mentevideo to Buenos Ayres, we have seen peach-trees growing spontaneously in the greatest perfection, and in such abundance as to ferm a considersble portion of the fuel of the provinces in which they grew. The frult there is of a fine quality, large quantities of which are annually dried for domentic use, snd the chief part of the remainder is consumed by cattle, or is suffered to decsy upon the ground.

The wood of the pesch-tree is hard, compact, of a roseate hue, and is susceptible of a fine polish; but owing to its Inferior size and comparative scarcity, it is but little used in the arte, or for fuel, except in countries where other kinds of wood are rarc. When obtained, however, of suitable dimenaiens, it may be employed for similar purposes as that of tho slmend. A coior may aleo be extractod from ic called rose-pink. Its leaves yield, by distilation, a volatile oll of a yellow color, containing hydrocysnic acid. Its bark, bios80 ms , and keruels of the fruit, slso posacss the samio poisonous property. From the quantity of gum and sugar contained in the delicious pulp, the peach is nutritious, sud is omployed as a desaert, both fresin and preserved. From the malic acid contained in its juies, it is slightly refrigerant, and if eaton in moderate quantities it is generaliy considered as wholosons; but if teken tou freeiy it is liable to diserder the bowels. When atewed with sugar, it may be given as a mild relaxative to convalescents. The kernels may be used fer the same purpose as thoee of the bitter almond. The leaves are sometimes employsd by the cook, the liquorist, and the confectioner, for flavoring, and they have aiso been substituted for Chinese toa; but, as fatai consequonces have sometimes followed these uses, they should be looked upon. with precsution. Tho preservation of pesches, plums, cherries, apricote, and other kinds of fruit In sirup occupies a prominent rank in the induatry and commerce of Fraueo and of Ma-
jorea, and doubtlase could be profitably carried on in those parts of the United States whero these fruits are cultivated in abundence, To, those who, are desirous of eutering Into the businese on an extensive acale, we would recommend the Nouveas. Manuel du Limoma dier, du Glacier, du Chocolatier, et du Confiseur, par MM. Cardelli, Lionnet-Clémandot, et Julia de Fontenelle; published at Paris in 1838 ; or, what would be still better, the employment of ain intelligent confiseur who is prectically acquainted with all its manipula tions.-Beowne's. Trees of Americas.

1. Pealc, a nama given to the upper corner of those sails whioh are extended by agaff; or by a yard which cromaes the mast obliquely, as the mizzen-yard of a ship, the maln-yard of a byiander, eto. The upper extremity of these yards and gaffs is also denominated the peak.

Peax-tree (Pyrus Communit). The common peartree is Indigenous to Europe, Weatern Asis, the Himalayas, and to China; but not to Africa nor Americs. It is found wild in most of the counties of Britain, as far north as Forfarshire; on the continent of Furope, from Swoden to the Mediterranean; and in Aaia, as far east as Chins and Japan. It is alwaye found on a dry soll, and more frequently on plains than on hille or mountains; and solitary, or Ja amall groupe, rather than in woods and forests. The varieties cultivated for their fruit sncceed both in the temperate and transition zones of tho two hemiapheres, and It hs. 1 been remarked that this tree, as weli as the apple anci the cherry, will grow in the open air wherever the oak will thrive.

The wood of the common pear-tree is heavy, otrong, compact, of a fine grain, and slightly tinged with red. In common with that of all the Rosacea, it is liable to have its natural color changed by ateeping in water, which, therefore, ought to be avoided when intended for particular purposes in the arta. When green, it weighs nearly elghty pounds to a cubic foot, and from forty-nine to fifty-three pounds when dry. , According to Du Hamel, it is, next to the true aervice (lyrua sorbus), the best woed that can be employed in woodengraving, for which purpose, hewever, it is far inferior to that of the box. Yet it is allowed to be very hard and homogeneous, casy to cut, and, when perfectiy dry, is not liable either to crack or warp. For the coarser kiaús of engraving, such as large plans or diagrains, show-bills, etc., it serves a very good purpose. When it can be obtained, In Europe, it is much used by turuers and pattern-makers; alao for joiners' tools; snd, as it can readily be atained, it is sometimes made into various articles, dyed black, in imitation of ebony. As fuel, the wood of this tree ls excelient, producing s vivid and durable fiame, accompanied by an intense heat. According to Withering, the leaves afford a yellow dye, and may. be empleyed to impart a greenish shade to blue eloths. But the most important uses of the pear-tree are thoae which arise from its fruit. When ripe, it is employed at the table as a dossert, either row, stewed, or presea . ad in sirup, and occaalonally it is used in tarts. In most of the countries where it grows this fruit is very generally dried in ovens, or in the aun, in which atate, when stewed, it le excelient, either as a substitute for puddings and pice, or as forming part of the dessert.

Another purpose to which the pear is applied lis for making perry. It is extensively cultivated for this oljeget in various parts of Britain, France, snd Germany, where the trecs are sometimes planted in rows eighteen or twenty yards spart, in order to admit a free accoss of light and air. Perry is made in the same manner as cider. The pears should be gathered haforo they begin to fall, and should be ground as soon after as possible. Should the perry not be sufficiently clear, when racked off, it may bo fined in the usual manner of clarlfying cider, by lainglase, In the proportion of about lialf an ounce to a barrel. The kinda of pears
used for making this llqnor in Herefordshire are auch as have an austere juice, as the "Squash," the "Oldfield," the "Barland," the "Hnff-cap," the "Sack," the "Red," and the "Longland" varieties. Pears were coneidered by the Romans as an antluete to the effect of eating poiooneus mushroomes and up to the present tims perty in aaid to be the best remedy that can be omployed for the same purpose. In Britain and France an agreeable wine is made from a mixture of crabapples and pears, which in the latter country is called piquette. Pears, in general, produce fietuleacy, and consequently are tefit for weak atomacha; but when they are quite ripe, and contain a aweet juice, they seldom prove nexious, nuless eaten to excess. Pears that are to be kept for winter use ahould hang as long on the trees as the atate of the weather will admit. They should then be kept in heaps, in an open, dry situation, for about ten days, then wiped with a dry woolen cioth, and, lastly, packed up close from the air and moisture. But to keep the fruit in its greateat perfection, small earthen jars may be selected about the size of the pear, which should be packed separately, in clean oat ehaff or wheaten bran, then tied down with olled paper or akin, and cemented tight with wax or pitch. These jars should then be packed in a cask, chest, or mome ether secure place, with their bottoms upward, where they ahould remain until required for nse.-Browns'a Trees of America.

Pearl-ath. See Potasi.
Pearly (Du. Pacrion; Fr. Perlew; Ger, Perlen; It. Perle; Lat. Margarites ; Ruas. Shemptschug, Perlis; Sp. Perlae; Arab. Looloo; Cyng. Mootoo; Ilind. Mootic), are well-known globular concretions fouad in severai s, ecies of shell-fiah, but particularly the mother-of-pearl c, ster (Comehas margarilifera, Linn.). Pearis should bo chosen round, of a bright, translucent, ailvery whiteness, free from stains end roughness. Heving these qualities, the largest are of course the mest valuable. The larger ones have frequently the shape of a pear; and when these are otherwise perfect, they are in great demand for ear-rings. Ceylnn pearis are most esteemod in Iingland. The formation of the pearl has einbarrassed both ancient and modern naturalists te explain, and has given oecasion to a number of vain and absurd hypotheses. M. Rísumur, in 1717, alleged that pearls are formed like other atones in animais. An ancient pearl was valued hy Pliny at $\mathbf{£ 8 0 , 0 0 0}$ sterling. One which was brought, in 1574 , to Philip II., of the size of a pigeon's egg, was valued at 14,400 dacata, eqúal to $£ 13,996$. A pearl spoken of by Boetius, named the Incomparable, weighed thirty carate, equal to five pennyweights, and was about the size of a muscadine pear. The pearl mentioned hy Tavernier as being in poasesaion of the Emperor of Persia was purchased of an Arab in 1633, and is valued at a oum equal to $£ 110,400$. Haydn.

Value of Pearls.-Pearis were in the highest possible estimation in ancient Rome, and bere an enormous price. Jrincipium culmenque onnium rerum pretii, margarita tenent.-P1iny, Jist. Nat. Their price in mod. ern times has very much dectined; partiy, no doubt, from changes of manners and fashions, but more probably from the admirable imitations of pearls that may be olbtained at co very low prico. According to Mr. Milburn, a handsome neeklace of Ceyion pearis, amailer than a large pea, costa from $£ 170$ to $\mathbf{f 3 0 0}$; but one of pearls about the size of peppercorns may be had for 215. The pearls in the former sell ot a guines each, and thoas in the latter at about $1 s .6 \mathrm{c}$. When the pearls dwindle to the size of sinall shat, they are deneminated seed pearls, and are of little value. They are mostly sent to Chins. One of the most remarkable pearls of which we have any authentic account was bought by Tavernler at Catifa, in Arabia, a fishery famolls in the daya of Pliny, for the enormous anm of $£ 110,000$ ! It is pear-shaped, regular, and without blemish, The diameter is " 68 inch at the large." part,
and the length from two to three inches.: Mueh difference of opinlen has exlated among naturalista with respect to the production of pearla in the oyster; but it seeme now to be generally believed that it is the result of dhease, and ls formed in the same manner as besoar (ese Beyoar), pearle, like it, consiaing of nuccesuive coats apread with perfect regularity romad a foreign mucleus. In fact, the Chinese throw inte a species of thell-fish (mytilus cygneus, or awan muscle), when It opens, five or alx very minate mother-of-pearl beada strung on a thread; and in the course of a year they are found covered with a pearly crust, which perfectiy resemblea the real pearl.-Milaburn's Oriental Commerce; Ainsliz's Materia /edica.
4 Pead Fibleries.-The pearl eyster in fished in various parts of the world, partlcularly on the weat ceest ef Ceyion; at Tuticoreen, in the province of Tinnevelley, on the conat of Coromandel ; at the Bahrein Islanda, in the Gulf of Peraia; at the Sooloo Islands; off the coast of Algiers; off St. Margarita, or Pearl Islands, in the West Indies, and other places on the coast of Colombia; and in the Bay of Panama, in the South Sea. Pearls have sonnetimes been feund on the Scetch coast, and in various ether places. The pearl tiahery of Tuticoreen is monopolized by the East India Company, and that of Ceylon by government. But these monopolies are of no value; as in neither case dees the sum for which the fishery is let equal the expenges ineurred in guerding, surveying, and managing the banks. It $\mathrm{I}_{\mathrm{a}}$, therefore, sufficiently obvioue that this system ougat to be abolished, and every one allowed to fiah on paying a moderato lieense duty. The fear of exisusting the banks ls quite ludicrous. The fishery would be sbandoned as unprofitable long before the breed of oyaters had been injuriously diminished; and in a few years it wonld be as productive as ever. Besides giving freah life to the fishery, the sbolition of tie monopoly would put an end to some very oppressive regulations enected by the Dntch mere than a century ago.

Persian Gulf.-The mest extensive pearl fisheries are those on the several banke not far distant from the island of Balirein, on the weat side of the Peraian Gulf, in lat. $26^{\circ} 50^{\prime} \mathrm{N}$;; long- $51^{\circ} 10^{\prime} \mathrm{E} . ;$ but peari oysters are found along the whele of the Aralisn const, and round elmost all the islands of the Gulf. Such as are fished in the ses near the islands of Kar-rak- and Corgo contain pearle said to be of a superie: color and deacription. They are formed of eight layers or folds, while othera have only five, but the wster is too deep to make fishing for them either very profitable or easy. Beaides, the entire monopoly of the fishery is in the hands of the Sheik of Bushire, whe seems to consider these islands as his immediate pioperty. "The fishing eeason is divided into two portions -the one cailed the short and culd, the other the iang and hot. In the cooler weather of the nonth of June, diving is practiced along the coast in shallow water; but it is not until the intensely hot months of July, August, and September, that tive Bahrein banks are mueh frequented. The water on them is about sevell fathoms deep, and the divers are inuch inconvenienced when it is cold; indeed; they can do littie when it is not as warm as the ajr, and it frequently becomes even more 86 in the hottest months of the summer. When they dive, they compress the nostrils tightly with a small piece of horn, which keeps the water out, and etuff their ears with beeswax for the same purpose. They attach a net to their waiats, to contain the oysters ; and aid their deacent hy means of a stone, which they hoid by a rope attaehed to a hoat, and shake it when they wish to be drawn up. From what $i$ couid learn, two minutes may be considered as rather above the average time of their remaining under water. Aithough severe labor, and very exhausting at the time, diving is net considered partlcularly injurious to the constitution; even old men practice it. $A$ persoa

usually dives from twelve to fifteen times day in favorable weathery but when otherwise, three or four times only, Tha work is performed on an empty atomach. When the dlver becomes fatigued, he goes to sleep, and does not oat until he has slept aome time. At Bahrein alone the annual amount produced by the pearl fiahery may be reckoned at from $£ 200,000$ to $\boldsymbol{£} 240,000$. If to thls the purchasea made by the Bahrein merchants or agents at Aboottabee Sharga, Rag-ul Khymack, eto., be added, which may amount to half as much more, there will be a total of about $\mathbf{\& 8 0 0 , 0 0 0}$ or $\mathbf{£ 8 6 0 , 0 0 0 ;}$; hut thls is calculated to include the whole pearl trade of the Gulf; for it ls belleved that all the principal merchants of India, Arabla, and Peraia who desl in pearls make their parchases, through agents, at Bahrein. I have not admitted In the above estimate much more than ome-riath of the amount some native merchants have atated it to be, as a good deal seemed to be matter of guess or opinion, and it is difficult to get at facts. My own estimate is in aome measure checked by the eatlmatod profite of the small bosts. But even the aum which I have estimated is an enormons annual value for an article found in other parts of the world as well as here, and which is never used in lta best and most valuable atato except as an ornament. Iarge quantitles of the seed pearls are used throughout Asia in the composition of majoons, or olectuaries, to form which all kinds of preclous stenes are occasionally mixed, after being peunded, exceptlag, Indeed, dlamonds; these belng considered, frem their hardness, as utterly indigestible. The majoon in which there la a larga quantlity of pearls, is much sought for and valued, on account of Its aupposed stimulating and restorative qualltles. The Bahrein pearl fishery boats are reckoned to amount to about 1500 , and the trade is in the hands of merchants, some of whom possess conclderable capital. Thay bear hard on the producers or fishere, and even those who make the greateat exertions in diving, hardly ha re food to eat. Tise merchant advances some money to the fishermsin at cent. per cent,, and s portion of dates, rice, and other necessary articles, all at the supplicr's own price; be also lets a boat to them, for which ho gets one share of the gross profits of all tivat is fished; and, finally, he purchases the pearls nearly at his own price, for the unhappy fishermen are generally in hls dobt, and therefore at his mercy."-Mfanuscript Notes communicated by Bfajor D. Wi lson, lute political Resident at Bushire.

The fishery at Algiers was farmed by an English associstion in 1826, but we are ignorant of their success. The pearl fisheries on the coast of Colombla were at one time of very great valuc. In 1587 upward of 697 llis. of pearls are sald to hsve been imported into Seville. Phllip IL. had ona from St. Margarita which welghed 250 carats, and was valued at 150,000 delisrs. But for many years past the Colomblan penrl fisheries have been of comparatively littie impertance. Daring the mania for joint-stock companies, in 1825, two were formed; olle, on a large scais, for prosecuting the pearl fishery on tho coast of Colombia; and anotieer, vit a smaller scale, for prosecuting it in the Bay of Panama and the Pacifie. Both wero abandened In 182. Tie best fishery ground is said to be in from six to elght fathoms water. The divers continue under water from a minute to a minute sud a half, or at most two minutes. They lave a sack or bag fastened to the neck, in whleh they bring un the eystere. The exertion is extremely violent; and the divers aro unhealthy and short-lived.-Fur further information, see IIunr's Mferchanta' Magazine, $x$ vili. 505.

Pearl shells, commonly called Mother-of-pearl shells, are imported from varione parte of the East, and conaist principaily of the shells of the pearl oyster from the Gulf of Persia and other places, particularly the Sooloo Islsnds, situato between Borneo and the Phllip-
plnes the ahores of whloh afford the largest and fineat shells hitherto discovered. On the inalde the ahell is beautifully polished, and of the whiteness and water of pearl itself: it has the same lustre on the outside, after the exteraal lamine have been removed. Moth-or-of-pearl ahella are extensively ased in the arts, particularly in inlald work; and in the manvfacture of handlen for knives, buttons, toys, anuff-boxes, etc, The Chinese manufacture them into beads, fish, connters, spoons, otc. ; giviag them a finish to which European artists have not been able to attain. Shells for the European market ahenld be ohosen of the larg, st alse, of a beantliful pearly lustre, thick and even, and free from stalns. Reject such as are small, cracked or liroken, or have lumpy on them." When stowed loose as dunnage, they are sometlmes allowed to pass free of frelght.-Milsunn'a Oriontal Commerce. The Imports during the three years ending wich 1842 amounted, at an average, to about $050,000 \mathrm{lbs}$ a year.

Artificial Pearls.-These are small glubules or pearshaped $s_{5}$ heroids of thin glass, perforated with two opposite holes, through which they are strung, and mnunted into necklaces, etc., like real pearl ornaments. They must not oaly be whito and brllliant, but exhlbit the iridescent reflections of mother-0f-pearl. The liquor employed to imitate tho pearly lustre is called the essencs of the Euast (essence d' Orient), which is prepared by throwing lato water of ammonla the brilliant scales, or ratier the lamello, separated by washing and frictlon, of the acalos of a small river fish, the blay, called in French ableite. These scales digested in ammonia, having acquired a degree of softness and flexlbillty which allow of thelr application to the inner suriaces of the glass globules, they are introduced by suction of the liquor containing them in suspeasion. The ammonia is volatilized in the act of drying the globules. It is said that some manufacturera employ ammonia merely to prevent the altcration of the scales; that when they wish to make use of them, they suspend them in a well-claritied solution of isinglass, then pour a drop of the mixture into each bead, and spread It round the inner surface. It is doultful whether, by this method, the eame lustre and play of colore can be oltained as by the former. It seema, moreover, to be of importance for the success of the imitation, that the globules be formed of a bluish, opalescent, very thin glass, containing but llttle potash and oxyd of lead. In every manufactory of artiticla, pearls there must be some workmen possessed of great eznerience and dexterity. The French are supposed to ezcel Ir this ingenions branch of Industry. False pearls were invented In the time of Catherine de Medicis, by a person of the name of Jaquin. Thay are made of small globules of glass, blown by the ordinary lamp. Tho pearly lustre is communiested by introducing by means of a blewpipo a sinall quantity of nacreous substances obtained from the surface of the scale of a omall fish very commen in the Seine and the Rhine, and also in the Thames. This aubstance preserved with sal ammoniac in a liquid state is commonly sold under the name of "Oriental essence." After having covered the inside of the pearl with thls liquid, a coating of wax is added, which is colored to the required thade. The manufacture of pearls is principally carried on in the department of the Seine in France. There are also manufactorles in Germany and Italy, but to a amall extent. In Germany, or rather Saxony, a cheap but inferior quality Is manufactured. The globe of glass forming the pearl in inferlor ones being very thin, and coated with wax, they break on the slightest pressurc. They are knewn by the name of German fish pearls. Italy also manufactures pearls by a method borrowed from the Chinese; they are known under the name of Roman pearls, and a very good imitetlon of natural ones: they have on their outaide a ceating of the nacreeus liquid. The Chinese pearls are made of a kind of gum, and are covered likewies with the asme liquid. In the year

1084 a Freneh artisan diacevered an opsline flass of a nacreous or pearly ccior, very heavy and fusibse, which gave to the beads the different woights and varied forma found among real pearist gun instend of wax is now used to fili them; by which they attain a high degree of tranaparencr; and the ghassy appearance has been Intely obviated by the use of the vapor of hydro-fuotic acid. Thia acta lu buch a mianter as to denden the surface, and remove Its otherwise glaring look.-Uke's Dictiomaty.

Peas (Gor. Erbeen ; Fr. Pois ; It. Piselli, Risi; Sp. Pesoles, Guieances ; Rnss, (ioroch). The pes in one of the most eateemed of the leguminous or puise piants. There are many varleties; but the common garden pea (Piam adirwm), and the common gray or fleld jea (Pisum arvense), are the most generally cultivated; being reared in large quantities in all parts of the country. But since the Introduction of the drill husluandry, the culture of the pea as a fleld-crop has been to a considerable extent superseded by the bean. Sometimes, hovever, it la drilied along with the iatter; fer, being a climbing piant, it attacises itself to the bean, $s 0$ as to admit the ground being hoed, at tho same tlme thet the free admission of air about its roota promotes ite growth. It is not possible to framo any estinuete of the consumption of peas. The field pea is now hardIy ever manufactured into meal for the purpose of being made lnto bread, as was formerly the case in many parts of the country; but there is reason to think that the garden pea ia now more extensively used than ever. -Lounon's Encyclopedia of Agricalture; Brown on Rural Affairs.

Varions kinds of ulse, from the facility with which they are produced ir almost evary country of the glohe, and the highly nutritive propertles whith they usuaily possess, have been a favorite food for man and enimais ameng all natlens, and in every age of the world. Thus we find that the Athenians eniployed sodden beans in their feasts dedicated to Apolio, and that tho Romans presented them as an oblation in their solemn sacrifice called Fiabaria. Pliny informs us that they offered bean-meal cakes to certain guds and goddenses in these anclent rites and ceremonies; and Lempriere states that bscon was added to beans in the offerings to Caina, not so much to gratify the palate of that goddess as to represent the simplicity of their ancestors. The bean came originally from the East, and was caltivated in Egypt and Barbary in the earilest ages of which we have any records. It was brought into Spain and Portugal In the eariy part of the elghth century, whence some of the beat varieties were introduced inte other parts of Enrope, and finally into the United States. The first beans Introduced from Europe into the British North American colonies were by Captain Gasnold, in 1602, who planted them on the Ellzabeth Ialands, near the coast of Massachuaetts, where they flourlshed weil. They were also cultivated in Newfoundinnd as eariy as 1622 ; in New Netheriands in 1644; and in Virginia prior to 1648. French, Indian, or kidney beans were extensively cultivated by the Indians of New York and New England long before their aettlement by the whites; and both beans and peas (calavances), of various hues, wero cnitivated by the natives of Virglinia prlor to the first landing of Captain John Smith. Among these were embraced the celebrated cow-pea (Phaseolus), or Indian pen, at present so extensively caltivated at the South for feeding stoek, as well as for the purposes of naking into fodder, and for plowing under, like clover, as n fallow crop.

The varleties of heans at present cultivated in the United States, as field and garden crops, are too numerous to admit of repetition in thls report. For field culture, thir common small white, the red-eyed China, the turtie-soup, the Nohawk, and the refugee are preferred; for gerden cuiture, the Mohewk, the eariy slx-weeks, the eariy Valentlne, the yellow sixwecks, the biack Vaientine, the royal white kiduey,
tho Carolina, or Sewee, the cranberry, the London hortieultarai, and the Duteh easobknife. The ylald usually varies from thirty to alxty bushels per acre; weighing alxty-three peunds to the bubliol. The common pea is aupponed to hate been Indigenous to tho South. of Europe, and wan cultivited both by tine Greaks and Remans. Its Intruduction into the British North American colonies probably dites back to the early perieds of their settelement by Europeanis, as it is onnmerated in several Inntances among the culkivated products of thls country by"our carly historians. The cultivation of the pea io fiold crop is principaliy confined to the Middle, Esieiern, and Weaterni States, the varietien of which are disilngulshed as the early and the late ripening. The early varietles are generaliy smali and dark-colored, among which the gray and grass are the most common. The yleld varies from twenty-five to forty bushels per acre, weighing aixty-four pounds to the buchel.- The marrow-fats are among the rlchest of the field peas, which ard much preferred for good lands. The amall yellow are thought to be best for peorer solls. A very prollfio "bush pea" is cultivated in the Sonthern States, bearing podas six or seven Inches in length, which hang in clustera, and are flled with fine white peas, much esteemed for the table, either green or dry. The amount of peas exporter from Savannah in 1755 was 400 bushels; in 1770, 601 bushels; froin Charleston, in 1754, 9162 bushels; from North Carolina, in 1753, 10,000 busheis; aunually from Firginia, before the Kevolutlon, 5000 bushels; annually from the United Stalen, tweht: years preceding 1817, 90,000 bushels. The amount of beans annually exported during the last-named period, from 80,000 to 40,000 bushels.--Patent Office Riport.
Peat, a well-known inflammable substance, employed in many parte of the world as fuel. There are two species of pest. The first is a yellowish brown or black peat, found in moorish grounds in Scosland, IIolland, and Germany. When fresh, it is of a viscid conslatence, but hardens by exposure to the air. It consista, according to Kirwan, of elay mixed with calcareous earth and pyrites; sometimes, alse, it contains cominon salt. While soft, it is fermed inte obiong pleces for fuel, after the pyritaceous and atony matters are soparated from it. Jy distiliation, It yields water, acid, oll, and volatile alkall, the ashes containing a small proportion of fixed alkali, and being either whits or red, according to the proportion of pyrites contained in the substa.ıce. The oll which is oltained from peat has a very pungent taate, and en empyreumatic smell, less fetid than that of animal sulastances, but more so than that of mineral bitumens. It congeals in the cold into a pitchy mass, whlch llquefles in a smail heat; it readliy catches fire from a candic, lut burns less vehemently then other olls, and immediately goes out upon remaving the axternal fiame; and in rectifiad spirit of wine it dlasoives elmost totaily into a dark, brownlsh red ilquer. The second apecies is found near Newbury, in Berkshire. In the Philosophical Transactions for the year 1767, we have an acceant of this species, the subatance of which is as foliows: Peat is a compoaltion of the branches, twigs, leaves, and roots of trees, with grase, straw, plants, and weeds, which having isin long in water, is formed into a mass aoft enough to be cut through with a sharp spade. The color ls a biackish brown, and it is used in many places for fuel. There is a stratum of thla peat on each side of the Kennet, near Newbury, in Berks, which is from about a quarter to half a mile in width, and many miles in jength. The depth below the surface of the ground is trom one foot to eight. Great numbers of entire trees are found lyiug irregularly in the true peat. These are chiefly oaks, alders, wiflows, and fra, and appear to have been torn up by the roots; many horses' heads, and bones of severai kinds of deer, the horns of the antelope, the heade and tusks of boars, and the heads uf beavers, are also found Imbeddod in it.

Peols, a dry measure for grain, puleo, eto. The standard, or imperiai peek, contains two gallens, or 50450 cnbic fnches. " Four peoka make a bushel, and four bushela a coomb.-See Weights and Menaures.
Peoulation, the cerm, in the Roman law, for the embeaziement of publie money belanging aither to the government or to communities. Under peculation, also, was comprised the adulteration of gold, ailver, or any metal belonging to government. Connected with it, by a law, of the dictator, Casar, were the crimen de renduis (if a person had received public money for a particular purpose, and did not apply it for the saine), and the sacrilegium (the theft or misappropriation of money or other thizga asered to a god). In most governments the embezalement of publie anoney by public officers is severely punished. Peculation and treason were, by the French charter of 1814, the only crimes for which a miniater was impeachable.-E. A.
Pellitory, the roet of a perennial plant' nthemit pyrethrum), a native of the Levant, Barbary, and the south of Europe. The roet is long, tapering, about the thickness of the finger, with a browaieh cuticle. It is imjorted packed in bales, somstimes mixed with other roots, from which, however, it is eacily distinguished. It is inodorous. When chewed, it seems at first to be insipid, hut after a few secoads it excites a glowing beat, add a pricking sensation on the tongue and lips, which romains for 10 or 12 minutes. The pieces break with a short, reainous fracture; the transverse section prasenting a thick, brown bark, studded with black, shining pointe, and a pale yellow radiated inside. It is used in medicine as a atimulant.-Tnomson's Dispencatory.

Peltry is the name given to the sking of different kinds of widd animals found in high northern latitudes, particularly in North America, such as the beaver, sable, waif, bear, etc. Wisen the akins of such animsls havo received no preparation they are termed peltry; but when the inner side has been tanned by an aluminous procesa they are denominated furs.

Panoils (Ger. Pinsel; Du. Pinseelen; Fr. Pinceaux; It. Pennelli; Sp. Pinceles). . The word pencil is used in two senses. It signities either a small hair brush emplayed by paiaters in oil and water colors-they are of various kinds, and made of various materials, some being formed of the bristles of the boar and others of camel's hair, the down of swans, etc.-or a sleader cylinder, of black-lead or plumbaga, either naked or in closed in a wooden case, for drawing black lines upon paper. Thee last sort, which is the one to be considered liere, corresponds nearly to the Freach term crayon, though thia includes aiso pencils made of differentlycolored earthy compositions. The hest black-lead pencils of this country are formed of slender perallelopipelis, cut out by a saw from sonnd pieces of plumbago, which have been previously calcined in close vessels at a bright red heat. These parallelopipeds are generally inclosed in cases made of cedar wood, though of late years they are also used alone, in peculiar pencil-cases, ancier the name of ever-pointed pencils, provided with an iron wire and seraw, to protrude a minute portion of the plumbage beyond the tubular metallic case, in proportion as it is wanted.

Pondant, or Pennant, a sort of long and narrow banner displayed from the mast-head of a ship-of-war, and uauslly teriniasting in two ends or points, called the suallow's tail. It denotes that the vessel is in actual service. Broad pendant is a kind of flag terminating in one or two points, used to diatinguish the chief of a squadron. Pendant is also a short plece of rope, fixed on each side, under the shrouds, upon the heads of the main and foremasts.

Penknives (Germ. Federmesser; Fr. Canifs; It. Temperini; Sp. Corta plumas), small knives, too well known te need any partleular deseription, used in making and mending pens. The best penknives are manufactured in London and Sheffield.

Penneylvania, one of the central United Staten, liea between $89^{\circ} 48^{\prime}$ and $42^{\circ} \mathrm{N}$. lat., and between $74^{\circ}$ and $80^{\circ} 40^{\circ} \mathrm{W}$. long. It is 307 milea long and 180 broad, containing 47,000 aquare miles. Population in 1700 was 434,878; in 1800, 602,545; in 1810, 810,001; in $1820,1,040,818$; in $1880,1,347,672$; in 1810, $1,724,033_{1}$ and in 1850, 2,811,786. The Alleghany Mountaina cross the State from southweat to northeast, and there are many amalier ranges on each side of the principal ridge and parallel to it . The southeastern and northweetern parts of the State are elther level or moderataly hilly. The an'l is generally fertile, and much of it is of a superior quality, the best land on the southeast is on both sides of the Susquehana. Between the head-waters of the Alleghany and Lake Erie the soil is very fertlle. . The anthracite coal region la immense. The Mauch Chunk, Schuylkill, and Lyken'a Valiey coal-field extenda from the Lehigh River acrose the head-waters of the Schuylkill, and is 65 miles in length, with an average breadth of fiva miles. The Lackawanaa coal-feld extends from Carbondaie, on the Lackawannock, to 10 miles bolow Wilkesbarre, on the Susquehanna. The Shamokin field has been less explored. Iron ore existe in nearly every county, and in the vicinity of Pittsburgh vast quantities are manufacturcd. Beds of copper and lead exist, snd quarries of marble and buildingratone abound. There are in the south part valuable mineral springs. There were in the State, in 1850, $8,628,619$ acres of, improved and 0,291,728 acree of unimproved land in farms; cash value of farms, $8407,876,099$; and the value of implements and machinery, 814,722,541. Live Stock.-Horses, 350,898 ; asses and mules, 2250 ; milch cows, 530,224 ; working oxen, 61,527 ; other cattle, 562,105 ; sheep, $1,822,357$; swine, $1,040,366$; total value of live stock, © $41,500,053$.

Early History of Pennsylcania.--The territory of this State was, before tho ycar 1681, for the greater part comprised under the name Northern Virginia, and ofter 1616 under the name of New England. When Penn, in the year 1681, obtained from Charles II. a grant of a great tract of land, between $40^{\circ}$ and $42^{\circ} \mathrm{N}$. lat., he himself wished to give to it the name of New Wales ; but the king, agninst Penn's wish, called it, in honor of Penn, Pennsyluania. The name is to be found for the first time in the King's charter of the 4th of March, of the year 1681. In the year 1682 Penn, desirons of approaching his province to the sea-cosst, bought from the Duke of York the whole tract of land and gettlements along the west sido of Delaware Bay, the socalled three lower counties. This tract of land remained, however, in connection with Pennsylvania only until the year 1776, when the inhabitants of these lands declared themsel ves independent and founded the State of Delaware. By this the State of Pennsylvenia was again excluded from the sea-coasts, and as a nearly entirely inland State the history of its limits is not of a great Interest for our hydrographical researches.-J. G. Koul.

The Delaware River washes the entire eastern border of the State, and is navigable for ships to Philadelphin. The Lehigh, after a course of 75 miles, enters it at Easton. The Schuylkill, 130 miles long, unites with it aix miles below Philadelphia. The Susquehanns is a large river, which rises in New York, tiows seuth through thls State, nnd enters the Chesapeake Bay in Maryland. It is much obstructed by falls and rapids. The Juniats rises among the Alleghany Mountains, and, after a course of 180 miles, enters the Susquebanne 11 miles above Harrisburg. The Alleghany River, 400 miles long, from the north, and the Monongahela, 800 miles long, unite at Pittsburgh, and form the Ohio. The Youghiogheny is a small river which flows into the Monongahela.

Agricultural Products.-. Wheat, 15,367,691 bushels; rye, $4,805,160$ bushels; Indian corn, 19,835,214 bushels; oats, 21,538,156 bushels; barley, 165,584 bushels ;
buokwheat, 2,183,602 buchela; pers and beana, 65,201 buahele; potatoes, $5,080,752$ buahels; aweet potatoes, 62,172 busiole. Value of products of the orehard, © 723,889 ; produce of market gardena, 8684,714 . Pounde of butter made, $39,878,418$; of choese, $2,505,084$; maple augar, $2,326,525 ;$ molasces, 50,652 gallons ; beeewax and honey, 800,509 pounde; wool, ponads produced, 4,481, Ji0 ; flax, 630, BU7 ; silk coccona, 288 ; hopa, 22,088 ; to bacco, 012,651 ; hay, tons of, $1,842,050$; hemp, 4t tons; clover seeds, 125,080 buehels; other graes seeds, 68,013 buahela; fax soed, 41,728 bushels ; and were made, 25,600 gallens of wine. Value of hoimemade manufactares, 4749,132 ; value of slaughtered animile, 88,219,848,-Cenous Report, 1850.

Manufactures.-Thero were in the State in 1800, 186 cotton factories, with a capital Invoated of $1,671,015$, employing 4283 malen and 4374 females, produclng $59,632,000$ yards of aheeting, etc.; $5,808,561$ pounds of yarn, valued at $\$ 5,812,128 ; 254$ woolen factorisa, with a capital investad of $\mathbf{1 1 , 7 7 8 , 2 6 8}$, employing 1747 malee and 753 females, manufacturing articien valued at $\$ 2,703,409 ; 178$ entablithmonts making pig iron, with a capital invested of $88,857,525$, employing 9264 percons, producing 822,752 tona pig iron, etc., valued at $\$ 6,170,625$; 320 estallishments, with a capital of $\$ 3,422,024$, onploying 4783 persons, and making 57,810 tons of castlags, elc., valued at $\$ 5,854,881 ; 131$ estabb lishmenta, wilh a capital of $\$ 7,620,066$, employing 671 persons, mallufaeturing 182,506 tons of wrought iron, valued at $88,002,907$; 2880 tlouring and grist mills, 2986 aaw milla, 1640 tanneries; 103 printing-otticen, 328 newapapera, 25 daily, three tri-weekly, one semiweekly, 275 weekly, eight semi-monthly, 12 monthly, and two quarterly publications. Capital invented in nanufactures, $991,462,210$; value of manufactured articles, $\mathbf{1 5 4 , 0 4 4 , 6 9 8}$.

Camale.-The State of Pennaylvania as early as the
year 1791 Initiated a aystom of Inland watar commanication. Wiliiam Pemn, it is said, first concoived the idea. In 1792 two companiea were forsed, to build the Schuylkill and Susquehanna, and Delaware and Sebuylkili canala. Thoy conatructed fifeean miles and abandoned the work. In 1821 the enterprine was renewod, and completed in 1827, when other worke wers atarted, and nearly all tha present canale authorieod and thioir routen surveyed. The State has now 848 miles of canala, which cost $124,168,000$, aecurding te an entimiate conoldered to be under rathor than above the mark. Private companies have buill 485 milee of csnal, costing $\mathbf{2 1 , 9 5 5 , 0 0 0}$. The Statg has therefore 1838 miles of canal, costing upward of $818,000,000$. Besides these it has 2164 miles of rallrend, which cost soma \$58,000,000. The totale of these important improvementa added together, maike 8497 milien, and their cost foots up $104,000,000$.. Their valwe to the Stac is not represented by their cost, for without them Pennaylvania would be a wilderneas. They unite her to the Great Weat, to the soutbern part of our State, and to the great metropolis; and enable her to aend ber coal and iron to distant marts, anriching her beyond eatimate.
The following is prosented as a comparisen of the anthracile coal trade of Penneyivania for two years:

Philadelphia, near the confluence of the rivers Deleware and Sohuylkill, In lat. $39^{\circ} 67^{\prime}$ N., long. $75^{\circ} 10^{\prime}$ W., and near the head of the Dolawave Bay. Veasols of the largent burden accend the river as far as Newcontle, but those drawing above 18 or 20 feet of water can not reach Philedelphis, on socount of a bar a littie beiow the city. The ontrance to the magnilleent bay fermed by the embonchure of the Delaware has Cape May on the north, and Cape IIeniopen on Its south side. The commeroe of Phitadelphis hus not kept pace with her growth in other reapeets, especially In insautactures. The tonnage In 1856 was 197, 228 tons.-See Philadelfifia.

Erie, port of eatry, is beantifully situnted on Pretque Isle Bay, on Lake Erie, or ere one mile square, and has one of the beat harbers on the lake, the ohamnel or eatrance to which han Iately been much improved; the water ia from 11 to 20 feet deep, and the largest steambosta enter without diffioulty. There is a light-house on the wat dide of the entrance of Presque Isle Bay, lat. $42^{\circ} 8^{\prime} 14^{\prime \prime}$ N. ; shows a fixed light, elevated 88 foet above the aurfuce of the lake, and viaible for a distance of $14 \frac{1}{8}$ miles. The beacon is on the east side of the bay ; viaible 8 miles.-For further information of the commerce and recources of Pennsyivania, see Bankers' Sngazine, New York, 1851-1856; North A merican Review, xlii. 241 (C. Cualing); Hunt's Merchants' Magazine, x. 808, xii. 237; Dr Bow'a Revieno, xil. 476. See alse articles Delaware Hiver-Coat-Cakals and Railhoads.

Penny, formerly a silver, but now a copfar coin. This was the first ailver coln atruck in England by our Saxon ancestors, being the 240 th part of their pound; so that its weight was about 22 grains Troy. Camden derives the word foom the Latin, pecunia, money. The aacient Engiish renny, penig, or pening, was the first silver coin stru i in England, nay, the oniy one current among our laxon anceators, as is agreed by Camden, Spelman, Hickes, and others. The penny was equal in weight to our threepence ; five of tivem made oas shilling or sciliing Saxon, and 80 s mark or mancuse, equal to 7s. 6d, Titl the time of King Edward the First, the penny was struck with a oross, no deeply indented into it thet it baight be easily broken, and parted, on eccasion, into two parts, which were thence called half-pennies, or into four, which were called fourthings, or furthings. But that $i$ ace coined It without indenture, instend of which he first struck round helfpence and farthinga. . He also reduced the weight of a penoy to a standard, ortoring that it should weigh 32 grsias of wheat, taken ont of the middio of the ear. This penny was called the peuny sterling; and, as 20 of these pence were to weigh an ounce, the penny thus becamc a weight as weil as a coin. The peany sterling was long diaused as a coin, snd was scarcely known, except as a meney of account, containing the twelfth part of a shiling; but latteriy it has been introduced inte the Britieh current coia.--See Post-office.

To ascertain the, as yet unknown, quality of the metal in ths old British penny, the chicf assayers in Philadetphia were addressed, to procure information from books of roference or actual assay. The anawer decided: "The ancients intended fine silver and pure gotd In their coins, refined them as weli as they could, and issued them for fine metal. But the old silver pennies of Britaln are now so few and expensive-one in the mint coliection coat seven doilars-we can not sfford to assay them." As this point was essential for accurate calculation, Mr. DuBoia added, in a postscript, "Since writing the above I have assayed a sliver penny of Withiam the Conqueror. It gives a fineness of $\cdot 950$ theusandths, and coatsins gold equal to $\cdot 009$ thousandths.". This trial shows an alloy of some base metal exceeding 040 thousandths ( 040 ) contained in the silver ;isnny, diminishing its atandard in that degree from .,", of perfect purity. "The Mint remedy" of the United States, regarded to be a necessary aliow-
ance for casmal deviatlons in the quality of aliver pieces, can not exceed 008 thousandiths, instead of 040 , on each side the standard. It ls net now propesed at mints to have the coins of the highest quality, but the rula or atandard of purity, ordered by law, muat be exect, both in fiae metal and alloy. By recent proof with wheat corn muasure, the woight of the oid peing may have varied from five grains in the red to eight grala in the white wheat. The modern "allowence" for variation in quantity is one-fourth or one-half a grain, In a coin approaching the value of the AngloNorman periny. The allver penny of old time-the only money except ringa known to the native Britons -was at once a coin, a weight, and a measure. Its character of purity checked and ruled the velues of all moneys, weights, and measuras reprasented by or deduced from it. Sach values do not depend solely on weight ner sololy upon fineness, but on their combined powers, the product of both. The keymtone of the socalled "syatem" of 1266 was conceived to be "the weight of the silver penny sterling." But defective quality cansed this " keystone" to crumblo. The superstracture erected upon auch foundation failed, because metallurgical irreguiarity was not checked by metrical exactness. The measures were fauity throughout" weighed in the bolances, they were both found wanting." The bases for calculation in this ancient seale being ineccurate, no truth could be elicited by any lncrease of numbers-or quantities in progression. Some of the ailver pennies of the early Britons were nearly divided by the impression of a cross, through the middie on the reverse, $s 0$ they could be broken into halfpennies, and again into quarters, csilied "fourthiags," or farthings. This practlee of simple division had continued until silver half-pennies and farthings wera specially coined by King John, In 1185-first in Ireland, whore his principal Mint was. During the latter part of the reign of Henry the Third, of England, "a penny" of fine gold was ordered of the value of twenty pennics of silver. The word "penny" had its derivation from the French "denier," the "denarius" of the Latins. The French title, shortened into "denny" by the Normans, was easily changed on the English tongue to "penny"-at that time a common term for money in general, of whatever metal it might be. Goiden deniers, coined spariugly in France, bearing the figure of a lamb, were called deniers d'agneau, or moutons d'or. During the religns of the eariy Norman kings, their rents, though reserved in money, were answered in cattic, corn, and other provisious, because money was then acarce among the people. Coins of gold, named "nobles d'or," were first issucd from the British Mint by Edward the Third, In 1344; but with so much difficulty that it was thought necessary to order by law, "no one ohould be obliged to receive them." It was decided to prove the standard of the silver penny of our remote ancestry, by the approval of English and other contemporaries, in wheat corn grains from "the Ofd Nerth State of Carollna." Six different growths of the crop of 1856, inteaded for seed and consumption, sclected in October from two prominent varietics, the red and the white, choosing grains of average quality, but perfect fullness, were antagonized by a pennyweight Troy of the purest silver, specialiy prepared from solution, for assays of goid. No two asmples of thirty-two wheat corn grains were found of tho aame weight. Of early red-May wheat-from thirty-eight to forty and forty-three corns wero required to balance the sil .er piece, while of white wheat from tweaty-eight to thirty-five end thirty-six grains eflected the sams purpose, showing a disproportion equal to fifteen wheat grains in the aix porcels; that is, from tw nty-eight to forty-three corne-a deviation in the value of a silver penny equivalent to nearly one half the standard weight. An act of Henry the Third, in 1266, explains the primitive Initials of these ancient British, Gallic, and German atandards, to all which one commen deri-
vation Is imputed. "By consent of the whole reair.?, the msacure of the king was made, that is to say, an Bingliah penny of sllver, called satorling, round, and wichout my ellpping, shall wulgh thirty-two wheat cornm, taken from the middle of ths ear.' And twenty pence of elliver do make one ounce. 'And twilvs ounces of sliver do make one pound. And eight poends of allvar do makn a gallon of wias. And eight gallone of wine do make a london bushel, whleh in the elghth part of a quarter." Thls general arrangement for monsy welghte and measures wan that of the Kastern nations, by whlch Rurope had been overrun. The term "easterlin" of the Norman French was transmuted on the Engliah tongue, firat to "eantering," and Anally to "sterliag."-Report of Dr. J. II. Ginnos, United Statea Mint, North Curolina, See Pound.

Ponny-Poest. Nirat set up in London and ite suburbe by a Mr. Murray, upholsterer, A.b. 1681. Mr. Murray afterward assigned hla laterest in the undertaking to Mr. Dockwra, a merchant, 1683 ; but on a trial at the King'a Bench bar In the reign of Charles II., was adjudged to belong to the Duke of York as a branch of the general post, and was thereupon annexed to tha revenue of the orown.-Drlatunr, 1690. Thia Inatltutlon was conslderutly improved In and round London, July, 1794, et aeq., and was made a twopenny-post. A penny-post was first eot up In Dublin in 1774,-See Postapifice.

Pennywelght, a Troy weight, containing twentyfour grains, each grain welghing a grain of wheat, gathered out of the mlidile of the ear and well dried. The name took its rlse from the circumstance that thls wat anclently the weight of one of our silver pennies.

Pons (Fr, Plumes à écrire; Ger. Achreibfedern; It. Penne da Scrivere; Rues. Pera Stwoli), weil-known instrumente for writing, usuaily formed of the quilis of the gooes, awan, or some other Brd. Metaillo pens havo been occaslonally employed for a lengthened period; but it is only withln thees few yeara that they havo been extensively introduced. They are now, howerer, manufactured in vast quantlilea, ar:d of an immense variety of forms. But though they have muperseded to a very concilershle extent the use of quilia, snd have some pecullar advantages, It does not appear poaslble to give them tha elantleity of the quill, nor to fit them so weil for quick and easy writling on common deecriptions of paper. Quille are suld to have been firat used for pens in A.n. B58; but some any not before 635. Quills are for the most part plucked with great eruelty from llving geese; and all persons, from convenience, economy, adi feeling, ought to prefer metailic pens, whleh came into use In 1880.-l'mileips.
.- For the manufacture of steel pens the best metal, inade from Dannemora or hoop (1.) iron, is selected and laminated Into alips about three feet'long and four inches broad, of a thlckneas corresponding to the desired utiffness and flexibiity of the pena. These slips are subjected to tha action of a stamping-press. somewhat similar to that for making buttons. Tive polnt deetined for the nib Is next intraduced into an sppropriate gauged hola of a little machine, and pressed Into the meni-cylindrical shspe; where it is also pierced with the middle slit, and the lateral ones, provided the latter are to be given. The pens are now cleaned, by being tossed about smong each other, in a tin cyllnder, about three feet long, and nine inches in diameter; which is suspended at each end upon joints to two cranks, formed one on each of two shafts. The cyilinder, by the rotation of a fly-wheel, scting opon the crank-shafty, fo made to deacribe auch revolutions as agitate the pens la all directions, and pollsh them by mutual attrition. In the course of four hours several thousund pens may be finished upon thls machlne. When steel pens have beed punched out of the afftened sheet of steel by the approprista tool, fasiloned In the deslred form, and hardened by ignition In an oven and audden quenching lo cold water, they are best tempered
by belag heated to the requisite apring siaatiolty In an oil buth. The heat of thls bath is naually judged of by the appearance to the eye; but thle point should be corrsctly determined by a thermometer, according to the acale; and then the pene would acquire dofinite degree of flexihility or otilmess, adapted to the wants and wishes of the conaumera. ${ }^{\text {a }}$. They are at present tempered too often at random.

Pepper (Pr. Poiver ; Ger: Pfefler; Du. Prper ; It. Prpe; Sp. Pimienta; Russ. Perez; Lat. Piper), the berry or fruit of diffrent species of planta, having an aromatle, extremely hot, pungent taste, ueed In seasoning, etc. The following sorta of pepper are met with in commerce I Rlack Pepper (Fr. Poitre; Ger. Schwarzen pfoffer; Jt: Prpe neyro; 8p. Pimienta; 8ans. Merchn; Hind. Gol-mirch; Malay, Iada; Jav. Marihn), the rrult of a creeplng plant (Piper nigrum), one of the jepper genus, of which there are upward of 80 species, It is coltlvated extensively In India, Slam, tha Fastern tslands, etc. It requires the snpport of other trees, to whleh it resilly adtheres. It climba to the helght of 20 feet, but is sald to bear iest when reatralaed to the height of 12 feet. It legins to pruduce at about the thlrd year, and in In perfection at the seventh; continnes In this atate for three or foor years; and dechnea for about as many more, until it ceases to be worth kerping. The frilt growa abundantly from all the lorancien, in long amali clusters of from 20 to 50 graina; when ripe, it is of a bright rod color. After being guthered, It is spread on mata la the san, when it loses its red color, and becomes black and shriveled as wo see it. The grainn are separsted from the staiks by hand rubblug. That which has been gathered at the proper period shrivels the least; but if plucked too soon, it will become broken and dusty in its removal from place to place. The vine produces two crepsin the year; but the sessons are subject to great lrregalarities. Pepper should be chosen of a pungent aromatle odor, an extremely hot and acrid taste, in large gralns, firm, sound, and with fow wrinkles-for of these it slways has some. Keject that which Is shriveled, or amall gralned, or which on being rubbeil will break to pieces. In point of quality, the pepper of Malsiar is ueually reckoned the best; bat there is no material difierence between it and that of Sumatra, and the other islands. In the market of lBengal, where ticy acat on equal terins, the produce of Malabar ls generaily about two per cent. hlgher than the other. In Firope there is generally a difference of $d d$. per $1 b$. In favor of Mulabar; but in Chlns they are lield in equal estimation. Black pepper sold ground is said to be often adulterated with burned crust of bread.

Whits Pepper is made by blansbing the fineat graius of the common black pepper by ateeping them for a while in water, and then gently rabbing them, so as to remove tha dark outer cont. It is milder than the other, and is much prized by the Chinese; but very little is imported into England.

Cayemne Pepper ls the produce of severs] varictles of the Capsicum, cn annual plant, a native of both the Indles. The best is brought from the West Indies ready prepared, and is made from the Capsicum baccatum (bird pepper). It has an aromatle, extremely pengent, acrimonious taste, settlag the mouth, as it were, on fre, and the impresalon remaining long on the palste. It is sometlmes adulterated with muriate of soda; and sometlmes wlth a very deieterious aubstance, the red exyd of lead; but this fraud may be detected by its weight, and by chemical testa.

Long Pepper.-Thls apecies is the produce of a peres-

nlal (Piper longum), no nuva of Malabar and Bengai. Tha frult is hottent in ite inmmatore state, and le thervfore gathered while green, aod dried is the sen. It in ionported in antire aplicen, which are about one and a half inch long. It has weak aromatie odor; an intenacly Hary, pungent tante, and a dark gray color, 'lise ruot of long pepper in a fuvorite medicine among the Hindoos. The quantition of the last three apecien of pepper imported are quite Inconalderabla, $\rightarrow$ Mit unun's Oriental Commereof Anmele's Materia Jndica; 'Tiomson's Diopeneatory, etc.

Trade in Pepper.-J'epper is extenalvely used, all over Eucope and the East, as a condiment. It was originally imported Into England by way of the Levaint ; and for many yeara after the eatabliahment of the East India Company it formed the most Important articte of their linports. An nothing has the beneficial effect of opening the inilian trade been so unequivocally displayed as in the inatance of pepper. Tha private tradera have resorted to naw markets, and discovered new sources of aupply, which had hitherto been wholly anexplored $\mid$ so that there ban been not only a very great iscrease in the quantity of pepper brought to market, but also a very great fall in its price, which does not now oxceed a third part of what it amoanted to in 18141

Supply of Pepper.-The following Inatructivg detalla with respect to the supply of pepper are taken from the Singapors Chroniele, tw :rhich they were contributed by John Crawfurd, Eaq., than whom there can be no more competent authority as to such anljecta. Of all the products of the Eastern Islands, and of the countries imnediately in their nelghborhood, in domand among atrangers, black pepper is the most Important, both in value and quantity. The pepper countries oxtend from about the long. of $06^{\circ}$ to that of $115^{\circ} \mathrm{E}$., beyond which no pepper is to be found; and they reach from $5^{\circ} \mathrm{S}$. lat. to about $12^{\circ} \mathrm{N}$., where it again ceases. Within these limits we have Sumatra, Borneo, the Maluyan peninsula, and certain countriea lylag on the oast coast of the Gulf of Slam. The whole produce of the istand of Sumatra in estimated not to fall short of 168,000 piculs of 133 I Ibs, each; the southweat coast being ssid to produce 150,000 , and tho northesst coast 18,000 picula. The pepper porta on the northeast coast of Sumatra are Lankat and Delll, with Sardang. 'The first two produce 15,000 pleuls, and the latter 8000 an nually. The cultivation is carried on by tho Batta nation In the interior. The ports on the southwest coast, and the amount of their produce, as given in a recent estimate, are as follows : viz., port and district of Trumah, 40,000; district of Pulo Dua, 4000; ditto of Clust, 30,000 ; coest from Tampat Tuan to Susu, 83,000 ; port of Susu, 1000 ; Kualla Batta, 20,000; Andabu, 2000 ; districte to the north of Analabu, 20,000 ; making in all, 150,000 piculs. Here it is of importance to remark that the culture and production are extremely tructuating. During the last pepper season, there obtalned cargoes on the wost const of Sumatra, 27 American ships, six country traders, four large French shipa, besidon the ships belonging to the East India Company, whleh generally tako away 500 tons. Nearly the whole of this trade is in the hands of Europeans or Americans; tho pepper finds its way to Europe, to America, and in a small proportion to China. The northenst coast of Sumatra, from Pedier down to the Carimons, fe estimated, as already mentioned, to produce 18,000 piculs. Prince of Wales Isiand is the principal depot for this, from whence the greatest part Is exported to India and China. The produce of Prince of Wales Islend Itself is about $15,0 \mathrm{~m}$ plculs. Of the islands at the mouth of the Straite or Malacea and Singapore, Blagtang, on which Rhlo is situated, and adjacent islands, produce 10,000 picula; and Lingga about 2000. - A large proportion of thls is brought to Singapore, which exported last year about 21,000 piculs; some part to Bengal and China, but
prinelpally to Xarope direct, in free traderk. The weat cosat of the Malayan peninaula produces no pepper, with the exeeption of about 4000 plenil afforded by the verfitory of Malacea On the east coast of the peninmula, the production of pepper is very considerable. The perte of Pateni and Calsntan-chiofly the latter -yleld ahowt 16,000 pleule annually, and Tringanu mbout 8000 . ${ }^{\prime}$ A portion of thin is brought to Singapore and Ponang ; but we belleve the greater proportion gees difect to China in junkt, of whieh three large ones frequent Triuganu annually, and one Calantan. The Amerienna, too, oceasionally viale these porta. "In the yeaf 1821, three vessels of conalderable hurden obtalned eargoes. The east coast of the Galf of Slam, from the jat. of $10 f^{\circ}$ to that of $121^{\circ} \mathrm{N}$., affords an extenalve produce of pepper. Thie coant in mearcely known, even Ly name, to the triders of Europe. The principal porta here are Chantibun, Tungyal, Pongsom, and Karapop-the firat two being under the dominion of Stam, and the latter under that of Kamboja. The whole produce is estimated at not lesa than 60,000 pleula ; 40,000 of whleh are brought at ones to the capital of Slain as tribute to the king, and the whole finde It way to Chins In Junks. It remains only to eatimate the produce of the taland of Borneo. The whole produce of Bornen is estimated at about 20,000 pleuls; of which a large ahare is carried to China direct in junks, some by Portuguese vessels; and about 7000 piculs are now amnually brought by the native craft of the country Itself to Eingspore in tho coun. of that free trade which is happlly flourishing at thia aettlement. The data which have been atated will enable us to eatimate the whole production of the Malayan Archipelago, Including that of the peninsula of Malacea, and that of the enat coast of the Galf of Siam, at 308,000 pleuls $;$ and as there It no other part of the world that affords pepper, excepting the western coast of the peninsula of India, and this afforda but 80,000 plevis, or less than one-tenth part of what the placea we have enumerated produce, ve have, accordingly, at one view the whole production of the earth, being 388,000 pleuln, or $45,066,666$ lbs. avolrdupois. Tho average price of pepper has been lately aloont nine Spanisla dollars a plenl ; so that ihe whole value drawn into Indla from Curope, China, and the New World, on account of this single commodity, is $8,042,000$ dollars. The quantly given In this statement may appear enormans; but If meted out to the whole popalation of the globe, or to $1,000,000,000$ of people, It would be found that the average annual consumption of an Individual woold amount to no moro than 323 grains. Mr. Crawfurd has more recently anpplied a roviaed eatimate of the annual production of pepper as follows:
8umatra (weat coast) . . . . . . . . . . . . . . . . . . . $80,(400,000$

Majabar. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $4,060,000$

Ferfume (Fr. purfum), a term used to denote the volatile eflluvia from any boty affecting the organ of aiaelling, or the substance emitting those efluvia. Perfumes were in genaral use among the ancients (see the Quarterly Review, vol. xxiii.); and in France, Germany, Spain, and Portugal, and even, though not to so considerabie an extent, in liugland, they are regarded alinost as necessaries. In general they are made of musk, anbergris, civet, rose, and cedar woods, orange tlowers, jessamines, jouquils, tuberosas, and other odorlferous tiowers. Aromatic druga, such as storax, frankincense, benzoin, cloves, ete., onter into the conposition of a perfune; and many perfumes are composed of aromatle herbs or leaves, as lavender, marjoram, sage, thyme, etc.

Perfumery. Many of the wares coming under this name were known to the ancients, and the Seriptures abound with instances of the use of incenses and perfumes. No such trado as a perfomer was known in Scotland in 1763.-Cueecir. A stamp tax was laid on various articles of perfumery in England, and the vender was obliged to take out a license, in 1786. At the corner of Beaufort Buildings, in the Strand, resided Lilly the perfumer, mentionedin the Spectator.-Leign.

Some of the most exquisite of perfumes are obtained from the most offensive sulstances. In olden times the most delicate perfumes were distilled from flowers, whose names they bore; but ohemistry has ahown how to obtain them from other sources. To give one example, a peculiarly fetid oil, called fuacl-oil, is formed during the making of brandy and whisky. Now this loathsome oil, by a particular mode of treatment, is made to yichl the fragrant oil of poars; by another process, oil of apples; ant by others, ont of gropes and oil of cognac. The oil of pine-rpples is produced frou augar and putrid cheese. The oil of bitter almonds is a resultant from aquafortis and the otieusive oils from gas tar. The dainty eau de mille fleurs is made from the drainage of cow-houses. Ant in all these cases, there is not the same kind of framl which is practiced in ordinary alolterations; for though the perfumes are not aetually, in the present state of things, produced from the flowers und fruits which give them their nomes, yet they are renlly identical, or nearly so, in chemical compesition with the original perfumes; nature mixes the ingrediente in one case, man in the other, but the ingredients are the ssme. The passion for prerfumes is increasing. Britlsh Indinand Europe consume atwout 150,400 gullous of handkerchicf otors yearly; and the English revenue from ean de Cologne is about 8000 pounds sterling a year. The total revenue from imported perfumes in Eingland is estimated at afont $£(1,000$ sterling per annmi. The largest revenues of the astates on the borders of the Mediterranean are those which proreed from the sale of the orange blossoms and l'arma violets. The house of Faguer, 83 line de Blehelien, and many of the other perfumers of Jarls, pay a yearly sum, varying from 10 to 30,000 franes, to the proprictors, for their whole crop of orange blossoms or violets. The plens de citriomiar of f'agter is one of the favorite and most delightful oders used for scenting the pocket bandkerchief.

Periodical Publications. These, as the name implies, are pulications which appear at tixed periods or stated intervais, and consequently include newspapers, montlily and other magazines, quarterly reviews, and journals, and all such books as appear at monthly or other intervals. Ilut the term "periodical publications" is usually understood in a more conflned sense, or as comprising only magozines and such political, literary, and seientific jouraals as appear at reguler intervals, without including newspapera or works published In parts. Even when thus restricted, this Is a very extensive und important department of literature. No doubt a vast deal of trash gets into jrint by
the agency of magazines that might not otherwise see the light; but mest part of these publlcations contain at the same time some superlor articlea; and a few are ably conductad and embrace a wida range of topics. Since the establiahment of the Edinburgh Review in 1802, the quarterly journals, eapecially those that embrace pulitica and literature, have risen to great eminence, and have had a powerful influence over the publie nind. At present, however, and for seme the past, the Influence of this class of journals has been declining. An ably conducted dally paper is, at this monent, by far the most powerful engine the press can bring into the field.-See Newwpapers. For further informailon refer to American A/manac, 1835, p. 97, 256, 1836, 1. 92; North American Reviere, xxxix. 277 (.1. G. 'Halfiey) ; Southern Literary Messenger, 11.893; Westminsfer Leriew, i. 206, ii. 463; Edinburgh Retiew, xxxviii. 349; Awerican Quarterly Observer, iii. $1: 15$.

Pernambuco Province. This is one of the most important provinces in Brazil. It abounds with many sood harbors, and poesesses an exceedingly fertite soil. lts chief ataples ars sugar, cotton, and hides. Of these its averuge annual exporta from 1840 to 1845 were ss follows : Sugar, 34,174 tona; cotton, 82,279 bags ( 160 Hhs. cach) ; hides, $\mathbf{7 2}, 500$. The city of Pernamfuce maintuins the third rank in the empire. There are in this province about six hundred "cugenhos," or sugar estates, each covering ubout one equare league. On euch engenho are produced annually about fifty cases of white, shi, ive of brown, or muscovado sugar-or forty tons of the former, and four and a half tons of the lutter-equal to aliont 24,000 tons of white, ano 2550 tons of brown, for the whole province. The province is cstimated to bo capable of ylelding 896,800 tons of white, and 40,800 tons of miscovade sogar. Imports from the United States conslst chiefly of cotton domestics. Fsbrics of this kind, thirty yards in length, and tweuty-aeven to twenty-eight linches In whelth, are in demand, and bring much better prices than similar goods from England. Of late years the manufacturers of Lancashire liave imitated these cloths, and have succeeded in sharing ths advantages which the American article had secured. In printed cottons Manchester and Glasgow almest monopollze the markets of Pernuinboco. The quallity as well as the chenpuess of their goods have secured this privilege. The inportation of butter, hitherto almost exclusively in the hands of the French, might be advantageously shared by the citizens of the United States.

The production of cotton has diminished, owing mainly to the expense attending its transportation to market; but the production of angar has incruasel. lirom 1828 to 1831 , the averago amunal export was 1,507,389 arrobas, and in the years 1841 to $184 t$ it was nugmented to $2,083,212$ nrrobas ; heing an annual iserense of $475,8: 3$ arrobas, or $6797 \frac{33}{2}$ tous. The nume ber of hides exported during the two perlots of fotr years abowenamed lucreased in a atill grenter ratio than sugar. Jrom 1828 to 18 ill the ammal average export was 60,272 lides; and during the latter four ycara, from 1811 to 1841 , the same average augmented
 crease of 62,301 hides. It has already been otiserved that if the export duty levied upon the produce of Irazil transmitted to foreign purts were medified or repenled, a vast augmentation in agricultural productions wonld unquestionably follow. While an export duty of tan per cent. on the weekly average pitico of white, dno The prov396,800 tons uggar. linly of cotton Is in length, widtb, are han similar inufacturers e, and have Ithe Ameras Manches. markets of heapness of The import. vely in the usly shared
gugar continuobe, zed a slmilar duty on cotton, coffee, tobucco, rum, hides, and, with one or two unimportant exceptions, on all other artleles produced in the country, the produeing intereats must remain erippled, and expertations either continue to be stationary or decreaso. The cotton and sugar-growing districts suffer most under these heavy taxes upon their industry and capital. The planters are obliged to carry cotton and sugar to Pernambuco by hurse conveyance, a distance of frem twenty to one hundred leagues, dinring the dry season, when food and water are ditifeult to bo obtained. These charges are such, in addition to those imposed by law, that when tho planter reachea inarket his cetton hardly yialds him net four cents per $\mathbf{l b}$. And so with his sugar, and all other heavy produce.
The navlgation and trade of Pernambuco in 1815 stood as follows: Inward from all nations--Vessels, 242 ; tonnage, 49,796 ; value of cargoes, $84,136,075$. Of which from the United States: Vessels, 35 ; tonnage, 6117 ; value of cargoes, $\$ 602,075$. Outward to all nations-Vessels, 226 ; tomnage, 48,539 ; value of cargoes, $\$ 4,567,870$. Of which to the United States : Vessels, 19 ; tonnage, 3216 ; value of eargoes, 8283,160 . During the year 1845 two United States vessels went south with eargoes; two were sold, and four remained in port. 'lhis will, to a certaln extent, aecount for the difference between the values of importe and exports to and from the United States, as above shown.

The vessels from the United States inported as follows :

| 181 | 17,478,000 | 1,124,000 | 1,336,016 | \$2,000 |

From the preceding table It will be geen that the market at Pernambuce was moro brisk in 1817 than during the preceding year. Sugar is the leading artiele in this market, and is exported to England, Trieste, Geuoa, Portugal, the north of Europe, and to the United States. The total exports of sugar from Brazil are thus distributed throughout the ports of the empire. The exports for 1846 are taken as a busis for ealculation :

|  | $K$ Klo. | Pounda |
| :---: | :---: | :---: |

The sugar produced in the province of Permambuco amounts to about 80,000 toms a year, of which $\mathbf{C 0 , 0 0 0}$ are exported to forelgn countries, 5000 coastwise, and 15,000 are retained for heme consumption. There are about 1000 eugenhes or sugar estates, 257 of which have been established within the last ten years. They average in extent about two square miles, and their crops vary from 200 tons as a maximum to 30 as a minimum; or at an average of about 75 tons each. Very few eugenhos possess 150 slares, and the smallest not more than 10 or 12 ; the average number of slaves employed on each eugenho is about 50 , so that 50,000 mny he said to be her employed in sugar enltivation. They aro badly treated and hard worked.
Pernambu... has many of the privileges of a sovereign state; it las its own president, provincial and munieipal eliambers, Jevies a portion of its own taxes, and maintains a militia which ean not be removed from the province. It sends four senators and fifteen representatives to we imperial government - elected, tho former for life, and the latter for four years, by almost universal but indircet suffrage, The imperial revenue levied within the province in 1849-'0n amomnted to $\mathcal{L} 542,423$; in $1850-61$ to $£ 690,526$; and as these sums are derived chiefly from imports nad exports, and no additional duties have been imposed, the incrense is a proof of its commercial prosperity. The details of the latter year's general revenue wero as follows:
 Total E6901,526

In 1841 the receipt of imperial taxes from the province of l'ermambueo amounted to only $£ 278,85211 \mathrm{~s}$. 2 d .; so that in the course of ten years it has nearly trebled. Provincial taxes are levled upon sugar, coftee, tobacco, eattle, horses, spirits, paskports, licenses for potteries, saw-mills, cigar shops, auetiens, etc.; upon houses, legacles, inlseritnnces, slaves, the tolls of bridges, ete., ete. Total amount in $18500^{\circ} \cdot \mathbf{b 1}, \mathbf{£ 1 7 3 , 9 9}$ 's. The municipal
taxes are derived from the stamping of weights and measures, licenses to public housea, and places of entertainment, etc. They amounted in 18:0-'51 to 128,650 reals, or $£ 12,50611 \mathrm{~s}$. $3 d^{2}$., maklng the total taxation of the province as follows :

| Imperiat taxes. | 1090,526 |
| :---: | :---: |
| Provinctal .. | 173,907 |
| Municipal. | 12,506 |
| Total. | 2877, 030 |

Of these sums nearly two-thirds are expended by the imperial government; and to thia is chlefly to be attriluted the many attempts which have been mada by Pernambuce to free heraelf froin the imperial connectlon; and if the weight of a country's taxation may Le judged of by its relation to the number of its inhabitants, the province of l'ernamluce is as heavily taxed as most Eurepean atates. The population of the province of Pernainbuco amounted, accerding to the last census, to 606,036 ; of these 143,102 are white, and 463,834 colored; viz., 4078 Indiana, 322,685 mulattoes, and $137,0 \overline{1} 1$ blacks. 506,702 were free, and 106,234 are slaves ; 315,719 males, and 291,157 feinales. But the population must have incressed considerably of lato years.
Pernambuco, a city and sca-port of Brazil, infe. rier only to Rlo Jancire and Bahia in commercial importnnce ; capitai of the province of its own name, on the Atlantic, at the mouth of the Capabaribe, 210 miles northeast from Bahla; latitude of light-house, $8^{\circ} 3$ $2 \mathbf{F i n}^{\prime \prime}$ S. ; longitude, $34^{\circ}{ }^{\circ} 52 \mathrm{~W}$. Population estinated in 1852 at 100,000 . It consists of the separate towns of Olinda, Recife, Boa-Vista, and St. Antonio: the first of which is on the main land, and the others lie south from it on a succession of low sandy banks, separated by salt-water creeks and different arms of the river, but connected with each other by two bridges. Recife, or Pernambuco proper, the most southerly, about feur miles senthwest from Olinda, is defended by the principal forts, and comprises the dock-yard and the large merchants' warehousces. In St. Antonio are the governer's palace, formerly the Jesults' convent ; the treasury, tewn-hull, prison, bsrracks, with convents, churches, and several good squares. A long embankment connects this town with the maln land. Bea-VIstn is extensive, but irregularly laid out; it has one handsome strect, and comprises the resilences of many of the richer inhabitants of the city, with gardens, various churches and convents, etc. Olinda, though beautifully situated, is in a state of decay, having been deserted by many of its population for Recifo and the other parts of the city. The liarbor of Pernambuco is defended from the swell of the ocean by an extensive reef(rerift), which, according to Koster, centinues along the whole coast from Maranham, at a variable distance from the shore, and has numberless breaks, through which shlps approach the land. Thls reef, which is sald to be of coral, "is scarcely sixteen feet broad at top; it slopes off more rapidily than the Plymeuth breakwater, to a great depth on the outside, and is perpendlcular within to many fathoms."-Gbaibas, in Modern Traveler, xxx., 228. This natural breakwater forms the harbor; for though at high-water the waves beat over it, they strike the quays and buildings of the town with diminished force. Along the sandy neck of land hetween Olinda and Boa-Vista, however, which is not covered by the recf, the surf is very violent; hut the harbor itself is quite aafe for vessels that are wellfound and well-meored. It conslsts of $t$ wo parts-the Poco, capable of receiving vessels of 400 tons and upward, entered across a bar on which there are from seventeen to thirty feet of water, and the Mosqueiras. much better protected than the former, but on the bar of which there are but acven fect of water at ebb-tide. Vessels trading with Pernambuco should not, however, draw more than from ten to twelve feet of water.Buant's Imerican Coast Pilo, 519 . The harlor is defended by several strong military works, the prineipal
being the stone forts of Do Buraco and Do Brum. The light.house, on a reef at the entrance to the harbor, has a revolving light.-See Province of Peinambico; also Bnazil.

Foreign vessels are not allowed to engage in the consting trade, but they can load here for any foreign port. Vessels from the United Statea can diseliarge part of their cargo, and, If leaired, they can proceed on with the remainder to Bahis, Rio de Janciro, etc.

There are no insurance otfices bere, all husiness of that kind being done either In the Unlted States or England. With funds in hand, a commisslon of $2 \frac{1}{2}$ per cent. is charged. Vessels are generally chartered botk ways, arriving with flour, the charterer stipulating for a return cargo of sugar. Vessels coming out on their own account have been chartered hack this season as low as 60 cents a bag of 160 lus. Usually, hewever, the frelght ranges from 80 centa to $\$ 1$ per bag. There is no buainess done in exchange between this port and the United States, except the few whalers' drafts that are purchused nt from two to twelve per cent. discount. The value of the milreis is geverned by the state of ex. clange on England. The principal articles imported fromi the United States are fiour and tea. The former pays a duty of 3 milreis ( $\$ 160$ ) per barrel, and the latter pays 600 rels ( 30 cents) per 1 ll ; hams pay 60 reis ( 3 centa) per lb.; tobacco pays 180 rels ( 9 cents) per lb. Sugar and hides are the only articles of expert worth mentioning. Sugar pays an export duty of eight per cent. The export duty on hides is ten per cent. on a valuation fixed weekly by a committee appointed for the purpose. The only articles on which this goveriment levies a consumers' tax ure, all spirituous and malt liquors, eigars, tobacce, soap, and snuff. Wines and liquers pay $1 \frac{1}{2}$ cents a canada ( $1 \frac{3}{3}$ gallons); ib cents, in addition to thls, is levied on each pipe for whist the decree terms "charitable purposes." Cigars pay 56 cents per 1000 ; tobacco, 1 cent per 1 lb . ; sosp, 14 cents per 1b. This tax affects the United States only in tobacco and snutf.-Consular Returns for the L'nited States, 1854.

Perry, a fermented liquer made from pears, in ibe snme manner as cider from apples. The pears best fitted for producing this liquor are exceedingly harsh and tart ; but it is itself pleasant and wholesome.-See Ciden; Pealis.
Peru, a repullic of South America, between lat. $3^{3}$ $25^{\prime}$ and $21^{\circ} 48^{\prime}$ S., and long. $68^{\circ}$ and $81^{\circ} 20^{\prime} \mathrm{W}$. Ares, 520,000 square miles. P'eru is beunded north by Ecuador, east by Brazil, southeast and south by ilolivia, nod west by the Pacific Ocean. Its coast reaches from the month of the Rio Tumber to that of the L.on, 1240 miles ; capital, Lima. All the menntains of Peruf form part of tho great chain (cordillers) of the Andes. From Porco, in Bolivia, it is separated into two chnme-that of Ancumar, whlch runs from the cast between thr provinces of Carabaya and Azangaro, in the depnrtment of Puno, and that which runs to the west through Tarna, Moqucgua, and Arequipa. Both remnite afterwarilnear the city of Cusco, and ngain separate, the one running to the east of the provinees of IIunnta und Taraa, and the other to the west of those of Castrovireym, lluancavelica, nall IInarochirl, reuniting themselves again in P'raco. Jrom Pasco three chama detach thrmselves -the enstern between the Rie Guallaga ann the l'achitea, the central ene between the Gusllaga and the Upper Maranion, and the weatern one hetween the latter and the coast of Trujillo and Paita. These several chains reunite in the prownce of Loja, in Ecuador. The direction of these chains of mountains determmes the great valleys of the interior of Poru. Tho lakes most notable in Peru are those of Titicaca, between the departments of Puno and Ja Paz, the latter In Dolivia; of Vraos to the south of the city of Cuzco; of l'leyes or $I$ unln ; and of Iauricocha, in the department of Jumla. Lake Titicaca has a perlphery of ninety leagues, and that of Juiln of tun lengues. The other two are

smaller. In that of Lauricocha the Rio Marañon has its birth; In that of Junin, the Rio Jauja, which runs into the Ucayall; and in that of Titicaca, the Desaguadero (angllee, outlet), which empties into the Lake of laria, in the Republic of Bolivla. The rivers of Peru flow, some to the Pacific. Ocean, others into the Amszon, and others into Lake Tltleaca. These that empty into the Paelfic aro the Tumbez, Chira, Sechura, Jequitepeque, Saña, Viru, Santa, Patavilca, Huaura, Chlllon, Kimac, Mala, Cañete, Peaco, Ocoña, Camana, Quilea, Tambo, and Loa; and those flowiag to the Amazon are the Tungaragua or Marañon, which takes the name of Amazon at ita conflueace wlth the Ueayall, the Guallaga, the Ueayali (formed by the rivers Pachitea, Apurimac, and Beni), and the Rio Yavari. The mincral resources of Peru, like those of Mexico, are inexhaustible. The very name of the country is assoeiated in the mind with ideas of gold and silver. Besldes the precious metale, however, the country produces copper, tin, Iron, coal, saltpetro, etc., lo abundance-the latter, under the name of nitrate of soda, has become an important expert. The agricultural staples of the country are sugar, rice, tohaceo, ete., which grow in the warmer situations ; the vine, wheat, etc., in the milder. Petatoes are cultivated lis all parts, Maize is cultivated, and is the common diet of the prople. Medicinal plants, drugs, and dye-stuffs form a large part of the experts, and aome of the hard woots abound in the furests. The Cinchona, or Peruvian bark, is indigenous to tha country: it grows at the clovation of 10,000 or 12,000 feet, and abounds most in the northern provinces. Among the wild animals of l'eru are the puma, the uturunca (a species of tiger), the acumari (a black bear), and great varieties of deer, will bears, armadillos, etc. The llama, alpaca, gnauco, vicuñ, ete., are the mest valuable animals. Four varieties of condor aro indigenous. Of acelimated animals the sheep has succeeded best, and goats, hogs, etc., thrive well. In the mountains cattle and horses fird a congenial climate, but on the const speedily pine and die away. The wool of l'eru is among the best in the markets. The political divisions of Peru consist of eleven departments, and two provinces called "littorales." The rtepartments are subdivided into sixty-one provinces, the provinces into distriets, and theso into parishes. The government, civil and economical, of each department is in charge of a Prefect, dependent directly on the President of the Republic; that of the provinces is in charge of Sub-prefecte, dependent on the l'refects; that of the districts is in eharge of Governors, and that of parishes is in charge of Sulb-governors. Tho departments ami the population in 1852 were as follows:

| Departmenta. | Population. | Capitals. |

The most castern parts of the ilepartments of Amnzenas, Junin, Ayacucho, and Cuzeo have not been well explored, and are inhubited by diverse trilses of savage Indians, for whose civilization ditferent missions have beell established, and to whom belongs entirely all the teritory to the cast of tha Ueayali, and whero the Irefeets of the departmente above-named do not exercise their authority.

I'cru is an integral republie. The Constitution, which was finally settled in 1839, recognizes legislative, julleial, and executive powers entirely separate and independent of each other. The legislative power is vested in a Sonate and Assembly, chosen by the peo-
ple through electoral colleges; the deputies are apportioned in the ratio of one to every 20,900 inhabitants. The judiciary is appointed by the Preaident, and juigea are not removable except for cause. The Constitution providea for aub-judlciaries, having separate quallfications, for departments, districts, towns, and parishes. The executl ve power Is delegated to a President, whose term is alx years. There is no Vice-president, but the President of the Executive Councll supplies the placo of President in case of the removal, inability, or death of that officer. The Council conslsts of tha Ministers and members of the Senate. The establlshed religion is the Roman Catholic. The Church is presided over by an Archbishop and several sufiragans. It is immensely rich. The Inquisition has besn entirely abolished throughout the Republic.

Peru was conquered in 1532 by the Spanlards, under Pizarro and Almagro, and remained a colony of Spain for nearly thres liundred yeara. The independence of the comtry was proclaimed at Lima, 28th July, $18 \% 1$. Since that period the following parties have exercised aupreme power: General San Martin, to 21st September, 1822; thence a "Junta Gubernativa," composed of General Lamar and Sefiora Saluzar-y-baquijuno and Alvarado; thence General Don José de la Kiva Aguero, as President, to July, 1828; thence José Bernardo Tagle; thence General Simon Bolivar, to July, 1835 ; thence a "Council of Government," to the end of 1826 ; thence General Bolivar, as President ; thence General Lamar, as Constitutional President, to June, 1829 ; thence General Gamarra, to 1833; thence General Orbegoso; thence Gensral Salaberry, as "Supreme Chicf," to 1886; thence General Santa Cruz, to 20th January, 1839; thence General Gainarra, to Noveinber, 1841 ; thence Señor Menenilez, to August, 1812; thence Vidal, Figuerola, and Vivanco, suecessively, to 184]; thence Menenilez (restored), to 1st A pril, 1845 ; thence General Ramon Castilla, to 1st April, 1851; and thence Geueral Rutino Eehenique. the present President.

The following is a statement of the publie debt of Peru, as given by Scfior E. Escobar de Bedoya, attaché to the Legation of Peru at Paris, 26th October, 1853 :

$150,300,000$
The deposits of Chincha alone are worth three hundred millions of clollars (piastres). The Chinclia and Lobos Islands, of the coasts of Peru, are of immense value to the country, on account of their guano deposits. This substance is the most potent of fertilizers, nud untll lately the islands above-named were the only sources whence it was terived. Aecording to a report made by Sener Villa in 1812, the deposita in these islands were estimated to be $16,632,280$ tons. Assuming the consumplion to bo 300,000 tons a year, valued at $\$ 20$ a ton, it would produce: $86,000,000$ anmually, and require 160 years for its total consumption. This resonree has been on efficient alil to the matlonal treasury, and has made Peru the most upparently prosperous of all the South American republics. The exports in 1852 amounted to 220,500 tons- 32,000 of which went to the United States, and the remainder to France and En-gland.-See article Guano.

According to a treaty between Peru and the United States signed July, 1857, it is agreed that the permission to the whale ships of the Uuited States by the treaty of 1851 , to barter or sell their supplies and goods to the value of two hundred dollars, ad ralorem, without being obliged to pay port or tonnage dues or other imposte, should not be understood to compreheud every kind of merelandise without limitation, hut those only that whale ships are usually provided with for their long
veyages. That in the said exemption from duties of every kind are lncluded the following articles in addltlon to the produce of their fiehery, viz., white unbleached domestics, white bleached domestics, wide cotton clothe, blue drills, twilled cottons, shirting stripes, ticking, cotton, prints, shirtings, sailors' clothing of all kinds, soap, slush, boots, sloea, and brogans, axes, hatchets, hiscnit of every klnd, flour, lard, butter, rum, Lreef, pork, spermaceti and composition candles, canvas, rope, tebacco.
The principal ports of Peru are Paita, San José, Huanchaco, Callso, Jalay, Arica, and Iquique. These are ports of entry for forelgn commerce. There are other ports open to the ceasting trade, and for the exportation of the produce of the country. Theee are Ylo, Chala, Pisco, Huacho, Casma, Pacaamayo, and Tumber, and the small harbors of Sechure, Samane, Santa, Supe, Huarmes, Echenique, Chancay, Aneen, Cerro, Azul, Chinca, Canchto, Nasca, Qullea, Cocetea, Morro do Sama, and Pisaque.
The commercial relations of the United Statea with Peru are regulated by the treaty already cited, bearIng date July 26, 1851, and by auch decrees and erders as are issued from time to time by the Supreme Goverument of that republic. The treaty guarantees entire liberty of commerce and navigation, and perfect reciprocity between the flags of the twe comntries in the ports of the ether.
The trade between the two nations (Peruvian guano excepted) is not, however, very extensive, as appoara from the efficial returns of the United Statea Treasury Department. Before ontering into the detaila of the cenmerce between the United States and Peru, the fellowing summary of the genernl foreign trade of that repulific is given, with a vew to show the relative rank held by the United States and other nations In that trale. The figures are derived from the official returns of the Peravian government for the years 1851 from all natione, nod in 1851 and 1853 from the United States. -See Commercial Relutions of United States.

Balance of foreign trade in faver of Peru, during these three years, $\Phi 12,200,956$; making on ananal aver. age in favor of Peru of $\$ 4,096,085$. The number of vesaels employed In the steam navigation of Peru is: six steamelhipa belouging to the British mail line, which ply semi-monthly between Valparalse and Panama. The aggregate tonnage of thene six steamers ia 8506 tons. There is alse a seventh steamer of 500 tens on the same line. One Pernvian ateamer, of $2: 0$ tons burden, coasta regularly hetween Callao and Vslparaiso. The two latter are screw-prepellers; the other nix have paddle-wheela. The merchant marine of Peru in 185\% consisted of nine ahips, with an aggregate of 3194 tous; ten barks, measuring In all 4156 tons; and eight brigs, of 1681 tons; making a total of twentaeven vesself, with an aggregate of 9031 tons. The tutal numher of Peruvlan veasels employed in the ceasting trade during the same year was 141, with an aggregate of 14,705 tons. The number of seamen engaged In this service is abent 4000 , of which 2150 are natives, and 285 citizens of the United States- 1250 being employed in the fereign trade, and 2750 in the coasting trade. The talles on next page, tranacribed from French official authorities (the dollars having been reduced to franes by multiplying by 5), exhibit in desail the general import and export trade of Peru in 1803.

Callao is the chief port in Pern for foreign commerce. The aggregate tonnage of Peruvian vessels, belonging te and employed in foreign trate at Calla, in 1852, was 67 vessels, measuring an aggregate of 15,031 tons; in the ceasting trade the number of vessels was 181 , with a tounage of 17,705 tens; mesking a total of 248 vessels, and 32,736 tons. Hesides the above, there were employed, during the same year, at the port of Plsce, six ressels of 1200 tons sgigregate; and at the port of Inache (hoth perta being in the cenanlar district of Callao), eight vessels, with an negregate of 400 tons; making a tetal in both perts of 1600 tonc. The total number of Peruvian vessels which entered at Callao (in ferelgn trade) in 1852 was 150, with a tomare of 19,478 tons; and the number cleared, 157 vessels, with a tonuage of 19,326 tons. The number and tonnage of United States vessels which entered Callino durlug the same year was: vessels, 69 ; tomage, 27,360 tons; and the number and tonnage of those cleared was: vessels, 56 ; fonnage, 23,160 tons. The following comparative table shows the rauk which the Inited States hell, relatively with olher forigu mations, in the navigution of this port in 1852, including 13ritish mail steumships:

United States at that port, as follows; "The most valuable of the articles importel into this consulate aro asserted merehandises from England, France, Italy, the United States, Chill, Spain, and Equador; viz., Cotton, linens, silks, wines, hardware, otc. From the United States, domestic cottons, furniture, lumber, provisons, ete. The oxport trade of Peru consiats chiefly of guano, which is sent to England, tho United States, France, and Spain, and in smaller quantities to Italy, India, and tho West Indies. Tho export was forced daring the revolution, and a diminution lias taken place under the present government, owing to over-supplies in Europe and the United States, and a wish on the part of Peru to raiso the price of this article abroad to its consumers. It is valued on board tho ships at the lslands where laden at $\$ 5$ per ton-that is, at the cost attending its shipment. The average rate of freights to the United States during the year past (18is) has been $\$ 22$ per ton of 22.10 liss. This much of the product of gunno goes into the hands of our ship-owners, who carry neariy all of it to the United States, and part of it to other plaees, from Callao and the Cbincha Islands. No prohilitions exist, in firet, upon imports; but arms and munitions of war are difficult of introdnction luring revolutions. Powder is strietly prohibited. The general trade regulations are liberal. Goods lic in bend at the option of tho merchant; paying only, after the first month, storage and labor, until entered for consmpution, or elso exported abroad, and then no elarges forther. There are at present no differcutial or liseriminating dutics on any foreign vessels or coods. A quarantine exists in the case of coolies from China, who usually arrive sick; and this district, during the last three years, has becons suliject to fatal epldomic fevers, etc. Cnited States capital is cmployed iu the
ice trade, and in repuiring ships; in the humbler trades, and in commerce, and upon the public works. The English at present enjoy the largest alare of the import and export trade; but the activity and intelligence of all commercial nations are occupied in seeking a shere, and the tendency is gradually toward a more equal participation.

Crude wools aro largely exported; but the high duty on them in the United States throws nearly all that trado into Europe, mostly to England, where wool is free under the tariff. Of late they have been paying good profits. This remark applies nlso to the barks of Peru, and to copper. Tho bar silver exported all goes to England, because there is no direct steam communication with the United States. Somo supplies of wheat, Hour, and other ngricultural products begin to be imported into this consular district from California, such ns barley, potutoes, etc. ; and about 2500 tlasks of quieksilver, valued nt nearly \$t00,000, have been imported during this last quarter. Whale ships, while cruising, calt at times for refreshments, and to change their erews. The agricultural industry of ate country has been ohstructed by the liberation of the slaves in 1855, to replace whom Chineso coulies are being imported. Such laborers are also now being employed by the government at the Chincha gunno islands, near l'isco. 'The army of Peru employs about 7000 Cholo half-breed Indian soldiers, the tendeney of which polity is to hinder population. There is a pereeptibla increase in the number of Americans in this consulate-seamen, artisans, and tradesmen, who come to reside. Nitrate of soda is largely exported-at least a million and a lialf of quintala annually, valued at $\$ 2$ per 100 lbs ; a considerathe part of which goes to the United States. Dry and salted hides, and straw
hats, are exported in small quantities. The circulatlug currency of Peru, representling sllver, and now the only monay in common uaa, is below the nominal atandard about three-eightha, or $87 \frac{1}{2}$ per cent. The rate of exchange fluctuates from five to fifteen per cent. on the dollar. The dollar of Perru, In invoices of export to the Unlted States, is now naually valued at from 80 to 85 cents of United States currency. The Peruvian dollar, of pure silver, not in clrculation, is worth about $87 t$ cents of Unlted States currency. Gold coins of P'ern are not now scen in common use. Patriot doubloons pass current at $\$ 17$, and of late are worth 3 per cent. premium, and but few to be obtained."

Paita.-The chief staples of export from the port of Palta are straw (Panama) hats and Peruvlan bark. The exports consiat chiefly of cotton manufactures, of iron, and assorted aundrles. The official navigation returing for this port, for a period later than 1852, are not at hand. There entered from all foreign nations In that year 185 veasels, with an aggregate of $61,62 \cdot 4$ tons; of which there were from tho United States 42 vessels, measuring an aggregate of 10,256 tons. The direct trade between the United States and this port is llmitel, owing to the facilities afforded in the coasting trade between this polist and Callao.
Arica.-The staple exports from the port of Arlca are tin, copper ore, Peruvlan bark, and alpace wool. With the exception of the latter, all these exports are of Bolivian produce. Indeed, the port of Arica is merely a transit port for Bolivian preduce and trale. Owing, hovever, to some ins:inderstanding bet ween the governments of Peru and Bolivia, which resulted in the imposition by the former, in 1853, of 40 per cent. duty on the produce of the lutter pasaling through this port, this transit trade is now conducted through the port of Cobija (Port La Mar), the only pert open for foreign commerce in Bolivia. The imports from the United States are cotton domeatics, blue drills, chairs, and shoes, on which last-named article a duty of 40 per cent. is levied.

Iquique. -Thia port possesses a harbor safe and commodious, and is well protected by the island of Iquique from the heavy swells whleh, in the winter season, set in frour the southwest. With the exception of a few months during the late revolution in Peru, up to the month of July, 1855, when it was declared n puerto mayor, Iquique ranked as a puerto nenor, ulth seme extra privileges. The province of Iquique ia the great centre of the nitrate of solh trade, and to this article alone it owes its present position. Out of a population of about 15,000 feur-tifi hs are more or less interested in this trade. At the works, the nitrate of seda varies in value from $81 \nmid$ cents to $\$ 106$ of carriage to the coast varies from 688 cents to 931 cents per quintal. The average rate paid for the article placed on the beach is $\$ 175$ per quintal; and this price gives the makers a pretit of $9 \frac{2}{8}$ cents per quintal.

Nitrate of soda is alwaya sold deliverable along side the ship's launch, outside the aurf. The merchant has to bag and embark it, which costs him about $21 \frac{1}{3}$ cents per quintal. Selling it, therefore, at $\$ 18 \frac{-1}{2}$, would yield him a protit of 158 centa per quintal.

Nitrate of soda is used in the manufacture of sulphuric and nitric acids, and as a fertilizer. Between 1820 and 1830, attempts were made to export it to the Uuited States and England, but the cargoes were unaalaile. Soon afterward, however, ita value became knew, and at this the the quantity annually exported reaches nearly $1,500,000$ quintals, valued at about $\$ 12 \mathrm{~s}$ to $\$ 2$ per 100 lbs . The following statement will show the total amount of nitrate of soda exported since 1830, when tho trade began:

| 1880 to 1834 , inclusive |  | Quintals. | 361,385 |
| :---: | :---: | :---: | :---: |

Before Iquique was constituted a puerto mayor, foreign ressels from any foreign port could call and anchor, provided their cargoes consisted of nothing but the following articles: P'eas, beans, lentils, Indian cern, wheat, barley, nuts, raisins, almonds, cocoa-nuts, flour, bran, biscuit, n.acnroni, frangallo, chococa, dried potatoes, fat, butter, tallow, lard, jerked beef, cheese, livo and dead stock, salted meats, and all kinds of vegetablea and roots, candles and soap, lire-wood, timber for building, coala, bricks, iron, atcel, nails, tools for mincs, emply sucks, twine, machines for making nitrate or distilling water. It is now open to general commerce, and will necessarily hecome a port of much inportance. Heing the most windward of the Peruvian ports, vessels proceeding from the south, having other gbors on board than those above specificd, wero obliged to go to Arlca, the first puerto mayor, and, after dispatching at the custom-kouse there, beat back again te Imnique, at a cost of from five to tifteen days' ailing. The consequence of this restriction wa, that but few vessela entered this port with cargoes dircet from forcign countries. Another advantage to be derived from making Iquique a puerto mayor is, that it will open a transit trade into Belivia, and thus render this port an entrepot for an extensive trade with that republic. The distance to Putosl is much less-less, it is stated by three or four days' journey, than ly the way of Colija. The mules would only have to travel fifteen leagues without water, and the pass in the Cordillera is equally as favorable as by the latter route.

Tumbez.-No vessels except whale ships are allowed to enter at this port. The privileges to which American whalers are entitled ly the twelfth artlcle of the treaty of Peru with the Unitel States, have already been stated. The market of Tumbez is supplied diefly by Americnn whale ships, which usually hmport smail quantities of American manufactured goouls, flour, ett. Other foreign whale ships must conform to the general regulations of commerce, which allow them to anchor, provided they have on board only the products of the tishery, previsions and supplies necessary for the use of the vessel and crew, and to sell oil and randles to any amome, in exchange for provisions, frec of import duty. The following summary exhithts the nunber and tomage of Amerimu whaling vessels which arrived it the port of 'Tumbez, from August, 185, to June 30th, 1855 :

* Nine months to Jone 50, and the fiscsi year from thita time beging July 1.

