The scarcity of hogs at Otaheite may be owing to two causes; first, the number which have been consumed and carried off by the shipping which have touched here of late years; and, secondly, to the frequent wars between the two kingdoms. We know of two since the year 1767: at present a peace subsists between them, though they do not seem to entertain much friendship for each other. I never could learn the cause of the late war, nor who got the better in the conflict. In the battle, which put an end to the dispute, many were killed on both sides. On the part of Opoourenu, fell Toutaha, and several other chiefs, who were mentioned to me by name. Toutaha lies interred in the family *Marai* at Oparree; and his mother, and several other women who were of his household, are now taken care of by Otoo the reigning prince; a man who, at first, did not appear to us to much advantage. I know but little of Waheatooa of Tiarrabou. This prince, who is not above twenty years of age, appeared with all the gravity of a man of fifty. His subjects do not uncover before him, or pay him any outward obeisance, as is done to Otoo; nevertheless, they seem to show him full as much respect, and he appeared in rather more state. He was attended by a few middle-aged or elderly men, who seemed to be his counsellors. This is what appeared to me to be the then state of Otaheite. The other islands, that is, Huahine, Ulietea, and Otaha, were in a more flourishing state than they were when I was there before. Since that time, they had enjoyed the blessing of peace; the people seemed to be as happy as any under heaven; and well they may, for they possess not only the necessaries, but many of the luxuries of life in the greatest profusion; and my young man told me that hogs, fowls, and fruits are in equal plenty at Bola-bola, a thing which Tupia would never allow. To clear up this seeming contradiction, I must observe, that the one was prejudiced against, and the other in favour of, this isle.

The produce of the islands, the manners and customs of the natives, &c. having been treated at large in the narrative of my former voyage, it will be unnecessary to take notice of these subjects in this, unless where I can add new matter, or clear up any mistakes which may have been committed.

As I had some reason to believe, that amongst their religious customs, human sacrifices were sometimes considered as necessary, I went one day to a *Marai* in Matavai, in company with Captain. Furneaux; having with us, as I had upon all other occasions, one of my men who spoke their language tolerably well, and several of the natives, one of whom appeared to be an intelligent, sensible man. In the *Marai* was a *Tupapou*, on which lay a corpse and some viands; so that everything promised success to my inquiries. I began with asking questions relating to the several objects before me, if the plantains &c. were for the *Eatua*? If they sacrificed to the *Eatua*, hogs, dogs, fowls, &c., to all of which he answered in the affirmative. I then asked, if they sacrificed men to the *Eatua*? he answered, *Taata eno*; that is, Bad men they did, first *Tiparraky*, or beating them till they were dead. I then asked him, If good men were put to death in this manner? his answer was, No, only *Taata eno*. I asked him, If any *Earces* were? he said, they had hogs to give to the *Eatua*; and again repeated *Taata eno*. I next asked him, If *Toutoues*, that is, servants or slaves, who had no hogs, dogs, or fowls, but yet were good men, if they were sacrificed to the *Eatua*? His answer was, No, only bad men. I asked him several more questions, and all his answers seemed to tend to this one point, that men for certain crimes were condemned to be sacrificed to the gods, provided they had not wherewithal to redeem themselves. This, I think, implies that, on some occasions, human sacrifices are considered as necessary; particularly when they take such men as have, by the laws of the country, forfeited their lives, and have nothing to redeem them; and such will generally be found among the lower class of people.

The man of whom I made these inquiries, as well as some others, took some pains to explain the whole of this custom to us; but we were not masters enough of their language to understand them. I have since learnt from Omai, that they offer human sacrifices to the Supreme Being. According to his account, what men shall be so sacrificed depends on

the caprice of the high-priest, who, when they are assembled on any solemn occasion, retires alone into the house of God, and stays there some time. When he comes out he informs them, that he has seen and conversed with their great God (the high priest alone having that privilege), and that he has asked for a human sacrifice, and tells them that he has desired such a person, naming a man present, whom most probably the priest has an antipathy against. He is immediately killed, and so falls a victim to the priest's resentment: who, no doubt, (if necessary,) has address enough to persuade the people that he was a bad man*. If I except their funeral ceremonies, all the knowledge that has been obtained of their religion, has been from information; and as their language is but imperfectly understood, even by those who pretend to the greatest knowledge of it, very little on this head is yet known with certainty.

The liquor which they make from the plant called *Aca zea*, is expressed from the root, and not from the leaves, as mentioned in the narrative of my former voyage. The manner of preparing this liquor is as simple as it is disgusting to a European. It is thus: several people take some of the root and chew it till it is soft and pulpy; then they spit it out into a platter, or other vessel, every one into the same; when a sufficient quantity is chewed, more or less water is put to it, according as it is to be strong or weak; the juice thus diluted is strained through some fibrous stuff like fine shavings; after which it is fit for drinking; and this is always done immediately. It has a pepperish taste, drinks flat, and rather insipid. But though it is intoxicating, I saw only one instance where it had that effect; as they generally drink it with great moderation, and but little at a time. Sometimes they chew this root in their mouths, as Europeans do tobacco, and swallow their spittle; and sometimes I have seen them eat it wholly. At Ulietea they cultivate great quantities of this plant. At Otaheite but very little. I believe there are but few islands in this sea that do not produce more or less of it; and the natives apply it to the same use, as appears by Le Maire's account of Horn Island, wherein he speaks of the natives making a liquor from a plant in the same manner as above mentioned.

Great injustice has been done to the women of Otaheite, and the Society Isles, by those who have represented them, without exception, as ready to grant the last favour to any man who will come up to their price. But this is by no means the case: the favours of married women, and also the unmarried of the better sort, are as difficult to be obtained here as in any other country whatever.

* Mr. Williams, in his "Missionary Enterprises in the South Sea Islands," informs us that "the system of human sacrifices did not prevail at the Navigator's Islands, but at the Hervey Group, and still more at the Tahitian and Society Islands, where it was carried to an extent truly appalling. There was one ceremony called *Raumatachi raa*, 'the feast of restoration,' at which no less than seven human victims were always required. This festival was celebrated after an invading army had driven the inhabitants to the mountains, and had desecrated the morai by cutting down the branches of the sacred trees, and cooking their food with them, and with the wooden altars and decorations of the sacred place. As soon as the retirement of the invaders allowed the refugees to leave their hiding-place, their first object was to celebrate this 'feast of restoration,' which was supposed to restore the morai to its previous sanctity, and to reinstate the god in his former glory. A few years ago [Mr. Williams wrote in 1837], I sent to England a very sacred relic called *maro ura*, or the Red Sash. This was a piece of net-work, about seven inches wide and six feet long, upon which the red feathers of the parrot were neatly fastened. It was used at the inauguration of their greatest kings, just as the crown is with us; and the most honourable appellation which a chief could receive was *Arii maro ura*, 'King of the Red Sash!' A new piece, about eighteen inches in length, was attached at the inauguration of every sovereign; to accomplish which several human victims were required. The first was for the *mau raa ti i*, or the stretching it upon pegs in order to attach to it the new piece. Another

was necessary for the *fatu raa*, or attaching the new portion, and a third for the *piu raa*, or twirling the sacred relic off the pegs. This not only invested the sash itself with a high measure of solemn importance, but also rendered the chiefs who wore it most noble in public estimation. On the eve of war also, human victims were invariably offered."

When the priest declared a sacrifice necessary, messengers were despatched by the king to the various chiefs, to collect the requisite number of victims. These emissaries would inquire, on entering his house, whether the chief had a *broken calabash*, or a rotten *cocoa-nut* band, (terms very well understood,) on which the devoted objects, often long before fixed upon, were pointed out, and instantly knocked down with a small round stone concealed in the hollow of the hand by the messengers, when others rushed in and crushed the skull to pieces by beating it in with stones, after which the body was carried to the morai. If the victim took refuge in a house, he was speared to death from the outside.

As soon as one of a family had been selected, all the other male members of it were looked upon as devoted to the same horrid purpose. It would avail them nothing if they removed to another island, for the reason of their removal would soon be known there, and whenever a sacrifice was required, it would be sought amongst them.

A very affecting account of the last human sacrifice offered up in Tahiti, is given in Mr. Williams's interesting and valuable work.—Ed.

A stranger who visits England might with equal justice draw the characters of the women there, from those which he might meet with on board the ships in one of the naval ports, or in the purlieus of Covent Garden and Drury Lane. I must, however, allow that they are all completely versed in the art of coquetry, and that very few of them fix any bounds to their conversation. It is, therefore, no wonder that they have obtained the character of libertines.

To what hath been said of the geography of these isles, in the narrative of my former voyage, I shall now only add that we found the latitude of Oaitipiba Bay, in Otaheite, to be $17^{\circ} 46' 28''$ south, and the longitude $0^{\circ} 21' 25\frac{1}{2}''$ east from Point Venus; or $149^{\circ} 13' 24''$ west from Greenwich. The difference both of latitude and longitude, between Point Venus and Oaitipiba, is greater than I supposed it to be, when I made the circuit of the island in 1769, by two miles and $4\frac{3}{4}$ miles respectively. It is, therefore, highly probable that the whole island is of a greater extent than I at that time estimated it to be. The astronomers set up their observatory, and made their observations on Point Venus, the latitude of which they found to be $17^{\circ} 29' 13''$ south. This differs but two seconds from that which Mr. Green and I found; and its longitude, viz., $149^{\circ} 34' 49\frac{1}{2}''$ west, for anything that is yet known to the contrary, is as exact.

Mr. Kendal's watch was found to be gaining on mean time $8''$ 163 per day, which is only $3''$ 142 less than at Queen Charlotte's Sound, consequently its error in longitude was trifling.

LIZARD.

BOOK II.

FROM OUR DEPARTURE FROM THE SOCIETY ISLES, TO OUR RETURN TO AND LEAVING THEM THE SECOND TIME.

CHAPTER I.—PASSAGE FROM ULITEA TO THE FRIENDLY ISLANDS, WITH AN ACCOUNT OF THE DISCOVERY OF HERVEY'S ISLAND, AND THE INCIDENTS THAT HAPPENED AT MIDDLEBURG.

AFTER leaving Ulitea, as before mentioned, I steered to the west, inclining to the south, to get clear of the tracks of former navigators, and to get into the latitude of the islands of Middleburg and Amsterdam; for I intended to run as far west as these islands, and to touch there if I found it convenient, before I hauled up for New Zealand. I generally lay to every night, lest we might pass any land in the dark. Part of the 21st and 22nd, the wind blew from N.W., attended with thunder, lightning, and rain; having a large swell from S.S.E. and S., which kept up for several days—an indication that no land was near us in that direction. On the 23rd, at ten o'clock in the morning, land was seen from the topmast-head, and at noon from the deck, extending from S. by W. to S.W. by S. We hauled up for it with the wind at S.E., and found it to consist of two or three small islets, connected together by breakers like most of the low isles in the sea, lying in a triangular form, and about six leagues in circuit. They were clothed with wood, among which were many cocoa-nut trees. We saw no people, or signs of inhabitants, and had reason to think there were none. The situation of this isle, which is in the latitude of $19^{\circ} 18'$ south, longitude $153^{\circ} 54'$ west, is not very different from that assigned by Mr. Dalrymple to La Dezena. But as this is a point not easily determined, I named it Hervey's Island, in honour of the Honourable Captain Hervey of the Navy, one of the Lords of the Admiralty, and now Earl of Bristol.

As the landing on this isle, if practicable, would have caused a delay which I could ill spare at this time, we resumed our course to the west; and on the 25th we again began to use our sea-biscuit, the fruit, which had served as a succedaneum, being all consumed; but our stock of fresh pork still continued, each man having as much every day as was needful. In our route to the west, we now and then saw men-of-war and tropic birds, and a small sea-bird, which is seldom seen but near the shores of the isles; we therefore conjectured that we had passed some land at no great distance. As we advanced to the west, the variation of the compass gradually increased, so that on the 29th, being in the latitude of $21^{\circ} 20'$ south, longitude $170^{\circ} 40'$ west, it was $10^{\circ} 45'$ east.

At two o'clock, *v.m.*, on the 1st of October, we made the island of Middleburg, bearing W.S.W., at six o'clock it extended from S.W. by W. to N.W., distant four leagues, at which time another land was seen in the direction of N.N.W. The wind being at S.S.E., I hauled to the S., in order to get round the south end of the island before the morning; but at eight o'clock a small island was seen lying off it; and not knowing but they might be connected by a reef, the extent of which we must be ignorant of, I resolved to spend the night where we were. At daybreak the next morning we bore up for the S.W. side of Middleburg, passing between it and the little isle above mentioned, where we found a clear channel two miles broad.

After ranging the S.W. side of the greater isle to about two-thirds of its length, at the distance of half a mile from the shore, without seeing the least prospect of either anchorage or landing-place, we bore away for Amsterdam, which we had in sight. We had scarcely turned our sails before we observed the shores of Middleburg to assume another aspect, seeming to offer both anchorage and landing. Upon this we hauled the wind, and plied in under the island. In the meantime, two canoes, each conducted by two or three men, came boldly alongside; and some of them entered the ship without hesitation. This mark of confidence gave me a good opinion of these islanders, and determined me to visit them if possible. After making a few trips, we found good anchorage, and came to in twenty-five fathoms' water, and gravel bottom, at three cables' length from the shore. The highest land on the island bore S.E. by E., the north point N.E. $\frac{1}{4}$ E., and the west S. by W. $\frac{1}{4}$ W., and the island of Amsterdam extending from N. by W. $\frac{1}{4}$ W. to N.W. $\frac{1}{4}$ W. We had scarcely got to an anchor before we were surrounded by a great number of canoes full of people, who had brought with them cloth, and other curiosities, which they exchanged for nails, &c. Several came on board; among whom was one, who, by the authority he seemed to have over the others, I found was a chief, and accordingly made him a present of a hatchet, spike-nails, and several other articles, with which he was highly pleased. Thus I obtained the friendship of this chief, whose name was Tioony.

Soon after, a party of us embarked in two boats, in company with Tioony, who conducted us to a little creek formed by the rocks, right abreast of the ships, where landing was extremely easy, and the boats secure against the surf. Here we found an immense crowd of people, who welcomed us on shore with loud acclamations. Not one of them had so much as a stick, or any other weapon in their hands; an indubitable sign of their pacific intentions. They thronged so thick round the boats with cloth, matting, &c. to exchange for nails, that it was some time before we could get room to land. They seemed to be more desirous to give than receive; for many who could not get near the boats, threw into them, over the others' heads, whole bales of cloth, and then retired, without either asking or waiting to get anything in return. At length the chief caused them to open to the right and left, and make room for us to land. He then conducted us up to his house, which was situated about three hundred yards from the sea, at the head of a fine lawn, and under the shade of some shaddock-trees. The situation was most delightful. In front was the sea and the ships at anchor; behind, and on each side, were plantations, in which were some of the richest productions of nature. The floor was laid with mats, on which we were seated, and the people seated themselves in a circle round us on the outside. Having the bagpipes with us, I ordered them to be played; and, in return, the chief directed three young women to sing a song, which they did with a very good grace; and having made each of them a present, this immediately set all the women in the circle a-singing. Their songs were

musical and harmonious, and nowise harsh or disagreeable. After sitting here some time, we were, at our own request, conducted into one of the adjoining plantations, where the chief had another house, into which we were introduced. Bananas and cocoa-nuts were set before us to eat, and a bowl of liquor prepared in our presence of the juice of *cava* for us to drink. Pieces of the root were first offered to us to chew; but as we excused ourselves from assisting in the operation, this was performed by others. When sufficiently chewed, it was put into a large wooden bowl, then mixed with water, in the manner already related; and as soon as it was properly strained for drinking, they made cups by folding of green leaves, which held near half a pint, and presented to each of us one of these filled with the liquor. But I was the only one who tasted it; the manner of brewing it having quenched the thirst of every one else. The bowl was, however, soon emptied of its contents, of which both men and women partook. I observed that they never filled the same cup twice; nor did two persons drink out of the same; each had a fresh cup and fresh liquor. This house was situated at one corner of the plantation, and had an area before it, on which we were seated. The whole was planted round with fruit and other trees, whose spreading branches afforded an agreeable shade, and whose fragrance diffused a pleasing odour through the air.

Before we had well viewed the plantation it was noon, and we returned on board to dinner, with the chief in our company. He sat at table, but ate nothing, which, as we had fresh pork roasted, was a little extraordinary. After dinner we landed again, and were received by the crowd as before. Mr. Forster, with his botanical party, and some of the officers and gentlemen, walked into the country. Captain Furneaux and myself were conducted to the chief's house, where fruit and some greens, which had been stewed, were set before us to eat. As we had but just dined, it cannot be supposed we ate much; but Oedidee, and Onai, the man on board the *Adventure*, did honour to the feast. After this we signified our desire of seeing the country. Tiiony very readily assented, and conducted us through several plantations, which were laid out with great judgment, and inclosed with very neat fences made of reeds. They were all in very good order, and well planted with various fruit-trees, roots, &c. The chief took some pains to let us know the most of them belonged to himself. Near some of the houses and in the lanes that divided the plantations were running about some hogs, and very large fowls, which were the only domestic animals we saw; and these they did not seem willing to part with. Nor did any one, during the whole day, offer in exchange any fruit, or roots, worth mentioning; which determined me to leave this island, and to visit that of Amsterdam.

The evening brought every one on board, highly delighted with the country and the very obliging behaviour of the inhabitants, who seemed to vie with each other in doing what they thought would give us pleasure. The ships were crowded with people the whole day, trafficking with those on board, in which the greatest good order was observed; and I was sorry that the season of the year would not admit of my making a longer stay with them. Early the next morning, while the ships were getting under sail, I went ashore with Captain Furneaux and Mr. Forster to take leave of the chief. He met us at the landing-place, and would have conducted us to his house had we not excused ourselves; we therefore were seated on the grass, where we spent about half an hour in the midst of a vast crowd of people. After making the chief a present, consisting of various articles and an assortment of garden seeds, I gave him to understand that we were going away, at which he seemed not at all moved. He, and two or three more, came into our boat, in order to accompany us on board; but seeing the *Resolution* under sail, he called to a canoe to put alongside, into which he and his friends went, and returned on shore. While he remained in our boat, he continued to exchange fish-hooks for nails, and engrossed the trade in a manner wholly to himself; but when on shore, I never saw him make the least exchange.

CHAPTER II.—THE ARRIVAL OF THE SHIPS AT AMSTERDAM; A DESCRIPTION OF A PLACE OF WORSHIP; AND AN ACCOUNT OF THE INCIDENTS WHICH HAPPENED WHILE THEY REMAINED AT THIA^s ISLAND.

As soon as I was on board, we made sail down to Amsterdam. The people of this isle were so little afraid of us, that some met us in three canoes about midway between the two isles. They used their utmost efforts to get on board, but without effect, as we did not shorten sail for them, and the rope which we gave them broke. They then attempted to board the *Adventure*, and met with the same disappointment. We ran along the S.W. coast of Amsterdam at half a mile from shore, on which the sea broke in a great surf. We had an opportunity, by the help of our glasses, to view the face of the island, every part of which seemed to be laid out in plantations. We observed the natives running along the shore, displaying small white flags, which we took for ensigns of peace, and answered them by hoisting a St. George's ensign. Three men belonging to Middleburg, who, by some means or other, had been left on board the *Adventure*, now left her, and swam to the shore, not knowing that we intended to stop at this isle, and having no inclination, as may be supposed, to go away with us.

As soon as we opened the west side of the isle, we were met by several canoes, each conducted by three or four men. They came boldly alongside, presented us with some *cava* root, and then came on board without farther ceremony, inviting us, by all the friendly signs they could make, to go to their island, and pointing to the place where we should anchor,—at least so we understood them. After a few boards, we anchored in Van Diemen's Road, in eighteen fathoms water, little more than a cable's length from the breakers which line the coast. We carried out the coasting anchor and cable to seaward, to keep the ship from tailing on the rocks, in case of a shift of wind or a calm. This last anchor lay in forty-seven fathoms water, so steep was the bank on which we anchored. By this time we were crowded with people; some came off in canoes, and others swam; but, like those of the other isle, brought nothing with them but cloth, matting, &c., for which the seamen only bartered away their clothes. As it was probable they would soon feel the effects of this kind of traffic, with a view to put a stop to it, and to obtain the necessary refreshments, I gave orders that no sort of curiosities should be purchased by any person whatever.

The good effect of this order was found in the morning; for when the natives saw we would purchase nothing but eatables, they brought off bananas and cocoa-nuts in abundance, some fowls and pigs, all of which they exchanged for small nails and pieces of cloth; even old rags of any sort was enough for a pig or a fowl.

Matters being thus established, and proper persons appointed to trade under the direction of the officers to prevent disputes, after breakfast, I landed, accompanied by Captain Furneaux, Mr. Forster, and several of the officers; having along with us a chief, or person of some note, whose name was Attago, who had attached himself to me from the first moment of his coming on board, which was before we anchored. I know not how he came to discover that I was the commander; but, certain it is, he was not long on deck before he singled me out from all the other gentlemen, making me a present of some cloth, and other things he had about him; and, as a greater testimony of friendship, we now exchanged names, a custom which is practised at Otaheite and the Society Isles. We were lucky, or rather we may thank the natives, for having anchored before a narrow creek in the rocks which line the shore. To this creek we were conducted by my friend Attago; and there we landed dry on the beach, and within the breakers, in the face of a vast crowd of people, who received us in the same friendly manner that those of Middleburg had done.

As soon as we were landed, all the gentlemen set out into the country, accompanied by some of the natives; but the most of them remained with Captain Furneaux and me, who amused ourselves some time in distributing presents amongst them, especially to such as Attago pointed out, which were not many, but who I afterwards found were of superior rank to himself. At this time, however, he seemed to be the principal person, and to be

obeyed as such. After we had spent some time on the beach, as we complained of the heat, Attago immediately conducted and seated us under the shade of a tree, ordering the people to form a circle round us. This they did, and never once attempted to push themselves upon us, like the Otaheiteans.

After sitting here some time, and distributing some presents to those about us, we signified our desire to see the country. The chief immediately took the hint, and conducted us along a lane that led to an open green, on the one side of which was a house of worship, built on a mount that had been raised by the hand of man, about sixteen or eighteen feet above the common level. It had an oblong figure, and was inclosed by a wall or parapet of stone, about three feet in height. From this wall the mount rose with a gentle slope, and was covered with a green turf. On the top of it stood the house, which had the same figure as the mount, about twenty feet in length, and fourteen or sixteen broad. As soon as we came before the place, every one seated himself on the green, about fifty or sixty yards from the front of the house. Presently came three elderly men, who seated themselves between us and it, and began a speech, which I understood to be a prayer, it being wholly directed to the house. This lasted about ten minutes; and then the priests, for such I took them to be, came and sat down along with us, when we made them presents of such things as were about us. Having then made signs to them that we wanted to view the premises, my friend Attago immediately got up, and going with us, without showing the least backwardness, gave us full liberty to examine every part of it.

In the front were two stone steps leading to the top of the wall; from this the ascent to the house was easy, round which was a fine gravel walk. The house was built, in all respects, like to their common dwelling-houses; that is, with posts and rafters, and covered with palm thatch. The eaves came down within about three feet of the ground, which space was filled up with strong matting made of palm leaves as a wall. The floor of the house was laid with fine gravel, except in the middle, where there was an oblong square of blue pebbles, raised about six inches higher than the floor. At one corner of the house stood an image rudely carved in wood, and on one side lay another; each about two feet in length. I, who had no intention to offend either them or their gods, did not so much as touch them, but asked Attago, as well as I could, if they were *Eatus* or gods. Whether he understood me or no I cannot say; but he immediately turned them over and over, in as rough a manner as he would have done any other log of wood, which convinced me that they were not there as representatives of the Divinity. I was curious to know if the dead were interred there, and asked Attago several questions relative thereto; but I was not sure that he understood me; at least I did not understand the answers he made well enough to satisfy my inquiries. For the reader must know that, at our first coming among these people, we hardly could understand a word they said: even my Otaheitean youth, and the man on board the *Adventure*, were equally at a loss; but more of this by and bye. Before we quitted the house, we thought it necessary to make an offering to the altar. Accordingly we laid down upon the blue pebbles, some medals, nails, and several other things; which we had no sooner done than my friend Attago took them up and put them in his pocket. The stones with which the walls were made that inclosed this mount, were some of them nine or ten feet by four, and about six inches thick. It is difficult to conceive how they can cut such stones out of the coral rocks.

This mount stood in a kind of grove open only on the side which fronted the high-road and the green on which the people were seated. At this green open place, was a junction of five roads, two or three of which appeared to be very public ones. The groves were composed of several sorts of trees. Among others was the *ctoa* tree, as it is called at Otaheite, of which are made clubs, &c., and a kind of low palm, which is very common in the northern parts of New Holland.

After we had done examining this place of worship, which in their language is called *A-fia-touet*, we desired to return; but instead of conducting us to the water-side, as we expected, they struck into the road leading into the country. This road, which was about sixteen feet broad, and as level as a bowling-green, seemed to be a very public one; there being many other roads from different parts, leading into it, all inclosed on each side, with

neat fences made of reeds, and shaded from the scorching sun by fruit trees. I thought I was transported into the most fertile plains in Europe. There was not an inch of waste ground; the roads occupied no more space than was absolutely necessary; the fences did not take up above four inches each; and even this was not wholly lost, for in many were planted some useful trees or plants. It was everywhere the same; change of place altered not the scene. Nature, assisted by a little art, nowhere appears in more splendour than at this isle. In these delightful walks, we met numbers of people; some travelling down to the ships with their burdens of fruit; others returning back empty. They all gave us the road by turning either to the right or left, and sitting down, or standing, with their backs to the fences, till we had passed.

AFIATOUCA.

At several of the cross roads, or at the meeting of two or more roads, were generally *Afiatoucas*, such as already described; with this difference, the mounts were palisadoed round, instead of a stone wall. At length, after walking several miles, we came to one larger than common; near to which was a large house belonging to an old chief in our company. At this house we were desired to stop, which we accordingly did, and were treated with fruit, &c.

We were no sooner seated in the house, than the eldest of the priests began a speech or prayer, which was first directed to the *Afiatouca*, and then to me, and alternately. When he addressed me, he paused at every sentence, till I gave a nod of approbation. I, however, did not understand one single word he said. At times, the old gentleman seemed to be at a loss what to say; or perhaps his memory failed him; for, every now and then, he was prompted by one of the other priests who sat by him. Both during this prayer and the former one the people were silent, but not attentive. At this last place we made but a short stay. Our guides conducted us down to our boat, and we returned with Attago to our ship to dinner. We had no sooner got on board, than an old gentleman came alongside, who, I understood from Attago, was some king or great man. He was, accordingly, ushered on board; when I presented him with such things as he most valued (being the only method to make him my friend), and seated him at table to dinner. We now saw that he

was a man of consequence; for Attago would not sit down and eat before him, but got to the other end of the table; and, as the old chief was almost blind, he sat there, and ate with his back towards him. After the old man had eaten a bit of fish and drunk two glasses of wine, he returned ashore. As soon as Attago had seen him out of the ship, he came and took his place at table, finished his dinner, and drank two glasses of wine. When dinner was over, we all went ashore, where we found the old chief, who presented me with a hog; and he and some others took a walk with us into the country.

Before we set out, I happened to go down with Attago to the landing-place, and there found Mr. Wales in a laughable, though distressed, situation. The boats which brought us on shore, not being able to get near the landing-place for want of a sufficient depth of water; he pulled off his shoes and stockings to walk through, and as soon as he got on dry land, he put them down betwixt his legs to put on again, but they were instantly snatched away by a person behind him, who immediately mixed with the crowd. It was impossible for him to follow the man bare-footed over the sharp coral rocks, which compose the shore, without having his feet cut to pieces. The boat was put back to the ship, his companions had each made his way through the crowd, and he left in this condition alone. Attago soon found out the thief, recovered his shoes and stockings, and set him at liberty. Our route into the country was by the first-mentioned *Afatonua*, before which we again seated ourselves, but had no prayers, although the old priest was with us. Our stay here was but short. The old chief, probably thinking that we might want water on board, conducted us to a plantation hard by, and showed us a pool of fresh water, though we had not made the least inquiry after any. I believe this to be the same that Tasman calls the *washing-place* for the king and his nobles. From hence we were conducted down to the shore of Maria bay, or N.E. side of the isle; where, in a boat-house, was shown to us a fine large double canoe not yet launched. The old chief did not fail to make us sensible it belonged to himself. Night now approaching, we took leave of him and returned on board, being conducted by Attago down to the water-side.

Mr. Forster and his party spent the day in the country botanizing; and several of the officers were out shooting. All of them were very civilly treated by the natives. We had also a brisk trade for bananas, cocoa-nuts, yams, pigs, and fowls; all of which were procured for nails, and pieces of cloth. A boat from each ship was employed trading ashore, and bringing off their cargoes as soon as they were laden, which was generally in a short time. By this method we got cheaper, and with less trouble, a good quantity of fruit, as well as other refreshments, from people who had no canoes to carry them off to the ships.

Pretty early in the morning on the 5th, my friend brought me a hog and some fruit; for which I gave him a hatchet, a sheet and some red cloth. The pinnace was sent ashore to trade as usual; but soon returned. The officer informed me that the natives were not taking everything out of the boat, and in other respects were very troublesome. The day before, they stole the grappling at the time the boat was riding by it, and carried it off undiscovered. I now judged it necessary to have a guard on shore, to protect the boats and people whose business required their being there; and accordingly sent the marines, under the command of Lieutenant Edgembe. Soon after, I went myself, with my friend Attago, Captain Furneaux, and several of the gentlemen. At landing, we found the old chief, who presented me with a pig. After this, Captain Furneaux and I took a walk into the country with Mr. Hodges, to make drawings of such places and things as were most interesting. When this was done, we returned on board to dinner, with my friend and two other chiefs; one of whom sent a hog on board the *Adventure* for Captain Furneaux, some hours before, without stipulating for any return; the only instance of this kind.—My friend took care to put me in mind of the pig the old king gave me in the morning; for which I now gave a checked shirt and a piece of red cloth. I had tied them up for him to carry ashore; but with this he was not satisfied. He wanted to have them put on him; which was no sooner done, than he went on deck, and showed himself to all his countrymen. He had done the same thing in the morning with the sheet I gave him. In the evening we all went on shore again, where we found the old king, who took to himself everything my friend and the others had got.

The different trading parties were so successful to-day as to procure for both ships a

tolerably good supply of refreshments. In consequence of which, I, the next morning, gave every one leave to purchase what curiosities and other things they pleased. After this, it was astonishing to see with what eagerness every one caught at everything he saw. It even went so far as to become the ridicule of the natives, who offered pieces of sticks and stones to exchange. One waggish boy took a piece of human excrement on the end of a stick, and held it out to every one he met with. This day a man got into the master's cabin, through the outside scuttle, and took out some books and other things. He was discovered just as he was getting out into his canoe, and pursued by one of our boats, which obliged him to quit the canoe and take to the water. The people in the boat made several attempts to lay hold on him; but he as often dived under the boat, and at last, having unshipped the rudder, which rendered her ungovernable, by this means he got clear off. Some other very daring thefts were committed at the landing-place. One fellow took a seaman's jacket out of the boat, and carried it off, in spite of all that our people in her could do. Till he was both pursued and fired at by them, he would not part with it; nor would he have done it then, had not his landing been intercepted by some of us, who were on shore. The rest of the natives, who were very numerous, took very little notice of the whole transaction; nor were they the least alarmed when the man was fired at.

My friend Attago having visited me again next morning, as usual brought with him a hog, and assisted me in purchasing several more. Afterwards we went ashore; visited the old king, with whom we staid till noon; then returned on board to dinner, with Attago, who never once left me. Intending to sail the next morning, I made up a present for the old king, and carried it on shore in the evening. As soon as I landed, I was told by the officers who were on shore, that a far greater man than any we had yet seen was come to pay us a visit. Mr. Pickersgill informed me that he had seen him in the country, and found that he was a man of some consequence; by the extraordinary respect paid him by the people. Some, when they approached him, fell on their faces, and put their heads between their feet; and no one durst pass him without permission. Mr. Pickersgill, and another of the gentlemen, took hold of his arms, and conducted him down to the landing-place, where I found him seated with so much sullen and stupid gravity, that notwithstanding what had been told me, I really took him for an idiot, whom the people, from some superstitious notions, were ready to worship. I saluted and spoke to him; but he neither answered, nor took the least notice of me; nor did he alter a single feature in his countenance. This confirmed me in my opinion, and I was just going to leave him, when one of the natives, an intelligent youth, undertook to undeceive me; which he did in such a manner as left me no room to doubt that he was the king, or principal man on the island. Accordingly I made him the present I intended for the old chief, which consisted of a shirt, an ax, a piece of red cloth, a looking-glass, some nails, medals, and beads. He received these things, or rather suffered them to be put upon him, and laid down by him, without losing a bit of his gravity, speaking one word, or turning his head either to the right or left; sitting the whole time like a statue; in which situation I left him, to return on board; and he soon after retired. I had not been long on board before word was brought me that a quantity of provisions had come from this chief. A boat was sent to bring it from the shore; and it consisted of about twenty baskets of roasted bananas, sour bread and yams, and a roasted pig of about twenty pounds weight. Mr. Edgumbe and his party were just reimbarking, when these were brought to the water-side, and the bearers said it was a present from the *Areeke*, that is the king of the island, to the *Areeke* of the ship. After this I was no longer to doubt the dignity of this sullen chief.

Early in the morning of the 7th, while the ships were unmooring, I went ashore with Captain Furneaux and Mr. Forster, in order to make some return to the king for his last night's present. We no sooner landed than we found Attago, of whom we inquired for the king, whose name was Kolahgetoo-Pallangon. He accordingly undertook to conduct us to him; but whether he mistook the man we wanted, or was ignorant where he was, I know not. Certain it is that he took us a wrong road, in which he had not gone far before he stopped; and after some little conversation between him and another man, we returned back, and presently after the king appeared with very few attendants. saw him coming, he sat down under a tree, and desired us to do the same. The king seated himself on a rising ground, about twelve or fifteen yards from us: here we sat facing one another for some minutes. I waited for Attago to show us the way; but seeing he did not rise, Captain Furneaux and I got up, went and saluted the king, and sat down by him. We then presented him with a white shirt (which we put on his back), a few yards of red cloth, a brass kettle, a saw, two large spikes, three looking-glasses, a dozen of medals, and some strings of beads. All this time he sat with the same sullen stupid gravity as the day before: he even did not seem to see or know what we were about; his arms appeared immovable at his sides; he did not so much as raise them when we put on the shirt. I told him, both by words and signs, that we were going to leave his island; he scarcely made the least answer to this, or any other thing we either said or did. We, therefore, got up and took leave; but I yet remained near him, to observe his actions. Soon after, he entered into conversation with Attago and an old woman, whom we took to be his mother. I did not understand any part of the conversation; it however made him laugh, in spite of his assumed gravity. I say assumed, because it exceeded everything of the kind I ever saw; and therefore think it could not be his real disposition (unless he was an idiot indeed), as these islanders, like all the others we had lately visited, have a great deal of levity; and he was in the prime of life. At last, he rose up, and retired with his mother and two or three more.

Attago conducted us to another circle, where were seated the aged chief and several respectable old persons of both sexes: among whom was the priest, who was generally in company with this chief. We observed that this reverend father could walk very well in a morning; but, in an evening, was obliged to be led home by two people. By this we concluded, that the juice of the pepper-root had the same effect upon him, that wine and other strong liquors have on Europeans who drink a large portion of them. It is very certain, that these old people seldom sat down without preparing a bowl of this liquor; which is done in the same manner as at Ulitea. We, however, must do them the justice to believe, that it was meant to treat us: nevertheless, the greatest part, if not the whole, generally fell to their share. I was not well prepared to take leave of this chief, having exhausted almost all our store on the other. However, after rummaging our pockets, and treasury bag, which was always carried with me wherever I went, we made up a tolerable present, both for him and his friends. This old chief had an air of dignity about him that commanded respect, which the other had not. He was grave, but not sullen: would crack a joke, talk on indifferent subjects, and endeavour to understand us and be understood himself. During this visit, the old priest repeated a short prayer or speech, the purport of which we did not understand. Indeed he would frequently, at other times, break out in prayer; but I never saw any attention paid to him by any one present. After a stay of near two hours, we took leave, and returned on board, with Attago and two or three more friends, who staid and breakfasted with us; after which they were dismissed, loaded with presents.

Attago was very importunate with me to return again to this isle, and to bring with me cloth, axes, nails, &c. &c., telling me that I should have hogs, fowls, fruit, and roots, in abundance. He particularly desired me, more than once, to bring him such a suit of clothes as I had on, which was my uniform. This good-natured islander was very serviceable to me, on many occasions, during our short stay. He constantly came on board every morning soon after it was light, and never quitted us till the evening. He was always ready, either on board or on shore, to do me all the service in his power: his fidelity was rewarded at a small expense; and I found my account in having such a friend.

In heaving in the coasting cable, it parted in the middle of its length, being chafed by the rocks. By this accident we lost the other half, together with the anchor, which lay in forty fathoms water, without any buoy to it. The best bower cable suffered also by the rocks; by which a judgment may be formed of this anchorage. At ten o'clock we got under sail; but as our decks were much encumbered with fruit, &c. we kept plying under the land till they were cleared. The supplies we got at this isle were about one hundred and fifty pigs, twice that number of fowls, as many bananas and cocoa-nuts as we could find room for, with a few yams; and had our stay been longer, we, no doubt, might have got a great deal more. This, in some degree, shows the fertility of the island, of which, together with the neighbouring one of Middleburg, I shall now give a more particular account.

CHAPTER III.—A DESCRIPTION OF THE ISLANDS AND THEIR PRODUCE, WITH THEIR CULTIVATION, HOUSES, CANOES, NAVIGATION, MANUFACTURES, WEAPONS, CUSTOMS, GOVERNMENT, RELIGION, AND LANGUAGE OF THE INHABITANTS.

THESE islands were first discovered by Captain Tasman, in January 1642-3; and, by him, called Amsterdam and Middleburg. But the former is called by the natives *Tou-ga-ta-bu*, and the latter *Ea-oo-we*. They are situated between the latitude of $21^{\circ} 20'$ and $21^{\circ} 3'$ south, and between the longitude of $174^{\circ} 40'$ and $175^{\circ} 15'$ west, deduced from observations made on the spot.

Middleburg, or *Eaoowe*, which is the southernmost, is about ten leagues in circuit, and of a height sufficient to be seen twelve leagues. The skirts of this isle are mostly taken up in the plantations; the S.W. and N.W. sides especially. The interior parts are but little cultivated, though very fit for cultivation. However, the want of it added greatly to the beauty of the isle; for here are, agreeably dispersed, groves of cocoa-nut and other trees, lawns covered with thick grass, here and there plantations, and paths leading to every part of the island, in such beautiful disorder as greatly enlivens the prospect.

The anchorage, which I named English Road, (being the first who anchored there,) is on the N.W. side, in latitude $21^{\circ} 20' 30''$ south. The bearing we took when at anchor, already mentioned, together with the chart, will be more than sufficient to find this anchorage. The bank is a coarse sand; it extends two miles from the land, and on it there is from twenty to forty fathoms water. The small creek before it affords convenient landing for boats at all times of the tide; which here, as well as at the other islands, rises about four or five feet, and is high water on the full and change days about seven o'clock. The island of *Tongatabu* is shaped something like an isosceles triangle, the longest sides whereof are seven leagues each, and the shortest four. It lies nearly in the direction of E.S.E. and W.N.W. is nearly all of an equal height, rather low, not exceeding sixty or eighty feet above the level of the sea. This island, and also that of *Eaoowe*, is guarded from the sea by a reef of coral rocks extending out from the shore one hundred fathoms more or less. On this reef the force of the sea is spent before it reaches the land or shore. Indeed, this is, in some measure, the situation of all the tropical isles in this sea that I have seen; and thus nature has effectually secured them from the encroachments of the sea, though many of them are mere points when compared to this vast ocean. Van Diemen's Road, where we anchored, is under the north-west part of the island, between the most northern and western points. There lies a reef of rocks without it, bearing N.W. by W., over which the sea breaks continually. The bank does not extend more than three cables' length from the shore; without that, is an unfathomable depth. The loss of an anchor, and the damage our cables sustained, are sufficient proofs that the bottom is none of the best.

On the east side of the north point of the island (as Mr. Gilbert, whom I sent to survey the parts, informed me) is a very snug harbour, of one mile or more in extent, wherein is seven, eight, and ten fathoms water, with a clean sandy bottom. The channel, by which he went in and out, lies close to the point, and has only three fathoms water; but he believes that farther to the N.E. is a channel with a much greater depth, which he had not time to examine. Indeed, it would have taken up far more time than I could spare to have surveyed these parts minutely; as there lie a number of small islets and reefs of rocks along the N.E. side of the island, which seemed to extend to the N.E. farther than the eye could reach. The island of Amsterdam or *Tongatabu* is wholly laid out in plantations, in which are planted some of the richest productions of nature; such as bread-fruit, cocoa-nut-trees, plantains, bananas, shaddocks, yams, and some other roots, sugar-cane, and a fruit like a nectarine, called by them *Fighega*, and at Otaheite *Ahuja*: in short, here are most of the articles which the Society Islands produce, besides some which they have not. Mr. Forster tells me, that he not only found the same plants here that are at Otaheite, and the neighbouring isles, but several others which are not to be met with there. And I probably have

NATIVES OF NEW GUINEA.

added to their stock of vegetables, by leaving with them an assortment of garden seeds, pulse, &c. Bread-fruit here, as well as at all the other isles, was not in season; nor was this the time for roots and shaddocks. We got the latter only at Middleburg.

The produce and cultivation of this isle is the same as at Amsterdam; with this difference, that a part only of the former is cultivated, whereas the whole of the latter is. The lanes, or roads necessary for travelling, are laid out in so judicious a manner as to open a free and easy communication from one part of the island to the other. Here are no towns or villages, most of the houses are built in the plantations, with no other order than what convenience requires; they are neatly constructed; but do not exceed those in the other isles. The materials of which they are built are the same; and some little variation in the disposition of the framing is all the difference in their construction. The floor is a little raised, and covered with thick strong mats; the same sort of matting serves to inclose them on the windward side, the other being open. They have little areas before the most of them, which are generally planted round with trees, or shrubs of ornament, whose fragrant perfume the very air in which they breathe. Their household furniture consists of a few wooden platters, cocoa-nut shells, and some neat wooden pillows shaped like four-footed stools or forms. Their common clothing, with the addition of a mat, serves them for bedding. We got from them two or three earthen vessels, which were all we saw among them. One was in the shape of a bomb-shell, with two holes in it opposite to each other; the others were like pipkins, containing about five or six pints, and had been in use on the fire. I am of opinion they are the manufacture of some other isle; for, if they were of their own, we ought to have seen more of them. Nor am I to suppose they came from Tasman's ships; the time is too long for brittle vessels like these to be preserved.

We saw no other domestic animals amongst them but hogs and fowls. The former are of the same sort as at the other isles in this sea; but the latter are far superior, being as large as any we have in Europe, and their flesh equally good, if not better. We saw no dogs, and believe they have none, as they were exceedingly desirous of those we had on board. My friend Attago was complimented with a dog and a bitch, the one from New Zealand, the other from Ulitea. The name of a dog with them is *Looree* or *gooree*, the same as at New Zealand, which shows that they are not wholly strangers to them. We saw no rats in these isles, nor any other wild quadrupeds, except small lizards. The land birds are pigeons, turtle-doves, parrots, paroquets, owls, bald coots with a blue plumage, a variety of small birds, and large bats in abundance. The produce of the sea we know but little of; it is reasonable to suppose that the same sorts of fish are found here as at the other isles. Their fishing instruments are the same; that is, hooks made of mother-of-pearl, gigs with two, three, or more prongs, and nets made of a very fine thread, with the meshes wrought exactly like ours. But nothing can be a more demonstrative evidence of their ingenuity than the construction and make of their canoes, which, in point of neatness and workmanship, exceed everything of this kind we saw in this sea. They are built of several pieces sewed together with bandage, in so neat a manner, that on the outside it is difficult to see the joints. All the fastenings are on the inside, and pass through kants or ridges, which are wrought on the edges and ends of the several boards which compose the vessel, for that purpose. They are of two kinds, viz., double and single. The single ones are from twenty to thirty feet long, and about twenty or twenty-two inches broad in the middle; the stern terminates in a point, and the head something like the point of a wedge. At each end is a kind of deck, for about one-third part of the whole length, and open in the middle. In some the middle of the deck is decorated with a row of white shells, stuck on little pegs wrought out of the same piece which composes it. These single canoes have all out-riggers, and are sometimes navigated with sails, but more generally with paddles, the blades of which are short, and broadest in the middle. The two vessels which compose the double canoe are each about sixty or seventy feet long, and four or five broad in the middle; and each end terminates nearly in a point; so that the body or hull differs a little in construction from the single canoe; but is put together exactly in the same manner; these having a rising in the middle round the open part, in the form of a long trough, which is made of boards, closely fitted together, and well secured to the body of the vessel. Two such vessels

are fastened to and parallel to each other, about six or seven feet asunder, by strong cross beams, secured by bandages to the upper part of the risings above-mentioned. Over these beams and others, which are supported by stanchions fixed on the bodies of the canoes, is laid a boarded platform. All the parts which compose the double canoe, are made as strong and light as the nature of the work will admit, and may be immersed in water to the very platform, without being in danger of filling. Nor is it possible, under any circumstance whatever, for them to sink, so long as they hold together. Thus they are not only made vessels of burden, but fit for distant navigation. They are rigged with one mast, which steps upon the platform, and can easily be raised or taken down; and are sailed with a latteen-sail, or triangular one, extended by a long yard, which is a little bent or crooked. The sail is made of mats; the rope they make use of is laid exactly like ours, and some of it is four or five inch. On the platform is built a little shed or hut, which screens the crew from the sun and weather, and serves for other purposes. They also carry a moveable fire hearth, which is a square, but shallow, trough of wood, filled with stones. The way into the hold of the canoe is from off the platform, down a sort of uncovered hatchway, in which they stand to bail out the water. I think these vessels are navigated either end foremost, and that, in changing tacks, they have only occasion to shift or jib round the sail; but of this I was not certain, as I had not then seen any under sail, or with the mast and sail an end, but what were a considerable distance from us.

Their working-tools are made of stone, bone, shells, &c., as at the other islands. When we view the work which is performed with these tools, we are struck with admiration at the ingenuity and patience of the workman. Their knowledge of the utility of iron was no more than sufficient to teach them to prefer nails to beads, and such trifles; some, but very few, would exchange a pig for a large nail, or a hatchet. Old jackets, shirts, cloth, and even rags, were in more esteem than the best edge-tool we could give them; consequently they got but few axes from us but what were given as presents. But if we include the nails which were given by the officers and crews of both ships for curiosities, &c. with those given for refreshments, they cannot have got less than five hundred weight, great and small. The only piece of iron we saw among them was a small broad-awl, which had been made of a nail.

Both men and women are of a common size with Europeans; and their colour is that of a lightish copper, and more uniformly so than amongst the inhabitants of Otaheite and the Society Isles. Some of our gentlemen were of opinion these were a much handsomer race; others maintained a contrary opinion, of which number I was one. Be this as it may, they have a good shape, and regular features, and are active, brisk, and lively. The women, in particular, are the merriest creatures I ever met with, and will keep chattering by one's side, without the least invitation, or considering whether they are understood, provided one does but seem pleased with them. In general they appeared to be modest; although there was no want of those of a different stamp; and as we had yet some venereal complaints on board, I took all possible care to prevent the disorder being communicated to them. Upon most occasions they showed a strong propensity to pilfering; in which they were full as expert as the Otaheiteans.

Their hair in general is black, but more especially that of the women. Different colours were found among the men, sometimes on the same head, caused by something they put upon it, which stains it white, red, and blue. Both sexes wear it short; I saw but two exceptions to this custom, and the most of them combed it upwards. Many of the boys had it cut very close, except a single lock on the top of the head, and a small quantity on each side. The men cut or shave their beards quite close, which operation is performed with two shells. They have fine eyes, and in general good teeth, even to an advanced age. The custom of *tattooing* or puncturing the skin prevails. The men are *tattooed* from the middle of the thigh to above the hips. The women have it only on their arms and fingers; and there but very slightly.

The dress of both sexes consists of a piece of cloth, or matting, wrapped round the waist and hanging down below the knees. From the waist, upwards, they are generally naked; and it seemed to be a custom to anoint these parts every morning. My friend Attago never

failed to do it; but whether out of respect to his friend, or from custom, I will not pretend to say; though I rather think from the latter, as he was not singular in the practice.

Their ornaments are, amulets, necklaces, and bracelets of bones, shells, and beads of mother-of-pearl, tortoise-shell, &c., which are worn by both sexes. The women also wear on their fingers neat rings made of tortoise-shell, and pieces in their ears about the size of a small quill; but ear-ornaments are not commonly worn, though all have their ears pierced. They have also a curious apron made of the outside fibres of the cocoa-nut shell, and composed of a number of small pieces sewed together in such a manner as to form stars, half-moons, little squares, &c. It is studded with beads of shells, and covered with red feathers, so as to have a pleasing effect. They make the same kind of cloth, and of the same materials, as at Otaheite; though they have not such a variety, nor do they make any so fine; but as they have a method of glazing it, it is more durable, and will resist rain for some time, which Otaheite cloth will not. Their colours are black, brown, purple, yellow, and red; all made from vegetables. They make various sorts of matting; some of a very fine texture, which is generally used for clothing; and the thick and stronger sort serves to sleep on, and to make sails for their canoes, &c. Among other useful utensils, they have various sorts of baskets; some made of the same materials as their mats; and others of the twisted fibres of cocoa-nuts. These are not only durable, but beautiful; being generally composed of different colours, and studded with beads made of shells or bones. They have many little nick-nacks amongst them; which shows that they neither want taste to design nor skill to execute whatever they take in hand.

How these people amuse themselves in their leisure hours I cannot say, as we are but little acquainted with their diversions. The women frequently entertained us with songs, in a manner which was agreeable enough. They accompany the music by snapping their fingers, so as to keep time to it. Not only their voices but their music was very harmonious; and they have a considerable compass in their notes. I saw but two musical instruments amongst them. One was a large flute made of a piece of bamboo, which they fill with their noses as at Otaheite; but these have four holes or stops, whereas those of Otaheite have only two. The other was composed of ten or eleven small reeds of unequal lengths, bound together side by side, as the Doric pipe of the ancients is said to have been; and the open ends of the reeds into which they blow with their mouths are of equal height, or in a line. They have also a drum, which, without any impropriety, may be compared to a hollow log of wood. The one I saw was five feet six inches long, and thirty inches in girth, and had a slit in it, from the one end to the other, about three inches wide, by means of which it had been hollowed out. They beat on the side of this log with two drumsticks, and produce a hollow sound, not quite so musical as that of an empty cask.

The common method of saluting one another is by touching or meeting noses, as is done in New Zealand; and their sign of peace to strangers is the displaying a white flag or flags; at least such were displayed to us, when we first drew near the shore. But the people who came first on board brought with them some of the pepper-plant, and sent it before them into the ship; a stronger sign of friendship than which one could not wish for. From their unsuspicious manner of coming on board, and of receiving us at first on shore, I am of opinion that they are seldom disturbed by either foreign or domestic troubles. They are, however, not unprovided with very formidable weapons; such as clubs and spears, made of hard wood, also bows and arrows. The clubs are from three to five feet in length, and of various shapes; their bows and arrows are but indifferent: the former being very slight, and the latter only made of a slender reed pointed with hard wood. Some of their spears have many barbs, and must be very dangerous weapons where they take effect. On the inside of the bow is a groove in which is put the arrow; from which it should seem that they use but one.

They have a singular custom of putting everything you give them to their heads, by way of thanks, as we conjectured. This manner of paying a compliment is taught them from their very infancy; for when we gave things to little children, the mother lifted up the child's head to its head. They also used this custom in their exchanges with us: whatever we gave them for their goods was always applied to the head, just as if it had been given

them for nothing. Sometimes they would look at our goods, and, if not approved, return them back; but whenever they applied them to the head, the bargain was infallibly struck. When I had made a present to the chief of anything curious, I frequently saw it handed from one to another: and every one, into whose hands it came, put it to the head. Very often the women would take hold of my hand, kiss it, and lift it to their heads. From all this it should seem, that this custom, which they call *fagafatie*, has various significations according as it is applied; all however complimentary. It must be observed, that the sullen chief or king did not pay me any of these compliments for the presents I made him.

A still more singular custom prevails in these isles: we observed that the greater part of the people, both men and women, had lost one or both their little fingers.* We endeavoured, but in vain, to find out the reason of this mutilation; for no one would take any pains to inform us. It was neither peculiar to rank, age, or sex; nor is it done at any certain age, as I saw those of all ages on whom the amputation had been just made; and, except some young children, we found few who had both hands perfect. As it was more common among the aged than the young, some of us were of opinion that it was occasioned by the death of their parents, or some other near relation. But Mr. Wales one day met with a man, whose hands were both perfect, of such an advanced age, that it was hardly possible his parents could be living. They also burn or make incisions in their cheeks, near the cheek-bone. The reason of this was equally unknown to us. In some, the wounds were quite fresh; in others, they could only be known by the scars, or colour of the skin. I saw neither sick nor lame amongst them: all appeared healthy, strong, and vigorous; a proof of the goodness of the climate in which they live.

I have frequently mentioned a king, which implies the government being in a single person, without knowing for certain whether it is so or not. Such a one was, however, pointed out to us; and we had no reason to doubt it. From this, and other circumstances, I am of opinion that the government is much like that of Otaheite, that is, in a king or great chief, who is here called Areeke, with other chiefs under him, who are lords of certain districts, and perhaps sole proprietors, to whom the people seem to pay great obedience. I also observed a third rank, who had not a little authority over the common people: my friend Attago was one of these. I am of opinion that all the land on *Tongatabu* is private property, and that there are here, as at Otaheite, a set of people, who are servants or slaves, and have no property in land. It is unreasonable to suppose everything in common in a country so highly cultivated as this. Interest being the greatest spring which animates the hand of industry, few would toil in cultivating and planting the land, if they did not expect to reap the fruit of their labour: were it otherwise, the industrious man would be in a worse state than the idle sluggard. I frequently saw parties of six, eight, or ten people, bring down to the landing-place fruit and other things to dispose of, where one person, a man or woman, superintended the sale of the whole; no exchanges were made but with his or her consent; and, whatever we gave in exchange, was always given them, which, I think, plainly showed them to be the owners of the goods, and the others no more than servants. Though benevolent nature has been very bountiful to these isles, it cannot be said that the inhabitants are wholly exempt from the curse of our forefathers: part of their bread must be earned with the sweat of their brows. The high state of cultivation their lands are in must have cost them immense labour. This is now amply rewarded by the great produce, of which every one seems to partake. No one wants the common necessities of life; joy and contentment are painted in every face. Indeed, it can hardly be otherwise: an easy freedom prevails among all ranks of people: they feel no wants which they do not enjoy the means of gratifying; and they live in a clime where the painful extremes of heat and cold are equally unknown. If nature has been wanting in anything, it is in the article of fresh water, which, as it is shut up in the bowels of the earth, they are obliged to dig for. A running stream was not seen, and but one well, at Amsterdam. At Middleburg, we saw no water but what the natives had in vessels; but as it was sweet and cool, I had no doubt of its being taken up upon the island, and, probably, not far from the spot where I saw it.

* This custom is not peculiar to the inhabitants of the Friendly Isles. See *Recherches Philosophiques sur les Américains*, tome. ii. p. 253, &c.

So little do we know of their religion, that I hardly dare mention it. The buildings called *Afiatoucas*, before mentioned, are undoubtedly set apart for this purpose. Some of our gentlemen were of opinion, that they were merely burying-places. I can only say, from my own knowledge, that they are places to which particular persons directed set speeches, which I understood to be prayers, as hath been already related. Joining my opinion with that of others, I was inclined to think that they are set apart to be both temples and burying-places, as at Otaheite, or even in Europe. But I have no idea of the images being idols; not only from what I saw myself, but from Mr. Wales's informing me that they set one of them up, for him and others to shoot at. One circumstance showed that these *Afiatoucas* were frequently resorted to, for one purpose or other; the areas, or open places, before them, being covered with a green sod, the grass on which was very short. This did not appear to have been cut, or reduced by the hand of man, but to have been prevented in its growth by being often trod, or sat upon.

It cannot be supposed that we could know much, either of their civil or religious policy, in so short a time as four or five days, especially as we understood but little of their language: even the two islanders we had on board could not at first understand them; and yet as we became the more acquainted with them, we found their language was nearly the same spoken at Otaheite and the Society Isles; the difference not being greater than what we find betwixt the most northern and western parts of England, as will more fully appear by the vocabulary.

CHAPTER IV.—PASSAGE FROM AMSTERDAM TO QUEEN CHARLOTTE'S SOUND, WITH AN ACCOUNT OF AN INTERVIEW WITH THE INHABITANTS, AND THE FINAL SEPARATION OF THE TWO SHIPS.

ABOUT the time we were in a condition to make sail, a canoe, conducted by four men, came alongside, with one of those drums already mentioned, on which one man kept continually beating; thinking, no doubt, the music would charm us. I gave them a piece of cloth, and a nail, for the drum, and took the opportunity to send to my friend Attago some wheat, peas, and beans, which I had forgot to give him when he had the other seeds. As soon as this canoe was gone, we made sail to the southward, having a gentle gale at S.E. by E., it being my intention to proceed directly to Queen Charlotte's Sound in New Zealand, there to take in wood and water, and then to go on further discoveries to the south and east.

In the afternoon on the 8th, we made the island of Pilstart, bearing S.W. by W. $\frac{1}{2}$ W., distant seven or eight leagues. This island, which was also discovered by Tasman, is situated in the latitude of $22^{\circ} 26'$ south, longitude $175^{\circ} 59'$ west, and lies in the direction of S. 52° west, distant thirty-two leagues from the south end of Middleburg. It is more conspicuous in height than circuit; having in it two considerable hills, seemingly disjoined from each other by a low valley. After a few hours' calm, the wind came to S.W., with which we stretched to the S.E., but on the 10th, it veered round by the south to the S.E. and E.S.E., and then we resumed our course to the S.S.W.

At five o'clock in the morning of the 21st we made the land of New Zealand, extending from N.W. by N. to W.S.W. At noon, Table Cape bore west, distant eight or ten leagues. I was very desirous of having some intercourse with the natives of this country as far to the north as possible; that is, about Poverty or Tolaga Bays, where I apprehended they were more civilized than at Queen Charlotte's Sound; in order to give them some hogs, fowls, seeds, roots, &c., which I had provided for the purpose. The wind veering to the N.W. and north, enabled us to fetch in with the land a little to the north of Portland, and we stood as near the shore as we could with safety. We observed several people upon it, but none attempted to come off to us. Seeing this, we bore away under Portland, where we lay to some time, as well to give time for the natives to come off as to wait for the Adventure. There were several people on Portland, but none seemed inclined to come to us; indeed the wind at this time blew rather too fresh for them to make the attempt. Therefore, as soon as the Adventure was up with us, we made sail for Cape Kidnappers, which we passed at five o'clock in the morning, and continued our course alongshore, till nine, when, being about

three leagues short of Black Head, we saw some canoes put off from the shore. Upon this I brought to, in order to give them time to come on board; but ordered the Adventure, by signal, to stand on, as I was willing to lose as little time as possible.

Those in the first canoe which came alongside were fishers, and exchanged some fish for pieces of cloth and nails. In the next were two men, whom, by their dress and behaviour, I took to be chiefs. These two were easily prevailed on to come on board, when they were presented with nails, and other articles. They were so fond of nails, as to seize on all they could find, and with such eagerness, as plainly showed they were the most valuable things we could give them. To the principal of these two men I gave the pigs, fowls, seeds, and roots. I believe, at first, he did not think I meant to give them to him; for he took but little notice of them, till he was satisfied they were for himself. Nor was he then in such a rapture as when I gave him a spike-nail half the length of his arm. However, at his going away, I took notice that he very well remembered how many pigs and fowls had been given him, as he took care to have them all collected together, and kept a watchful eye over them, lest any should be taken away. He made me a promise not to kill any; and if he keeps his word, and proper care is taken of them, there were enough to stock the whole island in due time, being two boars, two sows, four hens, and two cocks. The seeds were such as are most useful, viz., wheat, French and kidney beans, peas, cabbage, turnips, onions, carrots, parsnips, and yams, &c. With these articles they were dismissed. It was evident these people had not forgot the Endeavour being on their coast; for the first words they spoke to us were, *Mataou no te pow pow* (We are afraid of the guns). As they could be no strangers to the affair which happened off Cape Kidnapper in my former voyage, experience had taught them to have some regard to these instruments of death.

As soon as they were gone we stretched off to the southward, the wind having now veered to the W.S.W. In the afternoon it increased to a fresh gale, and blew in squalls; in one of which we lost our fore-top-gallant mast, having carried the sail a little too long. The fear of losing the land induced me to carry as much sail as possible. At seven in the morning we tacked, and stretched in-shore; Cape Turnagain, at this time, bore about N.W. $\frac{1}{2}$ N., distant six or seven leagues. The Adventure, being a good way to leeward, we suppose did not observe the signal, but stood on, consequently was separated from us. During the night (which was spent in plying) the wind increased in such a manner as to bring us under our courses; it also veered to S.W. and S.S.W., and was attended with rain.

At nine in the morning on the 23d, the sky began to clear up, and the gale to abate, so that we could carry close-reefed top-sails. At eleven o'clock we were close in with Cape Turnagain, when we tacked and stood off; at noon the said Cape bore west a little northerly, distant six or seven miles. Latitude observed $41^{\circ} 30'$ south. Soon after, the wind falling almost to a calm, and flattering ourselves that it would be succeeded by one more favourable, we got up another topgallant mast, rigged topgallant yards, and loosed all the reefs out of the top-sails. The event was not equal to our wishes. The wind, indeed, came something more favourable—that is, at W. by N., with which we stretched alongshore to the southward; but it soon increased in such a manner as to undo what we had but just done, and at last stripped us to our courses, and two close-reefed top-sails, under which sails we continued all night. About daylight the next morning, the gale abating, we were again tempted to loose out the reefs, and rig topgallant yards, which proved all lost labour; for, by nine o'clock we were reduced to the same sail as before. Soon after the Adventure joined us; and at noon Cape Palliser bore west, distant eight or nine leagues. This cape is the southern point of Eahei-nomauwe. We continued to stretch to the southward till midnight, when the wind abated and shifted to S.E. Three hours after it fell calm, during which we loosed the reefs out, with the vain hopes that the next wind which came would be favourable. We were mistaken; the wind only took this short repose, in order to gain strength, and fall the heavier upon us. For at five o'clock in the morning, being the 25th, a gale sprung up at N.W., with which we stretched to S.W. Cape Palliser, at this time, bore N.N.W., distant eight or nine leagues. The wind increased in such a manner, as obliged us to take in one reef after another; and at last it came on with such fury as made it necessary to

take in all our sails with the utmost expedition, and to lie-to under bare poles. The sea rose in proportion with the wind; so that we had a terrible gale and a mountainous sea to encounter. Thus, after beating up against a hard gale for two days, and arriving just in sight of our port, we had the mortification to be driven off from the land by a furious storm. Two favourable circumstances attended it, which gave us some consolation; it was fair overhead, and we were not apprehensive of a lee-shore.

The storm continued all the day without the least intermission. In the evening we bore down to look for the *Adventure*, she being out of sight to leeward, and after running the distance we supposed her to be off, brought-to again without seeing; it being so very hazy and thick in the horizon that we could not see a mile round us, occasioned by the spray of the sea being lifted up to a great height by the force of the wind. At midnight the gale abated; soon after fell little wind; and at last shifted to S.W., when we wore, set the courses and top-sails close-reefed, and stood in for the land. Soon after the wind freshened and fixed at south; but as the *Adventure* was some distance astern, we lay by for her till eight o'clock, when we both made all sail, and steered N. by W. $\frac{1}{2}$ W. for the strait. At noon observed in $42^{\circ} 27'$ south, Cape Palliser, by judgment, bore north, distant seventeen leagues. This favourable wind was not of sufficient duration; in the afternoon it fell, by little and little, and at length to a calm; this at ten o'clock was succeeded by a fresh breeze from the north, with which we stretched to the westward.

At three o'clock next morning we were pretty well in with Cape Campbell on the west side of the strait, when we tacked, and stretched over for Cape Palliser, under courses and close-reefed topsails, having the wind at N.W. a very strong gale, and fair weather. At noon, we tacked and stretched to the S.W., with the last-mentioned cape bearing west, distant four or five leagues. In the afternoon the gale increased in such a manner, as brought us under our courses. We continued to stretch to the S.W. till midnight, when we wore, and set close-reefed topsails. On the 28th, at eight o'clock in the morning, we wore, and stood again to the S.W. till noon, when we were obliged to lie-to under the fore-sail. At this time the high land over Cape Campbell bore west, distant ten or twelve leagues. The *Adventure* four or five miles to leeward. In the afternoon the fury of the gale began to abate; when we set the main-sail, close-reefed main-top-sail, and stood to the northward with the wind at W.N.W. and W. by N., a strong gale attended with heavy squalls.

In the morning of the 29th, the wind abated and shifted to S.W. a gentle gale. Of this we took immediate advantage, set all our sails, and stood for Cape Palliser, which at noon bore W. by N. $\frac{1}{2}$ N., distant about six leagues. The wind continued between the S.W. and south till five in the evening, when it fell calm. At this time we were about three leagues from the Cape. At seven o'clock the calm was succeeded by a gentle breeze from N.N.E. as fair as we could wish; so that we began to reckon what time we should reach the Sound the next day; but at nine the wind shifted to its old quarter N.W., and blew a fresh gale, with which we stretched to the S.W. under single-reefed top-sails and courses, with the *Adventure* in company. She was seen until midnight, at which time she was two or three miles astern, and presently after she disappeared; nor was she to be seen at daylight. We supposed she had tacked and stood to the N.E., by which manœuvre we lost sight of her.

We continued to stretch to the westward with the wind at N.N.W., which increased in such a manner as to bring us under our two courses, after splitting a new main-top-sail. At noon, Cape Campbell bore W. by N., distant seven or eight leagues. At three in the afternoon, the gale began to abate, and to veer more to the north, so that we fetched in with the land under the Snowy Mountains, about four or five leagues to windward of the Lookers-on, where there was the appearance of a large bay. I now regretted the loss of the *Adventure*; for had she been with me, I should have given up all thoughts of going to Queen Charlotte's Sound to wood and water, and have sought for a place to get these articles farther south, as the wind was now favourable for ranging along the coast. But our separation made it necessary for me to repair to the Sound, that being the place of rendezvous.

As we approached the land we saw smoke in several places along the shore; a sure sign

that the coast was inhabited. Our soundings were from forty-seven to twenty-five fathoms; that is, at the distance of three miles from the shore, forty-seven fathoms; and twenty-five fathoms at the distance of one mile, where we tacked, and stood to the eastward, under the two courses and close-reefed top-sails; but the latter we could not carry long before we were obliged to haul them. We continued to stand to the eastward all night, in hopes of meeting with the *Adventure* in the morning. Seeing nothing of her then, we wore and brought-to, under the fore-sail and mizen-stay-sail, the wind having increased to a perfect storm; but we had not been long in this situation before it abated, so as to permit us to carry the two courses, under which we stood to the west; and at noon the *Snowy Mountains* bore W.N.W., distant twelve or fourteen leagues. At six o'clock in the evening the wind quite ceased; but this proved only a momentary repose; for presently after, it began to blow with redoubled fury, and obliged us to lie-to under the mizen-stay-sail; in which situation we continued till midnight, when the storm lessened; and two hours after it fell calm.

On the 1st of November, at four o'clock in the morning, the calm was succeeded by a breeze from the south. This soon after increased to a fresh gale, attended with hazy rainy weather, which gave us hopes that the N.W. winds were done; for it must be observed, that they were attended with clear and fair weather. We were not wanting in taking immediate advantage of this favourable wind, by setting all our sails, and steering for *Cape Campbell*, which at noon bore north, distant three or four leagues. At two o'clock we passed the *Cape*, and entered the *Strait* with a brisk gale a-stern, and so likely to continue that we thought of nothing less than reaching our port the next morning. Once more we were to be deceived: at six o'clock, being off *Cloudy Bay*, our favourable wind was succeeded by one from the north, which soon after veered to N.W., and increased to a fresh gale. We spent the night plying; our tacks proved disadvantageous; and we lost more on the ebb than we gained on the flood. Next morning, we stretched over for the shore of *Eahei-nomauwe*. At sunrise the horizon being extraordinarily clear to leeward, we looked well out for the *Adventure*; but as we saw nothing of her, judged she had got into the *Sound*. As we approached the above-mentioned shore, we discovered on the east side of *Cape Teerawhitte* a new inlet I had never observed before. Being tired with beating against the N.W. winds, I resolved to put into this place, if I found it practicable, or to anchor in the bay which lies before it. The flood being in our favour, after making a stretch off, we fetched under the *Cape*, and stretched into the bay along by the western shore, having from thirty-five to twelve fathoms, the bottom everywhere good anchorage. At one o'clock we reached the entrance of the inlet, just as the tide of ebb was making out; the wind being likewise against us, we anchored in twelve fathoms water, the bottom a fine sand. The easternmost of the *Black Rocks*, which lie on the larboard side of the entrance of the inlet, bore N. by E., one mile distant; *Cape Teerawhitte*, or the west point of the bay, west, distant about two leagues; and the east point of the bay N. by E., four or five miles.

Soon after we had anchored, several of the natives came off in their canoes; two from one shore, and one from the other. It required but little address to get three or four of them on board. These people were extravagantly fond of nails above every other thing. To one man I gave two cocks and two hens, which he received with so much indifference, as gave me little hopes he would take proper care of them. We had not been at anchor here above two hours, before the wind veered to N.E., with which we weighed; but the anchor was hardly at the bows before it shifted to south. With this we could but just lead out of the bay, and then bore away for the *Sound* under all the sail we could set; having the advantage, or rather disadvantage, of an increasing gale, which already blew too hard. We hauled up into the *Sound* just at dark, after making two boards, in which most of our sails were split; and anchored in eighteen fathoms water, between the *White Rocks* and the N.W. shore.

The next morning the gale abated, and was succeeded by a few hours' calm; after that a breeze sprung up at N.W., with which we weighed and ran up into *Ship Cove*, where we did not find the *Adventure* as was expected.

CHAPTER V.—TRANSACTIONS IN QUEEN CHARLOTTE'S SOUND, WITH AN ACCOUNT OF THE INHABITANTS BEING CANNIBALS, AND VARIOUS OTHER INCIDENTS.—DEPARTURE FROM THE SOUND, AND OUR ENDEAVOURS TO FIND THE ADVENTURE, WITH SOME DESCRIPTION OF THE COAST.

THE first thing we did, after mooring the ship, was to unbend all the sails, there not being one but what wanted repair. Indeed, both our sails and rigging had sustained much damage in beating off the Strait's mouth. We had no sooner anchored than we were visited by the natives, several of whom I remembered to have seen when I was here in the Endeavour, particularly an old man named Goubiah. In the afternoon I gave orders for all the empty water-casks to be landed, in order to be repaired, cleaned, and filled; tents to be set up for the sail-makers, coopers, and others, whose business made it necessary for them to be on shore. The next day we began to caulk the ship's sides and decks, to overhaul her rigging, repair the sails, cut wood for fuel, and set up the smith's forge to repair the iron-work; all of which were absolutely necessary. We also made some hauls with the seine, but caught no fish, which deficiency the natives in some measure made up, by bringing us a good quantity, and exchanging them for pieces of Otahitean cloth, &c.

On the 5th, the most part of our bread being in casks, I ordered some to be opened, when, to our mortification, we found a good deal of it damaged. To repair this loss in the best manner we could, all the casks were opened, the bread was picked, and the copper oven set up, to bake such parcels of it as by that means could be recovered. Some time this morning, the natives stole out of one of the tents a bag of clothes belonging to one of the seamen. As soon as I was informed of it, I went to them in an adjoining cove, demanded the clothes again, and, after some time spent in friendly application, recovered them. Since we were among thieves, and had come off so well, I was not sorry for what had happened, as it taught our people to keep a better look-out for the future.

With these people I saw the youngest of the two sows Captain Furneaux had put on shore in Cannibal Cove, when we were last here: it was lame of one of its hind legs; otherwise in good case, and very tame. If we understood these people right, the boar and other sow were also taken away and separated, but not killed. We were likewise told that the two goats I had put on shore up the Sound had been killed by that old rascal Goubiah. Thus all our endeavours to stock this country with useful animals were likely to be frustrated by the very people we meant to serve. Our gardens had fared somewhat better. Everything in them, except the potatoes, they had left entirely to nature, who had acted her part so well, that we found most articles in a flourishing state; a proof that the winter must have been mild. The potatoes had most of them been dug up; some, however, still remained, and were growing, though I think it is probable they will never be got out of the ground.

Next morning I sent over to the cove, where the natives reside, to haul the seine, and took with me a boar and a young sow, two cocks and two hens, we had brought from the isles. These I gave to the natives, being persuaded they would take proper care of them, by their keeping Captain Furneaux's sow near five months; for I am to suppose it was caught soon after we sailed. We had no better success with the seine than before; nevertheless, we did not return on board quite empty, having purchased a large quantity from the natives. When we were upon this traffic, they showed a great inclination to pick my pockets, and to take away the fish with one hand which they had just given me with the other. This evil one of the chiefs undertook to remove, and with fury in his eyes made a show of keeping the people at a proper distance. I applauded his conduct, but at the same time kept so good a look-out, as to detect him in picking my pocket of a handkerchief, which I suffered him to put in his bosom before I seemed to know anything of the matter, and then told him what I had lost. He seemed quite ignorant and innocent, till I took it from him; and then he put it off with a laugh, acting his part with so much address, that

it was hardly possible for me to be angry with him; so that we remained good friends, and he accompanied me on board to dinner. About that time we were visited by several strangers, in four or five canoes, who brought with them fish and other articles, which they exchanged for cloth, &c. These new-comers took up their quarters in a cove near us; but very early the next morning moved off with six of our small water-casks, and with them all the people we found here on our arrival. This precipitate retreat of these last we supposed was owing to the theft the others had committed. They left behind them some of their dogs, and the boar I had given them the day before, which I now took back again, as I had not another. Our casks were the least loss we felt by these people leaving us; while they remained, we were generally well supplied with fish, at a small expense.

We had fair weather, with the wind at north-east, on the 9th, which gave us some hopes of seeing the Adventure; but these hopes vanished in the afternoon, when the wind shifted to the westward. The next morning our friends the natives returned again, and brought with them a quantity of fish, which they exchanged for two hatchets. Fair weather on the 12th enabled us to finish picking, airing, and baking our biseuit; four thousand two hundred and ninety-two pounds of which we found totally unfit to eat; and about three thousand pounds more could only be eaten by people in our situation.

On the 13th, clear and pleasant weather. Early in the morning the natives brought us a quantity of fish, which they exchanged as usual. But their greatest branch of trade was the green tale or stone, called by them, *Poenamoo*, a thing of no great value; nevertheless, it was so much sought after by our people, that there was hardly a thing they would not give for a piece of it. The 15th being a pleasant morning, a party of us went over to the East Bay, and climbed one of the hills which overlooked the eastern part of the strait, in order to look for the Adventure. We had a fatiguing walk to little purpose; for when we came to the summit, we found the eastern horizon so foggy, that we could not see above two miles. Mr. Forster, who was one of the party, profited by this excursion, in collecting some new plants. I now began to despair of seeing the Adventure any more, but was totally at a loss to conceive what was become of her. Till now, I thought she had put into some port in the strait, when the wind came to north-west the day we anchored in the cove, and waited to complete her water. This conjecture was reasonable enough at first, but it was now hardly probable she could be twelve days in our neighbourhood, without our either hearing or seeing something of her.

The hill we now mounted is the same that I was upon in 1770, when I had the second view of the strait: we then built a tower with the stones we found there, which we now saw had been levelled to the ground, no doubt by the natives, with a view of finding something hid in it. When we returned from the hill, we found a number of them collected round our boat. After some exchanges, and making them some presents, we embarked, in order to return on board, and in our way visited others of the inhabitants, by whom we were kindly received. Our friends, the natives, employed themselves on the 17th in fishing in our neighbourhood, and, as fast as they caught the fish, came and disposed of them to us, insomuch that we had more than we could make use of. From this day to the 22d nothing remarkable happened, and we were occupied in getting everything in readiness to put to sea, being resolved to wait no longer than the assigned time for the Adventure.

The winds were between the south and west, stormy with rain till the 22d, when the weather became settled, clear, and pleasant. Very early in the morning we were visited by a number of the natives, in four or five canoes, very few of whom we had seen before. They brought with them various articles (curiosities) which they exchanged for Otaheitean cloth, &c. At first the exchanges were very much in our favour, till an old man, who was no stranger to us, came and assisted his countrymen with his advice, which in a moment turned the trade above a thousand per cent. against us.

After these people were gone, I took four hogs (that is, three sows and one boar), two cocks and two hens, which I landed in the bottom of the West Bay, carrying them a little way into the woods, where we left them with as much food as would serve them ten or twelve days. This was done with a view of keeping them in the woods, lest they should come down to the shore in search of food and be discovered by the natives; which, however,

seemed not probable, as this place had never been frequented by them, nor were any traces of them to be seen near it. We also left some cocks and hens in the woods in Ship Cove; but these will have a chance of falling into the hands of the natives, whose wandering way of life will hinder them from breeding, even suppose they should be taken proper care of. Indeed they took rather too much care of those which I had already given them, by keeping them continually confined, for fear of losing them in the woods. The sow pig we had not seen since the day they had her from me; but we were now told she was still living, as also the old boar and sow given them by Captain Furneaux; so that there is reason to hope they may succeed. It will be unfortunate, indeed, if every method I have taken to provide this country with useful animals should be frustrated. We were likewise told that the two goats were still alive and running about, but I gave more credit to the first story than this. I should have replaced them, by leaving the only two I had left, but had the misfortune to lose the ram soon after our arrival here in a manner we could hardly account for. They were both put ashore at the tents, where they seemed to thrive very well: at last the ram was taken with fits bordering on madness. We were at a loss to tell whether it was occasioned by anything he had eaten, or by being stung with nettles, which were in plenty about the place, but supposed it to be the latter, and therefore did not take the care of him we ought to have done. One night while he was lying by the sentinel, he was seized with one of these fits, and ran headlong into the sea, but soon came out again and seemed quite easy. Presently after, he was seized with another fit, and ran along the beach, with the she-goat after him. Some time after she returned, but the other was never seen more. Diligent search was made for him in the woods to no purpose; we, therefore, supposed he had run into the sea a second time and had been drowned. After this accident, it would have been in vain to leave the she-goat, as she was not with kid, having kidded but a few days before we arrived, and the kids dead. Thus the reader will see how every method I have taken to stock this country with sheep and goats has proved ineffectual.

When I returned on board in the evening, I found our good friends the natives had brought us a large supply of fish. Some of the officers visiting them at their habitations, saw among them some human thigh-bones, from which the flesh had been but lately picked. This and other circumstances led us to believe that the people whom we took for strangers this morning, were of the same tribe; that they had been out on some war expedition; and that those things they sold us were the spoils of their enemies. Indeed, we had some information of this sort the day before; for a number of women and children came off to us in a canoe, from whom we learnt that a party of men were then out, for whose safety they were under some apprehension; but this report found little credit with us, as we soon after saw some canoes come in from fishing, which we judged to be them. Having now got the ship in a condition for sea, and to encounter the southern latitudes, I ordered the tents to be struck and everything to be got on board.

The boatswain, with a party of men, being in the woods cutting broom, some of them found a private hut of the natives, in which was deposited most of the treasure they had received from us, as well as some other articles of their own. It is very probable some were set to watch this hut; as, soon after it was discovered, they came and took all away. But missing some things, they told our people they had stolen them, and in the evening came and made their complaint to me, pitching upon one of the party as the person who had committed the theft. Having ordered this man to be punished before them, they went away seemingly satisfied, although they did not recover any of the things they had lost, nor could I by any means find out what had become of them; though nothing was more certain than that something had been stolen by some of the party, if not by the very man the natives had pitched upon. It was ever a maxim with me to punish the least crimes any of my people committed against these uncivilized nations. Their robbing us with impunity is by no means a sufficient reason why we should treat them in the same manner, a conduct we see they themselves cannot justify. They found themselves injured, and sought for redress in a legal way. The best method, in my opinion, to preserve a good understanding with such people, is, first, by showing them the use of fire-arms, to convince them of the superiority

they give you over them, and then to be always upon your guard. When once they are sensible of these things, a regard for their own safety will deter them from disturbing you, or from being unanimous in forming any plan to attack you, and strict honesty and gentle treatment on your part will make it their interest not to do it.

Calm or light airs from the north all day on the 23d hindered us from putting to sea as intended. In the afternoon, some of the officers went on shore to amuse themselves among the natives, where they saw the head and bowels of a youth, who had lately been killed, lying on the beach, and the heart stuck on a forked stick which was fixed to the head of one of the largest canoes. One of the gentlemen bought the head and brought it on board, where a piece of the flesh was broiled and eaten by one of the natives, before all the officers and most of the men. I was on shore at this time, but soon after returning on board, was informed of the above circumstances, and found the quarter-deck crowded with the natives, and the mangled head, or rather part of it (for the under jaw and lip were wanting), lying on the taffrail. The skull had been broken on the left side just above the temples, and the remains of the face had all the appearance of a youth under twenty.

The sight of the head, and the relation of the above circumstances, struck me with horror, and filled my mind with indignation against these cannibals. Curiosity, however, got the better of my indignation, especially when I considered that it would avail but little, and being desirous of becoming an eye-witness of a fact which many doubted, I ordered a piece of the flesh to be broiled and brought to the quarter-deck, where one of these cannibals ate it with surprising avidity. This had such an effect on some of our people as to make them sick. Oedidee (who came on board with me) was so affected with the sight as to become perfectly motionless, and seemed as if metamorphosed into the statue of horror. It is utterly impossible for art to describe that passion with half the force that it appeared in his countenance. When roused from this state by some of us, he burst into tears; continued to weep and scold by turns; told them they were vile men; and that he neither was nor would be any longer their friend. He even would not suffer them to touch him; he used the same language to one of the gentlemen who cut off the flesh, and refused to accept or even touch the knife with which it was done. Such was Oedidee's indignation against the vile custom, and worthy of imitation by every rational being.

I was not able to find out the reason for their undertaking this expedition. All I could understand for certain was, that they went from hence into Admiralty Bay (the next inlet to the west) and there fought with their enemies, many of whom they killed. They counted to me fifty, a number which exceeded probability, as they were not more, if so many, themselves. I think I understood them clearly, that this youth was killed there, and not brought away prisoner and afterwards killed. Nor could I learn that they had brought away any more than this one; which increased the improbability of their having killed so many. We had also reason to think that they did not come off without loss; for a young woman was seen more than once to cut herself, as is the custom when they lose a friend or relation.

That the New Zealanders are cannibals can now no longer be doubted. The account given of this in my former voyage, being partly founded on circumstances, was, as I afterwards understood, discredited by many persons. Few consider what a savage man is in his natural state, and even after he is in some degree civilized. The New Zealanders are certainly in some state of civilization; their behaviour to us was manly and mild, showing on all occasions a readiness to oblige. They have some arts among them which they execute with great judgment and unwearied patience; they are far less addicted to thieving than the other islanders of the South Sea; and I believe those in the same tribe, or such as are at peace one with another, are strictly honest among themselves. This custom of eating their enemies slain in battle (for I firmly believe they eat the flesh of no others) has, undoubtedly, been handed down to them from the earliest times; and we know it is not an easy matter to wean a nation from their ancient customs, let them be ever so inhuman and savage; especially if that nation has no manner of connexion or commerce with strangers. For it is by this that the greatest part of the human race has been civilized; an advantage which the New Zealanders from their situation never had. An intercourse with foreigners would

reform their manners, and polish their savage minds. Or, were they more united under a settled form of government, they would have fewer enemies; consequently, this custom would be less in use, and might in time be a manner forgotten. At present, they have but little idea of treating others as themselves would *wish* to be treated, but treat them as they *expect* to be treated. If I remember right, one of the arguments they made use of to Tupia, who frequently expostulated with them against this custom, was, that there could be no harm in killing and eating the man who would do the same by them, if it was in his power. For, said they, "Can there be any harm in eating our enemies, whom we have killed in battle? Would not those very enemies have done the same to us?" I have often seen them listen to Tupia with great attention; but I never found his arguments have any weight with them, or that, with all his rhetoric he could persuade any one of them that this custom was wrong; and when Oedidee and several of our people showed their abhorrence of it, they only laughed at them.

Among many reasons which I have heard assigned for the prevalence of this horrid custom, the want of animal food has been one; but how far this is deducible either from facts or circumstances, I shall leave those to find out who advanced it. In every part of New Zealand where I have been, fish was in such plenty, that the natives generally caught as much as served both themselves and us. They have also plenty of dogs; nor is there any want of wild-fowl, which they know very well how to kill. So that neither this, nor the want of food of any kind, can in my opinion be the reason. But whatever it may be, I think it was but too evident that they have a great liking for this kind of food.

I must here observe that Oedidee soon learnt to converse with these people, as I am persuaded he would have done with the people of Amsterdam, had he been a little longer with them; for he did not understand the New Zealanders at first any more than, or not so much as, he understood the people of Amsterdam.

At four o'clock in the morning, on the 24th, we unmoored with an intent to put to sea; but the wind being at north and north-east without, and blowing strong puffs into the cove, made it necessary for us to lie fast. While we were unmooring, some of our old friends came on board to take their leave of us, and afterwards left the cove with all their effects; but those who had been out on the late expedition remained; and some of the gentlemen having visited them, found the heart still sticking on the canoe, and the intestines lying on the beach; but the liver and lungs were now wanting. Probably they had eaten them after the carcase was all gone.

On the 25th, early in the morning, we weighed, with a small breeze, out of the cove, which carried us no farther than between Motuara and Long Island, where we were obliged to anchor; but presently after a breeze springing up at north, we weighed again, turned out of the Sound, and stood over for Cape Teerawhitte. During our stay in the Sound we were plentifully supplied with fish, procured from the natives at a very easy rate; and besides the vegetables our own gardens afforded, we found everywhere plenty of scurvy-grass and celery, which I caused to be dressed every day for all the hands. By this means they had been mostly on a fresh diet for the three preceding months; and at this time we had neither a sick nor scorbutic man on board. It is necessary to mention, for the information of others, that we had now some pork on board, salted at Ulitea, and as good as any I ever ate. The manner in which we cured it was thus: In the cool of the evening, the hogs were killed, dressed, cut up, the bones cut out, and the flesh salted while it was yet hot. The next morning we gave it a second salting, packed it into a cask, and put to it a sufficient quantity of strong pickle. Great care is to be taken that the meat be well covered with pickle, otherwise it will soon spoil.

The morning before we sailed, I wrote a memorandum, setting forth the time we last arrived, the day we sailed, the route I intended to take, and such other information as I thought necessary for Captain Furneaux, in case he should put into the sound; and buried it in a bottle under the root of a tree in the garden, which is in the bottom of the cove, in such a manner as must be found by him or any European who might put into the cove. I, however, had little reason to hope it would fall into the hands of the person for whom it was intended, thinking it hardly possible that the Adventure could be in any port in New

Zealand, as we had not heard of her in all this time. Nevertheless, I was resolved not to leave the coast without looking for her, where I thought it most likely for her to be. It was with this view that I stood over for Cape Teerawhitte, and afterward ran alongshore, from point to point, to Cape Palliser, firing guns every half-hour; but all to no effect. At eight o'clock we brought-to for the night, Cape Palliser bearing south-east by east distant three leagues, in which situation we had fifty fathoms water.

I had now an opportunity of making the following remarks on the coast between Cape Teerawhitte and Cape Palliser. The bay which lies on the west side of the last cape does not appear to run so far inland to the northward as I at first thought, the deception being caused by the land in the bottom of it being low; it is, however, at least five leagues deep, and full as wide at the entrance. Though it seems to be exposed to southerly and south-west winds, it is probable there may be places in the bottom of it sheltered even from these. The bay or inlet on the east side of Cape Teerawhitte, before which we anchored, lies in north inclining to the west, and seemed to be sheltered from all winds. The middle cape or point of land that disjoins these two bays, rises to a considerable height, especially inland; for close to the sea is a skirt of low land, off which lie some pointed rocks, but so near to the shore as to be no ways dangerous. Indeed, the navigation of this side of the strait seems much safer than the other, because the tides here are not near so strong. Cape Teerawhitte and Cape Palliser lie in the direction of N. 69° W. and S. 69° E. from each other, distant ten leagues. The cape which disjoins the two bays above mentioned lies within, or north of this direction. All the land near the coast, between and about these capes, is exceedingly barren; probably owing to its being so much exposed to the cold southerly winds. From Cape Teerawhitte to the Two Brothers, which lie off Cape Koamaroo, the course is nearly north-west by north, distant sixteen miles. North of Cape Teerawhitte, between it and Entry Island, is an island lying pretty near the shore. I judged this to be an island when I saw it in my former voyage, but not being certain, left it undetermined in my chart of the strait, which is the reason of my taking notice of it now, as also of the bays, &c. above mentioned.

At daylight in the morning of the 26th, we made sail round Cape Palliser, firing guns as usual as we ran along the shore. In this manner we proceeded till we were three or four leagues to the north-east of the cape, when the wind shifting to north-east, we bore away to Cape Campbell, on the other side of the strait. Soon after seeing a smoke ascend, at some distance inland away to the north-east, we hauled the wind, and continued to ply till six o'clock in the evening; which was several hours after the smoke disappeared, and left us not the least signs of people. Every one being unanimously of opinion that the Adventure could neither be stranded on the coast, nor be in any of the harbours thereof, I gave up looking for her, and all thoughts of seeing her any more during the voyage; as no rendezvous was absolutely fixed upon after leaving New Zealand. Nevertheless, this did not discourage me from fully exploring the southern parts of the Pacific Ocean, in the doing of which I intended to employ the whole of the ensuing season.

On our quitting the coast, and, consequently, all hopes of being joined by our consort, I had the satisfaction to find that not a man was dejected, or thought the dangers we had yet to go through were in the least increased by being alone; but as cheerfully proceeding to the south, or wherever I might think proper to lead them, as if the Adventure, or even more ships, had been in our company.

CHAPTER VI.—ROUTE OF THE SHIP FROM NEW ZEALAND IN SEARCH OF A CONTINENT;
WITH AN ACCOUNT OF THE VARIOUS OBSTRUCTIONS MET WITH FROM THE ICE, AND
THE METHODS PURSUED TO EXPLORE THE SOUTHERN PACIFIC OCEAN.

AT eight o'clock in the evening of the 26th, we took our departure from Cape Palliser, and steered to the south, inclining to the east, having a favourable gale from the north-west and south-west: we daily saw some rock-weed, seals, Port-Egmont hens, albatrosses, pintoos, and other petrels; and on the 2d of December, being in the latitude of 48° 23' S.,

longitude $179^{\circ} 16' W.$, we saw a number of red-billed penguins, which remained about us for several days. On the 5th, being in the latitude $50^{\circ} 17' S.$, longitude $179^{\circ} 40' E.$, the variation was $18^{\circ} 25' E.$ At half an hour past eight o'clock the next evening, we reckoned ourselves antipodes to our friends in London, consequently as far removed from them as possible.

On the 8th, being in latitude $55^{\circ} 39'$, longitude $178^{\circ} 53' W.$, we ceased to see penguins and seals, and concluded that those we had seen retired to the southern parts of New Zealand whenever it was necessary for them to be at land. We had now a strong gale at north-west, and a great swell from south-west. This swell we got as soon as the south point of New Zealand came in that direction; and as we had had no wind from that quarter the six preceding days, but, on the contrary, it had been at east, north, and north-west, I conclude there can be no land to the southward, under the meridian of New Zealand, but what must lie very far to the south. The two following days we had very stormy weather, sleet and snow, winds between the north and south-west. The 11th the storm abated, and the weather clearing up, we found the latitude to be $61^{\circ} 15' S.$, longitude $173^{\circ} 4' W.$ This fine weather was of short duration: in the evening the wind increased to a strong gale at south-west, blew in squalls, attended with thick snow showers, hail, and sleet. The mercury in the thermometer fell to thirty-two, consequently the weather was very cold, and seemed to indicate that ice was not far off.

At four o'clock the next morning, being in the latitude of $62^{\circ} 10' S.$, longitude $172^{\circ} W.$, we saw the first ice island, $11\frac{1}{2}^{\circ}$ farther S. than the first ice we saw the preceding year after leaving the Cape of Good Hope. At the time we saw this ice, we also saw an antarctic peterel, some grey albatrosses, and our old companions, pintadoes and blue peterels. The wind kept veering from S.W. by the N.W. to N.N.E., for the most part a fresh gale, attended with a thick haze and snow; on which account we steered to the S.E. and E., keeping the wind always on the beam, that it might be in our power to return back nearly on the same track, should our course have been interrupted by any danger whatever. For some days we had a great sea from the N.W. and S.W., so that it is not probable there can be any land near between these two points. We fell in with several large islands on the 14th, and, about noon, with a quantity of loose ice, through which we sailed. Latitude $64^{\circ} 55' S.$, longitude $163^{\circ} 20' W.$ Grey albatrosses, blue peterels, pintadoes, and fulmers were seen. As we advanced to the S.E. by E., with a fresh gale at W., we found the number of ice islands increase fast upon us. Between noon and eight in the evening we saw but two, but before four o'clock in the morning of the 15th, we had passed seventeen, besides a quantity of loose ice which we ran through. At six o'clock we were obliged to haul to the north-east, in order to clear an immense field which lay to the south and south-east. The ice in most part of it lay close packed together; in other places there appeared partitions in the field, and a clear sea beyond it. However, I did not think it safe to venture through, as the wind would not permit us to return the same way that we must go in. Besides, as it blew strong, and the weather at times was exceedingly foggy, it was the more necessary for us to get clear of this loose ice, which is rather more dangerous than the great islands. It was not such ice as is usually found in bays or rivers, and near shore, but such as breaks off from the islands, and may not improperly be called parings of the large pieces, or the rubbish or fragments which fall off when the great islands break loose from the place where they are formed.

We had not stood long to the north-east before we found ourselves embayed by the ice, and were obliged to tack and stretch to the south-west, having the field or loose ice to the south, and many huge islands to the north. After standing two hours on this tack, the wind very luckily veering to the westward, we tacked, stretched to the north, and soon got clear of all the loose ice, but not before we had received several hard knocks from the larger pieces, which, with all our care, we could not avoid. After clearing one danger, we still had another to encounter; the weather remained foggy, and many large islands lay in our way; so that we had to luff for one, and bear up for another. One we were very near falling aboard of, and if it had happened, this circumstance would never have been related. These difficulties, together with the improbability of finding land farther south, and the impossibility of exploring

it on account of the ice, if we should find any, determined me to get more to the north. At the time we last tacked, we were in the longitude of $159^{\circ} 20'$ W., and in the latitude of $66^{\circ} 0'$ S. Several penguins were seen on some of the ice islands, and a few antarctic peterels on the wing.

We continued to stand to the north, with a fresh gale at west, attended with thick snow showers till eight o'clock in the evening, when the wind abated, the sky began to clear up, and, at six o'clock in the morning of the 16th, it fell calm. Four hours after, it was succeeded by a breeze at north-east, with which we stretched to the south-east, having thick hazy weather, with snow showers, and all our rigging coated with ice. In the evening, we attempted to take some out of the sea, but were obliged to desist, the sea running too high, and the pieces being so large, that it was dangerous for the boat to come near them. The next morning, being the 17th, we succeeded better; for falling in with a quantity of loose ice, we hoisted out two boats, and by noon got on board as much as we could manage. We then made sail for the east, with a gentle breeze northerly, attended with snow and sleet, which froze to the rigging as it fell. At this time we were in the latitude of $64^{\circ} 41'$ S., longitude $155^{\circ} 44'$ W. The ice we took up proved to be none of the best, being chiefly composed of frozen snow, on which account it was porous, and had imbibed a good deal of salt water; but this drained off after lying a while on deck, and the water then yielded was fresh. We continued to stretch to the east, with a piercing cold northerly wind, attended with a thick fog, snow, and sleet, that decorated all our rigging with icicles. We were hourly meeting with some of the large ice islands, which in these high latitudes render navigation so very dangerous. At seven in the evening, falling in with a cluster of them, we narrowly escaped running aboard of one, and with difficulty wore clear of the others. We stood back to the west till ten o'clock, at which time the fog cleared away, and we resumed our course to the east. At noon the next day, we were in the latitude of $64^{\circ} 49'$ S., longitude $149^{\circ} 19'$ W. Some time after, our longitude, by observed distance of the sun and moon, was $149^{\circ} 19'$ W.; by Mr. Kendal's watch, $148^{\circ} 36'$; and by my reckoning, $148^{\circ} 43'$, latitude $64^{\circ} 48'$ S.

The clear weather and the wind veering to north-west tempted me to steer south, which course we continued till seven in the morning of the 20th, when the wind changing to north-east, and the sky becoming clouded, we hauled up south-east. In the afternoon the wind increased to a strong gale, attended with a thick fog, snow, sleet, and rain, which constitutes the very worst of weather. Our rigging at this time was so loaded with ice that we had enough to do to get our top-sails down to double the reef. At seven o'clock in the evening, in the longitude of $147^{\circ} 46'$, we came the second time within the antarctic or polar circle, continuing our course to the south-east till six o'clock the next morning. At that time, being in the latitude of $67^{\circ} 5'$ S., all at once we got in among a cluster of very large ice islands, and a vast quantity of loose pieces; and, as the fog was exceedingly thick, it was with the utmost difficulty we wore clear of them. This done, we stood to the north-west till noon, when the fog being somewhat dissipated, we resumed our course again to the south-east. The ice islands we met with in the morning were very high and rugged, forming at their tops many peaks; whereas the most of those we had seen before were flat at top, and not so high, though many of them were between two and three hundred feet in height, and between two and three miles in circuit, with perpendicular cliffs or sides, astonishing to behold. Most of our winged companions had now left us, the grey albatrosses only remained, and instead of the other birds we were visited by a few antarctic peterels.

The 22nd we steered east-south-east with a fresh gale at north, blowing in squalls, one of which took hold of the mizen top-sail, tore it all to rags, and rendered it for ever after useless. At six o'clock in the morning, the wind veering toward the west, our course was east-northerly. At this time we were in the latitude of $67^{\circ} 31'$, the highest we had yet been in, longitude $142^{\circ} 54'$ west. We continued our course to the east by north till noon the 23d, when, being in the latitude of $67^{\circ} 12'$, longitude $138^{\circ} 0'$, we steered south-east, having then twenty-three ice islands in sight from off the deck, and twice that number from the mast-head, and yet we could not see above two or three miles round us. At four o'clock in the afternoon, in the latitude of $67^{\circ} 20'$, longitude $137^{\circ} 12'$, we fell in with such a quantity of

field or loose ice, as covered the sea in the whole extent from south to east, and was so thick and close as wholly to obstruct our passage. At this time, the wind being pretty moderate, and the sea smooth, we brought to at the outer edge of the ice, hoisted out two boats, and sent them to take some up. In the mean time, we laid hold of several large pieces alongside, and got them on board with our tackle. The taking up ice proved such cold work, that it was eight o'clock by the time the boats had made two trips; when we hoisted them in, and made sail to the west, under double-reefed topsails and courses, with a strong gale at north, attended with snow and sleet, which froze to the rigging as it fell, making the ropes like wires, and the sails like boards or plates of metal. The sheaves also were frozen so fast in the blocks, that it required our utmost efforts to get a topsail down and up; the cold so intense as hardly to be endured; the whole sea, in a manner covered with ice; a hard gale, and a thick fog.

Under all these unfavourable circumstances, it was natural for me to think of returning more to the north, seeing no probability of finding any land here, nor a possibility of getting farther south; and to have proceeded to the east, in this latitude, must have been wrong, not only on account of the ice, but because we must have left a vast space of sea to the north unexplored; a space of 24° of latitude, in which a large tract of land might have lain. Whether such a supposition was well grounded, could only be determined by visiting those parts.

While we were taking up ice, we got two of the antarctic peterels so often mentioned, by which our conjectures were confirmed of their being of the peterel tribe. They are about the size of a large pigeon; the feathers of the head, back, and part of the upper side of the wings, are of a light brown; the belly and under side of the wings, white; the tail-feathers are also white, but tipped with brown: at the same time, we got another new peterel, smaller than the former, and all of a dark-grey plumage. We remarked that these birds were fuller of feathers than any we had hitherto seen; such care has nature taken to clothe them suitably to the climate in which they live. At the same time we saw a few chocolate-coloured albatrosses; these, as well as the peterels above mentioned, we nowhere saw but among the ice; hence one may, with reason, conjecture that there is land to the south. If not, I must ask where these birds breed? A question which perhaps will never be determined; for hitherto we have found these lands, if any, quite inaccessible. Besides these birds, we saw a very large seal, which kept playing about us some time. One of our people who had been at Greenland called it a sea-horse; but every one else who saw it took it for what I have said. Since our first falling in with the ice, the mercury in the thermometer had been from 33 to 31 at noon-day.

On the 24th, the wind abated, veering to the north-west, and the sky cleared up, in the latitude of $67^{\circ} 0'$, longitude $138^{\circ} 15'$. As we advanced to the north-east, with a gentle gale at north-west, the ice islands increased so fast upon us, that this day at noon we could see near 100 round us, besides an immense number of small pieces. Perceiving that it was likely to be calm, I got the ship into as clear a berth as I could, where she drifted along with the ice; and by taking the advantage of every light air of wind, was kept from falling aboard any of these floating isles. Here it was we spent Christmas-day, much in the same manner as we did the preceding one. We were fortunate in having continual daylight and clear weather; for had it been as foggy as on some of the preceding days, nothing less than a miracle could have saved us from being dashed to pieces.

In the morning of the 26th, the whole sea was in a manner covered with ice, 200 large islands and upwards being seen within the compass of four or five miles, which was the limits of our horizon, besides smaller pieces innumerable. Our latitude at noon was $66^{\circ} 15'$, longitude $134^{\circ} 22'$. By observation we found that the ship had drifted, or gone about 20 miles to the north-east or east-north-east, whereas by the ice islands it appeared that she had gone little or nothing; from which we concluded that the ice drifted nearly in the same direction, and at the same rate. At four o'clock a breeze sprung up at west-south-west, and enabled us to steer north, the most probable course to extricate ourselves from these dangers. We continued our course to the north with a gentle breeze at west, attended with clear weather, till four o'clock the next morning, when, meeting with a quantity of loose ice, we

brought to, and took on board as much as filled all our empty casks, and for several days' present expense. This done, we made sail, and steered north-west, with a gentle breeze at north-east, clear frosty weather. Our latitude at this time was $65^{\circ} 53' S.$, longitude $133^{\circ} 42' W.$; islands of ice not half so numerous as before.

At four in the morning of the 28th, the wind having veered more to the east and south-east, increased to a fresh gale, and was attended with snow showers. Our course was north till noon the next day. Being then in the latitude of $62^{\circ} 24'$, longitude $134^{\circ} 37'$, westered north-west by north. Some hours after the sky cleared up, and the wind abating, veered more to the south. On the 30th, had little wind westerly; dark gloomy weather, with snow and sleet at times; several whales seen playing about the ship, but very few birds; islands of ice in plenty, and a swell from west-north-west. On the 31st, little wind from the westward; fair and clear weather, which afforded an opportunity to air the spare sails, and to clean and smoke the ship betwixt decks. At noon our latitude was $59^{\circ} 40' S.$, longitude $135^{\circ} 11' W.$ Our observation to-day gave us reason to conjecture that we had a southerly current. Indeed, this was no more than what might reasonably be supposed, to account for such huge masses of ice being brought from the south. In the afternoon, had a few hours' calm, succeeded by a breeze from the east, which enabled us to resume our north-west by north course.

January 1st, the wind remained not long at east; but veered round by the south to west; blew fresh, attended with snow showers. In the evening, being in the latitude of $58^{\circ} 39' S.$ we passed two islands of ice; after which we saw no more till we stood again to the south. At five o'clock in the morning on the 2nd, it fell calm: being at this time in the latitude of $58^{\circ} 2'$, longitude $137^{\circ} 12'$. The calm being succeeded by a breeze at east, we steered N.W. by W. My reason for steering this course was to explore part of the great space of sea between us and our track to the south.

On the 3rd, at noon, being in latitude $56^{\circ} 46'$, longitude $139^{\circ} 45'$, the weather became fair and the wind veered to south-west. About this time we saw a few small divers (as we call them) of the petrel tribe, which we judged to be such as are usually seen near land, especially in the bays, and on the coast of New Zealand. I cannot tell what to think of these birds. Had there been more of them, I should have been ready enough to believe that we were at this time not very far from land, as I never saw one so far from known land before. Probably these few had been drawn thus far by some shoal of fish, for such were certainly about us, by the vast number of blue petrels, albatrosses, and such other birds as are usually seen in the great ocean; all or most of which left us before night. Two or three pieces of sea-weed were also seen; but these appeared old and decayed.

At eight o'clock in the evening, being in the latitude of $56^{\circ} S.$, longitude $140^{\circ} 31'$ west, the wind fixing in the western board, obliged us to steer north-easterly, and laid me under the necessity of leaving unexplored a space of the sea to the west, containing near 40° of longitude and a half that in latitude. Had the wind continued favourable, I intended to have run 15 or 20 degrees of longitude more to the west, in the latitude we were then in, and back again to the east in the latitude of 50° . This route would have so intersected the space above mentioned, as hardly to have left room for the bare supposition of any land lying there. Indeed, as it was, we have little reason to believe that there is; but rather the contrary, from the great hollow swell we had had for several days, from the W. and N.W., though the wind had blown from a contrary direction great part of the time; which is a great sign we had not been covered by any land between these two points. While we were in the high latitudes, many of our people were attacked with a slight fever, occasioned by colds. It happily yielded to the simplest remedies; was generally removed in a few days; and at this time we had not above one or two on the sick list.

We proceeded N.E. by N. till the 6th, at noon. Being then in the latitude $52^{\circ} 0' S.$ longitude $135^{\circ} 32' W.$, and about 200 leagues from our track to Otaheite, in which space it was not probable, all circumstances considered, there is any extensive land; and it being still less probable any lay to the west, from the great mountainous billows we had had, and still continued to have from that quarter; I therefore steered N.E. with a fresh gale at W.S.W.

At eight o'clock in the morning on the 7th, being in the latitude of $50^{\circ} 49'$ south, we observed several distances of the sun and moon, which gave the longitude as follows, viz.:

By Mr. Wales	133°	24' west.
Gilbert	133	10
Clerke	133	0
Smith	133	37 25"
Myself	133	37
Mean	133	21 43
By the watch	133	44 west.
My reckoning	133	39
Variation of the compass	6	2 east.
Thermometer	50	0

The next morning we observed again; and the results were agreeable to the preceding observations, allowing for the ship's run. I must here take notice that our longitude can never be erroneous, while we have so good a guide as Mr. Kendal's watch. This day at noon we steered E.N.E. $\frac{1}{2}$ E., being then in the latitude of $49^{\circ} 7'$ S., longitude $131^{\circ} 2'$ W.

On the 9th, in the latitude of $48^{\circ} 17'$ S., longitude $127^{\circ} 10'$ W., we steered east with a fine fresh gale at west, attended with clear pleasant weather, and a great swell from the same direction as the wind. In the morning of the 10th, having but little wind, we put a boat in the water, in which some of the officers went and shot several birds. These afforded us a fresh meal. They were of the petrel tribe, and such as are usually seen at any distance from land. Indeed, neither birds nor any other thing was to be seen that could give us the least hopes of finding any; and therefore at noon the next day, being then in the latitude of $47^{\circ} 51'$ S., longitude $122^{\circ} 12'$ W., and a little more than 200 leagues from my track to Otaheite in 1769, I altered the course, and steered south-east with a fresh gale at S.W. by W. In the evening, when our latitude was $48^{\circ} 22'$ S., longitude $121^{\circ} 29'$ W., we found the variation to be $2^{\circ} 34'$ E.; which is the least variation we had found without the tropic. In the evening of the next day we found it to be $4^{\circ} 30'$ E.; our latitude at that time was $50^{\circ} 5'$ S., longitude $119^{\circ} 3'$ W.

Our course was now more southerly, till the evening of the 13th, when we were in the latitude of $53^{\circ} 0'$ S., longitude $118^{\circ} 3'$ W. The wind being then at north-west, a strong gale with a thick fog and rain, which made it unsafe to steer large, I hauled up south-west, and continued this course till noon the next day, when our latitude was $56^{\circ} 4'$ S., longitude $122^{\circ} 1'$ W. The wind having veered to the north, and the fog continuing, I hauled to the east, under courses and close-reefed topsails. But this sail we could not carry long; for before eight o'clock in the evening, the wind increased to a perfect storm, and obliged us to lie-to, under the mizzen stay-sail, till the morning of the 16th, when the wind having a good deal abated and veered to west, we set the courses, reefed top-sails, and stood to the south. Soon after, the weather cleared up; and in the evening we found the latitude to be $56^{\circ} 48'$ S., longitude $119^{\circ} 8'$ W. We continued to steer to the south, inclining to the east, till the 18th, when we stood to the south-west with the wind at south-east, being at this time in the latitude of $61^{\circ} 9'$ S., longitude $116^{\circ} 7'$ W. At ten o'clock in the evening, it fell calm, which continued till two the next morning, when a breeze sprung up at north, which soon after increased to a fresh gale and fixed at N.E. With this we steered south till noon, on the 20th, when, being now in the latitude of $62^{\circ} 34'$ S., longitude $116^{\circ} 24'$ W., we were again becalmed.

In this situation we had two ice islands in sight, one of which seemed to be as large as any we had seen. It could not be less than two hundred feet in height, and terminated in a peak not unlike the cupola of St. Paul's church. At this time, we had a great westerly swell, which made it improbable that any land should lie between us and the meridian of 1334° , which was our longitude under the latitude we were now in, when we stood to the north. In all this route, we had not seen the least thing that could induce us to think we were ever

in the neighbourhood of any land. We had, indeed, frequently seen pieces of sea-weed; but this, I am well assured, is no sign of the vicinity of land; for weed is seen in every part of the ocean. After a few hours' calm, we got a wind from S.E., but it was very unsettled, and attended with thick snow showers; at length it fixed at S. by E. and we stretched to the east. The wind blew fresh, was piercing cold, and attended with snow and sleet. On the 22d, being in the latitude of $62^{\circ} 5'$ S., longitude $112^{\circ} 24'$ W., we saw an ice island, an antarctic peterel, several blue peterels, and some other known birds; but no one thing that gave us the least hopes of finding land.

On the 23d, at noon, we were in the latitude of $62^{\circ} 22'$ S., longitude $110^{\circ} 24'$. In the afternoon, we passed an ice island. The wind, which blew fresh, continued to veer to the west; and at eight o'clock the next morning, it was to the north of west, when I steered S. by W. and S.S.W. At this time we were in the latitude of $63^{\circ} 20'$ S., longitude $108^{\circ} 7'$ W., and had a great sea from S.W. We continued

BLUE PETEREL.

this course till noon the next day, the 25th, when we steered due south. Our latitude, at this time, was $65^{\circ} 24'$ S., longitude $109^{\circ} 31'$ W.; the wind was at north; the weather mild and not unpleasant; and not a bit of ice in view. This we thought a little extraordinary; as it was but a month before, and not quite two hundred leagues to the east, that we were, in a manner, blocked up with large islands of ice, in this very latitude. Saw a single pintaoe peterel, some blue peterels, and a few brown albatrosses. In the evening, being under the same meridian, and in the latitude of $65^{\circ} 44'$ S., the variation was $19^{\circ} 27'$ E.; but the next morning, in the latitude of $66^{\circ} 20'$ S., longitude the same as before, it was only $18^{\circ} 20'$ E.: probably the mean between the two is the nearest the truth. At this time, we had nine small islands in sight; and soon after, we came, the third time, within the antarctic polar circle, in the longitude of $109^{\circ} 31'$ W. About noon, seeing the appearance of land to the S.E., we immediately trimmed our sails and stood towards it. Soon after it disappeared, but we did not give it up till eight o'clock the next morning, when we were well assured that it was nothing but clouds, or a fog-bank; and then we resumed our course to the south, with a gentle breeze at N.E. attended with a thick fog, snow, and sleet.

We now began to meet with ice islands more frequently than before; and, in the latitude of $69^{\circ} 38'$ S., longitude $108^{\circ} 12'$ W., we fell in with a field of loose ice. As we began to be in want of water, I hoisted out two boats and took up as much as yielded about ten tons. This was cold work; but it was now familiar to us. As soon as we had done, we hoisted in the boats, and afterwards made short boards over that part of the sea we had, in some measure, made ourselves acquainted with. For we had now so thick a fog that we could not see two hundred yards round us; and as we knew not the extent of the loose ice, I durst not steer to the south till we had clear weather. Thus we spent the night, or rather that part of the twenty-four hours which answered to night; for we had no darkness but what was occasioned by fogs.

At four o'clock in the morning of the 29th, the fog began to clear away; and the day becoming clear and serene, we again steered to the south with a gentle gale at N.E. and

sea-weed;
every part
unsettled,
retched to
and sleet.

N.N.E. The variation was found to be $22^{\circ} 41'$ E. This was in the latitude of $69^{\circ} 45'$ S., longitude $108^{\circ} 5'$ W.; and, in the afternoon, being in the same longitude, and in the latitude of $70^{\circ} 23'$ S., it was $24^{\circ} 81'$ E. Soon after, the sky became clouded, and the air very cold. We continued our course to the south, and passed a piece of weed covered with barnacles, which a brown albatross was picking off. At ten o'clock, we passed a very large ice-island; it was not less than three or four miles in circuit. Several more being seen ahead, and the weather becoming foggy, we hauled the wind to the northward; but in less than two hours, the weather cleared up, and we again stood south.

On the 30th, at four o'clock in the morning, we perceived the clouds, over the horizon to the south, to be of an unusual snow-white brightness, which we knew announced our approach to field-ice. Soon after, it was seen from the topmast head; and at eight o'clock, we were close to its edge. It extended east and west, far beyond the reach of our sight. In the situation we were in, just the southern half of our horizon was illuminated, by the rays of light reflected from the ice, to a considerable height. Ninety-seven ice-hills were distinctly seen within the field, besides those on the outside; many of them very large, and looking like a ridge of mountains, rising one above another till they were lost in the clouds. The outer, or northern edge of this immense field, was composed of loose or broken ice close packed together; so that it was not possible for anything to enter it. This was about a mile broad; within which was solid ice in one continued compact body. It was rather low and flat, (except the hills,) but seemed to increase in height, as you traced it to the south; in which direction it extended beyond our sight. Such mountains of ice as these were, I believe, never seen in the Greenland seas; at least, not that I ever heard or read of; so that we cannot draw a comparison between the ice here, and there. It must be allowed that these prodigious ice mountains must add such additional weight to the ice-fields which inclose them, as cannot but make a great difference between the navigating this icy sea and that of Greenland.

I will not say it was impossible anywhere to get farther to the south; but the attempting it would have been a dangerous and rash enterprise, and what, I believe, no man in my situation would have thought of. It was, indeed, my opinion, as well as the opinion of most on board, that this ice extended quite to the pole, or, perhaps, joined to some land, to which it had been fixed from the earliest time; and that it is here, that is, to the south of this parallel, where all the ice we find scattered up and down to the north is first formed, and afterwards broken off by gales of wind, or other causes, and brought to the north by the currents, which we always found to set in that direction in the high latitudes. As we drew near this ice, some penguins were heard, but none seen; and but few other birds, or any other thing, that could induce us to think any land was near. And yet I think there must be some to the south behind this ice; but if there is, it can afford no better retreat for birds, or any other animals, than the ice itself, with which it must be wholly covered. I, who had ambition not only to go farther than any one had been before, but as far as it was possible for man to go, was not sorry at meeting with this interruption; as it, in some measure, relieved us; at least, shortened the dangers and hardships inseparable from the navigation of the southern polar regions. Since, therefore, we could not proceed one inch farther to the south, no other reason need be assigned for my tacking, and standing back to the north; being at this time in the latitude of $71^{\circ} 10'$ S., longitude $106^{\circ} 54'$ W.

It was happy for us that the weather was clear when we fell in with this ice, and that we discovered it so soon as we did; for we had no sooner tacked than we were involved in a thick fog. The wind was at east, and blew a fresh breeze; so that we were able to return back over that space we had already made ourselves acquainted with. At noon the mercury in the thermometer stood at $32\frac{1}{2}^{\circ}$, and we found the air exceedingly cold. The thick fog continuing with showers of snow, gave a coat of ice to our rigging of near an inch thick. In the afternoon of the next day the fog cleared away at intervals; but the weather was cloudy and gloomy, and the air excessively cold; however, the sea within our horizon was clear of ice.

the day
E. and

We continued to stand to the north with the wind easterly till the afternoon, on the 1st of February, when, falling in with some loose ice which had broken from an island to wind-

ward, we hoisted out two boats, and having taken some on board, resumed our course to the north and north-east with gentle breezes from the south-east, attended sometimes with fair weather, and at other times with snow and sleet. On the 4th we were in the latitude of $65^{\circ} 42'$ S., longitude $9^{\circ} 44'$. The next day the wind was very unsettled both in strength and position, and attended with snow and sleet. At length on the 6th, after a few hours' calm, we got a breeze at south, which soon after freshened, fixed at west south-west, and was attended with snow and sleet.

I now came to a resolution to proceed to the north, and to spend the ensuing winter within the tropic, if I met with no employment before I came there. I was now well satisfied no continent was to be found in this ocean, but what must lie so far to the south as to be wholly inaccessible on account of ice; and that if one should be found in the Southern Atlantic Ocean, it would be necessary to have the whole summer before us to explore it. On the other hand, upon a supposition that there is no land there, we undoubtedly might have reached the Cape of Good Hope by April, and so have put an end to the expedition, so far as it related to the finding a continent; which indeed was the first object of the voyage. But for me at this time to have quitted this Southern Pacific Ocean, with a good ship expressly sent out on discoveries, a healthy crew, and not in want either of stores or of provisions, would have been betraying not only a want of perseverance, but of judgment, in supposing the South Pacific Ocean to have been so well explored, that nothing remained to be done in it. This, however, was not my opinion; for although I had proved there was no continent but what must lie far to the south, there remained, nevertheless, room for very large islands in places wholly unexamined: and many of those which were formerly discovered are but imperfectly explored, and their situations as imperfectly known. I was besides of opinion that my remaining in this sea some time longer would be productive of improvements in navigation and geography, as well as other sciences. I had several times communicated my thoughts on this subject to Captain Furneaux; but as it then wholly depended on what we might meet with to the south, I could not give it in orders without running the risk of drawing us from the main object.

Since now nothing had happened to prevent me from carrying these views into execution, my intention was first to go in search of the land, said to have been discovered by Juan Fernandez, above a century ago, in about the latitude of 38° ; if I should fail in finding this land, then to go in search of Easter Island or Davis's Land, whose situation was known with so little certainty that the attempts lately made to find it had miscarried. I next intended to get within the tropic, and then proceed to the west, touching at, and settling the situations of such islands as we might meet with till we arrived at Otaheite, where it was necessary I should stop to look for the Adventure. I had also thoughts of running as far west as the Tierra Austral del Espiritu Santo, discovered by Quiros, and which M. de Bougainville calls the Great Cyclades. Quiros speaks of this land as being large, or lying in the neighbourhood of large lands; and as this was a point which Bougainville had neither confirmed nor refuted, I thought it was worth clearing up. From this land my design was to steer to the south, and so back to the east, between the latitudes of 50° and 60° ; intending if possible to be the length of Cape Horn in November next, when we should have the best part of the summer before us to explore the southern part of the Atlantic Ocean. Great as this design appeared to be, I, however, thought it possible to be executed; and when I came to communicate it to the officers, I had the satisfaction to find that they all heartily concurred in it. I should not do these gentlemen justice, if I did not take some opportunity to declare that they always showed the utmost readiness to carry into execution, in the most effectual manner, every measure I thought proper to take. Under such circumstances, it is hardly necessary to say that the seamen were always obedient and alert; and, on this occasion, they were so far from wishing the voyage at an end, that they rejoiced at the prospect of its being prolonged another year, and of soon enjoying the benefits of a milder climate.

I now steered north, inclining to the east, and in the evening we were overtaken by a furious storm at west-south-west, attended with snow and sleet. It came so suddenly upon us, that before we could take in our sails, two old top-sails, which we had bent to the yards,

were blown to pieces, and the other sails much damaged. The gale lasted, without the least intermission, till the next morning, when it began to abate; it however continued to blow very fresh till noon on the 12th, when it ended in a calm. At this time we were in the latitude of $50^{\circ} 14'$ S., longitude $95^{\circ} 18'$ W. Some birds being about the ship, we took the advantage of the calm to put a boat in the water, and shot several birds, on which we feasted the next day. One of these birds was of that sort which has been so often mentioned in this journal, under the name of Port-Egmont hens. They are of the gull kind, about the size of a raven, with a dark brown plumage, except the under side of each wing, where there are some white feathers. The rest of the birds were albatrosses and shearwaters.

After a few hours' calm, having got a breeze at north-west, we made a stretch to the south-west for twenty-four hours; in which route we saw a piece of wood, a bunch of weed, and a diving petrel. The wind having veered more to the west, made us tack and stretch to the north till noon on the 14th, at which time we were in the latitude of $49^{\circ} 32'$ S., longitude $95^{\circ} 11'$ W. We had now calms and light breezes succeeding each other till the next morning, when the wind freshened at W.N.W., and was attended with a thick fog and drizzling rain the three following days, during which time we stretched to the north, inclining to the east, and crossed my track to Otaheite in 1769. I did intend to have kept more to the west; but the strong winds from that direction put it out of my power.

On the 18th the wind veered to south-west, and blew very fresh, but was attended with clear weather, which gave us an opportunity to ascertain our longitude by several lunar observations made by Messrs. Wales, Clerke, Gilbert, and Smith. The mean result of all was $94^{\circ} 19' 30''$ W.; Mr. Kendall's watch, at the same time, gave $94^{\circ} 46'$ W.; our latitude was $43^{\circ} 53'$ S. The wind continued not long at south-west before it veered back to west and west-north-west. As we advanced to the north we felt a most sensible change in the weather. The 20th, at noon, we were in the latitude of $39^{\circ} 58'$ S., longitude $94^{\circ} 37'$ W. The day was clear and pleasant, and I may say the only summer's day we had had since we left New Zealand. The mercury in the thermometer rose to 66.

We still continued to steer to the north, as the wind remained in the old quarter; and the next day, at noon, we were in the latitude $37^{\circ} 54'$ S., which was the same that Juan Fernandez's discovery is said to lie in. We, however, had not the least signs of any land lying in our neighbourhood. The next day at noon we were in latitude $36^{\circ} 10'$ S., longitude $94^{\circ} 56'$ W. Soon after, the wind veered to south-south-east, and enabled us to steer west-south-west, which I thought the most probable direction to find the land of which we were in search; and yet I had no hopes of succeeding, as we had a large hollow swell from the same point. We, however, continued this course till the 25th, when the wind having veered again round to the westward, I gave it up, and stood away to the north, in order to get into the latitude of Easter Island; our latitude at this time was $37^{\circ} 52'$, longitude $101^{\circ} 10'$ W.

I was now well assured that the discovery of Juan Fernandez, if any such was ever made, can be nothing but a small island; there being hardly room for a large land, as will fully appear by the tracks of Captain Wallis, Bougainville, of the Endeavour, and this of the Resolution. Whoever wants to see an account of the discovery in question, will meet with it in Mr. Dalrymple's Collection of Voyages to the South Seas. This gentleman places it under the meridian of 90° , where I think it cannot be; for M. de Bougainville seems to have run down under that meridian, and we had now examined the latitude in which it is said to lie, from the meridian of 94° to 101° . It is not probable it can lie to the east of 90° ; because if it did, it must have been seen at one time or other by ships bound from the northern to the southern parts of America. Mr. Pengr , in a little treatise concerning the transit of Venus, published in 1768, gives some account of land having been discovered by the Spaniards in 1714, in the latitude of 38° , and 550 leagues from the coast of Chili, which is in the longitude of 110° or 111° W., and within a degree or two of my track in the Endeavour; so that this can hardly be its situation. In short, the only probable situation it can have must be about the meridian of 106° or 108° W.; and then it can only be a small isle, as I have already observed.

I was now taken ill of the bilious colic, which was so violent as to confine me to my bed;

so that the management of the ship was left to Mr. Cooper, the first officer, who conducted her very much to my satisfaction. It was several days before the most dangerous symptoms of my disorder were removed; during which time Mr. Patten, the surgeon, was to me not only a skilful physician, but an affectionate nurse; and I should ill deserve the care he bestowed on me, if I did not make this public acknowledgment. When I began to recover, a favourite dog belonging to Mr. Forster fell a sacrifice to my tender stomach. We had no other fresh meat whatever on board; and I could eat of this flesh, as well as broth made of it, when I could taste nothing else. Thus I received nourishment and strength from food which would have made most people in Europe sick; so true it is, that necessity is governed by no law.

On the 28th, in the latitude of $33^{\circ} 7' S.$, longitude $102^{\circ} 33' W.$, we began to see flying-fish, egg-birds, and noddies, which are said not to go above sixty or eighty leagues from land; but of this we have no certainty. No one yet knows to what distance any of the oceanic birds go to sea; for my own part, I do not believe there is one in the whole tribe that can be relied on, in pointing out the vicinity of land.

In the latitude of $30^{\circ} 30' S.$, longitude $101^{\circ} 45' W.$, we began to see men-of-war birds. In the latitude of $29^{\circ} 44'$, longitude $100^{\circ} 45' W.$, we had a calm for near two days together, during which time the heat was intolerable; but what ought to be remarked, was a very great swell from the south-west. On the 6th of March, the calm was succeeded by an easterly wind, with which we steered north-west till noon the 8th, when, being in the latitude of $27^{\circ} 4' S.$, longitude $103^{\circ} 58' W.$, we steered west, meeting every day with great numbers of birds, such as men-of-war, tropic and egg birds, noddies, sheerwaters, &c.; and once we passed several pieces of sponge, and a small dried leaf not unlike a bay one. Soon after, we saw a sea-snake, in every respect like those we had before seen at the tropical islands. We also saw plenty of fish; but were such bad fishers, that we caught only four albacores, which were very acceptable, to me especially, who was just recovering from my late illness.

CHAPTER VII.—SEQUEL OF THE PASSAGE FROM NEW ZEALAND TO EASTER ISLAND, AND TRANSACTIONS THERE, WITH AN ACCOUNT OF AN EXPEDITION TO DISCOVER THE INLAND PART OF THE COUNTRY, AND A DESCRIPTION OF SOME OF THE SURPRISING GIGANTIC STATUES FOUND IN THE ISLAND.

At eight o'clock in the morning on the 11th, land was seen, from the mast-head, bearing west, and at noon from the deck, extending from $W. \frac{3}{4} N.$ to $W.$ by $S.$ about twelve leagues distant. I made no doubt that this was Davis's Land, or Easter Island, as its appearance from this situation corresponded very well with Wafer's account; and we expected to have seen the low sandy isle that Davis fell in with, which would have been a confirmation; but in this we were disappointed. At seven o'clock in the evening, the island bore from $N. 62^{\circ} W.$ to $N. 87^{\circ} W.$, about five leagues distant; in which situation we sounded, without finding ground, with a line of a hundred and forty fathoms. Here we spent the night, having alternately light airs and calms, till ten o'clock the next morning, when a breeze sprung up to west-south-west. With this we stretched in for the land; and, by the help of our glass, discovered people, and some of those colossian statues or idols mentioned by the authors of Roggwein's Voyage.* At four o'clock in the afternoon, we were half a league south-south-east, and north-north-west of the north-east point of the island; and, on sounding, found thirty-five fathoms, a dark sandy bottom. I now tacked and endeavoured to get into what appeared to be a bay, on the west side of the point, or south-east side of the island; but before this could be accomplished, night came upon us, and we stood on and off under the land till the next morning, having soundings from seventy-five to a hundred and ten fathoms, the same bottom as before.

On the 13th, about eight o'clock in the morning, the wind, which had been variable most part of the night, fixed at south-east and blew in squalls, accompanied with rain, but it was

* See Dalrymple's Collection of Voyages, vol. ii.

not long before the weather became fair. As the wind now blew right on the south-east shore, which does not afford that shelter I at first thought, I resolved to look for anchorage on the west and north-west sides of the island. With this view, I bore up round the south point, off which lie two small islets, the one nearest the point high and peaked, and the other low and flattish. After getting round the point, and coming before a sandy beach, we found soundings, thirty and forty fathoms, sandy ground, and about one mile from the shore. Here a canoe conducted by two men came off to us. They brought with them a bunch of plantains, which they sent into the ship by a rope, and then they returned ashore. This gave us a good opinion of the islanders, and inspired us with hopes of getting some refreshments, which we were in great want of.

I continued to range along the coast till we opened the northern point of the isle without seeing a better anchoring-place than the one we had passed. We therefore tacked, and plied back to it; and, in the mean time, sent away the master in a boat to sound the coast. He returned about five o'clock in the evening, and soon after we came to an anchor, in thirty-six fathoms water, before the sandy beach above mentioned. As the master drew near the shore with the boat, one of the natives swam off to her, and insisted on coming aboard the ship, where he remained two nights and a day. The first thing he did after coming aboard, was to measure the length of the ship, by fathoming her from the taffrail to the stern; and as he counted the fathoms, we observed that he called the numbers by the same names that they do at Otaheite: nevertheless, his language was in a manner wholly unintelligible to all of us.

Having anchored too near the edge of the bank, a fresh breeze from the land, about three o'clock the next morning, drove us off it; on which the anchor was heaved up, and sail made to regain the bank again. While the ship was plying in, I went ashore, accompanied by some of the gentlemen, to see what the island was likely to afford us. We landed at the sandy beach, where some hundreds of the natives were assembled, and who were so impatient to see us, that many of them swam off to meet the boats. Not one of them had so much as a stick or weapon of any sort in their hands. After distributing a few trinkets amongst them, we made signs for something to eat; on which they brought down a few potatoes, plantains, and sugar-canes, and exchanged them for nails, looking-glasses, and pieces of cloth. We presently discovered that they were as expert thieves, and as tricking in their exchanges, as any people we had yet met with. It was with some difficulty we could keep the hats on our heads, but hardly possible to keep anything in our pockets, not even what themselves had sold us; for they would watch every opportunity to snatch it from us, so that we sometimes bought the same thing two or three times over, and after all did not get it.

Before I sailed from England, I was informed that a Spanish ship had visited this isle in 1769. Some signs of it were seen among the people now about us; one man had a pretty good broad-brimmed European hat on, another had a grego jacket, and another a red silk handkerchief. They also seemed to know the use of a musket, and to stand in much awe of it; but this they probably learnt from Roggewein, who, if we are to believe the authors of that voyage, left them sufficient tokens.

Near the place where we landed were some of those statues before mentioned, which I shall describe in another place. The country appeared barren and without wood; there were, nevertheless, several plantations of potatoes, plantains, and sugar-canes; we also saw some fowls, and found a well of brackish water. As these were articles we were in want of, and as the natives seemed not unwilling to part with them, I resolved to stay a day or two. With this view, I repaired on board, and brought the ship to an anchor in thirty-two fathoms water; the bottom, a fine dark sand. Our station was about a mile from the nearest shore, the south point of a small bay, in the bottom of which is the sandy beach before mentioned, being east south-east distant one mile and a half. The two rocky islets lying off the south point of the island were just shut behind a point to the north of them; they bore S. $\frac{3}{4}$ W. four miles distant, and the other extreme of the island bore N. 25° E. distant about six miles. But the best mark for this anchoring-place is the beach; because it is the only one on this side the island. In the afternoon we got on board a few casks

of water, and opened a trade with the natives for such things as they had to dispose of. Some of the gentlemen also made an excursion into the country to see what it produced, and returned again in the evening, with the loss only of a hat, which one of the natives snatched off the head of one of the party.

Early next morning, I sent Lieutenants Pickersgill and Edgecumbe with a party of men, accompanied by several of the gentlemen, to examine the country. As I was not sufficiently recovered from my late illness to make one of the party, I was obliged to content myself with remaining at the landing-place among the natives. We had at one time a pretty brisk trade with them for potatoes, which we observed they dug up out of an adjoining plantation; but this traffic, which was very advantageous to us, was soon put a stop to by the owner (as we supposed) of the plantation coming down, and driving all the people out of it. By this we concluded that he had been robbed of his property, and that they were not less scrupulous of stealing from one another than from us, on whom they practised every little fraud they could think of, and generally with success; for we no sooner detected them in one, than they found out another. About seven o'clock in the evening, the party I had sent into the country returned, after having been over the greatest part of the island.

They left the beach about nine o'clock in the morning, and took a path which led across to the south-east side of the island, followed by a great crowd of the natives, who pressed much upon them. But they had not proceeded far, before a middle-aged man, punctured from head to foot, and his face painted with a sort of white pigment, appeared with a spear in his hand, and walked alongside of them, making signs to his countrymen to keep at a distance, and not to molest our people. When he had pretty well effected this, he hoisted a piece of white cloth on his spear, placed himself in the front, and led the way with his ensign of peace, as they understood it to be. For the greatest part of the distance across the ground had but a barren appearance, being a dry hard clay, and everywhere covered with stones; but, notwithstanding this, there were several large tracks planted with potatoes, and some plantain walks, but they saw no fruit on any of the trees. Towards the highest part of the south end of the island, the soil, which was a fine red earth, seemed much better, bore a longer grass, and was not covered with stones as in the other parts; but here they saw neither house nor plantation.

On the east side, near the sea, they met with three platforms of stone-work, or rather the ruins of them. On each had stood four of those large statues; but they were all fallen down from two of them, and also one from the third; all except one were broken by the fall, or in some measure defaced. Mr. Wales measured this one, and found it to be fifteen feet in length, and six feet broad over the shoulders. Each statue had on its head a large cylindric stone of a red colour, wrought perfectly round. The one they measured, which was not by far the largest, was fifty-two inches high, and sixty-six in diameter. In some, the upper corner of the cylinder was taken off in a sort of concave quarter-round, but in others the cylinder was entire.

From this place they followed the direction of the coast to the north-east, the man with the flag still leading the way. For about three miles they found the country very barren, and in some places stript of the soil to the bare rock, which seemed to be a poor sort of iron ore. Beyond this they came to the most fertile part of the island they saw, it being interspersed with plantations of potatoes, sugar-canes, and plantain trees, and these not so much encumbered with stones as those which they had seen before; but they could find no water except what the natives twice or thrice brought them, which, though brackish and stinking, was rendered acceptable by the extremity of their thirst. They also passed some huts, the owners of which met them with roasted potatoes and sugarcanes, and placing themselves ahead of the foremost of the party, (for they marched in a line in order to have the benefit of the path,) gave one to each man as he passed by. They observed the same method in distributing the water which they brought; and were particularly careful that the foremost did not drink too much, lest none should be left for the hindmost. But at the very time these were relieving the thirsty and hungry, there were not wanting others who endeavoured to steal from them the very things which had been given them. At last, to prevent worse consequences, they were obliged to fire a load of small shot at one who was so audacious as

to snatch from one of the men the bag which contained everything they carried with them. The shot hit him on the back ; on which he dropped the bag, ran a little way, and then fell ; but he afterwards got up and walked ; and what became of him they knew not, nor whether he was much wounded. As this affair occasioned some delay, and drew the natives together, they presently saw the man who had hitherto led the way, and one or two more coming running towards them ; but instead of stopping when they came up, they continued to run round them, repeating in a kind manner, a few words, until our people set forwards again. Then their old guide hoisted his flag, leading the way as before, and none ever attempted to steal from them the whole day afterwards.

As they passed along, they observed on a hill a number of people collected together, some of whom had spears in their hands ; but, on being called to by their countryman, they dispersed ; except a few, amongst whom was one seemingly of some note. He was a stout, well-made man, with a fine open countenance ; his face was painted, his body punctured, and he wore a better *Ha hou*, or cloth, than the rest. He saluted them as he came up, by stretching out his arms with both hands clenched, lifting them over his head, opening them wide, and then letting them fall gradually down to his sides. To this man, whom they understood to be the chief of the island, their other friend gave his white flag ; and he gave it to another, who carried it before them the remainder of the day.

Towards the eastern end of the island, they met with a well whose water was perfectly fresh, being considerably above the level of the sea ; but it was dirty, owing to the filthiness or cleanliness (call it which you will) of the natives, who never go to drink without washing themselves all over as soon as they have done ; and if ever so many of them are together, the first leaps right into the middle of the hole, drinks, and washes himself without the least ceremony ; after which another takes his place and does the same.

They observed that this side of the island was full of those gigantic statues so often mentioned ; some placed in groups on platforms of masonry ; others single, fixed only in the earth, and that not deep ; and these latter are in general much larger than the others. Having measured one which had fallen down, they found it very near twenty-seven feet long, and upwards of eight feet over the breast or shoulders ; and yet this appeared considerably short of the size of one they saw standing ; its shade, a little past two o'clock, being sufficient to shelter all the party, consisting of near thirty persons, from the rays of the sun. Here they stopped to dine ; after which they repaired to a hill, from whence they saw all the east and north shores of the isle, on which they could not see either bay or creek fit even for a boat to land in, nor the least signs of fresh water. What the natives brought them here was real salt water ; but they observed that some of them drank pretty plentifully of it ; so far will necessity and custom get the better of nature ! On this account, they were obliged to return to the last-mentioned well ; where, after having quenched their thirst, they directed their route across the island towards the ship, as it was now four o'clock.

In a small hollow on the highest part of the island, they met with several such cylinders as are placed on the heads of the statues. Some of these appeared larger than any they had seen before ; but it was now too late to stop to measure any of them. Mr. Wales, from whom I had this information, is of opinion that there had been a quarry here, whence these stones had formerly been dug, and that it would have been no difficult matter to roll them down the hill after they were formed. I think this a very reasonable conjecture, and have no doubt that it has been so. On the declivity of the mountain, towards the west, they met with another well ; but the water was a very strong mineral, had a thick green scum on the top, and stunk intolerably. Necessity, however, obliged some to drink of it ; but it soon made them so sick, that they threw it up the same way it went down.

In all this excursion, as well as the one made the preceding day, only two or three shrubs were seen. The leaf and seed of one (called by the natives *Torromedo*) were not much unlike those of the common vetch ; but the pod was more like that of a tamarind in its size and shape. The seeds have a disagreeable bitter taste ; and the natives, when they saw our people chew them, made signs to spit them out ; from whence it was concluded that they think them poisonous. The wood is of a reddish colour, and pretty hard and heavy ; but very crooked, small, and short, not exceeding six or seven feet in height. At the south-west

corner of the island, they found another small shrub, whose wood was white and brittle, and in some measure, as also its leaf, resembling the ash. They also saw in several places the Otahitean cloth plant; but it was poor and weak, and not above two and a half feet high at most. They saw not an animal of any sort, and but very few birds; nor indeed anything which can induce ships that are not in the utmost distress to touch at this island.

This account of the excursion I had from Mr. Pickersgill and Mr. Wales, men on whose veracity I could depend; and, therefore, I determined to leave the island the next morning, since nothing was to be obtained that could make it worth my while to stay longer; for the water which we had sent on board was not much better than if it had been taken up out of the sea. We had a calm till ten o'clock in the morning of the 16th, when a breeze sprung up at west, accompanied with heavy showers of rain, which lasted about an hour. The weather then clearing up, we got under sail, stood to sea, and kept plying to and fro, while an officer was sent on shore with two boats, to purchase such refreshments as the natives might have brought down; for I judged this would be the case, as they knew nothing of our sailing. The event proved that I was not mistaken; for the boats made two trips before night: when we hoisted them in, and made sail to the north-west with a light breeze at north north-east.

CHAPTER VIII.—A DESCRIPTION OF THE ISLAND, ITS PRODUCE, SITUATION, AND INHABITANTS; THEIR MANNERS AND CUSTOMS.—CONJECTURES CONCERNING THEIR GOVERNMENT, RELIGION, AND OTHER SUBJECTS; WITH A MORE PARTICULAR ACCOUNT OF THE GIGANTIC STATUES.

I SHALL now give some farther account of this island, which is undoubtedly the same that Admiral Roggewein touched at in April 1722, although the description given of it by the authors of that voyage does by no means agree with it now. It may also be the same that was seen by Captain Davis in 1686; for when seen from the east, it answers very well to Wafer's description, as I have before observed. In short, if this is not the land, his discovery cannot lie far from the coast of America, as this latitude has been well explored from the meridian of 80° to 110°. Captain Carteret carried it much farther, but his track seems to have been a little too far south. Had I found fresh water, I intended spending some days looking for the low sandy isle Davis fell in with, which would have determined the point; but as I did not find water, and had a long run to make before I was assured of getting any, and being in want of refreshments, I declined the search, as a small delay might have been attended with bad consequences to the crew, many of them beginning to be more or less affected with the scurvy.

No nation need contend for the honour of the discovery of this island, as there can be few places which afford less convenience for shipping than it does. Here is no safe anchorage, no wood for fuel, nor any fresh water worth taking on board. Nature has been exceedingly sparing of her favours to this spot. As everything must be raised by dint of labour, it cannot be supposed the inhabitants plant much more than is sufficient for themselves; and as they are but few in number, they cannot have much to spare to supply the wants of visitant strangers. The produce is sweet potatoes, yams, taroeddy-root, plantains, and sugar-canes, all pretty good, the potatoes especially, which are the best of the kind I ever tasted. Gourds they have also; but so very few, that a cocoa-nut shell was the most valuable thing we could give them. They have a few tame fowls, such as cocks and hens, small but well-tasted. They have also rats, which it seems they eat; for I saw a man with some dead ones in his hand, and he seemed unwilling to part with them, giving me to understand they were for food. Land-birds there were hardly any, and sea-birds but few; these were, men-of-war, tropic, and egg-birds, noddies, tern, &c. The coast seemed not to abound with fish; at least we could catch none with hook and line, and it was but very little we saw amongst the natives.

Such is the produce of Easter Island, or Davis's Land, which is situated in the latitude of 27° 5' 30" S., longitude 109° 46' 20" W. It is about ten or twelve leagues in circuit, hath a hilly and stony surface, and an iron-bound shore. The hills are of such a height as

to be seen fifteen or sixteen leagues. Off the south end are two rocky islets lying near the shore. The north and east points of the island rise directly from the sea to a considerable height; between them, on the south-east side, the shore forms an open bay, in which I believe the Dutch anchored. We anchored, as hath been already mentioned, on the west side of the island, three miles to the north of the south point, with the sandy beach bearing east-south-east. This is a very good road with easterly winds, but a dangerous one with westerly, as the other on the south-east side must be with easterly winds.

For this and other bad accommodations already mentioned, nothing but necessity will induce any one to touch at this isle, unless it can be done without going much out of the way*; in which case touching here may be advantageous, as the people willingly and readily part with such refreshments as they have, and at an easy rate. We certainly received great benefit from the little we got; but few ships can come here without being in want of water, and this want cannot be here supplied. The little we took on board could not be made use of; it being only salt water which had filtrated through a stony beach into a stone well. This the natives had made for the purpose, a little to the southward of the sandy beach so often mentioned, and the water ebbed and flowed into it with the tide.

The inhabitants of this island do not seem to exceed six or seven hundred souls; and above two-thirds of those we saw were males. They either have but few females among them, or else many were restrained from making their appearance during our stay; for though we saw nothing to induce us to believe the men were of a jealous disposition, or the women afraid to appear in public, something of this kind was probably the case. In colour, features, and language, they bear such affinity to the people of the more western isles, that no one will doubt that they have had the same origin. It is extraordinary that the same nation should have spread themselves over all the isles in this vast ocean, from New Zealand to this island, which is almost one-fourth part of the circumference of the globe. Many of them have now no other knowledge of each other than what is preserved by antiquated tradition; and they have by length of time become, as it were, different nations, each having adopted some peculiar custom or habit, &c. Nevertheless, a careful observer will soon see the affinity each has to the other.

In general, the people of this isle are a slender race. I did not see a man that would measure six feet; so far are they from being giants, as one of the authors of Roggewein's voyage asserts. They are brisk and active, have good features, and not disagreeable countenances; are friendly and hospitable to strangers, but as much addicted to pilfering as any of their neighbours. *Tattooing*, or puncturing the skin, is much used here. The men are marked from head to foot, with figures all nearly alike; only some give them one direction, and some another, as fancy leads. The women are but little punctured; red and white paint is an ornament with *them*, as also with the men; the former is made of turmeric; but what composes the latter I know not. Their clothing is a piece or two of quilted cloth about six feet by four, or a mat. One piece wrapped round their loins, and another over their shoulders, make a complete dress. But the men, for the most part, are in a manner naked, wearing nothing but a slip of cloth betwixt their legs, each end of which is fastened to a cord or belt they wear round the waist. Their cloth is made of the same materials as at Otaheite, viz. of the bark of the cloth-plant; but as they have but little of it, our Otaheitean cloth, or indeed any sort of it, came here to a good market.

Their hair, in general, is black; the women wear it long, and sometimes tied up on the crown of the head; but the men wear it and their beards cropped short. Their head-dress is a round fillet adorned with feathers, and a straw bonnet something like a Scotch one; the former, I believe, being chiefly worn by the men, and the latter by the women. Both men and women have very large holes, or rather slits, in their ears, extended to near three inches in length. They sometimes turn this slit over the upper part, and then the ear looks as if the flap was cut off. The chief ear ornaments are the white down of feathers, and rings, which they wear in the inside of the hole, made of some elastic substance, rolled up like a watch-

* The disadvantages above mentioned are such as to have prevented to this day any but the most casual intercourse between the natives and Europeans; even the zealous missionaries have, not hitherto attempted their conversion, and by the later accounts the island appears to be in much the same condition as in 1774.—Ed.

spring. I judged this was to keep the hole at its utmost extension. I do not remember seeing them wear any other ornaments, excepting amulets made of bone or shells. As harmless and friendly as these people seem to be, they are not without offensive weapons, such as short wooden clubs and spears; which latter are crooked sticks about six feet long, armed at one end with pieces of flint. They have also a weapon made of wood, like the *Patoo patoo* of New Zealand.

Their houses are low miserable huts, constructed by setting sticks upright in the ground, at six or eight feet distance, then bending them towards each other, and tying them together at the top, forming thereby a kind of Gothic arch. The longest sticks are placed in the middle, and shorter ones each way, and at less distance asunder; by which means the building is highest and broadest in the middle, and lower and narrower towards each end. To these are tied others horizontally, and the whole is thatched over with leaves of sugar-cane. The door-way is in the middle of one side, formed like a porch, and so low and narrow as just to admit a man to enter upon all-fours. The largest house I saw was about sixty feet long, eight or nine feet high in the middle, and three or four at each end; its breadth at these parts was nearly equal to its height. Some have a kind of vaulted houses built with stone, and partly under ground; but I never was in one of these.

I saw no household utensils amongst them except gourds, and of these but very few. They were extravagantly fond of cocoa-nut shells; more so than of anything we could give them. They dress their victuals in the same manner as at Otaheite; that is, with hot stones in an oven or hole in the ground. The straw or tops of sugar-cane, plantain heads, &c. serve them for fuel to heat the stones. Plantains, which require but little dressing, they roast under fires of straw, dried grass, &c., and whole races of them are ripened or roasted in this manner. We frequently saw ten or a dozen, or more, such fires in one place, and most commonly in the mornings and evenings.

Not more than three or four canoes were seen on the whole island; and these very mean, and built of many pieces sewed together with small line. They are about eighteen or twenty feet long, head and stern carved or raised a little, are very narrow, and fitted with outriggers. They do not seem capable of carrying above four persons, and are by no means fit for any distant navigation. As small and as mean as these canoes were, it was a matter of wonder to us where they got the wood to build them with; for in one of them was a board six or eight feet long, fourteen inches broad at one end, and eight at the other; whereas we did not see a stick on the island which would have made a board half this size; nor, indeed, was there another piece in the whole canoe half so big.

There are two ways by which it is possible they may have got this large wood: it might have been left here by the Spaniards; or it might have been driven on the shore of the island from some distant land. It is even possible that there may be some land in the neighbourhood from whence they might have got it. We, however, saw no signs of any; nor could we get the least information on this head from the natives, although we tried every method we could think of to obtain it. We were almost as unfortunate in our inquiries for the proper or native name of the island. For, on comparing notes, I found we had got three different names for it, viz. *Tamareki*, *Whyhu*, and *Tcapy*. Without pretending to say which, or whether any of them is right, I shall only observe, that the last was obtained by Oedidee, who understood their language much better than any of us; though even he understood it but very imperfectly.

It appears by the account of Roggwein's voyage, that these people had no better vessel than when he first visited them. The want of materials, and not of genius, seems to be the reason why they have made no improvement in this art. Some pieces of carving were found amongst them, both well designed and executed. Their plantations are prettily laid out by line, but not inclosed by any fence; indeed, they have nothing for this purpose but stones. I have no doubt that all these plantations are private property, and that there are here, as at Otaheite, chiefs (which they call *Areekes*) to whom these plantations belong. But of the power or authority of these chiefs, or of the government of these people, I confess myself quite ignorant.

Nor are we better acquainted with their religion. The gigantic statues so often mentioned

are not, in my opinion, looked upon as idols by the present inhabitants, whatever they might have been in the days of the Dutch; at least, I saw nothing that could induce me to think so. On the contrary, I rather suppose that they are burying-places for certain tribes or families. I, as well as some others, saw a human skeleton lying in one of the platforms, just covered with stones. Some of these platforms of masonry are thirty or forty feet long, twelve or sixteen broad, and from three to twelve in height; which last in some measure depends on the nature of the ground. For they are generally at the brink of the bank facing the sea, so that this face may be ten or twelve feet or more high, and the other may not be above three or four. They are built, or rather faced, with hewn stones of a very large size; and the workmanship is not inferior to the best plain piece of masonry we have in England. They use no sort of cement; yet the joints are exceedingly close, and the stones morticed and tenanted one into another, in a very artful manner. The side walls are not perpendicular, but inclining a little inwards, in the same manner that breast-works, &c., are built in Europe: yet had not all this care, pains, and sagacity been able to preserve these curious structures from the ravages of all-devouring time. The statues, or at least many of them, are erected on these platforms, which serve as foundations. They are, as near as we could judge, about half length, ending in a sort of stump at the bottom, on which they stand. The workmanship is rude, but not bad; nor are the features of the face ill formed, the nose and chin in particular; but the ears are long beyond proportion; and, as to the bodies, there is hardly anything like a human figure about them.

I had an opportunity of examining only two or three of these statues, which are near the landing-place; and they were of a grey stone, seemingly of the same sort as that with which the platforms were built. But some of the gentlemen who travelled over the island, and examined many of them, were of opinion that the stone of which they were made was different from any other they saw on the island, and had much the appearance of being factitious. We could hardly conceive how these islanders, wholly unacquainted with any mechanical power, could raise such stupendous figures, and afterwards place the large cylindric stones, before mentioned, upon their heads. The only method I can conceive, is by raising the upper end by little and little, supporting it by stones as it is raised, and building about it till they got it erect; thus a sort of mound, or scaffolding, would be made, upon which they might roll the cylinder, and place it upon the head of the statue, and then the stones might be removed from about it. But if the stones are factitious, the statues might have been put together on the place in their present position, and the cylinder put on by building a mount round them as above mentioned. But, let them have been made and set up, by this or any other method, they must have been a work of immense time, and sufficiently show the ingenuity and perseverance of the islanders in the age in which they were built; for the present inhabitants have most certainly had no hand in them, as they do not even repair the foundations of those which are going to decay. They give different names to them, such as Gotomoara, Marapate, Kanaro, Gowaytoo-goo, Matta Matta, &c. &c., to which they sometimes prefix the word *Moi*, and sometimes annex *Arcekee*. The latter signifies chief, and the former, burying, or sleeping-place, as well as we could understand. Besides the monuments of antiquity, which were pretty numerous, and nowhere but on or near the sea-coast, there were many little heaps of stones piled up in different places, along the coast. Two or three of the uppermost stones in each pile were generally white; perhaps always so, when the pile is complete. It will hardly be doubted that these piles of stone had a meaning. Probably they might mark the place where people had been buried, and serve instead of the large statues.

The working-tools of these people are but very mean, and, like those of all the other islanders we have visited in this ocean, made of stone, bone, shells, &c. They set but little value on iron, or iron tools, which is the more extraordinary as they know their use; but the reason may be their having but little occasion for them.

CHAPTER IX.—THE PASSAGE FROM EASTER ISLAND TO THE MARQUESAS ISLANDS.—TRANSACTIONS AND INCIDENTS WHICH HAPPENED WHILE THE SHIP LAY IN MADRE DE DIOS, OR RESOLUTION BAY, IN THE ISLAND OF ST. CHRISTINA.

AFTER leaving Easter Island, I steered north-west by north, and north-north-west, with a fine easterly gale, intending to touch at the Marquesas, if I met with nothing before I got there. We had not been long at sea before the bilious disorder made another attack upon me, but not so violent as the former. I believe this second visit was owing to my exposing and fatiguing myself too much at Easter Island.

On the 22d, being in the latitude of $19^{\circ} 20'$ S., longitude $114^{\circ} 49'$ W., steered north-west. Since leaving Easter Island, the variation had not been more than $3^{\circ} 4'$, nor less than $2^{\circ} 32'$ E.; but on the 26th, in latitude $15^{\circ} 7'$ S., longitude $119^{\circ} 45'$ W., it was no more than $1^{\circ} 1'$ E., after which it began to increase. On the 29th, being in latitude $10^{\circ} 20'$, longitude $123^{\circ} 58'$ W., altered the course to west north-west, and the next day to west, being then in latitude $9^{\circ} 24'$, which I judged to be the parallel of the Marquesas; where, as I have before observed, I intended to touch in order to settle their situation, which I find different in different charts. Having now a steady settled trade-wind and pleasant weather, I ordered the forge to be set up, to repair and make various necessary articles in the iron way, and the calkers had already been some time at work calking the decks, weather-works, &c.

As we advanced to the west, we found the variation to increase but slowly; for, on the 3d of April, it was only $4^{\circ} 40'$ E., being then in the latitude $9^{\circ} 32'$, longitude $132^{\circ} 45'$, by observation made at the same time. I continued to steer to the west till the 6th, at four in the afternoon, at which time, being in the latitude of $9^{\circ} 20'$, longitude $138^{\circ} 14'$ W., we discovered an island, bearing west by south, distant about nine leagues. Two hours after we saw another bearing south-west by south, which appeared more extensive than the former. I hauled up for this island, and ran under an easy sail all night, having squally unsettled rainy weather, which is not very uncommon in this sea when near high land. At six o'clock the next morning, the first island bore north-west, the second south-west $\frac{1}{2}$ west, and a third west. I gave orders to steer for the separation between the two last, and soon after a fourth was seen, still more to the west. By this time we were well assured that these were the Marquesas, discovered by Mendana in 1595. The first isle was a new discovery, which I named Hood's Island, after the young gentleman who first saw it; the second was that of Saint Pedro; the third, La Dominica; and the fourth, St. Christina. We ranged the south-east coast of La Dominica without seeing the least signs of anchorage, till we came to the channel that divides it from St. Christina, through which we passed, hauled over for the last-mentioned island, and ran along the coast to the south-west in search of Mendana's Port. We passed several coves in which there seemed to be anchorage; but a great surf broke on all the shores. Some canoes put off from these places, and followed us down the coast.

At length, having come before the port we were in search of, we attempted to turn into it, the wind being right out; but as it blew in violent squalls from this high land, one of these took us just after we had put in stays, payed the ship off again, and before she wore round she was within a few yards of being driven against the rocks to leeward. This obliged us to stand out to sea, and to make a stretch to windward; after which we stood in again, and, without attempting to turn, anchored in the entrance of the bay in thirty-four fathoms water, a fine sandy bottom. This was no sooner done, than about thirty or forty of the natives came off to us in ten or twelve canoes; but it required some address to get them alongside. At last, a hatchet and some spike-nails induced the people in one canoe to come under the quarter-gallery; after which all the others put alongside, and having exchanged some bread-fruit and fish, for small nails, &c. retired ashore, the sun being already set. We observed a heap of stones in the bow of each canoe, and every man to have a sling tied round his hand.

Very early next morning, the natives visited us again in much greater numbers than before; bringing with them bread-fruit, plantains, and one pig, all of which they exchanged for nails, &c. But, in this traffic, they would frequently keep our goods and make no return; till at last I was obliged to fire a musket-ball over one man who had several times served us in this manner; after which they dealt more fairly, and soon after several of them came on board. At this time we were preparing to warp farther into the bay; and I was going in a boat, to look for the most convenient place to moor the ship in. Observing too many of the natives on board, I said to the officers, "You must look well after these people, or they will certainly carry off something or other." I had hardly got into the boat, before I was told they had stolen one of the iron stanchions from the opposite gangway, and were making off with it. I ordered them to fire over the canoe till I could get round in the boat, but not to kill any one. But the natives made too much noise for me to be heard; and the unhappy thief was killed at the third shot. Two others in the same canoe leaped overboard, but got in again just as I came to them. The stanchion they had thrown overboard. One of them, a man grown, sat baling the blood and water out of the canoe, in a kind of hysteric laugh. The other, a youth about fourteen or fifteen years of age, looked on the deceased with a serious and dejected countenance: we had afterwards reason to believe he was his son.

At this unhappy accident, all the natives retired with precipitation. I followed them into the bay, and prevailed upon the people in one canoe to come alongside the boat, and receive some nails and other things, which I gave them. This, in some measure, allayed their fears. Having taken a view of the bay, and found the fresh water, which we most wanted, was to be had, I returned on board, and carried out a kedge-anchor with three hawsers upon an end, to warp the ship in by, and hove short on the bower. One would have thought that the natives, by this time, would have been so sensible of the effect of our fire-arms, as not to have provoked us to fire upon them any more; but the event proved otherwise. For the boat had no sooner left the kedge-anchor, than two men in a canoe put off from the shore, took hold of the buoy-rope, and attempted to drag it ashore, little considering what was fast to it. Lest, after discovering their mistake, they should take away the buoy, I ordered a musket to be fired at them. The ball fell short, and they took not the least notice of it; but a second having passed over them, they let go the buoy, and made for the shore. This was the last shot we had occasion to fire at any of them while we lay at this place. It probably had more effect than killing the man, by showing them that they were not safe at any distance; at least we had reason to think so, for they afterwards stood in great dread of the musket. Nevertheless, they would very often be exercising their talent of thieving upon us, which I thought proper to put up with, as our stay was not likely to be long amongst them. The trouble these people gave us retarded us so long, that, before we were ready to heave the anchor, the wind began to increase, and blew in squalls out of the bay; so that we were obliged to lie fast. It was not long before the natives ventured off to us again. In the first canoe which came, was a man who seemed to be of some consequence. He advanced slowly with a pig on his shoulder, and speaking something which we did not understand. As soon as he got alongside, I made him a present of a hatchet, and several other articles. In return he sent in his pig, and was, at last, prevailed upon to come himself up into the gangway, where he made but a short stay before he went away. The reception this man met with induced the people in all the other canoes to put alongside; and exchanges were presently re-established.

Matters being thus settled on board, I went on shore with a party of men, to see what was to be done there. We were received by the natives with great courtesy; and, as if nothing had happened, trafficked with them for some fruit and a few small pigs; and, after loading the launch with water, returned aboard. After dinner I sent the boats, under the protection of a guard, ashore for water. On their landing, the natives all fled but one man, and he seemed much frightened; afterwards one or two more came down; and these were all that were seen this afternoon. We could not conceive the reason of this sudden fright. Early in the morning of the 9th, the boats were sent as usual for water; and, just as they were coming off, but not before, some of the natives made their appearance. After breakfast,

I landed some little time before the guard, when the natives crowded round me in great numbers; but as soon as the guard landed, I had enough to do to keep them from running off. At length their fears vanished, and a trade was opened for fruit and pigs. I believe the reason of the natives flying from our people the day before, was their not seeing me at the head of them; for they certainly would have done the same to-day had I not been present. About noon, a chief of some consequence, attended by a great number of people, came down to the landing-place. I presented him with such articles as I had with me; and, in return, he gave me some of his ornaments. After these mutual exchanges, a good understanding seemed to be established between us; so that we got by exchanges as much fruit as loaded two boats, with which we returned on board to dinner, but could not prevail on the chief to accompany us.

In the afternoon, the watering and trading parties were sent on shore; though the latter got but little, as most of the natives had retired into the country. A party of us went to the other, or southern cove of the bay, where I procured five pigs, and came to the house, which, we were told, did belong to the man we had killed. He must have been a person of some note, as there were six pigs in and about his house, which, we were told, belonged to his son, who fled on our approach. I wanted much to have seen him, to make him a present, and by other kind treatment, to convince him and the others, that it was not from any bad design against the nation, that we had killed his father. It would have been to little purpose, if I had left anything in the house, as it certainly would have been taken by others; especially as I could not sufficiently explain to them my meaning. Strict honesty was seldom observed when the property of our things came to be disputed. I saw a striking instance of this in the morning, when I was going ashore. A man in a canoe offered me a small pig for a six-inch spike, and another man being employed to convey it, I gave him the spike, which he kept for himself, and, instead of it, gave to the man who owned the pig a sixpenny nail. Words of course arose, and I waited to see how it would end; but as the man who had possession of the spike seemed resolved to keep it, I left them before it was decided. In the evening we returned on board with what refreshments we had collected, and thought we had made a good day's work.

On the 10th, early in the morning, some people from more distant parts came in canoes alongside, and sold us some pigs; so that we had now sufficient to give the crew a fresh meal. They were in general so small, that forty or fifty were hardly sufficient for this purpose. The trade on shore for fruit was as brisk as ever. After dinner I made a little expedition in my boat along the coast to the southward, accompanied by some of the gentlemen; at the different places we touched at, we collected eighteen pigs; and, I believe, might have gotten more. The people were exceedingly obliging wherever we landed, and readily brought down whatever we desired.

Next morning I went down to the same place where we had been the preceding evening: but, instead of getting pigs as I expected, found the scene quite changed. The nails and other things they were mad after but the evening before they now despised, and instead of them wanted they did not know what; so that I was obliged to return with three or four little pigs, which cost more than a dozen did the day before. When I got on board, I found the same change had happened there, as also at the trading place on shore. The reason was, several of the young gentlemen having landed the preceding day, had given away in exchange various articles which the people had not seen before, and which took with them more than nails or more useful iron tools. But what ruined our market the most was, one of them giving for a pig a very large quantity of red feathers he had got at Amsterdam. None of us knew, at this time, that this article was in such estimation here; and if I had known it, I could not have supported the trade, in the manner it was begun, one day. Thus was our fine prospect of getting a plentiful supply of refreshments from these people frustrated; which will ever be the case so long as every one is allowed to make exchanges for what he pleases; and in what manner he pleases. When I found this island was not likely to supply us, on any conditions, with sufficient refreshments, such as we might expect to find at the Society Isles, nor very convenient for taking in wood and water, nor for giving the ship the necessary repairs she wanted, I resolved forthwith to leave it, and proceed to some other place where our wants might be effectually relieved. For, after having been

nineteen weeks at sea, and living all the time upon salt diet, we could not but want some refreshments; although I must own, and that with pleasure, that on our arrival here, it could hardly be said we had one sick man, and but a few who had the least complaint. This was undoubtedly owing to the many antiscorbutic articles we had on board, and to the great attention of the surgeon, who was remarkably careful to apply them in time.

CHAPTER X.—DEPARTURE FROM THE MARQUESAS.—A DESCRIPTION OF THE SITUATION, EXTENT, FIGURE, AND APPEARANCE OF THE SEVERAL ISLANDS; WITH SOME ACCOUNT OF THE INHABITANTS, THEIR CUSTOMS, DRESS, HABITATIONS, FOOD, WEAPONS, AND CANOES.

At three o'clock in the afternoon we weighed, and stood over from St. Christina for La Dominica, in order to take a view of the west side of that isle; but as it was dark before we reached it, the night was spent in plying between the two isles. The next morning we had a full view of the south-west point, from which the coast trended north-east, so that it was not probable we should find good anchorage on that side, as being exposed to the easterly winds. We had now but little wind, and that very variable, with showers of rain. At length we got a breeze at east north-east, with which we steered to the south. At five o'clock in the afternoon Resolution Bay bore E.N.E. $\frac{1}{2}$ E., distant five leagues, and the island Magdalena south-east about nine leagues distant. This was the only sight we had of this isle. From hence I steered S.S.W. $\frac{1}{2}$ W. for Otaheite, with a view of falling in with some of those isles discovered by former navigators, especially those discovered by the Dutch, whose situations are not well determined.

But it will be necessary to return to the Marquesas; which were, as I have already observed, first discovered by Mendana, a Spaniard, and from him obtained the general name they now bear, as well as those of the different isles. The nautical account of them, in Mr. Dalrymple's Collection of Voyages to the South Seas*, is deficient in nothing but situation. This was my chief reason for touching at them: the settling this point is the more useful, as it will, in a great measure, fix the situations of Mendana's other discoveries.

The Marquesas are five in number, viz. La Magdalena, St. Pedro, La Dominica, Santa Christina, and Hood's Island, which is the northernmost, situated in latitude $9^{\circ} 26' S.$, and $N. 13^{\circ} W.$, five leagues and a half distant from the east point of La Dominica, which is the largest of all the isles, extending east and west six leagues. It hath an unequal breadth, and is about fifteen or sixteen leagues in circuit. It is full of rugged hills rising in ridges directly from the sea; these ridges are disjoined by deep valleys, which are clothed with wood, as are the sides of some of the hills; the aspect is, however, barren; but it is, nevertheless, inhabited, latitude $9^{\circ} 44' 30'' S.$ St. Pedro, which is about three leagues in circuit, and of a good height, lies south four leagues and a half from the east end of La Dominica: we know not if it be inhabited. Nature has not been very bountiful to it. St. Christina lies under the same parallel, three or four leagues more to the west. This island stretches north and south, is nine miles long in that direction, and about seven leagues in circuit. A narrow ridge of hills of considerable height extends the whole length of the island. There are other ridges which, rising from the sea, and, with an equal ascent, join the main ridge. These are disjoined by deep narrow valleys, which are fertile, adorned with fruit and other trees, and watered by fine streams of excellent water. La Magdalena we only saw at a distance. Its situation must be nearly in the latitude of $10^{\circ} 25'$ longitude, $138^{\circ} 50'$. So that these isles occupy one degree in latitude, and near half a degree in longitude, viz. from $138^{\circ} 47'$ to $139^{\circ} 13' W.$, which is the longitude of the west end of La Dominica.

The port of Madre de Dios, which I named Resolution Bay, is situated near the middle of the west side of St. Christina, and under the highest land in the island, in latitude $9^{\circ} 55' 30''$, longitude $139^{\circ} 8' 40'' W.$; and $N. 15' W.$ from the west end of La Dominica. The south point of the bay is a steep rock of considerable height, terminating at the top in

* Vol. i. p. 61 to 73.

a peaked hill, above which you will see a pathway leading up a narrow ridge to the summits of the hills. The north point is not so high, and rises with a more gentle slope. They are a mile from each other, in the direction of north by east, and south by west. In the bay, which is near three-quarters of a mile deep, and has from thirty-four to twelve fathoms water, with a clean sandy bottom, are two sandy coves, divided from each other by a rocky point. In each is a rivulet of excellent water. The northern cove is the most commodious for wooding and watering. Here is the little waterfall mentioned by Quiros, Mendana's pilot; but the town or village is in the other cove. There are several other coves or bays on this side of the island; and some of them, especially to the northward, may be mistaken for this; therefore, the best direction is the bearing of the west end of La Dominica.

The trees, plants, and other productions of these isles, so far as we know, are nearly the same as at Otaheite and the Society Isles. The refreshments to be got are hogs, fowls, plantains, yams, and some other roots; likewise bread-fruit and cocoa-nuts, but of these not many. At first these articles were purchased with nails. Beads, looking-glasses, and such trifles, which are so highly valued at the Society Isles, are in no esteem here; and even nails at last lost their value for other articles far less useful. The inhabitants of these islands, collectively, are, without exception, the finest race of people in this sea. For fine shape and regular features, they perhaps surpass all other nations. Nevertheless, the affinity of their language to that spoken in Otaheite and the Society Isles shows that they are of the same nation. Oedidee could converse with them tolerably well, though we could not; but it was easy to see that their language was nearly the same.

NATIVES OF THE MARQUESAS.

The men are punctured, or curiously *tattooed*, from head to foot. The figures are various, and seem to be directed more by fancy than custom. These punctures make them look dark; but the women, who are but little punctured, youths, and young children who are not at all, are as fair as some Europeans. The men are in general tall; that is, about five feet ten inches or six feet; but I saw none that would be called meagre. Their teeth are not so good, nor are their eyes so full and lively, as those of many other nations. Their hair, like ours, is of many colours, except red, of which I saw none. Some have it long; but the most general custom is to wear it short, except a bunch on each side of the crown, which they tie in a knot. They observe different modes in trimming the beard, which is in general long. Some part it, and tie it in two bunches under the chin; others plat it; some wear it loose, and others quite short.

Their clothing is the same as at Otaheite, and made of the same materials; but they have

it not in such plenty, nor is it so good. The men, for the most part, have nothing to cover their nakedness, except the *Marra*, as it is called at Otaheite, which is a slip of cloth passed round the waist and betwixt the legs. This simple dress is quite sufficient for the climate, and answers every purpose modesty requires. The dress of the women is a piece of cloth, wrapped round the loins like a petticoat, which reaches down below the middle of the leg, and a loose mantle over their shoulders. Their principal head-dress, and what appears to be their chief ornament, is a sort of broad fillet, curiously made of the fibres of the husk of cocoa-nuts. In the front is fixed a mother-of-pearl shell, wrought round to the size of a tea-saucer; before that, another, smaller, of very fine tortoise-shell, perforated into curious figures. Also before, and in the centre of that, is another round piece of mother-of-pearl, about the size of half-a-crown; and before this another piece of perforated tortoise-shell, the size of a shilling. Besides this decoration in front, some have it also on each side, but in smaller pieces; and all have fixed to them the tail-feathers of cocks or tropic-birds, which, when the fillet is tied on, stand upright; so that the whole together makes a very slightly ornament. They wear round the neck a kind of ruff or necklace, call it which you please, made of light wood, the out and upper side covered with small red peas, which are fixed on with gum. They also wear small bunches of human hair, fastened to a string, and tied round the legs and arms. Sometimes, instead of hair, they make use of short feathers; but all the above-mentioned ornaments are seldom seen on the same person. I saw only the chief, who came to visit us, completely dressed in this manner. Their ordinary ornaments are necklaces and amulets made of shells, &c. I did not see any with ear-rings, and yet all of them had their ears pierced.

Their dwellings are in the valleys, and on the sides of the hills near their plantations. They are built after the same manner as at Otaheite; but are much meaner, and only covered with the leaves of the bread-tree. The most of them are built on a square or oblong pavement of stone, raised some height above the level of the ground. They likewise have such pavements near their houses, on which they sit to eat and amuse themselves. In the article of eating, these people are by no means so cleanly as the Otaheiteans. They are likewise dirty in their cookery. Pork and fowls are dressed in an oven of hot stones as at Otaheite; but fruit and roots they roast on the fire, and, after taking off the rind or skin, put them into a platter or trough with water, out of which I have seen both men and hogs eat at the same time. I once saw them make a batter of fruit and roots diluted with water, in a vessel that was loaded with dirt, and out of which the hogs had been but that moment eating, without giving it the least washing, or even washing their hands, which were equally dirty; and when I expressed a dislike, was laughed at. I know not if all are so. The actions of a few individuals are not sufficient to fix a custom on a whole nation. Nor can I say if it is the custom for men and women to have separate messes. I saw nothing to the contrary; indeed I saw but few women upon the whole.

They seemed to have dwellings, or strongholds, on the summits of the highest hills. These we only saw by the help of our glasses; for I did not permit any of our people to go there, as we were not sufficiently acquainted with the disposition of the natives, which I believe is humane and pacific. Their weapons are clubs and spears, resembling those of Otaheite, but somewhat neater. They have also slings, with which they throw stones with great velocity, and to a great distance, but not with a good aim.

Their canoes are made of wood and pieces of the bark of a soft tree which grows near the sea in great plenty, and is very tough and proper for the purpose. They are from sixteen to twenty feet long, and about fifteen inches broad; the head and stern are made of two solid pieces of wood; the stern rises or curves a little, but in an irregular direction, and ends in a point; the head projects out horizontally, and is carved into some faint and very rude resemblance of a human face. They are rowed by paddles, and some have a sort of latteen sail made of matting.

Hogs were the only quadrupeds we saw, and cocks and hens the only tame fowls. However, the woods seemed to abound with small birds of a very beautiful plumage, and fine notes; but the fear of alarming the natives hindered us from shooting so many of them as might otherwise have been done.

CHAPTER XI.—A DESCRIPTION OF SEVERAL ISLANDS DISCOVERED OR SEEN IN THE PASSAGE FROM THE MARQUESAS TO OTAHEITE, WITH AN ACCOUNT OF A NAVAL REVIEW.

With a fine easterly wind I steered south-west; south-west by west, and west by south till the 17th, at ten o'clock in the morning, when land was seen bearing W. $\frac{1}{4}$ N., which, upon a nearer approach, we found to be a string of low islets connected together by a reef of coral rocks. We ranged the north-west coast, at the distance of one mile from shore, to three quarters of its length, which in the whole is near four leagues, when we came to a creek or inlet that seemed to open a communication into the lake in the middle of the isle. As I wanted to obtain some knowledge of the produce of these half-drowned isles, we brought-to, hoisted out a boat, and sent the master in to sound, there being no soundings without.

As we ran along the coast, the natives appeared in several places armed with long spears and clubs; and some were got together on one side of the creek. When the master returned, he reported that there was no passage into the lake by the creek, which was fifty fathoms wide at the entrance, and thirty deep; farther in, thirty wide and twelve deep; that the bottom was everywhere rocky, and the sides bounded by a wall of coral rocks. We were under no necessity to put the ship into such a place as this; but as the natives had shown some signs of a friendly disposition, by coming peaceably to the boat, and taking such things as were given them, I sent two boats well armed ashore, under the command of Lieutenant Cooper, with a view of having some intercourse with them, and to give Mr. Forster an opportunity of collecting something in his way. We saw our people land without the least opposition being made by a few natives who were on the shores. Some little time after, observing forty or fifty more, all armed, coming to join them, we stood close in shore in order to be ready to support our people in case of an attack. But nothing of this kind happened; and soon after our boats returned aboard, when Mr. Cooper informed me that, on his landing, only a few of the natives met him on the beach, but there were many in the skirts of the woods with spears in their hands. The presents he made them were received with great coolness, which plainly showed we were unwelcome visitors. When their reinforcement arrived, he thought proper to embark, as the day was already far spent, and I had given orders to avoid an attack by all possible means. When his men got into the boats, some were for pushing them off, others for detaining them; but, at last, they suffered them to depart at their leisure. They brought on board five dogs, which seemed to be in plenty there. They saw no fruit but cocoa-nuts, of which they got, by exchanges, two dozen. One of our people got a dog for a single plantain, which led us to conjecture they had none of this fruit.

This island, which is called by the inhabitants Tiookea, was discovered and visited by Commodore Byron. It has something of an oval shape, is about ten leagues in circuit, lying in the direction of east south-east, and west north-west, and situated in the latitude of $14^{\circ} 27' 30''$ S., longitude $144^{\circ} 56'$ W. The inhabitants of this island, and perhaps of all the low ones, are of a much darker colour than those of the higher islands, and seem to be of a more ferine disposition. This may be owing to their situation. Nature not having bestowed her favours to these low islands with that profusion she has done to some of the others, the inhabitants are chiefly beholden to the sea for their subsistence; consequently, are much exposed to the sun and weather, and by that means become more dark in colour, and more hardy and robust; for there is no doubt of their being of the same nation. Our people observed that they were stout, well-made men, and had marked on their bodies the figure of a fish; a very good emblem of their profession.

On the 18th, at daybreak, after having spent the night making short boards, we wore down to another isle we had in sight to the westward, which we reached by eight o'clock, and ranged the south-east side at one mile from shore. We found it to be just such another as that we had left, extending north-east and south-west near four leagues, and from five to three miles broad. It lies south-west by west, two leagues distant from the west end of Tiookea, and the middle is situated in the latitude of $14^{\circ} 37'$ S., longitude $145^{\circ} 10'$ W.

These must be the same islands to which Commodore Byron gave the name of George's Islands. Their situation in longitude, which was determined by lunar observations made near the shores, and still farther correct by the difference of longitude carried on by the watch to Otaheite, is $3^{\circ} 54'$ more east than he says they lie. This correction, I apprehend, may be applied to all the islands he discovered.

After leaving these isles, we steered south south-west, half west, and south-west by south, with a fine easterly gale, having signs of the vicinity of land, particularly a smooth sea; and, on the 19th, at seven in the morning, land was seen to the westward, which we bore down to, and reached the south-east end by nine o'clock. It proved to be another of these half-overflowed or drowned islands, which are so common to this part of the ocean; that is, a number of little isles ranged in a circular form, connected together by a reef or wall of coral rock. The sea is, in general, everywhere, on their outside, unfathomable; all their interior parts are covered with water, abounding, I have been told, with fish and turtle, on which the inhabitants subsist, and sometimes exchange the latter with the high islanders for cloth, &c. These inland seas would be excellent harbours, were they not shut up from the access of shipping, which is the case with most of them, if we can believe the report of the inhabitants of the other isles. Indeed few of them have been well searched by Europeans; the little prospect of meeting with fresh water having generally discouraged every attempt of this kind. I, who have seen a great many, have not yet seen an inlet into one.

This island is situated in the latitude of $15^{\circ} 26'$, longitude $146^{\circ} 20'$. It is five leagues long in the direction of north-north-east and south-south-west, and about three leagues broad. As we drew near the south end, we saw from the mast-head another of these low isles bearing south-east, distant about four or five leagues, but being to windward we could not fetch it. Soon after a third appeared, bearing south-west by south, for which we steered, and at two o'clock p.m. reached the east end, which is situated in latitude $15^{\circ} 47'$ S., longitude $146^{\circ} 30'$ W. This island extends west-north-west and east-south-east, and is seven leagues long in that direction; but its breadth is not above two. It is in all respects like the rest; only here are fewer islets, and less firm land on the reef which incloseth the lake. As we ranged the north coast, at the distance of half a mile, we saw people, huts, canoes, and places built, seemingly for drying of fish. They seemed to be the same sort of people as on Tiookea, and were armed with long spikes like them. Drawing near the west end, we discovered another or fourth island, bearing north-north-east. It seemed to be low like the others, and lies west from the first isle, distant six leagues. These four isles I called Palliser's Isles, in honour of my worthy friend Sir Hugh Palliser, at this time comptroller of the navy.

Not choosing to run farther in the dark, we spent the night making short boards under the top-sail, and on the 20th, at daybreak, hauled round the west end of the third isle, which was no sooner done than we found a great swell rolling in from the south; a sure sign that we were clear of these low islands; and as we saw no more land, I steered S.W. $\frac{1}{2}$ S. for Otaheite; having the advantage of a stout gale at east, attended with showers of rain. It cannot be determined with any degree of certainty whether the group of isles we had lately seen be any of those discovered by the Dutch navigators or not; the situation of their discoveries not being handed down to us with sufficient accuracy. It is, however, necessary to observe, that this part of the ocean, that is from the latitude of 20° down to 14° or 12° , and from the meridian of 136° to 148° or 150° W., is so strewed with these low isles, that a navigator cannot proceed with too much caution.

We made the high land of Otaheite on the 21st, and at noon were about thirteen leagues east of Point Venus, for which we steered, and got pretty well in with it by sunset, when we shortened sail; and, having spent the night, which was equally, with rain, standing on and off, at eight o'clock the next morning anchored in Matavia Bay in seven fathoms water. This was no sooner known to the natives than many of them made us a visit, and expressed not a little joy at seeing us again. As my chief reason for putting in at this place was to give Mr. Wales an opportunity to know the error of the watch by the known longitude, and to determine anew her rate of going, the first thing we did was to land his instruments, and to erect tents for the reception of a guard and such other people as it wa

necessary to have on shore. Sick we had none; the refreshments we got at the Marquesas had removed every complaint of that kind.

On the 23rd, showery weather. Our very good friends the natives supplied us with fruit and fish sufficient for the whole crew. On the 24th, Otoo the king, and several other chiefs, with a train of attendants, paid us a visit, and brought as presents ten or a dozen large hogs, besides fruits, which made them exceedingly welcome. I was advertised of the king's coming, and looked upon it as a good omen. Knowing how much it was my interest to make this man my friend, I met him at the tents, and conducted him and his friends on board, in my boat, where they staid dinner; after which they were dismissed with suitable presents, and highly pleased with the reception they had met with.

Next day we had much thunder, lightning, and rain. This did not hinder the king from making me another visit, and a present of a large quantity of refreshments. It hath been already mentioned, that when we were at the island of Amsterdam we had collected, amongst other curiosities, some red parrot feathers. When this was known here, all the principal people of both sexes endeavoured to ingratiate themselves into our favour by bringing us hogs, fruit, and every other thing the island afforded, in order to obtain these valuable jewels. Our having these feathers was a fortunate circumstance; for as they were valuable to the natives, they became so to us; but more especially as my stock of trade was, by this time, greatly exhausted; so that, if it had not been for the feathers, I should have found it difficult to have supplied the ship with the necessary refreshments.