A treaty of frlendship, commerce, and navlgation exists between the United States and the Republic of Peru, the terms of which treaty are adhered to in good ".ith at the ports of Peru; and although questions sometimes arise in police cases regarding seamen belonging to American vessels, the authoritiea assist readily in arranging such questions as they occur. The present existing regulatlons are fixed and detinite as regards commeree. Changes in parts of these regulations aro made by deerees issued by the President and Congress, when that body is in session, and by the President and Councll of Stato during the recess of Congress, as required by the public exigencies. At present (August, 1855) the government is undergoing the process of a revision of its fundamental laws, now being made by a convention of deputies eleeted from all sections of the country, and holding its sessions in the hall of Congress at the city of Lima. There are no privileges permitted to the commerce of other nations which are denied or not allowed to the United States. There are no restrictions imposed on the commerce of other nations and not on that of the United States. But a line of eight fine British steamers, carrying the mails and running botween the perts of I'sama and Talcahuano, under the provisiens of a postal convention existing between Great Britain and P'ern, aro exempted from all tomange duties and port eharges whatsoever in the ports of Pern, in consilueration for the transmission of the mails of Peru to and from the various ports of Pera at which they touch in making passages to and from Talcahuano and Panams. The whaling vessels of the United States, also, are allowel certain privileges in the port of Tumbez anil all the open ports of Peru, in virtue of the treaty how existing. Some question has been made by Peru as to whether this privilege should allow whalo ships to avail themselves of its provisions in one port only, while on a cruise, or at each or any port or ports, and overy time they visit such port or other port or ports of Pern. The amount of the port eharges made upon the vessels of the United States in the ports of leru is as follows, namely: Tonunge duty, 25 cents per
ton ; anchorage fee, $\$ 8$ on vessels to Callao only; anchorage fee on vessels to Callao and the Chincha Islands is $\$ 1$ more, making $\$ 12$; inspector's feo, $\$ 425$; custom-house fee, $\$ 125$. The various stamped papers cost from $\$ 5$ to $\$ 12$, aecording to tho operations inade by the vessel. Thero are no light-house dues nor any light-houses, and no hospital money is exaeted. The tonnage duty is only payablo In one port, and only onec in six months. There are no pilots nor any pilot system in Peru-the naturo of the ports rendering pilots unnecessary. National vessels that measuro less than 200 tous do not pay any toonage duty, but pay the other port charges. National vessels over 200 tona register pay 25 cents per ton, being the same duty that the vessels of all nations are mado subject to. Tho lino of eight British mail steamers is exemptel from all port charges whatsoever, under the conditions of the postal convention now exlsting between Great Britain and Peru. The transhipment of goods is permitted in the vessels of the United States, either to another port in Pern or to a foreign port. This privilege is allowed also to the vessels of all nations. By the Reglumento de Commercio for 1852, the latest yet published, it is allowed to vessels of all nations to take coastwise, from one open port (mayor) to another, any foreign goods in bond; that is, which have not paid duty; for examplo, from Arica or Isly to Callao. It is also allowed to take tho productions of I'ern, and any foreign merchandise free of duty, in the same manner, from any port to another port or ports in Pera. All vessels may go loaded with free goods, and tho pro ductions of l'eru, not only from one open port to another, but from an open port to a minor port (menor), or from a minor port to an open port (mayor), or in any manner. Vessels of all nations aro permitted to go to the port Iquique, to load with nitrato of soda and other artlcles, and also to proceed from Callao to the Chincha Islanda to load with guano.

The moneys, weights, and measures, known and in common use in Peru, are thoso of Spain, having remained the saine as when Peru was a colony of Spain.

The difference between the vara and the yard in the cuatom-house is eight per cent, adiitional, the vara being about 33 inches of the Engliah yard of 36 inches. The gresa and dozen are the same aa $\ln$ the United Statew. The galion of oil, of wine, and of apirits, are each taken at 7it pounds to the gallon. Tha fanega is an arbitrary ideal ineasure, and is regulated by weight; namely, one fanega of wheat is 185 pounds; one fanega of miliet is 180 pounds; ono fanega of beana la 182 pounds; one fanega of pess la 182 pounda; one fanega of corn is 156 pounds; one fanega of Lima beans is 150 prounds; one fanega of taliow is 180 pounds. Ilut these measures do net come into use in foreign intercourse, or in any large transactions. There is no measure of bulk in use, such as a bushel or a gallon; articles measured in buahela or in gailona In the United States are sold by the pound or quintal of 100 pounds in Peru. Tho difference between the pound ani quintal (of 100 pounds) of Peru and those quantities in tho Unted States is two per cent., the pound of Spain and Jeru being two per cent. heavier than tho pound avoirdupois of the United Statea and England.

Insurance to the United States, one and a half to two per cent. Freight, $\$ 27$ to $\$ 30$ por ton of 2240 pounda, guano, delivered; and the same price on 40 cubic feet measurement of other articles. Commission, two and a half to five per cent. on the invoice. Cash in all cases on exports. Average rato of exchange, five to seven per cent. premlum for a bili on the United States, and eight to ten per cent. on United States currency. The true par of exchange is: Specie, six to ten per cent. premium; by exchange, six to seven per cent. Bils, six to seven per cent. premium; by the carrency, ten per ceat. No duty is charged on merchandise exported. No intermil or other taxes are levied on exports, Guano belonge to the government and people of leazu, and is sold by itaclf.

Peruvian Bark. The trees yielding l'eruvian bark, which grow at an elevation of 7000 to 8000 fect on the Andes, have for a long series of years been feiled for the sake of their bark, and no pains were taken to replace them. Feors have been naturally entertained that ere long the supply of bark, and consequently of quininc, would fail. Efforts have consequently been mado to transplant the tree into countrics where it is aupposed the climate would be suitalic. Dr. Royle has taken measures for introducing Cinchnaa Calisaya, or the yellow-bark tree, into the higher rigions of india; and of late years the Dutch goverr ent have employed Mr. Haskkarl to tranapert piate fivaious species of cinchona from South America to Java and other parts of the Dutch East Indles. These attenpts have been auccessful; and tho reperts in regard to the growth of the plant are such as to lead to tho expectation that cre long the Peruvian bark trees will be scattered over extensivo districts, and will thus be saved from destruction.-Edin. New Phil. Journ., No. 9.
Pewter (Ger, Zinn, Zinngeisserzinn; Fr. Ltain; It. Stagno; Sp. Estano, Peltre; Russ, Olouo), a factitious metal used in making plates, dishes, and other domestic utensila. It is a compound, the hasis of which is tin. The best sort consists of tin alloyed with about one-t wentieth or leas of copper, or other metallic bodies, as the experience of the workmen has shown to he most conducive to the improvement of its hardness and
celor, such as lead, zlnc, biamuth, and antimony. Thera are three aorts of pewter, distingulshed by tho names of plate, triffe, and ley pewter. The lirst was furmerly much used for plates and dlahes; of the second are made the pints, quarts, and other measures for beer; and of the ley-pewter, wine measures and large meatures. A fine pewter ls made, according to Aiken, by fusing together 100 parts of tin, 8 of antimony, 1 of biamuth, and 4 of copper. The nee of those additions to tin is to harden it and preserve its color; and a good pewter, when clean and polished, has a silvery lustre, and does not readily tarnisi. Common pewter, of which mensures and pewter pots are made, is an alloy of lead and tin.
Philadelphia, the metropolia of Pennsylvania, and the second city in the United States of America in papulation and in manufactures, is in lat. $89^{\circ} 56^{\prime} 39^{\prime \prime} \mathrm{N}$., and long. $75^{\circ} 10^{\prime} 54^{\prime \prime} \mathrm{W}$., 130 miles from Washington, and 87 from New York. Population in 1800 was 70,287 ; in 1810, 96,287; in 1820, 119,325; in 1880, 167,325; in $1840,258,037$; in 1850, 408,762; and in 1854, 480,000. It is situated between the Delaware and Schuylkill rivers, five miles above their junction, and extends from the ono to the other. Tho rivers beus ding it lie about two milies apart in the narrowest place. The city is 100 miles distant from the ocean by the course of the Deiaware. Its prineipai harbor is on the cast, or Delaware River side, where ahipr come up, and its foreign commereo centres. Philidelphia has an extensive foreign, and a still greater domestle trade; by means of railroads and canala it possessea facilities for communication with a great extent of country. The city is built upon a plain rising gradually from the Delaware on the east, and the Schuyikill on the west, to the height of ahout 65 feet above the surfuce of the rivers at highest water. The portion most densely built upon has an outline of about ten miles, and extends along the Delsware River fiva miles. Pliladelphia is laid out with great regularity, the streets, with lut few exceptions, crossing cach other at right angles. High Street, extending from river to river, and Bread Street, which extends south and north from Penn Square, are very wide and spacious thoroughfares; the other strects are, many of them, neat and elcanly kept. The public huildings are geverally tasty and well built editices, and the private residences hare a neat and cheerful appearance. It was surveyed aad laid out in 1682 hy Timmas Holmes; the ground selected was claimed by three Swedes by the name of Swenson, who held a title to it oltained of the Dutch Governor of New York in 1664. This claim was purchased by Penn.-Harper's and Lippincott's Gazetters.

Manufaetures.-This branch of the industry of Philadelphin is very important both as regaris value and extent. The vicinity aloomds with water-power of great magnitude, and conl is obtained at an casy and cheap rate, so that steam can be applied as a motive pewer to a great advantage over other places, and which has been made extensively availahle. Machinery, locomotives, hardware, sugar-refinlng, cordage, and a variety of wares are preduced here.-Census Report, 1850.

${ }_{\text {Prodocter }}^{\text {Annual }}$ +20.310,265 7,1173,123 8.376,731 10,453,904 3,734.334 1,293,201 $10,237,348$ $\$ 64,11+112$ F the year 1853 and the quan0 tons. The
commerce of Phlladelphis is rapidly on the increase, amounting in valne the aame yaar to $14,500,000$, and employing a tonnage of 252,451 tons. In 1854 there was a line of first-cluse ateamelipe and four lines of anil-ing-vessels plylng between thls port and Liverpool; two steamshipe to Charleaton, South Carolina ; ons to lichmond, Virginia, via Norfolk and Petersburg; one to Boston; one to Hartford; two to Now York; and one to lialtimore. These veesela were aubatantial and well built, and most of them constructed in thla clty. The total number of steamshipa, ships, barks, brlgs, schooners, barges, etc., enterlng the port during the year 1856, was 27,044 .-See Coal; Coinage.

The following railroads centre hare: The Camden ant Amboy; Philadelphia and Trenton, connecting with the New Jersey; the Camden and Atlentle; Philadelphis and Germantown; Philsdelphia, Rsading, ant Pottsville; the Great Central Railrond of Pennsylvania, with lts extenslve connectlons; Philadelphia and Westchester; Philadolphia, Wilmington, and Baltimore; etc. The Schuylkill Navigation Canal, 108 miles long, extends to Port Carbon; and the Chesapeake and Delaware Canal, 14 mllea long, extending from the Delaware River at Delawsro city to Back Creek, Maryland. These great arterica of traflic contribute much to the trade of Philaitelphla.

The city, as consolldated by the act of January, 1854, cmbraces a territory $23 \frac{2}{2}$ miles long, and $5 \frac{1}{2}$ average breadth, coextensive with the county. It is divided into $2 t$ wards, and is governed by a mayor, elected for two ysars, a select council of 24 members for the anme periol, and a common council of 72 menbers, elected annually.

Phlladelphia was first survoyed and regulated in 1632. It had previously been in possession of the Swedes, some of whom csme into the country borderling on Delaware Bay as early aa 1627. It was named after a city in Asla Minor, and the plan is said to have been suggeated by that of ancient Babylon, and sccording to the original design of William Penn, its originsl founder and proprietor, was designed to have equaled that ancient espital in oxtent; but the idea was soon absandoned, and the chsrter of 1701 restricted it to the boundsries of tho late city proper. Penn's country residence was at Pennsburg Manor, above Bristol, in which was a large Hall of Audience, where he held treaties with the Indians; and the oak armchair in which he sat is now in the Pennsylvania llospital. The first Congress assembled in Phlladelphia September 5th, 1774, and adopted a declaration of rights; on July 4th, 1776, the Declarstion of Independence; in the sutumn of 1776 retirsil to Baltimore; September 26th, 1777, the city fell into the hands of the British, who occupied it until the 18 th of June following. May 17th, 1787, a convention met here, and in September 17th, following, agreed on a Constitution for the United Stateg, when it becamo the seat of Government of the Unlted States until 1800.
Harbor, light-houses, l'ilotage, etc. - Vessels of the largest burden ascend the river as far as Neweastle, lut those drawing above 18 or 20 fect water can not reach Thiladelphia on account of a bar a littlo below the city. The entrance to the magnificent bay formed by the emhouchuro of the Delaware, has Cape May on its north, and Cape Ilenlopen on its south side. The former, in lat. $38^{\circ} 57^{\prime}$ N., long. $75^{\circ} 47^{\prime} 45^{\prime \prime} \mathrm{W}$., is a sandy healland, rising abont 12 feet above the level of the sea. It has recently been surmounted by a light-house 60 feet In height. The light revolves once a minute; an eclipse of 50 seconds being succeedel by a brilliant fiash of 10 aeconds. It is seen in clear weather from 20 to 25 miles off. Cape IIenlopen, marking the southorn boundary of tho bay, is in lat. $38^{\circ} 47^{\prime} \mathrm{N}$., long. $75^{\circ} 4^{\prime} 45^{\prime \prime} \mathrm{W}$. A little south from it is a hill, elevsted about 60 feet feet above the level of the sea; and on it is erected a light-house 72 feet In height, furnished with a powerful fixed llght visible in cleal weath-
er ten leagues off. To the north of this principal light, and clone to the extremity of the Cape, a second Ilghthouse has been conatructed, 36 feet above the level of the see, which is also furnizhed with a fixed light, which may be seen about alx lesgues off. The channel for large ahipa is between Cape Honlopen and the hanka cslled the Overfalla. The navigatlon la, however, a little difficult, and it is compulsory on shlpa to take pllots. The latter frequently board them at aea; but, if not, as soon as a ahlp comes hetween the Capes, ahe must holst the signal for a pllot, and heave to as soon as one offers to come on board.

Wrports of Breadstuffs,-The sanexed statemont shows the quantity and value of breade:uffs exported from Philadelphia to foreign ports during 1855 and 1856:

|  | 1856. |  | 1856. |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Quanlity | Volue. | Qunatily. | Velae. |
| Flour .... Barrels. | 218,197 | \$1,902,618 | 343,835 | $\$ 2,400,115$ |
| Corn meal " | 15,1c8 | 435,204 | 91,249 | 200,400 |
| Rye monl. | 12,75.7 | 80,238 | 16,298 | 68,612 |
| Wheat ... Bushols. | 226.071 | 451.921 | 662,888 | 1,049,7i7 |
| Corn ..... | 680,252 | 683,782 | 1,093,621 | 711,090 |
| Ryy, Oats, etc. | .... | 57,897 | $\ldots$ | 232,435 |
| Totsl |  | \$ $\$ 3,6 \mathrm{i} 7,507$ | .... | \$4,733,836 |

These figures show a marked difference in the prices of breadstuffs in the years specified, as follows:

|  | Average Prico 1655. | Average Price 1850. |
| :---: | :---: | :---: |
| Flour........ | \$8 99\% per barrel. | \$690 per berrel. |
| Corn Meal | $457 \%$ | $318 t \quad 4$ |
| Ryo Mcal .... | 076 | 421 " |
| Wheat....... Corn ....... | 1091 per bushel. | $151{ }_{6+1}$ per bushel. |

It will be observed also that, had the articles enumerated brought the prices in 1856 that were paid for them in 1855, the value of breadstuffs experted in 1856 would have aggregated $86,123,216$ instead of $84,753,336$, the real cost.

Receipts of Catte in Philalelphia.-The following tabular statement presents the number of cattle received here during each of the last twelve years, with the exception of the large number brought in by butchers, of which no account can bo obtuined:

Philippine Islands, a large and important group in the Asiatic Archlpelago, forming its nortl:crn division, and next to Cuba the most valuable colonial posseasion of Spain, chiefly between lat. $5^{\circ} 32^{\prime}$ and $19^{\circ} 38^{\prime}$ N., and leng. $117^{\circ}$ and $127^{\circ}$ E., having north and east the Pacifle Ocean, west the China Sea, and south tho seas of Scoloo and Cclebes. There are at least 1200 islands, great and small. Principal islants, Luzon, Mindano, and Palawan, sith Mindoro, Panay, Marindiquo, Negros, Zohu, Bohol, Leyte, Samar, Masbate, and niany of less size. 'Total area estimated at 120,000 square miles. The Spanish dominion la stated to extend over only 52,148 sq. miles. Population, in 1850, 3,815,878, consisting of Europeans, native whites, the Papuan negro race, and independent tribes, Malay Indiane, half castes, and Chinese. The islands are of volcanic formation, and contain a chain of active volcanoes. Earthquakes also are of frequent occurrence. The group is within the range of the monsoons, and violent hurricanes are common. From May to September the
western conats aro deluged with rain, while the October monsoon brings rain to the castern coasta, at other seasons dry. The high temperature and abundance of moisture produce a luxuriant vegetation; so that they are capable of yielding all kinds of colonial, nad probably European produce. Rice, millet, maize, sugar, indigo, hemp, tobacco, coffee, and cotton, are raised; and sago, cocoa-nuts, banazas, cinaman, betel, numerous fine fruits, and timber for ship-building are among the products. Buffaloes and most of the domestie animals common in Europe are reared. There are no predaceous quadrupeds; the enyman is found in the rivers. Pearls, pearl-oyster shell, the sca-slug, edible birts' nests, and sapan-wood, are important articles of ex port henco to China. Domestic weaving is pretty generally carried on by the females, and straw hats, cigar cares, and earthen-wares, are mado; but the chicf manufacture is that of "Government Manilln" cigars, which oceupies 2000 hands at a royal fnctory in Manilla. The w retched colonial policy of Old Spain oxcluded all for-

## PHI

eign ships and Chinese nettiers from these lalands, and the traile with the Spaniah deminion in America was also contined to that condacted annaally by alogle ship. But auch reatrictiona have vanlahed alnce the revolution, and the colony is now making commensurate progresa toward proaperity. In 1842, 149 shipa, aggregate burden 46,869 tons, entered, and $162 \mathrm{~d} \cdot .$, burden 50,226, cleared, at the different ports, Imports amounted in value to $\mathbf{5 0 0 0} \mathbf{0 8 0}$, one-third from England, and more than another thilrd from China, the Iniled States, and Britiah India, Exporta amounted in value to $\mathbf{2 0 7 4}, \mathbf{1 6 0}$, chiafly sent to Fingland, Spain, the United States, Cbina, and Auatralia. Manilla (which ace) is the principal neat of the trade, and aleo the seat of the government, it being the reaidence of the eaptain genoral. In each of the larger Isiands is a lieutenant govornor; and each of the 30 provincea, governed by an ulcalde, is divided into pueblos, or communes. The lloman Catholic religion has beell extenaively diffused among the Maiaypopulation. Public revenue iadorived chiefly from duties on exports and imports, the tobacco monopoly, and a capltation tax, which in 1887 was paid by $1,305,142$ adults, of whom 901,924 belongel to the island Luzon. Armed force amounta to about 7000 men, one-tenth Spaniards, and the reat Malaya. Theas islanda were discovered by Magalhaens in 1521, and settled liy the Spaniards in the reign of Philip Il., after whom they were named.

The commerciai intercourse generally is under the laws and regulations of the mother comntry, but, in fact, Is in some degree dependent upon the local authority, the power being with the governor to order the departure from the colony of any person who may become obnoxions to himscif or his goverament. The regulations are fixed for an findefinite time; amendmenta are conatautly proposed, and, for several years past, a total reviaion of the tariff of duties on forcign produce has been, from tlme to time, diacussed. Any such changes, though they may bo proposed and discussed in Manilla, can only be made law by the homo govermment. In fact, the reins are held vory tightly in Madrid, and the governor general is constantly mede to feel his dependence upon the minister in power. Citizens of the L'nited States enjoy the privileges of all other foruigners. There is no distinction made in the privileges or reatrict:.ans permitted or imposed on the commerco of foreugn issions. The port charges consist of tonnege dues, river-cleanir.g dues, and light dues. Tho tonnage dues aro 25 centa per ton register, if the vess. 1 discharges or takea in cargo; and one-half, or $12 \frac{1}{2}$ cents per ton, if she departs without having liroke balk or received cargo. A vessel may land specle withont being sabjected to the full ducs. The river dues, for the support of a mud-boat, are : on a vessel discharging and loading any cargo, 61 cents per ton; entering in ballast and sailing whth cargo, or rice rersa, $3 \frac{1}{8}$ centa per ton; entering wleli cargo and aailing with same, 3 conts per ton; entering and sailing in ballast, nothing. The light dues are, on all foreign vesacls, $6 \frac{1}{4}$ cents per ton regiater.' Spanish vessels pay one half these rates. The transhipment of goods is atrictly prohibited. In order to effect a tranahipment, the goods must be entered in deposit, actually brought on shore to the eustom-house, and then shlpped umier fresh doeumente from deposit. There is but one port, this of Manilla, open to foreign ahipping, and foreigners are excluded from ell fiternal and coasting trade.

The moneys, weights, and measures in common use in Manilla are authorized by the iaws of Spain, hut can not be aaid to correspond with those of the mother country, Inasmuch as in Spain the weight and neasurea are not the same throughout the kingdom. The moneys current hare aro specie only. Of gold, the doubloon of Spain, Mexico, and the republics of South America, of full weight, is current at \$16. The smaller coins-halves, quarters, and eighths-at their proportlonate valuo. Of silver, the dollar of Spain, Mex-
ico, and the other South American republics, of full welght, is current at 1 United Staten currency, The reintiva amaller coina pass at their reiative value. Copper coin is of three sizes; I cuarto, 2 cuartos, and 4 cuartoa; 160 cuartoa are eqnal to a dollar. Aeco'nt are kept by Spanish merchants in dollara, realu, and cuarton; 20 cuartos equal I real; 8 reala equal I dollar. Forelguera generaily keep their accounts in dollars and cents. The value of these coins is abont the same in the United States as here; but not belog tixed by the United States iaws, there ja a fluctuation whlch can not he reduced to regular itmith.

The weights in common use are pleuls, quintala, arrobas, and pounda. The pound is atoont is per cent. heaviur than that of the United States. 25 poumls cqual 1 arroba, or, at the United States atinndard, about $25 \frac{1}{2}$ pounds ; 4 arrobas $=1$ quintal $=101 ; \mathrm{ilise}^{2} ; 5 \frac{1}{2}$ ar. robas $=1$ pical $=140 \mathrm{ibd}$. The measures are long meas-ure-inches, feet, yards, fathoma, miles, and leagurs. I2 inches make 1 foot; 8 fect make one yard; 2 yarda make 1 fathom; 1111 fathoms and 0 linches make $t$ mile; 8 miles make one league. The yaril (or yara) in use here is about 38 inches of the United Stntes. Grain is usually sold In the country by the cavan. tapatanes equal 1 chupo ; 8 chupos equal 1 ganto; 25 gantos equal 1 cavan. These differ, however, in the different provinces. In Manilla, a cavan of rice welghs 127 ibs ; of cottee, about 52 its ; of wheat, shout 1 is lbs. A tinaja of oll contains 16 gantos; of wine, 17 gantos.

Tho rate of insurance to the United States from Manilla is charged 3 to $3 \frac{1}{2}$ per cent. ; but littic is thone, howevor, there lieing but one local insurance office with a trifling capitai, the policiea issucd by which contain so many exceptions as to make them of very little value. The shipments of produco to the United States are cosered ly Insurance made in the United States or in England. Frelghts vary constantly, being governed by the supply of tonnage and quantity of produce walting shipment. At present, 200 per ton of 40 cubic feet of henp and other measurement goods, and 余\} 2 or क्षे3 per ton of 22.10 pounds of aingar, are current. These are comsidered full rates. Commission to charged $2 \frac{1}{2}$ per cent. on all purchases for the United States. When s broker is employed he is paid a trokerage commission of $6 \frac{1}{2}$ cents per pienl on bemp, $6 \frac{1}{2}$ per picul on sugar, $3 \$$ centa per pieul on rice, and on other articles as may - agreed upon. All articles of produce are tought for cash, and paid for on delivery. Oftentlmes paymest is made in part before delivery, and in the hemp trade the advances made are very large. The rate of exehange bet ween thls and the United States Is net quoted, there being no transactions in the regular course of trude. All exchango tranactions per American acceunt (and the greater portion of the exports to the United States is paid for in bills) are made through lingland, tills being drawn here on Lonton bankers, by virtus of credlts granted thy the lankers themselves in l.ondon, or by their egents in the United States. The average rate of exchange during the past ycar has been, for billa on London, drawn at six months' sight, bs. $02 d$. per dolliar. The par of exchange is abiont $4 x .2 d$., the same as in the United States; the currency In silver teing ahout equivalent that of one commery with the other. The flollar current here, being of the Mexican und South American currency, is werth one hundred cents in the United Statea.

Duties on exports are, en hemp, 2 per cent.; on tortoise shell, mother-of-peari shell, and ratans, 1 per cent. (these three articles last named are, in fact, not productions of this island, but brought from the Soeloo Ialands, and pay 1 per cent. import dut.y); all other artleles, 3 per cent. On all Imports direct from the United States, 14 per cent. There are no internal taxes of any kind on produce. The rates of wages in agricultural pursuita are very low, generally paid in produce sufficing for the aubsiatence of the laborer, and diffeult
to be r 50 cent or evea 25 ceat bay th Iatior I: L'nited done b: hly wit Si'als. riew, v The ment, gar, sa hidee, tortois rics, ai elry, The! Sut Lof

The average price of hemp at Manills is from $\boldsymbol{e n}_{7}$ to 8706$\}$ per picul, though $\ln 185 t-55$ it ascended as high as $\$ 10$, owing to the Eastern war. The average price of sugar is $\$ 3 \quad 37 \frac{1}{2}$.

The preceding table shows that the quantity of hemp exported from Manilia to the United States In 1853 suounted to 201,584 piculs $=27,277,866$ pounds; and the quantity of sugar to 194,195 piculs $=25,802,667$ pounds. The following condensed summary exhibits the total export trade from Manilia to the United States during the same year: Hamp, 201,584 piculs; sugar, 104,195 piculs; jndigo, 9050 quintals; sapan-wood, 8002 piculs; coffee. 1724 piculs; mother-of-pearl shell, 712 pieuis; hidn cuttings, 3201 pieula; ratans, $\mathbf{7 6 3}$ piculs; hides, 4,886 piculs, grass-cloth, 19,598 piculs; gam slmaciga, 2556 piculs; tortoise-shell, 214 catties; cigara, 148 thousand. The merchandise above specified was floated in 41 vessels; of which 21 cleared for New York, 17 for Boston, 2 for Salem, and 1 for Philsdelphia. The preceding summary exhibits the general character of the imports into the United States from the Philippine Islanda. In the official reports published at Manilia the trade with San Francisco is given separately from that with the United States. During the year under review (1853), the exports to Caiifornia consisted of: Sugar, 3976 piculs; coftee, 7546 piculs; rice, 16,876 piculs; cordage, 2285 piculs; cigars, 812 thousand; paddy, 2949 cavanas; panocha, 1818 baskata; Indian corn, 8922 lbs. ; garlic, 46 piculs; lime, 78 cavanas; hats, 1200 . The total exports from Manilia to ali countries in 1853 were: Sugar, 566,371 picuis; hemp, 222,089 piculs; sapan-wood, 81,963 pictuls; rice, 303,902 pieuls; cordage, 12,119 piculs; coffee, 18,080 piculs ; cigars, 79,311 thousand; indigo, 9123 quintais; mother-of-pearl, 2040 piculs; hides, 5874 piculs; hide cuttings, 8697 piculs. In cotton goods (the principal import of the Philippine Islands) England and the United States are the chief competitors.

Formerly, if the master of a reasel tonching at these islands deaired to ship native sailors, he was obliged to give his bond for their return to Manilis This, it is
obvious, was but a mero matter of form, and hence but few of the saliors thus taken eway ever returned. After the aliscovery of gold in Caiifornia, it was found extremeiy difficuit to procure sailors at any of the Malayian islands; and this difficulty was increased by a new regulation at the Philippines, which requires the consignee to sign the captain's bond for the return of such sailors as should be shipped at Manilia This the consignees are, in most cases, unwiling to do. Ilence the :xide between the United States and the Philippines remains so long stationary. For a number of years the United States has enjoyed about one fifth of the entire trade of the islands. Were this difficulty in regard to the employment of native sailors removed, this one fifth of the trade would in a short time ascend to one half.

In ship-building at Manilia, the timber used ls all the growth of the country. The timbers and knees are of "molare;" planking above water is of " manyachapuy," and below of " banaba" in the northern provinces, and "bntitinan" in the south; dock beams, molare, or "dougon;" keel of dougon, and waterways of the same. Ali these woods are very excellent, and, if well sensoned before using, are very durable. The molare is a hard, close-grained, strong wood, but is very heavy; dougon is next in value, and the mangachapuy ranke third. There are many other kinds of wood which are used, according to the caprice of bulders. The cost where grown is trlffing, but if brought to Manilla the addition of freight makes it expensive. The preservation or seasoning of ship-timber is not attended to here; and there are no depositories of ahtip-timber, properiy speaking, though it may always be had in sufficient quantities for repairs to vesseia frequenting the ialands.

Port-charges.--Vessels arriving in ballast, and not breaking bulk, pay $12 \frac{1}{2}$ cents per ton (register tonnage). If cargo ls landed or stripped, 25 cents per ton. Mudmachine, $6 t$ cents per ton; light-house dues, of cente per ton. Spanish vessels pay only one half of the above rates.-United States Commercial Relations.

Coymaber of tif Leitid Statea with Manilla and Pimlippige Ialanda, frox Ootober 1, 1820, to Jelt 1, 1856.

- Nino months to June 30, and fiscal year begins July $1,1 \times 43$.

Phosphorus, a кubatance of a light amber color, and semi-transparent; but, when carefully prepared, nearly colorlesa and transparent. When kept aome time, it becomes opaque externally, and has then a great reaemblance to white wax. It may be cut with a knife, or twisted to pieces with the fingers. It is insoluble in water; lts specific gravity is 1.77 . When exposed to the atmosphere, it emits a white smoke, and Is luminous in the dark. When heated to $148^{\circ}$ it takes fire, and burns with a very bright flame. When phosphorus is inflamed in oxygen, the light and heat are incomparably more intense-the former dazzling the eye, and the latter crucking the glass vessol.-Tномsos's Chemistry.
Piano-forte. Invented by J. C Schroeder, of Dresden, in 1717. He presented a model of his invention to the court of Saxony; and some time after, G. Silverman, a musical-Instrument maker, bega.. to manufacture pianofortes with considerable suceess The invention has also been ascribed to an instrumentmaker of Florence. The squaro piano-forte was first made by Freiderica, an organ-huilder of Saxony, about 1758. Piano-fartes wero made in London by M. Zumpio, a German, 1766, and have been since greatly Improved by others here. They are now extensively manufactured In Boston, Now York, Philalelphia, Ihaitimore, Albany, Buffalo, Cincinnati, thicago, and St. Louia, and other cities of the United States.-F'Fr "OrIgin of the Piane-forte" seo Weatminater Rerive, $x \times x i l$. 306

Plastres, or Dcllars, Spanish and American silver colns in very extensivo circulation. They are uned In Spuin, Italy, Turkey, South Ainerlea, the East Indies, etc., varying in value in every country,-See Corss.
Pickles are varlous kInds of vegetables and fruits preserved in vinegar The sulstances are firat well cleaned with water, then steeped for some time in brine,
and afterward transferred to bottles, which are filled up with good vinegar. Certain frulta, like walnt , require to be pickled with sealding-hot vinegnr; others, as red-cablage, with cold vinegar; but onlons, to preserve their whiteness, with distllled vinegar. Wood vinegar is never used ly the princlpal pickle-manofacturers, but the lest malt or white-whe vinegar, No. 22 or 24 . Kitchener says that, by parhoiling the pickles in brine, they will be ready in half the time of what they require when done cold. Cabbage, however, cauliflowers, nand such articles, would thereby becone flaliby, and lose that crispness which many people relish. When removed from the brine, they should be cooled, drained, and even dried, before beits put into the vinegar. To assiat the preservation of pirkles, a portion of salt ls also addal, and likewise, to give Havor, various spices, anch as long gepper, black pepper, white pepper, allspice, ginger, cloves, mace, garlle, mustard, horseradish, shallots, capsicun. When the spices are bruised they are most eflicaclous, but they are apt to render the pickle turtid and disedlored. The flavoring ingredients of Indian plekle are Curry powder milxed with a large proportion of mustarid and garlic Green peaches are sald to make the best imtation of the Indian mango.
Pilchards, fishtes closely resembling the common herring, but amaller, and at tho same time thicker and rounder. They are rarely found on the Ilritish shores, except on the consts of Cornwall and Devon, particularly the former, where they are taken in great numbers from the midd!e of July to the end of Novemiter, or even the middlie of December. It is a snying of the Cornlah fishermen, that the pllchard is the least fish in size, moat in number, and greateat for galn, taken from the sea.
Pilchard Fishery.-Thls is carried on along the British couats of Comwall and Devon, from tho Bolt IIead in the latter, round by the Land'a End to I'adatow sad

Bossiney in the former. Its principal seata are St. Ives, Mount's Bay, and Mevagiseey. The fish usually make their appearance $\ln$ vast shoals in the early pnrt of July, and disappear about the middle of October; but they aometlmes reappear In large quantlties in November and December. They are taken either by seines or by drift-nets, but princlpally, perhaps, by the former. A selne is a net, varying from 200 to 300 fathoms in length, and from 10 to $14 \frac{1}{2}$ feet in depth, having cork buoys on one edge and lead welghts on the other. Three boats are attached to each aelne, viz., a boat (seine-boat) of about 15 tons burden, for carrying the seine; another (fullower) of ahout the samo size, to assist in mooring it; and a smaller boat (lurker) for general purposes. The number of hands empioyed in these three boats varies from about 18 to 18, but may be taken at an average at about 16. When the shoals of fish ceme so near the shore that the water is about the depth of the scine, it is employed to encircle them; the fishermen belng directed to the preper place for casting or shooting the nets by peraons (huers) stationed for that purpose on the cliffs and in the boate. The practice is to row the bost with the seine on board gently round the shoal; and the selne being, at the snme time, thrown gradually into the water, assumes, by means of its buoys and weights, a vertical position, its loaded edgo being at the bottom, and the other floating on the surface. Its two ends are then fastened together, nnsl, being brought into a convenient situation, it is inoored by small anchors or grapnels; sennetimes, however, one or two smaller seines are cmployed to assist in securing the fish. At low water the inclosed fish are taken out by a tuch-net, and carried to the shorc. A slingle seine has been known to inclose at once as many as 4200 hogsheads ( 1200 tons) of fish! But this was the greatest quantity ever taken, and it is but seldoin that as many as 1200 hogsheads are caught at a tine. The "take," in fact, depends on so many sceidental circumstances, that while one seine may catch and cure in a eeasen from 1000 to 2000 loggsheads, others in the neighborhood may not get a single fish. In some places tho tides are so strong as to break the seines and set the fish at liberty. When the quantity inclosed is large, it $\mathbf{r}$-uires several days to take them out, as they must no. be removed in greator numbers than those who salt them can conveniently manage. Drift-ncts are usually about half a mile in length, ly about $4 \frac{1}{2}$ fathoms in depth; they nre shot in the epen sea, and entangle the fish in their meshes in the same way as the herring-nets. The fish thus taken are snit to be superior to those taken by the seine, though it be doubtful, from thelr being strangled in the nets, whether they are so good for curing. As soon ss the fish are breught on sloore, they are carried to cellars or warchouses, where they are piled In large heaps, having a sufficlent quantity of salt interspersed between inc 1 -ers. Having remained in this atate fer about 35 days, they aro, after bu ing carcfully washed nud eleaned, packed in hogshends, each contalalng, nt nu average, about 2600 fish; they are then subjected to a pressure sufficient to extract the oli, of which ench hogsheal yields, provided the fish be caught in mummer, about three gallons; but those that nre taken late In the season do not yield abovo half this quantity. This oil usually sells for from 12 to 15 per cent. inder the price of brow: seal eil. The broken and refuse ilsh and salt aro sold to the farmers, nud are used as nanure with excellent effect. The skimmings which Hoat on the water in whlch the pilcharde nre washed sre called dregs, and aro chlefly sold as greaso for inachinuery. The fresh fish in a hogshend of pilchards welgh nbout 6 owt., and the salt about $3 \frac{1}{2}$ ewt. ; but the weight of the hogshead when oured and pressed is reduced to about $4 \frac{1}{c}$ cwt.; includling the weight of the cask, from 20 to 24 lbs. Four-lifhs of the pereons employed on shore in the salting, euring, packing, otc., of the lish are women.-Dr. J'Anis's Guide to Mount's Bay.

Pilots and Pilotage. The name of pilot or atcersman ls applled either to a particular officer, serving on board a ship during the course of a voyage, and having charge of the helm and the ship's route; or to a person taken on board at any particular place, for the purpose of conducting a ship through a river, road, or channel, or from or inte a port. Masters and mates of merchant vessels, after having passed an examination before legally constituted authorities, and possesslug a certificato to that effect, may pilot their own vesscla within the prescribed llmits for whlch they havo passed, without being liable to any penalty. In all other cases, when a master is by law subject to a penalty for not taking a pilot, he is bound to do ao when ho has the opportunlty; and after the pilot is taken on hoard, the master has no longer any command of the ship, ner is he reeponsible for the management of her while she continucs In the distrlet for which the pilot is autherized to act. When beyond that district, the master again resumes the government of the vessel, the pilot being then no longer linile, although for his own convenience he may still remain on board. In such case he is ouly to be considered as a passenger, and is not entitled to any remuncration for whatever service ho may choose to perform on the voyage, beyond that for which he wns originally engaged; but should he remain on board nt the request of ths master, he is entitled, besides his pilotage, to a further remuncration per day or por month, according te the rules of the respective ports, from the dny when he has passed the limits of his license to the day of his return to the port from whicl he was taken on board. If a master of a vessel in any district within which pilots are appointed to act (usually denominated "Pilots' Water") should, except under the circumstanees before stated, refuse the service of a pilot uffering to come on Loard, he immediately renders hilmself liable to his owners, freightars, or insurers for any damage that mny occur to the vessel or cargo, arising from the want of such service. When the law does not cempel a mnster to take a pilot on board, nad he nevertheless, of his own discretion, chooses to de so, the pilot is considered to be the servant of the owners, who under such circumstances would be responsible to strangers for the management of the ship during the tlme he continued in charge. If the inaster at a forcign port attempt to obtain a pilot and fail, and then, in the excrelse of his best discretion, endeaver to enter the port and fail, the insurer ts not discharged. If the vessel approach a port in the night, he must make signsls for a pilot, and wait a reasonable tlime for one; and if he nttempt to enter the port without one, except in case of extreme necessity, the insurers are discharged. Pilotage constitutes a llen upen the vessel, and may be prosecuted in admiralty. But the pilot must be employed by some person rightfully in possession of the vessel. $\dot{A}$ pilot can not recover for plloting into an encmy's pert.

Grint Britain.-Under most charter partles, with the oxception of those made for vessels in the ceal trade in England, the charge for pilotage is paid by the charterers. Many ports enjoy sepnrate and distinct jurisdictiens for the nppointment and government of pilots, and the regulations of the rates of pilotage. These jurisdlctions are exercised by cerporations and other bodics, the privileges of which have been granted either by anclent charters or by prrlinmentary. Among the minny corporations so established, the most important are those of the Trinity IIouse of Deptford Strand, whose jurisdiction is the most extensive; and of the Trinity Houses of IIull and Newcastle. The bodies nre authorized within their disiricts to determine the qualifications of pilots, license them, mnke regulations for thelr government, fix nnd alter pilotage rates, and arrange the limite of the pilotage illstricte, suth' 'ct, however, to the special provislons contnined in the Merchants' Shippling Aet of 185t. The regulations of which are given in summary, as follows:

It is questionable whether the Trinity House may rovoke a pilot's license without besring him; but if, after hearing him, it revoko his license, Its decision ia biading. 'The application of the Merchants' Slipping Act of $185 \pm$ applies oaly to the United Kingdom.
Powers of Pillutage Authorities.-Every pllotage anthority shall retain all powers and jurisdiction which it now possesses, ao far, and only so far, an they are consistent with the provision of the geveral act. Every pilotage authority has the power to exempt ships from being compelled to employ pllots; also to license pilota; to inake regulatlone as to pilot-boats; to make regulations for the government of pilota; to alter rates of pilotage; to limilt pilotage districts-all belag within their district.
R'ower of Appeal to Board of Trade,-If the greater number of qualitied pilots belonging to any port, or the local marine board, or any number of owners of ahips, mastors or insurere, consider themselves aggrieved by any regulations euforeed by the pilotage uuthority, they may appeal to the Board of Trade; and tho consequent decision shall be deemed conclusive.

Spain.- No ono can be a pilut or officer of a merchant ship without baving obtained a license. In case of docouse, absence, or illnesa of the captain, the pilot takes his place, and lncurs all hise reaponsilility. The pilot can not change the course, unleas the captain agrees to it. In case of difference of opinion, the pilot shall explain bis reasons to the other officers; and if the captain persisto in his orders, tho pilot shall onter his protest in the navigation trook.
Hussia.-The pilot should look after the vessol, tho embarkation and dobarkation of merchandise, keep a registry of all that passes on hoard and of tho ouservatlons. He owee obedience only to the captain, and should nover quit the vessel when the captain is absent uuless forced to do so.
Portugal.-The pilot who from ignorance, negligence, or design, lesce, or exposes a vessel to damage, is bound to repair her, and is llablo to be rovoked and pursucd by criminal process.

United States,-An act of Congress authorizen all Statee to make their own pilotage laws, and questions under these laws are cognizable in the State courts. No ono can act as pilot, and ciaim the compeneation allowed by law for the service, unless duly ajpointed. And ho should always have with him his commission, which usually deaignates the largest veasel ho may pilot, or that which draws the most water. If a pilot offers himself to a ship that has no pilot, and is cntering or leaving a harbor, and has not reached certain geogrs. cal limits, the shlip muat pay hint pilotage feee, whether hle services arc acceptel or not. As aoon as tho pilot stands on deek be has command of the ship. But it remains the master's daty and power, in case of obvious and certain disability, or dangerous ignorance or error, to disobey the pilot, and diapossess him of his authority. If a ship neglect to take a pilot when it should and can do so, the owners witl be answeraile in dainages to shippers and others for any loss whicit may be caused by auch negleet or refusal. Pilots aro answerabie for any damare reaulting from their own negligenes or default, and have been lield ot-cetly to this liability. The owner is simo liable on general prinelples for tho defandt of the pilot, who is his servant.
The lawa passed by tho United States concerning pllats are comprehended in tho following: August 7, : $: 89-$ "That ail pilots in tho bays, Inleta, rivera, harbora, and ports of the United States ahail contlnue to be reguiated in conformity with the existlng lawa of the Statea reapectively wherein auch pilote may be, or with such laws as the Statea may reapectiveiy hareafter enact for the purpose, until further provision ahall be made by Congress." March 2, 1837-" That it shall be lawful for the mater or commander of any yeasel coming lnto or going out of any port sltuated upon
waters which are the boundary between two States, to employ any pilot duly licensed or authorized by the lawa of either of the States bounded ou the sald waters, to pliot sald vossels to or from sald port; any law, usage, or custom to the contrary notwithatanding."
Maine- - Pilots are appointed by the Governor and Conncil upon the recommendation of a majority of the ship-owners and masters in the port for which they are appointed. Bonds are required to tho amonnt of $\$ 5000$ for the falthful discharge of the duties, and the pilots are liable for damages from neglect or unakillfulnesa. Any master may pilot his own vessel.

New Hampshire:-The appointment of pilots is the same as in Maine. Pilote must tako charge of vessela drawing over nine feet, except coasting veseels. Bonds for $\$ 1000$ are required for a faithful performance of duties. Masters may pilot their vessels when outwerd bound, and pay no pliotage. Bat vessels inward bound nust pay half pilotage if they refuse a pilot, unless the versel be within the lighthouse before a pilot offers, in which ease no pilotage is due unlese a pilot is employed. The Governor and Council regulate the fees for pilotage, and euspend or removo pilots for misconduct.

Massachusetts.-The Governor appointe pilots, except for the ports of Boston, where two commissioners, and New Bedford, where five commiseioners, have the appointing power. The pllote give bonds for $\$ 2000$ for the faithful performance of their duties. All ves sels, except fishing-vessels and consting veseels of less than two hundred tona, and vessela trading within the State lismite, are bound to employ pliots or pay fuli pilotage, unless no pilots offer lefore veasels have arnivel withln the following limita : viz., within the chops of the harbore of Salem, Marblehead, or Gloucester; within the garnet of Plymouth harbor, or within the bar of any barrel harbor, or withiu the entrance of Boston harbor, being a line drawn from Hariing Rocks to the Outer Graves, and thence to Nahant Head. In such caee tho master may refuee pilot.

Neo York,-In this State, Sandy Hook pilots are appointed and regulated by the Pilot Commiseioners, who are chosen by the Underwriters and Chumber of Commerce. Ileli Gate pilots are appointed by the Governor, and ouhject to the reguiations of the Port Wardena.

The ratos of pilotage in and out of New York are sa follows: For vessels drawing

New Jersey.-Sandy Hook pilots for tho ports of Jorsey City, Nowark, and Perth Amboy are appointed liy commlasioners. The regulations do not differ materially from those emacted in regard to the New York piints.

Pennsylvania.-Pilots for Philadelphis are appointed by a lloard of Werdens. There are threa classes of pilots: the tirst for veasels of any description; the second for vessela drawing lese than twelve feet; the third for vessels drawing less than nine feet. Unilicensed pilots are aubject to fino and imprisonment. New Jorsey and Delaware pilota have power to act without a special licenec. The firat quallied pilot that offers is entitled to take charge of the vissel. A second or thlrd grade pilot may aet unleas a superior pilot offors hofore the vesael passes lieedy lsland. Coasting veasela pay no haif pilotage.

Delaware.-Vessele of 75 tone and upward, unless owned in Deluware, muat take a pllot or pay half pilotage.

Maryland,-Pilote for the Cheapeake Bay sro appointed by a Pilvt Iloard. I'llota are divided into the oame classes as in Pennayivanla. Pilots muat take the nearest veseel to ahore, or $\ln$ the mont distress. Foreign vessela must take a pilot, if one offers, or pay full pilotage.

States, to d loy tha sald waany lsw, ding." ernor and liy of the I they are $t$ of $\$ 5000$ tie pilots illfulness. of verseis 5. Virginia.-Pilots are appointed by a Board. "Pllots are livided into three elasses, es in Ponnsylvanla. Vesesels other then ooasters muat take a pilot or pay full pilotage.
North Carolina.--Pilots are appointed by commissloners for each port. Vessels pay full pilotage when refusing a pllot.

South Carolina_-Pilots are appolnted by commissioners. Pilots who bring vessels into port are entltled to carry them out. Vessels pay full pilotage to the first pilot offering, whether bls services are accepted or not.

Alabama.-milots are llcensed by the harbor-master and port wardens. Vessels pay half pilotage, if pilot is not accepted.

Louintiana.-The barbor-master and port warden of New Orleans appoint pilots. There are no river pilots. Vessels pay half pilotago to the pllot if hils servioes are not accepted. If the Ballze, or regular pilots, carry the vessal to New Orleans, the compensation is a matter of agreement.

Florida.-Pilots are appointed by Pilot Commis. sioners. Vessels pay half pilotage, refasing a pllot, If outward bound, and full pilotage whon Ir:zard bound. -Sec Kent'a Cummentoriea, vol. iii. ; Pahsons's Mercantile Lavo; Mercantile and Maritime Guide; Blunt's Shipmaster's Assistant.

Pimento, Allspioe, or Jamaioa Pepper (Fr. Poivre de Janaique; Ger. Nelkenpfeffer; It. Pinenti), the frult of the Mfyrtus pinenta, a beautiful tree which grows in great plenty on the hills on the north side of Jamaica. The berries are spherical, and, when ripe, of a blaek or dark purple color. But, as the pulp is in this state moist and glutlnous, the berries are plueked when green; and being exposed in the aun to dry, they lose their green color, and become of a reddish brown. Thay are packed In bags and hogsheads for the European market. The more fragrent and emaller they are, the better are they accounted. Thay bave an aronstic, agreeable odor, resembling that of a mlxturo of cinnamon, cloves, and nutmegs, with the warm, pungent taste of the clove. Pimento ls used in modicine, bat its principal use is in the seasoning of soups and other dishes. "The returns," says Mr. Bryan Edwards, "from a pimento walk In a favorable season are prodigious. A single tree has heen known to yield 150 pounds of the raw fruit, or 100 pounds of the dried spice, there being commonly a loes in weight of onethird in curing; but this, like many other of the minor productions, is exccedingly uncertaln, and perhaps a very plenteous crop occurs but once in five years. The price in the market, as may be aupposed, fluctuates nccordingly; but tta average for some years past may be set down at 14 cents per pound."-Vol. ii. p. 872, ed. 1819.

Pin, in Commerce, a Hitle necessary instrument, made of brass wire, chlefly used by wotnen In adjusting their dress. When the wire in received in tho manufactory, it is wound off from one wheel to another, and passed through a clrole of a amaller disinoter in a piece of iron. Being thus reduced to its proper slze, it is astraightened by drawing it between iron plins fixed in a bourd in a rigeng mannor. It is afterward cut inte lengths of about four yards, and then into smaller pleces, every length beling suffloient for aix pins. Fach end of theve is ground to a point by boys, each of whom sita with two small grindstones before him,
turned by a wheel. Taklog np a handful, he applies the wires to the coarsest of the two stenes, moving' them round, that the points may not become fat. $\cdot$ He then givea them a smoother and a sharper polut on the other stone.- A lad of twelve years of age can point 16,000 in an hour. When the wire la pointed a pin is taken off from esch end, till it in cut into slx pieces. The head ie made solid by the present process; but by the old methed it is a separate piece, and is miade as follows: One plece of wire is with rapldity drawn round another, and the interior one being drawn out, leaves a hollow tube botween the clrcumvolutions. It ls then cut iy shears, every two turns of the wire formlag one head. These are softened by throwing them into iron pana, and placing them in a furnace till thay are red hot. As eoon as they are cold they are distributed to children, who sit with anvlls and hammers bofore them. These they work with their feet, by means of a lathe. They take up one of the lengths, and thrust the blunt end into a quantity of heads which lie before tham; then catchlng one at the extremity, they apply it lmmedlately to the anvil' and bammer, and by a motlon or two of the foot the point and head are fixed together, in much less time than can be deacribed, and with a dexterity that can only be acquirod by practlee. The pina are thrown into a copper, contsining a solution of tin and wine lees. Here they remain for some tlme, and when taken out their brass color has becomo changed to a dull white. In order to give them a polish, thoy are now put into a tub containing a quantity of bran, which is set in motion by turning a shaft that runs through its centre; and thus, by means of friction, the pina become eatirely bright. They are now separated from the bran, which is performed by a mode exactly similar to the winnowing of corn ; the bran flying off, and leaving the pla bebind it fit for sale.-E. A.
The manufacture of plas thas commenced in the United States between 1812 and 1820. Among tho irst eatablished were those at Bellevue and Greenwich, New York. Mr. Lemuel William Wright, of Massachusetta, obtalned patents in the United States and in England, and commenced the manufacture at Lambeth, London. John J. Howe obtained patents In 1882-1834, in the UnIted States and In England, and established the Howe Manufacturing Company in New York, which was afterward renoved to Birmingham, Connecticut. Mr. Semuel Slocum obtaiaed another pitent, and in 1838 eatabllshed a manufactory of pins at Poughkeepsie, New York. The "American Pin Company" has been established for some years at Waterbury, Connecticut, and is the leading manufactory of the kind In the United States. The Improvements proluced In the United States have been for several years adopted in England and other parts of Europe. -Seo American Journal of Science, xxxvlii. 209; Il unt's Merchants' Magazine, xxv. 641; Economy of Manufactures, by Babnaoe.

Pinchbeok (Ger. Tomback; Du. Tombak; Fr. Tam. bne, Similor; It. Tombaceo; Sp. Tambac, Tumbaya), n name given to one of the maisy initatlons of gold. Hy melting zlnc In various proportlons with copper or brass, some alloys result, the colers of which approach more or lens to that of gold. This composition is frequently employed as a sulistltuto for gold, In the formation of watch-cuses, and rarious other artleles of a like doseription. Pluchiock is sometimes calied Tambao, and sometimes Similor, and Petit-or.

Pine, or Pir, a apecies of forest tree, next, if not superior, to the oak, in point of atility and value. There are above twenty species of pine. They do not bear flat leaves, but a species of spinee, which, however, are real leavea. They are moatly, though not all, avergreens; but the appearance of the tree, as well sa the quality of the timber, varies with the species, and also with the eituation in which it growe. Generally speaking, the timber is hardest and beat in exposed cold aituations, and where its growth is slow.

Scotch pine (Pinus alvestris) is a native of the Scotch mountains, and of moat northern parts of Europe; beIng common in Russia, Denmark, Sweden, Norway, and Lapiand. It is atraight, abruptly branched, rising in favorable uituations to the height of eighty or ninety feet, and being from three to four feat in diameter. It is at perfection when aeventy or eighty yeara old. The color of the wood differs considerably; it is generally of a reddish yellow, or of a honey yellow, of various degrees of brightness. It has no larger transverse septa, and It has a strong resinous odor and taste. In the best timber tho annual rings aro thin, not exceeding $\frac{1}{10}$ th of an lnch in thickneas; the dark parta of the rings of a bright reddish color; the wood hard and dry to the fecl, neither leaving a woolly burface after the aaw, nor filling lts teeth with reain. The beat Norway is the finest of this kind, and the best Riga and Memel are not much inferior. The inferior sorts have thick annual rings in aomo the dark parts of the ring are of a honey yellow, the wood heavy, and filled with a soft resinous matter, feels clammy, and chokes tho saw. Timber of this kind is not durable, nor fit for bearing strains. In some inferior species the wood ia spongy, containa less resinous matter, and presents a woolly surface after the saw. Swedieh timber is often of this kind. Scotch fir is the most durable of the pino species. It was the opinion of the celebrated Mr. Brindley, "that red Riga deal, or plne wood, would endure as long as oak in all situations." Its lightnesa and atiffnesa render it auperior to any other material for beama, glrders, joists, rafters, ete. I't is much uged in joiners' work, as it la moro easily wrought, stands better, is mach cheaper, and is nearly, it not quite, as durablo as oak. Scotch fir is exported from Norway and Sweden, under the name of red-rood. Norway exports no trees above eighteen inches diameter, consequently there is much sap-wood; but tho heart-wood is both stronger and more durable than that of larger trees from other aituations. Riga exports a considerable quantity under the name of masts and spars: pieces froms elghteen to twenty-five inches dlameter are called masts, and are uaually seventy or eighty fect in length; those of less than oighteen lisches diameter are called ppars. Vellow deals and planks are imported from varions parts of Norway, Sweclen, Prussia, Runsia, etc. Tar, pitch, and turpentine are obtained from the Scoteh fir.-See these titles. When tho tree hns attained to a proper age It is not injured by the extraction of these products.

Spruce Pine.-Of this there are three apecies-the Norway spruce, or $P$ inus abies; white spruce, or I'inus alla; ind blaek spruce, or Pinue nigra. These are noWe trees, rising in straight stems from 150 to 200 feet In height. They yield the thmber known by the name of whife fir, or deal, from ita always being imported in sleals or planks. Deals iniported from Christiana are In the lighest estimation. - See Curistiana. The trees aro ueually cut into threo lengths, generally of abont twelve feet each, and are afterward elit into deals by aaw-mills, each length ylelding three deala. The Norway opruce thrives very well in Britain, and produces tlmber little inferior to tho foreign ; it is somewhat softer, and the knots are extremely hard. The white sprnce, or Pinus alba, is brought from British Nortls America. The wood is not so reninous as the Norway npruce; it is tougher, Ilghter, and more liable to twist in drying. The black spruce, or linus
nigra, is also an American tree ; bat it is not much imported into England. The black and white apruce derive their namea from the color of the bark, the wood of both being of the aame color. The color of apruce fir, or white deal, is yellowiah or brownish white; the hurd part of the annual ring a darker shade of the aame color. It often has a sllky Justre, especially in the American and British grown kinds. Each annual ring consists of two parta; the one hard, the other softer. The knots are generally very hard. The clear and etraight-grained kjads are often tough, but not very difficult to work, and stand extremely well when properly seasoned. White deal, as Imported, ohrinks about toth part in becoming quite dry.

Weymouth Pine, or White Pine (Pinue strobus), is a nativo of North America. It is one of the largeat and most useful of the American trees, and makes excellent masta; but it is not durable, nor fit for large timliers, being very subject to dry-rot. It has a peculiar odor,

The commercial value of pine la greater than that of any other wood, and it forms a large proportion of the lumber trade. The Northeastern States are supplled principally hy Maine. The Middle States olitsin their supplles from Michigan, New York, and Western Pennsylvania; the Northwestern States from Wes ern Pennsylvania, Virginia, and Wiaconsin.-See Dumaka Trade.

Larch (Iinus larix). There are three species of thls valuable tree-oue European, and two American. The variety from the Italian Alpe is the most esteemed, and lasa lately been extensively introduced into plantations in Great Britain. It is a straight and lofty tred, of rapid growth. A tree aoventy-nine years of age was cut down at Blair Athol in 1817, which contained 252 cubic feet of timber; and one of eighty years of age, nt Dunkeld, measured 300 cuble feet. The mean size of the trunk of the larch may be taken at 45 feet in length, and 83 incles diameter. The wood of the European larch la generally of a honey yellow color, the hard part of the annual rings of a redder cast ; sometimea it is brownish white. In common with the other specles of pine, each annal ring consista of a hard and a soft part. It generally has a silky Justre; its color is browner than that of the Scoteh pine, and it is much tougher. It is more difficult to work than liga or Memel timber, but the surfaco ia better when onca it is obtained. It bears driving bolte arid naile better than any other apecies of resinous wood. When perfectly dry it atands well, but it warpa much in seasoning. It is in all situationa extremely durable. It is uscful for every purpose of building, whether external or internal; it makes excellent ahip timber, masts, losts, pos, a rails, antl furniture. It is peculiarly adapted for flooring bosrds, in aituatlons where there is much wear, and for stair-enses; in thu latter, fits fint color, when rubled with oil, ia much preferabla to that of the black oalea stair-cases to bo seen in aomo old mansions. It is well adapted for cloors, shutters, and the like; sud, from the beautiful color of its wood when varnighed, painting is not neccssary:-(Wo have abstracted these jarticulars from Mr. Tuengoin's excellent work, The Irinciples of Carpentry, p. 209-217.)

Pine-apple, or Ananas, though a tropical fruit, is now extensively cultivated in hot-houses and gardens, and is well known to every one. When of a gooid sort and healthy, it is the most luseious, and periaps the bent fruit that is produced; and, when carefully cultivated, ia superior, in point of quality, to that produced in the West Indice.

Pink, a ressel masted and rigged like other shipa, only that this is bullt with a round atern, the bends and ribe compasming so that her ribs bulge out very much. This renders the plaks difficult to be bonrded, and also enaliles them to carry great burdens, for which purpose they are often used.

chisfly employed to obtain intelligence, and to land mien, etc. One of the boats of a man-of-war, used to earry the officera to and from the shore, is also called the pinnace.

Pint, a measure used chlefly in the measuring of liquida. The word is High Dutch, aad signifies a little measure of wine. The Englioh plnt used to be of twe sorts: the one for wine, the other for beer and ale. Two pints make a quart ; two quarts a pottle ; two pottles a gallea, etc. The pint, imperial llquid measure, contains $34 \cdot 659$ cuble inches.
Pipe, a wine measure, usually containing 105 (very nearly) imperial, or 126 wine gallons. Two plpes, or 210 imperial gallons, make a tun. But, in practice, the size of the pipe varles according to the deacription of wine it contain. This a pipe of port contains 188 wiae gullons ; of aherry, 130 ; of Lisbon and Buccllas, 140 ; of Madeira, 110 ; and of Vidonia, 120. The plipe of pert, It is to be observed, is seldom accurately 138 gallens, and it ia usual to charge what the veesel actually containg.

Pipe-ciay, a species of clay ahounding in Devonshire, and other parts of England, employed in the manufacture of varlous sorts of earthen-ware, and in bleaching.

Pipes, Amber (In Turkey). Prussia is almost the only country by which amber is furnished for ornamsutel purposes. M. Von Roy, an amber merchsnt, of Dantzig, ia sald to have been twenty-five years collecting the splendid specinuens whish he now possesses. The most extensive use of this elegant material is for the manufacture of the mouth-pieces of meerschaum pipes and hookahs. Up to the present day amber mouth-pleces continue in great request in the East, where they fetch very high prices; and almost all the Prussian ainber is sold to the Turks for menufacturing. There were in the Turkish department of the Exhibltien four amber mouth-pleces for pipes, which ware collectively worth $£ 1000$. It may scrve in some measure to explain the peculiar favor which anber is held in by the Turks, that there is a current belief that amber is Incapnale of trananitting Infection; it is deemed a mark of politeness to hand ant amber pipe to a stranger.

Meerschaums.-The cley of which these are insde is procured chiefly in Asia Minor, but also in Spain, Greece, end Moravia. The manufacture of pipes from the clay is carried on with especial care at Vienna and Pesth. The meerschaun is soaked in a liquefied compesition of wax, oil, and fat, the absorption of which eccasious the colors asaumed by the plpe after smoking. Occasionally the bowls are artlficially stalned by dipping them in a solution of copperas and other substances before the appllication of the wax composition. The carving of the bowls is often difficult work, owing to the occurrence of a kind of clay inixed up with and harder than the meerschunm. The large quantity of parings left In roughing out the bowls would entail considerable loss, unless some process had been devised fer using them. This has been done; the parings are employed in making the kind of meerschamm bowls called masa-bowls. The parings are ground to $n$ flue powder, boiled in water, and moulded Into blocks, with or withont the addition of clay. The blocks are allowed to dry, and then a pipe-bowl is fashioned from each. These bowls are distinguished from the real meerschaum chiefly by being rather heavier. Meerschaum bowts have been produced so large and so elaborately earved us to be velued at five hundred dollara ench.
Piracy censists in committing those aets of robbery and violence upon the seas that, if committed upon land, would amount to a felony. Pirates hold no commission or delegated authority from any soveraign or state, cmpowering them to attack others. They cpn, therefore, be only regarded in the light of robbers or assassins. They are, as Clcero has truly stated, the common enemies of all (communes hostes omnium); and the law of nathens gives io every one the right to pursue and exterm.
inats them withont any provious declaration of war; but it le not allowed to kill them without trlal, except In bettle. Those who surrender, or are taken prisoners, must be brought before the proper magistrates, and dealt with according to law. By the anclent common law of England, piracy, If commltted by a subject, was held to be a apecius of treason, being contrary to his natural allegiance; and, by an alien, to be felony only; but alnce the statute of treasons (25 Edw. III. c, 2) it is held to be only felony In a aubject. Formerly thls offense was only cognizable by the admlralty courts, whlch proceed by the rulea of the civil law; but it beIng inconsistent with the liberties of the nation that any man's Ilfe should be taken away unless by the judgment of his peers, the statute 28 Hen. VIII. c. 15 , estahlished a new jurisdiction for this purpose, which proceeds according to the course of cemmon law. It was formerly a questlon whether the Algerlaes, and other African statcs, should be consldered plratea; but, however exceptlonable their conduct might have been on many occasions, and however hostile their pollcy might be to the intarests of humanity, still, as they had been subjected to what may be called regular governmenta, and had been admitted to enter into treaties with other powers, they could not be treated as piratee. Pirates having no right to make conquests, or to seize upon what helongs to others, capture by them does not divest the owner of hls property. At an early period of English history a law was made for the restltution of property taken by pirates, if found within the realm, whether belonging to atrangers or Englishmen; but any foreigner suing upon this statute must prove that at the time of the capture his own sovereign and the sovereign of the captor were in mutual amity ; for it is held that piracy can not be committed by the subjects of states at war with each other. Piracy was almost universally practiced in the Heroic Ages. Instead of being estecmed lnfumous, it was supposed to be honor-able.-Lat'ocinium maris glorice habebatur.-Jus'rinian, lib. xliil. Menelaus, in the Odyssey, does not hesitate to inform his guests, who edmired his riches, that they were the fruit of his piratlcal expeditions (lib. iv. ver. 90); and such, incleed, was the way in which most of the Greek princes amassed great wealth.-Goguet, Origin of Laws. The prevalence of this piratical spirit in these early ages may, perhaps, be explained by the infinite number of small, independent states into which the country was divided, and the violent animosity constantly subsisting emong them. In this way ferocious and predatory halits were universally ditlused and kept alive; and it is not to be supposed that those who wore at all times liable to be attacked by hosts of enemles should very accurately examine the grounds upon which they attacked others. Accoving, however, as a more lmproved aystem of government grew np, Greece, nnd a few states, as Athens, Corinth, etc., had attained to listinction by their naval power, piracy was made a capital offense; hut though repressed, it was never entirely put down. Cllicia was at all times the great strong-hold of the pirntes of antiquity: and in consequence of the decline of the maritime forecs of Athens, Rhodes, etc., which had kept them in check, they increased so much In numbers and audacity as to insult the majesty of Rome hersclf; so that it became necessary to send Pompey against them, with a large fleet and army, and more extensive powers than had been ever previonsly conferred on any Loman general.
During the anarchy of the Middle Ages, when every baron considered himself a sort of independent prince, entitled to make war on others, plracy was universally practiced. The famous Hanseatic league was formed chiefly for the purpose of protecting the ships of the confedcrated cities from tho attacks of the pirstes by which tho Baltle was then infested. The nuisance was not finally abated ln Europe till the feudal system had been subverted, and the ascentency of the law every
where secured. In more modern times, some of the smaller West Judia islands have been the great resort of pirates: latterly, however, they bave been driven from most of their haunts in that quarter. They are still not unfrequently met with in the Indian seas east of Sumatra.-M'Celloch's Com. Dict.

Piracy, is robbery, or a forclble dopredation on the high seas, without lawful anthority; and done animo furandi, and in the splrit and Intention of universal hostlity. It is the same oflense at sea with robbery on land; and all the writers on the law of aations, and on the marithae luw of Europe, agree in this definition of piracy. Pirates have been regarded by all civilized nations as the enemien of the haman race, and the most atroclous violators of tho universal law of soclety. They are every where pursued and panlahed with death; and the severity with which the law has animadverted upon this crime arisea from its enormity and denger, the cruelty that accompanles it, the necessity of cheoking it, the difficulty of deteotion, and the facility with which robberiea may be committed upon pacilic traders in the solizudes of the ocean. Every nation has a right to attack and exterminate them withous any declaration of war; for though pirates may form a loose and temporary association aniong themselves, and reeatablish In some degree those lawe of justico which they have violated with the rest of the world, yet they are not coneidered as a national body, or entitied to the laws of war, as olte of the cominunity of nations. They scquire no rights by conquent; and the law of nations, and the municipal law of every country, authorize the truc owner to reclaim his property taken by piratee, whereever it can be found, and they do not recognize any ttele to be derived from an act of plracy. The prindple that a pirutis ef latronibus capla dominium non mutant, is the received opinion of ancient civilians and modern writers on general jurlsprudence, and the same doctrine was maintained in the Engliah courts of common la w prior to the great modern improvementa mado in the sclence of the law of nations.
By the Constitution of the United Stater, Congress is authorized to define and punish plracies and felonles committed on the high aeas, and offensee agalnst the law of nations. In pursusnce of the authorlty It was declared, by the act of Congress of April 80, 1790, c. 9 , sec. 8 , that murder or robbery committed on the high seas, or in any river, harbor, or bay, out of the jurisdjetion of any particular state, or any other offense, which, if committed within the body of a county, would, by the laws of the United States, be punishable wilth death, should he adjudged to be piracy or felony, and punishable with death. It was further declared, that if any captain or marlner should piratically or feloniously run away with any vessel, or any goods or merchandise to the value of tifty dollars, or should yielil up any such vessel voluntarily to pirates; or if any seaman should forclbly endeavor to linder bis commander frem defending the ship or goods committed to hls irust, or should make a revolt in the ship, every such offender should tse adjudged a plrate and felon, and be punirhable with death And by the act of March 3, 1819, c. 76, sec. 5, Congrese declared, that If any such person on the high scas should conimit the crime of piracy as defined by the law of nations, he should, on convletion, suffer death. Trisect was but temporary In ita llnitation, and has expired; but it was again declared, and essentially to the rame effect, by the act of Congress, 15 th of May, 1820, c. 113, sec. 3, that If any person upon the high seas, or in any open roadstead or bay or river, where the sea ebbin and flows, commits the crime of robbery, in or upon any vessel, or the lading thereof, or the crew, he shali be adjudged a pirate. So if any person, engaged in any piratical enterprise, or belongiog to the crew of any plratical veanel, should land and commit robbery on ahore, auch an offender shall also be adjudged a pirate. The atatute in this respect seenis to be oniy deciaratory of the
law of nations; and upon the doctrine of the case of Lind $v$. Rodney, such plunder and robbery ashore by the crew, and whith the uld of veesels, is a marine case, and of admiralty jurladiction. The statute further declared, that the above proviaion was not to be construed to deprive any partleular State of lta jurisdletion over such otleases when committed withlin the body of a county, or to authorize the courts of the Unlted States to try any auch offenders, after convietion or acquittance, for the same offense in a State court.

There can be no doubt of the right of Congress to pase laws praishing piratee, though thoy may be forelgnera, ind may have cominitted no partlcular offense against the Unlted States, $6=$ It is of no importance, for the purpose of giving jurladiction, on whom or whem a piratical act has been committed. A pirate, who is one ly the law of natlons, may be tried and punlshed In any country where ho may be found, for he is reputed to be out of the protection of all laws and privilages. Tha statute of any government may declare an offense coinmitted on board its own veasels to be piracy, and sach offense will be punlahable excluslvely by che natlon which passes the statute. Bet piracy, under the law of natlons, is an offense againat all nations, and punishabla by all.-Kent'a Commentaries, vol 1.
ISability of Insurers.-Thers can be no plracy or robbery without vlolenco; but thls is not necessary to constitute the crime of theft. Piracy and robbery are most nsually committed by strangere to the ship; they may, however, be committed by the crew; and the insurers are anawerable for such loss, unleas it arise from the fault of the owner. If theft be committed by the crew, we ahould still hold the Ineurera liable. Thia may be doubtful; but insurers regard it as at least posslble, and provide agalnat it by the phrase, "assailling thleves." This excludes theft without violenee, and perhaps all thoft by those lawfuliy on boart the vessel, as a part of the shlp's company. If, after shlpwreck, the property is atolen, the insurcrs are liahle, and would probably be so if there were no insurance against theft, if thla was a direct effect of the wrecking.-Parsona's Mrercantils Luw. The suljects of plrates and plracy have been discuassed in the followIng works • Nilks's Register, x vili. 275, xxxii. 302, xx. $59, \mathrm{xxvll} .391, \mathrm{xxv} .15 \overline{7}, \mathrm{xx} \times 1 \mathrm{l} .138, \mathrm{x}$ xili. 211 ; Ilent's Aferchonta' Magazine, xiil. 450, 526, xlv. 89 ; Edinburgh Revien, $1 \times \mathrm{v}$ III 33, xxvl. 449; Littei.L's Museum, xxv. 337, xxvl. 266.

Pistachia, or Pistachio Nuts (Ger. Pistaschen; Du. Pist ayes; Fr I'istarhes; It. Pistacchi, Fustucchi; Sp. Alfocigos; Lat. Pistaciox), the frult of the Mistachia vera, a kind of turpentine-tree. It grows naturally in Arabla, Perafa, and Syria; also in Slelly, whence the nute are annually bronght to us. They are oblong sad pointed, about the size and shape of a filbert, inciuding a kernel of a pale greenleh color, covered with a yellowish or reddish skin. They have a plessant, sweetlsh, unctuous taste, resambling that of aweet almonds; their principal difference from which consists in their having a greater degrec of aweetness, accompranied with a ilght grateful flavor, and In leing more olly. Pistachias Imported from the East are superior to those ralsed in Hurope.-Lewis's Mfateria Med.

Pistols. These are the smallest sort of firc-arms, carried sometimes on the saddle-bow, sometimes in a girdie round the walst, sometimes in the pocket, etc.Paribon. The pletol was first used ly the cavalry of Eugland, $\ln 1444$.

The insnufacture of guns and platols in the United States has become an aotlve one. Colt's licvolvers have acquired a reputation throughont Europe and South America, as well as the Unlted Statce. Ills principal factory is locsted near Hartford, Connecticut. "It ls so well ordered, so complete, so striking in its reanita, that all engaged In manufacturo may jearn something from It; it is in itself one large machine, well oiled too, which takes in at one enil a shapeless

ump of iron, and a piece of wood, and puts ont at the other a veautifully finisined arm which you may load and fire six balls from separately in three-quarters of a minuta, after a certain amoant of practiee. In each pistel there are fifty-tiree distinct pieces, inclading fourtean screws, and for the formation of these forty or forty-ive eeparate machinas co-operate, hammering, milling, cutting, driliting, punching, rifing, and shaving; all put into motion by a galion of water 'in a vioient perspiration;' in other werds, a twenty-horse power teameengine. Some of the machincs ara especially besutiful: look at that for rifling the ? in mrels, for example, with the brush to keap the cutters clean; and the ene near it for driliing the six chambers around the central boring in the aolid cylinder, where accuracy is so indispensable. That regular irregularity, the eccentric, plays a: important part in this, as it does in the hammering machine below-the machine patented by Rider. In one week they turned out 525 perfect pistols here, and there are the means for making 800 or 900 a week, if it wure necessary to do so."-London Builder.

Pistois were flrst used by the Germans: Bellay mentions them in the year 1544. In the tinie or Francis I, and under Henry II, the German horsemen, des reiters, were called pistoliers. The derivation of this term is uncurtain. Frisch conjectures that it may have arisen from pistilio or stiopo, because pistols used to have large knobs on the handies. Daniel and others think that the name comes from Pistoja, in Tuscany, where they were firat manufactured. . He says he saw an old pistol that, with the exception of the ramrod, was all iron. During the latter part of the last century many ingenious persons directed their attention to the improvement of firc-arms, with a view to simplify their construction, to render them more effective, and to combine safety with celerity in firing. One of the most marked advancements was effected by $\mathbf{M r}$ Heary Nock, and patented by him in England in 1787. Previous to this the breeching or plug of a gun was a soiid lump of iron, acrewed into one end of the bsarrel, the tench-hele being drilled through the side of the bsrrel above it. Another most marked improvement was the introduction and adaptation of fulminating powder, fur igniting the charge in the ehamber of the breech; and fur which the Rev. Mr. Forsyth obtained a patent in Great Britain, in 1807. The perfection of a proper fulminating powder was long a matter of great difficuity. Other cinanges were anggested, but not of a practical kind. One made by Mr. F. H. Collier, of Beston, Massachusetts, in 1818 ; and another by 3ir. Wheeler, of Boston, in 1819.

The first valuable improvements made by Colonel Samuel Colt, of Connecticut, in the construction of the pistel, were made public in the year 1835. The original conception of Colonel Colt in regard to fire-arms was the combination of a number of long barrels to rotate upon a spindie, by the act of cocking the Jock, in the same manner that they have since been made by others who ciaim to hate originated the plan; but as objections arosn from the weight and bulk of the arm, in his study to obviate them, the iciea of a singie barrel and a chambered breeeh suggested itself to him. Aithougi without the pecuniary means of then practically testing his convictions, he made a emall wooden model of his conception, wilich he possesses at the present day. He then assiduously pursued his calling as a scientific lecturer, and from its rewards procured the aid to manufacture specimen arms, which in their practical resulta exceeded eveu his most sanguine expectatiens; and in 1835 he received his first patent from the Government of the United States.

Colonel Colt's first mannfactory of firc-arms was lecated at Paterzon, New Jersey, in the vear 1836, with a capital of $\$ 800,000$. This continuat in operation untli the year $18: 2$, when it was relinquished as unprofitable. The Florida war of 1837-'38 created a
damand for, and gave practical demonstration of the great value of, the repeating fire-arme patented by him. They were also nsed with great effect in the Texan revelution and war; and afterward in the war with Mexico (18i6-47), when a contract was made by him with the government for the supply of one thoueand of the improved arms. A temporary manufactory was established for this purpose at Whitneyville, Connecticut. This was succeeded by the present extensive factory at or near Hartford, on the Connecticut River, which was finished and In euccessful operation in the year 185s, with a capital of $81,250,000$. These buildings present a front of 500 feet. The repeating principle has also been succesmfully applied by Cojonel Colt to rifies and carbines, sevaral varieties of witich are constanily in the course of completion in the armory. Lately the demand for the sporting rifie has increased wonderfally, which increase will, no doubt, be much augnented as their superiority is more generaliy practically demonstrated by our hardy backwoodsmen; and the day is not distant when regiments of riffemen will be equipped with Colt's revolvers.

Within the last year still another style of pistol has been introduced. It is called "Colt's new Model," and by some it is preferred to either of the others. Undoubtedly this is a matter of fancy with the party osing the arm, as in some cases individuals yet prefer Colt's first to any arin that was ever manufactured. The arms are of several sizes, and weigh as follows:
The mitttary rifle, barrel 36 inehes fit Poundh Ouncen. ted with Improved buyonet......... 11 . 8 Sporting riffe, barrel from is to 60 tnches averace. The army or holster pistol.
The navy or belt pistol.
The poeket pistol, barrei 6 inche.
The poeket plistol, barrel 5 inchea
The poekot pistol, barrel 5 inehea
The pooket platot, barret 4 inelica

These are kinds that are constantly in the course of construction; of course many other varietics are made by special order.

Of the improved pistel, over 138,000 had been manufactured here up to Janunry, 1857. Nearly elght hundred men are ordinarily employed in this work alone. This result is the fruit of a market for arms, not contined to the United States, but extending over both the Americas; more or less to the Indies, East and West; to Egypt-oven to distant Australia; to remote Asintic tribes assembled at the great fairs of Novgorod; and over Europe generally, but especially to England. IIere the arms of Colonej Colt, first introduced in splendil style through the World's Fair, were warmly wejcomed, and led to the speedy establishment in Londen of an extensive armery for their manufacture, and to their rapid adoption inte the British army and naval service.-United States Mfagazine, March, 1857. See Fine-Aums.
Pitcairn's Island. A small solitary island in the Pacifle Ocean, seen by Cook in 1773, and noted for bcing colonized by ten mutincers from the ship Bounty, Captain Bligh, in 1789, from witich time till 1814 they (or rather their descendants) remained here unknown. Soll fertile, but porcus, and rather defective in water; well wooded, and ci, mate healthful; thermometer ranging frem $59^{\circ}$ to $89^{\circ}$ Fahr. l'revailing winds sonthwest and cast-southeast, but it is beyond the limits of the regular trade-winds. It is surrennded by rocky shores, and has only ene accessible landingplace at Boanty Bay. The cocea-nut, plantain, banana, and bread-fruit trecs flourish, hibiseus, or cloth tree, banyan-trec, orange, and others; and the potate, sweet potato, yams, weter-melons, pumpkin, taro, sugar cane, ginger, turmeric, tobacco, tea-plant, and maize, are cultivated. The island contained no indigenous quadrupeds, but geats, hega, and poultry have been imported. In 1790 this island was resorted to by the mutinecrs of the Bounty, consisting of nine British sailors, six native Tahitian men, and twelve women.

In consequr nce of various diacords and massacres, at the end of ten years there remsined only one Englishman, Adams, the Tahitian females, and nineteen children, their offipring. Under the superintendence of this man the children wers elucated and traiasd up to habits of iaduatry and morality. In 1825 Captain Beechey found a most Interesting and Intelligent colony of sixty-six persens. In 1831, by the somewhat imprudent sanction of the British goverument, the colony, numbering eighty-seven persons, was transferred to Tahlti. After remaining five months there, and losing twelve of their number by death, the colony, at their own aollicitation, were again reinstated in their native island. In 1840 the popuiation amounted to 75 males and 74 females, in ail 149 ; of these, three were Englishmen, one a native Tahitian woman, the only remaining female of the original migration, and the remainder were natives of the island. They live chiefly on yams, potatoes, and other vegetables, which they raise by their own lator. From the ramains of burialgrounds, the island would appear to hava been occupied by inhabitants at a peried antececient to the viait of the mutineers of tho Bounty. It was seen by Carteret in 1767, and named by him after one of him officers.

Pitch (Ger. Pech; Fr. Poix, Brai; It. Pece; Sp. $P e z$, Ross. Smola gustija), the residuum which remains on inspissating tar, or boiling it down to dryness. It is extensively used inship-buiidiug, and for other pur-poses.-See Navat. Stores.

Pittaburgh, city, port of entry, and capital of Alleghany county, Penusylvania, la situated at the contux of the Alieghany and Monongabela rivers, where they form the Ohio, which is here a quarter of a mile wide. It is in $40^{\circ} 32^{\prime} \mathrm{N}$. lat., and $80^{\circ} 2^{\prime} \mathrm{W}$. long., 357 m . ria Pennsyivania Raiiroad from Phiiadelphia, 247 westnorthweat of IIarrisburg, 226 from Washington, D. C., and 2044 above New Orleans by the course of the river. Population in 1810, 4768; in 1820, $\mathbf{7 2 4 8}$; in 1830, 12,568; in 18.10, 21,115; in 1800, 16,601 ; in 1854, the city and immediate vicinity estinsated at 110,000 . It was originally lnid out on the northeast bank of the Menongabeia, after the medel of Pliiadielphia, with streets runniag parallel with the rivers, and others crossing them at right angles. The streets on the Alleghany are laid out on a similar plan, and bence a short distance from the Alieghany the old and new atreets meet in obique dircetiona. The Alleghany River is spanned by three bridges, which, with seversl ateam ferries, connect the city with tise suburba. The Pennsylvania Canal crossea the river by an aqueduct, and there is a suspension-bridge over the Monongaheia.

As a menufacturing city, I'ittsburgh is second in the State only to Hhiladelphia. In 1850 it had thirteen roling-milis, with a capital of $\$ 5,000,000$, employiug 2500 hands, consuming 60,000 tons of jig metal, and producing annualiy bar iron and nails to the value of $\$ 4,000,000$; thirty large founderies, with an aggregate cajital of $\$ 2,000,000$, and 2500 hands, using 20,000 tons of pig iron, anil yiclding articles valued at $\mathbf{2 , 0 0 0 , 0 0 0}$ annualiy; two eatablishmenta for manufacturing locks, latches, coffee milis, scaies, and other iron casting, employing 500 ibunds, and a capital of $\$ 250,000$, using 1200 tons metai, and producing annually to the vaiue of $\$ 3,000,000$; tive large cotton factories-capital © $1,500,000$, hands 1560 , cotton consumed 15,000 bales, and products valued at upward of $\$ 1,500,000$ annaally ; eight flint-glass manufactories-capital $\$ 300,000$, hands 500, and producing various articles of glass, in the manufactore of which 150 tons lead and 200 tona of pearlash are used, to the value of $\$ 100,000$ smnually; seven phisl furnaces and eleven window-glass factorics-capital $\$ 250,000$, hands 600 , and amual producta $\$ 600,000$; one soda-ash factory, employing $\%$ hands, and producing annually 1500 tens; one copper-smelting house, producing 600 tons refined copper annuslly, valued at $\$ 380$ per ton; one rolling-mill, producing annusliy 300 tons sheatiing and brazier's copper; five white-jead
factories - capital $\$ 100,000$, hands 60 , and producing 150,000 kegs nnanaliy, worth 200,000 . There are also a number of manufactories of the amaller sizes of iron, several extensive manufactoriea of axes, hatchets, spring-stcel, steel springe, axles, anvila, vices, milis, eross-cut and other sawa, gan barrela, shovels, spades, forks, hoes, cut tacks, brads, etc. The products of the manufactures in the aggregate are valued at between $\$ 50,000,000$ and $\$ 60,000,000$ annually. There are cossuned about $12,000,000$ lishels of coal annualiy, werth © 600,000 , and an equal quantity is experted frem the city, giving employment coastantly to 4000 hands.

Plains. In Geegraphy, the genersi term for ali those parts of the dry land which can not properly be called mountainous, and which compose by far the greater part of the earth's surface. . Piaina have different physical appearances according to their geographical position, and the pecullar characteristics of cuch have procured for them different names; thus we have the steppes of Asia, the deserts of Africa, the pampss of South America, and the pralries or savannas of North Anserica. See these different ferms.

Plane, a forest tree, of which there are two species; the Oriental plane (Platanus Orientalis), and the Occidental jlane (Platanue Occidentalis). The Oriental piane is a native of the Levant, and other Eastern countries, and is considered one of the finest of trees. It grows te about 60 feet in height, and has been knewn to exceed eigitt feet in diameter. Ite wood is much like beech, but more tigured, and is used for furniture and such like articles. The Occidental plane is a native of North America, and is one of the largest of the American trees, being sometimes more thas 12 fect in diameter. The wood of the Oecidental plane is harder than that of the Oriental. It is very durable in water. The tree known by the nan'e of plane in England is the sycamore, or great maple (A cer pseudo-platanus). It is a large tree, grows quickly, avd atands the seaspray better than most trees. The timber is very close and compact, casily wrought, and not linble cither te splinter or warp. It is gencraily of a browaish white or yellowiah white color, and sonctimes it is very hesutifully curied and mottled. In this stute it takes a tine polish, and beara varniahing weil. It is chietiy used in the manufacture of saddle-trees, wooden dishes, and a variety of artieles of furniture and machinery. When kept ilry, and protected from werms, it is pretty durabie; but it is quite as liable as beech to be attacked by them.-Tnethiold, p. 196.
Plane Bailing, in Nacigation, ls the are of determining the ship's piace, on the supposition that she is moving on a plane, or that the surface of the ocean is plane instead of being spherical. On account of the magnitude of the terrestrinl radius, this supposition may be adopted for short distancea without leading to grest errors; and it affords great facilitiea in calcuiation, for the place of the sitip is feund by the soiution of a rightangled plane triangle. The part of the meridian between the ship and the paraliel of latitude of the place whence she doparted forms tise perpendicular of the trlangle; the distance on the paraliel between the pisce of departure and the foot of tine perpendicalar is the base of the triangle (tecinnically called the departure); and the distance sailed is the liypothenuse. The angle ot the sisip is cailed the coursa, and the other scute angle the comptement of the course. Now, of these four things, the perpendicular, the departure, the distance seijed, and the courac, any two being given, the triangle car be iaid down on the chart, and ail the other parts of it found.-See Navioation.

Planks (Ger, and Du. I'lanken; Da, Jlanker; Sw. I'lankor; Fr. I'lanches, Bora'ages ; Russ. Tolstüle olosku), thick atrong boarils, cut from varivus kinda of wood, eapeclally oak and pine. Plantain, or Banana, the pulpy fruit of the Muea paradisiaca, an herbaceous plant, extonsively oultivated in nost inter-tropical coustitios, but espocially is Mexieg. It is not, dike mont other frults, used merely as an occasionial luxary, but is rather on ostablished saticle of subsister ro. Being long and extensively cuitivated, it has diverged into numerous varieties, the fruit of whioh differs matorially in elve; flavor; and color. If That of some is not above two or thres inohes long; while that of others is not much short of a foot ; some sorts are aweet, and of a flavor not unilke nor iuferior to that of good mellow pear; but the largor kind are, for the moat part, coarae : and farinaceous. The latter are eithar used freeh or dried in the isun, in wiuch latter stato they are occasionally ground into meal and made into bread. In Mexico the sweetor sorts are frequently pressed and dried, an:figs are in Europe; and, while they are not very inferior to the last-mentioned frult, they are infinitely cheaper. "I doubt," says M. Humboldt, "whether there be any other plant that produces eo great a quantity of nutritive aubatance in so small a space. Jight or nine months after tha sucker is planted, it begins to dovelop its cluster. The frult may be gathered in the tenth and eleventh month. $n$ When the stalk is cut, there is alwaya found, among the numerous ahoots that have taken root; a sprout (pimpollo), which, being 2-8ds the height of its pareat plant, bears fruit three months latcr. Thus a plantation of bananas perpetustos itself, without requiring any eare on the part of man, further than to cut the atalks when the fruit has ripened, and to atir the earth gently once or twice a year about the roots. A piece of grount of 100 square metres of surface will contain from 30 to 40 plants, During the courso of a year this same plece of grourid, neckoning the weight of the eluster at from 15 to 20 kilog. only, will yield 2000 kilog., or more than 4000 lbs., of nutritive subatance. I What a difference between this product and that of the cereas graasea in most parts of Europe! The same extent of land planted with wheat would not produce nbeve 30 lbs ., and not mere than 90 lbs , of rotatocs.: Hence the product of the banana ia to that of wheat as 183 to 1 , and to that of potatoes as 44 to 1. "-Essmi sur la Nouvello Neprigno. The banana forms:a principal part of the food of the people of Mexico; and the apathy and indolence of the natives in the tierras oclientes, or hot regions, has been ascribed, and probably with good reason, to the facility witit which it supplies them with subsistence. It is by no means in auch extensive use in tropical Asia, and comes nowhere in it into compatition with corn 8 an article of food.
Plastrac, or Plaister, in building, a composition of lime, aunctimes with aand, or other substance, to parget or cover the nudities of building.

Plaster of Paris, a preparation of several species of gypsum duy near Montmartre, a village in the neighborhood of Paris, and hence the name. The best sort is hard, white, sinining, and marbly, iving known by the aame of plastemstone, or parget of Montmartre. It wili neither give fire with atcel, nor ferment with squifortis; but it calcines very freely and readily into a fine plaster, the use of which in building and casting statues is wrll known.
Plata (hio De Ia), or the Plato River, one of the great rivers, or rather a great eatuary of South America, in tho Argentine Republic, formed by the junction of the Parana and Uruguay rivers, in lst. $34^{\circ}$ S., long. $58^{\circ} 80^{\circ}$ W., its baein lying south of those of the Amazon, Tocantins, and San Franclsco, and its namereus tributaries draining most part of the Plata, Paraguay, and Uruguay territories, with considerahle portions of Bolivia and Brazil. : The estuary resulting from their union is 200 miies in length northwest to
southesat; snd whe o It joins the Atlantio Ocean, is 170 mile acrosa foetween Maldonado and Cape 8t, Antonio) f its cenuis being abont lat. $85^{\circ} 30^{\prime} \mathrm{S} . \boldsymbol{y}^{\prime}$ long. $56^{\circ}$ W ${ }_{i}$ ils Its muddy waters can be traced in the ocean 200 miles from its mouth. :The total length of the Hata and the Paragury has been estimated at nesrly 2500 milleaf and from the ocean to the island of Aplpe In the Parana, at least 1280 miles, there is a continuous and eafe navigation for vessele of 800 tohs. The Agutpehy, an afflueat of the Paraguay neur lat. $15^{\circ} 40^{\prime} \mathrm{B}$., long. $39^{\circ} 20^{\prime}$ W., ia separated only by a portage of three miles from the Alegre, a tributary of the Guapore, and were a canal to be made to connect the two streams, a complete aystam of internsl navigation' throughout nearly sll South America would exiat.-Ses Paraovat.

Plate, the denomination usually given to gold and silver wrought into articles of housohold furniture. ${ }^{\text {rl }}$ It appears from Portis's Progreso of the Nation, 111. 25, that the annual consumption of siiver plate has inereased from about $800,000 \mathrm{oz}$. at the commencement of the century, to about $1,050,000 \mathrm{oz}$. at present. Most persone may, perhsps, be Inclined to think that this is not so great an incresse as might have been auticipated from the increase of wealth and popniation. But It should be borne in mind that thia account refers only to articles of standard silver and gold, and that the great consumption of the precious metals consiats in plated and gilt articles, which are now made of a very superior quality. Owing also to the fact of old plate boing hold in the greatast estimation, but little of it is melted down to be remanafactured, so that the principal consumption is by new families.-See Gocd and Puectous Mexals.

Platina, a metal which, in respect of scarcity, beanty, ductility, and indestructibility, is hardly inferior to gold, was unknown in Europe till about the middle of last century, when it began to be imported in amall quantities from South America. It has aince been digcovered in Fistremadura in Spain, and more recently in the Ural Mountains in Asistic Rusais, where it is now raiaed in very considerable quantitles. Plating is of a white color, like silver, but not so bright, and has no tasto or smell. Ita hardness is intermediate between copper and iron. Its apecific gravity is about $21 \cdot \delta$, that of gold beling 19.3 ; so that it is the heaviest hody with which we are acquainted. It is exccedingly ductile and malleable; It nay be hammered out. into very thin plates, and drawn into wires not exceeding 1-1940th of an inch in diameter. In these properties it is probabiy inferior to gold, but it aeems to surpass all the otiner metals. Its tenacity is such, that a wire of platina 0.078 inch in dlameter is capable of supporting a weight of $\mathbf{2 7 4 . 3 1} \mathrm{lbs}$. avoirdupois without breakiog. It is ono of the most infusible of ail metals; but pieces of it may be welded together without difficulty when heated to whiteness. It is not in the amailest degree altered by the action of air or water.-Tuonson's Chemistry. The late Dr. Woilaston discovered a method of fusing platina, and, consequently, of rendering it easily availabic in the arts. The Russians have within these few years issued platina coins of the value of 3,6 , and 20 aliver roubles. Platina first began to le an object of attention in Russia in 1824, when 1 pood 33 lts. wero collected. In 1836 the produce amounted to 138 poods 42 lbs . In 1831 a piace of native platina was discovered at Demidoff's gold mines, weighing 29 liss. $2 \frac{1}{2}$ zolt.-Official Statements published by the Russian government.

Plating. The art of covering copper and other metala with silver or gold: it is effected in various ways. Sometimes the silver is attached to and rolled out with the copper hy pressure; sometimes the one metal is precipitated from its solutions upon the other; and of late manufacturers have avsiled themselves of elec-tro-chemical decomposition for the purpose.

Platinum (so called from the Spanish word plats,
ailror; on account of ite coler), a metal of a white color, exceedingly ductile, malieable, and difficult of fusion. It is the heaviest subatance known, lts speeific gravity being 21-6. It undergoes no change from air or moisture, and is not attacked by any of the pare acids; it is dissolved by chlorine and nitro-miuriatic acid, and is oxydized at high temperatures by pure potassa and lithia. It is only found in South Ameries and in the Uralian Mountains: it is usuaily In small grains of a metailio luatre, associsted or combined with paliadium, rhodium, iridium, and ormium ; and with copper, iron, lead, titanlum, chromium, gold, and vilver; it is also usualiy mixed with slluvial Band. The particles are seldom so large an a small pea, but sometimes lumps have beon fuund of the size of a hazel-uut to that of a pigeon's egg. In 1826, It was first discovered in a rein associated with gold by Boussingault, in the province of Antioquia, in South America. When a perfectly clean surfuce of platinum is presented to a mixture of hydrogen and oxygengus, it has the extraordinary property of causing them to cumbine so as to form water, and often with such rapidity as to render the metal red hot : spongy platinum, as it is ueually called, obtained by heating the amnomio-muriate of platinum, is most effective in producing this extraordinary result; and a jet of hydrogen directed upon it may be inflamed by the metal thus ignited, a property which has been aiplied to the construction of convenient inat ruments for procuring a ligitt. The equivaleat of platinum is about 98. It is precipitated from its nitro-muriatic aolution by as ammoniac, which throws it down in the form of a yellow powder, composed of bichioride of piatinum and aal ammoniac.

Platting, slips of bast, canc, straw, etc., woven or plaited for making into hats, etc.

Plumbago. Sec Black-lead.
Plums, the fruit of the Prunus domestica, are too weli known to require any description. They were introduced into England in the 15 th century, and are cultivated fil all parts of the country. There are said to be nearly 300 varieties of plums.

Plum-tree (Prunus domeatica). The Prunue domestica appears to be more widely diffused in its original lecality than the apricot. It is believed to be indig* enous to the south of Russia, Caucasus, the Ilimalayas, and to many parts of Earope. In England, and in some parts of the Unitcd States, it ls sometimes found in hedges, but never truly wild. This species end many of i ss varieties are cultivated for ornament, or their fruit, in ail the temperate countrics of the habitable glowe. Faulkner, in his Keneington, makes the plum \& native of Asia, and an introduction into Europe of the Crusaders. Gough, in his British Topography, says that lord Cromwell introduced tho Perdrigon plum into England in the tlme of IIeary VII. The introduction of this tree into the United States dates back to the earliest periods of their settlements. Several valuable and lnteresting varieties have originated in this country, among which the Bolmsr or Washington pium stands conspicuous. The parent tree la said to have been purchased in a market in New York, about the end of the last century. It remained barren for several years, till, during a violent storm of thunder, the entire trank was severed to the earth by lightning, and destroyed. The part remaining in the ground afterward threw up beveral vigorous shoots, which were allowed to remain and finaliy produce fruit. Trees of this varicty were firat aent to England in 1819, to Mr. Robert Iarclay, of Bury Hill; and several others were sent to the London Horticultural Society in 1821, by Dr. Hosack, of New York. The wood of the Prunus domestica is hard, close, compact, beautifully veined, and susceptible of a fine polish. When dry, it weighs from forty to fifty poundis to a culic foot, according to the age and growth of the tree. Its texture is silky, and when washed with lime-water its color is heightened, and may be pre-
served by the application of varmith or wax. Unfortunately for tilis iree, Its wood is sometimes rotten at the heart. In France and Germuny it is much sougit after by turners, cabinet-nakers, and the manufacturers of musicai instruments. The leavea are sometimes given to cattle for forage. The use of the fruit in domestic economy fur dessert, and for making tarts and puddinge, is weli known. In France plums are principally used dry or preserved, and enter extenaively into commerce. The kinds usually employed for pre. serving are the Brignole, the prune d'Ast, the 1'erdrigoa blanc, the prane d'Agen, and the Ste. Catherine. In warm countries plums or prunea are dried on hurdles by solar hest; but in cold climates artilicial heat is employed; the froit being exposed to the hent of an oven and to that of the sun on aiternate deys, Thible pruses are prepared from the larger kinds of plums, as the green-gage, and Ste. Catherine; those employed in medicine from the Ste, Juiienne. The former have a very oweet and agreeable taste, and the latter are somewhat austere. Fresh, ripe plums, taken in moderate quantities, are regarded as nutritire and wholeaome; but in large quantities they readily disorder the beweis; and when immature, they atill modre easily excite ill effecta. The medicinal prunes ars enuployed as an agrecable, mild laxative for children, and are given during convaleacence from febrile and inflammatory disorders in adults.-Browss's Trees of A merica.

Pluah (Fr. Panne, Peluchs; Germ. IVollsammet, I'luseh) ie a textile fabric, having a sort of velvet nap or shag upon cyeside. It is composed regularily of a woof of a single woolen thread, and a two-fold warp, the one wool of two threads twisted, the other goat's or camel's hair. There are also several sorts of plush made entirely of worsted. It is manufactured, like velvet, in a loom with three treadles; two of which separate and depress the woolen warp, and the third raises the hair-warp, whereupon the weaver, throwing the sliuttie, passes the woof between the woolen and hair warp; afterward, iaying a braas broach or needia under that of the hair, he cuts it with a knife (bee Fustian) destined for that use, running its fine, slender point along in the hoilow of the guide-broach, to the end of a piece extended upon a table. Thus the surface of thie plush receives its velvety appearance. This stuff is also made of cotton and silk.

Plymouth, a aca-port of England, on the east side of a peninsula between the rivers Plym and Tamar, at the heaid of Plymouth Sound; latitude of Mount Wise, $50^{\circ} 22^{\prime}$ N., long. $4^{\circ} 10^{\prime} 2^{\prime \prime} \mathrm{W}$. The port of Plymonth is distinguiahed for its capacity and security; it is capable of containing 2000 sail, and is one of the best harbers in the world. It consists of three divisions: Suttonport, adjoining the town; Catwater, formed by an estuary of the Plym ; and the Bay of Hamoaze. At the mouth of these harbors the great bay of Piymouth Sound forms an excellent roadstead, which is new completely secure by the erection of the breakwater across the entrance. This is an isolated mole at the entrsnce of the Sound 5100 feet long, and opposing a barrier to the heary swell of the Atlontic. The found is three miliss long and four miles wide, and forms the harbor of Davenport and Plymouth.
Point net is a atyle of iace formerly mach in vegue, but now auperseded by the bebhin-net manufacture.Ses L.ace.

Points of the Compass. In Geography and Navigation, the joints of diviaion of tise circio reprecenting the horizon, or of the compass card over which the magnetic needle is suspended. A diameter of the circle being drawn to represent the meridian, or north and south directions, and another at right angies to it to represent the directions east and west, the circle is thus divided into four quarters, each of which is subdivided into eight equal parte, so thst the wiole circle is divided into thirty-two equal parts; and the poiats

Polar Bea, North. We aro now able to draw with nearly geographlcal accuracy tho boundaries of the North Polar Sea, A very large portion of the northern shores of Europo, Asia, and Atsorica, which circumseribe it, have been visited, and the position of most of their bays, headlands, and rivers, geograpliceally ascertained. By caating our eye over the North Polar chart, it will be seen that the Polar Sea of that hemiephere ls an immonse clrcular basin, which colnmunicates with the two groat oceans of the world-tine Atlantic and the Paclic - by two channels, the one separatiog America from Europe, and the other Amerlca from Asia. It will be seon that few pointe of the coasts of Europe and Asia, which occupy a full half of the circumacrlbing circle, extend much beyond the 70th parallel of latitudo; and all these polnts have been passed by water, though at different polnts and by different persons, with the single exception of the Cape Cevero Vastochnoi, which on the charts is made to extend to the latltude $75 \frac{1}{2}^{\circ}$. The northern const of America, with Old Greenland, and the two channels above mentioned, complete the circle, America extending sbout $80^{\circ}$ of longitude, or juat two nlathe of the whole circle; and of this portlon the whole coast has now been ascertalned, with tho oxceptlon of that part which llea between Cape Turuagaln of Franklln, and the land at the bottom of Prince Regent's Inlet, which the gentlemen of the IIndson's Bay Company are now (1838) exploring. This belng accomplished, wo shall havo the whole line of the northern coast of America completed. We may, therefore, state that the avorage of the degree of latitude of this cosst ls about the same as, or rather lower than, that of Europe and Asia, anu the extent of tho North Polar Sea may bo considered as about 2100 geographical miles in dlameter, or T200 in circumference. The interlor or central parts of thls sea are very littlo known. Several ialands are scsttered over lte southern extremities, the largest of which is OId Greenlend, whose northern limit has not yet been passed; tho others are, Spitzbergen, Nova Zembla, the lelands of Liaknov, or, as eome have been pleased to call them, New Siboria; the North Georgian Islamis of I'arry, and those which form the weetern lands of Buffin's Bay, to which may be added the Boothia Felix of Ross, which there Is no doubt is an is]and. Besides thesc, there are a number of amall alluvial islands, formed at the nouths of the several rlvers of the two continents; but whether any, or what number of lslands may exlst nearer to the Pole, we must of course remaln ignorant till the Polar Sea has been further explored.

For the little which ls known of this soa, we aro indebted to that spirit of dlecovery which showed itself iumediately after a passage to the East Indles brd been effected round the Cape of Good Hope; not so much, it is irue, for the sake of geographicsl discovery as that of shorteniag the pasaage by sea to tho enstern parts of the world. It was olvvlous that if a ship could proceed from the Atlantic to the Paclicic on a great circle of the sphere, or nearly so, the distanco, compared with the circuitous passage round Southern Africa or Southern America, would be prodlglonsly shortened. The voyage of Columbus had that object; but it was soon discovered that, from the Straite of Magelhaens to the Gulf of St. Lawrence there was an uninterrupted continuity of land. Of the northern regions the informstlon obtained has been scanty and discouraging for such an enterprise. One of the Scandiaavian plrates had, indeed, been driven hy stress of weather, as early as the middle of the 9 th century, upon an lsland to the northwest, to which, from its appesrance, he gave the name of Snowland, which was afterward changed to that of Iceland, by the leader of the Nor-
weglan colonists who took refuge on that inhospitable spot ; but it was not till more than a century after this that Eric Randa diacovered the southern part of Old Greenland, and there are ground for bellevlag that in the year 1001 some of those colonista discovered New. foundland and the coast of Labrador.

Of the South Polar Sea little or nothing may be anid to be kunwn. Captain Cook, In the years 1778 and 1774, croased the antarctlc clrcie in fire places only ; in lougltude $80 \mathrm{f}^{\circ}$ east, where he advanced to latltude $67 \frac{1}{2}$, and met with fields and detached pleces of ice; In longitudes $101^{\circ}$ and $110^{\circ}$ west, between which he proceeded to latltude $71^{\circ} 10^{\prime}$ south, tho farthest progrese made by hlun toward the South Pole, where he was atopped, or at least dcemed it prudent to return, on account of the flelds and mountalns of lice which were scattered over the surface of the aea; and in longltudes $186^{\circ}$ and $148^{\circ}$ west, bet weon which he descended to latltude $68^{\circ}$, and saw many float.ang ice islands. There are, therefore, stlll romalaing about 340 degrecs of longltude in which the antarctlc circlo has not been crossed, and full half the clrcumference of the globe which has not been visited lower to the southward than the parallel of $60^{\circ}$ south latitude.
Mr. Weidell, a master In tho navy, proceeded some three degrecs farthor south than Cook; and elnce that, two ships of Mr. Enderby discovered a lons tract of land, the extent of which they did not determine.

There was llttle doubt of the existence of high land In the South Polnr Sea, though Cook diecovered nono beyond the Southern Thule, or Sandwlch Land, on the parallel of $60^{\circ}$. Without high, precipitous land, those largo icebergs which ho met with floating among the fields of ice could not havo been formed; the hummocks of lee, occasioned by the agitation of the sea, and the meeting of the fields or flaws in oppusite directlons, seldom rise to the helght of twelve or fifteen feet above the sufface. Tho llussians, indeed, on a recent voyage of discovery, aro said to havo fallen in with many islands about the 70th parallel of lstitude. They also clrcumnavigated the Sandwleh Land, which was left undetermined by Cook, and conjectured that it might be a part of the grest Southern ContInent, which occupled so much attentlon of the geographers and philosophers of the last century. Thls idea was renewed by the recent discovery of a very considerable extent of land to the southward of Cape Horn, in latltudo $63^{\circ}$, and seen extending from longitude $85^{\circ}$ to $65^{\circ}$ west. As tho esstern extremity had not been seen, and the wInding of the coast was to northeast, it was conjectured that it might unlte with the Southern Thule of Cook, and form the long-sought-for Southern Continent. It ls sald, however, that the Russians have also circumnavigsted this land, and that it is composed of a great cluster of islands.

The land In question has been called South Shetland, but it is no hitw discovery. In the account of the voyage of the fire ships of Rotterdam, undicr the command of Jacob Mshn and Simon de Cordes, to the South Seas, In the year 1599, it is stated that, on approaching the Stralt of Magelhaens, the yacht commanded by Dirk Gherritz was separated from all the other shlps, and was carried lyy tempestuous weather to the south of tho Stralt, to $64^{\circ}$ sonth latltude, where they discovered a high country, with mountains, which were covered with snow, llke the land of Norway. Thls land of Gherrita was marked on some of the old charts, but discontlnued on the more modern ones, from the uncertalaty of Its position with regard to longitu .e. There can be no doubt of ite identity with the modern South Shetland. It answered to the descriptlon of the mountains of Norway, covered with snow, and is wholly barren, having neither tree nor shrub of any klnd. It is unnecessary to say that it ls uninhsbited, there being no such people in the southern hemisphere as the Esquimaux ; and it may be remarked, that no haman beings are found In the Sonthern Ocean below the 55 th

## 1'OM

parallel of latitucle, and nons beyond the 50th, except | on I'atagonia and Tlurra del Fuego. On the shorea, the meals and moe hormes, which had remainad from the Creation undistarbed, were ao numeroas, that on the first notice of the rediscovery, a whole tleet of veasele fror. Aingland and North America crowded thither on apeculation; but the loas of several from tempestuune westher, and a dangerous navigation, and the ileatruetion and alami of the ohjecta of their cupidlty, will probably cause it, for aone tione at least, to remain as much a land of devolation as it had been before.

Pollcy of Insuranoe, or Assurance, of shlps, is a contract or convention by which a person takea upon himseif the riske of a sea-voyage, ohilging himself to make good, in part or in whole, the loeses and damages that may befall the vessel, ite equipuge, tackle, vioiualing, lading, etc., olther from tempests, shipwrecks, pirstes, fire, war, reprisele, in considoration of a certaln sum, more or less accurding to the risk; which sum is paid down to the aseurer by the assuree upan hia signing the policy.-mee I naerance.

Polyneada ("many islanda") Includes the multitute of lalands scattered over the Pacifio Ocean, and comprehenda a belt ehiefly within $80^{\circ}$ on each side of the equator, and from longitude $135^{\circ}$ E. to $135^{\circ} \mathrm{W}$. Including New Zealand, the boundary extends south of the equator to lat. $47^{\circ} \mathrm{S}$. The lalande are diatributed into numerous groupe, and these groups, of an elongated form, have a general direction from northweat to southeast, and are composed of one or more larger islands, and numerous amaller ones. The principal groupa to the north of the equator are the Pelew, Ladrone, or Mariane, Caroline, Radack, Marshali, Gilbert, and Sandwich Ialandis. South of the equatoare New Ireland, New Hebrides, New Britain, Feejeo, Frlendly, Nevigator's, Solomon's, Soclety, Mendana or Marquesas, Low Archipelago, Couk's, Austral, and othor minor gronps, beaides numerona detached falsads, as Easter and liteairn islands. With the exception of Hawall, tha largest islund of Polynesia, the most considerable of the others range from 20 to 60 and 100 milee In circumference, while many do not oxceed a mile or two in length. These islands are all, moro or less, of coral formation; the Low Archipelago, Soclety Isiands, Marshall, and Cerolinea, presenting the regular stoll form, with circular reofs and lagoons. The Friendly, New Helrides, Solomon's, and Sandwich Islands, preeent fringed reefa, and have active voleanocs; summits of mountains varying from 2000 to 13,000 feet. In the lower coral islands tho elevations do not exceed $\mathbf{6 0 0}$ feet. In the stoll coral islands, Darwin hes aupposed that a depression of surfaco is taking place, and that the volcanic islanda are either stationary or rising. From the great predominance of ocean, the temperature of Polynesia is comparatively moderate, tho climate delightful and selubrions. Mean amual temperature of Sandwich Islands $77^{\circ}$; temperature of Soclety Islands, $70^{\circ}$ to $80^{\circ}$, and rarely $90^{\circ}$, Fahrenheit. The aoutheast tropical winds generally prevall, but northwest and southwest winds are not unconmon. Horricanes are rare, and earthquakes slight and not of frequent occurrence. The refreahing coolnese of the trade-winds, and is regular hut not execsaive supply of molature, are favorable to a luxuriant vegotation. Soil in the valleys and in the river coursea a rich volcanic
mould; on the mountains lese fertile: Boih vegetable and animal prociuetionm are limited na to riomber of specied. In the lalanda of the middle and eastern divisiona not more than 600 apecies of plunts are found. Thia number ingreusen toward the weat and notthweat. The hread-frnit, peculler to thim region, the cocoa, lignana, plantain, banyun, Eugar-cane, ynm; and cottonplunt, puper-mulberty; and a species of cheatnut, are indigenous. Other trees and plants of tropical climatea heve been Introducad and flourish; and ntrow-root, aweet potatoes, the common potato, and maize, are now reared abondantly. ${ }^{3}$ There are aeveral timber trees; eapecially esndal-wood; a few splces, and otnamental fowera, which, howover, hava little odor or decided color. 'The ialands were' all remarkally deficient in animals, thus indicating their isolated nnd conrpara. tivaly recent orighin. Tuptle report in great numbers to many localitiea, and fish are pleniliful on the coasts. Several epecies of whales, the cachalet or sperm whale, Cape whale, humpback, and blackflah, nre pecollar to the aeas of the Pacifle, and their capture hus veen tho chief inducement forabipe viliting these regions. Oxen have been int roduced from New Sonth Wules, and thrive well; and harses from South Americs. The natives of Polynesja are in general a well-furmed, tall, active, and intelligent people. There are two distinct races, one apparently of Malay origin, by far the most numerons and Intellectual, and spread over all Central and Eaatern I'olynesia, and apesking one comimon langnago, though varying in dialecta. 'The other a negro or l'apuan race, with negro features and color, und crisyed mop-like hair, growing in aepa pate tufts, speaking a distinct language, and exhiblting an intellect of ar. inferiop graile, prowslly the first settlers of the islands, and now confined to the western jart of Polynesis, and Inhabiting partly or wholly New Guinea, New Brlesin, New Ireland, the Solomon lslands, New Calcdonia, New IIebrides, and part of the Ladrone [s]. ands. Some of the weatern islands, as the Ladrones, were discovered by Magelhaens in 1621 , the Marquesas by Mendafia in 1595 ; lut it whe not till 1767 that Wallis, and sulssequently Cook, explored and degcribed the leading islanda of thle region. Soon after this, missionaries began to settle in the isjands; and after many discouragements at laat have succeeded in promoting Christianity and civilization in some of the principal islands; though cannibalism and aavage ferocity still prevail in the majority. The populat lon of these islande varica continually from ware, migrations, and oceasional pestilonce. Tahiti and some others, when first discovered, wero conjectured to be greatly more zopuluns thun at present, but no proper data cxist fur athording even en approximation to the real nmubers. Probably the popalntion of the whole of lolynesia does not oxceed one million or one million and a hslf. - Hathere's Gazetteer.

Pomegranate (Ger. Granatijpfel; Ft. Girer des; It. Granati, Melagrani; Sp. Granadas), the fruit of the pornegrnaste-tree (f'unica granatum). This itre, which grows to the height of 15 or 20 feet, appears to be a native of Persia, whence it has been conveycd, on the one side, to Sonthern Burope, and on the other to the tropical parts of Asia, und eventually to the New World. The fruit is n pulpy, mony-seeded berry, the size of an orange, covered with a thick, brown, coriaceous rind. The pulp hus $n$ reddish color, and a pleasant sub-itid taste. The valuo of the fruit depends on the smallness of the seed and the largeness of the pulp. The finest, called by the Persians badenn, or seedless, is imported into India from Cabui and Candahar, where the pomegranate grows In perfection. The tree thrives all the way to the equator: Iut within the tropics the fruit is hardly fit for use. The pomegranates brought to market from the sonth of Europe and the West lndies are very inferior to those of Persia.

The Punica granatum. is 'n tree, in magnitude and ligneous character, bearing considerable resenblance

The

British porcelain manufacture is principally carried on at the potteries in Staffordohire, and at Worcester, Derby, Colebrook Dale, and other places.
M.rrhine C'upa,-It was long a prevalent oplnion amoug moders eritics that the tasa murrhina, so fameus in Roman history, were formed of porcelain. Pompey was the first who brought them to Kems from the East, abeut 64 yeare before the Christlan era. They were used as drinking-cups, and fetched enormous pricea; Nero having given, according to the commen method of fiterpreting, $£ 58,000$ for a single cup! The extravagance of the purchaser may, in thls instance, be suppesed to have increased the price; so that the dogree of estimation in which these cups were beid may be mic: 9 at urately inferred from the fact that, of all the rich speils of Alexandria, Augustus was content to select one for his share.-Surtonius, lib. il, c. 71. Pliny (lib. xxxvii. c. 2) sajs they were mado in l'ersia, particularly in Karamania. But thoee whe contend they were China-ware, chiefly found on the following line of Propertius:

Murrheaque in Purthis pocula coora poots.-Lib. Iv.
In despitc, howover, of thls apparently decialve anthority, Le Bland and Larelver have, In two very learned dinsertatlons (Mfimoires de Littérat. tom. sllii.), which Dr. Rebertson has icelared are quite satisfactery, endeavored to preve that the vasa murrhina were formet of transparent stone, dug out of the earth in some Eastern provinces, and that they were Imitated in vessels of colored glass.-Robertson's Disquisition on India, neto 39. Dr. Vlucent 'Commerce and Navigation of the Ancients, vol. ii. p. $72 i s$ ) inclines to the oppesite opinion; but the welght of authority is evidently on the other side. At all events, it la plain that if the murrhine eups were really porcelain, it had been exceetingly scarce at Reme, as their price would otherwise have been comparatlvely moderate. But it is mest prehable that the ancients were wholly unacquainted with this article; which, Indeed, was but litthe known in Europe till ufter the discevery of the route to India hy the Cape of Goot Hope. For some tarther tetails on this question, ste Kinmivaif, Antiq. Rom. Jib. iv. c. 3.-See American Jounal of Science, xxvi. 233; American Monthly Review, il. 117.

Port, a harbor, river, or haven, fermed either by natore or art to recelve and shelter shippiag from the sterms and waves of the open sea. Artitieial ports are those which are either formed by throwing 'a streng moond or rampart across tho harber's mouth to some island or rock, or erecting two long barriers, which stretch from the land on each side like arms or the horns of a crescent, and nearly inclose the haven. Tho former of these are called mole-heads, and the latter piers.
Port is also a name given on some occaslons to the larbeard or left side of the ship, as in the followine instances. Thus it is said, "The ship heels to port;" that is, stoops or inclines to tho larbeard slde. "Top the yard to port," the order to make the larboard extromity of a yard higher than the other. "Port the helm," the order to put the helm over the larboard side the vessel. In all these sonses this phrase appears intended to prevent any mistakes happening from the similerity of sounds in the werds starboard and larboard, particularly when they relate to the helm, where a misapprehension might be attended $w$ : th very dangerous consequences.

Ports, the embrasures or openings in tho side of a ship of war, wherein the artillery is ranged in battery upon the tecks abovo and below.

Port-au-Prince, the capital of IIayti, or St. Domiugo, in lat. $18^{\circ} 33^{\prime} 42^{\prime \prime} \mathrm{N}$., long. $72^{\circ} 22^{\prime} 11^{\prime \prime} \mathrm{W}$. Popuation variously estimated, pwobally from 18,000 to 20,000 . It is situated on the west cosst of the island, at the bottom of a large and deep gulf. It wns founded in $1 \mathbf{7 4 9}$; since which, vith few intervals, it has been tha eapital of lirench St. Demingo, as it is now of the entlo island. It is partially fortlied; the harbor being protected by a battery on a amull lsland nt a little distance from the shore. The country round Is low and marshy; and the heat In the summermentha being excessive, the climate is then oxccedingly unhealthy. The buildings are principally of wood, and seldoni exceed two atories in hoight. The entrance to the harbor is between White lsland and the seuthern shore. The depth of water varies from about 18 fect at elb to about 21 feet at full tide. It la customary, lut not compulsery, to employ a pilot in entering the harbor. They are alwaye oh the look-out. Ships moor head and atern, nt from 100 to 500 yards from shore; loading and molording by means of boatr, as there are noither docks nor quays to assist these operations. The larbor is perfectly aafe, except durlng hurricancs, whiell may be expected from Augunt to November. The comnerco of l'ort-au-Prince is carried on by various classes of persons. The lmperts from Vurope and America are principally consignell to Jitropean and North Americun enmmission houses, besides a fow Itaytien establishments. The eapital is one of the ports to which foreign merchants are confined by the law of patenta; bat they are reatrleted by heavy penalties to a wholesale business with Haytiens, and to a minimmm amount of gooda. Of course they can not deal with the consumers, but with the natise retailera, who are chiefly women, styled "merchanden;" these employ hucksters, also women, whe traverse the country, attend the marketa, and five an necomit of their transactions to their emplogers, elther every even-

Jing, onee a week, or once a month, according to their eharaeter for integrity.

This clty, being the capital of tha emplre, centralizes the large bulk of Haytien foreign commerce. It is true that lesa than a third of the vessels ongaged in this foreign commerce depart from its ports with full eargoes; but thie ia owing to the fact that it is unable to supply sufficient exports; and the Jaws of Hayti permit foreign veasels, after unloading at the first port, to proceed to others to make up their cargoes. The gencral navigation from 1846 to 1850 comprised, arrivals and departures, 1448 vessels, with an aggregate of 219,810 tons, or an annual average of, 290 vessels of 43,962 tons. The flags whioh enter into the forcign trate of thls pert are, the United States, French, English, Danish, Belgiun, Hamburgian, and Bremen. Notwithstanding the great efforts made by Great liritain and France in 1847 and 1848 to ameliorate the commereial and agricultural condltion of Hayti, its general commerce, during the five years ending with 1850 , deelined at least thirty-three per cent. 'W hen compared with the preceding tive years. Its Europan commeree, more especially, is yearly declining, while its general trade with the United States has largely increased. The number of Ameriean vessels entered aud cleared during the last six months of 1854 was 122 , with an average of 200 tods each. Total value of ear-
 lumber, and dry goorin. l'sijoes homeward consisted of logwood, eoffec, and homp, the value of which is omitted in the official returus. Assuming the nqrigation between the Inited States and this port to have been as active the firat six montha of 1854 as the last, the tigures for the wholo year would stand thus: 'lotal number of Amerlean vessels entered and cleared at Port-au-Prince in 185.4, 244. Official returus give as the total for 1852, 210; 18* 189 ; which aloows an increase for each successive : ....-Commercial Relations of the U'nited States.

Port Aux Cayes, a sea-port of Hayti, is one of the most impertant of the empire. In 1850 there ontered and cleored 372 vessels, measuring an aggregate of 50,574 tons. The city is generully reputed one of the most pregressive in the Island, and is theo capitsl of the sonthern penlusula of Mayti; the best irrigatel and most fertile province in the empire. Here, sa in the other perts, the United States holds the first commercial rank. The chief imports from the l'aited States are provisions, of which the consunption is heuvy. During the jast two or three years Aluericsa merchants have also imported domestic cottons and manufacturea of cotton, generally in such quantities, and with such suecess, as to have already disheartenedsil forelgn competitlon. The French authority (Comonerve Aixterieur) \&ays, in refercnee to this singular snccess of Ameriean merchants In this ns in the other markets of Ilayti: "This speciea of merchandine (American cottons) is in high repute for its exeellent quality. It is superior to that manufactured In England, and is sold at a lower llgrese." Frauce supplies a small quan. tity of wioen, oils, and fabries of Marsellles nut Paris. Consters plying hetween St. Thomas, Curaçoa, and Jamaiea, impert amall packeges of Luropean wares, and some provisions, for which they gencrally find a ready market. 'The quantity of eoffee amminlly exported from Aux Cayes is entlmated at between four and tive million pounda. Furing good neasons this Gigure rises to six million pounds. In thia total, how. ever, aro included considerable quantliles imported constwise from the nolghbnringi porth. The district proper of Aux Cayen fuppling hut littlo eoties, the primeipal article of enlt ore being the sugar-eane, the produce of whleh, first converted into slrup, then nanufactured into rum, tatha, ete., suppliea the greater part of the islami with spirltuens lifuors. Imports into Aux Cayes, 1850.-From the Uniter Statos, $\$ 266,106$; Great llritain, $\mathbf{~} 246,480$; lirance, 839,432 ; IIanse. Towns, $\$ 29,0074$; othar countries, 898j8; total, \$591,510.

Porte, the Bublime. The official title of the governmeat of tha Ottuman empire: said to be derlved from a gate of the palace at Broussa, the original metropolis of that ampirc, callad Bâb Humayoor, the subline gata.

Porter, a liquor brewed from ianlt, part of which has been mora highly dried than that used for ale. It is hopped in tha same way as ale; and lts deep color is tinally given to it either lyy burned sugar, which usually goes under the name of coloring, or, more legitimately, by roasted or parched malt. Porter was first brewed in $1: 22$. The malt liquor previonsly drunk conaisted of three kiuds-ale, heer, and "twopenny ;" and a mixture of eithle of these kinds was a favorite beverage under the nam3 of "half-and-half;" or a mixture was drunk called "three threads," consisting of equal portions of each oit the above kinds of liquor, for a draught of which the publioan had to go to threa ditferent caske. About 1722, Harwood, a London brewer, commenced brewing a malt liquor which was intendel to unite the flavers of als and beer, or ale, leeer, and "twopenny;" and, having succeeded, he called his liquor "entire," or "entira butt," n name intended to lntimato that it was drawa from one cask or butt only. A mixture of nle or porter, drawn from different casks, is very commonly lrunk lul London at the present time. Harwood'a liquor obtained the name of porter from its consumption by porters and laborera. From 1;22 to 1761, the retail price of porter in London was $3 d$. per pot, when it was raised to $3 \frac{1}{2} d$., at which it continued till 1790. It has never been higher than $6 d$.

Porter's Anchor. This anchor is an English patent, and is axteusively used at Southampton, and other Euglish porta. Ita peculiarity consists in giving to the arms and flukes a freedom of motion romed a pivot or fulerum at the end of tha shank, thus departing at onco from the rigidity usunlly observed in the constructiou of anchors. The arms and flukea aro forged wholly independent of the shank, and have a hole drilled transvorsely through the centre ior tha reception of the iron bolt which counects them with tho shank. The effect of this construction of a awlvel nnchor is, that when ona fluks enters the grouad the other necessurily falls dowr upon tha aliank, thereby avoiding the danger incident to tho upward projection of a aharp point. The objects llasigned to bo attained by this new construction are said to be mainly the two following : the avoidanco of the conaequence of what is called "fouling," by the cable passiog over the exposed fluke of the anchor when tha veasel is awinging in a side way; and the aveilance of injury to the vessel itaelf in the event of falling on i.er anchor.

Porters and Porterage. Porters are persons employet to carry mesagges or parcels, etc.-See Callmens.
Portlana, city, port of entry, and capitnl, Cumberland county, Naine, is situatod on a peninsula at the western extremity of Casco ISay, 60 miles sonth-southwest of Augusta. It is 105 mlles from Ilosten, via the Eastern Lailroad, aad 111 via lleston and Maine, and 904 from Montrenl, dia the Atlantic and St. Lawrence lailroail, and the Kenuebeo and Portland, and the Androscoggin and Kamnabec, conneoting it with Augusta aud with Waterville. Lat. (Mount Joy), $43^{\circ} 30^{\prime} 63^{\prime \prime}$ N., aud long. $70^{\circ} 18^{\prime} 81^{\prime \prime}$ W. from Greenwich, nad $7^{\circ}$ $49^{\prime} 14^{\prime \prime} \mathrm{E}$, from Washington. Population in 1800, 11677 ; in 18t0, 7169 ; in 1820, 11, 581 ; in 1830, 12,601; in 18.10 , 15,318 ; in $1850,20,815$; and in 185-4, 25,010. The peninsula projects castwardly into the bay about three miles, and has an avarage ivilth of three-fourthe of a mile, forming throughons its entlre leugth an elevated ridge, which, infand, ises into considerable hilla, presenting a very beautiful appearance. The ro wera
in 1856 seven banka, with an aggregate capital of $\$ 2,000,000$; an insurance offica; an extensive establishmeat maklng locomotives and rallroad cara, employing 175 persona; threa iron founderics, three braas funderlea, six machlne shops, three edge-tool factories, a chaln-cable factory, an axtensiva sperm-oil factory, two plane factorles, two piano-forte factorics, two tannerias, aix lumber-yards, fiva ship-building establishmenta, 295 stores of various kinds, and many manufaotures of small wares; ten printing-offices, issuing two dally, two tri-weekly, nina weekly, and one semimonthly, publication. Capltal employed in manufactures $\mathrm{ln} 1850, \$ 761,850$; value of manufactured articles, $\$ 2,168,290$.

Tha harbor ia capaclous and safe, and among the best in the linited States. It is pretected by islands from the violence of atorms, is seldom obatracted by 100, has a good entrance, aud la defended by forta Preble and Scammel, the former garrisoned by United States artillery. At the eastern extrenity of the city is a tower, 70 feet high, erected for the parpose of obacrving veasels at sea, and furnishad with slgnals. The harbor is connected by the Cumberland and Oxford Canal, $20 \frac{1}{2}$ miles long, with Sebago Pond, and thenco with Long Pond, ctc. Tho Atiantic and St. Lawrence Railroad, or, as it is now ealled In Canadu, the Grand Trank Railrond, waa commenced In 1844, and is now complete to Montreal. Through thls avenuc pasa $n$ large propertlon of the products of the North and Wast for shipment to Europe and clsewhere. The fordign commerge of the city is chlefiy with the West Indies and Euro ${ }^{-}$e. Its clicef exports are lumber, ice, fish, provisions, ete. The coasting trade is principally with Boston, and during the summer a steamboat pllea daily to that city. Tonnage in 1853, 104,350 tons. Portland was formerly a port of Falmouth, and 130 houses, constituting two-thiris of tha village, ware burned by the British in October, 1775. It was incorperated onder its present name in 1780, and received a eity charter in 1832 . It was formerly the capitel of the State of Maine,
Port Louis, or IJorthwest Port, the caplal of tho Nauritlas, at the bottom of a triangular bay, the entrance to which is rather difficult, in lat. $20^{\circ} 9^{\prime} 56^{\prime \prime}$ 8., long. $67^{\circ} 28^{\prime} 41^{\prime \prime}$ E. Every vessel appronching the harbor must holat her flag and fire : wo gons; if in the nlght, a light must be shown, when a pllot comes on board and stecrs tho ship to the entrance of the port. It is a very convenient port for carcening and repalring, but provlsions of all sorts are dear. In the hurricane months the anchorage In Port Louis is not good, and it can then only accominodate a vory few v"ssels. The houses arg low, and prinelpally bnilt of wood. The town and harbor :.,e pretty atrongly fortified. Almost all tho foreign trade of tho island is carried on here.

Porto Rico (San Juan de), the capital of tho valunble Spaulsh island of the same name, on the nurth side of the islant, on a peninsula jolned to the main land by a narrow isthmus, lat. $18^{\circ} 29^{\prime} 10^{\prime \prime} \mathrm{N}$., long. $66^{\circ} 7^{\prime} 2^{\prime \prime} \mathrm{W}$. Tho fortlicatlons are very st rong. 'The town, which stands on a pretty atee decl vity, is well built, clean, and coutains nenrly 80,000 inhabitents.

Harbor.-Tha harbor of Porto Rleo has a atriking resomblance to that of Havena, to which it is hut lltthe inferior. The entrance to lt , about 300 fathoms in width, has the Moro Castle on Its east slde, and is deferded on the west aide by forts creeted on twe small isla. .ls. Within, the harbor expande Into a capaciens basill, the depth of water varying from five to $\mathrm{A} \mid \mathrm{x}$ and soven fathoms. On the side opposito to the town there are extensl re and banks; but the entrance to the port, as well as the port itself, is unobstructed by any bar or shallow.

Porto Rioo, Island $n f$, lies in the sance latltude as Jemaica. Though the smallest of the greater Antilles, it is of very conalderable size. Its ferm la that of a pazallelegrain, being about 110 miles in length from
east to west, with a mean breadth of about 88 , containing an area of 8750 square miles. Surface pleasantly diversified with hills and valleys; soil generally fertile. It has, however, anffered much from hurricanes; these of 1742 and 1825 laving been particularly deatructlve. Since the breaking $n p$ of the old Spanish coloulal aysatem, the pregress of Porto Rlco has hardly been lesa rapld than that of Cuba. Her population, which In 1778 was eatlmated at 80,650 , amounted, according to a census taken In 1836 , to 357,086 , of whom 188,869 were whites, and only 41,818 slaves. It is obvieus from this statement that a large proportion of the free inhabltants are colored; but the law knowa no distinction between the white and the colored roturier; and thls circumstance, as well as the whitea being in the habit of freely Intermixing with peopla of coler, has prevented the growth of those prejudices and deep-rooted antipathles that prevail between the white and the black and celored population in the United States, and in the Engllsh and French islanda. The pepulation is now (1853) probably above 500,000 .

Porte Rico was discovered by Columbus in 1493, at which perlod it is said to have had a population of 800,000 souls. In 1509 it was lavaded by the Spaniards from St. Domingo, and in a few years the natives were exterminated. The island was explored and conquered by Ponce de Leon, the discoverer of Florlda, while prosecuting hls veyage in search of the foumtain of perpetual youth. Although, daring the past fifteen years, agricnltura has made great progress on the island of Porto Rico, there yet remalns, owing chlefiy to the want of labor and good roads, a considerable portion of it uncultivated. Immease plains, which, if planted with the sugar-cane, wonld reward labor most bountifally, are yet lying untouched by the hand of clvllization or colture, because canals are wanting, through which the water by which they are now lnundated could be drawn off. The islund abounds in excellent timber, but as yet it has yielded no profit to the inhabitants. There are also different kinds of the mere valuable woods for cabinet-makers, such as the acajou, polysander, etc.; but they still repose undisturbed ainidst the raviaes of the mountains. A remedy for these evils miglit be found in Immigration; but it has ever been the policy of the government to discourage the introduction and sittlement of foreigners. The laws to that end have been puiticularly severe in regard to all forelgners, especially to those not professing the Roman Catholic relig on. Every foreigner arrlving in l'orto liico is compelled, before landlng, to give some responsible resident as surety for his good behavier. After alx menths he muat either domiciliate or leave the lsland. Shond he select the former alternative, he must embrace the liemon Catholic faith, the only religion tolerated. An intelligent traveler, who lived for some time on the island, glves the following lnformation relative to the laws under whleh soreigners could become denizens:
" I'revious to the year 1828 strangers were required to produce the most undoubted evidence of belng Roman Cathollics, In order to become domiciled ; and having satisfied the authorities on this point, they were farther obliged, after five years' residence, to becomo naturalizel. lefere a stranger would the permitted to land, he must glve security for good politleal and moral conduet; and supposing that he could gratify the requirements of the law lit all these porticulars; such were the jealonsy and illiberality of the government, that few could be induced to remain In a country where no prospect of saceess appeared. Ia 1828, however, the leniency and more liberal pollcy of Don Miguel La Tone, the Captaln-general, ly relaxing the rigor of former requirements, contributed greatly in removing the lmpediments to the settlement of ferelgners on the Island. La Tone strictly carried out the spirlt of the Real Cedule of $\mathbf{1 8 1 5}$, having for its object the encouragement of agriculture and commerce in the Spanish
colenles. Thas the domicilio was procured by pajilng a trifling sum of mency, and by the $a_{1} p$ plr.unt coniblyIng with certain formalities. A censiderable whims. gration was the immediate effect of these measures of La Tone. Lured by the anperior fertllity of the soil, and the llberal pelley of hls adminlstration, planters from the nelghboring lalands of St . Crolx and St. Thomas sold their estates, and brought their capital and slaves into Porto Rlce. Their example was followed by averal plantera from the windward British and French islands. Thus seconded by foreign enterprise and forelgn capltal, the Island has conthued to prosper in a most extraordlnary degree slnee 1828. But notwithstanding thla rapid improvement, and the continued augmentation of its staple experts, thls inprovement would have been greater, and the exports considerably latger, but for the oppressive duties upon all articles of necessary consumption, and the frequent heavy exactions made by the government toward the support of the war in spoin. 'these causes, by diminishlug the profits of the planters, have prevented them from extending their estates. Hence the progress which has been maile in the cultivation of the soil is due rather te the centlnued Influx of new settlers with their important capital, than to the prosperity or in. creased Industry of the old."

The alave population is almest the only preducing power on the island; but this is so totally inadequate to the wants of the planters, that they are frequeatly obliged to procure additlonal help from Cuba. This, however, greatly angments their expenses, alnce a ro. bust and good-werklng slave, who in Porto Rict may be valued at $\$ 150$, can not be purchased in Caba for less than $\$ 600$. Sugar and coffiee are the staple productions; while tebacco, hides, woods, cotton, fruit, and rum form nlso a part, though to no conslderath extent, of the exports. Tohacco is cultivated entirely by free laber. The five principal commercial perts of Porto Rico are San Juan (the capltel of the is'and), Arecibo, Mayagüez, Ponce, and Guayama.

San Juan, or St. John.-Although pessessing a mag. nificent port, consldered one of the best on the islani, San Juan is net the first commercinl place, as the products exported thence are of a very inferlor quality. Of the sugar shipped from this port, as well as from the other ports of the Island, the United States recelve more than two-thirils of the whole. But a small quantity goes to lingland, and also, though rarely, to France. From the United States are imperted codfish and other salt fish; salt meat, hoards, lumber, hoops, staves, and butter; from Eng'md, beilers for the manufacture of sugar, machinery, small quantities of iron, and heavy supplles of earthen-ware. Spanish vessels take in cargoes at St. Thomas, and discharge at Sun Juan, thereby avoiding the duty applicalle to all vessels from all other adjacent forelgn perts, in the ports of Porto Rlco. Gencrally speaking, the whole island of St. Thomas ls but a great entrepôt of European and American manufactures destined for the markets of Cuba and Porto Rlco-a fact shown by the large amount of impertatlons from St. Thomas into heth these islands. The exports from San Juan in 1853 consisted of $11,369,304$ pounds of sugar ; 5803 hogsheads of molasses; 376 hogsheads of rum; and 910,966 pounds of ceffee. It Is to be regretted that the port of Sin Juan, one of tho best and salest of the Island, shemid be kept in so deplerable a condition. Six or seven years agn, a vessel drawing 16 to 18 fret water could take in of full cargo at the wharf; at present, a ship of the same tomnage can receive only three-fourths of her carge, nad is compelled to leave the wharf in order to get into water deep enough to take in the balance.

Arecibo, or Areibo,-During the last cight yenrs the commerclal condition of thls port has been highly prosperous. The imports and experts have greally lacreased; splenild manslons have been erected, and aeveral commerdal honsea establlshed. The harbor,
howev pelled during tire fr times or. seldon lobs of same logrsh to 15,0 of tith yards. of tob amell

ight years the n highly pros-- greatly inerected, and The hastber,
however, is so totally unprotected that veasels aro compelled to auchor in a very wido berth, and frequently, during the prevalence of north winds, are forced to retire from the shore and put out to sea. They sometimes recelve cargoes under sail, without casting anchor. Accidents are, in consequence, 80 frequent, that setdom does a year pass withoat having to record the loss of ono or more vessels. Imports are nearly tho same as at San Juan; the exports comprlae about 10,000 hogrsheads of sugar, 3000 of molasses, 1000 of rum, 14,000 to 15,00 quintals of coffee, and a considerable quantity of timber for Spaln, to be used in the Spanish shipyards. Arecibo also exports considerablo quantities of tobacco to Germany, the Unltel States, and Cuba, amoming la tho whole to about 2,500,000 pounds.

Mayagüez, or Mayaguas.-Thls is tho most lmportant port on the island. It possesses large capital, and contalns several costly and fine dwellings. Rapidly rebuilt after the great conflagration by which it was destroyed in 1841, Mayaguez has gained lin prosperity ; having been before that disaster but an inconsiderable village, it has now become the most important city on the island. The surrounding district produces large quantities of coffee, though since 1840 there has been a sensible diminution in that article. For that yeur the exports amounted to 80,000 quintals, while in 1853 they fell to 43,500 quintals. The coffee of Mayaguez stands in such high repute in Aincrica and Gerinany that purchascs are frequently mado in advance of the crop. Hence comes also tho best sugar of tho island, which is mostly imported in American bottoms into the United States. In 1853 thero arrived 83 American vessels of 13,272 tons, carrying freight to the value of $\$ 223,600$; and there cleared 76 , of $12,680 \frac{1}{2}$ tons, taking cargoes worth $\$ 460,013$. The molasses from this port is always of the best quality, and much sought after by American and English shippers. Besides coffoo, in 1853 there were exported $165 \frac{1}{2}$ hogsheads of rum, 8221 hogsheads of molasses, $20,766,033$ pounds of sugar, but only 4463 pounds of tohacco, showing a decrease, compared with the preceding year, of over 50,000 pounds. Thero were, besides, 1000 hogsheads of rum mixed with tabasoo pepper (malagueta), a preparation constituting now a new and profitablo branch of domestic industry. Imports from the United States and England are generally similar to tho imports into San Juan. Within the past few yoars a considerable number of planters, of moderate capital, have engaged in tho cultivation of cocos with perfect success. A few quintals of it sold to Spanish merchants have found a ready uppreciation at Barcelona, and the article is cousidered equal to the cocoa of Caraccas. It is quite probable that, in the course of a few years, cocoa will bo largely exported from Mayaguez, and thus supply the deficit caused by tho diminution in tho exportation of coffee. In addition to the products already specified, Mayaguez exports also considerable quantities of oranges, citrons, and other fruits to the United States.

Ponce.-This port is almost as important, in a commereisl point of view, as Mnyagitez. In 1853 it exported even more sagar and molassos than the latter. But the long droughts frequently destroy entiro crops-no rain fulling, oftentimes, for tive or six successive months. Notwith tanding, by dint of incessant labor, and by meuns fartificial Irrigation, tho industrious planter often succeeds in partially overcoming this drawback, and in securing a passablo harvest. Like Mayagüez, lonce possesses aome few vessels, which make regular voyages to and from Spaln. In 1853 the exports consisted of $27,804,269$ pounds of sugar, 13,161 hogsheads of molasses, $1,876,249$ pounds of cotfee, 72 hogrsheads of rum, and some hides. This trade employed 90 vessels from the United States, carrying 15,616 tons, and entering with cargoes of the valuo of $\$ 173,168$; and 80 vessels of 15,208 tons, clearing wlth cargoes in value \$684,662.

Guayama.-The drought, which affects this district
even more e2varely than Ponce, is the chlef cause of its commercial decadence. Many of the inhabitants have abandoned their eatablishments, and gone with their slaves to seek, in the interlor of the islund, a cllmate mere congenial to the culture of the sugar-canc. The sugar of Guayama shows a fino grain and good color for refinery. In 1853 there entered the port 85 Amerlcan vessels, having an aggregate of 15,471 tons, importling in value 8205,153 ; and cleared 83 , of 14,873 tons, exporting a value of $\$ 192,338$. The total exports of eugar during the saine year were $21,920,511$ pounds : of molasses, 11,618 hogsheads; of coffee, 806,683 pounds; and of tobacco, 101,862 pounds.

Mayaguez, Ponce, and Guayama are the three places on the island which possess the greatest number of steam-engincs, and machines for the manufacture of sugar. This remark applies in a special manner to Mayaguez, the climate of which is particularly favorable to the development of labor. In 1800 thero were put up here ten machines of from 10 to 16 horse-power each. The exportation of rum is not in proportion to that of sugar, owing to the largo consumption of that article on the island.

Among the secondary ports of tho lsland, Aguadilia and Humacao are tho most considerable. In 1853 the former exported $8,092,302$ pounds of sugar, 2,438,788 pounds of coffee, 649 hogsheads of inolasses, and 469,956 pounds of tobacco. The latter, in tho same year, exported $4,183,233$ pounds of sugar, 100,000 pounds of coffee, 1676 hogsheads of molasses, and only 11,220 pounda of tobacco, against 28,300 the preceding year. The great bulk of the coffee shipped from these two ports goes to Trieste, Genoa, and IIamburg. Germuny also takes from these ports a considerable quantity of tobacco.

Fajardo and Naguaba have some trade with the French West Iudies, with St. Thomas and St. Croix, consisting chiefly in an exchange of live animals and provisions for tho imports irom those islands. Their sugar, however, amounting annually to ahout 5000 hogsheads, is almost exclusively sent to the United States.

Sugar.-Previously to $18: 0$ scarcely enongh augar was produced for tho consumption of the island. According to official statements, the quantity exported from all parts of tho isiund of Porto Rico in 1839 amounted to $69,245,783$ pounds, valued at $\$ 2,423,602$; while in 1853 the quantity of sugar exported amountod to $110,605,859$ pounds, valued at $\$ 3,318,175$, showing an increaso in fourteen years of over tifty per cent. Tho United States alone received in 1853 74,710,336 pounds, valued at $\$ 2,244,3 \theta 9$, or over two-thirds of the whole quantity exported.

Coffee.-The quantity exported in 1839 was $8.538,302$ lbs., valued at $\$ 853,000$; and $\ln 1849,8,615.311 \mathrm{lbs} .$, valued at $\$ 516,918$. In 1853 it amounted to $11,580,604$ tbs., valued at $\$ 694,836$. Despite this seeming in. crease, it is a well-known fact that the cultivation of coffee is on the decline. Tho llanseatic citiea receive nearly one half of tho whole exportation of coffee, while tho United States take but an inconsiderable quantity.

Molasse3.-In 1839 there were exported $3,311,7197$ gallous, of the value of $\$ 496,759$; in $1849,4,328,135 \frac{1}{2}$ gallons, valued at $\$ 649,220$; and in $1853,46,6303$ hogsheads, valued at $\$ 466,307$. The United States received of the quantity exported in 1853 to the value of $\$ 363,612$, nearly three-fourths of the total exportation.

Cotton.-The cultivntion of cotton declines yearly, and has becomo at this timo insigniticant. In 1839 thero were exported $1,183,973$ lbs., valued at $\$ 189,435$; while in 1850 tho whole amount did not exceed 280,505 lbs., valued at $\$ 28,056$.

Rum.--'Tho value of rum exported in 1839 was $\$ 16,241$; and in $1853, \$ 17,106$. Tho exportation of this article bears no proportion to that of molasses, as rum is immoderately consumed by the common people on the island.

*Tho "Balanza" glves thle sum as $\$ 107,257$ 31, whitoh lo an crror.

Previously to 1815, Porto Rico, being exeluded from all direct intercourse with other conntries, excepthg Old Spain, was either stationary or but slowly progressive, the entlre value of the exports in that year having amounted to only $\mathbf{i 5}, 274$ dollars! But at that epoeh a royal decree appeured, which exempted the trate between Spain and the Spanish colonies and Porto lleo from all duties for tificen years; and sho was then also permitted to carry on a free trade, under rea-
sonalle dutles, with other countries. In consequence proncipally of these wise and liberal measures, hut partly also of a considerable lmmilgration of rich Spanish colonists from South Ameriea, Porto Rico has latterly made raphd progress. Great improvements linve been effected In the police and internal adminis tration, and roads have been constructed tn all parts of the island. The exports of domestle produce from the U. S. for the fiseal ycar $1856-57$ were $\$ 1,783,429$.

General coniarative Statement of the Anount and Chapacter of the conmpice of hobto Rico phom 1 gis to 1858.--(From tho "thanzus Geverales.")

Spanish: Weat Indles, as a market for nll the merchandise. It will bo seen that the United States occupy the ilrst ranl: as regarde the amount of exporta, taking mote than ono half of the total exportations. "They receive two-thirds of all the sugar, and three-fourtha of cll the molasses exported; these being the principul articies ontcriag into the export trade of Porto Hico. The exportation to the United States amounted In 1853 to $\$ 2,340,000$, chiefly for suggr ant molassea. Spain holds the soeond rank in importations into, and only the fourth ss reapects exportations frein, Porto Rico; since the forelgn Antilies Import more into the island, and the United Statea, England, and the Hanseatic cities take more from it, than does Spain, despits all differential suties in her favor, both as respecta shipping and trade.

Tonnage Dutise.-Ships entering the ports of the isl ant of lorto Rico will pay, If forelgn, $\$ 1$ the ton; if aationai, $37 \frac{1}{3}$ conts the ton, as per regiater. National vesse's bringing full enrgoes of coald will jay no ton-
nage dutiea, although the number of tons be lesa than indicated by their regiater; forelgn veasels will, however, pay 50 cents per ton, in compliance with the royal decree of December 28,1848 . But whenever a ahlp, cither natlenal or forelgn, brings other eargo beaides coals, no matter whether tho coals be equal to, or more tban, the amount of her tonnage, she will pay the tonnage duty in accordance with aaid decrec. Veasels loaded with coala only are exempted from local duties with the single exception of the fee (\$23) to the captain of the port for ontering and clearing. National or foreign vessola elitering the ports will pay, In addjtion to the duties speelifed, $12 \frac{1}{2}$ cents per ton, as per regiater, for the parpose of deepening the harbor. Vessels arriving in the harbor of San Jusn, under whatever circumstances, or for whatever purpose, will pay 12$\}$ eents per ton for dredging and keeping the port navignlile. National vessels to or frem the island of St. Thoinas will pay, at whatever port, the tonuage duties applicable to tha flag.

American vessels entering ports in tho ialands of Cuba nud Porto Rico in ballast are not subjeeted to the payment of any towage duty whatever; and American vessels entering the forta in the islands of Cuba and Porto Rico, with cargoea of any description of merchandise whatsoever, are exompted from any charge of tonngge duty, if such vessela export or convey therefrom cargoes of molassea taken in at said ports. Exetnption, therefore, from the liability to tonnage duty of Spanish vriascls coming froin ports in the islanda of Cuba and Y'urto Rico is oxtendet to such vossels arriving in ports of the United States, elther in ballast or laden with molasses taken in at any of tho aaid porta, togetier with such quantity of fresh fruit, the proluction of suid islands, as may be deaned by the collector and naval oflice:, under the provisions of the forty-tifth section of tles act of 2 d Marel, $\mathbf{1 7 9 0}$, to to admissible as surplus stores: provided the said vessels dejont from the United States in ballast, or with their cargoes of molasses, or cargoes of the staple productions of the United Stutes.mSee Commercial Relutions with the United States; Manual for United States Consuls; TurnieliL's Cuba and Porto Rico; llunt's Merchants Maga:ine, x. 327.
Portsmouth, a sea-port of England, In the English Chinamel, on the western side of the island of Portsen, at the month of the bay called Portsmoutl IIarbor, lat. $50^{\circ} 47^{\prime}$ N., long. $1^{\circ} 6^{\prime} \mathrm{W}$. Portsmouth 11 arbor excels every other in Great Britain in depth, capaciousness, and sccurity. At its entrance the harbor is very nevrow, but soon expninds into a grent wilth. Every where the anchorage is good, the depth sufficient for ships of any size, and in extent alnoat sufficient to contain the whole English navy. The roadstead of Spithead, between Portsmouth and the Isle of Wight, can contan 1000 sail with security. Ship-building and other manufactures are carried on to a considernble extent. The cod und other fisheries are actively presecuted, and l'ortsmouth has considerable foreign and
coasting trade. The toanage of the port in 1853 was 26,645 tona.

Portugal (Lusitania), a country of southwestern Europe, forming the western portion of the Iberlan peninsula, and aituated between lat. $36^{\circ} 57^{\prime}$ and $42^{\circ} 8^{\prime} \mathrm{N}$., and long. $6^{\circ} 15^{\prime}$ and $9^{\circ} 32^{\prime}$ W., bounded east and north by Spain, south and west by the Atlantic Ocean. Capital, Lishon. Length, north to mouth, $\mathbf{3 6 8}$ milca; breadth, 80 to 140 miles; and there ure few pasaable roada. Wheat, barley, oata, fax, and hemp are cultivatod in the elevated tracts; rice in the lowlands; olivea, oranges, lemons, citrons, figs, and almonds in the central and bouthern provinces; and at the southern extromity, the American aloe, the date, and other troplcal plants. The cultivation of the vine is the most important branch of industry, and the produce of the vincyards watered by the upper Douro, termed port, Is the ataple export. There are extenaive foresta of oak in the north, chestnut in the centre, and the sea-pine, kermes, and cork in the south. The olive oil is of inferior quality. Mules and nsses are the chief beasta of burden; oxell are used for draught in the provinces. Cattlo and sheep are reared in considerable numbers, but the wool is not of fine quality. Goats and hogn are numerous, and fish ahomd in the rivers and on the coasts. Iron, marble, ant salt are the chlef mineral products; the mines of tin, lead, and antitnony are not worked. There are numeroua salt marahos on the coust, and 200 mineral apringa ase enumerated. The mannfactures are very limited, ehiefly arms and porcelain at Lishon, woolens at Portalegre and Fundao, cot-ton-spinuing at Thomar, jewelry and trinkets at Lisbon and Oporto, glass at Marinha-Granne, paper at Alemquer, allka at Brnganza and at Campo-Grande, near Lishon. Liabon, the capital of Portugal, is the principal port, and ia situated on the north bank of the River Tagus, the oliservatory of the fort being in lat. $38^{\circ} 42^{\prime} 24^{\prime \prime}$ N., long. $9^{\circ} 5^{\prime} 50^{\prime \prime} \mathrm{W}$. Pophlation, about 240,000 . The harbor, or rather road, of Lisbon is one

## POR

of the finest in the world, and the quays are at once cenveniant and besutiful. Fort St. Jullan marks the northern entrance of the Tagus. It is built on a ateep, projecting rock. There ia a light-house in the centre, 120 feet c.bove the level of the sea. At the mouth of the Tagus are two large banka, called the North and South Cachopa. There are two channela for entering the river - the north or little, and the south or great channel. On the middle of the South Cachop, about 1\& mille from Fort St. Julian, is the Buglo fort and lightheuse, the latter belog 68 feet in height. The least depth of water in the north chananal, on the bar, is four fathems, and iu the south six. The only danger in enteriog the part arisce from the atrength of the tide, the ebb runaing down at the rate of aeven niles an hour ; and after heavy raina the difficulty of entering is considerably augmented. The trade of the country is mootly conducted by the English and other foreigners. The population and extent of Portugal are ehown by the following atatisties, taken in 1855:

> Population. 3,500,000
> Extent in equary miles 34,600
> Conmunga. . . . . . . . . . 260

The greal foumtain of wealth in Portugal is in its vineyards; nad yet, under the system of polltical econouny practiced by the govemment of that kingdem, wind can not be either grown, made, or exported, exeept under heavy restrictions and imposts. Until within the past few years, there was not sufficient corn grown in the few agriculturel districts for the necessities of tho country; still, corn is classed amung its ataples, and ita importation frmon forcign countries prohibited, unless when, from any causo, the home supplies aro inadequate to meet the demands for consumptien. The foilowing official return exhibits the entire agricultural resources of Pertugal for the year 1851, nnd, with the exception of corn, the supply of which is constant?: fluctuating, may lse regarded as a fair index of the average yearly agricultural wealth of this kingdom:

The moie is equivalent to 22.30 bushels. The arola equala 32 ive.
In 1831 Portugal imported 553.740 alquieres ( $\mathrm{er}^{\prime}$ ? equal to 82 lbs .) of grain; i,et veen 1846 and 1851 sl: exported, as appears froun 'her official statistics, about $1,800,000$ alquiere from Caminha, and about $4,00 \mathrm{M}, 000$ alquiere from Via 7a; making a total of nearly $6,000,000$ alquieres, c. $1,00,000$ alquieres per annuin; or an expertati, $n$ of about $t$ wice as much as she formerly imported. With this brief refere, ice to the natural capabilitien and agricultural resources of Yortugal, the laws and regulaicicas under which that kingdom conducts its toreign cominerce, the cha' acter and extent of that commeree, and the deacriction of merchasdise which conatitutes the laid'ng articles of exchanges eapecially between Portapz: and the United states, will next considered. Fir a long period the comroercial relations of the United States with J'ertugal were regulated by such nets of legisiation as tho Portuguase governmeat thought proper to adopt, with no other check ther the countervailing legislation of the United Statee. Under thia system the direct trade
between the two countriea in national vessels, laden with the produce and manufactures of either, was al. lowed on terme of full reciprocity; but the indirect trada was fottered by discriminations and restrictions, and by the countervailing duties to which they gave rise, until the treaty of commerce and navigation entered into between the two countrice in 1840 placed their trade on a basis of entire reciprocity. This treaty atipulates that vessela of elther country arriving la the porta of the other shall be put on the footing of nation. al vessels; that no other or higher duties ahall le lev. ied on the produce or manufactures of either country, when imported into the other, than on similar produce, etc., of other foreign countries ; that the same duties shall bo levied on anch importations, whether In Ameriean or Pertugueae vessela; that all favora granted by either party to other nationa shall become commen to both; anil that Amorican vessels shall pay no lugher duties of export in the ports of Portugal than national vessels. This treaty is declared to be in force for six yenrs, a d further, untll the end of one year after either party shall have given notice to the other to terminate the same: no such notice haviug been given by elther party, commercial relations between the two countrles are atill governed by its proviaione.

Under the stipulation equalizing American and Portuguese ressels with respact to dircet importations, the American flag enjoyed, during a brief period after the ratification of the treaty, apecinl advantages ever the vessela of other foreign nationa. This was the result of a law passed by tha Cortes in 1837 wefore tho treaty was alopted), by which a deduction of fifteen per cent. on alt dutiea was allowed on merchandise limported in national bottoms. This ineasure, although it had gives a great impulse to the national shipping of Portugst, and largely augmented importations in Anecrican bot toms, was found to exercise a disastrous effect on the publie treasury, diminishing the revenue from that souree about $\$ 300,000$ annually. It was consequentiy alollshed; and after the 15tt. January, 1842, ail foreign vessels wero equalized, in this respect, with the national flag. Notwith standing Portugal possesses natural advantages and resources which inight enable her to rank among the most important trading conntrice in Europe, her commerce with foreign nations, and partleularly with the United States, has dwindleit dewn to the mere sladow of what it was in lormer times; nor can much lope be inci:nged of a speedy cominercial regeneration of this kingden so long as her present restrictive and prohibitory regulationses. ist, and her unsurpasseci natural resources remain onder their present partial and iniperfect systen of development. The dismemhermet: of Bruzil from the kinglom of Portugal (1820) would seem to mark the A iod of the greatest decline in her commerce with the United States. This can be hest iilustrated iy giving the official returns for ("a equal periods preceding and following tilis evert, a. centrasting the resulta.

The wines which, at the exportation of 1853 , were valued at $6,186,680$ france, were not put in the account of the crop of 1852. The imports of wine from Madeira into the United States for the fiscal year ending Junc 30, 1856, were 23,649 gallons ; and from Portugal, 62,583 galions.

It thus appears that in 1818 the exports from Portugal to all nationa were only about one-thirl, and the imports from all nations about one half of the amount of exports and imports in 1801, or half a century ago. The general movementa of trade between tho United States and Portugal have varied so little during the past twenty years that they may be regarded na stationary, at least so long as the existling commorcial regulations remain unchanged in both countries. I)uring the past ycar, however, the government of Portugal has manifested some disjosition to review and modify its entire system ot comnercial policy ; and the good effects that have already succeeded the initiatory measures to this end, already adopted, will, it is believed, encourage it to removo altogether the onerous reatrictions which have so long fettered its trado wit's foreign nations. In 1853 the export duty on wine was materially reduced, and equallzed to all nations (a dlscrimin. ation having been mado, before that period, between exports to Europe and America); and the effect of this first atep toward a more liberal policy is evidenced in the increasod exportation of that great atapio in 1853 over the preceding year, to an amount excceding threefourths of the whole. This will be seen from the following table. The pipe is estimated at the United States custom-house at about $113 \frac{1}{2}$ galions:
Exporte of Wing, Baandy, etc, thom the port of Orobto in the Yeade 852 and 1853.

The subjoined statements of the commerce and navigation of Oporto during the Portuguese fanancial year

1854-55, and the movementa in wines and brandy the same period, are mado up from returns of the United States consul at that port.

Alterations lately made in the Portuguese Tarif (1853). - Broadeloths have been reduced 12 per cent. Kaw silk now pays only two-fiftha of tho former duty. On satins, gros-de-Naples, etc., a reduction of nearly 54 per eent. has been made. Flax has been raised to 42 cents per quilntal of 128 pounds, being an advance of 200 per cent. In Jinens, and goods of cotton and linen, as woll as woolens, no great alteration has been made. In gray cloths and white shirtinge there haa been a reduction of about 12 per cent. Ale pays about onethird of the old duties. Wine, which heretofore paid an import luty of about $\$ 266$ per pipe, has been reduced to alout one-fifth of that amount. The export duty on port has been reduced and equalized to all the world. Pinnos, which formerly paid from $\$ 48$ to $\$ 192$ each, accoriling to size, now pay $\$ 24$ each, regardless of size. Formerly, no tea could be importod except in national vessels; the duty being, from Portuguese territories, about 1s. 9 d . English (42 cents), and from other paizs $4 s .3 d$. per pound, equal to $\$ 102$. Now tea may be imported indirectly, in national or foreign bottoma; Portuguese vessels atill enjoying the usual discrlminations over forcign vessels engaged in the indirect trade. It is believed that Portugal has no treaty with any nation equalizing foreign vessels to national vessels in the indirect trade. If so, all foreign flags are equally subject, with those of tho United States, to an additional daty of 20 per cent. when importing goods not the produce of the country to which they beiong. The chief difficulty which forcign merchants have to encounter, in selecting a cargo for the Portugueso market, arisce from the complicated and alnost uninteliigible terms in which tho tariff of that country estimates the value of merchandise. Cottons, linens, and in many instances, even fluids, are estimated by the pound; and, owing to the great varicty of specific articles under any particular genua, and the great differonce in their respectivo prices, it were next to impossible to say, oven approximatoly, what duty is assigned to all or any of the descriptions of merchandise which usually make up a mixed cargo. Cotton, for instance, is thus classed in the tariff of 1852: raw, per 101 pounds, $2 \frac{8}{\operatorname{con}}$ ces (which ia plain enougi); manufactured, from 6 cents to 70 centa per pound (which is not). Siould an American merchant desire to ship, to Lisbon or Oporto a cargo of such American produce as would be most likely to find a ready market in exchangu for the wines or fruits of Portagal, he would naturally turn to the Portuguese tariff, to ascertain tho import duty on such descriptions of merchandise as he could most proftally send. The articlu of cotton manufactures, it has been shown, would probahiy afford some oxercise to his skill; but let him select a cargo of tobaceo. The Portuguese tariff informs him that it is admitted only when sold to government contractors; but ine is left in the dark with respect to the preciso duty to which it ia sulyect. If he has a correspondent
nt $O$ ，arto or Jiahon，he will inform him that the daty on tobacea is axilitraty，and deperads on the torms of the partionlar bargain the may make with the govern－ ment contraotors，＇after his cargo shall havo penclied port．

- Thin complex clasalfication of the Portaguese tariff Induced some Britleh merchanta，a feer yeare aince，to

An additional tax of 15 per cent. on the amount of tonnage and bar-dues is also exacted in Tporto. Under treaty, American vessels are cqualized with national vessela as to these duties. Contributions for the exchange building, five reas $=$ one half cent, nearly. Steamers pay two-fifthe less tonnarge duos than salling vessels. The contribution for the bar is the same for both. Every captain of a merchant-vcasel is bound to have two manifceta of the same tenor, slgned by himself, and certified by the Portuguese consul or vicoconsul at the port of departure. Goods omltted in his manifest, or of a different description, have to pay a sum equal to the value of the goods. Goods adinicsible being omitted, a fine equal to double the amount of the duties, and custom-honse charges and imposts. - U'nited States Commercial Relations.

Portuguese Settlements. - The Portuguese havo nitmerous settlements lin Weatern Africa, situated on the River Caches, the St. Domingo, and the Rio Grande. The chiof settlement In Gulnea is on tho jeland of Loaado; and in Benguela, that of St. Philip. There is soms trade earried on between tho United States and these settlements, especially at Loando. The exports from the United States to this point consist of domestie cottons, flour, and speele; imports to the United States, gum-copsl, palm-oll, ivory, hides, etc. The following summary, exhibiting the general trado between the United States and Loando, during the first six months of 1854 , Is derived from a consular return : Number of American vessels arrived and clenred, 10, with an aggregate of 2218 tons. Vnlue of cargoce inward, $\$ 65,000$; discharged at Loando, $\$ 13,000$. Value of eargoes outward, $\$ 22,000$.

From a return of later date, the trade between the United States and Loando, for the last three months of 1855 appears to have been carried on Ly five American vessets, of some 200 tons each-three of them bolenging to Salem, Massschueette, and two to New York. Their cargoes Inward, Innded, conslated of dry goods, flour, rum, ete., to the value of $\$ 24,200$; the totai valne of inward cargoes being $\$ 61,500$; end their eargoes

[^42]outward, of palm-oll, guin-copal, Ivory, copper ore, etc.; to the value of $\$ 07,100$. Eish of thene vessels touched at Ambriz. Indeed, vessel trading to Loando uausl. Iy touch at Ambriz and Ambrizatte, where they hava agents, to whose consignment they land part of their cargoes, and take In such produce an may be in waltIng. They then touch at Loundo, and leave part of thelr remaining cargoes; then they inake for Benguela, where they uaually remaln from 40 to 60 daya, to close their ssles, and take on bosrd gum-copal and Ivory. On thelr homeward royage they agaln touch at Ambria and Losndo, at which places they complete their cargoes of gums, paim-oll, Ivory, hides, and coffee.

At Ambria there are now two Amerlean, two English, ono French, and a number of Portuguese factories. Ileretofore the only duty pald at this jert was a small tribute to the native king, for the privilege of trading. Kecent movements Indicate a deaign on the part of the I'ortuguese government to establiah a regular cuatom-house, and charge import and export dutles. The claim of l'ortugal is predlcated on Its alleged title to some copper mines in the interior, which can be reached only through this port. The little kingdom of Ambriz is too weak to resist the pretenslons of the Portuguese ; and however novel this claim may appear to more civillzed natlons than the little negro kingdom of Ambriz, there is official informsition to the effect that, Instead of free trade, Unlted States commerce wlll probably hereafter encounter at thls point the burdensome restrlctions of Portugueae commercial legislntion.

Postage-Post-office. Postage is the duty or charge impused on letters or pareels conveyed by post; the post-offico being the establishment by which auch letters or pareels are conveyed. Wo propese, in the present artiele, to divido and treat tho subject under the following heads:
I. Sketch of early Postsl Affairs. II. The first Nstional Post-offiee. III. The Britlsh I'ost-offico. IV. Introduction of cheap Postage. V. Postal Statistics, and Rates of Postage in other Countries. VI. History of the United States Post-oflice. VII. The present Condition and future Prospects of the United States Post-office.

The post-office, as It exista to-day, is essentially a modern institution. Some wrlters have traced the orlglu of the Posr to a very early period in the pollt-
ed oil, soap, es. The lmTreasury ret, salt, corks
lead, copper,

Portugal for
unmanufac-
teal tintory of the world. They find the origin of the word poat in the Latin posirm, as applied to the poatal couriors whe were placed or poated at certain intervala or atations on the route over which lettere or meseagea ware convayed. Herodotur, Xenophon, and other anciont historians, epeak of postal couriers that wore employed by kinga, rulern, and commanders of armien. In Parsia, in the time of Cyrus, atations were hept at regular Intervals along the principal highwaya of the country, and messagen were forwaried for the governmant by courlery, who acted an post-riders. In the Homan empire, in the time of Jullus Casar, and daring the relgn of Auguatus, a similar method of communication was kept up between the central government and the principal military atations. Marco Polo tella us, and his narrative is confirmed by other travelers, that Kublal Khan, the Eimperor of Tartary, had regular pont eatebltshmente throughout his vast empire. Thia was in the 13th century. In his narrative we find the followiog, which is particularly intereating, as giving an acconnt of a regular rost among a comparaUively barbaroug people, that was quite equal to the postal eatablishmenta of many modern Chriatian nationat "From the city of Kanbalu there are many roads leading to the difierent provincee, and upon each of these, that is to aay, upon every great high road, at the distance of 25 or 10 miles, accordingly as the towns happen to be altuated, there are atations, with houses of ar ismmodation for travelers, called yamb or posthou t.j." [These are mansiones equorum; in the Chinese language tchon, and In the Persian marhileh.] "These are large and handsome buildings, having well-furnished apartmente, hung with silk, and provided wlth every thing suitable to persons of rank. Even kinga may be lodged at these stations in a becoming manner, as every article required may be obtalned from the towns and strong places in the vicinity; and for some of them the conrt makes regular provision. At each station 400 good horses are kept in constant reauliness, in order that all messengers going and coming upon the husinesa of the Grand Khan, and all embassadora may have relaya, and, leaving their jaded horeea, be supplied with fresh ones. Even in mountainous districts, remote from the great roada, where there are no villages, and the towna are far fistant from each other, his majesty has equally caused buildinge of the same kind to be ewected, furnished with every thing neceasary, and provided with the usual eatablishment of horses. Ile sends people to dwell upon the spot, in order to cultivate the land, and attend to the service of the post ; by which means large villagea are formed. In consequence of these regulations, embasadors to the court and royal messengers go and return through every proviace and kingdom of the empire with th, greatest convedience and facillit."

Thia la a picture of a very complete postal establisument. The Incas of Pern, in the 16 th century, had a aimilar system of postal couriers to keep up communication between different parts of the country. There was a aystem of postal cominnnication In France as early as the time of Charlemagne, and used principalIy for the conveyance of government diapatehes. Louis XI. also employed postal couriers. "A permanent establishment of messengers for the conveyance of letters was attached to the University of Paria from the beginning of the 13th century, and indeed was net abolished until the year $\mathbf{1 7 1 9}$, long after a general poat had been settled In France. Other universities were similarly provided. Sometimes powerfil or opulent individuala eatablished posta for mercantile purposes, and the convenience of a particular district."-Encyclopaedia Britannica. The date of the first regular post establishment in modern time was not far from the year 1497. There is a general coincidence in point of time of a number of leading diacoveries, conquesto, inventions, and improvements. Printing was invented In 144t. Constantinople was taken by the Ottomans,
he Grecka iriven from the Eaat, and the Turkish em. pire founded in 1483. Pootal couriere ware employed in Great Britain es eariy as 1464, Printing wan intro. duced Into Eingland in 1474. The kingiom of Spain wat eatablished by the naion of Aragon and Cantile, In 1479. The Cape of Good Hope was discovered in 1486, and America In 1492. The poat-offiee was established in Germany about the year 1497. Africa was circumnavigated in 1488. The Reformation com. menced in ibl7. A ayatem of punctnatlon by marks and pausea was introduced in 1520. IIungary was united to Auatria in 1621 . Magellan completed tha first circumnavigation of the globe In 15\%2. The aso tronomical ayatem of Copernicua was proclaimed in 1032. In India, as early an 1600, a syatem of foot-posta was eatabliahed by Akbar, the head of the Mogul em. pire. Indian runners, noted for their apeed, were employad, and one measenger, without relief, we are toid, would often travel from 80 to 90 milea in a day.
15. The firat Nutional Ibot-afice,-The Arst reguiar pont-offico was estabilahed by Maximilian, omperor of Germany, near the clowe of the 1 bth century-abont the year 1497. At the head of thia poat eatablishment the emperor placed Francia, prince of Tharn and Taxia, the firut post master-general mentioned in history. This establishment, originally atarted like all other gevernment posta as a general errand-hoy and measage-bearer of government, soon lecame a powerful monopoly, and claimed the sole right of transmitting the correepond. ence of the people. From the time of ita foundation to the preaent doy the German post eatabliahment hat been held as a hereditary fief or property by the princes of the house of Thurn and Taxis. It has been a subject of frequent discussion whether postal business should be entirely carried on by government. There are argumente on both sides, and many against it can le found in the history of this Gemnan postai union. The Catholic religion being the religion of the state, Proteatanta mada frequent and just complaints against the suppression and violation of correapondence in the cause of political tyranny and religious intolerance. Wo are informed that this was one of the direct eauses of the Thirty Years' War. Lamoral, prince of Thum and Taxis, a mliltary leader (Catholic) an well as post-naster-general, by the assistance of hia allies defeated and dispersed the Protestant Union nuder Frederick, the Elector Palatine. This wan followed by the "Mas. sacre of Prague," the "herrible persecution of all malcontents,"the "banishment of thirty thousand Protestant families, and the total auppression of the Protestant religion." In this work the poat-office was nsed as a machine for annoyance, espionage, persecution and warlike conquest. The very same postal concern is this day a atumbling-block and a sorioua impediment in the way of cheap postage between nations on the westFrance, Great Britain and the United States-and people living in the eastern part of Etrope. But the house of Thurn and Taxia own the poet, poeket large profits, are deaf to all considerationa of public geod, and insiat on the very higheat paying (transit) rates of postage.
III. The British Post-office.-The Post-office of Grest Britain, at once the most efficient, economical, and profItable of modern times, has a moet interesting history. We find mention of poatal couriers employed by government as early as the reign of King John. He summoned his barons to form the Parliament by fasaing " letters patent." During this reign state accounts exhibit frequent itema of charge for the carriage of letters. In the time of Edward II., there were fixed posts or stationa where horses were kept for post-riders. In 1481, Edward IV., during hla wars with Scotiand, establiahed, as atated by Gale, certain posta, twenty miles apart, where the riders relleved one another, and in thia way conveyed lettern onn hundred miles a day. Long before there was any account of a national postoffice, wo meet with the auperscription of letters,
"heste Eliabe chiaf po an to hi Amo Britain particul embave land (\$ the viel senger, to relle burgh, callod ' handa o ters tha cused to fer th "which had kep cipherin they eon George he hath wick, be IIe adds thas cou taken by him wit notable a latere One of ashore n the card he (" thr (the Pop temporal to be his James th the Incen land that execution istratien quoth he punish hi

"haste, ponte haste." In is81, during the roign of Eliaaboth, Camdon staten that Thomas Randolph waa chiff pootinaster of England, but nothing is mentloned the to his functlona as a tranamitter of letters.

Among the early recorda of pontal aftain in Great Britaln are various accounta of the violation of latters, particularly in the relgn of Hepry VIII. The Einglich ambasnador at the Court of Jamen V., Kiag of Scotland (Sir Iivph Sadler), given numerone inatancen of the violation of letters by Cardinal Beaton. Ons messenger, a eoldjer from Berwlck-on-Tweed, was amployed to relieve the courler from the south on his way to Edinburgh, with dispatcies for the ombatsador. He waa callod "the pest." While on the way, he fell inte the hasds of Beaton's omisaries, and they meized the lot ters that were addressed to Sir Ralph Sadier, and refused to give them up. They were finally delivered, after they had been kept some day , and opened; "which," an Sir Ralph says, " being in cipher, they had kept the longer to prove their cunning in tite deciphering of them, which (as I eredibly am informed) they could do." A letter from the Barl of Angns, "Sir George Dougias hath to convey by pont, and will, as tho hath written to me, ride himself therewith to Berwick, because he dare trunt no other man to earry lt." IIe adds, "it is much sdo to convey lettert safely in thas country." One messenger of King Henry wes taken by the cardinal's party, who "threatoned to hang hini with all his leiters sbout his neck." But on two notable occesiona the wily eardinal-the Pope's legatua it latere in Scotland-had the tablea turned upon him. One of his own courlers was shlpwrecked and cast ashore near Bamborough Castle, was captured, and by the cardinal's letters found on him, it appeared that he ("through the anthority of the Bishop of Rome") (the Pope) intended to get all power, apiritual and temporal, from the King of Scotland, while profesaing to be his friend. King Henry reported this to King James through bla enibassador. When ho heard it, the incensed monarch said, "whatsoever he be in Scotland that we may know, doth nat his duty both in the execution of God's lawi above ali, and alao in the ministration of Indifferent justice to our lleges; by God," quoth he, "If we may know him, we shall not lett to puaish him, be he spiritual or temporal."

The last notable act of thls kind was when Cardinal Beaton sent Norman Lenlie, son of the Earl of Rothes, and others, to Edinburgh, from his strong-hoid at St. Andrews. Suspecting foul play, they "fingered the packet," and found they were the bearers of their own death-warrants. They retarned by night, and at a very early hour in the morning, while the draw-bridge of the caatie was lowered, rushed In and atahbed the cardinal in his own room. The journals and correspondence of this period contain various other Instances of the violation of correspondence. The earliest mention of a postmaster, who had the charge of correspondenco, and whose duties and privileges were defined, was in the reign of James I. of England. He was charged witi " the sole taking up, sending and conveying of sll packets and letters intu foreign parts." The office was filled by Mathew le Quector, and by Mathew le Quester, his son. In 1635 King Charies iasued a proclamation "for settling of the letter-office of England and Scotland." "This," maye an English writer, "may properly be regarded as the origin of the British Poatoftice." By royal command, Thomas Witherings, Esq-, was Postmaster-general. Posts were established from Londou to the Continent, and to Scotland and Ireiand. in 1644 the Parliament made Edmund Prideaux Post-master-general, and he estahlished a weekly mail. Cromwell made important improvements. Ife had an act passed " to settle the postage of England, Scotland, and ireland." By this it was enacted that "there shall be ono General Post-office, and one officer styled the Postmaster-general of England, and the comptroller of the Pont-office." This officer was to have the
"horsing" of all persons "riding In poat." The rates of pontage wore fixed, and all otter persons forbidden to " ant up or Imploy any foot-postr, horse-poste, or pacyuet-boata." The postage of a letter sighty miles from London was two penee aterilngi above that diso tance, In England, three pence ; to Scotland, four pence and to Ireland, six pence. Double lettere were double thece rates. The post-riders were required to ride seven miles an hour in summer and five in winter. Cromwell farmed the pont-oilice out for $\mathbf{C 1 0 , 0 0 0}$ a year; and on the reatoration of Charles II., in $\mathbf{1 0 6 0}$, the office was rented for $\mathcal{2 1 , 5 0 0}$ a year. : In 1668 the entire profite were settled on the king'n brother, the Duke of York (afterward King James 11.), and his helra male. In 1685, by an order in conndil, a post-office was entabHished on this continent "for the better correspondence between the colonies of America."
During the reign of James II., William Dockwra set up a local ayatem of letter and parcel diatribution in London. IIe was allowed to contlaue It for several years, until it proved profitable, and then his local letter aystem was seized under pretonse that it encroachel upon the royal prerogative. In the more modern hilst tory of the post-office there are paraliel cases. In 1688 an act was passed for the est.ablishment of a Goneral Post-office In Scotland. In 1698 King William made a grant of the wholo revennes of this office to SIr Robert Sinclair, with a subsidy besides of $£ 300$ a year. Even at this rate Sir Robert found It a losing busineas, enil threw it up. In 1710 ( 0 Anne, ch. 10) an act was passed that may be considered the charter of tho British Post-office. This act established a General Postoffice throughout Great Britaln and Ireland, the North American colonies, and the West Iniles. It was nil put under the control of one officer, atyled her Majesty'n Postmaster-genersl. The act provided for one chiof letter-office In Edinhurgh, one In Dublin, one in New York, and others in the West Indies. For a considerable perlod after the act of 1710 , there were no relays of post-horses, one man or boy, and a horae, accomplishing an entlre journey like the one frem Aberdeen to Edinhurgh, traveling by day and stopping at night. Up to $\mathbf{1 7 6 8}$ there was only a tri-weekly mail from Londion to Edinburgh. That year the trips were increased to five times a week. The time required for the mall-coach to go between the two cities was from eighty-two to eighty-five inours. Until 1788, there was no direct mail from London to Glasgow. It ia inatructive to note the progress in the income of the British post-office for a period of two hundred years. The net and gross income of the British post-offico nt different periods will be seen in the following talik, the last columa giving the groas income in United States currency, reckoning five dollars to the pound sterling:

| Years. | Nel Revenue. | Grome Reeelpta. | Grome Reesipte. |

| 1850.......... | 808.898 | 9,264,684 | 11,828,480 |
| 1855.......... | 1,065,056 | 2,716,420 | 12,582,100 |
| 1856...... | 1,207,725 | 2,867,904 | 14,889,770 |

The first year of penny postage was in 1840.
To give the differant ratee of postago that have been levied at various periods since the act of Qusen Anne would require a long tabular statement. In 1710 the clasge for a single letter from London to Fdinhurgh,
and from London to Dublin, wia sixpence. Iu England the rates wore three, or four pence, according to distance; In Scotland, two, three, or four pence, and in Ireland two or four peace. The rates were altered ${ }_{3}$ and generally increased in amount and also in number, in each of tho three kingdoms-and without anlformity In either two-in 1765, 1784, 1797, 1801, 1805, and 1812, and in Ireland in 1813 and 1814. From two or three rates in 1710, they went on inereasing in number until they reached the cllmax of absurdity and inconvenience in twelve different rates in England and Scotland, in 1812, and thlrteen rates in Ireland, In 1814. In Scotland, in 1813, an additional half-penny was levied on all letters that were conveyed In mail-coaches. These alsurd, complicnted, troublesome, and multifarious rates of postage remained on the statute books until they were blown from existence by the relluetion of all rates to one ut**rm charge of a peuny, through the exertions of Mr. Howland Hill, in 1840.

The next great improvement in the mail service of liseat Britaln was the intıoduction of mail coaches, in 1784. This was pincipally accomplished by the exextions of Jir. John Palmer. Like mest new improvements, it was the projoct of an outslder, Mr. Palmer not belng an officer of the post-office, but the manager of a provincial theatre. That extraordinary fatali'y usual in such cases took possesston of nearly all prominent offleials; and the Postmaster-general, members of Parliament, and other dignitaries, denounced the scheme as prepostorous, undignilied, and imprneticable. The projector was pronounced a visionary zealot, and as unreliable as a madman. It appeured to Mr. Palmer that when passenger coaches traveled regularly over the principal roads at a much more rapid rate than the horse-posts usually did, the mails could, with advantage, be transported by them. At this day wo can searcely see tangible grounds for a violent opposition to n plan to ndopt the swiftest and most reliable conayance for the mails, except in that afficial jealousy, which never bears a rival near tho throne, or that resents the assumption of an outsider in presunsing to know any thing better than the servant of routino who is pald to carry or a concern that he feels no interest in improving. The mails were transferred to stagecoaches, all tha opponents of the plan were put to shame, and Mr. Jolm Palmer received from the 'Treasury tho aum of $\pm 50,000$, and an annuity of $\mathbf{5 3 0} \mathbf{3 0}$ a rear for life, for the benelits he had conferred on tho nation in augmenting tho national fncome, and increasing the facilities for correspondence.
IV. Introduction of ('heap l'ostage.-Mr. Rowland IIill, an English country geutleman, in no way connected whth the govermment or the P'ost-offlee, set to work, in 1836, to devise a plan to effect somo permanent finprovements in the regulation nnd management of the postal establishment. Ile fomme by referring to the official records of the l'ost-offiee !epartment, that while the population, the lusiness of the conntry, and all branches of the mationnl income (the post excepted) had grently lacreased during the precoding twenty years, tho revenne and business of the post-othee had with some tluctuations, netually decreasel. Jle conspared the postal income to the revenue derived from atage-coaches, a branch of husiness thnt aforctet a good index to the prosperity of the conntry. The following table exhlbits at one view a comparison of the revente from stage-conches, with the net postal income; nud a column showing what the net revenue of the postofice woulth have heen in $1833^{\circ}$ had the receipts kept fice with the re:enue fre 11 cosched:

| Tees. | Revenue inom Btaye: coaches. | $\begin{gathered} \text { ravase } \\ \text { jent } \\ \text { feni. } \end{gathered}$ | $\begin{gathered} \text { Nol } \\ \text { Poat-office } \end{gathered}$ Rever de. | Hevenue which would base bees. | Cons: paralive L.ons. |

Bejeving that tho leglimate demand for the coyveyance of letters and distribution of correspondence had increasel as fast as that for the conveyance of persons and parcels, It was evldent that, In effect, there was a lose in post-office revenue, amounting to $£ 2,000,000$. These facta and others were first submitted privately to the govermment, and In 1837 to the publle, in a pamphlet, entitled "Post-offica Reform, lts Importance and Practicability." It was recelved with great favor, and in a short tlme passed through three editions. The author came to the following conclusions: He demonstrated clearly that the aetual cost of conveying a let. ter by coach in the mail from London to Eillnburgh400 miles-was only one-thirty-sixth part of a penny. It must be evident that the actual difference of expense between transporting a letter ono mile and delvering it, and carrying one four hundred miles to he delivered, dit: not justlfy a different rate of charge. He came to the conclusion that the large nost of distrlhuting letters was the result of complex arrange ments in tho post-office, arising from many rates of postage. That these complex arrangements would be avoided if postage were charged, without regard to distance, at a vimons rate. That all letters should be charged by weight, those reckoned as slugle letters that, did notoxceed half an ounce each. That the uniform charge for letters, including their delivery, should be one penny. That this rate of charge wonld afford the greatest facilitles to the public, put a stop to correspondence through privato channels, and eventusliy prove the most profitable to the government. That with the simplicity and economy of arrangement at tending the uniform chargo of a penny, there would be but little more expense attending a four-fold inerease of correspondence than ther ss with the then mumer. ous rates of postage. Thint the effect of a uniform penny rate would be to increase corrsspondence "In all probability at least five-and-a quarter fold." [ $\operatorname{In} 1850$ the number of letters In the kingdom $(478,893,808)$ bat increased more than six-fold beyond the number in 1839 (then $\mathbf{T} 5,907,572$ ), the last year of the eld rates.] That the necessary cost of primary distrlbution, instend of leing 81 hundredths of a penny, as it was uncler the numerons rates of postage, would only ho 32 hundredths of a penny, the difference, 52 hundredths of a penny, arising from the expenslveness of the arrangements, the excessive charges, and the consequent restrietion of corresjondence. That the secondary distribution of iettors (the delivory) ought to be untaxtil, so as not in any desree to interfire with the slmplleity of arrangements attending a uniform and low rate.

A verification of Mr. Jlill's predictions, almost amounting to propheey, has been established by the working of the system. In lifs pamphlet, published in 16:3, he predleted that tho increase of correspondence, and the attendant economy of management that wrud result fron a uniform rato of n peuny, "would allord a probable net revenue"-that in, in a reasonalile time"of $\mathbf{\Sigma 1 , 2 7 8 , 0 0 0 . " ~ I n ~} 1856$ the net revenue was exact$1 y £ 1,208,725$. One statement will show the great ceonomy of management under a miform rate of postage. Taking the cost of carrying on the liritish postal ostablishment (transportation excepted) in $18: 7$, hefore there was uniform postage, and in 1859 (with the uniform eharge of $n$ penny), aud looking nlso at the numher of letters at each period, we consee what the hamiling, sorting, distriloution, und delivery amounts to per lunired or per thousand letters. The following in the oflicial record:

tee was appolnted: and after numerous sittiags, and the examination of nearly a hundred witnesses frem all classes and ranks of soclety, they made their report in twe formldable blue-books, giving the entire testimony, and a great mase of official statistical information. It la a fact worth mentioning in this place that all great postal improvements, loth in Great Britain and the Unit: A States, were commenced, carried on, and prosecuted to a succeasful termination, by citizens entirely uncoanceted with the postal estabiishment. So far from deriving aid from those who would be supposed to pessess the ability and dispesition to afford it -viz., these in the pest-oftice-they hava nniformly opposed all reforms. It was aingularly true in the present inquiry. "It was fonnd, by the commission, te be a matter of the greatest difficulty to extract from the post-cflice any Information necessary for the elucidation of the inquiry." "Not only has the post-office been utterly barren of improvement iteelf, but its weight is thrown Into the opposite acale." "Whensver the pest-office attempted to give facts and estimates to combat Mr. Hill"-to quote from an eminent writer--" it was found that Mr. Hill was alwaye right, and the pest-office always wrong." A Chancellor of the Exchequer described the "gentlemen of the postoffice" as "unwilling herses." Petitions to the number of 320 , from 262 different places, and bearing over 38,000 names, were sent to Parliament, asking for the bideption of Mr. Hill's plan. In 1830 franking was abelished, and an act passed authorizing the lords of the Treasury to adopt a uniform rate of one penny ou sll single let izs, without regard to distance. The penny pestage went into operation on the 5th day of Jaauary, 1840.

The efficial reports of the Post-office, shewing the revenue and expenditure, and the amount of correspendence, comprise the best eulogy of the principle of the uniform penny rate. It is no dispuragement to Mr. Rowland Hill to say that, whilo he was onco in faver of riepayment of postage being compulsory, he lass long einco receded from that idea. Prepayment is net, and never has been, compnisory in Ureat Britain, nll letters being forwarded to the persons addressed, whether prepald or net, with the exception of letters weighing over four eunces; and these, if not prepaid, are at onee opened and returned to the writer. Letters not prepaid are charged double; and auch letters, if refused er net dellvered, are returned to the writer from the Returaed-letter office, and the double postage then due may be collected by compulsory process. By this means the distribution of circulars and advertising sheets through the mails, without prepayment, is effectually prevented. In Grent Britain it is customary to refuse ull unpaid matter unless a name or the handwriting on the outside shows who the sender is; and se near universal is prepayment $c_{i}$ all postage, that more than $98 \frac{1}{2}$ per cent. of all letters have their postage paid before mailing.

In Great Britain there is no Dead-letter offlee, and there are no "lead" letters. There is a "Returnedletter effice," and all letters, and even papers and printed packages, that have not, for any reason, been delivered aro at once opened or sxamined, and, where possible, recurned to the senders. When the name is printed or writtan on the outside of the letter, or impressed in the seal, or where a coat of arms or device reveals the writer, the letter or package la returned unopened. As there is n letter delivery by carrlers daily, or several times a day, at almost every post-otfice and pest village, refused, misdirected, or other "stray" letters are at once known, and, by the above regnlatiens, almost all letters that $\ln$ other countries (and perticularly in the United States) would be pronomiced "dead," and cosciamned to a hopeless imprisonment for menths, rind then, perhapa, to bo burned, are hero sent har: io the writers and rightful ownern, and usually in less than a week from the dny they aro mailed.

The practice now is to dispatch every letter on the day it is received at tho Returned-letter office. The laet annual report (1857) says: "By rccent arrangemeuts, returned letters are sent back to the writers much more quick'y than formerly ; every such letter (except from abroad) being now opened [where necessary], redirected and reposted on the day of its arrival at the Re-turned-letter office. The number of letters retnrned to the writers last year ( 1856 ), owing to failure in the attempts to dellver them, was nearly the same as in the previous year-viz., sbout $2,400,000$, or about 1 in 200 of the whole number of letters posted. Owing to the same canse, about 550,000 newspapers, also, were nndelivered, being about 1 in 129 of the whole number."

In the case of letters that can not be delivered, even though by the fault of the writers, the British post-office is ouppesed to bo just as much the servant of the people as in the case of letters when originally mailed and correctly addressed, and every such letter is looked upon as a piece of property, to be sent to tho person addressed, when possible, and when not, returned to the owner. All letters and packages that are prepaid, when returned, are delivered to tie eenders without any charge; and when not prepaid, double poatage is exacted. With such system, simplicity, and facility is the returning of letters carried on, that each elerk returne two hundred per day.

The principle and operation of the British Pennypostage system is this: A minimum rate of postage is sought for that shall not he an exorlitant charge for the emallest packages the shortest distances, and this postage is paid by a stamp. Now the object is to make this stamp cover as large a number and variety of pack-ages-written and printed-ss possible. Each letter is called a "single" letter that does not exceed half an ounce in weight, and each packago of printed matternewspapers, circulars, hand-bills, pamphlets, or books -done up open at the ends or sides, Is considered "single" up to four ounces. Here is the value, convenience, aimplicity, and utility of unifors pestage, both to the public at large, and to these who handle, sert, rate, and attend to the letters and mails. Drop-letters, or more properly local letters-for they are not permitted to "drop" and become "dead"-and all local mail matter, is charged at the same rate as these that are transported five hundred miles. The consequence is readily ssen. The penny stamp covers almost all-more than nineteen-twenticths-the packages that are mailed. A letter not weighing over half an ounce, local or otherwise, a newspaper, painphlet, or other printed package, not weighing over a quarter of a pound, have the postage prepaid by the all-powerful, all-cenvenient, niversal, uniform penny stamp. Then la larger packages the rates aro not ent up so fine as to be inconvenient to either the citizen or tha postmaster. Letters from half an ounce to an ounce are two postages, and after the first ounce each ounce or fraction of an ounce in excess is reckoned as two postages, In printed matter, after the first half pound, the reek. oning is made by half pounds; each half pound, or fraction of a half pound, being charged two postages -two pence. All the Items in thie rimplicity and unlformity of arrangement save a vast amoint of tlme and trouble to the peuple, and the clerks and postmasters, in a uation that writes and sends by mail annually nearly six hundred million lettere and printed packages, particularly as each letter and printed package has to go through from tonr to eight different processes or operations In the hands of the citizen, and from fifteen to twenty after it gets into the post-office. Would any other syatem but one that conbinos so much wisdom, economy, convenience, simplicity, uniformity, and ntilIty, bring mearly six hundred million letters and packages through the post-ofllee in a single year? A record of the business, and the revenucs and eorrespondence of the post-office of the kingdom for a few years, will do something toward answering the question.