When I put in at this island, I intended to stay no longer than till Mr. Wales had made the necessary observations for the purposes already mentioned; thinking we should meet with no better success than we did the last time we were here. But the reception we had already met with, and the few excursions we had made, which did not exceed the plains of Matavai and Oparree, convinced us of our error. We found, at these two places, built and adorned with a great number of large canoes, and houses of every kind; people living in spacious habitations, who had not a place to shelter themselves in eight months before; several large hogs about every house; and every other sign of a rising state. Judging from these favourable circumstances that we should not mend ourselves by removing to another island, I resolved to make a longer stay, and to begin with the repairs of the ship and stores, &c. Accordingly I ordered the empty casks and sails to be got ashore to be repaired, the ship to be calked, and the rigging to be overhauled; all of which the high southern latitudes had made indispensably necessary.

In the morning of the 26th, I went down to Oparree, accompanied by some of the officers and gentlemen, to pay Otoo a visit by appointment. As we drew near we observed a number of large canoes in motion; but were surprised, when we arrived, to see upwards of three hundred ranged in order, for some distance along the shore, all completely equipped and manned, besides a vast number of armed men upon the shore. So unexpected an armament collected together in our neighbourhood, in the space of one night, gave rise to various conjectures. We landed however in the midst of them, and were received by a vast multitude, many of them under arms, and many not. The cry of the latter was *Tiyo no Otoo*, and that of the former *Tiyo no Towha*. This chief, we afterwards learned, was admiral or commander of the fleet and troops present. The moment we landed, I was met by a chief whose name was Tee, uncle to the king, and one of his prime ministers, of whom I inquired for Otoo. Presently after we were met by Towha, who received me with great courtesy. He took me by the one hand, and Tee by the other; and, without my knowing where they intended to carry me, dragged me as it were through the crowd that was divided into two parties, both of which professed themselves my friends by crying out *Tiyo no Tootee*. One party wanted me to go to Otoo, and the other to remain with Towha. Coming to the usual place of audience, a mat was spread for me to sit down upon, and Tee left me to go and bring the king. Towha was unwilling I should sit down, partly insisting on my going with him; but, as I knew nothing of this chief, I refused to comply. Presently Tee returned, and wanted to conduct me to the king, taking hold of my hand for that purpose. This Towha opposed; so that, between the one party and the other, I was like to have been torn in pieces; and was obliged to desire Tee to desist, and to leave me to the

admiral and his party, who conducted me down to the fleet. As soon as we came before the admiral's vessel, we found two lines of armed men drawn up before her, to keep off the crowd, as I supposed, and to clear the way for me to go in. But, as I was determined not to go, I made the water, which was between me and her, an excuse. This did not answer; for a man immediately squatted himself down at my feet, offering to carry me; and then I declared I would not go. That very moment Towha quitted me, without my seeing which way he went, nor would any one inform me. Turning myself round, I saw Tee, who, I believe, had never lost sight of me. Inquiring of him for the king, he told me he was gone into the country *Mataou*, and advised me to go to my boat; which we accordingly did, as soon as we could get collected together; for Mr. Edgecumbe was the only person that could keep with me; the others being jostled about in the crowd in the same manner we had been.

When we got into our boat, we took our time to view this grand fleet. The vessels of war consisted of a hundred and sixty large double canoes very well equipped, manned, and armed. But I am not sure that they had their full complement of men or rowers; I rather think not. The chiefs, and all those on the fighting stages, were dressed in their war habits; that is, in a vast quantity of cloth, turbans, breastplates, and helmets. Some of the latter were of such a length as greatly to encumber the wearer. Indeed, their whole dress seemed to be ill calculated for the day of battle, and to be designed more for show than use. Be this as it may, it certainly added grandeur to the prospect, as they were so complaisant as to show themselves to the best advantage. The vessels were decorated with flags, streamers, &c. so that the whole made a grand and noble appearance, such as we had never seen before in this sea, and what no one would have expected. Their instruments of war were club-, spears, and stones. The vessels were ranged close alongside of each other, with their heads ashore, and their stern to the sea; the admiral's vessel being nearly in the centre. Besides the vessels of war, there were a hundred and seventy sail of smaller double canoes, all with a little house upon them, and rigged with mast and sail, which the war canoes had not. These, we judged, were designed for transports, victuallers, &c.; for in the war canoes was no sort of provisions whatever. In these three hundred and thirty vessels, I guessed there were no less than seven thousand seven hundred and sixty men; a number which appears incredible, especially as we were told they all belonged to the districts of Attahourou and Ahopatea. In this computation, I allow to each war canoe forty men, troops and rowers, and to each of the small canoes eight. Most of the gentlemen who were with me, thought the number of men belonging to the war canoes exceeded this. It is certain that the most of them were fitted to row with more paddles than I have allowed them men; but at this time I think they were not complete. Tupia informed us, when I was first here, that the whole island raised only between six and seven thousand men, but we now saw two districts only raise that number; so that he must have taken his account from some old establishment, or else he only meant *Tatatous*, that is, warriors, or men trained from their infancy to arms, and did not include the rowers, and those necessary to navigate the other vessels. I should think he only spoke of this number as the standing troops or militia of the island, and not their whole force. This point I shall leave to be discussed in another place, and return to the subject.

WAR DRESS OF OTAHEITE.

After we had well viewed this fleet, I wanted much to have seen the admiral, to have gone with him on board the war canoes. We inquired for him as we rowed past the fleet to no purpose. We put ashore and inquired, but the noise and crowd were so great that no one attended to what we said. At last Tee came, and whispered us in the ear, that Otoo was gone to Matavai, advising us to return thither, and not to land where we were. We accordingly proceeded for the ship, and this intelligence and advice received from Tee gave rise to new conjectures. In short, we concluded that this Towha was some powerful disaffected chief, who was upon the point of making war against his sovereign; for we could not imagine Otoo had any other reason for leaving Oparree in the manner he did.

We had not been long gone from Oparree before the whole fleet was in motion to the westward, from whence it came. When we got to Matavai, our friends there told us that this fleet was part of the armament intended to go against Eimeo, whose chief had thrown off the yoke of Otaheite, and assumed an independency. We were likewise informed, that Otoo neither was nor had been at Matavai; so that we were still at a loss to know why he fled from Oparree. This occasioned another trip thither in the afternoon, where we found him; and now understood that the reason of his not seeing me in the morning was, that some of his people having stolen a quantity of my clothes which were on shore washing, he was afraid I should demand restitution. He repeatedly asked me if I was not angry; and when I assured him that I was not, and that they might keep what they had got, he was satisfied. Towha was alarmed partly on the same account. He thought I was displeased when I refused to go aboard his vessel; and I was jealous of seeing such a force in our neighbourhood without being able to know anything of its design. Thus, by mistaking one another, I lost the opportunity of examining more narrowly into part of the naval force of this isle, and making myself better acquainted with its manœuvres. Such an opportunity may never occur; as it was commanded by a brave, sensible, and intelligent chief, who would have satisfied us in all the questions we had thought proper to ask; and, as the objects were before us, we could not well have misunderstood each other. It happened unluckily that Oedidee was not with us in the morning; for Tee, who was the only man we could depend on, served only to perplex us. Matters being thus cleared up, and mutual presents having passed between Otoo and me, we took leave and returned on board.

CHAPTER XII.—SOME ACCOUNT OF A VISIT FROM OTOO, TOWHA, AND SEVERAL OTHER CHIEFS; ALSO OF A ROBBERY COMMITTED BY ONE OF THE NATIVES, AND ITS CONSEQUENCES, WITH GENERAL OBSERVATIONS ON THE SUBJECT.

In the morning of the 27th, I received a present from Towha, consisting of two large hogs and some fruit, sent by two of his servants, who had orders not to receive anything in return; nor would they, when offered them. Soon after, I went down to Oparree in my boat, where having found both this chief and the king, after a short stay, I brought them both on board to dinner, together with Tarevatoo, the king's younger brother, and Tee. As soon as we drew near the ship, the admiral, who had never seen one before, began to express much surprise at so new a sight. He was conducted all over the ship, every part of which he viewed with great attention. On this occasion Otoo was the principal show-man; for, by this time, he was well acquainted with the different parts of the ship. After dinner Towha put a hog on board and retired, without my knowing anything of the matter, or having made him any return either for this or the present I had in the morning. Soon after, the king and his attendants went away also. Otoo not only seemed to pay this chief much respect, but was desirous I should do the same; and yet he was jealous of him, but on what account we knew not. It was but the day before that he frankly told us, Towha was not his friend. Both these chiefs when on board solicited me to assist them against Tiarabou, notwithstanding a peace at this time subsisted between the two kingdoms, and we were told that their joint force was to go against Eimeo. Whether this was done with a view of breaking with their neighbours and allies, if I had promised them assistance, or only to sound my disposition, I know not. Probably they would have been ready enough to have embraced

an opportunity which would have enabled them to conquer that kingdom, and annex it to their own as it was formerly. Be this as it may, I heard no more of it; indeed, I gave them no encouragement.

Next day we had a present of a hog sent by Wahea-toua, king of Tiarabou. For this, in return, he desired a few red feathers, which were, together with other things, sent him accordingly. Mr. Forster and his party set out for the mountains, with an intent to stay out all night. I did not go out of the ship this day. Early on the morning of the 29th, Otoo, Towha, and several other grandees, came on board, and brought with them as presents, not only provisions, but some of the most valuable curiosities of the island. I made them returns, with which they were well pleased. I likewise took this opportunity to repay the civilities I had received from Towha.

The night before, one of the natives attempting to steal a water-cask from the watering-place, he was caught in the act, sent on board, and put in irons; in which situation Otoo and the other chiefs saw him. Having made known his crime to them, Otoo begged he might be set at liberty. This I refused, telling him, that since I punished my people, when they committed the least offence against his, it was but just this man should be punished also; and as I knew he would not do it, I was resolved to do it myself. Accordingly, I ordered the man to be carried on shore to the tents, and having followed myself with Otoo, Towha, and others, I ordered the guard out under arms, and the man to be tied up to a post. Otoo, his sister, and some others begged hard for him; Towha said not one word, but was very attentive to everything going forward. I expostulated with Otoo on the conduct of this man, and of his people in general; telling him, that neither I, nor any of my people, took anything from them, without first paying for it; enumerating the articles we gave in exchange for such and such things, and urging that it was wrong in them to steal from us who were their friends. I, moreover, told him, that the punishing this man would be the means of saving the lives of others of his people, by deterring them from committing crimes of this nature, in which some would certainly be shot dead, one time or another. With these and other arguments, which I believe he pretty well understood, he seemed satisfied, and only desired the man might not be *Matterou* (or killed). I then ordered the crowd, which was very great, to be kept at a proper distance, and, in the presence of them all, ordered the fellow two dozen of lashes with a cat-of-nine-tails, which he bore with great firmness, and was then set at liberty. After this the natives were going away; but Towha stepped forth, called them back, and harangued them for near half an hour. His speech consisted of short sentences, very little of which I understood; but, from what we could gather, he recapitulated part of what I had said to Otoo; named several advantages they had received from us; condemned their present conduct, and recommended a different one for the future. The gracefulness of his action, and the attention with which he was heard, bespoke him a great orator. Otoo said not one word. As soon as Towha had ended his speech, I ordered the marines to go through their exercise, and to load and fire in volleys with ball; and as they were very quick in their manœuvres, it is easier to conceive than to describe the amazement the natives were under the whole time, especially those who had not seen anything of the kind before.

This being over, the chiefs took leave and retired with all their attendants, scarcely more pleased than frightened at what they had seen. In the evening, Mr. Forster and his party returned from the mountains, where he had spent the night, having found some new plants, and some others which grew in New Zealand. He saw Huahaine, which lies forty leagues to the westward; by which a judgment may be formed of the height of the mountains in Otaheite.

Next morning I had an opportunity to see the people of ten war-canoes go through part of their paddling exercise. They had put off from the shore before I was apprised of it; so that I was only present at their landing. They were properly equipped for war, the warriors with their arms, and dressed in their war habits, &c. In landing, I observed that the moment the canoe touched the ground, all the rowers leaped out, and, with the assistance of a few people on the shore, dragged the canoe on dry land to her proper place; which being done, every one walked off with his paddle, &c. All this was executed with such

expedition, that, in five minutes' time after putting ashore, you could not tell that anything of the kind had been going forward. I thought these vessels were thinly manned with rowers; the most being not above thirty, and the least sixteen or eighteen. I observed the warriors on the stage encouraged the rowers to exert themselves. Some youths sat high up in the curved stern, above the steersmen, with white wands in their hands. I know not what they were placed there for; unless it was to look out, and direct, or give notice of what they saw, as they were elevated above every one else. Tarevato, the king's brother, gave me the first notice of these canoes being at sea; and, knowing that Mr. Hodges made drawings of everything curious, desired, of his own accord, that he might be sent for. I being at this time on shore with Tarevato, Mr. Hodges was, therefore, with me, and had an opportunity to collect some materials for a large drawing or picture of the fleet assembled at Oparree, which will convey a far better idea of it than can be expressed by words. Being present when the warriors undressed, I was surprised at the quantity and weight of cloth they had upon them, not conceiving how it was possible for them to stand under it in time of battle. Not a little was wrapped round their heads as a turban, and made into a cap. This indeed might be necessary in preventing a broken head. Many had fixed to one of this sort of caps, dried branches of small shrubs covered over with white feathers; which, however, could only be for ornament.

I had a very great supply of provisions, sent and brought by different chiefs on the 1st of May; and the next day received a present from Towha, sent by his servants, consisting of a hog, and a boat-load of various sorts of fruit and roots. The like present I also had from Otoo, brought by Tarevato, who stayed dinner; after which I went down to Oparree, paid a visit to Otoo, and returned on board in the evening.

On the 3d, in looking into the condition of our sea-provisions, we found that the biscuit was in a state of decay, and that the airing and picking we had given it at New Zealand, had not been of that service we expected and intended; so that we were obliged to take it all on shore here, where it underwent another airing and cleaning, in which a good deal was found wholly rotten and unfit to be eaten. We could not well account for this decay in our bread, especially as it was packed in good casks, and stowed in a dry part of the hold. We judged it was owing to the ice we so frequently took in when to the southward, which made the hold damp and cold, and to the great heat which succeeded when to the north. Be it this, or any other cause, the loss was equal to us: it put us to scanty allowance of this article; and we had bad bread to eat too.

On the 4th, nothing worthy of note. On the 5th, the king and several other great men paid us a visit, and brought with them, as usual, some hogs and fruit. In the afternoon, the botanists set out for the mountains, and returned the following evening, having made some new discoveries in their way.

On going ashore in the morning of the 7th, I found Otoo at the tents, and took the opportunity to ask his leave to cut down some trees for fuel. He not well understanding me, I took him to some growing near the sea-shore, where I presently made him comprehend what I wanted, and he as readily gave his consent. I told him at the same time, that I should cut down no trees that bore any fruit. He was pleased with this declaration, and told it aloud, several times, to the people about us. In the afternoon, he and the whole royal family, viz. his father, brother, and three sisters, paid us a visit on board. This was properly his father's visit of ceremony. He brought me, as a present, a complete mourning dress, a curiosity we most valued. In return, I gave him whatever he desired, which was not a little; and having distributed red feathers to all the others, conducted them ashore in my boat. Otoo was so well pleased with the reception he and his friends met with, that he told me at parting, I might cut down as many trees as I pleased, and what sort I pleased.

During the night, between the 7th and 8th, some time in the middle watch, all our friendly connexions received an interruption, through the negligence of one of the sentinels on shore. He having either slept or quitted his post, gave one of the natives an opportunity to carry off his musket. The first news I heard of it was from Tee, whom Otoo had sent on board for that purpose, and to desire that I would go to him, for that he was *matooned*. We were not well enough acquainted with their language to understand all Tee's story; but we

understood enough to know that something had happened which had alarmed the king. In order, therefore, to be fully informed, I went ashore with Tee and Tarevato, who had slept aboard all night. As soon as we landed, I was informed of the whole by the serjeant who commanded the party. I found the natives all alarmed, and the most of them fled. Tarevato slipped from me in a moment, and hardly any remained by me but Tee. With him I went to look for Otoo; and, as we advanced, I endeavoured to allay the fears of the people, but at the same time insisted on the musket being restored. After travelling some distance into the country, inquiring of every one we saw for Otoo, Tee stopped all at once, and advised me to return, saying that Otoo was gone to the mountains, and he would proceed and tell him that I was still his friend; a question which had been asked me fifty times by different people, and if I was angry, &c. Tee also promised that he would use his endeavours to recover the musket. I was now satisfied it was to no purpose to go farther; for, although I was alone and unarmed, Otoo's fears were such, that he durst not see me; and, therefore, I took Tee's advice, and returned aboard. After this I sent Oedidee to Otoo to let him know that his fears were ill-grounded; for that I only required the return of the musket, which I knew was in his power.

Soon after Oedidee was gone, we observed six large canoes coming round Point Venus. Some people whom I had sent out, to watch the conduct of the neighbouring inhabitants, informed me they were laden with baggage, fruit, hogs, &c. There being room for suspecting that some person belonging to these canoes had committed the theft, I presently came to a resolution to intercept them; and having put off in a boat for that purpose, gave orders for another to follow. One of the canoes, which was some distance ahead of the rest, came directly for the ship. I went alongside this, and found two or three women in her whom I knew. They told me they were going on board the ship with something for me; and on my inquiring of them for Otoo, was told he was then at the tents. Pleased with this news, I contradicted the orders I had given for intercepting the other canoes, thinking they might be coming on board also, as well as this one, which I left within a few yards of the ship, and rowed ashore to speak with Otoo. But when I landed, I was told that he had not been there, nor knew they anything of him. On my looking behind me, I saw all the canoes making off in the greatest haste; even the one I had left alongside the ship had evaded going on board, and was making her escape. Vexed at being thus outwitted, I resolved to pursue them, and as I passed the ship, gave orders to send another boat for the same purpose. Five out of six we took, and brought alongside; but the first, which acted the finesse so well, got clear off. When we got on board with our prizes, I learnt that the people who had deceived me, used no endeavours to lay hold of the ship on the side they were upon, but let their canoe drop past as if they meant to come under the stern, or on the other side; and that the moment they were past, they paddled off with all speed. Thus the canoe, in which were only a few women, was to have amused us with false stories, as they actually did, while the others, in which were most of the effects, got off.

In one of the canoes we had taken, was a chief, a friend of Mr. Forster's, who had hitherto called himself an *Earee*, and would have been much offended if any one had called his title in question; also three women, his wife and daughter, and the mother of the late Tontaha. These, together with the canoes, I resolved to detain, and to send the chief to Otoo, thinking he would have weight enough with him to obtain the return of the musket, as his own property was at stake. He was, however, very unwilling to go on this embassy, and made various excuses, one of which was his being of too low a rank for this honourable employment; saying he was no *Earee*, but a *Manahoua*, and, therefore, was not a fit person to be sent; that an *Earee* ought to be sent to speak to an *Earee*; and as there were no *Earees* but Otoo and myself, it would be much more proper for me to go. All his arguments would have availed him little, if Tee and Oedidee had not, at this time, come on board and given a new turn to the affair, by declaring that the man who stole the musket was from Tiarabou, and had gone with it to that kingdom, so that it was not in the power of Otoo to recover it. I very much doubted their veracity, till they asked me to send a boat to Waheateua, the king of Tiarabou, and offered to go themselves in her, and get it. I asked why this could not be done without my sending a boat? They said it would not otherwise be given to them.

This story of theirs, although it did not quite satisfy me, nevertheless carried with it the probability of truth; for which reason I thought it better to drop the affair altogether, rather than to punish a nation for a crime I was not sure any of its members had committed. I, therefore, suffered my new ambassador to depart with his two canoes without executing his commission. The other three canoes belonged to Maritata, a Tiarabou chief, who had been some days about the tents; and there was good reason to believe it was one of his people that carried off the musket. I intended to have detained them; but as Tee and Oedidee both assured me that Maritata and his people were quite innocent, I suffered them to be taken away also, and desired Tee to tell Otoo, that I should give myself no farther concern about the musket, since I was satisfied none of his people had stolen it. Indeed, I thought it was irrecoverably lost; but, in the dusk of the evening, it was brought to the tents, together with some other things we had lost, which we knew nothing of, by three men who had pursued the thief and taken them from him. I know not, if they took this trouble of their own accord, or by order of Otoo. I rewarded them, and made no farther inquiry about it. These men, as well as some others present, assured me that it was one of Maritata's people who had committed this theft; which vexed me that I had let his canoes so easily slip through my fingers. Here, I believe, both Tee and Oedidee designedly deceived me.

When the musket and other things were brought in, every one then present, or who came after, pretended to have had some hand in recovering them, and claimed a reward accordingly. But there was no one who acted this farce so well as Nuno, a man of some note, and well known to us when I was here in 1769. This man came, with all the savage fury imaginable in his countenance, and a large club in his hand, with which he beat about him, in order to show us how he alone had killed the thief; when, at the same time, we all knew that he had not been out of his house the whole time.

Thus ended this troublesome day; and next morning early, Tee, Otoo's faithful ambassador, came again on board, to acquaint me that Otoo was gone to Oparree, and desired I would send a person (one of the natives, as I understood) to tell him that I was still his *Tigo*. I asked him why he did not do this himself, as I had desired. He made some excuse; but I believe the truth was, he had not seen him. In short, I found it was necessary for me to go myself; for while we thus spent our time in messages, we remained without fruit, a stop being put to all exchanges of this nature; that is, the natives brought nothing to market. Accordingly, a party of us set out with Tee in our company, and proceeded to the very utmost limits of Oparree, where, after waiting some considerable time, and several messages having passed, the king at last made his appearance. After we were seated under the shade of some trees as usual, and the first salutations were over, he desired me to *parou* (that is, to speak). Accordingly, I began with blaming him for being frightened and alarmed at what had happened, since I had always professed myself his friend, and I was not angry with him or any of his people, but with those of Tiarabou, who were the thieves. I was then asked, how I came to fire at the canoes? Chance, on this occasion, furnished me with a good excuse. I told them, that they belonged to Maritata, a Tiarabou man, one of whose people had stolen the musket, and occasioned all this disturbance; and if I had them in my power I would destroy them, or any other belonging to Tiarabou. This declaration pleased them, as I expected, from the natural aversion the one kingdom has to the other. What I said was enforced by presents, which perhaps had the greatest weight with them. Thus were things once more restored to their former state; and Otoo promised, on his part, that the next day we should be supplied with fruit, &c. as usual. We then returned with him to his proper residence at Oparree, and there took a view of some of his dock-yards (for such they well deserved to be called) and large canoes; some lately built, and others building; two of which were the largest I had ever seen in this sea, or indeed anywhere else, under that name. This done, we returned on board with Tee in our company, who, after he had dined with us, went to inform old Happei, the king's father, that all matters were accommodated.

This old chief was at this time in the neighbourhood of Matavai, and it should seem, from what followed, that he was not pleased with the conditions; for that same evening, all tho

women, which were not a few, were sent for out of the ship, and people stationed on different parts of the shore to prevent any from coming off; and the next morning, no supplies whatever being brought, on my inquiring into the reason, I was told Happi was *mataoued*. Chagrined at this disappointment as I was, I forbore taking any step, from a supposition that Tee had not seen him, or that Otoo's orders had not yet reached Matavai. A supply of fruit sent us from Oparree, and some brought us by our friends, served us for the present, and made us less anxious about it. Thus matters stood till the afternoon, when Otoo himself came to the tents with a large supply. Thither I went, and expostulated with him for not permitting the people in our neighbourhood to bring us fruit as usual, insisting on his giving immediate orders about it, which he either did, or had done before; for, presently after, more was brought us than we could well manage. This was not to be wondered at; for the people had everything in readiness to bring the moment they were permitted, and, I believe, thought themselves as much injured by the restriction as we did. Otoo desiring to see some of the great guns fire from the ship, I ordered twelve to be shotted, and fired towards the sea. As he had never seen a cannon fired before, the sight gave him as much pain as pleasure. In the evening we entertained him with fire-works, which gave him great satisfaction.

Thus ended all our differences, on which I beg leave to suggest the following remarks:— I have had occasion, in this journal before, to observe, that these people were continually watching opportunities to rob us. This their governors either encouraged, or had not power to prevent; but most probably the former, because the offender was always screened. That they should commit such daring thefts was the more extraordinary, as they frequently ran the risk of being shot in the attempt; and if the article that they stole was of any consequence, they knew they should be obliged to make restitution. The moment a theft of this kind was committed, it spread like the wind over the whole neighbourhood. They judged of the consequences from what they had got. If it were a trifle, and such an article as we usually gave them, little or no notice was taken of it; but if the contrary, every one took the alarm, and moved off with his moveables in all haste. The chief then was *mataoued*, giving orders to bring us no supplies, and flying to some distant part. All this was sometimes done so suddenly, that we obtained, by these appearances, the first intelligence of our being robbed. Whether we obliged them to make restitution or not, the chief must be reconciled before any of the people were permitted to bring in any refreshments. They knew very well we could not do without them; and, therefore, never failed strictly to observe this rule, without ever considering that all their war canoes, on which the strength of their nation depends, their houses, and even the very fruit they refused to supply us with, were entirely in our power. It is hard to say how they would act, were one to destroy any of these things. Except the detaining some of their canoes for a while, I never touched the least article of their property. Of the two extremes, I always chose that which appeared the most equitable and mild. A trifling present to the chief always succeeded to my wish, and very often put things upon a better footing than they had been before. That they were the first aggressors, had very little influence on my conduct in this respect, because no difference happened but when it was so. My people very rarely or never broke through the rules I thought it necessary to prescribe. Had I observed a different conduct, I must have been the loser by it in the end; and all I could expect, after destroying some part of their property, would have been the empty honour of obliging them to make the first overture towards an accommodation. But who knows if this would have been the event? Three things made them our fast friends: their own good-nature and benevolent disposition; gentle treatment on our part; and the dread of our fire-arms. By our ceasing to observe the second, the first would have worn out of course; and the too frequent use of the latter would have excited a spirit of revenge, and perhaps have taught them that fire-arms were not such terrible things as they had imagined. They were very sensible of the superiority of their numbers; and no one knows what an enraged multitude might do.

CHAPTER XIII.—PREPARATIONS TO LEAVE THE ISLAND. — ANOTHER NAVAL REVIEW, AND VARIOUS OTHER INCIDENTS ; WITH SOME ACCOUNT OF THE ISLAND, ITS NAVAL FORCE AND NUMBER OF INHABITANTS.

In the morning of the 11th, a very large supply of fruit was brought to us from all parts. Some of it came from Towha, the admiral, sent as usual by his servants, with orders to receive nothing in return. But he desired I would go and see him at Attahouron, as he was ill, and could not come to me. As I could not well undertake this journey, I sent Oedidee, along with Towha's servants, with a present suitable to that which I had, in so genteel a manner, received from him. As the most essential repairs of the ship were nearly finished, I resolved to leave Otaheite in a few days, and accordingly ordered everything to be got off from the shore, that the natives might see we were about to depart.

On the 12th, old Oberca, the woman who, when the Dolphin was here in 1767, was thought to be queen of the island, and whom I had not seen since 1769, paid us a visit, and brought us a present of hogs and fruit. Soon after came Otoo with a great retinue, and a large quantity of provisions. I was pretty liberal in my returns, thinking it might be the last time I should see these good people who had so liberally relieved our wants ; and in the evening entertained them with fire-works.

On the 13th, winds easterly, fair weather. Nevertheless, we were not ready to sail, as Otoo had made me promise to see him again, and I had a present to make him, which I reserved to the last. Oedidee was not yet come back from Attahouron ; various reports arose concerning him : some said he had returned to Matavai ; others that he would not return ; and some would have it that he was at Oparree. In order to know more of the truth, a party of us in the evening went down to Oparree, where we found him, and likewise Towha, who, notwithstanding his illness, had resolved to see me before I sailed, and had gotten thus far on his journey. He was afflicted with a swelling in his feet and legs, which had entirely taken away the use of them. As the day was far spent, we were obliged to shorten our stay ; and after seeing Otoo, we returned with Oedidee on board.

This youth, I found, was desirous of remaining at this isle, having before told him, as likewise many others, that we should not return. I now mentioned to him that he was at liberty to remain here, or to quit us at Ulietea, or to go with us to England, frankly owning that if he chose the latter, it was very probable he would never return to his country ; in which case I would take care of him, and he must afterwards look upon me as his father: He threw his arms about me, and wept much, saying many people persuaded him to remain at Otaheite. I told him to go ashore and speak to his friends, and then come to me in the morning. He was well beloved in the ship, so that every one was persuading him to go with us, telling him what great things he would see in England, and the immense riches (according to his idea of riches) he would return with. But I thought proper to undeceive him, as knowing that the only inducement to his going was the expectation of returning, and I could see no prospect of an opportunity of that kind happening, unless a ship should be expressly sent out for that purpose ; which neither I nor any one else had a right to expect. I thought it an act of the highest injustice to take a person from these isles, under any promise which it was not in my power to perform. At this time, indeed, it was quite unnecessary, for many youths voluntarily offered themselves to go, and even to remain and die in *Pretanee* ; as they call our country. Otoo importuned me much to take one or two to collect red feathers for him at Amsterdam, willing to risk the chance of their returning. Some of the gentlemen on board were likewise desirous of taking some as servants ; but I refused every solicitation of this kind, knowing, from experience, they would be of no use to us in the course of the voyage ; and farther my views were not extended. What had the greatest weight with me was, the thinking myself bound to see they were afterwards properly taken care of, as they could not be carried from their native spot without consent.

Next morning early, Oedidee came on board with a resolution to remain at the island ;

but Mr. Forster prevailed upon him to go with us to Ulietea. Soon after, Towha, Poatatou, Oamo, Happi, Oberea, and several more of our friends, came on board with fruit, &c. Towha was hoisted in, and placed on a chair on the quarter-deck. His wife was with him. Amongst the various articles which I gave this chief, was an English pipe, which pleased him more than all the rest, especially after he had been instructed in the use of it.

We had no sooner despatched our friends than we saw a number of war canoes coming round the point of Oparree. Being desirous of having a nearer view of them, accompanied by some of the officers and gentlemen, I hastened down to Oparree, which we reached before all the canoes were landed, and had an opportunity of seeing in what manner they approached the shore. When they got before the place where they intended to land, they formed themselves into divisions, consisting of three or four, or perhaps more, lashed square and close alongside of each other; and then each division, one after the other, paddled in for the shore with all their might, and conducted in so judicious a manner, that they formed and closed a line along the shore to an inch. The rowers were encouraged to exert their strength by their leaders on the stages, and directed by a man who stood with a wand in his hand in the fore part of the middlemost vessel. This man, by words and actions, directed the paddlers when all should paddle, when either the one side or the other should cease, &c., for the steering paddles alone were not sufficient to direct them. All these motions they observed with such quickness, as clearly showed them to be expert in their business. After Mr. Hodges had made a drawing of them, as they lay ranged along the shore, we landed, and took a nearer view of them by going on board several. This fleet consisted of forty sail, equipped in the same manner as those we had seen before, belonged to the little district of Tettaha, and were come to Oparree to be reviewed before the king, as the former fleet had been. There were attending on this fleet some small double canoes, which they called *Marais*, having on their fore part a kind of double bed-place laid over with green leaves, each just sufficient to hold one man. These, they told us, were to lay their dead upon; their chiefs I suppose they meant, otherwise their slain must be few. Otoo, who was present, caused, at my request, some of the troops to go through their exercise on shore. Two parties first began with clubs; but this was over almost as soon as begun, so that I had no time to make my observations upon it. They then went to single combat, and exhibited the various methods of fighting with great alertness, parrying off the blows and pushes which each combatant aimed at the other with great dexterity. Their arms were clubs and spears; the latter they also used as darts. In fighting with the club, all blows intended to be given the legs were evaded by leaping over it; and those intended for the head, by couching a little, and leaping on one side; thus the blow would fall to the ground. The spear or dart was parried, by fixing the point of a spear in the ground right before them, holding it in an inclined position, more or less elevated, according to the part of the body they saw their antagonist intended to make a push, or throw his dart at, and by moving the hand a little to the right or left, either the one or the other was easily turned off with great ease. I thought that when one combatant had parried off the blows, &c., of the other, he did not use the advantage which seemed to me to accrue. As, for instance: after he had parried off a dart, he still stood on the defensive, and suffered his antagonist to take up another, when I thought there was time to run him through the body. These combatants had no superfluous dress upon them; an unnecessary piece of cloth or two which they had on when they began, were presently torn off by the bystanders, and given to some of our gentlemen present. This being over, the fleet departed,—not in any order, but as fast as they could be got afloat; and we went with Otoo to one of his dock-yards, where the two large *pahies* or canoes were building, each of which was a hundred and eight feet long: they were almost ready to launch, and were intended to make one joint double *pahie* or canoe. The king begged of me a grappling and rope, to which I added an English jack and pendant (with the use of which he was well acquainted), and desired the *pahie* might be called *Britannia*. This he very readily agreed to, and she was named accordingly. After this he gave me a hog, and a turtle of about sixty pounds weight, which was put privately into our boat, the giving it away not being agreeable to some of the great lords about him, who were thus deprived of a feast. He likewise would have given me a large shark they

had prisoner in a creek (one of his fins being cut off so that he could not make his escape), but the fine pork and fish we had got at this isle had spoiled our palates for such food. The king, and his prime minister Tee, accompanied us on board to dinner; and after it was over, took a most affectionate farewell. He hardly ever ceased soliciting me, this day, to return to Otaheite; and, just before he went out of the ship, took a youth by the hand, and presented him to me, desiring I would keep him on board to go to Amsterdam to collect red feathers. I told him I could not, since I knew he would never return; but that, if any ship should happen to come from Britain to this isle, I would either bring or send him red feathers in abundance. This, in some measure, satisfied him; but the youth was exceedingly desirous of going, and, if I had not come to a resolution to carry no one from the isles (except Oedidee, if he chose to go), and but just refused Mr. Forster the liberty of taking a boy, I believe I should have consented. Otoo remained alongside in his canoe till we were under sail, when he put off, and was saluted with three guns.

Our treatment at this isle was such as had induced one of our gunner's mates to form a plan to remain at it. He knew he could not execute it with success while we lay in the bay, therefore took the opportunity, as soon as we were out, the boats in, and sails set, to slip overboard, being a good swimmer: but he was discovered before he got clear of the ship, and we presently hoisted a boat out and took him up. A canoe was observed, about half-way between us and the shore, seemingly coming after us; she was intended to take him up; but as soon as the people in her saw our boat, they kept at a distance. This was a preconcerted plan between the man and them, which Otoo was acquainted with, and had encouraged. When I considered this man's situation in life, I did not think him so culpable, nor the resolution he had taken of staying here so extraordinary, as it may at first appear. He was an Irishman by birth, and had sailed in the Dutch service. I picked him up at Batavia on my return from my former voyage, and he had been with me ever since. I never learnt that he had either friends or connexions to confine him to any particular part of the world: all nations were alike to him; where then could such a man be more happy than at one of these isles? where, in one of the finest climates in the world, he could enjoy not only the necessaries, but the luxuries of life, in ease and plenty. I know not, if he might not have obtained my consent, if he had applied for it in proper time. As soon as we had got him on board, and the boat in, I steered for Huahine, in order to pay a visit to our friends there. But, before we leave Otaheite, it will be necessary to give some account of the present state of that island, especially as it differs very much from what it was eight months before.

I have already mentioned the improvements we found in the plains of Oparree and Matavai. The same was observed in every other part into which we came. It seemed to us almost incredible that so many large canoes and houses could be built in so short a space as eight months. The iron tools which they had got from the English, and other nations who have lately touched at the isle, had, no doubt, greatly accelerated the work; and they have no want of hands, as I shall soon make appear. The number of hogs was another thing that excited our wonder. Probably they were not so scarce when we were here before as we imagined, and, not choosing to part with any, they had conveyed them out of our sight. Be this as it may, we now not only got as many as we could consume during our stay, but some to take to sea with us.

When I was last here, I conceived but an unfavourable opinion of Otoo's talents. The improvements since made in the island convinced me of my mistake; and that he must be a man of good parts. He has, indeed, some judicious, sensible men about him; who, I believe, have a great share in the government. In truth, we know not how far his power extends as king, nor how far he can command the assistance of the other chiefs, or is controllable by them. It should however seem, that all have contributed towards bringing the isle to its present flourishing state. We cannot doubt that there are divisions amongst the great men of this state, as well as of most others; or else why did the king tell us that Towha, the admiral, and Poatatou, were not his friends? They were two leading chiefs; and he must be jealous of them on account of their great power; for on every occasion he seemed to court their interest. We had reason to believe that they had raised by far the

greatest number of vessels and men to go against Eimeo, and were to be two of the commanders in the expedition, which we were told was to take place five days after our departure. Waheatoua, king of Tiarabou, was to send a fleet to join that of Otoo, to assist him in reducing to obedience the chief of Eimeo. I think we were told that young prince was one of the commanders. One would suppose that so small an island as Eimeo would hardly have attempted to make head against the united force of these two kingdoms, but have endeavoured to settle matters by negotiation. Yet we heard of no such thing; on the contrary, every one spoke of nothing but fighting. Towha told us more than once that he should die there; which, in some measure, shows what he thought of it. Oedidee told me the battle would be fought at sea; in which case the other must have a fleet nearly equal, if not quite, to the one going against them; which I think was not probable. It was therefore more likely they would remain ashore upon the defensive, as we were told they did, about five or six years ago, when attacked by the people of Tiarabou whom they repulsed. Five general officers were to command in this expedition; of which number Otoo was one; and, if they named them in order according to the posts they held, Otoo was only the third in command. This seems probable enough, as being but a young man he could not have sufficient experience to command such an expedition, where the greatest skill and judgment seemed to be necessary.

I confess I would willingly have staid five days longer, had I been sure the expedition would have then taken place; but I rather seemed that they wanted us to be gone first. We had been all along told it would be ten moons before it took place; and it was not till the evening before we sailed, that Otoo and Towha told us it was to be in five days after we were gone, as if it were necessary to have that time to put everything in order; for while we lay there, great part of their time and attention was taken up with us. I had observed that, for several days before we sailed, Otoo and the other chiefs had ceased to solicit my assistance, as they were continually doing at first, till I assured Otoo that, if they got their fleet ready in time, I would sail with them down to Eimeo: after this I heard no more of it. They probably had taken it into consideration, and concluded themselves safer without me, well knowing it would be in my power to give the victory to whom I pleased, and that, at the best, I might thwart some favourite custom, or run away with the spoils. But be their reasons what they might, they certainly wanted us to be gone, before they undertook anything. Thus we were deprived of seeing the whole fleet equipped on this occasion, and perhaps of being spectators of a sea-fight, and by that means gaining some knowledge of their manœuvres.

I never could learn what number of vessels were to go on this expedition. We knew of no more than two hundred and ten, besides smaller canoes to serve as transports, &c. and the fleet of Tiarabou, the strength of which we never learnt. Nor could I ever learn the number of men necessary to man this fleet; and whenever I asked the question, the answer was, *Warou, warou, warou te Tata*, that is, many, many, many men, as if the number far exceeded their arithmetic. If we allow forty men to each war canoe, and four to each of the others, which is thought a moderate computation, the number will amount to nine thousand: an astonishing number to be raised in four districts; and one of them, viz. Matavai, did not equip a fourth part of its fleet. The fleet of Tiarabou is not included in this account; and many other districts might be arming which we knew nothing of. I, however, believe that the whole isle did not arm on this occasion, for we saw not the least preparations making in Oparree. From what we saw and could learn, I am clearly of opinion that the chief, or chiefs, of each district superintended the equipping of the fleet belonging to that district; but, after they are equipped, they must pass in review before the king, and be approved of by him. By this means he knows the state of the whole, before they assemble to go on service.

It hath been already observed, that the number of war canoes belonging to Attahourou and Ahopata was a hundred and sixty, to Tettaha forty, and to Matavai ten, and that this district did not equip one-fourth part of their number. If we suppose every district in the island, of which there are forty-three, to raise and equip the same number of war canoes as Tettaha, we shall find, by this estimate, that the whole island can raise and equip one

thousand seven hundred and twenty war canoes, and sixty-eight thousand able men, allowing forty men to each canoe. And, as these cannot amount to above one-third part of the number of both sexes, children included, the whole island cannot contain less than two hundred and four thousand inhabitants; a number which, at first sight, exceeded my belief. But, when I came to reflect on the vast swarms which appeared wherever we came, I was convinced that this estimate was not much, if at all, too great*. There cannot be a greater proof of the richness and fertility of Otaheite (not forty leagues in circumference) than its supporting such a number of inhabitants.

This island made formerly but one kingdom; how long it has been divided into two, I cannot pretend to say; but I believe not long. The kings of Tiarabou are a branch of the family of those of Opourouou; at present, the two are nearly related; and, I think, the former is, in some measure, dependent on the latter. Otoo is styled *Earee de hie* of the whole island; and we have been told that Waheatoua, the king of Tiarabou, must uncover before him, in the same manner as the meanest of his subjects. This homage is due to Otoo, as *Earee de hie* of the isle, to Tarevatu, his brother, and his second sister; to the one as heir, and to the other as heir apparent; his eldest sister being married, is not entitled to this homage.

The *Eowas* and *Whannos* we have sometimes seen covered before the king, but whether by courtesy, or by virtue of their office, we never could learn. These men, who are the principal persons about the king, and form his court, are generally, if not always, his relations. Tee, whom I have so often mentioned, was one of them. We have been told that the *Eowas*, who have the first rank, attend in their turns, a certain number each day, which occasioned us to call them lords in waiting; but whether this was really so, I cannot say. We seldom found Tee absent; indeed his attendance was necessary, as being best able to negotiate matters between us and them, on which service he was always employed; and he executed it, I have reason to believe, to the satisfaction of both parties.

It is to be regretted that we know little more of this government than the general outline; for, of its subdivisions, classes, or orders of the constituent parts, how disposed, or in what manner connected, so as to form one body politic, we know but little. We, however, are sure that it is of the feudal kind; and, if we may judge from what we have seen, it has sufficient stability, and is by no means badly constructed. The *Eowas* and *Whannos* always eat with the king; indeed I do not know if any one is excluded from this privilege but the *Toumas*. For as to the women, they are out of the question, as they never eat with the men, let their rank be ever so much elevated.

Notwithstanding this kind of kingly establishment, there was very little about Otoo's person or court by which a stranger could distinguish the king from the subject. I seldom saw him dressed in anything but a common piece of cloth wrapped round his loins; so that he seemed to avoid all unnecessary pomp, and even to demean himself more than any other of the *Earees*. I have seen him work at a paddle, in coming to and going from the ship, in common with the other paddlers; and even when some of his *Toutous* sat looking on. All have free access to him, and speak to him wherever they see him, without the least ceremony: such is the easy freedom which every individual of this happy isle enjoys. I have observed that the chiefs of these isles are more beloved, by the bulk of the people, than feared. May we not from hence conclude, that the government is mild and equitable?

* Mr. Ellis in his *Polynesian Researches*, vol. ii. p. 26, has the following passage in relation to the population of Otaheite:—"It is impossible for any one who has visited these shores, or traversed any one of the districts, to entertain the slightest doubt that the number of inhabitants in the South Sea Islands was formerly much greater than at present. What their number in any remote period of their history may have been it is not easy to ascertain: Captain Cook estimated those residing in Tahiti at 200,000. The grounds, however, on which he formed his conclusion were certainly fallacious. The population was at all times so fugitive and uncertain, as to the proportion it bore to any section of geographical surface, that no correct inference, as to the amount of the whole could be drawn from

the numbers seen in one part. Captain Wilson's calculations, in 1797, made the population of Tahiti only about 16,000; and not many years afterwards, the Missionaries declared it as their opinion that this island did not contain more than 8000 souls; and I cannot think that within the last thirty years it has ever contained fewer inhabitants. The present number of natives is about 10,000." There are ancient remains which indicate that formerly, the Society and other neighbouring islands were far more densely populated than they were at the period at which they were first visited by Europeans. Some further remarks on this subject will be found in the Appendix.

—Ed.

We have mentioned that Waheatoua of Tiabarou is related to Otoo. The same may be said of the chiefs of Eimeo, Tapamannoo, Huaheine, Ulietea, Otaha, and Bolabola; for they are all related to the royal family of Otaheite. It is a maxim with the *Earees*, and others of superior rank, never to intermarry with the *Toutous*, or others of inferior rank. Probably this custom is one great inducement to the establishment of these societies called *Earecoies*. It is certain that these societies greatly prevent the increase of the superior classes of people, of which they are composed, and do not at all interfere with the inferiors or *Toutous*; for I never heard of one of these being an *Earecoy*. Nor did I ever hear that a *Toutou* could rise in life above the rank in which he was born.

I have occasionally mentioned the extraordinary fondness the people of Otaheite showed for red feathers. These they call *Oora*, and they are as valuable here as jewels are in Europe, especially those which they call *Oravine*, and grow on the head of the green parrot: all red feathers are, indeed, esteemed, but none equally with these; and they are such good judges as to know very well how to distinguish one sort from another. Many of our people attempted to deceive them, by dyeing other feathers; but I never heard that any one succeeded. These feathers they make up in little bunches, consisting of eight or ten, and fix them to the end of a small cord about three or four inches long, which is made of the strong outside fibres of the cocoa-nut, twisted so hard, that it is like a wire, and serves as a handle to the bunch. Thus prepared, they are used as symbols of the *Eatuas*, or divinities, in all their religious ceremonies. I have often seen them hold one of these bunches, and sometimes only two or three feathers, between the fore-finger and thumb, and say a prayer, not one word of which I could ever understand. Whoever comes to this island will do well to provide himself with red feathers, the finest and smallest that are to be got. He must also have a good stock of axes and hatchets, spike-nails, files, knives, looking-glasses, beads, &c. Sheets and shirts are much sought after, especially by the ladies; as many of our gentlemen found by experience.

The two goats which Captain Furneaux gave to Otoo when we were last here, seemed to promise fair for answering the end for which they were put on shore. The ewe soon after had two female kids, which were now so far grown as to be nearly ready to propagate; and the old ewe was again with kid. The people seemed to be very fond of them, and they to like their situation as well; for they were in excellent condition. From this circumstance, we may hope that, in a few years, they will have some to spare to their neighbours; and, by that means, they may in time spread over all the isles in this ocean. The sheep which we left, died soon after, excepting one, which we understood was yet alive. We have also furnished them with a stock of cats; no less than twenty having been given away at this isle, besides what were left at Ulietea and Huaheine.

CHAPTER XIV.—THE ARRIVAL OF THE SHIP AT THE ISLAND OF HUAHEINE; WITH AN ACCOUNT OF AN EXPEDITION INTO THE ISLAND, AND SEVERAL OTHER INCIDENTS WHICH HAPPENED WHILE SHE LAY THERE.

AT one o'clock in the afternoon on the 15th, we anchored in the north entrance of O'Wharre harbour, in the island of Huaheine; hoisted out the boats, warped into a proper berth, and moored with the bower and kedg anchor, not quite a cable's length from the shore. While this was doing, several of the natives made us a visit, amongst whom was old Oree, the chief, who brought a hog, and some other articles, which he presented to me, with the usual ceremony.

Next morning, the natives began to bring us fruit. I returned Oree's visit, and made my present to him; one article of which was red feathers. Two or three of these the chief took in his right hand, holding them up between the finger and thumb, and said a prayer, as I understood, which was little noticed by any present. Two hogs were, soon after, put into my boat; and he, and several of his friends, came on board, and dined with us. After dinner Oree gave me to understand what articles would be most acceptable to him and his friends; which were chiefly axes and nails. Accordingly I gave him what he asked, and

desired he would distribute them to the others, which he did, seemingly to the satisfaction of every one. A youth about ten or twelve years of age, either his son or grandson, seemed to be the person of most note, and had the greatest share. After the distribution was over, they all returned ashore. Mr. Forster and his party being out in the country botanising, his servant, a feeble man, was beset by five or six fellows, who would have stripped him, if, that moment, one of the party had not come to his assistance; after which, they made off with a hatchet they had got from him.

On the 17th I went ashore to look for the chief, in order to complain of the outrage committed as above; but he was not in the neighbourhood. Being ashore in the afternoon, a person came and told me Oree wanted to see me. I went with the man, and was conducted to a large house, where the chief, and several other persons of note, were assembled, in council, as well as I could understand. After I was seated and some conversation had passed among them, Oree made a speech, and was answered by another. I understood no more of either, than just to know it regarded the robbery committed the day before. The chief then began to assure me, that neither he, nor any one present (who were the principal chiefs in the neighbourhood) had any hand in it; and desired me to kill, with the guns, all those which had. I assured him that I was satisfied that neither he, nor those present, were at all concerned in the affair; and that I should do with the fellows as he desired, or any others who were guilty of the like crimes. Having asked where the fellows were, and desired they would bring them to me that I might do with them as he had said; his answer was, they were gone to the mountains, and he could not get them. Whether this was the case or not, I will not pretend to say. I knew fair means would never make them deliver them up; and I had no intention to try others. So the affair dropt, and the council broke up.

In the evening, some of the gentlemen went to a dramatic entertainment. The piece represented a girl as running away with us from Otaheite; which was in some degree true; as a young woman had taken a passage with us down to Ulitea, and happened now to be present at the representation of her own adventures; which had such an effect upon her, that it was with great difficulty our gentlemen could prevail upon her to see the play out, or to refrain from tears while it was acting. The piece concluded with the reception she was supposed to meet with from her friends at her return; which was not a very favourable one. These people can add little extempore pieces to their entertainments when they see occasion. Is it not then reasonable to suppose that this was intended as a satire against this girl, and to discourage others from following her steps?

In the morning of the 18th Oree came on board with a present of fruit, stayed dinner, and in the afternoon desired to see some great guns fired, shotted, which I complied with. The reason of his making this request was his hearing, from Oedidee and our Otaheitean passengers, that we had so done at their island. The chief would have had us fire at the hills; but I did not approve of that, lest the shot should fall short, and do some mischief. Besides, the effect was better seen in the water. Some of the petty officers, who had leave to go into the country for their amusement, took two of the natives with them to be their guides, and to carry their bags, containing nails, hatchets, &c., the current cash we traded with here; which the fellows made off with in the following artful manner:—The gentlemen had with them two muskets for shooting birds. After a shower of rain, their guides pointed out some for them to shoot. One of the muskets having missed fire several times, and the other having gone off, the instant the fellows saw themselves secure from both, they ran away, leaving the gentlemen gazing after them with so much surprise, that no one had presence of mind to pursue them.

The 19th, showery morning; fair afternoon; nothing happened worthy of note. Early in the morning of the 20th, three of the officers set out on a shooting party, rather contrary to my inclination; as I found the natives, at least some of them, were continually watching every opportunity to rob straggling parties, and were daily growing more daring. About three o'clock in the afternoon, I got intelligence that they were seized and stripped of everything they had about them. Upon this I immediately went on shore with a boat's crew, accompanied by Mr. Forster, and took possession of a large house with all its effects, and

two chiefs, whom I found in it; but this we did in such a manner that they hardly knew what we were about, being unwilling to alarm the neighbourhood. In this situation I remained till I heard the officers had got back safe, and had all their things restored to them: then I quitted the house; and presently after everything in it was carried off. When I got on board, I was informed of the whole affair by the officers themselves. Some little insult on their part induced the natives to seize their guns, on which a scuffle ensued, some chiefs interfered, took the officers out of the crowd, and caused everything which had been taken from them to be restored. This was at a place where we had before been told, that a set of fellows had formed themselves into a gang, with a resolution to rob every one who should go that way. It should seem, from what followed, that the chief could not prevent this, or put a stop to these repeated outrages. I did not see him this evening, as he was not come into the neighbourhood when I went on board; but I learnt from Oedidee that he came soon after, and was so concerned at what had happened that he wept. Daylight no sooner broke upon us on the 21st, than we saw upwards of sixty canoes under sail going out of the harbour, and steering over for Ulietea. On our inquiring the reason, we were told that the people in them were *Earecoies*, and were going to visit their brethren in the neighbouring isles. One may almost compare these men to freemasons; they tell us they assist each other when need requires; they seem to have customs among them which they either will not or cannot explain. Oedidee told us he was one; Tupia was one; and yet I have not been able to get any tolerable idea of this set of men from either of them. Oedidee denies that the children they have by their mistresses are put to death, as we understood from Tupia and others. I have had some conversation with Omai on this subject, and find that he confirms everything that is said upon it in the narrative of my former voyage*.

Oedidee, who generally slept on shore, came off with a message from Oree, desiring I would land with twenty-two men, to go with him to chastise the robbers. The messenger brought with him, by way of assisting his memory, twenty-two pieces of leaves, a method customary amongst them. On my receiving this extraordinary message, I went to the chief for better information; and all I could learn of him was, that these fellows were a sort of banditti, who had formed themselves into a body with a resolution of seizing and robbing our people wherever they found them, and were now armed for that purpose; for which reason he wanted me to go along with him to chastise them. I told him, if I went, they would fly to the mountains; but he said they were resolved to fight us, and therefore desired I would destroy both them and their house; but begged I would spare those in the neighbourhood, as also the canoes and the *Whenooa*. By way of securing these, he presented me with a pig as a peace-offering for the *Whenooa*. It was too small to be meant for anything but a ceremony of this kind. This sensible old chief could see (what, perhaps, none of the others ever thought of) that everything in the neighbourhood was at our mercy, and therefore took care to secure them by this method, which I suppose to be of weight with them. When I returned on board, I considered of the chief's request, which, upon the whole, appeared an extraordinary one. I, however, resolved to go, lest these fellows should be (by our refusal) encouraged to commit greater acts of violence; and, as their proceeding would soon reach Ulietea, where I intended to go next, the people there might be induced to treat us in the same manner, or worse, they being more numerous. Accordingly, I landed with forty-eight men, including officers, Mr. Forster, and some others of the gentlemen. The chief joined us with a few people, and we began to march, in search of the banditti, in good order. As we proceeded, the chief's party increased like a snow-ball. Oedidee, who was with us, began to be alarmed, observing that many of the people in our company were of the very party we were going against, and at last telling us that they were only leading us to some place where they could attack us to advantage. Whether there was any truth in this, or it was only Oedidee's fears, I will not pretend to say; he, however, was the only person we could confide in, and we regulated our motions according to the information he had given us. After marching some miles, we got intelligence that the men we were going after had fled to the mountains; but I think this was not till I had declared to the chief I would

* For a full account of the constitution of the *Arcois* see the Appendix.—Ed.

proceed no farther; for we were then about crossing a deep valley, bounded on each side by steep rocks, where a few men, with stones only, might have made our retreat difficult, if their intentions were what Oedidee had suggested, and which he still persisted in. Having come to a resolution to return, we marched back in the same order as we went, and saw, in several places, people, who had been following us, coming down from the sides of the hills with their arms in their hands, which they instantly quitted, and hid in the bushes, when they saw they were discovered by us. This seemed to prove that there must have been some foundation for what Oedidee had said; but I cannot believe the chief had any such design, whatever the people might have. In our return, we halted at a convenient place to refresh ourselves. I ordered the people to bring us some cocoa-nuts, which they did immediately: indeed, by this time, I believe many of them wished us on board out of the way; for although no one step was taken that could give them the least alarm, they certainly were in terror. Two chiefs brought each of them a pig, a dog, and some young plantain trees, the usual peace-offerings, and, with due ceremony, presented them singly to me. Another brought a very large hog, with which he followed us to the ship. After this we continued our course to the landing-place, where I caused several volleys to be fired, to convince the natives that we could support a continual fire. This being done, we all embarked and went on board; and soon after the chief, following, brought with him a quantity of fruit, and sat down with us to dinner. We had scarce dined, before more fruit was brought us by others, and two hogs; so that we were likely to make more by this little excursion than by all the presents we had made them. It certainly gave them some alarm to see so strong a party of men march into their country, and probably gave them a better opinion of fire-arms than they had before; for I believe they had but an indifferent, or rather contemptible, idea of muskets in general, having never seen any fired but at birds, &c., by such of our people as used to straggle about the country, the most of them but indifferent marksmen, losing generally two shots out of three, their pieces often missing fire, and being slow in charging. Of all this they had taken great notice, and concluded, as well they might, that fire-arms were not so terrible things as they had been taught to believe.

When the chiefs took leave in the evening, they promised to bring us the next day a very large supply of provisions. In the article of fruit they were as good as their word; but of hogs, which we most wanted, they brought far less than we expected. Going ashore in the afternoon, I found the chief just sitting down to dinner. I cannot say what was the occasion of his dining so late. As soon as he was seated, several people began chewing the pepper-root; about a pint of the juice of which, without any mixture, was the first dish, and was despatched in a moment. A cup of it was presented to me, but the manner of brewing it was at this time sufficient. Oedidee was not so nice, but took what I refused. After this the chief washed his mouth with cocoa-nut water; then he ate of repe, plantain, and mahee, of each not a little; and, lastly, finished his repast by eating, or rather drinking, about three pints of *popoie*, which is made of bread-fruit, plantains, mahee, &c., beat together, and diluted with water till it is of the consistence of a custard. This was at the outside of his house, in the open air; for at this time a play was acting within, as was done almost every day in the neighbourhood; but they were such poor performances that I never attended. I observed that, after the juice had been squeezed out of the chewed pepper-root for the chief, the fibres were carefully picked up and taken away by one of his servants. On my asking what he intended to do with it, I was told he would put water to it, and strain it again. Thus he would make what I will call small beer.

The 23d, wind easterly, as it had been ever since we left Otaheite. Early in the morning we unmoored, and at eight weighed and put to sea. The good old chief was the last man who went out of the ship. At parting I told him we should see each other no more; at which he wept, and said, "Let your sons come; we will treat them well." Oree is a good man, in the utmost sense of the word; but many of the people are far from being of that disposition, and seem to take advantage of his old age, Teraderre, his grandson and heir, being yet but a youth. The gentle treatment the people of this isle ever met with from me, and the careless and imprudent manner in which many of our people had rambled about in the country, from a vain opinion that fire-arms rendered them invincible, encouraged many

at Huaheine to commit acts of violence, which no men at Otaheite ever durst attempt. During our stay here we got bread-fruit, cocoa-nuts, &c., more than we could well consume, but not hogs enough by far to supply our daily expense; and yet it did not appear that they were scarce in the isle. It must, however, be allowed, that the number we took away, when last here, must have thinned them greatly, and at the same time stocked the isle with our articles. Besides, we now wanted a proper assortment of trade; what we had being nearly exhausted, and the few remaining red feathers being here but of little value, when compared to the estimation they stand in at Otaheite. This obliged me to set the smiths to work, to make different sorts of iron tools, nails, &c., in order to enable me to procure refreshments at the other isles, and to support my credit and influence among the natives.

CHAPTER XV.—ARRIVAL AT ULITEA, WITH AN ACCOUNT OF THE RECEPTION WE MET WITH THERE, AND THE SEVERAL INCIDENTS WHICH HAPPENED DURING OUR STAY. A REPORT OF TWO SHIPS BEING AT HUAHEINE. PREPARATIONS TO LEAVE THE ISLAND, AND THE REGRET THE INHABITANTS SHOWED ON THE OCCASION. THE CHARACTER OF OEDIDEE, WITH SOME GENERAL OBSERVATIONS ON THE ISLANDS.

As soon as we were clear of the harbour, we made sail, and stood over for the south end of Ulitea. Oreo took the opportunity to send a man with a message to Opoony. Being little wind all the latter part of the day, it was dark before we reached the west side of the isle, where we spent the night. The same light variable wind continued till ten o'clock next morning, when the trade-wind at east prevailed, and we ventured to ply up to the harbour, first sending a boat to lie in anchorage in the entrance. After making a few trips, we got before the channel, and with all our sails set, and the head-way the ship had acquired, shut her in as far as she would go; then dropped the anchor, and took in the sails. This is the method of getting into most of the harbours which are on the lee-side of these isles; for the channels, in general, are too narrow to ply in. We were now anchored between the two points of the reef which form the entrance; each not more than two-thirds the length of a cable from us, and on which the sea broke with such height and violence, us, to people less acquainted with the place, would have been terrible. Having all our boats out with anchors and warps in them, which were presently run out, the ship warped into safety, where we dropped anchor for the night. While this work was going forward, my old friend Oreo the chief, and several more, came to see us. The chief came not empty.

Next day we warped the ship into, and moored her in, a proper berth, so as to command all the shores around us. In the mean time a party of us went ashore to pay the chief a visit, and to make the customary present. At our first entering his house, we were met by four or five old women, weeping and lamenting, as it were, most bitterly. and at the same time cutting their heads with instruments made of sharks' teeth, till the blood ran plentifully down their faces and on their shoulders. What was still worse, we were obliged to submit to the embraces of these old hags, and by that means were all besmeared with blood. This ceremony (for it was merely such) being over, they went out, washed themselves, and immediately after appeared as cheerful as any of the company. Having made some little stay, and given my present to the chief and his friends, he put a hog and some fruit into my boat, and came on board with us to dinner. In the afternoon, we had a vast number of people and canoes about us, from different parts of the island. They all took up their quarters in our neighbourhood, where they remained feasting for some days. We understood the most of them were *Eareoys*.

The 26th afforded nothing remarkable, excepting that Mr. Forster, in his botanical excursions, saw a burying-place for dogs, which they called *Marai no te Oore*. But, I think, we ought not to look upon this as one of their customs; because few dogs die a natural death, being generally, if not always, killed and eaten, or else given as an offering to the gods. Probably this might be a *Marai* or altar, where this sort of offering was made; or it might have been the whim of some person to have buried his favourite dog in this manner. But

be it as it will, I cannot think it is a general custom in the nation ; and, for my own part, I neither saw nor heard of such a thing before.

Early in the morning of the 27th, Oreo, his wife, son, daughter, and several more of his friends, made us a visit and brought with them a good quantity of all manner of refreshments ; little having as yet been got from anybody else. They staid dinner ; after which a party of us accompanied them on shore, where we were entertained with a play, called *Mididdij Harramy*, which signifies the *Child is coming*. It concluded with the representation of a woman in labour, acted by a set of great brawny fellows, one of whom at last brought forth a strapping boy, about six feet high, who ran about the stage, dragging after him a large wisp of straw which hung by a string from his middle. I had an opportunity of seeing this acted another time, when I observed, that the moment they had got hold of the fellow who represented the child, they flattered or pressed his nose. From this I judged that they do so by their children when born, which may be the reason why all in general have flat noses. This part of the play, from its newness, and the ludicrous manner in which it was performed, gave us, the first time we saw it, some entertainment, and caused a loud laugh, which might be the reason why they acted it so often afterwards. But this, like all their other pieces, could entertain us no more than once ; especially as we could gather little from them, for want of knowing more of their language.

The 28th was spent by me in much the same manner as the preceding day, viz., in entertaining my friends, and being entertained by them ; Mr. Forster and his party in the country botanising. Next morning, we found several articles had been stolen out of our boats lying at the buoy, about sixty or seventy yards from the ship. As soon as I was informed of it, I went to the chief to acquaint him therewith. I found that he not only knew they were stolen, but by whom, and where they were ; and he went immediately with me in my boat in pursuit of them. After proceeding a good way along shore, towards the south end of the island, the chief ordered us to land near some houses, where we did not wait long before all the articles were brought to us, except the pinnae's iron tiller, which I was told was still farther off. But, when I wanted to go after it, I found the chief unwilling to proceed ; and he actually gave me the slip, and retired into the country. Without him I knew I could do nothing. The people began to be alarmed when they saw I was for going farther ; by which I concluded that the tiller was out of their reach also. I therefore sent one of them to the chief to desire him to return. He returned accordingly ; when we sat down, and had some victuals set before us ; thinking perhaps that, as I had not breakfasted, I must be hungry, and not in a good humour. Thus I was amused till two hogs were produced, which they entreated me to accept. This I did, and then their fears vanished ; and I thought myself not ill off in having gotten two good hogs for a thing which seemed to be quite out of my reach. Matters being thus settled, we returned on board, and had the company of the chief and his son to dinner. After that we all went ashore, where a play was acted for the entertainment of such as would spend their time in looking at it. Besides these plays, which the chief caused frequently to be acted, there were a set of strolling players in the neighbourhood, who performed every day. But their pieces seemed to be so much alike, that we soon grew tired of them ; especially as we could not collect any interesting circumstances from them. We, our ship, and our country, were frequently brought on the stage ; but on what account I know not. It can hardly be doubted that this was designed as a compliment to us, and probably not acted but when some of us were present. I generally appeared at Oreo's theatre towards the close of the play, and twice at the other, in order to give my mite to the actors. The only actress at Oreo's theatre was his daughter, a pretty brown girl, at whose shrine, on these occasions, many offerings were made by her numerous votaries. This, I believe, was one great inducement to her father's giving us these entertainments so often.

Early in the morning of the 30th, I set out with the two boats, accompanied by the two Mr. Forsters, Oedidee, the chief, his wife, son, and daughter, for an estate which Oedidee called his, situated at the north end of the island. There I was promised to have hogs and fruit in abundance ; but when we came there we found that poor Oedidee could not command one single thing, whatever right he might have to the *Whenoa*, which was now in possession

of his brother, who, soon after we landed, presented to me, with the usual ceremony, two pigs. I made him a very handsome present in return, and Oedidee gave him every thing he had left of what he had collected the time he was with us.

After this ceremony was over, I ordered one of the pigs to be killed and dressed for dinner, and attended myself to the whole operation, which was as follows:—They first strangled the hog, which was done by three men; the hog being placed on his back, two of them laid a pretty strong stick across his throat, and pressed with all their weight on each end; the third man held his hind legs, kept him on his back, and plugged up his fundament with grass, I suppose to prevent any air from passing or repassing that way. In this manner they held him for about ten minutes before he was quite dead. In the mean time, some hands were employed in making a fire, to heat the oven, which was close by. As soon as the hog was quite dead, they laid him on the fire, and burnt or singed the hair, so that it came off with almost the same ease as if it had been scalded. As the hair was got off one part, another was applied to the fire till they had got off the whole, yet not so clean but that another operation was necessary; which was to carry it to the sea-side, and there give it a good scrubbing with sandy stones, and sand. This brought off all the scurf &c. which the fire had left on. After well washing off the sand and dirt, the carcase was brought again to the former place, and laid on clean green leaves, in order to be opened. They first ripped up the skin of the belly, and took out the fat or lard from between the skin and the flesh, which they laid on a large green leaf. The belly was then ripped open, and the entrails taken out and carried away in a basket, so that I know not what became of them; but am certain they were not thrown away. The blood was next taken out and put into a large leaf, and then the lard, which was put to the other fat. The hog was now washed clean, both inside and out, with fresh water, and several hot stones put into his belly, which were shaken in under the breast, and green leaves crammed in upon them. By this time the oven was sufficiently heated; what fire remained was taken away, together with some of the hot stones; the rest made a kind of pavement in the bottom of the hole or oven, and were covered with leaves, on which the hog was placed on his belly. The lard and fat, after being washed with water, were put into a vessel, made just then of the green bark of a plantain tree, together with two or three hot stones, and placed on one side the hog. A hot stone was put to the blood, which was tied up in the leaf, and put into the oven; as also bread-fruits and plantains. Then the whole was covered with green leaves, on which were laid the remainder of the hot stones; over them were leaves; then any sort of rubbish they could lay their hands on; finishing the operation by well covering the whole with earth. While the victuals were baking, a table was spread with green leaves on the floor, at one end of a large boat-house. At the close of two hours and ten minutes, the oven was opened, and all the victuals taken out. Those of the natives who dined with us, sat down by themselves, at one end of the table, and we at the other. The hog was placed before us, and the fat and blood before them, on which they chiefly dined, and said it was *Mamity*, very good victuals; and we not only said, but thought the same of the pork. The hog weighed about fifty pounds. Some parts about the ribs I thought rather overdone; but the more fleshy parts were excellent; and the skin, which by our way of dressing can hardly be eaten, had, by this method, a taste and flavour superior to any thing I ever met with of the kind. I have now only to add, that during the whole of the various operations, they exhibited a cleanliness well worthy of imitation. I have been the more particular in this account, because I do not remember that any one of us had seen the whole process before; nor is it well described in the narrative of my former voyage.

While dinner was preparing, I took a view of this *Whenooa* of Oedidee. It was small, but a pleasant spot; and the houses were so disposed as to form a very pretty village, which is very rarely the case at these isles. Soon after we had dined, we set out for the ship, with the other pig, and a few races of plantains, which proved to be the sum total of our great expectations. In our return to the ship, we put ashore at a place where, in the corner of a house, we saw four wooden images, each two feet long, standing on a shelf, having a piece of cloth round their middle, and a kind of turban on their heads, in which were stuck long cocks' feathers. A person in the house told us they were *Eatua no te Toutou*, gods of the

servants or slaves. I doubt if this be sufficient to conclude that they pay them divine worship, and that the servants or slaves are not allowed the same gods as men of more elevated rank. I never heard that Tupia made any such distinction, or that they worshipped any visible thing whatever. Besides, these were the first wooden gods we had seen in any of the isles; and all the authority we had for their being such was the bare word of perhaps a superstitious person, and whom we were likewise liable to misunderstand. It must be allowed that the people of this isle are, in general, more superstitious than at Otaheite. At the first visit I made the chief after our arrival, he desired I would not suffer any of my people to shoot herons and woodpeckers; birds as sacred with them as robin-redbreasts, swallows, &c. are with many old women in England. Tupia, who was a priest, and well acquainted with their religion, customs, traditions, &c., paid little or no regard to these birds. I mention this because some amongst us were of opinion that these birds are their *Eduas*, or gods. We, indeed, fell into this opinion when I was here in 1769, and into some others still more absurd, which we had undoubtedly adopted if Tupia had not undeceived us. A man of his knowledge and understanding we have not since met with, and consequently have added nothing to his account of their religion, but superstitious notions.

The people, knowing that we should sail soon, began, on the 31st, to bring on board more fruit than usual. Amongst those who came was a young man who measured six feet four inches and six-tenths; and his sister, younger than he, measured five feet ten inches and a half. A brisk trade for hogs and fruit continued on the 1st of June. On the 2d, in the afternoon, we got intelligence that, three days before, two ships had arrived at Huaheine. The same report said the one was commanded by Mr. Banks, and the other by Captain Furneaux. The man who brought the account said he was made drunk on board one of them, and described the persons of Mr. Banks and Captain Furneaux so well, that I had not the least doubt of the truth, and began to consider about sending a boat over that very evening, with orders to Captain Furneaux, when a man, a friend of Mr. Forster, happened to come on board, and denied the whole, saying it was *wa warre*, a lie. The man from whom we had the intelligence was now gone, so that I could not confront them, and there were none else present who knew anything about it but by report; so that I laid aside sending over a boat till I should be better informed. This evening we entertained the people with fire-works, on one of the little isles near the entrance of the harbour.

I had fixed on the next day for sailing, but the intelligence from Huaheine put a stop to it. The chief had promised to bring the man on board who first brought the account; but he was either not to be found, or would not appear. The morning, the people were divided in their opinions; but in the afternoon all said it was a false report. I had sent Mr. Clerke, in the morning, to the farthest part of the island, to make inquiries there: he returned without learning anything satisfactory. In short, the report appeared now too ill-founded to authorise me to send a boat over, or to wait any longer here; and, therefore, early in the morning of the 4th, I got everything in readiness to sail. Oreo, the chief, and his whole family, came on board, to take their last farewell, accompanied by Oo-oo-ron, the *Earee de hi*, and Boba the *Earee* of Otaha, and several of their friends. None of them came empty; but Oo-oo-rou brought a pretty large present, this being his first and only visit. I distributed amongst them almost everything I had left. The very hospitable manner in which I had ever been received by these people, had endeared them to me, and given them a just title to every thing in my power to grant. I questioned them again about the ships at Huaheine; and they all, to a man, denied that any were there. During the time these people remained on board, they were continually importuning me to return. The chief, his wife, and daughter, but especially the two latter, scarcely ever ceased weeping. I will not pretend to say whether it was real or feigned grief they showed on this occasion. Perhaps there was a mixture of both; but were I to abide by my own opinion only, I should believe it was real. At last, when we were about to weigh, they took a most affectionate leave. Oreo's last request was for me to return; when he saw he could not obtain that promise, he asked the name of my *Marai* (burying-place). As strange a question as this was, I hesitated not a moment to tell him Stepney; the parish in which I live when in London. I was made to repeat it several times over till they could pronounce it: then, Stepney, *Marai no Toote*, was echoed

through a hundred mouths at once. I afterwards found the same question had been put to Mr. Forster by a man on shore; but he gave a different, and, indeed, more proper answer, by saying, no man, who used the sea, could say where he should be buried. It is the custom at these isles for all the great families to have burial-places of their own, where their remains are interred. These go with the estate to the next heir. The *Marai* at Oparree at Otaheite, when Tootaha swayed the sceptre, was called *Marai no Tootaha*; but now it is called *Marai no Otoo*. What greater proof could we have of these people esteeming us as friends, than their wishing to remember us, even beyond the period of our lives? They had been repeatedly told that we should see them no more; they then wanted to know where we were to mingle with our parent dust.

As I could not promise, or even suppose, that more English ships would be sent to those isles, our faithful companion, Oedidee, chose to remain in his native country. But he left us with a regret fully demonstrative of the esteem he bore to us; nor could anything, but the fear of never returning, have torn him from us. When the chief teased me so much about returning, I sometimes gave such answers as left them hopes. Oedidee would instantly catch at this, take me on one side, and ask me over again. In short, I have not words to describe the anguish which appeared in this young man's breast, when he went away. He looked up at the ship, burst into tears, and then sunk down into the canoe. The maxim that a prophet has no honour in his own country was never more fully verified than in this youth. At Otaheite he might have had anything that was in their power to bestow; whereas here he was not in the least noticed. He was a youth of good parts, and, like most of his countrymen, of a docile, gentle, and humane disposition; but, in a manner, wholly ignorant of their religion, government, manners, customs, and traditions; consequently, no material knowledge could have been gathered from him, had I brought him away. Indeed, he would have been a better specimen of the nation, in every respect, than Omai. Just as Oedidee was going out of the ship, he asked me to *Tatou* some *Purou* for him, in order to show the commanders of any other ships which might stop here. I complied with his request, gave him a certificate of the time he had been with us, and recommended him to the notice of those who might touch at the island after me.

We did not get clear of our friends till eleven o'clock, when we weighed, and put to sea; but Oedidee did not leave us till we were almost out of the harbour. He staid in order to fire some guns; for it being his Majesty's birth-day, we fired the salute at going away.

When I first came to these islands, I had some thought of visiting Tupia's famous Bolabola. But as I had now got on board a plentiful supply of all manner of refreshments, and the route I had in view allowing me no time to spare, I laid this design aside, and directed my course to the west; taking our final leave of these happy isles, on which benevolent nature has spread her luxuriant sweets with a lavish hand. The natives, copying the bounty of nature, are equally liberal; contributing plentifully and cheerfully to the wants of navigators. During the six weeks we had remained at them, we had fresh pork, and all the fruits which were in season, in the utmost profusion; besides fish at Otaheite, and fowls at the other isles. All these articles we got in exchange for axes, hatchets, nails, chisels, cloth, red feathers, beads, knives, scissors, looking-glasses, &c., articles which will ever be valuable here. I ought not to omit shirts as a very capital article in making presents; especially with those who have any connexions with the fair sex. A shirt here is full as necessary as a piece of gold in England. The ladies at Otaheite, after they had pretty well stripped their lovers of shirts, found a method of clothing themselves with their own cloth. It was their custom to go on shore every morning, and to return on board in the evening, generally clad in rags. This furnished a pretence to importune the lover for better clothes; and when he had no more of his own, he was to dress them in new cloth of the country, which they always left ashore; and appearing again in rags, they must again be clothed. So that the same suit might pass through twenty different hands, and be as often sold, bought, and given away.

Before I finish this account of these islands, it is necessary to mention all I know concerning the government of Ulitea and Otaha. Oroo, so often mentioned, is a native of

Bolabola; but is possessed of *Whenoa*s or lands at Ulietea; which, I suppose, he, as well as many of his countrymen, got at the conquest. He resides here as Opoony's lieutenant; seeming to be vested with regal authority, and to be the supreme magistrate in the island. Oo-oo-ron, who is the *Earee* by hereditary right, seems to have little more left him than the bare title, and his own *Whenoa* or district, in which, I think, he is sovereign. I have always seen Oreo pay him the respect due to his rank; and he was pleased when he saw me distinguish him from others.

Otaha, so far as I can find, is upon the very same footing. Boba and Ota are the two chiefs; the latter I have not seen; Boba is a stout, well-made young man; and we are told, is, after Opoony's death, to marry his daughter, by which marriage he will be vested with the same regal authority as Opoony has now; so that, it should seem, though a woman may be vested with regal dignity, she cannot have regal power. I cannot find that Opoony has got anything to himself by the conquest of these isles, any further than providing for his nobles, who have seized on best part of the lands. He seems to have no demand on them for any of the many articles they have had from us. Oedidee has several times enumerated to me all the axes, nails, &c. which Opoony is possessed of, which hardly amount to as many as he had from me when I saw him in 1769. Old as this famous man is, he seems not to spend his last days in indolence. When we first arrived here, he was at Maurana; soon after, he returned to Bolabola; and we were now told he was gone to Tubi.

I shall conclude this account of these islands with some observations on the watch which Mr. Wales hath communicated to me. At our arrival in Matavai Bay in Otaheite, the longitude pointed out by the watch was $2^{\circ} 8' 38\frac{1}{2}''$ too far to the west; that is, it had gained, since our leaving Queen Charlotte's Sound, of its then rate of going, $8' 34\frac{1}{2}''$. This was in about five months, or rather more, during which time it had passed through the extremes of cold and heat. It was judged that half this error arose after we left Easter Island; by which it appeared that it went better in the cold than in the hot climates*.

BOOK III.

FROM ULIETEA TO NEW ZEALAND.

CHAPTER I.—PASSAGE FROM ULIETEA TO THE FRIENDLY ISLES; WITH A DESCRIPTION OF SEVERAL ISLANDS THAT WERE DISCOVERED, AND THE INCIDENTS WHICH HAPPENED IN THAT TRACK.

On the 6th, being the day after leaving Ulietea, at eleven o'clock A. M., we saw land bearing N.W., which, upon a nearer approach, we found to be a low reef island about four leagues in compass, and of a circular form. It is composed of several small patches connected together by breakers, the largest lying on the N.E. part. This is Howe Island, discovered by Captain Wallis, who, I think, sent his boat to examine it; and, if I have not

* Capt. Fitzroy, in the Appendix to the surveying voyages of the Adventure and the Beagle, page 326, gives it as his opinion, "confirmed by eight years' observations of the movement of chronometers," that "temperature is the chief, if not the only cause (generally speaking), of marked changes of rate; the balances of but few watches being so well compensated as to be proof against a long continuance of higher or lower temperature." In connection with this subject, Capt. Fitzroy has the following remarks, deserving of great attention by all travellers and readers of travels, and which serve to illustrate the observations in the text, though not fully to explain the result there noticed:—"Some chronometrical measurements have erred, and caused much perplexity in the following manner:—The chronometers were rated in air whose average temperature was—let us suppose for example,

seventy. They were then carried through air either considerably hotter, or considerably colder, and again rated in a temperature nearly equal to that specified. The rates were not found to differ much, and it was supposed that the chronometers had been going extremely well; though, in truth, the rates of most of the watches had differed extremely (from those found in port) during the voyage; but they had returned nearly to the old rates upon reaching nearly equal temperature. And this has happened, more or less, to every ship carrying chronometers across the equator; especially when going to Rio de Janeiro with the sun to the northward of the line." The consideration of this fact will account for many errors into which navigators, depending solely on their chronometers for their longitude, have been and are continually liable to fall.—Ed.

been misinformed, found a channel through, within the reef, near the N.W. part *. The inhabitants of Ulietea speak of an uninhabited island, about this situation, called by them Mopelia, to which they go at certain seasons for turtle. Perhaps this may be the same; as we saw no signs of inhabitants upon it. Its latitude is $16^{\circ} 46'$ South; longitude $154^{\circ} 8'$ West.

From this day to the 16th we met with nothing remarkable, and our course was West southerly; the winds variable from the North round by the East to S.W. attended with cloudy, rainy, unsettled weather, and a southerly swell. We generally brought-to, or stood upon a wind, during night; and in the day made all the sail we could. About half-an-hour after sunrise this morning, land was seen from the topmast head, bearing N.N.E. We immediately altered the course and steering for it, found it to be another reef island, composed of five or six woody islets, connected together by sand-banks and breakers, inclosing a lake, into which we could see no entrance. We ranged the West and N.W. coasts, from its southern to its northern extremity, which is about two leagues; and so near the shore, that at one time we could see the rocks under us; yet we found no anchorage, nor saw we any signs of inhabitants. There were plenty of various kinds of birds, and the coast seemed to abound with fish. The situation of this isle is not very distant from that assigned by Mr. Dalrymple for La Sagitaria, discovered by Quiros; but, by the description the discoverer has given of it it cannot be the same. For this reason I looked upon it as a new discovery, and named it Palmerston Island, in honour of Lord Palmerston, one of the Lords of the Admiralty. It is situated in latitude $18^{\circ} 4'$ South, longitude $163^{\circ} 10'$ West.

At four o'clock in the afternoon we left this isle, and resumed our course to the W. by S. with a fine steady gale easterly, till noon on the 20th, at which time, being in latitude $18^{\circ} 50'$, longitude $168^{\circ} 52'$, we thought we saw land to S.S.W. and hauled up for it accordingly. But, two hours after, we discovered our mistake, and resumed our course W. by S. Soon after we saw land from the mast-head in the same direction; and, as we drew nearer, found it to be an island which, at five o'clock, bore West, distant five leagues. Here we spent the night plying under the topsails; and, at daybreak next morning, bore away, steering for the northern point, and ranging the West coast at the distance of one mile, till near noon. Then, perceiving some people on the shore, and landing seeming to be easy, we brought-to, and hoisted out two boats, with which I put off to the land, accompanied by some of the officers and gentlemen. As we drew near the shore, some of the inhabitants, who were on the rocks, retired to the woods, to meet us, as we supposed; and we afterwards found our conjectures right. We landed with ease in a small creek, and took post on a high rock to prevent a surprise. Here we displayed our colours, and Mr. Forster and his party began to collect plants, &c. The coast was so overrun with woods, bushes, plants, stones, &c. that we could not see forty yards round us. I took two men, and with them entered a kind of chasm, which opened a way into the woods. We had not gone far before we heard the natives approaching; upon which I called to Mr. Forster to retire to the party, as I did likewise. We had no sooner joined, than the islanders appeared at the entrance of a chasm not a stone's throw from us. We began to speak, and make all the friendly signs we could think of to them, which they answered by menaces; and one of two men, who were advanced before the rest, threw a stone, which struck Mr. Sparr on the arm. Upon this two muskets were fired, without order, which made them retire under cover of the woods; and we saw them no more.

After waiting some little time, and till we were satisfied nothing was to be done here, the country being so overrun with bushes that it was hardly possible to come to parley with them, we embarked and proceeded down along shore, in hopes of meeting with better success in another place. After ranging the coast for some miles without seeing a living soul, or any convenient landing-place, we at length came before a small beach, on which lay four canoes. Here we landed by means of a little creek, formed by the flat rocks before it, with a view of just looking at the canoes, and to leave some medals, nails, &c. in them, for not a soul was to be seen. The situation of this place was to us worse than the former. A flat rock lay next the sea; behind it a narrow stone beach; this was bounded by a perpendicular

* Captain Wallis did not land on this island, being deterred from attempting to do so by the breakers.—Ed.

rocky cliff of unequal height, whose top was covered with shrubs; two deep and narrow chasms in the cliff seemed to open a communication into the country. In or before one of these lay the four canoes which we were going to look at; but in the doing of this, I saw we should be exposed to an attack from the natives, if there were any, without being in a situation proper for a defence. To prevent this as much as could be, and to secure a retreat in case of an attack, I ordered the men to be drawn up upon the rock, from whence they had a view of the heights; and only myself, and four of the gentlemen, went up to the canoes. We had been there but a few minutes, before the natives, I cannot say how many, rushed down the chasm out of the wood upon us. The endeavours we used to bring them to a parley were to no purpose; for they came with the ferocity of wild boars, and threw their darts. Two or three muskets, discharged in the air, did not hinder one of them from advancing still farther, and throwing another dart, or rather a spear, which passed close over my shoulder. His courage would have cost him his life, had not my musket missed fire; for I was not five paces from him when he threw his spear, and had resolved to shoot him to save myself. I was glad afterwards that it happened as it did. At this instant, our men on the rock began to fire at others who appeared on the heights, which abated the ardour of the party we were engaged with, and gave us time to join our people, when I caused the firing to cease. The last discharge sent all the islanders to the woods, from whence they did not return so long as we remained. We did not know that any were hurt. It was remarkable, that when I joined our party, I tried my musket in the air, and it went off as well as a piece could do. Seeing no good was to be got with these people, or at the isle, as having no port, we returned on board, and having hoisted in the boats, made sail to W.S.W. I had forgot to mention, in its proper order, that having put ashore a little before we came to this last place, three or four of us went upon the cliffs, where we found the country, as before, nothing but coral rocks, all overrun with bushes; so that it was hardly possible to penetrate into it, and we embarked again with intent to return directly on board, till we saw the canoes; being directed to the place by the opinion of some of us, who thought they heard some people.

The conduct and aspect of these islanders occasioned my naming it Savage Island *. It is situated in the latitude $19^{\circ} 1'$ South, longitude $169^{\circ} 37'$ West. It is about eleven league

CORAL ROCKS.

in circuit; of a round form, and good height; and hath deep waters close to its shores. All the sea-coast, and as far inland as we could see, is wholly covered with trees, shrubs, &c.

* The natives of Savage Island are still, it appears, deserving of the title bestowed on them by Cook, being described by Mr. Williams as the most wretched and degraded of any nation he had ever seen except the Aborigines of New Holland, and as having lost none of their ferocity of disposition. A fuller notice of the little that is known of these people will be given in its proper place in the Appendix.—Ed.

amongst which were some cocoa-nut trees; but what the interior parts may produce we know not. To judge of the whole garment by the skirts, it cannot produce much; for so much as we saw of it consisted wholly of coral rocks, all overrun with wood and bushes. Not a bit of soil was to be seen; the rocks alone supplying the trees with humidity. If these coral rocks were first formed in the sea by animals, how came they thrown up to such a height? Has this island been raised by an earthquake? Or has the sea receded from it? Some philosophers have attempted to account for the formation of low isles, such as are in this sea; but I do not know that anything has been said of high islands, or such as I have been speaking of. In this island, not only the loose rocks which cover the surface, but the cliffs which bound the shores, are of coral stone, which the continual beating of the sea has formed into a variety of curious caverns, some of them very large: the roof or rock over them being supported by pillars, which the foaming waves have formed into a multitude of shapes, and made more curious than the caverns themselves. In one we saw, light was admitted through a hole at the top; in another place, we observed that the whole roof of one of these caverns had sunk in, and formed a kind of valley above, which lay considerably below the circumjacent rocks.

I can say but little of the inhabitants, who, I believe, are not numerous. They seemed to be stout, well-made men, were naked, except round the waists, and some of them had their faces, breast, and thighs painted black. The canoes were precisely like those of Amsterdam: with the addition of a little rising like a gunwale on each side of the open part; and had some carving about them, which showed that these people are full as ingenious. Both these islanders and their canoes agree very well with the descriptions M. de Bougainville has given of those he saw off the Isle of Navigators, which lies nearly under the same meridian.

After leaving Savage Island, we continued to steer W.S.W. with a fine easterly trade-wind, till the 24th in the evening, when, judging ourselves not far from Rotterdam, we brought-to, and spent the night plying under the topsails. At daybreak, next morning, we bore away West; and soon after saw a string of islands* extending from S.S.W. by the West to N.N.W. The wind being at N.E. we hauled to N.W. with a view of discovering more distinctly the isles in that quarter; but, presently after, we discovered a reef of rocks a-head, extending on each bow farther than we could see. As we could not weather them, it became necessary to tack and bear up to the South, to look for a passage that way. At noon, the southernmost island bore S.W., distant four miles. North of this isle were three others, all connected by breakers, which we were not sure did not join to those we had seen in the morning, as some were observed in the intermediate space. Some islands were also seen to the West of those four; but Rotterdam was not yet in sight. Latitude $20^{\circ} 23' S.$, longitude $174^{\circ} 6' W.$ During the whole afternoon, we had little wind: so that, at sunset, the southernmost isle bore W.N.W., distant five miles; and some breakers, we had seen to the South, bore now S.S.W. half W. Soon after it fell calm, and we were left to the mercy of a great easterly swell; which, however, happened to have no great effect upon the ship. The calm continued till four o'clock the next morning, when it was succeeded by a breeze from the South. At daylight, perceiving a likelihood of a passage between the islands to the North, and the breakers to the South, we stretched in West, and soon after saw more islands, both to the S.W. and N.W., but the passage seemed open and clear. Upon drawing near the islands, we sounded, and found forty-five and forty fathoms, a clear sandy bottom. I was now quite easy, since it was in our power to anchor, in case of a calm; or to spend the night, if we found no passage. Towards noon, some canoes came off to us from one of the isles, having two or three people in each; who advanced boldly alongside, and exchanged some cocoa-nuts and shadocks for small nails. They pointed out to us Anamocka or Rotterdam; an advantage we derived from knowing the proper names. They likewise gave us the names of some of the other isles, and invited us much to go to theirs, which they called Cornango. The breeze freshening, we left them astern, and steered for Anamocka; meeting with a clear passage, in which we found unequal sounding, from forty to nine fathoms, depending, I believe, in a great measure, on our distance from the islands which form it.

As we drew near the south end of Rotterdam, or Anamocka, we were met by a number

* The Hapai islands now christianised.—Ed.

of canoes, laden with fruit and roots; but, as I did not shorten sail, we had but little traffic with them. The people in one canoe inquired for me by name; a proof that these people have an intercourse with those of Amsterdam. They importuned us much to go towards their coast, letting us know, as we understood them, that we might anchor there. This was on the S.W. side of the island, where the coast seemed to be sheltered from the South and S.E. winds; but as the day was far spent, I could not attempt to go in there, as it would have been necessary to have sent first a boat in to examine it. I therefore stood for the north side of the island, where we anchored about three-fourths of a mile from shore; the extremes of it bearing S. 88° East to S.W. a cove with a sandy beach at the bottom of it S. 50° East.

CHAPTER II. — RECEPTION AT ANAMOCKA; A ROBBERY AND ITS CONSEQUENCES, WITH A VARIETY OF OTHER INCIDENTS. DEPARTURE FROM THE ISLAND. A SAILING CANOE DESCRIBED. SOME OBSERVATIONS ON THE NAVIGATION OF THESE ISLANDERS. A DESCRIPTION OF THE ISLAND, AND OF THOSE IN THE NEIGHBOURHOOD, WITH SOME ACCOUNT OF THE INHABITANTS, AND NAUTICAL REMARKS.

BEFORE we had well got to an anchor, the natives came off from all parts in canoes, bringing with them yams and shaddocks, which they exchanged for small nails and old rags. One man taking a vast liking to our lead and line, got hold of it, and, in spite of all the threats I could make use of, cut the line with a stone; but a discharge of small shot made him return it. Early in the morning, I went ashore, with Mr. Gilbert, to look for fresh water. We landed in the cove above mentioned, and were received with great courtesy by the natives. After I had distributed some presents amongst them, I asked for water, and was conducted to a pond of it that was brackish, about three-fourths of a mile from the landing-place; which I suppose to be the same that Tasman watered at. In the mean time, the people in the boat had laden her with fruit and roots, which the natives had brought down, and exchanged for nails and beads. On our return to the ship, I found the same sort of traffic carrying on there. After breakfast, I went ashore with two boats to trade with the people, accompanied by several of the gentlemen, and ordered the launch to follow with casks to be filled with water. The natives assisted us to roll them to and from the pond; and a nail or a bead was the expense of their labour. Fruit and roots, especially shaddocks and yams, were brought down in such plenty, that the two boats were laden, sent off, cleared, and laden a second time, before noon; by which time also the launch had got a full supply of water, and the botanical and shooting parties had all come in, except the surgeon, for whom we could not wait, as the tide was ebbing fast out of the cove; consequently he was left behind. As there is no getting into the cove with a boat, from between half ebb to half flood, we could get off no water in the afternoon. However, there is a very good landing-place without it, near the southern point, where boats can get ashore at all times of the tide; here some of the officers landed after dinner, where they found the surgeon, who had been robbed of his gun. Having come down to the shore some time after the boats had put off, he got a canoe to bring him on board; but as he was getting into her, a fellow snatched hold of the gun, and ran off with it. After that no one would carry him to the ship, and they would have stripped him, as he imagined, had he not presented a toothpick case, which they, no doubt, thought was a little gun. As soon as I heard of this, I landed at the place above mentioned, and the few natives who were there fled at my approach. After landing, I went in search of the officers, whom I found in the cove, where we had been in the morning, with a good many of the natives about them. No step had been taken to recover the gun, nor did I think proper to take any; but in this I was wrong. The easy manner of obtaining this gun, which they now, no doubt, thought secure in their possession, encouraged them to proceed in these tricks, as will soon appear. The alarm the natives had caught being soon over, they carried fruit, &c. to the boats, which got pretty well laden before night, when we all returned on board.

Early in the morning of the 28th. Lieutenant Clerke, with the Master and fourteen or

fifteen men, went on shore in the launch for water. I did intend to have followed in another boat myself, but rather unluckily deferred it till after breakfast. The launch was no sooner landed than the natives gathered about her, behaving in so rude a manner, that the officers were in some doubt if they should land the casks; but, as they expected me on shore soon, they ventured, and, with difficulty, got them filled, and into the boat again. In the doing of this, Mr. Clerke's gun was snatched from him, and carried off; as were also some of the cooper's tools; and several of the people were stripped of one thing or another. All this was done, as it were, by stealth; for they laid hold of nothing by main force. I landed just as the launch was ready to put off; and the natives, who were pretty numerous on the beach, as soon as they saw me, fled; so that I suspected something had happened. However, I prevailed on many to stay, and Mr. Clerke came, and informed me of all the preceding circumstances. I quickly came to a resolution to oblige them to make restitution; and, for this purpose, ordered all the marines to be armed, and sent on shore. Mr. Forster and his party being gone into the country, I ordered two or three guns to be fired from the ship, in order to alarm him; not knowing how the natives might act on this occasion. These orders being given, I sent all the boats off but one, with which I stayed, having a good many of the natives about me, who behaved with their usual courtesy. I made them so sensible of my intention, that long before the marines came, Mr. Clerke's musket was brought, but they used many excuses to divert me from insisting on the other. At length Mr. Edgcombe arriving with the marines, this alarmed them so much, that some of them fled. The first step I took was to seize on two large double-sailing canoes which were in the cove. One fellow making resistance, I fired some small shot at him, and sent him limping off. The natives being now convinced that I was in earnest, all fled; but on my calling to them, many returned; and, presently after, the other musket was brought, and laid at my feet. That moment I ordered the canoes to be restored, to show them on what account they were detained. The other things we had lost being of less value, I was the more indifferent about them. By this time the launch was ashore for another turn of water, and we were permitted to fill the casks without any one daring to come near us; except one man, who had befriended us during the whole affair, and seemed to disapprove of the conduct of his countrymen.

On my returning from the pond to the cove, I found a good many people collected together, from whom we understood that the man I had fired at was dead. This story I treated as improbable, and addressed a man, who seemed of some consequence, for the restitution of a cooper's adze we had lost in the morning. He immediately sent away two men, as I thought, for it; but I soon found that we had greatly mistaken each other; for, instead of the adze, they brought the wounded man, stretched out on a board, and laid him down by me, to all appearance dead. I was much moved at the sight; but soon saw my mistake, and that he was only wounded in the hand and thigh. I therefore desired he might be carried out of the sun, and sent for the surgeon to dress his wounds. In the mean time, I addressed several people for the adze; for as I had now nothing else to do, I determined to have it. The one I applied the most to, was an elderly woman, who had always a great deal to say to me, from my first landing; but, on this occasion, she gave her tongue full scope. I understood but little of her eloquence; and all I could gather from her arguments was, that it was mean in me to insist on the return of so trifling a thing. But when she found I was determined, she and three or four more women went away; and soon after the adze was brought me, but I saw her no more. This I was sorry for, as I wanted to make her a present, in return for the part she had taken in all our transactions, private as well as public. For I was no sooner returned from the pond, the first time I landed,

As soon as the surgeon got ashore, he dressed the man's wounds, and bled him; and was of opinion that he was in no sort of danger, as the shot had done little more than penetrate the skin. In the operation, some poultice being wanting, the surgeon asked for ripe plantains; but they brought sugar-cane, and having chewed it to a pulp, gave it him to apply to the wound. This being of a more balsamic nature than the other, proves that these people have some knowledge of simples. As soon as the man's wounds were dressed, I made him a present, which his master, or at least the man who owned the canoe, took most

probably to himself. Matters being thus settled, apparently to the satisfaction of all parties, we repaired on board to dinner, where I found a good supply of fruit and roots, and therefore gave orders to get everything in readiness to sail.

I now was informed of a circumstance which was observed on board: several canoes being at the ship, when the great guns were fired in the morning, they all retired, but one man, who was baling the water out of his canoe, which lay alongside, directly under the guns. When the first was fired, he just looked up, and then, quite unconcerned, continued his work; nor had the second gun any other effect upon him; he did not stir till the water was all out of his canoe, when he paddled leisurely off. This man had several times been observed to take fruit and roots out of other canoes, and sell them to us. If the owners did not willingly part with them, he took them by force; by which he obtained the appellation of custom-house officer. One time, after he had been collecting tribute, he happened to be lying alongside of a sailing canoe which was on board. One of her people seeing him look another way, and his attention otherwise engaged, took the opportunity of stealing somewhat out of his canoe; they then put off, and set their sail; but the man, perceiving the trick they had played him, darted after them, and having soon got on board their canoe, beat him who had taken his things, and not only brought back his own but many other articles which he took from them. This man had likewise been observed making collections on shore at the trading-place. I remembered to have seen him there; and, on account of his gathering tribute, took him to be a man of consequence, and was going to make him a present; but some of their people would not let me, saying he was no *Areeke* (that is, chief).

SCENE IN THE FRIENDLY ISLES.

He had his hair always powdered with some kind of white dust

As we had no wind to sail this afternoon, a party of us went ashore in the evening. We found the natives everywhere courteous and obliging; so that, had we made a longer stay, it is probable we should have had no more reason to complain of their conduct. While I was now on shore, I got the names of twenty islands which lie between the N.W. and N.E., some of them in sight. Two of them, which lie most to the West, viz. Amattafoa and Oghao, are remarkable on account of their great height. In Amattafoa, which is the westernmost, we judged there was a volcano, by the continual column of smoke we saw daily ascending from the middle of it.

Both Mr. Cooper and myself being on shore at noon, Mr. Wales could not wind up the watch at the usual time; and as we did not come on board till late in the afternoon, it was forgotten till it was down. This circumstance was of no consequence, as Mr. Wales had had several altitudes of the sun at this place before it went down, and also had opportunities of taking some after.

At daybreak on the 29th, having got under sail with a light breeze at west, we stood to the north for the two high islands; but the wind, scanting upon us, carried us in amongst the low isles and shoals, so that we had to ply to clear them. This gave time for a great many canoes, from all parts, to get up with us. The people in them brought for traffic various articles; some roots, fruits, and fowls, but of the latter not many. They took in exchange small nails and pieces of any kinds of cloth. I believe, before they went away,

they stripped the most of our people of the few clothes the ladies of Otaheite had left them ; for the passion for curiosities was as great as ever. Having got clear of the low isles, we made a stretch to the south, and did but fetch a little to windward of the south end of Anamocka ; so that we got little by this day's plying. Here we spent the night, making short boards over that space with which we made ourselves acquainted the preceding day. On the 30th, at daybreak, stretched out for Amattafoa, with a gentle breeze at W.S.W. Day no sooner dawned than we saw canoes coming from all parts. Their traffic was much the same as it had been the day before, or rather better ; for out of one canoe I got two pigs, which were scarce articles here. At four in the afternoon, we drew near the island of Amattafoa, and passed between it and Oghao, the channel being two miles broad, safe, and without soundings. While we were in the passage, we had little wind and calms. This gave time for a large sailing double canoe, which had been following us all the day, as well as some others with paddles, to come up with us.

I had now an opportunity to verify a thing I was before in doubt about ; which was, whether or not some of these canoes did not, in changing tacks, only shift the sail, and so proceed with that end foremost which before was the stern. the one we now saw wrought in this manner ; the sail is latteen, extended to a latteen yard above, and to a boom at the foot ; in one word, it is like a whole mizen, supposing the whole foot to be extended to a boom. The yard is slung nearly in the middle, or upon an equipoise. When they change tacks, they throw the vessel up in the wind, ease off the sheet, and bring the heel or tack-end of the yard to the other end of the boat, and the sheet in like manner : there are notches, or sockets, at each end of the vessel, in which the end of the yard fixes. In short, they work just as these do at the Ladrone Islands, according to Mr. Walter's description *. When they want to sail large, or before the wind, the yard is taken out of the socket and squared. It must be observed, that all their sailing vessels are not rigged to sail in the same manner ; some, and those of the largest size, are rigged so as to tack about. These have a short, but pretty stout mast, which steps on a kind of roller that is fixed to the deck near the fore part. It is made to lean or incline very much forward ; the head is forked : on the two points of

SAILING CANOES OF ANAMOCKA.

which the yard rests, as on two pivots, by means of two strong cleats of wood secured to each side of the y. ., at about one-third its length from the tack or heel, which, when under sail, is confined down between the two canoes by means of two strong ropes, one to and passing through a hole at the head of each canoe ; for, it must be observed, that all the sailing vessels of this sort are double. The tack being thus fixed, it is plain that, in changing tacks, the vessels must be put about ; the sail and boom on the one tack will be clear of the mast, and on the other it will lie against it, just as a whole mizen. However, I am not

* See Lord Anson's Voyage.

sure if they do not sometimes unlace that part of the sail from the yard which is between the tack and mast-head, and so shift both sail and boom leeward of the mast. The drawings which Mr. Hodges made of these vessels seem to favour this supposition, and will not only illustrate, but in a manner make the description of them unnecessary. The out-riggers and ropes used for shrouds &c. are all stout and strong: indeed, the sail, yard, and boom are all together of such an enormous weight, that strength is required.

The summit of Amattafoa was hid in the clouds the whole day, so that we were not able to determine with certainty whether there was a volcano or not; but everything we could see concurred to make us believe there was. This island is about five leagues in circuit: Oghao is not so much, but more round and peaked. They lie in the direction of N.N.W. $\frac{1}{2}$ W. from Anamocka, eleven or twelve leagues distant: they are both inhabited, but neither of them seemed fertile. We were hardly through the passage before we got a fresh breeze at south. That moment, all the natives made haste to be gone, and we steered to the west, all sails set. I had some thoughts of touching at Amsterdam, as it lay not much out of the way; but, as the wind was now, we could not fetch it; and this was the occasion of my laying my design aside altogether.

Let us now return to Anamocka, as it is called by the natives. It is situated in the latitude of $20^{\circ} 15' S.$, longitude $174^{\circ} 31' W.$, and was first discovered by Tasman, and by him named Rotterdam. It is of a triangular form, each side whereof is about three and a half or four miles. A salt-water lake in the middle of it occupies not a little of its surface, and in a manner cuts off the S.E. angle. Round the island, that is, from the N.W. to the S., round by the N. and E., lie scattered a number of small isles, sand-banks, and breakers. We could see no end to their extent to the north; and it is not impossible that they reach as far south as Amsterdam or Tongatabu. These, together with Middleburg, or Eaoowee, and Pylstart, make a group, containing about three degrees of latitude and two of longitude, which I have named the Friendly Isles or Archipelago, as a firm reliance and friendship seems to subsist among their inhabitants, and their courteous behaviour to strangers entitles them to that appellation; under which we might perhaps extend their group much farther, even down to Boscawen and Keppel's Isles, discovered by Captain Wallis, and lying nearly under the same meridian, and in the latitude of $15^{\circ} 53'$; for, from the little account I have had of the people of these two isles, they seem to have the same sort of friendly disposition we observed in our Archipelago.

The inhabitants, productions, &c. of Rotterdam and the neighbouring isles, are the same as at Amsterdam. Hogs and fowls are, indeed, much scarcer; of the former having got but six, and not many of the latter. Yams and shaddock were what we got the most of; other fruits were not so plenty. Not half the isle is laid out in inclosed plantations as at Amsterdam; but the parts which are not inclosed are not less fertile or uncultivated. There is, however, far more waste land on this isle, in proportion to its size, than upon the other, and the people seem to be much poorer; that is, in cloth, matting, ornaments, &c., which constitute a great part of the riches of the South Sea islanders. The people of this isle seem to be more affected with the leprosy, or some scrofulous disorder, than any I have seen elsewhere. It breaks out in the face more than any other part of the body: I have seen several whose faces were ruined by it, and their noses quite gone. In one of my excursions, happening to peep into a house where one or more of them were, one man only appeared at the door, or hole by which I must have entered, and which he began to stop up, by drawing several parts of a cord across it; but the intolerable stench which came from his putrid face was alone sufficient to keep me out, had the entrance been ever so wide. His nose was quite gone, and his whole face in one continued ulcer, so that the very sight of him was shocking. As our people had not all got clear of a certain disease they had contracted at the Society Isles, I took all possible care to prevent its being communicated to the natives here; and I have reason to believe my endeavours succeeded.

Having mentioned a house, it may not be amiss to observe, that some here differ from those I saw at the other isles; being inclosed or walled on every side with reeds neatly put together, but not close. The entrance is by a square hole about two and a half feet each way. The form of these houses is an oblong square; the floor or foundation every way

shorter than the eye, which is about four feet from the ground. By this construction, the rain that falls on the roof is carried off from the wall; which otherwise would decay and rot. We did not distinguish any king, or leading chief, or any person who took upon him the appearance of supreme authority. The man and woman before mentioned, whom I believed to be man and wife, interested themselves on several occasions in our affairs; but it was easy to see they had no great authority. Amongst other things which I gave them as a reward for their service, was a young dog and bitch, animals which they have not, but are very fond of, and know very well by name. They have some of the same sort of earthen pots we saw at Amsterdam; and I am of opinion they are of their own manufacture, or that of some neighbouring isle.

The road, as I have already mentioned, is on the north side of the isle, just to the southward of the southernmost cove; for there are two on this side. The bank is of some extent, and the bottom free from rocks, with twenty-five and twenty fathoms water, one or two miles from the shore. Fire-wood is very convenient to be got at, and easy to be shipped off; but the water is so brackish that it is not worth the trouble of carrying it on board; unless one is in great distress for want of that article, and can get no better. There is, however, better, not only on this isle, but on others in the neighbourhood; for the people brought us some in cocoa-nut shells, which was as good as need be; but probably the springs are too trifling to water a ship.

I have already observed that the S.W. side of the island is covered by a reef or reefs of rocks and small isles. If there be a sufficient depth of water between them and the island, as there appeared to be, and a good bottom, this would be a much securer place for a ship to anchor in than that where we had our station.

CHAPTER III.—THE PASSAGE FROM THE FRIENDLY ISLES TO THE NEW HEBRIDES; WITH AN ACCOUNT OF THE DISCOVERY OF TURTLE ISLAND, AND A VARIETY OF INCIDENTS WHICH HAPPENED, BOTH BEFORE AND AFTER THE SHIP ARRIVED IN PORT SANDWICH, IN THE ISLAND OF MALLICOLLO.—A DESCRIPTION OF THE PORT; THE ADJACENT COUNTRY; ITS INHABITANTS, AND MANY OTHER PARTICULARS.

ON the 1st of July, at sunrise, Amattafoa was still in sight, bearing E. by N., distant twenty leagues. Continuing our course to the west, we, the next day at noon, discovered land bearing N.W. by W., for which we steered, and, upon a nearer approach, found it to be a small island. At 4 o'clock it bore, from N.W. $\frac{1}{2}$ W. to N.W. by N., and, at the same time, breakers were seen from the mast-head, extending from W. to S.W. The day being too far spent to make farther discoveries, we soon after shortened sail, hauled the wind, and spent the night making short boards, which, at daybreak, we found had been so advantageous, that we were farther from the island than we expected, and it was eleven o'clock before we reached the N.W. or lee side, where anchorage and landing seemed practicable. In order to obtain a knowledge of the former, I sent the master with a boat to sound; and, in the mean time, we stood on and off with the ship. At this time, four or five people were seen on the reef, which lies round the isle, and about three times that number on the shore. As the boat advanced, those on the reef retired, and joined the others; and when the boat landed, they all fled to the woods. It was not long before the boat returned, when the master informed me that there were no soundings without the reef, over which, in one place only, he found a boat-channel of six feet water. Entering by it, he rowed in for the shore, thinking to speak with the people, not more than twenty in number, who were armed with clubs and spears; but the moment he set his foot on shore, they retired to the woods. He left on the rocks some medals, nails, and a knife; which they, no doubt, found, as some were seen near the place afterwards. This island is not quite a league in length, in the direction of N.E. and S.W., and not half that in breadth. It is covered with wood, and surrounded by a reef of coral rocks, which, in some places, extend two miles from the shore. It seems to be too small to contain many inhabitants; and probably the few whom we saw may have come from some isle in the neighbourhood to fish for turtle;

as many were seen near this reef, and occasioned that name to be given to the island, which is situated in latitude $19^{\circ} 48' S.$, longitude $178^{\circ} 2' W.$

Seeing breakers to the S.S.W., which I was desirous of knowing the extent of before night, I left Turtle Isle, and stood for them. At two o'clock we found they were occasioned by a coral bank of about four or five leagues in circuit. By the bearing we had taken, we knew these to be the same breakers we had seen the preceding evening. Hardly any part of this bank or reef is above water at the reflux of the waves. The heads of some rocks are to be seen near the edge of the reef, where it is the shoalest; for in the middle is deep water. In short, this bank wants only a few little islets to make it exactly like one of the half-drowned isles so often mentioned. It lies S.W. from Turtle Island, about five or six miles, and the channel between it and the reef of that isle is three miles over. Seeing no more shoals or islands, and thinking there might be turtle on this bank, two boats were properly equipped and sent thither, but returned without having seen one.

The boats were now hoisted in, and we made sail to the west, with a brisk gale at east, which continued till the 9th, when we had, for a few hours, a breeze at N.W., attended with squalls of rain. This was succeeded by a steady fresh gale at S.E., with which we steered N.W., being at this time in the latitude of $20^{\circ} 20' S.$, longitude $176^{\circ} 8' E.$ On the 15th at noon, being in the latitude of $15^{\circ} 9' S.$, longitude $171^{\circ} 16' E.$, I steered W. The next day the weather was foggy, and the wind blew in heavy squalls, attended with rain, which in this ocean, within the tropics, generally indicates the vicinity of some high land. This was verified at three in the afternoon, when high land was seen bearing S.W. Upon this we took in the small sails, reefed the top-sails, and hauling up for it, at half past five, we could see it extend from S.S.W. to N.W. by W. $\frac{1}{2}$ W. Soon after we tacked and spent the night, which was very stormy, in plying. Our boards were disadvantageous; for, in the morning, we found we had lost ground. This, indeed, was no wonder, for having an old suit of sails bent, the most of them were split to pieces; particularly a fore-top-sail, which was rendered quite useless. We got others to the yards, and continued to ply, being desirous of getting round the south ends of the lands, or at least so far to the south as to be able to judge of their extent in that direction. For no one doubted that this was the *Australia del Espiritu Santo* of Quiros, which M. de Bougainville calls the *Great Cyclades*, and that the coast we were now upon was the east side of *Aurora Island*, whose longitude is $168^{\circ} 30' E.$

The gale kept increasing till we were reduced to our low sails; so that, on the 18th, at seven in the morning, I gave over plying, set the top-sails double-reefed, bore up for, and hauled round the north end of *Aurora Island*, and then stretched over for the *Isle of Lepers*, under close-reefed top-sails and courses, with a very hard gale at N.E.; but we had now the advantage of a smooth sea, having the *Isle of Aurora* to windward. At noon the north end of it bore N.E. $\frac{1}{2}$ N., distant four leagues; our latitude, found by double altitudes, and reduced to this time, was $15^{\circ} 1' 30' S.$, longitude $168^{\circ} 14' E.$ At two o'clock P.M. we drew near the middle of the *Isle of Lepers*, and tacked about two miles from land; in which situation we had no soundings with a line of seventy fathoms. We now saw people on the shore, and many beautiful cascades of water pouring down the neighbouring hills. The next time we stood for this isle, we came to within half-a-mile of it, where we found thirty fathoms, a sandy bottom; but a mile off we had no soundings at seventy fathoms. Here two canoes came off to us, in one of which were three men, and in the other but one. Though we made all the signs of friendship, we could not bring them nearer than a stone's throw; and they made but a short stay before they retired ashore, where we saw a great number of people assembled in parties, and armed with bows and arrows. They are of a very dark colour, and, excepting some ornaments at their breast and arms, seemed to be entirely naked.

As I intended to get to the south, in order to explore the land which might lie there, we continued to ply between the *Isle of Lepers* and *Aurora*; and on the 19th, at noon, the south end of the last-mentioned isle bore south 24° east, and the north end north, distant twenty miles. Latitude observed, $15^{\circ} 11'$. The wind continued to blow strong at S.E.; so that what we got by plying in the day, we lost in the night. On the 20th, at sunrise,

we found ourselves off the south end of Aurora, on the N.W. side of which the coast forms a small bay. In this we made some trips to try for anchorage; but found no less than eighty fathoms water, the bottom a fine dark sand, at half-a-mile from shore. Nevertheless, I am of opinion that, nearer, there is much less depth, and secure riding; and in the neighbourhood is plenty of fresh water and wood for fuel. The whole isle, from the sea-shore to the summits of the hills, seemed to be covered with the latter; and every valley produced a fine stream of the former. We saw people on the shore, and some canoes on the coast, but none came off to us. Leaving the bay just mentioned, we stretched across the channel which divides Aurora from Whitsuntide island. At noon we were abreast of the north end of this latter, which bore E.N.E., and observed in $15^{\circ} 28\frac{1}{2}'$. The Isle of Aurora bore from N. to N.E. $\frac{1}{2}$ E., and the Isle of Lepers from N. by W. $\frac{1}{2}$ W. to W. Whitsuntide Isle appeared joined to the land to the S. and S.W. of it; but in stretching to S.W. we discovered the separation. This was about four o'clock P.M., and then we tacked and stretched in for the island till near sunset, when the wind veering more to the east made it necessary to resume our course to the south. We saw people on the shore, smokes in many parts of the island, and several places which seemed to be cultivated. About midnight, drawing near the south land, we tacked and stretched to the north, in order to spend the remainder of the night.

At daybreak on the 21st, we found ourselves before the channel that divides Whitsuntide island from the south land, which is about two leagues over. At this time, the land to the southward extended from S. by E. round to the west farther than the eye could reach, and on the part nearest to us, which is of considerable height, we observed two very large columns of smoke, which, I judged, ascended from volcanoes. We now stood S.S.W. with a fine breeze at S.E., and, at ten o'clock, discovered this part of the land to be an island which is called by the natives Ambrym. Soon after an elevated land appeared open off the south end of Ambrym; and after that, another still higher, on which is a high peaked hill. We judged these lands to belong to two separate islands. The first came in sight at S.E., the second at E. by S., and they appeared to be ten leagues distant. Holding on our course for the land ahead, at noon it was five miles distant from us, extending from S.S.E. to N.W. by W., and appeared to be continued. The islands to the east bore from N.E. by E., to S.E. by E.; latitude observed $16^{\circ} 17'$ South. As we drew nearer the shore we discovered a creek, which had the appearance of being a good harbour, formed by a low point or peninsula, projecting out to the north. On this a number of people were assembled, who seemed to invite us ashore; probably with no good intent, as the most of them were armed with bows and arrows. In order to gain room and time to hoist out and arm our boats, to reconnoitre this place, we tacked and made a trip off, which occasioned the discovery of another port about a league more to the south. Having sent two armed boats to sound, and look for anchorage, on their making the signal for the latter, we sailed in S.S.W. and anchored in eleven fathoms water, not two cables' length from the S.E. shore, and a mile within the entrance. We had no sooner anchored than several of the natives came off in canoes. They were very cautious at first; but, at last, trusted themselves alongside, and exchanged, for pieces of cloth, arrows; some of which were pointed with bone, and dipped in some green gummy substance, which we naturally suppose was poisonous. Two men having ventured on board, after a short stay I sent them away with presents. Others, probably induced by this, came off by moonlight; but I gave orders to permit none to come alongside; by which means we got clear of them for the night.

Next morning early, a good many came round us, some in canoes, and others swimming. I soon prevailed on one to come on board; which he no sooner did than he was followed by more than I desired; so that not only our deck but rigging was presently filled with them. I took four into the cabin, and gave them various articles, which they showed to those in the canoes, and seemed much pleased with their reception. While I was thus making friends with those in the cabin, an accident happened that threw all into confusion, but in the end, I believe, proved advantageous to us. A fellow in a canoe having been refused admittance into one of our boats that lay alongside, bent his bow to shoot a poisoned arrow at the boat-keeper. Some of his countrymen prevented his doing it that instant, and gave time to

acquaint me with it. I ran instantly on deck, and saw another man struggling with him; one of those who had been in the cabin, and had leaped out of the window for this purpose. The other seemed resolved, shook him off, and directed his bow again to the boat-keeper; but on my calling to him, pointed it at me. Having a musket in my hand, loaded with small-shot, I gave him the contents. This staggered him for a moment, but did not prevent him from holding his bow still in the attitude of shooting. Another discharge of the same nature made him drop it, and the others, who were in the canoe, to paddle off with all speed. At this time, some began to shoot arrows on the other side. A musket discharged in the air had no effect; but a four-pound shot over their heads sent them off in the utmost confusion. Many quitted their canoes and swam on shore; those in the great cabin leaped out of the windows; and those who were on the deck, and on different parts of the rigging, all leaped overboard. After this we took no farther notice of them, but suffered them to come off and pick up their canoes; and some even ventured again alongside the ship. Immediately after the great gun was fired, we heard the beating of drums on shore; which was, probably, the signal for the country to assemble in arms. We now got every thing in readiness to land, to cut some wood, of which we were in want, and to try to get some refreshments, nothing of this kind having been seen in any of the canoes.

About nine o'clock, we put off in two boats, and landed in the face of four or five hundred people, who were assembled on the shore. Though they were all armed with bows and arrows, clubs and spears, they made not the least opposition. On the contrary, seeing me advance alone, with nothing but a green branch in my hand, one of them, who seemed to be a chief, giving his bow and arrows to another, met me in the water, bearing also a green branch, which having exchanged for the one I held, he then took me by the hand, and led me up to the crowd. I immediately distributed presents to them, and, in the mean time, the marines were drawn up on the beach. I then made signs (for we understood not a word of their language) that we wanted wood; and they made signs to us to cut down the trees. By this time, a small pig being brought down and presented to me, I gave the bearer a piece of cloth, with which he seemed well pleased. This made us hope that we should soon have some more; but we were mistaken. The pig was not brought to be exchanged for what we had, but on some other account; probably as a peace-offering. For all we could say or do did not prevail on them to bring down, after this, above half-a-dozen cocoa-nuts, and a small quantity of fresh water. They set no value on nails, or any sort of iron tools; nor indeed on anything we had. They would, now and then, exchange an arrow for a piece of cloth; but very seldom would part with a bow. They were unwilling we should go off the beach, and very desirous we should return on board. At length, about noon, after sending what wood we had cut on board, we embarked ourselves; and they all retired, some one way and some another.

Before we had dined, the afternoon was too far spent to do anything on shore; and all hands were employed, setting up the rigging, and repairing some defects in it. But seeing a man bring along the strand a buoy, which they had taken in the night from the kedg-anchor, I went on shore for it, accompanied by some of the gentlemen. The moment we landed, it was put into the boat by a man who walked off again without speaking one word. It ought to be observed, that this was the only thing they took, or even attempted to take from us, by any means whatever. Being landed near some of their plantations and houses, which were just within the skirts of the woods, I prevailed on one man to conduct me to them; but, though they suffered Mr. Forster to go with me, they were unwilling any more should follow. These houses were something like those of the other isles; rather low, and covered with palm thatch; some were inclosed, or walled round with boards; and the entrance to these was by a square hole at one end, which at this time was shut up, and they were unwilling to open it for us to look in. There were here about six houses, and some small plantations of roots, &c. fenced round with reeds as at the Friendly Isles. There were, likewise, some bread-fruit, cocoa-nut, and plantain trees; but very little fruit on any of them. A good many fine yams were piled up upon sticks, or a kind of raised platform; and about twenty pigs, and a few fowls, were running about loose. After making these observations, having embarked, we proceeded to the S.E. point of the harbour, where we again landed

and walked along the beach till we could see the islands to the S.E. already mentioned. The names of these we now obtained, as well as the name of that on which we were. This they called Mallicollo*: the island that first appeared over the south end of Ambrym is called Apee; and the other, with the hill on it, Paoom. We found on the beach a fruit like an orange, called by them Abli-mora, but whether it be fit for eating, I cannot say, as this was decayed.

Proceeding next to the other side of the harbour, we there landed, near a few houses, at the invitation of some people who came down to the shore; but we had not been there five minutes before they wanted us to be gone. We complied, and proceeded up the harbour in order to land it, and to look for fresh water, of which, as yet, we had seen none, but the very little that the natives brought, which we knew not where they got. Nor was our search now attended with success; but this is no proof that there is not any. The day was too far spent to examine the place well enough to determine this point. Night having brought us on board, I was informed that no soul had been off to the ship; so soon was the curiosity of these people satisfied. As we were coming on board, we heard the sound of a drum, and, I think of some other instruments, and saw people dancing; but as soon as they heard the noise of the oars, or saw us, all was silent.

Being unwilling to lose the benefit of the moonlight nights, which now happened, at seven A. M. on the 23d we weighed, and, with a light air of wind, and the assistance of our boats, proceeded out of the harbour; the south end of which, at noon, bore W.S.W. distant about two miles. When the natives saw us under sail, they came off in canoes, making exchanges with more confidence than before, and giving such extraordinary proofs of their honesty as surprised us. As the ship at first had fresh way through the water, several of them dropped astern after they had received our goods, and before they had time to deliver theirs in return. Instead of taking advantage of this, as our friends at the Society Isles would have done, they used their utmost efforts to get up with us, and to deliver what they had already been paid for. One man, in particular, followed us a considerable time, and did not reach us till it was calm, and the thing was forgotten. As soon as he came alongside, he held up the thing which several were ready to buy; but he refused to part with it, till he saw the person to whom he had before sold it, and to him he gave it. The person not knowing him again, offered him something in return, which he refused, and showed him what he had given him before. Pieces of cloth and marble paper were in most esteem with them; but edge-tools, nails, and beads, they seemed to disregard. The greatest number of canoes we had alongside at once did not exceed eight, and not more than four or five people in each; who would frequently retire to the shore all on a sudden, before they had disposed of half their things, and then others would come off.

At the time we came out of the harbour, it was about low water, and great numbers of people were then on the shoals or reefs which lie along the shore, looking, as we supposed, for shell and other fish. Thus our being on their coast, and in one of their ports, did not hinder them from following the necessary employments. By this time they might be satisfied we meant them no harm; so that, had we made a longer stay, we might soon have been upon good terms with this ape-like nation; for, in general, they are the most ugly, ill-proportioned people I ever saw, and in every respect different from any we had met with in this sea. They are a very dark-coloured and rather diminutive race; with long heads, flat faces, and monkey countenances. Their hair, mostly black or brown, is short and curly; but not quite so soft and woolly as that of a negro. Their beards are very strong, crisp, and bushy, and generally black and short. But what most adds to their deformity, is a belt, or cord, which they wear round the waist, and tie so tight over the belly that the shape of their bodies is not unlike that of an overgrown pismire. The men go quite naked, except a piece of cloth or leaf used as a wrapper†.

* Or Mallicollo. Some of our people pronounced it Manicelo or Manicola, and thus it is also written in Quiros's Memorial, as printed by Dalrymple, vol. ii. p. 146.

† The particular manner of applying the wrapper may

be seen in Wafer's Voyage, who mentions this singular custom as existing, though with some little variation, amongst the Indians of the Isthmus of Darien. See Wafer's Voyage, p. 140.

We saw but few women, and they were not less ugly than the men: their heads, faces, and shoulders are painted red; they wear a kind of petticoat; and some of them had something over their shoulders like a bag, in which they carry their children. None of them came off to the ship, and they generally kept at a distance when we were on shore. Their ornaments are ear-rings, made of tortoiseshell, and bracelets. A curious one of the latter, four or five inches broad, wrought with thread or cord, and studded with shells, is worn by them just above the elbow. Round the right wrist they wear hogs' tusks bent circular and rings made of shells; and round their left, a round piece of wood, which we judged was to ward off the bow-string. The bridge of the nose is pierced, in which they wear a piece of white stone, about an inch and a half long, and in this shape. As signs of friendship they present a green branch, and sprinkle water with the hand over the head.

Their weapons are clubs, spears, and bows and arrows. The two former are made of hard or iron wood. Their bows are about four feet long, made of a stick split down the middle, and are not circular, but in this form. The arrows, which are a sort of reeds, are sometimes armed with a long and sharp point, made of the hard wood, and sometimes with a very hard point made of bone; and these points are all covered with a substance which we took for poison. Indeed, the people themselves confirmed our suspicions, by making signs to us not to touch the point, and giving us to understand, that if we were pricked by them we should die. They are very careful of them themselves, and keep them always wrapped up in a quiver. Some of these arrows are armed with two or three points, each with small prickles on the edges, to prevent the arrow being drawn out of the wound.

The people of Mallicollo seemed to be a quite different nation from any we had yet met with, and speak a different language. Of about eighty words which Mr. Forster collected, hardly one bears any affinity to the language spoken at any other island or place I had ever been at. The letter R is used in many of their words; and frequently two or three being joined together, such words we found difficult to pronounce. I observed that they could pronounce most of our words with great ease. They express their admiration by hissing like a goose.

To judge of the country by the little we saw of it, it must be fertile; but I believe their fruits are not so good as those of the Society or Friendly Isles. Their coconut trees, I am certain, are not; and their bread-fruit and plantains did not seem much better. But their yams appeared to be very good. We saw no other animals than those I have already mentioned. They have not so much as a name for a dog, and consequently have none; for which reason we left them a dog and a bitch; and there is no doubt they will be taken care of, as they were very fond of them. After we had got to sea, we tried what effect one of the poisoned arrows would have on a dog. Indeed we had tried it in the harbour the very first night, but we thought the operation had been too slight, as it had no effect. The surgeon now made a deep incision in the dog's thigh, into which he laid a large portion of the poison just as it was scraped from the arrows, and then bound up the wound with a bandage. For several days after, we thought the dog was not so well as he had been before; but whether this was really so, or only suggested by imagination, I know not. He was afterwards as if nothing had been done to him, and lived to be brought home to England. However, I have no doubt of this stuff being of a poisonous quality, as it could answer no other purpose. The people seemed not unacquainted with the nature of poisons; for when they brought us water on shore, they first tasted it, and then gave us to understand we might with safety drink it.

This harbour, which is situated on the N.E. side of Mallicollo, not far from the S.E. end, in latitude $16^{\circ} 25' 20''$ S., longitude $167^{\circ} 57' 23''$ E., I named Port Sandwich. It lies in S.W. by S. about one league, and is one-third of a league broad. A reef of rocks extends out a little way from each point; but the channel is of a good breadth, and hath in it from forty to twenty-four fathoms water. In the port, the depth of water is from twenty to four fathoms; and it is so sheltered that no winds can disturb a ship at anchor there. Another great advantage is, you can lie so near the shore as to cover your people who may be at work upon it.

CHAPTER IV.—AN ACCOUNT OF THE DISCOVERY OF SEVERAL ISLANDS, AN INTERVIEW AND SKIRMISH WITH THE INHABITANTS UPON ONE OF THEM. THE ARRIVAL OF THE SHIP AT TANNA, AND THE RECEPTION WE MET WITH THERE.

Soon after we got to sea, we had a breeze at E.S.E. with which we stood over for Ambrym till three o'clock in the afternoon, when the wind veering to E.N.E. we tacked and stretched to the S.E. and weathered the S.E. end of Mallicollo, off which we discovered three or four small islands, that before appeared to be connected. At sunset the point bore S. 77° west, distant three leagues, from which the coast seemed to trend away west. At this time the isle of Ambrym extended from N. 30° E. to N. 65° E. The isle of Paoom from N. 76° E. to S. 88° E. and the isle of Apee from S. 83° E. to S. 43° east. We stood for this last isle, which we reached by midnight, and then brought to till daybreak on the 24th, when we made sail to the S.E. with a view of plying up to the eastward on the south side of Apee. At sunrise, we discovered several more islands, extending from the S.E. point of Apee to the south as far as S.E. by S. The nearest to us we reached by ten o'clock, and not being able to weather it, we tacked a mile from its shore in fourteen fathoms water. This island is about four leagues in circuit, is remarkable by having three high peaked hills upon it, by which it has obtained that name. In the p.m. the wind veering more to the north, we resumed our course to the east; and having weathered Threehills, stood for the group of small isles which lie off the S.E. point of Apee. These I called Shepherd's Isles, in honour of my worthy friend Dr. Shepherd, Plumian professor of astronomy at Cambridge. Having a fine breeze, I had thoughts of going through between them; but the channels being narrow, and seeing broken water in the one we were steering for, I gave up the design, and bore up, in order to go without, or to the south of them. Before this could be accomplished, it fell calm, and we were left to the mercy of the current, close to the isles, where we could find no soundings with a line of a hundred and eighty fathoms. We had now lands or islands in every direction, and were not able to count the number which lay round us. The mountain on Paoom was seen over the east end of Apee, bearing N.N.W. at eight o'clock. A breeze at S.E. relieved us from the anxiety the calm had occasioned; and we spent the night making short boards.

The night before we came out of Port Sandwich, two reddish fish, about the size of large bream, and not unlike them, were caught with hook and line. On these fish most of the officers, and some of the petty officers, dined the next day. The night following, every one who had eaten of them was seized with violent pains in the head and bones, attended with a scorching heat all over the skin, and numbness in the joints. There remained no doubt that this was occasioned by the fish being of a poisonous nature, and having communicated its bad effects to all who partook of them; even to the hogs and dogs. One of the former died about sixteen hours after; it was not long before one of the latter shared the same fate; and it was a week or ten days, before all the gentlemen recovered. These must have been the same sort of fish mentioned by Quiros*, under the name of Pargos, which poisoned the crews of his ships, so that it was some time before they recovered; and we should, doubtless, have been in the same situation, had more of them been eaten.

At daybreak on the 25th, we made a short stretch to the east of Shepherd's Isles till after sunrise, when, seeing no more land in that direction, we tacked and stood for the island we had seen in the south, having a gentle breeze at S.E. We passed to the east of Threehills, and likewise of a low isle, which lies on the S.E. side of it, between a remarkable peaked rock which obtained the name of Monument, and a small island named Twohills, on account of two peaked hills upon it, disjoined by a low and narrow isthmus. The channel between this island and the Monument is near a mile broad, and twenty-four fathoms deep. Except this rock, which is only accessible to birds, we did not find an island on which people were not seen. At noon, we observed, in latitude 17° 18' 30" longitude, made from Port Sand-

* Dalrymple's Collection of Voyages, vol. i. p. 140, 141.

wich, 45' east. In this situation the Monument bore N. 16° east, distant two miles; Two-hills bore N. 25° west, distant two miles, and in a line with the S.W. part of Threehills; and the islands to the south extended from S. 10° 30' E. to S. 42° west.

Continuing our course to the south, at five P.M. we drew near the southern lands, which we found to consist of one large island, whose southern and western extremities extended beyond our sight, and three or four smaller ones, lying off its north side. The two northernmost are much the largest, have a good height, and lie in the direction of E. by S. and W. by N. from each other, distant two leagues. I named the one Montagu, and the other Hinchinbrook, and the large island Sandwich, in honour of my noble patron the earl of Sandwich. Seeing broken water a-head between Montagu and Hinchinbrook Isles, we tacked; and soon after it fell calm. The calm continued till seven o'clock the next morning, when it was succeeded by a breeze from the westward. During the calm, having been carried by the currents and a S.E. swell, four leagues to the W.N.W., we passed Hinchinbrook Isle, saw the western extremity of Sandwich Island, bearing S.S.W. about five leagues distant, and at the same time discovered a small island to the west of this direction. After getting the westerly breeze, I steered S.E. in order to pass between Montagu Isle and the north end of Sandwich Island. At noon we were in the middle of the channel, and observed in latitude 17° 31' S. The distance from one island to the other is about four or five miles; but the channel is not much above half that breadth, being contracted by breakers. We had no soundings in it with a line of forty fathoms.

As we passed Montagu Isle several people came down to the sea-side, and, by signs, seemed to invite us ashore. Some were also seen on Sandwich Island, which exhibited a most delightful prospect, being spotted with woods and lawns, agreeably diversified, over the whole surface. It hath a gentle slope from the hills, which are of a moderate height, down to the sea-coast. This is low and guarded by a chain of breakers, so that there is no approaching it at this part. But more to the west, beyond Hinchinbrook Island, there seemed to run in a bay, sheltered from the reigning winds. The examining it not being so much an object with me as the getting to the south, in order to find the southern extremity of the archipelago, with this view I steered S.S.E., being the direction of the coast of Sandwich Island. We had but just got through the passage, before the west wind left us to variable light airs and calms; so that we were apprehensive of being carried back again by the currents, or rather of being obliged to return in order to avoid being driven on the shoals, as there was no anchorage, a line of a hundred and sixty fathoms not reaching to the bottom. At length a breeze springing up at S.W., we stood to S.E., and at sunset the Monument bore N. 14° 30' W., and Montagu Island N. 28° W., distant three leagues. We judged we saw the S.E. extremity of Sandwich Island bearing about S. by E.

We continued to stand to S.E. till four A.M. on the 27th, when we tacked to the west. At sunrise having discovered a new land bearing south, and making in three hills, this occasioned us to tack and stand towards it. At this time Montagu Isle bore N. 52° W., distant thirteen leagues; at noon it was nearly in the same direction, and the new land extended from S. $\frac{1}{2}$ E. to S. by W., and three hills seemed to be connected. Our latitude, by observation, was 18° 1' S., and the longitude, made from Port Sandwich, 1° 23' E. We continued to stand to the S.E. with a gentle breeze at S.W. and S.S.W. till the 28th at sunrise, when, the wind veering to the south, we tacked and stood to the west. The three hills mentioned above, we now saw belonged to one island, which extended from S. 35° to 71° W., distant about ten or twelve leagues.

Retarded by contrary winds, calms, and the currents that set to N.W., we were three days in gaining this space; in which time we discovered an elevated land to the south of this. It first appeared in detached hummocks, but we judged it to be connected. At length, on the 1st of August, about ten A.M. we got a fine breeze at E.S.E. which soon after veered to N.E., and we steered for the N.W. side of the island. Reaching it about two P.M., we ranged the west coast at one mile from shore, on which the inhabitants appeared in several parts, and by signs invited us to land. We continued to sound without finding bottom, till we came before a small bay, or bending of the coast, where, near a mile from

shore, we found thirty and twenty-two fathoms water, a sandy bottom. I had thoughts of anchoring here, but the wind almost instantly veered to N.W., which being nearly on shore, I laid this design aside. Besides, I was unwilling to lose the opportunity that now offered of getting to the south-east, in order first to explore the lands which lay there. I therefore continued to range the coast to the south, at about the same distance from shore; but we soon got out of soundings. About a league to the south of this bay, which hath about two miles extent, is another more extensive. Towards the evening, the breeze began to abate, so that it was sunset before we got the length of it. I intended not to stop here, and stand to the south under an easy sail all night, but at eight o'clock, as we were steering S.S.E., we saw a light a-head. Not knowing but it might be on some low detached isle, dangerous to approach while dark, we hauled the wind, and spent the night standing off and on, or rather driving to and fro; for we had but very little wind.

At sunrise on the 2nd, we saw no more land than the coast we were upon; but found that the currents had carried us some miles to the north, and we attempted, to little purpose, to regain what we had lost. At noon we were about a league from the coast, which extended from S.S.E. to N.E. Latitude observed $18^{\circ} 46'$ S. In the afternoon, finding the ship to drift, not only to the north, but in shore also, and being yet to the south of the bay we passed the day before, I had thoughts of getting to an anchor before night, while we had it in our power to make choice of a place. With this view, having hoisted out two boats, one of them was sent a-head to tow the ship; in the other Mr. Gilbert went to sound for anchorage. Soon after, the towing boat was sent to assist him. So much time was spent in sounding this bay, that the ship drove past, which made it necessary to call the boats on board to tow her off from the northern point. But this service was performed by a breeze of wind, which, that moment, sprung up at S.W., so that as the boats got on board, we hoisted them in, and then bore up for the north side of the island, intending once more to try to get round by the east. Mr. Gilbert informed me that, at the south part of the bay, he found no soundings till close to a steep stone beach, where he landed to taste a stream of water he saw there, which proved to be salt. Some people were seen there, but they kept at a distance. Farther down the coast, that is to the north, he found twenty, twenty-four, and thirty fathoms, three-fourths of a mile, or a mile from shore, the bottom a fine dark sand.

On the 3rd, at sunrise, we found ourselves abreast a lofty promontory on the S.E. side of the island, and about three leagues from it. Having but little wind, and that from the south, right in our teeth, and being in want of fire-wood, I sent Lieutenant Clerke with two boats to a small islet which lies off the promontory, to endeavour to get some. In the mean time we continued to ply up with the ship; but what we gained by our sails, we lost by the current. At length, towards noon, we got a breeze at E.S.E. and E. with which we could lie up for the head; and soon after Mr. Clerke returned, having not been able to land, on account of a high surf on the shore. They met with no people on the isle; but saw a large bat, and some birds, and caught a water-snake. At six o'clock p.m. we got in with the land, under the N.W. side of the head, where we anchored in seventeen fathoms water, the bottom a fine dark sand, half-a-mile from shore; the point of the head bearing N. 18° E., distant half a league; the little islet before-mentioned N.E. by E. 4° E., and the N.W. point of the bay N. 32° W. Many people appeared on the shore, and some attempted to swim off to us; but having occasion to send the boat a-head to sound, they retired as she drew near them. This, however gave us a favourable idea of them.

On the 4th, at daybreak, I went with two boats to examine the coast, to look for a proper landing-place, wood, and water. At this time the natives began to assemble on the shore, and by signs invited us to land. I went first to a small beach, which is towards the head, where I found no good landing, on account of some rocks which everywhere lined the coast. I, however, put the boat's bow to the shore, and gave cloth, medals, &c. to some people who were there. For this treatment they offered to haul the boats over the breakers to the sandy beach, which I thought a friendly offer, but had reason afterwards to alter my opinion. When they found I would not do as they desired, they made signs for us to go down into the bay, which we accordingly did, and they ran along shore abreast of us, their

number increasing prodigiously. I put into the shore in two or three places, but, not liking the situation, did not land. By this time, I believe, the natives conceived what I wanted, as they directed me round a rocky point, where, on a fine sandy beach, I stepped out of the boat without wetting a foot, in the face of a vast multitude, with only a green branch in my hand, which I had before got from one of them. I took but one man out of the boat with me, and ordered the other boat to lie to a little distance off. They received me with great courtesy and politeness, and would retire back from the boat on my making the least motion with my hand. A man whom I took to be a chief, seeing this, made them form a semicircle round the boat's bow, and beat such as attempted to break through this order. This man I loaded with presents, giving likewise to others, and asked by signs for

ERROMANGO.

fresh water, in hopes of seeing where they got it. The chief immediately sent a man for some, who ran to a house, and presently returned with a little in a bamboo; so that I gained but little information by this. I next asked, by the same means, for something to eat; and they as readily brought me a yam and some cocoa-nuts. In short, I was charmed with their behaviour; and the only thing which could give the least suspicion was, that most of them were armed with clubs, spears, darts, and bows and arrows. For this reason I kept my eye continually upon the chief, and watched his looks as well as his actions. He made many signs to me to haul the boat up upon the shore, and at last slipped into the crowd, where I observed him speak to several people, and then return to me, repeating signs to haul the boat up, and hesitating a good deal before he would receive some spike-nails which I then offered him. This made me suspect something was intended, and immediately I stepped into the boat, telling them by signs that I should soon return. But they were not for parting so soon, and now attempted, by force, what they could not obtain by gentle means. The gang-board happened unluckily to be laid out for me to come into the boat. I say unluckily, for if it had not been out, and if the crew had been a little quicker in getting the boat off, the natives might not have had time to put their design in execution, nor would the following disagreeable scene have happened. As we were putting off the boat, they laid hold of the gang-board, and unhooked it off the boat's stern, but as they did not take it away, I thought this had been done by accident, and ordered the boat in again: to take it up. Then they themselves hooked it over the boat's stern, and attempted to haul her ashore; others, at the same time, snatched the oars out of the people's hands. On my pointing a musket at them, they in some measure desisted, but returned in an instant, seemingly determined to haul the boat ashore. At the head of this party was the chief; the others, who could not come at the boat, stood behind with darts, stones, and bows and arrows in hand, ready to support them. Signs and threats having no effect, our own safety

but, not

became the only consideration; and yet I was unwilling to fire on the multitude, and resolved to make the chief alone fall a victim to his own treachery; but my musket at this critical moment missed fire. Whatever idea they might have formed of the arms we held in our hands, they must now have looked upon them as childish weapons, and began to let us see how much better theirs were, by throwing stones and darts, and by shooting arrows. This made it absolutely necessary for me to give orders to fire. The first discharge threw them into confusion; but a second was hardly sufficient to drive them off the beach; and, after all, they continued to throw stones from behind the trees and bushes, and, every now and then, to pop out and throw a dart. Four lay, to all appearance dead, on the shore; but two of them afterwards crawled into the bushes. Happy it was for these people, that not half our muskets would go off, otherwise many more must have fallen. We had one man wounded in the cheek with a dart, the point of which was as thick as my finger, and yet it entered above two inches; which shows that it must have come with great force, though indeed we were very near them. An arrow struck Mr. Gilbert's naked breast, who was about thirty yards off; but probably it had struck something before; for it hardly penetrated the skin. The arrows were pointed with hard wood.

As soon as we got on board, I ordered the anchor to be weighed, with a view of anchoring near the landing-place. While this was doing, several people appeared on the low rocky point, displaying two oars we had lost in the scuffle. I looked on this as a sign of submission, and of their wanting to give us the oars. I was, nevertheless, prevailed on to fire a four-pound shot at them, to let them see the effect of our great guns. The ball fell short, but frightened them so much, that none were seen afterwards; and they left the oars standing up against the bushes. It was now calm; but the anchor was hardly at the bow before a breeze sprung up at north, of which we took the advantage, set our sails, and plied out of the bay, as it did not seem capable of supplying our wants, with that conveniency I wished to have. Besides, I always had it in my power to return to this place, in case I should find none more convenient farther south.

These islanders seemed to be a different race from those of Mallicollo, and spoke a different language. They are of the middle size, have a good shape, and tolerable features. Their colour is very dark, and they paint their faces, some with black, and others with red pigment. Their hair is very curly and crisp, and somewhat woolly. I saw a few women, and I thought them ugly; they wore a kind of petticoat made of palm leaves, or some plant like it. But the men, like those of Mallicollo, were in a manner naked; having only the belt about the waist, and the piece of cloth, or leaf, used as a wrapper*. I saw no canoes with these people, nor were any seen in any part of this island. They live in houses covered with thatch, and their plantations are laid out by line, and fenced round.

At two o'clock in the afternoon, we were clear of the bay, bore up round the head, and steered S.S.E. for the south end of the island, having a fine breeze at N.W. On the S.W. side of the head is a pretty deep bay, which seemed to run in behind the one on the N.W. side. Its shores are low, and the adjacent lands appeared very fertile. It is exposed to the S.E. winds; for which reason, until it be better known, the N.W. bay is preferable, because it is sheltered from the reigning winds; and the winds to which it is open, viz. from N.W. by N. to E. by N. seldom blow strong. The promontory, or peninsula, which disjoins these two bays, I named Traitor's Head, from the treacherous behaviour of its inhabitants. It is the N.E. point of the island, situated in the latitude $18^{\circ} 43'$ south, longitude $169^{\circ} 28'$ east, and terminates in a saddle hill which is of height sufficient to be seen sixteen or eighteen leagues. As we advanced to S.S.E., the new island we had before discovered began to appear over the S.E. point of the one near us, bearing S. $\frac{1}{2}$ E. distant ten or twelve leagues. After leaving this one, we steered for the east end of the other, being directed by a great light we saw upon it.

At one o'clock the next morning, drawing near the shore, we tacked, and spent the remainder of the night making short boards. At sun-rise, we discovered a high table land (an island) bearing E. by S., and a small low isle in the direction of N.N.E. which we had

passed in the night without seeing it. Traitor's Head was still in sight, bearing N. 20° West, distant fifteen leagues, and the island to the south extended from S. 7° West to S. 87° West, distant three or four miles. We then found that the light we had seen in the night was occasioned by a volcano, which we observed to throw up vast quantities of fire and smoke, with a rumbling noise heard at a great distance. We now made sail for the island; and, presently after, discovered a small inlet which had the appearance of being a good harbour. In order to be better informed, I sent away two armed boats under the command of Lieutenant Cooper, to sound it; and, in the mean while, we stood on and off with the ship, to be ready to follow, or give them any assistance they might want. On the east point of the entrance, we observed a number of people, and several houses and canoes; and when our boats entered the harbour they launched some, and followed them, but came not near. It was not long before Mr. Cooper made the signal for anchorage; and we stood in with the ship. The wind being at west, and our course S.S.W. we borrowed close to the west point, and passed over some sunken rocks, which might have been avoided by keeping a little more to the east, or about one-third channel over. The wind left us as soon as we were within the entrance, and obliged us to drop an anchor in four fathoms water. After this, the boats were sent again to sound; and, in the mean time, the launch was hoisted out, in order to carry out anchors to warp in by, as soon as we should be acquainted with the channel.

While we were thus employed, many of the natives got together in parties, on several parts of the shore, all armed with bows, spears, &c. Some swam off to us, others came in canoes. At first they were shy, and kept at the distance of a stone's throw; they grew insensibly bolder; and at last, came under our stern, and made some exchanges. The people in one of the first canoes, after coming as near as they durst, threw towards us some coconuts. I went into a boat and picked them up, giving them in return some cloth and other articles. This induced others to come under the stern, and alongside, where their behaviour was insolent and daring. They wanted to carry off everything within their reach; they got hold of the fly of the ensign, and would have torn it from the staff; others attempted to knock the rings off the rudder; but the greatest trouble they gave us was to look after the buoys of our anchors, which were no sooner thrown out of the boats, or let go from the ship, than they got hold of them. A few muskets fired in the air had no effect; but a four-pounder frightened them so much, that they quitted their canoes that instant, and took to the water. But as soon as they found themselves unhurt, they got again into their canoes; gave us some halloos; flourished their weapons; and returned once more to the buoys. This put us to the expense of a few musketoon shot, which had the desired effect. Although none were hurt, they were afterwards afraid to come near the buoys; very soon all retired on shore; and we were permitted to sit down to dinner undisturbed.

During these transactions, a friendly old man in a small canoe made several trips between us and the shore, bringing off each time a few coconuts, or a yam, and taking in exchange whatever we gave him. Another was on the gangway, when the great gun was fired, but I could not prevail on him to stay there long. Towards the evening, after the ship was moored, I landed at the head of the harbour, in the S.E. corner, with a strong party of men, without any opposition being made by a great number of the natives who were assembled in two parties, the one on our right, the other on our left, armed with clubs, darts, spears, slings and stones, bows and arrows, &c. After distributing to the old people, (for we could distinguish no chief,) and some others, presents of cloth, medals, &c., I ordered two casks to be filled with water out of a pond about twenty paces behind the landing-place; giving the natives to understand that this was one of the articles we wanted. Besides water, we got from them a few coconuts, which seemed to be in plenty on the trees; but they could not be prevailed upon to part with any of their weapons. These they held in constant readiness, and in the proper attitudes of offence and defence; so that little was wanting to make them attack us; at least we thought so, by their pressing so much upon us, and in spite of our endeavours to keep them off. Our early re-embarking probably disconcerted their scheme; and after that, they all retired. The friendly old man before mentioned was in one of these parties; and we judged, from his conduct, that his temper was pacific.

CHAPTER V.—AN INTERCOURSE ESTABLISHED WITH THE NATIVES; SOME ACCOUNT OF THE ISLAND; AND A VARIETY OF INCIDENTS THAT HAPPENED DURING OUR STAY AT IT.

As we wanted to take in a large quantity both of wood and water, and as, when I was on shore, I had found it practicable to lay the ship much nearer the landing-place than she now was, which would greatly facilitate that work, as well as overawe the natives, and enable us better to cover and protect the working party on shore; with this view, on the 6th, we went to work to transport the ship to the place I designed to moor her in. While we were about this, we observed the natives assembling from all parts, and forming themselves into two parties, as they did the preceding evening, one on each side the landing-place, to the amount of some thousands, armed as before. A canoe, sometimes conducted by one, and at other times by two or three men, now and then came off, bringing a few cocoa-nuts or plantains. These they gave us without asking for any return; but I took care that they should always have something. Their chief design seemed to be to invite us on shore. One of those who came off was the old man who had already ingratiated himself into our favour. I made him understand, by signs, that they were to lay aside their weapons, took those which were in the canoe and threw them overboard, and made him a present of a large piece of cloth. There was no doubt that he understood me, and made my request known to his countrymen. For as soon as he landed we observed him to go first to the one party, and then to the other; nor was he, ever after, seen by us with any thing like a weapon in his hand. After this, three fellows came in a canoe under the stern, one of them brandishing a club, with which he struck the ship's side, and committed other acts of defiance, but at last offered to exchange it for a string of beads, and some other trifles. These were sent down to him by a line; but the moment they were in his possession, he and his companions paddled off in all haste, without giving the club, or anything else, in return. This was what I expected, and indeed what I was not sorry for, as I wanted an opportunity to show the multitude on shore the effect of our fire-arms, without materially hurting any of them. Having a fowling-piece loaded with small shot, (No. 3,) I gave the fellow the contents; and, when they were above musket-shot off, I ordered some of the musketoons, or wall-pieces, to be fired, which made them leap out of the canoe, keep under her off side, and swim with her ashore. This transaction seemed to make little or no impression on the people there. On the contrary, they began to hullo, and to make sport of it.

After mooring the ship, by four anchors, with her broadside to the landing-place, hardly a musket-shot off, and placing our artillery in such a manner as to command the whole harbour, I embarked with the marines, and a party of seamen, in three boats, and rowed in for the shore. It hath been already mentioned, that the two divisions of the natives were drawn up on each side the landing-place. They had left a space between them of about thirty or forty yards, in which were laid, to the most advantage, a few small bunches of plantains, a yam, and two or three roots. Between these and the water were stuck upright in the sand, for what purpose I never could learn, four small reeds, about two feet from each other, in a line at right angles to the shore, where they remained for two or three days after. The old man before mentioned, and two more, stood by these things, inviting us by signs to land; but I had not forgot the trap I was so near being caught in at the last island; and this looked something like it. We answered, by making signs for the two divisions to retire farther back, and give us more room. The old man seemed to desire them so to do, but no more regard was paid to him than to us. More were continually joining them, and, except two or three old men, not one unarmed. In short, everything conspired to make us believe they meant to attack us as soon as we should be on shore; the consequence of which was easily supposed; many of them must have been killed and wounded, and we should hardly have escaped unhurt; two things I equally wished to prevent. Since, therefore, they would not give us the room we required, I thought it was better to frighten them into it, than to oblige them by the deadly effect of our fire-arms. I accordingly ordered a musket to be fired over the party on our right, which was by far the strongest body; but the alarm it gave them was momentary. In an instant they recovered themselves, and began to display their weapons. One fellow showed us his backside, in a manner which plainly

conveyed his meaning. After this I ordered three or four muskets to be fired. This was the signal for the ship to fire a few great guns, which presently dispersed them; and then we landed, and marked out the limits, on the right and left, by a line. Our old friend stood his ground, though deserted by his two companions, and I rewarded his confidence with a present. The natives came gradually to us, seemingly in a more friendly manner; some even without their weapons, but by far the greatest part brought them; and when we made signs to lay them down, they gave us to understand that we must lay down ours first. Thus all parties stood armed. The presents I made to the old people, and to such as seemed to be of consequence, had little effect on their conduct. They indeed climbed the cocoa-nut trees, and threw us down the nuts, without requiring any thing for them; but I took care that they should always have somewhat in return. I observed that many were afraid to touch what belonged to us; and they seemed to have no notion of exchanging one thing for another. I took the old man, whose name we now found to be Paowang, to the woods, and made him understand I wanted to cut down some trees to take on board the ship; cutting some down at the same time, which we put into one of our boats, together with a few small casks of water, with a view of letting the people see what it was we chiefly wanted. Paowang very readily gave his consent to cut wood; nor was there any one who made the least objection. He only desired the cocoa-nut trees might not be cut down. Matters being thus settled, we embarked and returned on board to dinner, and immediately after they all dispersed. I never learnt that any one was hurt by our shot, either on this or the preceding day; which was a very happy circumstance. In the afternoon, having landed again, we loaded the launch with water, and having made three hauls with the seine, caught upwards of three hundred pounds of mullet and other fish. It was some time before any of the natives appeared, and not above twenty or thirty at last, amongst whom was our trusty friend Paowang, who made us a present of a small pig, which was the only one we got at this isle, or that was offered us.

During the night, the volcano, which was about four miles to the west of us, vomited up vast quantities of fire and smoke, as it had also done the night before; and the flames were seen to rise above the hill which lay between us and it. At every eruption, it made a long rumbling noise like that of thunder, or the blowing up of large mines. A heavy shower of rain, which fell at this time, seemed to increase it; and the wind blowing from the same quarter, the air was loaded with its ashes, which fell so thick that every thing was covered with the dust. It was a kind of fine sand or stone, ground or burnt to powder, and was exceedingly troublesome to the eyes.

Early in the morning of the 7th, the natives began again to assemble near the watering-place, armed as usual, but not in such numbers as at first. After breakfast we landed, in order to cut wood and fill water. I found many of the islanders much inclined to be friends with us, especially the old people; on the other hand, most of the younger were daring and insolent, and obliged us to keep to our arms. I staid till I saw no disturbance was like to happen, and then returned to the ship, leaving the party under the command of Lieutenants Clerke and Edgecumbe. When they came on board to dinner, they informed me that the people continued to behave in the same inconsistent manner as in the morning; but more especially one man, whom Mr. Edgecumbe was obliged to fire at, and believed he had struck with a swan-shot. After that, the others behaved with more discretion; and as soon as our people embarked, they all retired. While we were sitting at dinner, an old man came on board, looked into many parts of the ship, and then went ashore again.

In the afternoon, only a few of those who lived in the neighbourhood, with whom we were now upon a tolerable footing, made their appearance at the watering-place. Paowang brought us an axe which had been left by our people, either in the woods or on the beach, and found by some of the native. A few other articles were afterwards returned to us which either they had stolen, or we had lost by our negligence. So careful were they now not to offend us in this respect. Early the next morning I sent the launch, protected by a party of marines in another boat, to take in ballast, which we wanted. This work was done before breakfast; and after it, she was sent for wood and water, and with her the people employed in this service under the protection of a serjeant's guard, which was now

thought sufficient, as the natives seemed to be pretty well reconciled to us. I was told, that they asked our people to go home with them, on condition they stripped naked as they were. This shows that they had no design to rob them, whatever other they might have.

On the 9th, I sent the launch for more ballast, and the guard and wooders to the usual place. With these I went myself, and found a good many of the natives collected together, whose behaviour, though armed, was courteous and obliging; so that there was no longer any occasion to mark out the limits by a line; they observed them without this precaution. As it was necessary for Mr. Wales's instruments to remain on shore all the middle of the day, the guard did not return to dinner, as they had done before, till relieved by others. When I came off, I prevailed on a young man, whose name was Wha-a-gou, to accompany me. Before dinner I showed him every part of the ship; but did not observe that any one thing fixed his attention a moment, or caused in him the least surprise. He had no knowledge of goats, dogs, or cats, calling them all hogs (*Booga* or *Boogas*). I made him a present of a dog and a bitch, as he showed a liking to that kind of animal. Soon after he came on board, some of his friends followed in a canoe, and inquired for him, probably doubtful of his safety. He looked out of the quarter-gallery, and having spoken to them, they went ashore, and quickly returned with a cock, a little sugar-cane, and a few coconuts, as a present to me. Though he sat down with us, he did but just taste our salt pork, but ate pretty heartily of yam, and drank a glass of wine. After dinner I made him presents, and then conducted him ashore.

As soon as we landed, the youth and some of his friends took me by the hand with a view, as I understood, to conduct me to their habitations. We had not gone far, before some of them, for what reason I know not, were unwilling I should proceed; in consequence of which the whole company stopped; and, if I was not mistaken, a person was despatched for something or other to give me; for I was desired to sit down and wait, which I accordingly did. During this interval, several of our gentlemen passed us, at which they showed great uneasiness, and importuned me so much to order them back, that I was at last obliged to comply. They were jealous of our going up the country, or even along the shore of the harbour. While I was waiting here, our friend Paowang came with a present of fruit and roots, carried by about twenty men; in order, as I supposed, to make it appear the greater. One had a small bunch of plantains, another a yam, a third a cocoa-nut, &c.: but two men might have carried the whole with ease. This present was in return for something I had given him in the morning; however, I thought the least I could do now was to pay the porters. After I had despatched Paowang, I returned to Wha-a-gou and his friends, who were still for detaining me. They seemed to wait with great impatience for something, and to be unwilling and ashamed to take away the two dogs, without making me a return. As night was approaching, I pressed to be gone; with which they complied, and so we parted.

The preceding day, Mr. Forster learnt from the people the proper name of the island, which they call Tanna; and this day I learnt from them the names of those in the neighbourhood. The one we touched at last is called Erromango*; the small isle which we discovered the morning we landed here, Immer; the Table Island to the east, discovered at the same time, Erronan or Foottoona; and an island which lies to the S.E. Innatoom. All these islands are to be seen from Tanna.

They gave us to understand, in a manner which I thought admitted of no doubt, that they eat human flesh, and that circumcision was practised among them. They began the subject of eating human flesh of their own accord, by asking us if we did; otherwise I

* It was at this island that the well-known missionary John Williams lost his life in 1839, in a fray occasioned by a misunderstanding with the natives. This excellent and indefatigable minister of the Gospel was fired a smith; but notwithstanding the disadvantages of his early life, his zeal and energy enabled him to surmount those difficulties, and not only to qualify himself for a preacher, but to attain considerable skill in other branches of knowledge, which under the guidance of the strong

common sense which was his peculiar characteristic, rendered him one of the most efficient instructors of the heathen that has ever adventured upon that difficult task. His work, entitled "Missionary Enterprises in the South Sea Islands," is not only interesting from its immediate subject, but is attractive from its plain and nervous style, and from the variety of information it contains. The notices on the language and races of the inhabitants are very valuable.—Ed.

should never have thought of asking them such a question. I have heard people argue that no nation could be cannibals, if they had other flesh to eat, or did not want food; thus deriving the custom from necessity. The people of this island can be under no such necessity; they have fine pork and fowls, and plenty of roots and fruits. But since we have not actually seen them eat human flesh, it will admit of doubt with some, whether they are cannibals.

When I got on board, I learnt that, when the launch was on the west side of the harbour taking in ballast, one of the men employed on this work had scalded his fingers in taking a stone up out of some water. This circumstance produced the discovery of several hot springs at the foot of the cliff, and rather below high-water mark. This day, Mr. Wales and two or three of the officers advanced a little, for the first time, into the island. They met with a straggling village, the inhabitants of which treated them with great civility; and the next morning, Mr. Forster and his party, and some others, made another excursion inland. They met with several fine plantations of plantains, sugar-canes, yams, &c.; and the natives were courteous and civil. Indeed, by this time, the people, especially those in our neighbourhood, were so well reconciled to us, that they showed not the least dislike at our rambling about in the skirts of the woods, shooting, &c. In the afternoon, some boys having got behind thickets, and having thrown two or three stones at our people, who were cutting wood, they were fired at by the petty officers present on duty. Being ashore at the time, I was alarmed at hearing the report of the muskets, and seeing two or three boys run out of the wood. When I knew the cause, I was much displeased at so wanton a use being made of our fire-arms, and took measures to prevent it for the future.

VIEW IN THE ISLAND OF TANNA.

Wind southerly, with heavy showers of rain. During the night, and also all the 11th, the volcano was exceedingly troublesome, and made a terrible noise, throwing up prodigious columns of fire and smoke at each explosion, which happened every three or four minutes; and at one time, great stones were seen high in the air. Besides the necessary work of wooding and watering, we struck the maintopmast to fix new trestle-trees and back-stays. Mr. Forster and his party went up the hill on the west side of the harbour, where he found three places from whence smoke of a sulphureous smell issued, through cracks or fissures in the earth. The ground about these was exceedingly hot, and parched or burnt, and they seemed to keep pace with the volcano,

for at every explosion of the latter, the quantity of smoke or steam in these was greatly increased, and forced out so as to rise in small columns, which we saw from the ship, and had taken for common fires made by the natives. At the foot of this hill are the hot springs before mentioned. In the afternoon Mr. Forster, having begun his botanical researches on the other side of the harbour, fell in with our friend Paowang's house, where he saw most of the articles I had given him, hanging on the adjoining trees and bushes, as if they were not worthy of being under his roof.

On the 12th, some of the officers accompanied Mr. Forster to the hot places he had been at the preceding day. A thermometer placed in a little hole made in one of them rose from 80, at which it stood in the open air, to 170. Several other parts of the hill emitted smoke or steam all the day, and the volcano was unusually furious, insomuch that the air was loaded with its ashes. The rain which fell at this time was a compound of water, sand, and earth; so that it properly might be called showers of mire. Whichever way the wind was, we were plagued with the ashes; unless it blew very strong indeed from the opposite direction. Notwithstanding the natives seemed well enough satisfied with the few expeditions we had made in the neighbourhood, they were unwilling we should extend them farther. As a proof of this, some undertook to guide the gentlemen, when they were in the country, to a place where they might see the mouth of the volcano. They very readily embraced the offer, and were conducted down to the harbour before they perceived the cheat.

The 13th, wind at N.E., gloomy weather. The only thing worthy of note this day was, that Paowang being at dinner with us on board, I took the opportunity to show him several parts of the ship, and various articles, in hopes of finding out something which they might value, and be induced to take from us in exchange for refreshments; for what we got of this kind was trifling. But he looked on everything that was shown him with the utmost indifference; nor did he take notice of any one thing except a wooden sand-box, which he seemed to admire, and turned two or three times over in his hand.

Next morning, after breakfast, a party of us set out for the country, to try if we could not get a nearer and better view of the volcano. We went by the way of one of those hot smoking places before mentioned, and dug a hole in the hottest part, into which a thermometer of Fahrenheit's construction was put; and the mercury presently rose to 100°. It remained in the hole two minutes and a half without either rising or falling. The earth about this place was a kind of white clay, had a sulphureous smell, and was soft and wet, the surface only excepted, over which was spread a thin dry crust, that had upon it some sulphur, and a vitriolic substance, tasting like alum. The place affected by the heat was not above eight or ten yards square; and near it were some fig-trees, which spread their branches over a part of it, and seemed to like their situation. We thought that this extraordinary heat was caused by the steam of boiling water, strongly impregnated with sulphur. I was told that some of the other places were larger than this; though we did not go out of the road to look at them, but proceeded up the hill through a country so covered with trees, shrubs, and plants, that the bread-fruit and cocoa-nut trees, which seem to have been planted here by nature, were in a manner choked up. Here and there we met with a house, some few people, and plantations. These latter we found in different states; some of long standing, others lately cleared, and some only clearing, and before anything had been planted. The clearing a piece of ground for a plantation seemed to be a work of much labour considering the tools they had to work with, which, though much inferior to those at the Society Isles, are of the same kind. Their method is, however, judicious, and as expeditious as it can well be. They lop off the small branches of the large trees, dig under the roots, and there burn the branches and small shrubs and plants which they root up. The soil in some parts is a rich black mould; in other parts it seemed to be composed of decayed vegetables and of the ashes the volcano sends forth throughout all its neighbourhood. Happening to turn out of the common path, we came into a plantation, where we found a man at work, who, either out of good-nature, or to get us the sooner out of his territories, under-

took to be our guide. We followed him accordingly, but had not gone far before we came to the junction of two roads, in one of which stood another man with a sling and a stone, which he thought proper to lay down when a musket was pointed at him. The attitude in which we found him, the ferocity appearing in his looks, and his behaviour after, convinced us that he meant to defend the path he stood in. He in some measure gained his point; for our guide took the other road, and we followed; but not without suspecting he was leading us out of the common way. The other man went with us likewise, counting us several times over, and hallooing, as we judged, for assistance; for we were presently joined by two or three more, among whom was a young woman with a club in her hand. By these people we were conducted to the brow of a hill, and shown a road leading down to the harbour, which they wanted us to take. Not choosing to comply, we returned to that we had left, which we pursued alone, our guide refusing to go with us. After ascending another ridge, as thickly covered with wood as those we had come over, we saw yet other hills between us and the volcano, which seemed as far off as at our first setting out. This discouraged us from proceeding farther, especially as we could get no one to be our guide. We therefore came to a resolution to return; and had but just put this in execution, when we met between twenty and thirty people, whom the fellow before mentioned had collected together, with a design, as we judged, to oppose our advancing into the country; but as they saw us returning, they suffered us to pass unmolested. Some of them put us into the right road, accompanied us down the hill, made us stop by the way to entertain us with cocoa-nuts, plantains, and sugar-cane; and what we did not eat on the spot they brought down the hill with us. Thus, we found these people hospitable, civil, and good-natured, when not prompted to a contrary conduct by jealousy; a conduct I cannot tell how to blame them for, especially when I consider the light in which they must view us. It was impossible for them to know our real design; we enter their ports without their daring to oppose; we endeavour to land in their country as friends, and it is well if this succeeds; we land nevertheless, and maintain the footing we have got, by the superiority of our fire-arms. Under such circumstances, what opinion are they to form of us? Is it not as reasonable for them to think that we come to invade their country, as to pay them a friendly visit? Time, and some acquaintance with us, can only convince them of the latter. These people are yet in a rude state; and, if we may judge from circumstances and appearances, are frequently at war, not only with their neighbours, but among themselves; consequently must be jealous of every new face. I will allow there are some exceptions to this rule to be found in this sea; but there are few nations who would willingly suffer visitors like us to advance far into their country.

BREAD-FRUIT TREE.

In the evening I took a walk, with some of the gentlemen, into the country on the other side of the harbour, where we had very different treatment from what we had met with in

the morning. The people we now visited, among whom was our friend Paowang, being better acquainted with us, showed a readiness to oblige us in everything in their power. We came to the village which had been visited on the 9th. It consisted of about twenty houses, the most of which need no other description than comparing them to the roof of a thatched house in England taken off the walls and placed on the ground. Some were open at both ends, others partly closed with reeds; and all were covered with palm thatch. A few of them were thirty or forty feet long, and fourteen or sixteen broad. Besides these, they have other mean hovels, which, I conceived, were only to sleep in. Some of these stood in a plantation, and I was given to understand that in one of them lay a dead corpse. They made signs that described sleep, or death; and circumstances pointed out the latter. Curious to see all I could, I prevailed on an elderly man to go with me to the hut, which was separated from the others by a reed fence, built quite round it, at the distance of four or five feet. The entrance was by a space in the fence, made so low as to admit one to step over. The two sides and one end of the hut were closed or built up in the same manner, and with the same materials, as the roof. The other end had been open, but was now well closed up with mats, which I could not prevail on the man to remove, or suffer me to do it. There hung at this end of the hut a matted bag or basket, in which was a piece of roasted yam, and some sort of leaves, all quite fresh. I had a strong desire to see the inside of the hut, but the man was peremptory in refusing this, and even showed an unwillingness to permit me to look into the basket. He wore round his neck, fastened to a string, two or three locks of human hair; and a woman present had several about her neck. I offered something in exchange for them; but they gave me to understand they could not part with them, as it was the hair of the person who lay in the hut. Thus I was led to believe that these people dispose of their dead in a manner similar to that of Otaheite. The same custom of wearing the hair is observed by the people of that island, and also by the New Zealanders. The former make *Tamau* of the hair of their deceased friends, and the latter make ear-rings and necklaces of their teeth.

Near most of their large houses were fixed upright in the ground the stems of four cocoa-nut trees, in a square position, about three feet from each other. Some of our gentlemen, who first saw them, were inclined to believe they were thus placed on a religious account; but I was now satisfied that it was for no other purpose but to hang cocoa-nuts on to dry. For when I asked, as well as I could, the use of them, a man took me to one, loaded with cocoa-nuts from the bottom to the top; and no words could have informed me better. Their situation is well chosen for this use, as most of their large houses are built in an open airy place, or where the wind has a free passage, from whatever direction it blows. Near most, if not all of them, is a large tree or two, whose spreading branches afford an agreeable retreat from the scorching sun. This part of the island was well cultivated, open, and airy; the plantations were laid out by line, abounding with plantains, sugar-canes, yams, and other roots, and stocked with fruit-trees. In our walk we met with our old friend Paowang, who, with some others, accompanied us to the water-side, and brought with them, as a present, a few yams and cocoa-nuts.

On the 15th, having finished wooding and watering, a few hands only were on shore making brooms, the rest being employed on board, setting up the rigging, and putting the ship in a condition for sea. Mr. Forster, in his botanical excursion this day, shot a pigeon, in the claw of which was a wild nutmeg. He took some pains to find the tree, but his endeavours were without success. In the evening a party of us walked to the eastern sea-shore, in order to take the bearing of Annatom, and Erronan or Foottoona. The horizon proved so hazy that I could see neither; but one of the natives gave me, as I afterwards found, the true direction of them. We observed that in all, or most of their sugar plantations, were dug holes or pits, four feet deep, and five or six in diameter; and on our inquiring their use, we were given to understand that they caught rats in them. These animals, which are very destructive to the canes, are here in great plenty. The canes, I observed, were planted as thick as possible round the edge of these pits, so that the rats in coming at them are the more liable to tumble in.

RATS AND TRAP.

Next morning we found the tiller sprung in the rudder-head, and, by some strange neglect, we had not a spare one on board, which we were ignorant of till now it was wanting. It knew but of one tree in the neighbourhood fit for this purpose, which I sent the carpenter on shore to look at, and an officer, with a party of men, to cut it down, provided he could obtain leave of the natives; if not, he was ordered to acquaint me. He understood that no one had any objection, and set the people to work accordingly. But as the tree was large, this required some time; and before it was down, word was brought me that our friend Paowang was not pleased. Upon this I gave orders to desist, as we found that, by searfig a piece to the inner end of the tiller, and letting it farther into the rudder-head, it would still perform its office. But as it was necessary to have a spare one on board, I went on shore, sent for Paowang, made him a present of a dog and a piece of cloth, and then explained to him that our great steering paddle was broken, and that I wanted that tree to make a new one. It was easy to see how well pleased every one present was with the means I took to obtain it. With one voice they gave their consent, Paowang joining his also, which he perhaps could not have done without the others; for I do not know that he had either more property or more authority than the rest. This point being obtained, I took our friend on board to dinner, and after it was over went with him on shore, to pay a visit to an old chief, who was said to be king of the island, which was a doubt with me. Paowang took little or no notice of him. I made him a present, after which he immediately went away, as if he had got all he came for. His name was Geogy, and they gave him the title of *Areeke*. He was very old, but had a merry, open countenance. He wore round his waist a broad red and white checkered belt, the materials and manufacture of which seemed the same as that of Otaheite cloth; but this was hardly a mark of distinction. He had with him a son, not less than forty-five or fifty years of age. A great number of people were at this time at the landing-place; most of them from distant parts. The behaviour of many was friendly, while others were daring and insolent, which I thought proper to put up with, as our stay was nearly at an end.

On the 17th, about ten o'clock, I went ashore, and found in the crowd old Geogy and his son, who soon made me understand that they wanted to dine with me; and accordingly I brought them and two more on board. They all called them *Areekees* (or kings); but I doubt if any of them had the least pretensions to that title over the whole island. It had been remarked that one of these kings had not authority enough to order one of the people up into a cocoa-nut tree to bring him down some nuts. Although he spoke to several, he was at last obliged to go himself, and by way of revenge, as it was thought, left not a nut on the

tree, taking what he wanted himself, and giving the rest to some of our people. When I got them on board, I went with them all over the ship, which they viewed with uncommon surprise and attention. We happened to have for their entertainment a kind of pie or pudding made of plantains, and some sort of greens which we had got from one of the natives. On this, and on yams, they made a hearty dinner; for as to the salt beef and pork, they would hardly taste them. In the afternoon, having made each of them a present of a hatchet, a spike-nail, and some medals, I conducted them ashore.

Mr. Forster and I then went over to the other side of the harbour, and having tried, with Fahrenheit's thermometer, the head of one of the hot springs, we found that the mercury rose to 191° . At this time the tide was up within two or three feet of the spring, so that we judged it might, in some degree, be cooled by it. We were mistaken, however; for, on repeating the experiment next morning, when the tide was out, the mercury rose no higher than 187° ; but at another spring, where the water bubbled out of the sand from under the rock at the S.W. corner of the harbour, the mercury, in the same thermometer, rose to 202° , which is but little colder than boiling water. The hot places before mentioned are from about three to four hundred feet perpendicular above these springs, and on the slope of the same ridge with the volcano; that is, there are no valleys between them but such as are formed in the ridge itself; nor is the volcano on the highest part of the ridge, but on the S.E. side of it. This is, I have been told, contrary to the general opinion of philosophers, who say that volcanoes must be on the summits of the highest hills. So far is this from being the case on this island, that some of its hills are more than double the height of that on which the volcano is, and close to it. To these remarks I must add, that, in wet or moist weather, the volcano was most violent. There seems to be room for some philosophical reasoning on these phenomena of nature; but not having any talent that way, I must content myself with stating facts as I found them, and leave the causes to men of more abilities.

The tiller was now finished; but as the wind was unfavourable for sailing, the guard was sent on shore on the 19th, as before, and a party of men to cut up and bring off the remainder of the tree from which we had got the tiller. Having nothing else to do, I went on shore with them, and finding a good number of the natives collected about the landing-place as usual, I distributed among them all the articles I had with me, and then went on board for more. In less than an hour I returned, just as our people were getting some large logs into the boat. At the same time four or five of the natives stepped forward to see what we were about, and as we did not allow them to come within certain limits, unless to pass along the beach, the sentry ordered them back, which they readily complied with. At this time, having my eyes fixed on them, I observed the sentry present his piece (as I thought at these men), and was just going to reprove him for it, because I had observed that, whenever this was done, some of the natives would hold up their arms, to let us see they were equally ready. But I was astonished beyond measure when the sentry fired, for I saw not the least cause. At this outrage most of the people fled: it was only a few I could prevail on to remain. As they ran off, I observed one man to fall; and he was immediately lifted up by two others, who took him into the water, washed his wound, and then led him off. Presently after, some came and described to me the nature of his wound; and, as I found he was not carried far, I sent for the surgeon. As soon as he arrived, I went with him to the man, whom we found expiring. The ball had struck his left arm, which was much shattered, and then entered his body by the short ribs, one of which was broken. The rascal who fired pretended that a man had laid an arrow across his bow, and was going to shoot at him, so that he apprehended himself in danger. But this was no more than they had always done, and with no other view than to show they were armed as well as we; at least I have reason to think so, as they never went farther. What made this incident the more unfortunate, was, it not appearing to be the man who bent the bow that was shot, but one who stood by him. This affair threw the natives into the utmost consternation; and the few that were prevailed on to stay ran to the plantations and brought cocoa-nuts, &c. which they laid down at our feet. So soon were these daring people humbled! When I went on board to dinner they all retired, and only a few appeared in the afternoon, amongst whom were Paowang and Wha-a-gou. I had not seen this young man since the day he dined on board. Both he and Paowang promised to bring me fruit, &c. the next morning, but our early departure put it out of their power.

CHAPTER VI.—DEPARTURE FROM TANNA ; WITH SOME ACCOUNT OF ITS INHABITANTS, THEIR MANNERS, AND ARTS.

DURING the night the wind had veered round to S.E. As this was favourable for getting out of the harbour, at four o'clock in the morning of the 20th we began to unmoor, and at eight, having weighed our last anchor, put to sea. As soon as we were clear of the land, I brought to, waiting for the launch which was left behind to take up a kedge-anchor and hawser we had out, to cast by. About day-break a noise was heard in the woods, nearly abreast of us, on the east side of the harbour, not unlike singing of psalms. I was told that the like had been heard at the same time every morning, but it never came to my knowledge till now, when it was too late to learn the occasion of it. Some were of opinion, that at the east point of the harbour (where we observed, in coming in, some houses, boats, &c.) was something sacred to religion, because some of our people had attempted to go to this point, and were prevented by the natives. I thought, and do still think, it was only owing to a desire they showed, on every occasion, of fixing bounds to our excursions. So far as we had once been, we might go again, but not farther with their consent ; but by encroaching a little every time, our country expeditions were insensibly extended without giving the least umbrage. Besides, these morning ceremonies, whether religious or not, were not performed down at that point, but in a part where some of our people had been daily.

I cannot say what might be the true cause of these people showing such dislike to our going up into their country : it might be owing to a naturally jealous disposition, or perhaps to their being accustomed to hostile visits from their neighbours, or quarrels among themselves. Circumstances seemed to show that such must frequently happen ; for we observed them very expert in arms, and well accustomed to them, seldom or never travelling without them. It is possible all this might be on our account, but I hardly think it. We never gave them the least molestation, nor did we touch any part of their property, not even the wood and water, without first having obtained their consent. The very cocoa-nuts, hanging over the heads of the workmen, were as safe as those in the middle of the island. It happened, rather fortunately, that there were so many cocoa-nut trees near the skirts of the harbour, which seemed not to be private property ; so that we could generally prevail on the natives to bring us some of these nuts, when nothing would induce them to bring any out of the country.

We were not wholly without refreshments ; for besides the fish, which our seine now and then provided us with, we procured daily some fruits or roots from the natives, though but little in proportion to what we could consume. The reason why we got no more might be our having nothing to give them in exchange which they thought valuable. They had not the least knowledge of iron ; consequently, nails and iron tools, beads, &c., which had so great a run at the more eastern isles, were of no consideration here ; and cloth can be of no use to people who go naked.

The produce of this island is bread-fruit, plantains, cocoa-nuts, a fruit like a nectarine, yams, terra, a sort of potatoe, sugar-cane, wild figs, a fruit like an orange, which is not eatable, and some other fruit and nuts whose names I have not. Nor have I any doubt that the nutmeg before mentioned was the produce of this island. The bread-fruit, cocoa-nuts, and plantains : are neither so plentiful nor so good as at Otahite ; on the other hand, sugar-canes and yams are not only in greater plenty, but of superior quality, and much larger. We got one of the latter which weighed fifty-six pounds, every ounce of which was good. Hogs did not seem to be scarce, but we saw not many fowls : these are the only domestic animals they have. Land-birds are not more numerous than at Otahite and the other islands ; but we met with some small birds, with a very beautiful plumage, which we had never seen before. There is as great a variety of trees and plants here as at any island we touched at, where our botanists had time to examine. I believe these people live chiefly on the produce of the land, and that the sea contributes but little to their subsistence. Whether this arises from the coast not abounding with fish, or from their being bad fishermen, I know not ; both

causes perhaps concur. I never saw any sort of fishing-tackle amongst them, nor any one out fishing, except on the shoals, or along the shores of the harbour, where they would watch to strike with a dart such fish as came within their reach; and in this they were expert. They seemed much to admire our catching fish with the seine, and, I believe, were not well pleased with it at last. I doubt not they have other methods of catching fish besides striking them.

We understood that the little isle of Immer was chiefly inhabited by fishermen, and that the canoes we frequently saw pass, to and from that isle and the east point of the harbour, were fishing-canoes. These canoes were of unequal sizes, some thirty feet long, two broad, and three deep; and they are composed of several pieces of wood clumsily sewed together with bandages. The joints are covered on the outside by a thin batten clamped off at the edges, over which the bandages pass. They are navigated either by paddles or sails: the sail is latteen, extended to a yard and boom, and hoisted to a short mast. Some of the large canoes have two sails, and all of them outriggers.

At first we thought the people of this island, as well as those of Erromango, were a race between the natives of the Friendly Islands and those of Mallicollo; but a little acquaintance with them convinced us that they had little or no affinity to either, except it be in their hair, which is much like what the people of the latter island have. The general colours of it are black and brown, growing to a tolerable length, and very crisp and curly. They separate it into small locks, which they wind or cue round with the rind of a slender plant, down to about an inch of the ends; and, as the hair grows, the wadding is continued. Each of these cues or locks is somewhat thicker than common whipcord, and they look like a parcel of small strings hanging down from the crown of their heads. Their beards, which are strong and bushy, are generally short. The women do not wear their hair so, but cropped; nor do the boys, till they approach manhood. Some few men, women, and children were seen who had hair like ours; but it was obvious that these were of another nation; and I think we understood they came from Erronan. It is to this island they ascribe one of the two languages which they speak, and which is nearly, if not exactly, the same as that spoken at the Friendly Isles. It is, therefore, more than probable that Erronan was peopled from that nation, and that, by long intercourse with Tanna and the other neighbouring islands, each hath learnt the other's language, which they use indiscriminately. The other language which the people of Tanna speak, and, as we understood, those of Erromango and Annatom, is properly their own. It is different from any we had before met with, and bears no affinity to that of Mallicollo; so that, it should seem, the people of these islands are a distinct nation of themselves. Mallicollo, Apce, &c., were names entirely unknown to them; they even knew nothing of Sandwich Island, which is much the nearer. I took no small pains to know how far their geographical knowledge extended, and did not find that it exceeded the limits of their horizon.