BTATIBTICS OF TIE BRITIBH POBT-OFFICLin-[Reduced to Unitea States Currency.]
 dekine a akerga of Yeara, oommenoina witil 18t5, and endina wita 1860.

The money columna give the amounta in United States currency, caiculating five dollare to the pound sterling. It will be seen that the groas and net revenue of the post-office for twonty years, from 1815 to 1885, actualiy declined. Then there were twelve or fourteen rates of postage for letters, averaging about six and a half pence sterling ( 13 cents) a letter. With a reduction to the uniform rate of a penny-less than one-sixth of the former rates-the postal revenue more than recovered in eleven years, while the number of iutters sent by mall annualiy increased from $75,007,572$ in 1839, to $478,893,803$ in 1856 . The remittances of money, in money orders, inereased from a million and a half in 1839, to fifty-nine millions in 1856. To mako a direct comparizon between the use of the post-offico in Great Britaia and in the United States, it mny be stated that, after a careful catimate, the number of letters sent through the post-office in this country aince 1789, to 1856, jnclusive-a perlod of sixty-seven years -has Imeen 1,652,104,648, while in Great Britain, in the yeare $1853,1854,1855$, and 1856 , the number of letters was $1,789,016,769$; or mere ill that country in four yearn, with low and uniform postage, tian in thia country alnce the formation of the government, now nearly threequarters of a century! During ten yeara -from 1847 to $\mathbf{1 8 5 6}$, incluaive-the population of London alone sent by post $920,527,039$ letters, or moro than in the entire United States during the same perl-
od; the latter numbering $888,527,549!$ But in Great Iritain there was one uniform rate for letters, and one uniform scala by welght for printed matter, while in this country there are three ratea of postage on letters, and on printed matter, from a small newspaper to a large book, the number of rates is almost one tiousand! Under the post-office system of Great lyritain there is a free-letter delivery, a safe way of remittugg money by money orders, tisat ia ued to the extent of about aixty inillions a year, aidd one low rate of postage that hrings an annual income of over fourteen millions of dollars. In the United Stated the postage is higber; there is no uniformity, no letter delivery, and no inoney order aystem, and our population searcely pay seven millions in postage. The people of Grest lbritain can acarcely one half of them read or write, and yot they write and send by mail alnıest $500,000,000$ letters in a year.

The population of the United Stetes, numivering just about the same as Great Britain, and nearly nill sble to read and write, only write and send by mail $131,000,000$ letters in a year. Are further facts and illustrations neceasary to ahow the auperierity of the Britisi postal oystem, or tho relative merits of the "uniform postage" and the "complex postage" bystems?
The corrcapondence between Great Britaln nnd sereral of her colonles, and foreign countries, lor the year 1866, will be seen in the following table:

The rate of letter-pastage between Great Britain and |two hundred pounds sterling each, ir annual profits, each of her colonies-over forty in number-is sixpence sterling, except to the Cape of Good Hope, Nstal, Labuan, Gambia, Island of Ascension, Falkland 1shands, and Vanconver's Island. A book-post, for the transaission of every species of printed matter, has also been established with the most of the colonice. The abeve table exhibits at one viow the population, annual postal revenuc, loeal post expenses-fir rent of post-ofilces, salaries, ete., not transportation-amount of money remitted by money orders in a year, tergther with (secead column of figures) the number of ilerks, postmasters, sub-postmasters, and letter-receivers, and (third coluons) the number of town and rural lotter-carriers $\operatorname{In}$ (and around) twenty-five of the leading eities and tewns of Great Britain. The population is from tho eensus of 1851 , the lecal expenses and number of persons employed, for the year 185.1 , the money orders for 1850 , and the postal revenue for both 1855 and 1850.

Tho British meney order system is one of the most impertant adjuncts to the post-office. This was first started as a private enterprise by certain officers of the post-office, ill the year 1792 . The commission charged was elght-pence to the pound sterling, makhig the whole bualness complicated and expensive. The conserguenco wae, it afforded little profit to the projectors, and but very trifing accommolation to the pullic. The three officers engiged in it received less than
the entire commissions amounting in a year to less than four thousand pounds. August 13th, 1838, the money-order office was attached to the post-offieo, and the officers compensated for their rights. At first the commissions were put at six-pence sterling for all orders less than two pounds, aul one and six-peneo for orders between two and five pounds. These cemmissions were reduced on the 20 th of November, 1840, to six-pence and three-pence respectlvely, No order is granted for more than five pounds. The number of persons employed in the money-order office at first was three. This was in 1838 . In 1841 there were thirtyseven, and now in the money-order office in London alone there are nearly two hundred. We have seen in a inble on a previous page [1558] the vast increas in the money-order business in the kingdom. In 1839 the number of orders was less than two hunired thousand, and the amount of money emitted about $\$ 1,5 \% 0,000$. In 1856 the number of orders had inereased to over six millions in number, and the amount in a year to about eixty million dollars. The money order is a draft fiom ono postmaster on another, and is paid at sight, In specie, to the person in whose favor it Is drawn. $\therefore$ is as anfe as a duplicate bsuk cheok before it is endursed, and if proper care is used in remiltting it; if it get lost or stolen, it will be impossible for any but the . Mrhtful owner to obtain the money on ft , even by committing forgery, as a casual finder
will not know the name of the person in whose favorit is drawn. It ts safe to aay that not one money order in five hundred thousand geta appropriated by the wrong person. All post-offices are not money-order othees.

There are in the United Kingdom 10,866 poat-offices. Of these 845 are head poat-offices, and 10,021 sub-postoffices. The number of post-offices where money orders are bought and sold is 2095 . The net protit on money orders during aeveral yeara was as follows In 1849, £322; in 1851, £7437; in 1854, £16,167; and in $1856, £ 22,674$. The commisalona averaged leas than one per cent.

One vast auperiority of the British Post-office consists in the facilitles for rapld delivery and local diatribution in citles and towna. The postage on each local letter being one penny, the eame as for lettera the longeat distance, there ls a very large profit on the local distribution of letters, admittling that the carriers deliver eyery thing "free" that comes from other places. The clear protits on the local diseribution of letters in London alone, after deducting the entire expense of letter-carriers, recelvers, and mail-men, ls over $\$ 900,000$ a year. It will then be seen that the term "frec-letter delivery" is a misnomer. By the figurea in a tuble on a previous page it will be seen that the number of local letters in London annually is over fortyseven millions. I'he machinery for the local diatribution of letters $\ln$ London consists of about 1400 lettercarxiers, one or two score of mail-men, with horse and cart, and about 500 sub-poatmasters and letter-receivers. In all the densely populated parts of London there are hourly deliveries through the day, and more than four-fiftha of tho Arst morning delivery is accomplished between the hours of soven and a quarter past nine. Nore than one half la done before nine o'elock. In addition to the "receiving-houses," where atamps can be purehased and letters can be posted at all hours of nlght and clay, thero are now in use a large number of "letter-pillars" of east iron. These convenient ieceptacles of lettera lave given great satisfaction, ant are rapidly coning into use in cities, towns, and country districts. Thers ia but one assignable cause for the extensive use, large income, and great profit, of the British I'ost-office. The charges are simple, uniform, and Jow ; the accommodationa numerous, ond the teilveries rapld and punctual. The estimated number
of book packagea that passed through the British Post. offiew in 1856 was $3,000,000$, the newspapera $71,000,000$ and the lettera $478,893,803$, being a total number of 552,893,803 packagea. This is probably one helf of the entire number aent by mail in the civilized world.

It is an lnvaria and loost-oftice the shall aubmit to a rigid examination, to ace if they possess the neceasary qualifications. Letter-carriers and sorters must be hetween the ages of 17 and 27 at the date of their origimal appointment, and shall undergo an examination by a physicisn to set if they possess the requisite health and atrength. Wages and salaries are not exorbitant, but none are discharged except for some fault or derelietion of daty; and after a certaia number of years of faithful service, they are nermitted to retire on a pension, amounting to from one third to twe thirds of their salnry, according to the length of time they have served.

We will close our account of the post-offices of Great Britain by giving the revenue and expenditure, the rates of postage, and the various improvementa lntroduced into the post-offices of the princip: I British colonies since the introduction of the penny postage into England in 1840. The revenne and expenses in each case are for 1854, exeept for Canada; which is for 18 ä.

Nearly or quite all of the improvements introduced into the colonial post-oflices appear to be the direet reault of the suceess of the penny postoge in Great liritain. It will be seen that many of them cling to the old absurdity of a number of ratea, all entallhig great inconvenience ou every person that mails a detiet; amd greatly multiplying the operations and iucreasing the labor and expense in the pestofllices.
V. Potal Statistica, and Rutca of Postage in other Countries.-There ars certain peculiarities and features of interest ia many of the Continental post-oflices of Eu-
rope that deserve notice, leaving the prominent statisties to be given In tabular form. In the German Postal Union, in Prussia, Switzerland, Spain, and some other countrien, the posi-oflice undertakes the carriage of passengera and small pareels as well as letters and wail mutter. In thly spucies of traffic the government does not hold an absolute monopoly, but, liko stage proprictora that get the mail contract, they are enaHed to nold an untue competition with all outsiders, resalting front their alvantages as mail carriers. In ucarly ill tiee Contlnental citles the govennuent post
makes ness.
The Contin charge at 10 m of lotte poatal The ha States, Britain Austria Hameth and six is used cany; aighths Brunsw ounce s equival Kingrle

tensive soon co will ad system clpal n By insi ters, th authori there I adopte seale ro much light, ago in gle up charge one cen consitle unber of te half of cd werld. ted King-
makes tha dellvery of letters a part of the postal busl- | Spanish islands were considered slngle up to five-sixness.
The absurditlea in some of the postal systems of the Continental stntes conaist generally of a varied scale of charges, and the adoptlen of so low a standard of welght tis to make a great deal of uaeless labor in the rating of letters, besides puttling other states that enter into postal rolations with them to serious inconvenience. The half-ounce scala for letters is $\ln$ use $\operatorname{In}$ the United States, Peru, New Granada, Equador, Brazil, Grent Britaiu, Spain, Holland, Dermark, Iceland, Prusala; Austria, Baden, Bavaria, Frankfort-on-the-Maine, Hu:ahurg, Hanover, Labeck, Saxony, Würtemberg, and sixte 11 British colonies. The quarter-ounce acale Is uscel only in Franec, Swltzerland, Sardinia, and Tuscany; while a welght equivalent to one-third or threeeighiths of an ounce is used In Portugal, Belginm, and Brunswiek. Russia, Chill, and Bremen, adopt the ounce scale for eingle lettera, Sweden a weight that is equivalent to about five-eighths of an ounce, and the Kingdon of Naples atill uses the old plan of charging by the shoet. The half-ounce scale being in such extensive use, is it too much to expect that the time may soon conse when all the principal commercial intions will adopt that atandard, whent waiting for a ..nform gystem of weights and measures? France is the principal nation now in the way of such an arrangement. By lusisting on a quarter-ounce aenle for foreign letters, that government puis the publie and the postal authorities of other nations to great inconvenience, and there is nothing galned by It . Such a rato can be adopted as will prove remunerativo, and by having a seale relucithe to greater convenlence and simplicity, muelr labor is saved. To see thls in the most striking light, let us look at the former rates in use a few yeare ago in Spain. Domestic letters were conaidered single up to six-sixteenths of an ounce, and the postage charged was one real ( 5 cents), with tha addition of one cent for each eighth of an oonce beyond the velght considered as sliggle. Then all letters sent to the
teenths of an ounce, and charged thirty-five cents, wlth the addition of ten cents for every blxteenth of an ounce boyond! Is not thls excessive fineness as ab-aurd-except in degree-as it would be to welgh and reckon by the single graln? This old atisurdicy and Inconvenience in welghing and rating letters in Spaln has been swept away by the adoption of the regular half-onnco seale. In Great Britain, up to two ounces, there are hut three rates of postage for letters, while ln the United States there are nine rates. When will the convenlence and economy of simplicity In the arrangement of matters hrving such a vast detall as postal operations be elearly understood by the nations? Let us look at one fact. There are passing through the British Post-office in a year, in round numbers, five hundred million ( $500,000,000$ ) letters, and each one of these, in the various processes of sorting, rating, stamplng, mailing, and delivery, goes through not far from twenty (not less) distinet processes, bes:des what is done In bulk, like welghing and transportation. This is by the employés of the Post-office, Independent of all the eare and lahor of tho public in eonsidering the vaious charges, rates, weights, and arljustiment of differences. Here, then, are ien thousand million-let us see how it will look in figures, $10,000,000,000$-different and distinet handlings anil processes of separate letters, each of them consuming and requiring more or less time, toil, talent, and care; and every useless or nceded operation, turn, or thought, bestowed on a letter in its passage through the mill in Great Britain entalls at once an additionul five hundred million ( $500,000,000$ ) processes or operations on the postal laborers annually! Will these who make laws for the post-office think of these things? Will it, need it, any longer bo a matter of wonder that the annuil correspondence of Great Britain has inereased from 75 million letters to ahout 300 millions; that It ls all done for a peuny $n$ letter, and that about one half of the reveuue from this bource is clenr profit?

Nearly all of the European (continental) nations $\mid$ financial results of the different postsl systems can not inake It a part of their postal business to transport pas-- be given. The total annual revenue of the post-offices sengers and parcels as well as malls. In conseque.,eo of thls arrangement, an accurate comparison of the on the Contlnent of liurope, at the latest dates glven above, ameunted to $\$ 32,403,40 \overline{\text {-p }}$ probably one thlrd
of this being for goods and passengern-and the total annual expenses to $\$ 24,362,450$. The post-offiees of South Anerica had an annual revenue of 8368,890 , with expensea to the anount of $\$ 249,235$. If we ase sume that one gross third of the postal revenue and expenses on the Continent of Europa are on account of passenger and parcel traftic, we shall be able to make the following summary statement of the postal affairs of different nations and different parts of the world; the figures standing exclusively for the legitimate postal trafic-letters, papers, and printed documents:

| Natioas | Revenue. | Experaee |
| :---: | :---: | :---: |
| Great Britain | \$14,931, 770 | 48,30t, 145 |
| Hritish Colontes ............ | 8,497,490 | 3,146,290 |
| United States . . . . . . . . . . . . | 7,620,822 | 10,407,668 |
| Total | \$24,458,012 | \$ $21,865,243$ |
| Continental Europe | \$21,006,270 | \$16,241,688 |
| South America.... | - 336,890 | 240,235 |
| Total | \$21, 1843,160 | \$16,410,868 |
| Grand total.......... | \$46,401,172 | 438,946,111 |

If we add to the above the one third of the postal revenue of European countries that was deducted for parcel and passenger traffic, we shall have tho sum of \$57,201,307 as the total annual revenue of all the postoffices in the world (that wo have given above), and $\$ 46,466,928$ as the totai annual expeases. Of the legitimate postal traffic- letters and printed mattermore than one half of the revenue is in the United States, Great Britain, and the British colonica.

A fair estimate of the anount of letter correspondence may be arrived at hy the foliowing catculation; The ratea of poatage in Great Inritain being much low-
er than in most other countries, we may assume that one dollar of revenue in that country represents as many letters as twn dollars throughont the rest of the world. The annual postal revenue of Great Britain is $\$ 14,339,770$; of the British Colonies, $\$ 2,497,420$; and of the rest of the world, $\$ 20,563,982$. From thls we conclude that the correspondence by mail in Great Britain and the british colonies amounts to rathar more than the correspondence in all the other nations referred to. The correapondence through British poat-offices anounts to about $500,000,000$ letters annually, andincluding this number-in all the nations under consideration, not far from $1,000,000,000$. In this calculation, of course, we do not include China, Turkey, ant other countries, of which no statistles are given. Of the tifty-one nations and colonies mentioned in the preceding and a former table (page 1560), thirty-six adopt the half-ounce scale for letters. T'en of the nations and nine Britlsla colonies have uniform postage, $u$ hite in one only (Iceland) the postage is frre, the entire expense being defrayed from the national treasury.

The following table has been complled to show the getual and conparative amount of money paid in postages in each of soven different countries, during the same year (1853), along with the population, and col. unns, also, showing the cost of each thousand letters, together with the number of letters in a year, the number for each thousand persons, and the money paid annually (on the average) by each thousand persons. The last line gives the same atatistics for Great Iritain for 1839, the year before the penny poatage was established. Except this last, the statistice are all for the year 1853:

| Countries. | Popnialion. | Postal Revenue. | Putal Expenets. | Number of Letters. | Cous of 1000 Letters. | Revenue per 1090 Perbons. | Letters per 1000 Periont |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Switzerisnd | 2392.640 | \$447,672 | \$ 841,028 | 10.773.6ะ ${ }^{\text {d }}$ | \$23 | $\$ 187$ | 8.230 |
| Holtand | 3,050,691 | 288, 162 | 156,784 | 18,849.869 | 28 | 94 | 4.867 |
| Helgium . . . . . . . . . . . . . . . . . . . | 4,426,202 | 75.5,648 | 327, 118 | 11.521,9\%s | C6 | 171 | 2,603 |
| Spain.. | 18,486,218 | 1,281,761 | 1,095, 398 | 30,775,'s8 | 42 | 94 | 2.209 |
| Frunce. | 35,783,170 | 1,321,p60 | 6,023,925 | 157,010,6,93 | 48 | 260 | 4,102 |
| United 8tates | 2:1.191,876 | 6,140,724 | 7,982,757 | 102,189, 14: | 38 | 266 | 4,404 |
| Cireat tiritain | $27.833,501$ | 12,572,039 | 7,009,399 | 410,817,489 | 81 | 462 | 14,7ti0 |
| Great Bittain, $1839 . . . . . .$. . | 215,488,910 | 11,953, 318 | 3,784,997 | 88,4710,596 | 145 | 443 | 3,065 |

In those countries where the post-office engages in passenger and parcel traffic, the revenue has, in the above table, been given onjy for the letters and maii matter.

V1. Mistury of the United States Post-office.-IIaving taken a rajid survey of the postal affinirs of other countries and other times, we will glance at the progress and condition of tine pst-oflice in the United States. Probably the earliest mention of a legal post in the British colonies of North America is found in the General Court records of Massachusetts in 1639. We tind It there recorded as follows: "It is ordered that notico be given, that Richard Fairbanks, his housa in Hoston, is the place appointed for all letters whlch are brought from beyond the seas, or are to be sent thither, are to be left with him; and ho is to take care that they aro to le dellvered or sent according to the directions; and he is allowed for every letter $1 d$. , and must answer all miscarriages through his own neglect in this kind, provided that no man be compelled to hoving his own letters except he please." In 1667 , in consequence of the uncertainty and luss attending correspondence, a petition was signed by some twenty persons, "To the Monorable Gencral Court, now sitting in Boston." That petition set forth that "several of us belite innsible of the loss of letters, whereby merchants, especially with their friends and empioyers in foreign parts, are greatly damnitied; many times the letters are inputed and thrown upor the exchange, so that those who will may take them up; no person, without some satisface tion, leing wiiling to trouble their houses therewith," ote., etc. They then request that the honorable court "will deputo some mete person to take in and convey letters according to directions." After due deliberation, they did "make choice of Mr. John Ilaywari, the
scrivencr, to be the man." There are no records to show how long Johu Ilayward kept his office, or what amount of busineas he alid. In 1657, tise colony of Virginia passed a law reçuiring each plantation to provide a messenger to convey the government dispatches as they arrived, each planter in succession sending a messenger to the next, and so on to the final destination. The penalty for neglecting this duty was a hogshead of tobacco. In Jtirit Governor Lovelace, of New York, established "a post to goo monthly" from New York city to lloston and hack. 'This purported to be in olvdience to his Majesty's commands, "who enjoynes sll inis subjects in their distinct colonys to enter into a strict allyance and correspondency with each other, os likewise for the advancement of negotiation, trade, and civill commerce, and for the speedy intelligence and dispatch of athyres." It gave notice that a messenger would start on the tirst of January, 1673, and that "If any, therefore, have nuy small letters or portable goods to be conveyed to Llartfori, Connecticatt, Boston, or nay other parts on the road, they shail be carpfully delivered according to the directions, by a sworne mrssenger and post, who is purposely empiojed in that affayre. In tha interim, those that bee disposed to send letters, lett them bring them te the Secretary's office, where, in a lockt box, they shall be preserved till the messenger callis for them. All persons paying the post before the bagg be sealed up." The mails at this period dil not appear to have a very rapid transit. The post-ilhers set out from New York and lloston simultancously, on Monday morning, and on the Saturday evening following, they met at the half-way house, Saybrook, Connecticut, where they exchanged mails, and each wended his way back, arrisiog on Saturday of the following week. At the present time, resents as est of the Britain is 20 ; and of is we con. at Britain nore than 8 referred 108t-offices lly, andmiler conthls calcuirkey, and iven. records to ce, or what ony of Vir. to provide patches as ling a meslestination, a hogshead New York, New York pe in olerioynes sll hter into $n$ Is other, as trnde, and igence and messenger , and that ir portable icott, Bosull be carp. $y$ a sworne red in that isposed to Secretary's preserved bus paying re mails at iul transit. nd Beston " 1 the Sat-linlf-way exchanged riving on 'sent time,

Instead of two weeks being requiled, and as semimonthly mail only, tho malls are transported between Buston and Now lork three times a day, each way, in from eight to eleven hours; two weeks belug aniple tims to convey the malls from New York to Copenhagen, Denmark, to Marselles, Berlin, Vienna, or Trieste. It is shrewdly suspected that the fatherly care exhibited by King Charles for a muil servica, and a "strlct allyance and correspondency" between the American colonies, was with an eye to the proita, which all went to a member of the royal fainily.

In 1683 Willam Penn established a post-office In l'ennsylvania, and appointed Henry Waddy postmaster. The mails were sent to the principal tovens in Pennsylvanla, and to the neighboring colonies, once a week, the times of departure belng regularly published "on the meeting-houso door and other public places." Postal affials in the colonics roceived marked attention in England, in 1685, on the accession of Klng James, who owned the Post, and put the profits in hls own privy purse, and an order in comncil was made "for the better correspondence between the Colonies of America." In 1686 an order was mado in Now York that all letters coming from beyond sea should be dolivered at the custom-house. The postage was "fourpence half-penny for a single letter, and nine-pence for every packett or double letter," "one half of the money to be given to the poor," under the direction of the Captain-general and the Council, and the other half to the oflicers of the custom-housc.

In 1601-'92 Thomas Neal, by letters patent, was appointed Poatmaster-general, with authority to erect post-offices in the American colonics. It appears, however, that he did not aet hlmself, but appeinted Colonel Andrew Llamilton, of New Jersey; Postmastorgeneral for all the colonies. In 1692, by the recommendation of Colonel Hamilton, the Common Council established a post-office in New York city. It was located in Brondway, opposite the end of Beaver Street. The rates of postage were, for eighty miles or under, four-pence half-penny; from New York to Phlladelphia, nine-pence; and to Virginia, twelve-pence. The cxpense, however, was found grently to exceed the income. For ten years there was no regular Post further east than Boaton, or further west than Philadelphia. Lord Cornbury wrote home, in 1704, saylng "there is no other Post upon all this continent. If i have any letter to send to Virglnla or to Maryland, I must either send an express, who is often retarded for want of boats to cross those great rivers they must gr over, or else for want of horses; or else 1 must send them by some passengers who are golng thithor. The least I have known any express to take hence to Virginla has been three weekg." At this poriod tho mail was carricd twice a month in stage-coaches, between loston and New York and Philadelphia; and from New York to Albany by a foot-post, onco a month. In 1732 a General l'ost-office was establiahed in Vlrginla, and a post-oflice in each ceunty. In 1736 there was a weekly mail from Phlladelphia to Now York and Boston. In 1737 Colonel Spottswood, formerly Governor of Virginia, appears to have been Postmaster-general, and he appointed Benjamin Franiclin postmaster at Philadelphia. The following is an ndvertisement from Frankilin's newspaper at this period:
"October 27, 1737.-Notice is hereby given, that the l'ost-office of Philadelphice is now kept at B. Franklis's, in Market Street, and that IIenry Pratt is appointed riding postmaster for all stages between Philadelphia and Newport, in Virginia, who sets out about the beginning of each month, and returns in twenty-four days, by whom gentlemen, merchants, and others, may have their letters carefally convayed, and business faithfully transacted, he having giren good security for the same to the Honorable Colonel Spottswood, Postmastergeneral of all his Majesty's dominions in America."

Culonel Spottawcod died $\ln$ 1753, and the home
government appointed Franklin as hls san.sessor, and he held the office for twenty-one years, tlli 1774, when the dlfficultes occurring between the colonles and the mother country, Franklln was unceremonlously turned out of office. IIe sympathized too strongly with the people of the colonies in thelr wrongs, hardships, and oppressione to be a fit instrument of the crown. IIo la not the last or the only instance of a postmsster losing hls office for polltical opinions. During Franklin's administration of the Colonial Posts, numerous improvements wers made. At one tlme he took his own conveyance, and, in cumpany with his daugliter, made a journey of several hundred miles, visiting all the principal post-offices In l'ennsylvania, New Jersey, New York, and New England. With that sttention to details which alwaya marks the man of large business capaclty, he set ahout making numerous reforms in the administration of the Post. He had as associate or assistant, Mr. WIlllam Ilunter. By the terms of thelr appointment they were to have six hundred pounds a year, prorided they could get it! Franklin, in giving an account of the Post-oflice during his admlnistration of its affairs, after ho had been turned ont of the office by George the Third, makes the following pithy summary:
"The American Post-office had hitherto (i.e., before 1753) never paid any thing to that of Britain. We were to have six bundred pounds a year between us, If we conld nake that sum out of the profits of the office. To do this, a variety of improvements were necessary; some of these were inevitably, in the beglnning, expensive; so that in the first four years the office became above nine hundred pounds in debt to us. But it soon after began to repay us; and before I was displaced hy a freak of the minister's, we had brought it to yicld three tlmes as much clear revenue to the crown as the Post-office in Ireland. Since that imprudent transaction, they havo reccived from itnot ono farthing !"

The practice of sending newspapers in exchange, free, dates from Franklin's administration of the Colonial Post-office. He was editor and publisher of a newspaper, and he received his exchanges free, and accorded the sume privilege to other journals. The philosopher undoubtedly soon recovered his equanimity after that "freak of the minister's," for though he suffered officlal decapitation, he was soon after reinstated in office by a more competent authority, being unanimously appointed Postmaster-genernl of tho Culted Colonies by the Continental Congress. In 1776 he vacated tho office, on belng appointed embassadlor to France. On the 7 th of November of that year, Richard Bache was appointed to the office. IIe held the place for a little over five years, and on the 28th of January, 1782, Ebenezer Hazard was appolnted Postmaster-general, and renained in office until the adoption of the Constitution, in 1789, when Samuel Osgood was appointed. The different incumbents of the office of Postmaster-general since the Revolutionary war broke out were as follows:

Benjamin Franklin, in 1775; Richard Bache, 1776; Ebenezer Hazard, 1782; Samuel Osgood, 1789; Timothy Pickering, 1791 ; Joseph Habersham, 1795 ; Gidcon Granger, 1802; Return J. Meigs, 1814; Join M'Lean, 1823; William T. Barry, 1829; Amos Kendall, 1835 ; John M. Niles, 1840 ; Francis Granger, March, 1841 ; Charles A. Wickliffe, September, 1841; Cave Johnson, 1845; Jacob Collainer, 1849 ; Nathan K. Hall, 1850; Samuel D. IIubbard, 1852; James Camplell, 1853; and Aaron V. Drown, in 1857.
The rates of postage from 1776 to 1816 were from 7 to 33 cents, according to distance. In 1816 the rates were fixed hy act of Congress at $6 \frac{1}{4}, 10,12 \frac{1}{2}, 18 \frac{3}{3}$, and 25 cents for each slngle letter, according to distance. These rates remained till the act of 1845 , which established the balf-ounce scale for single letters, and ixed the rates at five and ten cents.

The act of March 3, 18jl, establithes the following | of time after they fail or miacarrys. The neage of our
rates: one cent for drop letters, three centa for all singlu letters (hali ounce), for evory diatance not over three thousand milea, when prep:aid, and flve centa if not prepaid; and double these rates when over three Hiousand miles. The law of 1855 fixed the rates at one cent for drop? etters, three cents for letters all distances under three thousand miles, and ten cents when over that distance, and all to he prepaid, or retained and sent to the dead-letter office. This law went into ojeration, as far as it was fonud practicable, on the first of April, $185 \overline{5}$. difter the firat of January, 18066, all lettere were required to be prepaid by alamps. In March, 1850 , s law was passed making prepayment compulsary on ail transient printed matter; and this law went into eset a the 1st of April, 1856. The incici cnicneen a it ir, 4 nsistencies of the law making

th:... . 2 unch. I thousund dallare, nearly all lit: . ... urned o the writers in a brief period government is in strong contrast to that of Great Brit. ain, where all dead ur returned letters aro sent to their writers at once.

It ls inatructive to obnerve the progresp of our " nstal correspondence beyond the increase of populatic 7 ani the augmentation of almost all other national mestic Iransactiona. During cach period of ten. nis, from 1790 to $\mathbf{1 8 5 0}$, the average increase of the $\mathrm{pos}_{\text {, ' }}$ 'a tion of the country lias heen 04 per cent., the ex, arts 42 per cent., the expenses of government 96 per $\&$ nt., Post-ollice revenue 120 per cent., and corresp ch ence uy mall 140 per cent. Thus, whlle the populn. T of the country has increased in cixty years aeven-iold, letter correapondenee has increased four hundied and forty fold. nr aixty-throt. liwes as fast an the population. it 1790, the letters sent by mail in the United satas were estlmated at 265,545 ; and in 1856 131,450,409. V11. The present Condtion and future Prospects of the Inted States Postoffice.-lirom the official figures given previously, we aee that while the correspondence ly mail and the postal revenue actually decreased during twenty years of high postage in Grent Britain-ending with 1835-the revenue and correspondeace hoth, from the date of low and uniform postage, in 1840, has greatly increased-the latter six hundred per cent. The vast economy in the management of the Post-office in that country is seen in the fact that while the correspondence fnercased from 75 millions of letters in 1840, to 478 milhons in $1856^{\circ}-a t$ least six-fold-the expense was bui little more than doubled. Had it been deemed necessary, but few figures would have been required to show elearly-what was demonstrated by Mr. Liowland IIll-that the alight diminution in the net revenue of the Post-office in Great Iritain, consequent to the great reduction of postage in 18.10 , was far more than malle up to the national treasury, during each and every year thereafter, in other branches of national income, und all from the direct and sole causo of the activity and prosperity of all businosa interests, engendered by a reduclion in the rates of postage. We beliere, and are confident that it is susceptible of a clear demonstration, that the principal reasons why our Post-office has not kept pace with the advanelng spirit of the ane, and been made as efficlent as the post in several other conn-
trles, are the following: In the first place, soveral popular fullacies have leen engendered and hept up by offielal post-office reporte: Again, the official heada of thls important department, for the last fifteen years, have almost imvariably thrown their official and personal influence ngainst all the great Improvements urgently demanded by the people; and In carrying out this opposition, several of these officers have exhibited an unwarrantable interference with the legislation of the country. All of the prineipal improvements liave been accomplished, not through their ald, but In the face of thelr opposition. The annual reports of the Postmaster-general, since 1852, have declared and attempted to prove that the legltinate revenue of the Post-office his been lesa than its legitlmate expenditures, while the contrary has been the fact, as must be evident when we have a complete view of the premises. The true state of the case is-and thls is the important matter that has been overlooked-the Post-office has performed u large amount of labor, and consequently been put to great expense, without any clear record or any alequate return.

The payment for and on a-sount of letters and documents trausported an ${ }^{1}$ ileilvered by the Post-olfice for the govermuent-i $\quad \therefore \quad, 00,000$-is entirely inadequate to the s. see ormed. To show the amoont of "frar" es $11:$ : aent from Washington alone, the follos. itew.. $\cdots$ glven in an ofricial

 tives, as the unt of ciescription of mail matter for one month - 'aus $\quad, \quad \pm 5 \%$.

|  | 3,410 | ${ }^{\$ 10,064}$ |
| Letters from Departmenta | 7,065 | 6,782 |
| Newspapere (numbering 1,10,020) | 111,002 | 11,100 |
| Total for one menth (prepald rates). | 815,021 | \$103,607 |
| For twolve months "* "* | 0,580,242 | 1,602,087 |
| Postage for twelve months, If not prepald |  | 3,158,890 |

The newspapers wero not counted, but weighed; and as the newrpapers of the country average about one and a balf ounces each, these have been considered as averaging ten papers to a pound. The postmaster expressed it as his opinlon that the free matter durlng that month, of which lie gave the results, was less than the avernge quantity. The amount given would make about 5000 tons of "free" matter in a year, from the post-office of the city of Washington alone; or an average for ench week-day of fifteen tors. Looking at thls $\$ 1,602,087$ due by goverument at prepnid rates, for the postage on free matter, outward only, from the city of Washington alone, ln a year, it would ba a very moderate estimate that should put the pestage of the governnent, at the rate the citizen prys, at $92,500,000$ annually. If we look at the revenue and expenses of the Post-effice for ten years, and see what appropriations were made for tha free matter transported for govcrnment, we shall see whether the Post-office actually supported itself or not.

That the Post-oflice dld not support itself from the postage paid by citlzens during thic last ten years, and
also aupport the burden of all the "franked" matter thrown on it by government, is avident from the above figares. The "official" statement is, that the ontire poatal revenue for ten yeara was $\$ 39,041,484$, and the expenditures ${ }^{68}, 186,197$; therefore there was a "deficiency," ehowing that the Poat-office did not aupport itseif by $\$ 8,494,763$. But the reality in thia. At the rates of postage now levied, the cost of transporting and dellvering the letters and documents for the citlzens and the government, for ten years, was as foilowa: Postage duc and puid by eltizens for ten yearn. . $\mathbf{* 5 4 , 0 1 4 , 0 5 2}$ Portage due (but not all paid) by goverumeat... 25,000,000
Total . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . $\$ 72,014,0502$ Expenses of the yout-omee for tea yeari......... 6s, 136,107 Post-office earnings exceeded the expenses by. ., $\$ t 0,878,405$
It la clearly evident that eny attempt to show whether our Post-office supporta Itself under the present la wa, regulationa, ratea of poatage and mamagement, must begin by showiug what are ita legitimate expensea and what its legltimate Income. Tho theory and practice of our law-makers is in strong contrast to the action of the members of the British P'arliament in 1839 and 1840, at the tims of the agitation and adoption of the penny postago. They at once abolished and renounced the frarking privilege, on the principie that oflicers of the government could as weil aford to pay their own postage as private citizens; that thoy wero In that case put to far less troublo to frank and send documents for others, and tist all postage necessary for carrying on the business of tho government should be charged to the Treasury, like all other national or government expenses. In reality, we to not know the amount of expenses and burdens that fall ou the Post-office, and yet the head of that Depar:ment has tuken upon himself to say that its income is not sufficient for its legitimate support. If a merchant or man of business were to know the precise amount of income that he actually received, whise he was Ignorant of a large portion of his expenditures, would he, or could he, conduct and manage his affaire with prudence, judgment, and economy? It is a paraliel case with our I'ont-office, burdened as it ic annually with five thousand tons of franked matter.
The history of our Poat-office for the last sixteen years diacloses the following facts: Letter postago has been raduced from a scale of five rates, running from six to iwenty-five cents, and averagiag, perhaps, thirteen or fourteen cents a letter ; first (ln 1845) to five and ten, and next (in 1801) to three, five, and six cents, and lastiy (in 18:5) to three and ten cents; and yet there has been no sensible diminution of the postal receipts, taking one vear with another. Taking the yearly increase of the postal revenue for a number of yenra before the first reduction as a criterion, the recelpts of the P'ost-office in 185.3 and 1856 were us large, if nut larger than they would have been ander the old raton. And yet the postage on each separate letter sveragas less than one third the clarge previous to 1445. I3y the side of that fact it may be stated here that in the postal history of all nationa there is no inatance on record where a seduction of postage, however great, has benn followed by any perament reduction of the postal revenuc. In public as in private aftioirs, the inhabitants of a country extend their patroage juat in proportion to the lusiuess and economical fucilitiea afforded them.

After the successful introduction of penny pastage fnto Great Britaln in 1840, the citizens of the United States commenced holdiag pulific meatings and petitioning Congress for a roduction of ratea, and other postal improvements. The pressure and agitation were kept up from 1841 to 1845 , and during that perind the Post-master-general-the Hun. Charien A. Wicklifth-used avery exertion, and brought every infinence, official and parsonal, to defeat the measure. With all this uncalled.for interferenco with the wishes of the people and the legislation of the country by an executivo of-
flcer, the blll reducing poatage to the two rates of five and ten recite was paseed, and want into operation In 1845. The incumbent of thls office from 1858 to 1857 -James Camphell-made overy possible aftort not only to defeat the wishes of the people in having the rates of postage reduced and made unlform, but to raiee the then exiating prepaid rase of letter poatage from three to five cents, and to double all the rates on printed matter. These ineasures were introduced in a kill, at the solisitation of the Iostmaster-peneral, by the chalrman of the House Committee, and at once defeated, recelviag only the mall minority of thirty-slx votes.

The efforts mado by the Postmaster-general to raise the rates were auccessful in Increasing the postage from si $x$ to ten cente on all letters that are tranaported over 8000 milles.

It may bo uncharitable to hat that cur auteamen have heretofore pald so little attention to the postal aubject as to be unacqualnted wlth lta detalla, though it is unqueationably true that this branch of government has not received the attention that ita importance fomands. In examining the postal auhject wa can not arrive at correct results by any syatem of generalizatlon, or by wholesale comparisons. It is a queation of cietall, of calculatlon, and of fact, in which certain cardinal principles can not be lgnored or lost sight of. It is true that the peoplo of Great Britain write many more letters than the peoplo of the United States; and it is equally true that thlis is the consequence of receiring a far greater amount of postal accominodation for the money they pay. It is eminently true that the large and profitable amount of correspondence passing through the Ilritish I'ost-office is the direct remul' of low and $v$ niform postage, combined with the great facilities for collecting, distributing, and delivering letters and other mall matter in cities and large towns. While we have populous citles with varled interests that require an Immenso local correspondence, our postal nffalrs are conducted in the same manner that they were In the first yeara of the Repobllc. Except by the labors of private partles, who are allowed to deliver lettera fromi the post-office, and levy a tax fer the service, or to set up private post-offices of their own, for the collection and diatribution of mall matter, we have harilly an improvement or facillty for diatributing letters in citlea to-day that did not exlat seventy years ago. People who write letters may carry or send them to the post-office, and those to whom they are addressed havo the privilego of ealling for the same and taking them out. Except through and by the labors of the privato postinan and carrierf, we, as a people, seem to be aware that the greatest want and the most profitsble field for postal facllities is $\ln$ and about our large citles and towns. In the country the distance betwren post-affices may bo reckoned by miles, but in jarge clties the legitimate wante of the people are not inet except by having deliveries many times a day, and places for obtaining stamps and mailing letters at every one or two hundred yards. The relative postal wants of the residents of different elty and country districts, and the extent to which those wants are met, in this country and in Great Britain, may be seen by the fige ure representing the average number of letters writtea by each person in a year, in the various locallies. Ths figures relatlng to the annual correspondence in this country are in whole numbers and decimals.

The

These figurea are not supposed to be exact, but they are a very near approxlmation to the precise number, arrived at by a close oalculation, hased on the relative population and postal lineoma. The following otatement exhlblts the annual correspondence per personin whole numbera-In different localltien In Great Britaln :

Connespondinom in Gheay Dmitain.

In London., ... 48
These results are very difiorent from what wa see in this country. They all go to establishone clear, iadisputable fact. They prove beyond question that the people of cities write from five to twonty times ae
many letters as the residents of conntry diatricta. And as we know that a very large portlon of tha Inhabitanta of cities ar. $I$ towna are minors, paupers, vagrants, and lgnorant persons, It la clear that tho adult male busin as population have oceasion to write from a hundred to thousand letters each per annum. We know, from the habits and wants of the population In rural districts, that the adult persons who are engaged in agricultural and mechanieal purouits do not uaually carry on one-forlieth part as anerch correspondence as the mercanille clanses in elties. Bearing these facts in mind, and remembering that there are from sla to twelve deliveries a dny In all parts of London, with over five hundred recelving houses and letter-pillars whers fetters enn the malled-averaging one for every second block or square tiroughout the city-bearing these facts in mind, we need not be surprised at the widely difierent resulte In that coantry and this, as conveyed in the fellowling authentic figures:

Anndal Nemarr of Letteas in mifygbent focalitire.

We ree by the above that the peoplo of Iondon alone (leas than two and a belf millions) have written and sent through the post more letters in the last ten years than all the people in the United States, whilo the popolation of Great Britaln-about tho same as in the Uoited States-havo written almost five times as many as the people of this country. Wo musi seck for a solutien of this in the far greater postal facilities in the United Kingdom, partlcularly In cities, than in this country. See the gigantic results of $n$ good local post in Loudon. There are almost one hali' as many letters written sud malled in London, for ilstribution in the city (local letters, a0o first column in the preceding table), as are written in a year by all the people in America! Could we get at the results of our local distribution of letters, we should find that the number of letters written in our cities, and distrlbuted by the govermment post in the plece where written-"drop letters," as wo vory appropriately call thein-we should find that they were only abont one-fortieth or one-fiftieth part as many as in the cities of Great Britaln. In other words, the aetlve business population of our cities write about as many lettere to go through the mails to a distanee, as the same population do of that class of letters in eltios in England; but of locai letters, for distribution In the city where they aro written, only abont one-fortleth part as many.
It is as easily shown that the local eorrespondence of cities is nuch more profitable to the I'ost-office than correspondence that is conveyed hundreds of miles, as it is to demonstrate that the correspondence of eities is of more importance and of greater amount than the correspondence of rinal districts. The whole secret of accommodating the people with a good ciry post, and making it profitable at the bame time, consists in hav-
ing our means allaptel to our wants. The mnils are sent over the rontes between New York and lBoston three thmes a day, twice $n$ dny from New Yoris to Wasinington, once a day from C'tarleston to New Orleans, onee a week betreen some small country villages, once a fortnight from Now York to San Frnncisco, and once a month frem Missourl to Grent Salt Lake City. By the very same rule, and for the same reasons, there should be a local distribution of letters in large cities like New York, Boston, and Philatelphla, from six to twelvo times a day. The very term "free-letter delivery," as applied to the local distribution of letters in English clties, is a mlanomer. It does not exist, nor is it asked for in this country. The local distribution of letters in the citles and towns of Great Britain amounts to just this: One unlform rate of postage is fixed on all singlo lofters-local and otherwise-without regard to distance, and this postage-one penny sterling-pays for trsnsporting the letter to the end of the route; and this, in cltles and towns, means to the door of the person addressed. It unquestionably eosts a slade less to circulate and deliver letters in n eitythose that are mailod there for dellvery-than it does to transport them hundreds of miles, and then deliver them. The actual result is this: the large number ofloeal letters in cities, at the postage of one penny for each, pays all the expense of collection and delivery-wages of receivers, mail-men and letter carriers-whlle theso persons coilect and deliver all letters that are to go and that come from out of town, wlthout any extra charge, and then the profit on theso local letters alone -admitting that the letters from a distance are delivered "free"-is very large. The following table, made up from the official report of the year 1854, needs no explanstion :

Looal toabegrondenoe in febtain i'itife in Great Britain, witil the Fixpenge of Colleevion and Delivgay.

| Cilles, | Nuaber of Letters in tha Maila. | h.seal Cireulaiton or Mrop Lettors. | Grone Reveaue from Local Cirentation. | Wagee of Letter carrient and Recsivers | Not Profit On Local Cireolation. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1andon. | 67,186,159 | 46,101,509 | \$1,385,747 | \$761.5117 | \$324,087 |
| I.tverpool | 0,145, 502 | 7,3901,044 | 221,701 | 27,035 | 194,666 |
| Mancheste | 10,088,55\% | 8,149,560 | 244,487 | 38,245 | 206,262 |
| Dubiln | 0,592,534 | 5, 390,184 | 150, ${ }^{374}$ | 88,940 | 120,034 |
| Edinbarg | 4,208,094 | 8,401,670 | 102,050 | 80,060 | 81,990 |
| Bristol | 4,381,410 | 8,543,816 | 106,314 | 15,855 | 90,459 |
| Total. | 91,605,561 | 74,005,781 | \$2,220,178 | \$901,8\%5 | \$1,018,348 |

The total mumber of letter receivera and letter carrlera in the United Kingdem, In 180.1, with the gross amount of their salaries, was a followa :

|  | Number. | Bulartes. |
| :---: | :---: | :---: |
| I-atier recelvers In the Kinsdom ... | 4.280 | \$230,74: |
| Letter carpiers in cities and towah. . | 4,315 | 804,5is |
| Letter carriers in rural dimerlets | 4.326 | 601, 210 |
| Total. | 13, 190 | \$1,643,677 |

Looking at the resulte in the two tables given above, we find that tha money recelved for posiage on the lucal lettere, in alx eitlea only, amounted to a larger sun than the entire cost of letter carriors and letter recelvers thronghout the united Kligdom of Great Britaln and Ireland! And we may mention, in this connection, that the rural letter earriers penetiate all the country districts of tireat liritain, the carriors in their walks geing from three to six milles from every villago post-oflee, at least onet a day.

The gigantio resulta shown in the English Dost-ofice are due to three or four aimple princtples. There is one uniform rate of postage on all single letters-those welghligg not to exceed half tun ontec-and this same rate also pays the postage on all pareels of printed matter-dons up in packages open at the ends-so that with one kind of stamp the citizen prepays more than nineteen-twenticths of all the packages he puta in the post-office. There is in every elty and villige a letter dellvery by cerriers, from two to twelve timen a day, with convenient places at every one or two hundrod yaris for posting letters and parcels. Thero la a system of renitting money by mail, through money orders ordrafts, for small suns, between all tho prineipsl postoflices ; and the money-order husiuess, like the uniform postage, la baned on so simple and economleal a system, and is carried on with such satisfactory results, that there ls cumbined the greatest convenience and smillest cost to the citizen, and the largest economy of management to the l'ont-oflice othiclals.

It is useless to say that the businesa of collecting and distributing letters in a city In Europe is any ditierent process, and involves any different principles, from that of distributing letters hero; fur it is not true. And certainly, so fat as correspondenco is concerned, our social and cumnercial wants are like those of the restdenta of Louden, Manclenter, l'aris, and Berlin. Conld we get at tho amennt of letter distribution done by privato parties in our large citica, it would be found that thero is a far greater correspontance carrled on outside of, than througla the post. And yet theru is no regularity, unifornity, safety, or system, and with all the multifarious appliances, we aro wretehedle: nerved, as every one knows. Philadelphia has repcri .' through the government Poat-otlice a leas correspondereve-or at least a amaller postal revenue-in proportion to popirlation, than any other large cityin Anerica. There a private individual carries on a very protitable and extenslvo aystem of city letter diatribution. 'the faet is, and it can not be dinguised, that our Post-oftice, being an exclusive goverument function, for long distances, should not alluw privato parties to carry it on for short distancea in cities. We cither wanl an etheient uniform gotermment l'oat-oflice over the entire coustry, or it should be abolished altogether, or d'arown open to private parties. Wo make the Post-office perform nearly three million dollars' worth of labor for the government., and appropriate for the same out of the Treasury less than a quarter of that sum, and then the government allows private parties to step in and set up a post In the very localities where a good prostal establishment is most needed, anil where it can be made the most protitable. With any thing like a critleal examination of our postal establishment, and to a person of any sagacity, it is clearly evident that in the lucalities where a post is most needed-lar se citiesand where it would pay the best, there our poat is most notoriously inefficient. The poatal establighment labora under the following prominent disalvantages:

Hirat. It performa a large amount of service for the govermment withont adequite compensation, Secont, Thers la not a uniform rate of postage, and the labinr and expense of conducting the pestal business is thereby grently inereased. Third. The correapontence of the country has never heen stlinulated and increased by low and uniform postage ani tho bent postal facilitica. Fourth. Our local correspontence in citicnthe most protitable bushesa of tha poatal entabilishment, when on a correet hasis-labors under every disadvantage, belog the canse, and juatly, of conntunt cem. plaint on the part of the eiticens. fïth. In all the large eltles, In consequence of the Irregularlty, unecrtalnty, sal Inconvenicnces of the Nathonal l'estoflle, prlvate posts earry off a large share of tho bushess.

If the above premises are correet, the remedies nee nelther hard to tind or diflleult to carry out. Fitul the amount of matter that is sent "free" by governmeat departments, offleers anil members of Congrean, and luve a sum paid or appropriated from some yuarter sumfient to meet it . Then make one rate of portage, so low that lt will not be exorbitant for single letters and the smallest packages for the shortest distances, and let thia rute pay as many descriptlons and slzen of written and printed packets an possllile. Abolish all private posta in citlem, and make a government pose that is adequate to the wasts of the citizens. It may be safely promised that a convenlent, reliable, economleal, punetual, and rapld distribution of letters in our cities will meet with all that encouragement and that extensive use that attends a good post in liuropeon eltles. Send all tetters and. printed packagestprhaps up to a certain amount, say four or elght just. ages In one parcel, as is dene In Great Itritaln-whecher they are prepalel or not, ant if not prepait, charge llouble poatage. Make a moneyorder system for remitting money in sums not exceeding twenty or twen-ty-ilve dollars; at first between all the larger offices, extending it as it becomes known and understool. Return all "dead" and refused letters to the writers, and enforec the payment of such postages as have not been prepald.

The question of the most profitable rate or rates of poatage may be discussed and examined for years, and We areforced to one conclumion; and that is, that there is no convenient, economical, or Just syatem withont unifonmity. The truth is, several of our rates of postage are too low, not allowing a falr compenation, and others are too high. Onr rate of one cent for drop letters or local letters, one cent for printed circulars, and one cent for transient newspapera, are all too low. They are not compensating; and if ralsed to two cents the charge would not be consldered hilgh, provideri alt letters of half an ounco welght, and printed packages up to four ounces, could be sent any and every dis. tance for the samo sum. We want a twoecent rate of pootage, with a tworent postage stamp, and a total abolition of all of the oncocent rates and stamps, nuil the threceent rates and stamps. It shoulit be the minimum; that is, no letter or transient packuge shoukd be mailed or sent the shortest distance for less than this at:n. We would pay with this two-cent stamp our city or drop letters-and that should include dulivery by a carrier, as carriers ahould work for salaries, and deliver every thing in cities without extra charin--our letters for all distances in the United States, all circtr lars, and all packages of printtitl matter, up to four onnces in wi.yht, that are done up open at tho ends. Is it not reasonable to suppose that there would be a sufficient increase in letters for elty circulation, and to go to a distance, nlong with the increase of price of postage on drop letters, on printed circulars, and on tranaient nownjapers, to make up for the luss on the threement letters, and the few letters that now pay ten cents? Anl we must hear in mind that one of the greatest argumenta for a uniform rate of postuge is the aimplicity, economy, and chcapmess that it effects in Secund the labing is theredence of inervased tal freiti1 citlesevery llis. tait com(ut alithe $y$, uncer. ostooflice isiness. edies are Filul line vermment ress, and e guarter f partage, gle letters distances and sizes Abolish verument zens. By distributiag $\$ 2,500,000-$ the supposed cost of transporting the "frankel" matter for government, instead of $\$ 700,000$, the sum now paid-among the different States, in tho proportions of their present postal revenue, the revonue of each Stato would tien be as seen in the last column but two. In the columin of postal expenses the complete amount of expenses is not quite all stated, but all is given that is get down under the head of each State, in tho official Report of the. Department. If tho entire sum were given, it would uet alter this comparative statement, or much atfeet the general result. We see by this-the last column lut one-that only 50 per cent, of the postal revenue of Massachusetts is used In expenses for that State, 52 per cent. in New York, and so on with the old, the thickly-settled, and the commercial States, while Texas $\$ 268$ is expended for every $\$ 100 \mathrm{re}-$ celved, and in Arkanaas 9610 to $\$ 100$ of revenue. The sums here given as the expenses of each State cre not supposed to be the exset amounts required for all the pestal expenses within the State-as sometintes a mail route runs through several States, and the expenses of mail transportation over it all falls on or is set down to the State where the route conmmences. But as theso routes generally commence at the East or North, and run West or Southwest, the largest show of expenses is mado in the States farthest east. We do not claim as a literal fact that the ontire expense of each letter mailed in the State of Massachusetts (sce last oolumn of table) amounts, on the average, to one cent five milils, and those in Arkansas to just eighteen cents three mills; but it is a fact that when the amount of correapondence, the postal revenue, and the postal expenses of each and every State are all fairly conaidered, the proportlon of money 6G
received in postage in each State is, to each letter mailed in that State, as here given. We know that letters starting in New York sometimes go to Arkansaa, Texas, Florida, or New Mexieo, and we do not claim that the exact proportion of money due on eteh letter mailed In each State can be elearly adjusted, and should be charged to each eltizen yesicirg in the State. But -and here lies one great arg anent for a vnifonm and a Low rate of postage-we do know, by tho preceding authentic figures, that the expense of transporilng and distributing letters differs very widely in each Stato; and the general rule is, that the newer, the more apiarsely settled, and the less commercial the State, the larger the proportlon of expenses to receipts. To illustrate this in a very striking light, let us compare the postal expenses and reeelpts, and the amount of correspondence in the two States of New York and Massachusette, with tho amount in all of the Southern States and tho region west of the Mississippi Rlver. They stand as follows:

| Localition. | $\begin{array}{\|c\|} \hline \text { Numbar of } \\ \text { Letters. } \\ \hline \end{array}$ | Poetal Reverine | $\begin{gathered} \text { Poofal } \\ \text { Expenues. } \\ \hline \end{gathered}$ |
| :---: | :---: | :---: | :---: |
| $\left.\begin{array}{l}\text { Now York and Mansa-\} } \\ \text { ehusetts ............. }\end{array}\right\}$ |  |  |  |
| Seuthern Statea and west of Mlasisslppl River... |  |  |  |

While the amount of corrasmontence, and the portal revenue in New York and Miscsehusette, exceed al aonth of the Potomac and Ohic, and west of the M $\mathrm{t}, 23 \mathrm{~s}$ sippl, the expenaea are lecis than one-thirs Agcid, let us divide the Union into three seetiens, exHing them the Nertheast, the Middle, and the Sonthvestern sectlons, and see the comparative amount of revenue, expensea, letters, cost per $\mathbf{1 0 , 0 0}$, letters, and per slrgie
lotter; The Northeast ection comprisas New England, fineluding also Missouri and California; the SouthNew York, New Jersey, and Peansylvania ; the Middle section, from Delaware to the southern boundary of Virginia and Tennessee, and.west to the Missisolppi,

From these facts we see and know that the expense of transporting and distributing letters is nut in proportlon to the distance they are carried. We see that all of tho letters circulated from Nelne, on the caat, to Tennessee an d Missourl, throughout our northeastern and midulle actions, Involve an average expensetransportation and every thing included-of two centa four mills a letter. It coata moro to send and tako care of $n$ latter that goes tifty or a hundred miles in Florida, Arkansas, or 'lexas, than it does to take one from Purtland, Maine, to Mlemphis, from Boston to St. Loais, or from New York to New Orkeans.

Now our Southern brethren will do us the eredit to believe that we propose nothing sectionn), nothing narrow, and nothing partial. Every single fuct, figure, and circumstance goes to prove, beyond all cavil, that correspondence ia carried on to a fur greater extent in the thiekly-settied soeial and commercial districts of the North and East, than at tho south and Weat. The people in these districts write the largest share of the letters, and pay by far the largest ahare of the poatage, whitle with them postal expenses are comparatively light. Wero there two nadiona placed in the relative posltions of New York aud Now Eugland on the one ham, and Mississippi, Lonisinna, and the States of the South and Southwest on the other, the one eould have a self-supporting mail syatem, at a uniform rate of postage, nut to exceed one-quarter what would bo rechired in the other. In tho State of Now York alone are written annanlly $29,259,943$ letters, whild in all of the States south of the Potomac and Ohio Kivers, Misaouri, Arkansas, and Texas included, tha number is but 31, 090,035 . The city of Nuw York alone contributes one-tenth of the jostal reveune of the uation, and writes one-tenth of the letters, being a larger proportion than is contributed by every State that bordors on the Gulf of Dexico.
'lhese aro facta, and they aro not held up as a reproanh, but to illustrate the linancial condition of our postal system, and io al.ow that a good, nu active, and an economical postal eatablishment is of vast inportance in large towns, citica, and thickly-sented and commercial diatricts. Tho propla in thoso localities where many letters are written, where correspondence is the life-blood of the comsuercial aul social aystem, feel that they have a right to ask that a postal systemi ahall be adapted to the wants of thase on whom its aupport principally falls. We, as a people residing in cities and thickly-settled States, ask for not oute single privilege or one charge for sorvice that ia not to be accorded to the lonely aettler of New Atexico or the planter of Texas, under the same circnmatances, but we do ask for a uniform rate of letter postage of just two cents for all diatsnces; and the faets given in thls artlele-and they challenge examination for theirgeneral correctucse-these facts clearly prove, beyond a doult, that this rate will be ample to defray the expenses of all, except, perhapa, in somo forest frontiers or thiuly-nettled regions; and there any extra ex-pense-if there is any-should fall on the entire treasury of the nation, tuscead of heing levied es a partial, a special, and an unjust tax on the Induatrious active classes, who make extensive use of the prost-otlice.

We want and need a convenient nunsbr of receivinghouses and lutter-pillais in our citiee, after the plan of
the distribution system in England. Theae "receiv. ing-houses" do not require to be sub-postroffices, or officis for the delivery of letters, but oaly for the teception of letters and the sale of stamps. Under these circumatances, a very small salary and a small commission on the sale of stampe, is anfficient to coupensate the receiver.

Therights of the eitizen are not atteniled to in this couniry in the managensent of "dead letters." In this case we have only to look at the satisfactory and just method allopted in Greut Britain. There there is no "Dend-letter Office," but there is a "Returnedletter Office." Sottcra aro not reportel " dead" except they are nnonymous, or when, from other circunstances, the owner can not be found. There, with the great bulk of the letters, a rapid and secure methol of returning "misearriad" lotters to the writers is adopted, ly means of which every letter is returnel on the very day it arrives at the Retumed-letter Office. It is done so expeditionsly, that a clerk returns 200 per day, and $1200 \ln$ a week. At thia rate all of our "doad letters" could le returned, at a cost to the nation of Juss than one hundred thousand dollars. With a syatem of letter delivery in cities and towns, the refused or miscurried letters conld usually be sent to the Departmeot and returned to the writers, in from one to three weeks of the date of mailing. In England, letters that misearry usually get baek to the writers within a week of the date of mailing. Oftentimes these dead or nisearried letters would he of great advantage to the writer, particularly in informing him that his letter hall not reached its destination. On the face of it wonld be written usually, as is praeticed in lingland, the canse of its non-delivery.
Auy person who will give it an examination will see that we liave at this time a most troublesome, perplexing, and absurd system of rates; and it must, we think, be quite as clear that, in a tinancial anil economical point of viuw, our proposed scale of rates is satisfretory, simple, cconomical, and adapted to aur wants. - See 'hankers' Magazine, New York, vol. vii., Novemler and December, $180^{2} \overline{7}$. Potash (Da. Potaske; Fr. Potasse; Ger. Pottcesche; It. Potucsa, Pol. Potasz; Russ. Potasch). If vegetables be burned, th: whes fixiviated, and the solution boiled to dryness in tion vessels, tho mass left behind is the potash of comnerce-the impure carhonate of potasa of chemists. It is intenaely alkaline, solid, and colored brown hy the adinixture of a sinall pertion of vegetable inflammable matter, which generally becomes meist. Whon potash is calcined in a reverberstory furnaco, tho coloring matter is destroyed, it asaumes a spongy texture, and a whitish pearly lustre; whenco It is denominated pearlash. The latter generaily contains from 60 to 83 or 84 per cent. of pure carbonate of potass. Tho asbos of those vegetables only which grow at a distance from tho sea are employed in the manufactare of potash. LIerbaceous plants yicid the largest portion, and shrubs moro than trees. It is princlpaily manufacturod in America, Russia, nnd Poiand, tho vast forests of which furnish an inexhaustible supply of ashes.
In some portions of the Unitod States and Canatla, where timber is an incumbrance upon the soil, it is felled, pilel up in pyramids, and burned, solely with a view to the manufacture of potashes. Tho ashes ars put into wooden cisterns, having a plug at the bottom of one of the sides under a false bottom; a moderato quantity of water is then poured on the mass, and somo quicklime is stirred in . After standing for a few hours, so as to take up tho solublo matter, tho clear liquor is drawn off, ovaporated to dryness in Iron pota, and finally fused at a red heat into compact masses, which are gray on the outside and pink-colored within. Pearlash is prepared by caloining potaohes upon a reverberatory hearth, till the whole carbonaceous matter, and tho greater part of the sulphur, be dissipated; then lixiviating tho mass in a cistern having a falso bottom covared with straw, evaporating the clear lyo to dryness in flat iron pana, and stirring it toward the ead into wlite lumpy granulations. All kinda of vogetables do not yield the same proportion of potassa. The more succulent tho plant, the more does it afford; for it is only in the juicen that the vegetable salts reside, which are converted by incineration into slkaline matter. Horbaceous weeds are more productivo of potash than the graminiferous species, or shrubs, and these than trees; and for a liko reason twige and leaves are moro productivo than timber. But plants in all eases are richest in alkallne salta when they have arrived at maturity. Tho soil in which they grow also influences the quantity of saline matter.
The following tnble exhibita tho average product in potassa of severnl plants, according to the rescarches of Vauquelin, Pertuis, Kirwan, and De Saussure:

| In 1000 parta. | Potaseal | In 1000 parts. | Potase. |

Stalks of tobacco, potatoes, cheatnute, cheatnut huaks, broom, heath, furze, tansy, sorrel, vine leavas, beet leaves, orach, and many other planta, abound in potash ealts. In Burgundy, the well-known cendres graveles are made by incinerating the lees of wine pressed into cakes, and dried in the sun : the ashea contain fully 16 .per cent. of potassa.

Potatoes (Ger. Kartoffeln; Du. Aarduppelen; Fr. Ponmes de terre ; It. Patate, Pomi witerra; Sp. Patatas munchegas; Russ. Jabloki sendenie), the roots of the Solanua tuberosum, of innumerable varieties, and too well known to require any description.
Historical Notice.-The common Engilish or Irish potato (Solanum tuberosum), so extensivoly cultivated throughout unost of the temperate countrios of the civilized globe, contributing, as it does, to the necessitica of a large portion of the human race, as weli as to tho nourishment and fattening of atock, is regarded as of bat litule leas importance in our nationai economy than maize, wheat, or rice. It has been found in an indigonous atate in Chili, on the mountains near Vaiparaiso and Mendoza; also near Montevideo, Lima, Quito, as weil as in Santa Fó de Bogota, and more recently in Mexico, on che flanks of the Orizaba.
Ths history of this plant, in connection with that of the sweet potato, is involved in obscurity, as the accounts of their introduction into Europe are somewhat conflicting, and often thay uppear to be confounded with ons another. The common kind was doubtless introduced into Spain in the early part of the 16th century, from the neighborhood of Quito, where as well as in all Spsnish countries, the tubers are known as papas. The tirst published account of it we find on record is in la Cronica del Peru, by Pedrı de Cieca, printed at Soville in 1553, in which it is described, and illustrated by an eagraving. Trom Spain it sppears to have found its way into Italy, where it assumed the anme name as the truffle. It was reatived by Clusius, at Vienna, in 1598, in wlicze time it apread rapidly in ths south of Europo, and even into Germany. To England it is said to havo found its way hy a different route, having been brnught trom Virginia by Raloigh's coloniats in 1586, which would seem inuprobahis, as it was unknown in North America at that time, either wild or cultivated; and, besides, Gough, in inis edition of Camden's Britanma, says it was tirst plantel by Sir Walter Kaleigh on his estate at Youghall, near Cork, and that it was cultivated in Iroland hefore its value was known in England. Gerard, in his Ilerbal, published in 1597, gives a tigure of this plant, under the name of Batata Virginiana, to distinguish it from tho sweet potato, Butata edulie, and recommends the root to be caten an a "delicate dish," but not as a common food. "The sweet potato," says Sir Josoph Bariks, "was used in England as a delicacy iong before the introduction of our potatoes; it was imported in considerable quantitios from Spaiu and tho Canaries, and was supposod to possess the power of restoring decajed vigor." It is celated that the common potato was accidentally introduced into England from ireland at a period somowhat earlier than that noticed by Gerard, in consequence of the wrecking of a vessel on the colast of Lancoahire, which had a quantity on board. In 1663, the Royal Society of England tcok measures for encoursging the cultivation of illis vegetablo, with the visw of preventing famine. Notwithstandlug ite utillty as a food hecame better known, ao high charecter waa attached to i ; and the writere on gardening toward tho end of the 17th century,
n handred years or more after its introduction，treated of it rather indifferently．＂They are much used in Ireland and Amerlca as bread，＂says one author，＂and may be propagated with advantage to poor people．＂ The famous nurserymen，London and Wise，dld not conslder it worthy of notice in their Complete Gardener， published in 1719．But lta nse gradually apread，as ita excellences became better understood．It waa near the milddle of the last century before it was general－ ly known either lu Britain or North America，aince which it has been most extensively cultivated．The perlod of the introduction of tha common potato inte the British North American colonies is not precisely known．
The culture of this plant extenda through the whole of ist，rope，a large portion of Asia，Australia，the aouth－ ern and northern parts of Afrlca，and the adjacent isl－ ands．On the American contincnt，with the exception of some sectiona of the torrid zone，the culture of thia root extends from Labrador on the east，and Nootkn Sound on the wert，to Cape IIorn．It resista more ef－ fectually than the cereals the frosts of the North．In this country it is principally confined to the Northern， Middle，and Western States，where，from the coolness nf the elimate，it acquires a farinaceous consistence highly condurive to the support of aulasal life．It has never been extensively cultivated in Florida，Alabana， Miasissippl，nor Louisiana－perhaps from the grenter facility of raising the sweet potato，its more tropical rival．Ita perfection，however，depends as much upou the soll as on the cillunte in which it growa；for in the red loem on the banka of Bayon Bruf，in Louisiana， where the land is now，it is stated that tubera are pro－ duced as large，aavory，and as free from water as any raised In other parts of the world．The asme may be said of those grown at Bermuda，Madeira，the Cana－ rics，and numerons other ocean isles，The chicf vari－ eties cultivated in the Northern States are tion Carter， the kidneyn，the pink－eyes，the Mercer，the orange，the Sault St．Marie，the Merino，and the Western red；in the Middle and Western Staten，the Mercer，the Inrg red or Merino，the orange，and the Western red．The yield varies from 50 to 400 buakels and upward per acre，but generally it is below 200 bushels．Within the last ten ycara an alarming disense，or＂rot，＂has attacked the abers of this plant abont the the they are fully grown．It has not only oppeared in nearly every part of our own country，but has apreal dismay at times througheut Great liritain and Ireland，ant has been felt more or less seriously in every quarter of the giobe．To the greater uneertainty attending its cultivation of late years，from this cause，must be at－ tributed the deficiency of the crop of $184!$ as compared with that of $\mathbf{1 8 3 9}$ ．This is one of the four agricultural products whieh，by the present census，appears smaller than it wat ten yenrs since．

Swret fotato．－The aweet potato（Ratata edulis）is a native of the East Indlen，and of Intertropical America， and was the＂potato＂of the oll English writers in the early part of the 14 th century．It was dountens in－ troducel into Carolina，Georgia，and Virgiola，noon aft－ er their settlement hy the Eurepeann，Preing mentioned as one of the eultimated profucts of those colonies an early as the year 1648．It arowa In excessive almant－ ance throughout the Southers States，and as far north as New Jersey and the southern part of Michigan． The varieties cultivated are the purple，the red，the ycllow，an＇the white，the former of which is confined to the Soutl．The amount of aweet jotatoen exported from Louth Carolina in 1747－＇48 was 700 lushels；that of the common poitato exported from the Irsited States in $\mathbf{3 8 2 0 - 2 1}, 90,889$ humhels；in 1880－91， 112,875 lush－ els；in 1840－41，1201，045 lushels ；in 1850－51，106，842 Inshels．According to the cenaua roturns ef 1840 ，the quantity of potatoes of all marts ralned in the I＇nion was 108,298, imio buslicls；of $1850,104,055,989$ bushels， of which $88,259,196$ bushels were sweet．

Potomao River, in Maryland and Virginia, rises in two branches, the north and the south, in and near the Alleghany Mountnins, and forms, through nearly its whole course, the boundary between Virginia and Maryland. It is about 300 miles long, nud enters Chesapeake Bny letween l'oint Lookout and Smith's l'oint by a mouth ten miles wide. At Alexandria it is a milo nud a quarter wido, 290 miles from tho ocean. It is navigable for ships of the lino to the navy-yard in Washington, 300 miles from the sea, and three miles below tho head of tide-water. Above this it is obstructed by numerous falls and rapids. - See Manihand, Chesaideake.

Pound (Lat. pondus, weight), a measure of weight. In England two different pounds are used-the pound avoirdupois, and the pound Troy. Tho pound avoirdupois welghs 7000 grains Troy, and the pound Troy 5760 grains. The former is divided into 16 ounces, uud the lntter into 12. The pound sterling was in Saxon times, ahout A.1. 671, a pound 'Troy of silver, sud a shilling was its twentiech part; consecquently the latter was threo times as large as it is at present. lesachsa. Tho value of the Roman pondo is not precisely known, though some suppose it was equivalent to an Attic mina, or $£ 34 s .7 d$. Our avoirdupois weight (utoir det poids) came from the French, and contains sisteen onnees; $i t$ is in proportion to our Troy weiglat as seventeen to fourteen.-Cinaminens; see nlso Bankers' Magazine, December, 1857, 456-45i. An ohl pound weight of geographical signifiennee, named liasterling, divided into twelvo ounces, was in uso among the An-flo-Saxons some centuries hefore the Norman Conquest. The snume weight, ealled the Tower, nnil the Moneyers' pound, was styled by early lirench writers the Ronan nud the Rochelle pound ; also known among tio Garmans as the Cologne pound. A simple syster of exchange, by which a pound of silver money, in tale, was male to equal a pound in gross weight, had been nrranged by Charles the Great, in lirance, towarl the end of the eighth century. In Britain, under the lirst William, of Normandy, an orilinance declared, "The weights and measures throughout the kingdom shall remain as our worthy predecessors have established." Queen Eliznbeth oriered the ounco of silver, in England, to be cut into sixty penilies; so that the penny, formerly the twenticth of an ounce, thenceforth became the sixtieth part! From the termination of Queen Elizabeth's reign tho cevinnge of Euglish silver lata generally retained a purity of 925 thousandths, called the "Sterling Standard." Another pound weight, ulso divided into twelve ounces, had been brought from. Cniro, in ligypt, to Troyes of Champagne, in l'ranee, during the Crusndes. Carried into Englnnd by foreign goldsmiths, lombard merehanta, possibly from Veme, about the year 1490 , it gradually superseded tho oil Easterling weights, and found aceess Into the Itritish Slint, ly decision of IIenry V11I. In 1543 this king began to delase the fineness of the silver coins, und also relueed their standard welght. The lBritish statute of 1266 established two common measures for money, weights, Iry and wet quantities, with presumed consent of tho people and approval by the king, which sem to renter "wheat and silver money the two weights of the halnnee, the natural tests and standartis "f ench other." Unfortunately for such decision, neither whent eorn grains nor sllver are by nature exact weights suited for a standard, " $n$ rule by which other things may be correetly compared, adjusted, and valued." "the neeredited proportions of these old measures being accessible an ntempt has been made to test their quantlies. Edward IV., in 1.14i, struek a golit coin of the value of ten shillings, numed sum "angel," hecause such all inuge was represented upon the face of it, with the likeness of a ship on the reverse. Itenry IV. ( 1483 to $: 50!1$ ) intruduced "tho sovereigu," or "rose nothe," of groll "Tho guinea," designed to he of the ralue of twenty shillings, but requiring subse-
quent correction, was not oriained till the relgn of Charles 11, in England. In 1821 a committee of the Royal Soclety, to whom the matter had been referred, proposed, and lt was so decided, by act of George IV., in 1824, 1st. That the parliamentary standard yard, made by Bird, in 1760, be henceforth the legal staudard of the British empire; 2d. That the parliamentaxy standard Troy pound weight, made in 1758, continuo unaltered; Bd. That seven thousand grsins be deelared to constituto the pound-weight avoirdupois, now ealled the British imperial pound. By act of Congress of the United States, in 1828, "the brass Troy pound weight, procured by tho Minister of the United States at London, in the year i.827, for tho use of the Mint, shall be the standard of the Mint of the United States, conformably to which the coinage thereof shall bo regulated." Yet we possess three several standing weights for coinaye accounts, each one derived from a distinct unitary, measure taken from as many different nations. 1st. We have a Troy standard for quantities, from Britain ; 2d. A metrical standard for qualities, from Fwanco; 3d. An avoirdupois standard for proportons, from Spain. The sole remnant retained trom the originsl seale of tho mother country being the Troy ounce, now divided and multiplied decimally. - Report of Dr. J. H. Gimuses of tho United States Mint, North Carolina. See Penvy.

Pratique. The writing or liceuse of this name was originally addressed ly the Southern nations to the ports of Italy to which vessels wero bound, and signified that the ship so lieensed came from a place or conntry in a healthy state, and no way infected with the plague or other contagious disease. The pratique is now ealled a bill of health, and is still of tho same intent and import.-Asies.

Precious Metals, a designation frequently applied to gold and silver. We have given, under the articles Gols and Silven, a short account of esch metal; and we now proposo laying before the reader some detaila with respect to their supply and consumption. To entor fully lnto this interesting and difficult subject would require a ling essay, or rather a large velume. Mir. Jncol publisied in 1831 an "Historical Inguiry Int's the Production and Consumption of the Preclous Metals," in which ho takes up tho subject at the earliest period, and continues it to the abovo epoch. And though far fror i being so learned, complete, or satisfnetory as might havo been oxpocted, this work contains a good deal of valuable information, and deserves the attention of those who take an interest in such inquiries. But within the isst fivo or six years the subjeet has aequired an interest and importanee with which it was not previously invested.

Supply of the Precioas Metals. - Since tho discovery of Amerien, the far greater part of the sur plies of gold nul si'ver have been derived from thint continent. Jreviously io the publiention of IImmbolde's grent work, "Eissai Politique sur la Noutelle Espagne," several estimates, somo of them framed by individuals of great :ntelligence, wero in elreulation, of the quantitios of gold and silver imported from Amerien. They, however, differed widely from each other, and were all fransed from comparatively limited sources of information. Ilumboldt brought these estimntes together as follows:

| Authom. | Eproctie. | Dollars. |

| Total | -5,217 | 17,29t | 3,460,840 | 7r6,6st | 48,500, 0200 |

Ilumbolds further estimated the annual produce of the liuropean miacs of Ilungary. Saxony, etc., and those of Norhhern Asia, at the rause period, at about $\mathrm{El}, 060,000$ more. The quantidy of gold produced in America at the beginuing of tho century was to the quantity of silver as 1 to 46 ; in Earepe the proportions were as 1 to 40 . The value of equal quantities of gold and eilver were then in the proportion of 15 or $15 \frac{1}{2}$ to 1. From 1800 to 1810 the yield of tho American mines continued to lucrease; and their produce, and that of the European and Russian mines, wan then probalily rather above than below $\$ 55,040,000$. But in the lastmentioned ycar the contest began which terminated in the dissolution of the comection between Spain and her American colonies. The convulsions and insecurity arising out of this atruggle-the proseription of the old Spanish families, to whom tho mines pringipally belonged, who repaired, with the wrocks of their fortunes, some to Cubn, some to Spain, and some to Horleaux aud the sonth of France-caused the abandoninent of several of the miues, and an extraordinary falling off in the amount of their profuce. 'I here aro no means of estimating the prerise oxtent of this decline; but according to Jacol, who collected and compared all the existing infomation on the sulject, the total average produce of the American mines, inclusivo of Ilraxil, during the twenty yeara ending with 1829, may ber estimated at $\$ 20,000,000$ a year; being less than half their produce at the beginning of the cen-tury!-dacon on Itecious Aetals. It has, huwever, been aupposed that Jaxol, ratier exaggerated the fuiling off. And, at all ovents, the supplies of bullion obtained from Mexico and south Auterica began, soun after the publication of his work (1831), to lucreams; and, notwithstanding the anarchy to which they have rontinued to be a prey, that inerease has been maintalued down to the year $1 \times 53$. It appears from the returns sent home lyy the lbritish consuls that the coinage of gold and silver in the Mexican mints amounted in $1817^{7}$ to $816,923,948$, and in 1814 to $\geqslant 19,5 \times 16,-5 \cdot$. Put it is well known that consideralle guantitics of these metuls are rised and exported from Mexico without ikeing bren,, , to the minas to be ceviuod. Aud taking thin ite:a noto account, wo shall not, perhaps, to very wide of the mark if we estimate the entire produce of the N'er an mines in 1847 and $18+8$ at atout 19 and 2 $1 \frac{1}{2}$ mil.' min of dollsra, of which from 17 to $20 \frac{2}{2}$ millions were in allver. In 1842, Mr. B. H. Wilson, eunsul ina
l'era, estimated the produce of the Peruvian mines at alout $\$ 5,210,000$ a year. - Parliamentary Paper, $\mathrm{N}_{0}$. 176, Sossion 1848 . And it has siuco increnesu to $\$ 6,500,000$ or $\$ 7,000,000$. The produce of the Dulitiun mines is usually cetimated at abont balf the produce of those of leru. In $180^{5} 0$ the produco of the Chilian mines, accordiag to the official returns, ameunted to \$7,0:0,G7̈1.-A anucire de I'F.conomie Politique, 1853.

Birkmyre's esthate of the production of the precious metals in $18 / 6$ and 1850 , tho nuost elaborate and ral. mable of any hitherto puhlished, appeared in the loudon Times of the 19th May, 1851. We auljoin senie of its principal portiens.
"The quantities of goll and silver produced at the under-meationed epachas were:
" In 1801 the qumutity of pure gold produce! in Allerica was 46,331 lus.; inl Europe and Northen Asia (exclusive of Chii a mmil Japan), 4,916 1 ls . ; tetal produce, $51,217 \mathrm{llss}=\mathbf{=}=55,910$ llis. Itritish staudard gold $=$ £2,612,200.

In 1846 the quantity of pure gold proluced ia Anorica was $2 \overline{5}, 503$ lis. ; in Europe, Africa, and Asia (exclusive of China and Japan), 89, 171 lbs ; totul proluee, $114,644 \mathrm{lbs}$. $=125,108 \mathrm{lua}$. British standard gold= £ $5,816,721$.
"In 1850 the quanticy of puro gole prolucel in America was $261,761 \mathrm{lhs}$; in Eureje, Africa, and Asia (exclusire of China and Japan), 101,219 Jus, thal produce, $36 \mathrm{G}, 969$ lus. $=399,217$ liss. liritish standarl bold $=£ 18,654,322$.
"The alowe quantitiea are probsbly less than the actual production. The duties on gold in liussia on the produce of the private mines are heavy, varyiut from 12 to 24 per cent.; in Austria they amement to 10 per cent., in lirazit to 5 per cent., and are underatound to lead to a great deal of amuggling. In other coun. tries, such an the Luited States, where there are no duties, the gold and silver stated in the table are only the quantities lnought to the mints to be coivel, there be. ing uo means of determining the quantity used in jewelry and other arts ant manufactures."
The exhnustion of the precieus metals in manufactures and the arta throughout Luropo and the Dinited States probally $y$ exceecis the ordinary estimates. It is known that in Eingland alone the weekly consumption of fine gold is equivalent to 600 ounces-used hargely in gilling metale by the electrotype and the watergildlug processes.

 horsia; ihe latter two teais after the Dibcovery.

' Excluaivo of Ching and Japan, which produce largo quantlies of gold and sllver, the amount of whleh is quito unknown to Europeans,

Same small portlon of tho quantities exported to bigyt was probably detained in that country or forwarded to Australia. But by far the greater part, perhaps not less tban nineteen-twentieths of tho whole, was destinod for, and went to, Iadia. But although hudia did not, for several years prior to 1850 , derivo any considerablo supply of bullion from Europe, sho drew during that period largo supplies from China. This was a consequence of the vast increasa in the importations of opiun into the lattor. With the exception of tea and silk, China has fow nativo products, other than the precious motals, fit for foreign markets. And the exports of the former being not much more than sullicient to pay for the products sent to her from Liurope and Amorica, a vory considorable part of the cotton and opium importod from India is paid for In bullion, the increased exports of which are said to have latterly brought serious ditficulties. It appears, fol example, that at an uyorago of the seventeen years ending with 1850-'ol, the annnal value of the merchandise pxported from India to China amonuted to $\mathbf{x t , 5 6 t , 4 0 0}$ a year, and that of the marohandiso imported to oply £643,210, leaving a balance of no less than $£ 3,921,190$ a year to be paid in bullion, and in drates on London and other places indebied to China. The following tahle, which is deduced from the account compiled by the Indian custom-house, shows the balance between tho importation and exportstion of Iressure into and from India, tor 17 years, 18:5-'0l. Since 1851 this enrrent of goldand sllverfrom Europe has largely increased, swelling thas hoards of treasure in China und Iadia.

Total excess of imports. . ................... $831,427,905$
Now it appears from this table that the imports of bullion into India during tho soveuteen years ending with $1850-51$, oxceoded the oxprorts by the gross sum of $£ 36,427,905$, being at the rate of $£ 2,142,818$ a year. Tho following tables show the countries from which tho bullion imported into Iudia during the four years ending with $1850-$ '01 was derived, and those to which the bullion exportod was sent.

The accumulations of gold from California and Australia have created a strong desire for India and China goods, for which specio must be paid in lieu of donestic goods or produce from Laghand or tho Linited States.

Trearvaf impobted into lniha from 1847-48 to 185j-'51.

It appears from these tables that China furnished two-thirds or more of all the bullion imported in.o India during the four years ending with 1850-'51: : il that till the last-mentioned year the imports from l:uropo were quite inconsiderable, and greatly en ceeded by the exporta to it. Chiua, indeed, has been long known to be both an importer and an exporter of bullion. But it is only within the last few years, or since the importations of opium became no inmenso, that $h$ rexports of bullion have become so very large as to m . ke them productive of much inconvenience. The imp orts of bullion into India from the Inlted States hav, till recently, been too inconsiderable to deserve notis: A direct intercourse has now been commenced betwi in San Francisco and the eastern hemisphere; but hi, herto all shipments of hullion to India and China on / merican accuiat havo been made through London. Luring the year ending the 30th June, 1852, the Amorienna sent gold and silver to the amount of
, 127,379 to England. Hut though the value of ceir imports from India nad China during that year amounted to $811,818,991$, while that of their exports thither amounted to only $\hat{3}, 2627$, tian, they did not send to either a single dollar or a single dollar's worth of gold or silver direct from Ameriea.-Rfjort on Commerce and Narigation of the L'nited stutes for 185!, $p$. 36, et seq.

But uader such cireumstances there will lie a eorros sponding inerease of demand in India for the bullion of Australia and America. Indced, tho probability seems to be, from the late extraordinary importation of bullion from Liurope, that the supply from China and clsewhere, notwithstanding its magnitude, had not sufticed fully to mect the wants of India. And independent of this circumstance, it is plain that a slight fall in the value of bullion in other countries would render it a still more advantageous artlele of export to India. Aul taking the vast extent and population of the peninsula into account, and the habit, universally prevalent in it, of hourding the precions metals, it is impossible to say, supposing the treasure-current to continue in set in an easterly direction, how great $n$ quautity of hullion might he thrown upon the markets of Indla and tio aljacent countries before any very sensible reduction of its value was manifented. It is diflicult satisfactorily to account for the extraordinary exportation of bulition to India in $1 \times 50-\mathbf{D}^{2} 2$. Mlost probally It has been owing partly to circumstances connected with the demand for it in India, mud partly to those peculiar to its supply in Fingland and the
 of the annual imports from India and China connists of remittances on account of the East Intla Company's homa charges. But indepencently of this item, the imports of Indian and Chinese goods into Vingland and tho Cnitell States Hal a laterly been so very great, that they have left a balance to be defraved by the export of specie. Most prulably, also, the oceupation of the l'unjalı has oceasinned a demand for additional supplies of currency for that province, while consiter-
able quantities would be wanted for the llurmese expedition. The refusal to receive gold tis phyment of revenne, though ita influence has been exaggerated, lias no doubt contributed to bring about the same result, or to inerease the demand for silver in India. And it further appenrs that the balances of treasure belonging to the Indian government in its ditlerent treaauries throughout India have lately increased to an inconvenient extent, or to alout 16 millions nter. ling, when from 8 to 10 millions would suftice for r ery purpose of regularity and security. Hat measires aro nuw (1853) in progress connected with the liquida. tion of a portion of the Indian delit which will set free a conalderable portion of this aurplus treasure; and will thus have the donble effect of diminishing or stopping the demand for silver in India, and of enal ling the country to avail itself of the serviees of the capital which has been abstracted from the great work of pro-duction.-.See an ablo article in the Efonomist, 3il Jecember, 18:53. It would also seem that while cireumstanees were oceluring In India which account for the origin of the drain for bullion to thut quarter and its continuance, thero was simultaneonsly an excess of silver in America nnd Europe, oceasioned hy the substitution of gold for that metal in the eurrencies of the United States and of France. And such being the case, the renewed exportation of hullion to the East appears to be sufficiently acconnted for, and to have been almost a matter of course.

In aldition to the Inereased product in the American mines, thero has been within the last twenty years an extraordinary increase in the produce of the kussoAsiatie mines and washings, or rather of the latter. In 1810, for example, the pmiluce of the Siberian golt washings was estimated at only of poods; whereas it had increased in 1840 to nbove 2.10 poods, and in $3 \times 17$ to no fewer than 1:16A poods. In addition to the washinge t'e I'ral mines yield from 310 to 320 poods cokd. The produce from both sources amounted in INTï, ar:corling to the officlal returns, to 17.11 poods. inut it has not heen so great since, heing in

The ofiel il authoritles nserihe this falling off to the exhansion of the deposits, null the unskillfaluess of those engaged in the basiness. Hut it is dotubtful whether the falling off be not more apparent than real, and whether it be not oceasioned by the enomons taxes which lisve heen juposed of late years on the gold obtalned from the whshings. The principal tax varies according to the produce, being $f$ per cent, on washings that yield from 1 to 2 joods per ammm, increasInfy by varlous steps till It amounts to 82 per cent. an these which yiehl 50 poods. And there are other dathes which, though lebs in anount, are of the same oppressive character.

These exorbitant duties have, no doubt, tended to lessen the produce of the washings. It is, lowever,
all but certaln that their principal gffect has been to defeat theniselves by templing the partles concerned to adopt every means by which they milght be evaded; and the notorlous corruptlon of the Rusalan revenue officers renders this comparstlvely easy. Parhaps, under the circumstances, we may not be far wrong in supposing hat from a third part to a half of tho produce of the washings is exempted from the duty. But taking It at a third, and aupposing the taxed produce of the washings to have amounted in 1851 to 1117 poods, the real produce would be 1489 poods; to which if we add 315 poods for the praduce of the minea of the Oural, the aggregate total would amount to 1804 poods. And this, equal to 72,160 lbs. Troy, makes over $1818,905,000$.

There has also been of late a considerable increase in the yleld of the Spanish mlues, which is ut present supposed to amount to from $\$ 2,250,000$ to $\$ 2,500,000$ a year. Including the silver ralsed in Russia and elsewhere, and that obtalned from the refining of lead, the produce of which in the United Kingdom exceeds $\$ 1,000,000$ a year (see ILeAD), tho total annual production of the precious metals In Europo may be roughly estimated at about $\$ 7,500,000$. On the whole, therefore, it would seem (excluding the produce of the Californian and Australian gold tields) that the aggregate production of the precious metals in Europe, Americu, and Asiatle Russia, may be supposed to havo amounted in 1850-'51 (and it is probably alsout the same at present, 1803 ) to $\$ 70,425,000$, being about $\$ 15,000,000$ greater than their production in 1810 , when the American mines had attained their maximum degree of productiveness. Notwlthstanding the large addition made to the supply of gold by the Siberian washings, it appears to have been nearly balenced by tho excess of silver produced In America and elsewhere. And the old proportion of about 15 to 1 between the values of gold and silver dees not appear to have been sensibly atlected previously to the discovery of the auriferous deposits in California and Australia.

Supplies of Gold from Culifornia and Australia.-But the discovery of these deposits threatens to bring about a most material change in the real, and perhaps also in the comparative values of the precious metals; and is, ituleed, among tho most remarkablo events of which economical history has preserved any account. Tho gold is found in the debris of the quartz rocks in which it had been imbedded, sometimes in grains and flakes, and sometimes in lumps (nuggets), of varying, but occasionally of considerable magnitude. In some localities it is comparatively abundant; and the yield, both in Califoruia and Australia, is quite umprecedented, and such as would not previously have been conceived possible. The Califormian deposits were discovered late in May or early in June, 1818 ; and notwithstanding the remoteness of the country, and the fact of its being almost destitute of inhabitants, ahove 5000 persons we:e attracted to the spot by the ond of the season, who are supposed to have realized above $£ 5,000,000$. The news of the discovery and of the unexampled richness of the gold fields laving spread on all sides with electrical rapidity, oceasioned an extraordinary influx of inmigrunts from most parts of the world into California. The supplies of gold attained to an unexampled magnitude; eities rose in the wilderness as if by enchantment; tho great llay of San Franciseo, which lad hitherto been entirely deserted, was crowded with ships and steamers from the most distant countries; and Californin is now one of the States of the Union, with a population of from 250,000 to 300,000 .-See articles Golid, California, and Prices, for the production of gold up to tho prosent timo.
In addition to the regular shipments, very large amounts, of which to account is taken, ars conveyer away from Califormia by parties returning to Mexico, to the Eastern States, Europe, and China. Of these various estimates have been made; but the prevalent opinion in the best-informed quarters seem to he that,
when they are included, and allowance ls also made for the quantity retained at home, the total yleld of gold In California in 1852 may be moderately reckoned at from $\$ 40,000,000$ to $\$ 50,000,000$.

But vast as it certalnly is, thls production is exceeded by that of Australia. The deposits in the latter were not discovered till 1851. And they are so very rich, and tha Influx of immigrants has been so extraordinary, that the gold fields of Victoria only are estlmated to have produced in 1852 no fewer than $4,247,657$ oz., which, taken at the rate of $\$ 18$ an oz. gives a gross amount of $\mathbf{8 7 6 , 4 5 7 , 8 2 6 - ( S t a t e m e n t ~ b y ~ M r . ~ K h u l l , ~ o f ~}$ Melbourne); to whleh, adding $\$ 15,000,000$ for the estimated produce of the Sydney or New Sourlb Wales gold fields, the total produce of the continent will amount to $\$ 91,457,826$. On the whole, therefore, the present annual supply of gold and silver may be estimated at about $£ 47,000,000$ or $\$ 209,905,000$; viz.,

| America (except Callfornia) | \$43,500, 000 |
| :---: | :---: |
| Europe | 7,500,019 |
| Russo-Aslatic provinces | 18,015,000 |
| Callfornia | 45,040,000 |
| Australi | $95.0 \times 10,100$ |
| Totat | 099,905,000 |

Consumption of the Precious Mfetals,-In order to form a reasonable conjecture in regard to the probable in luence of this vast supply of the precions metals, it is necessary to inquire into their uses and probable consumption. And this inquiry, we regret to say, is atill more difficult, and more likely to be infected with errors, than the inquiry in regard to their production. The precious metals are used as coin or currency to faeilituto excharges; as wealth which may be conveniently kept or hoarded; and they aro used in the arts, as plate, ic gilding, etc. The quantities employed : , l:kwo functions are very large indeed. They va : "10" "er, in different countries and periods with the i ances peculiar to each; such, for example, as the greater or less abmondance of paper money, and the degree in which the use of coins is lessened by tho various devices resorted to for economizing currency the fashion, as to plate and furniture; the feeling of security at the time; and a number of other circumstances, all liable to great and sometimes sudden changes. The gold and silver employed in Great Britain as currency, and in the customary reserves in the hands of the bankers, is supposed to amount to at least \$200,000,000. In France the precious metals employed in the same way probably amount to double that sum, or to $\$ 400,000,000$. The amount in the United States employed for the same purposes may be stated at $\$ 275,000,000$. And we believe that we may estinuate the entire sum employed as currency in Enrope, Ameriva (North and Sonth), Australia, the Capo of Good Ilope, and Algerin, at about $\$ 1,900,000,000$. It would bo inconsistent with the objects of this anicle, and with the limits within which it must be confined, to engage in a diseussion of the numerous, and often conflicting, statements and details on which this estimate has been founded. Some in formation with respect to it may be found is Chevalier's valualle treatise De la Monnaie (p. 326, etc.), Paris, 1850 ; in Stirling's Gold Diseoveries, j. 182 ; in the learned and excellent tract of Tegolonrski, Essai de la Découverte des Gites Auriferes en Californie et en Australie, etc., p. 65 ; and in a host of other publications. The precious metals in cireulation in Russia in the early part of 1851 were estimated in the Petersburg Gazette (October 12, 1802) at $326,000,000$ routhles, equal, at 80 cents per rouhle, to $\$ 260,000,000$. The greater part ( $190,000,000$ roubles) of this currency consisted of gold. Now, supposing this sum to be employed, os above stated, as currency, we have first to nifuire into its probable wear and tear and loss, and then into the probable rate of its increase. And taking into account the extraordinary extension of navigation, and the proportional risk of loss from shipwreck and other casualties, we are disposel to think that the
annual wear aurl tear and lose of coin may be esifmated / produce of tha mines previougly to the mupplies from at about 11 fer ceat. of the eatire mass of the cutrenoy, which, taking the lattor at $81,900,000,000$, would ameunt to $\$ 28,500,000$ a year. It is ditheult to form any probable entimate of the rata at which the tultion used as curroncy may be Hkely to inorease, oupproaluyg its value vot to fell oft. Hut considering tho exiremely raphl lacrease of retinement and population in most parts of the civilized world, and especially in America and Australia, we scarcely think thet wo shall be exaggerating If we estimate this increase at 3 per cent.; which on $\$ 1,900,000,000$ would ameunt to $\$ 57,000,000$ a year. It is impossible, bowever, supponing this estlmate not to the very wide of the mark at present, to conjecture how long the currener wlil go on Inereasing in this ratio. It may, indeed, be safely taken for graated that the sphere of civilizailon und commerce is destined rapidly to axpand. But their exparsion will, no doubi, be accompanied with various contrivances for economizing the uss of metallic uoney, se that the quantity of it in einvulation can hardly be supposed to iscrease for any vory lengthened period at the rate atated above. If it did, It would absorl, an inmmense supply of eold. In barbarous conatries, and in those enterlag on the cereer of civituation, the coins afleat muy increase at the rnte of 3 or 5 per cent., or more. But in countries which nro more ad. vanced lts inerease will be less, poshot ', than even 1 per cont.