These people are of the middle size, rather slender than otherwise; many are little, but few tall or stout; the most of them have good features, and agreeable countenances; are like all the tropical race, active and nimble; and seem to excel in the use of arms, but not to be fond of labour. They never would put a hand to assist in any work we were carrying on, which the people of the other islands used to delight in. But what I judge most from, is their making the females do the most laborious work, as if they were pack-horses. I have seen a woman carrying a large bundle on her back, or a child on her back and a bundle under her arm, and a fellow strutting before her with nothing but a club or spear, or some such thing. We have frequently observed little troops of women pass, to and fro, along the beach, laden with fruit and roots, escorted by a party of men under arms; though, now and then, we have seen a man carry a burden at the same time, but not often. I know not on what account this was done, nor that an armed troop was necessary. At first, we thought they were moving out of the neighbourhood with their effects; but we afterwards saw them both carry out and bring in every day.

I cannot say the women are beauties; but I think them handsome enough for the men, and too handsome for the use that is made of them. Both sexes are of a very dark colour, but not black; nor have they the least characteristic of the negro about them. They make themselves blacker than they really are, by painting their faces with a pigment of the colour

of black lead. They also use another sort which is red, and a third sort brown, or a colour between red and black. All these, but especially the first, they lay on, with a liberal hand, not only on the face, but on the neck, shoulders, and breast. The men wear nothing but a belt, and the wrapping leaf as at Mallicollo *. The women have a kind of petticoat made of the filaments of the plantain-tree, flags, or some such thing, which reaches below the knee. Both sexes wear ornaments, such as bracelets, ear-rings, necklaces, and amulets. The bracelets are chiefly worn by the men; some made of sea-shells, and others of those of the cocoa-nut. The men also wear amulets; and those of most value being made of a greenish stone, the green stone of New Zealand is valued by them for this purpose. Necklaces are chiefly used by the women, and made mostly of shells. Ear-rings are common to both sexes, and those valued most are made of tortoise-shell. Some of our people having got some at the Friendly Islands, brought it to a good market here, where it was of more value than anything we had besides; from which I conclude that these people catch but few turtle, though I saw one in the harbour, just as we were getting under sail. I observed that, towards the latter end of our stay, they began to ask for hatchets, and large nails; so that it is likely they had found that iron is more serviceable than stone or shells, of which all their tools I have seen are made. Their stone hatchets, at least all those I saw, are not in the shape of adzes, as at the other islands, but more like an axe, in the form conjoined. In the helve, which is pretty thick, is made a hole into which the stone is fixed.

These people, besides the cultivation of ground, have few other arts worth mentioning. They know how to make a coarse kind of matting, and a coarse cloth of the bark of a tree, which is used chiefly for belts. The workmanship of their canoes, I have before observed, is very rude; and their arms, with which they take the most pains in point of neatness, come far short of some others we had seen. Their weapons are clubs, spears, or darts, bows and arrows, and stones. The clubs are of three or four kinds, and from three to five feet long. They seem to place most dependence on the darts, which are pointed with three bearded edges. In throwing them they make use of a becket, that is, a piece of stiff plaited cord about six inches long, with an eye in one end and a knot at the other. The eye is fixed on the fore-finger of the right hand, and the other end is hitched round the dart, where it is nearly on an equipoise. They hold the dart between the thumb and remaining fingers, which serve only to give it direction, the velocity being communicated by the becket and fore-finger. The former flies off from the dart the instant its velocity becomes greater than that of the hand, but it remains on the finger ready to be used again. With darts they kill both birds and fish, and are sure of hitting a mark, within the compass of the crown of a hat, at the distance of eight or ten yards; but, at double that distance, it is chance if they hit a mark the size of a man's body, though they will throw the weapon sixty or seventy yards. They always throw with all their might, let the distance be what it will. Darts, bows and arrows, are to them what muskets are to us. The arrows are made of reeds pointed with hard wood: some are bearded and some not, and those for shooting birds have two, three, and sometimes four points. The stones they use are, in general, the branches of coral rocks from eight to fourteen inches long, and from an inch to an inch and a half in diameter. I know not if they employ them as missive weapons; almost every one of them carries a club, and besides that, either darts, or a bow and arrows, but never both: those who had stones kept them generally in their belts.

I cannot conclude this account of their arms without adding an entire passage out of Mr. Wales's journal. As this gentleman was continually on shore amongst them, he had a better opportunity of seeing what they could perform than any of us. The passage is as follows: "I must confess I have been often led to think the feats which Homer represents his heroes as performing with their spears a little too much of the marvellous to be admitted into an heroic poem; I mean when confined within the strait stays of Aristotle. Nay, even so great an advocate for him as Mr. Pope acknowledges them to be *surprising*. But since I have seen what these people can do with their wooden spears, and those badly pointed, and not of a very hard nature, I have not the least exception to any one passage in that great

* See note p. 499.

poet on this account. But, if I see fewer exceptions, I can find infinitely more beauties in him; as he has, I think, scarce an action, circumstance, or description of any kind whatever, relating to a spear, which I have not seen and recognised among these people; as their whirling motion, and whistling noise, as they fly; their quivering motion, as they stick in the ground when they fall; their meditating their aim, when they are going to throw; and their shaking them in their hand as they go along, &c. &c."

I know no more of their cookery, than that it consists of roasting and baking; for they have no vessel in which water can be boiled. Nor do I know that they have any other liquor but water and the juice of the cocoa-nut. We are utter strangers to their religion, and but little acquainted with their government. They seem to have chiefs among them; at least some were pointed out to us by that title; but, as I before observed, they appeared to have very little authority over the rest of the people. Old Geogy was the only one the people were ever seen to take the least notice of; but whether this was owing to high rank or old age I cannot say. On several occasions I have seen the old men respected and obeyed. Our friend Paowang was so; and yet I never heard him called chief, and have many reasons to believe that he had not a right to any more authority than many of his neighbours, and few, if any, were bound to obey him, or any other person in our neighbourhood; for if there had been such a one, we certainly should, by some means, have known it. I named the harbour Port Resolution, after the ship, she being the first which ever entered it. It is situated on the north side of the most eastern point of the island, and about E.N.E. from the volcano; in the latitude of $19^{\circ} 32' 25'' \frac{1}{2}$ South, and in the longitude of $169^{\circ} 44' 35''$ East. It is no more than a little creek running in S. by W. $\frac{1}{2}$ W. three quarters of a mile, and is about half that in breadth. A shoal of sand and rocks lying on the east side makes it still narrower. The depth of water in the harbour is from six to three fathoms, and the bottom is sand and mud. No place can be more convenient for taking in wood and water; for both are close to the shore. The water stunk a little after it had been a few days on board, but it afterwards turned sweet; and, even when it was at the worst, the tin machine would, in a few hours, recover a whole cask. This is an excellent contrivance for sweetening water at sea, and is well known in the navy.

Mr. Wales, from whom I had the latitude and longitude, found the variation of the needle to be $7^{\circ} 14' 12''$ East, and the dip of its south end $45^{\circ} 24'$. He also observed the time of high water, on the full and change days, to be about 5h. 45m., and the tide to rise and fall three feet.

CHAPTER VII.—THE SURVEY OF THE ISLANDS CONTINUED, AND A MORE PARTICULAR DESCRIPTION OF THEM.

As soon as the boats were hoisted in, we made sail, and stretched to the eastward, with a fresh gale at S.E., in order to have a nearer view of Erroonan, and to see if there was any land in its neighbourhood. We stood on till midnight, when, having passed the island, we tacked, and spent the remainder of the night making two boards. At sunrise on the 21st, we stood to S.W. in order to get to the south of Tanna, and nearer to Anattom, to observe if any more land lay in that direction; for an extraordinary clear morning had produced no discovery of any to the east. At noon having observed in latitude $20^{\circ} 33' 30''$, the situation of the lands around us was as follows. Port Resolution bore 86° West, distant six and a half leagues; the island of Tanna extended from S. 88° West, to N. 64° West; Traitor's Head N. 58° West, distant twenty leagues; the island of Erroonan N. 86° East, distant five leagues; and Anattom from S. $\frac{1}{2}$ E. to S. $\frac{1}{2}$ W., distant ten leagues. We continued to stretch to the south till two o'clock P.M. when, seeing no more land before us, we bore up round the S.E. end of Tanna; and, with a fine gale at E.S.E., ran along the south coast at one league from shore. It seemed a bold one, without the guard of any rocks; and the country full as fertile as in the neighbourhood of the harbour, and making a fine appearance. At six o'clock the high land of Erromango appeared over the west end of Tanna in the direction of N. 16° West; at eight o'clock we were past the island, and steered N.N.W. for

Sandwich Island, in order to finish the survey * of it, and of the isles to the N.W. On the 22nd, at four o'clock P.M., we drew near the S.E. end, and ranging the south coast, found it to trend in the direction of W. and W.N.W. for about nine leagues. Near the middle of this length, and close to the shore, are three or four small isles, behind which seemed to be a safe anchorage. But not thinking I had any time to spare to visit this fine island, I continued to range the coast to its western extremity, and then steered N.N.W. for the S.E. end of Mallicollo, which, at half past six o'clock next morning, bore N. 14° East, distant seven or eight leagues, and Three-Hills Island S. 82° East. Soon after, we saw the islands Apee, Paoom, and Ambrym. What we had comprehended under the name of Paoom appeared now to be two isles, something like a separation being seen between the hill and the land to the West of it. We approached the S.W. side of Mallicollo to within half a league, and ranged it at that distance. From the S.E. point, the direction of the land is west, a little southerly, for six or seven leagues, and then N.W. by W. three leagues, to a pretty high point or head-land, situated in latitude $16^{\circ} 29'$, and which obtained the name of South-West Cape. The coast, which is low, seemed to be indented into creeks and projecting points; or else, these points were small isles lying under the shore. We were sure of one, which lies between two and three leagues east of the Cape. Close to the west side or point of the Cape lies, connected with it by breakers, a round rock or islet, which helps to shelter a fine bay, formed by an elbow in the coast, from the reigning winds.

The natives appeared in troops on many parts of the shore, and some seemed desirous to come off to us in canoes; but they did not: and, probably, our not shortening sail was the reason. From the South-West Cape, the direction of the coast is N. by W., but the most advanced land bore from it N.W. by N. at which the land seemed to terminate. Continuing to follow the direction of the coast, at noon it was two miles from us; and our latitude, by observation, was $16^{\circ} 22' 30''$ South. This is nearly the parallel to Port Sandwich, and our never-failing guide, the watch, showed that we were $26'$ W. of it; a distance which the breadth of Mallicollo cannot exceed in this parallel. The South-West Cape bore S. 26° East, distant seven miles; and the most advanced point of land, for which we steered, bore N.W. by N. At three o'clock we were the length of it, and found the land continued, and trending more and more to the north. We coasted it to its northern extremity, which we did not reach till after dark, at which time we were near enough the shore to hear the voices of people, who were assembled round a fire they had made on the beach. There we sounded, and found twenty fathoms and a bottom of sand; but, on edging off from the shore, we soon got out of sounding, and then made a trip back to the south till the moon got up. After this we stood again to the north, hauled round the point, and spent the night in Bougainville's passage; being assured of our situation before sunset, by seeing the land, on the north side of the passage, extending as far as N.W. $\frac{1}{2}$ W. The south coast of Mallicollo, from the S.E. end to the S.W. Cape, is luxuriantly clothed with wood, and other productions of nature, from the sea-shore to the very summits of the hills. To the N.W. of the Cape the country is less woody, but more agreeably interspersed with lawns, some of which appeared to be cultivated. The summits of the hills seemed barren; and the highest lies between Port Sandwich and the S.W. Cape. Farther north, the land falls insensibly lower, and is less covered with wood. I believe it is a very fertile island, and well inhabited; for we saw smoke by day, and fire by night, in all parts of it.

Next morning at sunrise, we found ourselves nearly in the middle of the passage, the N.W. end of Mallicollo extending from S. 30° East, to S. 58° West; the land to the north from N. 70° West, to N. 4° East; and the Isle of Lepers bearing N. 30° East, distant eleven or twelve leagues. We now made sail, and steered N. by E., and afterwards north, along the east coast of the northern land, with a fine breeze at S.E. We found that this coast, which at first appeared to be continued, was composed of several low woody isles, the most of them of small extent, except the southernmost, which, on account of the day, I named St. Bartholomew. It is six or seven leagues in circuit, and makes the N.E. point of

* The word Survey is not here to be understood in its literal sense. Surveying a place, according to my idea, is taking a geometrical plan of it, in which every place is to have its true situation, which cannot be done in a work of this nature.

Bougainville's Passage. At noon the breeze began to slacken. We were at this time between two and three miles from the land, and observed, in latitude $15^{\circ} 23'$, the Isle of Leppers bearing from E. by N. to E. by S., distant seven leagues; and a high bluff-head, at which the coast we were upon seemed to terminate, N.N.W. $\frac{1}{2}$ W., distant ten or eleven leagues; but from the mast-head we could see land to the east. This we judged to be an island, and it bore N. by W. $\frac{1}{2}$ W.

As we advanced to N.N.W. along a fine coast covered with woods, we perceived low land that extended off from the bluff-head towards the island above mentioned, but did not seem to join it. It was my intention to have gone through the channel, but the approach of night made me lay it aside, and steer without the island. During the afternoon we passed some small isles lying under the shore, and observed some projecting points of unequal height, but were not able to determine whether or not they were connected with the main land. Behind them was a ridge of hills which terminated at the bluff-head. There were cliffs, in some places of the coast, and white patches, which we judged to be chalk. At ten o'clock, being the length of the isle which lies off the head, we shortened sail, and spent the night making short boards. At daybreak on the 25th, we were on the north side of the island (which is of a moderate height, and three leagues in circuit), and steered west for the bluff-head along the low land under it. At sunrise an elevated coast came in sight beyond the bluff-head, extending to the north as far as N.W. by W. After doubling the head we found the land to trend south, a little easterly, and to form a large, deep bay, bounded on the west by the coast just mentioned.

Everything conspired to make us believe this was the bay of St. Philip and St. Jago, discovered by Quiros in 1606. To determine this point it was necessary to proceed farther up; for at this time we saw no end to it. The wind being at south, we were obliged to ply, and first stretched over for the west shore, from which we were three miles at noon, when our latitude was $14^{\circ} 55' 30''$ south, longitude $167^{\circ} 3'$ east; the mouth of the bay extending from N. 64° west to S. 86° east, which last direction was the bluff-head, distant three leagues. In the afternoon, the wind veering to the E.S.E., we could look up to the head of the bay; but as the breeze was faint, a N.E. swell hurled us over to the west shore; so that at half-past four o'clock P.M. we were no more than two miles from it, and tacked in one hundred and twenty fathoms water, a soft muddy bottom. The bluff-head, or east point of the bay, bore N. 53° east.

We had no sooner tacked than it fell calm, and we were left to the mercy of the swell, which continued to hurtle us towards the shore, where large troops of people were assembled. Some ventured off in two canoes; but all the signs of friendship we could make did not induce them to come alongside, or near enough to receive any present from us. At last they took sudden fright at something, and returned ashore. They were naked, except having some long grass, like flags, fastened to a belt, and hanging down before and behind, nearly as low as the knee. Their colour was very dark, and their hair woolly; or cut short, which made it seem so. The canoes were small, and had out-riggers. The calm continued till near eight o'clock, in which time we drove into eighty-five fathoms water, and so near the shore that I expected we should be obliged to anchor. A breeze of wind sprung up at E.S.E., and first took us on the wrong side; but, contrary to all our expectations, and when we had hardly room to veer, the ship came about, and having filled on the larboard tack, we stood off N.E. Thus we were relieved from the apprehensions of being forced to anchor in a great depth, on a lee shore, and in a dark and obscure night.

We continued to ply upwards, with variable light breezes between E.S.E. and S., till ten next morning, when it fell calm. We were, at this time, about seven or eight miles from the head of the bay, which is terminated by a low beach; and behind that is an extensive flat covered with wood, and bounded on each side by a ridge of mountains. At noon we found the latitude to be $15^{\circ} 5'$ south, and were detained here by the calm till one o'clock P.M., when we got a breeze at N. by W., with which we steered up to within two miles of the head of the bay; and then I sent Mr. Cooper and Mr. Gilbert to sound and reconnoitre the coast, while we stood to and fro with the ship. This gave time to three sailing canoes, which had been following us some time, to come up. There were five or six men in each,

and they approached near enough to receive such things as were thrown to them fastened to a rope, but would not advance alongside. They were the same sort of people as those we had seen the preceding evening; indeed we thought they came from the same place. They seemed to be stouter and better shaped men than those of Mallicollo; and several circumstances concurred to make us think they were of another nation. They named the numerals as far as five or six, in the language of Anamocka, and understood us when we asked the names of the adjacent lands in that language. Some, indeed, had black short frizzled hair, like the natives of Mallicollo; but others had it long, tied up on the crown of the head, and ornamented with feathers, like the New Zealanders. Their other ornaments were bracelets and necklaces; one man had something like a white shell on his forehead; and some were painted with a blackish pigment. I did not see that they had any other weapon but darts and gigs, intended only for striking of fish. Their canoes were much like those of Tanna, and navigated in the same manner, or nearly so. They readily gave us the names of such parts as we pointed to: but we could not obtain from them the name of the island. At length, seeing our boats coming, they paddled in for the shore, notwithstanding all we could say or do to detain them.

When the boats returned, Mr. Cooper informed me, that they had landed on the beach which is at the head of the bay, near a fine river, or stream of fresh water, so large and deep, that they judged boats might enter it at high water. They found three fathoms depth close to the beach, and fifty-five and fifty, two cables' length off. Farther out they did not sound; and where we were with the ship, we had no soundings with a hundred and seventy fathoms line. Before the boats got on board, the wind had shifted to S.S.E. As we were in want of nothing, and had no time to spare, I took the advantage of this shift of wind, and steered down the bay. During the fore-part of the night, the country was illuminated with fires, from the sea-shore to the summits of the mountains; but this was only on the west side of the shore. I cannot pretend to say what was the occasion of these fires, but have no idea of their being on our account. Probably they were burning or clearing the ground for new plantations. At daybreak on the 27th, we found ourselves two-thirds down the bay; and, as we had but little wind, it was noon before we were the length of the N.W. point, which at this time bore N. 82° west, distant five miles. Latitude observed, 14° 39' 30''.

Some of our gentlemen were doubtful of this being the bay of St. Philip and St. Jago, as there was no place which they thought could mean the port of Vera Cruz. For my part, I found general points to agree so well with Quiros's description, that I had not the least doubt about it. As to what he calls the port of Vera Cruz, I understand that to be the anchorage at the head of the bay, which in some places may extend farther off than where our boats landed. There is nothing in his account of the port which contradicts this supposition*. It was but natural for his people to give a name to the place, independent of so large a bay, where they lay so long at anchor. A port is a vague term, like many others in geography, and has been very often applied to places far less sheltered than this. Our officers observed that grass and other plants grew on the beach close to high-water mark; which is always a sure sign of pacific anchorage, and an undeniable proof that there never is a great surf on the shore. They judged that the tide rose about four or five feet, and that boats and such craft might, at high water, enter the river, which seemed to be pretty deep and broad within; so that this, probably, is one of those mentioned by Quiros; and, if we were not deceived, we saw the other.

The bay hath twenty leagues sea-coast; six on the east side, which lies in the direction of S. $\frac{1}{2}$ west, and N. $\frac{1}{2}$ east; two at the head, and twelve on the west side, the direction of which is S. by E. and N. by W. from the head down to two-thirds of its length, and then N.W. by N. to the N.W. point. The two points which form the entrance lie in the direction of S. 53° east, and N. 53° west, from each other distant ten leagues. The bay is everywhere free from danger, and of unfathomable depth, except near the shores, which are for the most part low. This, however, is only a very narrow strip between the sea-shore and the foot of the hills; for the bay, as well as the flat land at the head of it, is

* See Quiros's Voyage, in Dalrymple's Collection, vol. i. p. 136, 137.

bounded on each side by a ridge of hills, one of which, that to the west, is very high, and double, extending the whole length of the island. An uncommonly luxuriant vegetation was everywhere to be seen; the sides of the hills were checkered with plantations, and every valley watered by a stream. Of all the productions of nature this country was adorned with, the cocoa-nut trees were the most conspicuous. The columns of smoke we saw by day, and the fires by night, all over the country, led us to believe that it is well inhabited and very fertile. The east point of this bay, which I name Cape Quiros, in memory of its first discoverer, is situated in latitude $14^{\circ} 56'$ south, longitude $167^{\circ} 13'$ east. The N.W. point, which I named Cape Cumberland, in honour of his Royal Highness the Duke, lies in the latitude of $14^{\circ} 38' 45''$ south, longitude $166^{\circ} 49\frac{1}{2}'$ east, and is the N.W. extremity of this archipelago; for, after doubling it, we found the coast to trend gradually round to the S. and S.E.

On the 28th and 29th we had light airs and calms, so that we advanced but little. In this time we took every opportunity, when the horizon was clearer than usual, to look out for more land; but none was seen. By Quiros's track to the north, after leaving the bay above mentioned, it seems probable that there is none nearer than Queen Charlotte's Island, discovered by Captain Carteret, which lies about ninety leagues N.N.W. from Cape Cumberland, and I take to be the same with Quiros's Santa Cruz. On the 30th the calm was succeeded by a fresh breeze at S.S.E., which enabled us to ply up the coast. At noon we observed in $15^{\circ} 20'$; afterwards we stretched in east, to within a mile of the shore, and then tacked, in seventy-five fathoms, before a sandy flat, on which several of the natives made their appearance. We observed, on the sides of the hills, several plantations that were laid out by line, and fenced round. On the 31st, at noon, the S. or S.W. point of the island bore N. 62° east, distant four leagues. This forms the N.W. point of what I call Bougainville's Passage; the N.E. point, at this time, bore N. 85° east, and the N.W. end of Mollicollo from S. 54° east to S. 72° east. Latitude observed, $15^{\circ} 45'$ S. In the afternoon, in stretching to the east, we weathered the S.W. point of the island, from which the coast trends east northerly. It is low, and seemed to form some creeks or coves; and, as we got farther into the passage, we perceived some small low isles lying along it, which seemed to extend behind St. Bartholomew Island.

Having now finished the survey of the whole archipelago, the season of the year made it necessary for me to return to the south, while I had yet some time left to explore any land I might meet with between this and New Zealand; where I intended to touch, that I might refresh my people, and recruit our stock of wood and water for another southern course. With this view, at five p.m. we tacked, and hauled to the southward, with a fresh gale at S.E. At this time the N.W. point of the passage, or the S.W. point of the island Tierra del Espiritu Santo, the only remains of Quiros's continent, bore N. 82° west, distant three leagues. I named it Cape Lisburne, and its situation is in latitude $15^{\circ} 40'$, longitude $165^{\circ} 59'$ east.

The foregoing account of these islands, in the order in which we explored them, not being particular enough either as to situation or description, it may not be improper now to give a more accurate view of them, which, with the chart, will convey to the reader a better idea of the whole group.

The northern islands of this archipelago were first discovered by that great navigator, Quiros, in 1606; and, not without reason, were considered as part of the southern continent, which, at that time, and until very lately, was supposed to exist. They were next visited by M. de Bougainville, in 1768; who, besides landing on the Isle of Lepers, did no more than discover that the land was not connected, but composed of islands, which he called the Great Cyclades. But as, besides ascertaining the extent and situation of these islands, we added to them several new ones which were not known before, and explored the whole, I think we have obtained a right to name them; and shall in future distinguish them by the name of the New Hebrides. They are situated between the latitude of $14^{\circ} 29'$ and $20^{\circ} 4'$ south, and between $166^{\circ} 41'$ and $170^{\circ} 21'$ east longitude, and extend an hundred and twenty-five leagues in the direction of N.N.W. $\frac{1}{2}$ west, and S.S. E. $\frac{1}{2}$ east.

The most northern island is that called by M. de Bougainville Peak of the Etoile. It is

situated, according to his account, in latitude $14^{\circ} 29'$, longitude $168^{\circ} 9'$; and, N. by W., eight leagues from Aurora. The next island, which lies farthest north, is that of *Tierra del Espiritu Santo*. It is the most western and largest of all the *Hebrides*, being twenty-two leagues long, in the direction of N.N.W. $\frac{1}{2}$ west, and S.S.E. $\frac{1}{2}$ east, twelve in breadth, and sixty in circuit. We have obtained the true figure of this island very accurately. The land of it, especially the west side, is exceedingly high and mountainous; and, in many places, the hills rise directly from the sea. Except the cliffs and beaches, every other part is covered with wood, or laid out in plantations. Besides the Bay of St. Philip and St. Jago, the isles which lie along the south and east coast cannot, in my opinion, fail of forming some good bays or harbours.

The next considerable island is that of *Mallicollo*, to the S.E. It extends N.W. and S.E., and is eighteen leagues long in that direction. Its greatest breadth, which is at the S.E. end, is eight leagues. The N.W. end is two-thirds this breadth; and nearer the middle, one-third. This contraction is occasioned by a wide and pretty deep bay on the S.W. side. To judge of this island from what we saw of it, it must be very fertile and well inhabited. The land on the sea-coast is rather low, and lies with a gentle slope from the hills which are in the middle of the island. Two-thirds of the N.E. coast were only seen at a great distance; therefore the delineations of it on the chart can have no pretensions to accuracy; but the other parts, I apprehend, are without any material errors. *St. Bartholomew* lies between the S.E. end of *Tierra del Espiritu Santo*, and the north end of *Mallicollo*; and the distance between it and the latter is eight miles. This is the passage through which *M. de Bougainville* went; and the middle of it is in latitude $15^{\circ} 48'$. The Isle of *Lepers* lies between *Espiritu Santo* and *Aurora Island*, eight leagues from the former, and three from the latter, in latitude $15^{\circ} 22'$, and nearly under the same meridian as the S.E. end of *Mallicollo*. It is of an egg-like figure, very high, and eighteen or twenty leagues in circuit. Its limits were determined by several bearings; but the lines of the shore were traced out by guess, except the N.E. part, where is anchorage half a mile from the land.

Aurora, *Whitsuntide*, *Ambrym*, *Paoom*, and its neighbour *Apee*, *Threehills*, and *Sandwich Islands*, lie all nearly under the meridian of $167^{\circ} 29'$ or $30'$ east, extending from the latitude of $14^{\circ} 51' 30''$, to $17^{\circ} 53' 30''$. The island of *Aurora* lies N. by W. and S. by E., and is eleven leagues long in that direction; but I believe it hardly anywhere exceeds two or two and a half in breadth. It hath a good height, its surface hilly, and everywhere covered with wood, except where the natives have their dwellings and plantations. *Whitsuntide Isle*, which is one league and a half to the south of *Aurora*, is of the same length, and lies in the direction of north and south, but is something broader than *Aurora Island*. It is considerably high, and clothed with wood, except such parts as seemed to be cultivated, which were pretty numerous.

From the south end of *Whitsuntide Island* to the north side of *Ambrym* is two leagues and a half. This is about seventeen leagues in circuit; its shores are rather low, but the land rises with an unequal ascent to a tolerably high mountain in the middle of the island, from which ascended great columns of smoke; but we were not able to determine whether this was occasioned by a volcano or not. That it is fertile and well inhabited seems probable, from the quantities of smoke which we saw rise out of the woods, in such parts of the island as came within the compass of our sight; for it must be observed, that we did not see the whole of it. We saw much less still of *Paoom*, and its neighbourhood. I can say no more of this island than that it towers up to a great height, in the form of a round haystack; and the extent of it, and of the adjoining isle (if there are two) cannot exceed three or four leagues in any direction; for the distance between *Ambrym* and *Apee* is hardly five; and they lie in this space, and east from *Port Sandwich*, distant about seven or eight leagues. The island of *Apee* is not less than twenty leagues in circuit; its longest direction is about eight leagues N.W. and S.E.; it is of considerable height, and hath a hilly surface, diversified with woods and lawns, the west and south parts especially; for the others we did not see.

Shepherd's Isles are a group of small ones of unequal size, extending off from the S.E. point of *Apee* about five leagues, in the direction of S.E. The island *Threehills* lies south four

leagues from the coast of Apee, and S.E. $\frac{1}{2}$ S., distant seventeen leagues from Port Sand-
wich: to this, and what has been already said of it, I shall only add, that W. by N., five
miles from the west point, is a reef of rocks on which the sea continually breaks.

Nine leagues, in the direction of south, from Threehills, lies Sandwich Island. Twohills,
the Monument, and Montagu Islands, lie to the east of this line, and Hinchinbrook to the
west, as also two or three small isles which lie between it and Sandwich Island, to which
they are connected by breakers. Sandwich Island is twenty-five leagues in circuit; its
greatest extent is ten leagues; and it lies in the direction of N.W. by W., and S.E. by E.
The N.W. coast of this island we only viewed at a distance; therefore the chart in this
part may be faulty, so far as it regards the line of the coast, but no farther. The distance
from the south end of Mallicollo to the N.W. end of Sandwich Island is twenty-two leagues
in the direction of S.S.E. $\frac{1}{2}$ E.

In the same direction lie Erromango, Tanna, and Annatton. The first is eighteen
leagues from Sandwich Island, and is twenty-four or twenty-five leagues in circuit. The
middle of it lies in the latitude of $18^{\circ} 54'$, longitude $169^{\circ} 19' E.$, and it is of a good height,
as may be gathered from the distance we were off when we first saw it. Tanna lies six
leagues from the south side of Erromango, extending S.E. by S. and N.W. by N., about
eight leagues long in that direction, and everywhere about three or four leagues broad.

The Isle of Immer lies in the direction of N. by E. $\frac{1}{2}$ E., four leagues from Port
Resolution in Tanna; and the island of Erronau or Footoonna east, in the same direction,
distant eleven leagues. This, which is the most eastern island of all the Hebrides, did not
appear to be above five leagues in circuit, but of a considerable height, and flat at top. On
the N.E. side is a little peak, seemingly disjoined from the isle, but we thought it was
connected by low land. Annatton, which is the southernmost island, is situated in the
latitude of $20^{\circ} 3'$, longitude $170^{\circ} 4'$, and S. $30^{\circ} E.$, eleven or twelve leagues from Port
Resolution. It is of a good height, with a hilly surface; and more I must not say of it.

Here follow the lunar observations by Mr. Wales, for ascertaining the longitude of
these islands, reduced by the watch to Port Sandwich in Mallicollo and Port Resolution in
Tanna.

PORT SANDWICH,	{	Mean of 10 sets of observ. before	.	.	167° 56' 33 $\frac{1}{2}$ "	E. Long.

It is necessary to observe, that each set of observations, consisting of between six and ten
observed distances of the sun and moon, or moon and stars, the whole number amounts to
several hundreds; and these have been reduced, by means of the watch, to all the islands;
so that the longitude of each is as well ascertained as that of the two ports above mentioned.
As a proof of this, I shall only observe, that the longitude of the two ports, as pointed out
by the watch and by the observations, did not differ two miles. This also shows what
degree of accuracy these observations are capable of, when multiplied to a considerable
number, made with different instruments, and with the sun and stars, on both sides of the
moon. By this last method, the errors, which may be either in the instruments or
lunar tables, destroy one another, and likewise those which may arise from the observer
himself; for some men may observe closer than others. If we consider the number of
observations that may be obtained in the course of a month (if the weather is favourable),
we shall perhaps find this method of finding the longitude of places as accurate as most
others; at least, it is the most easy, and attended with the least expense to the observer.
Every ship that goes to foreign parts is, or may be, supplied with a sufficient number of
quadrants at a small expense; I mean good ones, proper for making these observations.
For the difference of the price between a good and bad one, I apprehend, can never be an

object with an officer. The most expensive article, and what is in some measure necessary in order to arrive at the utmost accuracy, is a good watch; but for common use, and where that strict accuracy is not required, this may be dispensed with. I have observed before, in this journal, that this method of finding the longitude is not so difficult but that any man, with proper application, and a little practice, may soon learn to make these observations as well as the astronomers themselves. I have seldom known any material difference between the observations made by Mr. Wales, and those made by the officers at the same time*.

In observing the variation of the magnetic needle, we found, as usual, our compasses differ among themselves, sometimes near 2° ; the same compass, too, would sometimes make nearly this difference in the variation on different days, and even between the morning and evening of the same day, when our change of situation has been but very little. By the mean of the observations which I made about Erromango, and the S.E. part of these islands, the variation of the compass was $10^{\circ} 5' 48''$ east; and the mean of those made about Tierra del Espiritu Santo gave $10^{\circ} 5' 30''$ east. This is considerably more than Mr. Wales found it to be at Tanna. I cannot say what might occasion this difference in the variation observed at sea and on shore, unless it be influenced by the land; for I must give the preference to that found at sea, as it is agreeable to what we observed before we made the islands, and after we left them.

CHAPTER VIII.—AN ACCOUNT OF THE DISCOVERY OF NEW CALEDONIA, AND THE INCIDENTS THAT HAPPENED WHILE THE SHIP LAY IN BALADE.

At sunrise on the 1st of September, after having stood to S.W. all night, no more land was to be seen. The wind remaining in the S.E. quarter, we continued to stand to S.W. On the 2nd, at five o'clock p.m., being in the latitude $18^{\circ} 22'$, longitude $165^{\circ} 26'$, the variation was $10^{\circ} 50'$ east; and at the same hour on the 3rd, it was $10^{\circ} 51'$, latitude at that time $19^{\circ} 14'$, longitude 165° east. The next morning, in the latitude of $19^{\circ} 49'$, longitude $164^{\circ} 53'$, the amplitude gave $10^{\circ} 21'$, and the azimuths $10^{\circ} 7'$ east. At eight o'clock, as we were steering to the south, land was discovered bearing S.S.W., and at noon it extended from S.S.E. to W. by S., distant about six leagues. We continued to steer for it with a light breeze at east, till five in the evening, when we were stopped by a calm. At this time we were three leagues from the land, which extended from S.E. by S. to W. by N., round by the S.W. Some openings appeared in the west, so that we could not tell whether it was one connected land or a group of islands. To the S.E. the coast seemed to terminate in a high promontory, which I named Cape Colnett, after one of my midshipmen, who first discovered this land. Breakers were seen about half-way between us and the shore; and, behind them, two or three canoes under sail, standing out to sea, as if their design had been to come off to us; but a little before sunset they struck their sails, and we saw them no more. After a few hours' calm, we got a breeze at S.E., and spent the night standing off and on.

On the 5th, at sunrise, the horizon being clear, we could see the coast extend to the S.E. of Cape Colnett, and round by the S.W. to N.W. by W. Some gaps or openings were yet to be seen to the west; and a reef, or breakers, seemed to lie all along the coast, connected with those we discovered the preceding night. It was a matter of indifference to me whether we plied up the coast to the S.E. or bore down to N.W. I chose the latter; and after running two leagues down the outside of the reef (for such it proved), we came before an opening that had the appearance of a good channel, through which we might go in for the land. I wanted to get at it, not only to visit it, but also to have an opportunity to observe an eclipse of the sun which was soon to happen. With this view we brought to, hoisted out two armed boats, and sent them to sound the channel, ten or twelve large sailing canoes being then near us. We had observed them coming off from the shore, all the morning, from different parts; and some were lying on the reef, fishing as we supposed. As soon as

they all got together, they came down to us in a body, and were pretty near when we were hoisting out our boats, which probably gave them some alarm; for, without stopping, they hauled in for the reef, and our boats followed them. We now saw that what we had taken for openings in the coast was low land, and that it was all connected, except the western extremity, which was an island, known by the name of Balabea, as we afterwards learnt.

The boats having made a signal for a channel, and one of them being placed on the point of the reef, on the weather side of it, we stood in with the ship, and took up the other boat in our way, when the officer informed me, that where we were to pass, was sixteen and fourteen fathoms water, a fine sandy bottom, and that, having put alongside two canoes, he found the people very obliging and civil. They gave him some fish; and, in return, he presented them with medals, &c. In one was a stout robust young man, whom they understood to be a chief. After getting within the reef, we hauled up S. $\frac{1}{2}$ E. for a small low sandy isle that we observed lying under the shore, being followed by all the canoes. Our sounding, in standing in, was from fifteen to twelve fathoms (a pretty even fine sandy bottom), for about two miles; then we had six, five, and four fathoms. This was on the tail of a shoal which lies a little without the small isle to the N.E. Being over it, we found seven and eight fathoms water, which shallowed gradually, as we approached the shore, to three fathoms, when we tacked, stood off a little, and then anchored in five fathoms, the bottom a fine sand mixed with mud. The little sandy isle bore E. by S., three quarters of a mile distant; and we were one mile from the shore of the main, which extended from S.E. by E. round by the south to W.N.W. The island of Balabea bore N.W. by N., and the channel, through which we came, north, four miles distant. In this situation we were extremely well sheltered from the reigning winds, by the sandy isle and its shoals, and by the shoal without them.

We had hardly got to an anchor before we were surrounded by a great number of the natives, in sixteen or eighteen canoes, the most of whom were without any sort of weapons. At first they were shy of coming near the ship; but in a short time we prevailed on the people in one boat to get close enough to receive some presents. These we lowered down to them by a rope; to which, in return, they tied two fish that stunk intolerably, as did those they gave us in the morning. These mutual exchanges bringing on a kind of confidence, two ventured on board the ship; and presently after she was filled with them, and we had the company of several at dinner in the cabin. Our pea-soup, salt beef, and pork, they had no curiosity to taste; but they ate of some yams, which we happened to have yet left, calling them *Oobee*. This name is not unlike *Oofee*, as they are called at most of the islands, except Mallicollo; nevertheless we found these people spoke a language new to us. Like all the nations we had lately seen, the men were almost naked, having hardly any other covering but such a wrapper as is used at Mallicollo*. They were curious in examining every part of the ship, which they viewed with uncommon attention. They had not the least knowledge of goats, hogs, dogs, or cats, and had not even a name for one of them. They seemed fond of large spike-nails, and pieces of red cloth, or indeed of any other colour; but red was their favourite.

After dinner I went on shore with two armed boats, having with us one of the natives who had attached himself to me. We landed on a sandy beach before a vast number of people, who had got together with no other intent than to see us; for many of them had not a stick in their hands; consequently we were received with great courtesy, and with the surprise natural for people to express at seeing men and things so new to them as we must be. I made presents to all those my friend pointed out, who were either old men, or such as seemed to be of some note; but he took not the least notice of some women who stood behind the crowd, holding my hand when I was going to give them some beads and medals. Here we found the same chief who had been seen in one of the canoes in the morning. His name, we now learnt, was Teabooma; and we had not been on shore above ten minutes, before he called for silence. Being instantly obeyed by every individual present, he made a short speech; and soon after another chief having called for silence, made a speech also. It was pleasing to see with what attention they were heard. Their speeches were composed of

* See the note at page 499.

short sentences; to each of which two or three old men answered, by nodding their heads, and giving a kind of grunt, significant, as I thought, of approbation. It was impossible for us to know the purport of these speeches; but we had reason to think they were favourable to us, on whose account they doubtless were made. I kept my eyes fixed on the people all the time, and saw nothing to induce me to think otherwise. While we were with them, having inquired, by signs, for fresh water, some pointed to the east, and others to the west. My friend undertook to conduct us to it, and embarked with us for that purpose. We rowed about two miles up the coast to the east, where the shore was mostly covered with mangrove trees; and entering amongst them, by a narrow creek or river, which brought us to a little straggling village above all the mangroves, there we landed, and were shown fresh water. The ground near this village was finely cultivated, being laid out in plantations of sugar-canes, plantains, yams, and other roots; and watered by little rills, conducted by art from the main stream, whose source was in the hills. Here were some cocoa-nut trees, which did not seem burdened with fruit. We heard the crowing of cocks, but saw none. Some roots were baking on a fire, in an earthen jar, which would have held six or eight gallons; nor did we doubt its being their own manufacture. As we proceeded up the creek, Mr. Forster having shot a duck flying over our heads, which was the first use these people saw made of our fire-arms, my friend begged to have it; and when he landed, told his countrymen in what manner it was killed. The day being far spent, and the tide not permitting us to stay longer in the creek, we took leave of the people, and got on board a little after sunset. From this little excursion, I found that we were to expect nothing from these people but the privilege of visiting their country undisturbed. For it was easy to see they had little else than good-nature to bestow. In this they exceeded all the nations we had yet met with; and, although it did not satisfy the demands of nature, it at once pleased and left our minds at ease.

Next morning we were visited by some hundreds of the natives; some coming in canoes, and others swimming off; so that before ten o'clock, our decks, and all other parts of the ship, were quite full with them. My friend, who was of the number, brought me a few roots, but all the others came empty in respect to eatables. Some few had with them their arms, such as clubs and darts, which they exchanged for nails, pieces of cloth, &c. After breakfast, I sent Lieutenant Pickersgill with two armed boats to look for fresh water; for what we found the day before was by no means convenient for us to get on board. At the same time, Mr. Wales, accompanied by Lieutenant Clerke, went to the little isle to make preparations for observing the eclipse of the sun, which was to be in the afternoon. Mr. Pickersgill soon returning, informed me that he had found a stream of fresh water, pretty convenient to come at. I therefore ordered the launch to be hoisted out to complete our water, and then went to the isle to assist in the observation.

About one P.M. the eclipse came on. Clouds interposed, and we lost the first contact, but were more fortunate in the end, which was observed as follows:—

By Mr. Wales with Dollond's $3\frac{1}{2}$ foot achromatic refractor, at	3h 28' 49 $\frac{1}{2}$ "	} Apparent time.
By Mr. Clerke with Bird's 2 foot reflector, at	3 28 52 $\frac{1}{2}$	
And by me with an 18 inch reflector, made by Watkins	3 28 53 $\frac{1}{2}$	

Latitude of the isle or place of observation, $20^{\circ} 17' 39''$ south.

Longitude per distance of the sun and moon, and moon and stars, $164^{\circ} 41' 21''$ E.

Ditto per watch 163 58 0

Mr. Wales measured the quantity eclipsed by a Hadley's quadrant, a method never before thought of. I am of opinion it answers the purpose of a micrometer to a great degree of certainty, and is a great addition to the use of this most valuable instrument. After all was over, we returned on board, where I found Teabooma the chief, who soon after slipped out of the ship without my knowledge, and by that means lost the present I had made up for him. In the evening I went ashore to the watering-place, which was at the head of a little creek, at a fine stream that came from the hills. It was necessary to have a small boat in the creek to convey the casks from and to the beach over which they were rolled, and then put into the launch; as only a small boat could enter the creek, and that only at high water.

Excellent wood for fuel was here far more convenient than water, but this was an article we did not want. About seven o'clock the dog, died Simon Monk, our butcher, a man much esteemed in the ship; his death being occasioned by a fall down the fore-hatchway the preceding night.

Early in the morning of the 7th, the watering-party, and a guard, under the command of an officer, were sent ashore; and soon after, a party of us went to take a view of the country. As soon as we landed, we made known our design to the natives, and two of them undertaking to be our guides, conducted us up the hills by a tolerably good path. In our route we met several people, most of whom turned back with us; so that at last our train was numerous. Some we met who wanted us to return; but we paid no regard to their signs, nor did they seem uneasy when we proceeded. At length we reached the summit of one of the hills, from which we saw the sea in two places, between some advanced hills on the opposite or S.W. side of the land. This was a useful discovery, as it enabled us to judge of the breadth of the land, which, in this part, did not exceed ten leagues. Between those advanced hills and the ridge we were upon, was a large valley, through which ran a serpentine river. On the banks of this were several plantations, and some villages, whose inhabitants we had met on the road, and found more on the top of the hill gazing at the ship, as might be supposed. The plain or flat land, which lies along the shore we were upon, appeared from the hills to a great advantage; the winding streams which ran through it, the plantations, the little straggling villages, the variety in the woods, and the shoals on the coast, so variegating the scene, that the whole might afford a picture for romance. Indeed, if it were not for those fertile spots on the plains, and some few on the sides of the mountains, the whole country might be called a dreary waste. The mountains and other high places are, for the most part, incapable of cultivation, consisting chiefly of rocks, many of which are full of mundieks. The little soil that is upon them is scorched and burnt up with the sun; it is, nevertheless, coated with coarse grass and other plants, and here and there trees and shrubs. The country in general bore great resemblance to some parts of New Holland under the same parallel of latitude, several of its natural productions seeming to be the same, and the woods being without underwood, as in that country. The reefs on the coast, and several other similarities, were obvious to every one who had seen both countries. We observed all the N.E. coast to be covered with shoals and breakers, extending to the northward, beyond the isle of Balabea, till they were lost in the horizon. Having made these observations, and our guides not choosing to go farther, we descended the mountains by a road different from that by which we ascended. This brought us down through some of their plantations in the plains, which I observed were laid out with great judgment, and cultivated with much labour. Some of them were lying in fallow; some seemingly lately laid down, and others of longer date, pieces of which they were again beginning to dig up. The first thing I observed they did, was to set fire to the grass, &c. which had over-run the surface. Recruiting the land by letting it lie some years untouched, is observed by all the nations in the sea; but they seem to have no notion of manuring it, at least I have nowhere seen it done. Our excursion was finished by noon, when we returned on board to dinner; and one of our guides having left us, we brought the other with us, whose fidelity was rewarded at a small expense.

In the afternoon, I made a little excursion alongshore to the westward, in company with Mr. Walker. Besides making observations on such things as we met, we got the names of several places, which I then thought were islands; but, upon farther inquiry, I found they were districts upon this same land. This afternoon, a fish being struck by one of the natives near the watering-place, my clerk purchased it, and sent it to me after my return on board. It was of a new species, something like a sun-fish, with a large, long, ugly head. Having no suspicion of its being of a poisonous nature, we ordered it to be dressed for supper; but, very luckily, the operation of drawing and describing took up so much time, that it was too late, so that only the liver and roe were dressed, of which the two Mr. Forsters and myself did but taste. About three o'clock in the morning, we found ourselves seized with an extraordinary weakness and numbness all over our limbs: I had almost lost the sense of feeling, nor could I distinguish between light and heavy bodies, of such as I had strength to move;

a quart pot full of water and a feather being the same in my hand. We each of us took an emetic, and after that a sweat, which gave us much relief. In the morning, one of the pigs which had eaten the entrails was found dead. When the natives came on board, and saw the fish hang up, they immediately gave us to understand it was not wholesome food, and expressed the utmost abhorrence of it; though no one was observed to do this when the fish was to be sold, or even after it was purchased.

On the 8th, the guard and a party of men were on shore as usual. In the afternoon, I received a message from the officer, acquainting me that Teabooma, the chief, was come with a present, consisting of a few yams and sugar-canes. In return I sent him, amongst other articles, a dog and a bitch, both young, but nearly full-grown. The dog was red and white, but the bitch was all red, or the colour of an English fox. I mention this, because they may prove the Adam and Eve of their species in that country. When the officer returned on board in the evening, he informed me that the chief came attended by about twenty men, so that it looked like a visit of ceremony. It was some time before he would believe the dog and bitch were intended for him; but as soon as he was convinced, he seemed lost in an excess of joy, and sent them away immediately. Next morning early, I despatched Lieutenant Pickersgill and Mr. Gilbert, with the launch and cutter, to explore the coast to the west; judging this would be better effected in the boats than in the ship, as the reefs would force the latter several leagues from land. After breakfast, a party of men was sent ashore to make brooms; but myself and the two Mr. Forsters were confined on board, though much better, a good sweat having had a happy effect. In the afternoon, a man was seen, both ashore and alongside the ship, said to be as white as any European. From the account I had of him (for I did not see him), his whiteness did not proceed from hereditary descent, but from chance or some disease; and such have been seen at Otaheite and the Society Isles*. A fresh easterly wind, and the ship lying a mile from the shore, did not hinder these good-natured people from swimming off to us in shoals of twenty or thirty, and returning the same way.

On the 10th, a party was on shore as usual; and Mr. Forster so well recovered as to go out botanizing. In the evening of the 11th the boats returned, when I was informed of the following circumstances. From an elevation which they reached the morning they set out, they had a view of the coast. Mr. Gilbert was of opinion that they saw the termination of it to the west, but Mr. Pickersgill thought not; though both agreed that there was no passage for the ship that way. From this place, accompanied by two of the natives, they went to Balabea, which they did not reach till after sunset, and left again next morning before sunrise; consequently this was a fruitless expedition, and the two following days were spent in getting up to the ship. As they went down to the isle, they saw abundance of turtle, but the violence of the wind and sea made it impossible to strike any. The cutter was near being lost, by suddenly filling with water, which obliged them to throw several things overboard before they could free her and stop the leak she had sprung. From a fishing canoe, which they met coming in from the reefs, they got as much fish as they could eat; and they were received by Teabi, the chief of the isle of Balabea, and the people, who came in numbers to see them, with great courtesy. In order not to be too much crowded, our people drew a line on the ground, and gave the others to understand they were not to come within it. This restriction they observed; and one of them, soon after, turned it to his own advantage: for happening to have a few cocoa-nuts, which one of our people wanted to buy, and he was unwilling to part with, he walked off, and was followed by the man who wanted them. On seeing this, he sat down on the sand, made a circle round him, as he had seen our people do, and signified that the other was not to come within it; which was accordingly observed. As this story was well attested, I thought it not unworthy of a place in this journal.

Early in the morning of the 12th, I ordered the carpenter to work, to repair the cutter, and the water to be replaced which we had expended the three preceding days. As Tea-

booma, the chief, had not been seen since he got the dogs, and I wanted to lay a foundation for stocking the country with hogs also, I took a young boar and sow with me in the boat, and went up the mangrove creek to look for my friend, in order to give them to him. But when we arrived there, we were told that he lived at some distance, and that they would send for him. Whether they did or not, I cannot say ; but, he not coming, I resolved to give them to the first man of note I met with. The guide we had to the hills happening to be there, I made him understand that I intended to leave the two pigs on shore, and ordered them out of the boat for that purpose. I offered them to a grave old man, thinking he was a proper person to entrust them with ; but he shook his head, and he, and all present, made signs to take them into the boat again. When they saw I did not comply, they seemed to consult with one another what was to be done ; and then our guide told me to carry them to the *Alekee* (chief). Accordingly I ordered them to be taken up, and we were conducted by him to a house wherein were seated, in a circle, eight or ten middle-aged persons. To them I and my pigs being introduced, with great courtesy they desired me to sit down ; and then I began to expatiate on the merits of the two pigs, explaining to them how many young ones the female would have at one time, and how soon these would multiply to some hundreds. My only motive was to enhance their value, that they might take the more care of them ; and I had reason to think I, in some measure, succeeded. In the mean time, two men having left the company, soon returned with six yams, which were presented to me ; and then I took leave and went on board.

I have already observed, that here was a little village ; I now found it much larger than I expected, and about it a good deal of cultivated land, regularly laid out, planted and planting with taro or eddy root, yams, sugar-canes, and plantains. The taro plantations were prettily watered by little rills, continually supplied from the main channel at the foot of the mountains, from whence these streams were conducted in artful meanders. They have two methods of planting these roots ; some are in square or oblong patches, which lie perfectly horizontal, and sink below the common level of the adjacent land ; so that they can let in on them as much water as they think necessary. I have generally seen them covered two or three inches deep ; but I do not know that this is always necessary. Others are planted in ridges about three or four feet broad, and two or two and a half high. On the middle or top of the ridge is a narrow gutter, in and along which is conveyed, as above described, a little rill that waters the roots planted in the ridge on each side of it ; and these plantations are so judiciously laid out, that the same stream waters several ridges. These ridges are sometimes the divisions to the horizontal plantations ; and when this method is used, which is for the most part observed where a pathway or something of that sort is requisite, not an inch of ground is lost. Perhaps there may be some difference in the roots, which may make these two methods of raising them necessary. Some are better tasted than others, and they are not all of a colour ; but be this as it may, they are a very wholesome food, and the tops make good greens, and are eaten as such by the natives. On these plantations, men, women, and children were employed.

In the afternoon I went on shore, and, on a large tree, which stood close to the shore, near the watering-place, had an inscription cut, setting forth the ship's name, date, &c., as a testimony of our being the first discoverers of this country, as I had done at all others at which we had touched, where this ceremony was necessary. This being done, we took leave of our friends, and returned on board, when I ordered all the boats to be hoisted in, in order to be ready to put to sea in the morning.

CHAPTER IX.—A DESCRIPTION OF THE COUNTRY AND ITS INHABITANTS ; THEIR MANNERS, CUSTOMS, AND ARTS.

I SHALL conclude our transactions at this place with some account of the country and its inhabitants. They are strong, robust, active, well-made people, courteous and friendly, and not in the least addicted to pilfering, which is more than can be said of any other nation in this sea. They are nearly of the same colour as the natives of Tanna, but have better

features, more agreeable countenances, and are a much stouter race; a few being seen who measured six feet four inches. I observed some who had thick lips, flat noses, and full cheeks, and, in some degree, the features and look of a negro. Two things contributed to the forming of such an idea: first, their rough mop heads; and secondly, their besmearing their faces with black pigment. Their hair and beards are in general black. The former is very much frizzled; so that at first sight it appears like that of a negro. It is, nevertheless, very different, though both coarser and stronger than ours. Some, who wear it long, tie it up on the crown of the head; others suffer only a large lock to grow on each side, which they tie up in clubs; many others, as well as all the women, wear it cropped short. These rough heads most probably want frequent scratching, for which purpose they have a most excellent instrument. This is a kind of comb made of sticks of hard wood, from seven to nine inches long, and about the thickness of knitting-needles. A number of these, seldom exceeding twenty, but generally fewer, are fastened together at one end, parallel to, and near 1-10th of an inch from each other. The other ends, which are a little pointed, will spread out or open like the sticks of a fan, by which means they can beat up the quarters of a hundred lice at a time. These combs or scratchers—for I believe they serve both purposes—they always wear in their hair, on one side their head. The people of Tanna have an instrument of this kind, for the same use; but theirs is forked, I think never exceeding three or four prongs; and sometimes only a small pointed stick. Their beards, which are of the same crisp nature as their hair, are, for the most part, worn short. Swelled and ulcerated legs and feet are common among the men.

The wrapper mentioned they use as at Tanna and Mallicollo. This is their only covering, and is made generally of the bark of a tree, but sometimes of leaves. The small pieces of cloth, paper, &c., which they got from us, were commonly applied to this use. We saw coarse garments amongst them, made of a sort of matting; but they seemed never to wear them, except when out in their canoes, and unemployed. Some had a kind of concave, cylindrical, stiff black cap, which appeared to be a great ornament among them, and, we thought, was only worn by men of note, or warriors. A large sheet of strong paper, when they got one from us, was generally applied to this use.

The women's dress is a short petticoat, made of the filaments of the plantain-tree laid over a cord, to which they are fastened, and tied round the waist. The petticoat is made at least six or eight inches thick, but not one inch longer than necessary for the use designed. The outer filaments are dyed black; and, as an additional ornament, the most of them have a few pearl oyster-shells fixed on the right side. The general ornaments of both sexes are ear-rings of tortoise-shell, necklaces or amulets, made both of shells and stones, and bracelets, made of large shells, which they wear above the elbow. They have punctures, or marks on the skin, on several parts of the body; but none, I think, are black as at the eastern islands. I know not if they have any other design than ornament; and the people of Tanna are marked much in the same manner.

Were I to judge of the origin of this nation, I should take them to be a race between the people of Tanna and of the Friendly Isles; or between those of Tanna and the New Zealanders, or all three; their language, in some respects, being a mixture of them all. In their disposition they are like the natives of the Friendly Isles, but in affability and honesty they excel them. Notwithstanding their pacific inclination, they must sometimes have wars, as they are well provided with offensive weapons, such as clubs, spears, darts, and slings for throwing stones. The clubs are about two feet and a half long, and variously formed; some like a scythe, others like a pick-axe; some have a head like a hawk, and others have round heads; but all are neatly made. Many of their darts and spears are no less neat, and ornamented with carvings. The slings are as simple as possible; but they take some pains to form the stones that they use into a proper shape, which is something like an egg, supposing both ends to be like the small one. They use a becket in the same manner as at Tanna, in throwing the dart, which, I believe, is much used in striking fish, &c. In this they seem very dexterous; nor, indeed, do I know that they have any other method of catching large fish; for I neither saw hooks nor lines among them. It is needless

to mention their working tools, as they are made of the same materials, and nearly in the same manner, as at the other islands. Their axes, indeed, are a little different—some, at least—which may be owing to fancy as much as custom.

Their houses, or at least most of them, are circular; something like a beehive, and full as close and warm. The entrance is by a small door, or long square hole, just big enough to admit a man bent double. The side-walls are about four feet and a half high; but the roof is lofty, and peaked to a point at the top, above which is a post or stick of wood, which is generally ornamented either with carving or shells, or both. The framing is of small spars, reeds, &c., and both sides and roof are thick, and close covered with thatch, made of coarse long grass. In the inside of the house are set up posts, to which cross spars are fastened and platforms made, for the conveniency of laying anything on. Some houses have two floors, one above the other. The floor is laid with dry grass, and here and there mats are spread for the principal people to sleep or sit on. In most of them we found two fire-places; and commonly a fire burning; and, as there was no vent for the smoke but by the door, the whole house was both smoky and hot, insomuch that we, who are not used to such an atmosphere, could hardly endure it a moment. This may be the reason why we found these people so chilly when in the open air and without exercise. We frequently saw them make little fires anywhere, and hustle round them, with no other view than to warm themselves. Smoke within doors may be a necessary evil, as it prevents the musquitoes from coming in, which are pretty numerous here. In some respects their habitations are neat; for, besides the ornaments at top, I saw some with carved door-posts. Upon the whole, their houses are better calculated for a cold than a hot climate; and as there are no partitions in them, they can have little privacy.

They have no great variety of household utensils; the earthen jars before mentioned being the only article worth notice. Each family has, at least, one of them, in which they bake their roots, and perhaps their fish, &c. The fire by which they cook their victuals is on the outside of each house, in the open air. There are three or five pointed stones fixed in the ground, their pointed ends being about six inches above the surface, in the form conjoined. Those of three stones are only for one jar, those of five stones for two. The jars do not stand on their bottoms, but lie inclined on their sides. The use of these stones is, obviously, to keep the jars from resting on the fire, in order that it may burn the better. They subsist chiefly on roots and fish, and the bark of a tree, which, I am told, grows also in the West Indies. This they roast, and are almost continually chewing. It has a sweetish, insipid taste, and was liked by some of our people. Water is their only liquor; at least I never saw any other made use of. Plantains and sugar-canes are by no means in plenty. Bread-fruit is very scarce, and the cocoa-nut trees are small, and but thinly planted; and neither one nor the other seems to yield much fruit.

To judge merely by the numbers of the natives we saw every day, one might think the island very populous; but I believe that at this time the inhabitants were collected from all parts on our account. Mr. Pickersgill observed, that down the coast, to the west, there were but few people; and we knew they came daily from the other side of the land, over the mountains, to visit us. But although the inhabitants, upon the whole, may not be numerous, the island is not thinly peopled on the sea-coast, and in the plains and valleys that are capable of cultivation. It seems to be a country unable to support many inhabitants. Nature has been less bountiful to it than to any other tropical island we know in this sea. The greatest part of its surface, or at least what we saw of it, consists of barren, rocky mountains; and the grass, &c., growing on them, is useless to people who have no cattle. The sterility of the country will apologize for the natives not contributing to the wants of the navigator. The sea may, perhaps, in some measure compensate for the deficiency of the land; for a coast surrounded by reefs and shoals as this is, cannot fail of being stored with fish.

I have before observed, that the country bears great resemblance to New South Wales, or New Holland, and that some of its natural productions are the same. In particular, we

found here the tree which is covered with a soft white ragged bark, easily peeled off, and is, as I have been told, the same that in the East Indies is used for caulking of ships. The wood is very hard; the leaves are long and narrow, of a pale dead green and a fine aromatic; so that it may properly be said to belong to that continent. Nevertheless, here are several plants, &c., common to the eastern and northern islands, and even a species of the passion-flower, which, I am told, has never before been known to grow wild anywhere but in America. Our botanists did not complain for want of employment at this place; every day bringing something new in botany or other branches of natural history. Land-birds, indeed, are not numerous, but several are new. One of these is a kind of crow—at least, so we called it, though it is not half so big, and its feathers are tinged with blue. They also have some very beautiful turtle-doves, and other small birds, such as I never saw before.

All our endeavours to get the name of the whole island proved ineffectual. Probably, it is too large for them to know by one name. Whenever we made this inquiry, they always gave us the name of some district or place, which we pointed to; and, as before observed, I got the names of several, with the name of the king or chief of each. Hence, I conclude that the country is divided into several districts, each governed by a chief; but we know nothing of the extent of his power. Balade was the name of the district we were at, and Tea Booma the chief. He lived on the other side of the ridge of hills, so that we had but little of his company, and therefore could not see much of his power. *Tea* seems a title prefixed to the names of all or most of their chiefs or great men. My friend honoured me by calling me *Tea Cook*.

They deposit their dead in the ground. I saw none of their burying-places; but several of the gentlemen did. In one, they were informed, lay the remains of a chief, who was slain in battle; and his grave, which bore some resemblance to a large mole-hill, was decorated with spears, darts, paddles, &c., all stuck upright in the ground round about it. The canoes which these people use are somewhat like those of the Friendly Isles, but the most heavy, clumsy vessels I ever saw. They are what I call double canoes, made out of two large trees hollowed out, having a raised gunnel about two inches high, and closed at each end with a kind of bulk-head of the same height; so that the whole is like a long square trough, about three feet shorter than the body of the canoe; that is, a foot and a half at each end. Two canoes, thus fitted, are secured to each other, about three feet asunder, by means of cross spars, which project about a foot over each side. Over these spars is laid a deck or very heavy platform, made of plank and small round spars, on which they have a fire-hearth, and generally a fire burning; and they carry a pot or jar to dress their victuals in. The space between the two canoes is laid with plank, and the rest with spars. On one side of the deck, and close to the edge, is fixed a row of knees, pretty near to each other, the use of which is to keep the mast, yards, &c. from rolling overboard. They are navigated by one or two latteen sails, extended to a small latteen yard, the end of which fixes in a notch or hole in the deck. The foot of the sail is extended to a small boom. The sail is composed of pieces of matting; the ropes are made of the coarse filaments of the plantain-tree, twisted into cords of the thickness of a finger; and three or four more such cords, marled together, serve them for shrouds, &c. I thought they sailed very well; but they are not at all calculated for rowing or paddling. Their method of proceeding, when they cannot sail, is by sculling; and for this purpose there are holes in the boarded deck or platform. Through these they put the sculls, which are of such a length, that, when the blade is in the water, the loom or handle is four or five feet above the deck. The man who works it stands behind, and with both his hands sculls the vessel forward. This method of proceeding is very slow, and for this reason the canoes are but ill calculated for fishing, especially for striking of turtle, which, I think, can hardly ever be done in them. Their fishing implements, such as I have seen, are turtle-nets, made, I believe, of the filaments of the plantain-tree twisted; and small hand-nets with very minute meshes made of fine twine, and fish-gigs. Their general method of fishing, I guess, is to lie on the reefs in shoal water, and to strike the fish that may come in their way. They may, however, have other methods, which we had no opportunity to see, as no boat went out while we were here, all their time and attention being taken up with us. Their canoes are about thirty feet lon

and the deck or platform about twenty-four in length, and ten in breadth. We had not, at this time, seen any timber in the country so large as that of which their canoes were made. It was observed, that the holes made in the several parts, in order to sew them together, were burnt through, but with what instrument we never learnt; most probably it was of stone; which may be the reason why they were so fond of large spikes, seeing at once they would answer this purpose. I was convinced they were not wholly designed for edge-tools; because every one showed a desire for the iron belying pins which were fixed in the quarter-deck rail, and seemed to value them far more than a spike-nail, although it might be twice as big. These pins, which are round, perhaps have the very shape of the tool they wanted to make of the nails. I did not find that a hatchet was quite so valuable as a large spike. Small nails were of little or no value; and beads, looking-glasses, &c., they did not admire.

The women of this country, and likewise, those of Tanna, are, so far as I could judge, far more chaste than those of the more eastern islands. I never heard that one of our people obtained the least favour from any one of them. I have been told, that the ladies here would frequently divert themselves, by going a little aside with our gentlemen, as if they meant to be kind to them, and then would run away laughing at them. Whether this was chastity or coquetry, I shall not pretend to determine; nor is it material, since the consequences were the same.

CHAPTER X.—PROCEEDINGS ON THE COAST OF NEW CALEDONIA, WITH GEOGRAPHICAL AND NAUTICAL OBSERVATIONS.

EVERYTHING being in readiness to put to sea, at sunrise, on the 13th of September, we weighed, and with a fine gale at E. by S., stood out for the same channel we came in by. At half-past seven we were in the middle of it. Observatory Isle bore S. 5° E., distant four miles, and the Isle of Balabea W.N.W. As soon as we were clear of the reef, we hauled the wind on the starboard tack, with a view of plying in to the S.E.; but as Mr. Gilbert was of opinion that he had seen the end or N.W. extremity of the land, and that it would be easier to get round by the N.W., I gave over plying, and bore up along the outside of the reef, steering N.N.W., N.W., and N.W. by W. as it trended. At noon the island of Balabea bore S. by W., distant thirteen miles; and what we judged to be the west end of the great land, bore S.W. $\frac{1}{2}$ S.; and the direction of the reef was N.W. by W.; latitude observed, 19° 53' 20". Longitude from Observatory Isle, 14' W. We continued to steer N.W. by W. along the outside of the reef till three o'clock, at which time the Isle of Balabea bore S. by E. $\frac{1}{2}$ E. In this direction we observed a partition in the reef, which we judged to be a channel, by the strong tide which set out of it. From this place the reef inclined to the north, for three or four leagues, and then to N.W. We followed its direction, and as we advanced to N.W., raised more land, which seemed to be connected with what we had seen before; so that Mr. Gilbert was mistaken, and did not see the extremity of the coast. At five o'clock this land bore W. by N. $\frac{1}{2}$ N., distant twenty miles; but what we could see of the reef trended in the direction of N.W. by N.

Having hauled the wind on the starboard tack, and spent the night plying, on the 14th, at sunrise, the island of Balabea bore S. 6° E., and the land seen the preceding night west; but the reef still trended N.W., along which we steered with a light breeze at E.S.E. At noon we observed in latitude 19° 28', longitude from Observatory Isle 27' W. We had now no sight of Balabea; and the other land, that is, the N.W. part of it, bore W. by S. $\frac{1}{2}$ S.; but we were not sure if this was one continued coast, or separate islands. For though some partitions were seen, from space to space, which made it look like the latter, a multitude of shoals rendered a nearer approach to it exceedingly dangerous, if not impracticable. In the afternoon, with a fine breeze at E.S.E., we ranged the outside of these shoals, which we found to trend in the direction of N.W. by W., N.W. by N., and N.N.E. At three o'clock we passed a low sandy isle, lying on the outer edge of the reef, in latitude 19° 25', and in the direction of N.E. from the north-westernmost land, six or seven leagues distant. So much as we could see of this space was strewed with shoals, seemingly detached

from each other; and the channel leading in amongst them appeared to be on the S.E. side of the sandy isle; at least there was a space where the sea did not break. At sunset, we could but just see the land, which bore S.W. by S., about ten leagues distant. A clear horizon produced the discovery of no land to the westward of this direction; the reef, too, trended away W. by N. $\frac{1}{2}$ N., and seemed to terminate in a point which was seen from the mast-head. Thus everything conspired to make us believe that we should soon get round these shoals; and with these flattering expectations we hauled the wind, which was at E.N.E., and spent the night making short boards.

Next morning, at sunrise, seeing neither land nor breakers, we bore away N.W. by W., and two hours after saw the reef extending N.W. farther than the eye could reach; but no land was to be seen. It was therefore probable that we had passed its N.W. extremity; and, as we had seen from the hills of Balade its extent to the S.W., it was necessary to know how far it extended to the E. or S.E., while it was in our power to recover the coast. For, by following the direction of the shoals, we might have been carried so far to leeward as not to be able to beat back without considerable loss of time. We were already far out of sight of land; and there was no knowing how much farther we might be carried, before we found an end to them. These considerations, together with the risk we must run in exploring a sea strewn with shoals, and where no anchorage, without them, is to be found, induced me to abandon the design of proceeding round by the N.W., and to ply up to the S.E., in which direction I knew there was a clear sea. With this view, we tacked and stood to the S.E., with the wind at N.E. by E., a gentle breeze. At this time we were in the latitude of $19^{\circ} 7' S.$, longitude $163^{\circ} 57' E.$

In standing to S.E. we did but just weather the point of the reef we had passed the preceding evening. To make our situation the more dangerous, the wind began to fail us; and at three in the afternoon it fell calm, and left us to the mercy of a great swell, setting directly on the reef, which was hardly a league from us. We sounded, but found no bottom, with a line of 200 fathoms. I ordered the pinnace and cutter to be hoisted out to tow the ship; but they were of little use against so great a swell. We, however, found that the ship did not draw near the reef so fast as might be expected; and at seven o'clock, a light air at N.N.E. kept her head to the sea; but it lasted no longer than midnight, when it was succeeded by a dead calm. At daybreak, on the 16th, we had no sight of the reef; and at eleven, a breeze springing up at S.S.W., we hoisted in the boats, and made sail to S.E. At noon we observed in $19^{\circ} 35'$ south, which was considerably more to the south than we expected, and showed that a current or tide had been in our favour all night, and accounted for our getting so unexpectedly clear of the shoals. At two o'clock P.M. we had again a calm, which lasted till nine, when it was succeeded by a light air from E.N.E. and E., with which we advanced but slowly.

On the 17th, at noon, we observed in latitude $19^{\circ} 54'$, when the Isle of Balade bore S. $60^{\circ} W.$, ten and a half leagues distant. We continued to ply, with variable light winds, between N.E. and S.E., without meeting with anything remarkable till the 20th at noon, when Cape Colnet bore N. $78^{\circ} W.$, distant six leagues. From this cape the land extended round by the south to E.S.E. till it was lost in the horizon; and the country appeared with many hills and valleys. Latitude observed $20^{\circ} 41'$, longitude made from Observatory Isle $1^{\circ} 8' E.$ We stood in-shore with a light breeze at east till sunset, when we were between two and three leagues off. The coast extended from S. $42^{\circ} \frac{1}{2} E.$ to N. $59^{\circ} W.$ Two small islets lay without this last direction, distant from us four or five miles; some others lay between us and the shore, and to the east, where they seemed to be connected by reefs, in which appeared some openings from space to space. The country was mountainous, and had much the same aspect as about Balade. On one of the western small isles was an elevation like a tower; and, over a low neck of land within the isle, were seen many other elevations resembling the masts of a fleet of ships. Next day, at sunrise, after having stood off all night with a light breeze at S.E., we found ourselves about six leagues from the coast; and in this situation we were kept by a calm till ten in the evening, when we got a faint land-breeze at S.W., with which we steered S.E. all night.

On the 22d, at sunrise, the land was clouded; but it was not long before the clouds went

off, and we found, by our land-marks, that we had made a good advance. At ten o'clock, the land-breeze being succeeded by a sea-breeze at E. by S., this enabled us to stand in for the land, which at noon extended from N. 78° W. to S. $31\frac{1}{2}^{\circ}$ E. round by the south. In this last direction the coast seemed to trend more to the south in a lofty promontory, which, on account of the day, received the name of Cape Coronation. Latitude $22^{\circ} 2'$, longitude $167^{\circ} 7\frac{1}{2}'$ E. Some breakers lay between us and the shore, and probably they were connected with those we had seen before. During the night we had advanced about two leagues to S.E.; and at daybreak, on the 23d, an elevated point appeared in sight beyond Cape Coronation, bearing S. 23° E. It proved to be the S.E. extremity of the coast, and obtained the name of Queen Charlotte's Foreland. Latitude $22^{\circ} 16'$ S., longitude $167^{\circ} 14'$ E. About noon, having got a breeze from the N.E., we stood to S.S.E., and, as we drew towards Cape Coronation, saw, in a valley to the south of it, a vast number of those elevated objects before mentioned; and some low land under the Foreland was wholly covered with them. We could not agree in our opinions of what they were. I supposed them to be a singular sort of trees, being too numerous to resemble anything else; and a great deal of smoke kept rising all the day from amongst those near the Cape. Our philosophers were of opinion that this was the smoke of some internal and perpetual fire. My representing to them that there was no smoke here in the morning, would have been of no avail, had not this eternal fire gone out before night, and no more smoke been seen after. They were still more positive that the elevations were pillars of basaltes, like those which compose the Giant's Causeway in Ireland. At sunset, the wind veering round to the south, we tacked and stood off, it not being safe to approach the shore in the dark. At daybreak we stood in again, with a faint land-breeze between E.S.E. and S.S.E. At noon observed in latitude $21^{\circ} 59' 30''$, Cape Coronation bearing west southerly, distant seven leagues, and the Foreland S. 38° west. As we advanced to S.S.W. the coast beyond the Foreland began to appear in sight; and, at sunset, we discovered a low island lying S.S.E., about seven miles from the Foreland. It was one of those which are generally surrounded with shoals and breakers. At the same time a round hill was seen bearing S. 24° E., twelve leagues distant. During night, having had variable light winds, we advanced but little either way.

On the 25th, about ten o'clock A.M., having got a fair breeze at E.S.E., we stood to S.S.W., in hopes of getting round the Foreland; but, as we drew near, we perceived more low isles beyond the one already mentioned, which at last appeared to be connected by breakers, extending towards the Foreland, and seeming to join the shore. We stood on till half-past three o'clock, when we saw, from the deck, rocks just peeping above the surface of the sea, on the shoal above mentioned. It was now time to alter the course, as the day was too far spent to look for a passage near the shore, and we could find no bottom to anchor in during the night. We, therefore, stood to the south, to look for a passage without the small isles. We had a fine breeze at E.S.E., but it lasted no longer than five o'clock, when it fell to a dead calm. Having sounded, a line of 170 fathoms did not reach the bottom, though we were but a little way from the shoals, which, instead of following the coast to S.W., took a S.E. direction towards the hill we had seen the preceding evening, and seemed to point out to us that it was necessary to go round that land. At this time the most advanced point on the main bore S. 68° W., distant nine or ten leagues. About seven o'clock we got a light breeze at north, which enabled us to steer out E.S.E., and to spend the night with less anxiety. On some of the low isles were many of those elevations already mentioned. Every one was now satisfied they were trees, except our philosophers, who still maintained that they were basaltes.

About daybreak, on the 26th, the wind having shifted to S.S.W., we stretched to S.E. for the hill before mentioned. It belonged to an island, which at noon extended from S. 16° E. to S. 7° W., distant six leagues. Latitude observed $22^{\circ} 16'$ South. In the P.M. the wind freshened, and, veering to S.S.E., we stretched to the east till two A.M. on the 27th, when we tacked and stood to S.W. with hopes of weathering the island; but we fell about two miles short of our expectations, and had to tack about a mile from the east side of the island, the extremes bearing from N.W. by N. to S.W., the hill W., and some low isles, lying off the S.E. point, S. by W. These seemed to be connected with the large island by breakers.

We sounded when in stays, but had no ground with a line of eighty fathoms. The skirts of this land were covered with the elevations more than once mentioned. They had much the appearance of tall pines, which occasioned my giving that name to the island. The round hill, which is on the S.W. side, is of such a height as to be seen fourteen or sixteen leagues. The island is about a mile in circuit, and situated in latitude $22^{\circ} 38' S.$, longitude $167^{\circ} 40' E.$ Having made two attempts to weather the Isle of Pines before sunset, with no better success than before, this determined me to stretch off till midnight. This day, at noon, the thermometer was at $68\frac{1}{2}^{\circ}$, which is lower than it had been since the 27th of February.

Having tacked at midnight, assisted by the currents, and a fresh gale at E.S.E. and S.E., next morning, at daybreak, we found ourselves several leagues to windward of the Isle of Pines, and bore away large, round the S.E. and south sides. The coast from the S.E., round by the south to the west, was strewed with sandbanks, breakers, and small low isles, most of which were covered with the same lofty trees that ornamented the borders of the greater one. We continued to range the outside of these small isles and breakers, at three-fourths of a league distance, and as we passed, one raised another; so that they seemed to form a chain extending to the isles which lie off the Foreland. At noon we observed, in latitude $22^{\circ} 41' 36'' S.$, the Isle of Pines, extending from N. by E. $\frac{1}{2}$ E. to E. by N., and Cape Coronation N. $32^{\circ} 30' W.$, distant seventeen leagues. In the afternoon, with a fine gale at E., we steered N.W. by W. along the outside of the shoals, with a view of falling in with the land a little to S.W. of the Foreland. At two o'clock P.M., two low islets were seen bearing W. by S.; and as they were connected by breakers, which seemed to join those on our starboard, this discovery made it necessary to haul off S.W. in order to get clear of them all. At three, more breakers appeared, extending from the low isles towards the S.E. We now hauled out close to the wind, and in an hour and a half were almost on board the breakers, and obliged to tack. From the mast-head they were seen to extend as far as E.S.E., and the smoothness of the sea made it probable that they extended to the north of east, and that we were in a manner surrounded by them. At this time the hill on the Isle of Pines bore N $71\frac{1}{2}^{\circ} E.$, the Foreland N. $\frac{1}{4} W.$, and the most advanced point of land on the S.W. coast bore N.W., distant fifteen or sixteen leagues. This direction of the S.W. coast, which was rather within the parallel of the N.E., assured us that this land extended no farther to the S.W. After making a short trip to N.N.E., we stood again to the south, in expectation of having a better view of the shoals before sunset. We gained nothing by this but the prospect of a sea strewed with shoals, which we could not clear but by returning in the track by which we came. We tacked nearly in the same place where we had tacked before, and on sounding found a bottom of fine sand. But anchoring in a strong gale, with a chain of breakers to leeward, being the last resource, I rather chose to spend the night in making short boards over that space we had, in some measure, made ourselves acquainted with in the day. And thus it was spent; but under the terrible apprehension, every moment, of falling on some of the many dangers which surrounded us.

Daylight showed that our fears were not ill-founded, and that we had been in the most imminent danger, having had breakers continually under our lee, and at a very little distance from us. We owed our safety to the interposition of Providence, a good look-out, and the very brisk manner in which the ship was managed; for, as we were standing to the north, the people on the lee gangway and fore-castle saw breakers under the lee-bow, which we escaped by quickly tacking the ship. I was now almost tired of a coast which I could no longer explore but at the risk of losing the ship and ruining the whole voyage. I was, however, determined not to leave it till I knew what trees those were which had been the subject of our speculation; especially as they appeared to be of a sort useful to shipping, and had not been seen anywhere but in the southern part of this land. With this view, after making a trip to the south, to weather the shoals under our lee, we stood to the north, in hopes of finding anchorage under some of the islets on which these trees grew. We were stopped by eight o'clock by the shoals which lie extended between the Isle of Pines and Queen Charlotte's Foreland, and found soundings off them in fifty-five, forty, and thirty-six fathoms, a fine sandy bottom. The nearer we came to these shoals, the more we saw of them, and we were not able to say if there was any passage between the two lands.

Being now but a few miles to windward of the low isles lying off the Foreland, mentioned on the 25th and 26th, I bore down to the one next to us. As we drew near it, I perceived that it was unconnected with the neighbouring shoals, and that it is probable we might get to an anchor under its lee or west side. We therefore stood on, being conducted by an officer at the mast-head; and after hauling round the point of the reef which surrounds the isle, we attempted to ply to windward, in order to get nearer the shore. Another reef to the north confined us to a narrow channel, through which ran a current against us, that rendered this attempt fruitless; so that we were obliged to anchor in thirty-nine fathoms water, the bottom fine coral sand; the isle bearing W. by N., one mile distant. As soon as this was done, we hoisted out a boat, in which I went ashore, accompanied by the botanists. We found the tall trees to be a kind of spruce pine, very proper for spars, of which we were in want. After making this discovery, I hastened on board in order to have more time after dinner, when I landed again with two boats, accompanied by several of the officers and gentlemen, having with us the carpenter and some of his crew, to cut down such trees as were wanting. While this was doing, I took the bearings of several lands round. The hill on the Isle of Pines bore S. 50° 30' E.; the low point of Queen Charlotte's Foreland, N. 14° 30' west; the high land over it, seen over two low isles, N. 20° west; and the most advanced point of land to the west, bore west, half a point south, distant six or seven leagues. We had, from several bearings, ascertained the true direction of the coast from the Foreland to this point, which I shall distinguish by the name of Prince of Wales's Foreland. It is situated in the latitude of 22° 29' S., longitude 166° 57' E., is of a considerable height, and, when it first appears above the horizon, looks like an island. From this cape the coast trended nearly N.W. This was rather too northerly a direction to join that part which we saw from the hills of Balade. But as it was very high land which opened off the cape in that direction, it is very probable that lower land, which we could not see, opened sooner; or else the coast more to the N.W. takes a more westerly direction, in the same manner as the N.E. coast. Be this as it may, we pretty well know the extent of the land, by having it confined within certain limits. However, I still entertained hopes of seeing more of it; but was disappointed.

The little isle upon which we landed, is a mere sandbank, not exceeding three-fourths of a mile in circuit, and on it, besides these pines, grew the *Etoa* tree of Otaheite, and a variety of other trees, shrubs, and plants. These gave sufficient employment to our botanists, all the time we staid upon it, and occasioned my calling it Botany Isle. On it were several water-snakes, some pigeons and doves, seemingly different from any we had seen. One of the officers shot a hawk, which proved to be of the very same sort as our English fishing-hawks. Several fire-places, branches, and leaves very little decayed, remains of turtle, &c., showed that people had lately been on the isle. The hull of a canoe, precisely of the same shape as those we had seen at Balade, lay wrecked in the sand. We were now no longer at a loss to know of what trees they make their canoes, as they can be no other than these pines. On this little isle were some which measured twenty inches diameter, and between sixty and seventy feet in length, and would have done very well for a foremast to the Resolution, had one been wanting. Since trees of this size are to be found on so small a spot, it is reasonable to expect to find some much larger on the main, and larger isles; and, if appearances did not deceive us, we can assert it.

If I except New Zealand, I, at this time, knew of no island in the South Pacific Ocean, where a ship could supply herself with a mast or a yard, were she ever so much distressed for want of one. Thus far the discovery is or may be valuable. My carpenter, who was a mast-maker as well as a ship-wright, two trades he learnt in Deptford-yard, was of opinion that these trees would make exceedingly good masts. The wood is white, close-grained, tough, and light. Turpentine had exuded out of most of the trees, and the sun had inspissated it into a rosin, which was found sticking to the trunks, and lying about the roots. These trees shoot out their branches like all other pines; with this difference, that the branches of these are much smaller and shorter; so that the knots become nothing when the tree is wrought for use. I took notice, that the largest of them had the smallest and shortest branches, and were crowned, as it were, at the top, by a spreading branch like

a bush. This was what led some on board into the extravagant notion of their being basaltes: indeed, no one could think of finding such trees here. The seeds are produced in cones; but we could find none that had any in them, or that were in a proper state for vegetable or botanical examination. Besides these, there was another tree or shrub of the spruce fir kind; but it was very small. We also found on the isle a sort of scurvy-grass, and a plant, called by us Lamb's Quarters, which, when boiled, eat like spinach. Having got ten or twelve small spars to make studding-sail booms, boats'-masts, &c., and night approaching, we returned with them on board.

The purpose for which I anchored under this isle being answered, I was now to consider what was next to be done. We had, from the topmast head, taken a view of the sea around us, and observed the whole, to the west, to be strewed with small islets, sandbanks, and breakers, to the utmost extent of our horizon. They seemed, indeed, not to be all connected, and to be divided by winding channels. But when I considered, that the extent of this S.W. coast was already pretty well determined; the great risk attending a more accurate survey, and the time it would require to accomplish it, on account of the many dangers we should have to encounter; I determined not to hazard the ship down to leeward, where we might be so hemmed in as to find it difficult to return, and by that means lose the proper season for getting to the south. I now wished to have had the little vessel set up, the frame of which we had on board. I had some thoughts of doing this when we were last at Otaheite, but found it could not be executed, without neglecting the caulking and other necessary repairs of the ship, or staying longer there than the route I had in view would admit. It was now too late to begin setting her up, and then to use her in exploring this coast; and in our voyage to the south, she could be of no service. These reasons induced me to try to get without the shoals; that is, to the southward of them.

Next morning, at daybreak, we got under sail, with a light breeze at E. by N. We had to make some trips to weather the shoals to leeward of Botany Isle; but when this was done, the breeze began to fail; and at three p.m. it fell calm. The swell, assisted by the current, set us fast to S.W. towards the breakers, which were yet in sight in that direction. Thus we continued till ten o'clock, at which time a breeze springing up at N.N.W. we steered E.S.E., the contrary course we had come in; not daring to steer farther south till daylight. At three o'clock next morning, the wind veered to S.W., blew hard, and in squalls, attended with rain, which made it necessary to proceed with our courses up, and topsails on the cap, till daybreak, when the hill on the Isle of Pines bore N. and our distance from the shore in that direction was about four leagues. We had now a very strong wind at S.S.W., attended by a great sea, so that we had reason to rejoice at having got clear of the shoals before this gale overtook us. Though everything conspired to make me think this was the westerly monsoon, it can hardly be comprehended under that name, for several reasons: first, because it was near a month too soon for these winds; secondly, because we know not if they reach this place at all; and lastly, because it is very common for westerly winds to blow within the tropics. However, I never found them to blow so hard before, or so far southerly. Be these things as they may, we had now no other choice but to stretch to S.E., which we accordingly did, with our starboard tacks aboard; and at noon were out of sight of land.

The gale continued with very little alteration till noon next day; at which time we observed in latitude $23^{\circ} 18'$, longitude made from the Isle of Pines $1^{\circ} 54'$ east. In the afternoon we had little wind from the south, and a great swell from the same direction; and many boobies, tropic, and men-of-war birds were seen. At eleven o'clock a fresh breeze sprung up at W. by S., with which we stood to the south. At this time we were in the latitude of $23^{\circ} 18'$, longitude $169^{\circ} 49'$ E., and about forty-two leagues south of the Hebrides. At eight o'clock in the morning, on the 3rd, the wind veered to S.W., and blew a strong gale by squalls, attended with rain. I now gave over all thought of returning to the land we had left. Indeed, when I considered the vast ocean we had to explore to the south; the state and condition of the ship, already in want of some necessary stores; that summer was approaching fast; and that any considerable accident might detain us in this sea another year; I did not think it advisable to attempt to regain the land.

Thus I was obliged, as it were by necessity, for the first time, to leave a coast I had discovered, before it was fully explored. I called it New Caledonia ; and, if we except New Zealand, it is perhaps the largest island in the South Pacific Ocean ; for it extends from the latitude of $19^{\circ} 37'$ to $22^{\circ} 30'$ S., and from the longitude of $163^{\circ} 37'$ to $167^{\circ} 14'$ E. It lies nearly N.W. $\frac{1}{2}$ W., and S.E. $\frac{1}{2}$ E., and is about eighty-seven leagues long in that direction ; but its breadth is not considerable, not anywhere exceeding ten leagues. It is a country full of hills and valleys, of various extent both for height and depth. To judge of the whole by the parts we were on, from these hills spring vast numbers of little rivulets, which greatly contribute to fertilise the plains, and to supply all the wants of the inhabitants. The summits of most of the hills seem to be barren ; though some few are clothed with wood ; as are all the planes and valleys. By reason of these hills, many parts of the coast, when at a distance from it, appeared indented, or to have great inlets between the hills ; but when we came near the shore, we always found such places shut up with low land, and also observed low land to lie along the coast between the sea-shore and the foot of the hills. As this was the case in all such parts as we came near enough to see, it is reasonable to suppose that the whole coast is so. I am likewise of opinion, that the whole, or greatest part, is surrounded by reefs or shoals, which render the access to it very dangerous, but at the same time guard the coast from the violence of the wind and sea ; make it abound with fish ; secure an easy and safe navigation along it, for canoes, &c. and most likely form some good harbours for shipping. Most, if not every part of the coast is inhabited, the Isle of Pines not excepted ; for we saw either smoke by day, or fires by night, wherever we came. In the extent which I have given to this island is included the broken or unconnected lands to the N.W., as they are delineated in the chart. That they may be connected, I shall not pretend to deny ; we were however of opinion that they were isles, and that New Caledonia terminated more to S.E., though this, at most, is but a well-founded conjecture.

But whether these lands be separate isles, or connected with New Caledonia, it is by no means certain that we saw their termination to the west. I think we did not, as the shoals did not end with the land we saw, but kept their N.W. direction farther than Bougainville's track in the latitude of 15° or $15\frac{1}{2}^{\circ}$. Nay, it seems not improbable, that a chain of isles, sandbanks, and reefs may extend to the west, as far as the coast of New South Wales. The eastern extent of the isles and shoals off that coast, between the latitude of 15° and 23° , were not known. The semblance of the two countries* ; Bougainville's meeting with the shoal of Diana above sixty leagues from the coast, and the signs he had of land to the S.E., all tend to increase the probability. I must confess that it is carrying probability and conjecture a little too far, to say what may lie in a space of two hundred leagues ; but it is in some measure necessary, were it only to put some future navigator on his guard.

Mr. Wales determined the longitude of that part of New Caledonia we explored, by ninety-six sets of observations, which were reduced to one another by our trusty guide the watch. I found the variation of the compass to be $10^{\circ} 24'$ E. This is the mean variation given by the three azimuth compasses we had on board, which would differ from each other a degree and a half, and sometimes more. I did not observe any difference in the variation between the N.W. and S.E. parts of this land, except when we were at anchor before Balade, where it was less than 10° ; but this I did not regard, as I found such a uniformity out at sea ; and it is there where navigators want to know the variation. While we were on the N.E. coast, I thought the currents set to S.E. and W. or N.W. on the other side ; but they are by no means considerable, and may as probably be channels of tides as regular currents. In the narrow channels which divide the shoals, and those which communicate with the sea, the tides run strong ; but their rise and fall are inconsiderable, not exceeding three feet and a half. The time of high-water, at the full and change, at Balade, is about six o'clock ; but at Botany Isle we judged it would happen about ten or eleven o'clock.

* See his Voyage, English translation, p. 303.

CHAPTER XI.—SEQUEL OF THE PASSAGE FROM NEW CALEDONIA TO NEW ZEALAND, WITH AN ACCOUNT OF THE DISCOVERY OF NORFOLK ISLAND, AND THE INCIDENTS THAT HAPPENED WHILE THE SHIP LAY IN QUEEN CHARLOTTE'S SOUND.

THE wind continuing at S.W., W.S.W., and W., blowing a fresh gale, and now and then squalls, with showers of rain, we steered to S.S.E., without meeting with any remarkable occurrence till near noon on the 6th, when it fell calm. At this time we were in the latitude of $27^{\circ} 50'$ S., longitude $171^{\circ} 43'$ E. The calm continued till noon the next day, during which time we observed the variation to be $10^{\circ} 33\frac{1}{2}'$ E. I now ordered the carpenters to work to caulk the decks. As we had neither pitch, tar, nor rosin left to pay the seams, this was done with varnish of pine, and afterwards covered with coral sand, which made a cement far exceeding my expectation. In the afternoon we had a boat in the water, and shot two albatrosses, which were geese to us. We had seen one of this kind of birds the day before, which was the first we observed since we had been within the tropic. On the 7th, at one P.M., a breeze sprang up at south; soon after it veered to, and fixed at S.E. by S., and blew a gentle gale, attended with pleasant weather.

We stretched to W.S.W., and next day at noon were in the latitude of $28^{\circ} 25'$, longitude $170^{\circ} 26'$ E. In the evening, Mr. Cooper having struck a porpoise with a harpoon, it was necessary to bring to, and have two boats out, before we could kill it, and get it on board. It was six feet long; a female of that kind which naturalists call dolphin of the ancients, and which differs from the other kind of porpoise in the head and jaw, having them long and pointed. This had eighty-eight teeth in each jaw. The haslet* and lean flesh were to us a feast. The latter was a little liverish, but had not the least fishy taste. It was eaten roasted, broiled, and fried, first seaking it in warm water. Indeed, little art was wanting to make anything fresh palatable to those who had been living so long on salt meat.

We continued to stretch to W.S.W. till the 10th, when, at daybreak, we discovered land bearing S.W., which on a nearer approach we found to be an island of good height, and five leagues in circuit. I named it Norfolk Isle, in honour of the noble family of Howard. It is situated in the latitude of $29^{\circ} 2' 30''$ S., and longitude $168^{\circ} 16'$ E. The latter was determined by lunar observations made on this, the preceding, and following days; and the former, by a good observation at noon, when we were about three miles from the isle. Soon after we discovered the isle, we sounded in twenty-two fathoms on a bank of coral sand; after this we continued to sound, and found not less than twenty-two, or more than twenty-four fathoms (except near the shore), and the same bottom mixed with broken shells. After dinner, a party of us embarked in two boats, and landed on the island, without any difficulty, behind some large rocks which lined part of the coast

on the N.E. side. We found it uninhabited, and were undoubtedly the first that ever set foot on it. We observed many trees and plants common at New Zealand; and in particular, the flax-plant, which is rather more luxuriant here than in any part of that country: but the chief produce is a sort of spruce pine, which grows in great abundance, and to a large size, many of the trees being as thick, breast-high, as two men could fathom, and exceedingly straight and tall. This pine is of a sort between that which grows in New Zealand and that in New Caledonia; the foliage differing something from both; and the wood not so heavy as the former, nor so light and close-grained as the latter. It is a good deal like the Quebec pine. For about two hundred yards from the shore the ground is covered so thick with shrubs and plants, as hardly to be penetrated farther inland. The woods were perfectly clear and free from underwood, and the soil seemed rich and deep.

We found the same kind of pigeons, parrots, and parroquets as in New Zealand, rails, and some small birds. The sea-fowl are, white boobies, gulls, tern, &c. which breed undisturbed on the shores, and in the cliffs of the rocks. On the isle is fresh water; and cabbage-palm, wood-sorrel, sow-thistle, and samphire abounding in some places on the shores: we brought on board as much of each sort as the time we had to gather them would admit. These cabbage-trees, or palms, were not thicker than a man's leg, and from ten to twenty feet high. They are of the same genus with the cocoa-nut tree; like it, they have large pinnated leaves, and are the same as the second sort found in the northern parts of New South Wales*. The cabbage is, properly speaking, the bud of the tree; each tree producing but one cabbage, which is at the crown, where the leaves spring out, and is inclosed in the stem. The cutting off the cabbage effectually destroys the tree; so that no more than one can be had from the same stem. The cocoa-nut tree, and some others of the palm kind, produce cabbage as well as these. This vegetable is not only wholesome, but exceedingly palatable, and proved the most agreeable repast we had for some time.

The coast does not want fish. While we were on shore, the people in the boats caught some which were excellent. I judged that it was high water at the full and change, about one o'clock, and that the tide rises and falls upon a perpendicular about four or five feet. The approach of night brought us all on board, when we hoisted in the boats; and stretching to E.N.E. (with the wind at S.E.) till midnight, we tacked and spent the remainder of the night making short boards.

Next morning, at sunrise, we made sail, stretching to S.S.W., and weathered the island, on the south side of which lie two isles, that serve as roosting and breeding places for birds. On this, as also on the S.E. side, is a sandy beach; whereas most of the other shores are bounded by rocky cliffs which have twenty and eighteen fathoms water close to them; at least so we found it on the N.E. side, and with good anchorage. A bank of coral sand, mixed with shells, on which we found from nineteen to thirty-five or forty fathoms water, surrounds the isle, and extends, especially to the south, seven leagues off. The morning we discovered the island, the variation was found to be $13^{\circ} 9' E.$, but I think this observation gave too much, as others, which we had, both before and after, gave 2° less. After leaving Norfolk Isle, I steered for New Zealand, my intention being to touch at Queen Charlotte's Sound, to refresh my crew, and put the ship in a condition to encounter the southern latitudes.

On the 17th, at daybreak, we saw Mount Egmont, which was covered with everlasting snow, bearing S.E. $\frac{1}{2}$ E. Our distance from the shore was about eight leagues; and on sounding, we found seventy fathoms water, a muddy bottom. The wind soon fixed in the western board, and blew a fresh gale, with which we steered S.S.E. for Queen Charlotte's Sound, with a view of falling in with Cape Stephens. At noon Cape Egmont bore E.N.E. distant three or four leagues; and though the mount was hid in the clouds, we judged it to be in the same direction as the Cape; latitude observed, $39^{\circ} 24'$. The wind increased in such a manner as to oblige us to close-reef our topsails, and strike top-gallant yards. At last we could bear no more sail than the two courses, and two close-reefed topsails; and under them we stretched for Cape Stephens, which we made at eleven o'clock at night. At midnight we tacked and made a trip to the north till three o'clock next morning, when we bore away for the Sound. At nine we hauled round Point Jackson, through a sea which looked terrible, occasioned by a rapid tide and a high wind; but as we knew the coast, it

* Vide Hawkesworth's Voyages, vol. iii.

did not alarm us. At eleven o'clock we anchored before Ship Cove; the strong flurries from off the land not permitting us to get in.

In the afternoon, as we could not move the ship, I went into the cove, with the seine, to try to catch some fish. The first thing I did after landing was to look for the bottle I left hid when last here, in which was the memorandum. It was taken away; but by whom it did not appear. Two hauls with the seine producing only four small fish, we in some measure made up for this deficiency by shooting several birds, which the flowers in the garden had drawn thither, as also some old shags, and by robbing the nests of some young ones. Being little wind next morning, we weighed, and warped the ship into the Cove, and there moored with the two bowers. We unbent the sails to repair them, several having been split, and otherwise damaged in the late gale. The main and fore courses, already worn to the very utmost, were condemned as useless. I ordered the topmasts to be struck and unrigged, in order to fix to them moveable chocks or knees, for want of which the trestle-trees were continually breaking; the forge to be set up to make bolts and repair our iron-work; and tents to be erected on shore for the reception of a guard, coopers, sail-makers, &c. I likewise gave orders that vegetables (of which there were plenty) should be boiled every morning with oatmeal and portable broth for breakfast, and with peas and broth every day for dinner for the whole crew, over and above their usual allowance of salt meat.

In the afternoon, as Mr. Wales was setting up his observatory, he discovered that several trees, which were standing when we last sailed from this place, had been cut down with saws and axes; and a few days after, the place where an observatory, clock, &c., had been set up, was also found in a spot different from that where Mr. Wales had placed his. It was therefore now no longer to be doubted that the Adventure had been in this cove after we had left it.

Next day, winds southerly, hazy cloudy weather. Everybody went to work at their respective employments, one of which was to caulk the ship's sides, a thing much wanted. The seams were payed with putty, made with cook's fat and chalk; the gunner happening to have a quantity of the latter on board. The 21st, wind southerly, with continual rains. The weather being fair in the afternoon of the 22d, accompanied by the botanists, I visited our gardens on Motuara, which we found almost in a state of nature, having been wholly neglected by the inhabitants. Nevertheless, many articles were in a flourishing condition, and showed how well they liked the soil in which they were planted. None of the natives having yet made their appearance, we made a fire on the point of the island, in hopes, if they saw the smoke, they might be induced to come to us.

Nothing remarkable happened till the 24th, when, in the morning, two canoes were seen coming down the Sound; but as soon as they perceived the ship, they retired behind a point on the west side. After breakfast I went in a boat to look for them; and as we proceeded along the shore, we shot several birds. The report of the muskets gave notice of our approach, and the natives discovered themselves in Shag Cove by hallooing to us; but as we drew near to their habitations, they all fled to the woods, except two or three men, who stood on a rising ground near the shore, with their arms in their hands. The moment we landed, they knew us. Joy then took place of fear, and the rest of the natives hurried out of the woods, and embraced us over and over again, leaping and skipping about like madmen; but I observed that they would not suffer some women, whom we saw at a distance, to come near us. After we had made them presents of hatchets, knives, and what else we had with us, they gave us in return a large quantity of fish, which they had just caught. There were only a few amongst them whose faces we could recognise; and on our asking why they were afraid of us, and inquiring for some of our old acquaintances by name, they talked much about killing, which was so variously understood by us, that we could gather nothing from it; so that, after a short stay, we took leave, and went on board. Next morning early, our friends, according to a promise they made us the preceding evening, paying us a visit, brought with them a quantity of fine fish, which they exchanged for Otahitean cloth, &c., and then returned to their habitations.

On the 26th, we got into the after-hold four boat-load of shingle ballast, and struck down six guns, keeping only six on deck. Our good friends the natives having brought us a

plentiful supply of fish, afterwards went on shore to the tents, and informed our people there that a ship like ours had been lately lost in the Strait; that some of the people got on shore, and that the natives stole their clothes &c., for which several were shot; that afterwards, when they could fire no longer, the natives having got the better, killed them with their *Patapatoos*, and ate them; but that they themselves had no hand in the affair, which, they said, happened at Vanna Aroa, near Teerawhiitt on the other side of the Strait. One man said it was two moons ago; but another contradicted him, and counted on his fingers about twenty or thirty days. They described by actions how the ship was beat to pieces, by going up and down against the rocks, till at last it was all scattered abroad.

The next day some others told the same story, or nearly to the same purport, and pointed over the East Bay, which is on the east side of the sound, as to the place where it happened. These stories making me very uneasy about the Adventure, I desired Mr. Wales, and those on shore, to let me know if any of the natives should mention it again, or to send them to me; for I had not heard anything from them myself. When Mr. Wales came on board to dinner, he found the very people who had told him the story on shore, and pointed them out to me. I inquired about the affair, and endeavoured to come at the truth by every method I could think of. All I could get from them was, *Caurey* (no); and they not only denied every syllable of what they had said on shore, but seemed wholly ignorant of the matter; so that I began to think our people had misunderstood them, and that the story referred to some of their own people and boats.

On the 28th, fresh gales westerly, and fair weather. We rigged and fitted the topmasts. Having gone on a shooting-party to West Bay, we went to the place where I left the hogs and fowls; but saw no vestiges of them, nor of anybody having been there since. In our return, having visited the natives, we got some fish in exchange for trifles which we gave them. As we were coming away, Mr. Forster thought he heard the squeaking of a pig in the woods, close by their habitations; probably they may have those I left with them when last here. In the evening we got on board, with about a dozen and a half of wild-fowl, shags, and sea-pies. The sportsmen who had been out in the woods near the ship were more successful among the small birds.

On the 29th and 30th nothing remarkable happened, except that in the evening of the latter all the natives left us. The 31st being a fine pleasant day, our botanists went over to Long Island, where one of the party saw a large black boar. As it was described to me, I thought it to be one of those which Captain Furneaux left behind, and had been brought over to this isle by those who had it in keeping. Since they did not destroy those hogs when first in their possession, we cannot suppose they will do it now; so that there is little fear but that this country will, in time, be stocked with these animals, both in a wild and domestic state. Next day we were visited by a number of strangers, who came from up the sound, and brought with them but little fish. Their chief commodity was green stone or tale, an article which never came to a bad market; and some of the largest pieces of it I had ever seen were got this day.

On the 2d I went over to the east side of the sound, and, without meeting anything remarkable, returned on board in the evening, when I learnt that the same people who visited us the preceding day had been on board most of this, with their usual article of trade. On the 3d, Mr. Pickersgill met with some of the natives, who related to him the story of a ship being lost, and the people being killed; but added, with great earnestness, it was not done by them. On the 4th, fine pleasant weather. Most of the natives now retired up the sound. Indeed, I had taken every gentle method to oblige them to be gone; for since these new-comers had been with us, our old friends had disappeared, and we had been without fish. Having gone over to Long Island to look for the hog which had been seen there, I found it to be one of the sows left by Captain Furneaux; the same that was in possession of the natives when we were last here. From a supposition of its being a boar, I had carried over a sow to leave with him; but on seeing my mistake, brought her back, as the leaving her there would answer no end.

Early in the morning of the 5th, our old friends made us a visit, and brought a seasonable supply of fish. At the same time, I embarked in the pinnace with Messrs. Forsters and

Sparman, in order to proceed up the sound. I was desirous of finding the termination of it, or rather of seeing if I could find any passage out to sea by the S.E., as I suspected from some discoveries I had made when first here. In our way up we met with some fishers, of whom we made the necessary inquiry; and they all agreed that there was no passage to sea by the head of the sound. As we proceeded, we some time after met a canoe, conducted by four men, coming down the sound. These confirmed what the others had said, in regard to there being no passage to sea the way we were going; but gave us to understand that there was one to the east, in the very place where I expected to find it. I now laid aside the scheme of going to the head of the sound, and proceeded to this arm, which is on the S.E. side, about four or five leagues above the Isle of Motuara.

A little within the entrance on the S.E. side, at a place called Kotieghenooce, we found a large settlement of the natives. The chief, whose name was Tringo-boohce, and his people, whom we found to be some of those who had lately been on board the ship, received us with great courtesy. They seemed to be pretty numerous, both here and in the neighbourhood. Our stay with them was short, as the information they gave us encouraged us to pursue the object we had in view. Accordingly, we proceeded down the arm E.N.E. and E. by N., leaving several fine coves on both sides, and at last found it to open into the strait by a channel about a mile wide, in which ran out a strong tide; having also observed one setting down the arm, all the time we had been in it. It was now about four o'clock in the afternoon; and in less than an hour after, this tide ceased, and was succeeded by the flood, which came in with equal strength.

The outlet lies S.E. by E., and N.W. by W., and nearly in the direction of E.S.E., and W.N.W. from Cape Teerawhitte. We found thirteen fathoms water a little within the entrance, clear round. It seemed to me that a leading wind was necessary to go in and out of this passage, on account of the rapidity of the tides. I, however, had but little time to make observations of this nature, as night was at hand, and I had resolved to return on board. On that account, I omitted visiting a large *hippa*, or stronghold, built on an elevation on the north side, and about a mile or two within the entrance. The inhabitants of it, by signs, invited us to go to them; but, without paying any regard to them, we proceeded directly for the ship, which we reached by ten o'clock, bringing with us some fish we had got from the natives, and a few birds we had shot. Amongst the latter, were some of the same kind of ducks we found in Dusky Bay; and we have reason to believe that they are all to be met with here; for the natives knew them all by the drawings, and had a particular name for each.

On the 6th, wind at N.E., gloomy weather with rain. Our old friends having taken up their abode near us, one of them, whose name was Pedero, (a man of some note,) made me a present of a staff of honour, such as the chiefs generally carry. In return, I dressed him in a suit of old clothes, of which he was not a little proud. He had a fine person and a good presence; and nothing but his colour distinguished him from a European. Having got him and another into a communicative mood, we began to inquire of them if the *Adventure* had been there during my absence, and they gave us to understand, in a manner that admitted of no doubt, that soon after we were gone she arrived, that she staid between ten and twenty days, and had been gone ten months. They likewise asserted, that neither she nor any other ship had been stranded on the coast, as had been reported. This assertion, and the manner in which they related the coming and going of the *Adventure*, made me easy about her; but did not wholly set aside our suspicions of a disaster having happened to some other strangers. Besides what has been already related, we had been told that a ship had lately been here, and was gone to a place called Terato, which is on the north side of the Strait. Whether this story related to the former or not, I cannot say. Whenever I questioned the natives about it, they always denied all knowledge of it; and for some time past had avoided mentioning it. It was but a few days before, that one man received a box on the ear for naming it to some of our people. After breakfast, I took a number of hands over to Long-Island, in order to catch the sow, to put her to the boar, and remove her to some other place; but we returned without seeing her. Some of the natives had been there not long before us, as their fires were yet burning; and they had undoubtedly taken her

away. Pedero dined with us, ate of everything at table, and drank more wine than any one of us, without being in the least affected by it.

The 7th, fresh gales at N.E. with continual rain. The 8th, fore-part rain, remainder fair weather. We put two pigs, a boar and a sow, on shore, in the cove next without Cannibal Cove; so that it is hardly possible all the methods I have taken to stock this country with these animals should fail. We had also reason to believe that some of the cocks and hens which I left here still existed, although we had not seen any of them; for a hen's egg was, some days before, found in the woods almost new laid.

On the 9th, wind westerly or N.W. squally, with rain. In the morning we unmoored, and shifted our berth farther out of the cove, for the more ready getting to sea the next morning; for, at present, the caulkers had not finished the sides, and till this work was done we could not sail. Our friends having brought us a very large and seasonable supply of fish, I bestowed on Pedero a present of an empty oil-jar, which made him as happy as a prince. Soon after, he and his party left the cove, and retired to their proper place of abode, with all the treasure they had received from us. I believe that they gave away many of the things they, at different times, got from us, to their friends, and neighbours, or else parted with them to purchase peace of their more powerful enemies; for we never saw any of our presents after they were once in their possession; and every time we visited them they were as much in want of hatchets, nails, &c. to all appearance, as if they never had had any among them.

I am satisfied that the people in this Sound, who are upon the whole pretty numerous, are under no regular form of government, or so united as to form one body politic. The head of each tribe, or family, seems to be respected; and that respect may, on some occasions, command obedience; but I doubt if any amongst them have either a right or power to enforce it. The day we were with Tringo-boohoe, the people came from all parts to see us, which he endeavoured to prevent. But though he went so far as to throw stones at some, I observed that very few paid any regard either to his words or actions; and yet this man was spoken of as a chief of some note. I have, before, made some remarks on the evils attending these people for want of union among themselves; and the more I was acquainted with them, the more I found it to be so. Notwithstanding they are cannibals, they are naturally of a good disposition, and have not a little humanity.

In the afternoon a party of us went ashore into one of the coves, where were two families of the natives variously employed; some sleeping, some making mats, others roasting fish and fir roots, and one girl, I observed, was heating of stones. Curious to know what they were for, I remained near her. As soon as the stones were made hot, she took them out of the fire, and gave them to an old woman, who was sitting in the hut. She placed them in a heap, laid over them a handful of green celery, and over that a coarse mat, and then squatted herself down, on her heels, on the top of all; thus making a kind of Dutch warming-pan, on which she sat as close as a hare on her seat. I should hardly have mentioned this operation, if I had thought it had no other view than to warm the old woman's back. I rather suppose it was intended to cure some disorder she might have on her, which the steams arising from the green celery might be a specific for. I was led to think so by there being hardly any celery in the place, we having gathered it long before; and grass, of which there was great plenty, would have kept the stones from burning the mat full as well, if that had been all that was meant. Besides, the woman looked to me sickly, and not in a good state of health.

Mr. Wales from time to time communicated to me the observations he had made in this sound for determining the longitude, the mean results of which give $174^{\circ} 25' 7'' \frac{1}{2}$ E. for the bottom of Ship Cove, where the observations were made; and the latitude of it is $41^{\circ} 5' 56'' \frac{1}{2}$ S. In my chart, constituted in my former voyage, this place is laid down in $184^{\circ} 54' 30''$ West, equal to $175^{\circ} 5' 30''$ E. The error of the chart is therefore $0^{\circ} 40' 0''$, and nearly equal to what was found at Dusky Bay; by which it appears that the whole of Tavaipoenammoo is laid down $40'$ too far east in the said chart, as well as in the journal of the voyage. But the error in Eaheino-mauwe is not more than half a degree, or thirty minutes; because the distance between Queen Charlotte's Sound and Cape Palliser has been found to

be greater by 10' of longitude than it is laid down in the chart. I mention these errors, not from a fear that they will affect either navigation or geography, but because I have no doubt of their existence; for, from the multitude of observations which Mr. Wales took, the situation of few parts of the world is better ascertained than Queen Charlotte's Sound. Indeed, I might, with equal truth, say the same of all the other places where we made any stay; for Mr. Wales, whose abilities are equal to his assiduity, lost no one observation that could possibly be obtained. Even the situation of those islands which we passed without touching at them, is, by means of Kendal's watch, determined with almost equal accuracy. The error of the watch from Otaheite to this place was only $43^{\circ} 39' \frac{1}{4}$ in longitude, reckoning at the rate it was found to go at, at that island and at Tanna; but by reckoning at the rate it was going when last at Queen Charlotte's Sound, and from the time of our leaving it, to our return to it again, which was near a year, the error was $19^{\circ} 31' \frac{1}{2}$, 25 in time, or $4^{\circ} 52' 48'' \frac{3}{4}$ in longitude. This error cannot be thought great, if we consider the length of time, and that we had gone over a space equal to upwards of three-fourths of the equatorial circumference of the earth, and through all the climates and latitudes from 9° to 71° . Mr. Wales found its rate of going here to be that of gaining $12''$, 576, on mean time, per day.

The mean result of all the observations he made for ascertaining the variation of the compass and the dip of the south end of the needle, the three several times we had been here, gave $14^{\circ} 9' \frac{1}{4}$ E. for the former, and $64^{\circ} 36' \frac{3}{4}$ for the latter. He also found, from very accurate observations, that the time of high-water preceded the moon's southing, on the full and change days, by three hours; and that the greatest rise and fall of the water was five feet ten inches and a half; but there were evident tokens on the beach of its having risen two feet higher than it ever did in the course of his experiments.

BOOK IV.

FROM LEAVING NEW ZEALAND TO OUR RETURN TO ENGLAND.

CHAPTER I.—THE RUN FROM NEW ZEALAND TO TERRA DEL FUEGO, WITH THE RANGE FROM CAPE DESEADA TO CHRISTMAS SOUND, AND DESCRIPTION OF THAT PART OF THE COAST.

At daybreak on the 10th, with a fine breeze at W.N.W., we weighed and stood out of the Sound; and, after getting round the Two Brothers, steered for Cape Campbell, which is at the S.W. entrance of the strait, all sails set, with a fine breeze at north. At four in the afternoon, we passed the Cape, at the distance of four or five leagues, and then steered S.S.E. $\frac{1}{2}$ E., with the wind at N.W., a gentle gale, and cloudy weather. Next morning, the wind veered round by the west to south, and forced us more to the east than I intended. At seven o'clock in the evening, the snowy mountains bore W. by S., and Cape Palliser N. $\frac{1}{2}$ W., distant sixteen or seventeen leagues; from which cape, I, for the third time, took my departure. After a few hours' calm, a breeze springing up at north, we steered S. by E. all sails set, with a view of getting into the latitude of 54° or 55° ; my intention being to cross this vast ocean nearly in these parallels, and so as to pass over those parts which were left unexplored the preceding summer.

In the morning of the 12th, the wind increased to a fine gale: at noon we observed in latitude $43^{\circ} 13' 30''$ S., longitude $176^{\circ} 41'$ E. An extraordinary fish of the whale kind was seen, which some called a sea-monster: I did not see it myself. In the afternoon, our old companions the pintado peterels began to appear. On the 13th, in the morning, the wind veered to W.S.W. At seven, seeing the appearance of land to the S.W., we hauled up towards it, and soon found it to be a fog-bank. Afterwards we steered S.E. by S., and soon after saw a seal. At noon, latitude, by account, $44^{\circ} 25'$, longitude $177^{\circ} 31'$ E. Foggy weather, which continued all the afternoon. At six in the evening, the wind veered to N.E. by N., and increased to a fresh gale, attended with thick hazy weather; course steered E., E. $\frac{1}{4}$ S.

On the 14th A.M. saw another seal. At noon, latitude $45^{\circ} 54'$, longitude $179^{\circ} 29'$ E. On the 15th A.M. the wind veered to the westward; the fog cleared away, but the weather continued cloudy. At noon, latitude $47^{\circ} 30'$, longitude $178^{\circ} 19'$ W.; for, having passed the meridian of 180° E., I now reckon my longitude west of the first meridian, viz., Greenwich. In the evening heard penguins, and, the next morning, saw some sea or rock weed. At noon a fresh gale from the west, and fine weather. Latitude observed $49^{\circ} 33'$, longitude $175^{\circ} 31'$ W.

Next morning fresh gales and hazy weather; saw a seal and several pieces of weed. At noon, latitude $51^{\circ} 12'$, longitude $173^{\circ} 17'$ W. The wind veered to the north and N.E. by N., blew a strong gale by squalls, which split an old topgallant sail, and obliged us to double-reef the topsails; but in the evening the wind moderated, and veered to W.N.W., when we loosed a reef out of each topsail, and found the variation of the compass to be $9^{\circ} 52'$ E., being then in the latitude $51^{\circ} 47'$, longitude $172^{\circ} 21'$ W.; and the next morning, the 18th, in the latitude of $52^{\circ} 25'$, longitude $170^{\circ} 45'$ W., it was $10^{\circ} 26'$ E. Towards noon, had moderate but cloudy weather, and a great swell from the west: some penguins and pieces of sea-weed seen. On the 19th, steered E.S.E. with a very fresh gale at N., hazy, dirty weather. At noon, latitude $53^{\circ} 43'$, longitude $166^{\circ} 15'$ W. On the 20th, steered E. by S. with a moderate breeze at N., attended with thick, hazy weather. At noon, latitude $54^{\circ} 8'$, longitude $162^{\circ} 18'$ W.

On the 21st, winds mostly from the N.E., a fresh gale, attended with thick, hazy, dirty weather. Course S.E. by S.; latitude, at noon, $55^{\circ} 31'$; longitude $160^{\circ} 29'$ W.; abundance of blue peterels and some penguins seen. Fresh gales at N.W. by N. and N. by W., and hazy till towards noon of the 22nd, when the weather cleared up, and we observed in latitude $55^{\circ} 48'$ S., longitude $156^{\circ} 56'$ W. In the afternoon had a few hours' calm; after that, the wind came at S.S.E. and S.E. by S., a light breeze, with which we steered east-northerly. In the night the aurora australis was visible, but very faint, and noways remarkable.

On the 23rd, in the latitude of $55^{\circ} 46'$ S., longitude $156^{\circ} 13'$ W. The variation was $9^{\circ} 42'$ E. We had a calm from ten in the morning till six in the evening, when a breeze sprung up at west; at first it blew a gentle gale, but afterwards freshened. Our course was now E. $\frac{1}{2}$ N. On the 24th, a fresh breeze at N.W. by W., and N. by W. At noon, in latitude $55^{\circ} 38'$ S., longitude $153^{\circ} 37'$ W., foggy in the night, but next day had a fine gale at N.W., attended with clear pleasant weather; course steered E. by N. In the evening, being in the latitude of $55^{\circ} 8'$ S., longitude $148^{\circ} 10'$ W. the variation, by the mean of two compasses, was $6^{\circ} 35' \frac{1}{2}$ E. Having a steady fresh gale at N.N.W. on the 26th and 27th, we steered east, and at noon, on the latter, were in latitude $55^{\circ} 6'$ S., longitude $138^{\circ} 58'$ W.

I now gave up all hopes of finding any more land in this ocean, and came to a resolution to steer directly for the west entrance of the Straits of Magalhaens, with a view of coasting the out or south side of Terra del Fuego, round Cape Horn, to the Strait Le Maire. As the world has but a very imperfect knowledge of this shore, I thought the coasting of it would be of more advantage, both to navigation and to geography, than anything I could expect to find in a higher latitude. In the afternoon of this day, the wind blew in squalls, and carried away the main-topgallant-mast.

A very strong gale northerly, with hazy rainy weather, on the 28th, obliged us to double-reef the fore and main-topsail, to hand the mizen-topsail, and get down the fore-topgallant-yard. In the morning, the bolt-rope of the main-topsail broke, and occasioned the sail to be split. I have observed that the ropes to all our sails, the square-sails especially, are not of a size and strength sufficient to wear out the canvas. At noon, latitude $55^{\circ} 20'$ S., longitude $134^{\circ} 16'$ W., a great swell from N.W.; albatrosses and blue peterels seen. Next day towards noon, the wind abating, we loosed all the reefs out of the topsails, rigged another topgallant-mast, and got the yards across. P.M., little wind, and hazy weather; at midnight calm, that continued till noon the next day, when a breeze sprung up at E., with which we stretched to the northward. At this time we were in the latitude $55^{\circ} 32'$ S., longitude $128^{\circ} 45'$ W.; some albatrosses and peterels seen. At eight P.M. the wind veering to N.E., we tacked and stood to E.S.E.

On the 1st of December, thick, hazy weather, with drizzling rain, and a moderate breeze of wind, which at three o'clock P.M. fell to a calm; at this time in latitude $55^{\circ} 41'$ S., longitude $127^{\circ} 5'$ W. After four hours' calm, the fog cleared away, and we got a wind at S.E., with which we stood N.E. Next day, a fresh breeze at S.E. and hazy, foggy weather, except a few hours in the morning, when we found the variation to be $1^{\circ} 28'$ E., latitude $55^{\circ} 17'$, longitude $125^{\circ} 41'$ W. The variation after this was supposed to increase; for on the 4th, in the morning, being in latitude $53^{\circ} 21'$, longitude $121^{\circ} 31'$ W., it was $3^{\circ} 16'$ E.; in the evening, in latitude $53^{\circ} 13'$, longitude $119^{\circ} 46'$ W., it was $3^{\circ} 28'$ E.; and on the 5th, at six o'clock in the evening, in latitude $53^{\circ} 8'$, longitude $115^{\circ} 58'$ W., it was $4^{\circ} 1'$ E. For more than twenty-four hours having had a fine gale at S., this enabled us to steer E., with very little deviation to the N.; and the wind now altering to S.W. and blowing a steady fresh breeze, we continued to steer E., inclining a little to S. On the 6th, had some snow showers. In the evening, being in latitude $53^{\circ} 13'$, longitude $111^{\circ} 12'$, the variation was $4^{\circ} 58'$ E.; and the next morning being in latitude $58^{\circ} 16'$, longitude $109^{\circ} 33'$, it was $5^{\circ} 1'$ E.

The wind was now at W., a fine pleasant gale, sometimes with showers of rain. Nothing remarkable happened, till the 9th, at noon, when being in the latitude of $53^{\circ} 37'$, longitude $103^{\circ} 44'$ W., the wind veered to N.E., and afterwards came insensibly round to the S., by the E. and S.E., attended with cloudy, hazy weather, and some showers of rain. On the 10th, a little before noon, latitude 54° , longitude $102^{\circ} 7'$ W., passed a small bed of sea-weed. In the afternoon the wind veered to S.W., blew a fresh gale, attended with dark cloudy weather. We steered E. half a point N.; and the next day, at six in the evening, being in latitude $53^{\circ} 35'$, longitude $95^{\circ} 52'$ W., the variation was $9^{\circ} 58'$ E. Many and various sorts of albatrosses about the ship.

On the 12th, the wind veered to the W.N.W., and in the evening to N.; and, at last, left us to a calm. That continued till midnight, when we got a breeze at S.; which, soon after, veering to and fixing at W., we steered E.; and on the 14th, in the morning, found the variation to be $13^{\circ} 25'$ E., latitude $53^{\circ} 25'$, longitude $87^{\circ} 53'$ W.; and in the afternoon, being in the same latitude, and the longitude of $86^{\circ} 2'$ W., it was $15^{\circ} 3'$ E., and increased in such a manner, that on the 15th, in the latitude of $53^{\circ} 30'$, longitude $82^{\circ} 23'$ W., it was 17° E.; and the next evening, in the latitude of $53^{\circ} 25'$, longitude $78^{\circ} 40'$, it was $17^{\circ} 38'$ E. About this time, we saw a penguin and a piece of weed; and the next morning, a seal and some diving peterels. For the three last days, the wind had been at W., a steady fresh gale, attended now and then with showers of rain or hail.

At six in the morning of the 17th, being nearly in the same latitude as above, and in the longitude of $77^{\circ} 10'$ W., the variation was $18^{\circ} 33'$ E.; and in the afternoon it was $21^{\circ} 38'$, being at that time in latitude $53^{\circ} 16'$ S., longitude $75^{\circ} 9'$ W. In the morning, as well as in the afternoon, I took some observations to determine the longitude by the watch; and the results, reduced to noon, gave $76^{\circ} 18' 30''$ W. At the same time the longitude, by my reckoning, was $76^{\circ} 17'$ W. But I have reason to think, that we were about half a degree more to the west than either the one or the other; our latitude, at the same time, was $53^{\circ} 21'$ S. We steered E. by N. and E. $\frac{1}{2}$ N. all this day, under all the sail we could carry, with a fine fresh gale at N.W. by W. in expectation of seeing the land before night; but not making it till ten o'clock, we took in the studding-sails, topgallant-sails, and a reef in each topsail, and steered E.N.E., in order to make sure of falling in with Cape Deseada. Two hours after, we made the land, extending from N.E. by N. to E. by S., about six leagues distant. On this discovery, we wore and brought-to, with the ship's head to the S., and having sounded, found seventy-five fathoms water, the bottom stone and shells. The land now before us could be no other than the west coast of Terra del Fuego, and near the west entrance to the Straits of Magalhaens.

As this was the first run that had been made directly across this ocean, in a high southern latitude*, I have been a little particular in noting every circumstance that appeared in the least material; and after all, I must observe that I never made a passage anywhere of such length, or even much shorter, where so few interesting circumstances occurred. For, if

* It is not to be supposed that I could know at this time that the Adventure had made the passage before me.

I except the variation of the compass, I know of nothing else worth notice. The weather had been neither unusually stormy nor cold. Before we arrived in the latitude of 50° , the mercury in the thermometer fell gradually from sixty to fifty; and after we arrived in the latitude of 55° , it was generally between forty-seven and forty-five; once or twice it fell to forty-three. These observations were made at noon.

I have now done with the Southern Pacific Ocean; and flatter myself that no one will think that I have left it unexplored; or that more could have been done, in one voyage, towards obtaining that end, than has been done in this.

Soon after we left New Zealand, Mr. Wales contrived and fixed up an instrument, which very accurately measured the angle the ship rolled when sailing large and in a great sea; and that in which she lay down when sailing upon a wind. The greatest angle he observed her to roll was 38° . This was on the 6th of this month, when the sea was not unusually high; so that it cannot be reckoned the greatest roll she had made. The most he observed her to heel or lie down, when sailing upon a wind, was 18° ; and this was under double-reefed topsails and courses.

On the 18th, at three in the morning, we sounded again, and found one hundred and ten fathoms, the same bottom as before. We now made sail with a fresh gale at N.W. and steered S.E. by E. along the coast. It extended from Cape Deseada, which bore N. 7° E., to E.S.E., a pretty high ragged isle, which lies near a league from the main, and S. 18° E. six leagues from Cape Deseada, bore N. 49° E. distant four leagues; and it obtained the name of Landfall. At four o'clock, we were north and south of the high land of Cape Deseada, distant about nine leagues; so that we saw none of the low rocks said to lie off it. The latitude of this Cape is about 53° S., longitude $74^{\circ} 40'$ W. Continuing to range the coast, at about two leagues' distance, at eleven o'clock we passed a projecting point, which I called Cape Gloucester. It shows a round surface of considerable height, and has much the appearance of being an island. It lies S.S.E. $\frac{1}{2}$ E., distant seventeen leagues from the Isle of Landfall. The coast between them forms two bays, strewed with rocky islets, rocks, and breakers. The coast appeared very broken with many inlets; or rather it seemed to be composed of a number of islands. The land is very mountainous, rocky, and barren, spotted here and there with tufts of wood and patches of snow. At noon Cape Gloucester bore N. distant eight miles, and the most advanced point of land to the S.E., which we judged to be Cape Noir, bore S.E. by S. distant seven or eight leagues. Latitude observed $54^{\circ} 13'$ S. Longitude made from Cape Deseada, 54° E. From Cape Gloucester, off which lies a small rocky island, the direction of the coast is nearly S.E.; but to Cape Noir, for which we steered, the course is S.S.E., distant about ten leagues.

At three o'clock we passed Cape Noir, which is a steep rock of considerable height, and the S.W. point of a large island that seemed to lie detached a league or a league and a half from the main land. The land of the Cape, when at a distance from it, appeared to be an island disjoined from the other; but, on a nearer approach, we found it connected by a low neck of land. At the point of the Cape are two rocks; the one peaked like a sugarloaf, the other not so high, and showing a rounder surface; and S. by E. two leagues from the Cape are two other rocky islets. This cape is situated in the latitude of $54^{\circ} 30'$ S., longitude $73^{\circ} 33'$ W.

After passing the two islets, we steered E.S.E. crossing the great bay of St. Barbara. We but just saw the land in the bottom of it; which could not be less than seven or eight leagues from us. There was a space, lying in the direction of E.N.E. from Cape Noir, where no land was to be seen: this may be the Channel of St. Barbara which opens into the Straits of Magalhaens, as mentioned by Frezier. We found the Cape to agree very well with his description; which shows that he laid down the channel from good memoirs. At ten o'clock, drawing near the S.E. point of the bay, which lies nearly in the direction of S. 60° E. from Cape Noir, eighteen leagues distant, we shortened sail, and spent the night standing off and on. At two o'clock in the morning of the 19th, having made sail, we steered S.E. by E. along the coast, and soon passed the S.E. point of the Bay of St. Barbara, which I called Cape Desolation; because near it commenced the most desolate and barren country I ever saw. It is situated in the latitude of $54^{\circ} 55'$ S., longitude $72^{\circ} 12'$ W. About four

leagues to the east of this cape is a deep inlet, at the entrance of which lies a pretty large island, and some others of less note. Nearly in this situation some charts place a channel leading into the Straits of Magalhaens, under the name of Straits of Jelouzel. At ten o'clock, being about a league and half from the land, we sounded, and found sixty fathoms water, a bottom of small stones and shells.

The wind, which had been fresh at N. by W., began to abate, and at noon it fell calm, when we observed in latitude $55^{\circ} 20' S.$, longitude made from Cape Descada $3^{\circ} 24' E.$ In this situation we were about three leagues from the nearest shore, which was that of an island. This I named Gilbert Isle, after my master. It is nearly of the same height with the rest of the coast, and shows a surfaco composed of several peaked rocks unequally high. A little to the S.E. of it are some smaller islands, and, without them, breakers. I have before observed that this is the most desolate coast I ever saw. It seems entirely composed of rocky mountains without the least appearance of vegetation. These mountains terminate in horrible precipices, whose craggy summits spire up to a vast height; so that hardly anything in nature can appear with a more barren and savage aspect than the whole of this country. The inland mountains were covered with snow, but those on the sea-coast were not. We judged the former to belong to the main of Terra del Fuego, and the latter to be islands, so ranged as apparently to form a coast.

After three hours' calm, we got a breeze at S.E. by E. and having made a short trip to south, stood in for the land; the most advanced point of which, that we had in sight, bore E., distant ten leagues. This is a lofty promontory, lying E.S.E. nineteen leagues from Gilbert Isle, and situated in latitude $55^{\circ} 26' S.$, longitude $70^{\circ} 25' W.$ Viewed from the situation we now were in, it terminated in two high towers; and within them a hill shaped like a sugarloaf. This wild rock therefore obtained the name of York Minster. Two leagues to the westward of this head appeared a large inlet, the west point of which we fetched in with by nine o'clock, when we tacked in forty-one fathoms water, half a league from the shore; to the westward of this inlet was another, with several islands lying in the entrance. During the night between the 19th and 20th, we had little wind easterly, which in the morning veered to N.E. and N.N.E., but it was too faint to be of use; and at ten we had a calm, when we observed the ship to drive from off the shore out to sea. We had made the same observation the day before. This must have been occasioned by a current; and the melting of the snow increasing, the inland waters will cause a stream to run out of most of these inlets. At noon, we observed in latitude $55^{\circ} 39' 30'' S.$, York Minster, then bearing N. $15^{\circ} E.$, distant two leagues; and Round-hill, just peeping above the horizon, which we judged to belong to the isles of Saint Ildefonso, E. $25^{\circ} S.$, ten or eleven leagues distant. At ten o'clock, a breeze springing up at E. by S., I took this opportunity to stand in for the land, being desirous of going into one of the many ports which seemed open to receive us, in order to take a view of the country, and to recruit our stock of wood and water.

In standing in for an opening, which appeared on the east side of York Minster, we had forty, thirty-seven, fifty, and sixty fathoms water, a bottom of small stones and shells. When we had the last soundings we were nearly in the middle between the two points that form the entrance to the inlet, which we observed to branch into two arms, both of them lying in nearly N., and disjoined by a high rocky point. We stood for the eastern branch as being clear of islets; and after passing a black rocky one, lying without the point just mentioned, we sounded and found no bottom with a line of a hundred and seventy fathoms. This was altogether unexpected, and a circumstance that would not have been regarded, if the breeze had continued; but at this time it fell calm, so that it was not possible to extricate ourselves from this disagreeable situation. Two boats were hoisted out, and sent ahead to tow; but they would have availed little, had not a breeze sprung up about eight o'clock, at S.W. which put it in my power either to stand out to sea, or up the inlet. Prudence seemed to point out the former; but the desire of finding a good port, and of learning something of the country, getting the better of every other consideration, I resolved to stand in; and as night was approaching, our safety depended on getting to an anchor. With this view we continued to sound, but always had an unfathomable depth.

Hauling up under the east side of the land which divided the two arms, and seeing a small cove ahead, I sent a boat to sound; and we kept as near the shore as the flurries from the land would permit, in order to be able to get into this place, if there should be anchorage. The boat soon returned, and informed us that there was thirty and twenty-five fathoms water, a full cable's length from the shore. Here we anchored in thirty fathoms, the bottom sand and broken shells; and carried out a kedje and hawser, to steady the ship for the night.

CHAPTER II.—TRANSACTIONS IN CHRISTMAS SOUND, WITH AN ACCOUNT OF THE COUNTRY AND ITS INHABITANTS.

THE morning of the 21st was calm and pleasant. After breakfast, I set out with two boats to look for a more secure station. We no sooner got round, or above the point, under which the ship lay, than we found a cove in which was anchorage in thirty, twenty, and fifteen fathoms, the bottom stones and sand. At the head of the cove was a stony beach, a valley covered with wood, and a stream of fresh water; so that there was everything we could expect to find in such a place, or rather more; for we shot three geese out of four that we saw, and caught some young ones, which we afterwards let go.

After discovering and sounding this cove, I sent Lieutenant Clerke, who commanded the other boat, on board, with orders to remove the ship into this place, while I proceeded farther up the inlet. I presently saw that the land we were under, which disjoined the two arms, as mentioned before, was an island, at the north end of which the two channels united. After this I hastened on board, and found everything in readiness to weigh; which was accordingly done, and all the boats sent ahead to tow the ship round the point. But, at that moment, a light breeze came in from the sea too scant to fill our sails; so that we were obliged to drop the anchor again, for fear of falling upon the point, and to carry out a kedje to windward. That being done, we hove up the anchor, warped up to and weighed the kedje, and proceeding round the point under our stay-sails, there anchored with the best bower, in twenty fathoms; and moored with the other bower, which lay to the north, in thirteen fathoms. In this position we were shut in from the sea by the point above mentioned, which was in one with the extremity of the inlet to the east. Some islets, off the next point above us, covered us from the N.W., from which quarter the wind had the greatest fetch; and our distance from the shore was about one-third of a mile. Thus situated, we went to work, to clear a place to fill water, to cut wood, and to set up a tent for the reception of a guard, which was thought necessary; as we had already discovered, that, barren as this country is, it was not without people, though we had not yet seen any. Mr. Wales also got his observatory and instruments on shore; but it was with the greatest difficulty he could find a place of sufficient stability, and clear of the mountains, which everywhere surrounded us, to set them up in; and at last he was obliged to content himself with the top of a rock, not more than nine feet over.

Next day I sent Lieutenants Clerke and Pickersgill, accompanied by some of the other officers, to examine and draw a sketch of the channel on the other side of the island; and I went myself in another boat, accompanied by the botanists, to survey the northern parts of the sound. In my way, I landed on the point of a low isle covered with herbage, part of which had been lately burnt; we likewise saw a hut; signs sufficient that people were in the neighbourhood. After I had taken the necessary bearings, we proceeded round the east end of Burnt Island, and over to what we judged to be the main of Terra del Fuego, where we found a very fine harbour encompassed by steep rocks of vast height, down which ran many limpid streams of water; and at the foot of the rocks, some tufts of trees, fit for little else but fuel. This harbour, which I shall distinguish by the name of the Devil's Basin, is divided, as it were, into two, an inner and an outer one; and the communication between them is by a narrow channel five fathoms deep. In the outer basin, I found thirteen and seventeen fathoms water, and in the inner, seventeen and twenty-three. This last is as secure a place as can be, but nothing can be more gloomy. The vast height of the savage

rocks which encompass it, deprived great part of it, even on this day, of the meridian sun. The outer harbour is not quite free from this inconvenience, but far more so than the other; it is also rather more commodious, and equally safe. It lies in the direction of north, a mile and a half distant from the east end of Burnt Island. I likewise found a good anchoring-place a little to the west of this harbour, before a stream of water that comes out of a lake or large reservoir, which is continually supplied by a cascade falling into it.

Leaving this place, we proceeded along the shore to the westward, and found other harbours, which I had not time to look into. In all of them is fresh water, and wood for fuel; but except these little tufts of bushes, the whole country is a barren rock, doomed by nature to everlasting sterility. The low islands, and even some of the higher, which lie scattered up and down the sound, are indeed mostly covered with shrubs and herbage, the soil a black rotten turf, evidently composed, by length of time, of decayed vegetables. I had an opportunity to verify what we had observed at sea; that the sea-coast is composed of a number of large and small islands, and that the numerous inlets are formed by the junction of several channels,—at least so it is here. On one of these low islands we found several huts which had lately been inhabited; and near them was a good deal of celery, with which we loaded our boat, and returned on board at seven o'clock in the evening. In this expedition we met with little game; one duck, three or four shags, and about that number of rails or sea-pies, being all we got. The other boat returned on board some hours before; having found two harbours on the west side of the other channel, the one large and the other small, but both of them safe and commodious; though, by the sketch Mr. Pickersgill had taken of them, the access to both appeared rather intricate. I was now told of a melancholy accident which had befallen one of our marines. He had not been seen since eleven or twelve o'clock the preceding night. It was supposed that he had fallen overboard out of the head, where he had been last seen, and was drowned.

Having fine pleasant weather on the 23d, I sent Lieutenant Pickersgill in the cutter to explore the east side of the sound, and went myself in the pinnace to the west side, with an intent to go round the island, under which we were at anchor (and which I shall distinguish by the name of Shag Island), in order to view the passage leading to the harbours. Mr. Pickersgill had discovered the day before, on which I made the following observations. In coming from sea, leave all the rocks and islands, lying off and within York Minster, on your larboard side; and the black rock, which lies off the south end of Shag Island, on your starboard; and when abreast of the south end of that island, haul over for the west shore, taking care to avoid the beds of weeds you will see before you, as they always grow on rocks; some of which I have found twelve fathoms under water, but it is always best to keep clear of them. The entrance to the large harbour, or Port Clerke, is just to the north of some low rocks lying off a point on Shag Island. This harbour lies V. by S., a mile and a half, and hath in it from twelve to twenty-four fathoms depth, wood, and fresh water. About a mile without, or to the southward of Port Clerke, is, or seemed to be, another which I did not examine. It is formed by a large island, which covers it from the south and east winds. Without this island, that is, between it and York Minster, the sea seemed strewed with islets, rocks, and breakers. In proceeding round the south end of Shag Island, we observed the shags to breed in vast numbers in the cliffs of the rocks. Some of the old ones we shot, but could not come at the young ones, which are by far the best eating. On the east side of the island we saw some geese; and having with difficulty landed, we killed three, which at this time was a valuable acquisition.

About seven in the evening we got on board, where Mr. Pickersgill had arrived but just before. He informed me that the land opposite to our station was an island, which he had been round; that, on another, more to the north, he found many *terns'* eggs, and that without the great island, between it and the east head, lay a cove in which were many geese; one only of which he got, besides some young goslings. This information of Mr. Pickersgill induced me to make up two shooting parties next day; Mr. Pickersgill and his associates going in the cutter, and myself and the botanists in the pinnace. Mr. Pickersgill went by the N.E. side of the large island above mentioned, which obtained the name of Goose Island; and I went by the S.W. side. As soon as we got under the island, we found plenty of shags

in the cliffs, but, without staying to spend our time and shot upon these, we proceeded on, and presently found sport enough; for in the south of the island were abundance of geese. It happened to be the moulting season, and most of them were on shore for that purpose, and could not fly. There being a great surf, we found great difficulty in landing, and very had climbing over the rocks when we were landed; so that hundreds of the geese escaped us, some into the sea, and others up into the island. We, however, by one means or other, got sixty-two; with which we returned on board, all heartily tired; but the acquisition we had made overbalanced every other consideration, and we sat down with a good appetite to supper, on part of what the preceding day had produced. Mr. Pickersgill and his associates had got on board some time before us, with fourteen geese; so that I was able to make distribution to the whole crew, which was the more acceptable, on account of the approaching festival; for, had not Providence thus singularly provided for us, our Christmas cheer must have been salt beef and pork.

I now learnt that a number of the natives, in nine canoes, had been alongside the ship, and some on board. Little address was required to persuade them to either; for they seemed to be well enough acquainted with Europeans, and had amongst them some of their knives. The next morning, the 25th, they made us another visit. I found them to be of the same nation I had formerly seen in Success Bay; and the same which M. de Bougainville distinguishes by the name of Pecheras, a word which these had on every occasion in their mouths. They are a little, ugly, half-starved, beardless race: I saw not a tall person amongst them. They were almost naked; their clothing was a seal-skin; some had two or three sewed together, so as to make a cloak which reached to the knees; but the most of them had only one skin, hardly large enough to cover their shoulders, and all their lower parts were quite naked. The women, I was told, cover their nakedness with a flap of a seal-skin, but in other respects are clothed like the men. They, as well as the children, remained in the canoes. I saw two young children at the breast entirely naked; thus they are inured from their infancy to cold and hardships. They had with them bows and arrows, and darts, or rather harpoons, made of bone, and fitted to a staff. I suppose they were intended to kill seals and fish; they may also kill whales with them, as the Esquimaux do. I know not if they resemble them in their love of train-oil; but they, and everything they had, smelt most intolerably of it. I ordered them some biscuit, but did not observe them so fond of it as I had been told. They were much better pleased when I gave them some medals, knives, &c.

The women and children, as before observed, remained in the canoes. These were made of bark; and in each was a fire, over which the poor creatures huddled themselves. I cannot suppose that they carry a fire in their canoes for this purpose only; but rather that it may be always ready to remove ashore wherever they land; for let their method of obtaining fire be what it may, they cannot be always sure of finding dry fuel that will kindle from a spark. They likewise carry in their canoes large seal hides, which I judged were to shelter them when at sea, and to serve as covering to their huts on shore; and occasionally to be used for sails. They all retired before dinner, and did not wait to partake of our Christmas cheer. Indeed I believe no one invited them, and for good reasons; for their dirty persons, and the stench they carried about them, were enough to spoil the appetite of any European; and that would have been a real disappointment, as we had not experienced such fare for some time. Roast and boiled geese, goose-pie, &c. was a treat little known to us; and we had yet some Madeira wine left, which was the only article of our provision that was mended by keeping. So that our friends in England did not, perhaps, celebrate Christmas more cheerfully than we did.

On the 26th, little wind, next to a calm, and fair weather, except in the morning, when we had some showers of rain. In the evening, when it was cold, the natives made us another visit; and it being distressing to see them stand trembling and naked on the deck, I could do no less than to give them some baize and old canvas to cover themselves. Having already completed our water, on the 27th I ordered the wood, tent, and observatory to be got on board; and, as this was work for the day, a party of us went in two boats to shoot geese, the weather being fine and pleasant. We proceeded round by the south side of Goose Island, and picked up in all thirty-one. On the east side of the island, to the north

of the east point, is good anchorage, in seventeen fathoms water, where it is entirely land-locked. This is a good place for ships to lie in that are bound to the west. On the north side of this isle I observed three fine coves, in which were both wood and water; but it being near night, I had no time to sound them; though I doubt not there is anchorage. The way to come at them is by the west end of the island.

When I returned on board, I found everything got off the shore, and the launch in; so that we now only waited for a wind to put to sea. The festival, which we celebrated at this place, occasioned my giving it the name of Christmas Sound. The entrance, which is three leagues wide, is situated in the latitude of $55^{\circ} 27'$ S., longitude $70^{\circ} 16'$ W.; and in the direction of N. 37° W. from St. Ildefonso Isles, distant ten leagues. These isles are the best land-mark for finding the sound. York Minster, which is the only remarkable land about it, will hardly be known by a stranger from any description that can be given of it, because it alters its appearance according to the different situations it is viewed from. Besides the black rock, which lies off the end of Shag Island, there is another about midway between this and the east shore. A copious description of this sound is unnecessary, as few would be benefited by it. The sketch which accompanies this journal will be a sufficient guide for such ships as chance may bring hither. Anchorage, tufts of wood, and fresh water, will be found in all the coves and harbours. I would advise no one to anchor very near the shore for the sake of having a moderate depth of water; because there I generally found a rocky bottom.

CHRISTMAS SOUND

The refreshments to be got here are precarious, as they consist chiefly of wild-fowl, and may probably never be found in such plenty as to supply the crew of a ship; and fish, so far as we can judge, are scarce. Indeed the plenty of wild-fowl made us pay less attention to fishing. Here are however plenty of muscels, not very large, but well tasted; and very good celery is to be met with on several of the low islets, and where the natives have their habitations. The wild-fowl are geese, ducks, sea-pies, shags, and that kind of gull so often mentioned in this journal under the name of Port Egmont hen. Here is a kind of duck,

generally found a

called by our people race-horses, on account of the great swiftness with which they run on the water; for they cannot fly, the wings being too short to support the body in the air. This bird is at the Falkland Islands, as appears by Pernety's journal*. The geese too are there, and seem to be very well described under the name of bustards. They are much smaller than our English tame geese, but eat as well as any I ever tasted. They have short black bills and yellow feet. The gander is all white; the female is spotted black and white, or grey with a large white spot on each wing. Besides the bird above mentioned, here are several other aquatic, and some land ones; but of the latter not many.

From the knowledge which the inhabitants seem to have of Europeans, we may suppose that they do not live here continually, but retire to the north during the winter. I have often wondered that these people do not clothe themselves better, since nature has certainly provided materials. They might line their seal-skin cloaks with the skins and feathers of aquatic birds; they might make their cloaks larger, and employ the same skins for other parts of clothing; for I cannot suppose they are scarce with them. They were ready enough to part with those they had to our people; which they hardly would have done, had they not known where to have got more. In short, of all the nations I have seen, the Pecheras are the most wretched. They are doomed to live in one of the most inhospitable climates in the world, without having sagacity enough to provide themselves with such conveniences as may render life in some measure more comfortable.

Barren as this country is, it abounds with a variety of unknown plants, and gave sufficient employment to Mr. Forster and his party. The tree which produceth the Winter's bark is found here in the woods, as is the holly-leaved berberry, and some other sorts which I know not, but I believe are common in the Straits of Magalhæns. We found plenty of a berry which we called the cranberry, because they are nearly of the same colour, size, and shape. It grows on a bushy plant, has a bitterish taste, rather insipid; but may be eaten either raw or in tarts, and is used as food by the natives.

CHAPTER III.—RANGE FROM CHRISTMAS SOUND, ROUND CAPE HORN, THROUGH STRAIT LE MAIRE, AND ROUND STATEN LAND; WITH AN ACCOUNT OF THE DISCOVERY OF A HARBOUR IN THAT ISLAND, AND A DESCRIPTION OF THE COASTS.

At four o'clock in the morning on the 23th we began to unmoor; and at eight weighed and stood out to sea, with a light breeze at N.W. which afterwards freshened, and was attended with rain. At noon the east point of the sound (Point Nativity) bore N. $\frac{1}{2}$ W. distant one and a half leagues, and St. Ildefonso Isles S.E. $\frac{1}{2}$ S., distant seven leagues. The coast seemed to trend in the direction of E. by S.; but the weather being very hazy, nothing appeared distinct.

We continued to steer S.E. by E. and E.S.E., with a fresh breeze at W.N.W., till four o'clock p.m., when we hauled to the South, in order to have a nearer view of St. Ildefonso Isles. At this time we were abreast of an inlet, which lies E.S.E. about seven leagues from the sound; but it must be observed that there are some isles without this distinction. At the west point of the inlet are two high peaked hills; and below them to the E. two round hills, or isles, which lie in the direction of N.E. and S.W. of each other. An island, or what appeared to be an island, lay in the entrance; and another but smaller inlet appeared to the west of this; indeed, the coast appeared indented and broken as usual. At half past five o'clock, the weather clearing up, gave us a good sight of Ildefonso Isles. They are a group of islands and rocks above water, situated above six leagues from the main, and in the latitude of $55^{\circ} 53' S.$, longitude $69^{\circ} 41' W.$

We now resumed our course to the east; and, at sunset, the most advanced land bore S.E. by E. $\frac{3}{4}$ E.; and a point, which I judged to be the west point of Nassau Bay, discovered by the Dutch fleet under the command of Admiral Hermite in 1624, bore N. $80^{\circ} E.$, six leagues distant. In some charts, this point is called false Cape Horn, as being the southern point of Terra del Fuego. It is situated in latitude $55^{\circ} 39' S.$ From the inlet above men-

* See Pernety's Journal, p. 244 and p. 213.

of wild-fowl, and
ship; and fish, so
pay less attention
tasted; and very
natives have their
kind of gull so often
is a kind of duck,

tioned to this false cape, the direction of the coast is nearly E., half a point S., distant fourteen or fifteen leagues. At ten o'clock, having shortened sail, we spent the night in making short boards under the topsails, and, at three next morning, made sail and steered S.E. by S. with a fresh breeze at W.S.W., the weather somewhat hazy. At this time, the west entrance to Nassau Bay extended from N. by E. to N. $\frac{1}{2}$ E.; and the south side of Hermite's Isles, E. by S. At four, *Cape Horn*, for which we now steered, bore E. by S. It is known at a distance, by a high round hill over it. A point to the W.N.W. shows a surface not unlike this; but their situations alone will always distinguish the one from the other.

At half-past seven, we passed this famous cape, and entered the Southern Atlantic Ocean. It is the very same point of land I took for the cape when I passed it in 1769, which at that time I was doubtful of. It is the most southern extremity on a group of islands of unequal extent, lying before Nassau Bay, known by the name of Hermite Islands, and is situated in the latitude of $55^{\circ} 58'$, and in the longitude of $68^{\circ} 13'$ west, according to the observations made of it in 1769. But the observations which we had in Christmas Sound, and reduced to the cape by the watch, and others which we had afterwards, and reduced back to it by the same means, place it in $67^{\circ} 19'$. It is most probable that a mean between the two, viz. $67^{\circ} 46'$, will be nearest the truth. On the N.W. side of the cape are two peaked rocks like sugarloaves. They lie N.W. by N. and S.E. by S., by compass, of each other. Some other straggling low rocks lie west of the cape, and one south of it; but they are all near the shore. From Christmas Sound to Cape Horn, the course is E.S.E. $\frac{1}{2}$ E., distant thirty-one leagues. In the direction of E.N.E., three leagues from Cape Horn, is a rocky point, which I called Mistaken Cape, and is the southern point of the easternmost of Hermite Isles. Between these two capes there seemed to be a passage directly into Nassau Bay; some small isles were seen in the passage; and the coast, on the west side, had the appearance of forming good bays or harbours. In some charts, Cape Horn is laid down as belonging to a small island. This was neither confirmed nor can it be contradicted by us; for several breakers appeared in the coast, both to the east and west of it; and the hazy weather rendered every object indistinct. The summits of some of the hills were rocky, but the sides and valleys seemed covered with a green turf, and wooded in tufts.

From Cape Horn we steered E. by N. $\frac{1}{2}$ N. which direction carried us without the rocks that lie off Mistaken Cape. These rocks are white with the dung of fowls; and vast numbers were seen about them. After passing them, we steered N.E. $\frac{1}{2}$ E. and N.E. for Strait Le Maire, with a view of looking into Success Bay, to see if there were any traces of the Adventure having been there. At eight o'clock in the evening, drawing near the strait, we shortened sail, and hauled the wind. At this time the Sugarloaf on Terra del Fuego bore N. 33° W.; the point of Success Bay, just open of the cape of the same name, bearing N. 20° E.; and Staten Land, extending from N. 53° E. to 67° E. Soon after, the wind died away, and we had light airs and calms by turns till near noon the next day; during which time we were driven by the current over to Staten Land.

The calm being succeeded by a light breeze at N.N.W. we stood over for Success Bay, assisted by the currents, which set to the north. Before this, we had hoisted our colours, and fired two guns; and soon after, saw a smoke rise out of the woods, above the south point of the bay; which I judged was made by the natives, as it was at the place where they resided when I was here in 1769. As soon as we got off the bay, I sent Lieutenant Pickersgill to see if any traces remained of the Adventure having been there lately; and in the mean time we stood on and off with the ship. At two o'clock, the current turned and set to the south; and Mr. Pickersgill informed me when he returned, that it was falling water on shore; which was contrary to what I had observed when I was here before; for I thought then that the flood came from the north. Mr. Pickersgill saw not the least signs of any ship having been there lately. I had inscribed our ship's name on a card, which he nailed to a tree at the place where the Endeavour watered. This was done with a view of giving Captain Furneaux some information, in case he should be behind us and put in here. On Mr. Pickersgill's landing, he was courteously received by several of the natives, who were clothed in guanicoe and seal-skins, and had on their arms bracelets, made of silver wire, and wrought not unlike the hilt of a sword, being no doubt the manufacture of some

Europeans. They were the same kind of people we had seen in Christmas Sound; and, like them, repeated the word *Pechera* on every occasion. One man spoke much to Mr. Pickersgill, pointing first to the ship and then to the bay, as if he wanted her to come in. Mr. Pickersgill said the bay was full of whales and seals; and we had observed the same in the strait, especially on the Terra del Fuego side, where the whales, in particular, are exceedingly numerous.

As soon as the boat was hoisted in, which was not till near six o'clock, we made sail to the east, with a fine breeze at north. For since we had explored the south coast of Terra del Fuego, I resolved to do the same by Staten Land; which I believed to have been as little known as the former. At nine o'clock the wind freshening, and veering to N.W. we tacked, and stood to S.W. in order to spend the night, which proved none of the best, being stormy and hazy, with rain. Next morning, at three o'clock, we bore up for the east end of Staten Land, which, at half-past four, bore S. 60° E. the west end S. 2° E. and the land of Terra del Fuego S. 40° W. Soon after I had taken these bearings, the land was again obscured in a thick haze, and we were obliged to make way, as it were, in the dark; for it was but now and then we got a sight of the coast. As we advanced to the east, we perceived several islands, of unequal extent, lying off the land. There seemed to be a clear passage between the easternmost and the one next to it, to the west. I would gladly have gone through this passage, and anchored under one of the islands, to have waited for better weather; for on sounding we found only twenty-nine fathoms water; but when I considered that this was running to leeward in the dark, I chose to keep without the islands, and accordingly hauled off to the north. At eight o'clock we were abreast of the most eastern isle, distant from it about two miles, and had the same depth of water as before. I now shortened sail to the three topsails, to wait for clear weather; for the fog was so thick that we could see no other land than this island. After waiting an hour, and the weather not clearing up, we bore, and hauled round the east end of the island, for the sake of smooth water and anchorage, if it should be necessary. In hauling round, we found a strong race of a current, like unto broken water; but we had no less than nineteen fathoms. We also saw on the island abundance of seals and birds. This was a temptation too great for people in our situation to withstand, to whom fresh provisions of any kind were acceptable; and determined me to anchor, in order that we might taste of what we now only saw at a distance. At length, after making a few boards, fishing, as it were, for the best ground, we anchored in twenty-one fathoms water, a stony bottom, about a mile from the island, which extended from N. 18° E. to N. 55° $\frac{1}{2}$ W.; and soon after, the weather clearing up, we saw Cape St. John, or the east end of Staten Land, bearing S. 75° E., distant four leagues. We were sheltered from the south wind by Staten Land, and from the north wind by the island; the other isles lay to the west, and secured us from that wind; but beside being open to the N.E. and E., we also lay exposed to the N.N.W. winds. This might have been avoided by anchoring more to the west; but I made choice of my situation for two reasons: first, to be near the island we intended to land upon; and secondly, to be able to get to sea with any wind.

After dinner we hoisted out three boats, and landed with a large party of men; some to kill seals, others to catch or kill birds, fish, or what came in our way. To find of the former, it mattered not where we landed, for the whole shore was covered with them; and, by the noise they made, one would have thought the island was stocked with cows and calves. On landing, we found they were a different animal from seals, but in shape and motion exactly resembling them. We called them lions, on account of the great resemblance the male has to that beast. Here were also the same kind of seals which we found in New Zealand generally known by the name of sea-bears,—at least, we gave them that name. They were, in general, so tame, or rather stupid, as to suffer us to come near enough to knock them down with sticks; but the large ones we shot, not thinking it safe to approach them. We also found on the island abundance of penguins and shags; and the latter had young ones almost fledged, and just to our taste. Here were geese and ducks, but not many; birds of prey, and a few small birds. In the evening we returned on board, our boats well laden with one thing or other.

Next day, being January the 1st, 1775, finding that nothing was wanting but a good harbour to make this a tolerable place for ships to refresh at, whom chance or design might

bring hither, I sent Mr. Gilbert over to Staten Land in the cutter to look for one. Appearances promised success in a place opposite the ship. I sent also two other boats for the lions &c. we had killed the preceding day; and soon after I went myself, and observed the sun's meridian altitude at the N.E. end of the island, which gave the latitude $54^{\circ} 40' 5''$ south. After shooting a few geese, some other birds, and plentifully supplying ourselves with young shags, we returned on board, laden with sea-lions, sea-bears, &c. The old lions and bears

SEA BEAR. (*Arctocephalus ursinus*.)

were killed chiefly for the sake of their blubber, or fat, to make oil of; for, except their harslets, which were tolerable, the flesh was too rank to be eaten with any degree of relish. But the young cubs were very palatable, and even the flesh of some of the old lionesses was not much amiss; but that of the old males was abominable. In the afternoon, I sent some people on shore to skin and cut off the fat of those which yet remained dead on shore, for we had already more carcasses on board than necessary; and I went myself, in another boat, to collect birds. About ten o'clock Mr. Gilbert returned from Staten Land, where he found a good port, situated three leagues to the westward of Cape St. John, and in the direction of north, a little easterly, from the N.E. end of the eastern island. It may be known by some small islands lying in the entrance. The channel, which is on the east side of these islands, is half a mile broad. The course in is S.W. by S., turning gradually to W. by S. and W. The harbour lies nearly in this last direction; is almost two miles in length; in some places near a mile broad; and hath in it from fifty to ten fathoms water, a bottom of mud and sand. Its shores are covered with wood fit for fuel; and in it are several streams of fresh water. On the islands were sea-lions, &c., and such an innumerable quantity of gulls as to darken the air when disturbed, and almost to suffocate our people with their dung. This they seemed to void in a way of defence, and it stunk worse than asafetida, or, as it is commonly called, devil's dung. Our people also saw several geese, ducks, and race-horses, which is also a kind of duck. The day on which this port was discovered, occasioned my calling it New Year's Harbour. It would be more convenient for ships bound to the west, or round Cape Horn, if its situation would permit them, to put to sea with an easterly and northerly wind. This inconvenience, however, is of little consequence, since these winds are never known to be of long duration. The southerly and westerly are the prevailing winds; so that a ship can never be detained long in this port.

As we could not sail in the morning of the 2d for want of wind, I sent a party of men on shore to the island, on the same duty as before. Towards noon we got a fresh breeze at west; but it came too late, and I resolved to wait till the next morning, when, at four

when, at four

o'clock, we weighed with a fresh gale at N.W. by W., and stood for Cape St. John, which, at half-past six, bore N. by E., distant four or five miles. This cape, being the eastern point of Staten Land, a description of it is unnecessary. It may, however, not be amiss to say, that it is a rock of considerable height, situated in the latitude of $54^{\circ} 46'$ south, longitude $64^{\circ} 7'$ west, with a rocky islet lying close under the north part of it. To the westward of the cape, about five or six miles, is an inlet, which seemed to divide the land; that is, to communicate with the sea to the south; and between this inlet and the cape is a bay, but I cannot say of what depth. In sailing round the cape we met with a very strong current from the south: it made a race which looked like breakers; and it was as much as we could do, with a strong gale, to make head against it.

After getting round the cape I hauled up along the south coast; and as soon as we had brought the wind to blow off the land, it came upon us in such heavy squalls as obliged us to double reef our topsails. It afterwards fell, by little and little, and at noon ended in a calm. At this time Cape St. John bore N. $20'$ east, distant three and a half leagues; Cape St. Bartholomew, or the S.W. point of Staten Land, S. 80° west; two high detached rocks N. 80° west; and the place where the land seemed to be divided, which had the same appearance on this side, bore N. 15° west, three leagues distant. Latitude observed $54^{\circ} 56'$. In this situation we sounded, but had no bottom, with a line of one hundred and twenty fathoms. The calm was of very short duration, a breeze presently springing up at N.W., but it was too faint to make head against the current, and we drove with it back to the N.N.E. At four o'clock the wind veered at once to S. by E., and blew in squalls attended with rain. Two hours after, the squalls and rain subsided, and the wind, returning back to the west, blew a gentle gale. All this time the current set us to the north; so that at eight o'clock, Cape St. John bore W.N.W., distant about seven leagues. I now gave over plying, and steered S.E. with a resolution to leave the land; judging it to be sufficiently explored to answer the most general purposes of navigation and geography.

CHAPTER IV. — OBSERVATIONS, GEOGRAPHICAL AND NAUTICAL, WITH AN ACCOUNT OF THE ISLANDS NEAR STATEN LAND, AND THE ANIMALS FOUND IN THEM.

THE annexed chart will very accurately show the direction, extent, and position of the coast along which I have sailed, either in this or my former voyage; and no more is to be expected from it*. The latitudes have been determined by the sun's meridian altitude, which we were so fortunate as to obtain every day, except the one we sailed from Christmas Sound; which was of no consequence, as its latitude was known before. The longitudes have been settled by lunar observations, as is already mentioned. I have taken $67^{\circ} 46'$ for the longitude of Cape Horn. From this meridian the longitudes of all the other parts are deduced by the watch; by which the extent of the whole must be determined to a few miles; and whatever errors there may be in longitude, must be general. But I think it highly probable that the longitude is determined to within a quarter of a degree. Thus the extent of Terra del Fuego from east to west, and consequently that of the Straits of Magalhaens, will be found less than most navigators have made it. In order to illustrate this, and to show the situations of the neighbouring lands, and, by this means, make the annexed chart of more general use, I have extended it down to 47° of latitude. But I am only answerable for the inaccuracy of such parts as I have explored myself. In laying down the rest, I had recourse to the following authorities.

The longitude of Cape Virgin Mary, which is the most essential point, as it determines the length of the Straits of Magalhaens, is deduced from Lord Anson, who made $2^{\circ} 3'$ difference of longitude between it and the Strait Le Maire. Now, as the latter lies in $65^{\circ} 22'$, Cape Virgin Mary must lie in $67^{\circ} 52'$, which is the longitude I have assigned to it, and which I have reason to think cannot be far from the truth. The Strait of Magalhaens,

* This chart, being now entirely superseded by the recent surveys of Captains King and Fitzroy, is omitted in this edition.—Ed.

and the east coast of Patagonia, are laid down from the observations made by the late English and French navigators.

The position of the west coast of America, from Cape Victory northward, I have taken from the discoveries of *Sarmiento*, a Spanish navigator, communicated to me by Mr. Stuart, F.R.S. Falkland Islands are copied from a sketch taken from Captain M-Bride, who circumnavigated them some years ago in his Majesty's ship *Jason*; and their distance from the main is agreeable to the run of the *Dolphin*, under the command of Commodore Byron, from Cape Virgin Mary to Port Egmont, and from Port Egmont to Port Desire; both of which runs were made in a few days; consequently no material errors could happen.

The S.W. coast of Terra del Fuego, with respect to inlets, islands, &c., may be compared to the coast of Norway; for I doubt, if there be an extent of three leagues where there is not an inlet or harbour which will receive and shelter the largest shipping. The worst is, that till these inlets are better known, one has, as it were, to fish for anchorage. There are several lurking rocks on the coast; but happily none of them lie far from land, the approach to which may be known by sounding, supposing the weather so obscure that you cannot see it. For to judge of the whole by the parts we have sounded, it is more than probable that there are soundings all along the coast, and for several leagues out to sea. Upon the whole, this is by no means the dangerous coast it has been represented.

Staten Land lies nearly E. by N. and W. by S., and is ten leagues long in that direction; and nowhere above three or four leagues broad. The coast is rocky, much indented, and seemed to form several bays or inlets. It shows a surface of craggy hills which spire up to a vast height, especially near the west end. Except the craggy summits of the hills, the greatest part was covered with trees and shrubs, or some sort of herbage, and there was little or no snow on it. The currents between Cape Descada and Cape Horn set from west to east, that is, in the same direction as the coast; but they are by no means considerable. To the east of the cape their strength is much increased, and their direction is N.E. towards Staten Land. They are rapid in Strait Le Maire, and along the south coast of Staten Land, and set like a torrent round Cape St. John; where they take a N.W. direction, and continue to run very strong both within and without New Year's Isles. While we lay at anchor within this island, I observed that the current was strongest during the flood; and that on the ebb, its strength was so much impaired, that the ship would sometimes ride head to wind when it was at west and W.N.W. This is only to be understood of the place where the ship lay at anchor; for at the very time we had a strong current setting to the westward, Mr. Gilbert found one of equal strength near the coast of Staten Land, setting to the eastward; though probably this was an eddy current or tide.

If the tides are regulated by the moon, it is high-water by the shore at this place, on the days of the new and full moon, about four o'clock. The perpendicular rise and fall is very inconsiderable, not exceeding four feet at most. In Christmas Sound it is high water at half-past two o'clock on the days of the full and change, and Mr. Wales observed it to rise and fall, on a perpendicular, three feet six inches; but this was during the neap-tides: consequently the spring-tides must rise higher. To give such an account of the tides and currents on these coasts as navigators might depend on, would require a multitude of observations, and in different places, the making of which would be a work of time. I confess myself unprovided with materials for such a task, and believe, that the less I say on this subject the fewer mistakes I shall make. But I think I have been able to observe, that in Strait Le Maire, the southerly tide or current, be it flood or ebb, begins to act, on the days of new and full moon, about four o'clock, which remark may be of use to ships who pass the strait. Were I bound round Cape Horn to the west, and not in want of wood of water, or anything that might make it necessary to put into port, I would not come near the land at all. For by keeping out at sea, you avoid the currents, which, I am satisfied, lose their force at ten or twelve leagues from land; and at a greater distance there is none.

During the time we were upon the coast, we had more calms than storms, and the winds so variable, that I question if a passage might not have been made from east to west in as short a time as from west to east; nor did we experience any cold weather. The mercury

in the thermometer at noon was never below 46° ; and while we lay in Christmas Sound, it was generally above temperate. At this place, the variation was $23^{\circ} 30'$ east; a few leagues to the S.W. of Strait Le Maire, it was 24° ; and at anchor, within New Year's Isles, it was $24^{\circ} 20'$ east. These isles are, in general, so unlike Staten Land, especially the one on which we landed, that it deserves a particular description. It shows a surface of equal height, and elevated about thirty or forty feet above the sea, from which it is defended by a rocky coast. The inner part of the isle is covered with a sort of sword-grass, very green, and of a great length. It grows on little hillocks, of two or three feet in diameter, and as many or more in height, in large tufts, which seemed to be composed of the roots of the plant matted together. Among these hillocks are a vast number of paths made by sea-bears and penguins, by which they retire into the centre of the isle. It is, nevertheless, exceedingly bad travelling; for these paths are so dirty that one is sometimes up to the knees in mire. Besides this plant, there are a few other grasses, a kind of heath, and some celery. The whole surface is moist and wet, and on the coast are several small streams of water. The sword-grass, as I call it, seems to be the same that grows in Falkland Isles, described by Bougainville as a kind of *gladiolus*, or rather a species of *gramen**, and named by Pernety, corn-flags.

The animals found on this little spot are sea-lions, sea-bears, a variety of orcanic and some land-birds. The sea-lion is pretty well described by Pernety; though these we saw here have not such fore-feet or fins as that he has given a plate of, but such fins as

SEA LION. (*Platyrrhynchus leoninus*.)

not half so big as the male, and is covered with a short hair of an ash, or light dun colour. They live, as it were, in herds on the rocks and near the sea-shore. As this was the time for engendering as well as bringing forth their young, we have seen a male with twenty or thirty females about him, and always very attentive to keep them all to himself, and beating off every other male who attempted to come into his flock. Others again had a less number; some

* See English translation of Bougainville, p. 51.

no more than one or two ; and here and there we have seen one lying growling in a retired place alone, and suffering neither males nor females to approach him : we judged these were old and superannuated.

The sea-bears are not so large by far as the lions, but rather larger than a common seal. They have none of that long hair which distinguishes the lion. Theirs is all of an equal length, and finer than that of the lion, something like an otter's ; and the general colour is that of iron-grey. This is the kind which the French call sea-wolves, and the English seals ; they are, however, different from the seals we have in Europe and in North America. The lions may, too, without any great impropriety, be called overgrown seals ; for they are all of the same species. It was not at all dangerous to go among them ; for they either fled or lay still. The only danger was in going between them and the sea ; for if they took fright at anything, they would come down in such numbers, that, if you could not get out of their way, you would be run over. Sometimes, when we came suddenly upon them, or waked them out of their sleep (for they are a sluggish sleepy animal), they would raise up their heads, snort and snarl, and look as fierce as if they meant to devour us ; but as we advanced upon them, they always ran away ; so that they are downright bullies.

The penguin is an amphibious bird, so well known to most people, that I shall only observe, they are here in prodigious numbers ; so that we could knock down as many as we pleased with a stick. I cannot say they are good eating. I have, indeed, made several good meals of them ; but it was for want of better victuals. They either do not breed here, or else this was not the season ; for we saw neither eggs nor young ones. Shags breed here in vast numbers ; and we carried on board not a few, as they are very good eating. They take certain spots to themselves, and build their nests near the edge of the cliffs or little hillocks, which are either those of the sword-grass, or else they are made by the shags building on them from year to year. There is another sort rather smaller than these, which breed on the cliffs of rocks.

The geese are of the same sort we found in Christmas Sound ; we saw but few, and some had young ones. Mr. Forster shot one which was different from these, being larger, with a grey plumage and black feet. The others make a noise exactly like a duck. Here were ducks, but not many ; and several of that sort which we called race-horses. We shot some, and found them to weigh twenty-nine or thirty pounds ; those who ate of them said they were very good. The oceanic birds were gulls, terns, Port Egmont hens, and a large brown bird of the size of an albatross, which Pernetty calls quebrantahuessas. We called them Mother Cary's geese, and found them pretty good eating. The land-birds were eagles, or hawks, bald-headed vultures, or what our seamen called turkey-buzzards, thrushes, and a few other small birds.

Our naturalists found two new species of birds. The one is about the size of a pigeon, the plumage as white as milk. They feed alongshore, probably on shell-fish and carrion ; for they have a very disagreeable smell. When we first saw these birds, we thought they were the snow-peterel, but the moment they were in our possession the mistake was discovered ; for they resemble them in nothing but size and colour. These are not web-footed. The other sort is a species of curlews nearly as big as a heron. It has a variegated plumage, the principal colours whereof are light grey, and a long crooked bill. I had almost forgot to mention that there are sea-pies, or what we called, when in New Zealand, curlews ; but we only saw a few straggling pairs. It may not be amiss to observe, that the shags are the same bird which Bongainville calls saw-bills ; but he is mistaken in saying that the quebrantahuessas are their enemies ; for this bird is of the peterel tribe, feeds wholly on fish, and is to be found in all the high southern latitudes.

It is amazing to see how the different animals which inhabit this little spot are mutually reconciled. They seem to have entered into a league not to disturb each other's tranquillity. The sea-lions occupy most of the sea-coast ; the sea-bears take up their abode in the isle ; the shags have post in the highest cliffs ; the penguins fix their quarters where there is the most easy communication to and from the sea ; and the other birds choose more retired places. We have seen all these animals mix together, like domestic cattle and poultry in a farm-yard, without one attempting to molest the other. Nay, I have often observed the

eagles and vultures sitting on the hillocks among the shags, without the latter, either young or old, being disturbed at their presence. It may be asked how these birds of prey live? I suppose, on the carcasses of seals and birds which die by various causes; and probably not few, as they are so numerous.

This very imperfect account is written more with a view to assist my own memory, than to give information to others. I am neither a botanist nor a naturalist; and have not words to describe the productions of nature, either in the one branch of knowledge or the other.

CHAPTER V.—PROCEEDINGS AFTER LEAVING STATEN ISLAND, WITH AN ACCOUNT OF THE DISCOVERY OF THE ISLE OF GEORGIA, AND A DESCRIPTION OF IT.

HAVING left the land in the evening of the 3rd, as before-mentioned, we saw it again next morning at three o'clock, bearing W. Wind continued to blow a steady fresh breeze till six P.M., when it shifted in a heavy squall to S.W., which came so suddenly upon us that we had not time to take in the sails, and was the occasion of carrying away a top-gallant-mast, a studding-sail-boom, and a fore studding-sail. The squall ended in a heavy shower of rain, but the wind remained at S.W. Our course was S.E., with a view of discovering that extensive coast, laid down by Mr. Dalrymple in his chart, in which is the Gulf of St. Sebastian. I designed to make the western point of that gulf, in order to have all the other parts before me. Indeed, I had some doubt of the existence of such a coast; and this appeared to me the best route for clearing it up, and for exploring the southern part of this ocean.

On the 5th, fresh gales, and wet and cloudy weather. At noon observed in $57^{\circ} 9'$ longitude made from Cape Saint John, $5^{\circ} 2' E.$ At six o'clock, P.M., being in the latitude $57^{\circ} 21'$, and in longitude $57^{\circ} 45' W.$, the variation was $21^{\circ} 28' E.$ At eight o'clock in the evening of the 6th, being then in the latitude of $58^{\circ} 9' S.$, longitude $53^{\circ} 14' W.$, we close-reefed our topsails, and hauled to the north, with a very strong gale at W., attended with a thick haze and sleet. The situation just mentioned is nearly the same that Mr. Dalrymple assigns for the S.W. point of the Gulf of St. Sebastian. But as we saw neither land, nor signs of land, I was the more doubtful of its existence, and was fearful that by keeping to the south I might miss the land said to be discovered by La Roche in 1675, and by the ship *Lion* in 1756, which Mr. Dalrymple places in $54^{\circ} 30'$ latitude, and 45° of longitude, but on looking over Danville's chart, I found it laid down 9° or 10° more to the west; this difference of situation being to me a sign of the uncertainty of both accounts, determined me to get into the parallel as soon as possible, and was the reason of my hauling to the north at this time.

Towards the morning of the 7th the gale abated, the weather cleared up, and the wind veered to the W.S.W., where it continued till midnight; after which it veered to N.W. Being at this time in the latitude of $56^{\circ} 4' S.$, longitude $53^{\circ} 36' W.$, we sounded, but found no bottom with a line of one hundred and thirty fathoms. I still kept the wind on the larboard-tack, having a gentle breeze and pleasant weather. On the 8th, at noon, a bed of sea-weed passed the ship. In the afternoon, in the latitude of $55^{\circ} 4'$, longitude $51^{\circ} 45' W.$, the variation was $20^{\circ} 4' E.$ On the 9th, wind at N.E., attended with thick hazy weather; saw a seal, and a piece of sea-weed. At noon, latitude $55^{\circ} 12' S.$, longitude $50^{\circ} 15' W.$, the wind and weather continuing the same till towards midnight, when the latter cleared up, and the former veered to west, and blew a gentle gale. We continued to ply till two o'clock the next morning, when we bore away E., and at eight, E.N.E.; at noon we observed, in latitude $54^{\circ} 35' S.$, longitude $47^{\circ} 56' W.$, a great many albatrosses and blue pterrels about the ship. I now steered E., and the next morning, in the latitude of $54^{\circ} 38'$, longitude $45^{\circ} 10' W.$, the variation was $19^{\circ} 25' E.$ In the afternoon saw several penguins, and some pieces of weed.

Having spent the night lying-to, on the 12th, at daybreak, we bore away, and steered east northerly, with a fine fresh breeze at W.S.W.; at noon observed in latitude $54^{\circ} 28' S.$

longitude in $42^{\circ} 8' W.$; that is, near $3^{\circ} E.$ of the situation in which Mr. Dalrymple places the N.E. point of the Gulf of St. Sebastian; but we had no other signs of land than seeing a seal and a few penguins; on the contrary, we had a swell from E.S.E. which would hardly have been, if any extensive tract of land lay in that direction. In the evening the gale abated, and at midnight it fell calm. The calm, attended by a thick fog, continued till six next morning, when we got a wind at E., but the fog still prevailed. We stood to the S. till noon, when being in the latitude of $55^{\circ} 7'$, we tacked and stretched to the N. with a fresh breeze at E. by S. and E.S.E., cloudy weather; saw several penguins and a snow-peterel, which we looked on to be signs of the vicinity of ice. The air too was much colder than we had felt it since we left New Zealand. In the afternoon the wind veered to S.E., and in the night to S.S.E., and blew fresh; with which we stood to the N.E.

At nine o'clock the next morning we saw an island of ice as we then thought; but at noon were doubtful whether it was ice or land. At this time it bore E. $\frac{3}{4}$ S., distant thirteen leagues; our latitude was $53^{\circ} 50\frac{1}{2}'$, longitude $39^{\circ} 24' W.$; several penguins, small divers, a snow-peterel, and a vast number of blue peterels about the ship. We had but little wind all the morning; and at two P.M. it fell calm. It was now no longer doubted that it was land, and not ice, which we had in sight. It was, however, in a manner wholly covered with snow. We were further confirmed in our judgment of its being land, by finding soundings at one hundred and seventy-five fathoms, a muddy bottom. The land at this time bore E. by S., about twelve leagues distant. At six o'clock the calm was succeeded by a breeze at N.E., with which we stood to S.E. At first it blew a gentle gale, but afterwards increased so as to bring us under double-reefed topsails, and was attended with snow and sleet. We continued to stand to the S.E. till seven in the morning on the 15th, when the wind veering to the S.E. we tacked and stood to the N. A little before we tacked, we saw the land bearing E. by N. At noon the mercury in the thermometer was at $35\frac{1}{4}^{\circ}$. The wind blew in squalls, attended with snow and sleet, and we had a great sea to encounter. At a lee-lurch which the ship took, Mr. Wales observed her to lie down 42° . At half-past four P.M. we took in the topsails, got down top-gallant-yards, wore the ship, and stood to the S.W. under two courses. At midnight the storm abated, so that we could carry the topsails double reefed.

At four in the morning of the 16th we wore and stood to the E., with the wind at S.S.E., a moderate breeze and fair; at eight o'clock saw the land extending from E. by N. to N.E. by N.; loosed a reef out of each top-sail, got top-gallant yards across, and set the sails. At noon observed in latitude $54^{\circ} 25\frac{1}{2}'$; longitude $38^{\circ} 18' W.$ In this situation we had one hundred and ten fathoms water; and the land extended from N. $\frac{1}{4}$ W. to E., eight leagues distant. The northern extreme was the same that we first discovered, and it proved to be an island; which obtained the name of Willis's Island, after the person who first saw it. At this time we had a great swell from the S., an indication that no land was near us in that direction; nevertheless, the vast quantity of snow on that in sight induced us to think it was extensive, and I chose to begin with exploring the northern coast. With this view we bore up for Willis's Island, all sails set, having a fine gale at S.S.W. As we advanced to the N., we perceived another isle lying east of Willis's, and between it and the main. Seeing there was a clear passage between the two isles, we steered for it, and at five o'clock, being in the middle of it, we found it about two miles broad.

Willis's Isle is a high rock of no great extent, near to which are some rocky islets. It is situated in the latitude of $54^{\circ} S.$, longitude $38^{\circ} 23' W.$ The other isle, which obtained the name of Bird Isle, on account of the vast number that were upon it, is not so high, but of greater extent, and is close to the N.E. point of the main land, which I called Cape North.

The S.E. coast of this land, as far as we saw it, lies in the direction of S. $50^{\circ} E.$, and N. $50^{\circ} W.$ It seemed to form several bays or inlets; and we observed huge masses of snow, or ice, in the bottoms of them, especially in one which lies ten miles to the S.S.E. of Bird Isle. After getting through the passage, we found the north coast trended E. by N. for about nine miles; and then E. and E. southerly to Cape Buller, which is eleven miles more. We ranged the coast, at one league distance, till near ten o'clock, when we brought to for the night, and, on sounding, found fifty fathoms, a muddy bottom.

ought to for

At two o'clock in the morning of the 17th we made sail in for the land, with a fine breeze at S.W.; at four, Willis's Isle bore W. by S. ¹⁰ at thirty-two miles; Cape Buller, to the west of which lie some rocky islets, bore S. w. ¹⁰; and the most advanced point of land to the E., S. 63° E. We now steered along the shore, at the distance of four or five miles, till seven o'clock, when, seeing the appearance of an inlet, we hauled in for it. As soon as we drew near the shore, having hoisted out a boat, I embarked in it, accompanied by Mr. Forster and his party, with a view of reconnoitring the bay before we ventured in with the ship. When we put off from her, which was about four miles from the shore, we had forty fathoms water. I continued to sound as I went farther in, but found no bottom with a line of thirty-four fathoms, which was the length of that I had in the boat, and which also proved too short to sound the bay, so far as I went up it. I observed it to lie in S.W. by S. about two leagues, about two miles broad, well sheltered from all winds; and I judged there might be good anchorage before some sandy beaches which are on each side, and likewise near a low flat isle, towards the head of the bay. As I had come to a resolution not to bring the ship in, I did not think it worth my while to go and examine these places; for it did not seem probable that any one would ever be benefited by the discovery. I landed in three different places, displayed our colours, and took possession of the country in his Majesty's name, under a discharge of small arms. I judged that the tide rises about four or five feet, and that it is high water on the full and change days about eleven o'clock.