It is equally alffienlt to acquire any satiffactory information in regard to the quautity of bullion consumed in the arts. Jacob estima* its amosnt in Europe and Anerica, in 1850 , at about $\$ 29,500,000$ a year. This eatimate was in various respects wide of the mark, and it was, un the whele, considerably under the true anount. And supposis!g the consuanption of the precious metals in the arts to have amounted to $32 \frac{1}{2}$ or 85 million dollars in 1830, it must now be much greuter. There has every where, but mone espeeially in England, America, Germany, and Russia, been an extraordinary increase of popuiation and weallh during the last twenty-seven yeurs. And the taste for plate, splendid furniture, and luxarious accomnodations of all sorts, has certainly increased in at least an equal degree. It ls well klown that specuJatora and those who rapidly athaln to aituence are the principal buyers of phite and other costly articles. And taking these and otiser eircumstances into account, we are disposed to eooclua that the exjenditure of bullion in the arts in Europe, Ancrica, and. Iustralis can not at present ( 1853 ) be under, if it do not exceed, 70 million dullars a year. But of this a portion, catimated at about one-fifth or 20 per cent., is supposed to be obtained from the fusion of old plate, the burning of Jace, picture frames, etc. And hence, if we deduct from the 70 million dollars nsed in the arts 20 per cent. for the old bullion, we have $\$ 56,000,000$ for the total quantity of the snyplies from the mines annually dieposed of in this way; a considerable portion of which, includiag that nsed in the gilding of rooms, books, harness, buttons, ete., can never be agnain recovered or applied to any useful purpose. This quantity, hovever great it may appear to be, will bo increased with ths increase of population, and the spread of relinement and the arts; and it will also be certainly increased by any thing like a contiderable fall in the value of bullion. Hence it would appear, putting these items together, that the regular annual consumption of bullion as currency and in the arta amounts to atout $\& 1 \cdot 11,500, t) 00$; viz,,

| Wear nad tear, and 10 | \$:8,500,000 |
| :---: | :---: |
| tnervams of currency. | 67,000,000 |
| Cined in lize arts | (00,000,000 |
| Total | \$141,800,000 |

It may be naid, perhaps, that these estimates mnst he exaggerated, imanmuch as the sum which, it appears from them, is annually consumud exceeds the entire

Callfornia and Australia, But while we ndmit the fact to be a stated, we deny the inferenee which is attempted to be drawn from it.' The trath is, that while the discovery of the Califorwinn and Australian cleponits has added in so great a degroe to the supply of bullion, It has aleo addel very laryely to its conammption. It has given an uaparalleind stimulus to emigration and cotnmerce. The riss of wuges and prices consequent on these extraordinary mutations, and on the increased exports of produce which they have oceasioned, is matrIng ifself felt in the Linited States ae well as in Lumpe; nal hnro, conseq̧uently, as well as there, a greater supply of bullion will be required to sarve as currency. Aidd while this lulluence is operating on the one hani, on the other the awarms of purvenua who are returning from the gold ticlds, wlth pockets ainfled with the prod. uce of all sorts of successful alventures, are cvery where contributieg to increase the demand for ali sorts of thing, but especially for plate, jowelry, and other ostentatioua linery.

Exportution of Gold and Silver to the East.--Ilesides the conntries already mentiened, there is a vast pertion of the earth's surface, including 'Turkny in Aaja, Persia, Hintuatan, China, und other Fastern terrioories, into which bullion has been largely imported from the re. motert era. Humbolilt eatimated chat, of the entire produce of the American mines at the beglaning of this century, amountling, as already sean, to $\$ 48,500,000$, no less than $\% 25,500,000$ were sent to Asin, $\$ 17,500,000$ by the Cape of Good Ilope, $\$ 1,000,000$ by the leevant, anil $4,000,000$ through the Russian frontier. Probably, however, this estimato was $n$ good deal beyoud the marl: " IIumbolat, cela n'est plue doutenx, estimait trep haut la valeur cis l'or et de l'argent, qui s'écoulaient an commencement de ce siècle d'Europe en Asio, et portaient trop bas la déperilition qu'ils éprouvaient, dans la méme temps, par io frottement et leur converaion en oljets dorfevrerle ot de bijouterie."-Inupu. node de la Monmaie, ete., i. p. 35. There is no longer, wo believe, any doubt in regard to the accuracy of the latter purt of this otatement ; and it is pretty generally supposed that the tirst part is also well founded. lint sonse years age this immense drain began to diminish, and in i832 and $183^{2}$ it actually aet in an opposite djrection. Slnce then it has fluctuated, aometimes inelining to the one side, and sonsetlines to the uther. With the eveoprion, however, of the bullion received by Finglandin payment of the $\$ 21,000,000$ dine hy China, under the treaty of 18.42 , there was net for some years any very decided movement of bullion from Eurepe to the East, or from the Eust to Europe, though, on the wholo, the imports inte the latter appear to have exceeded the oxperts; at Jeast, this was certainl! tho case during the live years from 1844-45 to $18.18-19$, both inclusive. lint vary recently, or within the last four years ( $1850-$ - 03 ) the drain for bullion for the Eist has eet in with renewed force; so mach 50 , that in $i \$ 52$ no frwer than $12,655,393$ oz. ollver were shipped from the United Kingdom for India and Egypt.

This continued process of export of gold and silver is attributell hy sonie writers to the excessive use of paper noney, wherely the latter supersedes in commercial channels the use of the former. "There can be wo doubt that the ultimate effect of a purely specie curreucy (or a paper currency baseal entirely on specie) would be in the highest degree heneticial to all departments of indusiry and coterpise. It is a currency that can not fluctuate. It may expand with the increased quantity of the promious metals, but there is hardly a possiblity of its contraeling ; and its expansion must take place by the operation of couses which opurate eçually throughout the civilized world."-North interican lieriew, January, 1858.

The foll swing table shows the oxport of coin and Inllion from Great Hritain to the East during each of the $\mathbf{1 0}$ years eniling with $185 z$.

- Xine montits to June 30, and the fiscal year from thif the begins duly 1.
burying of Gold and Silrer.-It is aingular that, in estimating the consumption of roja and silver, Jacob did not make nay allusion to the 1 ractico which has uniformily prevailed in all countries liarassed loy intesting commotions, or exposed to forelgn invasion, of burying treasure in the earth. Of the hoarda so ileposited, a very considerable portion has been altogetier lost; and there can be no doubt that this has lieen one of the principal meana ly which the stock of the precious metals has been kept down to its present level. Every one is a ware that during the Midele Ages treasuredroce, or money dug from the ground by chance tinders, belonged to the Crown, and formed no inconsideralle part of the reyal revenue of England and other countries. The practice has always prevailed in Turkey, P'crsia, India, China, and gencrally In all parts of the East. The extortion practiced on the inhabitants, and the want of ali eesurity, make them look upon the moncy they have hidden as their only wealth, the oniy thing which they can really cali their own. "In India," saya Mr. Luke Scrafion, "the Llindoos lury their money under ground, often with such secreey as not to trust their own childien with the knowledge of it; and it: is amazing what they will suffer rather than betray it. When thelr tyrants have tried all manner of corporal punlabmenta on them, they threaten to defle them; but even that often fails; for, resentment prevailing over the love of life, they frequently rip up thio bowels, or poison themselves, and carry the necret to their graves. And the sums lost in this manner in some measure account why the silver of India does not appear to increase, though there are auch quantities montiuually coming into it, and none going out."-On the Gorernment of Hindoztan, p. 16,
etc.; see also Bernizr, Voyage de Mogol, Amsterdam, 1710, 1. p. 209.
The comparative securlty now enjoyed by the IIIndoos must iatterly have iessened tinia practlce. But a habit so prevalent and ao deeply rooted ia nut easliy eradicated; and though the illegal exactions of thelr rulera be curbed or put an end to, there is in many parta of India a great deal of robbery and Insecturly. At ali events, the practice of burying treasure ia still very general in It; and at this moment it prevalls to a great extent throughout ali the vast countrles which stretch from the Adriatle to the Chinese Sea. We have been assured by persons well qualified to form an opinion that the stimulus glven to the lurying of treasure by the inteatine motions now prevaient in China must have alrendy cocasloned the disappearnnce of full 20 or 25 millions stering! And the previons statements confirm in some measure this estimate. Jut we must not imagino that the burying of treasure is confined to the East. Wherever property la insceure, it is invariably resorted to. Wakefleld tells us that it ued to be common in Ireland (Account of Ireland, i. 593 ) ; and we are informed that it continues to this day to be pretty prevalent in that country. It has niwhys been acted on to $n$ considersible extent in liussin, Germany, Italy, and France; and In the latter, turing the revolutionary anarchy, immenso sums were buried, of which it is abundantly certain a large proportion will never be resuscitated. The wars and convulsions by which Europe was desolated for more than 20 years mado the practice bo carried to a great leight in al parts of the Continent, and withdrew in this way fiom circulation a very considerable part of the increased produce of the mines.-Storcir, Economic Politique, i. $2: 1$, Paris, 1823. And large aums are atill, ne doubt, disposed of in the same way.

Gieneral Remarks.-These statements, how imperfect soever, are suthicient to show that the field over which the precious metals are spread is so immense, and the demand for them so great and varions, snd so likely to increase, that it Is not ensy to imagine that their vilue can be speedily reduced, at least in any sensibie degree. Nevertheless, if we be warronted in eatimating ns alove the present supply at $8235,000,000$ a year, and their consumption (including an allowance for the increasing stock of coin) at $\$ 1 \cdot 11,500,000 n$ year, it would be jdlo to suppose that this excess of $\$ 93,500,000$ beyoud the existing demahd should he speedily holanced, or that it should not in the end occasion a serious decline in their value. But much, or rather every thing, will depend on the continuance of the supply; and here we have nothing to go upon but the merest conjecture. The probnbility, indeed, would secm to the that the supply both from Culifornia and Australin wial increase for some conslderable time to come. Vast, however, as is the area over which the goid deposits are scattered in theso countries, still there can be little or no deult that they will gradually bu exhausted. The pepulation attracted to the "diggings" is already so great, while (in Australla, at all ovents) it is increasing so rapidly, and is so thoroughly imbned with the auri acra fames, that it bida fair ln no very long time to rific all the richest beds. And supposing that they are elther wholiy, or to a considerablo degrec, exhausted 't may be doubtful whether the gold obtaised by a more aborious search, or by crushing quartz rocks, will yield more than a reasonable profit on the capital employed, if so much.

In all speculations in regard to the probable future supply of gotd it should be carcfully berne in mind that any considerable fail in its valuo would unnveldably check its production, and, consequentis, tend to leasen or prevent its further fall. It ls piain, for example, that a decline of 10 per cent. in the vaiue of goid would, cateria paribus, occasion the abandonment of all those mines, diggings, wushlngs, cte., which onily yiold a net profit of that amount. We are aware that,

he future in mind unareid, tend to , for exvalue of donment lich ouly are that,
owing to the production of goid, an at present carried on, having more of a gambling character than pertains to most brancies of industry, the prinelple now atated would not operate as ajeedily as might perhaps be anticipated. But of its ultimate operation there can be ne question. And it may, therefore, be laid down that any reduction in the value of geld which ts not accompanied by a corresponding improvement in the methoda of its production lnevitably tends to correct itself, or to check or hinder its further reduction. It is idie, therefore, where so much is uncortain, and indeed altogether unknown, to attempt to draw any conciusions entitied to much attantion with reapect to the probable future supply of the precious metais. But auppesing it to go on for a few years as at present, or not muteriaily to deciine, and that their vaius is in consequence gradualiy reduced, there is no good ground for upprehending that this reduction will have any injurieus reaults. If it take piace, it wili be alow, and wili not suddeniy aflect the incomes or the pesition of individuals. And we have eisewhere endeavored to show that the changes which, undar thes: conditions, may be uitimately effected by a decline in the value of builion, wiil, in a national peint of view, be eminently desirabio and ben-eflciai.-Trentiss on T'uxation, 2d cd., p. 375-387; see aiso an abie article In the American Review for October, $\mathbf{1 8 5 2}$. We have acen nothing to induce us to change or modify in any degree this opinion. Seme stress inas been inid on the circumstanco of the sums payabis under lifo insurances faling in value with a decrease in the value of money. But the great majority of people are, and all may bo, insured in mutual insurance offices, and may provido ly proper investments against less. No full witinin the compass of probability is likely seriousiy to affect the existing race of annultants. And those who are now buying annuities know what they may expect, nnd their heirs wili have them only to blame if they do not gnard against probable contingencies.

Substitution of Gold for Silver.-The production of goid has very iargely increased since 1818 , as compared with that of silver ; and if this state of things ro on, tho value of silver, measured in gold, can havdly foil gradually to rise. But it is by no means cleur that it wili go on. The supplies of silver are increasing in most parts of the world, particularly in Mexice and Europe. And the increased supplies of quicksiiver obtained from California and other jolaces wili powerfully contribute stili further to augment the suppies of silver. It is aiso to be observed that a comparatively inconsideruble rise in tie vulue of silver as compared with gold is sufficient, mesess prevented by legisiative enuctments, to make the latter be used in preference to the former in the currency of those countries in which both metals are legal tender. Ilitherto botio gold and sitver coins have been iegal tender in the United States, France, and some other countries. Ibut when such is the case the value of the colus in respect to each other has to be fixed by authority, that is, it has to be ebacted that debts may be discharged by puyments either of goid or silver money at the rate of so many doliars to the eagle, francs to the Nupoicon d'or, sliillings to tho sovereipn, and so on, as laid down in the Mint valuations of the dillerent countrics. And we have aiready explained (art. Coins) that, however correct at the periods when they are made, these valuations speedily become incorrect; and that whenever such is the case, it is for every body's advantage to make all payments in tho metal which happens to be overvalued as compared with the other. And hence (as seen in the articio referred to) the use of goid as money in preference to siiver in England, and of silver in preference te gold in France and the United States.

In accordance with these stntements, it would seem that the change which has taken piace in the relative values of gold and silver, thengh not very appreciabic, is quite enough te make the former be employed in-
stead of the latter in all countrien where they are equaily legal tender. In 1849, for example, the geld colned In France amounted to oniy 27,109, 060 francs, whereas in 1801 it ameunted to $285,237,280$ franca! In the United States the coinage of gold has increased in a semewhat similar ratio, having risen from $89,007,76 \mathrm{~L}$ in 1840 to $862,614,492$ in 1851, and to $852,846,187$ in 1852. There ia, therefore, every probability that in no long thme goid coin will be used in these two countries in ali considerabie paymenta which are not effected by meana of notes or checks. This substitution of goid for allve;; whiie it materially enlarges the tiold for the employment of the former, propertlonaily narrows that for the employment of the latter. And hence a very considerable permanent increase may be made to the comparative supply of gold without its valus, measured in ailver, being materiaily atlected. In the end, no doubt, the values of both matals wiil be proportioned, independently of varlations of demand, to the respective coats of thelr production. But beforo this equalization can take place, they nust be distributed among the vatious countries of the world according to tho circumstances peculiar to each, including therein the novel condlions of their supply.

In lloiland and India that substitution of goid for silver coin, which is taking piace in the United States and liranee, has been hindered by the intervention of government, whleh has decicied that silver only sinali bo legai tender. In Iloliand this was effected by laws passed in 1847 and 1849, and in India by enactmenta in 1835 and 18502 . The value of the geld coin that was consequentiy liberated in Iloiland has been estimated at alwout $172,000,000$ tlorins, a considerable portion of which has been absorbed in the now geld currency of France. We may add that the additional quantity of sifer reyuired through the cessation of goid as currency for the supply of the Duteh mints, slightly affected tho prico of the former, which afterward feil to neariy lts old levei.

In Indin, where wages have always been very low, the greut bulk of the coin in circuiation has consisted of silver; and in 1835 it was made the only legal tender. But though not legal tender, gold coins continued to circulate in India; and a proclamation issued in 1841 directed them to be received at the public treasurles. Littie nttention was paid to this measure at the time; but after the discovery of the goid depesits in Anstralia, it becane obvions, if geld coins continued to be reccived by the pullic departments, that eventualiy nono else would bo paid into them; and tbat sifver would cease to be employed except in petty payments. This contingency nppears to liave alarmed the covernment; and notice was accordingly given on the 22 d of December, 1852 , thut from and after the 1st of January next (18503) gold coins would not lie received on accomint of taxes or other payments due to the public. Silver has, consequently, again become in fact, as well as in law, the sole legai tender of India. A grood deal of controversy has taken place in regard to this measurc. It is plain, however, that by continuing to act on tho proclamation of 1841 , government wonld have jractically set aside the law of 1835 , which made silver the onily jegal tender; and would thus have made itself responsible for all the losses that might in consequence havo resuited to individuals, while it would also have become liable to the risk of having its own revenues reluced by the unticipated fall in the value of gold. No doubt, therefore, the repeai of the proclamatlon referred to was consistent with geod faith, and in some degree aiso with sound poiicy. At the same time, we regret that the situation of affairs in India should have been shei as to require that an attempt should be made to exciude goid from the circulation. Most likely it would otherwise have absorbed considerable supplies of that metal ; and we inclina to tinink, for the reasons previousiy stated, that it will do so, notwithstanding itsexclusion from the pubilic treas-

United States imported thence produce to the value of $\$ 920$ ．In 1833 it amounted to 1094 ；in 1887 to ©6601；in 1840 to $\mathbf{8 6}, 298$ ；and in 1841 to 847,630 ． The tonnage omployed was，in 1885， 682 tons $;$ in 1836， 1418 tona；in 1887， 1574 tons ；in 1841， 1048 tone ；in 1842， 1809 tond；in 1848， 1813 tone；and in 1844， 8217 tons－all Amerioan．

It is only within a few years，hewever，that the trade of the Sandwich Islands with the United Seatee has ascumed any considerable importance．The great wealth and rapidly increasing trade of California，to－ gother with the facilities which this group，from tes goo－ graphical position，has always，as already intimated， been onabied to afford to whaling ohips，both as a re－ cruiting etation and as regards the general aupplies which such vessels require during their long cruisea in distant latitudes，have recently given to these iel－ ands a commercial importance which，under other cir－ cumstances，might not have been reached for a century to come．The etapies of the island have now a market in California，close at hand，and the communications with the Atiantic const huve become regular and fre－ quent．

Owing to the prevalence of the smail－pox，which first made its appearance in the month of May，1858，and spread with such fatal malignity throughout the group as to carry off nearly 8000 victime，the trade of that year was languld；the markets were overatocked，and prices were，consequently，low and unremunerative．

The retail trade，especially，ohared in this general atagnation．The whaling fleet of 1853 was about equal to that of 1852，though，geaerally，the results of the latter year were not equal to those of the former．The average catch of the Ochotsk fleet was over 1600 bar－ rela，while in the Arctic esas the yieid did not average more than 680 barrels．Freights also ruled low，and the demande for the productions of the islands for the markets of California were amell，owing chiefly to the fact that the almost nomiual difference in prices be－ tween the two places procluded all hope of realizing any profits after the payment of duties．

The following summary of the recent commerce of the Sandwich Islands has boen compiled from thn latent and most anthentic sources ：

The total emount of imports for 1853 exceeded those of 1852 by $\mathbf{8 5 2 2 , 0 8 2 6 4 .}$ ．From the United Stales they amounted to $\$ 954,91998$ ，being more than three fourtis of the whnle amow＇imported．The importe for four years，from 1850 to 1858，both inclusive，were al fol－ Jowe：

| 1865. | 1,306,856 | 790,574 | 572,602 |
| Annual average | \$1,188,241 | \$797,488 | \$1565,793 |

According to the returns made to the United States Treasury Department, the total value of exports to the Sandwich Ielands for the year ending June 80, 1855, was $\$ 1,125,622$, of which $\$ 929,671$ was for domestic products, and only $\$ 195,951$ for foreign prodncts. From the same authority it appeare that the imports into the United States from the Sandwich Islands for the same year amounted to $\$ 442,899$. The carrying trado between the two countries is almost exclusively in tho hands of American shippers. Of the totsl exports of domestic produce as given above ( $\$ 929,671$ ), there was borne in United Statea bottoms \$928,458, while there was only $\$ 1218$ carried under ali foreign flags. Of the total tonnage that entered the United States from these ialands in 1855 ( 25,009 tons), 24,807 were under the flag of the United States. More thun three-fourths of the exports of the Sandwich Ielands gu to the United States, either on the Atlantic or Pacific side, and the statemente already given show the proportion of the imports into the islands from the United States. Of the 468 whalers that touched at the isiands in 1855, 436 bore the flag of the United States, 20 were French, and 8 Hawailian. Of the 108
merchant veasels that entered the Hawaiian ports the same year, 129 were American, while there were only 8 under the British, and 1 under the French flag. Among the latest acts passed by the Hawailan Legislatare relating to commerce, which has been pablished in the officiai organ of that government; is one prohibiting the importation and eale of opium.
: A considerable trade has aprung up between WashIngton Territory and the Sandwich Islands. Foar vessels have been for some time regularly and constantly engaged in this trade, carrying (especially from Obhu) sugar, coffee, molasses, salt products of the islands, as well as foreign merchandise from the different warehousea; and bringing back, in return, lumber, shingles, ahip-timber, spars, salmon, coals, etc. This trade has had the effect of entiroly driving from the market the traffio previously carried on by the Hudson Bay Company betwoen Honolulu and Vancouver's Island; "for; althongh," saya a recent Britieh official report' on the Sandwich Ialands, "Vancouver's 1eland possesees superior natural advantages over Washington Territory with respect to her ports and several of her productions, on the other hand, the American settlers, not being bound by any conditions that can not be easily fulfilled, their energy and private enterprieo are unshackled."
A steam-mill, having two engines, one of eighty and the other of forty horse power, has been erected at the mouth of IIood's Canel, and head of the Straits of Fuca, opposite Vancouver's Island, for mannfacturing lumber, shinglea, lathe, and planed, grooved, and tongued boards. This mill supplien the Honolulu and the San Francisco markets. Other and similar milla have been put up; and the business continues profitable, though compettion is increasing. For an account of the lumber trada via San Francisco, see San Francisco.

The proportion which the United States had in the total trade of the islands in 1856 ls shown by the following:

|  | Espports. | Imparta. | Tatal. |
| :---: | :---: | :---: | :---: |
| Tolal 4 rade. | \$070,824 | \$1,151,422 | \$1,822,240 |
| With the United States | 249,704 | 019,4,6 | 1,160,110 |

From this exhibit we find that in 1856, 80 per cent. of the imports into the Sandwich Ielands wore from the United States, snd that 37 per cent. of the experto were to the United States. The balance of trade in favor of the United States for the samo year was 4669,700.

On the whole, the statistics published for $\mathbf{1 8 5 6}$ show the traile of the iolands in a more favorable and healthy cmidition than those of any previous year since 1850 . The number of merchant and whaling veesels visiting the islunds during the year hae been lese, and the 1 m portations into the lalands were $\$ 230,000$ less, while the exports show an increase of about $\$ 100,000$ for the year.

According to the tables published by the Collector General, the importations during 1856 are ahown to be 81,151,422; the exports at only half that amount, or
\$583,544, omitting the sum of $\$ 87,280$, which is atated to be the produce of vessels bearing the Hawaiian flag. The total exports appear as $\$ 670,824$.
ln estimating the "supplies" furnished to whale ships for the year 1855, it is estimated that each whale ship took, on an average, $\$ 275$ worth of supplies, or island produce.

In examining the table of domestic exports, it will be observed that the exportation of staple products has not increased rapidly, though the sum total of domestics exported in 1856 ls much in advance of previous years, excepting only the "potuto year," 1850, which apparent incresse is owing somewhat to the different ostimates of the supplies furnished to whale shipe. We give a comparison of some of our staple exports for four years:

| Exporn. | 1848. | 1 mso | 1885. | 1885. |
| :---: | :---: | :---: | :---: | :---: |
| (1als. of molassee and alrup Pounds of sagar <br> Orangem... <br> coffeo | 28,974 | 41,235 | 38,304 |  |
|  | ${ }_{68,1985}$ | ${ }_{88,281}$ |  |  |
|  | , | $\mathrm{SO}_{0}$,0041 | 25,9461 |  |
|  |  | 81,4 | 1nB,700 |  |

The domestic consumption of sngar as well as coffee
in the islands has been greater during the past than in former years. It is supposed that the amount of augar produced the past year la at least 500 tons, about one half of which has been exported. Of coffee the prochuce has been not less than 800,000 libs. Only a small portion appears above as having been exported. But of both sugar and eoffee the whaling fleet will yearly require larger supplles, as they leave home with smallor
atocks, owing to the high rates these article command In the 8tates.

The recelpts at the customs for 1856 show a falling off of about $\$ 35,000$ frem those of 1855 , which is accounted for In part by the decrease ln the Importation of goods ( $\$ 230,000$ ) and apirits ( 8600 galls.), and theso items show sbout the same falling off as the number of whaling and merchant vessels visiting the group.

- Theso figures give the number of different entries of whaters at the varions ports-some of the vessels cotering at three, four, and even five ports duriog the year. The actual aumber of different whalera duriog 1858 will dot exceed 240 .

Ports of Eintry.-The following are the only porta of entry in the Sandwich Ielands, viz. : for veasels of all deacriptions, Honolulu (Oahu), Lahsina (Maui), Hilo, Kealakeakua, and Kawaihae (llawaii), and Walmea (Kaual); and for whalers, and vessels of war only, Ilanalei (Kauai).
Port Charges on Merchant Vessels.-At Honolulu.Tonnage dues, fifteen cents per ton reglster; pilotage, one dollur per foot each way; or half-pilotage if no pilot la employed; health certificate, one dollar; buoys, two dollars; harbor-master, three dollars; clearance, one dollar ; pilot for anchoring a vessel outside which does not enter tho harbor, ten dollars.

At Lahaina.-Tonnage dues the same as at llonolulu; boarding officera, five dollars; lights, one dollur; canal, if used, two dollars; clearance, one dollar.

At /lilo.-Tonnage duos, pilotage, health certillcute, und clearance, the same as at Honolulu.

At Kealakeakwa.-Tonnage dues the same as nt Hooolulu; boarding officer, five dollars; clenrance, one dollar.

At Kavaihae (IInwaii), and Waimen (Kauai), the same as at Kealakeakua. Any vessol, having paid the tonnage duea at one port, complied with all the port regulations, and obtained in clearance from the collector, may go to either or all of the other ports of entry, without paying ony additional tonnage dues during the rame voyuge.

Privileges to Whale Ships. Whale ships are allowed to land goods to the value of $\& 200$ freo of duty, and $\$ 1000$ worth additional, subject to a duty of 5 per cent. ad ralorem, without being llable to phy any tonnage dues; but if they land more than 81200 worth (including the $\boldsymbol{\$} 200$ worth free of duty), they are eubjects to the nawe charges and lin:. litles as nerchant vessels.--See Witale Fibiferies.

I'naltirs, Restrictions, efc.-Any master of a whale ship who shall fall to produee hls permit when called for is liable to a fine of not less than $\$ 10$, or more than $\$ 50$, to be imponed by tho collector. Any vessel having cargo on ioard intended for a foreign port, or apirits in eargo or stores, und touching at a place not a port of entry, withont a permit from a collector, is Hablo to pay double tonnage dues. Oil, whalebono, or nny other nutielo of merehandise, landed or tranabipped without a permit, is linhlo to seizure or conffecetion. Seamen ore not allowed to be diseharged at any of the ports of theso lalands, except Honolulu and lahaina. It is not lawful to discharge aenmen at any of the ports of the islands without the written consent of tho governor. Ilonolulu and lahaina are the only ports at which native aeamen nre allowed to he shipped, and at these places only with the consent of the governor.
-See United States Com. Relations ; Stewart's Journal; Ilunt's Merchants' Magazine, xvil. 33, xvil. 316, xxlv. 185 ; North American Reviet, li. 508, xxvi. 59 (Evarts), lv. 193 (R. II. Dasa); Chriatian Eraminer; xix. 244 ; De Bow's Review, xilil. 457.

Eandy Eook, Middletown township, Monmonth countr, New Jersey, is a aandy beach extending north from Old Shrewabury Inlet und the south point of the Highlanda of Navesink, five miles, and is from lialf a mile to a mile wide. It incloses Sandy Hook Bay The llghta are on the north part. The Sundy Hook lights consist of the main light, and two beacons placed In position, for ronges of channels. The main light is in lat. $46^{\circ} 27^{\prime} 42^{\prime \prime} \mathrm{N}$., long. $73^{\circ} 59^{\prime} 48^{\prime \prime} \mathrm{W}$. from Greenwich, England.

I,ight-ship.-A light-ship, palnted red, of nbout 950 tons burden, and showing two lights, Js anchored off Sandy Hook. The forward light is 30 feet nhove the deck, and tho nfter one 40 feet. She is also provided with a bell of 800 pounds weight, whlch will the rung in thick weather. She is placed $\ln 13$ fathoms water. Sandy IIook light-house bears from the light-8hip west by north, distant $6 \frac{8}{8}$ miles; Ilighland llght-house, westsouthwest, distunt 7 miles.

Highlands of Navesink.-Navesink hills, on which two light-houses are built, extend northwest and southeast, abont aouthwest from Sundy Ilook, on the Atlantlc Ocean to Rariton Bay. Tho correct altitudes of tho following places, which present themselves to mariners as thoy approach them, ore: Mount Mitchell, the highest point of Navesink, Monmouth county, New Jersey, 282 fect; Tompkins' Hill, on Staten Island, 307 feet; Hempstead IIII, Queen's county, Long Island, 319 feet.

Ilighland Lights.--On the Hlghlands of Navesink there are two light-houses bearing north $23^{\circ} \mathrm{W}$., and south $23^{\circ} \mathrm{E}$., from ench other distant 100 yurds. 'The southern light ls a rovolving one, on tho Pressel plan; it is 248 feet above the lovel of the sen. Tho northorn light is a fixed light, 2.16 fect 7 inches alove the sea.
Ledge South Sandy $H o o k$--On this reef there are but 9 feet of wnter. The northern light on the Ilighlands, a little open to the enstwurl of the southern one, lends right on the reef. This ledge ls south half east from Sandy Ilook light, 7 miles distant, und about if millo from tho whore, nnd on which tho ship Jlilliam Thompson struck.

Oil Epot.- Vast-southenat 18 mlle from Sandy IJook light is the Oil Sjot, having only 10 feet of water in one spot at low water. It ls of $n$ triangular shape, and about holf a mile on each sido in exteut. The nlong-shore channel la inside of it.

False Hook. -14 mile east, a little northeriy, from Sandy Hook light, there is a smali shoal spot, wlth only 12 feet water upon it at low water. It is the remalns of the eld False Hook.

New York Harbor.-There are four channals over New York bar. The first ls that along and parallel to the Jersey shore, inside of the Outer Middie. The second ls the South Channel, between the Black Can Buoy, No. 1, and the Red Can Buoy, No. 2. The third is the Main Shlp-channel, between the Red Can Buoy, No. 2, and the Biack Nun Buoy, No. 1. The fourth is Gedney's Channel, berween the Black Nun Buoy, No. 1, and the Red Nun Buoy, No. 2. Thls channel runs weat by north, and Is used by our largest class ehlps of war. -Blunt's Coast Pilot.
During the year 1857 the Fest beacon at Sandy look, the foundation of which had been undermined by the sea, was removed to a secure position by order of the Light-house Board, a now screen erected, and the main light-house fitted with a new lantern and a third order lens. Gedney's Channal into Now York Bay having two feet more water than the old channels, was unknown nitli a fow years siace. The knowledge of this channel is owing to the operations of the Coast Survey. Had the true depth of thls channel been known in 1778, the French fleet under Count D'Estalng would have passed into the bay and taken the assembled British naval force.-Coast Survey Report, 1854 ; Light-house Report, 1857.
San Francisco, a city and sea-port of the United States, in California, on the south promontory, divlding the great bay of San Francisco from the Pacific, inside the bay, and a short wny to the south of its en trance. The latter, now called the Golden Gate, little more than a mile in width, has on its south side an old Spanish fort, or mesidio, in iat. $37^{\circ} 48^{\prime} 80^{\prime \prime} \mathrm{N}$., long. $122^{\circ} 27^{\prime} 23^{\prime \prime} \mathrm{W}$. Having passed the fort, the course to the town is nearly east from three to four miles, and then south and west about as much more. The city is situated at the bottom of $a$ bay, skirted by extensive fiats, some of which are now being formed into docks. Its growth has been quite extraordinary. In the early part of 1848 it consisted only of a few rude cabins; whereas it has now an exchange, a theatre, a custom-house, sundry churehes and other public buildings, with great numbers of private houses, many of which are of wood, but many also of adobe (sun-dried) and burned bricks, with a vast number of attached tents and booths. And whilo such is the metamorphosis on shore, her waters, which were formerly quite deserted are crowded with ships and steamers from all parts of the world! San Francisco is Indebted, as every one knows, for this ail but miraculous transformation to the discovery of gold deposits in the beds of the tributaries of the San Joaquin and Sacramento rivers, whlch fall into her bay, and in the quartz of the contlguous mountains. Such, however, are the advantages of her situation, and the fertility of the adjacent country, that the exhaustion of the goid deposits, though it might check for a while, would not permanently affect the growth of the city, or the extent of her trade. To obvhate the shallowness of the wator close to the town, A wharf 2300 feet in length has already been projected into the bay, and to it all sorts of vessels are safoly moored. The construction of extenslve docks has also been commenced; and every effort is being made to provide the accommodation necessary for the rapidly increasing trade of tire town.

San Francisco stands on a sandy level ; and during tho wet season, when it is most crowded, the strects were at first mare puddles, into which carriages sunk to the axies; whlle in the dry season the amoyance from dust was all but intolerable. But these inconvenionces have been to a grest extent obvlated by ilvorit $g$ the streets, or covering them with stout pianke, n process which has been carried to a great extent, and has had the most compiate success Thc city has suf-
fored much from fires, by which, indeed, It bas repeatedly been lald waste. Thase, however, have been speedily repalred; and in a fow weeks no traces are seen of the mo.t deatructive conflagratlons. According, however, as houses of brick or-stone are substituted for those of wood and for tents, fires will become lesa frequent and less destructive.

The population of San Frencisco is the most motley that can be imagined; for, though Americans predomInate, a large admixture is to be seen of adventurers from all parts of the world. Gamhling is very prevalent ; and is, perhaps, carried on to a greater extent here, during the ralny' season, than in any other place either of the New or the Old World. But this is the natural result of the clrcamstances ander which the population has been brought together; and the passion will no doubt abate as the circumstances in which it originated change or lose their Influence. Iynchlaw has been here reduced to a system, and carried to n greater extent than any where else; and, despite the gross abuses to which it unavoidably leads, it is the general opinion that it could not have been dispensed with. A sense of its necessity has led, not only to its being adoptcd, but to its baing generally approved.

Nowhere in the world is there 80 grent a disparity between the sexes as in San Francisco, there being at least "rom three to five men for one woman. But this disparity is gradually lessening, and with it some of the worst features in the present condition of the population. The population of the city differs widely at different periods, being crowded in the wet, and comparatively desertod in the dry season. Though by far the largest and most Important town in the State, it is not its capltal. That distinction has been conferred on San José in consequence of its more central situntion.

The Bay of San Franclsco, thongh, as already stated, it has a narrow entrance, expands within into ono of the noblest basins that is any where to be met with, having a const line of about 275 miles. The town has already become the seat of a very extensive trade, and will most likely be the grand emporium of tho vast territory belonging to the United States on the Pacific. The trade with Chlna, Australla, the Eastern Archipelago, and the Polynesian Islands, is even now very extensive, and several ships have been fitted out for the whale-fishery. At present, however, the principal trade of the city is with Panama on the one hand, and Oregon on tho other; bringing immigrants and ail sorts of manufactured goods from the former, and corn and other raw produce from the latter. But she has also an extensive trade with Chill, the eastern portion of the United States, and with Europe by Cape llorn. The linportation of many sorts of products has been completely overdone, and some varietios of manufactured goods might, in 1853 and 1854, bo bought in San Francisco ns chenp as in Liverpool or liarro. This, however, ls a specles of miscalculation incldent to the opening of ail new markets, and will speedily correct itself. Gold bullion, with small but increasing quantities of quicksiiver, and hides, have hitherto been the all but exclusive articles of export.

The subjolned tabular form gives at a comprehenslve glance the amounts of tho nssessmetit: together with the rates of taxation of the city alil county of San Franclsco, for eight fiscal yoars, since tise firut organization of the local governnent, viz.:

| Flueai 'eors | $\left\|\begin{array}{c} \text { Rate of } \\ \text { Thxalion } \\ \text { berciant. } \end{array}\right\|$ | Amount of Asemements. |  |  |  |

| Excen of arriva | 31 | 3890 | 1435 | 5,362 |

Showing a net gain of population from arrivals ly sea, during the yesr 1856 , of 6362 souls. This is a very unfavorable exhibit, and we regret to make it public. During the last six months of the year the departures were 927 souls in excess of the srrivals. It is, however, the clase of population that we are losing which is the worst feature. During the last half of 1856, the departures of male adults for the Atlantic States were 2634 in excess of the arrively.

The population has recelved a atrong reinforcement during the past year by immigration over the plains. Early in the season oxaggerated extinates were made of the extent of this immigration, as well as of the quantity of stock tiant would be driveri over; but we do not overestimato the number when we say that fully 8000 persons ware added to the permanent popuiation of the State by the overinnd route during the past yenr, and that they brought with them 25,000 to 80,000 head of horned cattie. This is the character of populatlon that the State needs, and if Congress would nuthorize the construetion of a wagon read over the plains, we should see 50,000 people ranualiy leaving the Valley of the Misaissipui to mako their homes on the l'acille slope of the locky Mountains. As matters nre now. with virtuaily but one line of communication with the Atinntic coast, we need Induige in no brilliant hopen of the alvancement of California in population of the right stainp.-San Francisco Price Current.

Since the preceding was written, Congress passed an act under date Felruary 17, 1857, entitied "An Act for the construction of a wiggn road from Fort Kear. ney, via the South l'ass of the lecky Dountains and Great Salt lako Valley, to the eastern portion of the State of California;" 2. For a rosd from Fil l'aso, on the IKio Grande, to Fort Yuma, at the month of the (illa; 3. For a roal from Fort Defiance, in New Mexico, to the Colorado.

The following table will rinw the excess of arrivaln over departures, and aleo those which have gained dur. ing the year 1856, together with the nuounte of our gain and loss:

| Add probable amount in hands of pamens. | "AM: |
| gers, 6 years, $\$ 10,000,060$ per anmum. | 60,000,900 |
| Totni. . . . . . . . . . . . . . . . . . . . . . . . . | 38,100,600 |

In the foregoing estimate no sccount ia taken of the amount of uncoined gold in the hands of miners, or lying ca general deposit with the various express agents snd bankers It is the oplnion of those who have made inquiries on the subject, that the amount thus retalaed in the country is fully up to three millions of dollars. Nor is the amoont shipred by sailing vessels lnciuded, an omission caused by our inability to ascertaln the proportion which diust benrs to coin in such shipments. The shipments of treasure to China, Manilla, Caicutta, Valparaiso, and. Honolulu, the prosent year, amount to about $\$ 853,00 \%$.

It would be a difflcuit task to ascertain the total vaiue of foreign goods imported and consumed in this region, as a gieat part are previously imported at the esstward, and do not require to be specifically ontered in cur custom house. In atating, therefore, the amount of our direct importation of foreign gooda, for the year ending the 1st of October last, at $\$ 7,490,000$, we merely do ao en pasaant, without reference to the actual consumption. If wo were to form an opinion of our lmperts from the amount of our aunual exporta, both of produce and gold, we ahould say that the former would nmount te at loast $\$ 36,000,000$, which forms nearly the whole basis of our trade.
'Ihe following is a comparative atatement of the exports from San Francisco for the years 1855 and 1856 :

In estimating, 88 we have done, the imports at only $\$ 36,000,000$, or two-thirds the amount of our exportatious, we presume the remaining $\$ 18,000.000$ to have been absorbed by the rents and other revenues of absentees; by the interost on foreign capitel ; and by the remittances of miners and others to their absent famiiies, as well as those of others whose entire esrnings nre sent out of the country. These are mere apeculative views and opinions, but, in the absence of positive dats, they may not bo deemed unworthy of applica-tion,--San Francisco Price Current.

## Total

 domentic portu... ${ }^{1} \frac{1}{5}$The tonnage arriving during the three years below steted was an follows:

| Arrived in 1 | Vemens. | Toms. 549.756 |
| :---: | :---: | :---: |
| 41854. | 689 | 409, 114 |
| 41855. | 894 | 412,086 |

The tonnage entering from eastern domestle ports in 1853 was 260,045 tons; in 1854 it was 153,318 tons; and in 1855, 144,484 tons. The arrivals of the past year from New York are in the proportion of two tons to one from Boston, the actual fignres being 89,051 tons from New York against 45,601 tons from Bowton.

The tonnage from all quarters arriving in San Francisco in 1856 comprised 1455 vessels of 440,015 tons agalnet 1520 vessels of 517,019 tons in 1855. The decrease has been $\ln$ domestic coast and foreign trade, the tonnage entered from domestic Atlantlic ports being somewbat larger than in 1855. The following figurea illustrate this:

| Arrived. | Fromi dorientic Aliantie l'orto. | From dinaeatic Pacife t'onta | From inneyn Icerts. |
| :---: | :---: | :---: | :---: |
| 1855 | $\begin{aligned} & \text { Tond } \\ & 14,810 \end{aligned}$ | $\begin{aligned} & \text { Tone } \\ & 15: 9,635 \end{aligned}$ | $117,092$ |
| 1850 | 147,371 | 13S, 149 | 14, 617 |
| Increase in 1854.. Decrease in 185\% | 1,606) | 6t,496 | 27,45 |

The tonnage eutered from domestic Atlantic ports in 1853 was 260,045 tons; in 1854, 153,313 tons, in 1855, 147,870 tons; and In 1856, 149,370 tons. Thus it appeare that the inporta from that quarter have hardly decreased since 1854. The great falling off in trade is more apparent than real, as in the tonnage entering in 1855 were included the ocean steumers erriving from Benleia, and in the table of 1856 they arn excluded. Undoubtedly, however, the coasting trado has fallen off 20,000 to 30.000 tons, compared with 1855 , which la owing to the decreased shipments of lumber from the North.
The imports this past year from Greut Brituin oxhibit a fulling off of ncar 60 per cent. compared with thoso of 1854 . The tonnage entered for four years past was es follows:

|  | 85.934 tona | 1865 ......... 96.608 tona. |
| :---: | :---: | :---: |
|  | 22,11: | 1850 . . . . . . . 11,729 " |

From the continent of Europe there entered in 1855, 13,242 tons against 10,434 tons in 1856 .
With Ching the trado shows a consilerable increaso -tho tonnage entered in 1856 being $\mathbf{2 7 , 1 1 0}$ tons agsinst 17,206 tons in 1865. The clearances to that country have little connection with trade, anil therefore there is no need of making comparisons with previons years.

The exports have been upon a larger scale to Australis in the year 1858 than to any other country. Tho tonnage movemant for three yeara was as follows:

Pntered.
tone 6,864 Departed . . . . . . . . . . . . . . . . . 4 , $10,902 \quad 16,718 \quad 18,508$
With the Sandwich Islands the tride for the years 1854-'56 was as followa:

The increase noticeabln in the tonnage departing for the lalanda in 1850 was caused by a larger number of clippers than usual going thithor to frelght oil home.
With the other Pacifio Islavds trade since 1854 bas ranged at follows:

The tonnage movement for the three fullowing years with Mexico was as follows:

| To | Treamara : | Marchandate acod Produca. |
| :---: | :---: | :---: |
| Naw York | *80,887,778 | \$2,168,000 |

Tonmage Morement of the Port of Alan Francisco．－ The arrivala from all quartern during thu yeain 1806－＇67 have boen as follows：

Tho tonnage arriving from domestio Allantio ：rts during the past year exhibits a large falling off when compared with that of 1856－that from domestio cosst ports an equally large increase，and that from foreign ports a falling off of abont 10 per cent．compared with 1856．The following an the figures：

| Arrived | $\begin{aligned} & \text { Pium namentic } \\ & \text { Allatio Porta } \end{aligned}$ | $\begin{gathered} \text { From domantic } \\ \text { Conal Ports. } \\ \hline \end{gathered}$ | $\begin{aligned} & \text { From Iorelga } \\ & \text { Ports. } \end{aligned}$ |
| :---: | :---: | :---: | :---: |
| 1856 ．．．． | $\begin{aligned} & \text { Tone 7 } \\ & 149,870 \end{aligned}$ | $\begin{aligned} & \text { Toun } \\ & 138,149 \end{aligned}$ | $\begin{aligned} & \text { Tonat } \\ & 141,617 \end{aligned}$ |
| 1867 | 109， 025 | 182，030 | 184，41 |
| Decrease in 1987. | 39，845 |  | 15，176 |
| Increase in 1857．． | 1） | 43，887 | ．．．． |

The tonnage from homu Atlantio ports in 1858 was 260,045 tons，being more than two and a half times larger than in 1857；the arrivals of 1854，＇55，and＇56 averaged ubout 150.000 tons．From Great Britain the tonnage arriving in 1857 wae 16,992 tone against 11，729 tona in 1856，exhibiting an increase of neariy 50 per cent．，hat a decrease compared with preceding years． From the continent of Europe there entered in 1857， 12，681 tons againet 10,484 tons in 1856．＂With China the import trade shows a slight falling off compared with 1856，the totaia being 23，824 tons againat 27.110 tons．The trade with Auetralia，as indicated by the tonnage arriving and departing for the past four years et San Francisco，has been as follows：

The arrivals from the Sandwich Isiands are the best index of the direct trade with that country（a number of the clearances thence being veseels to freight oil to the Eastern Statea），and for the last feur years have been as followa：

$$
\begin{aligned}
& \text { 1854.......... } \\
& \text { tone } 8,497 \mid 1856 . \\
& \text { tons } 0,093 \\
& \text { 1855. ......... } 410,361 \text { 1857............. } 4 \text {. } 8,900
\end{aligned}
$$

It will thus he meen that the trade with the iglands since 1855 has falien off nearly two－thirds．In like manner as with the Sandwich Islands，the srrivals from the west coast of Mexico indicate the traite proper between the two countries，and for the past four yarr havo been us followe：

These figures indicate a healthful and gratifying in－ crease in the trade with Maxico，which is destined in the future to become of very great inportance．The ton－ nage movement during the past year indicates that the imports from the Eastern Statea and foreign countriea were about 18 per cent．leas than in 1856，and althoagh making，as a genoral thing，a nearer approach than over before to being adapted to the wants of the mark－ et，have yet in many important reepecta been of the meat exceseive cheracter，and have resulted in heavy ioses to those interested in them

Export Trude of San Francesco．－The prominert item in exports of course is，and will continue to bo for many yeare，the product of the minee．The ex－ ports of treasure in 1857，as compared with those of the preceding years of which we have any record stands thus：

| In 1861 | ＊．4，412 |  |
| :---: | :---: | :---: |
| In 1858 | 45，174，000 | In 1550．．．．．\＄0，69 4，434 |
| In 1853 | 54，1065，000 | In 1857．．．．${ }^{(9,859,0 S ~}$ ） |
| 10． 1854 | \＄1，429，000 |  |

The exports in 1857，when compared with those of 1856，show a smali fulling off compared with those of 1855．There is a large item connected with the ex－ ports of last year which in reality has no bearing one way or another on the product of gold in this State．

We refor to the shipmonts of treasure to China and Manilla. In 1857 the axports to those polints ware \$3,272,164, almost whelly made up of doubloona and dollars received from Mexico. San Francisco Imported in 1887 3,168,711 in apecle, nearly all of which came from Maxico, and went from here to China and tha East Indles. More gold every year goes to Englend direct, and loes to Naw York; the figuroa for five years past show the change in thio respect:

| uportest it | 1858 Epported to Eegland, 689 |
| :---: | :---: |
|  | 1884.......... 8,78t,080 |
| 1855......... 88,790,64 | 1856......... 5,184,166 |
| 1860......... $39,765,294$ | $1856 . \ldots . . . . .8$ 8,686,990 |
| 1857. ........ $85,287,778$ | 1807......... $9,847,748$ |

The Light-heuse Beard Report for 1857 atatea that "the ateam tender authorized by Congress in 1856, and built at the Philedelphia navy yard, will reach Sa: Francisco probabily early in the year 1858. The presence of this vessel will serve the economical purpose of transporting anpplies, materials, and workinen for building and repairing thio light-houses, and also, in case of incursione of the Indians from the Britioh dominione la the Straita of Fuca and vielnity, to protect the keepers and citieens in that quarter against their attacks. Representations have beon made that a light ls necesanry between the bays of Monterey and San Francleco, and one on Mare Ieland, In San Prancisco Bay. The latter is receminended mainily in conalderation of the diffleulties at night in approaching the nevy yard and Benicia."

Pory Charges.--Pilotage outaide Farralones, 110 ; inside Farralones, 68 per foot ; tonnage dues, 4 cents per ton; dockage. 3 to 6 cente per ton per day; stevedore's charges, 75 conts perton; shipping inen, 05 each; ballast, rough atone, 225 per ton; cobble stone, 275 ; sand, 4150 . Water, 1 t cente per galion. Day labor,

Exchange.-On Atlantic States, aight, 3 per cent.; England, alght, 一d. at 47d. per dullar ; France, sight, 480 frs.

Money.-Scarce at 2 to 4 per cent. on good security. Doubloons very scarce, and wanted- 7 per cent. premium. Mexlcan doilars, dc. de. 7 per cent. premlum.

Rate of Inverest on Money.-By all act passod March 13, 1850, the rate of interept on money was fixed at 10 per cent. where there was no special contract; but "parties may agree in writing for the payment of any rate of interest whatever on money due, or to become due on any contract. Any judgment rendered on such contract shall conform thereto, and shall bear tho interest agreed upon."

Ban ITrancisoo (Bay of), California. One of the best barbors of the l'acific Oceati. The entrance is very remarkable, bold, and rocky; a mile wide and 4 milies in length, with deep water and no obatructiona. It then expande into an exteusive bay, in which lie several inlands ; that of San Angelo ls the largest and highest, and covered with vegetation to jts very top. TEe next in size are Yerba Buena and Al:- cras. The Bay of San Francisco is 36 miles in length oy an average of $6 \ln$ width. A large portion of its southern, eastern, and nerthern shores is boriered by extensive and wide mud-fiats, preventing the landing, at low water, of even a boat; so nucis so, that the eastern shore may be sald to be inaccessible fur a distance of 30 miles; and this luppediment prevents it from ever beconing useful, except by $t$ 'e construction of extengive artiticial works. On the north it is bounded by the Straits of San Pablo, which divide it from the bay of that name. The Bay of San l'ablo is nearly circular, about 10 miles in dianneter, the largeat segment of which is a mud-flat, with but a few fect of water over it. On the east side lies the channel, with a sufficiont depth of water for large vesels, leading to the Straits of Karquines, at the mouth of the Sacramento River. On the western side of the Bay of San Francisco, from the Straits of San Pablo, for a distance of 15 miles,
the country is broken and mountalnons, and the shores rocky and indented by smail bays. These obatructious reduoe this extenalve hay very much in alze, and it becomes still more to when the safoty anil convenlonce of vessals is taken luto consideration; indoed, with the deesp water, crose-tidee, and exposed sifuations, there are but two safe anchorages, viz., San Francieco and Sausalito. The Bay of San Francieco has been celehratod, from the tinse of its firat discovery, as one of the finest in the world, and is juatly entitied to that charactor, oven under the seaman'a, view of a mere barbor.
Ban Juan, or \$t, John (sea-port of Porto Rleo), Although posseasing a magnificent port, consldered one of the best on the island, San Juan ia not the firat cominereial place, as the products exported thence are of a very inforior quallity. Of the augar shilpped from thls port, as well as from the other ports of the island the Jnited States receives mere than two-thirds of the whole. But a amall quantity goes to England, and also, though rarely, to France. From the United States are imported codfich and other calt fish; salt meat, boarda, lumber, hoopa, ataven, and butter; from England, boilers for the manufacture of sugar, ma chinery, amall quantities of iron, and heavy nuppiles of earthen-waro. Spanish vessols take in cargoes at 8t. Thomas, and discharge at San Juan, thereby avoiding the duty applicable to all vessela from all other adja. cent foraign ports, in the ports of Porto Rico. Generally speaking, the whole Iuland of St. Thomas is but a great entrepôt of European and American manufactures destined for the markets of Cuba and Perto Rico -a fact shown by the large amount of importations from St. Thomas loto both these islanda. The aanual exports from San Juan in 1853 conaisted of $11,360,304$ liks. of sugar; 8808 hhds. of molasses; 876 hhds. of rum; and $910,966 \mathrm{lbs}$, of coffee. It is to be regretted that the port of San Juan, one of the best and safest of the island, thould be kept in to deplerable a condition. Six or seven years aga, a vessel drawing 16 to 18 feet water could take $\ln$ a full cargo at the wharf; at present a ship of the same tonnage can receive only threefourths of her cargo, and is compelled to leave the wharf in order to get into water deep encugh to take In the balance.
Ban Juan de Nioaragua (peewdo Greytown), s sca-port town of Nicaragua, Central America, at the mouth of the San Juan, in the Carilhbean Sen, lat. $10^{\circ}$ $55^{\prime}$ N., long. $83^{\circ} 43^{\prime}$ W. It is stated to have the best port on this const between Cape Gracias is Dios and the Boco del Toro, and to be much more healthy than Chagres. It has an export trade in hides, indigo, and coln, brought down the San Juan In boats from Granada. It was almost entirely destroyed by Captain Hollins, in comnand of the frlgato Cyase, July, 1831, to obtaln redrese for an insult to the Amorican eavoy to Central Amerjea.--See Nicaragua.
Ean Juan del Sul, a port of Nicaragua, Central America, on the Pacific Ocean, 24 iniles southwest from Nicaragua, snd the marltime harbor nearest to that city. Lat. $11^{\circ} 15^{\prime} 37^{\prime \prime}$ N., leng. $85^{\circ} 52^{\prime} 56^{\prime \prime}$ W. it has a good (amall) harbor, aurrounded by high land, except on the southwest by south, whare it lies open to the ocean. It ls one of the proposed termini of the canal from Lake Nicaragua.
Ean Ealvador. This is the amallest of the Central Aruerican states, embracing but 7500 square miks, and la separated from Nicaragua by the Bay of Con chagua. The soil is in many places exceedingly fertile, but the country ia generaliy hilly and mountainous. Indian corn, cotton, coffee, and varisua kinds of vegetable produce, an cultivated to some extent. The most important article of cuitivation, and, indeed, the chief staple of San Salvador, is indigo, which grows in great perfoction and abundance. Near the coast, the lands of Acajutla and Libertad produce the article known in commerco as the balsam of Pera, of which
about $20,000 \mathrm{lbs}$, if the annual yield. The iah Itante ditpiny much ingenuity in the manufecture of an artide of female drese, celled by the natives relosas, which in much used in Central America and Mesico. San Salvador has a coast line along the Pacifie of about 150 miles, with the ports of Acajutla and Libertad, and within the Bay of Conchagua the axcellent harbor of La Union. Commercial relations between the United States and San Salvador are regulated by treaty of Janvary 2, 1850: This treaty is bused upon the principle of the most favered nation, and stipulates for rece iprocity of cemmerce and equality of flag, without any diacrimination as respeeta the origin of eargoes.

Eapan-wood is chtained from a specied of the sume tree that yielde the Braull-wood (Cesalpinia Sapan, Linn.). "It is a middie-sized forest tree, indigenous to Slam, Pegu, the Ph!lippine Iolands, otc. ${ }^{\text {. }}$ It has been employed for dycing in the greater part of Asia for many centuries. IV found its way into Europe some time before the discovery of America। and the imperts are now yery conalderable. "Its celoring matter differs but little from that of Brasil-wood, but the beat sapan-wood does not yleld more than half the quantity that may be obtained from an equal weight of Jrasil-wood, and the color is not quite so bright.Banchorts on Colors, vol. 31. p. 829.

Sapphire (Ger. Sapphir; Du. Saffiersteen; Fr. Saphir: It. Zaffiro; Sp. Safiro, Safir ; Russ. Jachant; Lat. sapphirus), a precleus stone in very high eatimation. Colors blus and red; also gray, white, green and yellow. It occurs In blunt-edged pleces, in roundish pebblea, and erystallized. Varles from traneparent to translucent. Refracta double. After diamend, it is tha hardest substance in nature. The blue variety, or sapphire; is harder than the ruby, or red veriety. Brittle; specifio gravity 4 to $4 \cdot 2$. It is feund in Bohemia, Saxeny, France, etc.; but the red sapphire, or Oriental ruby, is not found in any considerable quantities any where except in Ava. Next to diamond, sapphire is the meat valuable of the gems. The white and pale blue varietien, by expoeure te heat, become snow-white, and; when cut, exhibit so high a degree of lustre that they are used in place of diamonds. The most highly prized verieties are the crimson and carmine red; theee are the Oriental ruby of the jeweler the next is anpphire; and last, the yellow or Oriental topaz. The asterias, or atar-stone, is a very beautiful variety, in which the coler la generally of a reddish violet, snd the form a rhomboid, with truncated apicee, which exhibit an opalescent lustre.

Garcooolla, a sub-viseld, sweetioh, and somewhat nauseous gum reain. It is brought from Arabia and Persia in small grains of a pale yellow color: the whitest, as being the freaheat, ia preferred. It ia but acldom imported.-Mis.nons's Orient. Com.

Bardines, or Bardinias (Ger. Sardellen ; Fr. Sardines; 1t. Sardine; Sp. Sardinas), a species of flah of the herring tribe, but smaller. Tioy are taken in considerable quantities on our ceasts, and are exceedingly plentiful on the eeasts of Algarve in Portugal, Andalusia and Granada in Spain, and along the shores of Itaiy. The small sardines caught on the coast of Provence, in France, are esteemed the best. From 1000 to 1200 fishing emacks are engaged in catching theee fish on the coast of Brittany, from June to the middle of October. The French frequentiy cure them in red brine; and, when thus prepared, designate them anchoisees, or anchoried sardines. These are packed in vessels previously employed for bolding wine, and exparted to the Levant. When perfectly fresh, aardines are accounted excellent fiel; but if kept for any time, they entirely lose their faver, and become quite Inaipld.

Consumption of Sardinet in the United States.-The Impertation of arrilines into the United States is increasing every year. Tha fleherie commence ebout the middle of May, and last until about the middle of October. The quantlics consumed aro enormous.

Each evening, upon the retnra of the fishing omacks, thay can bo bought for a fow cents per deven i they are an impertant part of the food of the poorer classes. These fish are better, and have a flavor, when put up in oll, whleh they otherwiee have not. They are found in great plenty from the coast of Brotagne to the month of the Garonne. La Rochelle la the principal depot cor the Bohery. The quantity exported to the United Stateu in 1862 was 60,840 kilogrammes; in 1858 the quantity way 76,787 kilogrammea; in 1854 the quantity was estimated at 100,000 kilogrammes, and of this more than one half, strange to any, was for California -Letter to the Dep. of State.

Elardinit. The whole area of thil kingdom, including Piedmont, Savoy, and Genom, and the idland of Sardin's, is estimated at 28,229 aquare milen, containing a population, In 1852, of ovar $5,000,000$, viz. the contineutal states 18,994 square miles, population $4,500,000$; and the ialand of Sardinia 2235 square miles, population 500,000.
The chief ataples of this kingdom are raw silk, rice, maize, wheat, chestnuts, wines, olives and oliveoll, fige, oranges, and citrens. In the island of Surdinia the productions are maize, wheat, hemp, ailk, beana, and other pulse vegetablea. There are aeveral extencive vineyards, though the wines are not in much repute in foreign markets. Piedmont la considered the most productive part of the continental kingdom, and usually exporte ita surplus preduce for the consumption of Genoa, Nice, and the reglons along the ceast. Silk is one of the most profitable productione.* The ollive and vine are extensivoly cultivate '; wheat and Indiars corn are also grown; the latter of which, mixed ith roas!ed chestnuts, constitutes the chief fooc cc the rural inhabitants. The miverals of the country are valuable, censlsting of iron, cepper, lead, manganese, and colualt ; but, owing to bad roads and the lack of capital, they are not worked. The aalt aprings and mines of alabaster, marhle, and slate, recelve the protection of the government, and their produete constitute some of the chjef exports of Sardinia. The exportation of marble alone to the United States amonnts annually in value to about $\$ 15,000$. The manufactures consist of ailks, velveta, and other ailk stuffs, stockinga, commen linens and woolens, and the product of the tanneries; but, with the exception of ailka, fow of these manufacturea are exported. The chidef ports are Genoa, "pezzia, and Nice, on the con tinent, and Cagliari, or obe ieland of Sardinia. Genoa is a free pert, in which goods may be warehoused or re-exported free of duty. It ia the chlef outlet of the Mediterranean for the manufactures of Switzerland, Lombardy, and Piedmont

In 1815 the republie of Genea whe ceded to the King of Sardinia, with the express stipulation that " the free port of Genoa shall be re-eatabliahed, with the regu'a tiona which exiated under the anclent ovvernment. Every facility shall be given by the king to the transit through his atates of merchandise from that free pert. under auch restrictions as his majeaty shall judge expedient for preventing the said merchandise being ;' lieitly sold or consunied in the interior. It shall be subject only to the usual moierate duty." The commercial relationa of the United States with Sardinia are regulated by treaty. Frior to the ratification of thia treaty (November 26, 1838), the commerce of the United States with this kingdom was conducted excluaively under foreign flags. Indeed, until within a recent period, the commercial system of the Sardinian government was directly epposed to the principle of free intercourse. The treaty with the United State guarantees entire reciprocity and perfect equality with the Sardinian tiag in the direet and indirect trade. The following are the etipulations of this treaty which relate to cemmerce:

- Pledmont and Lombariy produce more raw allk than all the rest of the wortd together.

Parfect reciprocity of commerce and navigation betweon the two countries, inhabitante of the one enjoyling in the other all the privileges of aubjects or cltb sons. Veasels in thoir reppective ports to anjoy the amme peivileges, and to pay no hugher duties or charges than national veseela. Ali commodities and merchandise, the produce of the soll or industry of thin United Staten, or of any other country, which mey be legally imported into Sardinian ports in Sarilinian voscela, unay also be imported by Amorican voseels, and pay no hlgher duties. Sardinian vescel to enjoy the same privileges in the ports of the United Statea, The name principle extended to all exporta from oither country. The vemsels of enoh country may entar the port: of the cther with eargoen from any foreign couthtry whatever. Any duty or rentriction impoeed on the vaseels or merchandise of the one country in the other to be axtended to the vessels or merchandise of all nations. Coasting trade reserved to national veaeels. Special favora to any other nation to be enjoyed by the contracting parties reapectivaly. Vescela of either conntry forced into the ports of the other by atcoas of weather to be exempted from port chargea,

Article 9 atipulates tree transit from the port of Genow across Piedmont, except for salt, gmppowder, und manufactured tobaceo.

Cagliari, the capital of Sardiaia, on the northeast shore of a spacious bay on the south coast of the island, lat. $39^{\circ} 12^{\prime} 18^{\prime} \mathrm{N} .$, long. $9^{\circ} 7^{\prime} 44^{\prime \prime} \mathrm{E}$. Population in 1850 entimated at 80,000 . The eity atands on a ribing ground, and has an impoaing effeet from the sea. The public buildincs and churches are numerous, aml sonse of them oplendid; but the atreets are frr the mont part narrow, eteep, and filthy. The Gulf of Cagliari extends from Pula on the west, to Cape Carlonark on the east, a diatance of about twenty four miles across, and about twelve in depth, with grod anchorage every where after getting into soundings. A molo projects from the Pratique office, and shipe usuali, lie about one mille southwest by south from It, in eix or eight fachoms water, on an excellent bottom of mud. There is a very convenieat pier harior at the south angle of the tower wall, capaile of conteining fourteen or aixteen vesseis of a tolerable aine, beaides small craf. Altogether Cagliari in one of the best and safest ports in the Mediterranean. Vessels belouging to Bardinin are admitted by treaty' into the ports of the United Staten on the same terma no American vessels, with the produce or manufactures of their own or any other country:-See Cagliari.

Other uaual provisions respecting the appointment of consule, etc., are made ; and, in a neparate articie, his Sardinian majesty continues the differential dutjen in favor of Sardinian ahips on the Jmportation of wheat, oliveoil, and wine, from the ports of the Black Sea, Adriatic, and Mediterranean, as far went as Cape Trafalgar. Thls separate clause is explained by the fact that the grain, oll, and wine trade, carried on with the ports of the Mediterranean, has alwaya been the chief source of the commercial ptomperity of Genon. On the 12th July, 1850, this differential position was aban. doned, and American veasela can aow engage in the grain-carrying trade, as well as in all other kinda of commerce, between Genoa and other ports within the Mediterranean and Black seas, on terms of perfect equality with Gencese vessels. The separats artlele has, therefore, become a dead letter.

Gienoa is the only port in Sardinia much frequented by United States vesseia. The port chargea are: For juilotage, according todranght ; anchorage, 30 centimes* jur ton; quarantine dues, 8 centimes per ton each day; lonard of health fees, 40 centimes per ton; measurement charges, according to size of vessel.

The shipping frequenting the port of Cagilarl, on the Inland of Sardinis, has conslderobly increased dur-

[^44]Ing the pant ten years. This is owing to the shelter and refuge it afforde in atormy weather, and to the facllition it offors for obtaining all neconamy aupplies.

This may be men from the following atatement, ahowiag the number and tonnage of vasselis of all nations that have viriced this port since 1845 ;

| 1365. | 14,777,765 | 1,288,387 | $8: 311$ | 383,245 |

Imports into the Uaited Statos from Sardinin ennsist chiefly of flax, olive-oil, rags, silik. piece goods, red wines, woul (unmanufactured), marble, and manufacturee of wool. Marble ia the most valuable article oncelved, amounting annually to upward of $\$ 30,000$

Almont all the trade of Sardinla is carried on by atrangera; and even the fiah on Ite coast and in it harbore are caught by Siclilians, Neapolitans. Tascans, and Genbese Grain is the principal article of export In good years, the exports from the whoie leland may amount to 400,000 atarelli, or about 500,000 bushels of wheat, 200,000 atarelli of bariey, 6000 atarelli of maize, 100,000 starelll of beana, 200,000 starelli of peas, und 1000 atarell of leatiln. The cuiture of vines is grada. ally becoming of more Importance; and alout 3500 Catalan plpes are oxported, principally from Alghero and Ogliastro. Choese is an Important object in the rural economy of Sardinia, and considerable quantilijes are exported. Salt is a royal monopoly, and affords a cuasiderablo revenue. Untll recently, Sweden drew almoxt all her aupplles of this important necessary from Sardinia, and it continues to be exported in consider. alle quantities. Flax, ilnseed, hiles, oill, saffron, rags, alquifonx, etc., are among the articles of export. The tunny and coral fisheries employ a good many hands; but, an already observod, they are almost wholly managed by foreigners.

## SAR

Almont every art:cla of drese, whethar for tha gentry or tha pen santry, in imported. Boap, ntationary, glase, earthen-ware, and furniture, an wel: an augur, coffee, drusa, atc., aro also mupplied by forelgners ; and notwithstanding the Bards possees many rich miner, mev. eral of which were auccesafuily Frought in antiquity, they import all their iron and ateel. The only manufacturea cerried on in the island are those of gunpow. der, salt, tobacco, and woolen caps. isut salt, of which the export may be estimated at 14,000 or 15,000 tons a year, is excinded from the preceding table, on which, Indeed, but little rellance can be placed.

Theae statements nufficiently ahow that the commerce of Sardinia is very far from boing what might naturally be expected from her extent, fortiltty, admb rablesituation, and the excelience of her many harbors.

The following aummary presenta a general viow of the forelgn commoree of Sardiuia)

Of these there were under the American flag:

The trade of the kingdom in 1858 amounted In value to $833,942,000$ france ( $963,448,080$ ) imports ; and $220,630,000$ francs ( $\$ 41,010,700$ ) exports. In 1852 the direct trade between the United States and Sardinia amounted to $7,725,802$ frenes ( $\$ 1,477,818$ 78). In 1853 it reached as high as $18,891,561$ france $(2,689,896)$. showing an increase of nearly 100 per cent.

The entire trade, compared with that of 1852, shows an increase of $21,600,000$ fruncs on imports, and of $5,500,000$ france on exporta. The Imports comprise in values (in round numbers) as follows: Cotton, $34,000,000$ fruncs ; colonial or trane-Atiantic produce, $25,000,000$; corn, $22,300,000$ : allks, $20,000,000$; woolens, $18,000,000$, eto. The exports comprise: Silks, $43,000,000$ francs ; wine and oll, $10,000,000$ franes ; riee, $8,000,000$; cattle, $4,000,000$, etc.

Tha countries with which Pledmont carriea on tho largest trade are as foliowe:

Imports.
France Tranca. France . . . . . . . . . 48,000,000 France. . . Pranca. Eagland . . . . . . . . . $89,000,000$ Eingland . . . . . . . . . $8,5100,000$ Ewilzerland . . . . . 14,600,000 switzerland . . . . . . 18,000,000 Austria. . . . . . . . . . . 10,000,000 Autria . . . . . . . . . . . $10.000,160,000$ lustia. ........... $17,000,000$ Kussia ............ 163,000
The customs' revenue amounted in the year 1853 to \$3,464,472.

Bardinian official roturne show an Importation of raw cotton; disect from the United States, for 1858, of about $02,000,000$ in valua; and it is cupposed that while of tha remalnder some nndoabtedty came from Algeria, the grenter part came indireetly from the Unitod Statea, through England, Holland, ote. If, however, these Barilinian retatns are compared with those prepared by the United Staten Trenaury Depart ment, it will appear that the direct importation of cotton from tine United States must be, ase it nnqueetionably is, iargely ovementimated; while the indinect importation from English, Duteh, and other European ports la much below the actual quantities given. Thas the value of cotton exported from the United States to Sardinia in 1853, 49 per United States Report on Commgree and Nevigation, was only $\mathbf{8 1 5 0 , 4 2 2 \text { ; and in 1852, }}$ \$418, 982 i making for both yeare the sum of $\$ 578,40$; or a litt:: more than one-fourth of the value given In the Sardinimn retarns for 1858 alone. The following summary prosents as accurste a statement of the cotton trado of Sardinla as can be derived from a comparison of the off ' Ial reports of the Earopean countrien whence cott." - re-exported, and of the United States, with the off. al returns of the Sardinian government. The countries given are not the only, but the prinelpal countries, whence Sardinis impo-ts cotton:
Iounds of Cofton inmontrin into बagdinia ron tim pous

The ralirned facilitien afforded at the port of Genna for the trausuaision of merchandise to the interior of Itaiy, Switzeriand, eto., have already produced a marked effect on the cotton trade of that port. It has been shown that the total quantity of cotton exported from the United Statea to Sardinis was, in 1851, 2,136,000 lbs. ; in $1852,5,568,828$ lbe. ; in 1858, 1,629,025 lbe. ; in 1864, 1,645,372 lhs. In 1855 the exportation reachol $14,777,765 \mathrm{lbe}$., of which the port of Genoa received $10,085,600 \mathrm{lbs}$; and on official document received from Gonos gives the quantity recelved at this port from tho United States, in American vessels alone, the Ifrst aix months of 1856, at $12,164,000$ ibs.-C. D.

Money, Weights, and Measures.-Accounts are kept in lire, reall, and soldi. 6 soldi $=1$ real $=41 d$. 4 reall $=1$ lira $=1 \mathrm{e} .6 \mathrm{~d} . ; 10$ reall $=1$ scudo $=8 \mathrm{~s}, 9 \mathrm{~d}$. The paper money consiets of notes for 5,10 , and 20 ecudi. Farm produce and the coarser metals are weighed by the peai diferro: 12 Sardinian oz. $=1 \mathrm{lb} .=14 \mathrm{oz} . ~ \measuredangle d r$. avoirdupois; 26 lbs, $=1$ rubbo; 4 rubbi $=1$ cantaro: $=$ 93 lbs. 8 dr. avoirdupois. The starello or corn measure is equivalent to 1 bushal $1 \frac{1}{4}$ peck English. The palm $=10 \frac{1}{3}$ English inches.

- Nine monthe to Jana BO, and the fiscal year from this time begins July 1.

Earionyre, a precioua atone, a varioty of chslcedony. The ancients selected this aubstance to ongrave upon, no donbt, from ite possessing two peculiar and necessary qualitios: via., hardness and tonacity, by which it is capable of receiving the finest touch or otroke of the tool without chipping, and showing the art of the eegraver to the highest perfection.-Maws on Diamonds.
Sareaparilla (Ger. Sarsaparille; Vr. Salepareille; It. Saleapariglia; Sp. Zarsaparilla), the root of the Smilax Sarsuparilla, a plant growing in South America and the West Indies. It is inuported in bales. It is known in the London market by the names of Lisbon, Ilonduras, and Veru Cruz, but it is alsu brought from Jamaica. 'The ILisbon root, which la the produce of lirazil, has a reddish or dark brown cuticle, is futernally farinaceous, and more free from fibre than the other kinds: the Honduras has a dirty brown, nnd sometimes whitish, eutlele; it is more fibrous, and has more ligneous matter than the Lision and Vera Cruz. It is in long, slender twigs, covered with it wrinkled brown cuticle, and has a small, woody heart. The Jamaica differs from the others, in huving a deep red cusicle of a close texture, and the red color purtially diffrsed through the ligacous part. The root is inoderous, and has a mucilaginoun, very slightity bitter taste: the bark is the only useful part of the plant; the ligneous part being tastaless, inert, wrody fibre.Thomson's Dispensatory.

Bassafras (Ger, and Fr. Sassafras ; It. Sassafraso, ; Sp. Sassafras), apecies of laurel (Laurus Sasma fras, Linn.), a nstlve of the southern parts of North Ameriea, Cochln-China, and several of the Indian islands. Sussufras wood, root, and bark have a fragrant odor, and a aweetish aromatic taste. The wool is of a brownish white color; and the bark ferruginous within, spongy, and divisible Into lsyers. Their sensible qualities and virtues depend on an essential oil, which may be olitained separate by distilling the chips or the bark with water. It is very f.agrant, hot, and penetrating to the taste, of a pale yellow coior, and heavier than water. It is used only in the materia medica.-Tuomson's Diepensatory.

Satin (Eng., Fr., and Germ.) is the name of a silk etuff first imported from Chins, which ls distinguished by its very smooth, polished, and glosny surface. It is woven upon a loom with at least dive-leaved healds or heddles, and as many corresponding treddles. These are so mounted as to rise and full four at a time, raising snd depressing aiternately four yarns of the warp, acrons the whule of which the weft is thrown by the ohuttle, so us to produce a uniform smooth texture, instead of the checkered work resulting from intermediate dec $18 s a t i o n s$, as in common webs. Satins are woven with the glossy or right side undermust, because the four-fifthe. the warp, which are always loft there during it. .ction of the healds, serve to support the shuttle $i_{1}$, its race. Were they woven in the reverse way, the scanty fifth part of tae warp threads could either not support, or would be too much worn by the shuttle.

Saunders (Red) (Arab. Sundal-ahmer; Hind. Ruchut-chundum), the wood of a lofty tree ( Iterocarpus santalinus) Indigeneus to various parta of India, Ceylon, Timor, etc. The wood is brought to liurope in lillets, which are very heavy, and sink in water. It is oxtremely hard, of a tine grain, anil a liright garnet red color, whith lirightens on exposure to the uir. It is employed to dye lasting redidish brown colors on wool. It yieids its coloring matter to ether and aicohel, but not to water.-Tiomson's Ihiquensatory; Banchort on Colors, vol. il. p. 236.

Eavannah, city, jort of entry, and capital of Chntham eounly, Georgia, is situated on the right hank of the Ravanaah River, 17 miles from its mouth. It is In $82^{\circ} 4^{\prime} 56^{\prime \prime} \mathrm{N}$. Lut., and $81^{\circ} \mathbf{y}^{\prime} 18^{\prime \prime} \mathrm{W}$. long. from Greenwich, and $4^{\circ} 10^{\prime} \mathrm{W}$. from Washington. It is

118 milos southwest from Churleaton, 128 miles southeast from Auguatu, 158 miles east-southeast from $\mathbf{~ M i i - ~}$ ledgeville, 662 milee south by west from Washington. The population in 1810 was 6105 ; in 1820,7523 ; in 1880, 7776; in 1840, 11,214; $\ln$. 1850, 15,812; in 1854, 10,000. This city was founded in 1783 by Gen. eral Jsmes Ogiethorpe and others. It was taken by the British in 1778, but they abandoned it in 1782. On the 10th of January, 1820, 468 buildings were burned, occasioning a loss of property amountling to $94,000,000$; bat it bas been rebuilt with additional beauty. There are in Savunnah eight banks, sggregate capital $4,000,000$; four printing-offices, issuing throe dulliy and one weekly newapaper. Capital employed in manufactures, $1850, \$ 180,550$; value of manufactured articlea, 256,250. Savanasin ls the port for nn extenalve region, rich in agricultural and mineral wealth, and by the immense extent of railroad converging to this point (ubout 1200 miles) wili undoubtedly be the port of the Southern Atlentie coast. The cetton slipped from Savannuh for the years 1856-'57 amounted to 827,658 bales.--See Georgia.
The recent construction of raiironds from Savannsh westwardly has an lupertant bearing, present and prospective, upon the commerce of Savannal. Those in operation in 1857 are as follows:

These roads connect either direetly or indirectly with 800 miles of railroad in l'ennesees.

Baxe-Meintngen (one of the Zoll-Verein). The general trade between this duchy and the Unitel States is Increasing. Iler manufisctures are deservediy in high repute, and are chiefly deatined for the America. market. They consist of leather, wooien and cetton stuffe, musical instruments, toys of every description, cbina, glass, fron, atune, and willow wrres, slute peacils, marbles, nails, drugs, colors, wooken wares, etc.
This duchy is rich in mineral productions, snd min. ing is pursued with considerable activity. Iron, copper, cont, alum, vitriol, marble, and salt are extensiveIy produced, and enter largely inte the exports of the duchy. Exports for the United States are trunsported either to Bremen, IIamburg, Antwerp, Rotterdana, er Ilavre.

The following statement exhibits the value of exports, the produce and manufacture of Saxe-Meinh. gen, to the Unitel States, durlug a jeriod of five years, from 1851 to 1855 , both inclusive, specifying the countries through which said exports were niripied for the United Stutes:

| Vears. | Via |  |  | Total. |
| :---: | :---: | :---: | :---: | :---: |
|  | Ifamburg. | Hremen. | Trames. |  |
| 1451 |  | \$20,4*3 |  |  |
| 1852 | \$743 | 100, $6 \times 25$ | +2823 | 43, 2 ? 619 |
| 1853 | 6818 | 40,962 |  | 41.5411 |
| 1854 | 94\% | 10,3148 | .... | 114,415 |
| 1806 | .... | 6,171 | . | (i, 1i1 |

The exports from the United States to this iuchy conslat of tobacco, rice, brondstuffs, cotton, and masnufactures of India-rubber, etc. The soil, owing to the vast foresta and mountuins which cover sa much of its surface, is not favorable to agricultural jursuits; hence breudatuffs form a inrge ltem of injorts from foreign countries.

Baxony (one of the Zoll-Verein). This kingiom lies In the centre of Gernuuly, and though the soil in generally fortile In groin, ani is cultivated with the greatest care, the quantity ralsed, even in the bext harveats, is not moro than sufficient for the consumption of the inhabitants. Wheat, rye, outs, hariey; nud potatoes are the general crops.
Saxony ia rich in mines of Iron, lead, copper, cobalt,
bismuth, antimony, and ooal ; consequently we find that mining and manufuctures occupy the princlpal portion of its nearly, 2,000,000 inhabltants. There are upward of 800 mines in active operation, the centre of which is at Frelburg. Friut ls extensively cultivated, and exoclient wine is produced from the vineyards of the Elbe. The forests, which cover one-fourth of the gurface, furnish fine timber, which is floated down the Elbe to Hamburg. The chief manufactures of Saxuny are those of cotton, in the spianing of which the latest improvementa have been introduced.* The other chief branches of manufacturing industry are linen aud woolen weaving, stocking-making, and the fine porcelain of Meisson, known it commerce aa Dresden china. Dresden and Leipsio are the commercial
marts of Saxony. Annual falrs are held in these cities, which are attended by vast concourses of people from most of the countries of Europe and Western Asia. Lelpsto ls the great emporiuin of the book trude of Germany ; and In both these cities manufactures, particularly in ailk and woolen fabrics, jewelry, musical and scientifio instruments, artiticial flowers, etc,, are carried to the very highest atate of perfertion. Leipaic communicates by railroad with Drosden, and the trade of the latter le conducted up and down the Elbe.

The following statement exhibits the value of exports, the produce and manufactures of Saxony, to the United States, during a period of five years, from 1851 to 1855, both inclusive, specifying the countries through which said exports were shipped for the United States I

## $t$ Thean figures are for tho po.t of New lork ouly, and for six montis. No returna are at land for the general trade.

Scammony (Gcr. Skammonien; Fr. Scammonée; It. Scummonea; Sj1. Escamonea), a gum-resin, the produce of a species of convolvulus, or creeper plant, which grows abuadantly in Syria. When an incision is mads into the roots, they yield a milky juice, which beling kent, grows hard, and is the scammony of tio shops. It ls imported from Aleppo in what aro called drums, weighing from 75 to 125 lbs . each; and from Smyrna in cokes like wux, pucked in chests. The former in light and friabie, nud is considered the best; that from Smyrna is more compact and ponderoua, less friuble, and fullor of impurities. It has a peculiar heavy odor, not unlike that of old choese, and a bitterish, slightly acrid taste. The color is blackish or bluish gray; changing to dirty white, or lathering when the surface is rubbed with a wet finger. Its specific gravity is 1.235 . It is very liable to be aduiterated; and when of a dark color, heavy, and splintery, it ought to lo rejected. It is used only in medicine.Thomson's Dispensatory.
Schooner, in Nautica! language, a small vessel with two masts, whose mainsuil and foresall are suspenied from gaffs, reaching from the mnst toward the stern, and stretched out below by booms, und whose foremost ends are hooked to an iron, whlch clasps the mant so as to turn therein ns upon an axis, when the after eads are swung from one aide of the vessel to the other.

Ecotland, the northorn portion of Great Britaln, extends in its main land from lat. $54^{\circ} 38^{\prime}$ to $58^{\circ} 41^{\prime}$ N ., and long. $1^{\circ} 45^{\prime}$ to $6^{\circ} 14^{\prime} \mathrm{W}$., and, including its islands, to lat. $60^{\circ} 50^{\circ} \mathrm{N}$., and long. $8^{\circ} 35^{\prime} \mathrm{W}$.

Scotlund is separated fron England by a waving line of the Cheviot Hills in the centre, ly the Tweed, which enters the rea at Berwick, on the east, and ly the Solway Firth on the west. Its eastern shores are washed by tho North Sef, and its western by the Atlantie. It is of an oblong, irregular form, extending longitudinally due north und south 280 miles, and varying in breadth from 175 to 100,50 , and 30 miles. Area, 31,324 square miles, or $20,047,462$ ucres, $6-9$ acre to a person, 92 persons to $n$ square mile. Population in 1801, 1,500,068; in 1841, 2,620,18.1; in 1851, 2,888,742. For Manufacturing Districts, etc., of Scotlund, sce Blackwood's Magazine, 1. 659, Ixv. 152 ; London Quarterly Reviev, 1xxxil. 187. For Scottish Fisheries, ave Iondon Quarterly Review, Ixix. 226 ; North British Rerien, 1. 326.
The relative commerce of the three lesding Scotch ports, compared with the leading ports of Enginnd and Irelanil, is shown in the following table, showing the

[^45]declared value of British and Irish produce and manufactures exportod to foreign countries for cacle year, from 1851 to 1855 :

[^46]Bcud, the name given by eeamen to loose, vapory clouds driven switly along by the winds. To scud, gigniftes to run directly beforo the wind in a gale. As tho olject is to keep before the nen, the foresail or fore topssili is set : the latter or the main topsail is often necessary, as the foresail is often becalmed from the height of the waves.

Scudo. See Conss.
Scull, un oar, so short that one can work a pair. It most generally implies an oar placed over the stern of a boat, and worked from side to side; the blado, which is turned diagoaally, being always in the water. In Chhas, where the method is well understood, large boats are impellod by a single scull with considerable velocity.

Sculptures, figures cut in stone, metal, or other solid substance, representing or lescribing some real or imagionary olject. The art of the sculptor, or statuary, was carried to the highest pitch of exceilence in ancient Greece. Fortunately, several of the works of the Grecian sculptors lave heen preserved, and serve at once to stimulate and direct the genius of modern artists. Models are casts or representations of sculptures.

Ecuppers are pipes of lead inserted in openings bored from the deck through the sides of a ahip, to carry the water off from the deck to the sea. To avoid the inconvenience of having the acuppers broken by the working of the ship, each is formed of two pipes, one of which is pansed upward to the ileck through the opening in the ship's side, and having its lower end nailet en the outside planking; the other, which is of manaller diameter, after being woolded on the outside with fiannel dipped in taliow, is dussed downward into the lower pipe, throngh the opening in the deck, and its upper end secured on the plank of the deck. In order to prevent the entrance of wasas by these scup-
pers when the ship is inclined, valves of metal are placed over the external outer ends, which close with the pressure of the external water. In morchant vessels, lenther pipes, called scupper hoses, are sometimes nailed round the opening for the same purpose. Sometimes acuppera are only leaden pipes passed tilrough the ship's side, and turned and fastened at esch end.

Bcuttles, in a ship, holes in the decks, either for air or as passages to the store-rooms; also openings in a ship's side for the admission of air. If, in order to sink a ship, a holo be eut in her bottom, she is said, in Nautical languoge, to be scuttled.

Bea. The jurisdiction over the sess las long been a question of difficulty and of doubtful right. Grotius published his Mare Liberum agsinst the Portuguese claim to an exclusive trade to the Indies through the South Atlantic and Indian oceans, and he proves the sea is not capalle of private dominion. Ile vindicates the free navigation of the seas, sull the right of commeree, and exposes the absurdity of the l'ortuguese claim. Selden's Mare Clausum was written io answer to the doctrine of Grotius, and he undertook to prove, by the laws, usages, and opinions of all natious, uncient and modern, that the aea was capable of private dominion. He asserted that the English had long cisimed and enjoyed a supremacy over tha surrounding and narrow seas. Itynkershoiek concedes to Seiden much of his argument, and admita that private dominim mas be exercised over adjoining seas; but denies the right of the Fingliah on the ground of a want of uninterrupted possession.

The claim of dominion to close or narrow seas is still sabject to discussion. As far as a nation can conveniently occupy, and that occupancy is acquired by prior possessiun or treaty, the jurisdiction is exelusive. Navigable rivere which flow through a territory, and the sea-coast adjoining it, and the navigable waters
included in baye, and between headlands and arme of the sea, belong to the people of the adjoining territory, as being necessary to the safety of the nation, and to the undisturbed use of the neigboring shores. The open sea is not capable of being possessed as private property. The free use of the ocean for navigation and fishing is commen to all mankind, and the public juriste generally and explicitly deny the main ocean can ever be appropriated. The subjects of all nations meet there, in time of peace, on a footing of entire equality and independeace. No nation has any right or jurisdiction at ses, except it he over the persons of its own subjecte, in its own private and public vessels; and se far territorial jurisdictlon may be considered or preserved as portlons of its territory, and persons on board are protected and governed by the law of the country to which the vessels belong. They may be punished for offenses against the municipal laws of the State, committed on beard of its public and private vessels at gea, and on hoard of its public vessels in foreign ports. This jurisdiction is confined to the ship; and ne ship has a right to prohibit the approach of ariother at sea, or to draw round her a line of territorial jurisdiction, within which no other is at liberty to intrude. Every vessel has a right, in time of peace, to consult its own safety and convenience, and to parsue its own conrse and business without being disturbed, when it does not violate the rights of othere. As to narrow seas and waters approaching the land, there have been many and sharp controversies among European nations concerning the claim of exclusive dominion. The questions arieing on this claim are not very clearly defined and settled, and extravagunt pretensions are occasionally put forward. ***Puffendorf admits that in a narrow sea the deminion of it may lelong to the sovereigus of the adjoining shores. Vattel, also, lays down the position that the various uses to which the sea contiguous to the coast may be applied, render it justly the sulject of property. * * * Chitty, in his werk on Commercial Law, has entered into an elaborate vindication of the British title to the four seas sorreunding the British Islands, and known by the name of British Seas, and, consequently, to the excluslve right of fiehing and of centrolling the navigation of fereigners thoreill. * * * On tho other hand, Sir William. Scott did not treat the claim of territory to contiguous portions of the sea with much indulgence. He suld the general inclination of the law was against it; for in the sea, out of the reuch of cannon shot, universal law was presumed, in like manuer as a commen use in rivers flowing through conterminous states was presumed; and yet in both cases there might exist a peculiar property excludiag the universal or common use.-Kint's Com, vol. i.
The United States have recognized the general limitatien of a marine league, or a cannen-shot diatance; but considerlug the contour of our coast, the law of nations would justify, and it would not be unreasonable for us to cluim, the control of the waters from Cape Ann to Cape Cod, and from Nantucket to Montauk Point, and frow that point to tho Capes of the Delaware, and from tho South Cape of Florida to some point on our coast west of the mouth of the Mississippi.
Seal (Lat. Sigillum), a atone, plece of metal, or othor selld substance, generally round or elliptical, on which is eagraved the arms, crest, name, device, ctc., of some state, prince, public body, or private individual. It is employed as ustamp to make an inpression on seuling-wax: thereby authentleating public acts, deeds, etc., or to close letters or packets. Sesls were very curly invented, and much learning has been employed in tracing their history, and explaining the figures upon them. See particularly the work of Hopкınce, De Sigillorum Prisco el Noto Jure, 4to, $16+2$.
Seal-fishery. The seal, an ampliblous animal, of which there are many varieties, is found in vast numbers in the seas round Spitzbergen, and on the
coasts of Labrador and Newfoundland. Seals are principally humted for their oil and skins. Whan taken in the epring of the year, when they are fatteet, a fullgrown seal will yield from 8 to 12 gallons of oil, and a emall one from 4 to 5 gallons. The oil, when extracted before putrefaction has commenced, is beautifully transparent, fres from smell, and not unpleasant in its taste. The skin, when tanned, is extensively employed in the making of shoes ; and, when dressed with the hair on, servee for the covering of trunks, etc.-For an account of the Imports of seal skins, see article Funs.

To the Eequimaux the seal is of as much importance as bread to a Europenn. Its flesh forms their most neual food; the fat is partly dressed for eating, and partly consumed in their lamps; the liver, when fried, is esteemed, even among sailors, as an agresable dish. Tho skin, which the Esquimsux dress by processes peculiar to themselvee, is made water-proof. With the hair off, it is used as coverings, instead of planks, for their boats, and as outer garnents for themselves; shlelded with which, they can invert themselves and canoes in the water, without getting their bodies wet. It serves aleo for coverings for their tents, and for varieus other purposes. The jackets and trowsers made of seal skin by the Esquimanx are in grest request among the whale-fishers for preserving them from oil and wet.-Sconesny's Arctic Regions, vol. I. p. 510 Seals in fine weather prefer the ice to the water, and vast herds of them are frequently found lying on the field ice; the places whcre they are met with being thence calied "seal meadows." The seal hunters endeavor to surprise them while sleeping, and to intercept their retreat to the water. They attack them with muekets and bludgeons, but principally the latter, they belng easily dispatched by a blow on the nese. The ssalfishery has long been prosecuted to a conslderable extent in the Northern geas by shlps from the Elbe and the Weser. But very few ships have been sent out for sealing only from England, though occasionally some of the whale-shipe have taken large quantities of senls. Latterly, however, the seal-fishery has been prosecuted on a large scale, and with extraordinary euccess, by vessels of from 60 to 120 tons each, having crews of from 16 to 30 men, fitted out frem the ports of Nowfoundland, Nova Scotia, etc. The buelness is attended with a good deal of risk, and instances frequently occur of the vessels being crushed to pieces by the collision of the fields of ice. We borrew the following detuils from Mr. Bliss's tract on the Trade, Statistics, eic., of Canada and North A merican Possessions:
"There is another department of the colonial fishery which has originated within no distant period, and is now of great extent and importance. The large fields of ice which, in the months of March and April, drift southward from the l'olar seas, are accompanied by many herds of esele; these are found sleeping in what are called the seal mendows of the ice, and are there attacked and slaughtered in vast numbers. For thls purpose the fishers of New foundland, from which island these vojages are principally made, without waiting till the return of spring shall have opened their harbors, saw channels through the ice for their vassels, and set sail in quest of those drifting fields, through the openings of which they work a passage, attended with great difficultics and dangers, till they encounter their prey on the seal meadows. This bold and hazardous enterprise seems well compensated by its success. The number of seals thus taken ls almost incredible, and is greatly on the incresse" (p. 70).-Living Age, xxvil. 186. See articles Fisheries, Oils, Newfoundland, and Lamrador; see also M'Gaecon's British America, 2l edit., and Sabine's American Fisheries. There is a good account of the seal in Laing's Voyage to Apilzbergen.

Sealing-wax (Ger. Siegellack; Fr. Cire d'Espagne, Cire d cacheter; It. Cera Lacca, Cera di Spagna; Sp. Lacre; Russ. Surgutsch), the wax used for sealing
letters, legal instruments, etc. It is a composition of gum-lac, multed and incorporated with resin, and afterward colored with some pigment, as vermilion, verditer, ivory black, etc.
The Hindoos from time immemorial have posseased the resin lac, and were long accustomed to ube it for uealing manuscripts before it was known In Europe. It was firot imported from the East into Venice, and then into Spain ; in which country sealing-wax became the object of a considerable commerce, under the name of Spanish wax.
If sheil-lac be compounded into mealing-wax immediately after it has been separated by fusion from the palest qualities of stiek or seed lac, it then forms a better and less brittle article than when the ahell-lac io fused a aecond time. Hence sealing-wax rightly prepared in the East Indies, deserves a preference over what can be mado in other countries, where the lac is not indigenous. Sheil-jac can be restored in some dogree, however, to a plastic and tenacious state by moltling it with a very small portion of turpentine. The paleat shell-lao is to be selected for bright-colored seal-ing-wax, the dark kind being reservel for black.
Seamen, the individuals engaged in navigating shipa, barges, etc., upon the high seas. Those employed for this purpose upon rivers, lakes, or canals are denominated watermen
Of the Rights and Duties of Seamen.-The seamen employed in the merchant service are made eubject to special regulations prescribed by acts of Congress. Shipping articles are contracta in writhng or in print, declaring the voyage and the tarm of time for which the seamen are shipped, and when they are to render themaelves on bourd; and the articles nre to be signed by every seaman or mariner on all voyages from the United States to a foreign port ; and, in certaln cases, to a port in another State other than an adjuining one. If there be no auch contract, the master is lwund to pay every seaman who performs the voyage the highest wagea given at the port for a aimilar voynge within the next three preceding monthes, besides forfeiting fur every seaman a penalty of twenty dollars.

The seamen are made subject to forfeitures if they do not render themseives on board to the contract, or if they desert the service; and they are liable to summary imprisonmeat for denertion, and to be detained until the ship, be ready to sail. If the mate and a majority of the crew, after the voyage is begon, but before the vessel has left the iand, deem the vessel unsafe, or not duly provided, nad shall require an exsuination of the ship, the master must proceed to, or stop at, the nearest or moat convenient port, where an inquiry is to be made, and the master and crew must couform to the judgment of the experienced persong selected by the district judge, or a justice of the peace. If the complaint shall appear to have been without foundation, the expenses nad reasonable damages to have been ascertained by the judge or jubtice are to be deducted from the wages of the seamen. Hut if the vessel to found or made seaworthy, and the seamen whall refuse to proceed on the voyage, they are sutjected to imprisomment until they pay donthe the advance made to them on the shipping contract. Fishermen engaged in the fisheries are lialle to like ponaities for desertion ; and the fishiag contract must the in writing eignefl ty the shipper and the fishermen, and countersigned ly the owner.

The articies do not determine exclusively who are the owners, and the seamen may prove by other docunents the reai and reaponaible ownern. The object of the articiea is toplace th. crew of a fishing vessel upon a footing with seamen in the merchant service, and to make them liable to the sume restrictiona, and entitied to the same remedies. Provision is made for the prompt recovery of seamen's wages, of which onethird is due at evary port at which the veseel shall unboad and dellver her cargo befure the voyage be ended;
and at the end of the voyage the seamen may proceed In the District Conrt by admiralty process againet the ohip, If the wages be not pald within ten days after they are discharged. The seamen having like cause of complaint, may all join in one suit, and they may proceed against the vessel within the ten days, if she be about to proceed to sea; bnt this remedy in rem does not deprive the aeamen of their remedy at com. mon law for the recovery of their wages.

Every shlp belonging to a citizon of the United States, of the burden of 150 tone or upward, and navigated by six or more peraons, and bound from any port in the United States to any port in the West In. dies, shall he provided with a medicine-chest, properly sapplied with fresh and eound medlecines; and, if bound on a voyage across the Atlantic Ocean, with requieite stores of water, and salted meat, and wholesome shipbread, well secnred under deck. A fund shall be raised out of the mariners' wages earned on board of any vesael of the United Statea, and he paid by the master to the collector of the port, on entry from a forelgn port, at the rate of twenty cente per month for every seaman. The liko assessment is to be made and pald on the new enrollment and ilcenee for carrying on the coasting trade, and also by persons navigating boats and rafte on the Mlaslesippi. The moneys so raised are to le expended for the temporary relief of sick and disabled aeamen in hospitala and other proper institutions established for such purpose; and the surplus moneys, when sufficlently accumulated, shall be spiphied to the orection of nurine hospitala for the accommodation of sick and disabled senmen. The hospitals, ss far us it can be done with convenience, are to receive sick foreign seamen on a charge of seventy-five cints per day, to be paid by the master of the foreign veasel.

And to relieve Anerican seamen who may he found destituto in foreign places, it is the duty of the Anerican consuls and commercial agenta to provide for those who may be found destitute within their consalar districts, and for their passagee to some port in the United States, in a reasonable manner, at the expense of tho United States; and American vessels are hound to take such seamen on board at the request of the consul, but not exceeding two men to every hundred tons burden of the ship, And transport theni to the Cnited States on such terms, not exceeding $\$ 10$ for each person, as may be agreed on. So, if an American vessel be sold in a foreign port, and her company dischurged, or a seaman bo discharged with his consent, the inster must pay to the consul or commercial agent three montha' pay over and above the wages then due for every such reaman. twothinds of which is to he paid over to every aemman so discharged, upon his engagement on bourd of any vessel to return to the laited States, and the remaining third to be retained for the purpose of creating a fund for the maintenance and return of deatitnto American seamen in such foreign ports.
The master is personally responsihie in damages for any injary or loss to the ehip or cargo liy reason of his negligence or misconduct. He has authority to imprison, and also inflict reasonable corporeal punishment, upon a seaman for disobedience to rensoushle commands, or for disorderly, riotous, or ineolent conduct. If the correction le excessive or unjuatilisble, the seaman is sure to recoive compensation for damages on his return to port in an action at common law. And it must be an extreme case that will juntify $n$ oraster to contine a seaman in a comnion jaili in a foreign port. He can not do it as a punishment, but only by way of precaution under existing circumstanees. The master may alao confine a passenger who refusea to submit to the necessary discipine of the ship. The master hat aiso the right to discharge a seaman for just causes, and put him aahore in a foreign country; but the causen must be not alight, but aggravated ; such as habitual disoledience, mutinous conduct, theft, or
habitual drunkenness; and be is responsihle in dam. ages if he discharge him without just cause. This power of discharge extends to the mate and subordinate officers as well as the seamen. But it would require a case of flagrant disobedience, or gross negligence, or palpable want of skill, to authorize a captain to displace a mate, who is generally chosen with the consent of the owners, and with a view to the better safsty of the ship and the security of their property.

The master must receive back a seaman whom be has discharged, if he reports and offers to return to his duty and make satisfaction; and if the master refuses, or the seaman has been unduly discharged, he may follow the ship, and recover his wages for the voyage, and his expenses for his return. The master subjects his:self to fine and imprisonment if, without justifisble cause, he maliciously force an officer or mariner on shore while abroad, or leaves him behind in any foreign port or place, or refuses to bring home those whom he took out, and are in a condition and willing to return. The expense of curing a sick seaman in the course of the voyage is a charge upon the ship in the nsture of additional wages during sickness.
The act of Congress requires that in seamen's shipping articles the voyage and the term of time for which the seamen may have shipped be specified. The regulation relates to voyages from a port in the United States, and It does not apply to a voyage commencing from a foreign port to the United States. The voyage within the attention of the statute means one having a definite commencement and end. The terminus a quo and the terminus ad quein must ho stated precisely; and in a case of general adventure the term of service must be specified. A voyage from New York to the Curacos and elsewhere means, in shipping articles, a voyage from New York to Curacos, and the word elsewhere is rejected as being vold for uncertainty. Seamen in the merchant service are usually hired at a certain sum, either by the month or for the voyage. In the fishing trade the seamen usmally serve under tin engagement to receive a portion of the profits of the adventure. The share or profits of the voyage are a subetitute for regular wages, and the act of Congress (19th June, 1813) extends the admiralty jurisdiction to the cognizance of auits for shares in whallng voyages in the sanue form and manner ins in ordinary cases of wages in the merchant service. Every seaman engriged to servo on board a ship ts bound, from the nature and terms of the contract, to do his duty in the service to the utmost of his abllity; and, thereforo, a promise made by the master when the ship is in distress, to pay extra wagee as an inducement to extraordianry exertion, is illegal and void. It would be the same if some of the crew had deserted, or wero sick, or dead, or peculiar efforts becume requisite; for the general engagement of the seamen is to do all they can for the good of the service under all the emergencies of the voyage.

A seaman is entitled to his whole wages for the voyage, even though he be unable to render his service ly slekness or bodlly injury happening in the course of the voyage, and whlle he was in the performance of his duty. Ile will equally be entitled to his wages to the end of his voynge when wrongfully diselurged by the maeter in the course of it. The marine law distingulshes letween the cases in which seamen's services are not rendered in consequence of a peril of the sea, and in which they are not rendered hy reason of some iilegal uet, or misconduct, or frand, of the master or owner interrupting und destroying the voyage. In the latter cases the seamen are entitied to their wages. If a seamm be wrongfully discharged on the voynge, the voyage is then ended with respect to him, and he is entitled to aue for his full wages for the voynge.

Frelght is the mether of wages, and If no freighi be earned no wages are due; but the frelght must not be lost by the fraud or wrongful act of the master. The
rule applies to cases of loss of freight by a peril of the sea. Seamen's wages in trading voyagea are due pro rata itineris. If the seaman dies on the voyage, it was decided in the Circult or District Court of the United States in Pennsylvania that the representatives were ontitled to full wages to the end of the voyage; and on the other hand, In the Distriet Conit of South Carolina and Massachusetts, it was decided that fuil wages by marine law meant only full wages up to the death of the mariner. As the payment of wages depends, in general, upon the earning of freight, if a ship delivers her outward cargo, and perishes on her return voyage, and the outward freight be earned, the sep.men's wages on the outward voyrage are consequently due.

By the custom of merchants, seamen's wages are due at every dellivering port, and their wages are not affected, without their 日pecial agreement, by any stipulation between the owners and the charterers, making the voyages ont and home one entire voyage, and the freight to depend on the accomplishment of the entlre voyage out and in. The owners may waive or modify their claim to freight as they please, but their acts can not deprive the seamen, without their consent, of the rights belonging to them by the general prineiples of the marine law. They are entitled to wages not only when the owner earns frelght, but when, uniess for his own act, he may earn it. The wages are due by an arrival at a port of destination, when no cargo is on board, or when the owner chooses to bring the cargo back again, and when the port of deatination be not, in fact, the port of delivery. Even if the ship perishes on the outward voynge, yet, if part of the outward freight has been paid, the seamen are entitled to wagea in propertion to the amount of the freight advanced, for there is an inseparable connection between freight and wages. In case of capture, the seamen taken prisoners by the captor and detalned are entitled to their wages for the whole voynge, if the same be nfterward performed, with a ratable dedetion for the expenses of anlvage. The same is the case of a vessel cuptured and afterward ransomed, and enabled to arrive at her port of destination. In the case of shipwreck, if any proportion of froight be paid for the cargo saved, wages of seamen are to be paid in the same proportion.

Mariners are bound to contribute ont of their wages for embezzlements of the cargo, or injuries produced by the misconduct of any of the crow. But the circumstances mast be such as to fix the wrong upon some of the crew; and then, if the individual bo unknown, those of the crew upon whom the presumption of guilt resta stand ne sureties for each ether, and they must contribute ratably to the loss. Where the embezzlement has arisen from the fault, fraud, cenaivsnce, or negligence of any of the crew, they are bound to contribute to the reparation of the loss, in proportion to their wages. Where no reasonable presumption is shown against their innocence, the loss must be borne exclusively by the owner or master.

In case of shipwreck, sind there be relics or materials of the ship saved, tho seamen by whese exertions part of a vessel had been saved are allowed the payment of their wages, as far as the fragments of the materials would form in fund, although there was no freight earned by the owners. But in such cases where the voyage is broken up by vis major, and no frelght earned, no wages eo nomine are duo; and the equitable clain whlch seamen may have upon the remains of tho wreek is rather a clalin to salvage than a title to wages. Wages in such cases would bo contrary to the principle of marine law-that freight is the mether of wages, and tine safety of the ship the mether of freight. If, however, the seamen abanden the wreck of a ship, ns being a hopeless case, and without the intention of returuing to possess and anve it, they lose their lien or privllege for any equitable compensatlon, whether as wages or salvage-their claim is extinguished; and
though other persons may possers the property which had been derelict, it belongs to the original owner, burdened for their claim for salvage.
By the act of Congress, one-third of seamen's wagea is due at the port whire the ahip uniades and dolivore her cargo, ualose there be an exprese stipulation to the contrary; and when the voyage is ended, and the cargo or ballast is fully discharged, the wages are due, and If not pald withtn ten daya thereafter, admiralty process may be inatituted. But there is no flxed period of time within which marinere muat proceed to enforce lien for wages. It does not, like other liens, depend upon possession. The seamen need not libel the versel at the intormediate port at which thoy are diocharged. They may disregard bottomary bonds, and pursue thelr liens for wagee afterwan, aven against a aubsequent bonafids purchacer. It followi the shlp and Ite proceeds, intc whose hands eoverer they may come by title or purchase. Their demand for wages takes procedence of bottomry bonds, and is proferred to all other demands. Their ciaim is a macred. lien, and as long as a single plank of the ship remains the sailor is entitled, as against all othor persons, to the proceeds as a security for his wages. The seamens' lien exists to the extent of the whole compenaation due them. There is no difference between the cave of a vessel melzed abroad, and restored in apocle or in value; the llon reattaches to the thing, and to whetever la substituted for it. Desertion from the ship without just cause, or the justifiahle discharge of a seaman by the master for bad conduct, will work a forfelture of the wagee previously earned. Desertlon is accompanied with a forfeilure of all the wages that are doe; and whatever unjustlfiable conduct will warrant the act of the master in discharging a seaman during the voyage, will equally deprive the seaman of his wages. Hut the forfeiture is saved if the seaman repenta, makea com-
pensation or offer of amenda, and ts rentored to his dety.
The master has power to remilt a forfolture, and the penalty of forfelture is not applied to silght faults, olther of negleet or disobedience. There must either be an habitual negloct, or ásobedience; or druikenness, or alee a siagle act of gross dishomenty, or some other act of a hoinous and aggravated natars, to juatify the discharging a soaman in a forelgn port, or tho forfeiture of wages ; nor will the adminalty coarts, except in case of groat atrocity, visit the offenses of moamen with the accumulated load of forfeltare of wages and compenaation in damagse, : They ntop at thio forfelture of wages antecedontly sarned; and in the application of forfelture the advance wages are mide a charge on the forfelted wages, but the hoapital money la apportioned ratably on the wagee for the whole voyage. If the seaman quits the ship Involuntarily, or is driven ashore by reason of cruel usage, and for personal safety, the wages are not forfilted. On the other hand, it is the duty of the seamen to ablde by the vessel as long as reasonahle hope remaine; and if they desert the khip under circumstances of danger or diatress from perils of the mea, when their prosence and oxertions might have prevented damage, or restored the ship to mafety, they forfeit their wages, and are anewerable In dam. ages. And even when a seaman might well have been discharged in the course of the voyage for gross misbehavior, if the mastor refuses to discharge him, and leaves him in imprisonment abroed, he will in that ease be entitled to his wages until his roturn to the United States, after deducting from the claim his time of im-prisonment.-Leone Levi's Com. Law of the World, rol. II. p. 226. See Mercawtile Guide, Londoh, Avo; Am. Whig Rev., ii. 230. Ilc ipitals for Seamen, see Newo Eingland Revien, 1il. 481; Huxt's Merchants' Mag., xi. 844, xi. 230 (J. H. Lanman).

Relief of Destitute Seamen.-By the fourth sectlon of $\mid$ at the expense of the United States, subject to such the act of Congress, 28th Februsy, 1803, it is made |instruction as the Secretary of State shall give; und the duty of consular officers to provide for the mariners of the Linited States who may he found destitute within their districts sufficient subniatence and passage to the United States, in the most reasonable manner, the section also provides for the manner in which such mariners are to be transported to the United States. If any seaman happens at a United States consulate, not from dischargo from a vessel, but from shipwreck
or otherwise, the same must be atated eccordingly, with the time he artived at the consulate, $s 0$ that the return will show how and when each relioved seaman happened there. And if no oxtra rages are received, the reasons why such wages have $n$. been received should appear from the return, or other accompanying papers.
When American seamen are discharged in any port from sickness or any other cause, the three months' extra wages ahould invariably be exacted as required by the acte of February 28, 1803, and of August 18, 1856. The three months' oxtra wages are to be credited in consular accounte, and the two-thirds thereof are not to be paid to seamen until they shall have ongaged on board some veasol to return to the United States; and then only when no disbursemente shall have been made on their account. Expenses incurred for them are first to be paid, and the balance only, if sny, to be raturned them. On payment of the two months' extra wages to seamen, consular officere will take and forward receipte with their accounts. Whenever a ship or vessel belonging to a citizen of the United States is seld in a foreign conntry, and her company discharged, or when a seaman or mariner, a citizen of the United States, is with his own consent discharged in a foreign country, it is the duty of the master or commander to produce to the coneular officer the certified list of his ship's company, and pay to such consular officer for every seaman or mariner so discharged, being designated on such list as a citizen of the United States, three months' pay, over and above the wages which may then be dae to such mariner or seaman; two-thirds thereof to be paid by such conenlar officer to each seaman or mariner so discharged, upon his engagement on board of any vessel to return to the United States, and the other remaining third to be retained for the purpose of creating a fund for the payment of the passages of seamen or mariners, citizens of the United States, who may be desirous of returning to the United States, and for the maintenance of destitute American seamen.

Whenever any seamsn or mariner of any vessel of the United States deserts anch vessei, the master or commsnder of the veasel is required to note the fact and date of the desertion on the list of the crew, and to have the same officialiy authenticated at the port or piace of the consulate or commercial agency first visited by the vessel after such desertion. If the desertion shail have occurred in a foreign country, or if, in anch case, the vessei ehall not visit any place where there is any consulate or commercial agency before her return to the United States, or if the desertion shall have occurred in the United Stutee, the fact and time of desertion shali be officialiy authenticated before a notary public immediately at the first port or place where such vessel urrives after the desertion. Ali wages that may be due to such seaman or mariner, and whatever interest he may have in the cargo of auch vessel, shaii be forfeited to and become the property of the United States, and paid over for their use to the coliector of the port where the crew of such vessel are accounted for as soon as the same can be ascertained, first deducting therefrom any expense which may necessarily have been incurred on account of such vessel in consequence of such desertion. In eettling the account of such wages or interest, no aliowance or deduction siali be made, except for moneye actuaily paid, or goods at a fair price supplied, or expenses incurred to or for auch seaman or mariner, any raceipt or voucher from or arrangement with such seaman or mariner to tile contrary notwithstanding.

Upon the application of any seaman or mariner for a discharge, if it shall appear to the consular officer that he is entitled to his discharge under any act of Coagress, or according to the general principles or usages of maritime law as recognized in tie United States, he is required to discharge such seaman or mariner, and require from the master or commander of
the ship or vessel from which ouch diecharge shall be made the payment of three montha' extra wages, as provided by the act approved February 28, 1808; and it ahall be the duty of auch mastor or commander to pay the asme, and no auch paymont, or any part thereof, thall be romitted in any case, axcept such as are mentioned in the preceding suction, and isi cases of wrecked or stranded ships or vassels, or ships or vessels condemned as unfit for sorvice, when no payment of extra wages ehall be required. The extra wages required to be paid by the foregoing clanse of this section are applicable to the same purposes and in the same manner as is directed by the act approved February. 28,1808 , in regard to the oxtra wages required to be paid by that act.

* If the first officer, or any officer and a majority of the crew, of any vessel make complaint in writing that she is in an unsuitable condition to go to sea, because she is leaky, or insufficiently supplied with sails, rigging, anchors, or any other equipment, or that the crew is insufficient to man her, or that her provisions, stores, and supplies are not, or have not been daring the royage, sufficient and wholesome, thereupon, in any of these or like cases, the consular officer of the port is required to appoint tro disinterested competent practical men, acquainted with maritime sffairs, to examine into the causes of complaint, who must, in their report, state what defects and deficiencies, if any, they find to be well founded, as well as what, in their judgment, ought to be done to put the vessel in order for the continuance of her voyage.

By the 4th section of the act of February 28, 1808, all masters and commanders of vessels beionging to citizens of the United States, and bound to some port of the same, are required and onjoined to take on board their ships or vesseis, at the request of the consular officers, such American seamen as may be found In their districts reapectively, and to transport them to the port in the United States to which such ships or vessele may be bound, on such torms, net exceeding ton dollars for esch person, as may be agreed npon between the said masters and consular officers. And the :aid seamen shail, if able, be bound to do duty on board such ships or vesseis according to their several ablilties. To ensble the master of the veseel to obtais the payment specified, the consnlar officer will give him a certificate, stating the names of the seamen placed on board, and the amount to be paid for their passage; on which, upen the arrivai of the vessel in a port of the United States, an indorsement must be made by the collector of the customs at such pert, stating that such eeamen have arrived in said vessel in his district. When the certificate so indorsed is received at the Treasury Department, the amount will be paid to its holder. No master or cantain of any ship or vessei is obliged to take a grenter number than two men to every one inundred tons burden of the said ship or vessel on any one voyage.

Wages of Seamen.-The genoral ruie in regard to the wages of seamen is, that such wages on board of merchant ships are payable out of the earnings for froight; and if ne freight is earned, by reason of the perils of the sea or capture by the enomy, and not by the fault or negicet of the master or owner, no wages are due. The maxim that "freight is the mother of wages" is a formula which, though it has obtained general curreney, is to be carefuily 2 arutinized in its application. A distinction is to de mado between those accidents by which tho voyage is interrupted and the freight lost, without the fauit of the owner or nusster, and other causes arising from the acts of the owner or master. If the voyage or freight be lost by the negligence, fraud, or misconduct of the owner or master, or voluntarily abandoned by them; if tise owner has contracted for ireight upen terms or contingencies differing from the general rulos of the maritime low; or, if he haa chartered his ship to toke a freight at a
forelgn port, and none is to be earned on the outward voyage-in all these casea the mariner is entitical to wages, notwithatanding no freight has acorued. Whoms freight is, or might be, earned, wagee are duc for the full period of employnent in the ahip's service, whother the freight is actually received by the owner or not. No private contract between the owner and the shipper, with regard to freight, can affect the right to wagen, ".
If the vessel and cargo are lost on the outward voyage, before any freight is earned, and no part of eithor is saved hy the crew, the wages of the sesmen are also lost, and the original contraot thovefor is annulied, but the advance wages are not in auch case to be returned. If. the vesael is.loot on the homeward voyage, and freight has been, or might have been, by the geaeral principles of law, earned to an out ward port, the wages for the ontward voyage to that port are deemed to have beeu earned. No abatement is to be made from the wagee in case of the freight belag partially loet or diminiahed by maritime aceidents or perils. If freight is earned, whether it be large or amall, the whole wages, which are deemed to have been earned, are to be pald without deduction. When the vessel fo tont between Intermediate porte, the wages are to be caloulated up to the last port of the delivery or receipt of cargo, and for half the time that the ship lies there. Where a voyage is divided ly various ports of dellivery, a claim for proportioaal wages attaches at each of snch ports of delivery upon safo arrival; and all attempts to evade or iavade that titie, by renunciations obtained from the mariners without any conalderation, by collateral boade, or by contracte inserted in the body of the shipping articles, not ususl, not fa $y$ explained to these illiterate and inexperienced persons, ara irnffectual and vold.

Prucection and Care of Seamen.-It ls provided by the 10th section of the ect of July 20, 1840, that the crew of any vessel shall have the fallest liberty to lay their complaints before the consular officer In any foreign port, and ehall in no respect be reetrained or hindered therein by the master or any officer, unless some sufficient and valid objection exist against their ianding; in which case, if any mariner desire to see the consular officer, it shall be the duty of the master to acquaint hiln witi it forthwith, statiag the resson why the mariner is not permitted to land, and that he is desired to come on board; wherenpon it ahall be the daty of such officer to repair on board and inguire into the causes of the complaint, and proceed therein as the act directs.

Desertion.-In countries with which the Unfted States have stipulations by treaty or convention to anthorize it, or where it is permitted by the local authorities, consolar officers may apprebend deserters as fugitives from justice, and imprison them until required by their commander.-Consular Regulations, United States, 1856.

For further information upon the rights and duties of semmen, se articles Ayfreiohtment, Charter-party, Comsehce, Insuance, Shipping, etc. See also Kint's Com. vol.iii. p. 231; Pansons's Mercantile Lavo, p. $3 \times \overline{5}$; Dunlap's Digeat of the laws of the U. S.

Seaworthy, a term applied to a ship, indicating that sho is in every respect fit for her voyage. It is provided in ali charter-partiee that the vessel chartered shall be "tight, stanch, snd strong, well appareied, furnished with an adequate number of men and mariners, tackie, provisions, etc." If the ship bo insuffcient in any of these particulars, the owners, though ignorant of the circumetance, will be liable for whatever damage may, in cobsequence, be done to the goods of the merchant; and if an iasurance have been effected upon her, it will be void. Bat whether the condition of seaworthiness be expressed in the charter-party or not, it is always implied. "In every contrect," eaid Lord Elleaborough," between a person holding himself forth as the owner of a lighter or vessei ready to carry goods for hire, and the porson putting goods
on board, or employing his veesel or lighter for that purpose, it is $\boldsymbol{n}$ term of the contract on the part of the lighterman or carrler implied by lawi that hin veisel to tight, and fit for the purpose for which the offers and holde it forth to the pablio ; it is the Immediate foundation and subatratum of the contract that it is so. The lavo presumes a promise to that effect on the part of the carrior, woithout any aetual proof; and overy reason of oonnd poiley and publio con venlence requires that it thould be so.".
A ship is not seaworthy unless she be provided with all the documents or papers necessary for the manifeatation of the ahip and cargo. Neither is the seaworthy, If, daring war, the be not supplied with the sailis required to facilitate her escape from an enemy. "It is not sufficient to defest the liability of the owner that he did not know that the shlp was not seaworthy, for he onght to havo known that the wae so at the time he chartered her. The sufficiency of the chip is the foundation of the contract between the parties, and a shlp not capable of conveying the goods in a proper state is a fallure of the condition precedent to the whole contract. The seaworthiness of the ship is not a question of fraud or good Intention, but it is a positive stipniation that the ship shall bo so; and therefore, although the owner may himself have been decelved by the ship-builder, repairer, otc., If the vessel be, in fact, unseaworthy, have an insufficient bottom or ansound timbers, it is a breach of a preiminary condition, and is fatal, as such, to the contract."-Hour's Lato of Shipping. It is only necessary, to guarantee the owners from lose, that the ahip should be seaworthy at the time of her departare. She may ceaso to be so in a few bours, and yet they may not be liable. The question to be decided in such cases always is, whether the ship's disability aroso from any defect existing in her befors her departure, or from a cause which occasioned it aftercard. But if a ahlp, within a day or two of her departure, become leaky or founder at sea, or be obliged to put back, without any visibie or adequate cause to produce such an effect-such as the starting of a plank or other accident, to which the best ships are liable, and which no human pruderice can prevent--the fair presumption is that she was not seaworthy when she ssiled; and it wili be inenmbent on the owners to show that she was seaworthy at that time. They are liable for damage oceasioned by every injary arising from any original defect in the ship, or from bad stowage; but they are not liable for any injary axiaing from the aet of God, tho king's enemies, or the perils of the sea.

It is further to be observed, that how perfect noever a ship may be, yet If, from tho natere of her construction, or any other cause, she be incapabie of performing the proposed voyage, with the proposed cargo on board, she fs not seaworthy. She must be in all respects fit for the trade in which she is meant to be employed. And it is a wholesome rule that the owners ahould be held to a pretty strict proof of this. It has been already observed that any defect in point of seaworthiness invalidates an insurunce upon a silip. There is not onily an expresa but an implied warranty in every poliey that the ship shall be "tight, stanch, and strong, ete.;" and the reason of this is plain. The insurer undertakes to indemnify the insured against the extraordinary and unforeseen perils of the sea; and it would be absurd to suppose that any man would insure against those perils, but in confidence that the ship is in a condition to encounter the ordinary perils to which every ship must be exposed in the usual course of the proposed voyage.
"In many ports certain equipments would now be coneidered easential which at an earlier period were not customary on the same voyages. Seaworthiness Is to be messured by the standsrd in the ports of the country to wheh the veseel belongs, rather than that In the port or conntry where the insurance was made. * * A veseel may be seaworthy whilo lying in port
for the purposes to which ahe io to be there applised, whon ahe would not befor the voyage, and ohe may be seaworthy for one voyage and not for another. It is anfilient if she be seaworthy for the voyage when she salls. The general ruia is, that the vessel muat be seaworthy at the commencement of the riak, whatever that risk may be, in order to make the policy attach and charge the insurer. It was heid, in the case of Wier va, Aberdeen, that thongh a alip be unseaworthy at the commencement of the riak, yet, if the defect be cared before a loss, a subsequent loas is recoverable under the policy. The argument of Lord Tenterden in favor of this doctrine is verf weighty, but a doubt seems to have been thrown over its solldity by tho Supreme Court of the United Statea.-See M'Lamahan vs. The Universal Inourance Co. ;" Kent's Com. vol. iii. p. 864.

For further information apon this subjoct tho reader is roferred to the able and excellent work of Chiefjustice A bbot (Lord Touterden) on the Law of Shipping, part ili.; Holt on Shipping, part III.; Mr. Sergeant Marsilalli on Insurance; Kent's Comm. vol. iii. ; and Parsons's Mercantila Law.

Beeds, in Commerce, the grains of several apecies of gramina. Those of most importance are clover eeed, flsx or linseed, hemp seed, rape seed, mustard seed, ete.; for which see the respective articics.

Segarn, or Cigars. See Tonacco.
Beizure, in Commerce, the arrest of aome merchandiso, movable, or other matter, olthor in consequence of some law, or some express order of the sovereign. Contraband goods, those fraudulently entered, or landed without entering at all, or at wrong places, aro subject to seizure.

Bonegal and Dependencies. Gorée is tho only port which foreign vessels are permitted to enter. Vessela of tho United States pay a duty of 187 centa per ton. By decree of January 6, 1855, foreign vessels visiting Gorée are aubjeot to a duty of 50 centincs per ton, about one half of a franc, or $9 \cdot 3$ cents. They are upos an equal footing with those of France in respect to navigation duties. Up to 1831, the exportation of gum Senegal was limited to France. By a royal ordinance of that year it is permitted to bo exported to all countries from the port of Goré only. Merchandise of every kind and of every production (Guineas or Indinblue cloths excepted) can be limported into or exported from the islaud of Goreo by versela of all nations, free of duty.

The name Sencgal is derived from the great river of that namo, and includes several emali French colonies, embracing a number of Iittlo islanda, and a strip of the main land between tho Senegal and Ganibia rivers. It is divided into a northern and a aouthern arrondisaement. Tho total nativo popuiation of these settlementa amounted in 1836 to upward of 18,000 . They are all Mohammedan and blacks. The soll of the islands is very poor. Tho maln land, not near tho shore, is fertile, and covered with foresta. Tho climato is sultry, and extremely unliealthy. Tho rainy season lasts from June to Octoher, and breeds fatal diseases. Geld is found near the sources of the Senegal, but attempts to form settlements there have proved abortive. Salt is quite abundant. The vegetable products are varied and luxuriant. Thero mey be found the gigantic jalnt, the gum, mimosas, ebony, cotton, indigo, coffee, amnatto, olives, hemp, eassia, sweet potatoes, millet, maize, etc. Tho wild animals are the elephant, lion, hippopotamus, boar, buffiaio, tigor-cat, dcer, and an insmense variety of birds. Oxen; gonts, mules, horses, nud asses are used for domestic purpoees, and shoep and hogs are bred.
The articles of export are raw hides, wax, elephant teeth, guin Senegal, cabinet woods, and gold. The value of the exporta, including goods re-exported, is nbout $1,300,000$; and the value of the imports is about $\$ 2,350,000$. The Importe are chiefly linen and cotton
goode, ready-made clothing, brandy, liquors, winea, and some provialons.

- Benna (Fr. Sénd; Gorm. Sennablater: It. Senna; Sp. Sen ; Lat. Casoia Senma ; Arab. Suna). The plant (Cassia Semna) which ylelda the leavea known in commeroe and the materia medica by the name of senna is an annual, a native of Upper Egypt, and Bernou in Central Africa. The genna, after being collected in Upper Egypt, is packed up in bales and aent to Boullac, where it is mixed with other leaves, come of which ara nearly equailly good, while othere are very inferior. After being mixed, it is repacked in bales at Alexandria, and sent to Europe. A great deal of eenna is imported from Calcutta and Bombay, under the name of Eaat India senna; but it is originally brought to them from Ara-bia.-Tnomson's Diopensatory. Senna ia very extensively used in medicinc.

Sequ .., a gold coin atruck at Vonice, and In several parts of the Grand Seignlor'a dominions. In Turkey it is called dahob, or piece of gold, and, ascording to Volney, ia in value about 8s. 6d. aterling. It variea, however, conaiderably in its valuo in different countrics. At Venice it is equal to about 0 s. 2d. sterting.

Bewing Machines, a recent French invention for atitching. The piece of cloth is lald down flat upon a cushion; the seamatress who works the machine aits at a kind of lathe, on which the cushion is laid, and works a treadle with her foot; st each movement of the treadle a needle deacenda vertically and pierces tho cloth, carrying with it a thresd; the needle lias a small hook or notch on one side, which eatches and bringa up a thread on it return from the hole; and thus, two or three hundred times in a ininute, a thread becomes interiaced in tho manner of "chain-stitch," or "tambour work." The machine, which coste twenty or thirty guineas, can embroider as much cloth in an hour as an embroidereas can complete in a day. Another French machine, by M. Seneachal, of Paris, is more complex in ita conatruction, and is intended for sewing coarso cloth. Great Ingenuity is shown in the arrangement of the several parts; the machine piercea its own holes, insorts its own thread, tightens the thread after insertion, and shifts the cloth aa the work advances, at the rute of forty or fifty atitches a minnte. Barlow's (English) patent stitching machine for making articlos of dress: two distinct threads are used, one at the front and the other at the back of the fabric, so that each stitch forms an independent fastening. Judking's (Engliah) sewing machine, aaid to be "suited to sewing either a circlo, curve, or atraight line, at the rate of 500 stitches per minute." There are racks or toothed arms employed, straight or curved, according to the shape of the work to be done; there are two threada, one in a reel and one in a shuttle; and a necdlo very ingeniously entangles theso threada one in another, tirrough the heles pierced in tho cloth. Tho United States have also contributed to ' $\mathbf{h}_{1}$ ) class of macbines. Of Morey's sewing machino, made at Boaten, the following cheracter is given: "By a very" simplo process, straight and curvilinear seams are sewn in cotton, linen, or woolen cloth with great rapidity. With one attendent, it will accomplish the work of five seamstresses; it is easily wrought, is not liable to get out of repair, and is readily applicable to almost every variety of plain stitch. In the large ready-made clothIng eatablishments in the United States it is universaliy used." Among the most preminent patents now in uso in this conntry are Grover and Baker's, Wheeler and Wilson's, and Singer's.
Bextant (Lat. sextane, the sixth part; tho limb of the instrument being the sixth part of a complete circie), an instrument for measuring the angular distances of objeots by refiection. The aextant is capable of very general application; but it la chiefly used as a nautical instrument for meanaring the altitndes of celestial objects, and their apparent angular diatances. It is an instrument of the utmoat importance in naviga.

## SHA

tion. The sextant is used in the manner of a quadrant, and contains sixty degreet, or the aixth part of a circle. It is for taking the altitude of the planets, atc. Invented by the celebrated Tycho Brahe, at Augburg, in 1650. - Vixcs'a Astronomy. The Arabian astronomers under the callife are said to have had a sextant of fifty-nine feet nime inchen radius, about A.D. 095.-Aailv.

Bhagreen(Ger. Schagrin; It. Chagrin; Russ. Schagrim Schayren), a kind of grained leathar, used for various purposes in the arts. It is oxtensively manufactured at Aatraklsan, in Russia.-Ses Toosk'a Russia, vol. ili. p. 403.

Bhallop, or Eloop, ia a light versel, with only a small mainuast or foremast, and lug-ails to huul up and let down on occusion. Shallopa are comnonly good sailers, and aro therefore often used as tenders upon mels-of-war.

Shammy,or Chamal.) Ieather (Ger. Sümischleder; Fr. Chamois; It. Camoscio; Russ. Smochanüi, Noshi), a klal of leather dressed in oil, or tanned, and much esteemed for its softness, pliancy, and capalility of bearing soup without hurt. The real shammy is propared of the skin of the chamoia goat. But leather prepared from the akins of the common goat, kid, and sheep is frequently substituted in its stead.
ghanghai, a city and river port of China, province of Kiang-su, oll the Woosung Liver, 40 milea by water from tho sca, and 169 miles east-southeast from Nankin; lat. $31^{\circ} 12^{\prime} \mathrm{N}$., long. $120^{\circ} 53^{\prime} \mathrm{E}$. I'opulation estimated at from $115,000 \pm 0135,000$. It otands in a level and well-cultivated plain, producing gool crops of cotton, rice, and wheat. Inmediately outaide the wall by which it is inclosed are several populous suburbs. Strects narrow and filthy. Foundling hospitals, teagardena, and vast jce-houses, are the objecta most worthy of notice in the city. It has a Mint, with manufactures of sillk, vegetable oils, and oll-cake (of which vast quantities are annually sent into the interior), iron ware, glass, paper, ivory ware, etc. This is the most northeriy of the tive Chinese ports opened to foreigners by the treaty of 1842, and, excepting Canton, it is also the most important. The river, which insy be navigated by ships of 450 or 500 tons for a considerable distance above the town, crosses the Grand Canal, so that Shanghai is an entrepôt for all the vast and fertile country traversed by the canal, and by the great rivers, including the liang-tee-Kiang and the Iloang-1Io, with which it is connected. Hence the present importance of the emporlum, and hence. also, the Indefinite extension to which ita forelgn trade wiil probsibly cittain. Its inland and coasting trades are loth very extenaive. It is said to be annually visited by from 5000 to 6000 canal and river boats, some from very great distances, and hy 1500 or 1600 coasting junks. The province of Kiang-su, in which Shanghai is situated, proluces great quantities of silk; and besides supplying most part of the northern provinces of the empire, the shipments of silk to the forelgner are greater from this than from any other port. It is also well situated for the export of both green and black teas. Atnong the other exports are gold and silver, with oil and oll-cake, camphor, drugs, porcelain, cotton, cassla, alum, gypsum, coal, etc. Of the imports opium is by far the greatest ; and at leaet 20,000 chests of Bombay (Malwa) and I'atia opium are now annually disposed of in this market ; which, supposing the chest to be worth 8500 , will represent an aggregate suin of $\$ 10,000,000$ or $£ 2,200,000$ sterling, for which payment is almost invariably made in the precious metals! Sugar is extenaively imported from Furmosa, Canton, the Phillppines, ete.; cotton atuffs, woolens, iron, etc., from England; with aandal-wood, birdsnestr, biche de mer, and other producta of the Eastern Archipelago, etc. The inhabitants of Shanghai are much more hospitablo and better dlaposed toward forelgners than those of Canton; and strangers
unay travel for miles into the interior all round the city with perfect security. Within the last four or five yeare, some very fina brick housea have been built by foreign merchants in the auburbs,-Parl. Reports, etc.

Commerce wi/h the United States.-The commercial reiations of the United States with China are regulated by the atipulations of the treaty of July 8, 1844. A treaty, slinitar in all its leading provisions, was negotiated with Great Britain In 1812, and a tariff of cluties on inporta and exports, and dutien on tonnage, are made a part of both these treatice. Formerly, foreigu intercourse, as already remarked, was confined to Cal: toln, and hitber were brought from the distant parts of the empire teas, illks, and other leading staples of China. Trado was invariably conducted through the intervention of hong merchants, who were licensed agents of the government, and answerable to it for all duties of import, export, and other chargea accruing on the vessel, the affairs of which they managed. This system was adopted ae a precautionary measure for securing the dutiea and other dues levied on foreign vessels; but the treatiea reforred to containing ample stipulations respecting this sulyject, the agency of the hong merchants has been alolished, and their dutics tranaferred to the consuls of the nations to which the vessels respectively belong. The treaty between the United States and Chlua guarantees the same commercial advantagea and privilegea to the citizens of the United States that are or shall bo conceded to the citizens of any other foreign power. Fees and charges of every kind not compreliended in the treaty are aloolished. Irade ls permitted to the five ports of Kwang. chow, Amoy; Foochow, Ningpo, and Shenghai, anu from either of the sald porte to any other of them; but it is prohilited to any other ports in the empire, er along the coasts thereof, under a penalty of confiscation of veasel and cargo. Trade is subject to no restrictions es to origin or nature of cargo, or port of departure, with the exception of the article opiunn, which is declared contraband. Captains, on entering, are required to deposit their papera with the consul of their nation, who wili notify the proper local authority of the asme and tonnage of the vessel, oames of the crew, and nature of eargo. Tonnuge duty is fixed at 5 maces (eques to 74 cents) per ton, If the vessel is over 150 tons burden; 160 tons or under, 1 mace (equal to 14.8 cents) per ton. Before cargo can be landed, a permit must be obtained froms the local authority, under a penalty of © 500 and forfeiture of geods so landed.

Standards of weighte and measures aro to he aupplied by the Chinese government to the cousuls of the different natious, to secure uniformity, and prevent confusion in measures and weights of merchandise. The former limitation of forelgn trade to hong merchants, appointed by the governnant, is aholished; and citizens of the United States are permitted to trade with any and all subjects of China, without distinction. The privilege is conceded of reeexporting into any other port ally merchandise imported into any one of the five ports, without leing sulject to any sdditional duty, provided the full duty was paid when first imported, and the goods remaiu with their original marks unchanged; but this privilcge must be apecially applied for through the American consul. The other provisiona of the treaty apply mostly to the privileges, and duties, and police regulations, applicable to the consuls, merchants, and citizens of the United States at the five ports. Shipping dues, formerly charged on the measurement of the ship's length and breadth, at so much per chang, and all the old charges of messurement, entrance, and port clearance fees, daily and mouthly fees, ete., aro also abollshed by this treaty; and the tonnage duty on the registered tonnage of the vessel, specified in the precading synopsia, is substituted in lieu thercof. Commercial relations between the United States and Chinn date from a period as early as 1784. In the month of February of that ycar,

The other the privileges, licabie to the United States rly charged on ud breadth, at res of neasureces, daily and $y$ this treaty; tonnage of the psis, is substiations betweed mi a period as ry of that year,

It appears that the Einpreas of Chima, a ship of 860 tons, alled from New York for Canten, and returned the following year with a rich and valuable cargo. The success, as well as the novelty of this adventure, attracted nolittie attention throughout the ceuntry. The ensuing year another voyage was made, in a amall vessel of only 84 tons burden, with equal auccess. Merchants were soon induced to engage in an enterprise which promised the most flattering resulta ; and as early as 1789, five years aftor the American flag had flrat entered the Chincse seas, fifteen American ships arrived at Canton. Such was the origin of en extensive and profitable trade between the United States and the Celestial empire.

Tha geographical ponition, excellent shipping facillties, and proximity to the fertle valley of $\mathrm{V}_{\text {ang-tse- }}$ Kiang, would aeem to polnt to Shanghal as a port pos$t$ essing pre-eminent advantages, which, when fully developed, must makeit a fourishing and primary station. The follewing extrect in relation to the trade of Shanghal is from an official communication addressed to the Department of State, dated Shanghal, August 7, 1855 : "It will be observed that the expert trade for the first six menths of $185 \%$ has more than doubled any previous one; and, Inasmuch as the business season is just openIng, It may safely be inferred that the value of exports for this yesr will be about double that of any previous one. The disorganizel state of the rest of the empire, the equal and regular levy duties at this port, and its superior geographical poaition, are the main causes of the concentration of trade at this point. The imports have been small, because it has required some time to dispose of the enormous quantities which had collected st this port during the perlod the city was in poesession of the rebels. That impertant branch of our trade will now, I believe, revive; and if our government will but vigorously and prudently zourish tho facilities now enjoyed at this port a com terce may be developed rivaling Calcutta in import ance, and superior to any other port in the East. The great valley of the Yang-tse-Kiang is the commercial tield, and this port is the entrepôt. The greatest privileges conceivabio might be obtained at all the other ports, and yet one half of such facilities at thls port would be productive of more advantage than could by any possibility be derived from all the other ports combined. Foo-chow will in time be a pert of some importance for thr purchase of a few black teas, but no more. Amo and Ningpo never have furnished any thing worthy of notice ; and Canton was only a port of trade, because the Chinese had been in the habit of going there to trade with foreigners when there were no other ports open. But the difficulty created by the rebellion has diverted the great mass of the trade from its ancient and out-of-the-way channel, and concentrated it here. And new that the Chineso find Shanghai to bo nearer to their tea and silk dlatricts than Canton, and that they ca: often get better prices, and always as good as at Canton, they will abandon their old and loug routo to a pert of sale, and will continue to concentrate at Shanghai. This they have dono last year, as well as the present; and already they have made contracts on next year's produce, deliverable at this port."
In another and later commanication, it is stated that property in heuses and lands, to the value of a mililon of dollers, is owned by American citizens in Shanghai.

Navigation and Trade.-The number and tonnago of American yessels, inward and outward, at the port of Shanghel, for the years deaignated, were a follows:

| Xaarr. | Inward. |  | Oulward. |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Vamala, | Tonamge. | Vaseele. | Taunage. |
| 1849 | 24 | 0,826 | 24 | 9,877 |
| 1850 | 87 | 18,308 | 34 | 14,464 |
| 1851. | 64 | 27,634 | 88 | 26,097 |
| 1852. | 68 | 38,790 | 70 | 40,592 |

hal duriog the frat aix mentla of $1355^{\circ}$ was 28 , with an aggregate tonnage of 27,480.

The cargoes inward conslsted of stone coal, sugar, drills, general merchandise, and assorted cargoes, auitable for the Chinese markete, valued at 268,907 . The cargoes outward were chlefly allk and tea, valued at 4,480,198. Of the vesaela inward, there were from the Atlantle perta direct, 2, with an aggregate of 1235 tons; and from the l'aclie ports 13 , with an aggregate of 13,839 tons. The following is a summary of the navigation and tracle of the port of Shanghal with the United States during the last six months of 1855:

Number of American vessels entered, 67 ; measurIng 27,262 tons. Number of American vessels entered from Atlantie ports, 4 ; measuring 1589 tnns. Number of American vessels entered from Pacific ports, 10; measuring 10,632 tona. Number of American vessels entered from foreign ports, 30; meaeuring 18,000 tons. The returns de net gire the ports of departure of aeven of the American vessels entered. The number of American vessels cleared from the port of Shanghai during the ame period was 57 ; aggregate tonnage, 80,5t2 tons. Of these, 13 veseels, all frelghted with tea and sijk, proceeded direct to New York, and the remainder to foreign ports.

During the same period, the duties paid by the Amerjean flag to the authoritles at Slianghai were:

Total valua of the trade of Shanghal during the laat six monthe of 1855 : Imports, $2,812,0191$ exports, *501,786. Total trade, $93,313,305$. During the last six monthe of 1855 great improvements were mada in the navigation of the lliver Woosung, on which the port of Shanghai la aituated, and, from having been one of the most dangerous of access in the Pacific, it has been made one of the asfeat and easiest. The ax. pense of the work $(\mathbf{6} 20,000)$ was iefrayed by the Chl nese authoritice. A ayatem of pilot regulations, agreed upon by the consule of the United States, Great Britain, and France, was ratificd by the superintendent of customs, and is as follows:
Pilot Regulations,-The following rulea and regulations for the government of piluts, native and foreign, at the pert of Shanghal are herely jssued and made binding by his excellency Chasu, superintendent of customs, in communication with the conaule of the three trenty powers:
lat. A beard shali be appointed by the three consuls, sanctloned by his oxcellency Chaou, consisting of not less than three, nor more than five shipmanters, with whom a naval officer shall be aesociated, if required, before whom all persons wishing to become pliots shali appear for examination.
2 d . A certificale of competency from a majority of said board being deposited at his consulate, shali entitle the person therein named to a license as a pilot. In all cases where the nationality of the applieant is other than one of those nations in treaty with China, his certiflcate from the board of examiners must be deposited with the senlor conaul, who will obtaln for him the necessary license.
3d. Every pilot-boat is to heist a red and white flag horizental, on which the number of hia boat shall appear in black.

4th. The rates of pilotace ahall be by the water the ship draws, viz.: from Gutalaff, es per foot; from beacon-shlp, ther foot; from any point outside Woosung, but liside beacon-ship, \&8 00 per foot; from Woosung to Shanghai, 3 per foot. The same rates of pilutage aro aliowed fur vessels outward hound.

5th. Every pilot, on boarding a ship, shall proluce, for the inspection of the master, his license as a piiot.
6th. All persons acting as piiots witbout a license, as hereinbefore prescritiel, shall havo no claim for services rendered, and shall bo dealt with by their own consnls, according to law, for vielating these regulatlons; and all sucis cases not coming withintha jurisdiction of the three treaty consule aro to be referred to the local Chinese autherities.

Th. [ilots shali be responsible for the faithful and complete discharge of their duty; and any misconduct, elther from ignorance, Incopacity, willful neglect, or otherwine, being known, shali enlail a forfeiture of the offender's license, in addition to any other liability lie say have incurred by the laws of his own country.

8th. The foregoing regulations to take effect on and nfter the 10th day of December, 1855.

General Regulations,-The general regulations under which forsign trade la conducted at the five porte of Canton, Amoy, Fooechow-foo, Ningpo, and Shanghal, are such as are usually prescribed in all well-regulated
ports, and are suhfect to aus h modifications, under the treaties, as the conauls of tr i three nations, via. i England, France, and the United States, may from time to time fix and determine. These regulatione provide amply for all the wants of toreign commarce, and guari agginst eatortion, unnecesaary delay, or capricivus emliarrasemente, either on the part of Chineee officials, or the eaptalua or other officern of vessels trating at any of the five porta. To givs proper annetlon to, and en. force the due observance of these regulations, the consuls of the three nations, In Chinese jortu, are inveuted with judicial as well ae with the ordinary consular powers, by virtue of which they are enabled to exact atrict conformity to auch provisions and regulations as they may deam neceseary in the maintenance of geoi order and the falthfui fultiliment of treaty obligations. Prior to 1843, as before noted, it was the custom, when foreign vessela entered the poit of Canton, that a Chinese houg merchant atood security for her, and that all dutle and charges were paid through auch security merclant. But the eoveral treation having provided for the abolition of thia security syatem, the consuls of the different treaty nations are now subatlituted as security for the vessels of their reapective nations $\mathrm{cn}-$ tering any of the five ports. IIence one of the reasons why the powers of coneuls in China should le ample, and these offieers invested with full powern to conisol the shipping of their respective nations.

During the recent troables In China, forelgn commerce at the port of Shanghal war conolderably Intermpted, and the custom-houac at this port was abandoned by the Chincee officisls, who organized In lien thereof two other cuatom-houses In the interier. An arrangement was subsequently entered into between the conanls of the three treaty powera and the Chibese anthorltice, by virtue of which these cuatom-houses were auppressed, and foreign commeree was again coaducted under tite usual regulations.

It way be here observed that the five porta pertsin to different provincial juriadictions, having different local administrations, and not unfrequently different commercial regulatlons. It is by no means rare to sce, notwlthstaming the trenties apply to ali in commen, privileges enjoyed at one which are strietly interdicted at another-perhaps at the other four. Thins, in 1855 , it is atated that rice was exported to the ameust of 30,000 piculs (each $138 \$$ libs.) to a vestel, free, too, ef all export or other daty, save a dowceur of 200 or 800 doliars to some aubordinate; while the expertation of thia article Ia not only forbidden at Shanghai, but the death-penalty is Inflicted on auch of tite Chinese as are detected in violating the prohilition. The same observation applies to the emigration of coolies, which is tolerated at Amoy, but strictiy forbidden at the other ports. So the importation of opium, as already stated, though illegal, ls openly tolerated by Chiness officials.

Thes state of the currency at this port has for some time attracted attention.

A letter from the United States consul at Shanghai, under date of June - 0,1855 , staten as follows:
"The rate of exchange here has exceeded that of Canton from 25 to 30 per cent., olthough the dintance betucen the iwo $\mathrm{l}_{\mathrm{s}}$ but 800 nilles, and of casy and certain cemmunicution. Inder ordinary financial rulem, the difforenco of exchange between the two placea Ia regulated by the cost of tmaportabetween the two piacea in regulated by the cost of tanaporas.
Hon, the Insprance, and asight per cent. for brokerage. Whn, the insurance, and a sight per cent. for brokerage.
While 21 per ennt. would be allierul allowance on these Itemn between this yort and Canton, and liong Kong, yet exchange has varied frem 25 to 30 per cent. againet tilat port,
"Chlua han no currency but copper cabb-one of whileh la equal to the nixteen-hundredth part of a dollar. All large transactiona, therefore, are nade in pore sliver, denominated by the chinese bycee, which is measured in tacis, or a melght equivalent, when at jar, to $\$ 188$ pectacl. When the foreign trade became impoitant in Chlan, forelgn dollars were introduced; and, on account of their superlor qualitien as a drenlatiog medlam over the ponderoua aycee, became quite popuiar, and were universaily adopted. The Carolus dollar ris the Arst adopted; sfterward the Iolivian, Jeruvian, Chllian, and Mexican: bat tho Carolua havlng been first : introduced, the Chiticese formed a prejudice in ita faror to the extent
of a diseount of 10 per cent, on all othere, When this port was frit epened, tha Criaese received the mexican in a pre-
 raders here the mame prefudice which extated where they came from, and the Carotua eradually rose in value, and the other dotiars sank, untif tha aigarence hat become 85 or 80 per cent., which le equivatemt almost to an ontire excluaten from circuiation. This reault was chiofly brought about by the native brokers, in oonduaction with a how forolga commearelal houmes at this port, whe have ohtalaed the exclualve control of afl the Carmiua dollare that are made. The Spanfin government have fong since diccontinued their (moue, bat they are made at Canton, in Indie, and in Merico, though not ae pure an tha originat dollar.
"Thua ihla prejudice tn faver of the Curolna has been fosterad by a fnw commeretal heusea, untit the evil consequent u pon IImited currency, and oad which is bocomiag lemand leas every year, in almont beyond a remedy. The loager it ha perriltied to exiat, the more vexatioua will its remedy become. The Carolus dellar ta carried Into the Interior to pay for teas and aitik, and never returns, thus each year renders the amoust of circutating medium teas and leas The Carolus doilar ta the atandard, and, therefore, as it deoreanea in quantlty, exchange rimes The sotne heusee which have the control of the Carolna dellar alme dtecount sll hllis of exchange, and thas hoid the entire comenercial machinery of blia port at their contron. They diacount bilts of exchanys a whatover rates thay piease to tix at Canton and alt the other ports in China. The foreign doliara at present cireniate, aocording to treaty, with reference to thelr parity in allver a compared with aycee; but here a diatinciion la kept up to favor of the Carolua far above its retative value in pure allyer, and againat aflothor dollarn far below thelra, thusex change at thle port rutes from 25 to 30 por ceot, above any other port lo China.
"The United Stato aro great consumers of green toa, and this port auppllea it. The censumer pays this extraordinnry exchage on the price of ten, and thise the agent here, and the importer at home, can feel no internat in amellornaing the condition of the exchanges, an it is not their lown fut, on the contrary, as they new have control of all the elrculating medlum, it le to their advantage and intereat to let it remain mo.
"I have thue briefly endeavored to aliow, fime, that the enor meua difference of excliange al this port over any other in Chlos in produced by a combination of native and forelgn merchanta; and, necend, that as the United States take near ly all the green toms exported from the empire, which are al purohased at this port, and an the consumer must in the end pay all chargea on the imported article, thenfore the cousumers of the United Statea are the aufferoris to the fult ex. tent of this exorbitant exchange. Entertaining the convictlon that it ta the duty of an efficer to guard and protect the Intereets of theese whom he has the honer to reproment, eupeclally when theme intereata are guaranteed by the lawe and trcaties of the land, and not to permit the advantegee of a me lect few to be develeped at the expecto of the many, I will now jroceed to lay before the honorable secretary of state the course I thave puraucd in giviug fult effect to the treaty of the United states with China in the matter of the currency. To remedy the groat evil which exlsta at this port in relation to the currency, there appeared to be bet two ways: Firat, a combination among the merchanta that they weuld pay and recelve all dolismalike, zo far as their intrinsio value should be the tame. Fecond, the enactment of regulations by the Chineme anthorities, whioh weuld place and dellari on an equality, by their agreeling to receive them alike for all gevernment dues The Armi was impossithle in a community where ali are morchanta possessed of as many different inter eate, and therefore to the eecoud 1 gave $m y$ attention. The manaer in whioh I presented this subject, and carried it through to an ectual assay of the varous dollare, may be futly examined by roference to the entire correspondence which I have the henor herawith to inclose. The amsay as made here differe buts slightly from that made at Canton: and as there la an allowance of 1 i per cent. for differenco of scales, It la more then msde up.

The whole examinstiou of the subject proved most satisfactery to his excellency the Inipertal cullerter of custome and hile excetiency has asked for twenty dayg to refer the matter to hls supertors, prler to carrylog it into practica operatlon. I have thereforo given notico to his exceltency thist on and after the 12th of July next Aizerican merchanta shall be altewed to discharge all their treaty obligations at this port in forelga money, at the rate as ascertained by actual assay on the 4 th lnatant. Grest resilite will inevitr bty follow the adoption of this mesaure. Exchange will decifne 25 or 30 per cent.-that, too, just at the opering of the business geason-and witl assimilate with that at Canton, plua the cost of transportation, atc., etc. The circulating me dinm will be in the greateat abundance. The importer in the Ualted statea will. throigh his agent hero, ruallize more money on his bille of exchange, conmequently he call purchame more tese and alliks; and, finalif, at the conaumera par tlicipate milike in the advantages and diandvantages, they will be enabled to purchase teas and sllks aubject to the same reduatlon In price which the Importer has enjoyed."

Currency.-Tho only legal coin of China is the copper cash, worth the fifteenth part of a cont ; though by
utipulations of the ireaty of 1844 the syoes is recelved in payment of duties. The sycee fluctuates in price with the value of aliver. The shea is worth about meventy dollars. In 1853 the American merciannta re. alding at Shanghal aditreased a memorial to the United Staten commiseloner in China, setting forth the great inconvenience to which mercantile Interesta in China were suhjected by the absence of an adequato circulating medium between the two extremes above named, and invoking the commiasioner's aid in establiahing a national Mint in that empire. To the succens of auch a measure the sanction and co-operation of the Chinese government are indispenasble. The treaty of 1844 provides that, ahould exjerlence show that any modifications herealter become requisite in those parts which relate to commerce and navigation, the two governmente will, at the explration of twelve years from the dato thereof, treat amicably concerning the ame, by the means of suitable persons appointed to conduct auch negotiation. The time dosignated will soon arrive; and should such modifications as the treaty contemplates become a subject of negotintion, the question of a national Mint, and of the currency generally, will douistess, demand the attention of the United States Commissioner. At Shanghal an attempt has been mado by the fureign consuls to cause an official substitution of the Mexican for the Carolus doliar as the money of account.-Cum. Rrl. U. S.

From official tables it is shown, 1at. That, until tho year 1850, Canton was the principal port for tea, bit in that year Shanghai exported 50 per cent.; and of ailk, three-fourths of the whole export was from Shanghai. 2d. That the trade of Shanglaci continued to increase over that of Canton, and even Foo-chow, which derlves all its tratie from this emporium, until the year 1855, when Shanghai exported in tea about 80 per cent. more than both Canton and Foo-chow, and in ailk almost the entire amount was furnished at Shanghai. 8d. That the grand increase of the forcign trade for twelve years is an average per annum of about 3 per cent. 4th. That the increase of silk for exportation has been, on the grand aggregate, at the rate of 8 per cent. per annam for the past eleven ycars.

It appears also, 1st. That the trade of the United States in China has increased in the lapt ten years 17 per cent. per annum. 2d. That since the year 1848 the porta of Canton and Shanghal have changed conimercial positions, the latter having exported more tea the last year to the United States than the whole tradu amounted to when Canton was the only port opened. 8i. That Foo-chow is now a port of more cominerco with the United States than Canton, and ranks next to the most important, Shanghai. 4th. That the trado in silk to the United Siates has developed immensely; and as this port is the great emprium for that commodity, it will probably furnish more trade than all the othors combined. Dth. That for the past year tho port of Shanghai has furnished more than thrac-fourths of the American trade in ten, and all tho silk.

Up to the year 1858, excinal.ge was stcady at from 15 to 21 per cent., but the change which followod, and the variableness whioh is marked, arose from the fact that the city of Shanghal being taken by the rebels on the 7 th Suptember, 1853 , many large josses were incurred by the wealthy Chinese, which, creating embarrassment, engendered a lack of confidence and trust, so that money became scarce and exchange began to rise. About this time foreigners hegan to impose the belicf on the native Chinese that the Carolus dollar was the most valuable, and at the same time secured the monopoly of ail obtainable over the world, and have since been having the Mexican reetamped with the Carolus des. This latter coir sloes not pase well, as it is too new to the : ainese; but the old and genuine Carolus doliars are simost exhausted, and, indeed, are becoming less and less every year, while just in proportion to the aupply or demand exchange riees or falls.

The commerce of China is conducted on the basia of impor as, opium, and credita on London. The imports are a triffe; opium is about 30 per cent., and the difference is made up by a direct drain on Europe In pure silver and some dollara; the former is caat into oycee, or pure ailver ingots, and rarely, if ever, leaven the empire, as it is atrictly forbiddes by the lawe.-See Cuisa, Caxton.

Sharicn' Fins form a regular article of trade to Chlun, and are collocted for thia purpose ln every country from the eastern shore of Africa to New Guinea. In the Canton Price-currents they are as regularly quoted as tes oriopium; and the price of late yeare has been, accorilling to quality, from $\$ 15$ to \$ 18 per picul, equal to from 500 . to 60 s. per cwt .
Shawle (Ger. Schalen; Fr. Chals, Chales; It. Sha. vali; Sp. Schacalos), articles of fine wool, silk, or wool and silk, manufactured after the fashion of a larga handkerchlef, used in female dress. The finest ehawls are imported from India, where they are hlghly csteemed, and cost from $\$ 250$ to $\$ 1500$.

Cashmere Shavels.-The shawl manufacture is believed to have originated th the valley of Cashmore, the ancient Caspira, in the northwest of India, between lat. $34^{\circ}$ and $85^{\circ} \mathrm{N}$., and long. $78^{\circ}$ and $76^{\circ} \mathrm{E}$. Though not so flourisbling as it once was, tho manufacture is atill proseeuted in this province to a very considerable extent. The shawls aro the very best that are made, possessing unequaled finencsa, delicacy, and warmth. They are formed of the inner hair of a variety of the common goat (Cupra hircus), reared on tho cold, dry tuble-land of Thibet, elovated from 14,000 to 16,000 feet abovo the level of the sea. The goat thrives aufficiently well in many other countries; but in the aultry plains of Hlindostan it has harilly noore hair than a greyhound; and though in higher latitudes tho hair is more abundant, it is for the nost part shagey and coarse. It is only in the intensely cold and dry climato of Thibet that it yields the peculiarly soft woolly hair that constitutea the mate cial of tho Indian aliawl. Wo do not, therefore, suppose that the offorta to noturalize the i.swl-goat in Franee will turn out well. On the contrary, we believe the chances of success would be about equal wore an attempt made to breed beavers in a hot country, without water, or camels in a moist country, free from heat and drought. The inner or fine wool ts covered over and protected by a quantity of long ebaggy hair, which it, of course, carefully separated from it before it is manufactured. The genulne shawl-wool has been im. ported into Europe, and tho finest Edinburgh and Paisley shawls have been produced from it. But it must be adnitted that shawls have nowhere been made that can come, as respects quality, into successful compelition with those of Cashmere. The manufacture bas been establishet at Delhi and Lalore for some years; but, notwithatanding it is carried on by vative Cashmerians, and though the material employed be quite the same, the fabrics are said to want the fincness of those made in Caslamere, and to have a degenerated, coarse appearence. It is difficult to account for this superiority. It has been ascribed to some peculiar quality of the weter in the valley of Cashmere; but it is most probally $\begin{gathered}\text { owing to a varicly of circumstances, }\end{gathered}$ which, though each may appear of littie importance, collectively give a character to the manufacture.
The following details as to the manufacture of Cashmero shawly have been extracted from an Engliil paper published at Delhi: "The great mart for the wool of which shawls are mailo is at Kilghet, which is said to be a depeadency of Ladak, and situated 20 days' journey from the northern honndaries of Cashmere, There are two kinds of itt that which can be readily dyed is white; the other sort is of an ashy color, which being with ilfficulty changed, or, at least, improved ly art, is geaerally woven of its natural hue. About 2 lls . of etther are oltained from a single goat oncea year, Aflar the down has been carefully separated from the hairs, it is repeatedly washed with rice starch. This process is reckoned important; and it is to the quality of the water of their valley that the Cashmerians attribute the peculiar and inimitaile fineness of the fabrica produced there. At Kilghet the best raw wool is aold for about one rupee a pound. Hy the preparation and washing referred to, it loses one hail, and the remainder being spun, three rupees' weight of

the thread is considered worth one rupee. Shawls are miade of various forms, sizes, and borders, which are wrought separstely, with the view of adapting them to the different markets. Those senit is Trurkey used to bs of the softest and most delleste texture. Carpets and counterpanes are fabricated of the hair or coarser part of tha wool. From a variety of causes, among others the destruction of the Janizaries, who dressed much in shawle, tho loss of reysilty in Cabul, and the ruined finances of Lucknow, It ls certain that the demand for this elegant commodity has greatly declined of late yaars. Under the Mogul einperors, Cashmere found work for 30,000 shawl-looms. In the time of the Afghan kings, tho number decreased to 18,000 . There are nownot mere than 6000 employed. We should attribute little of this diminution to the sale of English imitations among the Asiatic nations. When these counterfeits first appeared, the pretty patterns and brilliancy of the colors took the fancy of some; but their great Inferiority in the softness and warmth which mark the genuine ahawl noon caused the new article to be neglected. The average value of shawls exported from Cashmere amounts annually to $1,800,000$ rupees. Ranjeet Singh took two-thirds in kind as part of the grose revenue of the province, which was about 25 lacs a year. He ia said to have sold threa-fourths of what he thus received, and to have kept the remainder for his own court. Of those dieposed of by hlm and left for snle in the valley, aeven lacs' worth went to Hombay and Western India; three to llindostan, chiefly Oude; hall a lac each to Calcutte, Cabul, IIerat, and Balk, whence some were carried to neighboring countrics. A curioua calculation of the successive oxactions, from Cashmere to Bombay Inclusive, which magnify the price of shawls, is herewlth sulijoined.

A pair of such shawls might acll for 500 rupees a Amritsir, and in liombsy for 900 . The amount of the importa, and the sams levied by each government, will appear more in relief if stated as they afiect a cemellond in Its progress. It consists of fourteen and a half cutcia maunds, and contains, at an average, 2000 shawls of different klnds, valued, on reaching Bombay, at 28,500 Furrikabad rupees.
"'lhe govermment of Lahore exacte Furrukabad rupees, 15646 ; Patialah, 610 ; llikeneer, 430 ; Joudpore, 1214 ; Bhownuggur, 200 ; total levied Ly native princes, 18000 ; Bombay, 10 per cent. (ad valorcm) $28500 . "$

It is not as yet generally known that the Thibet goat, from whose wool the famous Cashmere shawls ara made, has been introduced successfully lito the United States. This enterprising undertaking was achieved a few years since, after many difficulties, by Dr. J, B. Davis, of Columbla, South Carolina, at that time employed by the Ottoman Porte in experimenting on the growth of cotton in the Sultan's dominions. Dr. Davis aucceeded, at vast expense, in securing
eleven of the pure breed, which, on his way home, he exhibited in London and Paria. Bince that period, the goat has been introduced from Sonth Carolina into Tennessee, where it is sald to thrive. The value of a flock may be estimated from the fact that no real Thibet goat has ever been sold for lesa than $\$ 1000$. This enormous price, moreover, is not a speculative one, for no fleeced snimal has wool of such fineness, softneas, and durabillty. The wool of all the Thibet goats in Tennessee, for example, has been engaged at New York this year at $\$ 850$ per pound, the purchasers designing to send it to Paisley, in Scotland, In ordor to be mannfactared into shawla.

The prices paid for the real Cablimere shawls, or those woven in India, have sometimes been almost fabvlous. A full-slzed shawl, such as is called In America a "long shawl," ordinarily commands in Paris or London from $\$ 500$ to $\$ 5000$, according to the qualityScarfs and square shawls, being smaller, sell for less. It is a mistake, however, to suppose that all these shawls aro manufactured in India In the shape in which they are sold here. Generally, indeed, the centres and borders come out separstely, and are put together afterward in aizes, and often patterns, to suit purchasers. Moreover, a larga portion of the shawls sold as real India ones are actually made in France, for the Thibet gost was introduced into that country more than thilrty years age, and the Caghmere shnwls initated with considerable skill. Judges of the articlo pretent to say, however, that the real India ahawl can be detected by its having a less evenly woven web, as also from its brighter colors. It is likewise said that the borier of the genuine Cashmero shawls is invarlably woven in small pleces, which are afterward sewed together, as the whole border is subsequently sewn on to the centre. But other authoritios deny that. skill of India is insufficlent to broche a shawl ; in other words, to weave the border and centre in ono piece, or run the pattern of tho former over the lattor.

Notwlthatanding the successful imitation of these shawls, fashion and luxury still prefer the apparently original. Just as laces, woven by hand, bring a price more than fivo times as great as the aame pattern woven by machinery, so a Cashmere shawl, known to have come from India, will fetch vastly more than the cleverest lmitation. Probably, however, this is not all. Persons famillar with both tho article and the imita tion asaert that the former is aofter than the latter, and that this softness arises partly from the way the thread is spun, and partly becanse the Thibet gust, when exported from its native hills, sensibly deterlorates. There is alse a shawl popu rly known as the French Cashmera, which is an initation of the imitation ; but this has none or very little of the wool of the imported Thibet goat. Tho animal frem which this valuable fleece is taken is a hardy creatura, at least in its original locality; and their tine curled wool lies close to the akin, just as the under hair of the common goat lies under the upper hair.
The importation of shawle, mannfactured all or in part from wool, into tho United Stntes for the year ending June 30, 1857, was as followa:

-Sce Cashmere, Cottun Manufactures, Wool.
Bheathing. The covering laid on the ship's bottom to defend it from the worms. Sheets of thin copper nailed on with copper nails constitutes, at present, the sheathing of all the better kinils of vessels. Lead has been used; and large-heeded iron nails, called scupper nalls, sire used atill for the same purpose on the bottoms of old hulks, piles, etc. Zinc and different
compositions have been proposed as subatituted for copper; and Sir H. Davy logenlously suggeated the applicatlon of pleces of alne or Iron upon difierent parta of the copper aurfuce, which by the action of the acewater render the latter metal electro-negative, and capable, therefore, of resiating the oxidizing and corrosive agencles of the subatancea held in solution. The plecea of iron or of zlac so applied have been properly called protectors; but by occasioning the preclpitation of earthy matters upon the copper, while they effectually profect if, they render lits aurface favorable to the adhesion of weeds, barnacles, etc., and sometimes to such an extent as to interfere with the passage of the ship through the water: upon such grounds, Sir Humsphrey's valuable suggestion has been neglected. When vessels are laid up in dock the protectors are in auccessful use. Sheathing formerly was conposed of thin fir boards. By a recent applleation of electrotyping, plates of sheet-iron are covered with a surface of cepper which effectually protects the iron from oxidation. Iron bolts are also similarly electrotyped.

Sheep (Ger. Schafe; Fr. Brebis, Bêtes à laine, Moutons; It. Pecore; Sp. Pecora, Oefjas; Ruas. Owzü; Lat. Ores). Of the domestic animals betonging to Great Irituin, abcep, with the exception of horses, and perhapa cattle, are by far the most important. They can be reared in situations and upon soils where other animala would not live. They afford a large supply of food, and one of the principal materiala of clothing. Wool has long been a staple commodity of this country, and its manufacture employa an immense namber of people. "The dressed skln," says Mr. Pennant, "forms different parta of our apparel, and ia used for covers of books. The entrails, properly prepared and twisted, serve for strings for various musical instruments. The bones, caleined (like other bones, in gencral), form materials for tests for the retiner. The milk is thicker than that of cows, and consequently yielda a greater quantlty of butter and elieese; and in some places is so rich, that it will not produce the cheese without a mixture of water to make it part from the whey. The dung is a remarkably rich manure insomuch that the folding of sheep is become too useful a branch of husbandry for the farmer to neglect. 'Io conclude: whether we consider the advantages that reault frou thia animal to Individuaia in particular, or to these kingdoms in general, we may, wlth Columella, consider this, in one sense, as the tirst of the domeatic quadrupeds,"-Pexnant's British Zoology.
There was between 1840 and 1850 an increase of $2,309,108$ ln the number of sheep In tho United States. It will be useful to observe with aome closeness the progress of sheep-breeding in different parts of the country. We percelve that in New lingland there han ocourred a renarkable decrease in their number. There were in that division of the Unien in $1840,3,811,307$; in 1850 the ummer had deelined to $2,164,462$; being a decrease of $1,646, n 05$, or 45 per cent. In the five Atlantic Middle States, New York, New Jersey, Pennaylvalia, Delaware, and Maryland, there was a decrease from $7,402,851$ to $5,641,891$, equal to $1,761,460$, or about 2e2 percent. In l'ennsylvania there was a gain, however, during this puriod, of 155,010 sheep. We see that while there has been a poritive diminution of $3,408,000$ In the States ahove named, there has been an augmentation of $5,717,60 \mathrm{~s}$ in those south of Maryland and weat of New York. Ohio has gained thont largely, having leecn returned as pasturing in 1840, 2,02s, 101 ; and in $1850,3,912,929$; an increase of $1,914,524$, or nearly $3(0)$ per cent. In each of the States sonth and west of the lines ahove indicated, there has been a very large proportional increase in thin kind of stock, anil there is reasonable ground for the opinlon that the hilly lands of Virginla, North and South Carolina, Tennessee, and the prairies of illinois, Iowa, and 'Jexas, will prove hlghly favorable for the rearing of sheep for their wool and pelts.

New Mexlco has the extraordlnary number of 377,271 aheep-more than slx to each lahabliant; proving the soil and elimate of that terrltory to be well adapted to this deacriptlon of stock, and giving promise of a large addlition from that quarter to the supply of wool. The importance of fosterlng this great branch of national production la ahown by the fact, as assumed by an intelligent writer on the aubject, that our population annually conaumea an amount of wool equal to seven pounds for each person. If this estinate be evell an approxlmation to correctness, wo are yet very far short of prodncing a quantity adequale to the wants of the country; and it la equally clear that we possese an amount of unemployed land adapted to grazing, sufliclent to support flocka numereus enough to clothe the people of the world. The kinds of sheep mest songht for are the pore-blooded Merinos, the Saxons, the Cots. wolils, the Leicentershires, the Oxfordahlres, and the South Downs. The Mferinos (including the Kamibonillets), the Cotswolds, the Lelcestershires, the Oxtordshires, and the Saxons, aro the most highly prized for their wool. The South Downs are particularly es. teemed for the excellence of thoir flesh, and their wool is valuable for many purposes on account of the facility with which lt can be w rought.-U. S. Patent (lfice Report. Nee Sirawls and Wool.
Sheer. The curve which the line of ports or of the deck presents to the eye when vlewing the side of the ahip. When these lines are straight, or thes extremities do not rise, as is mest usual, the shij, is said to have a atraight sheel.

Sheer Hulk.-A hulk permanently fitted with sheers for masting and dismastling ships.

Sheers.-I'wo masts or spara lashed together st or near the head, and raised to a vertical position, for the purpose of lifring tho masts into or out of vessels.

Bheet. Tho rope attached to the altermost or lec. wardmest clew or corner of a sail, to extend it to the wind. In the square sails above the courses, the ropes attachell to both clews nre called sheets: in all other cases the weathermost one ls called $a$ tack.

Bheet Anchor. The thirl of the four large anch. ors gencrally carried ly a ship.

Sherry. A Spanlsh wine mado from the grapes of Xeres, in Andalusia. Genulno sherry la n ricli, dry wine, containing from 20 to 23 per cent. of alcohol: there are many varietles, and it is extensively imitated and arlulterated.-See Wing.

Bhilling. An linglish silver coln, equal to twelve. pence, or the twentieth part of a pound. Freherus derivea the Saxon scilling, whence our shilling, from a corruption of siliqua; proving the derivation by several texts of law, and, anong others, hy the twenty-sixth law, Je annuis legatis. SkInner deduces it from the Saxon srild, "shield," hy reason of the escutcheos of arms which it han upon it. Ilshop llooper derives it from the Arabic acheele, signifying a weight; but others. with greater probnhility, deduce lt from the latin $n$ cilicus, which signitied in that langnage a tumeter of an ounce, or the forty-eighth prort of a Roman pround. In contirmation of this etymology, It is allegeel that the shilling kept its original signilication, and bore the same jroportion to the Saxon pound as sicilicus did to the Roman and the Greek, lelng exactly the forty. eighth part of a Saxon pound.
llowever, the Saxon law reckons the pound la the round number at fifty shillings, lut they renlly coineil ont of it only forty-elght. The value of the shilling was ifve-pence, but it was reduced to four-pence alsive a century before the ( $n$ nquest ; for several of the Saxon laws, made in Athelstan's relign, ohlige us to take this estimate. 'I'lus it continued to the Norman times, as one of the Conqueror's laws sufficiently ascertains; and it seems to liave breen the common coin ly which the English paymenta were adjusted. After the Conquest, the French solituas of twelve-pence, which was in use among the Normans, was called hy the Einglish

 ally coined the shilling ence above of the Sax. us to take man times, ascertains; n by which er the Conhich was in he Englishname of shllling; and the Saxon shllling of four-pence took a Normsn name, and was called the groat, or great coin, becsuse it was the largest English coln then known in England. It was the opinjon of bishopa Fleetwood and Gibson, and of the antiquaries in general, that, though the method of reckoning by pounds, marks, and shillings, as well as by pence nad farthings, bad been in constunt use even from the Saxon times, long before the Norman Conquest, there was never auch a coln in England as either a pound or a mark, nor any ahilling, till the yrur 1504 or 1505, when a few ailver shillings or twelve-pences were coined, which have long aince been solely confined to the cabinets of collectors. Mr. Clarke combats this oplnion, alleging that aome coins mentioued by Mr. Folkes, under Edward the First, were probably Saxon ahlllings new minted, and that Archbishop Elfric expressly says that the Saxons had three numes for thelr money-mancusea, shillings, and pennies. He also urges the different value of the Saxon shilling at different times, and its uniform proportion to the pound, as an argument that their shilling was a coin; and the testimony of the Saxon Gospels, in which the word we have translated pieces of silver is rendered shillings, which, he says, they would hardly have dose if there had been no such coin as a shilling then in use. Accordingly, the Saxons expressed their shilling in Latin by siclus and argenteus. He further adds, that the Saxon shilling was never expressed by soïdus till after the Norman settlements in England; and howsoever it altered during the long period that clapsed from the Conquest to the time of Heury the Seventh, it was the most constant donomination of money in all payments, though it was then only a species of account, or the twentieth part of the pound sterling; and when it was agsin revived as a coin, it lessened gradually as the pound sterling lessened, from the 28th of Ldward the Third to the 43d of Elizabeth.

In the year 10060 there was a peculiar sort of shilling struck in Ireland, of the value of nine-pence English, which passed in Ireland for twelve-pence. The motto on the reverse was, Posui Deum adjutorem meum. Eightytwo of these shillings, according to Malynes, went to the pound. They weighed, therefore, twenty grains one fourth each, which is sonsewhat heavier in proportion than the English shilliag of that time, slxty-two of which went to the pound, each weighing nincty-t wo grains sevell-eighths; and the Irish shilling being valued at the Tower at nine-pence Engliah, that ia, one fourth part less than the English shilling, it should therefore proportionally weigh one fourth part less, and its full weight be somewhat more than sixt y-two grains. But some of them found at this time, thongh much worn, weighed sixty-nine grains. In 1598 five different pieces of mency of this kind were struck in England for the service of the kingdom of Ireland. These were shillings to be current in Ireland at twelve-pence each, half-shillings to be current at six-pence, and quartershillings at three-pence. Fennies and hnlf-pennies wero also struck of the sumo kind, and sent over for the payment of tho army in Ireland. Tho money thus coincd was of a very base mixture of copper and silver; and two years after there were more pieces of the same kinds struck for the same service, which were atill worse; the former being three ounces of silver to nine ounces of copper, and the latter onlly two onnces eighteon pennyweights to nine ounces two pennyweights of the alloy.

The Dutch, Flemlsh, and Germans have Jikewlse their shilling, called schelin, schilling, and scalin; lint these, not being of the same welght or fineness with the English shilling, are not curreat at the same value. The English shilliug is worth about twenty-three French sols; those of Holland and Germany about eleven sols and a half; those of Flanders about nine. The Dutch shillinga aro also called sols de gros, becauso equal to twelve gros. The Danes have copper shil.
lings worth about one fourth'of a farthing sterling E. B. See Coing.

Ehip-money was first lovied A.D. 1007, and caused great commotiona. This impost being illegally levied by Charles the First in 1634, led to the Revolution. He assessed London in seven ahips, of 4000 tons and 1560 men; Yorkshire in two ships of 600 tons, or £12,000; Bristol in one ship of 100 tons; Lancashire in one ahip of 400 tons. The trial of the patriet Hampden for refusing to pay the tax, which he at first solely opposed, took place in 1638. Ship-money was included in a redrees of grievances, in 1641. Ilampden recelved a wound in a skirmish with Prince Rupert, and died June 24, 1643.

Ships. Nautical men apply the term ship to distinguish a vessel having three masta, each consisting of a lower mast, a topmast, and top-gallant mast, with their appropriate rigging. In familiar language, it is usually employed to distinguish any large vessel, however rigged; bat it is also frequently used as a general designation for all vessels navigated with sails; and it is in this sense that we now employ it.

Merchant Ships.-IIt is hardly possible to divide merchant ships into classes, at least with any degree of precision. Their size, shape, the mode of their rigging, etc., depend net merely on the particular trade for which they are destined, hut on the varying tastes and fancies of their owners. In the articles Cinaiterenparty, Fineight, Masten, Ownens, Seamen, Seawontiry, etc., the law with respect to ships and shipowners, in their capacity of carriers or public servants, and the reciprocul duties and obligations of the masters and crews, is pretty fully expounded.

Ship-building.-Tho art is attributed to the Egyptians, as the first inventors, the first ahip (probably a galley) being brought from Egypt to Greece, hy Danaus, 1485 n.c.- Heain. The tirst donble-decked ship was built by the Tyrians, 786 n.c.-Lenalet. The first double-deck vessel built in England was of 1000 tons hurden, by order of Henry VII., 1509 ; it was called the Great IIarry, and cost $£ 14,000$.-Stow. Before this time, 24 -gun ships were the largest in the British navy, and these had no port-holes, the gime being on the upper decks only. Port-holes and other improvements wero invented by Descharges, a Freach builder at Brest, In the reign of Louis XII., about 1500. Ship-building was first treated as a science by Hoste, 1696. A 74-gun ship was put upon the stocks at Van Diemen's Land, to be aheathed with India-rubber, 1829. -Haydn. For articles on ship-building, see Quarterly Reviev, vol. jii. 28, xl. 227, xi1. 444 ; Anal. Mag., i. 263, vi. 450; IIvnt's Merchants' Mag., xi. 11, xviii. 172.

State of Shipping fnterest.-The complaints which were so frequent some years since in regard to the shippling interest have now wholly ceased. Most probsbly they never had any very goed foundation; but whether that were so or not, this interest hos been for some thme past in a peculisrly prosperous condition. This has beeen occasioned partly and principully by the gold discoveries in California and Australia, or rather by the unprecedented stimulus which they have given to emigration and commerce. It is not, therefore, to be supposed that the existing state of things, as respects the shipping interest, can be permanent ; for while, on the one linnd, the advantages resulting from emigration with gradunlly diminish, on the other the supply of slips will be angmented in proportion to the greater demnnd for their services. However, it is all but certain that the commerce of the world is destined to ln erease for a long time to come; and our mercantilo navy will, no doubt, continte to reallze n full and fair share of the arlvantages resulting from this extension of trade.

Some very important changes have been made of late years, and are yot in progress, in the construction of ships. Thay are now bult of a much larger aizo than formerly, of finer models, and wlth a power of
salling of which no juat idea could previoualy have been formed. Ships of $\mathbf{2 0 0 0}$ tona burden are now reckoned only of little more than a misdium size; and those of 2300 and 2500 tons and upward are every day becoming more and more common. It fa probable, Indeed, that in this, as In moat other things, we shall run from one extremie Into another; and that from belog too small, our ships for distant voyages wlll become too large and unwliddy. This, however, ia a polnt whlch experience only can aettle, and to that it may safely be left. Iron ships are also, as previously stated, beglnning to be extensively constructed; and shlps aro now frequently fitted out with screws and steameengines, to be used only as a subsidlary power in calms, and against contrary winds.

Most sorts of short passage traffic are now carried on by steamers; and it is probable that in the end they will engross the greater part of the coasting trade of most countries, and of the trade between forelgn countries adjacent to each other. But the improved class of sailing ships have little to fear from the competition of steamers in all the more distant branches of trade. For general statistiee in regard to the number of ships and amount of tonnage, see articlea Steam Navigation and Tonnage

Shipping, Iawis of.-Under the gencral heads of Affreightment, Cilanten-party, Billa of Lading, Caniafins, Cghlision, Commerce, Masters, Mabitime Laife, legerstay, Sea mex, ctc. (ree lndex), particular information has been glven concerning the laws of shipping. We wlll, therefore, lnthis article only give a synopsis of the gencral lswa regulating ships and shipping.

Title to Vessels.-The tltle of a ship, unless acquired by capture, passes by writing. A bill of sale is the proper record of title to a ship, and one whleh the maritime courts of all nations will look for and, in their ordinary practice, require. In Scotland, a written conveyance of property in ships has, by custom, become necessary : and in England a statute requires it with regard to British suhjects. In this country, possession of a ship and sets of ownerghip are presumptive erldence without the aid of docomentary proof, and will hold good untll destroyed by contrary proof, and a sale with delivery of a ship, wlthout a bill of sale or written Instrument of any kind, will be good at law. But the presumptive title from possession can easily be destroyed; and the general rulu is that no persen can convey whe has no title, and the fact of possession does not give title. The master of a shlp has no authority to sell, unless in a case of necessity. It is generally, thengh not universally, consldered that a sale by order of an admiralty court in a foreign port, by a petition of the master on the ground of unseaworthiness, is valid. The capture by a public enemy divests the title from the original owner after a regular condemmation liy a prize court. Upon the sale of s ship in port, delivery of poasession ls requisite to perfect the title. If the vessel is at sea at the time of sale, possession must take place upon arrival at port.
liability of Ocner.-The owner is persouslly liable as owner for necessaries furnished and repairs made to a ship by order of the master. It has been a disputed question whether the mortgagee of a ship ls liable before taking possession. The welght of the American decisions decides that he is net liable for repairs procured on the order of the master, If not upon the credit of the mortgagee, and if the same was not in recejpt of the freight. When the vessel is at sea, the lisbility of the mortgagee for wages, ete., resolves itself Into the question of his possession. The lisbility of the charterer or freighter under similar circumstances also depends upon the question of temporary ownership by their use of the vessel.

Cuatom-house Documenta.--The Unlted Staten have followed the policy of other commercial nationa in give ing peculiar privileges upon American-built vessela
owned by our own citlzena. Thls is obtained by a registry of vessels (ses article Reaistry), and which provislon is intended to encourage our own trade, navigation, and ahlp-bailding. The regiatry of all vessels at the custom-house, and the records of the transfers also, add great security to the titles. No veasel ls to be deemed as belonging to the United States, and entliled to the privileges of one, unless registered and whelly owned and cemmanded by a eltizen of the United States.

Part Ouners.-The several part owners of a ship are tenants in common, and not partners. Each has hls undivlded interest, and when one is appointed to msnage the concerns of the ship he is called the slolp's lusband. If there be no definite agreement among the owners as to the employment of the ship, the majority in value may employ the shlp, whille the admiralty conrt secures the interests of the minority from injury. Thls practice is dictated by the commonscnse view that "shlps were made to plow the ocean, and not to rot by the wall." The court takes a security from the majority to a sum equal to the shures of the minorlty, either to bring back the shlp or pay the minority the value of their shares, and $\ln$ this case the ship ssils wholly at the profit or risk of the majority. The distlnction between prirt owners and partners may be stated thus: Part ownership is but a tenancy in common, and as such a part owner can only ecll his undivided right, and can give title only to such; but a partner has implled authority over the joint property. A vessel may be held fin partnership, but is not unless by agreement.-See Kкst's Comm., vel. Jil.

Carriage of Goods.- When the ship is hired and the esrgo laden on board, the duties of the owner, and of his agent, the master, arise in respect to the commencement, pragress, and termination of the voyage. When the voyage is ready, the master is bonnd to sail as soon as the wind and the tide permit, but he ought not to set out in very tempestuous weather. If, by the charter-party, the vessel fs to sail ly a given day, the master must do it, unless prevented by necessity; and if there be an understanding to sail with convoy, he is bound to go to the place of rendezvoins, and place himself inder the protection and control of the convey, nud continue, as far as possible, under that protection duriag his course. Ile ls bound, llkewise, to obtsin the necessary ssiling instructions for the convoy ; but these covenants to sail with the tirst fair wind and with convoy, are not condltions precedent to the recovery of freight, and a breach of them only goes to the question of damages. The master is bound, likewise, to proceed to the port of delivery without delay, and without eny unnecessary deviation from the direct and usual course. If he covenants to go to a loading port by a given time, he must do it or ablde the forfelture; and if he be forced by perils ont of his regular course, he must regain it with as little delay as possible. Nothing lut some just and necessary cause, as to avold a storm, or pirates. or enemies, or to procnre requisite supplies or repairs, or to relieve a ship in distress, wIll justify a deviation from the regular course of the voyage. If he deriates unnecessarily from the usual course, and the cargo be injured by tempests during the deviation, it is a sufficient proximate cause of the loss to entitle the freighter to recover; though If It conld he sliown that the same loss not only might but mist have happened if there had not been any devintion, the conclusion night be otherwise. Nor has the eaptain any authority to substitute another voyage in the place of the one agreel between the owner and frelghter of the ship. Such a power is altogether beyond the scope of his authority as master. In case of necessity, as where the ship is wrecked, or otherwise disabled in the course of the voyage, and can not he repaired, under the circumstances, wlthout too great delay snd expense, the master may procure snother competent vesal to carry on the cargo and ae ve hils freight. If othor mana

When to sail gs ought not If, ly the n day, the ssity ; and nvoy, he is place himonroy, and tion during the necesthese cove. th convor: ' of freight. uestion of to proceed ithout eny 3ual course. given time, ie be forced t regain it it some just or pirates. or repairs, a deviation he deviates he earga be it is a suffihe frelghter at the same ted if there n might be rity to subone agreed hip. Such of his autwhere the the ceurse , under the id expense, nt vessel to othar moans
to forward the cargo can be procured, the master must procure them or lose his freight; and if he offers to do it, aud the froighter will not consent, he will then be entitled to his full freight. The master must act in port of necessity for the best interest of all concerned, nod the has the power and discretion adequate to the trust, and requisite for the safe delivery of the cargo st the port of destination. If there be another vessel in the same or in a contiguous port which can be had, the dity is clear and imperative upon the master to hire it ; but still the master is to exercise a sound dige cretion adapted to the case. He may transmit the curgo, if he has the means, or let it remaln. He may bind it fer repairs to the ship. He may sell part, or hypothecate the whole. If he hires another vessel for the completion of the voysge, he may chsrge the cargo with the increased freigitt arising from the hire of the new ship. The master may refuse to bire another vejsel, ant insist on repsiring his own; and whether the freighter be bound to walt for the time to repair, or becomes entitled to her goods without any charge of freight, will depend apon circumstances. What may be a reasonabie time for the merchant to wait for the repairs can not be defined, and must be governed by the facts applicable to the place and the time, and to the nature and condition of the eargo. A cargo of a perishable nature may be so deterlorated as not to endure the delsy for repairs, or to be too unfit and worthiess to be carried on. The captain is not bound to go to a distance to procure another vessel, and encounter serious inprediments in tise way of putting tho cargo on bosrd another vessol. His duty is only luperative when another vessel can be had in the same or a contiguous port, or at one within a reasonable distance, and there be no great difficulties in the way of a ssfe reshipment of the cargo. In the course of the voysge, the master is bound to take all possible care over the cargo; and he is responsible for every injury which might have been prevented by human foresighit and prudence, and competent naval skill. He is chargenble with the most exact diligence. If the ship be esptured during the voyage, the master is bound to render his exertions to rescue the property from condemnstion, by interposing his neutral claims, and exlibiting all the documents in his power for tie protectien of the cargo.

Of the Delivery of the Goods at the Port of Destination. -On the arrival of the ship at the place of destination, the cargo is to bo delivered to the consignce, or to the order of the shipper, on the production of the bill of lading and payment of the freight. The cargo is bound to the slip as well as the ship to the cargo; bitt the master con not detain the goods on board the ship until the freight be paid, for the merchant ought to have an opportunity to examine the condition of them previous to payment. Delivery at the wharf (where there are no speclai directions to the contrary) discharges the master. But there must be a delivery at the wharf to some person authorized to recaive the goods, or due previeus notiee must have been given to the conaignee of the time and place of delivery; and the master can not discharge himself by leaving them naked and exposed at the wharf. Ilis responsibility wili continue until there is actual delivery, or some act which is equivalent, or a substituto for it, unloss the owner of tice goods or his agent had previously assumed tho charge of the goods; or at least until tite consignee has had notice of the place and time of delivery, and the goods have been duiy separated and designed for his use. When thero are conflicting claims between consigner and eonsignee, or consigner and the assignes of the consignes, if the consignee has fsiled, he ought to deliper to the claimant on behalf of the consignee; and if the consignee has assigned the bill of isding, and the rights of the consignee be atill interposed and coutested, it is safost for the master to depasit the goods wilh some bailee, until the rights of the claimants are
set tled, as they can always be upon a bill of interpleader in chancery to be filed by the master. Having made a consigament, the consignee or seller bas not an ninlimised power to vary it at pleasure. He may do It only for the purpose of protecting himself agaiast the insolvency of the buyer or consignec.

Responsibility of the Ship-owner.-Tho cases that will excuse the ownera and masters for the non-delivery of the cargo must he eventa falling within the meaning of one of the expressions, act of God and public enemiss; or they must arise from aome event expressly provided for in the charter-party. Water-carriers aro liable as common carriers in ali the atrictness and extent of the common-law rule, unless the loss happens by means of one of the excepted perils. A loss by lightning is within the exception of the act of God; but a loss by fire proceeding from any other caase ls chargeable upon the ship-owner. The moment the goods are transferred from the ship or lighter to the warehouse, this extraordinary responsibility ends.

If a rock or a saud-bar be generally known, and the ship be not forced npon it by adverse winds or tempests, the loss is to be Imputed to the fault of the master. But if the ship be forced upon such shallow by winds or tempests, or if the bar was occasioned by a recent and sudden collection of sand in a place where ships could before sail with safety, the loss is to be attributed to n peril of the sea. A statute in Massachusetts, passed in 1818, and re-enacted in 1895, limits the responsibility of owners for the scts of the master and mariners to the value of the ship and freight, but otherwise the owner is bound for the whole amount of the injury done by the master or crew.