The head of the bay, as well as two places on each side, was terminated by perpendicular ice-cliffs of considerable height. Pieces were continually breaking off, and floating out to sea; and a great fall happened while we were in the bay, which made a noise like cannon. The inner parts of the country were not less savage and horrible. The wild rocks raised their lofty summits till they were lost in the clouds, and the valleys lay covered with everlasting snow. Not a tree was to be seen, nor a shrub even big enough to make a toothpick. The only vegetation we met with was a coarse strong-bladed grass, growing in tufts, wild burnet, and a plant like moss, which sprung from the rocks.

Seals, or sea-bears, were pretty numerous. They were smaller than those at Staten Land; perhaps the most of those we saw were females; for the shore swarmed with young cubs. We saw none of that sort which we call lions; but there were some of those which the writer of Lord Anson's Voyage describes under that name; at least they appeared to us to be of the same sort; and are, in my opinion, very improperly called lions; for I could not see any grounds for the comparison. Here were several flocks of penguins, the largest I ever saw; some which we brought on board weighed from twenty-nine to thirty-eight pounds. It appears by Bougainville's account of the animals of Falkland Islands, that this penguin is there; and I think it is very well described by him under the name of First Class of Penguins*. The oceanic birds were albatrosses, common gulls, and that sort which I call Port Egmont hens, terns, shags, divers, the new white bird, and a small bird like those of the Cape of Good Hope, called yellow birds; which, having shot two, we found most delicious food. All the land birds we saw consisted of a few small larks; nor did we meet with any quadrupeds. Mr. Forster, indeed, observed some dung, which he judged to come from a fox, or some such animal. The lands, or rather rocks, bordering on the sea-coast, were not covered with snow like the inland parts; but all the vegetation we could see on the clear places was the grass above-mentioned. The rocks seemed to contain iron. Having made the above observations, we set out for the ship, and got on board a little after twelve o'clock, with a quantity of seals and penguins, an acceptable present to the crew.

It must not, however, be understood that we were in want of provisions: we had yet plenty of every kind; and since we had been on this coast, I had ordered, in addition to the common allowance, wheat to be boiled every morning for breakfast; but any kind of fresh meat was preferred by most on board to salt. For my own part, I was now, for the first time, heartily tired of salt meat of every kind; and though the flesh of the penguins could scarcely vie with bullock's liver, its being fresh was sufficient to make it go down. I called the bay we had been in, Possession Bay. It is situated in the latitude of 54° 5' S., longitude 37° 18' W., and eleven leagues to the east of Cape North. A few miles to the

* See Bougainville, p. 64.

west of Possession Bay, between it and Cape Buller, lies the Bay of Isles; so named on account of several small isles lying in and before it.

As soon as the boat was hoisted in, we made sail along the coast to the E. with a fine breeze at W.S.W. From Cape Buller, the direction of the coast is S. $72^{\circ} 30'$ E., for the space of eleven or twelve leagues, to a projecting point, which obtained the name of Cape Saunders. Beyond this Cape, is a pretty large bay, which I named Cumberland Bay. In several parts in the bottom of it, as also in some others of less extent, lying between Cape Saunders and Possession Bay, were vast tracts of frozen snow, or ice not yet broken loose. At eight o'clock, being just past Cumberland Bay, and falling little wind, we hauled off the coast, from which we were distant about four miles, and found one hundred and ten fathoms water. We had variable light airs and calms till six o'clock the next morning, when the wind fixed at N. and blew a gentle breeze; but it lasted no longer than ten o'clock, when it fell almost to a calm. At noon, observed in latitude $54^{\circ} 30'$ S., being then about two or three leagues from the coast, which extended from N. 59° W. to S. 13° W. The land in this last direction was an isle, which seemed to be the extremity of the coast to the east. The nearest land to us being a projecting point which terminated in a round hillock, was, on account of the day, named Cape Charlotte. On the west side of Cape Charlotte lies a bay, which obtained the name of Royal Bay, and the west point of it was named Cape George. It is the east point of Cumberland Bay, and lies in the direction of S.E. by E. from Cape Saunders, distant seven leagues. Cape George and Cape Charlotte lie in the direction of S. 37° E., and N. 37° W., distant six leagues from each other. The isle above mentioned, which was called Cooper's Isle, after my first-lieutenant, lies in the direction of S. by E., distant eight leagues from Cape Charlotte. The coast between them forms a large bay, to which I gave the name of Sandwich. The wind being variable all the afternoon, we advanced but little; in the night it fixed at S. and S.S.W., and blew a gentle gale attended with showers of snow.

The 19th was wholly spent in plying, the wind continuing at S. and S.W., clear pleasant weather, but cold. At sunrise, a new land was seen bearing S E. $\frac{1}{2}$ E. It first appeared in a single hill, like a sugar-loaf; some time after, other detached pieces appeared above the horizon near the hill. At noon observed in the latitude $54^{\circ} 42' 30''$ S., Cape Charlotte bearing N. 38° W., distant four leagues; and Cooper's Isle S. 31° W. In this situation, a lurking rock, which lies off Sandwich Bay, five miles from the land, bore W. $\frac{1}{2}$ N., distant one mile, and near this rock were several breakers. In the afternoon we had a prospect of a ridge of mountains behind Sandwich Bay, whose lofty and icy summits were elevated high above the clouds. The wind continued at S.S.W. till six o'clock, when it fell to a calm. At this time Cape Charlotte bore N. 31° W., and Cooper's Island W.S.W. In this situation we found the variation, by the azimuths, to be $11^{\circ} 39'$, and by the amplitude, $11^{\circ} 12'$ E. At ten o'clock, a light breeze springing up at N., we steered to the S. till twelve, and then brought to for the night.

At two o'clock in the morning of the 20th, we made sail to S.W., round Cooper's Island. It is a rock of considerable height, about five miles in circuit, and one mile from the main. At this isle the main coast takes a S.W. direction for the space of four or five leagues to a point, which I called Cape Disappointment. Off that, are three small isles, the southernmost of which is green, low, and flat, and lies one league from the Cape. As we advanced to S.W., land opened off this point, in the direction of N. 60° West, and nine leagues beyond it. It proved an island quite detached from the main, and obtained the name of Pickersgill Island, after my third officer. Soon after, a point of the main, beyond this island, came in sight, in the direction of N. 55° W.; which exactly united the coast at the very point we had seen, and taken the bearing of, the day we first came in with it, and proved to a demonstration that this land, which we had taken for part of a great continent, was no more than an island of seventy leagues in circuit.

Who would have thought that an island of no greater extent than this, situated between the latitude of 54° and 55° , should, in the very height of summer, be in a manner wholly covered many fathoms deep with frozen snow, but more especially the S.W. coast? The very sides and craggy summits of the lofty mountains were cased with snow and ice; but

the quantity which lay in the valleys is incredible; and at the bottom of the bays, the coast was terminated by a wall of ice of considerable height. It can hardly be doubted that a great deal of ice is formed here in the winter, which in the spring is broken off and dispersed over the sea; but this island cannot produce the ten thousandth part of what we saw; so that either there must be more land, or the ice is formed without it. These reflections led me to think that the land we had seen the preceding day might belong to an extensive tract; and I still had hopes of discovering a continent. I must confess the disappointment I now met with did not affect me much, for to judge of the bulk by the sample, it would not be worth the discovery.

I called this land the Isle of Georgia, in honour of his Majesty. It is situated between the latitude of $53^{\circ} 57'$ and $54^{\circ} 57'$ S.; and between $38^{\circ} 13'$ and $35^{\circ} 34'$ W. longitude. It extends S.E. by E., and N.W. by W. and is thirty-one leagues long in that direction; and its greatest breadth is about ten leagues. It seems to abound with bays and harbours, the N.E. coast especially; but the vast quantity of ice must render them inaccessible the greatest part of the year; or, at least, it must be dangerous lying in them, on account of the breaking up of the ice-cliffs.

It is remarkable that we did not see a river or stream of fresh water, on the whole coast. I think it highly probable that there are no perennial springs in the country; and that the interior parts, as being much elevated, never enjoy heat enough to melt the snow in such quantities as to produce a river or stream of water. The coast alone receives warmth sufficient to melt the snow, and this only on the N.E. side; for the other, besides being exposed to the cold south winds, is in a great degree deprived of the sun's rays by the uncommon height of the mountains. It was from a persuasion that the sea-coast of a land situated in the latitude of 54° could not, in the very height of summer, be wholly covered with snow, that I supposed Bouvet's discovery to be large islands of ice. But after I had seen this land, I no longer hesitated about the existence of Cape Circumcision; nor did I doubt that I should find more land than I should have time to explore. With these ideas I quitted this coast, and directed my course to the E.S.E. for the land we had seen the preceding day.

The wind was very variable till noon, when it fixed at N.N.E., and blew a gentle gale; but it increased in such a manner, that, before three o'clock, we were reduced to our two courses, and obliged to strike top-gallant yards. We were very fortunate in getting clear of the land before this gale overtook us, it being hard to say what might have been the consequence had it come on while we were on the north coast. This storm was of short duration, for at eight o'clock it began to abate, and at midnight it was little wind. We then took the opportunity to sound, but found no bottom with a line of a hundred and eighty fathoms. Next day the storm was succeeded by a thick fog, attended with rain; the wind veered to N.W., and at five in the morning it fell calm, which continued till eight, and then we got a breeze southerly, with which we stood to the east till three in the afternoon. The weather then coming somewhat clear, we made sail and steered north in search of the land; but at half-past six we were again involved in a thick mist, which made it necessary to haul the wind, and spend the night in making short boards.

We had variable light airs, next to a calm, and thick foggy weather, till half-past seven o'clock in the evening of the 22nd, when we got a fine breeze at N., and the weather was so clear that we could see two or three leagues round us. We seized the opportunity, and steered to west; judging we were to the east of the land. After running ten miles to the west, the weather became again foggy, and we hauled the wind, and spent the night under top-sails. Next morning, at six o'clock, the fog clearing away, so that we could see three or four miles, I took the opportunity to steer again to the W., with the wind at E., a fresh breeze; but two hours after, a thick fog once more obliged us to haul the wind to the south. At eleven o'clock, a short interval of clear weather gave us a view of three or four rocky islets, extending from S.E. to E.N.E., two or three miles distant; but we did not see the Sugar-loaf Peak before mentioned. Indeed, two or three miles was the extent of our horizon. We were well assured that this was the land we had seen before, which we had now been quite round: and therefore it could be no more than a few detached rocks.

receptacles for birds, of which we now saw vast numbers, especially shags, who gave us no notice of the vicinity of land before we saw it. These rocks lie in the latitude of 55° S. and S. 75° E., distant twelve leagues from Cooper's Isle.

The interval of clear weather was of very short duration, before we had as thick a fog as ever, attended with rain; on which we tacked in sixty fathoms water, and stood to the north. Thus we spent our time involved in a continual thick mist; and for aught we knew, surrounded by dangerous rocks. The shags and soundings were our best pilots; for after we had stood a few miles to the north, we got out of soundings, and saw no more shags. The succeeding day and night were spent in making short boards; and at eight o'clock on the 24th, judging ourselves not far from the rocks by some straggling shags which came about us, we sounded in sixty fathoms water, the bottom stones and broken shells. Soon after we saw the rocks bearing S.S.W. $\frac{1}{2}$ W., four miles distant, but still we did not see the Peak. It was, no doubt, beyond our horizon, which was limited to a short distance; and, indeed, we had but a transient sight of the other rocks, before they were again lost in the fog. With a light air of wind at N., and a great swell from N.E., we were able to clear the rocks to the W.; and at four in the p.m., judging ourselves to be three or four leagues E. and W. of them, I steered S., being quite tired with cruising about them in a thick fog; nor was it worth my while to spend any more time in waiting for clear weather, only for the sake of having a good sight of a few straggling rocks. At seven o'clock, we had at intervals a clear sky to the W., which gave us a sight of the mountains of the Isle of Georgia, bearing W.N.W., about eight leagues distant. At eight o'clock we steered S.E. by S. and at ten S.E. by E., with a fresh breeze at N., attended with a very thick fog; but we were, in some measure, acquainted with the sea over which we were running. The rocks above mentioned obtained the name of Clerke's Rocks, after my second officer, he being the first who saw them.

CHAPTER VI.—PROCEEDINGS AFTER LEAVING THE ISLE OF GEORGIA, AND AN ACCOUNT OF THE DISCOVERY OF SANDWICH LAND; WITH SOME REASONS FOR THERE BEING LAND ABOUT THE SOUTH POLE.

ON the 25th we steered E.S.E., with a fresh gale at N.N.E., attended with foggy weather, till towards the evening, when the sky becoming clear, we found the variation to be 9° $26'$ E., being at this time in the latitude of 56° $16'$ S., longitude 32° $9'$ W. Having continued to steer E.S.E., with a fine gale at N.N.W., till daylight next morning, on seeing no land to the E., I gave orders to steer S., being at this time in the latitude of 56° $33'$ S., longitude 31° $10'$ W. The weather continued clear, and gave us an opportunity to observe several distances of the sun and moon for the correcting our longitude, which at noon was 31° $4'$ W., the latitude observed 57° $38'$ S. We continued to steer to the S. till the 27th at noon, at which time we were in the latitude of 59° $46'$ S., and had so thick a fog that we could not see a ship's-length. It being no longer safe to sail before the wind, as we were to expect soon to fall in with ice, I therefore hauled to the E., having a gentle breeze at N.N.E. Soon after, the fog clearing away, we resumed our course to the S. till four o'clock, when it returned again as thick as ever, and made it necessary for us to haul upon a wind.

I now reckoned we were in latitude 60° S., and farther I did not intend to go, unless I observed some certain signs of soon meeting with land; for it would not have been prudent in me to have spent my time in penetrating to the south, when it was at least as probable that a large tract of land might be found near Cape Circumcision. Besides, I was tired of these high southern latitudes, where nothing was to be found but ice and thick fogs. We had now a long hollow swell from the W., a strong indication that there was no land in that direction; so that I think I may venture to assert that the extensive coast, laid down in Mr. Dalrymple's chart of the ocean between Africa and America, and the Gulf of Saint Sebastian, does not exist.

At seven o'clock in the evening, the fog receding from us a little, gave us a sight of an ice-

island, several penguins and some snow peterels; we sounded, but found no ground at one hundred and forty fathoms. The fog soon returning, we spent the night in making boards over that space which we had, in some degree, made ourselves acquainted with in the day. At eight in the morning of the 28th, we stood to the E., with a gentle gale at N.; the weather began to clear up, and we found the sea strewn with large and small ice; several penguins, snow peterels, and other birds were seen, and some whales. Soon after we had sunshine, but the air was cold; the mercury in the thermometer stood generally at thirty-five, but at noon it was at 37°; the latitude by observation was 60° 4' S., longitude 29° 23' W.

We continued to stand to the E. till half-past two o'clock p.m., when we fell in, all at once, with a vast number of large ice-islands, and a sea strewn with loose ice. The weather too was become thick and hazy, attended with drizzling rain and sleet, which made it the more dangerous to stand in among the ice. For this reason we tacked and stood back to the W., with the wind at N. The ice-islands, which at this time surrounded us, were nearly all of equal height, and showed a flat even surface; but they were of various extent, some being two or three miles in circuit. The loose ice was what had broken from these isles. Next morning, the wind falling and veering to S.W., we steered N.E., but this course was soon intercepted by numerous ice-islands; and, having but very little wind, we were obliged to steer such courses as carried us the clearest of them; so that we hardly made any advance, one way or other, during the whole day. Abundance of whales and penguins were about us all the time; and the weather fair, but dark and gloomy.

At midnight the wind began to freshen at N.N.E., with which we stood to N.W. till six in the morning of the 30th, when the wind veering to N.N.W., we tacked and stood to N.E., and soon after sailed through a good deal of loose ice, and passed two large islands. Except a short interval of clear weather about nine o'clock, it was continually foggy, with either sleet or snow. At noon we were, by our reckoning, in the latitude of 59° 30' S., longitude 29° 24' W. Continuing to stand to N.E., with a fresh breeze at N.N.W., at two o'clock, we passed one of the largest ice-islands we had seen in the voyage, and some time after passed two others, which were much smaller. Weather still foggy, with sleet; and the wind continued at N. by W., with which we stood to N.E. over a sea strewn with ice.

At half an hour past six in the morning, as we were standing N.N.E. with the wind at W., the fog very fortunately clearing away a little, we discovered land a-head, three or four miles distant. On this we hauled the wind to the N., but finding we could not weather the land on this tack, we soon after tacked in one hundred and seventy-five fathoms water, three miles from the shore, and about half a league from some breakers. The weather then cleared up a little more, and gave us a tolerably good sight of the land. That which we had fallen in with proved three rocky islets of considerable height. The outermost terminated in a lofty peak like a sugar-loaf, and obtained the name of Freezeland Peak, after the man who first discovered it. Latitude 59° S., longitude 27° W. Behind this peak, that is, to the east of it, appeared an elevated coast, whose lofty snow-clad summits were seen above the clouds. It extended from N. by E. to E.S.E. and I called it Cape Bristol, in honour of the noble family of Hervey. At the same time another elevated coast appeared in sight, bearing S.W. by S., and at noon it extended from S.E. to S.S.W., from four to eight leagues distant; at this time the observed latitude was 59° 13' 30' S., longitude 27° 45' W. I called this land Southern Thule, because it is the most southern land that has ever yet been discovered. It shows a surface of vast height, and is everywhere covered with snow. Some thought they saw land in the space between Thule and Cape Bristol. It is more than probable that these two lands are connected, and that this space is a deep bay, which I called Forster's Bay.

At one o'clock, finding that we could not weather Thule, we tacked and stood to the north, and at four, Freezeland Peak bore E., distant three or four leagues. Soon after it fell little wind, and we were left to the mercy of a great westerly swell, which set right upon the shore. We sounded, but a line of two hundred fathoms found no bottom. At eight o'clock, the weather, which had been very hazy, clearing up, we saw Cape Bristol bearing E.S.E., and terminating in a point to the north, beyond which we could see no land. This

discovery relieved us from the fear of being carried by the swell on the most horrible coast in the world, and we continued to stand to the north all night, with a light breeze at W.

On the 1st of February, at four o'clock in the morning, we got sight of a new coast, which at six o'clock bore N. 60° E. It proved a high promontory, which I named Cape Montagu, situated in latitude 58° 27' S., longitude 26° 44' W., and seven or eight leagues to the north of Cape Bristol. We saw land from space to space between them, which made me conclude that the whole was connected. I was sorry I could not determine this with greater certainty; but prudence would not permit me to venture near a coast, subject to thick fogs, on which there was no anchorage; where every port was blocked or filled up with ice; and the whole country, from the summits of the mountains, down to the very brink of the cliffs which terminate the coast, covered, many fathoms thick, with everlasting snow. The cliffs alone was all which was to be seen like land. Several large islands lay upon the coast; one of which attracted my notice. It had a flat surface, was of considerable extent both in height and circuit, and had perpendicular sides, on which the waves of the sea had made no impression; by which I judged that it had not been long from land, and that it might have lately come out of some bay on the coast, where it had been formed.

At noon we were east and west of the northern part of Cape Montagu, distant about five leagues, and Foulzland Peak bore S. 16° E., distant twelve leagues; latitude observed 58° 25' S. In the morning the variation was 10° 11' E. At two in the afternoon, as we were standing to the north, with a light breeze at S.W. we saw land bearing N. 25° E., distant fourteen leagues. Cape Montagu bore at this time, S. 66° E.; at eight it bore S. 40° E.; Cape Bristol, S. by E.; the new land extending from N. 40° to 52° E.; and we thought we saw land still more to the E., and beyond it. Continuing to steer to the north all night, at six o'clock the next morning a new land was seen, bearing N. 12° E., about ten leagues distant. It appeared in two hummocks just peeping above the horizon; but we soon after lost sight of them; and having got the wind at N.N.E., a fresh breeze, we stood for the northernmost land we had seen the day before, which at this time bore E.S.E. We fetched in with it by ten o'clock, but could not weather it, and were obliged to tack three miles from the coast, which extended from E. by S. to S.E., and had much the appearance of being an island of about eight or ten leagues' circuit. It shows a surface of considerable height, whose summit was lost in the clouds, and, like all the neighbouring lands, covered with a sheet of snow and ice, except on a projecting point on the north side, and two hills seen over this point, which probably might be two islands. These only were clear of snow, and seemed covered with a green turf. Some large ice-islands lay to the N.E., and some others to the S. We stood off till noon, and then tacked for the land again, in order to see whether it was an island or no. The weather was now become very hazy, which soon turning to a thick fog, put a stop to discovery, and made it unsafe to stand for the shore; so that after having run the same distance in, as we had run off, we tacked and stood to N.W. for the land we had seen in the morning, which was yet at a considerable distance. Thus we were obliged to leave the other, under the supposition of its being an island, which I named Saunders, after my honourable friend Sir Charles. It is situated in the latitude of 57° 49' S., longitude 26° 44' W.; and N., distant thirteen leagues from Cape Montagu.

At six o'clock in the evening, the wind shifting to the W., we tacked, and stood to the N., and at eight, the fog clearing away, gave us a sight of Saunders's Isle, extending from S.E. by S. to E.S.E. We were still in doubt if it were an island; for, at this time, land was seen bearing E. by S., which might, or might not, be connected with it; it might also be the same that we had seen the preceding evening. But, be this as it may, it was now necessary to take a view of the land to the north, before we proceeded any farther to the east. With this intention we stood to the north, having a light breeze at W. by S., which, at two o'clock in the morning of the 3rd, was succeeded by a calm that continued till eight, when we got the wind at E. by S., attended with hazy weather. At this time we saw the land we were looking for, and which proved to be two isles. The day on which they were discovered, was the occasion of calling them Candlemas Isles; latitude 57° 11' S., longitude 27° 6' W. They are of no great extent, but of considerable height, and were covered with snow. A small rock was seen between them, and perhaps there may be more; for the

weather was so hazy that we soon lost sight of the islands, and did not see them again till noon, at which time they bore W., distant three or four leagues.

As the wind kept veering to the S., we were obliged to stand to the N.E., in which route we met with several large ice-islands, loose ice, and many penguins; and, at midnight, came at once into water uncommonly white, which alarmed the officer of the watch so much that he tacked the ship instantly. Some thought 't was a float of ice, others that it was shallow water; but as it proved neither, probably it was a shoal of fish. We stood to the south till two o'clock next morning, when we resumed our course to the E., with a faint breeze at S.S.E., which having ended in a calm, at six, I took the opportunity of putting a boat in the water to try if there were any current; and the trial proved there was none. Some whales were playing about us, and abundance of penguins; a few of the latter were shot, and they proved to be of the same sort that we had seen among the ice before, and different both from those on Staten Land, and from those at the Isle of Georgia. It is remarkable, that we had not seen a seal since we left that coast. At noon we were in the latitude of $56^{\circ} 44'$ S., longitude $25^{\circ} 33'$ W. At this time we got a breeze at E., with which we stood to the S., with a view of gaining the coast we had left; but at eight o'clock the wind shifted to the S., and made it necessary to tack and stand to the E.; in which course we met with several ice-islands and some loose ice, the weather continuing hazy with snow and rain.

No penguins were seen on the 5th, which made me conjecture that we were leaving the land behind us, and that we had already seen its northern extremity. At noon we were in the latitude of $57^{\circ} 8'$ S., longitude $23^{\circ} 34'$ W., which was 3° of longitude to the east of Saunders's Isle. In the afternoon the wind shifted to the W., this enabled us to stretch to the S., and to get into the latitude of the land, that, if it took an east direction, we might again fall in with it. We continued to steer to the S. and S.E. till next day at noon, at which time we were in the latitude of $58^{\circ} 15'$ S., longitude $21^{\circ} 34'$ W., and seeing neither land nor signs of any, I concluded that what we had seen, which I named Sandwich Land, was either a group of islands, or else a point of the continent; for I firmly believe that there is a tract of land near the pole which is the source of most of the ice that is spread over this vast Southern Ocean. I also think it probable that it extends farthest to the north opposite the southern Atlantic and Indian Oceans, because ice was always found by us farther to the north in these oceans than anywhere else, which I judge could not be, if there were not land to the S.; I mean a land of considerable extent. For if we suppose that no such land exists, and that ice may be formed without it, it will follow of course that the cold ought to be everywhere nearly equal round the pole, as far as 70° or 60° of latitude, or so far as to be beyond the influence of any of the known continents; consequently we ought to see ice everywhere under the same parallel, or near it; and yet the contrary has been found. Very few ships have met with ice going round Cape Horn; and we saw but little below the sixtieth degree of latitude, in the Southern Pacific Ocean. Whereas in this ocean, between the meridian of 40° W. and 50° or 60° E., we found ice as far N. as 51° . Bouvet met with some in 48° ; and others have seen it in a much lower latitude. It is true, however, that the greatest part of this southern continent (supposing there is one) must lie within the polar circle, where the sea is so pestered with ice that the land is thereby inaccessible*. The risk one runs in exploring a coast, in these unknown and icy seas, is so very great, that I can be bold enough to say that no man will ever venture farther than I have done; and that the lands which may lie to the south will never be explored. Thick fogs, snow-storms, intense cold, and every other thing that can render navigation dangerous, must be encountered; and these difficulties are greatly heightened by the inexpressibly

* The reader will find a short sketch of the progress of antarctic discovery, since the time of Cook, in the Appendix. This, as far as it has yet proceeded, for we know not yet what may be the ultimate result of the expedition now at sea under the command of Capt. J. C. Ross, is very far from confirming Capt. Cook's opinion that the absence of ice indicated an absence of land. "Very few ships," he remarks, "have met with ice going

round Cape Horn," and yet the presence of the group known as the South Shetlands, discovered by Captain Smith, would, if the theory were true, have occasioned the presence of fields of ice. This question will be necessarily discussed more at large in the Appendix, and to pursue it further in this place would be superfluous.—Ed.

horrid aspect of the country; a country doomed by nature never once to feel the warmth of the sun's rays, but to lie buried in everlasting snow and ice. The ports which may be on the coast, are, in a manner, wholly filled up with frozen snow of vast thickness; but it any should be so far open as to invite a ship into it, she would run a risk of being fixed there for ever, or of coming out in an ice-island. The islands and floats on the coast, the great falls from the ice-cliffs in the port, or a heavy snow-storm attended with a sharp frost, would be equally fatal.

After such an explanation as this, the reader must not expect to find me much farther to the south. It was, however, not for want of inclination, but for other reasons. It would have been rashness in me to have risked all that had been done during the voyage, in discovering and exploring a coast, which, when discovered and explored, would have answered no end whatever, or have been of the least use, either to navigation or geography, or, indeed, to any other science. Bouvet's discovery was yet before us, the existence of which was to be cleared up; and besides all this, we were not now in a condition to undertake great things; nor indeed was there time, had we been ever so well provided. These reasons induced me to alter the course to E., with a very strong gale at N., attended with an exceedingly heavy fall of snow. The quantity which lodged in our sails was so great, that we were frequently obliged to throw the ship up in the wind to shake it out of them, otherwise neither they nor the ship could have supported the weight. In the evening it ceased to snow; the weather cleared up; the wind backed to the W.; and we spent the night in making two short boards, under close-reefed topsails and foresail.

At daybreak on the 7th, we resumed our course to the E., with a very fresh gale at S.W. by W., attended by a high sea from the same direction. In the afternoon, being in the latitude of $58^{\circ} 24' S.$, longitude $16^{\circ} 19' W.$, the variation was $1^{\circ} 52' E.$ Only three ice-islands seen this day. At eight o'clock, shortened sail, and hauled the wind to the S.E. for the night, in which we had several showers of snow and sleet.

On the 8th, at daylight, we resumed our east course with a gentle breeze and fair weather. After sunrise, being then in the latitude of $58^{\circ} 30' S.$, longitude $15^{\circ} 14' W.$, the variation, by the mean results of two compasses, was $2^{\circ} 43' E.$ These observations were more to be depended on than those made the night before, there being much less sea now than then. In the afternoon we passed three ice-islands. This night was spent as the preceding. At six next morning, being in the latitude of $58^{\circ} 27' S.$, longitude $13^{\circ} 4' W.$, the variation was $26' E.$, and in the afternoon, being in the same latitude, and about a quarter of a degree more to the E., it was $2' W.$ Therefore this last situation must be in or near the line in which the compass has no variation. We had a calm the most part of the day. The weather fair and clear, excepting now and then a snow shower. The mercury in the thermometer at noon rose to 40; whereas for several days before, it had been no higher than 36 or 38. We had several ice-islands in sight, but no one thing that could induce us to think that any land was in our neighbourhood. At eight in the evening, a breeze sprung up at S.E., with which we stood to N.E.

During the night the wind freshened and veered to south, which enabled us to steer east. The wind was attended with showers of sleet and snow till daylight, when the weather became fair, but piercing cold, so that the water on deck was frozen, and at noon the mercury in the thermometer was no higher than $34\frac{1}{2}$. At six o'clock in the morning, the variation was $23'$ west, being then in the latitude of $58^{\circ} 15' S.$, longitude $11^{\circ} 41' W.$, and at six in the evening, being in the same latitude, and in the longitude of $9^{\circ} 24' W.$, it was $1^{\circ} 51' W.$ In the evening the wind abated; and during the night it was variable between south and west. Ice-islands continually in sight.

On the 11th, wind westerly, light airs attended with heavy showers of snow in the morning; but, as the day advanced, the weather became fair, clear, and serene. Still continuing to steer east, at noon we observed in latitude $58^{\circ} 11'$, longitude at the same time $7^{\circ} 55'$ west. Thermometer $34\frac{1}{2}$. In the afternoon we had two hours' calm, after which we had faint breezes between the N.E. and S.E. At six o'clock in the morning of the 12th, being in the latitude of $58^{\circ} 23' S.$, longitude $6^{\circ} 54' W.$, the variation was $3^{\circ} 23' W.$ We had variable light airs next to a calm all this day, and the weather was fair and clear till

towards the evening, when it became cloudy, with snow showers, and the air very cold. Ice-islands continually in sight; most of them small and breaking to pieces.

In the afternoon of the 13th the wind increased, the sky became clouded, and soon after we had a very heavy fall of snow, which continued till eight or nine o'clock in the evening, when the wind abating and veering to the S.E., the sky cleared up, and we had a fair night, attended with so sharp a frost, that the water in all our vessels on deck was next morning covered with a sheet of ice. The mercury in the thermometer was as low as 29°, which is 3° below freezing, or rather 4; for we generally found the water freeze when the mercury stood at 33°. Towards noon on the 14th, the wind veering to the south, increased to a very strong gale, and blew in heavy squalls, attended with snow. At intervals, between the squalls, the weather was fair and clear, but exceedingly cold. We continued to steer east, inclining a little to the north, and in the afternoon crossed the first meridian, or that of Greenwich, in the latitude of 57° 50' S. At eight in the evening we close-reefed the topsails, took in the mainsail, and steered east, with a very hard gale at S.S.W., with a high sea from the same direction.

At daybreak on the 15th we set the mainsail, loosed a reef out of each topsail, and with a very strong gale at S.W. and fair weather, steered E.N.E. till noon, at which time we were in the latitude of 56° 37' S., longitude 4° 11' east, when we pointed to the N.E., in order to get into the latitude of Cape Circumcision. Some large ice-islands were in sight, and the air was nearly as cold as on the preceding day. At eight o'clock in the evening, shortened sail, and at eleven hauled the wind to the N.W., not daring to stand on in the night, which was foggy, with snow-showers, and a smart frost. At daybreak on the 16th we bore away N.E. with a light breeze at west, which, at noon, was succeeded by a calm and fair weather. Our latitude at this time was 55° 26' S., longitude 5° 52' east, in which situation we had a great swell from the southward, but no ice in sight. At one o'clock in the p.m., a breeze springing up at E.N.E., we stood to S.E. till six, then tacked and stood to the north, under double-reefed topsails and courses, having a very fresh gale, attended with snow and sleet, which fixed to the masts and rigging as it fell, and coated the whole with ice. On the 17th the wind continued veering by little and little to the south till midnight, when it fixed at S.W. Being at this time in the latitude of 54° 20' S., longitude 6° 33' east, I steered east, having a prodigious high sea from the south, which assured us no land was near in that direction.

In the morning of the 18th it ceased to snow; the weather became fair and clear; and we found the variation to be 13° 44' west. At noon we were in the latitude 54° 25', longitude 8° 46' east. I thought this a good latitude to keep in, to look for Cape Circumcision; because, if the land had ever so little extent in the direction of north and south, we could not miss seeing it, as the northern point is said to lie in 54°. We had yet a great swell from the south, so that I was now well assured it could only be an island; and it was of no consequence which side we fell in with. In the evening Mr. Wales made several observations of the moon, and stars Regulus and Spica; the mean results, at four o'clock, when the observations were made, for finding the time by the watch, gave 9° 15' 20" east longitude. The watch at the same time gave 9° 36' 45". Soon after the variation was found to be 13° 10' west. It is nearly in this situation that Mr. Bouvet had 1° east. I cannot suppose that the variation has altered so much since that time; but rather think he had made some mistake in his observations. That there could be none in ours was certain, from the uniformity for some time past. Besides, we found 12° 8' west, variation, nearly under this meridian, in January, 1773. During the night the wind veered round by the N.W. to N.N.E., and blew a fresh gale.

At eight in the morning of the 19th, we saw the appearance of land in the direction of E. by S., or that of our course; but it proved a mere fog-bank, and soon after dispersed. We continued to steer E. by S. and S.E. till seven o'clock in the evening, when, being in the latitude of 54° 42' S., longitude 13° 3' E., and the wind having veered to N.E., we tacked and stood to N.W. under close-reefed topsails and courses; having a very strong gale, attended with snow-showers. At four o'clock next morning, being in the latitude of 54° 30' S., longitude 12° 33' E., we tacked and stretched to N.E. with a fresh gale at S.W., attended with snow-showers and sleet. At noon, being in the latitude of 54° 8' S. longitude

12° 59' E., with a fresh gale at W. by N., and tolerably clear weather, we steered E. till ten o'clock in the evening, when we brought-to, lest we might pass any land in the night, of which we, however, had not the least signs. At daybreak, having made sail, we bore away east, and at noon observed in latitude 54° 16' S., longitude 16° 13' E., which is 5° to the east of the longitude in which Cape Circumcision is said to lie; so that we began to think there was no such land in existence. I, however, continued to steer east, inclining a little to the south, till four o'clock in the afternoon of the next day, when we were in latitude of 54° 24' S., longitude 19° 18' E.

We had now run down thirteen degrees of longitude, in the very latitude assigned for Bouvet's Land; I was therefore well assured that what he had seen could be nothing but an island of ice; for, if it had been land, it is hardly possible we could have missed it, though it were ever so small. Besides, from the time of leaving the southern lands, we had not met with the least signs of any other. But even suppose we had, it would have been no proof of the existence of Cape Circumcision; for I am well assured that neither seals, nor penguins, nor any of the oceanic birds, are indubitable signs of the vicinity of land. I will allow that they are found on the coasts of all these southern lands; but are they not also to be found in all parts of the southern ocean? There are, however, some oceanic or aquatic birds which point out the vicinity of land; especially shags, which seldom go out of sight of it; and gannets, boobies, and men-of-war birds, I believe, seldom go very far out to sea.

As we were now no more than two degrees of longitude from our route to the south, when we left the Cape of Good Hope, it was to no purpose to proceed any further to the east under this parallel, knowing that no land could be there. But an opportunity now offering of clearing up some doubts of our having seen land farther to the south, I steered S.E. to get into the situation in which it was supposed to lie. We continued this course till four o'clock the next morning, and then S.E. by E. and E.S.E. till eight in the evening, at which time we were in the latitude of 55° 25' S., longitude 23° 22' E., both deduced from observations made the same day; for, in the morning, the sky was clear at intervals, and afforded an opportunity to observe several distances of the sun and moon, which we had not been able to do for some time past, having had a constant succession of bad weather. Having now run over the place where the land was supposed to lie, without seeing the least signs of any, it was no longer to be doubted but that the ice islands had deceived us as well as Mr. Bouvet. The wind by this time having veered to the north, and increased to a perfect storm, attended as usual with snow and sleet, we handed the top-sails, and hauled up E.N.E. under the courses. During the night the wind abated, and veered to N.W., which enabled us to steer more to the north, having no business farther south.

CHAPTER VII.—HEADS OF WHAT HAS BEEN DONE IN THE VOYAGE; WITH SOME CONJECTURES CONCERNING THE FORMATION OF ICE ISLANDS; AND AN ACCOUNT OF OUR PROCEEDINGS TILL OUR ARRIVAL AT THE CAPE OF GOOD HOPE.

I HAD now made the circuit of the Southern Ocean in a high latitude, and traversed it in such a manner as to leave not the least room for the possibility of there being a continent, unless near the pole, and out of the reach of navigation. By twice visiting the tropical sea, I had not only settled the situation of some old discoveries, but made there many new ones, and left, I conceive, very little more to be done even in that part. Thus I flatter myself that the intention of the voyage has, in every respect, been fully answered; the southern hemisphere sufficiently explored; and a final end put to the searching after a southern continent, which has, at times, engrossed the attention of some of the maritime powers for near two centuries past, and been a favourite theory amongst the geographers of all ages. That there may be a continent, or large tract of land, near the pole, I will not deny; on the contrary, I am of opinion there is; and it is probable that we have seen a part of it. The excessive cold, the many islands and vast floats of ice, all tend to prove that there must be land to the south; and for my persuasion that this southern land must lie, or extend, farthest to the north, opposite to the Southern Atlantic and Indian Oceans, I have already

assigned some reasons; to which I may add the greater degree of cold experienced by us in these seas, than in the Southern Pacific Ocean under the same parallels of latitude.

In this last ocean, the mercury in the thermometer seldom fell so low as the freezing-point, till we were in 60° and upwards; whereas in the others it fell as low in the latitude of 54°. This was certainly owing to there being a greater quantity of ice, and to its extending farther to the north, in these two seas than in the South Pacific; and if ice be first formed at, or near land, of which I have no doubt, it will follow that the land also extends farther north.

The formation or coagulation of ice islands has not, to my knowledge, been thoroughly investigated. Some have supposed them to be formed by the freezing of the water at the mouths of large rivers, or great cataracts, where they accumulate till they are broken off by their own weight. My observations will not allow me to acquiesce in this opinion; because we never found any of the ice which we took up incorporated with earth, or any of its produce, as I think it must have been, had it been coagulated in land waters. It is a doubt with me, whether there be any rivers in these countries. It is certain, that we saw not a river, or stream of water, on all the coast of Georgia, nor on any of the southern lands. Nor did we ever see a stream of water run from any of the ice islands. How are we then to suppose that there are large rivers? The valleys are covered, many fathoms deep, with everlasting snow; and, at the sea, they terminate in icy cliffs of vast height. It is here where the ice islands are formed; not from streams of water but from consolidated snow and sleet, which is almost continually falling or drifting down from the mountains, especially in the winter, when the frost must be intense. During that season, the ice-cliffs must so accumulate as to fill up all the bays, be they ever so large. This is a fact which cannot be doubted, as we have seen it so in summer. These cliffs accumulate by continual falls of snow, and what drifts from the mountains, till they are no longer able to support their own weight; and then large pieces break off, which we call ice-islands. Such as have a flat, even surface, must be of the ice formed in the bays, and before the flat valleys; the others, which have a tapering, unequal surface, must be formed on, or under, the side of a coast composed of pointed rocks and precipices, or some such uneven surface. For we cannot suppose that snow alone, as it falls, can form, on a plain surface, such as the sea, such a variety of high peaks and hills as we saw on many of the ice-isles. It is certainly more reasonable to believe that they are formed on a coast whose surface is something similar to theirs. I have observed that all the ice-islands of any extent, and before they begin to break to pieces, are terminated by perpendicular cliffs of clear ice or frozen snow, always on one or more sides, but most generally all round. Many, and those of the largest size, which had a hilly and spiral surface, showed a perpendicular cliff or side from the summit of the highest peak down to its base. This to me was a convincing proof, that these, as well as the flat isles, must have broken off from substances like themselves, that is, from some large tract of ice*.

When I consider the vast quantity of ice we saw, and the vicinity of the places to the pole where it is formed, and where the degrees of longitude are very small, I am led to believe that these ice-cliffs extend a good way into the sea, in some parts, especially in such as are sheltered from the violence of the winds. It may even be doubted if ever the wind is violent in the very high latitudes. And that the sea will freeze over, or the snow that falls upon it, which amounts to the same thing, we have instances in the northern hemi-

* That the vast fields of ice surrounding the southern pole, and the floating icebergs which in that hemisphere nearly approach even tropical regions, owe their origin to such masses of ice or glaciers descending to the sea, as are described above as occupying the valleys of Georgia, appears to be a well settled fact. With modern geologists it has been a favourite theory to refer the existence of these boulders, or erratic water-worn blocks, which are found scattered in various parts of the earth's surface, at vast distances from any rocks of a similar nature, to the action of similar glaciers, which carrying with them masses of rock from the mountain's side, and afterwards bearing them away from the land on icebergs, deposit them at length in the sea, which, in course of time, the land as the

bottom of it being elevated into a continent, a process the effects of which are distinctly visible in many parts of the world, and particularly so in South America, has carried with it boulders scattered abroad on its surface, even as they may be supposed to lie at the bottom of the ocean. This opinion is confirmed by the fact that icebergs bearing rocks upon their surface have occasionally been met with, and that icebergs have been met at sea at no greater distance than 35° 50' from the equator. This remarkable variation of climate between the northern and southern extremities of the globe appears more forcibly, when we consider that the latitude of Georgia corresponds to the southern part of Scotland.—Ed.

sphere. The Baltic, the Gulf of St. Lawrence, the Straits of Belle-Isle, and many other equally large seas, are frequently frozen over in winter. Nor is this at all extraordinary, for we have found the degree of cold at the surface of the sea, even in summer, to be two degrees below the freezing-point; consequently nothing kept it from freezing but the salts it contains, and the agitation of its surface. Whenever this last ceaseth in winter, when the frost is set in, and there comes a fall of snow, it will freeze on the surface as it falls, and in a few days, or perhaps in one night, form such a sheet of ice as will not be easily broken up. Thus a foundation will be laid for it to accumulate to any thickness by falls of snow, without its being at all necessary for the sea-water to freeze. It may be by this means these vast floats of low ice we find in the spring of the year are formed, and which, after they break up, are carried by the currents to the north. For, from all the observations I have been able to make, the currents everywhere, in the high latitudes, set to the N., or to the N.E. or N.W.; but we have very seldom found them considerable.

If this imperfect account of the formation of these extraordinary floating islands of ice which is written wholly from my own observations, does not convey some useful hints to an abler pen, it will, however, convey some idea of the lands where they are formed. Lands doomed by nature to perpetual frigidness; never to feel the warmth of the sun's rays; whose horrible and savage aspect I have not words to describe;—such are the lands we have discovered; what then may we expect those to be which lie still farther to the south? For we may reasonably suppose that we have seen the best, as lying most to the north. If any one should have resolution and perseverance to clear up this point by proceeding farther than I have done, I shall not envy him the honour of the discovery; but I will be bold to say, that the world will not be benefited by it.

I had, at this time, some thoughts of revisiting the place where the French discovery is said to lie. But then I considered that, if they had really made this discovery, the end would be as fully answered as if I had done it myself. We know it can only be an island; and if we may judge from the degree of cold we found in that latitude, it cannot be a fertile one. Besides, this would have kept me two months longer at sea, and in a tempestuous latitude, which we were not in a condition to struggle with. Our sails and rigging were so much worn, that something was giving way every hour; and we had nothing left, either to repair or replace them. Our provisions were in a state of decay, and consequently afforded little nourishment, and we had been a long time without refreshments. My people, indeed, were yet healthy, and would have cheerfully gone wherever I had thought proper to lead them; but I dreaded the scurvy laying hold of them, at a time when we had nothing left to remove it. I must say farther, that it would have been cruel in me to have continued the fatigues and hardships they were continually exposed to, longer than was absolutely necessary. Their behaviour, throughout the whole voyage, merited every indulgence which it was in my power to give them. Animated by the conduct of the officers, they showed themselves capable of surmounting every difficulty and danger which came in their way, and never once looked either upon the one or the other as being at all heightened by our separation from our consort the *Adventure*.

All these considerations induced me to lay aside looking for the French discoveries, and to steer for the Cape of Good Hope; with a resolution, however, of looking for the isles of Denia and Marseven, which are laid down in Dr. Halley's variation chart in the latitude of $41\frac{1}{2}^{\circ}$ S., and about 4° of longitude to the east of the meridian of the Cape of Good Hope. With this view I steered N.E., with a hard gale at N.W. and thick weather; and on the 26th at noon, we saw the last ice-island, being at this time in the latitude of $52^{\circ} 52'$ S., longitude $26^{\circ} 31'$ E. The wind abating and veering to the S., on the 1st of March, we steered W., in order to get farther from Mr. Bouvet's track, which was but a few degrees to the east of us, being at this time in the latitude of $46^{\circ} 44'$ S., longitude $33^{\circ} 20'$ E., in which situation we found the variation to be $23^{\circ} 36'$ west. It is somewhat remarkable, that all the time we had northerly winds, which were regular and constant for several days, the weather was always thick and cloudy; but as soon as they came S. of W. it cleared up, and was fine and pleasant. The barometer began to rise several days before this change happened; but whether on account of it, or our coming northward, cannot be determined.

The wind remained not long at south before it veered round by the N.E. to N.W., blowing fresh and by squalls, attended, as before, with rain and thick misty weather. We had some intervals of clear weather on the afternoon of the 3d, when we found the variation to be 22° 26' W.; latitude at this time 45° 8' S., longitude 30° 50' E. The following night was very stormy; the wind blew from S.W. and in excessively heavy squalls. At short intervals between the squalls, the wind would fall almost to a calm, and then come on again with such fury, that neither our sails nor rigging could withstand it, several of the sails being split, and a middle staysail being wholly lost. The next morning the gale abated, and we repaired the damage we had sustained in the best manner we could.

On the 8th, being in the latitude of 41° 30' S., longitude 26° 51' E., the mercury in the thermometer rose to 61, and we found it necessary to put on lighter clothes. As the wind continued invariably fixed between N.W. and W., we took every advantage to get to the west, by tacking whenever it shifted anything in our favour; but as we had a great swell against us, our tacks were rather disadvantageous. We daily saw albatrosses, petrels, and other oceanic birds; but not the least sign of land. On the 11th, in the latitude of 40° 40' S., longitude 23° 47' E., the variation was 20° 48' W. About noon the same day, the wind shifting suddenly from N.W. to S.W. caused the mercury in the thermometer to fall as suddenly from 62° to 52°; such was the different state of the air, between a northerly and southerly wind. The next day, having several hours' calm, we put a boat in the water, and shot some albatrosses and petrels; which, at this time, were highly acceptable. We were now nearly in the situation where the isles which we were in search of are said to lie; however, we saw nothing that could give us the least hope of finding them.

The calm continued till five o'clock of the next morning, when it was succeeded by a breeze at W. by S., with which we stood to N.N.W. and at noon observed in latitude 38° 51' S. This was upwards of thirty miles more to the north than our log gave us; and the watch showed that we had been set to the east also. If these differences did not arise from some strong current, I know not how to account for them. Very strong currents have been found on the African coast, between Madagascar and the Cape of Good Hope; but I never heard of their extending so far from the land; nor is it probable they do. I rather suppose that this current has no connexion with that on the coast, and that we happened to fall into some stream which is neither lasting nor regular. But these are points which require much time to investigate, and must therefore be left to the industry of future navigators.

We were now two degrees to the north of the parallel in which the isles of Denia and Marseven are said to lie. We had seen nothing to encourage us to persevere in looking after them; and it must have taken up some time longer to find them, or to prove their non-existence. Every one was impatient to get into port, and for good reasons; as for a long time we had had nothing but stale and salt provisions, for which every one on board had lost all relish. These reasons induced me to yield to the general wish, and to steer for the Cape of Good Hope, being at this time in the latitude of 38° 38' S., longitude 23° 37' E. The next day the observed latitude at noon was only seventeen miles to the north of that given by the log; so that we had either got out of the strength of the current, or it had ceased. On the 15th the observed latitude at noon, together with the watch, showed that we had had a strong current setting to the S.W. the contrary direction to what we had experienced on some of the preceding days, as hath been mentioned. At daylight on the 16th, we saw two sail in the N.W. quarter standing to the westward, and one of them showing Dutch colours. At ten o'clock we tacked and stood to the west also, being at this time in the latitude of 35° 9' S., longitude 22° 38' E.

I now, in pursuance of my instructions, demanded of the officers and petty officers the log-books and journals they had kept; which were delivered to me accordingly, and sealed up for the inspection of the Admiralty. I also enjoined them, and the whole crew, not to divulge where we had been, till they had their Lordships' permission so to do. In the afternoon the wind veered to the west and increased to a hard gale, which was of short duration; for, the next day, it fell, and at noon veered to S.E. At this time we were in the latitude of 34° 49' S., longitude 22° E.; and, on sounding, found fifty-six fathoms water.

In the evening we saw the land in the direction of E.N.E., about six leagues distant; and, during the fore part of the night, there was a great fire or light upon it.

At daybreak on the 18th, we saw the land again, bearing N.N.W., six or seven leagues distant, and the depth of water forty-eight fathoms. At nine o'clock, having little or no wind, we hoisted out a boat and sent on board one of the two ships before mentioned, which were about two leagues from us; but we were too impatient after news to regard the distance. Soon after, a breeze sprung up at west, with which we stood to the south; and, presently, three sail more appeared in sight to windward, one of which showed English colours. At one p.m. the boat returned from on board the Bownkerke Polder, Captain Cornelius Bosch, a Dutch Indiaman from Bengal. Captain Bosch, very obligingly, offered us sugar, arrack, and whatever he had to spare. Our people were told by some English seamen on board this ship, that the *Adventure* had arrived at the Cape of Good Hope twelve months ago, and that the crew of one of her boats had been murdered and eaten by the people of New Zealand; so that the story which we heard in Queen Charlotte's Sound was now no longer a mystery.

We had light airs, next to a calm, till ten o'clock the next morning, when a breeze sprung up at west, and the English ship, which was to windward, bore down to us. She proved to be the *True Briton*, Captain Broadly, from China. As he did not intend to touch at the Cape, I put a letter on board him for the Secretary of the Admiralty. The account which we had heard of the *Adventure* was now confirmed to us by this ship. We also got, from on board her, a parcel of old newspapers, which were new to us, and gave us some amusement; but these were the least favours we received from Captain Broadly. With a generosity peculiar to the commanders of the India Company's ships, he sent us fresh provisions, tea, and other articles, which were very acceptable, and deserve from me this public acknowledgment. In the afternoon we parted company. The *True Briton* stood out to sea, and we in for the land; having a fresh gale at west, which split our fore top-sail in such a manner, that we were obliged to bring a .other to the yard. At six o'clock we tacked within four or five miles of the shore; and, as we judged, about five or six leagues to the east of Cape Aguilas. We stood off till midnight, when, the wind having veered round to the south, we tacked, and stood along-shore to the west. The wind kept veering more and more in our favour, and at last fixed at E.S.E., and blew, for some hours, a perfect hurricane. As soon as the storm began to subside, we made sail, and hauled in for the land. Next day at noon, the Table Mountain over the Cape Town bore N.E. by E., distant nine or ten leagues. By making use of this bearing and distance to reduce the longitude shown by the watch to the Cape Town, the error was found to be no more than 18' in longitude, which it was too far to the east. Indeed, the difference we found between it and the lunar observations, since we left New Zealand, had seldom exceeded half a degree, and always the same way.

The next morning, being with us Wednesday, the 22nd, but with the people here Tuesday, the 21st, we anchored in Table Bay, where we found several Dutch ships; some French; and the *Ceres*, Captain Newte, an English East India Company's ship, from China, bound directly to England, by whom I sent a copy of the preceding parts of this journal, some charts, and other drawings, to the Admiralty. Before we had well got to an anchor, I despatched an officer to acquaint the governor with our arrival, and to request the necessary stores and refreshments, which were readily granted. As soon as the officer came back, we saluted the garrison with thirteen guns, which compliment was immediately returned with an equal number.

I now learnt that the *Adventure* had called here, on her return; and I found a letter from Captain Furneaux, acquainting me with the loss of his boat, and of ten of his best men, in Queen Charlotte's Sound. The captain, afterwards, on my arrival in England, put into my hands a complete narrative of his proceedings, from the time of our second and final separation, which I now lay before the public in the following chapter.

CHAPTER VIII.—CAPTAIN FURNEAUX'S NARRATIVE OF HIS PROCEEDINGS IN THE ADVENTURE, FROM THE TIME HE WAS SEPARATED FROM THE RESOLUTION, TO HIS ARRIVAL IN ENGLAND ; INCLUDING LIEUTENANT HURNEY'S REPORT CONCERNING THE BOAT'S CREW, WHO WERE MURDERED BY THE INHABITANTS OF QUEEN CHARLOTTE'S SOUND.

AFTER a passage of fourteen days from Amsterdam, we made the coast of New Zealand near the Table Cape, and stood along-shore till we came as far as Cape Turnagain. The wind then began to blow strong at west, with heavy squalls and rain, which split many of our sails, and blew us off the coast for three days ; in which time we parted company with the Resolution, and never saw her afterwards.

On the 4th of November, we again got in-shore, near Cape Palliser, and were visited by a number of the natives in their canoes, bringing a great quantity of cray-fish, which we bought of them for nails and Otaheite cloth. The next day it blew hard from W.N.W., which again drove us off the coast, and obliged us to bring to for two days ; during which time it blew one continual gale of wind with heavy falls of sleet. By this time our decks were very leaky ; our beds and bedding wet ; and several of our people complaining of colds ; so that we began to despair of ever getting into Charlotte Sound, or joining the Resolution. On the 6th, being to the north of the Cape, the wind at S.W. and blowing strong, we bore away for some bay to complete our water and wood, being in great want of both ; having been at the allowance of one quart of water for some days past ; and even that pittance could not be come at, above six or seven days longer. We anchored in Tolaga Bay on the 9th, in latitude $38^{\circ} 21'$ S., longitude $178^{\circ} 37'$ E. It affords good riding with the wind westerly, and regular soundings from eleven to five fathoms, stiff muddy ground across the bay for about two miles. It is open from N.N.E. to E.S.E. It is to be observed, easterly winds seldom blow hard on this shore, but when they do, they throw in a great sea ; so that if it were not for a great undertow, together with a large river that empties itself in the bottom of the bay, a ship would not be able to ride here. Wood and water are easily to be had, except when it blows hard easterly. The natives here are the same as those at Charlotte Sound, but more numerous, and seemed settled, having regular plantations of sweet potatoes, and other roots, which are very good ; and they have plenty of cray and other fish, which we bought of them for nails, beads, and other trifles, at an easy rate. In one of their canoes we observed the head of a woman lying in state, adorned with feathers and other ornaments. It had the appearance of being alive ; but, on examination, we found it dry, being preserved with every feature perfect, and kept as the relic of some deceased relation. Having got about ten tons of water, and some wood, we sailed for Charlotte Sound on the 12th. We were no sooner out than the wind began to blow hard, dead on the shore, so that we could not clear the land on either tack. This obliged us to bear away again for the bay, where we anchored the next morning, and rode out a very heavy gale of wind at E. by S. which threw in a very great sea. We now began to fear we should never join the Resolution ; having reason to believe she was in Charlotte Sound, and by this time ready for sea. We soon found it was with great difficulty we could get any water, owing to the swell setting in so strong ; at last, however, we were able to go on shore, and got both wood and water.

Whilst we lay here, we were employed about the rigging, which was much damaged by the constant gales of wind we had met with since we made the coast. We got the booms down on the decks, and having made the ship as snug as possible, sailed again on the 16th. After this we met with several gales of wind off the mouth of the strait, and continued beating backwards and forwards till the 30th, when we were so fortunate as to get a favourable wind, which we took every advantage of, and at last got safe into our desired port. We saw nothing of the Resolution, and began to doubt her safety ; but on going ashore, we discerned the place where she had erected her tents ; and, on an old stump of a tree in the garden, observed these words cut out, "Look underneath." There we dug, and soon found a bottle corked and waxed down, with a letter in it from Captain Cook, signify-

ing their arrival on the 3d instant, and departure on the 24th; and that they intended spending a few days in the entrance of the straits to look for us. We immediately set about getting the ship ready for sea as fast as possible; erected our tents; sent the cooper on shore to repair the casks; and began to unstow the hold, to get at the bread that was in butts; but on opening them, found a great quantity of it entirely spoiled, and most part so damaged that we were obliged to fix our copper oven on shore to bake it over again, which undoubtedly delayed us a considerable time. Whilst we lay here, the inhabitants came on board as before, supplying us with fish, and other things of their own manufacture, which we bought of them for nails, &c., and appeared very friendly; though twice in the middle of the night they came to the tent, with an intention to steal, but were discovered before they could get anything into their possession.

On the 17th of December, having refitted the ship, completed our water and wood, and got everything ready for sea, we sent our large cutter, with Mr. Rowe, a midshipman, and the boat's crew, to gather wild greens for the ship's company, with orders to return that evening, as I intended to sail the next morning. But on the boat's not returning the same evening, nor the next morning, being under great uneasiness about her, I hoisted out the launch, and sent her, with the second lieutenant, Mr. Burney, manned with the boat's crew and ten marines, in search of her. My orders to Mr. Burney were, first to look well into East Bay, and then to proceed to Grass Cove, the place to which Mr. Rowe had been sent; and if he heard nothing of the boat there, to go farther up the Sound, and come back along the west shore. As Mr. Rowe had left the ship an hour before the time proposed, and in a great hurry, I was strongly persuaded that his curiosity had carried him into East Bay, none in our ship having ever been there or else, that some accident had happened to the boat, either by going adrift through the boat-keeper's negligence, or by being stove among the rocks. This was almost everybody's opinion; and on this supposition the carpenter's mate was sent in the launch, with some sheets of tin. I had not the least suspicion that our people had received any injury from the natives; our boats having frequently been higher up, and worse provided. How much I was mistaken too soon appeared; for Mr. Burney having returned about eleven o'clock the same night, made

report of a horrible scene indeed, which cannot be better described than in his own words, which now follow.

"On the 18th we left the ship; and having a light breeze in our favour, we soon got round Long Island, and within Long Point. I examined every cove on the larboard hand, as we went along, looking well all around with a spy-glass, which I took for that purpose. At half-past one we stopped at a beach, on the left-hand side going up East Bay, to boil some victuals, as we brought nothing but raw meat with us. Whilst we were cooking, I saw an Indian on the opposite shore running along a beach to the head of the bay. Our meat being drest, we got into the boat and put off; and, in a short time, arrived at the head of this reach, where we saw an Indian settlement. As we drew near, some of the Indians came down on the rocks, and waved for us to be gone; but seeing we disregarded them, they altered their notes. Here we found six large canoes hauled up on the beach, most of them double ones, and a great many people; though not so many as one might expect from the number of houses and size of the canoes. Leaving the boat's crew to guard the boat, I stepped ashore with the marines (the corporal and five men), and searched a good many of their houses; but found nothing to give me any suspicion. Three or four well-beaten paths led farther into the woods, where were many more houses; but the people continuing friendly, I thought it unnecessary to continue our search. Coming down to the beach, one of the Indians had brought a bundle of *hepatoos* (long spears), but seeing I looked very earnestly at him, he put them on the ground, and walked about with seeming unconcern. Some of the people appearing to be frightened, I gave a looking-glass to one, and a large nail to another. From this place the bay ran, as nearly as I could guess, N.N.W. a good mile, where it ended in a long sandy beach. I looked all round with the glass, but saw no boat, canoe, or sign of inhabitant. I therefore contented myself with firing some guns, which I had done in every cove as I went along.

"I now kept close to the east shore, and came to another settlement, where the Indians invited us ashore. I inquired of them about the boat, but they pretended ignorance. They appeared very friendly here, and sold us some fish. Within an hour after we left this place, in a small beach adjoining to Grass Cove, we saw a very large double canoe just hauled up, with two men and a dog. The men, on seeing us, left their canoe, and ran up into the woods. This gave me reason to suspect I should here get tidings of the cutter. We went ashore, and searched the canoe, where we found one of the rullock-ports of the cutter, and some shoes, one of which was known to belong to Mr. Woodhouse, one of our midshipmen. One of the people, at the same time, brought me a piece of meat, which he took to be some of the salt meat belonging to the cutter's crew. On examining this, and smelling to it, I found it was fresh. Mr. Fannin (the master), who was with me, supposed it was dog's flesh, and I was of the same opinion; for I still doubted their being cannibals. But we were soon convinced by most horrid and undeniable proof. A great many baskets (about twenty) lying on the beach tied up, we cut them open. Some were full of roasted flesh, and some of fern-root, which serves them for bread. On farther search, we found more shoes and a hand, which we immediately knew to have belonged to Thomas Hill, one of our fore-castle men, it being marked T. H. with an Otaheite tallow-instrument. I went with some of the people a little way up the woods, but saw nothing else. Coming down again, there was a round spot covered with fresh earth about four feet diameter, where something had been buried. Having no spade, we began to dig with a cutlass; and in the mean time I launched the canoe with intent to destroy her; but seeing a great smoke ascending over the nearest hill, I got all the people into the boat, and made what haste I could to be with them before sunset.

"On opening the next bay, which was Grass Cove, we saw four canoes, one single and three double ones, and a great many people on the beach, who, on our approach, retreated to a small hill within a ship's length of the water-side, where they stood talking to us. A large fire was on the top of the high land beyond the woods, from whence, all the way down the hill, the place was thronged like a fair. As we came in, I ordered a musketoon to be fired at one of the canoes, suspecting they might be full of men lying down in the bottom; for they were all afloat, but nobody was seen in them. The savages on the little hill still kept hallooing and making signs for us to land. However, as soon as we got close in, we all

fired. The first volley did not seem to affect them much; but on the second, they began to scramble away as fast as they could, some of them howling. We continued firing as long as we could see the glimpse of any of them through the bushes. Amongst the Indians were two very stout men, who never offered to move till they found themselves forsaken by their companions; and then they marched away with great composure and deliberation; their pride not suffering them to run. One of them, however, got a fall, and either lay there or crawled off on all-fours. The other got clear without any apparent hurt. I then landed with the marines, and Mr. Fannin staid to guard the boat.

"On the beach were two bundles of celery, which had been gathered for loading the cutter. A broken oar was struck upright in the ground, to which the natives had tied their canoes; a proof that the attack had been made here. I then searched all along at the back of the beach, to see if the cutter was there. We found no boat, but instead of her, such a shocking scene of carnage and barbarity as can never be mentioned or thought of but with horror; for the heads, hearts, and lungs of several of our people were seen lying on the beach, and, at a little distance, the dogs gnawing their entrails. Whilst we remained almost stupified on the spot, Mr. Fannin called to us that he heard the savages gathering together in the woods; on which I returned to the boat, and hauling alongside the canoes, we demolished three of them. Whilst this was transacting, the fire on the top of the hill disappeared; and we could hear the Indians in the woods at high words: I suppose quarrelling whether or no they should attack us, and try to save their canoes. It now grew dark: I therefore just stepped out, and looked once more behind the beach, to see if the cutter had been hauled up in the bushes; but seeing nothing of her, returned and put off. Our whole force would have been barely sufficient to have gone up the hill, and to have ventured with half (for half must have been left to guard the boat) would have been fool-hardiness.

"As we opened the upper part of the Sound, we saw a very large fire about three or four miles higher up, which formed a complete oval, reaching from the top of a hill down almost to the water-side, the middle space being enclosed all round by the fire, like a hedge. I consulted with Mr. Fannin, and we were both of opinion that we could expect to reap no other advantage than the poor satisfaction of killing some more of the savages. At leaving Grass Cove, we had fired a general volley towards where we heard the Indians talking; but by going in and out of the boat, the arms had got wet, and four pieces missed fire. What was still worse, it began to rain; our ammunition was more than half expended, and we left six large canoes behind us in one place. With so many disadvantages, I did not think it worth while to proceed, where nothing could be hoped for but revenge. Coming between two round islands, situated to the southward of East Bay, we imagined we heard somebody calling; we lay on our oars and listened, but heard no more of it; we hallooed several times, but to little purpose; the poor souls were far enough out of hearing; and, indeed, I think it some comfort to reflect that, in all probability, every man of them must have been killed on the spot."

Thus far Mr. Burney's report; and, to complete the account of this tragical transaction, it may not be unnecessary to mention that the people in the cutter were, Mr. Rowe, Mr. Woodhouse; Francis Murphy, quarter-master; William Facey, Thomas Hill, Michael Bell, and Edward Jones, fore-castle-men; John Cavenaugh and Thomas Milton, belonging to the after-guard; and James Sevilley, the captain's man; being ten in all. Most of these were of our very best seamen, the stoutest and most healthy people in the ship. Mr. Burney's party brought on board two hands; one belonging to Mr. Rowe, known by a hurt he had received on it; the other to Thomas Hill, as before mentioned; and the head of the captain's servant. These, with more of the remains, were tied in a hammock and thrown overboard, with ballast and shot sufficient to sink it. None of their arms nor clothes were found, except part of a pair of trowsers, a frock, and six shoes, no two of them being fellows.

I am not inclined to think this was any premeditated plan of these savages; for the morning Mr. Rowe left the ship, he met two canoes, which came down and staid all the forenoon in Ship Cove. It might probably happen from some quarrel which was decided on the spot; or the fairness of the opportunity might tempt them, our people being so incautions, and thinking themselves too secure. Another thing which encouraged the New Zealanders was, they were sensible that a gun was not infallible, that they sometimes missed, and that, when

discharged, they must be loaded before they could be used again, which time they knew how to take advantage of. After their success, I imagine there was a general meeting on the east side of the Sound. The Indians of Shag Cove were there; this we knew by a cock which was in one of the canoes, and by a long single canoe, which some of our people had seen four days before in Shag Cove, where they had been with Mr. Rowe in the cutter.

We were detained in the Sound by contrary winds four days after this melancholy affair happened, during which time we saw none of the inhabitants. What is very remarkable, I had been several times up in the same cove with Captain Cook, and never saw the least sign of an inhabitant, except some deserted towns, which appeared as if they had not been occupied for several years; and yet, when Mr. Burney entered the cove, he was of opinion there could not be less than fifteen hundred or two thousand people. I doubt not, had they been apprised of his coming, they would have attacked him. From these considerations I thought it imprudent to send a boat up again, as we were convinced there was not the least probability of any of our people being alive.

On the 23d, we weighed and made sail out of the Sound, and stood to the eastward to get clear of the Straits; which we accomplished the same evening, but were baffled for two or three days with light winds before we could clear the coast. We then stood to the S.S.E., till we got into the latitude of 56° S., without anything remarkable happening, having a great swell from the southward. At this time the winds began to blow strong from the S.W., and the weather to be very cold; and as the ship was low and deep laden, the sea made a continual breach over her, which kept us always wet; and by her straining, very few of the people were dry in bed or on deck, having no shelter to keep the sea from them. The birds were the only companions we had in this vast ocean; except, now and then, we saw a whale or porpoise, and sometimes a seal or two, and a few penguins. In the latitude of 58° S., longitude 213° * E., we fell in with some ice, and every day saw more or less, we then standing to the E. We found a very strong current setting to the eastward; for by the time we were abreast of Cape Horn, being in the latitude of 61° S., the ship was ahead of our account eight degrees. We were very little more than a month from Cape Palliser, in New Zealand, to Cape Horn, which is an hundred and twenty-one degrees of longitude, and had continual westerly winds from S.W. to N.W., with a great sea following.

On opening some casks of peas and flour, that had been stowed on the coals, we found them very much damaged, and not eatable; so thought it most prudent to make for the Cape of Good Hope, but first to stand into the latitude and longitude of Cape Circumcision. After being to the eastward of Cape Horn, we found the winds did not blow so strong from the westward as usual, but came more from the north, which brought on thick foggy weather; so that for several days together we could not be able to get an observation, or see the least sign of the sun. This weather lasted above a month, being then among a great many islands of ice, which kept us constantly on the look-out for fear of running foul of them, and, being a single ship, made us more attentive. By this time our people began to complain of colds and pains in their limbs, which obliged me to haul to the northward to the latitude of 54° S.; but we still continued to have the same sort of weather, though we had oftener an opportunity of obtaining observations for the latitude. After getting into the latitude above mentioned, I steered to the east, in order, if possible, to find the land laid down by Bouvet. As we advanced to the east, the islands of ice became more numerous and dangerous, they being much smaller than they used to be, and the nights began to be dark.

On the 3d of March, being then in the latitude of 54° 4' S., longitude 13° E., which is the latitude of Bouvet's discovery, and half a degree to the eastward of it, and not seeing the least sign of land, either now or since we have been in this parallel, I gave over looking for it, and hauled away to the northward. As our last track to the southward was within a few degrees of Bouvet's discovery, in the longitude assigned to it, and about three or four degrees to the southward, should there be any land thereabout, it must be a very inconsiderable island. But I believe it was nothing but ice, as we, in our first setting out, thought we had seen land several times, but it proved to be high islands of ice at the back of the large fields; and as it was thick foggy weather when Mr. Bouvet fell in with it, he might very easily mistake them for land.

* About 147° west longitude, as I reckon.

On the 7th, being in the latitude of $48^{\circ} 30' S.$, longitude $14^{\circ} 26' E.$, saw two large islands of ice. On the 17th, made the land of the Cape of Good Hope; and on the 19th, anchored in Table Bay, where we found Commodore Sir Edward Hughes, with his Majesty's ships *Salisbury* and *Seahorse*. I saluted the Commodore with thirteen guns, and, soon after, the garrison with the same number; the former returned the salute, as usual, with two guns less, and the latter with an equal number.

On the 24th, Sir Edward Hughes sailed with the *Salisbury* and *Seahorse* for the East Indies; but I remained, refitting the ship and refreshing my people, till the 16th of April, when I sailed for England; and on the 14th of July, anchored at Spithead.

CHAPTER IX.—TRANSACTIONS AT THE CAPE OF GOOD HOPE; WITH AN ACCOUNT OF SOME DISCOVERIES MADE BY THE FRENCH; AND THE ARRIVAL OF THE SHIP AT ST. HELENA.

I now resume my own Journal, which Captain Furneaux's interesting Narrative, in the preceding chapter, had obliged me to suspend.

The day after my arrival at the Cape of Good Hope, I went on shore and waited on the governor, Baron Plettenberg, and other principal officers, who received and treated us with the greatest politeness, contributing all in their power to make it agreeable. And, as there are few people more obliging to strangers than the Dutch in general at this place, and refreshments of all kinds are nowhere to be got in such abundance, we enjoyed some real repose, after the fatigues of a long voyage. The good treatment which strangers meet with at the Cape of Good Hope, and the necessity of breathing a little fresh air, has introduced a custom not common anywhere else (at least I have nowhere seen it so strictly observed), which is, for all the officers who can be spared out of the ships to reside on shore. We followed this custom. Myself, the two Mr. Forsters, and Mr. Sparrman, took up our abode with Mr. Brandt, a gentleman well known to the English by his obliging readiness to serve them. My first care after my arrival, was to procure fresh-baked bread, fresh meat, greens, and wine, for those who remained on board; and, being provided every day during our stay with these articles, they were soon restored to their usual strength. We had only three men on board whom it was thought necessary to send on shore for the recovery of their health; and for these I procured quarters, at the rate of thirty stivers, or half-a-crown, per day, for which they were provided with victuals, drink, and lodging.

We now went to work to supply all our defects. For this purpose, by permission, we erected a tent on shore, to which we sent our casks and sails to be repaired. We also struck the yards and topmasts, in order to overhaul the rigging, which we found in so bad a condition, that almost everything, except the standing rigging, was obliged to be replaced with new; and that was purchased at a most exorbitant price. In the article of naval stores, the Dutch here, as well as at Batavia, take a shameful advantage of the distress of foreigners. That our rigging, sails, &c. should be worn out, will not be wondered at, when it is known, that, during this circumnavigation of the globe, that is, from our leaving this place, to our return to it again, we had sailed no less than twenty thousand leagues; an extent of voyage nearly equal to three times the equatorial circumference of the earth, and which, I apprehend, was never sailed by any ship in the same space of time before. And yet, in all this great run, which had been made in all latitudes between 9° and 71° , we sprung neither low-masts, top-mast, lower nor top-sail yard, nor so much as broke a lower or top-mast shroud; which, with the great care and abilities of my officers, must be owing to the good properties of our ship.

One of the French ships which were at anchor in the bay, was the *Ajax* Indiaman, bound to Pondicherry, commanded by Captain Crozet. He had been second in command with Captain Marion, who sailed from this place with two ships, in March 1772, as hath been already mentioned. Instead of going from hence to America, as was said, he stood away for New Zealand; where, in the Bay of Isles, he and some of his people were killed by the inhabitants. Captain Crozet, who succeeded to the command, returned by the way of the Philippine Isles, with the two ships, to the Island of Mauritius. He seemed to be a man

possessed of the true spirit of discovery, and to have abilities. In a very obliging manner, he communicated to me a chart, wherein were delineated not only his own discoveries, but also that of Captain Kerguelen, which I found laid down in the very situation where we searched for it; so that I can, by no means, conceive how both we and the Adventure missed it. Besides this land, which Captain Crozet told us was a long but very narrow island, extending east and west, Captain Marion, in about the latitude of 43° S., and from 16° to 30° of longitude east of the Cape of Good Hope, discovered six islands which were high and barren*. These, together with some islands lying between the line and the southern tropic in the Pacific Ocean, were the principal discoveries made in this voyage, the account of which, we were told, was ready for publication.

By Captain Crozet's chart, it appeared that a voyage had been made by the French across the South Pacific Ocean, in 1769, under the command of one Captain Surville; who, on condition of his attempting discoveries, had obtained leave to make a trading voyage to the coast of Peru. He fitted out, and took in a cargo, in some part of the East Indies; proceeded by way of the Philippine Isles; passed near New Britain; and discovered some land in the latitude of 10° S., longitude 158° E. to which he gave his own name. From hence he steered to the south; passed but a few degrees to the west of New Caledonia; fell in with New Zealand at its northern extremity, and put into Doubtful Bay, where, it seems, he was when I passed it, on my former voyage, in the Endeavour. From New Zealand, Captain Surville steered to the east, between the latitude of 35° and 41° south, until he arrived on the coast of America; where, in the port of Callao, in attempting to land, he was drowned. These voyages of the French, though undertaken by private adventurers, have contributed something towards exploring the Southern Ocean. That of Captain Surville clears up a mistake which I was led into, in imagining the shoals off the west end of New Caledonia to extend to the west, as far as New Holland. It proves that there is an open sea in that space, and that we saw the N.W. extremity of that country.

From the same gentleman we learnt, that the ship which had been at Otaheite before our first arrival there this voyage, was from New Spain; and that, in her return, she had discovered some islands in the latitude of 32° S. and under the meridian of 130° W. Some other islands, said to be discovered by the Spaniards, appeared on this chart; but Captain Crozet seemed to think, they were inserted from no good authorities. We were likewise informed of a later voyage undertaken by the French, under the command of Captain Kerguelen, which had ended much to the disgrace of that commander.

While we lay in Table Bay, several foreign ships put in and out, bound to and from India, viz. English, French, Danes, Swedes, and three Spanish frigates, two of them going to, and one coming from, Manilla. It is but very lately that the Spanish ships have touched here; and these were the first that were allowed the same privileges as other European friendly nations.

On examining our rudder, the pintles were found to be loose, and we were obliged to unhang it, and take it on shore to repair. We were also delayed for want of calkers to calk the ship, which was absolutely necessary to be done, before we put to sea. At length I obtained two workmen from one of the Dutch ships; and the Dutton English East Indiaman, coming in from Bengal, Captain Rice, obliged me with two more; so that by the 26th of April, this work was finished; and having got on board all necessary stores, and a fresh supply of provisions and water, we took leave of the governor and other principal officers, and the next morning repaired on board. Soon after, the wind coming fair, we weighed and put to sea; as did also the Spanish frigate Juno, from Manilla, a Danish Indiaman, and the Dutton. As soon as we were under sail, we saluted the garrison with thirteen guns; which compliment was immediately returned with the same number. The Spanish frigate and Danish Indiaman both saluted us as we passed them, and I returned each salute with an equal number of guns. When we were clear of the bay, the Danish ship steered for the East Indies, the Spanish frigate for Europe, and we and the Dutton for St. Helena.

* These were visited by Cook: when going out on his third voyage, and were distinguished by him by the names of Prince Edward's Islands, Marion's and Crozet's Islands. For a further account of Kerguelen's Land, see the

narrative of Cook's visit to it on his third voyage, in Dec. 1776, and Dr. Douglas's notes upon the subject of the previous visits of the French.—Ed.

Depending on the goodness of Mr. Kendall's watch, I resolved to try to make the island, by a direct course. For the first six days, that is, till we got into the latitude of 27° S., longitude 114° W. of the Cape, the winds were southerly and S.E. After this we had variable light airs for two days; they were succeeded by a wind at S.E. which continued to the island, except a part of one day, when it was at N.E. In general, the wind blew faint all the passage, which made it longer than common. At daybreak in the morning of the 15th of May, we saw the island of St. Helena, at the distance of fourteen leagues; and, at midnight, anchored in the road before the town, on the N.W. side of the island. At sunrise the next morning, the castle, and also the Dutton, saluted us, each with thirteen guns: on my landing, soon after, I was saluted by the castle, with the same number; and each of the salutes was returned by the ship. Governor Skettowe, and the principal gentlemen of the island, received and treated me, during my stay, with the greatest politeness, by showing me every kind of civility in their power.

Whoever view St. Helena, in its present state, can but conceive what it must have been originally. will not hastily charge the inhabitants with want of industry: though, perhaps, they might apply it to more advantage, were more land appropriated to planting of corn,

vegetables, roots, &c., instead of being laid out in pasture, which is the present mode. But this is not likely to happen, so long as the greatest part of it remains in the hands of the Company and their servants. Without industrious planters this island can never flourish, and be in a condition to supply the shipping with the necessary refreshments*. Within these three years a new church has been built; some other new buildings were in hand; a commodious landing-place for boats has been made; and several other improvements, which add both strength and beauty to the place. During our stay here we finished some necessary repairs of the ship, which we had not time to do at the Cape. We also filled all our empty water-casks; and the crew were served with fresh beef, purchased at fivepence per pound. Their beef is exceedingly good, and is the only refreshment to be had worth mentioning.

By a series of observations made at the Cape Town, and at James Fort, in St. Helena; at the former by Messrs. Mason and Dixon, and at the latter by Mr. Maskelyne, the present astronomer royal; the difference of longitude between these two places is $24^{\circ} 12' 15''$, only two miles more than Mr. Kendall's watch made. The lunar observations made by Mr. Wales, before we arrived at the island, and after we left it, and reduced to it by the watch, gave

* In recent years great improvement has taken place in the cultivation of the island, which has been encouraged by the exertions of the government and the establishment of Agricultural and Horticultural Societies. Still the

chief supplies to be obtained here are fresh meat and water: and the former is held of such importance, that no one is allowed to kill an ox without the governor's permission.—Ed.

5° 51' for the longitude of James Fort, which is only five miles more west than it is placed by Mr. Maskelyne. In like manner, the longitude of the Cape Town was found within 51' of the truth. I mention this to show how near the longitude of places may be found by the lunar method, even at sea, with the assistance of a good watch.

CHAPTER X.—PASSAGE FROM ST. HELENA TO THE WESTERN ISLANDS, WITH A DESCRIPTION OF THE ISLAND OF ASCENSION AND FERNANDO NORONHA.

On the 21st, in the evening, I took leave of the governor, and repaired on board. Upon my leaving the shore, I was saluted with thirteen guns; and, upon my getting under sail, with the Dutton in company, I was saluted with thirteen more; both of which I returned. After leaving St. Helena, the Dutton was ordered to steer N.W. by W. or N.W. by compass, in order to avoid falling in with Ascension; at which island, it was said, an illicit trade was carried on between the officers of the India Company's ships and some vessels from North America, who, of late years, had frequented the island, on pretence of fishing for whales or catching turtle, when their real design was to wait the coming of the India ships. In order to prevent their homeward-bound ship from falling in with these smugglers, and to put a stop to this illicit trade, the Dutton was ordered to steer the course above mentioned till to the northward of Ascension. I kept company with this ship till the 24th, when, after putting a packet on board her for the Admiralty, we parted, she continuing her course to the N.W., and I steering for Ascension.

In the morning of the 28th, I made the island, and the same evening anchored in Cross Bay, on the N.W. side, in ten fathoms water, the bottom a fine sand, and half a mile from the shore. The Cross Hill, so called on account of a cross or flag-staff erected upon it, bore by compass S. 38° E.; and the two extreme points of the Bay extended from N.E. to S.W. We remained here till the evening of the 31st; and, notwithstanding we had several parties out every night, we got but twenty-four turtle, it being rather too late in the season; however, as they weighed between four and five hundred pounds each, we thought ourselves not ill off. We might have had a plentiful supply of fish in general; especially of that sort called old wives, I have nowhere seen such abundance; there were also cavalies, congor eels, and various other sorts; but the catching of any of these was not attended to, the object being turtle. There are abundance of goats, and aquatic birds, such as men-of-war and tropic birds, boobies, &c.

The Island of Ascension is about ten miles in length, in the direction of N.W. and S.E., and about five or six in breadth. It shows a surface composed of barren hills and valleys, on the most of which not a shrub or plant is to be seen for several miles, and where we found nothing but stones and sand, or rather slags and ashes; an indubitable sign that the isle, at some remote time, has been destroyed by a volcano, which has thrown up vast heaps of stones, and even hills. Between these heaps of stones we found a smooth even surface, composed of ashes and sand, and very good travelling upon it; but one may as easily walk over broken glass bottles as over the stones. If the foot deceives you, you are sure to be cut or lamed, which happened to some of our people. A high mountain, at the S.E. end of the isle, seems to be left in its original state, and to have escaped the general destruction. Its soil is a kind of white marl, which yet retains its vegetative qualities, and produeth a kind of purslain, spurg, and one or two grasses. On these the goats subsist; and it is at this part of the isle where they are to be found, as also land-crabs, which are said to be very good. I was told, that about this part of the isle is some very good land, on which might be raised many necessary articles; and some have been at the trouble of sowing turnips and other useful vegetables. I was also told there is a fine spring in a valley which disjoins two hills on the top of the mountain above mentioned; besides great quantities of fresh water in holes in the rocks, which the person who gave me this information believed was collected from rains. But these supplies of water can only be of use to the traveller, or to those who may

the governor's ter-

be so unfortunate as to be shipwrecked on the island * ; which seems to have been the fate of some not long ago, as appeared by the remains of a wreck we found on the N.E. side. By what we could judge, she seemed to have been a vessel of about one hundred and fifty tons burthen.

While we lay in the road, a sloop of about seventy tons burthen came to an anchor by us. She belonged to New York, which place she left in February ; and having been to the coast of Guinea with a cargo of goods, was come here to take in turtle to carry to Barbadoes. This was the story which the master, whose name was Greves, was pleased to tell, and which may, in part, be true ; but I believe the chief view of his coming here was the expectation of meeting with some of the India ships. He had been in the island near a week, and had got on board twenty turtle. A sloop, belonging to Bermuda, had sailed but a few days before with one hundred and five on board, which was as many as she could take in ; but having turned several more on the different sandy beaches, they had ripped open their bellies, taken out the eggs, and left the carcasses to putrify ; an act as inhuman as injuries to those who came after them. Part of the account I have given of the interior parts of this island I received from Captain Greves, who seemed to be a sensible, intelligent man, and had been all over it. He sailed in the morning of the same day we did.

Turtle, I am told, are to be found at this isle from January to June. The method of catching them is to have people upon the several sandy bays, to watch their coming on shore to lay their eggs, which is always in the night, and then to turn them on their backs, till there be an opportunity to take them off the next day. It was recommended to us to send a good many men to each beach, where they were to lie quiet till the turtle were ashore, and then rise and turn them at once. This method may be the best when the turtle are numerous ; but when there are but few, three or four men are sufficient for the largest beach ; and if they keep patrolling it, close to the wash of the surf, during the night, by this method they will see all that come ashore, and cause less noise than if there were more of them. It was by this method we caught the most we got ; and this is the method by which the Americans take them. Nothing is more certain, than that all the turtle which are found about this island come here for the sole purpose of laying their eggs, for we meet with none but females ; and of all those which we caught, not one had any food worth mentioning in its stomach ; a sure sign, in my opinion, that they must have been a long time without any ; and this may be the reason why the flesh of them is not so good as some I have ate on the coast of New South Wales, which were caught on the spot where they fed.

The watch made $8^{\circ} 45'$ difference of longitude between St. Helena and Ascension ; which added to $5^{\circ} 49'$, the longitude of James Fort in St. Helena, gives $14^{\circ} 34'$ for the longitude of the Road of Ascension, or $14^{\circ} 30'$ for the middle of the island, the latitude of which is 8° S. The lunar observations made by Mr. Wales, and reduced to the same point of the island by the watch, gave $14^{\circ} 28' 30''$ west longitude.

On the 31st of May we left Ascension, and steered to the northward, with a fine gale at S.E. by E. I had a great desire to visit the island of St. Matthew, to settle its situation ; but as I found the winds would not let me fetch it, I steered for the island of Fernando de Noronho, on the coast of Brazil, in order to determine its longitude, as I could not find this had yet been done. Perhaps I should have performed a more acceptable service to navigation, if I had gone in search of the island of St. Paul, and those shoals which are said to lie near the equator, and about the meridian of 20° west ; as neither their situation nor existence is well known. The truth is, I was unwilling to prolong the passage in searching for what I was not sure to find ; nor was I willing to give up every object, which might tend to the improvement of navigation or geography, for the sake of getting home a week or a fortnight sooner. It is but seldom that opportunities of this kind offer ; and when they do, they are too often neglected.

In our passage to Fernando de Noronho, we had steady fresh gales between the S.E. and E.S.E. attended with fair and clear weather ; and as we had the advantage of the moon, a

day or night did not pass without making lunar observations for the determining our longitude. In this run, the variation of the compass gradually decreased from 11° west, which it was at Ascension, to 1° west, which we found off Fernando de Noronha. This was the mean result of two compasses, one of which gave $1^{\circ} 37'$, and the other $23'$ west. On the 9th of June, at noon, we made the island of Fernando de Noronha, bearing S.W. by W. $\frac{1}{2}$ W., distant six or seven leagues, as we afterwards found by the log. It appeared in detached and peaked hills, the largest of which looked like a church tower or steeple. As we drew near the S.E. part of the isle, we perceived several unconnected sunken rocks lying near a league from the shore, on which the sea broke in a great surf. After standing very near the rocks, we hoisted our colours, and then bore up round the north end of the isle, or rather round a group of little islets; for we could see that the land was divided by narrow channels. There is a strong fort on the one next the main island, where there are several others; all of which seemed to have every advantage that nature can give them, and they are so disposed as wholly to command all the anchoring and landing places about the island. We continued to steer round the northern point, till the sandy beaches (before which is the road for shipping) began to appear, and the forts and the peaked hills were open to the westward of the said point. At this time, on a gun being fired from one of the forts, the Portuguese colours were displayed, and the example was followed by all the other forts. As the purpose for which I made the island was now answered, I had no objection to anchor; and therefore, after firing a gun to leeward, we made sail and stood away to the northward, with a fine fresh gale at E.S.E. The peaked hill or church tower bore south, 27° west, distant about four or five miles; and from this point of view it leans, or overhangs, to the east. This hill is nearly in the middle of the island, which now we exceeds two leagues in extent, and shows a hilly, unequal surface, mostly covered with wood and herbage.

Ulloa says, "This island hath two harbours, capable of receiving ships of the greatest burde; one is on the north side, and the other on the N.W. The former is, in every respect, the principal, both for shelter and capacity, and the goodness of its bottom; but both are exposed to the north and west, though these winds, particularly the north, are periodical, and of no long continuance." He further says, that you anchor in the north harbour (which is no more than what I would call a road) in thirteen fathoms water, one-third of a league from shore, bottom of fine sand; the peaked hill above mentioned bearing S.W. 3° southerly*.

This road seems to be well sheltered from the south and east winds. One of my seamen had been on board a Dutch India ship, who put in at this isle in her way out, in 1770. They were very sickly, and in want of refreshments and water. The Portuguese supplied them with some buffaloes and fowls; and they watered behind one of the beaches in a little pool, which was hardly big enough to dip a bucket in. By reducing the observed latitude at noon to the peaked hill, its latitude will be $3^{\circ} 53'$ south; and its longitude, by the watch, carried on from St. Helena, is $32^{\circ} 34'$ west; and by observations of the sun and moon, made before and after we made the isle, and reduced to it by the watch, $32^{\circ} 44' 30''$ west. This was the mean result of my observations. The results of those made by Mr. Wales, which were more numerous, gave $32^{\circ} 23'$. The mean of the two will be pretty near the watch, and probably nearest the truth. By knowing the longitude of this isle, we are able to determine that of the adjacent east coast of Brazil; which, according to the modern charts, lies about sixty or seventy leagues more to the west. We might very safely have trusted to these charts, especially the Variation Chart for 1744, and Mr. Dalrymple's of the Southern Atlantic Ocean†.

On the 11th. at three o'clock in the afternoon, we crossed the equator in the longitude of $32^{\circ} 14'$ west. We had fresh gales at S.S.E., blowing in squalls, attended by showers of

* See Don Antonio d'Ulloa's book, vol. ii. chap. 3, page 55 to 162, where there is a very particular account of this island.

† Ulloa says, that the chart places this island sixty leagues from the coast of Brazil; and that the Por-

tuguese pilots, who often make the voyage, judge it to be eighty leagues; but, by taking the mean between the two opinions, the distance may be fixed at seventy leagues.

rain, that continued at certain intervals, till noon the next day, after which we had twenty-four hours' fair weather. At noon on the 13th, being in the latitude of $3^{\circ} 49'$ north, longitude $31^{\circ} 47'$ west, the wind became variable, between the N.E. and south; and we had light airs and squalls by turns, attended by hard showers of rain, and for the most part dark, gloomy weather, which continued till the evening of the 15th, when in the latitude of $5^{\circ} 47'$ north, longitude 31° west, we had three calm days, in which time we did not advance above ten or twelve leagues to the north. We had fair weather and rain by turns; the sky, for the most part, being obscured, and sometimes by heavy dense clouds which broke in excessive hard showers. At seven o'clock in the evening on the 18th, the calm was succeeded by a breeze at east, which, the next day, increasing and veering to and fixing at N.E., we stretched to N.W. with our tacks on board. We made no doubt that we had now got the N.E. trade-wind, as it was attended with fair weather, except now and then some light showers of rain; and as we advanced to the north, the wind increased and blew a fresh top-gallant gale.

On the 21st, I ordered the still to be fitted to the largest copper, which held about sixty-four gallons. The fire was lighted at four o'clock in the morning, and at six the still began to run. It was continued till six o'clock in the evening; in which time we obtained thirty-two gallons of fresh water, at the expense of one bushel and a half of coals; which was about three-fourths of a bushel more than was necessary to have boiled the ship's company's victuals only; but the expense of fuel was no object with me. The victuals were dressed in the small copper, the other being applied wholly to the still; and every method was made use of to obtain from it the greatest quantity of fresh water possible, as this was my sole motive for setting it to work. The mercury in the thermometer at noon was at eighty-four and a half, and higher it is seldom found at sea. Had it been lower, more water, under the same circumstances, would undoubtedly have been produced; for the colder the air is, the cooler you can keep the still, which will condense the steam the faster. Upon the whole, this is a useful invention; but I would advise no man to trust wholly to it. For although you may, provided you have plenty of fuel and good coppers, obtain as much water as will support life, you cannot, with all your efforts, obtain sufficient to support health, in hot climates especially, where it is the most wanting; for I am well convinced, that nothing contributes more to the health of seamen than having plenty of water.

The wind now remained invariably fixed at N.E. and E.N.E. and blew fresh with squalls, attended with showers of rain, and the sky for the most part cloudy. On the 25th, in the latitude of $16^{\circ} 12'$ north, longitude $37^{\circ} 20'$ west, seeing a ship to windward steering down upon us, we shortened sail in order to speak with her; but finding she was Dutch by her colours, we made sail again and left her to pursue her course, which we supposed was to some of the Dutch settlements in the West Indies. In the latitude of 20° north, longitude $39^{\circ} 45'$ west, the wind began to veer to E. by N. and E.; but the weather remained the same; that is, we continued to have it clear and cloudy by turns, with light squalls and showers. Our track was between N.W. by N. and N.N.W. till noon on the 28th, after which our course made good was N. by W., being at this time in the latitude of $21^{\circ} 21'$ north, longitude $40^{\circ} 6'$ west. Afterwards, the wind began to blow a little more steady, and was attended with fair and clear weather. At two o'clock in the morning of the 30th, being in the latitude of $24^{\circ} 20'$ north, longitude $40^{\circ} 47'$ west, a ship, steering to the westward, passed us within hail. We judged her to be English, as they answered us in that language; but we could not understand what they said, and they were presently out of sight.

In the latitude of $29^{\circ} 30'$, longitude $41^{\circ} 30'$, the wind slackened and veered more to the S.E. We now began to see some of that sea-plant which is commonly called gulf-weed, from a supposition that it comes from the Gulf of Florida. Indeed, for aught I know to the contrary, it may be a fact; but it seems not necessary, as it is certainly a plant which vegetates at sea. We continued to see it, but always in small pieces, till we reached the latitude 36° , longitude 39° west, beyond which situation no more appeared. On the 5th of July, in the latitude of $32^{\circ} 31' 30''$ north, longitude $40^{\circ} 29'$ west, the wind veered to the east, and blew very faint; the next day it was calm; the two following days we had

variable light airs and calms by turns; and, at length, on the 9th, having fixed at S.S.W., it increased to a fresh gale, with which we steered first N.E. and then E.N.E. with a view of making some of the Azores, or Western Isles. On the 11th, in the latitude of $36^{\circ} 45'$ north, longitude $36^{\circ} 45'$ west, we saw a sail which was steering to the west; and the next day we saw three more.

CHAPTER XI.—ARRIVAL OF THE SHIP AT THE ISLAND OF FAYAL, A DESCRIPTION OF THE PLACE, AND THE RETURN OF THE RESOLUTION TO ENGLAND.

At five o'clock in the evening of the 13th, we made the Island of Fayal, one of the Azores, and soon after that of Pico, under which we spent the night making short boards. At daybreak the next morning we bore away for the bay of Fayal, or De Horta, where, at eight o'clock, we anchored in twenty fathoms water, a clean sandy bottom, and something more than half-a-mile from the shore. Here we moored N.E. and S.W., being directed so to do by the master of the port, who came on board before we dropped anchor. When moored, the S.W. point of the bay bore S. 16° W., and the N.E. point N. 33° E.; the church at the N.E. end of the town N. 33° W.; the west point of St. George's Island N. 42° E., distant eight leagues; and the Isle of Pico extending from N. 74° E. to S. 46° E., distance four or five miles. We found in the bay the *Pourvoyeur*, a large French frigate, an American sloop, and a brig belonging to the place. She had come last from the river Amazon, where she took in a cargo of provisions for the Cape Verde Islands; but, not being able to find them, she steered for this place, where she anchored about half an hour before us.

As my sole design in stopping here was to give Mr. Wales an opportunity to find the rate of the watch, the better to enable us to fix, with some degree of certainty, the longitude of these islands, the moment we anchored, I sent an officer to wait on the English consul, and to notify our arrival to the governor, requesting his permission for Mr. Wales to make observations on shore, for the purpose above-mentioned. Mr. Dent, who acted as consul in the absence of Mr. Gathorne, not only procured this permission, but accommodated Mr. Wales with a convenient place in his garden to set up his instruments; so that he was enabled to observe equal altitudes the same day. We were not more obliged to Mr. Dent for the very friendly readiness he showed in procuring us this and every other thing we wanted, than for the very liberal and hospitable entertainment we met with at his house, which was open to accommodate us, both night and day.

During our stay, the ship's company was served with fresh beef; and we took on board about fifteen tons of water, which we brought off in the country boats, at the rate of about three shillings per ton. Ships are allowed to water with their own boats, but the many inconveniences attending it more than overbalance the expense of hiring shore-boats which is the most general custom. Fresh provisions for present use may be got, such as beef, vegetables, and fruit; and hogs, sheep, and poultry, for sea-stock, at a pretty reasonable price; but I do not know that any sea-provisions are to be had, except wine. The bullocks and hogs are very good, but the sheep are small, and wretchedly poor.

The principal produce of Fayal is wheat and Indian corn, with which they supply Pico, and some of the other isles. The chief town is called Villa de Horta. It is situated in the bottom of the bay, close to the edge of the sea, and is defended by two castles, one at each end of the town, and a wall of stone-work, extending along the sea-shore, from the one to the other. But these works are suffered to go to decay, and serve more for show than strength. They heighten the prospect of the city, which makes a fine appearance from the road; but, if we except the Jesuits' College, the monasteries, and churches, there is not another building that has anything to recommend it, either outside or in. There is not a glass window in the place, except what are in the churches, and in a country-house, which lately belonged to the English consul; all the others being latticed, which, to an Englishman, makes them look like prisons.

This little city, like all others belonging to the Portuguese, is crowded with religious

buildings; there being no less than three convents of men, and two of women; and eight churches, including those belonging to the convents, and the one in the Jesuits' College. The college is a fine structure, and is seated on an elevation in the pleasantest part of the city. Since the expulsion of that order, it has been suffered to go to decay, and will probably in a few years, be no better than a heap of ruins. Fayal, although the most noted for wine, does not raise sufficient for its own consumption. This article is raised on Pico, where there is no road for shipping; but being brought to De Horta, and from thence shipped abroad, chiefly to America, it has acquired the name of Fayal wine.

The bay, or road of Fayal, is situated at the east end of the isle, before the Villa do Horta, and facing the west end of Pico. It is two miles broad, and three quarters of a mile deep, and hath a semicircular form. The depth of water is from twenty to ten, and even six fathoms, a sandy bottom; except near the shore, and particularly near the S.W. head, off which the bottom is rocky, also without the line, which joins the two points of the bay, so that it is not safe to anchor far out. The bearing before-mentioned, taken when at anchor, will direct any one to the best ground. It is by no means a bad road, but the winds most to be apprehended are those which blow from between the S.S.W. and S.E.; the former is not so dangerous as the latter, because, with it, you can always get to sea. Besides this road, there is a small cove round the S.W. point, called Porto Piere, in which, I am told, a ship or two may lie in tolerable safety, and where they sometimes heave small vessels down.

A Portuguese captain told me, that about half a league from the road, in the direction of S.E., in a line between it and the south side of Pico, lies a sunken rock, over which is twenty-two feet water, and on which the sea breaks in hard gales from the south. He also assured me, that of all the shoals that are laid down in our charts and pilot-books about these isles, not one has any existence but the one between the islands of St. Michael and St. Mary, called Hornmingan.—This account may be believed, without relying entirely upon it. He further informed me, that it is forty-five leagues from Fayal to the island of Flores; and that there runs a strong tide between Fayal and Pico, the flood setting to the N.E., and the ebb to the S.W., but that out at sea, the direction is east and west. Mr. Wales having observed the times of high and low water, by the shore, concluded that it must be high water at the full and change about twelve o'clock, and the water riseth about four or five feet.

The distance between Fayal and Flores was confirmed by Mr. Rebiers, lieutenant of the French frigate, who told me, that, after being by estimation two leagues due south of Flores, they made forty-four leagues, on a S.E. by E. course by compass, to St. Catherine's Point, on Fayal.

I found the latitude of the ship at anchor in the bay	38° 31' 55" N
By a mean of seventeen sets of lunar observations, taken before we arrived, and reduced to the bay by the watch, the longitude was made	28 24 30 W.
By a mean of six sets after leaving it, and reduced back by the watch	28 53 22
Longitude by observation	28 38 56
Ditto, by the watch	28 55 48
Error of the watch on our arrival at Portsmouth	— 16 26½
True longitude by the watch	28 39 18½

I found the variation of the compass, by several azimuths, taken by different compasses on board the ship, to agree very well with the like observations made by Mr. Wales on shore; and yet the variation thus found is greater by 5°, than we found it to be at sea; for the azimuths taken on board, the evening before we came into the bay, gave no more than 16° 18' west variation, and the evening after we came out, 17° 33' west.

I shall now give some account of the variation, as observed in our run from the Island of Fernando de Noreño to Fayal. The least variation we found was 37' W., which was the

the Island of
which was the

day after we left Fernando de Noronho, and in the latitude of 33° S., longitude 32° 16' W. The next day, being nearly in the same longitude, and in the latitude of 1° 25' N. it was 1° 23' west ; and we did not find it increase till we got into the latitude of 5° N., longitude 31° west. After this our compasses gave different variations, viz., from 3° 57' to 5° 11' W., till we arrived in the latitude of 26° 44' north, longitude 41° west, when we found 6° west. It then increased gradually, so that in the latitude of 35° N. longitude 40° W., it was 10° 24' W. ; in the latitude of 38° 12' N., longitude 32½° W., it was 14° 47' ; and in sight of Fayal 16° 18' W., as mentioned above.

Having left the bay at four in the morning of the 19th, I steered for the west end of St. George's Island. As soon as we had passed it, I steered E. ¼ S. for the Island of Terceira ; and after having run thirteen leagues, we were not more than one league from the west end. I now edged away for the north side, with a view of ranging the coast to the eastern point, in order to ascertain the length of the island ; but the weather coming on very thick and hazy, and night approaching, I gave up the design, and proceeded with all expedition for England. On the 29th we made the land near Plymouth. The next morning we anchored at Spithead ; and the same day I landed at Portsmouth, and set out for London, in company with Messrs. Wales, Forsters, and Hodges.

Having been absent from England three years and eighteen days, in which time, and under all changes of climate, I lost but four men, and only one of them by sickness, it may not be amiss, at the conclusion of this journal, to enumerate the several causes to which, under the care of Providence, I conceive this uncommon good state of health experienced by my people was owing. In the Introduction, mention has been made of the extraordinary attention paid by the Admiralty, in causing such articles to be put on board as, either from experience or suggestion, it was judged would tend to preserve the health of the seamen. I shall not trespass upon the reader's time in mentioning them all, but confine myself to such as were found the most useful. We were furnished with a quantity of malt, of which was made *Sweet Wort*. To such of the men as showed the least symptoms of the scurvy, and also to such as were thought to be threatened with that disorder, this was given from one to two or three pints a day each man ; or in such proportion as the surgeon found necessary, which sometimes amounted to three quarts. This is, without doubt, one of the best antiscorbutic sea medicines yet discovered ; and, if used in time, will, with proper attention to other things, I am persuaded, prevent the scurvy from making any great progress for a considerable while. But I am not altogether of opinion that it will cure it at sea.

Sour Krait, of which we had a large quantity, is not only a wholesome vegetable food, but, in my judgment, highly antiscorbutic ; and it spoils not by keeping. A pound of this was served to each man when at sea, twice a week or oftener, as was thought necessary. *Portable Broth* was another great article, of which we had a large supply. An ounce of this to each man, or such other proportion as circumstances pointed out, was boiled in their pease, three days in the week ; and when we were in places where vegetables were to be got, it was boiled with them, and wheat or oatmeal every morning for breakfast ; and also with pease and vegetables for dinner. It enabled us to make several nourishing and wholesome messes, and was the means of making the people eat a greater quantity of vegetables than they would otherwise have done. *Rob of Lemon* and *Orange* is an antiscorbutic we were not without. The surgeon made use of it in many cases, with great success. Amongst the articles of victualling, we were supplied with *Sugar* in the room of *Oil*, and with *Wheat* for a part of our *Oatmeal* ; and were certainly gainers by the exchange. *Sugar*, I apprehend, is a very good antiscorbutic ; whereas oil (such as the navy is usually supplied with), I am of opinion, has the contrary effect.

But the introduction of the most salutary articles, either as provisions or medicines, will generally prove unsuccessful, unless supported by certain regulations. On this principle, many years' experience, together with some hints I had from Sir Hugh Palliser, Captains Campbell, Wallis, and other intelligent officers, enabled me to lay a plan whereby all was to be governed. The crew were at three watches, except upon some extraordinary occasions. By this means they were not so much exposed to the weather as if they had been at watch and watch ; and had generally dry clothes to shift themselves, when they happened to get

wet. Care was also taken to expose them as little to wet weather as possible. Proper methods were used to keep their persons, hammocks, bedding, clothes, &c., constantly clean and dry. Equal care was taken to keep the ship clean and dry betwixt decks. Once or twice a week she was aired with fires; and when this could not be done, she was smoked with gunpowder mixed with vinegar or water. I had also frequently a fire made in an iron pot at the bottom of the well, which was of great use in purifying the air in the lower parts of the ship. To this and to cleanliness, as well in the ship as amongst the people, too great attention cannot be paid; the least neglect occasions a putrid and disagreeable smell below, which nothing but fires will remove. Proper attention was paid to the ship's coppers, so that they were kept constantly clean. The fat which boiled out of the salt beef and pork, I never suffered to be given to the people; being of opinion that it promotes the scurvy.

I was careful to take in water wherever it was to be got, even though we did not want it. Because I look upon fresh water from the shore to be more wholesome than that which has been kept some time on board a ship. Of this essential article we were never at an allowance, but had always plenty for every necessary purpose. Navigators in general cannot, indeed, expect, nor would they wish to meet with, such advantages in this respect, as fell to my lot. The nature of our voyage carried us into very high latitudes. But the hardships and dangers inseparable from that situation, were, in some degree, compensated by the singular felicity we enjoyed, of extracting inexhaustible supplies of fresh water from an ocean strewed with ice. We came to few places where either the art of man or the bounty of nature had not provided some sort of refreshment or other, either in the animal or vegetable way. It was my first care to procure whatever of any kind could be met with, by every means in my power; and to oblige our people to make use thereof, both by my example and authority; but the benefits arising from refreshments of any kind soon became so obvious, that I had little occasion to recommend the one or to exert the other.

It doth not become me to say how far the principal objects of our voyage have been obtained. Though it hath not abounded with remarkable events, nor been diversified by sudden transitions of fortune; though my relation of it has been more employed in tracing our course by sea, than in recording our operations on shore; this, perhaps, is a circumstance from which the curious reader may infer, that the purposes for which we were sent into the southern hemisphere were diligently and effectually pursued. Had we found out a continent there, we might have been better enabled to gratify curiosity; but we hope our not having found it, after all our persevering searches, will leave less room for future speculation about unknown worlds remaining to be explored. But, whatever may be the public judgment about other matters, it is with real satisfaction, and without claiming any merit but that of attention to my duty, that I can conclude this account with an observation which facts enable me to make, that our having discovered the possibility of preserving health amongst a numerous ship's company, for such a length of time, in such varieties of climate and amidst such continued hardships and fatigues, will make this voyage remarkable in the opinion of every benevolent person, when the disputes about a southern continent shall have ceased to engage the attention, and to divide the judgment of philosophers.

COOK'S THIRD VOYAGE.

A VOYAGE TO THE PACIFIC OCEAN,

TO DETERMINE

THE POSITION AND EXTENT OF THE WEST SIDE OF NORTH AMERICA; ITS DISTANCE
FROM ASIA; AND THE PRACTICABILITY OF A NORTHERN PASSAGE TO EUROPE.

PERFORMED UNDER THE DIRECTION OF

CAPTAINS COOK, CLERKE, AND GORE.

IN HIS MAJESTY'S SHIPS THE RESOLUTION AND DISCOVERY, IN THE YEARS
1776, 1777, 1778, 1779, AND 1780.

PART I.

WRITTEN BY CAPTAIN COOK.

A VOYAGE TO THE PACIFIC OCEAN.

PART I.

BOOK I.

TRANSACTIONS FROM THE BEGINNING OF THE VOYAGE TILL OUR DEPARTURE FROM NEW ZEALAND.

CHAPTER I.—VARIOUS PREPARATIONS FOR THE VOYAGE.—OMAI'S BEHAVIOUR ON EMBARKING.—OBSERVATIONS FOR DETERMINING THE LONGITUDE OF SHEERNESS AND THE NORTH FORELAND.—PASSAGE OF THE RESOLUTION FROM DEPTFORD TO PLYMOUTH.—EMPLOYMENTS THERE.—COMPLEMENTS OF THE CREWS OF BOTH SHIPS, AND NAMES OF THE OFFICERS.—OBSERVATIONS TO FIX THE LONGITUDE OF PLYMOUTH.—DEPARTURE OF THE RESOLUTION.

HAVING, on the 9th day of February, 1776, received a commission to command his Majesty's sloop the *Resolution*, I went on board the next day, hoisted the pendant, and began to enter men. At the same time, the *Discovery*, of three hundred tons' burthen, was purchased into the service, and the command of her given to Captain Clerke, who had been my second Lieutenant on board the *Resolution*, in my second voyage round the world, from which we had lately returned. These two ships were, at this time, in the dock at Deptford, under the hands of the shipwrights, being ordered to be equipped to make farther discoveries in the Pacific Ocean, under my direction.

On the 9th of March the *Resolution* was hauled out of dock into the river, where we completed our rigging, and took on board the stores and provisions requisite for a voyage of such duration. Both ships, indeed, were supplied with as much of every necessary article as we could conveniently stow, and with the best of every kind that could be procured. And, besides this, everything that had been found, by the experience acquired during our former extensive voyages, to be of any utility in preserving the health of seamen, was supplied in abundance.

It was our intention to have sailed to Long Reach on the 6th of May, when a pilot came on board to carry us thither; but it was the 29th before the wind would permit us to move, and the 30th before we arrived at that station, where our artillery, powder, shot, and other ordnance stores were received. While we lay in Long Reach, thus employed, the Earl of Sandwich, Sir Hugh Palliser, and others of the Board of Admiralty, as the least mark of the very great attention they had all along shown to this equipment, paid us a visit on the 8th of June, to examine whether everything had been completed conformably to their intentions and orders, and to the satisfaction of all who were to embark in the voyage. They, and several other noblemen and gentlemen, their friends, honoured me with their company at dinner on that day; and, on their coming on board, and also on their going ashore, we saluted them with seventeen guns, and three cheers.

With the benevolent view of conveying some permanent benefit to the inhabitants of Otaheite, and of the other islands in the Pacific Ocean, whom we might happen to visit, his Majesty having commanded some useful animals to be carried out, we took on board, on the 10th, a bull, two cows, with their calves, and some sheep, with hay and corn for their

subsistence; intending to add to these other useful animals, when I should arrive at the Cape of Good Hope. I was also, from the same laudable motives, furnished with a sufficient quantity of such of our European garden-seeds as could not fail to be a valuable present to our newly-discovered islands, by adding fresh supplies of food to their own vegetable productions. Many other articles, calculated to improve the condition of our friends in the other hemisphere in various ways, were, at the same time, delivered to us by order of the Board of Admiralty. And both ships were provided with a proper assortment of iron tools and trinkets, as the means of enabling us to traffic and to cultivate a friendly intercourse with the inhabitants of such new countries as we might be fortunate enough to meet with.

The same humane attention was extended to our own wants. Some additional clothing, adapted to a cold climate, was ordered for our crews; and nothing was denied to us that could be supposed in the least conducive to health or even to convenience. Nor did the extraordinary care of those at the head of the naval department stop here. They were equally solicitous to afford us every assistance towards rendering our voyage of public utility. Accordingly, we received on board, next day, several astronomical and nautical instruments, which the Board of Longitude intrusted to me and to Mr. King, my second lieutenant; we having engaged to that board to make all the necessary observations during the voyage, for the improvement of astronomy and navigation; and, by our joint labours, to supply the place of a professed observer. Such a person had been originally intended to be sent out in my ship.

The Board likewise put into our possession the same watch, or time-keeper, which I had carried out in my last voyage, and had performed its part so well. It was a copy of Mr. Harrison's, constructed by Mr. Kendall. This day, at noon, it was found to be too slow for mean time at Greenwich, by $3^{\circ} 31' .890$; and by its rate of going, it lost on mean time, $1' .209$ per day. Another time-keeper, and the same number and sort of instruments for making observations, were put on board the *Discovery*, under the care of Mr. William Baily, who, having already given satisfactory proofs of his skill and diligence as an observer, while employed in Captain Furneaux' ship, during the late voyage, was engaged a second time in that capacity, to embark with Captain Clerke.

Mr. Anderson, my surgeon, who, to skill in his immediate profession, added great proficiency in natural history, was as willing as he was qualified to describe everything in that branch of science which should occur worthy of notice. As he had already visited the South Sea Islands in the same ship, and been of singular service, by enabling me to enrich my relation of that voyage with various useful remarks on men and things, I reasonably expected to derive considerable assistance from him in recording our new proceedings. I had several young men amongst my sea-officers who, under my direction, could be usefully employed in constructing charts, in taking views of the coasts and headlands near which we should pass, and in drawing plans of the bays and harbours in which we should anchor. A constant attention to this I knew to be highly requisite, if we would render our discoveries profitable to future navigators. And that we might go out with every help that could serve to make the result of our voyage entertaining to the generality of readers, as well as instructive to the sailor and scholar, Mr. Webber was pitched upon, and engaged to embark with me, for the express purpose of supplying the unavoidable imperfections of written accounts, by enabling us to preserve and to bring home such drawings of the most memorable scenes of our transactions as could only be executed by a professed and skilful artist.

Every preparation being now completed, I received an order to proceed to Plymouth, and to take the *Discovery* under my command. I accordingly gave Captain Clerke two orders; one to put himself under my command, and the other to carry his ship round to Plymouth. On the 15th, the *Resolution* sailed from Long Reach, with the *Discovery* in company, and the same evening they anchored at the Nore. Next day the *Discovery* proceeded, in obedience to my order; but the *Resolution* was ordered to remain at the Nore till I should join her, being at this time in London.

As we were to touch at Otaheite and the Society Islands, in our way to the intended scene of our fresh operations, it had been determined not to omit this opportunity (the only

[Cook's Voyages.

one ever likely to happen) of carrying Omai back to his native country *. Accordingly, everything being ready for our departure, he and I set out together from London on the 24th, at six o'clock in the morning. We reached Chatham between ten and eleven o'clock and after dining with Commissioner Proby, he very obligingly ordered his yacht to carry us to Sheerness, where my boat was waiting to take us on board. Omai left London with a mixture of regret and satisfaction. When we talked about England and about those who, during his stay, had honoured him with their protection or friendship, I could observe that his spirits were sensibly affected, and that it was with difficulty he could refrain from tears. But the instant the conversation turned to his own islands, his eyes began to sparkle with joy. He was deeply impressed with a sense of the good treatment he had met with in England, and entertained the highest ideas of the country and of the people. But the pleasing prospect he now had before him of returning home, loaded with what he well knew would be esteemed invaluable treasures there; and the flattering hope which the possession of these gave him, of attaining to a distinguished superiority amongst his countrymen, were considerations which operated by degrees to suppress every uneasy sensation; and he seemed

* Omai, or, more properly, Mai (the *o* being only a particle prefixed in the native language to nouns in the nominative case), was a native of Raiatea, who having taken shelter in Huahine, after a defeat which his countrymen had sustained from the people of Borabora, persuaded Captain Furneaux, when he was at Huahine in Sept. 1775, to convey him to Britain, somewhat against the wishes of Captain Cook, who did not consider that his qualifications were such as to promise any great advantages to himself or his countrymen from such an expedition. Captain Cook's objections were well-founded; for Omai, although not destitute of intelligence, and, like the generality of the South Sea Islanders, possessing much quickness of apprehension and readiness to conform to the manners and customs of those by whom they are surrounded, was a man of very inferior capabilities to Tupia, the Otahitian chief and priest, whom Captain Cook took with him, on his return from his first voyage, but who unfortunately died at Batavia. Omai possessed no rank in his own country beyond that, as he himself stated, of a *hoa*, or attendant upon the king, and therefore was not a person who could be expected, even had every advantage been afforded him in England, to exercise much moral influence on his return. But the treatment he experienced here was as injudicious as the project of bringing him over at all. Being the first native of the South Sea Islands brought to England, he was sought after as a wonder, and became the "lion" of a season; he was introduced to fashionable parties, conducted to the splendid entertainments of the highest classes, and presented at court. In all these positions, the pliancy natural to the Tahitians and their congeners, enabled him to preserve a perfect propriety of demeanour, and his natural lively disposition, rendered him, with his imperfect English (a language varying so much from the idiom of his native tongue, as to render its perfect acquirement very difficult), an exceedingly entertaining guest. As such he was welcomed everywhere, and carried about from one public exhibition to another, without time being allowed him to comprehend any; but no effort was made to instruct him in any useful art, or to enable him to comprehend the wonders he beheld, or the condition of the society by which he was surrounded. Of all those who took an interest in him, Mr. Granville Sharp alone exerted himself to turn his attention to rational pursuits, by teaching him to write, and instructing him in some degree in the principles of Christianity.

When he departed from England, he was loaded with presents, but few of which were calculated to be of real service. He carried with him a coat of mail, a suit of armour, a musket, pistols, cartouch-box, cutlasses, powder

and ball; a portable organ and an electrical machine; but no implements of agriculture or useful tools are included in the catalogue of his treasures. The account of his final settlement in Huahine will be found in the subsequent pages. Captain Cook procured for him a grant of land, on which a house in the European style was erected for him; and he was furnished with seeds, plants, horses, goats, and other useful animals. His warlike stores rendered him a man of consequence to the king, who gave him his daughter in marriage, and honoured him with the name of *Paari* (wise, or instructed), by which name, Mr. Ellis informs us, he is now always spoken of by the natives, several of whom still remember him. So far, however, from becoming the instructor or improver of the natives, he seems to have sunk into the mere compliant tool of the king, who, Mr. Ellis states, "not only availed himself of the effects of his fire-arms in periods of war, but frequently ordered him to shoot at a man at a certain distance, in order to see how far the musket would do execution, or to despatch with his pistol, in the presence of the king, the ill-fated objects of his deadly anger."

Mr. Ellis further informs us (Polynesian Researches, vol. ii. p. 370, second edition, 12mo, 1831), that "the spot where Mai's house stood is still called Beretani, or Britain, by the inhabitants of Huahine. A shaddock-tree, which the natives say was planted by Captain Cook himself, while the vessels lay at anchor, is still growing on what was once part of his garden. The animals, with the exception of the goats and pigs, have all died; and in this instance, the benevolent intentions of the British government, in sending out horses, cattle, &c., proved abortive. The helmet, and some other parts of his armour, with several cutlasses, are still preserved, and, when we arrived in Huahine, were displayed on the sides of the house standing on the spot where Mai's dwelling was erected by Captain Cook. A few of the trinkets, such as a jack-in-the-box, a kind of serpent that darts out of a cylindrical case when the lid is removed, were preserved with care by one of the principal chiefs, who, when we first saw them, considered them great curiosities, and exhibited them as a mark of his condescension, to particular favourites. What became of the organ and the electrical machine, I never knew. Among the curiosities preserved by the young chief of Tahaa, there was an article that I was very glad to see; it was a large quarto English Bible, with numerous coloured engravings, which were the only objects of attraction with the natives. I was told it belonged to Paari, or Mai, and hope it was given him among the presents from England, although no mention whatever is made of a Bible, or any other book, among the various articles enumerated by those who conveyed him to his native shores."—Ed.

to be quite happy when he got on board the ship. He was furnished by his Majesty with an ample provision of every article which, during our intercourse with his country, we had observed to be in any estimation there, either as useful or as ornamental. He had, besides, received many presents of the same nature from Lord Sandwich, Mr. Banks, and several other gentlemen and ladies of his acquaintance. In short, every method had been employed, both during his abode in England and at his departure, to make him the instrument of conveying to the inhabitants of the islands of the Pacific Ocean the most exalted opinion of the greatness and generosity of the British nation.

While the *Resolution* lay at the Nore, Mr. King made several observations for finding the longitude by the watch. The mean of them all gave $0^{\circ} 44' 0''$, for the longitude of the ship. This, reduced to Sheerness, by the bearing and estimated distance, will make that place to be $0^{\circ} 37' 0''$ east of Greenwich; which is more by seven miles than Mr. Lyons made it, by the watch which Lord Mulgrave had with him, on his voyage towards the North Pole. Whoever knows anything of the distance between Sheerness and Greenwich, will be a judge which of these two observations is nearest the truth. The variation of the needle here, by a mean of different sets, taken with different compasses, was $20^{\circ} 37'$ west.

On the 25th, about noon, we weighed anchor, and made sail for the Downs, through the Queen's Channel, with a gentle breeze at north-west by west. At nine in the evening we anchored, with the North Foreland bearing south by east, and Margate Point south-west by south. Next morning, at two o'clock, we weighed and stood round the Foreland; and when it bore north, allowing for the variation of the compass, the watch gave $1^{\circ} 24'$ east longitude, which, reduced to the Foreland, will be $1^{\circ} 21'$ east. Lunar observations, made the preceding evening, fixed it at $1^{\circ} 20'$ east. At eight o'clock the same morning, we anchored in the Downs. Two boats had been built for us at Deal, and I immediately sent on shore for them. I was told that many people had assembled there to see *Omai*; but to their great disappointment he did not land.

Having received the boats on board, and a light breeze at south-south-east springing up, we got under sail the next day at two o'clock in the afternoon. But the breeze soon died away, and we were obliged to anchor again till ten o'clock at night. We then weighed, with the wind at east, and proceeded down the channel. On the 30th, at three o'clock in the afternoon, we anchored in Plymouth Sound, where the *Discovery* had arrived only three days before. I saluted Admiral Amherst, whose flag was flying on board the *Ocean*, with thirteen guns, and he returned the compliment with eleven.

It was the first object of our care, on arriving at Plymouth, to replace the water and provisions that we had expended, and to receive on board a supply of Port wine. This was the employment which occupied us on the 1st and 2d of July. During our stay here, the crews were served with fresh beef every day: and I should not do justice to Mr. Ommanney, the agent-victualler, if I did not take this opportunity to mention, that he showed a very obliging readiness to furnish me with the best of everything that lay within his department. I had been under the like obligations to him on my setting out upon my last voyage. Commissioner Ourry, with equal zeal for the service, gave us every assistance that we wanted from the naval yard.

It could not but occur to us as a singular and affecting circumstance, that at the very instant of our departure upon a voyage, the object of which was to benefit Europe by making fresh discoveries in North America, there should be the unhappy necessity of employing others of his Majesty's ships, and of conveying numerous bodies of land forces, to secure the obedience of those parts of that continent which had been discovered and settled by our countrymen in the last century. On the 6th, his Majesty's ships *Diamond*, *Ambuscade*, and *Unicorn*, with a fleet of transports, consisting of sixty-two sail, bound to America, with the 1st division of the Hessian troops, and some horse, were forced into the Sound by a strong north-west wind. On the 8th, I received, by express, my instructions for the voyage, and an order to proceed to the Cape of Good Hope with the *Resolution*. I was also directed to leave an order for Captain Clerke to follow us, as soon as he should join his ship; he being, at this time, detained in London.

were justly thought to have exerted such uncommon abilities, and to have accomplished such perilous enterprises, that their names have been handed down to posterity as so many Argonauts. Nay, even the hulks of the ships that carried them, though not converted into constellations in the heavens, used to be honoured and visited as sacred relics upon earth. We, in the present age of improved navigation, who have been instructed by their labours, and have followed them as our guides, have no such claim to fame. Some merit, however, being still, in the public opinion, considered as due to those who sail to unexplored quarters of the globe, in conformity to this favourable judgment, I prefixed to the account of my last voyage the names of the officers of both my ships, and a table of the number of their respective crews. The like information will be expected from me at present.

The Resolution was fitted out with the same complement of officers and men she had before; and the Discovery's establishment varied from that of the Adventure, in the single instance of her having no marine officer on board. This arrangement was to be finally completed at Plymouth; and, on the 9th, we received the party of marines allotted for our voyage. Colonel Bell, who commanded the division at this port, gave me such men for the detachment as I had reason to be satisfied with. And the supernumerary seamen, occasioned by this reinforcement, being turned over into the Ocean man-of-war, our several complements remained fixed, as represented in the following table:—

On the 10th, the commissioner and pay-clerks came on board, and paid the officers and crew up to the 30th of last month. The petty officers and seamen had besides, two months'

wages in advance. Such indulgence to the latter is no more than what is customary in the navy. But the payment of what was due to the superior officers was humanely ordered by the Admiralty, in consideration of our peculiar situation, that we might be better able to defray the very great expense of furnishing ourselves with a stock of necessaries for a voyage which, probably, would be of unusual duration, and to regions where no supply could be expected.

Nothing now obstructing my departure but a contrary wind, which blew strong at south-west, in the morning of the 11th I delivered into the hands of Mr. Burney, first lieutenant of the *Discovery*, Captain Clerke's sailing orders; a copy of which I also left with the officer * commanding his Majesty's ships at Plymouth, to be delivered to the Captain immediately on his arrival. In the afternoon, the wind moderating, we weighed with the ebb, and got farther out, beyond all the shipping in the Sound; where, after making an unsuccessful attempt to get to sea, we were detained most of the following day, which was employed in receiving on board a supply of water; and, by the same vessel that brought it, all the empty casks were returned.

As I did not imagine my stay at Plymouth would have been so long as it proved, we did not get our instruments on shore to make the necessary observations for ascertaining the longitude by the watch. For the same reason, Mr. Baily did not set about this, till he found that the *Discovery* would probably be detained some days after us. He then placed his quadrant upon Drake's Island; and had time, before the *Resolution* sailed, to make observations sufficient for the purpose we had in view. Our watch made the island to lie $4^{\circ} 11'$, and his $4^{\circ} 13\frac{1}{2}'$ west of Greenwich. Its latitude, as found by Messrs. Wales and Baily, on the last voyage, is $50^{\circ} 21' 30''$ north.

We weighed again at eight in the evening, and stood out of the Sound, with a gentle breeze at north-west by west.

CHAPTER II.—PASSAGE OF THE *RESOLUTION* TO TENERIFFE.—RECEPTION THERE.—DESCRIPTION OF SANTA CRUZ ROAD.—REFRESHMENTS TO BE MET WITH.—OBSERVATIONS FOR FIXING THE LONGITUDE OF TENERIFFE.—SOME ACCOUNT OF THE ISLAND.—BOTANICAL OBSERVATIONS.—CITIES OF SANTA CRUZ AND LAGUNA.—AGRICULTURE.—AIR AND CLIMATE.—COMMERCE.—INHABITANTS.

We had not been long out of Plymouth Sound, before the wind came more westerly, and blew fresh, so that we were obliged to ply down the Channel; and it was not till the 14th, at eight in the evening, that we were off the Lizard. On the 16th, at noon, St. Agnes's light house, on the Isles of Scilly, bore north-west by west, distant seven or eight miles. Our latitude was now $49^{\circ} 53' 30''$ north, and our longitude, by the watch, $6^{\circ} 11'$ west. Hence, I reckon that St. Agnes's light-house is in $49^{\circ} 57' 30''$ north latitude, and in $6^{\circ} 20'$ of west longitude. On the 17th† and 18th we were off Ushant, and found the longitude of the island to be, by the watch, $5^{\circ} 18' 37''$ west. The variation was $23^{\circ} 0' 50''$, in the same direction.

With a strong gale at south, on the 19th, we stood to the westward, till eight o'clock in the morning; when the wind shifting to the west and north-west, we tacked and stretched to the southward. At this time, we saw nine sail of large ships, which we judged to be French men-of-war. They took no particular notice of us, nor we of them. At ten o'clock in the morning of the 22d, we saw Cape Ortegal; which at noon bore south-east, half south, about four leagues distant. At this time we were in the latitude of $44^{\circ} 6'$ north; and our longitude by the watch, was $8^{\circ} 23'$ west. After two days of calm weather we passed Cape Finisterre, on the afternoon of the 24th, with a fine gale at north-north-east. The longitude

t. The longitude

of this Cape, by the watch, is 9° 29' west; and, by the mean of forty-one lunar observations, made before and after we passed it, and reduced to it by the watch, the result was 9° 19' 12".

On the 30th at six minutes and thirty-eight seconds past ten o'clock at night, apparent time, I observed with a night-telescope, the moon totally eclipsed. By the *ephemeris*, the same happened at Greenwich at nine minutes past eleven o'clock: the difference being one hour, two minutes, and twenty-two seconds, or 15° 35' 30" of longitude. The watch, for the same time, gave 15° 26' 45" longitude west; latitude 31° 10' north. No other observation could be made on this eclipse, as the moon was hid behind the clouds the greater part of the time; and, in particular, when the beginning and end of total darkness, and the end of the eclipse, happened.

Finding that we had not hay and corn sufficient for the subsistence of the stock of animals on board, till our arrival at the Cape of Good Hope, I determined to touch at Teneriffe, to get a supply of these, and of the usual refreshments for ourselves; thinking that island, for such purposes, better adapted than Madeira. At four in the afternoon of the 31st, we saw Teneriffe, and steered for the eastern part. At nine, being near it, we hauled up, and stood off and on during the night. At daylight on the morning of the 1st of August, we sailed round the east Point of the island; and, about eight o'clock, anchored on the south-east side of it, in the road of Santa Cruz, in twenty-three fathoms water; the bottom, sand and ower. Punta de Nago, the east point of the road, bore north 64° east; St. Francis's church, remarkable for its high steeple, west-south-west; the Pic, south 65° west; and the south-west point of the road, on which stands a fort or castle, south 39° west. In this situation, we moored north-east and south-west, with a cable each way, being near half a mile from the shore. We found, riding in this road, La Boussole, a French frigate, commanded by the *Chevalier de Borda*; two brigantines of the same nation; an English brigantine from London, bound to Senegal; and fourteen sail of Spanish vessels.

No sooner had we anchored, than we were visited by the master of the port, who satisfied himself with asking the ship's name. Upon his leaving us, I sent an officer ashore to present my respects to the Governor; and to ask his leave to take in water, and to purchase such articles as we were in want of. All this he granted with the greatest politeness; and, soon after, sent an officer on board, to compliment me on my arrival. In the afternoon, I waited upon him in person, accompanied by some of my officers; and, before I returned to my ship, bespoke some corn and straw for the live stock; ordered a quantity of wine from Mr. McCarriek, the contractor, and made an agreement with the master of a Spanish boat to supply us with water, as I found that we could not do it ourselves.

The road of Santa Cruz is situated before the town of the same name, on the south-east side of the island. It is, as I am told, the principal road of Teneriffe, for shelter, capacity, and the goodness of its bottom. It lies entirely open to the south-east and south winds. But these winds are never of long continuance; and, they say, there is not an instance * of a ship driving from her anchors on shore. This may, in part, be owing to the great care they take in mooring them; for I observed, that all the ships we met with there had four anchors out; two to the north-east, and two to the south-west: and their cables buoyed up with casks. Ours suffered a little by not observing this last precaution.

At the south-west part of the road, a stone pier runs out into the sea from the town, for the convenience of loading and landing of goods. To this pier, the water that supplies the shipping is conveyed. This, as also what the inhabitants of Santa Cruz use, is derived from a rivulet that runs from the hills, the greatest part of which comes into the town in wooden spouts or troughs, that are supported by slender posts, and the remainder doth not reach the sea; though it is evident, from the size of the channel, that sometimes large torrents rush down. At this time these troughs were repairing, so that fresh water, which is very good here, was scarce.

Were we to judge from the appearance of the country in the neighbourhood of Santa

* Though no such instance was known to those from whom Captain Cook had this information, we learn from Glas that, some years before he was at Teneriffe, almost all the shipping in the road were driven on shore.—

See Glas's Hist. of the Canary Islands, p. 235. We may well suppose the precautions now used have prevented any more such accidents happening. This will sufficiently justify Captain Cook's account.

On the 17th, the
th gunpowder. The

Cruz, it might be concluded that Teneriffe is a barren spot, insufficient to maintain even its own inhabitants. The ample supplies, however, which we received, convinced us that they had enough to spare for visitors. Besides wine, which is the chief produce of the island, beef may be had at a moderate price. The oxen are small and bony, and weigh about ninety pounds a quarter. The meat is but lean, and was, at present, sold for half a bit (threepence sterling) a pound. I, unadvisedly, bought the bullocks alive, and paid considerably more. Hogs, sheep, goats, and poultry, are likewise to be bought at the same moderate rate; and fruits are in great plenty. At this time we had grapes, figs, pears, mulberries, plantains, and musk-melons. There is a variety of other fruits produced here, though not in season at this time. Their pumpkins, onions, and potatoes, are exceedingly good of their kind, and keep better at sea than any I ever before met with.

The Indian corn, which is also their produce, cost me about three shillings and sixpence a bushel; and the fruits and roots were, in general, very cheap. They have not any plentiful supply of fish from the adjoining sea; but a very considerable fishery is carried on by their vessels upon the coast of Barbary; and the produce of it sells at a reasonable price. Upon the whole, I found Teneriffe to be a more eligible place than Madeira for ships bound on long voyages to touch at; though the wine of the latter, according to my taste, is as much superior to that of the former, as strong beer is to small. To compensate for this, the difference of prices is considerable; for the best Teneriffe wine was now sold for twelve pounds a pipe; whereas a pipe of the best Madeira would have cost considerably more than double that sum*.

The Chevalier de Borda, commander of the French frigate now lying in Santa Cruz road, was employed, in conjunction with Mr. Varila, a Spanish gentleman, in making astronomical observations for ascertaining the going of two time-keepers which they had on board their ship. For this purpose, they had a tent pitched on the pier head, where they made their observations, and compared their watches every day at noon with the clock on shore by signals. These signals the Chevalier very obligingly communicated to us; so that we could compare our watch at the same time. But our stay was too short to profit much by his kindness.

The three days' comparisons which we made, assured us that the watch had not materially, if at all, altered her rate of going; and gave us the same longitude, within a very few seconds, that was obtained by finding the time from observations of the sun's altitude from the horizon of the sea. The watch, from a mean of these observations, on the 1st, 2nd, and 3rd of August, made the longitude $16^{\circ} 31'$ west; and, in like manner, the latitude was found to be $28^{\circ} 30' 11''$ north. Mr. Varila informed us, that the true longitude was $18^{\circ} 35' 30''$ from Paris, which is only $16^{\circ} 16' 30''$ from Greenwich; less than what our watch gave by $14' 30''$. But, far from looking upon this as an error in the watch, I rather think it a confirmation of its having gone well; and that the longitude by it may be nearer the truth than any other. It is farther confirmed by the lunar observations that we made in the road, which gave $16^{\circ} 37' 10''$. Those made before we arrived, and reduced to the road by the watch, gave $16^{\circ} 33' 30''$. And those made after we left it, and reduced back in the same manner, gave $16^{\circ} 28'$. The mean of the three is $16^{\circ} 30' 40''$.

To reduce these several longitudes, and the latitude to the Pic of Teneriffe, one of the most noted points of land with geographers (to obtain the true situation of which, I have entered into this particular discussion), I had recourse to the bearing, and a few hours of the ship's run after leaving Santa Cruz road; and found it to be $12^{\circ} 11'$ south of the road, and $29^{\circ} 30''$ of longitude west of it. As the base, which helped to determine this, was partly estimated, it is liable to some error; but I think I cannot be much mistaken. Dr. Maskelyne, in his *British Mariner's Guide*, places the Pic in the latitude of $28^{\circ} 12' 54''$.

* Formerly, there was made at Teneriffe a great quantity of Canary sack, which the French call Vin de Malvesie; and we, corruptly after them, name Malmsiey (from Malvesia, a town in the Morea, famous for such luscious wine). In the last century, and still later, much of this was imported into England; but little wine is now

made there, but of the sort described by Captain Cook. Not more than fifty pipes of the rich Canary was annually made in Glas's time; and he says, they now gather the grapes when green, and make a dry hard wine of them fit for hot climates, p. 262.

This, with the bearing from the road, will give the difference of longitude 43', which considerably exceeds the distance they reckon the Pic to be from Santa Cruz. I made the latitude of the Pic to be 28° 18' north. Upon that supposition, its longitude will be as follows:—

By	the time-keeper	17° 0' 30"	} west.
	lunar observations	16° 30' 20"	
	Mr. Varila	16° 46' 0"	

But if the latitude of it is 28° 12' 54", as in the *British Mariner's Guide*, its longitude will be 13° 30' more westerly.

The variation, when we were at anchor in the road, by the mean of all our compasses, was found to be 14° 41' 20" west. The dip of the north end of the needle was 61° 52' 30".

Some of Mr. Anderson's remarks on the natural appearances of Teneriffe and its productions; and what he observed himself, or learnt by information, about the general state of the island, will be of use, particularly in marking what changes may have happened there since Mr. Glas visited it. They here follow in his own words:—

"While we were standing in for the land, the weather being perfectly clear, we had an opportunity of seeing the celebrated Pic of Teneriffe. But I own I was much disappointed in my expectation with respect to its appearance. It is, certainly, far from equalling the noble figure of Pico, one of the western isles which I have seen; though its perpendicular height may be greater. This circumstance, perhaps, arises from its being surrounded by other very high hills; whereas Pico stands without a rival. Behind the city of Santa Cruz, the country rises gradually, and is of a moderate height. Beyond this, to the south-westward, it becomes higher, and continues to rise towards the Pic, which, from the road, appears but little higher than the surrounding hills. From thence it seems to decrease, though not suddenly, as far as the eye can reach. From a supposition that we should not stay above one day, I was obliged to contract my excursions into the country; otherwise, I had proposed to visit the top of this famous mountain*. To the eastward of Santa Cruz, the island appears perfectly barren. Ridges of hills run towards the sea; between which ridges are deep valleys, terminating at mountains or hills that run across, and are higher than the former. Those that run towards the sea are marked by impressions on their sides, which make them appear as a succession of conic hills, with their tops very rugged. The higher ones that run across, are more uniform in their appearance.

"In the forenoon of the 1st of August, after we had anchored in the road, I went on shore to one of these valleys, with an intention to reach the top of the remoter hills, which seemed covered with wood; but time would not allow me to get further than their foot. After walking about three miles, I found no alteration in the appearance of the lower hills; which produce great quantities of the *Euphorbia canariensis*. It is surprising that this large succulent plant should thrive on so burnt-up a soil. When broken, which is easily done, the quantity of juice is very great; and it might be supposed that, when dried, it would shrivel to nothing; yet it is a pretty tough, though soft and light wood. The people here believe its juice to be so caustic as to erode the skin†; but I convinced them, though with much difficulty, to the contrary, by thrusting my finger into the plant full of it, without afterwards wiping it off. They break down the bushes of *euphorbia* and, suffering them to dry, carry them home for fuel. I met with nothing else growing there, but two or three small shrubs, and a few fig-trees near the bottom of the valley. The basis of the hills is a heavy, compact, blueish stone, mixed with some shining particles; and, on

* See an account of a journey to the top of the Pic of Teneriffe, in Sprat's History of the Royal Society, p. 200, &c. Glas also went to the top of it. History of the Canary Islands, p. 252 to 259. In the Philosophical Transactions, vol. xlvii. p. 353—356, we have Observations made, in going up the Pic of Teneriffe, by Dr. T. Heberden. The Doctor makes its height, above the level of the sea, to be 2566 fathoms, or 15,396 English feet; and says, that this was confirmed by two subsequent observations by himself, and another made by

Mr. Crosse, the consul. And yet, I find, that the Chevalier de Borda, who measured the height of this mountain in August 1776, makes it to be only 1931 French toises, or 12,340 English feet. See Dr. Forster's Observations during a Voyage round the World, p. 32.

† Glas, p. 231, speaking of this plant, says, that he "cannot imagine why the natives of the Canaries do not extract the juice, and use it instead of pitch, for the bottoms of their boats." We now learn from Mr. Anderson their reason for not using it.

the surface, large masses of red friable earth, or stone, are scattered about. I also often found the same substance disposed in thick *strata*; and the little earth, strewed here and there, was a blackish mould. There were likewise some pieces of slag; one of which, from its weight and smooth surface, seemed almost wholly metalline.

"The mouldering state of these hills is, doubtless, owing to the perpetual action of the sun, which calcines their surface. This mouldering part being afterwards washed away by the heavy rains, perhaps is the cause of their sides being so uneven. For, as the different substances of which they are composed are more or less easily affected by the sun's heat, they will be carried away in the like proportions. Hence, perhaps, the tops of the hills, being of the hardest rock, have stood, while the other parts on a declivity have been destroyed. As I have usually observed that the tops of most mountains that are covered with trees have a more uniform appearance, I am inclined to believe that this is owing to their being shaded.

"The city of Santa Cruz, though not large, is tolerably well built. The churches are not magnificent without; but within are decent, and indifferently ornamented. They are inferior to some of the churches at Madeira; but, I imagine, this rather arises from the different disposition of the people, than from their inability to support them better. For the private houses, and dress of the Spanish inhabitants of Santa Cruz, are far preferable to those of the Portuguese at Madeira; who, perhaps, are willing to strip themselves, that they may adorn their churches. Almost facing the stone pier at the landing-place is a handsome marble column, lately put up, ornamented with some human figures, that do no discredit to the artist; with an inscription in Spanish, to commemorate the occasion of the erection, and the date.

"In the afternoon of the 2nd, four of us hired mules to ride to the city of Laguna*, so called from an adjoining lake, about four miles from Santa Cruz. We arrived there between five and six in the evening; but found a sight of it very unable to compensate for our trouble, as the road was very bad, and the mules but indifferent. The place is, indeed, pretty extensive, but scarcely deserves to be dignified with the name of city. The disposition of its streets is very irregular; yet some of them are of a tolerable breadth, and have some good houses. In general, however, Laguna is inferior in appearance to Santa Cruz, though the latter is but small, if compared with the former. We were informed, likewise, that Laguna is declining fast; there being, at present, some vineyards where houses formerly stood; whereas Santa Cruz is increasing daily. The road leading from Santa Cruz to Laguna runs up a steep hill, which is very barren; but, lower down, we saw some fig-trees, and several corn-fields. These are but small, and not thrown into ridges, as is practised in England. Nor does it appear that they can raise any corn here without great labour, as the ground is so encumbered with stones, that they are obliged to collect and lay them in broad rows, or walls, at small distances. The large hills that run to the south-west, appeared to be pretty well furnished with trees. Nothing else worth noticing presented itself during this excursion, except a few aloe plants in flower, near the side of the road, and the cheerfulness of our guides, who amused us with songs by the way.

"Most of the laborious work in this island is performed by mules; horses being to appearance scarce, and chiefly reserved for the use of the officers. They are of a small size, but well-shaped and spirited. Oxen are also employed to drag their casks along upon a large clumsy piece of wood; and they are yoked by the head; though it doth not seem that this has any peculiar advantage over our method of fixing the harness on the shoulders. In my walks and excursions, I saw some hawks, parrots, which are natives of the island, the sea-swallow or tern, sea-gulls, partridges, wagtails, swallows, martins, blackbirds, and canary birds in large flocks. There are also lizards of the common, and another sort; some insects, as locusts; and three or four sorts of Dragon-flies.

"I had an opportunity of conversing with a sensible and well-informed gentleman residing here, and whose veracity I have not the least reason to doubt. From him I learnt some

* Its extended name is St. Christobal de la Laguna; and it used to be reckoned the capital of the island, the gentry and lawyers living there; though the Governor- General of the Canary Islands resides at Santa Cruz, as being the centre of their trade, both with Europe and America. particulars, which, during the short stay of three days, did not fall within my own obser-
vation. He informed me, that a shrub is common here, agreeing exactly with the descrip-
tion given by Tournefort and Linnaeus, of the tea shrub, as growing in China and Japan.
It is reckoned a weed, and he roots out thousands of them every year, from his vineyards.
The Spaniards, however, of the island, sometimes use it as tea, and ascribe to it all the
qualities of that imported from China. They also give it the name of tea; but what is
remarkable, they say it was found here when the islands were first discovered. Another
botanical curiosity, mentioned by him, is what they call the *impregnated lemon* *. It is a
perfect and distinct lemon, inclosed within another, differing from the outer one only in
being a little more globular. The leaves of the tree that produces this sort, are much
longer than those of the common one; and it was represented to me as being crooked, and
not equal in beauty.

"From him I learnt also, that a certain sort of grape growing here is reckoned an
excellent remedy in phtisical complaints. And the air and climate, in general, are remark-
ably healthful, and particularly adapted to give relief in such diseases. This he endeavoured
to account for, by its being always in one's power to procure a different temperature of the
air, by residing at different heights in the island; and he expressed his surprise that the
English physicians should never have thought of sending their consumptive patients to
Teneriffe, instead of Nice or Lisbon. How much the temperature of the air varies here, I
myself could sensibly perceive, only in riding from Santa Cruz up to Laguna, and you may
ascend till the cold becomes intolerable. I was assured that no person can live comfortably
within a mile of the perpendicular height of the Pic, after the month of August †. Although
some smoke constantly issues from near the top of the Pic, they have had no earthquake or
eruption of a volcano since 1704, when the port of Garrachica, where much of their trade
was formerly carried on, was destroyed ‡.

"Their trade, indeed, must be considered as very considerable; for they reckon that
forty thousand pipes of wine are annually made; the greatest part of which is either con-
sumed in the island, or made into brandy, and sent to the Spanish West Indies §. About
six thousand pipes were exported every year to North America, while the trade with it was
uninterrupted; at present, they think not above half the quantity. The corn they raise is,
in general, insufficient to maintain the inhabitants; but the deficiency used to be supplied
by importation from the North Americans, who took their wines in return. They make a
little silk; but unless we reckon the filtering-stones, brought in great numbers from Grand
Canary, the wine is the only considerable article of the foreign commerce of Teneriffe.

"None of the race of inhabitants found here when the Spaniards discovered the Canaries
now remain a distinct people||, having intermarried with the Spanish settlers; but their
descendants are known, from their being remarkably tall, large-boned, and strong. The
men are, in general, of a tawny colour, and the women have a pale complexion, entirely
destitute of that bloom which distinguishes our northern beauties. The Spanish custom of
wearing black clothes continues amongst them; but the men seem more indifferent about
this, and, in some measure, dress like the French. In other respects, we found the inhabit-

* The writer of the Relation of Teneriffe in Sprat's
Sprat's History, p. 207, takes notice of this lemon as
produced here, and calls it *Pregnada*. Probably, *em-
pregnada*, the Spanish word for *impregnated*, is the
name it goes by.

† This agrees with Dr. T. Heberden's account, who
says that the sugar-loaf part of the mountain, or *la peri-
cosa* (as it is called), "which is an eighth part of a
league (or 980 feet) to the top, is covered with snow
the greatest part of the year." See Philosophical Trans-
actions, as quoted above.

‡ This port was then filled up by the rivers of burning
lava that flowed into it from a volcano; inasmuch that
houses are now built where ships formerly lay at anchor.
See Glas's Hist. p. 244.

§ Glas, p. 342, says, that they annually export no less
than fifteen thousand pipes of wine and brandy. In another

place, p. 252, he tells us, that the number of the inhabi-
tants of Teneriffe, when the last account was taken, was
no less than 96,000. We may reasonably suppose that
there has been a considerable increase of population since
Glas visited the island, which is above thirty years ago.
The quantity of wine annually consumed, as the common
beverage of at least one hundred thousand persons, must
amount to several thousand pipes. There must be a vast
expenditure of it, by conversion into brandy; to produce
one pipe of which, five or six pipes of wine must be dis-
tilled. An attention to these particulars will enable every
one to judge, that the account given to Mr. Anderson, of
an annual produce of 40,000 pipes of wine, has a founda-
tion in truth.

|| It was otherwise in Glas's time, when a few families
of the *Guanches* (as they are called) remained still in
Teneriffe, not blended with the Spaniards. Glas, p. 240.

ants of Teneriffe to be a decent and very civil people, retaining that grave cast which distinguishes those of their country from other European nations. Although we do not think that there is a great similarity between our manners and those of the Spaniards, it is worth observing, that Onai did not think there was much difference. He only said, that they seemed not so friendly as the English; and that, in their persons, they approached those of his countrymen."

CHAPTER III.—DEPARTURE FROM TENERIFFE.—DANGER OF THE SHIP NEAR BONAVIDA.—ISLE OF MAYO.—PORT PRAYA.—PRECAUTIONS AGAINST THE RAIN AND SULTRY WEATHER IN THE NEIGHBOURHOOD OF THE EQUATOR.—POSITION OF THE COAST OF BRAZIL.—ARRIVAL AT THE CAPE OF GOOD HOPE.—TRANSACTIONS THERE.—JUNCTION OF THE DISCOVERY.—MR. ANDERSON'S JOURNEY UP THE COUNTRY.—ASTRONOMICAL OBSERVATIONS.—NAUTICAL REMARKS ON THE PASSAGE FROM ENGLAND TO THE CAPE, WITH REGARD TO THE CURRENTS AND THE VARIATION.

HAVING completed our water, and got on board every other thing we wanted at Teneriffe, we weighed anchor on the 4th of August, and proceeded on our voyage, with a fine gale at north-east. At nine o'clock in the evening on the 10th*, we saw the island of Bonavista bearing S., distant little more than a league; though, at this time, we thought ourselves much farther off; but this proved a mistake. For, after hauling to the eastward till twelve o'clock, to clear the sunken rocks that lie about a league from the S.E. point of the island, we found ourselves, at that time, close upon them, and did but just weather the breakers. Our situation, for a few minutes, was very alarming. I did not choose to sound, as that might have heightened the danger without any possibility of lessening it. I make the N. end of the island of Bonavista to lie in the latitude of $16^{\circ} 17' N.$, and in the longitude of $22^{\circ} 59' W.$ As soon as we were clear of the rocks, we steered S.S.W., till daybreak next morning, and then hauled to the westward, to go between Bonavista and the Isle of Mayo, intending to look into Port Praya for the Discovery, as I had told Captain Clerke that I should touch there, and did not know how soon he might sail after me. At one in the afternoon, we saw the rocks that lie on the S.W. side of Bonavista, bearing S.E., distant three or four leagues.

Next morning, at six o'clock, the isle of Mayo bore S.S.E., distant about five leagues. In this situation we sounded, and found ground at sixty fathoms. At the same time the variation, by the mean of several azimuths taken with three different compasses, was $9^{\circ} 32\frac{1}{2}' W.$ At eleven o'clock, one extreme of Mayo bore E. by N., and the other S.E. by S. In this position, two roundish hills appeared near its N.E. part; farther on, a large and higher hill; and, at about two-thirds of its length, a single one that is peaked. At the distance we now saw this island, which was three or four miles, there was not the least appearance of vegetation, nor any relief to the eye from that lifeless brown which prevails in countries under the torrid zone that are unwooded.

Here I cannot help remarking that Mr. Nicholson, in his Preface to "Sundry Remarks and Observations made in a Voyage to the East Indies†," tells us, that "with eight degrees W. variation, or anything above that, you may venture to sail by the Cape de Verde Islands night or day, being well assured, with that variation, that you are to the eastward of them." Such an assertion might prove of dangerous consequence, were there any that would implicitly trust to it. We also tried the current, and found one setting S.W. by W., something more than half a mile an hour. We had reason to expect this, from the differences between the longitude given by the watch and dead reckoning, which, since our leaving Teneriffe, amounted to one degree. While we were amongst these islands we had

* As a proof of Captain Cook's attention, both to the discipline and to the health of his ship's company, it may be worth while to observe here, that it appears from his log-book, he "exercised them at great guns and small arms, and cleared and smoked the ship below decks,"

twice in the interval between the 4th and the 10th of August.

light breezes of wind, varying from the S.E. to E., and some calms. This shows that the Cape de Verde Islands are either extensive enough to break the current of the trade-wind, or that they are situated just beyond its verge, in that space where the variable winds, found on getting near the line, begin. The first supposition, however, is the most probable, as Dampier* found the wind westerly here in the month of February; at which time the trade-wind is supposed to extend farthest towards the equinoctial. The weather was hot and sultry, with some rain; and, for the most part, a dull whiteness prevailed in the sky, that seems a medium between fog and clouds. In general, the tropical regions seldom enjoy that clear atmosphere observable where variable winds blow; nor does the sun shine with such brightness. This circumstance, however, seems an advantage; for otherwise, perhaps, the rays of the sun, being uninterrupted, would render the heat quite unsupportable. The nights are, nevertheless, often clear and serene.

At nine o'clock in the morning of the 13th, we arrived before Port Praya, in the island of St. Jago, where we saw two Dutch East India ships, and a small brigantine at anchor. As the Discovery was not there, and we had expended but little water in our passage from Teneriffe, I did not think proper to go in, but stood to the southward. Some altitudes of the sun were now taken, to ascertain the true time. The longitude by the watch, deduced therefrom, was $23^{\circ} 48' W.$; the little island in the bay bore W.N.W., distant near three miles, which will make its longitude $23^{\circ} 51'$. The same watch, on my late voyage, made the longitude to be $23^{\circ} 30' W.$, and we observed the latitude to be $14^{\circ} 53' 30'' N.$

The day after we left the Cape de Verde Islands, we lost the N.E. trade-wind; but did not get that which blows from the S.E. till the 30th, when we were in the latitude of $2^{\circ} N.$, and in the twenty-fifth degree of W. longitude. During this interval†, the wind was mostly in the S.W. quarter. Sometimes it blew fresh, and in squalls; but for the most part a gentle breeze. The calms were few, and of short duration. Between the latitude of 12° and of $7^{\circ} N.$, the weather was generally dark and gloomy, with frequent rains, which enabled us to save as much water as filled most of our empty casks.

These rains, and the close sultry weather accompanying them, too often bring on sickness in this passage. Every bad consequence, at least, is to be apprehended from them; and commanders of ships cannot be too much upon their guard, by purifying the air between-decks with fires and smoke, and by obliging the people to dry their clothes at every opportunity. These precautions were constantly observed on board the Resolution‡ and Discovery; and we certainly profited by them, for we had now fewer sick than on either of my former voyages. We had, however, the mortification to find our ship exceedingly leaky in all her upper works. The hot and sultry weather we had just passed through, had opened her seams, which had been badly caulked at first, so wide, that they admitted the rain-water through as it fell. There was hardly a man that could lie dry in his bed; and the officers in the gun-room were all driven out of their cabins, by the water that came through the sides. The sails in the sail-room got wet; and before we had weather to dry them, many of them were much damaged, and a great expense of canvas and of time became necessary to make them in some degree serviceable. Having experienced the same defect in our sail-rooms on my late voyage, it had been represented to the yard-officers, who undertook to remove it. But it did not appear to me that anything had been done to remedy the complaint. To repair these defects the caulkers were set to work, as soon as we got into fair settled weather, to caulk the decks and inside weather works of the ship; for I would not trust them over the sides while we were at sea.

* Dampier's Voyages, vol. iii. p. 10.

† "On the 18th, I sunk a bucket with a thermometer seventy fathoms below the surface of the sea, where it remained two minutes; and it took three minutes more to haul it up. The mercury in the thermometer was at 66, which before, in the air, stood at 78, and in the surface of the sea at 79. The water which came up in the bucket contained, by Mr. Cavendish's table $\frac{1}{2}$ gr. 7 part salt; and that at the surface of the sea $\frac{1}{2}$ gr. 4. As this last was taken up after a smart shower of rain, it

might be lighter on that account."—Captain Cook's log-book.

‡ The particulars are mentioned in his log-book:—"On the 14th of August, a fire was made in the well, to air the ship below. On the 15th, the spare sails were aired upon deck, and a fire made to air the sail-room. On the 17th, cleaned and smoked betwixt decks, and the bread-room aired with fires. On the 21st, cleaned and smoked betwixt decks; and on the 22nd, the men's bedding was spread on deck to air."

On the first of September * we crossed the equator in the longitude of $27^{\circ} 38'$ W., with a fine gale at S.E. by S.; and notwithstanding my apprehensions of falling in with the coast of Brazil in stretching to the S.W., I kept the ship a full point from the wind. However, I found my fears were ill-grounded; for, on drawing near that coast, we met with the wind more and more easterly; so that, by the time we were in the latitude of 10° S., we could make a south-easterly course good. On the 8th we were in the latitude of $8^{\circ} 57'$ S.; which is a little to the southward of Cape St. Augustine, on the coast of Brazil. Our longitude, deduced from a very great number of lunar observations, was $34^{\circ} 16'$ W.; and by the watch $34^{\circ} 47'$. The former is $1^{\circ} 43'$, and the latter $2^{\circ} 14'$ more westerly than the island of Fernando de Noronha, the situation of which was pretty well determined during my late voyage †. Hence I concluded that we could not now be farther from the continent than twenty or thirty leagues at most; and perhaps not much less, as we neither had soundings, nor any other signs of land. Dr. Halley, however, in his voyage, published by Mr. Dalrymple, tells us ‡, that "he made no more than one hundred and two miles, meridian distance, from the island [Fernando de Noronha] to the coast of Brazil;" and seems to think that "currents could not be the whole cause" of his making so little. But I rather think that he was mistaken, and that the currents had hurried him far to the westward of his intended course. This was, in some measure, confirmed by our own observations; for we had found, during three or four days preceding the 8th, that the currents set to the westward; and, during the last twenty-four hours, it had set strong to the northward, as we experienced a difference of twenty-nine miles between our observed latitude and that by dead reckoning. Upon the whole, till some better astronomical observations are made on shore on the eastern coast of Brazil, I shall conclude that its longitude is thirty-five degrees and a half, or thirty-six degrees west, at most.

We proceeded on our voyage, without meeting with anything of note till the 6th of October. Being then in the latitude of $35^{\circ} 15'$ S., longitude $7^{\circ} 45'$ W., we met with light airs and calms by turns, for three days successively. We had, for some days before, seen albatrosses, pintadoes, and other petrels; and here we saw three penguins, which occasioned us to sound; but we found no ground with a line of one hundred and fifty fathoms. We put a boat in the water, and shot a few birds; one of which was a black petrel, about the size of a crow, and, except as to the bill and feet, very like one. It had a few white feathers under the throat; and the under-side of the quill-feathers were of an ash-colour. All the other feathers were jet black, as also the bill and legs.

On the 8th, in the evening, one of those birds which sailors call noddies settled on our rigging, and was caught. It was something larger than an English blackbird, and nearly as black, except the upper part of the head, which was white, looking as if it were powdered; the whitest feathers growing out from the base of the upper bill, from which they gradually assumed a darker colour, to about the middle of the upper part of the neck, where the white shade was lost in the black, without being divided by any line. It was web-footed; had black legs and a black bill, which was long, and not unlike that of a curlew. It is said these birds never fly far from land. We knew of none nearer the station we were in, than Gough's or Richmond Island, from which our distance could not be less than one hundred leagues. But it must be observed that the Atlantic Ocean, to the southward of this latitude, has been but little frequented; so that there may be more islands there than

* The afternoon, as appears from Mr. Anderson's Journal, was spent in performing the old and ridiculous ceremony of ducking those who had not crossed the equator before. Though Captain Cook did not suppress the custom, he thought it too trifling to deserve the least mention of it in his Journal, or even in his log-book. Pernetty, the writer of Bougainville's Voyage to the Falkland Islands, in 1763 and 1764, thought differently; for his account of the celebration of this childish festival on board his ship is extended through seventeen pages, and makes the subject of an entire chapter, under the title of *Baptême de la Ligne*.

† It may be worth while to transcribe his introduction to the description of it. "C'est un usage qui ne remonte

pas plus haut que ce voyage célèbre de Gama, qui a fourni au Camoens le sujet de la Lusade. L'idée qu'on ne sauroit être un bon marin, sans avoir traversé l'Equateur, l'ennui inséparable d'une longue navigation, un certain esprit républicain qui règne dans toutes les petites sociétés, peut-être toutes ces causes réunies, ont pu donner naissance à ces espèces de saturnales. Quoiqu'il en soit, elles furent adoptées, en un instant, dans toutes les nations, et les hommes les plus éclairés furent obligés de se soumettre à une coutume dont ils reconnoissoient l'absurdité. Car, partout, dès que le peuple parle, il faut que le sage se mette à l'unisson."—Histoire d'un Voyage aux Isles Malouines. p. 107, 108.

c. 10. † P. 11.

we are acquainted with. We frequently, in the night, saw those luminous marine animals mentioned and described in my first voyage *. Some of them seemed to be considerably larger than any I had before met with; and sometimes they were so numerous, that hundreds were visible at the same moment.

This calm weather was succeeded by a fresh gale from the N.W., which lasted two days. Then we had again variable light airs for about twenty-four hours; when the N.W. wind returned, and blew with such strength, that on the 17th we had sight of the Cape of Good Hope; and the next day anchored in Table Bay, in four fathoms water, with the church bearing S.W. $\frac{1}{2}$ S., and Green Point N.W. $\frac{1}{4}$ W. As soon as we had received the usual visit from the master attendant and the surgeon, I sent an officer to wait on Baron Plettenberg the governor; and, on his return, saluted the garrison with thirteen guns, which compliment was returned with the same number. We found in the bay two French East India ships; the one outward, and the other homeward bound. And two or three days before our arrival, another homeward bound ship of the same nation had parted from her cable, and been driven on shore at the head of the bay, where she was lost. The crew were saved; but the greatest part of the cargo shared the same fate with the ship, or (which amounted to the same) was plundered and stolen by the inhabitants, either out of the ship, or as it was driven or carried on shore. This is the account the French officers gave to me; and the Dutch themselves could not deny the fact. But, by way of excusing themselves from being guilty of a crime disgraceful to every civilised state, they endeavoured to lay the whole blame on the French captain, for not applying in time for a guard.

As soon as we had saluted, I went on shore, accompanied by some of my officers, and waited on the governor, the lieutenant-governor, the fiscal, and the commander of the troops. These gentlemen received me with the greatest civility; and the governor, in particular, promised me every assistance that the place afforded. At the same time I obtained his leave to set up our observatory on any spot I should think most convenient; to pitch tents for the sail-makers and coopers; and to bring the cattle on shore to graze near our encampment. Before I returned on board, I ordered soft bread, fresh meat, and greens, to be provided every day for the ship's company. On the 22nd, we set up the tents and observatory, and began to send the several articles out of the ship which I wanted on shore. This could not be done sooner, as the militia of the place were exercising on, or near, the ground which we were to occupy. The next day we began to observe equal altitudes of the sun, in order to ascertain the rate of the watch, or, which is the same thing, to find whether it had altered its rate. These observations were continued every day, whenever the weather would permit, till the time of our departure drew near. But before this, the caulkers had been set to work to caulk the ship; and I had concerted measures with Messrs. Brandt and Chiron, for supplying both ships with such provisions as I should want. Bakers, likewise, had been ordered, immediately after our arrival, to bake such a quantity of bread as I thought would be requisite. As fast as the several articles destined for the Resolution were got ready, they were carried on board.

On the 26th, the French ship sailed for Europe, and by her we sent letters to England. The next day the Hampshire, East India ship, from Bencoolen, anchored in the bay, and saluted us with thirteen guns, which we returned with eleven.

Nothing remarkable happened till the evening of the 31st, when it came on to blow excessively hard at S.E., and continued for three days; during which time there was no communication between the ship and the shore. The Resolution was the only ship in the bay that rode out the gale without dragging her anchors. We felt its effects as sensibly on shore. Our tents and observatory were torn to pieces; and our astronomical quadrant narrowly escaped irreparable damage. On the 3rd of November the storm ceased, and the next day we resumed our different employments. On the 6th, the Hampshire, India ship, sailed for England. In her I sent home an invalid, whom Captain Trimble was so obliging as to receive on board. I was afterwards sorry that I had not availed myself of this opportunity to part with two or three more of my crew, who were troubled with different complaints; but, at this time, there was some hope of their health being re-established.

* See vol. I. p. 9

In the morning of the 10th, the *Discovery* arrived in the bay. Captain Clerke informed me that he had sailed from Plymouth on the 1st of August, and should have been with us here a week sooner if the late gale of wind had not blown him off the coast. Upon the whole, he was seven days longer in his passage from England than we had been. He had the misfortune to lose one of his marines, by falling overboard; but there had been no other mortality amongst his people, and they now arrived well and healthy. Captain Clerke having represented to me that his ship was in want of caulking; that no time might be lost in repairing this defect, next day I sent all my workmen on board her, having already completed this service on board the *Resolution*. I lent every other assistance to the captain to expedite his supply of provisions and water, having given him an order to receive on board as much of both articles as he could conveniently stow. I now found that the bakers had failed in baking the bread I had ordered for the *Discovery*. They pretended a want of flour; but the truth was, they were doubtful of her coming, and did not care to begin till they saw her at anchor in the bay.

I have before made mention of our getting our cattle on shore. The bull and two cows, with their calves, were sent to graze along with some other cattle; but I was advised to keep our sheep, sixteen in number, close to our tents, where they were penned up every night. During the night preceding the 14th, some dogs having got in amongst them, forced them out of the pen, killing four, and dispersing the rest. Six of them were recovered the next day; but the two rams, and two of the finest ewes in the whole flock, were amongst those missing. Baron Plettenberg being now in the country, I applied to the lieutenant-governor, Mr. Hemmy, and to the fiscal. Both these gentlemen promised to use their endeavours for the recovery of the lost sheep. The Dutch, we know, boast that the police at the Cape is so carefully executed, that it is hardly possible for a slave, with all his cunning and knowledge of the country, to effectuate his escape. Yet my sheep evaded all the vigilance of the fiscal's officers and people. However, after much trouble and expense, by employing some of the meanest and lowest scoundrels in the place (who, to use the phrase of the person who recommended this method to me, would, for a ducatoon, cut their master's throat, burn the house over his head, and bury him and the whole family in the ashes), I recovered them all but the two ewes. Of these I never could hear the least tidings: and I gave over all inquiry after them, when I was told, that since I had got the two rams, I might think myself very well off. One of these, however, was so much hurt by the dogs, that there was reason to believe he would never recover.

Mr. Hemmy very obligingly offered to make up this loss, by giving me a Spanish ram, out of some that he had sent for from Lisbon. But I declined the offer, under a persuasion that it would answer my purpose full as well, to take with me some of the Cape rams; the event proved, that I was under a mistake. This gentleman has taken some pains to introduce European sheep at the Cape; but his endeavours, as he told me, have been frustrated by the obstinacy of the country people, who hold their own breed in greater estimation, on account of their large tails, of the fat of which they sometimes make more money than of the whole carcass besides*; and think that the wool of European sheep will, by no means, make up for their deficiency in this respect. Indeed, I have heard some sensible men here make the same observation. And there seems to be foundation for it. For, admitting that European sheep were to produce wool of the same quality here as in Europe, which experience has shown not to be the case, the Dutch have not hands, at the Cape of Good Hope, to spare for the manufacturing even their own clothing. It is certain that, were it not for the continual importation of slaves, this settlement would be thinner of people than any other inhabited part of the world.

While the ships were getting ready for the prosecution of our voyage, some of our officers made an excursion to take a view of the neighbouring country. Mr. Anderson, my surgeon,

* "The most remarkable thing in the Cape sheep, is the length and thickness of their tails, which weigh from fifteen to twenty pounds. The fat is not so tallowish as that of European mutton, and the poorer sort use it for butter." Kolben's *Cape of Good Hope* [English translation], vol. ii. p. 63. De la Caille, who finds every-

thing wrong in Kolben, says, the weight of the tails of the Cape sheep is not above five or six pounds. *Voyage de la Caille*, p. 343. If the information given to Captain Cook may be depended upon, it will prove that, in this instance at least, Kolben is unjustly accused of exaggeration.

unjustly accused of

who was one of the party, gave me the following relation of their proceedings* :—"On the 16th, in the forenoon, I set out in a waggon, with five more, to take a view of some part of the country. We crossed the large plain that lies to the eastward of the town, which is entirely a white sand, like that commonly found on beaches, and produces only heath, and other small plants of various sorts. At five in the afternoon we passed a large farm-house, with some corn-fields, and pretty considerable vineyards, situated beyond the plain, near the foot of some low hills, where the soil becomes worth cultivating. Between six and seven we arrived at Stellenbosh, the colony next to that of the Cape for its importance. The village does not consist of more than thirty houses, and stands at the foot of the range of lofty mountains, above twenty miles to the eastward of the Cape Town. The houses are neat; and, with the advantage of a rivulet which runs near, and the shelter of some large oaks, planted at its first settling, forms what may be called a rural prospect in this desert country. There are some vineyards and orchards about the place, which, from their thriving appearance, seem to indicate an excellent soil; though, perhaps, they owe much to climate, as the air here has an uncommon serenity. I employed the next day in searching for plants and insects about Stellenbosh, but had little success. Few plants are in flower here at this season, and insects but scarce. I examined the soil in several places, and found it to consist of yellowish clay, mixed with a good deal of sand. The sides of the low hills, which appear brown, seem to be constituted of a sort of stone marl.

"We left Stellenbosh next morning, and soon arrived at the house we had passed on Saturday; the owner of which, Mr. Cloeder, had sent us an invitation, the evening before, to visit him. This gentleman entertained us with the greatest hospitality, and in a manner very different from what we expected. He received us with music; and a band also played while we were at dinner, which, considering the situation of the place, might be reckoned elegant. He showed us his wine-cellars, his orchards, and vineyards; all which, I must own, inspired me with a wish to know in what manner these industrious people could create such plenty in a spot where, I believe, no other European nation would have attempted to settle. In the afternoon we crossed the country, and passed a few plantations, one of which seemed very considerable, and was laid out in a taste somewhat different from any other we saw. In the evening we arrived at a farm-house, which is the first in the cultivated tract called the Pearl. We had, at the same time, a view of Drakenstein, the third colony of this country, which lies along by the foot of the lofty hills already mentioned, and contains several farms or plantations, not very extensive.

"I went, on the 19th in the forenoon, in quest of plants and insects, which I found almost as scarce as at Stellenbosh; but I met with more shrubs or small trees, naturally produced, in the valleys, than in any part of the country I had hitherto seen. In the afternoon, we went to see a stone of a remarkable size, called by the inhabitants the Tower of Babylon, or the Pearl Diamond†. It lies, or stands, upon the top of some low hills, at the foot of which our farm-house was situated; and though the road to it is neither very steep nor rugged, we were above an hour and a half in walking to it. It is of an oblong shape, rounded on the top, and lies nearly south and north. The east and west sides are steep, and almost perpen-

* In the Philosophical Transactions, vol. lxi. p. 268 to 319, is an "Account of Three Journeys from the Cape Town into the Southern Parts of Africa," in 1772, 1773, and 1774; by Mr. Francis Masson, who had been sent from England for the discovery of new plants, towards the improvement of the Royal Botanical Garden at Kew. Much curious information is contained in Mr. Masson's account of these journeys. M. de Pagès, who was at the Cape in 1773, gives some remarks on the state of that settlement, and also the particulars of his journey from False Bay to the Cape Town.—"Voyage vers le Pôle du Sud," p. 17 to 32.

† In the Philosophical Transactions, vol. lxxviii. part I. p. 102, we have a Letter from Mr. Anderson to Sir John Pringle, describing this remarkable stone. The account sent home from the Cape, and read before the Royal Society, is much the same with that now published, but rather fuller. In particular, he tells Sir John, that he

went to see it at "Mr. Masson's desire," who, probably, had not had an opportunity of sufficiently examining it himself. In the account of his journeys, above referred to, p. 270, he only says, "There are two large solid rocks on the Perel Berg, each of which (he believes) is more than a mile in circumference at the base, and upwards of two hundred feet high. Their surfaces are nearly smooth, without chink or fissures; and they are found to be a species of granite, different from that which composes the neighbouring mountains."

Mr. Anderson having, with his letter to Sir John Pringle, also sent home a specimen of the rock, it was examined by Sir William Hamilton, whose opinion is, that "this singular, immense fragment of granite, most probably, has been raised by a volcanic explosion, or some such cause." See his Letter to Sir John Pringle, annexed to Mr. Anderson's in the Philosophical Transactions.

dicular. The south end is likewise steep, and its greatest height is there; from whence it declines gently to the north part, by which we ascended to its top, and had an extensive view of the whole country.

"Its circumference, I think, must be at least half a mile; as it took us above half an hour to walk round it, including every allowance for the bad road, and stopping a little. At its highest part, which is the south end, comparing it with a known object, it seems to equal the dome of St. Paul's church. It is one uninterrupted mass of stone, if we except some fissures, or rather impressions, not above three or four feet deep, and a vein which runs across near its north end. It is of that sort of stone called, by mineralogists, *Saxum conglutinatum*. and consists chiefly of pieces of coarse *quartz* and *glimmer*, held together by a clayey cement. But the vein which crosses it, though of the same materials, is much compacter. This vein is not above a foot broad or thick; and its surface is cut into little squares or oblongs, disposed obliquely, which makes it look like the remains of some artificial work. But I could not observe whether it penetrated far into the large rock, or was only superficial. In descending, we found at its foot a very rich black mould; and on the sides of the hills, some trees of a considerable size, natives of the place, which are a species of *olea**. In the morning on the 20th, we set out from the Pearl; and going a different road from that by which we came, passed through a country, wholly uncultivated, till we got to the Tyger hills, when some tolerable corn-fields appeared. At noon, we stopped in a hollow for refreshment; but, in walking about here, were plagued with a vast number of mosquitoes or sand-flies, which were the first I saw in the country. In the afternoon we set out again, and in the evening arrived at the Cape Town, tired with the jolting waggon."

On the 23d, we got on board the observatory, clock, &c. By a mean of the several results of the equal altitudes of the sun, taken with the astronomical quadrant, the astronomical clock was found to lose on sidereal time 1' 8" .368 each day. The pendulum was kept at the same length as at Greenwich, where the daily loss of the clock on sidereal time, was 4".

The watch, by the mean of the results of fifteen days' observations, was found to be losing 2' .261, on mean time, each day; which is 1" .052 more than at Greenwich: and on the 21st, at noon, she was too slow for mean time by 1^h 20' 57" .66. From this, 6' 48" .956, is to be subtracted, for what she was too slow on the 11th of June at Greenwich, and her daily rate since; and the remainder, viz., 1^h 14' 08" .704, or 18° 32' 10", will be the longitude of the Cape Town by the watch. Its true longitude, as found by Messrs. Mason and Dixon, is 18° 23' 15". As our observations were made about half a mile to the east of theirs, the error of the watch, in longitude, is no more than 8' 25". Hence we have reason to conclude, that she had gone well all the way from England, and that the longitude, thus given, may be nearer the truth than any other. If this be admitted, it will, in a great measure, enable me to find the direction and strength of the currents we met with on this passage from England. For, by comparing the latitude and longitude by dead reckoning, with those by observation and the watch, we shall, from time to time, have, very accurately, the error of the ship's reckoning, be the cause what it will. But as all imaginable care was taken in heaving and keeping the log, and every necessary allowance made for lee-way, heave of the sea, and other such circumstances, I cannot attribute those errors that did happen, to any other cause but currents; but more particularly when the error was constantly the same way, for several days successively.

On the contrary, if we find the ship ahead of the reckoning on one day, and astern of it

* It is strange that neither Kolben nor De la Caille should have thought the "Tower of Babylon" worthy of a particular description. The former [vol. ii, p. 52, 53, English Translation], only mentions it as a "high mountain." The latter contents himself with telling us, that it is a very low hillock, "un très-bas monticule." Voyage de la Caille, p. 341. We are much obliged to Mr. Anderson for his very accurate account of this remarkable rock, which agrees with Mr. Sonnerat's, who was at the Cape of Good Hope so late as 1781. His

words are, "La montagne de la *Perle* mérito d'être observée. C'est une des plus hautes des environs du Cap. Elle n'est composée que d'un seul bloc de granit crévasse dans plusieurs endroits."—Voyage aux Indes, tom. ii. p. 91.

Mr. Sonnerat tells us, that Mr. Gordon, commander of the troops at the Cape, had lately made three journeys up the country, from which, when he publishes his Journal, we may expect much curious information.

on another, we have reason to believe that such errors are owing to accidental causes, and not to currents. This seems to have been the case in our passage between England and Teneriffe. But, from the time of our leaving that island, till the 15th of August, being then in the latitude of 12° N., and longitude 24° W., the ship was carried $1^{\circ} 20'$ of longitude to the westward of her reckoning. At this station the currents took a contrary direction, and set to E.S.E., at the rate of twelve or fourteen miles a day, or twenty-four hours, till we arrived into the latitude of 5° N., and longitude of 20° W.; which was our most easterly situation after leaving the Cape de Verde Islands, till we got to the southward. For in this situation the wind came southerly, and we tacked and stretched to the westward; and for two or three days could not find that our reckoning was affected by any current. So that, I judged, we were between the current that generally, if not constantly, sets to the east upon the coast of Guinea, and that which sets to the west towards the coast of Brasil. This westerly current was not considerable till we got into 2° N., and 25° W. From this station, to 3° S. and 30° W., the ship, in the space of four days, was carried one hundred and fifteen miles in the direction of S.W. by W. beyond her reckoning; an error by far too great to have any other cause but a strong current running in the same direction. Nor did its strength abate here; but its course was, afterward, more westerly, and to the N. of W.; and off Cape Augustine, north, as I have already mentioned. But this northerly current did not exist at twenty or thirty leagues to the southward of that Cape, nor any other, that I could perceive, in the remaining part of the passage. The little difference we afterward found between the reckoning and observations, might very well happen without the assistance of currents, as will appear by the Table of Days' Works.

In the account of my last voyage*, I remarked, that the currents one meets with in this passage generally balance each other. It happened so then, because we crossed the line about 20° more to the eastward than we did now; so that we were, of consequence, longer under the influence of the easterly current, which made up for the westerly one. And this, I apprehend, will generally be the case, if you cross the line 10° or 15° to the east of the meridian of St. Jago.

From these remarks I shall draw the following conclusion, that, after passing the Cape de Verde Island, if you do not make above 4° or 5° easting, and cross the line in, or to the westward of the meridian of St. Jago, you may expect to find your ship 3° or 4° to the westward of her reckoning, by the time you get into the latitude of 10° S. If, on the other hand, you keep well to the east, and cross the line 15° or 20° to the east of St. Jago, you will be then as much to the east of your reckoning; and the more you keep to the eastward, the greater will be your error; as has been experienced by some India ships, whose people have found themselves close upon the coast of Angola, when they thought its distance was above two hundred leagues. During the whole of our passage from England, no opportunity was omitted of observing, with all the attention and accuracy that circumstances would permit, the variation of the compass, which I have inserted in a table, with the latitude and longitude of the ship at the time of observation. As the longitude may be depended upon, to a quarter or half a degree at most, this table will be of use to those navigators who correct their reckoning by the variation. It will also enable Mr. Dun to correct his new Variation Chart, a thing very much wanted.

It seems strange to me, that the advocates for the variation should not agree amongst themselves. We find one† of them telling us, as I have already observed, "that with 8° west variation, or anything above that, you may venture to sail by the Cape de Verde islands, by night or day, being well assured, with that variation, that you are to the eastward of them." Another, in his chart‡, lays down this variation ninety leagues to the westward of them. Such a disagreement as this, is a strong proof of the uncertainty of both. However, I have no doubt, the former found here, as well as in other places, the variation he mentions. But we should have considered, that at sea, nay even on land, the results of the most accurate observations will not always be the same. Different compasses will give different variations; and even the same compass will differ from itself two degrees, without our being able to

* Vol. I., p. 343.

† Nicholse

‡ Mr. Dun.

discover, much less to remove, the cause. Whoever imagines he can find the variation within a degree, will very often see himself much deceived. For, besides the imperfection which may be in the construction of the instrument, or in the power of the needle, it is certain that the motion of the ship, or attraction of the ironwork, or some other cause not yet discovered, will frequently occasion far greater errors than this. That the variation may be found, with a share of accuracy more than sufficient to determine the ship's course, is allowed; but that it can be found so exactly as to fix the longitude within a degree, or sixty miles, I absolutely deny.

CHAPTER IV.—THE TWO SHIPS LEAVE THE CAPE OF GOOD HOPE.—TWO ISLANDS, NAMED PRINCE EDWARD'S, SEEN, AND THEIR APPEARANCE DESCRIBED.—KERGUELEN'S LAND VISITED.—ARRIVAL IN CHRISTMAS HARBOUR.—OCCURRENCES THERE.—DESCRIPTION OF IT.

AFTER the disaster which happened to our sheep, it may be well supposed I did not trust those that remained long on shore, but got them, and the other cattle, on board as fast as possible. I also added to my original stock by purchasing two young bulls, two heifers, two young stone-horses, two mares, two rams, several ewes and goats, and some rabbits and poultry. All of them were intended for New Zealand, Otaheite, and the neighbouring islands, or any other places, in the course of our voyage, where there might be a prospect that the leaving any of them would be useful to posterity. Towards the latter end of November the calkers had finished their work on board the *Discovery*, and she had received all her provisions and water. Of the former, both ships had a supply sufficient for two years and upwards; and every other article we could think of, necessary for such a voyage, that could be had at the Cape, was procured; neither knowing when or where we might come to a place where we could furnish ourselves so well.

CAPE-TOWN.

Having given Captain Clerke a copy of my instructions, and an order directing him how to proceed in case of separation, in the morning of the 30th we repaired on board. At five in the afternoon a breeze sprung up at S.E., with which we weighed, and stood out of the bay. At nine it fell calm, and we anchored between Penguin Island and the east shore, where we lay till three o'clock next morning. We then weighed and put to sea, with a light breeze at south, but did not get clear of the land till the morning of the 3d, when with a fresh gale at W.N.W. we stood to the S.E. to get more into the way of these winds.

3d, when with
se winds.

On the 5th a sudden squall of wind carried away the Resolution's mizen topmast. Having another to replace it, the loss was not felt, especially as it was a bad stick, and had often complained. On the 6th, in the evening, being then in the latitude of $39^{\circ} 14'$ S., and in the longitude of $23^{\circ} 56'$ E., we passed through several small spots of water of reddish colour. Some of this was taken up, and it was found to abound with a small animal which the microscope discovered to be like a cray-fish, of a reddish hue. We continued our course to the south-east, with a very strong gale from the westward, followed by a mountainous sea, which made the ship roll and tumble exceedingly, and gave us a great deal of trouble to preserve the cattle we had on board. Notwithstanding all our care, several goats, especially the males, died; and some sheep. This misfortune was, in a great measure, owing to the cold, which we now began most sensibly to feel.

On the 12th, at noon, we saw land extending from S.E. by S. to S.E. by E. Upon a nearer approach, we found it to be two islands. That which lies most to the south, and is also the largest, I judged to be about fifteen leagues in circuit, and to be in the latitude of $46^{\circ} 53'$ S., and in the longitude of $37^{\circ} 46'$ E. The most northerly one is about nine leagues in circuit, and lies in the latitude of $46^{\circ} 40'$ S., and in $38^{\circ} 8'$ E. longitude. The distance from the one to the other is about five leagues. We passed through this channel at equal distance from both islands, and could not discover, with the assistance of our best glasses, either tree or shrub on either of them. They seemed to have a rocky and bold shore; and excepting the south-east parts, where the land is rather low and flat, a surface composed of barren mountains, which rise to a considerable height, and whose summits and sides were covered with snow, which in many places seemed to be of a considerable depth. The south-east parts had a much greater quantity on them than the rest; owing probably to the sun acting for a less space of time on these than on the north and north-west parts. The ground, where it was not hid by the snow, from the various shades it exhibited, may be supposed to be covered with moss, or, perhaps, such a coarse grass as is found in some parts of Falkland's Islands. On the north side of each of the islands is a detached rock: that near the south island is shaped like a tower, and seemed to be at some distance from the shore. As we passed along, a quantity of sea-weed was seen, and the colour of the water indicated soundings. But there was no appearance of an inlet, unless near the rock just mentioned; and that, from its smallness, did not promise a good anchoring-place.

These two islands, as also four others which lie from nine to twelve degrees of longitude more to the east, and nearly in the same latitude, were discovered, as I have mentioned in my late voyage *, by Captains Marion du Fresne, and Crozet, French navigators, in January 1772, on their passage in two ships from the Cape of Good Hope to the Philippine Islands. As they have no names in the French chart of the southern hemisphere which Captain Crozet communicated to me in 1775 †, I shall distinguish the two we now saw, by calling them Prince Edward's Islands, after his Majesty's fourth son; and the other four by the name of Marion's and Crozet's Islands, to commemorate their discoveries. We had now, for the most part, strong gales between the north and west, and but very indifferent weather; not better, indeed, than we generally have in England in the very depth of winter, though it was now the middle of summer in this hemisphere. Not discouraged, however, by this, after leaving Prince Edward's Islands, I shaped our course to pass to the southward of the others, that I might get into the latitude of the land discovered by Monsieur de Kerguelen.

I had applied to the Chevalier de Borda, whom, as I have mentioned, I found at Teneriffe, requesting, that if he knew anything of the island discovered by Monsieur de Kerguelen, between the Cape of Good Hope and New Holland, he would be so obliging as to communicate it to me. Accordingly, just before we sailed from Santa Cruz bay, he sent me the following account of it, viz., "That the pilot of the Boussole, who was in the voyage with

* See book iv. chap. 9. These islands are there said to be in the latitude of 48° S., that is, two degrees farther south than what here appears to be their real position.

† See vol. I., as above. Dr. Forster, in his Observations made during that voyage, p. 30, gives us this

description of the chart then communicated by Monsieur Crozet; that it was "published under the patronage of the Duke de Croze by Robert de Vaugondy." Captain Cook tells us later in this chapter that it was published in 1773.

Monsieur de Kerguelen, had given him the latitude and longitude of a little island, which Monsieur de Kerguelen called the Isle of Rendezvous, and which lies not far from the great island which he saw. Latitude of the little isle, by seven observations, $48^{\circ} 26'$ south; longitude, by seven observations of the distance of the sun and moon, $64^{\circ} 57'$ east from Paris." I was very sorry I had not sooner known that there was on board the frigate at Teneriffe an officer who had been with Monsieur de Kerguelen, especially the pilot; because from him I might have obtained more interesting information about this land than the situation alone, of which I was not before entirely ignorant*.

My instructions directing me to examine it, with a view to discover a good harbour, I proceeded in the search; and on the 16th, being then in the latitude of $48^{\circ} 45'$, and in the longitude of 52° E., we saw penguins and divers, and rock-weed floating in the sea. We continued to meet with more or less of these every day, as we proceeded to the eastward;

* Captain Cook's proceedings, as related in the remaining part of this chapter, and in the next, being upon a coast newly discovered by the French, it could not but be an object of his attention to trace the footsteps of the original explorers. But no superiority of professional skill, nor diligence in exerting it, could possibly qualify him to do this successfully, without possessing, at the same time, full and authentic intelligence of all that had been performed here by his predecessors in the discovery. But that he was not so fortunate as to be thus sufficiently instructed, will appear from the following facts, which the reader is requested to attend to, before he proceeds to the perusal of this part of the journal.

How very little was known, with any precision, about the operations of Kerguelen, when Captain Cook sailed in 1776, may be inferred from the following paragraph of his instructions:—"You are to proceed in search of some islands said to have been lately seen by the French in the latitude of 48° S., and in the meridian of Mauritius." This was barely the amount of the very indefinite and imperfect information which Captain Cook himself had received from Baron Plettenberg at the Cape of Good Hope, in November 1772; in the beginning of which year Kerguelen's first voyage had taken place.

The Captain, on his return homeward in March 1775, heard, a second time, something about this French discovery at the Cape, where he met with Monsieur Crozet, who "very obligingly communicated to him" a chart of the southern hemisphere, "wherein were delineated not only his own discoveries, but also that of Captain Kerguelen." But what little information that chart could convey, was still necessarily confined to the operations of the first voyage; the chart here referred to having been published in France in 1773; that is, before any intelligence could possibly be conveyed from the southern hemisphere of the result of Kerguelen's second visit to this new land, which we now know happened towards the close of the same year.

Of these latter operations, the only account (if that can be called an account which conveys no particular information) received by Captain Cook from Monsieur Crozet was, "that a later voyage had been undertaken by the French, under the command of Captain Kerguelen, which had ended much to the disgrace of that commander."

What Crozet had *not* communicated to our author, and what we are sure, from a variety of circumstances, he had *never* heard of from any other quarter, he missed an opportunity of learning at Teneriffe. He expresses his being sorry, as we have just read, "that he did not know sooner that there was on board the frigate an officer who had been with Kerguelen, as he might have obtained from him more interesting information about this land than its situation." And, indeed, if he had conversed with that officer, he might have obtained information

"more interesting" than he was aware of; he might have learned that Kerguelen had actually visited this southern land a second time, and that the little isle of which he then received the name and position from the Chevalier de Borda, was a discovery of this later voyage. But the account conveyed to him being, as the reader will observe, unaccompanied with any date, or other distinguishing circumstance, he left Teneriffe, and arrived on the coasts of Kerguelen's Land, under a full persuasion that it had been visited only *once* before. And, even with regard to the operations of that first voyage, he had nothing to guide him but the very scanty materials afforded to him by Baron Plettenberg and Monsieur Crozet.

The truth is, the French seem, for some reason or other, not surely founded on the importance of Kerguelen's discovery, to have been very shy of publishing a full and distinct account of it. No such account had been published while Captain Cook lived. Nay, even after the return of his ships in 1780, the gentleman who obligingly lent his assistance to give a view of the prior observations of the French, and to connect them on the same chart with those of our author, though his assiduity in procuring geographical information can be equalled only by his readiness in communicating it, had not, it should seem, been able to procure any materials for that purpose, but such as mark the operations of the first French voyage; and even for these he was indebted to a MS. drawing.

But this veil of unnecessary secrecy is at length drawn aside. Kerguelen himself has, very lately, published the journal of his proceedings in two successive voyages in the years 1772 and 1773; and has annexed to his Narrative a chart of the coasts of this land, as far as he had explored them in both voyages. Monsieur de Pagès also, much about the same time, favoured us with another account of the second voyage, in some respects fuller than Kerguelen's own, on board whose ship he was then an officer.

From these sources of authentic information we are enabled to draw every necessary material to correct what is erroneous, and to illustrate what otherwise would have remained obscure, in this part of Captain Cook's Journal. We shall take occasion to do this in separate notes on the passages as they occur, and conclude this tedious, but, it is hoped, not unnecessary detail of facts, with one general remark, fully expressive of the disadvantages our author laboured under. He never saw that part of the coast upon which the French had been in 1772; and he never knew that they had been upon another part of it in 1773, which was the very scene of his own operations. Consequently, what he knew of the *former* voyage, as delineated upon Crozet's chart, only served to perplex and mislead his judgment; and his total ignorance of the *latter* put it out of his power to compare his own observations with those then made by Kerguelen; though we, who are better instructed, can do this, by tracing the plainest marks of coincidence and agreement.

and on the 21st, in the latitude of $48^{\circ} 27'$ S., and in the longitude of 65° E., a very large seal was seen. We had now much foggy weather, and, as we expected to fall in with the land every hour, our navigation became both tedious and dangerous.

At length, on the 24th, at six o'clock in the morning, as we were steering to the eastward, the fog clearing away a little, we saw land*, bearing S.S.E., which, upon a nearer approach, we found to be an island of considerable height, and about three leagues in circuit†. Soon after, we saw another of the same magnitude, one league to the eastward‡; and between these two, in the direction of S.E., some smaller ones§. In the direction of S. by E. $\frac{1}{2}$ E., from the E. end of the first island, a third|| high island was seen. At times, as the fog broke away, we had the appearance of land over the small islands; and I had thoughts of steering for it, by running in between them. But, on drawing near, I found this would be a dangerous attempt, while the weather continued foggy. For, if there should be no passage, or if we should meet with any sudden danger, it would have been impossible for us to get off; the wind being right astern, and a prodigious sea running, that broke on all the shores in a frightful surf. At the same time, seeing another island in the N.E. direction, and not knowing but that there might be more, I judged it prudent to haul off, and wait for clearer weather, lest we should get entangled amongst unknown lands in a thick fog. We did but just weather the island last mentioned. It is a high round rock, which was named Bligh's Cap. Perhaps this is the same that Monsieur de Kerguelen called the Isle of Rendezvous¶; but I know nothing that can rendezvous at it, but fowls of the air; for it is certainly inaccessible to every other animal.

At eleven o'clock the weather began to clear up, and we immediately tacked, and steered in for the land. At noon we had a pretty good observation, which enabled us to determine the latitude of Bligh's Cap, which is the northernmost island, to be $48^{\circ} 29'$ S., and its longitude $68^{\circ} 40'$ E.** We passed it at three o'clock, standing to the S.S.E., with a fresh gale at W. Soon after we saw the land, of which we had a faint view in the morning; and at four o'clock it extended from S.E. $\frac{1}{2}$ E., to S.W. by S., distant about four miles. The left extreme, which I judged to be the northern point of this land called, in the French chart of the southern hemisphere, Cape St. Louis††, terminated in a perpendicular rock of a considerable height; and the right one (near

* Captain Cook was not the original discoverer of these small islands which he now fell in with. It is certain that they had been seen and named by Kerguelen, on his second voyage, in December, 1773. Their position, relatively to each other, and to the adjoining coasts of the greater land, bears a striking resemblance to Kerguelen's delineation of them.

† This is the isle to which Kerguelen gave the name of Croy or Crony. Besides delineating it upon his chart, he has added a particular view of it, exactly corresponding with Captain Cook's account of its being of "considerable height."

‡ Kerguelen called this Isle Rolland, after the name of his own ship. There is also a particular view of it on the French chart.

§ The observations of the French and English navigators agree exactly, as to the position of these smaller isles.

|| The situation of Kerguelen's Isle de Clugny, as marked on his chart, shows it to be the "third high island" seen by Captain Cook.

¶ This isle, or rock, was the single point about which Captain Cook had received the least information at Teneriffe; and we may observe how sagacious he was in tracing it. What he could only speak of as *probable*, a comparison of his chart with that lately published by Kerguelen, proves to be certain; and if he had even read and copied what his predecessors in the discovery says of it, he could scarcely have varied his account of its shape. Kerguelen's words are "Isle de Réunion, qui n'est qu'une roche, nous servoit de rendezvous, ou de point de ralliement; et ressembloit à un coin de mire."

** The French and English agree very nearly (as might be expected) in their accounts of the latitude of this island; but the observations by which they fix its longitude, vary considerably.

The pilot at Teneriffe made it only $64^{\circ} 57'$ E. from Paris, which is about $67^{\circ} 16'$ E. from London; or $1^{\circ} 24'$ more westerly than Captain Cook's observations fix it. Monsieur de Pagès says it is $66^{\circ} 47'$ E. from Paris, that is $69^{\circ} 6'$ E. from London, or twenty-six miles more easterly than it is placed by Captain Cook. Kerguelen himself only says that it is *about* 68° of E. longitude, "par 68° de longitude."

†† Hitherto, we have only had occasion to supply defects, owing to Captain Cook's entire ignorance of Kerguelen's second voyage in 1773; we must now correct errors, owing to his very limited knowledge of the operations of the first voyage in 1772. The chart of the southern hemisphere, his only guide, having given him, as he tells us, the name of Cape St. Louis (or Cap Louis) as the most northerly promontory then seen by the French; and his own observations now satisfying him that no part of the main land stretched further N. than the "left extreme" now before him; from this supposed similarity of situation he judged that his own "perpendicular rock" must be the Cap Louis of the first discoverers. A comparison of the chart laid down by Captain Cook with that published by Kerguelen, shows in the clearest manner that the northern point now described by Captain Cook is the very same to which the French have given the name of Cap François.

which is a detached rock) in a high indented point *. From this point the coast seemed to turn short round to the southward; for we could see no land to the westward of the direction in which it now bore to us, but the islands we had observed in the morning; the most southerly† of them lying nearly W. from the point, about two or three leagues distant.

About the middle of the land there appeared to be an inlet, for which we steered; but, on approaching, found it was only a bending on the coast, and therefore bore up, to go round Cape St. Louis‡. Soon after, land opened off the Cape, in the direction of S. 53° E., and appeared to be a point at a considerable distance; for the trending of the coast from the Cape was more southerly. We also saw several rocks and islands to the eastward of the above directions, the most distant of which was about seven leagues from the Cape, bearing S. 88° E.§ We had no sooner got off the Cape, than we observed the coast, to the southward, to be much indented by projecting points and bays; so that we now made sure of soon finding a good harbour. Accordingly, we had not run a mile farther, before we discovered one behind the Cape, into which we began to ply; but after making one board, it fell calm, and we anchored at the entrance, in forty-five fathoms water, the bottom black sand; as did the *Discovery* soon after. I immediately despatched Mr. Bligh, the master, in a boat to sound the harbour; who, on his return, reported it to be safe and commodious, with good anchorage in every part; and great plenty of fresh water, seals, penguins, and other birds, on the shore; but not a stick of wood. While we lay at anchor, we observed that the flood-tide came from the south-east, running two knots, at least, in an hour.

At daybreak, in the morning of the 25th, we weighed with a gentle breeze at west; and having wrought into the harbour, to within a quarter of a mile of the sandy beach at its head, we anchored in eight fathoms water, the bottom a fine dark sand. The *Discovery* did not get in till two o'clock in the afternoon; when Captain Clerke informed me, that he had narrowly escaped being driven on the south point of the harbour, his anchor having started before they had time to shorten in the cable. This obliged them to set sail, and drag the anchor after them, till they had room to heave it up; and then they found one of its palms was broken off. As soon as we had anchored, I ordered all the boats to be hoisted out; the ship to be moored with a kedge-anchor; and the water-casks to be got ready to send on shore. In the mean time I landed, to look for the most convenient spot where they might be filled, and to see what else the place afforded.

I found the shore, in a manner, covered with penguins and other birds, and seals. These latter were not numerous, but so insensible of fear (which plainly indicated that they were unaccustomed to such visitors), that we killed as many as we chose, for the sake of their fat or blubber, to make oil for our lamps, and other uses. Fresh water was in no less plenty than were birds; for every gully afforded a large stream. But not a single tree or shrub, nor the least sign of any, was to be discovered, and but very little herbage of any sort. The appearances, as we sailed into the harbour, had flattered us with the hope of meeting with something considerable growing here, as we observed the sides of many of the hills to be of a lively green. But I now found that this was occasioned by a single plant, which, with the other natural productions, shall be described in another place. Before I returned to my ship, I ascended the first ridge of rocks, which rise in a kind of amphitheatre above one another. I was in hopes, by this means, of obtaining a view of the country; but before I reached the top, there came on so thick a fog, that I could hardly find my way down again. In the evening, we hauled the seine at the head of the harbour, but caught only half-a-dozen small fish. We had no better success next day, when we tried with hook and line. So

* This *right extreme* of the coast, as it now showed itself to Captain Cook, seems to be what is represented on Kerguelen's chart under the name of Cap Aubert. It may be proper to observe here, that all that extent of coast lying between Cap Louis and Cap François, of which the French saw very little during their first visit in 1772, and may be called the N.W. side of this land, they had it in their power to trace the position of in 1773, and

have assigned names to some of its bays, rivers, and promontories, upon their chart.

† Kerguelen's Isle de Clugny.

‡ Cap François, as already observed.

§ The observations of the French, round Cap François, remarkably coincide with Captain Cook's in this paragraph; and the rocks and islands here mentioned by him, also appear upon their chart.

that our only resource here, for fresh provisions, were birds, of which there was an inexhaustible store.

KERGUELEN'S LAND.

The morning of the 26th proved foggy, with rain. However, we went to work to fill water, and to cut grass for our cattle, which we found in small spots near the head of the harbour. The rain which fell swelled all the rivulets to such a degree, that the sides of the hills bounding the harbour seemed to be covered with a sheet of water. For the rain, as it fell, ran into the fissures and crags of the rocks that composed the interior parts of the hills, and was precipitated down their sides in prodigious torrents.

The people having wrought hard the two preceding days, and nearly completed our water, which we filled from a brook at the left corner of the beach, I allowed them the 27th, as a day of rest, to celebrate Christmas. Upon this indulgence, many of them went on shore and made excursions, in different directions, into the country, which they found barren and desolate in the highest degree. In the evening, one of them brought to me a quart-bottle which he had found, fastened with some wire to a projecting rock on the north side of the harbour. This bottle contained a piece of parchment, on which was written the following inscription:—

LUDOVICO XV. GALLIARUM
REGE, ET D.* DE BOYNES
REGI A SECRETIS AD RES
MARITIMAS ANNIS 1772 ET

1773.

From this inscription, it is clear, that we were not the first Europeans who had been in this harbour. I supposed it to be left by Monsieur de Boisguenennu, who went on shore in a boat, on the 13th of February, 1772, the same day that Monsieur de Kerguelen discovered this land; as appears by a note in the French chart of the southern hemisphere, published the following year†.

* The D., no doubt, is a contraction of the word *Domino*. The French Secretary of the Marine was then Monsieur de Boynes.

† On perusing this paragraph of the Journal, it will be natural to ask, How could Monsieur de Boisguenennu,

in the beginning of 1772, leave an inscription, which, upon the very face of it, commemorates a transaction of the following year? Captain Cook's manner of expressing himself here strongly marks that he made this supposition only for want of information to enable him to make

As a memorial of our having been in this harbour, I wrote on the other side of the parchment,

NAVES RESOLUTION
ET DISCOVERY
DE REGE MAGNÆ BRITANNIÆ,
DECEMBRIS, 1776.

I then put it again into a bottle, together with a silver two-penny piece of 1772; and having covered the mouth of the bottle with a leaden cap, I placed it, the next morning, in a pile of stones erected for the purpose, upon a little eminence on the north shore of the harbour, and near to the place where it was first found; in which position it cannot escape the notice of any European, whom chance or design may bring into this port. Here I displayed the British flag, and named the place *Christmas Harbour*, from our having arrived in it on that festival.

It is the first, or northernmost inlet that we meet with on the south-east side of Cape St. Louis *, which forms the north side of the harbour, and is also the northern point of this land. The situation alone is sufficient to distinguish it from any of the other inlets; and, to make it more remarkable, its south point terminates in a high rock, which is perforated quite through, so as to appear like the arch of a bridge. We saw none like this upon the whole coast †. The harbour has another distinguishing mark within, from a single stone or

any other. He had no idea that the French had visited this land a second time; and, reduced to the necessity of trying to accommodate what he saw himself to what little he had heard of their proceedings, he confounds a transaction which we, who have been better instructed, know, for a certainty, belongs to the second voyage, with a similar one, which his chart of the Southern Hemisphere has recorded, and which happened in a different year, and at a different place. The bay, indeed, in which Monsieur de Boisguchenneu landed is upon the west side of this land, considerably to the south of Cape Louis, and not far from another more southerly promontory, called Cape Bourbon; a part of the coast which our ships were not upon. A particular view of the *Bay du Lion Marin* (for so Boisguchenneu called it), with the soundings, is preserved by Kerguelen.

But if the bottle and inscription, found by Captain Cook's people, were not left here by Boisguchenneu, by whom and when were they left? This we learn most satisfactorily, from the accounts of Kerguelen's second voyage, as published by himself and Monsieur de Pagès, which present us with the following particulars:—That they arrived on the west side of this land on the 14th of December, 1773; that, steering to the north-east, they discovered, on the 16th, the *Isle de Réunion*, and the other small islands as mentioned above; that, on the 17th, they had before them the principal land (which they were sure was connected with that seen by them on the 14th), and a high point of that land named by them Cap François; that beyond this Cape the coast took a south-easterly direction, and behind it they found a bay, called by them *Baie de l'Oiseau*, from the name of their frigate; that they then endeavoured to enter it, but were prevented by contrary winds and blowing weather, which drove them off the coast eastward; but that, at last, on the 6th of January, Monsieur de Roinevet, Captain of the *Oiseau*, was able to send his boat on shore into this bay, under the command of Monsieur de Rohegude, one of his officers, "who took possession of that bay, and of all that country, in the name of the King of France, with all the requisite formalities."

Here, then, we trace, by the most unexceptionable evidence, the history of the bottle and inscription; the leaving of which was, no doubt, one of the requisite formalities observed by Monsieur de Rohegude on this occasion.

And though he did not land till the 6th of January 1774, yet, as Kerguelen's ships arrived upon the coast on the 14th of December, 1773, and had discovered and looked into this very bay on the 17th of that month, it was with the strictest propriety and truth that 1773, and not 1774 was mentioned as the date of the discovery.

We need only look at Kerguelen's and Cook's charts, to judge that the *Baie de l'Oiseau*, and the harbour where the French inscription was found, is one and the same place. But besides this agreement as to the general position, the same conclusion results more decisively still, from another circumstance worth mentioning: the French, as well as the English visitors of this bay and harbour, have given us a particular plan of it; and whoever compares ours, published in this volume, with that to be met with in Kerguelen's and De Pagès' voyages, must be struck with a resemblance that could only be produced by copying one common original with fidelity. Nay, even the soundings are the same upon the same spots in both plans, being forty-five fathoms between the two Capes, before the entrance of the bay; sixteen fathoms further in, where the shores begin to contract; and eight fathoms up, near the bottom of the harbour.

To these particulars, which throw abundant light on this part of our author's Journal, I shall only add, that the distance of our harbour from that where Boisguchenneu landed, in 1772, is forty leagues. For this we have the authority of Kerguelen, in the following passage:—"Monsieur de Boisguchenneu descendit le 13 de Février, 1772, dans un baie, qu'il nomme Baie du Lion Marin, et prit possession de cette terre au nom de Roi; il n'y vit aucune trace d'habitants. Monsieur de Rohegude, en 1774, a descendu dans un autre baie, que nous avons nommé Baie de l'Oiseau, et cette seconde rade est à quarante lieues de la première. Il en a également pris possession, et il n'y trouva également aucune trace d'habitants."—Kerguelen, p. 92.

* Cap François, for reasons already assigned.

† If there could be the least doubt remaining of the identity of the Baie de l'Oiseau, and Christmas Harbour, the circumstance of the perforated rock, which divides it from another bay to the south, would amount to a strict demonstration. For Monsieur de Pagès had observed this discriminating mark before Captain Cook. His words are as follow:—"L'on vit que la côte de l'est

rock, of a vast size, which lies on the top of a hill on the south side, near its bottom; and opposite this, on the north side, there is another hill, much like it, but smaller. There is a small beach at its bottom, where we commonly landed; and, behind it, some gently rising ground, on the top of which is a large pool of fresh water. The land on both sides of the inlet is high, and it runs in west, and W.N.W., about two miles. Its breadth is one mile and a quarter, for more than half its length; above which, it is only half a mile. The depth of water, which is forty-five fathoms at the entrance, varies, as we proceed farther in, from thirty to five and four fathoms, as marked upon the plan. The shores are steep; and the bottom is everywhere a fine dark sand, except in some places close to the shore, where there are beds of sea-weed, which always grows on rocky ground. The head of the harbour lies open only to two points of the compass; and even these are covered by islands in the offing, so that no sea can fall in to hurt a ship. The appearances on shore confirmed this; for we found grass growing close to high-water mark, which is a sure sign of a pacific harbour*. It is high water here, at the full and change days, about ten o'clock; and the tide rises and falls about four feet. After I had finished this business of the inscription, I went, in my boat, round the harbour, and landed in several places, to examine what the shore afforded; and, particularly, to look for drift-wood. For, although the land here was totally destitute of trees, this might not be the case in other parts; and if there were any, the torrents would force some, or, at least, some branches, into the sea, which would afterward throw them upon the shores; as in all other countries where there is wood, and in many where there is none; but throughout the whole extent of the harbour I found not a single piece.

In the afternoon I went upon Cape St. Louis†, accompanied by Mr. King, my second lieutenant. I was in hopes, from this elevation, to have had a view of the sea-coast, and of the islands lying off it. But, when I got up, I found every distant object below me hid in a thick fog. The land on the same plain, or of a greater height, was visible enough, and appeared naked and desolate in the highest degree; except some hills to the southward, which were covered with snow.

When I got on board, I found the launch hoisted in, the ships unmoored, and ready to put to sea; but our sailing was deferred till five o'clock the next morning, when we weighed anchor.

voisins du Cap François, avoit deux baies; elles étoient séparées par une pointe très-reconnoissable par sa forme, qui représentoit une porte cochère, au travers de laquelle l'on voyoit le jour."—Voyage du M. de Pagès, vol. ii. p. 67. Every one knows how exactly the form of a *porte cochère*, or arched gateway, corresponds with that of the arch of a bridge. It is very satisfactory to find the two navigators, neither of whom knew anything of the other's description, adopting the same idea; which both proves that they had the same uncommon object before their eyes, and that they made an accurate report.

* In the last note, we saw how remarkably Monsieur de Pagès and Captain Cook agree about the appearance of the south point of the harbour; I shall here subjoin another quotation from the former, containing his account of the harbour itself, in which the reader may trace the same distinguishing features observed by Captain Cook in the foregoing paragraph.

"Le 6, l'on mit à terre dans la première baie à l'est du Cap François, et l'on prit possession de ces contrées. Ce mouillage consistoit en une petite rade, qui a environs quatre encablures, ou quatre cents toises de profondeur,

sur un tiers en sus de largeur. En dedans de cette rade est un petit port, dont l'entrée, de quatre encablures de largeur, présente au sud-est. La sonde de la petite rade est depuis quarante-cinq jusqu'à trente brasses; et celle du port, depuis seize jusqu'à huit. Le fond des deux est de sable noir et vaseux. La côte des deux bords est haute, et par une pente très-tude; elle est couverte de verdure, et il y a une quantité prodigieuse d'outardes. Le fond du port est occupé par un monticule qui laisse entre lui et la mer une plage de sable. Une petite rivière, de très-bonne eau, coule à la mer dans cet endroit; et elle est fournie par un lac qui est un peu au loio, au-dessus du monticule. Il y avoit sur la plage beaucoup de pingouins et de lions marins. Ces deux espèces d'animaux ne fuyoient pas, et l'on augura que le pays n'étoit point habité; la terre rapportoit de l'herbe large, noire, et bien nourrie, qui n'avoit cependant que cinque pouces ou plus de hauteur. L'on ne vit aucun arbre, ni signe d'habitation."—Voyage du Monsieur du Pagès, tom. ii. p. 69, 70.

† Cap François.

CHAPTER V.—DEPARTURE FROM CHRISTMAS HARBOUR.—RANGE ALONG THE COAST, TO DISCOVER ITS POSITION AND EXTENT.—SEVERAL PROMONTORIES AND BAYS, AND A PENINSULA, DESCRIBED AND NAMED.—DANGER FROM SHOALS.—ANOTHER HARBOUR AND A SOUND.—MR. ANDERSON'S OBSERVATIONS ON THE NATURAL PRODUCTIONS, ANIMALS, SOIL, ETC. OF KERQUELEN'S LAND.

As soon as the ships were out of Christmas Harbour, we steered S.E. $\frac{1}{4}$ S., along the coast, with a fine breeze at N.N.W., and clear weather. This we thought the more fortunate, as, for some time past, fogs had prevailed, more or less, every day; and the continuance of them would have defeated our plan of extending Kerguelen's discovery. We kept the lead constantly going, but seldom struck ground with a line of fifty or sixty fathoms. About seven or eight o'clock, we were off a promontory, which I called Cape Cumberland. It lies a league and a half from the south point of Christmas Harbour, in the direction of S.E. $\frac{1}{4}$ S. Between them is a bay with two arms, both of which seemed to afford good shelter for shipping. Off Cape Cumberland is a small but pretty high island, on the summit of which is a rock like a sentry-box, which occasioned our giving that name to the island. Two miles farther to the eastward, lies a group of small islands and rocks, with broken ground about them; we sailed between these and Sentry-Box Island, the channel being a full mile broad, and more than forty fathoms deep; for we found no bottom with that length of line.

Being through this channel, we discovered, on the south side of Cape Cumberland, a bay, running in three leagues to the westward. It is formed by this cape to the N., and by a promontory to the S., which I named Point Pringle, after my good friend Sir John Pringle, President of the Royal Society. The bottom of this bay was called Cumberland Bay; and it seemed to be disjoined from the sea, which washes the N.W. coast of this country, by a narrow neck of land. Appearances, at least, favoured such a conjecture. To the southward of Point Pringle, the coast is formed into a fifth bay; of which this point is the northern extreme; and from it to the southern extreme is about four miles in the direction of S.S.E. $\frac{1}{2}$ E. In this bay, which obtained the name of White Bay, on account of some white spots of land or rocks in the bottom of it, are several lesser bays or coves, which seemed to be sheltered from all winds. Off the S. point are several rocks which raise their heads above water, and, probably, many more that do not.

Thus far our course was in a direction parallel to the coast, and not more than two miles from it. Thither our glasses were continually pointed; and we could easily see that, except the bottoms of the bays and coves, which, for the most part, terminated in sandy beaches, the shores were rocky, and, in many places, swarmed with birds; but the country had the same barren and naked appearance as in the neighbourhood of Christmas Harbour. We had kept on our larboard bow the land which first opened off Cape St. Louis*, in the direction of S. 53° E., thinking that it was an island, and that we should find a passage between it and the main. We now discovered this to be a mistake, and found that it was a peninsula, joined to the rest of the coast by a low isthmus. I called the bay, formed by this peninsula, Repulse Bay; and a branch of it seemed to run a good way inland towards the S.S.W. Leaving this, we steered for the northern point of the peninsula, which we named Howe's Foreland†, in honour of Admiral Lord Howe. As we drew near it, we perceived some rocks and breakers near the N.W. part, and two islands a league and a half to the eastward of it, which, at first, appeared as one. I steered between them and the Foreland†, and was in the middle of the channel by noon. At that time our latitude, by observation, was 48° 51' S., and we had made twenty-six miles of E. longitude from Cape St. Louis‡.

* Cap François.

† Though Kerguelen's ships, in 1773, did not venture to explore this part of the coast, Monsieur de Pagès' account of it answers well to Captain Cook's. "Du 17 au 23, l'on ne prit d'autre connoissance que celle de la figure de la côte, qui, courant d'abord au S.E., et revenant ensuite

au N.E., forme un grand golfe. Il étoit occupé par des brisans et des rochers; il avoit aussi une île basse, et assez étendue, et l'on usa d'une bien soignée précaution, pour ne pas s'affaler dans ce golfe."—Voyage de M. de Pagès, tom. ii. p. 67.

-Voyage de M. de

From this situation, the most advanced land to the southward bore S.E.; but the trending of the coast from the foreland was more southerly. The islands which lie off Christmas Harbour bore N.; and the N. point of the foreland, N. 60° W., distant three miles. The land of this peninsula, or foreland, is of a moderate height, and of a hilly and rocky substance. The coast is low, with rocky points shooting out from it; between which points are little coves, with sandy beaches; and these, at this time, were mostly covered with sea-birds. We also saw upon them some seals. As soon as we were clear of the rocks and islands before mentioned, I gave orders to steer S.E. by S., along the coast. But before these orders could be carried into execution, we discovered the whole sea before us to be chequered with large beds of rock-weed, which we knew to be fast to the bottom, and to grow on rocky shoals. I had often found a great depth of water on such shoals; and I had as often found rocks that have raised their heads nearly to the surface of the water. It is always dangerous, therefore, to sail over them before they are well examined; but more especially, when there is no surge of the sea to discover the danger. This was the case at present, for the sea was as smooth as a mill-pond. Consequently we endeavoured to avoid them, by steering through the winding channels by which they were separated. We kept the lead continually going, but never struck ground with a line of sixty fathoms. This circumstance increased the danger, as we could not anchor, whatever necessity there might be for it. After running in this manner above an hour, we discovered a lurking rock just even with the surface of the sea. It bore N.E. $\frac{1}{2}$ E., distant three or four miles, and lay in the middle of one of these large beds of weeds. This was a sufficient warning to make us use every precaution to prevent our coming upon them.

We were now across the mouth of a large bay, that lies about eight miles to the southward of Howe's Foreland. In and before the entrance of this bay are several low islands, rocks, and those beds of sea-weed. But there seemed to be winding channels between them. After continuing our course half an hour longer, we were so much embarrassed with these shoals, that I resolved to haul off to the eastward, as the likeliest means of extricating ourselves from the danger that threatened us. But so far was this from answering the intended purpose, that it brought us into more. I therefore found it absolutely necessary to secure the ships, if possible, in some place before night, especially as the weather had now become hazy, and a fog was apprehended. And seeing some inlets to the south-west of us, I ordered Captain Clerke, as the Discovery drew less water than the Resolution, to lead in for the shore; which was accordingly done.

In standing in, it was not possible to avoid running over the edges of some of the shoals, on which we found from ten to twenty fathoms water; and the moment we were over, had no ground at the depth of fifty fathoms. After making a few boards to weather a spit that ran out from an island on our lee, Captain Clerke made the signal for having discovered a harbour; in which, about five o'clock, we anchored in fifteen fathoms water, over a bottom of fine dark sand, about three-quarters of a mile from the shore; the north point of the harbour bearing N. by E. $\frac{1}{2}$ E., one mile distant; and the small islands in the entrance, within which we anchored, extending from E. to S.E. Scarcely were the ships secured, when it began to blow very strong; so that we thought it prudent to strike top-gallant yards. The weather, however, continued fair; and the wind dispersing the fog that had settled on the hills, it was tolerably clear also. The moment, therefore, we had anchored, I hoisted out two boats; in one of which I sent Mr. Bligh, the master, to survey the upper part of the harbour, and look for wood; for not a shrub was to be seen from the ship. I also desired Captain Clerke to send his master to sound the channel that is on the south side of the small isles, between them and a pretty large island which lies near the south point of the harbour. Having given these directions, I went myself, in my other boat, accompanied by Mr. Gore, my first lieutenant, and Mr. Bailey, and landed on the north point, to see what I could discover from thence.

From the highest hill over the point, we had a pretty good view of the sea-coast, as far as Howe's Foreland. It is much indented, and several rocky points seemed to shoot out from it, with coves and inlets of unequal extent. One of the latter, the end of which I could not see, was disjoined from that in which the ships were at anchor, by the point we

then stood upon. A great many small islands, rocks, and breakers appeared scattered along the coast, as well to the southward as northward; and I saw no better channel to get out of the harbour than by the one through which we had entered it.

While Mr. Bailey and I were making the observations, Mr. Gore encompassed the hill, and joined us by a different route, at the place where I had ordered the boat to wait for us. Except the craggy precipices, we met with nothing to obstruct our walk. For the country was, if possible, more barren and desolate than about Christmas Harbour. And yet, if there be the least fertility in any part of this land, we ought to have found it in this, which is completely sheltered from the predominating bleak southerly and westerly winds. I observed, with regret, that there was neither food nor covering for cattle of any sort; and that if I left any, they must inevitably perish. In the little cove where the boat waited for us (which I called Penguin Cove, as the beach was covered with these birds), is a fine rivulet of fresh water, that may be easily come at. Here were also some large seals, shags, and a few ducks; and Mr. Bailey had a transient sight of a very small land-bird; but it flew amongst the rocks, and we lost it. About nine o'clock we got on board. Soon after, Mr. Bligh returned, and reported that he had been four miles up the harbour, and, as he judged, not far from the head of it. He found that its direction was W.S.W.; and that its breadth, a little above the ships, did not exceed a mile, but grew narrower towards the head. The soundings were very irregular, being from thirty-seven to ten fathoms; and, except under the beds of sea-weed, which in many places extended from the shore near half channel over, the bottom was a fine sand. He landed on both shores, which he found barren and rocky, without the least signs of tree or shrub, and with very little verdure of any kind. Penguins, and other oceanic birds and seals, occupied part of the coast, but not in such numbers as at Christmas Harbour.

Being no encouragement to continue our researches, and the next morning both wind and weather being favourable, I weighed anchor and put to sea. To this harbour I gave the name of Port Palliser, in honour of my worthy friend Admiral Sir Hugh Palliser. It is situated in the latitude of $49^{\circ} 3' S.$, in the longitude of $69^{\circ} 37' E.$, and five leagues from Howe's Foreland, in the direction of $S. 25^{\circ} E.$ There are several islands, rocks, and breakers lying in and without the entrance, for which the annexed chart* of the coast and sketch of the harbour may be consulted. We went in and out between them and the north head; but I have no doubt that there are other channels.

As we were standing out of Port Palliser, we discovered a round hill, like a sugar-loaf, in the direction of $S. 72^{\circ} E.$, about nine leagues distant. It had the appearance of an island lying at some distance from the coast; but we afterwards found it was upon the mainland. In getting out to sea, we had to steer through the winding channels amongst the shoals. However, we ventured to run over some of them, on which we never found less than eighteen fathoms, and often did not strike ground with twenty-four; so that, had it not been for the sea-weed growing upon all of them, they would not have been discovered. After we had got about three or four leagues from the coast, we found a clear sea, and then steered east till nine o'clock, when the Sugar-loaf hill, above mentioned, which I named Mount Campbell, bore S.E., and a small island that lies to the northward of it, S.S.E., distant four leagues. I now steered more southerly, in order to get in with the land. At noon, the latitude by double altitudes was $49^{\circ} 8' S.$; and we had made eighty miles of E. longitude from Cape St. Louis†. Mount Campbell bore $S. 47^{\circ} W.$, distant about four leagues; a low point, beyond which no land was to be seen, bore S.S.E., at the distance of about twenty miles; and we were about two leagues from the shore.

The land here is low and level‡. The mountains ending about five leagues from the low point, a great extent of low land is left, on which Mount Campbell is situated, about four miles from the foot of the mountains, and one from the sea-coast. These mountains have a considerable elevation, as also most of the inland ones. They seemed to be composed of naked

* See the quarto edition.

† Cap François.

‡ This part of the coast seems to be what the French saw on the 5th of January, 1774. Monsieur de Pagès speaks of it thus. "Nous reconnûmes une nouvelle côte

étendue de toute vue dans l'est, et dans le ouest. Les terres de cette côte étoient moins élevées que celles que nous avions vues jusques ici; elles étoient aussi d'un aspect moins rude."—De Pagès, tom. II. p. 68.

rocks, whose summits were capped with snow. Nor did the valleys appear to greater advantage. To whatever quarter we directed our glasses, nothing but sterility was to be seen.

We had scarcely finished taking the bearings at noon, before we observed low land opening off the low point just mentioned, in the direction of S.S.E., and eight miles beyond it. This new point proved to be the very eastern extremity of this land, and it was named Cape Digby. It is situated in the latitude of $49^{\circ} 23' S.$, and in the longitude of $70^{\circ} 34' E.$ Between Howe's Foreland and Cape Digby, the shore forms (besides the several lesser bays and harbours) one great bay that extends several leagues to the south-west, where it seemed to lose itself in various arms running in between the mountains. A prodigious quantity of sea-weed grows all over it, which seemed to be the same sort of weed that Mr. Banks distinguished by the name of *Fucus giganteus* *. Some of this weed is of a most enormous length, though the stem is not much thicker than a man's thumb. I have mentioned, that on some of the shoals upon which it grows, we did not strike ground with a line of twenty-four fathoms. The depth of water, therefore, must have been greater. And as this weed does not grow in a perpendicular direction, but makes a very acute angle with the bottom, and much of it afterwards spreads many fathoms on the surface of the sea, I am well warranted to say, that some of it grows to the length of sixty fathoms and upward.

At one o'clock (having run two leagues upon a S.E. $\frac{1}{2}$ E. course, from noon) we sounded, and found eighteen fathoms water, and a bottom of fine sand. Seeing a small bending in the coast, on the north side of Cape Digby, I steered for it. It was my intention to anchor there, if I should find it might be done with safety, and to land on the Cape, to examine what the low land within it produced. After running in one league, we sounded again, and found thirteen fathoms; and, immediately after, saw a shoal right before us, that seemed to extend off from the shore, from which we were distant about two miles. This discovery obliged us to haul off, E. by S., one league, where our depth of water increased to twenty-five fathoms. We then steered along shore, and continued in the same depth, over a bottom of fine sand, till Cape Digby bore west, two leagues distant, when we found twenty-six fathoms.

After this we did not strike ground, though we tried several times; but the ship having a good deal of way, ran the line out before the lead could reach the bottom; and being disappointed in my views, both of anchoring and of landing, I would not shorten sail, but pushed forward, in order to see as much of the coast as possible before night. From Cape Digby, it trends nearly S.W. by S. for about four or five leagues, or to a low point, to which, in honour of her Majesty, I gave the name of Point Charlotte; and it is the southernmost on the low coast. Six leagues from Cape Digby, in the direction of S.S.W. $\frac{1}{2}$ W., is a pretty high projecting point, which was called Prince of Wales's Foreland; and six leagues beyond that, in the same direction, and in the latitude of $49^{\circ} 54' S.$, and the longitude of $70^{\circ} 13' E.$, is the most southerly point of the whole coast, which I distinguished by the name of Cape George, in honour of his Majesty.

Between Point Charlotte and Prince of Wales's Foreland, where the country to the south-west began again to be hilly, is a deep inlet, which was called Royal Sound. It runs in west, quite to the foot of the mountains which bound it on the south-west, as the low land before mentioned does on the north. There are islands lying in the entrance, and others higher up, as far as we could distinguish. As we advanced to the south, we observed, on the south-west side of Prince of Wales's Foreland, another inlet into Royal Sound; and it then appeared that the Foreland was the east point of a large island lying in the mouth of it. There are several small islands in this inlet, and one about a league to the southward of Prince of Wales's Foreland. All the land on the south-west side of Royal Sound, quite to Cape George, is composed of elevated hills, that rise directly from the sea, one behind another, to a considerable height. Most of the summits were capped with snow, and they appeared as naked and barren as any we had seen. The smallest vestige of a tree or shrub was not discoverable, either inland or on the coast; and I think I may venture to pronounce that the country produces none. The low land about Cape Digby, when examined through our glasses, resembled the rest of the low land we had before met with; that is, it appeared to

* See vol. i. p. 20.

be partly naked and partly covered with a green turf, a description of which shall be given in its proper place. The shore is composed of sandy beaches, on which were many penguins and other oceanic birds; and an immense number of shags kept perpetually flying about the ships as we sailed along.

Being desirous of getting the length of Cape George, to be assured whether or not it was the most southerly point of the whole land, I continued to stretch to the south, under all the sail we could carry, till half an hour past seven o'clock; when, seeing no likelihood of accomplishing my design, as the wind had, by this time, shifted to W.S.W., the very direction in which we wanted to go, I took the advantage of the shifting of the wind, and stood away from the coast. At this time Cape George bore south 53° W. distant about seven leagues. A small island that lies off the pitch of the Cape was the only land we could see to the south of it; and we were farther confirmed that there was no more in that quarter, by a south-west swell which we met as soon as we brought the Cape to bear in this direction. But we have still a stronger proof that no part of this land can extend much, if at all, to the southward of Cape George; and that is, Captain Furneaux's tract in February 1773, after his separation from me during my late voyage. His log-book is now lying before me; and I find from it, that he crossed the meridian of this land only about seventeen leagues to the southward of Cape George; a distance at which it may very well be seen in clear weather. This seems to have been the case when Captain Furneaux passed it. For his log-book makes no mention of fogs or hazy weather; on the contrary, it expressly tells us, that, when in this situation, they had it in their power to make observations, both for latitude and longitude, on board his ship; so that, if this land extends farther south than Cape George, it would have been scarcely possible that he should have passed without seeing it. From these circumstances we are able to determine, within a very few miles, the quantity of latitude that this land occupies; which does not much exceed one degree and a quarter. As to its extent from east to west, that still remains undecided. We only know, that no part of it can reach so far to the west as the meridian of 65° ; because, in 1773, under that meridian I searched for it in vain*. The French discoverers, with some reason, imagined Cape St. Louis† to be the projecting point of a southern continent. The English have since proved that no such continent exists, and that the land in question is an island of no great extent‡; which, from its sterility, I should, with great propriety, call the Island of Desolation, but that I would not rob Monsieur de Kerguelen of the honour of its bearing his name§.

* If the French observations, as marked upon Captain Cook's chart, and still more authentically upon that published by their own discoverers, may be depended upon, this land doth not reach so far to the west as the meridian of 68° ; Cap Louis, which is represented as its most westerly point, being laid down by them to the east of that meridian.

† The idea of Cap Louis being this projecting point of a southern continent, must have soon vanished, as Cap François, within a year after, was found, by the same discoverer, to lie above one third of a degree farther north upon the same land. But if Kerguelen entertained any such imagination at first, we are sure that at present he thinks very differently. This appears from the following explicit declaration of his sentiments, which deserves to be transcribed from his late publication, as it does equal honour to his candour, and to Captain Cook's abilities. "La terre que j'ai découverte est certainement une île; puisque le célèbre Capitaine Cook a passé au sud, lors de son premier voyage, sans rien rencontrer. Je juge même, que cette île n'est pas bien grande. Il y a aussi apparence, d'après le Voyage de Monsieur Cook, que toute cette étendue de mers méridionales est semée d'îles ou de rochers, mais qu'il n'y a ni continent ni grande terre."—Kerguelen, p. 92.

‡ Kerguelen, as we see in the last note, concurs with Captain Cook as to this. However, he tells us, that he has reason to believe that it is about two hundred leagues in circuit; and that he was acquainted with about four-

score leagues of its coast. "J'en connois environs quatre vingt lieues des côtes; et j'ai lieu de croire, qu'elle a environ deux cents lieues de circuit."—Kerguelen, *ibid.*

§ Some of Monsieur de Kerguelen's own countrymen seem more desirous than we are, to rob him of this honour. It is very remarkable that Monsieur de Pagès never once mentions the name of his commander. And, though he takes occasion to enumerate the several French explorers of the southern hemisphere, from Gonneville down to Crozet, he affects to preserve an entire silence about Kerguelen, whose first voyage, in which the discovery of this considerable tract of land was made, is kept as much out of sight as if it never had taken place. Nay, not satisfied with refusing to acknowledge the right of another, he almost assumes it to himself. For, upon a map of the World, annexed to his book, at the spot where the new land is delineated, we read this inscription: "Isles nouvelles Australes vues par Monsieur de Pagès, en 1774." He could scarcely have expressed himself in stronger terms, if he had meant to convey an idea that he was the conductor of the discovery. And yet we know, that he was only a lieutenant [enseigne de vaisseau] on board one of the three ships commanded by Kerguelen; and that the discovery had been already made in a former voyage, undertaken while he was actually engaged in his singular journey round the world.

After all, it cannot but be remarked that Kerguelen was peculiarly unfortunate, in having done so little to

Mr. Anderson, my surgeon, who, as I have already mentioned, had made natural history a part of his studies, lost no opportunity, during the short time we lay in Christmas Harbour, of searching the country in every direction. He afterwards communicated to me the observations he made on its natural productions; and I shall insert them here in his own words:—"Perhaps no place, hitherto discovered in either hemisphere, under the same parallel of latitude, affords so scanty a field for the naturalist as this barren spot. The verdure which appears, when at a little distance from the shore, would flatter one with the expectation of meeting with some herbage; but in this we were much deceived. For on landing, we saw that this lively colour was occasioned only by one small plant, not much unlike some sorts of *Saxifrage*, which grows in large spreading tufts, to a considerable way up the hills. It forms a surface of a pretty large texture, and grows on a kind of rotten turf, into which one sinks a foot or two at every step. This turf, dried, might in cases of necessity serve for fuel, and is the only thing we met with here that could possibly be applied to this use.

"There is another plant, plentifully enough scattered about the boggy declivities, which grows to near the height of two feet, and not much unlike a small cabbage, when it has shot into seeds. The leaves about the root are numerous, large, and rounded; narrower at the base, and ending in a small point. Those on the stalks are much smaller, oblong, and pointed. The stalks, which are often three or four, all rise separately from the root, and run into long cylindrical heads, composed of small flowers. It has not only the appearance, but the watery acrid taste of the antiscorbutic plants, and yet differs materially from the whole tribe; so that we looked upon it as a production entirely peculiar to the place. We ate it frequently raw, and found it almost like the New Zealand scurvy-grass. But it seemed to acquire a rank flavour by being boiled; which, however, some of our people did not perceive, and esteemed it good. If it could be introduced into our kitchen-gardens, it would, in all probability, improve so far by cultivation as to be an excellent pot-herb. At this time, none of its seeds were ripe enough to be preserved, and brought home, to try the experiment. Two other small plants were found near the brooks and boggy places, which were eaten as salad; the one almost like garden cresses, and very fiery; and the other very mild. This last, though but small, is in itself a curiosity; having not only male and female, but what the botanists call *androgynous* plants.

"A coarse grass, which we cut down for the cattle, grows pretty plentifully in a few small spots about the sides of the harbour, with a smaller sort which is rarer; and, upon the flat ground, a sort of goose-grass, and another small plant much like it. In short, the whole catalogue of plants does not exceed sixteen or eighteen, including some sorts of moss, and a beautiful species of *lichen*, which grows upon the rocks, higher up than the rest of the vegetable productions. Nor is there even the least appearance of a shrub in the whole country.

"Nature has rather been more bountiful in furnishing it with animals; though, strictly speaking, they are not inhabitants of the place, being all of the marine kind; and, in general, only using the land for breeding, and for a resting-place. The most considerable are seals, or (as we used to call them) sea-bears; being that sort called the ursine seal. These come ashore to rest or breed; but they were not very numerous, which is not to be wondered at, as it is known that these animals rather frequent out-rocks, and little islands lying off coasts, than bays or inlets. They were, at this time, shedding their hair, and so tame, that we killed what number we chose. No other quadruped, either of the sea or of the land kind, was seen; but a great number of birds, viz., ducks, petrels, albatrosses, shags, gulls, and sea-swallows.

"The ducks are about the size of a teal or widgeon, but somewhat different in colour from either. They were in tolerable plenty about the sides of the hills, or even lower; and we killed a considerable number, which were good, and without the least fishy taste. We met with some of the same sort at the island of Georgia, in our late voyage. The Cape

complete what he had begun. He discovered a new land Captain Cook, as we have seen in this, and in the fore-
need; but, in two expeditions to it, he could not once going chapter, had either fewer difficulties to struggle with,
ring the ships to an anchor upon any part of its coasts. or was more successful in surmounting them.

petrel, or Pintado bird; the small blue one, which is always seen at sea, and the small black one, or Mother Carey's chicken, are not here in great numbers. But we found a nest of the first with an egg in it, about the size of a pullet's; and the second, though scarce, was met with in some holes like rabbit-burrows. Another sort, which is the largest of all the petrels, and called by the seamen Mother Carey's goose, is in greater numbers, and so tame, that at first we could kill them with a stick upon the beach. They are not inferior in size to an albatross, and are carnivorous, feeding on the dead carcasses of seals or birds that were thrown into the sea. Their colour is a sooty brown, with a greenish bill and feet; and, doubtless, they are the same that the Spaniards call *quebrantahuesos*, whose head is figured in Pernetty's Voyage to Falkland Islands.

"Of the albatrosses, none were found on shore except the grey one, which is commonly met with at sea in the higher southern latitudes. Once I saw one of these sitting in the cliff of a rock, but they were frequently flying about the harbour; and the common large sort, as well as a smaller with a black face, were seen farther out.

"Penguins form, by far, the greatest number of birds here, and are of three sorts: The first, or largest, I have seen formerly at the island of Georgia*. It is also mentioned by Bougainville†; but it does not seem to be so solitary as he represents it, for we found considerable numbers flocking together. The head is black, the upper part of the body a leaden grey, and the under part white, with black feet. It has two broad stripes of fine yellow, that begin on the sides of the head, and descending by each side of the neck, meet above its breast. The bill is partly reddish, and longer than in the other sorts. The second sort of penguin scarcely exceeds half the size of the former. The upper part of the body is a blackish grey, with a white spot on the upper part of the head, growing broader at each side. The bill and feet are yellowish. A very accurate figure and description, both of this and of the preceding, is given by M. Sonnerat‡. The third sort of penguin met with here had never been seen by any of us before. Its length is twenty-four inches, and its breadth twenty. The upper part of the body and throat are black; the rest white, except the upper part of the head, which has a fine yellow arch, looking backward, and ending on each side in long soft feathers, which it can erect as two crests. The two first sorts were found together on the beach; the large ones keeping by themselves, and walking in small flocks amongst the others, which were more numerous, and were sometimes seen a considerable way up the sides of the hills. The third sort were only found by themselves, but in great numbers, on the outer shores of the harbour. They were breeding at this time; and they lay, on the bare stones, only one white egg, larger than that of a duck. All the three sorts of penguins were so tame, that we took as many as we pleased with our hands.

"The shags of this place are of two sorts; the lesser cormorant or water-crow, and another, which is black above, with a white belly; the same that is found in New Zealand, Terra del Fuego, and the island of Georgia. We also met with here the common sea-gull, sea-swallow, tern, and Port Egmont hen; the last of which were tame and numerous. Another sort of white bird, flocks of which flew about the bay, is very singular, having the base of the bill covered with a horny crust§. It is larger than a pigeon, with the bill black and the feet white, made like those of a curlew. Some of our people put it in competition with the duck as food.

"The seine was hauled once; but we found only a few fish about the size of a small haddock, though quite different from any we knew. The snout is lengthened, the head armed with some strong spines, the rays of the back fin long, and very strong; the belly is large, and the body without scales. The only shell-fish are a few limpets and muscles; and amongst the stones a few small star-fish and sea-anemones were found.

"The hills are of a moderate height; yet many of their tops were covered with snow at this time, though answering to our June. Some of them have large quantities of stones, irregularly heaped together at their foot, or on their sides. The sides of others, which form steep cliffs towards the sea, are rent from the top downward, and seem ready to fall off,

having stones of a considerable size lying in the fissures. Some were of opinion that frost might be the cause of these fissures, which I shall not dispute; but how others of the appearances could be effected, but by earthquakes, or some such severe shocks, I cannot say. It appears that rain must be almost constant here, not only from the marks of large torrents having rushed down, but from the disposition of the country, which, even on the hills, is almost an entire bog or swamp, the ground sinking at every step.

"The rocks, or foundations of the hills, are composed chiefly of a dark blue, and very hard stone, intermixed with small particles of glimmer or quartz. This seems to be one of the most universal productions of nature, as it constitutes whole mountains in Sweden, in Scotland, at the Canary Islands, the Cape of Good Hope, and at this place. Another brownish, brittle stone forms here some considerable rocks; and one which is blacker, and found in detached pieces, incloses bits of coarse quartz. A red, a dull yellow, and a purplish sandstone, are also found in small pieces; and pretty large lumps of semi-transparent quartz, disposed irregularly in polyedral pyramidal crystals of long shining fibres. Some small pieces of the common sort are met with in the brooks, made round by attrition, but none hard enough to resist a file. Nor were any of the other stones acted on by aqua fortis, or attracted by the magnet. Nothing that had the least appearance of an ore or metal was seen."

CHAPTER VI. — PASSAGE FROM KERGUELEN'S TO VAN DIEMEN'S LAND. — ARRIVAL IN ADVENTURE BAY. — INCIDENTS THERE. — INTERVIEWS WITH THE NATIVES. — THEIR PERSONS AND DRESS DESCRIBED. — ACCOUNT OF THEIR BEHAVIOUR. — TABLE OF THE LONGITUDE, LATITUDE, AND VARIATION. — MR. ANDERSON'S OBSERVATIONS ON THE NATURAL PRODUCTIONS OF THE COUNTRY, ON THE INHABITANTS, AND THEIR LANGUAGE.

AFTER leaving Kerguelen's Land, I steered E. by N., intending, in obedience to my instructions, to touch next at New Zealand, to recruit our water, to take in wood, and to make hay for the cattle. Their number, by this time, had been considerably diminished; two young bulls, one of the heifers, two rams, and several of the goats, having of late died, while we were employed in exploring this desolate coast. The 31st, in the morning, being the day after we stood out to sea, we had several observations of the sun and moon. Their results gave the longitude $72^{\circ} 33' 36''$ E. The time-keeper, in this situation, gave $72^{\circ} 38' 15''$. These observations were the more useful, as we had not been able to get any for some time before, and they now served to assure us that no material error had crept into the time-keeper.

On the 1st of January, being then in the latitude of $48^{\circ} 41' S.$, longitude $76^{\circ} 50' E.$, the variation was $30^{\circ} 39' W.$; and the next day, in the latitude of $48^{\circ} 22' S.$, longitude $80^{\circ} 22' E.$, it was $30^{\circ} 47' 18' W.$ This was the greatest variation we found in this passage; for afterward it began to decrease, but so slowly, that on the 3d, in the evening, being then in the latitude of $48^{\circ} 16' S.$, longitude $85^{\circ} E.$, it was $29^{\circ} 38' W.$

Thus far we had fresh gales from the W. and S.W., and tolerably clear weather. But now the wind veered to the N., where it continued eight days, and was attended with a thick fog. During this time we ran above three hundred leagues in the dark. Now and then the weather would clear up, and give us a sight of the sun; but this happened very seldom, and was always of short continuance. On the 7th, I hoisted out a boat, and sent an order to Captain Clerke, appointing Adventure Bay, in Van Diemen's Land, as our place of rendezvous, in case of separation, before we arrived in the meridian of that land. But we were fortunate enough, amidst all this foggy weather, by frequently firing guns as signals, though we seldom saw each other, not to lose company.

On the 12th, being in the latitude of $48^{\circ} 40' S.$, longitude $110^{\circ} 26' E.$, the northerly winds ended in a calm, which, after a few hours, was succeeded by a wind from the southward. This, with rain, continued for twenty-four hours, when it freshened, and veered to the west and north-west, and brought on fair and clear weather. We continued our course to the

eastward, without meeting with anything worthy of notice, till four o'clock in the morning of the 19th, when, in a sudden squall of wind, though the *Discovery* received no damage, our fore-top-mast went by the board, and carried the main-top-gallant-mast with it. This occasioned some delay, as it took us up the whole day to clear the wreck, and to fit another topmast. The former was accomplished without losing any part of it, except a few fathoms of small rope. Not having a spare main-top-gallant-mast on board, the fore-top-gallant-mast was converted into one for our immediate use.

The wind continued westerly, blew a fresh gale, and was attended with clear weather; so that scarcely a day passed without being able to get observations for fixing the longitude and the variation of the compass. The latter decreased in such a manner, that in the latitude of $44^{\circ} 18' S.$, longitude $132^{\circ} 2' E.$, it was no more than $5^{\circ} 34' 18'' W.$; and on the 22d, being then in the latitude of $43^{\circ} 27' S.$, longitude $141^{\circ} 50' E.$, it was $1^{\circ} 24' 15'' E.$ So that we had crossed the line where the compass has no variation.

On the 24th, at three o'clock in the morning, we discovered the coast of Van Diemen's Land, bearing $N. \frac{1}{2} W.$ At four o'clock, the south-west Cape bore $N.N.W. \frac{1}{2} W.$; and the Mewstone, $N.E.$ by $E.$ three leagues distant. There are several islands and high rocks lying scattered along this part of the coast, the southernmost of which is the Mewstone. It is a round, elevated rock, five or six leagues distant from the south-west Cape, in the direction of $S. 55^{\circ} E.$ At noon, our latitude was $43^{\circ} 47' S.$, longitude $147^{\circ} E.$; and the situation of the lands round us, as follows: An elevated round-topped hill bore $N. 17^{\circ} W.$; the south-west Cape, $N. 74^{\circ} W.$; the Mewstone, $W. \frac{1}{2} N.$; Swilly Isle or Rock, $S. 49^{\circ} E.$; and the south-east or South Cape, $N. 40^{\circ} E.$, distant near three leagues. The land between the south-west and the south capes is broken and hilly, the coast winding, with points shooting out from it; but we were too far off to be able to judge whether the bays formed by these points were sheltered from the sea-winds. The bay, which appeared to be the largest and deepest, lies to the westward of the peaked hill above mentioned. The variation of the compass here was $5^{\circ} 15' E.$

At six o'clock in the afternoon we sounded, and found sixty fathoms water, over a bottom of broken coral and shells. The South Cape then bore $N. 75^{\circ} W.$, two or three leagues distant; Tasman's Head, $N.E.$; and Swilly Rock, $S.$ by $W. \frac{1}{2} W.$ About a league to the eastward of Swilly is another elevated rock, that is not taken notice of by Captain Furneaux. I called it the Eddystone, from its very great resemblance to that lighthouse. Nature seems to have left these two rocks here for the same purpose that the Eddystone lighthouse was built by man, viz., to give navigators notice of the dangers around them: for they are the conspicuous summits of a ledge of rocks under water, on which the sea in many places breaks very high. Their surface is white with the dung of sea-fowls, so that they may be seen at some distance, even in the night. On the north-east side of Storm Bay, which lies between the South Cape and Tasman's Head, there are some coves or creeks, that seemed to be sheltered from the sea-winds; and I am of opinion, that were this coast examined, there would be found some good harbours.

Soon after we had sight of land, the westerly winds left us, and were succeeded by variable light airs and alternate calms till the 26th at noon. At that time a breeze sprung up and freshened at south-east, which put it in my power to carry into execution the design I had, upon due consideration, formed, of carrying the ships into Adventure Bay, where I might expect to get a supply of wood, and of grass for the cattle; of both which articles we should, as I now found, have been in great want, if I had waited till our arrival in New Zealand. We therefore stood for the bay, and anchored in it at four o'clock in the afternoon, in twelve fathoms water, over a bottom of sand and ooze. Penguin Island, which lies close to the east point of the bay, bore $N. 84^{\circ} E.$; the southernmost point of Maria's Islands bore $N. 76^{\circ} \frac{1}{2} E.$; and Cape Frederic Henry, or the north point of the bay, bore $N. 33^{\circ} E.$ Our distance from the nearest shore was about three quarters of a mile.

As soon as we had anchored, I ordered the boats to be hoisted out. In one of them I went myself, to look for the most commodious place for furnishing ourselves with the necessary supplies; and Captain Clerke went in his boat upon the same service. Wood and water we found in plenty, and in situations convenient enough, especially the first: but grass, of which

we stood most in need, was scarce, and also very coarse. Necessity, however, obliged us to take such as we could get.

Next morning early, I sent Lieutenant King to the east side of the bay, with two parties one to cut wood, and the other to cut grass, under the protection of the marines, whom I judged it prudent to land as a guard. For although, as yet, none of the natives had appeared, there could be no doubt that some were in our neighbourhood, as we had seen columns of smoke from the time of our approaching the coast, and some now was observed at no great distance up in the woods. I also sent the launch for water, and afterwards visited all the parties myself. In the evening we drew the seine at the head of the bay, and, at one haul, caught a great quantity of fish. We should have got many more, had not the net broken in drawing it ashore: most of them were of that sort known to seamen by the name of elephant fish. After this, every one repaired on board with what wood and grass we had cut, that we might be ready to sail whenever the wind should serve. This not happening next morning, the people were sent on shore again, on the same duty as the day before. I also employed the carpenter, with part of his crew, to cut some spars for the use of the ship; and despatched Mr. Roberts, one of the mates, in a small boat, to survey the bay.

In the afternoon, we were agreeably surprised, at the place where we were cutting wood, with a visit from some of the natives; eight men and a boy. They approached us from the woods, without betraying any marks of fear, or rather with the greatest confidence imaginable; for none of them had any weapons, except one, who held in his hand a stick about two feet long, and pointed at one end. They were quite naked, and wore no ornaments; unless we consider as such, and as a proof of their love of finery, some large punctures or ridges raised on different parts of their bodies, some in straight, and others in curved lines. They were of the common stature, but rather slender. Their skin was black, and also their hair, which was as woolly as that of any native of Guinea; but they were not distinguished by remarkably thick lips nor flat noses. On the contrary, their features were far from being disagreeable. They had pretty good eyes; and their teeth were tolerably even, but very dirty. Most of them had their hair and beards smeared with a red ointment; and some had their faces also painted with the same composition.

They received every present we made to them without the least appearance of satisfaction. When some bread was given, as soon as they understood that it was to be eaten, they either returned it, or threw it away, without even tasting it. They also refused some elephant fish, both raw and dressed, which we offered to them. But upon giving some birds to them, they did not return these, and easily made us comprehend that they were fond of such food. I had brought two pigs ashore, with a view to leave them in the woods. The instant these came within their reach, they seized them, as a dog would have done, by the ears, and were for carrying them off immediately; with no other intention, as we could perceive, but to kill them. Being desirous of knowing the use of the stick which one of our visitors carried in his hand, I made signs to them to show me; and so

we succeeded, that one of them set up a piece of wood as a mark, and threw at it, at the distance of about twenty yards. But we had little reason to commend his dexterity; for after repeated trials, he was still very wide

HEAD OF MAN OF VAN DIEMEN'S LAND.

from the object. Omai, to show them how much superior our weapons were to theirs, then fired his musket at it; which alarmed them so much, that notwithstanding all we could do or say, they ran instantly into the woods. One of them was so frightened, that he let drop an axe and two knives, that had been given to him. From us, however, they went to the place where some of the Discovery's people were employed in taking water into their boat. The officer of that party, not knowing that they had paid us so friendly a visit, nor what their intent might be, fired a musket in the air, which sent them off with the greatest precipitation.

Thus ended our first interview with the natives. Immediately after their final retreat, judging that their fears would prevent their remaining near enough to observe what was passing, I ordered the two pigs, being a boar and sow, to be carried about a mile within the woods, at the head of the bay. I saw them left there by the side of a fresh-water brook. A young bull and a cow, and some sheep and goats, were also, at first, intended to have been left by me as an additional present to Van Diemen's Land. But I soon laid aside all thoughts of this, from a persuasion that the natives, incapable of entering into my views of improving their country, would destroy them. If ever they should meet with the pigs, I have no doubt this will be their fate. But as that race of animals soon becomes wild, and is fond of the thickest cover of the woods, there is great probability of their being preserved. An open place must have been chosen for the accommodation of the other cattle; and in such a situation, they could not possibly have remained concealed many days.

The morning of the 29th was ushered in with a dead calm, which continued all day, and effectually prevented our sailing. I therefore sent a party over to the east point of the bay to cut grass; having been informed that some of a superior quality grew there. Another party, to cut wood, was ordered to go to the usual place, and I accompanied them myself. We had observed several of the natives this morning sauntering along the shore, which assured us, that though their consternation had made them leave us so abruptly the day before, they were convinced that we intended them no mischief, and were desirous of renewing the intercourse. It was natural that I should wish to be present on the occasion. We had not been long landed, before about twenty of them, men and boys, joined us, without expressing the least sign of fear or distrust. There was one of this company conspicuously deformed; and who was not more distinguishable by the hump upon his back, than by the drollery of his gestures, and the seeming humour of his speeches; which he was very fond of exhibiting, as we supposed, for our entertainment. But, unfortunately, we could not understand him; the language spoken here being wholly unintelligible to us. It appeared to me to be different from that spoken by the inhabitants of the more northern parts of this country, whom I met with in my first voyage; which is not extraordinary, since those we now saw, and those we then visited, differ in many other respects*. Nor did they seem to be such miserable wretches as the natives whom Dampier mentions to have seen on its western coast†.

* The most striking difference seems to be with regard to the texture of the hair. The natives whom Captain Cook met with at Endeavour River in 1770 are said, by him, to have "naturally long and black hair, though it be universally cropped short. In general it is straight, but sometimes it has a slight curl. We saw none that was not matted and filthy. Their beards were of the same colour with the hair, and bushy and thick." See vol. i. p. 262, of this edition of Cook's Voyages.

It may be necessary to mention here, on the authority of Captain King, that Captain Cook was very unwilling to allow that the hair of the natives now met with in Adventure Bay was woolly, fancying that his people, who first observed this, had been deceived, from its being clothed with grease and red ochre. But Captain King prevailed upon him afterward to examine carefully the hair of the boys, which was generally, as well as that of the women, free from this dirt; and then he owned himself satisfied that it was naturally woolly. Perhaps we may suppose it possible that he himself had been deceived

when he was in Endeavour River, from this very circumstance; as he expressly says, that "they saw none that was not matted and filthy."

† And yet Dampier's New Hollanders, on the western coast, bear a striking resemblance to Captain Cook's at Van Diemen's Land, in many remarkable instances:—

1st, As to their becoming familiar with the strangers.

2dly, As to their persons; being straight-bodied and thin; their skin black; and black, short, curled hair, like the negroes of Guinea; with wide mouths.

3dly, As to their wretched condition; having no houses, no garment, no canoes, no instrument to catch large fish; feeding on broiled muscles, cockles, and periwinkles; having no fruits of the earth; their weapons a straight pole, sharpened and hardened at the end, &c. &c.

The chief peculiarities of Dampier's "miserable wretches" are, 1st, Their eyelids being always half closed, to keep the flies out, which were excessively troublesome there; and, 2dly, Their wanting the two fore-teeth of the upper

Some of our present group wore loose round their necks three or four folds of small cord made of the fur of some animal; and others of them had a narrow slip of the *kangooroo* skin tied round their ankles. I gave to each of them a string of beads and a medal; which I thought they received with some satisfaction. They seemed to set no value on iron, or on iron tools. They were even ignorant of the use of fish-hooks, if we might judge from their manner of looking at some of ours which we showed to them. We cannot, however, suppose it to be possible that a people who inhabit a sea-coast, and who seem to derive no part of their sustenance from the productions of the ground, should not be acquainted with some mode of catching fish, although we did not happen to see any of them thus employed; nor observe any canoe or vessel in which they could go upon the water. Though they absolutely rejected the sort of fish that we offered to them, it was evident that shell-fish, at least, made a part of their food, from the many heaps of muscle-shells we saw in different parts near the shore, and about some deserted habitations near the head of the bay. These were little sheds or hovels built of sticks, and covered with bark. We could also perceive evident signs of their sometimes taking up their abode in the trunks of large trees, which had been hollowed out by fire, most probably for this very purpose. In or near all these habitations, and wherever there was a heap of shells, there remained the marks of fire; an indubitable proof that they do not eat their food raw.

OPOSUM RAT AND TASMANIAN WOLF.

After staying about an hour with the wooding party and the natives, as I could now be pretty confident that the latter were not likely to give the former any disturbance, I left them, and went over to the grass-cutters on the east point of the bay, and found that they had met with a fine patch. Having seen the boats loaded, I left that party, and returned on board to dinner; where, some time after, Lieutenant King arrived. From him I learned that I had but just left the shore, when several women and children made their appearance, and were introduced to him by some of the men who attended them. He gave presents to all of them, of such trifles as he had about him. These females wore a *kangooroo* skin (in the same shape as it came from the animal) tied over the shoulders and round the waist. But its only use seemed to be, to support their children when carried on their backs; for it did not cover those parts which most nations conceal; being in all other respects as naked as the men, and as black, and their bodies marked with scars in the same manner. But in this they differed from the men, that though their hair was of the same colour and texture, some of them had their heads completely shorn or shaved; in others this operation had been performed only on one side, while the rest of them had all the upper part of the head shorn close, leaving a circle of hair all round, somewhat like the tonsure of the Romish ecclesiastics. Many of the children had fine features, and were thought pretty; but of the persons of the women, especially those advanced in years, a less favourable report was made.

jaw, and their having no beards. See Dampier's reason for supposing that Dampier was mistaken in the Voyages, vol. i. p. 464, &c. There seems to be no above account of what he saw.

In the afternoon I went again to the grass-cutters, to forward their work. I found them then upon Penguin Island, where they had met with a plentiful crop of excellent grass. We laboured hard till sunset, and then repaired on board, satisfied with the quantity we had collected, and which I judged sufficient to last till our arrival in New Zealand.

During our whole stay, we had either calms or light airs from the eastward. Little or no time, therefore, was lost by my putting in at this place. For if I had kept the sea, we should not have been twenty leagues advanced farther on our voyage. And, short as our continuance was here, it has enabled me to add somewhat to the imperfect acquaintance that hath hitherto been acquired with this part of the globe. Van Diemen's Land has been twice visited before. It was so named by Tasman, who discovered it in November 1642. From that time it had escaped all farther notice by European navigators, till Captain Furneaux touched at it in March 1773. I hardly need say, that it is the southern point of New Holland*, which, if it doth not deserve the name of a continent, is by far the largest island in the world.

The land is, for the most part, of a good height, diversified with hills and valleys, and everywhere of a greenish hue. It is well wooded; and if one may judge from appearances, and from what we met with in Adventure Bay, is not ill supplied with water. We found plenty of it in three or four places in this bay. The best, or what is most convenient for ships that touch here, is a rivulet, which is one of several that fall into a pond that lies behind the beach at the head of the bay. It there mixes with the sea-water; so that it must be taken up above this pond, which may be done without any great trouble. Firewood is to be got with great ease in several places. The only wind to which this bay is exposed, is the N.E. But as this wind blows from Maria's Islands, it can bring no very great sea along with it; and, therefore, upon the whole, this may be accounted a very safe road. The bottom is clean, good holding-ground, and the depth of water from twelve to five and four fathoms.

Captain Furneaux's sketch of Van Diemen's Land, published with the Narrative of my last Voyage†, appears to me to be without any material error, except with regard to Maria's Islands, which have a different situation from what is there represented. What my idea of them is, will be seen in the sketch of that coast here inserted‡; and I insert it, not as the result of a more faithful, but merely of a second examination. The longitude was determined by a great number of lunar observations which we had before we made the land, while we were in sight of it, and after we had left it; and reduced to Adventure Bay, and the several principal points, by the time-keeper. The following Table will exhibit both the longitude and latitude at one view:—

	Latitude south.	Longitude east.
Adventure Bay	43° 21' 20"—	147° 29' 0''
Tasman's Head	43 33 0 —	147 28 0
South Cape	43 42 0 —	146 56 0
South-west Cape	43 37 0 —	146 7 0
Swilly Isle	43 55 0 —	147 6 0

Adventure Bay { Variation of the compass 5° 15' east.
 { Dip of the south end of the needle 70° 15½'.

We had high-water on the 29th, being two days before the last quarter of the moon, at nine in the morning. The perpendicular rise then was eighteen inches; and there was no appearance of its having ever exceeded two feet and a half. These are all the memorials useful to navigation, which my short stay has enabled me to preserve, with respect to Van Diemen's Land.

Mr. Anderson, my surgeon, with his usual diligence, spent the few days we remained in Adventure Bay, in examining the country. His account of its natural productions, with which he favoured me, will more than compensate for my silence about them: some of his

remarks on the inhabitants will supply what I may have omitted or represented imperfectly; and his specimen of their language, however short, will be thought worth attending to, by those who wish to collect materials for tracing the origin of nations. I shall only premise, that the tall straight forest-trees which Mr. Anderson describes in the following account, are of a different sort from those which are found in the more northern parts of this coast. The wood is very long and close-grained; extremely tough; fit for spars, oars, and many other uses; and would, on occasion, make good masts (perhaps none better), if a method could be found to lighten it.

"At the bottom of Adventure Bay is a beautiful sandy beach, which seems to be wholly formed by the particles washed by the sea from a very fine white sand-stone, that in many places bounds the shore, and of which Fluted Cape, in the neighbourhood, from its appearance, seems to be composed. This beach is about two miles long, and is excellently adapted for hauling a seine, which both ships did repeatedly with success. Behind this, is a plain or flat, with a salt, or rather brackish lake (running in length parallel with the beach), out of which we caught, with angling rods, many whitish bream, and some small trout. The other parts of the country adjoining the bay are quite hilly; and both those and the flat are an entire forest of very tall trees, rendered almost impassible by shrubs, brakes of fern, and fallen trees; except on the sides of some of the hills, where the trees are but thin, and a coarse grass is the only interruption. To the northward of the bay, there is low land, stretching farther than the eye can reach, which is only covered with wood in certain spots; but we had no opportunity to examine in what respects it differed from the hilly country. The soil on the flat land is either sandy, or consists of a yellowish mould, and, in some places, of a reddish clay. The same is found on the lower part of the hills; but farther up, especially where there are few trees, it is of a grey tough cast, to appearance very poor.

"In the valleys between the hills, the water drains down from their sides; and at last, in some places, forms small brooks; such indeed as were sufficient to supply us with water, but by no means of that size we might expect in so extensive a country, especially as it is both hilly and well wooded. Upon the whole, it has many marks of being naturally a very dry country; and perhaps might (independent of its wood) be compared to Africa, about the Cape of Good Hope, though that lies ten degrees farther northward, rather than to New Zealand, on its other side, in the same latitude, where we find every valley, however small, furnished with a considerable stream of water. The heat too appears to be great, as the thermometer stood at 64, 70, and once at 74. And it was remarked, that birds were seldom killed an hour or two, before they were almost covered with small maggots, which I would rather attribute merely to the heat; as we had not any reason to suppose there is a peculiar disposition in the climate to render substances soon putrid. No mineral bodies, nor indeed stones of any other sort, but the white sand one already mentioned, were observed.

"Amongst the vegetable productions, there is not one, that we could find, which afforded the smallest subsistence for man. The forest-trees are all of one sort, growing to a great height, and in general quite straight, branching but little, till towards the top. The bark is white, which makes them appear, at a distance, as if they had been peeled; it is also thick; and within it are sometimes collected pieces of a reddish transparent gum or resin, which has an astringent taste. The leaves of this tree are long, narrow, and pointed; and it bears clusters of small white flowers, whose cups were, at this time, plentifully scattered about the ground, with another sort resembling them somewhat in shape, but much larger; which makes it probable that there are two species of this tree. The bark of the smaller branches, the fruit, and leaves, have an agreeable pungent taste, and aromatic smell, not unlike peppermint; and in its nature, it has some affinity to the *myrtus* of botanists. The most common tree, next to this, is a small one about ten feet high, branching pretty much, with narrow leaves, and a large, yellow, cylindrical flower, consisting only of a vast number of filaments; which, being shed, leave a fruit like a pine-top. Both the above-mentioned trees are unknown in Europe. The underwood consists chiefly of a shrub somewhat resembling a myrtle, and which seems to be the *Leptospermum scoparium*, mentioned in Dr. Forster's *Char. Gen. Plant.*; and, in some places, of another, rather smaller, which is a new species of the *Melaleuca* of Linnæus. Of other plants, which are by no means numerous,

there is a species of *Gladiolus*, rush, bell-flower, samphire, a small sort of wood-sorrel, milk-wort, endweed, and Job's tears; with a few others, peculiar to the place. There are several kinds of fern, as polypody, spleenwort, female fern, and some mosses; but the species are either common, or at least found in some other countries, especially New Zealand.

"The only animal of the quadruped kind we got, was a sort of *opossum*, about twice the size of a large rat; and is, most probably, the male of that species found at Endeavour River, as mentioned in Hawkesworth's Collection of Voyages*. It is of a dusky colour above, tinged with a brown or rusty cast, and whitish below. About a third of the tail, towards its tip, is white, and bare underneath; by which it probably hangs on the branches of trees, as it climbs these, and lives on berries. The *kangaroo*, another animal found farther northward in New Holland, as described in the same voyage†, without all doubt also inhabits here, as the natives we met with had some pieces of their skins; and we several times saw animals, though indistinctly, run from the thickets when we walked in the woods, which, from the size, could be no other. It should seem also, that they are in considerable numbers, from the dung we saw almost everywhere, and from the narrow tracks or paths they have made amongst the shrubbery.

"There are several sorts of birds, but all so scarce and shy, that they are evidently harassed by the natives, who, perhaps, drew much of their subsistence from them. In the woods, the principal sorts are large brown hawks or eagles; crows nearly the same as ours in England; yellowish paroquets; and large pigeons. There are also three or four small birds, one of which is of the thrush kind; and another small one, with a pretty long tail, has part of the head and neck of a most beautiful azure colour; from whence we named it *Motacilla cyanea*. On the shore were several common and sea gulls; a few black oystercatchers, or sea-pies; and a pretty plover of a stone colour, with a black hood. About the pond or lake behind the beach, a few wild ducks were seen; and some shags used to perch upon the high leafless trees near the shore. Some pretty large blackish snakes were seen in the woods; and we killed a large, hitherto unknown, lizard, fifteen inches long and six round, elegantly clouded with black and yellow; besides a small sort, of a brown gilded colour above, and rusty below.

"The sea affords a much greater plenty, and at least as great a variety as the land. Of these the elephant fish, or *pejegallo*, mentioned in Frezier's Voyage‡, are the most numerous; and though inferior to many other fish, were very palatable food. Several large rays, nurses, and small leather-jackets, were caught; with some small white bream, which were firmer and better than those caught in the lake. We likewise got a few soles and flounders; two sorts of gurnards, one of them a new species; some small spotted mullet; and, very unexpectedly, the small fish with a silver band on its side, called *Atherina hepsetus* by Hasselquist§. But that next in number, and superior in goodness, to the elephant fish, was a sort none of us recollected to have seen before. It partakes of the nature both of a round and of a flat fish, having the eyes placed very near each other; the fore-part of the body much flattened or depressed, and the rest rounded. It is of a brownish sandy colour, with rusty spots on the upper part, and whitish below. From the quantity of slime it was always covered with, it seems to live after the manner of flat fish, at the bottom.

"Upon the rocks are plenty of muscles, and some other small shell-fish. There are also great numbers of sea-stars; some small limpets; and large quantities of sponge; one sort of which, that is thrown on shore by the sea, but not very common, has a most delicate texture; and another, is the *Spongia dichotoma*. Many pretty *Medusa's heads* were found upon the beach; and the stinking *Laplysia*, or sea-hare, which, as mentioned by some authors, has the property of taking off the hair by the acrimony of its juice; but this sort was deficient in this respect.

"Insects, though not numerous, are here in considerable variety. Amongst them are grasshoppers, butterflies, and several sorts of small moths, finely variegated. There are two sorts of dragon-flies, gad-flies, camel-flies; several sorts of spiders; and some scorpions; but the last are rather rare. The most troublesome, though not very numerous tribe of insects,

are the musquitoes; and a large black ant, the pain of whose bite is almost intolerable, during the time it lasts. The musquitoes, also, make up the deficiency of their number, by the severity of their venomous proboscis.

"The inhabitants whom we met with here had little of that fierce or wild appearance common to people in their situation; but, on the contrary, seemed mild and cheerful, without reserve or jealousy of strangers. This, however, may arise from their having little to lose or care for. With respect to personal activity or genius, we can say but little of either. They do not seem to possess the first in any remarkable degree; and as for the last, they have, to appearance, less than even the half-animated inhabitants of Terra del Fuego, who have not invention sufficient to make clothing for defending themselves from the rigour of their climate, though furnished with the materials. The small stick, rudely pointed, which one of them carried in his hand, was the only thing we saw that required any mechanical exertion, if we except the fixing on the feet of some of them pieces of kangaroo skin, tied with thongs; though it could not be learned whether these were in use as shoes, or only to defend some sore. It must be owned, however, they are masters of some contrivance, in the manner of cutting their arms and bodies in lines of different lengths and directions, which are raised considerably above the surface of the skin, so that it is difficult to guess the method they use in executing this embroidery of their persons. Their not expressing that surprise which one might have expected from their seeing men so much unlike themselves, and things to which, we were well assured, they had been hitherto utter strangers—their indifference for our presents, and their general inattention, were sufficient proofs of their not possessing any acuteness of understanding.

"Their colour is a dull black, and not quite so deep as that of the African Negroes. It should seem, also, that they sometimes heightened their black colour, by smutting their bodies; as a mark was left behind on any clean substance, such as white paper, when they handled it. Their hair, however, is perfectly woolly, and it is clotted or divided into small parcels, like that of the Hottentots, with the use of some sort of grass, mixed with a red paint or ochre, which they smear in great abundance over their heads. This practice, as some might imagine, has not the effect of changing their hair into the frizzling texture we observed; for, on examining the head of a boy, which appeared never to have been smeared, I found the hair to be of the same kind. Their noses, though not flat, are broad and full. The lower part of the face projects a good deal, as is the case of most Indians I have seen; so that a line let fall from the forehead, would cut off a much larger portion than it would in Europeans. Their eyes are of a middling size, with the white less clear than in us; and though not remarkably quick or piercing, such as give a frank, cheerful cast to the whole countenance. Their teeth are broad, but not equal, nor well set; and either from nature or from dirt, not of so true a white as is usual among people of a black colour. Their mouths are rather wide; but this appearance seems heightened by wearing their beards long, and clotted with paint, in the same manner as the hair on their heads. In other respects, they are well-proportioned; though the belly seems rather projecting. This may be owing to the want of compression there, which few nations do not use, more or less. The posture of which they seem fondest, is to stand with one side forward, or the upper part of the body gently reclined, and one hand grasping (across the back) the opposite arm, which hangs down by the projecting side.

"What the ancient poets tell us of Fauns and Satyrs living in hollow trees, is here realised. Some wretched constructions of sticks, covered with bark, which do not even deserve the name of huts, were indeed found near the shore in the bay; but these seemed only to have been erected for temporary purposes; and many of their largest trees were converted into more comfortable habitations. These had their trunks hollowed out by fire, to the height of six or seven feet; and that they take up their abode in them sometimes, was evident from the hearths, made of clay, to contain the fire in the middle, leaving room for four or five persons to sit round it*. At the same time, these places of shelter are durable; for they take

* Tasman, when in the bay of Frederick Henry, adjoining to Adventure Bay, found two trees, one of which was two fathoms, and the other two fathoms and a half in

girth, and sixty or sixty-five feet high, from the root to the branches. See his Voyage, in Harris's Collection. Campbell's Edition, vol. i. p. 326.

care to leave one side of the tree sound, which is sufficient to keep it growing as luxuriantly as those which remain untouched.

"The inhabitants of this place are, doubtless, from the same stock with those of the northern parts of New Holland. Though some of the circumstances mentioned by Dampier, relative to those he met with on the western coast of this country, such as their defective sight, and want of fore-teeth, are not found here; and though Hawkesworth's account of those met with by Captain Cook on the east side shows also that they differ in many respects, yet still, upon the whole, I am persuaded, that distance of place, entire separation, diversity of climate, and length of time, all concurring to operate, will account for greater differences, both as to their persons and as to their customs, than really exist between our Van Diemen's Land natives, and those described by Dampier, and in Captain Cook's first Voyage. This is certain, that the figure of one of those seen in Endeavour River, and represented in Sidney Parkinson's Journal of that voyage, very much resembles our visitors in Adventure Bay. That there is not the like resemblance in their language, is a circumstance that need not create any difficulty. For though the agreement of the languages of people living distant from each other may be assumed as a strong argument for their having sprung from one common source, disagreement of language is by no means a proof of the contrary*.

"However, we must have a far more intimate acquaintance with the languages spoken here and in the more northern parts of New Holland, before we can be warranted to pronounce that they are totally different. Nay, we have good grounds for the opposite opinion; for we found that the animal called kangaroo at Endeavour River was known under the same name here†; and I need not observe that it is scarcely possible to suppose

IMMENSE TREE OF VAN DIEMEN'S LAND.

* The ingenious Author of *Recherches sur les Américains* illustrates the grounds of this assertion, in the following satisfactory manner:—"C'est quelque chose de surprenant, que la foule des idiomes, tous variés entr'eux, que parlent les naturels de l'Amérique Septentrionale. Qu'on réduise ces idiomes à des racines, qu'on les simplifie, qu'on en sépare les dialectes et les jargons dérivés, il en résulte toujours cinq ou six langues-mères, respectivement incompréhensibles. On a observé la même singularité dans la Sibérie et la Tartarie, où le nombre des idiomes, et des dialectes, est également multiplié; et rien n'est plus commun que d'y voir deux hordes voisines qui ne se comprennent point. On retrouve cette même multiplicité de jargons dans toutes les provinces de l'Amérique Méridionale." [He might also have included Africa.] "Il y a beaucoup d'apparence que la vie sauvage, en dispersant les hommes par petites

troupes isolées dans des bois épais, occasionne nécessairement cette grande diversité des langues, dont le nombre diminue à mesure que la société, en rassemblant les barbares vagabonds, en forme un corps de nation. Alors l'idiome le plus riche, ou le moins pauvre en mots, devient dominant, et absorbe les autres."—Tom. 1. p. 159, 160.

[These observations, which are worthy of much consideration in attempting to investigate the origin of "mother-tongues," are supported by the evidence of Mr. Catlin, whose remarkable travels among the Indian tribes of North America have recently excited so much attention. He states, that among the forty-eight tribes he visited, most of them make use of languages wholly distinct from each other.—Ed.]

† [That there is no distinction of races among the inhabitants of New Holland and Van Diemen's Land,

luxuriantly

that this was not transmitted from one another, but accidentally adopted by two nations, differing in language and extraction. Besides, as it seems very improbable that the Van Diemen's Land inhabitants should have ever lost the use of canoes or sailing vessels if they had been originally conveyed thither by sea, we must necessarily admit that they, as well as the kangaroo itself, have been stragglers by land from the more northern parts of the country. And if there be any force in this observation, while it traces the origin of the people, it will, at the same time, serve to fix another point, if Captain Cook and Captain Furneaux have not already decided it, that New Holland is nowhere totally divided by the sea into islands, as some have imagined*.

"As the New Hollanders seem all to be of the same extraction, so neither do I think there is anything peculiar in them. On the contrary, they much resemble many of the inhabitants whom I have seen at the islands Tanna and Manicula. Nay, there is even some foundation for hazarding a supposition that they may have originally come from the same place with all the inhabitants of the South Sea. For, of only about ten words which we could get from them, that which expresses *cold* differs little from that of New Zealand and Otaheite; the first being *Mallareede*, the second *Makku'reede*, and the third *Ma'reede*. The rest of our very scanty Van Diemen's Land Vocabulary is as follows:—

Quadue,	A woman.	Ka'my,	The teeth, mouth, or tongue.
Eve'ndi,	The eye.	Koy'gee,	The ear.
Mildje,	The nose.	No'unga,	Elevated scars on the body.
Lae'enne,	A small bird, a native of the woods here.	Tegeera,	To eat.
		Toga'rago,	I must be gone, or I will go.

"Their pronunciation is not disagreeable, but rather quick, though not more so than is that of other nations of the South Sea; and if we may depend upon the affinity of languages as a clue to guide us in discovering the origin of nations, I have no doubt but we shall find, on a diligent inquiry, and when opportunities offer to collect accurately a sufficient number of these words, and to compare them, that all the people from New Holland, eastward to Easter Island, have been derived from the same common root†."

Diemen's Land,

confirmed by the accounts of all writers who have given us descriptions of them; but the habits and customs, and also the languages or dialect, used by various tribes vary considerably. Thus, some tribes use the throwing stick and the boomerang, and others are unacquainted with either of these instruments; some are accustomed to strike out the two fore-teeth, whilst others, as the natives of Van Diemen's Land, do not practise this mutilation; and although the tribe whom Captain Cook found at Endeavour River gave the name Kangaroo to the animal still so called by us, yet Captain King, on visiting the same place, found it distinguished by the natives then dwelling there by another name.—The aborigines of Van Diemen's Land are now no longer denizens of their native soil, having been, after a protracted resistance, all conveyed to Gun Carriage Island, in Bass's Straits, which has been given up to their undisputed possession, but where, as is natural, they are far from being contented: Mr. Darwin states, that it was "the opinion of some that the race will soon become extinct." Their removal appears to have been necessary for the safety of the settlers, but it is one more melancholy proof of the exterminating influence of the step of the white man.—Ed.

* Dampier seems to be of this opinion. Vol. iii. p. 104. 125.

† It was not until the year 1797 that this question was set at rest by Captain Flinders, then a lieutenant of H. M. S. Reliance, who, in company with Mr. Bass the

surgeon, in a small decked boat or sloop built at Norfolk Island of native fir, and thence called the Norfolk, discovered Port Dalrymple, and passing through the straits, since known as Bass's Straits, circumnavigated the island, and, on its southern extremity, sailed up and examined the river Derwent, on the west bank of which Hobart Town has since been erected. The first European settlement was made in 1803, at Risdon, on the left or eastern bank of the Derwent, about eighteen miles from its northern entrance. Hobart Town was established on the western bank, in the following year.—Ed.]

† We find Mr. Anderson's notions on this subject conformable to those of Mr. Marsden, who has remarked "that one general language prevailed (however mutilated and changed in the course of time) throughout all this portion of the world, from Madagascar to the most distant discoveries eastward: of which the Malay is a dialect, much corrupted or refined by a mixture of other tongues. This very extensive similarity of language indicates a common origin of the inhabitants; but the circumstances and progress of their separation are wrapped in the darkest veil of obscurity."—History of Sumatra, p. 35.

See also his very curious paper, read before the Society of Antiquaries, and published in their Archaeologia, vol. vi., p. 155; where his sentiments on this subject are explained more at large, and illustrated by two tables of corresponding words.

CHAPTER VII.—THE PASSAGE FROM VAN DIEMEN'S LAND TO NEW ZEALAND.—EMPLOYMENTS IN QUEEN CHARLOTTE'S SOUND.—TRANSACTIONS WITH THE NATIVES THERE.—INTELLIGENCE ABOUT THE MASSACRE OF THE ADVENTURE'S BOAT'S CREW.—ACCOUNT OF THE CHIEF WHO HEADED THE PARTY ON THAT OCCASION.—OF THE TWO YOUNG MEN WHO EMBARK TO ATTEND OMAI.—VARIOUS REMARKS ON THE INHABITANTS.—ASTRONOMICAL AND NAUTICAL OBSERVATIONS.

AT eight o'clock in the morning of the 30th of January, a light breeze springing up at W., we weighed anchor, and put to sea from Adventure Bay. Soon after, the wind veered to the southward, and increased to a perfect storm. Its fury abated in the evening, when it veered to the E. and N.E. This gale was indicated by the barometer, for the wind no sooner began to blow than the mercury in the tube began to fall. Another remarkable thing attended the coming on of this wind, which was very faint at first. It brought with it a degree of heat that was almost intolerable. The mercury in the thermometer rose, as it were, instantaneously, from about 70° to near 90°. This heat was of so short a continuance, that it seemed to be wafted away before the breeze that brought it; so that some on board did not perceive it.

We pursued our course to the eastward, without meeting with anything worthy of note till the night between the 6th and 7th of February, when a marine belonging to the *Discovery* fell overboard, and was never seen afterward. This was the second misfortune of the kind that had happened to Captain Clerke since he left England. On the 10th, at four in the afternoon, we discovered the land of New Zealand. The part we saw proved to be Rock's Point, and bore S.E. by S., about eight or nine leagues distant. During this run from Van Diemen's Land, the wind, for the first four or five days, was at N.E., N., and N.N.W., and blew, for the most part, a gentle breeze. It afterward veered to S.E., where it remained twenty-four hours. It then came to W. and S.W.; in which points it continued, with very little deviation, till we reached New Zealand. After making the land, I steered for Cape Farewell, which at day-break, the next morning, bore S. by W., distant about four leagues. At eight o'clock it bore S.W. by S., about five leagues distant; and, in this situation, we had forty-five fathoms' water over a sandy bottom. In rounding the Cape we had fifty fathoms, and the same sort of bottom.

I now steered for Stephen's Island, which we came up with at nine o'clock at night; and at ten next morning, anchored in our old station, in Queen Charlotte's Sound. Unwilling to lose any time, our operations commenced that very afternoon, when we landed a number of empty water-casks, and began to clear a place where we might set up the two observatories, and tents for the reception of a guard, and of such of our people whose business might make it necessary for them to remain on shore. We had not been long at anchor before several canoes, filled with natives, came alongside of the ships; but very few of them would venture on board; which appeared the more extraordinary, as I was well known to them all. There was one man in particular amongst them, whom I had treated with remarkable kindness, during the whole of my stay when I was last here. Yet now, neither professions of friendship, nor presents, could prevail upon him to come into the ship. This shyness was to be accounted for only upon this supposition, that they were apprehensive we had revisited their country, in order to revenge the death of Captain Furneaux's people. Seeing Omai on board my ship now, whom they must have remembered to have seen on board the *Adventure*, when the melancholy affair happened, and whose first conversation with them, as they approached, generally turned on that subject, they must be well assured that I was no longer a stranger to it. I thought it necessary, therefore, to use every endeavour to assure them of the continuance of my friendship, and that I should not disturb them on that account. I do not know whether this had any weight with them; but certain it is that they very soon laid aside all manner of restraint and distrust.

On the 13th we set up two tents, one from each ship, on the same spot where we had pitched them formerly. The observatories were at the same time erected; and Messrs. King and Bayly began their operations immediately, to find the rate of the time-keeper, and

to make other observations. The remainder of the empty water-casks were also sent on shore, with the cooper to trim, and a sufficient number of sailors to fill them. Two men were appointed to brew spruce-beer ; and the carpenter and his crew were ordered to cut wood. A boat, with a party of men, under the direction of one of the mates, was sent to collect grass for our cattle ; and the people that remained on board were employed in refitting the ship, and arranging the provisions. In this manner, we were all profitably busied during our stay. For the protection of the party on shore, I appointed a guard of ten marines, and ordered arms for all the workmen ; and Mr. King, and two or three petty officers, constantly remained with them. A boat was never sent to any considerable distance from the ships without being armed, and under the direction of such officers as I could depend upon, and who were well acquainted with the natives. During my former visits to this country, I had never taken some of these precautions ; nor were they, I firmly believe, more necessary now than they had been formerly. But after the tragical fate of the Adventure's boat's crew in this Sound, and of Captain Marion du Fresne, and of some of his people, in the Bay of Islands *, it was impossible totally to divest ourselves of all apprehension of experiencing a similar calamity. If the natives entertained any suspicion of our revenging these acts of barbarity, they very soon laid it aside. For, during the course of this day, a great number of families came from different parts of the coast, and took up their residence close to us, so that there was not a spot in the cove where a hut could be put up, that was not occupied by them, except the place where we had fixed our little encampment. This they left us in quiet possession of ; but they came and took away the ruins of some old huts that were there, as materials for their new erections.

It is curious to observe with what facility they build these occasional places of abode. I have seen above twenty of them erected on a spot of ground that, not an hour before, was covered with shrubs and plants. They generally bring some part of the materials with them ; the rest they find upon the premises. I was present when a number of people landed, and built one of these villages. The moment the canoes reached the shore, the men leaped out, and at once took possession of a piece of ground, by tearing up the plants and shrubs, or sticking up some part of the framing of a hut. They then returned to their canoes, and secured their weapons, by setting them up against a tree, or placing them in such a position, that they could be laid hold of in an instant. I took particular notice that no one neglected this precaution. While the men were employed in raising the huts, the women were not idle. Some were stationed to take care of the canoes ; others to secure the provisions, and the few utensils in their possession ; and the rest went to gather dry sticks, that a fire might be prepared for dressing their victuals. As to the children, I kept them, as also some of the more aged, sufficiently occupied in scrambling for beads, till I had emptied my pockets, and then I left them. These temporary habitations are abundantly sufficient to afford shelter from the wind and rain, which is the only purpose they are meant to answer. I observed that, generally, if not always, the same tribe or family, though it were ever so large, associated and built together ; so that we frequently saw a village, as well as their larger towns, divided into different districts by low palisades, or some similar mode of separation.

The advantage we received from the natives coming to live with us, was not inconsiderable. For, every day, when the weather would permit, some of them went out to catch fish ; and we generally got, by exchanges, a good share of the produce of their labours. This supply, and what our own nets and lines afforded us, were so ample, that we seldom were in want of fish. Nor was there any deficiency of other refreshments. Celery, scurvy-grass, and portable soup, were boiled with the peas and wheat, for both ships' companies, every day during our whole stay ; and they had spruce-beer for their drink. So that, if any of our people had contracted the seeds of the scurvy, such a regimen soon removed them. But the truth is, when we arrived here, there were only two invalids (and these on board the Resolution) upon the sick lists in both ships.

Besides the natives who took up their abode close to us, we were occasionally visited

* In 1772.

by others of them, whose residence was not far off; and by some who lived more remote. Their articles of commerce were, curiosities, fish, and women.

Amongst our occasional visitors was a chief named Kahooru, who, as I was informed, headed the party that cut off Captain Furneaux's people, and himself killed Mr. Rowe, the officer who commanded. To judge of the character of Kahooru by what I heard from many of his countrymen, he seemed to be more feared than beloved amongst them. Not satisfied with telling me that he was a very bad man, some of them even importuned me to kill him; and I believe they were not a little surprised that I did not listen to them; for, according to their ideas of equity, this ought to have been done. But if I had followed the advice of all our pretended friends, I might have extirpated the whole race; for the people of each hamlet or village, by turns, applied to me to destroy the other. One would have almost thought it impossible that so striking a proof of the divided state in which this miserable people live, could have been assigned. And yet I was sure that I did not misconceive the meaning of those who made these strange applications to me; for Omai, whose language was a dialect of their own, and perfectly understood all that they said, was our interpreter.

On the 15th I made an excursion in my boat to look for grass, and visited the Hippah, or fortified village, at the south-west point of Motuara, and the places where our gardens had been planted on that island. There were no people at the former; but the houses and palisades had been rebuilt, and were now in a state of good repair; and there were other evident marks of its having been inhabited not long before. It would be unnecessary, at present, to give a particular account of this Hippah, sufficient notice having been taken of it in the Account of my first Voyage, to which I refer*.

When the Adventure arrived first at Queen Charlotte's Sound, in 1773†, Mr. Bayly fixed upon this place for making his observations; and he and the people with him, at their leisure hours, planted several spots with English garden-seeds. Not the least vestige of these now remained. It is probable that they had been all rooted out to make room for buildings, when the village was re-inhabited; for, at all the other gardens then planted by Captain Furneaux, although now wholly overrun with the weeds of the country, we found cabbages, onions, leeks, purslane, radishes, mustard, &c., and a few potatoes. These potatoes, which were first brought from the Cape of Good Hope, had been greatly improved by change of soil; and, with proper cultivation, would be superior to those produced in most other countries. Though the New Zealanders are fond of this root, it was evident that they had not taken the trouble to plant a single one (much less any other of the articles which we had introduced); and if it were not for the difficulty of clearing ground where potatoes had been once planted, there would not have been any now remaining‡.

* See vol. I. p. 168.

† See vol. I. p. 388.

‡ Potatoes have already been exported to New South Wales, from New Zealand; and Mr. Petrie, who in 1841 published an interesting account of his experience as a colonist, says they are likely to become a very considerable article of exportation. The natives, although they have kept up a stock of potatoes, have hitherto conducted the cultivation in the same slovenly and careless way they did in Captain Cook's time. "In many cases," says Mr.

Petrie, "the crop is left on the ground, the natives merely opening the earth about the roots, taking up enough to supply their immediate wants, and covering the root again with earth." This mode, as is well known to all European agriculturists, tends to deteriorate both the land and the produce; but the example of the settlers will, without doubt, soon teach a nation, deficient in no one quality fitting them for high civilization, to adopt a better plan. — Ed.

more remote.

On the 16th, at daybreak, I set out with a party of men, in five boats, to collect food for our cattle. Captain Clerke, and several of the officers, Omai, and two of the natives, accompanied me. We proceeded about three leagues up the Sound, and then landed on the east side, at a place where I had formerly been. Here we cut as much grass as loaded the two launches. As we returned down the Sound, we visited Grass Cove, the memorable scene of the massacre of Captain Furneaux's people. Here I met with my old friend Pedro, who was almost continually with me the last time I was in this Sound, and is mentioned in my History of that Voyage *. He, and another of his countrymen, received us on the beach, armed with the pa-too and spear. Whether this form of reception was a mark of their courtesy or of their fear, I cannot say ; but I thought they betrayed manifest signs of the latter. However, if they had any apprehensions, a few presents soon removed them, and brought down to the beach two or three more of the family ; but the greatest part of them remained out of sight.

was informed, Mr. Rowe, the ard from many Not satisfied me to kill him ; or, according to advice of all our each hamlet or most thought it ble people live, the meaning of was a dialect of

Whilst we were at this place, our curiosity prompted us to inquire into the circumstances attending the melancholy fate of our countrymen ; and Omai was made use of as our interpreter for this purpose. Pedro, and the rest of the natives present, answered all the questions that were put to them on the subject, without reserve, and like men who are under no dread of punishment for a crime of which they are not guilty. For we already knew that none of them had been concerned in the unhappy transaction. They told us, that while our people were sitting at dinner, surrounded by several of the natives, some of the latter stole, or snatched from them, some bread and fish, for which they were beat. This being resented, a quarrel ensued, and two New Zealanders were shot dead, by the only two muskets that were fired. For before our people had time to discharge a third, or to load again those that had been fired, the natives rushed in upon them, overpowered them with their numbers, and put them all to death. Pedro and his companions, besides relating the history of the massacre, made us acquainted with the very spot that was the scene of it. It is at the corner of the cove, on the right hand. They pointed to the place of the sun, to mark to us at what hour of the day it happened ; and, according to this, it must have been late in the afternoon. They also showed us the place where the boat lay ; and it appeared to be about two hundred yards distant from that where the crew were seated. One of their number, a black servant of Captain Furneaux, was left in the boat to take care of her. We were afterwards told that this black was the cause of the quarrel, which was said to have happened thus : One of the natives stealing something out of the boat, the negro gave him a severe blow with a stick. The cries of the fellow being heard by his countrymen at a distance, they imagined he was killed, and immediately began the attack on our people ; who, before they had time to reach the boat, or to arm themselves against the unexpected impending danger, fell a sacrifice to the fury of their savage assailants.

the Hippah, or Mr. gardens had the houses and here were other unnecessary, at been taken of it B t, Mr. Bayly th him, at their least vestige of make room for hen planted by ntry, we found These potatoes, y improved by oduced in most ident that they ticles which we re potatoes had

The first of these accounts was confirmed by the testimony of many of the natives, whom we conversed with at different times, and who, I think, could have no interest in deceiving us. The second manner of relating the transaction rests upon the authority of the young New Zealander, who chose to abandon his country and go away with us, and who, consequently, could have no possible view in disguising the truth. All agreeing that the quarrel happened when the boat's crew were sitting at their meal, it is highly probable that both the accounts are true, as they perfectly coincide. For we may very naturally suppose, that while some of the natives were stealing from the man who had been left in the boat, others of them might take the same liberties with the property of our people who were on shore.

the natives merely king up enough to ering the root again known to all Euro both the land and settlers will, with t in no one quality adopt a better plan.

Be this as it will, all agree that the quarrel first took its rise from some thefts, in the commission of which the natives were detected. All agree, also, that there was no premeditated plan of bloodshed, and that, if these thefts had not been, unfortunately, too hastily resented, no mischief would have happened. For Kahoora's greatest enemies, those who solicited his destruction most earnestly, at the same time confessed that he had no intention to quarrel, much less to kill, till the fray had actually commenced. It also appears that the unhappy victims were under no sort of apprehension of their fate ; otherwise they never

* See vol. I, p. 546.

would have ventured to sit down to a repast at so considerable a distance from their boat, amongst people who were the next moment to be their murderers. What became of the boat I never could learn. Some said she was pulled to pieces and burnt; others told us that she was carried, they knew not whither, by a party of strangers.

We staid here till the evening, when, having loaded the rest of the boats with grass, celery, scurvy-grass, &c., we embarked to return to the ships. We had prevailed upon Pedro to launch his canoc, and accompany us; but we had scarcely put off from the shore, when the wind began to blow very hard at north-west, which obliged him to put back. We proceeded ourselves, but it was with a good deal of difficulty that we could reach the ships; where some of the boats did not arrive till one o'clock the next morning; and it was fortunate that they got on board then, for it afterwards blew a perfect storm, with abundance of rain, so that no manner of work could go forward that day. In the evening the gale ceased, and the wind having veered to the east, brought with it fair weather.

The next day we resumed our works; the natives ventured out to catch fish; and Pedro, with all his family, came and took up his abode near us. This chief's proper name is Matalouah; the other being given him by some of my people during my last voyage, which I did not know till now. He was, however, equally well known amongst his countrymen by both names. On the 20th, in the forenoon, we had another storm from the north-west. Though this was not of so long continuance as the former, the gusts of wind from the hills were far more violent, insomuch that we were obliged to strike the yards and top-masts to the very utmost; and even with all this precaution, it was with difficulty that we rode it out. These storms are very frequent here, and sometimes violent and troublesome. The neighbouring mountains, which at these times are always loaded with vapours, not only increase the force of the wind, but alter its direction in such a manner, that no two blasts follow each other from the same quarter; and the nearer the shore, the more their effects are felt.

The next day we were visited by a tribe or family, consisting of about thirty persons, men, women, and children, who came from the upper part of the Sound. I had never seen them before. The name of their chief was Tomatongeanooranue; a man of about forty-five years of age, with a cheerful open countenance. And, indeed, the rest of his tribe were, in general, the handsomest of the New Zealand race I had ever met with. By this time more than two-thirds of the inhabitants of the Sound had settled themselves about us. Great numbers of them daily frequented the ships, and the encampment on shore: but the latter became, by far, the most favourite place of resort, while our people there were melting some seal blubber. No Greenlander was ever fonder of train-oil, than our friends here seem to be. They relished the very skimmings of the kettle, and dregs of the casks; but a little of the pure stinking oil was a delicious feast, so eagerly desired, that I supposed it is seldom enjoyed.

Having got on board as much hay and grass as we judged sufficient to serve the cattle till our arrival at Otaheite, and having completed the wood and water of both ships, on the 23rd we struck our tents, and carried everything off from the shore; and next morning we weighed anchor, and stood out of the cove. But the wind not being very fair, and finding that the tide of ebb would be spent before we could get out of the Sound, we cast anchor again a little without the island Motuara, to wait for a more favourable opportunity of putting into the strait. While we were unmooring and getting under sail, Tomatongeanooranue, Matalouah, and many more of the natives, came to take their leave of us, or rather to obtain, if they could, some additional present from us before we left them. These two chiefs became suitors to me for some goats and hogs. Accordingly, I gave to Matalouah two goats, a male and female with kid; and to Tomatongeanooranue two pigs, a boar, and a sow. They made me a promise not to kill them; though I must own I put no great faith in this. The animals which Captain Furneaux sent on shore here, and which soon after fell into the hands of the natives, I was now told were all dead; but I could get no intelligence about the fate of those I had left in West Bay, and in Cannibal Cove, when I was here in the course of my last voyage. However, all the natives whom I conversed with agreed, that poultry are now to be met with wild in the woods behind Ship Cove; and

VIEW OF AN ANCIENT PYRAMID IN JAVA.

THE ISLAND OF SUMATRA.

I was afterward informed, by the two youths who went away with us, that Tiraton, a popular chief amongst them, had a great many cocks and hens in his separate possession, and one of the sows.

On my present arrival at this place, I fully intended to have left not only goats and hogs, but sheep, and a young bull, with two heifers, if I could have found either a chief powerful enough to protect and keep them, or a place where there might be a probability of their being concealed from those who would ignorantly attempt to destroy them. But neither the one nor the other presented itself to me. Tiraton was now absent; and Tringoboohee, whom I had met with during my last voyage*, and who seemed to be a person of much consequence at that time, had been killed five months ago, with about seventy persons of his tribe; and I could not learn that there now remained in our neighbourhood any tribe whose numbers could secure to them a superiority of power over the rest of their countrymen. To have given the animals to any of the natives who possessed no such power, would not have answered the intention. For, in a country like this, where no man's property is secure, they would soon have fallen a prey to different parties, and been either separated or killed; but most likely both. This was so evident, from what we had observed since our arrival, that I had resolved to leave no kind of animal, till Matahouah and the other chief solicited me for the hogs and goats. As I could spare them, I let them go, to take their chance. I have, at different times, left in New Zealand no less than ten or a dozen hogs, besides those put on shore by Captain Furneaux. It will be a little extraordinary, therefore, if this race should not increase and be preserved here, either in a wild or in a domestic state, or in both†.

We had not been long at anchor near Motuara, before three or four canoes, filled with natives, came off to us from the south-east side of the Sound; and a brisk trade was carried on with them for the curiosities of this place. In one of these canoes was Kahoora, whom I have already mentioned as the leader of the party who cut off the crew of the *Adventure's* boat. This was the third time he had visited us, without betraying the smallest appearance of fear. I was ashore when he now arrived, but had got on board just as he was going away. Omai, who had returned with me, presently pointed him out, and solicited me to shoot him. Not satisfied with this, he addressed himself to Kahoora, threatening to be his executioner, if ever he presumed to visit us again. The *New Zealander* paid so little regard to these threats, that he returned, the next morning, with his whole family, men, women, and children, to the number of twenty and upwards. Omai was the first who acquainted me with his being alongside the ship, and desired to know if he should ask him to come on board. I told him he might; and accordingly he introduced the chief into the cabin, saying, "There is Kahoora; kill him!" But, as if he had forgot his former threats, or were afraid that I should call upon him to perform them, he immediately retired. In a short time, however, he returned; and seeing the chief unhurt, he expostulated with me very earnestly, saying, "Why do you not kill him? You tell me, if a man kills another in England, that he is hanged for it. This man has killed ten, and yet you will not kill him; though many of his countrymen desire it, and it would be very good." Omai's arguments, though specious enough, having no weight with me, I desired him to ask the chief, why he had killed Captain Furneaux's people? At this question, Kahoora folded his arms, hung down his head, and looked like one caught in a trap; and, I firmly believe, he expected instant death. But no sooner was he assured of his safety, than he became cheerful. He did not, however, seem willing to give me an answer to the question that had been put to him, till I had, again and again, repeated my promise that he should not be hurt. Then he ventured to tell us, that one of his countrymen having brought a stone hatchet to barter, the man to whom it was offered took it, and would neither return it nor give anything for it; on which the owner of it snatched up the bread as an equivalent; and then the quarrel began.

* See vol. I. p. 546.

† The quantity of food, particularly the fern-root, fitted for the support of swine, which abounds in the forests of New Zealand, would lead us to suppose that at the present

day those animals would be found wild; but such does not appear to be the case, although they are bred in large numbers by the natives, who undoubtedly derived their first supply from Cook.—Ed.

The remainder of Kahoora's account of this unhappy affair differed very little from what we had before learned from the rest of his countrymen. He mentioned the narrow escape he had during the fray, a musket being levelled at him, which he avoided by skulking behind the boat; and another man, who stood close to him, was shot dead. As soon as the musket was discharged, he instantly seized the opportunity to attack Mr. Rowe, who commanded the party, and who defended himself with his hanger (with which he wounded Kahoora in the arm) till he was overpowered by numbers.

Mr. Burney, who was sent by Captain Furneaux the next day* with an armed party, to look for his missing people, upon discovering the horrid proofs of their shocking fate, had fired several volleys amongst the crowds of natives who still remained assembled on the spot, and were, probably, partaking of the detestable banquet. It was natural to suppose that he had not fired in vain; and that, therefore, some of the murderers and devourers of our unhappy countrymen had suffered under our just resentment. Upon inquiry, however, into this matter, not only from Kahoora, but from others who had opportunities of knowing, it appeared that our supposition was groundless, and that not one of the shot fired by Mr. Burney's people had taken effect, so as to kill, or even to hurt, a single person.

It was evident, that most of the natives we had met with since our arrival, as they knew I was fully acquainted with the history of the massacre, expected I should avenge it with the death of Kahoora. And many of them seemed not only to wish it, but expressed their surprise at my forbearance. As he could not be ignorant of this, it was a matter of wonder to me that he put himself so often in my power. When he visited us while the ships lay in the Cove, confiding in the number of his friends that accompanied him, he might think himself safe. But his two last visits had been made under such circumstances, that he could no longer rely upon this. We were then at anchor in the entrance of the Sound, and at some distance from any shore; so that he could not have any assistance from thence, nor flatter himself he could have the means of making his escape, had I determined to detain him. And yet, after his first fears, on being interrogated, were over, he was so far from entertaining any uneasy sensations, that, on seeing a portrait of one of his countrymen hanging up in the cabin, he desired to have his own portrait drawn; and sat till Mr. Webber had finished it, without marking the least impatience. I must confess, I admired his courage, and was not a little pleased to observe the extent of the confidence he put in me. For he placed his whole safety in the declarations I had uniformly made to those who solicited his death, that I had always been a friend to them all, and would continue so, unless they gave me cause to act otherwise; that as to their inhuman treatment of our people, I should think no more of it; the transaction having happened long ago, and when I was not present; but that, if ever they made a second attempt of that kind, they might rest assured of feeling the weight of my resentment.

For some time before we arrived at New Zealand, Omai had expressed a desire to take one of the natives with him to his own country. We had not been there many days, before he had an opportunity of being gratified in this; for a youth, about seventeen or eighteen years of age, named Tawehiarooa, offered to accompany him, and took up his residence on board. I paid little attention to this at first, imagining that he would leave us when we were about to depart, and after he had got what he could from Omai. At length, finding that he was fixed in his resolution to go with us, and having learnt that he was the only son of a deceased chief, and that his mother, still living, was a woman much respected here, I was apprehensive that Omai had deceived him and his friends, by giving them hopes and assurances of his being sent back. I therefore caused it to be made known to them all, that if the young man went away with us, he would never return. But this declaration seemed to make no sort of impression. The afternoon before we left the cove, Tiratoutou, his mother, came on board, to receive her last present from Omai. The same evening, she and Tawehiarooa parted, with all the marks of tender affection that might be expected between a parent and a child who were never to meet again. But she said she would cry no more; and, sure enough, she kept her word. For, when she returned the next morning, to take

* See his Narrative, vol. I. p. 584.

her last farewell of him, all the time she was on board she remained quite cheerful, and went away wholly unconcerned.

That Taweharooa might be sent away in a manner becoming his birth, another youth was to have gone with him as his servant; and, with this view, as we supposed, he remained on board till we were about to sail, when his friends took him ashore. However, his place was supplied, next morning, by another, a boy of about nine or ten years of age, named Kokoa. He was presented to me by his own father, who, I believe, would have parted with his dog with far less indifference. The very little clothing the boy had, he stripped him of, and left him as naked as he was born. It was to no purpose that I endeavoured to convince these people of the improbability, or rather of the impossibility, of these youths ever returning home. Not one, not even their nearest relations, seemed to trouble themselves about their future fate. Since this was the case, and I was well satisfied that the boys would be no losers by exchange of place, I the more readily gave my consent to their going.

From my own observations, and from the information of Taweharooa and others, it appears to me that the New Zealanders must live under perpetual apprehensions of being destroyed by each other; there being few of their tribes that have not, as they think, sustained wrongs from some other tribe, which they are continually upon the watch to revenge. And, perhaps, the desire of a good meal may be no small incitement. I am told that many years will sometimes elapse before a favourable opportunity happens, and that the son never loses sight of an injury that has been done to his father. Their method of executing their horrible designs, is by stealing upon the adverse party in the night; and if they find them unguarded (which, however, I believe, is very seldom the case), they kill every one indiscriminately, not even sparing the women and children. When the massacre is completed, they either feast and gorge themselves on the spot, or carry off as many of the dead bodies as they can, and devour them at home, with acts of brutality too shocking to be described. If they are discovered before they can execute their bloody purpose, they generally steal off again; and sometimes are pursued and attacked by the other party in their turn. To give quarter, or to take prisoners, makes no part of their military law; so that the vanquished can only save their lives by flight. This perpetual state of war, and destructive method of conducting it, operates so strongly in producing habitual circumspection, that one hardly ever finds a New Zealander off his guard, either by night or by day. Indeed, no other man can have such powerful motives to be vigilant, as the preservation both of body and of soul depends upon it. For, according to their system of belief, the soul of the man whose flesh is devoured by the enemy is doomed to a perpetual fire; while the soul of the man whose body has been rescued from those who killed him, as well as the souls of all who die a natural death, ascend to the habitations of the gods. I asked whether they ate the flesh of such of their friends as had been killed in war, but whose bodies were saved from falling into the enemy's hands? I seemed surprised at the question, which they answered in the negative, expressing some abhorrence at the very idea. Their common method of disposing of their dead, is by depositing their bodies in the earth; but if they have more of their slaughtered enemies than they can eat, they throw them into the sea.

They have no such thing as *morais*, or other places of public worship; nor do they ever assemble together with this view. But they have priests, who alone address the gods in prayers for the prosperity of their temporal affairs; such as an enterprise against a hostile tribe, a fishing party, or the like. Whatever the principles of their religion may be, of which we remain very ignorant, its instructions are very strongly inculcated into them from their very infancy. Of this I saw a remarkable instance, in the youth who was first destined to accompany Taweharooa. He refrained from eating, the greatest part of the day, on account of his hair being cut; though every method was tried to induce him to break his resolution, and he was tempted with the offer of such victuals as he was known to esteem the most. He said, if he ate anything that day, the *Eatara* would kill him. However, towards evening, the cravings of nature got the better of the precepts of his religion, and he ate, though but sparingly. I had often conjectured, before this, that they had some superstitious notions about their hair, having frequently observed quantities of it tied to the branches of trees near some of their habitations; but what these notions are, I never could learn.

Notwithstanding the divided and hostile state in which the New Zealanders live, travelling strangers, who come with no ill design, are well received and entertained during their stay; which, however, it is expected will be no longer than is requisite to transact the business they come upon. Thus it is that a trade for *poenammoo*, or green tale, is carried on throughout the whole northern island. For they tell us, that there is none of this stone to be found, but at a place which bears its name, somewhere about the head of Queen Charlotte's Sound, and not above one or two days' journey, at most, from the station of our ships. I regretted much that I could not spare time sufficient for paying a visit to the place; as we were told a hundred fabulous stories about this stone, not one of which carried with it the least probability of truth, though some of their most sensible men would have us believe them. One of these stories is, that this stone is originally a fish, which they strike with a gig in the water, tie a rope to it, and drag it to the shore, to which they fasten it, and it afterwards becomes stone. As they all agree that it is fished out of a large lake, or collection of waters, the most probable conjecture is, that it is brought from the mountains, and deposited in the water, by the torrents*. This lake is called by the natives *Taeai Poenammoo*; that is, the Water of Green Tale; and it is only the adjoining part of the country, and not the whole southern island of New Zealand, that is known to them by the name which hath been given to it on my chart.

Polygamy is allowed amongst these people; and it is not uncommon for a man to have two or three wives. The women are marriageable at a very early age; and it should seem, that one who is unmarried is but in a forlorn state. She can with difficulty get a subsistence; at least she is, in a great measure, without a protector, though in constant want of a powerful one. The New Zealanders seem to be a people perfectly satisfied with the little knowledge they are masters of, without attempting, in the least, to improve it; nor are they remarkably curious, either in their observations or their inquiries. New objects do not strike them with such a degree of surprise as one would naturally expect; nor do they even fix their attention for a moment. Oniai, indeed, who was a great favourite with them, would sometimes attract a circle about him; but they seemed to listen to his speeches like persons who neither understood, nor wished to understand, what they heard.

One day, on our inquiring of Taweharocoo how many ships, such as ours, had ever arrived in Queen Charlotte's Sound, or in any part of its neighbourhood? he began with giving an account of one absolutely unknown to us. This, he said, had put into a port on the north-west coast of Teerawitte, but a very few years before I arrived in the Sound in the Endeavour, which the New Zealanders distinguish by calling Tupia's ship. At first, I thought he might have been mistaken as to the time and place; and that the ship in question might be either Monsieur Surville's, who is said to have touched upon the north-east coast of Eaheinomauwe, the same year I was there in the Endeavour, or else Monsieur Marion du Fresne's, who was in the Bay of Islands, on the same coast, a few years after; but he assured us that he was not mistaken, either as to the time or as to the place of this ship's arrival, and that it was well known to everybody about Queen Charlotte's Sound and Teerawitte. He said, that the Captain of her, during his stay here, cohabited with a woman of the country; and that she had a son by him still living, and about the age of Kokoa; who, though not born then, seemed to be equally well acquainted with the story. We were also informed by Taweharocoo, that this ship first introduced the venereal disease amongst the New Zealanders. I wish that subsequent visitors from Europe may not have their share of guilt, in leaving so dreadful a remembrance of them amongst this unhappy race. The disorder now is but too common here, though they do not seem to regard it, saying, that its effects are not near so pernicious at present as they were at its first appearance. The only method, as far as I ever heard, that they make use of as a remedy, is by giving the patient the use of a sort of hot bath, which they produce by the steam of certain green plants laid over hot stones.

* The situation of this lake is now understood to be in the southern part of the southern island, or New Munster, a site yet unexplored by Europeans, between two and three hundred miles from Queen Charlotte's Sound. The account given to Cook, whose care in procuring and ac-

cure in reporting information has never been surpassed, may still be correct, as the lake laid down in the maps of the present day as Te-wai-poenannu, or the Water of Green Tale, may not be the only one where that substance is procurable.—Ed.

I regretted much that we did not hear of this ship while we were in the Sound; as, by means of Onai, we might have had full and correct information of her from eye-witnesses. For Taweharooa's account was only from what he had been told, and therefore liable to many mistakes. I have not the least doubt, however, that his testimony may so far be depended upon, as to induce us to believe that a ship really had been at Terrawitte prior to my arrival in the Endeavour, as it corresponds with what I had formerly heard. For in the latter end of 1773, the second time I visited New Zealand, during my last voyage, when we were continually making inquiries about the Adventure, after our separation, some of the natives informed us of a ship's having been in a port on the coast of Teerawitte. But, at that time, we thought we must have misunderstood them, and took no notice of the intelligence. The arrival of this unknown ship has been marked by the New Zealanders with more cause of remembrance than the unhappy one just mentioned. Taweharooa told us their country was indebted to her people for the present of an animal, which they left behind them. But as he had not seen it himself, no sort of judgment could be formed, from his description, of what kind it was. We had another piece of intelligence from him, more correctly given, though not confirmed by our own observations, that there are snakes and lizards there of an enormous size. He described the latter as being eight feet in length, and as big round as a man's body. He said, they sometimes seize and devour men; that they burrow in the ground; and that they are killed by making fires at the mouths of the holes. We could not be mistaken as to the animal; for with his own hand he drew a very good representation of a lizard on a piece of paper, as also of a snake, in order to show what he meant.*

Though much has been said, in the narratives of my two former voyages, about this country and its inhabitants, Mr. Anderson's remarks, as serving either to confirm or to correct our former accounts, may not be superfluous. He had been three times with me in Queen Charlotte's Sound, during my last voyage; and, after this fourth visit, what he thought proper to record may be considered as the result of sufficient observation. The reader will find it in the next chapter; and I have nothing farther to add, before I quit New Zealand, but to give some account of the astronomical and nautical observations made during our stay there.

The longitude of the Observatory in Ship Cove, by a mean of 103 sets of

observations, each set consisting of six or more observed distances, was $174^{\circ} 25' 15''$ east.

By the time-keeper, at Greenwich rate, it was $175^{\circ} 26' 30''$

By ditto, at the Cape rate, it was $174^{\circ} 56' 12''$

Variation of the compass, being the mean of six needles, observed on board

the ship $12^{\circ} 40' 0''$ east.

By the same needles on shore, it was $13^{\circ} 53' 0''$

The dip of the south end, observed on shore, was $63^{\circ} 42' 0''$

By a mean of the results of eleven days' observations, the time-keeper was too slow for mean time, on February 22, at noon, by $11^h 50' 37''$.396; and she was found to be losing, on mean time, at the rate of $2''$.913 per day. From this rate the longitude will be computed, till some other opportunity offers to ascertain her rate anew. The astronomical clock, with the same length of pendulum as at Greenwich, was found to be losing on sidereal time $40''$.239 per day. It will not be amiss to mention, that the longitude, by lunar observations, as above, differs only $6' 45''$ from what Mr. Wales made it during my last voyage; his being so much more to the W., or $174^{\circ} 18' 30''$. The latitude of Ship Cove is $41^{\circ} 6' 0''$, as found by Mr. Wales.

* This man's story still wants confirmation, as neither snakes nor lizards, of the size he mentioned, have yet been met with. Perhaps the animal he mentions as left behind

by the strange ship, was the Norway rat, which has nearly exterminated the New Zealand rat, the only indigenous four-footed animal known in the country.—Ed.

CHAPTER VIII.—MR. ANDERSON'S REMARKS ON THE COUNTRY NEAR QUEEN CHARLOTTE'S SOUND.—THE SOIL.—CLIMATE.—WEATHER.—WINDS.—TREES.—PLANTS.—RIBBS.—FISH.—OTHER ANIMALS.—OF THE INHABITANTS.—DESCRIPTION OF THEIR PERSONS.—THEIR DRESS.—ORNAMENTS.—HABITATIONS.—BOATS.—FOOD AND COOKERY.—ARTS.—WEAPONS.—CRUELTY TO PRISONERS.—VARIOUS CUSTOMS.—SPECIMEN OF THEIR LANGUAGE.

THE land everywhere about Queen Charlotte's Sound is uncommonly mountainous, rising immediately from the sea into large hills with blunted tops. At considerable distances are valleys, or rather impressions on the sides of the hills, which are not deep; each terminating toward the sea in a small cove, with a pebbly or sandy beach; behind which are small flats, where the natives generally build their huts, at the same time hauling their canoes upon the beaches. This situation is the more convenient, as in every cove a brook of very fine water (in which are some small trout) empties itself into the sea. The bases of these mountains, at least toward the shore, are constituted of a brittle, yellowish sandstone, which acquires a bluish cast where the sea washes it. It runs, at some places, in horizontal, and, at other places, in oblique strata; being frequently divided, at small distances, by thin veins of coarse quartz, which commonly follow the direction of the other, though they sometimes intersect it. The mould, or soil, which covers this, is also of a yellowish cast, not unlike marl; and is commonly from a foot to two, or more, in thickness.

The quality of this soil is best indicated by the luxuriant growth of its productions. For the hills (except a few toward the sea, which are covered with smaller bushes) are one continued forest of lofty trees, flourishing with a vigour almost superior to anything that imagination can conceive, and affording an august prospect to those who are delighted with the grand and beautiful works of nature. The agreeable temperature of the climate, no doubt, contributes much to this uncommon strength in vegetation: for at this time, though answering to our month of August, the weather was never disagreeably warm; nor did it raise the thermometer higher than 66° . The winter, also, seems equally mild with respect to cold; for in June 1773, which corresponds to our December, the mercury never fell lower than 48° , and the trees, at that time, retained their verdure as if in the summer season; so that, I believe, their foliage is never shed till pushed off by the succeeding leaves in spring.

The weather in general is good, but sometimes windy, with heavy rain; which, however, never lasts above a day, nor does it appear that it is ever excessive. For there are no marks of torrents rushing down the hills, as in many countries; and the brooks, if we may judge from their channels, seem never to be greatly increased. I have observed, in the four different times of my being here, that the winds from the S. eastward are commonly moderate, but attended with cloudy weather or rain. The S.W. winds blow very strong, and are also attended with rain; but they seldom last long. The N.W. winds are the most prevailing; and though often pretty strong, are almost constantly connected with fine weather. In short, the only obstacle to this being one of the finest countries upon earth is its great hilliness, which, allowing the woods to be cleared away, would leave it less proper for pasturage than flat land, and still more improper for cultivation, which could never be effected here by the plough.

The large trees which cover the hills are chiefly of two sorts. One of them, of the size of our largest firs, grows much after their manner; but the leaves and small berries on their points are much liker the yew. It was this which supplied the place of spruce in making beer; which we did with a strong decoction of its leaves, fermented with treacle or sugar. And this liquor, when well prepared, was acknowledged to be little inferior to the American spruce-beer, by those who had experience of both. The other sort of tree is not unlike a maple, and grows often to a great size; but it only served for fuel, as the wood, both of this and of the preceding, was found to be rather too heavy for masts, yards, and other similar repairs. There is a greater variety of trees on the small flat spots behind the beaches. Amongst these are two that bear a kind of plum of the size of prunes, the one yellow, called *karraca*; and the other black, called *maitao*; but neither of them of a very agreeable taste, though the natives ate both, and our people did the same. grow on small trees, always facing the sea; but the others belong to larger trees that stand farther within the wood, and which we frequently cut down for fuel. A species of *Philadelphus* grows on the eminences which jut out into the sea; and also a tree bearing flowers almost like myrtle, with roundish-spotted leaves of a disagreeable smell. We drank the leaves of the *Philadelphus* as tea; and found that they had a pleasant taste and smell, and might make an excellent substitute for the Oriental sort.

Among other plants that were useful to us, may be reckoned wild celery, which grows plentifully in almost every cove, especially if the natives have ever resided here before; and one that we used to call scurvy-grass, though entirely different from the plant to which we give that name. This, however, is far preferable to ours for common use; and may be known by its jagged leaves and small clusters of white flowers on the top. Both sorts were boiled every morning with wheat ground in a mill, and with portable soup for the people's breakfast, and also amongst their pease-soup for dinner. Sometimes they were used as salad, or dressed as greens. In all which ways they are good; and together with the fish, with which we were constantly supplied, they formed a sort of refreshment, perhaps little inferior to what is to be met with in places most noted by navigators for plentiful supplies of animal and vegetable food.

Amongst the known kinds of plants met with here, are common and rough bindweed, nightshade, and nettles, both which grow to the size of small trees; a shrubby speedwell, found near all the beaches; sow-thistles, virgin's bower, vanelloe, French willow, euphorbia, and crane's-bill; also endweed, rushes, bull-rushes, flax, all-heal, American nightshade, knot-grass, brambles, eye-bright, and groundsel; but the species of each are different from any we have in Europe. There is also polypody, spleenwort, and about twenty other different sorts of ferns, entirely peculiar to the place; with several sorts of mosses, either rare, or produced only here; besides a great number of other plants, whose uses are not yet known, and subjects fit only for botanical books.

Of these, however, there is one which deserves particular notice here, as the natives make their garments of it; and it produces a fine silky flax, superior in appearance to anything we have, and, probably, at least as strong. It grows everywhere near the sea, and in some places a considerable way up the hills, in bunches or tufts, with sedge-like leaves, bearing, on a long stalk, yellowish flowers, which are succeeded by a long roundish pod, filled with very thin shining black seeds*. A species of long pepper is found in great plenty; but it has little of the aromatic flavour that makes spices valuable; and a tree much like a palm at a distance is pretty frequent in the woods, though the deceit appears as you come near it. It is remarkable that, as the greatest part of the trees and plants had, at this time, lost their flowers, we perceived they were generally of the berry-bearing kind; of which, and other seeds, I brought away about thirty different sorts. Of these, one in particular, which bears a red berry, is much like the supple-jack, and grows about the trees, stretching from one to another, in such a manner as to render the woods almost wholly impassable.

The birds, of which there is a tolerable stock, as well as the vegetable productions, are almost entirely peculiar to the place. And though it be difficult to follow them, on account of the quantity of underwood and the climbing plants, that render travelling, for pleasure alone, uncommonly fatiguing, yet a person, by remaining in one place, may shoot as many in a day as would serve six or eight others. The principal sorts are, large brown parrots, with white or greyish heads; green parroquets with red foreheads; large wood-pigeons, brown above, with white bellies, the rest green, and the bill and feet red. Two sorts of cuckoos, one as large as our common sort, of a brown colour, variegated with black; the other not larger than a sparrow, of a splendid green cast above, and elegantly varied with waves

* The *Phormium tenax*, or New Zealand flax. Of this there are several species, and already it has been employed with considerable success as a substitute for hemp, but until a method of dressing it in a better manner than that practised by the natives, which at present is the only one found to answer, is practised, it cannot become, what it is probably eventually destined to be, a

large article of commerce, and even the staple of the country. The settlers at Port Nicholson offered a large reward to the inventor of a machine for dressing New Zealand flax; but we have not yet heard that the prize has been gained, although many attempts have been made to obtain it. See the Hon. H. W. Petre's "New Zealand."—Ed.

of golden, green, brown, and white colours below. Both these are scarce; but several others are in greater plenty; one of which, of a black colour, with a greenish cast, is remarkable for having a tuft of white curled feathers hanging under the throat, and was called the *pooy* bird by our people. Another sort, rather smaller, is black, with a brown back and wings, and two small gills under the root of the bill. This we called the small wattle-bird, to distinguish it from another, which we called the large one, of the size of a common pigeon, with two large yellow and purple membranes also at the root of the bill. It is black, or rather blue, and has no resemblance of the other but in name; for the bill is thick, short, and crooked, and has altogether an uncommon appearance. A gross-beak, about the size of a thrush, of a brown colour, with a reddish tail, is frequent; as is also a small greenish bird, which is almost the only musical one here, but is sufficient by itself to fill the woods with a melody that is not only sweet, but so varied, that one would imagine he was surrounded by a hundred different sorts of birds, when the little warbler is near. From this circumstance we named it the mocking-bird. There are likewise three or four sorts of smaller birds; one of which, in figure and tameness, exactly resembles our robin, but is black where that is brown, and white where that is red. Another differs but little from this, except in being smaller; and a third sort has a long tail, which it expands as a fan on coming near, and makes a chirping noise when it perches. King-fishers are seen, though rare, and are about the size of our English ones, but with an inferior plumage.

About the rocks are seen black sea-pies with red bills; and crested shags of a leaden colour, with small black spots on the wings and shoulders, and the rest of the upper part of a velvet black tinged with green. We frequently shot both these, and also a more common sort of shags, black above and white underneath, that build their nests upon trees, on which sometimes a dozen or more sit at once. There are also, about the shore, a few sea-gulls; some blue herons; and sometimes, though very rarely, wild ducks; a small sandy-coloured plover, and some sand-larks; and small penguins, black above with a white belly, as well as numbers of little black divers, swim often about the Sound. We likewise killed two or three rails of a brown or yellowish colour, variegated with black, which feed about the small brooks, and are nearly as large as a common fowl. No other sort of game was seen, except a single snipe, which was shot, and differs but little from that of Europe.

The principal fish we caught by the seine were mullets and elephant-fish, with a few soles and flounders; but those that the natives mostly supplied us with, were a sort of sea-bream of a silver colour with a black spot on the neck, large conger-eels, and a fish in shape much like the bream, but so large as to weigh five, six, or seven pounds. It is blackish with thick lips, and called *mogge* by the natives. With hook and line we caught chiefly a blackish fish of the size of a haddock, called *cole-fish* by the seamen, but differing much from that known by the same name in Europe; and another of the same size, of a reddish colour with a little beard, which we called night-walkers, from the greatest number being caught in the night. Sometimes we got a sort of small salmon, gurnards, skate, and nurses; and the natives, now and then, brought hake, paracutas, a small sort of mackerel, parrot-fish, and leather-jackets; besides another fish which is very rare, shaped almost like a dolphin, of a black colour, with strong bony jaws, and the back-fin, as well as those opposite to it, much lengthened at the end. All these sorts, except the last, which we did not try, are excellent to eat; but the *mogge*, small salmon, and *cole-fish*, are superior to the rest.

The rocks are abundantly furnished with great quantities of excellent muscles; one sort of which, that is not very common, measures above a foot in length. There are also cockles buried in the sand of the small beaches; and in some places oysters, which, though very small, are well tasted. Of other shell-fish, there are ten or twelve sorts, such as periwinkles, wilks, limpets, and some very beautiful sea-ears; also another sort which stick to the weeds; with some other things, as sea-eggs, star-fish, &c., several of which are peculiar to the place. The natives likewise sometimes brought us very fine cray-fish, equal to our largest lobsters, and cuttle-fish, which they eat themselves.

Insects are very rare. Of these, we only saw two sorts of dragon-flies, some butterflies,

small grasshoppers, several sorts of spiders, some small black ants, and vast numbers of scorpion flies, with whose chirping the woods resound. The only noxious one is the sand-fly, very numerous here, and almost as troublesome as the musquito; for we found no reptile here, except two or three sorts of small harmless lizards*.

It is remarkable that, in this extensive land, there should not even be the traces of any quadruped, only excepting a few rats, and a sort of fox-dog, which is a domestic animal with the natives. Neither is there any mineral worth notice, but a green jasper or serpent-stone, of which the New Zealanders make their tools and ornaments. This is esteemed a precious article by them; and they have some superstitious notions about the method of its generation, which we could not perfectly understand. It is plain, however, that wherever it may be found (which, they say, is in the channel of a large river far to the southward), it is disposed in the earth in thin layers, or, perhaps, in detached pieces, like our flints; for the edges of those pieces, which have not been cut, are covered with a whitish crust like these. A piece of this sort was purchased, about eighteen inches long, a foot broad, and near two inches thick; which yet seemed to be only the fragment of a larger piece.

The natives do not exceed the common stature of Europeans; and, in general, are not so well made, especially about the limbs. This is, perhaps, the effect of sitting, for the most part, on their hams; and of being confined, by the hilly disposition of the country, from using that sort of exercise which contributes to render the body straight and well-proportioned. There are, however, several exceptions to this; and some are remarkable for their large bones and muscles; but few that I have seen are corpulent. Their colour is of different casts, from a pretty deep black to a yellowish or olive tinge; and their features also are various, some resembling Europeans. But, in general, their faces are round, with their lips full, and also their noses towards the point; though the first are not uncommonly thick, nor the last flat. I do not, however, recollect to have seen an instance of the true aquiline nose amongst them. Their teeth are commonly broad, white, and well set; and their eyes large, with a very free motion, which seems the effect of habit. Their hair is black, straight, and strong, commonly cut short on the hind part, with the rest tied on the crown of the head; but some have it of a curling disposition, or of a brown colour. In the young, the countenance is generally free or open; but in many of the men it has a serious cast, and sometimes a sullenness or reserve, especially if they are strangers. The women are, in general, smaller than the men; but have few peculiar graces, either in form or features, to distinguish them.

The dress of both sexes is alike; and consists of an oblong garment about five feet long, and four broad, made from the silky flax already mentioned. This seems to be their most material and complex manufacture, which is executed by knotting; and their work is often ornamented with pieces of dog-skin, or checkered at the corners. They bring two corners of this garment over the shoulders, and fasten it on the breast with the other part, which covers the body; and about the belly, it is again tied with a girdle made of mat. Sometimes they cover it with large feathers of birds (which seem to be wrought into the piece of cloth when it is made), or with dog-skin; and that alone we have seen worn as a covering. Over this garment, many of them wear mats, which reach from the shoulders to near the heels. But the most common outer-covering is a quantity of the above sedgy plant, badly dressed, which they fasten on a string to a considerable length, and, throwing it about the shoulders, let it fall down on all sides, as far as the middle of the thighs. When they sit down with this upon them, either in their boats, or upon the shore, it would be difficult to distinguish them from large grey stones, if their black heads, projecting beyond their coverings, did not engage one to a stricter examination.

By way of ornament, they fix in their heads feathers, or combs of bone, or wood, adorned with pearl shell, or the thin inner skin of some leaf. And in the ears, both of men and women, which are pierced, or rather slit, are hung small pieces of jasper, bits of cloth, or beads when they can get them. A few also have the *septum* of the nose bored in its lower part; but no ornament was worn there that we saw; though one man passed a twig through

* In a separate memorandum-book, Mr. Anderson mentions the monstrous animal of the lizard kind, described by the two boys after they left the island.

it, to show us that it was sometimes used for that purpose. They wear long beards, but are fond of having them shaved. Some are punctured or stained in the face with curious spiral and other figures, of a black or deep blue colour; but it is doubtful whether this be ornamental, or intended as a mark of particular distinction; and the women, who are marked so, have the puncture only on their lips, or a small spot on their chins. Both sexes often besmear their faces and heads with a red paint, which seems to be a martial ochre mixed with grease; and the women sometimes wear necklaces of shark's teeth, or bunches of long beads, which seem to be made of the leg-bones of small birds, or a particular shell. A few also have small triangular aprons adorned with the feathers of parrots, or bits of pearl shells, furnished with a double or treble set of cords to fasten them about the waist. I have sometimes seen caps or bonnets made of the feathers of birds, which may be reckoned as ornaments; for it is not their custom to wear any covering on their heads.

They live in the small coves formerly described, in companies of forty or fifty, or more; and sometimes in single families, building their huts contiguous to each other; which, in general, are miserable lodging-places. The best I ever saw was about thirty feet long, fifteen broad, and six high, built exactly in the manner of one of our country barns. The inside was both strong and regularly made of supporters at the sides, alternately large and small, well fastened by means of withes, and painted red and black. The ridge pole was strong; and the large bulrushes, which composed the inner part of the thatching, were laid with great exactness parallel to each other. At one end was a small square hole, which served as a door to creep in at; and near it another much smaller, seemingly for letting out the smoke, as no other vent for it could be seen. This, however, ought to be considered as one of the best, and the residence of some principal person; for the greatest part of them are not half the above size, and seldom exceed four feet in height; being, besides, indifferently built, though proof against wind and rain.

No other furniture is to be seen in them, than a few small baskets or bags, in which they put their fishing-hooks, and other trifles; and they sit down in the middle round a small fire, where they also probably sleep, without any other covering than what they wear in the day, or perhaps without that; as such confined places must be very warm, though inhabited but by a few persons.

They live chiefly by fishing, making use either of nets of different kinds, or of wooden fish-hooks pointed with bone; but so oddly made, that a stranger is at a loss to know how they can answer such a purpose. It also appears, that they remove their habitations from one place to another when the fish grow scarce, or for some other reason; for we found houses now. It in several parts, where there had been none when we were here during our last voyage, and even these have been already deserted. Their boats are well built, of planks raised upon each other, and fastened with strong withes, which also bind a long narrow piece on the outside of the seams to prevent their leaking. Some are fifty feet long, and so broad as to be able to sail without an outrigger; but the smaller sort commonly have one; and they often fasten two together by rafters, which we then call a double canoe. They carry from five to thirty men or more; and have often a large head ingeniously carved, and painted with a figure at the point, which seems intended to represent a man, with his features distorted by rage. Their paddles are about four or five feet long, narrow, and pointed; with which, when they keep time, the boat is pushed along pretty swiftly. Their sail, which is seldom used, is made of a mat of a triangular shape, having the broadest part above.

The only method of dressing their fish, is by roasting, or rather baking, for they are entirely ignorant of the art of boiling. In the same manner they dress the root, and part of the stalk, of the large fern-tree, in a great hole dug for that purpose, which serves as an oven. After which they split it, and find within a fine gelatinous substance, like boiled sago-powder, but firmer. They also use another smaller fern root, which seems to be their substitute for bread, as it is dried and carried about with them, together with dried fish in great quantities, when they remove their families, or go far from home. This they beat with a stick till it becomes pretty soft, when they chew it sufficiently, and spit out the hard fibrous part, the other having a sweetish mealy taste not at all disagreeable. to sea, or perhaps from choice, they supply the place of other fish with muscles and sea-cars, great quantities of the shells of which lie in heaps near their houses. And they sometimes, though rarely, find means to kill rails, penguins, and shags, which help to vary their diet. They also breed considerable numbers of the dogs, mentioned before, for food ; but these cannot be considered as a principal article of diet. From whence we may conclude, that as there is not the least sign of cultivation of land, they depend principally for their subsistence on the sea, which, indeed, is very bountiful in its supply.

Their method of feeding corresponds with the nastiness of their persons, which often smell disagreeably from the quantity of grease about them, and their clothes never being washed. We have seen them eat the vermin, with which their heads are sufficiently stocked. They also used to devour, with the greatest eagerness, large quantities of stinking train oil, and blubber of seals, which we were melting at the tent, and had kept near two months ; and, on board the ships, they were not satisfied with emptying the lamps, but actually swallowed the cotton and fragrant wick with equal voracity. It is worthy of notice, that though the inhabitants of Van Diemen's Land appear to have but a scanty subsistence, they would not even taste our bread, though they saw us eat it ; whereas these people devoured it greedily, when both mouldy and rotten. But this must not be imputed to any defect in their sensations ; for I have observed them throw away things which we eat, with evident disgust, after only smelling to them.

They show as much ingenuity, both in invention and execution, as any uncivilized nations under similar circumstances. For, without the use of any metal tools, they make everything by which they procure their subsistence, clothing, and warlike weapons, with a degree of neatness, strength, and convenience, for accomplishing their several purposes. Their chief mechanical tool is formed exactly after the manner of our adzes ; and is made, as are also the chisel and gouge, of the green serpent-stone or jasper already mentioned ; though sometimes they are composed of a black, smooth, and very solid stone. But their masterpiece seems to be carving, which is found upon the most trifling things ; and, in particular, the heads of their canoes are sometimes ornamented with it in such a manner, as not only shows much design, but is also an example of their great labour and patience in execution. Their cordage for fishing-lines is equal, in strength and evenness, to that made by us ; and their nets not at all inferior. But what must cost them more labour than any other article is the making the tools we have mentioned ; for the stone is exceedingly hard, and the only method of fashioning it, we can guess at, is by rubbing one stone upon another, which can have but a slow effect. Their substitute for a knife is a shell, a bit of flint, or jasper. And, as an auger, to bore holes, they fix a shark's tooth in the end of a small piece of wood. It is true, they have a small saw made of some jagged fishes' teeth, fixed on the convex edge of a piece of wood nicely carved. But this, they say, is only used to cut up the bodies of their enemies whom they kill in battle.

No people can have a quicker sense of an injury done to them, and none are more ready to resent it. But, at the same time, they will take an opportunity of being insolent when they think there is no danger of punishment ; which is so contrary to the spirit of genuine bravery, that, perhaps, their eagerness to resent injuries is to be looked upon rather as an effect of a furious disposition than of great courage. They also appear to be of a suspicious or mistrustful temper (which, however, may rather be acquired than natural), for strangers never came to our ships immediately, but lay in their boats at a small distance, either to observe our motions, or consult whether or no they should risk their safety with us. To this they join a great degree of dishonesty ; for they steal everything they can lay their hands on, if there be the least hope of not being detected ; and, in trading, I have little doubt but they would take advantages, if they thought it could be done with safety ; as they not only refuse to trust a thing in one's hand for examination, but exult, if they think they have tricked you in the bargain.

Such conduct, however, is in some measure to be expected where there appears to be but little subordination, and consequently few, if any laws, to punish transgressions. For no man's authority seems to extend farther than his own family ; and when, at any time, they join for mutual defence, or any other purpose, those amongst them who are eminent for

courage or prudence, are directors. How their private quarrels are terminated is uncertain; but, in the few we saw, which were of little consequence, the parties concerned were clamorous and disorderly. Their public contentions are frequent, or rather perpetual; for it appears, from their number of weapons, and dexterity in using them, that war is their principal profession. These weapons are spears, *patoos*, and halberts, or sometimes stones. The first are made of hard wood pointed, of different lengths, from five to twenty, or even thirty feet long. The short ones are used for throwing as darts. The *patoos* or *emete* is of an elliptical shape, about eighteen inches long, with a handle made of wood, stone, the bone of some sea animal, or green jasper, and seems to be their principal dependence in battle. The halbert, or long club, is about five or six feet long, tapering at one end with a carved head, and at the other, broad or flat, with sharp edges.

Before they begin the onset, they join in a war-song, to which they all keep the exactest time, and soon raise their passion to a degree of frantic fury, attended with the most horrid distortion of their eyes, mouths, and tongues, to strike terror into their enemies; which, to those who have not been accustomed to such a practice, makes them appear more like demons than men, and would almost chill the boldest with fear. To this succeeds a circumstance, almost foretold in their fierce demeanour, horrid, cruel, and disgraceful to human nature; which is, cutting in pieces, even before being perfectly dead, the bodies of their enemies, and, after dressing them on a fire, devouring the flesh, not only without reluctance, but with peculiar satisfaction.

One might be apt to suppose, that people, capable of such excess of cruelty, must be destitute of every humane feeling, even amongst their own party. And yet we find them lamenting the loss of their friends, with a violence of expression which argues the most tender remembrance of them. For both men and women, upon the death of those connected with them, whether in battle or otherwise, bewail them with the most doleful cries; at the same time cutting their foreheads and cheeks, with shells or pieces of flint, in large gashes, until the blood flows plentifully and mixes with their tears. They also carve pieces of their green stone, rudely shaped as human figures, which they ornament with bright eyes of pearl shell, and hang them about their necks, as memorials of those whom they held most dear; and their affections of this kind are so strong, that they even perform the ceremony of cutting, and lamenting for joy, at the return of any of their friends, who have been absent but for a short time.

The children are initiated, at a very early age, into all the practices, good or bad, of their fathers; so that you find a boy or girl, nine or ten years old, able to perform all the motions, and to imitate the frightful gestures, by which the more aged use to inspire their enemies with terror, keeping the strictest time in their song. They likewise sing, with some degree of melody, the traditions of their forefathers, their actions in war, and other indifferent subjects; of all which they are immoderately fond, and spend much of their time in these amusements, and in playing on a sort of flute. Their language is far from being harsh or disagreeable, though the pronunciation is frequently guttural; and whatever qualities are requisite in any other language to make it musical, certainly obtain to a considerable degree here, if we may judge from the melody of some sorts of their songs. It is also sufficiently comprehensive, though, in many respects, deficient, if compared with our European languages, which owe their perfection to long improvement. But a small specimen is here subjoined, from which some judgment may be formed. I collected a great many of their words, both now and in the course of our former voyage; and being equally attentive, in my inquiries, about the languages of the other islands throughout the South Sea, I have the amplest proof of their wonderful agreement, or rather identity. This general observation has indeed been already made in the accounts of the former voyages*. I shall be enabled, however, to confirm and strengthen it, by a fresh list of words, selected from a large vocabulary in my possession; and by placing in the opposite column the corresponding words as used at Otaheite, the curious reader will, at one view, be furnished with sufficient materials for judging by what subordinate changes the difference of dialect has been effected

* See vol. I. page 321.

BOOK II.

FROM LEAVING NEW ZEALAND TO OUR ARRIVAL AT OTAHEITE, OR THE SOCIETY ISLANDS.

CHAPTER I.—PROSECUTION OF THE VOYAGE.—BEHAVIOUR OF THE TWO NEW ZEALANDERS ON BOARD.—UNFAVOURABLE WINDS.—AN ISLAND CALLED MANGEEA DISCOVERED.—THE COAST OF IT EXAMINED.—TRANSACTIONS WITH THE NATIVES.—AN ACCOUNT OF THEIR PERSONS, DRESS, AND CANOE.—DESCRIPTION OF THE ISLAND.—A SPECIMEN OF THE LANGUAGE.—DISPOSITION OF THE INHABITANTS.

ON the 25th, at ten o'clock in the morning, a light breeze springing up at N.W. by W., we weighed, stood out of the Sound, and made sail through the strait, with the Discovery in company. We had hardly got the length of Cape Tierawhitte, when the wind took us aback at S.E. It continued in this quarter till two o'clock the next morning, when we had a few hours' calm. After which we had a breeze at N.; but here it fixed not long, before it veered to the E., and after that to the S. At length, on the 27th at eight o'clock in the morning, we took our departure from Cape Palliser, which, at this time, bore W., seven or eight leagues distant. We had a fine gale, and I steered E. by N.

We had no sooner lost sight of the land than our two New Zealand adventurers, the sea-sickness they now experienced giving a turn to their reflections, repented heartily of the step they had taken. All the soothing encouragement we could think of, availed but little. They wept both in public and in private; and made their lamentations in a kind of song, which, as far as we could comprehend the meaning of the words, was expressive of their praises of their country and people, from which they were to be separated for ever. Thus they continued for many days, till their sea-sickness wore off, and the tumult of their minds began to subside. Then these fits of lamentation became less and less frequent, and at length entirely ceased. Their native country and their friends were, by degrees, forgot, and they appeared to be as firmly attached to us, as if they had been born amongst us.

The wind had not remained many hours at S., before it veered to S.E. and E.; and, with this, we stood to the N., till the 28th at noon. Being then in the latitude of $41^{\circ} 17'$, and

in longitude of $177^{\circ} 17'$ E., we tacked and stood to the S.E., with a gentle breeze at E.N.E. It afterwards freshened, and came about to N.E.; in which quarter it continued two days, and sometimes blew a fresh gale with squalls, accompanied with showers of rain. On the 2nd of March at noon, being in the latitude of $42^{\circ} 35' 30''$, longitude $180^{\circ} 8'$ E., the wind shifted to north-west; afterward to south-west; and between this point and north it continued to blow, sometimes a strong gale with hard squalls, and at other times very moderate. With this wind we steered north-east by east and east, under all the sail we could carry, till the 11th at noon, at which time we were in the latitude of $39^{\circ} 29'$, longitude $196^{\circ} 4'$ E. The wind now veered to north-east and south-east, and I stood to the north, and to the north-east, as the wind would admit, till one o'clock in the morning on the 16th, when having a more favourable gale from the north, I tacked and stood to the east, the latitude being $33^{\circ} 40'$, and the longitude $198^{\circ} 50'$ E. We had light airs and calms by turns, till noon the next day, when the wind began to freshen at east south-east, and I again stood to the north-east. But as the wind often veered to east and east north-east, we frequently made no better than a northerly course; nay sometimes to the westward of north. But the hopes of the wind coming more southerly, or of meeting with it from the westward, a little without the tropic, as I had experienced in my former visits to this ocean, encouraged me to continue this course. Indeed it was necessary that I should run all risks, as my proceeding to the north this year, in prosecution of the principal object of the voyage, depended entirely on my making a quick passage to Otaheite, or the Society Islands.

The wind continued invariably fixed at east south-east, or seldom shifting above two points on either side. It also blew very faint, so that it was the 27th before we crossed the tropic, and then we were only in the longitude of $201^{\circ} 23'$ east, which was nine degrees to the westward of our intended port. In all this run we saw nothing, except now and then a tropic bird, that could induce us to think we had sailed near any land. In the latitude of $34^{\circ} 20'$, longitude 199° , we passed the trunk of a large tree, which was covered with barnacles, a sign that it had been long at sea. On the 29th, at ten in the morning, as we were standing to the north-east, the *Discovery* made the signal of seeing land. We saw it from the mast-head almost the same moment, bearing north-east by east by compass. We soon discovered it to be an island of no great extent, and stood for it till sunset, when it bore north north-east, distant about two or three leagues.

The night was spent in standing off and on, and at daybreak the next morning, I bore up for the lee or west side of the island, as neither anchorage nor landing appeared to be practicable on the south side, on account of a great surf*, which broke everywhere with violence against the shore, or against the reef that surrounded it. We presently found that the island was inhabited, and saw several people, on a point of the land we had passed, wading to the reef, where, as they found the ship leaving them quickly, they remained. But others, who soon appeared in different parts, followed her course, and sometimes several of them collected into small bodies, who made a shouting noise all together, nearly after the manner of the inhabitants of New Zealand. Between seven and eight o'clock, we were at the west north-west part of the island, and being near the shore, we could perceive with our glasses, that several of the natives, who appeared upon a sandy beach, were all armed with long spears and clubs, which they brandished in the air with signs of threatening, or, as some on board interpreted their attitudes, with invitations to land. Most of them appeared naked, except having a sort of girdle, which being brought up between the thighs, covered that part of the body. But some of them had pieces of cloth of different colours, white, striped, or checkered, which they wore as a garment thrown about their shoulders. And almost all of them had a white wrapper about their heads, not much unlike a turban; or, in some instances, like a high conical cap. We could also perceive that they were of a tawny colour, and in general of a middling stature, but robust, and inclining to corpulency.

At this time, a small canoe was launched in a great hurry from the further end of the beach, and a man getting into it, put off, as with a view to reach the ship. On perceiving this, I brought to, that we might receive the visit; but the man's resolution failing, he soon returned

* A very ingenious and satisfactory account of the cause of the surf, is to be met with in Marsden's History of Sumatra, p. 29, 32.

toward the beach, where, after some time, another man joined him in the canoe; and then they both paddled towards us. They stopped short, however, as if afraid to approach, until Omai, who addressed them in the Otaheite language, in some measure quieted their apprehensions. They then came near enough to take some beads and nails, which were tied to a piece of wood, and thrown into the canoe. They seemed afraid to touch these things, and put the piece of wood aside without untying them. This, however, might arise from superstition; for Omai told us, that when they saw us offering them presents, they asked something for their *Eatooa*, or god. He also, perhaps improperly, put the question to them, whether they ever ate human flesh? which they answered in the negative, with a mixture of indignation and abhorrence. One of them, whose name was Mouroua, being asked how he came by a scar on his forehead, told us that it was the consequence of a wound he had got in fighting with the people of an island which lies to the north-eastward, who sometimes came to invade them. They afterward took hold of a rope. Still, however, they would not venture on board; but told Omai, who understood them pretty well, that their countrymen on shore had given them this caution, at the same time directing them to inquire from whence our ship came, and to learn the name of the captain. On our part, we inquired the name of the island, which they called *Mangya* or *Mangeea*; and sometimes added to it *Nooe, nai, naira*. The name of their chief, they said, was Oroaeeke.

Mouroua was lusty and well made, but not very tall. His features were agreeable, and his disposition seemingly no less so; for he made several droll gesticulations, which indicated both good nature and a share of humour. He also made others which seemed of a serious kind, and repeated some words with a devout air, before he ventured to lay hold of the rope at the ship's stern, which was probably to recommend himself to the protection of some divinity. His colour was nearly of the same cast with that common to the most southern Europeans. The other man was not so handsome. Both of them had strong, straight hair, of a jet colour, tied together on the crown of the head with a bit of cloth. They wore such girdles as we had perceived about those on shore, and we found they were a substance made from the *Morus papyrifera*, in the same manner as at the other islands of this ocean. It was glazed like the sort used by the natives of the Friendly Islands; but the cloth on their heads was white, like that which is found at Otaheite. They had on a kind of sandals, made of a grassy substance interwoven, which we also observed were worn by those who stood upon the beach, and, as we supposed, intended to defend their feet against the rough coral rock. Their beards were long; and the inside of their arms, from the shoulder to the elbow, and some other parts, were punctured or tattooed, after the manner of the inhabitants of almost all the other islands in the South Sea. The lobe of their ears was pierced, or rather slit, and to such a length, that one of them stuck there a knife and some beads, which he had received from us; and the same person had two polished pearl shells, and a bunch of human hair, loosely twisted, hanging about his neck, which was the only ornament we observed. The canoe they came in (which was the only one we saw) was not above ten feet long, and very narrow, but both strong and neatly made. The forepart had a flat board fastened over it, and projecting out, to prevent the sea getting in on plunging, like the small *Evaas* at Otaheite; but it had an upright stern, about five feet high, like some in New Zealand, and the upper end of this stern-post was forked. The lower part of the canoe was of white wood, but the upper was black, and their paddles, made of wood of the same colour, not above three feet long, broad at one end, and blunted. They paddled either

HEAD OF MAN OF MANGEEA.

end of the canoe forward indifferently, and only turned about their faces to paddle the contrary way.

We now stood off and on; and as soon as the ships were in a proper station, about ten o'clock I ordered two boats, one of them from the *Discovery*, to sound the coast, and to endeavour to find a landing-place. With this view, I went in one of them myself, taking with me such articles to give the natives as I thought might serve to gain their good will. I had no sooner put off from the ship than the canoe with the two men, which had left us not long before, paddled towards my boat; and, having come alongside, Mourooa stepped into her without being asked, and without a moment's hesitation. Omai, who was with me, was ordered to inquire of him where we could land, and he directed us to two different places: but I saw, with regret, that the attempt could not be made at either place, unless at the risk of having our boats filled with water, or even staved to pieces. Nor were we more fortunate in our search for anchorage; for we could find no bottom till within a cable's length of the breakers. There we met with from forty to twenty fathoms depth, over sharp coral rocks, so that anchoring would have been attended with much more danger than landing.

While we were thus employed in reconnoitring the shore, great numbers of the natives thronged down upon the reef, all armed as above mentioned. Mourooa, who was now in my boat, probably thinking that this warlike appearance hindered us from landing, ordered them to retire back. As many of them complied, I judged he must be a person of some consequence among them: indeed, if we understood him right, he was the king's brother. So great was the curiosity of several of them, that they took to the water, and swimming off to the boats, came on board them without reserve. Nay, we found it difficult to keep them out, and still more difficult to prevent their carrying off everything they could lay their hands upon. At length, when they perceived that we were returning to the ships, they all left us, except our original visitor Mourooa. He, though not without evident signs of fear, kept his place in my boat, and accompanied me on board the ship.

The cattle, and other new objects that presented themselves to him there, did not strike him with so much surprise as one might have expected. Perhaps his mind was too much taken up about his own safety to allow him to attend to other things. It is certain that he seemed very uneasy; and the ship, on our getting on board, happening to be standing off shore, this circumstance made him the more so. I could get but little new information from him; and, therefore, after he had made a short stay, I ordered a boat to carry him in toward the land. As soon as he got out of the cabin, he happened to stumble over one of the goats: his curiosity now overcoming his fear, he stopped, looked at it, and asked Omai what bird this was; and not receiving an immediate answer from him, he repeated the question to some of the people upon deck. The boat having conveyed him pretty near to the surf, he leaped into the sea and swam ashore. He had no sooner landed, than the multitude of his countrymen gathered round him, as if with an eager curiosity to learn from him what he had seen; and in this situation they remained when we lost sight of them. As soon as the boat returned, we hoisted her in, and made sail from the land to the northward.

Thus were we obliged to leave unvisited this fine island, which seemed capable of supplying all our wants. It lies in the latitude of $21^{\circ} 57'$ S., and in the longitude of $201^{\circ} 53'$ E. Such parts of the coast as fell under our observation are guarded by a reef of coral rock, on the outside of which the sea is of an unfathomable depth. It is full five leagues in circuit, and of a moderate and pretty equal height, though in clear weather it may be certainly seen at the distance of ten leagues; for we had not lost sight of it at night when we had run above seven leagues, and the weather was cloudy. In the middle it rises into little hills, from whence there is a gentle descent to the shore, which at the south-west part is steep, though not above ten or twelve feet high; and has several excavations, made by the beating of the waves against a brownish sandstone of which it is composed. The descent here is covered with trees of a deep green colour, very thick, but not high, which seem all of one sort, unless nearest the shore, where there are great numbers of that species of *dracæna* found in the woods of New Zealand, which are also scattered in some other places. On the north-west part, the shore, as we mentioned above, ends in a sandy beach; beyond which the land is broken down into small chasms or gullies, and has a broad border of trees resembling tall willows: which, from its regularity, might be supposed a work of art, did not its extent

forbid us to think so. Farther up on the ascent, the trees were of the deep green mentioned before. Some of us supposed these to be the *rima*, intermixed with low cocoa palms, and a few of some other sorts. They seemed not so thick as on the south-west part, and higher; which appearance might be owing to our nearer approach to the shore. On the little hills were some trees of a taller sort, thinly scattered; but the other parts of them were either bare and of a reddish colour, or covered with something like fern. Upon the whole, the island has a pretty aspect, and might be made a beautiful spot by cultivation.

As the inhabitants seemed to be both numerous and well fed, such articles of provision as the island produces must be in great plenty. It might, however, be a matter of curiosity to know, particularly, their method of subsistence; for our friend Monrooa told us that they had no animals, as hogs and dogs, both which, however, they had heard of; but acknowledged they had plantains, bread-fruit, and taro. The only birds we saw, were some white egg-birds, terns, and noddies, and one white heron on the shore.

The language of the inhabitants of Mangea is a dialect of that spoken at Otaheite; though their pronunciation, as that of the New Zealanders, be more guttural. Some of their words, of which two or three are perhaps peculiar to this island, are here subjoined, as taken by Mr. Anderson, from Omai, who had learnt them in his conversations with Mourooa. The Otaheite words, where there is any resemblance, are placed opposite.

ENGLISH.	MANGEEA.	OTAHEITE.	ENGLISH	MANGEEA.	OTAHEITE.

A spear . . .	Heyhey.		To kiss . . .	Ooma.	

The natives of Mangea seem to resemble those of Otaheite and the Marquesas in the beauty of their persons, more than any other nation I have seen in these seas; having a smooth skin, and not being muscular. Their general disposition also corresponds, as far as we had opportunities of judging, with that which distinguishes the first-mentioned people. For they are not only cheerful, but, as Mourooa showed us, are acquainted with all the lascivious gesticulations which the Otaheiteans practise in their dances. It may also be supposed, that their method of living is similar. For, though the nature of the country prevented our seeing many of their habitations, we observed one house near the beach, which much resembled, in its mode of construction, those of Otaheite. It was pleasantly situated in a grove of trees, and appeared to be about thirty feet long, and seven or eight high, with an open end, which represented an ellipse divided transversely. Before it was spread something white on a few bushes; which we conjectured to be a fishing-net, and, to appearance, of a very delicate texture.

They salute strangers much after the manner of the New Zealanders, by joining noses; adding, however, the additional ceremony of taking the hand of the person to whom they are paying civilities, and rubbing it with a degree of force upon their nose and mouth*.

* The inhabitants of the Palaoa, New Philippine, or rather Caroline Islands, at the distance of almost fifteen hundred leagues from Mangea, have the same mode of salutation. "Leur civilité, et la marque de leur respect,

consiste à prendre la main ou le pied de celui à qui ils veulent faire honneur, et s'en frotter doucement tout le visage."—"Lettres Edifiantes et Curieuses," tom. p. 208. Edit. 1781.

CHAPTER II.—THE DISCOVERY OF AN ISLAND CALLED WATEOO.—ITS COASTS EXAMINED.—VISITS FROM THE NATIVES ON BOARD THE SHIPS.—MESSRS. GORE, BURNES, AND ANDERSON, WITH OMAI, SENT ON SHORE.—MR. ANDERSON'S NARRATIVE OF THEIR RECEPTION.—OMAI'S EXPEDIENT TO PREVENT THEIR BEING DETAINED.—HIS MEETING WITH SOME OF HIS COUNTRYMEN, AND THEIR DISTRESSFUL VOYAGE.—FARTHER ACCOUNT OF WATEOO, AND OF ITS INHABITANTS.

AFTER leaving Manglea, on the afternoon of the 30th, we continued our course northward all that night, and till noon on the 31st; when we again saw land, in the direction of N.E. by N., distant eight or ten leagues. Next morning, at eight o'clock, we had got abreast of its north end within four leagues of it, but to leeward; and could now pronounce it to be an island, nearly of the same appearance and extent with that we had so lately left. At the same time, another island, but much smaller, was seen right ahead. We could have soon reached this; but the largest one had the preference, as most likely to furnish a supply of food for the cattle, of which we began to be in great want. With this view I determined to work up to it; but as there was but little wind, and that little was unfavourable, we were still two leagues to leeward at eight o'clock the following morning. Soon after, I sent two armed boats from the Resolution, and one from the Discovery, under the command of Lieutenant Gore, to look for anchoring-ground, and a landing-place. In the meantime, we plied up under the island with the ships.

Just as the boats were putting off, we observed several single canoes coming from the shore. They went first to the Discovery, she being the nearest ship. It was not long after, when three of these canoes came alongside of the Resolution, each conducted by one man. They are long and narrow, and supported by outriggers. The stern is elevated about three or four feet, something like a ship's stern-post. The head is flat above, but prow-like below, and turns down at the extremity, like the end of a violin. Some knives, beads, and other trifles were conveyed to our visitors; and they gave us a few cocoa-nuts, upon our asking for them. But they did not part with them by way of exchange for what they had received from us. For they seemed to have no idea of bartering; nor did they appear to estimate any of our presents at a high rate. With a little persuasion, one of them made his canoe fast to the ship, and came on board; and the other two, encouraged by his example, soon followed him. Their whole behaviour marked that they were quite at their ease, and felt no sort of apprehension of our detaining, or using them ill. After their departure, another canoe arrived, conducted by a man who brought a bunch of plantains as a present to me; asking for me by name, having learnt it from Omai, who was sent before us in the boat with Mr. Gore. In return for this civility, I gave him an axe and a piece of red cloth; and he paddled back to the shore well satisfied. I afterward understood from Omai, that this present had been sent from the king, or principal chief of the island.

Not long after, a double canoe, in which were twelve men, came toward us. As they drew near the ship, they recited some words in concert, by way of chorus*, one of their number first standing up, and giving the word before each repetition. When they had finished their solemn chant, they came alongside, and asked for the chief. As soon as I showed myself, a pig and a few cocoa-nuts were conveyed up into the ship; and the principal person in the canoe made me an additional present of a piece of matting, as soon as he and his companions got on board. Our visitors were conducted into the cabin, and to other parts of the ship. Some objects seemed to strike them with a degree of surprise; but nothing fixed their attention for a moment. They were afraid to come near the cows and horses; nor did they form the least conception of their nature. But the sheep and goats

* Something like this ceremony was performed by the inhabitants of the Marquesas, when Captain Cook visited them in 1774. It is curious to observe, at what immense distances this mode of receiving strangers prevails.—Padillo, who sailed from Manila in 1710, on a voyage to discover the Palaos Islands, was thus received there.

The writer of the relation of his voyage says, "Aussitôt qu'ils approchèrent de notre bord, ils se mirent à chanter. Ils régloient la cadence, en frappant des mains sur leurs cuisses."—"Lettres Edifiantes et Curieuses," tom. xv. p. 323.

did not surpass the limits of their ideas; for they gave us to understand that they knew them to be birds. It will appear rather incredible, that human ignorance could ever make so strange a mistake; there not being the most distant similitude between a sheep or goat, and any winged animal. But these people seemed to know nothing of the existence of any other land animals, besides hogs, dogs, and birds. Our sheep and goats, they could see were very different creatures from the two first, and therefore they inferred, that they must belong to the latter class, in which they knew there is a considerable variety of species. I made a present to my new friend of what I thought might be most acceptable to him; but, on his going away, he seemed rather disappointed than pleased. I afterward understood that he was very desirous of obtaining a dog, of which animal this island could not boast, though its inhabitants knew that the race existed in other islands of their ocean. Captain Clerke had received the like present, with the same view, from another man, who met with from him the like disappointment.

The people in these canoes were in general of a middling size, and not unlike those of Mangera; though several were of a blacker cast than any we saw there. Their hair was tied on the crown of the head, or flowing loose about the shoulders; and though in some it was of a frizzling disposition, yet, for the most part, that, as well as the straight sort, was long. Their features were various, and some of the young men rather handsome. Like those of Mangera, they had girdles of glazed cloth, or fine matting, the ends of which, being brought betwixt their thighs, covered the adjoining parts. Ornaments, composed of a sort of broad grass, stained with red, and strung with berries of the nightshade, were worn about their necks. Their ears were bored, but not slit; and they were punctured upon the legs, from the knee to the heel, which made them appear as if they wore a kind of boots. They also resembled the inhabitants of Mangera in the length of their beards, and, like them, wore a sort of sandals upon their feet. Their behaviour was frank and cheerful, with a great deal of good-nature.

At three o'clock in the afternoon, Mr. Gore returned with the boat, and informed me, that he had examined all the west side of the island, without finding a place where a boat could land, or the ships could anchor, the shore being everywhere bounded by a steep coral rock, against which the sea broke in a dreadful surf. But as the natives seemed very friendly, and to express a degree of disappointment when they saw that our people failed in their attempts to land, Mr. Gore was of opinion, that by means of Omai, who could best explain our request, they might be prevailed upon to bring off to the boats, beyond the surf, such articles as we most wanted; in particular, the stems of plantain-trees, which make good food for the cattle. Having little or no wind, the delay of a day or two was not of any moment; and therefore I determined to try the experiment, and got everything ready against the next morning. Soon after daybreak, we observed some canoes coming off to the ships, and one of them directed its course to the Resolution. In it was a hog, with some plantains and cocoa-nuts, for which the people, who brought them, demanded a dog from us, and refused every other thing that we offered in exchange. One of our gentlemen on board happened to have a dog and a bitch, which were great nuisances in the ship, and might have been disposed of on this occasion for a purpose of real utility, by propagating a race of so useful an animal in this island. But their owner had such views in making them the companions of his voyage. However, to gratify these people, Omai parted with a favourite dog he had brought from England; and with this acquisition they departed highly satisfied.

About ten o'clock I despatched Mr. Gore with three boats, two from the Resolution and one from the Discovery, to try the experiment he had proposed. And, as I could confide in his diligence and ability, I left it entirely to himself, to act as from circumstances he should judge to be most proper. Two of the natives who had been on board accompanied him; and Omai went with him in his boat as an interpreter. The ships being a full league from the island when the boats put off, and having but little wind, it was noon before we could work up to it. We then saw our three boats riding at their grapplings, just without the surf, and a prodigious number of the natives on the shore abreast of them. By this we concluded that Mr. Gore and others of our people had landed, and our impatience to know

the event may be easily conceived. In order to observe their motions, and to be ready to give them such assistance as they might want, and our respective situations would admit of, I kept as near the shore as was prudent. I was sensible, however, that the reef was as effectual a barrier between us and our friends who had landed, and put them as much beyond the reach of our protection, as if half the circumference of the globe had intervened. But the islanders, it was probable, did not know this so well as we did. Some of them now and then came off to the ships in their canoes with a few cocoa-nuts, which they exchanged for whatever was offered to them, without seeming to give the preference to any particular article.

These occasional visits served to lessen my solicitude about our people who had landed. Though we could get no information from our visitors; yet their venturing on board seemed to imply, at least, that their countrymen on shore had not made an improper use of the confidence put in them. At length, a little before sun-set, we had the satisfaction of seeing the boats put off. When they got on board, I found that Mr. Gore himself, Omai, Mr. Anderson, and Mr. Burney, were the only persons who had landed. The transactions of the day were now fully reported to me by Mr. Gore; but Mr. Anderson's account of them being very particular, and including some remarks on the island and its inhabitants, I shall give it a place here nearly in his own words.

"We rowed toward a small sandy beach, upon which, and upon the adjacent rocks, a great number of the natives had assembled, and came to an anchor within a hundred yards of the reef, which extends about as far, or a little farther from the shore. Several of the natives swam off, bringing cocoa-nuts; and Omai, with their countrymen, whom we had with us in the boats, made them sensible of our wish to land. But their attention was taken up for a little time by the dog which had been carried from the ship, and was just brought on shore, round whom they flocked with great eagerness. Soon after, two canoes came off; and, to create a greater confidence in the islanders, we determined to go unarmed, and run the hazard of being treated well or ill.

"Mr. Burney, the first lieutenant of the *Discovery*, and I went in one canoe a little time before the other; and our conductors, watching attentively the motions of the surf, landed us safely upon the reef. An islander took hold of each of us, obviously with an intention to support us in walking over the rugged rocks to the beach, where several of the others met us, holding the green boughs of a species of *Mimosa* in their hands, and saluted us by applying their noses to ours. We were conducted from the beach by our guides, amidst a great crowd of people, who flocked with very eager curiosity to look at us, and would have prevented our proceeding, had not some men, who seemed to have authority, dealt blows with little distinction amongst them to keep them off. We were then led up an avenue of cocoa-palms, and soon came to a number of men arranged in two rows, armed with clubs, which they held on their shoulders much in the manner we rest a musket. After walking a little way amongst these, we found a person who seemed a chief, sitting on the ground cross-legged, cooling himself with a sort of triangular fan, made from a leaf of the cocoa-palm, with a polished handle of black wood fixed to one corner. In his ears were large bunches of beautiful red feathers which pointed forward. But he had no other mark or ornament to distinguish him from the rest of the people, though they all obeyed him with the greatest alacrity. He either naturally had, or at this time put on, a serious but not severe countenance; and we were desired to salute him as he sat by some people who seemed of consequence. We proceeded still amongst the men armed with clubs, and came to a second chief, who sat fanning himself, and ornamented as the first. He was remarkable for his size and uncommon corpulence, though to appearance not above thirty years of age. In the same manner we were conducted to a third chief, who seemed older than the two former, and, though not so fat as the second, was of a large size. He also was sitting, and adorned with red feathers; and after saluting him as we had done the others, he desired us both to sit down, which we were very willing to do, being pretty well fatigued with walking up, and with the excessive heat we felt amongst the vast crowd that surrounded us.

"In a few minutes the people were ordered to separate; and we saw, at the distance of thirty yards, about twenty young women, ornamented as the chiefs with red feathers,

ready to admit of. It was as much beyond. But now and changed for particular

the distance of h red feathers,

engaged in a dance, which they performed to a slow and serious air sung by them all. We got up and went forward to see them; and though we must have been strange objects to them, they continued their dance without paying the least attention to us. They seemed to be directed by a man who served as a prompter, and mentioned each motion they were to make. But they never changed the spot as we do in dancing; and though their feet were not at rest, this exercise consisted more in moving the fingers very nimbly, at the same time holding their hands in a prone position near the face, and now and then also clapping them together*. Their motions and song were performed in such exact concert, that it should seem they had been taught with great care; and probably they were selected for this ceremony, as few of those whom we saw in the crowd equalled them in beauty. In general they were rather stout than slender, with black hair flowing in ringlets down the neck, and of an olive complexion. Their features were rather fuller than what we allow to perfect beauties, and much alike; but their eyes were of a deep black, and each countenance expressed a degree of complacency and modesty peculiar to the sex in every part of the world, but perhaps more conspicuous here, where Nature presented us with her productions in the fullest perfection, unbiassed in sentiment by custom, or unrestrained in manner by art. Their shape and limbs were elegantly formed; for, as their dress consisted only of a piece of glazed cloth fastened about the waist, and scarcely reaching so low as the knees, in many we had an opportunity of observing every part. This dance was not finished when we heard a noise as if some horses had been galloping toward us; and, on looking aside, we saw the people armed with clubs, who had been desired, as we supposed, to entertain us with the sight of their manner of fighting. This they now did, one party pursuing another who fled.