Duties of the Shippers.--The duties of the charterer are to use the ship in a lawful manner, nnd for the purpose for which it was let. If the freighter puts on board prohibited or contraband goods, hy means whereof the ship is subjected to detention and forfeiture, he must answer to the ship-owner for the consequences of the act. And if the merchant declines to lade the ship according to contract, or to furnish a return cargo, as he had engaged to clo, he must render in damages due compensation for the loss.

Payment of Freight.-Freight, in its original and more common acceptation, means the hire which is carned for the transportation of goods, but in its more extensive sense it is appied to all rewards for compensation paid for the use of ships. If the liring be of the whois slip, or for an entire part of her for the voyage, the merchant must pay the freight theugh he toes not fully lade the ship. But if he agrees to pay in proportion to tise amount of the goods put on board, and dues not sgree to provide a whole cargo, the owner can demand payment for the cargo actually shipped. If the merchant agrees to furnish a return cargo, and he furnishes none, and lets the ship return in bailast, be must make compensation to the amount of the freight.-Leone Levi's Com. Law of the World.

Analysis of the General Law of Shipping.-The sale of ships in Great Britain must be made by a bill of ssle containing a recital of the certificate of registry. In France, Spain, and Sardinia, it must be made by public deed. In Hollund the deed is transferred into a public register. Ali British subjects are authorized to possess shares in ships in Great Britain. In Spain foreigners not natursiized can not acquire the ownership of ships. In Russia this right is limited to merchants of the first and second guild. Part owners are tenants in common with cach other of their respective shares in Great lbritain. Lach ship's hushand may sell his share, but he should give preference to his part owners at equal price, provided they pay the price within three days: Spsin, Prussia, Russia, Denmark, and Sweden. The respensibility of ship-owners for the acts of the captain is unlimited in Prussia and Spain, provided It be proved that such expenses turned to the ndivantage of the vessela. In Great Britain the own-
ere are reaponslule where the expenditure la for necessaries. In Portugal obligations are not binding beyond the value of the ship and freigit. In France owners may relieve themselves from such obligations by the aliandonment of ship and freight. In Russia the ship's huaband is responaible only to the value of the ship. In the Two Sicilies, Sardinia, Jioliand, Grecee, and Hayti, the same reatriction la admitted. In the United States the seamen are not paid If the ohip and freight have been loat; but thelr wagea are preferred to bottumry bond on the ship and frelght preserved.-See Ownens of Surs. In Franco the same law prevalla.

Ships' Propers, the papers or docnments required for the manifestation of the property of the ahip and cargo, etc. They are of two sorts; viz., 1st, those required by the law of a particular country-ae the certificate of registry, license, charter-party, bills of lading, bili of health, ctc. (seo theae titles), required by tise law of lingland to be on board British ahips; and, 2d, thoae required by the law of nationa to be on beard neutral ships, to vindicate their title to that character. Mr. Sergeant Marshali, following Hubner (De la Saisis des Bitimens Neutres, 1. 241-252), has given the following deseription of the latter class of documents:

1. The I'ussport, Sea Bricf, or Sea Letter.-This is a jermission from the neutral state to the captain or master of the shilp to preceed on the voyage proposed, anti usuaily contains his name and realdence; the name, property, description, tonnage, and deatination of the ship; the nature and quantity of the cargo, the place whence it comea, and its destination; with such other matters as the practice of tho piace requires. Jhis document is indispensably necessary for the safety of every neutral ship. Hubner snys that it ia the only paper rigorously insisted en by the Barbary corsairs; by the production of which alone their friends are protected trom insult.
2. The I'roufs of Property.-These ought to show that the ship really belongs to the suljecta of a neutral state. If ahe appear to elther belligerent to have been built In the enemy's country, proof is generally required that she was purchased by the neutral before, or captured and legally condemned and sold to the neutral after, the declnration of war; and in the latter case the bill of sale, properly authentleated, ought to be produced. Ilubner admits that these proofs are so easential to every neutral vessel, for the prevention of frands, that such as sail withont them have no reason to complain if they the interrupted in their voyages, and their neutrality disputed.
3. The Juster-roll.-This, which the French call rôle dequipage, contains the names, nges, quaility, place of residence, and, above nli, the place of birth, of every persen of the ship's company. This document is of great use in ascertaining a ship's neutrality. It must naturally excite a strong auspicioo, if the innjority of the crew to found to consist of foreigners; still more, if they lo natives of the enemy'a country.-See Sesmis:,
4. The Charter-party.-Where tbe ship is chartered, this instrument serves to anthenticate many of the facts ont which the truth of her neutrality must rest, nud should therefore be always found on board chartered ships.- See Affreithtiment and Chahten-paity.
5. The Bills of lading.-lly these the cnptain acknowledges the recelpt of the goods specitled therein, and promises to deliver them to the consignee or inis order. Uf these there are uaually soveral duplicates; one of which is kept by the captain, one by the shipper of the goods, and one transmi'sed to the consignee. This inatrument, being only th. evidence of a private transaction between the owner of the goods and the captain, does net carry with it the mame degree of authenticity as the charter-party.-See bills of Ladinc.
6. The Invoices.-'These contain the particulars and prices of each parcel of goorls, with the amount of the freight, duties, and other charges thereon, which are
uanally tranomitted from the abippers to their factors or conaignees. These invoicsa prove by whom the goods were shipped, and to whom censigned. They carry with them, however, but little authenticity, be ing easily fabricated where fraud is inteuded.
7. The Log-book, or Ship's Journal.--Thia containa a minute account of the shlp's course, with a ahort history of every occurrence during the vuyage. If this be faithfully kept, it will throw great light on the question of newtrality; if it be in any respect fabricated, the fraud may lo general to eaaily detected.
8. The Bill of Ilealth.-This is a certifleate, properly authenticated, that the shlp comes from a place where no contaglous distemper prevails; and that none of tho crew, at the time of her departure, were infected with any such diaorder. It is generaily found on board ships coming from tho Ievant, or from the coast of Barbary, where the plagne so frequently prevails.
A ship using false or aimulated papers is liable to confiacation.-Manailall on Insurance.

The reciprocal Duties of Consular Officers and Masters of American Vessels.- By an act of the Congress of the United Statea, approved Feloruary 28, 1803, It is in substance directed that every master of an American vessel shall, on his arrival at a foreign port, deposit hls reglster, aca-letter, and Mediterranean passport, with the consalar oflicer of the United States, if there be one at the port, under a penalty of $\$ 500$, which the consular ofticer may recover in his own naine for the use of the United States. Whenever a clearanco from the proper officer of the port shall be produced to the consular officer, he ahall deliver up all the ship's papere, provided the master shall have complied with the provisions of the above-mentioned act, and those of the 28th aectlon of the act of Augnst 18, 1856. Where vesaels merely touch at a foreigu port to try the market, or are aceidentally driven into such fort, and make no formal entry, it does not conatitute an "arrit al" within the meaning of the act, and the ship's papers cas not be required by the consul.
As aome doubt bea arlsen in regard to what constitutes an "arrival," attention is particulariy called to the following extract from an opinlon of the Supreme Court of the United States: "Our vlew, then, is, that the term arriral, aa used in this act, must be construed according to the sulyect-matter, the object of the provision, and the expressiona in other sections of this act, and in other like acts; and that according to nil theze, a vessel putting into a foreign port to get informstion, and getting it without geing at all to the upper barbor or wharves, and not entering, or repairing, or breahing huik, or discharging seamen, or being bound homeward, so as to take scamen, or needing the aid of the consul In any respect, but leaving the port in a few hours; not doing any of these, nor being reguired to, and duly entering and delivering her cargo at a neighboring port, where it had been sold, and there depositing her papers with the vice-consul, can not be said to have arrived at the first port, so as to come within the spirit of the penal provislon as to depositing her papers with tho consul. So far as regarda precedents on this matter, the actual decision of one court and the opinions of two Attorneys General are in favor of our condusion."

Vessels accidentally driven into a port are not required to deposit their papers with the consular oticer, unlese formai entry be afterward made, or consular services required. It is atated in the opinion of the Attorney-general of October 17, 1853, that the body of the accond acetion of the act of 1803 contemplates an arrival at a foreign port, with a clearance from the proper officer of the port. It la the production of the elearance to the conaular officer which gives to the master the right to demand a return of the ship'o pis pera, and limposes on the conaul the duty of returning them. The proviso to the sectlon allows the cunsular officer, notwithstandling tho clearance from the proper
officer o tain req which a lleer for monthe charged of the al and the offcer, United

officer of the port, to detain the ohip's papora until certnin requirements of law shall have been complied with: which are the payment of the fees dne the consular offleer for his aervices; the payment to him of three months' pay, additional to wages due, for every dischargel seaman who ls deaignated on the certified list of the ship's company as a citlzen of the United States : and the taking on board, at the request of the consular offeer, of destltate mariners for transportation to the United States.
This right of the consnlar officer attaches to the register and other papers when they shall have been lawfully deposited with him; but the statuto does not compel the deposit for the parpose of giving the right of detention. Neither the section of the act which regarls discharged aeamen, nor that which provides for distressed seamen, nor the regulation as to consular fees, reguires a deposit of the register and other papers, although the former makes it the dety of the master to exhibit to the consul a certified list of the ship's company. And tho proviso above cited does not enlarge the scope of the other provisions of law as to the deposit of the papers; it only releases the consul from the duty, which would otherwiee be imperativo upon him, of returning the papers upon the exhlbition of the clearance alone.

By the first section of the act of 1803, It is made the duty of the consular officer, limmediately on the arrival of an American vessel, should the master neglect to deliver his ship's papers, as ho is direeted 'y law, to inform him of the necessity of so doing, by showing him the law that requires it, and apprising him of the penalty he will incur by refusal or neglect. If he fail to comply, a certificate of the fact, under the consalar seal, must be Immediately sent to the Department of State, giving a description of the vessel, the port to which she belongs, where bound, and the nsual residence of the nuster. In sueb a case, $i t$ is clesirahle that the consul should send some other evitence of the arrival and departure of the delinquent master with his vessel besides that of his own certiticate, as it has been held that such evidence of $2 y$ fact is not sufficient, unless expressly or impliedly made so by statute.

Whenever the master shall produce tho clearance of his vessel, and shali have complied with the directions of the acts above mentioned, having fulfilied every lawful requisition of the consul and of the local autherities, the consul shall, withont delay, deliver up the papers, with a consular certificate, under seal, of the time of such delivery, ani inake an entry of the like perlod in his consular record.

Before a clearance is granted to any American vessel bound on a foreign voyage, the master thereof is required to deliver to the collector of the eustoms a list, containing the names, places of birth and residence, and a deserlption of the persons who compoee his ship's company, to which list the oath or affirmation of the eaptain is to be annexed, that It contains the names of his erew, together with the places of thelr blrth and residence, as far as he can ascertain them; a certified copy, written in a miform hand, withont erasures or interlineations, must be delivered to the master by the collector, for which he is entitled to recelve from the master the sum of twenty-five cents. The said master must then enter into bonl, with suffieient security, in the sum of $\$ 400$ dollars, to exhiblt the aforesaid certified copy of the list to the firat boarding-officer at the first port in the United States at which he ehall arrlve on his return thereto, and then and there also to produce the persons named thereln to the said boardingofficer, whose duty it is to examine the men with such list, and to report the samo to the collector.

Ily the act of Congress, August 18, 1856, it is made the luty of every master and commander of a ship or vessel of the United States, whenever he shall have oceasion for any consular or other official service which any consular officer of the United States shall be au-
thorized by law or usage offcially to perform, and for which any fees shall bo allowed by the sald rates or tariffs of fees as aforesaid, to apply to such one of the said officers to perform the servico as may then be officially In chargo of the consulate or commercial agen-

## gIIIP'S DAILY JOLRNAL.

In which, on the daposit of the ship's register and paycrs, shall be recorded, for exampie, as follows:

Notr-Should any of the seamen or martners havo dled nt sen, or have been lost overboard, on the passage, the faet wilt be reporied at once by the master, and a note thereof made opposite to the name of such person so deecased or loet; as, for example. see Stoward. Should any acamen or mariner bo discharged, or desert, a almilar note of the fact must be mado opposite to such deserter's or dlacharged seaman's naine; as, for example, aee Carpenter and Cook. In case any aeaman or mariner has taken the nume of any other acaman or nariner, who may have deserted or otherwlao absented himseif, after the clearing of the veasel, In the United States or elsewhere, anch seaman or mariner's correet and proper name must be entered opposite tho nama of the seaman or mariner so deserting or absenting himself; as, for example, sec boatswain. And In the eved tof the scaman or mariner's taking the name of another seamon or mariner as aforesald, entering the hospltal, belng diseharged, or deserting, the order to tho hospltal, certficate of discharge or desertion, and consubar returns must contain the namo of asid seaman or mariner no taking the place of the absconding seaman; as, for example, sec Boatawain.

Shipwrecks. See Wrecks.
Shoal, in the Sea language, denotes a place where the water is shallow ; and likewise a great quantity of fishes, such as a shoal of herrings.

Shoes (Du. Schoenen ; Fr. Souliers; Ger. Schuhe; It. Scarpe; Russ. Baschmaki; Sp. Zapatos), articles of clothing that are universally worm, and require no
description. The shoe manufacture is of great value and importance.

Boos and Shoe Trade.-The ennual value of boota and shoes manufactured in Massachusetts is estlmated at $\$ 37,000,000$, exceeding any othar branch of manufacture, The demand for boots and shoen for years past has been fully equal to the production, and the trade generally of Boaton has been quite up to expectatlon. The high pricas of leather and all kinds of stock have induced manufacturers to work very eautlously, and they have turned out no more goole than were actually wanted. The trade opened in January last with a good demand and a firm market, and the purchases generally were at an advance of about 5 per cent. Early in Feliruary the trade was materially checked by the ice ombargo South and Weat, whleh completely closed river and harbor navigation, and prevented the forwarding of goods. The opening of navigation In March led to an active demand, and throughout March and April the husineas was quite actlve, luyers from the South and Weat completely clearing the market of all desirable goods, the Spring trade closing quite satisfactorily.
The high cost of etock the past yeent has also been quite a check on the production, keeping it within the limits of the demand; and the same policy is likely to control the operatlons of manufactnrers the comin; ycar. For soma months past the quantity of goods turned out has been comparatively smail, aud the supply on the market for Spring sales will not be likel. to exceed the actusl wants of the trade. The quantity of boots and shoea cleared at the custom-house has beea as folliows:

| Vears. | Quanily | Years. | Quanlity |

In the immeriate vicinity of Boston there are manufactures to the extont of nt least $\$ 150,000,000$ annunlly; and of thia $t^{\prime}$.. value added to the raw inaterial by labor can not be less than $\$ 75,000,000$. In addition, the foreign dry goods, groceries, drugs, hardware, and a multipilicity of other articles sold there, swell the trade of Boston to nearly or quite a hundred millions more. Of manufactures, the first in hmportance are domestic cottons; and of ahout fifty millions manufnctured annually, they send to foreign countrics lesm than two militons, or 4 per cent. Ono half of these go to the west coast of South America, the eust coast of South America, and the Central American Staten, while the West Indies receive less than 220,000 worth of cotton manufactures from 13oston In a year. The truda of Boston with Cuba during tho fiscal year ending Juna

80, 1856, stood as followes: Value of imports, $8,683,226$; exports, $1,044,859$.

Shola. There is a slagular substance manufactured in Inclia from the cellular, pith-like atems of the hedyarrum lagenarium. It closely resembles in nppearance the Chinesa rice-paper, and is considered to be well adapted to various purposes in the arts. The shola is wrought In Indla into life-buoys, boxes, bottle-cases, hata, and numerous other arteles. From its looselycellular structure, it is a very bad conductor of heat, and this, together with its lightness, admirally fits it for the manufacture of hats. It is also advantageously fitted for purposes of ornament, as it may readily be made to present all the appearnnce of ivory.
Bhore, a placo which is washed by the gen or by some large river. Count Marsigll divides the seashore into three portlons: the first of which is that tract of land whieh the sea just reachas in storme and high tides, hut which it never covers; the second part of the shore ia that which is covered in high tides and storms, but is dry at other timea; and the third is the descent from this, and is always covered with water. The first part is only a contlnuation of the continent, and suffers no alteratlon from the neighborhood of the
sea, except that it is readered fit for the growth of nome plants, and wholly unfit for that of others, by the saline ateame and impregnatloas ; and it is rearcely to be conceived by any but those who have olbserved it how far on land tha affects of the gea can reach, so as to make the earth proper for plants which wili not grow whthout this infiuence; there being eeveral plants frequeatly fouad upon high bllis and dry placee at three, four, and more miles from the see, whieh yet would not grow unless in the neighborhood of it, nor will they ever bo found elsewhere.

The second part or portion of the shore is much moro uffected by the sea than the former, heing frequently washed and beaten by it. It productions are rendered salt by the water, and it is covered with sand or with the fragmenta of shells in the form of sand, and In some placee with a tartareus matter deposited from the water. The color of this whole extent of ground Is usually dusky and dull, especially whare there aro rocks and stones covered with a allmy matter.

The third part of the shore is more affected by the asa than either of the others; and it is covered with a uniform cruat of the true nature of the bottons of the sea, except that planty and animals have their residence in it, and the decayeci parts of these alter it a little.-See Gulf Stnram and Ocean.

Bhumao, or Sumach (Ger. Schmack, Sumach; Fr. Sumac, Roure, Roux; It. Sommaco; Sp. Zumaque; Ruas, Sumak). Common shumac (Rhus coriaria) is a ahrub that grows naturally in Syria, Palestine, Spaln, and Portugal. That which is cultiveted in Italy, and Is improperly called young fustic, is the Rhus cotinus. It ls cultivated with great care: its shoots are cut down every year quite to the root; and, after belng driod, they are chipped or reduced to powder by a mill, and thus prepared for the purposes of dyelng and tanning. The shumac cultivated in the neighborhood of Montpellier is called redoul or rowdo. Shumes may be conaidered of good quality when its odor is strong, color of a livaly grean, is well ground, and free from atalks. Italian shumae is used in djeling a full high yellow, approaching to the orange, upon wool or cloth; but the color is fugitive. Common ahumac is useful for drab and dove colors in calico-printing, and is also capable of dyeing black.-Banchort on Colors.
Biam. This extenslve kingdom, in the sontheastern part of Asia, occupies the central part of Farther India, and has on its west the Dritish Teasarin provinces and the Bay of Bengal; on the north and northwest, Burmah and the free Laos country; on the east, Anam; and on the south, a coast line of 1470 miles along the Gulf of Siam. Its area has been differently estimated: some authors extending it to 294, 7 ij square miles, of which there are assigned to Siam ${ }^{*}$ proper 141,175 square milles; 20,420 to Cambodia; 108,645 to the tributary Laos; and 24,480 to the Malay provinces. Crawford, however, who scems to hava enjoyed the most favorable opportunities of correctly eatlmating the extent of Siam, fixes its area at 190,000 square miles.

Tho same authority eatimates the population at 2,790,500, in 1822; but the American commissioner, who negotiated the commercial treaty with Siam on the part of the United States in 1832, gives an estimate for that period as followa :

| Shamera. | 1,600,000 |
| :---: | :---: |
| Inea | 1,200,000 |
| Malays | 920,000 |
| Chlnese | \$00,000 |
|  | 3,020,000 |

All anthora concur in representing Siam as one of the most fertile and delightful countrlea in the East, nnd capable, when its immense resources are more fully developed, of sustalning an extensive and valuablo forelgn trade. No other country eastward of the Cape of Good Hope abounds more plentifully in all the productions sulted for foreign commerce; and it is found
to be no less diatinguiahed for the great variety of its mineral than it is acknowladged to be for ita vegotabla productiona. The largeat-nised vessela are bullt annually in Siam.? Some of the Chinese Junks, the conatruction of which forma an important feature in the trade with Chins, measars 1000 tons burden. $n$ The timbera are of a hard wood, called by the natives marbao, and the piank are of the tinest teak in the world.

Among the large rivera of \&lam, through which the internal and foreign trade of the kinglom in conducted, the Menam is the meatimportant, aa pervaling the graater part of the kingdem, and almost monopoliziug ita trade and navigation. On this river is aituated llangkok, which has long been the great centre of the commerce of the kingdom, inland, coustwias, and foreign. The principal articlea brought down thia river from the higher provinces are rles and paddy, cotton, teak-limber, aapan-wood, lac, Lenzoin, ivory, aud beeawax ; while the diatricts east and weat of the Menan furniah gamboge, cardamoma, and sugar; and the Malay provincea contribute to the trade of Bangkok tin, ainc, cotton, atc. The foreign trade ia conducted chiefly with the southern porta of Anam, Java, Singapore, Pulo-Penang, and occasionally with British India, the United Stater, and Great Britain. The moat extenslve foreign trade of Siam Is with China; this trade employs from 200 to 200 junka annualiy, having an aggregate burden of about 25,000 tons, nootly built in Siam by the Chinese. These junka make one voyage annually, leaving the Menam in Junc, and returning in December. The exports to the United States and to Europe comprise augar, pepper, lac, benzoin, gamboge, tin, cardamoms, ivory, horns, and hidea, with other articlea of minor importance. For theae they receive all kinds of textile fabrics, shawls, cotton umbrellas, iron and ateel gooda, ateel bars, lead and apelter, earthen and glass ware, ail kinda of hardware and cotlery; with fire-arms, nuskettlints, etc. Formerly the British trade wfh Siam was carried on under treatien with the East Intia Company. Duty was levied on the ship, and amounted to about $\$ 1000$ per fathom on the $v$ ith of the vessel. The length, draught, or tonnage was not regarded; there was no import or export duty; all duties and tolis were inerged in the charge on the ship,

On the 20th of March, 1833, a treaty of amity and commerce was concluded between the King of Siam and the United Statea by Mr. Roberta, who had been sent thither for that purpose; ratifications were exchanged at Bangkok, April 14, 1836, and the proclamation of the President gave it effect in the United States June 24, 1837. By this treaty citizena of the United Statea are permitted to enter and depart from any port of the kingdom with cargoes of whatever description, and to bny, sell, and exchange, without qualification or reatriction, except that they are not to aell munitions of war to any other person than the king, or to import epiunt or export rice. The only charge to be exacted from American vessels is a measurement duty of 1700 ticals or bats for every fathom of $i 8$ American inches in breadeh, upon ships aelling merchaudise, and of 1500 ticals or bats per fathom on these purchasing cargoes with specie; the measurement to be made in the inlddle of the vessel's length upon the single deck; or if there be more than one deck, then upon the lower one; but no charge is to be made upon a vessel entering merely to refit, or for rofresiment, or to iuquire the state of the market. In casc of a reduction of the dutlea upon the vessela of any foreign nation, the same reduction is to be made in favor of those of the United States. American debtors, who ahall have henestly brought forward and sold all their property for the payment of their debts, aro not to bo proceeded against for the balance remaining due after the application of the proceeds of such sale. Merchants trading to Siam ahall obey the lawa and customs of the country; and if they wish to rent
houses, thoy ahall rent the kinge factories, and pay the cuatomary rent therefor. The king's officers may take account of goods brought on shore, but no dutlea shall be levied thereon. In case of shipwreck of on Amarican veasel on the Slanese coast, the persons eseaping ahall be hospitably entertained, and the property saved ahall be reatored to the owners ; and if a vessel of the United Statea aball be eaptured by piratea, and brought into a Siamese port, the persons on board shall be set at liberty, and the property restored to thie rigatful proprietors. If the privilege aliali hereafter be granted to any foreign nation, other than tive l'ortuguese, to have conaula reaident in the kIngilom, the samo privilege ahall be extended to the United States.

With a few exceptiona, thia treaty is a mere transcript, as regarda ita conimercial atipulations, of the treaties of Slum with the liritish East India Company. Anterior to the period of ita concluaion, quite a number of American vessela had viaited that kingdom, and it was supposed that the treaty would open an extensive trade between Siam and the United States. Quite the contrary, however, has proved to be the case; for it is stated that not a aingle cargo has aince been shipped under the flag of the United Staten. In 1850 a speciai cominissioner was sent by the governmeut of the United Statea to Siam for the purpose of negotiating a new treaty, but without aucceas. A similar reault followed the efforta of Sir J. Brooke, British envoy, who had been specially deputed to proceed to Sliam for the same object. Since that periol, however, and very recently (April, 1855), Sir J. Howring, for the Jritish governinent, haa aucceeded in negotiating a new and much more favorable treaty than the one which it supersedes with the Siamese kingdom. Efforts are now in progresa on the part of the United States to negrotiate a new conimercial treaty with this kingdom; but until auch treaty shall have been formed, the United Staten, being entitled, by Articlo 4th of the treaty of 1833, to any dimination of duties payable by foreign vessela granted at any future time to any ether nation, can, of course, avail itself in that regarl, as well as reapecting the appointment of consuls, of the Britiah treaty of 1855.

Of the gencral trade and commereial relations of Sian with nations but little, comparatively, is with gertainty known. The following summary respecting the principal producta of that kingdonn, and their commercial importance, is made up chlefly from British otticiai returns of recent date:

Sugar is looked upon as the principal return for British importo. Its cultivation as an article of commerce originated in the enterprise of Chineso settles in the year 1810. In 1822 it had reached 60,000 piculs, or 3700 tons; in $1835,185,000$ piculs, or 15,295 tons, At this period tho trade in sugar received a severe check, in consequence of the king monoptlizing the entire trade in liss own hands, and flxing his own prices both for tho producer and foreign purchaser. The preaent king has discontinued the traffic carried on by his predecessor, and cultivators are once more free to sell to any customer. The munufacture, however, atili remalns burdened with various taxes, which keep up the cost of production, and check lemand, so that 80,000 piculs (say 5000 to 6000 tons) are now spoken of as an average crop. The land-tax on suyar plantations is one tical per square of twenty fathems, which, under favorahle circumstances, will yield fons piculs. Thia would amount, on production, to one salung ( 15 cents) per picol ( $138 \frac{1}{\mathrm{j}}$ lios.); and the duty which is levied on sugar, on Its passage to Jangkok, is exactly double the amount of the land-tax, the payment of which, under the new treaty, will free it from any further charge on exportation. Siamese sutgar is much eateemed for ita whiteneas and fine atrong grain, and as the greater portion of the valiey of the Menam, the area of which has been eatimated at 22,000 square miles, is atated to be well adapted is the growtil of tha

cane, it is aupposed that the annual angar crop would admit of very materinl increase.
Rice.-The extreme facility of irrigation, and the periodical inundations of the Menans, supply with unusual certaiaty the fertility necessary for the growth of this cereal. Hitherto its exportation was forbidden by law ; but under the new treaty it is stipulated that thie prohibition ahall oniy be enforced In times of noaitive scarcity. The demand for this articie, both for home and Oriental consumption, is conatantly on the lucrease; and there is every preapeet that Siam will, in the course of time, rival the British province of Arracan (in the Bengal presidency) in supplying this articlo for the markets of China, Australia, and burope. The annual exportation of rice in this British province is now raised to 120,000 tons-neariy 800 per cent. over the total exportation of rice from the United States in 1855. The trade with Slam, how: ever, will always have thia aivantage over that with Arracan, that in the former rice and all other products are given in exchange for manufactures and other articies of trade; whilo in the latter the exporta ere paid for in bullion. Forty times the amount of seed is stated as the average yiold; and the ordinary price is one tical ( 01 cents) per 138 lbs.

Salt.-This article is oltained of excellent quaiity from the extenaive mud-fiata which line the head of tin Gulf of Siam, and at so cheap a rate that the cost of production does not exceed from one to two ticals ( 61 conts to $\$ 122$ ) per koyan of 25 picula, or 8400 ibs. English. Salt is, however, a special object of taxation in Siam; and the duty of $\$ 3 \mathbf{6 0}$ per koyan raises the above-mentioned price to seven or cight ticals (84 27 to $\$ 488$ ) per koyan, equal to about 8288 to $\$ 336$ per ton. The Britiah commisaioner endeavored, in negotinting the late treaty, but ineffectually, to obtain a reluction of this high duty. It is, notwithatanding its pricu in market, in much demend at Singapore; and the Siamese government have withdrawn all impediments bitherto existing to its ahipment.

Teak,-The teak forests of Siam are situated at some considerable distance up the Menam, and the trees, when feiled, are flosted down in large rafts to Bangkok. There is alwaya a briak demand for this articie, both in the markets of China and Singapore.

Sapan-scood.-The annual exportation of this dyewood reaches from 80,000 to 100,000 piculs (from 5000 to 6000 tons). Ilitherto the Siamese government have levied a tax of rne tical per picul on sapan-wood, heing from üù to more than 100 per cent. upon its value; and it was with great diffieulty that the British commissioner persuaded the Sianoese authorities to lessen this tax to $2 \frac{1}{2}$ salungs per pieui--being a reduction of more than one-third upon the old rate.

Rose-ucood and Ebony,-These woods are abundant in Siam, aud are largely shipped to China and Singapere. The export duty bas been reduced one-third of former rates.

I'pper.-The prod'action of this article had reached at one time more than $9,000,000 \mathrm{Jbs}$. per annum, when an oppressive tax, imposed ly the present administration of Siam, of one catty of pepper on every vine, or abont 8 per cent. on tho produce, in addition to an export duty of one tical ( 61 cents) per picul, amounting to the same pereentage, caused such a cherk to the cultivation, that last year only 20,000 piculs were brought to market. The removal of the tirst of these taxes, now ngreed to, will acrve, it is stated, to restore the growth of this useful spice to its former flourishing condition. In 1855 the United States imported from the British and Dutch East Indies $3,301,460 \mathrm{lbs}$, of hlack pepper, valued at $\$ 171,008$.

Cotton.-A Aove the line of the inundated tracts, land fit for the cultivation of cotton alrounds. The crop has reached as high as 140,000 picuia ( 8330 tons) in a year; lut owing to various causes, some of which the British commissioner has succeeded in removing, it is thought
that its culture will be again encouraged, and its exportation i. reased.
silk,-Thie product has been largely grown in the rich diatriet of Kocat, and the crop has reached 1500 piculs per annum-valued at 150,000 ; but the larger markets of China being so ciose at band, the silk of Siam will probably never assume mnch importance in the forelgn trade of the kingdom.

Jemp,-This mrticle hoids out much interest to forelgn traders. Its growth in Siam ia only just becoming known, and it ie particularly recommended on account of ita great otrength, and its glossy and silky texture, which would allow of its beling woven up into silk fabrics. Its noderate price- 10 ticals ( 8010 ) per picul-will enable it to compete aucceasfully with that of Manilla.

The following liat will be found to contain all the manufactures which are nost suited to Slamese consumption: White and gray long cloths; white and gray madapo!lana;' white and gray camlirics; white and gray jaconets; book lappets ; velvets, plain and figured ; checked fancy muslins; American drills; cotton umbrellas; figured long cloths; dyed cambrics; dyed long cloths; prints, chintzes, furnitures, and neutrais; Siam chowls, or dresses; Turkey red cioth; gray cetton twist ; Turkey red twist; imperial red and blue twist : long ells; ladies' cloth; Spanish stripes; merinos of assorted colors; canvas; iron, steel, lead, spelter; carthen-ware, assorted; glass ware and lamps, assorted; mukkets, gun-locks; brimstone, beeswex; cowries, flint-stone, musket-flints, etc.
The importa from India and China are even more variod, and consist of almost every article of manuficture, trifling or important, produced in those countries; these being required not only to meet the tastes and requirements of the Siamese, but also to supply the wants of the natives of India and China, many of whom are domiciled in Siam. The statistics of the trade of Slam are but meagre. The following table exhluits the number and tonnage of ships which left the port of Bangkok for China and Singapore, from April 1, to August 31, 1855 :

## -U. S. Comh Relations.

Sicily, or Two Sicilies. The kingdom of the Two Sicliics comprises the nncient realm of Naples and the isiand of Sicily. Naples proper embracea an area of 81,350 square miles, and, by the census of 1854 , contnins a population of $6,843,355$ inhabitants. Its productions are of the most valuable and varied kind; and it only requires good ronds to carry the preduce of tha soll to market, and security cnil encourngement under the government, to render the Neapolitan dominions among the most profitably productive in Europe. The chlef products are corn, wine, olive-oil, cotton, flax, hemp, liquorice-paste, silk, and wool.

The annual crop of wheat is between $00 r^{\prime} \mathrm{d} 80 \mathrm{mili}-$ ion busheis. and the yenrly consumption is about 40 million busheis. The nnnual produce of Indian corn is nbout 40 mililon bushels. The yearly protuction of wine ia about 400,000 pijees, the greater part of which is consumed at home. About 13,000 pipes are made into brandy near Naples, und frem 250 to 300 tons of argol und cream of tartar are prepared for foreign markets. About 70,000 tons of olive-oil are expreased yearly, half of which is exported to foreign markets. The quantity of catton rajsed annually in the continentai part of the kingdom amounts to about two million pounds. In Sirily the cuitivation is greater than in Naples. The annual produce of raw silk is about $1,000,000$ lhs., of which cne half is consumed is the factorics of the kingdom.

There are wo specles of wheat raised in the kingdom of the Two Sicilies-the soft, of which the best quality
(s) 'reed is made $\ddagger$ and the hard wheat, chlefly employwd in the preparation of macaroni. The principal exports of Naples propar are, ollve-oil, ailk, homp, wool, wine, grain, macaroni, and coral ; Importa, colonial and manufactured goods, iron, and cutlery.

Irior to the ratiflication of the treaty lietween the United Statea and the Liagrom of the Two Sicilien, of December 1, 1845, the cunmerce between the two countries was chiefly lidirect. Ilaving no commerclal treaty, the United States flug bad to contend agginat high duties, an examption of 10 per cent. in favor of Britinh and French vensels employed in the direct trade, and the extreme rigor of quarantine regulations. The indirect trade was carried on through leghorn and the French Mediterranean ports, and was necemarily fettered with the incumbrances and burdens incident to a circuitous route. Neapolitan morchandise was taken on board American ships In these ports; while coloniat goods destined for the marketa of the Sicilien were sold to the French and Tuscan merchants, on whose accuunt they were shipped to their destination, or sold direct to Neapolitan traders, by whom they were introduced under the $\mathbf{1 0}$ per eant. diacrimination. Tho retallatory duties of import and tonnage levied on the Sicilian tlag ia the linited $\mathrm{S}^{\text {b }}$ "tes virtually excluded their vessels from our ports, and the coneequence was that the trade between the twe countries becane exceediagly limited. Indeed, in returns of the forelgn trade and navigation of the Two Sicilles for a period of three years (1839, 1840, and 18-11), but a single American vessel appears to have entered or cleared at the ports of that kingdom.

The treaty of 1845, whleh went into fiect July 24, 1846, provides that there wiall exist between the two countriea reciprocal literty of commerce and navigation; that no higher duties shall be imposed on importations into either country of articles from the other than from any other eountry; that favors granted by either party to other nations shall be common to the other; that thero shall be equaiization of duties, etc., on imports and exports, on vessels of either country, as also of tonnage, harbor, and light-house duties; that the stipulstions of the treaty shall not apply to the coasting trads; and that no preference shall to given by either party to lmportations on account of the national character of veasels in which imported. The treaty to be in force ten years, with the usual twelve months' notice for its termination.

By a convention ratified July 14, 1855, two principles were recognized between the two countries as permancat and immutable, to wit: 1st. That the effects or goods belonging to citizens or aubjects of a power or state at war are frou from capture and confiscation when found on board of neutral vessels, except articies contraband of war ; und, 2d. That the property of neutrals on board an enemy's vessel is not subject to confiscation, unless contraband of war.

In 1852 the commerce of the continental part of the kingdom of the Two Sicilies is thus given: Imports, , $12,372,363$; exports, $\$ 10,943,831$; total, $\$ 23,316,194$.

The trade represented ty the jreceding tigures passed exclusively through the custom-houses, and does not comprise the movements at the general entrepoit of liriadisi, nor the translujument in the roads. The principal foreign powers which particlpated in the commercial movements of 1853 were England, France, Austria, Sardinia, the Papal States, and Tuscany ; and next in the order of importance were Ilolland, Sweden, Russia, Spain, Greece, the Ionian Islands, Irazil, and the United States. The value of merchandise imported into the continental part of the kingdom, it is seen sbove, amounted to $612,372,363$. This is the value of maritine commerce with foreign mations only. The coasting trade batween the different ports of the kingslom would largely augment this total, but no returns of this trade are accessible. Of the importa, sugar, coffee, and trans-Atlantic produce are chiefly supplied
by England. Marreilles aluo furnishes amall quantitiss of sugar and coffee from Kranch colonles; but, owing to their superior quality and high price, they are uot mach in demand. The sugars from Holland, boing lower priced, find a readier market. Besides theso sources of aupply, several Neapolitan vassels have for some yoars past kept up a direct intercourse between tho port of Naples and Brasll. There seems no reason why the United States shnuld not compete with En. gland, IIolland, France, and even Genou, in aupply. ing these trans-Atlantie necassaries to the kingdom of the Two Sicilias ; nor why the carrying trado In these articlen from the countries of production, or from the bonded warehouses of the United States, could not be mado as profitalile to American as tu British, Dutch, French, or even to Genoese vessels. Geaua is a free port, and the dues for pilotage, anchorabe, and quarantine are light.-See Saninivia.

The subjoined statement exhibits the quantities and values of sugar and coffee respectively, oxported from the United Staten to the kingdom of the 'T'wo Siclies, during a period of five yearb, from 1831 to 1855 , both inclusive, made up from the annual reports of the Sec. retary of the Treasury on Commerce and Navigation; followed liy in statement exhibiting the quantities and values of the same articles exported to all countries; and a third exhibiting the quantities and values of cotton and tobacco exported to the Two Sicilies during the same period:

| Yeara. | Sukap: |  | Cofee, |  |

The following are the chief ataples which the Two Sicilies draw from tho United Statea: Tobacco, cutton, rum, flour, naval atores, ets Of these there were ex. prorted iu 1854 and 1855 in vastie as follows:

In exchange for these staples and for miscelitneous cargoes, our ships return honie laden with wincs, drugs, fruits, feathers, anchovies, oil, auljhur, silks, corks, and rags ; of which latter article were imported in 1804 , direct from the Sicilies, 3,140,718 lbs., of the value of $\$ 90,424$. Under $t^{t}$ e treaty of 18.15 Sicillan and Vnited States vessels are equalized in the ports of the tro countries, when laden with the produce and manufactures of the country to which the vessels helong. The direct trade is, therefore, ílead from the restrictions amd incumbrances with which it was cloggel prior to that period, and the commerce between the two countries has in consequence largely increased. The exports from the United States of its staples alone amount now annually to between $\$ 250,000$ and $\$ 300,000$, more than one half of which is ahipped under the United States tlag. By a royal decree bearing date 18th December, 1854, the privileges which apply to the direct trade with the Twe Sicilies have been equally extended to the indirect trade in finvor of those nutious which have

Re
commercial treaties with the kingdom of the Slelliea, when they shall have granted like favors to the flag of the Two Slelles.

Uniler the operation of the treaty already referred to, and of the liberal privileges conceded by this decree, the commerce of the IJnited States with the Two Sleilies is increasing. The totai ralue of exports from the Siciliea to the United Statea in 1845 was $\$ 630,000$. In 1884 they reached nearly $\$ 1,000,000$, and in 1855 they aseunded to $1,718,949$. In 1845 the United Staten exported to tice Sicilies its own ataples to the amount
 1855. The totul trade in 1855 wan $42,370,425$, against $81,219,861$ in 1854, and 9034,725 in 1845.

The jort chargea in the Two Sleilica are $3 \frac{1}{8}$ cente per ton on equalized renseln, and 32 cents per ton on these non-equalized. Ilesidea the tonnage duty there are sundry miner chargea, Including cuatom-honae visit, entrance and clearance charges, ete., nmonnting in the aggregato io 8375 per vessel on entrance; and on cleurance, including compensation to lirokers, $\$ 510$. The quarantine regulations require a payment of $\& 5$ for ohtaining the requisite pratique. Should the veasel le aubject to quarantine, the chargea aro largely augmented. In orier to obtain free entrance, it is necessary to exhihit a clean hiil of henlth, signed hy the Neapolitan consul nt the port of clearance. It wouid seem, however, that vessels Inden with cotton or other "suscejtibje" merchandise have olways to modergo quarantine,* whleh is exceedingly atrict if during the voyage alckness chanced to prevall on board.

The following is a condensed summary of the latest quarantine regulations in force at the different ports of the Two Sicilies. Thicse regulatlons are revised annualiy, lut the general principles on which they are basedi remain unaitered:
"Vessels proceeding from New Orieans, or any port of Louisiana, shali be excluded whenever they come unprovided witis a certificate algned by the royal consui at the port of departure, attesting that the yeliow fever did not exist in that State, either at the period of saling or twenty diays prior to the same.
"The jlaces supposed to be infected by yellow fever are the Argentine nud Paraguaian republica, Demerara, Peru, Costa Firma, Guif of Mexico, Mississippi, Great and Little Antilles, and Savannah.
"The places suspected of yeliow fever are Santa Martha in Columbia, Chili, Guayann (except Demerara), Ohio and Missouri, Vera Cruz, and ports of the United States, except as above."

The certificate of the Sicillan consul is indiapensable to be adimitted to pratiquo; but even with such protection the quaruntine regulntions are oppressive and uncertain, especiaily if any sickness has occurred on board during the voyage.

Pilotuge.-Vessels arriving at Napies are seldom under the necessity of taking pilots, and hence tisero is no fixed regulation respecting them. Shouid a pilot, however, be required, one can at nli times be found among the fishermen on the coast, with whom the captain must make the best bargain he can.

The principal ports are Naples, sitnated on a bay of the samo name, havlng a commodious harbor, and good anchorage for any sized vesseis to load and discharge cargoes; nnd in Sicily proper, Palermo and Messina.
'lhe forcign trade of Naples is aimost exciusively in possession of English merchants. The returns for 1855 usaign two-thirds of this trade to the English flag, and the other third to the Neapolitan and other flagg. Some twenty or thirty vessels from the nortit of Europe arrive annuaily with stock-fish, crushed augar, etc., from iIolland. lingiand employa annually in the trade with Naples about one hundred and thirty vesseis of small size, from one to two hundred tons each, beaidea a line of steamers, which regulariy touch at thia port, to and - See Consular Returne, "Nsples, Na 30, December 30,
from Livarpool. The faclition which theee metnarners furniah for execnting orders sultable for the Noupolitan market prosent the mont serious obatacle to a direct trade with the United Staten. The privilege of the Indirect trade, however, lately conceded to the Amerlean flag, may tend to Incrase the commarcial interconrse lietwuen the two countries.

The imporsa from Great Britaln In 1855 umounted In quantity to 81,900 tens, which at $40 s$. $(9960)$ per ton gave to British alippers on freight alone the sum of ©335,040, beaidea 10 per cent. jirimnge. The value of these Imports was ectimated ut $\mathcal{\Sigma B , 0 0 0 , 0 0 0 \text { , or }}$ $\$ 15,000,000$.

The exports from Naples to Great Britaln were entimated at 15,500 tons, and the value at about $\$ 7,800,000$ :

Bealdea the disadivantage aiready reforred to, under which American vesaels would have to compete with Engilisis in the trade of Napies, the quarantine regula. tionil are wuch as to render any enterprise in that trade on the part of American ohippers uncertain ind hazardous. heae rugulationa, an already observed, are revised annually, and provide that, under the most favoralie circumstances, a certificate from the Sicllian consul at the port of departure ls indiapenaable to be admitted to free protique.
A few facts relative to currency and exchange at Messina, communicated to tho Stato Department under dute of October 20, 1853, iy the United States consui at that port, are aulijoined:
"It is customary to draw, for ail transactlons with the United States, on Parls or London, and occaslonaily on Miarscilies, Ilamburg, or Genom. American coin, goid and ailver, is, and inas heen for some tlme, at a discount of $f$ m 10 to 15 per cent.
"The oniy kind of Spanish doliar current here ia the piliar dioijar, and is at an advance of about 4 per cent.
"Exchangea are very unfavorable, and far belqu the rates of former years. London, 1088 graina per $\boldsymbol{f}$; Paria und Marscilies, $41 \frac{8}{6}$ graina per franc; Lyons, 41?, and Genoa 42 grains per frane; Leghorn, $85 \frac{1}{2}$ gralns per liro ${ }^{\text {g }}$ Amsterdam, 888 graina per florin; ilamburg, 78 grains per mark-banco.
"The Sicilian ounce is two deliara and a half, or 30 lires, or 600 grains Sicillan currency."

Island af Sicily.-Thils island has an area of 10,656 equare miles, and a population of $2,208,892$ inhabitants. Since lts annexation to the kingdom of Naples in 1786, it has oxperienced much of the evils of absenteeism. The revenue, except that pertion of it which ia pald to the Neapoitan employes who reside on the island, is drained off to he spent in enriching the metropolitan court. In this rospect Siclly in some degree resembles Ireland. The resources which might be beneficially expended in making ronds and other improvements, indispensable to tho proper development of the industry of the island and the growth of its commerce, are squandered in cther countries by an absentee nobility.*

Wheat and hariey are exported in small quantities. Other chief crops are beans, puise, maize, rice, oliveoii, oranges, lomons, almonds, and other fruit ; petatoes, tobacco, flux, hemp, sumach, liquorice, and manna. In the northeast part of the isiand silk is produced, and it Is woven at Catania; and in the weatern part 30,000 pipes of wine nre annualiy made, of which about 20,000 are exported from Marsaia. Sulphur is aiso a jeading staple of the island of Sicily. It is found in tertiary formations, and its production is annually increasing. From 1838 to 1842 a monopoly in the export of sulphur was granted hy the Neapoiitan government to a French mercantile firm ; Lut so vigorous was the resiatance of the British government, that in 1842 the monopoly was suppressed. Since that period the

[^47]trade in this article has been annually Increasing. These aulphur mines hrve been explorel and worked for more than three hundred years, but it was not mintil chemical science bad pointed out the various uses to which sulphur can be applied that ita exportation had risen to any great importance. There nre now about 150 mines worked in an area of 2700 miles, though the most productlve mines are confined to Favarn. Sommatirio, Gallizzi, and Riesi.
Mr. Macgregor gives some interesting statistlcs nf the sulphur trade of the island of Sicily, from whic) It appears that in 1838 the nmount on hand was 80,000 quintals; on tho 1st August, 1840, it had risen to $\mathbf{C 8 0 , 0 0 0}$ quintals; in 1841 it reached 830,000 quintals ; and in 1842 it stood as high ns $1,100,000$ quintals.

There entered the ports of the island of Sicily in 1843,1435 vessels of 211,000 tons; of which from the United States there were 9 of 2500 tons; and during the same year there cleared from Sicilian ports 1427 vessels of 256,000 tons; of which from the United States there were 80 vessels, messuring 22,600 tons.

The value of imports and exports during the same year was:

Vessels helonging to the Two Sicilies aro admitted into the ports of the United States on the same terms as American vessels only when laden with tho home produce or home manufactures.

- Nine monthe to Juac 30, a ad the fiseal year from that 1 we begina suly 1.

Irincipal Port--Palermo, anciently Panermus, a |ing northwest threc-quarters west. A hearyseasomelarge city, and sea-port, the capital of the noble island times rolls into the bay, but no danger neel be appeof Sielly, on the north coast of which it is situated, the hended by ships properly fanm in unehors and chain light-house being in Int. $38^{\circ} 8^{\prime} 16^{\prime \prime}$ N., long. $13^{\circ} 21^{\prime}$ $66^{\prime \prime}$ E. Population, 170,0\%0. The Bny of l'alermo in about flve miles in depth, the city being siluated on its sonthwest shore. A tine mole, fully one quarter of a mile in length, laving a light-house and bittery at its extremity, projecting in a southerly direction from the arsenal into nine or ten fathoms of water, forming a convenient port, cupable of containing a great aumber of vessels. This inmiense work cost about $£ 1,000,000$ sterling in its construction; but the light-house, though a splendid atructure, is sald to be vary ill lighted. There is an inner port, which is reserved for the nae of the arsenal. Ships that do not mean to go within the mole may anchor shout half a mile from it, in from 16 to 23 fathoms, mole light hearcables. In going into the bay it is neces ary to keep clear of the nets of the tumy fishery, for thesp are so strong and well moored as to bo cajable of arresting a ship uader sail.
Afoney.-Since 1818 the coins of Sicily have heen the anme ns those of Naples, their mames only differIng. The ducat $=3$. $5 \cdot 2 d$. sterling, is subdivided into 1100 lajocehi and 10 pidecioli; but aceounts are still generally kejt fin onclo, sarie, and grani: 20 grani= 1 taro; 30 tari $=1$ oncia; the oncia $=4$ ducats; and 1 carlino of Najles $=1$ taro of Sielly. The Spanish dollar is current nt 12 tarl 8 grani.

Weights,-100 Sicilian pounds of 12 ounces $=90$ lbs. uvolriupuis $=85 \cdot 11 \mathrm{lhs}$. Troy $=31 \% 6$ kilog. $=6 \mathrm{l} \cdot 23 \mathrm{lbs}$. of $A$ msterdant $=\mathbf{6 5} \cdot \mathbf{5 8} \mathrm{lbs}$, of IIamburg.

Sierra Leone, an English settlement, near the mouth of the river of the same name, on the west coast of Africa, lat. $8^{\circ} 30^{\prime} \mathrm{N}$., long. $13^{\circ} 5^{\prime} \mathrm{W}$. This colony was founded partly as a commereial establishment, but more from motives of humnnity. It was intended to consist prineipally of free blacks, who, being instructed in the Christian religion, and in the arts of Europe, should become, as it were, a foeus whence civilization might be diffused among tho surrounding tribes. About 1200 frea negroes, who, having joined the royal standard in the American war, were obliged, at the termlnation of that contest, to triko refuge in Neva Scotia, wero conveyed thither in 1792. To these were afterwnrl added the Msroons from Jamaica; and sinea the legal abolition of the slave-trade, the negroes taken in the captured vessels, and liberated by the mixed commission courts, have been carried to the colony. The total population of the colony in 1850 ameunted to about 55,500 , all black or celored, with the exception of about 100 whites.

Success of the Eifforts to cicilize the Blacks.-Great eflorts have been mate to introduce order and industrious habits among these persons. Wo are sorry, however, to be obliged to add that these efforts, though prosecuted at an enormous expense of blood and treasure, have been signally unsuceessful. Thero is, no donbt, some discrepancy in the aceounts of the progress male by the blacks. It is, however, sufficiently clear that it has been very ineonsiderable, and we do not think that nny other result could be rationally anticipated. Their laziness has been londly complained of, but without reason. Men are not industrious without a motive; and most of those motlves that stimulate all classes in colter climates to engage in laborious employments are unknown to the indolent inhabitants of this burning region, where clothing is of little importance, where sufficient supplies of food may be obtained with compnratively little exertion, and where more than half the necessaries and conveniences of Europeans would be positive incumbrances. And had it been otherwise, what progress could a colony be expected to make into which thero have been annually impl 'od crowds of liberated negroes, most of whom are barbarians in the lowest stare of civilization?
Influence of the Colony upon the illicit Slave-trude.As a means of checking the prevalence of the illicit slave-trade, the establishment of a colony at Sierra leone has heen worse than useless. The trade is principally earried on with the countrles round the Blght of Biafra and the Blght of Benin, many hundred miles distant from Sierrn Leone; and the mortallty in the eaptured ships during their voynge to the tatter is often very great. The truth is that this trafle will never be effectually put down otherwise than by the great powris deelaring it to be piracy, and treating those engaged in it, wherever and by whomsoever they may be found, as sen robbers or pirates. Such a declaration would be quite cenformalle to the apirit of the deelnration put $f$ th by the Congress of Vierin $\ln$ 1824.See Slaye-thade. But the jeulousies with respect to the right of visitntlon and search are so very great, that it is exceedingly doubtful whether the minitme powers will ever be brought to concur In any declaration of the kind now nlluded to; unless, however, something of this sert he done, we rpprehend there are but sleuler gromiss for supposing that the trade will be specdily suppressed

Climate of Sierra Leone.-The soll in the vielnity of Sierra Leoue seems to be but of indifferent fertility, and the ellmate is about the most destruetive that enn be imagined. The mortality among the Africans sent to it seems unusually grent, and among the whites it Is quilte execssive. Duch as we destro the improvement of tho blacks, we protest ngainst its being attempted by sending our countrymen to certalin destruction in this most pestiferous of nll pestifereus phees. It would seem, too, that it is quite unneces-
sary, and that blacks may be empleyed to fill tha omcial situations in the colony. But if otherwise, it should be unconditionally abandened.

Commerce.-Commercially considered, Sierra Leone appears to quite as little advantage as in other polnts of view. Palm-oil is the great article of export from the west ceast of Africa; and by far the largest portion of it is furnished by the coast to the west and qouth of the Rio Volta, many hundred miles from Sierra Leone. We doubt, indeed, whether the commerce with the latter will ever be of much importance. At nlt events, we hardly think that it can be expected materially to increase if it be conducted in the way in which it is affirmed that the intercourse with the literated n-groes is at present coaducted.-Reports on Colonial Possessions, 1851, p. 175. If there he not some mistake or exaggeration in the atatement now referred to, nothing can be conceived more disgrnceful. Should it, howover, be ascertained that an establishment is really required for the advantageous prosecution of the trade to Western Afriea, it is abundantly obvicus that it should be placed inuch farther to the south than Sierra Leone. The island of Fernando Po has been sug. gested for this purpose; but after the dear-bought experience we have already had, it is to be hoped that nothing will be done with respeet to it without mature consideration.

Account showino tie Vatum of the varioge Articleg, the (ihowtit, l'rodece, anib Manufagture of the Col. ony and West Coagt of Afuioa, bilomteid from Sienta LRONE DUANG EACN OF TIIE learg FROM 1848 TO $15 \delta 0$, 1NCTUSIVE.

The total value of the exports of Dritish produce and masufacture to the west coast of Africa amounted in 1851 to $£ 658,934$; but of that amount only $£ 94,546$ went to Sierrn Leone. The value of the experts from the latter to the United Kingdomi during the ten years ending with 1850 amounted to $£ 63,290$ a year. The only manufacturo that can be sald to exist lat the colon. is the expression of the oil from the ground-nut by menns of machinery,-See Nuts, Grocnd. In 1850, 122 ships entered tho river, of which 27 were from England.

Colonial Expenses.-The pecuniary expenses ocessloncd to Grent Britain ly this colony, nud the unsuccessful efforts to suppress the foreign slnve-trado, have been nltogether ennrmous. Mr. Keith Douglas is reported to havo stnted In the IIouse of Commens, in July, 1831, that " down to the year 1824 the cinil expenses of Sierrn Leone amounted to $£ 2,268,000$; and that the same expenses had ameunted, from 1824 to 1830 , to $£ 1,082,000$. The naval expenses, from 1807 to 1824 , hail been $£ 1,630,000$. The inyments to Spain and Portugal, to induce them to relinquish the slavetrade, amounted to $£ 1,230,000$. The expenses on account of captured slaves were $\pm 533,092$. The expenses ineurred on account of the mixed cominission courts
wero $£ 198,000$. Altogether this establishment lisd cost Grent Britain nearly $£ 8,000,000$ !" The prodigality of this expenditure is ummatehod, except by its uselessness. It is doubtful whether it has prevented a single African from being dragged into slavery, or conferred the smallest real advantago on Africa. It, however, enabled the kings of Spuin and Portugal to turn their mercenary homanity to good account.-For further details with respect to Siorra Leone and tho trade of Western Africa, see the Report of the Select Committes of the House of Commons on the West Coast of'Africa, Sess. 1842, nul the Path. I'rper for 1851.

The trade hetween the United States and the whoia of Afriea is most jusignificant in comprarison with that fretween England and simply the western coast ; and it is a fact especially deserving of nttention, with reference to Liberia, that for some timo past, while the importations from England are lncreasing, from the United States they are diminishing, particulsrly cotton goods. It is estimated that there are not less than one hundrel ships regularly trading between tho lhitish ports and the coast of Africa, while a regular line of steamers plies between England and Liberia and other settlements on tho coast. In atdition, it is now proposed to send a steamer up tho Niger River each season for the encouragement of emigrants and the protection of traders; to seeure a free port at Fernamdo Po, by a commercial treaty with Spain, or in sume other convenient locality, as an entreput for British merclıant ships; to maintain the African equadron in its former state of efficiency, and to make Sictra Leone a free port. The following tables show the relative importance of British and Ancrican trade with Africa:
Tife Thade of the IVitrd States with Africa derino

This is independent of the lritish colonies of Slerra I.eone, the trade of which amomuted in 1851 to $\$ 1,121,865$, nud of the Iritish pessesslons on the Goln Coast nut the liver Giamhia, amounting to $81,617,285$ more; and of thoso at the Cane of Good Hope and In South Afrien, swclling the anount $\$ 8,383,090$ more ; making in nll nn aggregate of over $823,000,000$ in 1854 for the western coast of Africa entirc. - Sfe Ih.ackwootis Mayaziue, xxili. 63, xll. 693; Mlonthly Rclier, exxiii. 188; IIust's Merchants' Jfagazine, xv. 502: E:linburgh Revicu, lii. Bj5.

Bilk (Lat. Sericum, from Sires, the supposed ancient name of the Chinese), a fine glossy threarl or filament aqua by various species of caterpillars or larva of the phulirna genus. Of these the Phalena athas produces the greatest quantity; but the Phalarna bombyx is that commonly employed for this purpose io

Europe. The silk-worm, in its caterpillar state, which msy be considered as the first stage of its existence, after aequiring its full growth (about three inches in length), proceeds to inclose itself in an oval-shaped bult or cocoon, whteh is formed by sn exceedingly slender und long filmment of line yellow silk, emitted from the stomach of the inseet preparatory to its assuming the shupe of the chrysalis or moth. In this latter stage, after emancipating itself from lts silken prison, it seeks its mate, which has undergone a similar trnnsformation; and in two or three days afterward, the female having deposited her eggs (from 30 w to 500 in number), both inseets terminste their existence. According to Reaumur, the phalena is not the only insect that affords this naterial-several species of the aranea, or spider, iuclose their eggs in very fine silk.

Raw silk is proluced by the operation of winding off ot tho same time several of the balls or cocoons (which are immersed in hot water to soften the naturn gum on the filament) on a common reel, thereby ferming one smooth even threat. When tho skein is dry, it is taken from the reel and made up into hanks; but before it is fit for weaving, and in order to enuble it to undergo the process of dyeing without furring up or separating tho tibres, it is converted into one of three forms, viz., singles, tram, or organzins.

Singles (a collective nomn) is formed of one of the reeled threads being twisted, in ordor to give it strength and firmness.

Tram is formed of two or moro threads twisted together. In this state it is commonly used in weaving. as the shoot or weft.

Throtes silli is formed of two, three, or nuere singles, according to the substance required, being twisted to gether in a contrary direction to that in which the singles of which it is composed are twisted. This process is termed orgunizing, and the silk so twisted organzine. The art of throwing was originally contined to Italy, where it was kept n secret for a long periol. Stow says it was known in England since the bth of Queen Elizabeth. " when it was gaiued from the strangers;" mud in that year ( 1062 ) the silk throwsters of the metropolis were united into a fellowshij. They were incorporated in the year 1629, but the art continued to be very imperfect in that country until 1719.

Datcs of the Introlurtion of silk:-Wrought silk was brought from Persia to Greeco 325 n.c. Known at liome in 'Iiberius's time, when a lnw passed in the Sennte prohibiting the use of plate of massy gold, sad also forbidding men to debsso themeelves lyy wearing silk, lit only for women. Ileliogabalus first wore a garment of silk A.v. 220. Silk was at lirst of the same value with gold, weight for weight, sud was thought to grow in the snme manner as cotton ot trees, Silk-worms were hrought from Indin to liurupe in the 6th century. Charlemagne sent Offa, king of Mercia, a present of two silken vesta A.1. $\mathbf{7 8 0}$. The manufncture was enconraged ly loger, king of cibily, at l'alermo, 1130, when the Siciliams not only bred the silk-worms, but spun und weaved the silk. The mantfacture sprend into Italy and Spain, and aloo into the south of lirance, a little before the reign of limelis 1. . about 1510 ; and Ilenry IV. bropagated mulberry-tres and silk-worme throughout the Kinglom, lasi. In Einghand silk mantles were worn by some noblemen's ladies at a hall nt Kenilworth Castle, 1286 . Silk was worn by the Emglish clergy in 1534 . IIstorical Sketch.-'The art of rearing silk-worms, of noraveling the threads spun by them, and manufacturing the latter into articles of dress and ernament, seems to have been first practiced by the Chinese. Virgil is the carliest of the Roman writers who has been supposed to allude to the production of silk in China, and the teras he employs show how little was then known at Rome of the real nature of the article:
"Vodleraque ut follls depectant tenata Seres."-Georg. Ibb. fi. In. 1:2l.

But it may be doubted whether Virgil do not in this line refer to cotton rather than silk. Pliny, however, has distinctly described the formation of silk by the bombyx.--Hist. Nat. It is uneertain when it first began to be introduced at Rome; but it was most probably in the age of Pompey and Julius Casar-the latter of whem displayed a profusion of silks in some of the magnificent theatrical spectacles with which ho sought to conciliate and amuse the people. Owing principally, no doult, to the great distance of China from Rome, and to the difficulties $\ln$ the way of the interceurse with that country, which was carried on by land in caravans whose route lay through the Persian empire, and partly, perhaps, to the high price of silk in China, its cost, when it arrived at Rome, was very grent; so much so that a given weight of silk was sometimes sold for an equal weight of gold; at first it was only used by a few ladies eminent for their rank and opulenee. In the beginning of the reign of Tl berins, a law was passed, ne vestis serica viros fralaret -that no man ehould disgrace himself by wearing a silken garment.-Tacitus, Annal. But the profligate Heliogabalus despised this law, and was the first of the Roman emperors who were a dress compesed wholly of silk (holosericum). The example onee set, the custom of wearing silk soon became general among the wealthy citizens of Rome, and throughout the provinces. According as the demand for the article increased, efforts were made to import larger quantities; and the price ecems to have progressively declined from the reign of Aurellan. That this must have been the case is obvious from the statement of Ammianus Mareellinus, that silk was in his time (nnno 370) very generally worn, even by the lowest classes. Nericum ad usuon antehac nobiliunt, munc ctiam infimorum sine ulli discretione proficiens,-1.ib, xviii.

Chinn continued to draw considerable sums from the Roman empire ln return for silk, now becomo indisjensable to the Western World, till the 6th century. Alout the year 500, two I'ersian monks, who had long resided in China and made thenselves acquainted with the mode of rearing the sllk-worm, encouraged by the gifts und promises of Justinian, succeeded in carrying the eggs of the insect to Constantinople. Under thelr direction they were hatched and fed; they lived and laiored in a foreign cllmate; n sufficient number of butterlies was sared to propagate the race, and mul-berry-trees were planted to afford nourishment to the rising generations. A new and impurtant branch of industry was thus established in lurope, Experience and retlection gradually corrected the errors of a new attempt; aul the Sogloite embassadors acknowledged in the sncceeding relgn that the Romans were not inferior to the natives of China in the education of the insects and the mannfacture of silk.-Ginnon, Decline and Full. Greece, particularly the P'eloponnesus, was carly distinguished by the reariag of silk-worms, and ly the skill and success with which the luhabitants of Thebes, Corinth, and Argos carried on the manufncture. Until the 12 th century, Greece continued to be the only Europem country in which these arts were practiced: but the forces of Roger, king of Sielly, havlag in 1147 sacked Corinth, Athens, and Thebes, carrled off large numbers of the inhabitants to Palermo, who int reduced the culture of the worm und the manufacture of silk into Sicily. Firom this island the arts spread into Italy; and Venice, Milan, Forence, Lueca, cte., were
soon after distinguislsed for their auccess in raising sillc-worms, and for the extent and beauty of thelr manufactures of silk.-Ginbon, vol. x. p. 110 ; Biographie Universelle, art. Roaen II. The silk manufacture was introduced into France in 1480, Louis XI. having invited workmen from Italy, who established themselves in Tours. The manufacture was not begun at Lyons till about 1520, when Francis 1., having got possession of Milan, prevailed on some artisens of the latter city to establish themselves, under his protection, in the former. Nearly at the same period the rearing of silk-worms began to be successfully prosecuted in Provence and other provinces of the south of lirance. Henry IV. rewarded sueh of the carly manufacturers as had supported and pursuod the trade for twelve years with patents of nobility.

One circumstance distinguishes silk from the other three great sources of textile fabrics; viz., the silk is already a continuous illament before it reaches the hands of the manufacturer; wherens eotton, wool, and flax are all short in the fibre; and these fibres have to bo combincd end to ent by spinning. The little silk-worm, intent upon making a warm habitation for himself, wraps or builds around him a cocoon or small egg-shaped hellow envelope, filbricated of one vory long and exquisitely-fine filnment of silk. This filament the silk growers-whether in Italy, Turkey, China, or Indis (these being the chicf silk-producing countries)-unwind by various ingenious means; and many filaments are then combined into one to form a thread sufficiently strong to form into lanks or skeins. Such silk is called raw silk, and in this state most of our supply is obtained. It thence follows that the twisting and spiming machinery differs from that enployed for the other three kinds of fibre mentioned above. The silk is transferred from hanks to reels, round which it is wound. It is twisted, and wound, and doubled, and wound again, and transferred from one machine to another, until there is sufficient thickness to form a thread for wenving or for sewing, and sufficient twist to give it strength.

A document of particular interest has been publishcd, showing the arrivals of raw silk in Great Britain in cach of the fifteen years from 1842 to 1856 inclusive. The entire figures are too extended for insertion, but the following abstract embodies the princlpal points of interest. The most remarkable feature is that, whilo Clina sent to Great Britain only 180,124 lbs. in 1842, the supply furnished by her ansounted to 4,576,706 lbs. in 1854 , and in 1856 was $3,723,693$ lhs., not withstandIng the shipment of a large portion of her erop direct to France in consequence of the failure in that country. The next most important imports are those of Egypt. Fifteen years back-nnmely, in 1842-the quantity thence was 1 lh , and in 1856 lt was $2,51 \mathrm{~s}, 356 \mathrm{lbs}$. The Finst Indian supply has gradually declined, the crops In Bengal for the pnst few years having been unsatis. factory. From lirance, in 1842, Great Mritain obtalaed $1,156,498$ lbs., and in 1856 only $157,559 \mathrm{lbs}$. So far from having any to spare, the Frenel manufucturers were compelled to draw upon the stocks In other coumtries. The imports from Italy have been similarly affected. Those from Turkey liavo also diminished, but thls is to he nttributed to the French demand. Among the countrics that Great Britain has drawn upon are the United States, hut the amall quantitles obtained must have been of Chinese growth. The supplles from IIolland and Belglom, it is also assumed, nust have come originally elther from the Indian Arehipelago or France. It nppears that the largest Importution ever known was in 1854, when the total was $7,5 \mathrm{Bin}, 407 \mathrm{lbs}$. Last year, lowever, It was almost as great, and, ns prices have advanced in the two years more than 50 per cent., the meney value was proportionately beyond all former precedent.

The following is an oticial summary of the British importations of raw silks for the years 1852-1856:

The silk exported from Conton consists of two leadiag varieties, known in commerce ly the names of Canton and Nankin. The first, which is raised principally in the province of Canton, is divided inte five sorts. The Nankin silk, proluced in the province of Kiangaan, is divided into two sorts, known in commerce by the names of Tantlee and Tuysaam. It is very auperior to the othor, and usually fetclea more than doublo its price. Bast India nativo silk comes wholly from Hengal. About the year 1760, the East India Compony introduced the Italian mosle of reeling silk, which was productive of a very great improvement in the quality of the urticle; lat we nre not aware that any subsequent improvement has been effectel. The silk goods lrought from Inilia are nut only inferiur, in point of quality, to these of Europe, but also to those of Chinn. Turkey wilk whilly consinted, some yeara back, of what is termed long reel and short reel bratia, a ralher coarse deacription, suited to few buyers, and chiefly used in the riblon trade of Coventry; but of late it has lieen insported of a very far asperior texture and quality, coming successfully iuto competitioa with Italian and Chius silk. The qualities now known as 1 rutian may be classell as follows ; viz., long reel l,rutia, short reel brutia, long reei Meatup (being a finer tiread than common bratia), short reel

Mestup, Selo (a finer sort, generally in loose skeins) Demirdask (a superior kind). At Brassa, the seat of the silk trade in Asia Minor, it is now sold by the oke of 400 drams, and not by the teffee of 616 drams, as formerly: the teffee is, however, still used at Constantinople. The pluins of Brussa and the adjacent villages produce different qualities, varying considerably in size, color, and quality. The village of Demirdask produces tho finest, owing to the care tuken ty the nutives in selecting the best cocoons, and attending curefully to the evenness of the thread threnghout the process of reeling; consequently this description commands a high price, and is approved by our throwsters.

The water of this place is considered favorable to the brightness and glocsiness of the silk, hy which it may be distinguished from that of Hrussa. The silk at Brussa is taken by the country people in small parcels to tho lechestar or customs, where it pays duty. The proprictor, wilh a hroker, then takes it to the silk bazar, where it is handel round to the different stands and sold to the highest bidder, resembling in this respect the mode of selling the orea in Cornwull to the diffierent smelters.

Thus a pers... luying saveral okes at a time, assont as well as be can the different qualities for packing. It is generally bought by speculators for the Constantinople market, and is forwarded to Ghemlek on cumels for shipment per stcamers to Constantinople, where it finds its way to the Mizam, or some broker's romm, where it is sold to the different merchants. The fibet longs are mostly lought for the Freuch and Russian: markets, geucrally the lutter. The loug reels are going out of uso in this conutry, as the more nodern naschinery is not adapted to its use.
The prices of silk at Brussa in Septenber, 1842, were:

Cogts ant ('narorg ov gil.k not'int at libegsa and gilitpll at Congtantinople for lonimn.

By far the greater part of the raw and thrown silk that comes from France is not the growth of that country, but of Italy; being principally conveyed by the canal of Languedoc and the Garonne to Bordeaux, whence It is shipped for England. So much is this the ense, that it appeara from the official accounts published by the French government, that while the aggregate quantity of the French and foreign raw and thrown silk ex ported from France in 1841 amounted to 1,074,144 kilograms, the portion which was of French origin amounted to only 12,294 kilograms l-Aclministration des Douanes, 18.11, p. 241.

We have lefore us an interesting report on the production of siis, submitted to the Acsdemy of Sclences by M. Dımas, to whom was referred a paper on the subject dravn up by M. André Jean, one of the most experienced silk growers, and for some time engaged with the most commendable perseverance and sigmal euccess in the ir provement of the different varietios of silk-worms. The observations of the learned nuthor of the report are based unainly upon the important fact that the production of cocoons in France has climinished from $26,000,000$ of kilograma (about $58,500,000$ llis.) in 1853 to $7,500,000$ (about 16,700,000) in 1856. To comprehend in its proper light the full effect of similar diminutions, in view of a continued nul constantly mereasing consumption, we must Inquire what are the limits to which th production of silk extends? The aggregate productlon of sllk in the world may be estimated at n value of at least $1,000,000,000$ francs, or nearly $\quad \$ 200,000,000$. Of this sum n little over ouethird is assigned to Europe, and the balance to Asia.

If these figures are accurate, must we not conclude from them that the aggregato quantity of silk nyail. able in commercial movemonta is exceedingly limited, and that a general uneasiness in tho silk markets must result from any failure in the cocooneries of Italy, where one-fourth of all the silk in the world is produeed, or in those even of France, which yield about one-tenth of the whole production? The falling off in the production of cocoons in France, which we have already indicated, would represent $n$ diminution in valuo of from $100,000,000$ of francs to $25,000,000$ had the price of cocoons remained the same at both perlods-namely, 1853 and 1856. But the movements of commerce have been so powerless in replacing the doficit of $19,000,000$ of kilograms (nearly $42,750,000$ pounds), that the price has advanced from 4 francs 50 centimes ( 84 cents) to 8 france ( $\$ 119$ ) per kilogram ( 2.20 lhs.), so that the loss falls equally upon the producer and the consumer. Foi the exports of sllk from China, see articles Cuins, Canton, and Silanehiai.
silk Mfanufactur in the United States.-The introduction of silk culture into the North American colonies dates hack to the first settlement of Virginiu. Jumes I., who wss anxious to promote this branch of industry, several times urged the "London Company" to encourage the growth of mulberry-trees, and uddressed a letter to them on the subjoct $\ln 1622$, conveyIng strict injunctions that they should use every exertion for this purpose, and stmulated the colonists to apply themselves diligently and promptly to the breed-
|ing of silk-worms, and the eatablishment of silk works, bestowing their labors rather in producing this rich commodity than to the growth of tobacco-an article to which his majesty had recorded and published his violent aversion. The company thus incited, showed much zeal in their endeavors to accomplish the king's wishes. A considerabli number of mulberry-trees was planted; but little silk was producerd, owin'; to difficulties involved by thelr dissolution soon after. In about the year 1651 the rearing of silk-worms ngain became a subject of interest in Virginia, and premiume were offered for its encouragement; but it does not appear that the business was ever prosecuted to any extent. The silk culture was introduced into Louieiana In 1718 by the "Company of the West." In the infant settlement of Georgia, in 1732, a piece of ground belonging to government was allotted as a nursery plantation for white mulberry-trees, and the nttention of some of the settlers was soon engeged in renring silk-worms. In 1726 a quantity of raw silk was raised in that colony, which was manufactured into a piece of stuff, and presented to the queen.

In 1749 an act of Parliament was passed for encouraging the growth of silk in Georgia nnd Carolina, exempting the producer from the payment of duties on importation into London. A bounty was also offered for the production of silk, and a mun named Ortolengi, from Ituly, was employed to instruct the colonists in the Italian mode of management. A few years beforo the Revolution considerable quantities of raw nuterial hegan to be raised, which was said to be equal, in somo cases, to the best Piedmont silk, and worked with less waste than the Chinese article.

In Carolina the cultnre was undertaken by the small firmers. In 1766 the IIouse of Assembly of this provinee voted the sum of $£ 1000$ towarl the establishment of a silk flature at Charleston, under the direction of Mr. Gilbert.

In Counecticut, attention was first directed to the rearing of silk-worms in 1760. Dr. Asjinwall, of Mansfield, from motives of patriotism, used his hest exertions to introduce thls importinnt branch of rural ceonomy. Ile succeeded in forming extensive nurscries of the mulberry at New IIaven, Long Island, Pennsylvania, and other places. Ilalf an ounco of mulbery seeds was sent to each parish in tho colony, with such directions as his knowledge of the bisiness enabled him to impart. In 1783 the Legislature of Connecticut passed an act granting a bounty on mutherry-trees and raw silk. It may here be stated to tho honor of Connecticut that she is the only Stato in the Union which has continued the buainess without anspension, nnd probably has produced more silk, from the time of her conumencement up to the year 1830, than all the other States.

In the year 1769, on the recommendation of Dr. Franklin, through the American Philosophical Society, n filature of raw silk was established in Philadelphia, ly private subseriptlon, and placed under tho direction of an litelligent and skillful I'renchman, who, it is said, proluced samples of reeled silk not inferior in quality to the best from France and Ituly. In 1771 the managers purchnsed 2300 lbs , of cocoons-ill the product of Penusylvanin, New Jersey, and Delaware. The enterprise was interrupted by the Revolution. A similar undertaking was again nttemptel in Philadelphia ia 1830, under the supervision of NI. J. D'llomergue, nad cocoons were brought in abundance to the establishment from various parts of the conntry, and so continued for some time afterwarl ; but for want of capital the enterprise failed.

In about the year 1831 the project of rearing silkworms and estallishing filatures of silk was renewed in varlous paris of the Union, and the subject was deemed to lis of so much importance, that it not onlyattracted the attention of Congress, but afterward recelved encouragement from the Legislatures of several

States，by hounties offered for all the raw silk produced within their limita for certain periods of time．The business soon began to be prosecuted with extreme ar－ dor，and cuntinued for several yours，resulting in the establishment of several nurserice of mulberry－trees， and ending in the downfall of the famous＂Morus Mnlticaulis speculation，＂in 1845.

The amount of raw silk exported from Geergia In 1750 was 118 lbs ； $\ln 1755,138 \mathrm{lbs}$ ；in $1760,558 \mathrm{lbs}$ ； In 1766, more than $20,000 \mathrm{lbs} ; \ln 1770,290 \mathrm{lbs}$ ．From South Carolina，In 1772，4i5 libs．In the year 1760， there were raised on Silk llope Plantation，in South Carolina， 630 lbe．of cocoons；in Mansfield，Connecti－ cut，in 1793， 265 lbs ．of raw silk；in $1827,2430 \mathrm{lbs}$ ．； In 1831，10，000 1bs．；in Connecticut，in 1844，176，210 lis．；in the United States，the same year， 396,790 the．

A remarkablo circumstance is said to have occurred in the silk factory of M．Garibalili，at Cromona．It is stated that in this fuctory a quantity of silk－worms， instead of forming tho cocoon as usual，actually wove a kind of silk ribbon，of the breadth of un linch and the length of twelve feet．－Year－Book of Facts， 1857.

According to the census returns of 1840，the amount of silk cocoons raised in the United Statee was $61,5 \mathbf{0}_{2}$ lhs．；of $1850,10,843$ liss．From the above it is obvious that the－wrduction of cocoons has decrensed，sinco 18．10，46，4 thes；and aince $18+4,382,027$ liss．

silk-cotton. A beautiful eilky kind of cotton is obtainel from the Borrbus und other trees; it is short and remarkably elastic, and would bo very largely usel were it not fragile and tender. Tho Hindoos spin it into a loose, conrse, warm kind of cloth. In Europe it has not yet been much employed; but in America a method has heen discovered of upplying it as a covering for so-called silk hats, for which it is said to be admirably alapted. As thico is an almost boundless supply of the trees yielding theso delicate fibres, there may here be a great manufacture in tho future.

Eilver (Ger. Silber; Du. Zilver; Da. Nalv, Swed. silfver; Fr. Argent; It. Argento; Sp. Plata; Port. Prata; Russ. Serctro; Pol. Srebro; Lat. Argentum; Gr. $u_{1}$ y yopos; Arab. Fuzzeh), a metal of a the white color, without eithor taste or emell; being in peint of brilliancy inferior to none of the metallic borlies, if we except polished stecl. It is softer than copper, hut harder than gold. When melted Its specific gravity is 10.474 ; when huminered, $10 \cdot 51$. In mullentility it is inferior to none of the metals, if we except goid. It may be beaten out inta loavos only pouroo of an inch thick. lte ductility is oqually romurkable: it may be drawn
out into wire much finer than a human halr; so fine indeed, that a single grain of silver may bo extended aloont 400 feot in length. Its tenacity is such, that a wiro of sllver 0.078 inch in diameter is capable of supporting a weight of $187 \cdot 13$ liss. avoirdupois withont breuking. Silver is easily alloyed with copper by fusion. The compound is hurder and more sonorous than silver, and retains its white color even when the proportion of copper exceels ono half. The hardness is at a maximmu when the copper amounts to one-fifth of the silver. The standard or sterling silver of Britain, of which coin is made, is a compound of 121 parts silver and 1 copper. Its speelfic gravity is $10^{\circ} 2$. Tho apecific gravity of Paris standaril silver, composed of 137 parts silver and 7 copper, is $10 \cdot 175$. The French silver coin during the old govermment was not nearly so fine, being composed of 261 parts silver und 27 copper, or 9 g parts silvor to 1 part copper. The Austrian silver coin contains $\frac{13}{2 / 3}$ of copper. The silver coin of tho ancients wus nearly pure, and appears not to have been mixed with alloy.-Tromson's Chemistry.
The most productive silver mines are in Americn, particularly in Mexico and Peru. There are also silver mines in Hungnry, Saxony, Spain, and other parts of Earope, and in Asiatic Russin.-See Purcious Metals.
Besiles being used as a coin, or money, silver is ex-
tensively employed in the arts. The value of the silver plate annually manufactured is very considernble. Large quantitlea are also used In plating. silver oxista in most parts of the world, and is fonnd mixed with other ores in varlous mines in Great Britaln. The silver mines of Sonth America are far the rachest. A mine was discovered in the district of La I P az in 1660 , which wus so rich that the silver of it was often cut with a chisel. In 1749 one mass of silver, weighing 370 lbs., was sent to Spain. From a mine in Norway a piece of silver was dug, and sent to the loyul Museum ut Copenhugen, weighing 560 llse., and worth c1680. In England silver plute and vossels were tirst used by Wilfrid, a Northumberland hishop, a lofty and mulitions man, A.D. 709.-Tynenti's Ilist. of Eugland. Silver knives, spoons, and cups wero great luxuries in 1300.

Silver Coin. Silver was first coined by the lydians, some say; others, by I'hidon of Argos, 869 u.c. At Rome it was first colned by Fabius I'ictor, 269 u.c. Used in llritaln 25 n.c. The Saxons colned silver pennjes, which wero 298 grains weight. In 1302 the penny was yet the largest silvor coin in England.- See Suluinges, ete., and Corn.

The scarcity of silver in Western Europe, Including Great Britain, and in this country, has given rise to the question, "Where does the silver go?" In connection with this question, we make the following extract from a paper read by Prof. I. 11. Walsh, of the Dublin University:

At the time when Pliny termed it the sink of the precious metals, silver was a favorite article of export to the biast. It has continued so sinee, but tho trade of late has assumed an extraordinary magnitude. In the five years prior to 1850 over $\$ 110,000,060$ worth of silver have heen exported to tho Fast through Finghand alone, and from other countries a similar movement has heen in operation. The export in 1825 was 832,000, 000 , and this year ( 1856 ) it is proceding at tho rate of over $-45,000,000$ per unnum, judging from the returns that have been published for the tirst four months. ['nlike the old movement, tho present ean not be permanent. The former was seldom more than might le accounted for as the distribution of silver to some of its chief consumers-the nations of the Fastaccording us new supplies were raised elsewhere. It was, in tart, the ordinary movement from the producer to the consumer. Ilumboldt estimated the ammal production of silver in Mexico nt $\mathbf{1 , 1 8 4 , 0 0 0} \mathbf{~ J b s}$., or aloout $\$ 25,000,000$.

But now silver goes fuster to the liast than it is produced throughout the world. Jlence the process can not be permanent, but must come to an end as soon ns the redist ribution of the old stock has been effected; for the annual production of sil ver isonly alsut $\% 10,000,400$; and since the export to the Enst through Eingland alone is at tho rute of over $840,000,000$, it follows that it can not the the new supplies of silver which meet that domand and all others for the same metul, but that there must tie some auxillary fund to lie drawn upon. Such a fund is furnished by a cessation in the demand for silver in several conntries which leforo employed it most largely, but now uso gold insteal. Silver, which used to be coined in France and the United States at an average rate of $\$ 20,000,000$ per annum, is now little enpluyed, while much of the ohd coin of that metal is metted down and exportel. In France, it is suid that in one year ( $18^{\circ} 3$ ) so much as $f 60,000,000$ were disposed of in this manner, and that the operation has been sinco proceeding at a still is reater rate. In Nextwo there are eight or nine mints, one of which is national, laviog one general law of colnage, but ladependent of each other, and subject to no general contrul. There are some characteristic differences in rebpect to grsdes of fineness and aceuracy, but they seem not suflicient to call for a distinction, us the only external meuns of identifying is in the mint mark.

Silicer Minez of Mexico.-It ls not generally known in this country that tho silver minos of Mexico, which yichled to tho Spaniards, hetween the conquest by Cortez and their expulsion by the Mexicans in $1 \times 2 i$, $22,028,000,000$, as shown by the records of the Nints, have sinee that jeriod steadly and rupidy increased their product, until from an annual yleld of about $\$ 20,100,000$ it has risen, according to some nuthorities, to upward of $\& 10,000,000$ in 1856 . We have no oflicial datia "poon which to affirm or deny this. This vast product is from the working of a very small number of mines, whilo that portion of Mexico north of latitude $24^{\circ}$, and on our own frontier, which, aecording to Haron IIumboldt and others, contains the richest rains -uften beginuing near the surface, and ahove waterlevel, and somethes yielding vast quantities of pure native silver-havo lain for many years entirel unworked mind neglected. This has been in consequence of the insbility of the few Mexicans scattered over those regions to cone with the wild $A$ pache and Cammuche Indians, who have held free scope there until wilhina few years past. 'Jhey are now kept out from the states near tho lower part of the Rlo Grande by tho filting up of the comntry, and liy the vicinity of our newly-estahlished military jousts. Up to this time the only forcigners who have "wailed themselves of the opportunities of annussing fortunes from these mines are the linglish, and a few Germans; and they have confined themselves principally to the poorer veins of the thickly-settled Contral and Southern parts of Mexico. Jut they are now meeting witb the rewards of their enterprise.

Recently, several companies have been formed in the United States for working mines in Northern Mexico and Arizona. One of these is composed, in part. of oflicers of our army, who have geen and exabined the localities, and some of whon have resigned theit commissions for the purpose of devoting their time to tho opening of these mines. Those in Arizomin are so far distant, and in a country so uncultivated anif so beset by Indisna, that it may be the work of time and of much expense to overcome these obstacles. llat that American enterprise will finally overcome them none can doulit. On the Jower Rio Girande, however, in the state of Nuevo Jeon, within forty-live miles of steamboat navigation, and but forty-five miles from the Texas line, and but fonir days' sail from New Orieans, are sume of the richest mines In the Repי'ilie of Mexico. One of these is being reojened by a very' strong New York company, called the Vallicillio, ind with good prospects of large returns.-Letler from Sto Mexico. See artides Mexico, Pafchoin Metals, and Conss for more oxtended information in regarl to the production of silver.

The product of ellver at dlfferent periods of the present century is estlmuted as follows :

In regard to the production of silver ln Mexice, it nppeurs that the amount of colnage in that country in 1851 was $\$ 23,166,000$, of which $\$ 2,004,000$ was in sil ver. From the year 1690 to 1800 the production of the gold and silver mines of Mexico is estimated at $\$ 1,351,000,000$, and from 1800 to 1856 at $\$ 160,000,000$, us the production of the silver mines alone.

Singapore, an island and British settlement at the eastern extremity of the Straits of Mulacea, the town heing in lat. $1^{\circ} 17^{\prime} 22^{\prime \prime}$ N., long. $103^{\circ} 51^{\prime} 45^{\prime \prime}$ F. The island is of an elliptical form, about 27 miles in its grentest leugth, nnd 11 In breadth, contuining an estimated areu of 275 agnare miles. Hut the whole Iritish settlement embraces a circumference of above 120 miles; in which are included about 50 desert islets, and the seas and straits within 10 miles of the coast of the principal island. The latter is separated from the main land liy a strait of the same nano, of small breadth throughout, and scarcely, indeed, a quarter of a mile wite in lts narrowest part, which, in the early peried of Europeun navigation, was the thoroughfare between India nnd China. But the grand commerciul highway between the eastern and western portions of maritime Asia now passes nlong the south side of the ishnd, on which the town is built, between it and a chain of desert islands about 9 miles distant; the safest and most convenient channel being so near to the island that ships in passing and repassing come close to the ruals. The town is wholly indelited for its rapid rise and growing importance to its position on this strait. This has rentered it not merely a convenient entrepsot for the trade between the Western World and India on the one hand, and China on the other, but nlso for that between the former and the Eastern Archipelago, the Philippines, etc. It is situated on a river, or rather salt ereek, navigable by lighters about three quarters of a mile from the sea. Ships lio in the roads, or open harbor, at the distance of from 1 to 2 miles from town, aecording to their draught of water. The ussistance of a number of convenient llyhters, which are always in readiness, enables them to load or unload, with searcely eny interruption, throughout the year. The creek is accessible to the lighters, and the gootis nre taken in and discharged at convenient quays, at the cloors of the principal warehouses.

The climate of Singapore, though hot, is healthy. Falrenheit's thermometer ranges from $71^{\circ}$ to $89^{\circ}$. Being only about 80 miles from the equator, there is, of course, very little vnriety In the seasons. There is neither summer nor winter; and evas the periodical ralns are short, nul not very weil marked-moderate showers of ratin fulling for about 150 days each year. The suttlement of Singaporo was formed in February, 1819, and its sovereignty and property, in their present extent, confirmed to the Britlsh government in 1825, by a convention with the King of the Netherlands, and a treaty with the Malay princes to whom it belonged. I'revlously to its being taken possession of by the English, it had been inhabited for about eight years by a colony of Malays, half fishermen and hulf pirntes. When the first census was taten in January, 182., the pepulation was found to amount to 10,683 . In 1828 it had increased to 15,834 , in both cases exelusive of troops, cump followers, Indian conviets, and a floating population of nhout 3000 . In 1837 it amounted to 29,4184 , of whom 13,749 were Chinese settlers, and 9132 Malays, the Europeans being but few in number; nud at present (1853) the population exceeds 50,000 , of whom ubout half are Chineso.

The principal merchants and agents are Engllshmen, of whom also there are a fow shop-keepers, auctloneers, etc. There are also some respectablo Chinese merchants; and the bulk of the ahop-keepers, with the most valuable part of the laboring population, consist of Chinese. About 5000 adult males arrive annually from Chlua by the junks, about 1000 of whom remain at Singapore, the rest dispersing themselves among the nelghboring Dutch, English, and Malay settlements. The boatmen are chiefly natives of the Coromundel coust ; and the Malays employ themselves ns fishermen, in cutting timber, and in supplying the settlement with the rude produce of the nelghborhoot. There are good daily markets, open at all hours, and well supplied with vegetables, fruits, graln, fish, pork, and green turtle-the latter the cheapest animal food that can be proctured. Thero are no export or import duties, nor anchorage, harber, light-honse dues, or any fees; but a register la kept of all exports and imports. Reports must be made to the master attendant by the masters of vessels, and involcee delivered to the superIntendent of imports and exports. Though there are nelther duties on imports or exports, nor on the ships frequenting the port, the revenne of Singapore amount ed in 1842-43 to 509,000 rupees, while its expenditure, clvil and military, amounted to only 494,029 rupees.

United States Consular Returns from Singapore, Jan. 1,1855.-The commercial interconrse of the United States with this consular distrlet is governed partly by general acts of the Parliament of Great Ilritain, and partly by special legislation of the East Indla Company, through the governor and council at Calcutta. The present port regulations are aupposed to bo fixed, being for un indefinite poriod. Singapore is a free port, and the privileges permitted to commerce, as well as the restrictions imposed on lt, are applicable, without distinction of flag, to all nutions alike. There aro no other port cherges than tho Pedra Branea or Straits llght dues, which are three cents per reglstered ton on merchant vessels. National vessels of all countries are exempt from this tnx. The transhipment of goods to any other port in the East India Company's possession, or to any foreign port, is freely permitted to vessels of the United States, but without any special privlleges or restrictions. The moneys, weights, and measures known and in common use at Singapore, are neither those of the mother country nor those made use of in the continental possessions of the East India Company. Merchants keep their aecounts in Spunish dollars, divided into one hundred parts, called cents, precisely as in our federal currency. Fractional parts of thls cent are also coined, and are much in use; these are the half cent and the quarter cent, the latter being called a pie, or pice. The post-office, however, and all other offices of the British East Indian government, keep accounts only in rupees, annas, and pice.

Moneys.-4 pice mako 1 cent; $2 \frac{5}{8}$ cents make 1 numa; 16 annas make 1 company's rupee (marked $K$ ); 100,900 rupees make 1 lac; 100 lacs mako 1 erore. The company's rapee, which is here meant, is valued at 45 eents at Calcutta, whllo here it is now current at only 42 cents. Besides this coin, there is tho old Sicca rupee (now nenrly obaclete), worth here 45 cents, and the Java rupee, wbich is just now fluetuating at 35 to 36 cents.

Weights.-Measures of eapacity aro rarely used, nud then only with eertain articles, auch ns tobaceo; even oils and other fluids being sold by weight. Tho denominations of the weights used in Singapore are taken both frum the Maluys and the Chinese. In naming and redueing them to the United standard value, I omit all those which are not employed comnercially with and by foreign resldents:

16 tacls make 1 catty. (The catty is 1 lb .5 oz .5 g grs . avoirdupols, or if ib.)
100 cathes make 1 Chitucse picul marked ( 1 l. or Pls.) $=1334$ lbs. avoirdippois.
2 Malay picula make 1 char.
40 Chiaese picuis make 1 koyan (or coyan).

The Malay eatty weigha 24 Spanish, and the Chinone catty welgha 3221 Spanish; hence 15 eattlea MaIny $=16$ catties Chinene. 13y the Malay, or grenter pleul, merchenta purchase pepper, tin, ete., from the native vessela, but sell by the Chinene or lazar plenl of $1 a 3+$ lbs. avolrdupois. Rice la mold by the koyan of 40 pls. ; salt by the same measure, but wolghe now 52 pleuls ; gold anil sllvor thrend by a partleular catty of 336 welght; golil dust by the bunkal, whleh weighs \% $2=8: 12$ grs. 'lroy; Java tobaceo la aeld by the corge of 40 baskets; Indla plece geods by the corge of 20 pieces; wheat and grain by the bag, eontaining 2 liengal mannds (the maund ia $61 \frac{1}{\frac{1}{c} \text { catties). }}$

Freight.- The rates at which shlpe are freighted or chartered depend on tho demand for tonnage and the supply ; on the kind of cargo to be trunsported, and on the saillug qualitios of the vessela. These very so greatly that it is imposslble to givo them even approximately. At the present time, for miscellaneons Strilta' prowiuce, shippers are paying $\$ 18$ (6) $\$ 20$ per ton of 50 feet to Now York or Boaton.

C'ommianions.- Whilo tha trading ships of all other nations pay the uniform commiasions of $\mathbf{1 0}$ per cent. (as eatablishod by the Bingapore Chamber of Comunerce), which include expenses of overy sort for purchasing or selling, a special exception ls mado for whit is culled the "Ameriean trade," meaning that of tho United Statee. The establishod chargea on thia are: Commissions on sales of goods or purchase of prodinec, free of risk, either in sales or on advances on produce, 21 per cent. (Both of these are guaranteed for an extm - + per cent., or 5 per cent. in all.) On negotiating billa of oxchange, 1 per cent. Other husinosa on the usual terms. Interest on all moneys advanced is at the rato of 12 per ecut. per annum, but on dishursements on account of ships while in port, 5 per eent. Added to these expenses are boat and cooly hire and warehousing, the charges for which differ whely, being govemed by circumatancea.

The imports from the Linited States, in comparison with the exports thither, are of tribling amonint. I thewfore state the modes and terma of purchase, an woll as those of aule. Sales of imports are effecterl in the usual manner by private arrangement with the buyer, and sometimes also by publie auction. The terms are, eash down.

I'urchase of ('argo.-This is tone by private cont ract (never at public sales) by the house to which the master of the vessel is consigned; the sald honso buying the gouds from either the native or from the Chinese dealers, who are what is commercially styled the "firat hands."

Sinhara. The sinhara, or wator-nut (Trapa i), is a native of the Cashmere, but grows abundantly in the lakes near the eapital, especially in the Wurlor lake, and yields an average return of $\mathbf{1 0 , 0 0 0 , 0 0 0 ~ l b s . ~ o f ~}$ nuts a year. They are scooled up from the bottom of the lake in small nets, and afford employment to the inhermen for meveral months. Theso nuts constituto almost the only food of at least 30,000 persons for ilve months in the year. When extracted from the shell, they are eaten raw, boiled, roasted, fried, or dressed in various ways, after being reduced to flour.