"As we supposed the ceremony of being introduced to the chiefs was at an end, we began to look about for Mr. Gore and Omai; and though the crowd would hardly suffer us to move, we at length found them coming up, as much incommoded by the number of people as we had been, and introduced in the same manner to the three chiefs, whose names were Otteroo, Taroa, and Fatouweera. Each of these expected a present; and Mr. Gore gave them such things as he had brought with him from the ship for that purpose. After this, making use of Omai as his interpreter, he informed the chiefs with what intention we had come on shore; but was given to understand, that he must wait till the next day, and then he should have what was wanted.

"They now seemed to take some pains to separate us from each other; and every one of us had his circle to surround and gaze at him. For my own part, I was at one time above an hour apart from my friends; and when I told the chief, with whom I sat, that I wanted to speak to Omai, he peremptorily refused my request. At the same time I found the people began to steal several trifling things which I had in my pocket; and when I took the liberty of complaining to the chief of this treatment, he justified it. From these circumstances, I now entertained apprehensions, that they might have formed the design of detaining us amongst them. They did not, indeed, seem to be of a disposition so savage, as to make us anxious for the safety of our persons; but it was, nevertheless, vexing to think we had hazarded being detained by their curiosity. In this situation I asked for something to eat; and they readily brought me some cocoa-nuts, bread-fruit, and a sort of sour pudding, which was presented by a woman. And on my complaining much of the heat, occasioned by the crowd, the chief himself condescended to fan me, and gave me a small piece of cloth, which he had round his waist. Mr. Burney happened to come to the place where I was; I mentioned my suspicions to him, and, to put it to the test, whether they were well-founded, we attempted to get to the beach. But we were stopped when about half way by some men, who told us that we must go back to the place which we had left. On coming up, we found Omai entertaining the same apprehensions. But he had, as he fancied, an additional reason for being afraid, for he had observed that they had dug a hole in the ground for an oven, which they were now heating; and he could assign no other reason for this, than that

* The dances of the inhabitants of the Caroline Islands in the same volume, p. 207, what is said of the singing have a great resemblance to those here described. See and dancing of the inhabitants of the Palao Islands, *Lettres Edif. et Curieuses*, tom. xv. p. 315. See also, which belong to the same group.

they meant to roast and eat us, as is practised by the inhabitants of New Zealand. Nay, he went so far as to ask them the question; at which they were greatly surprised, asking in return whether that was a custom with us? Mr. Burney and I were rather angry that they should be thus suspected by him, there having as yet been no appearances in their conduct towards us of their being capable of such brutality.

"In this manner we were detained the greatest part of the day, being sometimes together, and sometimes separated; but always in a crowd; who, not satisfied with gazing at us, frequently desired us to uncover parts of our skin, the sight of which commonly produced a general murmur of admiration. At the same time, they did not omit these opportunities of rifling our pockets; and at last one of them snatched a small bayonet from Mr. Gore, which hung in its sheath by his side. This was represented to the chief, who pretended to send some person in search of it. But in all probability, he countenanced the theft; for soon after, Omai had a dagger stolen from his side in the same manner, though he did not miss it immediately. Whether they observed any signs of uneasiness in us, or that they voluntarily repeated their emblems of friendship when we expressed a desire to go, I cannot tell; but, at this time, they brought some green boughs, and sticking their ends in the ground, desired we might hold them as we sat. Upon our urging again the business we came upon, they gave us to understand that we must stay and eat with them; and a pig which we saw soon after lying near the oven, which they had prepared and heated, removed Omai's apprehensions of being put into it himself, and made us think it might be intended for our repast. The chief also promised to send some people to procure food for the cattle, but it was not till pretty late in the afternoon, that we saw them return with a few plantain-trees, which they carried to our boats.

"In the mean time, Mr. Burney and I attempted again to go to the beach, but when we arrived, found ourselves watched by people, who, to appearance, had been placed there for this purpose. For when I tried to wade in upon the reef, one of them took hold of my clothes and dragged me back. I picked up some small pieces of coral, which they required me to throw down again; and on my refusal, they made no scruple to take them, forcibly from me. I had gathered some small plants, but these also I could not be permitted to retain; and they took a fan from Mr. Burney, which he had received as a present on coming ashore. Omai said we had done wrong in taking up any thing, for it was not the custom here to permit freedoms of that kind to strangers, till they had in some measure naturalized them to the country, by entertaining them with festivity for two or three days. Finding that the only method of procuring better treatment was to yield implicit obedience to their will, we went up again to the place we had left, and they now promised that we should have a canoe to carry us off to our boats, after we had eaten of a repast which had been prepared for us.

"Accordingly, the second chief, to whom we had been introduced in the morning, having seated himself upon a low broad stool of blackish hard wood, tolerably polished, and directing the multitude to make a pretty large ring, made us sit down by him. A considerable number of cocoa-nuts were now brought; and shortly after, a long green basket with a sufficient quantity of baked plantains to have served a dozen persons. A piece of the young hog that had been dressed, was then set before each of us, of which we were desired to eat. Our appetites, however, had failed from the fatigue of the day; and though we did eat a little to please them, it was without satisfaction to ourselves. It being now near sunset, we told them it was time to go on board. This they allowed; and sent down to the beach the remainder of the victuals that had been dressed, to be carried with us to the ships. But before we set out, Omai was treated with a drink he had been used to in his own country; which, we observed, was made here as at other islands in the South Sea, by chewing the root of a sort of pepper. We found a canoe ready to put us off to our boats; which the natives did with the same caution as when we landed. But even here their thievish disposition did not leave them; for a person of some consequence among them, who came with us, took an opportunity, just as they were pushing the canoe into the surf, to snatch a bag out of her which I had, with the greatest difficulty, preserved all the day, there being in it a small pocket-pistol which I was unwilling to part with. Perceiving him, I called out, expressing as much displeasure as I could; on which he thought proper to return, and swim

with the bag to the canoe, but denied he had stolen it, though detected in the very act. They put us on board our boats, with the cocoa-nuts, plantains, and other provisions which they had brought; and we rowed to the ships very well pleased that we had at last got out of the hands of our troublesome masters.

"We regretted much, that our restrained situation gave us so little opportunity of making observations on the country. For, during the whole day, we were seldom a hundred yards from the place where we were introduced to the chiefs on landing; and, consequently, were confined to the surrounding objects. The first thing that presented itself worthy of our notice was the number of people, which must have been at least two thousand. For those who welcomed us on the shore bore no proportion to the multitude we found amongst the trees, on proceeding a little way up. We could also observe that, except a few, those we had hitherto seen on board were of the lower class; for a great number of those we now met with, had a superior dignity in their air, and were of a much whiter cast. In general they had the hair tied on the crown of the head, long, black, and of a most luxuriant growth. Many of the young men were perfect models in shape, of a complexion as delicate as that of the women, and, to appearance, of a disposition as amiable. Others who were more advanced in years, were corpulent; and all had a remarkable smoothness of the skin. Their general dress was a piece of cloth or mat wrapped about the waist, and covering the parts which modesty conceals. But some had pieces of mats most curiously varied with black and white, made into a sort of jacket without sleeves; and others wore conical caps of cocoa-nut core, neatly interwoven with small beads made of a shelly substance. Their ears were pierced; and in them they hung bits of the membranous part of some plant, or stuck there an odoriferous flower, which seemed to be a species of *gardenia*. Some who were of a superior class, and also the chiefs, had two little balls with a common base, made from the bone of some animal, which was hung round the neck, with a great many folds of small cord. And after the ceremony of introduction to the chiefs was over, they then appeared without their red feathers; which are certainly considered here as a particular mark of distinction, for none but themselves and the young women who danced assumed them.

"Some of the men were punctured all over the sides and back in an uncommon manner; and some of the women had the same ornament on their legs. But this method was confined to those who seemed to be of a superior rank; and the men, in that case, were also generally distinguished by their size and corpulence, unless very young. The women of an advanced age had their hair cropped short; and many were cut in oblique lines all over the fore part of the body; and some of the wounds, which formed rhomboidal figures, had been so lately inflicted, that the coagulated blood still remained in them. The wife of one of the chiefs appeared with her child, laid in a piece of red cloth which had been presented to her husband, and seemed to carry it with great tenderness, suckling it much after the manner of our women. Another chief introduced his daughter, who was young and beautiful, but appeared with all the timidity natural to the sex, though she gazed on us with a kind of anxious concern that seemed to struggle with her fear, and to express her astonishment at so unusual a sight. Others advanced with more firmness, and, indeed, were less reserved than we expected, but behaved with a becoming modesty. We did not observe any personal deformities amongst either sex, except in a few who had scars of broad superficial ulcers remaining on the face and other parts. In proportion to the number of people assembled, there appeared not many old men or women; which may easily be accounted for, by supposing that such as were in an advanced period of life might neither have the inclination nor the ability to come from the more distant parts of the island. On the other hand, the children were numerous; and both these and the men climbed the trees to look at us when we were hid by the surrounding crowd.

"About a third part of the men were armed with clubs and spears; and, probably, these were only the persons who had come from a distance, as many of them had small baskets, mats, and other things, fastened to the ends of their weapons. The clubs were generally about six feet long, made of a hard black wood, lance-shaped at the end, but much broader, with the edge nicely scalloped, and the whole neatly polished. Others of them were narrower at the point, much shorter and plain; and some were even so small as to be used

with one hand. The spears were made of the same wood, simply pointed; and, in general, above twelve feet long; though some were so short, that they seemed intended to be thrown as darts.

"The place where we were all the day was under the shade of various trees, in which they preserved their canoes from the sun. About eight or ten of them were here, all double ones; that is, two single ones fastened together (as is usual throughout the whole extent of the Pacific Ocean), by rafters lashed across. They were about twenty feet long, about four feet deep, and the sides rounded with a plank raised upon them, which was fastened strongly by means of withes. Two of these canoes were most curiously stained or painted all over with black, in numberless small figures, as squares, triangles, &c., and excelled by far any thing of that kind I had ever seen at any other island in this ocean. Our friends here, indeed, seemed to have exerted more skill in doing this than in puncturing their own bodies. The paddles were about four feet long, nearly elliptical, but broader at the upper end than the middle. Near the same place was a hut or shed about thirty feet long, and nine or ten high, in which, perhaps, these boats are built, but at this time it was empty.

"The greatest number of the trees around us were cocoa-palms; some sorts of *hibiscus*; a species of *euphorbia*; and, toward the sea, abundance of the same kind of trees we had seen at Mangeea Nooe Nainaiwa; and which seemed to surround the shores of this island in the same manner. They are tall and slender, not much unlike a cypress; but with bunches of long, round, articulated leaves. The natives call them *etoa*. On the ground we saw some grass; a species of convolvulus; and a good deal of *treacle-mustard*. There are also, doubtless, other fruit-trees and useful plants which we did not see. For, besides several sorts of plantains, they brought, at different times, roots which they call *taro* (the *cocos* of other countries); a bread-fruit; and a basket of roasted nuts, of a kidney-shape, in taste like a chesnut, but coarser. What the soil of the island may be further inland, we could not tell. But, toward the sea, it is nothing more than a bank of coral, ten or twelve feet high, steep and rugged; except where there are small sandy beaches, at some clefts where the ascent is gradual. The coral, though it has, probably, been exposed to the weather for many centuries, has undergone no farther change than becoming black on the surface; which, from its irregularity, is not much unlike large masses of a burnt substance. But on breaking some pieces off, we found that, at the depth of two or three inches, it was just as fresh as the pieces that had been lately thrown upon the beach by the waves. The reef, or rock, that lines the shore entirely, runs to different breadths into the sea, where it ends, all at once, and becomes like a high steep wall. It is nearly even with the surface of the water, and of a brown or brick colour; but the texture is rather porous, yet sufficient to withstand the washing of the surf, which continually breaks upon it."

Though the landing of our gentlemen proved the means of enriching my journal with the foregoing particulars, the principal object I had in view was, in a great measure, unattained; for the day was spent without getting any one thing from the island worth mentioning. The natives, however, were gratified with a sight they never before had; and probably, will never have again. And mere curiosity seems to have been their chief motive for keeping the gentlemen under such restraint, and for using every art to prolong their continuance amongst them.

It has been mentioned that Omai was sent upon this expedition; and perhaps, his being Mr. Gore's interpreter was not the only service he performed this day. He was asked by the natives a great many questions concerning us, our ships, our country, and the sort of arms we used; and, according to the account he gave me, his answers were not a little upon the marvellous. As, for instance, he told them that our country had ships as large as their island, on board which were instruments of war (describing our guns), of such dimensions, that several people might sit within them; and that one of them was sufficient to crush the whole island at one shot. This led them to inquire of him what sort of guns we actually had in our two ships. He said, that though they were but small, in comparison with those he had just described, yet, with such as they were, we could, with the greatest ease, and at the distance the ships were from the shore, destroy the island, and kill every soul in it. They persevered in their inquiries, to know by what means this could be done: and Omai

ne ; and Omai

explained the matter as well as he could. He happened luckily to have a few cartridges in his pocket. These he produced ; the balls and the gunpowder which was to set them in motion were submitted to inspection ; and to supply the defects of his description, an appeal was made to the senses of the spectators. It has been mentioned above, that one of the chiefs had ordered the multitude to form themselves into a circle. This furnished Omai with a convenient stage for his exhibition. In the centre of this amphitheatre, the inconsiderable quantity of gunpowder, collected from his cartridges, was properly disposed upon the ground, and, by means of a bit of burning wood from the oven, where dinner was dressing, set on fire. The sudden blast and loud report, the mingled flame and smoke, that instantly succeeded, now filled the whole assembly with astonishment ; they no longer doubted the tremendous power of our weapons, and gave full credit to all that Omai had said. If it had not been for the terrible ideas they conceived of the guns of our ships, from this specimen of their mode of operation, it was thought that they would have detained the gentlemen all night. For Omai assured them, that if he and his companions did not return on board the same day, they might expect that I would fire upon the island. And as we stood in nearer the land in the evening than we had done any time before, of which position of the ships they were observed to take great notice, they, probably, thought we were meditating this formidable attack, and therefore suffered their guests to depart, under the expectation, however, of seeing them again on shore next morning. But I was too sensible of the risk they had already run, to think of a repetition of the experiment.

This day, it seems, was destined to give Omai more occasions than one of being brought forward to bear a principal part in its transactions. The island, though never before visited by Europeans, actually happened to have other strangers residing in it ; and it was entirely owing to Omai's being one of Mr. Gore's attendants that this curious circumstance came to our knowledge. Scarcely had he been landed upon the beach, when he found amongst the crowd there assembled three of his own countrymen, natives of the Society Islands. At the distance of about two hundred leagues from those islands, an immense unknown ocean intervening, with such wretched sea-boats as their inhabitants are known to make use of, and fit only for a passage where sight of land is scarcely ever lost, such a meeting, at such a place, so accidentally visited by us, may well be looked upon as one of those unexpected situations with which the writers of feigned adventures love to surprise their readers, and which, when they really happen in common life, deserve to be recorded for their singularity.

It may easily be guessed with what mutual surprise and satisfaction Omai and his countrymen engaged in conversation. Their story, as related by them, is an affecting one. About twenty persons in number, of both sexes, had embarked on board a canoe at Otaheite, to cross over to the neighbouring island Ulitea. A violent contrary wind arising, they could neither reach the latter nor get back to the former. Their intended passage being a very short one, their stock of provisions was scanty and soon exhausted ; the hardships they suffered, while driven along by the storm, they knew not whither, are not to be conceived ; they passed many days without having anything to eat or drink ; their numbers gradually diminished, worn out by famine and fatigue ; four men only survived, when the canoe overset, and then the perdition of this small remnant seemed inevitable. However, they kept hanging by the side of their vessel during some of the last days, till Providence brought them in sight of the people of this island, who immediately sent out canoes, took them off their wreck, and brought them ashore. Of the four who were thus saved, one was since dead ; the other three, who lived to have this opportunity of giving an account of their almost miraculous transplantation, spoke highly of the kind treatment they here met with ; and so well satisfied were they with their situation, that they refused the offer made to them by our gentlemen, at Omai's request, of giving them a passage on board our ships, to restore them to their native islands. The similarity of manners and language had more than naturalised them to this spot ; and the fresh connexions which they had here formed, and which it would have been painful to have broken off, after such a length of time, sufficiently account for their declining to revisit the places of their birth. They had arrived upon this island at least twelve years ago. For I learn from Mr. Anderson that he found they knew nothing of Captain Wallis's visit to Otaheite in 1765, nor of several other memorable occurrences,

such as the conquest of Ulitea by those of Bolabola, which had preceded the arrival of the Europeans. To Mr. Anderson I am also indebted for their names, Orononte, Otirrona, and Taveo; the first, born at Matavai in Otaheite; the second, at Ulitea; and the third, at Huahine.

The landing of our gentlemen on this island, though they failed in the object of it, cannot but be considered as a very fortunate circumstance. It has proved, as we have seen, the means of bringing to our knowledge a matter of fact, not only very curious, but very instructive. The application of the above narrative is obvious. It will serve to explain, better than a thousand conjectures of speculative reasoners, how the detached parts of the earth, and, in particular, how the islands of the South Sea, may have been first peopled; especially those that lie remote from any inhabited continent, or from each other.*

This island is called Watecoo by the natives. It lies in the latitude of $20^{\circ} 1' S.$, and in the longitude $201^{\circ} 45' E.$, and is about six leagues in circumference. It is a beautiful spot, with a surface composed of hills and plains, and covered with verdure of many hues. Our gentlemen found the soil where they passed the day to be light and sandy; but farther up the country a different sort perhaps prevails, as we saw from the ship, by the help of our glasses, a reddish cast upon the rising grounds. There the inhabitants have their houses, for we could perceive two or three which were long and spacious. Its produce, with the addition of hogs, we found to be the same as at the last island we had visited, which the people of this, to whom we pointed out its position, called Owahavarouah; a name so different from Mangea Noe Nainaiwa, which we learned from its own inhabitants, that it is highly probable Owahavarouah is another island.

From the circumstances already mentioned, it appears, that Watecoo can be of little use to any ship that wants refreshment, unless in a case of the most absolute necessity. The natives, knowing now the value of some of our commodities, might be induced to bring off fruits and hogs to a ship standing off and on, or to boats lying off the reef, as ours did. It is doubtful, however, if any fresh water could be procured. For, though some was brought in cocoa-nut shells to the gentlemen, they were told that it was at a considerable distance; and probably it is only to be met with in some stagnant pool, as no running stream was anywhere seen.

According to Omai's report of what he learned in conversation with his three countrymen, the manners of these islanders, their method of treating strangers, and their general habits of life, are much like those that prevail at Otaheite, and its neighbouring isles. Their religious ceremonies and opinions are also nearly the same. For upon seeing one man, who was painted all over of a deep black colour, and inquiring the reason, our gentlemen were told that he had lately been paying the last good offices to a deceased friend: and they found that it was upon similar occasions the women cut themselves, as already mentioned. From every

* Such accidents as this, here related, probably happen frequently in the Pacific Ocean. In 1696, two canoes, having on board thirty persons of both sexes, were driven by contrary winds and tempestuous weather on the isle of Samal, one of the Philippines, after being tossed about at sea seventy days, and having performed a voyage from an island called by them Anorot, 300 leagues to the east of Samal. Five of the number who had embarked died of the hardships suffered during this extraordinary passage. See a particular account of them, and of the islands they belonged to, in "Lettres Edifiantes et Curieuses," tom. xv., from p. 196 to p. 215. In the same volume, from p. 242 to p. 320, we have the relation of a similar adventure, in 1721, when two canoes, one containing twenty-four, and the other six persons, men, women, and children, were driven from an island they called Farroilep, northward to the isle of Guam, or Guahan, one of the Ladrones or Marianas. But these had not sailed so far as their countrymen, who reached Samal as above, and they had been at sea only twenty days. There seems to be no reason to doubt the general authenticity of these two relations. The information contained in the letters of the Jesuits,

about these islands, now known under the name of the Carolines, and discovered to the Spaniards by the arrival of the canoes at Samal and Guam, has been adopted by all our later writers. See President de Brosse's "Voyages aux Terres Australes," tom. ii., from p. 443 to p. 490. See also the "Modern Universal History."—[Many other well-authenticated instances in which the frail canoes of the natives of the South Sea Islands have been drifted many hundred miles across the ocean have been recorded by voyagers, or preserved in the traditions of the natives. It would occupy too much space to particularize them here, but a remark of Mr. Ellis upon them ("Polynesian Researches," vol. i., p. 26, 12mo edit.) is worthy of attention, in relation to the question of the original source of the general population of Polynesia. He states, that "it is a striking fact, that every such voyage related in the accounts of voyagers, preserved in the traditions of the natives, or of recent occurrence, has invariably been from east to west, directly opposite to that in which it must have been had the population been altogether derived from the Malayan archipelago."—Ed.]

circumstance, indeed, it is indubitable, that the natives of Watecoo sprang, originally, from the same stock, which hath spread itself so wonderfully all over the immense extent of the South Sea. One would suppose, however, that they put in their claim to a more illustrious extraction, for Omai assured us that they dignified their island with the appellation of *Wenooa no to Eatooa*, that is, a land of gods; esteeming themselves a sort of divinities, and possessed with the spirit of the Eatooa. This wild enthusiastic notion Omai seemed much to approve of, telling us there were instances of its being entertained at Otaheite, but that it was universally prevalent amongst the inhabitants of Mataia, or Osnaburg Island. The language spoken at Watecoo was equally well understood by Omai and by our two New Zealanders. What its peculiarities may be when compared with the other dialects, I am not able to point out; for though Mr. Anderson had taken care to note down a specimen of it, the natives, who made no distinction of the objects of their theft, stole the memorandum-book.

CHAPTER III.—WENOOA-ETTE, OR OTAKOOTAIA, VISITED.—ACCOUNT OF THAT ISLAND, AND OF ITS PRODUCE.—HERVEY'S ISLAND, OR TEROUGE MOU ATTOOA, FOUND TO BE INHABITED.—TRANSACTIONS WITH THE NATIVES.—THEIR PERSONS, DRESS, LANGUAGE, CANOES.—FRUITLESS ATTEMPT TO LAND THERE.—REASONS FOR BEARING AWAY FROM THE FRIENDLY ISLANDS.—PALMERSTON'S ISLAND TOUCHED AT.—DESCRIPTION OF THE TWO PLACES WHERE THE BOATS LANDED.—REFRESHMENTS OBTAINED THERE.—CONJECTURES ON THE FORMATION OF SUCH LOW ISLANDS.—ARRIVAL AT THE FRIENDLY ISLANDS.

LIGHT airs and calms having prevailed, by turns, all the night of the 3rd, the easterly swell had carried the ships some distance from Watecoo, before daybreak. But as I had failed in my object of procuring, at that place, some effectual supply, I saw no reason for staying there any longer. I therefore quitted it, without regret, and steered for the neighbouring island, which, as has been mentioned, we discovered three days before. With a gentle breeze at east, we got up with it before ten o'clock in the morning, and I immediately despatched Mr. Gore, with two boats, to endeavour to land, and get some food for our cattle. As there seemed to be no inhabitants here to obstruct our taking away whatever we might think proper, I was confident of his being able to make amends for our late disappointment, if the landing could be effected. There was a reef here surrounding the land, as at Watecoo, and a considerable surf breaking against the rocks; notwithstanding which, our boats no sooner reached the lee, or west side of the island, but they ventured in, and Mr. Gore and his party got safe on shore. I could, from the ship, see that they had succeeded so far; and I immediately sent a small boat to know what farther assistance was wanting. She did not return till three o'clock in the afternoon, having waited to take in a lading of what useful produce the island afforded. As soon as she was cleared, she was sent again for another cargo; the jolly-boat was also despatched, and Mr. Gore was ordered to be on board, with all the boats, before night; which was complied with.

The supply obtained here consisted of about a hundred cocoa-nuts for each ship; and besides this refreshment for ourselves, we got for our cattle some grass, and a quantity of the leaves and branches of young cocoa-trees, and of the *ucharra* tree, as it is called at Otaheite, the *pandanus* of the East Indies. This latter being of a soft, spongy, juicy nature, the cattle ate it very well, when cut into small pieces; so that it might be said, without any deviation from truth, that we fed them upon billet wood.

This island lies in the latitude of $19^{\circ} 51' S.$, and the longitude of $201^{\circ} 37' E.$, about three or four leagues from Watecoo, the inhabitants of which called it Otakootaia; and sometimes they spoke of it under the appellation of *Wenooa-ette*, which signifies "little island." Mr. Anderson, who was on shore with our party, and walked round it, guessed that it could not be much more than three miles in circuit. From him I also learned the following particulars. The beach within the reef is composed of a white coral sand; above which, the land within does not rise above six or seven feet, and is covered with a light reddish soil, but is entirely destitute of water. The only common trees found there were cocoa-palms, of which there

were several clusters; and vast numbers of the *wharra*. There were, likewise, the *Collophylum, Suriana, Guettarda*, a species of *Tournefortia*, and *Taberna montana*, with a few other shrubs; and some of the *etou* tree seen at Watecoo. A sort of bindweed overran the vacant spaces; except in some places, where was found a considerable quantity of treacle-mustard, a species of spurge, with a few other small plants, and the *Morinda citrifolia*; the fruit of which is eaten by the natives of Otaheite in times of scarcity. Omai, who had landed with the party, dressed some of it for their dinner; but it proved very indifferent.

The only bird seen amongst the trees, was a beautiful cnekoo, of a chesnut brown, variegated with black, which was shot. But, upon the shore, were some egg-birds; a small sort of curlew; blue and white herons; and great numbers of noddies; which last, at this time, laid their eggs, a little farther up, on the ground, and often rested on the *wharra* tree. One of our people caught a lizard of a most forbidding aspect, though small, running up a tree; and many, of another sort, were seen. The bushes, toward the sea, were frequented by infinite numbers of a sort of moth, elegantly speckled with red, black, and white. There were also several other sorts of moths, as well as some pretty butterflies; and a few other insects.

Though there were, at this time, no fixed inhabitants upon the island, indubitable marks remained of its being, at least occasionally, frequented. In particular, a few empty huts were found. There were also several large stones erected, like monuments, under the shade of some trees; and several spaces inclosed with smaller ones, where, probably, the dead had been buried. And, in one place, a great many cockle-shells, of a particular sort, finely grooved, and larger than the first, were to be seen; from which it was reasonable to conjecture, that the island had been visited by persons who feed partly on shell-fish. In one of the huts, Mr. Gore left a hatchet and some nails, to the full value of what we took away.

As soon as the boats were hoisted in, I made sail again to the northward, with a light air of wind easterly; intending to try our fortune at Hervey's Island, which was discovered in 1773, during my last voyage. Although it was not above fifteen leagues distant, yet we did not get sight of it till daybreak in the morning of the 6th, when it bore west-south-west, at the distance of about three leagues. As we drew near it, at eight o'clock, we observed several canoes put off from the shore; and they came directly towards the ships. This was a sight that, indeed, surprised me, as no signs of inhabitants were seen when the island was first discovered, which might be owing to a pretty brisk wind that then blew, and prevented their canoes venturing out, as the ships passed to leeward; whereas now we were to windward. As we still kept on toward the island, six or seven of the canoes, all double ones, soon came near us. There were from three to six men in each of them. They stopped at the distance of about a stone's-throw from the ship; and it was some time before Omai could prevail upon them to come alongside; but no entreaties could induce any of them to venture on board. Indeed, their disorderly and clamorous behaviour by no means indicated a disposition to trust us, or treat us well. We afterward learned that they had attempted to take some oars out of the Discovery's boat, that lay alongside, and struck a man who endeavoured to prevent them. They also cut away, with a shell, a net with meat, which hung over that ship's stern, and absolutely refused to restore it; though we, afterward, purchased it from them. Those who were about our ship behaved in the same daring manner; for they made a sort of hook, of a long stick, with which they endeavoured openly to rob us of several things; and, at last, actually got a frock belonging to one of our people, that was towing overboard. At the same time, they immediately showed a knowledge of bartering, and sold some fish they had (amongst which was an extraordinary flounder, spotted like porphyry; and a cream-coloured eel, spotted with black), for small nails, of which they were immoderately fond, and called them *goore*. But, indeed, they caught, with the greatest avidity, bits of paper, or anything else that was thrown to them; and if what was thrown fell into the sea, they made no scruple to swim after it.

These people seemed to differ as much in person, as in disposition, from the natives of Watecoo; though the distance between the two islands is not very great. Their colour was of a deeper cast; and several had a fierce, rugged aspect, resembling the natives of New

Zealand; but some were fairer. They had strong black hair, which, in general, they wore either hanging loose about the shoulders, or tied in a bunch on the crown of the head. Some, however, had it cropped pretty short; and, in two or three of them, it was of a brown or reddish colour. Their only covering was a narrow piece of mat, wrapped several times round the lower part of the body, and which passed between the thighs; but a fine cap of red feathers was seen lying in one of the canoes. The shell of a pearl-oyster polished, and hung about the neck, was the only ornamental fashion that we observed amongst them; for not one of them had adopted that mode of ornament, so generally prevalent amongst the natives of this Ocean, of puncturing, or *tattooing* their bodies. Though singular in this, we had the most unequivocal proofs of their being of the same common race. Their language approached still nearer to the dialect of Otaheite, than that of Watecoo, or Mangea. Like the inhabitants of these two islands, they inquired from whence our ships came; and whither bound; who was our chief; the number of our men on board; and even the ship's name. And they very readily answered such questions as we proposed to them. Amongst other things, they told us they had seen two great ships, like ours, before; but that they had not spoken with them as they sailed past. There can be no doubt, that these were the *Resolution* and *Adventure*. We learned from them, that the name of their island is *Teronggemon Atooa*; and that they were subject to *Teerevatooeah*, king of Watecoo*. According to the account that they gave, their articles of food are cocoa-nuts, fish, and turtle; the island not producing plantains, or bread-fruit; and being destitute of hogs and dogs. Their canoes, of which near thirty were at one time in sight, are pretty large and well built. In the construction of the stern, they bear some resemblance to those of Watecoo; and the head projects out nearly in the same manner; but the extremity is turned up instead of down.

Having but very little wind, it was one o'clock before we drew near the north-west part of the island; the only part where there seemed to be any probability of finding anchorage for our ships, or a landing-place for our boats. In this position, I sent Lieutenant King, with two armed boats, to sound and reconnoitre the coast, while we stood off and on with the ships. The instant the boats were hoisted out, our visitors in the canoes, who had remained alongside all the while, bartering their little trifles, suspended their traffic, and pushing for the shore as fast as they could, came near us no more. At three o'clock, the boats returned; and Mr. King informed me, "That there was no anchorage for the ships; and that the boats could only land on the outer edge of the reef, which lay about a quarter of a mile from the dry land. He said, that a number of the natives came down upon the reef, armed with long pikes and clubs, as if they intended to oppose his landing. And yet when he drew near enough, they threw some cocoa-nuts to our people, and invited them to come on shore; though, at the very same time, he observed, that the women were very busy bringing down a fresh supply of spears and darts. But, as he had no motive to land, he did not give them an opportunity to use them."

Having received this report, I considered, that, as the ships could not be brought to an anchor, we should find that the attempt to procure grass here would occasion much delay, as well as be attended with some danger. Besides, we were equally in want of water; and though the inhabitants had told us that there was water on their island, yet we neither knew in what quantity, nor from what distance we might be obliged to fetch it. And, after all, supposing no other obstruction, we were sure that to get over the reef would be an operation equally difficult and tedious. Being thus disappointed at all the islands we had met with since our leaving New Zealand, and the unfavourable winds, and other unforeseen circumstances, having unavoidably retarded our progress so much, it was now impossible to think of doing anything this year, in the high latitudes of the northern hemisphere, from which we were still at so great a distance, though the season for our operations there was already begun. In this situation, it was absolutely necessary to pursue such measures as were most likely to preserve the cattle we had on board, in the first place; and, in the next place (which was still a more capital object), to save the stores and provisions of the ships, that we might

* The reader will observe, that this name bears little affinity to any one of the names of the three chiefs of Watecoo, as preserved by Mr. Anderson.

be better enabled to prosecute our northern discoveries, which could not now commence till a year later than was originally intended.

If I had been so fortunate as to have procured a supply of water, and of grass, at any of the islands we had lately visited, it was my purpose to have stood back to the south, till I had met with a westerly wind. But the certain consequence of doing this without such a supply, would have been the loss of all the cattle, before we could possibly reach Otaheite, without gaining any one advantage with regard to the great object of our voyage. I therefore determined to bear away for the Friendly Islands, where I was sure of meeting with abundance of everything I wanted, and it being necessary to run in the night as well as in the day, I ordered Captain Clerke to keep about a league ahead of the *Resolution*. I used this precaution, because his ship could best claw off the land, and it was very possible we might fall in with some in our passage.

The longitude of Hervey's Island, when first discovered, deduced from Otaheite, by the time-keeper, was found to be $201^{\circ} 6'$ E., and now, by the same time-keeper, deduced from Queen Charlotte's Sound, $200^{\circ} 34'$ E. Hence I conclude, that the error of the time-keeper, at this time, did not exceed twelve miles in longitude.

When we bore away, I steered west by south, with a fine breeze easterly. I proposed to proceed first to Middleburgh, or Eoon, thinking, if the wind continued favourable, that we had food enough on board for the cattle, to last till we should reach that island. But about noon next day, those faint breezes, that had attended and retarded us so long, again returned, and I found it necessary to haul more to the north, to get into the latitude of Palmerston's and Savage Islands, discovered in 1774, during my last voyage, that if necessity required it, we might have recourse to them. This day, in order to save our water, I ordered the still to be kept at work, from six o'clock in the morning to four in the afternoon, during which time we procured from thirteen to sixteen gallons of fresh water. There has been lately made some improvement, as they are pleased to call it, of this machine, which, in my opinion, is much for the worse.

These light breezes continued till the 10th, when we had for some hours the wind blowing fresh from the north, and north-north-west, being then in the latitude of $18^{\circ} 38'$, and longitude $198^{\circ} 24'$ E. In the afternoon, we had some thunder squalls from the south, attended with heavy rain, of which water we collected enough to fill five puncheons. After these squalls had blown over, the wind came round to the north-east and north-west; being very unsettled both in strength and in position, till about noon the next day, when it fixed at north-west and north-north-west, and blew a fresh breeze with fair weather. Thus were we persecuted with a wind in our teeth whichever way we directed our course, and we had the additional mortification to find here those very winds which we had reason to expect 8° or 10° farther south. They came too late; for I durst not trust their continuance, and the event proved that I judged right. At length, at daybreak, in the morning of the 13th, we saw Palmerston Island, bearing west by south, distant about five leagues. However, we did not get up with it till eight o'clock the next morning. I then sent four boats, three from the *Resolution*, and one from the *Discovery*, with an officer in each, to search the coast for the most convenient landing-place. For now we were under an absolute necessity of procuring from this island some food for the cattle, otherwise we must have lost them.

What is comprehended under the name of Palmerston's Island is a group of small islets, of which there are, in the whole, nine or ten, lying in a circular direction, and connected together by a reef of coral rocks. The boats first examined the south-easternmost of the islets which compose this group, and failing there, ran down to the second, where we had the satisfaction to see them land. I then bore down with the ships till abreast of the place, and there we kept standing off and on; for no bottom was to be found to anchor upon, which was not of much consequence, as the party who had landed from our boats were the only human beings upon the island. About one o'clock one of the boats came on board, laden with scurvy-grass and young cocoa-nut trees, which at this time was a feast for the cattle. The same boat brought a message from Mr. Gore, who commanded the party informing me that there was plenty of such produce upon the island, as also of the *ucharra* tree, and some cocoa-nuts. This determined me to get a good supply of these articles before

I quitted this station; and before evening I went ashore in a small boat, accompanied by Captain Clerke.

We found everybody hard at work, and the landing-place to be in a small creek, formed by the reef, of something more than a boat's length in every direction, and covered from the force of the sea by rocks projecting out on each side of it. The island is scarcely a mile in circuit, and not above three feet higher than the level of the sea. It appeared to be composed entirely of a coral sand, with a small mixture of blackish mould, produced from rotten vegetables. Notwithstanding this poor soil, it is covered with trees and bushes of the same kind as at Wenoa-ctte, though with less variety; and amongst these are some cocoa-palms. Upon the trees or bushes that front the sea, or even farther in, we found a great number of men-of-war birds, tropic-birds, and two sorts of boobies, which at this time were laying their eggs, and so tame, that they suffered us to take them off with our hands. Their nests were only a few sticks loosely put together, and the tropic-birds laid their eggs on the ground, under the trees. These differ much from the common sort, being entirely of a most splendid white, slightly tinged with red, and having the two long tail-feathers of a deep crimson or blood colour. Of each sort our people killed a considerable number, and though not the most delicate food, they were acceptable enough to us, who had been long confined on a salt diet, and who, consequently, could not but be glad of the most indifferent variety. We met with vast numbers of red crabs creeping about everywhere amongst the trees, and we caught several fish that had been left in holes upon the reef when the sea retired.

At one part of the reef which looks into or bounds the lake that is within, there was a large bed of coral, almost even with the surface, which afforded, perhaps, one of the most enchanting prospects that nature has anywhere produced. Its base was fixed to the shore, but reached so far in that it could not be seen; so that it seemed to be suspended in the water, which deepened so suddenly, that at the distance of a few yards, there might be seven or eight fathoms. The sea was, at this time, quite unruffled; and the sun, shining bright, exposed the various sorts of coral, in the most beautiful order; some parts branching into the water with great luxuriance; others lying collected in round balls, and in various other figures; all which were greatly heightened by spangles of the richest colours, that glowed from a number of large clams, which were everywhere interspersed. But the appearance of these was still inferior to that of the multitude of fishes that glided gently along, seemingly with the most perfect security. The colours of the different sorts were the most beautiful that can be imagined; the yellow, blue, red, black, &c., far exceeding anything that art can produce. Their various forms, also, contributed to increase the richness of this submarine grotto, which could not be surveyed without a pleasing transport, mixed, however, with regret, that a work so stupendously elegant should be concealed in a place where mankind could seldom have an opportunity of rendering the praises justly due to so enchanting a scene.

There were no traces of inhabitants having ever been here; if we except a small piece of a canoe that was found upon the beach, which, probably, may have drifted from some other island. But what is pretty extraordinary, we saw several small brown rats on this spot; a circumstance, perhaps, difficult to account for, unless we allow that they were imported in the canoe of which we saw the remains. After the boats were laden, I returned on board, leaving Mr. Gore, with a party, to pass the night on shore, in order to be ready to go to work early the next morning. That day, being the 15th, was accordingly spent, as the preceding one had been, in collecting and bringing on board food for the cattle, consisting chiefly of palm-cabbage, young cocoa-nut trees, and the tender branches of the wharra-tree. Having got a sufficient supply of these by sunset, I ordered everybody on board. But having little or no wind, I determined to wait, and to employ the next day, by endeavouring to get some cocoa-nuts for our people, from the next island to leeward, where we could observe that those trees were in much greater abundance, than upon that where we had already landed, and where only the wants of our cattle had been relieved.

With this view, I kept standing off and on, all night; and, in the morning, between eight and nine o'clock, I went with the boats to the west side of the island, and landed with

little difficulty. I immediately set the people with me to work, to gather cocoa-nuts, which we found in great abundance. But to get them to our boats was a tedious operation; for we were obliged to carry them at least half a mile over the reef, up to the middle in water. Omai, who was with me, caught, with a scoop net, in a very short time, as much fish as served the whole party on shore for dinner, besides sending some to both ships. Here were also great abundance of birds, particularly men-of-war and tropic-birds; so that we fared sumptuously. And it is but doing justice to Omai to say, that, in these excursions to the uninhabited islands, he was of the greatest use. For he not only caught the fish, but dressed these, and the birds we killed, in an oven, with heated stones, after the fashion of his country, with a dexterity and good-humour that did him great credit. The boats made two trips before night well laden; with the last I returned on board, leaving Mr. Williamson, my third lieutenant, with a party of men, to prepare another lading for the boats, which I proposed to send next morning. I accordingly despatched them at seven o'clock, and they returned laden by noon. No time was lost in sending them back for another cargo; and they carried orders for everybody to be on board by sunset. This being complied with, we hoisted in the boats, and made sail to the westward, with a light air of wind from the north.

We found this islet near a half larger than the other, and almost entirely covered with cocoa-palms; the greatest part of which abounded with excellent nuts, having often both old and young on the same tree. They were, indeed, too thick in many places to grow with freedom. The other productions were, in general, the same as at the first islet. Two pieces of board, one of which was rudely carved, with an elliptical paddle, were found on the beach. Probably, these had belonged to the same canoe, the remains of which were seen on the other beach, as the two islets are not above half a mile apart. A young turtle had also been lately thrown ashore here, as it was still full of maggots. There were fewer crabs than at the last place; but we found some scorpions, a few other insects, and a greater number of fish upon the reefs. Amongst these were some large eels, beautifully spotted, which, when followed, would raise themselves out of the water, and endeavour, with an open mouth, to bite their pursuers. The other sorts were chiefly parrot-fish, snappers, and a brown spotted rock-fish, about the size of a haddock, so tame, that, instead of swimming away, it would remain fixed, and gaze at us. Had we been in absolute want, a sufficient supply might have been had; for thousands of the clams already mentioned stuck upon the reef, some of which weighed two or three pounds. There were, besides, some other sorts of shell-fish, particularly the large periwinkle. When the tide flowed, several sharks came in over the reef, some of which our people killed; but they rendered it rather dangerous to walk in the water at that time. The party who were left on shore with Mr. Williamson were a good deal pestered (as Mr. Gore's had been) with mosquitoes in the night. Some of them, in their excursions, shot two curlews, exactly like those of England, and saw some plovers or sandpipers upon the shore; but in the wood, no other bird beside one or two of the cuckoos that were seen at Wenooa-ette.

Upon the whole, we did not spend our time unprofitably at this islet; for we got there about twelve hundred cocoa-nuts, which were equally divided amongst the whole crew; and were, doubtless, of great use to them, both on account of the juice and of the kernel. A ship, therefore, passing this way, if the weather be moderate, may expect to succeed as we did. But there is no water upon either of the islets where we landed. Were that article to be had, and a passage could be got into the lake, as we may call it, surrounded by the reef, where a ship could anchor, I should prefer this to any of the inhabited islands, if the only want were refreshment: for the quantity of fish that might be procured would be sufficient; and the people might roam about unmolested by the petulance of any inhabitants. The nine or ten low islets comprehended under the name of Palmerston's Island, may be reckoned the heads or summits of the reef of coral rock that connects them together, covered only with a thin coat of sand, yet clothed, as already observed, with trees and plants; most of which are of the same sorts that are found on the low grounds of the high islands of this ocean.

There are different opinions amongst ingenious theorists concerning the formation of such

low islands as Palmerston's. Some will have it, that in remote times these little separate heads or islets were joined, and formed one continued and more elevated tract of land, which the sea, in the revolution of ages, has washed away, leaving only the higher grounds, which, in time, also, will, according to this theory, share the same fate. Another conjecture is, that they have been thrown up by earthquakes, and are the effect of internal convulsions of the globe. A third opinion, and which appears to me as the most probable one, maintains that they are formed from shoals, or coral banks, and of consequence increasing. Without mentioning the several arguments made use of in support of each of these systems, I shall only describe such parts of Palmerston's Island as fell under my own observation when I landed upon it.

The foundation is, everywhere, a coral rock; the soil is coral sand, with which the decayed vegetables have, but in a few places, intermixed, so as to form anything like mould. From this a very strong presumption may be drawn, that these little spots of land are not of very ancient date, nor the remains of larger islands now buried in the ocean. For, upon either of these suppositions, more mould must have been formed, or some part of the original soil would have remained. Another circumstance confirmed this doctrine of the increase of these islets. We found upon them, far beyond the present reach of the sea, even in the most violent storms, elevated coral rocks, which, on examination, appeared to have been perforated in the same manner that the rocks are that now compose the outer edge of the reef. This evidently shows that the sea had formerly reached so far; and some of these perforated rocks were almost in the centre of the land.

But the strongest proof of the increase, and from the cause we have assigned, was the gentle gradation observable in the plants round the skirts of the islands; from within a few inches of high-water mark, to the edge of the wood. In many places, the divisions of the plants, of different growths, were very distinguishable, especially on the lee, or west side. This I apprehend to have been the operation of extraordinary high tides, occasioned by violent, accidental gales from the westward; which have heaped up the sand beyond the reach of common tides. The regular and gentle operation of these latter, again, throw up sand enough to form a barrier against the next extraordinary high tide, or storm, so as to prevent its reaching as far as the former had done, and destroying the plants that may have begun to vegetate from cocoa-nuts, roots, and seed brought thither by birds, or thrown up by the sea. This, doubtless, happens very frequently; for we found many cocoa-nuts, and some other things, just sprouting up, only a few inches beyond where the sea reaches at present, in places where, it was evident, they could not have had their origin from those, farther in, already arrived at their full growth. At the same time, the increase of vegetables will add fast to the height of this new-created land; as the fallen leaves and broken branches are, in such a climate, soon converted into a true black mould, or soil*.

Perhaps there is another cause, which, if allowed, will accelerate the increase of these islands as much as any other, and will also account for the sea having receded from those elevated rocks before mentioned. This is, the spreading of the coral bank, or reef, into the sea; which, in my opinion, is continually, though imperceptibly, affected. The waves receding, as the reef grows in breadth and height, leave a dry rock behind, ready for the reception of the broken coral and sand, and every other deposit necessary for the formation of land fit for the vegetation of plants. In this manner, there is little doubt, that, in time, the whole reef will become one island; and, I think, it will extend gradually inward, either from the increase of the islets already formed, or from the formation of new ones, upon the

* Mr. Anderson, in his journal, mentions the following particulars, relative to Palmerston's Island, which strongly confirm Captain Cook's opinion about its formation. "On the last of the two islets, where we landed, the trees being in great numbers, had already formed, by their rotten parts, little risings or eminences, which, in time, from the same cause, may become small hills. Whereas, on the first islet, the trees being less numerous, no such thing had as yet happened. Nevertheless, on that little spot, the manner of formation was more plainly

pointed out. For, adjoining to it, was a small isle, which had, doubtless, been very lately formed; as it was not, as yet, covered with any trees, but had a great many shrubs, some of which were growing among pieces of coral, that the sea had thrown up. There was still a more sure proof of this method of formation a little farther on, where two patches of sand, about fifty yards long, and a foot or eighteen inches high, lay upon the reef, but not, as yet, furnished with a single bush or tree."

beds of coral, within the inclosed lake, if once they increase so as to rise above the level of the sea*.

After leaving Palmerston's Island, I steered west, with a view to make the best of my way to Annamooka. We still continued to have variable winds, frequently between the north and west, with squalls, some thunder, and much rain. During these showers, which were generally very copious, we saved a considerable quantity of water; and finding that we could get a greater supply by the rain, in one hour, than we could get by distillation in a month, I laid aside the still, as a thing attended with more trouble than profit. The heat, which had been great for about a month, became now much more disagreeable in this close rainy weather; and, from the moisture attending it, threatened soon to be noxious; as the ships could not be kept dry, nor the skuttles open, for the sea. However, it is remarkable enough, that though the only refreshment we had received, since leaving the Cape of Good Hope, was that at New Zealand, there was not, as yet, a single person on board sick from the constant use of salt food, or vicissitude of climate.

In the night between the 24th and 25th we passed Savage Island, which I had discovered in 1774; and on the 28th, at ten o'clock in the morning, we got sight of the islands which lie to the eastward of Annamooka, bearing north by west, about four or five leagues distant. I steered to the south of these islands, and then heeled up for Annamooka; which, at four in the afternoon, bore north-west by north, Pallafajera south-west by south, and Komango north by west, distant about five miles. The weather being squally, with rain, I anchored, at the approach of night, in fifteen fathoms deep water, over a bottom of coral, sand, and shells; Komango bearing north-west, about two leagues distant.

CHAPTER IV.—INTERCOURSE WITH THE NATIVES OF KOMANGO, AND OTHER ISLANDS.—ARRIVAL AT ANNAMOOKA.—TRANSACTIONS THERE.—FEENOU, A PRINCIPAL CHIEF, FROM TONGATABOO, COMES ON A VISIT.—THE MANNER OF HIS RECEPTION IN THE ISLAND, AND ON BOARD.—INSTANCES OF THE PILFERING DISPOSITION OF THE NATIVES.—SOME ACCOUNT OF ANNAMOOKA.—THE PASSAGE FROM IT TO HAPAREE.

Soon after we had anchored, two canoes, the one with four, and the other with three men, paddled towards us, and came alongside without the least hesitation. They brought some cocoa-nuts, bread-fruit, plantains, and sugar-cane, which they bartered with us for nails. One of the men came on board; and when these canoes had left us, another visited us; but did not stay long, as night was approaching. Komango, the island nearest to us, was at least five miles off; which shows the hazard these people would run, in order to possess a few of our most trifling articles. Besides this supply from the shore, we caught this evening, with hooks and lines, a considerable quantity of fish. Next morning, at four o'clock, I sent Lieutenant King, with two boats, to Komango, to procure refreshments; and, at five,

* Mr. Darwin has offered an explanation of the formation of coral reefs, much more satisfactory than any which has been hitherto attempted. For a full detail of the facts and reasoning by which he supports his theory, we must refer our readers to his very interesting paper, read before the Geological Society, May 1837, and reprinted in the third volume of the *Surveying Voyage of the Adventure and the Beagle*, p. 554, *et seq.*; we cannot here do more than briefly notice the conclusions which he draws from the observations he made whilst accompanying Captain Fitzroy in his circumnavigation of the globe. The coral insect never works at a greater depth than twenty fathoms, and dies if exposed to the sun and air. The range of its labours then are confined between that depth and the line of low water at neap tides. But the coral reefs sink at once on the side next the ocean to a depth often un-fathomable, and invariably very profound, and on the inner side are frequently found almost equally abrupt. Mr. Darwin supposes that these reefs, whether forming

Lagoon islands as at the Palmerston Islands, encircling bands as at Tahiti, or barriers as on the north-east coast of New Holland, are occasioned by the gradual sinking of the mainland, during which process the coral insect still builds upward. In the Lagoon islands the land has totally disappeared, but the accumulation of broken fragments and sand on the top of the reef, together with the vegetation which takes place there from seeds cast up by the sea, gradually form a circle of islands, while the labours of the more delicate coral insect help to fill up the lagoons, and the more vigorous species, who only flourish in the surf, repair the ravages of the never-ceasing waves. In the encircled islands, and in barrier reefs, the distance between the in-land and the reef marks the process of decadence of the former; in stationary coasts the coral is found at precisely the distance from the shore which is most favourable for its growth; while in other cases, coral rock elevated above high-water mark shows that the land there has been raised beyond its former level.—Eo.

made the signal to weigh, in order to ply up to Annamooka, the wind being unfavourable at north-west.

It was no sooner daylight, than we were visited by six or seven canoes from different islands, bringing with them, besides fruits and roots, two pigs, several fowls, some large wood-pigeons, small rails, and large violet-coloured coots. All these they exchanged with us for beads, nails, hatchets, &c. They had also other articles of commerce; such as pieces of their cloth, fish-hooks, small baskets, musical reeds, and some clubs, spears, and bows. But I ordered that no curiosities should be purchased, till the ships should be supplied with provisions, and leave given for that purpose. Knowing, also, from experience, that if all our people might trade with the natives according to their own caprice, perpetual quarrels would ensue, I ordered that particular persons should manage the traffic both on board and on shore, prohibiting all others to interfere. Before mid-day, Mr. King's boat returned with seven hogs, some fowls, a quantity of fruit and roots for ourselves, and some grass for the cattle. His party was very civilly treated at Komango. The inhabitants did not seem to be numerous; and their huts, which stood close to each other, within a plantain walk, were but indifferent. Not far from them, was a pretty large pond of fresh water, tolerably good; but there was not any appearance of a stream. With Mr. King, came on board the chief of the island, named Tooboulangee; and another, whose name was Taipa. They brought with them a hog as a present to me, and promised more the next day.

As soon as the boats were aboard, I stood for Annamooka; and the wind being scant, I intended to go between Annamooka-ette* and the breakers to the south-east of it. But, on drawing near, we met with very irregular soundings, varying every cast, ten or twelve fathoms. This obliged me to give up the design, and to go to the southward of all; which carried us to leeward, and made it necessary to spend the night under sail. It was very dark; and we had the wind, from every direction, accompanied with heavy showers of rain. So that, at daylight the next morning, we found ourselves much farther off than we had been the evening before; and the little wind that now blew was right in our teeth. We continued to ply, all day, to very little purpose; and, in the evening, anchored in thirty-nine fathoms water; the bottom, coral rocks and broken shells; the west point of Annamooka bearing E.N.E., four miles distant. Tooboulangee and Taipa kept their promise, and brought off to me some hogs. Several others were also procured by bartering, from different canoes that followed us; and as much fruit as we could well manage. It was remarkable, that, during the whole day, our visitors from the islands would hardly part with any of their commodities to anybody but me. Captain Clerke did not get above one or two hogs.

At four o'clock next morning, I ordered a boat to be hoisted out, and sent the master to sound the south-west side of Annamooka; where there appeared to be a harbour, formed by the island on the north-east, and by small islets and shoals, to the south-west and south-east. In the mean time the ships were got under sail, and wrought up to the island. When the master returned, he reported, that he had sounded between Great and Little Annamooka, where he found ten and twelve fathoms depth of water, the bottom coral sand; that the place was very well sheltered from all winds; but that there was no fresh water to be found, except at some distance inland; and that, even there, little of it was to be got, and that little not good. For this reason only, and it was a very sufficient one, I determined to anchor on the north side of the island, where, during my last voyage, I had found a place fit both for watering and landing.

It was not above a league distant; and yet we did not reach it till five o'clock in the afternoon, being considerably retarded by the great number of canoes that continually crowded round the ships, bringing to us abundant supplies of the produce of their island. Amongst these canoes, there were some double ones, with a large sail, that carried between forty and fifty men each. These sailed round us apparently with the same ease as if we had been at anchor. There were several women in the canoes, who were, perhaps, incited by curiosity to visit us; though, at the same time, they bartered as eagerly as the men, and used the paddle with equal labour and dexterity. I came to an anchor in eighteen

* That is, Little Annamooka.

fathoms water, the bottom coarse coral sand; the island extending from east to south-west; and the west point of the westernmost cove south-east, about three quarters of a mile distant. Thus I resumed the very same station which I had occupied when I visited Annamooka three years before; and, probably, almost in the same place where Tasman, the first discoverer of this, and some of the neighbouring islands, anchored in 1643*.

The following day, while preparations were making for watering, I went ashore, in the forenoon, accompanied by Captain Clerke, and some of the officers, to fix on a place where the observatories might be set up, and a guard be stationed; the natives having readily given us leave. They also accommodated us with a boat-house, to serve as a tent, and showed us every other mark of civility. Toobon, the chief of the island, conducted me and Omai to his house. We found it situated on a pleasant spot, in the centre of his plantation. A fine grass plot surrounded it, which, he gave us to understand, was for the purpose of cleaning their feet, before they went within doors. I had not before observed such an instance of attention to cleanliness at any of the places I had visited in this ocean; but afterward found that it was very common at the Friendly Islands. The floor of Toobon's house was covered with mats; and no carpet in the most elegant English drawing-room could be kept neater. While we were on shore, we procured a few hogs, and some fruit, by bartering; and, before we got on board again, the ships were crowded with the natives. Few of them coming empty-handed, every necessary refreshment was now in the greatest plenty. I landed again in the afternoon, with a party of marines; and, at the same time, the horses, and such of the

VIEW IN ANNAMOOKA.

cattle as were in a weakly state, were sent on shore. Everything being settled to my satisfaction, I returned to the ship at sunset, leaving the command upon the island to Mr. King. Taipa, who was now become our fast friend, and who seemed to be the only active person about us, in order to be near our party in the night, as well as the day, had a house brought on men's shoulders a full quarter of a mile, and placed close to the shed which our party occupied.

Next day the various operations on shore began. Some were employed in making hay for the cattle; others, in filling our water-casks at the neighbouring stagnant pool; and

* See Tasman's account of this island, in Mr. Dairymple's valuable Collection of Voyages to the Pacific Ocean, vol. ii. p. 79, 80. The few particulars mentioned by

Tasman agree remarkably with Captain Cook's more extended relation.

a third party in cutting wood. The greatest plenty of this last article being abreast of the ships, and in a situation the most convenient for getting it on board, it was natural to make choice of this. But the trees here, which our people erroneously supposed to be manchineel, but were a species of pepper, called *faitanoo* by the natives, yielded a juice of a milky colour, of so corrosive a nature, that it raised blisters on the skin, and injured the eyes of our workmen. They were, therefore, obliged to desist at this place, and remove to the cove, in which our guard was stationed, and where we embarked our water. Other wood, more suitable to our purposes, was there furnished to us by the natives. These were not the only employments we were engaged in, for Messrs. King and Bayly began this day to observe equal altitudes of the sun, in order to get the rate of the time-keepers. In the evening, before the natives retired from our post, Taipa harangued them for some time. We could only guess at the subject; and judged, that he was instructing them how to behave toward us, and encouraging them to bring the produce of the island to market. We experienced the good effects of his eloquence, in the plentiful supply of provisions which, next day, we received.

Nothing worth notice happened on the 4th and 5th, except that, on the former of these days, the *Discovery* lost her small bower anchor, the cable being cut in two by the rocks. This misfortune made it necessary to examine the cables of the *Resolution*, which were found to be unburnt. On the 6th we were visited by a great chief from Tongataboo, whose name was Feenou, and whom Taipa was pleased to introduce to us as king of all the Friendly Isles. I was now told, that on my arrival, a canoe had been despatched to Tongataboo with the news; in consequence of which, this chief immediately passed over to Annamooka. The officer on shore informed me, that when he first arrived, all the natives were ordered out to meet him, and paid their obeisance by bowing their heads as low as his feet, the soles of which they also touched with each hand, first with the palm, and then with the back part. There could be little room to suspect that a person, received with so much respect, could be anything less than the king.

In the afternoon, I went to pay this great man a visit, having first received a present of two fish from him, brought on board by one of his servants. As soon as I landed, he came up to me. He appeared to be about thirty years of age, tall but thin, and had more of the European features than any I had yet seen here. When the first salutation was over, I asked if he was the king; for, notwithstanding what I had been told, finding he was not the man whom I remembered to have seen under that character during my former voyage, I began to entertain doubts. Taipa officiously answered for him, and enumerated no less than one hundred and fifty-three islands, of which, he said, Feenou was the sovereign. After a short stay, our new visitor, and five or six of his attendants, accompanied me on board. I gave suitable presents to them all, and entertained them in such a manner as I thought would be most agreeable.

In the evening, I attended them on shore in my boat, into which the chief ordered three hogs to be put, as a return for the presents he had received from me. I was now informed of an accident which had just happened, the relation of which will convey some idea of the extent of the authority exercised here over the common people. While Feenou was on board my ship, an inferior chief, for what reason our people on shore did not know, ordered all the natives to retire from the post we occupied. Some of them having ventured to return, he took up a large stick and beat them most unmercifully. He struck one man, on the side of the face, with so much violence, that the blood gushed out of his mouth and nostrils; and, after lying some time motionless, he was at last removed from the place in convulsions. The person who had inflicted the blow, being told that he had killed the man, only laughed at it; and it was evident that he was not in the least sorry for what had happened. We heard, afterward, that the poor sufferer recovered. The *Discovery* having found again her small bower anchor, shifted her berth on the 7th; but not before her best bower cable had shared the fate of the other. This day, I had the company of Feenou at dinner; and also the next day, when he was attended by Taipa, Toobou, and some other chiefs. It was remarkable, that none but Taipa was allowed to sit at table with him, or even to eat in his presence. I own that I considered Feenou as a very convenient guest, on account of this etiquette. For

before his arrival, I had generally a larger company than I could well find room for, and my table overflowed with crowds of both sexes. For it is not the custom at the Friendly Islands, as it is at Otaheite, to deny to their females the privilege of eating in company with the men.

The first day of our arrival at Annamooka, one of the natives had stolen out of the ship a large junk axe. I now applied to Feenou to exert his authority to get it restored to me; and so implicitly was he obeyed, that it was brought on board while we were at dinner. These people gave us very frequent opportunities of remarking what expert thieves they were. Even some of their chiefs did not think this profession beneath them. On the 9th, one of them was detected carrying out of the ship, concealed under his clothes, the bolt belonging to the spun-yarn winch, for which I sentenced him to receive a dozen lashes, and kept him confined till he paid a hog for his liberty. After this we were not troubled with thieves of rank. Their servants, or slaves however, were still employed in this dirty work; and upon them a flogging seemed to make no greater impression than it would have done upon the mainmast. When any of them happened to be caught in the act, their masters, far from interceding for them, would often advise us to kill them. As this was a punishment we did not choose to inflict, they generally escaped without any punishment at all; for they appeared to us to be equally insensible of the shame and of the pain of corporal chastisement. Captain Clerke at last hit upon a mode of treatment which we thought had some effect. He put them under the hands of the barber, and completely shaved their heads; thus pointing them out as objects of ridicule to their countrymen, and enabling our people to deprive them of future opportunities for a repetition of their rogueries, by keeping them at a distance.

Feenou was so fond of associating with us, that he dined on board every day, though sometimes he did not partake of our fare. On the 10th, some of his servants brought a mess which had been dressed for him on shore. It consisted of fish, soup, and yams. Instead of common water to make the soup, cocoa-nut liquor had been made use of, in which the fish had been boiled or stewed, probably in a wooden vessel with hot stones; but it was carried on board in a plantain leaf. I tasted of the mess, and found it so good, that I afterwards had some fish dressed in the same way. Though my cook succeeded tolerably well, he could produce nothing equal to the dish he imitated.

Finding that we had quite exhausted the island of almost every article of food that it afforded, I employed the 11th in moving off from the shore the horses, observatories, and other things that we had landed, as also the party of marines who had mounted guard at our station, intending to sail as soon as the *Discovery* should have recovered her best bower anchor. Feenou understanding that I meant to proceed directly to Tongatabu, importuned me strongly to alter this plan, to which he expressed as much aversion as if he had some particular interest to promote by diverting me from it. In preference to it, he warmly recommended an island, or rather a group of islands, called Hapae, lying to the north-east. There he assured us we could be supplied plentifully with every refreshment in the easiest manner; and to add weight to his advice, he engaged to attend us thither in person. He carried his point with me; and Hapae was made choice of for our next station. As it had never been visited by any European ships, the examination of it became an object with me. The 12th and the 13th were spent in attempting the recovery of Captain Clerke's anchor, which, after much trouble, was happily accomplished; and on the 14th in the morning we got under sail, and left Annamooka.

This island is somewhat higher than the other small isles that surround it; but still it cannot be admitted to the rank of those of a moderate height, such as Mangea and Watereo. The shore, at that part where our ships lay, is composed of a steep, rugged coral rock, nine or ten feet high, except where there are two sandy beaches, which have a reef of the same sort of rock extending across their entrance to the shore, and defending them from the sea. The salt-water lake that is in the centre of the island is about a mile and a half broad; and round it the land rises like a bank, with a gradual ascent. But we could not trace its having any communication with the sea; and yet the land that runs across to it from the largest sandy beach being flat and low, and the soil sandy, it is most likely that it may have formerly

communicated that way. The soil on the rising parts of the island, and especially toward the sea, is either of a reddish clayey disposition, or a black loose mould ; but there is nowhere any stream of fresh water.

The island is very well cultivated, except in a few places ; and there are some others which, though they appear to lie waste, are only left to recover the strength exhausted by constant culture ; for we frequently saw the natives at work upon these spots to plant them again. The plantations consist chiefly of yams and plantains. Many of them are very extensive, and often inclosed with neat fences of reed, disposed obliquely across each other, about six feet high. Within these we often saw other fences of less compass surrounding the houses of the principal people. The bread-fruit and cocoa-nut trees are interspersed with little order, but chiefly near the habitations of the natives ; and the other parts of the island, especially toward the sea, and about the sides of the lake, are covered with trees and bushes of a most luxuriant growth ; the last place having a great many mangroves, and the first a vast number of the *faitanoo* trees already mentioned. There seem to be no rocks or stones of any kind about the island that are not coral, except in one place to the right of the sandy beach, where there is a rock twenty or thirty feet high, of a calcareous stone of a yellowish colour, and a very close texture. But even about that place, which is the highest part of the land, are large pieces of the same coral rock that composes the shore.

Besides walking frequently up into the country, which we were permitted to do without interruption, we sometimes amused ourselves in shooting wild ducks, not unlike the widgeon, which are very numerous upon the salt lake and the pool where we got our water. In these excursions we found the inhabitants had often deserted their houses to come down to the trading place, without entertaining any suspicion that strangers rambling about would take away or destroy anything that belonged to them. But though, from this circumstance, it might be supposed that the greater part of the natives were sometimes collected at the beach, it was impossible to form any accurate computation of their number, as the continual resort of visitors from other islands mixing with them might easily mislead one. However, as there was never to appearance above a thousand persons collected at one time, it would perhaps be sufficient to allow double that number for the whole island.

To the north and north-east of Annamooka, and in the direct track to Hapaee, whither we were now bound, the sea is sprinkled with a great number of small isles. Amidst the shoals and rocks adjoining to this group, I could not be assured that there was a free or safe passage for such large ships as ours, though the natives sailed through the intervals in their canoes. For this substantial reason, when we weighed anchor from Annamooka, I thought it necessary to go to the westward of the above islands, and steered north-north-west, towards Kao and Toofoa, the two most westerly islands in sight, and remarkable for their great height. Peenon and his attendants remained on board the Resolution till near noon, when he went into the large sailing canoe which had brought him from Tongataboo, and stood in amongst the cluster of islands above mentioned, of which we were now almost abreast, and a tide or current from the westward had set us, since our sailing in the morning, much over toward them.

They lie scattered at unequal distances, and are in general nearly as high as Annamooka, but only from two or three miles to half a mile in length, and some of them scarcely so much. They have either steep rocky shores like Annamooka, or reddish cliffs ; but some have sandy beaches extending almost their whole length. Most of them are entirely clothed with trees, amongst which are many cocoa-palms, and each forms a prospect like a beautiful garden placed in the sea. To heighten this, the serene weather we now had contributed very much ; and the whole might supply the imagination with an idea of some fairy land realised. It should seem, that some of them at least may have been formed as we supposed Palmerston's Island to have been ; for there is one which as yet is entirely sand, and another on which there is only one bush or tree.

At four o'clock in the afternoon, being the length of Kotoo, the westernmost of the above cluster of small islands, we steered to the north, leaving Toofoa and Kao on our larboard, keeping along the west side of a reef of rocks which lie to the westward of Kotoo, till we came to their northern extremity, round which we hauled in for the island. It was our

intention to have anchored for the night, but it came upon us before we could find a place in less than fifty-five fathoms water; and rather than come to in this depth, I chose to spend the night under sail. We had in the afternoon been within two leagues of Tofoa, the smoke of which we saw several times in the day. The Friendly Islanders have some superstitious notions about the volcano upon it, which they call *Kollofee*, and say it is an *Otoou*, or divinity. According to their account, it sometimes throws up very large stones; and they compare the crater to the size of a small islet, which has never ceased smoking in their memory, nor have they any tradition that it ever did. We sometimes saw the smoke rising from the centre of the island while we were at Annamooka, though at the distance of at least ten leagues. Tofoa, we were told, is but thinly inhabited, but the water upon it is good.

At daybreak the next morning, being then not far from Kao, which is a vast rock of a conic figure, we steered to the east for the passage between the islands Footooha and Hafaiva, with a gentle breeze at south-east. About ten o'clock, Feenon came on board, and remained with us all day. He brought with him two hogs and a quantity of fruit; and, in the course of the day, several canoes from the different islands round us came to barter quantities of the latter article, which was very acceptable, as our stock was nearly expended. At noon, our latitude was $19^{\circ} 49' 45''$ S., and we had made seven miles of longitude from Annamooka; Tofoa bore north, 88° W.; Kao, north, 71° W.; Footooha, north, 89° W.; and Hafaiva, south, 12° W.

After passing Footooha, we met with a reef of rocks, and, as there was but little wind, it cost us some trouble to keep clear of them. This reef lies between Footooha and Neeneeva, which is a small low isle in the direction of east-north-east from Footooha, at the distance of seven or eight miles. Footooha is a small island of middling height, and bounded all round by a steep rock. It lies south 67° E., distant six leagues from Kao, and three leagues from Kotoo, in the direction of north 33° E. Being past the reef of rocks just mentioned, we hauled up for Neeneeva, in hopes of finding anchorage, but were again disappointed, and obliged to spend the night in making short boards: for, although we had land in every direction, the sea was unfathomable. In the course of this night we could plainly see flames issuing from the volcano upon Tofoa, though to no great height.

At daybreak in the morning of the 16th, with a gentle breeze at south-east, we steered north-east for Hapae, which was now in sight, and we could judge it to be low land from the trees only appearing above the water. About nine o'clock, we could see it plainly forming three islands nearly of an equal size; and soon after, a fourth to the southward of these, as large as the others. Each seemed to be about six or seven miles long, and of a similar height and appearance. The northernmost of them is called Haanno, the next Foa, the third Lefooga, and the southernmost Hoolaiva; but all four are included by the natives under the general name Hapae.

The wind scanting upon us, we could not fetch the land, so that we were forced to ply to windward. In doing this we once passed over some coral rocks, on which we had only six fathoms water; but the moment we were over them, found no ground with eighty fathoms of line. At this time, the isles of Hapae bore from north, 50° E., to south, 9° W. We got up with the northernmost of these isles by sunset, and there found ourselves in the very same distress for want of anchorage that we had experienced the two preceding evenings; so that we had another night to spend under sail, with land and breakers in every direction. Toward the evening, Feenon, who had been on board all day, went forward to Hapae, and took Omai in the canoe with him. He did not forget our disagreeable situation, and kept up a good fire all night, by way of a land-mark.

As soon as the daylight returned, being then close in with Foa, we saw it was joined to Haanne by a reef running even with the surface of the sea, from the one island to the other. I now despatched a boat to look for anchorage. A proper place was soon found, and we came to abreast of a reef, being that which joins Lefooga to Foa (in the same manner that Foa is joined to Haanne), having twenty-four fathoms depth of water, the bottom coral sand. In this station, the northern point of Hapae, or the north end of Haanno, bore north, 13° E. The southern point of Hapae, or the south end of Hoolaiva, south, 29° W.; and the north end of Lefooga, south, 65° E. Two ledges of rocks lay without us; the one bearing south,

50° W.; and the other west by north one-half north, distant two or three miles. We lay before a creek in the reef, which made it convenient landing at all times, and we were not above three quarters of a mile from the shore.

CHAPTER V.—ARRIVAL OF THE SHIPS AT HAPAE, AND FRIENDLY RECEPTION THERE.—PRESENTS AND SOLEMNITIES ON THE OCCASION.—SINGLE COMBATS WITH CLUBS.—WRESTLING AND BOXING MATCHES.—FEMALE COMBATANTS.—MARINES EXERCISED.—A DANCE PERFORMED BY MEN.—FIREWORKS EXHIBITED.—THE NIGHT ENTERTAINMENTS OF SINGING AND DANCING PARTICULARLY DESCRIBED.

By the time we had anchored, the ships were filled with the natives, and surrounded by a multitude of canoes, filled also with them. They brought from the shore hogs, fowls, fruit, and roots, which they exchanged for hatchets, knives, nails, beads, and cloth. Feenou and Omai having come on board after it was light, in order to introduce me to the people of the island, I soon accompanied them on shore for that purpose, landing at the north part of Lefooga, a little to the right of the ship's station.

The chief conducted me to a house, or rather a hut, situated close to the sea-beach, which I had seen brought thither but a few minutes before for our reception. In this Feenou, Omai, and myself were seated. The other chiefs and the multitude composed a circle on the outside, fronting us, and they also sat down. I was then asked, how long I intended to stay? On my saying five days, Taipa was ordered to come and sit by me, and proclaim this to the people. He then harangued them in a speech mostly dictated by Feenou. The purport of it, as I learned from Omai, was, that they were all, both old and young, to look upon me as a friend, who intended to remain with them a few days; that during my stay they must not steal anything, nor molest me any other way; and that it was expected they should bring hogs, fowls, fruits, &c. to the ships, where they would receive in exchange for them, such and such things, which he enumerated. Soon after Taipa had finished this address to the assembly, Feenou left us. Taipa then took occasion to signify to me, that it was necessary I should make a present to the chief of the island, whose name was Earoupa. I was not unprepared for this, and gave him such articles as far exceeded his expectation. My liberality to him brought upon me demands of the same kind from two chiefs of other isles who were present, and from Taipa himself. When Feenou returned, which was immediately after I had made the last of these presents, he pretended to be angry with Taipa for suffering me to give away so much; but I looked upon this as a mere finesse, being confident that he acted in concert with the others. He now took his seat again, and ordered Earoupa to sit by him, and to harangue the people as Taipa had done, and to the same purpose; dictating, as before, the heads of the speech.

These ceremonies being performed, the chief, at my request, conducted me to three stagnant pools of fresh water, as he was pleased to call it; and, indeed, one of these the water was tolerable, and the situation not inconvenient for filling our casks. After viewing the watering-place, we returned to our former station, where I found a baked hog and some yams, smoking hot, ready to be carried on board for my dinner. I invited Feenou and his friends to partake of it, and we embarked for the ship; but none but himself sat down with us at the table. After dinner I conducted them on shore, and before I returned on board, the chief gave me a fine large turtle and a quantity of yams. Our supply of provisions was copious, for, in the course of the day, we got by barter alongside the ship about twenty small hogs, beside fruit and roots. I was told that, on my first landing in the morning, a man came off to the ships and ordered every one of the natives to go on shore. Probably this was done with a view to have the whole body of inhabitants present at the ceremony of my reception, for when that was over, multitudes of them returned again to the ships.

Next morning early, Feenou and Omai, who scarcely ever quitted the chief, and now slept on shore, came on board. The object of the visit was to require my presence upon the island. After some time I accompanied them, and upon landing was conducted to the same

place where I had been seated the day before, and where I saw a large concourse of people already assembled. I guessed that something more than ordinary was in agitation, but could not tell what, nor could Omai inform me. I had not been long seated, before near a hundred of the natives appeared in sight, and advanced laden with yams, bread-fruit, plantains, cocoa-nuts, and sugar-canes. They deposited their burdens in two heaps or piles upon our left, being the side they came from. Soon after, arrived a number of others from the right, bearing the same kind of articles; which were collected into two piles upon that side. To these were tied two pigs and six fowls, and to those upon the left six pigs and two turtles. Earoupa seated himself before the several articles upon the left, and another chief before those upon the right; they being, as I judged, the two chiefs who had collected them, by order of Feenou, who seemed to be as implicitly obeyed here as he had been at Annamooka; and, in consequence of his commanding superiority over the chiefs of Hapae, had laid his tax upon them for the present occasion.

As soon as this munificent collection of provisions was laid down in order, and disposed to the best advantage, the bearers of it joined the multitude, who formed a large circle round the whole. Presently after a number of men entered this circle or area before us, armed with clubs, made of the green branches of the cocoa-nut-tree. These paraded about for a few minutes, and then retired, the one-half to one side, and the other half to the other side; seating themselves before the spectators. Soon after they successively entered the lists, and entertained us with single combats. One champion, rising up and stepping forward from one side, challenged those of the other side, by expressive gestures more than by words, to send one of their body to oppose him. If the challenge was accepted,

BOXING-MATCH AT HAPAE.

which was generally the case, the two combatants put themselves in proper attitudes, and then began the engagement, which continued till one or other owned himself conquered, or till their weapons were broken. As soon as each combat was over, the victor squatted himself down facing the chief, then rose up and retired. At the same time some old men, who seemed to sit as judges, gave their plaudit in a few words; and the multitude, especially those on the side to which the victor belonged, celebrated the glory he had acquired in two or three huzzas.

This entertainment was now and then suspended for a few minutes. During these intervals

there were both wrestling and boxing matches. The first were performed in the same manner as at Otaheite, and the second differed very little from the method practised in England. But what struck us with most surprise, was to see a couple of lusty wenches step forth and begin boxing, without the least ceremony, and with as much art as the men. This contest, however, did not last above half a minute before one of them gave it up. The conquering heroine received the same applause from the spectators, which they bestowed upon the successful combatants of the other sex. We expressed some dislike at this part of the entertainment, which, however, did not prevent two other females from entering the lists. They seemed to be girls of spirit, and would certainly have given each other a good drubbing, if two old women had not interposed to part them. All these combats were exhibited in the midst of at least three thousand people; and were conducted with the greatest good humour on all sides, though some of the champions, women as well as men, received blows, which, doubtless, they must have felt for some time after.

As soon as these diversions were ended, the chief told me that the heaps of provisions on our right hand were a present to Omai, and that those on our left hand, being about two-thirds of the whole quantity, were given to me. He added, that I might take them on board whenever it was convenient; but that there would be no occasion to set any of our people as guards over them, as I might be assured that not a single cocoa-nut would be taken away by the natives. So it proved, for I left everything behind, and returned to the ship to dinner, carrying the chief with me; and when the provisions were removed on board in the afternoon, not a single article was missing. There was as much as loaded four boats; and I could not but be struck with the munificence of Feenou; for this present far exceeded any I had ever received from any of the sovereigns of the various islands I had visited in the Pacific Ocean. I lost no time in convincing my friend that I was not insensible of his liberality; for before he quitted my ship, I bestowed upon him such of our commodities as I guessed were most valuable in his estimation. And the return I made was so much to his satisfaction, that as soon as he got on shore, he left me still indebted to him, by sending me a fresh present, consisting of two large hogs, a considerable quantity of cloth, and some yams.

Feenou had expressed a desire to see the marines go through their military exercise. As I was desirous to gratify his curiosity, I ordered them all ashore from both ships in the morning of the 20th. After they had performed various evolutions, and fired several volleys, with which the numerous body of spectators seemed well pleased, the chief entertained us, in his turn, with an exhibition which, as was acknowledged by us all, was performed with a dexterity and exactness far surpassing the specimen we had given of our military manoeuvres. It was a kind of dance, so entirely different from anything I had ever seen, that I fear I can give no description that will convey any tolerable idea of it to my readers. It was performed by men, and one hundred and five persons bore their parts in it. Each of them had in his hand an instrument neatly made, shaped somewhat like a paddle, of two feet and a half in length, with a small handle and a thin blade, so that they were very light. With these instruments they made many and various flourishes, each of which was accompanied with a different attitude of the body, or a different movement. At first the performers ranged themselves in three lines; and, by various evolutions, each man changed his station in such a manner, that those who had been in the rear came into the front. Nor did they remain long in the same position, but these changes were made by pretty quick transitions. At one time they extended themselves in one line; they then formed into a semicircle; and, lastly, into two square columns. While this last movement was executing, one of them advanced, and performed an antic dance before me, with which the whole ended.

The musical instruments consisted of two drums, or rather two hollow logs of wood, from which some varied notes were produced by beating on them with two sticks. It did not, however, appear to me that the dancers were much assisted or directed by these sounds, but by a chorus of vocal music in which all the performers joined at the same time. Their song was not destitute of pleasing melody; and all their corresponding motions were executed with so much skill, that the numerous body of dancers seemed to act as if they were one

great machine. It was the opinion of every one of us, that such a performance would have met with universal applause on a European theatre; and it so far exceeded any attempt we had made to entertain them, that they seemed to pique themselves upon the superiority they had over us. As to our musical instruments, they held none of them in the least esteem, except the drum; and even that they did not think equal to their own. Our French horns, in particular, seemed to be held in great contempt; for neither here, nor at any other of the islands, would they pay the smallest attention to them. In order to give a more favourable opinion of English amusements, and to leave their minds fully impressed with the deepest sense of our superior attainments, I directed some fireworks to be got ready; and, after it was dark, played them off in the presence of Feenou, the other chiefs, and a vast concourse of their people. Some of the preparations we found damaged; but others of them were in excellent order, and succeeded so perfectly, as to answer the end I had in view. Our water and sky-rockets, in particular, pleased and astonished them beyond all conception; and the scale was now turned in our favour.

This, however, seemed only to furnish them with an additional motive to proceed to fresh exertions of their very singular dexterity; and our fireworks were no sooner ended, than a succession of dances, which Feenou had got ready for our entertainment, began. As* a prelude to them, a band of music, or chorus of eighteen men, seated themselves before us, in the centre of the circle composed by the numerous spectators, the area of which was to be the scene of the exhibitions. Four or five of this band had pieces of large bamboo, from three to five or six feet long, each managed by one man, who held it nearly in a vertical position, the upper end open, but the other end closed by one of the joints. With this close end the performers kept constantly striking the ground, though slowly, thus producing different notes, according to the different lengths of the instruments, but all of them of the hollow or base sort; to counteract which, a person kept striking quickly, and with two sticks, a piece of the same substance, split, and laid along the ground, and, by that means, furnishing a tone as acute as those produced by the others were grave. The rest of the band, as well as those who performed upon the bamboos, sung a slow and soft air, which so tempered the harsher notes of the above instruments, that no bystander, however accustomed to hear the most perfect and varied modulation of sweet sounds, could avoid confessing the vast power, and pleasing effect, of this simple harmony.

The concert having continued about a quarter of an hour, twenty women entered the circle. Most of them had, upon their heads, garlands of the crimson flowers of the China rose, or others; and many of them had ornamented their persons with leaves of trees, cut with a great deal of nicety about the edges. They made a circle round the chorus, turning their faces toward it, and began by singing a soft air, to which responses were made by the chorus in the same tone; and these were repeated alternately. All this while, the women accompanied their song with several very graceful motions of their hands toward their faces, and in other directions at the same time, making constantly a step forward, and then back again, with one foot, while the other was fixed. They then turned their faces to the assembly, sung some time, and retreated slowly in a body, to that part of the circle which was opposite the hut where the principal spectators sat. After this, one of them advanced from each side, meeting and passing each other in the front, and continuing their progress round, till they came to the rest. On which two advanced from each side, two of whom also passed each other, and returned as the former; but the other two remained, and to these came one from each side, by intervals, till the whole number had again formed a circle about the chorus. Their manner of dancing was now changed to a quicker measure, in which they made a kind of half turn by leaping, and clapped their hands, and snapped their fingers, repeating some words in conjunction with the chorus. Toward the end, as the quickness of the music increased, their gestures and attitudes were varied with wonderful vigour and dexterity; and some of their motions, perhaps, would, with us, be reckoned rather indecent; though this part of the performance, most probably, was not meant to convey any wanton ideas, but merely to display the astonishing variety of their movements.

* Mr. Anderson's account of the night dances being much fuller than Captain Cook's, the reader will not be displeased that it has been adopted.

To this grand female ballet, succeeded one performed by fifteen men. Some of them were old; but their age seemed to have abated little of their agility or ardour for the dance. They were disposed in a sort of circle, divided at the front, with their faces not turned out toward the assembly, nor inward to the chorus; but one half of their circle faced forward as they had advanced, and the other half in a contrary direction. They sometimes sung slowly, in concert with the chorus; and, while thus employed, they also made several very fine motions with their hands, but different from those made by the women, at the same time

GRAND FEMALE BALLET AT HAPARY.

inclining the body to either side alternately, by raising one leg, which was stretched outward and resting on the other; the arm of the same side being also stretched fully upward. At other times, they recited sentences in a musical tone, which were answered by the chorus; and, at intervals, increased the measure of the dance by clapping the hands, and quickening the motions of the feet, which, however, were never varied. At the end, the rapidity of the music, and of the dancing, increased so much, that it was scarcely possible to distinguish the different movements; though one might suppose the actors were now almost tired, as their performance had lasted near half an hour.

After a considerable interval, another act, as we may call it, began. Twelve men now advanced, who placed themselves in double rows fronting each other, but on opposite sides of the circle; and, on one side, a man was stationed, who, as if he had been a prompter, repeated several sentences, to which the twelve new performers, and the chorus, replied. They then sung slowly; and afterwards danced and sung more quickly, for about a quarter of an hour, after the manner of the dancers whom they had succeeded. Soon after they had finished, nine women exhibited themselves, and sat down fronting the hut where the chief was. A man then rose, and struck the first of these women on the back, with both fists joined. He proceeded, in the same manner, to the second and third; but when he came to the fourth, whether from accident or design I cannot tell, instead of the back, he struck her on the breast. Upon this, a person rose instantly from the crowd, who brought him to the ground with a blow on the head; and he was carried off without the least noise or disorder. But this did not save the other five women from so odd a discipline, or perhaps necessary ceremony; for a person succeeded him, who treated them in the same manner. Their disgrace did not end here; for when they danced, they had the mortification to find their

performance twice disapproved of, and were obliged to repeat it. This dance did not differ much from that of the first women, except in this one circumstance, that the present set sometimes raised the body upon one leg, by a sort of double motion, and then upon the other alternately, in which attitude they kept snapping their fingers; and, at the end, they repeated, with great agility, the brisk movements in which the former group of female dancers had shown themselves so expert.

In a little time, a person entered unexpectedly, and said something in a ludicrous way about the fireworks that had been exhibited, which extorted a burst of laughter from the multitude. After this, we had a dance composed of the men who attended or had followed Feenon. They formed a double circle (*i.e.* one within another) of twenty-four each, round the chorons, and began a gentle soothing song, with corresponding motions of the hands and head. This lasted a considerable time, and then changed to a much quicker measure, during which they repeated sentences, either in conjunction with the chorons, or in answer to some spoken by that band. They then retreated to the back part of the circle, as the women had done, and again advanced, on each side, in a triple row, till they formed a semicircle, which was done very slowly, by inclining the body on one leg, and advancing the other a little way, as they put it down. They accompanied this with such a soft air as they had sung at the beginning; but soon changed it to repeat sentences in a harsher tone, at the same time quickening the dance very much, till they finished with a general shout and clap of the hands. The same was repeated several times; but at last they formed a double circle, as at the beginning, danced, and repeated very quickly, and finally closed with several very dextrous transpositions of the two circles.

The entertainments of this memorable night concluded with a dance, in which the principal people present exhibited. It resembled the immediately preceding one in some respects, having the same number of performers, who began nearly in the same way; but their ending, at each interval, was different. For they increased their motions to a prodigious quickness, shaking their heads from shoulder to shoulder with such force, that a spectator, unaccustomed to the sight, would suppose that they ran a risk of dislocating their necks. This was attended with a smart clapping of the hands, and a kind of savage holla, or shriek, not unlike what is sometimes practised in the comic dances on our European theatres. They formed the triple semicircle, as the preceding dancers had done; and a person who advanced at the head on one side of the semicircle, began by repeating something in a truly musical recitative, which was delivered with an air so graceful, as might put to the blush our most applauded performers. He was answered in the same manner by the person at the head of the opposite party. This being repeated several times, the whole body on one side joined in the responses to the whole corresponding body on the opposite side, as the semicircle advanced to the front; and they finished, by singing and dancing as they had begun.

These two last dances were performed with so much spirit, and so great exactness, that they met with universal approbation. The native spectators, who no doubt were perfect judges whether the several performances were properly executed, could not withhold their applauses at some particular parts; and even a stranger, who never saw the diversion before, felt similar satisfaction, at the same instant. For though, through the whole, the most strict concert was observed, some of the gestures were so expressive, that it might be said they spoke the language that accompanied them, if we allow that there is any connexion between motion and sound. At the same time, it should be observed, that though the music of the chorons and that of the dancers corresponded, constant practice in these favourite amusements of our friends seems to have a great share in effecting the exact time they keep in their performances. For we observed, that if any of them happened accidentally to be interrupted, they never found the smallest difficulty in recovering the proper place of the dance or song. And their perfect discipline was, in no instance, more remarkable, than in the sudden transitions they so dextrously made, from the ruder exertions, and harsh sounds, to the softest airs and gentlest movements*.

* In a former note, at p. 70, it was observed, that the songs and dances of the Caroline Islanders, in the north Pacific, bear a great resemblance to those of the inhabitants of Wateoon. The remark may now be extended to those of the Friendly Islanders, described at large in this chapter. That the reader may judge for himself, I have selected

The place where the dances were performed was an open space amongst the trees, just by the sea, with lights at small intervals placed round the inside of the circle. The concourse of people was pretty large, though not equal to the number assembled at the forenoon, when the marines exercised. At that time, some of our gentlemen guessed there might be present about five thousand persons; others thought there were more; but they who reckoned that there were fewer, probably came nearer to the truth

CHAPTER VI.—DESCRIPTION OF LEFOOGA.—ITS CULTIVATED STATE.—ITS EXTENT.—TRANSACTIONS THERE.—A FEMALE OCULIST.—SINGULAR EXPEDIENTS FOR SHAVING OFF THE HAIR.—THE SHIPS CHANGE THEIR STATION.—A REMARKABLE MOUNT AND STONE.—DESCRIPTION OF HOOLAIVA.—ACCOUNT OF FOULAH, KING OF THE FRIENDLY ISLANDS.—RESPECTFUL MANNER IN WHICH HE IS TREATED BY HIS PEOPLE.—DEPARTURE FROM THE HAPAE ISLANDS.—SOME ACCOUNT OF KOTOO.—RETURN OF THE SHIPS TO ANNAMOOKA.—FOULAH AND FEENOU MEET.—ARRIVAL AT TONGATABOO.

CURIOSITY on both sides being now sufficiently gratified, by the exhibition of the various entertainments I have described, I began to have time to look about me. Accordingly, next day, I took a walk into the island of Lefooga, of which I was desirous to obtain some knowledge. I found it to be in several respects superior to Annamooka. The plantations were both more numerous and more extensive. In many places, indeed, toward the sea, especially on the east side, the country is still waste, owing perhaps to the sandy soil; as it is much lower than Annamooka, and its surrounding isles. But toward the middle of the island, the soil is better; and the marks of considerable population, and of improved cultivation, were very conspicuous. For we met here with very large plantations, inclosed in such a manner that the fences running parallel to each other form fine spacious public roads, that would appear ornamental in countries where rural conveniences have been carried to the greatest perfection. We observed large spots covered with the paper-mulberry-trees; and the plantations in general were well stocked with such roots and fruits as are the natural produce of the island. To these I made some addition, by sowing the seeds of Indian corn, melons, pumpkins, and the like. At one place was a house four or five times as large as those of the common sort, with a large area of grass before it; and I take it for granted, the people resort thither on certain public occasions. Near the landing-place we saw a mount two or three feet high, covered with gravel; and on it stood four or five small huts, in which the natives told us the bodies of some of their principal people had been interred. The island is not above seven miles long, and in some places not above two or three broad. The east side of it, which is exposed to the trade-wind, has a reef running to a considerable breadth from it, on which the sea breaks with great violence. It is a continuation of this reef that joins Lefooga to Foa, which is not above half a mile distant, and at low water the natives can walk upon this reef, which is then partly dry, from the one island to the other. The shore itself is either a coral rock, six or seven feet high, or a sandy beach; but higher than the west side, which in general is not more than three or four feet from the level of the sea, with a sandy beach its whole length.

When I returned from my excursion into the country and went on board to dinner, I found a large sailing canoe fast to the ship's stern. In this canoe was Latooliboula, whom I had seen at Tongataboo, during my last voyage, and who was then supposed by us to be the king of that island. He sat in the canoe with all that gravity by which, as I have

the following particulars from Father Cantova's account. "Pendant la nuit, au clair de la lune, ils s'assemblent, de temps en temps, pour chanter et danser devant la maison de leur *Tamole*. Leurs danses se font au son de la voix, car ils n'ont point d'instrument de musique. La beauté de la danse consiste dans l'exacte uniformité des mouvements du corps. Les hommes, séparés des femmes, se posent vis-à-vis les uns des autres; après quoi, ils re-

muent la tête, les bras, les mains, les pieds, en cadence. Leur tête est couverte de plumes, ou de pennis; et l'on voit, attachés à leurs oreilles, des fanilles de palmier tissées avec assez d'art. Les femmes, de leur côté, se regardant les unes les autres, commencent un chant pathétique et languoureux, accompagnant le son de leur voix du mouvement cadencé de la tête et des bras."—*Lettres Rédigées et Curieuses*, tom. xv. p. 314, 315.

mentioned in my journal *, he was so remarkably distinguished at that time; nor could I by any entreaties prevail upon him now to come into the ship. Many of the islanders were present, and they all call him *Areeke*, which signifies king. I had never heard any one of them give this title to Feenou, however extensive his authority over them, both here and at Annamooka, had appeared to be; which had all along inclined me to suspect that he was not the king, though his friend Taipa had taken pains to make me believe he was. Latooliboula remained under the stern till the evening, when he retired in his canoe to one of the islands. Feenou was on board my ship at the same time; but neither of these great men took the least notice of the other. Nothing material happened the next day, except that some of the natives stole a tarpaulin, and other things, from off the deck. They were soon missed and the thieves pursued, but a little too late. I applied, therefore, to Feenou, who, if he was not king, was at least vested with the highest authority here, to exert it, in order to have my things restored. He referred me to Earoupa, who put me off from time to time; and at last nothing was done.

In the morning of the 23rd, as we were going to unmoor, in order to leave the island, Feenou and his prime-minister Taipa came along-side in a sailing canoe, and informed me that they were setting out for Vavaoo, an island which, they said, lies about two days' sail to the northward of Hapace. The object of their voyage, they would have me believe, was to get for me an additional supply of hogs, and some red-feathered caps for Omai, to carry to Otaheite, where they are in high esteem. Feenou assured me that he should be back in four or five days; and desired me not to sail till his return, when he promised he would accompany me to Tongataboo. I thought this a good opportunity to get some knowledge of Vavaoo, and proposed to him to go thither with the ships. But he seemed not to approve of the plan; and, by way of diverting me from it, told me that there was neither harbour nor anchorage about it. I, therefore, consented to wait in my present station for his return, and he immediately set out. The next day our attention was for some time taken up with a report, industriously spread about by some of the natives, that a ship like ours had arrived at Annamooka since we left it, and was now at anchor there. The propagators of the report were pleased to add, that Toobou, the chief of that island, was hastening thither to receive these new-comers; and as we knew that he had actually left us, we were the more ready to believe there might be some foundation for the story of this unexpected arrival. However, to gain some further information, I went on shore with Omai, in quest of the man who, it was said, had brought the first account of this event from Annamooka. We found him at the house of Earoupa, where Omai put such questions to him as I thought necessary; and the answers he gave were so clear and satisfactory, that I had not a doubt remaining. But just about this time, a chief of some note, whom we well knew, arrived from Annamooka, and declared that no ship was at that island, nor had been since our leaving it. The propagator of the report, finding himself detected in a falsehood, instantly withdrew, and we saw no more of him. What end the invention of this tale could answer, it was not easy to conjecture; unless we suppose it to have been artfully contrived, to get us removed from the one island to the other.

In my walk on the 25th, I happened to step into a house, where a woman was dressing the eyes of a young child, who seemed blind; the eyes being much inflamed, and a thin film spread over them. The instruments she used were two slender wooden probes, with which she had brushed the eyes so as to make them bleed. It seems worth mentioning, that the

* See Second Voyage, book ii. ch. 2. The name of this extraordinary personage is there said to be *Kohageetoo Fallangou*; which cannot, by the most skillful etymologist, be tortured into the least most distant resemblance of *Latooliboula*. It is remarkable, that Captain Cook should not take any notice of his having called the same person by two names so very different. Perhaps we may account for this by supposing one to be the name of the person, and the other the description of his title or rank. This supposition seems to be well founded, when we consider, that *Laloo*, in the language of these people, is sometimes used to signify a great chief; and Dr. Foster,

in his *Observations*, p. 378, 379, and elsewhere, speaks of the sovereign of Tongataboo, under the title of their *Laloo*. This very person is called by Dr. Foster, p. 370, *Laloo-Nipooroo*; which furnishes a very striking instance of the variations of our people in writing down the same word as pronounced by the natives. However, we can easily trace the affinity between *Nipooroo* and *Liboula*, as the changes of the consonants are such as are perpetually made, upon hearing a word pronounced to which our ears have not been accustomed. Mr. Anderson here agrees with Captain Cook in writing *Latooliboula*.

natives of these islands should attempt an operation of this sort; though I entered the house too late, to describe exactly how this female oculist employed the wretched tools she had to work with.

I was fortunate enough to see a different operation going on in the same house, of which I can give a tolerable account. I found there another woman shaving a child's head with a shark's tooth stuck into the end of a piece of stick. I observed, that she first wet the hair with a rag dipped in water, applying her instrument to that part which she had previously soaked. The operation seemed to give no pain to the child, although the hair was taken off as close as if one of our razors had been employed. Encouraged by what I now saw, I soon after tried one of these singular instruments upon myself, and found it to be an excellent succedaneum. However, the men of these islands have recourse to another contrivance when they shave their beards. The operation is performed with two shells, one of which they place under a small part of the beard, and with the other applied above, they scrape that part off. In this manner they are able to shave very close. The process is, indeed, rather tedious, but not painful; and there are men amongst them who seem to profess this trade. It was as common while we were here, to see our sailors go ashore to have their beards scraped off, after the fashion of Hapace, as it was to see their chiefs come on board to be shaved by our barbers.

Finding that little or nothing of the produce of the island was now brought to the ships, I resolved to change our station, and to wait Feenon's return from Vavaoo, in some other convenient anchoring-place, where refreshments might still be met with. Accordingly, in the forenoon of the 26th, we got under sail, and stood to the southward along the reef of the island; having fourteen and thirteen fathoms water, with a sandy bottom. However, we met with several detached shoals. Some of them were discovered by breakers; some by the water upon them appearing discoloured; and others by the lead. At half-past two in the afternoon, having already passed several of these shoals, and seeing more of them before us, I hauled into a bay that lies between the south end of Lefooga and the north end of Hoolaiwa, and there anchored in seventeen fathoms water, the bottom a coral sand; the point of Lefooga bearing south-east by east, a mile and a half distant. The Discovery did not get to an anchor till sunset. She had touched upon one of the shoals, but backed off again without receiving any damage. As soon as we had anchored, I sent Mr. Bligh to sound the bay where we were now stationed; and myself, accompanied by Mr. Gore, landed on the southern part of Lefooga, to examine the country, and to look for fresh water; not that we now wanted a supply of this article, having filled all the casks at our late station; but I had been told, that this part of the island could afford us some, preferable to any we had got at the former watering-place. This will not be the only time I shall have occasion to remark, that these people do not know what good water is. We were conducted to two wells; but the water in both of them proved to be execrable; and the natives, our guides, assured us that they had none better.

Near the south end of the island, and on the west side, we met with an artificial mount. From the size of some trees that were growing upon it, and from other appearances, I guessed that it had been raised in remote times. I judged it to be about forty feet high, and the diameter of its summit measured fifty feet. At the bottom of this mount stood a stone, which must have been hewn out of coral rock. It was four feet broad, two and a half thick, and fourteen high; and we were told by the natives present, that not above half its length appeared above ground. They called it *Tangata Arckee*; and said that it had been set up, and the mount raised, by some of their forefathers, in memory of one of their kings; but how long since they could not tell.

Night coming on, Mr. Gore and I returned on board; and, at the same time, Mr. Bligh got back from sounding the bay, in which he found from fourteen to twenty fathoms water; the bottom for the most part sand, but not without some coral rocks. The place where we now anchored is much better sheltered than that which we had lately come from; but between the two is another anchoring station, much better than either. Lefooga and Hoolaiwa are divided from each other by a reef of coral rocks, which is dry at low water;

* *Tangata*, in their language, is man; *Arckee*, king.

so that one may walk, at that time, from the one to the other without wetting a foot. Some of our gentlemen, who landed in the latter island, did not find the least mark of cultivation, or habitation upon it, except a single hut, the residence of a man employed to catch fish and turtle. It is rather extraordinary that it should be in this deserted state, communicating so immediately with Lefooga, which is so perfectly cultivated; for though the soil is quite sandy, all the trees and plants found in a natural state on the neighbouring islands, are produced here with the greatest vigour. The east side of it has a reef like Lefooga; and the west side has a bending at the north part, where there seems to be good anchorage. Uninhabited as U'oolaiwa is, an artificial mount, like that at the adjoining island, has been raised upon it, as high as some of the surrounding trees.

At daybreak next morning I made the signal to weigh; and as I intended to attempt a passage to Annamooka, in my way to Tongataboo, by the south-west, amongst the intervening islands, I sent the master in a boat to sound before the ships. But before we could get under sail, the wind became unsettled; which made it unsafe to attempt a passage in this way, till we were better acquainted with it. I therefore lay fast, and made the signal for the master to return; and afterward sent him and the master of the *Discovery*, each in a boat, with instructions to examine the channels as far as they could, allowing themselves time to get back to the ships before the close of the day.

About noon a large sailing canoe came under our stern, in which was a person named Futtaihi, or Poulaho, or both; who, as the natives then on board told us, was king of Tongataboo, and of all the neighbouring islands that we had seen or heard of. It was a matter of surprise to me to have a stranger introduced under this character, which I had so much reason to believe really belonged to another. But they persisted in their account of the supreme dignity of this new visitor; and now, for the first time, they owned to me that Feenou was not the king, but only a subordinate chief, though of great power, as he was often sent from Tongataboo to the other islands on warlike expeditions, or to decide differences. It being my interest as well as my inclination to pay court to all the great men, without making inquiry into the validity of their assumed titles, I invited Poulaho on board, as I understood he was very desirous to come. He could not be an unwelcome guest; for he brought with him, as a present to me, two good fat hogs, though not so fat as himself. If weight of body could give weight in rank or power, he was certainly the most eminent man in that respect we had seen; for, though not very tall, he was very unwieldy, and almost shapeless with corpulence. He seemed to be about forty years of age, had straight hair, and his features differed a good deal from those of the bulk of his people. I found him to be a sedate, sensible man. He viewed the ship and the several new objects with uncommon attention; and asked many pertinent questions, one of which was, what could induce us to visit these islands? After he had satisfied his curiosity in looking at the cattle, and other novelties which he met with upon deck, I desired him to walk down into the cabin. To this some of his attendants objected, saying, that if he were to accept of that invitation, it must happen that people would walk over his head, which could not be permitted. I directed my interpreter Omai to tell them, that I would obviate their objection, by giving orders that no one should presume to walk upon that part of the deck which was over the cabin. Whether this expedient would have satisfied them was far from appearing; but the chief himself, less scrupulous in this respect than his attendants, waved all ceremony, and walked down without any stipulation. He now appeared to be as solicitous himself, as his people were, to convince us that he was king, and not Feenou, who had passed with us as such, for he soon perceived that we had some doubts about it; which doubts Omai was not very desirous of removing. The closest connexion had been formed between him and Feenou, in testimony of which they had exchanged names; and, therefore, he was not a little chagrined that another person now put in his claim to the honours which his friend had hitherto enjoyed.

Poulaho sat down with us to dinner; but he ate little and drank less. When we arose from the table, he desired me to accompany him ashore. Omai was asked to be of the party; but he was too faithfully attached to Feenou to show any attention to his competitor, and therefore excused himself. I attended the chief in my own boat, having first made

presents to him of such articles as I could observe he valued much, and were even beyond his expectation to receive. I was not disappointed in my view of thus securing his friendship; for the moment the boat reached the beach, and before he quitted her, he ordered two more hogs to be brought and delivered to my people to be conveyed on board. He was then carried out of the boat by some of his own people upon a board resembling a handbarrow, and went and seated himself in a small house near the shore, which seemed to have been erected there for his accommodation. He placed me at his side; and his attendants, who were not numerous, seated themselves in a semicircle before us on the outside of the house. Behind the chief, or rather on one side, sat an old woman with a sort of fan in her hand, whose office it was to prevent his being pestered with the flies.

The several articles which his people had got by trading on board the ships were now displayed before him. He looked over them all with attention, inquired what they had given in exchange, and seemed pleased with the bargains they had made. At length he ordered everything to be restored to the respective owners, except a glass bowl, with which he was so much pleased that he reserved it for himself. The persons who brought these things to him first squatted themselves down before him, then they deposited their several purchases, and immediately rose up and retired. The same respectful ceremony was observed in taking them away; and not one of them presumed to speak to him standing. I staid till several of his attendants left him, first paying him obeisance, by bowing the head down to the sole of his foot, and touching or tapping the same with the upper and under side of the fingers of both hands. Others who were not in the circle came, as it seemed, on purpose, and paid him this mark of respect, and then retired without speaking a word. I was quite charmed with the decorum that was observed. I had no where seen the like, not even amongst more civilised nations.

I found the master returned from his expedition when I got on board. He informed me, that, as far as he had proceeded, there was anchorage and a passage for the ships; but that towards the south and south-east he saw a number of small isles, shoals, and breakers. Judging from this report that my attempting a passage that way would be attended with some risk, I now dropped all thoughts of it, thinking it better to return toward Annamooka by the same route, which we had so lately experienced to be a safe one. Having come to this resolution, I should have sailed next morning, if the wind had not been too far southerly, and, at the same time, very unsettled. Poulaho, the king, as I shall now call him, came on board betimes, and brought as a present to me, one of their caps, made, or at least covered, with red feathers. These caps were much sought after by us, for we knew they would be highly valued at Otaheite. But though very large prices were offered, not one was ever brought for sale; which showed that they were no less valuable in the estimation of the people here; nor was there a person in either ship that could make himself the proprietor of one, except myself, Captain Clerke, and Omai. These caps, or rather bonnets, are composed of the tail feathers of the tropic bird, with the red feathers of the parroquets wrought upon them, or jointly with them. They are made so as to tie upon the forehead without any crown, and have the form of a semicircle, whose radius is eighteen or twenty inches. The chief stayed on board till the evening, when he left us; but his brother, whose name was also Futtafaihe, and one or two more of his attendants, continued in the ship all night.

At daybreak the next morning, I weighed with a fine breeze at east-north-east, and stood to the westward, with a view to return to Annamooka, by the track we had already experienced. We were followed by several sailing canoes, in one of which was the king. As soon as he got on board the Resolution he inquired for his brother, and the others who had remained with us all night. It now appeared that they had staid without his leave; for he gave them, in a very few words, such a reprimand as brought tears from their eyes; and yet they were men not less than thirty years of age. He was, however, soon reconciled to their making a longer stay; for, on quitting us, he left his brother and five of his attendants on board. We had also the company of a chief just then arrived from Tongataboo, whose name was Taoboueioa. The moment he arrived, he sent his canoe away, and declared that he and five more who came with him would sleep on board; so that I had now

my cabin filled with visitors. This, indeed, was some inconvenience; but I bore with it more willingly, as they brought plenty of provisions with them as presents to me, for which they always had suitable returns.

About one o'clock in the afternoon, the easterly wind was succeeded by a fresh breeze at south-south-east. Our course now being south-south-west, or more southerly, we were obliged to ply to windward, and did but just fetch the north side of Pootoolah by eight o'clock, where we spent the night, making short boards. The next morning, we plied up to Lofanga, where, according to the information of our friends, there was anchorage. It was one o'clock, in the afternoon, before we got soundings, under the lee or north-west side, in forty fathoms water, near half a mile from the shore; but the bank was steep, and the bottom rocky, and a chain of breakers lay to leeward. All these circumstances being against us, I stretched away for Kotoo, with the expectation of finding better anchoring ground under that island. But so much time had been spent in plying up to Lofanga, that it was dark before we reached the other; and, finding no place to anchor in, the night was spent as the preceding one.

At daybreak on the 31st, I stood for the channel which is between Kotoo, and the reef of rocks that lie to the westward of it; but on drawing near, I found the wind too scant to lead us through. I, therefore, bore up on the outside of the reef, and stretched to the south-west, till near noon, when perceiving that we made no progress to windward, and being apprehensive of losing the islands, with so many of the natives on board, I tacked and stood back, intending to wait till some more favourable opportunity. We did but just fetch in with Pootoolah, between which and Kotoo we spent the night, under reefed topsails and foresail. The wind blew fresh, and by squalls, with rain; and we were not without apprehensions of danger. I kept the deck till midnight, when I left it to the master, with such directions as, I thought, would keep the ships clear of the shoals and rocks that lay round us. But, after making a trip to the north, and standing back again to the south, our ship, by a small shift of the wind, fetched farther to the windward than was expected. By this means she was very near running full upon a low sandy isle, called Pootoo Pootoo, surrounded with breakers. It happened very fortunately that the people had just been ordered upon the deck, to put the ship about, and the most of them were at their stations; so that the necessary movements were not only executed with judgment, but also with alertness; and this alone saved us from destruction. The *Discovery* being astern, was out of danger. Such hazardous situations are the unavoidable companions of the man who goes upon a voyage of discovery.

This circumstance frightened our passengers so much, that they expressed a strong desire to get ashore. Accordingly, as soon as daylight returned, I hoisted out a boat, and ordered the officer who commanded her, after landing them at Kotoo, to sound along the reef that spits off from that island, for anchorage. For I was full as much tired as they could be, with beating about amongst the surrounding isles and shoals, and determined to get to an anchor somewhere or other if possible. While the boat was absent, we attempted to turn the ships through the channel, between the sandy isle and the reef of Kotoo, in expectation of finding a moderate depth of water behind them to anchor in. But, meeting with a tide or current against us, we were obliged to desist, and anchor in fifty fathoms water, with the sandy isle bearing east by north, one mile distant.

We lay here till the 4th. While in this station we were, several times, visited by the king, by Tooboneitoa, and by people from the neighbouring islands, who came off to trade with us, though the wind blew very fresh most of the time. The master was now sent to sound the channels between the islands that lie to the eastward; and I landed on Kotoo, to examine it, in the forenoon of the 2nd.

This island is scarcely accessible by boats, on account of coral reefs that surround it. It is not more than a mile and half, or two miles long; and not so broad. The north-west end of it is low, like the islands of Iapace; but it rises suddenly in the middle, and terminates in reddish clayey cliffs, at the south-east end, about thirty feet high. The soil, in that quarter, is of the same sort as in the cliffs; but, in the other parts, it is a loose, black mould. It produces the same fruits and roots which we found at the other islands: is

tolerably cultivated, but thinly inhabited. While I was walking all over it, our people were employed in cutting some grass for the cattle; and we planted some melon seeds, with which the natives seemed much pleased, and inclosed them with branches. On our return to the boat, we passed by two or three ponds of dirty water, which was more or less brackish in each of them; and saw one of their burying-places, which was much neater than those that were met with at Hapace.

On the 4th, at seven in the morning, we weighed; and, with a fresh gale at east-south-east, stood away for Annamooka, where we anchored, next morning, nearly in the same station which we had so lately occupied. I went on shore soon after, and found the inhabitants very busy in their plantations, digging up yams to bring to market; and, in the course of the day, about two hundred of them had assembled on the beach, and traded with as much eagerness as during our late visit. Their stock appeared to have been recruited much, though we had returned so soon; but, instead of bread-fruit, which was the only article we could purchase on our first arrival, nothing was to be seen now but yams, and a few plantains. This shows the quick succession of the seasons, at least of the different vegetables produced here, at the several times of the year. It appeared also that they had been very busy, while we were absent, in cultivating; for we now saw several large plantain fields, in places which we had so lately seen lying waste. The yams were now in the greatest perfection; and we procured a good quantity, in exchange for pieces of iron. These people in the absence of Toobon, whom we left behind us, at Kotoo, with Poulaho and the other chiefs, seemed to be under little subordination. For we could not perceive, this day, that one man assumed more authority than another. Before I returned on board, I visited the several places where I had sown melon seeds, and had the mortification to find that most of them were destroyed by a small ant; but some pine-apple plants, which I had also left, were in a thriving state.

About noon next day, Feenou arrived from Vavaoo. He told us that several canoes, laden with hogs, and other provisions, which had sailed with him from that island, had been lost, owing to the late blowing weather; and that everybody on board them had perished. This melancholy tale did not seem to affect any of his countrymen who heard it; and as to ourselves, we were by this time too well acquainted with his character to give much credit to such a story. The truth, probably, was, that he had not been able to procure at Vavaoo the supplies which he expected; or, if he got any there, that he had left them at Hapace, which lay in his way back, and where he could not but receive intelligence that Poulaho had been with us, who therefore, he knew, would, as his superior, have all the merit and reward of procuring them, though he had not any share of the trouble. The invention of this loss at sea was, however, well imagined; for there had lately been very blowing weather; inasmuch, that the king and other chiefs, who had followed us from Hapace to Kotoo, had been left there, not caring to venture to sea when we did; but desired I might wait for them at Annamooka, which was the reason of my anchoring there, this second time, and of my not proceeding directly to Tongataboo.

The following morning, Poulaho, and the other chiefs who had been wind-bound with him, arrived. I happened at this time to be ashore in company with Feenou, who now seemed to be sensible of the impropriety of his conduct, in assuming a character that did not belong to him. For he not only acknowledged Poulaho to be king of Tongataboo, and the other isles; but affected to insist much on it, which, no doubt, was with a view to make amends for his former presumption. I left him to visit this greater man, whom I found sitting with a few people before him. But, every one hastening to pay court to him, the circle increased pretty fast. I was very desirous of observing Feenou's behaviour on this occasion, and had the most convincing proof of his superiority; for he placed him amongst the rest that sat before Poulaho, as attendants on his majesty. He seemed at first rather abashed, as some of us were present who had been used to see him act a different part; but he soon recovered himself. Some little conversation passed between these two chiefs which none of us understood; nor were we satisfied with Omai's interpretation of it. We were, however, by this time sufficiently undeceived as to Feenou's rank. Both he and Poulaho went on board with me to dinner; but only the latter sat at table. Feenou, having made

his obeisance in the usual way, saluting his sovereign's foot with his head and hands, retired out of the cabin *. The king had before told us, that this would happen; and it now appeared that Feenou could not even eat or drink in his royal presence.

At eight o'clock next morning we weighed and steered for Tongataboo, having a gentle breeze at north-east. About fourteen or fifteen sailing vessels belonging to the natives set out with us, but every one of them outran the ships considerably. Feenou was to have taken his passage in the Resolution, but preferred his own canoe; and put two men on board to conduct us to the best anchorage. We steered south by west by compass. At five in the afternoon we saw two small islands bearing west, about four leagues distant. Our pilots called the one Hoonga Hapace, and the other Hoonga Tonga. They lie in the latitude of $20^{\circ} 36'$; and ten or eleven leagues from the west point of Annamooka, in the direction of south, 46° west. According to the account of the islanders on board, only five men reside upon Hoonga Hapace; and Hoonga Tonga is uninhabited; but both of them abound with sea-fowl.

We continued the same course till two o'clock next morning, when, seeing some lights ahead, and not knowing whether they were on shore or on board the canoes, we hauled the wind, and made a short trip each way till daybreak. We then resumed our course to the south by west; and presently after saw several small islands before us, and Eooa and Tongataboo beyond them. We had at this time twenty-five fathoms water, over a bottom of broken coral and sand. The depth gradually decreased as we drew near the isles above mentioned, which lie ranged along the north-east side of Tongataboo. By the direction of our pilots we steered for the middle of it, and for the widest space between the small isles which we were to pass, having our boats ahead employed in sounding. We were insensibly drawn upon a large flat, upon which lay innumerable coral rocks of different depths, below the surface of the water. Notwithstanding all our care and attention to keep the ship clear of them, we could not prevent her from striking on one of these rocks: nor did the Discovery, though behind us, escape any better. Fortunately, neither of the ships stuck fast, nor received any damage. We could not get back without increasing the danger, as we had come in almost before the wind; nor could we cast anchor, but with the certainty of having our cables instantly cut in two by the rocks. We had no other resource but to proceed. To this, indeed, we were encouraged, not only by being told, but by seeing, that there was deeper water between us and the shore. However, that we might be better informed, the moment we found a spot where we could drop the anchor clear of rocks, we came to, and sent the masters with the boats to sound.

Soon after we had anchored, which was about noon, several of the inhabitants of Tongataboo came off in their canoes to the ships. These, as well as our pilots, assured us that we should find deep water farther in, and a bottom free from rocks. They were not mistaken; for about four o'clock the boats made the signal for having found good anchorage. Upon this we weighed, and stood in till dark, and then anchored in nine fathoms, having a fine, clear, sandy bottom. During the night we had some showers of rain; but toward the morning, the wind shifted to the south and south-east, and brought on fair weather. At daybreak we weighed, and working in to the shore, met with no obstructions but such as were visible and easily avoided. While we were plying up to the harbour, to which the natives directed us, the king kept sailing round us in his canoe. There were at the same time a great many small canoes about the ships: two of these, which could not get out of the way of his royal vessel, he ran quite over, with as little concern as if they had been bits of wood. Amongst many others who came on board the Resolution, was Otago, who had

* Marks of profound respect, very similar to those paid by natives of the Friendly Islands to their sovereign, are also paid to the principal chiefs, or *Tamoles*, of the Carolinian Islands, as appears from Father Cantova's account, here transcribed. "Lorsqu'un *Tamole* donne audience, il paroît assis sur une table élevée: les peuples s'inclinent devant lui jusqu'à terre; et de plus loin qu'ils arrivent, ils marchent, le corps tout courbé, et la tête presque entre les genoux, jusqu'à ce qu'ils soient auprès de sa

personne; alors ils s'asséent à plate-terre; et, les yeux baissés, ils reçoivent ses ordres avec le plus profond respect. Quand le *Tamole* les congédie, ils se retirent, en se courbant de la même manière que quand ils sont venus, et ne se relèvent que lorsqu'ils sont hors de sa présence. Ses paroles sont autant d'ordres qu'on révère; on rend à ses ordres une obéissance aveugle; enfin, on lui baise les mains et les pieds quand on lui demande quelque grâce." — "Lettres Edifiantes et Curieuses," tom. xv. p. 312, 313.

been so useful to me when I visited Tongataboo during my last voyage; and one Toobou, who at that time had attached himself to Captain Furneaux. Each of them brought a hog and some yams, as a testimony of his friendship; and I was not wanting on my part in making a suitable return. At length, about two in the afternoon, we arrived at our intended station. It was a very snug place, formed by the shore of Tongataboo on the south-east, and two small islands on the east and north-east. Here we anchored in ten fathoms water, over a bottom of oozy sand, distant from the shore one-third of a mile.

CHAPTER VII.—FRIENDLY RECEPTION AT TONGATABOO.—MANNER OF DISTRIBUTING A BAKED HOG AND KAVA TO POULAHU'S ATTENDANTS.—THE OBSERVATORY, &c. ERECTED.—THE VILLAGE WHERE THE CHIEFS RESIDE, AND THE ADJOINING COUNTRY, DESCRIBED.—INTERVIEWS WITH MAHEEWAGEE AND TOOHOU, AND THE KING'S SON.—A GRAND HAIVA, OR ENTERTAINMENT OF SONGS AND DANCES, GIVEN BY MAHEEWAGEE.—EXHIBITION OF FIREWORKS.—MANNER OF WRESTLING AND BOXING.—DISTRIBUTION OF THE CATTLE.—THEFTS COMMITTED BY THE NATIVES.—POULAHU, AND THE OTHER CHIEFS, CONFINED ON THAT ACCOUNT.—POULAHU'S PRESENT, AND HAIVA.

Soon after we had anchored, having first dined, I landed, accompanied by Omai and some of the officers. We found the king waiting for us upon the beach: he immediately conducted us to a small neat house, situated a little within the skirts of the woods, with a fine large area before it. This house, he told me, was at my service during our stay at the island; and a better situation we could not wish for. We had not been long in the house, before a pretty large circle of the natives were assembled before us, and seated upon the area. A

POULAHU DRINKING KAVA

root of the *kava* plant being brought and laid down before the king, he ordered it to be split into pieces, and distributed to several people of both sexes, who began the operation of chewing it; and a bowl of their favourite liquor was soon prepared. In the mean time, a baked hog and two baskets of baked yams were produced, and afterward divided into ten portions. These portions were then given to certain people present; but how many were to share in each, I could not tell. One of them, I observed, was bestowed upon the king's brother; and

one remained undisposed of, which I judged was for the king himself, as it was a choice bit. The liquor was next served out; but Poulaho seemed to give no directions about it. The first cup was brought to him, which he ordered to be given to one who sat near him. The second was also brought to him, and this he kept. The third was given to me; but their manner of brewing quenched my thirst, it became Omai's property. The rest of the liquor was distributed to different people by direction of the man who had the management of it. One of the cups being carried to the king's brother, he retired with this, and with his mess of victuals. Some others also quitted the circle with their portions; and the reason was, they could neither eat nor drink in the royal presence; but there were others present, of a much inferior rank, of both sexes, who did both. Soon after, most of them withdrew, carrying with them what they had not ate of their share of the feast. I observed, that not a fourth part of the company had tasted either the victuals or the drink; those who partook of the former, I supposed to be of the king's household. The servants who distributed the baked meat and the *kava* always delivered it out of their hand sitting, not only to the king, but to every other person. It is worthy of remark, though this was the first time of our landing, and a great many people were present who had never seen us before, yet no one was troublesome, but the greatest good order was preserved throughout the whole assembly.

Before I returned on board, I went in search of a watering-place, and was conducted to some ponds, or rather holes, containing fresh water, as they were pleased to call it. The contents of one of these, indeed, were tolerable; but it was at some distance inland, and the supply to be got from it was very inconsiderable. Being informed that the little island of Pangimodoo, near which the ships lay, could better furnish this necessary article, I went over to it next morning, and was so fortunate as to find there a small pool that had rather fresher water than any we had met with amongst these islands. The pool being very dirty, I ordered it to be cleaned; and here it was that we watered the ships.

As I intended to make some stay at Tongataboo, we pitched a tent, in the forenoon, just by the house which Poulaho had assigned for our use. The horses, cattle, and sheep were afterward landed, and a party of marines, with their officer, stationed there as a guard. The observatory was then set up, at a small distance from the other tent; and Mr. King resided on shore, to attend the observations, and to superintend the several operations necessary to be conducted there. For the sails were carried thither, to be repaired; a party was employed in cutting wood for fuel, and plank for the use of the ships; and the gunners of both ships were ordered to remain upon the spot, to conduct the traffic with the natives, who thronged from every part of the island with hogs, yams, cocoa-nuts, and other articles of their produce. In a short time our land-post was like a fair, and the ships were so crowded with visitors that we had hardly room to stir upon the decks.

Feenon had taken up his residence in our neighbourhood; but he was no longer the leading man. However, we still found him to be a person of consequence; and we had daily proofs of his opulence and liberality, by the continuance of his valuable presents. But the king was equally attentive in this respect; for scarcely a day passed without receiving from him some considerable donation. We now heard, that there were other great men of the island whom we had not as yet seen. Otago and Toobou, in particular, mentioned a person named Mareewagee, who, they said, was of the first consequence in the place, and held in great veneration; nay, if Omai did not misunderstand them, superior even to Poulaho, to whom he was related; but, being old, lived in retirement, and therefore would not visit us. Some of the natives even hinted that he was too great a man to confer that honour upon us. This account exciting my curiosity, I this day mentioned to Poulaho that I was very desirous of waiting upon Mareewagee, and he readily agreed to accompany me to the place of his residence the next morning.

Accordingly, we set out pretty early in the pinnace; and Captain Clerke joined me in one of his own boats. We proceeded round, that is, to the eastward of the little isles that form the harbour, and then turning to the south, according to Poulaho's directions, entered a spacious bay or inlet, up which we rowed about a league, and landed amidst a considerable number of people, who received us with a sort of acclamation, not unlike our huzzaing. They immediately separated, to let Poulaho pass, who took us into a small inclosure, and

l inclosure, and

shifted the piece of cloth he wore, for a new piece, neatly folded, that was carried by a young man. An old woman assisted in dressing him, and put a mat over his cloth, as we supposed, to prevent its being dirtied when he sat down. On our now asking him where Mareewagee was, to our great surprise, he said, he had gone from the place to the ship, just before we arrived. However, he desired us to walk with him to a *malace*, or house of public resort, which stood about half a mile up the country; but when we came to a large area before it, he sat down in the path, and desired us to walk up to the house. We did so, and seated ourselves in front, while the crowd that followed us filled up the rest of the space. After sitting a little while, we repeated our inquiries, by means of Omai, whether we were to see Mareewagee? But receiving no satisfactory information, and suspecting that the old chief was purposely concealed from us, we went back to our boats, much piqued at our disappointment; and when I got on board, I found that no such person had been there. It afterwards appeared, that, in this affair, we had laboured under some gross mistakes, and that our interpreter Omai had either been misinformed, or, which is more likely, had misunderstood what was told him about the great man, on whose account we had made this excursion.

The place we went to was a village, most delightfully situated on the bank of the inlet, where all or most of the principal persons of the island reside; each having his house in the midst of a small plantation, with lesser houses, and offices for servants. These plantations are neatly fenced round; and, for the most part, have only one entrance. This is by a door, fastened on the inside by a prop of wood; so that a person has to knock before he can get admittance. Public roads and narrow lanes lie between each plantation; so that no one trespasseth upon another. Great part of some of these inclosures is laid out in grass-plots, and planted with such things as seem more for ornament than use; but hardly any where without the *kava* plant, from which they make their favourite liquor. Every article of the vegetable produce of the island, abounded in others of these plantations; but these, I observed, are not the residence of people of the first rank. There are some large houses near the public roads, with spacious smooth grass-plots before them, and uninclosed. These, I was told, belonged to the king; and probably they are the places where their public assemblies are held. It was to one of these houses, as I have already mentioned, that we were conducted, soon after our landing at this place.

About noon, the next day, this Mareewagee, of whom we had heard so much, actually came to the neighbourhood of our post on shore; and with him a very considerable number of people of all ranks. I was informed, that he had taken this trouble on purpose to give me an opportunity of waiting upon him; having, probably, heard of the displeasure I had shown, on my disappointment the day before. In the afternoon, a party of us, accompanied by Feenou, landed to pay him a visit. We found a person sitting under a large tree, near the shore, a little to the right of the tent. A piece of cloth, at least forty yards long, was spread before him, round which a great number of people of both sexes were seated. It was natural to suppose that this was the great man; but we were undeceived by Feenou; who informed us that another, who sat on a piece of mat, a little way from this chief, to the right hand, was Mareewagee, and he introduced us to him, who received us very kindly, and desired us to sit down by him. The person who sat under the tree, fronting us, was called Toobou; and when I have occasion to speak of him afterwards, I shall call him old Toobou, to distinguish him from his namesake, Captain Furneaux's friend. Both he and Mareewagee had a venerable appearance. The latter is a slender man, and from his appearance, seems to be considerably above threescore years of age. The former is rather corpulent, and almost blind with a disorder of his eyes; though not so old. Not expecting to meet with two chiefs, on this occasion, I had only brought on shore a present for one. This I now found myself under a necessity of dividing between them; but it happened to be pretty considerable, and both of them seemed satisfied. After this, we entertained them for about an hour with the performance of two French horns and a drum. But they seemed most pleased with the firing off a pistol, which Captain Clerke had in his pocket. Before I took my leave, the large piece of cloth was rolled up, and, with a few cocoa-nuts, presented to me.

The next morning, old Toobou returned my visit on board the ship. He also visited Captain Clerke; and if the present we made to him the evening before was scanty, the

deficiency was now made up. During this time, Mareewagee visited our people ashore; and Mr. King showed to him everything we had there. He viewed the cattle with great admiration; and the cross-cut saw fixed his attention for some time. Toward noon, Poulaho returned from the place where we had left him two days before, and brought with him his son, a youth about twelve years of age. I had his company at dinner; but the son, though present, was not allowed to sit down with him. It was very convenient to have him for my guest. For when he was present, which was generally the case while we staid here, every other native was excluded from the table, and but few of them would remain in the cabin. Whereas, if by chance it happened that neither he nor Feenou were on board, the inferior chiefs would be very importunate to be of our dining-party, or to be admitted into the cabin at that time; and then we were so crowded, that we could not sit down to a meal with any satisfaction. The king was very soon reconciled to our manner of cookery. But still, I believe he dined thus frequently with me more for the sake of what we gave him to drink, than what we set before him to eat. For he had taken a liking to our wine, could empty his bottle as well as most men, and was as cheerful over it. He now fixed his residence at the house, or *malace*, by our tent; and there he entertained our people this evening with a dance. To the surprise of everybody, the unwieldy Poulaho endeavoured to vie with others in that active amusement.

In the morning of the 15th, I received a message from old Toobou that he wanted to see me ashore. Accordingly, Omai and I went to wait upon him. We found him, like an ancient patriarch, seated under the shade of a tree, with a large piece of a cloth made in the island, spread out at full length before him, and a number of respectable-looking people sitting round it. He desired us to place ourselves by him; and then he told Omai that the cloth, together with a piece of red feathers, and about a dozen cocoa nuts, were his present to me. I thanked him for the favour, and desired he would go on board with me, as I had nothing on shore to give him in return. Omai now left me, being sent for by Poulaho; and, soon after, Feenou came and acquainted me that young Fattafaihe, Poulaho's son, desired to see me. I obeyed the summons, and found the prince and Omai sitting under a large canopy of the finer sort of cloth, with a piece of the coarser sort spread under them and before them, that was seventy-six yards long, and seven and a half broad. On one side was a large old boar, and on the other side a heap of cocoa-nuts. A number of people were seated round the cloth; and, amongst them, I observed Mareewagee and others of the first rank. I was desired to sit down by the prince, and then Omai informed me that he had been instructed by the king to tell me, that as he and I were friends, he hoped that his son might be joined in this friendship; and that, as a token of my consent, I would accept of his present. I very readily agreed to the proposal; and it being now dinner-time, I invited them all on board.

Accordingly, the young prince, Mareewagee, old Toobou, three or four inferior chiefs, and two respectable old ladies of the first rank, accompanied me. Mareewagee was dressed in a new piece of cloth, on the skirts of which were fixed six pretty large patches of red feathers. This dress seemed to have been made on purpose for this visit; for, as soon as he got on board, he put it off, and presented it to me; having, I guess, heard that it would be acceptable on account of the feathers. Every one of my visitors received from me such presents as I had reason to believe they were highly satisfied with. When dinner came upon table, not one of them would sit down or eat a bit of anything that was served up. On expressing my surprise at this, they were all *taboo*, as they said; which word has a very comprehensive meaning; but, in general, signifies that a thing is forbidden. Why they were laid under such restraints at present was not explained. Dinner being over, and having gratified their curiosity by showing to them every part of the ship, I then conducted them ashore. As soon as the boat reached the beach, Feenou and some others instantly stepped out. Young Fattafaihe following them, was called back by Mareewagee, who now paid the heir-apparent the same obeisance, and in the same manner that I had seen it paid to the king. And when old Toobou, and one of the old ladies had shown him the same marks of respect, he was suffered to land. This ceremony being over, the old people stepped from my boat into a canoe, that was waiting to carry them to their place of abode.

I was not sorry to be present on this occasion, as I was thus furnished with the most unequivocal proofs of the supreme dignity of Poulaho and his son over the other principal chiefs. Indeed, by this time I had acquired some certain information about the relative situations of the several great men, whose names have been so often mentioned. I now knew that Mareewagee and old Toobou were brothers. Both of them were men of great property in the island, and seemed to be in high estimation with the people ; the former, in particular, had the very honourable appellation given to him, by everybody, of *Motooa Tonga* ; that is to say, Father of Tonga, or of his country. The nature of his relationship to the king was also no longer a secret to us ; for we now understood that he was his father-in-law, Poulaho having married one of his daughters, by whom he had this son ; so that Mareewagee was the prince's grandfather. Poulaho's appearance having satisfied us that we had been under a mistake in considering Feenou as the sovereign of these islands, we had been at first much puzzled about his real rank ; but that was by this time ascertained. Feenou was one of Mareewagee's sons ; and Tooboneitoa was another.

On my landing, I found the king in the house adjoining to our tent, along with our people who resided on shore. The moment I got to him, he bestowed upon me a present of a large hog and a quantity of yams. About the dusk of the evening a number of men came, and having sat down in a round group, began to sing in concert with the music of bamboo drums, which were placed in the centre *. There were three long ones and two short. With these they struck the ground end-ways as before described. There were two others which lay on the ground, side by side, and one of them was split or shivered ; on these a man kept beating with two small sticks. They sung three songs while I staid ; and I was told, that after I left them the entertainment lasted till ten o'clock. They burned the leaves of the *wharra* palm for a light ; which is the only thing I ever saw them make use of for this purpose.

While I was passing the day in attendance on these great men, Mr. Anderson, with some others, made an excursion into the country, which furnished him with the following remarks :—"To the westward of the tent, the country is totally uncultivated for near two miles, though quite covered with trees and bushes in a natural state, growing with the greatest vigour. Beyond this is a pretty large plain, on which are some cocoa-trees, and a few small plantations that appear to have been lately made ; and seemingly on ground that has never been cultivated before. Near the creek which runs to the westward of the tent the land is quite flat, and partly overflowed by the sea every tide. When that retires, the surface is seen to be composed of coral rock, with holes of yellowish mud scattered up and down ; and toward the edges, where it is a little firmer, are innumerable little openings, from which issue as many small crabs of two or three different sorts, which swarm upon the spot as flies upon a carcass ; but are so nimble that, on being approached, they disappear in an instant, and baffle even the natives to catch any of them. At this place is a work of art, which shows that these people are capable of some design and perseverance when they mean to accomplish anything. This work begins, on one side, as a narrow causeway, which, becoming gradually broader, rises with a gentle ascent to the height of ten feet, where it is five paces broad, and the whole length seventy-four paces. Joined to this is a sort of circus, whose diameter is thirty paces, and not above a foot or two higher than the causeway that joins it, with some trees planted in the middle. On the opposite side, another causeway of the same sort descends ; but this is not above forty paces long, and is partly in ruin. The whole is built with large coral stones, with earth on the surface, which is quite overgrown with low trees and shrubs ; and, from its decaying in several places, seems to be of no modern date. Whatever may have been its use formerly, it seems to be of none now ; and all that we could learn of it from the natives was, that it belonged to Poulaho, and is called *Etchee*."

On the 16th, in the morning, after visiting the several works now carrying on ashore,

* The same sort of evening concert is performed round the house of the chief, or *Tanole*, at the Caroline Islands.

"Le *T. mole* ne s'endort qu'au bruit d'un concert de musique que forme une troupe de jeunes gens, qui s'assem-

blent le soir, autour de sa maison, et qui chantent, à leur manière," certaines poésies."—"Lettres Edifiantes et Curieuses," tom. xv. p. 314.

Mr. Gore and I took a walk into the country; in the course of which nothing remarkable appeared, but our having opportunities of seeing the whole process of making cloth, which is the principal manufacture of these islands, as well as of many others in this ocean. In the narrative of my first voyage *, a minute description is given of this operation as performed at Otahite; but the process here differing in some particulars, it may be worth while to give the following account of it.

The manufacturers, who are females, take the slender stalks or trunks of the paper-mulberry, which they cultivate for that purpose, and which seldom grows more than six or seven feet in height, and about four fingers in thickness. From these they strip the bark, and scrape off the outer rind with a muscle-shell. The bark is then rolled up to take off the convexity which it had round the stalk, and macerated in water for some time (they say a night). After this it is laid across the trunk of a small tree squared, and beaten with a square wooden instrument about a foot long, full of coarse grooves on all sides; but sometimes with one that is plain. According to the size of the bark, a piece is soon produced; but the operation is often repeated by another hand, or it is folded several times and beat longer, which seems rather intended to close than to divide its texture. When this is sufficiently effected, it is spread out to dry; the pieces being from four to six or more feet in length, and half as broad. They are then given to another person who joins the pieces, by smearing part of them over with the viscous juice of a berry called *to-oo*, which serves as a glue. Having been thus lengthened, they are laid over a large piece of wood, with a kind of stamp made of a fibrous substance pretty closely interwoven, placed beneath. They then take a bit of cloth and dip it in a juice expressed from the bark of a tree called *kokka*, which they rub briskly upon the piece that is making. This at once leaves a dull brown colour, and a dry gloss upon its surface; the stamp, at the same time, making a slight impression, that answers no other purpose that I could see but to make the several pieces that are glued together stick a little more firmly. In this manner they proceed, joining and staining by degrees, till they produce a piece of cloth of such length and breadth as they want; generally leaving a border of a foot broad at the sides, and longer at the ends, unstained. Throughout the whole, if any parts of the original pieces are too thin, or have holes, which is often the case, they glue spare bits upon them, till they become of an equal thickness. When they want to produce a black colour, they mix the soot procured from an oily nut called *doedooe*, with the juice of the *kokka*, in different quantities, according to the proposed depth of the tinge. They say that the black sort of cloth, which is commonly most glazed, makes a cold dress, but the other a warm one; and, to obtain strength in both, they are always careful to join the small pieces lengthwise, which makes it impossible to tear the cloth in any direction but one.

On our return from the country we met with Feenou, and took him and another young chief on board to dinner. When our fare was set upon the table, neither of them would eat a bit, saying that they were *taboo ayy*. But, after inquiring how the victuals had been dressed, having found that no *ayy* (water) had been used in cooking a pig and some yams, they both sat down and made a very hearty meal; and, on being assured that there was no water in the wine, they drank of it also. From this we conjectured that, on some account or another, they were, at this time, forbidden to use water; or, which was more probable, they did not like the water we made use of, it being taken up out of one of their bathing-places. This was not the only time of our meeting with people that were *taboo ayy*; but for what reason we never could tell with any degree of certainty.

Next day, the 17th, was fixed upon by Mareewagee for giving a grand *haira* or entertainment, to which we were all invited. For this purpose, a large space had been cleared before the temporary hut of this chief, near our post, as an area where the performances were to be exhibited. In the morning great multitudes of the natives came in from the country, every one carrying a pole about six feet long upon his shoulder; and at each end of every pole a yam was suspended. These yams and poles were deposited on each side of the area, so as to form two large heaps, decorated with different sorts of small fish, and piled up to the greatest advantage. They were Mareewagee's present to Captain Clerke

and me; and it was hard to say whether the wood for fuel or the yams for food were of most value to us. As for the fish, they might have pleased the sight, but were very offensive to the smell, part of them having been kept two or three days to be presented to us on this occasion.

Everything being thus prepared, about eleven o'clock they began to exhibit various dances, which they call *mai*. The music * consisted at first of seventy men as a chorus, who sat down; and amidst them were placed three instruments which we called drums, though very unlike them. They are large cylindrical pieces of wood, or trunks of trees from three to four feet long, some twice as thick as an ordinary-sized man, and some smaller, hollowed entirely out, but close at both ends, and open only by a chink about three inches broad, running almost the whole length of the drums; by which opening, the rest of the wood is certainly hollowed, though the operation must be difficult. This instrument is called *naffa*; and with the chink turned toward them, they sit and beat strongly upon it with two cylindrical pieces of hard wood about a foot long, and as thick as the wrist; by which means they produce a rude, though loud and powerful sound. They vary the strength and rate of their beating at different parts of the dance; and also change the tones by beating in the middle, or near the end of their drum.

The first dance consisted of four ranks, of twenty-four men each, holding in their hands a little thin, light, wooden instrument, above two feet long, and in shape not unlike a small oblong paddle. With these, which are called *pagge*, they made a great many different motions; such as pointing them toward the ground on one side, at the same time inclining their bodies that way, from which they were shifted to the opposite side in the same manner; then passing them quickly from one hand to the other, and twirling them about very dexterously; with a variety of other manœuvres, all which were accompanied by corresponding attitudes of the body. Their motions were at first slow, but quickened as the drums beat faster; and they recited sentences in a musical tone the whole time, which were answered by the chorus; but at the end of a short space they all joined, and finished with a shout.

After ceasing about two or three minutes, they began as before, and continued, with short intervals, above a quarter of an hour; when the rear rank dividing, shifted themselves very slowly round each end, and meeting in the front, formed the first rank; the whole number continuing to recite the sentences as before. The other ranks did the same successively, till that which at first was the front, became the rear; and the evolution continued, in the same manner, till the last rank regained its first situation. They then began a much quicker dance (though slow at first), and sang for about ten minutes, when the whole body divided into two parts, retreated a little, and then approached, forming a sort of circular figure, which finished the dance; the drums being removed, and the chorus going off the field at the same time.

The second dance had only two drums, with forty men for a chorus; and the dancers, or rather actors, consisted of two ranks, the foremost having seventeen, and the other fifteen persons. Feenou was at their head, or in the middle of the front rank, which is the principal place in these cases. They danced and recited sentences, with some very short intervals, for about half an hour, sometimes quickly, sometimes more slowly, but with such a degree of exactness, as if all the motions were made by one man, which did them great credit. Near the close, the back rank divided, came round, and took the place of the front, which again assumed its situation, as in the first dance; and when they finished, the drums and chorus, as before, went off.

Three drums (which, at least, took two, and sometimes three men to carry them) were now brought in; and seventy men sat down as a chorus to the third dance. This consisted of two ranks, of sixteen persons each, with a young Toobou at their head, who was richly ornamented with a sort of garment covered with red feathers. These danced, sung, and twirled the *pagge*, as before; but in general, much quicker, and performed so well, that they had the constant applauses of the spectators. A motion that met with particular

* Mr. Anderson's description of the entertainments of this day being much fuller than Captain Cook's, it has been adopted, as on a former occasion.

approbation, was one in which they held the face aside, as if ashamed, and the *page* before it. The back rank closed before the front one, and that again resumed its place, as in the two former dances; but then they began again, formed a triple row, divided, retreated to each end of the area, and left the greatest part of the ground clear. At that instant, two men entered very hastily, and exercised the clubs which they use in battle. They did this, by first twirling them in their hands, and making circular strokes before them with great force and quickness; but so skilfully managed, that, though standing quite close, they never interfered. They shifted their clubs from hand to hand, with great dexterity; and after continuing a little time, kneeled, and made different motions, tossing the clubs up in the air, which they caught as they fell, and then went off as hastily as they entered. Their heads were covered with pieces of white cloth, tied at the crown (almost like a night-cap, with a wreath of foliage round the forehead; but they had only very small pieces of white cloth tied about their waists; probably, that they might be cool, and free from every incumbrance or weight. A person with a spear, dressed like the former, then came in, and in the same hasty manner; looking about eagerly, as if in search of somebody to throw it at. He then ran hastily to one side of the crowd in the front, and put himself in a threatening attitude, as if he meant to strike with his spear at one of them, bending the knee a little, and trembling, as it were with rage. He continued in this manner only a few seconds, when he moved to the other side, and having stood in the same posture there, for the same short time, retreated from the ground, as fast as when he made his appearance. The dancers, who had divided into two parties, kept repeating something slowly all this while; and now advanced, and joined again, ending with universal applause. It should seem, that this dance was considered as one of their capital performances, if we might judge from some of the principal people being engaged in it. For one of the drums was beat by Futtafaihe, the brother of Poulaho, another by Feenou, and the third, which did not belong to the chorus, by Marceewagee himself, at the entrance of his hut.

The last dance had forty men, and two drums, as a chorus. It consisted of sixty men, who had not danced before, disposed in three rows, having twenty-four in front. But, before they began, we were entertained with a pretty long preliminary harangue, in which the whole body made responses to a single person who spoke. They recited sentences (perhaps verses) alternately with the chorus, and made many motions with the *page*, in a very brisk mode, which were all applauded with *marceai!* and *fufage!* words expressing two different degrees of praise. They divided into two bodies, with their backs to each other; formed again, shifted their ranks as in the other dances; divided and retreated, making room for two champions, who exercised their clubs as before; and after them two others: the dancers, all the time, reciting slowly in turn with the chorus; after which they advanced, and finished.

These dances, if they can properly be called so, lasted from eleven till near three o'clock; and though they were doubtless intended particularly either in honour of us, or to show a specimen of their dexterity, vast numbers of their own people attended as spectators. Their numbers could not be computed exactly, on account of the inequality of the ground; but, by reckoning the inner circle, and the number in depth, which was between twenty and thirty in many places, we supposed that there must be near four thousand. At the same time, there were round the trading place at the tent, and straggling about, at least as many more; and some of us computed, that, at this time, there were not less than ten or twelve thousand people in our neighbourhood; that is, within the compass of a quarter of a mile; drawn together, for the most part, by mere curiosity. It is with regret I mention, that we could not understand what was spoken, while we were able to see what was acted in these amusements. This, doubtless, would have afforded us much information as to the genius and customs of these people. It was observable, that, though the spectators always approved of the various motions, when well made, a great share of the pleasure they received seemed to arise from the sentimental part, or what the performers delivered in their speeches. However, the mere acting part, independently of the sentences repeated, was well worth our notice, both with respect to the extensive plan on which it was executed, and to the various motions, as well as the exact unity, with which they were

performed. But neither pencil nor pen can describe the numerous actions and motions, the singularity of which was not greater, than was the ease and gracefulness with which they were performed.

At night we were entertained with the *bomai*, or night dances, on a space before Feenou's temporary habitation. They lasted about three hours; in which time we had about twelve of them performed, much after the same manner as those at Hapace. But in two that were performed by women, a number of men came and formed a circle within theirs. And, in another, consisting of twenty-four men, there were a number of motions with the hands, that we had not seen before, and were highly applauded. The music was also once changed, in the course of the night; and in one of the dances, Feenou appeared at the head of fifty men who had performed at Hapace, and he was well dressed with linen, a large piece of gauze, and some little pictures hung round his neck. But it was evident, after the diversions were closed, that we had put these poor people, or rather that they had put themselves, to much inconvenience. For being drawn together on this uninhabited part of their island, numbers of them were obliged to lie down and sleep under the bushes, by the side of a tree, or of a canoe; nay, many either lay down in the open air, which they are not fond of, or walked about all the night.

The whole of this entertainment was conducted with far better order, than could have been expected in so large an assembly. Amongst such a multitude, there must be a number of ill-disposed people; and we hourly experienced it. All our care and attention did not prevent their plundering us, in every quarter; and that, in the most daring and insolent manner. There was hardly anything that they did not attempt to steal; and yet, as the crowd was always so great, I would not allow the sentries to fire, lest the innocent should suffer for the guilty. They once, at noon-day, ventured to aim at taking an anchor from off the *Discovery's* bows; and they would certainly have succeeded, if the flock had not hooked one of the chain-plates in lowering down the ship's side, from which they could not disengage it by hand; and tackles were things they were unacquainted with. The only act of violence they were guilty of, was the breaking the shoulder-bone of one of our goats, so that she died soon after. This loss fell upon themselves, as she was one of those that I intended to leave upon the island; but of this, the person who did it, was ignorant. Early in the morning of the 18th, an incident happened, that strongly marked one of their customs. A man got out of a canoe into the quarter gallery of the *Resolution*, and stole from thence a pewter basin. He was discovered, pursued, and brought alongside the ship. On this occasion, three old women, who were in the canoe, made loud lamentations over the prisoner, beating their breasts and faces in a most violent manner, with the inside of their fists; and all this was done without shedding a tear. This mode of expressing grief is what occasions the mark which almost all this people bear on the face, over the cheek-bones. The repeated blows which they inflict upon this part, abrade the skin, and make even the blood flow out in a considerable quantity; and when the wounds are recent, they look as if a hollow circle had been burnt in. On many occasions, they actually cut this part of the face with an instrument; in the same manner as the people of Otaheite cut their heads.

This day, I bestowed on Mareewagee some presents, in return for those we had received from him the day before; and as the entertainments which he had then exhibited for our amusement, called upon us to make some exhibition in our way, I ordered the party of marines to go through their exercise, on the spot where his dances had been performed; and, in the evening, played off some fire-works at the same place. Poulaho, with all the principal chiefs, and a great number of people, of all denominations, were present. The platoon firing, which was executed tolerably well, seemed to give them pleasure; but they were lost in astonishment when they beheld our water rockets. They paid but little attention to the fife and drum, or French horns, that played during the intervals. The king sat behind everybody, because no one is allowed to sit behind him; and that his view might not be obstructed, nobody sat immediately before him; but a lane, as it were, was made by the people from him, quite down to the space allotted for the fire-works.

In expectation of this evening show, the circle of natives about our tent being pretty large,

they were engaged, the greatest part of the afternoon, in boxing and wrestling; the first of which exercises they call *fangatooa*, and the second *foohoo*. When any of them chooses to wrestle, he gets up from one side of the ring, and crosses the ground in a sort of measured pace, clapping smartly on the elbow-joint of one arm, which is bent, and produces a hollow sound; that is reckoned the challenge. If no person comes out from the opposite side to engage him, he returns, in the same manner, and sits down; but sometimes stands clapping in the midst of the ground, to provoke some one to come out. If an opponent appear, they come together with marks of the greatest good-nature, generally smiling, and taking time to adjust the piece of cloth which is fastened round the waist. They then lay hold of each other by this girdle, with a hand on each side; and he who succeeds in drawing his antagonist to him, immediately tries to lift him upon his breast, and throw him upon his back; and if he be able to turn round with him two or three times, in that position, before he throws him, his dexterity never fails of procuring plaudits from the spectators. If they be more equally matched, they close soon, and endeavour to throw each other by entwining their legs, or lifting each other from the ground; in which struggles they show a prodigious exertion of strength, every muscle, as it were, being ready to burst with straining. When one is thrown, he immediately quits the field, but the victor sits down for a few seconds, then gets up, and goes to the side he came from, who proclaim the victory aloud, in a sentence delivered slowly, and in a musical cadence. After sitting a short space, he rises again and challenges; when sometimes several antagonists make their appearance; but he has the privilege of choosing which of them he pleases to wrestle with; and has likewise the preference of challenging again, if he should throw his adversary, until he himself be vanquished; and then the opposite side sing the song of victory in favour of their champion. It also often happens, that five or six rise from each side, and challenge together; in which case, it is common to see three or four couple engaged on the field at once. But it is astonishing to see what temper they preserve in this exercise; for we observed no instances of their leaving the spot with the least displeasure in their countenances. When they find that they are so equally matched as not to be likely to throw each other, they leave off by mutual consent. And if the fall of one is not fair, or if it does not appear very clearly who has had the advantage, both sides sing the victory, and then they engage again. But no person, who has been vanquished, can engage with his conqueror a second time.

The boxers advance side ways, changing the side at every pace, with one arm stretched fully out before, the other behind; and holding a piece of cord in one hand, which they wrap firmly about it, when they find an antagonist, or else have done so before they enter. This, I imagine, they do, to prevent a dislocation of the hand or fingers. Their blows are directed chiefly to the head; but sometimes to the sides; and are dealt out with great activity. They shift sides, and box equally well with both hands. But one of their favourite and most dexterous blows, is, to turn round on their heel, just as they have struck their antagonist, and to give him another very smart one with the other hand backward. The boxing-matches seldom last long; and the parties either leave off together, or one acknowledges his being beat. But they never sing the song of victory in these cases, unless one strikes his adversary to the ground; which shows, that, of the two, wrestling is their most approved diversion. Not only boys engage, in both the exercises, but frequently little girls box very obstinately for a short time. In all which cases, it doth not appear that they ever consider it as the smallest disgrace to be vanquished; and the person overcome sits down, with as much indifference, as if he had never entered the lists. Some of our people ventured to contend with them in both exercises, but were always worsted; except in a few instances, where it appeared, that the fear they were in of offending us contributed more to the victory, than the superiority of the person they engaged.

The cattle, which we had brought, and which were all on shore, however carefully guarded, I was sensible, ran no small risk, when I considered the thievish disposition of many of the natives, and their dexterity in appropriating to themselves, by stealth, what they saw no prospect of obtaining by fair means. For this reason, I thought it prudent to declare my intention of leaving behind me some of our animals; and even to make a distribution of them previously to my departure. With this view, in the evening of the 19th,

I assembled all the chiefs before our house, and my intended presents to them were marked out. To Poulaho, the king, I gave a young English bull and cow; to Mareewagee, a Cape ram, and two ewes; and to Feenou, a horse and a mare. As my design, to make such a distribution, had been made known the day before, most of the people in the neighbourhood were then present, I instructed Omai to tell them, that there were no such animals within many months' sail of their island; that we had brought them, for their use, from that immense distance, at a vast trouble and expense; that, therefore, they must be careful not to kill any of them till they had multiplied to a numerous race; and, lastly, that they and their children ought to remember, that they had received them from the men of *Britane*. He also explained to them their several uses, and what else was necessary for them to know, or rather as far as he knew; for Omai was not very well versed in such things himself. As I intended that the above presents should remain with the other cattle, till we were ready to sail, I desired each of the chiefs to send a man or two to look after their respective animals, along with my people, in order that they might be better acquainted with them, and with the manner of treating them. The king and Feenou did so; but neither Mareewagee, nor any other person for him, took the least notice of the sheep afterwards; nor did old Toobon attend at this meeting, though he was invited, and was in the neighbourhood. I had meant to give him the goats, viz. a ram and two ewes; which, as he was so indifferent about them, I added to the king's share.

It soon appeared, that some were dissatisfied with this allotment of our animals; for early next morning, one of our kids and two turkey cocks were missing. I could not be so simple as to suppose, that this was merely an accidental loss; and I was determined to have them again. The first step I took was to seize on three canoes that happened to be alongside the ships. I then went ashore, and having found the king, his brother, Feenou, and some other chiefs in the house that we occupied; I immediately put a guard over them, and gave them to understand, that they must remain under restraint, till not only the kid and the turkeys, but the other things that had been stolen from us, at different times, were restored. They concealed, as well as they could, their feelings, on finding themselves prisoners; and, having assured me, that everything should be restored, as I desired, sat down to drink their *kava*, seemingly much at their ease. It was not long before an axe, and an iron wedge, were brought to me. In the meantime, some armed natives began to gather behind the house; but, on a part of our guard marching against them, they dispersed; and I advised the chiefs to give orders that no more should appear. Such orders were accordingly given by them, and they were obeyed. On asking them to go aboard with me to dinner, they readily consented. But some having afterward objected to the king's going, he instantly rose up, and declared he would be the first man. Accordingly we came on board. I kept them there till near four o'clock, when I conducted them ashore; and soon after, the kid and one of the turkey-cocks were brought back. The other they said should be restored the next morning. I believed this would happen, and released both them and the canoes.

After the chiefs had left us, I walked out with Omai, to observe how the people about us fared; for this was the time of their meals. I found that, in general, they were at short commons. Nor is this to be wondered at, since most of the yams and other provisions which they brought with them were sold to us; and they never thought of returning to their own habitations, while they could find any sort of subsistence in our neighbourhood. Our station was upon an uncultivated point of land; so that there were none of the islanders who, properly, resided within half-a-mile of us. But even at this distance, the multitude of strangers being so great, one might have expected that every house would have been much crowded. It was quite otherwise. The families residing there were as much left to themselves as if there had not been a supernumerary visitor near them. All the strangers lived in little temporary sheds, or under trees and bushes; and the cocoa-trees were stripped of their branches to erect habitations for the chiefs. In this walk we met with about half-a-dozen women in one place at supper. Two of the company, I observed, being fed by the others; on our asking the reason, they said *taboo mattee*. On farther inquiry we found that

one of them had, two months before, washed the dead corpse of a chief; and that, on this account, she was not to handle any food for five months. The other had performed the same office to the corpse of another person of inferior rank, a id was now under the same restriction, but not for so long a time. At another place hard by, we saw another woman fed; and we learned that she had assisted in washing the corpse of the above-mentioned chief.

Early the next morning, the king came on board to invite me to an entertainment, which he proposed to give the same day. He had already been under the barber's hands; his head being all besmeared with red pigment, in order to redden his hair, which was naturally of a dark brown colour. After breakfast I attended him to the shore; and we found his people very busy in two places, in the front of our area, fixing, in an upright and square position, thus [C], four very long posts, near two feet from each other. The space between the posts was afterward filled up with yams; and as they went on filling it, they fastened pieces of sticks across, from post to post, at the distance of about every four feet, to prevent the posts from separating by the weight of the inclosed yams, and also to get up by. When the yams had reached the top of the first posts, they fastened others to them, and so continued till each pile was the height of thirty feet or upward. On the top of one they placed two baked hogs; and on the top of the other, a living one; and another they tied by the legs half-way up. It was matter of curiosity to observe with what facility and despatch these two piles were raised. Had our seamen been ordered to execute such a work, they would have sworn that it could not be performed without carpenters; and the carpenters would have called to their aid a dozen different sorts of tools, and have expended, at least, a hundred-weight of nails; and, after all, it would have employed them as many days as it did these people hours. But seamen, like most other amphibious animals, are always the most helpless on land. After they had completed these two piles, they made several other heaps of yams and bread-fruit on each side of the area; to which were added a turtle and a large quantity of excellent fish. All this, with a piece of cloth, a mat, and some red feathers, was the king's present to me; and he seemed to pique himself on exceeding, as he really did, Feenou's liberality, which I experienced at Hapace.

About one o'clock they began the *mai*, or dances; the first of which was almost a copy of the first that was exhibited at Mareewagee's entertainment. The second was conducted by Captain Furneaux's Toobou, who, as we mentioned, had also danced there; and in this, four or five women were introduced, who went through the several parts with as much exactness as the men. Toward the end, the performers divided to leave room for two champions, who exercised their clubs as described on a former occasion. And, in the third dance, which was the last now presented, two more men with their clubs displayed their dexterity. The dances were succeeded by wrestling and boxing; and one man entered the lists with a sort of club made from the stem of a cocoa-leaf, which is firm and heavy, but could find no antagonist to engage him at so rough a sport. At night we had the *bomai* repeated; in which Poulaho himself danced, dressed in English manufacture. But neither these nor the dances in the daytime were so considerable, nor carried on with so much spirit as Feenou's or Mareewagee's; and, therefore, there is less occasion to be more particular in our description of them. In order to be present the whole time, I dined ashore. The king sat down with us; but he neither ate nor drank. I found that this was owing to the

presence of a female, whom, at his desire, I had admitted to the dining party; and who, as we afterwards understood, had superior rank to himself. As soon as this great personage had dined, she stepped up to the king, who put his hands to her feet, and then she retired. He immediately dipped his fingers into a glass of wine, and then received the obeisance of all her followers. This was the single instance we ever observed of his paying this mark of reverence to any person. At the king's desire, I ordered some fire-works to be played off in the evening; but, unfortunately, being damaged, this exhibition did not answer expectation.

CHAPTER VIII.—SOME OF THE OFFICERS PLUNDERED BY THE NATIVES.—A FISHING PARTY.—A VISIT TO POULAHU.—A FIATOOKA DESCRIBED.—OBSERVATIONS ON THE COUNTRY ENTERTAINMENT AT POULAHU'S HOUSE.—HIS MOURNING CEREMONY.—OF THE KAVA PLANT, AND THE MANNER OF PREPARING THE LIQUOR.—ACCOUNT OF ONEVY, A LITTLE ISLAND.—ONE OF THE NATIVES WOUNDED BY A SENTINEL.—MESSRS. KING AND ANDERSON VISIT THE KING'S BROTHER.—THEIR ENTERTAINMENT.—ANOTHER MOURNING CEREMONY.—MANNER OF PASSING THE NIGHT.—REMARKS ON THE COUNTRY THEY PASSED THROUGH. PREPARATIONS MADE FOR SAILING.—AN ECLIPSE OF THE SUN, IMPERFECTLY OBSERVED.—MR. ANDERSON'S ACCOUNT OF THE ISLAND, AND ITS PRODUCTIONS.

As no more entertainments were to be expected on either side, and the curiosity of the populace was by this time pretty well satisfied; on the day after Poulahu's *haiea* most of them left us. We still, however, had thieves about us; and, encouraged by the negligence of our own people, we had continual instances of their depredations. Some of the officers, belonging to both ships, who had made an excursion into the interior parts of the island, without my leave, and, indeed, without my knowledge, returned this evening, after an absence of two days. They had taken with them their muskets, with the necessary ammunition, and several small articles of the favourite commodities; all which the natives had the dexterity to steal from them in the course of their expedition. This affair was likely to be attended with inconvenient consequences. For our plundered travellers upon their return, without consulting me, employed Omai to complain to the king of the treatment they had met with. He, not knowing what step I should take, and, from what had already happened, fearing lest I might lay him again under restraint, went off early the next morning. His example was followed by Feenou; so that we had not a chief, of any authority, remaining in our neighbourhood. I was very much displeased at this, and reprimanded Omai for having presumed to meddle. This reprimand put him upon his mettle to bring his friend Feenou back; and he succeeded in the negotiation; having this powerful argument to urge, that he might depend upon my using no violent measures to oblige the natives to restore what had been taken from the gentlemen. Feenou, trusting to this declaration, returned toward the evening; and, encouraged by his reception, Poulahu favoured us with his company the day after. Both these chiefs, upon this occasion, very justly observed to me, that if any of my people at any time wanted to go into the country, they ought to be acquainted with it; in which case they would send proper people along with them; and then they would be answerable for their safety. And I am convinced, from experience, that by taking this very reasonable precaution, a man and his property may be as safe among these islanders, as in other parts of the more civilised world. Though I gave myself no trouble about the recovery of the things stolen upon this occasion, most of them, through Feenou's interposition, were recovered; except one musket and a few other articles of inferior value. By this time also we had recovered the turkey-cock and most of the tools, and other matters, that had been stolen from our workmen.

On the 25th, two boats, which I had sent to look for a channel, by which we might most commodiously get to sea, returned. The masters, who commanded them, reported that the channel to the north, by which we came in, was highly dangerous, being full of coral rocks from one side to the other; but that, to the eastward, there was a very good channel; which, however, was very much contracted in one place by the small islands: so that a leading

wind would be requisite to get through it; that is, a westerly wind, which we had found did not often blow here. We had now recruited the ships with wood and water; we had finished the repairs of our sails; and had little more to expect from the inhabitants of the produce of their island. However, as an eclipse of the sun was to happen upon the 5th of the next month, I resolved to defer sailing till that time had elapsed, in order to have a chance of observing it.

Having, therefore, some days of leisure before me, a party of us, accompanied by Poulaho, set out early next morning in a boat, for Mooa, the village where he and the other great men usually reside. As we rowed up the inlet, we met with fourteen canoes fishing in company, in one of which was Poulaho's son. In each canoe was a triangular net, extended between two poles; at the lower end of which was a cod to receive and secure the fish. They had already caught some fine mullets; and they put about a dozen into our boat. I desired to see their method of fishing; which they readily complied with. A shoal of fish was supposed to be upon one of the banks, which they instantly inclosed in a long net like a seine, or set-net. This the fishers, one getting into the water out of each boat, surrounded with the triangular nets in their hands; with which they scooped the fish out of the seine, or caught them as they attempted to leap over it. They showed us the whole process of this operation (which seemed to be a sure one), by throwing in some of the fish they had already caught; for at this time, there happened to be none upon the bank that was inclosed.

Leaving the prince and his fishing party, we proceeded to the bottom of the bay, and landed where we had done before, on our fruitless errand to see Mareewagee. As soon as we got on shore, the king desired Omai to tell me, that I need be under no apprehensions about the boat, or anything in her, for not a single article would be touched by any one; and we afterward found this to be the case. We were immediately conducted to one of Poulaho's houses not far off, and near the public one, or *malae*, in which we had been when we first visited Mooa. This, though pretty large, seemed to be his private habitation, and was situated within a plantation. The king took his seat at one end of the house, and the people, who came to visit him, sat down as they arrived, in a semicircle at the other end. The first thing done, was to prepare a bowl of *kava*, and to order some yams to be baked for us. While these were getting ready, some of us, accompanied by a few of the king's attendants, and Omai as our interpreter, walked out to take a view of a *fiatooka*, or burying-place, which we had observed to be almost close by the house, and was much more extensive, and seemingly of more consequence, than any we had seen at the other islands. We were told, that it belonged to the king. It consisted of three pretty large houses, situated upon a rising ground, or rather just by the brink of it, with a small one at some distance, all ranged longitudinally. The middle house of the three first was by much the largest, and placed in a square, twenty-four paces by twenty-eight, raised about three feet. The other houses were placed on little mounts, raised artificially to the same height. The floors of these houses, as also the tops of the mounts round them, were covered with loose fine pebbles, and the whole was inclosed by large flat stones* of hard coral rock, properly hewn, placed on their edges; one of which stones measured twelve feet in length, two in breadth, and above one in thickness. One of the houses, contrary to what we had seen before, was open on one side; and within it were two rude wooden busts of men; one near the entrance, and the other farther in. On inquiring of the natives who had followed us to the ground, but durst not enter here, what these images were intended for, they made us as sensible as we could wish, that they were merely memorials of some chiefs who had been buried there, and not the representations of any deity. Such monuments, it should seem, are seldom raised; for these had probably been erected several ages ago. We were told that the dead had been buried in each of these houses, but no marks of this appeared. In one of them was the carved head of an Otaheite canoe, which had been driven ashore on their coast, and deposited here. At the foot of the rising ground was a large area, or grass-plot, with different trees planted about it; amongst which were several of those called *etoea*, very large. These, as they resemble the

* The burying-places of the chiefs at the Caroline Islands, are also inclosed in this manner. See "Lettres Edifiantes et Curieuses," tom. xv. p. 309.

cypress, had a fine effect in such a place. There was also a row of low palms near one of the houses, and behind it a ditch, in which lay a great number of old baskets.

After dinner, or rather after we had refreshed ourselves with some provisions which we had brought with us from our ship, we made an excursion into the country, taking a pretty large circuit, attended by one of the king's ministers. Our train was not great, as he would not suffer the rabble to follow us. He also obliged all those whom we met upon our progress, to sit down till we had passed; which is a mark of respect due only to their sovereigns. We found by far the greatest part of the country cultivated, and planted with various sorts of productions; and most of these plantations were fenced round. Some spots, where plantations had been formerly, now produced nothing, lying fallow; and there were places that had never been touched, but lay in a state of nature; and yet, even these were useful in affording them timber, as they were generally covered with trees. We met with several large uninhabited houses, which we were told belonged to the king. There were many public and well-beaten roads, and abundance of foot-paths leading to every part of the island. The roads being good and the country level, travelling was very easy. It is remarkable, that when we were on the most elevated parts, at least a hundred feet above the level of the sea, we often met with the same coral rock which is found at the shore, projecting above the surface, and perforated and cut into all those inequalities which are usually seen in rocks that lie within the wash of the tide. And yet these very spots, with hardly any soil upon them, were covered with luxuriant vegetation. We were conducted to several little pools, and to some springs of water; but in general, they were either stinking or brackish, though recommended to us by the natives as excellent. The former were mostly inland, and the latter, near the shore of the bay, and below high-water mark; so that tolerable water could be taken up from them only when the tide was out.

When we returned from our walk, which was not till the dusk of the evening, our supper was ready. It consisted of a baked hog, some fish, and yams, all excellently well cooked, after the method of these islands. As there was nothing to amuse us after supper, we followed the custom of the country, and lay down to sleep, our beds being mats spread upon the floor, and cloth to cover us. The king, who had made himself very happy with some wine and brandy which we had brought, slept in the same house, as well as several others of the natives. Long before daybreak, he and they all rose, and sat conversing by moonlight. The conversation, as might well be guessed, turned wholly upon us; the king entertaining his company with an account of what he had seen, or remarked. As soon as it was day they dispersed, some one way and some another; but it was not long before they all returned, and with them several more of their countrymen. They now began to prepare a bowl of *kava*; and, leaving them so employed, I went to pay a visit to Toobon, Captain Furneaux's friend, who had a house hard by, which for size and neatness, was exceeded by few in the place. As I had left the others, so I found here a company preparing a morning draught. This chief made a present to me of a living hog, a baked one, a quantity of yams, and a large piece of cloth. When I returned to the king, I found him and his circle of attendants, drinking the second bowl of *kava*. That being emptied, he told Omai, that he was going presently to perform a mourning ceremony, called *Tooge*, on account of a son who had been dead some time; and he desired us to accompany him. We were glad of the opportunity, expecting to see somewhat new or curious.

The first thing the chief did, was to step out of the house, attended by two old women, and put on a new suit of clothes, or rather a new piece of cloth, and over it an old ragged mat, that might have served his great-grandfather on some such occasion. His servants, or those who attended him, were all dressed in the same manner, excepting that none of their mats could vie in antiquity with that of their master. Thus equipped we marched off, preceded by about eight or ten persons, all in the above habits of ceremony, each of them, besides, having a small green bough about his neck. Poulaho held his bough in his hand till we drew near the place of rendezvous, when he also put it about his neck. We now entered a small inclosure in which was a neat house, and we found one man sitting before it. As the company entered they pulled off the green branches from round their necks, and threw them away. The king having first seated himself, the others sat down before him in

the usual manner. The circle increased by others dropping in to the number of a hundred or upward, mostly old men, all dressed as above described. The company being completely assembled, a large root of *kava*, brought by one of the king's servants, was produced, and a bowl which contained four or five gallons. Several persons now began to chew the root, and this bowl was made brimful of liquor. While it was preparing others were employed in making drinking-cups of plantain leaves. The first cup that was filled was presented to the king, and he ordered it to be given to another person. The second was also brought to him, which he drank, and the third was offered to me. Afterward, as each cup was filled, the man who filled it asked who was to have it? Another then named the person, and to him it was carried. As the bowl grew low, the man who distributed the liquor seemed rather at a loss to whom cups of it should be next sent, and frequently consulted those who sat near him. This mode of distribution continued while any liquor remained; and though not half the company had a share, yet no one seemed dissatisfied. About half-a-dozen cups served for all; and each, as it was emptied, was thrown down upon the ground, where the servants picked it up, and carried it to be filled again. During the whole time the chief and his circle sat, as was usually the case, with a great deal of gravity, hardly speaking a word to each other. We had long waited in expectation each moment of seeing the mourning ceremony begin; when, soon after the *kava* was drank out, to our great surprise and disappointment they all rose up and dispersed; and Poulaho told us he was now ready to attend us to the ships. If this was a mourning ceremony, it was a strange one. Perhaps it was the second, third, or fourth mourning; or, which was not very uncommon, Omai might have misunderstood what Poulaho said to him. For, excepting the change of dress, and the putting the green bough round their necks, nothing seemed to have passed at this meeting but what we saw them practise too frequently every day.

"* We had seen the drinking of *kava* sometimes at the other island, but by no means so frequently as here, where it seems to be the only forenoon employment of the principal people. The *kava* is a species of pepper which they cultivate for this purpose, and esteem it a valuable article, taking great care to defend the young plants from any injury; and it is commonly planted about their houses. It seldom grows to more than a man's height; though I have seen some plants almost double that. It branches considerably, with large heart-shaped leaves and jointed stalks. The root is the only part that is used at the Friendly Islands, which being dug up, is given to the servants that attend, who, breaking it in pieces, scrape the dirt off with a shell or bit of stick, and then each begins and chews his portion, which he spits into a piece of plantain leaf. The person who is to prepare the liquor, collects all these mouthfuls, and puts them into a large wooden dish or bowl, adding as much water as will make it of a proper strength. It is then well mixed up with the hands; and some loose stuff, of which mats are made, is thrown upon the surface, which intercepts the fibrous part, and is wrung hard to get as much liquid out from it as is possible. The manner of distributing it need not be repeated. The quantity which is put into each cup, is commonly about a quarter of a pint. The immediate effect of this beverage is not perceptible on these people, who use it so frequently; but on some of ours who ventured to try it, though so hastily prepared, it had the same power as spirits have in intoxicating them; or rather, it produced that kind of stupefaction which is the consequence of using opium, or other substances of that kind. It should be observed, at the same time, that though these islanders have this liquor always fresh prepared, and I have seen them drink it seven times before noon, it is, nevertheless, so disagreeable, or at least seems so, that the greatest part of them cannot swallow it without making wry faces, and shuddering afterward."

As soon as this mourning ceremony was over, we left Moota, and set out to return to the ships. While we rowed down the lagoon or inlet, we met with two canoes coming in from fishing. Poulaho ordered them to be called alongside our boat, and took from them every fish and shell they had got. He afterward stopped two other canoes and searched them, but they had nothing. Why this was done I cannot say, for we had plenty of provisions in the boat. Some of this fish he gave to me; and his servants sold the rest on board the ship. As we proceeded down the inlet, we overtook a large sailing-canoe. Every person on board

* The following account of *kava*, to the end of this paragraph, is inserted from Mr. Anderson's journal.

her that was upon his legs when we came up, sat down till we had passed; even the man who steered, though he could not manage the helm except in a standing posture.

Poulaho and others having informed me that there was some excellent water on Onevy, a little island which lies about a league off the mouth of the inlet, and on the north side of the eastern channel, we landed there in order to taste it. But I found it to be as brackish as most that we had met with. This island is quite in a natural state, being only frequented as a fishing-place, and has nearly the same productions as Palmerston's Island, with some *etoea* trees. After leaving Onevy, where we dined, in our way to the ship, we took a view of a curious coral rock, which seems to have been thrown upon the reef where it stands. It is elevated about ten or twelve feet above the surface of the sea that surrounds it. The base it rests upon is not above one-third of the circumference of its projecting summit, which I judged to be about one hundred feet, and is covered with *etoea* and *pandanus* trees.

When we got on board the ship, I found that everything had been quiet during my absence, not a theft having been committed; of which Feenou and Futtafaihe, the king's brother, who had undertaken the management of his countrymen, boasted not a little. This shows what power the chiefs have when they have the will to execute it, which we were seldom to expect, since whatever was stolen from us, generally, if not always, was conveyed to them. The good conduct of the natives was of short duration; for the next day six or eight of them assaulted some of our people who were sawing planks. They were fired upon by the sentry; and one was supposed to be wounded, and three others taken. These I kept confined till night, and did not dismiss them without punishment. After this they behaved with a little more circumspection, and gave us much less trouble. This change of behaviour was certainly occasioned by the man being wounded; for, before they had only been told of the effect of fire-arms, but now they had felt it. The repeated insolence of the natives had induced me to order the muskets of the sentries to be loaded with small-shot, and to authorise them to fire on particular occasions. I took it for granted, therefore, that this man had only been wounded with small-shot. But Mr. King and Mr. Anderson, in an excursion into the country, met with him, and found indubitable marks of his having been wounded, but not dangerously, with a musket-ball. I never could find out how this musket happened to be charged with ball; and there were people enough ready to swear that its contents were only small-shot.

Mr. Anderson's account of the excursion just mentioned, will fill up an interval of two days, during which nothing of note happened at the ships:—"Mr. King and I went, on the 30th, along with Futtafaihe as visitors to his house, which is at Mooa, very near that of his brother, Poulaho. A short time after we arrived, a pretty large hog was killed; which is done by repeated strokes on the head. The hair was then scraped off very dexterously with the sharp edge of pieces of split bamboo; taking the entrails out at a large oval hole cut in the belly by the same simple instrument. Before this, they had prepared an oven; which is a large hole dug in the earth, filled at the bottom with stones about the size of the fist, over which a fire is made till they are red-hot. They took some of these stones wrapped up in leaves of the bread-fruit tree, and filled the hog's belly, stuffing in a quantity of leaves to prevent their falling out, and putting a plug of the same kind in the anus. The carcase was then placed on some sticks laid across the stones in a sitting posture, and covered with a great quantity of plantain leaves. After which they dug up the earth all round; and having thus effectually closed the oven, the operation of baking required no farther interference.

"In the mean time we walked about the country, but met with nothing remarkable except a *fiatooka* of one house, standing on an artificial mount, at least thirty feet high. A little on one side of it was a pretty large open area; and, not far off, was a good deal of uncultivated ground; which, on inquiring why it lay waste, our guides seemed to say, belonged to the *fiatooka* (which was Poulaho's), and was not by any means to be touched. There was also, at no great distance, a number of *etoea* trees, on which hung vast numbers of the large *ternate* bats, making a disagreeable noise. We could not kill any at this time for want of muskets; but some that were got at Annamooka measured near three feet when the wings were extended. On our returning to Futtafaihe's house, he ordered the hog that had

been dressed to be produced, with several baskets of baked yams, and some cocoa-nuts. But we found, that instead of his entertaining us, we were to entertain him; the property of the feast being entirely transferred to us as his guests, and we were to dispose of it as we pleased. The same person who cleaned the hog in the morning now cut it up (but not before we desired him,) in a very dexterous manner, with a knife of split bamboo; dividing the several parts, and hitting the joints with a quickness and skill that surprised us very much. The whole was set down before us, though at least fifty pounds weight, until we took a small piece away, and desired that they would share the rest amongst the people sitting round. But it was not without a great many scruples they did that at last; and then they asked what particular persons they should give it to. However, they were very well pleased when they found that it was not contrary to any custom of ours; some carrying off the portion they had received, and others eating it upon the spot. It was with great difficulty that we could prevail upon Futtafaihe himself to eat a small bit.

"After dinner we went with him and five or six people, his attendants, toward the place where Poulaho's mourning ceremony was transacted, the last time we were at Mooa; but we did not enter the inclosure. Every person who went with us had the mat tied over his cloth, and some leaves about the neck, as had been done on the former occasion; and when we arrived at a large open boat-house, where a few people were, they threw away their leaves, sat down before it, and gave their cheeks a few gentle strokes with the fist; after which they continued sitting for about ten minutes, with a very grave appearance, and then dispersed without having spoken a single word. This explained what Poulaho had mentioned about *Tooge*; though, from the operation only lasting a few seconds, he had not been observed to perform it. And this seems to be only a continuation of the mourning ceremony by way of condolence. For, upon inquiring on whose account it was now performed, we were told that it was for a chief who had died at Vavavoo some time ago; that they had practised it ever since, and should continue to do so for a considerable time longer.

"In the evening we had a pig dressed as the hog, with yams and cocoa-nuts, brought for supper; and Futtafaihe finding that we did not like the scruples they had made before, to accept of any part of the entertainment, asked us immediately to share it, and give it to whom we pleased. When supper was over, abundance of cloth was brought for us to sleep in; but we were a good deal disturbed by a singular instance of luxury, in which their principal men indulged themselves, that of being beat while they are asleep. Two women sat by Futtafaihe and performed this operation, which is called *tooge tooge*, by beating briskly on his body and legs with both fists as on a drum, till he fell asleep, and continuing it the whole night with some short intervals. When once the person is asleep they abate a little in the strength and quickness of the beating; but resume it, if they observe any appearance of his awaking. In the morning, we found that Futtafaihe's women relieved each other, and went to sleep by turns. In any other country it would be supposed that such a practice would put an end to all rest; but here it certainly acts as an opiate, and is a strong proof of what habit may effect. The noise of this, however, was not the only thing that kept us awake; for the people who passed the night in the house, not only conversed amongst each other frequently, as in the day, but all got up before it was light, and made a hearty meal on fish and yams, which were brought to them by a person who seemed to know very well the appointed time for this nocturnal refreshment.

"Next morning we set out with Futtafaihe, and walked down the east side of the bay to the point. The country all along this side is well cultivated; but, in general, not so much inclosed as at Mooa; and amongst many other plantain fields that we passed, there was one at least a mile long, which was in excellent order, every tree growing with great vigour. We found that, in travelling, Futtafaihe exercised a power, though by no means wantonly, which pointed out the great authority of such principal men; or is, perhaps, only annexed to those of the royal family. For he sent to one place for fish, to another for yams, and so on, at other places; and all his orders were obeyed with the greatest readiness, as if he had been absolute master of the people's property. On coming to the point, the natives mentioned something of one who, they said, had been fired at by some of our people; and,

to cocoa-nuts. The property of it as we went up (but not too; dividing raised us very light, until we told the people that at last; then, they were ours; some It was with

upon our wishing to see him, they conducted us to a house, where we found a man who had been shot through the shoulder, but not dangerously, as the ball had entered a little above the inner part of the collar-bone, and passed out obliquely backward. We were sure, from the state of the wound, that he was the person who had been fired at by one of the sentinels, three days before; though positive orders had been given, that none of them should load their pieces with anything but small-shot. We gave some directions to his friends how to manage the wound, to which no application had been made; and they seemed pleased when we told them it would get well in a certain time. But, on our going away, they asked us to send the wounded man some yams and other things for food; and in such a manner, that we could not help thinking they considered it to be our duty to support him till he should get well.

"In the evening we crossed the bay to our station in a canoe which Futtafaihe had exercised his prerogative in procuring, by calling to the first that passed by. He had also got a large hog at this place; and brought a servant from his house with a bundle of cloth, which he wanted us to take with us as a present from him. But the boat being small, we objected; and he ordered it to be brought over to us the next day."

I had prolonged my stay at this island on account of the approaching eclipse; but, on the second of July, on looking at the micrometer belonging to the Board of Longitude, I found some of the rack-work broken, and the instrument useless till repaired; which there was not time to do before it was intended to be used. Preparing now for our departure, I got on board this day all the cattle, poultry, and other animals, except such as were destined to remain. I had designed to leave a turkey-cock and hen; but having now only two of each undisposed of, one of the hens, through the ignorance of one of my people, was strangled and died upon the spot. I had brought three turkey-hens to these islands. One was killed as above mentioned; and the other by a useless dog belonging to one of the officers. These two accidents put it out of my power to leave a pair here; and, at the same time, to carry the breed to Otaheite, for which island they were originally intended. I was sorry afterward that I did not give the preference to Tongataboo, as the present would have been of more value there than at Otaheite; for the natives of the former island, I am persuaded, would have taken more pains to multiply the breed.

The next day we took up our anchor, and moved the ships behind Pangimodoo, that we might be ready to take the advantage of the first favourable wind to get through the narrows. The king, who was one of our company this day at dinner, I observed took particular notice of the plates. This occasioned me to make him an offer of one, either of pewter, or of earthenware. He chose the first; and then began to tell us the several uses to which he intended to apply it. Two of them are so extraordinary, that I cannot omit mentioning them. He said, that whenever he should have occasion to visit any of the other islands, he would leave this plate behind him at Tongataboo, as a sort of representative in his absence, that the people might pay it the same obeisance they do to himself in person. He was asked what had been usually employed for this purpose before he got this plate; and we had the satisfaction of learning from him that this singular honour had hitherto been conferred on a wooden bowl in which he washed his hands. The other extraordinary use to which he meant to apply it in the room of his wooden bowl, was to discover a thief. He said that when anything was stolen, and the thief could not be found out, the people were all assembled before him, when he washed his hands in water in this vessel; after which it was cleaned, and then the whole multitude advanced, one after another, and touched it in the same manner that they touch his foot when they pay him obeisance. If the guilty person touched it, he died immediately upon the spot; not by violence, but by the hand of Providence; and if any one refused to touch it, his refusal was a clear proof that he was the man.

In the morning of the 5th, the day of the eclipse, the weather was dark and cloudy, with showers of rain; so that we had little hopes of an observation. About nine o'clock the sun broke out at intervals for about half an hour; after which it was totally obscured till within a minute or two of the beginning of the eclipse. We were all at our telescopes, viz. Mr. Bayly, Mr. King, Captain Clerke, Mr. Bligh, and myself. I lost the observation by not

having a dark glass at hand, suitable to the clouds that were continually passing over the sun; and Mr. Bligh had not got the sun into the field of his telescope; so that the commencement of the eclipse was only observed by the other three gentlemen, and by them with an uncertainty of several seconds, as follows:—

	H.	M.	S.	
By Mr. Bayly, at	11	46	23½	} Apparent time.
Mr. King, at	11	46	28	
Capt. Clerke, at	11	47	5	

Mr. Bayly and Mr. King observed with the achromatic telescopes, belonging to the Board of Longitude, of equal magnifying powers; and Captain Clerke observed with one of the reflectors. The sun appeared at intervals, till about the middle of the eclipse; after which it was seen no more during the day; so that the end could not be observed. The disappointment was of little consequence, since the longitude was more than sufficiently determined, independently of this eclipse, by lunar observations, which will be mentioned hereafter.

As soon as we knew the eclipse to be over, we packed up the instruments, took down the observatories, and sent everything on board that had not been already removed. As none of the natives had taken the least notice or care of the three sheep allotted to Mareewagee, I ordered them to be carried back to the ships. I was apprehensive that, if I had left them here, they ran great risk of being destroyed by dogs. That animal did not exist upon this island, when I first visited it in 1773; but I now found they had got a good many, partly from the breed then left by myself, and partly from some imported, since that time, from an island not very remote, called Ferjee. The dogs, however, at present, had not found their way into any of the Friendly Islands, except Tongataboo; and none but the chiefs there had as yet got possession of any.

Being now upon the eve of our departure from this island, I shall add some particulars about it, and its productions, for which I am indebted to Mr. Anderson. And, having spent as many weeks there, as I had done days* when I visited it in 1773, the better opportunities that now occurred of gaining more accurate information, and the skill of that gentleman in directing his inquiries, will, in some measure, supply the imperfection of my former account of this island.

“Amsterdam, Tongataboo, or (as the natives also very frequently call it) Tonga, is about twenty leagues in circuit, somewhat oblong, though, by much, broadest at the east end; and its greatest length from east to west. The south shore, which I saw in 1773, is straight, and consists of coral rocks, eight or ten feet high, terminating perpendicularly, except in some places, where it is interrupted by small sandy beaches; on which, at low water, a range of black rocks may be seen. The west end is not above five or six miles broad, but has a shore somewhat like that of the south side; whereas the whole north side is environed with shoals and islands, and the shore within them low and sandy. The east side or end is, most probably, like the south; as the shore begins to assume a rocky appearance toward the north-east point, though not above seven or eight feet high. The island may, with the greatest propriety, be called a low one, as the trees, on the west part, where we now lay at anchor, only appeared; and the only eminent part, which can be seen from a ship, is the south-east point; though many gently rising and declining grounds are observable by one who is ashore. The general appearance of the country does not afford that beautiful kind of landscape that is produced from a variety of hills and valleys, lawns, rivulets, and cascades; but, at the same time, it conveys to the spectator an idea of the most exuberant fertility, whether we respect the places improved by art, or those still in a natural state; both which yield all their vegetable productions with the greatest vigour and perpetual verdure. At a distance, the surface seems entirely clothed with trees of various sizes; some of which are very large. But above the rest, the tall cocoa-palms always raise their tufted heads; and are far from being the smallest ornament to any country that produces them. The *boogo*, which is a species of fig, with narrow-pointed leaves, is the largest sized tree of

the island; and on the uncultivated spots, especially toward the sea, the most common bushes and small trees are the *pandanus*; several sorts of *hibiscus*; the *fuitanoo*, mentioned more than once in the course of our voyage; and a few others. It ought also to be observed, that though the materials for forming grand landscapes are wanting, there are many of what might, at least, be called neat prospects, about the cultivated grounds and dwelling-places; but more especially about the *fiatookas*; where sometimes art, and sometimes nature, has done much to please the eye.

"From the situation of Tongataboo, toward the tropic, the climate is more variable, than in countries farther within that line; though, perhaps, that might be owing to the season of the year, which was now the winter solstice. The winds are, for the most part, from some point between south and east; and when moderate are commonly attended with fine weather. When they blow fresher, the weather is often cloudy, though open; and, in such cases, there is frequently rain. The wind sometimes veers to the north-east, north-north-east, or even north-north-west, but never lasts long, nor blows strong from thence; though it is commonly accompanied by heavy rain, and close sultry weather. The quick succession of vegetables has been already mentioned; but I am not certain that the changes of weather, by which it is brought about, are considerable enough to make them perceptible to the natives as to their method of life, or rather that they should be very sensible of the different seasons. This, perhaps, may be inferred from the state of their vegetable productions, which are never so much affected, with respect to the foliage, as to shed that all at once; for every leaf is succeeded by another, as fast as it falls; which causes that appearance of universal and continual spring found here.

"The basis of the island, as far as we know, is entirely a coral rock, which is the only sort that presents itself on the shore. Nor did we see the least appearance of any other stone, except a few small blue pebbles strowed about the *fiatookas*; and the smooth, solid black stone, something like the *lapis lydius*, of which the natives make their hatchets. But these may, probably, have been brought from other islands in the neighbourhood; for a piece of slaty, iron-coloured stone was bought at one of them, which was never seen here. Though the coral projects in many places above the surface, the soil is, in general, of a considerable depth. In all cultivated places it is commonly of a loose black colour; produced, seemingly, in a great measure, from the rotten vegetables that are planted there. Underneath which is, very probably, a clayey stratum; for a soil of that kind is often seen both in the low and in the rising grounds; but especially in several places toward the shore, where it is of any height; and, when broken off, appears sometimes of a reddish, though oftener of a brownish yellow colour, and of a pretty stiff consistence. Where the shore is low, the soil is commonly sandy, or rather composed of triturated coral; which, however, yields bushes growing with great luxuriance; and is sometimes planted, not unsuccessfully, by the natives.

"Of cultivated fruits, the principal are,—plantains; of which they have fifteen different sorts or varieties; bread-fruit; two sorts of fruit found at Otaheite, and known there under the names of *jambu* and *reevee*; the latter a kind of plum; and vast numbers of shaddocks, which, however, are found as often in a natural state as planted. The roots are,—yams, of which are two sorts; one black, and so large, that it often weighs twenty or thirty pounds; the other white and long, seldom weighing a pound; a large root called *kappe*; one not unlike our white potatoes, called *mauhaha*; the *talo*, or *cocos*, of other places; and another, named *jeejee*.

"Besides vast numbers of cocoa-nut-trees, they have three other sorts of palms, two of which are very scarce. One of them is called *beeco*; which grows almost as high as the cocoa-tree, has very large leaves plaited like a fan, and clusters or bunches of globular nuts, not larger than a small pistol-ball, growing amongst the branches, with a very hard kernel, which is sometimes eaten. The other is a kind of cabbage-tree, not distinguishable from the cocoa, but by being rather thicker, and by having its leaves more ragged. It has a cabbage three or four feet long; at the top of which are the leaves, and at the bottom the fruit, which is scarcely two inches long, resembling an oblong cocoa-nut, with an insipid tenacious kernel, called, by the natives, *necoogoola*, or red cocoa-nut, as it assumes a reddish

cast when ripe. The third sort is called *ongo ongo*, and much commoner, being generally found planted about their *fiatookas*. It seldom grows higher than five feet, though sometimes to eight; and has a vast number of oval compressed nuts, as large as a pippin, sticking immediately to the trunk amongst the leaves, which are not eaten. There is plenty of excellent sugar-cane, which is cultivated; gourds; bamboo; turmeric; and a species of fig, about the size of a small cherry, called *mattee*, which, though wild, is sometimes eaten. But the catalogue of uncultivated plants is too large to be enumerated here. Besides the *Pemphis decaspermum*, *mallocoeca*, *maba*, and some other new genera, described by Doctor Foster *, there are a few more found here; which perhaps the different seasons of the year, and his short stay, did not give him an opportunity to take notice of. Although it did not appear, during our longer stay, that above a fourth part of the trees and other plants were in flower; a circumstance absolutely necessary to enable one to distinguish the various kinds.

"The only quadrupeds besides hogs are a few rats and some dogs, which are not natives of the place, but produced from some left by us in 1773, and by others got from Feejee. Fowls, which are of a large breed, are domesticated here. Amongst the birds are parrots, somewhat smaller than the common grey ones, of an indifferent green on the back and wings, the tail blueish, and the rest of a sooty or chocolate brown; parroquets not larger than a sparrow, of a fine yellowish green, with bright azure on the crown of the head, and the throat and belly red; besides another sort as large as a dove, with a blue crown and thighs, the throat and under part of the head crimson, as also part of the belly, and the rest a beautiful green. There are owls about the size of our common sort, but of a finer plumage; the cuckoos mentioned at Palmerston's Island; kingfishers about the size of a thrush, of a greenish-blue, with a white ring about the neck; and a bird of the thrush kind, almost as big, of a dull green colour, with two yellow wattles at the base of the bill, which is the only singing one we observed here; but it compensates a good deal for the want of others by the strength and melody of its notes, which fill the woods at dawn, in the evening, and at the breaking up of bad weather.

"The other land-birds are,—rails as large as a pigeon, of a variegated grey colour, with a rusty neck; a black sort with red eyes, not larger than a lark; large violet-coloured coots with red bald crowns; two sorts of fly-catchers; a very small swallow; and three sorts of pigeons, one of which is *le ramier cuivré* of Mons. Sonnerat †; another, half the size of the common sort, of a light green on the back and wings, with a red forehead; and a third, somewhat less, of a purple brown, but whitish underneath. Of water-fowl, and such as frequent the sea, are the ducks seen at Annamooka, though scarce here; blue and white herons; tropic birds; common noddies; white terns; a new species of a leaden colour, with a black crest; a small blueish curlew; and a large plover spotted with yellow. Besides the large bats, mentioned before, there is also the common sort.

"The only noxious or disgusting animals of the reptile or insect tribe, are sea-snakes, three feet long, with black and white circles alternately, often found on shore; some scorpions and centipedes. There are fine green guanoes, a foot and a half long; another brown and spotted lizard about a foot long; and two other small sorts. Amongst the other insects are some beautiful moths, butterflies, very large spiders, and others; making in the whole about fifty different sorts. The sea abounds with fish, though the variety is less than might be expected. The most frequent sorts are mullets; several sorts of parrot-fish; silver-fish; old wives; some beautifully spotted soles; leather-jackets; bonnetos; and albicores; besides the eels mentioned at Palmerston's Island; some sharks; rays; pipe-fish; a sort of pike; and some curious devil-fish.

"The many reefs and shoals on the north side of the island afford shelter for an endless variety of shell-fish; amongst which are many that are esteemed precious in Europe. Such as the true hammer-oyster; of which, however, none could be obtained entire; a large indented oyster; and several others, but none of the common sort; panamas; concs; a sort of gigantic cockle, found also in the East Indies; pearl-shell oysters, and many others;

* See his "Characteres Generum Plantarum." Lond. 1776.

† "Voyage à la Nouvelle Guinée," Tab. ch.

several of which, I believe, have been hitherto unknown to the most diligent inquirers after that branch of natural history. There are likewise several sorts of sea-eggs; and many very fine star-fish; besides a considerable variety of corals; amongst which are two red sorts, the one most elegantly branched, the other tubulous. And there is no less variety amongst the crabs and cray-fish, which are very numerous. To which may be added, several sorts of sponge; the sea-hare, *holothurie*, and the like."

CHAPTER IX.—A GRAND SOLEMNITY CALLED NATCHE, IN HONOUR OF THE KING'S SON, PERFORMED.—THE PROCESSIONS AND OTHER CEREMONIES, DURING THE FIRST DAY, DESCRIBED.—THE MANNER OF PASSING THE NIGHT AT THE KING'S HOUSE.—CONTINUATION OF THE SOLEMNITY THE NEXT DAY.—CONJECTURES ABOUT THE NATURE OF IT.—DEPARTURE FROM TONGATABOO, AND ARRIVAL AT EOOA.—ACCOUNT OF THAT ISLAND, AND TRANSACTIONS THERE.

WE were now ready to sail, but the wind being easterly, we had not sufficient daylight to turn through the narrows, either with the morning or with the evening flood; the one falling out too early and the other too late. So that, without a leading wind, we were under a necessity of waiting two or three days.

I took the opportunity of this delay to be present at a public solemnity, to which the king had invited us when we went last to visit him, and which he had informed us was to be performed on the 8th. With a view to this, he and all the people of note quitted our neighbourhood on the 7th, and repaired to Mooa, where the solemnity was to be exhibited. A party of us followed them the next morning. We understood, from what Poulaho had said to us, that his son and heir was now to be initiated into certain privileges; amongst which was that of eating with his father; an honour he had not as yet been admitted to. We arrived at Mooa about eight o'clock, and found the king with a large circle of attendants sitting before him, within an inclosure so small and dirty, as to excite my wonder that any such could be found in that neighbourhood. They were intent upon their usual morning occupation, in preparing a bowl of *kava*. As this was no liquor for us, we walked out to visit some of our friends, and to observe what preparations might be making for the ceremony, which was soon to begin. About ten o'clock the people began to assemble in a large area, which is before the *malae*, or great house, to which we had been conducted the first time we visited Mooa. At the end of a road that opens into this area, stood some men with spears and clubs, who kept constantly reciting or chanting short sentences, in a mournful tone, which conveyed some idea of distress, and as if they called for something. This was continued about an hour; and, in the meantime, many people came down the road, each of them bringing a yam tied to the middle of a pole, which they laid down before the persons who continued repeating the sentences. While this was going on, the king and prince arrived, and seated themselves upon the area; and we were desired to sit down by them, but to pull off our hats, and to untie our hair. The bearers of the yams being all come in, each pole was taken up between two men, who carried it over their shoulders. After forming themselves into companies of ten or twelve persons each, they marched across the place with a quick pace, each company headed by a man bearing a club or spear, and guarded on the right by several others armed with different weapons. A man carrying a living pigeon on a perch closed the rear of the procession, in which about two hundred and fifty persons walked.

Omai was desired by me to ask the chief to what place the yams were to be thus carried with so much solemnity; but as he seemed unwilling to give us the information we wanted, two or three of us followed the procession, contrary to his inclination. We found that they stopped before a *morai* or *fatooka* * of one house standing upon a mount, which was hardly a quarter of a mile from the place where they first assembled. Here we observed them depositing the yams, and making them up into bundles; but for what purpose we could not learn. And as our presence seemed to give them uneasiness, we left them, and returned to

* This is the *fatooka* mentioned above by Mr. Anderson, p. 123.

Poulaho, who told us we might amuse ourselves by walking about, as nothing would be done for some time. The fear of losing any part of the ceremony prevented our being long absent. When we returned to the king, he desired me to order the boat's crew not to stir from the boat; for, as everything would very soon be *taboo*, if any of our people, or of their own, should be found walking about, they would be knocked down with clubs; nay, *mated*, that is, killed. He also acquainted us that we could not be present at the ceremony; but that we should be conducted to a place where we might see everything that passed. Objections were made to our dress. We were told that, to qualify us to be present, it was necessary that we should be naked as low as the breast, with our hats off and our hair untied. Omai offered to conform to these requisites, and began to strip; other objections were then started, so that the exclusion was given to him equally with ourselves.

I did not much like this restriction; and therefore stole out to see what might now be going forward. I found very few people stirring, except those dressed to attend the ceremony; some of whom had in their hands small poles about four feet long, and to the under part of these were fastened two or three other sticks not bigger than one's finger, and about six inches in length. These men were going toward the *morai* just mentioned. I took the same road, and was several times stopped by them, all crying out *taboo*. However, I went forward without much regarding them, till I came in sight of the *morai*, and of the people who were sitting before it. I was now urged very strongly to go back; and not knowing what might be the consequence of a refusal, I complied. I had observed that the people who carried the poles passed this *morai*, or what I may as well call temple; and guessing, from this circumstance, that something was transacting beyond it which might be worth looking at, I had thoughts of advancing, by making a round for this purpose; but I was so closely watched by three men, that I could not put my design in execution. In order to shake these fellows off, I returned to the *malace*, where I had left the king, and from thence made an elopement a second time; but I instantly met with the same three men; so that it seemed as if they had been ordered to watch my motions. I paid no regard to what they said or did till I came within sight of the king's principal *fiatooka* or *morai*, which I have already described*, before which a great number of men were sitting, being the same persons whom I had just before seen pass by the other *morai*, from which this was but a little distant. Observing that I could watch the proceedings of this company from the king's plantation, I repaired thither, very much to the satisfaction of those who attended me.

As soon as I got in, I acquainted the gentlemen who had come with me from the ships with what I had seen; and we took a proper station to watch the result. The number of people at the *fiatooka* continued to increase for some time; and at length we could see them quit their sitting posture, and march off in procession. They walked in pairs, one after another, every pair carrying between them one of the small poles above-mentioned on their shoulders. We were told that the small pieces of sticks fastened to the poles were yams; so that, probably, they were meant to represent this root emblematically. The hindmost man of each couple, for the most part, placed one of his hands to the middle of the pole, as if, without this additional support, it were not strong enough to carry the weight that hung to it, and under which they all seemed to bend as they walked. This procession consisted of one hundred and eight pairs, and all, or most of them, men of rank. They came close by the fence behind which we stood, so that we had a full view of them. Having waited here till they had all passed, we then repaired to Poulaho's house, and saw him going out. We could not be allowed to follow him; but were forthwith conducted to the place allotted to us, which was behind a fence, adjoining to the area of the *fiatooka* where the yams had been deposited in the forenoon. As we were not the only people who were excluded from being publicly present at this ceremony, but allowed to peep from behind the curtain, we had a good deal of company; and I observed that all the other inclosures round the place were filled with people. And yet all imaginable care seemed to be taken that they should see as little as possible; for the fences had not only been repaired that morning, but in many places raised higher than common, so that the tallest man could not look over them. To remedy this defect in our station, we took the liberty to cut holes in the fence

* See p. 120.

with our knives; and by this means we could see pretty distinctly everything that was transacting on the other side.

NATCHE IN HONOUR OF THE KING'S SON.

On our arrival at our station, we found two or three hundred people sitting on the grass near the end of the road that opened into the area of the *morai*, and the number continually increased, by others joining them. At length arrived a few men carrying some small poles, and branches or leaves of the cocoa-nut tree; and upon their first appearance, an old man seated himself in the road, and, with his face towards them, pronounced a long oration in a serious tone. He then retired back, and the others advancing to the middle of the area, began to erect a small shed, employing for that purpose the materials above-mentioned. When they had finished their work, they all squatted down for a moment before it, then rose up and retired to the rest of the company. Soon after came Poulaho's son, preceded by four or five men, and they seated themselves a little aside from the shed, and rather behind it. After them appeared twelve or fourteen women of the first rank, walking slowly in pairs, each pair carrying between them a narrow piece of white cloth, extended about two or three yards in length. These marched up to the prince, squatted down before him, and, having wrapped some of the pieces of the cloth they had brought round his body, they rose up and retired in the same order, to some distance on his left, and there seated themselves. Poulaho himself soon made his appearance, preceded by four men, who walked two and two abreast, and sat down on his son's left hand, about twenty paces from him. The young prince then quitting his first position, went and sat down under the shed with his attendants; and a considerable number more placed themselves on the grass before this royal canopy. The prince himself sat facing the people, with his back to the *morai*. This being done, three companies, of ten or a dozen men in each, started up from amongst the large crowd, a little after each other, and running hastily to the opposite side of the area, sat down for a few seconds, after which they returned in the same manner to their former stations. To them succeeded two men, each of whom held a small green branch in his hand, who got up and approached the prince, sitting down for a few seconds three different times as they advanced; and then turning their backs, retired in the same manner, inclining their branches to each other as they sat. In a little time two more repeated this ceremony.

The grand procession which I had seen march off from the other *morai* now began to come on. To judge of the circuit they had made from the time they had been absent, it must have

been pretty large. As they entered the area, they marched up to the right of the shed, and, having prostrated themselves on the grass, deposited their pretended bartheus (the poles above-mentioned), and faced round to the prince. They then rose up and retired in the same order, closing their hands, which they held before them, with the most serious aspect, and seated themselves along the front of the area. During all the time that this numerous band were coming in, and depositing their poles, three men, who sat under the shed with the prince, continued pronouncing separate sentences in a melancholy tone. After this a profound silence ensued for a little time, and then a man, who sat in the front of the area, began an oration (or prayer), during which, at several different times, he went and broke one of the poles which had been brought in by those who had walked in procession. When he had ended, the people sitting before the shed separated, to make a lane, through which the prince and his attendants passed, and the assembly broke up.

Some of our party, satisfied with what they had already seen, now returned to the ships, but I, and two or three more of the officers, remained at Mooa, to see the conclusion of the solemnity, which was not to be till the next day; being desirous of omitting no opportunity which might afford any information about the religious or the political institutions of this people. The small sticks, or poles, which had been brought into the area by those who walked in procession, being left lying on the ground after the crowd had dispersed, I went and examined them. I found that, to the middle of each, two or three small sticks were tied, as has been related. Yet we had been repeatedly told by the natives who stood near us that they were young yams; insomuch that some of our gentlemen believed them rather than their own eyes. As I had the demonstration of my senses to satisfy me that they were not real yams, it is clear that we ought to have understood them, that they were only the artificial representations of these roots.

Our supper was got ready about seven o'clock. It consisted of fish and yams. We might have had pork also; but we did not choose to kill a large hog which the king had given to us for that purpose. He supped with us, and drank pretty freely of brandy-and-water; so that he went to bed with a sufficient dose. We passed the night in the same house with him and several of his attendants. About one or two o'clock in the morning, they waked and conversed for about an hour, and then went to sleep again. All but Poulaho himself rose at daybreak, and went I know not whither. Soon after a woman, one of those who generally attended upon the chief, came in and inquired where he was. I pointed him out to her; and she immediately sat down by him, and began the same operation which Mr. Anderson had seen practised upon Futtafaihe, tapping or beating gently with her clenched fists on his thighs. This, instead of prolonging his sleep, as was intended, had the contrary effect; however, though he awaked, he continued to lie down.

Omai and I now went to visit the prince, who had parted from us early in the evening: for he did not lodge with the king, but in apartments of his own, or at least such as had been allotted to him, at some distance from his father's house. We found him with a circle of boys, or youths about his own age, sitting before him; and an old woman and an old man, who seemed to have the care of him, sitting behind. There were others, both men and women, employed about their necessary affairs in different departments, who probably belonged to his household. From the prince we returned to the king. By this time he had got up, and had a crowded circle before him, composed chiefly of old men. While a large bowl of *kava* was preparing, a baked hog and yams, smoking hot, were brought in, the greatest part of which fell to our share, and was very acceptable to the boat's crew; for these people eat very little in the morning, especially the *kava* drinkers. I afterward walked out and visited several other chiefs, and found that all of them were taking their morning draught or had already taken it. Returning to the king, I found him asleep in a small retired hut, with two women tapping on his breech. About eleven o'clock he arose again; and then some fish and yams, which tasted as if they had been stewed in cocoa nut milk, were brought to him. Of these he ate a large portion, and lay down once more to sleep. I now left him, and carried to the prince a present of cloth, beads, and other articles, which I had brought with me from the ship for the purpose. There was a sufficient quantity of cloth to make him a complete suit, and he was immediately decked out with it. Proud of his

dress, he first went to show himself to his father, and then conducted me to his mother, with whom were about ten or a dozen other women of a respectable appearance. Here the prince changed his apparel, and made me a present of two pieces of the cloth manufactured in the island. By this time it was past noon, when, by appointment, I repaired to the palace to dinner. Several of our gentlemen had returned this morning from the ships; and we were all invited to the feast, which was presently served up, and consisted of two pigs and yams. I roused the drowsy monarch to partake of what he had provided for our entertainment. In the mean time, two mullets and some shell-fish were brought to him, as I supposed, for his separate portion; but he joined it to our fare, sat down with us, and made a hearty meal.

When dinner was over, we were told that the ceremony would soon begin, and were strictly enjoined not to walk out. I had resolved, however, to peep no longer from behind the curtain, but to mix with the actors themselves if possible. With this view I stole out from the plantation, and walked toward the *morai*, the scene of the solemnity. I was several times desired to go back by people whom I met; but I paid no regard to them, and they suffered me to pass on. When I arrived at the *morai*, I found a number of men seated on the side of the area on each side of the road that leads up to it. A few were sitting on the opposite side of the area, and two men in the middle of it, with their faces turned to the *morai*. When I got into the midst of the first company, I was desired to sit down, which I accordingly did. Where I sat there were lying a number of small bundles or parcels, composed of cocoa-nut leaves, and tied to sticks made into the form of hand-barrows. All the information I could get about them was, that they were *taboo*. Our number kept continually increasing, every one coming from the same quarter. From time to time, one or another of the company turned himself to those who were coming to join us, and made a short speech, in which I could remark that the word *areke*, that is, king, was generally mentioned. One man said something that produced bursts of hearty laughter from all the crowd; others of the speakers met with public applause. I was several times desired to leave the place; and, at last, when they found that I would not stir, after some seeming consultation, they applied to me to uncover my shoulders as theirs were. With this request I complied, and then they seemed to be no longer uneasy at my presence.

I sat a full hour without anything more going forward beside what I have mentioned. At length the prince, the women, and the king, all came in, as they had done the day before. The prince, being placed under the shed, after his father's arrival, two men, each carrying a piece of mat, came, repeating something seriously, and put them about him. The assembled people now began their operations; and first, three companies ran backward and forward across the area, as described in the account of the proceedings of the former day. Soon after, the two men who sat in the middle of the area made a short speech or prayer; and then the whole body amongst whom I had my place, started up, and ran and seated themselves before the shed under which the prince and three or four men were sitting. I was now partly under the management of one of the company, who seemed very assiduous to serve me. By his means, I was placed in such a situation, that if I had been allowed to make use of my eyes, nothing that passed could have escaped me. But it was necessary to sit with downcast looks, and demure as maids.

Soon after, the procession came in, as on the day before; each two persons bearing on their shoulders a pole, round the middle of which a cocoa-nut leaf was plaited. These were deposited with ceremonies similar to those observed on the preceding day. This first procession was followed by a second; the men composing which brought baskets, such as are usually employed by this people to carry provisions in, and made of palm-leaves. These were followed by a third procession, in which were brought different kinds of small fish; each fixed at the end of a forked stick. The baskets were carried up to an old man, whom I took to be the chief-priest, and who sat on the prince's right hand, without the shed. He held each in his hand, while he made a short speech or prayer, then laid it down, and called for another, repeating the same words as before; and thus he went through the whole number of baskets. The fish were presented one by one on the forked sticks, as they came in, to two men who sat on the left; and who, till now, held green branches in their hands. The first fish they laid down on their right, and the second on their left. When the third

was presented, a stout-looking man, who sat behind the other two, reached his arm over between them, and made a snatch at it; as also did the other two, at the very same time. Thus they seemed to contend for every fish that was presented; but as there were two hands against one, besides the advantage of situation, the man behind got nothing but pieces; for he never quitted his hold till the fish was torn out of his hand; and what little remained in it he shook out behind him. The others laid what they got on the right and left alternately. At length, either by accident or design, the man behind got possession of a whole fish, without either of the other two so much as touching it. At this the word *marecai*, which signifies "very good," or "well done," was uttered in a low voice throughout the whole crowd. It seemed that he had performed now all that was expected from him; for he made no attempt upon the few fish that came after. These fish, as also the baskets, were all delivered, by the persons who brought them in, sitting; and in the same order and manner the small poles, which the first procession carried, had been laid upon the ground.

The last procession being closed, there was some speaking or praying by different persons. Then, on some signal being given, we all started up, ran several paces to the left, and sat down with our backs to the prince, and the few who remained with him. I was desired not to look behind me. However, neither this injunction, nor the remembrance of Lot's wife, discouraged me from facing about. I now saw that the prince had turned his face to the *morai*. But this last movement had brought so many people between him and me, that I could not perceive what was doing. I was afterwards assured, that at this very time, the prince was admitted to the high honour of eating with his father, which till now had never been permitted to him; a piece of roasted yam being presented to each of them for this purpose. This was the more probable, as we had been told beforehand that this was to happen during the solemnity, and as all the people turned their backs to them at this time, which they always do when their monarch eats.

After some little time, we all faced about, and formed a semicircle before the prince, leaving a large open space between us. Presently there appeared some men coming toward us, two and two, bearing large sticks, or poles, upon their shoulders, making a noise that might be called singing, and waving their hands as they advanced. When they had got close up to us, they made a show of walking very fast, without proceeding a single step. Immediately after, three or four men started up from the crowd, with large sticks in their hands, who ran towards those newcomers. The latter instantly threw down the poles from their shoulders and scampered off; and the others attacked the poles; and, having beat them most unmercifully, returned to their places. As the pole-bearers ran off, they gave the challenge that is usual here in wrestling; and not long after, a number of stout fellows came from the same quarter, repeating the challenge as they advanced. These were opposed by a party who came from the opposite side almost at the same instant. The two parties paraded about the area for a few minutes, and then retired, each to their own side. After this, there were wrestling and boxing matches for about half an hour. Then two men seated themselves before the prince, and made speeches, addressed, as I thought, entirely to him. With this the solemnity ended, and the whole assembly broke up. I now went and examined the several baskets which had been presented; a curiosity that I was not allowed before to indulge; because everything was then *taboo*. But the solemnity being now over, they became simply what I found them to be, empty baskets. So that, whatever they were supposed to contain, was emblematically represented. And so, indeed, was every other thing which had been brought in procession, except the fish.

We endeavoured in vain to find out the meaning, not only of the ceremony in general, which is called *Natche*, but of its different parts. We seldom got any other answer to our inquiries, but *taboo*; a word which I have before observed, is applied to many other things. But as the prince was evidently the principal person concerned in it; and as we had been told by the king, ten days before the celebration of the *Natche*, that the people would bring in yams for him and his son to eat together; and as he even described some part of the ceremony, we concluded, from what he had then said, and from what we now saw, that an oath of allegiance, if I may so express myself, or solemn promise, was on this occasion made

to the prince, as the immediate successor to the regal dignity, to stand by him, and to furnish him with the several articles that were here emblematically represented. This seems the more probable, as all the principal people of the island, whom we had ever seen, assisted in the processions. But, be this as it may, the whole was conducted with a great deal of mysterious solemnity ; and that there was a mixture of religion in the institution was evident, not only from the place where it was performed, but from the manner of performing it. Our dress and deportment had never been called in question upon any former occasion whatever. Now, it was expected that we should be uncovered as low as the waist ; that our hair should be loose, and flowing over our shoulders ; that we should, like themselves, sit cross-legged ; and at times in the most humble posture, with downcast eyes, and hands locked together ; all which requisites were most devoutly observed by the whole assembly. And, lastly, every one was excluded from the solemnity, but the principal people, and those who assisted in the celebration. All these circumstances were to me a sufficient testimony, that, upon this occasion, they considered themselves as acting under the immediate inspection of a Supreme Being.

The present *Natche* may be considered, from the above account of it, as merely figurative. For the small quantity of yams, which we saw the first day, could not be intended as a general contribution ; and, indeed, we were given to understand, that they were a portion consecrated to the *Otooa* or divinity. But we were informed, that in about three months there would be performed, on the same account, a far more important and grander solemnity ; on which occasion, not only the tribute of Tongataboo, but that of *Ilapaeae*, *Vavaoo*, and of all the other islands, would be brought to the chief, and confirmed more awfully, by sacrificing ten human victims from amongst the inferior sort of people. A horrid solemnity, indeed ! and which is a most significant instance of the influence of gloomy and ignorant superstition, over the minds of one of the most benevolent and humane nations upon earth. On inquiring into the reasons of so barbarous a practice, they only said, that it was a necessary part of the *Natche* ; and that if they omitted it, the deity would certainly destroy their king.

Before the assembly broke up, the day was far spent ; and as we were at some distance from the ships, and had an intricate navigation to go through, we were in haste to set out from Moon. When I took leave of Poulaho, he pressed me much to stay till the next day, to be present at a funeral ceremony. The wife of Mareewagee, who was mother-in-law to the king, had lately died ; and her corpse had, on account of the *Natche*, been carried on board a canoe that lay in the lagoon. Poulaho told me, that as soon as he had paid the last offices to her, he would attend me to Eooa ; but, if I did not wait, that he would follow me thither. I understood at the same time, that, if it had not been for the death of this woman, most of the chiefs would have accompanied us to that island ; where, it seems, all of them have possessions. I would gladly have waited to see this ceremony also, had not the tide been now favourable for the ships to get through the narrows. The wind, besides, which for several days past had been very boisterous, was now moderate and settled ; and to have lost this opportunity, might have detained us a fortnight longer. But what was decisive against my waiting, we understood that the funeral ceremonies would last five days, which was too long a time, as the ships lay in such a situation that I could not get to sea at pleasure. I, however, assured the king, that if we did not sail, I should certainly visit him again the next day. And so we all took leave of him, and set out for the ships, where we arrived about eight o'clock in the evening.

I had forgot to mention that Omai was present at the second day's ceremony, as well as myself ; but we were not together ; nor did I know that he was there, till it was almost over. He afterwards told me, that as soon as the king saw that I had stolen out from the plantation, he sent several people, one after another, to desire me to come back. Probably, these messengers were not admitted to the place where I was ; for I saw nothing of them. At last, intelligence was brought to the chief, that I had actually stripped, in conformity to their custom ; and then he told Omai, that he might be present also, if he would comply with all the necessary forms. Omai had no objection, as nothing was required of him, but to conform to the custom of his own country. Accordingly, he was furnished with a proper

dress, and appeared at the ceremony as one of the natives. It is likely, that one reason of our being excluded at first, was an apprehension that we would not submit to the requisites to qualify us to assist.

While I was attending the *Natche* at Mooa, I ordered the horses, bull and cow, and goats, to be brought thither; thinking that they would be safer there, under the eyes of the chiefs, than at a place that would be, in a manner, deserted, the moment after our departure. Besides the above-mentioned animals, we left, with our friends here, a young boar, and three young sows, of the English breed. They were exceedingly desirous of them, judging, no doubt, that they would greatly improve their own breed, which is rather small. Fee-nou also got from us two rabbits, a buck and a doe; and, before we sailed, we were told, that young ones had been already produced. If the cattle succeed, of which I make no doubt, it will be a vast acquisition to these islands; and, as Tongataboo is a fine level country, the horses cannot but be useful.

On the 10th, at eight o'clock in the morning, we weighed anchor, and with a steady gale at south-east, turned through the channel, between the small isles called Makkahaa and Monooafai; it being much wider than the channel between the last mentioned island and Pangimodoo. The flood set strong in our favour, till we were the length of the channel leading up to the lagoon, where the flood from the eastward meets that from the west. This, together with the indraught of the lagoon, and of the shoals before it, causeth strong ripplings and whirlpools. To add to these dangers, the depth of water in the channel exceeds the length of a cable; so that there is no anchorage, except close to the rocks, where we met with forty and forty-five fathoms, over a bottom of dark sand. But, then, here a ship would be exposed to the whirlpools. This frustrated the design which I had formed, of coming to an anchor, as soon as we were through the narrows, and of making an excursion to see the funeral. I chose rather to lose that ceremony, than to leave the ships in a situation in which I did not think them safe. We continued to ply to windward, between the two tides, without either gaining or losing an inch, till near high-water, when, by a favourable slant, we got into the eastern tide's influence. We expected there to find the ebb to run strong to the eastward in our favour; but it proved so inconsiderable, that, at any other time, it would not have been noticed. This informed us, that most of the water, which flows into the lagoon, comes from the north-west, and returns the same way. About five in the afternoon, finding that we could not get to sea before it was dark, I came to an anchor, under the shore of Tongataboo, in forty-five fathoms water; and about two cables' length from the reef, that runs along that side of the island. The *Discovery* dropped anchor under our stern; but before the anchor took hold, she drove off the bank, and did not recover it till after midnight. We remained at this station, till eleven o'clock the next day, when we weighed and plied to the eastward. But it was ten at night before we weathered the east end of the island, and were enabled to stretch away for Middleburg, or Eooa (as it is called by the inhabitants), where we anchored at eight o'clock the next morning, in forty fathoms water, over a bottom of sand, interspersed with coral rocks; the extremes of the island extending, from N. 40° E. to S. 22° W.; the high land of Eooa, S. 45° E.; and Tongataboo, from N. 70° W. to N. 19° W.; distant about half a mile from the shore; being nearly the same place where I had my station in 1773, and then named by me, English Road.

We had no sooner anchored, than Taooa the chief, and several other natives, visited us on board, and seemed to rejoice much at our arrival. This Taooa* had been my *Tayo*, when I was here during my last voyage; consequently we were not strangers to each other. In a little time, I went ashore with him, in search of fresh water; the procuring of which was the chief object that brought me to Eooa. I had been told at Tongataboo, that there was here a stream running from the hills into the sea; but this was not the case now. I was first conducted to a brackish spring, between low and high water mark, amongst rocks in the cove where we landed, and where no one would ever have thought of looking for what we wanted. However, I believe the water of this spring might be good, were it

* In the account of Captain Cook's former voyage, he calls the only chief he then met with at this place, *Tioony*. See vol. I. p. 216.

possible to take it up, before the tide mixes with it. Finding that we did not like this, our friends took us a little way into the island; where, in a deep chasm, we found very good water; which, at the expense of some time and trouble, might be conveyed down to the shore, by means of spouts or troughs, that could be made with plantain leaves, and the stem of the tree. But, rather than to undertake that tedious task, I resolved to rest contented with the supply the ships had got at Tongataboo. Before I returned on board, I set on foot a trade for hogs and yams. Of the former we could procure but few; but of the latter, plenty. I put ashore, at this island, the ram and two ewes, of the Cape of Good Hope breed of sheep; entrusting them to the care of Tuoofa, who seemed proud of his charge. It was fortunate, perhaps, that Marcewagee, to whom I had given them, as before-mentioned, slighted the present. Eooa, not having as yet got any dogs upon it, seems to be a properer place than Tongataboo for the rearing of sheep.

As we lay at anchor, this island bore a very different aspect from any we had lately seen, and formed a most beautiful landscape. It is higher than any we had passed, since leaving New Zealand (as Kao may justly be reckoned an immense rock), and from its top, which is almost flat, declines very gently toward the sea. As the other isles of this cluster are level, the eye can discover nothing but the trees that cover them; but here the land, rising gently upward, presents us with an extensive prospect, where groves of trees are only interspersed at irregular distances, in beautiful disorder, and the rest covered with grass. Near the shore, again, it is quite shaded with various trees, amongst which are the habitations of the natives; and to the right of our station, was one of the most extensive groves of cocoa-palms we had ever seen.

The 13th, in the afternoon, a party of us made an excursion to the highest part of the island, which was a little to the right of our ships, in order to have a full view of the country. About half way up, we crossed a deep valley, the bottom and sides of which, though composed of hardly anything but coral rock, were clothed with trees. We were now about two or three hundred feet above the level of the sea, and yet, even here, the coral was perforated into all the holes and inequalities, which usually diversify the surface of this substance within the reach of the tide. Indeed, we found the same coral, till we began to approach the summits of the highest hills; and it was remarkable, that these were chiefly composed of a yellowish, soft, sandy stone. The soil there is, in general, a reddish clay; which, in many places, seemed to be very deep. On the most elevated part of the whole island we found a round platform, or mount of earth, supported by a wall of coral stones; to bring which to such a height, must have cost much labour. Our guides told us that this mount had been erected by order of their chief; and that they sometimes met there to drink *kara*. They called it *Etchee*; by which name an erection which we had seen at Tongataboo, as already mentioned, was distinguished. Not many paces from it was a spring of excellent water; and, about a mile lower down, a running stream, which we were told found its way to the sea, when the rains were copious. We also met with water, in many little holes; and, no doubt, great plenty might be found, by digging. From the elevation to which we had ascended, we had a full view of the whole island, except a part of the south point. The south-east side, from which the highest hills we were now upon are not far distant, rises with very great inequalities immediately from the sea; so that the plains and meadows, of which there are here some of great extent, lie all on the north-west side; and, as they are adorned with tufts of trees, intermixed with plantations, they form a very beautiful landscape in every point of view. While I was surveying this delightful prospect, I could not help flattering myself with the pleasing idea that some future navigator may, from the same station, behold these meadows stocked with cattle, brought to these islands by the ships of England; and that the completion of this single benevolent purpose, independently of all other considerations, would sufficiently mark to posterity that our voyages had not been useless to the general interests of humanity. Besides the plants common on the other neighbouring islands, we found, on the height, a species of *Acrosticum melastoma*, and fern-tree; with a few other ferns and plants, not common lower down.

Our guides informed us, that all, or most of the land on this island, belonged to the great chiefs of Tongataboo; and that the inhabitants were only tenants or vassals to them.

Indeed, this seemed to be the case at all the other neighbouring isles, except Annamooka, where there were some chiefs, who seemed to act with some kind of independence. Omai, who was a great favourite with Feenou, and these people in general, was tempted with the offer of being made chief of this island if he would have staid amongst them; and it is not clear to me, that he would not have been glad to stay, if the scheme had met with my approbation. I own I did disapprove of it; but not because I thought that Omai would do better for himself in his own native isle.

On returning from my country expedition, we were informed that a party of the natives had, in the circle where our people traded, struck one of their own countrymen with a club, which laid bare, or, as others said, fractured his skull, and then broke his thigh with the same, when our men interposed. He had no signs of life when carried to a neighbouring house; but afterward recovered a little. On my asking the reason of so severe a treatment, we were informed that he had been discovered in a situation rather indelicate with a woman who was *tabooed*. We, however, understood that she was no otherwise *tabooed*, than by belonging to another person, and rather superior in rank to her gallant. From this circumstance we had an opportunity of observing how these people treat such infidelities. But the female sinner has, by far, the smaller share of punishment for her misdemeanor; as they told us that she would only receive a slight beating.

The next morning I planted a pine-apple, and sowed the seeds of melons and other vegetables in the chief's plantation. I had some encouragement, indeed, to flatter myself that my endeavours of this kind would not be fruitless; for, this day, there was served up at my dinner a dish of turnips, being the produce of the seeds I had left here during my last voyage.

I had fixed upon the 15th for sailing, till Taofa pressed me to stay a day or two longer, to receive a present he had prepared for me. This reason, and the daily expectation of seeing some of our friends from Tougataboo, induced me to defer my departure. Accordingly, the next day, I received the chief's present; consisting of two small heaps of yams, and some fruit, which seemed to be collected by a kind of contribution, as at the other isles. On this occasion, most of the people of the island had assembled at the place; and, as we had experienced on such numerous meetings amongst their neighbours, gave us not a little trouble to prevent them from pilfering whatever they could lay their hands upon. We were entertained with cudgelling, wrestling, and boxing-matches; and in the latter, both male and female combatants exhibited. It was intended to have finished the show with the *bonai*, or night-dance; but an accident either put a total stop to it, or, at least, prevented any of us from staying ashore to see it. One of my people, walking a very little way, was surrounded by twenty or thirty of the natives, who knocked him down, and stripped him of everything he had on his back. On hearing of this, I immediately seized two canoes and a large hog; and insisted on Taofa's causing the clothes to be restored, and on the offenders being delivered up to me. The chief seemed much concerned at what had happened; and forthwith took the necessary steps to satisfy me. This affair so alarmed the assembled people, that most of them fled. However, when they found that I took no other measures to revenge the insult, they returned. It was not long before one of the offenders was delivered up to me, and a shirt and a pair of trousers restored. The remainder of the stolen goods not coming in before night, I was under the necessity of leaving them to go aboard; for the sea ran so high, that it was with the greatest difficulty the boats could get out of the creek with daylight, much less in the dark.

The next morning I landed again, having provided myself with a present for Taofa, in return for what he had given me. As it was early, there were but few people at the landing-place, and those few not without their fears. But on my desiring Omai to assure them that we meant no harm; and, in confirmation of this assurance, having restored the canoes and released the offender, whom they had delivered up to me, they resumed their usual gaiety; and, presently, a large circle was formed, in which the chief and all the principal men of the island took their places. The remainder of the clothes were now brought in; but, as they had been torn off the man's back by pieces, they were not worth carrying on board. Taofa, on receiving my present, shared it with three or four other chiefs, keeping

only a small part for himself. This present exceeded their expectation so greatly, that one of the chiefs, a venerable old man, told me that they did not deserve it, considering how little they had given to me, and the ill treatment one of my people had met with. I remained with them till they had finished their bowl of *kava*; and having then paid for the hog which I had taken the day before, returned on board with Taooa, and one of Poulaho's servants, by whom I sent, as a parting mark of my esteem and regard for that chief, a piece of bar-iron; being as valuable a present as any I could make to him.

Soon after we weighed, and, with a light breeze at south-east, stood out to sea; and then Taooa, and a few other natives that were in the ship, left us. On heaving up the anchor, we found that the cable had suffered considerably by the rocks; so that the bottom in this road is not to be depended upon. Besides this, we experienced that a prodigious swell rolls in there from the south-west. We had not been long under sail, before we observed a sailing-canoe coming from Tongataboo, and entering the creek before which we had anchored. Some hours after a small canoe, conducted by four men, came off to us; for, as we had but little wind, we were still at no great distance from the land. These men told us that the sailing-canoe, which we had seen arrive from Tongataboo, had brought orders to the people of Eooa, to furnish us with a certain number of hogs; and that in two days, the king and other chiefs would be with us. They, therefore, desired we would return to our former station. There was no reason to doubt the truth of what these men told us. Two of them had actually come from Tongataboo in the sailing-canoe; and they had no view in coming off to us, but to give this intelligence. However, as we were now clear of the land, it was not a sufficient inducement to bring me back; especially as we had already on board a stock of fresh provisions, sufficient, in all probability, to last during our passage to Otaheite. Besides Taooa's present, we had got a good quantity of yams at Eooa, in exchange chiefly for small nails. Our supply of hogs was also considerably increased there; though, doubtless, we should have got many more if the chiefs of Tongataboo had been with us, whose property they mostly were. At the approach of night, these men finding that we would not return, left us; as also some others, who had come off in two canoes, with a few cocoa-nuts and shaddocks, to exchange them for what they could get; the eagerness of these people to get into their possession more of our commodities, inducing them to follow the ships out to sea, and to continue their intercourse with us to the last moment.

CHAPTER X.—ADVANTAGES DERIVED FROM VISITING THE FRIENDLY ISLANDS.—BEST ARTICLES FOR TRAFFIC.—REFRESHMENTS THAT MAY BE PROCURED.—THE NUMBER OF THE ISLANDS, AND THEIR NAMES.—KEPPEL'S AND BOSCAWEN'S ISLANDS BELONG TO THEM.—ACCOUNT OF VAVAOO—OF UAMOA—OF FEEJEE.—VOYAGES OF THE NATIVES IN THEIR CANOES.—DIFFICULTY OF PROCURING EXACT INFORMATION.—PERSONS OF THE INHABITANTS OF BOTH SEXES—THEIR COLOUR—DISEASES—THEIR GENERAL CHARACTER.—MANNER OF WEARING THEIR HAIR—OF PUNCTURING THEIR BODIES.—THEIR CLOTHING AND ORNAMENTS.—PERSONAL CLEANLINESS.

Thus we took leave of the Friendly Islands and their inhabitants, after a stay of between two and three months; during which time, we lived together in the most cordial friendship. Some accidental differences, it is true, now and then happened, owing to their great propensity for thieving; but, too often encouraged by the negligence of our own people. But these differences were never attended with any fatal consequences; to prevent which, all my measures were directed; and I believe, few on board our ships left our friends here without some regret. The time employed amongst them was not thrown away. We expended very little of our sea provisions; subsisting in general upon the produce of the islands, while we staid; and carrying away with us a quantity of refreshments sufficient to last till our arrival at another station, where we could depend upon a fresh supply. I was not sorry, besides, to have had an opportunity of bettering the condition of these good people, by leaving the useful animals before-mentioned among them; and, at the same time, those designed for Otaheite, received fresh strength in the pastures of Tongataboo. Upon the whole, therefore, the advantages we received by touching here were very great; and I

had the additional satisfaction to reflect, that they were received, without retarding one moment the prosecution of the great object of our voyage; the season for proceeding to the north being, as has been already observed, lost, before I took the resolution of bearing away for these islands.

But, besides the immediate advantages, which both the natives of the Friendly Islands, and ourselves, received by this visit, futuro navigators from Europe, if any such should ever tread our steps, will profit by the knowledge I acquired of the geography of this part of the Pacific Ocean; and the more philosophical reader, who loves to view human nature in new situations, and to speculate on singular, but faithful representations of the persons, the customs, the arts, the religion, the government, and the language of uncultivated man, in remote and fresh discovered quarters of the globe, will, perhaps, find matter of amusement, if not of instruction, in the information which I have been enabled to convey to him, concerning the inhabitants of this Archipelago. I shall suspend my narrative, of the progress of the voyage, while I faithfully relate what I had opportunities of collecting on these several topics.

We found by our experience, that the best articles for traffic, at these islands, are iron tools in general. Axes and hatchets; nails, from the largest spike down to tenpenny ones; rasps, files, and knives, are much sought after. Red cloth, and linen, both white and coloured; looking-glasses and beads, are also in estimation; but of the latter, those that are blue are preferred to all others; and white ones are thought the least valuable. A string of large blue beads would, at any time, purchase a hog. But it must be observed, that such articles as are merely ornaments, may be highly esteemed at one time, and not so at another. When we first arrived at Annamooka, the people there would hardly take them in exchange even for fruit; but when Feenon came, this great man set the fashion, and brought them into vogue, till they rose in their value to what I have just mentioned. In return for the favourite commodities which I have enumerated, all the refreshments may be procured that the islands produce. These are hogs, fowls, fish, yams, bread-fruit, plantains, cocoa-nuts, sugar-cane, and, in general, every such supply as can be met with at Otaheite, or any of the Society Islands. The yams of the Friendly Islands are excellent, and when grown to perfection, keep very well at sea. But their pork, bread-fruit, and plantains, though far from despicable, are, nevertheless, much inferior in quality to the same articles at Otaheite, and in its neighbourhood.

Good water, which ships on long voyages stand so much in need of, is scarce at these islands. It may be found, it is true, on them all; but, still, either in too inconsiderable quantities, or in situations too inconvenient to serve the purposes of navigators. However, as the islands afford plenty of provisions, and particularly of cocoa-nuts, ships may make a tolerable shift with such water as is to be got; and if one is not over nice, there will be no want. While we lay at anchor under Kotoo, on our return from Hapae, some people from Kao informed us that there was a stream of water there, which, pouring down from the mountain, runs into the sea on the south-west side of the island; that is, on the side that faces Tofoa, another island remarkable for its height, as also for having a considerable volcano in it, which, as has been already mentioned, burned violently all the time that we were in its neighbourhood. It may be worth while for future navigators to attend to this intelligence about the stream of water at Kao; especially as we learned that there was anchorage on that part of the coast. The black stone, of which the natives of the Friendly Islands make their hatchets and other tools, we were informed, is the production of Tofoa.

Under the denomination of Friendly Islands, we must include not only the group at Hapae, which I visited, but also all those islands that have been discovered nearly under the same meridian to the north, as well as some others that have never been seen, hitherto, by any European navigators; but are under the dominion of Tongataboo, which, though not the largest, is the capital, and seat of government.

According to the information that we received there, this archipelago is very extensive. Above one hundred and fifty islands were reckoned up to us by the natives, who made use of bits of leaves to ascertain their number; and Mr. Anderson, with his usual diligence, even procured all their names. Fifteen of them are said to be high or hilly, such as Tofoa

and Eooa ; and thirty-five of them large. Of these only three were seen this voyage ; Hapae (which is considered by the natives as one island), Tongataboo and Eooa : of the size of the unexplored thirty-two, nothing more can be mentioned, but that they must be all larger than Annamooka ; with those, from whom we had our information, ranked amongst the smaller isles. Some, or indeed several, of this latter denomination, are mere spots, without inhabitants. Sixty-one of these islands have their proper places and names marked upon our chart of the Friendly Islands, and upon the sketch of the harbour of Tongataboo, to both which I refer the reader. But it must be left to future navigators to introduce into the geography of this part of the South Pacific Ocean, the exact situation and size of near a hundred more islands in this neighbourhood, which we had not an opportunity to explore, and whose existence we only learnt from the testimony of our friends, as above mentioned. On their authority the following list of them was made ; and it may serve as a groundwork for farther investigation.

NAMES OF THE FRIENDLY ISLANDS AND OTHERS IN THAT NEIGHBOURHOOD, MENTIONED BY THE INHABITANTS OF ANNAMOOKA, HAPAE, AND TONGATABOO.†

I have not the least doubt that Prince William's Islands, discovered and so named by Tasman, are included in the foregoing list. For while we lay at Hapae, one of the natives told me, that, three or four days' sail from thence to the north-west, there was a cluster of small islands, consisting of upward of forty. This situation corresponds very well with that assigned in the accounts we have of Tasman's voyage to his Prince William's Islands‡.

We have also very good authority to believe that Keppel's and Boscawen's Islands, two of Captain Wallis's discoveries in 1765, are comprehended in our list ; and that they are not only well known to these people, but are under the same sovereign. The following information seemed to me decisive as to this. Upon my inquiring one day of Poulaho, the king, in what manner the inhabitants of Tongataboo had acquired the knowledge of iron,

† These islands, which the natives represented as large ones, are distinguished by an asterisk.

‡ Tasman saw eighteen or twenty of these small islands, every one of which was surrounded with sands, shoals, and

rocks. They are also called, in some charts, Heemskirk's Banks. See Dalrymple's Collection of Voyages to the South Pacific Ocean, vol. ii. p. 83 ; and Campbell's edition of Harria's, vol. i. p. 325.

and from what quarter they had procured a small iron tool which I had seen amongst them, when I first visited their island, during my former voyage, he informed me that they had received this iron from an island, which he called Necoatabootaboo. Carrying my inquiries further, I then desired to know whether he had ever been informed from whom the people of Necoatabootaboo had got it. I found him perfectly acquainted with its history. He said that one of those islanders sold a club for five nails to a ship which had touched there; and that these five nails afterward were sent to Tongataboo. He added that this was the first iron known amongst them; so that what Tasman left of that metal must have been worn out, and forgot long ago. I was very particular in my inquiries about the situation, size, and form of the island; expressing my desire to know when this ship had touched there; how long she staid; and whether any more were in company. The leading facts appeared to be fresh in his memory. He said that there was but one ship; that she did not come to an anchor, but left the island after her beat had been on shore. And from many circumstances which he mentioned, it could not be many years since this had happened. According to his information, there are two islands near each other, which he himself had been at. The one he described as high and peaked like Kao, and he called it Kootahee; the other, where the people of the ship landed, called Necoatabootaboo, he represented as much lower. He added, that the natives of both are the same sort of people with those of Tongataboo; built their canoes in the same manner; that their islands had hogs and fowls; and, in general, the same vegetable productions. The ship so pointedly referred to in this conversation could be no other than the Dolphin; the only single ship from Europe, as far as we have ever learned, that had touched, of late years, at any island in this part of the Pacific Ocean, prior to my former visit to the Friendly Islands*.

But the most considerable islands in this neighbourhood that we now heard of (and we heard a great deal about them), are Hamoa, Vavaoo, and Feejee. Each of these was represented to us as larger than Tongataboo. No European, that we know of, has as yet seen any one of them. Tasman, indeed, lays down in his chart an island nearly in the situation where I suppose Vavaoo to be; that is, about the latitude of 19° †. But, then, that island is there marked as a very small one; whereas Vavaoo, according to the united testimony of all our friends at Tongataboo, exceeds the size of their own island, and has high mountains. I should certainly have visited it; and have accompanied Feenou from Hapace, if he had not then discouraged me, by representing it to be very inconsiderable, and without any harbour. But Poulaho, the king, afterward assured me, that it was a large island; and that it not only produced everything in common with Tongataboo, but had the peculiar advantage of possessing several streams of fresh water, with as good a harbour as that which we found at his capital island. He offered to attend me if I would visit it; adding, that, if I did not find everything agreeing with his representation, I might kill him. I had not the least doubt of the truth of his intelligence; and was satisfied that Feenou, from some interested view, attempted to deceive me.

Hamoa, which is also under the dominion of Tongataboo, lies two days' sail north-west from Vavaoo. It was described to me as the largest of all their islands, as affording harbours and good water; and as producing, in abundance, every article of refreshment found at the places we visited. Poulaho himself frequently resides there. It should seem that the people of this island are in high estimation at Tongataboo; for we were told that some of the songs and dances with which we were entertained, had been copied from theirs; and we saw some

* See Captain Wallis's Voyage, in Hawkesworth's Collection, vol. i. p. 492—494. Captain Wallis there calls both these islands "high ones." But the superior height of one of them may be inferred, from his saying, that it appears "like a sugar-loaf." This strongly marks its resemblance to Kao. From comparing Poulaho's intelligence to Captain Cook, with Captain Wallis's account, it seems to be past all doubt, that Boscawen's Island is our Kootahee, and Keppel's Island our Necoatabootaboo. The last is one of the large islands marked in the foregoing list. The reader, who has been already apprised of the

variations of our people in writing down what the natives pronounced, will hardly doubt that Kottejeea and Kootahee are the same.

† Neither Dalrymple nor Campbell, in their accounts of Tasman's voyage, take any particular notice of his having seen such an island. The chart here referred to by Captain Cook is probably Mr. Dalrymple's, in his Collection of Voyages, where Tasman's track is marked accurately; and several very small spots of land are laid down in the situation here mentioned.

houses said to be built after their fashion. Mr. Anderson, always inquisitive about such matters, learnt the three following words of the dialect of Hamoa:—

Tamolao, a chief man. *Tamacty*, a chief woman. *Solle*, a common man.

Feejee, as we were told, lies three days' sail from Tongataboo, in the direction of north-west by west. It was described to us as a high, but very fruitful island; abounding with hogs, dogs, fowls, and all the kinds of fruit and roots that are found in any of the others; and as much larger than Tongataboo; to the dominion of which, as was represented to us, it is not subject as the other islands of this archipelago are. On the contrary, Feejee and Tongataboo frequently make war upon each other. And it appeared, from several circumstances, that the inhabitants of the latter are much afraid of this enemy. They used to express their sense of their own inferiority to the Feejee men, by bending the body forward, and covering the face with their hands. And it is no wonder that they should be under this dread; for those of Feejee are formidable on account of the dexterity with which they use their bows and slings; but much more so, on account of the savage practice to which they are addicted, like those of New Zealand, of eating their enemies whom they kill in battle. We were satisfied that this was not a misrepresentation. For we met with several Feejee people at Tongataboo, and, on inquiring of them, they did not deny the charge.

Now that I am again led to speak of cannibals, let me ask those who maintain that the want of food first brings men to feed on human flesh, what is it that induceth the Feejee people to keep it up in the midst of plenty? This practice is detested very much by those of Tongataboo, who cultivate the friendship of their savage neighbours of Feejee, apparently out of fear; though they sometimes venture to skirmish with them on their own ground; and carry off red feathers as their booty, which are in great plenty there, and, as has been frequently mentioned, are in great estimation amongst our Friendly Islanders. When the two islands are at peace, the intercourse between them seems to be pretty frequent; though they have, doubtless, been but lately known to each other; or we may suppose that Tongataboo and its adjoining islands would have been supplied, before this, with a breed of dogs which abound at Feejee, and had not been introduced at Tongataboo so late as 1773, when I first visited it. The natives of Feejee, whom we met with here, were of a colour that was a full shade darker than that of the inhabitants of the Friendly Islands in general. One of them had his left ear slit, and the lobe was so distended, that it almost reached his shoulder; which singularity I had met with at other islands of the South Sea during my second voyage. It appeared to me that the Feejee men, whom we now saw, were much respected here; not only, perhaps, from the power and cruel manner of their nation's going to war, but also from their ingenuity. For they seem to excel the inhabitants of Tongataboo in that respect, if we might judge from several specimens of their skill in workmanship which we saw; such as clubs and spears, which were carved in a very masterly manner; cloth beautifully chequered; variegated mats; earthen pots, and some other articles; all which had a cast of superiority in the execution.

I have mentioned that Feejee lies three days' sail from Tongataboo, because these people have no other method of measuring the distance from island to island, but by expressing the time required to make the voyage in one of their canoes. In order to ascertain this with some precision, or, at least, to form some judgment how far these canoes can sail in a moderate gale, in any given time, I went on board one of them when under sail, and, by several trials with the log, found that she went seven knots or miles in an hour, close hauled, in a gentle gale. From this I judge that they will sail, on a medium, with such breezes as generally blow in their sea, about seven or eight miles in an hour. But the length of each day is not to be reckoned at twenty-four hours. For when they spoke of one day's sail, they mean no more than from the morning to the evening of the same day; that is, ten or twelve hours at most. And two days' sail, with them, signifies from the morning of the first day to the evening of the second; and so for any other number of days. In these navigations the sun is their guide by day, and the stars by night. When these are obscured, they have recourse to the points from whence the winds and the waves came upon the vessel.

If, during the obscuration, both the wind and the waves should shift (which, within the limits of the trade-wind, seldom happens at any other time), they are then bewildered, frequently miss their intended port, and are never heard of more. The history of Omai's countrymen, who were driven to Watecoo, leads us to infer, that those not heard of are not always lost.

Of all the harbours and anchoring places I have met with amongst these islands, that of Tongataboo is by far the best; not only on account of its great security, but of its capacity, and of the goodness of its bottom. The risk that we ran in entering it from the north, ought to be a sufficient caution to every future commander not to attempt that passage again with a ship of burden; since the other, by which we left it, is so much more easy and safe. To sail into it by this eastern channel, steer in for the north-east point of the island, and keep along the north shore, with the small isles on your starboard, till you are the length of the east point of the entrance into the lagoon; then edge over for the reef of the small isles; and, on following its direction, it will conduct you through between Makka-haaa and Monocafai, or the fourth and fifth isles, which you will perceive to lie off the west point of the lagoon. Or you may go between the third and fourth islands, that is, between Pangimodoo and Monocafai; but this channel is much narrower than the other. There runs a very strong tide in both. The flood, as I have observed before, comes in from the north-west, and the ebb returns the same way; but I shall speak of the tides in another place. As soon as you are through either of these channels, haul in for the shore of Tongataboo, and anchor between it and Pangimodoo, before a creek leading into the lagoon; into which boats can go at half flood. Although Tongataboo has the best harbour, Annamooka furnishes the best water; and yet it cannot be called good. However, by digging holes near the side of the pond, we can get what may be called tolerable. This island, too, is the best situated for drawing refreshments from all the others, as being nearly in the centre of the whole group. Besides the road in which we anchored, and the harbour within the south-west point, there is a creek in the reef, before the eastern sandy cove on the north side of the island, in which two or three ships may lie very securely, by mooring head and stern, with their anchors or moorings fast to the rocks.

I have already described the Hapace Islands; and shall only add to that description by mentioning, that they extend south-west by south, and north-east by north, about nineteen miles. The north end lies in the latitude of $19^{\circ} 39'$ S., and $33'$ of longitude to the east of Annamooka. Between them are a great many small islands, sand-banks, and breakers; so that the safest way to arrive at Hapace is either by the course I held, or round by the north; according to the situation of the ship bound thither. Lefooga, off which we anchored, is the most fertile isle of those that are called Hapace; and, consequently, is the best inhabited. There is anchorage along the north-west side of this island; but it will be necessary to examine the ground well before you moor. For, although the lead may bring up fine sand, there are, nevertheless, some sharp coral rocks that would soon destroy the cables.

What has been here omitted, concerning the geography of these islands, will be found in the narrative of my last voyage*. To that narrative I must also refer for such particulars concerning the inhabitants, their manners, and arts, as I had observed then, and about which I saw no reason to change my judgment. At present I shall confine myself to such interesting particulars, as either were not mentioned in that narrative, or were imperfectly and incorrectly represented there; and to such as may serve to explain some passages in the foregoing account of our transactions with the natives.

It may, indeed, be expected that, after spending between two and three months amongst them, I should be enabled to clear up every difficulty, and to give a tolerably satisfactory account of their customs, opinions, and institutions, both civil and religious; especially as we had a person on board, who might be supposed qualified to act the part of an interpreter, by understanding their language and ours. But poor Omai was very deficient. For unless the object or thing we wanted to inquire about was actually before us, we found it difficult to gain a tolerable knowledge of it from information only, without falling into a hundred

mistakes; and to such mistakes Omai was more liable than we were. For, having no curiosity, he never gave himself the trouble to make remarks for himself; and, when he was disposed to explain matters to us, his ideas appeared to be so limited, and, perhaps, so different from ours, that his accounts were often so confused, as to perplex, instead of instructing us. Add to this, that it was very rare that we found, amongst the natives, a person who united the ability and the inclination to give us the information we wanted; and we found that most of them hated to be troubled with what they probably thought idle questions. Our situation at Tongataboo, where we remained the longest, was likewise unfavourable. It was in a part of the country where there were few inhabitants except fishers. It was always holiday with our visitors, as well as with those we visited; so that we had but few opportunities of observing what was really the domestic way of living of the natives. Under these disadvantages it is not surprising that we should not be able to bring away with us satisfactory accounts of many things; but some of us endeavoured to remedy those disadvantages by diligent observation; and I am indebted to Mr. Anderson for a considerable share of what follows in this and in the following chapter. In other matters I have only expressed, nearly in his words, remarks that coincided with mine; but what relates to the religion and language of these people is entirely his own.

The natives of the Friendly Islands seldom exceed the common stature (though we have measured some who were above six feet); but are very strong and well made, especially as to their limbs. They are generally broad about the shoulders; and though the muscular disposition of the men, which seems a consequence of much action, rather conveys the appearance of strength than of beauty, there are several to be seen who are really handsome. Their features are very various; insomuch, that it is scarcely possible to fix on any general likeness by which to characterise them, unless it be a fulness at the point of the nose, which is very common. But on the other hand, we met with hundreds of truly European faces, and many genuine Roman noses amongst them. Their eyes and teeth are good; but the last neither so remarkably white, nor so well set, as is often found amongst Indian nations; though, to balance that, few of them have any uncommon thickness about the lips, a defect as frequent as the other perfection. The women are not so much distinguished from the men by their features as by their general form, which is, for the most part, destitute of that strong fleshy firmness that appears in the latter. Though the features of some are so delicate as not only to be a true index of their sex, but to lay claim to a considerable share of beauty and expression, the rule is by no means so general as in many other countries. But, at the same time, this is frequently the most exceptionable part; for the bodies and limbs of most of the females are well proportioned; and some absolutely perfect models of a beautiful figure. But the most remarkable distinction in the women, is the uncommon smallness and delicacy of their fingers, which may be put in competition with the finest in Europe.

The general colour is a cast deeper than the copper brown; but several of the men and women have a true olive complexion; and some of the last are even a great deal fairer; which is probably the effect of being less exposed to the sun; as a tendency to corpulence, in a few of the principal people, seems to be the consequence of a more indolent life. It is also amongst the last, that a soft clear skin is most frequently observed. Amongst the bulk of the people, the skin is more commonly of a dull hue, with some degree of roughness, especially the parts that are not covered; which, perhaps, may be occasioned by some cutaneous disease. We saw a man and boy at Hapae, and a child at Annamooka, perfectly white. Such have been found amongst all black nations; but I apprehend that their colour is rather a disease than a natural phenomenon. There are, nevertheless, upon the whole, few natural defects or deformities to be found amongst them; though we saw two or three with their feet bent inward; and some afflicted with a sort of blindness, occasioned by a disease of the cornea. Neither are they exempt from some other diseases; the most common of which is the tetter, or ring-worm, that seems to affect almost one-half of them, and leaves whitish serpentine marks everywhere behind it. But this is of less consequence than another disease which is very frequent, and appears on every part of the body, in large broad ulcers, with thick white edges, discharging a thin clear matter; some of which had a very virulent appearance, particularly those on the face, which were shocking

to look at; and yet we met with some who seemed to be cured of it, and others in a fair way of being cured; but this was not effected without the loss of the nose, or of the best part of it. As we know for a certainty* (and the fact is acknowledged by themselves), that the people of these islands were subject to this loathsome disease before the English first visited them, notwithstanding the similarity of symptoms, it cannot be the effect of the venereal contagion; unless we adopt a supposition, which I could wish had sufficient foundation in truth, that the venereal disorder was not introduced here from Europe by our ships in 1773. It assuredly was now found to exist amongst them; for we had not been long there before some of our people received the infection; and I had the mortification to learn from thence, that all the care I took, when I first visited these islands, to prevent this dreadful disease from being communicated to their inhabitants, had proved ineffectual. What is extraordinary, they do not seem to regard it much; and as we saw few signs of its destroying effects, probably the climate, and the way of living of these people, greatly abate its virulence. There are two other diseases frequent amongst them; one of which is an indolent firm swelling, which affects the legs and arms, and increases them to an extraordinary size in their whole length. The other is a tumour of the same sort in the testicles, which sometimes exceed the size of the two fists. But, in other respects, they may be considered as uncommonly healthy; not a single person having been seen, during our stay, confined to the house by sickness of any kind. On the contrary, their strength and activity are every way answerable to their muscular appearance; and they exert both, in their usual employment, and in their diversions, in such a manner, that there can be no doubt of their being as yet little debilitated by the numerous diseases that are the consequence of indolence, and an unnatural method of life. The graceful air and firm step with which these people walk, are not the least obvious proof of their personal accomplishments. They consider this as a thing so natural or so necessary to be acquired, that nothing used to excite their laughter sooner than to see us frequently stumbling upon the roots of trees, or other inequalities of the ground.

Their countenances very remarkably express the abundant mildness or good-nature which they possess; and are entirely free from that savage keenness which marks nations in a barbarous state. One would, indeed, be apt to fancy, that they had been bred up under the severest restrictions, to acquire an aspect so settled, and such a command of their passions as well as steadiness in conduct. But they are, at the same time, frank, cheerful, and good-humoured; though sometimes, in the presence of their chiefs, they put on a degree of gravity, and such a serious air as becomes stiff and awkward, and has an appearance of reserve. Their peaceable disposition is sufficiently evinced from the friendly reception all strangers have met with who have visited them. Instead of offering to attack them openly or clandestinely, as has been the case with most of the inhabitants of these seas, they have never appeared in the smallest degree hostile; but, on the contrary, like the most civilised people, have courted an intercourse with their visitors by bartering, which is the only medium that unites all nations in a sort of friendship. They understand barter (which they call *fukkatou*) so perfectly, that at first we imagined they might have acquired this knowledge of it by commercial intercourse with the neighbouring islands; but we were afterward assured that they had little or no traffic, except with Feejee, from which they get the red feathers, and the few other articles mentioned before. Perhaps, no nation in the world traffic with more honesty and less distrust. We could always safely permit them to examine our goods, and to hand them about, one to another; and they put the same confidence in us. If either party repented of the bargain, the goods were re-exchanged with mutual consent and good-humour. Upon the whole, they seem possessed of many of the most excellent qualities that adorn the human mind; such as industry, ingenuity, perseverance, affability, and, perhaps, other virtues which our short stay with them might prevent our observing.

The only defect sullyng their character, that we knew of, is a propensity to thieving; to which we found those of all ages and both sexes addicted, and to an uncommon degree. It should, however, be considered that this exceptionable part of their conduct seemed to exist

* See Vol. I. p. 494, where Captain Cook gives a particular account of meeting with a person afflicted with this disease, at Annamooka, on his landing there in 1773.

merely with respect to us ; for in their general intercourse with one another, I had reason to be of opinion that thefts do not happen more frequently (perhaps less so) than in other countries, the dishonest practices of whose worthless individuals are not supposed to authorise any indiscriminate censure on the whole body of the people. Great allowances should be made for the foibles of these poor natives of the Pacific Ocean, whose minds we overpowered with the glare of objects equally new to them as they were captivating. Stealing, amongst the civilised and enlightened nations of the world, may well be considered as denoting a character deeply stained with moral turpitude, with avarice unrestrained by the known rules of right, and with profligacy producing extreme indigence, and neglecting the means of relieving it. But at the Friendly and other Islands which we visited, the thefts so frequently committed by the natives, of what we had brought along with us, may be fairly traced to less culpable motives. They seemed to arise solely from an intense curiosity or desire to possess something which they had not been accustomed to before, and belonging to a sort of people so different from themselves. And, perhaps, if it were possible, that a set of beings seemingly as superior in our judgment as we are in theirs, should appear amongst us, it might be doubted whether our natural regard to justice would be able to restrain many from falling into the same error. That I have assigned the true motive for their propensity to this practice, appears from their stealing everything indiscriminately at first sight, before they could have the least conception of converting their prize to any one useful purpose. But, I believe, with us, no person would forfeit his reputation, or expose himself to punishment, without knowing beforehand how to employ the stolen goods. Upon the whole, the pilfering disposition of these islanders, though certainly disagreeable and troublesome to strangers, was the means of affording us some information as to the quickness of their intellects. For their small thefts were committed with much dexterity ; and those of greater consequence with a plan or scheme suited to the importance of the objects. An extraordinary instance of the last sort, their attempts to carry away one of the Discovery's anchors at mid-day, has been already related.

Their hair is in general straight, thick, and strong, though a few have it bushy or frizzled. The natural colour, I believe, almost without exception, is black ; but the greatest part of the men, and some of the women, have it stained of a brown or purple colour, and a few of an orange cast. The first colour is produced by applying a sort of plaster of burnt coral, mixed with water ; the second by the raspings of a reddish wood, which is made up with water into a poultice, and laid over the hair ; and the third is, I believe, the effect of turmeric root. When I first visited these islands, I thought it had been an universal custom for both men and women to wear the hair short ; but, during our present longer stay, we saw a great many exceptions. Indeed they are so whimsical in their fashions of wearing it, that it is hard to tell which is most in vogue. Some have it cut off one side of the head, while that on the other side remains long ; some have only a portion of it cut short, or perhaps shaved ; others have it entirely cut off, except a single lock, which is left commonly on one side, or it is suffered to grow to its full length without any of these mutilations. The women in general wear it short.

The men have their beards cut short ; and both men and women strip the hair from their armpits : the operation by which this is performed has been already described. The men are stained from about the middle of the belly, to about half-way down the thighs, with a deep blue colour. This is done with a flat bone instrument cut full of fine teeth, which being dipped in the staining mixture, prepared from the juice of the *dooe-dooe*, is struck into the skin with a bit of stick, and by that means indelible marks are made. In this manner they trace lines and figures, which in some are very elegant, both from the variety and from the arrangement. The women have only a few small lines or spots thus imprinted on the inside of their hands.

Their kings, as a mark of distinction, are exempted from this custom, as also from inflicting on themselves any of those bloody marks of mourning which shall be mentioned in another place.

The dress of both men and women is the same ; and consists of a piece of cloth or matting (but mostly the former), about two yards wide, and two and a half long ; at least, so long as to go once and a half round the waist, to which it is confined by a girdle or cord. It is double before, and hangs down like a petticoat, as low as the middle of the leg. The upper part of the garment above the girdle is plaited into several folds ; so that when unfolded, there is cloth sufficient to draw up and wrap round the shoulders, which is very seldom done. This, as to form, is the general dress ; but large pieces of cloth and fine matting are worn only by the superior people. The inferior sort are satisfied with small pieces, and very often wear nothing but a covering made of leaves of plants, or the *maro*, which is a narrow piece of cloth or matting, like a sash. This they pass between the thighs, and wrap round the waist ; but the use of it is chiefly confined to the men. In their great *haieas*, or entertainments, they have various dresses made for the purpose ; but the form is always the same ; and the richest dresses are covered, more or less, with red feathers. On what particular occasion their chiefs wear their large red feather-caps, I could not learn. Both men and women sometimes shade their faces from the sun with little bonnets, made of various materials.

As the clothing, so are the ornaments worn by those of both sexes, the same. The most common of these are necklaces made of the fruit of the *pandanus*, and various sweet-smelling flowers, which go under the general name of *kahulla*. Others are composed of small shells, the wing and leg bones of birds, shark's teeth, and other things ; all which hang loose upon the breast. In the same manner, they often wear a mother-of-pearl shell neatly polished, or a ring of the same substance carved on the upper part of the arm ; rings of tortoise-shell on the fingers, and a number of these joined together as bracelets on the wrists. The lobes of the ears (though, most frequently, only one), are perforated with two holes, in which they wear cylindrical bits of ivory, about three inches long, introduced at one hole, and brought out of the other ; or bits of reed of the same size, filled with a yellow pigment. This seems to be a fine powder of turmeric, with which the women rub themselves all over, in the same manner as our ladies use their dry rouge upon the cheeks.

Nothing appears to give them greater pleasure than personal cleanliness ; to produce which they frequently bathe in the ponds, which seem to serve no other purpose. Though the water in most of them stinks intolerably, they prefer them to the sea ; and they are so sensible that salt water hurts their skin, that when necessity obliges them to bathe in the sea, they commonly have some cocoa-nut shells filled with fresh water poured over them to wash it off. They are immoderately fond of cocoa-nut oil for the same reason ; a great quantity of which they not only pour upon their head and shoulders, but rub the body all over, briskly, with a smaller quantity. And none but those who have seen this practice can easily conceive how the appearance of the skin is improved by it. This oil, however, is not to be procured by every one ; and the inferior sort of people, doubtless, appear less smooth for want of it.

 OBSERVATIONS.

THEIR domestic life is of that middle kind, neither so laborious as to be disagreeable, nor so vacant as to suffer them to degenerate into indolence. Nature has done so much for their country, that the first can hardly occur, and their disposition seems to be a pretty good bar to the last. By this happy combination of circumstances, their necessary labour seems to yield in its turn to their recreations, in such a manner, that the latter are never

interrupted by the thoughts of being obliged to recur to the former, till satiety makes them wish for such a transition. The employment of the women is of the easy kind, and, for the most part, such as may be executed in the house. The manufacture of their cloth is wholly consigned to their care. Having already described the process, I only add, that they have this cloth of different degrees of fineness. The coarser sort, of which they make very large pieces, does not receive the impression of any pattern. Of the finer sort they have some that is striped and chequered, and of other patterns differently coloured. But how these colours are laid on, I cannot say, as I never saw any of this sort made. The cloth in general will resist water for some time; but that which has the strongest glaze will resist longest.

The manufacture next in consequence, and also within the department of the women, is that of their mats, which excel everything I have seen at any other place, both as to their texture and their beauty. In particular, many of them are so superior to those made at Otahite, that they are not a bad article to carry thither by way of trade. Of these mats, they have seven or eight different sorts, for the purposes of wearing or sleeping upon, and many are merely ornamental. The last are chiefly made from the tough membranous part of the stock of the plantain-tree; those that they wear from the *pandanus*, cultivated for that purpose, and never suffered to shoot into a trunk; and the coarser sort, which they sleep upon, from a plant called *evarra*. There are many other articles of less note, that employ the spare time of their females; as combs, of which they make vast numbers; and little baskets made of the same substance as the mats, and others of the fibrous cocoa-nut husk, either plain or interwoven with snail beads; but all finished with such neatness and taste in the disposition of the various parts, that a stranger cannot help admiring their assiduity and dexterity.

MATS, BASKETS, AND FANCY-WORK OF WOMEN.

The province allotted to the men is, as might be expected, far more laborious and extensive than that of the women. Agriculture, architecture, boat-building, fishing, and other things that relate to navigation, are the objects of their care. Cultivated roots and fruits being their principal support, this requires their constant attention to agriculture, which they pursue very diligently, and seem to have brought almost to as great perfection as circumstances will permit. The large extent of the plantain fields has been taken notice of already; and the same may be said of the yams; these two together being at least as ten to one with respect to all the other articles. In planting both these, they dig small holes for their reception, and afterwards root up the surrounding grass, which, in this hot country, is quickly deprived of its vegetating power, and soon rotting, becomes a good manure. The instruments they use for this purpose, which they call *hoo*, are nothing more than pickets or stakes of different lengths, according to the depth they have to dig. These are flattened and sharpened to an edge at one end; and the largest have a short piece fixed transversely, for pressing it into the ground with the foot. With these, though they are not more than from two to four inches broad, they dig and plant ground of many acres in extent. In planting the plantains and yams, they observe so much exactness, that whichever way you look the rows present themselves regular and complete.

The cocoa-nut and bread-fruit trees are scattered about without any order, and seem to give them no trouble after they have attained a certain height. The same may be said of another large tree which produces great numbers of a large roundish compressed nut, called *ceefee*; and of a smaller tree that bears a rounded oval nut two inches long, with two or three triangular kernels, tough and insipid, called *mabba*, most frequently planted near their houses. The *koppe* is commonly regularly planted, and in pretty large spots; but the *maichaka* is interspersed amongst other things, as the *jeejee* and yams are; the last of which, I have frequently seen in the interspaces of the plantain-trees at their common distance. Sugar-cane is commonly in small spots, crowded closely together; and the mulberry, of which the cloth is made, though without order, has sufficient room allowed for it, and is kept very clean. The only other plant that they cultivate for their manufactures is the *pandanus*, which is generally planted in a row close together at the sides of the other fields; and they consider it as a thing so distinct in this state, that they have a different name for it, which shows that they are very sensible of the great changes brought about by cultivation.

It is remarkable that these people, who in many things show much taste and ingenuity, should show little of either in building their houses, though the defect is rather in the design than in the execution. Those of the lower people are poor huts, scarcely sufficient to defend them from the weather, and very small. Those of the better sort are larger and more comfortable, but not what one might expect: the dimensions of one of a middling size are about thirty feet long, twenty broad, and twelve high. Their house is, properly speaking, a thatched roof or shed, supported by posts and rafters disposed in a very judicious manner. The floor is raised with earth, smoothed, and covered with strong thick matting, and kept very clean. The most of them are closed on the weather-side (and some more than two-thirds round) with strong mats, or with branches of the cocoa-nut tree, plaited or woven into each other. These they fix up edgewise, reaching from the eaves to the ground, and thus they answer the purpose of a wall. A thick strong mat, about two and one-half or three feet broad, bent into the form of a semicircle, and set upon its edge, with the ends touching the side of the house, in shape resembling the fender of a fire-hearth, encloses a space for the master and mistress of the family to sleep in: the lady, indeed, spends most of her time during the day within it. The rest of the family sleep upon the floor wherever they please to lie down; the unmarried men and women apart from each other; or, if the family be large, there are small huts adjoining, to which the servants retire in the night; so that privacy is as much observed here as one could expect. They have mats made on purpose for

ADZES, KNIVES, FILES, &c.

sleeping on; and the clothes that they wear in the day serve for their covering in the night. Their whole furniture consists of a bowl or two, in which they make *kava*; a few gourds; cocoa-nut shells; some small wooden stools, which serve them for pillows; and perhaps a large stool for the chief or master of the family to sit upon. The only probable reason I can

assign for their neglect of ornamental architecture in the construction of their houses, is their being fond of living much in the open air. Indeed, they seem to consider their houses, within which they seldom eat, as of little use but to sleep in, and to retire to in bad weather. And the lower sort of people, who spend a great part of their time in close attendance upon the chiefs, can have little use for their own houses but in the last case.

They make amends for the defects of their houses by their great attention to, and dexterity in, naval architecture, if I may be allowed to give it that name. But I refer to the narrative of my last voyage for an account of their canoes, and their manner of building and navigating them. The only tools which they use to construct these boats are,—hatchets, or rather thick adzes, of a smooth black stone that abounds at Tofoa; augers, made of sharks' teeth, fixed on small handles; and rasps, of a rough skin of a fish, fastened on flat pieces of wood thinner on one side, which also have handles. The labour and time employed in finishing their canoes, which are the most perfect of their mechanical productions, will account for their being very careful of them. For they are built and preserved under sheds; or they cover the decked part of them with cocoa-leaves, when they are hauled on shore, to prevent their being hurt by the sun. The same tools are all they have for other works, if we except different shells, which they use as knives. But there are few of their productions that require these, unless it be some of their weapons; the other articles being chiefly their fishing materials and cordage.

The cordage is made from the fibres of the cocoa-nut husk, which, though not more than nine or ten inches long, they plait about the size of a quill or less, to any length that they please, and roll it up in balls; from which the larger ropes are made, by twisting several of these together. The lines that they fish with are as strong and even as the best cord we make, resembling it almost in every respect. The other fishing implements are large and small hooks. The last are composed entirely of pearl-shell; but the first are only covered with it on the back; and the points of both commonly of tortoise-shell; those of the small being plain, and the others barbed. With the large ones they catch bonnetos and albigores, by putting them to a bamboo rod twelve or fourteen feet long, with a line of the same length, which rests in a notch of a piece of wood, fixed in the stern of the canoe for that purpose, and is dragged on the surface of the sea, as she rows along, without any other bait than a tuft of flaxy stuff near the point. They have also great numbers of pretty small seines, some of which are of a very delicate texture. These they use to catch fish with, in the holes on the reefs when the tide ebbs.

The other manual employments consist chiefly in making musical reeds, flutes, warlike weapons, and stools, or rather pillows, to sleep on. The reeds have eight, nine, or ten pieces placed parallel to each other, but not in any regular progression; having the longest sometimes in the middle, and several of the same length; so that I have seen none with more than six notes; and they seem incapable of playing any music on them that is distinguishable by our ears. The flutes are a joint of bamboo, close at both ends, with a hole near each, and four others; two of which, and one of the first only, are used in playing. They apply the thumb of the left hand to close the left nostril, and blow into the hole at

one end with the other. The middle finger of the left hand is applied to the first hole

MUSICAL INSTRUMENTS.

on the left, and the fore finger of the right to the lowest hole on that side. In this manner, though the notes are only three, they produce a pleasing, yet simple music, which they vary much more than one would think possible with so imperfect an instrument. Their being accustomed to a music which consists of so few notes, is perhaps the reason why they do not seem to relish any of ours, which is so complex. But they can taste what is more deficient than their own; for we observed that they used to be well pleased

with hearing the chant of our two young New Zealanders, which consisted rather in mere strength than in melody of expression.

The weapons which they make are clubs of different sorts (in the ornamenting of which they spend much time), spears, and darts. They have also bows and arrows; but these seemed to be designed only for amusement, such as shooting at birds, and not for military purposes. The stools are about two feet long, but only four or five inches high, and near four broad, bending downward in the middle, with four strong legs and circular feet; the whole made of one piece of black or brown wood, neatly polished, and sometimes inlaid with bits of ivory. They also inlay the handles of fly-flaps with ivory, after being neatly carved; and they shape bones into small figures of men, birds, and other things, which must be very difficult, as their carving instrument is only a shark's tooth.

Yams, plantains, and cocoa-nuts, compose the greatest part of their vegetable diet. Of their animal food, the chief articles are hogs, fowls, fish, and all sorts of shell-fish; but the lower people eat rats. The two first vegetable articles, with bread-fruit, are what may be called the basis of their food, at different times of the year, with fish and shell-fish; for hogs, fowls, and turtle, seem only to be occasional dainties reserved for their chiefs. The intervals between the seasons of these vegetable productions must be, sometimes, considerable, as they prepare a sort of artificial bread from plantains, which they put under ground before ripe, and suffer them to remain till they ferment, when they are taken out, and made up into small balls; but so sour and indifferent, that they often said our bread was preferable, though somewhat musty. Their food is generally dressed by baking, in the same manner as at Otateite; and they have the art of making, from different kinds of fruit, several dishes, which most of us esteemed very good. I never saw them make use of any kind of sauce; nor drink anything at their meals but water, or the juice of the cocoa-nut; for the *kava* is only their morning draught. I cannot say that they are cleanly either in their cookery or manner of eating. The generality of them will lay their victuals upon the first leaf they meet with, however dirty it may be; but when food is served up to the chiefs, it is commonly laid upon green plantain leaves. When the king made a meal, he was, for the most part, attended upon by three or four persons. One cut large pieces of the joint, or of the fish; another divided it into mouthfuls; and others stood by with cocoa-nuts, and whatever else he might want. I never saw a large company sit down to what we should call a sociable meal, by eating from the same dish. The food, be what it will, is always divided into portions, each to serve a certain number; these portions are again subdivided; so that one seldom sees above two or three persons eating together. The women are not excluded from eating with the men; but there are certain ranks or orders amongst them, that can neither eat nor drink together. This distinction begins with the king; but where it ends I cannot say.

They seem to have no set time for meals; though it should be observed, that, during our stay amongst them, their domestic economy was much disturbed by their constant attention to us. As far as we could remark, those of the superior rank only drink *kava* in the

to the first hole

forenoon, and the others eat perhaps a bit of yam; but we commonly saw all of them eat something in the afternoon. It is probable that the practice of making a meal in the night is pretty common; and their rest being thus interrupted, they frequently sleep in the day. They go to bed as soon as it is dark, and rise with the dawn in the morning. They are very fond of associating together; so that it is common to find several houses empty, and the owners of them convened in some other one, or rather upon a convenient spot in the neighbourhood, where they recreate themselves by conversing, and other amusements. Their private diversions are chiefly singing, dancing, and music performed by the women. When two or three women sing in concert, and snap their fingers, it is called *oobai*; but when there is a greater number, they divide into several parties, each of which sings on a different key, which makes a very agreeable music, and is called *heeva* or *haiva*. In the same manner, they vary the music of their flutes, by playing on those of a different size; but their dancing is much the same as when they perform publicly. The dancing of the men (if it is to be called dancing), although it does not consist much in moving the feet, as we do, has a thousand different motions with the hands, to which we are entire strangers; and they are performed with an ease and grace which are not to be described, nor even conceived, but by those who have seen them. But I need add nothing to what has been already said on this subject, in the account of the incidents that happened during our stay at the islands.

Whether their marriages be made lasting by any kind of solemn contract, we could not determine with precision; but it is certain, that the bulk of the people satisfied themselves with one wife. The chiefs, however, have commonly several women; though some of us were of opinion that there was only one that was looked upon as the mistress of the family. As female chastity at first sight seemed to be held in no great estimation, we expected to have found frequent breaches of their conjugal fidelity; but we did them great injustice. I do not know that a single instance happened during our whole stay. Neither are those of the better sort, that are unmarried, more free of their favours. It is true there was no want of those of a different character; and, perhaps, such are more frequently met with here, in proportion to the number of people, than in many other countries. But it appeared to me that the most, if not all of them, were of the lowest class; and such of them as permitted familiarities to our people, were prostitutes by profession.

Nothing can be a greater proof of the humanity of these people, than the concern they show for the dead. To use a common expression, their mourning is not in words but deeds. For, besides the *tooge* mentioned before, and burnt circles and scars, they beat the teeth with stones, strike a shark's tooth into the head until the blood flows in streams, and thrust spears into the inner part of the thigh, into their sides below the arm-pits, and through the cheeks into the mouth. All these operations convey an idea of such rigorous discipline, as must require either an uncommon degree of affection or the grossest superstition, to exact. I will not say that the last has no share in it; for, sometimes, it is so universal, that many could not have any knowledge of the person for whom the concern is expressed. Thus we saw the people of Tongataboo mourning the death of a chief at Vavaoo; and other similar instances occurred during our stay. It should be observed, however, that the more painful operations are only practised on account of the death of those most nearly connected with the mourners. When a person dies, he is buried, after being wrapped up in mats and cloth, much after our manner. The chiefs seem to have the *fiatookas* appropriated to them as their burial-places; but the common people are interred in no particular spot. What part of the mourning ceremony follows immediately after, is uncertain; but that there is something besides the general one, which is continued for a considerable length of time, we could infer, from being informed, that the funeral of Mareewagee's wife, as mentioned before, was to be attended with ceremonies that were to last five days, and in which all the principal people were to commemorate her.

Their long and general mourning proves that they consider death as a very great evil. And this is confirmed by a very odd custom which they practise to avert it. When I first visited these islands, during my last voyage, I observed that many of the inhabitants had

one or both of their little fingers cut off; and we could not then receive any satisfactory account of the reason of this mutilation. But we now learned that this operation is performed when they labour under some grievous disease, and think themselves in danger of dying. They suppose that the deity will accept of the little finger, as a sort of sacrifice efficacious enough to procure the recovery of their health. They cut it off with one of their stone hatchets. There was scarcely one in ten of them whom we did not find thus mutilated in one or both hands; which has a disagreeable effect, especially as they sometimes cut so close that they encroach upon the bone of the hand which joins to the amputated finger*.

From the rigid severity with which some of these mourning and religious ceremonies are executed, one would expect to find that they meant thereby to secure to themselves felicity beyond the grave; but their principal object relates to things merely temporal. For they seem to have little conception of future punishment for faults committed in this life. They believe, however, that they are justly punished upon earth; and, consequently, use every method to render their divinities propitious. The Supreme Author of most things they call *Kallafootonga*; who, they say, is a female residing in the sky, and directing the thunder, wind, rain; and, in general, all the changes of weather. They believe, that when she is angry with them, the productions of the earth are blasted; that many things are destroyed by lightning; and that they themselves are afflicted with sickness and death, as well as their hogs and other animals. When this anger abates, they suppose that everything is restored to its natural order; and it should seem, that they have a great reliance on the efficacy of their endeavours to appease their offended divinity. They also admit a plurality of deities, though all inferior to *Kallafootonga*. Amongst them, they mention *Toofooa-boo-lootoo*, God of the clouds and fog; *Talletoboo*, and some others, residing in the heavens. The first in rank and power, who has the government of the sea and its productions, is called *Futtafaihe*, or, as it was sometimes pronounced, *Footafooa*; who, they say, is a male, and has for his wife *Fykava kajee*; and here, as in heaven, there are several inferior potentates, such as *Vahaa funooa*, *Tarceaba*, *Mutaba*, *Evaroo*, and others. The same religious system, however, does not extend all over the cluster of the Friendly Isles; for the supreme god of Hapae, for instance, is called *Alo Alo*; and other isles have two or three, of different names. But their notions of the power and other attributes of these beings are so very absurd, that they suppose they have no farther concern with them after death. They have, however, very proper sentiments about the immateriality and the immortality of the soul. They call it life, the living principle, or, what is more agreeable to their notions of it, an *Otooa*; that is, a divinity, or invisible being. They say, that, immediately upon death, the souls of their chiefs separate from their bodies, and go to a place called *Boolootoo*; the chief, or god of which is *Goolcho*. This *Goolcho* seems to be a personification of Death; for they used to say to us, "You, and the men of Feejee (by this juncture, meaning to pay a compliment, expressive of their confession of our superiority over themselves,) are also subject to the power and dominion of *Goolcho*." His country, the general receptacle of the dead, according to their mythology, was never seen by any person; and yet, it seems, they know that it lies to the westward of Feejee; and that they who are once transported thither, live for ever; or, to use their own expression, are not subject to death again; but feast upon all the favourite products of their own country, with which this everlasting abode is supposed to abound. As to the souls of the lower sort of people, they undergo a sort of transmigration; or, as they say, are eaten up by a bird called *loata*, which walks upon their graves for that purpose.

I think I may venture to assert, that they do not worship anything that is the work of their own hands, or any visible part of the creation. They do not make offerings of hogs, dogs, and fruit, as at Otaheite, unless it be emblematically; for their *morais* were perfectly free from everything of the kind. But that they offer real human sacrifices, is with me beyond a doubt. Their *morais* or *fiatookas* (for they are called by both names, but mostly by the latter), are, as at Otaheite and many other parts of the world, burying-grounds and

* It may be proper to mention here, on the authority of Captain King, that it is common for the inferior people to cut off a joint of their little finger, on account of the sickness of the chiefs to whom they belong.

places of worship; though some of them seemed to be only appropriated to the first purpose; but these were small, and in every other respect inferior to the others.

Of the nature of their government, we know no more than the general outline. A subordination is established among them, that resembles the feudal system of our progenitors in Europe. But of its subdivisions of the constituent parts, and in what manner they are connected, so as to form a body-politic, I confess myself totally ignorant. Some of them told us that the power of the king is unlimited, and that the life and property of the subject is at his disposal. But the few circumstances that fell under our observation, rather contradicted than confirmed the idea of a despotic government. Mareewagee, old Tooboo, and Feenou, acted each like petty sovereigns, and frequently thwarted the measures of the king; of which he often complained. Neither was his court more splendid than those of the two first, who are the most powerful chiefs in the islands; and next to them, Feenou, Mareewagee's son, seemed to stand highest in authority. But, however independent on the despotic power of the king the great men may be, we saw instances enough to prove, that the lower order of people have no property, nor safety for their persons, but at the will of the chiefs to whom they respectively belong.

Tongataboo is divided into many districts; of above thirty of which we learned the names. Each of these has its particular chief, who decides differences, and distributes justice within his own district. But we could not form any satisfactory judgment about the extent of their power in general, or their mode of proportioning punishments to crimes. Most of these chiefs have possessions in other islands, from whence they draw supplies. At least, we know this is so with respect to the king, who, at certain established times, receives the product of his distant domains at Tongataboo; which is not only the principal place of his residence, but seemingly of all the people of consequence amongst these isles. Its inhabitants, in common conversation, call it the Land of Chiefs; while the subordinate isles are distinguished by the appellation of Lands of Servants. These chiefs are, by the people, styled not only lords of the earth, but of the sun and sky; and the king's family assume the name of Futtafaihe, from the god so called, who is probably their tutelary patron, and, perhaps, their common ancestor. The sovereign's peculiar earthly title is, however, simply *Tuooa Tonga*.

There is a decorum observed in the presence of their principal men, and particularly of their king, that is truly admirable. Whenever he sits down, whether it be in a house or without, all the attendants seat themselves at the same time in a semicircle before him; leaving always a convenient space between him and them, into which no one attempts to come, unless he has some particular business. Neither is any one allowed to pass or sit behind him, nor even near him, without his order or permission; so that our having been indulged with this privilege, was a significant proof of the great respect that was paid us. When any one wants to speak with the king, he advances and sits down before him, delivers what he has to say in a few words, and having received his answer, retires again to the circle. But if the king speaks to any one, that person answers from his seat, unless he is to receive some order, in which case he gets up from his place and sits down before the chief with his legs across; which is a posture to which they are so much accustomed, that any other mode of sitting is disagreeable to them*. To speak to the king standing would be accounted here as striking a mark of rudeness, as it would be with us for one to sit down and put on his hat, when he addresses himself to his superior, and that superior on his feet, and uncovered.

It does not, indeed, appear that any of the most civilised nations have ever exceeded this people in the great order observed on all occasions; in ready compliance with the commands of their chiefs; and in the harmony that subsists throughout all ranks, and unites them as if they were all one man, informed with and directed by the same principle. Such a behaviour is remarkably obvious, whenever it is requisite that their chief should harangue any body of them collected together, which is frequently done. The most profound silence

* This is peculiar to the men; the women always sitting with both legs thrown a little on one side. We owe this remark to Captain King.

and attention is observed during the harangue, even to a much greater degree than is practised amongst us, on the most interesting and serious deliberations of our most respectable assemblies. And whatever might have been the subject of the speech delivered, we never saw an instance when any individual present showed signs of his being displeased, or that indicated the least inclination to dispute the declared will of a person who had a right to command. Nay, such is the force of these verbal laws, as I may call them, that I have seen one of their chiefs express his being astonished at a person's having acted contrary to such orders; though it appeared that the poor man could not possibly have been informed in time to have observed them.

Though some of the more potent chiefs may vie with the king in point of actual possessions, they fall very short in rank, and in certain marks of respect, which the collective body have agreed to pay the monarch. It is a particular privilege annexed to his sovereignty, not to be punctured nor circumcised as all his subjects are. Whenever he walks out, every one whom he meets must sit down till he has passed. No one is allowed to be over his head; on the contrary, all must come under his feet; for there cannot be a greater outward mark of submission than that which is paid to the sovereign and other great people of these islands by their inferiors. The method is this: the person who is to pay obeisance squats down before the chief, and bows the head to the sole of his foot; which, when he sits, is so placed that it can be easily come at; and having tapped, or touched it with the under and upper side of the fingers of both hands, he rises up and retires. It should seem, that the king cannot refuse any one who chooses to pay him this homage, which is called *moe moea*; for the common people would frequently take it into their heads to do it when he was walking; and he was always obliged to stop and hold up one of his feet behind him, till they had performed the ceremony. This, to a heavy unwieldy man, like Poulaho, must be attended with some trouble and pain; and I have sometimes seen him make a run, though very unable, to get out of the way, or to reach a place where he might conveniently sit down. The hands, after this application of them to the chief's feet, are, in some cases, rendered useless for a time; for, until they be washed, they must not touch any kind of food. This interdiction in a country where water is so scarce would seem to be attended with some inconvenience; but they are never at a loss for a succedaneum; and a piece of any juicy plant, which they can easily procure immediately, being rubbed upon them, this serves for the purpose of purification, as well as washing them with water. When the hands are in this state, they call it *taboo rema*. *Taboo*, in general, signifies forbidden, and *rema* is their word for hand. When the *taboo* is incurred by paying obeisance to a great personage, it is thus easily washed off. But in some other cases it must necessarily continue for a certain time. We have frequently seen women, who have been *taboo rema*, fed by others. At the expiration of the time, the interdicted person washes herself in one of their baths, which are dirty holes, for the most part, of brackish water. She then waits upon the king, and after making her obeisance in the usual way, lays hold of his foot and applies it to her breast, shoulders, and other parts of her body. He then embraces her on each shoulder; after which she retires purified from her uncleanness. I do not know that it is always necessary to come to the king for this purpose, though Omai assured me it was. If this be so, it may be one reason why he is, for the most part, travelling from island to island. I saw this ceremony performed by him two or three times; and once by Feenou, to one of his own women; but as Omai was not then with me, I could not ask the occasion.

Taboo, as I have before observed, is a word of an extensive signification. Human sacrifices are called *tangata taboo*; and when anything is forbidden to be eaten, or made use of, they say that it is *taboo*. They tell us, that if the king should happen to go into a house belonging to a subject, that house would be *taboo*, and could never more be inhabited by the owner; so that wherever he travels, there are particular houses for his reception. Old Toobou, at this time, presided over the *taboo*; that is, if Omai comprehended the matter rightly, he and his deputies inspected all the produce of the island; taking care that every man should cultivate and plant his quota; and ordering what should be eaten and what

not. By this wise regulation they effectually guard against a famine; a sufficient quantity of ground is employed in raising provisions; and every article thus raised is secured from unnecessary waste. By another prudent regulation in their government, they have an officer over the police, or something like it. This department, when we were amongst them, was administered by Feenou; whose business we were told it was to punish all offenders, whether against the state or against individuals. He was also generalissimic, and commanded the warriors, when called out upon service; but, by all accounts, this is very seldom. The king frequently took some pains to inform us of Feenou's office; and among other things, told us that if he himself should become a bad man, Feenou would kill him. What I understood by this expression of being a bad man was, that if he did not govern according to law or custom, Feenou would be ordered, by the other great men, or by the people at large, to put him to death. There should seem to be no doubt, that a sovereign, thus liable to be controlled and punished for an abuse of power, cannot be called a despotic monarch.

When we consider the number of islands that compose this little state, and the distance at which some of them lie from the seat of government, attempts to throw off the yoke, and to acquire independence, it should seem, might be apprehended; but they tell us that this never happens. One reason why they are not thus disturbed, by domestic quarrels, may be this; that all the powerful chiefs, as we have already mentioned, reside at Tongataboo. They also secure the dependence of the other islands by the celerity of their operations; for if, at any time, a troublesome and popular man should start up in any of them, Feenou, or whoever holds his office, is immediately despatched thither to kill him. By this means, they crush a rebellion in its very infancy.

The orders or classes amongst their chiefs, or those who call themselves such, seemed to be almost as numerous as amongst us; but there are few in comparison that are lords of large districts of territory, the rest holding their lands under those principal barons, as they may be called. I was indeed told that when a man of property dies, everything he leaves behind him falls to the king; but that it is usual to give it to the eldest son of the deceased, with an obligation to make a provision out of it for the rest of the children. It is not the custom here, as at Otaheite, for the son, the moment he is born, to take from the father the homage and title; but he succeeds to them at his decease; so that their form of government is not only monarchical but hereditary. The order of succession to the crown has not been of late interrupted; for we know from a particular circumstance, that the Futtafaihes (Poulaho being only an addition to distinguish the king from the rest of his family) have reigned in a direct line, for at least one hundred and thirty-five years. Upon inquiring whether any account had been preserved amongst them of the arrival of Tasman's ships, we found that this history had been handed down to them from their ancestors, with an accuracy which marks that oral tradition may sometimes be depended upon. For they described the two ships as resembling ours, mentioning the place where they had anchored, their having staid but a few days; and their moving from that station to Annamooka. And by way of informing us how long ago this had happened, they told us the name of the Futtafaihe who was then king, and of those who had succeeded down to Poulaho, who is the fifth since that period; the first being an old man, at the time of the arrival of the ships.

From what has been said of the present king, it would be natural to suppose, that he had the highest rank of any person in the islands. But to our great surprise, we found it is not so, for Latoolibooloo, the person who was pointed out to me as king when I first visited Tongataboo, and three women, are, in some respects, superior to Poulaho himself. On our inquiring who these extraordinary personages were, whom they distinguished by the name and title of *Tammaha*?* we were told that the late king, Poulaho's father, had a sister of equal rank, and older than himself; that she, by a man who came from the island of Feejee, had a son and two daughters; and that these three persons, as well as their mother, rank above Futtafaihe the king. We endeavoured, in vain, to trace the reason of this singular pre-eminence of the *Tammahas*; for we could learn nothing besides this account of

* The reader need not be reminded that *Tamoloo*, which signifies a chief in the dialect of Hamoa, and *Tammaha* become the same word by the change of a single letter the articulation of which is not very strongly marked.

their pedigree. The mother and one of the daughters, called Tooeelakaipa, live at Vavaoo. Latoolibooloo, the son, and the other daughter, whose name is Moungoula-kaipa, reside at Tongataboo. The latter is the woman who is mentioned to have dined with me on the 21st of June. This gave occasion to our discovering her superiority over the king, who would not eat in her presence, though she made no scruple to do so before him, and received from him the customary obeisance, by touching her foot. We never had an opportunity of seeing him pay this mark of respect to Latoolibooloo; but we have observed him leave off eating, and have his victuals put aside, when the latter came into the same house. Latoolibooloo assumed the privilege of taking anything from the people, even if it belonged to the king; and yet in the ceremony called *Natche*, he assisted only in the same manner as the other principal men. He was looked upon by his countrymen as a madman, and many of his actions seemed to confirm this judgment. At Eooa they showed me a good deal of land, said to belong to him; and I saw there a son of his, a child whom they distinguish by the same title as his father. The son of the greatest prince in Europe could not be more humoured and caressed than this little *Tammaha* was.

The language of the Friendly Islands has the greatest affinity imaginable to that of New Zealand, of Watecoo, and Mangcea; and, consequently, to that of Otaheite, and the Society Islands. There are also many of their words the same with those used by the natives of Cocos Island, as appears from the vocabulary collected there by Le Maire and Schouten. The mode of pronunciation differs, indeed, considerably, in many instances, from that both of New Zealand and Otaheite; but still a great number of words are either exactly the same, or so little changed, that their common original may be satisfactorily traced. The language, as spoken at the Friendly Islands, is sufficiently copious for all the ideas of the people; and we had many proofs of its being easily adapted to all musical purposes, both in song and in recitative; besides being harmonious enough in common conversation. Its component parts, as far as our scanty acquaintance with it enabled us to judge, are not numerous; and in some of its rules, it agrees with other known languages. As, for instance, we could easily discern the several degrees of comparison, as used in the Latin; but none of the inflections of nouns and verbs.

We were able to collect several hundreds of the words; and, amongst these, are terms that express numbers as far as a hundred thousand; beyond which they never would reckon. It is probable, indeed, that they are not able to go farther; for, after having got thus far, we observed that they commonly used a word which expresses an indefinite number. A short specimen, selected from the larger vocabulary, is here inserted, with the corresponding words, of the same signification as used at Otaheite, on the opposite column; which, while it will give, as we may say, ocular demonstration of their being dialects of the same language, will, at the same time, point out the particular letters by the insertion, omission, or alteration of which the variations of the two dialects from each other have been effected.

It must be observed, however, that our vocabularies of this sort must necessarily be liable to great mistakes. The ideas of those from whom we were to learn the words were so different from ours, that it was difficult to fix them to the object of inquiry. Or, if this could be obtained, to learn an unknown tongue from an instructor, who did not know a single word of any language that his scholar was conversant with, could not promise to produce much. But even when these difficulties were surmounted, there still remained a fruitful source of mistake. I mean, inaccuracy in catching exactly the true sound of a word to which our ears had never been accustomed, from persons whose mode of pronunciation was, in general, so indistinct, that it seldom happened that any two of us, in writing down the same word from the same mouth, made use of the same vowels in representing it. Nay, we even very commonly differed about consonants, the sounds of which are least liable to ambiguity. Besides all this, we found by experience, that we had been led into strange corruptions of some of the most common words, either from the natives endeavouring to imitate us, or from our having misunderstood them. Thus, *cheeto* was universally used by us to express a thief, though totally different from the real word in the language of Tongataboo. The mistake arose from a prior one into which we had run when at New Zealand; for though the word that signifies thief there, be absolutely the same that belongs to the

dialect of the Friendly Islands (being *kaehau* at both places), yet, by some blunder, we had used the word *teete* first at New Zealand, and afterwards at Tongataboo, on our arrival there. The natives endeavouring to imitate us as nearly as they could, and so fabricating the word *cheeto*, this, by a complication of mistakes, was adopted by us as their own. All possible care has been taken to make the following table as correct as possible.

ENGLISH.	FRIENDLY ISLANDS.	OTAHEITE.	ENGLISH.	FRIENDLY ISLANDS.	OTAHEITE.

Having now concluded my remarks on these islands and people, I shall take my final leave of them, after giving some account of the astronomical and nautical observations that were made during our stay. And first I must take notice, that the difference of longitude between Annamooka and Tongataboo is somewhat less than was marked in the chart and narrative of my last voyage. This error might easily arise, as the longitude of each was then found without any connexion with the other. But now the distance between them is determined to a degree of precision that excludes all possibility of mistake; which the following table will illustrate:—

The latitude of the observatory at Tongataboo, by the mean of several observations	21° 8' 19" south.
The longitude, by the mean of one hundred and thirty-one sets of lunar observations, amounting to above a thousand observed distances between the moon, sun, and stars	184 55 18 east.
The difference of longitude, made by the time-keeper, between the above observatory and that at Annamooka	0 16 0
Hence, the longitude of Annamooka is	185 11 18 east.
By the time-keeper it is—Greenwich rate	186 12 27
New Zealand rate	184 37 0
Its latitude	20 13 0 south.

N.B.—The observatory at Tongataboo was near the middle of the north side of the island; and that at Annamooka, on its west side; but the chart will elucidate this.

The time-keeper was too slow for mean time at Greenwich, on the first of July at noon, by 12^h 34^m 33^s.2; and her daily rate, at that time, was losing, on mean time, 1^m.783 per day. This rate will now be used for finding the longitude by the time-keeper; and 184° 55' 18", or 12^h 19^m 41^s.2, will be taken as the true longitude of Tongataboo, east from Greenwich.

By the mean of several observations, the south end of the needle was found to dip

At Lefooga, one of the Hapace islands	36° 55' 0"
Tongataboo	39 1½ 0

The variation of the compass was found to be—

At Annamooka, on board	8° 30' 34" east.
Anchor off Koioo, between Annamooka and Hapace	8 12 29½
Anchor off Lefooga	10 11 40
Tongataboo, on board	9 44 54
Ditto, on shore	10 12 58

I can assign no reason why the variation is so much less at and near Annamooka, than at either of the other two places. I can only say, that there is no fault in the observations; and that the variation ought to be more at Annamooka than the above, as it has been found to be so to the northward, southward, eastward, and westward of it. But disagreements in the variation, greater than this, even in the same needle, have been often observed. And I should not have taken notice of this instance, but from a belief that the cause, whatever it is, exists in the place, and not in the needles; for Mr. Bayly found the same, or rather more difference.

The tides are more considerable at these islands, than at any other of my discoveries in this ocean, that lie within the tropics. At Annamooka it is high water, on the full and change days, nearly at six o'clock; and the tide rises and falls there, upon a perpendicular, about six feet. In the harbour of Tongataboo, it is high water, on the full and change days, at fifty minutes past six. The tide rises and falls on those days, four feet nine inches; and three feet six inches at the Quadratures. In the channels between the islands, which lie in this harbour, it flows near tide and half-tide; that is, the flood continues to run up near three hours, after it is high water by the shore; and the ebb continues to run down, after it is flood by the shore. It is only in these channels, and in a few other places near the shores, that the motion of the water or tide is perceivable; so that I can only guess at the quarter from which the flood comes. In the road of Annamooka, it sets west south-west, and the ebb the contrary; but it falls into the harbour of Tongataboo from the north-west, passes through the two narrow channels, on each side of Hoolaiwa, where it runs with considerable rapidity, and then spends itself in the lagoon. The ebb returns the same way, and runs with rather greater force. The north-west tide is met at the entrance of the lagoon, by one from the east; but this, as I have before observed, was found to be very inconsiderable.

BOOK III

TRANSACTIONS AT OTAHEITE, AND THE SOCIETY ISLANDS; AND PROSECUTION OF THE VOYAGE TO THE COAST OF NORTH AMERICA.

CHAPTER I.—AN ECLIPSE OF THE MOON OBSERVED.—THE ISLAND TOOBOUAI DISCOVERED.—ITS SITUATION, EXTENT, AND APPEARANCE.—INTERCOURSE WITH ITS INHABITANTS.—THEIR PERSONS, DRESSES, AND CANOES DESCRIBED.—ARRIVAL IN OHEITEPEHA BAY AT OTAHEITE.—OMAI'S RECEPTION, AND IMPRUDENT CONDUCT.—ACCOUNT OF SPANISH SHIPS TWICE VISITING THE ISLAND.—INTERVIEW WITH THE CHIEF OF THIS DISTRICT.—THE OLLA, OR GOD, OF BOLABOLA.—A MAD PROPHET.—ARRIVAL IN MATAVAI BAY.

HAVING, as before related*, taken our final leave of the Friendly Islands, I now resume my narrative of the voyage. In the evening of the 17th of July, at eight o'clock, the body of Eaoo bore north-east by north, distant three or four leagues. The wind was now at east, and blew a fresh gale. With it I stood to the south, till half an hour past six o'clock the next morning, when a sudden squall from the same direction took our ship aback; and before the ships could be trimmed, on the other tack, the mainsail and the top-gallant sails were much torn.

The wind kept between the south-west, and south-east, on the 19th and 20th; afterward it veered to the east, north-east, and north. The night between the 20th and 21st, an epistle of the moon was observed as follows; being then in the latitude of $22^{\circ} 57' \frac{1}{2}$ south

Myself, at	1	44	56	" "

The latitude and longitude are those of the ship, at 8^h 56^m A.M., being the time when the sun's altitude was taken for finding the apparent time. At the beginning of the eclipse, the moon was in the zenith; so that it was found most convenient to make use of the sextants; and to make the observations by the reflected image, which was brought down to a convenient altitude. The same was done at the end; except by Mr. King, who observed with a night telescope. Although the greatest difference between our several observations is more than fifty seconds, it, nevertheless, appeared to me, that two observers might differ more than double that time, in both the beginning and end. And though the times are noted to seconds, no such accuracy was pretended to. The odd seconds, set down above, arose by reducing the time, as given by the watch, to apparent time.

I continued to stretch to the east-south-east, with the wind at north-east and north, without meeting with any thing worthy of note, till seven o'clock in the evening of the 29th; when we had a sudden and very heavy squall of wind from the north. At this time, we were under single-reefed top-sails, courses, and stay-sails. Two of the latter were blown to pieces; and it was with difficulty that we saved the other sails. After this squall, we observed several lights moving about on board the *Discovery*; by which we concluded that something had given way; and, the next morning, we saw that her main-topmast had been lost. Both wind and weather continued very unsettled till noon this day, when the latter cleared up, and the former settled in the north-west quarter. At this time we were in the latitude of 28° 6' south, and our longitude was 190° 23' east. Here we saw some pintado birds, being the first since we left the land. On the 31st, at noon, Captain Clerke made a signal to speak with me. By the return of the boat, which I sent on board his ship, he informed me, that the head of the main-mast had been discovered to be sprung, in such a manner, as to render the rigging of another topmast very dangerous; and that, therefore, he must rig something lighter in its place. He also informed me, that he had lost his main-top-gallant-yard; and that he neither had another, nor a spar to make one, on board. The *Resolution's* sprit-sail top-sail-yard, which I sent him, supplied this want. The next day, we got up a jury top-mast, on which he set a mizen-top-sail; and this enabled him to keep way with the *Resolution*.

The wind was fixed in the western board; that is, from the north, round by the west to south, and I steered east, and north-east, without meeting with anything remarkable, till eleven o'clock in the morning of the 8th of August, when the land was seen, bearing north-north-east, nine or ten leagues distant. At first, it appeared in detached hills, like so many separate islands; but as we drew nearer, we found that they were all connected, and belonged to one and the same island. I steered directly for it, with a fine gale at south-east by south; and at half-past six o'clock in the afternoon, it extended from north by east, to north-north-east $\frac{3}{4}$ east, distant three or four leagues. The night was spent standing off and on; and, at day-break, the next morning, I steered for the north-west or lee side of the island; and, as we stood round its south, or south-west part, we saw it every where guarded by a reef of coral rock, extending, in some places, a full mile from the land, and a high surf breaking upon it. Some thought that they saw land to the southward of this island; but, as that was to the windward, it was left undetermined. As we drew near, we saw people on several parts of the coast, walking or running along-shore; and, in a little time, after we had reached the lee-side of the island, we saw them launch two canoes, into which above a dozen men got, and paddled toward us.

I now shortened sail, as well to give these canoes time to come up with us, as to sound for anchorage. At the distance of about half a mile from the reef, we found from forty to thirty-five fathoms' water, over a bottom of fine sand. Nearer in, the bottom was strewed with coral rocks. The canoes having advanced to about the distance of a pistol-shot from the ship, there stopped. Omai was employed, as he usually had been on such occasions,

to use all his eloquence to prevail upon the men in them to come nearer ; but no entreaties could induce them to trust themselves within our reach. They kept eagerly pointing to the shore with their paddles, and calling to us to go thither ; and several of their countrymen, who stood upon the beach, held up something white, which we considered also as an invitation to land. We could very well have done this, as there was good anchorage without the reef, and a break or opening in it, from whence the canoes had come out, which had no surf upon it, and where, if there was not water for the ships, there was more than sufficient for the boats ; but I did not think proper to risk losing the advantage of a fair wind, for the sake of examining an island that appeared to be of little consequence. We stood in no need of refreshments, if I had been sure of meeting with them there ; and having already been so unexpectedly delayed in my progress to the Society Islands, I was desirous of avoiding every possibility of farther retardment. For this reason, after making several unsuccessful attempts to induce these people to come alongside, I made sail to the north, and left them ; but not without getting from them, during their vicinity to our ship, the name of their island, which they called Toobonai. It is situated in the latitude of $22^{\circ} 15'$ south ; and in $210^{\circ} 37'$ east longitude. Its greatest extent, in any direction, exclusive of the reef, is not above five or six miles. On the north-west side, the reef appears in detached pieces, between which the sea seems to break in upon the shore. Small as the island is, there are hills in it of a considerable elevation. At the foot of the hills, is a narrow border of flat land, running quite round it, edged with a white sand beach. The hills are covered with grass, or some other herbage, except a few steep, rocky cliffs at one part, with patches of trees interspersed to their summits. But the plantations are more numerous in some of the valleys ; and the flat border is quite covered with high, strong trees, whose different kinds we could not discern, except some cocoa-palms, and a few of the *etoea*. According to the information of the men in the canoes, their island is stocked with hogs and fowls ; and produces the several fruits and roots that are found at the other islands in this part of the Pacific Ocean.

We had an opportunity, from the conversation we had with those who came off to us, of satisfying ourselves, that the inhabitants of Toobonai speak the Otaheite language ; a circumstance that indubitably proves them to be of the same nation. Those of them whom we saw in the canoes, were a stout copper-coloured people, with straight black hair, which some of them wore tied in a bunch on the crown of the head, and others, flowing about the shoulders. Their faces were somewhat round and full, but the features, upon the whole, rather flat ; and their countenances seemed to express some degree of natural ferocity. They had no covering but a piece of narrow stuff wrapped about the waist, and made to pass between the thighs, to cover the adjoining parts ; but some of those whom we saw upon the beach, where about a hundred persons had assembled, were entirely clothed with a kind of white garment. We could observe, that some of our visitors, in the canoes, wore pearl shells, hung about the neck, as an ornament. One of them kept blowing a large conch-shell, to which a reed, near two feet long, was fixed ; at first, with a continued tone of the same kind ; but he afterward converted it into a kind of musical instrument, perpetually repeating two or three notes, with the same strength. What the blowing the conch portended, I cannot say ; but I never found it the messenger of peace*.

Their canoes appeared to be about thirty feet long, and two feet above the surface of the water as they floated. The forepart projected a little, and had a notch cut across, as if intended to represent the mouth of some animal. The afterpart rose with a gentle curve to

* This instrument is described by Mr. Ellis as " used in war to stimulate action, by the priests in the temple, and also by the herald and others on board their fleets." He represents its sound as being " more horrid than that of the drum," and informs us that " the largest shells (of a species of *murex*) were usually selected for the purpose, and were sometimes above a foot in length, and seven or eight inches in diameter at the mouth. In order to facilitate the blowing of this trumpet, they made a perforation, about an inch in diameter, near the apex of the shell. Into this they inserted a bamboo cane, about

three feet in length, which was secured by binding it to the shell with fine braid ; the aperture was rendered airtight by cementing the outsides of it with a resinous gum from the bread-fruit tree. These shells were blown when a procession walked to the temple, or their warriors marched to battle, at the inauguration of the king, during the worship at the temple, or when a tabu, or restriction, was imposed in the name of the gods. We have sometimes heard them blown. The sound is extremely loud, but the most monotonous and dismal that it is possible to imagine."—Ed.

the height of two or three feet, turning gradually smaller, and, as well as the upper part of the sides, was carved all over. The rest of the sides, which were perpendicular, were curiously incrustated with flat, white shells, disposed nearly in concentric semicircles, with the curve upward. One of the canoes carried seven, and the other eight, men; and they were managed with small paddles, whose blades were nearly round. Each of them had a pretty long outrigger; and they sometimes paddled with the two opposite sides together so close, that they seemed to be one boat with two outriggers; the rowers turning their faces occasionally to the stern, and pulling that way, without paddling the canoes round. When they saw us determined to leave them, they stood up in their canoes, and repeated something very loudly in concert; but we could not tell whether this was meant as a mark of their friendship or enmity. It is certain, however, that they had no weapons with them; nor could we perceive, with our glasses, that those on shore had any.

After leaving this island, from the discovery of which future navigators may possibly derive some advantage, I steered to the north, with a fresh gale at E. by S., and at day-break in the morning of the 12th, we saw the island of Maitea. Soon after, Otaheite made its appearance; and at noon it extended from S.W. by W. to W.N.W.; the point of Oheitepeha Bay bearing W., about four leagues distant. I steered for this bay, intending to anchor there, in order to draw what refreshments I could from the south-east part of the island, before I went down to Matavai; from the neighbourhood of which station I expected my principal supply. We had a fresh gale easterly, till two o'clock in the afternoon; when, being about a league from the bay, the wind suddenly died away, and was succeeded by baffling, light airs from every direction, and calms by turns. This lasted about two hours. Then we had sudden squalls, with rain, from the east. These carried us before the bay, where we got a breeze from the land, and attempted in vain to work in to gain the anchoring place. So that, at last, about nine o'clock, we were obliged to stand out, and to spend the night at sea.

When we first drew near the island, several canoes came off to the ship, each conducted by two or three men; but as they were common fellows, Omai took no particular notice of them, nor they of him. They did not even seem to perceive that he was one of their countrymen, although they conversed with him for some time. At length, a chief whom I had known before, named Ootee, and Omai's brother-in-law, who chanced to be now at this corner of the island, and three or four more persons, all of whom knew Omai before he embarked with Captain Furneaux, came on board. Yet there was nothing either tender or striking in their meeting. On the contrary, there seemed to be a perfect indifference on both sides, till Omai having taken his brother down into the cabin, opened the drawer where he kept his red feathers and gave him a few. This being presently known amongst the rest of the natives upon deck, the face of affairs was entirely turned, and Ootee, who would hardly speak to Omai before, now begged that they might be *tayos**, and exchange names. Omai accepted of the honour, and confirmed it with a present of red feathers; and Ootee, by way of return, sent ashore for a hog. But it was evident to every one of us, that it was not the man, but his property they were in love with. Had he not shown them his treasure of red feathers, which is the commodity in greatest estimation at the island, I question much whether they would have bestowed even a cocoa-nut upon him. Surprised at Omai's first reception among his countrymen. I own I never expected it would be otherwise; but still, I was in hopes that the valuable cargo of presents with which the liberality of his friends in England had loaded him, would be the means of raising him into consequence, and of making him respected, and even courted by the first persons throughout the extent of the Society Islands. This could not but have happened, had he conducted himself with any degree of prudence; but instead of it, I am sorry to say, that he paid too little regard to the repeated advice of those who wished him well, and suffered himself to be duped by every designing knave.

From the natives who came off to us in the course of this day, we learnt that two ships had twice been in Oheitepeha Bay since my last visit to this island in 1774, and that they had left animals there, such as we had on board. But, on farther inquiry, we

* Friends.

found they were only hogs, dogs, goats, one bull, and the male of some other animal, which, from the imperfect description now given us, we could not find out. They told us that these ships had come from a place called Roema; by which we guessed that Lima, the capital of Peru, was meant, and that these late visitors were Spaniards. We were informed, that the first time they came, they built a house and left four men behind them, *viz.* two priests, a boy or servant, and a fourth person called Mateema, who was much spoken of at this time; carrying away with them, when they sailed, four of the natives; that in about ten months, the same two ships returned, bringing back two of the islanders, the other two having died at Lima; and that, after a short stay, they took away their own people; but that the house which they had built was left standing.

The important news of red feathers being on board our ships, having been conveyed on shore by Omai's friends, day had no sooner begun to break next morning, than we were surrounded by a multitude of canoes crowded with people, bringing hogs and fruit to market. At first, a quantity of feathers, not greater than what might be got from a tom-tit, would purchase a hog of forty or fifty pounds' weight. But as almost everybody in the ships was possessed of some of this precious article in trade, it fell in its value above five hundred per cent. before night. However, even then, the balance was much in our favour; and red feathers continued to preserve their superiority over every other commodity. Some of the natives would not part with a hog, unless they received an axe in exchange; but nails, and beads and other trinkets, which, during our former voyages had so great a run at this island, were now so much despised, that few would deign so much as to look at them.

There being but little wind all the morning, it was nine o'clock before we could get to an anchor in the bay; where we moored with two bowers. Soon after we had anchored, Omai's sister came on board to see him. I was happy to observe, that, much to the honour of them both, their meeting was marked with expressions of the tenderest affection, easier to be conceived than to be described. This moving scene having closed, and the ship being properly moored, Omai and I went ashore. My first object was to pay a visit to a man whom my friend represented as a very extraordinary personage indeed, for he said that he was the god of Bolabola. We found him seated under one of those small awnings which they usually carry in their larger canoes. He was an elderly man, and had lost the use of his limbs, so that he was carried from place to place upon a hand-barrow. Some called him *Ola* or *Orra*, which is the name of the god of Bolabola; but his own proper name was Etary. From Omai's account of this person, I expected to have seen some religious adoration paid to him. But, excepting some plantain-trees that lay before him, and upon the awning under which he sat, I could observe nothing by which he might be distinguished from their other chiefs. Omai presented to him a tuft of red feathers, tied to the end of a small stick; but, after a little conversation on indifferent matters with this Bolabola man, his attention was drawn to an old woman, the sister of his mother. She was already at his feet, and had them plentifully bedewed with tears of joy.

I left him with the old lady in the midst of a number of people who had gathered round him, and went to take a view of the house said to be built by the strangers who had lately been here. I found it standing at a small distance from the beach. The wooden materials of which it was composed seemed to have been brought hither ready prepared, to be set up occasionally, for all the planks were numbered. It was divided into two small rooms; and in the inner one were, a bedstead, a table, a bench, some old hats, and other trifles, of which the natives seemed to be very careful, as also of the house itself, which had suffered no hurt from the weather, a shed having been built over it. There were scuttles all around which served as air-holes; and, perhaps, they were also meant to fire from, with muskets, if ever this should be found necessary. At a little distance from the front stood a wooden cross, on the transverse part of which was cut the following inscription:

CHRISTUS VINCIT.

And, on the perpendicular part (which confirmed our conjecture, that the two ships were Spanish,)

On the other side of the post, I preserved the memory of the prior visits of the English, by inscribing,

GEORGIUS TERTIUS REX,
ANNIS 1767,
1769, 1773, 1774, AND 1777.

The natives pointed out to us, near the foot of the cross, the grave of the commodore of the two ships, who had died here, while they lay in the bay the first time. His name, as they pronounced it, was Oreede. Whatever the intentions of the Spaniards in visiting this island might be, they seemed to have taken great pains to ingratiate themselves with the inhabitants, who, upon every occasion, mentioned them with the strongest expressions of esteem and veneration.

I met with no chief of any considerable note on this occasion, excepting the extraordinary personage above described. Waheiadooa, the sovereign of Tiaraboo (as this part of the island is called,) was now absent; and I afterwards found, that he was not the same person, though of the same name, with the chief whom I had seen here during my last voyage; but his brother, a boy of about ten years of age, who had succeeded upon the death of the elder Waheiadooa, about twenty months before our arrival. We also learned, that the celebrated Oberea was dead; but that Otoo, and all our other friends, were living. When I returned from viewing the house and cross erected by the Spaniards, I found Omai holding forth to a large company; and it was with some difficulty that he could be got away, to accompany me on board; where I had an important affair to settle.

As I knew that Otaheite and the neighbouring islands could furnish us with a plentiful supply of cocoa-nuts, the liquor of which is an excellent succedaneum for any artificial beverage, I was desirous of prevailing upon my people to consent to be abridged, during our stay here, of their stated allowance of spirits to mix with water. But as this stoppage of a favourite article, without assigning some reason, might have occasioned a general murmur, I thought it most prudent to assemble the ship's company, and to make known to them the intent of the voyage, and the extent of our future operations. To induce them to undertake which with cheerfulness and perseverance, I took notice of the rewards offered by Parliament to such of his Majesty's subjects as shall first discover a communication between the Atlantic and Pacific Oceans, in any direction whatever, in the northern hemisphere: and also to such as shall first penetrate beyond the 89th degree of northern latitude. I made no doubt, I told them, that I should find them willing to co-operate with me in attempting, as far as might be possible, to become entitled to one or both these rewards; but that, to give us the best chance of succeeding, it would be necessary to observe the utmost economy in the expenditure of our stores and provisions, particularly the latter, as there was no probability of getting a supply anywhere after leaving these islands. I strengthened my argument, by reminding them, that our voyage must last at least a year longer than had been originally supposed, by our having already lost the opportunity of getting to the North this summer. I begged them to consider the various obstructions and difficulties we might still meet with, and the aggravated hardships they would labour under, if it should be found necessary to put them to short allowance of any species of provisions in a cold climate. For these very substantial reasons, I submitted to them, whether it would not be better to be prudent in time, and rather than to run the risk of having no spirits left, when such a cordial would be most wanted, to consent to be without their grog now, when we had so excellent a liquor as that of cocoa-nuts to substitute in its place; but that, after all, I left the determination entirely to their own choice. I had the satisfaction to find, that this proposal did not remain a single moment under consideration; being unanimously approved of, immediately, without any objection. I ordered Captain Clerke to make the same proposal to his people; which they also agreed to. Accordingly, we stopped serving grog, except on Saturday nights, when the companies of both ships had full allowance of it, that they might drink the healths of their female friends in England; lest these, amongst the pretty girls of Otaheite, should be wholly forgotten.

The next day we began some necessary operations; to inspect the provisions that were

in the main and fore hold ; to get the casks of beef and pork, and the coals, out of the ground tier ; and to put some ballast in their place. The caulkers were set to work to caulk the ship, which she stood in great need of ; having at times, made much water on our passage from the Friendly Islands. I also put on shore the bull, cows, horses, and sheep, and appointed two men to look after them while grazing ; for I did not intend to leave any of them at this part of the island. During the two following days, it hardly ever ceased raining. The natives, nevertheless, came to us from every quarter, the news of our arrival having rapidly spread. Waheiadooa, though at a distance, had been informed of it ; and, in the afternoon of the 16th, a chief, named Etoea, under whose tutorage he was, brought me two hogs as a present from him ; and acquainted me, that he himself would be with us the day after. And so it proved ; for I received a message from him the next morning, notifying his arrival, and desiring I would go ashore to meet him. Accordingly, Omai and I prepared to pay him a formal visit. On this occasion, Omai, assisted by some of his friends, dressed himself, not after the English fashion, nor that of Otaheite, nor that of Tongataboo, nor in the dress of any country upon earth, but in a strange medley of all that he was possessed of.

Thus equipped, on our landing, we first visited Eтары ; who, carried on a hand-barrow, attended us to a large house, where he was set down ; and we seated ourselves on each side of him. I caused a piece of Tongataboo cloth to be spread out before us, on which I laid the presents I intended to make. Presently the young chief came, attended by his mother, and several principal men, who all seated themselves, at the other end of the cloth, facing us. Then a man who sat by me, made a speech, consisting of short and separate sentences ; part of which was dictated by those about him. He was answered by one from the opposite side, near the chief. Eтары spoke next ; then Omai ; and both of them were answered from the same quarter. These orations were entirely about my arrival, and connexions with them. The person who spoke last told me, amongst other things, that the men of *Reema*, that is, the Spaniards, had desired them not to suffer me to come into Oheitepeha Bay, if I should return any more to the island, for that it belonged to them ; but that they were so far from paying any regard to this request, that he was authorised now to make a formal surrender of the province of Tiaraboo to me, and of every thing in it ; which marks very plainly, that these people are no strangers to the policy of accommodating themselves to present circumstances. At length, the young chief was directed, by his attendants, to come and embrace me ; and, by way of confirming this treaty of friendship, we exchanged names. The ceremony being closed, he and his friends accompanied me on board to dinner.

Omai had prepared a *maro*, composed of red and yellow feathers, which he intended for Otoo, the king of the whole island ; and, considering where we were, it was a present of very great value. I said all that I could to persuade him not to produce it now, wishing him to keep it on board till an opportunity should offer of presenting it to Otoo, with his own hands. But he had too good an opinion of the honesty and fidelity of his countrymen to take my advice. Nothing would serve him but to carry it ashore, on this occasion, and to give it to Waheiadooa, to be by him forwarded to Otoo, in order to its being added to the royal *maro*. He thought, by this management, that he should oblige both chiefs ; whereas he highly disobliged the one, whose favour was of the most consequence to him, without gaining any reward from the other. What I had foreseen happened. For Waheiadooa kept the *maro* for himself, and only sent to Otoo a very small piece of feathers ; not the twentieth part of what belonged to the magnificent present. On the 19th, this young chief made me a present of ten or a dozen hogs, a quantity of fruit, and some cloth. In the evening we played off some fire-works, which both astonished and entertained the numerous spectators.

This day, some of our gentlemen, in their walks, found, what they were pleased to call, a Roman Catholic chapel. Indeed, from their account, this was not to be doubted ; for they described the altar and every other constituent part of such a place of worship. However, as they mentioned, at the same time, that two men, who had the care of it, would not suffer them to go in, I thought that they might be mistaken, and had the curiosity to

pay a visit to it myself. The supposed chapel proved to be a *toopapaoo*, in which the remains of the late Waheiaodoo lay, as it were, in state. It was in a pretty large house, which was inclosed with a low palisade. The *toopapaoo* was uncommonly neat, and resembled one of those little houses, or awnings, belonging to their large canoes. Perhaps it had originally been employed for that purpose. It was covered, and hung round, with cloth and mats of different colours, so as to have a pretty effect. There was one piece of scarlet broad cloth, four or five yards in length, conspicuous among the other ornaments ; which, no doubt, had been a present from the Spaniards. This cloth, and a few tassels of feathers, which our gentlemen supposed to be silk, suggested to them the idea of a chapel ; for whatever else was wanting to create a resemblance, their imagination supplied ; and if they had not previously known that there had been Spaniards lately here, they could not possibly have made the mistake. Small offerings of fruit and roots seemed to be daily made at this shrine, as some pieces were quite fresh. These were deposited upon a *whatta*, or altar, which stood without the palisades ; and within these we were not permitted to enter. Two men constantly attended, night and day, not only to watch over the place, but also to dress and undress the *toopapaoo*. For when I first went to survey it, the cloth and its appendages were all rolled up ; but, at my request, the two attendants hung it out in order, first dressing themselves in clean white robes. They told me, that the chief had been dead twenty months.

Having taken in a fresh supply of water, and finished all our other necessary operations, on the 22d, I brought off the cattle and sheep, which had been put on shore here to graze ; and made ready for sea. In the morning of the 23d, while the ships were unmooring, Omai and I landed, to take leave of the young chief. While we were with him, one of those enthusiastic persons, whom they call *Eatoos*, from a persuasion that they are possessed with the spirit of the Divinity, came and stood before us. He had all the appearance of a man not in his right senses ; and his only dress was a large quantity of plantain leaves, wrapped round his waist. He spoke in a low, squeaking voice, so as hardly to be understood ; at least, not by me. But Omai said, that he comprehended him perfectly, and that he was advising Waheiaodoo not to go with me to Matavai ; an expedition which I had never heard he intended, nor had I ever made such a proposal to him. The *Eatooa* also foretold, that the ships would not get to Matavai that day. But in this he was mistaken ; though appearances now rather favoured his prediction, there not being a breath of wind in any direction. While he was prophesying, there fell a very heavy shower of rain, which made every one run for shelter but himself, who seemed not to regard it. He remained squeaking by us about half an hour, and then retired. No one paid any attention to what he uttered ; though some laughed at him. I asked the chief, what he was, whether an *Earee*, or *Toictow* ? and the answer I received was, that he was *taato eno* ; that is, a bad man. And yet, notwithstanding this, and the little notice any of the natives seemed to take of the mad prophet, superstition has so far got the better of their reason, that they firmly believe such persons to be possessed with the spirit of the *Eatooa*. Omai seemed to be very well instructed about them. He said, that, during the fits that came upon them, they knew nobody, not even their most intimate acquaintances ; and that, if any one of them happens to be a man of property, he will very often give away every moveable he is possessed of, if his friends do not put them out of his reach ; and, when he recovers, will inquire what had become of those very things, which he had, but just before distributed ; not seeming to have the least remembrance of what he had done while the fit was upon him.

As soon as I got on board, a light breeze springing up at east, we got under sail, and steered for Matavai Bay ; where the Resolution anchored the same evening. But the Discovery did not get in till the next morning ; so that half of the man's prophecy was fulfilled.

CHAPTER II.—INTERVIEW WITH OTOO, KING OF THE ISLAND.—IMPRUDENT CONDUCT OF OMAI.—EMPLOYMENTS ON SHORE.—EUROPEAN ANIMALS LANDED.—PARTICULARS ABOUT A NATIVE WHO HAD VISITED LIMA—ABOUT OEDIDEE.—A REVOLT IN EIMEO.—WAR WITH THAT ISLAND DETERMINED UPON, IN A COUNCIL OF CHIEFS.—A HUMAN SACRIFICE ON THAT ACCOUNT.—A PARTICULAR RELATION OF THE CEREMONIES AT THE GREAT MORAI, WHERE THE SACRIFICE WAS OFFERED.—OTHER BARBAROUS CUSTOMS OF THIS PEOPLE.

ABOUT nine o'clock in the morning, Otoo, the king of the whole island, attended by a great number of canoes full of people, came from Oparre, his place of residence, and having landed on Matavai Point, sent a message on board, expressing his desire to see me there. Accordingly I landed, accompanied by Omai, and some of the officers. We found a prodigious number of people assembled on this occasion, and in the midst of them was the king, attended by his father, his two brothers, and three sisters. I went up first and saluted him, being followed by Omai, who kneeled and embraced his legs. He had prepared himself for this ceremony, by dressing himself in his very best suit of clothes, and behaved with a great deal of respect and modesty. Nevertheless, very little notice was taken of him. Perhaps envy had some share in producing this cold reception. He made the chief a present of a large piece of red feathers, and about two or three yards of gold cloth; and I gave him a suit of fine linen, a gold-laced hat, some tools, and, what was of more value than all the other articles, a quantity of red feathers, and one of the bonnets in use at the Friendly Islands.

After the hurry of this visit was over, the king and the whole royal family accompanied me on board, followed by several canoes, laden with all kind of provisions, in quantity sufficient to have served the companies of both ships for a week. Each of the family owned, or pretended to own, a part; so that I had a present from every one of them; and every one of them had a separate present in return from me; which was the great object in view. Soon after, the king's mother, who had not been present at the first interview, came on board, bringing with her a quantity of provisions and cloth, which she divided between me and Omai; for, although he was but little noticed at first by his countrymen, they no sooner gained the knowledge of his riches, than they began to court his friendship. I encouraged this as much as I could: for it was my wish to fix him with Otoo. As I intended to leave all my European animals at this island, I thought he would be able to give some instruction about the management of them, and about their use. Besides, I knew and saw, that the farther he was from his native island, he would be the better respected. But, unfortunately, poor Omai rejected my advice, and conducted himself in so imprudent a manner, that he soon lost the friendship of Otoo, and of every other person of note in Otahite. He associated with none but vagabonds and strangers, whose sole views were to plunder him; and, if I had not interfered, they would not have left him a single article worth the carrying from the island. This necessarily drew upon him the ill-will of the principal chiefs; who found that they could not procure, from any one in the ships, such valuable presents as Omai bestowed on the lowest of the people, his companions.

As soon as we had dined, a party of us accompanied Otoo to Oparre, taking with us the poultry, with which we were to stock the island. They consisted of a peacock and hen (which Lord Besborough was so kind as to send me for this purpose a few days before I left London); a turkey-cock and hen; one gander, and three geese; a drake, and four ducks. All these I left at Oparre, in the possession of Otoo; and the geese and ducks began to breed, before we sailed. We found there, a gander, which the natives told us, was the same that Captain Wallis had given to Oberea ten years before; several goats; and the Spanish bull, whom they kept tied to a tree, near Otoo's house. I never saw a finer animal of his kind. He was now the property of Etary, and had been brought from Oheitepeha to this place, in order to be shipped for Bolabola. But it passes my comprehension, how they can contrive to carry him in one of their canoes. If we had not arrived, it would have been of little consequence who had the property of him, as, without a cow, he could be of no use; and none had been left with him. Though the natives told us that there were cows

on board the Spanish ships, and that they took them away with them, I cannot believe this; and should rather suppose, that they had died in the passage from Lima. The next day, I sent the three cows, that I had on board, to this bull; and the bull, which I had brought, the horse and mare, and sheep, I put ashore at Matavai. Having thus disposed of these passengers, I found myself lightened of a very heavy burthen. The trouble and vexation that attended the bringing of this living cargo thus far, is hardly to be conceived. But the satisfaction that I felt, in having been so fortunate as to fulfil his Majesty's humane design, in sending such valuable animals, to supply the wants of two worthy nations, sufficiently recompensed me for the many anxious hours I had passed, before this subordinate object of my voyage could be carried into execution.*

As I intended to make some stay here, we set up the two observatories on Matavai Point. Adjoining to them, two tents were pitched for the reception of a guard, and of such people as it might be necessary to leave on shore, in different departments. At this station, I intrusted the command to Mr. King; who, at the same time, attended the observations for ascertaining the going of the time-keeper, and other purposes. During our stay, various necessary operations employed the crews of both ships. The Discovery's main-mast was carried ashore, and made as good as ever. Our sails and water-casks were repaired; the ships were caulked; and the rigging all overhauled. We also inspected all the bread that we had on board in casks; and had the satisfaction to find, that but little of it was damaged.

On the 26th, I had a piece of ground cleared for a garden, and planted it with several articles; very few of which, I believe, the natives will ever look after. Some melons, potatoes, and two pine-apple plants, were in a fair way of succeeding, before we left the place. I had brought from the Friendly Islands several shaddock trees. These I also planted here; and they can hardly fail of success, unless their growth should be checked by the same premature curiosity, which destroyed a vine planted by the Spaniards at Oheitepeha. A number of the natives got together, to taste the first fruit it bore; but, as the grapes were still sour, they considered it as little better than poison, and it was unanimously determined to tread it under foot. In that state, Omai found it by chance, and was overjoyed at the discovery. For he had a full confidence that, if he had but grapes, he could easily make wine. Accordingly, he had several slips cut from off the tree, to carry away with him; and we pruned and put in order the remains of it. Probably, grown wise by Omai's instructions, they may now suffer the fruit to grow to perfection, and not pass so hasty a sentence upon it again.

We had not been eight-and-forty hours at anchor in Matavai Bay, before we were visited by our old friends, whose names are recorded in the account of my last voyage. Not one of them came empty-handed; so that we had more provisions than we knew what to do with. What was still more, we were under no apprehensions of exhausting the island, which presented to our eyes every mark of the most exuberant plenty, in every article of refreshment.

Soon after our arrival here one of the natives, whom the Spaniards had carried with them to Lima, paid us a visit, but in his external appearance he was not distinguishable from the rest of his countrymen. However he had not forgot some Spanish words which he had acquired, though he pronounced them badly: amongst them the most frequent were *si Senor*; and when a stranger was introduced to him he did not fail to rise up and accost him as well as he could. We also found here the young man whom we called Oedidee, but whose real name is Heete-heete. I had carried him from Ulietea in 1773, and brought him back in 1774, after he had visited the Friendly Islands, New Zealand, Easter Island and the Marqueses, and been on board my ship, in that extensive navigation, about seven months. He was at least as tenacious of his good-breeding as the man who had been at Lima; and Yes, sir, or If you please, sir, was as frequently repeated by him as *si Senor* was by the other. Heete-heete, who is a native of Bolabola, had arrived in Otaheite about three months before, with no other intention, that we could learn, than to gratify his curiosity, or, perhaps, some

* We have before noticed, Vol. II. p. 5, that the cattle here alluded to, with the exception of the goats and pigs, all died. Fresh supplies have been introduced by the exertions of the Missionaries, which have succeeded well.—Ed.

other favourite passion, which are very often the only object of the pursuit of other travelling gentlemen. It was evident, however, that he preferred the modes, and even garb, of his countrymen to ours; for, though I gave him some clothes, which our Admiralty Board had been pleased to send for his use (to which I added a chest of tools, and a few other articles, as a present from myself), he declined wearing them after a few days. This instance, and that of the person who had been at Lima, may be urged as a proof of the strong propensity natural to man of returning to habits acquired at an early age, and only interrupted by accident. And perhaps it may be concluded, that even Omai, who had imbibed almost the whole English manners, will, in a very short time after our leaving him, like Oedidee and the visitor of Lima, return to his own native garments.

In the morning of the 27th a man came from Oheitepeha, and told us that two Spanish ships had anchored in that bay the night before; and in confirmation of this intelligence he produced a piece of coarse blue cloth, which he said he got out of one of the ships, and which indeed, in appearance, was almost quite new. He added, that Mateema was in one of the ships, and that they were to come down to Matavai in a day or two. Some other circumstances which he mentioned, with the foregoing ones, gave the story so much the air of truth, that I despatched Lieutenant Williamson, in a boat, to look into Oheitepeha bay; and, in the mean time, I put the ships into a proper posture of defence: for, though England and Spain were in peace when I left Europe, for aught I knew a different scene might, by this time, have opened. However, on farther inquiry, we had reason to think that the fellow who brought the intelligence had imposed upon us; and this was put beyond all doubt when Mr. Williamson returned next day, who made his report to me that he had been at Oheitepeha, and found that no ships were there now, and that none had been there since we left it. The people of this part of the island where we now were, indeed, told us from the beginning that it was a fiction invented by these of Tiaraboo: but what view they could have we were at a loss to conceive, unless they supposed that the report would have some effect in making us quit the island, and by that means deprive the people of Otaheite-nooe of the advantages they might reap from our ships continuing there, the inhabitants of the two parts of the island being inveterate enemies to each other.

From the time of our arrival at Matavai the weather had been very unsettled, with more or less rain every day, till the 29th, before which we were not able to get equal altitudes of the sun for ascertaining the going of the time-keeper. The same cause also retarded the caulking, and other necessary repairs of the ships. In the evening of this day the natives made a precipitate retreat, both from on board the ships and from our station on shore: for what reason we could not at first learn; though, in general, we guessed it arose from their knowing that some theft had been committed, and apprehending punishment on that account. At length I understood what had happened. One of the surgeon's mates had been in the country to purchase curiosities, and had taken with him four hatchets for that purpose. Having employed one of the natives to carry them for him, the fellow took an opportunity to run off with so valuable a prize. This was the cause of the sudden flight, in which Otoo himself and his whole family had joined; and it was with difficulty that I stopped them, after following them two or three miles. As I had resolved to take no measures for the recovery of the hatchets, in order to put my people upon their guard against such negligence for the future, I found no difficulty in bringing the natives back, and in restoring everything to its usual tranquillity.

Hitherto the attention of Otoo and his people had been confined to us; but, next morning, a new scene of business opened, by the arrival of some messengers from Eimeo, or (as it is much oftener called by the natives) Morea*, with intelligence that the people in that island were in arms; and that Otoo's partisans there had been worsted, and obliged to retreat to the mountains. The quarrel between the two islands, which commenced in 1774, as mentioned in the account of my last voyage, had, it seems, partly subsisted ever since. The formidable armament which I saw at that time, and described†, had sailed soon after I then left

* Morea, according to Dr. Forster, is a district in Eimeo. See his "Observations," p. 217.

Otaheite; but the malcontents of Eimeo had made so stout a resistance, that the fleet had returned without effecting much; and now another expedition was necessary.

On the arrival of these messengers all the chiefs, who happened to be at Matavai, assembled at Otoo's house, where I actually was at the time, and had the honour to be admitted into their council. One of the messengers opened the business of the assembly in a speech of considerable length: but I understood little of it, besides its general purport, which was to explain the situation of affairs in Eimeo, and to excite the assembled chiefs of Otaheite to arm on the occasion. This opinion was combated by others, who were against commencing hostilities; and the debate was carried on with great order, no more than one man speaking at a time. At last they became very noisy, and I expected that our meeting would have ended like a Polish diet. But the contending great men cooled as fast as they grew warm, and order was soon restored. At length the party for war prevailed; and it was determined that a strong force should be sent to assist their friends in Eimeo; but this resolution was far from being unanimous. Otoo, during the whole debate, remained silent, except that, now and then, he addressed a word or two to the speakers. Those of the council who were for prosecuting the war applied to me for my assistance; and all of them wanted to know what part I would take. Omai was sent for to be my interpreter; but, as he could not be found, I was obliged to speak for myself, and told them, as well as I could, that as I was not thoroughly acquainted with the dispute, and as the people of Eimeo had never offended me, I could not think myself at liberty to engage in hostilities against them. With this declaration they either were, or seemed satisfied. The assembly then broke up; but before I left them Otoo desired me to come to him in the afternoon, and to bring Omai with me. Accordingly, a party of us waited upon him at the appointed time; and we were conducted by him to his father, in whose presence the dispute with Eimeo was again talked over. Being very desirous of devising some method to bring about an accommodation, I sounded the old chief on that head, but we found him deaf to any such proposal, and fully determined to prosecute the war. He repeated the solicitations which I had already resisted, about giving them my assistance. On our inquiring into the cause of the war, we were told that some years ago a brother of Waheadooa, of Tieraboo, was sent to Eimeo, at the request of Maheine, a popular chief of that island, to be their king; but that he had not been there a week before Maheine, having caused him to be killed, set up for himself, in opposition to Tierataboonooe, his sister's son, who became the lawful heir; or else had been pitched upon by the people of Otaheite, to succeed to the government on the death of the other.

Towha, who is a relation of Otoo, and chief of the district of Tettaha, a man of much weight in the island, and who had been commander-in-chief of the armament fitted out against Eimeo in 1774, happened not to be at Matavai at this time, and, consequently, was not present at any of these consultations. It however appeared that he was no stranger to what was transacted, and that he entered with more spirit into the affair than any other chief; for, early in the morning of the first of September, a messenger arrived from him to acquaint Otoo that he had killed a man, to be sacrificed to *Eatooa*, to implore the assistance of the god against Eimeo. This act of worship was to be performed at the great *morai* at Attahooroo; and Otoo's presence, it seems, was absolutely necessary on that solemn occasion.

That the offering of human sacrifices is part of the religious institutions of this island, had been mentioned by Mons. Bougainville, on the authority of the native whom he carried with him to France. During my last visit to Otaheite, and while I had opportunities of conversing with Omai on the subject, I had satisfied myself that there was too much reason to admit that such a practice, however inconsistent with the general humanity of the people, was here adopted. But as this was one of those extraordinary facts, about which many are apt to retain doubts, unless the relater himself has had ocular proof to confirm what he had heard from others, I thought this a good opportunity of obtaining the highest evidence of its certainty, by being present myself at the solemnity; and accordingly proposed to Otoo that I might be allowed to accompany him. To this he readily consented; and we immediately set out in my boat, with my old friend Potatou, Mr. Anderson, and Mr. Webber, Omai following in a canoe. In our way we landed upon a little island, which lies off Tettaha, where we found Towha and his retinue. After some little conversation between

"The two chiefs on the subject of the war, Towha addressed himself to me, asking my assistance. When I excused myself he seemed angry, thinking it strange that I, who had always declared myself to be the friend of their island, would not now go and fight against its enemies. Before we parted he gave to Otoo two or three red feathers, tied up in a tuft; and a lean, half-starved dog was put into a canoe that was to accompany us. We then embarked again, taking on board a priest, who was to assist at the solemnity.

As soon as we landed at Attahooroo, which was about two o'clock in the afternoon, Otoo expressed his desire that the seamen might be ordered to remain in the boat; and that Mr. Anderson, Mr. Webber, and myself might take off our hats as soon as we should come to the *morai*, to which we immediately proceeded, attended by a great many men and some boys, but not one woman. We found four priests and their attendants, or assistants, waiting for us. The dead body, or sacrifice, was in a small canoe that lay on the beach, and partly in the wash of the sea, fronting the *morai*. Two of the priests, with some of their attendants, were sitting by the canoe, the others at the *morai*. Our company stopped about twenty or thirty paces from the priests. Here Otoo placed himself, we and a few others standing by him, while the bulk of the people remained at a greater distance.

The ceremonies now began. One of the priests' attendants brought a young plantain-tree and laid it down before Otoo. Another approached with a small tuft of red feathers, twisted on some fibres of the cocoa-nut husk, with which he touched one of the king's feet, and then retired with it to his companions. One of the priests, seated at the *morai*, facing those who were upon the beach, now began a long prayer; and, at certain times, sent down young plantain-trees, which were laid upon the sacrifice. During this prayer a man, who stood by the officiating priest, held in his hands two bundles, seemingly of cloth. In one of them, as we afterwards found, was the royal *maro*; and the other, if I may be allowed the expression, was the ark of the *Eatooa*. As soon as the prayer was ended, the priests at the *morai*, with their attendants, went and sat down by those upon the beach, carrying with them the two bundles. Here they renewed their prayers; during which the plantain-trees were taken, one by one, at different times, from off the sacrifice, which was partly wrapped up in cocoa leaves and small branches. It was now taken out of the canoe and laid upon the beach, with the feet to the sea. The priests placed themselves around it, some sitting and others standing; and one or more of them repeated sentences for about ten minutes. The dead body was now uncovered by removing the leaves and branches, and laid in a parallel direction with the sea shore. One of the priests then, standing at the feet of it, pronounced a long prayer, in which he was at times joined by the others, each holding in his hand a tuft of red feathers. In the course of this prayer some hair was pulled off the head of the sacrifice, and the left eye taken out, both of which were presented to Otoo wrapped up in a green leaf. He did not, however, touch it; but gave to the man who presented it the tuft of feathers which he had received from Towha: this, with the hair and eye, was carried back to the priests. Soon after Otoo sent to them another piece of feathers, which he had given me in the morning to keep in my pocket. During some part of this last ceremony a kingfisher making a noise in the trees, Otoo turned to me, saying, "That is the *Eatooa*," and seemed to look upon it to be a good omen.

The body was then carried a little way with its head towards the *morai*, and laid under a tree, near which were fixed three broad thin pieces of wood, differently but rudely carved. The bundles of cloth were laid on a part of the *morai*, and the tufts of red feathers were placed at the feet of the sacrifice, round which the priests took their stations; and we were now allowed to go as near as we pleased. He who seemed to be the chief priest sat at a small distance, and spoke for a quarter of an hour, but with different tones and gestures, so that he seemed often to expostulate with the dead person, to whom he constantly addressed himself; and sometimes asked several questions, seemingly with respect to the propriety of his having been killed. At other times he made several demands, as if the deceased either now had power himself, or interest with the divinity, to engage him to comply with such requests. Amongst which, we understood, he asked him to deliver Eimeo, Maheine its chief, the hogs, women, and other things of the island, into their hands; which was, indeed, the express intention of the sacrifice. He then chanted a prayer, which lasted half an hour, in a whin-

hour, in a whin-

ing, melancholy tone, accompanied by two other priests, and in which Potatou and some others joined. In the course of this prayer some more hair was plucked by a priest from the head of the corpse, and put upon one of the bundles. After this the chief priest prayed alone, holding in his hand the feathers which came from Towha. When he had finished he gave them to another, who prayed in like manner. Then all the tufts of feathers were laid upon the bundles of cloth, which closed the ceremony at this place.

HUMAN SACRIFICE AT THE GREAT MORAI OF OTAREITE.

The corpse was then carried up to the most conspicuous part of the *morai*, with the feathers, the two bundles of cloth, and the drums; the last of which beat slowly. The feathers and bundles were laid against the pile of stones, and the corpse at the foot of them. The priests having again seated themselves round it, renewed their prayers; while some of the attendants dug a hole about two feet deep, into which they threw the unhappy victim, and covered it with earth and stones. While they were putting him into the grave, a boy squeaked aloud, and Omai said to me, that it was the *Eatooa*. During this time, a fire having been made, the dog before mentioned was produced and killed, by twisting his neck and suffocating him. The hair was singed off, and the entrails taken out and thrown into the fire, where they were left to consume. But the heart, liver, and kidneys were only roasted, by being laid on the stones for a few minutes; and the body of the dog, after being besmeared with the blood which had been collected in a cocoa-nut shell, and dried over the fire, was, with the liver, &c., carried and laid down before the priests, who sat praying round the grave. They continued their ejaculations over the dog for some time, while two men, at intervals, beat on two drums very loud; and a boy screamed as before, in a loud shrill voice, three different times. This, as we were told, was to invite the *Eatooa* to feast on the banquet that they had prepared for him. As soon as the priests had ended their prayers, the carcase of the dog, with what belonged to it, were laid on a *whattu*, or scaffold, about six feet high, that stood close by, on which lay the remains of two other dogs, and of two pigs which had lately been sacrificed, and at this time emitted an intolerable stench. This kept us at a greater distance than would otherwise have been required of us. For after the victim was removed from the sea-side toward the *morai*, we were allowed to approach as near as we pleased. Indeed, after that, neither seriousness nor attention were much observed by the spectators. When the dog was put upon the *whattu*, the priests and attendants gave a kind of shout, which closed the ceremonies for the present. The day being now also closed, we were conducted to a house belonging to Potatou, where we were entertained and lodged for the night. We had been told that the religious rites were to be

renewed in the morning; and I would not leave the place, while anything remained to be seen.

Being unwilling to lose any part of the solemnity, some of us repaired to the scene of action pretty early, but found nothing going forward. However, soon after, a pig was sacrificed, and laid upon the same *whatta* with the others. About eight o'clock, Otoo took us again to the *morai*, where the priests and a great number of men were by this time assembled. The two bundles occupied the place in which we had seen them deposited the preceding evening; the two drums stood in the front of the *morai*, but somewhat nearer it than before; and the priests were beyond them. Otoo placed himself between the two drums, and desired me to stand by him. The ceremony began, as usual, with bringing a young plantain-tree, and laying it down at the king's feet. After this a prayer was repeated by the priests, who held in their hands several tufts of red feathers, and also a plume of ostrich feathers, which I had given to Otoo on my first arrival, and had been consecrated to this use. When the priests had made an end of the prayer, they changed their station, placing themselves between us and the *morai*, and one of them, the same person who had acted the principal part the day before, began another prayer, which lasted about half an hour. During the continuance of this, the tufts of feathers were, one by one, carried and laid upon the ark of the *Eatooa*.

Some little time after, four pigs were produced; one of which was immediately killed; and the others were taken to a sty hard by, probably reserved for some future occasion of sacrifice. One of the bundles was now untied, and it was found, as I have before observed, to contain the *maro*, with which these people invest their kings, and which seems to answer, in some degree, to the European ensigns of royalty. It was carefully taken out of the cloth in which it had been wrapped up, and spread at full length upon the ground before the priests. It is a girdle about five yards long and fifteen inches broad, and, from its name, seems to be put on in the same manner as is the common *maro*, or piece of cloth used by these people to wrap round the waist. It was ornamented with red and yellow feathers, but mostly with the latter, taken from a dove found upon the island. The one end was bordered with eight pieces, each about the size and shape of a horse-shoe, having their edges fringed with black feathers. The other end was forked, and the points were of different lengths. The feathers were in square compartments, ranged in two rows, and otherwise so disposed as to produce a pleasing effect. They had been first pasted or fixed upon some of their own country cloth, and then sewed to the upper end of the pendant which Captain Wallis had displayed, and left flying ashore, the first time that he landed at Matavai. This was what they told us, and we had no reason to doubt it, as we could easily trace the remains of an English pendant. About six or eight inches square of the *maro* was unornamented, there being no feathers upon that space, except a few that had been sent by Waheadooa, as already mentioned. The priests made a long prayer relative to this part of the ceremony; and, if I mistook not, they called it the prayer of the *maro*. When it was finished, the badge of royalty was carefully folded up, put into the cloth, and deposited again upon the *morai*.

The other bundle, which I have distinguished by the name of the ark, was next opened at one end. But we were not allowed to go near enough to examine its mysterious contents. The information we received was, that the *Eatooa*, to whom they had been sacrificing, and whose name is *Ooro*, was concealed in it; or rather, what is supposed to represent him. This sacred repository is made of the twisted fibres of the husk of the cocoa-nut, shaped somewhat like a large fid or sugar-loaf, that is, roundish, with one end much thicker than the other. We had very often got small ones from different people, but never knew their use before.

By this time the pig that had been killed was cleaned, and the entrails taken out. These happened to have a considerable share of those convulsive motions, which often appear in different parts after an animal is killed, and this was considered by the spectators as a very favourable omen to the expedition, on account of which the sacrifices had been offered. After being exposed for some time, that those who chose might examine their appearances, the entrails were carried to the priests and laid down before them. While one of their number

prayed, another inspected the entrails more narrowly and kept turning them gently with a stick. When they had been sufficiently examined, they were thrown into the fire and left to consume. The sacrificed pig, and its liver, &c. were now put upon the *whatta*, where the dog had been deposited the day before; and then all the feathers, except the ostrich-plume, were inclosed with the *Eatooa* in the ark; and the solemnity finally closed.

Four double canoes lay upon the beach, before the place of sacrifice, all the morning. On the forepart of each of these was fixed a small platform covered with palm-leaves tied in mysterious knots; and this also is called a *morai*. Some cocoa-nuts, plantains, pieces of bread-fruit, fish, and other things, lay upon each of these naval *morais*. We were told that they belonged to the *Eatooa*, and that they were to attend the fleet designed to go against Eimeo. The unhappy victim offered to the object of their worship upon this occasion seemed to be a middle-aged man, and, as we were told, was a *towetow*, that is, one of the lowest class of the people. But, after all my inquiries, I could not learn that he had been pitched upon on account of any particular crime committed by him meriting death. It is certain, however, that they generally make choice of such guilty persons for their sacrifice, or else of common low fellows, who stroll about from place to place and from island to island, without having any fixed abode, or any visible way of getting an honest livelihood, of which description of men enough are to be met with at these islands. Having had an opportunity of examining the appearance of the body of the poor sufferer now offered up, I could observe that it was bloody about the head and face, and a good deal bruised upon the right temple; which marked the manner of his being killed. And we were told, that he had been privately knocked on the head with a stone.

Those who are devoted to suffer, in order to perform this bloody act of worship, are never apprised of their fate till the blow is given that puts an end to their existence. Whenever any one of the great chiefs thinks a human sacrifice necessary on any particular emergency, he pitches upon the victim. Some of his trusty servants are then sent, who fall upon him suddenly, and put him to death with a club or by stoning him. The king is next acquainted with it, whose presence at the solemn rites that follow is, as I was told, absolutely necessary; and, indeed, on the present occasion, we could observe that Otoo bore a principal part. The solemnity itself is called *Pooro Eree*, or chief's prayer; and the victim who is offered up *Taala-taboo*, or consecrated man. This is the only instance where we have heard the word *taboo* used at this island, where it seems to have the same mysterious signification as at Tonga, though it is there applied to all cases where things are not to be touched. But at Otaheite, the word *raa* serves the same purpose, and is full as extensive in its meaning.

The *morai* (which, undoubtedly, is a place of worship, sacrifice, and burial, at the same time), where the sacrifice was now offered, is that where the supreme chief of the whole island is always buried, and is appropriated to his family and some of the principal people. It differs little from the common ones, except in extent. Its principal part is a large oblong pile of stones, lying loosely upon each other, about twelve or fourteen feet high, contracted towards the top, with a square area on each side loosely paved with pebble stones, under which the bones of the chiefs are buried. At a little distance from the end nearest the sea, is the place where the sacrifices are offered; which, for a considerable extent, is also loosely paved. There is here a very large scaffold or *whatta*, on which the offerings of fruits and other vegetables are laid. But the animals are deposited on a smaller one already mentioned, and the human sacrifices are buried under different parts of the pavement. There are several other relics which ignorant superstition had scattered about this place, such as small stones raised in different parts of the pavement, some with bits of cloth tied round them, others covered with it; and, upon the side of the large pile which fronts the area, are placed a great many pieces of carved wood, which are supposed to be sometimes the residence of their divinities, and, consequently, held sacred. But one place, more particular than the rest, is a heap of stones at one end of the large *whatta*, before which the sacrifice was offered, with a kind of platform at one side. On this are laid the skulls of all the human sacrifices, which are taken up after they have been several months under ground. Just above them are placed a great number of the pieces of wood; and it was also here where the

maro, and the other bundle supposed to contain the god *Ooro* (and which I call the ark), were laid during the ceremony; a circumstance which denotes its agreement with the altar of other nations.

It is much to be regretted that a practice so horrid in its own nature and so destructive of that inviolable right of self-preservation which every one is born with, should be found still existing; and (such is the power of superstition to counteract the first principles of humanity!) existing amongst a people in many other respects emerged from the brutal manners of savage life. What is still worse, it is probable that these bloody rites of worship are prevalent throughout all the wide-extended islands of the Pacific Ocean. The similarity of customs and language, which our late voyages have enabled us to trace between the most distant of these islands, makes it not unlikely that some of the most important articles of their religious institutions should agree. And, indeed, we have the most authentic information that human sacrifices continue to be offered at the Friendly Islands. When I described the *Nutche* at *Tonge-taboo*, I mentioned that, on the approaching sequel of that festival, we had been told that ten men were to be sacrificed. This may give us an idea of the extent of this religious massacre in that island. And though we should suppose that never more than one person is sacrificed, on any single occasion, at *Otaheite*, it is more than probable that these occasions happen so frequently as to make a shocking waste of the human race; for I counted no less than forty-nine skulls of former victims lying before the *morai*, where we saw one more added to the number. And as none of those skulls had as yet suffered any considerable change from the weather, it may hence be inferred, that no great length of time had elapsed since, at least, this considerable number of unhappy wretches had been offered upon this altar of blood.

The custom, though no consideration can make it cease to be abominable, might be thought less detrimental, in some respects, if it served to impress any awe for the divinity or reverence for religion upon the minds of the multitude. But this is so far from being the case, that though a great number of people had assembled at the *morai* on this occasion, they did not seem to show any proper reverence for what was doing or saying during the celebration of the rites. And *Omai* happening to arrive after they had begun, many of the spectators flocked round him, and were engaged the remainder of the time in making him relate some of his adventures, which they listened to with great attention, regardless of the solemn offices performing by their priests. Indeed the priests themselves, except the one who chiefly repeated the prayers, either from their being familiarised to such objects, or from want of confidence in the efficacy of their institutions, observed very little of that solemnity which is necessary to give to religious performances their due weight. Their dress was only an ordinary one; they conversed together without scruple; and the only attempt made by them to preserve any appearance of decency, was by exerting their authority to prevent the people from coming upon the very spot where the ceremonies were performed, and to suffer us, as strangers, to advance a little forward. They were, however, very candid in their answers to any questions that were put to them concerning the institution. And particularly, on being asked what the intention of it was? they said that it was an old custom, and was agreeable to their god, who delighted in, or, in other words, came and fed upon the sacrifices; in consequence of which he complied with their petitions. Upon its being objected that he could not feed on these, as he was neither seen to do it, nor were the bodies of the animals quickly consumed; and that, as to the human victim, they prevented his feeding on him by burying him. But to all this they answered, that he came in the night, but invisibly, and fed only on the soul or immaterial part, which, according to their doctrine, remains about the place of sacrifice, until the body of the victim be entirely wasted by putrefaction.

It were much to be wished that this deluded people may learn to entertain the same horror of murdering their fellow-creatures, in order to furnish such an invisible banquet to their god, as they now have of feeding, corporeally, on human flesh themselves. And yet we have great reason to believe that there was a time when they were cannibals. We were told (and, indeed, partly saw it), that it is a necessary ceremony, when a poor wretch is sacrificed, for the priest to take out the left eye. This he presents to the king, holding it

en a poor wretch is
the king, holding it

to his mouth, which he desires him to open; but, instead of putting it in, immediately with-
draws it. This they call "eating the man," or "food for the chief;" and, perhaps, we may
observe here some traces of former times, when the dead body was really feasted upon. But
not to insist upon this, it is certain that human sacrifices are not the only barbarous custom
we find still prevailing amongst this benevolent, humane people. For, besides cutting out
the jaw-bones of their enemies slain in battle, which they carry about as trophies, they, in
some measure, offer their dead bodies as a sacrifice to the *Eatooa*. Soon after a battle, in
which they have been victors, they collect all the dead that have fallen into their hands,
and bring them to the *morai*, where, with a great deal of ceremony, they dig a hole, and
bury them all in it, as so many offerings to the gods; but their skulls are never after
taken up.

Their own great chiefs, that fall in battle, are treated in a different manner. We were
informed that their late king, Tootaha, Tubonrai-tamaide, and another chief, who fell with
them in the battle, fought with those of Tiarahoo, and were brought to this *morai*, at
Attahooroo. There their bowels were cut out by the priests, before the great altar, and the
bodies afterwards buried in three different places, which were pointed out to us in the
great pile of stones that compose the most conspicuous part of this *morai*. And their
common men, who also fell in this battle, were all buried in one hole, at the foot of the pile.
This, Omai, who was present, told me was done the day after the battle, with much pomp
and ceremony, and in the midst of a great concourse of people, as a thanksgiving-offering to
the *Eatooa*, for the victory they had obtained, while the vanquished had taken refuge in
the mountains. There they remained a week or ten days, till the fury of the victors was
over, and a treaty set on foot, by which it was agreed that Otoo should be declared king of
the whole island; and the solemnity of investing him with the *maro* was performed at the
same *morai*, with great pomp, in the presence of all the principal men of the country.

CHAPTER III.—CONFERENCE WITH TOWHA.—HEEVAS DESCRIBED.—OMAI AND OEDIDEE GIVE

ANIMALS GIVEN TO HIM.—ETARY, AND THE DEPUTIES OF A CHIEF, HAVE AUDIENCES.—A
MOCK-FIGHT OF TWO WAR CANOES.—NAVAL STRENGTH OF THESE ISLANDS.—MANNER OF
CONDUCTING A WAR.

THE close of the very singular scene exhibited at the *morai*, which I have faithfully
described in the last chapter, leaving us no other business in Attahooroo, we embarked about
noon, in order to return to Matavai; and, in our way, visited Towha, who had remained on
the little island, where we met him the day before. Some conversation passed between
Otoo and him, on the present posture of public affairs; and then the latter solicited me,
once more, to join them in their war against Eimeo. By my positive refusal I entirely lost
the good graces of this chief. Before we parted, he asked us if the solemnity at which we
had been present, answered our expectations; what opinion we had of its efficacy; and
whether we performed such acts of worship in our own country? During the celebration of
the horrid ceremony, we had preserved a profound silence; but, as soon as it was closed, had
made no scruple in expressing our sentiments very freely about it to Otoo and those who
attended him; of course, therefore, I did not conceal my detestation of it in this conversation
with Towha. Besides the cruelty of the bloody custom, I strongly urged the unreasonableness
of it; telling the chief that such a sacrifice, far from making the *Eatooa* propitious to
their nation, as they ignorantly believed, would be the means of drawing down his
vengeance; and that, from this very circumstance, I took upon me to judge that their
intended expedition against Maheine would be unsuccessful. This was venturing pretty
far upon conjecture, but still I thought that there was little danger of being mistaken. For
I found that there were three parties in the island, with regard to this war; one extremely
violent for it, another perfectly indifferent about the matter, and the third openly declaring

themselves friends to Maheine and his cause. Under these circumstances of disunion distracting their councils, it was not likely that such a plan of military operation would be settled as could insure even a probability of success. In conveying our sentiments to Towha on the subject of the late sacrifice, Omai was made use of as our interpreter; and he entered into our arguments with so much spirit that the chief seemed to be in great wrath; especially when he was told that if he had put a man to death in England, as he had done here, his rank would not have protected him from being hanged for it. Upon this he exclaimed, *Maeno! maeno!* [vile! vile!] and would not hear another word. During this debate many of the natives were present, chiefly the attendants and servants of Towha himself; and when Omai began to explain the punishment that would be inflicted in England upon the greatest man if he killed the meanest servant, they seemed to listen with great attention, and were, probably, of a different opinion from that of their master on this subject.

After leaving Towha we proceeded to Oparre, where Otoo pressed us to spend the night. We landed in the evening; and on our road to his house had an opportunity of observing in what manner these people amuse themselves, in their private *heevas*. About a hundred of them were found sitting in a house; and in the midst of them were two women, with an old man behind each of them, beating very gently upon a drum; and the women, at intervals singing in a softer manner than I ever heard at their other diversions. The assembly listened with great attention, and were seemingly almost absorbed in the pleasure the music gave them; for few took any notice of us, and the performers never once stopped. It was almost dark before we reached Otoo's house, where we were entertained with one of their public *heevas*, or plays, in which his three sisters appeared as the principal characters. This was what they call a *heeva raï*, which is of such a nature that nobody is to enter the house or area where it is exhibited. When the royal sisters are the performers this is always the

HEEVA MAI DANCE OF WOMEN.

case. Their dances on this occasion was truly picturesque and elegant; and they acquitted themselves in their parts in a very distinguished manner; though some comic interlude, performed by four men, seemed to yield greater pleasure to the audience, which was numerous. The next morning we proceeded to Matavai, leaving Otoo at Oparre; but his

mother, sisters, and several other women, attended me on board, and Otoo himself followed me soon after.

While Otoo and I were absent from the ships they had been sparingly supplied with fruit, and had few visitors. After our return we again overflowed with provisions and with company. On the 14th a party of us dined ashore with Omai, who gave excellent fare, consisting of fish, fowls, pork, and puddings. After dinner I attended Otoo, who had been one of the party, back to his house, where I found all his servants very busy getting a quantity of provisions ready for me. Amongst other articles there was a large hog, which they killed in my presence. The entrails were divided into eleven portions, in such a manner that each of them contained a bit of everything. These portions were distributed to the servants, and some dressed theirs in the same oven with the hog, while others carried off, undressed, what had come to their share. There was also a large pudding, the whole process in making which I saw. It was composed of bread-fruit, ripe plantains, taro, and palm or pandanus nuts, each rasped, scraped, or beat up fine, and baked by itself. A quantity of juice, expressed from cocoa-nut kernels, was put into a large tray, or wooden vessel. The other articles, hot from the oven, were deposited in this vessel; and a few hot stones were also put in, to make the contents simmer. Three or four men made use of sticks to stir the several ingredients, till they were incorporated one with another, and the juice of the cocoa-nut was turned to oil; so that the whole mass, at last, became of the consistency of a hasty-pudding. Some of these puddings are excellent, and few that we make in England equal them. I seldom or never dined without one when I could get it, which was not always the case. Otoo's hog being baked, and the pudding which I have described, being made, they, together with two living hogs, and a quantity of bread-fruit and cocoa-nuts, were put into a canoe, and sent on board my ship, followed by myself and all the royal family.

The following evening, a young ram of the Cape breed, that had been lambed, and, with great care, brought up on board the ship, was killed by a dog. Incidents are of more or less consequence, as connected with situation. In our present situation, desirous as I was to propagate this useful race amongst these islands, the loss of the ram was a serious misfortune; as it was the only one I had of that breed; and I had only one of the English breed left. In the evening of the 7th, we played off some fire-works before a great concourse of people. Some were highly entertained with the exhibition; but by far the greater number of spectators were terribly frightened; insomuch that it was with difficulty we could prevail upon them to keep together to see the end of the show. A table-rocket was the last. It flew off the table, and dispersed the whole crowd in a moment; even the most resolute among them fled with precipitation.

The next day a party of us dined with our former ship-mate, Oedidee, on fish and pork. The hog weighed about thirty pounds; and it may be worth mentioning, that it was alive, dressed, and brought upon the table, within the hour. We had but just dined, when Otoo came, and asked me if my belly was full? On my answering in the affirmative, he said, "Then come along with me." I accordingly went with him to his father's, where I found some people employed in dressing two girls with a prodigious quantity of fine cloth, after a very singular fashion. The one end of each piece of cloth, of which there was a good many, was held up over the heads of the girls, while the remainder was wrapped round their bodies, under the arm-pits. Then the upper ends were let fall, and hung down in folds to the ground, over the other, so as to bear some resemblance to a circular hoop-petticoat. Afterward, round the outside of all, were wrapped several pieces of differently coloured cloth, which considerably increased the size; so that it was not less than five or six yards in circuit, and the weight of this singular attire was as much as the poor girls could support. To each were hung two *taames*, or breast-plates, by way of enriching the whole, and giving it a picturesque appearance. Thus equipped, they were conducted on board the ship, together with several hogs, and a quantity of fruit, which, with the cloth, was a present to me from Otoo's father. Persons, of either sex, dressed in this manner, are called *ateo*; but, I believe, it is never practised except when large presents of cloth are to be made. At least, I never saw it practised upon any other occasion; nor, indeed, had I ever such a

present before ; but both Captain Clerke and I had cloth given to us afterward, thus wrapped round the bearers. The next day, I had a present of five hogs, and some fruit, from Otoo ; and one hog, and some fruit, from each of his sisters. Nor were other provisions wanting. For two or three days, great quantities of mackerel had been caught by the natives, within the reef, in seines ; some of which they brought to the ships and tents, and sold.

Otoo was not more attentive to supply our wants, by a succession of presents, than he was to contribute to our amusement, by a succession of diversions. A party of us having gone down to Oparre, on the 10th, he treated us with what may be called a play. His three sisters were the actresses ; and the dresses they appeared in were new and elegant ; that is, more so than we had usually met with at any of these islands. But the principal object I had in view, this day, in going to Oparre, was to take a view of an embalmed corpse, which some of our gentlemen had happened to meet with at that place, near the residence of Otoo. On inquiry, I found it to be the remains of Tee, a chief well known to me, when I was at this Island, during my last voyage. It was lying in a *toopapao*, more elegantly constructed than their common ones, and in all respects similar to that lately seen by us at Oheitepeha, in which the remains of Waheadooa are deposited, embalmed in the same manner. When we arrived at the place, the body was under cover, and wrapped up in cloth, within the *toopapao* ; but at my desire, the man who had the care of it brought it out, and laid it upon a kind of bier, in such a manner, that we had as full a view of it as we could wish ; but we were not allowed to go within the pales that inclosed the *toopapao*. After he had thus exhibited the corpse, he hung the place with mats and cloth, so disposed as to produce a very pretty effect. We found the body not only entire in every part ; but, what surprised us much more, was, that putrefaction seemed scarcely to be begun, as there was not the least disagreeable smell proceeding from it, though the climate is one of the hottest, and Tee had been dead above four months. The only remarkable alteration that had happened, was a shrinking of the muscular parts of the eyes ; but the hair and nails were in their original state, and still adhered firmly ; and the several joints were quite pliable, or in that kind of relaxed state which happens to persons who faint suddenly. Such were Mr. Anderson's remarks to me, who also told me, that, on his inquiring into the method of effecting this preservation of their dead bodies, he had been informed that soon after their death, they are disembowelled, by drawing the intestines, and other *viscera*, out at the *anus* ; and the whole cavity is then filled or stuffed with cloth, introduced through the same part ; that when any moisture appeared on the skin, it was carefully dried up, and the bodies afterward rubbed all over with a large quantity of perfumed cocoa-nut oil ; which, being frequently repeated, preserved them a great many months ; but that, at last, they gradually moulder away. This was the information Mr. Anderson received ; for my own part, I could not learn any more about their mode of operation than what Omai told me, who said, that they made use of the juice of a plant which grows amongst the mountains ; of cocoa-nut oil ; and of frequent washing with sea water. I was also told that the bodies of all their great men, who died a natural death, are preserved in this manner ; and that they expose them to public view for a considerable time after. At first, they are laid out every day, when it does not rain ; afterward, the intervals become greater and greater ; and, at last, they are seldom to be seen.