Binope, a town of Asia Minor, on the south const of the llinck Soa, lat. $42^{\circ} 2^{\prime} 30^{\prime \prime} \mathrm{N} .$, long. $35^{\circ} 9^{\prime} 45^{\prime \prime}$ i:. I'opulation uncertain, probably from 8000 to 10,000 . Sinope is situated on a low narrow isthmus, connecting the high rocky promontory of Ada with the main land. Its port, which is the liest on thls coart, on the wuth side of the town, is protectorl from the north and northeast gales by the isthmus and promontory already mentioned. Ships anchor within a third of a mile of the town, in frum 13 to $\mathbf{1 7}$ fathoms; or nearer to it, in from 5 to 7 fathoms. There is a roadstead on the north side of the lathnus, but it is open and exposed. Sinope is one of the princlpal atations of the Turkish fleet; and there aro docks and arsenals for ita
accommodation and outfit. Its exports are Inconsliderable, the principal being timber, salt, cordage, fish oll, etc. In ancient timea Sinope was a city of great wealth, magnitude, and importnnee. It wan the birthplace of Diogenos the Cynie; and Mithridates made it the caplal of hla ilominions, After lts conquest by the Romana under Lueullus, it became the seat of a colony, and continued for a leagthened period to enjoy a good deal of consderation. Should clvilization and the arta onec more revive in the ancient Pontus, and tho other countries to tho mouth of the Black Sen, the excellence of its port could not fall to restoro to Sinope somo portion of its former grandeur. Even now a conalderable Intercourso la beginnlng to take place with the countries east and south of Sinope. Dlarbeker on tho Tigris, In lat. $87^{\circ} 54^{\prime}$ N., long. $39^{\circ} 53^{\prime} 45^{\prime \prime} \mathrm{E}$. , is ono of tho prinelpel seats of Eastern commerce; nud caravans set out regularly from it for Aleppo, Smyrna, and Constantinople: but any one who consilts a map of Asla Minor, and of the contlguous countries, will see at once that Treblzond and the nelghboring ports on the southeast coast of the llack Sea are the natural channels through which Armenla, Koordistun, and the northweatern parts of Persia may hest maintain an intercourso wlth Europe. For further partlcularg as to Simope, see Tornxpront, Voyage du Levant, and Nume's Sailing IVirections for the Black Sea.

Blains. The term is applled in commercial lin. grage to the skins of those animals-ns deer, goats, klis, lambs, etc.-which, when prepared, are used in the lighter works of book-binding, the manufacture of gloven, parchment, ete.; while the term bldes is applied to the skins of the ox, horse, etc.; which, when tanned, are used in the manufacture of shoes, harness, and other henvy and strong artleles. Lamb and khd skins are principally used in tho glove manufacture; 120 skins being supposed to produce, at an average, 18 dozen paits of gioven.-.Sec limes and Leatimis.

Glate (Roof) (fier. Schiefer; Fr. Ardoise; It. In. magna, Iastm; Spl. Pizarra), a fossil or compact stone (argillaceous schistus) that may be readily split into even, amooth, thin laminae. There are several varistles of this valuable mineral, the prevalling colors being gray, hlue, and brown. lut the tints are very various; and slates nre often marked with streaks of a different color from the ground. Slate is principally used in the covering of honses, for wheh purpose it is infinltely superior to thateh or tlles, and ls far less expensive than lead. Good roofing slate should not absorh water; and lt should be so compact as not to he decomponed by the netlon of the atinosphere. When properly selected, roof slates aro of ninost perpetual duratlon; but those which are apongy ard imbilie molsture speedily get covered with mass, and require, at no very distant period, to be renewed.

Blaves and Blave-trade. A slave, in the ordinary senso of the term, Is an Individual at the alsolute disposal of ancther, who has a right to emplos and treat lim as he pleases. But the state of slavery is susceptible of innumerallo nodifientions; and it has been usual, In most countries where it has been long established, to limit in varlous ways the power of the master over the slave. The slave-trade is, of course, the business of thoso who deal in slaves. A great deal of learning has been employed In trating the history of slavery, though the suliject is still far from exhausted. It seems most probablo that lt orighally grew out of a state of war. In rude, uneivilized eommunities, where the passion of revenge acyuires a strength tuk uown in more advanced states of soclety; captives taken in war are adjulged to belong to the victors, who may either put them to tho sword or reduce them to a state of servitude. In antlquity the ldeas of war und slavery were inseparable. l'rohably lin very remote ages prisoners were most commonly put to death; but the selfish graduslly predomlnated over the more passionate feelinga, and for many ages it was usual to reduce thent
nshlerish oll, great 9 birthnaiso it lest by at of $n$ o enjoy on anil lea, the Sinope , eker on " E., is ; and myrna, 3 п map will see rorts ar nattrai and the tain an ulars as int, and
to the condlition of slaves; being either soll by their captors to others, or employed by them as they might think fit. The practice of reducing men to a state of slavery, having once t:egun, was extended in varlous ways. The progeny of slavos or of women ln a atato of alavery were slaves; men born free might seil themselves aa slaves; and parnts had authority, in Julaa and liome, to dispose of their children for the same pur-pose.-Micifaklis on the Laws of Moses, II. 168, Engl. ed. It was the law of Rome, und of meat other ancient states, that the persons of debtors who had contructed obligations which they could not dischargo should become the property of their creditora. "Servi," asys dustinian, "auten aut nascuntur aut fiunt: nascuntur ex ancillis nostris, jiunt aut jure gentium, id est ex captivitate ; ant jure civili, cum liber homo major riginti an-nos al pretiam participunduan sese venundari pasus est." --Instit., lit. i. tit. 3.

The African place-trade was commenced by the Portugueso in ladiz. It was, howover, but of trifing extent till tho commencement of the 16 th century. In consequence, however, of the rapid destruction of tho Indians employed in the mines of St. Domingo or IIajti , Charles V. huthorized, In 1517, tho intruduction into the islund of African slaves from the estublishments of the Portuguese on tho coast of Guinea. The concurrence of tho emperor was ohtained by the intercesaiun of the celebratel Las Casaa, bishop of Chiapa, who labored to protect the Indians by enslaving tho Africans; though, as the latter wero certainly more vigorous and capable of bearlng fatigue than the former, the measuro was not in reality go contr idictory as it would at first stght appear to be,-lioneletson's /Iist, A merica. The inportation of negroes into the West Indies and America, having once begun, grajually increased, until the traffic becamo of great extent and importance. Sir John IIawkins was the first Englishman who engrged In It; and such was the ardor with which our countrymen followed his example, that thoy exported from Africa more than 300,000 f ives het ween the years 1680 and 1700 ; and hetween 1700 and $1786,610,000$ Africans wero inported into Jamaica only; to which adding the importa into the other islands ond the continental colonies, and those who died on their passage, the number carried from Africa will appear immense.bryan Edwalida, Hiat. Wegt Indies. The importatione by other nations, particularly the French and l'ortuguese, were also very great. We may, howover, shortly observe that there can be no doubt that slavery has always existed in Africa; and it is sufficiently well known that previously to the commencement of the traffic auch of the cajtives tuken in war as could not be advantageously employed as alaves were most commonly put to death-cannibalism, the exposure of infants, and humnn sacrifices being then also very frequent. The slave-trade, by opening a ready and jrolitable market for slaves, assisted in putting an cnd to
theso enormilties, though it be, at the samse time, true that the "esire of profiting by their sale has tempted the petty princes to make war on each other for the chance of making captivea, and lins given a stimulua to man-stealing und other atrocities.-Geog. Dict. art. Africa. But thoso who inquire dispassionntely Into the aubject will probably conse to the conclusion that, instead of being injured, the silaves have galned by be ing carried frem the Old to the New World. Spenking generully, the negroes aro in the loweat stato of abasement, poasessing merely the rudiments of the most in dispensable arts, a prey to the vilest superatition and tyranny, without any tincture of learning, and with little or no regard for the futire. The circumstances under which they are placed in their native land moy, perhaps, uccount for the low stute in which we find them; but, howover explmined, the genuine negroes of Africa are admitted, sven hy thoso least inclined to depreciate them, to be for the most prart "either feroclons saviges, or stupht, sensual, and indolent."-Piucitand, History of Man, ii. $33 \mathrm{sH}, \mathrm{Bd} \mathrm{ed}$.

Abolition of Slarery,-The year 1883 was menornble for the abolition of slavery throughout the British colonies. In enaeting this celebrsted statute, Parliament endeavored to reconcile the opparently conficting claims of hamanity and justlce, by providing for the emancipation of the alaves without prejudice to the just rights and claima of their proprictors. This was effected by assigning to the latter the 8 mm of tuenty millions sterling, which wns distrihuted among them on thelr complying with the provislons of the act. This is, perhaps, the grenteat pecunlary sacrifico ever voluntarily made by any nation in vindiention of the right of property. Juit it was not too grent for the oljject in view; for had that right been violated in this instance, a precedent would havo heen set for its violation in others, and the consequences would have been most disastrous. The measure, in fact, reflects quite as much creclit on the wisdom and honesty as on the generosity of the llritish nation. Thls celebrated statute cnacted that slavery should cense in all British colonial possesaions on the 1at of August, 1834 ; when the slaves ware to becomo apprenticed laborers, their finul and complete omancipution taking place partly on the 1st of August, 1838, and partly on the 1st of August, 1840. I But n clumor having been raiscl ngainst the durntion of the cyprenticeship, its period was shortened, and tho backs became universally freo in 1838

Distribution of Slare Compensation.-The commissioners for tho apportionment of tho $£ 20,000,000$ granted by Parliament as compensntion to slave owners, under the act 3 and 4 Wtll. IV., cap. 73 , issued the following table, showing the average value of $n$ alave in ench col. ony; the nuinber of alnvos in each; the totnl value of the slaves, supposing the annual valuo of each were realized; and the proportion of the $£ 20,000,000$ received by each colony.

| Colony. | . | A verage Value of a Slave froma 1899 to 1N30. | Number of Slavee by the lent Registralion. | Relative Value of ise sloves. | Proporion of the E9ne 000,1000 to which eat licolony ts entutled |

Dr. Llvingatone, who la acknowlealgeil as leing conversant upon subjecta affecting the shave-trade, may: " I have thus ventured to atate my conviction in faver of our present aystem, formed as it was from personal observation, and in the teeth of a strong binu to the contrary, that you may, necording to your custom, and If you shonld tieen it alvisable, give thila to your readors by way of helping them to both slilee of the question. It is not to be supposed for a noment that the present ayatem of coerclon will reault in a rallienl cure of the evil. The cultiration by the Africuns on their own soil of the rau" moterinla of our manyfactures, and the inAlucace of Chriatian cicilization alone will effict a jermunent suppreanion of the slareatrade. But all hope of this must be given יpi if the coust tribes are to to hounded on hy the Eumpeans to hunt down the defenseless inland inhabitanta, on the abaurd pretense of promoting 'free emigration.' It is no mere true that Africans take dellght in bunting, huying, ard seiling each other than that the linglish glory in hangiag themselves in November. I know that this is the case throughout the interior, anil I was aorry at the enuae of a different state of things on the borders of elvillzation. But we are lgnorunt of the aources whence atatements such as that referred to ariso. From meoting it In various quarters, and more erpecially in the mouths of slavehulders, or would-te slave employers, 1 am incilned to think that both It and that about the inefficioncy of Iler Majenty's erulsers have had their orlgin in thone who aro, directly or indirectly, abettors of slavery, and that they are promulgatel by many who, like myself, hal not the means of testing their truth."

Pussing over the intervul from the periot when the slavo-trado was declared to be piracy to the year 18.40 , we find that tho number Introduced into Brazil from that year to $1 \times 51$, inclusive, was 848,601 , or a little more than 30,000 a year. During the same period the number imported into Cuba amounted to an average of about 6010 a year. The following tables show the importations into Brazil and Cuba from 1851 to 18i-4:

For the four years from 1851 to $185-$, inclusive, this gives an average importation into both countries of something over 34,000 a year. As perhaps not more than threc-fourths of the whole number was reported to the mixed commission, the yearly average for thls periol may be set down at 15,000 . From the year 180.1 there were very few, if any, slaves lmorted into Iirazil, in consequence of the laus passed by the government of that country against the traffic. The slavetrade ls now malaly, if not wholly, carried on with Cuba, which imports about 20,000 slaves every year ; which, added to the total of the trade with both IIrazil and Cuba since the year 1850, gives the wverage number importel every year, up, to the present time, st about 30,000 . If the profit realized on the purchase of one slave amounts, as we have shown in the followIng tables, to sil65, the total profits of one year's trade will therefore he about $\$ 11,000,000$.

As a curious exhibit, we give the statistica showing the estimatell part which this country takes in this nefarious traffle. It is eatlmated that in the port of New York alone about twelve vessels are fitted out overy year for the slave-trade, and that lloston and Ihaltimore furniah esch about the same nunber, making a fleet of thirty-six vessels all engaged in a commerce at which the best feeling's of our nature revolt. If to these bo
udded the nlavers fitted out in other Eastern porta lee. arden Iloston, we will have a total of about forty, whleh is rather under than over the actuai number. Faldh diaver reglaters from 160 to 250 tous, and coata, when realy for sea, with proviaions, slave equipments, and overy thing necesmary for a successful trip, about $\boldsymbol{\psi}^{\prime} \times(0) 0$. Here, to start with, we have a capitul of 9320,000 , the greater part of which ls contrllouted by Northern men. The expensen of Ittting out, und of the trip to and frum the coant of Africa, may te entimated as follows:
Coat of firty atavirn runily for ana
4320,900

Amunat pishif fur argroes noll the conast of Africs, ai

* 15 a bead, stiow ing $6(6)$ to each veasel.
t'ort charges aud suctel money patil at the quace of
 each negro, atlowing a dimitnition of 160 ta ench reasel liy death ou the panage.. Total. .
From this eatimate it will be aeen that the amount of capital required to tit out a fieet of alavers is aluut \$1,500,000, ulon which the profts are so immense as almost to surpass bellef. In a single voyago of this Ileet 21, th0 human belngs are carried off from different polnts on the slave coast ; a wl of theae 40N0, or une sixth of the whole number, beeome victlms to the horrors of the mildle parange, leaving 20,0 tho fit for market. For each of these the traler olitalns an average of sinn, making a tutal for tho whole 20,000 of $\$ 10,000,000$. Now, if we estimate the number of trips male by eadi vescel In a year at two, we will have this lnereasel to Q $20,000,000$. Fach ressel, it is true, can make three, and eometlmes funt trips, but as ame of them are deatroyed after the ilrst voyage, wo have placed the number at the lowest estimate. Tho expenses and profits of the alave-trade for a singlo year compare as follows:
$\begin{aligned} & \text { Total cxpechasen of two voyaged } \\ & \text { Totat recetpen of ditto }\end{aligned}$

Cowlie Trade. -This trade has ajrung up since vigorous efforts have been made to sulpress the slave-trule proper. Although theoretically the coolie trade prom-
lsed benefita to both planters and coolle, yet practlcally it la only another form of the slava-trade.

The truth uttered by a lata number of the California Chronicle In the following paragraph is but too true:
"We hear of these wretched belngs dying on their passage from Canton to Callao of hunger, thirst, and foul disense angendered by close confinement, without air or nutriment, In the holds of ehips; we liear of these unfortunates murdering one another in tha agony of thelr suffering; and yet, although the thlug is plain and palpablo before our very eyea, the clilized, the Christlan world shruga lts shoulders, exclalins 'horrlble,' und leaves the helpless croatures to their fate."

In oxtenuatlon of the guilt incurred, It ia alleged that the partles concerued have a contract with the coolles ; but in effect the deluded victim ls a slave, aud not the faintest diwn of hope Illumines hia dark horizan. Numerous Inıportant and Incontrovertible facta have been brought to the attention of our government hy means of the " measage from the President of the United States communicating laformation in regard to the shave and coolle trade," presented to the Houso of lepresentatives one year ago.

Mr. Parker, United States Minister to ChIna, wroto to Mr. Marcy on the 12th of February, 1850, that the followlng shipments of coolles had been made during the year 1855 from Swatow, an lllegal port oven fur legal trade:

|  | 8hym | Tonnas ${ }^{\text {e }}$ | Coosten. |
| :---: | :---: | :---: | :---: |
| Amprican |  | 0,602 | 8050 |
| Ifritisti. |  | 8,82t | 1938 |
| Chiltan | 1 | 5000 | 250 |
| deruvlan | 3 | 1,960 | 1 150 |
| Totat | 13 | 12,773 | 6353 |

Mr. Parker also stated, from official Information, that the number of mules imported as coolics from Calcutta and Madrus, from 18.15 to 1852, linto British Giulana and Trinidud, was 1700 ; and he suggested "the necessity of specific instructions emanating from the Nayy Department to our men-of-war on the China station, authorizing them to resort to illegal ports, and to examine such vessela as do, and ascertuln that they do not offeud ugainst law, and to muke them accountahie If they do." danaury, 1856, Mr. C. D. Mugford, at Hong Kong, notitied Mr. Parker that he was agent fir one of the most respectable firms in the United States, who had mado a contruct with the Brazilian sovernment for sending to Rlo de Janciro some 2000 Chinese, and that part of them had beon shipped, but the tirm referred to were ready to alilde by the tociaion of the governments of the United States or China as regards the legality of the trade. Suhsequently, Mr. larker addressed a public notitleation calling on eltizens of the United States to dosist from this lrregular and imnoral truffic.
The evidence constantly accumulating to show the horrible character of this trade calls still more loudly for its speedy suppression. The Lowdon Times recently published a decply interesting communication on this subject, fon which we extract the following:
"The testimony of Sir John Bowring to the lamentable coudition of the Chinese emigrant can not bat recall to most of our readers' minds the disclosures mude a few weeks ago at the Thames Police Court in London with respect to the condition of tho coolies on hoard the ship Duke of Portland, on her voyage from llong Koug to Ilavana. It will be remembered that on the occasion referred to the master of the vessel made the confession that ons hundred and thlrty-t wo of the emigrants, all of whom had been tuken on board, ho said, in good health, had died between Ilong Kong and llavana. Ite had 'had as many as two hundred invalids at one tlme,' and 'many more had died after they had landed in Cuba.' His log-book contained laily, and more than daily, entries of death. The magistrate said 'he had heserd of the horrors of the middle passage whea the odious slave-trade was in

5 R
exlatence, but he never heard of any thing like thla.' The counsel sald, 'It ta most horitule. Chinamen are brought from China to wurk on plantations, and thla is the result. The Engllah flag is diagrased ly such a traflic.' The captain confessed, ${ }^{1}$ It is a dreadful traffle, and quite tlme it was put an ead to." Yet thia wus but an aceldental diselosure of a system whith was only casually brought to light la this instance hy the magistrate's inspection of the log-book in a sult of wages.
"I have myaelf, when In IIavana, heard accounta and witnessed sceuca connected with this traffle which are perfectly appalling. In aome lastances the proportion of dead to liviug at the concluaion of the voyuge has been as high as two hundred of the one for every three hundred of the other. In March, 1858, tho Britlsh slilp Gertrude arrived at Havana with a cargo of 198 Chilnamen, and in a noto appended to tho return we read, ' of tha Gertrude's 162 died.'
"Such are the horrors of this second slave-trade during the pasaage. When he arrives at his destination, in the majority of instances, the coolle tivds that his misery has but commenced. I have seen examplea of considerate trearment, and consequently of comparative convort ; but these are unhappily rare. On arrlving at Jlavana, after passing the quarantine, the coolie, if he survive is transferred to the highest bidder, who places him upon his plantation alide by alde with his slavea. llis term of service is eight jeesrs ; his labor as hard as his master thinks he can sustaln. He receives a small payment moathly, which makes has condition hy a few dollars preferable to that of the slave. Ila ls exposed to the same toil, watched by the same overseer, with whlp in hand and sword at hia side, as the mave.
"On the other hand, his position la worse than that of his slave companion, lnasmuch as his muster's interest ia him terminates after eight years. In proportion as the terin of service appronches its explration, the motive for retaining the coolio in lifo decreases. The slave's lifs is usually worked out, as the Cuban planters have themselves confessed to me, in ten years of full work. The Chinese coolie, as every one who has lived on the Cuban plantations knows, reaches his end on an averago after a very much shorter term of labor. Agaln, the Chinamna docs not hear the tropical hent with the easo with which the negro endures it."

Sloop, a vessel of one mast, the mainsai] of which is attached to a gaff above, to a hoom balow, and to the mast on its foremost edge; different from a cutter by having a fixed bowsprit and a jib-stay. It is also a general namo for ships of war below the slze of frigates.
Smack, a vessel with one mast, commonly rigged ns a sloop, and used in the coasting trade, or aa a tendor in the royal nuvy. Tho vessels of thle name that have long plied between leith and London are well known, and have always been noted for their security.

Smaltz, or Bmalt (Ger. Schmalz; Du. Smalt; Fr. Smalt ; It. Smalto azzurro, Smaltino; Sp. Esmalte, Azul azur; Rass. Lasor), an oxyl of colnlt, melted with siliceous earth and potash. It is a sort of glass, of a beautiful deep hlue color; and being ground very fine, is known by the name of powder blue. The color of smaltz is not affected by tire; and it is consequently in great demand in the painting of earthen-ware. It is also eurployed in the coloring of paper, and for other purposes in the arts. Beckmann has proved that the process used in the preparation of smaltz was invented about the end of the 15 th or the beginaing of the 16 th century; aul that the blue glass of the ancients owes its color, not to the presence of cobalt or amaltz, but to that of iron,--Ilist. of Inventions, vol. ii., art. Conalt.

Smuggling, the offense of importing prohibited articles, or of defrauding the revenus by the introduction of articles into consumption, without paying the duties chargeable upon them. It may be committed indifferently either upon the excise or customs revenue.

This crime, which occupies so prominent a place in the criminul legislation of all modern states, is wholly the result of vicieus commercial and financlal legislation. It is the fruit either of prohibitions of importation, or of oppressively high dutiee. It does not originate in any depravity linherent in man, but in the folly and Ignorance of leglslators. A prohilition against lm porting a commodity does not take away the taste for it ; and the imposition of a high duty on any article cecasions a unlversul desiro to escape or evade its payment. Hence the rise and occupation of the smuggler. The risk of being detected in the clandestine introluction of conmodities under any system ot fiscal regulations muy always be valued at a cortain average rate; and wherever the duties exceed this rate, sinuggling immediately takes place. Now there are plainly hut two ways of checking thls practice-either the temptatien to smuggle inust be diminished hy lowering the duties, or the difleulties in the way of amuggling must be increased. The first is obviously the more natural ard efficient inethed of effectling the object in view ; hut the second has been most genendly resorted to, even in cases where the duties were quite excessive, Geveruments have uniformly alnest consuiced the persons employed in the collection of the revenus with respect to the best mode of rendering taxes effectual; theugh it is clear that the interesta, prejudices, and peculiur habits of such persens utterly disqualify them from forming a sound opinion on such a suljeet. They cun not recommend a reduction of duties as a means of repressing smuggling and increasing revel ue, without acknowledging their own incapucity to detect and defeat illicit practices; and the result has been that, instead of uascribing the prevalence of smuggling to its true causes, the oflicers of customs and excise nave aluost universally ascribed it th some defect in the laws, or ir the mode of adminlatering them, and have proposed reprossing it by new regrlatlons, and by increasing the number and aeverity of the penalties affecting the smoggler. As might have leen expected, these atteupts have, in the great majority of cases, proved signsily unsuccessful. And it has lieen Invariably found that no vigilance on the part of the rovenne eflicers, and no soverity of punishment, can prevent the smaggling of such commedities us are either jrohilited or leaded with oppressive duties. The mmgfier is generally a popular charater; and whatever the law may declare on the suljeet, it is ludierones to expect that the bulk of society should ever be brought to think that those who furnish thean with cheal brandy, geneva, tobacco, ete., are gullty of any very heinous offense.
"To pretend," says Dr. Suith, "to have any scruple alout buying smuggled goods, though a manifest encouragement to the violation of th revenue lawn, und to the perjury which almost always attends it, would in most countries ba regardel es ope of those pedantic pieces of hypucrisy which, instead of galaing eredit with any boily, seem only to expowe the person who affects to practice them to the suspicion of being a greater knave than most of his neighbors. liy thly indulgence of the poolic, the smaggler is often encouraged to continue a trade which the if thas taught to conxider as, in some measure, hnocent ; and when the theverity of the revenue laws hs ready to fall upom him, he is frequently disjosed to defend with violence whit ho has been accustomed to regard as his juat property; und from being at lirst rather improdent than criminial, the at hast too often becomes one of the mort deterinthed violators of the laws ot sceiety."- It'eallh of Nations, p. 406. To create by means of high dutiex min everwhelming temptation to induige in crime, and then to punish men for indulging in it, is a promeding completely sulversive of every principle of justice it revolts the natural feelings of the prople, and teaches them to feel an interent in the worst characters-for such smugglers generally sre-to esponse their canse
and avenge their wrongs. A punishment which is not proportloned to the offense, and whlel dees not carry the sanctlon of public opinion along with it, can never be productive of any good effect. The true way to put down smaggling is to render it unprotitable-to diminizh the temptation to engage in It; and this is not to be done by surrounding the coasts with cordons of troops, by the multiplication of oathe and penalties, and making the country the theatre of feroclous and bloody contests in the field, and of perjury und chicanery In the courts of law; but by repealing prohibitions, and redacing duties, so that thelr collectlon may be enforced with a moderate degree of vigilumee; and that thd forfelture of the article may he a sublicicut penalty upon the smuggler. It is in this, and in this only, that we inust seek for an effectual eheck to illicit tratieking. Whenever the profits of the fair trader become nearly equal to those of the smuggler, the latter is furced to abandon his hazardous protession. But so long as prohilitions or eppressively high duties ure kept up, or, which is, in fuet, the same thing, so long as high bounties are held out to encourage the allventurous, the needy, and the profligate, to enter on this career, we may be assured that armies of customs officers, backed by the utmest severity of the revenus laws, will he insufticlent to hinder them.

The penalty for amuggling ln this country is fixed by tho act of Congress, August 30, 18.12, as follows: That if any person shall knowingly und willfully, with intent to defruad the revenue of the United States, smuggle or clundestinely introduce into the Cuited States any goods, wares, or merchandise, sulbect to duty by law, and which should have been invoical, without paying or accounting for the duty; or shall make out, or pass, or attempt to puss throngh the cus-tom-louse, any falke, forged, or fraudulent invoice, every such person, his, her, or their uiders and alettors, shall be deened guity of a mistemeanor, and, wa conviction, shall be thed In any aun not excerling tive thousani dollars, or Imprisonment for any tern not exceeding two years, or beth, at the discrection of the court.

Smyrna, a large eity and sea-port of A siatic Turker, on the western sille of Asla Minor, lat. $33^{\circ} 25^{\prime} 336^{\prime \prime \prime}$ N., long. $27^{\circ} 6^{\prime} 45^{\prime \prime}$ W. 1'opulation probally aheut 120,000 , of whom 60,000 may be Turks, 40,000 tireeks, and the remainder Armenians, Jranks, lews, etc. Smyrna is sltuated at the lotiom of a deep gulf. the entrance to which lies leetween the mand in lytilene on the north, and Cape Carabourun, in lat. "\$ ${ }^{\circ} 41^{\prime}$ $10^{\prime \prime}$ N., hong. $26^{\circ} 21^{\prime}$ E., on the south. The passag Letween Jancw's Castle on the south annl the opposite samd-lonk is narrow; but there is from nine to ter fathoms water, with a blue clay bottom. Merchant ships unchor alirenst of the city in from seven to cight fithoms ; but the water is so deep that they may come close to the qunys. The inbat, or sealrecese, hows from morning till evening, and is always waital for ly ships going up to the city. There is excelleat anchorage in must parts of the gulf, merely avoiliug the shoals on the north side. Smyrnat is a place of great antiquity. The excellence of its port, and its adnirable situation, have mate ic be several tines rebuilt, after being destroyed by earthyuakes. On appromeling it from the sea, it has the apmorame of an umphitheatre: the cuatle is at the lack of the town, which it commanls, on the top of the hill; lant it is in a state of decay, and could oppowe no resistance to ar invaling force. The interine of the city dues nut correspond to it extermal upparance: the streds being for the mowt part narrow, dirty, and ill pavell. Owing to the want of clemiliness, and of all morts of procontions on the purt of the 'Turks, Suy.rna is frequently visited by the plague. In 1814 , from $60,(00)$ ta 60, ,ivio of the inhatitants are said to have been ent "fl by ihiw irvalful seourge. The trade of this city is mume patensive tham that of any other in the Turkish empiry. Tho
caravans from Persia are chlefly composed of Armenians. They arrive and depart at fixed periods, which are nearly identical with those of the arrival and departure of most of tho forelgn shlpe frequenting the port. llargains are principally nffected by Jew brokers, many of whom have amassed conslderable fortunes. Thn princlpal articles of import conslst of train, furs, Iron, butter, etc., from Odesss and Taganrog; and of cotton stuffa and twist, silk and woolen goods, coffee, sugar, cochineal, and dye-woods, iron, tin and tin plates, rum, brandy, paper, cheese, glass, wine, etc., from Great Britaln, France, Italy; the United itates, etc. The exports consist princlpally of nudder, which is the most valuahle artlele, dried fruits, valonia, opium, silk, wool, box-wood, emerystone, sponge, lrugs, yeliow berries, ollve oil Tur sy carpets, galls, wax, copper, haro sklns, goats' wool etc. - F'or further details, see article Tunker, nnd Tocnsefont, loyage au Levan, tome li. ; Macuill's Trarels in Turkey, vol. I.

- oplum, 2121 casea. Of this 713 aro large, nal go to En'und; 1408 are small, add go direct to China via ligypt.

In hils Lettres sur la Turquie, the well-Informed M. Thicinl estimates the valuo of the Inports into Smyrmn in 1851 at $28,173,060$ francs, nod that of the exports at

30,682,000 francs. The coasting trade, as that between Smyrna, Constantinople, Syria, Alexandria, and the Levant generally; is usually denominated, is almosi entlrely In the hands of the Greeks, and is very extensive, Excluding Greeks, the port is annually visited by from 550 to 600 forelgn shlps. Uhiclni reckons the value of the Imports of English and Swiss cottons at above $14,000,000$ francs ; the other leading articles of imports are Engllsh and German woolens, French silks, and colonial products.

The weights and measures are the sams in thls elty as at Constantinople, with an exception of a small differenca on some of the welghts. The principal weight in Smyrna is the oke, which is of two different weights. The oke used in retall is of 400 drams, and In wholesale of 380 . The wholesale oke beling also known as oke of 400 drams, in order to draw a distinction between the two, we will call the first, the oke of 400 drams, "real ;veight," and the other, the oke of $40 r$ dtams, "nominal weight." The only oke known in Constantinople is tiat of 400 drams, "real weigi t." At Smyrna, 400 drams, " nominal weight," av" $=1$ oke; 45 okes $=1 C u$ rotoli $=1$ kintal or kartar.

At Constantinople, 400 drams, "real weight," are $=$ 1 oke; 44 okes $=100$ rotoli $=1$ kintal or kantar.
'Thus, 100 kintals of iron lought at Constantinople will ronder here 102 货 5 kintals, if weighed by two ac. curate steelyurds in looth pluces; but as they are genernlly very imperfectly made, the difference varies from 1 to $1 \frac{1}{2}$ per cent. Generully, however, 100 kln tals of Constantinople render here from 102 $\frac{1}{2}$ to $104 \frac{1}{2}$.

General Remarks.-Exports are generally sold for c :sh, and pryment is made on the first Saturday following the day of sule. It sometimes occurs, however, that one half of the money is paid the first, and tf.s other half the succeeding suturduy; hut for this purposo a special ngreement is generally necessary before concluding the purchase. The term of paynent is seldom extended to a third Saturday. The internal duty is alwnys puid ty the seller, and Is included In the prices of commodities. The exporter has no other tax to pay than the export duty. Box-wood, canary seed, hemp seed, and terra umbra, are generally sold free on board, which comprises export duty, porterage, and shipping charges. Weighing, meusuring, and all othor charges, are paid by the exporter. The insuranco is nlmost exclusively efiected in the United States for goods to tho States. The freaght for figs, raisins, gums, nut-galls, yellow herries, aud valonla, is made payable in pounds sterling (䰻84 per pound sterling). Some housos charge a half per cent. for storage, some one per cent., and others charge n, storage at all; but when they do, they netunlly bay for one.

Cnwashed Wool.- llesides all the charges on unwnshed wool, a loss of welght must be added, arising from the picking anl nasorting, which generally varies from 8 to 5 per cent. Tlio export duty shown in this statement is for Anatolia, lioumelia, and Constantinople wool, which are the kinds generally exported to the Initell States. The duty upon the wool of Syria, 'Tripoli (larlury), Ilagdad, and the adjoining country; is of $80 \cdot 1097$ per 100 pounds. 13,085 bales, washed null unwushed wool, have been exported to the United States during the period mentloned in this statement, representing an amount of $\$ 598,178$. No sales of commorities took plnce durlng the months at which tho price is left hank in this statement. On all such comm onltles where the price ls left open In the colnmu of " retail prices," little or no consumptlon exists.

Lerches.-Leeches are a monopoly, and two European houses of this city lave the exclusive right of exporting them, or to sell thein in the market.

Sponges.- The price of this article varles considernhly: that of common sponges, called "chemuches," after they hud been prepared for shipment, varled from $\% 15$ to $\$ 27$ per 100 lhs, , and that of the sponges from $\$ 105$ to $\% 600$ per 100 th . The former are shipped in
bales, and are the kind most exported to tha United States, and the latter in casea. They are generally bought in the lump from on board the boats which bring them from the neighboring islands by the exporters, who wash them, throw off the asnd, and otherwise prepare thom for ahipment ; consequently their price per weiglit depends on the quantity of sand, stones, etc., chey may contain, and can only be ascertnined after this operation has been gone through. The purchase of this article requires considerable skill, and oftentimes the most experienced dealera are much deceived, so much so that a differance in price of 20 to 25 per cent., more or less, ls regarded as as matter of no grest moment. Besides the commoditios noted in this statement, 2677 biles of rags and 70 tons of emery stones have also been exported to the United States; but botr of these articles are a monopoly, and are only exported by two houses of Smyrna. The trade between Smyma and the United States la generally carried on with Boston and New York, but princinally with the former place.--United States Consul at Smyr$n \boldsymbol{n}$, November 4, 185. For further information, see Com. Relat. United States; Living Age, x. 201, xxviil. 167; IIınt's Merchants' Magazine, xxv. 452 (F. W. Holland).
Snuff (Gcrm. Schnupflaback; Fr. Tabac en poudre; It. Tabacco ada naso; Sp. Tabaco de polvo; Russ, Nosowoi tabak), a powder in very general use as an errhine. Tobaceo is tho usual basle of snuff; but small quantities of other articles are frequently adled to 1 t, to vary its pungency, flavor, seent, etc. Though substantially the same, the kinds and names of snuff aro infinite, and nre perpetually changing There are, however, three jrincipal sorts. the first, granulated; tho second, en impalpable powder; and tho third. the bran or coarse furt remaining after sifting the second sort. U'uless taken in excess, no bad consequences result from its use.-S.Se Tomacco.

Snufiboxes aro made of every variety of puttern, nud of a: endless varicty of materials. We only mention them bere for the purpose of giving the following details, net elsewhere to be met with, with respect to tho manufacture of Laurencekirk or Ayrshiro boxes. These are made of wool, ndmirably jointed, painted, $\cdot$ 'id varnished. These beautiful boxes were lirst manulactured at the village of Lavzencekirk, in Kincardinethire, abot: 60 years sime. The original inventor was a cripple hardly possessed of the power of locomotion. Insteal of curtains, hils bed (ratheracurious work-slepp) was surrounded with benches and receptacles for tools, in the contrivance and use of which he diseovered the utmest ingenuity. Instead of taking out a patent, the inventor confided his secret to a joiner in the same village, who in a few years amassed consideralle property, while the other died, as ho had lived, in the greatr.t poverty. The great difliculty of the renufacture lies in the formation of the hhige, whict, in a genuine hex, is so delicately made as hardly to be visible. Peculiar, or, an they are called, secret tools, are required in its formation; and though greatly improved by time mul expericuce, the mystery attached to their prejaration is still so studiously kept up that the workment ( mploged in one bhop are debarrel having any communication with those employed in nuother.

Snuff-taking. This practice took its rise ln E゙nfland from the captures made of vast quantitios of
 The prize of tho forces having been sent home and mold, the vice soon obtained from which the rev. nue miv draws, with tubaceo, considerably more than © $1,000,000$ per annum. In the ywar ending Jantury $\therefore$. 185: there were imperte $\mathrm{i} 5,000,000 \mathrm{ibs}$. of tobareo and snuff, of which $36,400,000 \mathrm{lly}$, were entercal for lame consumption,-See Tohacto.

Boap (Ger Srife; Fr. Sucon; 1t. Supone ; Spr. Jahen; lluss . Juho; Lat. Supe). This article was tiuperfectly known to the anciests. Tho tirst express men-
tion of It occura in Pliny and Galen ; and the former declares it to bo an invention of the Gaula, though he prefers tho German to the Gallic soap. In remote periods clothea were clennsed by being rubbed or atamped upon in water. Nausicaa and her attendanta, Homer vells us, washed thelra by treading upen them with their feot in plta of water.-Odyssey, book vl. Tho mantfacture of soap begnan in London in 1524, before which time it was supplied by Bristol at one penny per pound. -Hayds. The soap met with in commerce is generally divided into two sorts, hand and soft: the former is made of sods and tallow or oil, and the latter of potash and similar oily matters. Soap made of taliow and sod. las a whitish coler, and is, thorefore, sometimes denominated white soap; but it is usual for soapmakers, in order to lower tho prico of tho article, to mix a considersbls portion of rosin with the tallow; this mixturo forms the common yellow aoap of this country. Sosp made of tallow, etc., and potsah dees not assume a solid form; its consistenco is never greater than that of hog's lard. The properties of soft soap as a detergent do net difier materialiy frem those of hard soap, but it is not noarly so convenient to use. Tho alkali employed by the ancient Gaula and Germans in the formation of soap was potash - hence we seo why it was described by tho Romans as an uuguent. The oil employed for making soft sonp in this country is whale oil. A littlo tallow is also added, which, by a peculiar management, is dispersed through the soap in line white spots. The soap mude in comutries whin produce olive oil, as the south of Franco, Italy, and Spain, is preferalile to tho soap of this comntry, which is usualiy manufactured from grease, taliow, etc.Tuomson's Chemistry.

The use of soup as a detergent ls well krown; it masy, in fact, be considered as a necessary of life. Its consumptic itr most civilized comtries is immense. Pliny luforms us that soap was first invented by the Gauls; that it was compored of tallow and ashes; and that tio tierman seap was reckoned the best.-lib. xviii.

Bociety Islands. These islands, lying in the Pacitic Ocean, between lat. $16^{\circ}$ and $18^{\circ}$ S., and long. $145^{\circ}$ and $155^{\circ} \mathrm{N}^{\circ}$., are under the protectorate of the French government. The princlpal islamis of the group are Tahiti, Fimeo, Hunheine, Raiatea, lonu-hona, Ta fua, an Meura. Papiete, the enpital of Tohiti, is much resorted to by American nad other whalers. The exports consist of oranges, pearl-shell, arrow-root, cocosnut oil, and other nutive products of minor commercial Importanee. Theintercourse between the l'nited Statcs and these lslands has increased with our rapidy-increasing relations with Valparnise, ('allao, l'anama, the Samlwich Islanils, Australia, and China. In 180 there entered the port of Tahiti isi vessels under the l'nited Sintes tiag, mensurimg in all Stite toms. Vnder ali obler thags there entered 111 vessels, with an aghregate of 12,817 tons. There are uo import duties charged at tho Society Islands, except upon spirituons lipuors nod wines, null on tire-nrms and munitions of war. Th the last-mamed articles these duties mmount to $a$ pobibition. 'These islands are muler a ditherent aystem of commercini legishation fron, that whid ohtenins in the other french eolonial settements. No distinctions are recognized as to any forifign conntriss, or as to any foreign or domestic purts, with respert to ratering or clearing forvign vessels, with cargen's or in hallast. As regards alcolmic and other heverapes, American vessuls are placed on the anme footing as lirench vassels as to duty, while those of ether mations pay doulde import duties. Ihis tlistinetion is regulated ly arrele Nu. 65, of May $8,18.33$. The ports open to foreign vessela are l'apicte and Taunoa, nt Tahitl; and l'apetoai, at Meura. No forcign vessel is permitted without a special permission, or is urgent necessity, to muchor in any other jerta of the islands sulject to the French protectorate. to 500 francs. The coasting trade of tho islands belonging to Franee is reserved exclusively to vessela carrying the French or protectorate flag. Tha penalty for violating this reatriction la, for the first offense, a fine of from 1000 to 2000 franes, and, in case of repetition, double that aum. Every captain must, withln twenty-four hours after his arrival, present to the director of customs his manifest, with a detailed statement of the ammunition and arms of every kind, and also of tha liquors, which, being subject to import dutios, can not be landed without the authorization of tha director of customa. Those who infringe this regulation are liable to a fino of from 50 to 400 franes. Making a false declaration respecting prohibited goods, or those tha sale of which is restricted, is puaished by a fine of from 1000 to 5000 francs.
When vessels hare on board prohilited goods, spirits, arms, or ammunition, intended only for their own consumption or the defense of the shlp, captnins must present to the director of cuatoms a delsiled declaration of such kinds of stores within twenty-four hours after their arrival. The sale of munitions of war, powder, saltpetre, projoctiles, nuskets, arms of any kind, is prohibited, except under apecial permission from tho commissioner of the empire; and should any goods of this klad be attempted to be fraudulently landed, they will be confiscated, in addiltion to the fine imposed by the police regulations. All spirits or liquera which may be attempted to bo fraudulently landed are liable to confiscation, as well as the bont conveying them; nad the captain, who is held responsible for all goods which may be on board, under whatever conditions, is liable to a fine of from 5000 to 10,000 frnncs. All goods admitted to entry in the French establishments of Oceania may be sold on board, provided they be not sold by retail. To effect sales of this kind, howaver, a licease of the first elass must be previously oltained, payable in advance, and for a period of threa months. Sales of eargoes may also he effected on shore, by opening a store for that purpose, for which a similar license must be obtained, and for the samo period. Wines nad liquors, however, must be sold exclusively on ahore, either through the medium of a consiguee, or by the captain or his ngent, having first procured tho necessary liceusc. Captains of vessels, whenaver the length of their stay permits, must give notice of their departure it the post-office forty-eight hours beforehand; and when it is desired that a vessel should remain in port less than forty-eight hours, notice to that effact must he given on the day of arrival. If any of tho fines specified in the foregoing regulations ahould not be paid within five days, at the farthest, from tho date of condemnation, or satisfactory accurity not he tendered, a part or the whole of the cargo will be sold, or the vessel itself be retained, to liquidata the debt.-Com. Relut. U. S.

## Soda. See Almain.

Solder, Sodder, or Soder, a mestallic or mineral composition used in soldering or jolning together other metais. Solders are made of gold, silver, copper, tin, bismuth, and lead. In the composition there must he some of the metnl that is to he soldered mixed with some higher and finer metals. Goldsmiths usually make four kinds of solder, viz.: solder of eight, where to seven parts of allver there is one of brass or copper; solder of six, where only a sixth part is copper; solder of four, and solder of three. It is the mixturs of copper in the solder that munks raised plate come always cheaper than fiat.

Sound Dues. Under the head of Dexmank the reader will find a full history of this fiteresting conmereinl question, and also statistics ilhastrating tha proportional interest whlel every nation had in the aboliahment of the sound dues. Since the article Dessmank was in type the final trenties (ineluding that of the United States here gelveri) neeeasary for the adjustment of this question havo been signed. Wo here an-
nex, as $n$ supplement to this question, the treaty be tween the United States and Denmark, year 1857. We also give a table ahowing the pro rata division of tho indemnity which each nation agrees to pay Denmark.

On the 4th Januar, 1856, a meeting of the Miaisters of Austria, Beigium, France, Holland, Prassia, Spain, and Sweden, and a Commissioner from Russia, met at Copenhagen to consider the disputed queation. On the 17th of February another meeting of the Comnission took place, when the same states were represented, with the addition of a delegate from Oldenburg. At this meeting a memorandum was presented, in which Denmark offered to aecept aa a compensation for the abolition of the soand dues, a sum of $35,000,000$ rix dollars (about $£ 3,888,888$ ), which is about fifteen and a half years' purchase of $2,248,579$ rix dollars, the avcraga net revenue from the dues during the nina years of peace-1842 to 1847, and 1851 to 1853. Each state interested in the commerce of the Baltic to be responsible for the sum only which is assigued to $i t$, but the offer to be binding on Denmark, on its acceptance by all the states whoso representatives have taken part in the negotiation. This proposal has been accepted, as will be seen by the following treaty between the United States and Denmark (see next page).
In the annexed table, showing the pro rata amounts to be paid by each nation for the abolishment of the sound dues, it will be seen that Great Britain, Russin, and Prussia pay over 68 per cent. of the total; and that the first and second pay 56 per cent. of the total. The shara apportioned to the United States is only 2 per cent., while the trade of thia country would appear to be about 6 per cent. of the whole.

Table showino tile fro hata Division ef the Indemnity to lienmark for the amolighment of the sodnd Deen to ue paid hy eaci Nation.

As to the basis of the contribution, It would have been just to have taken the q.antity of goods carried, or duties paid, by the ships of eneh nation through the Sound and the Belt as determining the proportlons respectively to bo pald to the capitalization of tho dues. But this proportion has not ln every casa been carried out, as may be seen by comparing the foregoing table with the following, which exhluits the duties paid by overy nation.

A Iroctirmation. - Wheress a convention between tho trill. ed States of America and hia Majesty the King of Denmark, for the discontinuance of the Sound duen, was concluded and algned by their reapective plenipotentiarics at Washington, on the 11th day of April, 1857, which convenilon is as follow's:

The Cnlted State of America and bla Majoaty the King of Denmark, being desirona to terminato amicably the differesces which have ariacn between them in regard to tho tolla levied by Denmark on American vessela and their cargoes passing through the Sonnd and Beits, and commonly colled the Sound dues, havo resolved to conclude a convention for that purpose, and have named as thelr plenipotentiaries, that is to say, the President of the Linted States, Lewia Casa Secretary of State of the United States, and hia Majesty the Kjug of Denmark, Torben Bihie, Fsquilre, Knight of the Dannebrog, and decorated with the Cross of Ilonor of the same order, his sald Majeaty'a Charge d'Affairee near the government of the Inited states, who, after having conmunleated to each other their fulf powers in due form, have agreed to and aigned tho following articlea:

Artiele I. 11 ia Najeaty the Klag of Denmark declares entire freedem of tha navigation of the Sound and tho Beits in favor of American veaseia and thelr cargoes from and forevor after the day when this convonllon shall go into effect as hereinafter provlded. And it is hereby agreed that American ressels and their cargoea, after that day, ehall not be subject to any chargea whatever in passiog the Sound or the Belts, or to any delention in the sald watera; and both governments will concur, If occasion should recpuiro it, In taklog measures to prevent abueo of the free liag of the Cinited statea tiy the shipping of other nations wheh shall not have secured the same freedom and exemption from charges enJoyed by that of the United States.
Article II. 1 IIa Danial Majeaty further engagea that the passagen of the found and Beits shall contlinge to be IIghted and booyed na heretofore, withoul any eharge upon American vessejo or thelr cargoea on passing tho Sound and tho theits, and that the present establiahmenta of Danish pliota in these waters shall continue to be malataines by Denmark. His Damiah Majesty agreen to makn such additiona and insprovementa in regard to tho lighta, buoym, and piliot entabilshmenta In theme waters an elrenmatances anel the increasing trado of the Bailic may require. 1le further engagen that no charge shall be made, in consequence of such additions and Improvements, on American shipe and their cargoea paseling througit the somud and the Belts.
It is underatood, bowever, to be optional for the mastera of American vessefa either to empioy in the anid waters inanlah pllote, at reasonabio rates fiacil by the baniah government, or to navigate thelr vessels withonl sach assiatance.

Article III. In consideration of the foragolng agreementa und atipulation on the fiart of Irenmark, wherehy the tree and unincumbered novigation of American veasela through the Sonnd and the Beita is forever arcured, the Linited Staten agree to pay to the government of Denrairk, once for ail, the sum of meven hundred and neventeen thousand dight handred and twenly-nine rix doliarm, or lis equisajent, three hundred and aluety throe thousand and eleven dollara lu tinited Statem
curroncy, at London, on the day when tho sald conventlon ahall go into full offect, as hereln afterward provided.
Article IV. It is furiher agreed that any other or further privileges, righta, or advantagea whleh may have been or nay be granted by Denmark to the commerce and navlgation of any other nation at the Sound and Relts, or on her cuasta and In her harbors, with reference to the tranalt by land through Danjah torritory of merchandise helonging to tho eltizens ar unbjecta of such nation, alrall also bo fulliy oxtouded ta, and anjoyed by, the eltizena of the Vinted Stales, and by their vessela and property in thrt quarter.
Article V. Tho gencral convention of frlendahyp, commerec, and navigation, concluded between tho United Btates and his Mnjesty the King of Denmark, on the 2ath of Aprii, 1826, land which was abrogated on the 15th of April, 1850, ant the proviaiona contained in each and alf of its artleics, the sth article alone exceptod, alohl, after tho ratificalion of thls pres. ent conventlon, again hecome binding npon the lnited Sitates and Denmark; it being, however, understood that a year's notlee shall auffice for the abrogation of the stipulations of the sald convention henuy renewed.
Article F'I. The present convention ahall take effect as 600 n as the lawa to cerry lt Into operation shall bo paased by the governmenta of tho contracting parties, and tho sum stipuhited to be paid by tho l'nlled states shall be recelved by . tentered to Denmark : and for tho fulfiliment of these purposes a period nol exceeding twelvo months from the elgalug of this convention alall be allowed.
But if, in tho interval, an earlier dny thall be fived upon and carrled Into effect fur a free navigation through the sound and lielta in favor of any other power or powers, the samo shall simuitancoualy be exlended to the vessels of tho tinited Statea and their cargoca, in anticipation of the payment of the aum stipuiatal In Article MII. ; It being understood, however, that In that event tho government of the United States shall also pay to that of Denmark 4 per cent. Int.rect on the yaid anin from the day the sald inmually ahall have gone Into operation untll tho princlpel shall have been paid as aforesaid.
Artich VII. Tho preaent convention shall be duly ratified, and the exchango of raliffeations ohali take phaco in Wash. ington withln ten months from the date bereof, or souncr if practicabic.
In falth whercof the reapectivo plenipotentiarien linve aigued the present convoutlon, in daplicato, and havo thereunto affixed their scels.
Done at Washington thia 11th day of April, in the year of our Lord ono thonsand elght hundred and tifty-geven, and of the Indopendence of tho Linlted Statea the elglity first.
$\begin{array}{ll}\text { Lemir Caha. } & \text { [bral] } \\ \text { Tobien Itille. } & \text { (beale] }\end{array}$
And whoreas the sald convontion has beea duly ratificd oa both parta, and the renpective ratlifationa of the bame wero exchanged In the clty of Waahington on the 12th Instant by Lewia Cass, Beeretary of State of the I'nited states, and W. de Raakioff, Lila Daniah Majesty'a Chargú d'Affaires and Con-sul-generai in tho L'uited states, on tho purt of their respect. Ive governments:
Nuw, thereforo, be It known that I, James Ruchanan, Pres. Ident of the T'nited States of Amerifa, liave cansed the salil convention to be made puhile, to the end that the wime and every clause and article thereof may he obaerved and fulfilted with good faith by tho United States and the eitlzens thereof. In wilness whereof I have hereanto set my hand and caused the aeal of tho I'nited statea to bo allixed.
Dono in the eity of Wastington, thia 13 th day of Jamary, in the year of our Lord ono thousand eight han-
[BEat.] dred and fifty eight, and of tho independence of tho Unlted Statea the elghty-second.

Janes Buehanan.

## By the President:

## L.ewis Cabes, Secretary of Stat.

Bounding, the operntion of trying the depth of the sea, and the nature of the bettom, by means of a plummet sunk frem a ship to the botlem. There are two plummets used for this purpose, ote of which is called the hamd-leat, weighing about eight or nine peunds; and the other the deeposea lead, which weighs from twenty-fiva to thirly pounds; and beth are shaped like the frustum of a cone or pyramil. T'he furner is used in shallow waters, and on appreaching the land after a sen-voyaye. Accordingly, the lines need for this purpose are called the deep-sca lend line, und the hund-beall line. The hand-lead line, which is nsmally twenly fathoms in iength, is marked at every tuv or threu fathoms ; so that the deptl! of the water may bo

## mventlon

 $r$ on or may on waygation of caste and thirough ttizens or d to, and by their
ascertained either in the day or night. At the depth of two or three fathoms thero are marks of black leather; at live fathoms there is a white rag; at seven, a red rag, at ten, black leather; at thirteen, black leath' ; at fifeeen, a white rag; and at seventoen, a red rag.
Sountung with the hand-lead, which hy seamen is called heaving the lead, ls generally performed by a man who stands in the maia chains to windward. IIaving the line quito ready to run out without interruption, he holds it nearly at the distance of a futhom from the plummet; and having swong the latter Lackward and forward three or four times, in order to acquire the greater velocity, he swings it round his head, and thence 80 far forward as is necessary; so that by the lead's sinkligg while the ship advances the line may be alnost perpendicular when it reaches the bottom. The person sounding then proclalms the depth of the water, in a kind of song resembling the cries of hawkers in a city. Thus, if the mark of live fathoms is close to the surface of the water, he calls, "By the mark five;" and as there is no mark at four, six, eight, etc., he estimates those numbers, and calls, "By the dip four," etc.; if he jniges it to be a quarter or a half more than any part' cular number, he calls, "And a quarter five," "and a half four," etc. If he conceives the depth to be three quarters more than a particular number, he calls it a quarter less than the next: thus, nt four fathoms and three fourths he calls, "A quarter less five."
The deep-sea lead is marked with two knots at twenty fathoms, three at thirty, and foor at forty, and so on to the end. It is also marked with a single knot in the middle of each interval.

Until the commencement of the plan of deep-sea soundinge, as now conducted in the navy of the United States, the bottom of the sea was nlmost entirely unknown to us.

It has been proven that the system of deep-sea soundings formerly in use was not accurate. This was simply letting down a lead, until by a shock the line became slack; but it was found that the line would run on without end, being dragged out by under-currents, and thit beyond a certain depth no shock was felt.

The plan of deep-sea soundings now in practice in our navy was sugges'ed by Lieutenant Maury, and has been successful principally from the adoption of a lead invented by Lieutenant J. M. Brooke, U.S.N.

This method is to take a cannen-ball, bored through the middle, and a wire inserted; and so arranged that when it tuaches bottom the ball elips off, and the wire with the line is drawn up. The wiro has a cap at the encl, with some adhesive matter to nttach particles of the bottom. The line is prepared for the purpose, so as to bear tho weight, and yet of small resistance in sinking. Experiment has proven that while the plumwet is sinking the line runs out at an increasing rate per minute; and by observing when the rato becones cunstant, we get the depth, as a current would draw nt a constant speed.
Mr. Maury gives this law of descent:
2 m .21 s . as an average thme of desecnt from 400 to 500 faths $9 \mathrm{ml} .264{ }^{2}$

Lieutenant Walsh, of the Unlted States sehooner Fancy, reported a cast with the deen-sea lead of thirtyfour thousand feet without a bott m . His soundingline wus au iron wire more than e.even miles in length. Lieuteuant Ilerryman, of the United States brig Dolphin, reported another unsuccessful at:empt to fathom mild-ocean with a line thlrty-nlne thousand feet in length. Cuptain Dedham, of Her liritannle Majesty's ship /Ierald, reported bottom at the depth of forty-six thousand feet ; and Lieutenant J. P. Parker, of the United States frigate Congress, afterward, in attempting to sound near the same place, let go hls plummet, aml saw a line fifty thousant feet long run after it as
though the hottem had not been reached. The last three attempts were mado according to the plan mentloned above. For further interesting items we refer to Mauny's Physical Geography of the Sea.-See Athantic Ocean.

Soundings for the Atlantic Telegraph.-The result of aese soundings has been to establish the hypothesis of Lleutenant Msury, of a submarine platean from the Newfoundland Banks nearly to the coast of Irelaad. We extract portions of the report of Lleutenant 0 . H. Berryman, U.S.N., to the Secretary of the Navy, givIng an account of the experimental soundings made by him in the United States steamer Arctic, to corroborate the existence of this platesu.

## 

"Leaving New York on the night of July 18, 1 atcered dlrectly for St. Johns, whore I arrlved on the 29th. Taking in coal by the 3lat, 1 ailled for Ireland, and commanced soundIng as near on the Great Circlo as possibie, passing the north end of tho 'Grand Banks' in fatitoda $48^{\circ} 34^{\prime}$ N., and one hundred and twenty fathome wnter, although the best charts I have un board record one hundred aud fifty-four. This difference I attribate to tha moda of taking soundiags at the time that aurvey was made. At intervala of thirty, forty, sixty, and oae hundred miles, wo sounded, all attended with complete success, but frequenly Involving many hours, both night and day, of great suapense and hard work, loatgg sometimes two or three thousand fathoms of line, soundleg apparatus and all.
"The great piateau became eo apparent in the middle of the ocean, and our fuel being conalderably reduced, I determined to Increasa the intervala between the positions, to enable me to reach the ceast of Irelaed with enough soundings to complete a line entirely across. This was accomplished on the 22d of Auguat, and I arrived in tho harbor of Queenstewa with only a few bushels of coal on board.
"Temperatures were taken hourly at the surface, and at twenty fathoms every four heurs. Attempts were made to obtrin them at the bottom and at different depths, but the results were so worthless, owing to aome derangement of the thermometers, that I ohandoned takiog them, as they interfored very much with the more important object of sounding and obtaining bottom. On one occealon two were sent to tho bottom in very deep wator, and ene indicated a temperature of twenty-one degrees, the other twonty-foor degrees, On examining and comparing the rest of tha thermometers, I found them all differing from each other so much, and some of the handa belng broken, I was aure that they could nat be used with any proper results.
"Corrents were experienced to the castward, from nine to fifteen milles in each twenty-four hours, between the Grand Banks and those of Ireland. No good opportunitles for obsorving under-currenta occurred, there being always either too much wind or a high sea. None appeared to atfect our aoundings very much -60 little, Indeed, that frequently the slack line would he celled or kinked upon the bottom, shewing piainly that it reached the bottom without the asalatance of the lead-detormining in my own mind that, however others may think, the cable or wire of the lightest kind will here reach the bottom moat certalinly.
"Onig ono of tho sounding apparatus winlch was used remains, and is sent to the departmont for inapection, it beling somewhat different, we belleve, from any heretofore usedbelug an association of Brooke's and Mnasey's, with a weight or lead of my own adoption.
"Tha llne used In sounding was that obtained from Boston, which proved indifferent, and was all expended before reachIng Irciand, and wa had to resort to two parta of smaller lino furnashed at the navy-ynrd. Having eighty thousand fathoms of the smaller alze tine on recla, we had it made up into one of about four thousand, and we found it decidedly the best that we have yet used, it belug very strong and small.
"On both sides the interest taken in this great enterpiae is very great, and it is whth every batlafaction that I can atate that tho navy of the United States ia particularly recognized as having promptly and efficiently executed tho preliminary and importunt survey for mo atupendous a work as laying a telegraphte cable of three theusand milen long across ae ocean upward of two thousand fathoms decp, and nearly seventeen handred milea wide."-O. M. Brabyman, C. S. N.

For a full statement of the results of these soundings In determining the proposed line of the cable of the Atlantic submarine telegraph, and for the statistics concerning this line, see article Tedegraph.

Norz－The bonisdinga in thin tablo aro placed in tio order
South America．Tho southern portion of the American continent extends from Polnt Gallenas，in lat． $12^{\circ} 30^{\circ}$ ，to Cape Horn，in lat． $56^{\circ} 30^{\prime}$ ．The oxtent of const that it offers to the Caribbean Sea and tho At－ lantic is estimated at 11,000 miles ；and tho const wash－ ed by the lacitic，it is stated lyy tho latest geographical authority，has an approximate continuity of 5800 miles． It the southern extremity there is a group of mount－ ninous islants，seprated from the main land by the Straits of Magellan，and forming the Archipelago of Torra del Facgo，or＂Land of Fire；＂so called from tho number of fires which its diseoverer，Magellan，saw aloug its coast at utght，supposed to havo been volcanic． Thls archipelago，with its barren islands and roeks， must，however，be considered as the termination of the contincut．Immediately north lies the vast and almost minnhabited country of Patagonia；while on the east， at a distanco of from 300 to 400 miles in the South At lantic，lie the Falkland group of islands．
The vast region known geographically as Patagonia extends from the liver Negro，lat． $39^{2}$ ，to the Straits of Magellam，lat．bit ${ }^{\circ}$ S．，a distance of about 970 miles
length，with a breadth varying from 200 to 420 miles． It comprises two diatlnet phyaical reglons，differing in surface and climate－the one lying on tho west side of tho Andes，tho other on tho east，and called，respect－ Ively，Eastern and Western Patagonin．The formor is elalmed ly the Argeatino Republle to the Stralts of Magelian，and the latter by Chili，down to Capo Horn． Both sectiona are as yet，however，inhabited by abo－ rlginal races，with the exception of a Chilian settlement at Port Famine，and on tho Straits of Mngellan．This diviston of Patagonia is comprised in the Chilian prov－ Ince of Chlloe，which is composed of tho arelipelago of that namo；that of Chonos，of the most suntinern islands，and that part of the continent which extends from Rio Negro，and as faz sonth as Capo Horn．On the eastern dlvision there are several ports，among which are，Gallegos，in $51^{\circ} 38^{\prime}$ ；Sunta Cruz，in $50^{\circ} 7^{\prime}$ ； Sau Jullan，in $49^{\circ} 12^{\prime}$ ；Desire，In $47^{\circ}{ }^{\circ}{ }^{\prime}$ ；Nuevo Golfo， In $43^{\circ}$ ；and San Antonio，in $41^{\circ}$ south．The fow tribes of aboriginal Indians that ：nhabit this inhospitable re－ gion subsist upon the products of thelr fishery．The princlpal object of Chill in colonizing Port Fanine，on tho Straits，was to keep fin check theso nomadic tribes， though tho colony has also been used for penal pur－ poses．Cape IIorn is uninhabited．
The South American continent has on its Pacific coast no large rivers．On tho Atlantic，however，are the Amazon，the Orinoco，and the Plata，and a number of others，whiel，though not so large as those named， are equal in size，if not superior，to even the largest rivers in Europe．The Amazon is the largest tiver on tho globe．Its principal trihutaries vary in length from 1000 to 1800 miles，while the central stream is $4000 \mathrm{~m} / \mathrm{les}$ long，anil is navigablo 2200 miles from the sea．Peru，Bolivia，and Chill are tho great mineral sites of South America，and prodnco chiefly silver，but also some gold and other metals，espectally copper， wheh is very abundent in Chili．Tho most distion gnishing feature in tho vegetation of South $A_{\text {merica }}$ is the prodlglous forests，which cuver about two－thirds of the whole surface．Fruits of nimost every variety abound，and indigo，coffec，sugar－cane，maize，and the eocoa－treo aro anong tho chief products．The cultiva－ tion of the tea－tree has been attempted In Brazil，though it is beliceed without success；but yerver matte，from which is prepared the customary beverage of one hali of tho peulusula，grows in tho greatest abundance in Paraguny．Spain and Portugal wero severally the original coloulsts of South America－the former fomil． ing tho states of Venezuela，New Granala，Holivia， Peru，Claili，the Argentine Republle，Uruguay，and Paraguay ；and the latter tho vast empire of Brazil．
Tho South American states all achic ved their inde－ pendenco between tho years 1810 and 1825．These states，together with the colonics and other regions comprised In Sonth America，with their respective arcas，population，capitals，etc．，ars exlibited in the following talle，derived from tho latest geographical authority；though，as regards the striet aecuracy of the fibures given，the same remark applies that is male with reference to similar tables respeeting Mexico atd the Central American states：

In the population given in the third column, no account is taken of the uncivilized Indian races, which probably number between $1,000,000$ and $1,200,000$ souls. These are foand chlofly in the great plalns of the Orinoco, Amazon, and Parana. The relative rank of the South Amerlcan states, as regards their commercial intercourso with the United

States, may be inferred from the subjolned comparative statement, exhibiting the values of exports to each country from the United States, and of imports from each country lnto tho United States, during a perlod of four years, from 1852 to 1855, incluslve; made up from United States Treasury reports for sald years:

| Sooth Amorican Statos. | 1804. |  | 1855. |  | 1886. |  | 1887. |  |

Southampton, a parlianentary and municipal borough, sea-prort town, and county of England, in the southern part of the county IIants, oceupying a peninsula between the mouths of the Test and Itchin rlvers, at the head of Southampton water, 12 miles south-southwosi from Winchester, on the southwestern railroad, 72 miles southwest from London. Latitudo of Saint Michacl's spire, $50^{\circ} 54^{\prime} \mathrm{N}$., long. $1^{\circ} 24^{\prime} 2^{\prime \prime} \mathrm{W}$. Pojulation in $1851,35,305$. The now docks on the oast of the town, epened in 1842, have an area of 208 aeres, and have admitted steamers of more than 700 tons burden. The West India, Mediterranean, and other mails, have their station here, and tho town communicates by steamers with all the ports of South England, the Channel islands, Ireland, and by railroad with London, and ail the centre of England. The port extends from near Portsmouth to Christehureh. IIere are some manufactures of silks and earpets, but ship-bullding and general commerce are the chief sources of wealth. Sonthampton is now the point of departure of the steamers for Aloxandria (sce ante, p. 20), and a stopplng-place for tise steamers between IBremen and New York.

South Carolina, one of tho Southern United States, is situated between $32^{\circ} 2^{\prime}$ and $35^{\circ} 10^{\prime} \mathrm{N}$. lat., and between $78^{\circ} 24^{\prime}$ and $83^{\circ} 30^{\prime} \mathrm{W}$. long. It is 200 miles long and 125 broad, containing 58,000 stpare miles. The population in 1790 was $2 \mathbf{2 0 , 0 0 0} ; \ln 1800$, 345,591 ; in 1810, 415,115; in 1820, $002,7.11$; in 1830, 581,458; in 1840, 591,398; and in 1850, 668,507.

Fimly Ifistory.- When the Spaniards, under Vasquez Ayllon ( 1520 and 1526), arrived on the coasts of what we now call Carolina, and more especially South Carolina, they heard here of a geat 'adlan ting and country, hoth called Chicora or Chicoria, and they applied that Indian name for some time to this conntry; without, however, giving to it very alistinct limits. The country was also sometimes called after its discoverer, Tierre del Licenciado Ayllon, or, shorter, Tierra de Ayllon, often also eorrupted to Terra de Aullon. Under this name tho Spaniarils comprehended sometimes a very great iart of North America, sometimes not more than this province.

French Cluims.-It is curious enough that the French nhso, when they ( 1004 ) arrived at the locality of Ayllon's activity, licard again of an Indian king and country of that name. In their ears it somnded, however, like Chicola or Chionole. Aftr. tho French navigation to these regions wo hes. the conntry sometimes designated ly the Freneh themselves with the namo $L a$ Floride Frangoise, and other nations also called it French Florila. Tho Spanlards, of course, always considered it as a part of their Spanish Florida. The French built on their Riviere May (St. Mateo or St.

John's River) a fort, which thoy called Fort Carolino or Carolina. Sonse map-makers and geographers applied this name, as an appellation of a country or territory, to tho whole reglon. So we see, for Instance, on a map of Nortin America by Cornclius a Judreis (1503), tho whola Frepch Florida called Carolina, in honor of Charles LX., king of France. It is curious that the same namo was aftorward given to the some locality in honor of an English king.

English Settements.-The English, since their settlements at Roanoke, comprehended the whole territory of Carolina uncler thoir widely-extended name of Virginia, after 1583. This grant had, however, very slight consequences. The country was not settled, not taken possession of, not even surveyed or explored. In the year 1063 Charles II. made annther grant of all the lands between the 36th and 37th degrees of north latitude to Edward, earl of Clarendon, and some other lords and gentlemen, and this tract was again enlled, In his honor, Carolina; so that wo may say we have three kings as golfathers to this province-Charles IX. of France, Charles I. and Charles II. of Eagland. I3y a second more ample charter of the 24th of March, 1667, Charles II. extended the houndaries of Carolina from nortli latitude $20^{\circ}$ to $36^{\circ} 30^{\prime}$, and from east to west "until the Pacitic Ocean." The country was divilled into two great counties-a northern one, called the county of Albemarle, and a southern one, called Clarendon county.
In this same year (1667) William Sayle, the appointed Governor of Carolina, explored and surveyed the whole coast of the provinee, entering all the rivers and making astronomical observations. He no doult, also, procurod a map of tho country to be made, hut unlappily this map is not preserved for us Probally the results of this first good survey of tho consts of Corolina were not then made known to the world at largo; for wo find still, on the edition of Champlain's maps of the year 16:7, along the coasts of Carolina, this inseription. "Terre non encore bien découverte continente a la Fhorida" (a land not yet well discovered is conneeted with Florida).

In the year 1729 the whole great province was divided lnto North and Sonth Carolina, and as the dividing point on tho coast was fixod a small inlet to the west of Cape Fear, called Little River Inlet. In the year 1733 the provlnce of Georgia was detached as a separate governuent of tho old Territory of Carolina, and tho southern houndaries of this latter were fixed at the mouth of the Savannah River, and within theso boundaries the name of Carolina has been proscribed ever since. Accorling to what we stated, wo may in a certaln degree consider the names of Wingandacoa, Weapemeoc, Ould Virginin, Albemarle county, as old particular designations for North Curolina; and tho name of Chicora, Terra de Ayllon, Florida Francoise, Clarendon county, as particular apjellations applied to South Carolina.-I. G. Kom.. Sre Noutir Cabolina.
I'hysical Features, etc.-The sen-coast is hordered with a series of islands, between which and the shore thero is $n$ very convenient navigation. The main land is
naturally divided into the lowar and upper country. pounds produced, 487,233; cotton, 800,901; flax, 33.3; The low country extenis from eighty to ove hundred miles from the sea-coast, and is coverell with extensive forests of pine, callel pine barrens, interspersed with marshes and swamps of a rich soil. The banks of the large rivers and the ereeks of this region are borlered with a belt of excellent land, prolucing cotton and Itidian corn in abumdance. The marshes and swamps in this district make tine rice plantations. The staple productlons of tho State are cotton and rice, great quantities of which are exported. Rice is extensively cultivated where the land can be irrigated by the tide or the overflowing of the rivers. The seaishuml cotten produced on the islands along the shores is of a superior quality, and is in great demand. Gold, tron, granite, and marble, aro the principal minerals.

There wero in this Stato in 1850, 4,072,651 acres of land impeoved, and 12,140,019 acres of unimproved lund in farms. Cash valye of farms, $882,431,684$; nnd the value of implements and machinery was $\$ 1,130,351$. The number of live ftock was-horses, $97,17 \mathrm{~L}$; nsses and mules, $3 i, 48: 3$; milch cows, 193,244 ; working oxen, 20,507 ; other chitte, 5133,1215 ; sheep, 285,651 ; swine, 1,065,503: aggregate valuc, $815,060,015$.

Agricultural tioducts, elc.-Wha, W, 1,066,2:7 bushels; rye, 13,790; Indian sern, $16,2,1,451$; bnck wheat, 283; onts, 2,322,105; barley, 458:3; pens, 1,026,900; petatoes, $1: 6,494$; sweel potates, $4,337,469$; rice, 159,930,613 pounds ; pulue of prodects of the orehari, \$35,105; prucluce of market gardens, 847,286 ; pounis of hutter made, 2,981,8i0; of checse, 49r0; sugar, hizl hogsheads; maplo-sugar, ${ }^{2} 00$ pounds; molasses, 15,901 gallons; leeswax and honey, 916,281 pounds; weol,
silk cocoons, 123; hops, 26 pounds: tobacco, 74,285 ; hay, tons of, 20,925 ; clover sceds, 376 bushels ; other grass seeds, 30 ; Hax-seed, 55 bushels; wine, 5880 gallons. Value of home-made manufactures, $\mathbf{8 9 0 9 , 5 2 5 ;}$ and of slaughtered animals, $\$ 1,302,637$.

The Great Pellee River, 150 miles long, rises in Nerth Carolina, and runs through the eastern part of the siate. It is navigable for sloops 130 miles. The Santee, fermed by the junction of the Wateree and the Congaree, rises in North Carolina, and has a sloop navigation for abeut 130 milles. The Saluda is a branch of the Congare. The Edisto is navigable for large boats 100 miles. The Savannah washes the whole southwest berder of the State, and is a noble strean. 'There are several mualler rivers, among which are Cooper, Ashley, and Combahee.

Manufictures, etc.-There were in the State in 1850, 13 cotton factories, with a capital invested of 8778,1001 employing 371 males anil $6{ }^{2} 2$ females, producing gools valued at \$it2;220; 6 establishments with a capitul of $\$ 185,700$, employing 155 persons, and making i:28i ons of castings, etc., valued at \$87.683; 287 Ilourin, aul grist mills, 118 saw-mills, 107 tamuerins, 41 print. ing-onlees, 45 newspapers - 7 daily, 4 tri-weekly, ? semi-weekly, 24 weckly, 1 hi-monthly, 5 monthly, mad 1 quarticly publication. Cupltal investal in mas. ufactures, $80,040,50 \overline{3}$; value of manufuetured articles, $56,200,84 \mathrm{f}$.

In dune, 1 s:56, there were 9 railroarls, witis 816 miles of onalhis isbel aud in operation, and 37.1 miles in course of sonstryetion. There were 11; banks and 2 branches, with a ene! capitul of $\$ 14,0 ; 3,580$.

- Herere is a samel lar, of ahout -ing nevomati chabumels. Tiree be used by hlig of large ton.
nage; one, the ships' clannel, has a depth of water of twelve feet at obb-tile, and irom saventeen to twenty nt flood-tide. Ships always take a pilot, on account of shifting sands, and are moored along side wharves in eufety inside the harlior. It is the chlef commercial emporium of the State, and the largest shipping port on the Atiantio beiow llalthore. The ehief exports are cotton anti rice. It is connected with the inter:s: by the South Carolinn nad the Northeastern rallroads. The tonnage of Charleston, in 1856, was 59,128 tona.

Beanfort, on the west alde of Port Royal Rlver, an inlet of the Allantic, and sixteen miles from the sea, lus a good barbor, but on account of a bar nit its month only small vessels can enter it. It has little or no commerce. The tonnage in 1856 was only 110 tons.-mpor further particulars as to South Carolina, see Southern (Zurt. Rer., xviii. 66, xs. 273, 298, iv. 247 (Sıs318); IN: llow's Rev., viii. 2t, xi. 123; Nurth American Rev. xiii. 1-13.

South Bea Bubble. Tinis destruclive speculatien was commenced In 1710, and the company incorporated by statute in 1716 . The bubhie, which ruined thensands of familles, exploded in 1820 , and the directors' estates, to the value of $\mathbb{E} 2,014,000$ sterling, were scized in 17el. Mr. Knight, the cashier, absconded with $\mathcal{E 1 0 0 , 0 0 0 ; \text { but he compounded the frand }}$ for $\mathbf{£ 1 0 , 0 0 0 , ~ a n d ~ r e t u r n e d ~ t o ~ E n g l a n d ~ i n ~} 1743$. A] most nll the wealthy persons in the kingdom had become stock-jobbers nutispeculators in this unfortunate scheme. The artifices of the directors lind raised the shares, originally of $£ 100$, to the enormous price of fltol - See Clamifs Mackay's Mistory of Modern Manias; Bankers' Magazine, N. Y.

South Bea Duties. The British net of the $y$ Ann, c. 21, establishing the South Sea Company, conveyed to them the exclnsive privilege of trading to the Pacifie Ocenn, and along the east coast of America, from the Orinoco to Cape IIorn.

Sovereign (the Coin). The name of an ancient as well as a modern English gold coin. In Henry I.'s reign, $n$ coin of this denomination was issued, of the valuo of twenty-two shilings, and one twenty-fourth part of the weight of a pound of gold. In 34 IIenry VIII., sovereigos wero coined of tho value of twenty shillings, which afterwarl ( 4 noll 6 Edward VI.) passed for twenty-four and thirty shilings. 13y 56 Geerge III., soverelgus of the new goll coinago were directed to pass for twenty shilings, nud they were issued from tho Mint the same year (1816), and have since mainthined the same value.

Sovereignty of the Seas. The claim of England is of very muenent dnte. Arthur was the tirst who assumel the soverelgnty of ihe seas for Britain, and Alfred afterward supported this right. The sovereignty of Engiand over the lbritish seas was maintained hy Selden, and mensures were taken by government in consetuence, 8 Charles I., in 1633. The Dutch, after the death of Charles I., made some attempts to obtain it, but were roughly treated by thake mul other almirals. Linsain end other powers of the North armed, to avoid search, sin 1780; again in 1800,-11ayts.

Soy, is speuses of sauce prepured in China nad Japan from a small bean, the produce of the Jolichos apja. It is caten with fish mul other articles. It should be chosen of a good flawer, not too salt nor too sweet, of a kond thick consistence, a brown culor, and char: when slaken in a flass, it should lenve n cont on the surface, of a bright yeliowish brown color; if it do not, it is of an inferior kind, and should be rejected. dapall soy is deemed superior to the Chinese. It is worth, fa boud, from six to seven shillings sterling n gallon. It is believed to be exteosively counterfeited. -Murumen's Orient, Com.

Spain, or Espana (iberia, IIispania), n untry of southwestern Furope, oceapying the greater part of the Iberian peninsula, and often termed collopuially "the Ieninsula," extending between lat. $30^{\circ} 1^{\prime}$ and
$43^{\circ} 45^{\prime} \mathrm{N}$. , and long. $3^{\circ} 20^{\prime} \mathrm{E}$., and $9^{\circ} 21^{\prime} \mathrm{W}$., bounded north by the Bay of Biscay and by the Pyrenees, whleh separato It from France, east by the Mediterrancan, south by the Mediterranenn and the Strait of Glbraltar, and west by Portughl and the Atlantic Ocean.
Spain is rich in minerals, especially mercury, Jron, copper, atsd lead. The celebrated golit and silver mines of the time of the llomans have long been alsandoned, but mercury is extracted in great abundance from the mines of Almaden. Lead forms an important branch of mining intustry. Coal Is found chiefty in the Asturias; copper, tin, zinc, antimony, arsenic, and colnit, are common, and rock-salt is abundant in tho hilis of Cardoua. The principal rivers of Spaill are, from north to soath, the Ter, Llobregat, Ebro. Guadalaviar, Jucar, and Segara, flowing cast to the Mediterranenn. The Minho, Douro, Tagns, Guadiana, and Guadalquivir, flowing mostly through Portugal west and south to the Atlantic. Few of these are navigable, and those only for small boats near their meuths.

Spanish Cuionies.-The principal are Cuba, Puerto Rico, and some smaller islands in America; the Plitlppine and Marrianne Islands in the Pacittc, the Canary Islands in tho Atlantic, Fernando I'o and the Island of Annaion in the Gulf of Guinea, and Centa, Gomern, and Melilla in Barbary.-For a fuil account of the Colonies, see articles under these heads.

The same report states that the total amount of redeemnblo debt, inciuding lst and 20 class, parchased
since the law of 1851 to the end of June, 1855 , was $934,935,271$ reala, and coat the atato $67,10^{\prime}, 134$ reala.

The climate of Spaln varies exceedingiy with eleva(ion and prosition; it is warm on the coasts; the tablelands are exposed to great heat in summer, and extreme cold in winter. The soil is generally fertile, excopt in the elovated and arld diatricts of the central provincus; the chlef crops aro wheat, malze, barley, rico, hemp, and flax. The amount of corn is often insufficient for home consumption. The winos of Spmin are unch esteemed; the princlpal growths are those of Xeres (sherry), Rota, Malaga, Alicante, Malvasia, and Val do l'enas; the other products aro soda (from marine plants), honey, wax, and silk, the latter very abundant in tho southeastern provinces. In tho south ern provinces tho sugar-cane and cotton have been acclimatized, and thero the orange and cltron grow In great ahnadanco. The best building timber grows in the northern coast; the cork-tree, the kermes oak, and the shumac-tree, yield valuablo products. The horses of Andalusia are celcbrated ; the mules ant asses are remarkuble for beanty and sizo. Cattle aro of good breeds. The ruce of sheep called the merlno ylelds a great quautity of oxcellont wool; their exportation has always been prohlbited, their pasturage is regnlated by ancient laws, and their number is reckoned at five or six millions.

Comnerce.-There is not at this time, nor has thero ever been, a commerclal treaty between the government of the United States and that of Spaln. Hut two treatics of any kind have been negotiated between tho two governments-one purporting to be "A treaty of friendslipp, limits, nal navigntion," signed Oetober 2:', 17.50 ; the other, "A treaty of amity; settlement; and limits," February 22, 1821.

In regard to navigation, the first-mentloned ireaty provided chiefly for a state of war, and preseribed the lumunities anil privileges to which the vessels of each should be entitled, in such a contingency, in the ports, harbors, bays, etc., of the other.

By articie 1st, the contracting partica agreo that there shall be a firm and invlolable peace and sincero friendship, between his Catholic Majesty, his suceessors and subjects, and the United States and their citizens, without exception of persons or places.-Art. 7 . The citiaens and subjects, vessels and effects, of cach of the parties, not to be liable to embargo or detention for any military expedition, or other public or private purpose, by either party--.1rt. 13. In the event of a war between the contracting parties, the merchants residing in the dominions of either to be allowed one year from the deelarntion of war to removo thelr effects.Art. 18. Ships of war of cither pasty, when exoreis ing right of search, to remsin out of cannon-shot, and to board with two or three inen only; and having seen passport, not to molest In any mamer, uor force to quit her intended course, tho vessel so visited. Art. 19. Consuls to be reciproeally established, and to be entithed to the privileges and powers cujoyed by those of the most favorel nations.-Irt. 22 (lst section). The two contracting parties to givo in future to their mutual conmeree all the extension and favor which the advantages of toth countries may require.

The treaty of 1810, so far as it relates to navigation, contirms all the forcgoing stipulations of the treaty of 1795 ; and as no immit was assigned to the duration of that treaty, those stipulations are still in fores, and, with subsequent acts of legislaton, regulate the intercourse, mavigation, and commerce between the Linited States and its eitizens, and the Kiug of Spain, his successors and anbjecta, between whom it is agreed "there shall ho a llm and inviolable peace and sincere frienclship, without exception of persuns or places." The commerce between the Ünted States and Spain, thongh at ali times employing but a limited capital, commonced at a period long anterior to the Aucrican Itevolution. The British-American colonists we. permitted, by act of

Parliament, to enrry on $n$ direct trade in all articlen, except tobacco and naval stores, with countrles south of Capo Finlsterre. This trado consisted principally In exporting from the colonica lumber, Inths, and other produce (tobaceo and naval atores excepted), and In bringing home roturn cargoes of wine, salt, frulta, and other proluctiona of the Spnnlsh peninaula.

After the peace of 1783, a more unrestricted trade was openell between the two countries; but, owing to tho prohibition on tobacco (a policy adopted for the pur pose of encouraging the growth of that article in the Spanish colonlal possessions), and the high protectivo dutles on most of the other learling staples of the L'nited States, the trado could not havo reallzed any hope of profitable investment, or given much encouragoment to conmercial entorpriac. The wines, frults, olive oll, salt, brandios, barllla, silks, and wools of Spaln, would constitute a protitable and an onsy exchange for the productlons of the United States, partlcularly lrenclstuffa, tobacco, and cotton, If that country conlid le induced to relax a aystem of restrictive pollcy which his never realized tho benefits it was designed to sceure, and has virtually rendered Spain, to a great extent, commorcinlly isolnted from the other untlons of tho earth. Her legislation in regarl to commereial intercourse with foreign countries would seem to be based upon the principlo of possessing and securing within herself all tho advantages of an extenslve commerce, nud all the menns of lixury, wealth, and power-a principlo which, however gratifying to natlonal vanity it may be in theory, needs no other proof of lis utter lmpracticabiltty, if not of its inevitably perniclous consequences, than a reference to what is known of the bistory of Japan or China, or oven to the conmercial condition of Spain herself during the last half century. She has ever maintained and exercised the right to bo tho sole arhiter of her commercial regulations, nud, as such, permits no foreign interference with her poliey of excludlng from her ports the produce of the industry and soll of other uations. Two features stand prominently forvard ln this exclusive and restrletive syssan : the first, the exclusion of commotitics from any country, oxcept her coloulal empire, especially lefore its disumberment and consequent liminution; and, secondly, by compelling the latter to consume no manufacturet articles except those of Sjain, with the view that all the precious metals ahonh be sent to the mother country, where they would remnin if no foreign therchandiso wns admitted. Notwithstanding these precautions, the precious metnls wero drained off' to forcign countrles, ill exchange for the enormous contrsband importations smaggled Into Sprin, hy way of the Hasquo provincea, through lortugal ; hy why of the Mediterrancan; and also oven, as they wore, and are to the present iny, by way of Gibraltar. Ihesites, an extensive contrabiand trade with tho Spanish settlements in Cuba and South America was cnrricil on by the Britislt-American colonics, thus itrnining off elarge portion of the precions metals, which it was the policy of the mother country to monopslize, nt a cost so fatal to her commercial prosperity. This contraband trate was, however, arrested, and after a short time lotall. suppressed, by the vigilanes of the gharde-rovtits stitioned by Sjain along the consta, and by the indiscrimInate seizure of all British coloninl vessels found near the shores of the Npanlsh colonies.

The trade with Spain of Inte yenrs exhibits in a most striking nanner the pernicious etfect of a system of commercial intercourse which, however will it may have fultilled its ends when Mexico, the West Indiers, the South American republics, and the Spanish l'olynesian lslands all poured their united treasures iato the lap of Spaln, and thus rendered her to n ecrtain extent independent of other nations, has long since proved to ho the most sorious, if not the only, ofstncle to her regaining the prond and prominent josition she once beld in tho family of nations. The difference in the antount
of exports between the periods of 1834 and 1854 is attrlbutnole to the partial rolaxation of the reatrictlve system within the past few years, particularly the modlifeatlous which the tariff has undergone since $[849$; but the great dlsproportion between imports and exports, resulting in mo large a balance against Spain, shows that the prohibitions and restrietions are as yet lut partially abated.

Of the article of tolseco, about $6,000,0,0 \mathrm{lbs}$ is smuggled annually from Gibraltar into Spsin, and about $4,000,000 \mathrm{lbs}$. is exported from the same depuét to Oran, Algiers, Malta, sud other places. Spaln, In the fece of this coatraband, still maintalne her royal tobacco monopoly. Exclusivo of the tobaeco amuggled into Spain froal Glbraitar, it is smugglad along the whole north and weat coasta of Spain. The extension of the Spanish customs to the sea-consts and ports of Biecny in $18+4$ has not diminished, but, it is asserted, has greatly lacreased, the contraband trade. - Maconedon. parts 13 nud 14, p. 95 .

Notwithstanding the apparently satisfactory results, the commerco of tha United States with Spain, in Amerienn bottoms, ia perceptibly decllning. Various causes conspire to this result, among which may be regarded as the most prominent the enormous differential dutles imposed on linports under all foreign fliggs, and the discrlminating thutles of port and navigation, amounting to 100 par cent. on American vessels in favor of national, and what is styled "privileged vessels;" or, in other words, the vessels of nearly all other forelgn natlons. Besldes, American vessela are frequently exposed to local restrietlons (doubtless unauthorized by the government) In the diflerent ports, to whleh they must either quletly submit, or incur all the expense, lelay, and trouble of protesting agalust the aetion of -ficials whose powor in such cases is as unllmitet as lts oxercisela arbltrary and oppreselvo. Vessels of the following nations are ascortalned to be of this clnss : England, France, II olland, Portugal, Inssia, Prussia, Sardinia, Belgiam, llamburg, Sweten and Norway, Tuscany, Bremen, Papal States, Denmark, Brazll, Eecuador, Läboek, Ilanover, Mecklenburg, Oldenburg, and Slelly.
This has been a subject of frequent complnint on the part of Ameriean captalas, but thas far wlthout obtnining relicf. The United States consul at Malaga, under late of April 3, 1851, adverting to this subject, says: "Althongh subject to the Central Board at Madrid, [quarautine regulations] are almost entirely under the control of the local bonrd of this city, * * ordering vessels off to lazarctios, * * * in the face of clean bills of health certified by Spanish consuls, upon mero reports, without any official information to warrant sach extrnordinary measures."

The following table will show, approximately, to what extent the direct trade between the United States and Spain has fallen off within the past few years. Most of this trade is carried on through the port of Maluga.
Tonnagr of dmprioan Virsel.s fenterfd at tie Pont of
Malaga in tife yollowino Tieabs.

| Years. | Tons. | Yeara. | Tona |
| :---: | :---: | :---: | :---: |
| 1846 | 35,:74 | 1850. | 16,600 |
| 1847. | . 18,283 | 1851 | 11,018 |
| 1848 | 15,093 | 1552. | 12,010 |
| 1519 | 13, 6 \% | 1853 | 11 |

The falling off in tounnge which the above table exhibits is, however, perfectly reconcilable with the comparative tables for 1854 and 1832, when wo take into consideration tho fact that at least one-third of the exports to the United States is carried by privileged vessels; and even national vessels, notwithstanding the discriminating daty of 10 per cent. to which they are subjeet in the ports of the United States, participute largely in this carrying trade, for the purpose of returning with cargoes of cotton for Malaga and Bareelona, or with codilish from Newfoundland.
The great artlcles of export from Spain consist (exclusive of silk manufactures) of raw products. Of these
wine, olivo oil, wool, fruits of various kinds, lead, quickallver, brandy, cork - wood, salt, raw allk, wheat, etc., are the mosc important, and are almost all susceptible of an indefinlte increave.
The great articlea of import are colonial producta obtalnel prineipally from Cuba, Porto RIco, ete.; cot tons aud cotton wool; linens, and hemp and flax; woolens; alted flsh; hardware, glass, and earthenware; timber, rice, hides, butter and cheese, etc. Subjoined ls

The importance of the trade that Spain formerly carried on with her vast possessions in the New World was at all times much exaggerated; ant she, in truth, was little better than an ngent in the business, the greater part of the goods sent on Spanish bottoms to the colonies being, in reality, the property of forcign merchants. Spain, notwithstanding the emancipation of Mexico and South America, has still nome very valuable colonics; and, if nothing else can, tho astonishing progress made by Cuba and Porto Rico since the abolition of the prolibitive system, should satisfy her of its ruinots tendency.

New Organization of Ports.--By royal tlecree of February 28,1854 , a new orgsnization is made of the customs service by land and sea, the principal features of which it may be intereating to the mercantile interests of the United States in have noted. As regards the sea, It divides the service into four classes. Tho first class comprises importation, exportation, re-exportation, coasting-trade, and all other commercial operations in the ports of Alicante, Almeria, Barcelona, Bl] boa, Cadiz, Carthngena, Palma de Majorca, San Sebastian, Santander, Seville, Tarragona, and Vigo. In the second class, comprising the ports of Carril, Palo-
mas, and IRivadeo, the fimportation of cotton tisaues is not to be permittel. In the ports of the third class, comprising those of seventeen provincen, only certain specitled artleles, prineipally raw materials, are to be imported and exported; and in those of the funrth elass, comprising sixteen provinces and the lialearlo Isles, only coasting-trate operations and exports are to be allowed. As rogands the limnd, it is divided into three classea, and the regulations are framed solety wlth a viow to prevent smugglligg. They do hot, however, posesss sufficient Interest fur linaertion here at length.

The principal ports are, Alicant, a sea-port In Valencia, lat. $88^{\circ} 20^{\prime} 41^{\prime \prime}$ N., long. $30^{\prime} \mathrm{W}$. The harbor is open and spacibus, between Cape in Ia IIuerta on the northeast, and Isla l'lans on the gonth, diftant from each other about ten milles. Ships of conalderablife burden moor from one-fourth to one mile from shore, In from 30 to 40 feet of water; they ure exposed to all winds from the eat-northenat to sonth by west; but the bidilngeground is gool, and there ls no Instance of a sbip havlag been drivea from her moorings in the past twenty years.

Hareelena, the principal tuwn of Spain on the MedIterrancan, In lat. $41^{\circ} 22^{\prime} \mathrm{N}$., and long. $2^{\circ} 10^{\prime} \mathrm{E}$. The liartior is naturally bad, and ls formed by mole or jetty. The depth of water within the molo is from 18 to 20 feet: but there is $n$ bar between the mole and Monjui, anil which has frequently not more than ten foef. Vessels inside the molv are safe, Large ressels have lo anchor outsite, aml are much incommoded by the winds.
llilbao, semetimes Incorreetly written Dellioa, a seaport la the Ilay of Illscay.
Cadlz, the priucipal commerelal city and sca-port of Spaln, on its bouthweatern coast, on the rocky nud elevated extremity of a narrow, low peninsula, or tongue of land, profecting from the lsla de leon N.N.W. about $4 \frac{1}{2}$ nanticul miles. It Is surrounded on all shiles except the sonth-where it jeins tho laud-by tho sea, and is very atrongly fortiled. Fopulation in 18:17, $5 \times, 525$. It is well built, and has at a tistance a very striking appearance. The tower or light-houso of St. Seloastian stands on the western side of the city, being in lat. $36^{\circ} 31^{\prime} 5^{\prime \prime} \mathbf{N}$., long. $6^{\circ} 18^{\prime}$ be" W. It is a most censpicuous object to vessels approaching from the At lantic. The light, which is $1 / 2$ feet high, is of great brilliancy, revelves once a minute, and in fatr weather may be seen more than six leagues off.

Bay of Calliz,-The entrance to this noble basin lies between the city and the town and promontory of Rota, hearing northwest by north, distant about $1 \frac{1}{3}$ leagnea The hay ls of very great extent, affording in mont places good anchorage. The port is on the eastern side of the city, where a largu mole bas been constructed.

By a roval order of January 3, 1852, it was decreed that all foreign vessels belonging to countries where Spanish vessels are placed on the same footing os nationsl, with respect to port ducs and charges, ahould enjoy a like privilege in the ports ef Spain and arljncent lalands; but, practically, this deeree was not permitted to apply to vessels of the United States, ant they continued subject to doublo the nomont of such dues and eharges paid by other forelyn and the national vessels. The reason for the non-folfillment of this provision, as reapecta this cotatry, was the refasal of the government of the United States to recoive sessels in its porta on equal terms from Cuba and Porte lico; and the government of Spain refused to accede to auch rondition, as it desired to secure this benelit tor its marine, from wheresoever her vessels might proced. On the 16th of June, 1854, however, the Amerlean minister at Mailrld was oflicially informed liy the Spanish Minister of Stato that her Majeaty the Queen hat been pleased to commanil that American vessels "be censidcred in the peninsula and adjacent islands like national oues, as regaris the dutics of port and navigation, in