In the evening, we returned from Oparre, where we left Otoo, and all the royal family ; and I saw none of them till the 12th, when all but the chief himself paid me a visit. He, as they told me, was gone to Attahooroo, to assist, this day, at another human sacrifice, which the chief of Tiaraboo had sent thither to be offered up at the *morai*. This second instance, within the course of a few days, was too melancholy a proof how numerous the victims of this bloody superstition are amongst this humane people. I would have been present at this sacrifice, too, had I known of it in time ; for now it was too late. From the very same cause, I missed being present at a public transaction which had passed at Oparre the preceding day, when Otoo, with all the solemnities observed on such occasions, restored to the friends and followers of the late king Tootaha the lands and possessions which had been withheld from them ever since his death. Probably the new sacrifice was the concluding ceremony of what may be called the reversal of *Ma'inder*. The following

The following

evening, Otoo returned from exercising this most disagreeable of all his duties as sovereign ; and, the next day, being now honoured with his company, Captain Clerke and I, mounted on horseback, took a ride round the plain of Matavai, to the very great surprise of a great train of people who attended on the occasion, gazing upon us with as much astonishment as if we had been centaurs. Omai, indeed, had, once or twice before this, attempted to get on horseback ; but he had as often been thrown off, before he could contrive to seat himself ; so that this was the first time they had seen anybody ride a horse. What Captain Clerke and I began, was, after this, repeated every day, while we staid, by one or another of our people ; and yet the curiosity of the natives continued still unabated. They were exceedingly delighted with these animals, after they had seen the use that was made of them ; and, as far as I could judge, they conveyed to them a better idea of the greatness of other nations than all the other novelties put together that their European visitors had carried amongst them. Both the horse and mare were in good case, and looked extremely well.*

The next day, Etary, or Olla, the god of Bolabola, who had, for several days past, been in the neighbourhood of Matavai, removed to Oparre, attended by several sailing canoes. We were told, that Otoo did not approve of his being so near our station, where his people could more easily invade our property. I must do Otoo the justice to say, that he took every method prudence could suggest to prevent thefts and robberies ; and it was more owing to his regulations than to our circumspection that so few were committed. He had taken care to erect a little house or two on the other side of the river, behind our post, and two others close to our tents, on the bank between the river and the sea. In all these places some of his own people constantly kept watch ; and his father generally resided on Matavai point ; so that we were, in a manner, surrounded by them. Thus stationed, they not only guarded us in the night from thieves, but could observe everything that passed in the day ; and were ready to collect contributions from such girls as had private connexions with our people, which was generally done every morning. So that the measures adopted by him to secure our safety, at the same time served the more essential purpose of enlarging his own profits.

Otoo informing me that his presence was necessary at Oparre, where he was to give audience to the great personage from Bolabola ; and asking me to accompany him, I readily consented, in hopes of meeting with something worth our notice. Accordingly, I went with him, in the morning of the 16th, attended by Mr. Anderson. Nothing, however, occurred on this occasion, that was either interesting or curious. We saw Etary and his followers present some coarse cloth and hogs to Otoo ; and each article was delivered with some ceremony, and a set speech. After this, they, and some of their chiefs, held a consultation about the expedition to Eimeo. Etary at first seemed to disapprove of it, but at last his objections were over-ruled. Indeed, it appeared, next day, that it was too late to deliberate about this measure ; and that Towha, Potaton, and another chief, had already gone upon the expedition with the fleet of Attahooroo. For a messenger arrived in the evening with intelligence that they had reached Eimeo, and that there had been some skirmishes, without much loss or advantage on either side.

In the morning of the 18th, Mr. Anderson, myself, and Omai, went again with Otoo to Oparre, and took with us the sheep which I intended to leave upon the island, consisting of an English ram and ewe, and three Cape ewes ; all which I gave to Otoo. As all the three cows had taken the bull, I thought I might venture to divide them, and carry some to Ulitea. With this view I had them brought before us, and proposed to Etary, that if he would leave his bull with Otoo, he should have mine, and one of the three cows ; adding, that I would carry them for him to Ulitea ; for I was afraid to remove the Spanish bull, lest some accident should happen to him, as he was a bulky spirited beast. To this proposal of mine Etary at first made some objections, but at last agreed to it, partly through the persuasion of Omai. However, just as the cattle were putting into the boat, one of Etary's followers valiantly opposed any exchange whatever being made. Finding this, and suspect-

* These horses, which were Omai's property, proved a useless present, and the breed was suffered to become extinct. Mr. Ellis states that "they appear to have been regarded by him as mere objects of curiosity, and when occasionally ridden, it was to inspire terror, or excite admiration, in the minds of the inhabitants."—Ed.

ing that Etary had only consented to the proposed arrangement, for the present moment, to please me, and that after I was gone he might take away his bull, and then Otoo would not have one, I thought it best to drop the idea of an exchange, as it could not be made with the mutual consent of both parties, and finally determined to leave them all with Otoo, strictly enjoining him never to suffer them to be removed from Oparre, not even the Spanish bull, nor any of the sheep, till he should get a stock of young ones; which he might then dispose of to his friends, and send to the neighbouring islands.

This being settled, we left Etary and his party to ruminate upon their folly, and attended Otoo to another place hard by, where we found the servants of a chief, whose name I forgot to ask, waiting with a hog, a pig, and a dog, as a present from their master to the sovereign. These were delivered with the usual ceremonies, and with an harangue in form, in which the speaker, in his master's name, inquired after the health of Otoo, and of all the principal people about him. This compliment was echoed back in the name of Otoo, by one of his ministers; and then the dispute with Eimeo was discussed, with many arguments for and against it. The deputies of this chief were for prosecuting the war with vigour, and advised Otoo to offer a human sacrifice. On the other hand, a chief who was in constant attendance on Otoo's person opposed it, seemingly, with great strength of argument. This confirmed me in the opinion that Otoo himself never entered heartily into the spirit of this war. He now received repeated messages from Towha, strongly soliciting him to hasten to his assistance. We were told that his fleet was in a manner surrounded by that of Maheine; but that neither the one nor the other durst hazard an engagement.

After dining with Otoo we returned to Matavai, leaving him at Oparre. This day, and also the 19th, we were very sparingly supplied with fruit. Otoo hearing of this, he and his brother, who had attached himself to Captain Clerke, came from Oparre between nine and ten o'clock in the evening, with a large supply for both ships. This marked his humane attention more strongly than anything he had hitherto done for us. The next day, all the royal family came with presents, so that our wants were not only relieved, but we had more provisions than we could consume. Having got all our water on board, the ships being caulked, the rigging overhauled, and everything put in order, I began to think of leaving the island, that I might have sufficient time to spare for visiting others in this neighbourhood. With this view we removed from the shore our observatories and instruments, and bent the sails. Early the next morning Otoo came on board to acquaint me that all the war canoes of Matavai, and of the three other districts adjoining, were going to Oparre to join those belonging to that part of the island; and that there would be a general review there. Soon after, the squadron of Matavai was all in motion; and, after parading a while about the bay, assembled ashore near the middle of it. I now went in my boat to take a view of them.

Of those with stages on which they fight, or what they call their war-canoes, there were about sixty, with near as many more of a smaller size. I was ready to have attended them to Oparre; but, soon after, a resolution was taken by the chiefs that they should not move till the next day. I looked upon this to be a fortunate delay, as it afforded me a good opportunity to get some insight into their manner of fighting. With this view, I expressed my wish to Otoo that he would order some of them to go through the necessary manœuvres. Two were, accordingly ordered out into the bay, in one of which Otoo, Mr. King, and myself were embarked, and Omai went on board the other. When we had got sufficient sea-room, we faced and advanced upon each other, and retreated by turns, as quick as our rowers could paddle. During this, the warriors on the stages flourished their weapons, and played a hundred antic tricks, which could answer no other end, in my judgment, than to work up their passions and prepare them for fighting. Otoo stood by the side of our stage, and gave the necessary orders when to advance and when to retreat. In this, great judgment and a quick eye combined together seemed requisite to seize every advantage that might offer, and to avoid giving any advantage to the adversary. At last, after advancing and retreating from each other at least a dozen times, the two canoes closed head to head, or stage to stage; and, after a short conflict, the troops on our stage were supposed to be all killed, and we were boarded by Omai and his associates. At that very instant, Otoo and

If Omai's information is to be depended upon, their naval engagements are not always conducted in this manner. He told me, that they sometimes begin with lashing the two vessels together, head to head, and then fight till all the warriors are killed on one side or the other. But this close combat, I apprehend, is never practised but when they are determined to conquer or die. Indeed, one or the other must happen; for all agree that they never give quarter, unless it be to reserve their prisoners for a more cruel death the next day. The power and strength of these islands lie entirely in their navies. I never heard of a general engagement on land; and all their decisive battles are fought on the water*. If the time and place of conflict are fixed upon by both parties, the preceding day and night are spent in diversions and feasting. Toward morning they launch the canoes, put everything in order, and with the day begin the battle, the fate of which generally decides the dispute. The vanquished save themselves by a precipitate flight; and such as reach the shore fly with their friends to the mountains; for the victors, while their fury lasts, spare neither the aged, women, nor children. The next day they assemble at the *morai*, to return thanks to the *Eatooa* for the victory, and to offer up the slain as sacrifices, and the prisoners also, if they have any. After this, a treaty is set on foot, and the conquerors for the most part obtain their own terms, by which particular districts of lands, and sometimes whole islands, change their owners. Omai told us that he was once taken a prisoner by the men of Bolabola, and carried to that island, where he and some others would have been put to death the next day if they had not found means to escape in the night.

As soon as this mock fight was over, Omai put on his suit of armour, mounted a stage in one of the canoes, and was paddled all along the shore of the bay; so that every one had a full view of him. His coat of mail did not draw the attention of his countrymen so much as might have been expected. Some of them, indeed, had seen a part of it before; and there were others, again, who had taken such a dislike to Omai, from his imprudent conduct at this place, that they would hardly look at anything, however singular, that was exhibited by him.

CHAPTER IV.—THE DAY OF SAILING FIXED.—PEACE MADE WITH EIMEO.—DEBATES ABOUT IT, AND OTOO'S CONDUCT BLAMED.—A SOLEMNITY AT THE MORAI ON THE OCCASION, DESCRIBED BY MR. KING.—OBSERVATIONS UPON IT.—INSTANCE OF OTOO'S AID.—OMAI'S WAR-CANOE, AND REMARKS UPON HIS BEHAVIOUR.—OTOO'S PRESENT, AND MESSAGE TO THE KING OF GREAT BRITAIN.—REFLECTIONS ON OUR MANNER OF TRAFFIC, AND ON THE GOOD TREATMENT WE MET WITH AT OTAHEITE.—ACCOUNT OF THE EXPEDITION OF THE SPANIARDS.—THEIR FICTIONS TO DEPRECIATE THE ENGLISH.—WISHES EXPRESSED THAT NO SETTLEMENT MAY BE MADE.—OMAI'S JEALOUSY OF ANOTHER TRAVELLER.

EARLY in the morning of the 22nd, Otoo and his father came on board, to know when I proposed sailing. For, having been informed that there was a good harbour at Huahine; I had told them that I should visit that island on my way to Huahine; and they were desirous of taking a passage with me, and of their fleet sailing at the time to reinforce Towlin. As I was ready to take my departure, I left it to them to name the day, and the Wednesday following was fixed upon, when I was to take on board Otoo, his father, —ther, and, in short, the whole family. These points being settled, I proposed setting out immediately for Oparre, where all the fleet fitted out for the expedition was to assemble this day, and to be reviewed.

* This people have a natural aptitude for the sea. When the late lamented Mr. Williams published his "Narrative of Missionary Enterprises in the South Sea Islands," the natives had made great progress in many departments of useful knowledge, but especially in building small vessels of from twenty to fifty tons. "More than twenty of these," he stated, "were sailing from island to

island when he left, two of which belonged to the queen, and were employed in fetching cargoes of pearl and pearl-shells from a group of islands to the eastward of Tahiti. These were exchanged with the English and American vessels for clothing and other articles." Such was the progress made in 1837, since which time the people have been on the advance.—Fu.

I had but just time to get into my boat, when news was brought that Towha had concluded a treaty with Maheine, and had returned with his fleet to Attahooroo. This unexpected event made all further proceedings in the military way quite unnecessary, and the war-canoes, instead of rendezvousing at Oparre, were ordered home to their respective districts. This alteration, however, did not hinder me from following Otoo to Oparre, accompanied by Mr. King and Omai. Soon after our arrival, and while dinner was preparing, a messenger arrived from Eimeo, and related the conditions of the peace, or rather of the truce, it being only for a limited time. The terms were disadvantageous to Otaheite; and much blame was thrown upon Otoo, whose delay in sending reinforcements had obliged Towha to submit to a disgraceful accommodation. It was even currently reported that Towha, resenting his not being supported, had declared, that as soon as I could leave the island he would join his forces to those of Tiaraboo, and attack Otoo at Matavai or Oparre. This called upon me to declare, in the most public manner, that I was determined to espouse the interest of my friend against any such combination; and that whoever presumed to attack him, should feel the weight of my heavy displeasure when I returned again to their island. My declaration probably had the desired effect; and if Towha had any such hostile intention at first, we soon heard no more of the report. Whappai, Otoo's father, highly disapproved of the peace, and blamed Towha very much for concluding it. This sensible old man wisely judged, that my going down with them to Eimeo must have been of singular service to their cause, though I should take no other part whatever in the quarrel. And it was upon this that he built his arguments, and maintained that Otoo had acted properly by waiting for me, though this had prevented his giving assistance to Towha so soon as he expected.

Our debates at Oparre, on this subject, were hardly ended before a messenger arrived from Towha, desiring Otoo's attendance the next day at the *morai* in Attahooroo, to give thanks to the gods for the peace he had concluded; at least, such was Omai's account to me of the object of this solemnity. I was asked to go; but being much out of order, was obliged to decline it. Desirous, however, of knowing what ceremonies might be observed on so memorable an occasion, I sent Mr. King and Omai, and returned on board my ship, attended by Otoo's mother, his three sisters, and eight more women. At first I thought that this numerous train of females came into my boat with no other view than to get a passage to Matavai. But when we arrived at the ship, they told me they intended passing the night on board, for the express purpose of undertaking the cure of the disorder I complained of; which was a pain of the rheumatic kind, extending from the hip to the foot. I accepted the friendly offer, had a bed spread for them upon the cabin floor, and submitted myself to their directions. I was desired to lay myself down amongst them. Then, as many of them as could get round me, began to squeeze me with both hands, from head to foot, but more particularly on the parts where the pain was lodged, till they made my bones crack, and my flesh became a perfect mummy. In short, after undergoing this discipline about a quarter of an hour, I was glad to get away from them. However, the operation gave me immediate relief, which encouraged me to submit to another rubbing-down before I went to bed; and it was so effectual, that I found myself pretty easy all the night after. My female physicians repeated their prescription the next morning before I went ashore, and again in the evening when they returned on board; after which I found the pains entirely removed; and the cure being perfected, they took their leave of me the following morning. This they call *romee*; an operation which, in my opinion, far exceeds the flesh-brush, or anything of the kind that we make use of externally. It is universally practised amongst these islanders; being sometimes performed by the men, but more generally by the women. If at any time one appears languid and tired, and sits down by any one of them, they immediately begin to practise the *romee* upon his legs; and I have always found it to have an exceeding good effect*.

In the morning of the 25th, Otoo, Mr. King, and Omai, returned from Attahooroo: and Mr. King gave me the following account of what he had seen: "Soon after you left me, a second messenger came from Towha, to Otoo, with a plantain-tree. It was sunset when we

* See Captain Wallis's account of the same operation performed on himself, and his first lieutenant, in "Hawkesworth's Collection," vol. i. p. 463. London edit.

Towha had committed Attahooroo. This was unnecessary, and to their respective Ototo to Oparre, was preparing, or rather of the Otaheite; and the agents had obliged to report that could leave the Otavai or Oparre. Attahooroo; and after you left me, a as sunset when we lieutenant, in "Hawkes

embarked in a canoe and left Oparre: about nine o'clock we landed at Tettana, at that extremity which joins to Attahooroo. Before we landed, the people called to us from the shore, probably to tell us that Towha was there. The meeting of Ototo and this chief I expected would afford some incident worthy of observation. Ototo and his attendants went and seated themselves on the bench, close to the canoe in which Towha was. He was then asleep; but his servants having awaked him, and mentioning Ototo's name, immediately a plantain-tree and a dog were laid at Ototo's feet; and many of Towha's people came and talked with him, as I conceived, about their expedition to Eimeo. After I had, for some time, remained seated close to Ototo, Towha neither stirring from his canoe, nor holding any conversation with us, I went to him. He asked me if *Toote* was angry with him. I answered, No: that he was his *taio*; and that he had ordered me to go to Attahooroo to tell him so. Omai now had a long conversation with this chief; but I could gather no information of any kind from him. On my returning to Ototo, he seemed desirous that I should go to eat, and then to sleep. Accordingly, Omai and I left him. On questioning Omai, he said, the reason of Towha's not stirring from his canoe was his being lame; but that, presently, Ototo and he would converse together in private. This seemed true; for, in a little time, those we left with Ototo came to us; and, about ten minutes after, Ototo himself arrived, and we all went to sleep in his canoe.

"The next morning, the *ava* was in great plenty. One man drank so much that he lost his senses. I should have supposed him to be in a fit, from the convulsions that agitated him. Two men held him, and kept plucking off his hair by the roots. I left this spectacle to see another more affecting. This was the meeting of Towha and his wife, and a young girl, whom I understood to be his daughter. After the ceremony of cutting their heads, and discharging a tolerable quantity of blood and tears, they washed, embraced the chief, and seemed unconcerned. But the young girl's sufferings were not yet come to an end. Terridiri* arrived; and she went, with great composure, to repeat the same ceremonies to him, which she had just performed on meeting her father. Towha had brought a large war-canoe from Eimeo, I inquired if he had killed the people belonging to her; and was told, that there was no man in her when she was captured.

"We left Tettana, about ten or eleven o'clock, and landed, close to the *morai* of Attahooroo, a little after noon. There lay three canoes, hauled upon the beach, opposite the *morai*, with three hogs exposed in each: their sheds, or awnings, had something under them which I could not discern. We expected the solemnity to be performed the same afternoon; but as neither Towha nor Potatou had joined us, nothing was done. A chief from Eimeo came with a small pig, and a plantain-tree, and placed them at Ototo's feet. They talked some time together; and the Eimeo chief often repeating the words, *Warry, warry*, 'false,' I supposed that Ototo was relating to him what he had heard, and that the other denied it.

"The next day (Wednesday), Towha and Potatou, with about eight large canoes, arrived, and landed near the *morai*. Many plantain-trees were brought, on the part of different chiefs, to Ototo. Towha did not stir from his canoe. The ceremony began by the principal priest bringing out the *maro*, wrapped up, and a bundle shaped like a large sugar-loaf. These were placed at the head of what I understood to be a grave. Then three priests came and sat down opposite, that is, at the other end of the grave; bringing with them a plantain-tree, the branch of some other tree, and the sheath of the flower of the cocoa-nut tree. The priests, with these things in their hands, separately repeated sentences; and, at intervals, two, and sometimes all three, sung a melancholy ditty, little attended to by the people. This praying and singing continued for an hour. Then, after a short prayer, the principal priest uncovered the *maro*; and Ototo rose up, and wrapped it about him, holding, at the same time, in his hand, a cap or bonnet, composed of the red feathers of the tail of the tropic-bird, mixed with other feathers of a dark colour. He stood in the middle space, facing the three priests, who continued their prayers for about ten minutes; when a man, starting from the crowd, said something which ended with the word *heiva!* and the crowd echoed back

* Terridiri was Oberea's son. See an account of the royal family of Otaheite, Vol. I. p. 146

to him, three times, *Earee!* This, as I had been told before, was the principal part of the solemnity.

"The company now moved to the opposite side of the great pile of stones, where is what they call the king's *morai*; which is not unlike a large grave. Here the same ceremony was performed over again, and ended in three cheers. The *maro* was now wrapped up, and increased in its splendour by the addition of a small piece of red feathers, which one of the priests gave Otoo when he had it on, and which he stuck into it. From this place the people went to a large hut, close by the *morai*, where they seated themselves in much greater order than is usual among them. A man of Tiaraboo then made an oration, which lasted about ten minutes. He was followed by an Attahooroo man; afterward Potaton spoke with much greater fluency and grace than any of them; for, in general, they spoke in short, broken sentences, with a motion of the hand that was rather awkward. Tootoo, Otoo's orator, spoke next, and after him a man from Eimeo. Two or three more speeches were made; but not much attended to. Omai told me, that the speeches declared that they should not fight, but all be friends. As many of the speakers expressed themselves with warmth, possibly there were some recriminations and protestations of their good intentions. In the midst of their speaking, a man of Attahooroo got up, with a sling fastened to his waist, and a large stone placed upon his shoulder. After parading near a quarter of an hour in the open space, repeating something in a singing tone, he threw the stone down. This stone, and a plantain-tree that lay at Otoo's feet, were, after the speeches ended, carried to the *morai*; and one of the priests, and Otoo with him, said something upon the occasion.

"On our return to Oparre, the sea-breeze having set in, we were obliged to land, and had a pleasant walk through almost the whole extent of Tettaha to Oparre. A tree, with two bundles of dried leaves suspended upon it, marked the boundary of the two districts. The man who had performed the ceremony of the stone and sling came with us. With him Otoo's father had a long conversation. He seemed very angry. I understood he was enraged at the part Towha had taken in the Eimeo business."

From what I can judge of this solemnity, as thus described by Mr. King, it had not been wholly a thanksgiving, as Omai told us, but rather a confirmation of the treaty, or perhaps both. The grave, which Mr. King speaks of, seems to be the very spot where the celebration of the rites began, when the human sacrifice, at which I was present, was offered, and before which the victim was laid, after being removed from the sea-side. It is at this part of the *morai*, also, that they first invest their kings with the *maro*. Omai, who had been present when Otoo was made king, described to me the whole ceremony, when we were here; and I find it to be almost the same as this that Mr. King has now described, though we understood it to be upon a very different occasion. The plantain-tree, so often mentioned, is always the first thing introduced, not only in all their religious ceremonies, but in all their debates, whether of a public or private nature. It is also used on other occasions; perhaps, many more than we know of. While Towha was at Eimeo, one or more messengers came from him to Otoo every day. The messenger always came with a young plantain-tree in his hand, which he laid down at Otoo's feet, before he spoke a word; then seated himself before him, and related what he was charged with. I have seen two men in such high dispute that I expected they would proceed to blows; yet, on one laying a plantain-tree before the other, they have both become cool, and carried on the argument without farther animosity. In short, it is, upon all occasions, the olive-branch of these people.

The war with Eimeo, and the solemn rites which were the consequence of it, being thus finally closed, all our friends paid us a visit on the 26th; and, as they knew that we were upon the point of sailing, brought with them more hogs than we could take off their hands. For, having no salt left, to preserve any, we wanted no more than for present use. The next day, I accompanied Otoo to Oparre; and, before I left it, I looked at the cattle and poultry, which I had consigned to my friend's care, at that place. Every thing was in a promising way; and properly attended unto. Two of the geese and two of the ducks were sitting; but the pea and turkey hens had not begun to lay. I got from Otoo four goats; two of which I intended to leave at Ulieten, where none had as yet been introduced; and

the other two, I proposed to reserve for the use of any other islands I might meet with in my passage to the north.

A circumstance which I shall now mention of Otoo, will show that these people are capable of much address and art to gain their purposes. Amongst other things which, at different times, I had given to this chief, was a spying-glass. After having it in his possession two or three days, tired of its novelty, and probably finding it of no use to him, he carried it privately to Captain Clerke, and told him, that, as he had been his very good friend, he had got a present for him, which he knew would be agreeable. "But," says Otoo, "you must not let *Toote* know it; because he wants it, and I would not let him have it." He then put the glass into Captain Clerke's hands; at the same time, assuring him, that he came honestly by it. Captain Clerke at first declined accepting it; but Otoo insisted upon it, and left it with him. Some days after, he put Captain Clerke in mind of the glass; who, though he did not want it, was yet desirous of obliging Otoo; and thinking that a few axes would be of more use at this island, produced four to give him in return. Otoo no sooner saw this, than he said, "*Toote* offered me five for it." "Well," says Captain Clerke, "if that be the case, your friendship for me shall not make you a loser, and you shall have six axes." These he accepted; but desired again, that I might not be told what he had done.

Our friend Omai got one good thing at this island for the many good things he gave away. This was a very fine double sailing canoe, completely equipped, and fit for the sea. Some time before, I had made up for him, a suit of English colours; but he thought these too valuable to be used at this time; and patched up a parcel of colours, such as flags and pendants, to the number of ten or a dozen, which he spread on different parts of this vessel, all at the same time; and drew together as many people to look at her, as a man-of-war would, dressed, in a European port. These streamers of Omai were a mixture of English, French, Spanish, and Dutch, which were all the European colours that he had seen. When I was last at this island, I gave to Otoo an English jack and pendant, and to Towha a pendant; which I now found they had preserved with the greatest care. Omai had also provided himself with a good stock of cloth and cocoa-nut oil, which are not only in greater plenty, but much better, at Otaheite than at any of the Society Islands; inasmuch, that they are articles of trade. Omai would not have behaved so inconsistently, and so much unlike himself, as he did, in many instances, but for his sister and brother-in-law, who, together with a few more of their acquaintance, engrossed him entirely to themselves, with no other view than to strip him of everything he had got. And they would, undoubtedly, have succeeded in their scheme, if I had not put a stop to it in time, by taking the most useful articles of his property into my possession. But even this would not have saved Omai from ruin, if I had suffered these relations of his to have gone with, or to have followed us to, his intended place of settlement, Huahine. This they had intended; but I disappointed their farther views of plunder, by forbidding them to show themselves in that island, while I remained in the neighbourhood; and they knew me too well not to comply.

On the 28th, Otoo came on board, and informed me, that he had got a canoe, which he desired I would take with me, and carry home, as a present from him to the *Earee vakie no Pretane*; it being the only thing, he said, that he could send worth his Majesty's acceptance. I was not a little pleased with Otoo for this mark of his gratitude. It was a thought entirely his own, not one of us having given him the least hint about it; and it showed that he fully understood to whom he was indebted for the most valuable presents that he had received. At first, I thought that this canoe had been a model of one of their vessels of war; but I soon found that it was a small *ieahak*, about sixteen feet long. It was double, and seemed to have been built for the purpose; and was decorated with all those pieces of carved work, which they usually fix upon their canoes. As it was too large for me to take on board, I could only thank him for his good intentions; but it would have pleased him much better, if his present could have been accepted.

We were detained here some days longer than I expected, by light breezes from the west, and calms by turns; so that we could not get out of the bay. During this time, the ships were crowded with our friends, and surrounded by a multitude of canoes; for not one would leave the place till we were gone. At length, at three o'clock in the afternoon of

the 20th, the wind came at east, and we weighed anchor. As soon as the ships were under sail, at the request of Otoo, and to gratify the curiosity of his people, I fired seven guns, loaded with shot; after which, all our friends, except him, and two or three more, left us with such marks of affection and grief, as sufficiently showed how much they regretted our departure. Otoo being desirous of seeing the ship sail, I made a stretch out to sea, and then in again; when he also bid us farewell, and went ashore in his canoe. The frequent visits we have lately paid to this island, seem to have created a full persuasion that the intercourse will not be discontinued. It was strictly enjoined to me by Otoo, to request, in his name, the *Earee rahie no Pretane*, to send him, by the next ships, red feathers, and the birds that produce them; axes; half a dozen muskets, with powder and shot; and by no means to forget horses.

I have occasionally mentioned my receiving considerable presents from Otoo, and the rest of the family, without specifying what returns I made. It is customary for these people, when they make a present, to let us know what they expect in return; and we find it necessary to gratify them; so that what we get by way of present, comes dearer than what we get by barter. But as we were sometimes pressed by occasional scarcity, we could have recourse to our friends for a present, or supply, when we could not get our wants relieved by any other method; and therefore, upon the whole, this way of traffic was full as advantageous to us as to the natives. For the most part, I paid for each separate article as I received it, except in my intercourse with Otoo. His presents generally came so fast upon me, that no account was kept between us. Whatever he asked for, that I could spare, he had whenever he asked for it; and I always found him moderate in his demands.

If I could have prevailed upon Omai to fix himself at Otaheite, I should not have left it so soon as I did; for there was not a probability of our being better or cheaper supplied with refreshments at any other place, than we continued to be here, even at the time of our leaving it. Besides, such a cordial friendship and confidence subsisted between us and the inhabitants, as could hardly be expected anywhere else; and, it was a little extraordinary, that this friendly intercourse had never once been suspended by any untoward accident; nor had there been a theft committed that deserves to be mentioned. Not that I believe their morals, in this respect, to be much mended; but am rather of opinion, that their regularity of conduct was owing to the fear the chiefs were under of interrupting a traffic which they might consider as the means of securing to themselves a more considerable share of our commodities than could have been got by plunder or pilfering. Indeed, this point I settled at the first interview with their chiefs, after my arrival. For, observing the great plenty that was in the island, and the eagerness of the natives to possess our various articles of trade, I resolved to make the most of these two favourable circumstances, and explained myself, in the most decisive terms, that I would not suffer them to rob us, as they had done upon many former occasions. In this Omai was of great use, as I instructed him to point out to them the good consequences of their honest conduct; and the fatal mischiefs they must expect to suffer by deviating from it.

It is not always in the power of the chiefs to prevent robberies; they are frequently robbed themselves; and complain of it as a great evil. Otoo left the most valuable things he had from me in my possession, till the day before we sailed; and the reason he gave for it was, that they were nowhere so safe. Since the bringing in of new riches, the inducements to pilfering must have increased. The chiefs, sensible of this, are now extremely desirous of chests. They seemed to set much value upon a few the Spaniards had left amongst them; and they were continually asking us for some. I had one made for Otoo, the dimensions of which, according to his own directions, were eight feet in length, five in breadth, and about three in depth. Locks and bolts were not a sufficient security; but it must be large enough for two people to sleep upon, by way of guarding it in the night.

It will appear a little extraordinary, that we, who had a smattering of their language, and Omai, besides, for an interpreter, could never get any clear account of the time when the Spaniards arrived, how long they staid, and when they departed. The more we inquired into this matter, the more we were convinced of the inability of most of these

people to remember, or note the time, when past events happened; especially if it exceeded ten or twenty months. It, however, appeared, by the date of the inscription upon the cross, and by the information we received from the most intelligent of the natives, that two ships arrived at Oheitepeha in 1774, soon after I left Matavai, which was in May, the same year. They brought with them the house and live-stock before mentioned. Some said, that, after landing these things, and some men, they sailed in quest of me, and returned in about ten days. But I have some doubt of the truth of this, as they were never seen, either at Huahine or at Ulieten. The live-stock they left here consisted of one bull, some goats, hogs, and dogs, and the male of some other animal; which we afterwards found to be a ram, and, at this time, was at Bolabola, whither the bull was also to have been transported.

The hogs are of a large kind; have already greatly improved the breed originally found by us upon the island; and, at the time of our late arrival, were very numerous. Goats are, also, in tolerable plenty; there being hardly a chief of any note that has not got some. As to the dogs that the Spaniards put ashore, which are of two or three sorts, I think they would have done the island a great deal more service, if they had hanged them all, instead of leaving them upon it. It was to one of them that my young ram fell a victim. When these ships left the islands, four Spaniards remained behind. Two were priests, one a servant, and the fourth made himself very popular among the natives, who distinguish him by the name of Mateema. He seems to have been a person who had studied their language; or, at least, to have spoken it so as to be understood; and to have taken uncommon pains to impress the minds of the islanders with the most exalted ideas of the greatness of the Spanish nation, and to make them think meanly of the English. He even went so far as to assure them, that we no longer existed as an independent nation; that *Pretane* was only a small island, which they, the Spaniards, had entirely destroyed; and for me, that they had met with me at sea, and, with a few shot, had sent my ship, and every soul in her, to the bottom; so that my visiting Otaheite, at this time, was, of course, very unexpected. All this, and many other improbable falsehoods, did this Spaniard make these people believe. If Spain had no other views in this expedition but to depreciate the English, they had better have kept their ships at home; for my returning again to Otaheite was considered as a complete confutation of all that Mateema had said.

With what design the priests staid, we can only guess. If it was to convert the natives to the catholic faith, they have not succeeded in any one instance. But it does not appear that they ever attempted it; for, if the natives are to be believed, they never conversed with them, either on this, or on any other subject. The priests resided constantly in the house at Oheitepeha; but Mateema roved about, visiting most parts of the island. At length, after he and his companions had staid ten months, two ships came to Oheitepeha, took them on board, and sailed again in five days. This hasty departure shows, that, whatever design the Spaniards might have had upon this island, they had now laid it aside. And yet, as I was informed by Otoo, and many others, before they went away, they would have the natives believe that they still meant to return, and to bring with them houses, all kinds of animals, and men and women, who were to settle, live, and die on the island. Otoo, when he told me this, added, that if the Spaniards should return, he would not let them come to Matavai Fort, which, he said, was ours. It was easy to see that the idea pleased him; little thinking that the completion of it would at once deprive him of his kingdom, and the people of their liberties. This shows with what facility a settlement might be made at Otaheite; which, grateful as I am for repeated good offices, I hope will never happen. Our occasional visits may, in some respects, have benefited its inhabitants, but a permanent establishment amongst them, conducted as most European establishments amongst Indian nations have unfortunately been, would, I fear, give them just cause to lament that our ships had ever found them out. Indeed, it is very unlikely that any measure of this kind should ever be seriously thought of, as it can neither serve the purposes of public ambition, nor of private avarice; and, without such inducements, I may pronounce that it will never be undertaken.

I have already mentioned the visit that I had from one of the two natives of this island, who had been carried by the Spaniards to Lima. I never saw him afterward; which I

rather wondered at, as I had received him with uncommon civility. I believe, however, that Omai had kept him at a distance from me, by some rough usage; jealous that there should be another traveller upon the island who might vie with himself. Our touching at Teneriffe was a fortunate circumstance for Omai; as he prided himself in having visited a place belonging to Spain as well as this man. I did not meet with the other, who had returned from Lima; but Captain Clerke, who had seen him, spoke of him as a low fellow, and as a little out of his senses. His own countrymen, I found, agreed in the same account of him. In short, these two adventurers seemed to be held in no esteem. They had not, indeed, been so fortunate as to return home with such valuable acquisitions of property as we had bestowed upon Omai; and with the advantages he reaped from his voyage to England, it must be his own fault if he should sink into the same state of insignificance.

CHAPTER V.—ARRIVAL AT EIMEO.—TWO HARBOURS THERE, AND AN ACCOUNT OF THEM.—VISIT FROM MAIHINE, CHIEF OF THE ISLAND.—HIS PERSON DESCRIBED.—A GOAT STOLEN, AND SENT BACK WITH THE THIEF.—ANOTHER GOAT STOLEN, AND SECRETED.—MEASURES TAKEN ON THE OCCASION.—EXPEDITION ACROSS THE ISLAND.—HOUSES AND CANOES BURNED.—THE GOAT DELIVERED UP, AND PEACE RESTORED.—SOME ACCOUNT OF THE ISLAND, ETC.

As I did not give up my design of touching at Eimeo, at daybreak, in the morning of the 30th, after leaving Otaheite, I stood for the north end of the island; the harbour, which I wished to examine, being at that part of it. Omai, in his canoe, having arrived there long before us, had taken some necessary measures to show us the place. However, we were not without pilots, having several men of Otaheite on board, and not a few women. Not caring to trust entirely to these guides, I sent two boats to examine the harbour, and, on their making the signal for safe anchorage, we stood in with the ships, and anchored close up to the head of the inlet, in ten fathoms water, over a bottom of soft mud, and moored with a hawser fast to the shore. This harbour, which is called Taloo, is situated upon the north side of the island, in the district of Oboonohoo, or Poonohoo. It runs in south, or south by east, between the hills, above two miles. For security and goodness of its bottom, it is not inferior to any harbour that I have met with at any of the islands in this ocean; and it has this advantage over most of them, that a ship can sail in and out with the reigning trade-wind; so that the access and recess are equally easy. There are several rivulets that fall into it. The one at the head is so considerable as to admit boats to go a quarter of a mile up, where we found the water perfectly fresh. Its banks are covered with the *pooroo* tree, as it is called by the natives, which makes good firing, and which they set no value upon; so that wood and water are to be got here with great facility. On the same side of the island, and about two miles to the eastward, is the harbour of Parowroah, much larger within than that of Taloo; but the entrance, or opening in the reef, (for the whole island is surrounded with a reef of coral rock,) is considerably narrower, and lies to leeward of the harbour. These two defects are so striking, that the harbour of Taloo must always have a decided preference. It is a little extraordinary, that I should have been three times at Otaheite before, and have once sent a boat to Eimeo, and yet not know till now that there was a harbour in it; on the contrary, I always understood there was not; whereas there are not only the two above mentioned, but one or two more on the south side of the island; but these last are not so considerable as the two we have just described.

We had no sooner anchored than the ships were crowded with the inhabitants, whom curiosity alone brought on board; for they had nothing with them for the purposes of barter. But, the next morning, this deficiency was supplied; several canoes then arriving from more distant parts, which brought with them abundance of bread-fruit, cocoa-nuts, and a few hogs. These they exchanged for hatchets, nails, and beads, for red feathers were not so much sought after here as at Otaheite. The ship being a good deal pestered with rats, I hauled her within thirty yards of the shore, as near as the depth of water would allow, and made a path for them to get to the land, by fastening hawsers to the trees. It is said that

believe, however, jealous that there Our touching at having visited a other, who had as a low fellow, the same account They had not, of property as we yage to England, ice.

habitants, whom the purposes of es than arriving , cocoa-nuts, and feathers were not ered with rats, I would allow, and It is said that

this experiment has sometimes succeeded; but, I believe, we got clear of very few, if any, of the numerous tribe that haunted us.

In the morning of the 2d, Maheine, the chief of the island, paid me a visit. He approached the ship with great caution, and it required some persuasion to get him on board. Probably, he was under some apprehensions of mischief from us, as friends of the Otaheiteans; these people not being able to comprehend how we can be friends with any one, without adopting, at the same time, his cause against his enemies. Maheine was accompanied by his wife, who, as I was informed, is sister to Oamo of Otaheite, of whose death we had an account while we were at this island. I made presents to both of them, of such things as they seemed to set the highest value upon; and after a stay of about half an hour, they went away. Not long after, they returned with a large hog, which they meant as a return for my present; but I made them another present to the full value of it. After this, they paid a visit to Captain Clerke.

This chief, who with a few followers has made himself in a manner independent of Otaheite, is between forty and fifty years old. He is bald-headed, which is rather an uncommon appearance in these islands at that age. He wore a kind of turban, and seemed ashamed to show his head. But whether they themselves considered this deficiency of hair as a mark of disgrace, or whether they entertained a notion of our considering it as such, I cannot say. We judged that the latter supposition was the truth, from this circumstance, that they had seen us shave the head of one of their people, whom we had caught stealing. They therefore concluded that this was the punishment usually inflicted by us upon all thieves; and one or two of our gentlemen, whose heads were not overburdened with hair, we could observe, lay under violent suspicions of being *tetos*. In the evening, Omai and I mounted on horseback, and took a ride along the shore to the eastward. Our train was not very numerous, as Omai had forbid the natives to follow us; and many complied, the fear of giving offence getting the better of their curiosity. Towha had stationed his fleet in this harbour; and though the war lasted but a few days, the marks of its devastation were everywhere to be seen. The trees were stripped of their fruit; and all the houses in the neighbourhood had been pulled down or burnt.

Having employed two or three days in getting up all our spirit-casks to tar their heads, which we found necessary to save them from the efforts of a small insect to destroy them, we hauled the ship off into the stream on the 6th, in the morning, intending to put to sea the next day; but an accident happened that prevented it, and gave me a good deal of trouble. We had sent our goats ashore in the daytime to graze, with two men to look after them; notwithstanding which precaution, the natives had contrived to steal one of them this evening. The loss of this goat would have been of little consequence, if it had not interfered with my views of stocking other islands with these animals; but this being the case, it became necessary to recover it if possible. The next morning we got intelligence, that it had been carried to Maheine, the chief, who was at this time at Parowroah harbour. Two old men offered to conduct any of my people whom I might think proper to send to him, to bring back the goat. Accordingly, I despatched them in a boat, charged with a threatening message to Maheine, if the goat was not immediately given up to me, and also the thief.

It was only the day before, that this chief had requested me to give him two goats. But, as I could not spare them, unless at the expense of other islands that might never have another opportunity to get any, and had, besides, heard that there were already two upon this island, I did not gratify him. However, to show my inclination to assist his views in this respect, I desired Tidooa, an Otaheite chief who was present, to beg Otoo, in my name, to send two of these animals to Maheine; and, by way of insuring a compliance with this request, I sent to Otoo, by this chief, a large piece of red feathers, equal to the value of the two goats that I required. I expected that this arrangement would have been satisfactory to Maheine and all the other chiefs of the island; but the event showed that I was mistaken. Not thinking that any one would dare to steal a second, at the very time I was taking measures to recover the first, the goats were put ashore again this morning; and in

the evening a boat was sent to bring them on board. As our people were getting them into the boat, one was carried off undiscovered. It being immediately missed, I made no doubt of recovering it without much trouble, as there had not been time to carry it to any considerable distance. Ten or twelve of the natives set out soon after, different ways, to bring it back or to look for it; for not one of them would own that it was stolen, but all tried to persuade us that it had strayed into the woods; and, indeed, I thought so myself. I was convinced to the contrary, however, when I found that none of those who went in pursuit of it returned; so that their only view was to amuse me, till their prize was beyond my reach; and night coming on, put a stop to all further search. About this time the boat returned with the other goat, bringing also one of the men who had stolen it; the first instance of the kind that I had met with amongst these islands.

The next morning, I found that most of the inhabitants in the neighbourhood had moved off, carrying with them a corpse which lay on a *toopapao* opposite the ship; and that Maheine himself had retired to the most distant part of the island. It seemed now no longer doubtful, that a plan had been laid to steal what I had refused to give; and that, though they had restored one, they were resolved to keep the other, which was a she-goat and big with kid. I was equally fixed in my resolution that they should not keep it. I therefore applied to the two old men who had been instrumental in getting back the first. They told me that this had been carried to Watea, a district on the south side of the island, by Hamoa, the chief of that place; but that, if I would send anybody for it, it would be delivered up. They offered to conduct some of my people across the island; but on my learning from them that a boat might go and return the same day, I sent one, with two petty officers, Mr. Roberts and Mr. Shuttleworth; one to remain with the boat, in case she could not get to the place, while the other should go with the guides, and one or two of our people. Late in the evening the boat returned, and the officers informed me, that after proceeding as far in the boat as rocks and shoals would permit, Mr. Shuttleworth with two marines and one of the guides landed and travelled to Watea, to the house of Hamoa, where the people of the place amused them for some time, by telling them that the goat would soon be brought, and pretended they had sent for it. It, however, never came, and the approach of night obliged Mr. Shuttleworth to return to the boat without it.

I was now very sorry that I had proceeded so far, as I could not retreat with any tolerable credit, and without giving encouragement to the people of the other islands we had yet to visit, to rob us with impunity. I asked Omai and the two old men what methods I should next take; and they, without hesitation, advised me to go with a party of men into the country, and shoot every soul I should meet with. This bloody counsel I could not follow but I resolved to march a party of men across the island; and at daybreak the next morning, set out with thirty-five of my people, accompanied by one of the old men, by Omai, and three or four of his attendants. At the same time, I ordered Lieutenant Williamson with three armed boats round the western part of the island to meet us.

I had no sooner landed with my party, than the few natives who still remained in the neighbourhood fled before us. The first man that we met with upon our march ran some risk of his life; for Omai, the moment he saw him, asked me if he should shoot him; so fully was he persuaded that I was going to carry his advice into execution. I immediately ordered both him and our guide to make it known, that I did not intend to hurt, much less to kill, a single native. These glad tidings flew before us like lightning, and stopped the flight of the inhabitants; so that no one quitted his house or employment afterward. As we began to ascend the ridge of hills over which lay our road, we got intelligence that the goat had been carried that way before us; and, as we understood, could not as yet have passed the hills; so that we marched up in great silence, in hopes of surprising the party who were bearing off the prize. But when we had got to the uppermost plantation on the side of the ridge, the people there told us, that what we were in search of had, indeed, been kept there the first night, but had been carried the next morning to Watea by Hamoa. We then crossed the ridge without making any further inquiry, till we came within sight of Watea, where some people showed us Hamoa's house, and told us that the goat was there,

so that I made no doubt of getting it immediately upon my arrival. But when I reached the house, to my very great surprise, the few people we met with denied that they had ever seen it, or knew anything about it; even Hamoa himself came and made the same declaration.

On our first coming to the place, I observed several men running to and fro in the woods, with clubs and bundles of darts in their hands; and Omai, who followed them, had some stones thrown at him, so that it seemed as if they had intended to oppose any step I should take by force; but, on seeing my party was too strong, had dropped the design. I was confirmed in this notion, by observing that all their houses were empty. After getting a few of the people of the place together, I desired Omai to expostulate with them on the absurdity of the conduct they were pursuing; and to tell them that, from the testimony of many on whom I could depend, I was well assured that the goat was in their possession, and, therefore, insisted upon its being delivered up, otherwise I would burn their houses and canoes. But notwithstanding all that I or Omai could say, they continued to deny their having any knowledge of it. The consequence was, that I set fire to six or eight houses, which were presently consumed, with two or three war-canoes that lay contiguous to them. This done, I marched off to join the boats, which were about seven or eight miles from us; and, in our way, we burned six more war-canoes, without any one attempting to oppose us; on the contrary, many assisted, though, probably, more out of fear than good-will. In one place, Omai, who had advanced a little before, came back with information that a great many men were getting together to attack us. We made ready to receive them, but instead of enemies we found petitioners with plantain-trees in their hands, which they laid down at my feet, and begged that I would spare a canoe that lay close by, which I readily complied with.

At length, about four in the afternoon, we got to the boats, that were waiting at Whararade, the district belonging to Tiarataboone; but this chief, as well as all the principal people of the place, had fled to the hills; though I touched not a single thing that was their property, as they were the friends of Otoo. After resting ourselves here about an hour, we set out for the ships, where we arrived about eight o'clock in the evening. At that time, no account of the goat had been received; so that the operations of this day had not produced the desired effect.

Early next morning, I despatched one of Cai'ai's men to Maheine, with this peremptory message, that if he persisted in his refusal, I would not leave him a single canoe upon the island, and that he might expect a continuation of hostilities as long as the stolen animal remained in his possession. And, that the messenger might see that I was in earnest, before he left me I sent the carpenter to break up three or four canoes that lay ashore at the head of the harbour. The plank was carried on board, as materials for building a house for Omai, at the place where he intended to settle. I afterward went, properly accompanied, to the next harbour, where we broke up three or four more canoes, and burned an equal number; and then returned on board about seven in the evening. On my arrival I found that the goat had been brought back about half an hour before; and, on inquiry, it appeared that it had come from the very place where I had been told the day before, by the inhabitants, that they knew nothing of it. But in consequence of the message I sent to the chief in the morning, it was judged prudent to trifle with me no longer. Thus ended this troublesome and rather unfortunate business; which could not be more regretted on the part of the natives, than it was on mine. And it grieved me to reflect, that, after refusing the pressing solicitations of my friends at Otaheite, to favour their invasion of this island, I should so soon find myself reduced to the necessity of engaging in hostilities against its inhabitants, which, perhaps, did them more mischief than they had suffered from Towha's expedition.

The next morning our intercourse with the natives was renewed; and several canoes brought to the ships bread-fruit and cocoa-nuts to barter; from whence it was natural for me to draw this conclusion, that they were conscious it was their own fault if I had treated them with severity; and that the cause of my displeasure being removed, they had a full confidence that no further mischief would ensue. About nine o'clock we weighed, with a

breeze down the harbour; but it proved so faint and variable, that it was noon before we got out to sea, when I steered for Huahine, attended by Omai in his canoe. He did not depend entirely upon his own judgment, but had got on board a pilot. I observed, that they shaped as direct a course for the island as I could do. At Eimeo we abundantly supplied the ships with fire-wood. We had not taken in any at Otaheite, where the procuring this article would have been very inconvenient; there not being a tree at Matavai but what is useful to the inhabitants. We also got here good store of refreshments, both in hogs and vegetables; that is, bread-fruit and cocoa-nuts; little else being in season. I do not know that there is any difference between the produce of this island and of Otaheite; but there is a very striking difference in their women, that I can by no means account for. Those of Eimeo are of low stature, have a dark hue, and, in general, forbidding features. If we met with a fine woman amongst them, we were sure, upon inquiry, to find that she had come from some other island.

The general appearance of Eimeo is very different from that of Otaheite. The latter rising in one steep hilly body, has little low land, except some deep valleys; and the flat border that surrounds the greatest part of it, toward the sea. Eimeo, on the contrary, has hills running in different directions, which are very steep and rugged, leaving in the interspaces very large valleys, and gently-rising grounds about their sides. These hills, though of a rocky disposition, are in general covered almost to their tops with trees; but the lower parts, on the sides, frequently only with fern. At the bottom of the harbour where we lay, the ground rises gently to the foot of the hills which run across nearly in the middle of the island; but its flat border, on each side, at a very small distance from the sea, becomes quite steep. This gives it a romantic cast, which renders it a prospect superior to anything we saw at Otaheite. The soil, about the low grounds, is a yellowish and pretty stiff mould; but, upon the lower hills, it is blacker and more loose; and the stone that composes the hills is, when broken, of a bluish colour, but not very compact texture, with some particles of *glimmer* interspersed. These particulars seem worthy of observation. Perhaps the reader will think differently of my judgment, when I add, that, near the station of our ships, were two large stones, or rather rocks, concerning which the natives have some superstitious notions. They consider them as *Eatooas*, or divinities; saying that they are brother and sister, and that they came, by some supernatural means, from Ulitea.

CHAPTER VI.—ARRIVAL AT HUAHEINE.—COUNCIL OF THE CHIEFS.—OMAI'S OFFERINGS, AND SPEECH TO THE CHIEFS.—HIS ESTABLISHMENT IN THIS ISLAND AGREED TO.—A HOUSE BUILT AND GARDEN PLANTED FOR HIM.—SINGULARITY OF HIS SITUATION.—MEASURES TAKEN TO INSURE HIS SAFETY.—DAMAGE DONE BY COCKROACHES ON BOARD THE SHIPS.—A THIEF DETECTED AND PUNISHED.—FIRE-WORKS EXHIBITED.—ANIMALS LEFT WITH OMAI.—HIS FAMILY.—WEAPONS.—INSCRIPTIONS ON HIS HOUSE.—HIS BEHAVIOUR ON THE SHIP'S LEAVING THE ISLAND.—SUMMARY VIEW OF HIS CONDUCT AND CHARACTER.—ACCOUNT OF THE TWO NEW ZEALAND YOUTHS.

HAVING left Eimeo, with a gentle breeze and fine weather, at daybreak the next morning we saw Huahine, extending from south-west by west, half west, to west by north. At noon we anchored at the north entrance of Owharre harbour, which is on the west side of the island. The whole afternoon was spent in warping the ships into a proper berth, and mooring. Omai entered the harbour just before us, in his canoe, but did not land. Nor did he take much notice of any of his countrymen, though many crowded to see him; but far more of them came off to the ships, insomuch that we could hardly work on account of their numbers. Our passengers presently acquainted them with what we had done at Eimeo, and multiplied the number of houses and canoes that we had destroyed, by ten at least. I was not sorry for this exaggerated account; as I saw that it made a great impression upon all who heard it; so that I had hopes it would induce the inhabitants of this island to behave better to us than they had done during my former visits. While I was at Otaheite, I had learned that my old friend Oree was no longer the chief of Huahine; and that, at

heine; and that, at

this time, he resided at Ulietea. Indeed, he never had been more than regent during the minority of Taireetareea, the present *Earee rahie*; but he did not give up the regency till he was forced. His two sons, Opoony and Towha, were the first who paid me a visit, coming on board before the ship was well in the harbour, and bringing a present with them.

Our arrival brought all the principal people of the island to our ships on the next morning, being the 13th. This was just what I wished, as it was high time to think of settling Omai; and the presence of these chiefs, I guessed, would enable me to do it in the most satisfactory manner. He now seemed to have an inclination to establish himself at Ulietea; and if he and I could have agreed about the mode of bringing that plan to bear, I should have had no objection to adopt it. His father had been dispossessed by the men of Bolabola, when they conquered Ulietea, of some land in that island; and I made no doubt of being able to get it restored to the son in an amicable manner. For that purpose it was necessary that he should be upon good terms with those who now were masters of the island; but he was too great a patriot to listen to any such thing, and was vain enough to suppose that I would reinstate him in his forfeited lands by force. This made it impossible to fix him at Ulietea, and pointed out to me Huahine as the proper place. I therefore resolved to avail myself of the presence of the chief men of the island, and to make this proposal to them.

After the hurry of the morning was over, we got ready to pay a formal visit to Taireetareea, meaning then to introduce his business. Omai dressed himself very properly on the occasion, and prepared a handsome present for the chief himself, and another for his *Eatooa*. Indeed, after he had got clear of the gang that surrounded him at Otaheite, he behaved with such prudence as to gain respect. Our landing drew most of our visitors from the ships; and they, as well as those that were on shore, assembled in a large house. The concourse of people, on this occasion, was very great; and amongst them, there appeared to be a greater proportion of personable men and women than we had ever seen in one assembly at any of these new islands. Not only the bulk of the people seemed in general much stouter and fairer than those of Otaheite, but there was also a much greater number of men who appeared to be of consequence, in proportion to the extent of the island; most of whom had exactly the corpulent appearance of the chiefs of Wateco. We waited some time for Taireetareea, as I would do nothing till the *Earee rahie* came; but when he appeared, I found that his presence might have been dispensed with, as he was not above eight or ten years of age. Omai, who stood at a little distance from this circle of great men, began with making his offering to the gods, consisting of red feathers, cloth, &c. Then followed another offering, which was to be given to the gods by the chief; and, after that, several other small pieces and tufts of red feathers were presented. Each article was laid before one of the company, who, I understood, was a priest, and was delivered with a set speech or prayer, spoken by one of Omai's friends, who sat by him, but mostly dictated by himself. In these prayers, he did not forget his friends in England, nor those who had brought him safe back. The *Earee rahie* no Pretane, Lord Sandwich, *Toote, Tatee**, were mentioned in every one of them. When Omai's offerings and prayers were finished, the priest took each article, in the same order in which it had been laid before him, and after repeating a prayer, sent it to the *morai*; which, as Omai told us, was at a great distance, otherwise the offerings would have been made there.

These religious ceremonies having been performed, Omai sat down by me, and we entered upon business, by giving the young chief my present, and receiving his in return; and, all things considered, they were liberal enough on both sides. Some arrangements were next agreed upon, as to the manner of carrying on the intercourse betwixt us; and I pointed out the mischievous consequences that would attend their robbing us, as they had done during my former visits. Omai's establishment was then proposed to the assembled chiefs.

He acquainted them, "That he had been carried by us into our country, where he was well received by the great king and his *Earees*, and treated with every mark of regard and affection, while he staid amongst us; that he had been brought back again, enriched by our liberality with a variety of articles, which would prove very useful to his countrymen; and

* Cook and Clerke.

that, besides the two horses which were to remain with him, several other new and valuable animals had been left at Otaheite, which would soon multiply, and furnish a sufficient number for the use of all the islands in the neighbourhood. He then signified to them, that it was my earnest request, in return for all my friendly offices, that they would give him a piece of land, to build a house upon, and to raise provisions for himself and servants; adding, that, if this could not be obtained for him at Huaheine, either by gift or by purchase, I was determined to carry him to Ulietea*, and fix him there."

Perhaps I have here made a better speech for my friend than he actually delivered; but these were the topics I dictated to him. I observed, that what he concluded with, about carrying him to Ulietea, seemed to meet with the approbation of all the chiefs; and I instantly saw the reason. Omai had, as I have already mentioned, vainly flattered himself, that I meant to use force in restoring him to his father's lands in Ulietea, and he had talked idly, and without any authority from me, on this subject, to some of the present assembly; who dreamed of nothing less than a hostile invasion of Ulietea, and of being assisted by me to drive the Bolabola men out of that island. It was of consequence, therefore, that I should undeceive them; and in order to this, I signified, in the most peremptory manner, that I neither would assist them in such an enterprise, nor suffer it to be put in execution, while I was in their seas; and that, if Omai fixed himself in Ulietea, he must be introduced as a friend, and not forced upon the Bolabola men as their conqueror.

This declaration gave a new turn to the sentiments of the council. One of the chiefs immediately expressed himself to this effect: "That the whole island of Huaheine, and everything in it, were mine; and that, therefore, I might give what portion of it I pleased to my friend." Omai, who, like the rest of his countrymen, seldom sees things beyond the present moment, was greatly pleased to hear this; thinking, no doubt, that I should be very liberal, and give him enough. But to offer what it would have been improper to accept, I considered as offering nothing at all; and, therefore, I now desired, that they would not only assign the particular spot, but also the exact quantity of land which they would allot for the settlement. Upon this, some chiefs, who had already left the assembly, were sent for, and after a short consultation among themselves, my request was granted, by general consent, and the ground immediately pitched upon, adjoining to the house where our meeting was held. The extent, along the shore of the harbour, was about two hundred yards, and its depth, to the foot of the hill, somewhat more; but a proportional part of the hill was included in the grant.

This business being settled to the satisfaction of all parties, I set up a tent ashore, established a post, and erected the observatories. The carpenters of both ships were also set to work, to build a small house for Omai, in which he might secure the European commodities that were his property. At the same time, some hands were employed in making a garden for his use; planting shaddecks, vines, pine-apples, melons, and the seeds of several other vegetable articles, all of which I had the satisfaction of observing to be in a flourishing state before I left the island. Omai now began seriously to attend to his own affairs, and repented heartily of his ill-judged prodigality while at Otaheite. He found at Huaheine, a brother, a sister, and a brother-in-law, the sister being married. But these did not plunder him, as he had lately been by his other relations. I was sorry, however, to discover, that though they were too honest to do him any injury, they were of too little consequence in the island to do him any positive good. They had neither authority nor influence to protect his person or his property; and in that helpless situation, I had reason to apprehend that he ran great risk of being stripped of everything he had got from us, as soon as he should cease to have us within his reach, to enforce the good behaviour of his countrymen, by an immediate appeal to our irresistible power.

A man who is richer than his neighbours is sure to be envied by numbers, who wish to see him brought down to their own level. But in countries where civilisation, law, and religion impose their restraints, the rich have a reasonable ground of security. And, besides,

* Now known as Ioretea or Raiatea. The difference in sound seems to arise from the same indistinctness of pronunciation which led Captain Cook to write "Bolabola" for "Borabora," and, as will be seen in a subsequent page, to call the god, called Orua by Mr. Anderson, and Oro by the Missionaries, Olla. — *Et*,

WAR DANCE OF FEEJEE ISLANDERS.

there being in all such communities a diffusion of property, no single individual need fear that the efforts of all the poorer sort can ever be united to injure him, exclusively of others who are equally the objects of envy. It was very different with Omai. He was to live amongst those who are strangers, in a great measure, to any other principle of action, besides the immediate impulse of their natural feelings. But what was his principal danger? He was to be placed in the very singular situation of being the only rich man in the community to which he was to belong; and having, by a fortunate connexion with us, got into his possession an accumulated quantity of a species of treasure which none of his countrymen could create, by any art or industry of their own,—while all coveted a share of this envied wealth, it was natural to apprehend, that all would be ready to join in attempting to strip its sole proprietor. To prevent this, if possible, I desired him to make a proper distribution of some of his moveables to two or three of the principal chiefs, who being thus gratified themselves, might be induced to take him under their patronage, and protect him from the injuries of others. He promised to follow my advice, and I heard, with satisfaction, before I sailed, that this very prudent step had been taken. Not trusting, however, entirely to the operation of gratitude, I had recourse to the more forcible motive of intimidation. With this view, I took every opportunity of notifying to the inhabitants, that it was my intention to return to their island again, after being absent the usual time; and that if I did not find Omai in the same state of security in which I was now to leave him, all those whom I should then discover to have been his enemies, might expect to feel the weight of my resentment. This threatening declaration will probably have no inconsiderable effect, for our successive visits of late years have taught these people to believe that our ships are to return at certain periods; and while they continue to be impressed with such a notion, which I thought it a fair stratagem to confirm, Omai has some prospect of being permitted to thrive upon his new plantation.

While we lay in this harbour, we carried ashore the bread remaining in the bread-room, to clear it of vermin. The number of cockroaches that infested the ship at this time is incredible; the damage they did us was very considerable, and every method devised by us to destroy them proved ineffectual. These animals, which at first were a nuisance, like all other insects, had now become a real pest, and so destructive that few things were free from their ravages; if food of any kind was exposed only for a few minutes, it was covered with them, and they soon pierced it full of holes resembling a honeycomb. They were particularly destructive to birds, which had been stuffed and preserved as curiosities, and, what was worse, were uncommonly fond of ink; so that the writing on the labels, fastened to different articles, was quite eaten out; and the only thing that preserved books from them was the closeness of the binding, which prevented these devourers getting between the leaves. According to Mr. Anderson's observations, they were of two sorts, the *Blatta orientalis* and *germanica*. The first of these had been carried home in the ship from her former voyage, where they withstood the severity of the hard winter in 1776, though she was in dock all the time. The others had only made their appearance since our leaving New Zealand, but had increased so fast, that they now not only did all the mischief mentioned above, but had even got amongst the rigging, so that when a sail was loosened, thousands of them fell upon the decks. The *orientales*, though in infinite numbers, scarcely came out but in the night, when they made everything in the cabins seem as if in motion, from the particular noise in crawling about; and, besides their disagreeable appearance, they did great mischief to our bread, which was so bespattered with their excrement, that it would have been badly relished by delicate feeders.

The intercourse of trade and friendly offices was carried on between us and the natives without being disturbed by any one accident, till the evening of the 22d, when a man found means to get into Mr. Bayly's observatory, and to carry off a sextant, unobserved. As soon as I was made acquainted with the theft, I went ashore, and got Omai to apply to the chiefs, to procure restitution. He did so, but they took no steps toward it, being more attentive to a *hwea* that was then acting, till I ordered the performers of the exhibition to desist. They were now convinced that I was in earnest, and began to make some inquiry after the thief, who was sitting in the midst of them quite unconcerned, inasmuch that I was in great doubt

of his being the guilty person, especially as he denied it. Omai, however, assuring me that he was the man, I sent him on board the ship, and there confined him. This raised a general ferment amongst the assembled natives, and the whole body fled, in spite of all my endeavours to stop them. Having employed Omai to examine the prisoner, with some difficulty he was brought to confess where he had laid the sextant; but, as it was now dark, he could not find it till daylight the next morning, when it was brought back unhurt. After this, the natives recovered from their fright, and began to gather about us as usual; and as to the thief, he appearing to be a hardened scoundrel, I punished him more severely than I had done any culprit before. Besides having his head and beard shaved, I ordered both his ears to be cut off, and then dismissed him.

This, however, did not deter him from giving us farther trouble; for, in the night between the 24th and 25th, a general alarm was spread, occasioned, as was said, by one of our goats being stolen by this very man; on examination, we found that all was safe in that quarter. Probably, the goats were so well guarded, that he could not put his design in execution. But his hostilities had succeeded against another object, and it appeared that he had destroyed and carried off several vines and cabbage-plants in Omai's grounds; and he publicly threatened to kill him, and to burn his house, as soon as we should leave the island. To prevent the fellow's doing me and Omai any more mischief, I had him seized and confined on board the ship, with a view of carrying him off the island; and it seemed to give general satisfaction to the chiefs that I meant thus to dispose of him. He was from Bolabola; but there were too many of the natives here ready to assist him in any of his designs, whenever he should think of executing them. I had always met with more troublesome people in Hualaheine than in any other of the neighbouring islands; and it was only fear and the want of opportunities that induced them to behave better now. Anarchy seemed to prevail amongst them; their nominal sovereign, the *Earee rahie*, as I have before observed, was but a child, and I did not find that there was any one man, or set of men, who managed the government for him; so that, whenever any misunderstanding happened between us, I never knew, with sufficient precision, where to make application, in order to bring about an accommodation, or to procure redress. The young chief's mother would, indeed, sometimes exert herself; but I did not perceive that she had greater authority than many others.

Omai's house being nearly finished, many of his moveables were carried ashore on the 26th. Amongst a variety of other useless articles was a box of toys, which, when exposed to public view, seemed greatly to please the gazing multitude; but as to his pots, kettles, dishes, plates, drinking-mugs, glasses, and the whole train of our domestic accommodations, hardly any one of his countrymen would so much as look at them. Omai himself now began to think that they were of no manner of use to him,—that a baked hog was more savoury food than a boiled one,—that a plantain-leaf made as good a dish or plate as pewter,—and that a cocoa-nut shell was as convenient a goblet as a black-jack; and, therefore, he very wisely disposed of as many of these articles of English furniture for the kitchen and pantry, as he could find purchasers for, amongst the people of the ships, receiving from them, in return, hatchets, and other iron tools, which had a more intrinsic value in this part of the world, and added more to his distinguishing superiority over those with whom he was to pass the remainder of his days. In the long list of the presents bestowed upon him in England, fire-works had not been forgot. Some of these we exhibited in the evening of the 28th, before a great concourse of people, who beheld them with a mixture of pleasure and fear; what remained after the evening's entertainment, were put in order and left with Omai, agreeably to their original destination. Perhaps we need not lament it as a serious misfortune, that the far greater share of this part of his cargo had been already expended in exhibitions at other islands, or rendered useless by being kept so long.

Between midnight and four in the morning of the 30th, the Bolabola man, whom I had in confinement, found means to make his escape out of the ship. He carried with him the shackle of the bilboe bolt that was about his leg, which was taken from him as soon as he got on shore, by one of the chiefs, and given to Omai, who came on board very early in the morning, to acquaint me that his mortal enemy was again let loose upon him. Upon inquiry, it appeared that not only the sentry placed over the prisoner, but the whole watch upon the

quarter-deck where he was confined, had laid themselves down to sleep. He seized the opportunity to take the key of the irons out of the binnacle drawer, where he had seen it put, and set himself at liberty. This escape convinced me that my people had been very remiss in their night duty, which made it necessary to punish those who were now in fault, and to establish some new regulations to prevent the like negligence for the future. I was not a little pleased to hear afterward, that the fellow who escaped had transported himself to Ulitea; in this, seconding my views of putting him a second time in irons.

As soon as Omai was settled in his new habitation, I began to think of leaving the island, and got everything off from the shore this evening except the horse and mare, and a goat big with kid, which were left in the possession of our friend, with whom we were now finally to part. I also gave him a boar and two sows of the English breed, and he had got a sow or two of his own. The horse covered the mare while we were at Otaheite, so that I consider the introduction of a breed of horses into these islands as likely to have succeeded by this valuable present.

The history of Omai will, perhaps, interest a very numerous class of readers, more than any other occurrence of a voyage, the objects of which do not, in general, promise much entertainment. Every circumstance, therefore, which may serve to convey a satisfactory account of the exact situation in which he was left, will be thought worth preserving; and the following particulars are added, to complete the view of his domestic establishment. He had picked up at Otaheite four or five *Toutous*; the two New Zealand youths remained with him, and his brother and some others joined him at Huahine, so that his family consisted already of eight or ten persons, if that can be called a family to which not a single female as yet belonged, nor, I doubt, was likely to belong, unless its master became less volatile; at present, Omai did not seem at all disposed to take unto himself a wife. The house which we erected for him was twenty-four feet by eighteen, and ten feet high. It was composed of boards, the spoils of our military operations at Eimeo; and, in building it, as few nails as possible were used, that there might be no inducement, from the love of iron, to pull it down. It was settled that, immediately after our departure, he should begin to build a large house after the fashion of his country, one end of which was to be brought over that which we had erected so as to enclose it entirely for greater security. In this work, some of the chiefs promised to assist him; and if the intended building should cover the ground which he marked out, it will be as large as most upon the island*.

His European weapons consisted of a musket, bayonet, and cartouch-box; a fowling-piece, two pairs of pistols, and two or three swords or cutlasses. The possession of these made him quite happy, which was my only view in giving him such presents; for I was always of opinion that he would have been happier without fire-arms, and other European weapons, than with them; as such implements of war, in the hands of one whose prudent use of them I had some grounds for mistrusting, would rather increase his dangers than establish his superiority. After he had got on shore everything that belonged to him, and was settled in his house, he had most of the officers of both ships, two or three times, to dinner; and his table was always well supplied with the very best provisions that the island produced. Before I sailed, I had the following inscription cut upon the outside of his house:—

GEORGIUS TERTIUS, REG, 2 NOVEMBRIS, 1777.

NAVES { RESOLUTION, JAC. COOK, PR.
DISCOVERY, CAN. CLERKE, PR.

* Some account of the subsequent career of Omai is given at page 5 of this volume. In addition to what is there stated, Mr. Ellis informs us that "within the limits of the grant made to Captain Cooke for his friend Mai, some of the missionaries who in 1809 took shelter at Huahine, after their expulsion from Otaheite in 1808, erected their temporary habitations. A few yards distant from the spot in which Mai's house stood, and immediately in front of the dark and glossy-leaved shaddock here planted by Captain Cook, the first building for the worship of Jehovah was erected; and on the same spot the first school in Huahine was opened, in which the use of letters and the principles of religion were inculcated.

Nearly in front of the site of Mai's dwelling now stands the residence of Pohuetua and Teraimano, to whom, by right of patrimony, Beritani [the name given by Omai to his estate], belongs. It was, when I was last there, in 1824, one of the most neat, substantial, and convenient modern houses in the settlement, containing two stories and eight apartments. The district around, which when we arrived was altogether uncultivated, and overrun with brushwood growing in wild luxuriance, has been cleared; the garden has been again enclosed, and planted with many useful vegetable productions of the tropical regions. It is cultivated by two proprietors, who, there is reason to hope, are decided Christians."—ED

On the 2d of November, at four in the afternoon, I took the advantage of a breeze which then sprung up at east, and sailed out of the harbour. Most of our friends remained on board till the ships were under sail, when, to gratify their curiosity, I ordered five guns to be fired. They then all took their leave, except Omai, who remained till we were at sea. We had come to sail by a hawser fastened to the shore. In casting the ship it parted, being cut by the rocks, and the outer end was left behind, as those who cast it off did not perceive that it was broken; so that it became necessary to send a boat to bring it on board. In this boat Omai went ashore, after taking a very affectionate farewell of all the officers. He sustained himself with a manly resolution till he came to me. Then his utmost efforts to conceal his tears failed; and Mr. King, who went in the boat, told me that he wept all the time in going ashore.

It was no small satisfaction to reflect that we had brought him safe back to the very spot from which he was taken. And yet, such is the strange nature of human affairs, that it is probable we left him in a less desirable situation than he was in before his connexion with us. I do not by this mean, that because he has tasted the sweets of civilised life, he must become more miserable from being obliged to abandon all thoughts of continuing them. I confine myself to this single disagreeable circumstance, that the advantages he received from us have placed him in a more hazardous situation with respect to his personal safety. Omai, from being much caressed in England, lost sight of his original condition, and never considered in what manner his acquisitions, either of knowledge or of riches, would be estimated by his countrymen at his return; which were the only things he could have to recommend him to them now more than before, and on which he could build either his future greatness or happiness. He seemed even to have mistaken their genius in this respect, and, in some measure, to have forgotten their customs, otherwise he must have known the extreme difficulty there would be in getting himself admitted as a person of rank, where there is, perhaps, no instance of a man's being raised from an inferior station by the greatest merit. Rank seems to be the very foundation of all distinction here, and, of its attendant, power; and so pertinaciously, or rather blindly adhered to, that, unless a person has some degree of it, he will certainly be despised and hated if he assumes the appearance of exercising any authority. This was really the case, in some measure, with Omai; though his countrymen were pretty cautious of expressing their sentiments while we remained among them. Had he made a proper use of the presents he brought with him from England, this, with the knowledge he had acquired by travelling so far, might have enabled him to form the most useful connexions; but we have given too many instances, in the course of our narrative, of his childish inattention to this obvious means of advancing his interest. His schemes seemed to be of a higher, though ridiculous nature; indeed, I might say meaner, for revenge, rather than a desire of becoming great, appeared to actuate him from the beginning. This, however, may be excused, if we consider that it is common to his countrymen. His father was, doubtless, a man of considerable property in Ulitea, when that island was conquered by those of Bolabola, and, with many others sought refuge in Huahine, where he died, and left Omai with some other children, who by that means became totally dependent. In this situation he was taken up by Captain Furneaux, and carried to England. Whether he really expected, from his treatment there, that any assistance would be given him against the enemies of his father and his country, or whether he imagined that his own personal courage and superiority of knowledge would be sufficient to dispossess the conquerors of Ulitea, is uncertain; but, from the beginning of the voyage, this was his constant theme. He would not listen to our remonstrances on so wild a determination, but flew into a passion if more moderate and reasonable counsels were proposed for his advantage. Nay, so infatuated and attached to his favourite scheme was he, that he affected to believe these people would certainly quit the conquered island as soon as they should hear of his arrival at Otaheite. As we advanced, however, on our voyage, he became more sensible of his error; and, by the time we reached the Friendly Islands, had even such apprehensions of his reception at home, that, as I have mentioned in my journal, he would fain have staid behind at Tongataboo, under Fenou's protection. At these islands he squandered away much of his European treasure very unnecessarily; and he was equally imprudent, as I also took notice of above, at Tiaraboo,

where he could have no view of making friends, as he had not any intention of remaining there. At Mataiva he continued the same moderate behaviour, till I absolutely put a stop to his profusion; and he formed such inconnexions there, that Otoo, who was at first much disposed to countenance him, afterwards openly expressed his dislike of him, on account of his conduct. It was not, however, too late to recover his favour; and he might have settled to great advantage in Otaheite, as he had formerly lived several years there, and was now a good deal noticed by Towha, whose valuable present of a very large double canoe we have seen above. The objection to admitting him to some rank would have also been much lessened if he had fixed at Otaheite, as a native will always find it more difficult to accomplish such a change of state amongst his countrymen than a stranger, who naturally claims respect. But Omai remained undetermined to the last, and would not, I believe, have adopted my plan of settlement in Huabeine, if I had not so explicitly refused to employ force in restoring him to his father's possessions. Whether the remains of his European wealth, which, after all his improvident waste, was still considerable, will be more prudently administered by him, or whether the steps I took, as already explained, to insure him protection in Huabeine shall have proved effectual, must be left to the decision of future navigators of this ocean, with whom it cannot but be a principal object of curiosity to trace the future fortunes of our traveller. At present, I can only conjecture that his greatest danger will arise from the very impolitic declarations of his antipathy to the inhabitants of Bolabola; for these people, from a principle of jealousy, will, no doubt, endeavour to render him obnoxious to those of Huabeine; as they are at peace with that island at present, and may easily effect their designs, many of them living there. This is a circumstance which, of all others, he might the most easily have avoided; for they were not only free from any aversion to him, but the person mentioned before, whom we found at Tiaraboo as an ambassador, priest, or god, absolutely offered to reinstate him in the property that was formerly his father's. But he refused this peremptorily; and, to the very last, continued determined to take the first opportunity that offered of satisfying his revenge in battle. To this, I guess, he is not a little spurred by the coat of mail he brought from England; clothed in which, and in possession of some fire-arms, he fancies that he shall be invincible.

Whatever faults belonged to Omai's character, they were more than overbalanced by his great good nature and docile disposition. During the whole time he was with me, I very seldom had reason to be seriously displeased with his general conduct. His grateful heart always retained the highest sense of the favours he had received in England; nor will he ever forget those who honoured him with their protection and friendship during his stay there. He had a tolerable share of understanding, but wanted application and perseverance to exert it; so that his knowledge of things was very general, and, in many instances, imperfect. He was not a man of much observation. There were many useful arts, as well as elegant amusements, amongst the people of the Friendly Islands, which he might have conveyed to his own, where they probably would have been readily adopted, as being so much in their own way. But I never found that he used

the least endeavour to make himself master of any one. This kind of indifference is, indeed,

OMAI.

the characteristic foible of his nation. Europeans have visited them, at times, for these ten years past; yet we could not discover the slightest trace of any attempt to profit by this intercourse; nor have they hitherto copied after us in any one thing. We are not, therefore, to expect that Omai will be able to introduce many of our arts and customs among them, or much improve those to which they have been long habituated. I am confident, however, that he will endeavour to bring to perfection the various fruits and vegetables we planted, which will be no small acquisition. But the greatest benefit these islands are likely to receive from Omai's travels will be in the animals that have been left upon them, which, probably, they never would have got had he not come to England. When these multiply, of which I think there is little doubt, Otaheite and the Society Islands will equal, if not exceed, any place in the known world for provisions.

Omai's return, and the substantial proofs he brought back with him of our liberality, encouraged many to offer themselves as volunteers to attend me to *Pretane*. I took every opportunity of expressing my determination to reject all such applications. But, notwithstanding this, Omai, who was very ambitious of remaining the only great traveller, being afraid lest I might be prevailed upon to put others in a situation of rivalling him, frequently put me in mind, that Lord Sandwich had told him no others of his countrymen were to come to England.

If there had been the most distant probability of any ship being again sent to New Zealand, I would have brought the two youths of that country home with me, as both of them were very desirous of continuing with us. Tiarooa, the eldest, was an exceedingly well-disposed young man, with strong natural sense, and capable of receiving any instruction. He seemed to be fully sensible of the inferiority of his own country to these islands, and resigned himself, though perhaps with reluctance, to end his days in ease and plenty in Huaheine. But the other was so strongly attached to us, that he was taken out of the ship and carried ashore by force. He was a witty, smart boy; and on that account much noticed on board.

CHAPTER VII.—ARRIVAL AT ULIETEA.—ASTRONOMICAL OBSERVATIONS.—A MARINE DESERTS, AND IS DELIVERED UP.—INTELLIGENCE FROM OMAI.—INSTRUCTIONS TO CAPTAIN CLERKE.—ANOTHER DESERTION, OF A MIDSHIPMAN AND A SEAMAN.—THREE OF THE CHIEF PERSONS OF THE ISLAND CONFINED ON THAT ACCOUNT.—A DESIGN TO SEIZE CAPTAINS COOK AND CLERKE DISCOVERED.—THE TWO DESERTERS BROUGHT BACK, AND THE PRISONERS RELEASED.—THE SHIPS SAIL.—REFRESHMENTS RECEIVED AT ULIETEA.—PRESENT AND FORMER STATE OF THAT ISLAND.—ACCOUNT OF ITS DETHRONED KING, AND OF THE LATE REGENT OF HUAHEINE.

THE boat which carried Omai ashore never to join us again, having returned to the ship with the remainder of the hawser, we hoisted her in, and immediately stood over for Ulietea, where I intended to touch next. At ten o'clock at night we brought to till four the next morning, when we made sail round the south end of the island for the harbour of Ohamaneno. We met with calms and light airs of wind from different directions, by turns, so that at noon we were still a league from the entrance of the harbour. While we were thus detained, my old friend Oreo, chief of the island, with his son, and Pootoe his son-in-law, came off to visit us. Being resolved to push for the harbour, I ordered all the boats to be hoisted out, and sent them ahead to tow, being assisted by a slight breeze from the southward. This breeze failed too soon, and being succeeded by one from the east, which blew right out of the harbour we were obliged to come to an anchor at its entrance, at two o'clock, and to warp in, which employed us till night set in. As soon as we were within the harbour, the ships were surrounded with canoes filled with people, who brought hogs and fruit to barter with us for our commodities; so that, wherever we went, we found plenty.

Next morning, being the 4th, I moored the ship, head and stern, close to the north shore, at the head of the harbour; hauled up the cables on deck; and opened one of the ballast-ports. From this a slight stage was made to the land, being at the distance of about twenty

feet, with a view to get clear of some of the rats that continued to infest us. The *Discovery* moored alongside the south shore for the same purpose. While this work was going forward, I returned Oro's visit. The present I made him, on the occasion, consisted of a linen gown, a shirt, a red-feathered cap from Tongataboo, and other things of less value. I then brought him, and some of his friends, on board to dinner.

On the 6th, we set up the observatories, and got the necessary instruments on shore. The two following days, we observed the sun's azimuths, both on board and ashore, with all the compasses, in order to find the variation; and in the night of the latter, we observed an occultation of ϵ *Capricorni*, by the moon's dark limb. Mr. Bayly and I agreed in fixing the time of its happening at six minutes and fifty-four seconds and a half past ten o'clock. Mr. King made it half a second sooner. Mr. Bayly observed with the achromatic telescope belonging to the Board of Longitude; Mr. King, with the reflector belonging to the board; and I made use of my own reflector, of eighteen inches. There was also an immersion of π *Capricorni* behind the moon's dark limb, some time before; but it was observed by Mr. Bayly alone. I attempted to trace it, with a small achromatic; but found its magnifying power not sufficient.

Nothing worthy of note happened, till the night between the 12th and 13th, when John Harrison, a marine, who was sentinel at the observatory, deserted; carrying with him his musket and accoutrements. Having in the morning got intelligence which way he had moved off, a party was sent after him; but they returned in the evening, after an ineffectual inquiry and search. The next day, I applied to the chief to interest himself in this matter. He promised to send a party of his men after him, and gave me hopes that he should be brought back the same day. But this did not happen; and I had reason to suspect that no steps had been taken by him. We had, at this time, a great number of the natives about the ships, and some thefts were committed; the consequence of which being dreaded by them, very few visitors came near us the next morning. The chief himself joined in the alarm, and he and his whole family fled. I thought this a good opportunity to oblige them to deliver up the deserter; and having got intelligence that he was at a place called Hamoa, on the other side of the island, I went thither with two armed boats, accompanied by one of the natives; and, in our way, we found the chief, who also embarked with me. I landed about a mile and a half from the place, with a few people, and marched quickly up to it, lest the sight of the boats should give the alarm, and allow the man time to escape to the mountains. But this precaution was unnecessary; for the natives there had got information of my coming, and were prepared to deliver him up. I found Harrison, with the musket lying before him, sitting down between two women, who, the moment that I entered the house, rose up to plead in his behalf. As it was highly proper to discourage such proceedings, I frowned upon them, and bid them be gone. Upon this they burst into tears, and walked off. Paha, the chief of the district, now came with a plantain tree, and a sucking pig, which he would have presented to me, as a peace-offering. I rejected it, and ordered him out of my sight; and having embarked with the deserter on board the first boat that arrived, returned to the ships. After this, harmony was again restored. The fellow had nothing to say in his defence, but that the natives had enticed him away; and this might in part be true, as it was certain that Paha, and also the two women above mentioned, had been at the ship the day before he deserted. As it appeared that he had remained upon his post till within a few minutes of the time when he was to have been relieved, the punishment that I inflicted upon him was not very severe.

Though we had separated from Omai, we were still near enough to have intelligence of his proceeding; and I had desired to hear from him. Accordingly, about a fortnight after our arrival at Ulitea, he sent two of his people in a canoe; who brought me the satisfactory intelligence, that he remained undisturbed by the people of the island, and that everything went well with him, except that his goat had died in kidding. He accompanied this intelligence with a request, that I would send him another goat, and two axes. Being happy to have this additional opportunity of serving him, the messengers were sent back to Huahine, on the 18th, with the axes, and two kids, male and female, which were spared for him out of the *Discovery*.

The next day, I delivered to Captain Clerke instructions how to proceed, in case of being separated from me, after leaving these islands; and it may not be improper to give them a place here.

“BY CAPTAIN JAMES COOK,

COMMANDER OF HIS MAJESTY'S SLOOP THE RESOLUTION.

“Whereas the passage from the Society Islands to the northern coast of America is of considerable length, both in distance and in time, and as a part of it must be performed in the very depth of winter, when gales of wind and bad weather must be expected, and may, possibly, occasion a separation, you are to take all imaginable care to prevent this. But if, notwithstanding all our endeavours to keep company, you should be separated from me, you are first to look for me where you last saw me. Not seeing me in five days, you are to proceed (as directed by the Instructions of their Lordships, a copy of which you have already received) for the coast of New Albion; endeavouring to fall in with it in the latitude of 45° . In that latitude, and at a convenient distance from the land, you are to cruise for me ten days. Not seeing me in that time, you are to put into the first convenient port, in or to the north of that latitude, to recruit your wood and water, and to procure refreshments.

“During your stay in port, you are constantly to keep a good look-out for me. It will be necessary, therefore, to make choice of a station situated as near the sea-coast as is possible, the better to enable you to see me when I shall appear in the offing. If I do not join you before the 1st of next April, you are to put to sea, and proceed northward to the latitude 56° ; in which latitude, and at a convenient distance from the coast, never exceeding fifteen leagues, you are to cruise for me till the 10th of May.

“Not seeing me in that time, you are to proceed northward, and endeavour to find a passage into the Atlantic Ocean, through Hudson's or Baffin's Bays, as directed by the above-mentioned Instructions. But if you should fail in finding a passage through either of the bays, or by any other way, as the season of the year may render it unsafe for you to remain in high latitudes, you are to repair to the harbour of St. Peter and St. Paul, in Kamtschatka, in order to refresh your people, and to pass the winter.

“But, nevertheless, if you find that you cannot procure the necessary refreshments at the said port, you are at liberty to go where you shall judge most proper; taking care, before you depart, to leave with the governor an account of your intended destination, to be delivered to me upon my arrival: and in the spring of the ensuing year, 1779, you are to repair back to the above-mentioned port, endeavouring to be there by the 10th of May, or sooner. If, on your arrival, you receive no orders from, or account of me, so as to justify your pursuing any other measures than what are pointed out in the before-mentioned Instructions, your future proceedings are to be governed by them. You are also to comply with such parts of said Instructions as have not been executed, and are not contrary to these orders. And in case of your inability, by sickness or otherwise, to carry these, and the Instructions of their Lordships, into execution, you are to be careful to leave them with the next officer in command, who is hereby required to execute them in the best manner he can.

“Given under my hand, on board the Resolution, at Ulietea, the 18th day of November, 1777. J. COOK.

“TO CAPTAIN CHARLES CLERKE,

Commander of His Majesty's Sloop The Discovery.”

While we lay moored to the shore, we heeled, and scrubbed both sides of the bottoms of the ships. At the same time, we fixed some tin-plates under the binds; first taking off the old sheathing, and putting in a piece unfilled, over which the plates were nailed. These plates I had from the ingenious Mr. Pelham, secretary to the Commissioners for Victualling His Majesty's Navy; with a view of trying whether tin would answer the same end as copper, on the bottoms of ships.

On the 24th, in the morning, I was informed that a midshipman and a seaman, both belonging to the Discovery, were missing. Soon after, we learned from the natives, that they went away in a canoe the preceding evening, and were, at this time, at the other end

of the island. As the midshipman was known to have expressed a desire to remain at these islands, it seemed pretty certain that he and his companion had gone off with this intention; and Captain Clerke set out in quest of them with two armed boats, and a party of marines. His expedition proved fruitless; for he returned in the evening, without having got any certain intelligence where they were. From the conduct of the natives, Captain Clerke seemed to think, that they intended to conceal the deserters; and, with that view, had amused him with false information the whole day, and directed him to search for them in places where they were not to be found. The captain judged right; for the next morning we were told, that our runaways were at Otaha. As these two were not the only persons in the ships who wished to end their days at these favourite islands, in order to put a stop to any further desertion, it was necessary to get them back at all events; and that the natives might be convinced that I was in earnest, I resolved to go after them myself; having observed, from repeated instances, that they seldom offered to deceive me with false information. Accordingly, I set out the next morning with two armed boats; being accompanied by the chief himself. I proceeded, as he directed, without stopping anywhere, till we came to the middle of the east side of Otaha. There we put ashore; and Oreo despatched a man before us, with orders to seize the deserters, and keep them till we should arrive with the boats. But when we got to the place where we expected to find them, we were told that they had quitted this island, and gone over to Bolabola the day before. I did not think proper to follow them thither, but returned to the ships; fully determined, however, to have recourse to a measure which, I guessed, would oblige the natives to bring them back.

In the night, Mr. Bayly, Mr. King, and myself observed an immersion of Jupiter's third satellite. It happened by the observation of

Mr. Bayly, at 2 ^h	37 ^m	54 ^s	} in the morning.
Mr. King, at 2	37	24	
Myself, at 2	37	44	

Mr. Bayly and Mr. King observed, with Dollond's three and a half feet achromatic telescope, and with the greatest magnifying power. I observed, with a two-feet Gregorian reflector, made by Bird.

Soon after daybreak, the chief, his son, daughter, and son-in-law, came on board the Resolution. The three last I resolved to detain, till the two deserters should be brought back. With this view, Captain Clerke invited them to go on board his ship; and as soon as they arrived there, confined them in his cabin. The chief was with me when the news reached him. He immediately acquainted me with it, supposing that this step had been taken without my knowledge, and consequently without my approbation. I instantly undeceived him; and then he began to have apprehensions as to his own situation, and his looks expressed the utmost perturbation of mind. But I soon made him easy as to this, by telling him, that he was at liberty to leave the ship whenever he pleased, and to take such measures as he should judge best calculated to get our two men back; that, if he succeeded, his friends on board the Discovery should be delivered up; if not, that I was determined to carry them away with me. I added, that his own conduct, as well as that of many of his people, in not only assisting these two men to escape, but in being, even at this very time, assiduous in enticing others to follow them, would justify any step I could take to put a stop to such proceedings. This explanation of the motives upon which I acted, and which we found means to make Oreo and his people, who were present, fully comprehend, seemed to recover them, in a great measure, from that general consternation into which they were at first thrown. But, if relieved from apprehensions about their own safety, they continued under the deepest concern for those who were prisoners. Many of them went under the Discovery's stern in canoes, to bewail their captivity, which they did with long and loud exclamations. Poedooa! for so the chief's daughter was called, resounded from every quarter; and the women seemed to vie with each other in mourning her fate, with more significant expressions of their grief than tears and cries; for there were many bloody heads upon the occasion. Oreo himself did not give way to unavailing lamentations, but instantly began his exertions to recover our deserters, by despatching a canoe to Bolabola, with a

message to Opoony, the sovereign of that island, acquainting him with what had happened, and requesting him to seize the two fugitives, and send them back. The messenger, who was no less a man than the father of Pootoe, Oreo's son-in-law, before he set out came to receive my commands. I strictly enjoined him not to return without the deserters; and to tell Opoony from me, that if they had left Bolabola, he must send canoes to bring them back; for I suspected that they would not long remain in one place.

The consequence, however, of the prisoners was so great, that the natives did not think proper to trust to the return of our people for their release; or, at least, their impatience was so great, that it hurried them to make an attempt which might have involved them in still greater distress, had it not been fortunately prevented. Between five and six o'clock in the evening, I observed that all their canoes in and about the harbour began to move off, as if some sudden panic had seized them. I was ashore, abreast of the ship at the time, and inquired in vain to find out the cause; till our people called to us from the *Discovery*, and told us that a party of the natives had seized Captain Clerke and Mr. Gore, who had walked out a little way from the ships. Struck with the boldness of this plan of retaliation, which seemed to counteract me so effectually in my own way, there was no time to deliberate. I instantly ordered the people to arm; and, in less than five minutes, a strong party, under the command of Mr. King, was sent to rescue our two gentlemen. At the same time, two armed boats and a party under Mr. Williamson went after the flying canoes, to cut off their retreat to the shore. These several detachments were hardly out of sight, before an account arrived, that we had been misinformed; upon which I sent and called them all in.

It was evident, however, from several corroborating circumstances, that the design of seizing Captain Clerke had really been in agitation amongst the natives. Nay, they made no secret in speaking of it the next day. But their first and great plan of operations was to have laid hold of me. It was my custom every evening to bathe in the fresh water. Very often I went alone, and always without arms. Expecting me to go as usual this evening, they had determined to seize me, and Captain Clerke too, if he had accompanied me. But I had, after confining Oreo's family, thought it prudent to avoid putting myself in their power; and had cautioned Captain Clerke and the officers not to go far from the ships. In the course of the afternoon, the chief asked me, three several times, if I would not go to the bathing-place; and when he found, at last, that I could not be prevailed upon, he went off with the rest of his people, in spite of all I could do or say to stop him. But as I had no suspicion at this time of their design, I imagined that some sudden fright had seized them, which would, as usual, soon be over. Finding themselves disappointed as to me, they fixed on those who were more in their power. It was fortunate for all parties, that they did not succeed; and not less fortunate that no mischief was done on the occasion; for not a musket was fired, except two or three to stop the canoes. To that firing, perhaps, Messrs. Clerke and Gore owed their safety*; for at that very instant, a party of the natives armed with clubs were advancing toward them; and on hearing the report of the muskets, they dispersed. This conspiracy, as it may be called, was first discovered by a girl, whom one of the officers had brought from Huaheine. She, overhearing some of the Ulieteans say, that they would seize Captain Clerke and Mr. Gore, ran to acquaint the first of our people that she met with. Those who were charged with the execution of the design threatened to kill her, as soon as we should leave the island, for disappointing them. Being aware of this, we contrived that her friends should come some days after and take her out of the ship, to convey her to a place of safety, where she might lie concealed, till they should have an opportunity of sending her back to Huaheine.

On the 27th, our observatories were taken down, and every thing we had ashore carried on board; the moorings of the ships were cast off, and we transported them a little way down the harbour, where they came to an anchor again. Toward the afternoon, the natives began to shake off their fears, gathering round and on board the ships as usual; and the awkward transaction of the day before seemed to be forgotten on both sides. The following

* Perhaps they owed their safety principally to Captain Clerke's walking with a pistol in his hand, which he once fired. This circumstance is omitted both in Captain

Cook's and in Mr. Anderson's journal; but is here mentioned on the authority of Captain King.

night, the wind blew in hard squalls from south to east, attended with heavy showers of rain. In one of the squalls, the cable, by which the Resolution was riding, parted just without the hawse. We had another anchor ready to let go, so that the ship was presently brought up again. In the afternoon, the wind became moderate; and we hooked the end of the best small bower cable, and got it again into the hawse.

Oreo, the chief, being uneasy as well as myself, that no account had been received from Bolabola, set out this evening for that island, and desired me to follow down the next day with the ships. This was my intention; but the wind which kept us in the harbour, brought Oreo back from Bolabola with the two deserters. They had reached Otaha the same night they deserted; but finding it impossible to get to any of the islands to the eastward (which was their intention), for want of wind, they had proceeded to Bolabola, and from thence to the small island Toobace, where they were taken by the father of Pootoe, in consequence of the first message sent to Opoony. As soon as they were on board, the three prisoners were released. Thus ended an affair which had given me much trouble and vexation. Nor would I have exerted myself so resolutely on the occasion, but for the reason before mentioned, and to save the son of a brother officer from being lost to his country.

The wind continued constantly between the north and west, and confined us in the harbour till eight o'clock in the morning of the 7th of December; when we took the advantage of a light breeze which then sprung up at north-east, and with the assistance of all the boats got out to sea, with the Discovery in company.

During the last week, we had been visited by people from all parts of the island, who furnished us with a large stock of hogs and green plantains. So that the time we lay wind-bound in the harbour was not entirely lost; green plantains being an excellent substitute for bread, as they will keep good a fortnight or three weeks. Besides this supply of provisions, we also completed our wood and water.

The inhabitants of Ulietea seemed, in general smaller and blacker than those of the other neighbouring islands, and appeared also less orderly, which, perhaps, may be considered as the consequence of their having become subject to the natives of Bolabola. Oreo, their chief, is only a sort of deputy of the sovereign of ~~the~~ island; and the conquest seems to have lessened the number of subordinate chiefs resident among them; so that they are less immediately under the inspection of those whose interest it is to enforce due obedience to authority. Ulietea, though now reduced to this humiliating state, was formerly, as we were told, the most eminent of this cluster of islands; and, probably, the first seat of government; for they say, that the present royal family of Otaheite is descended from that which reigned here before the late revolution. Ooroo, the dethroned monarch of Ulietea, was still alive when we were at Huaheine, where he resides a royal wanderer, furnishing, in his person, an instance of the instability of power; but what is more remarkable, of the respect paid by these people to particular families, and to the customs which have once conferred sovereignty; for they suffer Ooroo to preserve all the ensigns which they appropriate to majesty, though he has lost his dominions.

We saw a similar instance of this while we were at Ulietea. One of the occasional visitors I now had was my old friend Oreo, the late chief of Huaheine. He still preserved his consequence; came always at the head of a numerous body of attendants; and was always provided with such presents as were very acceptable. This chief looked much better now than I had ever seen him during either of my former voyages*. I could account for his improving in health as he grew older, only from his drinking less copiously of the *ava* in his present station as a private gentleman, than he had been accustomed to do when he was regent

* Captain Cook had seen Oreo in 1769, when he commanded the *Endeavour*; also twice during his second voyage in 1772.

CHAPTER VIII.—ARRIVAL AT BOLABOLA.—INTERVIEW WITH OPOONY.—REASONS FOR PURCHASING MONSIEUR BOUGAINVILLE'S ANCHOR.—DEPARTURE FROM THE SOCIETY ISLANDS.—PARTICULARS ABOUT BOLABOLA.—HISTORY OF THE CONQUEST OF OTAHA AND ULITEA.—HIGH REPUTATION OF THE BOLABOLA MEN.—ANIMALS LEFT THERE AND AT ULITEA.—PLENTIFUL SUPPLY OF PROVISIONS, AND MANNER OF SALTING PORK ON BOARD.—VARIOUS REFLECTIONS RELATIVE TO OTAHEITE AND THE SOCIETY ISLANDS.—ASTRONOMICAL AND NAUTICAL OBSERVATIONS MADE THERE.

As soon as we had got clear of the harbour, we took leave of Ulitea, and steered for Bolabola. The chief if not sole object I had in view by visiting that island, was to procure from its monarch, Opoony, one of the anchors which Monsieur de Bougainville had lost at Otaheite. This having afterward been taken up by the natives there, had, as they informed me, been sent by them as a present to that chief. My desire to get possession of it did not arise from our being in want of anchors; but having expended all the hatchets and other iron tools which we had brought from England, in purchasing refreshments, we were now reduced to the necessity of creating a fresh assortment of trading articles, by fabricating them out of the spare iron we had on board; and, in such conversions, and in the occasional uses of the ships, great part of that had been already expended. I thought that M. de Bougainville's anchor would supply our want of this useful material; and I made no doubt that I should be able to tempt Opoony to part with it.

Oreo, and six or eight men more from Ulitea, took a passage with us to Bolabola. Indeed, most of the natives in general, except the chief himself, would have gladly taken a passage with us to England. At sunset, being the length of the south point of Bolabola, we shortened sail, and spent the night making short boards. At day-break, on the 8th, we made sail for the harbour, which is on the west side of the island. The wind was scant, so that we had to ply up, and it was nine o'clock before we got near enough to send away a boat to sound the entrance; for I had thoughts of running the ships in, and anchoring for a day or two. When the boat returned, the master who was in her reported, that though, at the entrance of the harbour the bottom was rocky, there was good ground within, and the depth of water twenty-seven and twenty-five fathoms; and that there was room to turn the ships in, the channel being one-third of a mile broad. In consequence of this report, we attempted to work the ships in; but the tide, as well as the wind, being against us, after making two or three trips, I found that it could not be done, till the tide should turn in our favour. Upon this, I gave up the design of carrying the ships into the harbour; and having ordered the boats to be got ready, I embarked in one of them, accompanied by Oreo and his companions; and was rowed in for the island.

We landed where the natives directed us; and soon after I was introduced to Opoony, in the midst of a great concourse of people. Having no time to lose, as soon as the necessary formality of compliments was over, I asked the chief to give me the anchor, and produced the present I had prepared for him, consisting of a linen night-gown, a shirt, some gauze handkerchiefs, a looking-glass, some beads, and other toys, and six axes. At the sight of these last, there was a general outcry. I could only guess the cause, by Opoony's absolutely refusing to receive my present, till I should get the anchor. He ordered three men to go and deliver it to me; and, as I understood, I was to send, by them, what I thought proper in return. With these messengers, we set out in our boats for an island, lying at the north side of the entrance into the harbour, where the anchor had been deposited. I found it to be neither so large, nor so perfect, as I expected. It had originally weighed seven hundred pounds, according to the mark that was upon it; but the ring, with part of the shank, and the two points were now wanting. I was no longer at a loss to guess the reason of Opoony's refusing my present. He doubtless thought that it so much exceeded the value of the anchor in its present state, that I should be displeased when I saw it. Be this as it may, I took the anchor as I found it, and sent him every article of the present that I at first intended. Having thus completed my negotiation, I returned on board; and having hoisted

in the boats, made sail from the island to the north. While the boats were hoisting in, some of the natives came off, in three or four canoes, to see the ships, as they said. They brought with them a few cocoa-nuts, and one pig, which was the only one we got at the island. I make no doubt, however, that, if we had staid till the next day, we should have been plentifully supplied with provisions; and, I think, the natives would feel themselves disappointed, when they found that we were gone. But as we had already a very good stock both of hogs and of fruit on board, and very little of anything left to purchase more, I could have no inducement to defer any longer the prosecution of our voyage.

The harbour of Bolabola, called Oteavanooa, situated on the west side of the island, is one of the most capacious that I ever met with; and though we did not enter it, it was a satisfaction to me, that I had an opportunity of employing my people to ascertain its being a proper place for the reception of ships. The high double-peaked mountain, which is in the middle of the island, appeared to be barren on the east side; but on the west side, has trees or bushes on its most craggy parts. The lower grounds, all round, towards the sea, are covered with cocoa-palms and bread-fruit trees, like the other islands of this ocean; and the many little islets that surround it on the inside of the reef, add both to the amount of its vegetable productions, and to the number of its inhabitants. But still, when we consider its very small extent, being not more than eight leagues in compass, it is rather remarkable, that its people should have attempted, or have been able to achieve the conquest of Ulietea and Otaha, the former of which islands is, of itself, at least double its size. In each of my three voyages, we had heard much of the war that produced this great revolution. The result of our inquiries, as to the circumstances attending it, may amuse the reader; and I give it as a specimen of the history of our friends in this part of the world, as related to us * by themselves.

Ulietea and Otaha, which adjoins it, lived long in friendship, or, as the natives express it, were considered as two brothers, inseparable by any interested views. They also admitted the island of Huaheine as their friend, though not so intimate. Otaha, however, like a traitor, leagued with Bolabola, and they resolved jointly to attack Ulietea; whose people called in their friends of Huaheine, to assist them against these two powers. The men of Bolabola were encouraged by a priestess, or rather prophetess, who foretold, that they should be successful; and as a proof of the certainty of her prediction, she desired, that a man might be sent to the sea, at a particular place, where, from a great depth, a stone would ascend. He went, accordingly, in a canoe to the place mentioned; and was going to dive to see where this stone lay, when, behold, it started up to the surface spontaneously into his hand! The people were astonished at the sight; the stone was deposited as sacred in the house of the *Eatooa*; and is still preserved at Bolabola, as a proof of this woman's influence with the divinity. Their spirits being thus elevated with the hopes of victory, the canoes of Bolabola set out to engage those of Ulietea and Huaheine, which being strongly fastened together with ropes, the encounter lasted long, and would probably, notwithstanding the prediction and the miracle, have ended in the overthrow of the Bolabola fleet, if that of Otaha had not, in the critical moment, arrived. This turned the fortune of the day, and their enemies were defeated with great slaughter. The men of Bolabola, prosecuting their victory, invaded Huaheine two days after, which they knew must be weakly defended, as most of its warriors were absent. Accordingly, they made themselves masters of that island. But many of its fugitives having got to Otahaite, there told their lamentable story; which so grieved those of their countrymen, and of Ulietea, whom they met with in that island, that they obtained some assistance from them. They were equipped with only ten fighting canoes; but, though their force was so inconsiderable, they conducted the expedition with so much prudence, that they landed at Huaheine at night, when dark, and falling upon the Bolabola men by surprise, killed many of them, forcing the rest to fly. So that, by this means, they got possession of their island again, which now remains independent, under the government of its own chiefs. Immediately after the defeat of the united fleets of Ulietea and Huaheine, a proposal was made to the Bolabola men by their allies of Otaha, to be admitted to an equal share of the conquests. The refusal of this

* For this, as for many other particulars about these people, we are indebted to Mr. Anderson.

broke the alliance; and in the course of the war, Otaha itself, as well as Ulietea, was conquered; and both now remain subject to Bolabola; the chiefs who govern them being only deputies of Opoony, the sovereign of that island. In the reduction of the two islands, five battles were fought, at different places, in which great numbers were slain on both sides.

Such was the account we received. I have more than once remarked, how very imperfectly these people recollect the exact dates of past events. And with regard to this war, though it happened not many years ago, we could only guess at the time of its commencement and its conclusion, from collateral circumstances, furnished by our own observation, as the natives could not satisfy our inquiries with any precision. The final conquest of Ulietea, which closed the war, we know, had been made before I was there in the *Endeavour*, in 1769; but we may infer, that peace had not been very long restored, as we could see marks of recent hostilities having been committed upon that island. Some additional light may be thrown upon this inquiry, by attending to the age of Teerectareea, the present chief of Hualheine. His looks showed, that he was not above ten or twelve years old; and we were informed, that his father had been killed at one of the battles. As to the time when the war began, we had no better rule for judging than this, that the young people of about twenty years of age, of whom we made inquiries, could scarcely remember the first battles; and I have already mentioned, that Omai's countrymen, whom we found at Watecoo, knew nothing of this war; so that its commencement was subsequent to their voyage.

Ever since the conquest of Ulietea and Otaha, the Bolabola men have been considered by their neighbours as invincible; and such is the extent of their fame, that even at Otaheite, which is almost out of their reach, if they are not dreaded, they are at least respected for their valour. It is said, that they never fly in battle, and that they always beat an equal number of the other islanders. But, besides these advantages, their neighbours seem to ascribe a great deal to the superiority of their god, who, they believed, detained us at Ulietea by contrary winds, as being unwilling that we should visit an island under his special protection. How high the Bolabola men are now in estimation at Otaheite, may be inferred from Monsieur de Bougainville's anchor having been conveyed to them. To the same cause we must ascribe the intention of transporting to their island the Spanish bull. And they had already got possession of a third European curiosity, the male of another animal, brought to Otaheite by the Spaniards. We had been much puzzled, by the imperfect description of the natives, to guess what this could be. But Captain Clerke's deserters, when brought back from Bolabola, told me, that the animal had been there shown to them, and that it was a ram. It seldom happens but that some good arises out of evil; and if our two men had not deserted, I should not have known this. In consequence of their information, at the same time that I landed to meet Opoony, I carried ashore a ewe, which we had brought from the Cape of Good Hope; and I hope that, by this present, I have laid the foundation for a breed of sheep at Bolabola. I also left at Ulietea, under the care of Oreo, an English boar and sow, and two goats. So that, not only Otaheite, but all the neighbouring islands will, in a few years, have their race of hogs considerably improved; and, probably, be stocked with all the valuable animals which have been transported hither by their European visitors. When once this comes to pass, no part of the world will equal these islands in variety and abundance of refreshments for navigators. Indeed, even in their present state, I know no place that excels them. After repeated trials, in the course of several voyages, we find, when they are not disturbed by intestine broils, but live in amity with one another, which has been the case for some years past, that their productions are in the greatest plenty; and, particularly, the most valuable of all the articles, their hogs.

If we had had a larger assortment of goods, and a sufficient quantity of salt on board, I make no doubt that we might have salted as much pork as would have served both ships near twelve months. But our visiting the Friendly Islands, and our long stay at Otaheite and the neighbourhood, quite exhausted our trading commodities; particularly our axes, with which alone hogs, in general, were to be purchased. And we had hardly salt enough to cure fifteen puncheons of meat. Of these, five were added to our stock of provisions at the Friendly Islands, and the other ten at Otaheite. Captain Clerke also salted a propor-

ll as Ulietea, was govern them being of the two islands, slain on both sides. I, how very impervious to this war, time of its commission. The final decision. of salt on board, I e served both ships ng stay at Otaheite rticularly our axes, hardly salt enough ck of provisions at also salted a propor-

tionable quantity for his ship. The process was the same that had been adopted by me in my last voyage; and it may be worth while to describe it again. The hogs were killed in the evening; as soon as they were cleaned they were cut up, the bones taken out, and the meat salted when it was hot. It was then laid in such a position as to permit the juices to drain from it, till the next morning, when it was again salted, packed into a cask, and covered with pickle. Here it remained for four or five days, or a week; after which it was taken out and examined, piece by piece, and if there was any found to be in the least tainted, as sometimes happened, it was separated from the rest, which was repacked into another cask, headed up, and filled with good pickle. In about eight or ten days' time it underwent a second examination; but this seemed unnecessary, as the whole was generally found to be perfectly cured. A mixture of bay and of white salt answers the best, but either of them will do alone. Great care should be taken that none of the large blood-vessels remain in the meat; nor must too great a quantity be packed together at the first salting, lest the pieces in the middle should heat, and by that means prevent the salt from penetrating them. This once happened to us, when we killed a larger quantity than usual. Rainy, sultry weather, is unfavourable for salting meat in tropical climates.

Perhaps the frequent visits Europeans have lately made to these islands may be one great inducement to their keeping a large stock of hogs, as they have had experience enough to know, that whenever we come, they may be sure of getting from us what they esteem a valuable consideration for them. At Otaheite, they expect the return of the Spaniards every day; and they will look for the English two or three years hence, not only there but at the other islands. It is to no purpose to tell them that you will not return: they think you must; though not one of them knows, or will give himself the trouble to inquire the reason of your coming.

I own I cannot avoid expressing it as my real opinion, that it would have been far better for these poor people never to have known our superiority in the accommodations and arts that make life comfortable, than, after once knowing it, to be again left and abandoned to their original incapacity of improvement. Indeed, they cannot be restored to that happy mediocrity in which they lived before we discovered them, if the intercourse between us should be discontinued. It seems to me that it has become, in a manner, incumbent on the Europeans to visit them once in three or four years, in order to supply them with those conveniences which we have introduced among them, and have given them a predilection for. The want of such occasional supplies will, probably, be very heavily felt by them, when it may be too late to go back to their old less perfect contrivances, which they now despise, and have discontinued, since the introduction of ours. For, by the time that the iron tools, of which they are now possessed, are worn out, they will have almost lost the knowledge of their own. A stone hatchet is, at present, as rare a thing amongst them as an iron one was eight years ago; and a chisel of bone, or stone, is not to be seen. Spike-nails have supplied the place of the last; and they are weak enough to fancy that they have got an inexhaustible store of them, for these were not now at all sought after. Sometimes, however, nails, much smaller than a spike, would still be taken in exchange for fruit. Knives happened, at present, to be in great esteem at Ulietea; and axes and hatchets remained unrivalled by any other of our commodities at all the islands. With respect to articles of mere ornament, these people are as changeable as any of the polished nations of Europe; so that what pleases their fancy while a fashion is in vogue, may be rejected when another whim has supplanted it. But our iron tools are so strikingly useful, that they will, we may confidently pronounce, continue to prize them highly; and be completely miserable if, neither possessing the materials, nor trained up to the art of fabricating them, they should cease to receive supplies of what may now be considered as having become necessary to their comfortable existence.

Otaheite, though not comprehended in the number of what we have called the Society Islands, being inhabited by the same race of men, agreeing in the same leading features of character and manners, it was fortunate that we happened to discover this principal island before the others, as the friendly and hospitable reception we there met with, of course, led us to make it the principal place of resort in our successive visits to this part of the Pacific

Ocean. By the frequency of this intercourse, we have had better opportunities of knowing something about it and its inhabitants, than about the other similar, but less considerable islands in its vicinity. Of these, however, we have seen enough to satisfy us that all that we observed and have related of Otaheite, may, with trifling variations, be applied to them. Too much seems to have been already known, and published in our former relations, about some of the modes of life that made Otaheite so agreeable an abode to many on board our ships; and if I could add any finishing strokes to a picture, the outlines of which have been already drawn with sufficient accuracy, I should still have hesitated to make this journal the place for exhibiting a view of licentious manners, which could only serve to disgust those for whose information I write. There are, however, many parts of the domestic, political, and religious institutions of these people, which, after all our visits to them, are but imperfectly understood. The foregoing narrative of the incidents that happened during our stay, will probably be thought to throw some additional light; and, for further satisfaction, I refer to Mr. Anderson's remarks.

Amidst our various subordinate employments while at these islands, the great objects of our duty were always attended to. No opportunity was lost of making astronomical and nautical observations; from which the following table was drawn up:

Place.	Latitude. South.	Longitude. East.	Variation of the Compass.	Dip of the Needle.
Matavai Point, Otaheite	17° 29'	210° 22' 28"	5° 34' East	29° 12'
Owharree Harbour, Huahine	16 42½	208 52 24	5 13½ East	28 28
Ohuaneneno Harbour, Ulitea	16 45½	209 25 22	6 19 East	29 5

The longitude of the three several places is deduced from the mean of 145 sets of observations made on shore; some at one place and some at another; and carried on to each of the stations by the time-keeper. As the situation of these places was very accurately settled during my former voyages, the above observations were now made chiefly with a view of determining how far a number of lunar observations might be depended upon, and how near they would agree with those made upon the same spot in 1769, which fixed Matavai Point to be 210° 27' 30". The difference, it appears, is only of 5' 2"; and, perhaps, no other method could have produced a more perfect agreement. Without pretending to say which of the two computations is the nearest the truth, the longitude of 210° 22' 28", or, which is the same thing, 208° 25' 22", will be the longitude we shall reckon from with the time-keeper, allowing it to be losing, on mean time, 1.69" each day, as found by the mean of all the observations made at these islands for that purpose.

On our arrival at Otaheite, the error of the time-keeper in longitude was,

By Greenwich rate	1° 18' 58"
Tongataboo rate	0 16 40

Some observations were also made on the tide; particularly at Otaheite and Ulitea; with a view of ascertaining its greatest rise at the first place. When we were there, in my second voyage, Mr. Wales thought he had discovered that it rose higher than I had observed it to do, when I first visited Otaheite in 1769. But the observations we now made, proved that it did not; that is, that it never rose higher than twelve or fourteen inches at most. And it was observed to be high-water nearly at noon, as well at the quadratures, as at the full and change of the moon.

To verify this, the following observations were made at Ulitea:

Having now finished all that occurs to me with regard to these islands, which make so conspicuous a figure in the list of our discoveries, the reader will permit me to suspend the prosecution of my Journal, while he pursues the following chapter, for which I am indebted to Mr. Anderson.

CHAPTER IX.—ACCOUNTS OF OTAHEITE STILL IMPERFECT.—THE PREVAILING WINDS.—BEAUTY OF THE COUNTRY.—CULTIVATION.—NATURAL CURIOSITIES.—THE PERSONS OF THE NATIVES.—DISEASES.—GENERAL CHARACTER.—LOVE OF PLEASURE.—LANGUAGE.—SURGERY AND PHYSIC.—ARTICLES OF FOOD.—EFFECTS OF DRINKING AWA.—TIMES AND MANNER OF EATING.—CONNECTIONS WITH THE FEMALES.—CIRCUMCISION.—SYSTEM OF RELIGION.—NOTIONS ABOUT THE SOUL AND A FUTURE LIFE.—VARIOUS SUPERSTITIONS.—TRADITIONS ABOUT THE CREATION.—AN HISTORICAL LEGEND.—HONOURS PAID TO THE KING.—DISTINCTION OF RANKS.—PUNISHMENT OF CRIMES.—PECULIARITIES OF THE NEIGHBOURING ISLANDS.—NAMES OF THEIR GODS.—NAMES OF ISLANDS THEY VISIT.—EXTENT OF THEIR NAVIGATION.

"To what has been said of Otaheite, in the accounts of the successive voyages of Captain Wallis, Monsieur de Bougainville, and Captain Cook, it would, at first sight, seem superfluous to add anything; as it might be supposed, that little could be now produced, but a repetition of what has been told before. I am, however, far from being of that opinion; and will venture to affirm, though a very accurate description of the country, and of the most obvious customs of its inhabitants, has been already given, especially by Captain Cook, that much still remains untouched; that, in some instances, mistakes have been made, which later and repeated observation has been able to rectify; and that, even now, we are strangers to many of the most important institutions that prevail amongst these people. The truth is, our visits, though frequent, have been but transient; many of us had no inclination to make inquiries; more of us were unable to direct our inquiries properly; and we all laboured, though not to the same degree, under the disadvantages attending an imperfect knowledge of the language of those from whom alone we could receive any information. The Spaniards had it more in their power to surmount this bar to instruction; some of them having resided at Otaheite much longer than any other European visitors*. As, with their superior advantages, they could not but have had an opportunity of obtaining the fullest information on most subjects relating to this island, their account of it would, probably, convey more authentic and accurate intelligence than, with our best endeavours, any of us could possibly obtain. But as I look upon it to be very uncertain, if not very unlikely, that we shall ever have any communication from that quarter, I have here put together what additional intelligence about Otaheite and its neigh-

* An account of the visit of these Spaniards to Otaheite is given in an appendix to a description of the province and archipelago of Chiloe, published in the Spanish language, in 1791, by P. Fray P. Gonz. de Aguiros, from which the following particulars furnished in Burney's Voyages and Discoveries in the South Sea, 4to. 1816, vol. iv. p. 570, is derived. "In 1772, the viceroy of Peru, Don Manuel de Amat, sent two ships 'to make an exact survey of the many islands in the Pacific Ocean.' They saw a great number of islands, and visited Otaheite, whence they took two natives, who were carried to Lima and baptised by the names of Tomas Paulo and Manuel Amat. In 1774, another voyage was made from Peru to the islands, and two missionaries were sent with the two natives. A house was built at the smaller division of Otaheite for the missionaries, whom the chiefs took under their protection. Before the Spanish ships departed, the commander called a meeting of the chiefs, to whom he described the grandeur of his sovereign, and informed them of his right to all the islands. 'The natives,' the account says, demonstrated great complaisance, and by acclamation

acknowledged the king of Spain king of Otaheite and all the islands.' Whereupon the Spanish captain informed them, that if they preserved their fidelity and fulfilled their promises, they should be frequently visited by the ships of the king of Spain. The captain of one of the ships died and was buried on shore. In January 1775, the ships departed to return to Peru. They took two other islanders with them. Thomas Paulo, it appears, had profited little from the instruction given him; he rather chose to profit by his native habits, for he robbed the missionary house and absconded."

This account differs slightly from that given p. 164, where it is stated, and probably correctly, that the missionaries were left on the first visit of the Spanish ships, and taken away on the second. The Spaniards do not appear to have attempted a third expedition, nor, beyond making many particular inquiries concerning the position of the neighbouring islands, to have interested themselves much in affording instruction to the natives, or in investigating the products of the island, or the manners of its inhabitants.—Ed.

bouring islands I was able to procure, either from Omai while on board the ship, or by conversing with the other natives while we remained amongst them.

The wind, for the greatest part of the year, blows from between east-south-east, and east-north-east. This is the true trade-wind, or what the natives call *Maarae*; and it sometimes blows with considerable force. When this is the case, the weather is often cloudy, with showers of rain; but when the wind is more moderate, it is clear, settled, and serene. If the wind should veer farther to the southward, and become south-east, or south-south-east, it then blows more gently, with a smooth sea, and is called *Maoai*. In those months, when the sun is nearly vertical, that is, in December and January, the winds and weather are both very variable; but it frequently blows from west-north-west, or north-west. This wind is what they call *Toerou*; and is generally attended by dark cloudy weather, and frequently by rain. It sometimes blows strong, though generally moderate; but seldom lasts longer than five or six days without interruption; and is the only wind in which the people of the islands to leeward come to this, in their canoes. If it happens to be still more northerly, it blows with less strength, and has the different appellation of *Erapotai*; which they feign to be the wife of the *Toerou*; who, according to their mythology, is a male.

The wind from south-west, and west-south-west, is still more frequent than the former; and though it is, in general, gentle, and interrupted by calms, or breezes from the eastward, yet it sometimes blows in brisk squalls. The weather attending it is commonly dark, cloudy, and rainy, with a close hot air; and often accompanied by a great deal of lightning and thunder. It is called *Etoa*, and often succeeds the *Toerou*; as does also the *Farooa*, which is still more southerly, and, from its violence, blows down houses and trees, especially the cocoa-palms, from their loftiness; but it is only of short duration. The natives seem not to have a very accurate knowledge of these changes, and yet pretend to have drawn some general conclusions from their effects; for they say when the sea has a hollow sound, and dashes slowly on the shore, or rather on the reef without, that it portends good weather; but, if it has a sharp sound, and the waves succeed each other fast, that the reverse will happen.

Perhaps there is scarcely a spot in the universe that affords a more luxuriant prospect than the south-east part of Otaheite. The hills are high and steep; and, in many places, craggy. But they are covered to the very summits with trees and shrubs, in such a manner, that the spectator can scarcely help thinking that the very rocks possess the property of producing and supporting their verdant clothing. The flat land which bounds those hills toward the sea, and the interjacent valleys, also teem with various productions that grow with the most exuberant vigour; and at once fill the mind of the beholder with the idea that no place upon earth can outdo this in the strength and beauty of vegetation. Nature has been no less liberal in distributing rivulets, which are found in every valley; and as they approach the sea, often divide into two or three branches, fertilising the flat lands through which they run. The habitations of the natives are scattered, without order, upon the flats; and many of them appearing toward the shore, presented a delightful scene, viewed from our ships; especially as the sea, within the reef, which bounds the coast, is perfectly still, and affords a safe navigation at all times for the inhabitants, who are often seen paddling in their canoes indolently along, in passing from place to place, or in going to fish. On viewing these charming scenes, I have often regretted my inability to transmit to those who have had no opportunity of seeing them, such a description as might, in some measure, convey an impression similar to what must be felt by every one who has been fortunate enough to be upon the spot.

It is, doubtless, the natural fertility of the country, combined with the mildness and serenity of the climate, that renders the natives so careless in their cultivation, that, in many places, though overflowing with the richest productions, the smallest traces of it cannot be observed. The cloth plant, which is raised by seeds brought from the mountains, and the *ava*, or intoxicating pepper, which they defend from the sun when very young, by covering them with leaves of the bread-fruit-tree, are almost the only things to which they seem to pay any attention; and these they keep very clean. I have inquired very carefully in

their manner of cultivating the bread-fruit-tree; but was always answered, that they never planted it. This, indeed, must be evident to every one who will examine the places where the young trees come up. It will be always observed, that they spring from the roots of the old ones, which run along near the surface of the ground. So that the bread-fruit-trees may be reckoned those that would naturally cover the plains, even supposing that the island was not inhabited; in the same manner that the white-barked trees, found at Van Diemen's Land, constitute the forests there. And from this we may observe, that the inhabitant of Otaheite, instead of being obliged to plant his bread, will rather be under a necessity of preventing its progress; which I suppose is sometimes done, to give room for trees of another sort, to afford him some variety in his food. The chief of these are the cocoa-nut and plantain; the first of which can give no trouble, after it has raised itself a foot or two above the ground; but the plantain requires a little more care. For, after it is planted, it shoots up, and, in about three months, begins to bear fruit; during which time it gives young shoots, which supply a succession of fruit. For the old stocks are cut down, as the fruit is taken off.

The products of the island, however, are not so remarkable for their variety as great abundance; and curiosities of any kind are not numerous. Amongst these we may reckon a pond or lake of fresh water, at the top of one of the highest mountains, to go to and to return from which takes three or four days. It is remarkable for its depth, and has cels of an enormous size in it, which are sometimes caught by the natives, who go upon this water in little floats of two or three wild plantain-trees fastened together. This is esteemed one of the greatest natural curiosities of the country; insomuch, that travellers who come from the other islands are commonly asked, amongst the first things by their friends at their return, if they have seen it. There is also a sort of water of which there is only one small pond upon the island, as far distant as the lake, and to appearance very good, with a yellow sediment at the bottom; but it has a bad taste, and proves fatal to those who drink any quantity; or makes them break out in blotches if they bathe in it.

Nothing could make a stronger impression at first sight on our arrival here, than the remarkable contrast between the robust make and dark colour of the people of Tongataboo, and a sort of delicacy and whiteness which distinguish the inhabitants of Otaheite. It was even some time before that difference could preponderate in favour of the Otaheitans; and then only, perhaps because we became accustomed to them, the marks which had recommended the others began to be forgotten. Their women, however, struck us as superior in every respect; and as possessing all those delicate characteristics which distinguish them from the other sex in many countries. The beard, which the men here wear long, and the hair which is not cut so short as is the fashion at Tongataboo, made also a great difference; and we could not help thinking, that on every occasion they showed a greater degree of timidity and feckleness. The muscular appearance so common amongst the Friendly Islanders, and which seems a consequence of their being accustomed to much action, is lost here, where the superior fertility of their country enables the inhabitants to lead a more indolent life; and its place is supplied by a plumpness and smoothness of the skin, which, though perhaps more consonant with our ideas of beauty, is no real advantage, as it seems attended with a kind of languor in all their motions not observable in the others. This observation is fully verified in their boxing and wrestling, which may be called little better than the feeble efforts of children, if compared to the vigour with which these exercises are performed at the Friendly Islands.

Personal endowments being in great esteem amongst them, they have recourse to several methods of improving them, according to their notions of beauty. In particular it is a practice, especially amongst the *Erreoes*, or unmarried men of some consequence, to undergo a kind of physical operation to render them fair. This is done by remaining a month or two in the house; during which time they wear a great quantity of clothes, eat nothing but bread-fruit, to which they ascribe a remarkable property in whitening them. They also speak as if their corpulence and colour, at other times, depended upon their food; as they are obliged, from the change of seasons, to use different sorts at different times. Their common diet is made up of at least nine-tenths of vegetable food; and, I believe, more particularly the *makes* or

fermented bread-fruit, which enters almost every meal, has a remarkable effect upon them, preventing a costive habit, and producing a very sensible coolness about them, which could not be perceived in us who fed on animal food. And it is perhaps owing to this temperate course of life that they have so few diseases among them. They only reckon five or six, which might be called chronic, or national disorders; amongst which are the dropsy, and the *sefai*, or indolent swellings before mentioned as frequent at Tongataboo. But this was before the arrival of the Europeans; for we have added to this short catalogue a disease which abundantly supplies the place of all others, and is now almost universal. For this they seem to have no effectual remedy. The priests, indeed, sometimes give them a medley of simples; but they own that it never cures them. And yet they allow that, in a few cases, nature, without the assistance of a physician, exterminates the poison of this fatal disease, and a perfect recovery is produced. They say that if a man is infected with it, he will often communicate it to others in the same house, by feeding out of the same utensils, or handling them; and that in this case, they frequently die while he recovers; though we see no reason why this should happen.

Their behaviour on all occasions seems to indicate a great openness and generosity of disposition. Omai, indeed, who as their countryman should be supposed rather willing to conceal any of their defects, has often said that they are sometimes cruel in punishing their enemies. According to his representation they torment them very deliberately; at one time tearing out small pieces of flesh from different parts, at another taking out the eyes, then cutting off the nose, and lastly killing them by opening the belly. But this only happens on particular occasions. If cheerfulness argues a conscious innocence, one would suppose that their life is seldom sullied by crimes. This, however, I rather impute to their feelings, which, though lively, seem in no case permanent; for I never saw them in any misfortune labour under the appearance of anxiety after the critical moment was past. Neither does care ever seem to wrinkle their brow. On the contrary, even the approach of death does not appear to alter their usual vivacity. I have seen them, when brought to the brink of the grave by disease, and when preparing to go to battle; but in neither case ever observed their countenances overclouded with melancholy or serious reflection.

Such a disposition leads them to direct all their aims only to what can give them pleasure and ease. Their amusements all tend to excite and continue their amorous passions; and their songs, of which they are immoderately fond, answer the same purpose. But as a constant succession of sensual enjoyments must cloy, we found that they frequently varied them to more refined subjects, and had much pleasure in chanting their triumphs in war, and their occupations in peace; their travels to other islands, and adventures there; and the peculiar beauties and superior advantages of their own island over the rest, or of different parts of it over other less favourable districts. This marks that they receive great delight from music; and though they rather expressed a dislike to our complicated compositions, yet were they always delighted with the more melodious sounds produced singly on our instruments, as approaching nearer to the simplicity of their own.

Neither are they strangers to the soothing effects produced by particular sorts of motion; which, in some cases, seem to allay any perturbation of mind with as much success as music. Of this, I met with a remarkable instance. For on walking one day about Matavai Point, where our tents were erected, I saw a man paddling in a small canoe, so quickly, and looking about him with such eagerness on each side, as to command all my attention. At first I imagined he had stolen something from one of the ships, and was pursued; but, on waiting patiently, saw him repeat his amusement. He went out from the shore, till he was near the place where the swell begins to take its rise; and, watching its first motion very attentively, paddled before it with great quickness, till he found that it overlooked him, and had acquired sufficient force to carry his canoe before it, without passing underneath. He then sat motionless, and was carried along, at the same swift rate as the wave, till it landed him upon the beach. Then he started out, emptied his canoe, and went in search of another swell. I could not help concluding that this man felt the most supreme pleasure, while he was driven on so fast and so smoothly by the sea; especially as, though the tents and ships were so near, he did not seem in the least to envy, or even to take

any notice of, the crowds of his countrymen collected to view them as objects which were rare and curious. During my stay, two or three of the natives came up, who seemed to share his felicity, and always called out when there was an appearance of a favourable swell, as he sometimes missed it, by his back being turned, and looking about for it. By them I understood that this exercise, which is called *choroe*, was frequent amongst them; and they have probably more amusements of this sort, which afford them at least as much pleasure as skating, which is the only one of ours with whose effects I could compare it*.

The language of Otahite, though doubtless radically the same with that of New Zealand and the Friendly Islands, is destitute of that guttural pronunciation, and of some consonants, with which those latter dialects abound. The specimens we have already given, are sufficient to mark wherein the variation chiefly consists, and to show that, like the manners of the inhabitants, it has become soft and soothing. During the former voyage, I had collected a copious vocabulary, which enabled me the better to compare this dialect with that of the other islands; and, during this voyage, I took every opportunity of improving my acquaintance with it, by conversing with Omai before we arrived, and by my daily intercourse with the natives while we now remained there. It abounds with beautiful and figurative expressions, which, were it perfectly known, would, I have no doubt, put it upon a level with many of the languages that are most in esteem for their warmth and bold images. For instance, the Otahitians express their notions of death very emphatically, by saying, "That the soul goes into darkness; or rather into night." And, if you seem to entertain any doubt in asking the question, "if such a person is their mother," they immediately reply with surprise, "Yes; the mother that bore me." They have one expression that corresponds exactly with the phraseology of the Scriptures, where we read of the "yearning of the bowels." They use it on all occasions, when the passions give them uneasiness; as they constantly refer pain from grief, anxious desire, and other affections, to the bowels, as its seat; where they likewise suppose all operations of the mind are performed. Their language admits of that inverted arrangement of words which so much distinguishes the Latin and Greek from most of our modern European tongues, whose imperfections require a more orderly construction, to prevent ambiguities. It is so copious, that for the bread-fruit alone, in its different states, they have above twenty names; as many for the *taro* root; and about ten for the cocoa-nut. Ad to this, that, besides the common dialect, they often expostulate, in a kind of stanza or recitative, which is answered in the same manner.

Their arts are few and simple; yet, if we may credit them, they perform cures in surgery which our extensive knowledge in that branch has not as yet enabled us to imitate. In simple fractures they bind them up with splints; but if part of the substance of the bone be lost, they insert a piece of wood between the fractured ends, made hollow like the deficient part. In five or six days the *rapao*, or surgeon, inspects the wound, and finds the wood partly covered with the growing flesh. In as many more days it is generally entirely covered; after which, when the patient has acquired some strength, he bathes in the water and recovers. We know that wounds will heal over leaden bullets; and sometimes, though rarely, over other extraneous bodies. But what makes me entertain some doubt of the

* This sport was more frequently practised with a board generally about five or six feet long, and rather more than a foot wide, sometimes flat, but more frequently slightly convex on both sides; the management of a canoe in such circumstances requiring a greater degree of skill than the *papa fahee*, or surf-board. Great numbers would join in this amusement, which was common at the Sandwich as well as the Society Islands, openings in the reef or the entrance to some of the bays being generally chosen as the scene of the sport, which was partaken by young, old, the common people, and the most dignified chiefs and members of the royal family. The only danger apprehended was from sharks, for whom a bright look out was kept; the cry of *moo*, a shark, once raised, was echoed throughout the assembly, who rushed to the shore, while endeavouring to alarm their dreaded enemy by shouts and splashing the water around

them. This in common with all the other "sources of entertainment, in their juvenile or more advanced periods of life," has been discouraged among the Tahitians since their conversion to Christianity. Mr. Ellis, after giving a particular account of their different sports and amusements, tells us that "with the exception of one or two they have all, however, been discontinued, especially among the adults; and the number of those followed by the children" (even to their swings and kites, both which are spoken of in the past tense), "is greatly diminished." This Mr. Ellis considers to be "on no account matter of regret." The abolition of all the superstitious and occasionally obscene rites which were connected with some of these games was undoubtedly necessary, but the total abolition of all kinds of sports, especially in such a climate and among such a people, appears to us a proceeding of very doubtful policy.—Eo.

truth of so extraordinary skill, as in the above instance, is, that in other cases which fell under my own observation, they are far from being so dexterous. I have seen the stump of an arm, which was taken off after being shattered by a fall from a tree, that bore no marks of skilful operation, though some allowance be made for their defective instruments. And I met with a man going about with a dislocated shoulder, some months after the accident, from their being ignorant of a method to reduce it; though this be considered as one of the simplest operations of our surgery. They know that fractures or luxations of the spine are mortal, but not fractures of the skull; and they likewise know, from experience, in what parts of the body wounds prove fatal. They have sometimes pointed out those inflicted by spears, which, if made in the direction they mentioned, would certainly have been pronounced deadly by us; and yet these people have recovered. Their physical knowledge seems more confined; and that, probably, because their diseases are fewer than their accidents. The priests, however, administer the juices of herbs in some cases; and women who are troubled with after-pains, or other disorders after child-bearing, use a remedy which one would think needless in a hot country. They first heat stones, as when they bake their food; then they lay a thick cloth over them, upon which is put a quantity of a small plant of the mustard kind; and these are covered with another cloth. Upon this they seat themselves, and sweat plentifully, to obtain a cure. The men have practised the same method for the venereal *lues*, but find it ineffectual. They have no emetic medicines*.

Notwithstanding the extreme fertility of the island, a famine frequently happens, in

* Mr. Ellis bears ample testimony as to the surgical skill possessed by the Otaheitanians, and relates some facts so singular, that whilst we feel bound to transcribe them, we must do so without comment. He informs us that "the diseases formerly prevailing among the South Sea Islanders were comparatively few; those they now suffer are principally pulmonary, intermittent, and cutaneous." The priests were the physicians, and "an invocation to some spirit or god attended the administration of every medicine. No animal or mineral substances were admitted into their pharmacopœia; vegetable substances alone were used, and these simply pulverized, infused, heated on the fire or with red hot stones, and often fermented. Many of their applications, however, were powerful, especially a species of gourd or wild cucumber.

"There were persons among them celebrated as oculists, but their skill principally consisted in removing foreign substances from the eye; and when applied to for this purpose, they, as well as others, received the payment or fee before they commenced their operations; but if the present did not please them, they, to satisfy their employers, sometimes took one splinter, &c., out of the eye, and left another in, that they might be sent for again. Their surgeons were remarkably dexterous in closing a cut or thrust, by drawing the edges carefully together, and applying the pungent juice of the ape, *arum costatum*, to the surface. This, acting like caustic, must have caused great pain. A fractured limb they set without much trouble; applying splinters of bamboo-cane to the sides, and keeping it bound up till healed. A dislocation they usually succeeded in reducing; but the other parts of their surgical practice were marked by a rude promptness, temerity, and barbarism, almost incredible. A man one day fell from a tree and dislocated some part of his neck. His companions, on perceiving it, instantly took him up; one of them placed his head between his own knees and held it firmly, while the others, taking hold of his body, twisted the joint into its proper place. On another occasion a number of young men, in the district of Tare, were carrying large stones suspended from each end of a pole across their shoulders, their usual mode of carrying a burden: one of them so injured the vertebræ as to be almost unable to move; he had, as they expressed it, *fati tuæ*, broken the back. His fellow workmen laid him flat on his face on the grass, one grasped and pulled his shoulders, and the other's legs, while a third actually

pressed with both knees his whole weight upon the back, where the bones appeared displaced. It was not far from Mr. Barff's house where the accident occurred, and observing the people assembled, he went to inquire the cause, and saw them thus engaged. On his asking what they were doing, they coolly replied, that they were only straightening the man's back, which had been broken with carrying stones. The vertebræ appeared to be replaced; they bound a long girdle repeatedly round his body, led him home, and without any other treatment he was, in a short time, able to resume his employment.

"The operation of trepanning they sometimes attempted, and say they have practised it with success. It is reported that there are persons living in the island of Borabora on whom it has been performed, or at least an operation very much resembling it: the bones of the skull having been fractured in battle, they have cleared away the skin and coverings, and, having removed the fractured piece of bone, have carefully fitted in a piece of cocoa-nut shell, and replaced the covering and skin; on the healing of which the man has recovered. I never saw any individual who had undergone this operation, but, from the concurrent testimony of the people, I have no doubt they have performed it. It is also related, although I confess I can scarcely believe it, that on some occasions, when the brain has been injured as well as the bone, they have opened the skull, taken out the injured portion of the brain, and, having a pig ready, have killed it, taken out the pig's brains, put them in the man's head, and covered them up. They persist in stating that this has been done; but add, that the persons always became furious with madness, and died. They had no idea of phlebotomy as a remedy for disease, but were clever at lancing an abscess, which was generally effected with the thorn from a kind of bramble, or a shark's tooth.

"However great the influence of those persons who administered medicine, or practised surgery, might formerly have been, it has entirely ceased since the people have been acquainted with the more certain and efficacious application of English remedies. Like the priests in their temples formerly, the minister of their religion, at every station, is now sought in all cases of sickness as their physician; and no small portion of our time was occupied in administering medicine, so far as our scanty means would admit."—Ellis's *Polynesian Researches*, vol. 3, pp. 37, 42, 44

which, if, is said, many perish. Whether this be owing to the failure of some seasons, to over population, which must sometimes almost necessarily happen, or to wars, I have not been able to determine; though the truth of the fact may be fairly inferred, from the great economy that they observe with respect to their food, even when there is plenty. In times of scarcity, after their bread-fruit and yams are consumed, they have recourse to various roots which grow without cultivation upon the mountains. The *patarra*, which is found in vast quantities, is what they use first. It is not unlike a very large potatoe or yam, and good when in its growing state; but when old is full of hard stringy fibres. They then eat two other roots, one not unlike *taro*; and lastly, the *choce*. This is of two sorts; one of them possessing deleterious qualities, which obliges them to slice and macerate it in water a night before they bake and eat it. In this respect it resembles the *cassava* root of the West Indies; but it forms a very insipid, moist paste, in the manner they dress it. However, I have seen them eat it at times when no such scarcity reigned. Both this and the *patarra* are creeping plants; the last with ternate leaves.

Of animal food a very small portion falls, at any time, to the share of the lower class of people; and then it is either fish, sea-eggs, or other marine productions; for they seldom or ever eat pork. The *Eree de hoi** alone is able to furnish pork every day; and inferior chiefs, according to their riches, once a week, fortnight, or month. Sometimes they are not even allowed that; for when the island is impoverished by war, or other causes, the chief prohibits his subjects to kill any hogs; and this prohibition, we were told, is in force sometimes for several months, or even for a year or two. During that restraint the hogs multiply so fast, that there are instances of their changing their domestic state and turning wild. When it is thought proper to take off the prohibition, all the chiefs assemble at the king's place of abode; and each brings with him a present of hogs. The king then orders some of them to be killed, on which they feast; and, after that, every one returns home with liberty to kill what he pleases for his own use. Such a prohibition was actually in force on our arrival here; at least, in all those districts of the island that are immediately under the direction of Otoo. And, lest it should have prevented our going to Matavai after leaving Oheitepeha, he sent a message to assure us that it should be taken off as soon as the ships arrived there. With respect to us, we found it so; but we made such a consumption of them that, I have no doubt, it would be laid on again as soon as we sailed. A similar prohibition is also sometimes extended to fowls.

It is also amongst the better sort that the *ava* is chiefly used. But this beverage is prepared somewhat differently from that which we saw so much of at the Friendly Islands. For they pour a very small quantity of water upon the root here; and sometimes roast or bake and bruise the stalks, without chewing it previously to its infusion. They also use the leaves of the plant here, which are bruised and water poured upon them, as upon the root. Large companies do not assemble to drink it, in that sociable way which is practised at Tongataboo. But its pernicious effects are more obvious here; perhaps owing to the manner of preparing it; as we often saw instances of its intoxicating, or rather stupifying powers. Some of us who had been at these islands before, were surprised to find many people who, when we saw them last, were remarkable for their size and corpulency, now almost reduced to skeletons; and, upon inquiring into the cause of this alteration, it was universally allowed to be the use of the *ava*. The skins of these people were rough, dry, and covered with scales; which, they say, every now and then fall off, and their skin is, as it were, renewed. As an excuse for a practice so destructive, they allege that it is adopted to prevent their growing too fat; but it evidently enervates them, and in all probability shortens their days. As its effects had not been so visible during our former visits, it is not unlikely that this article of luxury had never been so much abused as at this time. If it continues to be so fashionable, it bids fair to destroy great numbers.

The times of eating, at Otaheite, are very frequent. Their first meal, or (as it may rather be called) their last, as they go to sleep after it, is about two o'clock in the morning;

* Mr. Anderson invariably, in his manuscript, writes *Eree de hoi*. According to Captain Cook's mode, it is *Eree rahie*. This is one of the numerous instances that

perpetually occur of our people's representing the same word differently.—[See note, Vol. I., p. 106. Ed.]

and the next is at eight. At eleven, they dine, and again, as Omai expressed it, at two, and at five; and sup at eight. In this article of domestic life, they have adopted some customs which are exceedingly whimsical. The women, for instance, have not only the mortification of being obliged to eat by themselves, and in a different part of the house from the men; but by a strange kind of policy, are excluded from a share of most of the better sorts of food. They dare not taste turtle, nor fish of the tunny kind, which is much esteemed; nor some particular sorts of the best plantains; and it is very seldom that even those of the first rank are suffered to eat pork. The children of each sex also eat apart; and the women, generally, serve up their own victuals; for they would certainly starve before any grown man would do them such an office. In this, as well as in some other customs relative to their eating, there is a mysterious conduct which we could never thoroughly comprehend. When we inquired into the reasons of it, we could get no other answer, but that it is right and necessary it should be so*.

VIEW OF DOLA-BOLA

As in such a life their women must contribute a very large share of their happiness, it is rather surprising, besides the humiliating restraints they are laid under with regard to food, to find them often treated with a degree of harshness, or rather brutality, which one would scarcely suppose a man would bestow on an object for whom he had the least affection. Nothing, however, is more common, than to see the men beat them without mercy; and,

* "The institutes of Oro and Tane, inexorably required, not only that the wife should not eat those kinds of food of which the husband partook, but that she should not eat in the same place, or prepare her food at the same fire. This restriction applied not only to the wife with regard to her husband, but to all the individuals of the female sex, from their birth to their death. In sickness or pain, or whatever other circumstances the mother, the wife, the sister or the daughter might be brought into, it was never relaxed. The men, especially those who occasionally attended on the service of idol worship in the temple, were considered *ra*, or sacred; while the female sex was considered *noa*, or common: the men were allowed to eat the flesh of the pig and of fowls, and a variety of fish, cocoa-nuts and plantains, and whatever was presented as an offering to the gods: these the females, on pain of death, were forbidden to touch, as it was supposed they would pollute them. The fires at which the men's food was cooked, were also sacred, and were forbidden to be used by

the females. The baskets in which their provision was kept, and the house in which the men ate, were also sacred, and prohibited to the females under the same cruel penalty. Hence the inferior food, both for wives, daughters, &c., was cooked at separate fires, deposited in distinct baskets, and eaten in lonely solitude by the females, in little huts erected for the purpose. The most offensive and frequent imprecations, which the men were accustomed to use towards each other, referred also to this degraded condition of the females. *Etaha mili noa oe na to medua!* Mayest thou become a bottle to hold salt water for thy mother! or another, *Mayest thou be baked as food for thy mother!* were imprecations they were accustomed to denounce upon each other; or, *Take out your eye-ball and give it to your mother to eat.* Their domestic habits were not only unsocial, but irregular, alike in their periods for refreshment and sleep, and their seasons of labour and amusement."—Ellis's *Polynesian Researches*, vol. i. p. 129.

unless this treatment is the effect of jealousy, which both sexes at least pretend to be sometimes infected with, it will be difficult to admit this as the motive, as I have seen several instances where the women have preferred personal beauty to interest ; though I must own, that, even in these cases, they seem scarcely susceptible of those delicate sentiments that are the result of mutual affection ; and, I believe, that there is less Platonic love in Otaheite than in any other country.

WEAPONS OF THE FRIENDLY ISLES.

Their religious system is extensive, and, in many instances, singular ; but few of the common people have a perfect knowledge of it ; that being confined chiefly to their priests, who are pretty numerous *. They do not seem to pay any respect to one god as possessing

* "Among the multitude of their gods, there was no one whom they regarded as a supreme intelligence or presiding spiritual being, possessing any moral perfections, resembling those which are inseparable from every sentiment we entertain of the true God. Like the most ancient nations, they ascribe the origin of all things to a state of chaos, or darkness, and even the first existence of their principal deities refer to this source. Taaroa, Oro, and Tane, with other deities of the highest order, are on this account said to be *fanan po*, born of night. But the origin of the gods, and their priority of existence in comparison with the formation of the earth, being a matter of uncertainty even among the native priests, involves the whole in obscurity. Taaroa, the Tanaroa of the Hawaiians, and the Tangaroa of the Western Isles, is generally spoken of by the Tahitians as the first and principal god, uncreated, and existing from the beginning, or from the time he emerged from the *po*, or world of darkness.

"Several of their *taata-paari*, or wise men, pretend that, according to other traditions, Taaroa was only a man who was deified after death. By some he is spoken of as the progenitor of the other gods, the creator of the heavens, the earth, the sea, man, beasts, fowls, fishes, &c. ; while by others it is stated, that the existence of the land, or the universe, was anterior to that of the gods.

"There does not appear to be anything in the Tahitian mythology corresponding with the doctrine of the Trinity, or the Hindoo traditions of Brahma, Vishnu, and Siva. Taaroa was the former and father of the gods ; Oro was his first son ; but there were three classes or orders between Taaroa and Oro. As in the theogony of the ancients, a bird was a frequent emblem of deity ; and in the body of a bird they supposed the god often approached the *marae*, where it left the bird, and entered the *too*, or image, through which it was supposed to communicate with the priest.

The inferior gods and men, the animals, the air, earth, and sea, were by some supposed to originate in the procreative power of the supreme god. One of the legends of their origin and descent, furnished to some of the missionaries, by whom it has been recorded, states, that Taaroa was born of night, or proceeded from chaos, and was not made by any other god. His consort, Ofeufumaiteri, also uncreated, proceeded from the *po*, or night. Oro, the great national idol of Raiatea, Tahiti, Eimeo, and some other islands, was the son of Taaroa and Ofeufumaiteri. Oro took a goddess to wife, who became the mother of two sons. These four male and two female deities constituted the whole of their highest rank of divinities, according to the traditions of the priests of Tahiti—though the late king informed Mr. Nott that there was another god, superior to them all, whose name was Rumia ; he did not, however, meet with any of their priests or heads who knew anything about him. The tradition most generally received in the Windward Islands, ascribed the origin of the world, and all that adorn or inhabit it, to the procreative power of Taaroa, who is said to have embraced a rock, the imagined foundation of all things, which afterwards brought forth the earth and sea. It states that soon after this, the heralds of day, the dark and light blue sky, appeared before Taaroa, and solicited a soul for his offspring, the then inanimate universe. The foundation of all replied, It is done, and directed his son, the sky-producer, to accomplish his will. In obedience to the mandate of Taaroa, his son looked up into the heavens, and the heavens received the power of bringing forth new skies and clouds, sun moon and stars, thunder and lightning, rain and wind. He then looked downwards, and the unformed mass received the power to bring forth earth, mountains, rocks, trees, herbs and flowers, beasts, birds, and insects, fountains, rivers, and fish. Raitubu, or sky-producer, then looked to the abyss, and imparted to it

pre-eminence, but believe in a plurality of divinities, who are all very powerful; and in this case, as in different parts of the island, and the other islands in the neighbourhood, have different ones. the inhabitants of each, no doubt, think that they have chosen the most eminent, or, at least, one who is invested with power sufficient to protect them, and to supply all their wants. If he should not answer their expectations, they think it no impiety to change, as has very lately happened in Tiareaboo, where in the room of the two divinities formerly honoured there, Oraa, god of Bolabola, has been adopted, I should suppose, because he is the protector of a people who have been victorious in war; and as, since they have made this change, they have been very successful themselves against the inhabitants of *Otaheite-nooe*, they impute it entirely to *Oraa*, who, as they literally say, fights their battles. Their assiduity in serving their gods is remarkably conspicuous. Not only the *whallas*, or offering-places of the *morais*, are commonly loaded with fruit and animals, but there are few houses where you do not meet with a small place of the same sort near them. Many of them are so rigidly scrupulous, that they will not begin a meal without first laying aside a morsel for the *Eatooa*; and we had an opportunity, during this voyage, of seeing their superstitious zeal carried to a most pernicious height in the instance of human sacrifices; the occasions of offering which, I doubt, are too frequent. Perhaps they have recourse to them when misfortunes occur; for they asked if one of our men, who happened to be confined when we were detained by a contrary wind, was *taboo*? Their prayers are also very frequent, which they chant, much after the manner of the songs in their festive entertainments. And the women, as in other cases, are also obliged to show their inferiority in religious observances; for it is required of them that they should partly uncover themselves, as they pass the *morais*; or take a considerable circuit to avoid them. Though they have no notion that their god must always be conferring benefits without sometimes forgetting them, or suffering evil to befall them, they seem to regard this less than the attempts of some more inauspicious being to hurt them. They tell us that *Etee* is an evil spirit, who sometimes does them mischief; and to whom, as well as to their god, they make offerings. But the mischiefs they apprehend from any superior invincible beings, are confined to things merely temporal.

They believe the soul to be both immaterial and immortal. They say that it keeps fluttering about the lips during the pangs of death; and that then it ascends and mixes with, or, as they express it, is eaten by the deity. In this state it remains for some time; after which, it departs to a certain place destined for the reception of the souls of men, where it exists in eternal night; or, as they sometimes say, in twilight or dawn. They have no idea of any permanent punishment after death for crimes that they have committed on earth; for the souls of good and bad men are eat indiscriminately by God. But they certainly consider this coalition with the deity as a kind of purification necessary to be undergone, before they enter a state of bliss. For, according to their doctrine, if a man refrain from all connexion with women some months before death, he passes immediately into his eternal mansion without such a previous union; as if already by this abstinence he were pure enough to be exempted from the general lot. They are, however, far from entertaining those sublime conceptions of happiness which our religion, and, indeed, reason, gives us room to expect hereafter. The only great privilege they seem to think they shall acquire by death, is immortality; for they speak of spirits being, in some measure, not totally divested of those passions which actuated them when combined with material vehicles. Thus, if souls who were formerly enemies should meet, they have many conflicts; though, it should seem, to no purpose, as they are accounted invulnerable in this invisible state. There is a similar reasoning with regard to the meeting of man and wife. If the husband

power to bring forth the purple water, rocks and corals, and all the inhabitants of the ocean. Some of the gods are said to have been produced in the same way, namely, by the god Taaroa looking at the goddess his wife, who afterwards became the mother of his children.

"Raa was also ranked among the principal deities, although inferior to Taaroa and Oro, and he was supposed to be an independent being; but nothing of consequence is ascribed to him in the native fables. His wife, Otupapa,

who was also a divinity, bore him three sons and two daughters. Tane, the tutelary idol of Huahine, was also numbered among the uncreated gods, considered as having proceeded from the state of night, or chaos. His goddess was called Tanfairei. They were the parents of eight sons, who were all classed with the most powerful gods, and received the highest honours."—Ellis's *Polynesian Researches*, vol. i., p. 326, 12mo. ed. 1831.

dies first, the soul of his wife is known to him on its arrival in the land of spirits. They resume their former acquaintance in a spacious house, called *Tourooa*, where the souls of the deceased assemble to recreate themselves with the gods. She then retires with him to his separate habitation, where they remain for ever, and have an offspring; which, however, is entirely spiritual; as they are neither married, nor are their embraces supposed to be the same as with corporeal beings.

Some of their notions about the deity are extravagantly absurd. They believe, that he is subject to the power of those very spirits to whom he has given existence; and that, in their turn, they frequently eat or devour him, though he possesses the power of recreating himself. They doubtless use this mode of expression, as they seem incapable of conversing about immaterial things without constantly referring to material objects to convey their meaning. And in this manner they continue the account, by saying, that, in the *Tourooa*, the deity inquires, if they intend or not to destroy him? And that he is not able to alter their determination. This is known to the inhabitants on earth, as well as to the spirits; for when the moon is in its wane, it is said, that they are then devouring their *Eatooa*; and that, as it increases, he is renewing himself. And to this accident, not only the inferior, but the most eminent gods are liable. They also believe that there are other places for the reception of souls at death. Thus, those who are drowned in the sea, remain there; where they think that there is a fine country, houses, and every thing that can make them happy. But what is more singular, they maintain that not only all other animals, but trees, fruit, and even stones, have souls, which at death, or upon being consumed or broken, ascend to the divinity, with whom they first mix, and afterwards pass into the mansion allotted to each.

They imagine that their punctual performance of religious offices procures for them every temporal blessing. And as they believe, that the animating and powerful influence of the divine spirit is everywhere diffused, it is no wonder that they join to this many superstitious opinions about its operations. Accordingly, they believe that sudden deaths, and all other accidents, are effected by the immediate action of some divinity. If a man only stumble against a stone and hurt his toe, they impute it to an *Eatooa*; so that they may be literally said, agreeable to their system, to tread enchanted ground. They are startled, in the night, on approaching a *teopapao*, where the dead are exposed, in the same manner that many of our ignorant and superstitious people are with the apprehensions of ghosts, and at the sight of a church-yard; and they have an equal confidence in dreams, which they suppose to be communications either from their god, or from the spirits of their departed friends, enabling those favoured with them to foretel future events; but this kind of knowledge is confined to particular people. Omai pretended to have this gift. He told us that the soul of his father had intimated to him in a dream, on the 26th of July, 1776, that he should go on shore, at some place, within three days; but he was unfortunate in this first attempt to persuade us that he was a prophet; for it was the 1st of August before we got into Teneriffe. Amongst them, however, the dreamers possess a reputation little inferior to that of their inspired priests and priestesses, whose predictions they implicitly believe, and are determined by them in all undertakings of consequence. The priestess who persuaded Opoony to invade Ulietea, is much respected by him; and he never goes to war without consulting her. They also, in some degree, maintain our old doctrine of planetary influence; at least, they are sometimes regulated, in their public counsels, by certain appearances of the moon; particularly when lying horizontally, or much inclined on the convex part, on its first appearance after the change, they are encouraged to engage in war, with confidence of success.

They have traditions concerning the creation, which, as might be expected, are complex and clouded with obscurity. They say, that a goddess, having a lump or mass of earth suspended in a cord, gave it a swing, and scattered about pieces of land, thus constituting Otahite, and the neighbouring islands, which were all peopled by a man and a woman originally fixed at Otahite. This, however, only respects their own immediate creation; for they have notions of an universal one before this; and of lauds, of which they have now no other knowledge than what is mentioned in the tradition. Their most remote account reaches to Tatoona, and Tapuppa, male and female stones or rocks, who support

the congeries of land and water, or our globe underneath. These produced Totorro, who was killed, and divided into land, and, after him, Otaia and Oroo were begotten, who were afterwards married, and produced, first land, and then a race of gods. Otaia is killed, and Oroo marries a god, her son, called Teorraha, whom she orders to create more land, the animals, and all sorts of food upon the earth; as also the sky, which is supported by men called Teeferei. The spots observed in the moon are supposed to be groves of a sort of trees which once grew in Otaheite, and being destroyed by some accident, their seeds were carried up thither by doves, where they now flourish.

They have also many legends, both religious and historical; one of which latter, relative to the practice of eating human flesh, I shall give the substance of, as a specimen of their method. A long time since, there lived in Otaheite two men called *Tahecai*; the only name they yet have for cannibals. None knew from whence they came, or in what manner they arrived at the island. Their habitation was in the mountains, from whence they used to issue, and kill many of the natives, whom they afterwards devoured, and by that means prevented the progress of population. Two brothers, determined to rid their country of such a formidable enemy, used a stratagem for their destruction with success. These still lived farther upward than the *Tahecai*, and in such a situation, that they could speak to them without greatly hazarding their own safety. They invited them to accept of an entertainment that should be provided for them, to which these readily consented. The brothers then taking some stones, heated them in a fire, and thrusting them into pieces of *makee*, desired one of the *Tahecai* to open his mouth. On which, one of these pieces was dropped in, and some water poured down, which made a boiling or hissing noise in quenching the stone, and killed him. They intreated the other to do the same; but he declined it, representing the consequences of his companion's eating. However, they assured him that the food was excellent, and its effects only temporary; for that the other would soon recover. His credulity was such, that he swallowed the bait, and shared the fate of the first. The natives then cut them in pieces, which they buried; and conferred the government of the island on the brothers, as a reward for delivering them from such monsters. Their residence was in the district called Whapaeenoo; and, to this day, there remains a bread-fruit tree, once the property of the *Tahecai*. They had also a woman, who lived with them, and had two teeth of a prodigious size. After they were killed, she lived at the island Otaia, and when dead, was ranked amongst their deities. She did not eat human flesh, as the men; but, from the size of her teeth, the natives still call any animal that has a fierce appearance, or is represented with large tusks, *Tahecai*.

Every one must allow, that this story is just as natural as that of Hercules destroying the Hydra, or the more modern one of Jack the giant-killer. But I do not find, that there is any moral couched under it, any more than under most old fables of the same kind, which have been received as truths only during the prevalence of the same ignorance that marked the character of the ages in which they were invented. It, however, has not been improperly introduced, as serving to express the horror and detestation entertained here against those who feed upon human flesh. And yet, from some circumstances, I have been led to think, that the natives of these isles were formerly cannibals. Upon asking Omai, he denied it stoutly; yet mentioned a fact, within his own knowledge, which almost confirms such an opinion. When the people of Bolabola, one time, defeated those of Huaheine, a great number of his kinsmen were slain. But one of his relations had, afterward, an opportunity of revenging himself, when the Bolabola men were worsted in their turn, and cutting a piece out of the thigh of one of his enemies, he broiled and eat it. I have also frequently considered the offering of the person's eye who is sacrificed to the chief, as a vestige of a custom which once really existed to a greater extent, and is still commemorated by this emblematical ceremony.*

* Mr. Ellis, when alluding to this conjecture of Mr. Anderson's, expresses his opinion that the fact of offering the eye to the king does not afford any very strong evidence of the existence of cannibalism among the Tahitians, although he entertained no doubt that the inhabitants of several of the South-sea Islanders have eaten human flesh.

The eye was regarded by the natives as the "organ of emblem of power," and as such was offered to the king. Whether the Tahitians ever indulged in human banquets seems still doubtful, but the practice was common in the Marquesas and the Hervey Islands, the inhabitants of the latter group being frequently driven to resort to the horrid

The being invested with the *maro*, and the presiding at human sacrifices, seem to be the peculiar characteristics of the sovereign. To these, perhaps, may be added, the blowing a conch-shell, which produces a very loud sound. On hearing it, all his subjects are obliged to bring food of every sort to his royal residence in proportion to their abilities. On some other occasions, they carry their veneration for his very name to an extravagant and very destructive pitch. For if, on his accession to the *maro*, any words in their language be found to have a resemblance to it in sound, they are changed for others; and if any man be bold enough not to comply, and continue to use those words, not only he, but all his relations, are immediately put to death. The same severity is exercised toward those who shall presume to apply this sacred name to any animal. And, agreeably to this custom of his countrymen, Omai used to express his indignation, that the English should give the names of prince or princess to their favourite horses or dogs. But while death is the punishment for making free with the name of their sovereign, if abuse be only levelled at his government, the offender escapes with the forfeiture of land and houses.

The king never enters the house of any of his subjects; but has, in every district, where he visits, houses belonging to himself. And if, at any time, he should be obliged by accident to deviate from this rule, the house thus honoured with his presence and every part of its furniture is burnt. His subjects not only uncover to him, when present, down to the waist; but if he be at any particular place, a pole, having a piece of cloth tied to it, is set up somewhere near, to which they pay the same honours. His brothers are also entitled to the first part of the ceremony; but the women only uncover to the females of the royal family. In short, they seem even superstitious in their respect to him, and esteem his person little less than sacred. And it is, perhaps to these circumstances, that he owes the quiet possession of his dominions. For even the people of Tiraboo allow him the same honours as his right, though at the same time they look upon their own chief as more powerful; and say, that he would succeed to the government of the whole island, should the present reigning family become extinct. This is the more likely, as Waheia dooa not only possesses Tiraboo, but many districts of Opooreano. His territories, therefore, are almost equal in extent to those of Otoo; and he has besides the advantage of a more populous and fertile part of the island. His subjects, also, have given proofs of their superiority, by frequent victories over those of Otaheite-nooe, whom they affect to speak of as contemptible warriors, easily to be worsted, if, at any time, their chief should wish to put it to the test.

The ranks of people, besides the *Eree de hoi*, and his family, are the *Erees*, or powerful chiefs; the *Manahoone*, or vassals; and the *Teou*, or *Toutou*, servants, or rather slaves*. The men of each of these, according to the regular institution, form their connexions with women of their respective ranks; but if with any inferior one, which frequently happens, and a child be born, it is preserved, and has the rank of the father, unless he happens to be an *Eree*, in which case it is killed. If a woman of condition should choose an inferior person to officiate as a husband, the children he has by her are killed. And if a *Teou* be caught in an intrigue with a woman of the blood royal, he is put to death. The son of the *Eree de hoi* succeeds his father in title and honours as soon as he is born; but if he should have no children, the brother assumes the government at his death. In other families, possessions always descend to the eldest son; but he is obliged to maintain his brothers and sisters, who are allowed houses on his estates.

The boundaries of the several districts into which Otaheite is divided, are, generally, either

practice by sheer nungur. It is stated that in times of famine "the husband preyed upon the body of his wife, and the parent upon his child, in a most revolting manner, without subjecting it to any previous preparation." The luxuriant vegetation of Otaheite saves the inhabitants from enduring such straits, and they probably went no farther than devouring human bodies symbolically; but the reluctance felt by the islanders to confess the enormities formerly practised, has prevented even the missionaries from procuring precise information on this point. The following passage contains the sum of the information which is afforded on the subject by Mr. Ellis. "Their mythology

led them to suppose, that the spirits of the dead are eaten by the gods or demons; and that the spiritual part of their sacrifices is eaten by the spirit of the idol before whom it is presented. Birds resorting to the temple, were said to feed upon the bodies of the human sacrifices, and it was imagined the god approached the temple in the bird, and thus devoured the victims placed upon the altar. In some of the islands, 'man-eater' was an epithet of the principal deities; and it was probably in connexion with this, that the king, who often personated the god, appeared to eat the human eye. Part of some human victims were eaten by the priests."—Ed.

* See note, vol. i. p. 106.

rivulets, or low hills, which, in many places, jut out into the sea. But the subdivisions into particular property are marked by large stones, which have remained from one generation to another. The removal of any of these gives rise to quarrels, which are decided by arms; each party bringing his friends into the field. But if any one complain to the *Eree de hoi*, he terminates the difference amicably. This is an offence, however, not common; and long custom seems to secure property here as effectually as the most severe laws do in other countries. In conformity also to ancient practice established amongst them, crimes of a less general nature are left to be punished by the sufferer, without referring them to a superior. In this case, they seem to think that the injured person will judge as equitably as those who are totally unconcerned; and as long custom has allotted certain punishments for crimes of different sorts, he is allowed to inflict them, without being amenable to any other person. Thus, if any one be caught stealing, which is commonly done in the night, the proprietor of the goods may put the thief instantly to death; and if any one should inquire of him after the deceased, it is sufficient to acquit him, if he only inform them of the provocation he had to kill him. But so severe a punishment is seldom inflicted, unless the articles that are stolen be reckoned very valuable; such as breast-plates and plaited hair. If only cloth, or even hogs be stolen, and the thief escape, upon his being afterward discovered, if he promise to return the same number of pieces of cloth, or of hogs, no farther punishment is inflicted. Sometimes, after keeping out of the way for a few days, he is forgiven, or, at most, gets a slight beating. If a person kill another in a quarrel, the friends of the deceased assemble, and engage the survivor and his adherents. If they conquer, they take possession of the house, lands, and goods of the other party; but if conquered, the reverse takes place. If a *Manahoone* kill the *Toutou*, or slave of a chief, the latter sends people to take possession of the lands and house of the former, who flies either to some other part of the island, or to some of the neighbouring islands. After some months he returns, and finding his stock of hogs much increased, he offers a large present of those, with some red feathers, and other valuable articles, to the *Toutou's* master, who generally accepts the compensation, and permits him to repossess his house and lands. This practice is the height of venality and injustice; and the slayer of the slave seems to be under no farther necessity of absconding, than to impose upon the lower class of people who are the sufferers. For it does not appear, that the chief has the least power to punish this *Manahoone*; but the whole management marks a collusion between him and his superior, to gratify the revenge of the former, and the avarice of the latter. Indeed, we need not wonder that the killing of a man should be considered as so venial an offence, amongst a people who do not consider it as any crime at all to murder their own children. When talking to them about such instances of unnatural cruelty, and asking, whether the chiefs, or principal people were not angry, and did not punish them? I was told, that the chief neither could nor would interfere in such cases; and that every one had a right to do with his own child what he pleased.

Though the productions, the people, and the customs and manners of all the islands in the neighbourhood, may, in general, be reckoned the same as at Otaheite, there are a few differences which should be mentioned, as this may lead to an inquiry about more material ones hereafter, if such there be, of which we are now ignorant. With regard to the little island Mataia, or Osnaburgh Island, which lies twenty leagues east of Otaheite, and belongs to a chief of that place, who gets from thence a kind of tribute, a different dialect from that of Otaheite is there spoken. The men of Mataia also wear their hair very long, and when they fight, cover their arms with a substance which is beset with shark's teeth, and their bodies with a sort of shagreen, being skin of fishes. At the same time, they are ornamented with polished pearl shells, which make a prodigious glittering in the sun; and they have a very large one that covers them before like a shield or breast-plate.

The language of Otaheite has many words, and even phrases, quite unlike those of the islands to the westward of it, which all agree; and it is remarkable for producing great quantities of that delicious fruit we called apples, which are found in none of the others, except Eimeo. It has also the advantage of producing an odoriferous wood, called *eahoi*, which is highly valued at the other isles where there is none; nor even in the south-east peninsula, or Tiaraboo, though joining it. And at Mouroua there is a particular bird found

the subdivisions from one generation to another are decided by the *Ere* ver, not common; severe laws do in st them, crimes of referring them to a judge as equitably certain punishments g amenable to any done in the night, if any one should inform them of the inflicted, unless the es and plaited hair. terward discovered. farther punishment e is forgiven, or, at nds of the deceased they take possession reverse takes place. e to take possession of the island, or to finding his stock of feathers, and other nsation, and permits nality and injustice; absconding, than to es not appear, that management marks he former, and the man should be con- as any crime at all stances of unnatural t, and did not punish uch cases; and that

upon the hills, much esteemed for its white feathers; at which place there is also said to be some of the apples, though it be the most remote of the Society Islands from Otaheite and Eimeo, where they are produced.

Though the religion of all the islands be the same, each of them has its particular or tutelar god; whose names, according to the best information I could receive, are set down in the following list.

GODS OF THE ISLES.

Huaheine, *Tanne*.—Ulietea, *Oroo*.—Otaha, *Tanne*.—Bolabola, *Oraa*.—Mourooa, *Ottoo, ee weiahoc*.—Toobace, *Tamouee*.—Tabooymanoo, or Saunders' Island, which is subject to Huaheine, *Tarooa*.—Eimeo, *Oroo hadoo*.—Otaheite, Otaheite-nooe, *Ooroo*.—Otaheite, Tiaboo, *Opoonoa*, and *Whatooteerre*, (whom they have lately changed for Orna, god of Bolabola). Matai, or Osnaburgh Island, *Toobo, tooboaio, Ry maraiva*.—The low isles, eastward, *Tammaree*.

Besides the cluster of high islands from Mataia to Mourrooa inclusive, the people of Otaheite are acquainted with a low uninhabited island, which they name Mopeechea, and seems to be Howe's Island, laid down to the westward of Mourrooa in our late charts of this ocean. To this the inhabitants of the most leeward islands sometimes go. There are also several low islands, to the north-eastward of Otaheite, which they have sometimes visited, but not constantly; and are said to be only at the distance of two days' sail with a fair wind. They were thus named to me:

Mataeeva, Oanaa (called Oanaa in Dalrymple's Letter to Hawkesworth), Taboohee, Awehee, Kaora, Orootoos, Otavaao, where are large pearls.

The inhabitants of these isles come more frequently to Otaheite, and the other neighbouring high islands, from whose natives they differ in being of a darker colour, with a fiercer aspect, and differently punctured.

POLYNESIAN IDOL.

These low isles are, doubtless, the farthest navigation, which those of Otaheite and the Society Islands perform at present. It seems to be a groundless supposition, made by M. de Bougainville, that they made voyages of the prodigious extent* he mentions; for I found, that it is reckoned a sort of prodigy that a canoe, once driven by a storm from Otaheite, should have fallen in with Mopeechea, or Howe's Island, though so near, and directly to leeward. The knowledge they have of other distant islands is no doubt traditional, and has been communicated to them by the natives of those islands, driven accidentally upon their coasts, who besides giving them the names, could easily inform them of the direction in which the places lie from whence they came, and of the number of days they had been upon the sea. In this manner, it may be supposed that the natives of Wateeo have increased their

* See Bougainville's Voyage autour du Monde, p. 228, where we are told that these people sometimes navigate at the distance of more than three hundred leagues.

catalogue by the addition of Otaheite and its neighbouring isles, from the people we met with there, and also of the other islands these had heard of. We may thus account for that extensive knowledge attributed by the gentlemen of the Endeavour* to Tupia in such matters. And with all due deference to his veracity, I presume that it was by the same means of information that he was able to direct the ship to Oheteroa, without having ever been there himself, as he pretended; which, on many accounts, is very improbable."

CHAPTER X.—PROGRESS OF THE VOYAGE, AFTER LEAVING THE SOCIETY ISLANDS.—CHRISTMAS ISLAND DISCOVERED, AND STATION OF THE SHIPS THERE.—BOATS SENT ASHORE.—GREAT SUCCESS IN CATCHING TURTLE.—AN ECLIPSE OF THE SUN OBSERVED.—DISTRESS OF TWO SEAMEN, WHO HAD LOST THEIR WAY.—INSCRIPTION LEFT IN A BOTTLE.—ACCOUNT OF THE ISLAND.—ITS SOIL.—TREES AND PLANTS.—BIRDS.—ITS SIZE.—FORM.—SITUATION.—ANCHORING GROUND.

AFTER leaving Bolabola, I steered to the northward, close-hauled, with the wind between N.E. and E., hardly ever having it to the southward of E., till after we crossed the line, and had got into north latitudes. So that our course, made good, was always to the W. of N., and sometimes no better than N.W. Though seventeen months had now elapsed since our departure from England, during which we had not, upon the whole, been unprofitably employed, I was sensible that, with regard to the principal object of my instructions, our voyage was at this time only beginning; and, therefore, my attention to every circumstance that might contribute toward our safety and our ultimate success, was now to be called forth anew. With this view I had examined into the state of our provisions at the last islands; and as soon as I had left them and got beyond the extent of my former discoveries, I ordered a survey to be taken of all the boatswain's and carpenter's stores that were in the ships, that I might be fully informed of the quantity, state, and condition of every article; and, by that means, know how to use them to the greatest advantage.

Before I sailed from the Society Islands, I lost no opportunity of inquiring of the inhabitants, if there were any islands in a N. or N.W. direction from them; but I did not find that they knew of any. Nor did we meet with anything that indicated the vicinity of land, till we came to about the latitude of 8° S., where we began to see birds, such as boobies, tropic, and men-of-war birds, tern, and some other sorts. At this time, our longitude was 205° E. Mendana, in his first voyage in 1568 †, discovered an island which he named Isla de Jesus, in latitude 6° 45' S., and 1450 leagues from Callao, which is 200° E. longitude from Greenwich. We crossed this latitude nearly a hundred leagues to the eastward of this longitude, and saw there many of the above-mentioned birds; which are seldom known to go very far from land. In the night, between the 22nd and 23rd, we crossed the line in the longitude of 203° 15' E. Here the variation of the compass was 6° 30' E. nearly.

On the 24th, about half an hour after daybreak, land was discovered bearing N.E. by E. $\frac{1}{2}$ E. Upon a nearer approach, it was found to be one of those low islands so common in this ocean; that is, a narrow bank of land inclosing the sea within. A few cocoa-nut-trees were seen in two or three places; but in general the land had a very barren appearance. At noon, it extended from N.E. by E. to S. by E. $\frac{1}{4}$ E., about four miles distant. The wind was at E.S.E.; so that we were under a necessity of making a few boards to get up to the lee or west side, where we found from forty to twenty and fourteen fathoms water, over a bottom of fine sand; the least depth about half a mile from the breakers, and the greatest about one mile. The meeting with soundings determined me to anchor, with a view to try to get some turtle; for the island seemed to be a likely place to meet with them, and to be without inhabitants. Accordingly, we dropped anchor in thirty fathoms;

* Vol. I. p. 118. We shall have occasion to notice various well-authenticated accounts of voyages of great extent performed in open canoes and boats, in the Appendix, to which we must refer our readers. Mr. Anderson was probably mistaken in undervaluing the information afforded by Tupia.—Ed.

and then a boat was despatched to examine whether it was practicable to land, of which I had some doubt, as the sea broke in a dreadful surf all along the shore. When the boat returned, the officer whom I had intrusted with this examination, reported to me that he could see no place where a boat could land; but that there was great abundance of fish in the shoal water, without the breakers.

At daybreak the next morning I sent two boats, one from each ship, to search more accurately for a landing-place; and, at the same time, two others to fish at a grappling near the shore. These last returned about eight o'clock with upward of two hundredweight of fish. Encouraged by this success, they were despatched again after breakfast, and I then went in another boat, to take a view of the coast and attempt landing; but this I found to be wholly impracticable. Toward noon, the two boats sent on the same search returned. The master, who was in that belonging to the *Resolution*, reported to me, that about a league and a half to the north, was a break in the land, and a channel into the lagoon, consequently, that there was a fit place for landing; and that he had found the same soundings off this entrance as we had where we now lay. In consequence of this report the ships weighed anchor, and after two or three trips came to again in twenty fathoms water, over a bottom of fine dark sand, before a small island that lies at the entrance of the lagoon; and on each side of which there is a channel leading into it; but only fit for boats. The water in the lagoon itself is all very shallow.

On the 26th, in the morning, I ordered Captain Clerke to send a boat with an officer to the S.E. part of the lagoon, to look for turtle; and Mr. King and I went, each in a boat to the N.E. part. I intended to have gone to the most easterly extremity; but the wind blew too fresh to allow it, and obliged us to land more to leeward, on a sandy flat, where we caught one turtle, the only one that we saw in the lagoon. We walked, or rather waded, through the water, to an island; where, finding nothing but a few birds, I left it, and proceeded to the land that bounds the sea to the N.W., leaving Mr. King to observe the sun's meridian altitude. I found this land to be even more barren than the island I had been upon; but walking over to the sea-coast, I saw five turtles close to the shore. One of these we caught, and the rest made their escape. Not seeing any more, I returned on board, as did Mr. King soon after, without having seen one turtle. We, however, did not despair of getting a supply, for some of Captain Clerke's officers who had been ashore on the land to the southward of the channel leading into the lagoon, had been more fortunate, and caught several there.

In the morning of the 27th, the pinnace and cutter, under the command of Mr. King, were sent to the S.E. part of the island, within the lagoon, and the small cutter to the northward where I had been the day before; both parties being ordered upon the same service, to catch turtle. Captain Clerke having had some of his people on shore all night, they had been so fortunate as to turn between forty and fifty on the sand, which were brought on board with all expedition this day. And in the afternoon, the party I had sent northward returned with six. They were sent back again and remained there till we left the island, having in general pretty good success. On the 28th, I landed in company with Mr. Bayly, on the island which lies between the two channels into the lagoon, to prepare the telescopes for observing the approaching eclipse of the sun; which was one great inducement to my anchoring here. About noon, Mr. King returned with one boat and eight turtles, leaving seven behind to be brought by the other boat, whose people were employed in catching more; and, in the evening, the same boat was sent with water and provisions for them. Mr. Williamson now went to superintend this duty in the room of Mr. King, who remained on board, to attend the observation of the eclipse. The next day, Mr. Williamson despatched the two boats back to the ship, laden with turtle. At the same time, he sent me a message, desiring that the boats might be ordered round by sea, as he had found a landing-place on the S.E. side of the island, where most of the turtle were caught; so that, by sending the boats thither, the trouble would be saved of carrying them over the land to the inside of the lagoon, as had been hitherto done. The boats were accordingly despatched to the place which he pointed out.

On the morning of the 30th, the day when the eclipse was to happen, Mr. King.

Mr. Bayly, and myself went ashore on the small island above-mentioned, to attend the observation. The sky was overcast till past nine o'clock, when the clouds about the sun dispersed long enough to take its altitude, to rectify the time by the watch we made use of. After this it was again obscured, till about thirty minutes past nine, and then we found that the eclipse was begun. We now fixed the micrometers to the telescopes, and observed or measured the uneclipsed part of the sun's disk. At these observations, I continued about three quarters of an hour before the end, when I left off, being, in fact, unable to continue them longer, on account of the great heat of the sun, increased by the reflection from the sand. The sun was clouded at times, but was clear when the eclipse ended, the time of which was observed as follows:—

		H.	M.	S.	
By Mr. Bayly	at	0	26	3	} Apparent time P.M.
Mr. King	„	0	26	1	
Myself	„	0	25	37	

Mr. Bayly and I observed with the large achromatic telescopes, and Mr. King with a reflector. As Mr. Bayly's telescope and mine were of the same magnifying power, I ought not to have differed so much from him as I did. Perhaps it was in part, if not wholly, owing to a protuberance in the moon which escaped my notice, but was seen by both the other gentlemen.

In the afternoon the boats and turtling party, at the south-east part of the island, all returned on board except a seaman belonging to the *Discovery*, who had been missing two days. There were two of them, at first, who had lost their way; but disagreeing about the most probable track to bring them back to their companions, they had separated; and one of them joined the party, after having been absent twenty-four hours, and been in great distress. Not a drop of fresh water could be had, for there is none upon the whole island; nor was there a single cocoa-nut tree on that part of it. In order to allay his thirst, he had recourse to the singular expedient of killing turtle, and drinking their blood. His mode of refreshing himself when weary, of which he said he felt the good effects, was equally whimsical. He undressed himself and lay down for some time in the shallow water upon the beach. It was a matter of surprise to every one, how these two men could contrive to lose themselves. The land over which they had to travel, from the sea-coast to the *lagoon*, where the boats lay, was not more than three miles across; nor was there anything to obstruct their view; for the country was a flat, with a few shrubs scattered upon it; and from many parts of it the masts of the ships could easily be seen. But this was a rule of direction they never once thought of; nor did they recollect in what quarter of the island the ships had anchored; and they were as much at a loss how to get back to them, or to the party they had straggled from, as if they had just dropped from the clouds. Considering how strange a set of beings the generality of seamen are, when on shore, instead of being surprised that these two men should thus lose their way, it is rather to be wondered at that no more of the party were missing. Indeed, one of those who landed with me, was in a similar situation; but he had sagacity enough to know that the ships were to leeward, and got on board almost as soon as it was discovered that he had been left behind. As soon as Captain Clerke knew that one of the stragglers was still in this awkward situation, he sent a party in search of him; but neither the man nor the party having come back, the next morning I ordered two boats into the *lagoon*, to go different ways in prosecution of the search. Not long after, Captain Clerke's party returned with their lost companion: and my boats having now no object left, I called them back by signal. This poor fellow must have suffered far greater distress than the other straggler; not only as having been lost a longer time, but as we found that he was too squeamish to drink turtle's blood.

Having some cocoa-nuts and yams on board, in a state of vegetation, I ordered them to be planted on the little island where we had observed the eclipse; and some melon seeds were sown in another place. I also left, on the little island, a bottle containing this inscription:

GEORGIUS TERTIUS REX, 31 DECEMBRIS, 1777.

ing this inscription:

On the 1st of January, 1778, I sent boats to bring on board all our parties from the land, and the turtle they had caught. Before this was completed, it was late in the afternoon; so that I did not think proper to sail till next morning. We got at this island, to both ships, about three hundred turtle, weighing, one with another, about ninety or a hundred pounds. They were all of the green kind; and perhaps as good as any in the world. We also caught, with hook and line, as much fish as we could consume, during our stay. They consisted principally of cavallies, of different sizes; large and small snappers; and a few of two sorts of rock-fish; one with numerous spots of blue, and the other with whitish streaks scattered about.
